Assistant Secretary to the Treasury. Formerly Fellow of Trinity College, Cam-
bridge. Hero of Alexandria.

T. Se. THOMAS SECCOMBE, M.A.
Balliol College, Oxford. Lecturer in History, East London and Birkbeck Colleges,
University of London. Stanhope Prizeman, Oxford, 1887. Assistant Editor of
Dictionary of National Biography, 1891-1901. Author of The Age of Johnson;
joint-editor of Bookman History of English Literature; &c. Hayward, Abraham;
Hughes, Thomas.

T. Wo. THOMAS WOODHOUSE.
Head of the Weaving and Textile Designing Department, Technical College, Dundee.
Hose-Pipe.

T. W. A. THOMAS WILLIAM ALLEN, M.A.
Fellow and Tutor of Queen’s College, Oxford. Joint-editor of The Homeric Hymns.
Homer (in part).

W. A. B. C. REV. WILLIAM AUGUSTUS BREVOORT COODIDGE, M.A., F.R.G.S., Ph.D.
Fellow of Magdalen College, Oxford. Professor of English History, St David’s
College, Lampeter, 1880-1881. Author of Guide to Switzerland; The Alps in Nature
and in History; &c. Editor of The Alpine Journal, 1880-1889. Hautes Alpes;
Haute-Savoie; Herzog, Hans.

W. A. P. WALTER ALISON PHILLIPS, M.A.
Formerly Exhibitor of Merton College and Senior Scholar of St John’s College,

W. Ba. WILLIAM BACHER, D.Ph.
Professor of Biblical Studies at the Rabbinical Seminary, Budapest. Holy Alliance, The;
Honorius I.; Hungary: History (in part).

W. Fr. WILLIAM FREAM, LL.D. (d. 1907).
Formerly Lecturer on Agricultural Entomology, University of Edinburgh, and
Agricultural Correspondent of The Times. Hildel.

W. F. C. WILLIAM FEILDEN CRAIGIE, M.A.
Barister-at-Law, Inner Temple. Lecturer on Criminal Law at King’s College,
London. Editor of Archbold’s Criminal Pleading (23rd ed.). Homicide.

W. G. H. WALTER GEORGE HEADLAM (1856-1906).
Fellow of King’s College, Cambridge. Editor of Herodas. Translator of the plays
of Aeschylus. Herodas.

W. H. F. SIR WILLIAM HENRY FLOWER, F.R.S.
See the biographical article, FLOWER, SIR W. H. Horse (in part).

W. H. Ha. WILLIAM HENRY HADOW, M.A., Mus.DOC.
Principal, Armstrong College, Newcastle-on-Tyne. Formerly Fellow and Tutor of
Worcester College, Oxford. Member of Council, Royal College of Music. Editor
W. L. G. William Lawson Grant, M.A. Professor at Queen's University, Kingston, Canada. Formerly Beit Lecturer in Colonial History at Oxford University. Editor of Acts of the Privy Council, Colonial Series; Canadian Constitutional Development (in collaboration).

W. M. R. William Michael Rossetti. See the biographical article, Rossetti, Dante Gabriel.

W. R. N. Sir William Robertson Nicoll, LL.D. See the biographical article, Nicoll, Sir W. R.

W. R. S. William Robertson Smith, LL.D. See the biographical article, Smith, William Robertson.

W. R. S.-R. William Ralston Shedden-Ralston, M.A. Assistant in the Department of Printed Books, British Museum. Author of Russian Folk Tales; &c.

W. T. H. William Tod Helmut, M.D., LL.D. (d. 1901). Formerly Professor of Surgery and Dean of the Homoeopathic and Medical College and Hospital, New York. President of the Collins State Homoeopathic Hospital. Sometime President of the American Institute of Homoeopathy and the New York State Homoeopathic Medical Society. Author of Treatise on Diphtheria; System of Surgery; &c.

W. W. William Wallace, LL.D. See the biographical article, Wallace, William (1844-1897).

W. Wr. Williston Walker, Ph.D., D.D. Professor of Church History, Yale University. Author of History of the Congregational Churches in the United States; The Reformation; John Calvin; &c.

W. Y. S. William Young Sellar, LL.D. See the biographical article, Sellar, W. Y.

HARMONY (Gr. ἀρμονία, a concord of musical sounds, ἀρμονίκην to join; ἀρμονική (sc. τεχνή) meant the science or art of music, μουσική being of wider significance), a combination of parts so that the effect should be aesthetically pleasing. In its earliest sense in English it is applied, in music, to a pleasing combination of musical sounds, but technically it is confined to the science of the combination of sounds of different pitch.

1. Concord and Discord.—By means of harmony modern music has attained the dignity of an independent art. In ancient times, as at the present day among nations that have not come under the influence of European music, the harmonic sense was, if not altogether absent, at all events so obscure and undeveloped as to have no organizing power in the art. The formation by the Greeks of a scale substantially the same as that which has received our harmonic system shows a latent harmonic sense, but shows it in a form which positively excludes harmony as an artistic principle. The Greek perception of certain successions of sounds as concordant rests on a principle identifiable with the scientific basis of concord in simultaneous sounds. But the Greeks did not conceive of musical simultaneity as consisting of anything but identical sounds; and when they developed the practice of magnifying—i.e. singing in octaves—they did so because, while the difference between high and low voices was a source of pleasure, a note and its octave were then, as now, perceived to be in a certain sense identical. We will now start from this fundamental identity of the octave, and with it trace the genesis of other concords and discords; bearing in mind that the history of harmony is the history of artistic instincts and not a series of progressive scientific theories.

The unisonous quality of octaves is easily explained when we examine the "harmonic series" of upper partials (see Sound). Every musical sound, if of a timbre at all rich (and hence pre-eminently the human voice), contains some of these upper partials. Hence, if one voice produce a note which is an upper partial of another note sung at the same time by another voice, the higher voice adds nothing new to the lower but only reinforces what is already there. Moreover, the upper partials of the higher voice will also coincide with some of the lower. Thus, if a note and its octave be sung together, the upper octave is itself No. 2 in the harmonic series of the lower, No. 2 of its own series is No. 4 of the lower, and its No. 3 is No. 6, and so on. The impression of identity thus produced is so strong that we often find among people unacquainted with music a firm conviction that a man is singing in unison with a boy or an instrument when he is really singing in the octave below. And even musical people find a difficulty in realizing more than a certain brightness and richness of single tone when a violinist plays octaves perfectly in tune and with a strong emphasis on the lower notes. Doubling in octaves therefore never was and never will be a process of harmonization.

Now if we take the case of one sound doubling another in the 12th, it will be seen that here, too, no real addition is made by the higher sound to the lower. The 12th is No. 3 of the harmonic series, No. 2 of the higher note will be No. 6 of the lower, No. 3 will be No. 9, and so on. But there is an important difference between the 12th and the octave. However much we alter the octave by transposition into other octaves, we never get anything but unison or octaves. Two notes two octaves apart are just as devoid of harmonic difference as a plain octave or unison. But, when we apply our principle of the identity of the octave to the 12th, we find that the removal of one of the notes by an octave may produce a combination in which there is a distinct harmonic element. If, for example, the lower note is raised by an octave so that the higher note is a fifth from it, No. 3 of the harmonic series of the higher note will not belong to the lower note at all. The 5th is thus a combination of which the two notes are obviously different; and, moreover, the principle of the identity of octaves can now operate in a contrary direction and transfer this positive harmonic value of the 5th to the 12th, so that we regard the 12th as a 5th plus an octave, instead of regarding the 5th as a compressed 12th. At the same time, the relation between the two is quite close enough to give the 5th much of the feeling of harmonic poverty and reduplication that characterizes the octave; and hence when medieval musicians

---

1 Musical intervals are reckoned numerically upwards along the degrees of the diatonic scales (described below). Intervals greater than an octave are called compound, and are referred to their simple forms, e.g. the 12th is a compound 5th.
doubled a melody in 5ths and octaves they believed themselves to be doing no more than extending and diversifying the means by which a melody might be sung in unison by different voices. How they came to prefer for this purpose the 4th to the 5th seems puzzling when we consider that the 4th does not appear as a fundamental interval in the harmonic series until that series has become an integral part of it that maintains any relation to our musical ideas. But it was of course certain that they obtained the 4th as the inversion of the 5th; and it is at least possible that the singers of lower voices found a peculiar pleasure in singing below higher voices in a position which they felt harmonically as that of a top part. That is to say, a bass, in singing a fourth below a tenor, would take pleasure in doubling in the octave an alto singing normally a 5th above the tenor.

This should also, perhaps, be taken in connexion with the fact that the interval of the downward 4th is in melody the earliest that became settled. And it is worth noticing that, in any singing-class where polyphonic music is sung, there is a marked tendency among the more timid members to find their way into their part by a gentle humming which is generally a 4th below the nearest steady singers.

The limited compass of voices soon caused modifications in the medieval parallelisms of 4ths and 5ths, and the introduction of independent ornaments into one or more of the voices increased to an extent which drew attention to other intervals. It was long, however, before the true criterion of concord and discord was attained; and at first the notion of concord was purely acoustic, that is to say, the ear was sensitive only to the difference in roughness and smoothness between combinations in themselves. And even the modern researches of Helmholtz fail to represent classical and modern harmony, in so far as the phenomena of beats are quite independent of the contrapuntal nature of concord and discord which depends upon the melodic intelligibility of the motion of the parts. Beats give rise to a strong physical sense of discord akin to the painlessness of a flickering light (see Sound). Accordingly, in the earliest experiments in harmony, the ear, in the absence of other criteria, attached much more importance to the purely acoustic roughness of beats than our ears under the experience of modern music. This, and the circumstance that the imperfect concords (the 3rds and 6ths) long remained out of tune owing to the incompleteness of the Pythagorean system of harmonic ratios, sufficiently explain the medieval treatment of these combinations as discords differing only in degree from the harshness of 2nds and 7ths. In the earliest attempts at really contrapuntal writing (the astonishing 13th- and 14th-century motets, in which voices are made to sing different melodies at once, with what seems to modern ears a total disregard of sound and sense) we find that the method consists in a kind of rough-hewing by which the concords of the octave, 5th and 4th are provided at most of the strong accents, while the rest of the harmony is left to take care of itself. As the art advanced the imperfect concords began to be felt as different from the discords; but as their true nature appeared it brought with it such an increased sense of the harmonic poverty of octaves, 5ths and 4ths, as ended in a complete inversion of the earliest rules of harmony.

The harmonic system of the later 15th century, which culminated in the "golden age" of the 16th-century polyphony, may be described as follows: Imagine a flux of simultaneous independent melodies, so ordered as to form an artistic texture based not only on the variety of the melodies themselves, but also upon gradations between points of repose and points in which the roughness of sound is rendered interesting and beautiful by means of the clearness with which the melodic sense in each part indicates the convergence of all towards the next point of repose. The typical point of repose owes its effect not only to the acoustic smoothness of the combination but primarily to the almost invariable result that in concords the concords, of whatever kind, are always at the final point of repose in the whole composition.

And by degrees the major triad, with its major 3rd, became so familiar that a chord consisting of a bare 5th, with or without an octave, was regarded rather as a skeleton triad without the 3rd than as a concord free from elements of imperfection. Again, the identity of the octave secured for the combination of a note with its minor 3rd and minor 6th a place among concords; because, whether so recognized by early theorists or not, it was certainly felt as an inversion of the major triad. The fact that its bass note is not the fundamental note (and therefore has a series of upper partials not compatible with the higher notes) deprives it of the finality and perfection of the major triad, to which, however, its relationship is too near for it to be felt otherwise than as a concord. This sufficiently explains why the minor 6th ranks as a concord in music, though it is acoustically nearly as rough as the discord of the minor 7th, and considerably rougher than that of the 7th note of the harmonic series, which has not become accepted in our musical system at all.

But the major triad and its inversion are not the only concords that will be produced by our flux of melodies. From time to time this flux will arrest attention by producing a combination which, while it does not appeal to the ear as being a part of the harmonic chord of nature, yet contains in itself no elements not already present in the major triad. Theorists have in vain tried to find in "nature" a combination of a note with its minor 3rd and perfect 5th; and so long as harmony was treated unhistorically and unscientifically as an a priori theory in which every chord must needs have a "root," the minor triad, together with nearly every other harmonic principle of any complexity, remained a mystery. But the minor triad, as an artistic and not purely acoustic phenomenon, is an inevitable thing. It has the character of a discord because of our intellectual perception that it contains the same elements as the major triad; but its absence of connexion with the natural harmonic series deprives it of complete finality in the simple system of 15th-century harmony, and at the same time gives it a permanent contrast with the major triad; a contrast which is acoustically intensified by the fact that, though its intervals are in themselves as concordant as those of the major triad, their relative position produces decidedly rough combinations of "resultant tones."

By the time our flux of melodies had come to include the major and minor triads as concords, the notion of the independence of parts had become of such paramount importance as totally to revolutionize the medieval conception of the perfect concords. Fifths and octaves no longer formed an oasis in a desert of cacophony, but they assumed the character of concord so nearly approaching to unison that a pair of consecutive 5ths or octaves began to be increasingly felt as violating the independence of the parts. And thus it came about that in pure 16th-century counterpoint (as indeed at the present day whenever harmony and counterpoint are employed in their purest significance) consecutive 5ths and octaves are strictly forbidden. When we compare our laws of counterpoint with those of medieval discord (in which consecutive 5ths and octaves are the rule, while consecutive 3rds and 6ths are strictly forbidden) we are sometimes tempted to think that the very nature of the human ear has changed. But it is now generally recognized that the process was throughout true, and it has been correctly observed that the attempt at showing that consecutive 5ths are forbidden by our harmonic system for the very reason which inculcated them in the system of the 12th century.

II. Tonality.—As soon as the major and minor triad and their first inversions were well-defined entities, it became evident that
the successions of these concords and their alternations with discord involved principles at once larger and more subtle than those of mere difference in smoothness and artificiality. Not only was a major chord (or at least its skeleton) necessary for the final point of repose in a composition, but it could not itself sound final unless the concords as well as the discords before it showed a well-defined tendency towards it. This tendency was best realized when the penultimate concord had its fundamental note at the distance of a 5th or a 4th above or below that of the final chord. When the fundamental note of the penultimate chord is a 5th above or (what is the same thing) a 4th below that of the final chord, we have an "authentic" or "perfect" cadence, and the relation between the two chords is very clear. While the contrast between them is well marked, they have one note in common—for the root of the penultimate chord is the 5th of the final chord; and the statement of this common note, first as an octave or unison and then as a 5th, expresses the first facts of harmony with a force which the major 3rds of the chords can only strengthen, while it also involves in the bass that melodic interval of the 4th or the 5th which is now known to be the germ of all melodic scales. The relation of the final note of a scale with its upper 5th or lower 4th thus becomes a fundamental fact of complex harmonic significance—that is to say, of harmony modified by melody so far as it concerns the succession of sounds as well as their simultaneous combination.

In our modern key-system the final note of the scale is called the tonic, and the 5th above or 4th below it the dominant. (In the 16th century the term "dominant" has this meaning only in the "authentic" modes other than the Phrygian, but as an aesthetic fact it has been in all music, though the theory here given would not have been intelligible to any composers before the 18th century.) Another penultimate chord asserts itself as the converse of the dominant—namely, the chord of which the root is a 5th below or a 4th above the final. This chord has not that relationship to the final which the dominant chord shows, for its fundamental note is not in the harmonic series of the final. But the fundamental note of the final chord is in its harmonic series, and in fact stands to it as the dominant stands to the final. Thus the progression from subdominant, as it is called, to tonic, or final, forms a full close known as the " plagal cadence," second only in importance to the "perfect" or "authentic cadence." In our modern key-system these three chords, the tonic, the dominant and the subdominant, form a firm harmonic centre in reference to which all other chords are grouped. The tonic is the final in which everything ultimately resolves: the dominant stands on one side of it as a chord based on the note harmonically most closely related to the tonic, and the subdominant stands on the other side as the converse and opposite of the dominant, weaker than the dominant because not directly derived from the tonic. The other triads obtainable from the notes of the scale are all minor, and of less importance; and their relationship to each other and to the tonic is most definite when they are so grouped that their bases rise and fall in 4th and 5ths, because they then tend to imitate the relationships between tonic, dominant and subdominant.

Here are the six common chords of the diatonic scale. The triad on the 7th degree or "leading-note" (B) is a discord, and is therefore not given here.

Now, in the 16th century it was neither necessary nor desirable that chords should be grouped exclusively in this way. The relation between tonic, dominant and subdominant must necessarily appear at the final close, and in a lesser degree at the successions of these concords and their alternations with discord involved principles at once larger and more subtle than those of mere difference in smoothness and artificiality. Not only was a major chord (or at least its skeleton) necessary for the final point of repose in a composition, but it could not itself sound final unless the concords as well as the discords before it showed a well-defined tendency towards it. This tendency was best realized when the penultimate concord had its fundamental note at the distance of a 5th or a 4th above or below that of the final chord. When the fundamental note of the penultimate chord is a 5th above or (what is the same thing) a 4th below that of the final chord, we have an “authentic” or “perfect” cadence, and the relation between the two chords is very clear. While the contrast between them is well marked, they have one note in common—for the root of the penultimate chord is the 5th of the final chord; and the statement of this common note, first as an octave or unison and then as a 5th, expresses the first facts of harmony with a force which the major 3rds of the chords can only strengthen, while it also involves in the bass that melodic interval of the 4th or the 5th which is now known to be the germ of all melodic scales. The relation of the final note of a scale with its upper 5th or lower 4th thus becomes a fundamental fact of complex harmonic significance—that is to say, of harmony modified by melody so far as it concerns the succession of sounds as well as their simultaneous combination.

In our modern key-system the final note of the scale is called the tonic, and the 5th above or 4th below it the dominant. (In the 16th century the term “dominant” has this meaning only in the “authentic” modes other than the Phrygian, but as an aesthetic fact it has been in all music, though the theory here given would not have been intelligible to any composers before the 18th century.) Another penultimate chord asserts itself as the converse of the dominant—namely, the chord of which the root is a 5th below or a 4th above the final. This chord has not that relationship to the final which the dominant chord shows, for its fundamental note is not in the harmonic series of the final. But the fundamental note of the final chord is in its harmonic series, and in fact stands to it as the dominant stands to the final. Thus the progression from subdominant, as it is called, to tonic, or final, forms a full close known as the “ plagal cadence,” second only in importance to the “perfect” or “authentic cadence.” In our modern key-system these three chords, the tonic, the dominant and the subdominant, form a firm harmonic centre in reference to which all other chords are grouped. The tonic is the final in which everything ultimately resolves: the dominant stands on one side of it as a chord based on the note harmonically most closely related to the tonic, and the subdominant stands on the other side as the converse and opposite of the dominant, weaker than the dominant because not directly derived from the tonic. The other triads obtainable from the notes of the scale are all minor, and of less importance; and their relationship to each other and to the tonic is most definite when they are so grouped that their bases rise and fall in 4th and 5ths, because they then tend to imitate the relationships between tonic, dominant and subdominant.

Here are the six common chords of the diatonic scale. The triad on the 7th degree or “leading-note” (B) is a discord, and is therefore not given here.

Now, in the 16th century it was neither necessary nor desirable that chords should be grouped exclusively in this way. The relation between tonic, dominant and subdominant must necessarily appear at the final close, and in a lesser degree at

1 The submediant is so-called because if the subdominant is taken a 5th below the tonic, the submediant will come midway between it and the tonic as the mediant comes midway between tonic and dominant.

2 See Plain Song.
variety of fixed chords needs a much more rigid harmonic scheme to control it, but they can never be falsified. And when Beethoven in his last "Bagatelle" raises the 6th of a minor scale for the pleasure he takes in an unexpectedly bright major chord; or when, in the Incantadii of his Mass in D, he makes a free use of the Dorian scale, he is actuated by precisely the same harmonic and aesthetic motives as those of the wonderful opening of Palestrina’s eight-part Stabat Mater; just as in the Lydian figured chorale in his A minor Quartet he carries out the principle of harmonic variety, as producable by an oblique melodic scale, with a thoroughness from which Palestrina himself would have shrunk. (We have noted that in 16th-century music the Lydian mode is almost invariably Imitonicized.)

III. Modern Harmony and Tonality.—In the harmonic system of Palestrina only two kinds of discord are possible, namely, suspensions and passing-notes. The principle of the suspension is that while parts are moving from one discord to another one of the parts remains behind, so as to create a discord at the moment when the other parts proceed. The suspended part then goes on to its concordant note, which must lie on an adjacent (and in most cases a lower) degree of the scale. Passing-notes are produced transiently by the motion of a part up or down the scale while other parts remain stationary. The possibilities of these two devices can be worked out logically so as to produce combinations of extreme harshness. And when combined with the rules which laid on the performers the responsibility for modifying the strict scale of the mode in order to form satisfactory closes and avoid melodic harshness, they sometimes gave rise to combinations which the clearest artistic intellects of the 16th century perceived as incompatible with the modal style. For example, in a passage written thus between F and B, while the other singer would be hardly less likely on the spur of the moment to sharpen his G under the impression that he was making a close; and thus one of the most complex and characteristic modern discords, that of the augmented 6th, did frequently occur in 16th-century performances, and was not always regarded as a blunder. But if the technical principles of 16th-century discord left much to the good taste of composers and singers, they nevertheless in conjunction with that good taste severely restricted the resources of harmony; for, whatever the variety and artificiality of the discords admitted by them, they all had this in common, that every discord was transient and could only arise as a phenomenon of delay in the movement of one or more parts smoothly allowing the scale ("in conjunct motion") or of a more rapid motion up and down the scale in which none but the rigorously concordant first and last notes received any emphasis. No doubt there were many licenses (such as the "changing-note") which introduced discords by skip, or on the strong beat without preparation, but these were all as natural as they were illogical. They were artistic as intelligible accidents, precisely like those which make language idiomatic, such as the "attraction of the relative" in Greek. But when Monteverde and his fellow monodists tried experiments with unprepared discords, they opened up possibilities far too vast to be organized by them or by the next three generations. We then, in our own hands compared the distinctly bright and always early and modern harmony with that between classical Greek, which is absolutely literal and concrete in expression, and modern English, which is saturated with metaphors and abstractions. We may go further and say that a 16th-century discord, with its preparation and resolution, is, on a very small scale, like a simile, in which both the figure and its interpretation are given, whereas modern discord is like the metaphor, in which the figure is a substitute for and not an addition to the plain statement. It is not surprising that the sudden opening up of the whole possibilities of modern harmony at the end of the 16th century at first produced a chaos of style.

Another feature of the harmonic revolution arose from the new habit of supporting a single voice on chords played by an instrument. This, together with the use of discords in a new sense, drew attention to the chords as things in themselves and not as moments of greater or less repose in a flux of independent melodies. This was as valuable an addition to musical thought and expression as the free use of abstract terms is in literature, but it had precisely the same dangers, and has until recent times vitiated harmonic theory and divorced it from the modest observation of the practice of great masters. When, early in the 18th century, Rameau devoted much of his best energy to the elaboration of a theory of harmony, his first of observation was a series of experiments begun in chaos and resolved, not as yet in a great art, but in a system of conventions, for the contemporary art of Bach and Handel was beyond the scope of contemporary theory. He showed great analytical genius and sense of tonality in his development of the notion of the "fundamental bass," and it is rather to his credit than otherwise that he did not emphasize the distinction between discords on the dominant and those on other degrees of the scale. But his system, with all subsequent improvements, refutations and repairs only led to that base of 19th-century theory and source of what may be called the journalese of harmonic style, according to which every chord (no matter how obviously artificial and transitory) must be regarded, so to speak, as a literal fact for which a root and a scientific connexion with the natural harmonic series must at all cost be found. Some modern theorists have, however, gone too far in denying the existence of harmonic roots altogether, and certainly it is neither scientific nor artistic to regard the coincidence of the major triad with the first five notes of the harmonic series as merely accidental. It is not likely that the dominant 7th owes all its naturalness to a resemblance to the flat 7th of the harmonic series, which is too far out of tune even to pass for an augmented 6th. But the dominant major 9th certainly gains in sonorosity from its free interaction with the 9th harmonic, and many cases in music could be found where the dominant 7th itself would gain from being so far flattened as to add coincidence with a natural harmonic to its musical significance as an unprepared discord (see, for example, the "native wood-notes wild" of the distant huntsmen in the second act of Tristan und Isolde, where also the 9th and 11th are involved, and, moreover, on horns, of which the natural scale is the harmonic series itself). If the distinction between "essential" and "unessential" discords is, in the light of history and common sense, a difference only in degree, it is thus none the less of great aesthetic importance. Arithmetic and acoustics show that in proportion as musical harmony emphasizes combinations belonging to the lower region of the series the effect will be sonorous and natural; but common sense, history and aesthetics also show that the interaction of melody, harmony and rhythm must produce a host of combinations which acoustics alone cannot possibly explain. These facts are amply competent to explain themselves. To describe them in detail is beyond the scope of the present article, but a few examples from different periods are given at the end in musical type.

IV. The Minor Mode.—When the predecessors of Bach and Handel had succeeded in establishing a key-system able to bear the weight of free discord, that key-system took two forms, in both of which the three chords of tonic, dominant and sub-dominant occupy crucial points. In one form the tonic was natural, that is to say, major. In the other form the tonic chord was artificial, that is to say, minor. In the minor mode so firm is the position of the tonic and dominant (the dominant chord always being major) that it is no longer necessary, as in the 16th century, to conclude with a major chord, although it long remained a frequent practice, rather because of the inherent beauty and surprise of the effect than because of any
Marginal survival of ancient customs, at least where great masters are concerned. (This final major chord is known as the Tercer de Picardie.) The effect of the minor mode is thus normally plaintive because it centres round the artificial concord instead of the natural; and, though the keynote bears this minor artificial triad, the ear nevertheless has an expectation (which may be intensified into a powerful emotional effect) that the final conclusion of the harmonic scheme may brighten out into the more sonorous harmonic system of major chords. Let us once more recall those ecclesiastical modes of which the 3rd degree is normally minor. We have seen how they may be regarded as the more oblique of the various cross-sections of the 16th-century harmonic scheme. Now, the modern minor mode is too firmly rooted in its minor tonic chord for the 16th-century feeling of an oblique harmonic scheme to be of more than secondary importance, though that feeling survives, as the discussion of key-relationships will show us. But it is constantly thrust into the background by the new possibility that the minor tonic chord with its attendant minor harmonies may give place to the major system round the same tonic, and by the certainty that if any change is made at the conclusion of the work it will be upon the same tonic and not have reference to some other harmonic centre. In other words, a major and minor key on the same tonic are felt as identical in everything but expression (a point in which the Tonic Sol Fa system, as hitherto practised, with its identification of the minor key with its "relative" instead of its tonic major, shows a most unfortunate lack of thought). The characteristics of the major and minor modes may of course be modified by many artistic considerations, and it would be as absurd to develop this account into a scheme of pigeon-holed passions as to do the same for the equally obvious and closely parallel fact that in drama a constant source of pathos is the placing of our sympathies in an oblique relation to the natural sequence of events or to the more universal issues of the subject.

1. Key-Relationships.—On the modern sense of the identity of the tonic in major and minor rests the whole distinctive character of modern harmony, and the whole key-system of the classical composers. The masters of the 16th century naturally found it necessary to make full closes much more frequently than would be desirable if the only possible close was that on the final of the mode. They therefore formed closes on other notes, but they formed them on these exactly as on a final. Thus, a close on the second degree of the Ionian mode was identical with a Dorian final close. The notes, other than the final, on which closes could be made were called modulations. And what between the three "regular modulations" (known as the dominant, mediant, and participant) and the "coupled modulations," of which two were generally admitted in each mode simply in the interests of variety, a composer was at liberty to form a full close on any note which did not involve too many extraneous sharps or flats for its correct accomplishment. But there was a great difference between modal and modern conceptions of modulation. We have said that the close on the second degree of the Ionian mode was Dorian, but such a modulation was not regarded as a visit paid to the Dorian mode, but merely a formation of a minor mode of repose on the second degree of the Ionian mode. When therefore it is said that the modulations of 16th-century music are "purposeless and shifting," the criticism implies a purpose in change of key which is wholly irrelevant. The modal composers' purpose lay in purely local relationships of harmony, in various degrees of refinement which are often crowded out of the larger and more coarse-grained scheme of modern harmony, but which modern harmony is perfectly capable of employing in precisely the same sense whenever it has leisure.

Modulation, in the modern sense of the term, is a different thing. The modern sense of tonality is so firm, and modern designs so large, that it is desirable that different portions of a composition should be arranged round different harmonic centres or keys, and moreover that the relation between these keys and the primary key should be felt, and the whole design should at last return to the primary key, to remain there with such emphasis and proportion as shall leave upon the mind the impression that the whole is in the primary key and that the foreign keys have been as artistically grouped around it as its own local harmonies. The true principles on which keys are related proved so elastic in the hands of Beethoven that their results utterly outstripped the earlier theory which adhered desperately to the limitation of the 16th century; and so vast is the range of key which Beethoven was able to organize in a convincing scheme of relationships, that even 19th-century theory, dazzled by the true harmonic possibilities, is apt to come to the conclusion, more lame and impotent than any ancient pedantry, that all keys are equally related. A vague conception, dubbed "the unity of the chromatic scale," is thus made to explain away the whole beauty and power of Wagner's no less than Beethoven's harmonic system. We have not space to dispute the matter here, and it must suffice to state dogmatically and statistically the classical facts of key-relationship, including those which Beethoven established as normal possibilities on the suggestion of Haydn, in whose works they appear as special effects.

a. Direct Relationships.—The first principle on which two keys are considered to be related is a strengthening of that which determined the so-called modulations of the 16th-century modes. Two keys are directly related when the tonic chord of the one is among the common chords of the other. Thus, D minor is related to C major because the tonic chord of D minor is the subdominant chord on the tonic of C major (see Ex. 6). In the same way the four other related keys to C major are F minor, the mediant, F major the subdominant, G major the dominant and A minor the submediant.

This last key-relationship is sometimes called the "relative" minor, partly because it is usually expressed by the same keynote-signature as the tonic, but probably more justifiably because it is the point of view from which to reckon the key-relationships of the minor tonic. If we take the minor scale in its "harmonic" form (i.e. the form deducible from its chords of minor tonic, minor subdominant and major dominant, without regard to the exigencies of melody in concession to which the "melodic" minor scale raises the 6th in ascent and flattens the 7th in descent), we shall find it impossible to build a common chord upon its mediant (Ex. 10). But we have seen that A minor is related to C major; Ex. 10. Therefore it is absurd to suppose that C major is not related to A minor. Clearly then we must deduce some of the relationships of a minor tonic as the converse of those of a major tonic. Thus we may read Ex. 6 backwards and see that A minor is the submediant of C major; therefore C major is the dominant of A minor. D minor is the supertonic of C major; therefore C major is related to D minor and may be called its flat 7th. Taking A minor as our standard key, G major is then the flat 7th of A minor. The remaining major keys (C major to E minor = F major to A minor) may be traced directly as well as conversely; and the subdominant, being minor, does not involve an appeal to the major scale at all. But with the dominant we find the curious fact that while the dominant chord of a minor key is major it is impossible to regard the major dominant key as directly related to the minor tonic chord at all; e.g. the only chord of A in E major is A major. But the dominant minor key contains the tonic chord of the primary minor key clearly enough as subdominant, and therefore when we modulate from a minor tonic to a minor dominant we feel that we have a direct key-relationship and have not lost touch with our tonic. Thus in the minor mode modulation to the dominant key is, though frequent and necessary, a much more uphill process than in the major mode, because the naturally common dominant chord has first to be contradicted. On the other hand, a contrast between minor tonic and major dominant key is very difficult to work on a large scale (as, for example, in the complementary key for second subjects of sonata movements) because, while the major dominant key behaves as if not directly
HARMONY

related to the minor tonic, it also gives a curious sensation of being merely on the dominant instead of in it; and thus we find that in the few classical examples of a dominant major second subject in a minor sonata-movement the second subject either relapses into the dominant minor, as in Beethoven's Kreutzer Sonata and the finale of Brahms's Third Symphony, or begins in it, as in the first movement of Brahms's Fourth Symphony.

The effect of a modulation to a related key obviously depends upon the change of meaning in the chords common to both keys, and also in the new chords introduced. Thus, in modulating to the dominant we invest the brightest chord of our first key with the finality and importance of a tonic; our original tonic chord becomes comparatively soft in its new position as subdominant; and a new dominant chord arises, surpassing in brilliance the old dominant (now tonic) as that surpassed the primary tonic. Again, in modulating to the subdominant the softest chord of the primary key becomes tonic, the old tonic is comparatively bright, and a new and softer subdominant chord appears. We have seen the peculiarities of modulation to the dominant from a minor tonic, and it follows from them that modulation from a minor tonic to the subdominant involves the beautiful effect of a momentary conversion of the primary tonic chord to major, the poetict and often dramatically ironical power of which is manifested at the conclusion of more than half the finest classical slow movements in minor keys, from Bach's E♭ minor Prelude in the first book of the Forty-eight to the slow movement of Brahms's G major String Quintet, Op. 111.

The effect of the remaining key-relationships involves contrasts between major and minor mode; but it is otherwise far less clear since the primary tonic chord does not occupy a cardinal position in the second key. These key-relationships are most important from a minor tonic, as the change from minor to major is more vivid than the reverse change. The smoothest changes are those to "relative" minor, "relative" major (C to A minor; C minor to E♭); and mediant minor and submediant major (C to G minor; C minor to Ab). The change from major tonic to supertonic major is extremely natural on a small scale, i.e. within the compass of a single melody, as may be seen in countless openings of classical sonatas. But on a large scale the identity of primary dominant with secondary subdominant confuses the harmonic perspective, and accordingly in concert music the supertonic major chord is neither in the second subjects of first movements nor as the key for middle movements. But since the key-relationships of a minor tonic are at once more obscure harmonically and more vivid in contrast, we find that the converse key-relationship of the flat 7th, though somewhat bold and archaic in effect on a small scale, has once or twice been given organic function on a large scale in classical movements of exceptionally fantastic character, of which the three great examples are the ghostly slow movement of Beethoven's D major Trio, Op. 70, No. 1, the scherzo of his Ninth Symphony, and the finale of Brahms's D minor Violin Sonata (where, however, the C major theme soon passes permanently into the more orthodox dominant minor).

Thus far we have the set of key-relationships universally recognized since the major and minor modes were established, a relationship based entirely on the place of the primary tonic chord in the second key. It only remains for us to protest against the orthodox description of the five related keys as being the "relative" minor or major and the dominant and subdominant with their "relative" minors or majors; a conception which expresses the fallacious assumption that keys which are related to the same key are related to one another, and which thereby implies that all keys are equally related and that classical composers were foolish. It can and does only insist that there is no foundation for key-relationship except through a tonic, and that it is through the tonic that the most distant keys have always been connected by every composer with a wide range of modulation, from Haydn to Brahms and (with due allowance for the conditions of his musical drama) Wagner.

b. Indirect Relationships.—So strong is the identity of the tonic in major and minor mode that Haydn and Mozart had no scruple in annexing, with certain reservations, the key-relationships of the major mode to the minor. The converse is not the case, and the brilliance of Mozart's style makes him prefer to annex the key-relationships of the tonic minor (e.g. C major to Ab, the submediant of C minor), because the primary tonic note is in the second key, although its chord is transformed. His range of thought does not allow him to use these keys otherwise than episodically; but he certainly does not treat them as chaotically remote by confining them to rapid modulations in the development-portions of his movements. They occur characteristically as beautiful purple patches before or during his second subjects. Haydn, with his mastery of rational paradox, takes every opportunity, in his later works, of using all possible indirect key-relationships in the choice of key for slow movements and for the trios of minuets. By using them thus sectionally (i.e. so as not to involve the organic connecting links necessary for the complementary keys of second subjects) he gives himself a free hand, and he rather prefers those keys which are obtained by transforming the minor relationships of a major key (e.g. C minor to A major, as in the G minor Quartet, Op. 72, No. 6, where the slow movement is in E major), and indeed there is not one key-contrast known to Beethoven and Brahms which Haydn does not use with complete sense of its meaning, though his art admits it only as a surprise.

Beethoven rationalized every step in the whole possible range of key-relationship by such harmonic means as are described in the article BEETHOVEN. Haydn's favourite key-relationships he used for the complementary key in first movements; and he at once discovered that the use of the major mediant as complementary key to a major tonic implied at all events just as much suggestion of the submediant major in the recapitulation as would not keep the latter half of the movement for too long as the first. The converse is not the case, and where Beethoven uses the submediant major as complementary key in a major first movement he does not subsequently introduce the still more remote and brilliant mediant in the recapitulation. The function of the complementary key is that of contrast and vividness, so that if the key is to be remote it is as well that it should be brilliant rather than sombre; and accordingly the easier key-relationships obtainable through transforming the tonic into minor do not appear as complementary keys until Beethoven's latest and most subtle works, as the Quartet in B♭, Op. 130 (where we again note that the flat mediant of the exposition is temporarily answered by the flat mediant of the recapitulation).

c. Artificial Key-relationships.—Early in the history of the minor mode it was discovered that the lower tetrachord could be very effectively and naturally altered as so to resemble the upper (thus producing the scale C Db Eb F G Ab B♭ C). This produces a flat supertonic (the chord of which is generally presented in its first inversion, and is known as the Neapolitan 6th, from its characteristic use in the works of the Neapolitan school which did so much to establish modern tonality) and its origin, as just described, often impels it to resolve on a major tonic chord. Consequently it exists in the minor mode as a phenomenon not much more artificial than the mode itself; and although the keys it thus connects are extremely remote, and the effect of their connexion very surprising, the connexion is none the less real, whether from a major or a minor tonic, and is a crucial test of a composer's sense of key-perspective. Thus Philipp Emanuel Bach in a spirit of mere caprice puts the charming little slow movement of his D major Symphony into Eb and obliterates all real relationship by chaotic operatic
HARMONY

connecting links. Haydn's greatest pianoforte sonata (which, being probably his last, is of course No. 1 in most editions) is in Eb, and its slow movement is in F# major (= Gb). That key had already appeared, with surprising effect, in the wanderings of the development of the first movement. No attempt is made to indicate its connexion with Eb; and the finale begins in Eb, but its first bar is unharmonized and starts on the one note which most contradicts E4 and least prepares the mind for Eb. The immediate repetition of the opening phrase a step higher on the normal supertonic strikes the note which the opening had contradicted, and thus shows its function as the main key without in the least degree explaining away the paradoxical effect of the key of the slow movement. Brahms's Violoncello Sonata Op. 99, is in F; a prominent episode in the development of the first movement is in E5 minor (= Gb), thus preparing the mind for the slow movement, which is in F# major (= Gb), with a central episode in F minor. The scherzo is in F minor, and begins on the dominant. Thus if we play its first chord immediately after the last chord of the slow movement we have exactly that extreme position of flat supertonic followed by dominant which is a favourite form of cadence in Wagner, which can even convey its meaning by its mere bass without any harmonies (Walküre, Act 3, Scene 2: "Was jetzt du bist, das sage dir selbst").

Converse harmonic relationships are, as we have seen, always weaker than their direct forms. And thus the relation of C major to B major or minor (as shown in the central episode of the slow movement just mentioned) is rare. Still more rare is the obtaining of indirect artificial relationships, of which the episode in the first movement just mentioned is an illustration in so far as it enhances the effect of the slow movement, but is inconclusive in so far as it is episodic. For with群岛 key-relationships everything depends upon whether they are used with what may be called cardinal function (like complementary keys) or not. Even a near key may occur in the course of wandering modulations without producing any effect of relationship at all, and this should always be borne in mind whenever we accumulate statistics from classical music.

d. Contrary and Unconnected Keys.—There remain only two pairs of keys that classical music has not brought into connexion, a circumstance which has co-operated with the utter vagueness of orthodox theories on the subject to confirm the conventionally progressive critic in his conviction that all modulations are alike. We have seen how the effect of modulation from major tonic to minor supertonic is, on a large scale, obscured by the identity of the primary dominant with the secondary subdominant, though the one chord is major and the other minor. Now when the supertonic becomes major this difference no longer obviates the confusion, and modulation from C major to D major, though extremely easy, is of so bewildering effect: that it is used by classical composers only in moments of intensely dramatic surprise, as, for example, in the recapitulation of the first subject of Beethoven's Eroica Symphony, and the last variation (or coda) of the slow movement of his Trio in Bb, Op. 97. And in both cases the balance is restored by the converse (and equally if not more contradictory) modulation between major tonic and major flat 7th, though in the slow movement of the Bb Trio the latter is represented only by its dominant chord which is "enharmonically" resolved into quite another key. The frequent attempts made by easy-going innovators to treat these key-contrasts on another footing than that of paradox, dramatic surprise or hesitation, only show a deficient sense of tonality, which must also mean an inability to see the intensely powerful effect of the true use of such modulations in classical music, an effect which is entirely independent of any ability to formulate a theory to explain it.

1 Many theorists mistake the usual extreme emphasis on the dominant chord of the dominant key, in preparation for second subjects, for a modulation to the major supertonic, but this can do no more than raise the sense of tonality. A good sense of tonality is to see what becomes of such passages when translated into the minor mode. Illusory modulation to the flat 7th frequently occurs as a bold method of throwing strong emphasis on to the subdominant at the outset of a movement, as in Beethoven's Sonata, Op. 31, No. 1.

There now remains only one pair of keys that have never been related, namely, those that (whether major or minor) are at the distance of a triton 4th. In the first place they are unrelated because there is no means of putting any form of a tonic chord of F# into any form of the key of C, or vice versa; and in the second place because it is impossible to tell which of two precisely opposite keys the second key may be (e.g. we have no means of knowing that a direct modulation from C to F# is not from C to Gb, which is exactly the same distance in the opposite direction). And this brings us to the only remaining subjects of importance in the science and art of harmony, namely, those of the tempered scale, enharmonic ambiguity and just intonation. Before proceeding we subjoin a table of all the key-relationships from major and minor tonics, representing the degrees by capital Roman figures when the second key is major and small figures

---

2 Very rare, but the slow movement of Schubert's C major String Quintet demonstrates it magnificently.

3 All the indirect relationships from a minor tonic are distinctly strained and, except in the violently contrasted doubly indirect keys, obscure as being themselves minor. But the direct artificial modulation is quite smooth, and rich rather than remote. See Beethoven's C minor Quartet.

4 No classical example, though the clearer converse from a major tonic occurs effectively.

5 Not (with the exception of II) so violent as when from major tonic. Bach, whose range seldom exceeds direct key-relationships, is not afraid to drift from D minor to C minor, though nothing would induce him to go from D major to C major or minor.
when minor. Thus I represents tonic major, iv represents subdominant minor, and so on. A flat or a sharp after the figure indicates that the normal degree of the standard scale has been lowered or raised a semitone, even when in any particular pair of keys it would not be expressed by a flat or a sharp. Thus vEb would, from the tonic of Bb major, express the position of the slow movement of Beethoven's Sonata, Op. 106, which is written in F♯ minor since G♭ is beyond the practical limits of notation that.

VI. Temperament and Enharmonic Changes.—As the facts of the purely acoustic principles which (as Helmholtz has shown) go so far to explain 16th-century aesthetics became more and more inadequate; and grave practical obstacles to euphonious tuning began to assert themselves. The scientific (or natural) ratios of the diatonic scale were not interfered with by art so long as no discords were "fundamental"; but when discords began to assume independence, one and the same note often became assignable on scientific grounds to two slightly different positions in pitch, or at all events to a position incompatible with even tolerable effect in performance. Thus, the chord of the diminished 7th, must be divided to accommodate both the "intonation," that is to say, intonation based upon the exact ratios of a normal minor scale. In practical performance the diminished 7th contains three minor 3rds and two imperfect 5ths (such as that which is present in the dominant 7th), while the peculiarly dissonant interval from which the chord takes its name is very nearly the same as a major 6th. Now it can only be said that an intonation which makes nonsense of chords of which every classical composer from the time of Corelli has made excellent sense, is a very unjust intonation indeed; and to anybody who realizes the universal relation between art and nature it is obvious that the chord of the diminished 7th must owe its naturalness to its close approximation to the natural ratios of the minor scale, while it owes its artistic possibility to the extremely minute instinctive modification by which its dissonance becomes tolerable. As a matter of fact, although we have shown here and in the article Music how artificial is the origin and nature of all but the very scantiest materials of the musical language, there is no art in which the element of practical compromise is so minute and so hard for any but trained scientific observation to perceive. If a painter could have a scale of light and shade as nearly approaching nature as the practical intonation of music approaches the acoustic facts it really involves, a visit to a picture gallery would be a severe strain on the strongest eyes, as Ruakin constantly points out. Yet music is in the vast extent exactly on the same footing as other arts. It constitutes no exception to the universal law that artistic ideas must be realized, not in spite of, but by means of practical necessities. However independent the treatment of discords, they assert themselves in the long run as transient. They resolve into permanent points of repose of which the basis is natural; but the transient phenomena float through the harmonic world adapting themselves, as best they can, to their environment, showing as much dependence upon the stable scheme of "just intonation" as a crowd of metaphors and abstractions in language shows a dependence upon the root of the syllogism. As much and no more, but that is a doubt a great deal. Yet the attempt to determine the point in modern harmony where just intonation should end and the tempered scale begin, is as vexatious as the attempt to define in etymology the point at which the literal meaning of a word gives places to a metaphorical meaning. And it is as unsound scientifically as the conviction of the typical circle-squarer that he is unravelling a mystery and measuring a quantity hitherto unknown. Just intonation is a reality in so far as it emphasizes the contrast between concord and discord; but when it forbids artistic interaction between harmony and melody it is a chimera. It is sometimes said that Bach, by the example of his forty-eight preludes and fugues in all the major and minor keys, first fixed the modern scale. This is true practically, but not aesthetically. By writing a series of movements in every key of which the keynote was present in the normal organ and harpsichord manuals of his and later times, he enforced the system by which all facts of modern musical harmony are represented on keyed instruments by dividing the octave into twelve equal semitones, instead of tuning a few much-used keys as accurately as possible and sacrificing the euphony of all the rest. This system of *equal temperament*, with twelve equal semitones in the octave, obviously annihilates important distinctions, and in the most used keys it sours the concords and blunts the discords more than unequal temperament; but it is never harsh; and where it does not express harmonic subtleties the ear instinctively supplies the interpretation; as the observing faculty, indeed, always does wherever the resources of art indicate more than they express.

Now it frequently happens that discords or artificial chords are not merely obscure in their intonation, whether ideally or practically, but as produced in practice they are capable of two sharply distinct interpretations. And it is possible for music to take advantage of this and to approach a chord in one significance and quite it with another. Where this happens in just intonation (in so far as that represents a real musical conception) such chords will, to speak, quiver from one meaning into the other. And even in the tempered scale the ear will interpret the change of meaning as involving a minute difference of intonation. The chord of the diminished 7th has in this way four different meanings—

and the chord of the augmented 6th, when accompanied by the fifth, may become a dominant 7th or vice versa, as in the passage already cited in the coda of the slow movement of Beethoven's *B♭ Trios*, Op. 97. Such modulations are called *enharmonic*. We have seen that all the more complex musical phenomena involve distinctions enharmonic in the sense of intervals smaller than a semitone, as, for instance, whenever the progression D E in the scale of C, which is a minor tone, is identified with the progression of D E in the scale of D, which is a major tone (differing from the former as § from 7♯5). But the special musical meaning of the word "enharmonic" is restricted to the difference between such pairs of sharps with flats or naturals as can be represented on a keyboard by the same note, this difference being the most impressive to the ear in "just intonation" and to the imagination in the tempered scale.

Not every progression of chords which is, so to speak, spelt enharmonically is an enharmonic modulation in itself. Thus a modulation from D flat to E major looks violently enharmonic on paper, as in the first movement of Beethoven's *Sonata*, Op. 110. But E major with four sharps is merely the most convenient way of expressing F flat, a key which would need six flats and a double flat. The reality of an enharmonic modulation can be easily tested by transporting the passage a semitone. Thus, the passage just cited, put a semitone lower, becomes a perfectly diatonic modulation from C to E flat. But no transposition of the sixteen bars before the return of the main theme in the scherzo of Beethoven's *Sonata in B♭*, Op. 31, No. 3, will get rid of the fact that the diminished 7th (G♭ B♭ D♭ F♭) on the dominant of F minor, must have changed into G ♭ B♭ D♭ F♭ (although Beethoven does not take the trouble to alter the spelling) before it could resolve, as it does, upon the dominant of Ab. But though there is thus a distinction between real and apparent enharmonic modulations, it frequently happens that a series of modulations perfectly diatonic in themselves returns to the original key by a process which can only be called an enharmonic circle. Thus the whole series of keys now in practical use can be arranged in what is called the circle of fifths (C G D A E B F♯ = G♯) B♭ A♭ B♭ F C, from which series we now see the meaning of what was said in the discussion of key-relationships as to the ambiguity of the relationships between keys a tritone fourth apart). Now no human memory is capable of distinguishing the difference of pitch between the
keys of C and B♭ after a wide series of modulations. The difference would be perceptible enough in immediate juxtaposition, but after some interval of time the memory will certainly accept two keys so near in pitch as identical, whether in “just intonation” or not. And hence the enharmonic circle of fifths is a conception of musical harmony by which infinity is at once rationalized and avoided, just as some modern mathematicians are trying to rationalize the infinity of space by a non-Euclidian space so curved in the fourth dimension as to return upon itself. A similar enharmonic circle progressing in major 3rds is of frequent occurrence and of very rich effect. For example, the keys of the movements of Beethoven’s C Minor Symphony are C minor, E major, Ab major (= G♯), and C (= B♭). And the same circle occurs in the opposite direction in the first movement of his Third Symphony, where the first subject is in B, the transition passes directly to D♭ and thence by exactly the same step to A (= B♭). The exposition is repeated, which of course means that in “just intonation” the first subject would begin in G♭ and then pass through a transition in E♭♭♭ to the second subject in C♯♯. As the development contains another spurious enharmonic modulation, and the recapitulation repeats in another position the first spurious enharmonic modulation of the exposition, it would follow that Beethoven’s movement began in F and ended in C sextuple-flat! So much, then, for the application of bad metaphysics and circle-squaring mathematics to the art of music. Neither in mathematics nor in art is an approximation to be confused with an imperfection. Beethoven’s movement begins and ends in F much more exactly than any wooden diagonal fits a wooden square.

The following series of musical illustrations show the genesis of typical harmonic resources of classical and modern music.

1. Musical sounds, or notes, are sensations produced by regular periodical vibrations in the air, sufficiently rapid to coalesce in a single continuous sensation, and not too rapid for the mechanism of our ear to reproduce them.

2. The pitch of a note is the sensation corresponding to the degree of rapidity of its vibrations; being low or grave where these are slow, and high or acute where they are rapid.

3. An interval is the difference in pitch between two notes.

4. Rhythm is the organization, in a musical scheme, of sounds in respect of time.

5. Harmony is the organization, in a musical scheme, of rhythmic notes in respect of pitch.

6. Harmony is the organization, in a musical scheme, of simultaneous combinations of notes on principles whereby their acoustic properties interact and produce effects.

7. The harmonic series is an infinite series of notes produced by the subdivision of a vibrating body or column of air into aliquot parts, such notes being generally inadmissible except in the form of the timbre which their presence in various proportions imparts to the fundamental note produced by the whole vibrating body or air-column.

8. A concord is a combination which, both by its acoustic smoothness and by its logical origin and purpose in a musical scheme, can form a point of repose.

9. A discord is a combination in which both its logical origin in a musical scheme and its acoustic roughness show that it cannot form a point of repose.

10. The perfect concords and perfect intervals are those composed with only the first four members of the harmonic series, namely, the octave, as between present members of the series (see Ex. 1 above); the 5th, as between Nos. 2 and 3; and the 4th, as between Nos. 3 and 4.

11. All notes exactly one or more octaves apart are regarded as harmonically identical.

12. The root of a chord is that note from which the whole or the most important parts of the chord appear (if distributed in the right octave) as members of the harmonic series.

13. A chord is inverted when its lowest note is not its root.

14. The major triad is a chord containing three different notes which (octaves being disregarded) are identical with the first, third and fifth members of the harmonic series (the second and fourth members being negligible as octaves).

15. The minor triad is a chord containing the same intervals as the major triad in a different order; in consequence it is artificial, as one of its notes is not derivable from the harmonic series.

16. Unessential disaccords are those that are treated purely as the phenomena of transition, delay or ornament, in an otherwise concordant harmony.

17. Essential disaccords are those which so treat the mind tends to regard them as definite chords possessing roots.

18. A key is an harmonic system in which there is never any doubt as to which note or triad shall be the final note of music in that system, nor of the relations between that note or chord and the other notes or chords. In the sense the church modes are not keys or else too subtle mixture of keys.

19. This final note of a key is called its tonic.

20. The major mode is that of keys in which the tonic triad and the two other cardinal triads are major.

21. The minor mode is that of keys in which the tonic triad and one other cardinal triad are minor.

22. A diatonic scale is a series of the notes essential to one major or minor key, arranged in order of pitch and repeating itself in other octaves on reaching the limit of an octave.

23. Modulation is the passing from one key to another.

24. Chromatic notes and chords are those which do not belong to the diatonic scale of the passage in which they occur, but which are not so used as to cause modulation.

25. Enharmonic intervals are minute intervals which never occur in music as directly measured quantities, though they exist as differences between approximately identical intervals, diatonic or chromatic. In an enharmonic modulation, two chords differing by an enharmonic quantity are treated as identical.

26. Pedal or organ point is the sustaining of a single note in the bass (or, in the case of an inverted pedal, in an upper part) while the harmonies move independently. Unless the harmonies are sometimes foreign to the sustained note, it does not constitute a pedal. In modern music pedals take place on either the tonic or the dominant, other pedal-notes being rare and of complex meaning. Double pedal (of tonic and dominant, with tonic below) are not unusual. The pedal is capable of very free treatment, and produces many very bold and rich harmonic effects in music since the earlier works of Beethoven. It probably accounts for many so-called essential disaccords.

In the form of drome the pedal is the only real harmonic device of ancient and primitive music. The ancient Greeks sometimes...
used a reiterated instrumental note as an accompaniment above the melody. These primitive devices, though harmonic in the true modern sense of the word, are out of the line of harmonic development, and did not help it in any definite way.

27. The fundamental bass of a harmonic passage is an imaginary bass consisting of the roots of the chords.

28. A figured bass, or continuo, is the basis of a composition supplied with numerals indicating the chords to be filled in by the performers. Thorough-bass (Ger. Generalbass) is the art of interpreting such figures.

(D. F. T.)

HARMOTOME, a mineral of the zeolite group, consisting of hydrous barium and aluminium silicate, $\text{H}_2\text{Ba}\text{Al}_2\text{Si}_6\text{O}_{18}$ $+\text{H}_2\text{O}$. Usually a small amount of quartz is present replacing part of the barium. The system of crystallization is monoclinic; only complex twinned crystals are known. A common and characteristic form of twinned crystal, such as is represented in the figure, consists of four intercrossing individuals twinned together according to two twin-laws; the compound group resembles a tetragonal crystal with prism and pyramid, but may be distinguished from this by the grooves along the edges of the pseudo-prism. The faces of the crystals are marked by characteristic striations, as indicated in the figure. Twinned crystals of exactly the same kind are also frequent in phillipsite (q.v.). Crystals are usually white and translucent, with a vitreous lustre. The hardness is 4, and the specific gravity 2–5.

The name harmotome (from ἁρμότωμος, "a joint," and τέμνειν, "to cut") was given by R. J. Haüy in 1801, and has a crystallographic signification. Earlier names are cross-stone (Ger. Kreuzstein), ercinite, andreasbergolite and androlite, the two last being derived from the locality. Andreasberg in the Harz. Morvenite (from Morven in Ayrshire) is the name given to small transparent crystals formerly referred to phillipsite.

Like other zeolites, harmotome occurs with calcite in the amygdaloidal cavities of volcanic rocks, for example, in the dolerites of Dumbartonshire, and as fine crystals in the agate-lined cavities in the melaphyre of Oberstein in Germany. It also occurs in gneiss, and sometimes in metalliferous veins. At Andreasberg in the Harz it is found in the lead and silver veins; and at Strontian in Ayrshire in lead veins, associated with brewsterite (a strontium and barium zeolite), barytes and calcite.

HARMS, CLAUS (1798–1855). German divine, was born at Fahrstedt in Schleswig-Holstein on the 25th of May 1798, and in his youth worked in his father's mill. At the university of Kiel he repudiated the prevailing rationalism and under the influence of Schleiermacher became a fervent Evangelical preacher, first at Lunden (1806), and then at Kiel (1810). His trenchant style made him very popular, and he did great service for his cause especially in 1817, when, on the 300th anniversary of the Reformation, he published side by side with Luther's theses, ninety-five of his own, attacking reason as "the pope of our time" who "discusses Christ from the altar and throws God's word from the pulpit." He also had some fame as a hymn-writer, and besides volumes of sermons published a good book on Pastoraltheologie (1830). He resigned his pastorate on account of blindness in 1849, and died on the 1st of February 1855.

See Autobiography (2nd ed., Kiel, 1852); M. Baumgarten, Ein Denkmal für C. Harms (Brunswick, 1855).

HARNACK, ADOFF (1851– ), German theologian, was born on the 7th of May 1851 at Dorpat, in Russia, where his father, Theodosius Harnack (1817–1889), held a professorship of pastoral theology.

Theodosius Harnack was a staunch Lutheran and a prolific writer on theological subjects; his chief field of work was practical theology, and his important book on that subject, summing up his long experience and teaching, appeared at Erlangen (1877–1878, 2 vols.). The liturgy of the Lutheran church of Russia has, since 1898, been based on his Liturgische Formulare (1872).

The son pursued his studies at Dorpat (1869–1872) and at Leipzig, where he took his degree; and soon afterwards (1874) began lecturing as a Privatdozent. These lectures, which dealt with such special subjects as Gnosticism and the Apocalypse, attracted considerable attention, and in 1876 he was appointed professor extraordinarius. In the same year he began the publication, in conjunction with O. L. von Gebhardt and T. Zahn, of an edition of the works of the Apostolic Fathers, Patrum apostolici corpora, a smaller edition of which appeared in 1877. Three years later he was called to Giessen as professor ordinarius of church history. There he collaborated with Oscar Leopold von Gebhardt in Texte und Untersuchungen zur Geschichte der altchristlichen Literatur (1882 sqq.), an irregular periodical, containing only essays in New Testament and patristic fields. In 1881 he published a work on monasticism, Das Mönchtum, seine Ideale und seine Geschichte (5th ed., 1900; English translation, 1901), and became joint-editor with Emil Schürer of Theologische Literaturzeitung. In 1885 he published the first volume of his epoch-making work, Lehrbuch der Dogmengeschichte (3rd ed. in three volumes, 1894–1898; English translation in seven volumes, 1894–1899). In this work Harnack traces the rise of dogma, by which he understands the authoritative doctrinal system of the 4th century and its development down to the Reformation. He considers that in its earliest origins Christian faith and the methods of Greek thought were so closely intermingled that much that is not essential to Christianity found its way into the resultant system. Therefore Protestants are not only free, but bound, to criticize it; indeed, for a Protestant Christian, dogma cannot be said to exist. An abridgment of this appeared in 1889 with the title Grundriss der Dogmengeschichte (3rd ed., 1898). In 1886 Harnack was called to Marburg; and in 1888, in spite of violent opposition from the conservative section of the church authorities, to Berlin. In 1890 he became a member of the Academy of Sciences. At Berlin, somewhat against his will, he was drawn into a controversy on the Apostles' Creed, in which the party antagonisms within the Prussian Church had found expression. Harnack's view is that the creed contains both too much and too little to be a satisfactory test for candidates for ordination, and he would prefer a briefer symbol which could be rigorously exacted from all (cf. his Das apostolische Glaubensbekenntnis. Ein geschichtlicher Bericht nebst einem Nachwort, 1892; 27th ed., 1896). At Berlin Harnack continued his literary labours. In 1893 he published a history of early Christian literature down to Eusebius, Geschichte der Alterthümer. Literatur bis Eusebius (part 2 of vol. I, 1897), and in 1900 appeared his popular lectures, Das Wesen des Christentums (4th ed., 1901; English translation, What is Christianity? 1901; 3rd ed., 1904). One of his more recent historical works is Die Mission und Ausbreitung des Christentums in den ersten drei Jahrhunderten (1902; English translation in two volumes, 1904–1905). It has been followed by some very interesting and important New Testament studies (Beiträge zur Einleitung in das neue Testament, 1906 sqq.; Engl. trans.: Luke the Physician, 1907; The Sayings of Jesus, 1908). Harnack, both as lecturer and writer, was one of the most prolific and most stimulating of modern critical scholars, and trained up in his "Seminar" a whole generation of teachers, who carried his ideas and methods throughout the whole of Germany and even beyond its borders. His distinctive characteristic is his claim for absolute freedom in the study of church history and the New Testament; his distrust of speculative theology, whether orthodox or liberal; his interest in practical Christianity as a religious life and not a system of theology. Some of his addresses on social matters have been published under the heading "Essays on the Social Gospel" (1907).

HARNES (from O. Fr. harneis or harneis; the ultimate origin is obscure; the Celtic origin which connects it with the Welsh hyrni, iron, has phonetic and other difficulties; the French is the origin of the Span. armes, and Ger. Harnisch), probably, in
HARO—HARP

origin, gear, tackle, equipment in general, but early applied particularly to the body armour of a soldier, including the trappings of the horse; now the general term for the gear of an animal used for draft purposes, traces, collar, bridle, girth, breeching, &c. It is usually not applied to the saddle or bridle of a riding animal. The word, in its original meaning of tackle or working apparatus, is still found in weaving, for the mechanism which shifts the warp-threads to form the "shed," and in bell-hanging, for the apparatus by which a large bell is hung. The New English Dictionary quotes an early use of the word for the lines, rod and hooks of an angler (Fishing with an Angle, &c.).

HARO, CLAMEUR DE, the ancient Norman custom of "crying for justice," still surviving in the Channel Islands. The wronged party must on his knees and before witnesses cry: "Haro! Haro! Haro! à aide, mon prince, on me fait tort." This appeal has to be respected, and the alleged trespass or tort must cease till the matter has been thrashed out in the courts. The "cry" thus acts as an interim injunction, and no inhabitant of the Channel Islands would think of resisting it. The custom is of great antiquity, very ancient, dating from a time when there were no courts and no justice except such as was meted out by princes personally. The popular derivation for the name is that which explains "Haro" as an abbreviation of "Ha! Rollo," a direct appeal to Rollo, first duke of Normandy. It is far more probable that haro is simply an exclamation to call attention (O.H.G. hera, kara, "here!"). Indeed it is clear that the "cry for justice" was in no sense an institution of Rollo, but was a method of appeal recognized in many countries. It is said to be identical with the "Legato" of the Bavarians and the Thuringians," and the first mention of it in France is to be found in the "Grand coutumier de Normandie."

A similar custom, only observed in criminal charges, was recognized by the Saxon laws under the name of "Clamor Violentiae." Thus there is reason to think that William the Conqueror on his arrival in England found the "cry" fully established as far as criminal matters were concerned. Later the "cry" was made applicable to civil wrongs, and, when the administration of justice became systematized, disappeared altogether in criminal cases. It naturally tended to become obsolete as the administration of justice became systematized, but it was long retained in north-western France in cases of disputed possession, and was not actually repealed until the close of the 18th century. A survival of the English form of haro is possibly to be found in the "Ara," a cry at fairs when "settling time" arrived.

HAROLD I. (d. 1040), surnamed Harfeot, the illegitimate son of Canute, king of England, and Ælfgifu of Northampton. On the death of his father in 1035, he claimed the crown of England in opposition to Canute's legitimate son, Hardicanute. His claims were supported by Leofric, earl of Mercia, and the north: those of Hardicanute by his mother, Queen Emma, Godwine, earl of the West-Saxons and the south. Eventually Harold was temporarily elected regent, pending a final settlement on Hardicanute's return from Denmark. Hardicanute, however, tarried, and meanwhile Harold's party increased rapidly. In 1037 he was definitely elected king, and banished Emma from the kingdom. The only events of his brief reign are ineffectual inroads of the Welsh and Scots. Hardicanute was preparing to invade England in support of his claims when Harold died at Oxford on the 10th of March 1040.

HAROLD II. (c. 1022-1066), king of the English, the second son of Earl Godwine, was born about 1022. While still very young (before 1045) he was appointed to the earldom of the East-Angles. He shared his father's outlawry and banishment in 1041; but while Godwine went to Flanders, Harold with his brother Leofwine took refuge in Ireland. In 1052 Harold and Leofwine returned. Having plundered in the west of England, they joined their father, and were with him at the assembly which decreed the restoration of the whole family. He was now restored to his earldom of the East-Angles, and on his father's death in 1053 he succeeded him in the greater earldom of the West-Saxons. He was now the chief man in the kingdom, and when the older earls Leofric and Siward died his power increased yet more, and the latter part of Edward's reign was virtually the reign of Harold. In 1055 he drove back the Welsh, who had burned Hereford. In 1063 came the great Welsh war, in which Harold, with the help of his brother Tostig, crushed the power of Gruffyd, who was killed by his own people. But in spite of his power and his prowess, Harold was the minister of the king rather than his personal favourite. This latter position rather belonged to Tostig, who on the death of Siward in 1055 received the earldom of Northumberland. Here, however, his harshness soon provoked enmity, and in 1062 the Northumbrians revolted against him, choosing Morkere in his place. Harold acted as mediator between the king and the insurgents, and at length agreed to the choice of Morkere, and the banishment of his brother. At the beginning of 1066 Edward died, with his last breath recommending Harold as his successor. He was accordingly elected at once and crowned. The men of Northumberland at first refused to acknowledge him, but Harold won them over. The rest of his brief reign was taken up with the preparation against the invasion of Hardrada, the Norwegian king, who had come down the coast and was then on both sides at once. William challenged the crown, alleging both a bequest of Edward in his favour and a personal engagement which Harold had contracted towards him—probably in 1064—and prepared for the invasion of England. Meanwhile Tostig was trying all means to bring about his own restoration. He first attacked the Isle of Wight, then Lindsey, but was compelled to take shelter in Scotland. From May to September the king kept the coast with a great force by sea and land, but at last provisions failed and the land army was dispersed. Harold then came to London, ready to meet whatever enemy first came. By this time Tostig had engaged Harold Hardrada of Norway to invade England. Together they sailed up the Humber, defeated Edwin and Morkere, and received the submission of York. Harold hurried northwards; and on the 29th of September he came on the Northmen at Stamford Bridge and won a complete victory, in which Tostig and Harold Hardrada were slain. But two days later William landed at Pevensey. Harold marched southward as fast as possible. He gathered his army in London from all southern and eastern England, but Edwin and Morkere kept back the forces of the north. The king then marched into Sussex and engaged the Normans on the hill of Senlac near Battle (see Hastings). After a fight which lasted from morning till evening, the Normans had the victory, and Harold and his two brothers lay dead on the field (14th of October 1066).

HARP (Fr. harpe; Ger. Harfe; Ital. arpa), a member of the class of stringed instruments of which the strings are twanged or vibrated by the fingers. The harp is an instrument of beautiful proportions, approximating to a triangular form, the strings diminishing in length as they ascend in pitch. The mechanism is concealed within the different parts of which the instrument is composed, (1) the pedal or pedal-box, on which rest (2) the vertical pillar, and (3) the inclined convex body in which the soundboard is fixed, (4) the curved neck, with (5) the comb concealing the mechanism for stopping the strings, supported by the pillar and the body.

(1) The pedal or pedal-box forms the base of the harp and contains seven pedals both in single and double action harps, the difference being that in the single action the pedals are only capable of raising the strings one semitone by means of a drop into a notch, whereas with the double action the pedals, after a first drop, can by a further drop into a second and lower notch shorten the string a second semitone, whereas in the single action string is raised one semitone at a time. The modern method of construction was introduced by the Normans under Willaume, and the modern method of tuning was imposed by the construction of the harp with double action. The pedals remain in the notches until released by the foot, when the pedals returns to its normal position through the action. The modern pedal harp is divided into several smaller pedals, each moved by a pedal, and each giving the species of scales which may be used under each of the pedals by turning the harp.

(2) The vertical pillar is a kind of tunnel in which are placed the seven rods worked by the pedals, which set in motion the mechanism situated in the neck of the instrument. Although the pillar apparently
HARP

rests on the pedestal, it is really supported by a brass shoulder firmly screwed to the beam which forms the lowest part of the body, a case in which the player remains undisturbed when the pedal box and its cover are removed.

(3) The body or sound-chest of the harp is in shape like the longitudinal section of a cone. It was formerly composed of plates joined together as in the lute and mandolin. Bodmer was the first to make it in two pieces of wood, generally sycamore, with the addition of a flat soundboard of Swiss pine. The body is strengthened on the inside, in order to resist the tension of the strings, by means of ribs; there are five soundholes in the back, which in the older models were furnished with swell shutters opened at will by the swell pedal, the fourth from the left worked by the left foot. As the increase of sound obtained by means of the swell was infinitesimal, the device has now been discarded. The harp is strong by knotting the end of the string and passing it through its hole in the centre of the soundboard, where it is kept in position by means of a grooved peg which goes all the way through the neck.

(4) The neck consists of a curved piece of wood resting on the body at the treble end of the instrument and joining the pillar at the bass end. In the neck are set the tuning pins round which are wound the strings.

(5) The comb is the name given to two brass plates or covers which fit over both sides of the neck, concealing part of the mechanism for shortening the strings and raising their pitch a semitone when the comb is drawn down. This form of harp is useful in the left of the player, is a row of brass bridges against which the strings rest below the tuning pins, and which determine the vibrating length of the string. The comb is fastened to the back of the harp; two bridges are two rows of brass disks, known as forks, connected by steel levers; each disk is equipped with two studs for grasping the string and shortening it. The mechanism is ingenious. When a pedal is pressed, the fork is raised; the vibrating length of the string is increased, and the key turns a little way on a mandrel keeping the studs clear of the string. The upper disk, set in motion by the steel levers connecting the disks, revolves simultaneously till the string is cut by the two studs which pass through the slot formed by the disks. The hidden mechanism meanwhile has gone through a series of movements; the pedal is really a lever set upon a spring, and when depressed it draws down the connecting rod in the pillar which sets in motion the disks.

The harp usually has forty-six strings, of gut in the middle and upper registers, and of covered steel wire in the bass; the C strings are red and the F strings blue. The compass thus has a range of 64 octaves from $E_3$ to $C_9$. The double stave is used as for the pianoforte.

The single action harp used to be tuned to the key of E major.

The double action is the only instrument with fixed tones, not determined by the ear or touch of the performer, which has separate notes for naturals, sharps and flats, giving it an enharmonic compass. On the harp the appreciable interval between D\# and F\# can be played. The harp in its normal compass extends from C\# to C\#; it rests with the performer to transpose it at will in a few seconds into any other key by means of the pedals. Each of the pedals influences one note of the scale throughout the compass, beginning at the left with D, C and B worked by the left foot. Missing the fourth or forte pedal, and continuing towards the right we get the E, F, G and A pedals worked by the right foot. By lowering D\# into D\# a whole step above the key of the pedal, and raising D\# a whole step above the key of the pedal, the harp is in the key of C. An additional pedal is used to raise the key of D. If, for example, a piece be written in the key of E major, the harp is transposed into that key by depressing the E, A, and B pedals to the first note D\# in the key of E below the harp. The pedal G\# can be used to transpose the harp an octave up and so on for all the keys. Accidents and modulations are readily played by means of the pedals, the transitions being not too rapid.

The harp is the instrument upon which transposition presents the least difficulty, for the fingers are the same for all keys. The strings are twanged with the thumbs and the first three fingers.

The quality of tone does not vary greatly in the different registers, but the tone becomes more brilliant in keys with many flats, for the strings are then open and not shortened by the forks. Various effects can be obtained on the harp: (1) by harmonics, (2) by damping, (3) by guitar tones, (4) by the glissando. (1) Harmonics are produced by pressing the strings without touching them and setting it in vibration by the thumb or the first two fingers of the same hand, whereby a mysterious and beautiful tone is obtained. The three harmonics can be played together with the left hand, and by using both hands at once as many as four are possible. (2) Damping is effected by laying the palm against the string in the bass and the back of the finger in the treble. (3) Guitar or pizzicato notes are obtained by twanging the strings sharply at the lower end near the soundboard, without the nail of the fingers, the sound of the strings in quick succession; this does not necessarily give the diatonic scale, for by means of the pedals the harp can be tuned (different kinds of harps which have no pedal mechanism) to give the diatonic scale and arpeggio passages, but no chromatic, except in very slow tempo, on account of the time required by the mechanism of the pedals. A whole series of complete chords can be repeated by quick, shortening of the string; by means of the pedals this can be done as rapidly as the performer desires. The three harmonics can also be repeated slowly or quickly, the next string being tuned to a duplicate note, and the two strings plucked alternately in order to give the string time to vibrate.

Pleyel's chromatic harp, patented in 1844 and improved in 1903 by Gustave Lyon, manager of the firm of Pleyel, Wolf & Co., is an instrument practically without mechanism which has already won a place in the concert hall. It is another model. The classifier, a effect of a pillar without internal mechanism, (3) a wide neck containing two bass-west-planks in which are fixed two rows of tuning pins, and (4) a soundchest in which is firmly riveted the steel plate to which the strings are strung. The soundboard, in addition to that for the black strings are set in the left side of the neck in alternate groups of two and three, and those for the white in the right side in alternate groups of threes and fours. The strings cross half-way between the two rows of tuning pins, each one of which is being pressed gives out one note of the chromatic scale, when turned to the pitch of the diapason note.

It is obvious that the repertoire for this harp is very extensive, including many compositions written for the piano, which however cannot be played with any legato effects, these being still impossible on this chromatic harp.

History.—While the instrument is of great antiquity, it is yet from northern Europe that the modern harp and its name are derived. The term Harpa, found in the O.H. Ger. must have been of northern origin, and a Latin writer, Venantius Fortunatus describes it in the 7th century of our era as an instrument of the barbarians—

Romanosque llyn, plead tibit barbarus harpars. This is believed to be the earliest reference to the harp in which it is clearly distinguished from the lute, and in D.I.H.Ger. harpa, A.S. harpæ, Old Norse harpa. The modern Fr. Harpe retains the aspirate; in the Spanish and Italian arpa it is dropped.

The earliest delineations of the harp in Egypt give no indication that it had not existed long before. There are, indeed, representations in Egyptian paintings of stringed instruments of a bow-form having affinities with both the primitive harp and nefer (a kind of oval guitar) that support the idea of the invention of the harp from the tenebra of the warrior's or hunter's bow.

This primitive-looking instrument, called nanga, had a boat-shaped sound-chest with a disc or flat plate at the top, and a soundboard, down the centre of which one end of the string was fastened to a strip of wood, whilst the other was wound round pegs in the upper part of the bow. The nanga was played horizontally, being borne upon the performer's shoulder.

Between it and the grand vertical harps in the frescos of the time of Ramses III., more than 3000 years old, discorded by the reflector, Bruce (fig. 1) said, are varieties which permit us to look at the whole.

---

2 A few nangas (c. 1500 B.C.) are preserved among the Egyptian antiquities at the British Museum, fourth Egyptian room.

3 Bruce's harps are reproduced by Champollion, tome iii. p. 261.
HARP

from the simplest bow-form to the almost triangular harp, into one family

The Egyptian harp had no front pillar, but as it was strong with a light tension and pitch must necessarily have been low. The harps above mentioned, depicted in the tomb at Thebes, assumed from the first, that the strings were in a number of not less than six 15 ft. high, having too many strings, the one having ten, the other thirteen. What the accordance of these strings was it would be hard to reconstruct from the use of round bone or ivory cylinders, which we do not know. That King David played upon the harp as commonly depicted is rather a modern idea. Medieval artists frequently gave King David the psaltery, a horizontal strung instrument from which the English psalm seems to have been derived. They also used the term "kinnor" may have been a kind of trigonon, a triangular strung instrument between a small harp and a psaltery, sounded by a plectrum, as suggested by Dr. Stainer in his essay on the music of the Bible, a kind of lyre.

The earliest records that we possess of the Celtic race, whether Gaelic or Cymric, give the harp a prominent place and harps a peculiar veneration and distinction. The names for the harp in these languages, however, are quite different from the Teutonic. The Irish "chaisceadh", the Highland Scottish "clarsach", the Welsh, Cornish and Breton "telyn", "telên", "tên", show no etymological kinship to the other European names. The first stringed instrument of the druidic class is derived from the Gaelic "clar", a board or table (soundboard), while the first syllable of telyn is distinctly Old Welsh, and has a tenable meaning; thus resonance supplies the one idea, tension the other. The literature of these Celtic harps may be most directly found in Bunting's Ancient Music of Ireland (Dublin, 1849); Gunn's Historical Enquiry respecting the Performance on the Harp in the Highlands of Scotland (Edinburgh, 1807), and E. Jones' Musical and Poetical Memoirs of the Welsh Bards (London, 1784). The treatises of Walker, Dalrymple, and other modern writers, as well as the view of the modern Irish harp, have been derived, or at least have been influenced by Bunting's work, to have no front pillar. This remarkable structural likeness to the old harps of Egypt and Assyria may be accidental, but permits the plausible hypothesis of Eastern descent. The oldest specimen of the beautiful form by which the Irish harp is now recognized, with gracefully curved front pillar and sweep of neck (the latter known as the harmonic curve), is the famous harp in Trinity College, Dublin, the possession of which has been attributed to King James I, who is supposed to have given it to the University of Edinburgh. Dr. Panum (see essay in Bunting) has delivered it; but he can only deduce the age from the ornamentation and chiseling, which fix its date in the 14th century or a little later. There is a bit of it in the Victoria and Albert Museum. The next oldest is in the Highlands of Scotland, the Clarsach Lumanach, or Lamont's Clarsach, belonging, with another of later date, to the old Perthshire family of Robertson of Largs. This harp was taken by a lady of that family from Argyleshire about 1500, on her marriage into the family of Lude. It had about thirty strings tuned, or not probably, as sometimes doubled in pairs of unisons like lutes and other contemporary instruments. The three harps mentioned in Ireland (fig. 3) inscribed "Ego sum Regina Cithararum," and dated 1621, appears to have had pairs of strings in the centre only. Their name is the Latin "Harpsichordium," and the Italian "Arpa Doppia." The Italian contemporary "Arpa Doppia," was entirely the double principle, but with gut strings played by the flesh ends of the fingers. When E. Bunting met at Belfast in 1722 as

many Irish harpers as could be at that late date assembled, he found the compass of their harps to comprise thirty notes which were tuned diatonically in the key of G, under circumstances transposable to C and readily to D, so that the scaling being the major of the key of G, the harp was degraded in the coast of arms of Ireland in the reign of Henry VIII.; and some years after in a map of 1567 preserved in a volume of state papers, we find it truly drawn as the national Irish instrument. References to the Highlands of Scotland are of necessity included with Ireland; and in both we find another name erroneously applied, namely, "harp," viz., "cruit," which has no connexions with the Irish harp. References to the Assyrians mentions the "cinard cruit" (harp with a high head) and the "crum cruit" (the drum cruit). At the end of the 18th century it is described by the Dean of Lismore (1512) the word "cruit" occurs several times, and in Neil M'Alpine's Gaelic Dictionary (1852), which gives the dialect of Ialay, closely related to the Ulster, the word "cruit" is rendered "harp." The confusion doubtless arose from the fact that from the Assyrian word "crūt" is glossed heartan in Anglo-Saxon MSS., a word which, like citharāsā in medieval Latin, referred to plucking or twanging of strings in contradistinction to instruments vibrated by means of the bow. In Irish of the 9th and 9th centuries (Zeuss) Irish (Dalway) Harp. It is always "telyn". The modern Welsh "cwyth" is not a harp but a "rota" (see Coda). The Old Welsh harp, not triple string, exists, which bears a great resemblance to the Irish harp in neck, soundboard and soundholes. But this derivation is too simple for derivation of the harp of Wales from that of Ireland or the reverse. There is really no good historical evidence, and there may have been a common or distinct origin on which etymology only can throw light. The Welsh like the Irish harp was often an hereditary instrument to be preserved with great care and veneration, and used by the bards of the family, who were like the poet-musicians and historians. A slave was not allowed to touch it. It is protected by Irish and Welsh laws for seizure for debt. The old Welsh harp appears to have been at one time strung with horse-hair, and by the Eisteddfods the pupil spent his noviciate of three years in the practice of a harp with that stringing. The comparatively modern Welsh triple harp (fig. 4) is always strung with gut. It has a rising neck as before stated, and three rows of strings,—the outer rows tuned diatonically, the centre one chromatic for the harps and flats. Jones gives it 98 strings and a compass of 5 octaves and one note, from violoncello C. As in all Celtic harps, the left, or treble hand, and in the triple harps there are 27 strings on that side, the right or bass hand having 37, and the middle or chromatic row 34.

The first pattern of the modern harp is discovered in German Illustrated MSS., as far back as the 9th century. A diatonic instrument, it must have been common throughout Europe, as Ortelius indicates. Many of our famous Italian painters depict it over and over again in their masterpieces. No accidental semitones were possible with this instrument, unless the strings were shortened by the player's fingers. This lasted until the 17th century, when a Tyrolese maker adopted hooks (perhaps suggested by the fretted hammer-chorded clavichord) Welsh Triple Harp that, screwed into the neck, could be turned downwards to fix the desired semitone at pleasure. At last, somewhere about 1720, Hochbrucker, a Bavarian, invented pedals that, like the Tyrolean harp, adapted the diatonic instrument for use in stopping, and thus left the player's hands free, an indisputable advantage; and it became possible at once to play in no less than two octaves. We find it described by the famous Handel (fig. 4) as the "Ego sum Regina Cithararum," and dated 1621, appears to have had pairs of strings in the centre only. Their name is the Latin "Harpsichordium," and the Italian "Arpa Doppia." The Italian contemporary "Arpa Doppia," was entirely the double principle, but with gut strings played by the flesh ends of the fingers. When E. Bunting met at Belfast in 1722 as

1 Representations of these may be seen among the musical scenes in the Nimrod Gallery at the British Museum.

2 See also a woodcut in John Derrick's Image of Ireland (1810), pl. iii. (Edinburgh ed. 1853).

3 See the fine view of Musical Instruments on the Irish and Scottish harps by Robert Bruce Armstrong (1904), vol. I. Vol. ii., which deals with the Welsh harp, has unfortunately been withdrawn from sale.

4 See the modern harp a careful article by Hortense Panum, "Harfe und Lyra im alten Nord-Europa," in Intern. Mus. Ges. vol. vii. pt. I (Leipzig, 1903); and for references as to illuminated medieval woodcuts, paintings, etc. see Hugo Leichtentritt, "Was lernen wir aus den Bildern der deutschen Instrumentalreise der Zeit ?" ibid. vol. vii. p. 3 (Leipzig, 1906).

HARPENDEN—HARPIES

than eight major scales. By a sequence of improvements, in which two Frenchmen named Coussiné took an important part, the various defects in the Hohchalm took on an entirely new appearance. The pedals were doubled, and, the tuning of the instrument being changed from the key of E3 to C3, it became possible to play in fifths as well as in thirds on the Keyboard instruments, over which the harp has another important advantage in the simplification of the fingering, which is the same for every key.

It is to Sebastian Erard we owe the perfecting of the pedal harp (fig. 5), a triumph in the mechanical arts begun before the time when he adopted a "fork" mechanism in 1786 and ended in 1810 when he had attained complete success with the double action pedal mechanism already described above. Erard's merit was not confined to this improvement only; he modified the structure of the comb that conceals the mechanism, and constructed the harp-bow, a modern principle more advantageous to the tone.

Withstanding these improvements and the great beauty of tone the harp possesses, the domestic use of it in modern times has almost disappeared. The great cost of a good harp, and the trouble to many amateurs of tuning, may have led to the supplanting of the harp by the more convenient and useful pianoforte.

With this comes naturally a diminution in the number of these instruments being manufactured. (K. S.; A. J. H.)

HARPENDE, an urban district in the Mid or St Albans parliamentary division of Hertfordshire, England, 23 m. N.W. by N. from London by the Midland railway, served also by a branch of the Great Northern railway. Pop. (1901) 4725. It is a favourite outlying residential district of London, and lies in London. The church of St Nicholas is a modern reconstruction with the exception of the Perpendicular tower. In the Lawes Testimonial Laboratory there is a vast collection of samples of experimentally grown produce, annual products, ashes and soils. Sir John Bennett Lawes (d. 1900) provided an endowment of £100,000 for the perpetuation of the agricultural experiments which he inaugurated here at his seat of Rothamsted Park. The success of his association of chemistry with botany is shown by the fact that soil has been made to bear wheat without intermission for upwards of half a century without manure. The country neighbouring to Harpenden is very pleasant, including the valley of Common and the narrow well-wooded valley of the upper Lea.

HARPER'S FERRY, a town of Jefferson county, West Virginia, U.S.A., finely situated at the confluence of the Potomac and Shenandoah rivers (which here pass through a beautiful gorge in the Blue Ridge), 55 m. N.W. of Washington. Pop. (1900) 896; (1910) 766. It is served by the Baltimore & Ohio railway, which crosses the Potomac here, by the Winchester & Potomac railway (Baltimore & Ohio) of which it is a terminus, and by boats on the Chesapeake & Ohio Canal, which passes along the Maryland side of the Potomac. Across the Potomac on the north rise the Maryland heights; across the Shenandoah, on the West Virginia side, the Virginia or Loudoun Heights; and behind the town to the W. the Bolivar Heights. A United States arsenal and armoury were established at Harper's Ferry in 1796, the site being chosen because of the good water-power;

these were seized on the 16th of October 1859 by John Brown (q.v.), the abolitionist, and some 21 of his followers. For four months before the raid Brown and his men lived on the Kennedy Farm, in Washington county, Maryland, about 4 m. N.W. of Harper's Ferry. The engine-house in which Brown was captured was exhibited at the Columbian Exposition at Chicago and was later rebuilt on Bolivar Heights; a marble pillar, marked "John Brown's Fort," has been erected on its original site.

On Camp Hill Storer College (state-aided), a normal school for negroes, which was established under Free Baptist control in 1857, and has academic, normal, biblical, musical and industrial departments.

The first settlement here was made about 1747 by Robert Harper, who ran a ferry across the Potomac. The position of Harper's Ferry at the lower end of the Shenandoah Valley rendered it a place of strategic importance during the Civil War. On the 18th of April 1861, the day after Virginia passed her ordinance of secession, when a considerable force of Virginia militia under General Kenton Harper approached the town—an attack having been planned in Richmond two days before—the Federal forces under General Robert Patterson and Colonel Lew Wallace approached, and Harper's Ferry was again occupied by a Federal garrison. In September 1862, during General Lee's first invasion of the North, General McClellan advised that the place be abandoned in order that the 10,000 men defending it might be added to his fighting force, but General Halleck would not consent, so that when Lee needed supplies from the Shenandoah Valley he was blocked by the garrison, then under the command of Colonel Dixon S. Miles. On Jackson's approach they were distributed as follows: about 7000 men on Bolivar Heights, about 2000 on Maryland Heights, and about 1800 on the lower ground.

On the 13th of September General Lafayette McLaws carried Maryland Heights and General John G. Walker planted a battery on Loudoun Heights. On the 14th there was some fighting, but early on the 15th, as Jackson was about to make an assault on Bolivar Heights, the garrison, surrounded by a superior force, surrendered. The total Federal loss (including the garrisons at Winchester and Martinsburg) amounted to 44 killed (the commander was mortally wounded), 12,570 prisoners, and 13,000 small arms. For this terrible loss to the Union army the responsibility seems to have been General Halleck's, though the blame was officially put on Colonel Miles, who died immediately after the surrender. Jackson rejoined Lee on the following day in time to take part in the battle of Antietam, and after the battle General McClellan placed a strong garrison (the 12th Corps) at Harper's Ferry. In June 1863 the place was again abandoned to the Confederates on their march to Pennsylvania. After their defeat at Gettysburg, the town again fell into the hands of the Federal troops, and it remained in their possession until the end of the war. It was the scene of the battle on 1 July 1864 General Franz Sigel, who was then in command here, withdrew his troops to Maryland Heights, and from there resisted Early's attempt to enter the town and to drive the Federal garrison from Maryland Heights. Harper's Ferry was seriously damaged by a flood in the Shenandoah in October 1878.

HARPIES (Gr. Ἀρπειας, older form Ἀρτειας, "swift robbers"), in ancient mythology, the personification of the sweeping storm-winds. In Homer, where they appear indifferently under the name of Ἀρπειας and θέλαια, their function is to carry off those whose sudden disappearance is desired by the gods. Only one of them is there mentioned (Iliad, xvi. 350) by name, Podargé, the mother of the courser of Achilles by Zephyrus, the geneva wind. According to Hesiod (Theog. 265) they are two in number, Aello and Ocyepē, daughters of Thaumas and Electra, winged
HARPIGNIES—HARPSICHORD

15

goddesses with beautiful locks, swifter than winds and birds in their flight, and their domain is the air. In later times their number was increased (Celeno being a frequent addition and their leader in Virgil), and they were described as hateful and repulsive creatures, birds with the faces of old women, the ears of bears, crooked talons and hangnails; with stringed lives, they appear grey and misshapen monsters.

Their function of snatching away mortals to the other world brings them into connexion with the Erinyes, with whom they are often confounded.

On the so-called Harpy monument from Lycia, now in the British Museum, the Harpies appear carrying off some small figures, supposed to be the daughters of Pandareus, unless they are intended to represent departed souls. The repulsive character of the Harpy is more especially seen in the legend of Phineus, king of Salmydessus in Thrace (Apollodorus i. 6, 21; see also Diod. Sic. iv. 43). Having been deprived of his sight by the gods for his ill-treatment of his sons by his first wife (or for having revealed the future to mortals), he was condemned to be tormented by two Harpies, who carried off whatever food was placed before him. On the arrival of the Argonauts, Phineus promised to give them particulars of the course they should pursue and of the dangers that lay before them, if they would deliver him from his tormentors. Accordingly, when the Harpies appeared as usual to carry off the food from Phineus’s table, they were driven off and pursued by Calais and Zetes, the sons of Boreas, and the Harpies fled to the islands in the Euxinides (Eumenides, 59). Their dwelling came from molesting Phineus, their lives were spared. Their place of abode is variously placed in the Strophades, the entrance to the under-world, or a cave in Crete. According to Cecil Smith, Journal of Hellenic Studies, xiii. (1892–1893), the Harpies are the hostile spirits of the scorching south wind; E. Rohde (Rheinisches Museum, i, 1895) regards them as spirits of the storm, which at the bidding of the gods carry off human beings alive to the under-world or some spot beyond human ken.

See articles in Rohde’s Lexicon der Mythologie and Darmen and Saglio’s Dictionnaire des antiques. In the article GREEK ART, fig. 14 gives a representation of the winged Harpies.

HARPIGNIES, HENRI (1819–1906), French landscape painter, born at Valenciennes in 1819, was intended by his parents for a business career, but his determination to become an artist was so strong that it conquered all obstacles, and he was allowed at the age of twenty-seven to enter Achard’s atelier in Paris. From this painter he acquired a groundwork of sound constructive draughtsmanship, which is so marked a feature of his landscape painting. After two years under this master he went to Italy, where he returned in 1850. During the next few years he devoted himself to the painting of children in landscape setting, and fell in with Corot and the other Barbizon masters, whose principles and methods are to a certain extent reflected in his own personal art. To Corot he was united by a bond of warm friendship, and the two artists went together to Italy in 1856. On his return, he scored his first great success at the Salon, in 1861, with his “Lisière de bois sur les bords de l’Allier.” After that year he was a regular exhibitor at the old Salon; in 1880 he received his first medal for “Le Soir dans la campagne de Rome,” which was acquired for the Luxembourg Gallery. Many of his best works were painted at Herisson in the Bourbounnais, as well as in the Nivernais and the Auvergne. Among his chief pictures are “Soir sur les bords de la Loire” (1861), “Les Corbeaux” (1863), “Le Soir” (1866), “Le Saut-du-Loup” (1873), “La Loire” (1882), and “Vue de Saint-Privé” (1885). He also did some decorative work for the Paris Opéra—the “Vallee d’Egérie” panel, which he showed at the Salon of 1870.

HARP-LUTE, or DITAL HARP, one of the many attempts to revive the popularity of the guitar and to increase its compass, invented in 1798 by Edward Light. The harp-lute owes the first part of its name to the characteristic mechanism for shortening the effective length of the strings; its second name—dital harp—emphasises the nature of the stops, which are worked by the thumb in contradistinction to the pedals of the harp worked by the feet. It consists of a pear-shaped body, to which is added a curved neck supported on a front pillar or arm springing from the body, and therefore reminiscent of the harp. There are 12 gut strings. The curved fingerboard, almost parallel with the neck, is provided with frets, and has in addition a thumb-key for each string, by means of which the accordance of the string is mechanically raised a semitone at will. The dital or key, on being depressed, acts upon a stop-ring or eye, which draws the string down against the fret, and thus shortens its effective length. The fingers then stop the strings as usual over the remaining frets. A further improvement was patented in 1816 as the British harp-lute. Other attempts possessing less practical merit than the dital harp were the lyra-guitarre, which appeared in Germany at the beginning of the 19th century; the accord-guitarre, towards the middle of the same century; and the keyed guitar.

HARPOCRATES, originally an Egyptian deity, adopted by the Greeks, and worshipped in later times both by Greeks and Romans. In Egypt, Harpa-khrut, Horus the child, was one of the forms of Horus, the sun-god, the child of Osiris. He was supposed to carry on war against the powers of darkness, and hence Herodotus (ii. 144) considers him the same as the Greek Apollo. He was represented in statues with his finger on his mouth, a symbol of childhood. The Greeks and Romans, not understanding the meaning of this attitude, made him the god of silence (Ovid, Metam. ix. 691), and as such he became a favourite deity with the later mystic schools of philosophy.

See articles by G. Lafaye in Darenberg and Saglio’s Dictionnaire des antiquités, and by E. Meyer (s.v. “Horos”) in Roscher’s Lexicon der Mythologie.

HARPOCRATON, VALERIUS, Greek grammarian of Alexandria. He is possibly the Harpocraton mentioned by Julius Capitolineus (Life of Verus, 2) as the Greek tutor of Antoninus Verus (2nd century A.D.); some authorities place him much later. He was born at Gera on the Gera river, and in the time of the Athenian orator. He is the author of a Lexicon, or Lexicon of the divine harpophors, which has come down to us in an incomplete form. The work contains, in more or less alphabetical order, notes on well-known events and persons mentioned by the orators, and explanations of legal and commercial expressions. As nearly all the lexicons to the Greek orators have been lost, Harpocratian’s work is especially valuable. Amongst his authorities were the writers of Attibhe (histories of Attica), the grammarian Didymus, Dionysius of Halicarnassus, and the lexicographer Dionysius, son of Tryphon. The book also contained contributions to Attic prosody and to the Greek regard of names generally. Nothing is known of an Ανθρωπον συναγωγον, a sort of anthology or chrestomathy attributed to him by Suidas. A series of articles in the margin of a Cambridge MS. of the lexicon forms the basis of the Lexicon rhetoricium Cantabrigiensis (see DOBBIE, P. P.).

The best edition is by W. Dindorf (1853); see also J. E. Sandys, History of Classical Scholarship, i. (1906), p. 325; C. Boysen, De Harpocratis fuitibus (Kiel, 1876).

HARPOON (from Fr. harpoon, a grappling-iron, O. Fr. harpe, a dog’s claw, an iron clamp for fastening stones together; the source of these words is the Lat. barba, barba, &c., formed from Gr. ἄραγη, hook, ἄραξαν, to snatch, tear away, cf. “harp’y”), barbed spear, particularly one used for spearing whales or other large fish, and either thrown by hand or fired from a gun (see WHALE-FISHERY).

HARPSICHORD, HARPSICHORD, DOUBLE VIRGINALS (Fr. clavecin; Ger. Clavichord, Kiel-Fitiel; Ital. arpicordo, cembalo, clavi-cembalo, gravecymbalo; Dutch, clavissenbal), a large keyboard instrument (see PIANOFORTE), belonging to the same family as the virginal and spinet, but having 2, 3, or even 4 strings to each note, and a case of the harp or wing shape, afterwards adopted for the grand pianoforte. J. S. Bach’s harpsichord, preserved in the museum of the Hochschule fur Musik at Charlottenburg, has two manuals and 4 strings to each note, one 16 ft., two 8 ft. and one 4 ft. By means of stops the performer has within his power a number of combinations for varying the tone and dynamic power. In all instruments of the harpsichord family
the strings, instead of being struck by tangents as in the clavi-
chord, or by hammers as in the pianoforte, are plucked by means
of a quill firmly embedded in the centred tongue of a jack or
upright placed on the back end of the key-lever. When the
finger depresses a key, the jack is thrown up, and in passing the
crow-quill catches the string and twangs it. It is this twanging
of the string which produces the brilliant incisive tone peculiar
to the harpsichord family. What these instruments gain in
brilliance of tone, however, they lose in power of expression and
of accent. The impossibility of commanding any emphasis
necessarily created for the harpsichord an individual technique
which influenced the music composed for it so great an extent
that it cannot be adequately rendered upon the pianoforte.
The harpsichord assumed a position of great importance
during the 16th and 17th centuries, more especially in the
orchestra, which was under the leadership of the harpsichord
player. The most famous of all harpsichord makers, whose
names form a guarantee for excellence, were the Ruckers,
established at Antwerp from the last quarter of the 16th
century.

**HARPY**, a large diurnal bird of prey, so named after the
mythological monster of the classical poets (see Harpies)—the
*Thrasæus harpyia* of modern ornithologists—an inhabitant of
the warmer parts of America from Southern Mexico to Brazil.
Though known since the middle of the 17th century, its habits
have come very little under the notice of naturalists, and what
is said of them by the older writers must be received with some
adorned with an erectile crest, the upper parts dark grey banded
with black, the wings dusky, and the tail barred; but the huge
powerful and scutellated legs most of all impress the beholder.
The precise affinities of the harpy cannot be said to
have been determined. By some authors it is referred to the
eagles, by others to the buzzards, and by others again to the
hawks; but possibly the first of these alliances is the most
likely to be true.

(A. N.)

**HARRAN**, Haran or Charran (Sept. Ḫarrān or Ḫarrār; Strabo,
Kabḥa: Pliny, *Carrae or Carrhae*; Arab. Ḫarrān), in biblical
history the place where Terah halted after leaving Ur, and ap-
parently the birthplace of Abraham, a town on the stream
Jılulab, some nine hours' journey from Edessa in Syria. At
this point the road from Damascus joins the highway between
Nimrud and Carchemish and Harran had thus considerable
military and commercial value. As a strategic position it
is mentioned in inscriptions as early as the time of Tiglath
Pileser I., about 1100 B.C., and subsequently by Sargon II.,
who restored the privileges lost at the rebellion which led to the con-
quest referred to in 2 Kings xix. 12 (= Isa. xxxvii. 12). It
was the centre of a considerable commerce (Ezek. xxvii. 23), and one of
its specialities was the odoriferous gum derived from the
strobus (Pliny, *H. N.* xii. 40). It was here that Crassus in his
external expedition was attacked and slain by the Parthians (53
B.C.); and here also the emperor Caracalla was murdered at the
insigation of Macrinus (A.D. 217). Haran was the chief home of
the moon-god Sin, whose temple was rebuilt by several kings,
among them Assur-bani-pal and Nabunaidus and Herodotus (Iv. 13, 7)
mentions the town as possessing in his day a temple of
the moon. In the middle ages it is mentioned as having been the
seat of a particular heathen sect, that of the Haranite Sabeans.
It retained its importance down to the period of the Arab
ascendance; but by Abu’l-feda it is mentioned as having before
his time fallen into decay. It is now wholly in ruins. The
Yahwistic writer (Gen. xxvii. 43) makes it the home of Laban
and connects it with Isaac and Jacob. But we cannot thus put
Haran in Aramnaharaim; the home of the Labanites is rather
to be looked for in the very similar word Hauran.

**HARRAN** (or Harb), a city of N.E. Africa, in 8° 45' N.,
42° 30' E., capital of a province of Abyssinia and 320 m. S.S.W.
of the ports of Zaila (British) and Jibuti (French) on the Gulf of
Aden. With Jibuti it is connected by a railway (188 m. long)
and carriage-road. Harran is built on the slopes of a hill at an
elevation of over 5000 ft. A lofty stone wall, pierced by five
gates and flanked by twenty-four towers, encloses the city,
which has a population of about 40,000. The streets are steep,
narrow, dirty and unpaved, the roadways consisting of rough
boulders. The houses are in general made of undressed stone
and mud and are flat-topped, the general aspect of the city
being Oriental and un-Abyssinian. A few houses, including
the palace of the governor and the foreign consulates, are of more
elaborate and solid construction than the majority of the build-
ings. There are several mosques and an Abyssinian church
(of the usual circular construction) built of stone. Harrar is a city
of considerable commercial importance, through it passing all
the merchandise of southern Abyssinia, Kaffa and Galla land.
The chief traders are Abyssinians, Armenians and Greeks.
The principal article of export is coffee, which is grown extensively
in the neighbouring hills and is of the finest quality. Besides
coffee there is a large trade in durra, the kat plant (used by the
Mahomedans as a drug), ghee, cattle, mules and camels, skins
and hides, ivory and gums. The import trade is largely in cotton
goods, but every kind of merchandise is included.

Harrar is believed to be the home of the Arab immigrants from the Yemen in the 7th century of the Christian era. In
the region of Somaliland, now the western part of the British
protectorate of that name, the Arabs established the Moslem state
of Adel or Zaila, with their capital at Zaila on the Gulf of Aden.
In the 13th century the sultans of Adel enjoyed great power.
In 1521 the then sultan Abubekr transferred the seat of govern-
ment to Harrar, probably regarding Zaila as too exposed to the
attacks of the Turkish and Portuguese navies then contending
for the mastery of the Red Sea and Gulf of Aden. Abubekr's successor was Mohamed III., Ahmed ibn Ibrahim el-Ghazi (1507–1543), surnamed Gran (Granyé), the left-handed. He was not an Arab but, probably, of Somali origin. The son of a noted warrior, he quickly rose to supreme power, becoming sultan or amir in 1525. He is famous for his invasion of Abyssinia, of which country he was virtual master for several years. From the beginning of the 17th century Adel suffered greatly from the ravages of pagan Galla tribes, and Harrar sank to the position of an amirate of little importance. It was first visited by a European in 1854 when (Sir) Richard Burton spent ten days there in the guise of an Arab. In 1875 Harrar was occupied by an Egyptian force under Raouf Pasha, by whose orders the amir was strangled. The town remained in the possession of Egypt until 1885, when the garrison was withdrawn in consequence of the rising of the Mahdi in the Sudan. The Egyptian garrison and many Egyptian civilians, in all 6300 persons, left Harrar between November 1884 and the 25th of April 1885; when a son of the ruler who had been deposed by Egypt returned to Harrar as amir, the arrangement being carried out under the superintendence of British officers. The new amir held power until January 1887, in which month Harrar was conquered by Menelek II., king of Shoa (afterwards emperor of Abyssinia). The governorship of Harrar was by Menelek entrusted to Ras Makonnen, who held the post until his death in 1906.

The Harrari proper are of a distinct stock from the neighbouring peoples, and speak a special language. Harrarese is "a Semitic graft inserted into an indigenous stock" (Sir R. Burton, First Footsteps in East Africa). The Harraris and Mahommedans of the Shafa and Persia sect, and they employ the solar year and the Persian calendar. Besides the native population there are in Harrar colonies of Abyssinians, Somalis and Gallas. By the Somalis the place is called Adari, by the Gallas Adaray.

HARRATIN, black Berbers, dwelling in Tidikelt and other Saharan oases. Many of them are blacker than the average negro. In physique, however, they are true to the Berber type, being of handsome appearance with European features and well-proportioned bodies. They are the result of an early crossing with the Sudanese negro races, though to-day they have all the pride of the Berbers (q.v.), and do not live with or intermarry among negroes.

HARRIER, or HEN-HARRIER, name given to certain birds of prey which were formerly very abundant in parts of the British Islands, from their habit of harrying poultry. The first of these names has now become used in a generic sense for all the species ranked under the genus Circus of Lécèpède, and the second confined to the particular species which is the Falco cyaneus of Linnaeus and the Circus cyaneus of modern ornithologists.

One European species, C. aeruginosus, though called in books the marsh-harrier, is far more commonly known in England and Ireland as the moor-buzzard. But harriers are not, like buzzards, arboreal in their habits, and always affect open country, generally, though not invariably, preferring marshy or fen districts, for snakes and frogs form a great part of their ordinary food. On the ground their carriage is utterly unlike that of a buzzard, and their long wings and legs render it easy to distinguish the two groups when taken in the hand. All the species also have a more or less well-developed ruff or frill of small thickset feathers surrounding the lower part of the head, nearly like that seen in owls, and accordingly many systematists consider that the genus Circus, though undoubtedly belonging to the Falconidae, connects that family with the Strigidae. No osteological affinity, however, can be established between the harriers and any section of the owls, and the superficial resemblance will have to be explained in some other way. Harriers are found almost all over the world,¹ and fifteen species are recognized by Bowdler Sharpe (Cat. Birds Brit. Museum, i. pp. 50–73). In most if not all the harriers the sexes differ greatly in colour, so much so that for a long while the males and females of one of the commonest and best known, the C. cyaneus above mentioned, were thought to be distinct species, and were or still are called in various European languages by different names. The error was maintained with the greater persistency since the young males, far more abundant than the adults, wear much the same plumage as their mother, and it was not until after Montagu's observations were published at the beginning of the 19th century that the "ringtail," as she was called (the Falco pygargus of Linnaeus), was generally admitted to be the female of the "hen-harrier." But this was not Montagu's only good service as regards this genus. He proved the hitherto unexpected existence of a second species,² subject to the same diversity of plumage. This was called by him the ash-coloured falcon, but it now generally bears his name, and is known as Montagu's harrier, C. cinereus. In habits it is very similar to the hen-harrier, but it has longer wings, and its range is not so northerly, for while the hen-harrier extends to Lapland, Montagu's is but very rare in Scotland, though in the south of England it is the most common species. Harriers indeed in the British Islands are rapidly becoming things of the past. Their nests are easily found, and the birds when nesting are easily destroyed. In the south-east of Europe, reaching also to the Cape of Good Hope and to India, there is a fourth species, the C. swainsoni of some writers, the C. paliduus of others. In North America C. cyaneus is represented by a kindred form, C. hudsonicus, usually regarded as a good species, the adult male of which is always to be recognized by its rufous markings beneath, in which character it rather resembles C. cinereus, but it has not the long wings of that species. South America has in C. cinereus another representative form, while China, India and Australia possess more of this type. Thus there is a section in which the males have a strongly contrasted black and grey plumage, and finally there is a group of larger forms allied to the European C. aeruginosus, wherein a grey dress is less often attained, of which the South African C. ranivorus and the New Zealand C. gouldi are examples. (A. N.)

HARRIGAN, EDWARD (1845–__), American actor, was born in New York of Irish parents on the 26th of October 1845. He made his first appearance in San Francisco in 1867, and soon afterwards formed a stage partnership with Tony Hart, whose real name was Anthony Cannon. As "Harrigan and Hart," they had a great success in the presentation of types of low life in New York. Beginning as simple sketches, these were gradually worked up into plays, with occasional songs, set to popular music.

¹ A singular mistake, which has been productive of further error, was made by Albin, who drew his figure (Hist. Birds, ii. pl. 5) from a specimen of one species, and coloured it from a specimen of the other.
by David Braham. The titles of these plays indicate their character, The Mulligan Guards, Squatter Sovereignty, A Leather Patch, The O'Regans. The partnership with Hart lasted from 1871–1884. Subsequently Harrigan played in different cities of the United States, one of his favourite parts being George Coggs-well in Old Lavender.

HARRIMAN, EDWARD HENRY (1848–1909), American financier and railroad magnate, son of the Rev. Orlando Harriman, rector of St George's Episcopal church, Hempstead, L.I., was born at Hempstead on the 25th of February 1848. He became a broker's clerk in New York at an early age, and in 1867 was able to buy a seat on the New York Stock Exchange, on his own account. For a good many years there was nothing sensational in his success, but he built up a considerable business connexion and prospered in his financial operations. Meanwhile he carefully mastered the situation affecting American railroads. In this respect he was assisted by his friendship with Mr Stuyvesant Fish, who, on becoming vice-president of the Illinois Central in 1883, brought Harriman upon the directorate, and in 1887, being then president, made Harriman vice-president; twenty years later it was Harriman who dominated the finance of the Illinois Central, and Fish, having become his opponent, was dropped from the board. It was not till 1898, however, that his career as a railroad financier began. He was abetted, by the aid of the bankers, Kuhn, Loeb & Co., of a syndicate to acquire the Union Pacific line, which was then in the hands of a receiver and was generally regarded as a hopeless failure. It was soon found that a new power had arisen in the railway world. Having brought the Union Pacific out of bankruptcy and prosperity, and made it an efficient instead of a decaying line, he utilized his position to draw other lines within his control, notably the Southern Pacific in 1901. These extensions of his power were not made without friction, and his abortive contest in 1901 with James J. Hill for the control of the Northern Pacific ended in litigation. Harriman was also engaged in the celebrated track dispute, then going on Wall Street. But in the result he became the dominant factor in American railroad matters. At his death, on the 9th of September 1909, his influence was estimated to extend over 60,000 m. of track, with an annual earning power of $700,000,000 or over. Astute and unscrupulous manipulation of the stock markets, and a capacity for the hardest of bargaining and the most determined warfare against his rivals, had their place in this success, and Harriman's methods excited the bitterest criticism, culminating in a stern denunciation from President Roosevelt himself in 1907. Nevertheless, besides acquiring colossal wealth for himself, he helped to create for the American public a vastly improved railway service, the benefits of which survived all controversy as to the means by which he triumphed over the obstacles in his way.

HARRIMAN, a city of Roane county, Tennessee, U.S.A., on the Emory river, about 35 m. W. by S. of Knoxville. Pop. (1900) 3442 (216 being negroes); (1910) 3061. Harriman is served by the Harriman & North Eastern, the Tennessee Central, and the Southern railroads. It is the seat of the East Tennessee Normal and Industrial Institute, for negroes, and of the American University of Harriman (Christian Church, coeducational: 1893), which comprises primary, preparatory, collegiate, Bible school, civic-research, commercial, music and art departments, and in 1906 and 1908 had 11 instructors and 317 students. Near the city are large deposits of iron and an abundance of coal and timber. Among manufactures are cotton products, farming tools, leather, tannic acid, furniture and flour. Harriman was founded in 1809 by a land company. A clause in this company's by-laws requires that every conveyance of real estate by the company "shall contain a provision forbidding the use of the property or any building thereon, for the purpose of making, storing or selling intoxicating beverages as such." Harriman was chartered as a city in 1801, and its charter was revised in 1899.

HARRINGTON, EARLS OF. The first earl of Harrington was the diplomatist and politician, William Stanhope (c. 1650–1756), a younger son of John Stanhope of Elvaston, Derbyshire, and a brother of Charles Stanhope (1673–1760), an active politician during the reign of George I. His ancestor, Sir John Stanhope (d. 1638), was a half-brother of Philip Stanhope, 1st earl of Chesterfield. Educated at Eton, William Stanhope entered the army and served in Spain, but soon he turned his attention to more peaceful pursuits, went on a mission to Madrid and represented his country at Turin. When peace was made between England and Spain in 1720 Stanhope became British ambassador to the latter country, and he retained this position until March 1727, having built up his reputation as a diplomatist during a difficult period. In 1720 he had some part in arranging the treaty of Seville between England, France and Spain, and for his services in this matter he was created Baron Harrington in January 1730. Later in the same year he was appointed secretary of state for the northern department under Sir Robert Walpole, but, like George II., he was anxious to assist the emperor Charles VI. in his war with France, while Walpole favoured a policy of peace. Although the latter had his way Harrington remained secretary until the great minister's fall in 1742, when he was transferred to the office of president of the council and was created earl of Harrington and Viscount Petersham. In 1744, owing to the influence of his political allies, the Pelhams, he returned to his former post of secretary of state, but he soon left this office as a sign of his growing jealousy, and this was the principal cause why he left office in October 1746. He was thus lieutenant of Ireland from 1747 to 1751, and died in London on the 8th of December 1756.

The earl's successor was his son, William (1719–1770), who entered the army, was wounded at Fontenoy and became a general in 1770. He was a member of parliament for about ten years and he died on the 1st of April 1770. This earl's wife Caroline (1724–1784), daughter of Charles Fitzroy, 2nd duke of Grafton, was a noted beauty, but was also famous for her eccentricities. Their elder son, Charles (1753–1830), who became the 3rd earl, was a distinguished soldier. He served with the British army during the American War of Independence and attained the rank of general in 1802. From 1803 to 1812 he was commander-in-chief in Ireland; he was sent on diplomatic errands to Vienna and to Berlin, and he died at Brighton on the 15th of September 1829.

Charles Stanhope, 4th earl of Harrington (1780–1851), the eldest son of the 3rd earl, was known as Lord Petersham until he succeeded to the earldom in 1829. He was very well known in society owing partly to his eccentric habits; he dressed like the French king Henry IV., and had other personal peculiarities. He married the actress, Maria Foote, but when he died in March 1851 he left no sons, and his brother Leicester bore the title of earl of Harrington. His unique character, this nobleman was a soldier and a politician of advanced views, who is best known as a worker with Lord Byron in the cause of Greek independence. He was in Greece in 1823 and 1824, where his relations with Byron were not altogether harmonious. He wrote A Sketch of the History and Influence of the Press in British India (1832); and Greece in 1823 and 1824 (English edition 1824, American edition 1825). His son Sydney Seymour Hyde, 6th earl (1843–1866), dying unmarried, was succeeded by a cousin, Charles Wyndham Stanhope (1809–1881), as 7th earl, and in 1881 the latter's son Charles Augustus Stanhope (b. 1844) became 8th earl of Harrington.

Before the time of the first earl of Harrington the Stanhope family had held the barony of Stanhope, which was created in 1605 in favour of Sir John Stanhope (c. 1550–1621) of Harrington, Northamptonshire. Sir John was a younger son of Sir Michael Stanhope (d. 1552) of Shelford, Nottinghamshire, who was a brother-in-law of the protector Somerset. Sir Michael's support of Somerset cost him his life, as he was beheaded on the 26th of February 1552. Sir John was treasurer of the chamber from 1556 to 1616 and was a member of parliament for several years. He died on the 9th of March 1621, and when his only son Charles, 2nd baron (c. 1595–1675), died without issue in 1675 the barony became extinct.

HARRINGTON, or HARRINGTON, JAMES (1611–1677). English political philosopher, was born in January 1611 of an old Rutland-shire family. He was son of Sir Sapcotes Harrington of Rand, Lincolnshire, and great-nephew of the first Lord Harrington of Exton (d. 1615). In 1629 he entered Trinity College, Oxford, as
a gentleman commener. One of his tutors was the famous
Chillingworth. After several years spent in travel, and as a
soldier in the Dutch army, he returned to England and lived in
retirement till 1646, when he was appointed to the suite of
Charles I., at that time being conveyed from Newcastle as
prisoner. Though republican in his ideas, Harrington won the
king’s regard and esteem, and accompanied him to the Isle of
Wight. He roused, however, the suspicion of the parliamenti-
arians and was dismissed: it is said that he was for a short time
put in confinement because he would not swear to the
truth to the king should he attempt to escape. After Charles’s
death Harrington devoted his time to the composition of his
Oceana, a work which pleased neither party. By order of Cromwell
it was seized when passing through the press. Harrington, how-
ever managed to secure the favour of the Protector’s favourite
dughter, Mrs Claypole; the work was restored to him, and
appeared in 1656, dedicated to Cromwell. The views embodied
in Oceana, particularly that bearing on vote by ballot and rota-
tion of magistrates and legislators, Harrington and others (who
in 1659 formed a club called the " Rota " 4) endeavoured to push
practically, but with no success. On November 16, 1659, member
of Charles II., Harrington was arrested, apparently without
sufficient cause, on a charge of conspiracy, and was thrown into
the Tower. Despite his repeated request no public trial could
be obtained, and when at length his sisters obtained a writ of
habeas corpus he was secretly removed to St. Nicholas Island off
Plymouth. There his health gave way owing to his drinking
gaiacum on medical advice, and his mind appeared to be
affected. Careful treatment restored him to bodily vigour, but
his mind never wholly recovered. After his release he married,
and the state does not seem to be precisely known. He died on
the 11th of September 1677, and was buried next to Sir Walter
Raleigh in St. Margaret’s, Westminster.

Harrington’s writings consist of the Oceana, and of papers,
 pamphlets, aphorisms, even treatises, in defence of the Oceana.
The Oceana is a hard, prolix, and in many respects heavy exposi-
tion of an ideal constitution, “ Oceana ” being England, and the
lawgiver Olyphaus Megaletor, Oliver Cromwell. The details are
elaborated with infinite care, even the salaries of officials being
computed, but the main ideas are two in number, each with a
practical corollary. The first is that the determining element of
property generally, property in land in particular; the second is that the executive power ought not to
be vested for any considerable time in the same men or class
of men. In accordance with the first of these, Harrington rec-
ommends an agrarian law, limiting the portion of land held to
that yielding a revenue of £1000, and consequently insisting on
particular modes of distributing landed property. As a practical
issue of the second he lays down the rule of rotation by ballot.
A third part of the executive or senate are voted out by ballot every
year (not being capable of being elected again for three
years). Harrington explains very carefully how the state and its govern-
ing parts are to be constituted by his scheme. Oceana contains
many valuable ideas, but it is irretrievably dull.

His works were edited with biography by John Toland in 1700;
Toland’s edition, with additions by Birch, appeared in 1747, and
again in 1771. Oceana was reprinted by Henry Morley in 1887.
See Dwight in Political Science Quarterly (March, 1887). Harrington
has often been confused with his cousin Sir James Harrington, a
member of the commission which tried Charles I., and afterwards
excluded from the acts of pardon.

HARRIOT, Sir HARRIOT, THOMAS (1560–1621). English mathe-
matician and astronomer was born at Oxford in 1560. After
studying at St Mary Hall, Oxford, he became tutor to Sir Walter
Raleigh, who appointed him in 1585 to the office of geographer
to the second expedition to Virginia. Harriot published an
account of this expedition in 1588, which was afterwards
reprinted in Hakluyt’s Voyages. On his return to England, after an absence of two years, he resumed his mathematical
studies, and having made the acquaintance of Henry Percy,
earl of Northumberland, distinguished for his patronage of
men of science, he received from him a yearly pension of £120.
He died at London on the 2nd of July 1621. A manuscript of
Harriot’s entitled Ephemeres chrysometria is preserved in Sion
College; and his Artis analyticae praxis ad acquisitiones alge-
braicas resolvendas was published at London in 1631. His con-
tributions to algebra are treated in the article ALGEBRA;
Wallis’s History of Algebra (1685) may also be consulted. From
some papers of Harriot’s, discovered in 1784, it would appear
that he had either procured a telescope from Holland, or divined
the construction of that instrument, and that he coincided in
point of time with Galileo in discovering the spots on the sun’s
disk.

See Charles Hutton, Mathematical and Philosophical Dictionary
(1816), and J. E. Montucut, Histoire des mathématiques (1758).

HARRIS, GEORGE, 1ST BARON (1746–1829). British general,
was the son of the Rev George Harris, curate of Brasted, Kent,
and was born on the 18th of March 1746. Educated at West-
minster school and at the Royal Military Academy, Woolwich,
he was commissioned to the Royal Artillery in 1766, transferring
to an ensigncy in the 5th foot (Northumberland Fusiliers) in
1762. Three years later he became lieutenant, and in 1771
became major. His first active service was in the American War
of Independence, in which he served at Lexington, Bunker Hill
(severely wounded) and in every engagement of Howe’s army
except one up to November 1778. By this time he had obtained
his majority, and his next service was under Major-General
Medows at Santa Lucia in 1776–1777, after which his regiment
served as marines in Rodney’s fleet. Later in 1779 he was for a
time a prisoner of war. Shortly before his promotion to lieu-
tenant-colonel in his regiment (1780) he married. After com-
manding the 5th in Ireland for some years, he exchanged and
served in the General Officers of the Line. He died survived by
that officer in India until 1792, taking part in various battles
and engagements, notably Lord Cornwallis’s attack on Seringapatam.
In 1794, after a short period of home service, he was again in
India. In the same year he became major-general, and in 1796
local lieutenant-general in Madras. Up to 1800 he commanded
the troops in the presidency, and for a short time he exercised
the civil government as well. In December 1798 he was appointed
by Lord Wellesley, the governor-general, to command the field
army which was intended to attack Tipu Sahib, and in a few
months Harris reduced the Mysore country and stormed the
great stronghold of Seringapatam. His success established his
reputation as a capable and experienced commander, and its
political importance led to his being offered the reward (which
he declined) of an Irish peerage. He returned home in 1800,
became lieutenant-general in the army the following year, and
attained the rank of full general in 1812. In 1815 he was made a
peer of the United Kingdom under the title Baron Harris of
Seringapatam and Mysore, and of Belmont, Kent. In 1820 he
received the G.C.B., and in 1824 the governorship of Dumbarton
Castle. Lord Harris died at Belmont in May 1829. He had been
colonel of the 73rd Highlanders since 1800.

His descendant, the 4th Baron Harris (b. 1851), best known as
a cricketer, was under-secretary for India (1855–1866), under-
secretary for war (1866–1889) and governor of Bombay (1890–
1895).

See R. Hon. S. Lushington, Life of Lord Harris (London, 1840),
and the regimental histories of the 5th Northumberland Fusiliers
and 73rd Highlanders.

HARRIS, JAMES (1790–1758). English grammarian, was born
at Salisbury on the 20th of July 1790. He was educated at the
grammar school in the Close at Salisbury, and at Wadham
College, Oxford. On leaving the university he was entered at
Lincoln’s Inn as a student of law, though not intended for the
bar. The death of his father in 1733 placed him in possession
of an independent fortune and of the house in Salisbury Close. He
became a county magistrate, and represented Christchurch in
parliament from 1761 till his death, and was comptroller to the
queen from 1774 to 1780. He held office under Lord Grenville,
retiring with him in 1785. The decided bent of his mind had
always been towards the Greek and Latin classics; and to the
study of these, especially of Aristotle, he applied himself with
unremitting assiduity during a period of fourteen or fifteen
HARRIS, J. C.—HARRIS, SIR W. S.

years. He published in 1744 three treatises—on art; on music, painting and poetry; and on happiness. In 1751 appeared the work by which he became best known, Hermes, a philosophical inquiry concerning universal grammar. He also published Philosophical Arrangements and Philosophical Inquiries. Harris was a great lover of music, and adapted the words for a selection from Italian and German composers, published by the cathedral organist, James Corfe. He died on the 22nd of December 1750.

His works were collected and published in 1801, by his son, the first earl of Malmsbury, who prefixed a brief biography.

HARRIS, JOEL CHANDLER (1848-1908), American author, was born in Eatonton, Putnam county, Georgia, on the 8th of December 1848. He started as an apprentice to the printer's trade in the office of the Countryman, a weekly paper published on a plantation not far from his home. He then studied law, and practised for a short time in Forsyth, Ga., but soon took to journalism. He joined the staff of the Savannah Daily News in 1871, and in 1876 that of the Atlanta Constitution, of which he was an editor from 1890 to 1901, and in this capacity did much to further the cause of the New South. But his most distinctive contribution to this paper, and to American literature, consisted of his dialect pieces dealing with negro life and folklore. His stories are characterized by a deep humor, poetical feeling and homely philosophy; and Uncle Remus, the principal character of most of them, is a remarkably vivid and real creation. The first collection of his stories was published in 1880 as Uncle Remus: his Songs and his Sayings. Among his later works are Nights with Uncle Remus (1883), Mingo and Other Sketches in Black and White (1884), Free Joe and Other Georgian Sketches (1887), Balaam and His Master and Other Sketches and Stories (1891), Uncle Remus and His Friends (1892), On the Plantation (1893), which is partly autobiographic, Sister Jane (1896), The Chronicles of Aunt Minery Ann (1899), and The Tar-Baby and Other Rhymes of Uncle Remus (1899), and as purely children's are Duddy Jake the Runaway and Other Stories (1889), Little Mr. Thimblesinger and his Queer Country (1894) and its sequel Mr. Rabbit at Home (1895), Aaron in the Wildwoods (1897), Plantation Pageants (1899), Tol'd by Uncle Remus (1905), and Uncle Remus and Br'er Rabbit (1907). He was one of the compilers of the Life of Henry W. Grady, including his Writings and Speeches (1890) and wrote Stories of Georgia (1896), and Georgia from the Invasion of De Soto to Recent Times (1899). He died in Atlanta on the 3rd of July 1908.

HARRIS, JOHN (c. 1666-1710), English writer. He is best known as the editor of the Lexicon technicum, or Dictionary of the Arts and Sciences (1704), which ranks as the earliest of the long line of English encyclopaedias, and as the compiler of the Collection of Voyages and Travels which passes under his name. He was born about 1666, probably in Shropshire, and was a scholar of Trinity College, Oxford, from 1684 to 1688. He was presented to the vicarage of Icklesham in Sussex, and subsequently to the rectory of St Thomas, Winchelsea. In 1698 he was entrusted with the delivery of the seventh series of the Boyle lectures—Atheistical Objections against the Being of God and his Attributes fairly considered and fully refuted. Between 1702 and 1704 he delivered at the Marine Coffee House in Birch Lane the mathematical lectures founded by Sir Charles Cotgrave, and advertised himself as a mathematical tutor at Amen Corner. The friendship of Sir William Cowper, afterwards lord chancellor, secured for him the office of private chaplain, a prebend in Rochester cathedral (1708), and the rectory of the united parishes of St Mildred, Bread Street and St Margaret Moses, in addition to other preferments. He showed himself an ardent supporter of the government, and engaged in a bitter quarrel with the Rev. Charles Humphreys, who afterwards was chaplain to Dr Sacheverel. Harris was one of the early members of the Royal Society, and for a time acted as vice-president. At his death on the 7th of September 1719, he was busy completing an elaborate History of Kent. He is said to have died in poverty brought on by his own bad management of his affairs.

HARRIS, THOMAS LAKE (1823-1906), American spiritualistic "prophet," was born at Fenney Stratford in Buckinghamshire, England, on the 15th of May 1823. His parents were Calvinistic Baptists, and very poor. They settled at Utica, New York, when Harris was five years old. When he was about twenty Harris became a Universalist preacher, and then a Swedenborgian. He became associated about 1847 with a spiritualist of indifferent character named Davis. After Davis had been publicly exposed, Harris established a congregation in New York. About 1850 he professed to receive inspirations, and published some long poems. He had the gift of improvisation in a very high degree. About 1870 he preached in London, and is described as a man "with low, black eyebrows, black beard, and sallow countenance." He was an effective speaker, and his poetry was admired by many; Alfred Austin in his book The Poetry of the Period even devoted a chapter to Harris. He founded in 1861 a community at Wassaic, New York, and opened a bank and a mill, which he superintended. There he was joined by about sixty converts, including five orthodox clergymen, some Japanese people, some American ladies of position, and especially by Laurence Oliphant (q.v.) with his wife and mother. The community—the Brotherhood of the New Life—decided to settle at the village of Brooton and River Thames. Harris established there a wine-making industry. In reply to the objections, "What are you drinking?" he said that the wine prepared by himself was filled with the divine breath so that all noxious influences were neutralized. Harris also built a tavern and strongly advocated the use of tobacco. He exacted complete surrender from his disciples—even the surrender of moral judgment. He taught that God was bi-sexual, and apparently, though not in reality, that the rule of society should be one of married celibacy. He professed to teach his community a change in the mode of respiration which was to be the visible sign of possession by Christ and the seal of immortality. The Oliphants broke away from the restraint about 1881, charging him with robbery and success in getting back from him many thousands of pounds by legal proceedings. But while losing faith in Harris himself, they did not abandon his main teaching. In Laurence Oliphant's novel Masolam his view of Harris will be found. Briefly, he held that Harris was originally honest, greatly gifted, and possessed of certain psychical powers. But in the end he came to practise unbridled licence under the loftiest pretensions, made the profession of extreme disinterestedness a cloak to conceal his avarice, and demanded from his followers a blind and supple obedience. Harris in 1876 discontinued for a time public activities, but issued to a secret circle books of verse dwelling mainly on sexual questions. About 1879, in London, Harris announced that his body had been renewed, and that he had discovered the secret of the resuscitation of humanity. He published a book, Lyra triumphalis, dedicated to A. C. Swinburne. He also made a third marriage, and visited England intending to remain there. He was called back by a fire which destroyed large stocks of his wine, and remained in New York till 1903, when he visited Glasgow. His followers believed that he had attained the secret of immortal life on earth, and after his death on the 23rd of March 1906 declared that he was only sleeping. It was three months before it was acknowledged publicly that he was really dead. There can be little doubt in the characters of the real character of Harris. His teaching was esoteric in form, but is a thinly veiled attempt to alter the ordering of sexual relations.

The authoritative biography from the side of his disciples is the Life by A. A. Cutibbert, published in Glasgow in 1908. It is full of the jargon of Harris's sect, but contains some biographical facts as well as many quotations. Mrs Oliphant's Life of Laurence Oliphant (1907) has not been imitated in any other form. Oliphant's own portrait of Harris in Masolam is apparently unexaggerated. But Harris had much personal magnetism, unbounded self-confidence, along with endless fluency, and to the last was believed in by some disciples of character and influence. (W. R. N.)

HARRIS, SIR WILLIAM SNOW (1791-1867), English electrician, was descended from an old family of solicitors at Plymouth, where he was born on the 1st of April 1791. He received his early education at the Plymouth grammar-school,
and completed a course of medical studies at the university of Edinburgh, after which he established himself as a general medical practitioner in Plymouth. On his marriage in 1824 he resolved to abandon his profession on account of its duties interfering too much with his favourite study of electricity. As early as 1820 he had invented a new method of arranging the lightning conductors of ships, the peculiarity of which was that the metal was permanently fixed in the masts and extended throughout the hull; but it was only with great difficulty, and not till nearly thirty years afterwards, that his invention was adopted by the government for the royal navy. In 1826 he read a paper before the Royal Society "On the Relative Powers of various Metallic Substances as Conductors of Electricity," which led to his being elected a fellow of the society in 1827. Subsequently, in 1834, 1836 and 1839, he read before the society several valuable papers on the elementary laws of electricity, and he also communicated to the Royal Society of Edinburgh various interesting accounts of his experiments and discoveries in the same field of inquiry. In 1835 he received the Copley gold medal from the Royal Society for his papers on the laws of electricity, and his tenacity and independence of character led to his being invited to deliver the Bakerian lecture. Meanwhile, although a government commission had recommended the general adoption of his conductors in the royal navy, and the government had granted him an annuity of £300 "in consideration of services in the cultivation of science," the naval authorities continued to offer various objections to his invention; to aid in removing these he in 1843 published his work on Thunderstorms, and also about the same time contributed a number of papers to the Nautical Magazine illustrative of damage by lightning. His system was actually adopted in the Russian navy before he succeeded in removing the prejudices against it in England, and in 1845 the emperor of Russia, in acknowledgment of his services, presented him with a valuable ring and vase. At length, the efficiency of his system being acknowledged, he received in 1847 the honour of knighthood, and subsequently a grant of £5000. After succeeding in introducing his invention into general use Harris resumed his labours in the field of original research, but as he failed to realize the advances that had been made by the new school of science his application resulted in no discoveries of much value. His manuals of Electricity, GALENTM and Magnetism, published between 1848 and 1856, were, however, written with great clearness, and passed through several editions. He died at Plymouth on the 2nd of January 1867, while having in preparation a Treatise on Frictional Electricity, which was published posthumously in the same year, with a memoir of the author by Charles Tomlinson.

HARRIS, WILLIAM TORREY (1835-1909), American educator, was born in North Killingly, Connecticut, on the 10th of September 1835. He studied at Phillips Andover Academy, Andover, Massachusetts, and entered Yale, but left in his junior year (1857) to accept a position as a teacher of shorthand in the St Louis, Missouri, public schools. Advancing through the grades of principal and assistant superintendent, he was city superintendent of schools from 1867 until 1880. In 1858, under the stimulus of Henry C. Brockmeyer, Harris became interested in modern German philosophy in general, and in particular in Hegel, whose works a small group, gathering about Harris and Brockmeyer, began to study in 1859. From 1867 to 1893 Harris edited The Journal of Speculative Philosophy (22 vols.), which was the quarterly organ of the Philosophical Society founded in 1866. The Philosophical Society died out before 1874, when Harris founded in St Louis a Kant Club, which lived for fifteen years. In 1873, with Miss Susan E. Blow, he established in St Louis the first permanent public-school kindergarten in America. He represented the United States Bureau of Education at the International Congress of Educators at Brussels in 1880. In 1889 he represented the United States Bureau of Education at the Paris Exposition, and from 1891 to 1906 was United States commissioner of education. In 1890 the university of Jena gave him the honorary degree of Doctor of Philosophy for his work on Hegel. In 1906 the Carnegie Foundation for the Advancement of Teaching conferred upon him, as the first man to whom such recognition for meritorious service is given, the highest retiring allowance which our rules will allow, as an initial annuity of $3000. Because being a contributor to the magazines and encyclopedias on educational and philosophical subjects, he wrote An Introduction to the Study of Philosophy (1830); The Spiritual Sense of Dante's Divina Commedia (1838); Hegel's Logic (1890); and Psychologicc Foundations of Education (1898); and edited Appleton's International Education Series and Webster's International Dictionary. He died on the 5th of November 1909.

HARRISBURG, the capital of Pennsylvania, U.S.A., and the county-seat of Dauphin county, on the E. bank of the Susquehanna river, about 105 m. W. by N. of Philadelphia. Pop. (1890), 39,385; (1900), 30,167, of whom 2493 were foreign-born and 4107 were negroes; (1010 census) 61,186. It is served by the Pennsylvania, the Philadelphia & Reading, the Northern Central and the Cumberland Valley railways; and the Pennsylvania, which serves it, is the communication with the ocean. The river here is a mile wide, appears ordinary, shallow, dotted with islets, but rises from 4 to 6 ft. after a moderate rain; it is spanned by several bridges.

The city lies for the most part on the E. slope of a hill extending from the river bank, several feet in height, across the Pennsylva­nia canal to Paxton Creek. Front Street, along the river, is part of a parkway connecting the park system with which the city is encircled. Overlooking it are the finest residences, among them the governor's mansion. State Street, 120 ft. in width, with the right angle angles along Street through the business centre of the city, being interrupted by the Capitol Park (just 16 acres). The Capitol,1 dedicated in 1906, was erected to replace one burned in 1897; it is a fine building, with a dome modelled after St Peter's at Rome. At the main entrance are bronze doors, decorated in relief with scenes from the state's history; the floor of the rotunda is of tiles made at Doylestown, in the style of the pottery made by early Moravian settlers, and illustrating the state's resources; the Senate Chamber and the House Chamber have stained-glass windows by W. B. van Ingen and mural paintings by Edwin A. Abbey, who painted a series, "The Development of the Laws," one of them representing the eastern hill, and decorated the rotunda. The mural decorations of the south corridor, by W. B. van Ingen, portray the state's religious sects; those in the north corridor, by John W. Alexander, represent the changes in the physical and material character of the state; and there is a frieze by Miss Violet Oxley, "The Founding of the State of Liberty Spiritual," in the governor's reception room. Two heroic groups of statuary for the building were designed by George Grey Barnard. The state library in the Capitol contains about 150,000 volumes. In the same park is also a monument 105 ft. high erected in

1 For this building the legislature in 1897 appropriated $1,000,000, stipulating that it should be completed before the 1st of January 1907. It was completed by that time, the net expenditure of the building commission being about $3,970,000. Although the legislative fund had made no provision for furnishing or decoration, the state Board of Public Grounds and Buildings (governor, auditor-general and treasurer) undertook to complete the furnishing and decoration of the building within the stipulated time, and paid out for that purpose more than $1,900,000. In May 1906 a new treasurer entered office, who discovered that many items for furniture and decoration were charged twice, once at a normal and again at a remarkably high and illegal price. He pointed out that the legislation of 1907 the building had been paid for, and the charge of fraud. The committee's decision was that the Board of Grounds and Buildings was not authorized to let the decorating and furnishing of the state house; that it had illegally authorized illegal expenditures; and that architect and contractors had made fraudulent invoices and certificates. Various indictments were found: in the first trial for conspiracy in the making and delivering of furniture the contractor and the former auditor-general, state treasurer and superintendent of public buildings and grounds were convicted and in December 1908 were sentenced to two years imprisonment and fined $500 each; in 1910 a suit was brought for the recovery of about $5,200,000 from those responsible.
HARRISMITH—HARRISON, BENJAMIN

1868. His memory of the soldiers who fell in the Mexican War; it has a column of Maryland marble 76 ft. high, which is surmounted by an Italian marble statue of Victory, executed in Rome. At the base of the monument are muskets used by United States soldiers in that war and guns captured at Cerro Gordo. In State Street is the Dauphin County Soldiers’ monument, a shaft 10 ft. sq. at the base and 110 ft. high, with a pyramid.

For several years prior to 1902 Harrismith suffered much from impure water, a bad sewerage system, and poorly paved and dirty streets. In that year, however, a League for Municipal Improvements was formed; in February 1902 a loan of $1,000,000 for municipal improvements was voted, landscape gardeners and sewage engineers were consulted, and a non-partisan mayor was elected, under whom great advances were made in street cleaning and street paving, a new filtration plant was completed, the river front was beautified and protected from flood, sewage was diverted from Paxton Creek, and the development of an extensive park system was undertaken.

Harrismith’s charitable institutions include a city hospital, a home for the friendless, a children’s industrial home, and a state lunatic hospital. The city is the seat of a Roman Catholic bishopric. Both coal and iron ore abound in the vicinity, and the city has numerous manufacturing establishments. The value of its factory products in 1905 was $17,146,338 (14.3% more than in 1900), the more important being those of steel works and rolling mills ($4,528,907), blast furnaces, steam railway repair shops, cigar and cigarette factories ($1,758,408), foundries and machine shops ($935,017), boot and shoe factories ($522,568), flouring and grist mills, slaughtering and meat-packing establishments and silk mills.

Harrismith was named in honour of John Harrison, who, upon coming into this region to trade early in the 18th century, was attracted to the site as an easy place at which to ford the Susquehanna, and about 1726 settled here. He was buried in what is now Harris Park, where he erected the first building, a small hut, within the present limits of Harrismith. In 1753 his son established a ferry over the river, and the place was called Harris’s Ferry until 1785, when the younger Harris laid out the town and named it Harrismith. In the same year it was made the county seat of the newly constituted county of Dauphin, and its name was changed to Louisburg; but when, in 1791, it was incorporated as a borough, the present name was again adopted. In 1813, after an effort begun twenty-five years before, it was made the capital of the state; and in 1860 it was chartered as a city. In the summer of 1827, through the persistent efforts of persons most interested in the woolen manufactures of Massachusetts and other New England states to secure legislative aid for that industry, a convention of about 100 delegates—manufacturers, newspaper men and politicians—was held in Harrismith, and the programme adopted by the convention did much to bring about the passage of the famous high tariff act of 1828.

HARRISmith, a town in the Orange Free State, 60 m. N.W. by rail of Ladysmith, Natal, and 240 m. N.E. of Bloemfontein via Bethlehem. Pop. (1904) 8,000 (including troops 1921). It is built on the banks of the Wilge, 520 ft. above the sea and some 20 m. W. of the Drakensberg. The mines of N. is town rising, a total of 1,000 ft. above the town, whereas an excellent supply of water is derived. The town is well laid out and several of the streets are lined with trees. Most of the houses are built of white stone quarried in the neighbourhood. The Kaifirs, who numbered in 1904 3,483, live in a separate location. Harrismith has a dry, bracing climate and enjoys a high reputation in South Africa as a health resort. It serves one of the best-watered and most fertile agricultural and pastoral districts of the province, of which it is the chief eastern trading centre. Wool and hides are the principal exports.

Harrismith was founded in 1849, the site first chosen being on the Elands river, where the small town of Aberfeldy now is; but the advantages of the present site soon became apparent and the settlement was removed. The founders were Sir Harry Smith (after whom the town is named), then governor of Cape Colony, and Major Henry D. Warden, at that time British resident at Bloemfontein, whose name is perpetuated in that of the principal street. In a cave about 2 m. from the town are well-preserved Bushman paintings.

HARRISON, BENJAMIN (1853-1901), the twenty-third president of the United States, was born at North Bend, near Cincinnati, Ohio, on the 20th of August 1833. His great- great-grandfather, Benjamin Harrison, a native of Virginia (1740-1791), was a signer of the Declaration of Independence. His grandfather, William Henry Harrison (1773-1841), was ninth president of the United States. His father, John Scott Harrison (1804-1878), represented his district in the national House of Representatives in 1853-1857. Benjamin’s youth was passed upon the ancestral farm, and as opportunity afforded he attended school in the log school-house near his home. He was prepared for college by a private tutor, studied for two years at the Farmers’ College, near Cincinnati, and in 1852 graduated from Miami University, at that time the leading educational institution in the State of Ohio. From his youth he was diligent in his studies and a great reader, and during his college life showed a marked talent for extemporaneous speaking. He practised law, partly in the office of Bellamy Storer (1798-1879), a leading lawyer and judge of Cincinnati, and in 1853 he was admitted to the bar. At the age of twenty-one he removed to Indianapolis. He had but one acquaintance in the place, the clerk of the federal court, who permitted him to occupy a desk in his office and place at the door his sign as a lawyer. Waiting for professional business, he was content to act as court crier for two dollars and a half a day; but he soon gave indications of his talent, and his studious habits and attention to his cases rapidly brought him clients. Within a few years he took rank among the leading members of the profession at a bar which included some of the ablest lawyers of the country. His legal career was early inter- rupted by the Civil War. His whole heart was enlisted in the anti-slavery cause, and during the second year of the war he accepted a commission from the governor of the state as second-lieutenant and speedily raised a regiment. He became its colonel, and as such continued in the Union Army until the close of the war, and on the 23rd of January 1865 was brevetted a brigadier-general of volunteers for “ability and manifest energy and gallantry in command of a brigade.” He participated with his regiment in various engagements during General Don Carlos Buell’s campaigns in Kentucky and Tennessee in 1862 and 1863; took part in General W. T. Sherman’s march on Atlanta in 1864 and in the Nashville campaign of the same year; and was transferred early in 1865 to Sherman’s army in its march through the Carolinas. As the commander of a brigade he served with particular distinction in the battles of Kenesaw Mountain (June 29-July 3, 1864), Peach Tree Creek (20th of July 1864) and Nashville (15th-16th of December 1864).

Allowing for this interval of military service, he applied himself exclusively for twenty-four years to his legal work. The only office he held was that of reporter of the supreme court of Indiana for two terms (1866-1869 and 1864-1868), and this was strictly in the line of his profession. He was a devoted member of the Republican party, but not a politician in the mean sense of the term. Once as a candidate for the presidency and his candidature was a forlorn hope, undertaken from a sense of duty after the regular nominee had withdrawn. He took a deep interest in the campaign which resulted in the election of James A. Garfield as president, and was offered by him a place in his cabinet; but this he declined, having been elected a member of the United States Senate, in which he took his seat on the 4th of March 1881. He was chairman of the committee on territories, and took an active part in urging the admission as states of North Dakota, South Dakota, Washington, Idaho and Montana, which finally came into the Union during his presidency. He served also on the committee of military and Indian affairs, the committee on foreign relations, and other committees. In 1884, the Senate from these committees, advocated the enlargement of the navy and the reform of the civil service, and opposed the
HARRISON, F.—HARRISON, J.

pension veto messages of President Cleveland. Having failed to secure a re-election to the Senate in 1887, Harrison was nominated by the Republican party for the presidency in 1888, and defeated Grover Cleveland, the candidate of the Democratic party, receiving 233 electoral votes to Cleveland's 168. Among the measures and events distinguishing his term as president were the following: The meeting of the Pan-American Congress at Washington; the passage of the McKinley Tariff Bill and of the Sherman Silver Bill of 1890; the suppression of the Populist party; the enlargement of the Navy; further advance in civil service reform; the convocation by the United States of an international monetary conference; the establishment of commercial reciprocity with many countries of America and Europe; the peaceful settlement of a controversy with Chile; the negotiation of a Hawaiian Annexation Treaty, which, however, before its ratification, his successor withdrew from the Senate; the settlement of difficulties with Germany concerning the Samoan Islands, and the adjustment by arbitration with Great Britain of the Bering Sea fur-seal question. His administration was marked by a revival of American industries and a reduction of the public debt, and at its conclusion the country was left in a condition of prosperity and on friendly terms with foreign nations. He was nominated by his party in 1892 for re-election, but was defeated by Cleveland, this result being, at least in part, to the labour strikes which occurred during the presidential campaign and arrayed the labour unions against the tariff party.

After leaving public life he resumed the practice of the law, and in 1893 was retained by the government of Venezuela as its leading counsel in the arbitration of its boundary dispute with Great Britain. In this capacity he appeared before the international tribunal of arbitration at Paris in 1894, worthily maintaining the reputation of the American bar. After the Spanish-American War he strongly disapproved of the colonial policy of his party, which, however, he continued to support. He occupied a portion of his leisure in writing a book, entitled This Country of Ours (1897), treating of the organization and administration of the government of the United States, and a collection of essays by him was published posthumously, in 1901, under the title Views of an Ex-President. He died at Indianapolis on the 13th of March, 1901. Harrison's distinguishing trait of character, to which his success is to be most largely attributed, was his thoroughness. He was somewhat reserved in manner, and this led to the charge in political circles that he was cold and unsympathetic; but no one gathered around him more devoted and loyal friends, and his dignified bearing in and out of office commanded the hearty respect of his countrymen.

President Harrison was twice married; in 1833 to Miss Caroline Lavinia Scott, by whom he had a son and a daughter, and in 1859 to Mrs Mary Scott Lord Dimmock, by whom he had a daughter. A "campaign" biography was published by Lew Wallace (Philadelphia, 1868), and a sketch of his life may be found in Presidents of the United States (New York, 1894), edited by James Grant Wilson.

HARRISON, FREDERIC (1831— ), English jurist and historian, was born in London on the 18th of October 1831. Members of his family (originally Leicestershire yeomen) had been lessees of Sutton Place, Guildford, of which he wrote an interesting account (Annals of an Old Manor House, 1803). He was educated at King's College school and at Wadham College, Oxford, where, after taking a first-class in Literae Humaniores in 1853, he became fellow and tutor. He was called to the bar in 1858, and, in addition to his practice in equity cases, soon began to distinguish himself as an effective contributor to the higher-class reviews. Two articles in the Westminster Review, one on the Italian question, which procured him the special thanks of Cavour, the other on Essays and Reviews, which had the probably undesigned effect of stimulating the attack on the book, attracted especial notice. A few years later Mr Harrison worked at the codification of the law with Lord Westbury, of whom he contributed an interesting notice to Nash's biography of the chan-
cellor. His special interest in legislation for the working classes led him to be placed upon the Trades Union Commission of 1867—1869; he was secretary to the commission for the digest of the law, 1869—1870; and was from 1877 to 1889 professor of jurisprudence and international law under the council of legal education. A follower of the positive philosophy, but in conflict with Richard Congreve (q.v.) as to details, he led the Positivists who split off and founded Newton Hall in 1881, and he was president of the English Positivists' Committee from 1880 to 1905; he was also editor and part author of the Positivist New Calendar of Great Men (1892), and wrote much on Comte and Positivism. Of his separate publications, the most important are his lives of Cromwell (1888), William the Silent, (1897), Ruskin (1902), and Chatham (1905); his Meaning of History (1862; enlarged 1894) and Byzantine History in the Early Middle Ages (1900); and his essays on Early Victorian Literature (1896) and The Choice of Books (1886) are remarkable alike for generous admiration and good sense. In 1904 he published a "romantic monograph" of the 10th century, Theophano, and in 1906 a verse tragedy, Nicephorus. An advanced and vehement Radical in politics and Progressive in municipal affairs, Mr Harrison in 1886 stood unsuccessfully for parliament against Sir John Lubbock for London University. In 1889 he was elected an alderman of the London County Council, but resigned in 1893. In 1897 he married Ethel Berta, daughter of Mr William Harrison, by whom he had four sons. George Gissing, the novelist, was at one time their tutor; and in 1905 Mr Harrison wrote a preface to Gissing's Verandilla (see also Mr Austin Harrison's article on Gissing in the Nineteenth Century). He was, besides, a religious teacher, literary critic, historian and jurist, Mr Harrison took a prominent part in the life of his time; and his writings, though often violently controversial on political and social subjects, and in their judgment and historical perspective characterized by a modern Radical point of view, are those of an accomplished scholar, and of one whose wide knowledge of literature was combined with independence of thought and admirable vigour of style. In 1907 he published The Creed of a Layman, Apologia pro fide mea, in explanation of his religious position.

HARRISON, JOHN (1603—1776), English horologist, was the son of a carpenter, and was born at Faulby, near Pontefract, in Yorkshire, in the year 1603. Thence his father and family removed in 1700 to Barrow in Lincolnshire. Young Harrison at first learned his father's trade, and worked at it for several years, at the same time occasionally making a little money by land-measuring and surveying. The bent of his mind, however, was towards mechanical pursuits. In 1715 he made a clock with wooden wheels, which is in the patent museum at South Kensington, and in 1726 he devised his ingenious "gridiron pendulum," which maintains its length unaltered in spite of variations of temperature (see Clock). Another invention of his was a recoil clock escapement in which friction was reduced to a minimum, and he was the first to employ the commonly used and effective form of "going ratchet," which is a spring arrangement for keeping the timepiece going at its usual rate during the interval of being wound up.

In Harrison's time the British government had become fully alive to the necessity of determining more accurately the longitude at sea. For this purpose they passed an act in 1713 offering rewards of £10,000, £15,000 and £20,000 to any who should construct chronometers that would determine the longitude within 60, 40 and 30 m. respectively. Harrison applied himself vigorously to the task, and in 1735 went to the Board of Longitude with a watch which he also showed to Edmund Halley, George Graham and others. Through their influence he was allowed to proceed in a king's ship to Lisbon to test it; and the result was so satisfactory that he was paid £500 to carry out further improvements. Harrison worked at the subject with the utmost perseverance, and, after making several watches, went up to Iceland in 1760, which he considered almost perfect. His son William was sent on a voyage to Jamaica to test it; and, on his return to Portsmouth in 1763, it was found to have lost...
HARRISON, T.—HARRISON, T. A.

only 1 minute 54⅔ seconds. This was surprisingly accurate, as it determined the longitude within 18 m, and Harrison claimed the full honor of £500. But though from time to time he ventured sums on account, it was not till 1773 that he was paid in full. In these watches compensation for changes of temperature was applied for the first time by means of a "compensation-curb," designed to alter the effective length of the balance-spring in proportion to the expansion or contraction caused by variations of temperature. Harrison died in London on the 24th of March 1776. His want of early education was felt by him greatly throughout life. He was unfortunately never able to express his ideas clearly in writing, although in conversation he could give a very precise and exact account of his many intricate mechanical contrivances.

Among his writings were a Description concerning such Mechanism as are afford A Nice or True Mensuration of Time (1755), and The Principles of Mr. Harrison's Timekeeper, published by order of the Commissioners of Longitude (1767).

HARRISON, THOMAS (1660-1660), English parliamentarian, a native of Newcastle-under-Lyme in Staffordshire, the son of a butcher and mayor of that town, was baptized in 1660. He was placed with an attorney of Clifford's Inn, but at the beginning of the war in 1642 he enlisted in Essex's lifeguards, became major in Fleetwood's regiment of horse under the earl of Manchester, was present at Marston Moor, at Naseby, Langport and at the taking of Oxford and Basing. He was also at the siege of Oxford. At Basing Harrison bore the onerous task of having killed a prisoner in cold blood. In 1646 he was returned to parliament for Wendover, and served in Ireland in 1647 under Lord Lisle, returning to England in May, when he took the side of the army in the dispute with the parliament and obtained from Fairfax a regiment of horse. In November he opposed the negotiations with the king, whom he styled "a man of blood" to be called to account, and he declaimed against the House of Lords. At the surprise of Lambert's quarters at Appleby on the 18th of July 1648, in the second civil war, he distinguished himself by his extraordinary daring and was severely wounded. He showed a special zeal in bringing about the trial of the king. Charles was entrusted to his care on being brought up from Hurst Castle to London, and believed that Harrison intended his assassination, but was at once favourably impressed by his bearing and reassured by his disclaiming any such design. Harrison was assiduous in his attendance at the trial, and signed the death-warrant with the fullest conviction that it was his duty. He took part in suppressing the royalist rising in the midlands in May 1649, and in July was appointed to the chief command in South Wales, where he is said to have exercised his powers with exceptional severity. On the 20th of February 1651 he became a member of the council of state, and during Cromwell's absence in Scotland held the supreme military command in England. He failed in stopping the march of the royalists into England at Knutsford on the 16th of August 1651, but after the battle of Worcester he rendered great service in pursuing and capturing the fugitives. Later he pressed on Cromwell the necessity of dismissing the Long Parliament, and it was he who at Cromwell's bidding, on the 20th of April 1653, laid hands on Speaker Lenthall and compelled him to vacate the chair. He was president of the council of thirteen which now exercised authority, and his idea of government appears to have been an assembly nominated by the congregations, on a strictly religious basis, such as Barebone's Parliament which now assembled, of which he was a member and a ruling spirit. Harrison belonged to the faction of the Puritans who saw the political ideals were entirely destroyed by Cromwell's assumption of the protectorate. He went immediately into violent opposition, was deprived of his commission on the 22nd of December 1653, and on the 3rd of February 1654 was ordered to confine himself to his father's house in Staffordshire. Suspected of complicity in the plots of the anabaptists, he was imprisoned for a short time in September, and on that occasion was sent for by Cromwell, who endeavoured in a friendly manner to persuade him to desist. He, however, incurred the suspicions of the administration afresh, and on the 15th of February 1655 he was imprisoned in Carisbrooke Castle, being liberated in March 1656, when he took up his residence at Highgate with his family. In 1662 he returned to staffordshire to complete Venn's conspiracy, and again once more in February 1658, when he was imprisoned in the Tower. At the Restoration, Harrison, who was excepted from the Act of Indemnity, refused to take any steps to save his life, to give any undertaking not to conspire against the government or to flee. "Being so clear in the thing," he declared, "I durst not turn my back nor step a foot out of the way by reason I had been engaged in the service of so glorious and great a God." He was arrested in Staffordshire in May 1660 and brought to trial on the 11th of October. He made a manly and straightforward defence, pleading the authority of parliament and adding, "May be I might be a little mistaken, but I did it all according to the best of my understanding, desiring to make the revealed will of God in His holy scriptures a guide to me." At his execution, which took place at Charing Cross on the 13th of October 1660, he behaved with great fortitude.

Richard Baxter, who was acquainted with him, describes Harrison as "a man of excellent natural parts for affection and oratory, but not well seen in the principles of his religion; of a sanguine complexion, naturally of such a vivacity, hilarity and alacrity as another man hath when he hath drunken a cup too much, but naturally also so far from humble thoughts of himself that it was his ruin." Cromwell also complained of his overbearing ways. "Harrison is an honest man and aims at good things, yet from the impatience of his spirit will not wait the Lord's leisure but hurries me on to that which he and all honest men will have cause to repent," Harrison was an eloquent and fluent exponent of the scriptures, and his "raptures" on the field of victory are recorded by Baxter. He was of the chief of those "fiery spirits" whose ardent and emotional religion inspired their political action, and who did wonders during the period of struggle and combat, but who later, in the more sober and difficult sphere of constructive statesmanship, showed themselves perfectly incapable.

Harrison married about 1645 Katherine, daughter and heiress of Ralph Harrison of Highgate in Middlesex, by whom he had several children, all of whom, however, appear to have died in infancy.

See the article on Harrison by C. H. Firth in the Dict. of Nat. Biog.; Life of Harrison by C. H. Simpkinson (1905); Notes and Queries, 9 series, xi. 211.

HARRISON, THOMAS ALEXANDER (1853- ), American artist, was born in Philadelphia on the 17th of January 1853. He was a pupil of the Pennsylvania Academy of Fine Arts and of the Ecole des Beaux-Arts, Paris, whither he went in 1875, having previously been with a United States government survey expedition on the Pacific coast. Chafing under the restraints of the schools, he went into Brittany, and at Pont Aven and Concarneau turned his attention to marine painting and landscape. In 1882 he sent a figure-piece to the Salon, a fisher boy on the beach, which he called "Châteaux en Espagne." This attracted attention, and in 1883 he received an honourable mention, the first of many awards conferred upon him, including the Temple gold medal (Pennsylvania Academy of Fine Arts, Philadelphia, 1887), first medal, Paris Exhibition (1880), and medals in Munich, Brussels, Ghent, Vienna and elsewhere. He became a member of the Legion of Honour and officer of Public Instruction, Paris; a member of the Société Nationale des Beaux-Arts, Paris; of the Royal Institute of Painters in Oil Colours, London; of the National Academy of Design, the Society of American Artists, New York, and other art bodies. In the Salon of 1885 he had a large canvas of several nude women, called "In Arcady," a remarkable study of flesh tones in light and shade which had a strong influence on the younger men of the day. But his reputation rests rather on his marine pictures, long waves rolling in on the beach, and great stretches of open sea under poetical conditions of light and colour.

His brother, BURGE HARRISON (1854- ), also a painter, particularly successful in snow scenes, was a pupil of the École
HARRISON, W.—HARRISON, W. H.

des Beaux Arts, Paris, under Cabanel and Carolus Duran; his "November" (honourable mention, 1882) was purchased by the French government. Another brother, BUTLER HARRISON (d. 1886), was a figure painter.

HARRISON, WILLIAM (1534-1593), English topographer and antiquary, was born in London on the 4th of April 1534. He was educated, according to his own account, at St Paul's school and at Westminster under Alexander Nowell. In 1551 he was at Cambridge, but he took his B.A. degree from Christ Church, Oxford, in 1566. He was inducted early in 1559 to the rectory of Radwinter, Essex, on the presentation of Sir William Brooke, Lord Cobham, to whom he had formerly acted as chaplain; and from 1577 to 1581 he held from another patron, Francis de la Wood, the living of Wimbish in the same county. He became canon of Windsor in 1586, and his death and burial are noted in the chapter book of St George's chapel on the 24th of April 1593.

His famous and amusing Description of England was undertaken for the queen's printer, Reginald Wolfe, who designed the publication of "an universal cosmographic of the whole world . . . with particular histories of every knowne nation." After Wolfe's death in 1576 this comprehensive plan was reduced to descriptions and histories of England, Scotland and Ireland. The historical section was to be supplied by Raphel Holinshed, the topographical by Harrison. The work was eventually published as The Chronicles of England, Scotland and Ireland . . . by Samuel Holinshed and others, and was printed in two black-letter folio volumes in 1577. Harrison's Description of England, humbly described as his "foulle frizedel treatise," and dedicated to his patron Cobham, is an invaluable survey of the condition of England under Elizabeth, in all its political, religious and social aspects. Harrison is a minute and careful observer of men and things, and his descriptions are enlivened with many examples of a lively and caustic humour which makes the book excellent reading. In spite of his Puritan prejudices, which led him to regret that those "pictures in glass" ("by reason of the extreme cost thereof"), and to exhaust his wit on the effeminate Italian fashions of the younger generation, he had an eye for beauty and is loud in his praise of such architectural gems as Henry VII's chapel at Westminster.

He is properly contemptuous of the snobbery that was even then characteristic of English society; but his account of "how gentlemen are made in England" must be read in full to be appreciated. He is especially instructive on the condition and services of the Church immediately after the Reformation, notably in the use of ancient Protestant, he is quite unconscious of any breach of continuity in the life and organization of the Church of England.

Harrison also contributed the translation from Scots into English of Bellenden's version of Hector Boëce's Latin Description of Scotland. His other works include a "Chronologie," giving an account of events from the creation to the year 1593, which is of some value for the period covered by the writer's lifetime. This, with an elaborate treatise on weights and measures, remains in MS. in the diocesan library of Londonderry.

For the later editions of the Chronicles of England . . . see Holinshed. The second and third books of Harrison's Description were edited by Dr F. J. Furnivall for the New Shakspere Society, with extracts from his "Chronologie" and from other contemporary writers, as Shakspere's England (2 vols, 1877-1878).

HARRISON, WILLIAM HENRY (1773-1841), ninth president of the United States, was born at Berkeley, Charles City county, Virginia, on the 9th of February 1773, the third son of Benjamin Harrison (c. 1719-1791). His father was long prominent in Virginia politics, and became a member of the Virginia House of Burgesses in 1764, opposing Patrick Henry's Stamp Act resolutions in the following year; he was a member of the Continental Congress in 1774-1777, signing the Declaration of Independence and serving for a time as president of the Board of War; speaker of the Virginia House of Delegates in 1777-1782; governor of Virginia in 1781-1784; and in 1788 as a member of the Virginia Convention he actively opposed the ratification of the Federal Constitution by his state. William Henry Harrison received a classical education at Hampden-Sidney College, where he was a student in 1787-1790, and began a medical course in Philadelphia, but the death of his father caused him to discontinue his studies, and in November 1793 he entered the army as ensign in the Tenth Regiment at Fort Washington, Cincinnati. In the following year he became a lieutenant, and subsequently acted as aide-de-camp to General Anthony Wayne in the campaign which ended in the battle of Fallen Timbers on the 10th of August 1794. He was promoted to a captaincy in 1797 and for a brief period served as commander of Fort Washington, but resigned from the army in June 1798.

Soon afterwards he succeeded Winthrop Sargent as secretary of the Northwest Territory. In 1799 he was chosen by the legislature of the territory as the delegate of the Congress. While serving in this capacity he devised a plan for disposing of the public lands upon favourable terms to actual settlers, and also assisted in the division of the North-west Territory. It was his ambition to become governor of the more populous eastern portion, which retained the original name, but instead, in January 1800, President John Adams appointed him governor of the newly created Indiana Territory, which comprised until 1809 a much larger area than the present state of Indiana.

Henry Harrison was born on the 9th of January 1801, and was governor until September 1812. Among the legislative measures of his administration may be mentioned the attempted modification of the slavery clause of the ordinance of 1787 by means of an indemnity law—a policy which Harrison favoured; more effective land laws; and legislation for the more equitable treatment of the Indians and for preventing the sale of liquor to them. In 1803 Harrison also became a special commissioner to treat with the Indians "on the subject of boundary or lands," and in 1805 to negotiate treaties with the Indians of the larger and portions of the present states of Illinois, Wisconsin and Missouri were opened to settlement. For a few months after the division in 1804 of the Louisiana Purchase into the Orleans Territory and the Louisiana Territory he also acted as governor of the Louisiana Territory—all of the Louisiana Purchase N. of the thirty-third parallel, his jurisdiction then being the greatest in extent ever exercised by a territorial official in the United States.

The Indian cessions of 1809, along the Wabash river, aroused the hostility of Tecumseh (q.v.) and his brother, familiarly known as "The Prophet," who were attempting to combine the tribes between the Ohio and the Great Lakes in opposition to the encroachment of the whites. Several fruitless conferences between the governor and the Indian chiefs, who were believed to be encouraged by the British, resulted in Harrison's advance with a force of militia and regulars to the Tippecanoe river, where (near the present Lafayette, Ind.) on the 7th of November 1811 he won over the Indians a victory which established his military reputation and was largely responsible for his subsequent nomination and election to the presidency of the United States. From one point of view the battle of Tippecanoe may be regarded as the opening skirmish of the war of 1812. When in the summer of 1812 open hostilities with Great Britain began, Harrison was appointed by Governor Charles Scott of Kentucky major-general in the militia of that state. A few weeks later (22nd August 1812) he was made brigadier-general in the regular U.S. army, and soon afterwards was put in command of all the troops in the north-west, and on the 2nd of March 1813 he was promoted to the rank of major-general. General James Winchester, whom Harrison had ordered to prepare to cross Lake Erie on the ice and surprise Fort Malden, turned back to rescue the threatened American settlement at Frenchtown (now Monroe), on the Raisin river, and there on the 22nd of January 1813 was forced to surrender to Colonel Henry A. Proctor. Harrison's offensive operations being thus checked, he accomplished nothing that summer except to hold in check Proctor, who (May 1-3) besieged him at Fort Meigs, the American advanced
HARRISON

post after the disaster of the river Raisin. After Lieutenant O. H. Perry's naval victory on the 10th of September 1813, Harrison no longer had to remain on the defensive; he advanced to Detroit, re-occupied the territory surrendered by General William Hull, and on the 5th of October administered a crushing defeat to Proctor at the battle of the Thames.

In 1814 Harrison received no active assignments to service, and on this account and because the secretary of war (John Armstrong) issued an order to one of Harrison's subordinates without consulting him, he resigned his commission. Armstrong accepted the resignation without consulting President Madison, but the president later utilized Harrison in negotiating with the north-western Indians, the greater part of whom agreed (22nd July 1814) to a second treaty of Greenville, by which they were to become active allies of the United States, should hostilities with Great Britain continue. This treaty publicly marked an American policy of alliance with these Indians and caused the British peace negotiators at Ghent to abandon them. In the following year Harrison held another conference at Detroit with these tribes in order to settle their future territorial relations with the United States.

From 1816 to 1819 Harrison was a representative in Congress, and as such worked for half of the liberal pension laws and a better militia organization, including a system of general military education, of improvements in the navigation of the Ohio, and of relief for purchasers of public lands, and for the strict construction of the power of Congress over the Territories, particularly in regard to slavery. In accordance with this view in 1819 he voted against Tallmadge's amendment (restricting the extension of slavery) to the enabling act for the admission of Missouri.

He also delivered forcible speeches upon the death of Kosciusko and upon General Andrew Jackson's course in the Floridas, favouring a partial censure of the latter.

Harrison was a member of the Ohio senate in 1819-1821, and was an unsuccessful candidate for the National House of Representatives in 1822, when his Missouri vote helped to cause his defeat; he was a presidential elector in 1824, supporting Henry Clay, and from 1825 to 1828 was a member of the United States Senate. In 1828 after unsuccessful efforts to secure for him the command of the army, upon the death of Major-General Jacob Brown, and the nomination for the vice-president, on the ticket with John Quincy Adams, his friends succeeded in getting Harrison appointed as the first minister of the United States to Colombia. He became, however, an early sacrifice to Jackson's spoils system, being recalled within less than a year, but not until he had involved himself in some awkward diplomatic complications with Bolivar's autocratic government.

For some years after his return from Colombia he lived in retirement at North Bend, Ohio. He was occasionally "mentioned" for governor, senator or representative, by the anti-Jackson forces, and delivered a few addresses on agricultural or political topics. Later he became clerk of the court of common pleas of Hamilton county—a lucrative position that was then most acceptable to him. Early in 1835 Harrison began to be mentioned as a suitable presidential candidate, and later in the year he was nominated for the presidency at large public meetings in Pennsylvania, New York and Maryland. In the election of the following year he attracted a large part of the Whig and Anti-Masonic vote of the Middle and Western states and led among the candidates opposing Van Buren, but received only 73 electoral votes while Van Buren received 170. His unexpected strength, due largely to his clear, if non-committal, political record, rendered him the most "available" candidate for the Whig party for the campaign of 1840, and he was nominated by the Whig convention at Harrisburg, Pa., in December 1839, his most formidable opponent being Henry Clay, who, though generally regarded as the real leader of his party, was less "available" because as a mason he would alienate former members of the old Anti-Masonic party, and as an advocate of a protective tariff would repel many Southern voters. The convention adjourned without adopting any "platform" of principles, the party shrewdly deciding to make its campaign merely on the issue of whether the Van Buren administration should be continued in power and thus to take full advantage of the popular discontent with the administration, to which was attributed the responsibility for the panic of 1837 and the subsequent business depression. Largely to attract the votes of Democratic malcontents the Whig convention nominated for the vice-presidency John Tyler, who had previously been identified with the Democratic party. The campaign was marked by the extraordinary enthusiasm exhibited by the Whigs, and by their skill in attacking Van Buren without binding themselves to any definite policy. Because of his fame as a frontier hero, of the circumstance that he had been born in front of the Ohio, it was humorously termed "the cabin, and of the story that cider, not wine, was served on his table, Harrison was derisively called by his opponents the "log cabin and hard cider" candidate; the term was eagerly accepted by the Whigs, in whose processions miniature log cabins were carried and at whose meetings hard cider was served, and the campaign itself has become known in history as the "log cabin and hard cider campaign." Harrison's canvass was conspicuous for the immense Whig processions and mass meetings, the numerous "stump" speeches (Harrison himself addressing meetings at Dayton, Chillicothe, Columbus and other places), and the use of campaign songs, of party insignia, and of campaign societies (such as "Tippecanoe and Tyler too"); and by the election he was won by an overwhelming majority of 244,912 votes to 60 cast for Van Buren.

President Harrison was inaugurated on the 4th of March 1841. He chose for his cabinet Daniel Webster as secretary of state, Thomas Ewing as secretary of the treasury, John Bell as secretary of war, George E. Badger as secretary of the navy, Francis Granger as postmaster-general, and John J. Crittenden as attorney-general. He survived his inauguration only one month, dying on the 4th of April 1841, and being succeeded by the vice-president, John Tyler. The immediate cause of his death was an attack of pneumonia, but the disease was aggravated by the excitement attending his sudden change in circumstances and the incessant demands of office seekers. After temporary interment at Washington, his body was removed to the tomb at North Bend, Ohio, where it now lies. A few of Harrison's public addresses survive, the most notable being A Discourse on the Aborigines of the Ohio. It has been said of him: "He was not a great man, but he had lived in a great time, and he had been a leader in great things." He was the first territorial delegate in the Congress of the United States and was the author of the first step in the development of the country's later homeland policy; the first presidential candidate to be selected upon the ground of "expediency" alone; and the first president to die in office. In 1795 he married Anna Symmes (1775-1864), daughter of John Cleves Symmes. Their grandson, Benjamin Harrison, was the twenty-third president of the United States.

AUTHORITIES.—In 1824 Moses Dawson published at Cincinnati the Historical Narrative of the Civil and Military Services of Major-General William H. Harrison. This is a combined defence and political pamphlet, but it is the source of all the subsequent "lives" that have appeared. There are several "campaign" biographies, including one by Richard Hildreth (1839) and one by Caleb Cushing (1840); and there is a good sketch in President's of the United States (New York, 1894). William H. S.eward, in his Life of Harrison's career in Indiana appears in vol. 4 of the Indiana Historical Society Publications. Selections from his scanty correspondence appear in vols. ii. and iii. of the Quarterly Publications of the Historical and Philosophical Society of Ohio.

HARRISON, a town of Hudson county, New Jersey, U.S.A., on the Passaic river, opposite Newark (with which it is connected by bridges and electric railways), and 7 m. W. of Jersey City. Pop. (1890) 8338; (1900) 10,596, of whom 3633 were foreign-born; (1910 census) 14,408. It is served by the Pennsylvania, the Erie, and the Delaware, Lackawanna & Western railways. Harrison was chosen as the eastern terminal of the Pennsylvania railroad for steam locomotive service, transportation thence to New York being by electric power through the railway's Hudson river tunnels. The town has an extensive river-front, along which are many of its manufactories; among their products are steam-pumps, steel, iron, machinery, roller bearings,
brass tubing, iron and brass castings, marine engines, hoisting engines, metal novelties, dry batteries, electric lamps, concrete blocks, cotton thread, wire cloth, leather, trunks, beer, barrels, lumber, inks and cutlery. The factory product in 1905 was valued at $8,486,924. The town is governed by a mayor and a common council. Harrison was settled toward the close of the 17th century, and for many years constituted the S. portion of the township of Lodi. In 1840, however, it was set off from Lodi and named in honour of President William Henry Harrison, and in 1873 it was incorporated. Harrison originally included what is now the town of Kearny (q.v.).

HARRISBURG, a city and the county-seat of Mercer county, Pennsylvania, U.S.A., 32 m. S.S. of Franklin, on the Southern railway. Pop. (1891) 21,865; (1901) 28,576, of whom 11,500 were negroes; (1910 U.S. census) 31,477. On account of its sulphur springs Harrodsburg became early in the 19th century a fashionable resort, and continues to attract a considerable number of visitors. The city is the seat of Harrodsburg Academy, Beaumont College for women (1854; founded as Daughters' College in 1856); and Wayman College (African M.E.) for negroes. Among its manufactures are flour, whisky, dressed lumber and ice. About 30 m. E. of Harrodsburg is Pleasant Hill Village, a summer resort and the home, since early in the 19th century, of a Shaker community. Harrodsburg was founded on the 16th of June 1774 by James Harrod (1746-1793) and a few followers, and is the oldest permanent settlement in the state. It was incorporated in 1875. Harrodsburg was formerly the seat of Bacon College (see LEXINGTON, Kentucky).

HARROGATE, a municipal borough and watering-place in the Ripon parliamentary division of the West Riding of Yorkshire, England, 203 m. N. by W. from London, on the Northern railway. Pop. (1801) 16,316; (1901) 28,423. It is indebted for its rise and importance to its medicinal springs, and is the principal inland watering-place in the north of England. It consists of two scattered townships, Low Harrogate and High Harrogate, which have gradually been connected by a continuous range of handsome houses and villas. A common called the Stray, of 200 acres, secured by act of parliament from ever being built upon, stretches in front of the main line of houses, and on this account Harrogate, notwithstanding its rapid increase, has retained much of its rural charm. As regards climate a choice is offered between the more bracing atmosphere of High Harrogate and the sheltered and warmer climate of the low town. The waters are chalybeate, sulphureous and saline, and some of the springs possess all these qualities to a greater or less extent. The principal chalybeate springs are the Tewitt well, called by Dr Bright, who wrote the first account of it, the "English Spa," discovered by Captain William Slingsby of Bilton Hall near the close of the 17th century; the Royal Chalybeate Spa, more commonly known as John's Well, discovered in 1631 by Dr Stanhope of York; Muspratt's chalybeate or chloride of iron spring discovered in 1819, but first properly analysed by Dr Sheridan Muspratt in 1865; and the Starbeck springs midway between High Harrogate and Knaresborough. The principal sulphur springs are the old sulphur well in the centre of Low Harrogate, discovered about the year 1656; the Montpellier springs, the principal well of which was discovered in 1822, situated in the grounds of the Crown Hotel and surmounted by a handsome building in the Chinese style, containing pump-room, baths and reading-room; and the Harlow Car springs, situated in a wooded glen about a mile west from Low Harrogate. Near Harlow Car is Harlow observatory, a square tower 100 ft. in height, standing on elevated ground and commanding a very extensive view. A saline spring situated in Low Harrogate was discovered in 1784. Some eighty springs in all have been discovered. The principal bath establishments are the Victoria Baths (1871) and the Royal Baths (1897). There are also a handsome kursaal (1903), a grand opera house, numerous modern churches, and several hospitals and benevolent institutions, including the Royal Bath hospital. The corporation owns the Stray, and also the Spa concert rooms and grounds, Harlow Moor, Crescent Gardens, Royal Bath gardens and other large open spaces, as well as Royal Baths, Victoria Baths and Starbeck Baths. The mineral springs are vested in the corporation. The high-lying moorland of the surrounding district is diversified by picturesque dales; and Harrogate is not far from many towns and sites of great interest, such as Ripon, Knaresborough and Fountains Abbey. The town was incorporated in 1884, and the corporation consists of a mayor, 8 aldermen and 24 councillors. Area, 3,376 acres.

HARROW, an agricultural implement used for (1) levelling ridges left by the plough and preparing a smooth surface for the reception of seeds; (2) covering in seeds after sowing; (3) tearing up and gathering weeds; (4) disintegrating and levelling the soil of meadows and pastures; (5) forming a surface tilth by pulverizing the top soil and so conserving moisture.

The harrow rivals the plough in antiquity. In its simplest form it consists of the boughs of trees interlaced into a wooden frame, and this form survives in the "bush-harrow." Another old type, found in the middle ages and still in use, consists of a wooden framework in which iron pegs or "tines" are set. This is now generally superseded by the "zig-zag" harrow patented by Armstrong in 1859, built of iron bars in which the tines are so arranged that each follows its own track and has a separate line of action. This harrow is usually made in two or three sections which fold over one another and are thus easily portable, the arrangement at the same time giving a flexibility on uneven ground. Additional flexibility may be imparted to the implement by joining the stays of the frame which are in the line of draught. The liability that the tines may snap off is the chief weakness of this type, and improvements have consisted chiefly in alterations in their shape and the method of fixing them to the frame.

The other type of harrow most used is the chain harrow, consisting of a number of square-link chains connected by cross links and attached to a draught-bar, the whole being kept expanded by stretchers and trailing weights. It is used for levelling and spreading manure over grass-land, from which it at the same time tears up moss and coarse herbage. Mention may also be made of the drag-harrow, a heavy implement with long tines, approximating closely to the cultivator, and of the Norwegian harrow with its revolving rows of spikes.

A few variations and developments of the ordinary harrow require notice. In the adjustable harrow (fig. 2) the teeth are secured to bars pivoted at their ends in the side bars of the frame, and provided with crank arms connected to a common link bar, which may be moved horizontally by means of a lever for the purpose of adjusting

1 In Mid. Eng. harowe; the O. Eng. appears to have been here, the word is cognate with the Dutch hark, Swed. harka, Ger. Hark, rake, and with Danish aare, and Swed. harf, harrow, but the ultimate origin is unknown; the Fr. herse is a different word, cf. Hearse.

FIG. 1.—Jointed Zig-zag Harrow. (Ransomes, Sims & Jefferies, Ltd.)
the angle which the teeth make with the ground, and thus convert
the machine from a pulverizer to a smoothing harrow. The small
figure illustrates a spring connexion between the adjusting lever and
its locking bar, which allows the teeth to yield upon striking an
obstruction. As the briskness of the operation adds to its effective-
ness, the harrow is often made with a seat from which the operator
can hasten the team without fatiguing himself.

Fig. 3 illustrates a spring-tooth harrow. In this harrow the in-
dependent frames are carried upon wheels, and a seat for the operator
is mounted upon standards supported by the two frames. The teeth
consist of flat steel springs of scroll form, which yield to rigid obstruc-
tions and are mounted on rock shafts in the same manner as in the
walking harrow before described. The levers enable the operator to
raise the teeth more or less, and thus free them from rubbish and
also regulate the depth of action.

Another variation of the harrow with great pulverizing and
loosening capabilities consists of a main frame, having a pole and
whipple-trees attached; to this frame are pivoted two supplemental
frames, each of which has mounted on it a shaft carrying a series of
concavo-convex disks. The supplemental frames may be swung by
the adjusting levers to any angle with relation to the line of draught,
and the disks then act like that of the disk plough (see PLOUGH),
throwing the soil outward with more or less force, according to the
angle at which they are set, and thus thoroughly breaking up and
pulverizing the clods. Above the disks is a bar to which are pivoted
a series of scrapers, one for each disk, which are held to their work
with a yielding action, being thrown out of operation when desired
by the levers shown in connexion with the operating bar. Pins on
the main frame are used to carry weights to hold the disks down to
their work. The cut away disk harrow differs from the ordinary disk
harrow in that its disks are notched and so have greater penetrating
power. The curved knife-tooth harrow consists of a frame to which
a row of curved blades is attached. Other forms of the implement
are illustrated and discussed in Farm Machinery and Farm Motors

HARROWBY, DUDLEY RYDER, 1ST EARL OF (1762-1847),
the eldest son of Nathaniel Ryder, 1st Baron Harrowby (1735-
1803), was born in London on the 22nd of December 1762. His
grandfather Sir Dudley Ryder (1691-1739) became a member of
parliament and solicitor-general owing to the favour of Sir
Robert Walpole in 1733; in 1737 he was appointed attorney-
general and three years later he was knighted; in 1754 he was
made lord chief justice of the king's bench and a privy councillor,
the patent creating him a peer having been just signed by the
king, but not passed, when he died on the 25th of May 1756. His
only son Nathaniel, who was member of parliament for Tiverton
for twenty years, was created Baron Harrowby in 1776. Edu-
cated at St John's College, Cambridge, Dudley Ryder became
member of parliament for Tiverton in 1784 and under-secretary
for foreign affairs in 1789. In 1791 he was appointed paymaster
of the forces and vice-president of the board of trade, but he
resigned the positions and also that of treasurer of the navy
when he succeeded to his father's barony in June 1803. In 1804 he
was secretary of state for foreign affairs and in 1805 chancellor
of the duchy of Lancaster under his intimate
friend William Pitt; in
the latter year he was sent on a special and
important mission to the emperors of Austria and Russia and the
king of Prussia, and

HARROWING OF HELL, an English poem in dialogue, dating
from the end of the 13th century. It is written in the East
Midland dialect, and is generally cited as the earliest dramatic
work of any kind preserved in the language, though it was in
reality probably intended for recitation rather than performance.
It is closely allied to the kind of poem known as a débat, and
the opening words—'Alle herketh to me now A strif wil I telle
ou O Jouv and of Satan'—seem to indicate that the piece was
delivered by a single performer. The subject is the descent of
Christ into Hades to succour the souls of the just, as related in
the apocryphal gospel of Nicodemus—is introduced in a kind of
prologue; then follows the dispute between 'Dominus' and
'Satan' at the gate of HELL; the gatekeeper runs away, and
the just are set free, while Adam, Eve, Habraham, David,
Johannes and Moyes do homage to the deliverer.
ends with a short prayer: "God, for his moder louse Let ous never thider come." Metrically, the poem is characterized by frequent alliteration imposed upon the rhymed octosyllabic couplet:—

Welcome, lourer, god of londe
Godes sone and godes sone (11. 149-150).

The piece is obviously connected with the Easter cycle of liturgical drama, and the subject is treated in the York and Townley plays.

MSS. are: Brit. Mus., Harl. MS. 2553; Edinburgh, Auchinleck MS., W 41; Oxford, Bodleian, Digby 86. It was privately printed by J. P. Collier and by J. O. Halliwell, but is available in Appendix III. of A. W. Pollard's English and English Drama, 1400-1642 (1904).

K. Bodde, Albrecht Dürer im Dichtungswesen des MS. Harl. 2253 (Berlin, 1878); and E. Mall, The Harrowing of Hell (Breslau, 1871). See also E. K. Chambers, The Medieval Stage (2 vols., 1903).

HARROW-ON-THE-HILL, an urban district in the Harrow parliamentary division of Middlesex, England, 12 m. W.N.W. of St Paul's cathedral, London, served by the London and North Western, Metropolitan, and District railways. Pop. (1901), 10,220.

It takes its name from its position on an isolated hill rising to a height of 345 ft. On the summit, and forming a conspicuous landmark, is the church of St Mary; said to have been founded by Lanfranc, archbishop of Canterbury, in the reign of William I., and Norman work appears at the base of the tower. The remainder of the church is of various later dates, and there are several ancient monuments and brasses.

Harrow is celebrated for its public school, founded in 1571 by John Lyon, whose brass is in the church, a yeoman of the neighbouring village of Preston who had yearly during his life set aside 20 marks for the education of poor children of Harrow; though a school existed before his time. Though the charter was granted by Queen Elizabeth in 1571, and the statutes drawn up by the founder in 1578, two years before his death, it was not till 1598 that the first building was opened for scholars. Lyon originally settled about two-thirds of his property on the school, leaving the remainder for the maintenance of the highway between London and Harrow, but in the course of time the values of the respective endowments have changed so far that the benefit accruing to the school is a small proportion of the whole. About 1660 the headmaster, taking advantage of a concession in Lyon's statutes, began to receive "foreigners," i.e. boys from other parishes, who were to pay for their education. From this time the prosperity of the school may be dated. In 1818, the parishioners of Harrow appealed to the court of chancery against the manner in which the school was conducted, but the decision, while it recognized their privileges, confirmed the right of admission to foreigners.

The government of the school was originally vested in six persons of standing in the parish who had the power of filling vacancies in their number by election among themselves; but under the Public Schools Act of 1868 the governing body now consists of the surviving members of the old board, besides six new members who are elected respectively by the lord chancellor, the universities of Oxford, Cambridge and London, the Royal Society, and the assistant masters of the school. There are several scholarships in connexion with the school to Oxford and Cambridge Universities.

Harrow was originally an exclusively classical school, but mathematics became a compulsory study in 1837; modern languages, made compulsory in the upper forms in 1851, were extended to the whole school in 1853; while English history and literature began to be especially studied about 1869. The number of boys is about 600. The principal buildings are modern, including the chapel (1857), the library (1863), named after the eminent headmaster Dr Charles John Vaughan, and the speech-room (1872), the scene of the brilliant ceremony on "Speech Day" each summer term. The fourth form room, however, dates from 1611, and on its panels are the cuts of many eminent alumni, such as Byron, Robert Peel, R. B. Sheridan and Temple (Lord Palmerston). Several of the buildings were erected out of the Lyon Tercentenary Fund, subscribed after the tercentenary celebration in 1671.

A considerable extension of Harrow as an outer residential suburb of London has taken place north of the hill, where is the urban district of Wealdstone (pop. 5901), and there are also important printing and photographic works.

HARRY THE MINSTREL, or BLIND HARRY (fl. 1470-1492), author of the Scots historical poem The Actis and Deidis of the Illustre and Victuous Campioun Schir William Wallace, Knight of Eilderss, published in the latter half of the 15th century. The details of his personal history are of the scantiest. He appears to have been a blind Lothian man, in humble circumstances, who had some reputation as a story-teller, and who authored, on five occasions, in 1490 and 1491, lengthy poems in verse borrowing themes from James IV. The entries of these, in the Accounts of the Lord High Treasurer, occur among others to harpers and singers. He is alluded to by Dunbar (q.v.) in the fragmentary Interlude of the Droichis Part of the Play, where a "droich," or dwarf, personates "the nakit byland Harry" That lang has bane in the fary Farleis to find;

and again in Dunbar's Lament for the Makaris. John Major (q.v.) in his Latin History speaks of "one Henry, blind from his birth, who, in the time of my childhood, fashioned a whole book about William Wallace, and therein wrote down in our popular verse—and this was a kind of composition in which he had much skill—all that passed current among the people at his day, and he believed he could give better information to the people than from these writings." This Henry used to recite his tales before nobles, and thus received food and clothing as his reward" (Bk. iv. ch. xv).

The poem (preserved in a unique MS., dated 1488, in the Advocates' library, Edinburgh) is divided into eleven books and runs to 11,853 lines. Its poetic merits are few, and its historical accuracy is easily impugned. It has the formal interest of being one of the earliest, certainly one of the most extensive verse-documents in Scots written in five-accents, or heroic, couplets. It is also the earliest outstanding work which clearly shows that habit of Scotticism which took such strong hold of the popular Northern literature during the coming years of conflict with England. In this respect it is in marked contrast with all the patriotic verse of preceding and contemporary literature. This attitude of the Wallace may perhaps be accepted as corroboration of evidence of the humble milieu and popular sentiment of its author. The poem owed its subsequent widespread reputation to its appeal to this sentiment rather than to its literary quality. On the other hand, there are elements in the poem which show that it is not entirely the work of a poor crowdery and these (notably references to historical and legendary events), and completed reminiscences of the literary tricks of the Scots Chancerian school) have inclined some to the view that the text, as we have it, is an edited version of the minstrel's rough sony-story. It has been argued, though by no means conclusively, that the "editor" was John Ramsay, the scribe of the Edinburgh MS. of the companion Edinburgh MS. of the Brus by John Barbour (q.v.).

The poem appears, on the authority of Laing, to have been printed at the press of Chepman & Myllar about 1508, but the fragments which Laing saw are not extant. The first edition, was printed by the successors for Henry Charteris in 1570 (Brit. Museum). It was reprinted by Charteris in 1594 and 1601, and by Andro Hart in 1611 and 1620. At least six other editions appeared in the 17th century. There are many later reprints, including some of William Hamilton of Gilbertfield's modern Scots version of 1722. The first critical edition was prepared by Dr Jamieson and published in 1820. In 1889 the Scottish Text Society completed their edition of the text, with preludes and notes by James Moir.

See, in addition to Jamieson's and Moir's volumes (n. a.), J. T. T. Brown's The Wallace and the Bruce Retouched (Honner, Bedrige zur HARS&DÖRFER, GEORG PHILIPP (1607-1658), German poet, was born at Nuremberg on the 1st of November 1607. He studied law at Altdorf and Strassburg, and subsequently travelled
through Holland, England, France and Italy. His knowledge of languages gained for him the appellation "the learned," though he was as little a learned man as he was a poet. As a member of the Fruchtbiringe Gesellschaft he was called der Spieler (the player). Jointly with Johann Klaj (q.v.) he founded in 1644 at Nuremberg the orchestral and operatic periodicals, and among the members thereof he was known by the name of Strephon. He died at Nuremberg on the 22nd of September 1658. His writings in German and Latin fill fifty volumes, and a selection of his poems, interesting mostly for their form, is to be found in Müller's Bibel collocher deutscher Dichter des 17ten Jahrhunderts, vol. ix. (Leipzig, 1826).

His life was written by Widmann (Altdorf, 1707). See also Tittmann, Die Nürnberger Dichterschule (Göttingen, 1847); Hodermann, Eine vornehme Gesellschaft, nach Harsdorfers "Gesprächsspielen" (Paderborn, 1890); T. Bischoff, "Georg Philipp Harsdorff" in the Festschrift zur 250jährigen Jubelfeier des Pegnitzschul-Museums (Nuremberg, 1894); and Krapp, Die deutsche Tendenz der Harsdorffs (Berlin, 1904).

HARSHA, or HARSHAVARDHANA (fl. A.D. 606-648), an Indian king who ruled northern India as paramount monarch for over forty years. The events of his reign are related by Hiuen Tsang, the Chinese pilgrim, and by Bana, a Brahman author. He was the son of a rajah of Thanesar, who gained prominence by successful wars against the Huns, and came to the throne in A.D. 606, though he was only crowned in 612. He devoted himself to a scheme of conquering the whole of India, and carried on wars for thirty years with success, until (A.D. 629) he came in contact with Pulakesin II., the greatest of the Chalukya dynasty, who made himself lord of the south, as Harsha was lord of the north. The Nerbudda river formed the boundary between the two empires. In the latter years of his reign Harsha's sway was all the way from the whole basin of the Ganges from the Himalayas to the Nerbudda was undisputed. After thirty-seven years of war he set himself to emulate Asoka and became a patron of art and literature. He was the last native monarch who held paramount power in the north prior to the Mahommedan conquest; and was succeeded by an era of petty states.

See Bana, Sri-harsa-charita, trans. Cowell and Thomas (1897); Ettinghausen, Harsha Vardhana (Louvain, 1906).

HARNESS, SAMUEL (1561-1631), English divine, archbishop of York, was born at Crotchle in June 1561, and was educated at Pembroke Hall, Cambridge, where he was successively scholar, fellow and master (1606-1610). He was also vice chancellor of the university in 1606 and 1614. His ecclesiastical career began somewhat unpromisingly, for he was censured by Archbishop Whitgift for Romanist tendencies in a sermon which he preached against predestination in 1584. After holding the living of Chigwell (1597-1603) he became chaplain to Bancroft (then bishop of London), and afterwards archdeacon of Essex (1603-1609), rector of Stisted and bishop of Chichester (1609-1619) and archbishop of York (1620). He died on the 25th of May 1631. Harness was not a favourite with the Puritan community, and Charles I. ordered his Considerations for the Better Setting of Church Government (1629) to be circulated among the bishops. His Declaration of Egregious Popish Impositions (1633) furnishes Shakespeare with the names of the spirits mentioned by Edgar in King Lear.

HART, ALBERT BUSHNELL (1854-1930), American historian, was born at Clarksville, Mercer county, Pennsylvania, on the 1st of July 1854. He graduated at Harvard College in 1880, studied at Paris, Berlin and Freiburg, and received the degree of Ph.D. at Freiburg in 1883. He was instructor in history at Harvard in 1883-1887, assistant professor in 1887-1897, and became professor in 1897. Among his writings are: Introduction to the Study of Federal Government (1890), Formation of the Union (1892, in the Epochs of American History series), Practical Essays on American Government (1893), Studies in New England (1897), Guide to the Study of Literature, History (with Edward Channing, 1897), Salmon Portland Chase (1899, in the American Statesman series), Foundations of American Foreign Policy (1901), Actual Government (1903), Slavery and Abolition (1906), the volume in the American Nation series dealing with the period 1831-1841), National Ideals Historically Traced (1907), the 26th volume of the American Nation series, and many historical pamphlets and articles. In addition he edited American History told by Contemporaries (4 vols., 1898-1901), and Source Readers in American History (4 vols., 1901-1905), and two of administrative histories of the United States, the Epochs of American History series (3 small text-books), and, on a much larger scale, the American Nation series (27 vols., 1903-1907); he also edited the American Citizen series.

HART, CHARLES (d. 1683), English actor, grandson of Shakespeare's sister Joan, is first heard of as playing women's parts at the Blackfriers' theatre as an apprentice to Richard Robinson. In the Civil War he was a lieutenant of horse in Prince Rupert's regiment, and after the king's defeat he played surreptitiously at the Cockpit and at Holland House and other noblemen's residences. After the Restoration he is known to have been in 1660 the original Don Quixote in The Mistaken Beauty, adapted from Corneille's Le Menteur.

In 1663 he went to the Theatre Royal in Killigrew's company, with which he remained until 1682, taking leading parts in Dryden's, Jonson's and Beaumont and Fletcher's plays. He is highly spoken of by contemporaries in such Shakespearian parts as Othello and Brutus. He is often mentioned by Pepys. Betterton praised him, and would not himself play the part of Hotspur until after Hart's retirement. He died in 1683 and was buried on the 20th of August. Hart is said to have been the first lover of Nell Gwyn, and to have trained her for the stage.

HART, ERNEST ABRAHAM (1833-1898), English medical journalist, was born in London on the 26th of June 1833; the son of a Jew. He was educated at the City of London school, and became a student at St George's hospital. In 1856 he became a member of the Royal College of Surgeons, making a specialty of diseases of the eye. He was appointed ophthalmic surgeon at St Mary's hospital at the age of 28, and occupied various other posts, introducing into ophthalmic practice some modifications since widely adopted. His name, too, is associated with a method of treating popliteal aneurism, which he was the first to use in Great Britain. His real life-work, however, was as a medical journalist, beginning with the Lancet in 1857. He was appointed editor of the British Medical Journal in 1866. He took a leading part in the exposures which led to the inquiry into the state of London workhouse infirmaries, and to the reform of the treatment of sick poor throughout England, and the Infant Life Protection Act of 1872, aimed at the evils of baby-farming, was largely due to his efforts. The record of his public work covers nearly the whole field of sanitary legislation during the last thirty years of his life. He had a hand in the amendments of the Public Health and of the Medical Acts; in the measures relating to notification of infectious disease, to vaccination, to the registration of plumbers; in the improvement of factory legislation; in the remedy of legitimate grievances of Army and Navy medical officers; in the removal of abuses and deficiencies in crowded barracks schools; in denouncing the sanitary shortcomings of the Indian government, particularly in regard to the prevention of cholera. His work on behalf of the British Medical Association is shown by the increase from 2000 to 19,000 in the number of members, and the growth of the British Medical Journal from 20 to 64 pages, during his editorship. From 1872 to 1897 he was chairman of the Association's Parliamentary Bill Committee. He died on the 7th of January 1898. For his second wife he married Alice Marion Rowland, who had herself studied medicine in London and Paris, and was no less interested than her husband in philanthropic reform. She was most active in her encouragement of Irish cottage industries, and was the founder of the Donegal Industrial Fund.

HART, SIR ROBERT, Bart. (1833-1909), Anglo-Chinese statesman, was born at Milltown, Co. Armagh, on the 20th of February 1835. He was educated at Taunton, Dublin and Belfast, and graduated at Queen's College, Belfast, in 1853. In the following year he received an appointment as student-
interpreter in the China consular service, and after serving for a short time at the Ningpo vice-consulate, he was transferred to Canton, where, after acting as secretary to the allied commissioners governing the city, he was appointed the local inspector of customs. There he first gained an insight into custom-house work. One effect of the Taiping rebellion was to close the native custom-house at Shanghai; and as the corrupt alternatives proposed by the Chinese were worse than useless, it was arranged by Sir Rutherford Alcock, the British consul, with his French and American colleagues, that they should undertake to collect the duties on goods owned by foreigners entering and leaving the port. Sir T. Wade was appointed to the post of collector in the first instance, and after a short tenure of the office was succeeded by Mr H. N. Lay, who held the post until 1863, when he resigned owing to a disagreement with the Chinese government in connexion with the Lay-OSborn fleet. During his tenure of office the system adopted at Shanghai was applied to the other treaty ports, so that when on Mr Lay's resignation Mr Hart was appointed inspector-general of foreign customs, he found himself at the head of an organization which collected a revenue of upwards of eight million taels per annum at fourteen treaty ports.

From the date when Mr Hart took up his duties at Peking, in 1863, he unceasingly devoted the whole of his energies to the work of the department, with the result that the revenue grew from upwards of eight million taels to nearly twenty-seven million, collected at the thirty-two treaty ports, and the customs staff, which in 1864 numbered 200, reached in 1901 a total of 5704. From the first Mr Hart gained the entire confidence of the members of the Chinese government, who were wise enough to recognize his loyal and able assistance. Of all their numerous sources of revenue, the money furnished by Mr Hart was the only certain asset which could be offered as security for Chinese loans. For many years, moreover, it was customary for the British minister, as well as the ministers of other powers, to consult him in every difficulty; and such complete confidence had Lord Granville in his ability and loyalty, that on the retirement of Sir T. Wade he appointed him minister plenipotentiary at Peking (1885). Sir Robert Hart, however—who was made a K.C.M.G. in 1882—recognized the anomalous position in which he would have been placed had he accepted the proposal, and declined the proffered honour. On all disputed points, whether commercial, religious or political, his advice was invariably sought by the foreign ministers and the Chinese alike. Thrice only did he visit Europe between 1866 and 1892, and, on no visit, did he return. This was to have the Chinese made him turn a deaf ear to the warnings which he received of the threatening Boxer movement in 1900. To the last he believed that the attacking force would at least have spared his house, which contained official records of priceless value, but he was doomed to see his faith falsified. The building was burnt to the ground with all that it contained, including his private diary for forty years. When the stress came, and he retreated to the British legation, he took an active part in the defence, and spared neither risk nor toil in his exertions.

In addition to the administration of the foreign customs service, the establishment of a postal service in the provinces devoted upon him, and after the signing of the protocol of 1901 he was called upon to organize a native customs service at the treaty ports.

The appointment of Sir Robert Hart as inspector-general of the imperial maritime customs secured the interest of European investors in Chinese securities, and helped to place Chinese finance generally on a solid footing. When, therefore, in May 1906 the Chinese government appointed a Chinese administrator and assistant administrator of the entire customs of China, who would control Sir Robert Hart and his staff, great anxiety was aroused. The Chinese government had bound itself in 1896 and 1898 that the imperial maritime customs service should remain as then constituted during the currency of the loan. The British government obtained no satisfactory answer to its remonstrances, and Sir Robert Hart, finding himself placed in a subordinate position after his long service, retired in July 1907. He received formal leave of absence in January 1908, when he received the title of president of the board of customs. Both the Chinese and the British governments from time to time conferred honours upon Sir Robert Hart. By giving him a Red Button, or button of the highest rank, a Peacock's Feather, the order of the Double Dragon, a patent of nobility to his ancestors for three generations, and the title of Junior Guardian of the heir apparent, the Chinese showed their appreciation of his manifold and great services; while under the new deal of the British government there were bestowed upon him the orders of C.M.G. (1880), K.C.M.G. (1882), G.C.M.G. (1888), and a baronetcy (1893). He has also been the recipient of many foreign orders. Sir Robert Hart married in 1886 Hester, the daughter of Alexander Bredon, Esq., M.D., of Portadown.

See his life by Julia Bredon (Sir Robert Hart, 1909).

**HART, WILLIAM** (1823-1894), American landscape and cattle painter, was born in Paisley, Scotland, on the 31st of March 1823, and was taken to America in early youth. He was engaged for a time as a carriage painter at Albany, New York, and his first efforts in art were in making landscape decorations for the panels of coaches. Subsequently he returned to Scotland, where he studied for three years. He opened a studio in New York in 1853, and was elected an associate of the National Academy of Design in 1857 and an academician in the following year. He was also a member of the American Water Colour Society, and was its president from 1870 to 1873. As one of the group of the Hudson River School he enjoyed considerable popularity, his pictures being in many well-known American collections. He died at Mount Vernon, New York, on the 17th of June 1894.

His brother, **JAMES MCDouGAL HART** (1828-1901), born in Kilmarnock, Scotland, was also a landscape and cattle painter. He was a pupil of Schirmer in Düsseldorf, and became an associate of the National Academy of Design in 1857 and a full member in 1859. He was survived by two daughters, both figure painters, Letitia B. Hart (b. 1867) and Mary Theresa Hart (b.1872).

**HARTE, FRANCIS BRETT** (1839-1903), American author, was born at Albany, New York, on the 25th of August 1839. His father was a professor of Greek at the Albany College, and died during his boyhood. After a common-school education he went with his mother to California at the age of seventeen, afterwards working in that state as a teacher, miner, painter, express-messenger, secretary of the San Francisco mint, and editor. His first literary venture was a series of *Condensed Novels* (travesties of well-known works of fiction, somewhat in the style of Thackeray), published weekly in *The Californian*, of which he was editor, and reissued in book form in 1867. *The Overland Monthly*, the earliest considerable literary magazine on the Pacific coast, was established in 1868, with Harte as editor. His sketches and poems, which appeared in its pages during the next few years, attracted wide attention in the eastern states and in Europe.

Bret Harte was an early master of the short story, and his Californian tales were regarded as introducing a new genre into fiction. "The Luck of Roaring Camp" (1868), "The Outcasts of Poker Flat" (1869), the later sketch "How Santa Claus came to Simpson's Bar," and the verses entitled "Plain Language from Truthful James," combined humour, pathos and power to portray the of the Klondike. At this time he was the new land of mining-gulches, gamblers, unassimilated Asiatics, and picturesque and varied landscape had found its best delineator; so that Harte became, in his pioneer pictures, a sort of later Fenimore Cooper. Forty-four volumes were published by him between 1867 and 1898. After a year as professor in the university of California, Harte lived in New York, 1871-1878; was United States consul at Crefeld, Germany, 1878-1880; consul at Glasgow, 1880-1883; and after 1885 resided in London, engaged
HARTEBEEST—HARTFORD

in literary work. He died at Camberley, England, on the 5th of May 1902.

A library edition of his *Writings* (16 vols.) was issued in 1900, and increased to 19 vols. in 1904. See also H. W. Boynton, *Bret Harte* (1905) in the Contemporary Men of Letters series; J. E. Pemberton, *Life of Bret Harte* (1903), which contains a list of his poems, tales, &c.

**HARTEBEEST,** the Boer name for a large South African antelope (also known as caama) characterized by its red colour, long face with naked muzzle and sharply angulated lyrate horns, which are present in both sexes. This antelope is the S. of the city is Goodwin Park (about 290 acres); in the S.E. is Colt Park (160 acres), the gift of Mrs Elizabeth Colt, the widow of Samuel Colt, inventor of the Colt revolver; in the S.W. is Pope Park (about 90 acres); in the W. is Elizabeth (100 acres); in the E., along the Connecticut river front, is Riverside (about 80 acres); and in the extreme N. is Keney Park (680 acres), the gift of Henry Keney, and, next to the Metropolitan Reservations near Boston, the largest park in the New England states. Near the center of the city are the Capitol Grounds (27 acres; until 1872 the campus of Trinity College) and Bushnell Park (41 acres), adjoining Capitol Park. Bushnell Park, named in honour of Horace Bushnell, contains the Corning Memorial Fountain, erected in 1890 and designed by J. Massey Rhind, and three bronze statues, one, by J. Q. A. Ward, of General Israel Putnam; one, by Truman H. Bartlett, of Dr Horace Wells (1815-1848), the discoverer of anaesthesia; and one, by E. S. Woods, of Colonel Thomas Knowlton (1749-1776), a patriot soldier of the War of Independence, killed at the battle of Harlem Heights. On the Capitol Grounds is the state capitol (Richard M. Upjohn, architect), a magnificent white marble building, which was completed in 1886 at a cost of $2,534,000. Its exterior is adorned with statues and busts of Connecticut statesmen and carvings of scenes in the history of the state. Within the building are regimental flags of the Civil War, a bronze statue by Olin L. Warner of Governor William A. Buckingham, a bronze statue by Karl Gerhardt of Nathan Hale, a bronze tablet (also by Karl Gerhardt) in memory of John Fitch (1743-1798), the inventor; a portrait of Washington, purchased by the state in 1800 from the artist, Gilbert Stuart; and a series of oil portraits of the colonial and state governors. The elaborately carved chair of the lieutenant-governor in the senate chamber, made of wood from the historic Charter Oak, and the original charter of 1662 (or its duplicate of the same date) are preserved in a special vault in the Connecticut state library. A new state library and art building, and a new state armory and arsenal, both of granite, have been (1910) erected upon lands recently added to the Capitol Grounds, thus forming a group of state buildings with the Capitol as the center. Near the Capitol, at the approach of the memorial bridge across the Park river, is the Soldiers' and Sailors' memorial arch, designed by George Keller and erected by the city in 1885 in memory of the Hartford soldiers and sailors who served in the American Civil War.

Near the center of the city is the old town square (now known as the City Hall Square), laid out in 1637. Here, facing Main Street, stands the city hall, a beautiful example of Colonial architecture, which was designed by Charles Bulfinch, completed in 1756, and until 1879 was a state capitol building. In Main Street is the present edifice of the First Church of Christ, known as the Centre Congregational Church, which was organized in Cambridge, Massachusetts, in 1632, and removed to Hartford, under the leadership of Thomas Hooker and Samuel Stone, in 1636. In the adjoining cemetery are the graves of Thomas Hooker, Governor William Leete (1630-1683), and Governor John Haynes, and a monument in memory of 100 early residents of Hartford. In the same thoroughfare is the Wadsworth Athenaeum (built in 1822; enlarged in 1852-1863 and 1907) and its companion buildings, the Colt memorial (built in 1908 to accommodate the Elizabeth Colt art collection) and the Morgan art gallery (built in 1908 by J. Pierpont Morgan in memory of his father, Junius Morgan, a native of Hartford). In this group of buildings are the Hartford public library (containing 90,000 volumes in 1908), the Watkinson library of reference (70,000 volumes in 1908), the library of the Connecticut historical society (25,000 volumes in 1908) and a public art gallery. Other institutions of importance in Hartford are the American school for the deaf (formerly the American asylum for the deaf and dumb), founded in 1816 by Thomas H. Gallaudet; the retreat for the insane (opened for patients in 1834); the Hartford hospital; St Francis hospital; St Thomas's seminary (Roman Catholic); La Salle Missionary college (R.C.; 1868); Trinity college (founded by members of the Protestant Episcopal church, and now non-sectarian), which was
chartered as Washington College in 1823, opened in 1824, renamed Trinity College in 1845, and in 1907-1908 had 27 in-
structors and 208 students; the Hartford Theological seminary, a Congregational institution, which was founded at East Windsor Hill in 1834 as the Theological Institute of Connecticut, was removed to Hartford in 1865, and adopted its present name in 1883; and, affiliated with the last mentioned institution, the Hartford School of Religious Pedagogy. The Hartford grammar school, founded in 1638, long managed by the town, and in 1847 merged with the classical department of the Hartford public high school, is the oldest educational institution in the state. In Farmington Avenue is St. Joseph's cathedral (Roman Catholic), the city being the seat of the diocese of Hartford.

During the 18th century Hartford enjoyed a large and lucrative commerce, but the railway development of the 19th century centralized commerce in New York and Boston, and consequently the principal source of the city's wealth has come to be manu-
facturing and insurance. In 1905 the total value of the "factory" product was $25,075,651. The principal industries are the manufacture of small arms (by the Colt's Patent Fire-Arms Manufacturing Co., makers of the Colt revolver and the Gatling gun), typewriters (Royal and Underwood), automobiles, bicycles, cyclometers, carriages and wagons, belting, cigars, harness, machinists' tools and instruments of precision, coll-piping, church organs, horse-shoe nails, electric equipment, machine screws, drop forgings, hydrants and valves, and engines and boilers. In 1838 the first woolen mill in New England was opened in Hartford; and here, too, about 1846, the Rogers process of electro-silver plating was invented. The city is one of the most important insurance centres in the United States. As early as 1794 policies were issued by the Hartford Fire Insurance Company (chartered in 1810). In 1909 Hartford was the home city of six fire insurance and six life insurance companies, the principal ones being the Aetna (fire), Aetna Life, Phoenix Mutual Life, Phoenix Fire, Travelers (Life and Accident), Hartford Fire, Hartford Life, National Fire, Connecticut Fire, Connecticut General Life and Connecticut Mutual Life. In 1906 the six fire insurance companies had an aggregate capital of more than $10,000,000; on the 1st January, 1906 they reported assets of about $75,000,000 and an aggregate surplus of $30,000,000. In the San Francisco disaster of that year they paid more than $15,000,000 in losses. Since the fire insurance business began in Hartford, the companies of that city now doing business there have paid out about $340,000,000 in losses. Several large and successful foreign companies have made Hartford their American headquarters. The life insurance companies have assets to the value of about $225,000,000. The Aetna (fire), Aetna Life, Connecticut Life, Connecticut Mutual Life, Connecticut General Life, Hartford Fire, Hartford Life, Hartford Steam Boiler Inspection and Insurance Co., National Fire, Orient Fire, Phoenix Mutual Life and Travelers companies have their own homes, some of these being among the finest buildings in Hartford. The city has also large banking interests.

The first settlement on the site of Hartford was made by the Dutch from New Amsterdam, who in 1633 established on the bank of the Connecticut river, at the mouth of the Park river, a fort which they called "Hartford," or, in English, New Haven. At Hartford occurred in 1687 the meeting of Edmund Andros and the Connecticut officials (see CONNECTICUT). Hartford was first chartered in 1784, was rechartered in 1836 (the charter of that date has been subsequently revised), and in 1881 was made coterminous with the township of Hartford. The city was the literary centre of Federalist ideas in the latter part of the 18th century, being the home of Lemuel Hopkins, John Trumbull, Joel Barlow and David Humphreys, the leading members of a group of authors known as the " Hartford Wits "; and in 1814-1815 the city was the meeting-place of the famous Hartford Convention, an event of great importance in the history of the Federalist party. The War of 1812, with the Embargo Acts (1807-1813), which were so destructive of New England's commerce, thoroughly aroused the Federalist leaders in this part of the country against the National government as ad-
ministered by the Democrats, and in 1814, when the British were not only threatening a general invasion of their territory but had actually occupied a part of the Maine coast, and the National government promised no protection, the legislature of Massachusetts invited the other New England states to join with her in sending delegates to a convention which should meet at Hartford to consider their grievances, means of preserving their resources, measures of protection against the British, and the advisability of taking measures to bring about a con-
vention of delegates from all the United States for the purpose of revising the Federal constitution. The legislatures of Connecticut and Rhode Island, and town meetings in Cheshire and Grafton counties (New Hampshire) and in Windham county (Vermont) accepted the invitation, and the convention, composed of 12 delegates from Massachusetts, 7 from Connecticut, 4 from Rhode Island, 2 from New Hampshire and 1 from Vermont, all Federalists, met on the 15th of December 1814, chose George Cabot of Massachusetts president and Theodore Dwight of Connecticut secretary, and remained in secret session until the 5th of January 1815, when it adjourned sine die. At the con-
clusion of its work it recommended greater military control for each of the several states and that the Federal constitution be so amended that representatives and direct taxes should be apportioned among the several states "according to their respective numbers of free persons," that no new state should be admitted to the Union without the concurrence of two-thirds of both Houses of Congress, that Congress should not have the power to lay an embargo for more than sixty days, that the concurrence of two-thirds of the members of both Houses of Congress should be necessary to pass an act "to interdict the commercial intercourse between the United States and any foreign nation or the dependencies thereof" or to declare war against any foreign nation except in case of actual invasion, that "no person who shall hereafter be naturalized shall be eligible as a member of the Senate or House of Representatives of the United States, nor capable of holding any civil office under the authority of the United States," and that "the same person shall not be elected president of the United States a second time; nor shall the president be elected from the same state two terms in succession." After making these recommendations concerning amendments the Convention resolved: "That if the application of these states to the government of the United States, recom-
mended by the foregoing resolutions of 1814, "shall be rejected, peace should not be concluded, and the defence of these states should be neglected, as it has been since the commencement of the war, it will, in the opinion of this convention, be expedient for the legislatures of the several states to appoint delegates to another convention, to meet at Boston in the state of Massachusetts on the third Thursday of June next, with such powers and instructions as the exigency of a crisis so momentous may require." The legislatures of Massachusetts and Connecticut approved of these proposed amendments and sent commissioners to Washington to urge their adoption, but before their arrival the war had closed, and not only did the amendments fail to receive the approval of any other state, but the legislatures of nine states expressed their disapproval of the Hartford Convention itself, some charging it with sowing "seeds of dissension and
HARTFORD CITY

HARTFORD CITY—HARTLEPOOL

Disunion.” The cessation of the war brought increased popularity to the Democratic administration, and the Hartford Convention was vigorously attacked throughout the country.

Hartford was the birthplace of Noah Webster, who here published his *Grammatical Institute of the English Language* (1783-1785), and of Henry Barnard, John Fiske and Frederick Law Olmsted, and has been the home of Samuel P. Goodrich (Peter Parley), George D. Prentice, Harriet Beecher Stowe, Charles Dudley Warner, Samuel L. Clemens (Mark Twain) and Horace Bushnell. More than 300 periodicals have been established in Hartford, of which the oldest is the *Hartford Courant* (1764), the oldest newspaper in the United States. This paper was very influential in shaping public opinion in the years preceding the War of Independence; after the war it was successively Federalist, Whig and Republican. *The Times* (semi-weekly 1817; daily 1841) was one of the most powerful Democratic organs in the period before the middle of the 19th century, and has Gideon Wells for editor 1826-1836. The Congregationalist (afterwards published in Boston) and the *Churchman* (afterwards published in New York) were also founded at Hartford.

HARTFORD CITY, a city and the county-seat of Blackford county, Indiana, U.S.A., 62 m. N.E. of Indianapolis. Pop. (1800) 2287; (1900) 5912 (572 foreign-born); (1910) 6187. The city is served by the Fort Wayne, Cincinnati & Louisville, and the Pittsburg, Cincinnati, Chicago & St Louis railways, and the Indiana Union Traction line (electric). There are oil and natural gas wells in the vicinity; and the city has pulp and paper mills, glass and tile works, and manufactories of woodware, and nitro-glycerine and powder. The municipality owns and operates its water-system. The first settlement in the vicinity was made in 1832. Hartford City became the county-seat of Blackford county when that county was erected in 1837; it was laid out in 1839 and was first incorporated as a town in 1867.

HARTIG, GEORG LUDWIG (1764-1837), German agriculturalist and writer on forestry, was born at Gladenbach, near Marburg, on the 2nd of September 1764. After obtaining a practical knowledge of forestry at Harzburg, he studied from 1783 to 1785 at the university of Giessen. In 1786 he became manager of forests to the Prince of Landsberg-Dwight. H. H. von Finck, and in 1795 he founded a school for the teaching of forestry. After obtaining in 1797 the appointment of inspector of forests to the prince of Orange-Nassau, he continued his school of forestry at Dillenburg, where the attendance thereof increased considerably.

On the dissolution of the principality by Napoleon I. in 1805 he lost his position, but in 1806 he went as chief inspector of forests to Stuttgart, whence in 1811 he was called to Berlin in a like capacity. There he continued his school of forestry, and succeeded in connecting it with the university of Berlin, where in 1830 he was appointed an honorary professor. He died at Berlin on the 2nd of February 1837. His son Theodor (1805-1880), and grandson Robert (1839-1901), were also distinguished for their contributions to the study of forestry.

G. L. Hartig was the author of a number of valuable works: *Lehrbuch für Jäger* (Stuttgart, 1810); *Lehrbuch für Förster* (3 vols., Stuttgart, 1808); *Kubiktabellen für geschmierte, beschlagene, und runde Hölzer* (1815, 10th ed. Berlin, 1871); and *Lexikon für Jäger und Förster* (2 vols., Berlin, 1806-1815). Hartig and his son Robert also published numerous works dealing with forestry, one of the latter's books being translated into English by W. Somerville and H. Marshall Ward as *Diseases of Trees* (1894).

HARTLEPOOL, a parliamentary borough of Durham, England, embracing the municipal borough of Hartlepool or East Hartlepool and the municipal and county borough of West Hartlepool. Pop. (1901) of Hartlepool, 22,727; of West Hartlepool, 62,527. The towns are on the coast of the North Sea separated by Hartlepool Bay, with a harbour, and both have stations on branches of the North Eastern railway, 247 m. N. by W. from London. The surrounding country is bleak, and the coast is low. Caves occur in the slighl cliffs, and protection against the attacks of the waves has been found necessary. The ancient market town of Hartlepool lies on a peninsula which forms the termination of a south-eastward sweep of the coast and embraces the bay. Its naturally strong position was formerly fortified, and part of the walls, serving as a promenade, remain. The parish church of St Hilda, standing on an eminence above the sea, is late Norman and Early English, with a massive tower, heavily buttressed. There is a handsome borough hall in Italian style. West Hartlepool, a wholly modern town, has several handsome modern churches, municipal buildings, exchange, market hall, Atheneum and public library. The municipal area embraces the three towns—ships of Seaton Carew, a seaside resort with good bathing, and golf links; Stranton, with its church of All Saints, of the 14th century, on a very early site; and Throston.

The two Hartlepoools are officially considered as one port. The harbour, which embraces two tidal basins and six docks aggregating 831 acres, in addition to timber docks of 37 acres, covers altogether 350 acres. There are five graving docks, admitting vessels up to 115 ft. at the river entrance. About 17 ft. of water on the dock sills varies from 17 ft. at neap tides to 25 ft. at spring tides. A breakwater three-quarters of a mile long protects the entrance to the harbour. An important trade is carried on in the export of coal, ships, machinery, iron and other metallic ores, woolens and cloths, and in the import of timber, sugar, iron and copper ores, and eggs. Timber makes up 50% of the imports, and coal and ships each about 35% of the exports. The principal industries are shipbuilding (iron), boiler and engineering works, iron and brass foundries, steam saw and planing mills, flour-mills, paper and paint factories, and soap works.

The parliamentary borough (falling within the south-east county division) returns one member. The municipal borough of Hartlepool is under a mayor, 6 aldermen and 18 councillors, and has an area of 972 acres. The municipal borough of West Hartlepool is under a mayor, 8 aldermen and 24 councillors, and has an area of 2684 acres.

Built on the horns of a sheltered bay, Hartlepool (Hertepull, Hertipoll), grew up round the monastery founded there in 640, but was destroyed by the Danes in 800 and rebuilt by Ecgred, bishop of Lindisfarne. In 1173 Bishop Hugh de Puisset allowed French and Flemish troops to land at Hartlepool to aid the Scots. It is not mentioned in Baldson Book as being part of the royal manor of Saddington held at this time by the family of Bruce, it did not become the property of the see of Durham until the possession of that manor in 1189. The bishops did not obtain possession until the reign of John, who during the interval in 1201 gave Hartlepool a charter granting the burgesses the same privileges that the burgesses of Newcastle enjoyed; in 1230 Bishop Richard Poor granted further liberties, including a guild merchant. Edward II. seized the borough as a possession of Robert Bruce, but he could control it very slightly owing to the bishop's powers. In 1328 Edward III. granted the borough 100 marks towards the town-wall and Richard II. granted murrage for seven years, the term being extended in 1400. In 1383 Bishop Fordham gave the burgesses licence to erect tolls within the borough for the maintenance of the walls, while Bishop Neville granted a commission for the construction of a pier or mole. In the 16th century Hartlepool was less prosperous; in 1523 the haven was said to be ruined, the fortifications decayed. An act of 1555 declared Hartlepool to be in Yorkshire, but in 1554 it was reinstated in the county of Durham. It fell into the hands of the northern earls in 1653, and a garrison was maintained there after the rebellion was crushed. In 1693 Elizabeth incorporated it, and gave the burgesses a town hall and court of pie powder. During the civil war Hartlepool, which a few years before was said to be the only port town in the country, was taken by the Scots, who maintained a garrison there until 1647. As a borough of the Palatinate Hartlepool was not represented in parliament until the 19th century, though strong arguments in its favour were advanced in the Commons in 1614. The markets of
HARTLEY, SIR C.—HARTLIB

Hartlepool were important throughout the middle ages. In 1216 John confirmed to Robert Bruce the market on Wednesday granted to his father and the church of St Lawrence; this fair was extended to fifteen days by the grant of 1230, while the charter of 1595 also granted a fair and market. During the 14th century the trade was carried on with Germany, Spain and Holland, and in 1346 Hartlepool provided five ships for the French war, being considered one of the chief seaports in the kingdom. The markets were still considerable in Camden's day, but declined during the 18th century, when Hartlepool became fashionable as a watering-place.

HARTLEY, SIR CHARLES AUGUSTUS (1825— ). English engineer, was born in 1825 at Heworth, Durham. Like most engineers of his generation he was engaged in railway work in the early part of his career, but subsequently he devoted himself to hydraulic engineering and the improvement of estuaries and harbours for the purposes of navigation. He was employed in connexion with some of the largest and most important waterways of the world. After serving in the Crimea as a captain of engineers in the Anglo-Turkish contingent, he was in 1856 appointed engineer-in-chief for the works carried out by the European Commission of the Danube for improving the navigation at the mouths of that river, and that position he retained till 1872, when he became consulting engineer to the Commission (see DANUBE). In 1875 he was one of the committee appointed by the authority of the U.S. Congress to report on the works necessary to form and maintain a deep channel through the south pass of the Mississippi delta; and in 1884 the British government nominated him a member of the international technical commission for widening the Suez Canal. In addition he was consulted by the British and other governments in connexion with many other river and harbour works, including the improvement of the navigation of the Scheldt, Hugli, Don and Danube, and of the ports of Odessa, Trieste, Kustendjic, Burgas, Varna and Durban. He was knighted in 1882, and became K.C.M.G. in 1884.

HARTLEY, DAVID (1705-1757). English philosopher, and founder of the Associationist school of psychologists, was born on the 7th of August 1705. He was educated at Bradford grammar school and Jesus College, Cambridge, of which society he became a fellow in 1727. Originally intended for the Church, he was deterred from taking orders by certain scruples as to signing the Thirty-nine Articles, and took up the study of medicine. Nevertheless, he remained to the communion of the English Church, living on intimate terms with the most distinguished churchmen of his day. Indeed he asserted it to be a duty to obey ecclesiastical as well as civil authorities. The doctrine to which he most strongly objected was that of eternal punishment. Hartley practised as a physician at Newark, Bury St Edmonds, London, and lastly at Bath, where he died on the 28th of August 1757. His Observations on Man was published in 1749, three years after Condillac's Essai sur l'origine des connaissances humaines, in which theories essentially similar to his were expounded. It is in two parts; the first dealing with the frame of the human body and mind, and their mutual connexions and influences, the second with the duty and expectations of mankind. His two main theories are the doctrine of vibrations and the doctrine of associations. His theory, he tells us, was drawn from certain speculations as to nervous action which Newton had published in his Principia. His psychological theory was suggested by the Dissertation concerning the Fundamental Principles of Virtue or Morality, which was written by a clergyman named John Gay (1689-1745), and prefixed by Bishop Newton to a merchant's Latin translation of the first two books of the Origin of Evil, its chief object being to show that sympathy and conscience are developments by means of association from the selfish feelings.

The outlines of Hartley's theory are as follows. With Locke he asserted that, prior to sensation, the human mind is a blank. By a growth from simple sensations those states of consciousness which appear most remote from sensation come into being. And the one

1 Anonymously in the 1731 ed., with acknowledgment in the 1758 ed.
with the peaceful study of agriculture, publishing various works by himself, and printing at his own expense several treatises by others on the subject. In 1652 he issued a second edition of the *Discourse of Flanders Husbandry* by Sir Richard Weston (1649); and in 1651 Samuel Hartlib, his Legacy, or an Enlargement of the *Discourse of Husbandry* used in Brabant and Flanders, by Robert Child. For his various labours Hartlib received from Cromwell a pension of £100, afterwards increased to £300, as he had spent all his fortune on his experiments. He planned a school for the sons of gentlemen, to be conducted on new principles, and this probably was the occasion of his friend Milton's *Tractate on Education*, addressed to him in 1644, and of Sir William Petty's *Two Letters* on the same subject, in 1647 and 1648. At the Restoration Hartlib lost his pension, which had already fallen into arrears; he petitioned parliament for a new grant of it, but what success he met with is unknown, as his latter years and death are wrapped in obscurity. A letter from him is known to have been written in February 1661-1662, and apparently he is referred to by Andrew Marvell as alive in 1670 and relieving to Holland from his creditors. "A Biographical Memoir of Samuel Hartlib, by H. Dircks, appeared in 1882."

**HARTMANN, KARL ROBERT EDUARD VON** (1842-1906), German philosopher, was born in Berlin on the 23rd of February 1842. He was educated for the army, and entered the artillery of the Guards as an officer in 1860, but a malady of the knee, which crippled him, forced him to quit the service in 1865. After some hesitation between music and philosophy, he decided to make the latter the serious work of his life, and in 1867 the university of Rostock conferred on him the degree of doctor of philosophy. He subsequently returned to Berlin, and died at Gross-Schönfeld on the 5th of June 1906. His reputation as a philosopher was established by his first book, *The Philosophy of the Unconscious* (1869; 10th ed. 1890). This success was largely due to the originality of its ideas, the variety of its contents (von Hartmann professing to obtain his speculative results by the methods of inductive science, and making plentiful use of concrete illustrations), the fashionableness of its pessimism and the vigour and lucidity of its style. The conception of the Unconscious, by which von Hartmann describes his ultimate metaphysical principle, is not at bottom as paradoxical as it sounds, being merely a new and mysterious designation for the Absolute of German metaphysicians. The Unconscious appears as a combination of the metaphysic of Hegel with that of Schopenhauer. The Unconscious is both Will and Reason and the absolute all-embracing ground of all existence. Von Hartmann thus combines "panianism" with "panologism" in a manner advocated by Schelling in his "positive metaphysic." Nevertheless Will and not Reason is the primary aspect of the Unconscious, whose melancholy career is determined by the primacy of the Will and the subservience of the Reason. Preconsciously the Will is potential and the Reason latent, and the Will is void of reason when it passes from potentiality to actual willing. This latter is absolute misery, and to cure it the Unconscious evokes its Reason and with its aid creates the best of all possible worlds, which contains the promise of its redemption from actual existence by the emancipation of the Reason from its subjugation to the Will in the conscious reason of the enlightened pessimist. When the greater part of the Will in existence is so far enlightened by reason as to perceive the inevitable misery of existence, a collective effort to will non-existence will be made, and the world will relapse into nothingness, the Unconscious into quiescence. Although von Hartmann is a pessimist, his pessimism is by no means unmitigated. The individual's happiness is indeed unattainable either here and now or hereafter and in the future, but he does not despair of ultimately releasing the Unconscious from its sufferings. He differs from Schopenhauer in making salvation by the "negation of the Will-to-live" depend on a collective social effort and not on individualistic asceticism. The conception of a redemption of the Unconscious also supplies the ultimate basis of von Hartmann's ethics. We must provisionally affirm life and devote ourselves to social evolution, instead of striving after a happiness which is impossible; in so doing we shall find that morality renders life less unhappy than it would otherwise be. Suicide, and all other forms of selfishness, are highly reprehensible. Epistemologically von Hartmann is a transcendental realist, who ably defends his views and acutely criticizes those of his opponents. His realism enables him to maintain the reality of Time, and so of the process of the world's redemption. Von Hartmann's numerous works extend to more than 12,000 pages. They may be classified into—A. Systematical, including Grundprobleme der Erkenntnistheorie; Die Philosophie der Weltwahrheit; Die Philosophie des Unbewussten (3 vols., which now include his *Philosophische Grundriss*, which contains the axioms) vom Standpunkt der Physiologie und Denkendzentrume, and its reductio ad absurdo (4 vols. by W. C. Coupland, 1884); System der Philosophie im Grundriss, i., Grundriss der Erkenntnislehre, B. Historical and critical—Das religiöse Bewusstsein der Menschheit; Geschichte der Metaphysik (2 vols.); Kant's Erkenntnistheorie; Kritische Grundlegung des transcendentalen Realismus; Uber die dialektische Methode; studies of Schelling, Lotze, von Kirchmann; Zur Geschichte des Pessimismus; Neuanalysen, Schopenhauerismus, Hegelianismus; Geschichte der deutschen Ästhetik seit Kant; Die Kritik des Christentums in der modernen Theologie; Philosophische Fragen der Gegenwart; Philosophische Grundriss der Psychologie; Das Christentum des neuen Testament; Die Wechselwirkung der Schichten; Von K. C. Populärs—Soziale Kernfragen; Moderne Probleme, Tagesfragen; Zweite Jahrhundert deutcher Politik; Das Judentum in Gegenwart und Entwurf der Seelengeschichte und der Philosophie der Geschichte; Satz messungen; Des Spiritismus und Die Geisterkommunikation des Spiritualismus; Zur Zeitgeschichte. His select works have been published in 16 volumes (2nd ed., 1893-1896). On his philosophy see R. Köcher, "Das philosophische System Eduard von Hartmann;" (1883); O. Plämacher, "Der Kampf ums Unbewusste" (2nd ed., 1890), with a chronological table of the Hartmann literature from 1868 to 1890; A. Drews, *von Hartmanns Philosophie und der Materialismus in der deutschen Kultur* (1890) and *E. von Hartmanns philosophisches System im Grundriss* (1902), with biographical introduction; and for further authorities, J. M. Baldwin, "Dictionary of Philosophy and Psychology;" (1901-1906)."
HARTMANN VON AUE—HARUSPICES

HARTMANN VON AUE (c. 1170–c. 1210), one of the chief Middle High German poets. He belonged to the lower nobility of Swabia, where he was born about 1170. After receiving a monastic education, he became retainer (diensman) of a nobleman whose domain, Aue, has been identified with Obernau on the Neckar. He also took part in the Crusade of 1190–97. The date of his death is not known, but he was certainly still alive in 1204, when he is mentioned by Gottfried von Strassburg (c. 1210) as still alive, and in the Krolne of Heinrich von dem Türlin, written about 1220, he is mourned for as dead. Hartmann was the author of four narrative poems which are of importance for the evolution of the Middle High German court epic. The oldest of these, Erec, which may have been written as early as 1191 or 1192, and the latest riposte, Iwein, belong to the Arthurian cycle and are based on epics by Chrétien de Troyes (q.v.); between them lie the romance, Gregorius, also an adaptation of a French epic, and Der arme Heinrich, on of the charming series of medieval German poetry. The theme of the latter—the cure of the leper, Heinrich, by a young girl who is willing to sacrifice her life for him—Hartmann had evidently found in the annals of the family in whose service he stood. Hartmann's most conspicuous merit as a poet lies in his style; his language is carefully chosen, his narrative lucid, flowing and characterized by a sense of balance and proportion which is rarely to be found in German medieval poetry. Gregorius, Der arme Heinrich and his lyrics, which are all fervidly religious in tone, imply a tendency towards asceticism, but, on the whole, Hartmann's striving seems to have been rather for a synthesis than for a separation of the extremes of life; to establish a middle way of human conduct between the worldly pursuits of knighthood and the ascetic ideals of medieval religion.

The literature on Hartmann is extensive. See especially L. Schmidt, Der Minnesingen Hartmann von Aue Stand, Heimat und Geschlecht (Tübingen, 1874); H. Rötke, Die epische Kunst Heinrichs von Veldeke und Hartmann von Aue (Halle, 1887); F. Saran, Hartmann von Aue als Lyriker (Halle, 1889); A. E. Schönbach, Über Hartmann von Aue (Graz, 1894); F. Piquet, Étude sur Hartmann von Aue (Tournai, 1894), and his articles in the Revue des études modernen German of all Hartmann's poems, while Der arme Heinrich has repeatedly attracted the attention of modern poets, both English (Longfellow, Rossetti) and German (notably, Gerhart Hauptmann).

See H. Tardel, Der arme Heinrich in der neueren Dichtung (Berlin, 1905).

HARTSHORN, SPIRITS OF, a name signifying originally the ammoniacal liquor obtained by the distillation of horn shavings, afterwards applied to the partially purified similar products of the action of heat on nitrogenous animal matter generally, and now popularly used to designate the aqueous solution of ammonia (q.v.).

HARTZBENSCHE, JUAN EUGENIO (1850–1886), Spanish dramatist, was born at Madrid on the 6th of September 1850. The son of a German carpenter, he was educated for the priesthood, but he had no religious vocation and, on leaving the theology school, followed his father's trade till 1850, when he learned shorthand and joined the staff of the Gaceta. His earliest dramatic essays were translations from Molière, Voltaire and the elder Dumas; he next recast old Spanish plays, and in 1857 produced his first original play, Los Amantes de Teruel, the subject of which had been used by Rey de Artieda, Tirs de Molina and Perez de Montalbán. Los Amantes de Teruel at once made the author's reputation, which was scarcely maintained by Doña Mencia (1859) and El Arca de Eufémia (1864); it was not till 1845 that he approached his former success with La Jura en Santa Gades. Hartzbenesch was chief of the National Library from 1862 to 1875, and was an indefatigable—though not very judicious—editor of many national classics. Inferior in inspiration to other contemporary Spanish dramatists, Hartzbenesch excels his rivals in versatility and in conscientious workmanship.

HÄRÜN AL-RASHID (763 or 766–809), i.e. "Hārūn the Orthodox," the fifth of the 'Abbāsids of Bagdad, and the second son of the third caliph Mahdi. His full name was Hārūn ibn Muḥammad ibn 'Abdallah ibn Muḥammad ibn 'Ali ibn 'Abdallah ibn 'Abbās. He was born at Rai (Rihage) on the 20th of March A.D. 763, according to some accounts, and according to others on the 19th of February A.D. 766. Harūn-āl-Rashid was twenty-two years old when he ascended the throne. His father Mahdi just before his death conceived the idea of superseding his elder son Mūsā (afterwards known as Hādī, the fourth caliph) by Hārūn. But on Mahdi's death Hārūn gave way to his brother. For the campaigns in which he took part prior to his accession see Caliphate, section C, The Abbassids, §§ 3 and 4.

Rashid's own succession to the throne proceeded by the prudence and sagacity of Yahyā b. Khallīd the Barmecide, his secretary, whom on his accession he appointed his lieutenant and viceroy (see Barmecides). Under his guidance the empire flourished on the whole, in spite of several revolts in the provinces by members of the old 'Abbāsid family. Successful wars were waged with the rulers of Byzantium and the Khaizar. In 803, however, Hārūn became suspicious of the Barmecides, whom with only a single exception he caused to be executed. Henceforward the chief power was exercised by Fadl b. Rabi, who had been chamberlain not only under Hārūn himself but under his predecessors, Māsūr, Mādhī and Hādī. In the later years of Hārūn's reign troubles arose in the eastern parts of the empire. These troubles assumed proportions so serious that Hārūn himself decided to go to Khorasan. He died, however, at Tus in March 800.

The reign of Hārūn (see Caliphate, section C, § 5) was one of the most brilliant in the annals of the caliphate, in spite of losses in north-west Africa and Transoxiana. His fame spread to the West, and Charlemagne and he exchanged gifts and compliments as masters respectively of the West and the East. No caliph ever gathered round him so great a number of learned men, poets, jurists, grammarians, calids and scribes, to say nothing of the wise and learned musicians who enjoyed his patronage. Hārūn himself was a scholar and poet, and was well versed in history, tradition and poetry. He possessed taste and discernment, and his dignified demeanour is extolled by the historians. In religion he was extremely strict; he prostrated himself a hundred times daily, and nine or ten times made the pilgrimage to Mecca. At the same time he cannot be regarded as a great administrator. He seems to have left everything to his viziers Yahyā and Fadl, to the former of whom especially was due the prosperous condition of the empire. Hārūn is best known to Western readers through the many of the stories in the Arabian Nights; and in Arab literature he is the central figure of numberless anecdotes and humorous stories. Of his incognito walks through Bagdad, however, the authentic histories say nothing. His Arabic biographers are unanimous in describing him as noble and generous, but there is little doubt that he was in fact a man of little force of character, suspicious, untrustworthy and on occasions cruel.

HARUSPICES, or ARUSPICES (perhaps "entrail observers," cf. Skt. hirā, Gr. χορής), a class of soothsayers in Rome. Their art (diescríptio) consisted especially, in drawing from the appearance revealed by the entrails of the slain victim. They also interpreted all portents or unusual phenomena of nature, especially thunder and lightning, and prescribed the expiatory ceremonies after such events. To please the god, the victim must be without spot or blemish, and the practice of observing whether the entrails presented any abnormal appearance,
and thence deducing the will of heaven, was also very important in Greek religion. This art, however, appears not to have been, as some other modes of ascertaining the will of the gods undoubtedly were, of genuine Aryan growth. It is foreign to the Homeric poems, and must have been introduced into Greece after their composition. In like manner, as the Romans themselves believed, the art was not indigenous in Rome, but derived from Etruria. The Etruscans were said to have learned it from a being named Tages, grandson of Jupiter, who had suddenly sprung from the ground near Tarquinii. Instructions were contained in certain books called *libri haruspicini, fulgurales, rituales*. The art was practised in Rome chiefly by Etruscans, occasionally by native-born Romans who had studied in the priestly schools of Etruria. From the regal period to the end of the republic, haruspices were summoned from Etruria to deal with prodigies not mentioned in the pontifical and Sibylline books, and the Roman priests carried out their instructions as to the offering necessary to appease the anger of the deity concerned. Though the art was of great importance under the early republic, it never became a part of the state religion. In this respect the haruspices ranked lower than the augurs, as is shown by the fact that they received a salary; the augurs were a more ancient and purely Roman institution, and were a most important element in the political organization of the city. In later times the art fell into disrepute, and the saying of Cato the Censorius well known of the Roman world is, "We ought to have had one in the face without laughing" (*Cic. De div. ii. 24*). Under the empire, however, we hear of a regular collegium of sixty haruspices; and Claudius is said to have tried to restore the art and put it under the control of the pontifices. This collegium continued to exist till the time of Alaric.

See A. Boucé-Declercq, *Histoire de la divination dans l'antiquité* (1879-1881); Marquardt, *Römische Staatsverwaltung*, ii. (1885), p. 315; H. Marquardt, *Die römischen genossenkirchen bis zum Untergang des Heidentums* (1881), and *Quaestiones de Etrusca disciplina parvula* (1872); P. Clairin, *De haruspicibus apud Romanos* (1880). Also Omen.

**Harvard University**, the oldest of American educational institutions, established at Cambridge, Massachusetts. In 1636 the General Court of the colony voted $400 towards "a schoole or college," which in the next year was referred to at "New Towne." In memory of the English university where many (probably some seventy) of the leading men of the colony had been educated, the township was named Cambridge in 1638. In the same year John Harvard (1607-1638), a Puritan minister lately come to America, a bachelor and master of Emmanuel college, Cambridge, dying in Charlestown (Mass.), bequeathed to the wilderness seminary half his estate ($780) and some three hundred books; and the college, until then unorganized, was named Harvard College (1639) in his honour. Its history is unbroken from 1649, and its first commencement was held in 1642. The spirit of the founders is beautifully expressed in the words of a contemporary letter which are carved on the college gates: "After God had carried us safe to New-England, and we had builded our houses, provided necessaries for our liveli-hood, reared convenient places for Gods worship, and set up the Civil Government; One of the next things we longed for, and looked after was to advance Learning, and perpetuate it to Posterity; dedicating to leave an illustre Ministry to the Churches, when our present Ministers shall lie in the Dust." The college charter of 1630 dedicated it to "the advancement of all good literature, arts, and sciences," and "the education of the English and Indian youth ... in knowledge and godliness." The second building (1654) on the college grounds was called "the Indian College." It was set up the College press, which since 1638 had been in the president's house, and here, it is believed, was printed the translation of the Bible (1660-1663) by John Eliot into the language of the natives, with primer, catechisms, grammars, tracts, &c. A fair number of Indians were students, but only one, Caleb Cheeshah-taumack, took a bachelor's degree (1665). By generous aid received from abroad for this special object, the college was greatly helped in its infancy.

The charter of 1639 has been in the main, and uninterruptedly since 1707, the fundamental source of authority in the administration of the university. It created a co-opting corporation consisting of the president, treasurer and five fellows, who formally initiate administrative measures, control the college funds, and appoint officers of instruction and government; subject, however, to confirmation by the Board of Overseers (established in 1642), which has a revisory power over all acts of the corporation. Circumstances gradually necessitated ordinary government by the resident teachers; and to-day the various faculties, elaborately organized, exercise immediate government and discipline over all the students, and individually or in the general university council consider questions of policy. The Board of Overseers was at first jointly representative of state and church. The former, as founder and patron, long regarded Harvard as a state institution, controlling or aiding it through the legislature and the overseers; but the controversies and embarrassments incident to legislative action proved prejudicial to the best interests of the college, and its organic connexion with the state was wholly severed in 1866. Financial aid and practical dependence had ceased some time earlier; indeed, from the very beginning, and with steadily increasing preponderance, Harvard has been sustained and fostered by private munificence rather than by public money. The last direct subsidy from the state determined in 1824, although state aid was afterwards given to the Agassiz museum, later united with the university. The church was naturally sponsor for the early college. The changing composition of its Board of Overseers marked its liberation first from clerical and later from political control; since 1865 the board has been chosen by the alumni (non-residents of Massachusetts being eligible since 1880), who therefore really control the university. When the state ceased to repress effectually the rife speculation characteristic of the first half of the seventeenth century, in religion as in politics, and in America as in England, the unity of Puritanism gave way to a variety of intense sectarianisms, and this, as also the incoming of Anglican churchmen, made the old faith of the college insecure. President Henry Dunster (c. 1612-1659), the first president, was censured by the magistrates and removed from office for questioning infant baptism. The conservatives, who clung to pristine and undiluted Calvinism, sought to interchne themselves in Harvard, especially in the Board of Overseers. The history of the college from about 1673 to 1725 was exceedingly troubled. Increase and Cotton Mather, forceful but bigoted, were the bulwarks of reaction and fomenters of discord. One episode in the struggle was the foundation and encouragement of Yale College by the reactionary of New England as a truer "school of the prophets" (Cotton Mather being particularly zealous in its interests), after they had failed to secure control of the government of Harvard. It represented conservative secession. In 1792 the first layman was chosen to the corporation; in 1803 a Unitarian became professor of theology; in 1843 the board of overseers was opened to clergymen of all denominations; in 1886 attendance on prayers by the students ceased to be compulsory. Thus Harvard, in response to changing ideas and conditions, grew away from the ideas of its founders.

Harvard, her alumni, and her faculty have been very closely connected with America and her interests not only in the colonial period, but into the Revolution. Harvard, William and Mary, and South Carolina. The Harvard, Samuel Sewall and Thomas Prince were important names, or in the revolutionary and early national epoch with the Adamses, Fisher Ames, Joseph Dennie and Robert Treat Paine, but especially in the second third of the 19th century, when the great New England movements of Unitarianism and Transcendentalism were led by Harvard graduates. In 1825 Henry Ware (1764-1843) was elected the first anti-Trinitarian to be Hollis professor of divinity, and this marked Harvard's close connexion with Unitarianism, in the latter history of which Ware, his son Henry (1794-1843), and Andrews Norton (1786-1852), all Harvard alumni and professors,
and Joseph Buckminster (1751–1812) and William Ellery Channing were leaders of the conservative Unitarians, and Joseph Stevens Buckminster (1784–1812), James Freeman Clarke, and Theodore Parker were liberal leaders. Of the "Transcendentalists," Emerson, Francis Henry Hedge (1805–1869), Clarke, Converse Francis (1795–1883), Parker, Thoreau and Christopher Pearse Cranch (1813–1892) were Harvard graduates. Longfellow's professorship at Harvard identified him with it rather than with Bowdoin; Oliver Wendell Holmes was professor of anatomy and physiology at Harvard in 1847–1885; and John Lowell, a Harvard alumnus, was Harvard's first professor in surgery in 1835–1886 as Smith Professor of the French and Spanish languages and literatures. Ticknor and Charles Eliot Norton are other important names in American literary criticism. The historians Sparks, Bancroft, Hildreth, Pulley, Prescott, Motley and Parkman were graduates of Harvard, as were Edward Everett, Charles Sumner and Wendell Phillips.

In organization and scope of effort Harvard has grown, especially after 1869, under the direction of President Charles W. Eliot, to be in the highest sense a university; but the "transcendental" impulse, whose intellectual and literary endowment and number of under-graduates, continues to be in many ways the centre of university life, as it is the embodiment of university traditions. The medical school (in Boston) dates from 1782, the law school from 1817, the divinity school (though instruction in theology was of course given from the foundation of the college) from 1819, and the dental school (in Boston) from 1867. The Bussey Institution at Jamaica Plain was established in 1877 as an undergraduate school of agriculture, and reorganized in 1908 for advanced instruction and research in subjects relating to agriculture and horticulture. The Graduate School of Arts and Sciences dates from 1872, the Graduate School of Applied Science (growing out of the Lawrence Scientific School) from 1906, and the Graduate School of Business Administration (which applies to commerce the professional methods used in post-graduate schools of medicine, law, &c.) from 1908. The Lawrence Scientific School, established in 1847, was practically abolished in 1907–1908, when its courses were divided between the College (which thereafter granted a degree of S.B.) and the Graduate School of Applied Science, which was established in 1906 and gives professional degrees in civil, mechanical, electrical, and mining engineering, mining, metallurgy, architecture, landscape architecture, forestry, applied physics, applied chemistry, applied zoology and applied geology. A school of veterinary medicine, established in 1882, was discontinued in 1901. The university institutions comprise the botanic garden (1807) and the (Asa) Gray herbarium (1854); the Arnold arboretum (1872), at Jamaica Plain, for the study of arboriculture, forestry and dendrology; the university museum of natural history, founded in 1859 by Louis Agassiz as a museum of comparative zoology, enormously developed by his son, Alexander Agassiz, and transferred to the university in 1876, though under an independent faculty; the Peabody museum of American archaeology and ethnology, founded in 1866 by George Peabody; the William Hayes Fogg art museum (1893); the Semitic museum (1886); the Germanic Museum (1902), containing rich gifts from Kaiser Wilhelm II., the Swiss government, and individuals and societies of Germanic lands; the social museum (1906); and the astronomical observatory (1843; location 42° 22' 48" N., lat., 71° 8' W. long.), which since 1891 has maintained a station near Arequipa, Peru. A permanent summer-engineering camp is maintained at Squam Lake, New Hampshire. In Petersham, Massachusetts, is the Harvard Forest, about 2000 acres of hilly wooded country with a stand in 1908 of 10,000,000 ft. B.M. of merchantable timber (mostly white pine); this forest was given to the university in 1907, and is an important part of the equipment of the division of forestry. The university library is the largest college library in the country, and from its slow and competent selection is of exceptional value. In 1908 it numbered, including the various special libraries, 883,800 bound volumes, about 406,600 pamphlets, and 27,450 maps. Some of its collections are of great value from associations or special richness, such as Thomas Carlyle's collection on Cromwell and Frederick the Great; the collection on folk-lore and medieval romances, supposed to be the largest in existence and including the material used by Bishop Percy in preparing his Reliques; and that on the Ottoman empire. The law library has been described by Professor A. V. Dicey of Oxford as "the most perfect collection of the legal records of the English people to be found in any country in the English-speaking world." There are departures in the libraries at the Arnold arboretum, the Gray herbarium, the Bussey Institution, the astronomical observatory, the dental school, the medical school, the law school, the divinity school, the Peabody museum, and the museum of comparative zoology. In 1878 the library published the first of a valuable series of Bibliographical Contributions. Other publications of the university (apart from annual reports of various departments) are: the Harvard Oriental Series (started 1891), Harvard Studies in Classical Philology (1896), Harvard Theological Review (1907), the Harvard Law Review (1906), Historical Series (1897), Harvard Economic Studies (1906), Harvard Psychological Studies (1903), the Harvard Engineering Journal (1902), the Bulletin (1874) of the Bussey Institution, the Archaeological and Ethnological Papers (1888) of the Peabody museum, and the Bulletin (1863), Contributions and Memoirs (1862) of the museum of comparative zoology. The students' publications include the Crimson (1873), a daily newspaper; the Advocate (1831), a literary bi-weekly; the Lampsco (1870), a comic bi-weekly; and the Harvard Monthly (1883), a literary monthly. The Harvard Bulletin, a weekly, and the Harvard Graduates' Magazine (1902), a quarterly, are published chiefly for the alumni.

In 1908–1909 there were 743 officers of instruction and administration (including those for Radcliffe) and 5320 students (1905 in 1869), the latter including 2238 in the college, 1641 in the graduate and professional schools, and 1332 in the summer school. Radcliffe College, for women, had 440 additional students. The whole number of degrees conferred up to 1905 was 31,805 (doctors of science and of philosophy by examination, 408; masters of arts and of science by examination, 1759). The conditions of the time when Harvard was a theological seminary (1636), and were for boys, governed like a higher boarding school, have left traces still discernible in the organization and discipline, though no longer in the aims of the college. The average age of students at entrance, only 14 years so late as 1820, had risen by 1890 to 19 years, making possible the transition to the present régime of almost entire liberty of life and studies without detriment, but with positive improvement, to the morals of the student body. A strong development toward the university ideal marked the opening of the 19th century, especially in the widening of the curricula, the betterment of instruction, and the suggestions of quickening ideas of university freedom, whose realization, along with others, has come since 1870. The elimination of the last vestiges of sectarianism and churchy discipline, a lessening of parietal oversight, a lopping off of various outgrown colonial customs, a complete reconstruction of professional standards and methods, the development of a great graduate school in arts and sciences based on and organically connected with the undergraduate college, a great improvement in the college standard of scholarship, the allowance of almost absolute freedom to students in the shaping of their college course (the "elective" system), and noteworthy material prosperity marked the administration (1869–1909) of President Eliot. In the readjustment in the curricula of American colleges of the elements of professional training and liberal culture Harvard has been bold in experiment and innovation. With Johns Hopkins University she has led the movement that has transformed university education, and her influence upon secondary education in America has been incomparably greater than that of any other university. Her entrance requirements to the college and to the schools of medicine, law, dentistry and divinity have been higher than those of any other American university.

1 Affiliated with the university, but autonomous and independent, is the Andover Theological Seminary, which in 1806 removed from Andover to Cambridge.
A bachelor's degree is requisite for entrance to the professional schools (except that of dentistry), and the master's degree (since 1872) is given to students only for graduate work in residence, and rarely to other persons as an honorary degree. In scholarship and in growth of academic freedom Germany has given the quickening impulse. This influence began with George Ticknor and Edward Everett, who were trained in Germany, and was continued by a number of eminent German scholars, some driven into exile for their liberalism, who became professors in the second half of the 19th century, and above all by the many members of the faculty still later trained in German universities. The ideas of recognizing special students and introducing the elective system were suggested in 1824, attaining establishment everywhere and obtaining the designation of the liberal system, particularly the years 1865-1885. The basis of the elective system (as in force in 1910) is freedom in choice of studies within liberal limits; and, as regards admission to college 1 (completely established 1801), the idea that the admission is of minds for the quality of their training and not for their knowledge of particular subjects, and that any subject may be acceptable for such training if followed with requisite devotion and under proper methods. Except for one course in English in the Freshman year, and one course in French or German for those who do not on entrance present both of these languages, no study is prescribed, but the student is compelled to select a certain number of subjects, the most of which are on the liberal side. The first years distribute the remainder among other departments, the object being to secure a systematic education, based on the principle of knowing a little of everything and something well.

The material equipment of Harvard is very rich. In 1900 it included invested funds of $22,716,760 ($2,257,900 in 1869) and lands and buildings valued at $12,000,000 at least. In 1908-1909 an income of more than $150,000 was distributed in scholarships, fellowships, prizes and other aids to students. The yearly income available for immediate use from all sources in 1895-1904 averaged $1,074,229, of which $452,760 yearly represented gifts. The total gifts, for funds and for current use, in the same years aggregated $6,515,988. The income in 1907-1908 was $1,836,976; $824,024 was given for immediate use, and $449,822 was given for capital. The medical school is well endowed and is housed in buildings (1906) on Longwood Avenue, Boston; the gifts for its buildings and endowments made in 1901-1902 aggregate $5,000,000. Among the university buildings are two dining-halls accommodating some 2500 students, a theatre for public ceremonies, a chapel, a home for religious societies, a club-house (the Harvard Union) for graduates and undergraduates, an infirmary, gymnasium, boat houses and large playgrounds, with a concrete stadium capable of seating 27,000 spectators. Massachusetts Hall (1720) is the oldest building. University Hall (1815), the administration building, dignified, of excellent proportions and simple lines, is a good example of the work of Charles Bulfinch. Memorial Hall (1874), an ambitious building of cathedral suggestion, commemorates the Harvard men who fell in the Civil War, and near it is an ideal statue (1884) of John Harvard by Daniel C. French. The medical and dental schools are in Boston, and the Bussey Institution and Arnold Arboretum are at Jamaica Plain.

Radcliffe College, essentially a part of Harvard, dates from the beginning of systematic instruction of women by members of the Harvard faculty in 1879, the Society for the Collegiate Instruction of Women being formally organized in 1882. The present name was adopted in 1894 in honour of Ann Radcliffe, Lady Mowlson (ob. c. 1661), widow of Sir Thomas Mowlson, alderman and (1634) lord mayor of London, who in 1643 founded the first scholarship in Harvard College. From 1894 also dates the present official connexion of Radcliffe with Harvard. The requirements for admission and for degrees are the same as in Harvard (whose president countersigns all diplomas), and the president and fellows of Harvard control absolutely the administration of the college, although it has for immediate administration a separate government. Instruction is given by members of the university teaching force, who repeat in Radcliffe many of the Harvard courses. Many advanced courses in Harvard, and to a certain extent laboratory facilities, are directly accessible to Radcliffe students, and they have unrestricted access to the library.

The presidents of Harvard have been: Henry Dunster (1640-1654); Charles Chauncy (1654-1672); Leonard Hoar (1672-1675); Urian Oakes (1675-1681); John Rogers (1682-1684); Increase Mather (1685-1701); Charles Morton (vice-president) (1697-1698); Samuel Willard (1700-1707); John Leverett (1708-1724); Benjamin Wadsworth (1725-1737); Edward Holyoke (1737-1769); Samuel Locke (1770-1773); Samuel Langdion (1774-1808); Joseph Willard (1811-1834); Charles Webster (1836-1860); John Thornton Kirkland (1810-1828); Josiah Quincy (1828-1843); Edward Everett (1846-1849); Jared Sparks (1849-1853); James Walker (1853-1860); Cornelius Lowrey Fisk (1860-1862); Thomas Hilly (1862-1868); Charles William Eliot (1869-1909); Abbott Lawrence Lowell (appointed 1909).

HARVEST (A.S. herfest “autumn,” O. H. Ger. herbst, possibly through an old Teutonic root representing Lat. carpere, “to pluck”), the season of the ingathering of crops. Harvest has been a season of rejoicing from the remotest ages. The ancient Jews celebrated the Feast of Pentecost as their harvest festival, the wheat ripening earlier in Palestine. The Romans had their Cerealia or festivities in honour of Ceres. The Druids celebrated their harvest on the 1st of November. In pre-reformation England Lammas Day (Aug. 1st, O.S.) was observed at the beginning of the harvest festival, every member of the church presenting a loaf made of new wheat. Throughout the world harvest has always been the occasion for many queer customs which all have their origin in the animistic belief in the Corn-Spirit or Corn-Mother. This personification of the crops has left its impress upon the harvest customs of modern Europe. In west Russia, for example, the figure made out of the last sheaf of corn is called the Bastard, and a boy is wrapped up in it. The woman who binds this sheaf represents the 2 Cornmother,” and an elaborate simulation of childbirth takes place, the boy in the sheaf squalling like a new-born child, and being, on his liberation, wrapped in swaddling bands. Even in England vestiges of sympathetic magic can be detected. In Northumberland, where the harvest rejoicing takes place at the close of the reaping and not at the ingathering, as soon as the last sheaf is set on end the reapers shout that they have “got the kern.” An image formed of a wheat sheaf, and dressed in a white frock and coloured ribbons, is hoisted on a pole. This is the “kern-baby” or harvest-queen, and it is carried back in triumph with music and shouting and set up in a prominent place during the harvest supper. In Scotland the last sheaf if cut before Hallowmas is called the “maiden,” and the youngest girl in the harvest-field is given the privilege of cutting it. If the reaping finishes after Hallowmas the last corn cut is called the Cailleach (old woman).

In some parts of Scotland this last sheaf is kept till Christmas morning and then divided among the cattle “to make them
THRIVE all the year round," or is kept till the first mare foals and is then given to her as her first food. Throughout the world, as J. G. Frazer shows, the semi-worship of the last sheaf is or has been the great feature of the harvest-home. Among harvest customs none is more interesting than harvest cries. The cry of the Egyptian reapers announcing the death of the corn-spirit, the rustic prototype of Osiris, has found its echo on the world's harvest-fields, and to this day, to take an English example, the Devonshire reapers utter cries of the same sort and go through a ceremony, which is its main features, an exact counterpart of pagan worship. After the wheats is cut they cry the neck. . . . An old man goes round to the shocks and picks out a bundle of the best ears he can find. . . . This bundle is called the neck; the harvest hands then stand round in a ring, the old man holding the neck in the centre. At a signal from him they take off their hats, stooping and holding with both hands towards the ground. Then all together they utter a prolonged cry the neck! three times, raising themselves upright with their hats held above their heads. Then they change their cry to 'Wee y'en way y'en!' or, as some report, 'we haven!' On a fine still autumn evening crying the neck has a wonderful effect at a distance. In East Anglia there still survives the custom known as Hallering Largess. The harvesters beg largesses from passers, and when they have received money they shout thrice 'Halloo, largess,' having first formed a circle, bowed their heads low crying Hoo-Hoo-Hoo., and then jerked their heads backwards and uttered a shrill shriek of 'Ah I Ah I!'

For a very full discussion of harvest customs see J. G. Frazer, The Golden Bough, and Brand's Antiquities of Great Britain (Hailit's edit., 1905).

HARVEST-BUG, the familiar name for mites of the family Trombidiidae, belonging to the order Acari of the class Arachnida. Although at one time regarded as constituting a distinct species, described as Letus autumnalis, harvest-bugs are now known to be the six-legged larval forms of several British species of mites of the genus Trombidium. They are minute, rusty-brown organisms, barely visible to the naked eye, which swarm in grass and low herbage in the summer and early autumn, and cause considerable, sometimes intense, irritation by piercing and adhering to the skin of the leg, usually lodging themselves in some part where the clothing is tight, such as the knee when covered with gartered stockings. They may be readily destroyed, and the irritation allayed, by rubbing the affected area with some insecticide like turpentine or benzine. They are not permanently parasitic, and if left alone will leave their temporary host to resume the active life characteristic of the adult mite, which is predatory in habits, preying upon minute living animal organisms.

HARVEST-BUG, HARVEST-SPIDER, or HARVEST-MAN, names given to the Arachnids of the order Opiliones, referable to various species of the family Phalangidiidae. Harvest-spiders or harvest-men, so-called on account of their abundance in the late summer and early autumn, may be at once distinguished from all true spiders by the extreme length and thinness of their legs, and by their small size and spherical or oval shape of the body, which is not divided by a waist or constriction into an anterior and a posterior region. They may be met with in houses, back yards, fields, woods and heaths; either climbing on walls, running over the grass, or lurking under stones and fallen tree trunks. They are predaeous, feeding upon small insects, mites and spiders. The males are smaller than the females, and often differ from them in certain well-marked secondary sexual characters, such as the mandibular protuberance from which one of the common English spiders, Phalangium cornutum, takes its scientific name. The male is also furnished with a long and protrusible penis, and the female with an equally long and protrusible ovipositor. The sexes pair in the autumn, and the female, by means of her ovipositor, lays her eggs in a split chit or hole in the soil and leaveth them to their own devices. After breeding, the parents die with the autumn cold; but the eggs retain their vitality through the winter and hatch with the warmth of spring and early summer, the young gradually attaining maturity as the latter season progresses. Hence the prevalence of adult individuals in the late summer and autumn, and at no other time of the year. They are provided with a pair of glands, situated one on each side of the carapace, which secrete an evil-smelling fluid believed to be protective in nature. Harvest-men are very widely distributed and are especially abundant in temperate countries of the northern hemisphere. They are also, however, common in India, where they are well known for their habit of adhering together in great masses, comparable to a swarm of bees, and of swaying gently backwards and forwards. The long legs of harvest-men serve them not only as organs of rapid locomotion, but also as props to raise the body well off the ground, thus enabling the animals to stalk un molested from the midst of an army of raiding ants.

(R. I. P.)

HARVEY, GABRIEL (c. 1545-1630), English writer, eldest son of a ropemaker of Saffron-Walden, Essex, was born about 1545. He matriculated at Christ's College, Cambridge, in 1566, and in 1570 was elected fellow of Pembroke Hall. Here he formed a lasting friendship with Edmund Spenser, and it has been suggested (Athen. Cantab. ii. 258) that he may have been the poet's tutor. Harvey was a scholar of considerable weight, who has perhaps been judged too exclusively from the brilliant invectives directed against him by Thomas Nashe. Henry Morley, writing in the Fortnightly Review (March 1869), brought evidence from Harvey's Latin writings which shows that he was distinguished by quite other qualities than the pedantry and conceit usually associated with his name. He desired to be epigraphed as the Inventor of the English Hexameter, and was the prime mover in the literary clique that desired to impose on English verse the Latin rules of quantity. In a gallant, familiar letter to M. Immerito (Edmund Spenser) he says that Sir Edward Dyer and Sir Philip Sidney were helping forward our new famous enterprise for the exchanging of Barbarous and Balducht Rumys with Artificial Verses. The document includes a tepid appreciation of the Faerie Queene which had been sent to him for his opinion, and he gives examples of English hexameters illustrative of the principles enunciated in the correspondence. The opening lines—

"What might I call this Tree? A Laurell? O bonny Laurell Needes to thy bowes will I bow this knee, and vayle my bonetto"—

afford a fair sample of the success of Harvey's metrical experiments, which presented a fair mark for the wit of Thomas Nashe. "He (Harvey) goes twitching and hopping in our language like a man running upon quagmires, up the hill in one syllable, and down the dale in another," says Nashe in Strange News, and he mimics him in the mocking couplet:

"But eh! what news do you hear of that good Gabriel Hufe-Sniffe, Known to the world for a foole, and clapt in the Fleet for a Runner?"

Harvey exercised great influence over Spenser for a short time, and the friendship lasted even though Spenser's genius refused
to be bound by the laws of the new prosody. Harvey is the Hobbinoll of his friend's Shepheardes Calender, and into his mouth is put the beautiful song in the fourth eclogue in praise of Eliza. If he was really the author of the verses "To the Learned Shepheard" sign'd "Hobynoll" and prefixed to the Fower Queene, he was a good poet spoiled. But Harvey's genuine friendship for Spenser shows the best side of a disposition uncompromising and quarrelsome towards the world in general. In 1573 ill-will against him in his college was so strong that there was a delay of three months before the fellows would agree to grant him the necessary grace for his M.A. degree. He became reader in rhetoric about 1576, and in 1578, on the occasion of the death of the founder Sir Thomas Smithus, he was chosen to succeed Mr. M.A. The evening after Sir Thomas Smithus, he was appointed to dispute publically before her. In the next year he wrote to Spenser complaining of the unauthorized publication of satirical verses of his which were supposed to reflect on high personages, and threatened seriously to injure Harvey's career. In 1583 he became junior proctor of the university, and in 1585 he was elected master of Trinity Hall, of which he had been a fellow from 1578, but the appointment appears to have been quashed at court. He was a protégé of the Earl of Leicester, to whom he introduced Spenser, and this connexion may account for his friendship with Sir Philip Sidney. But in spite of patronage, a second application for the mastership of Trinity Hall failed, and in 1585 he received the degree of D.C.L. from the university of Oxford, and is found practising at the bar in London. Gabriel's brother, Richard, had taken part in the Marprelate controversy, and had given offence to Robert Greene by contemptuous references to him and his fellow wits. Greene retorted in his Quip for an Uprostarr Courtier with some scathing remarks on the Harveys, the worst of which were expunged in later editions, drawing attention among other things to Harvey's modest parentage. In 1599 Archbishop Whitgift made a raid on contemporary satire in general, and among other books the tracts of Harvey and Nashe were destroyed, and it was forbidden to reprint them. Harvey spent the last years of his life in retirement at his native place, dying in 1630.

His extant Latin works are: Ciceronianus (1577); Careri rhetor. sive a diurnum oratio de natura. arte et exercitatione rhetoricae (1577); Smithus, vel Musarum lachrymosae (1578), in honour of Sir Thomas Smith; and G. Harveye gratulationum Valdensium libri quatuor (1600), written on the occasion of the queen's visit to Audley End. His Letters are collected, with a life of Harvey by J. Pearson, under the title of Harvey's Letters, ed. J. L. Scott, Camden Society, contains rough drafts of the correspondence between Spenser and Harvey, letters relative to the disputes at Pembroke Hall, and an extraordinary correspondence dealing with the pursuit of his sister Mercy by a young nobleman. A copy of Quintilian (1542), in the British Museum, is extensively annotated by Gabriel Harvey. After Greene's death Harvey published his works posthumously, and which in a spirit of righteous superiority he laid bare with spiteful fulness the miserable details of Greene's later years. Thomas Nashe, who in power of ineptive and merciless wit was far superior to Harvey, took upon himself to avenge Greene's memory, and at the same time settle his personal account with the Harveys, in Strange News (1593). Harvey refuted the personal charges made by Nashe in Pierce's Supererogation, or a New Praye of the Old Asse... (1593). In Christies Teares over Jerusalem (1593) Nashe made a full apology to Harvey, who refused to be appeased, and presumed what had become a very scurrilous controversy in a New Letter of Notable Contents (1593). Nashe thereupon withdrew his apology in a new edition (1594) of Christies Teares, and hearing that Harvey had boasted of victory he produced the most bittard satires of the series in Have you with saffron Walden (1596). Harvey retorted in The Trimming of Thomas Nashe Gentleman, by the most bittard patron Don Richardo de Medico campo... (1597).

His complete works were edited by Dr. A. B. Grosart with a "Memorial Introduction" for the Hakluyt Library (1884-1885). See also: Harvey's Works, ed. T. Warton (1840); Warton's History of English Poetry (ed. W. C. Hazlitt, 1871); J. P. Collier's Bibliographical and Critical Account of the Rarest Books in the English Language (1863), and the Works of Thomas Nashe.

**HARVEY, SIR GEORGE** (1806-1876), Scottish painter, the son of a watchmaker, was born at St Ninians, near Stirling, in February 1806. Soon after his birth his parents removed to Stirling, where George was apprenticed to a bookseller. His love for art having, however, become very decided, in his eighteenth year he entered the Trustees' Academy at Edinburgh. Here he so distinguished himself that in 1826 he was invited by the Scottish artists, who had resolved to found a Scottish academy, to join it as an associate. Harvey's first picture, "A Village School," was exhibited in 1826 at the Edinburgh Institution; and from the time of the opening of the Academy in the following year he continued annually to exhibit. His best-known pictures are those depicting historical episodes in religious history from a puritan or evangelical point of view, such as "Covenantes Preaching," "Covenantes' Communion," "John Bunyan and his Blind Daughter," "Sabbath Evening," and the Quitting of the Mans. He was, however, equally famous in the circle of his Scottish friends as a writer on subjects not directly religious; and "The Bowlers," "A Highland Funeral," "Scotch and Schule Skailin!," and "Children Blowing Bubbles in the Churchyard of Greyfriars, Edinburgh," manifest the same close observation of character, artistic conception and conscientious elaboration of details. In "The Night Mail" and "Dawn Revealing the New World to Columbus" the aspects of nature are made use of in different ways, but with equal happiness, to lend impressiveness and solemnity to human concerns. He also painted landscapes and portraits. In 1829 he was elected a fellow of the Royal Scottish Academy; in 1864 he succeeded Sir J. W. Gordon as president; and he was knighted in 1867. He died at Edinburgh on the 22nd of January 1876.

I came home and perused the pieces singly. I was amazed that so vast a treasure should have been so long hidden.” This was the publication of the Exercitaciones de generatione (1655).

This was the last of Harvey's labours. He had now reached his seventy-third year. His theory of the circulation had been opposed and defended, and was now generally accepted by the most eminent anatomists both in his own country and abroad. He was known and honoured throughout Europe, and his own college (Caius) voted a statue in his honour (1652) vibo monumentis suis immortal.

In 1654 he was elected to the highest post in his profession, that of president of the college; but the following year he died, after the assembled college, and, declining the honour they offered him, he retired to his chambers. It was at this time that he was re-elected the late president Dr Francis Prujean (1593-1666). He accepted, however, the office of consiliarius, which he again held in the following two years. He had already enriched the college with other gifts besides the honour of his name. He had raised for them "a noble building of Roman architecture (rustic work with Corinthian pilasters), comprising a great parlour or conversation room below and a library above"; he had furnished the library with books, and filled the museum with "simples and rarities," as well as with specimens of instruments and other curiosities. In 1683, when the college was enlarged, he gave them a room.

At last he determined to give to his beloved college his paternal estate at Burmarsh in Kent. His wife had died some years before, his brothers were wealthy men, and he was childless, so that he was despairing of no heir when, in July 1656, he made the transfer of this property, then valued at £56 per annum, with provision for a salary to the college librarian and for the endowment of an annual oration, which is still given on the anniversary of the day. The orator, so Harvey orders in his deed of gift, is to exhort the fellows of the college "to search out and study the secrets of nature by way of experiment, and also for the honour of the profession to continue mutual love and affection among themselves."

Harvey, like his contemporary and great successor Thomas Sydenham, was long afflicted with gout, but he preserved his activity of mind to an advanced age. In his eightieth year, on the 3rd of June 1657, he was attacked by paralysis, and though deprived of speech was able to send for his nephews and distribute his watch, ring, and other personal trinkets among them. He died the same evening, "the palsy giving him an easy passport," and was buried with great honour in his brother Eliah's vault at Westminster. The portrait of Harvey in his youth, which is engraved, is prefixed to the fine edition of his works published in 1676.

Harvey’s Work on the Circulation.—In estimating the character and value of the discovery announced in the Exercitatio de motu cordis et sanguinis, it is necessary to bear in mind the previous state of knowledge on the subject. Aristotle taught that in man and the higher animals the blood was elaborated from the food in the liver, thence carried to the heart, and sent by it through the veins over the body. His successors of the Alexandrian school of medicine, Erasistratus and Herophilus, further elaborated his system, and taught that, while the veins carried blood from the heart to the members, the arteries carried a subtle kind of air or spirit. For the practical physician only two changes had been made in this theory of the circulation between the Christian era and the 16th century. Galen had discovered that the arteries were not, as their name implies, merely air-pipes, but that they contained blood as well as vital air or spirit. And it had been gradually ascertained that the nerves (vibere) which

HARVEY, WILLIAM

way we could scarce see a dog, crow, kite, raven, or any bird, or anything to move nature; there are few miserable people, the relics of the war and the plague, whose famine made anatomy before I came.” Having returned to his practice in London at the close of the year 1636, he accompanied Charles I, in one of his journeys to Scotland (1639 or 1641). While at Edinburgh he visited the Bass Rock; he minutely describes its abundant population of sea-fowl in his treatise De generatione, and incidentally speaks of the account then credited of the solan goose growing on trees as a fable. He was in attendance on the king at the battle of Edgehill (October 1642), where he withdrew under a hedge with the prince of Wales and the duke of York (then boys) and hid them in the garden for ten years. When at last he took out of his pocket a book and read. But he had not read very long before a bullet of a great gun grazed on the ground near him, which made him remove his station,” as he afterwards told John Aubrey. After the indecisive battle, Harvey followed Charles I to Oxford, “where,” writes the same gossiping narrator, “I first saw him, but was then too young to be acquainted with so great a doctor. I remember he came several times to our college (Trinity) to George Bathurst, B.D. who had a hen to hatch eggs in his chamber, which they opened daily to see the progress and ways of the new-hatched. In Oxford he remained three years, but there was some chance of his being superseded in his office at St Bartholomew’s hospital, "because he hath withdrawn himself from his charge, and is retired to the party in arms against the Parliament." It was no doubt at this that his lodgings at Whitehall were searched, and not only the furniture seized but also invaluable manuscripts and anatomical preparations. 1

While with the king at Oxford he was made warden of Merton College, but a year later, in 1646, that city surrendered to Fairfax, and Harvey returned to London. He was now sixty-eight years old, and, having resigned his apointments and relinquished the cares of practice, lived in learned retirement with one or other of his brothers. It was in his brother Daniel’s house at Combe that Dr (afterwards Sir George) Ent, a faithful friend and disciple (1604-1686), visited him in 1650. "I found him,” he says, "with a cheerful and sprightly countenance investigating, like Democritus, the nature of things. Asking if all were well with him—’How can that be,’ he replied, ‘when the state is so agitated with storms and I myself am yet in the open sea? And indeed, were not my mind solaced by my studies and the recollection of the observations I have formed, I made, there is nothing which should make me desirous of a longer continuance. But thus employed, this obscure life and vacation from public cares which would disgust other minds is the medicine of mine,’ ”

The work on which he had been chiefly engaged at Oxford, and indeed since the publication of his treatise on the circulation in 1628, was an investigation into the resorbite and deeply interesting subject of generation. Charles I had been an enlightened patron of Harvey’s studies, had put the royal deer parks at Windsor and Hampton Court at his disposal, and had watched his demonstration of the growth of the chick with no less interest than the movements of the living heart. Harvey had now collected a large number of observations, though he would probably have delayed their publication. But Ent succeeded in obtaining the manuscripts, with authority to print them or not as he should find them. “I went from him,” he says, “like another Jason in possession of the golden fleece, and when

1 Ignoscant mihi niveae animae, si, summam inuniarum memem, levem geminum effuder. Doloris mihi haec causa est: cum, inter nuperos nostros tumultus et bella plusquam civilia, serenissimum regnum ex omnibus senatus pacificata rerum annullabatur. De rapaces quaedam manus non modo aedem mearum superpellellem omnen explicarunt, sed etiam, quae mihi causa gravior quaqminoniae, adqueae causa multorum anunnior liberatur parta, e museo meo summoventur. Quo facto est ut observationes plurimae, practicarum generantium insectorum, cum republicae literaric (ausim dicere) detrimento, pererit.” — De gen., Ex. Ixviii. To this loss Cowley adds: “O cursed war! who can forgive thee this? Houses and towns may rise again, And ten times easier ’tis To rebuild Paul’s than any work of his.”

This was the last of Harvey’s labours. He had now reached his seventy-third year. His theory of the circulation had been opposed and defended, and was now generally accepted by the most eminent anatomists both in his own country and abroad. He was known and honoured throughout Europe, and his own college (Caius) voted a statue in his honour (1652) vibo monumentis suis immortal. In 1654 he was elected to the highest post in his profession, that of president of the college; but the following year he died, after the assembled college, and, declining the honour they offered him, he retired to his chambers. It was at this time that he was re-elected the late president Dr Francis Prujean (1593-1666). He accepted, however, the office of consiliarius, which he again held in the following two years. He had already enriched the college with other gifts besides the honour of his name. He had raised for them “a noble building of Roman architecture (rustic work with Corinthian pilasters), comprising a great parlour or conversation room below and a library above”; he had furnished the library with books, and filled the museum with “simples and rarities,” as well as with specimens of instruments and other curiosities. In 1683, when the college was enlarged, he gave them a room.

At last he determined to give to his beloved college his paternal estate at Burmarsh in Kent. His wife had died some years before, his brothers were wealthy men, and he was childless, so that he was despairing of no heir when, in July 1656, he made the transfer of this property, then valued at £56 per annum, with provision for a salary to the college librarian and for the endowment of an annual oration, which is still given on the anniversary of the day. The orator, so Harvey orders in his deed of gift, is to exhort the fellows of the college “to search out and study the secrets of nature by way of experiment, and also for the honour of the profession to continue mutual love and affection among themselves.”

Harvey, like his contemporary and great successor Thomas Sydenham, was long afflicted with gout, but he preserved his activity of mind to an advanced age. In his eightieth year, on the 3rd of June 1657, he was attacked by paralysis, and though deprived of speech was able to send for his nephews and distribute his watch, ring, and other personal trinkets among them. He died the same evening, “the palsy giving him an easy passport,” and was buried with great honour in his brother Eliah’s vault at Westminster. The portrait of Harvey in his youth, which is engraved, is prefixed to the fine edition of his works published in 1676.
HARVEY, WILLIAM

The way then to Harvey’s great work had been paved by the discovery of the valves in the veins, and by that of the lesser circulation—the former due to Sylvius and Fabricius, the latter to Servetus—but the significance of the valves was unsuspected, and the fact of even the pulmonary circulation was not generally accepted.

In his treatise Harvey proves (1) that it is the contraction, not the dilatation, of the heart which coincides with the pulse, and that the ventricles as true muscular sacs squeeze the blood which they contain into the aorta and pulmonary artery; (2) that the pulse is not produced by the arteries enlarging and so filling, but by the arteries being filled with blood and so enlarging; (3) that there are no pores in the septum of the heart, so that the whole blood in the right ventricle is sent to the lungs and round by the pulmonary veins to the left ventricle, and also that the whole blood in the left ventricle is again sent into the arteries, round by the smaller veins into the venae cavae, and by them to the right ventricle again—thus making a complete “circulatio”; (4) that the blood in the arteries and that in the veins is the same blood; (5) that the action of the right and left sides of the heart, auricles, ventricles and veins, is the same, the mechanism in both being for reception and propulsion of liquid and not of air, since the blood on the right side, though mixed with air, is still blood; (6) that the blood sent through the arteries to the tissues is not all used, but that most of it runs through into the veins; (7) that there is no and fro undulation in the veins, but a constant stream from the distant parts towards the heart; (8) that the dynamical starting-point of the blood is the heart and not the liver.

The method by which Harvey arrived at his complete and almost faultless solution of the most fundamental and difficult problem in physiology has been often discussed, and is well worthy of attention. He begins his treatise by pointing out the many inconsistencies and defects in the Galenical theory, quoting the writings of Galen himself, of Fabricius, Columbus and others, with great respect, but with unflinching criticism. For, in his own noble language, wise men must learn anatomy, not from the decrees of philosophers, but from the fabric of nature herself, “nec ita in verba jurare antiquitatis magistri, ut veritatem amicam in apertis reliquant, et in conspectu omnium deserant.”

He had, as we know, not only furnished himself with all the knowledge that books and the instructions of the best anatomists of Italy could give, but, by a long series of dissections, had gained a far more complete knowledge of the comparative anatomy of the heart and vessels than any contemporary—we may almost say than any successor—until the times of John Hunter and J. F. Meckel. Thus equipped, he tells us that he began his investigations into the movements of the heart and blood by looking at them—i.e. by seeing their action in living animals. After a modest preface, he heads his first chapter strength of this phrase Professor J. B. Ercolani actually put up a tablet in the veterinary school at Bologna to Ruini as the discoverer of the circulation of the blood! The claims of Caesalpinus, a more plausible claimant to Harvey’s laurels, are scarcely better founded. In his Questiones peripateticae (1571) he followed Servetus and Columbus in describing what we now know as the pulmonary circulation, and, unprovided with a suitable name for the assertion (first made in Bayle’s dictionary) that Caesalpinus knew “the circulation of the blood.” He is even behind Servetus, for he only allows part of the blood of the right ventricle to go round the lungs by a stoppage: “ut venas ab aliis venis evertantur, sanguinem ordinem.”

Columbus was attacked by “il corsario don Vincenzo” because it was “a sinistro” and “unico.” Except for a superficial dissection by Servetus, and for a description of the pulmonary veins by a nameless anatomist, Caesalpinus had no original views on the anatomy of the heart and lungs, or on the origin and history of the idea of its functions. But he performed many dissections of the human body, and described the valves of the veins more perfectly than had Sylvius. Carlo Ruini, in his treatise on the Anatomy and Diseases of the Horse (1590), taught that the left ventricle sends blood and vital spirits to all parts of the body except the lungs—the ordinary Galenical doctrine. Yet on the

arose from the brain and conveyed “animal spirits” to the body were different from the tendons or sinews (sepius) which attach muscles to bones. First, then, the physicians of the time of Thomas Linacre knew that the blood is not stagnant in the body. So did Shakespeare and Homer, and every augur who inspired the entreaties of a victim, and every village barber that breathed a vein. Plato even uses the expression to αἷμα κατὰ πάττα μηκὺς σφάδως περιφέρεσιν. But no one had a conception of a continuous stream returning to its source (a circulation in the true sense of the word) either in the system or in the lungs. If they used the word circulatio, as did Caesalpinus,1 it was as vaguely as the French policeman cries “Circlez.” The movements of the blood were in fact thought to be slow and irregular in direction as well as in speed, like the “circulation of air in a house, or the circulation of a crowd in the streets of a city. Secondly, they supposed that one kind of blood flowed from the liver to the right ventricle of the heart, and thence to the lungs and the general system by the veins, and that another kind flowed from the left ventricle to the lungs and general system by the arteries. Thirdly, they supposed that the septum of the heart was pervious and allowed blood to pass directly from the right to the left side. Fourthly, they had no conception of the functions of the heart as the motor power of the movement of the blood. They doubted whether its substance was muscular; they supposed its pulsation to be due to expansion of the spirits it contained; they believed the only dynamic effect which it had on the blood to be sucking it in during its active distole, and they supposed the chief use of its constant movements to be the due mixture of blood and spirits.

In the greater part of the sixteenth century, Sylvius (In Hippi, et Gal. pars. partem anatom. isagogse) described the valves of the veins; Vesalius (De humani corporis fabrica, 1542) ascertained that the septum between the right and left ventricles is complete, though he could not bring himself to deny the invisible pores which Galen’s system demanded. Servetus, in his Christianismi resitutio (1553), goes somewhat farther than his fellow-student Vesalius, and says: “Paries ille mediocris non est aptus ad communicacionem et elaborationem illam; licet aliquid resurade possit”; and, from this anatomical fact and the large size of the pulmonary arteries he concludes that there is a communication in the lungs by which blood passes from the pulmonary artery to the pulmonary veins. Eodem articulo quo in hepate fit translatio, in valvis arteriis venarum venae cavae, asserit, et pulmone transfusio a vena arteriosa ad arteriam venosam propter spiritum.” The natural spirit of the left side and the vital spirit of the right side of the heart were therefore, he concluded, practically the same, and hence two instead of three distinct spiritus should be admitted. It seems doubtful whether even Servetus rightly conceived of the entire mass of the blood passing through the pulmonary artery and the lungs. The transference of the spiritus naturalis to the lungs, and its return to the left ventricle as spiritus vitalis, was the function which he regarded as important. Indeed a true conception of the lesser circulation as a transference of the whole blood of the right side to the left was impossible until the corresponding transference in the greater or systematic circulation was discovered. Servetus, however, was the true predecessor of Harvey in physiology, and his claims to that honour are perfectly authentic and universally admitted.2

1 Indeed the same word, plebdes eiauros, occurs in the Hippocratic writings, and was held by Van der Linden to prove that to the father of medicine himself, and not to Columbus or Caesalpinus, belonged the laurels of Harvey. 2 Realdo Columbus (De re anatomica, 1559) formally denies the muscularity of the heart, yet correctly teaches that blood and spirits pass from the right to the left ventricle, not through the septum but through the lungs. “Quod nemo hactenus aut animadverit aut scriptum reliquit.” The fact that Harvey quotes Columbus and not Servetus is explained by the almost entire destruction of the writings of the latter, which had escaped the copies made by him of all the works of all the most modern anatomists, and even by the rarest that he had. The fact that he only quotes from Galen or from Servetus except some erroneous observations of his own. His greatest merit was as a botanist; and no claim to the discovery of the circulation of the blood is made. An autem venarum eiauros, suasinm crasiorum, in quo calor intensus est magis, ex altero venturo, sanguinem temperatissimum ac sincerissimum habente, egressit aorta.” Caesalpinus seems to have been the first to separate the pulmonary circulation from the general circulation of the blood; only a proof of the blindness of misplaced national vanity.
“Ex vivorum dissectione, qualsis sit cordis motus.” He minutely describes what he saw and handled in dogs, pigs, serpents, frogs, and fishes, and even in slugs, oysters, lobsters and insects, in the transparent 

minima squilla, “quae Anglice dicetur a shrimp,” and lastly in the chick while still in the shell. In these investigations he used a perspicillum or simple lens. He particularly describes his observations and experiments on the ventricles, the auricles, the arteries and the veins. He shows how the arrangement of the protoplasm supports his theory. He addsuce facts observed in disease as well as in health to prove the rapidity of the circulation. He explains how the mechanism of the valves in the veins is adapted, not, as Fabricius believed, to moderate the flow of blood from the heart, but to favour its flow to the heart. He estimates the capacity of each ventricle, and reckons the rate at which the whole mass of blood passes through it. He elaborately and clearly demonstrates the effect of obstruction of the blood-stream in arteries or in veins, by the forces in the case of a snake, by a ligature on the arm of a man, and illustrates his argument by figures. He then sums up his conclusion thus: “Circulari quodam motu, in circuitu, agitati in animalibus sanguine, et esse in perpetuo motu; et hanc esse actionem sive functionem cordis quam pulsus peragit; et omni motus et pulsum cordis causam unam esse.” Lastly, in the 15th, 16th and 17th chapters, he adds certain confirmatory evidence, as the effect of position on the circulation, the absorption of animal poisons and of medicines applied externally, the muscular structure of the heart and the necessary working of its valves. The whole treatise, which occupies only 67 pages of large print in the 1657 edition, contains a minute and patient accumulation of facts, ingenious experimentation, bold yet cautious hypothesis and logical deduction.

In one point only was the demonstration of the circulation incomplete. Harvey could not discover the capillary channels by which the blood passes from the arteries to the veins. This gap in the circulation was supplied several years later by the great anatomist Marcello Malpighi, who in 1661 saw in the lungs of a frog, by the newly invented microscope, how the blood passes from the one set of vessels to the other. Harvey saw all that could be seen by the unaided eye in his observations on living animals; Malpighi, four years after Harvey’s death, by another observation on a living animal, completed the splendid chain of evidence. If this defect from Harvey’s merit it leaves Servetus no merit at all. But in fact the existence of the channels first seen by Malpighi was as clearly pointed to by Harvey’s reasoning as the existence of Neptune by the calculations of Leverrier and of Adams.

Harvey himself and all his contemporaries were well aware of the novelty and importance of his doctrine. He says in a letter to Dr Argent, president of the College of Physicians, which follows the dedication of his treatise to Charles I., that he should not have ventured to publish “a book which alone asserts that the blood pursues its course and flows back again by a new path, contrary to the received doctrine taught so many ages by innumerable learned and illustrious men,” if he had not set forth his theory for more than nine years in his college lectures, gradually gaining perfect conviction, and convinced his colleagues by actual demonstrations of the truth of what he advanced. He anticipates opposition, and even obloquy or loss, from the novelty of his views. These anticipations proved correct. The wrong ground of the charges are to credit Aubrey indeed, he found that after the publication of the De motu he “felt mighty in his practice; was believed by the vulgar that he was crackbrained, and all the physicians were against him.” But the last assertion is demonstrably untrue; and if apothecaries and patients ever foresook him, they must soon have returned, for Harvey left a handsome fortune. By his own profession the book was received as it deserved. So novel a doctrine was not to be accepted without due inquiry, but his colleagues had heard his lectures and seen his demonstrations for years; they were already familiar with the truth of his theory, urged its publication, continued him in his lectures, and gained even the ear of the Pope. In other countries the book was widely read and much canvassed. Few accepted the new theory; but no one dossiered the book as diabolical. It would require a great deal of ingenuity to prove that Harvey did any one pretend that it could be found in the works of previous authors. The first attack on it was a feeble tract by one James Prichard, a pupil of Jean Riordan (Exerciss. et animad. in libro, Harv. de motu cord. et sang., 1639). Five years later Parinius, an Italian physician, published his Lupis Lydii de motu cord.
Harvey's Work on Generation.—We have seen how Dr. Ent persuaded his friend to publish this book in 1651. It is between five and six times as long as the Exerc. de motu cord. et sanguine, and is followed by excursus De partu, De uteri membranis, De conceptione; but, though the fruit of as patient and extensive observations, its value is far inferior. The subject was far more abstruse, and in fact inaccessible to proper investigation without the aid of anatomy. Harvey had, indeed, already begun them a little over a hundred years before the days of Aristotle. Fabricius, Harvey's master, in his work De generatione et pulli (1621), had alone preceded him in modern times. Moreover, the seventy-two chapters which form the book lack the co-ordination so conspicuous in the earlier treatise, and some of them seem almost like detached chapters of a system which was never completed or finally revised.

Aristotle had believed that the male parent furnished the body of the future Embryo, while the female furnished merely the nourishment and formed the seed; this is in fact the theory on which, in the Eumenides of Aeschylus, Apollo obtains the acquittal of Orestes. Galen taught almost as erroneously that each parent contributes seeds, the union of which produced the young animal. Harvey, after speaking with due honour of Aristotle and Fabricius, begins rightly “ab ovo”;

for, as he remarks, “eggs cost little and are always and everywhere to be had,” and moreover almost all animals, even those which breed in their young alive, and man himself, are produced from eggs (“omnis animo animalia, citam vivipara, atque hominem adico ipsum, ex ovo proorigi”). This dictum, usually quoted as “omne vivum ex ovo,” would alone stamp this work as worthy of the name of treatise on generation. Harvey details his case, and then gives an account of the appearance seen on the successive days of incubation, from the 1st to the 6th, the 10th and the 14th, and lastly describes the process of hatching. He then comments upon and corrects the opinions of Aristotle and Fabricius, declares against spontaneous generation (though in one passage he seems to admit the current doctrine of production of worms by putrefaction as an exception), proves that the so-called semen gallii, that is to say, the eggs of hens are not the semen gallii, and that both parents contribute to the formation of the egg. He describes accurately the first appearance of the ovarian ovum as mere specks, their assumption of yolk and after-wards of albumen, which results in the production of the chick. He then turns to the action of both parents as the efficient instruments of the first great cause.1 He then goes on to describe the order in which the several parts appear in the chick. He states that this is due to their formation being in order of age from the blastomeres outward, so that some are close to the shell, and others farther removed from it. He explains that the nutrition of the chick is not only effected by yolk conveyed directly into the midgut, as Aristotle taught, but also by absorption from yolk and white by the umbilical (omphaloesenric) veins, and that the other vessels, viz. the umbilical (omphalomesenic) and vitelline (oddly names vermiculus), one of which develops into three vesicles, to form the cerebrum, cerebellum and eyes, the other into the bronchial and thorax; on the sixth or seventh day comes the visera, and lastly, the feathers and other external parts. He points out how nearly this order of development in the chick agrees with what he had observed in mammalian and particularly in human embryos. He notes the bifid apex of the foetal heart in man and the sheep, the true heart in all our domestic animals, but universal in the lower animals. He recognizes the true heart, and decomposes the several parts; the large amount of liquor amnii and absence of placenta which characterize the foetus in the third month; in the heart itself, the valves, arteries and veins, and their relationships with the Fallopian tubes resembling the uterus of the sheep; the large thymus; the caecum, small as in the adult, not forming a second stomach as in the pig, the horse and the hare; the lobulated kidneys, like those of the seal (Schizura, sc. arctica) and porpoise, and other marine mammals, not much smaller than the kidneys (ili-vii). He failed, however, to trace the connexion of the urachus with the bladder. In the following chapters (libri-xxxvii.) Harvey describes the process of generation in the fowl and the roe. After once again insisting that all animals arise from ova, that a “conception” is an internal egg and an egg an extruded conception, he goes on to describe the uterus of the dox, the process of transformation, and the subsequent development of the foetus and its membranes, the punctum saliens, the cotyledons of the placenta, and the “uterine milk,” to which Sir William Turner recalled attention in later years. The treatise concludes with detached notes on the placenta, parturition and allied subjects.

Harvey's other Writings and Medical Practice.—The remaining writings of Harvey which are extant are unimportant. A complete list of them will be found below, together with the titles of those which we know have been lost. It is there recorded that many were probably that on respiration, and the records of post-mortem examinations. From the following passage (De partu, p. 550) it seems that he had a notion of respiration being connected rather with the production of animal heat than, as then generally supposed, with the cooling of the blood. “Haec qui diligenter perpendit, naturalaque aeris diligenter intromitteret, facile opinor faticetur eundem nec refrigerationis gratia nec in pabulum animalibus concedi. Haec autem obiter duntaxat de respirazione diximus, proprio loco de caedem forsitius copiosius discipulitarius.”

Of Harvey as a practising physician we know very little. Authors deplore that “he paid his visits on horseback with a foot-cloth, his man following on foot, as the fashion then was.” He adds—“Though all of his profession would allow him to be an excellent anatomist, I never heard any that admired his therapeutic way. I knew several practitioners that would not have given thereforpe for one of his bills” (the apothecaries used to collect physicians' prescriptions and sell or publish them to their own profit), “and that a man could hardly tell by his bill what he did aim at.” However this may have been,—and rational therapeutics was impossible when the foundation stone of physiology had only just been laid,—we know that Harvey was an active practitioner, performing such important surgical operations as the removal of a breast, and he turned his obstetric experience to account in his book on generation. Some good practical precepts as to the conduct of labour are quoted by Percival Willughby (1596-1685). He also took notes of the anatomy of disease; these unfortunately perished with his other manuscripts. Otherwise we might regard him as a forerunner of G. B. Morgagni; for Harvey saw that pathology is but a branch of physiology, and like it must depend first on accurate anatomy. He speaks strongly to this purpose in his first epistle to Riolan: “Sicut enim sanorum et boni habitus corporum dissezi et pluriul ad philosophiam, et rectam physiologia facit, ita corporum morbosorum et cachecticos inspectio potissimum ad patholigam philosophiam.” The only specimen we have of his observations in morbid anatomy is his account of the post-mortem examination made by order of the king on the body of the famous Thomas Parr, who died in 1635, at the reputed age of 152. Harvey insists on the value of physiological truths for their own sake, independently of their immediate utility; but he himself gives us an interesting example of the practical application of his theory of the circulation in the cure of a large tumour by tying the arteries which supplied it with blood (De generat. Exerc. xix.).

The following is believed to be a complete list of all the known writings of Harvey, published and unpublished:

- Exercitationes de venarum terminis, 410 (Frankfort-on-the-Main, 1628);
- Exercitationes duae animalium de circulatione sanguinis, ad Johannem Riolanum, 2ilium, Parisiensem (Cambridge, 1649);
- Exercitationes de generatione animalium, quibus accidunt venarum tuba partu, de membranis ac umbilicos uteri, et de conceptione, 410 (London, 1651);
- Anatomia Thomas Parr, first published in the treatise of Dr John Betts, De oris et natura sanguinis, 8vo (London, 1660).

Letters: (1) to Caspar Hoffmann of Nuremberg, 1635; (2) to the School of Hamburg, 1635; (3) to Giovanni Nardi of Florence, July 1651, Dec. 1653 and Nov. 1655; (4) two to Dr Morison of Paris, May 1652; (5) two to Dr Horst of
Durmstadt, Feb. 1642-1645 and July 1655; (6) to Dr. Vlackveld of Haarlem, May 1657. His letters to Hufmann and Schlegel are on the
circulation; those to Morison, Horst and Vlackveld refer to
the discovery of the lacteals; the two to Nardi are short letters of
friendship. Some of Harvey’s Sir. recollections, in his collected works (Leiden, 1687). Of two MSs, one on official business to the secretary Dorchester was printed by Dr
Aveling, with a facsimile of the printing (Amsterdam, 1937). MSs
not open to the public, are (S. S.)—MS. a, Queen’s College, Oxford,
Lumen—MS. b, part of the Latin—are in the British Museum Library; an autotype reproduction
was issued by the College of Physicians in 1886. An account of
a second MS. in the British Museum, entitled “The great breed of
muttones” was published by Dr. G. E. Paget (Notice of an unp. MS. of Harvey, London, 1850). The following
treatises, or notes towards them, were lost either in the
pillage of the college and its libraries in the London, with the
old college of Physicians: A Treatise on Respiration, promised
and probably at least in part completed (pp. 82, 550, ed. 1766);
Observations de usu Lienis; Observationes de motu locali, perhaps
identical with the above-mentioned manuscript; Tractatus physiologi-
um; Anatomia medicales (apparently notes of morbid anatomy);
De generatione specierum. The hne 4to edition of Harvey’s Works,
published by the Linnean Society of London in 1834, is
important particularly to Mark Akeside; it contains the two treatises,
the account of the post-mortem examination of old Parr, and the
six letters enumerated above. A translation of this volume by Dr. Wilkins will be published by the Sydenham Society,
5vo (London, 1849).

The following are the principal biographies of Harvey: in Aubry’s
Letters of Eminent Persons &c., &c. vol. II. (London, 1843), first
published in 1833, is entitled “Harvey, John, Laetrudis,
notar historique et critique (1698 and 1720; Eng. ed., 1738);
in the Biographia Britannica, and in Atkin’s Biographical Memoirs;
the Latin Life by Dr. Thomas Lawrence, prefixed to the college
tion of Harvey’s Works in 1766; memoir in Lives of British
Physicians (London, 1830); a Life by Dr. Robert Willis, founded
on that by Lawrence, and prefixed to his English edition of Harvey
in 1847; the much enlarged Life by the same author, published
1878; the biography by Dr. William Munk in the Roll of the College

The literature on the great discovery of Harvey, on his methods and his merits, would fill a library. The most
important contemporary writings have been mentioned above. The following list gives some of the most remarkable in modern times: the article in Bayle’s dictionary quoted above; Anatomical Lectures,
by Wm. Hunter, M.D. (1784); Sprengell, Geschichte der Arzneikunde
(Halle, 1800), vol. iv.; Florens, Histoire de la circulation (1854);
Lewes, Physiology of Common Life (1859), vol. i. pp. 291-345;
Cerdinini, La Sopera dellaatrazione fisica (Milan, 1846); Thurn,
Tollin, Die Entdeckung des Blutkreislaufs durch Michael Servet
(Jena, 1856); Kirchner, Die Entdeckung des Blutkreislaufs (Berlin,
1857); Belchamber, “The Life of Harvey” Wharton Jones, “Lecture
on the Circulation of the Blood,” Lancet for Oct. 25 and Nov. 1, 1879;
and the various Harveyian Oration, especially those by Sir E. sieve-
king, Dr Guy and Professor George Rolleston.

REY, a city of Cook county, Illinois, U.S.A., about 18 m.
S. of the Chicago Court House. Pop. (1900) 5395 (982 foreign-
born); (1910) 7277. It is served by the Chicago Terminal Transfer,
the Grand Trunk and the Illinois Central railways. Harvey is a
manufacturing and residence suburb of Chicago. Among its
manufactures are railway, foundry and machine-shop supplies,
machine ditches, machine stones, street-making and
street-cleaning machinery, stoves and vehicle. It
was named in honour of Turlington W. Harvey, a Chicago
capitalist, founded in 1890, incorporated as a village in 1891
and charted as a city in 1893.

HARWICH, a municipal borough and seaport: in the Harwich
parliamentary division of Essex, England, on the extremity of
a small peninsula projecting into the estuary of the Stour and
Orwell, 70 m. N.E. by E. of London by the Great Eastern
railway. Pop. (1901) 10,070. It occupies an elevated situation,
and a wide view is obtained from Beacon Hill at the southern end of the esplanade. The church of St Nicholas was built of
brick in 1821; and there are a town hall and a custom-house.
The harbour is one of the best on the east coast of England, and
in stormy weather is largely used for shelter. A breakwater
and seawall prevent the blocking of the harbour entrance and
encroachment of the sea; and there is another breakwater at
Langland Point on the opposite (Suffolk) shore of the estuary.

The principal imports are grain and agricultural produce, timber
and coal, and the exports cement and fish. Harwich is one of the
principal English ports for continental passenger traffic,
tumers regularly serving the Hook of Holland, Amsterdam,
Rotterdam, Antwerp, Esbjerg, Copenhagen and Hamburg.
The continental trains of the Great Eastern railway run to Parkstone
Quay, 1 m. from Harwich up the Stour, where the passenger
steamers start. The fisheries are important, principally those for
shrimps and lobsters. There are cement and shipbuilding
works. The port is the headquarters of the Royal Harwich
Yacht Club. There are batteries at and opposite Harwich, and
modern works on Shotley Point, at the fork of the two estuaries.
There are also several of the Martello towers of the Napoleonic
era. At Landguard Fort there are important defence works with
heavy modern guns commanding the main channel. This has
been a point of coast defence since the time of James I. Between
the Parkstone Quay and Town railway stations is that of Dover
court, an adjoining parish and popular watering-place. Harwich
is under a mayor, 4 aldermen and 12 councillors. Area, 1541
acres.

Harwich (Herewica, Herewyck) cannot be shown to have been
inhabited very early, although in the 18th century remains of
a Roman road, possibly Roman, has been found near the
manor of Dovercourt. It became a borough in 1319 by a
charter of Edward II., which was confirmed in 1342 and 1378,
and by each of the Lancastrian kings. The exact
nature and degree of its self-government is not clear. Harwich received
charter in 1547, 1553 and 1560. In 1604 James I. gave it a charter
which amounted to a new constitution, and from this charter begins the regular parliamentary representation. Two burgesses
had attended parliament in 1343, but none had been summoned
since. Until 1867 Harwich returned two members; it then lost
one, and in 1885 it was merged in the county. Included in the
manor of Dovercourt, Harwich from 1086 was for long held by
the de Vere family. In 1252 Henry III., granted to Roger Bigod
a market here every Tuesday, and a fair on Ascension day, and
eight days after. In 1320 a grant occurs of a Tuesday market,
but no fair is mentioned. James I. granted a Friday market,
and two fairs, at the feast of St Philip and St James, and on
St Luke’s day. The fair has died out, but markets are still
held on Tuesday and Friday. Harwich has always had a
considerable trade; in the 14th century merchants came even from Spain, and there was much trade in hemp and
wool with Flanders. But the passenger traffic appears to
be as important at Harwich in the 14th century as it is now.
Shipbuilding was a considerable industry at Harwich in the
17th century.

HARZBURG, a town of Germany, in the duchy of Brunswick,
beautifully situated in a deep and well-wooded vale at the
foot of the Harz Mountains, at the terminus of the Brunswick-
Harzburg railway, 5 m. E.S.E. from Goslar and 18 m. S.
from Wolfsenbüttel. Pop. (1905), 4396. The Radau, a mountain
stream, descending from the Brocken, waters the valley and adds
much to its picturesque charm. The town is much frequented as a
summer residence. It possesses brine and carbonated springs,
the Juliusbath saline baths being about a mile to the south of
the town, and a hydropathic establishment. A mile and a half
south from the town lies the Burgberg, 1500 ft. above sea-level,
whose summit, according to tradition, was once an altar to
the heathen idol Krodo, still to be seen in the Ulrich chapel at
Goslar. There are on the summit of the hill the remains of an
old castle, and a monument erected in 1875 to Prince Bismarck,
with an inscription taken from one of his speeches against
the Ultramontane claims of Rome—"Nach Canossa gehen
wir nicht."

The castle on the Burgberg called the Harzburg is famous in
German history. It was built between 1065 and 1069, but
was laid in ruins by the Saxons in 1074; again it was built and
again destroyed during the struggle between the emperor
Henry IV. and the Saxons. By Frederick I. it was granted
to Henry the Lion, who caused it to be rebuilt about 1180. It
was a frequent residence of Otto IV., who died therein, and after
being frequently besieged and taken, it passed to the house of
Brunswick. It ceased to be of importance as a fortress after the Thirty Years' War, and gradually fell into ruins.

See Delius, Unternehmungen der Harzburg (Halfster, 1826); Domines, Harzburg and seine Umgebung (Goslar, 1862); Jacobs, Die Harzburg und ihre Geschichte (1885); and Stolle, Führer von Bad Harzburg (1899).

HARZ MOUNTAINS—HASA, EL

Brunswick. It ceased to be of importance as a fortress after the Thirty Years' War, and gradually fell into ruins.

See Delius, Unternehmungen der Harzburg (Halfster, 1826); Domines, Harzburg and seine Umgebung (Goslar, 1862); Jacobs, Die Harzburg und ihre Geschichte (1885); and Stolle, Führer von Bad Harzburg (1899).

HARZ MOUNTAINS—HASA, EL

The Brocken, opened in 1898. The district is traversed by excellent roads in all directions.

The Brocken summits are destitute of trees, but the lower slopes of the Upper Harz are heavily wooded with pines and firs.

Between the forests of these stretch numerous peat-mosses, which contain in their spongy reservoirs the sources of many small streams. On the Brocken are found one or two arctic and several alpine, plants. In the Lower Harz the forests contain a great variety of timber. The oak, elm and birch are common, while the beech especially attains an unusual size and beauty. The walnut-tree grows in the eastern districts.

The last bear was killed in the Harz in 1705, and the last lynx in 1817, and since that time the wolf too has become extinct; but deer, foxes, wild cats and badgers are still found in the forest.

The Harz is one of the richest mineral storehouses in Germany, and the chief industry is mining, which has been carried on since the middle of the 10th century. The most important mineral is a peculiarly rich argentiferous lead, but gold in small quantities, copper, iron, sulphur, alum and arsenic are also found. Mining is carried on principally at Klausthal and St Andreasberg in the Upper Harz. Near the latter is one of the deepest mining shafts in Europe, namely the Samson, which goes down 2790 ft. or 720 ft. below sea-level. For the purpose of getting rid of the water, and obviating the flooding of such deep workings, it has been found necessary to construct drainage works of some magnitude. Thus in the years 1776-1807 a tunnel 177 miles long was cut through the mountains from the east of Klausthal westward to Grund, a distance of 5 m.; but this proving insufficient, another sewer, the Ernst-Auguststollen, no less than 14 m. in length, was made from the same neighbourhood to Gittelde, at the west side of the Harz, in 1851-1864. Marble, granite and gyspum are worked; and large quantities of vitriol are manufactured. The vast forests that cover the mountain slopes supply the materials for a considerable trade in timber. Much wood is exported for building and other purposes, and in the Harz itself is used as fuel. The sawdust of the numerous mills is collected for use in the manufacture of paper. Turf-cutting, coarse lace-making and the breeding of canaries and native song-birds also occupies many of the people. Agriculture is carried on chiefly on the plateaus of the Lower Harz; but there is excellent pasturage both in the north and in the south. In the Lower Harz, as in Switzerland, the cows, which carry bells harmoniously tuned, are driven up to the heights in early summer, returning to the sheltered regions in late autumn.

The inhabitants are descended from various stocks. The Upper and Lower Saxons, the Thuringian and the Frankish races have all contributed to form the present people, and their respective influences are still to be traced in the varieties of dialect. The boundary line between High and Low German passes through the Harz. The Harz was the last stronghold of paganism in Germany, and to that fact are due the legends, in which no district is richer, and the fanciful names given by the people to peculiar objects and appearances of nature.

See Zeitsehrift des Harzvereins (Wernigerode, annually since 1868); Günther, Der Harz in Geschichts-Kultur- und Landschaftsbildern (Hanover, 1885); and "Der Harz" in Scobe's Monographien zur Erdkunde (Bielefeld, 1901); H. Hoffmann and others, Der Harz (Leipzig, 1903) (lower titles Lüneburger Berg). HASA, (Ahsa, Al Hasa), a district in the east of Arabia stretching along the shore of the Persian Gulf from Kúweit in 20° 20' N. to the south point of the Gulf of Bahrein in 25° 10' N., a length of about 360 m. On the W. it is bounded by Nejd, and on the S.E. by the peninsula of El Katir which forms part of Oman. The coast is low and flat and has no deep-water port along its whole length with the exception of Kúweit; from that place to El Katif the country is barren and without villages.
or permanent settlements, and is only occupied by nomad tribes, of which the principal are the Bani Hajar, Ajman and Khalid. The interior consists of low stony ridges rising gradually to the inner plateau. The oases of Hofuf and Katif, however, form a strong contrast to the barren wastes that cover the greater part of the district. Here an inexhaustible supply of underground water (to which the province owes its name) issues from springs, marking, according to Arab geographers, the course of a great subterranean river draining the Nejd highlands. Hofuf is the capital, a town of 15,000 to 20,000 inhabitants, with its neighbour Muharir scarcely less populous, forms the centre of a thriving district 50 m. long by 15 m. in breadth, containing numerous villages each with richly cultivated fields and gardens. The town walls enclose a space of 1½ by 1 m., at the north-west angle of which is a remarkable citadel attributed to the Carmathian princes. Muharir is celebrated for its hot spring, known as Um Sahā or "mother of seven," from the seven channels by which its water is distributed. Beyond the present limits of the oasis much of the country is well supplied with water, and ruined sites and half-obliterated canals show that it has only relapsed into waste in recent times. Cultivation reappears at Katif, a town situated on a small bay some 35 m. north-west of Bahrein. Date groves extend for several miles along the coast, which is low and muddy. The district is fertile but the climate is hot and unhealthy; still, owing to its convenient position, the town has a considerable trade with Bahrein and the gulf ports on one side and the interior of Nejd on the other. The fort is a strong-built enclosure attributed, like that at Hofuf, to the Carmathian prince Abu Tahir.

'Uker or 'Ujer is the nearest port to Hofuf, from which it is distant about 40 m.; large quantities of rice and piece goods transshipped at Bahrein are landed here and sent on by caravan to Hofuf, the great entrepôt for the trade between southern Nejd and the coast. It also shares in the valuable pearl fishery of Bahrein and the adjacent coast.

Politically El Haṣa is a dependency of Turkey, and its capital Hofuf is the headquarters of the sanjak or district of Nejd. Hofuf, Katif and El Katr were occupied by Turkish garrisons in 1871, and the occupation has been continued in spite of British protest as to El Katr, which according to the agreement made in 1867, when Bahrein was taken under British protection, was tributary to the latter. Turkish claims to Kuwait have not been admitted by Great Britain.

HASAN AND ḤOSAIN (or ḤUSEIN), sons of the fourth Mahomedan caliph Ali by his wife Fatima, daughter of Mahomet. On Ali's death Ḥasan was proclaimed caliph, but the strength of Moawiya who had rebelled against Ali was such that he resigned his claim on the grounds that he should have the disposal of the treasure stored at Kufa, with the revenues of Darabiljurf. This secret negotiation came to the ears of Ḥasan's supporters, a mutiny broke out and Ḥasan was wounded. He retired to Medina where he died about 669. The story that he was poisoned is probably due to an erroneous interpretation of ancient authorities (see Caliphate, sect. B, § 1). Subsequently his brother Ḥosain was invited by partisans in Kufa to revolt against Moawiya's successor Yazid. He was, however, defeated and killed at Kerbela on the 10th of October (Muharram) 680 (see Caliphate, sect. B, § 2 ad init.). Ḥosain is the hero of the Passion Play which is performed annually (e.g. at Kerbela) on the anniversary of his death by the Shi'ites of Persia and India, to whom from the earliest times the family of Ali are the only true descendants of Mahomet. The play lasts for several days and concludes with the carrying out of the collas (tubil) of the martyrs to an open place in the neighbourhood.

See Sir Wm. Muir, The Caliphate (1883); Sir Lewis Pelly, The Miracle Play of Ḥasan and Ḥosain (1879).

HASAN UL-BAṢRĪ [Abū Sa‘īd Ḥasan ibn Abī-l-Ḥasan Yassār ul- Başrī], (642-728 or 737), Arabian theologian, was born at Medina. His father was a freedman of Zaid ibn Thabit, one of the Anṣār ( Helpers of the Prophet), his mother a client of Umm Salama, a wife of Mahomet. Tradition says that Umm Salama often nursed Ḥasan in his infancy. He was thus one of the Tabī'ān (i.e. of the generation that succeeded the Helpers). He became a teacher of Baṣra and founded a school there. Among his pupils was Wazīr ibn Ḥādi, his nephew, Aṣ'ā, the founder of the Mu'tazilites. He himself was a great supporter of orthodoxy and the most important representative of asceticism in the time of its first development. With him fear is the basis of morality, and sadness the characteristic of his religion. Life is only a pilgrimage, and comfort must be denied to subdue the passions. Many writers testify to the purity of his life and to his excelling in the virtues of Mahomet's own companions. He was as if he were in the other world." In politics, too, he adhered to the earliest principles of Islam, being strictly opposed to the inherited caliphate of the Omayyads and a believer in the election of the caliph.

HASBEYA, or HASBEIYA, a town of the Druses, about 36 m. W. of Damascus, situated at the foot of Mt. Hermon in Syria, overlooking a deep amphitheatre from which a brook flows to the Hasbân. The population is about 5000 (4000 Christians). The town was the headquarters of the Druses in the 12th century. Here they held a council (tabut) in 1904.

HASDAI IBN SHAPRUT, the founder of the new culture of the Jews in Moorish Spain in the 10th century. He was both physician and minister to Caliph Abd-ar-Rahman III. In Cordova, a man of wide learning and culture, he encouraged the settlement of Jewish scholars in Andalusia, and his patronage of literature, science and art produced a very considerable uniqueness. Poetry, philology, philosophy all flourished under his encouragement, and his name was handed down to posterity as the first of the many Spanish Jews who combined diplomatic skill with artistic culture. This type was the creation of the Moors in Andalusia, and the Jews ably seconded the Mahomedans in the effort to make life at once broad and deep. (I. A.)

HASDEU, or HADEU, BOGDAN PETRICEICU (1836-1907), Rumanian philologist, was born at Khotin in Bessarabia in 1836. He studied at the universities of Kharov, Odessa, and Basarabia in 1850, and was the first settled in Jassy as professor of the rare Slavonic and Rumanian. He may be considered as the pioneer in many branches of Rumanian philology and history. At Jassy he started his Archiv historia a Româniel (1865-1867), in which a large number of old documents in Slavonic and Rumanian were published for the first time. In 1870 he inaugurated Columna lui Traian, the best philological review of the time in Rumania. In his Cursul den Bârănni (2 vols., 1878-1881) he was the first to contribute to the history of apocryphal literature in Rumania. His Historia critica a Românilor (1875), though incomplete, marks the beginning of critical investigation into the history of Rumania. Hasdeu edited the ancient Psalter of Corei of 1577 (Psalterul lui Corei, 1881). His Etymologicum magnus Rumanieae (1886, &c.) is the beginning of an encyclopaedic dictionary of the Rumanian language, though never finished
HASE, CARL AUGUST VON (1800–1890), German Protestant theologian and Church historian, was born at Steinbach in Saxony on the 23rd of August 1800. He studied at Leipzig and Erlangen, and in 1829 was called to Jena as professor of theology. He retired in 1853 and was made a baron. He died at Jena on the 3rd of January 1890. Hase’s aim was to reconcile modern culture with historical Christianity in a scientific way. But though a liberal theologian in the higher sense of that word, he vigorously attacked rationalism, as distinguished from the formal principle, charging it with being unscientific inasmuch as it ignored the historical significance of Christianity, shut its eyes to individuality and failed to give religious feeling its due. His views are presented scientifically in his Evangelisch-protestantische Dogmatik (1826; 6th ed., 1870), the value of which “lies partly in the full and judiciously chosen historical materials prefixed to each dogma, and partly in the skill, caution and tact with which the permanent religious significance of various dogmas is discussed” (Otto Pfleiderer). More popular in style is his Gnosis oder prot.-evang. Glaubenslehre (3 vols., 1827–1829; 2nd ed. in 2 vols., 1869–1870). But his reputation rests chiefly on his treatment of Church history in his Kirchengeschichte, Lehrbuch zurück für akademische Vorlesungen (1834, 12th ed., 1900).

HASEL, or HASHEESH, the Arabic name, meaning literally “dried herb,” for the various preparations of the Indian hemp plant (Cannabis indica), used as a narcotic or intoxicant in the East, and either smoked, chewed or drunk (see HEMP and BHANG). From the Arabic hashishin, i.e. “hemp-eaters,” comes the English “assassin” (see ASSASSIN).

HASELEMER, a market-town in the Guildford parliamentary division of Surrey, England, 43 m. S.W. from London by the London & South-Western railway. It is situated in an elevated valley, and is the highest point between Hindhead (895 ft.) and the back-down (518 ft.). Their summits are open and covered with heath, but their flanks and the lower ground are magnificently wooded. The hills are deeply scored by steep and picturesque valleys, of which the most remarkable is the Devil’s Punt Bowl, a hollow of regular form on the west flank of Hindhead. The invigorating air has combined with scenic attraction to make the district a favourite place of residence. Professor Tyndall built a house on the top of Hindhead, setting an example followed by many others. On Blackdown, closely screened by plantations, is Aldworth, built for Alfred, Lord Tennyson, who died here in 1892. George Eliot stayed for a considerable period at Shottermill, a neighbouring village. Pop. of Haslemere (1901), 20,147; of Hindhead, 666.

HASLINGDEN, a market-town and municipal borough in the Rossendale and Heywood parliamentary divisions of Lancashire, England, 19 m. N. by W. from Manchester by the Lancashire & Yorkshire railway. Pop. (1901), 18,543. It lies in a hilly district on the borders of the forest of Rossendale, and is supposed by some to derive its name from the hazel trees which formerly abounded in its neighbourhood. The old town stood on the slope of a hill, but the modern part has extended about its base. The parish church of St. James was rebuilt in 1780, with the exception of the tower, which dates from the time of Henry VIII. Thoral theolological manufacture was formerly the staple. The town, however, steadily increasing in importance, has cotton, woollen and engineering works—coal-mining, quarrying and brickmaking are carried on in the neighbourhood. The borough,
HASPE—HASSELQUIST

as incorporated in 1891, comprised several townships and parts of townships, but under the Local Government Act of 1894 these were united into one civil parish. The corporation consists of a mayor, 6 aldermen and 18 councillors. Area, 8156 acres.

HASPE, a town of Germany, in the Prussian province of Westphalia, in the valley of the Ennepe, at the confluence of the Hasp, and on the railway from Düsseldorf to Dortmund, 10 m. N.E. of Barmen by rail. Pop. (1905), 19,813. Its industries include iron foundries, rolling mills, puddling furnaces, and manufactures of iron, steel and brass wares and of machines. Haspe was raised to the rank of a town in 1875.

HASSAM, CHILDE (1859–1936), American figure and landscape painter, born in Boston, Massachusetts, was a pupil of Boudin and Lefebvre in Paris. He soon fell under the influence of the Impressionists, and took to painting in a style of his own, in brilliant colour, with effective touches of pure pigment. He won a bronze medal at the Paris Exhibition of 1889; medals at the World’s Fair, Chicago, 1893; Boston Art Club, 1896; Philadelphia Art Club, 1892; Carnegie Institute, Pittsburgh, 1898; Buffalo Pan-American, 1901; Temple gold medal, Pennsylvania Academy of Fine Arts, Philadelphia, 1899; and silver medal, Paris Exhibition, 1900. He became a member of the National Academy of Design, the Society of American Artists, the Ten Americans, the American Water Colour Society, the Société Nationale des Beaux Arts, Paris, and the Secessions Society, Munich.

HASSE, Johann Adolph (1690–1783), German musical composer, was born at Bergedorf near Hamburg, on the 25th of March 1690, and received his first musical education from his father. Being possessed of a fine tenor voice, he chose the theatrical career, and joined the operatic troupe conducted by Reinhard Keiser, in whose orchestra Handel had played the second violin some years before. Hasse’s success led to an engagement at the court theatre of Brunswick, and it was there that, in 1723, he made his début as a composer with the opera Antigone. The success of this first work induced the duke to send Hasse to Italy for the completion of his studies, and in 1724 he went to Naples and placed himself under Porpora, with whom, however, he seems to have disagreed both as a man and as an artist. On the other hand he gained the friendship of Alessandro Scarlatti, to whom he owed his first commission for a serenade for two voices, sung at a family celebration of a wealthy merchant by two of the greatest singers of Italy, Farinelli and Signora Tesi. This event established Hasse’s fame; he soon became very popular, and his opera Sestostrato, written for the Royal Opera at Naples in 1726, made his name known all over Italy. At Venice, where he went in 1727, he became acquainted with the celebrated singer Faustina Bordogni (born at Venice in 1700), who became the composer’s wife in 1730. These two artists soon afterwards went to Dresden, in compliance with the brilliant offer made by the young elector of Saxony, Augustus II. There Hasse remained for two years, after which he again journeyed to Italy, and also in 1733 to London, in which latter city he was tempted by the aristocratic clique inimical to Handel to become the rival and antagonist of that great master. But he modestly and wisely declined, remaining in London only long enough to superintend the rehearsals for his opera Artaserse (first produced at Venice, 1730). All this while Faustina had remained at Dresden, the declared favourite of the public and unfortunately also of the elector, who was her husband’s chief rival, was her choice, and allowed to see her except at long intervals. In 1739, after the death of Augustus II., Hasse settled permanently at Dresden till 1763, when he and his wife retired from court service with considerable pensions. But Hasse was still too young to rest on his laurels. He went with his family to Vienna, and added several operas to the great number of his works already in existence. His last work for the stage was the opera Ruggiero (1771), written for the wedding of Archduke Ferdinand at Milan. On the same occasion a work by Mozart, then fourteen years of age, was performed, and Hasse said to him, “This young天才 will surpass us all.” By desire of his wife Hasse settled at her birthplace Venice, and there he died on the 23rd of December 1783. His compositions include as many as 150 operas, besides oratorios, cantatas, masses, and almost every variety of instrumental music. During the siege of Dresden by the Prussians in 1760, most of his manuscripts, collected for a complete edition to be brought out at the expense of the elector, were burnt. Some of his works, amongst them an opera Alcide al Birro (1760), have been published, and the libraries of Vienna and Dresden possess the autographs of others. Hasse’s instrumentation is certainly not above the low level attained by the average musicians of his time, and his ensembles do not present any features of interest. In dramatic fire also he was wanting, but he had a fund of gentle and genuine melody, and by this fact his enormous popularity during his life must be accounted for. The two airs which Farinelli had to repeat every day for ten years to the melancholy king of Spain, Philip V., were both from Hasse’s works. Of Faustina Hasse it will be sufficient to add that she was, according to the unanimous verdict of the critics (including Dr Burney), one of the greatest sopranos of a time rich in vocal artists. The year of her death is not exactly known. Most probably it shortly preceded that of her husband.

HASSELQUIST, FREDRIK (1722–1752), Swedish traveller and naturalist, was born at Törmvell, East Gothland, on the 3rd of January 1722. On account of the frequently expressed regrets of Linnaeus, under whom he studied at Upsala, at the lack of information regarding the natural history of Palestine,
Hasselquist, Andre Henri Constant Van (1806-1874), Belgian poet, was born at Maastricht, in Limburg, on the 5th of January 1806. He was educated in his native town, and at the university of Liége. In 1833 he left Maastricht, then blockaded by the Belgian forces, and made his way to Brussels, where he became a naturalized Belgian, and was attached to the Bibliothèque de Bourgogne. In 1834 he entered the education department, and eventually became an inspector of normal schools. His native language was Dutch, and as a French poet André van Hasselust had to overcome the difficulties of writing in a foreign language. His first published work, a Chant hélénique in honour of Charles X in the columns of La Sentinelle des Pays-Bas as early as 1836, and other poems followed. His first volume of verse, Primières (1834), shows markedly the influence of Victor Hugo, which had been strengthened by a visit to Paris in 1830. His relations with Hugo became intimate in 1831-1832, when the poet was an exile in Brussels. In 1839 he became editor of the Renaissance, a paper founded to encourage the fine arts. His chief work, the epic of the Quatre Incarnations du Christ, was published in 1867. In the same volume were published his Études rythmiques, a series of metrical experiments designed to show that the French language could be adapted to every kind of musical rhythm. With the same end in view he executed, at the same period, a large number of French songs, and wrote new French librettos for the best-known operas of Mozart, Weber, and others. Hasselust died at Saint Josse ten Noode, a suburb of Brussels, on the 1st of December 1874.

A selection from his works (10 vols., Brussels, 1876-1877) was edited by M. Charles Hen and Louis Alvin. He wrote many books for children, chiefly under the pseudonym of Alfred Avelines; and studies on historical and literary subjects. The books written in collaboration with Charles Hen are signed Charles André. A bibliography of his writings is appended to the notice by Louis Alvin in the Bibliographie belge, vol. viii.

Hasselust’s fame has continued to increase since his death. A series of tributes to his memory are printed in the Poésies choisies (1901), edited by M. Georges Barral for the Collection des poètes français de l’étranger. This collection contains a centenary study by M. Lablache, and some valuable notes on the poet’s theories of rhythm.

**HASSELT, the capital of the Belgian province of Limburg.**

Pop. (1904), 16,179. It derives its name from Hazel-bosch (hazel wood). It stands at the junction of several important roads and railways from Maaseick, Maastricht and Liège. It has many breweries and distilleries, and the spirit known by its name, which is a coarse gin, has a certain reputation throughout Belgium. On the 6th of August 1831 the Dutch troops obtained here their chief success over the Belgian nationalists during the War of Independence. Hasselust is best known for its great semi-official fête held on the day of Assumption, August 15th. The curious part of this fête, which is held in honour of the Virgin under the name of Virga Jesse, is the conversion of the town for the day into the semblance of a forest. Fir trees and branches from the neighbouring forest are collected and planted in front of the houses, so that for a few hours Hasselust has the appearance of being restored to its primitive condition as a wood. The figure of the giant who is supposed to have once held the Hazel-bosch under his terror is paraded on this occasion as the “lounge man.” Originally this celebration was held annually, but in the 18th century it was restricted to once in seven years. There was a celebration in 1905.

**HASSENPLUG, Hans Daniel Ludwig Friedrich (1794-1862), German statesman, was born at Hanau in Hesse on the 26th of February 1794. He studied law at Göttingen, graduated in 1816, and took his seat as Assessor in the judicial chamber of the board of government (Regierungskollegium) at Cassel, of which his father Johann Hasenplug was also a member. In 1821 he was nominated by the new elector, William II., Justizrat (counsellor of justice); in 1832 he became Ministerialrat and reporter (Referent) to the ministry of Hesse-Cassel, and in May of the same year was appointed successively minister of justice and of the interior. It was from this moment that he became conspicuous in the constitutional struggles of Germany. The new constitutional system introduced by the elector William I. had broken down before the revolutionary movements of 1830, and in 1831 Hesse had received a constitution. This development was welcome neither to the elector nor to the other German governments, and Hasenplug deliberately set to work to reverse it. In doing so he gave the lie to his own early promise; for he had been a conspicuous member of the revolutionary Burschenschaft at Göttingen, and had taken part as a volunteer in the War of Liberation. Into the causes of the change it is unnecessary to inquire; Hasenplug by training and tradition was a strait-laced official; he was also a first-rate lawyer, and his naturally arbitrary temper had from the first displayed itself in an attitude of opposition towards the new constitution, which he sought to undermine towards the elector. To such a man constitutional restrictions were intolerable, and from the moment he came into power he set to work to override them, by means of press censorship, legal quibbles, unjustifiable use of the electoral prerogatives, or frank supression of the legislative rights of the Estates by electoral ordinances. The story of the constitutional deadlock that resulted belongs to the history of Hesse-Cassel and Germany; so far as Hasenplug himself was concerned, it made him, more even than Metternich, the Mephistopheles of the Reaction to the German people. In Hesse itself he was known as “Hessen’s Haas und Fluch” (Hesse’s hate and curse). In the end, however, his masterful spirit overcame his competitor (Frederick William); in the summer of 1837 he was suddenly removed from his post as minister of the interior and he thereupon left the elector’s service.

In 1838 he was appointed head of the administration of the little principality of Hohenzollern-Sigmaringen, an office which he exchanged in the following year for that of civil governor of the grand-duchy of Luxembourg. Here, too, his independent character suffered him to remain only a year; he resented having to transact all business with the grand-duke (king of the Netherlands) through a Dutch official at the Hague; he protested against the absorption of the Luxembourg surplus in the Dutch treasury and, failing to obtain redress, he resigned (1840). From 1841 to 1850 he was in Prussian service, first as a member of the supreme court of justice (Obertribunal) and then (1846) as president of the high court of appeal (Oberappellationsgericht) at Greifswald. In 1850 he was tried for peculation and convicted; and, though this judgment was reversed on appeal, he left the service of Prussia. With somewhat indecent haste (the appeal had not been heard) he was now summoned by the elector of Hesse once more to the head of the government, and he immediately threw himself again with zeal into the struggle against the constitution. He soon found, however, that the opinion of all classes, including the army, was solidly against him, and he decided to risk all on an alliance with the reviving fortunes of Austria, which was steadily working for the restoration of the status quo overthrown by the revolution of 1838. On his advice the elector seceded from the Northern Union established by Prussia and Austria, and, on the 13th of September, committed the folly of flying secretly from Hesse with his minister. They went to Frankfort, where the federal diet had been re-established, and on the 25th persuaded the diet to decree an armed intervention in Hesse. This decree, carried out by Austrian troops, all but led to war with Prussia, but the unreadiness of the Berlin government led to the triumph of Austria and of Hasenplug, who at the end of the year was once more installed in power at Cassel as minister of finance. His position was, however, not enviable; he was obliged and...

despised by all, and disliked even by his own master. The climax came in November 1853, when he was publicly horse-whipped by the count of Isenburg-Wächtersbach, the elector's son-in-law. The count was pronounced insane; but Hasennyssel was conscious of the method in his madness, and tendered his resignation. This was, however, not accepted; and it was not till the 16th of October 1855 that he was finally relieved of his offices. He retired to Marburg, where he died on the 15th of October 1862. He lived just long enough to hear of the restoration of the Hesse constitution of 1831 (June 21, 1862), which it had been his life's mission to destroy. Of his publications the most important is Aktensicle, die landständischen Anklagen wider den Kurfürstlichen hessischen Staatsminister Hasennyssel Ein Beitrag zur Zeitgeschichte and zum neuen deutschen Staatsrecht, anony. (Stuttgart and Tübingen, 1836). He was twice married, his first wife being the sister of the brothers Grimm. His son Karl Hasennyssel (1824-1890) was a distinguished sculptor.

See the biography by Wippermann in Allgemeine deutsche Biographie, with authorities.

HASTINAPUR, an ancient city of British India, in the Meerut district of the United Provinces, lying on the bank of a former bed of the Ganges, 22 m. N.E. of Meerut. It formed the capital of the great Pandir in the 13th century B.C., and probably one of the earliest Aryan settlements outside the Punjab. Tradition points to a group of shapeless mounds as the residence of the Lunar princes of the house of Bharata whose deeds are commemorated in the great national epic. After the conclusion of the famous war which forms the central episode of that poem, Hastinapura remained for some time the metropolis of the descendants of Parikshit, but the town was finally swept away by a flood of the Ganges, and the capital was transferred to Kausambi.

HASTINGS, a famous English family. John, Baron Hastings (c. 1262–c. 1313), was a son of Sir Henry de Hastings (d. 1268), who was summoned to parliament as a baron by Simon de Montfort in 1264. Having joined Montfort's party Sir Henry led the Londoners at the battle of Lewes and was taken prisoner at Evesham. After his release he continued his opposition to Henry III; he was among those who resisted the king at Kenilworth, and after the issue of the Dictum de Kenilworth he commanded the remnant of the baronial party when they made their last stand in the isle of Ely, submitting to Henry in July 1267. His younger son, Edmund, was specially noted for his military services in Ireland, where he became lord of Trim, and his younger son, John, who married Isabella (d. 1305), daughter of William de Valence, earl of Pembroke, a half-brother of Henry III., and fought in Scotland and in Wales. Through his mother, Joanna de Cantilupe, he inherited the extensive lordship of Abergavenny, hence he is sometimes referred to as lord of Abergavenny, and in 1265 he was summoned to parliament as a baron. Before this date, however, he had come somewhat prominently to the front. His paternal grandmother, Ada, was a younger daughter of David, earl of Huntingdon, and a niece of the Scottish king, William the Lion; and in 1200 when Margaret, the maid of Norway, died, Hastings came forward as a claimant for the vacant throne. Although unsuccessful in the matter he did not swerve from his loyalty to Edward I. He fought constantly either in France or in Scotland; he led the bishop of Durham's men at the celebrated siege of Carlaverock castle in 1300; and with his brother Edmund he signed the letter which in 1301 the English barons sent to Pope Boniface VIII. repudiating papal interference in the affairs of Scotland; on other occasions he represented the king in Aquitaine. Hastings died in 1312, leaving no direct heir, Isabella, daughter of the elder Hugh le Despenser, Hastings, who was one of the most wealthy and powerful nobles of his time, stood high in the regard of the king and is lauded by the chroniclers.

His eldest son John (d. 1325), who succeeded to the barony, was the father of Laurence Hastings, who was created earl of Pembroke in 1339, the earls of Pembroke retaining the barony of Hastings until 1389. A younger son by a second marriage, Sir Hugh Hastings (c. 1307–1347), saw a good deal of military service in France; his portrait and also that of his wife may still be seen on the east window of Elaing church, which contains a wall of brass to his memory. Down, 4th baronet, who

On the death of John, the third and last earl of Pembroke of the Hastings family, in 1380, Sir Hugh's son John had, according to a decision of the House of Lords in 1840, a title to the barony of Hastings, but he did not prosecute his claim and he died without sons in 1393. However his grand-nephew and heir, Hugh (d. 1506), claimed the barony, which was also claimed by Reginald, Lord Grey of Ruthyn. Like the earls of Pembroke, Grey was descended through his grandmother, Elizabeth Hastings, from John, Lord Hastings, by his first wife; he had been made a baronet in 1593. After Hugh's death his brother, Sir Edward Hastings (c. 1582–1453), claimed the barony, and the case as to who should bear the arms of the Hastings family came before the court of chivalry. In 1410 it was decided in favour of Grey, who thereupon assumed the arms. Both disputants still claimed the barony, but the view seems to have prevailed that it had fallen into abeyance in 1380. Sir Edward was imprisoned for refusing to pay his rival's costs, and he was probably still in prison when he died in January 1438. After his death the Hastings family, which had been extinct for a century, during the 16th century, tacitly abandoned the claim to the barony. After Edward IV's death Hastings be

A distant relative of the same family was William, Baron Hastings (c. 1430-1483), a son of Sir Leonard Hastings (d. 1455). He became attached to Edward IV., whom he served before his accession to the throne, and after this event he became master of the mint, chamberlain of the royal household and one of the king's most trusted counselors. During the so-called Marian period he was accused of complicity in the treason of his brother-in-law, Sir Reginald Grey, and was imprisoned at the Tower in 1513, but was released on payment of a sum of money. In 1520 his aid was required by the king to suppress a rising in Scotland, and in 1522 he was one of the king's commissioners for the settlement of the boundary with France. When Francis, 10th earl of Huntingdon, died in October 1789, the barony of Hastings passed to his sister Elizabeth (1731-1808), wife of John Rawdon, earl of Moira, and from her it came to her son Francis Rawdon-Hastings (see below), who was created marquess of Hastings in 1817.

HASTINGS, FRANCIS RAWDON-HASTINGS, 1st Marquess of (1754–1816), British soldier and governor-general of India, born on the 9th of December 1754, was the son of Sir John Rawdon of Moira in the county of Down, 4th baronet, who was created Baron Rawdon of Moira, and afterwards earl of Moira, in the Irish peerage. His mother was the Lady Elizabeth Hastings, daughter of Theophilus, 9th earl of Huntingdon. Lord Rawdon, as he was then called, was educated at Harrow and Oxford, and joined the army in 1771 as ensign in the 13th foot. His life henceforth was entirely spent in the service of his country, and may be divided into four periods: from 1775 to
HASTINGS, MARQUESS OF

1782 he was engaged with much distinction in the American war; from 1783 to 1783 he held various high appointments at home, and took an active part in the business of the House of Lords; from 1813 to 1823 was the period of his labours in India; after retiring from which, in the last years of his life (1824-1826), he was governor of Malta.

In America Rawdon served at the battles of Bunker Hill, Brooklyn, White Plains, Monmouth and Camden, at the attacks on Forts Washington and Wadsworth, and at the siege of Charleston. In fact he was engaged in many important operations of the war. Perhaps his most noted achievements were the raising of a corps at Philadelphia, called the Irish Volunteers, who under him became famous for their fighting qualities, and the victory of Hobbirk's Hill, which, in command of only a small force, he gained by superior military skill and determination against a much larger body of Americans. In 1781 he was invalided. The vessel in which he returned to England was captured and carried into Brest. He was speedily released, and on his arrival in England was much honoured by George III., who created him an English peer (Baron Rawdon) in March 1783. In 1786 his mother was raised to the barony of Hastings, and Rawdon added the surname of Hastings to his own.

In 1793 Rawdon succeeded his father as Earl of Moira. In 1794 he was sent with 7000 men to Ostend to reinforce the duke of York and the allies in Flanders. The march by which he effected a junction was considered extraordinary. In 1803 he was appointed commander-in-chief in Scotland, and in 1804 he married Flora Mure Campbell, countess of Loudoun in her own right. When Fox and Grenville came into power in 1806, Lord Moira, who had always voted with them, received the place of master-general of the ordnance. He was now enabled to carry a philanthropic measure, of which from his first entry into the House of Lords he had been a great promoter, namely, the Debtor and Creditor Bill for relief of poor debtors. Ireland was another subject to which he had given particular attention: in 1797 there was published a Speech by Lord Moira on the Dreadful and Alarm ing State of Ireland. Lord Moira's sound judgment on public affairs, combined with his military reputation and the uprightness of his character, won for him a high position among the statesman of the day, and he gained an additional prestige from his intimate relations with the prince of Wales. As a mark of the regent's regard Lord Moira received the order of the Garter in 1812, and in the same year was appointed governor-general of Bengal and commander-in-chief of the forces in India. He landed at Calcutta, and assumed office in succession to Lord Minto in October 1813. One of the chief questions which awaited him was that of relations with the Gurkha state of Nepal. The Gurkhas, a brave and warlike little nation, failing to extend their conquests in the direction of China, had begun to encroach on territories held or protected by the East India Company; especially they had seized the districts of Batwal and Searaj, in the northern part of Oudh, and when called upon to relinquish these, they deliberately elected (April 1814) to go to war rather than do so. Lord Moira, having travelled through the northern provinces and fully studied the question, declared war against Nepal (November 1814). The enemy's frontier was 1600 m. long, and Lord Moira, who directed the campaign in succession, resolved to act offensively along the whole line. It was an anxious undertaking, because the native states of India were all watching the issue and waiting for any serious reverse to the English to join against them. At first all seemed to go badly, as the British officers despised the enemy, and the sepoys were unaccustomed to mountain warfare, and thus alternate extremes of rashness and despondency were exhibited. But this rectified itself in time, especially through the achievements of General (afterwards Sir David) Ochterlony, who before the end of 1815 had taken all the Gurkha posts to the west, and early in 1816 was advancing victoriously within 50 m. of Kathmandu, the capital of Ghurkha. But the better discipline of the British army enabled the British to advance till they had subdued the disputed districts, ceded some territory to the British, and agreed to receive a British resident. For his masterly conduct of these affairs Lord Moira was created marquess of Hastings in February 1817.

He had now to deal with internal dangers. A combination of Mahratta powers was constantly threatening the continuance of British rule, under the guise of plausible assurances severally given by the peshwa, Sindhia, Holkar and other princes. At the same time the existence of the Pindari state was not only dangerous to the British, as being a warlike power always ready to turn against them, but it was a scourge to India itself. In 1816, however, the Pindaris entered British territory in the Northern Circars, where they destroyed 330 villages. On this, permission was obtained to act for their suppression. Before the end of 1817 the preparations of Lord Hastings were completed, when the peshwa suddenly broke into war, and the British were opposed at once to the Mahratta and Pindari powers, estimated at 200,000 men and 500 guns. Both were utterly shattered in a brief campaign of four months (1817-18). The peshwa's dominions were annexed, and those of Sindhia, Holkar, and the raja of Berar lay at the mercy of the governor-general, and were saved only by his moderation. Thus, after sixty years from the battle of Plassey, the supremacy of British power in India was effectively established. The Pindaris had ceased to exist, and peace and security had been substituted for misery and plunder.

"It is a proud phrase to use," said Lord Hastings, "but it is a true one, that we have bestowed blessings upon millions. Nothing can be more delightful than the reports I receive of the sensibility manifested by the inhabitants to this change in their circumstances. The smallest detachment of our troops during the campaign in that district without meeting everywhere eager and exulting gratulations, the tone of which proves them to come from glowing hearts. Multitudes of people have, even in this short interval, come from the hills and fastnesses in which they had sought refuge for years, and have reoccupied their ancient deserted villages. The ploughshare is again in every quarter turning up a soil which had for many seasons never been stirred, except by the hoofs of predatory cavalry."

While the natives of India appreciated the results of Lord Hastings's achievements, the court of directors grumbled at his having extended British territory. They also disliked and opposed his measures for introducing education among the natives and his encouraging the freedom of the press. In 1819 he obtained the cession by purchase of the island of Singapore. In finance his administration was very successful, as notwithstanding the expenses of his wars he showed an annual surplus of two millions sterling. Brilliant and beneficent as his career had been, Lord Hastings did not escape unjust detraction. His personality was not by any means agreeable to all; discussions on matters notorious at the time, namely, the affairs of the banking-house of W. Palmer and Company. The whole affair was mixed up with insinuations against Lord Hastings, especially charging him with having been actuated by favouritism towards one of the partners in the firm. From imputations which were inconsistent with his whole character he has subsequently been exonerated. But while smarting under them he tendered his resignation in 1821, though he did not leave India till the first day of 1823. He was much exhausted by the arduous labours which for more than nine years he had sustained. Among his characteristics it is mentioned that "his ample fortune enabled him to share the benefits of his office without having, far from having enriched himself in the appointment of governor-general, he returned to England in circumstances which obliged him to seek public employment. In 1824 he received the comparatively small post of governor of Malta, in which island he introduced many reforms and endeared himself to the inhabitants. He died on the 28th of November 1826, leaving a request that his right hand should be cut off and preserved till the death of the marchioness of Hastings, and then be interred in her coffin.

Hastings was succeeded by his son, Francis George Augustus (1809-1844), who in 1836 succeeded through right of the elder of Loudoun. When his second son, Henry Weyssof, the 4th marquess, died childless on the 10th of November 1868 the marquessate became extinct; the earldom of Loudoun devolved upon his sister, Edith Mary (d. 1874), wife of Charles Frederick Abney-Hastings, afterwards Baron Donington; the
HASTINGS, F. A.—HASTINGS, WARREN

harony of Hastings, which fell into abeyance, was also revived in 1871 in her favour.

See Rose-of-Bladensburg, The Marquess of Hastings ("Rulers of India," series) (1893); and Private Journal of the Marquesses of Hastings, edited by his daughter, the marchioness of Bute (1858).

HASTINGS, FRANK ABNEY (1794–1828), British naval officer and Philhellen, was the son of Lieut.-general Sir Charles Hastings, a natural son of Francis Hastings, tenth earl of Huntingdon. He entered the navy in 1805, and was in the "Neptune" (100) at the battle of Trafalgar; but in 1820 a quarrel with his flag captain led to his leaving the service. The revolu-
tional troubles of the time offered chances of foreign employ-
ment. Hastings spent a year on the continent to learn French, and sailed for Greece on the 1st of March 1822 from Marseilles. On the 3rd of April he reached Hydra. For two years he took part in the naval operations of the Greeks in the Gulf of Smyrna

and elsewhere. He saw that the light squadrons of the Greeks must in the end be overpowered by the heavier Turkish navy, clumsy as it was; and in 1823 he drew up and presented to Lord Byron a very able memorandum in which he laid before the Greek government in 1824. This paper is of peculiar interest apart from its importance in the Greek insurrection, for it contains the germs of the great revolution which has since been effected in naval gunnery and tactics. In substance the memorandum advocated the use of steamers in preference to sailing ships, and of direct fire with shells and hot shot, as a more trustworthy means of destroying the Turkish fleet than fire-ships. It will be found in Finlay's History of the Greek Revolution, vol. ii. appendix I. The application of Hastings's ideas led necessarily to the disuse of sailing ships, and the introduction of armour. The incompetence of the Greek government and the corrupt waste of its resources prevented the full application of Hastings's bold and far-seeing plans. But largely by the use of his own money, of which he is said to have spent £7,000, he was able to some extent to carry them out. In 1824 he came to England to obtain a steamer, and in 1825 he had fitted out a small steamer named the "Karteria" (Perseverance), manned by Englishmen, Swedes and Greeks, and provided with apparatus for the discharge of shell and hot shot. He did enough to show that if his advice had been vigorously followed the Turks would have been driven off the sea long before the date of the battle of Navarino. The great effect produced by his ships in an attack on the sea-line of communication of the Turkish army, then besieging Athens at Oropus and Volo in March and April 1827, was a clear proof that much more could have been done. Military mismanagement caused the defeat of the Greeks round Athens. But Hastings, in co-operation with General Sir R. Church (q.v.), shifted the scene of the attack to western Greece. Here he destroyed the small Turkish squadron at Salona Bay in the Gulf of Corinth (19th of September 1827) provoked Ibrahim Pasha into the aggressive movements which led to the destruction of his fleet by the allies at Navarino (q.v.) on the 20th of October 1827. On the 25th of May 1828 he was wounded in an attack on Anatolikon, and he died in the harbour of Zante on the 1st of June. General Gordon, who served in the war and wrote its history, says of him: "If ever there was a disinterested and really useful Philhellen it was Hastings. He received no pay, and had expended most of his slender fortune in keeping the 'Karteria' afloat for the last six months. His ship, too, was the only one in the Greek navy where regular discipline was maintained."

HASTINGS, WARREN (1732–1818), the first governor-general of British India, was born on the 6th of December 1732 in the little hamlet of Churchill in Oxfordshire. He came of a family which had been settled for many generations in the adjoining village of Newington. His father had been a captain in the Royal Artillery, and his grandfather had been unable to maintain himself in possession of the family living. His mother died a few days after giving him birth; his father, Pynaston Hastings, drifted away to perish obscurely in the West Indies. Thus unfortunate in his birth, young Hastings received the elements of education at a charity school in his native village. At the age of eight he was taken in charge by an elder brother of his father, Howard Hastings, who held a post in the customs. After spending two years at a private school at Newington Butts, he was moved to Westminster, where among his contemporaries occur the names of Lord Thurloe and Lord Shelburne, Sir Erjiah Impey, and the poets Cowper and Churchill. In 1749, when his headmaster Dr Nichols was already anticipating for him a successful career at the university, his uncle died, leaving him to the care of a distant kinsman, Mr Cresswicke, who was afterwards in the direction of the East India Company; and he determined to send his ward to seek his fortune as a "writer" in Bengal.

When Hastings landed at Calcutta in October 1750 the affairs of the East India Company were at a low ebb. Throughout the entire south of the peninsula French influence was predominant. The settlement of Fort St George or Madras, captured by force of arms, had only recently been restored in accordance with a clause of the peace of Aix-la-Chapelle. The organizing genius of Duplex everywhere overshadowed the native imagination, and the star of Clive had scarcely yet risen above the horizon. The rivalry between the English and the French, which had already convulsed the south, did not penetrate to Bengal. That province was under the able government of Ali Vardi Khan, who peremptorily forbade the foreign settlers at Calcutta and Chander-

nagore to introduce foods from Europe. The duties of a young "writer" were then such as are implied in the name. At an early date Hastings was placed in charge of an aurang or factory in the interior, where his duties would be to superintend the weaving of silk and cotton goods under a system of money advances. In 1753 he was transferred to Cossimbazar, the river-port of the native capital of Murshidabad. In 1756 the old nawab died, and was succeeded by his grandson Suraj-

ud-Dowlah, a young madman of 19, whose name is indelibly associated with the tragedy of the Black Hole. When that passionate young prince, in revenge for a fancied wrong, resolved to drive the English out of Bengal, his first step was to occupy the fortified factory at Cossimbazar, and make prisoners of Hastings and his companions. Hastings was soon released at the intercession of the Dutch resident, and made use of his position at Murshidabad to open negotiations with the English fugitives at Falta, the site of a Dutch factory near the mouth of the Hugli. In later days he used to refer with pride to his services on this occasion, when he was first initiated into the wiles of Oriental diplomacy. After a while he found it necessary to fly from the Mahommmedan court and join the main body of the English at Falta. When the relieving force arrived from Madras under Colonel Clive and Admiral Watson, Hastings enrolled himself as a volunteer, and took part in the action which led to the recovery of Calcutta. Clive showed his appreciation of Hastings's merits by appointing him in 1758 to the important post of resident at the court of Murshidabad. It was there that he first came into collision with the Bengali Brahman, Nunocomar, whose subsequent fate has supplied more material for controversy than any other episode in his career. During his three years as resident he was able to render not a few valuable services to the Company; but it is more important to observe that his name nowhere occurs in the official lists of those who derived pecuniary profit from the necessities and weakness of the native court. In 1761 he was promoted to be member of council, under the presi-
dency of Mr Vansittart, who had been introduced by Clive from Madras. The period of Vansittart's government has been truly described as "the most revolting page of our Indian history." The entire duties of administration were suffered to remain in the hands of the nawab, while a few irresponsible English traders had drawn to themselves all real power. The members of council, the commanders of the troops, and the commercial residents plundered on a grand scale. The youngest servant of the Company claimed to be "free from taxation and from local jurisdiction, not only for him-

self but also for every native subordinate whom he might permit

"..."
to use his name. It was this exemption, threatening the very foundations of the Mussulman government, that finally led to a rupture with the nawab. Macaulay, in his celebrated essay, has said that "of the conduct of Hastings at this time little is known." As a matter of fact, the book which Macaulay was professing to review describes at length the honourable part consistently taken by Hastings in opposition to the great majority of the council. Sometimes in conjunction only with Vansittart, sometimes absolutely alone, he protested unceasingly against the policy and practices of his colleagues. On one occasion he was stinted at a minute in Mr Batson with "having espoused the nawab's cause, and as a hired solicitor defended all his actions, however dishonourable and detrimental to the Company." An altercation ensued. Batson gave him the lie and struck him in the council chamber. When war was actually begun, Hastings officially recorded his previous resolution to have resigned, in order to repudiate responsibility for measures which he had always opposed. Waiting only for the decisive victory of Buxar over the allied forces of Bengal and Oudh, he resigned his seat and sailed for England in November 1764.

After fourteen years' residence in Bengal Hastings did not return home a rich man, estimated by the opportunities of his position. According to the custom of the time he had augmented his slender salary by private trade. At a later date he was charged by Burke with having taken up profitable contracts for supplying bullock for the use of the Company's troops. It is admitted that he conducted by means of agents a large business in timber in the Gangetic Sundarbans. When at Malta he had married Mrs Buchanan, the widow of an officer. She bore him two children, of whom one died in infancy at Murshidabad, and was shortly followed to the grave by her mother. Their common gravestone is in existence at the present day, hearing date July 11, 1759. The other child, a son, was sent to England, and also died shortly before his father's return. While at home Hastings is said to have attached himself to literary society; and it may be inferred from his own letters that he now made the personal acquaintance of Samuel Johnson and Lord Mansfield. In 1776 he was called upon to give evidence before a committee of the House of Commons upon the affairs of Bengal. The good sense and clearness of the views which he expressed caused attention to be paid to his desire to be again employed in India. His pecuniary affairs were embarrassed, partly from the liberality with which he had endowed his few surviving relatives. The great influence of Lord Clive was also exercised on his behalf. At last, in the winter of 1768, he received the appointment of second in council at Madras. Among his companions on his voyage round the Cape were the Baron Imhoff, a speculative portrait-painter, and his wife, a lady of some personal attractions and great social charm, who was destined henceforth to be Hastings's lifelong companion. Of his two years' work at Madras it is needless to speak in detail. He won the good-will of his employers by devoting himself to the improvement of their manufacturing business, and he kept his hands clean from the prevalent taint of pecuniary transactions with the nawab of the Carnatic. One fact of some interest is not generally known. He drew up a scheme for the construction of a pier at Madras, to avoid the dangers of landing through the surf, and instructed his brother-in-law in England to obtain estimates from the engineers Brindley and Smeaton.

In the beginning of 1772 his ambition was stimulated by the nomination to the second place in council in Bengal with a promise of the reversion of the governorship when Mr Carter should come. He found the previous settlers of that position determined to resist the changed feeling in the government, and the situation of affairs in that settlement had scarcely improved. The second governorship of Clive was marked by the transfer of the diwan or financial administration from the Mogul emperor to the Company, and by the enforcement of stringent regulations against the besetting sin of peculation. But Clive was followed by two inefficient successors; and in 1770 occurred the most terrible Indian famine on record, which is credibly estimated to have swept away one-third of the population. In April 1772 Warren Hastings took his seat as president of the council at Fort William. His first care was to carry out the instructions received from home, and effect a radical reform in the system of government. Clive's plan of an independent lists of the opposite side of the court had proved a failure. The directors were determined "to stand forth as dwān, and take upon themselves by their own servants the entire management of the revenues." All the officers of administration were transferred from Murshidabad to Calcutta, which Hastings boasted at this early date that he would make the first city in Asia. This reform involved the ruin of many native reputations, and for a second time brought Hastings into collision with the wily Brahman, Nuncumar. At the same time a settlement of the land revenue on leases for five years was begun, and the police and military systems of the country were placed upon a new footing. Hastings was a man of immense industry, with an insatiable appetite for detail. The whole of this large series of reforms was conducted under his own personal supervision, and upon no part of his multifarious labours did he dwell in his letters home with greater pride. As an independent measure of economy, the stipend paid to the titular nawab of Bengal, who was then a minor, was reduced by one-half—to sixteen lakhs a year (say £160,000). Macaulay imputes this reduction to Hastings as a characteristic act of financial immorality; but in truth it had been expressly enjoined by the court of directors, in a despatch dated six months before he took up office. His pecuniary bargains with Shuja-ud-Dowlah, the nawab wazir of Oudh, stand on a different basis. Hastings himself always regarded them as incidents in his general scheme of foreign policy. The Maharrattas at this time had got possession of the person of the Mogul emperor, Shah Alam, from whom Clive obtained the grant of Bengal in 1765, and to whom he assigned in return the districts of Allahabad and Kora and a tribute of £300,000. With the emperor in their camp, the Maharrattas were threatening the province of Oudh, and causing a large British force to be cantoned along the frontier for its defence. Warren Hastings, as a deliberate measure of policy, withheld the tribute due to the emperor, and resold Allahabad and Kora to the wazir of Oudh. The Maharrattas retreated, and all danger for the time was dissipated by the death of their principal leader. The wazir now beheld him that he had a good opportunity for satisfying an old quarrel against the adjoining tribe of Rohillas, who had played fast and loose with him while the Maharratta army was at hand. The Rohillas were a race of Afghan origin, who had established themselves for some generations in a fertile tract west of Oudh, between the Himalayas and the Ganges, which still bears the name of Rohilkhond. They were not so much the occupants of the soil as a dominant caste of warriors and freebooters. But in those troubled days their title was as good as any to be found in India. After not a little hesitation, Hastings consented to allow the Company's troops to be used to further the ambitious designs of his Oudh ally, in consideration of a sum of money which relieved the ever-pressing wants of the Bengal treasury. The Rohillas were defeated in fair fight. Some of them fled the country, and so far as possible Hastings obtained terms for those who remained. The fighting, no doubt, on the part of the wazir was conducted with all the savagery of Oriental warfare; but there is no evidence that it was a war of extermination.

Meanwhile, the affairs of the East India Company had come under the consideration of parliament. The Regulating Act, passed by Lord North's ministry in 1773, effected considerable changes in the constitution of the Bengal government. The council was reduced to four members with a governor-general, who was to derive all his measures from the company. The presidencies of Madras and Bombay. Hastings was named in the act as governor-general for a term of five years. The council consisted of General Clavering and the Hon. Colonel Monson, two third-rate politicians of considerable parliamentary influence; Philip Francis (q.v.), then only known as an able permanent official; and Barwell, of the Bengal Civil Service. At the same time a supreme court of judicature was appointed, composed of a chief and three puisne judges, to exercise an indeterminate jurisdiction at Calcutta. The chief-justice was Sir Elijah Impyey,
already mentioned as a schoolfellow of Hastings at Westminster. The
whole tendency of the Regulating Act was to establish for
the first time the influence of the crown, or rather of parliament,
in Indian affairs. The new members of council disembarked
at Calcutta on the 10th of October 1774; and on the following
day commenced the long feud which scarcely terminated twenty-
one years later with the acquittal of Warren Hastings by the
House of Lords. Macaulay states that the members of council
were put in ill-humour because their salute of guns was not
proportionate to their dignity. In a contemporary letter
Francis thus expresses the same petty feeling: “Surely Mr H.
might have had a better day on a ruffled ship," Tartar. For
improper natives of distinction. At last, after the dispute between the judges and the executive threatened to
become a trial of armed force, Hastings set it at rest by a charac-
teristic stroke of policy. A new judicial office was created
in the name of the Company, to which Sir Elijah Impey was
appointed, though he never consented to draw the additional
salary offered to him. The understanding between Hastings
and Francis, originating in this state of affairs, was for a short
period extended to general policy. An agreement was come to
by which Francis received patronage for his circle of friends,
preferring however the presiding judge who was afterwards the
head of foreign affairs. But a difference of interpretation arose. Hastings
recorded in an official minute that he had found Francis’s private
and public conduct to be “void of truth and honour.” They
met as duellists. Francis fell wounded, and soon afterwards
returned to England.

The Mahatta war was not yet terminated, but a far more
formidable danger now threatened the English in India. The
imprudent conduct of the Madras authorities had irritated bey-
ond endurance the two greatest Mussulman powers in the
 peninsula, the nizam of the Deccan and Hyder Ali, the usurper
of Mysoor, who began to negotiate an alliance with the Mahatta.
A second time the genius of Hastings saved the British empire
in the east. On the arrival of the news that Hyder had descended
from the highlands of Mysoor, cut to pieces the only British army
in the field, and swept the Carnatic up to the gates of Madras,
he at once adopted a policy of extraordinary boldness. He
signed a blank treaty of peace with the Mahattas, who were still
in arms, reversed the action of the Madras government towards
the nizam, and concentrated all the resources of Bengal against
Hyder Ali. Sir Eyre Coote, a general of renown in former
Carnatic wars, was sent by sea to Madras with all the troops and
treasures that could be got together; and a strong body of reen-
forcements subsequently marched southwards under Colonel
Perce along the coast line of Orissa. The landing of Coote
preserved Madras from destruction, though the war lasted
through many campaigns and only terminated with the death
of Hyder. Pearse’s detachment was decimated by an epidemic
of cholera (perhaps the first mention of this disease by name in
Indian history); but the survivors penetrated to Madras, and
not only held in check Bhonsla and the nizam, but also corro-
borated the lesson taught by Goddard—that the Company’s
seposys could march anywhere, when boldly led. Hastings’s
personal task was to provide the ways and means for this exhaust-
ing war. A considerable economy was effected by a reform in the
establishment for collecting the land tax. The government
monopolies of opium and salt were then for the first time placed
upon a remunerative basis. But these reforms were of necessity
slow in their beneficial operation. The pressing demands of the
military chest had to be satisfied by loans, and in at least one
case from the private purse of the governor-general. Ready
with the cash, he began to make war, and it was this turn of
native princes that Hastings’s fertile mind at once turned.
Chait Sing, raja of Benares, the greatest of the vassal chiefs who
had grown rich under the protection of the British rule, lay
under the suspicion of disloyalty. The wazir of Oudh had fallen
into arraies in the payment due for the maintenance of the
Company’s garrison posted in his dominions, and his administra-
tion was in great disorder. In his case the ancestral boards were
under the control of his mother, the begum of Oudh, into whose
hands they had been allowed to pass at the time when Hastings
was powerless in council. Hastings resolved to make a progress up country in order to arrange the affairs of both provinces, and bring back all the treasure that could be squeezed out of its holders by his personal intervention. When he reached Benares and presented his demands, the raja rose in insurrection, and the governor-general barely escaped with his life. But the faithful Popham rapidly rallied a force for his defence. The insurgents were defeated again and again; Chait Sing took to flight, and an augmented permanent tribute was imposed upon his successor. The Oudh business was managed with less risk. The wazir consented to everything demanded of him. The begum was charged with having abducted Chait Sing in his rebellion; and after the severest pressure applied to herself and her attendant eunuchs, a fine of more than a million sterling was exacted from her. Hastings appears to have been not altogether satisfied with the incidents of this expedition, and to have anticipated the censure which it received in England. As a measure of precaution, he procured documentary evidence of the rebellious intentions of the raja and the begum, to the validity of which Impry obligingly lent his extra-judicial sanction.

The remainder of Hastings's term of office in India was passed in comparative tranquility, both from internal opposition and foreign war. The centre of interest now shifts to the India House and to the British parliament. The long struggle between the Company and the ministry of the crown for the supreme control of Indian affairs and the attempt on the part of Hastings to reach its climax. The decisive success of Hastings's administration alone postponed the inevitable solution. His original term of five years would have expired in 1778; but it was annually prolonged by special act of parliament until his voluntary resignation. Though Hastings was thus irremovable, his policy did not escape censure. Ministers were naturally anxious to obtain the reversion to his vacant post, and Indian affairs formed at this time the hinge on which party politics turned. On one occasion Dundas carried a motion in the House of Commons, censuring Hastings and demanding his recall. The directors of the Company were disposed to act upon this resolution; but in the court of proprietors, with whom the decision ultimately lay, Hastings always possessed a sufficient majority. Fox's India Bill led to the downfall of the Coalition ministry in 1783. The act which Pitt successfully carried in the following year introduced a new constitution, in which Hastings felt that he had no place. In February 1783 he finally sailed from Calcutta, after a dignified ceremony of resignation, and amid enthusiastic farewells from all classes.

On his arrival in England, after a second absence of sixteen years, he was not displeased with the reception he met with at court and in the country. A peercity was openly talked of as his due, while his own ambition pointed to some responsible office at home. Pitt had never taken a side against him, while Lord Chancellor Thurlow was his pronounced friend. But he was now destined to learn that his enemy Francis, whom he had discomforted in the council chamber at Calcutta, was more than his match in the parliamentary arena. Edmund Burke had taken the subject races of India under the protection of his eloquence. Francis, who had been the early friend of Burke, supplied him with the personal animus against Hastings, and with the knowledge of detail, which he might otherwise have lacked. The Whig party on this occasion unanimously followed Burke's lead. Dundas, Pitt's favourite subordinate, had already committed himself by his earlier resolution of censure; and Pitt was induced by motives which are still obscure to incline the ministerial majority to the same side. To meet the oratory of Burke and Sheridan and Fox, Hastings wrote an elaborate minute with which he wearied the ears of the House for two successive nights, and he subsidized a swarm of pamphleteers. The impeachment was decided upon in 1786, but the actual trial did not commence until 1788. For seven long years Hastings was upon his defence on the charge of "high crimes and misdemeanours." During this anxious period he appears to have borne himself with characteristic dignity, such as is consistent with no other hypothesis than the consciousness of innocence. At last, in 1795, the House of Lords gave a verdict of not guilty on all charges laid against him; and he left the bar at which he had so frequently appeared, with his reputation clear, but ruined in fortune. However large the wealth he brought back from India, all was swallowed up in defraying the expenses of his trial. Continuing the line of conduct which in most other men would be called hypocrisy, he forwarded a petition to Pitt praying that he might be reimbursed his costs from the public funds. This petition, of course, was rejected. At last, when he was reduced to actual destitution, it was arranged that the East India Company should grant him an annuity of £4000 for a term of years, with £90,000 paid down in advance. This annuity expired before his death; and he was compelled to make more than one fresh appeal to the bounty of the Company, which was never withheld. Shortly before his acquittal he had been able to satisfy the dream of his childhood, by buying back the ancestral manor of Daylesford, where the remainder of his life was passed in honourable retirement. In 1818 he was called on to give evidence upon Indian affairs before the two houses of parliament, which received him with exceptional marks of respect. The university of Oxford conferred on him the honorary degree of D.C.L.; and in the following year he was sworn of the privy council, and took a prominent part in the reception given to the duke of Wellington and the allied sovereigns. He died on the 22nd of August 1818, in his 86th year, and was buried in the chancel of the parish church, which had justly restored to his memory. In physical appearance, Hastings "looked like a great man, and not like a bad man." The body was wholly subjugated to the mind. A frame naturally slight had been further attenuated by rigorous habits of temperance, and thus rendered proof against the diseases of the tropics. Against his private character not even calumny has breathed a reproach. As brother, as husband and as friend, his affections were as steadfast as they were warm. By the public he was always regarded as reserved, but within his own inner circle he gave and received perfect confidence. In his dealings with money, he was characterized rather by liberality of expenditure than by carefulness of acquisition. A classical education and the instincts of family pride saved him from both the greed and the vulgar display which marked the typical "nabob," the self-made man of those days. He could support the position of a governor-general and of a country gentleman with equal credit. Concerning his second marriage, it suffices to say that the Baroness Imbott was nearly forty years of age, with a family of grown-up children, when the complaisant love of her native land allowed her to become Mrs Hastings. She survived her husband, who cherished towards her to the last the sentiments of a lover. Her children he adopted as his own; and it was chiefly for her sake that he desired the peerage which was twice held out to him.

Hastings's public career will probably never cease to be a subject of controversy. It was his misfortune to be the scapegoat upon whose head parliament laid the accumulated sins, real and imaginary, of the East India Company. If the acquisition of the Indian empire can be supported on ethical grounds, Hastings needs no defence. No one who reads his private correspondence will admit that even his least defensible acts were dictated by dishonourable motives. It is more pleasing to point out certain of his public measures upon which no difference of opinion can arise. He was the first to attempt to open a trade route with Tibet, and to organize a survey of Bengal and of the eastern seas. It was he who persuaded the pandits of Bengal to disclose the treasures of Sanskrit to European scholars. He founded the Madras or college for Madrassu education at Calcutta, primarily out of his own funds; and he projected the foundation of an Indian institute in England. The Bengal Asiatic Society was established under his auspices, though he yielded the post of president to Sir W. Jones. No Englishman ever understood the native character so well, as Hastings; none ever devoted himself more heartily to the promotion of every scheme, great and small, that could advance the prosperity of India. Natives and Anglo-Indians alike venerate his name, the former as their first beneficent administrator, the latter as the
most able and the most enlightened of their own class. If Clive's sword conquered the Indian empire, it was the brain of Hastings that planned the system of civil administration, and his genius that saved the empire in its darkest hour.

See G. B. Malleson, Life of Warren Hastings (1894); G. W. F. Fleet, The Administrators of Warren Hastings (Calcutta, 1892); Sir Charles Lawson, The Private Life of Warren Hastings (1895); L. J. Trotter, Warren Hastings ("Kulers of India" series) (1890); Sir Alfred Lyall, Warren Hastings ("English Men of Action" series) (1890); F. M. Holmes, Four Heroes of India (1892); G. W. Macaulay, "A Vindication of Warren Hastings" (1909). Macaulay's famous essay, though a classic, is very partial and inaccurate; and Burke's speech, on the impeachment of Warren Hastings, is magnificent rhetoric. The latter has been extensively quoted by Sir James Stephen's Story of Nuncomar (1885) and by Sir John Strachey's Hastings and the Rehila War (1892), and it is enforced in some detail in Sydney C. Grier's Letters of Warren Hastings to His Wife (1905), material for which existed in a mass of documents relating to Hastings, acquired by the British Museum.

J. S. Co.)

HASTINGS, a municipal, county and parliamentary borough and watering-place of Sussex, England, one of the Cinque Ports, 62 m. S.E. by S. from London, on the South Eastern & Chatham and the London, Brighton & South Coast railways. (Pop. (1901), 65,528. It is picturesquely situated at the mouth of two narrow valleys, and, being sheltered by considerable hills on the north and east, has an especially mild climate. Eastward along the coast towards Hastings, and then towards the mouth of the river, the country is beautiful. A parade fronts the English Channel, and connects the town on the west with St Leonard's, which is included within the borough. This is mainly a residential quarter, and has four railway stations on the lines serving Hastings. Both Hastings and St Leonard's have fine piers; there is a covered parade known as the Marina, and the Alexandra Park of 75 acres was opened in 1891. There are also numerous public gardens. The sandy beach is extensive, and affords excellent bathing. On the brink of the West Cliff stand a square and a circular tower and other fragments of the castle, built soon after the Conquest by the Conqueror; together with the ruins, opened up by excavation in 1824, of the castle chapel, a transitional Norman structure 110 ft. long, with a nave, chancel and aisles. Besides the chapel there was formerly a college, both being under the control of a dean and secular canons. The deanery was held by Thomas Becket, and one of the canonsries by William of Wykeham. The principal public buildings are the old parish churches of All Saints and St Clements, the first containing in its register for 1619 the baptism of Titus Oates, whose father was rector of the parish; the second, of St Laurence; the free grammar school; the town hall; the music hall and assembly rooms. The Brasse Institute contains a public library, museum and art school. The Albert Memorial clock-tower was erected in 1864. Educational institutions include the grammar school (1883), school of science and art (1879) and technical schools. At the west end of the town are several hospitals and convalescent homes. The prosperity of the town depends almost wholly on its reputation as a watering-place, but there is a small fishing and boat-building industry. In 1890 an act of parliament authorized the construction of a harbour, but the work, begun in 1896, was not completed. The fish-market beneath the castle cliff is picturesque. The parliamentary borough, returning one member, falls within the Rye division of the county. The county borough was created in 1888. The municipal borough is under a mayor, 10 aldermen and 30 councillors. Area, 4837 acres. Rock shelters on Castle Hill and numerous flint instruments which have been discovered at Hastings point to an extensive neolithic population, and there are ancient earthworks and a promontory camp of unknown date. There is no evidence that Hastings was a Roman settlement, but it was a place of some note in the Anglo-Saxon period. In 795 land at Hastings (Haestingacaster, Haestingas, Haestingaport) is included in a grant, which may possibly be a forgery, of a South Saxon chieftain to the abbey of St Denis in France; and a royal mint was established at the town by Æthelstan. The battle of Hastings in 1066 described below was the first and decisive act of the Norman Conquest. It was fought near the present Battle Abbey, about 6 m. inland. After the Conquest William I. erected the earthworks of the existing castle. By 1086 Hastings was a borough and had given its name to the rape of Sussex in which it is the chief town. By the latter part of the 12th century it was a great market. Whether Hastings was one of the towns afterwards known as the Cinque Ports at the time when they received their first charter from Edward the Confessor is uncertain, but in the reign of William I. it was undoubtedly among them. These combined towns, of which Hastings was the head, had special liberties and a separate jurisdiction under a warden. The only charter peculiar to Hastings was granted in 1589 by Elizabeth, and incorporated the borough under the name of "mayor, jurats and commonalty," instead of the former title of "balliff, jurats and commonalty." Hastings returned two members to parliament from 1215 only, to 1566, until 1855, when the number was reduced to one.

Battle of Hastings.—On the 28th of September 1066, William of Normandy, bent on asserting by arms his right to the English crown, landed at Pevensey. King Harold, who had destroyed the invaders of northern England at the battle of Stamford Bridge in Yorkshire, on hearing the news hurried southward, gathering what forces he could on the way. He took up his position, athwart the road from Hastings to London, on a hill 1 some 6 m. inland from Hastings, with his back to the great forest of Anderida (the Weald) and from him the land falls away, like a slope, at the bottom of which began the opposing slope of Telham Hill. The English army was composed almost entirely of infantry. The shire levies, for the most part destitute of body armour and with miscellaneous and even improvised weapons, were arranged on either flank of Harold's guards (kuscars), picked men armed principally with the Danish axe and shield. Before this position Duke William appeared on the morning of the 14th of October. His host, composed not only of his Norman vassals but of barons, knights and adventurers from all quarters of the kingdom, was arranged in a centre and two wings, each corps having its archers and arblasters in the front line, the rest of the infantry in the second and the heavy armoured cavalry in the third. Neither the arrows nor the charge of the second line of foot-men, who, unlike the English, wore defensive mail, made any impression on the English standing in a scurried mass behind their interlocked shields.

Then the heavy cavalry came on, led by the duke and his brother Odo, and encouraged by the example of the minstrel Taillefer, who rode forward, tossing and catching his sword, and shouting, "The sons of Harold! Make way for me and you will be saved!" But the English held their ground and the valiant conquerors were met by the spears and battle-axes. All along the front the cavalry came to close quarters with the defenders, but the powerful Danish axes were

1 Freeman called this hill Senlac and introduced the fashion of describing the battle as "the battle of Senlac." Mr J. H. Round, however, proved conclusively that this name, being French (Sen- lecque), could not have been in use at the time of the Conquest, that the battlefield had in fact no name, pointing out that in William of Malmesbury and in Theophilo's Book the battle is called" of Hastings" (Bellum Hastingsense), while only one writer, Ovidarius Vitalis, describes it two hundred years after the event as Bellum Seleniacum. See Round, Pevensey England (London, 1895), p. 333 et seq.

2 There is still a difference of opinion as to whether the English were, or were not, defended by any other rampart than that of the customary "shield-wall." Freeman, apparently as a result of a misunderstanding of a passage in Henry of Huntingdon and the slightly ambiguous verse of Wace in the Roman de Rou (II. 6991-6994 and II. 7815-7826), affirms that Harold turned "the battle as far as possible into the likeness of a siege," by building round his troops a "palisade of solid timber" (Norman Conquest, iii. 444). This was proved to be a fable by J. H. Round, in the course of a general attack on Freeman's historical method, which provoked the latter to find the end of the battle "one of the most confounding and long and lively controversy." The result of this was that Freeman's account was wholly discredited, though Round's view—that there was a "wall of any kind save the shield-wall"—is not generally held. Professor Oman (Academy, June 9, 1894), for instance, holds that there was "an abatis of some sort" set to hamper the advance of cavalry (see also English History, vol. ix. p. 474). Mr Round (Round, Pevensey England, p. 334), on the contrary, found no evidence of a monograph, in his Pevensey England, p. 340 et seq., where references to other monographs on the subject will be found.

3
as formidable as the halbert and the bill proved to be in battles of later centuries, and they lopped off the arms of the assailants and cut down their horses. The fire of the attack died out and the left wing (Bretons) fled in rout. But as the fyrd levies broke out of the line and pursued the Bretons down the hill in a wild, formless mob, William’s cavalry swang round and destroyed them, and this suggested to the duke to repeat deliberately what the Bretons had done from fear. Another advance, followed by a jeigned retreat, drew down a second large body of the English from the crest, and these in turn, once in the open, were ridden over and slaughtered by the men-at-arms. Lastly, these two disasters having weakened the defenders both materially and morally, William subjected the Hastings, which had stood fast when the fyrd broke its ranks, to a constant rain of arrows, varied from time to time by cavalry charges. These magnificent soldiers endured the trial for many hours, from noon till close on nightfall; but at last, when the Norman archers raised their bows so as to pitch the arrows at a steep angle of descent in the midst of the huscarles, the strain became too great. Some while rushed forward alone or in twos and threes to die in the midst of the enemy, the remainder stood fast, too closely crowded almost for the wounded to drop. At last Harold received a mortal wound, the English began to waver, and the night began to draw near. Only a remnant of the defenders made its way back to the forest; and William, after resting for a night on the hard-won ground, began the work of the Norman Conquest.

HASTINGS, a city and the county-seat of Adams county, Nebraska, U.S.A., about 95 m. W. by S. of Lincoln. Pop. (1890) 13,584; (1900) 7288 (1253 foreign-born); (1910) 9338. Hastings is served by the Chicago, Burlington & Quincy, the Chicago & North-western, the Missouri Pacific and the St Joseph & Grand Island railways. It is the seat of Hastings College (Presbyterian, coeducational), opened in 1882, and having 280 students in 1908, and of the state asylum for the chronic insane. This city is a center of considerable jobbing business for the farming region of which it is the capital.

There are a large foundry and several large brickyards here. Hastings was settled in 1872, was incorporated in 1874, and was chartered as a city in the same year.

HAT, a covering for the head worn by both sexes, and distinguished from the cap or bonnet by the possession of a brim. The word in O.E. is hat, which is cognate with O. Frisian hat, O.N. hats, &c., meaning head-covering, hood; it is distinctly related to the O.E. kod, hood, which is cognate with the German for "hat," Hat. The history of the hat as part of the apparel of both sexes, with the various changes in shape which it has undergone, is treated in the article Costumes.

The term hat, which includes the notice of felting, and as tradition ascribed the discovery of that very ancient operation to St Clement, he was assumed as the patron saint of the craft. At the present day the trade is divided into two distinct classes. The first and most ancient is concerned with the manufacture of felt hats, and the second has to do with the recent but now most extensive and important manufacture of silk or dress hats. In addition to these there is the important manufacture of straw or plaited hats (see Straw and Straw Manufactures); and hats are occasionally manufactured of materials and by processes not included under any of these heads, but such manufactures do not take a large or permanent position in the industry.

Felt Hats.—There is a great range in the quality of felt hats; the finer and more expensive qualities are made entirely of fur; for commoner qualities a mixture of fur and wool is used; and for the cheapest kinda wool alone is employed. The processes and apparatus necessary for making hats of fur differ also from those required in the case of woolen bodies; and in large manufacturies machinery is now generally employed for operations which at no distant date were entirely manual. An outline of the operations by which the old beaver hat was made will give an idea of the manual processes in making a fur napped hat, and the apparatus and mechanical processes employed in making ordinary hard and soft felt hats, and will be noticed.

Hatters’ fur consists principally of the hair of rabbits (technically called coneyes) and hares, with some proportion of nutria, musquash and beavers’ hair; and generally any parings and cuttings from furriers are also used. Furs intended for felting are deprived of their long coarse hairs, after which they are treated with a solution of nitrate of mercury, an operation called carrottage or secratage, whereby the feltng properties of the fur are greatly increased. The fur is then cut by hand or machine from the skin, and in this state it is delivered to the hat maker.

The old process of making a beaver hat was as follows. The mark of the hat was a projection from the body or foundation, of rabbits’ fur, and for the nap, of beaver fur, although it was often mixed with or supplanted by a more common fur. In preparing the fur plate, the hatter weighed out a sufficient quantity of rabbit fur for a single hat, and spread it out and contaminated it by the operation of bowing. The bow or stang ABC (fig. 1) was about 7 ft. long, and it stretched a single cord of catgut D, which the workman vibrated by means of a wooden pin E, furnished with a half knob at each end. Holding the bow in his left hand, and the pin in his right, he caused the vibrating string to come in contact with the heap of tangled fur, which did not cover a space greater than that of the hand. At each vibration some of the filaments started up to the point of the pin, fell away from the mass, a little to the right of the bow, their excursions being restrained by a concave frame of wicker work called the basket. One half of the material was first operated on, and by bowing and gathering, or a patting use of the hand, the other half was treated; the stuff was then loosely packed into a triangular figure, about 50 by 36 in., called a bat. In this formation care was taken to work about two-thirds of the fur down towards what was intended for the brim, and this having been effected, greater density was in-duced by the wicker basket pressing on the surface of the material, a piece of dry half-tanned horse hide. On this the workman pressed until the stuff adhered closely to the damp cloth, in which it was then bunged, freely pressed with the round, and laid aside. By this process, called basoning, the bat became compactly felted and thinned toward the sides and point. The other half of the fur was next subjected to one or two similar processes, after which a cone-shaped slip of stiff paper was laid on its surface, and the sides of the bat were folded over its edges to its form and size. It was then laid paper-side downward upon the first hat, which was now replaced on the hurdle, and its edges were transversely doubled over the introverted side-lays of the second bat, thus giving equal thickness to the whole body. In this condition it was reintroduced between folds of damp linen cloth, and again hardened, so as to unite the two halves, the knitting together of which was quickly effected. The paper was then withdrawn, and the body in the form of a large cone removed to the plank or battery room.

The battery consisted of an open iron boiler or kettle (fig. 2), filled with scalding hot water, with shelves, B, partly of mahogany and partly of lead, sloping down to it. Here the body was first dipped in the water, and then was withdrawn to the plank to cool and drain, when it was unfolded. Rolled gently with a pin tapping towards the ends, turned, and worked in every direction to toughen and shrink it, and at the same time prevent adhesion of its sides. Stopping or thickening any thin spots seen on looking through the body, was carefully performed by dabbing on additional stuff in successive supplies from the hot liquor with a brush frequently dipped into the kettle, until the body was shrunk sufficiently (about one-half) and thoroughly equalized. When quite dried, stiffening was effected within a tumbler, which was filled with a solution of glue and heated to a thin wash of shellac, and rubbed into the body, the surface intended for the inside having much more laid on it than the outer, while the brim was made to absorb many times the quantity applied to any other part.

On being dried, the body was ready to be covered with a nap of beaver hair. For this, in inferior qualities, the hair of the otter, nutria or other fine fur was sometimes substituted. The requisite quantity of one or other of the same was taken and mixed with a small portion of cotton, and the whole was bowed up into a thin uniform lap. The cotton merely served to give sufficient body to the material to enable the workman to handle the lap. The body of the hat
being damped, the workman spread over it a covering of this lap, and by moistening and gentle patting with a brush the cut ends of the hair penetrated and fixed themselves in the felt body. The hat and its trimmings were then placed in a press, where the hot liquor until the fur was quite worked in, the cotton being left on the surface loose and ready for removal. The blocking, dyeing and finishing processes in the case of beaver hats were similar, and the same ordinary workers and dexterity were required on the part of the workmen, and further that the coarse hairs or kemp which might be in the fur were cut off by a razor. A ranking of the surface with a razor has the effect of giving a direction to the fibres, and the brushing done in this way is done in a single direction, smoothed and rendered glossy by repeated wettings, ironings and brushings. A hat so finished was very durable and much more light, cool and easy-fitting to the head than the silk hat which has been replaced by it.

The first efficient machinery for making felt hats was devised in America, and from the United States the machine-making processes were introduced into England about the year 1858; and now in all large cities, and to some extent also in smaller places, machinery is employed. For the forming of hat bodies two kinds of machine are used, according as the material employed is fur or wool. In the case of fur, the essential portion of the apparatus is a "former," consisting of a metal cone of the size and form of the body or hat to be made, perforated all over with small holes. The cone is made to revolve on its axis slowly over an orifice under which there is a powerful jet of air, which is conveyed through the holes in the cone. At the side of the cone, and with an opening towards it, is a trunk or box from which the fur to be made into a hat is thrown out by the rapid revolution of a brush-like brush, the wide end of which is carried round the cone. As the cone revolves, the current of air being sucked through the cone carries the fibres to it and causes them to cling closely to its surface. Thus a covering of felt is formed, and the copper tubes forming these are kept in position only by the exertion of air working upon them. When sufficient for a hat body has been deposited, it is damped and a cloth is wrapped round it; then another cone is slipped over it and the same operation repeated, when another copper tube is placed in position for continuing the work. The fur is next felted by being rolled and pressed, these operations being performed partly by hand and partly by machinery.

In the case of wool, instead of the hat or body being prepared for first carding in a modified form of carding machine, the wool is divided into two separate slivers as delivered from the cards, and these are wound simultaneously on a double conical block of wood mounted and turned to carry a horizontal air-drying tube, so that there is a continual crossing and recrossing of the wool as the sliver is wound around the cone. This diagonal arrangement of the sliver is an essential feature in the apparatus, as thereby the strength of the finished felt is made equal in every direction; and when strained in the blocking the texture yields in a uniform manner without rupture. The wool wound on the double block forms the material of two hats, which are separated by cutting across the air median or base line, and slipping each half off at its own end. Into each cone of wool or bat an "inlayer" is now placed to prevent the inside from matting, after which they are folded in cloths, and placed over other cones of the same size, and through which a current of well moistened and heated air is passed, they are placed between boards, and subjected to a rubbering action sufficient to harden them for bearing the pressure of the moulds and also for polishing. The manufacture of wool hats is generally done by machine, in some cases a form of fulling mill being used; but in all forms the agencies are heat, moisture, pressure, rubbing and turning.

When by thorough feltling the hat bodies of any kind have been reduced to dense leathery cones about one-half the size of the original bat, they are dried, and, if hard felts to be made, the bodies are at this stage hardened or stiffened with a varnish of shellac. Next follows the operations of blocking, in which the felt for the first time assumes approximately the form it is ultimately to possess. For this purpose the conical body is softened in boiling water, and forcibly drawn over and over a hat-shaped wooden block. The operation is repeated with wooden wheels, and in the process of blocking the shape is transferred to the hat, the felt being firmly pressed over it, and it firmly adheres to the wooden form after the latter is removed. The hat is then allowed to cool and harden itself for several days, and, when quite cool, is hardened in the press, which is again removed and the hat placed on a cardboard hat-board, and is finally ready for trimming and finishing. Silk Hats.—The silk hat, which has now become co-extensive with civilization, is an article of comparatively recent introduction. It was introduced into the United States about 1800, and it was more than half a century before it was worn to any great extent.

A silk hat consists of a light stiff body covered with a plush of silk, the manufacture of which in a brilliant glossy condition is the most difficult operation of the whole process. Originally they were made of felt and various other materials, but now calico is chiefly used. The calico is first stiffened with a varnish of shellacs, and then cut into pieces sufficient for crown, side and brim. The side-piece is wound round a wooden hat block, and its edges are joined by hot ironing, and the crown-piece is put on and similarly attached to the side. The brim, consisting of three thicknesses of calico cemented together, is now slipped over and brought to its position, and when this has been done the upper rim of the hat is rolled, and lastly the crown and side sewn together are drawn over. All these by hot ironing and stretching are drawn smooth and tight, and the operation is repeated until the softness of the body softens with the heat, and all adhesions there are left over without wrinkle or pucker. Dressing and polishing by means of damping, brushing and ironing, come next, after which the hat is "velured" in a revolving machine by the application of hardwax and velutine varnishes, which cleans the hats, and gives it a smooth and glossy surface. The brim has only then to be bound, the linings inserted, and the brim finally curled, when the hat is ready for use.

HATCH, EDWIN (1835–1889), English theologian, was born at Derby on the 14th of September 1853, and was educated at King Edward’s school, Birmingham, under James Prince Lee, afterwards bishop of Manchester. He had many struggles to pass through in early life, which tended to discipline his character and to form the habits of severe study and the mental independence for which he came to be distinguished. Hatch became scholar of Pembroke College, Oxford, took a second-class in classics in 1857, and won the Ellerton prize in 1858. He was professor of classics in Trinity College, Toronto, from 1859 to 1862, when he became rector of the high school at Quebec. In 1867 he returned to Oxford, and was made vice-principal of St Mary Hall, a post which he held until 1885. In 1883 he was presented to the living of Purleigh in Essex, and in 1884 was appointed university reader in ecclesiastical history. In 1880 he was Professor lecturer, and from 1886 to 1888 Grinfield lecturer on the Septuagint. In 1883 the university of Edinburgh conferred on him the D.D. degree. He was the first editor of the university official Gazette (1870), and of the Student’s Hand-book to the University. A reputation acquired through certain contributions to the Dictionary of Christian Antiquities was confirmed by his treatises On the Organization of the Early Christian Churches (1881), his Bampton lectures, and on The Influence of Greek Ideas and Usages on the Christian Church (the Hibbert lectures for 1888). These works provoked no little criticism on account of the challenge they threw down to the high-church party, but the research and fairness displayed were admitted on all hands. The Bampton lectures were translated into German by Harnack. Among his other works are The Growth of Church Institutions (1883); Essays in Biblical Greek (1886); A Concordance to the Septuagint (in collaboration with H. A. Redpath); Towards Fields of Light (verse, 1850); The God of Hope (sermons with memoir, 1890). Hatch died on the 10th of November 1889.

An appreciation by W. Sanday appeared in The Expositor for February 1890.

Hatch. 1. (In Mid. Eng. hacke; the word is of obscure origin, but cognate forms appear in Swed. häcka, and Dan. hacke; it has been connected with "hatch" grafting, with possible reference to a coop, and with "hack" in the sense "to peck," of chickens coming out of the shell), to engrave or draw by means of cutting lines on wood, metal, &c., or to ornament by inlaying with strips of some other substance as gold or silver. Engraved lines, especially those used in shading, are called "hatches" or "hacches" (see HACHURE). 2. (From the Fr. hacher, to cut, hacke, hatchet), to engrave or draw by means of cutting lines on wood, metal, &c., or to ornament by inlaying with strips of some other substance as gold or silver. Engraved lines, especially those used in shading, are called "hatches" or "hacches" (see HACHURE). 3. (O.E. hæt, a gate, rack in a stable; found in various Teutonic languages), Dutch pêck, Dan. bekke; the ultimate origin is obscure; Skeat suggests a connexion with the root seen in "hook").
door, as in "buttery-hatch," the half-door leading from the buttery or kitchen, through which the dishes could be passed into the dining-hall. It was used forecastle and had another name for a ship's deck, and thus the phrase "under hatches" meant properly below deck; the word is now applied to the doors of grated framework covering the openings (the "hatchways") which lead from one deck to another into the hold through which the cargo is lowered. In Cornwall the word is used to denote certain damps or mounds used to prevent the tin-washes and the water coming from the stream-works from flowing into the fresh rivers.

HATCHET (adapted from the Fr. hachette, diminutive of hache, axe, hacher, to cut, hack), a small, light form of axe with a short handle (see Toot); for the war-hatchet of the North American Indians and the symbolic ceremonies connected with it see TOMAHAWK.

HATCHETTITE, sometimes termed Mountain Tallow, Mineral Adipocire, or Adipocerite, a mineral hydrocarbon occurring in the Coal-measures of Belgium and elsewhere, occupying in some cases the interior of hollow concretions of iron-ore, but more generally the cavities of fossil shells or crevices in the rocks. It is of yellow colour, and translucent, but darkens and becomes opaque on exposure. It has no odour, is greasy to the touch, and has a slightly glistening lustre. Its hardness is that of soft wax. The melting point is 46° to 47° C., and the composition is C. 85-85, H. 14-45.

HATCHMENT, properly, in heraldry, an escutcheon or armorial shield granted for some act of distinction or "achievement," of which word it is a corruption through such forms as achèvement, achement, hackément, &c. "Achievement" is an adaptation of the Fr. achement, from achever, à chef venir, Lat. ad caput venire, to come to a head, or conclusion, hence accomplish, achieve. The term "hatchment" is now usually applied to funeral escutcheons or armorial shields enclosed in a black lozenge-shaped frame suspended against the wall of a deceased person's house. It is usually placed over the entrance at the level of the second floor, and remains for from six to twelve months, when it is removed to the parish church. This custom is falling into disuse, though still not uncommon. It is usual to hang the hatchment of a deceased head of a house at the universities of Oxford and Cambridge over the entrance to his lodge or residence.

If for a bachelor the hatchment bears upon a shield his arms, crest, and other appendages, the whole on a black ground. If for a single woman, her arms are represented upon a lozenge, bordered with knotted ribbons, also on a black ground. If the hatchment be for a married man (as in the illustration), his arms upon a shield impale those of his surviving wife; or if she be an heiress they are placed upon a scutcheon of pretence, and crest and other appendages are added. The dexter half of the ground is black, the sinister white. For a wife whose husband is alive the same arrangement is used, but the sinister ground only is black. For a widow the same is used as for a married man, but the whole ground is black; for a widower the same is used as for a married man, but the whole ground is white.

HATHERLEY, William Page Wood, 1st Baron (1801–1881), lord chancellor of Great Britain, son of Sir Matthew Wood, a London alderman and lord mayor who became famous for befriending Queen Caroline and braving George IV., was born in London in the 29th of November 1801. He was educated at Winchester, Geneva University, and Trinity College, Cambridge, where he became a fellow after being 24th wrangler in 1824. He entered Lincoln's Inn, and was called to the bar in 1824, studying conveyancing in Mr John Tyrrell's chambers. He soon obtained a good practice as an equity draughtsman and before parliamentary committees, and in 1830 married Miss Charlotte Moor. In 1845 he became Q.C., and in 1847 was elected to parliament for the city of Oxford as a Liberal. In 1849 he was appointed vice-chancellor of the county palatine of Lancaster, and in 1851 was made solicitor-general and knighted, vacating that position in 1857. When his party returned to the benches he was vice-chancellor. In 1868 he was made a lord justice of appeal, but before the end of the year he was selected by Mr Gladstone to be lord chancellor, and was raised to the peerage as Lord Hatherley of Down Hatherley. He retired in 1872 owing to failing eyesight, but sat occasionally as a law lord. His wife's death in 1878 was a great blow, from which he never recovered, and he died in London on the 10th of July 1881. Dean Hook said that Lord Hatherley—was a sound and benevolent supporter of the Church of

In Scottish hatchments it is not unusual to place the arms of the father and mother of the deceased in the two lateral angles of the lozenge, and sometimes the 4, 8 or 16 genealogical escheents are removed by the female line. In Great Britain this is practised, and the arms are placed in the four angles of the lozenge. The arms of the third marquess of Salisbury (d. 1903) in the vicinity is Hatfield House, close to the site of a palace of the bishops of Ely, which was erected about the beginning of the 12th century. From this palace comes the proper form of the name of the town, Bishop's Hatfield. In 1538 the manor was resigned to Henry VIII. by Bishop Thomas Goodrich of Ely, in exchange for certain lands in Cambridge, Essex and Norfolk; and after that monarch the palace was successively the residence of Edward VI. immediately before his accession, of Queen Elizabeth during the reign of her sister Mary, and of James I. The last named exchanged it in 1607 for Theobalds, near Cheshunt, in the same county as a relative of Robert Cecil, earl of Salisbury, in whose family Hatfield House has since remained. The west wing of the present mansion, built for Cecil in 1608–1612, was destroyed by fire in November 1835, the dowager marchioness of Salisbury, widow of the 1st marquess, perishing in the flames. Hatfield House was built, and has been restored and maintained, in the richest style of its period, both without and within. The buildings of mellowed red brick now used as stables and offices are, however, of a period far anterior to Cecil's time, and are probably part of the erection of John Morton, bishop of Ely in 1478-1486. The park measures some 10 m. in circumference. From the eminence on which the mansion stands the ground falls towards the river Lea, which here expands into a small lake. Beyond this is a rare example of a monks' walled vineyard. In the park is also an ancient oak under which Elizabeth is said to have been seated when the news of her sister's death was brought to her. Brocket Park is another fine demesne, at the neighbouring village of Lemsford, and the Brocket chapel in Hatfield church contains memorials of the families who have held this seat.
HATHERTON, BARON—HATTON, SIR C.

England—was the best man he had ever known. He was a particularly clear-headed lawyer, and his judgments—always delivered extemore—commanded the greatest confidence both with the public and the legal profession. He left no issue and the title became extinct on his death.

HATHERTON, EDWARD JOHN LITTLETON, 1ST BARON (1791-1863), was born on the 18th of March 1791 and was educated at Rugby school and at Brasenose College, Oxford. He inherited the estate of Moreton Walhouse of Hatheron, Staffordshire; but in 1872, in accordance with the will of his great-uncle Sir Edward Littleton, Bart. (d. 1812), he took the name of Littleton. From 1812 to 1832 he was member of parliament for Staffordshire and from 1832 to 1835 for the southern division of that county, being specially prominent in the House of Commons as an advocate of Roman Catholic emancipation. In January 1833, against his own wish, he was put forward by the Radicals as a candidate for the office of speaker, but he was not elected and in May 1833 he became chief secretary to the lord-lieutenant of Ireland in the ministry of Earl Grey. His duties in this capacity brought him frequently into conflict with O'Connell, but he was obviously unequal to the great Irishman, although he told his colleagues to "leave me to manage Dan." He had to deal with the vexed and difficult question of the Irish tithes on which the government was divided, and with his colleagues had to face the problem of a new coercion act. Rather hastily he made a compact with O'Connell on the assumption that the new act could not contain certain clauses which were part of the old act. The clauses, however, were inserted; O'Connell charged Littleton with attempting a "coup" (July 8). The Irish secretary resigned. The two latter were induced to serve under the new premier, Lord Melbourne, and they remained in office until Melbourne was dismissed in November 1834. In 1835 Littleton was created Baron Hatheron, and he died at his Staffordshire residence, Teddesley Hall, on the 4th of May 1863. In 1888 his grandson, Edward George Littleton (b. 1842), became 3rd Baron Hatheron.

HATHRAS, a town of British India, in the Aligarh district of the United Provinces, 29 m. N. of Agra. Pop. (1901), 42,578. At the end of the 18th century it was held by a Jat chiefyain, whose ruined fort still stands at the east end of the town, and was annexed by the British in 1803, but insubordination on the part of the chief necessitated the siege of the fort in 1817. Since it came under British rule, Hathras has rapidly risen to commercial importance, and now ranks second to Cawnpore among the trading centres of the Doab. The chief articles of commerce are sugar and grain, there are also factories for ginning and pressing cotton, and a cotton spinning-mill. Hathras is connected by a light railway with Muttra, and by a branch with Hathras junction, on the East Indian main line.

HATTIESBURG, a city and the county-seat of Forrest county, Mississippi, U.S.A., on the Hastahatchee (or Leaf) river, about 50 m. S.E. of Jackson. Pop. (1890) 1772; (1900) 4175 (1687 negroes); (1910) 11,733. Hattiesburg is served by the Gulf & Ship Island, the Mississippi Central, the New Orleans, Mobile & Chicago and the New Orleans & North Eastern railways. The officers and employees of the Gulf & Ship Island railway own and maintain a hospital here. The city is a rich farming, truck-gardening and lumbering centre. Among its manufactures are lumber (especially yellow-pine), wood-alcohol, turpentine, paper and pulp, fertilizers, wagons, mattresses and machine-shop products. Hattiesburg was founded about 1882 and was named in honour of the wife of W. H. Hardy, a railway official, who planned a town at the intersection of the New Orleans & North Eastern (which built a round house and repair shops here in 1883) and the Gulf & Ship Island railways. The latter was opened from Gulfport to Hattiesburg in January 1897, and from Hattiesburg to Jackson in September 1899. Hattiesburg was incorporated as a town in 1884 and was chartered as a city in 1890. Formerly the "court house" of the second judicial district of Perry county, Hattiesburg became on the 1st of January 1908 the county-seat of Forrest county, erected from the W. part of Perry county.

HATTINGEN, a town of Germany, in the Prussian province of Westphalia, on the river Ruhr, 21 m. N.E. of Düsseldorf. Pop. (1900), 8975. It has two Evangelical and a Roman Catholic church. The manufactures include tobacco, and iron and steel goods. The neighbouring states of the ruins of the Isembn, demolished in 1286. Hattingen, which received communal rights in 1306, was one of the Hanse towns.

HATTO I. (c. 850-913), archbishop of Mainz, belonged to a Swabian family, and was probably educated at the monastery of Reichenaun, of which he became abbot in 888. He soon became known to the German king, Arnulf, who appointed him archbishop of Mainz in 891; and he became such a trusted and confidential counsellor that he was popularly called "the heart of the king." He presided over the important synod at triburg in 895, and accompanied the king to Italy in 894 and 895, where he was received with great favour by Pope Formosus. In 899, when Arnulf died, Hatto became regent of Germany, and guardian of the young king, Louis the Child, whose authority he compelled Zwentibold, king of Lorraine, an illegitimate son of Arnulf, to recognize. During these years he did not neglect his own interests, for in 896 he secured for himself the abbey of Elwangen and in 898 that of Lorsch. He assisted the Franconian family of the Conradians in its feud with the Babenbergers, and was accused of betraying Adalbert, count of Babenberg, to death. He retained his influence during the whole of the reign of Louis, and on the king's death in 912 was prominent in securing the election of Conrad, duke of Franconia, to the vacant throne. When trouble arose between Conrad and Henry, duke of Saxony, afterwards Henry the Fowler, the attitude of Conrad was ascribed by the Saxons to the influence of Hatto, who wished to prevent Henry from securing authority in Thuringia, where the see of Mainz had extensive possessions. He was accused of complicity in a plot to murder Duke Henry, who in return ravaged the archiepiscopal lands in Saxony and Thuringia. He died on the 15th of May 913, one tradition saying he was struck by lightning, and another that he was thrown alive into the devil into the crater of Mount Etna. His memory was long regarded in Saxony with great abhorrence, and stories of cruelty and treachery gathered round his name. The legend of the Mouse Tower at Bingen is connected with Hatto II., who was archbishop of Mainz from 968 to 970. This Hatto built the church of St George on the island of Reichenaun, was generous to the see of Mainz and to the abbey of Fulda and Reichenaun, and was a patron of the chronicler Reginon, abbott of Prium.

HATTINGEN, J. Heidemann, Geschichte des ostfränkischen Reichs (Leipzig, 1887-1888); G. Phillips, Die grosse Synode von Tribur (Vienna, 1865); J. Heidemann, Hatto I., Erzbischof von Mainz (Berlin, 1865); C. Waiz, Jahrbiicher der deutschen Geschichte unter Heinrich I. (Berlin and Leipzig, 1865); and J. F. Böhmer, Regesta archiepiscoporum Magontinensium, edited by C. W. Illsnbruck, 1877-1886.

HATTON, SIR CHRISTOPHER (1540-1591), lord chancellor of England and favourite of Queen Elizabeth, was a son of William Hatton (d. 1546) of Holdenby, Northamptonshire, and was educated at St Mary Hall, Oxford. A handsome and accomplished man, being especially distinguished for his elegant dancing, he soon attracted the notice of Queen Elizabeth, became one of her gentlemen pensioners in 1574, and captain of her bodyguard in 1572. He subsequently held several important positions of trust and profit from the queen, and suspicion was not slow to assert that he was Elizabeth's lover, a charge which was definitely made by Mary queen of Scots in 1584. Hatton, who was probably innocent in this matter, had been made vice-chamberlain of the royal household and a member of the privy council in 1578, and had been a member of parliament since 1571, first representing the borough of Higham Ferrers and afterwards the county of Northampton. In 1578 he was knighted, and was now regarded as the queen's spokesman in the House of Commons, being highly esteemed by John Stubbe and William Parry. He was one of those who were appointed to arrange a marriage between Elizabeth and Francis, duke of
Alençon, in 1581; was a member of the court which tried Anthony Babington in 1586; and was one of the commissioners who found Mary queen of Scots guilty. He besought Elizabeth not to marry the French prince; and according to one account repeatedly assured Mary that he would fetch her to London if the English queen died. Whether or no this story be true, Hatton's loyalty was not questioned; and he was the foremost figure in that striking scene in the House of Commons in December 1584, when four hundred kneeling members repeated after him a prayer for Elizabeth's safety. Having been the constant recipient of substantial marks of the queen's favour, he vigorously denounced Mary Stuart in parliament, and advised William Davison to forward the warrant for her execution to Fotheringay.

In the following year (1587) Hatton was made lord chancellor, and although he was the queen's most trusted minister, he appears to have acted with sound sense and good judgment in his new position. He is said to have been a Roman Catholic in all but name, yet he treated religious questions in a moderate and tolerant way. He died in London on the 20th of November 1591, and was buried in St Paul's cathedral. Although mention has been made of a secret marriage, Hatton appears to have remained single, and his large and valuable estates descended to his nephew, Sir William Newport, who took the name of Hatton. Sir Christopher was a knight of the Garter and chancellor of the university of Oxford. Elizabeth frequently showed her affection for her favourite in an extravagant and ostentatious manner. She called him her majesty, and forced the bishop of Ely to give him the freehold of Ely Place, Holborn, which became his residence, his name being perpetuated in the neighbouring Hatton Garden. Hatton is reported to have been a very mean man, but he patronized men of letters, and among his friends was Edmund Spenser. He wrote the fourth act of a tragedy, Tancred and Gismond, and his death occasioned several panegyrics in both prose and verse.

When Hatton's nephew, Sir William Hatton, died without sons in 1597, his estates passed to a kinsman, another Sir Christopher Hatton (d. 1619), whose son and successor, Christopher (c. 1605-1670), was elected a member of the Long Parliament in 1640, and during the Civil War was a partisan of Charles I. In 1643 he was created Baron Hatton of Kirby; and, acting as comptroller of the royal household, he represented the king during the negotiations at Uxbridge in 1645. Later he lived for some years in France, and after the Restoration was made a privy councillor and governor of Guernsey. He died at Kirby on the 4th of July 1670, and was buried in Westminster Abbey. By his wife Elizabeth (d. 1672), daughter of Sir Charles Montagu of Boughton, he had two sons and three daughters. His eldest son Christopher (1632-1706), succeeded his father as Baron Hatton and also as governor of Guernsey in 1670. In 1683 he was created Viscount Hatton of Grendon. He was married three times, and left two sons: William (1660-1760), who succeeded to his father's titles and estates, and Henry Charles (c. 1700-1762), who enjoyed the same dignities for a short time after his brother's death. When Henry Charles died, the titles became extinct, and the family is now represented by the Finch-Hattons, earls of Winchilsea and Nottingham, whose ancestor, Daniel Finch, 2nd earl of Nottingham, married Anne (d. 1743), daughter of the 1st Viscount Hatton.

HATTON, JOHN Liptrot (1809-1886). English musical conductor, was born at Liverpool on the 12th of October 1809. He was virtually a self-taught musician, and besides holding several appointments as organist in Liverpool, appeared as an actor on the Liverpool stage, subsequently finding his way to London as a member of Macready's company at Drury Lane in 1832. Ten years after this he was appointed conductor at the same theatre for a series of English operas, and in 1843 his own first operaetta, Queen of the Thames, was given with success. Staudiel, the eminent German bass, was a member of the company, and at his suggestion Hatton wrote a more ambitious work, Pascal Brune, which, in a German translation, was presented at Vienna, 1843. The part; the opera contained a song, "Revenge," which the bass singer "quickly emblazoned" in England, though the piece as a whole was not successful enough to be produced here. Hatton's excellent pianoforte playing attracted much attention in Vienna; he took the opportunity of studying counterpart under Sechter, and wrote a number of songs, obviously modelled on the style of German classics. In 1846 he appeared at the Hereford festival as a singer, and also played a pianoforte concerto of Mozart. He undertook concert tours about this time with Sívori, Vieuxtemps and others. From 1848 to 1850 he was in America; on his return he became conductor of the Glee and Madrigal Union, and from about this time he began to take an active part in producing the music for Charles Kean's Shakespearean revivals. He seems to have kept this appointment for about five years. In 1856 a cantata, Robin Hood, was given at the Bradford festival, and a third opera, Rose, or Love's Ransom, at Covent Garden in 1864, without much success. In 1866 he went again to America, and from this year Hatton held the post of accompanist at the Ballad Concerts, St James's Hall, for nine seasons. In 1875 he went to Stuttgart, and wrote an oratorio, Heceshir, given at the Crystal Palace in 1877; like all his larger works it met with very moderate success. Hatton excelled in the lyrical forms of music, and, in spite of his distinct skill in the severer styles of the madrigal, &c., he won popularity by such songs as "To Anthea," "Good-bye, Sweetheart," and "Simon the Cellarer," the first of which may be called a classic in its own way. His glee and part-songs, such as "When Evening's Twilight," are still reckoned among the best of their class; and he might have gained a place of higher distinction among English composers had it not been for his irresistible animal spirits and a want of artistic reverence, which made it uncertain in his younger days whether, when he appeared at a concert, he would play a fugue of Bach or sing a comic song. He died at Margate on the 20th of September 1886.

HAUCH, JOHANNES CARSTEN (1790-1872). Danish poet, was born of Danish parents residing at Frederikshald in Norway, on the 12th of May 1790. In 1802 he lost his mother, and in 1803 returned with his father to Denmark. In 1807 he fought as a volunteer against the English invasion. He entered the university of Copenhagen in 1808, and in 1821 took his doctor's degree. He became the friend and associate of Steffens and Oehlenschläger, warmly adopting the romantic views about poetry and philosophy. His first two dramatic poems, The Journey to Ginistan and The Power of Fancy, appeared in 1816, and were followed by a lyrical drama, Rosaura (1817); but these works attracted little or no attention. Hauch therefore gave up all hope of fame as a poet, and resigned himself entirely to the study of science. He took his doctor's degree in zoology in 1821, and went abroad to pursue his studies. At Nice he had an accident which obliged him to submit to the amputation of one foot. He returned to literature, publishing a dramatized fairy tale, The Hamadryad, and the tragedies of Bajazet, Tiberius, Gregory VII., in 1828-1829, The Death of Charles V. (1831), and The Siege of Maestricht (1832). These plays were violently attacked and enjoyed no success. Hauch then turned to novel-writing, and published in succession five romances— Wilhelm Zabern (1834); The Alchemist (1836); A Polish Family (1839); The Castle on the Rhine (1845); and Robert Fulton (1853). In 1842 he collected his shorter Poems. In 1846 he was appointed professor of the Scandinavian languages in Kiel, but returned to Copenhagen when the war broke out in 1848. About this time his dramatic talent was at its height, and he produced one admirable tragedy after another; among these may be mentioned Swede Grathe (1841); The Sisters at Kinne-bulle (1843); Marshal Stig (1850); Honour Lost and Won (1851); and Tycho Brahe's Youth (1852). From 1858 to 1860 Hauch was director of the Danish National Theatre; he produced three more tragedies—The King's Favorite (1859); Henry of Navarre (1863); and Julian the Apostle (1866). In 1861 he
HAUER—HAUGE

published another collection of *Lyrical Poems and Romances*; and in 1862 the historical epic of *Vuldanar Seir*, volumes which contain his best work. From 1851, when he succeeded Oehlschläger to his death, he held the honorary post of professor of aesthetics at the university of Copenhagen. He died in Rome in 1872. Hauff was one of the most prolific of the Danish poets, though his writings are unequal in value. His lyrics and romances in verse are always fine in form and often strongly imaginative. In all his writings, but especially in his tragedies, he displays a strong bias in favour of what is mystical and supernatural. Of his dramas *Marvels* is perhaps the best, and of his novels the patriotic tale of *Vilhelm Zobens* is admired the most.

See G. Brandes, "Carsten Hauch" (1873) in *Dansk Digter* (1877); F. Rønning, J. C. Hauch (1890), and in *Dansk Biografisk Lexikon*, (vol. vii. Copenhagen, 1893). Hauch's novels were collected (1872–1874) and his dramatic works (3 vols, 2nd ed., 1852–1859).

HAUER, FRANZ, RITTER VON (1852–1890), Austrian geologist, born in Vienna on the 30th of January 1822, was son of Joseph von Hauer (1775–1863), who was equally distinguished as a high Austrian official and an authority on Sanskritology. He was educated in Vienna, afterwards studied geology at the mining academy of Schemnitz (1830–1843), and for a time was engaged in official mining work in Styria. In 1846 he became assistant to W. von Haidinger at the mineralogical museum in Vienna; three years later he joined the imperial geological institute, and in 1866 he was appointed director. In 1886 he became superintendent of the imperial natural history museum in Vienna. Among his special geological works are those on the Cephalopoda of the Triassic and Jurassic formations of Alpine regions (1855–1860). His most important general work was *Geologisches Atlas von Austro-Hungarien*, in twelve sheets (1867–1871; 4th ed., 1884, including Bosnia and Montenegro). This map was accompanied by a series of explanatory pamphlets. In 1882 he was awarded the Wollaston medal by the Geological Society of London. In 1892 von Hauer became a life-member of the upper house of the Austrian parliament. He died on the 20th of March 1899.

HAUFF, WILHELM (1802–1827), German poet and novelist, was born at Ostendorf near Balingen, Württemberg, on the 30th of January 1827. He became a pupil in the gymnasium at Stuttgart at a comparatively late age, and in 1848 he entered the university at Tubingen, where he studied oriental languages, especially Sanskrit. He afterwards attended lectures in the Austrian university, and in 1854 settled as Privatdozent at Bonn. In 1856 he removed to Heidelberg, where he assisted Bunsen in his literary undertakings; and in 1859 he accepted an invitation to India, where he became superintendent of Sanskrit studies and professor of Sanskrit in Poona. Here his acquaintance with the Zend language and literature afforded him excellent opportunities for extending his knowledge of this branch of literature. The result of his researches was a volume of *Essays on the sacred language, writings and religion of the Parsees* (Bombay, 1863).

But he returned to Stuttgart in 1866, and he was called to Munich as professor of Sanskrit and comparative philology in 1868. He died on the 3rd of June 1876.

Besides the *Essays on the Parsees*, of which a new edition, by E. W. West, greatly enriched from the posthumous papers of the author, appeared in 1874, Hauff published a number of works of considerable importance to the student of the ancient India and Persia. They include *Die Pehlevi-Sprache und der Bundeh-Buch* (1854); *Die Schriften und Sprache der zweiten Keilschriftzeit* (1855); *Fünf Gathas* (1856; translated and expanded (1856–1860); an edition, with translation and explanation, of the *Avesta*; *Brahmana* of the Rigveda (Bombay, 1863), which is accepted as his masterpiece; and the *Proverbs of Persia*, *Tragedies*, *Romances*; *Sanskrit* (1822); *An original Speech of Zarathustra* (1865); *An old Zend-Pahlavi Grammar* (1867); *Über den Charakter der Pehlevi-Sprache* (1869); *Das 18. Kapitel des Wendiald* (1869); *Über das Ardaiv-Vyraf namab* (1870); *An old Pahlavi-Pazand Grammar* (1870); and *Védica Rätifragen und Rätelsprache* (1875).

For particulars of Hauff's life and work, see A. Beesenberger, *Beiträge zur Kunde der indogermanischen Sprachen*, vol. i. pp. 70 seq. (1886).

HAUGE, HANS NIelsen (1771–1824), Norwegian Lutheran divine, was born in the parish of Thunø, Norway, on the 3rd of April 1771, the son of a peasant. With the aid of various religious works which he found in his father's house, he laboured to supplement his scanty education. In his twenty-sixth year, believing himself to be a divinely-commissioned prophet, he began to preach in his native parish and afterwards throughout Norway, calling people to repentance and attacking rationalism. In 1800 he passed to Denmark, where, as at home, he gained many followers and assistants, chiefly among the nobility. But in 1804, Hauge set up a printing-press to disseminate his views more widely, but was almost immediately arrested for holding illegal religious meetings, and for insulting the regular clergy in his books, all of which were confiscated; he was also heavily fined. After being in confinement for some years, he was released in 1814 on payment of a fine, and retiring to an estate at Breidwell, near Christiania, he died there on the 20th of March 1824. His adherents, who did not formally break with the church, were called *Haugianer* or *Leser* (i.e. Readers). He unquestionably did much to revive...
HAUGESUND—HAUGWITZ

the spiritual life of the northern Lutheran Church. His views were of a pietistic nature. Though he cannot be said to have rejected any article of the Lutheran creed, the peculiar emphasis which he laid upon the evangelical doctrines of faith and grace involved considerable antagonism to the rationalistic or sacerdotal views commonly held by the established clergy.

Hauge's principal writings are Forsøg til Afhandeling om Guds Visdom (1760); Anvisning til nogle mørkelige Sprog i Bibelen (1760); The Prophet-Literature (1793). For an account of his life and doctrines see C. Bang's Hans Nielsen Hauge and hans Samtid (Christiania; 2nd ed., 1873); O. Rost, Nogle Bemærkninger om Hans Nielsen Hauge og hans Reining (1883), and the article in Hauge Hauck, Religionen i Norden.

HAUGESUND, a county of Norway in Stavanger amt (county), on the west coast, 34 m. N. by W. of Stavanger. Pop. (1900), 7935. It is an important fishing centre. Herrings are exported to the annual value of £100,000 to £200,000, also mackerel and lobsters. The principal imports are coal and salt. There are factories for woolen goods and a margarine factory. Haugesund is the reputed death-place of Harald Haarfager, to whom an obelisk of red granite was erected in 1872 on the thousandth anniversary of his victory at the Hafsfjord (near Stavanger) whereby he won the sovereignty of Norway. The memorial stands 14 m. north of the town, on the Haraldshaug, where the hero's supposed tombstone is shown.

HAUGHTON, SAMUEL (1821-1877), Irish scientific writer, the son of Clement Haughton (1797-1873), was born at Carlow on the 21st of December 1821. His father, the son of a Quaker, but himself a Unitarian, was an active philanthropist, a strong supporter of Father Theobald Mathew, a vegetarian, and an anti-slavery worker and writer. After a distinguished career in Trinity College, Dublin, Samuel was elected a fellow in 1844. He was ordained priest in 1847, but seldom preached. In 1851 he was appointed professor of geology in Trinity College, and this post he held for thirty years. He began the study of medicine in 1859, and in 1862 took the degree of M.D. in the university of Dublin. He was then made registrar of the Medical School, the status of which he did much to improve, and he represented the university on the General Medical Council from 1878 to 1896. He was elected F.R.S. in 1858, and in course of time Oxford conferred upon him the hon. degree of D.C.L., and Cambridge and Edinburgh that of L.L.D. He was a man of remarkable knowledge and ability, and he communicated papers on widely different subjects to various learned societies and scientific journals in London and Dublin. He wrote on the laws of equilibrium and motion of solid and fluid bodies (1846), on sun-heat, terrestrial radiation, geological climates and on tides. He wrote also on the granites of Leinster and Donegal, and on the cleavage and joint-planes in the Old Red Sandstone of Waterford (1857-1858). He was president of the Royal Irish Academy from 1886 to 1891, and for twenty years he was secretary of the Royal Zoological Society of Ireland. He died in Dublin on the 31st of October 1897.

PUBLICATIONS.—Manual of Geology (1865); Principles of Animal Mechanics (1873); Six Lectures on Physical Geography (1880). In conjunction with his friend, Professor J. Galbraith, he issued a series of Manuals of Mathematical and Physical Science.

HAUGHTON, WILLIAM (fl. 1598), English playwright. He collaborated in many plays with Henry Chettle, Thomas Dekker, John Day and Richard Hathaway. The only certain biographical information about him is derived from Philip Henslowe, who on the 10th of March 1600 lent him ten shillings 'to release him out of the Clink.' Mr Fleay credits him with a considerable share in The Tragedy of Cymbeline (1590), and a merry comedy entitled English-Men for my Money, or A Woman will have her Will (1598) is ascribed to his sole authorship. The Devil and his Dame, mentioned as a forthcoming play by Henslowe in March 1600, is identified by Mr Fleay as Grim, the Collier of Croydon, which was printed in 1662. In this play an emissary is sent from the infernal regions to report on the conditions of married life on earth.

Thyraeus raises the question, Are the experiences hallucinatory? Did Mr Wesley (to take his case) receive a mere hallucinatory set of pushes? Was the hair of a friend of the writer's, who occupied a haunted house, only pushed in a subjective way? Thyraeus remarks that, in cases of noisy phenomena, not all persons present hear them; and, rather curiously, Mr Wesley records the same experience; he sometimes did not hear sounds that seemed violently loud to his wife and family, who were with him at prayers. Thyraeus says that, as collective hallucinations of sight are rare—all present not usually seeing the apparition—so audible phenomena are not always experienced by all persons present. In such cases, he thinks, that the sights and sounds have no external cause, he regards the sights and sounds as delusions—caused by spirits. This is a difficult question. He mentions that we hear all the furniture being tossed about (as Sir Walter and Lady Scott heard it at Abbotsford; see Lockhart's Life, v. 311-315). Yet, on inspection, we find all the furniture in its proper place. There is abundant evidence to experience of this phenomenon, which remains as inexplicable as it was in the days of Thyraeus. When the sounds are heard, has the atmosphere vibrated, or has the impression only been made on “the inner ear”? In reply, Mr. Procter, who for sixteen years (1831-1847) endured the unexplained disturbances at Whitney Mill, avers that the knocking objects on which the knocking appeared to be struck did certainly vibrate (see Poltergeist). Is then the vibration part of the hallucination?

As for visual phenomena, “ghosts,” Thyraeus does not regard them as space-filling entities, but as hallucinations imposed by spirits on the human senses; the spirit, in each case, not being necessarily the soul of the dead man or woman whom the phantom represents.

In the matter of alleged hauntings, the symptoms, the phenomena, to-day, are exactly the same as those recorded by Thyraeus. There are always in them so far a living thing that it greatly lowers the letting value of a house when it is reported to be haunted. (An action for libelling a house as haunted was reported in the London newspapers of the 7th of March 1907.) It is true that ancient family legends of haunts are glorified in by the inhabitants of stately homes in England, or castles in Scotland, and to discredit the traditional ghost—in the days of Sir Walter Scott—was to come within measurable distance of a duel. But the time-honoured phantasms of old houses usually survive only in the memory of “the oldest aunt telling the saddest tale.” Their reality, in the case of any one person, by another crossing a room, walking along a corridor, and entering chambers in which, on inspection, they were not found. There was almost never any story to account for the appearances, as in magazine ghost-stories, and, if story there were, it lacked evidence. Recognitions of known dead persons were infrequent; occasionally there was recognition of a portrait in the house. The apparitions spoke in only one or two recorded cases, and, as a rule, seemed to have no motive for appearing.
The "ghost" resembles nothing so much as a somnambulist, or the dream-walk of one living person made visible, telepathically, to another living person. Almost the only sign of consciousness given by the appearances is their shyness; on being spoken to or approached, they generally vanish. Not infrequently they are seen at first sight, for living human beings. In darkness they are often luminous, otherwise they would be invisible! Unexplained noises often, but not always, occur in houses where these phenomena are perceived. Evidence is only good, approximately, when a series of persons, in the same house, behold the same appearance, without being aware that it has previously been seen by others. Naturally it is almost impossible to prove this ignorance.

When inquirers believe that the appearances are due to the agency of spirits of the dead, they usually suppose the method to be a telepathic impact on the mind of the living by some "mere automatic" Chopin from a consciousness which has its centre elsewhere" (Myers, Proceedings S.P.R. vol. xv. p. 64). Myers, in Human Personality, fell back on "palaeeolithic psychology," and a theory of a phantasmoargentastic agency producing a phantasm which had some actual relation to space. But space forbids us to give examples of modern experiences in haunted houses, endured by persons sane, healthy and well educated. The cases, abundantly offered in Proceedings S.P.R., suggest that certain localities, more than others, are centres of permanent possibilities of being hallucinated in a manner more or less uniform. The causes of this fact (if causes there be, beyond a casual hallucination or illusion of A, which, when reported, betrays suggestion, or, when not reported, by telepathy, hallucinations in B, C, D, E), remain unknown (Proceedings S.P.R. vol. viii. p. 133 et seq.). Mr Podmore proposed this hypothesis of causation, which was not accepted by Myers; he thought that the theory laid too heavy a burden on telepathy and suggestion. Neither cause, nor any other cause of similar results, ever affects members of the S.P.R. who may be sent to dwell in haunted houses. They have no weird experiences, except when they are visionaries who see phantoms wherever they go.

HAUPT, MORITZ (1808–1874), German philologist, was born at Zittau, in Lusatia, on the 27th of July 1808. His early education was mainly conducted by his father, Ernst Friedrich Haupt, burgomaster of Zittau, an eloquent man, who used to take pleasure in turning German hymns or Goethe's poems into Latin, and whose memoranda were employed by G. Freytag in the 4th volume of his Bilder aus der deutschen Vergangenheit. From the Zittau gymnasium, where he spent the five years 1821–1826, Haupt removed to the university of Leipzig with the intention of studying theology; but the natural bent of his mind and the influence of Professor G. Hermann soon turned all his energies in the direction of philosophy. On the close of his university course (1830) he returned to his father's house, and the next seven years were devoted to quiet work, not only at Greek, Latin and German, but at Old French, Provencal and Bohemian. He formed with Lachmann at Berlin a friendship which had great effect on his intellectual development. In September 1837 he "habilitated" at Leipzig as Privatdozent, and his first lectures, dealing with such diverse subjects as Catullus and the Nibelungenlied, indicated the twofold direction of his labours. A new chair of German language and literature being founded for his benefit, he became professor extraordinarius (1841) and then professor ordinarius (1843); and in 1842 he married Louise Hermann, the daughter of his master and colleague. But the peaceful and prosperous course opening out before him at the university of Leipzig was brought to a sudden close. Having taken part in 1849 with Otto Jahn and Theodor Mommsen in a political agitation for the maintenance of the imperial constitution, Haupt was deprived of his professorship by a decree of the 22nd of April 1851. Two years later, however, he was called to succeed Lachmann at the university of Berlin; and at the same time the Berlin academy, which had made him a corresponding member in 1841, elected him an ordinary member. For twenty-one years he continued to hold a prominent place among the scholars of the Prussian capital, making his presence felt, not only by the prestige of his erudition and the clearness of his intellect, but by the tirelessness of his energy and the firmness of his convictions. He died, of heart disease, on the 5th of February 1874.

Haupt's critical work is distinguished by a happy union of the most painstaking investigation with intrepidity of conjecture, and while in his lectures and addresses he was frequently carried away by the excitement of the moment, and made sharp and questionable statements, no one of his opinions has been seriously questioned. The results of many of his researches are altogether lost, because he could not be prevailed upon to publish what fell much short of his own high ideal of excellence. To the progress of classical scholarship is contributed by Quaestiones Catulliannae (1837), Observationses criticae (1841), and editions of Ovid's Haliaeetica and the Cymurgica of Gratius and Nemesianus (1838), of Catullus, Tibullus and Propertius (3rd ed., 1868), of Horace (3rd ed., 1871), and of Virgil (2nd ed., 1873). As early as 1856, with Hoffmann von Fallersleben, he started the Alteutsche Blätter, which in 1841 gave place to the Zeitschrift für deutsches Altertum, of which he continued editor till his death. Hartmann von Aue's Erz (1830) and his Lieder, Büchlein and Der arme Heinrich (1842), Rudolf von Em's Guter Gerdhard (1840) and Conrad von Würzburg's Engelhardt (1844) are the principal German works which he edited.

To form a collection of the French works owned by Des Friedenfeste (1890), Einsame Menschen (1901) and Die Weber (1802), a powerful dramatic depiction of the rising of the Silesian weavers in 1844. Of Hauptmann's subsequent work mention may be made of the comedies Kollege Crampton (1892), Der Biberpelz (1893) and Der rote Hahn (1901), a "dream poem," Hennele (1903), and an historical drama Florian Geyer (1895). He also wrote two tragedies of Silesian peasant life, Fuhrmann Henschel (1898) and Rose Berndt (1903), and the "dramatic fairy-tales" Die versunkene Glocke (1897) and Und Pippa tant (1905). Several of his works have been translated into English.

Biographies of Hauptmann and critical studies of his dramas have been published by A. Bartels (1897), P. Schlenker (1898), and J. C. Woerner (2nd ed., 1900). See also L. Benoist-Hanappier, Le Drame naturaliste en Allemagne (1905).

HAUPTMANN, MORITZ (1792–1868), German musical composer and writer, was born at Dresden, on the 13th of October 1792, and studied music under Scholz, Lanska, Grosse and Morlach, the rival of Weber. Afterwards he completed his education as a violinist and composer under Spohr, and till 1820 held various appointments in private families, varying his musical occupations with mathematical and other studies bearing chiefly on acoustics and kindred subjects. For a time he was an army surgeon, but his chief pursuit gave place to music, and a grand tragic opera, Mathilde, belongs to the period just referred to. In 1822 he entered the orchestra of Cassel, again under Spohr's direction, and it was then that he first taught composition and musical theory to such men as Ferdinand David, Burgmüller, Kiel and others. His compositions at this time chiefly consisted of motets, masses, can- tatas and songs. His opera Mathilde was performed at Cassel...
HAUREAU—HAUSA

with great success. In 1847 Hauptmann obtained the position of cantor at the Thomas-school in Leipzig (long previously occupied by the great Johann Sebastian Bach) together with that of professor at the conservatoire, and it was in this capacity that his unique gift as a teacher developed itself and was acknowledged by a crowd of enthusiastic and more or less distinguished pupils. He died on the 3rd of January 1868, and the universal regret felt at his death at Leipzig is said to have been all but equal to that caused by the loss of his friend Medelssohn many years before. Hauptmann's compositions are marked by symmetry and perfection of workmanship rather than by spontaneity in inspiration.

Amongst his vocal compositions—by far the most important portion of his work—may be mentioned two masses, choral songs for mixed voices (Op. 32, 47), and numerous part songs. The results of his scientific research were embodied in his book Die Natur der Harmonik und Metrik (1853), a standard work of its kind, in which a philosophic explanation of the forms of music is attempted.

HAUREAU, JEAN BARTHÉLÉMY (1812-1860), French historian and miscellaneous writer, was born in Paris. At the age of twenty he published a series of apologetical works on the Montagnards. In later years he regretted the youthful enthusiasm with which he had written these papers, and endeavoured to destroy the copies. He joined the staff of the National Quarterly, and was praised by Théophile Gautier as the "tribune" of romanticism. At that time he seemed to be destined to a political career, and, indeed, after the revolution of the 24th of February 1848 was elected member of the National Assembly; but close contact with revolutionary men and ideas gradually cooled his old ardour. Throughout his life he was an enemy to innovators, not only in politics and religion, but also in literature. This attitude sometimes led him to form unjust estimates, but only on very rare occasions, for his character was as just as his erudition was scrupulous. After the coup d'État he resigned his position as director of the MS. department of the Bibliothèque Nationale, to which he had been appointed in 1848, and he refused to accept any administrative post until after the fall of the empire. After having acted as director of the national printing press from 1870 to 1881, he retired, but in 1893 accepted the post of director of the Fondation Thiéry. He was also a member of the council of improvement of the École des Chartes. He died on the 26th of April 1896. For over half a century he was engaged in writing on the religious, philosophic, and more particularly the literary history of the middle ages. As librarian of the celebrated library of the town of Le Mans in 1838, he was first attracted by the history of Maine, and in 1843 published the first volume of his Histoire littéraire (4 vols., 1843-1852), which he subsequently recast on a new plan (10 vols., 1870-1877). In 1845 he brought out an edition of vol. ii. of G. Ménage's Histoire de Savoie. He then undertook the continuation of the Gallia christiana, and produced vol. xiv. (1856) for the province of Tours, vol. xv. (1862) for the province of Besançon, and vol. xvi. (1865-1870) for the province of Vienne. This important work gained him admission to the Académie des Inscriptions et Belles-Lettres (1862). In the Notices et extraits des manuscrits he inserted several papers which were afterwards published separately, with additions and corrections, under the title Notices et extraits de quelques manuscrits de la Bibliothèque Nationale (6 vols., 1890-1893). To the Histoire littéraire de la France he contributed a number of studies, among which must be mentioned that relating to the sermon-writers (vol. xxvi. 1873), whose works, being often anonymous, raise many problems of attribution, and, though deficient in originality of thought and style, reflect the very spirit of the middle ages. Among his other contributions must be made of his remarkable Histoire de la philosophie scolastique (1853), extending from the time of Charlemagne to the 13th century, which was grouped by a paper crowned by the Académie des Sciences Morales et Politiques in 1850; Les Mélanges poétiques d'Hildebert de Lavardin (1882); an edition of the Works of Hugh of St Victor (1886); a critical study of the Latin poems attributed to St Bernard (1890); and Bernard Délécluze et l'inquisition albigeoise (1877). To these must be added his contributions to the Dictionnaire des sciences philosophiques, Didot's Biographie générale, the Biblio-thèque de l'École des Chartes, and the Journal des savants. From the time of his appointment to the Bibliothèque, Nationale up to the last days of his life he was engaged in making abstracts of all the medieval Latin writings (many anonymous or of doubtful attribution) relating to philosophy, theology, grammar, canon law, and poetry, carefully noting on slips the conclusions of each passage. After his death this index of incipits, arranged alphabetically, was presented to the Académie des Inscriptions, and a copy was placed in the MS. department of the Bibliothèque Nationale.

See obituary notice read by Henri Wallon at a meeting of the Académie des Inscriptions on the 12th of November 1897; and the notice by Paul Meyer prefixed to vol. xxiii. of the Histoire littéraire de la France.

HAUSA, sometimes incorrectly written HAUSSA, HOUSA or HAOUSSA, a people inhabiting about half a million square miles in the western and central Sudan from the river Niger in the west to Bornu in the east. Heinrich Barth identifies them with the Atarantians of Herodotus. According to their own traditions the oldest home of the race was the divide between the Sokoto and Chad basins, and more particularly the eastern watershed, whence they spread gradually westwards. In the middle ages, to which period the first authentic records refer, they were, though never a conquering race, attained great political power. They were then divided into seven states known as "Hausa bokko" ("the seven Hausa") and named Biram, Daura, Gober, Kano, Rano, Katsena and Zegzeg, after the sons of their legendary ancestor. This confederation extended its authority over many of the neighbouring countries, and remained paramount till the Fula under Sheikh Dan Fodio in 1810 conquered the Hausa states and founded the Fula empire of Sokoto (see FULA).

The Hausa, who number upwards of 5,000,000, form the most important nation of the central Sudan. They are undoubtedly nigrritic, though in places with a strong crossing of Fula and Arab blood. Morally and intellectually they are, however, far superior to the typical Negro. They are a powerful, heavily built race, with skin as black as most Negroes, but with lips not so thick nor hair so woolly. They excel in physical strength. The average Hausa will carry on his head a load of ninety or a hundred pounds without showing the slightest signs of fatigue for a long day's march. When carrying their own goods it is by means of yokes, which they use to take them to double this weight.

They are a peaceful and industrious people, living partly in farmsteads amid their crops, partly in large trading centres such as Kano, Katsena and Yakoba (Bauchi). They are extremely Intelligent and even cultured, and have exercised a civilizing effect upon their Fula conquerors to whose oppressive rule they submitted. They are excellent agriculturists, and, almost unaided by foreign influence, they have developed a variety of industries, such as the making of cloth, mats, leather and glass. In Sierra Leone and the Gold Coast territory they form the backbone of the military police, and under English leadership have again and again shown themselves to be admirable fighters and capable of a high degree of discipline and good conduct. Their food consists chiefly of guinea corn (sorghum vulgare), which is ground up and eaten as a sort of porridge mixed with large quantities of red pepper. The Hausa attribute their superiori in strength to the fact that they live on guinea corn instead of yams and bananas, which form the staple food of the tribes on the river Niger. The Hausa carried on agriculture chiefly by slave labour; they are themselves born traders, and it is this fact which has led to the African way of making the riches of the vocabulary Bishop Crowther mentions that there are eight names for different parts of the day from cockcrow till after sunset. About a third of the words are connected with Arabic roots, nor are these such as the Hausa could well have borrowed in anything like recent times from the Arabs. Many words representing
HAUSER—HAUSMANN

ideas or things with which the Hausa must have been familiar from childhood were expressed in a peculiarly native Semitic root. There is a certain amount of resemblance between the Hausa language and that spoken by the Berbers to the south of Tripoli and Tunis. This language, again, has several striking points of resemblance to Arabic. It is likely, if not certain, that between these three languages should be demonstrated, such connexion would serve to corroborate the Hausa tradition that their ancestors came from the very far east away beyond Mecca. The Hausa language has been reduced to writing for at least a century, possibly very much longer. It is the only language in tropical Africa which has been reduced to writing by the natives themselves, unless the Vai alphabet, introduced by a native inventor in the interest of his own school, which belongs to the same general type of language, is excepted. In each of these languages the character used is a modified form of Arabic. Some fragments of literature exist, consisting of political and religious poems, together with notes on native manners and customs. A volume, consisting of history and poems reproduced in facsimile, &c., first transcribed, has been published by the Cambridge University Press.

Religion.—About one-third of the people are professé Mahommedans, one-third are heathen, and the remainder have apparently no definite form of religion. Their Mahommedanism dates from the 14th century, but became more general when the Fula sheik Dan Fodio initiated the religious war which ended in the founding of the Fula empire in 1786; he was followed as the religious head of the whole country, and tribute has been paid to him as such. The Hausa who profess Mahommedanism are extremely ignorant of their own faith, and what little religious faith there is in the Hausa is confined to the few who belong to the Hausa start every year on the pilgrimage to Mecca, travelling sometimes across the Sahara desert and by way of Tripoli and Alexandria, sometimes by way of Wadai, Darfur, Khartum and Suakin. The Koran is usually read five or seven times a day, as much from trading as from religious motives. Mahommedanism is making very slow, if any, progress amongst the Hausa. The great number of the natives are so much attached to the institution of the Ramadan fast. In a climatic season, as that of the Hausa, the obligation to abstain from food and drink from sunrise to sunset during one month in the year is a serious difficulty. Until the last decade of the 19th century, the important attempt to introduce Christianity, but the fact that the Hausa are fond of reading, and that native schools exist in all parts of the country, should greatly facilitate the work of Christian missionaries.

HAUSER, KASPAR, a German youth whose life was remarkable from the circumstances of apparently inexplicable mystery in which it was involved. He appeared on the 26th of May 1828, in the streets of Nuremberg, dressed in the garb of a peasant, and with such a helpless and bewildered air that he attracted the attention of the passers-by. His behaviour was found a letter purporting to be written by a poor labourer, stating that the boy was given into his custody on the 7th of October 1828, and that according to agreement he had instructed him in reading, writing, and the Christian religion, but that up to the time fixed for relinquishing his custody he had kept him in close confinement. Along with this letter was enclosed another purporting to be written by the boy's mother, stating that he was born on the 30th of April 1812, that his name was Kaspar, and that his father, formerly a cavalry officer in the 6th regiment at Nuremberg, was dead. The appearance, bearing, and professions of the youth corresponded closely with these credentials. He showed a repugnance to all religious observances. On returning to his parents, who were ignorant of outward objects, wrote his name as Kaspar Hauser, and said that he wished to be a cavalry officer like his father. For some time he was detained in prison at Nuremberg as a vagrant, but on the 18th of July 1828 he was delivered over by the town authorities to the care of a schoolmaster, Professor Daumer, who undertook to be his guardian and to take the charge of his education. Further mysteries accumulated about Kaspar's personality and conduct, not altogether unconnected with the vogue in Germany, at that time, of "animal magnetism," "somnambulism," and similar theories of the occult and strange. People associated him with all sorts of possibilities. On the 17th of October 1829 he was found to have received a wound in the forehead, which, according to his own account, was inflicted on him by a man with a blackened face. Having on this account been brought to the house of a magistrate and placed under close surveillance, he was visited by Earl Stanhope, who became so interested in his history that he sent him in 1832 to Ansbach to be educated under a certain Dr Meyer. After this he became clerk in the office of Paul John Anselm von Feuerbach, president of the court of appeal, who had begun to pay attention to his case in 1828; and his strange history was almost forgotten by the public when the interest in it was suddenly revived by his receiving a deep wound on his left breast, on the 14th of December 1833, and dying from it three or four days afterwards. He affirmed that the wound was inflicted by a stranger, but many believed it to be the work of his own hand, and that he did not intend it to be fatal, but only so severe as to give a sufficient colouring of truth to his story. The affair created a great sensation, and produced a long literary agitation. But the whole story remains somewhat mysterious. Lord Stanhope eventually became decidedly sceptical as to Kaspar's stories, and ended by being accused of contriving his death!

In 1830 a pamphlet was published at Berlin, entitled Kaspar und sein Bruder: but the truthfulness of his statements was defended by Daumer in "Ange- liungen über Kaspar Hauser" (Nuremberg, 1832), and Enthüllungen über Kaspar Hauser (Frankfort, 1839); as well as Kaspar Hauser, sein Leben, seine Unschuld, &c. (Regensburg, 1837), in answer to Meyer's (a son of Kaspar's tutor) Authentische Mittheilungen über Kaspar Hauser (Ansbach, 1872). Feuerbach awakened considerable psychological interest in the case by his pamphlet Kaspar Hauser, Replique und Ergänzungen (Verden an der Aller, 1833). By this time Kaspar Hauser, who had been frequently an accomplice of Dr Meyer in the discussion by publishing Materialien zur Geschichte K. Hausers (Heidelberg, 1836). The theory of Daumer and Feuerbach and other pamphletemes (finally presented in 1862 by Dr Nissen, and Sir Henry Maine in his Story of Kaspar Hauser from Authentic Records) was that the youth was the crown prince of Baden, the legitimate son of the grand-duke Charles of Baden, that he had been kidnapped at Karlsruhe in October 1812 by minions of the countess of Hochberg (morganatic wife of the grand-duke) in order to secure the succession to her offspring; but this theory was answered in 1875 by the publication in the Augsburg Allgemeine Zeitung of a pamphlet, a pamphlet, by the late secretary, the death of the heir supposed to have been kidnapped. See Kaspar Hauser und sein badisches Prinzenstum (Heidelberg, 1875). In 1883 the story was again revived in a Regensburg pamphlet attacking, among other people, Dr Meyer and the sons of the latter, who was dead, brought an action for libel, under the German law, to which no defence was made; all the copies of the pamphlet were ordered to be destroyed. The evidence has been subtly analyzed in the pamphlet Kaspar Hauser (Berlin, 1872). Lang's view is that possibly Kaspar was a sort of "ambulatory automaton," an instance of a phenomenon, known by other cases to students of abnormal psychology, of which the characteristics are a capacity for straying away and the persistence of delusions as to identity; but he inclines to regard Kaspar simply as a "humbug". The "authentic records" purporting to confirm the kidnapping story, Lang stigmatizes as "worthless and impudent rubbish." The evidence is in any case in perfect confusion.

HAUSMANN, JOHANN FRIEDRICH LUDWIG (1782–1859), German mineralogist, was born at Hanover on the 22nd of Feb- ruary 1782. He was educated at Göttingen, where he obtained the degree of Ph.D. After making a geological tour in Denmark, Norway and Sweden in 1807, he was two years later placed at the head of a government mining establishment in Westphalia, and he established himself as a mining expert. In 1811 he was appointed professor of technology and mining, and afterwards of geology and mineralogy in the university of Göttingen, and this chair he occupied until a short time before his death. He was also for many years secretary of the Royal Academy of Sciences of Göttingen. He published observations on geology and mineralogy in Germany and Italy as well as in central and northern Europe; he wrote on gypsum, pyrites, felspath, tachylite, cordierite and on some erup-
Hausrat—Haussonville

rocks, and he devoted much attention to the crystals developed during metallurgical processes. He died at Hannover on the 20th of December 1839.

Publications: Grundlinien einer Enzyklopädie der Bergwerkswissenschaften (1811); Reise durch Skandinavien (5 vols., 1811–1818); Handbuch der Mineralogie (5 vols., 1813; 2nd ed., 1828–1847).

Hausrat, Adolph (1837–1909), German theologian, was born at Karlsruhe on the 13th of January 1837 and was educated at Jena, Göttingen, Berlin and Heidelberg, where he became Privatdozent in 1861, professor extraordinary in 1867 and ordinary professor in 1872. He was a disciple of the Tübingen school and a strong Protestant. Amongst many books which he wrote (44 vols. in all), he is best known for his Geschichte der freyen Zeitgeschichte (1868–1879; 4 vols.; Eng. trans.), D. F. Strauss und die Theologie seiner Zeit (1876–1878, 2 vols.), and Lives of Richard Rolle (2 vols. 1902), and Luther (1904). His scholarship was sound and his style vigorous. Under the pseudonym George Taylor he wrote several historical romances, especially Antinous (1880), which quickly ran through five editions, and is the story of a soul "which courted death because the objective restraint of faith had been lost." Klivia (1883) was a 19th-century story, Jelta (1884) a tale of the great immigrations, and Elfrida (1886) a romance of the last days of the 13th century.

Häuser, Ludwig (1818–1867), German historian, was born at Kleeberg, in Alsace. Studying philology at Heidelberg in 1835, he was led by F. C. Schlosser to give it up for history, and after continuing his historical work at Jena and teaching in the gymnasiu at Wertheim he made his mark by his Die deutschen Geschichtsschreiber vom Anfange des Frankenreichs bis auf die Hohenzollern (1839). Next year appeared his Sage von Tetel. After a short period of study in Paris on the Roman Revolution, he spent some time working in the archives of Baden and Bavaria, and published in 1845 Die Geschichte der rheinischen Pfälze, which won for him a professorship extraordinarius at Heidelberg. In 1850 he became professor ordinarius. Häuser also interested himself in politics while at Heidelberg, publishing in 1846 Schleswig-Holstein, Dänemark und Deutschland, and editing with Gervinus the Deutsche Zeitung. In 1848 he was elected to the lower legislative chamber of Baden, and in 1850 advocated the project of union with Prussia at the parliament held at Ertward. Another timely work was his edition of Friedrich List's Gesammelte Schriften (1850), accompanied with a life of the author. His greatest achievement, and the one on which his fame as an historian rests, is his Deutsche Geschichte vom Tode Friederichs des Grossen bis zu Gründung des deutschen Bundes (Leipzig, 1854–1857, 4 vols.). This was the first work covering that period based on a scientific study of the archival sources. In 1859 he again took part in politics, resigning his place in the lower chamber, opposing in 1862 the project of Austria for the reform of the Confederation brought forward in the assembly of princes at Frankfort, in his book Die Reform des deutschen Bundestages, and becoming one of the leaders of the "Little German" (kleindeutsche), party, which advocated the exclusion of Austria from Germany. In addition to various essays (in his Gesammelte Schriften, Berlin, 1869–1879, 2 vols.), Häuser's lectures have been edited by W. Oreck in Geschichte des Zeitalters der Reformation (1896, 2nd ed. 1890), and Geschichte der französischen Revolution (1860, 2nd ed. 1876). These lectures reveal all the charm of style and directness of presentation which made Häuser's work as a professor so vital.

Hausmann, Georges Eugène, Baron (1809–1891), who is associated with Paris, is born in that city on the 27th of March 1809 of a Protestant family, German in origin. He was educated at the Collège Henri IV, and subsequently studied law, attending simultaneously the classes at the Paris conservatoire of music, for he was a good musician. He became sous-préfet of Nérac in 1839, and advanced rapidly in the civil service until in 1853 he was chosen by Persigny prefect of the Seine in succession to Jean Jacques Berger, who hesitated to incur the vast expenses of the imperial schemes for the embellishment of Paris. Hausmann laid out the Bois de Boulogne, and made extensive improvements in the smaller parcs of Paris. The gardens of the Luxembourg Palace were cut down to allow of the formation of new streets, and the Boulevard de Sébastopol, the southern half of which is now the Boulevard St Michel, was driven through a populous district. A new water supply, a gigantic system of sewers, new bridges, the opera, and other public buildings, the inclusion of outlying districts—these were among the new prefect's achievements, accomplished by the aid of a bold handling of the public funds which called forth Jules Ferry's indictment, Les Comptes fantastiques de Hausmann, in 1867. A loan of 250 million francs before he entered the Senate in 1870.

The gardens of the Luxembourg Palace were cut down to allow of the formation of new streets, and the Boulevard de Sébastopol, the southern half of which is now the Boulevard St Michel, was driven through a populous district. A new water supply, a gigantic system of sewers, new bridges, the opera, and other public buildings, the inclusion of outlying districts—these were among the new prefect's achievements, accomplished by the aid of a bold handling of the public funds which called forth Jules Ferry's indictment, Les Comptes fantastiques de Hausmann, in 1867. A loan of 250 million francs before he entered the Senate in 1870. These sums represented only part of his financial schemes, which led to his dismissal by the government of Émile Ollivier. After the fall of the Empire he spent about a year abroad, but he re-entered public life in 1877, when he became Bonapartist deputy for Ajaccio. He died in Paris on the 11th of January 1891. Hausmann had been made senator in 1857, member of the Academy of Fine Arts in 1867, and grand cross of the Legion of Honour in 1862. His name is preserved in the Boulevard Hausmann. His later years were occupied with the preparation of his Mémoires (3 vols., 1867–1870).

Haussonville, Joseph Othenin Bernard de Cléron, Comte d' (1809–1884), French politician and historian, was born in Paris on the 27th of May 1809. His grandfather had been "grand louveteur" of France; his father Charles Louis Bernard de Cléron, comte d'Haussonville (1770–1846), was chamberlain at the court of Napoleon, a count of the French empire, and under the Restoration a peer of France and an opponent of the Villé ministry. Comte Joseph had filled a series of diplomatic appointments at Brussels, Turin and Naples, before he entered the chamber of deputies in 1842 for Provins. Under the Second Empire he published a liberal anti-imperial paper at Brussels, Le Bulletin françois, and in 1863 he actively supported the candidature of Prévost Paradol. He was elected to the French Academy in 1869, in recognition of his historical writings, Histoire de la politique extérieure du gouvernement français de 1830 à 1848 (2 vols., 1850), Histoire de la réunion de la Lorraine à la France (4 vols., 1854–1859), L'Église romaine et le premier empire 1800–1815 (4 vols., 1863–1870). In 1870 he published a pamphlet directed against the Prussian invasion of France and the Prussians devant l'Europe, the sale of which was prohibited in Belgium at the request of King William of Prussia. He was the president of an association formed to provide new homes in Algeria for the inhabitants of Alsace-Lorraine who elected to retain their French nationality. In 1878 he was made a life-senator, in which capacity he allied himself with the Right Centre in defence of the religious associations against the anti-clericals. He died in Paris on the 28th of May 1884.

His wife Louise (1818–1882), a daughter of Duc Victor de Broglie, published in 1858 a novel Robert Emmet, followed by Marguerite de Valois reine de Navarre (1870), La Jeunesse de Lord Byron (1872), and Les Dernières Années de Lord Byron (1874).

His son, Gabriel Paul Othenin de Cléron, comte d'Haussonville, was born at Gurcy de Châtel (Seine-et-Marne) on the 21st of September 1843, and married in 1865 Mlle Pauline d'Harcourt. He represented Seine-et-Marne in the National Assembly (1871) and voted with the Right Centre. Though he was not elected to the chamber of deputies he became the right-hand man of his maternal uncle, the marquis de St-Arnaud, minister of the Interior from the 14th to the 18th of May. His Établissements philanthropiques en France et aux colonies (1875) was crowned by the Academy, of which he was admitted a member in 1888. In 1891 the resignation of Henri Édouard Bocher from the administration of the Orleanist estates led to the appointment of M d'Haussonville as accredited representative of the comte de Paris in France. He at once set to work to strengthen the Orleanist party by recruiting from the smaller nobility the officials of the local monarchical committees. He established
new Orleanist organs, and sent out lecturers with instructions to emphasize the modern and democratic principles of the comte de Paris; but the prospects of the party were dashed in 1894 by the death of the comte de Paris. In 1904 he was admitted to the Academy of Moral and Political Science. The comte d’Haussonville published—C. A. Sainte-Beuve, sa vie et ses œuvres (1875), Études biographiques et littéraires, 2 series (1870 and 1888), Le Salut de Mme Necker (1882, 2 vols.), Madame de La Fayette (1891), Madame Ackermann (1892), Le Comte de Paris, souvenirs personnels (1903), La Duchesse de Bourgogne et l’alliance savoyarde (1898–1903), Salaire et mistres de femme (1900), and, with G. Hanotaux, Souvenirs sur Madame de Maintenon (3 vols., 1902–1904).

HAUTE-GARONNE—HAUTE-MARNE

The church of St Just at Valcabrère is of still greater age, the choir dating from the 8th or 9th century and part of the nave from the 11th century. There are ruins of a celebrated Cistercian abbey at Bonnefont near St Martory. Gallo-Roman remains and works of art have been discovered at Martres. Near Revel is the fine reservoir of St Feriol, constructed for the canal du Midi in the 17th century.

HAUTE-LOIRE, a department of central France, formed in 1790 in portions of Vivarais and Gévaudan, three districts formerly belonging to the old province of Languedoc, of a portion of Forez formerly belonging to Lyonnais, and a portion of lower Auvergne. Pop. (1906), 314,779. Area, 1931 sq. m. It is bounded N. by Puy-de-Dôme and Loire, E. by Loire and Ardèche, S. by Ardèche and Lozère and W. by Lozère and Cantal. Haute-Loire, which is situated on the central plateau of France, is traversed from north to south by four mountain ranges. Its highest point, the Mont Mézenc (5753 ft.), in the south-east of the department, belongs to the mountains of Vivarais, which are continued along the eastern border by the Boutières chain. The Lignon divides the Boutières from the Massif du Mégal, which is separated by the Loire itself from the mountains of Velay, a granitic range overlaid with the eruptions of more than one hundred and fifty craters. The Margeride mountains run along the western border of the department.

The Loire enters the department at a point 16 m. distant from its source in Ardèche, and first flowing northwards and then north-east, waters its eastern half. The Allier, which joins the Loire at Nevers, traverses the western portion of Haute-Loire in a northerly direction. The chief affluents of the Loire within the limits of the department are the Borne on the left, joining it near Le Puy, and the Lignon, which descends from the Mézenc, between the Boutières and Mégal ranges, on the right. The climate, owing to the altitude, the northward direction of the valleys, and the winds from the Cévennes, is cold, the winters being long and rigorous. Storms and violent rains are frequent on the higher grounds, and would give rise to serious inundations were not the rivers for the most part confined within deep rocky channels. Cereals, chiefly rye, oats, barley and wheat, are cultivated in the lowlands and on the plateaux, on which aromatic and medicinal plants are abundant. Lentils, peas, mangel-wurzels and other forage and potatoes are also grown. Horned cattle belong principally to the Montal, and there are numerous. The woods yield pine, fir, oak and beech. Lace-making, which employs about 90,000 women, and coal-mining are main industries; the coal basins are those of Brassac and Langeac. There are also mines of antimony and stone- quarries. Silk-milling, caoutchouc-making, various kinds of smith’s work, paper-making, glass-blowing, brewing, wood-sawing and flour-milling are also carried on. The principal imports are flour, brandy, wine, live-stock, lace-thread and agricultural implements. Exports include fat stock, wool, aromatic plants, coal, lace. The department is served chiefly by the Paris-Lyon-Méditerranée company. There are 24 administrative arrondissements—Le Puy, Brioude and Yssingeaux, with 28 cantons and 265 communes.

Haute-Loire forms the diocese of Le Puy and part of the ecclesiastical province of Bourges, and belongs to the academic (educational division) of Clermont-Ferrand. Its court of appeal is at Riom. Le Puy the capital, Brioude and La Chaise-Dieu the principal towns of the department, receive separate treatment. It has some notable churches, of which those of Chalamières, St Paulien and Sainte-Marie-des-Chazes are Romanesque in style; Le Monastier preserves the church, in part Romanesque, and the buildings of the abbey to which it belongs. Arhelmades and Boulouze (near Gueydon) have large feudal mansions. The Clos imperial overlooking Polignac is occupied by the ruins of the imposing stronghold of the ancient family of Polignac, including a square donjon of the 12th century. Interesting Gallo-Roman remains have been found on the site.

HAUTE-MARNE, a department of north-eastern France, made up for the most part of districts belonging to the former province of Champagne (Bassigny, Perthois, Vallage), with smaller portions of Lorraine and Burgundy, and some fragments of
HAUVERE—HAUTES ALPES

Franche-Comté. Area, 2,415 sq. m. Pop. (1906), 221,724. It is bounded N.E. by Meuse, E. by Voges, S.E. by Haute-Saône, S. and S.W. by Côte d’Or, W. by Aube, and N.W. by Marne. Its greatest elevation (1,693 ft.) is in the plateau of Langres in the south between the sources of the Marne and those of the Aube; the watershed between the two is near the north of France and the Seine. The country descends rapidly towards the south, but in very gentle slopes northwards. To the north is Bassigny (the paysbas or low country, as distinguished from the highlands), a district characterized by monotonous slats of little fertility and extensive wooded tracts. The lowest level of the department is 361 ft.

Hydrographically Haute-Marne belongs for the most part to the basin of the Seine, the remainder to those of the Rhone and the Meuse. The principal river is the Marne, which rises here, and has a course of 75 m. within the department. Among its more important affluents are, on the right the Rognon, and on the left the Blaise. The Saulx, another tributary of the Marne on the right, also rises in Haute-Marne. Westward the department is watered by the Aube and its tributary the Aubon, both of which have their sources on the plateau of Langres. The Meuse also rises in the department. Its course of 37 m. within the department. On the Mediterranean side the department sends to the Saône the Apace, the Amance, the Salond and the Vingeanne. The climate is partly of the Seine region, partly of that of the Vosges, and partly that of the Rhone; the mean temperature is 48° F., nearly that of Paris; the rainfall is slightly below the average for France.

The agriculture of the department is carried on chiefly by small proprietors. The chief crops are wheat and oats, which are more than sufficient for the needs of the inhabitants; potatoes, lucerne and mangel wuzworts are next in importance. Natural pasture is abundant, especially in Bassigny, where horse and cattle-raising flourish. The vineyards produce some fair wines, notably the white wine of Soyers. More than a quarter of the territory is under wood. The department is rich in iron and building and other varieties of stone are quarried. The warm springs of Bourbou-les-Bains are among the earliest known and most frequented in France. The leading industry is the metalurgical; its establishments include blast furnaces, foundries, forges, and smelters, and the iron-making and smith’s work of various descriptions. St. Dié is the chief centre of manufacture and distribution. The cutlery trade occupies thousands of hands at Nogent-en-Bassigny and in the neighbourhood of Langres. Val d’Osne is well known for its production of fountains, statues, &c., in metal-work. Flour-milling, glove-making (at Chaumont), basket-making, brewing, tanning and other industries are also carried on. The principal import is coal, while manufactured goods, iron, stone, wood and cereals are exported. The department is served by the Eastern railway, of which the line from Paris to Belfort passes through Chaumont and Langres. The canal from the Marne to the Saône and the canal of the Haute-Marne, which accompany the Marne, together cover 99 m.; there is a canal 14 m. long from St. Dizier to Wassy. There are three arrondissements (Chaumont, Langres and Wassy), with 28 cantons and 530 communes. Chaumont is the capital. The department forms the diocese of Langres; it belongs to the VIIth military region and to the educational circonscription (académie) of Dijon, where also is its court of appeal. The principal towns—Chaumont, Langres, St. Dizier and Bourbou-les-Bains—receive separate notice. At Montier-en-Der the remains of an abbey founded in the 7th century include a fine church with naves and aisles of the 10th, and choir of the 13th century. Wassy, the scene in 1562 of the celebrated massacre of Protestants by the troops of Francis, duke of Guise, has among its old buildings a church much of which dates from the Romanesque period. Vigny has a church of the 11th century. Toinville, a metalled market centre, preserves a château of the dukes of Guise in the Renaissance style. Tallay, near Langres, has a fine château of the last half of the 16th century.

HAUVERE, ALEXANDRE MAURICE BLANC DE LANANUTTE, COMTE d’ (1754-1830), French statesman and diplomatist, was born at Aspres (Hautes-Alpes) on the 14th of April 1754, and was educated at Grenoble, where he became a professor. He held a similar position at Tours, and there in 1779 he held the post of the duc de Choiseul, the former minister, and was sent to him to visit him at Chanteloup. Hauverie thus came in contact with the great men who visited the duke, and one of these, the comte de Choiseul-Goffier, on his appointment as ambassador to Constantinople in 1784 took him with him. Hauverie was enriched for a time by his marriage with a widow, Madame de Marchais, but was ruined by the Revolution. In 1790 he applied for and received the post of consul at New York. Under the Consulate, however, he was accused of embezzlement and re- called; and, though the charge was proved to be false, was not reinstated. In 1798, after trying his hand at farming in America, Hauverie was appointed to a post in the French foreign office. In this capacity he made a sensation by his L’Etat de la France à la fin de l’un VIII (1800), which he had been commissioned by Bonaparte to draw up, as a manifesto to foreign nations, after the coup d’etat of the 18th Brumaire. This won him the confidence of Bonaparte, and he was henceforth employed in drawing up many of the more important documents. In 1803 he was made a councillor of state and member of the Legion of Honour, and between 1804 and 1813 he was more than once temporarily minister of foreign affairs. He attempted, though vainly, to use his influence to moderate Napoleon’s policy, especially in the matter of Spain and the treatment of the pope. In 1805 a difference of opinion with Talleyrand on the question of the Austrian alliance, which Hauverie favoured, led to his withdrawal from the political side of the ministry of foreign affairs, and he was appointed keeper of the archives of the same department. In this capacity he did very useful work, and after the Restoration continued in this post at the request of the duc de Richelieu, his work being recognized by his election as a member of the Académie des Inscriptions et Belles-Lettres in 1820. He died at Paris on the 28th of July 1830.

There is a detailed account of Hauverie, with considerable extracts from his correspondence with Talleyrand, in the Biographie universelle by A. F. Artand de Montrou, who published a separate life in 1831. Criticisms of his État de la France appeared in Germany and England by F. von Gentz (Von dem politischen Zustände, 1801), and by T. B. Clarke (A Hist. and Pol. View... 1803).

ALPES, a department in S.E. France, formed in 1790 out of the south-eastern portion of old Dauphiny, together with a small part of N. Provence. It is bounded N. by the department of Savoie, E. by Italy, and the department of the Basses Alpes, S. by the last-named department and that of the Drôme, and W. by the departments of the Drôme and of the Isère. Its area is 2,785 sq. m., its greatest length 153 m. and its greatest breadth 62 m. It is a mountainous, and includes the Pointe des Écrins (13,462 ft.), the loftiest summit in France before the annexation of Savoy in 1860, as well as the Meije (13,081 ft.), the Allevard (12,896 ft.) and the Mont Pelvoux (12,073 ft.), though Mont Vélan (12,690 ft.) is wholly in Italy, rising just over the border. The department is to a large extent made up of the basins of the upper Durance (with its tributaries, the Guiane, the Gyronde and the Giff), of the upper Drac and of the Beuch—all being to a very large extent wild mountain torrents in their upper course. The department is divided into three arrondissements (Gap, Briançon and Embrun), 24 cantons and 186 communes. In 1906 its population was 107,486. It is a very poor department owing to its great elevation above the sea and the extent of its mountainous area, and its commerce is almost wholly of local importance. The prolonged winter greatly hinders agricultural development, while the pastoral region has been greatly damaged and the forests destroyed by the ravages of the Provençal sheep, vast flocks of which are driven up here in the summer, as the pastures are leased out to a large extent, and but little utilized by the inhabitants. It now forms the diocese of Gap (this see is first certainly mentioned in the 6th century), which is in the ecclesiastical province of Aix en Provence; in 1791 there was annexed
HAUTE-SAÔNE—HAUTES-PYRÉNÉES

to it the archiepiscopal see of Embrun, which was then suppressed. There are 114 m. of railway in the department. This includes the main line from Briçonnet past Gap towards Grenoble. About 161 m. W. of Gap is the important railway junction of Veynes, whence branch off the lines to Grenoble, to Valence by Die and Livron, and to Sisteron for Marseilles. The chief town is Gap, while Briçonnet and Embrun are the only other important places.

(W. A. B. C.)

HAUTE-SAÔNE, a department of eastern France, formed in 1790 from the northern portion of Franche Comté. It is traversed by the river Saône, bounded N. by the department of the Voges, E. by the territory of Belfort, S. by Doubs and Jura, and W. by Côte-d’Or and Haute-Marne. Pop. (1906), 265,890; area, 2075 sq. m. On the north-east, where they are formed by the Voges, and to the south along the course of the Ognon the limits are natural. The highest point of the department is the Ballon de Servance (3570 ft.), and the lowest the confluence of the Saône and Ognon (610 ft.). The general slope is from north-east to south-west, the direction followed by those two streams. In the north-east the department belongs to the Vogisan formation, consisting of forest-clad mountains of sandstone and granite, and of a marshy nature; but throughout the greater part of its extent it is composed of limestone plateaux 500 to 1000 ft. high pierced with crevasses and subterranean caves, into which the rain water disappears to issue again as springs in the valleys 200 ft. lower down. In its passage through the department the Saône receives from the right the Amance and the Salon from the Langres plateau, and from the left the Coney, the Lanterne (augmented by the Breuchin which passes by Luxeuil), the Durance (passing Vesoul), and the Ognon. The north-eastern districts are cold and have an annual rainfall ranging from 36 to 48 in. Towards the south-west the climate becomes more temperate. At Vesoul and Gray the rainfall only reaches 24 in. per annum.

Haute-Saône is primarily agricultural. Of its total area nearly half is arable land; wheat, oats, meslin and rye are the chief cereals and potatoes are largely grown. The vine flourishes mainly in the arrondissement of Gray. Apples, plums and cherries (from which the kirsch, for which the department is famous, is distilled) are the chief fruits. The woods which cover a quarter of the department are composed mainly of firs in the Voges and of oak, beech, hornbeam and aspen in the other districts. The river-valleys furnish good pasture for the rearing of horses and of horned cattle. The department possesses mines of coal (at Ronchamp) and rock-salt (at Gouhenans) and stone quarries are worked. Of the many mineral waters of Haute-Saône the best known are the hot springs of Luxeuil (q.v.). Besides iron-working establishments (smelting furnaces, foundries and wire-drawing mills), Haute-Saône possesses copper-foundries, engineering works, steel-foundries and factories at Plancher-les-Mines and elsewhere for producing ironmongery, nails, pins, files, saws, screws, shot, chains, agricultural implements, locks, spinning machinery, edge tools. Window-glass and glass wares, pottery and earthenware are manufactured; there are also brick and tile-works. The spinning and weaving of cotton, of which Héricourt (pop. in 1906, 5194) is the chief centre, stand next in importance to metal working, and there are numerous paper-mills. Print-works, fulling mills, hosery factories and straw-hat factories are also of some account; as well as sugar works, distilleries, dye-works, saw-mills, starch-works, the chemical works at Gouhenans, oil-mills, tanyards and flour-mills. The department exports wheat, cattle, cheese, butter, iron, wood, pottery, kirschvasser, plaster, leather, glass, &c. The Saône provides a navigable channel of about 70 m., which is connected with the Moselle and the Meuse at Corbe by the Canal de l’Est along the valley of the Coney. Gray is the chief emporium of the water-borne trade of the Saône. Haute-Saône is served chiefly by the Eastern railway. There are three arrondissements—Vesoul, Gray, Lure—comprising 28 cantons, 583 communes. Haute-Saône is in the district of the VII. army corps, and in its legal, ecclesiastical and educational relations depends on Besançon.

Vesoul, the capital of the department, Gray and Luxeuil are the principal towns. There is an important school of agriculture at St Réméy in the arrondissement of Vesoul. The Roman ruins and mosaics at Membrey in the arrondissement of Gray and the church and the department of Savoie, and W. by the department of the Ain. It is mainly made up of the river-basins of the Arve (flowing along the northern foot of the Mont Blanc range, and receiving the Giffre, on the right, and the Borne and Foron, on the left—the Arve joins the Rhone, close to Geneva), of the Dranse (with several branches, all flowing into the Lake of Geneva), of the Usseix and of the Fier (both flowing direct into the Rhone, the latter after forming the Lake of Annecy). The upper course of the Arly is also in the department, but the river then leaves it to fall into the Isère. The whole of the department is mountainous. But the hills attain no very great height, save at its south-east end, where rises the snow-clad chain of Mont Blanc, with its very high peaks (culminating in Mont Blanc, 15,782 ft.) and many glaciers. That portion of the department is alone frequented by travellers, whose centre is Chamonix in the upper Arly valley. The lowest point (945 ft.) in the department is at the junction of the Fier with the Rhone. The whole of the department is included in that portion of the duchy of Savoy which was neutralised in 1815. In 1906 the population of the department was 260,617. Its area is 1775 sq. m., and it is divided into four arrondissements (Annecy, the chief town, Bonneville, St Julien and Thonon), 28 cantons and 314 communes. It forms the diocese of Annecy. There are in the department 176 m. of broad-gauge railways, and 70 m. of narrow-gauge lines. There are also a number of mineral springs, only three of which are known to foreigners—the chalybeate waters of Évian and Amphion, close to each other on the south shore of the Lake of Geneva, and the chalybeate and sulphurous waters of St Gervais, at the north-west end of the chain of Mont Blanc. Anthracite and asphaltite mines are numerous, as well as stone quarries. Cotton is manufactured at Annecy, while Cluses is the centre of the clock-making industry. There is a well-known bell foundry at Annecy-le-Vieux. Thonon (the old capital of the Chablais) is the most important town on the southern shore of the Lake of Geneva and, after Annecy, the most populous place in the department.

(W. A. B. C.)

HAUTES-PYRÉNÉES, a department of south-western France, on the Spanish frontier, formed in 1790, half of it being taken from Bigorre and the remainder from Armagnac, Néouzoun, Astarac and Quatre Vallées, districts which all belonged to the province of Gascony. Pop. (1906), 209,397. Area, 1750 sq. m. Hautes-Pyrénées is bounded S. by Spain, W. by the department of Basses-Pyrénées (which encloses on its eastern border five communes belonging to Hautes-Pyrénées), N. by Gers and E. by Haute-Garonne. Except on the south its boundaries are very irregular. The southern part of the department, comprising two-thirds of its area, is occupied by the central Pyrénées. Some of the peaks reach or exceed the height of 10,000 ft., the Vignemale (10,820 ft.) being the highest in the French Pyrénées. The imposing cirques (Cirques de Troumouse, Gavarnie and Estaubé), with their glaciers and waterfalls, and the pleasant valleys attract a large number of tourists, the most noted point being the Cirque de Gavarnie. The northern portion of the department is a region of plains and undulating hills clothed with cornfields, vineyards and meadows. To the north-east, however, the
HAUTE-VIENNE

cold and wind-swept plateau of Lannemezan (about 2000 ft.), the watershed of the streams that come down on the French side of the Pyrenees, presents in its characteristic setting a striking contrast with the plain and the valley lies below. The department is drained by three principal streams, the Gave de Pau, the Adour and the Neste, an affluent of the Garonne. The sources of the first and third lie close together in the Cirque of Gavarnie and on the slopes of Tramouse, whence they flow respectively to the north-west and north-east. An important section of the Pyrenees, which carries the Massif Néouvielle and the Pic du Midi de Bigorre (with its meteorological observatory), runs northward between these two valleys. From the Pic du Midi, down which, after warming the pleasant valley of Campan, the mountains at Bagnères and then divides into a multitude of channels, to irrigate the rich plain of Tarbes. The chief of these is the Canal d’Ariège with a length of 36 m. Beyond Hautes-Pyrénées it receives on the right the Arros, which flows through the department from south to north-north-west; on the left it receives the Gave de Pau. This latter stream, rising in Gavarnie, is joined at Luz by the Gave de Bastan from Néouvielle, and at Pierrefitte by the Gave de Caustenac, fed by streams from the Vignemé. The Gave de Pau, after passing Argelès, a well-known centre for excursions, and Lourdes, leaves the mountains and turns sharply from north to west; it has a greater volume of water than the Adour, but, being more of a mountain torrent, is regarded as a tributary of the Adour, which is navigable in the latter part of its course. The Neste d’Aurie, descending from the peaks of Néouvielle and Tramouse, receives at Arreau the Neste de Louron from the pass of Clarabil and flows northwards through a beautiful valley as far as La Barthe, where it turns east; it is important as furnishing the plateau of Lannemezan with a canal, the Canal de la Neste, the waters of which are partly used for irrigation and partly for supplying the streams that rise there and are dried up in summer—the Gers and the Baïse, affluent of the Garonne. This latter only touches the department. The climate of Hautes-Pyrénées, though very cold on the highlands, is warm and moist in the plains, where there are hot summers, fine autumns, mild winters and rainy springs. On the plateau of Lannemezan, while the summers are dry and scorching, the winters are very severe. The average annual rainfall at Tarbes, in the north of the department, is about 34 in.; at the higher altitudes it is much greater. The mean annual temperature at Tarbes is 59° Fahr.

Hautes-Pyrénées is agricultural in the plains, pastoral in the highlands. The more important cereals are wheat and maize, which is much used for the feeding of pigs and poultry, especially geese; rye, oats and barley are grown in the mountain districts. The vines of Madiran and Peyruguei are well known and tobacco is also cultivated; chestnut trees and fruit trees are grown on the lower slopes. In the neighbourhood of Tarbes and Bagnères-de-Bigorre horse-breeding is the principal occupation and there is a famous stud at Tarbes. The horse of the region is the result of a fusion of Arab, English and Navarrese blood and is well fitted for saddle and harness; it is largely used by light cavalry regiments. Cattle raising is important; the milch-cows of Lourdes and the oxen of Tarbes and the valley of the Aure are highly esteemed. Sheep and goats are also reared. The forests, which occur chiefly in the highlands, contain bears, boars, wolves and other wild animals. There are at Campan and Sarraoncoin quarries of fine marble, which is sawn and worked at Bagnères. There is a group of slate quarries at Labassère. Deposits of lignite, lead, manganese and zinc are found. The mineral springs of Hautes-Pyrénées are numerous and much visited. The principal in the valley of the Gave de Pau are Cauterets (hot springs containing sulphur and sodium), St Sauveur (springs with sulphur and sodium), and Barèges (hot springs with sulphur and sodium), and in the valley of the Adour Bagnères (hot or cold springs containing calcium sulphates, iron, sulphur and sodium) and Capvern near Lannemezan (springs containing calcium sulphates).

The department has flour-mills and saw-mills, a large military arsenal at Tarbes, paper-mills, tanneries and manufactories of agricultural implements and looms. The spinning and weaving industry which the production of hand-woven goods is carried on; Bagnères-de-Bigorre is the chief centre of the textile industry.

Of the passes (ports) into Spain, even the chief, Gavarnie (7398 ft.), is not accessible to carriages. The department is served by the Southern railway and is traversed from west to east by the main line from Bayonne to Toulouse. There are three arrondissements, those of Tarbes, Argelès and Bagnères-de-Bigorre, 26 cantons and 480 communes. Tarbes is the capital and chief place of Bagnères-de-Bigorre, which constitutes the department of Tarbes, and is attached to the appeal court of Pau; it forms part of the region of the XVIIIth army corps. In educational matters it falls within the circumscription of the académie of Toulouse. Tarbes, Lourdes, Bagnères-de-Bigorre and Luz-St Saurier are the principal towns. St Savin, in the valley of the Gave de Pau, and Sarraoncoin have interesting Romanesque churches. The church of Maulbourget built by the Templiers in the 12th century is also remarkable.

HAUTE-VIENNE, a department of central France, formed in 1790 of Haut-Limousin and of portions of Marche, Poitou and Berry. Pop. (1906), 385,732. Area, 2144 sq. m. It is bounded N. by Indre, E. by Creuse, S.E. by Corrèze, S.W. by Dordogne, W. by Charente and N.W. by Vienne. Haute-Vienne belongs to the central plateau of France, and drains partly to the Loire and partly to the Garonne. The highest altitude (2540 ft.) is in the extreme south-east, and belongs to the treeless but well-watered plateau of Millevaches, formed of granite, gneiss and mica. From that point the department slopes towards the west, south-west and north. To the north-west of the Millevaches are the Ambazac and Blond Hills, both separating the valley of the Vienne from that of the Gartempe, a tributary of the Creuse. The Vienne traverses the department from east to west, passing Pymoutiers, St Léonard, Limoges and St Junien, and receiving on the right the Maude and the Taunier. The Isle, which flows into the Dordogne, with its tributaries the Auvezère and the Dronne, and the Tardoire and the Bandiat, tributaries of the Charente, all rise in the south of the department. The altitude and inland position of Haute-Vienne, its geological character, and the northern exposure of its valleys make the winters long and severe; but the climate is milder in the west and north-west. The annual rainfall often reaches 36 or 37 in. and even more in the mountains. Haute-Vienne is on the whole unproductive. Rye, wheat, buckwheat and oats are the cereals most grown, but the chestnut, which is a characteristic product of the department, still forms the staple food of large numbers of the population. Potatoes, mangold, hemp and colza are cultivated. After the chestnut, walnuts and cider-apples are the principal fruits. Good breeds of horned cattle and sheep are reared and find a ready market in Paris. Horses for remount purposes are also raised. The quarries furnish granite and large quantities of kaolin, which is both exported and used in the porcelain works of the department. Amianthus, emeralds and garnets are found. Limoges is the centre of the porcelain industry and has important liqueur distilleries. Woollen goods, starch, paper and pasteboard, wooden and leather shoes, gloves, agricultural implements and hats are other industrial products, and there are flour-mills, breweries, dye-works, tanneries, iron foundries and printing works. Wine and alcohol for the liqueur-manufacture, coal, raw materials for textile industries, hops, skins and various manufactured articles are among the imports.

The department is served almost entirely by the Orléans Railway. It is divided into the arrondissements of Limoges, Bellac, Rochechouart and St Yrieix (29 cantons and 205 communes), and belongs to the académie (educational division) of Poitou. The ecclesiastical province of Limoges, which includes the capital, is the seat of a bishopric and of a court of appeal, and is the headquarters of the XIIth army corps. The other principal towns are St Yrieix and St Junien. Solignac, St Léonard and Le Dorat have fine Romanesque churches. The remains
HAUT-RHIN—HAVANA

of the château of Chalusset (S.S.E. of Limoges), the most remarkable feudal ruins in Limousin, and the château of Rochechouart, which dates from the 13th, 14th and 16th centuries, are also of interest.

HAUT-RHIN, before 1871 a department of eastern France, formed in 1790 from the southern portion of Alsace. The name “Haut-Rhin” is sometimes used of the territory of Belfort (q.v.).

HAÜY, RENÉ JUST (1743-1822), French mineralogist, commonly styled the Abbé Haüy, from being an honorary canon of Notre Dame, was born at St Just, in the department of Oise, on the 28th of February 1743. His parents were in a humble rank of life, and were only enabled by the kindness of friends to send their son to the college of Navarre and afterwards to that of Lemoine. Becoming one of the teachers at the latter, he began to devote his leisure hours to the study of botany; but an accident directed his attention to another field in natural history. Happening to let fall a specimen of calcareous spar belonging to a friend, he was led by examination of the fragments to make investigations which resulted in the statement of the geometrical law of crystallization associated with his name (see CRYSTALLOGRAPHY). The value of this discovery, the mathematical theory of which is given by Haüy in his Traité de minéralogie, was immediately recognized, and when communicated to the Academy, it secured for its author a place in that society. Haüy's name is also known for the observations he made in pyro-electricity. When the Revolution broke out, he was imprisoned in the Temple, and his life was even in danger, when he was saved by the intercession of E. Geoffroy Saint-Hilaire. In 1802, under Napoleon, he became professor of mineralogy at the museum of natural history, but after 1814 he was deprived of his appointments by the government of the Restoration. His latter days were consequently clouded by poverty, but the courage and high moral qualities which had helped him forward in his youth did not desert him in his old age; and he lived cheerful and respected till his death at Paris on the 3rd of June 1822.

The following are his principal works: Essai d'une théorie sur la structure des cristaux (1784); Exposition raisonnée de la théorie de l'électricité et du magnétisme, d'après les principes d'Aepinus (1787); De la structure considérée comme caractère distinctif des minéraux (1793); Exposition abrégée de la théorie de la structure des cristaux (1793); Extrait d'un traité élémentaire de minéralogie (1797); Traité de minéralogie (4 vols., 1801); Traité élémentaire de physique (2 vols., 1803, 1806); Tableau comparatif des résultats de la cristallographie, et de l'analyse chimique relativement à la classification des cristaux (1809); Traité des pierres précieuses (1817); Traité de cristallographie (2 vols., 1822). He also contributed articles, of which 100 are enumerated in the Royal Society's catalogue, to various scientific journals, especially the Journal de physique and the Annales de l'Académie Royale des Sciences.

HAVANA (the name is of aboriginal origin; Span. Habana or, more fully, San Cristóbal de la Habana), the capital of Cuba, the largest city of the West Indies, and one of the principal seats of commerce in the New World, situated on the northern coast of the island in 23° 50' N. lat. and 82° 29' W. long. Pop. (1890), 235,981; (1901), 297,159. The city occupies a peninsula to the W. of the harbour, between its waters and those of the sea. Several small streams, of which the Almendares river is the largest, empty into the harbour. The pouch-shaped, landlocked bay is spacious and easy of access. Large merchantmen and men-of-war can come up and unload along at least a considerable part of the water-front, which is approached by neither bar nor rock, averages about 260 yds. in width and is about 1400 yds. long. Within, the bay breaks up into three distinct arms, Marimelena or Regla Bay, Guanabacoa Bay and the Bay of Atarás. On the left hand of the entrance stands the lofty lighthouse tower of the Morro. The sewage of the city and other impurities were for centuries allowed to pollute the bay, but the extent to which the harbour was thereby filled up has been exaggerated. Though very certainly much smaller than it once was, there is a difference of opinion as to whether the harbour has grown smaller since the end of the 18th century. From the sea the city presents a picturesque appearance.

The Havana side of the bay has a sea-wall and an excellent drive. The city walls, begun in 1671 and completed about 1740, were almost entirely demolished between 1863 and 1880, only a few insignificant remnants having survived the American occupation. The latter was forbidden by the treaty of the "instrumental" and the "extramural" city. The former, the old city, lying close to the harbour front, has streets as narrow as is consistent with wheel traffic. Obispo (Pi y Margall in the new republican nomenclature), O'Reilly and San Rafael are the finest retail business streets, and the Prado and the Cerro the handsomest residential streets in the city proper. The new city, including the suburbs to the W. overlooking the sea, has been laid out on a somewhat more spacious plan, with isolated dwellings and wide thoroughfares, some planted with trees. Most of the houses, and especially those of the planter aristocracy, are massively built of stone, with large grated windows, and roofs with heavy parapets and inner courts. As the erection of wooden buildings was illegal long after 1772, it is only in the suburban districts that they are to be seen. The limestone which underlies almost all the island affords excellent building stone. The poorer houses are built of brick with plaster fronts. Three-fourths of all the buildings of the city are of one very high storey; there are but a few dozen buildings as high as four storeys. Under Spanish rule, Havana was reputed to be a city of noises and smells. There was no satisfactory cleaning of the streets or draining of the sub-soil, and the harbour was rendered visibly foul by the impurities thrown into it. The city, especially during the United States military occupation of the city, and the republic continued the work.

Climate.—The general characteristics of the climate of Havana are described in the article Cuba. A temperature as low as 40° F. is extraordinary; and freezing point is only reached on extremely rare occasions. Long, hurrying days, such as are common in many of the United States, are unknown; the mean annual temperature is about 25°7° C. (78° F.); that of the hottest month is about 28°8° C. (84° F.), and that of the coldest, 21° C. (70° F.). The means of the four seasons are approximately—February, 73°; January, 72°; February and March, 68°; April, 73°; May and June, 76°; July, 77°; August, 78°; September, 77°; October, 75°; November, 73°; December, 72°. The mean relative humidity is between 75 and 80 for all seasons save spring, when it is least and may be as low as 65 upward. A difference of 30° F. (24° C) at mid-day in the temperature of two spots close together, one in sun and one in shade, is not unusual. The daily variation of temperature is also considerable. The depressing effect of the heat and humidity is alleviated by an occasional breeze from the sea, and the nights are invariably comfortable and generally cool.

Defences.—The principal defences of Havana under Spanish rule, when the city was maintained as a military stronghold of the first magnitude, were divided into two distinct flanks, each consisting of the Castillo de San Salvador de la Punta, to the W. of the harbour entrance; the Castillo de Los Tres Reyes del Morro and San Carlos de la Cabaña, to the E.; the Santo Domingo de Atrares, at the foot of the westward slope of the Morro; theParque de la Cabaña itself; and the Palace of the Vicinity; and the Castillo del Príncipe (1767-1780), situated inland on an eminence to the W. El Morro, as it is popularly called, was by far the most formidable. The former was conserved when the city by the English in 1763, from which time also date the castles of Príncipe, Atrares and the Cabaña. The Cabaña, which alone can accommodate some 6000 men, fronts the bay for a distance of more than 800 yds., and was long supposed, at least by Spaniards, to be the strongest fortress of America. Here is the "laural ditch" or "dead-line"—a handsome bronze enceinte, 27 ft. in height, with 36 casemates, placed at intervals of 100 yds. The average height of the walls is 27 ft. Each casemate was armed with a dozen 42-pounders. The defences were shot. To the E. and W. inland are several small forts. The military establishment of the republic is very small.

Havana.—Of the existing 18th century churches the most noteworthy is the cathedral. The original building was abandoned in 1762. The present one, originally the church of the Jesuits, was erected in 1650-1724. The interior decoration dates largely from the latter period. The statue of Our Lady of the Rosary (begun in 1578), Santa Catalina (1700), San Agustin (1608), Santa Clara (1644), La Merced (1744, with a collection of oil paintings) and San Felipe (1693). Monasteries and nunneries also flourished until the suppression of 1834, when many became simple churches. Some of the convents were successful in conserving their wealth. The former monastery of the Jesuits, now the Jesuit church of Belén (1704), at the corner of Luz
77

and Compostela Streets, is one of the most elegant and richly ornamented in Cuba.

The Palace, which served as a residence for the captains-general during the Spanish rule, is the home of the city government and the residence of the president of the republic. It is a striking example of the Spanish colonial style, surrounded by the Parque de Colon (opened 1772, 772-1775, improved 1844-1845), an embanked drive, continued by the Paseo de Rocali and the Cortina de Valdes, with fine views of the fort and the harbour. On the N., along the sea, beginning at the Punta fortress and running W. for several miles along the seawall, is a roadway and pleasure-drive, known—from the wall—as the Malecon. Beginning at the Punta fortress—where a park was laid out in 1763 in the place of an ugly quarter, and a home of the students judicially murdered by the Spanish volunteers in 1871—and running along the line of the former city walls, past the Parque Central, through the Parque de Isabel II. and the Parque de la Princesa. The buildings are now residences. The Parque de Colon or Campo de Marte, is the Prado, a wide and handsomely-promenade and drive, shaded with banyons and lined with fine houses and clubs. In 1797 a hurricane destroyed the greater part of the lauros of the Prado and the royal palms of the Parque de Colon. Central Park is surrounded by hotels, theatres, cafés and clubs, the last including the Centro Asturiano and Casino Español. In the corner of the Prado is the José Manuel Town Hall, a building of "independence," and in an adjoining square is the city's fine monument to the Cuban engineer Francisco de Alarcon, to whom she owes half the glory of the Prado. The Parque de la Reina—an ordinary, business street, once a promenade and known as the Alameda de Isabel II.—with its continuations, the Paseo de Carlos III. and Paseo de Tacón, runs westward through the city past the Alcázar and the Los Molinos, which contains the citadel of El Príncipe (1774-1794). A statue of Charles III. by Cano (1805), fountains, pavilions and four rows of trees adorn the Paseo Carlos III. The gardens of Los Molinos, where the captains-general formerly maintained their summer residence, and the adjoining botanical gardens of the university, contribute beautiful avenues of palm trees. Near El Príncipe is the Columbus cemetery, with a fine gateway, a handsome monument (1888) to the students shot in 1871, and another (1897; 75 ft. high) to the firemen lost in a great fire in 1890, besides many smaller memorials. The Calzada de la Infanta is a fine street at the W. end of the new city; the Cerro, in the S.W., is lined with massive residences, once the homes of Cuban aristocracy.

Suburbs.—In the coral rock of the coast sea-baths and excavations, some 200 squares, have to be freed from the sea. Only 1 square of the city is backed by an amphitheatre of hills, which are crowned in the W. by the conspicuous fortifications of Castillo del Príncipe. On the lower heights near the city lie Vedado, Jesus del Monte, Luyano and other healthy suburbs. Chorrera, Puentes Grandes, Marianao (founded 1830; pop. 1897, 9332) and Guanabacoa (with mineral springs), are attractive places of resort. Regla, just across the harbour mouth at the W. end of the island, serves as a new fishing port and, with a hospital, is a popular health resort.

Charities and Education.—Among the numerous charitable institutions the most important hospital is the Casa de Beneficencia y Asistencia de la Infancia (founded by the Legado de Materiales de Navidad). This contains an orphan asylum, a maternity ward, a home for vagrants, a lunatic asylum and an infirmary. There is also in the city an immense lazaretto for lepers. The Centro Asturiano, a club with a membership of some 15,000, is a meeting-place of the Asturian Cubans.

Havana supports a large and well-managed school system. The present government act, which was enacted into law on April 12, 1908, is the result of the work of the commission of education (1899). Among the schools of the city the most noteworthy is the university (581 regular students, 1907), founded in 1728. Its quarters were in the old convent of Santo Domingo until 1906, when the American government undertook the costs of the new college which was finally completed in October 1908. It is a provincial school of arts and trades (opened 1882), a theological seminary, a boys' technical school, a school of painting and sculpture, a conservatory of music, normal school, mercantile school and a high school of the Peninsular type, and a Technical School for boys, laboratories, an observatory, a museum of natural history, and an historical library. Great progress has been made in educat-

In the last census Havana contained 297,159, of which 25% were foreign (20% Spanish); and the census of 1907 showed 297,159 (not including the attached country districts and 932,549 (including these country districts and 360,000 "the last inhabited point") of the Havana. The industrial population is very densely crowded. Owing to this, as well as to the entire lack of proper sanitary customs among the people, the horrible condition of sewerage and the
prevalence of yellow fever (first brought to Havana, it is thought, in 1761, from Vera Cruz), the reputation of the city as regards health was long very bad. The practical extermination of yellow fever during the U.S. military occupation following 1899 was a remarkable achievement. Between 1899 and 1901, after World War I, there were few non-immune persons in the city, and there was no trouble from the fever, but from the autumn of 1899 a heavy immigration from Spain began, and a fever epidemic was raging in 1900. The American military authorities left no stone unturned to exterminate the disease. Among the measures taken were house-to-house inspection, enforced cleanliness, improved drainage and sewerage, the destruction of various public buildings, and thorough cleansing of the streets — all of which were largely military activities. The reductions in death-rates of the city (average, 1890-1899, 45.83; 1900, 24.40; 1901, 22.11; 1902, 20.63; general death-rate of U.S. soldiers in 1898, 67.94; in Havana, 1901, 15.57) did not affect yellow fever at all. In 1900-1901 Major Walter Reed (1851-1902), a surgeon in the United States army, proved by experiments on voluntary human subjects that the infection was spread by the Stegomyia mosquito,1 and the prevention of the disease was then undertaken by Major William C. Gorgas—all patients being screened and mosquitoes practically exterminated.2 The number of subsequent deaths from yellow fever has depended solely on the degree to which the necessary prophylactic measures were taken. The entire administrative system of the island, when a Spanish colony, was centred at Havana. Under this regime the capital and the residence of the president, the supreme court, council and chamber of procurators and the most important ministries were in the city. None of the public services was good in the Spanish period, except the water-supply, which was excellent. The water is derived from the mountain streams, which flow from Havana across the isthmus and through aqueducts constructed between 1859 and 1894 at a cost of some $5,000,000. About 40,000,000 gallons are supplied daily. The system is owned by the municipality. The old Fernando VII aqueduct was at length burned, but will usually be replaced, since the city is at the present time in the Almendares river (until long after the construction of this, a still older aqueduct, opened at the end of the 16th century, was in use). The sewerage system and conditions of house sanitation were found extremely inadequate between 1884 and 1891, when the town was in the city of 1899. Several public buildings were so foul that they were demolished and burned. The improvement since the end of Spanish rule has been steady.

History.—Havana, originally founded by Diego Velasquez in 1514 on an unhealthy site near the present Batatabano (pop. in 1907, 15,435, including attached county districts), on the south coast, was soon removed to its present position, was granted an ayuntamiento (town council), and shortly came to be considered one of the most important places in the New World. Its commanding position gained it in 1634, by royal decree, the title of “Llave del Nuevo Mundo y Antemural de las Indias Occidentales” (Key of the New World and Bulwark of the West Indies), in reference to which it bears on its coat of arms a symbolic key and representations of the Morro, Punta and Fuerza. In the history of the place in the 16th century few things stand out except the investments by buccaneers: in 1557 it was sacked and burned, and in 1555 plundered by French buccaneers, and in 1566 it was threatened by Drake. In 1586 Philip II. of Spain ordered the erection of the Punta and the Morro. In the same year the residence of the governor of the island was moved from Santiago de Cuba to Havana. Philip II. granted Havana the title of “ciudad” in 1592. Sugar plantations in the environs appeared before the end of the 16th century. The population of the city, probably about 3000 at the beginning of the 17th century, was doubled in the years following 1655 by the coming of Spaniards from Jamaica. In the course of the 17th century the port became the rendezvous for the royal merchant and treasure fleets that monopolized trade with America, and the commercial centre of the Spanish-American possessions. It was blocked four times by the Dutch (who were continuously molesting the treasure fleets) in the first half of the 17th century. In 1671 the city was bombarded and its walls were completed in 1702. The European wars of the 17th and 18th centuries were marked by various incidents in local history. After the end of the Spanish War of Succession (1713) came a period of comparative prosperity in slave-trading and general commerce. The creation in 1740 of a monopolistic trading-company was an event of importance in the history of the island. English squadrons threatened the city several times in the first half of the 18th century, but it was not until 1763 than an investment, made by Admiral Sir George Pocock and the earl of Albemarle, was successful. The siege lasted from June to August and was attended by heavy loss to both besiegers and besieged. The British commanders wrung great sums from the church and the city as price of war and price of good order. By the treaty of the 10th of February 1763, at the close of the Seven Years' War, Havana was restored to Spain in exchange for the Floridas. The English turned over the control of the city on the 6th of July. Their occupation greatly stimulated commerce, and from it dates the modern history of the city and of the island (see CUBA). The gradual removal of obstacles from the commerce of the island from 1766 to 1818 particularly benefited Havana. At the end of the 18th century the city was one of the seven or eight great commercial centres of the world, and in the first quarter of the 19th century it was a rival in importance to Havana, Caracas, Veracruz, Buenos Aires and New York. In 1789 a bishopric was created at Havana suffragan to the archbishopric at Santiago. From the end of the 18th century Havana, as the centre of government, was the centre of movement and interest. During the administration of Miguel Tacón Havana was improved by many important public works; his name is frequent in the nomenclature of the city. The railway from Havana to Gúines was built between 1835 and 1838. Fifty Americans under Lt. Crittenden, members of the Bahia Honda filibustering expedition of Narciso Lopez, were shot at Fort Avarés in 1851. The siege of the city from February 1858 was an influential factor in causing the outbreak of the Spanish-American War, and during the war the city was blockaded by a United States fleet.

See J. de la Pezuela, Diccionario de la Isla de Cuba, vol. iii. (Madrid, 1863), for minute details of history, administration and commercial conditions down to 1862; J. M. de la Torre, Lo que fuimos y lo que somos, á la Habana antigua y moderna (Havana, 1887); P. J. Guzmán, Historia de la conquista de la Habana 1762 (Philadelphia, 1865); J. de la Pezuela, Sitio y rendición de la Habana en 1762 (Madrid, 1859); A. Bachiller y Morales, Monografía histórica (Havana, 1885), minutely covering the English occupation (the best account) of 1762-1763; Maria de los Mercedes, comtesse de Merlin, La Habana (3 vols., Paris, 1844); and the works cited under CUBA.

HAVANT, a market-town in the Fareham parliamentary division of Hampshire, England, 67 m. S.W. from London by the London & South Western and the London, Brighton & South Coast Railway. Pop. of urban district (1901), 3857. The urban district; the old town is Warblington and the new, 5630, has a fine church, Norman and later, with traces of prie-Norman work, and some remains of a Tudor castle. Havant lies in a flat coast district, near the head of Langstone Harbour, a wide shallow inlet of the English Channel. The church of St Faith was largely rebuilt in 1875, but retains some good Early English work. There are breweries and tanneries, and the manufacture of parchment is carried on. Off the mainland near Havant lies Hayling, a flat island of irregular form lying between the harbours of Langstone and Chichester. It measures 4 m. in length from N. to S., and is nearly the same in breadth at the south, but the breadth generally is about 1½ m. It is well wooded and fertile. A railway serves the village of South Hayling, which is in some
favour as a seaside resort, having a wide sandy beach and good golf links. The island was in the possession of successive religious bodies from the Conquest (when it was given to the Benedictines of Juníperos, near Rouen), until the Dissolution. The church of South Hayling is a fine Early English building.

HAVEL, a river of Prussia, Germany, having its origin in Leipziger see, reached Brandenburg, traversing another chain of lakes, and finally continues north-west until it joins the Elbe from the right some miles above Wittenberge after a total course of 221 m. and a total fall of only 138 ft. Its banks are mostly marshy or sandy, and the stream is navigable from the Mecklenburg lakes downwarss. Several canals connect it with these lakes, as well as with other rivers—e.g. the Finow canal with the Oder, the Ruppin canal with the Rhin, the Berlin-Brandenburg navigable canal (58 m.) with the Spree, and the Plauer-Ile canal with the Elbe. The Sakrow-Paretz canal, 11 m. long, cuts off the deep bend at Potsdam. The most notable of the tributaries is the Spree (227 m. long), which bisects Berlin and joins the Havel at Spandau. Area of river basin, 10,159 sq. m.

HAVELBERG, a town of Germany, in the Prussian province of Brandenburg, on the Havel and the railway Glowne-Havelberg. Pop. (1095), 9088. The town is built partly on an island in the Havel, and partly on the right bank of the river, on one of which stands the fine Romanesque cathedral dating from the 12th century. The two parts, which are connected by a bridge, were incorporated as one town in 1875. The inhabitants are chiefly engaged in tobacco manufacturing, sugar-refining and boat-building, and in the timber trade.

Otto I. founded a bishopric at Havelberg in 946; the bishop, however, who was a prince of the Empire, generally resided at Plattenburg, or Wittstock, a few miles to the north. In 1458 the bishopric was seized by the Elector of Brandenburg, who finally took possession of it fifty years later, and the cathedral passed to the Protestant Church, retaining its endowments till the edict of 1810, by which all former ecclesiastical possessions were assumed by the crown. The final secularization was delayed till 1819. Havelberg was formerly a strong fortress, but in the Thirty Years' War it was taken from the Danish by the imperial troops in 1627. Recaptured by the Swedes in 1631, and again in 1635 and 1636, it was in 1637 retaken by the Saxons. It suffered severely from the Thirty Years' War, and remained a ruin for over a century.

HAVELOCK, SIR HENRY (1765-1857), British soldier, one of the heroes of the Indian Mutiny, the second of four brothers (all of whom entered the army), was born at Ford Hall, Bishopwearmouth, Sunderland, on the 5th of April 1791. His parents were William Havelock, a wealthy shipbuilder in Sunderland, and Jane, daughter of John Carter, solicitor at Stockton-on-Tees. When about five years old Henry accompanied his elder brother William to Mr Bradley's school at Swanscombe, whence at the age of ten he removed for seven years to Charterhouse school. In accordance with the desire of his mother, who had died in 1811, he entered the Middle Temple in 1813, studying under Chitty the eminent special pleader. His legal studies having been abridged by a misunderstanding with his father, he in 1815 accepted a second lieutenancy in the Rifle Brigade (9th), procured for him by the interest of his brother William. During the following eight years of service in Britain he read extensively and acquired a good acquaintance with the theory of war. In 1823, having exchanged into the 21st and thence into the 15th Light Infantry, he followed his brothers William and Charles to India, first qualifying himself in Hindustani under Dr Gilchrist, a celebrated Orientalist.

At the close of twenty-three years' service he was still a lieutenant, and it was not until 1838 that, after three years' adjutancy of his regiment, he became captain. Before this, however, he had held several staff appointments, notably that of deputy assistant-adjutant-general of the forces in Burma till the peace of Yandabu, of which he, with Lumaden and Knox, procured the ratifications at Ava from the "Golden Foot," who bestowed on him the "gold leaf" insignia of Burmese nobility. His first command had been at a stockade capture in the war, and he was present also at the battles of Napadec, Patanoga and Pagan. He had also held during his lieutenantcy various interpreterships and the adjutancy of the king's troops at Chinsura. In 1838 he published at Serampore Campaigns in Afghanistan, and in 1839 he married Hannah Shepherd, daughter of Robert Marshall, the eminent missionary. About the same time he became a Baptist, being baptized by Mr John Mack at Serampore. During the first Afghan war he was present as aide-de-camp to Sir Willoughby Cotton at the capture of Ghazni, on the 23rd of July 1839, and at the occupation of Kabul. After a short absence in Bengal to secure the publication of his Memoirs of the Afghan Campaign, he returned to Kabul in charge of recruits, and became interpreter to General Elphinstone. In 1840, being attached to Sir Robert Sale's force, he took part in the Khurd-Kabul fight, in the celebrated passage of the defiles of the Ghilzais (1841) and in the fighting from Tezzeon to Jalalabad. Here, after many months' siege, his column in a sortie en masse defeated Akbar Khan on the 7th of April 1842. He was now made deputy adjutant-general of the infantry division in Kabul, and in September he assisted at Jagdalak, at Tezzeon, and at the release of the British prisoners at Kabul, besides taking a prominent part at Istaliil. Having obtained a regimental majority he next went through the Maharra campaign as Persian interpreter to Sir Hugh (Viscount) Gough, and distinguished himself at Maharanpore in 1843, and also in the Sikh campaign at Moodkee, Ferozeshah and Sobroan in 1845. For these services he was made deputy adjutant-general at Bombay. He exchanged from the 13th to the 39th, then as second major into the 53rd at the beginning of 1849, and soon afterwards left for England, where he spent two years. In 1854 he became quartermaster-general, then full colonel, and lastly adjutant-general of the troops in India.

In 1857 he was selected by Sir James Outram for the command of a division in the Persian campaign, during which he was present at the actions of Muhamara and Ahwaz. Peace with Persia set him free just as the Mutiny broke out; and he was chosen to command a column "to quell disturbances in Allahabad, to support Lawrence at Lucknow and Wheeler at Cawnpore, to disperse and utterly destroy all mutineers and insurgents." At this time Lady Canning wrote of him in her diary: "General Havelock is not in fashion, but all the same we believe that he will do well to essay a campaign on his little old stiff figure looks as active and fit for use as if he were made of steel." But in spite of this lukewarm commendation Havelock proved himself the man for the occasion, and won the reputation of a great military leader. At Fatehpur, on the 12th of July, at Aong and Pandoobreed on the 15th, at Cawnpore on the 16th, at Una on the 20th, at Busherutunge on the 29th and again on the 5th of August, at Boorhya on the 12th of August, and at Bihur on the 16th, he defeated overwhelming forces. Twice he advanced for the relief of Lucknow, but twice prudence forbade a reckless exposure of troops wasted by battle and disease in the almost impracticable task. Reinforcements arriving at last under Outram, he was enabled by the generosity of his superior officer to crown his successes on the 25th of September 1857 by the capture of Lucknow. There he died on the 24th of November 1857, of dysentery, brought on by the anxieties and fatigue connected with his victorious march and with the subsequent blockade of the British troops. He lived long enough to receive the intelligence that he had been created K.C.B. for the first three battles of the campaign; but of the major-generalship which was shortly afterwards conferred he never knew. On the 26th of November, before tidings of his death had reached England, letters-patent were directed to create him a baronet and a pension of £1000 a year was voted at the assembling of parliament. The baronetcy was afterwards bestowed upon his eldest son; while to his widow, by royal order, was given the rank to which she would have been entitled had her husband survived and been created a baronet. To both widow and son pensions of £1000 were awarded by parliament.
HAVELOK THE DANE—HAVERFORDWEST

HAVELOK THE DANE, an Anglo-Danish romance. The hero, under the name of CUGERAN or CURAN, was a scullion-jongleir at the court of Edelzi (Als) or Godric, king of Lincoln and Lindsey. At the same court was brought up Argentile or Goldborough, the orphan daughter of Adelbrit, the Danish king of Norfolk, and his wife Orwan, Edelzi's sister; and Edelzi, to humiliate his ward, married her to the scullion Cuaran. But, inspired by a vision, Cuaran and Goldborough set out for Grimsby, where Cuaran learned that Grim, his supposed father, was dead. His foster-sister, moreover, told him that his real name was Havelok, that he was the son of Gunter (or Birkbaeyn), king of Denmark, and had been rescued by Grim, who though a poor fisherman was a noble in his own country, when Gunter perished by treason. The hero then wins back his own and Goldborough's kingdoms, punishing traitors and rewarding the faithful. The story exists in two French versions: as an interplay between Gaimar's Brut and his Estorie des Engles (1200) and in the Anglo-Norman Lai d'Havelok (12th century). The English Havelok (c. 1300) is written in a Lincolnshire dialect and embodies abundant local tradition. A short version of the tale is interpolated in the Lambeth MS. of Robert Mannynge's Handlyng Smyne. The story reappears more than once in English literature, notably in the ballad of "Argentille and Curan" in William Warner's Albion's England. The name of Havelok (Habloc, Abeoeg, Ablocy) is said to correspond in Welsh to Anlaf or Ohaf. Now the historical Anlaf Curan was the son of a Viking chief Sihtric, who was king of Northumbria in 925 and died in 927. Anlaf Sihtricson was driven into exile by his stepmother's brother Athelstan, and took refuge in Scotland at the court of Constantine II, whose daughter he married. He was defeated with Constantine¹ at Brunanburh (937), but was nevertheless for two short periods joint ruler in Northumbria with his cousin Anlaf Godfreyson. He reigned in Dublin till 940, when he was defeated. He died the next year as a monk at Iona. Round the name of Anlaf Curan a number of legends rapidly gathered, and the legend of the Danish hero probably filtered through Celtic channels, as the Welsh names of Argentille and Orwan indicate. The close similarity between the Havelok saga and the story of Hamlet (Amlethus) is told by the Danish critic Sibylla in her monumental study of the Scandinavians. The individual points they have in common are found in other legends, but the series of coincidences between the adventurous history of Anlaf Curan and the life of Amlethus can hardly be fortuitous. Interesting light is thrown on the whole question by Professor I. Gollancz in his Hamlet in Iceland, 1898, by the identification of Amhala—the who was said by Queen Gormfaith² in the Annals of Ireland by the Four Masters to have slain Niail Glundubh—with Anlaf's father Sihtric. The exploits of father and son were likely to be confused.

The mythical elements in the Havelok story are numerous. Argentille, as H. L. Ward shows, is a disguised Valkyrie. Lige Stærke, a dull and nameless youth, and as Hild raised the dead to fight by magic, so Argentille in Havelok and Hervorutha in Amleth prop up dead or wounded men with stakes to bluff the enemy. Havelok's royal lineage is betrayed by his flame breath when he is asleep, a phenomenon which has parallels in the history of Servius Tullius and of Dietrich of Bern. Part of the Havelok legend lingers in local tradition. Havelok destroyed his enemies in Denmark by casting down great stones upon them from the top of a tower, and Grim is said to have mention of Constantine in the Havelock legend which led Gaimar to place the tale in the 16th century in the days of the Constantines who succeeded King Arthur. Gaimar voices more than once an Anglo-Danish legend of a Danish dynasty in Britain anterior to the Saxon invasions.

¹ H. L. Ward, Cat. of Romances, i. 426 suggests that it was the mention of Constantine in the Havelock legend which led Gaimar to place the tale in the 16th century in the days of the Constantines who succeeded King Arthur. Gaimar voices more than once an Anglo-Danish legend of a Danish dynasty in Britain anterior to the Saxon invasions.

² A different person from the second wife of Anlaf Curan, also Gormfaith, who forms another link with Amlethus, as she was a woman of the Hervorutha type and married her husband's conqueror. But killed three of the turrets from the church tower in his efforts to destroy the enemy's ships. John Weever (Antient Funereal Monuments, 1631, p. 749) says that the privilege of the town in Elsinore, where its merchants were free from toll, was due to the interest of Havelok, the Danish prince, and the common seal of the town of Grimsby represents Grim, with "Habloc" on his right hand and Goldeburgh on his left.

The English MS. of Havelok (MSS. Laud Misc. 108) in the Bodleian library is unique. It was edited for the Roxburghe Club by Sir F. Madden in 1828. This edition contains, besides the English text, the two French versions. There are subsequent editions by W. W. Skeat (1868) for the E.E. Text Society, by F. Holthausen (London, New York and Heidelberg, 1898), and by E. R. and H. H. Elzevier (The Hague, 1902, where further bibliographical references will be found); and a modern English version by Miss E. Hickey (London, 1902). Gaimar's text and the French lai are edited by Sir T. D. Hardy and C. F. Martin in Roman Brit. med. aen. scriptor, vol. i. (1888). See also the account of the saga by H. L. Ward (Cat. of Romances, i. 423-446); for the identification of Havelok with Anlaf Curan see G. Storm, Enghlsiche Studien (1880), iii. 533, a reprint of an earlier article; E. K. Putnam, The Lambeth Version of Havelok (Baltimore, 1900).

HAVERFORDWEST (Welsh Haford, the English name being perhaps a corruption of the Scandinavian Hafoe-Fjord), the chief town of Pembrokeshire, S. Wales, a contributory parliamentary and municipal borough, and a county of itself with its own lord-lieutenant. Pop. (1901), 6007. It is picturesquely situated on the slopes overlooking the West Cleddau river, which here is crossed by two stone bridges. It has a station on the Great Western Railway on the east side of the river, and when viewed from this point the town presents an imposing appearance with its castle-keep and its many ancient buildings. The river is tidal and navigable for vessels of not more than 150 tons. Coal, cattle, butter and grain are exported, but the commercial importance of the place has greatly declined, as the many ruined warehouses near the river plainly testify. The old walls and fortifications have almost disappeared, but Haverfordwest is still rich in memorials of its past greatness. The huge castle-keep, which dominates the town, was probably built by Gilbert de Clare, early in the 12th century; formerly used as the county gaol, it now serves as the police-station. The large church of St Mary, at the top of the steep High Street, has fine clerestory windows, clustered columns and an elaborate carved-oak ceiling of the 15th century; it contains several interesting monuments of the 17th and 18th centuries, some of which commemorate members of the Peabody family of Philipps of Picton Castle. At the N. corner of the adjacent churchyard stands an ancient building with a vaulted roof, once the record office, but now used as a fish-market. St Martin's, with a low tower and spire, close to the castle, is probably the oldest church in the town, but has been much modernized. Near St Thomas's church on the Green stands an old Moravian chapel which is closely associated with the great scholar and divine, Bishop John Gambold (1711-1771). In a meadow on the W. bank of the river are the considerable remains of the Augustinian Priory of St Mary and St Thomas, built by Robert de Hwilford, lord of Haverford, about the year 1250. On the E. bank are the suburbs of Castlet and Prendergast, the latter of which contains the ancient parish church of St David and the ruins of a large mansion originally built by Maurice de Prendergast (12th century) and subsequently the seat of the Stepney family. A little to the S. of the town are the remains of Haroldstone, once the residence of the powerful Perrot family. The charities belonging to the town, which include John Perrot's bequest (1570), yielding about £350 annually for the improvement of the town, and Tasker's charity school (1684), are very considerable.

Haverfordwest owes its origin to the advent of the Flemings, who were permitted by Henry I. to settle in the hundred of Rhos, in the years 1166-1168, in 1172, and again in 1196. English is exclusively spoken in the town and district, and its inhabitants exhibit their foreign extraction by their language, customs and appearance. Haverfordwest is, in fact, the capital of that English-speaking portion of Pembrokeshire, which has been nicknamed "Little England beyond Wales."
This new settlement of intruding foreigners had naturally to be protected against the inquisitive natives, and the castle was accordingly built c. 1135 by Gilbert de Clare, first earl of Pembroke, who subsequently conferred the seignory of Haverford on his castellan, Richard Fitz-Tancred. On the death of Robert de Hwiford, the benefactor and perhaps founder of the priory of St Mary and St Thomas, in 1213, the lordship of the castle reverted to the Crown, and was purchased for 1000 marks from King John by William Marshal, earl of Pembroke, who gave various privileges to the town. Of the numerous charters, the earliest known (through an allusion found in a document of Bishop Houghton of St Davids, c. 1370) is one from Henry II., who therein confirms all former rights granted by his grandfather, Henry I. John in 1207 gave certain rights to the town concerning the Port of Milford, while William Marshal II., earl of Pembroke, presented it with three charters, the earliest of which is dated 1219. An important charter of Edward V., as prince of Wales and lord of Haverford, enacted that the town should be incorporated under a mayor, two sheriffs and two bailiffs, duly chosen by the burgesses. In 1376, under Henry VIII., Haverfordwest was declared a town and county of itself and was further empowered to send a representative burgess to parliament.

The town long played a prominent part in South Welsh history. In 1220 Llewellyn ap Iorwerth, prince of North Wales, during the absence of William Marshal II., earl of Pembroke, attacked and burnt the suburbs, but failed to reduce the castle by assault. Several of the Plantagenet kings visited the town, including Richard II., who stopped here some time on his return from Ireland in 1299, and is said to have performed here his last regal act—the confirmation of the grant of a burgage to the Friars Preachers. Oliver Cromwell spent some days here on his way to Ireland, and his original warrant to the mayor and council for the demolition of the castle is still preserved in the council chamber. The prosperity and local importance of Haverfordwest continued unimpaired throughout the 17th and 18th centuries, and Richard Fenton, the historian of Pembrokeshire, describes it in 1760, as "the largest town in the county, if not in all Wales." With the rise of Milford, however, the shipping trade greatly declined, and Haverfordwest has now the appearance of a quiet country town.

HAVERGAL, FRANCES RIDDLEY (1836-1879), English hymn-writer, daughter of the Rev. William Henry Havergal, was born at Astley, Worcestershire, on the 14th of December 1836. At the age of seven she began to write verse, most of it of a religious character. As a hymn-writer she was particularly successful, and the modern English Church collections include several of her compositions. Her collected Poetical Works were published in 1873. She died at Caswell Bay, Swansea, on the 3rd of June 1879.

See Memorials of Frances Ridley Havergal (1880), by her sister.

HAVERHILL, a market town of England, in the Sudbury parliamentary division of Suffolk, and the Saffron Walden division of Essex. Pop. of urban district (1901), 4862. It is 55 m. N.N.E. from London by the Great Eastern railway, on the Long Melford-Cambridge branch, and is the terminus of the Colne Valley railway from Chappel in Essex. The church of St Mary is Perpendicular, but extensively restored. There are large manufactures of cloth, silk, matting, bricks, and boots and shoes, and a considerable agricultural trade.

HAVERHILL, a city of Essex county, Massachusetts, U.S.A., situated on the Merrimac river, at the head of tide and navigation, and on the Boston & Maine railway, 33 m. N. of Boston. Pop. (1880) 18,472; (1890) 27,412; (1900) 37,175, of whom 8,530 were foreign-born (including 2403 French Canadians, 1651 English Canadians and 2144 Irish), and 15,077 were of foreign parentage born in the United States; (1910 census) 44,115. The city, 3 m. wide and 10 m. long, lies for its entire length along the Merrimac river, from which it rises picturesquely, its surface being undulating, with several detached round hills (maximum 335 ft.). Like all old New England cities, it is irregularly laid out. A number of lakes within its limits are the source of an abundant and excellent water supply. There are fifteen public parks, the largest of which, Winnikenni Park (214 acres), contiguous to Lake Kenoza, is of great natural beauty. The city has three well-equipped hospitals, the beautiful Pentucket club house, a children's home, an old ladies' home and numerous charitable organizations. The schools of the city, both public and private, are of high standing; they include Bradford Academy (1803) for girls and the St James School (Roman Catholic). The public library is generously endowed, and in 1906 had about 10,500 volumes. Almost from the beginning of its history Haverhill was active industrially. Thomas Dustin, the husband of Hannah Dustin, manufactured bricks, and this industry has been carried on in the same locality for more than two hundred years. The large Stevens woolen mills are the outgrowth of mills established in 1835. The manufacture of woolen hats, established in the middle of the 18th century, is one of the prominent industries. There are large morocco factories. By far the leading industry of the city is the manufacture of boots, shoes and slippers, chiefly of the finer kinds, of which it is one of the largest producers in the world. In 1905 Haverhill ranked fourth among the cities of the United States in the product value of this manufacture, which was 4.8% of the total value of boots and shoes made in the United States. This industry began about 1795. In 1905 Haverhill's manufacturing establishments produced goods valued at $24,459,504, 83.9% of this output being represented by boots and shoes or their accessories. One of the largest sole-leather manufactories in the world is here.

Haverhill was settled in June 1640 by a small colony from Newbury and Ipswich, and its Indian name, Pentucket, was replaced by that of Haverhill in compliment to the first minister, Rev. John Ward, who was born at Haverhill, England. In its earlier years this frontier town suffered severely from the forays of the Indians, and in 1690 the abandonment of the settlement was contemplated. Two Indian attacks are particularly noteworthy—one in 1698, in which Hannah Dustin, her newborn babe, and her nurse were carried away to the vicinity of Penacook, now Concord, New Hampshire. Here in the night Mrs Dustin, assisted by her nurse and by a captive English boy, tomahawked and scalped ten Indians (two men, the others children and women) and escaped down the river to Haverhill; a monument to her stands in City Hall Park. In 1708 250 French and Indians attacked the village, killing 40 of its inhabitants. In 1873 a destructive fire caused the loss of 35 places of business, and on the 17th of February 1882 almost the entire shoe district (consisting of 10 acres) was burned, with a loss of more than $2,000,000; but a greater business district was built on the ruins of the old. Haverhill was the birthplace of Whittier (1807-1909), who lived in the town and wrote in his house at Haverhill, written for the 250th anniversary of the town in 1890, and in many of his other poems, gave the poet's touch to the history, the legends and the scenery of his native city. His birthplace, the scene of Snow-Bound in the eastern part of the city, is owned by the Whittier Association and is open to visitors. A petition from Haverhill to the national House of Representatives in 1842, praying for a peaceable dissolution of the Union, raised about J. Q. Adams, its presenter, perhaps the most violent storm in the long course of his defence of the right of petition. Haverhill was incorporated as a town in 1645 and became a city in 1869. Bradford, a town (largely residential) lying on the opposite bank of the river, became a part of the city in 1857. In October 1908, by popular vote, the city adopted a new charter providing for government by commission.

HAVERSACK, or HAYRESACK (through the French from Ger. Habersack, an oat-sack, a nose-bag, Hafer or Haver, oats), the bag in which horsemen carried the oats for their horses. In Scotland and the north of England haver, meaning oats, is still used, as haver-meal or haver-speed. Haversack is now used for the strong bag made of linen or canvas, in which soldiers, sportsmen or travellers, carry their personal belongings, or more usually the provisions for the day.
HAVERSTRAW—HAVRE

HAVERSTRAW, a village of Rockland county, New York, U.S.A., in a township of the same name, 32 m. N. of New York City, and finely situated on the W. shore of Haverstraw Bay, an enlargement of the Hudson river. Pop. of the village (1890), 509; (1900) 593, of whom 131 were foreign-born and 968 were negroes (1905; state census 6182; (1910) 5660; of the township (1910) 9335. Haverstraw is served by the West Shore, the New Jersey & New York (Erie), and the New York, Ontario & Western railways, and is connected by steamboat lines with Peekskill and Newburgh. The village lies at the N. base of High Tor (832 ft.). It has a public library, founded by the King's Daughters' Society in 1805 and housed in the Fowler library building. Excellent clay is found in the township, and Haverstraw is one of the largest brick manufacturing centres in the world; brick-machines also are manufactured here. The Metropolitan Museum of Art has a branch store in the village, and works and print works. Haverstraw was settled by the Dutch probably as early as 1648. Near the village of Haverstraw (in the township of Stony Point), in the Joshua Hett Smith House, or "Old Treason House," as it is generally called, Benedict Arnold and Major André met before daylight on the 22nd of September 1780 to arrange plans for the betrayal of West Point. In 1826 a short-lived Owente Community (of about 80 members) was established near West Haverstraw and Garnerville (in the township of Haverstraw). The members of the community established a Church of Reason, in which lectures were delivered on ethics, philosophy and science. During was soon aware in the community, the experiment was abandoned within five months, and most of the members joined in turn the Cossack Community, also in New York, and the Kendal Community, near Canton, Ohio, both of which were also short-lived. The village of Haverstraw was originally known as Warren and was incorporated under that name in 1854; in 1873 it became officially the village of Haverstraw—both names had previously been used locally. The village of West Haverstraw (pop. in 1890, 185; in 1900, 2075; and in 1910, 2366), also in Haverstraw township, was founded in 1839, was long known as Samsondale, and was incorporated under its present name in 1883.

See F. B. Green, History of Rockland County (New York, 1886).

HAVET, EUGÈNE AUGUSTE ERNEST (1813–1889), French scholar, was born in Paris on the 11th of April 1813. Educated at the Lycée Saint-Louis and the École Normale, he was for many years before his death on the 21st of December 1889 professor of Latin eloquence at the Collège de France. His two capital works were a commentary on the works of Pascal, Pensées de Pascal publiées dans leur texte authentique avec un commentaire critique et explicatif (2 vols. 1834), and Le Christianisme des origines (4 vols., 1871–1884), the chief thesis of which was that Christianity owed more to Greek philosophy than to the writings of the Hebrew prophets. His eldest son, Pierre Antoine Louis Havet (b. 1849), was professor of Latin philology at the Collège de France and a member of the Institute. The younger, Julien, is separately noticed.

HAVET, JULIEN (PIERRE EUGÈNE) (1853–1893), French historian, was born at Vitry-sur-Seine on the 4th of April 1853, the second son of Ernest Havet. He early showed a remarkable aptitude for learning, but had a pronounced aversion for pure rhetoric. His studies at the École des Chartes were foreign-born and took first place both on entering and leaving and at the École des Hautes Études did much to develop his critical faculty, and the historical method taught and practised at these establishments brought home to him the dignity of history, which thenceforth became his ruling passion. His valedictory thesis at the École des Chartes, Série chronologique des gardens et seigneurs des Îles Normandes (1876), was a definitive work and but slightly affected by later research. In 1878 he followed this thesis by a study called Les Cours royales dans les Îles Normandes. Both these works were composed entirely from the original documents at the Public Record Office, London, and the archives of Jersey and Guernsey. On the history of Norman institutions, Havet's conclusions were widely accepted (see La Formule N. rex Frans., v. int., 1883). His first work in this province was Du sens du mot "romain" dans les lois franques (1876), a critical study on a theory of Fustel de Coulanges. In this he showed that the status of the homo Romanus of the barbarian laws was inferior to that of the Gallo-Roman; that the Gallo-Romans had been subjected by the Germans to a state of servitude; and, consequently, that the Germans had conquered the Gallo-Romans. He aimed a further blow at Fustel's system by showing that the Frankish kings had never borne the Roman title of vir inlustris, and that they could not therefore be considered as being in the first place Roman magistrates; and that in the royal diplomas the king issued his commands as rex Francorum and addressed his functionaries as viri inlustres. His attention having been drawn to questions of authenticity by the forgeries of Vrain Lucas, he devoted himself to tracing the spurious documents that embarrassed the student of the Merovingian and Carolingian history. In his A propos des découvertes de Jérôme Vignier (1886), he exposed the forgeries committed in the 17th century by this priest. He then turned his attention to a group of documents relating to ecclesiastical history in the Carolingian period and bearing on the question of false decretals, and produced Les Chartes de St-Calais (1887) and Les Actes de l'évêché du Mans (1894). On the problems afforded by the chronology of Gerbert's (Pope Silvester II) letters and by the notes in cipher in the MS. of his letters, he wrote L'Écriture secrète de Gerbert (1877), which may be compared with his Notes tironiennes dans les diplômes de l'abbaye de Saint-Amand (1889). In 1889 he brought out an edition of Gerbert's letters, which was hailed with much satisfaction. Each new work increased his reputation, in Germany as well as France. At the Bibliothèque Nationale, where he obtained a post, he rendered great service by his wide knowledge of foreign languages, and read voraciously everything that related, however remotely, to his favourite studies. He was finally appointed assistant curator in the department of printed books. He died prematurely at St Cloud on the 19th of August 1893.

After his death his published and unpublished writings were collected and published (with the exception of Les Cours royales des Îles Normandes et Lettres de Gerbert) in two volumes called Histoires mérovingiennes et Opuscules inféodés (1896), containing, besides important papers on diplomatic and on Carolingian and Merovingian history, a large number of short monographs ranging over a great variety of subjects. A collection of his articles was published by his friends under the title de Mêlanges Havet (1895), prefixed by a bibliography of his works compiled by his friend Henri Omont.

(C. B. *)

HAVRE, LE, a seaport of north-western France, in the department of Seine-Inférieure, on the north bank of the estuary of the Seine, 143 m. W.N.W. of Paris and 55 m. W. of Rouen by the Western railway (1850), 129.453. The greater part of the 16th century on the borders of the departments of Seine and Eure, but on the N. rises an eminence, la Côte, covered by the gardens and villas of the richer quarter. The central point of the town is the Place de l'hôtel de ville in which are the public gardens. It is crossed by the Boulevard de Strasbourg, running from the sea on the west to the railway station and the barracks on the east. The rue de Paris, the busiest street, starts at the Grand Quai, overlooking the outer harbour, and, intersecting the Place Gambetta, runs north and enters the Place de l'hôtel de ville on its southern side. The docks start immediately to the east of this street and extend over a large area to the south and south-east of the town. Apart from the church of Notre-Dame, dating from the 16th and 17th centuries, the chief buildings of Havre, including the hôtel de ville, the law courts, and the exchange, are of modern erection. The museum contains a collection of antiquities and paintings. Havre is the seat of a sub-prefect, and forms part of the maritime arrondissement of Cherbourg. Among the public institutions are a tribunal of first instance, a tribunal of commerce, a board of trade arbitrators, a tribunal of maritime commerce, a chamber of commerce and a branch of the Bank of France. There are lycées for boys and girls, schools of commerce and other educational establishments. Havre, which is a fortified place of the second class, ranks second to Marseille among French seaports. There are 240,000 houses (the oldest of which
dates back to 1669) with an area of about 200 acres and more than 8 m. of quays. They extend to the cast of the outer harbour which on the west opens into the new outer harbour, formed by two breakwaters converging from the entrance, an extent of 2000 ft. The breakwaters (see Dock plan for plan) are the Bassin Bellot and the Bassin de l'Eure. In the latter the mail-steamer of the Compagnie Générale Transatlantique are berthed; and the Tancarville canal, by which river-boats unable to attempt the estuary of the Seine can make the port direct, enters the harbour by this basin. There are, besides, several repairing docks and a petroleum dock for the use of vessels carrying that dangerous commodity. The port, which is an important point of emigration, has regular steam-communication with New York (by the New York line of the Compagnie Générale Transatlantique) and with many of the other chief ports of Europe, North, South and Central America, the West Indies and Africa. Imports in 1907 reached a value of £57,686,000. The chief were cotton, for which Havre is the great French market, coffee, copper and other metals, cacao, cotton goods, rubber, skins and hides, silk goods, dye-woods, tobacco, oil-seeds, coal, cereals and wool. In the same year exports were valued at £47,130,000, the most important being cotton, silk and woollen goods, coffee, hides, leather, wine and spirits, rubber, tin and metal ware, earthenware and glass, and miscellaneous, cacao and fancy goods. In 1907 the total tonnage of shipping (with cargoes) reached its highest point, viz. 5,671,075 tons (901 vessels) compared with 3,816,340 tons (382 vessels) in 1898. Forty-two per cent of this shipping sailed under the British flag. France and Germany were Great Britain's most serious rivals. Havre possesses oil works, soap works, saw mills, flour mills, works for extracting dyes and tannin from dye-woods, an important tobacco manufacturing factory, chemical works and rope works. It also has metal and mechanical works which construct commercial and war-vessels of every kind as well as engines and machinery, cables, boilers, &c.

Until 1516 Havre was only a fishing village possessing a chapel dedicated to Notre-Dame de Grâce, to which it owes the name, Havre (harbour) de Grâce, given to it by Francis I. when he began the construction of its harbour. The town in 1562 was delivered over to the keeping of Queen Elizabeth by Louis I., prince de Condé, leader of the Huguenots, and the command of it was entrusted to Ambrose Dudley, earl of Warwick; but the English were expelled in 1563, after a most obstinate siege, which was pressed forward by Charles IX. and his mother, Catherine de' Medici, in person. The defence of the town and the harbour-works were continued by Richelieu and completed by Vauban. In 1694 it was mainly besieged by the English, who also bombarded it in 1715, 1744 and 1795. It was a port of considerable importance as early as 1572, and despatched vessels to the whale and cod-fishing at Spitsbergen and Newfoundland. In 1672 it became the entrepôt of the French East India Company, and afterwards of the Senegal and Guiana companies. Napoleon I. raised it to a war harbour of the first rank, and under Napoleon III. works begun by Louis XVI. were completed.

HAWAI'I (HAWA'IAN OR SANDWICH ISLANDS), a Territory of the United States of America, consisting of a chain of islands in the North Pacific Ocean, eight inhabited and several uninhabited. The inhabited islands lie between latitudes 18° 54' and 22° 15' N., and between longitudes 154° 50' and 165° 30' W., and extend about 380 m. from E.S.E. to W.N.W.; the uninhabited ones, mere rocks and reefs, valuable only for their guano deposits and shark-fishing grounds, continue the chain several hundred miles farther W.N.W. From Honolulu, the capital, which is about 100 m. N.W. of the middle of the inhabited group, the distance to San Francisco is about 2100 m.; to Auckland, New Zealand, about 3810 m.; to Sydney, New South Wales, 4410 m.; to Yontan, Japan, 3400 m.; to Hong-Kong, about 4920 m.; to Manila, about 4800 m. The total area of the inhabited islands is 6651 sq. m., distributed as follows: Hawaii, 4210; Maui, 728; Oahu, about 600; Kauai, 547; Molokai, 201; Lanai, 139; Niihau, 97; Kahoolawe, 69.

All the islands are of volcanic origin, and have been built up by the series of eruptions of ancient cones. The highest in the group is the maximum height (Mauna Kea) on the largest island (Hawaii) of 13,823 ft. above the sea; altogether there are forty volcanic peaks. Evidence of slight upheaval is occasionally afforded by an elevated coral-reef along the shore, and evidence of the presence of a portion of Oahu for several hundred feet has been discovered by artesian borings through coral-rock. In some exceptions, notably the highest and nearly vertical wall along the coast near E. half of the island, there are proofs of these phenomena followed by the emergence of a portion of a volcano. With the exception of the coral and a small amount of calcareous sandstone, the rocks are entirely of volcanic nature, and are the products of eruptions of the same period. Cinder cones and tufaceous cones abound, but one of the most distinguishing features of the Hawaiian volcanoes is the great number of the engulfment type, i.e. pitted craters which enlarge slowly by the breaking off and falling in of their walls, and discharge lava-flows with comparatively little violence. The age of the several inhabited islands, or at least the time since the last eruptions on them, decreases from W. E. and on the most easterly (Hawaii) volcanic forces are still in operation. That those to the westward have long been inactive is shown by the destruction of craters by denudation, by deep ravines, valleys and tall cliffs eroded on the slopes, and by the absence of the typical black basalt. The black-tuff soil formed from the disintegrated rocks, and by the amount as well as variety of vegetable life.

Hawaii Island, from which the group and later the Territory was named, has the shape of a rude triangle with sides of 90 m., 75 m. and 65 m. Its coast, unlike that of the other islands of the archipelago, has few coral reefs. Its surface consists mainly of the gentle slopes of five volcanic mountains which have encroached much upon one another by their eruptions.

Mauna Loa ("Great Mountain"), on the S., is by far the largest volcano in the world; for a distance of about 75 m. from N. to S. and 50 m. from E. to W., it rises gradually to a height of 13,675 ft. On its E.S.E. side, at an elevation of 4000 ft. above the sea (300 ft. above the adjoining plain on the W.), is Kilauea from whose lava-flows the island has been extended to form its S.E. angle. To the N.N.E. of Mauna Loa, and blending with it in an intervening plateau, is Mauna Kea ("White Mountain"), so named from its appearance on its own, or its surrounding plain. Its maximum height is 13,823 ft. above the sea, the maximum height in the Pacific Ocean; blending with Mauna Loa on the N.N.W. is Mauna Hualalai, 2920 ft. in height, and rising abruptly from the extreme N.W. shore are the remains of the oldest mountains of the island, the Kohala, with a summit 5905 ft. in height. On the land side the Kohala Mountains have been covered with lava from Kilauea, and, further to the W., the gently undulating Kona flat, the maximum elevation of about 3000 ft.; on the ocean side, wherever this lava has not extended, erosion has gone on until bluffs 1000 ft. in height face the sea and the enormous gorges of Waipio and Hamakua, with sides rising almost perpendicular to the sea. On the N.E. side of the high and extending inland 5-6 m., have been formed. Mauna Kea is not nearly so old as the Kohala Mountains, but there is no record that it has been subjected to any modern eruptions, nor has the summit or crater of Mauna Hualalai been in 1801. Mauna Loa and Kilauea are still active. Cinder cones are the predominant type of crater on both Mauna Kea and the Kohala Mountains, and they are also numerous on the upper slopes of Mauna Hualalai; but the more typically Hawaiian pit or engulfment craters also abound on Mauna Hualalai and Mokuauaoweo, crowning the summit of Mauna Loa, as well as Kilauea, to the S.E. of it, are prominent representatives of the kind. Kilauea is the largest active crater in the world (8 m. in circumference) and is easily accessible. Enclosed by a circular wall from 200 to 700 ft. in height, in a black and slightly undulating plain that covers an area of 914 acres, where occurs a crater of 350 acres, known as Halemaumau, of varying area (about 2000 ft. in diameter in 1905), now filled of boiling lava, now empty to a depth of perhaps 1000 ft. When most active, Halemaumau affords a grand spectacle, especially at the time when the eruptions are in full progress. When the eruption is broken into cakes, the cakes plunge beneath, lakes of liquid lava are formed, over whose surface play fire-fountains to 50 ft. in height, the solids and the magma over the surface being eroded by the acid of the natives, a violent eruption of Kilauea occurred in 1790, or about that time, and deposits of volcanic sand, large stones, sponge-like scoria (pumice) and ashes for miles around are evidence of the eruption. Volcanic eruptions have also been frequently of the civilized

1Among the minor phenomena of Hawaiian volcanoes are the delicate glassy figures called Pele's hair by the Hawaiians, which are spun by the wind from the rising and falling drops of liquid lava, and blown over the edge into the crevices of the crater. Pele in idolatrous times was the dreaded goddess of Kilauea.
world in 1823, the eruptions have consisted mainly in the quiet discharge of lava through a subterranean passage into the sea. In the eruptions of 1823, 1832, 1840 and 1868 the floor of the crater rose on the eve of an eruption and then sank, sometimes hundreds of feet, with the discharge of lava; but since 1868 (in 1879, 1886, 1891, 1894 and 1907; and once, before 1868, in 1855) this action has been confined to Halemaumau and such other pits as at the time existed.

Nokauawacowoe, on the flat top of Mauna Loa, is a pit crater with a floor 3.7 sq. m. in area and sunk 500-600 ft. within walls that are almost vertical and that measure 9.47 m. in circumference. Formerly, on the eve of a great eruption of Mauna Loa, this crater often spouted forth great columns of flame and emitted clouds of vapour, but in modern times this action has usually been followed by a fracture of the mountain side from the summit down to a point 1000 ft. or more below where the lava was discharged in great streams, the action at the summit destroying all or nearly all the hummocks on the top when this discharge began. The first recorded eruption of Mauna Loa was in 1822; since then there have been eruptions in 1831, 1832, 1855, 1859, 1868, 1880-1881, 1887, 1896, 1899 and 1907. The eruptions of 1868, 1887 and 1907 were attended by earthquakes; in 1868 huge sea waves, 40 ft. in height, were raised, and, as they broke on the S. shore, they destroyed the villages of Punalu'u, Naino, Kawaa and Honauau. But the eruptions of Mauna Loa have consisted mainly in the quiet discharge of enormous flows of lava: in 1859 the lava-stream, which began to run on the 23rd of January, flowed N.W., reached the sea, 33 m. distant, eight days later, and continued to flow into it until the 25th of November; and the average length of the flows from seven other eruptions is nearly 14 m. The surface of the upper slopes of Mauna Loa is almost wholly of two widely different kinds of barren lava-dunes, called by the Hawaiians the pahoehe and the aa. The pahoehe has a smooth but billowy or hummocky surface, and is marked by lines which show that it cooled as it flowed. The aa is lava broken into fragments having sharp and jagged edges. As the same stream sometimes changes abruptly from one kind to the other, the two kinds must be due to different conditions affecting the flow, and among the conditions which may cause a stream to break up into the aa have been mentioned the greater depth of the stream, a sluggish current, impediments in its course just as it is granulating, and, what is more probable, subterranean moisture which causes it to cool from below upward instead of from above downward as in the pahoehe. The natives are in the habit of making holes in the aa, and planting in them banana shoots or sweet-potato cuttings, and though the holes are simply filled with stones or fern leaves, the plants grow and in due time are productive. Another curious feature of Mauna Loa, and to some extent of other Hawaiian volcanoes, is the great number of caves, some of them as much as 60 to 80 ft. in height and several miles in length; they were produced by the escape of lava over which a crust had formed. In the midst of barren wastes to the S.E. and S.W. of Kilauea are small channels with steam cracks, along which appears the only vegetation of the region.

Maui, lying 26 m. N.W. of Hawaii, is composed of two mountains connected by an isthmus, Walluku, 7 or 8 m. long, about 6 m. across, and about 160 ft. above the sea in its highest part.

Mauna Haleakala, on the E. peninsula, has a height of 10,032 ft., and forms a great dome-like mass, with a circumference at the base of 90 m. and regular slopes of only 8' or 9°. It has numerous cinder cones on its S.W. slope, is well wooded on the N. and E. slopes, and has on its summit an extinct pit-crater which is one of the largest in the world. This crater is 7-48 m. long, 2-37 m. wide, and covers 19 sq. m.; the circuit of its walls, which are composed of a hard grey clinkstone much fissured, is 20 m.; its greatest depth is 2720 ft. At opposite ends are breaks in the walls a mile or more in width—one about 1000 ft., the other at least 3000 ft. in depth—through which poured the lava of probably the last great eruption. From the floor of the crater rise sixteen well-preserved cinder-cones, which range from more than 400 ft. to 900 ft. in height. Along the N. base of the mountain are numerous ravines (several hundred feet deep), to the bottom of which small streams of water fall in long cascades, but elsewhere on the eastern mountain there is little erosion or other mark of age. That the mountainous mass of western Maui is much older is shown by the destruction of its crater, by its sharp ridges and by deeply eroded gorges or valleys. Its highest peak, Puu Kukui, rises 5788 ft. above the sea, and directly under this is the head of Iao Valley, 5 m. long and 2 m. wide, which has been cut in the mountain to a depth of 4000 ft. This and the smaller valleys are noted for the beauty of their tropical scenery.

Kahoolawe is a small island 6. S.W. of Maui. It is 14 m. long by 6 m. wide. Its mountains, which rise to a height of 1472 ft., are rugged and nearly destitute of verdure, but the intervening valleys afford pastureage for sheep.

Lanai is another small island, 7 m. W. of Maui, about 18 m. long and 12 m. wide. It has a mountain-range which rises to a
maximum height, S.E. of its centre, of about 3480 ft. The N.E. slope is cut by deep gorges, and at the bottom of one of these, which is 2000 ft. deep, is the only water-supply on the island. On the S. side is a rolling table-land affording considerable pasture for sheep, but over the whole N.W. portion of the island the trade winds, driving through the channel between Maui and Molokai, sweep the rocks bare. Kahoolawe and Lanai are both privately owned.

**Molokai**, 8 m. N.W. of Maui, extends 40 m. from E. to W. and has an average width of nearly 7 m. From the S.W. extremity of the island rises the backbone of a ridge which extends E.N.E. about 10 m., where it culminates in the round-topped hill of Mauna Loa, 1382 ft. above the sea. Both the northern and southern slopes of this ridge are cut by ravines and gullies, and along the N.W. shores is a narrow coastal belt. For Honolulu, at the m. extremity of the ridge there is a sudden drop to a low and gently rolling plain, but farther on the surface rises gradually towards a range of mountains which comprises more than one-half the island and attains a maximum height of 4958 ft. in the peak of Kama-kou. The S. slope of this range is gradual but is cut by many straight and narrow ravines, in some instances to a great depth. The N. slope is abrupt, with precipices from 1000 to 4000 ft. in height. Extending N. from the foot of the precipice, a little E. of the centre of the island, is a narrow, gently sloping plain (separated from the mainland by a rock wall 2000 ft. high), on which is a famous leper settlement. The peninsula forms a separate county, Kalawao.

**Oahu**, 23 m. N.W. of Molokai, has an irregular quadrangular form. It is traversed from S.E. to N.W. by two roughly parallel ranges of hill separated by a plain that is 20 m. long and in some parts 10 to 15 m. wide. The highest point in the island is Mauna Kaala, 4030 ft., in the Waianae or W. range; but the Koolau or E. range is much longer than the other, and its ridge is very much broken on the land side there are many ravines formed by lateral spurts, but to the sea for 30 m. it presents a nearly vertical wall without a break. The valleys are remarkable for beautiful scenery—peaks, cliffs, lateral ravines, cascades and tropical vegetation. There are few craters on the loftier heights, but on the coast there are several groups of small cones with craters, some of lava, others of tufa. The greater part of the coast is surrounded by a coral reef, often half a mile wide; in several localities an old reef upheaved, sometimes 100 ft. high, forms part of the land.

**Kauai**, 63 m. W.N.W. of Oahu, has an irregularly circular form with a maximum diameter of about 25 m. On the N.W. is a precipice 2000 ft. or more in height and above this is a mountain plain, but elsewhere around the island is a shore plain, from which rises Mount Waialeale to a height of 5250 ft. The peaks of the mountain are irregular, abrupt and broken; its sides are deeply furrowed by gorges and ravines; the shore plain is broken by ridges and by broad and deep valleys; no other island of the group is so well watered on all sides by large mountain streams; and it is called "garden isle.”

**Niihau**, the most westerly of the inhabited islands, is 18 m. W. by S. of Kauai. It is 16 m. long and 6 m. wide. The western two-thirds consists of a low plain, composed of an uplifted coral reef and matter washed down from the mountains; but on the E. side the island rises precipitously from the sea and attains a maximum height of 1304 ft. at Panaiu. There are large salt lagoons on the southern coast.

**Climate.**—The climate is cooler than that of other regions in the same latitude, and is very healthy. The sky is usually cloudless or only partly cloudy. The N.E. trades blow with periodic variations from March to December; and the leeward coast, being protected by high mountains, is refreshed by regular land and sea breezes. During the period of the N.W. the wind blows strongly from the S. or S.W.; and at this season an unpleasant hot, damp wind is sometimes felt. More rain falls from January to May than during the other months; yet much more falls on the windward side of the principal islands than on the leeward, and the amount increases with the elevation also up to about 4000 ft. The greatest recorded extremes of local rainfall for a year within the larger island range from 12 to 100 in.; the average 49-82; and the minimum 13-46. At sea level the daily average temperature for July is 86° F. for January, 70°; the mean annual temperature is about 73° F.—68° during the night; and for each 200 ft. of elevation the temperature falls about 1° F., and snow lies for most of the time on the highest mountains. The climate of the island is without disease, and the result of their isolation, the proportion of endemic plants is greater here than in any other region, and the great elevation of the mountains, with consequent variation in temperature, moisture and barometric pressure, has multiplied the number of species. The opening of the close of the 19th century William Hillebrand found 656 genera and 999 species, and of this number of species 653 were peculiar to this island.

The island is surrounded by a ring of mountains, particularly Kauai and Oahu, and the total number for the group has been constantly increasing, some being introduced, others probably being produced by varying climatic conditions from those already existing. Among the principal deciduous trees the island has a cycle of different species, with the result that heavy wood is used chiefly for fuel. The koa (Acacia koa), from the wood of which the natives used to make the bodies of their canoes, and the leaves and boughs of a tree that furnished the "wainui" (a hard cabinet wood marketed as "Hawaiian mahogany"), forms extensive forests on Hawaii and Maui between elevations of 2000 and 4000 ft. The mamane (Sophora chrysophylla), which furnishes the best posts, grows principally on the high slopes of Mauna Kea and Hualalai. Posts and railway ties are also made from ohi-aha (Eugenia sandwicensis). In many districts between elevations of 1800 and 2000 ft., where there is a moderate amount of moisture occur mixed forests of koa, koaia (Acacia koioia), kopiko (Strassia encocarpa and S. hawaiensis), koea (Myrsine kauaiensis and M. sandwicensis), naio or bastard sandalwood (Myoporum sandwicense) and pua (Olea sandwicensis). These trees furnish both hardwood suitable for the manufacture of furniture, and out of it the natives formerly made spears and fancy paddles. The wood of the naio when dry has a fragrance resembling that of sandalwood, and is used for torches in fishing. The kukui (Aleurites triboa) and the algaroba (Prosopis juliflora) are the principal species of forest trees that occur below elevations of 2000 ft. The kukui grows along streams and gulches; its wood is divided into three qualities, used to make canoes, and is still frequently called the candle-fruit tree. On the leeward side, from near the sea level to elevations of 800 or 1000 ft., and on grounds above flood water, is formed the "kai-lani" tree which has formed dense forests since its introduction in 1837. Forests of iron-wood and blue gum have also been planted. Sandalwood (Santalum album or freistinum) was once abundant on rugged and inaccessible coastal peaks, but so great was the demand in China, where it was used for incense and for the manufacture of fancy articles, that the supply was nearly exhausted between 1802 and 1836; since then some young trees have sprung up, but the number is relatively small. Other peculiar trees prized for their wood are: the kaulia (Alphitonia ponderosa), used for making spears, mallets and other tools; the kela (Mesoneron kanamei), the hard wood of which resembles ebony; the halapepe (Dracaena aurea), out of the soft wood of which the natives carved many of their idols; and the williwilli (Erythrina monosperma), the wood of which is as light as cork and is used for outriggers. In 1909, on six large rubber plantations, mostly on the windward side of the island of Maui, there were planted 444,450 cacao trees, 66,700 hevea trees, and 600 casitillo trees. About the only indigenous fruit-bearing plants are the oblong strawberries (Stemaria chinensis) and the "air apple" (Vaccinium reticulatum), both of which grow at high elevations on Hawaii and Maui. The ohelo berry is famous in song and story, and is regarded as a proposittory offering to Pele. The number of fruit-bearing trees, shrubs and plants that have been introduced and are successfully cultivated or grow wild is much greater; among them are the mango, orange, banana, pineapple, coconut, plum, grape, etc. The "sago" or "gymnema," litchi and "kava" or "bread fruit," etc., are also native. The "spice" or Chinese—avoardallariggar plant (Perna gratissima), Sapodilla pear (Chrysophyllum sapota), long or mespilus plum (Eriobotrya japonica), Cape gooseberry (Physalis peruviana), bananas, the "sugar" or "papaw" (Carica papaya), resembling in appearance the cantaloupe, granadilla (Passiflora quadrangularis) and guava (Psidium guajava). Most of the native grasses are too coarse for grazing, and some of

1 The Chinese name for the Hawaiian Islands means "Sandalwood Islands."
them, particularly the hilo grass (Paspalum conjugatum), which forms a dense mat over the ground, prevent the spread of forests. The pili grass (Paspalum laxum) is peculiar to the islands; its awns are entangled in the wool of sheep. The native manienie (Stenotaphrum americanum) and kukai (Panicum pruriens), however, are relished by stock and are found on all inhabited islands; the Bermuda grass (Cynodon dactylon), a large and vigorous species, also makes its appearance there. The black lama, or grasshopper (Panicum jeniferum) have also been successfully introduced. The Paspalum orbiculare is the large swamp grass with which the natives covered their houses. On the island of Nihoa, a fine grass (Anthera latifolia) of which the beautiful Nihoa mats were formerly made; it is used in making Panama hats. Mats were also made of the leaves of the hala tree (Pandanus odoratissimus, Brot.) in Kauai, and the leaves (Pandanus jenkinsianus, Wall.) are still in use on the island of Molokai. A different species of Pandanus, (Moho orbiculare) is used in the Molokai region as a sail for the hawaiian sailing canoes, for its awns get tangled in the windlass in starting the sails. The hala (Pandanus utilis) (Brot.) furnishes the bark out of which the famous kapa cloth was made, while the olopa (Chetrodendron saudichaudii) and the kokeo (Myrsine leptocarpa) furnished the seeds from which the dye used in coloring the kapa was made. Several species of Cibotium is obtained a glossy yellowish wood, used for making pillows and mattresses. Ferns, of which there are about 130 species varying from a few inches to 30 ft. in height, form a luxuriant undergrowth in the ohia-lehua forest and on the koa forests, and the islands are noted for the profusion and beautiful colours of their flowering plants. Kalo (Colocasia antiquorum, var. esculenta), which furnishes the principal food of the natives, and sugar-cane (Saccharum officinarum), the cultivation of which has become the chief industry of the islands, were introduced before the discovery of the group by Captain Cook in 1778. Sisal hemp has been introduced and is being planted extensively.

Over seventy varieties of seaweeds, growing in the fresh-water pools and in the waters near the coast, are used by the natives as food. These limu, as they are called by the Kanakas, are washed and dried, and eaten either raw, or boiled and used as a fish or other meat. The culture of such algae may prove of economic importance; gelatine, glue and agar-agar would be valuable by-products. A day-flying bat, whales and dolphins are about the only indigenous mammals; hogs, dogs and rats had been introduced before Cook's discovery. Fish in an interesting variety of colours and shapes abound in the waters, and herring and laua, and their relatives of the family Drequidae, so named for the stout sickle-shaped beak with which the birds extract insects from heavy-barked trees; Gadow considers the family American in its origin, and thinks that the Moho, a genus of horn-bills, was probably at one time present in Australia. The mamo (Drepanis pacifica) has large golden feathers on its back; it is now very rare, and is seldom found except on Mauna Loa, Hawaii, about 4,000 ft. above the sea. The smaller yellow feathers, once used for the war cloaks of the native chiefs, were furnished by the oo (Moho nobilis) and the ao (Moho braccatus), found only occasionally in the valleys of Kauai near Hanalei, on the N. side of the island, and the oo foramen for specimens of the species, is the only occurrence of the species in the United States. Pomo (Vestaria coccinea) is a black-bodied, scarlet-winged song-bird, which feeds on nectar and on insects found in the bark of the koa and ohia trees, and from the Pringlea coccinea. In the old times birds, though no longer considered sacred, are killed for food by the natives, whose delight in hunting is conveyed by bird cries, and by royal edict forbidding the killing of species furnishing the material for feather cloaks, contributions toward the payment of which was long almost the only taxes paid. Thus the downfall of the monarchy and of the ancient cults have been nearly fatal to some of the more beautiful birds; feather ornaments, formerly worn only by nobles, came to be a common decoration; and many species (for example the Hawaiian gallinule, Gallinula sandwicensis), which, because of its crimson frontal plate and bill, was said by the natives to have played the part of Prometheus, burning its head with fire stolen from the gods and bestowed on mortals, is now extinct. Some few may probably have been driven from their lowland homes to the mountains, such being the fate of the mamo, mentioned above, and of the Sandwich Island goose (Branta sandwicensis), which is here a remarkable example of adaptation to the environment. The black-footed albatross (Phoebastria nigripes) has been introduced successfully into Europe. A bird called maho, but actually of a different family, was the Pennula eucalata or miah. A fine bird, it is now extinct. Pears and apples, once thought of as too foreign for the islands, have now been grown almost wholly by Japanese and Chinese on small low farms along the coasts, mostly on the islands of Kauai and Oahu. In 1899 the product amounted to 33,441 lbs.; in 1907 about 2,000 acres were planted, and the crop estimated to be worth $2,500,000. Coffee of good quality is grown at elevations ranging between 1,000 to 3,000 ft. above the sea; the Hawaiian product is called Kona coffee, and is very much of it. The quality of the crop is somewhat variable. The pineapple is grown on a large scale in the Kona district, and the fruit is of much better quality.

Snakes. Land-snails, mostly Acheloides, are remarkably frequent and diverse; over 300 varieties exist. Insects are numerous, and a few are pests, notably the southern termite, which lives mainly in sugar-cane. The water-boatman, and the water-lily and other aquatic plants, which are sometimes abundant, give to the waters a rich and varied fauna. Insect life is continuous, sometimes over-rich, and various means have been resorted to for its control.

2 So Lesson called the family from the native name in 1831; Cabanis (1847) suggested Acradnocerus.

3 The entomological department of the Hawaiian Expedition Station undertakes "mosquito control," and in 1905-1906 imported the tsetse fly (Gusmania cicada). These flies have never been allowed to establish themselves.

4 These and other title-holders received corresponding rights to the use of irrigation ditches, and to fish in certain sea areas adjacent to their holdings.
HAWAII

pineapples has been successfully carried on, and in the year ending March 31, 1907, 186,700 cases were exported, being packed in nine canneries. Oranges, lemons, limes, figs, mangoes, grapes and peaches, besides a considerable variety of vegetables, are raised in considerable amount. In 1907 the combined value of fruits and nuts to the continental United States was valued at $1,457,644. An excellent quality of sisal is grown. Rubber trees have been planted with some success, particularly on eastern plains of Maui; they are now expected for commercial use until 1909. In 1907 there were vanilla plantations in the islands of Oahu and Hawaii. Tobacco of a high grade, especially for wrapping, is grown in the Agricultural Experimental farm at Hamakua, on the island of Hawaii, where the tobacco is practically "shade grown" under the afternoon fogs from Mauna Kea. Cotton and silk culture have been experimented with on the islands. Unlike sugar culture, the Hawaiian Agricultural Station is of great value, in introducing new crops, in improving old, in studying soils and fertilizers and in entomological research. Honey is a crop of some importance; in 1908 the yield was about 950 tons of honey and 15 tons of wax. The small islands of Lanai, Nihoa, and Kahoolawe are devoted chiefly to the raising of sheep and cattle—Nihoa is one large privately owned sheep-ranch. There are large cattle-ranches on the islands supplying nearly all the meat for domestic consumption, and cattle-raising is second in importance to the sugar industry. It was estimated in 1908 that there were about 70,500 stock in the islands. The "native" cattle, descended from those left on the islands by early navigators, are being improved by breeding with imported Herdexford, Shorthorn, Angus and Holstein bulls, the Hereford breed being predominant. The rough, rugged soil, the poor irrigation, and the lack of water have long been the most important of the manufacturing industries, indeed, are maintained for supplying the local market, being only three important exceptions—the manufacture of sugar, the cleaning of coffee and the cleaning and polishing of rice. There were 265 factories between 1840 and 1908, in which were manufactured about 359,413 lb of wool (valued at $8,133) and 928,999 lb of raw hides (valued at $87,599) were shipped to the Territory from the United States.

Minerals.—The islands have large (unworked) supplies of pumice, sandstone, sulphur, gypsum, alum, and mineral-paint ochres, and some salt, kaolin and sal-ammoniac, but otherwise they are without mineral wealth other than purpureous lapis lazuli. The manufacture of liquors is not permitted.

Manufactures.—The manufactures are chiefly sugar, fertilizers, and such products of the foundry and machine shop as are required for the maintenance of the sugar factories. Most of the manufacturing industries, indeed, are maintained for supplying the local market, being only three important exceptions—the manufacture of sugar, the cleaning of coffee and the cleaning and polishing of rice. There were 265 factories between 1840 and 1908, in which were manufactured about 359,413 lb of wool (valued at $8,133) and 928,999 lb of raw hides (valued at $87,599) were shipped to the Territory from the United States.

Communications.—There are good wagon roads on the islands, some of them macadamized, built of the hard blue lava rock; Honolulu is linked by roads of over 100 m. length with every portion of the island. The line that is that of the Oahu Railway & Land Company (about 89 m.), extending from Honolulu W. and N. along the coast to Kahuku about 35 m. from the coast. Another line now under construction is the Na Kuhau Mill, the most northerly point of the island, S.E. to Honolulu, was projected in 1905; on the island of Hawaii is the Hilo Railroad (about 46 m.), carrying sugar, pineapples, rubber and lumber; other railways are for the most part short lines on sugar estates and in coffee-producing sections of the islands of Hawaii and Maui. Each of the larger islands has one or more ports which a local steamboat serves regularly, and Honolulu has the service of several trans-Pacific lines (the American-Hawaiian Steamship Co., the Canadian-Australian Steamship Co., the Matson Navigation Co., the Oceanic Steamship Co., the Pacific Mail Steamship Co., the Morro Castle Line, the Toyo Steamship Co., and the Nippon Yusen Kaisha). The service of vessels between the United States (mainland) and Australia and Southern Asia. In 1908 five steamship companies were engaged in traffic between island ports and the mainland (including Mexico). Honolulu is the central depot of the United States, and the several islands of the group are served by wireless telegraph.

Commerce.—The position of the archipelago, at the "cross-roads" of the Pacific, seems to have been a powerful influence in import and export trade. The months of July, August, and September are the days of the whale fishery, and it has a practical monopoly of whaling, waterering and victualling. Its main disadvantage is the lack of harbours. Honolulu and Pearl Harbor are the only ones in the archipelago, built during the last quarter of the 19th century. The exports of and surveys were made to improve Hilo Bay on the island of Hawaii. Pearl Harbor is the U.S. naval station, and a great naval dock, necessary for the maintenance of the fleet in time of war, is in process of construction. In recent years commerce has grown greatly in volume; it has always been almost entirely with the United States. In 1880 the value of imports from the United States was $2,086,000, that of exports to the United States was $4,606,000; in 1907 the value of shipments of domestic merchandise from the United States to Hawaii was $13,557,907, and the value of shipments of domestic manufactures from Hawaii to the United States was $3,198,433, of which $30,111,524 was the value of brown sugar, $333,133 the value of toilet preparations, $1,278,406 the value of cotton, $3,424,195 the value of green, ripe or dried fruits, $117,493 the value of hides and skins, and $105,515 the value of green or raw coffee. The shipments of foreign merchandise each way are relatively insignificant. In the fiscal year 1908, the value of imports from foreign countries was valued at $257,640, ten times as much as in 1905 ($25,541); the imports into Hawaii from foreign countries were valued at $4,682,399 in the fiscal year 1908, as against $3,049,906 in 1905.

Population.—The total population of the islands in 1890 was 85,990; in 1900 it was 154,001, an increase within the decade of 77.13%; in 1910 it was 191,009. In 1908 there were about 72,000 Japanese, 19,000 Chinese, 5000 Koreans, 23,000 Portuguese, 16,000 Spaniards, 15,000 Hawaiians and part Hawaiians and 12,000 Teutos. Of the total for 1900 there were 61,111 Japanese, 25,767 Chinese and 233 negroes; of the same total there were 90,780 foreign-born, of whom 56,234 were natives of Japan, and 612 were natives of Portugal. There were in all, 1900, 166,396 males (69.1%; a preponderance due to the large number of Mongolian labourers, whose wives are left in Asia) and only 47,632 females. About three-fifths of the Hawaiians and nearly all of American, British or New Zealand European descent (chiefly the first two) and about one-third of the native Hawaiians are Roman Catholics. The Mormons claim more than 4000 adherents, whose principal settlement is at Laie, on the north-east shore of Oahu; the first Mormon missionaries came to the islands in 1850. The population of 1910 was distributed among the several islands as follows: Oahu, 82,028; Hawaii, 55,882; Kauai and Nihoa, 23,052; Kalawao, 758; and Maui, Lanai, Kahoolawe and Molokai, 29,702. The population of Honolulu district, the entire urban population of the Territory, was 23,900 in 1890, 30,360 in 1900, and 32,183 in 1910. The aboriginal Hawaiians (sometimes called Kanakas, from a Hawaiian word kanaka, meaning "man") belong to the Malayo-Polynesian race; they probably settled in Hawaii in the 3th century, having formerly lived in Samoa, and possibly before that in Tahiti and the Marquesas. Their reddish-brown skin has been compared in hue to tarnished copper. Their hair is dark brown or black, straight, wavy or curly; the beard is thin, the face broad, the profile not prominent, the eyes large and expressive, the nose somewhat flattened, the lips thin, the mouth closed, the smile almost like a smile of the Chinese and Japanese, and a pearly whiteness. The skull is sub-brachycephalic in type, with an index of 82-6 from living "specimens" and 79 from a large collection of skulls; it is never prognathous. Most of the people are of moderate stature, but the chiefs and the women of their families have been remarkable for their height, and 400 pounds was formerly not an unusual weight for one of this class. This corpulence was due not alone to over-eating but to an almost purely vegetable diet; stoutness was a part of the ideal of feminine beauty. The superiority in physique of the nobles to the common people may have been due in part to a system of massage, the lomi-lomi; it is certainly contrary to the belief in the bad effects of inbreeding—among the upper classes marriage was almost entirely between near relatives.

The Rev. William Ellis, an early English missionary, described the natives as follows: "The inhabitants of these islands are considered physically, amongst the finest races in the Pacific, bearing the strongest resemblance to the New Zealanders in stature, and in their well-developed muscular limbs. The tattooing of their bodies is less artistic than that of the New Zealanders, and much more limited than among some of the other islands. They are also more hardy and industrious than those living nearer the equator. This in all probability arises from their salubrious climate, and the comparative sterility of their soil rendering them dependent upon the cultivation of the ground for the yam, the arum, and the sweet potato, their chief articles of food. Though, like all undiscome races, the Sandwich Islanders [Hawaiians] have proved deficient in regard to some "existent" primitive" defence of the body, they manifest considerable intellectual capacity. Their moral character, when compared with Europeans, was not
superior to that of other islanders; and excepting when improved and preserved by the influence of Christianity, it has suffered much from the vices of intemperance and licentiousness introduced by foreigners. Polygamy prevailed among the chiefs and rulers, and women were subject to all the humiliations of the tabu system, which subjected them to moral privations, and kept them socially in a condition of inferiority to the other sex. Infanticide was practised to some extent, the children destroyed being chiefly females. Though less superstitious than the Tahitians, the idolatry of the Sandwich Islanders was equally barbarous and sanguinary, as, in addition to the chief objects of worship included in the mythology of the other islands, the supernatural beings supposed to reside in the volcanoes and direct the action of subterranean fires rendered the gods objects of peculiar terror. Human sacrifices were slain on several occasions, and vast offerings presented to the spirits supposed to preside over the volcanoes, especially during the periods of actual eruptions. The requisitions of their idolatry were severe and its rites cruel and bloody. Grotesque and repulsive wooden figures, animals and the bones of chiefs were the objects of worship. Human sacrifices were offered whenever a temple was to be dedicated, or a chief was sick, or a war was to be undertaken; and these occasions were frequent. The apprehensions of the people with regard to a future state were undefined, but fearful. The lower orders expected to be slowly devoured by evil spirits, or to dwell with the gods in burning mountains. The several trades, such as that of fisherman, the tiller of the ground, and the builder of canoes and houses, had each their presiding deities. Household gods were also kept, which the natives worshipped in their habitations. One merciful provision, however, had existed from time immemorial, and that was [the puakonias] sacred inclosures, places of refuge, into which those who fled in time of war, or from any violent pursuer, might enter and be safe. To violate their sanctity was one of the greatest crimes of which a man could be guilty. "The native religion was an admixture of idolatry and hero-worship, of some ethical but little moral force. The king was war chief, priest and god in one, and the shocking licence at the death of a king was probably due to the feeling that all law or restraint was annulled by the death of the king—an incarnate law. The mythic and religious legends of the people were preserved in chants, handed down from generation to generation; and in like poetic form was kept the knowledge of the people of botany, medicine and other sciences. Name-songs, written at the birth of a chief, gave his genealogy and the deeds of his ancestors; dirges and love-songs were common. These were without rhyme or rhythm, but had alliteration and a parallelism resembling Hebrew poetry. Drums, gourd and bamboo flutes, and a kind of guitar, were known before Cook's day.

When the islands first became known to Europeans, the Hawaiian family was in a stage including both polyandry and polygyny, and, according to Morgan, older than either: two or more brothers, with their wives, or two or more sisters with their husbands, cohabited with seeming promiscuity. This system called puana (a word which in the modern vernacular means merely "dear friend") was first brought to the attention of ethnologists in 1871 by Lewis H. Morgan (who was incorrect in many of his premises) and was made the basis of his second stage, the puana, in the evolution of the family. These conditions did not last long after the coming of the missionaries. Descent was more commonly traced through the female line. As regard cannibalism, it appears that the heart and liver of the human victims offered in the temples were eaten as a religious rite, and that the same parts of any prominent warrior slain in battle were devoured by the victor chiefs, who believed that they would thereby inherit the valour of the dead man. Under taboo as late as 1810 women were to be put to death if they ate bananas, cocoa-nuts, pork, turtles or certain fish. In the days of idolatry the only dress worn by the men was a narrow strip of cloth wound around the loins and passed between the legs. Women wore a short petticoat made of kapo cloth (already referred to), which reached from the waist to the knee. But now the common class of men wear a shirt and trousers; the better class are attired in the European fashion. The women are clad in the holoka, a loose white or coloured garment, with sleeves, reaching from the neck to the feet. A coloured handkerchief is twisted around the head or a straw hat is worn. Both sexes delight in adorning their hair with garlands (lei) of flowers and necklaces of coloured seeds. The Hawaiians are a good-tempered, light-hearted and pleasure-loving race. They have many games and sports, including boxing, wrestling (both in and out of water), hill-sliding, spear-throwing, and a game of bowls played with stone discs. Both sexes are passionately fond of riding. They delight to be in the water and swim with remarkable skill and ease. In the exciting sport of surf-riding, which always astonishes strangers, they balance themselves lying, kneeling or standing on a small board which is carried landwards on the curling crest of a great roller. All games were accompanied by gambling. Dances, especially the indigenous hula, "dance du ventre," were favourite entertainments.

Even at the time when they were first known to Europeans, they had stone and lava hatchets, shark's-tooth knives, hardwood spades, kapo cloth or paper, mats, fans, fish-hooks and nets, woven baskets, &c., and they had introduced a rough sort of irrigation of the inland country with long canals from highlands to plains. They derived their sustenance chiefly from pork and fish (both fresh and dried), from seaweed (limu), and from the kalo (Colocasia antiquorum, var. esculenta), the banana, potato, yam, bread-fruit and cocoyut. In the furnish of the kalo is made the national dish called poi; after having been baked and well beaten on a board with a stone pestle it is made into a paste with water and then allowed to ferment for a few days, when it is ready to be eaten. One of the table delicacies of former days was a particular breed of dog which was fed exclusively on poi before it was killed, cooked and served. Like other South Sea Islanders they made an intoxicating drink, awa or kava, from the roots of the Macropiper latifolium or Piper methysticum; in early times this could be drunk only by nobles and priests. The native dwellings are constructed of wood, and occasionally are huts thatched with grass at the sides and top. What little cooking is undertaken among the poorer natives is usually done outside. The oven consists of a hole in the ground in which a fire is lighted and stones made hot; and the fire having been removed, the food is wrapped up in leaves and placed in the hole beside the hot stones and covered up until ready; or else, as is now more common, the cooking is done in an old kerosene-oil can over a fire.

The Hawaiian language is a member of the widely-diffused Malayo-Polynesian group and closely resembles the dialect of the Marquesas; Hawaiians and New Zealanders, although occupying the most southerly regions of Polynesia in which the race has been found, can understand each other without much difficulty. Various unsuccessful attempts have been made to prove the language Aryan in its origin. It is soft and harmonious, being highly vocalic in structure. Every syllable is open, ending in a vowel sound, and short sentences may be constructed wholly of vocalic sounds. The only consonants are k, l, m, n and ñ, which with the gently aspirated k, the five vowels, and the vocalic w, make up all the letters in use. The letters r and t have been discarded in favour of l and k, as expressing more accurately the native pronunciation, so that, for example, tore, the former name of the Colocasia plant, is now kalo. The language was not reduced to a written form until after the arrival of the missionaries. A Hawaiian spelling book was printed in 1822; in 1834 two newspapers were founded; and in 1839 the first translation of the Bible was published.

In spite of moral and material progress—indeed largely because of changes in their food, clothing, dwellings and of other "advantages" of civilization—the race is probably dying out. Captain Cook estimated the number of natives at 400,000, probably an over-estimate; in 1823 the American missionaries estimated their number at 143,000; the census of 1832 showed the population to be 150,313; the census of 1878 proved that the number of natives was no more than 44,008. In 1890 they numbered
HAWAII

34,436; in 1900, 29,834, a decrease of 4624 or 13.3% within the decade. To account for this it is said that the blood of the race has become poisoned by the introduction of foreign diseases. The women are much less numerous than the men; and the married ones have few children at the most; two out of three have none at all. In the Hawaiian class, however, the men are more insistent and neglect their offspring. It is, however, thought by some that these causes are now diminishing in force, and that the "fittest" of the race may survive. The part-Hawaiians, the offspring of intermarriage between Hawaiian women and men of other races, increased from 3420 in 1878 to 6186 in 1890 and 7835 in 1900.

The pressing demand for labour created by the Reciprocity Treaty of 1875 with the United States led to great changes in the population of the Hawaiian Islands. It became the policy of the government to assist immigrants from different countries.

In 1877 arrangements were made for the importation of Portuguese families from the Azores and Madeira, and during the next ten years about 9000 of these people were brought to the islands; in 1906-1907 there was a second immigration from the Azores and Madeira of 3335 people. In 1900 the total number of Portuguese in the islands, including those born there, was not far from 24000. A group of Chinese, who were admitted in 1898, followed in 1900. They have shown themselves to be industrious, thrifty and law-abiding. In 1907-1908 Spanish immigrants from the sugar district about Malakula, in the New Hebrides, came to the islands, and 1903 the same year Portuguese migrated in the same year. The Board of Immigration, using funds contributed by planters, was very active in its efforts to encourage the immigration of suitable labourers, but the general immigration was prohibited by the Board from the 26th of June 1904, although through contributions from corporations. Persistent efforts have also been made to introduce Polynesian islanders, as being of a cognate race with the Hawaiians, and as having a thoroughly satisfactory history. About 2000, mainly from the Gilbert Islands, were brought in at the expense of the government between 1878 and 1884; but they did not give satisfaction either as laborers or as citizens, and most of them have been returned to their homes. There never existed any treaty or labour convention between Hawaii and China. In early days a limited number of Chinese settled in the islands, intermarrying with the native women and generally prospering. About 750 of them were naturalized under the monarchy. The first immigration of Chinese labourers was in 1852. In 1878 the number of Chinese had risen to 916. During the next few years there was such a steady influx of Chinese free immigrants that in the spring of 1881 the Hawaiian government sent a despatch to the governor of Hong Kong to stop this invasion. Again, in April 1883, it was suddenly renewed, and within twenty months 2253 Chinese passed from Hong Kong bringing 2253 Chinese passengers, followed by another, the next month by 1100 more, with the news that several thousand more were ready to embark. Accordingly, the same day the Hawaiian government sent a despatch to the governor of Hong Kong, refusing to permit any further immigration of Chinese from that port. Various regulations restricting Chinese immigration were enacted from time to time until 1893, laborers from China were not allowed to land as passengers without a passport was prohibited. The number of Chinese in the islands had then risen to 21,000. The consent of the Hawaiian government to the immigration of its subjects to Hawaii was obtained with difficulty in 1884, and in 1886 a labour convention was ratified. Subsequently the increase of the Japanese element in the population was rapid. It rose from 116 in 1884 to 12,350 in 1890 and 24,400 in 1896. Most of these were recruited from the lowest classes in Japan. Unlike the Chinese, they show no inclination to intermarry with the Hawaiians. The effect of making Hawaii a Territory of the United States was to put an end to all assisted immigration, of whatever race, and to exclude all Chinese labourers. No Chinese labourer is allowed to enter any other Territory of the Union from Hawaii; and the act of Congress of the 26th of February 1885, was intended to prohibit the importation and employment of Chinese labourers in the United States, or in any place or territory, on any ship or vessel, to perform labour in the United States, its Territories or the District of Columbia, and the amending and supplementary acts, are expressly declaratory of the same principle. The United States and Japan there is nothing to limit the free immigration of Japanese; and several companies have been formed to promote it. The system of contract labour, which was abolished by the act of Congress in 1882, has been carried on by various companies in the Pacific coast states, especially in San Francisco, and to remedy the difficulty Congress inserted a clause in the general immigration act of the 20th February 1907 which provides that whenever the president is satisfied that passports issued by any foreign government to any other country than the United States, or to any of its insular possessions, or to the Canal Zone, "are being used for the purpose of enabling individuals to leave the United States to the detriment of labour conditions therein," he may refuse to admit them.

An interesting sociological problem is raised by the presence of the large Asiatic element in the population. The Japanese and Koreans, and in less measure the Chinese, act as domestics, servants, workers on plantations, and are allowed to do most of the plantation work and compete successfully with whites and native islanders in all save skilled urban occupations, such as printing and the manufacture of machinery. The "Yellow Peril" is considered less dangerous in Hawaii than formerly, although it was used as a political cry in the campaign for American annexation. Since the successful conclusion of the Russo-Japanese War of 1904, the Central Japanese League, which was organized in November and December 1903 to promote the observance of law and order by the Japanese, was permitted to function. The Japanese are, however, felt to themselves free from governmental control whether Japanese or American; indeed, after the League had been in operation for a year or more, it almost seemed that it contributed to industrial unrest among the Japanese labourers. Again, about the same time Japanese immigration to Hawaii fell off upon the opening of new fields for colonization by the Russo-Japanese War, and Korean immigration was promoted by employment in the islands. From January 1903 to the 30th of June 1906 Japanese immigrants numbered 18,027; Koreans 7388 (four Koreans to every ten Japanese); but in the last twelve months of this same period there were 4733 Chinese, 3091 Japanese (eight Koreans to every ten Japanese).

Another fact which is possibly contributing to the solution of the problem is that the Japanese are leaving the islands in large numbers as compared with the Koreans. The Japanese leaving Hawaii between the 14th of June 1900 and the 31st of December 1905 numbered 42,313, or 4254 more than the number of Japanese immigrants arriving during the same period. The corresponding figures for Koreans during the same period are as follows: number leaving between the 14th of June 1900 and the 31st of December 1905, 721, or 6073 less than the Korean immigrants for the same period. The acceleration of the departure of the Japanese is shown by the fact that in the eighteen months (July 1904 to January 1906) occurred 19,114 of the 42,313 departures in the sixty-six months from July 1900 to January 1906. At 1906, owing to restrictions on immigration, the Japanese great departure ceased. At the same time the number of departures was decreasing rapidly. The change in the character of the immigration of Japanese and Koreans is thus shown. The relative number of female immigrants to males was as 1 to 8, in the fiscal year 1907-1908 as 1 to 2, and in the latter year, of 4933 births in the Territory, 4454 were Japanese.

Administration.—The Hawaiian Islands are governed under an Act of Congress, signed by the president on the 30th of April 1900, which first organized them as a Territory of the United States. The legislature, which meets biennially at Honolulu, consists of a Senate of 16 members, elected by the people of the Territory, and a House of Representatives of 30 members holding office for two years. In order to vote for Representatives or Senators, the electors must be a male citizen of the United States who has attained the age of twenty-one years, has lived in the Territory not less than one year preceding, and is able to speak, read and write the English or Hawaiian language. No person is allowed to vote by reason of being in or attached to the army or navy. The executive power is vested in a governor, appointed by the president and holding office for the term of four years. Every person of the thirty-five years of age and must be a citizen of the Territory. The secretary of the Territory is appointed in like manner for a term of the same length. The governor appoints, and with the consent of the Senate of the Territory, an attorney-general, treasurer, commissioner of public lands, commissioner of agriculture and forestry, superintendent of public works, superintendent of public instruction, commissioners of public instruction, auditor and deputy-auditor, surveyor, high sheriff, members of the board of health, board of prison inspectors, board of registration, inspectors of elections, &c.

All such officers are appointed for four years except the commissioners of public instruction and the members of the said 1. Large numbers of Japanese immigrants have used the Hawaiian Islands merely as a means of gaining admission at the mainlands. For, as the Japanese government would issue only a limited number of passports to the mainlands but would quite readily grant passports to Honolulu, the latter were accepted, and after a short stay on some one of the islands the immigrants would depart on a "coastwise" voyage to some mainland port. The increasing number of arrivals arrived from the Pacific coast states, especially in San Francisco, and to remedy the difficulty Congress inserted a clause in the general immigration act of the 20th of February 1907 which provides that whenever the president is satisfied that passports issued by any foreign government to any other country than the United States, or to any of its insular possessions, or to the Canal Zone, "are being used for the purpose of enabling individuals to leave the United States to the detriment of labour conditions therein," he may refuse to admit them.

This provision has been successful in reducing the number of Japanese coming to the mainland from Hawaii.
boards, whose terms are as provided by the laws of the Territory; all must be citizens of the Territory. The judicial power is vested in a supreme court, 5 circuit courts, and 29 district courts, each having a jurisdiction corresponding to similar courts in each state in the Union; and, entirely distinct from these territorial courts, Hawaii has a United States district court. A Supplementary Act of the 3rd of March 1905 provides that writs of error and appeals may be taken from the Supreme Court of Hawaii to the Supreme Court of the United States "in any case where the value exceeds the sum of five thousand dollars." The Territory was without the forms of local government common to the United States until 1905, when the Territorial legislature divided it into five counties without, however, giving them the usual powers of taxation. Each county has the following officers: a board of supervisors, a clerk, a treasurer, an auditor, an assessor and tax-collector, a sheriff and coroner, and a tax collector. The members (from five to nine) of the board of supervisors are elected by districts into which the county is divided, usually one only from each. All county officers are elected for a term of years. The act of 1905 empowered the Territorial legislature to elect delegates to Congress, and prescribes that the delegate shall have the qualifications necessary for membership in the Hawaiian Senate, and shall be elected by voters qualified to vote for members of the House of Representatives of Hawaii. As usual, the delegate has a right to take part in the debates in the national House of Representatives, but may not vote.

Charities.—The principal public charity of the Territory is the leper asylum on a peninsula almost 10 sq. m. in area on the N. side of the island of Molokai. A steep precipice forms a natural wall between it and the sea, and the patient, in the absence of an asylum, had to care for lepers and the caring for them began to be a charity under government charter in 1866; but conditions here were at first unspeakably unhygienic, their improvement being largely due to Father Damien, who, seeing the patients working in the plantation fields and in charge of the exclusively native Hawaiians, and their number is slowly but steadily decreasing; in 1908 they numbered 791, and there were at Molokai 46 non-leprosy helpers and 27 officers and assistants, including the Roman Catholic brothers and sisters in charge of the homes. In 1905 the United States government appropriated $100,000 for a hospital station and laboratory for the study of the methods of transmission, cause and treatment of leprosy, and $100,000 for a year's maintenance; the station and laboratory to be established when the territorial government should have ceded to the United States a tract of 1 sq. m. on the leper reservation. The cession was made on the 30th of June 1906, and the United States government is now a home for non-leprous boys of leprous parents established at Honolulu. Another public charity of Hawaii is the general dispensary maintained by the territorial government at Honolulu. Education is universal and compulsory. Girls as well as boys, regardless of age, must attend either a public school or a duly authorized private school. Consequently the percentage of illiteracy is extremely low. The school system is essentially the same in the islands as in the States, with district schools, county schools, and training schools, the latter being attended by the brighter members, foundations laid by American missionaries. Between 1820 and 1824 the missionaries taught about 2000 natives to read. Several important schools were founded before 1840, when the first written laws were published. Among these was a law providing for compulsory education, and decreeing that no illiterate born after the beginning of Liholiho's reign should hold office, and that no illiterate man or woman, born after the same date, could marry. The first Hawaiian minister of public instruction was the Rev. William Richards (1792-1847), who held office from 1833 to 1837, and was followed by Richard Armstrong (1805-1860), an American Presbyterian minister, who founded the Board of Education. Mr. Armstrong laid stress on the importance of manual and industrial training during his term of office (1847-1855), and was succeeded by a board of education (1855-1860), of which the principal officers were the Rev. P. J. McCully and Mr. Armstrong. Mr. Armstrong was succeeded as president-general of schools was appointed, Judge Abraham Fernandez being the first inspector; in 1896 an executive department was created under a minister of public instruction and six com-

---

1 These are: the county of Hawaii, consisting of the island of the same name; the county of Maui, including the islands of Maui, Lanai and Kahoolawe, and the greater part of Molokai; the county of Kauai, consisting of the islands of Kauai, Molokai, Oahu, and the four islands of the Midway archipelago; and the county of Honolulu (created from the former county of Oahu by an act of 1907, which came into effect in 1909), consisting of the island of Oahu and various small islands, of which the only ones of any importance are the Midway Islands, 1325 sq. m. from Honolulu, a Pacific cable relay station and a post of the U.S. navy marines; and the county of Kauai, including Kauai and Niihau islands.

2 Their discovery in the 16th century (in 1542 or 1555 by Juan Gaeta, or in 1528 when two of the vessels of Alvaro de Saavedra were shipwrecked here and the captain of one, with his sister, survived and intermarried with the natives) seems probable, because there are traces of Spanish customs in the islands; and they are marked in their correct latitude on an English chart of 1687, which is apparently based on Spanish maps; a later Spanish chart (1743) gives a group of islands 10° E. of the true position of the Hawaiian Islands.

3 The first horses were left by Captain R. J. Cleveland in 1803.
and derived from its profits a large increase of revenue as well as the means of consolidating his power. He died in 1819, and was succeeded by his son, Liholilo, or Kamehameha II., a mild and well-disposed prince, but destitute of his father's energy. One of the first acts of Kamehameha II. was, for vicious and selfish reasons, to abolish taboo and idolatry throughout the islands. Some disturbances were caused thereby, but the insurgents were defeated.

On the 31st of March 1820 missionaries of the American Board of Commissioners for Foreign Missions—two clergymen, two teachers, a physician, a farmer, and a printer, each with his wife—and three Hawaiians educated in the Cornwall (Connecticut) Foreign Missionary School, arrived from America and began their labours at Honolulu. A short time afterwards the British government presented a small schooner to the king, and this afforded an opportunity for the Rev. William Ellis, the well-known missionary, to visit Honolulu with a number of Christian natives from the Society Islands. Finding the language of the two groups nearly the same, Mr Ellis, who had spent several years in the southern islands, was able to assist the American missionaries in reducing the Hawaiian language to a written form. In 1825 the ten commandments were recognized by the king as the basis of a code of laws. In the years 1830-1843 the educational work of the American missionaries was so successful that hardly a native was unable to read and write. A law prohibiting drunkenness (1835) was followed in 1838 by a licence law and in 1839 by a law prohibiting the importation of spirits and taxing wines fifty cents a gallon; in 1840 another prohibitory law was enacted; but licence laws soon made the sale of liquor common. Missionary effort was particularly fruitful in Hilo, where Titus Coan (1801-1882), sent out in 1835 by the American Board of Commissioners for Foreign Missions, worked in repeated revivals, induced most of his church members to give up tobacco even, and received prior to 1880 more than 15,000 members into a church which became self-supporting and sent missions to the Gilbert Islands and the Marquesas. In 1823 Keopuolani, the king's mother, was baptized; and on a single Sunday in 1838 Coan baptized 170 converts at Hilo. In 1844 the American Board withdrew its control of evangelistic work.

In 1824 the king and queen of the Hawaiian Islands paid a visit to England, and both died there of measles. His successor, Kamehameha III., ruled from 1825 to 1854. In 1839 Kamehameha III. signed a Bill of Rights and in 1840 he promulgated the first constitution of the realm; in 1842 a code of laws was proclaimed; by 1848 the feudal system of land tenure was completely abolished; the first legislature met in 1845 and full suffrage was granted in 1852, but in 1864 suffrage was restricted. Progress was at times interrupted by the conduct of the officers of foreign powers. On one occasion (July 1839) French officers abrogated the laws (particularly against the importation of liquor), dictated treaties, extorted $20,000, and by force of arms procured privileges for Roman Catholic priests in the country; and at another time (February 1843) a British officer, Captain Paulet of the "Carysfort," went so far as to take possession of Oahu and establish a commission for its government. The act of the British officer was disapproved by his superiors as soon as known.

These incidents led to a representation on the part of the native sovereign to the governments of Great Britain, France and the United States, and the independence of the islands (recognized by the United States in 1842) was recognized in 1845 by the British crown. Great Britain. In 1844 John Ricord, an American lawyer, became the first attorney of the islands. A new constitution came into effect in 1852. It was the aim of Kamehameha III. and his advisers to combine the native and the foreign elements under one government; to make the king the sovereign not of one race or class, but of all; and to extend equal and impartial laws over all inhabitants of the country. Kamehameha IV. and his queen, Emma, ruled from 1855 to 1863 and were succeeded by his brother, Kamehameha V., who died in 1872, and in whose reign a third (and a reactionary) constitution went into effect in 1864, by mere royal proclamation. Lunalilo, a grandson of Kamehameha I., was king for two years, and in 1874, backed by American influence, some of Samoan insurrectionists, in preference to Queen Emma, a member of the Anglican Church and the candidate of the pro-British party. Kalakaua was elected king in 1891, and in the same year he appointed C. C. Morean, who had come to Honolulu in the interest of a Chinese steamship company, as Premier and minister of foreign affairs. This called forth the protest of the representatives of Great Britain, France and the United States, and aroused such opposition on the part of both the foreigners and the better class of natives that the king was obliged, after four days of popular excitement, to remove the obnoxious minister. During the king's absence on a tour round the world in 1881, his sister, Mrs Lydia Dominis (b. 1838), also styled Liliuokalani, acted as regent. After his return the contest was renewed between the so-called National party, which favoured abolution, and the Reform party, which sought to establish parliamentary government. The king took an active part in the elections, and used his patronage to the utmost to influence legislation. For three successive sessions a majority of the legislature was composed of office-holders, dependent on the favour of the executive. Among the measures urged by the king and opposed by the Reform party were the project of a ten-million dollar loan, chiefly for military purposes; the removal of the prohibition of the sale of alcohol to Hawaiians, which was carried in 1882; the licensing of the sale of opium; the chartering of a lottery company; the licensing of kahunas, or medicine men, &c. Systematic efforts were made to turn the constitutional question into a race issue, and the party cry was raised of "Hawaii for Hawaiians." Adroit politicians flattered the king's vanity, defended his follies and taught him how to violate the spirit of the constitution while keeping the letter of the law. From 1882 till 1887 his prime minister was Walter Murray Gibson (1832-1888), a singular and romantic genius, a visionary adventurer and a shrewd politician, who had been imprisoned by the Dutch government in Batavia in 1852 on a charge of inciting insurrection in Sumatra, and had arrived at Honolulu in 1861 with the intention of leading a Mormon colony to the East Indies. To exalt his royal dignity, which was lowered, he thought, by his being only an elected king, Kalakaua caused himself to be crowned with imposing ceremonies on the ninth anniversary of his election (Feb. 12, 1883).

Kalakaua was now no longer satisfied with being merely king of Hawaii, but aspired to what was termed the "Primacy of the Pacific." Accordingly Mr Gibson addressed a protest to the great powers, deprecating any further annexation of the islands of the Pacific Ocean, and claiming for Hawaii the exclusive right to assist them in improving their political and social condition. In pursuance of this policy, two commissioners were sent to the Gilbert Islands in 1883 to prepare the way for a Hawaiian protectorate. On the 23rd of December 1886 Mr J. E. Bush was commissioned as minister plenipotentiary to the chief islands of Polynesia and as plenipotentiary and head of chiefs of Polynesia. He arrived in Samoa on the 3rd of January 1887, and remained there six months, during which time he concluded a treaty of alliance with Malietoa, which was ratified by his government. The "Explorer," a steamer of 79 tons, which had been employed in the copra trade, was purchased for $20,000, and refitted as a man-of-war, to form the "nest-egg" of the future Hawaiian navy. She was renamed the "Kaimiloa," and was despatched to Samoa on the 17th of May 1887.
to strengthen the hands of the embassy. As R. L. Stevenson wrote: "The history of the Kaimiloa is a story of debauchery, mutiny and waste of government property." At length the intriguers of the Hawaiian embassy gave umbrage to the German government, and it was deemed prudent to recall it to Honolulu in July 1887. Meanwhile a reform league had been formed to stop the prevailing misrule and extravagance; it was supported by a volunteer military force, the "Honolulu Rifles." The king carried through the legislature of 1886 a bill for an opium licence, as well as a Loan Act, under which a million dollars were borrowed in London. Under his influence the Hale Naua Society was organized in 1886 for the spread of idolatry and king-worship; and in the same year a "Board of Health" was formed which revived the vicious practices of the kahunas or medicine-men.

The king's acceptance of two bribes—one of $75,000 and another of $80,000 for the assignment of an opium licence—precipitated the revolution of 1887. An immense mass meeting was held on the 30th of June, which sent a committee to the king with specific demands for radical reforms. Finding himself without support, he yielded without a struggle, dismissed his ministry and signed the constitution on the 7th of July 1887, revising that of 1864, and intended to put an end to personal government and to make the cabinet responsible only to the legislature; this was called the "bayonet constitution," because it was so largely the result of the show of force made by the Honolulu Rifles. By its terms office-holders were made ineligible for seats in the legislature, and no member of the legislature could be appointed to any civil office under the government during the term for which he had been elected.

The members of the Upper House, instead of being appointed by the king for life, were henceforth to be elected for terms of six years by electors possessing a moderate property qualification. The remainder of Kalakaua's reign teemed with intrigues and conspiracies to restore autocratic rule. One of these came to a head on the 30th of July 1889, but this "Wilcox rebellion," led by R. W. Wilcox, a half-breed, educated in Italy, and a friend of the king and of his sister, was promptly suppressed. Seven of the insurgents were killed and a large number wounded. For his health the king visited California in the United States cruiser "Charleston" in November 1890, and died on the 20th of January 1891 in San Francisco. On the 29th of January at noon his sister, the regent, took the oath to maintain the constitution of 1887, and was proclaimed queen, under the title of Liliuokalani.

The history of her reign shows that it was her constant purpose to restore autocratic government. The legislative session of 1892, during which four changes of ministry took place, was protracted to eight months chiefly by her determination to carry through the opium and lottery bills and to have a pliable cabinet. She had a new constitution drawn up, practically providing for an absolute monarchy, and disfranchising a large class of citizens who had voted since 1887; this constitution (drawn up, so the royal party declared, in reply to a petition signed by thousands of natives) she undertook to force on the country by compelling the congress to recognize the constitution on the 14th of January 1893, but her ministers shrank from the responsibility of so revolutionary an act, and with difficulty prevailed upon her to postpone the execution of her design. An uprising similar to that of 1887 declared the monarchy forfeited by its own act. A third party proposed a regency during the minority of the heir-apparent, Princess Ka'ulani, but in her absence this scheme found few supporters. A Committee of Safety was appointed at a public meeting, which formed a provisional government and reorganized the volunteer military companies, which had been disbanded in 1890. Its leading spirits were the "Sons of Missionaries" (as E. L. Godkin styled them), who were accus- ed of using their knowledge of local affairs and their inherent prestige among the natives for private ends—of founding a "Gospel Republic" which was actually a business enterprise. The provisional government called a mass meeting of citizens, which met on the afternoon of the 6th and ratified its action.

The United States steamer "Boston," which had unexpectedly arrived from Hilo on the 14th, landed a small force on the evening of the 16th, at the request of the United States minister, Mr. J. L. Stevens, and a committee of residents, to protect the lives and property of American citizens in case of riot or incendiarism. On the 17th the Committee of Safety took possession of the government building, and issued a proclamation declaring a monarchy to be abrogated, and establishing a provisional government, to exist "until terms of union with the United States of America shall have been negotiated and agreed upon. Meanwhile two companies of volunteer troops arrived and occupied the grounds. By the advice of her ministers, and to avoid bloodshed, the queen surrendered under protest, in view of the landing of United States troops, appealing to the govern- ment of the United States to reinstate her in authority. A treaty of annexation was negotiated with the United States during the next month, just before the close of President Benjamin Harrison's administration, but it was withdrawn on the 9th of March 1893 by President Harrison's successor, President Cleveland, who then despatched James H. Blount (1837-1903) of Macon, Georgia, as commissioner paramount, to investigate the situation in the Hawaiian Islands. On receiving Blount's report to the effect that the revolution had been accomplished by the aid of the United States minister and by the landing of troops from the "Boston," President Cleveland sent Albert Sydney Willis (1843-1897) of Kentucky to Honolulu with secret instructions as United States minister. Willis with much difficulty and delay obtained the queen's promise to grant an amnesty, and made a formal demand on the provisional government for her reinstatement on the 19th of December 1893. On the 23rd President Sanford B. Dole sent a reply to Willis, declining to surrender the authority of the provisional government to the deposed queen. The United States Congress declared against any further intervention by adopting on the 31st of May 1894 the Turpie Resolution. On the 30th of May 1894 a convention was held to frame a constitution for the republic of Hawaii, which was proclaimed on the 4th of July following, with S. B. Dole as its first president. Toward the end of the same year a plot was formed to overthrow the republic and to restore the monarchy. A cargo of arms and ammunition from San Francisco was secretly landed at a point near Honolulu, where a company of native royalists were collected on the 6th of January 1895, intending to capture the government buildings by surprise that night, with the aid of their allies in the city. A previous warning was given by a band of police alarmed the town and broke up their plans. There were several other skirmishes during the following week, resulting in the capture of the leading conspirators, with most of their followers. The ex-queen, on whose premises arms and ammunitions and a number of incriminating documents were found, was arrested and was imprisoned for nine months in the former palace. On the 24th of January 1895 she formally renounced all claim to the throne and took the oath of allegiance to the republic. The ex-queen and forty-eight others were granted conditional pardon on the 7th of September, and on the following New Year's Day the remaining prisoners were set at liberty.

On the inauguration of President McKinley, in March 1897, negotiations with the United States were resumed, and on the 16th of June a new treaty of annexation was signed at Washington. As its ratification by the Senate had appeared to be uncertain, extreme measures were taken: the Newlands joint resolution, by which the cession was "accepted, ratified and confirmed," was passed by the Senate by a vote of 42 to 21 and by the House of Representatives by a vote of 290 to 91, and was signed by the president on the 7th of July 1898. The formal transfer of sovereignty took place on the 12th of August 1898, when the flag of the United States (the same flag hailed down by order of Commissioner Blount) was raised over the Executive Building with impressive ceremonies.

The sovereigns of the monarchy, the president of the republic and the governors of the Territory up to 1910 were as follows:
HAWARDEN—HAWES, STEPHEN

HAWARDEN (pronounced Harden, Welsh Penarlâg), a market-town of Flintshire, North Wales, 6 m. W. of Chester, on the river Dee. It is the seat of a late medieval castle, ordered to be blown up by a branch with the London & North-Western railway. Pop. (1901), 5372. It lies in a coal district, with clay beds near. Coarse earthenware, draining tiles and fire-clay bricks are the chief manufactures. The Maunds take the title of viscount from the town. Hawarden castle—built in 1752, added to and altered in the Gothic style in 1814—stands in a fine wooded park near the old castle of the same name, which William the Conqueror gave to his nephew, Hugh Lupus. It was taken in 1282 by Dafydd, brother of Llewellyn, prince of Wales, destroyed by the Parliamentarians in the Civil War, and came into the possession of Sergeant Glyme, lord chief justice of England under Cromwell. The last baronet, Sir Stephen R. Glyme, dying in 1874, Castell Penrâl passed to his brother-in-law, William Ewart Gladstone. St Deiniol church, early English, was restored in 1857 and 1878. There are also a grammar school (1606), a Gladstone golden-wedding fountain (1886), and St Deiniol's Hostel (with accommodation for students and an Anglican clerical warden); west of the church, on Truman's hill.

HAWAWIR (Hawai'ait), an African tribe of Semitic origin, dwelling in the Bayuda desert, Anglo-Egyptian Sudan. They are found along the road from Debbâ to Khartum as far as Bir Garm, and from Ambigol to Wadi Bishâr. They have adopted none of the negro customs, such as gashing the cheeks or elaborate hairdressing. They own large herds of oxen, sheep and camels.

HaweIS, HUGH REGINALD (1834–1903). English preacher and writer, was born at Egham, Surrey, on the 3rd of April 1834. On leaving Trinity College, Cambridge, he travelled in Italy and served under Garibaldi in 1860. On his return to England he was ordained and held various curacies in London, becoming in 1866 incumbent of St James's, Marylebone. His unconventional methods of conducting the service, combined with dwarfish oratory and lively manner, soon attracted a crowded congregation. He married Miss M. E. Joy, 1871, and both he and Mrs Hawes (d. 1898) contributed largely to periodical literature and travelled a good deal abroad. Hawes was Lowell lecturer at Boston, U.S.A., in 1885, and represented the Anglican Church at the Chicago Parliament of Religions in 1893. He was much interested in music, and wrote books on violins and church bells, besides contributing an article to the 9th edition of the Encyclopaedia Britannica on bell-ringing. His best-known work was Music and Morals (3rd ed., 1873); and for a time he was editor of Cassell's Magazine. He also wrote five volumes on Christ and Christianity (a popular church history, 1886–1897). Other writings include Travel and Talk (1896), and similar chatty and entertaining books. He died on the 29th of January 1901.

HAWES, STEPHEN (fl. 1502–1521). English poet, was probably a native of Suffolk, and, if his own statement of his age may be trusted, was born about 1474. He was educated at Oxford, and travelled in England, Scotland and France. On his return he engaged in various occupations, especially his "most excellent vein" in poetry, procured him a place at court. He was a gentleman of the chamber to Henry VII. as early as 1502. He could repeat by heart the works of most of the English poets, especially the poems of John Lydgate, whom he called his master. He was still living in 1521, when it is stated in Henry VIII.'s household accounts that 16, 135. 4d. was paid "to Mr Hawes for his play," and he died before 1530, when Thomas Field, in his "Conversation between a Lover and a Jay," wrote "Yong Stephen Hawes, whose soule God pardon, Treated of love sockerly and well." His capital work is The Passion of Pilate, or the History of Graine Amour and la Bel Pucel, containing the knowledge of the seven Sciences and the Course of Man's Life in this Worlde, printed by Wynkyn de Worde, 1509, but finished three years earlier. It was also printed with slightly varying titles by the same printer in 1517, by J. Wayland in 1554, by Richard Tottel and by John Waley in 1555. Tottel's edition was edited by T. Wright and reprinted by the Percy Society in 1845. The poem is a long allegory in seven-lined stanzas of man's life in this world. It is divided into sections after the manner of the Morte Arthur and borrows the machinery of romance. Its main motive is the education of the knight, Graunde Amour, based, according to Mr W. J. Courthope (Hist. of Eng. Poetry, vol. i. 382), on the Marriage of Mercury and Philology, by Martinus Capella, and the details of the description prove Hawes to have been well acquainted with medieval systems of philosophy. At the suggestion of Fame, and accompanied by her two greyhounds, Grace and Governance, Graunde Amour starts out in quest of La Bel Pucel. He first visits the Tower of Doctrine or Science where he acquaints himself with the arts of grammar, logic, rhetoric and arithmetic. After a long dispute with the lady in the Tower of Music he returns to his studies, and after sojourns at the Tower of Geometry, the Tower of Doctrine, the Castle of Chivalry, &c., he arrives at the Castle of La Bel Pucel, where he is met by Peace, Mercy, Justice, Reason and Memory. His happy marriage does not end the story, which goes on to tell of the ensuing of Age, with the concomitant evils of Avarice and Cunning. The admonition of Death brings Contiption and Conscience, and it is only when Remembrance has delivered an epitaph chiefly dealing with the Seven Deadly Sins, and Fame has enrolled Graunde Amour's name with the knights of antiquity, that we are allowed to part with the hero. This long imaginative poem was widely read and esteemed, and certainly exercised an influence on the genius of Spenser.

The remaining works of Hawes are all of them bibliographical rarities. The Conversion of Sweers (1509) and A Joyfull Medacyon to all Enfylode, a coronation poem (1599), was edited by David Laing for the Abbotsford Club (Edinburgh, 1865).
Compendious Study... called the Example of Vertu (1512) and the Comfort of Lovers (not dated) complete the list of his extant works.

See also G. Staintsbury, The Flourishing of Romance and the Rise of Allegory (Edin. and Lond., 1897); the same writer's Illust. of English Prose (vol. i. 1906); and an article by W. Murison in the Camb. Phil. Soc. (vol. 26, 1908).

HAWES, WILLIAM (1785-1846). English musician, was born in London in 1785, and was for eight years (1793-1801) a chorister of the Chapel Royal, where he studied music chiefly under Dr. Ayerton. He subsequently held various musical posts, being in 1817 appointed master of the children of the Chapel Royal. He also carried on the business of a music publisher, and was for many years musical director of the Lyceum Theatre, then devoted to English opera. In the last-named capacity (July 23rd, 1824), he introduced Weber's Der Freischütz for the first time in England, at first slightly curtailed, but soon afterwards in its entirety. Winter's Interrupted Sacrifice, Mozart's Cosi fan tutte, Marschner's Vampyre and other important works were also brought out under his auspices. Hawes also wrote or compiled the music for numerous pieces. Better were his glees and madrigals, of which he published several collections. He also superintended a new edition of the celebrated Triumph of Oriana. He died on the 18th of February 1846.

HAWFINC, a bird so called from the belief that the fruit of the Hawthorn (Crataegus Oxycantha) forms its chief food, the Loxia coccothraustes of Linnaeus, and the Coccothraustes vulgaris of modern ornithologists, one of the largest of the finch family (Fringillidae), and found over nearly the whole of Europe, in Africa north of the Atlas and in Asia from Palestine to Japan. It was formerly thought to be only an autumnal or winter-visitor to Britain, but later experience has proved that, though there may very likely be an immigration in the fall of the year, it breeds in nearly all the English counties to Yorkshire, and abundantly in those nearest to London. In coloration it bears some resemblance to a chaffinch, but its much larger size and enormous beak make it easily recognizable, while on closer inspection the singular bull-hook form of some of its wing-feathers will be found to be very remarkable. Though not uncommonly frequenting gardens and orchards, in which as well as in woods it builds its nest, it is exceedingly shy in its habits, so as seldom to afford opportunities for observation.

HAWICK, a municipal and police burgh of Roxburghshire, Scotland. Pop. (1891), 19,204; (1901), 17,303. It is situated at the confluence of the Sillrig (which flows through the town) with the Teviot, 10 m. S.W. of Jedburgh by road and 52½ m. S.E. of Edinburgh by the North British railway. The name has been derived from the O. Eng. heath-wic, "the village on the flat meadow," or hag-wic, "the fenced-in dwelling," the Gadmen being supposed to have had a settlement at this spot. Hawick is a substantial and flourishing town, the prosperity of which dates from the beginning of the 19th century, its enterprise having won for it the designation of "The Glassworks of the Borders." The municipal buildings, which contain the free library and reading-room, stand on the site of the old town hall. The Buccleuch memorial hall, commemorating the 5th duke of Buccleuch, contains the Science and Art Institute and a museum rich in exhibits illustrating Border history. The Academy furnishes both secondary and technical education. The only church of historical interest is that of St Mary's, the third of the name, built in 1765. The first church, believed to have been founded by St Cuthbert (d. 687), was succeeded by one dedicated in 1214, which was the scene of the seizure of Sir Alexander Kennedy of Druglass in 1342 by Sir William Douglas. The modern Episcopal church of St Cuthbert was designed by Sir Gilbert Scott. The Moat or Moot hill at the south end of the town—an earthen mound 30 ft. high and 300 ft. in circumference—is conjectured to have been the place where formerly the court of the manor met; though some authorities think it was a primitive form of fortification. The Baron's Tower, founded in 1155 by the Lovels, lords of Branhom and Hawick, and afterwards the residence of the Douglases of Drumlanrig, is said to have been the only building that was not burned down during the raid of Thomas Radcliffe, 3rd earl of Sussex, in April 1570. At a later date it was the abode of Anne, duchess of Buccleuch and Monmouth, after the execution of her husband, James, duke of Monmouth in 1655, and finally became the Tower Hotel. Bridges across the Teviot connect Hawick with the suburb of Willson, in which a public park has been laid out, and St Leonard's Park and race-course are situated on the Common, 2 m. S.W. This town has long been both a market and a burgh, and unites with Selkirk and Galashiels (together known as the Border burghs) to send a member to parliament. The leading industries are the manufacture of hosiery, established in 1771, and woollens, dating from 1830, including blankets, shepherd's plaiding and tweeds. There are, besides, tanneries, dye works, oil-works, saw-mills, iron-founding and engineering works, quarries and nursery gardens. The markets for live stock and grain are also important.

In 1537 Hawick received from Sir James Douglas of Drumlanrig a charter which was confirmed by the infant Queen Mary in 1545, and remained in force until 1861, when the corporation was reconstituted by act of parliament. Owing to its situation Hawick was often imperilled by Border warfare and marauding freebooters. Sir Robert Umfraville (d. 1436), governor of Berwick, burned it about 1417, and in 1562 the regent Moray had to suppress the lawless with a strong hand. Neither of the Jacobite risings aroused enthusiasm. In 1715 the discontented Highlanders mutinied on the Common, 500 of them abandoning their cause, and in 1745 Prince Charles Edward's cavalry passed southward through the town. In 1514, the year after the battle of Flodden, in which the burghers had suffered severely, a number of young men surprised an English force at Hornshole, a spot on the Teviot 2 m. below the town, routed them and bore away their flag. This event is celebrated every June in the ceremony of "Riding the Common"—in which a facsimile of the captured pennon is carried in procession to the accompaniment of a chorus "Teribus, ye Teri Odin," supposed to be an invocation to Thor and Odin—a survival of Northumbrian paganism. Two of the most eminent' natives of the burgh were Dr Thomas Somerville (1741-1839), the historian, and James Wilson (1803-1866), founder of the Economist newspaper and the first financial member of the council for India.

Minto House, 5 m. N.E. is the seat of the earl of Minto. Denholm, about midway between Hawick and Jedburgh, was the birthplace of John Leyden the poet. The cottage in which Leyden was born is now the property of the Edinburgh Border Counties Association, and is always open to the public. It has the sign of the initials "H.A." and is painted white with green.
European Sparrow-Hawk (Male and Female).

itself, and gliding upon it when it appears to be unwary with a rapid swoop, clutching it in their talons, and bearing it away to eat it in some convenient spot.

Systematic ornithologists differ as to the groups into which the numerous forms known as hawks should be divided. There is at the outset a difference of opinion as to the scientific name which the largest and best known of these groups should bear—some authors terming it *Nisus*, and others, who seem to have the most justice on their side, *Accipiter*. In Europe there are two species—first, *A. nisus*, the common sparrow-hawk, which has a wide distribution from Ireland to Japan, extending also to northern India, Egypt and Algeria, and secondly, *A. brevipes* (by some placed in the group *Microisius* and by others called an *Astur*), which only appears in the south-east and the adjoining parts of Asia Minor and Persia. In North America the place of the former is taken by two very distinct species, a small one, *A. fuscus*, usually known in Canada and the United States as the sharp-shinned hawk, and Stanley's or Cooper's hawk, *A. cooperi* (by some placed in another genus, *Cooperastur*), which is larger and has not so northerly a range. In South America there are four or five more, including *A. tinnus*, before mentioned as the smallest of all, while a species not much larger, *A. minilus*, together with several others of greater size, inhabits South Africa. Madagascar and its neighbouring islands have three or four species sufficiently distinct, and India has *A. badius*. A good many more forms are found in south-eastern Asia, in the Indo-Malay Archipelago, and in Australia three or four species, of which *A. cirrhoccephalus* most nearly represents the sparrow-hawk of Europe and northern Asia, while *A. radiatus* and *A. approximans* show some affinity to the gos-hawks (*Astur*).

\[1\]

Situated but never notched. To these may be added as characters, structurally perhaps of less value, but in other respects quite as important, that the sexes differ very greatly in size, that in most species the irides are yellow, deepening with age into orange or even red, and that the immature plumage is almost invariably more or less striped or mottled with heart-shaped spots beneath, while that of the adults is generally much barred, though the old males have in many instances the breast and belly quite free from markings. Nearly all are of small or moderate size—the largest among them being the gos-hawk (*q.v.*) and its immediate allies, and the male of the smallest, *Accipiter tinus*, is not bigger than a song-thrush. They are all birds of great boldness in attacking a quarry, but if foiled in the first attempts they are apt to leave the pursuit. Thoroughly arboreal in their habits, they seek their prey, chiefly consisting of birds (though reptiles and small mammals are also taken), among trees or bushes, patienty waiting for a victim to shew with which they are often classed. The differences between all the forms above named and the much larger number here unnamed are such as can be only appreciated by the specialist.

The so-called "sparrow-hawks" of New Zealand (*Heteraciens*) does not belong to this group of birds at all, and by many authors has been deemed akin to the falcons. For hawking see *Falconry*.

HAWKE, EDWARD HAWKE, BARON (1705-1783), British admiral, was the only son of Edward Hawke, a barrister. On his mother's side he was the nephew of Colonel Martin Bladen (1680-1746), a politician of some note, and was connected with the family of Fairfæx. Edward Hawke entered the navy on the 20th of February 1720 and served the time required to qualify him to hold a lieutenant's commission on the North American and West Indan stations. Though he passed his examination on the 2nd of July 1725, he was not appointed to a ship to act in that rank till 1729, when he was named third lieutenant of the "Portland" in the Channel. The continuance of peace allowed him no opportunities of distinction, but he was fortunate in obtaining promotion as commander of the "Wolf" sloop in 1733, and as post captain of the "Flamborough" (20) in 1734. While he was thus, with Spain in 1739, he served as lieutenant of the "Portland" (50) in the West Indies. His ship was old and rotten. She nearly drowned her captain and crew, and was broken up after she was paid off in 1742. In the following year Hawke was appointed to the "Berwick" (70), a fine new vessel, and was attached to the Mediterranean fleet then under the command of Thomas Mathews. The "Berwick" was manned badly, and suffered severely from sickness, but in the ill-managed battle of Toulon on the 11th of January 1744 Hawke gained great distinction by the spirit with which he fought his ship. The only prize taken by the British fleet, the Spanish "Poder" (74), surrendered to him, and though she was not kept by the admiral, Hawke was not in any degree to blame for the loss of the only trophy of the fight. His gallantry attracted the attention of the king. There is a story that he was dismissed the service for having left the line to engage the "Poder," and was restored by the king's order. The legend grew not unnaturally out of the confusing series of courts martial which arose out of the battle, but it has no foundation. There is better reason to believe that when at a later period the Admiralty intended to pass over Hawke's name in a promotion of admirals, the king, George II., did insist that he should not be put on the retired list. He had no further chance of making his energy and ability known out of the ranks of his own profession, where they were fully realized, till 1747. In July of that year he attained flag rank, and was named second in command of the Channel fleet. Owing to the ill health of his superior he was sent in command of the fourteen ships detached to intercept a French convoy on its way to the West Indies. On the 14th of October 1747 he fell in with it in the Bay of Biscay. The French force, under M. Deshèbiers de l'Ètendueur, consisted of nine ships, which were, however, on the average larger than Hawke's. He attacked at once. The French admiral sent one of his liniers to escort the merchant ships on their way to the West Indies, and with the other eight fought a very gallant action with the British squadron. Six of the eight French ships were taken. The French admiral did for a time succeed in saving the trading vessels under his charge, but most of them fell into the hands of the British cruisers in the West Indies. Hawke was made a knight of the Bath for this timely piece of service, a reward which cannot be said to have been lavish.

In 1747 Hawke had been elected M.P. for Portsmouth, which he continued to represent for thirty years, though he can seldom have been in his place, and it does not appear that he often spoke. A seat in parliament was always valuable to a naval officer at that time, since it enabled him to be useful to ministers, and increased his chances of obtaining employment. Hawke had a very large family of fifteen children, and in 1770 he was, and was able to meet the expenses entailed by a seat in parliament, which were considerable at a time when votes were openly paid for by money down. In the interval between the war of
the Austrian Succession and the Seven Years' War, Hawke was almost always on active service. From 1748 till 1752 he was in command at home, and he rejoined his flag in 1753 as admiral in command of the Western Squadron. Although war was not declared for some time, England and France were on very hostile terms, and conflicts between the officers of the two powers in America had already taken place. Neither government was scrupulous in abstaining from the use of force while peace was still nominally unbroken. Hawke was sent to sea in 1754, but a restriction was put on the limits within which he might cruise, and he failed to meet the French. The fleet was much weakened by illness. In June 1756 the news of John Byng's retreat from Minorca reached England and aroused the utmost indignation. Hawke was at once sent out to relieve him in the Mediterranean command, and to send him home for trial. He sailed in the 'Antelope,' carrying, as the wits of the day put it, "a cargo of courage" to supply deficiencies in that respect among the officers then in the Mediterranean. Minorca had fallen, from want of resources rather than the attacks of the French, before he could do anything for the assistance of the garrison of Fort St Philip. In winter he was recalled to England, and he reached home on the 14th of January 1757. On the 24th of February following he was promoted full admiral. It is said, but on no very good authority, that he was not on good terms with Pitt (afterwards earl of Chatham), and it is certain that when Pitt's great ministry was formed in June 1757, he was not included in the Board of Admiralty. Yet as he was continued in command of important forces in the Channel, it is obvious that his great capacity was fully recognized. In the late summer of 1757 he was entrusted with the naval side of an expedition to the coast of France. These operations, which were scoffingly described at the time as breaking windows with guineas, were a favourite device of Pitt's for weakening the French and raising the confidence of the country. The expedition of 1757 was directed against Rochefort, and it effected nothing. Hawke, who probably expected very little good from it, did his own work as admiral punctually, but he cannot be said to have shown zeal, or any wish to inspirit the military officers into making greater efforts than they were disposed naturally to make. The expedition returned to Spithead by the 6th of October. No part of the disappointment of the moment was as acute as Hawke's. He did not quit the Channel till the end of 1757 and the beginning of 1758 he continued cruising in the Channel in search of the French naval forces, without any striking success. In May of that year he was ordered to detach a squadron under the command of Howe to carry out further combined operations. Hawke considered himself as treated with a want of due respect, and was at the time in bad humour with the Admiralty. He somewhat pettishly threw up his command, but was induced to resume it by the board, which knew his value, and was not wanting in flattery. He retired in June for a time on the ground of health, but happily for his own glory and the service of the country he was able to hang his flag in May 1759, the "wonderful year" of Garrick's song.

France was then elaborating a scheme of invasion which bears much resemblance to the plan afterwards formed by Napoleon. An army of invasion was collected at the Morbihan in Brittany, and the intention was to transport it under the protection of a powerful fleet which was to be made up by uniting the squadron at Brest with the ships at Toulon. The plan, like Napoleon's, had slight chance of success, since the naval part of the invading force must necessarily be brought together from distant points at the risk of interruption by the British squadrons. The naval forces of England were ample sufficient to provide what was ever needed to upset the plans of the French government. But the country was not so confident in the capacity of the navy to serve as a defence as it was taught to be in later generations. It had been seized by a most shameful panic at the beginning of the war in face of a mere threat of invasion. Therefore the anxiety of Pitt to balance the schemes of the French decisively was great, and the country looked on at the development of the naval campaign with nervous attention. The proposed combination of the French fleet was defeated by the annihilation of the Toulon squadron on the coast of Portugal by Boscawen in May, but the Brest fleet was still untouched and the troops were still at Morbihan. It was the duty of Hawke to prevent attack from this quarter. The manner in which he discharger his task marks an epoch in the history of the navy. Until his time, or very nearly so, it was still believed that there was rashness in keeping the great ships two fleets. Senator Hawke maintained his blockade of Brest till far into November. Long cruises had always entailed much bad health on the crews, but by the care he took to obtain fresh food, and the energy he showed in pressing the Admiralty for stores, he was able to keep his men healthy. Early in November a series of severe gales forced him off the French coast, and he was compelled to anchor in Torbay. His absence was brief, but it allowed the French admiral, M. de Conflans (1690-1777), time to put to sea, and to steer for the Morbihan. Hawke, who had left Torbay on the 11th of November, learnt of the departure of the French at sea on the 17th from the blockline ship, and as the French admiral could have done nothing but steer for the Morbihan, he followed him thither. The news that M. de Conflans had got to sea spread a panic through the country, and for some days Hawke was the object of abuse of the most irrational kind. There was in fact no danger, for behind Hawke's fleet there were ample reserves in the straits of Dover, and in the North Sea. Following his enemy as fast as the bad weather, a mixture of calms and head winds would allow, the admiral sighted the French about 40 m. to the west of Belleisle on the morning of the 20th of November. The British fleet was of twenty-one sail, the French of twenty. There was also a small squadron of British ships engaged in watching the Morbihan as an inshore squadron, which was in danger of being cut off. M. de Conflans had a sufficient force to fight in the open sea without rashness, but after making a motion to give battle, he changed his mind and gave the signal to his fleet to steer for the anchorage at Quiberon. He did not believe that the British admiral would dare to follow him, for the coast is one of the most dangerous in the world, and the wind was blowing hard from the west and rising to a storm. Hawke, however, pursued without hesitation, though it was well on in the afternoon before he caught up the rear of the French fleet, and at last forced them into the bay. The action, which was more a test of seamanship than of gunnery, or capacity to manœuvre in order, ended in the destruction of the French. Five ships only were taken or destroyed, but others ran ashore, and the French navy as a whole lost all confidence. Two British vessels were lost, but the price was little to pay for such a victory. No more fighting remained to be done. The fleet in Quiberon Bay suffered from want of food, and its distress is recorded in the lines:

"Ere Hawke did bang
Monsieur Conflant.
You sent us beef and beer;
Now Monsieur's a beat
We've nought to eat,
Since you have nought to fear."

Hawke returned to England in January 1760 and had no further service at sea. He was not made a peer till the 20th of May 1776, and then only as Baron Hawke of Towton. From 1776 to 1781 he was first lord of the Admiralty. His administration was much criticized, perhaps more from party spirit than because of its real defects. Whatever his relations with Lord Chatham may have been he was no favourite with Chatham's partizans. It is well known that the admiral did not show in the uncongenial life of the shore. As an admiral at sea and on his own element Hawke has had no superior. It is true that he was not put to the test of having to meet opponents of equal strength and efficiency, but then neither has any other British admiral since the Dutch wars of the 17th century. On his death on the 17th of October 1785 his title passed to his son, Martin Bladen (1744-1805), and it is
HAWKER—HAWKESWORTH

still held by his descendants, the 7th Baron (b. 1860) being best known as a great Yorkshire cricketer.

There is a portrait of Hawke in the Painted Hall at Greenwich. His Life by Montagu Burrows (1883) has superceded all other works on the subject, and has been largely used in particular by Sir J. K. Laughton's article in the Dict. Nat. Bioil. (1891).

HAWKER, ROBERT STEPHEN (1803-1874), English antiquary and poet, was born at Stoke Damerel, Devonshire, on the 3rd of December 1803. His father, Jacob Stephen Hawker, was at that time a doctor, but afterwards curate and vicar of Stratton, Cornwall. Robert was sent to Liskeard grammar school, and when he was about sixteen was apprenticed to a solicitor. He was soon removed to Cheltenham grammar school, and in April 1823 matriculated at Pembroke College, Oxford. In the same year he married Charlotte T'Ans, a lady much older than himself. On returning to Oxford he migrated to Magdalen Hall, where he graduated in 1828, having already won the Newdigate prize for poetry in 1827. He became vicar of Morwenstow, a village on the north Cornish coast, in 1834. Hawker described the bulk of his paragraphs as a "mixed multitude of smugglers, wreckers and dissenters of various hues." He was himself a high churchman, and carried things with a high hand in his parish, but was most beloved by his people. He was a man of great originality, and numerous stories of his eccentric conduct are related. He was the original of Mortimer Collins's Canon Tremains in Sweet and Twenty. His first wife died in 1863, and in 1864 he married Pauline Kuczynski, daughter of a Polish exile. He died in Plymouth on the 15th of August 1875. Before his death he was formally received into the Roman Catholic Church, a proceeding which aroused a bitter newspaper controversy. The best of his poems is The Quest of the Sangrael: Chant the First (Exeter, 1864). Among his Cornish Ballads (1869) the most remarkable is "Trelaway," the refrain of which, "And shall Trelaway die," &c., he declares to be the old Cornish saying. See The Vicar of Morwenstow (1875; later and corrected editions, 1876 and 1886), by the Rev. S. Baring-Gould, which was severely criticized by Hawker's friend, W. Maskell, in the Athenaeum (March 26, 1876); Memorials of the late Robert Stephen Hawker (1876), by the late Dr F. G. Lee. These were superseded in 1905 by The Life and Letters of R. S. Hawker, by his son-in-law, C. E. Byles, which contains a bibliography of his works, now very valuable to collectors. See also Boase and Courtney, Bibliotheca Cornubiensis. His Poetical Works (1879) and his Prose Works (1893) were edited by J. G. Godwin. Another edition of his Poetical Works (1899) has an introduction by Alfred Wallis, and a complete edition of his poems by C. E. Byles, with the title Cornish Ballads and other Poems, appeared in 1904.

HAWKERS and PEDLARS, the designation of itinerant dealers who convey their goods from place to place to sell. The word "hawker" seems to have come into English from the Ger. Hôker or Dutch hawker in the early 16th century. In an act of 1533 (25 Henry VIII. c. 9, § 6) we find "Sundry evill devised persons which commonly beeke called haukeres . . . buying and selling of Brasse and Pewter." The earlier word for such an itinerant dealer is "huckster," which is found in 1200, "For that they have turned God's house intill hucksterses bothe." (Ornamentum, 15,517). The base of the two words is the same, and is probably to be referred to German hochau, a hole, corner. It may be noticed that the termination of "huckster" is feminine; though there are a few cases in which women, it was always applied indiscriminately to either sex.

"Pedlar" occurs much earlier than the verbal form "to peddle," which is therefore a derivative from the substantive. The origin is to be found in the still older word "pedder," one who carries about goods for sale in a "ped," a basket or hamper. This is now only used dialectically and in Scotland. In the A strengthened (c. 1252), peedard is found with the meaning of "pedlar," though the Promptorium parvorum (c. 1440) defines it as calulaistes, i.e. a maker of panniers or baskets.

The French term for a hawker or pedlar of books, colporteur (col, neck, porter, to carry), has been adopted by the Bible Society and other English religious bodies as a name for itinerant vendors and distributors of Bibles and other religious literature.

The occupation of hawkers and peddlars has been regulated in the United Kingdom, and the two classes have also been technically distinguished. The Pedlars Act 1871 defines a pedlar as "any hawker, pedlar, petty chapman, tiercer of metals, mender of chairs, or other person who, without any horse or other beast bearing or drawing burden, trades and travels on foot and goes from town to town or to other men's houses, carrying to sell or hire for sale any parcel or parcels of merchandise, . . . offering for sale his skill in handicraft." Any person who acts as a pedlar must have a certificate, which is to be obtained from the chief constable of the county in which he is to trade. For the certificate has resided during one month previous to his application. He must satisfy the officer that he is above seventeen years of age, is of good character, and in good faith intends to carry on the trade of a pedlar. The fee for a pedlar's certificate is five shillings, and the certificate remains in force for a year from the date of issue. The act requires a register of certificates to be kept in each district, and imposes a penalty for the assigning, borrowing or forging of any certificate. It does not exempt any one from vagrant law, and requires the pedlar to show his certificate on demand to certain persons. It empowers the police to inspect a pedlar's certificate, and provides for the arrest of the pedlar or one refusing to show his certificate. A pedlar's certificate is not required by commercial travellers, sellers of vegetables, fish, fruit or victuals, or sellers in fairs. The Hawkers Act 1888 defines a hawker as "any one who travels with a horse or other beast of burden, selling goods," &c. An excise licence (expiring on the 31st of March in each year) must be taken out by every hawker in the United Kingdom. There exists an annual inspection of hawkers. A hawker's licence is not granted, otherwise than by way of licence, except on production of a certificate signed by a clergyman and two persons of the parish the hawker is in, stating that the licence is not required, or that the hawker has it for police purposes only, or by a justice of the county or place, or a superintendent or inspector of police for the district, attesting that the person is of good character and a proper person to be licenced as a hawker. There are certain exemptions from taking out a licence—commercial travellers, sellers of fish, coal, &c., sellers in fairs, and the real worker or maker of any goods. The act also lays down certain provisions to be observed by hawkers and others, and imposes penalties for infringements. In the United States hawkers and peddlars may take out licences under State laws and Federal laws.

HAWKESWORTH, JOHN (c. 1715-1773), English miscellaneous writer, was born in London about 1715. He is said to have been clerk to an attorney, and was certainly self-educated. In 1744 he succeeded Samuel Johnson as compiler of the parliamentary debates in the Gentleman's Magazine. In December 1749 he contributed poems signed Greville, or H. Greville, to that journal. In company with Johnson and others he started a periodical called The Adventurer, which ran to 140 numbers, of which 70 were from the pen of Hawkesworth himself. On account of what was regarded as its powerful defence of morality and religion, Hawkesworth was rewarded by the archbishop of Canterbury with the degree of L.L.D. In 1754-1755 he published an edition (12 vols.) of Swift's works, with a life prefixed which Johnson praised in his Lives of the Poets. A larger edition (27 vols.), appeared in 1766-1779. He adapted, Dryden's Amphiiron for the Drury Lane stage in 1756, and Southern's Oronooko in 1759. He wrote the libretto of an oratorio Zimri in 1760, and the next year Edgar and Emmeline; a Fairy Tale, was produced at Drury Lane. His Almonar and Hamet (2 vols., 1761) was first of all drafted as a play, and a tragedy founded on it by S. J. Pratt, The Fair Circassian (1781), met with some success. He was commissioned by the admiralty to edit Captain Haddock's papers relative to his first voyage. For this work, An Account of the Voyage and Landing of Captain Haddock in the Southern Hemisphere and performed by Commodore Byron, Captain Wallis, Captain Carteret and Captain Cook (from 1764 to 1771) drawn up from the Journals . . . (3 vols., 1773), Hawkesworth is said to have received from the publishers the sum of £6000. His descriptions of the manners and customs of the South Seas were, however, regarded by many critics as inexact and hurtful to the interests of morality, and the severity of their strictures is said to have hastened his death, which took place on the 16th of November 1773. He was buried...
at Bromley, Kent, where he and his wife had kept a school. Hawkesworth was a close imitator of Johnson both in style and thought, and was at one time on very friendly terms with him. It is said that he presumed on his success, and lost Johnson’s friendship as early as 1756.

HAWKURST, a town in the southern parliamentary division of Kent, England, 47 m. S.E. of London, on a branch of the South-Eastern & Chatham railway. Pop. (1901), 3,156. It lies mainly on a ridge above the valley of the Kent Ditch, a tributary of the River. The surrounding country is hilly, rich and well wooded, and the pleasant and healthy situation has led to the considerable extension of the old village as a residential locality. The Kent Sanatorium and one of the Barnardo homes are established here. The church of St Lawrence, founded from Battle Abbey in Sussex, is Decorated and Perpendicular and its east window, of the earlier period, is specially beautiful.

HAWKINS, CAESAR HENRY (1756–1884), British surgeon, son of the Rev. E. Hawkins and grandson of the Sir Caesar Hawkins (1711-1786), who was surgeon to Kings George II and George III, was served as lieutenant-colonel, Edward Penson, on the 10th of September 1708, was educated at Christ’s Hospital, and entered St George’s Hospital, London, in 1818. He was surgeon to the hospital from 1820 to 1861, and in 1862 was made surgeon-to-Queen Victoria. He was president of the College of Surgeons in 1872, and again in 1881; and he delivered the Hunterian oration in 1849. His success in complex surgical cases gave him a great reputation. For long he was noted as the only surgeon who had succeeded in the operation of ovariotomy in a London hospital. This occurred in 1846, when anaesthetics were unknown. He did much to popularize colotomy. A successful operator, he nevertheless was attached to the observatory, and was always more anxious to teach his pupils how to save a limb than how to remove it. He reprinted his contributions to the medical journals in two volumes, 1874, the more valuable papers being on Tumours, Excision of the Ovarian, Hydrophobia and Snake-bites, Stricture of the Colon, and The Relative Claims of Sir Charles Bell and Magendie to the Discovery of the Functions of the Spinal Nerves. He died on the 20th of July 1884. His brother, Edward Hawkins (1789–1882), was the well-known provost of Oriel, Oxford, who played so great a part in the Tractarian movement.

HAWKINS, or HAWKINS, SIR JOHN (1532–1595), British admiral, was born at Plymouth in 1532, and belonged to a family of Devonshire shipowners and skippers—occupations then more closely connected than is now usual. His father, William Hawkins (d. 1553), was a prosperous freeman of Plymouth, who throve represented that town in parliament, and is described by Hakluyt as one of the principal sea-captains in the west parts of England; his elder brother, also called William (d. 1586), was closely associated with him in his Spanish expeditions, and took an active part in fitting out ships to meet the Armada; and his nephew, the eldest son of the last named and of the same name, sailed with Sir Francis Drake to the South Sea (1577), and with the Earl of Cumberland (q.v.) in the expedition which started for the East Indies and China in 1582. His son, Sir Richard Hawkins, is separately noticed.

Sir John Hawkins was bred to the sea in the ships of his family. When the great epoch of Elizabethan maritime adventure began, he took an active part by sailing to the Guinea coast, where he robbed the Portuguese slaves, and then smuggled the negroes he had captured into the Spanish possessions in the New World. After a first successful voyage in 1562–1563, two vessels which he had rashly sent to Seville were confiscated by the Spanish government. With the help of friends, and the open approval of the queen, who hired one of her vessels to him, he sailed again in 1564, and repeated his voyage with success, trading with the Creoles by force when the officials of the king endeavoured to prevent him. These two voyages brought him reputation, and he was granted a coat of arms with a demi-Moor, or negro, chained, as his crest. The rivalry with Spain was now becoming very acute, and when Hawkins sailed for the third time in 1567, he went in fact, though not technically, on a national venture. Again he kidnapped negroes, and forced his goods on the Spanish colonies. Encouraged by his discovery that these settlements were small and unfortified, he on this occasion ventured to enter Vera Cruz, the port of Mexico, after capturing some Spaniards at sea to be held as hostages. He alleged that he had been driven in by bad weather. The falsity of the story was glaring, but the Spanish officers on the spot were too weak to offer resistance. Hawkins was allowed to enter the harbour, and to rest at the small rocky island of San Juan de Ulloa by which it is formed. Unfortunately for him, and for a French corsair whom he had in his company, a strong Spanish force arrived, bringing the new viceroy. The Spaniards, who were no more scrupulous of the truth than himself, pretended to accept the arrangement made before their arrival, and then when they thought he was off his guard attacked him on the 24th of September. Only two vessels escaped, his own, the "Minion," and the "Judith," a small vessel belonging to his cousin Francis Drake. The voyage home was miserable, and the vessel was driven on to the Spanish coast.

For some years Hawkins did not return to the sea, though he continued to be interested in privateering voyages as a capitalist. In the course of 1572 he recovered part of his loss by pretending to betray the queen for a bribe to Spain. He acted with the knowledge of Lord Burleigh. In 1573 he became treasurer of the navy in succession to his father-in-law Benjamin Gonson. The office of comptroller was conferred on him soon after, and for the rest of his life he remained the principal administrative officer of the navy. Burleigh noticed that he was suspected of fraud in his office, but the queen’s ships were kept by him in good condition. In 1588 he served as rear-admiral against the Spanish Armada and was knighted. In 1590 he was sent to the coast of Portugal to intercept the Spanish treasure fleet, but did not meet it. In giving an account of his failure to the queen he quoted the text "Paul doth plant, Apollo doth water, but God giveth the increase," which exhibition of piety is said to have provoked the queen into exclaiming, "God’s death! This fool went out a soldier, and has come home a divine." In 1593 he accompanied Drake on another treasure-hunting voyage to the West Indies, which was even less successful, and he died at sea off Porto Rico on the 12th of November 1595.

Hawkins was buried in St Margaret’s church, Southwark, and then to Margaret Vaughan. He was counted a puritan when puritanism meant little beyond hatred of Spain and popery, and when these principles were an ever-ready excuse for voyages in search of slaves and plunder. In the course of one of his voyages, when he was becalmed and his negroes were dying, he consoled himself by the reflection that God would not suffer his Elect to perish. Contemporary evidence can be produced to show that he was greedy, unscrupulous and rude. But if he had been a more delicate man he would not have risked the galloway by making piratical attacks on the Portuguese and by appearing in the West Indies as an armed smuggler; and in that case he would not have played an important part in history by setting the example of breaking down the pretension of the Spaniards to exclude all comers from the New World. His morality was that of the average stirring man of his time, whether in England or elsewhere.

See R. A. J. Walling, A Sea-dog of Devon (1907); and Southey in his British Admirals, vol. iii. The original accounts of his voyages compiled by Hakluyt have been reprinted by the Hakluyt Society, with preface by Sir C. R. Hakluyt.

HAWKINS, SIR JOHN (1745–1889), English writer on music, was born on the 24th of March 1745, in London, the son of an architect who destined him for his own profession. Ultimately, however, Hawkins took to the law, devoting his leisure hours to his favourite study of music. A wealthy marriage in 1753 enabled him to indulge his passion for acquiring rare works of music, and he bought, for example, the collection formed by Dr Pepusch, and subsequently presented by Hawkins to the British Museum. It was on such materials that Hawkins
HAWKSHAW, Sir R.—HAWKSHAW

founded his celebrated work on the General History of the Science and Practice of Music, in 5 vols. (republished in 2 vols., 1876). It was brought out in 1776, the same year which witnessed the appearance of the first volume of Burney's work on the same subject. The relative merits of the two works were eagerly discussed by contemporary critics. Burney no doubt is infinitely superior as a literary man, and his work accordingly comes much nearer the ideal of modern musical treatises than Hawkshaw's, which is essentially a collection of rare and valuable pieces of music with a more or less continuous commentary. But by rescuing these from oblivion Hawkshaw has given a permanent value to his work. Of Hawkshaw's literary efforts apart from music it will be sufficient to mention his occasional contributions to the Gentleman's Magazine, his edition (1760) of the Complete Angler (1787) and his biography of Dr Johnson, with whom he was intimately acquainted. He was one of the original members of the Ivy Lane Club, and ultimately became one of Dr Johnson's executors. If there were any doubt as to his intimacy with Johnson, it would be settled by the slighting way in which Boswell refers to him. Speaking of the Ivy Lane Club, he mentions amongst the members "Mr John Hawkins, an attorney," and adds the following footnote, which at the same time may serve as a summary of the remaining facts of Hawkshaw's life: "He was for several years chairman of the Middlesex justices, and upon presenting an address to the king accepted the usual offer of knighthood (1773). He is the author of a History of Music in five volumes in quarto. By assiduous attendance upon Johnson in his last illness he obtained the office of one of his executors—in consequence of which the booksellers of London employed him to publish an edition of Dr Johnson's works and to write his life." Sir John Hawkins died on the 21st of May 1789, and was buried in the cloisters of Westminster Abbey.

HAWKINS, or HAWKNS, Sir Richard (c. 1562-1622), British seaman, was the only son of Admiral Sir John Hawkins (q.v.) by his first marriage. He was from his earliest days familiar with ships and the sea, and in 1582 he accompanied his uncle, William Hawkins, to the West Indies. In 1588 he was captain of a galliot in Drake's expedition to the Spanish Main, and in 1588 he commanded a queen's ship against the Armada, and in 1590 served with his father's expedition to the coast of Portugal. In 1593 he purchased the "Dainty," a ship originally built for his father and used by him in his expeditions, and sailed for the West Indies, the Spanish main and the South Seas. It seems clear that his project was to prey on the overseas possessions of the Spanish in the West Indies. However, in an account of the voyage written thirty years afterwards, maintained, and by time perhaps had really persuaded himself, that his voyage was undertaken purely for the purpose of geographical discovery. After visiting the coast of Brazil, the "Dainty" passed through the Straits of Magellan, and in due course reached Valparaiso. Having plundered the town, Hawkins pushed north, and in June 1594, a year after leaving Plymouth, arrived in the bay of San Mateo. Here the "Dainty" was attacked by two Spanish ships. Hawkins was hopelessly outmatched, but defended himself with great courage. At last when himself and severely wounded, many of his men killed, and the "Dainty" was nearly sinking, he surrendered on the promise of a safe-conduct out of the country for himself and his crew. Through no fault of the Spanish commander this promise was not kept. In 1595 Hawkins was sent to Spain, and imprisoned first at Seville and subsequently at Madrid. He was released in 1602, and, returning to England, was knighted in 1603. In 1604 he became member of parliament for Plymouth and vice-admiral of Devon, a post which he held until his recall by central authority in 1611. In 1620-1621 he was vice-admiral, under Sir Robert Mansell, of the fleet sent into the Mediterranean to reduce the Algerian corsairs. He died in London on the 17th of April 1622.

See his Observations in his Voyage into the South Sea (1622), re-published by the Hakluyt Society.

HAWKS, Francis Lister (1798-1866), American clergyman, was born at Newbern, North Carolina, on the 10th of June 1798, and graduated at the university of his native state in 1815. After practising law with some distinction he entered the Episcopalian ministry in 1827 and proved a brilliant and impressive preacher, holding livings in New Haven, Philadelphia, New York and New Orleans, and declining several bishoprics. On his appointment as historiographer of his church in 1835, he went to England, and collected the abundant materials the work of his Contributions to the Ecclesiastical History of U.S.A. (New York, 1836-1839). These two volumes dealt with Maryland and Virginia, while two later ones (1863-1864) were devoted to Connecticut. He was the first president of the university of Louisiana (now merged in Tulane). He died in New York on the 26th of September 1866.

HAWKSHAW, Sir John (1811-1891), English engineer, was born in Yorkshire in 1811, and was educated at Leeds grammar school. Before he was twenty-one he had been engaged for six or seven years in railway engineering and the construction of roads in his native county, and in the year of his majority he obtained an appointment as engineer to the Bolivarian Mining Association in Venezuela. But the climate there was more to his health could stand, and in 1834 he was obliged to return to England. He soon obtained employment under Jesse Hartley at the Liverpool docks, and subsequently was made engineer in charge of the railway and navigation works of the Manchester, Bury and Bolton Canal Company. In 1835 he became chief engineer to the Manchester & Leeds railway, and in 1837 to its successor, the Lancashire & Yorkshire railway, for which he constructed a large number of branch lines. In 1850 he removed to London and began to practise as a consulting engineer, at first alone, but subsequently in partnership with Harrison Hayter. In that capacity his work was of an extremely varied nature, embracing almost every branch of engineering. He retained his connexion with the Lancashire & Yorkshire Company until his retirement from professional work in 1888, and was consulted on all the important engineering points that affected it in that long period. In London he was responsible for the Charing Cross and Cannon Street railways, together with the two bridges which carried them over the Thames; he was engineer of the East London railway, which passes under the Thames through Sir M. C. Brunel's well-known tunnel; and jointly with Sir J. Wolfe Barry he constructed the section of the Underground railway which completed the "inner circle" between the Aldgate and Mansion House stations. In addition, many railway works claimed his attention in all parts of the world—Germany, Russia, India, Mauritius, &c. One noteworthy point in his career was the connexion with the formation of the Compagnie des M. de Lesseps, of steeper gradients than had previously been thought desirable or possible, and so far back as 1838 he expressed decided disapproval of the maintenance of the broad gauge on the Great Western, because of the troubles he foresaw it would lead to in connection with future railway extension, and because he objected in general to breaks of gauge in the lines of a country. The construction of canals was another branch of engineering in which he was actively engaged. In 1862 he became engineer of the Amsterdam ship-canal, and in the succeeding year he may fairly be said to have been the pioneer of the Suez Canal. About that time the scheme was in very bad odour, and the khebde determined to get the opinion of an English engineer as to its practicability, having made up his mind to stop the works if that opinion was unfavourable. Hawkshaw was chosen to make the inquiry, and it was because his report was entirely favourable that M. de Lesseps was able to say at the opening ceremony that to him he owed the canal. As a member of the International Congress which considered the construction of an interoceanic canal across Central America, he thought it desirable to encourage a branch of such work between Panama and the Caribbean, and privately he regarded the Panama scheme as impracticable at a reasonable cost, although publicly he expressed no opinion on the matter and left the Congress without voting. Sir John Hawkshaw also had a wide experience in constructing harbours (e.g. Holyhead) and docks (e.g. Penarth, the Albert Dock at Hull, and the south dock of the East and West Docks in London), in river-engineering, in drainage and sewerage.
in water-supply, &c. He was engineer, with Sir James Brunlees, of the original Channel Tunnel Company from 1872, but many years previously he had investigated for himself the question of a tunnel under the Strait of Dover from an engineering point of view, and had come to a belief in its feasibility, so far as that could be determined from borings and surveys. Subsequently, however, he became convinced that the tunnel would not be to the advantage of Great Britain, and thereafter would have nothing to do with the project. He was also engineer of the Severn Tunnel, which, from its magnitude and the difficulties encountered in its construction, must rank as one of the most notable engineering undertakings of the 19th century. He died in London on the 2nd of June 1891.

HAWKSMOOR, NICHOLAS (1661–1730), English architect, of Nottinghamshire birth, became a pupil of Sir Christopher Wren at the age of eighteen, and his name is intimately associated with those of Wren and Sir J. Vanbrugh in the English architectural history of his time. He was designed for Wren's assistant, and he worked under him in the design and construction of a number of buildings in London and other places, and in 1657 he was called in, together with G. P. Bidder and Sir J. Bazalgette, to report on the best solution of the vexed question of a main-drainage scheme for London. In 1672 he was president of the Institution of Civil Engineers—an office in which his son Charles followed him in 1901. He died in London on the 23rd of September 1893.

HAWKSMOOR, SIR JOHN (c. 1694), an English adventurer who attained great wealth and renown as a condottiere in the Italian wars of the 14th century. His name is variously spelt as Haccoude, Aucud, Aguto, &c., by contemporaries. It is said that he was the son of a tanner of Hedingham Sibb in Essex, and was apprenticed in London, whence he went, in the English service of Edward III., into France in 1350. It is said also that he obtained the favour of the Black Prince, and received knighthood from King Edward III., but though it is certain that he was of knightly rank, there is no evidence as to the time or place at which he won it. On the peace of Bretigny in 1360, he collected a band of men-at-arms, and moved southward to Italy, where we find the White Company, as his men were called, assisting the marquis of Monferrato against Milan in 1362–63, and the Pisans against Florence in 1364. After several campaigns in various parts of central Italy, Hawkhurst in 1368 entered the service of Bernabo Visconti. In 1369 he fought for Perugia against the pope, and in 1370 for the Visconti against Pisa, Florence and other enemies. In 1372 he defeated the marquis of Monferrato, but soon afterwards, resenting the interference of a council of war with his plans, Hawkhurst resigned, and the White Company soon after left the service, in which he fought against the Viscontis 1372–1375. In 1375 the Florentines entered into an agreement with him, by which they were to pay him and his companion 150,000 gold florins in three months on condition that he undertook no engagement against them; and in the same year the priors of the arts and the gonfalonier decided to give him a pension of 1200 florins per annum for as long as he should remain in Italy. In 1377, under the orders of the cardinal Robert of Geneva, legate of Bologna, he massacred the inhabitants of Cesena, but in May of the same year, disliking the executioner's work upon him and the large payment of his services, he joined the anti-papal league, and married, at Milan, Donnina, an illegitimate daughter of Bernabo Visconti. In 1378 and 1379 Hawkhurst was constantly in the field; he quarrelled with Bernabo in 1378, and entered the service of Florence, receiving, as in 1375, 130,000 gold florins. He rendered good service to the republic up to 1382, when for a time he was one of the English ambassadors at the papal court. He engaged in a brief campaign in Naples in 1385, fought for the marquis of Padua against Verona in 1386, and in 1385 made an unsuccessful effort against Gian Galeazzo Visconti, who had murdered Bernabo. In 1396 the Florentines took up the war against Gian Galeazzo, and appointed Hawkhurst commander-in-chief. His campaign against the Milanese army in the Veronese and the Bergamasco was reckoned a triumph of generalship, and in 1392 Florence exacted a satisfactory peace from Gian Galeazzo. His latter years were spent in a villa in the neighbourhood of Florence. On his death in 1394 the republic gave him a public funeral of great magnificence, and decreed the erection of a marble monument in the cathedral. This, however, was never executed; but Paolo Ucelli painted his portrait in terre-verte on the inner façade of the building, where it still remains, though damaged by removal of the plaster to canvas. Richard II. of England, probably through the instigation of Hawkhurst's sons and daughters, and of the latter the youngest married John Shelley, an ancestor of the poet.

HAWLEY, HENRY (c. 1679–1759), British lieut.-general, entered the army, it is said, in 1694. He saw service in the War of Spanish Succession as a captain of Erle's (the 19th) foot. After Almanza he returned to England, and a year later had the lieutenancy of Hawkhurst's son, and in 1704 he was appointed Hawkhurst's successor. With this regiment he served at Sherrifmuir in 1715, where he was wounded. After this for some years he served in the United Kingdom, obtaining promotion in the usual course, and in 1739 he arrived at the grade of major general. Four years later he accompanied George II.
HAWLEY, J. R.—HAWTHORN

and Stair to Germany, and, as a general officer of cavalry under Sir John Cope, was present at Dettingen. Becoming lieu.-general somewhat later, he was second-in-command of the cavalry at Fontenoy, and on the 20th of December 1745 bore command in the hill or thick wood of St. John’s, where later Hawley suffered a severe defeat at Falkirk at the hands of the Highland insurgents. This, however, did not cost him his command, for the duke of Cumberland, who was soon afterwards sent north, was captain-general. Under Cumberland’s orders Hawley led the cavalry in the campaign of Culloden, and at that battle his dragoons distinguished themselves by their ruthless butchery of the fugitive rebels. After the end of the “Forty-Five” he accompanied Cumberland to the Low Countries and led the allied cavalry at Laufeld (Val). He ended his career as governor of Portsmouth and died at that place in 1759. James Wolfe, his brigade-major, wrote of General Hawley in no flattering terms: “The troops dread his severity, hate the man and hold his military knowledge in contempt,” he wrote. But, whether it be true or false that he was the natural son of George II., Hawley was always treated with the greatest favour by that king and by his son the duke of Cumberland.

HAWLEY, JOSEPH ROSWELL (1826–1905), American political leader, was born on the 31st of October at Stewartville, Richmond county, North Carolina, where his father, a native of Connecticut, was pastor of a Baptist church. The father returned to Connecticut in 1837 and the son graduated at Hamilton College (Clinton, N.Y.) in 1847. He was admitted to the bar in 1850, and practised at Hartford, Conn., for six years. An ardent opponent of slavery, he became a Free Soiler, was a delegate to the National Convention which nominated John P. Hale for the presidency in 1852, and subsequently served as chairman of the State Committee, having at the same time editorial control of the Charter Oak, the party organ. In 1856 he took a leading part in organizing the Republican party in Connecticut, and in 1857 became editor of the Hartford Evening Press, a newly established Republican newspaper. He served in the Federal army throughout the Civil War, rising from the rank of captain (April 22, 1861) to that of brigadier-general of volunteers (Sept. 1864); took part in the Port Royal Expedition, in the capture of Fort Pulaski (April 1862), in the siege of Charleston and the capture of Fort Wagner (Sept. 1863), in the battle of Olustee (Feb. 20, 1864), in the siege operations about Petersburg, and in General Grant’s campaign in the Carolinas; and in September 1865 received the brevet of major-general of volunteers. From April 1866 to April 1867 he was governor of Connecticut, and in 1867 he bought the Hartford Courant, with which he combined the press, and which became under his editorship the most influential newspaper in Connecticut and one of the leading Republican papers in the country. He was the permanent chairman of the Republican National Convention in 1868, was a delegate to the conventions of 1872, 1876 and 1880, was a member of Congress from December 1872 until March 1875 and again in 1879–1881, and was a United States senator from 1881 until the 3rd of March 1905, being one of the Republican leaders both in the House and the Senate. From 1873 to 1876 he was president of the United States Centennial Commission, the great success of the Centennial Exhibition being largely due to him. He died at Washington, D.C., on the 17th of March 1905.

HAWORTH, an urban district in the Keighley parliamentary division of the West Riding of Yorkshire, England, 10 m. N.W. of Bradford, on a branch of the Midland railway. Pop. (1901), 7,492. It is picturesquely situated on a steep slope, lying high, and surrounded by moorland. The Rev. Patrick Brontë (d.1861) was incumbent here for forty-one years, and a memorial near the west window of St. Michael’s church bears his name and the names of his gifted daughters upon it. The grave of Charlotte and Emily Brontë is also marked by a brass. In 1895 a museum was opened by the Brontë society. There is a large worsted industry.

HAWESER (in sense and form as if from "hawse," which, from the 16th-century form hāse, is derived from Teutonic \(hāse\), neck, of which there is a Scandinavian use in the sense of the forepart of a ship; the two words are not etymologically connected; “hawser” is from an O. Fr. hauiser, hauisser, to raise, tow, hoist, from the Late Lat. altiare, to lift, altus, high), is called from slavery, called from butchery, Hawley the the Scotland. 14 is slavery, called from butchery Hawley the the terms. of Connecticut, senator of the 1868, the leader, of the Charter Oak, the party organ. In 1856 he took a leading part in organizing the Republican party in Connecticut, and in 1857 became editor of the Hartford Evening Press, a newly established Republican newspaper. He served in the Federal army throughout the Civil War, rising from the rank of captain (April 22, 1861) to that of brigadier-general of volunteers (Sept. 1864); took part in the Port Royal Expedition, in the capture of Fort Pulaski (April 1862), in the siege of Charleston and the capture of Fort Wagner (Sept. 1863), in the battle of Olustee (Feb. 20, 1864), in the siege operations about Petersburg, and in General Grant’s campaign in the Carolinas; and in September 1865 received the brevet of major-general of volunteers. From April 1866 to April 1867 he was governor of Connecticut, and in 1867 he bought the Hartford Courant, with which he combined the press, and which became under his editorship the most influential newspaper in Connecticut and one of the leading Republican papers in the country. He was the permanent chairman of the Republican National Convention in 1868, was a delegate to the conventions of 1872, 1876 and 1880, was a member of Congress from December 1872 until March 1875 and again in 1879–1881, and was a United States senator from 1881 until the 3rd of March 1905, being one of the Republican leaders both in the House and the Senate. From 1873 to 1876 he was president of the United States Centennial Commission, the great success of the Centennial Exhibition being largely due to him. He died at Washington, D.C., on the 17th of March 1905.

HAWTHORN (O. Eng. haga-, hag-, or hege-thorn, i.e. "hedge-thorn"), the common name for Crataegus, in botany, a genus of shrubs or small trees belonging to the natural order Rosaceae, native of the north temperate regions, especially America. It is sometimes used in the British Isles by the hawthorn, white-thorn or may (Gen. Hagelorn and Christorn; Fr. subêpine, C. Oxycouathia, a small, round-headed, much-branched tree, to 20 ft. high, the branches often ending in single sharp spines. The leaves, which are deeply cut, are 1 to 2 in. long and very variable in shape. The flowers are sweet-scented, in flat-topped clusters, and 3/4 to 1 in. in diameter, with five spreading white petals alternating with five persistent green sepals, a large number of stamens with pinkish-brown anthers, and one to three carpels sunk in the cup-shaped floral axis. The fruit, or haw, is in the apple, consisting of the calyx floral axis, which is usually scarlet, and forms a dewy envelope surrounding the hard stone.

The common hawthorn is a native of Europe as far north as 60° in Sweden, and of North Africa, western Asia and Siberia, and has been naturalized in North America and Australia. It thrives best in dry soils, and in height varies from 4 or 5 to 12, 15 or, in exceptional cases, as much as between 20 and 30 ft. It may be propagated from seed or from cuttings. The seeds must be from ripe fruit, and if fresh gathered should be freed from pulp by maceration in water. They germinate only in the second year after sowing; in the course of their first year the seedlings attain a height of 6 to 12 in. Hawthorn has been for many centuries a favourite park and hedge plant in Europe, and numerous varieties have been developed by cultivation; these differ in the form of the leaf, the white, pink or red, single or double flowers, and the yellow, orange or red fruit. In England the hawthorn, owing to its hardiness and closeness of growth, has been employed for enclosure of land since the Roman occupation, but for ordinary field hedges it is believed it was generally in use till about the end of the 15th century. James I. of Scotland, in his Queir, li. 14 (early 15th century), mentions the “hawthorn hedges knot” of Windsor Castle. The first hawthorn hedges in Scotland are said to have been planted by soldiers of Cromwell at Inch Buckling Brae in East Lothian and Fianlarig in Perthshire. Annual pruning, to which the hawthorn is particularly amenable, is necessary if the hedge is to maintain its compactness and sturdiness. When the lower part shows a tendency to go bare the strong stems may be “plashed,” i.e. split, bent over and pegged to the ground so that new growths may start. The wood of the hawthorn is white in colour, with
HAWTHORNE, NATHANIEL

a yellowish tinge. Fresh cut it weighs 68 lb 12 oz. per cubic foot, and dry 57 lb 3 oz. It can seldom be obtained in large portions, and has the disadvantage of being apt to warp; its great hardness, however, renders it valuable for the manufacture of various articles, such as the cogs of mill-wheels, flails and mallets, and handles of hammers. Both green and dry it forms excellent fuel. The bark possesses tanning properties, and in Scotland in past times yielded with ferrous sulphate a black dye for wool.

The leaves are eaten by cattle, and have been employed as a substitute for tea. Birds and deer feed upon the haws, which are used in the preparation of a fermented and highly intoxicating liquor. The hawthorn serves as a stock for grafting other trees. As an ornamental feature in landscapes, it is worthy of notice; and the pleasing shelter it affords to the beauty of its blossoms have frequently been alluded to by poets. The custom of employing the flowering branches for decorative purposes on the 1st of May is of very early origin; but since the alteration in the calendar the tree has rarely been in full bloom in England before the second week of that month. In the Scottish Highlands the flowers may be seen as late as the middle of June. The hawthorn has been regarded as the emblem of hope, and its branches are stated to have been carried by the ancient Greeks in wedding processions, and to have been used by them to deck the altar of Hymen. The supposition that the tree was the source of Christ's crown of thorns grew out of the supposed relation between the tradition current among the French peasantry that it utters groans and cries on Good Friday, and probably also to the old popular superstition in Great Britain and Ireland that ill-luck attended the uprooting of hawthorns. Branches of the Glastonbury thorn, C. Oxycantha, var. procoxa, which flowers both in December and in spring, were formerly highly valued in England, on account of the legend that the tree was originally the staff of Joseph of Arimathea. The number of species in the genus is from fifty to seventy, according to the view taken as to whether or not some of the forms which have hitherto been considered to represent distinct species C. coccinea, a native of Canada and the eastern United States, with bright scarlet fruits, was introduced into English gardens towards the end of the 17th century. C. Crus-Galli, with a somewhat similar distribution and introduced about the same time, is a very decorative species with showy, bright red fruit, often remaining on the branches till spring, and leaves assuming a brilliant scarlet and orange in the autumn; numerous varieties are in cultivation. C. Pyracantha, known in gardens as pyracantha, is evergreen and has white flowers, appearing in May, and fine scarlet fruits of the size of a pea which remain on the tree nearly all the winter. It is a native of south Europe and was introduced to Britain early in the 17th century.

HAWTHORNE, NATHANIEL (1804-1864), American writer, son of Nathaniel Hawthorne (1776-1808), was born at Salem, Massachusetts, on the 4th of July 1804. The head of the American branch of the family, William Hathorne of Wilton, Wiltshire, England, emigrated with Winthrop and his company, and arrived at Salem Bay, Mass., on the 12th of June 1630. He had grants of land at Dorchester, where he resided for upwards of six years, when he was persuaded to remove to Salem by the tender of further grants of land there, it being considered a public benefit that he should become an inhabitant of that town. He represented his fellow-townsmen in the legislature, and served them in a military capacity as a captain in the first regular troop organized in Salem, which he led to victory through an Indian campaign in Maine. Originally a determined "Separatist," and opposed to compulsion for conscience, he signalized himself when a magistrate by the active part which he took in the Quaker persecutions of the time (1657-1662), going so far on one occasion as to order the whipping of Anne Coleman and four other Friends through Salem, Boston and Dedham. He died, an old man, in the year of sanctity, and left a good property to his son John, who inherited his father's capacity and intolerance, and was at turn a magistrate, a registrar, a soldier and a bitter persecutor of witches. Before the death of Justice Hathorne in 1717, the destiny of the family suffered a sea-change, and they began to be noted as mariners. One of these seafaring Hathornes figured in the Revolution as a privateer, who had the good fortune to escape from a British prison-ship; and another, Captain Daniel Hathorne, has left his mark on early American ballad-lore. He too was a privateer, commander of the brig "Fair American," which, cruising off the coast of Portugal, fell in with a British scow laden with troops for General Howe, which scow the bold Hathorne and his valiant crew at once engaged and fought for over an hour, until the vanquished enemy was glad to cut the Yankee grapplings and quickly bear away. The last of the Hathornes with whom we are concerned was a son of this sturdy old privateer, Nathaniel Hathorne. He was born in 1776, and about the beginning of the 19th century married Miss Sebago Clarke of the old noble family, daughter of Richard Manning of Salem, whose ancestors emigrated to America about sixty years after the arrival of William Hathorne. Young Nathaniel took his hereditary place before the mast, passed from the forecastle to the cabin, made voyages to the East and West Indies, Brazil and Africa, and finally died of fever at Surinam, in the spring of 1808. He was the father of three children, the second of whom was the subject of this article. The form of the family name was changed by the latter to "Hawthorne" in his early manhood.

After the death of his husband Mrs Hawthorne removed to the house in which her father with his little family of children. Of the boyhood of Nathaniel no particulars have reached us, except that he was fond of taking long walks alone, and that he used to declare to his mother that he would go to sea some time and would never return. Among the books that he is known to have read as a child were Shakespeare, Milton, Pope and Thomson, The Castle of Indolence being an especial favourite. In the autumn of 1818 his mother removed to Raymond, a town in Cumberland county, Maine, where his uncle, Richard Manning, had built a large and ambitious dwelling. Here the lad resumed his solitary walks, exchanging the narrow streets of Salem for the broad fields, primeval wilderness, and its sluggish harbour for the fresh bright waters of Sebago lake. He carried these woods by day, with his gun and rod, and in the moonlight nights of winter skated upon the lake alone till midnight. When he found himself away from home, and wearied with his exercise, he took refuge in a log cabin where half a tree would be burning upon the hearth. He had by this time acquired a taste for writing, that showed itself in a little blank-book, in which he jotted down his woodland adventures and feelings, and which was remarkable for minute observation and nice perception of nature.

In the spring of 1824 he removed to Raymond, and a year later a residence at Raymond, Nathaniel returned to Salem in order to prepare for college. He amused himself by publishing a manuscript periodical, which he called the Spectator, and which displayed considerable vivacity and talent. He speculated upon the profession that he would follow, with a sort of prophetic insight into his future. "I do not want to be a doctor and live by men's diseases," he wrote to his mother, "nor a minister to live by their sins, nor a lawyer and live by their quarrels. So I don't see that there is anything left for me but to be an author. How would you like some day to see a whole shelf full of books, written by your son, with 'Hawthorne's Works' printed on their backs?" Nathaniel entered Bowdoin College, Brunswick, Maine, in the autumn of 1821, where he became acquainted with two students who were destined to distinction—Henry W. Longfellow and Franklin Pierce. He was an excellent classical scholar, his Latin compositions, even in his freshman year, being remarkable for their elegance, while his Greek (which was less) was good. He made graceful translations from the Roman poets, and wrote several English poems which were creditable to him. After graduation three years later (1823) he returned to Salem, and to a life of isolation. He devoted his mornings to study, his afternoons to writing, and his evenings to long walks along the rocky coast. He was scarcely known by sight to his townsmen, and he held so little communication with the members of his own family that his meals were frequently left at his
HAWTHORNE, NATHANIEL

locked door. He wrote largely, but destroyed many of his manuscripts, his taste was so difficult to please. He thought well enough, however, of one of his compositions to print it anonymously in 1828. A crude melodramatic story, entitled Pauktuque, it was unworthy even of his immature powers, and should never have been rescued from the oblivion which speedily overtook it. The name of Nathaniel Hawthorne finally became known to his countrymen as a writer in The Token, a holiday annual which was commenced in 1828 by Mr S. G. Goodrich (better known as "Peter Parley"), by whom it was conducted for fourteen years. This forgotten publication numbered among its contributors most of the prominent American writers of the time, none of whom appeared to have had his name removed from its pages, except the least popular of all—Hawthorne, who for years the obscurest man of letters in America, though he gradually made admirers in a quiet way. His first public recognition came from England, where his genius was discovered in 1835 by Henry F. Chorley, one of the editors of the Athenaeum, in which he copied three of Hawthorne's most characteristic papers from The Token. He had but little encouragement to continue in literature, for Mr Goodrich was so much more a publisher than an author that he paid him wretchedly for his contributions. Hawthorne's next important book was the American Magazine of Useful and Entertaining Knowledge, which he persuaded him to edit. This author-publisher consenting, however, at a later period (1837) to bring out a collection of Hawthorne's writings under the title of Twice-told Tales. A moderate edition was got rid of, but the great body of the reading public ignored the book altogether. It was generously reviewed in the North American Review by his college friend Longfellow, who said it came from the hand of a man of genius, and praised it for the exceeding beauty of its style, which was as clear as running water.

The want of pecuniary success which had so far attended his authorship led Hawthorne to accept a situation which was tendered him by George Bancroft, the historian, collector of the port of Boston under the Democratic rule of President Van Buren. He was appointed a weigher in the custom-house at a salary of about $1200 a year, and entered upon the duties of his office, which consisted for the most part in measuring coal, salt and other bulky commodities on foreign vessels. It was irksome employment, but faithfully performed for two years, when he was superseded through a change in the national administration. Master of himself once more, he returned to Salem, where he remained until the spring of 1841, when he wrote a collection of children's stories entitled Grandfather's Chair, and joined an industrial association at West Roxbury, Mass. Brook Farm, as it was called, was a social Utopia, composed of a number of advanced thinkers, whose object was so to distribute manual labour as to give its members time for intellectual culture. The scheme worked admirably—on paper; but it was suited neither to the temperament nor the taste of Hawthorne, and after trying it patiently for nearly a year he returned to the everyday life of mankind.

One of Hawthorne's earliest admirers was Miss Sophia Peabody, a lady of Salem, whom he married in the summer of 1842. He made himself a new home in an old manse, at Concord, Mass., situated on historic ground, in sight of an old revolutionary battlefield, and devoted himself diligently to literature. He was known to the few by his Twice-told Tales, and to the many by his papers in the Democratic Review. He published in 1842 a further portion of Grandfather's Chair, and also a second volume of Twice-told Tales. He also edited, during 1845, the African Journals of Horatio Bridge, an officer of the navy, who had been at college with him; and in the following year he published in two volumes a collection of his later writings, under the title of Mosses from an Old Manse.

After a residence of nearly four years at Concord, Hawthorne returned to Salem, having been appointed surveyor of the custom-house by a new Democratic administration. He filled the duties of this position until the incoming of the Whig administration again led to his retirement. He seems to have written little during his official term, but, as he had leisure enough and to spare, he read much, and pondered over subjects for future stories. His next work, The Scarlet Letter, which was begun after his removal from the custom-house, was published in 1850. If there had been any doubt of his genius before, it was settled for ever by this powerful romance.

Shortly after the publication of The Scarlet Letter Hawthorne removed from Salem to Lenox, Berkshire, Mass., where he wrote The House of the Seven Gables (1851) and The Wonder-Book (1853). From Lenox he removed to West Newton, near Boston, Mass., where he wrote The Blithedale Romance (1852) and The Snow Image and other Twice-told Tales (1852). In the spring of 1855 he returned to Salem, where he purchased an old house which he called The Wayside, and wrote a Life of Franklin Pierce (1852) and Tanglewood Tales (1853). Mr Pierce was the Democratic candidate for the presidency, and it was only at his urgent solicitation that Hawthorne consented to become his biographer. He declared that he would accept no office in case he were elected, lest it might compromise him; but his friends gave him such weighty reasons for reconsidering his decision that he accepted the consulate at Liverpool, which was understood to be one of the best gifts at his disposal.

Hawthorne departed for Europe in the summer of 1853, and returned to the United States in the summer of 1860. Of the seven years which he passed in Europe five were spent in attending to the duties of his consulate at Liverpool, and in little journeys to Scotland, the Lakes and elsewhere, and the remaining two in France and Italy. They were quiet and uneventful, colored by observation and reflection, as his note-books show, but productive of only one elaborate work, Transformation, or The Marble Faun, which he sketched out during his residence in Italy, and prepared for the press at Lenox, England, whence it was despatched to America and published in 1860.

Hawthorne took up his abode at The Wayside, not much richer than when he left it, and sat down at his desk once more with a heavy heart. He was surrounded by the thrones of a great civil war, and the political party with which he had always acted was under a cloud. His friend ex-President Pierce was stigmatized as a traitor, and when Hawthorne dedicated his next book to him—a volume of English impressions entitled Our Old Home (1865)—it was at the risk of his own popularity. His pen was soon to be laid aside for ever; for, with the exception of the unfinished story of Septimus Felton, which was published after his death by his daughter Una (1872), and the fragment of The Dolliver Romance, the beginning of which was published in the Atlantic Monthly in July 1864, he wrote no more. His health gradually declined, his hair grew white as snow, and the once stalwart figure that in early manhood flashed along the airy cliffs and glittering sands sauntered idly on the little hill behind his house. In the beginning of April 1864 he made a short southern tour with his publisher Mr William D.Ticknor, and was benefited by the change of scene until he reached Philadelphia, where he was shocked by the sudden death of Mr Ticknor. He returned to The Wayside, and after a short season of rest joined his friend ex-President Pierce. He died at Plymouth, New Hampshire, on the 19th of May 1864, and five days later was buried at Sleepy Hollow, a beautiful cemetery at Concord, where he used to walk under the pines when he was living at the Old Manse, and where his ashes moulder under a simple stone, inscribed with the single word "Hawthorne."

The writings of Hawthorne are marked by subtle imagination, curious power of analysis and exquisite purity of diction. He studied exceptional developments of character, and was fond of exploring secret crypts of emotion. His shorter stories are remarkable for originality and suggestiveness, and his larger ones are as absolute creations as Hamlet or Undine. Lacking the accomplishment of verse, he was in the highest sense a poet. His work is pervaded by a manly personality, and by an almost feminine lucidity and gentleness. His name is graced by the genealogy of his Puritan ancestors without their superstition, and learned in his solitary meditations a knowledge of the night-side of life.
HAWTREY—HAY, G.

which would have filled them with suspicion. A profound anatomist of the heart, he was singularly free from morbidness, and in his darkest speculations concerning evil was robustly right-minded. He worshipped conscience with his intellectual as well as his moral nature; it is supreme in all he wrote. Besides these mental traits, he possessed the literary quality of style—a grace, a charm, a perfection of language which no other Author was ever equal to, and which places him among the great masters of English prose.

His Complete Writings (22 vols, Boston, 1901) were edited, with introduction, including a bibliography, by H. S. Schneider. The standard authority for Hawthorne’s biography is Nathaniel Haw- thorne, a Life (2 vols, Boston, 1884), by his son Julian Haw- thorne (b. 1846), himself a novelist and critic of distinction. See also Henry James, Hawthorne (London, 1879), in the “English Men of Letters” series; Julian Hawthorne, Hawthorne and his Circle (New York, 1903); and in R. H. S. Johnstone’s Essays Theological and Literary (London, 1871); George B. Smith, Poets and Novelists (London, 1875); Moncure D. Conway, Life of Nathaniel Hawthorne (London, 1890, in the “Great Writers” series); Horatio Bridge, Personal Recollections of Nathaniel Hawthorne (New York, 1893); Rose Hawthorne Lathrop, Memories of Hawthorne (Boston, 1897); W. C. Lawton, The New England Poets (New York, 1898); Sir L. Stephen, in his Life of Charles Dickens; Christopher H. Hawthorne (Boston, 1890); G. E. Woodberry, Life of Hawthorne (1902); and bibliography by N. E. Browne (1903). (R. H. S.)

HAWTREY, CHARLES HENRY (1838– ), English actor, was born at Eton, where his father was master of the lower school, and educated at Rugby and Oxford. He took to the stage in 1851, and in 1853 adapted von Moser’s Bibliothek as The Private Secretary, which had an enormous success. He then appeared in London in a number of modern plays, in which he was conspicuous as a comedian. He was unapproachable for parts in which cool imperturbable lying constituted the leading characteristic. Among his later successes A Message from Mars was particularly popular in London and in America.

HAWTREY, EDWARD CRAVEN (1790–1862), English educationalist, was born at Burham on the 7th of May 1790, the son of the vicar of the parish. He was educated at Eton and King’s College, Cambridge, and in 1814 was appointed assistant master at Eton under Dr Keate. In 1834 he became headmaster of the college, and his administration was a vigorous one. New Buildings were erected, including the school library and the sanatorium, the college chapel was restored, the Old Christopher Inn was closed, and the collection of “Montem,” the collection by street begging of funds for the university expenses of the captain of the school, was suppressed. He is supposed to have suggested the prince consort’s modern language prizes, while the prize for English essay he founded himself. In 1852 he became provost of Eton, and in 1854 vicar of Maplechurch. He died on the 27th of January 1862, and was buried in the Eton College chapel. On account of his command of languages ancient and modern, he was known in London as “the English Mezzofanti,” and he was a book collector of the finest taste. Among his own books are some excellent translations from the English into Italian, German and Greek. He had a considerable reputation as a writer of English hexameters and as a judge of Homeric translation.

HAXO, FRANÇOIS NICOLAS BENOIT, BARON (1774–1838), French general and military engineer, was born at Lunéville on the 24th of June 1774, and entered the Engineers in 1793. He remained unknown, doing duty as a regimental officer for many years, until, as major, he had his first chance of distinction in the second siege of Saragossa in 1806, after which Napoleon made him a colonel. Haxo took part in the campaign of Wagram, and then returned to the Peninsula to direct the siege operations of Sacket’s army at Bayonne in 1809. He was made general of brigade, in 1812 a baron, and in the same year he was employed in preparing the occupied fortresses of Germany against a possible Russian invasion. In 1812 he was chief engineer of Davout’s I. corps, and after the retreat from Moscow he was made general of division. In 1813 he constructed the works around Hamburg which made possible the famous defence of that fortress by Davout, and commanded the Guard Engineers until he fell into the enemy’s hands at Kulm. After the Restora-

tion Louis XVIII. wished to give Haxo a command in the Royal Guards, but the general remained faithful to Napoleon, and in the Hundred Days laid out the provisional fortifications of Paris and fought at Waterloo. It was, however, after the second Restoration that the best work of his career as a military engineer was done. As inspector-general he managed, though not without meeting considerable opposition, to reconstruct in accordance with the requirements of the time, and the designs which had evolved to meet them, the old Vauban and Corteinage fortresses which had failed to check the invasions of 1814 and 1815. For his services he was made a peer of France by Louis Philippe (1832). Soon after this came the French intervention in Belgium and the famous scientific siege of Antwerp citadel. Under Marshal Gédéon Haxo directed the besiegers and completely outmatched the opposing engineers, the fortress being reduced to surrender after a siege of a little more than three weeks (December 23, 1832). He was after this regarded as the first engineer in Europe, and his latter years were spent in urging upon the government and the French people the fortification of Paris and Lyons, a project which was partly realized in his time and after his death fully carried out. General Haxo died at Paris on the 25th of June 1838. He wrote Mémoire sur le figure du terrain dans les cartes topographiques (Paris, N.D.), and a memoir of General Dejean (1824).

HAUSKHAUS, AUGUST FRANZ LUDWIG MARIA, FRIEHER VON (1791–1866), German political economist, was born near Paderborn in Westphalia on the 3rd of February 1792. Having studied at the school of mining at Klausthal, and having served in the Hanoverian army, he entered the university of Göttingen in 1815. Finishing his course there in 1818 he was engaged in managing his estates and in studying the land laws. The result of his studies appeared in 1829 when he published Uber die Agrarverfassung in den Fürstentümern Paderborn und Coren, a work which attracted much attention and which procured for its author a commission to investigate and report upon the land laws of the Prussian provinces with a view to a new code. After nine years of labour he published in 1839 an exhaustive treatise, Die ländliche Verfassung in der Provinz Preussen, and in 1843, at the request of the emperor Nicholas, he undertook a similar work for Russia, the fruits of his investiga- tions in that country being contained in his Studien über die innern Zustände des Volkeslebens, and insbesondere die ländlichen Einrichtungen Russlands (Hanover, 1847–52). He received various honours, was a member of the combined diet in Berlin in 1847 and 1848, and afterwards of the Prussian upper house. Haxthausen died at Hanover on the 31st of December 1866.

In addition to the works already mentioned he wrote Die ländliche Verfassung in den Fürstentümern Coren und Paderborn (1829), which was translated into French and into English by R. Farie as The Russian Empire (1856). Other works of his which have appeared in English are: Transcensions; Sketches of the Nations and Races between the Black Sea and the Caspian (1854), and The Tribes of the Caucasus (1855). Haxthausen edited Das konstitutionelle Prinzip (Leipzig, 1864), a collection of political writings by various authors, which has been translated into French (1865).

HAY, GEORGE (1729–1811), Scottish Roman Catholic divine, was born at Edinburgh on the 24th of August 1729. He was a Jacobite refugee and took the rebellion of 1745 and served a term of imprisonment 1746–1747. He then entered the Roman Catholic Church, studied in the Scots College at Rome, and in 1759 accompanied John Geddes (1735–1799), afterwards bishop of Morocco, on a Scottish mission. Ten years later he was appointed bishop of Daulas in partibus and coadjutor to Bishop James Grant (1706–1758). In 1778 he became vicar apostolic of the lowland district. During the Protestant riots in Edinburgh in 1779 his furniture and library were destroyed by fire. From 1788 to 1793 he was in charge of the Scalain seminary; in 1802 he retired to that of Aquhorthies near Inverury, and died there on the 13th of October 1811.

His theological works, including The Sincere Christian, The Devout Christian, The Pious Christian and The Scripture Doctrine of Miracles, were edited by Bishop Strain in 1871–1873.
HAY, GILBERT—HAY

HAY, GILBERT, of "Sir Gilbert the Haye" (II. 1420), Scottish poet and translator, was perhaps a kinsman of the house of Errol, for he was the student named in the registers of the university of St. Andrews in 1418-1419, his birth may be fixed about 1405. He was in France in 1432, perhaps some years earlier, for a "Gilbert de la Haye" is mentioned as present at Reims, in July 1430, at the coronation of Charles VII. He has left it on record, in the Prologue to his 

_The Book of the Law of Armies,
_which he was "charmerlyn unquhyble to the maist worthy King Charles of France." In 1456 he was back in Scotland, in the service of the chancellor, William, earl of Orkney and Caithness, in his castell of Rosselyn," south of Edinburgh. The date of his death is unknown.

Hay is named by Dunbar (q.v.) in his Lament for the Makaris, and by Sir David Lyndsay (q.v.) in his Testament and Complaint of the Pappyme. His only political work is _The Book of Alexander the Conqueror_, of which a portion, in copy, remains at Taymouth Castle. He has left three translations, extant in one volume (in old binding) in the collection of Abbotsford: (a) _The Book of the Law of Armies_ or _The Book of Batallis_, a translation of Honoré Bonet's _Arbre des batallies_; (b) _The Book of the Order of Knighthood_ from the _Livre de Postre_ and (c) _The Book of the Governance of Princes_, from a French version of the pseudo-Aristotelian _Secreta secretorum_. The second of these precedes Caxton's independent translation by at least ten years.

For the _Book of Alexander_ see Albert Herrmann's _The Taymouth Castle MS. of Sir Gilbert Hay's _Buik_, &c. (Berlin, 1898). The complete Abbotsford MS. has been reprinted by the Scottish Text Society (ed. E. L. Stevenson). The first volume containing _The Book of the Law of Armies_, appeared in 1901. The _Order of Knighthood_ was printed by David Laing for the Abbotsford Club (1847). See also S.T.S. edition (n.s.) "Introduction," and Gregory Smith's, _Specimens of the Middle Scots_, in which annotated extracts are given from the Abbotsford MS., the oldest known example of literary Scots prose.

HAY, JOHN (1838-1905), American statesman and author, was born at Salem, Indiana, on the 8th of October 1838. He graduated from Brown University in 1858, studied law in the office of Abraham Lincoln, was admitted to the bar in Springfield, Illinois, in 1861, and soon afterwards was selected by President Lincoln as assistant private secretary, in which capacity he served till the president's death, being associated with John George Nicolay (1832-1901). Hay was secretary of the U.S. legation at Paris in 1865-1867, at Vienna in 1867-1869 and at Madrid in 1869-1870. After his return he was for five years an editorial writer on the New York _Tribune_; in 1879-1881 he was first assistant secretary of state to W. M. Evarts; and in 1881 was a delegate to the International Sanitary Conference, which met in Washington, D.C., and of which he was chosen president. Upon the inauguration of President McKinley in 1897 Hay was appointed ambassador to Great Britain, from which post he was transferred in 1898 to that of secretary of state, succeeding W. R. Day, who was sent to Paris as a member of the Peace Conference. He remained in this office until his death at Newburg, New Hampshire, on the 1st of July 1905. He directed the peace negotiations with Spain after the war of 1898, and not only secured American interests in the imbroglio caused by the Boxers in China, but grasped the opportunity to insist on the "administrative entity" of China; influenced the powers to declare publicly for the "open door" in China; challenged Russia as to her intentions in Manchuria, securing a promise to evacuate the country on the 8th of October 1903; and in 1904 again urged the "administrative entity" of China and took the initiative in inducing Russia and Japan to "localize and limit" the area of hostilities. It was largely due to his tact and good management, in concert with Lord Pauncefote, the British ambassador, that negotiations for abrogating the Clayton-Bulwer Treaty and for making a new treaty with Great Britain regarding the Isthmian Canal were successfully concluded at the end of 1899. He was successively in London, Paris, and with Panama, looking towards the construction by the United States of a trans-isthmian canal. He also arranged the settlement of difficulties with Germany over Samoa in December 1899, and the settlement, by joint commission, of the question concerning the disputed Alaskan boundary in 1903. John Hay was a man of quiet and unassuming disposition, whose training in diplomacy gave him cool and judicious character to his statesmanship. As secretary of state under Presidents McKinley and Roosevelt his guidance was invaluable during a rather critical period in foreign affairs, and no man of his time did more to create confidence in the increased interest taken by the United States in international matters. He also represented, in another capacity, the best American traditions—namely in literature. He published _Pike County Ballads_ (1871)—the most famous being "Little Breeknock", a volume worthy to rank with Bret Harte. He was associated with the _Lowell Offering_, and with _Gaelic Days_ (1871), recording his observations in Spain; and a volume of _Poems_ (1890); with John G. Nicolay he wrote _Abraham Lincoln: A History_ (10 vols., 1890), a monumental work indispensable to the student of the Civil War period in America, and published an edition of Lincoln's _Complete Works_ (2 vols., 1894). The authorship of the brilliant novel _The Breadwinners_ (1883) is now certainly attributed to him. Hay was an excellent public speaker; some of his best addresses are _In Praise of Omor; On the Unveiling of the Bust of Sir Walter Scott_ in Westminster Abbey, May 21, 1897; and a memorial address in honour of President McKinley.

The best of his previously unpublished speeches appeared in _Addresses of John Hay_ (1906).

HAY, a town of Wardagery county, New South Wales, Australia, on the Murrumbidgee river, 454 m. by rail W.S.W. of Sydney. Pop. (1901), 3012. It is the cathedral town of the Anglican diocese of Riverina, the terminus of the South Western railway, and the principal depot for the wool produced at the numerous stations on the banks of the Murrumbidgee and Lachlan rivers.

HAY, a market town and urban district of Breconshire, south Wales, on the Hereford and Brecon section of the Midland railway, 1643 m. from London, 20 m. W. of Hereford and 17 m. N.E. of Brecon by rail. Pop. (1901), 1680. The Golden Valley railway to Pontllas (183 m.), now a branch of the Great Western, also starts from Hay. The town occupies rising ground on the south (right) bank of the Wye, which here separates the counties of Brecknock and Radnor but immediately below enters Herefordshire, from which the town is separated on the E. by the river Dulas.

Leland and Camden ascribe a Roman origin to the town, and the former states that quantities of Roman coin (called by the country people "Jews' money") and some pottery had been found near by, but of this no other record is known. The Wye valley in this district served as the gate between the present counties of Brecknock and Hereford, and, though Welsh continued for two or three centuries after the Norman Conquest to be the spoken language of the adjoining part of Herefordshire south of the Wye (known as Archenfield), there must have been a "burh" serving as a Mercian outpost at Glasbury, 4 m. W. of Hay, which was itself several miles west of Offa's Dyke. But the earliest settlement at Hay probably dates from the Norman conquest of the district by Bernard Newnham about 1068 (in which year he granted Glasbury, probably as the first fruits of his invasion, to St. Peter's, Gloucester). The manor of Hay, which probably corresponded to some existing Welsh division, he gave to Sir Philip Walwyn, but it soon reverted to the donor, and its subsequent devolution down to its forfeiture to the crown as part of the duke of Buckingham's estate in 1521, was identical with that of the lordship of Brecknock (see BRECKNOCK). The castle, which was probably built in Newnham's time and rebuilt by his great-grandson William de Breos, passed on the latter's attainder to the crown, but was again seized by de Breos's second son, Giles, bishop of Hereford, in 1215, and re-taken by King John in the following year. In 1231 it was granted to Gilbert de Finch, who held it as a fief from de Breos, and it was taken in 1263 by Prince Edward, but in the following year was burnt by Simon Montfort and the last Llewelyn. From the 16th century the castle has been used as a private residence.

105
The Welsh name of the town is Y Gelli ("the wood"), or formerly in full (Y) Gelli ganddryll (literally "the wood all to pieces"), which roughly corresponds to Sepes Inscissa, by which name Walter Map (a native of the district) designates it. Its Norman name, La Haia (from the Fr. haute, cf. English "heading"), was probably intended as a translation of Gelli. The same word is found in Uskshay and Oldhay, both between Hay and the Golden Valley. The town is still locally called the Hay, as it also is by Leland.

Even down to Leland's time Hay was surrounded by a "right strong wall," which had three gates and a postern, but the town within the wall has "wonderfully decayed," its ruin being ascribed to Owen Glendower, while to the west of it was a flourishing suburb with the church of St Mary on a precipitous eminence overlooking the river. This was rebuilt in 1834. The old parish church of St John within the walls, used as a school-house in the 17th century, has entirely disappeared. The Baptists, Calvinistic Methodists, Congregationalists and Primitive Methodists have a chapel each. The other public buildings are the market house (1833); a masonic hall, formerly the town hall, its basement still serving as a cheese market; a clock tower (1834); parish hall (1809); and a drill hall. The Wye is here crossed by an iron bridge built in 1864. There are also eighteen almshouses for poor women, built and endowed by Miss Frances Harley in 1832-1836, and Gwyn's almshouses for six aged persons, founded in 1702 and rebuilt in 1878. Scarcely anything but provisions are sold in the weekly market, the farmers of the district now resorting to the markets of Brecon and Hereford. There are good monthly stock fairs and a hiring fair in May. There is rich agricultural land in the district.

Hay was reputed to be a borough by prescription, but it never had any municipal institutions. Its manor, like that of Talgarth, consisted of an Englishy and a Welshery, the latter, known as Haya Wallensis, comprising the parish of Llanigon with the hamlet of Glynach, and in this Welsh tenures and customs prevailed. The manor is specially mentioned in the act of Henry VIII. (1535) as one of those which were then taken to constitute the new county of Brecknock.

**HAY** (a word common in various forms to Teutonic languages; cf. Ger. *Heu*, Dutch *hoof*; the root from which it is derived, meaning "to cut," is also seen in "(o hew"); cf. "hoe"), grass mown and dried in the sun and used as fodder for cattle. It is properly applied only to the grass when cut, but is often also used of the standing crop. (See Haymaking below). Another word "hay," meaning a fence, must be distinguished; the root from which it is derived is seen in its doublet "hedge," cf. "haw-thorn," i.e. "hedge thorn." In this sense it survives in legal history in "hay bote," i.e. hedge-bote, the right of a tenant, copyholder, &c. to take wood to repair fences, hedges, &c. (see Estovers), and also in "hayward," an official of a manor whose duty was to protect the enclosed lands from cattle breaking out of the common land.

**Haymaking.**—The term "haymaking" signifies the process of drying and curing grass or other herbage so as to fit it for storage in stacks or sheds for future use. As a regular part of farm work it was unknown in ancient times. Before its introduction into Great Britain the animals intended for beef and mutton were slaughtered in autumn and salted down; the others were turned out to fend for themselves, and often lost all the fat in winter they had gained the previous summer. The introduction of haymaking gave unlimited scope for the production of winter food, and improved treatment of live stock became possible.

In every country has its own methods of haymaking, the principal stages in the process everywhere are: (1) mowing, (2) drying or "making," (3) "carrying" and storage in stacks or sheds.

In a wet district such as the west of Ireland the "making" is a difficult affair and large quantities of hay are often spoiled, while much labour has to be spent in copying up, turning over, ricking, &c., before it is fit to be stacked up. On the other hand, in the dry districts of south-eastern England it is often possible to cut and carry the hay without any special "making," as the sun and wind will dry it quickly enough to fit it for stacking up without the expenditure of much labour. This rule also applies to dry countries like the United States and several of the British colonies, and it is for this reason that most of the modern implements used for quickly handling a bulk of hay have been invented or improved in those countries. Forage of all kinds intended for hay should be cut at or before the flowering stage if possible. The full growth and food value of the plant are reached then, and further change consists in the formation and ripening of the seed at the expense of the leaves and stems, leaving these hard and woody and of less feeding value.

Grass or other forage, when growing, contains a large proportion of water, and after cutting must be left to dry in the sun and wind, a process which may at times be assisted by turning over or shaking up. In fine weather in the south of England grass is sufficiently dried in from two to four days to be stacked straight away. In Scotland or other districts where the rainfall is heavy and the air moist, it is first put into small field-ricks or "pykes" of from 10 to 20 cwt. each. In the drying process the 75% of water usually present in grass should be reduced to approximately 15% in the hay, and in wet or broken weather it is exceedingly difficult to secure this reduction. With a heavy crop or in damp weather grass may need turning in the swathe, raking up into "windrows," and then making up into cocks or "quilles," i.e. round bee-hive-like heaps, before it can be "carried." A properly made cock will stand bad weather for a week, as only the outside straws are weathered, and therefore the hay is kept fresh and green. A general rule is always to cock hay, for even in sunny weather undue exposure ends in bleaching, which is almost as detrimental to its quality as wet-weathering.

In the last quarter of the 19th century the methods of haymaking were completely changed, and even some of the principles underlying its practice were revised. Generally speaking, before that time the only implements used were the scythe, the rake and the pitchfork; nowadays—with the exception of the pitchfork—these implements are seldom used, except where the work is carried on in a small way. Instead of the scythe, for instance, the mowing machine is employed for cutting the crop, and with a modern improved machine taking a swathe as wide as 5 or 6 ft. some 10 acres per day can easily be mown by one man and a pair of horses (figs. 1 and 2).

It will be seen from the figures that a mower consists of three principal parts: (1) a truck or carriage on two high wheels carrying the driving gear; (2) the cutting mechanism, comprising a reciprocating knife or sickle operated through slots in the guards or "fingers" fastened to the cutting bar which projects to either the right or left of the truck; and (3) the pole with whippettes, by which the horses are attached to give the motive power. The reciprocating knife has a separate blade to correspond to each finger, and is driven by a connecting rod and crank on the fore part of the truck. In work the pointed "fingers" pass in between the stalks of grass and the knives shear them off, acting against the fingers as the crank drives them backwards and forwards. In the swathe of grass left

---

**FIG. 1.—MOWER (viewed from above) with enlarged detail of Blade.**

(Harrison, M'Gregor & Co.)
behind by the machine, the stalks are, in a manner, thatched over one another, so that it is in the best position for drying in the sun, or, per contra, for shedding off the rain if the weather is wet. This is a great point in favour of the use of the machine, because the swath left by the scythe required to be "tedded" out, i.e., the grass had to be shaken out or spread to allow it to be more easily dried.

After the grass has lain in the swath a day or two till it is partly dried, it is necessary to turn it over to dry the other side. This used to be done with the hand rake, and a band of men or women would advance in echelon across a field, each turning the swath of hay by regular strokes of the rake at each step: "driving the dusky wave along the mead," as described in Thomson's Seasons. This part of the work was the act of "haymaking" proper, and the subject of much sentiment in both prose and poetry. The swathes as laid by the mowing machine lent themselves to this treatment in the old days when the swath was only some 3 to 4 ft. wide, but with the wide cut of the present day it becomes impracticable. If the hay is turned and "made" at all, the operation is now generally performed by a machine made for the purpose. There is a wide selection of "tedders" or "kickers," and "swathe-turners" on the market. The one illustrated in fig. 3 is the first prize winner at the Royal Agricultural Society's trials (1907). It takes two swathes at a time, and it will be seen that the working part consists of a wheel or circle of prongs or tines, which revolves across the line of the swath. Each prong in turn catches the edge of the swath of grass and kicks it up and over, thus turning it and leaving it loose for the wind to blow through.

The "kicker" is mounted on two wheels, and carries in bearings at the rear of the frame a multiple-cranked shaft, provided with a series of forks sleeved on the cranks and having their upper ends connected by links to the frame. As the crank-shaft is driven from the wheels by proper gearing the forks move upward and forward, then downward and rearward, in an elliptical path, and kick the hay sharply to the rear, thus scattering and turning it.

It is a moot point, however, whether grass should be turned at all, or left to "make" as it falls from the mowing machine. In a dry sunny season and with a moderate crop it is only a waste of time and labour to turn it, for it will be cured quite as well as it lies, especially if raked up into loose "windrows" a little before carrying to the stack. On the other hand, where the crop is heavy (say over 2 tons per acre) or the climate is wet, turning will be necessary.

With heavy crops of clover, lucerne and similar forage crops, turning would be an absolutely necessary, because a thick swath of a succulent crop will be difficult to dry or "make" excepting in hot sunny weather, but with ordinary meadow grass or with a mixture of "artificial" grasses it may often be dispensed with. It must be remembered, however, that the process of turning breaks the stalks (thus letting out the aluminoid and saccharine juices), and should be avoided as far as possible in order to save both labour and the quality of the hay.

One of the earlier mechanical inventions in connexion with haymaking was that of the horse rake (fig. 4). Before its introduction the hay, after making, had to be gathered up by the hand rake—a tedious and laborious process—but the introduction of this implement, whereby one horse and one man can do work before requiring six or eight men, marked a great advance. The horse rake is a framework on two wheels carrying hinged steel teeth placed 3 in. apart, so that their points slide along the ground below the hay. In work it gathers up the loose hay, and when full a tipping mechanism permits the emptying of the load.

The tipping is effected by pulling down a handle which sets a lever device in motion, whereby the teeth are lifted up and the load of hay dropped below and left behind. On some rakes a clutch is worked by the driver's foot, and this put in action causes the ordinary forward revolving motion of the driving wheels to do the tipping. The loads are tipped end to end as the rake passes and repasses at the work, and thus the hay is left loose in long parallel rows on the field. Each row is termed a "windrow," the passage of the wind through the hay greatly aiding the drying and "making" thereof. When hay is in this form it may either be carried direct to the stack or turned, or else put into cocks to season a little longer. The original width of horse rakes was about 8 ft., but nowadays they range up to 16 and 18 ft. The width should be suited to that of the swathes as left by the mower, and as the latter is now made to cut 5 and 6 ft. wide, it is necessary to have a rake to cover two widths. The very wide rakes are only suitable for even, level land; those of less width must be used where the land has been laid down in ridge and furrow. As the swathes lie in long parallel rows, it is a great convenience in working for two to be taken in width at a time, so that the horse can walk in the space between.

The side-delivery rake, a development of the ordinary horse rake, is a useful implement, adapted for gathering and laying a quantity of hay in one continuous windrow. It is customary with this to go up the field throwing two swathes to one side, and then back down on the adjacent swathes, so that thus four are thrown into one central windrow. The implement consists of a frame carried on two wheels with shafts for a horse; across the frame are fixed travelling or revolving prongs of different varieties which pick up the hay off the ground and pass it along sideways across the line of travel, leaving it in one continuous line. Some makes of swath-turners are designed to do this work as well as the turning of the hay. Perhaps the greatest improvement of modern times is the method.
of carrying the hay from the field to the stack. An American invention known as the sweep rake was introduced by the writer into England in 1894, and now in many modified forms is in very general use in the Midlands and south of England, where the hay is carried from the cock, window or swath straight to the stack. This implement consists of a wheeled framework fitted with long wooden iron-pointed teeth which slide along the ground; two horses are yoked to it—one at each side—the driver directing from a central seat behind the framework. When in use it is taken to the farther end of a row of cocks, a window, or even to a row of untouched swaths on the road, and worked forwards. As it advances it scoops up a load, and when full is drawn to where the stack is being erected (fig. 5). In ordinary circumstances the sweep rake will pick up at a load two-thirds of an ordinary cart-load, but, where the hay is in good order and it is swept down hill, a whole one-horse cart-load can be carried each time. The driver the hay the bettor will the sweep rake work, and if it is not working sweetly but has a tendency to clog or make rolls of hay, it may be inferred that the latter is not in a condition fit for stacking. Where the loads must be taken through a gateway or a long distance to the stack, it is necessary to use carts or wagons, and the loading of these in the field out of the window is largely expedited by the use of the "loader," also an American invention of which many varieties are in the market. Generally speaking, it consists of a frame carrying a revolving web with tines or prongs. The implement is hitched on behind a cart or wagon, and as it moves forward the web picks the loose hay off the ground and delivers it on the top, where a man levels it with a pitchfork and builds it into a load ready to move to the stack. At the stack the most convenient method of transferring the hay from a cart, wagon or sweep rake is the elevator, a tall structure with a revolving web carrying teeth or spikes (fig. 6). The hay is thrown in forklifts on at the bottom, a pony-gear causes the web to revolve, and the hay is carried in an almost continuous stream up the elevator and dropped over the top on to the stack. The whole implement is made to fold down, and is provided with wheels so that it can be moved from stack to stack. In the older forms there is a "hopper" or box at the bottom into which the hay is thrown to enable the teeth of the web to catch it, but in the modern forms there is no hopper, the web reaching down to the ground so that hay can be picked up from the ground level. Where the hay is brought to the stack on carts or wagons it can be unloaded by means of the horse fork. This is an adaptation of the principle of the ordinary crane; a central pole and jib are supported by guy ropes, and from the end of the jib a rope runs out a pulley. At the end of this rope is a "fork" formed of two sets of prongs which open and shut. This fork is lowered on to the load of hay, the prongs are forced into it, a horse pulls at the other end of the rope, and the prongs close and "grab" several cwt. of hay which are swung up and dropped on the stack. In this way a large cart or wagon load is hoisted on to the stack in three or four "forkfuls." The horse fork is not suited for use with the sweep rake, however, because the hay is brought up to the stack in a loose flat heap without sufficient body for the fork to hold.

In northern and wet districts of England it is customary to "make" the hay as in the south, but it is then built into little stacks in the field where it grew (ricks, pykes or trampcocks are names used for these in different districts), each containing about 10 to 15 cwt. These are made in the same way as the ordinary stack—one person on top building, another on the ground pitching up the hay—and are carefully roped and raked down. In these the hay gets a preliminary sweating or tempering while at the same time it is rendered safe from the weather, and, thus stored, it may remain for weeks before being carried to the big stacks at the homestead. The practice of putting up the hay into little ricks in the field has brought about the introduction of another set of implements for carrying these to the stackyard.

Various forms of rick-lifters are in use, the characteristic feature of which is a tipping platform on wheels to which a horse is attached between shafts. The vehicle is backed against a rick, and a chain passed round the bottom of the latter, which is then pulled up the slant of the tipped platform by means of a small windlass. When the centre of the balance is passed, the platform carrying the rick tips back to the level, and the whole is thus loaded ready to move. Another variety of loader is formed of three wheeled legs with block and tackle. These are placed over a rick, under which the grab-irons are passed, and the whole hauled up by a horse. When high enough a cart is backed in below, the rick lowered, and the load is ready to carry away.

When put into a stack the next stage in curing the hay begins—the heating or sweating. In the growing plants the tissues are composed of living cells containing protoplasm. This continues its life action as long as it gets sufficient moisture and air. As life action involves the development of heat, the temperature in a confined space like a stack where the heat is not dissipated may rise to such a point that spontaneous combustion occurs. The chemical or physical reasons for this are not very well understood. The starch and sugar contents of the tissues are changed in part into alcohol. In the analogous process of making silage (i.e. stacking wet green grass in a closed building) the alcohol develops into acetic acid, thus making "sour" silage. In a haystack the intermediate body, acetaldehyde, which is both inflammable and suffocating, is produced—men having been suffocated when sleeping on the top of a heating stack. The production of this gas leads to slow combustion and ignition. One explanation of the process is that the protoplasm of the cells acts as a fermenting agent (like yeast) until a temperature sufficient to kill germ life, say 150° F., is reached, beyond which the action which leads up to the temperature of ignition must be purely chemical. If the stack contains no air at all it does not heat, or if it has excess of air it is safe. The danger-point in a stack is the centre at about 1 ft. from the ground; below this the weight of the hay itself squashes out the air, and at the sides and top the heat is dissipated outwards. If a stack shows signs of overheating (a process that may take weeks or even months to develop) it can be saved by cutting a gap in the side of it with the hay knife, thus letting out the heat and fumes, and admitting fresh air to the centre. The essential point in haymaking is that the hay should be dried sufficiently to ensure the sweating process in the stack reaching no further than the stage of the formation of
sugar. Good hay should come out green and with the odour of coumarin—to which is due the scent of new-mown hay. Only part of a stack can ever attain to a perfect state: the tops, bottom and outsides are generally wasted by the weather after stacking, while there may be three or four intermediate qualities present. In some markets hay that has been sweeted till it is brown in colour is desired, but for general purposes green hay is the best.

If it is then becomes misty when the weather during "making" has been too wet to allow of its getting sufficiently dry for stacking. Mustiness is caused by the growth of various moulds (Penicillium, Aspergillus, &c.) on the damp stems, with the result that the hay when cut out for use "is dusty and shows white streaks and spots. Such hay is inferior to that which has been overheated, and in practice it is found that a strong heating will prevent mouldiness by killing the fungi.

Heavy rush crops—especially those containing a large proportion of clover or other leguminous plants—are proportionately more difficult to "make" than light grassy ones. Thus, if one ton is taken as a fair yield off one acre, a two-ton crop will probably require four times as much work in curtaining as the smaller crop. In the treacherous climate of Great Britain hay is frequently spoiled because the weather does not hold good long enough to permit of its being properly "made." Consequently many experienced haymakers regard a moderate crop as the more profitable because it can be stacked in first-class condition, whereas a heavy crop forced by "high farming" is grown at a loss, owing to the weather and the heavier expenses involved in securing it.

In handling or marketing out of the stack hay may be transported loose on a cart or wagon, but it is more usual to truss or bale it. A truss is a rectangular block cut out of the solid stack, usually about 3 ft. long and 2 ft. wide, and of a thickness sufficient to give a weight of between 1 and 2 lb. 12 oz. to the unit of sale in many markets. A truss is generally bound with two bands of twisted straw, but if it has to undergo much handling it is compressed in a hay-press and tied with two string bands. In some districts a bale is used: a square box with a compressible lid. The hay is tumbled in loose, the lid forced down by a leverage arrangement and the bale tied by three strings. It is usually made to weigh from 1 to 1½ cwt. The customs of different markets vary very much in their methods of handling hay, and in the overseas trade the size and style of the trusses or bales are adapted for packing on shipboard.

HAYASHI, TADASU, COUNT (1850— ), Japanese statesman, was born in Tōkōō (then Yedo), and was one of the first batches of students sent by the Tokugawa government to study in England. He returned on the eve of the abolition of the Shōgunate, and followed Enomoto (q.v.) when the latter, sailing with the Tokugawa fleet to Yezo, attempted to establish a republic there in defiance of the newly organized government of the emperor. Thrown into prison on account of this affair, Hayashi did not obtain office until 1871. Thereafter he rose rapidly, until, after a long period of service as vice-minister of foreign affairs, he was appointed to represent his country first in Peking, then in St Petersburg and finally in London, where he acted an important part in negotiating the first Anglo-Japanese Alliance, for which service he received the title of viscount. He remained in London throughout the Russo-Japanese War, and was the first Japanese ambassador at the court of St James after the war. Returning to Tōkōō in 1906 to take the portfolio of foreign affairs, he remained in office until the resignation of the Saionjū cabinet in 1908. He was raised to the rank of count for eminent services performed during the war between his country and Russia, and in connexion with the Russo-Japanese Alliance of 1905.

HAYDEN, FERDINAND VANDEVEER (1828—1887), American geologist, was born at Westfield, Massachusetts, on the 7th of September 1828. He graduated from Oberlin College in 1850 and from the Albany Medical College in 1853, where he attracted the notice of Professor James Hall, state geologist of New York, through whose influence he was induced to join in an exploration of Nebraska. In 1856 he was engaged under the United States government, and commenced a series of investigations of the Western Territories, one result of which was his Geological Report of the Exploration of the Yellowstone and Missouri Rivers in 1859—1860 (1860). During the Civil War he was actively employed as an army surgeon. In 1867 he was appointed geologist-in-charge of the United States Geological and Geographical Survey of the Territories, and from his twelve years of labour there resulted a most valuable series of volumes in all branches of natural history and economic science; and he issued in 1871 his Geological and Geographical Atlas of Colorado. Upon the reorganization and establishment of the United States Geological Survey in 1879 he acted for seven years as one of the geologists. He died at Philadelphia on the 22nd of December 1887.

His other publications were: Sun Pictures of Rocky Mountain Scenery (1870); The Valley of the Delaware National Park, illustrated by chromolithographic reproduction of water-colour sketches by Thomas Moran (1876); The Great West: its Attractions and Resources (1880). With F. B. Meek, he wrote (Smithsonian Institution Contributions, v. 14, Art. 4) "Paleontology of the Upper Missouri. Pt. 1, Invertebrate." His valuable notes on Indian dialects are in The Transactions of the American Philosophical Society (1862), in The American Journal of Science (1862) and in The Proceedings of the American Philosophical Society (1889). With A. R. C. Selwyn he wrote North America (1883) for Stanford's Compendium.

HAYDN, FRANZ JOSEPH (1732—1809), Austrian composer, was born on the 31st of March 1732 at Rohrau (Tratnik), a village on the borders of Lower Austria and Hungary. There is sufficient evidence that his family was of Croatian stock: a fact which he himself did not deny. The Haydn family were of Slovenic character, and spoke a dialect which, at that time, was closely akin to the old South Slavonic. In 1749 his father, a wheelwright with twelve children, and at an early age evinced a decided musical talent. This attracted the attention of a distant relative named Johann Mathias Frankl, who was schoolmaster in the neighbouring town of Hainburg, and who, in 1738, took the child and for the next two years trained him as a chorister. In 1740, on the recommendation of the Dean of Hainburg, Haydn obtained a place in the cathedral choir of St Stanislaus, and in the capacity of one of the choir school, he received the violin. He afterwards fitted him out with the violin and the harpsichord. In 1749 his voice broke, and the director, Georg von Reutter, took the occasion of a boyish escape to turn him into the streets. A few friends lent him money and found him pupils, and in this way he was enabled to enter upon a rigorous course of study (he is said to have worked for sixteen hours a day), partly devoted to Fux's treatise on counterpoint; partly to the "Friedrich" and "Wurttemberg" sonatas of C. P. E. Bach, from which he gained his earliest notions of German music. The first fruits of his work were a comic opera, Der neue krumme Teufel, and a Mass in F major (both written in 1751), the former of which was produced with success. About the same time he made the acquaintance of Metastasio, who was lodging in the same house, and who introduced him to one or two patrons; among others Señor Martinez, to whose daughter he gave lessons, and Porpora, who, in 1753, took him for the summer to Männedorf, and there gave him instruction in singing and in the Italian language.

The turning-point of his career came in 1755, when he accepted an invitation to the country-house of Freiherr von Fürnberg, an accomplished amateur who was in the habit of collecting parties of musicians for the performance of chamber-works. Here Haydn wrote, in rapid succession, eighteenth divertimenti which include his first symphony and his first quartet; the two earliest examples of the forms with which his name is most closely associated. Thenceforward his prospects improved. On his return to Vienna in 1756 he became famous as teacher and composer, and in 1761 he was appointed conductor of the orchestra of Count Morzin, for whom he wrote several orchestral works (including a symphony in D major erroneously called his first), and in 1760 he was promoted to the sub-directorship of Prince Paul Esterhazy's Kapelle, at that time the best in Austria. During the tenure of his appointment with Count Morzin he married the daughter of a Viennese hairdresser named Keller, who had befriended him in his days of poverty, but the
marriage turned out ill and he was shortly afterwards separated from his wife, though he continued to support her until her death in 1800. From 1760 to 1790 he remained with the Esterhazys, principally at their country-seats of Esterháza and Eisenstadt, with occasional visits to Vienna in the winter. In 1762 Prince Paul Esterhazy died and was succeeded by his brother Nicholas, surnamed the Magnificent, who increased Haydn's salary, showed him every mark of favour, and, on the death of Werner in 1766, appointed him Oberkapellmeister. With the encouragement of a discriminating patron, a small but excellent orchestra and a free hand, Haydn made the most of his opportunity and produced a continuous stream of compositions in every known musical form. To this period belong five Masses, a dozen operas, over thirty clavier-sonatas, over forty quartets, over a hundred orchestral symphonies and overtures, a Stabat Mater, a set of interludes for the service of the Seven Words, an Oratorio Tobias written for the Tonkünstler-Societät of Vienna, and a vast number of concertos, divertimenti and smaller pieces, among which were no less than 175 for Prince Nicholas' favourite instrument, the baryton.

Meanwhile his reputation was spreading throughout Europe. A Viennese notice of his appointment as Oberkapellmeister spoke of him as "the darling of our nation," his works were reprinted or performed in every capital from Madrid to St Petersburg. He received commissions from every cathedral of Cadiz, from the grand duke Paul, from the king of Prussia, from the directors of the Concerts of Oxford at Paris; besides his transactions with Breitkopf and Härtel, and with La Chevardière, he sold to one English firm the copyright of no less than 120 compositions. But the most important fact of biography during these thirty years was his friendship with Mozart, whose acquaintance he made at Vienna in the winter of 1781-1782. There can have been little personal intercourse between them, for Haydn was rarely in the capital, and Mozart seems never to have visited Eisenstadt; but the cordiality of their relations and the mutual influence which they exercised upon one another is of the highest moment in the history of 18th-century music.

It was from Haydn that I first learned to write a quartet," said Mozart; it was from Mozart that Haydn learned the richer style and the fuller mastery of orchestral effect by which his later symphonies are distinguished. In 1790 Prince Nicolas Esterhazy died and the Kapelle was disbanded. Haydn, thus released from his official duties, forthwith accepted a commission from Salomon, the London concert-director, to write and conduct six symphonies for the concerts in the Hanover Square Rooms. He arrived in England at the beginning of 1791 and was welcomed with the greatest enthusiasm, receiving among other honours the degree of D Mus. from the university of Oxford. In June 1792 he returned home, and, breaking his journey at Bonn, was presented with a Cantata by Beethoven, then aged two-and-twenty, whom he invited to come to Vienna as his pupil. The lessons, which were not very successful, lasted for about a year, and were then interrupted by Haydn's second visit to England (January 1794 to July 1795), where he produced the last six of his "Salomon" symphonies. From 1795 onward he resided in the Mariawill suburb of Vienna, and there wrote his last eight Masses, the last and finest of his chamber works, the Austrian national anthem (1797), the Creation (1799) and the Seasons (1801). His last choral composition which can be coupled with any certainty was the Mass in C minor, written in 1802 for the name-day of Princess Esterhazy. Thenceforward his health declined, and his closing years, surrounded by the love of friends and the esteem of all musicians, were spent almost wholly in retirement. On the 27th of March 1808 he was able to attend a performance of the Creation, given in his honour, but it was his last effort, and on the 31st of May 1809 he died, aged seventy-seven. Among the mourners who followed him to the grave were many French officers from Napoleon's army, which was then occupying Vienna.

Haydn's place in musical history is best determined by his instrumental compositions. His operas, for all their daintiness and melody, no longer hold the stage; the Masses in which he "praised God with a cheerful heart" have been condemned by the severer decorum of our own day; of his oratorios the Creation alone survives. In all these his work belongs mainly to the style and idiom of a bygone generation: they are monuments, not landmarks, and their beauty and invention seem rather to close an epoch than to inaugurate its successor. Even the half pictorial suggestion, of which free use is made in the Creation and in the Seasons, is closer to the manner of Handel than to that of the 19th century: it is less the precursor of romance than the descendant of an earlier realism. But as the first great master of the quartet and the symphony his claim is incontestable. He began, half-consciously, by applying through the fuller medium the lessons of design which he had learned from C. P. E. Bach's sonatas; then the medium itself began to suggest wider horizons and new possibilities of treatment; his position at Eisenstadt enabled him to experiment without reserve; his genius, essentially symphonic in character, found its true outlet in the opportunities of pure musical structure. The quartets in particular exhibit a wider range and variety of structural invention than those of any other composer except Beethoven. Again it is here that we can most readily trace the important changes which he wrought in melodic idiom. Before his time instrumental music was chiefly written for the Paradiesensaal, and its melody often sacrificed vitality of idea to a ceremonial courtliness of phrase. Haydn broke through this convention by frankly introducing his native folk-music, and by writing many of his own tunes in the same direct, vigorous and simple style. The innovation was at first received with some disfavour; critics accustomed to polite formalism censured it as extravagant and undignified; but the freshness and beauty of its melody soon silenced all opposition, and did more than anything else throughout the 18th century to establish the principle of nationalism in musical art. The actual employment of Croatian folk-tunes may be illustrated from the string quartets Op. 17, No. 1; Op. 33, No. 3; Op. 50, No. 1; Op. 77, No. 1, and the Salomon Symphonies in D and E9, while there is hardly an instrumental composition of Haydn's in which his own melodies do not show some traces of the same influence. His natural idiom in short was that of a heightened and ennobled folk-song, and one of the most remarkable evidences of his genius was the power with which he adapted all his perfection and symmetry of style to the requirements of popular speech. His music is in this way singularly expressive; its humour and pathos are not only absolutely sincere, but so outspoken that we cannot fail to catch its significance.

In the development of instrumental polyphony Haydn's work was almost as important as that of Mozart. Having at his disposal a band of picked virtuosi he could produce effects which were beyond the conception of C. P. E. Bach, as these were from the orchestral platitudes of Reutter or Hasse. His symphony Le Midi (written in 1761) already shows a remarkable freedom and independence in the handling of orchestral forces, and further stages of advance were reached in the oratorio of Tobias, in the Paris and Salomon symphonies, and above all in the Creation, which turns to good account some of the debt which he owed to his younger contemporary. The importance of this lies not only in a greater richness of musical colour, but in the effect which it produced on the actual substance and texture of composition. The polyphony of Beethoven was unquestionably influenced by it and, even in his latest sonatas and quartets, may be regarded as its logical outcome.

The compositions of Haydn include 100 symphonies, 16 overtures, 76 quartets, 68 trios, 54 sonatas, 31 concertos and a large number of divertimentos, cassations and other instrumental pieces; 24 operas and oratorios, 16 Masses, 16 String Quartets, 3 Masterpieces, 3 oratorios, 2 Te Deums and many smaller pieces for the church, over 40 songs, over 50 canons and arrangements of Scottish and Welsh national melodies.

His youngest brother, Johann Michael Haydn (1737-1806), was also a chorister at St Stephen's, and shortly after leaving the choir-school was appointed Kapellmeister at Grossweiden (1755) and at Salzburg (1762). The latter office he held for thirty-three years, during which time he wrote over 360 compositions.
for the church and much instrumental music, which, though unequal, deserves more consideration than it has received. He was the intimate friend of Mozart, who had a high opinion of his genius, and the teacher of C. M. von Weber. His most important works were the Missa hispanica, which he exchanged for his diploma at Stockholm, a Mass in D minor, a Lauda Sion, a set of graduals, forty-two of which are reprinted in Diabelli's Ecclesiasticum, three symphonies (1785), and a string quartet in C major which has been erroneously attributed to Joseph Haydn. Another brother, Johann Evangelist Haydn (1743-1805), gained some reputation as a tenor vocalist, and was for many years a member of Prince Esterhazy's Kapelle.

HAYDON, BENJAMIN ROBERT (1786-1846), English historical painter and writer, was born at Plymouth on the 26th of January 1786. His mother was the daughter of the Rev. Benjamin Cobley, rector of Dodbrok, Devon, whose son, General Sir Thomas Cobley, signalized himself in the Russian service at the siege of Ismail. His father, a prosperous printer, stationer and publisher, was a man of literary taste, and was well known and esteemed amongst all classes in Plymouth. Haydon, an only son, at an early date gave evidence of his taste for study, which was carefully fostered and promoted by his mother. At the age of six he was placed in Plymouth grammar school, and at twelve in Plympton St Mary school. He completed his education in this institution, where Sir Joshua Reynolds also had acquired all the scholastic training he ever received.

On the ceiling of the school-room was a sketch by Reynolds in burnt cork, which it used to be Haydon's delight to sit and contemplate. Whilst at school he had some thought of adopting the medical profession, but he was so shocked at the spirit of an operation that he gave up the idea. A perusal of Albion's Lays, however, inspired him with a love for anatomy and Reynolds's discourses revolved within him a smouldering taste for painting, which from childhood had been the absorbing idea of his mind.

Sanguine of success, full of energy and vigour, he started from the parental roof, on the 14th of May 1804, for London, and entered his name as a student of the Royal Academy. He began and prosecuted his studies with such unceasing ardour that Fuseli wondered when he ever found time to eat. At the age of twenty-one, and to look at the lecturer, excited by his subject, one could scarcely fancy him a man overwhelmed with difficulties and anxieties. The height of Haydon's ambition was to behold the chief buildings of his country adorned with historical representations of her glory. He lived to see the acknowledgment of his principles by government in the establishment of schools of design, and the embellishment of the new houses of parliament; but in the competition of artists for the carrying out of this object, the commissioners (amongst whom was one of his former pupils considered, or affronted to consider that he had failed). Haydon was well versed in all points of his profession; and his Lectures, which were published shortly after their delivery, showed that he was as bold a writer as painter. It may be mentioned in this connexion that he was the author of the long and elaborate article, "Painting," in the 7th edition of the Encyclopaedia Britannica.
To form a correct estimate of Haydon it is necessary to read his autobiography. This is one of the most natural books ever written, full of various and abundant power, and fascinating to the reader. The author seems to have daguerreotyped his feelings and sentiments without restraint as they rose in his mind, and his portrait stands in these volumes limned to the life by his own hand. His love for his art was both a passion and a principle. He found patrons difficult to manage; and, not having the tact to lead them gently, he tried to drive them fiercely. He failed, abused patrons and patronage, and intermingled talk of the noblest independence with acts not always dignified. He was self-willed to perversity, but his perseverance was such as is seldom associated with so much vehemence and passion. With a large fund of genuine self-reliance he combined a considerable measure of vanity. To the last he believed in his own powers and in the ultimate triumph of art. In taste he was deficient, at least as concerned himself. Hence the tone of self-assertion which he assumed in his advertisements, catalogues and other appeals to the public. He proclaimed himself the apostle and martyr of high art, and, not without some justice, he believed himself to have on that account a claim on the sympathy and support of the nation. It must be confessed that he often tested severely those whom he called his friends. Every reader of his autobiography will be struck at the frequency and fervour of the short prayers interspersed throughout the work. Haydon had an overwhelming sense of a personal, overruling and merciful providence, which influenced his relations with his family, and to some extent with the world. His conduct as a husband and father entitles him to the utmost sympathy. In art his powers and attainments were undoubtedly very great, although his actual performances mostly fall short of the faculty which was manifestly within him; his general range and force of mind were also most remarkable, and would have qualified him to shine in almost any path of intellectual exertion or of practical work. His eager and combative character was partly his enemy; but he had other enemies actuated by motives as unworthy as his own were always high-pitched and on abstract grounds laudable. Of his three great works—the "Solomon," the "Entry into Jerusalem" and the "Lazarus"—the second has generally been regarded as the finest. The "Solomon" is also a very admirable production, showing his executive power at its highest. The political proclivities of his subject are to be found in the list of British historical painting in his own time. The "Lazarus" (which belongs to the National Gallery, but is not now on view there) is a more unequal performance, and in various respects open to criticism and censure; yet the head of Lazarus is so majestic and impressive that, if its author had done nothing else, we must still pronounce it a potent pictorial genius.

The chief authorities for the life of Haydon are Life of B. R. Haydon, from his Autobiography and Journals, edited and compiled by Tom Taylor (3 vols., 1853); and B. R. Haydon's Correspondence and Table Talk, with a memoir by his son, F. W. Haydon (2 vols., 1876).

HAYES, RUTHERFORD BIRCHARD (1822-1893), nineteenth president of the United States, was born in Delaware, Ohio, on the 4th of October 1822. He received his first education in the common schools, graduated in 1842 at Kenyon College, Gambier, Ohio, and was a student at the law school of Harvard University from 1843 until his graduation in 1845. He was admitted to the bar in 1845, and practised law, first at Lower Sandusky (now Fremont), and then at Cincinnati, where he won a very respectable standing, and in 1858-1861 served as city solicitor. In politics he was at first an anti-slavery Whig and then from the time of its organization in 1854 until his death was a member of the Republican party. In December 1852 he married Lucy Webb, who was the daughter of his former college classmate, George C. Webb. Their only child was Richard Grant, born on July 17, 1855. After the breaking out of the Civil War the governor of Ohio, on the 7th of June 1861, appointed him a major of a volunteer regiment, and in July he was sent to western Virginia for active service. He served throughout the war, distinguished himself particularly at South Mountain, Winchester, Fisher's Hill and Cedar Creek, and by successive promotions became a brigadier-general of volunteers and, by brevet, a major-general of volunteers. While still in the field he was elected a member of the National House of Representatives, and took his seat in December 1865. He was re-elected in 1866, and supported the reconstruction measures advocated by his party. From 1868 to 1872 he was governor of Ohio. In 1873 he removed from Cincinnati to Fremont, his intention being to withdraw from public life; but in 1875 the Republican party in Ohio once more selected him as its candidate for the governorship. He accepted the nomination with great reluctance. The Democrats adopted a platform declaring in favour of indefinitely enlarging the volume of the irredeemable paper currency which the Civil War had left behind it. Hayes stoutly advocated the speediest practicable resumption of specie payments, and carried the election. The "sound-money campaign" in Ohio having attracted the attention of the whole country, Hayes was marked out as a candidate for the presidency, and he obtained the nomination of the Republican National Convention of 1876, his chief competitor being James G. Blaine. The candidate of the Democratic party, Samuel J. Tilden, by his reputation as a statesman and a reformer of uncommon ability, drew many Republican votes. An excited controversy having arisen about the results of the balloting in the states of South Carolina, Florida, Oregon and Louisiana, the two parties in Congress in order to allay a crisis dangerous to public peace agreed to pass an act referring all contested election returns to an extraordinary commission, called the "Electoral Commission" (q.v.), which decided each contest by eight against seven votes in favour of the Republican candidates. Hayes was accordingly on the 2nd of March 1877 declared duly elected.

During his administration President Hayes devoted his efforts mainly to civil service reform, resumption of specie payments and the pacification of the Southern States, recently in rebellion. In order to win the co-operation of the white people in the South in maintaining peace and order, he put himself in communication with their leaders. He then withdrew the Federal troops which since the Civil War had been stationed at the southern State capitals. An end was thus made of the "carpet-bag governments" conducted by Republican politicians from the North, some of which were very corrupt, and had been upheld mainly by the Federal forces. This policy found much favour with the people generally, but displeased many of the Republican party. The social and political upheaval which followed the withdrawal of the Federal troops upon the Southern States. Though it did not secure to the negroes sufficient protection in the exercise of their political rights, it did much to extinguish the animosities still existing between the two sections of the Union and to promote the material prosperity of the South. President Hayes endeavoured in vain to induce Congress to appropriate money for a Civil Service Commission; and whenever he made an effort to restrict the operation of the traditional "spoils system," he met the strenuous opposition of a majority of the most powerful politicians of his party. Nevertheless the system of competitive examinations for appointments was introduced in some of the great executive departments in Washington, and in the custom-house and the post-office in New York. Moreover, he ordered that "no officer should be required or permitted to take part in the management of political organizations, caucuses, conventions or election campaigns," and that "no assessment for political purposes on officers or subordinates should be allowed"; and he removed from their offices the heads of the post-office in St Louis and of the custom-house in New York—influential party managers—on the ground that they had misused their official positions for partisan ends. In the sectional contest which determined the period of his administration, the key to the election lay in Ohio. At the polls in that State the candidate of the party of the "common people" was already in office as the head of the collector; Alonzo B. Cornell, the national officer of the Port; and George H. Sharpe, the surveyor of the customs. While these measures were of limited scope and effect, they served greatly to facilitate the more extensive reform of the civil service which subsequently took place, though at the same time they alienated a powerful faction of the Republican party in New York under the leadership of Roscoe Conkling. Although the resumption of specie payments had been provided for, to begin at a given
time by the Resumption Act of January 1875, opposition to its
did not cease. A bill went through both Houses of Congress
providing that a silver dollar should be coined of the weight of
412 grains, to be full legal tender for all debts and dues, public
and private, except where otherwise expressly stipulated in the
chartering of the issuing company. The joint action of the two
Houses to approve the bill was expected, and the veto was overruled
in both Houses of Congress. Meanwhile,
however, the preparations for the return of specie payments
were continued by the Administration with unflinching constancy
and on the 1st of January 1879 specie payments were resumed
without difficulty. None of the evils predicted appeared.
A marked revival of business and a period of general prosperity
ensued. In his annual message of the 1st of December 1879
President Hayes urged the suspension of the silver coinage and
the withdrawal of the silver certificate notes, but Congress
failed to act upon the recommendation. His ad-
ministration also did much to ameliorate the condition of
the Indian tribes and to arrest the spoliation of the public forest
lands.

Although President Hayes was not popular with the pro-
fessional politicians of his own party, and was exposed to bitter
attacks on the part of the Democratic opposition on account of
the cloud which hung over his election, his conduct of public
affairs was much satisfaction to the people generally. In the
presidential election of 1880 the Republican party carried the
day after an unusually quiet canvass, a result largely due to
popular contentment with the then existing state of public
affairs. On the 4th of March 1881 President Hayes retired to his
home at Fremont, Ohio. Various universities and colleges con-
ferred honorary degrees upon him. His remaining years he
devoted to active participation in philanthropic enterprises;
thus he served as president of the National Prison Association
and of the Board of Trustees chosen to administer the John F.
Slater Fund for the promotion of industrial education among the
negroes of the South, and was a member, also, of the Board of
Trustees of the Peabody Education fund for the promotion of
education in the South. He died at Fremont, after a short ill-
ness, on the 17th of January 1893.

There is no adequate biography, but three "campaign lives"
may be mentioned: Life, Public Services and Selected Speeches of
Rutherford B. Hayes, by James Quay Howard (Cincinnati, 1876);
Life of R. B. Hayes, by William D. Howells (New York, 1879); and
a Life by Russell H. Conwell (Boston, 1875). See also Paul L.
Hawley, R. B. Hayes, from Memory. The Tilden Disputed Presidential Election of 1876
(Cleveland, O., 1906). (C. S.)

HAY FEVER, Hay Asthma, or Summer Cataract, a catararrhal
affection of the mucous membrane of the upper respiratory tract,
due to the action of the pollen of certain grasses. It is often
associated with asthmatic attacks. The disease affects certain
families, and is hereditary in about one-third of the cases. It
is more common among women than men, city than country
dwellers, and the educated and highly nervous than the lower
classes. It has no connexion with the coryzas that are produced
in nervous people by the odour of cats, &c. The complaint has
been investigated by Professor W. P. Dunbar of Hamburg,
who has shown that it is due to the pollens of certain grasses
(notably rye) and plants, and that the severity of the attack is
directly proportional to the amount of pollen in the air. He has
isolated an albuminoid poison which, when applied to the nose
of a susceptible individual, causes an attack, while there is no
result in the case of a normal person. By injecting the poison
into animals, he has obtained an anti-4oxin, which is capable of
abating an attack of hay fever. The symptoms are those commonly
experienced in the case of a severe cold, consisting of
headache, violent sneezing and watery discharge from the nostrils
and eyes, together with a hard dry cough, and occasionally severe
asthmatic paroxysms. The period of liability to infection
naturally coincides with the pollen season.

The radical treatment is to avoid vegetation. Local treat-
ment consisting of thorough destruction of the sensitive area
of the mucous membrane of the nose often produces good results.
There are various drugs, the best of which are cocaine and the extract of the suprarenal body, which, when applied to the nose,
are sometimes effectual; in practice, however, it is found that
larger and larger doses are required, and that sooner or later they
afford no relief. The same remarks apply to a number of patent
specifics, of which the principal constituent is one of the above
drugs. An additional and stronger objection to the use of cocaine
is that it will often contract, with the most obvious results.
Finally Dunbar's serum may be applied to the nose and
eyes on rising, and on the slightest suggestion of irritation during
the day; it will, in the large majority of cases, be found to be
quite effectual.

HAYLEY, WILLIAM (1745-1820), English writer, the friend
and biographer of William Cowper, was born at Chichester
on the 6th of November 1745. He was sent to Eton in 1757,
and to Trinity Hall, Cambridge, in 1763; his connexion with
the Middle Temple, London, where he was admitted in 1766,
was merely nominal. In 1767 he left Cambridge and went to live in
London. Two years later he married Eliza, daughter of Thomas
Ball, dean of Chichester. His private means enabled Hayley
to live on his patrimonial estate at Earthatm, Sussex, and he retired
there in 1774. He had already written many occasional poetical
pieces, when in 1771 his tragedy, The Afflicted Father,
was rejected by David Garrick. In the same year his translation of
Pierre Corneille's Rodrigue as The Syrian Queen was also declined
by Dr. Johnson. He was then engaged, however, upon his
contemporary dramas, and in 1775 he introduced a new
genre, which was to supply the place of the metrical
verses of common usage. It was the Poetical Essay, a
Poetical Epistle to an Eminent Panelter (1775), addressed to
his friend George Romney, an Essay on History (1780), in
three epistles, addressed to Edward Gibbon: Essay on Epic Poetry
(1782) addressed to William Mason; A Philosophical Essay on
Old Maids (1785); and the Triumphs of Temper (1781). The last
mentioned work was so popular as to run to twelve or fourteen
ditions; together with the Triumphs of Music (Chichester,
1804) It was ridiculed by Byron in English Bards and Scotch
Reviewers. So great was Hayley's fame that on Thomas Warmon's
death in 1796 he was offered the laureateship, which he refused.
In 1792, while writing the Life of Milton (1794), Hayley made
Cowper's acquaintance. A warm friendship sprang up between
the two which lasted till Cowper's death in 1800. Hayley indeed
was mainly instrumential in getting Cowper his pension. In
1800 Hayley also lost his natural son, Thomas Alphonso Hayley,
to whom he was devotedly attached. He had been a pupil of
John Flaxman's, to whom Hayley's Essay on Sculpture (1800)
is dedicated. His Poetical Works were published 1803
and after the latter had moved in 1800 to his "marine hermitage"
at Felpham, Sussex, Blake settled near him for three years to
engrave the illustrations for the Life of Cowper. This, Hayley's
best known work, was published in 1803-1804 (Chichester) in
3 vols. In 1805 he published Ballads founded on Anecdotes of
Animals (Chichester), with illustrations by Blake, and in 1809
the Life of Romney. For the last twelve years of his life Hayley
received an allowance for writing his Memoirs. He died at
Felpham on the 12th of November 1820. Hayley's first wife
died in 1797; her mind had been seriously affected, and
since 1789 they had been separated. He married in 1809 Mary
Welford, but they also separated after three years. He left no
children.

Hayley's Poetical Works were published in 3 vols. (1785);
his Poems and Plays in 6 vols. (1788).

See Memoirs ... of William Hayley and Memoirs of his
son T. A. Hayley, ed. John Johnson (2 vols., 1823) (containing
many of Hayley's letters); an article on these memoirs by Robert
Southey in the Quarterly Review, vol. xxxi., 1825; William Blake,
by A. C. Swinburne (2nd ed., 1868, pp. 28 et seq.); Life of William
Blake, by Alexander Gilchrist (vol. i., 1880), with some of Blake's
letters to Hayley; The Correspondence of William Cowper, arranged
by Thomas Wright (vol. iv., 1904), containing many letters to Hayley.

HAYM, RUDOLF (1821-1901), German publicist and philo-
osopher, was born at Grünberg, in Silesia, on the 9th of October
1821, and died at St Anton (Arlberg) on the 27th of August 1901.
He studied philosophy and theology at Halle and Berlin, and
lived at Halé during 1846 and 1847. He was a member of the
National Assembly at Frankfurt in 1848, and wrote an account of
the proceedings from the standpoint of the Right Centre.
From 1851 he lectured in literature and philosophy at the university of Halle, and became professor in 1860. His writings are biographical and critical, devoted mainly to modern German philosophy and literature. In 1870 he published a masterly history of the Romantic school. He also wrote biographies of W. von Humboldt (1850), Hegel (1857), Schopenhauer (1864), Herder (1877-9, 2 vols., 1890). In 1901 he published Erinnerungen aus meinem Leben.

**HAYNAU, JULIUS JACOB** (1786-1853), Austrian general, was the natural son of the landgrave—afterwards elector—of Hesse-Cassel, William IX. He entered the Austrian army as an infantry officer in 1801, and saw much service in the Napoleonic wars. He was wounded at Wagram, and distinguished during the operations in Italy in 1813 and 1814. Between 1815 and 1847 he rose to the rank of field marshal lieutenant. A violent temper, which he made no attempt to control or conceal, led him into trouble with his superiors. His hatred of revolutionary principles was fanatical. When the insurrectionary movements of 1848 broke out in Italy, his known zeal for the cause of legitimacy, as much as his reputation as an officer, marked him out for command. He fought with success in Italy, but was chiefly noted for the severity he showed in suppressing and punishing a rising in Brescia. It ought to be remembered that the mob of Brescia had massacred invalid Austrian soldiers in the hospital, a provocation which always leads to reprisals. In June 1849 Haynau was called to Vienna to command first an army of reserve, and then in the field against the Hungarians. His successes against the declining revolutionary cause were numerous and rapid. In Hungary, as in Italy, he was accused of brutality. It was, for instance, asserted that he caused women who showed any sympathy with the insurgents to be whipped. His ostentatious hatred of the revolutionary parties marked him out as the natural object for these accusations. On the restoration of peace he was appointed to high command in Hungary. His temper quickly led him into quarrels with the minister of war, and he resigned his command in 1850. He then travelled abroad. The refugees had spread his evil reputation. In London he was attacked and beaten by Messrs Barchy & Perkins' draymen when visiting the brewery, and he was saved from mob violence in Brussels with some difficulty. He died on the 14th of March 1853. On the 11th of October 1856 Haynau had married Thérèse von Haynau, the daughter of Field Marshal Lieutenant Weber, who was slain at Aspern. She died, leaving one daughter, in 1850.

**HAYNE, ROBERT YOUNG** (1791-1839), American political leader, born in St Paul's parish, Colleton district, South Carolina, on the 10th of November 1791. He studied law in the office of Langdon Cheves (1776-1857) in Charleston, S.C., and in November 1812 was admitted to the bar there, soon obtaining a large practice. For a short time during the War of 1812 against Great Britain, he was captain in the Third South Carolina Regiment. He was a member of the lower house of the state legislature from 1814 to 1818, serving as speaker in the latter year; was attorney-general of the state from 1818 to 1822, and in 1823 was elected, as a Democrat, to the United States Senate. Here he was conspicuous as an ardent free-trader and an uncompromising advocate of "States Rights," opposed the protectionist tariff bills of 1824 and 1828, and consistently upheld the doctrine that slavery was a domestic institution and should be dealt with only by the individual states. In one of his speeches opposing the sending by the United States of representation to the Panama Congress, he said, "The moment the federal government shall make the unhallowed attempt to interfere with the domestic concerns of the states, those states will consider themselves driven from the Union." Hayne is best remembered, however, for his great debate with Daniel Webster (q.v.) in January 1830. The debate arose over the so-called "Foote's Resolution," introduced by Senator Samuel A. Foote (1783-1846) of Connecticut, calling for the restriction of the sale of public lands to those already in the market, but was concerned primarily with the relation to one another and the respective powers of the federal government and the individual states. Hayne contending that the constitution was essentially a compact between the states, and the national government and the states, and that any state might, at will, nullify any federal law which it considered to be in contravention of that compact. He vigorously opposed this view, and was a member of the South Carolina Nullification Convention of November 1832, and reported the ordinance of nullification passed by that body on the 24th of November. Resigning from the Senate, he was governor of the state from December 1832 to December 1834, and as such took a strong stand against President Jackson, though he was more conservative than many of the nullificationists in the state. He was a member (mayor) of Charleston, S.C., from 1835 to 1837, and was president of the Louisville, Cincinnati & Charleston railway from 1837 to 1839. He died at Asheville, N.C., on the 24th of September 1839. His son, Paul Hamilton Hayne (1825-1866), was a poet of some distinction, and in 1878 published a life of his father.

**HAYTER, SIR GEORGE** (1792-1871), English painter, was the son of a popular drawing-master and teacher of perspective who published a well-known introduction to perspective and other works. He was born in London, and in his early youth went to sea. He afterwards studied in the Royal Academy, became a miniature-painter, and was appointed in 1816 miniature-painter to the princess Charlotte. He passed some years in Italy, more especially in Rome, between 1816 and 1831, and in 1831 returned to London in the last-named year. As a miniature-painter, now chiefly in oil-colour, executed many likenesses of the royal family, and attained such a reputation for finish and refinement in his work that he received the appointment of principal painter to Queen Victoria and teacher of drawing to the princesses. In 1842 he was knighted. He painted various works on a large scale of a public and semi-historical character, but essentially works of portraiture; such as "The Trial of Queen Caroline" (1859), "The Meeting of the First Reformed Parliament," now in the National Portrait Gallery, "Queen Victoria taking the Coronation Oath" (accounted his finest production), "The Marriage of the Queen," and the "Trial of Lord Russell." The artistic merits of Hayter's works are not, however, such as to preserve him with posterity an amount of prestige corresponding to that which court patronage procured him.

He is not to be confused with a contemporary artist, John Hayter, who produced illustrations for the Book of Beauty, &c.

**HAYTON (HAIGHT, HETHUM),** king of Little Armenia or Cilicia from 1224 to 1269, traveller in western and central Asia, Mongolia, &c., was the son of Constantine Rupen, and became heir to the throne of Lesser Armenia by his marriage with Isabella, daughter and only child of Leo II. After a reign of forty-five years he abdicated (1269) in favour of his son Leo III., became a monk and died in 1271. Before his accession he had been "constable," or head of the Armenian army, and "bailiff" of the realm. Throughout his reign he followed the policy of friendship and alliance with the overwhelming power of the Mongols. In about 1248 he sent his brother Sempad, who was now constable in his place, on a mission to Kuyuk Khan, the supreme Mongol emperor. Sempad was well received and returned home in 1250, bringing letters from Kuyuk. After Mangu's accession in 1251, Batu (the most powerful of the Mongol princes and generals, and the conqueror—in name at least of the Central Empire, but in fact of the whole of the Volga) summoned Hayton to the court of the new grand khan. Carefully disguised, so as to pass safely through the Turkish states in the interior of eastern Asia Minor (where he was hated as an ally of the Mongols against Islam), Hayton made his way to Kars, the central Mongol camp in Great Armenia, where the famous general Bachu, or Baiju, commanded. Here he reported himself, and was permitted to remain some time in the Ararat region, at the foot of Mt Alagöz, near the metropolitan church of
Echmiadzin. Being joined by his suite, especially the clerical diplomats Bastl the Priest, and James the Abbot, Hayton next proceeded to Van, where Lord Williams, threading the pass of the Iron Gates of Derbent, and so reached the camp of Batu on the Volga, where he was cordially welcomed. Thence he set out (May 13th, 1524) on the "very long road beyond the Caspian Sea" to the residence of Mangu at or near Karakorum, south of Lake Baikal. After passing the Ural river, we only hear of his arrival at Or, probably the present Ili province, east of Balkhash, and of his reaching the Irtish, entering the Naiman country, and passing through "Karakhaitsi" (apparently the capital of the ruined Karakhita empire, invented), his progress is stodied till he is driven out of his place in Hayton's record. On the 13th of September the travellers entered Mongolia, and on the 14th (?) of September were received by Mangu. Here the king remained till the 1st of November, when he left with diplomats, seals and letters of enfranchisement which promised great things for the Armenian state, church and people. His return journey was by very unusual and interesting routes—through the Urumtsi range, the basin of "the sea of milk," Lake Satram, the valley of the Ili, the neighbourhoud of Kulja, and so over mountains, with which probably answer to certain outliars of the Alexander range, to Talas near the present Aulie Ata, midway between the Syr Daria and the Chu. Here he met and conferred with Hulagu Khan, Mangu's brother, the future conqueror of Bagdad: probably Hayton was expected to aid in the coming forward movement of the Mongol armies against the Moslem world. From Talas Hayton made a detour to the north-west to meet another Mongol prince, Sartach the son of Batu; after which he ascended the valley of the Syr Daria, crossed into Trans-Osiris, visited Samarkand and Bokhara, and passed the Oxus apparently near Charjui. By way of Merv and Sarakhs he then entered Khomsan and traversed north Persia, passing through Rai near Tehran, Kavzin and Tabriz, and so returning to the camp of Bachu in Armenia, now at Siian near Lake Gokcha (July 1525). Thanks to his powerful friends, Hayton's journey was unusually rapid. Eight months after quitting Mangu's horse, he was back in Great Armenia. The narrative of this journey, which was written by a member of the king's suite, one Kirakos of Gandash (the modern Elizavetpol), concludes with some interesting references to Buddhist tenets, to Chinese habits, to various monstrous races and to certain "women endowed with reason" dwelling "beyond Cathay." It also gives some notes, composed of truth and legend, on the wild tribes and animals of the Gobi and adjoining regions.

The record drawn up by Kirakos Gandaskatsi was in Armenian. A MS. of his, which he sold to his mahim master, Georg, and translated into Russian by Prince Argutinsky in the Sibirsky Vestnik for 1822, pp. 60, &c. This Russian version was again translated into French by Klaproth in the Nouveau Journal des Sciences for 1833 (vol. xi. pp. 273, &c.). Another French translation was made direct from the Armenian by M. Brosset in the Mémoires de l'Académie des Sciences de St. Pétersbourg for 1870; a fresh Russian version of the original, by Professor Patkanov, appeared in 1874. See also E. Breuschteich. Medieval Researches from Eastern Asiatic Sources, i. 163-172 (London, 1888, "Trümbir's Oriental " Series); C. R. Beazley, Dawn of Modern Geography, ii. 381-390 (1901). (C. R. B.)

**HAYWARD, ABRAHAM** (1818-1884), English man of letters, son of Joseph Hayward, of an old Wilshire family, was born at Witton, near Salford, on the 22nd of November 1818. After education at Blundell's school, Tiverton, he entered the Inner Temple in 1842, and was called to the bar in June 1832. He took part as a conservative in the discussions of the London Debating Society, where his opponents were J. A. Roebuck and John Stuart Mill. The editorship of the Law Magazine; or, Quarterly Review of Jurisprudence, which he held from 1829 to 1844, brought him into connexion with John Austin, G. Cornwiled Lewis, and such foreign jurists as Savigny, whose translation of his Eminent Jurists of Europe was rendered into English. In 1833 he travelled abroad, and on his return printed privately a translation of Goethe's Faust in English prose (pronounced by Carlyle to be the best version extant in his time). A second and revised edition was published after another visit to Germany in January 1834, in the course of which Hayward met Tiek, Chamisso, De la Motte Fouqué, and Varnhagen von Ense and Madame Goethe. In 1878 he contributed the rather colourless volume on Goethe to Blackwood's Foreign Classics. A successful translation was in those days a first-rate credential for a reviewer, and Hayward began contributing to the New Monthly, the Quarterly, the Quarterly Review and the Edinburgh Review. His first successes in this new field were won in 1853-1856 by articles on Walker's "Original" and on "Gastronomy." The essays were reprinted to form one of his best volumes, The Art of Dining, in 1852. In February 1853 he was elected to the Athenaeum Club under Rule II., and he remained for nearly fifty years one of its most conspicuous and most influential members. He was also a subscriber to the Carlton, but ceased to frequent it when he became a Peer. At the Temple, Hayward, whose reputation was rapidly growing as a connoisseur not only of a bill of fare but also (as Swift would have said) of a bill of company, gave recherché dinners, at which ladies of rank and fashion appreciated the wit of Sydney Smith and Theodore Hook, the dignity of Lockhart and Lyndhurst and the oratory of Macaulay. At the Athenaeum and in political society he to some extent succeeded to the position of Croker. He and Macaulay were commonly said to be the two best-read men in town. Hayward got up every important subject of discussion immediately it came into prominence, and concentrated his information in such a way that he habitually had the last word to say on a topic. When Rogers died, when Vanity Fair was published, when the Greville Memoirs was issued or a revolution occurred on the continent, Hayward, whose memory was as retentive as his power of accumulating documentary evidence was exhaustive, wrote an elaborate essay on the subject for the Quarterly or the Edinburgh. He followed up his paper by giving his acquaintances no rest until they either assimilated or undertook to combat his views. Political ladies first, and statesmen afterwards, came to recognize the advantage of obtaining Hayward's good opinion. In this way the "old reviewing hand" became an acknowledged link between society, letters and politics. As a professional man he was less successful; his promotion to Q.C. in 1845 excited a storm of opposition, and, disgusted at not being elected a Bancher of his Inn in the usual course, Hayward virtually withdrew from legal practice. In February 1848 he became one of the chief leader-writers for the Peelite organ, the Morning Chronicle. The morbid activity of his memory, however, continued to make him many enemies. He alienated Disraeli by tracing a purple patch in his official eulogy of Wellington to a newspaper translation from Thiers's funeral panegyric on General St. Cyr. His sharp tongue made an enemy of Roebuck, and he disgusted the friends of Mill by the stories he raked up for an obituary notice of the great economist (The Times, 16th May 1873). He broke with Henry Reeve in 1874 by a venomous review of the Greville Memoirs, in which Reeve was compared to the beggarly Scot deputed to let off the blunderbuss which Bolingbroke (Greville) had charged. His enemies prevented him from enjoying a well-selected quasisecure, which both Palmerston and Aberdeen admitted to be his due. Samuel Warren attacked him (very unjustly, for Hayward was anything but a parasite) as Venom Tutt in Ten Thousand a Year; and Disraeli aimed at him partially in Ste Barbe (in Euphemion), though the satire here was directed primarily against Thackeray. After his break with Reeve, Hayward devoted himself more exclusively to the Quarterly. His essays on Chesterfield and Selwyn were reprinted in 1854. Collective editions of his articles appeared in volumeform in 1858, 1873 and 1874, and Selected Essays in two volumes, 1878. In his useful but far from flawless edition of the Autobiography, Letters and Literary Remains of Mrs. Thrale (Piozzi) (1861), he again appears as a supplement under the editorship of J. W. Croker, and his Eminent Lawyers and Writers (1880) contributes to a large extent personal friendships with such men as Dumas, Cavour and Thiers, whom he knew intimately. As a counsellor of great ladies and of politicians, to whom he
held forth with a sense of all-round responsibility surpassing that of a cabinet minister, Hayward retained his influence to the last years of his life. But he had little sympathy with modern ideas. He used to say that he had outlived every one that he could really look up to. He died, a bachelor, in his rooms at 8 St James’s Street (a small museum of autograph portraits and reviewing trophies) on the 2d of February 1884.

Two volumes of Hayward’s Correspondence (edited by H. E. Carlisle) were published in 1886. In Vanity Fair (27th November 1875) he may be seen as he appeared in later life. (T. Se.)

HAYWARD, SIR JOHN (c. 1560–1627), English historian, was born at or near Felixstowe, Suffolk, where he was educated, and afterwards proceeded to Pembroke College, Cambridge, where he took the degrees of B.A., M.A. and LL.D. In 1599 he published The First Part of the Life and Raigne of King Henrie IV., dedicated to Robert Devereux, earl of Essex. This was reprinted in 1642. Queen Elizabeth and her advisers disliked the tone of the book and its dedication, and the queen ordered Francis Bacon to search it for "places in it that might be drawn within case of treason." Bacon reported "for treason sincerely I find none, but for folly very many," even the extraordinary sentences were stolen from Tacitus; nevertheless Hayward was put in prison, where he remained until about 1601. On the accession of James I. in 1603 he courted the new king’s favour by publishing two pamphlets—"An Answer to the first part of a certaine conference concerning succession," and "A Treatise of Union of England and Scotland." The former pamphlet, an argument in favour of the divine right of kings, was reprinted in 1683 as "The Right of Succession" by the friends of the duke of York during the struggle over the Exclusion Bill. In 1610 Hayward was appointed one of the historiographers of the college which James founded at Chelsea; in 1613 he published his Lives of the Three Norman Kings of England, written at the request of James’s son, Prince Henry; in 1616 he became a member of the College of Advocates; and in 1619 he was knighted. He died in London on the 27th of June 1627. Among his manuscripts was found The Life and Raigne of King Edward VI., first published in 1560, and Certain Yeres of Queen Elizabeth’s Raigne, the beginning of which was printed in an edition of his Edward VI., published in 1566, but which was first published in a complete form in 1840 for the Camden Society under the editorship of John Bruce, who prefixed an introduction on the life and writings of the author. Hayward was conscientious and diligent in obtaining information, and although his reasoning on questions of morality is often childish, his descriptions are generally graphic and vigorous. Notwithstanding his imprisonment under Elizabeth, his portrait of the qualities of the queen’s mind and person is flattering rather than detractive. He also wrote several works of a devotional character.

HAYWOOD, ELIZA (c. 1603–1756), English writer, daughter of a London tradesman named Fowler, was born about 1603. She made an early and unhappy marriage with a man named Haywood, and her literary enemies circulated scandalous stories about her, possibly founded on her works rather than her real history. She appeared on the stage as early as 1715, and in 1721 she revised for Lincoln’s Inn Fields The Fair Captive, by a Captain Hurst. Two other pieces followed, but Eliza Haywood made her mark as a follower of Mrs Manley in writing scandalous and voluminous novels. To Memoirs of a certain Island adjacent to Utopia, written by a celebrated author of that country. Now translated into English (1725), she appended a key in which the characters were explained by initials denoting living persons. The names are supplied to these initials in the copy in the British Museum. The Secret History of the Present Intrigues of the Court of Carmanie (1727) was composed in a similar manner. The style of these performances is so extravagant as their matter. Pope attacked her in a coarse passage in The Dunciad (bk. ii. 1157 et seq.), which is aggravated by a note alluding to the "profligate licentiousness of those shameless scribblers (for the most part of that sex which ought least to be capable of such malice or impudence) who in libellous Memoirs and Novels reveal the faults or misfortunes of both sexes, to the ruin of public fame, or disturbance of private happiness." Swift, writing to Lady Suffolk, says, "Mrs Haywood I have heard of as a stupid, infamous, scribbling woman, but have not seen any of her productions." She continued to be a prolific writer of novels until her death on the 25th of February 1756, but her later works are characterized by extreme propriety, though an anonymous story of The Fortunate Foundlings (1744), purporting to be an account of the children of Lord Charles Manners, is generally ascribed to her.

A collected edition of her novels, plays and poems appeared in 1724, and her Secret Histories, Novels and Poems in 1725. See also an article by S. L. Lee in the Dictionary of National Biography.

HAZARA, a race of Afghanistan. The Hazaras are of Mongolian origin, speak a dialect of Persian, and belong to the Shiah sect of Mahomedans. They are of middle size but stoutly made, with small grey eyes, high cheek bones and smooth faces. They are descendants of military colonists introduced by Jenghiz Khan, who occupy all the highlands of the upper Helmund valley, spreading through the country between Kabul and Herat, as well as into a strip of territory on the western frontier of the Chaharman (Hazara, Jamshidis, Taimanis and Ferozkhois), and in other districts they are distinguished by the name of the territory they occupy. They are pure Mongols, intermixing with no other races (chiefly for the reason that no other races will intermix with them), preserving their language and their Mongol characteristics uninfluenced by their surroundings, having absolutely displaced the former occupants of the Hazarajat and Ghor. They make good soldiers and excellent pioneers. The amir’s companies of engineers are recruited from the Hazaras, and they form perhaps the most effective corps in his heterogeneous army. They are now recruited into the British services in India.

HAZARA, a district of British India, in the Peshawar division of the North-West Frontier Province, with an area of 3301 sq. m. It is bounded on the N. by the Black Mountain, the Swat country, Kohistan and Chilas; on the E. by the native state of Kashmir; on the S. by Rawalpindi district; and on the W. by the river Indus. On the creation of the North-West Frontier Province in 1901 the district was reconstituted, the Tahsil of Attock being transferred to Rawalpindi. The district forms a wedge of territory extending far into the heart of the outer Himalayas, and consisting of a long narrow valley, shut in on both sides by lofty mountains, whose peaks rise to a height of 17,000 ft. above sea level. Towards the centre of the district the vale of Kagaun is bounded by mountain chains, which sweep southward still maintaining a general parallel direction, and send off spurs on every side which divide the country into numerous minor dales. The district is well watered by the tributaries of the Indus, the Kunhar, which flows through the Kagan valley into the Jhelum, and many rivulets. Throughout the scenery is picturesque. To the north rise the distant peaks of the snow-clad ranges; midway, the central mountains stand clothed to their rounded summits with pines and other forest trees, while grass and brushwood spread a green cloak over the nearer hills, and cultivation covers every available slope. The chief frontier tribes on the border are the cis-Indus Swatis, Hassanzaihs, Akaizais, Chagarzais, Parhai Syads, Madda Khels, Amazais and Umarzais. Within the district Pathans are not numerous.

The name Hazara possibly belonged originally to a Turki family which entered India with Timur in the 14th century, and subsequently settled in this remote region. During the prosperous period of the Mogul dynasty the population included a number of mixed tribes which each began to assert its independence, so that the utmost anarchy prevailed until Hazara attracted the attention of the rising Sikh monarchy. Ranjit Singh first obtained a footing here in 1818, and, after eight years of constant aggression, became master of the whole country. During the minority of the young maharaja Dhuleep Singh, the Sikh kingdom fell into a state of complete disorganization; the people seized the opportunity for recovering their independence,
HAZARD—HAZEL

and rose in 1845 in rebellion. They stormed the Sikh forts, laid siege to Haripur, and drove the governor across the borders. After the first Sikh War it was proposed to transfer Hazara with Kashmir to Gulab Singh, but it remained under the British government in charge of James Abbott, who pacified it in less than a year and held it single-handed throughout the troubles of the second Sikh War. It was also undisturbed during the Mutiny. The population in 1901 was 560,288, showing an increase of 8-52% in the decade. The headquarters are at Abbotabad; pop. (1901) 7704. Through the Kagan valley and over the Babusar pass at its head lies the most direct route from the Punjab to Chillas and Gilgit.

HAZARD (O. Fr. hazard, from Span. azar, unlucky throw at dice, misfortune, from Arab. al, and zar, dice), a game of dice (called Craps in America), once very popular in England and played for large stakes at the famous rooms of Crockett (St. James's Street, London) and Almack (Pall Mall, London). The player or “caster” calls a “main” (that is, any number from five to nine inclusive). He then throws with two dice. If he “throws in,” or “nicks,” he wins the sum played for from the banker or “setter.” Five is a nick to five, six and twelve are nicks to six, seven and eleven to seven; eight and twelve to eight and eleven to ten; nine and twelve to nine and ten to twelve.

If the caster throws six or nine the caster throws out with 11 or 12; when the main is six or eight he throws out with 11; when the main is seven he throws out with 12. If the caster neither nicks nor throws out, the number thrown is his “chance,” and he keeps on throwing till either the chance comes up, when he wins, or till the main comes up, when he loses. When a chance is thrown the odds for or against the chance are laid by the setter to the amount of the original stake. Seven is the best main for the caster to call, as it can be thrown in six different ways out of the thirty-six casts which are possible with dice. Supposing seven to be the main; then the caster wins if he throws 7 or 11; he loses if he throws crabs or 12. If he throws any other number, 4 for example, that is his chance. The odds against him are two to one, as 7 can be thrown in six ways, but 4 only in three; hence six to three, or two to one, are the correct odds, and if the original stake was £1, the setter now lays £2 to £1 in addition. It is useful to remember that 2 and 12 can be thrown in one way; 3 and 11 in two ways; 4 and 10 in three ways; 5 and 9 in four ways; 6 and 8 in five ways. The odds against the caster are thus given by Hoyle: If 7 is the main and 4 the chance, two to one; 6 and 4, five to three; 5 and 4, four to three; 7 and 9, three to two; 7 and 6, six and five; 7 and 5, three to two; 6 and 5, five to four; 8 and 5, five to four, &c.

HAZARIBAGH, a town and district of British India, in the Chota Nagpur division of Bengal. The town is well situated at an elevation of 2000 ft. Pop. (1901) 15,799. Hazaribagh has ceased to be a military cantonment since the European penitentiary was abolished. There are a central jail and a reformatory school. The Dublin University Mission maintains a First Arts college. The District comprises an area of 7021 sq. m. In 1901 the population was 1,177,691, showing an increase of 1% in the decade. The physical formation of Hazaribagh exhibits three distinct features: (1) a high central plateau occupying the western section, the surface of which is undulating and cultivated; (2) a lower and more extensive plateau, stretching along the north and eastern portions; to the north, the land is well cultivated, while to the east the country is of a more varied character, the elevation is lower, and the character of a plateau is gradually lost; (3) the central valley of the Damodar river occupying the entire southern section. Indeed, although the characteristics of the district are rock, hill and wide-spreading jungle, fine patches of cultivation are met with in all parts, and the scenery is generally pleasing and often striking. The district forms a part of the chain of high land which extends across the continent of India, from the Nerbudda on the west, and south of the Sone river on the east. The most important river is the Damodar, with its many tributaries, which drains an area of 2480 sq. m.

The history of the district is involved in obscurity until 1755, about which time a certain Mukund Singh was chief of the country. In a few years he was superseded by Tej Singh, who had gained the assistance of the British. In 1786 Hazaribagh, along with the surrounding territory, passed under direct British rule.

The district contains an important coal-field at Giridih which supplies the East Indian railway. There are altogether six mines. There are also mica mines which are gaining in importance. Rice and oilseeds are the principal crops. Tea cultivation has been tried but does not flourish, and is almost extinct. The only railways are the branch of the East Indian to the coal-field at Giridih, where there is a technical school maintained by the railway company, and the newly-opened Gaya-Katrasgarh chord line; but the district is traversed by the Grand Truck road. Parsanath hill is annually visited by large numbers of Jain worshippers.

HAZEBROUCK, a town of northern France, capital of an arrondissement in the department of Nord, on the canalized Bourre, 29 m. W.N.W. of Lille, on the Northern railway, between that town and St Omer. Pop. (1906), town, 8758; commune, 12,819. With the exception of the church of St Eloi, a building of the 13th century with a spire of fine open work, 260 ft. high, and the hospice, occupying a convent built in the 16th and 17th centuries, there is little of architectural interest in the town. Hazebrouck is the seat of a sub prefect, and has a tribunal of first instance and a board of trade arbitration. It is the market for a fertile agricultural district, and has trade in live-stock, grain and hops. Cloth-weaving is the chief industry. Hazebrouck is an important junction, and railway employes form a large part of its population.

HAZEL (O. Eng. hazel; cf. Ger. Hasel, Swed. and Dan. hasel, &c.; Fr. noisetier, coudrier), botanically Corylus, a genus of shrubs or low trees of the natural order Corylaceae. The common hazel, Corylus Avellana (fig. 1), occurs throughout Europe, in North Africa and in central and Russian Asia, except the northernmost parts. It is commonly found in hedges and copses, and as an undergrowth in woods, and reaches a height of some 12 ft.; occasionally, as at Eastwell Park, Kent, it may attain to 30 ft. According to Evelyn (Sylva, p. 35, 1664), hazels "above all affect cold, barren, dry, and sandy soils; also mountains, and even rocke ground produce them; but more pleasantly if somewhat moist, dankish, and mossy." In Kent they flourish best in a calcareous soil. The bark of the older stems is of a bright brown, mottled with grey, that of the young twigs is ash-coloured, and glandular and hairy. The leaves are alternate, from 2 to 4 in. in length, downy below, roundish heart-shaped, pointed and shortly stalked. In the variety C. purpurea, the leaves, as also the pellicle of the kernel and the husk of the nut, are purple, and in C. heterophylla they are thickly clothed with hairs. In autumn the rich yellow tint acquired by the leaves of the hazel adds greatly to the beauty of landscapes. The flowers are monocious, and appear in Great Britain in February and March, before the leaves. The cylindrical drooping yellow male catkins (fig. 2) are 1 to 2½ in. long, and occur 2 to 4 in a raceme; when in unusual numbers they may be terminal in position. The female flowers are small, sub-globose and sessile, 1 has been supposed that the origin is to be found in O. Eng. hease, a beest, connected with hazel—Ger. heissen, to give orders; the hazel-wand was the sceptre of authority of the shepherd chief, hazel (roßhauf) of olden times, see Grimm, Gesch. d. deutsch. Sprache, p. 1016, 1848. The root is haz-, cf. Lat. corvus, corvi; and the original meaning is unknown.
HAZLETON

resembling leaf-buds, and have protruding crimson stigmas; the minute inner bracts, by their enlargement, form the palatantly lobed and cut involucr or husk of the nut. The ovary is not visible till nearly midsummer, and is not fully developed before autumn. The nuts have a length of from \( \frac{1}{4} \) to \( \frac{1}{2} \) in., and grow in clusters. Double nuts are the result of the equal development of the two carpels of the original flower, of which ordinarily one becomes abortive; fusion of two or more nuts is not uncommon. From the light-brown or brown colour out of the nuts the terms hazel and hazel, i.e., "in huz as hazel nuts" (Shakespeare, The Shrew, i. 1), derive their significance. 1 The wood of the hazel is whist-red, close in texture and plant, and has when dry a weight of 49 lb per cub. ft.; it has been used in cabinet-making, and for toys and turned articles. Curiously veined veneers are obtained from the roots; and the root-shoots are largely used in the making of small boxes, corns, etc., or for the purpose of divining-rod. The rods are reputed to be most durable when from the driest ground, and to be especially good where the bottom is chalky. The light charcoal afforded by the hazel serves well for crayons, and is valued by gunpowder manufacturers. An objection to the construction of hedges of hazel is the injury not infrequently done to them by the active vigour crashes down the tree." (Thomson's Seasons, Autumn), and otherwise damages it.

The filbert, 2 among the numerous varieties of Corylus Avellana, is extensively cultivated, especially in Kent, for the sake of its nuts, which are readily distinguished from cob-nuts by their ample involucre and greater length. It may be propagated by suckers and layers, by grafting and by sowing. Suckers afford the strongest and earliest-bearing plants. Grafted filberts are less liable than others to be encumbered by suckers at the root. By the Maidstone growers the best plants are considered to be obtained from those which become rooted in about a twelvemonth, and then, after pruning, are kept several years in the nursery for two or three years. The filbert is economically grown on the borders of plantations or orchards, or in open spots in woods. It thrives most in a light loam with a dry subsoil; rich and, in particular, wet soils are unsuitable, conducing to the formation of too much wood. Plantations of filberts are made in autumn, in well-drained ground, and a space of about 10 ft. by 8 has to be allowed for each tree. In the third year after planting the trees may require root-pruning; in the fifth or sixth they should bear well. The nuts grow in greatest abundance on the extremities of second year's branches, where light and air have ready access. To obtain a good crop practically select a stout upright shoot 3 ft. in length; this is cut down to about 18 in. of which the lower 12 are kept free from outgrowth. The head is pruned to form six or eight strong offsets; and by judicious use of the knife, and by training, preferably on a hoop placed within them, these are caused to grow outwards and upwards to a height of about 6 ft. so as to form a bowl-like shape. Excessive luxuriance of the laterals may be combated by root-pruning, or by checking them early in the season, and again later, and by cutting back to a female blossom bud, or else spurring nearly down to the main branch in the following spring.

Filbert nuts required for keeping must be gathered only when quite ripe; they may then be dried on a dry sand or hay, by spreading them out, by drying, by packing with a sprinkling of salt in sound casks or new flower-pots. Their different forms include the Cosford, which are thin-shelled and oblong; the Downton, or large square nut, having a lacinated husk; the white or Wrotham Park filbert; and the hazel filbert, the kernels of which is a red pellicle. The last two, on account of their elongated, nut-like form, and colour, were named as species, under the name Corylus tubulosa. Like these, apparently, were the nuts of Abella, or Avella, in the Campaign (cf. Fr. Arville, filbert), said by Pliny to be "brought to Pontic," from their introduction into Asia and Greece from Pontus (see Nat Hist. xiv. 24, xxiii. 78). Hazel-nuts, under the name of Barcelona or Spanish or French, are largely exported from Portugal, and especially Toyon, or Spain. They afford 60% of a colourless or pale-yellow, sweet-tasting, non-drying oil, which has a specific gravity of 0.92 nearly, and is best obtained at \( -1^\circ C \) (C. Cloez), and consists approximately of 77% and hydrogen peroxide. Oxygen, hydrogen, ammonia, and water formed part of the food of the ancient lake-dwellers of Switzerland and other countries of Europe (see Keller, Lake Dwellings, trans. Lee, 2nd ed., 1878). By the Romans they were sometimes eaten roasted. Kaltenbach (Pflanzenfeinde, pp. 633-638, 1874) enumerates ninety-eight insects which attack the hazel. Among these the beetle Balaninus nucum, the nut-whelk, seen on hazel and oak stems about the month of May till July, is highly destructive to the nuts. The female lays an egg in the unripe nut, on the kernel of which the larva subsists till September, when it bores its way through the wood and enters the earth, to undergo transformation into a chrysalis in the spring springing forth as a butterfly. It has been found mined on the upper and under side respectively by the larvae of the moths Lithocolletis coryli and L. Nicolai. Squirrels and other small carnivorous animals also take present consumption but for a store for future supply. Parasitic on the roots of the hazel is found the curious leafless Lathraea Squamaria or toothwort.

A new word, hazel, translated "hazel" in the authorized version of the English Bible (Gen. xxx. 37), is believed to signify "almond" (see Kitto, Cyclo. of Bibl. Lit. ii. 680, and iii. 811, 1864). A belief in the efficacy of divining-rods of hazel for the discovery of concealed objects is probable of remote origin (cf. Howa, ix. 2). G. Agricola, in his treatise Vom Bergwerk (pp. xxiv.-xxvii., Basel, 1557), gives an account, accompanied by a woodcut, of their employment for mining veins. By certain persons, who for different metals used rods of various materials, rods of hazel, he says, were held serviceable simply for silver lodes, and by the skilled miner, who trusted to natural signs of mineral veins, they obtained gold and silver. "It is possible that this rod was supposed to be dependent on its having two forks; these were to be grasped in the fists, with the fingers uppermost, but with moderate firmness only, lest the free motion of the opposite end should be interfered with. According to Cornish tradition, the divining or dowsing rod is guided to lodes by the pixies, the guardians of the treasures of the earth." By Vallemont, who wrote towards the end of the 17th century, the divining or dowsing rod is described as instrumental in the pursuit of criminals. The Jesuit Vaniere, who flourished in the early part of the 18th century, in his divinatory rusticaria, describes this rod as "the method best suited to the purpose," and positively interlaces the manner in which he exposed the chicanery of one who pretended by the aid of a hazel divining-rod to point out hidden water-courses and gold. The burning of hazel nuts for the purpose of divination is prohibited in the Papal Bull of St. Thursday, or the Spell, and by Burns in Halloween. The hazel is very frequently mentioned by the old French romance writers. Corylus rostrata and C. americana of North America have edible fruits like those of C. Avellana.

The witch hazel is quite a distinct plant, Hamamelis virginica, of the natural order Hamamelidaceae, the astringent bark of which is used in medicine. It is a hardy deciduous shrub, native of North America, which bears a profusion of rich yellow flowers in autumn and winter when the plant is leafless.

HAZLETON, a city of Luzerne county, Pennsylvania, U.S.A., about 25 m. S. of Wilkes-Barre. Pop. (1890) 11,872; (1900) 14,420, of whom 2732 were foreign-born; (1910 census) 25,452. It is served by the Lehigh Valley, the Pennsylvania (for freight), and the Wilkes-Barre & Hazleton (electric) railways. The city is built on a broad tableland on Nescopeck or Buck Mountain, a spur of the Blue Mountains, about 1620 ft. above sea-level. It has a park and a number of handsome residences and its agreeable climate and picturesque situation have made it a summer resort. The city has a public library. Hazleton is near the centre of one of the richest coal regions (the Lehigh or "Eastern Middle Coal Field") of the state, and its principal industry is the mining and shipping of anthracite coal. It has silk mills, knitting mills, shirt factories, breweries, macaroni factories, lumber and planing mills, important iron works, a casket factory and a large electric power plant. The value of

2. For derivations of the word see Latham's Johnson's Dictionary.

Fig. 2.—Cattin of Hazel (Corylus Avellana), consisting of an axis covered with bracts in the form of scales, each of which covers a male flower, the stamens of which are seen projecting beyond the scale. The cattin falls off entire, separating from the branch by an articulation.

---
the city's factory products increased from $982,823 in 1800 to $2,125,576 in 1905, or 118.8% only three other cities in the state having a population of 5000 or more in 1900 showing a greater rate of increase. There is a state hospital here for the treatment of persons injured in mining and other industries. This town was settled in 1846, was laid out in 1856, and was incorporated as a borough in 1856 and received a city charter in 1891. The local coal industry dates from 1837.

HAZLITT, WILLIAM (1778-1830), British literary critic and essayist, was born on the 10th of April 1778 at Maidstone, where his father, William Hazlitt, was minister of a Unitarian congregation. The father took the side of the Americans in their struggle with the mother-country, and during a residence at Bandon, Co. Cork, interested himself in the welfare of some American prisoners at Kinsale. In 1783 he migrated with his family to America, but in the winter of 1786-1787 returned to England, and settled at Wem in Shropshire, where he ministered to a small congregation. There his son William went to school, till in 1793 he was sent to the Hackney theological college in the hope that he would become a dissenting minister. For this career, however, he had no inclination, and returned, probably in 1794, to Wem, where he led a desultory life until 1802, and then decided to become a portrait painter. His elder brother John was already a painter, and had been in London. The movement of life at Wem was broken in January 1798 by the visit of Samuel Taylor Coleridge to Shrewsbury, where young Hazlitt went to hear him preach. Coleridge encouraged William Hazlitt's interest in metaphysics, and in the spring of the next year Hazlitt visited Coleridge at Nether Stowey and made the acquaintance of William Wordsworth. The circumstances of this early intercourse with Coleridge are related with inimitable skill in a paper in Hazlitt's Literary Remains (1839). On visits to his brother in London he made many acquaintances, the most important being a friendship with Charles Lamb, said to have been founded on a remark of Lamb's, interpolated in a discussion between Coleridge, Godwin and Holcroft, "Give me man as he is not to be." He also formed an acquaintance with John Stoddart, whose sister Sarah he married in 1808. In October 1802 he went to Paris to copy portraits in the Louvre, and spent four happy months in Paris. When he returned to London he undertook commissions for portraits, but soon found he was not likely to excel in his art; his brother Charles Lamb was a Venetian senator (now in the National Portrait Gallery), was executed in 1805. In that year he published his first book, An Essay on the Principles of Human Action: being an argument in favour of the Natural Disinterestedness of the Human Mind, which had occupied him at intervals for six or seven years. It attracted little attention, but remained a favourite with his author. Other works belonging to this period are: Free Thoughts on Public Affairs (1806); An Abridgment of the Light of Nature Revealed, by Abraham Tucker... (1807); The Eloquence of the British Senate... (2 vols., 1809); A Reply to Malhus, on his Essay on Population (1807); A New and Improved Grammar of the English Tongue... (1810).

Hazlitt married in 1808. His domestic life was unhappy. His wife was an unromantic, business-like woman, while he himself was fitful and moody, and impatient of restraint. The dissolution of the ill-assorted union was nevertheless deferred for fourteen years, during which much of Hazlitt's best literary work had been produced. Mrs Hazlitt had inherited a small estate at Winterslow near Salisbury, and here the Hazlitts lived until 1812, when they removed to 10 York Street, Westminster, a house that was once Milton's. Hazlitt delivered in 1812 a course of lectures at the Russell Institution on the Rise and Progress of Modern Philosophy. He was a brilliant and original essayist, and his literary success was characterized by the Examiners...
HEAD, SIR E. W.:  

William Hazlitt (1811–1839), was born on the 26th of September 1811. The separation between his parents did not prevent him from being on affectionate terms with both of them. He early began to write for the Morning Chronicle, and in 1833 married Caroline Reynell. He was the author of many translations, chiefly from the French, and of some works on the law of bankruptcy. He was called to the bar at the Middle Temple in 1844, and became registrar in the court of bankruptcy. He held this position for more than thirty years, retiring two years before his death, which took place at Addlestone, Surrey, on the 23rd of February 1834.

Hazlitt’s grandson, William Carew Hazlitt, the bibliographer, was born on the 22nd of August 1834. He was educated at the Merchant Taylors’ school and was called to the bar of the Inner Temple in 1861. Among his many publications may be noted his invaluable Handbook to the Popular, Poetical and Dramatic Literature of Great Britain, from the Invention of Printing to the Restoration (1867), supplemented in 1876, 1882, 1887 and 1889, a General Index by J. G. Gray appearing in 1893. He published further contributions to the subject in Bibliographical Collections and Notes on English and Continental Drama during the years 1829–1903 (1903), and a Manual for the Collector and Amateur of Old English Plays ... (1892). He was the chief editor of the useful 1871 edition of Warton’s History of English Poetry, and compiled the Catalogue of the Huth Library (1886).

The list of the first William Hazlitt’s works also includes: Political Essays, with Sketches of Public Characters (1819); Sketches of the Principal Pictures in the British Museum, (2 vols., 1827); The Life of Napoleon Buonaparte (4 vols., 1828–1830). The undertaking was at best premature, and was inevitably disfigured by partiality to Napoleon as the representative of the popular cause, excusable in a Liberal politician writing in the days of the Holy Alliance. Owing to the failure of his publishers Hazlitt received no recompense for this laborious work.

Pecuniary anxieties and disappointments may have contributed to hasten his death, which took place on the 18th of September 1830. Charles Lamb was with him to the last.

Hazlitt had many serious defects of temper. His consistency was gained at the expense of refusing to revise his early impressions and prejudices. His estimate of a man’s work was too apt to be decided by sympathy or the reverse with his politics. For Scott, however, he had a great admiration, although they were far enough apart in politics. He was a compound of intellect and passion, and the refinement of his critical analysis is associated with vehement eloquence and glowing imagery. He was essentially a critic, a dissector and, as Bulwer justly remarks, a much better judge of men of thought than of men of action. The paradoxes with which his works abound never spring from affectation; they are in general the sallies of a mind so agile and ardent as to overrun its own goal. His style is perfectly natural, and yet admirably calculated for effect. His diction, always rich and masculine, seems to kindle as he proceeds; and when thoroughly animated by his subject, he advances with a succession of energetic, hard-hitting sentences, each carrying his argument a step further, like a champion dealing out blows as he presses upon the enemy. Although, however, his grasp upon his subject is strenuous, his insight into it is rarely profound. He can amply satisfy men of taste and culture; he cannot, like Coleridge or Burke, dissatisfy them with themselves by showing them how much they would have missed without him. He is a critic who exhibits, rather than reveals, the beauties of an author. But all shortcomings are forgotten in the genuineness and fervour of the writer’s self-portraiture. The intensity of his personal convictions causes all he wrote to appear in a manner autobiographic. Other men have been said to speak like books, Hazlitt’s books speak like men. To read his works in connexion with Leigh Hunt’s and Charles Lamb’s is to be introduced into one of the most attractive literary circles, and this alone will long preserve them from oblivion.

HEAD, SIR EDMUND WALKER, BART. (1805–1868), English colonial governor and writer on art, was the son of the Rev. Sir John Head, Bart., rector of Rayleigh, Essex. He was educated at Winchester school and Oriel College, Oxford, and taking his degree with first-class honours in classical and mathematics at Merton College. On his father’s death in 1838, he succeeded to the baronetcy as 8th baronet. His services as poor-law commissioner, to which post he was appointed in 1840 after five years as assistant-commissioner, procured for him in 1847 the office of lieutenant-governor of New Brunswick, whence he passed in 1854 to the governor-generalship of Canada, which he retained till 1861. The following year, having returned to England, Head was nominated a civil service commissioner. In 1857 he was sworn of the Privy Council, and in 1860 was created K.C.G.B., and in 1867 received the degrees of D.C.L. at Oxford and LL.D. at Cambridge. He died in London on the 28th of January 1868, the baronetcy becoming extinct, as his only son had died in 1859.

Sir Edmund Head wrote the article “Painting” in the Penny Cyclopedia; A Handbook of the Spanish and French Schools of Painting (1845); Shall and Will, or two Chapters on Future Auxiliary Verbs (1850); and Ballads and other Poems, Original and Translated (1868). He also edited F. T. Kugler’s Handbook of Painting of the

HEALTH, a condition of physical soundness or well-being, in which an organism discharges its functions efficiently; also in a transferred sense a state of moral or intellectual well-being (see HYGIENE, THERAPEUTICS AND PUBLIC HEALTH). "Health" represents the O. Eng. hailth, the condition or state of being hail, safe or sound. This word took in northern dialects the form "hale," in southern or midland English hole, hence "whole," with the addition of an initial hr, as in "whoop," and in the pronunciation of "hale" as "hail," properly an exclamation of greeting, good health to you, hence, to greet, to call out to, directly Scandinavian in origin, from Old Norwegian heli, cognate with the O. Eng. hæl, used also in this sense. "To heal" (O. Eng. hælan), to make in sound health, to cure, is also cognate.

Drinking of Healths.—The custom of drinking "health" to the living is most probably derived from the ancient religious rite of drinking to the gods and the dead. The Greeks and Romans at meals poured out libations to their gods, and at ceremonial banquets drank to them and to the dead. The Norsemen drank the "minni" of Thor, Odin and Freya, and of the Norsemen at their funeral feasts. With the advent of Christianity the pagan custom survived among the Scandinavian and Teutonic peoples. Such festal formulæ as "God's minne!" "A bowl to God in Heaven!" occur, and Christ, the Virgin and the Saints were invoked, instead of heathen gods and heroes. The Norse "minne" was at once love, memory and thought of the absent one, and it survived in medieval and later England in the "minning" or "mynding" days, with which the memory of the dead was celebrated by prayers and feasting. Intimately associated with these quasi-sacred drinking customs must have ever been the drinking to the health of living men. The Greeks drank to one another and the Romans adopted the custom. The Goths pledged each other with the cry "Hails!" a greeting which had its counterpart in the Anglo-Saxon "waes hael" (see WASSAIL). Most modern drinking-usages have had their equivalents in classic times. Thus the Greek practice of drinking to the Nine Muses as three times three survivors in England and elsewhere. The Roman gallants drank as many glasses to their mistresses as there were letters in each one's name. Thus Martial:

"Six cups to Naevia's health go quickly round,
And be with seven the fair Justin's crown'd."

The English drinking phrase—a "toast," to "toast" any one— not older than the 17th century, had reference at first to this custom of drinking to the ladies. A toast was at first invariably a woman, and the origin of the phrase is curious. In Stuart days there appears to have been a time-honoured custom of putting a piece of toast in the wine-cup before drinking, from which notion the drinker of the liquor a better flavour. In the

"Taller No. 24 the connexion between this sippet of toast and the fair one pledged is explained as follows: "It happened that on a publick day" (speaking of Bath in Charles II.'s reign)
"a celebrated beauty of those times was in the cross bath, and one of the crowd of her admirers took a glass of the water in which the fair one stood, and drank her health to the company. There was in the place a gay fellow, half fuddled, who offered to jump in, and swore, though he liked not the liquor, he would have the toast. He was opposed in his resolution; yet this whim gave foundation to the present honour which is done to the lady we mention in our liquor, who has ever since been called a toast."

Skeat adds (Evelyn Dict. 1698), "whether the story be true or not, it may be seen that a 'toast,' i.e. a health, easily took its name from being the usual accompaniment to liquor, especially in the days of Charles II.

Health drinking had by the beginning of the 17th century become a very ceremonious business in England. At Christmas 1623 the members of the Middle Temple, according to one of the Harleian MSS. quoted in The Life of Sir Simonds D'Ewes, drank to the health of the princess Elizabeth, who, with her husband the king of Bohemia, was then suffering great misfortunes, and stood up, one after the other, cup in one hand, sword in the other, and pledged her, swearing to die in her service. Toasts were often drunk solemnly on bended knees; according to one authority, Samuel Ward of Ipswich, in his Poems (1672), 'conjur'd with a careless knee.' In 1668 at Sir George Cartaret's at Cranbourne the health of the duke of York was drunk by all in turn, each on his knees, the king, who was a guest, doing the like. A Scotch custom, still surviving, was to drink a toast with one foot on the table and one on the chair. Healths, too, were drunk in a definite order. Braithwaite says: "These cups proceed either in order or out of order. In order when no person transgresseth or drinks out of course, but the cup goes round according to their manner of sitting; and this we call a health-cup, because in our wishing or confirming of any one's health, bare headed and standing, it is performed by all the company." (Laws of Drinking, 1617, in Francis Douce's MSS. notes says: "This was a custom in Beaumont and Fletcher's time for the young gallants to stab themselves in the arms or elsewhere, in order to drink the health of their mistresses.") Pepys, in his Diary for the 15th of June 1663, writes: "To the Rhenish wine house, where Mr Moore showed us the French manner when a healths is drunk, to bow to him that drank to you, and then apply yourself to him, whose lady's health is drunk, and then to the person that you drink to, which I never knew before; but it seems it is now the fashion." A Frenchman visiting England in Charles II.'s time speaks of the custom of drinking but half your cup, which is then filled up again and presented to him or her whose health you drank. England's divided loyalty in the 18th century bequeathed to modern times a custom which possibly yet survives. At dinners to royalties, until the accession of Edward VII., finger-glasses were not placed on the table, because in early Georgian days those who were secretly Jacobites passed their wine-glasses over the finger-bowls before drinking the loyal toasts, in allusion to the royal exiles "over the water," thus salving their consciences. Lord Cockburn (1770-1854), in his Memorials of his Time (1850), states that in his day: the drinking of toasts had become a perfect social tyranny; "every glass during dinner had to be dedicated to some one. It was thought sortish and rude to take wine without this, as if forsooth there was nobody present worth drinking with. I was present about 1803 when the late duke of Buccleuch took a glass of sherry by himself at the table of Charles Hope, then lord advocate, and this was noticed afterwards as a piece of direct contempt." In Germany to-day it is an insult to refuse to drink with any one; and at one time in the west of America a man took his life in his hands by declining to pledge another. All this is a survival of that very early and universal belief that drinking to one another was a proof of fair play, whether it be in a simple bargain or in matters of life and death. The ceremony surrounding the Loving Cup to-day is reminiscent of the Feast of Dous, that which every man's hand was raised against his fellow. This cup, known at the universities as the Grace Cup, was originated, says Miss Strickland in her Lives of the Queens of Scotland, by Margaret Atheling, wife of Malcolm Canmore, who, in order to induce the Scots to remain at table for grace had a cup of the choicest wine handed round immediately after it had been said. The modern "loving cup" sometimes has a cover, and in this case each guest rises and bows to his immediate neighbour on the right, who, also rising, removes and holds the cover with his right hand while the other drinks; the little comedy is a survival of the days when he who drank was glad to have the assurance that the right or daggier hand of his neighbour was occupied in holding the lid of the chalice. When there is no cover it is a common custom for both the left- and the right-hand neighbour to rise while the loving cup is drunk, with the similar object of protecting the drinker from the adoration of the Stirling Cup. In probably the Roman pocula duri genii, the last glass drunk at the banquet to a general "good night."

HEALY, GEORGE PETER ALEXANDER (1808-1894), American painter, was born in Boston, Massachusetts, on the 15th of July 1808. Going to Europe in 1835 Healy studied under Baron Gros in Paris and in Rome. He received a third-class medal in Paris in 1840, and one of the second class in 1855, when he exhibited his "Franklin urging the claims of the Colonies before Louis XVI." Among his portraits of eminent men are those of Webster, Clay, Calhoun, Gaya, Seward, Louis Philippe, and the presidents of the United States from John Quincy Adams to Grant—this series being painted for the Corcoran Gallery, Washington. His large group, "Webster replying to Hayne," containing 150 portraits, is in Faneuil Hall, Boston, Mass. He was one of the most prolific and popular painters of his day. He died in Chicago, Illinois, on the 24th of June 1894.

HEANOR, an urban district in the Ilkeston parliamentary division of Derbyshire, England, to m. N.W. of Nottingham, and the Gr. and Midland railways. Pop. (1901) 16,249. Large hosiery works employ many of the inhabitants, and collieries are worked in the parish. The urban district includes Codnor-cum-Loscoe. Shipley Hall, to the south of Heanor, is a mansion built on a hill, amidst fine gardens. The ruins of the ancient moated castle of Codnor stands, overlooking the vale of the Erewash, on land which was once Codnor Park, and is now the site of large ironworks.

HEARING (formed from the verb "to hear," O. Eng. kyron, heran, &c., a common Teutonic verb; cf. Ger. horen, Dutch horen, &c.; the O. Teut. form is seen in Goth. haugian; the initial k makes any connexion with "ear," Lat. audire, or Gr. akousa) is variously divided in modern natural science. If the function of the ear be examined with reference to its difficulties with which the auditory nervous by the vibrations of sonic bodies. The anatomy of the ear is described in the separate article on that organ. A description of sonic vibrations is given in the article SOUND; here we shall consider the transmission of such vibrations from the external ear to the auditory nerve, and the physiological characters of auditory sensation.

1. Transmission in External Ear.—The external ear consists of the pinna, or auricle, and the external auditory meatus, the entrance of which we find the membrana tymbali, or drum head. In many animals the auricle is trumpet-shaped, and, being freely movable by muscles, serves to collect sonic waves coming from various directions. The auricle of the human ear presents many irregularities of surface. If these irregularities are abolished by filling them up with a soft material such as wax or oil, leaving the entrance to the canal free, experiment shows that the intensity of sounds is weakened, and that there is more difficulty in judging of their direction. When waves of sound strike the auricle, they partly reflected outwards, while the remainder, impinging at various angles, are reflected into the auditory canal. Vibrations are transmitted along the auditory canal, partly by the air it contains and partly by its walls, to the membrana tymbali. The absence of the auricle, as the result of accident or injury, does not cause diminution of hearing.
In the auditory canal waves of sound are reflected from side to side until they reach the membra tympani. From the obliquity in position and peculiar curvature of this membrane, most of the waves strike it nearly perpendicularly, and in the majority, exert vibrations on it. 2. Transmission in Middle Ear.—The middle ear is a small cavity, the walls of which are rigid with the exception of the portions consisting of the membra tympani, and the membrane of the round window and of the apparatus filling the oval window. This cavity communicates with the pharynx by the Eustachian tube, which forms an air-tube between the pharynx and the tympanum for the purpose of regulating pressure on the membra tympani. During rest the tube is open, but it is closed during the act of deglutition. As this action is frequently taking place, not only when food or drink is introduced, but when saliva is swallowed, it is evident that the pressure of the air in the tympanum will be kept in a state of equilibrium with that of the external air on the outer surface of the membra tympani, and that thus the membra tympani will be rendered independent of variations of atmospheric pressure such as occur when we descend in a diving bell or ascend in a balloon. By a forcible expiration, the oral and nasal cavities being closed, air may be forced into the tympanum, while a forcible inspiration (Valsalva’s experiment) will draw air from that cavity. In the first case, the membra tympani will bulge outwards, in the second case inwards, and in both, from excessive stretching of the membrane, there will be partial deafness, especially for sounds of high pitch. Permanent occlusion of the tube is one of the most common causes of deafness.

The membra tympani is capable of being set into vibration by a sound of any pitch included in the range of perceptible sounds. It responds exactly as to number of vibrations (pitch), intensity of vibrations (intensity), and complexity of vibration (quality or timbre). Consequently we can hear a sound of any given pitch, of a certain intensity, and in its own specific timbre or quality. Generally speaking, very high tones are heard more easily than low tones of the same intensity. As the membra tympani is not only fixed by its margin to a ring or tube of bone, but is also adherent to the handle of the malleus, which follows its movements, its vibrations meet with considerable resistance. This diminishes the intensity of its vibrations, and prevents also the continued vibration of the membrane after an external pressure has ceased, so that a sound is not heard much longer than its physical cause lasts. The tension of the membrane may be affected (1) by differences of pressure on the two surfaces of the membra tympani, as may occur during forcible expiration or inspiration, and (2) by muscular action, due to contraction of the tensor tympani muscle. This small muscle arises from the apex of the petrous temporal and the cartilage of the Eustachian tube, enters the tympanum at its anterior wall, and is inserted into the malleus near its root. The handle of the malleus is inserted between the layers of the membra tympani, and, as the malleus and incus move round an axis passing through the neck of the malleus from before backwards, the action of the muscle is to pull the membra tympani inwards towards the tympanic cavity in the form of a cone, the meridians of which are not straight but curved, with convexity outwards. When the muscle contracts, the handle of the malleus is drawn still farther inwards, and thus a greater tension of the tympanic membrane is produced. On relaxation of the muscle, the membrane returns to its position of equilibrium by its elasticity and by the elasticity of the chain of bones. This power of varying the tension of the membrane is an accommodating mechanism for receiving and transmitting sounds of different pitch. With different degrees of tension it will respond more readily to sounds of different pitch. Thus, when the membrane is tense, it will readily respond to high sounds, while relaxation will be the condition most adapted for low tones. In addition, increased tension of the membrane, by increasing the resistance, will diminish the height of vibrations. This is especially the case for sounds of low pitch.

The vibrations of the membra tympani are transmitted to the internal ear partly by the air which the middle ear or tympanum contains, and partly by the chain of bones, consisting of the malleus, incus and stapes. Of these, transmission by the chain bones is by far the most important. In birds and in the so-called amphibia, this chain is formed by a single ossicle, the columella, but in man the two membranes—the membra tympani and the membrane filling the fenestra ovalis—are connected by a compound lever consisting of three bones, namely, the malleus, or hammer, inserted into the membra tympani, the incus, or anvil, and the stapes, or stirrup, the base of which is attached to a membrane covering the oval window. It must also be noted that in the transmission of vibrations of the membra tympani to the fluid in the labyrinth or internal ear, through the oval window, a chain of ossicles vibrate nearly as a whole and acts efficiently, although its length may be only a fraction of the wave-length of the sound transmitted. The chain is a lever in which the handle of the malleus forms the long arm, the fulcrum is where the short process of the incus abuts against the wall of the tympanum, while the long process of the incus, carrying the stapes, forms the short arm. The mechanism is a lever of the second order. Measurements show that the ratio of the lengths of the two arms is as 1:5:1; the ratio of the resulting force at the stapes is therefore as 1:15:1; while the amplitudes of the movements at the tip of the handle of the malleus and the stapes is as 1:5:1. Hence, while there is a diminution in amplitude there is a gain in power, and thus the pressures are conveyed with great efficiency from the membra tympani to the labyrinth, while the amplitude of the oscillation is diminished so as to be adapted to the small capacity of the labyrinth. As the drum-head is nearly twenty times greater in area than the membrane covering the oval window, with which the base of the stapes is connected, the energy of the movements of the membra tympani is concentrated on an area twenty times smaller; hence the pressure is increased thirtyfold (1·5·20) when it acts at the base of the stapes. Experiments on the human ear have shown that the movement of greatest amplitude was at the tip of the handle of the malleus, 0·76 mm.; the movement of the tip of the long arm process of the incus was 0·21 mm.; while the greatest amplitude at the base of the stapes was only ·0714 mm. Other observations have shown, the movements at the stapes to have a still smaller amplitude, varying from 0·010 to 0·032 mm. With tones of feeble intensity, the movements must be almost infinitesimal. There may also be very minute transverse movements at the base of the stapes.

3. Transmission in the Internal Ear.—The internal ear is composed of the labyrinth, formed of the vestibule or central part, the semicircular canals, and the cochlea, each of which consists of an osseous and a membranous portion. The osseous labyrinth may be regarded as an osseous mould in the petrous portion of the temporal bone, lined by tesselated endotheliun, and containing a small quantity of fluid called the perilymph. In this mould, partially surrounded by, and to some extent floating in, this fluid, there is the membranous labyrinth, in certain parts of which we find the terminal apparatus in connexion with the auditory nerve, immersed in another fluid called the endolymph. The membranous labyrinth consists of a vestibular portion formed by two small sac-like dilatations, called the sacculus and the utricle, the latter of which communicates with the semicircular canals by five openings. Each canal consists of a tube, bulging out at each extremity so as to form the so-called ampulla; in which, on a projecting ridge, called the crista acuta, there are cells bearing long auditory hairs, which are the peripheral end-organs of the vestibular branches of the auditory nerve. The cochlear division of the membranous labyrinth consists of the ductus cochlearis, a tube of triangular form fitting in between the two cavities in the cochlea, called the scala vestibuli, because it commences in the vestibule, and the scala tympani, because it ends in the tympanum, at the round window. These two scalae communicate at the apex of the cochlea. The roof of the ductus cochlearis is formed of the membra tua of Reissner, while its floor consists of the basilar membra, on which we find the remarkable organ of Corti, which constitutes
the terminal organ of the cochlear division of the auditory nerve. It is sufficient to state here that this organ consists essentially of an arrangement of epithelial cells bearing hairs which are in communication with the terminal filaments of this portion of the auditory nerve, and that groups of these hairs pass through holes in a closely investing membrane, *membrana reticularis*, which may act as a damping apparatus, so as quickly to stop their movements. The ductus cochlearis and the two scalae are filled with fluid. Sonorous vibrations may reach the fluid in the labyrinth by three different ways—(1) by the osseous walls of the labyrinth, (2) by the air in the tympanum and the round window, and (3) by the base of the stapes inserted into the oval window.

When the head is plunged into water, or brought into direct contact with any vibrating body, vibrations must be transmitted directly. Vibrations of the air in the mouth and in the nasal passages are also communicated directly to the walls of the cranium, and thus pass to the labyrinth. In like manner, we may experience auditory sensations, such as blowing, rubbing and hissing sounds, due to muscular contraction or to the passage of blood in vessels close to the auditory organ. It is doubtful whether any vibrations are communicated to the fluid in the labyrinths by the blood-vessels. Vibrations which cause hearing are communicated by the chain of bones. When the base of the stirrup is pushed into the oval window, the pressure in the labyrinth increases, and, as the only mobile part of the wall of the labyrinth is the membrane covering the round window, this membrane is forced outwards; when the base of the stirrup moves outwards a reverse action takes place. Thus the fluid of the labyrinth receives a series of pulses isochronous with the movements of the base of the stirrup, and these pulses affect the terminal apparatus in connexion with the auditory nerve.

The sacs of the internal ear, known as the utricle and saccule, receive the impulses of the base of the stapes. They are organs cannot be reflected backwards, but how they affect the advancing impulses is not known. But the problem is even more complex when we take into account the fact that impulses are transmitted simultaneously to the utricle and to the semicircular canals communicating with it by five openings. The mode of action of these vibrations or impulses upon the nervous terminations is still unknown; but to appreciate critically the hypothesis which has been advanced to explain it, it is necessary, in the first place, to refer to some of the general characters of auditory sensation.

4. General Characters of Auditory Sensations.—Certain conditions are necessary for excitation of the auditory nervesufficient to produce a sensation. In the first place, the vibrations must have a certain amplitude and energy; if too feeble, no impression will be produced.

Various physicists have attempted to measure the sensitiveness of the ear by estimating the amplitude of the molecular movements necessary to call forth the feeblest audible sound. Thus A. Töpler and L. Boltzmann, on data founded on experiments with organ pipes, state that the ear is affected by vibrations of molecules of the air not more in amplitude than 0.0004 mm. at the ear, or 0-1 of the wave-length of green light, and that the energy of such a vibration on the drum-head is not more than 3-25 billion kilog., or 17½ of that produced upon an equal surface of the retina by a single candle at the same distance (Ann. d. Phys. u. Chem., Leipzig, 1870, Bd. cxxi. S. 321). Lord Rayleigh, by two other methods, arrived at the conclusion that the currents of energy required to influence the eye and ear are of the same order of magnitude. He estimated the amplitude of the movement of the aerial particles, with a sound just audible, as less than the tenth-thousandth of a centimetre, and the energy emitted when the sound was first becoming audible, at 42·1 ergs per second. He also states that in considering the amplitude or condensation in progressive aerial waves, at a distance of 1770 metres from a tuning-fork, the maximum condensation was = 6·0×10−9 cm., a result showing "that the ear is able to recognize the addition or subtraction of densities far less than those to be found in our highest vacua" (Proc. Roy. Soc., 30, 1875, p. 111; Lond. Edin. und Dub. Phil. Mag., 1894, vol. xxxviii. p. 366).

In the next place, vibrations must have a certain duration to be perceived; and lastly, to excite a sensation of a continuous musical sound, a certain number of impulses must occur in a given interval of time. The lower limit is about 30, and the upper about 30,000 vibrations per second. Below 30, the individual impulses may be observed, and above 30,000 few ears can detect any sound at all. The extreme upper limit is not more than 35,000 vibrations per second. Auditory sensations are of two kinds—noises and musical sounds. *Noises* are caused by impulses which are not regular in intensity or duration, or are not periodic, or they may be caused by a series of musical sounds occurring instantaneously so as to produce discords, as when we place our hand at random on the key-board of a piano. *Musical tones* are produced by periodic and regular vibrations. In musical sounds three characters are prominent—intensity, pitch and quality. *Intensity* depends on the amplitude of the vibration, and a greater or lesser amplitude of the vibration will cause a corresponding movement of the transmitting apparatus, and a corresponding intensity of excitation of the terminal apparatus. *Pitch*, as a sensation, depends on the length of time in which a single vibration is executed, or, in other words, the rate of vibrations in a given interval of time. The ear is capable of appreciating the relative pitch or height of a sound as compared with another, although it may not ascertain precisely the absolute pitch of a sound. What we call an acute or high tone is produced by a large number of vibrations, while a grave or low tone is caused by few. The musical tones which can be used with advantage range between 40 and 4000 vibrations per second, extending thus from 6 to 7 octaves. According to E. H. Weber, practised musicians can perceive a difference of pitch amounting to only the 36th of a semitone, but this is far beyond the average attainment. In a few individuals, and especially in early life, there may be an appreciation of absolute pitch. *Quality* or *timbre* (or *Klang*) is that peculiar characteristic of a musical sound by which we may identify it as proceeding from a particular instrument or from a particular human voice. It depends on the fact
that many waves of sound that reach the ear are compound wave systems, built up of constituent waves, each of which is capable of exciting a sensation of a simple tone if it be singled out and resolved separately by the ear. This is not the case with certain sounds, such as the hum of bees or the tolling of a bell, which may be heard without a resonator, after special practice and tuition. Thus it appears that the ear must have some arrangement by which it resolves every wave system, however complex, into simple pendular vibrations. When we listen to a sound of any quality we recognize that it is of a certain pitch. This depends on the number of vibrations of one tone, predominant in intensity over the others, called the fundamental or ground tone, or first partial tone. The quality, or timbre, depends on the number and intensity of other tones added to it. These are termed harmonic or partial tones, and they are related to the first partial or fundamental tone in a very simple manner, being multiples of the fundamental tone: thus—

When a simple tone, or one free from partials, is heard, it gives rise to a simple, soft, somewhat insipid sensation, as may be obtained by blowing across the mouth of an open bottle or by a tuning-fork. The lower partials added to the fundamental tone give softness combined with richness; while the higher, especially if they be very high, produce a brilliant and thrilling effect, as is caused by the brass instruments of an orchestra. Such being the facts, how may they be explained physiologically?

Little is yet known regarding the mode of action of the vibrations of the fluid in the labyrinth upon the terminal apparatus connected with the auditory nerve. There can be no doubt that it is a mechanical action, a communication of impulses to delicate hair-like processes, by the movements of which the nervous filaments are irritated. In the basilar membrane it has been estimated there are about 3000 small arches formed by the rods of Corti. Each arch rests on the basilar membrane, and supports rows of cells having minute hair-like processes. It would appear also that the filaments of the auditory nerve terminate in the basilar membrane, and possibly they may be connected with the hair-cells. At one time it was supposed by Helmholtz that these fibres of the Corti were elastic and that they were tuned for particular sounds, so as to form a regular series corresponding to all the tones audible to the human ear. Thus 2800 fibres distributed over the tones of seven octaves would give 400 fibres for each octave, or nearly 33 for a semitone. Helmholtz put forward the hypothesis that, when a pendular vibration reaches the ear, it excites by sympathetic vibration the fibre of Corti which is tuned for its proper number of vibrations. If, then, different fibres are tuned to tones of different pitch, it is evident that we have here a mechanism which, by exciting different nerve fibres, will give rise to sensations of pitch. When the vibration is not simple but compound, in consequence of the blending of vibrations corresponding to various harmonics or partial tones, the ear has the power of resolving this compound vibration into its elements. It can only do so by different fibres responding to the constituent vibrations of the sound—one for the fundamental tone being stronger, and giving the sensation of a particular pitch to the sound, and the others, corresponding to the upper partial tones, being weaker, and causing undefined sensations, which are so blended together in consciousness as to terminate in a complex sensation of a tone of a certain quality or timbre. It would appear at first sight that 33 fibres of Corti for a semitone are not sufficient to enable us to detect all the gradations of pitch in that interval, since, as has been stated above, trained musicians may distinguish a difference of 1/20th of a semitone. To meet this difficulty, Helmholtz stated that if a sound of high pitch impinges upon the tympanic membrane of two adjacent fibres of Corti, both of these will be set into sympathetic vibration, but the one which comes nearest to the pitch of the sound will vibrate with greater intensity than the other, and that consequently the pitch of that sound would be thus appreciated. These theoretical views of Helmholtz have derived much support from experiments of V. Hensen, who observed that certain simple sounds, such as the name of Mytilus, a Crustacean, when seen with a low microscopic power, vibrated with certain tones produced by a keyed horn. It was seen that certain tones of the horn set some hairs into strong vibration, and other tones other hairs. Each hair responded also to several tones of the horn. Thus one hair responded strongly to $d_2$ and $d_4$, more weakly to $g$ and very weakly to $G$. It was probably tuned to some pitch between $d_3$ and $d_5$. (Studien üiber das Gehörorgan der Decapoden, Leipzig, 1863.)

5. Physiological Characters of Auditory Sensation.—Under ordinary circumstances auditory sensations are referred to the outer world. When we hear a sound, we associate it with some external cause, and it appears to originate in a particular place or to come in a particular direction. This feeling of exteriority of sound seems to require transmission through the membrana tympani. Sounds which are sent through the walls of the cranium, as when the head is immersed in, and the external auditory canals are filled with, water, appear to originate in the body itself.

An auditory sensation lasts a short time after the cessation of the exciting cause, so that a number of separate vibrations, each capable of exciting a distinct sensation if heard alone, may succeed each other so rapidly that they are fused into a single sensation. If we listen to the puls of a syren, or to vibrating tongues of low pitch, the single sensation is usually produced by about 30 or 35 vibrations per second; but when we listen to beats of considerable intensity, produced by two adjacent tones of sufficiently high pitch, the ear may follow as many as 12 to 132 intermussions per second.

The sensibility of the ear for sounds of different pitch is not the same. It is more sensitive for acute than for grave sounds, and it is probable that the maximum degree of acute ness is for sounds produced by about 3000 vibrations per second, that is near $f_2$. Sensibility as to pitch varies much with the individual. Thus some musicians may detect a difference of $\frac{1}{1000}$th of the total number of vibrations, while other persons may have difficulty in appreciating a semitone.

6. Analytical Power of the Ear.—When we listen to a compound tone, we have the power of picking out these partials from the general mass of sound. It is known that the frequencies of the partials as compared with that of the fundamental tone are simple multiples of the frequency of the fundamental, and also that physically the waves of the partials so blend with each other as to produce waves of very complicated forms. Yet the ear, or the ear and the brain together, can resolve this complicated wave-form into its component parts, and this it does so easily if we listen to a series of resonators, the pitch of which corresponds, or nearly corresponds, to the frequencies of the partials. Much discussion has taken place as to how the ear resolves this analysis. It has been thought that there is a complicated apparatus in the cochlea which may serve this purpose; but while some are of opinion that this structure is sufficient, others hold that the analysis takes place in the brain. Whatever the complicated mechanism may be, it must move out and in in a way corresponding to the variations of pressure, and these variations will, in a single vibration, depend on the greater or less degree of complexity of the wave. Thus a single tone will cause a movement like that of a pendulum, a simple pendular vibration,
HEARING may the (4) is (article Dissonance. Measurements simple appreciation and of between agreeable part two sonance there is found to be produced by simultaneously stimulating the skin, or margin of the lips, by bristles attached to tuning-forks giving forth quarter-tones. If the frequencies of the forks is great, the sensation is that of a harsh, disagreeable tickle. It is noted at an analysis of tones close in pitch causes the disagreeable sensation" (Schäfer's Text-Book, op. cit. p. 1187).

Theorists objected to the analysis theory, and urged that the cochea acted as a whole (Zischr. f. nat. Med., Dritte Reihe, Bd. xxiv, Hefl 1, S. 12-64). This view was revived by Volotin (Virchow's Archiv, Bd. c. 27) some years later, and in 1836 it was urged by E. Rutherford (Rep. Brith. Assoc. Ad. Sc., 1886), who compared the action of the cochlea to that of a telephone plate. According to this theory, all the hairs of the auditory cells vibrate to every note, and the hair-cells transform these vibrations into nerve impulses, similar in frequency, amplitude and character to the sound vibrations. There is no analysis in the peripheral organ. A. D. Waller, in 1891 (Proc. Roy. Soc. London, p. 505), conceived the cochlea as a whole as a vibratory plate to every note, but the hair-cells of the basilar membrane to the various notes its pressure on the cochlear nerve-fibers. The active parts of the cochlea are the small vibratory bodies such as filaments and hair cells, which are correspondingly stimulated and give rise to nerve impulses. Each vibration causes a corresponding pressure on the basilar membrane, and through it the energy is transferred to the auditory nerve. The basilar membrane is divided into three parts; the first, middle and lower, and the sensitivity of these parts to different frequencies is different. The frequency of a sound wave is determined by the length of the basilar membrane, and the higher the pitch of the sound, the longer the portion of the membrane that is stimulated. The sensitivity of the basilar membrane is also influenced by the width of the wave, and the higher the pitch, the narrower the wave.

The cochlea is divided into two main parts: the outer and inner. The outer part contains the outer hair cells, which are sensitive to low frequencies, and the inner part contains the inner hair cells, which are sensitive to high frequencies. The vibrations of the cochlea are transmitted to the inner ear, where they are converted into electrical impulses and sent to the brain.

The outer hair cells are responsible for the perception of sound, and their function is to convert the mechanical vibrations of the cochlear fluids into electrical impulses. The inner hair cells are responsible for the transmission of these impulses to the brain.

The cochlea is divided into three parts: the upper, middle, and lower. The upper part is responsible for the perception of high frequencies, the middle part for medium frequencies, and the lower part for low frequencies. The sensitivity of the cochlea decreases with frequency, and the highest frequencies are only audible to the upper part of the cochlea.
rapid succession in the minute tubes forming the scalae—the length of the scala being only a very small part of the wave-length of the sound; and, secondly, neither theory takes into account the differentiation of structure found in the epithelium of the organ of Corti. Each of the latter bases have a movement of the fluid, or a pressure, in the scalae as a whole.

There are difficulties in the way of applying the resonance theory to the perception of noises. Noises have pitch, and, as has already been said, the ear cannot perceive any portion of the disturbance if it is not transmitted to the fluid within the cochlea. It is evident that in the case of the pure harmonic series, the frequency of each tone is a multiple of the fundamental frequency of the liquid within the ear. This means that in the case of pure harmonics, the sound waves in the liquid may have a frequency of the order to which it is difficult to ascertain what is the limit beyond which distinct auditory sensations may be perceived. We have in listening to an orchestra a multiplicity of sensations which produces a total effect, while, at the same time, we can with ease single out and notice attentively the tones of one or two special instruments. Thus the pleasure of music may arise partly from the multiplicity of sensations, as in musical harmony. It is difficult to ascertain what is the limit beyond which distinct auditory sensations may be perceived. When the frequencies of the sounds are so close together that the combination tones are produced, this phenomenon of beats may be observed. These beats may be observed when two sounds of nearly the same pitch are produced together, and the number of beats per second is equal to the difference of the two harmonics, although it can be shown by experiment with the syrinx that this depends upon the vibrational numbers of the two tones. The octave (1:2), the twelfth (1:3) and double octave (1:4) are absolutely consonant sounds; if the two sound waves are in perfect musical harmony, they can be perceived as a single sound, while in the direction of dissonance, the fourth (3:4), major sixth (5:6), major third (4:5), minor sixth (5:6) and the minor third (3:5) are inharmonious. Helmholtz has attempted to account for this by the application of his theory of beats.

Helmholtz has attempted to account for this by the application of his theory of beats.

When the frequencies of the two tones differ by one-twelfth of an octave, the beats are very audible. If the frequencies differ by oneoctave the beats are not audible. If the frequencies differ by one-fourth of an octave the beats are very slight, and if the frequencies differ by one-eighth of an octave the beats are not audible.

10. Beat Tones.—Considerable difference of opinion exists as to whether beats can blend so as to give a sensation of tone; but K. König, by using pure tones of high pitch, has settled the question. These tones were produced by tuning forks, the frequency of which was varied by the use of the tuning-rod head to head. He suggested that the crista and macula acustica, structures that exist not in the cochlea but in the vestibule, have to do with the perception of noise. These structures, however, are concerned rather in the perception of the equilibrium of than of sound (Equilibrium).

11. Combination Tones.—Frequently, when two tones are sounded, not only do we hear the two constituent tones, but we may hear other tones, one of which is lower in pitch than the lowest primary, and one higher in pitch than the higher primary. These, known as combination tones, are produced when two tones are sounded together, and the frequency is the difference of the frequencies of the generating tones, and summational tones, having a frequency which is the sum of the frequencies of the two tones, first noticed by Sorge about 1740, are easily heard. Thus an interval of a fifth, 2:3, gives a differential tone 1, that is, an octave below 2; a fourth, 3:4, gives 1, a twelfth below 3; a major third, 4:5, two octaves below 5; and a minor third, 5:6, one octave and a major third below 5; a major sixth, 3:5, gives 2, that is, a fifth below 2; and a minor sixth, 5:8, gives 3, that is, a major sixth below 5. Summational tones, first noticed by Helmholtz, are so difficult to hear that much controversy has taken place as to their very existence. Some have contended that they are produced by beats. It appears to be proved physically that these tones can exist in the form of two vibrations of different tones may be generated in the middle ear. Helmholtz also demonstrated their independent existence, and he states that "whenever the vibrations of the air or of other elastic bodies, which are in motion at the same time by two generating simple tones, are so powerful that they can no longer be considered infinitely small, mathematical theory shows that vibrations of the air must arise which have the same vibrational numbers as the combination tones" (Helmholtz, Sensations of Tones, p. 235). The importance of these combinational tones in the theory of hearing is obvious. If the ear can distinguish two pure tones, it may distinguish any vibration of a certain order (simple multiples of the primary tone), hence it may detect combinational tones, which do not belong to that order. Again, if such tones are purely subjective and only exist in the brain, it would be futile to talk of them at all. There can be no doubt, however, that the ear, in dealing with them, vibrates in some part of its mechanism with each generator, while it is also affected by the combinational tone itself, according to its frequencies of beats to modulate the sensitiveness of the ear by determining the smallest difference in pitch that may give rise to a beat. In no part of the scale can a difference smaller than 0.05 vibrations be perceived. The sensitiveness varies with pitch. Thus at 120 vibrations per second, 0.01 vibrations per second, at 900 about 0.3 vibrations per second, and at 1000, 0.5 vibrations per second can be distinguished. This is a remarkable illustration of the sensitiveness of the ear. When tones of low pitch are produced, they do not rapidly die away, as by sounding heavy tuning-forks, not only may the beats be perceived corresponding to the difference between the two tones, but also the overtones produced in the form of a musical sound; in the fourth, major sixth and major third, only two pairs of the partial tones coincide, while in the minor sixth, minor third and minor seventh only one pair of the harmonics coincide.

The phenomena of beats in the subject of music (see Huygen's theory) is even here briefly to refer to them from the physiological point of view. If two musical sounds reach the ear at the same moment, an agreeable or disagreeable sensation is experienced, according to the frequency. These sensations can be shown by experiment with the syrinx that this depends upon the vibrational numbers of the two tones. The octave (1:2), the twelfth (1:3) and double octave (1:4) are absolutely consonant sounds; if the two sound waves are in perfect musical harmony, they can be perceived as a single sound, while in the direction of dissonance, the fourth (3:4), major sixth (5:6), major third (4:5), minor sixth (5:6) and the minor third (3:5) are inharmonious. Physiological effect of beats, though these may not be individually distinguishable, is to give roughness to the ear. If harmonies are coincident on the same note, if they do not coincide, the beats produced will give a character of roughness to the interval. Thus in the octave and twelfth, all the partial tones of both tones coincide, and the listener, if he is deaf to the sound; in the fourth, major sixth and major third, only two pairs of the partial tones coincide, while in the minor sixth, minor third and minor seventh only one pair of the harmonics coincide.

12. Hearing with two ears does not appear materially to influence auditory sensation, but probably the two organs are enabled, not only to correct each other's errors, but also to aid in determining the locality in which a sound originates. It is asserted by G. T. Fechner that one ear may perceive the same tone at a slightly higher pitch than the other, but this may probably be due to some slight difference in the physiological condition of one ear. If two tones, produced by two tuning-forks, of equal pitch, are produced one near each ear, there is a uniform single sensation; if one of the tuning-forks be made to produce such a wave that it approaches and diminishes in intensity, neither fork is heard continuously, but both sound alternately, the fixed one being only audible when the revolving one is not. It is difficult to decide whether excitations of the corresponding elements in the two ears can be distinguished from each other. It is probable that the resulting sensations may be distinguished, provided one of the generating tones differs from the other in intensity or frequency, but not if they are equal.

Our judgment as to the direction of sounds is formed mainly from the different degrees of intensity with which they are heard by two ears. Lord Rayleigh states that diffraction of the sound waves will cause two sources of sound to be heard slightly more from the source of sound; thus partial waves will reach the two ears with different intensities, and thus quality of tone may be affected (Proc. Roy. Soc. Ed. 1878, vol. li. p. 602). We have a similar view, and he shows that the direction of a complex tone can be more accurately determined than the direction of a simple tone, especially if it be of low pitch (Phil. Mag. 1862).
HEARN, LAFCADIO (1850-1904), author of books about Japan, was born on the 27th of June 1850 in Leucadia (pronounced Lefcadia, whence his name, which was one adopted by himself), one of the Greek Ionian Islands. He was the son of Surgeon-major Charles Hearn, of King's County, Ireland, who, during the English occupation of the Ionian Islands, was stationed there, and who married a Greek wife. Artistic and rather bohemian tastes were in Lafcadio Hearn's blood. His father's brother Richard was at one time a well-known member of the Barbizon set of artists, though he made no mark as a painter through his lack of energy. Young Hearn had rather a casual education, but was for a time (1865) at Ushaw Roman Catholic College, Durham. The religious faith in which he was brought up was, however, soon lost; and at nineteen, being thrown on his own resources, he went to America and at first picked up a living in the lower grades of newspaper work. The details are obscure, but he continued to occupy himself with journalism and with out-of-the-way observation and reading, and meanwhile his erratic, romantic and rather morbid idiosyncrasies developed. He was for some time in New Orleans, writing for the Times Democrat, and was sent by that paper for two years as correspondent to the West Indies, where he gathered material for his Two Years in the French West Indies (1860). At last, in 1861, he went to Japan with a commission as a newspaper correspondent, which was quickly broken off. But here he found his true sphere. The list of his books on Japanese subjects tells its own tale: Glimpses of Unfamiliar Japan (1864); Out of the East (1865); Kokoro (1869); Gleanings in Buddha Fields (1867); Exuits and Retrospections (1858); In Ghostly Japan (1869); Shadowings (1860); A Japanese Miscellaneous (1901); Kulta (1903); Japanese Fairy Tales and Kwaidan (1905), and (published just after his death) Japan, an Attempt at Interpretation (1904), a study full of knowledge and insight. He became a teacher of English at the University of Tokyo, and soon fell completely under the spell of Japanese ideas. He married a Japanese wife, became a naturalized Japanese under the name of Yakumo Koizumi, and adopted the Buddhist religion. For the last two years of his life (he died on the 26th of September 1904) his health was failing, and he was deprived of his lecturership at the University. But he had gradually become known to the world at large by the originality, power and life of his writings. The way was prepared by his German genealogy, who had seen life in so many climes, and turned from Roman Catholic to atheist and then to Buddhist, was curiously qualified, among all those who were "interpreting" the new and the old Japan to the Western world, to see it with unfettered understanding, and to express its life and thought with most intimate and most artistic sincerity. Lafcadio Hearn's books were indeed unique for their day in the literature about Japan, in their combination of real knowledge with a literary art which is often exquisite.

HEARN, SAMUEL (1745–1792), English explorer, was born in London. In 1766 he entered the navy, and was some time with Lord Hood; at the end of the Seven Years' War (1763) he took service with the Hudson's Bay Company. In 1768 he examined portions of the Hudson's Bay coast with a view to improving the cod fishery, and in 1769-1772 he was employed in north-western discovery, searching especially for certain copper mines described by Indians. His first attempt (from the 6th of November 1769) failed through the desertion of his Indian guides, and the destruction of the vessel in the breaking of the ice; but his second (December 1770 to June 1772) was successful, not only discovering the copper of the Coppermine river basin, but tracing this river to the Arctic Ocean. He reappeared at Fort Prince of Wales on the 30th of June 1772. Becoming governor of this fort in 1775, he was taken prisoner by the French under La Pérouse in 1782. He returned to England in 1787 and died there in 1792.

See his posthumous Journey from Prince of Wales Fort in Hudson's Bay to the Northern Ocean (London, 1795).

HEARN, THOMAS (1678–1733), English antiquary, was born in July 1678 at Littlefield Green in the parish of White Waltham, Berkshire. Having received his early education from his father, George Hearne, the parish clerk, he showed such taste for study that a wealthy neighbour, Francis Cherry of Shottesbrooke (c. 1665–1713), a celebrated nonjuror, interested himself in the boy, and sent him to the school at Bray "on purpose to learn the Latin tongue." Soon Cherry took him into his own house as a personal assistant, and his education was continued by John Wheelwright, who matriculated at St Edmund Hall, Oxford, in 1696, when he matriculated at the university. He attracted the attention of Dr John Mill (1645–1707), the principal of St Edmund Hall, who employed him to compare manuscripts and in other ways. Having taken the degree of B.A. in 1699 he was made assistant keeper of the Bodleian Library, where he worked on the catalogue of books, and in 1712 he was appointed second keeper. In 1715 Hearne was elected archiopeniographer and esquire becelli in civil law in the university, but objection having been made to his holding this office together with that of second librarian, he resigned it in the same year. As a nonjuror he refused to take the oaths of allegiance to King George I., and early in 1716 he was deprived of his librarianship. However he continued to reside in Oxford, and occupied himself in editing the English chroniclers. Having refused several important academic positions, including the librarianship of the Bodleian and the Camden professorship of ancient history, rather than take the oaths, he died on the 10th of June 1735.

Hearne's most important work was done as editor of the English chroniclers, and until the appearance of the "Rolls" series (1809) were the only ones prepared; they were, and indeed are still, of the greatest value to historical students. Perhaps the most important of a long list are: Peterborough's Benedictus Abbas De vita et gestis Henrici II. et Ricardi I. (1753); John Bedell's Scotia Chronicum (1722); the monk of Evesham's Historia vitae et regni Ricardi II. (1729); Robert Manýng's translation of Peter Langston's Chronicle of Henry the First (1731); the work of a Frenchman, Jean de la Rochebaron, through Duos rerum Anglicarum scriptores veteres (1732); Robert of Gloucester's Chronicle (1724); J. Spott's Chronica (1710); the Vita et gesta Henrici V., wrongly attributed to Thomas Elmham (1727); Titus Livy's Vita Henrici V. (1716); Walter of Hemsburgh's Chronicon (1721); and William of Newburgh's Historia rerum Anglicarum (1716). He also edited John Leland's Itinerary (1710–1712) and the same author's Collectanea (1715); W. Camden's Annales Angliarum and Historiarum re Anglia (1724); John Bedell's Scotia Chronicum; Sir John Spelman's Life of Alfred (1709); and W. Roper's Life of Sir Thomas More (1716). He brought out an edition of Livy (1708); and John Macray's Scotichronicon and an Epoch and a Map of the Acts of the Apocalypse (1715). Among his other compilations may be mentioned: Ductor historiae, A Short System of Universal History (1704. 1705, 1714, 1724); A Collection of Curious Discourses by English and French Antiquaries (1720); and Religione Bodeliensem (1702).

Hearne left his manuscripts to William Bedford, who sold them to Dr Richard Rawlinson, who in his turn bequeathed them to the Bodleian. Two volumes of extracts from his voluminous diary were published by Philip Bliss (Oxford, 1857), and afterwards an enlarged edition in three volumes appeared (London, 1869). A large part of his diary entitled Remarks and Collections, 1705–1714, edited C. E. Doble and D. W. Rannie, has been published by the Oxford Historical Society (1885–1886). Bibliotheca Hearniana, excerpts from the catalogue of Hearne's library, has been edited by B. Botfield (1848).

HEARNE—HEARSE (an adaptation of Fr. herce, a narrow, from Lat. herceps, hercium, rake or harrow, Gr. ἄραξ), a vehicle for the conveyance of a dead body at a funeral. The most usual shape is a four-wheeled car, with a roofed and enclosed body, sometimes with glass panels, which contains the coffin. This is the only current use of the word. In its earlier forms it is usually found as "herse," and meant, as the French word did, a harrow (q.v.). It was then applied to other objects resembling a harrow, following the French. It was then used of a portcullis, and thus becomes a heraldic term, the "herse" being frequently borne as a "charge," as in the arms of the City of Westminster. The
HEART

In anatomy, the heart is a four-chambered muscular bag, which lies in the cavity of the thorax between the two lungs. It is surrounded by another bag, the pericardium, for protective and lubricating purposes (see Coelom and Serous Membranes). Externally the heart is somewhat conical, its base being directed upward, backward and to the right, its apex downward, forward and to the left. In transverse section the cone is flattened, so that there is an anterior and a posterior surface and a superior and inferior border. The superior border, running obliquely downward and to the left, is very thick, and so gains the name of margo obtusus, while the inferior border is horizontal and sharp and is called margo acutus (see fig. 1). The divisions between the four chambers of the heart (namely, the two auricles and two ventricles) are indicated on the surface by grooves, and when these are followed it will be seen that the posterior part of it open the two venae cavae (see fig. 2), the superior (a) above and the inferior (b) below. In front and to the left of the superior vena cava is the right auricular appendage (e) which overlaps the front of the root of the aorta, while running obliquely from the front of one vena cava to the other is a shallow groove called the sulcus terminalis, which indicates the original separation between the true auricle in front and the sinus venosus behind. When the auricle is opened by turning the front wall to the right as a flap the following structures are exposed:

1. A muscular ridge, called the crista terminalis, corresponding to the sulcus terminalis on the exterior.

2. A series of ridges on the anterior wall and in the appendage, running downward from the last and at right angles to it, like the teeth of a comb; these are known as the musculi pectinati.

3. The orifice of the superior vena cava (fig. 2, a) at the upper and back part of the chamber.

4. The orifice of the inferior vena cava (fig. 2, b) at the lower and back part.

5. Attached to the right and lower margins of this opening are the remains of the Eustachian valve (fig. 2, h), which in the focus directs the blood from the inferior vena cava, through the foramen oval, into the left auricle.

6. Below and to the left of this is the opening of the coronary sinus (fig. 2, k), which collects most of the veins returning blood from the substance of the heart.

7. Guarding this opening is the coronary valve or valve of Thebesius.

8. On the posterior or septal wall, between the two auricles, is an oval depression, called the fossa ovalis (fig. 2, g), the remains of the original communication between the two auricles. In about a quarter of all normal hearts there is a small valvular communication between the two auricles in the left margin of this depression (see "7th Report of the Committee of Collective Investigation," J. Anat. and Phys. vol. xxxii. p. 164).

9. The anulus ovatis is the raised margin surrounding this depression.

10. On the left side, opening into the right ventricle, is the right auriculo-ventricular opening.

11. On the right wall, between the two caval openings, may occasionally be seen a slight eminence, the tubercle of Lower, which is supposed to separate the two streams of blood in the embryo.

12. Scattered all over the auricular wall are minute depressions, the foramina Thesesi, some of which receive small veins from the substance of the heart.

The right ventricle is a triangular cavity (see fig. 2) the base of which is largely formed by the auriculo-ventricular orifice. To the left of this it is continued up into the root of the pulmonary artery, and this part is known as the infundibulum. Its anterior wall forms part of the anterior surface of the heart, while its posterior wall is chiefly formed by the septum ventriculorum,
HEART

between it and the left ventricle. Its lower border is the margo acutus already mentioned. In transverse section it is crescentic, since the septal wall bulges into its cavity. In its interior the following structures are seen:

1. The tricuspid valve (fig. 2, 1, m, n) guarding against reflux of blood into the right auricle. This consists of a short cylindrical curtain of fibrous tissue, which projects into the ventricle from the margin of the auriculo-ventricular aperture, while from its free edge three appendages or flaps hang down, the bases of which touch one another. These cusps are spoken of as septal, marginal and infundibular, from their position.

2. The chordae tendineae are fine fibrous cords which fasten the cusps to the musculi papillares and ventricular wall, and prevent the valve being turned inside out when the ventricle contracts.

3. The columnae carneae are fleshy columns, and are of three kinds. The first are attached to the wall of the ventricle in their whole length and are merely sculptured in relief, as it were; the second are attached by both ends and are free in the middle; while the third are known as the musculi papillares and are attached by one end to the ventricular wall, the other end giving attachment to the chordae tendineae. These musculi papillares are grouped into three bundles (fig. 2, 0).

4. The moderator band is really one of the second kind of columnae carneae which stretches from the septal to the anterior wall of the ventricle.

5. The pulmonary valve (fig. 2, p) at the opening of the pulmonary artery has three crescentic, pocket-like cusps, which, when the ventricle is filling, completely close the aperture, but during the contraction of the ventricle fit into three small niches known as the sinuses of Valsalva, and so are quite out of the way of the escaping blood. In the middle of the free margin of each is a small knob called the corpus Arantii (fig. 2, q), and on each side of this a thin crescent-shaped flap, the bulla (fig. 2, r), which is only made of two layers of endocardium, whereas in the rest of the cusp there is a fibrous backing between these two layers.

The left auricle is situated at the back of the base of the heart, behind and to the left of the right auricle. Running down behind it are the oesophagus and the thoracic aorta. When it is opened it is seen to have a much lighter colour than the other cavities, owing to the greater thickness of its endocardium obscuring the red muscle beneath. There are no muscular pectinati except in the auriculo-ventricular appendage. The openings of the four pulmonary veins are placed two on each side of the posterior wall, but sometimes there may be three on the right side, and only one on the left. On the septal wall is a small depression like the mark of a finger-nail, which corresponds to the anterior part of the fossa ovalis and often forms a valvular communication with the right auricle. The auriculo-ventricular orifice is large and oval, and is directed downward and to the left. Foramina Thesbei and venae minimae cords are found in this auricle, as in the right, although the chamber is one for arterial or oxidized blood. At the lower part of the posterior surface of the unopened auricle, lying in the left auriculo-ventricular furrow, is the coronary sinus, which receives most of the veins returning the blood from the heart substance; these are the right and left coronary veins at each extremity and the posterior and left cardiac veins from below. One small vein, called the oblique vein of Marshall, runs down into it across the posterior surface of the auricle, from below the left lower pulmonary vein, and is of morphological interest.

The left ventricle is conical, the base being above, behind and to the right, while the apex corresponds to the apex of the heart and lies about one-third of the ventricular length from the mid line. The following structures are seen inside it:

1. The mitral valve guarding the auriculo-ventricular opening has the same arrangement as the tricuspid, already described, save that there are only two cusps, named marginal and aortic, the latter of which is the larger.

2. The chordae tendineae and columnae carneae resemble those of the right ventricle, though there are only two bundles of musculi papillares instead of three. These are very large. A moderator band has been found as an abnormality (see J. Anat. and Phys. vol. xxx. p. 568).

3. The aortic valve has the same structure as the pulmonary, though the cusps are more massive. From the anterior and left posterior sinuses of Valsalva the coronary arteries arise. That part of the ventricle just below the aortic valve, corresponding to the infundibulum on the right, is known as the aortic vestibule.

The walls of the left ventricle are three times as thick as those of the right, except at the apex, where they are thinner. The septum ventriculorum is concave towards the left ventricle, so that a transverse section of that cavity is nearly circular. The greater part of it has nearly the same thickness as the rest of the left ventricular wall and is muscular, but a small portion of the upper part is membranous and thin, and is called the pars membranacea septi; it lies between the aortic and pulmonary orifices.

Structure of the Heart.—The arrangement of the muscular fibres of the heart is very complicated and only imperfectly known. For details one of the larger manuals, such as Cunningham's Anatomy (London, 1910), or Gray's Anatomy (London, 1900), should be consulted. The general scheme is that there are superficial fibres common to the two auricles and two ventricles and deeper fibres for each cavity. Until recently no fibres had been traced from the auricles to the ventricles, though Gaskell predicted that these would be found, and the credit for first demonstrating them is due to Stanley Kent, their details having subsequently been worked out by W. His, Junr., and S. Tawara. The fibres of this auriculo-ventricular bundle begin in the right auricle, below the opening of the coronary sinus, and run forward on the right side of the auricular septum, below the fossa ovalis, and close to the auriculo-ventricular septum. Above the septal flap of the tricuspid valve they thicken and divide into two main branches, one on either side of the ventricular septum, which run down to the bases of the anterior and posterior papillary muscles, and so reach the walls of the ventricle, where their secondary branches form the fibres of Purkinje. The bundle is best seen in the hearts of young Ruminants, and it is presumably through it that the wave of contraction passes from the auricles to the ventricles (see article by A. Keith and M. Flack, Lancet, 11th of August 1906, p. 359).

The central fibrous body is a triangular mass of fibro-cartilage, situated between the two auriculo-ventricular and the aortic orifices. The upper part of the septum ventriculorum blends with it. The endocardium is a delicate layer of endothelial cells backed by a very thin layer of fibro-elastic tissue; it is continuous with the endothelium of the great vessels and lines the whole of the cavities of the heart.

The heart is roughly about the size of the closed fist and weighs from 8 to 12 oz.; it continues to increase in size up to about fifty years of age, but the increase is more marked in the male than in the female. Each ventricle holds about 4 f. oz. of blood, and each auricle rather less. The nerves of the heart are derived from the vagus, spinal accessory and sympathetic, through the superficial and deep cardiac plexuses.

Embryology.

In the article on the arteries (q.v.) the formation and coalescence of the two primitive ventral aortae to form the heart are noticed, so that we may here start with a straight median tube lying ventral to the pharynx and being prolonged cephalad into the ventral aortae and caudad into the vitelline veins. This soon shows four dilatations, which, from the tail towards the head, are called the sinus venosus, the sinus coronarius, the trunks 1 arteriosus, and the truncus arteriosus. As the tubular heart grows more rapidly than the pericardium which contains it, it becomes bent into the form of an S laid on its side (θ), the ventral convexity being the ventricle and the dorsal the auricle. The passage from the ventricle to the auricle is known as the auricular canal, and in the dorsal and ventral parts of this appear two thickenings

1 This is often called bulbus arteriosus, but it will be seen that the term is used rather differently in comparative anatomy.
known as endocardial cushions, which approach one another and leave a transverse slit between them (fig. 3, E.C.). Eventually these two cushions fuse in the middle line, obliterating the central part of the slit, while the lateral parts remain as the two auriculo-ventricular orifices; this fusion is known as the septum intermedium. From the bottom (ventral convexity) of the ventricle an antero-posterior median septum grows up, which is the septum primum or septum ventriculorum (fig. 3, V). Posteriorly (caudally) this septum fuses with the septum intermedium, but anteriorly it is free at the lower part of the truncus arteriosus. On referring to the development of the arteries (see Arteries) it will be seen that another septum starts between the last two pairs of aortic arches and grows downward (caudal) until it reaches and joins with the septum inferius just mentioned. This septum arcticum (formed by two ingrowths from the wall of the vessel which fuse later) becomes twisted in such a way that the right ventricle is continuous with the last pair of aortic arches (pulmonary artery), while the left ventricle communicates with the other arches (the permanent ventral aorta and its branches); it joins the septum ventriculorum in the upper part of the ventricular cavity and so forms the pars membranacea septi (fig. 3, T. Ar.).

The fate of the sinus venosus and auricule must now be followed. Into the former, at first, only the two vitelline veins open, but later, as they develop, the ducts of Cuvier and the umbilical veins join in (see Veins). As the ducts of Cuvier come from each side the sinus spreads out to meet them and becomes transversely elongated. The slight constriction, which at first is the only separation between the sinus and the auricule, becomes more marked, and later the opening is into the right part of the auricule, and is guarded by two valves (the venous valves) which project into that cavity, and are continuous above with a temporary downgrowth from the roof, known as the septum spurium. Later the right side of the sinus enlarges, and so does the right part of the aperture, until the back part of the right side of the auricule and the right part of the sinus venosus are thrown into one, and the only remnants of the partition are the crista terminalis and the Eustachian and Thebesian valves. The left part of the sinus venosus, which does not enlarge at the same rate as the right part, remains as the coronary sinus. It will now be seen why, in the adult heart, all the veins which open into the right auricle open into its posterior part, behind the crista terminalis. The septum spurium has been referred to as a temporary structure; the real division between the two auricles occurs at a later date than that between the ventricles and to the left of the septum spurium. It is formed by two partitions, the first of which, called the septum primum, grows down from the auricular roof. At first, as the endothelial cushions overlap, it forms the endocardial cushions and so the endocardial cushions. The septum primum, already mentioned, and so called the ostium primum, between. This has nothing to do with the foramen ovale, which occurs as an independent perforation higher up, and at first is known as the ostium secundum. When it is established the septum primum grows down and meets the endocardial cushions, and so the ostium primum is obliterated. The septum secundum grows down on the right side of the septum primum and is never complete; it grows round and largely overlaps the foramen ovale and its edges form the annulus ovalis, so that, in the later months of foetal life, the foramen ovale is a valvular opening, the floor of which is formed by the septum primum and the margins by the septum secundum. The closure of the foramen is brought about by adhesion of the two septa.

The pulmonary veins of the two sides at first join one another, dorsal to the left auricle, and open into the sac that can be by a single median trunk, but, as the auricle grows, this trunk and part of the right and left veins are absorbed into its cavity.

The mitral and tricuspid valves are formed by the shortening of the auricular canal which becomes telescoped into the ventricle, and the cusps are the remnants of this telescoping process.

The columnae carneae and chordae tendineae are the remains of a spongy network which originally filled the cavity of the primary ventricle.

The aortic and pulmonary valves are laid down in the ventral aorta, before it is divided into aorta and pulmonary artery, as four endocardial cushions; anterior, posterior and two lateral. The septum arcticum cuts the latter two into two, so that each artery has the rudiments of three cusps.

Abnormalities of the heart are very numerous, and can usually be explained by a knowledge of its development. They often cause grave clinical symptoms. A clear and well-illustrated review of the most important of them will be found in the chapter on congenital disease of the heart in Clinical Applied Anatomy, by C. R. Box and W. MacAdam Eccles, London, 1906.

For further details of the embryology of the heart see Oscar Hertwig's Entwickelungslahre der Wirbeltiere (Jena, 1902); G. Born, "Entwicklung des Säugertierherzens," Archiv f. mik. Anat. Bd. 33 (1889); W. His, Anatomie menschlicher Embryonen (Leipzig, 1881-1883); Quain's Anatomy, vol. i. (1898); C. S. Minot, Human Embryology (New York, 1892); and A. Keith, Human Embryology and Morphology (London, 1905).

Comparative Anatomy.

In the Acrania (e.g. lancelet) there is no heart, though the vessels are specially contractile in the ventral part of the pharynx.

In the Cyclostomata (lamprey and hag), and Fishes, the heart has the same arrangement which has been noticed in the human embryo. There is a smooth, thin-walled sinus venosus, a thin reticulate-walled auricule, produced laterally into two appendages, a thick-walled ventricle, and a conus arteriosus containing valves. In addition to these the beginning of the ventral aorta is often thickened and expanded to form a bulbus arteriosus, which is non-contractile, and, strictly speaking, belongs, as far as the term can be defined, with the arteries than with the heart.

In relation to human embryology the smooth venous sinus and reticulated auricule are interesting. Between the auricle and ventricle is the auriculo-ventricular valve, which primarily consists of two cusps, comparable to the two endocardial cushions of the human embryo, though in some forms they may be subdivided. In the interior of the ventricle is a network of muscular trabeculae. The conus arteriosus in the Elasmobranchs (sharks and rays) and Ganoids (sturgeon) is large and provided with several rows of semilunar valves, but in the Cyclostomata (lamprey) and Teleosts (bony fishes) the conus is reduced and only the anterior (cryptic) row of valves retained. With the reduction of the conus the bulbus arteriosus is enlarged. So far the heart is a single tubular organ expanded into various cavities and having the characteristic O-shaped form seen in the human embryo; it contains only venous blood which is forced through the gills to be oxidized on its way to the tissues. In the Dipnoi (mud fish), in which rudimentary lungs, as well as gills, are developed, the auricle is divided into two, and the sinus venosus opens into the right auricule. The conus arteriosus too begins to be divided into two chambers, and in Protopterus this division is complete. This division of the heart is one instance in which mammalian ontogeny does not repeat the processes of phylogeny, because, in the human embryo, it has been shown that the ventricular septum appears before the auricular. This want of harmony is sometimes spoken of as the falsification of the embryological record.

In the Amphibia there are also two auricles and one ventricle,
though in the Urodela (tailed amphibians) the auricular septum is often fenestrated. The sinus venosus is still a separate chamber, and the conus arteriosus, which may contain many or few valves, is usually divided into two by a spiral fold. Structurally the amphibian heart closely resembles the dipnoan, though the increased size of the left auricle is an advance. In the Anura (frogs and toads) the whole ventricle is filled with a spongy network which prevents the arterial and venous blood from the two auricles mixing to any great extent. (For the anatomy and physiology of the frog's heart, see The Frog, by Milnes Marshall.)

In the Reptiles the ventricular septum begins to appear; this in the lizards is quite incomplete, but in the crocodiles, which are usually regarded as the highest order of living reptiles, the partition has nearly reached the top of the ventricle, and the condition resembles that of the human embryo before the pars membranacea septi is formed. The conus arteriosus becomes included in the ventricular cavity, but the sinus venosus still remains distinct, and its opening into the right ventricle is guarded by two valves which closely resemble the two venous valves in the auricle of the human embryo already referred to.

In the Birds the auricular and ventricular septa are complete; the right ventricle is thin-walled and crescentic in section, as in Man, and the musculi papillares are developed. The left auriculo-ventricular valve has three membranous cusps with chordae tendineae attached to them, but the right auriculo-ventricular valve has a large fleshy cusp without chordae tendineae. The sinus venosus is largely included in the right auricle, but remains of the two venous valves are seen on each side of the orifice of the inferior vena cava.

In the Mammals the structure of the heart corresponds closely with the description of that of Man already given. In the Ornithorhynchus, among the Monotremes, the right auriculo-ventricular valve has two fleshy and two membranous cusps, thus showing a resemblance to that of the bird. In the Echidna, the other member of the order, however, both auriculo-ventricular valves are membranous. In the Edentates the remains of the venous valves at the opening of the inferior vena cava are better marked than in other orders. In the Ungulates the moderator band in the right ventricle is especially well developed, and the central fibrous body at the base of the heart is often ossified, forming the os cordis so well known in the heart of the ox.

The position of the heart in the lower mammals is not so oblique as it is in Man.

For further details see C. Rose, Beitr. z. vergl. Anat. des Herzens der Wirbeltiere Morph. Jahrb., Bd. xvi. (1890); R. Wiedersheim, Vergleichende Anatomie der Wirbeltiere (Jena, 1902) (for literature); also Parker and Haswell’s Zoology (London, 1897). (F. G. P.)

HEART DISEASE.—In the early ages of medicine, the absence of correct anatomical, physiological and pathological knowledge prevented diseases of the heart from being recognized with any certainty during life, and almost entirely precluded them from becoming the subject of medical treatment. But no sooner did Harvey (1628) publish his discovery of the circulation of the blood, and its dependence on the heart as its central organ, than derangements of the circulation began to be recognized as signs of disease of that central organ. (See also under Vascular System.)

Among the earliest to profit by this discovery and to make important contributions to the literature of diseases of the heart and circulation were, R. Lower (1631–1691), R. Vleussens (1641–1710), H. Boerhave (1668–1738) and the great pathologists at the beginning of the 19th century, G. M. Lancisi (1754–1820), G. B. Morgagni (1682–1771) and J. B. Senac (1763–1770). The works of these writers form very interesting reading, and it is remarkable how careful were the observations made, and how sound the conclusions drawn, by these pioneers of scientific medicine. J. N. Corvisart (1755–1821) was one of the earliest to make practical use of R. T. Auenbrugger’s (1722–1809) invention of percussion to determine the size of the heart. R. T. H. Laennec (1781–1826) was the first to make a scientific application of mediate auscultation to the diagnosis of disease of the chest, by the invention of the stethoscope. J. Bouillaud (1796–1851) extended its use to the diagnosis of disease of the heart. To James Hope (1801–1841) we owe much of the precision we have now attained in diagnosis of valvular disease from abnormalities in the sounds produced during cardiac movements. This short list by no means exhausts the earlier literature on the subject, but each of these names marks an era in the progress of the diagnosis of cardiac disease. In later years the literature on this subject has become very copious.

The heart and great vessels occupy a position immediately to the left of the centre of the thoracic cavity. The anterior surface of the heart is projected against the chest wall and is surrounded on either side by the lungs, which are resonant organs, so that any increase in the size of the heart, "dilatation," can be detected by percussion. By placing the hand on the chest, palpation, the impulse of the left ventricle, or apex beat, can normally be felt just below and internal to the nipple. Deviations from the normal in the position or force of the apex beat will afford important information as to the nature of the pathological changes in the heart. Thus, displacement downwards and outwards of the apex beat, with a forcible thrusting impulse, will indicate hypertrophy, or increase of the muscular wall and increased driving power of the left ventricle, whereas a similar displacement with a feeble diffuse impulse will indicate dilatation, or over-distension of its cavity from stretching of the walls.

By auscultation, or listening with a suitable instrument named a stethoscope over appropriate areas, we can detect any abnormality in the sounds of the heart, and the presence of murmurs indicative of disease of one or other of the valves of the heart.

The pericardium is a fibro-serous sac which loosely envelopes the heart and the origin of the great vessels. Inflammation of this sac, or pericarditis, is apt to occur as a result of rheumatism, or more especially in children. It may also occur as a complication of pneumonia. It is a serious affection associated with pain over the heart, fever, shortness of breath, rapid pulse and dilatation of the heart. As a result of the inflammation, fluid may accumulate in the pericardial sac, or the walls of the sac may become adherent to the heart and tend to embarrass its action. In favourable cases, however, recovery may take place without any untoward sequelae.

Diseases of the heart may be classified in two main groups, (1) Disease of the valves, and (2) Disease of the walls of the heart.

1. Valvular Disease.—Inflammation of the valves of the heart, or endocarditis, is one of the most common complications of rheumatism in children and young adults. More severe types, which are apt to prove fatal from a loss of blood poisoning, may result when the valves of the heart are attacked by certain micro-organisms, such as the pneumococcus, which is responsible for pneumonia, the streptococcus and the staphylococcus pyogenes, the gonococcus and the influenza bacillus. As a result of endocarditis, one or more of the valves may be seriously damaged, so that it leaks or becomes incompetent. The valves of the left side of the heart, the aortic and mitral valves, are affected far more commonly than those of the right side. It is indeed comparatively rare that the latter are attacked. In the process of healing of a damaged valve, scar tissue is formed which has a tendency to contract, so that in some cases the orifice of the valve becomes narrowed, and the resulting stenosis or narrowing gives rise to obstruction of the blood stream. We may thus have incompetence or stenosis of a valve or both combined.

Lesions of one or both valves are detected on auscultation over appropriate areas by the blowing sounds or murmurs to which they give rise, which modify or replace the normal heart sounds. Thus, lesions of the mitral valve give rise to murmurs which are heard at the apex beat of the heart, and lesions of the aortic valves to murmurs which are heard over the aortic area, in the second right intercostal space. Accurate timing of the murmurs in relation to the heart sounds enables us to judge whether the murmur is due to stenosis or incompetence of the valve affected.
If the valvular lesion is severe, it is essential for the proper maintenance of the circulation that certain changes should take place in the heart to compensate for or neutralize the effects of the regurgitation or obstruction, as the case may be. In affections of the aortic valve, the extra work falls on the left ventricle, which enlarges proportionately and undergoes hypertrophy. In affections of the mitral valve the effect is felt primarily by the left auricle, which is a thin walled structure incapable of undergoing the requisite increase in power to resist the backward flow through the mitral orifice in case of leakage, or to overcome the effects of obstruction in case of stenosis. The back pressure is therefore transmitted to the pulmonary circulation, and as the right ventricle is responsible for maintaining the flow of blood through the lungs, the strain and extra work fall on the right ventricle, which in turn enlarges and undergoes hypertrophy. The degree of hypertrophy of the left or right ventricle is thus, up to a certain point, a measure of the extent of the lesion of the aortic or mitral valve respectively. When the effects of the valvular lesion are so neutralized by these structural changes in the heart that the circulation is equally maintained, "compensation" is said to be efficient.

When the heart gives way under the strain, compensation is said to break down, and dropsey, shortness of breath, cough and cyanosis, are among the distressing symptoms which may set in. The mere existence of a valvular lesion does not call for any special treatment so long as compensation is efficient, and a large number of people with slight valvular lesions are living lives indistinguishable from those of their neighbours. It will, however, be readily understood that in the case of the more serious lesions certain precautions should be observed in regard to over-exertion, excitement, over-indulgence in tobacco or alcohol, &c., as the balance is more readily upset and any undue strain on the heart may cause a breakdown of compensation. When this occurs treatment is required. A period of rest in bed is often sufficient to enable the heart to recover, and this may be supplemented as required by the administration of mercurial and saline purgatives to relieve the embarrassed circulation, and of suitable cardiac tonics, such as digitalis and strychnin, to reinforce and strengthen the heart's action.

2. Affections of the Muscular Wall of the Heart.—Dilatation of the heart, or stretching of the walls of the heart, is an incident, as has already been stated, in pericarditis and in the earlier stages of valvular disease antecedent to hypertrophy. Temporary or permanent dilatation of the cavities of the heart occurs in violent and protracted exertion, but rapidly subsides and is in no wise harmful to the sound and vigorous heart of the young. It is otherwise if the heart is weak and flabby from a too sedentary life or degenerative changes in its walls or during convalescence from a severe illness, when the same circumstances which will not injure a healthy heart, may give rise to serious dilatation from which recovery may be very protracted.

Influenza is a common cause of cardiac dilatation, and is liable to be a source of trouble after the acute illness has subsided, if the patient goes about and resumes his ordinary avocations too soon.

Fatty or fibroid degeneration of the heart wall may occur in later life from impaired nutrition of the muscle, due to partial obstruction of the blood-vessels supplying it, when they are the seat of the degenerative changes known as arteriosclerosis or atheroma. The affection known as angina pectoris (q.v.) may be a further consequence of this defective blood-supply.

The symptoms will vary according to the nature of the case. In serious cases of dilatation, rest in bed, purgatives and cardiac tonics may be required.

In commencing degenerative change the Oertel treatment, consisting of graduated exercise up a gentle slope, limitation of fluids and a special diet, may be indicated.

In cases of slight dilatation after influenza or recent illness, the Schott treatment by baths and exercises as carried out at Nauehm may be sometimes beneficial. The change of air and scene, the enforced rest, the placid life, together with freedom from excitement and worry, are among the most important factors which contribute to success in this class of case.

Disorders of Rhythm of the Heart's Action.—Under this heading may be grouped a number of conditions to which the name "functional affections of the heart" has sometimes been applied, inasmuch as the disturbances in question cannot usually be attributed to definite organic disease of the heart. We must, of course, exclude from this category the irregularity in the force and frequency of the pulse, which is commonly associated with incompentence of the mitral valve.

The heart is a muscular organ possessing certain properties, rhythmicity, excitability, contractility, conductivity and tonicity, as pointed out by Gaskell, in virtue of which it is able to maintain a regular automatic beat independently of nerve stimulation. It is, however, intimately connected with the brain, blood-vessels and the abdominal and thoracic viscera, by innumerable nerves, through which impulses or messages are being constantly sent to and received from these various portions of the body. Such messages may give rise to disturbances of rhythm with which we are all familiar. For instance, sudden fright or emotion may cause a momentary arrest of the heart's action, and excitement or apprehension may set up a rapid action of the heart or pulsation. Pulsation, again, is often the result of digestive disorders, the message in this case being received from the stomach, instead of the brain as in emotional disturbances. It may also result from over-indulgence in tobacco and alcohol.

Tachycardia is the name applied to a more or less permanent increase in the rate of the heart-beat. It is usually a prominent feature in the affection known as Graves' disease or exophthalmic goitre. It may also result from chronic alcoholism. In the condition known as paroxysmal tachycardia there appears to be no adequate explanation for its onset.

Bradycardia or abnormal slowness of the heart-beat, is the converse of tachycardia. An abnormally slow pulse is met with in melancholia, cerebral tumour, jaundice and certain toxic conditions, or may follow an attack of influenza. There is, however, a peculiar affection characterized by abnormal slowness of pulse (often ranging as low as 30), and the onset, from time to time, of epileptiform or synopcal attacks. To this the name "Stokes-Adams disease" has been applied, as it was first called attention to by Adams in 1837, and subsequently fully described by Stokes in 1836. It is usually associated with senile degenerative change of the heart and vascular system, and is held to be due to impairment of conductivity in the muscular fibres (bundle of His) which transmit the wave of contraction from the auricle to the ventricle. It is of serious significance in view of the symptoms associated with it.

Intermittency of the Pulse.—By this is understood a pulse in which a beat is dropped from time to time. The dropping of a beat may occur at regular intervals every two, four, or six beats, &c., or occasionally at irregular intervals after a series of normal beats. On examining the heart, it is found, as a rule, that the cause of the intermission at the wrist is not actual omission of a heart-beat, but the occurrence of a hurried imperfect cardiac contraction which does not transmit a pulse-wave to the wrist. It is not characteristic of any special form of heart affection, and is rarely of serious import. It may be due to reflex digestive disturbances, or be associated with conditions of nervous breakdown and irritability, or with an atomic and relaxed condition of the heart muscle. The treatment of these disorders of rhythm of the heart will vary greatly according to the cause and is often a matter of considerable difficulty.

Surgery of Heart and Pericardium.—As the result of acute or chronic inflammation of the lining membrane of the fibrous sac which surrounds the heart and the neighbouring parts of the large blood-vessels, a dropscial or a purulent collection may form in it, or the sac may be quietly distended by a thin watery fluid. In, either case, but especially in the latter, the heart may be so embarrassed in its work that death seems imminent. The condition is generally due to the cultivation
in the pericardium of the germs of rheumatism, influenza or gonorrhoea, or of those of ordinary suppuration. Respiration as well as circulation is embarrassed, and there is a marked fulness and dullness of the front wall of the chest to the left of the breast-bone. In that region also pain and tenderness are complained of. By using the slender, hollow needle of an aspirator great relief may be afforded, but the tapping may have to be repeated from time to time. If the fluid drawn off is found to be purulent, it may be necessary to make a trap-door opening into the chest by cutting across the 4th and 5th ribs, incising and evacuating the pericardium and providing for drainage. In short, an abscess in the pericardium must be treated like an abscess in the pleura.

Wounds of the heart are apt to be quickly fatal. If the patient knows that the embolized action of the heart is due to pressure from blood which is leaking into, and is locked up in the pericardium, the proper treatment will be to open the pericardium, as described above, and, if possible, to close the opening in the auricle, ventricle or large vessel, by sutures.

HEART-BURIAL, the burial of the heart apart from the body. This is a very ancient practice, the special reverence shown towards the heart being doubtless due to its early association with the soul of man, his affections, courage and conscience. In medieval Europe heart-burial was fairly common. Some of the more notable cases are those of Richard I., whose heart, preserved in a casket, was placed in Rouen cathedral; Henry III., buried in Normandy; Eleanor, queen of Edward I., at Lincoln; Edward I., at Jerusalem; Louis IX., Philip III., Louis XIII. and Louis XIV., in Paris. Since the 17th century the hearts of deceased members of the house of Habsburg have been buried apart from the body in the Loretto chapel in the Augustiner Kirche, Vienna. The most romantic story of heart-burial is that of Robert Bruce. He wished his heart to rest at Jerusalem in the church of the Holy Sepulchre, and on his deathbed entrusted the fulfilment of his wish to Douglas. The latter broke his journey to join the Spaniards in their war with the Moorish king of Granada, and was killed in battle, the heart of Bruce enclosed in a silver casket hanging round his neck. Subsequently the heart was buried at Melrose Abbey. The heart of James, marquess of Montrose, executed by the Scottish Covenanters in 1650, was recovered from his body, which had been buried by the roadside outside Edinburgh, and, enclosed in a steel box, was sent to the duke of Montrose, then in exile. It was lost on its journey, and years afterwards was discovered in a curiosity shop in Flanders. Taken by a member of the Montrose family to India, it was stolen as an amulet by a native chief, was once more regained, and finally lost in France during the Revolution. Of notable 17th-century interest is the case of Jean Paul de la Croix, whose heart was buried in the church of the convent of the Visitation at Châlottet near Paris, and that of Sir William Temple, at Moor Park, Farnham. The last ceremonial burial of a heart in England was that of Paul Whitehead, secretary to the Monks of Medmenham club, in 1775, the interment taking place in the La Despenser mausoleum at High Wycombe, Bucks. Of later cases the most notable are those of Daniel O'Connell, whose heart is at Rome, Shelley at Bournemouth, Louis XVII. at Venice, Kosciusko at the Polish museum at Rapperswyll, Lake Zürich, and the marquess of Bute, taken by his widow to Jerusalem for burial in 1900. Sometimes other parts of the body, removed in the process of embalming, are given separate and solemn burial. Thus the viscera of the popes from Sixtus V. (1590) onward have been preserved in the parish church of the Quirinal. The custom of heart-burial was forbidden by Pope Boniface VIII. (1294–1303), but Benedict XI. withdrew the prohibition. See Pettigrew, Chronicles of the Tombs (1857).

HEARTH (a word which appears in various forms in several Teutonic languages, cf. Dutch haard, German Herd, in the sense of "floor"), the part of a room where a fire is made, usually constructed of stone, bricks, tiles or earth, beaten hard and having a chimney above; the fire being lighted either on the hearth itself, or in a receptacle placed there for the purpose. Like the Latin focus, especially in the phrase for "hearth and home" answering to pro aris et focis, the word is used as equivalent to the home or household. The word is also applied to the fire and cooking apparatus on board ship; the floor of a smith's forge; the floor of a reverberatory furnace which the ore is exposed to the flame; the lower part of a blast furnace through which the metal goes down into the crucible; in soldering, a portable brazier or chafing dish, and an iron box sunk in the middle of a flat iron plate or table. An "open-hearth furnace" is a regenerative furnace of the reverberatory type used in making steel, hence "open-hearth steel" (see Iron and Steel).

Hearth-money, hearth tax or chimney-money, was a tax imposed in England on all houses except cottages at a rate of two shillings for every hearth. It was first levied in 1662, but fell into disuse at an early date, chiefly because of the domiciliary visits of the collectors, it was repealed in 1669, although it was producing £170,000 a year. The principle of the tax was not new in the history of taxation, for in Anglo-Saxon times the king derived a part of his revenue from a fumage or tax of smoke farthings levied on all hearths except those of the poor. It appears also in the hearth-penny or tax of a penny on every hearth, which as early as the 10th century was paid annually to the pope (see Peter's Pence).

HEARTS, a game of cards of recent origin, though founded upon the same principle as many old games, such as Slobberharness, Four Jacks and Enflét, namely, that of losing instead of winning. Each player plays his cards as they come in one at a time, and keeping count of the pack, ace counting highest and deuce lowest. In the four-handed game, which is usually played, the entire pack is dealt out as at whist (but without turning up the last card, since there are no trumps), and the player at the dealer's left begins by leading any card he chooses, the trick being taken by the highest card of the suit led. Each player must follow suit if he can; if he has no cards of the suit led he is privileged to throw away any card he likes, thus having an opportunity of getting rid of his hearts, which is the object of the game. When all thirteen tricks have been played each player counts the hearts he has taken in and pays into the pool a certain number of counters for them, according to an arrangement made before beginning play. In the four-handed, or sweepstake, game the method of settling called "Howell's," from the name of the inventor, has been generally adopted, according to which each player begins with an equal number of chips, say 100, and, after the hand has been played, pays into the pool as many chips for each heart he had taken as there are players besides himself. Then each player takes out of the pool one chip for every heart he did not win. The pool is thus exhausted with every deal. Hearts may be played by two, three, four or even more players, each playing for himself.

Spot Hearts.—In this variation the hearts count according to the number of spots on the cards, excepting that the ace counts 14, the king 13, queen 12 and jack 11, the combined score of the thirteen hearts being thus 104.

Auction Hearts.—In this the eldest hand examines his hand and bids a certain number of counters for the privilege of naming the suit to be got rid of, but without naming the suit. The other players in succession have the privilege of outbidding him, and whoever bids most declares the suit and pays the amount of his bid into the pool, the winner taking it.

Joker.—If all hearts are discarded, and an extra card, called the joker, takes its place, ranking in value between ten and knave. It cannot be thrown away, excepting when hearts are led and an ace or court card is played, though if an opponent discards the ace or a court card of hearts, then the holder of the joker may discard it. The joker is usually considered worth five chips, which are either paid into the pool or to the player who succeeds in catching the joker.

Heartsicle.—In this variation the deuce of spades is deleted and the three cards left after dealing twelve cards to each player are called the widow (or kitly), and are left face downward on the table. The value of the first trick must take the widow without showing it to his opponents.

Slobberharness.—The object of this older form of Hearts is to avoid taking either the first or last trick or a trick containing the queen of clubs. The procedure is the same as that described above, except that each player is given 10 counters, one being forfeited to the widow if a player takes the first or last trick, or that containing the club queen. If he takes all three he forfeits four points.
Four Jacks (Polignac or Quatre-Valets) is usually played with a piquet pack, the cards ranking in France as at écarté, but in Great Britain and Ireland, in the usual trump suit. The cards are dealt, and the object of the game is to avoid taking any trick containing a knave, especially the knave of spades, called Polignac. The player taking such a trick forfeits one counter to the pool.

To avoid giving unnecessary details, I shall merely say that persons with the piquet pack and for a pool. The cards rank as at Hearts, and there is no trump suit. A player must follow suit if he can, but if he cannot he may not disregard his trump suit, as already won and add them to his hand. Play is continued until one player gets rid of all his cards and thus wins.

**HEAT**

(O. E. *ēahtu*, which like "hot," Old Eng. *hāt*, is from the Teutonic type *haita, hit*, to be hot; cf. Ger. *hitze*, *heiß*; Dutch, *hitte, heet*, &c.), a general term applied to that branch of physical science which deals with the effects produced by heat on material bodies, with the laws of transference of heat, and with the differentiations of heat into other kinds of energy. The object of the present article is to give a brief sketch of the historical development of the science of heat, and to indicate the relation of the different branches of the subject, which are discussed in greater detail with reference to the latest progress in separate articles.

1. **Meanings of the Term Heat.**—The term heat is employed in ordinary language in a number of different senses. This makes it a convenient term to employ for the general title of the science, but the different meanings of heat must be carefully distinguished in scientific discussion.

   (a) **Sensation of heat.**—By heat we mean the sensation experienced when a body is cooled or heated, or when a change occurs in the state of a body. This sensation we denote by the term *heat*, and its presence is inferred from the observations of its effects.

   (b) **Temperature.**—The term *temperature* is used, in a general sense, to denote the intensity of heat, i.e., the quantity of heat contained in a body or the number of degrees necessary to heat a body to a given temperature.

   (c) **Quantity of thermal energy.**—Heat is also employed to denote the quantity of thermal energy contained in a body or the number of degrees necessary to heat a body to a given temperature.

   (d) **Radiant heat.**—Radiant heat is employed to denote the quantity of radiant energy contained in a body or the number of degrees necessary to heat a body to a given temperature.

2. **Evolution of the Thermometer.**—The first step in the development of the science of heat was necessarily the invention of the thermometer, an instrument for indicating temperature and measuring its changes. The first requisite in the case of such an instrument is that it should always give, at least approximately, the same indication at the same temperature. The air-thermometer of Galileo, illustrated in fig. 1, which consisted of a glass bulb containing air, connected to a glass tube of small bore dipping into a coloured liquid, though very sensitive to variations of temperature, was not satisfactory as an ordinary instrument. The degree of temperature thus indicated is affected by variations of atmospheric pressure. The invention of the type of thermometer familiar at the present day, containing a liquid hermetically sealed in a glass bulb with a fine tube attached, is also generally attributed to Galileo at a slightly later date, about 1612. Alcohol was the liquid first employed, and the degrees, intended to represent thousands of the volume of the bulb, were marked with small beads of enamel fused on the stem, as shown in fig. 2. In order to render the readings of such instruments comparable with each other, it was necessary to select a fixed point or standard temperature as the zero or starting-point of the graduations. Instead of making each degree a given fraction of the volume of the bulb, which would be difficult in practice, and would give different values for different liquids, it was soon found to be preferable to take two fixed points, and to divide the interval between them into the same number of degrees. It was natural in the first instance to take the temperature of the human body as one of the fixed points. In 1701 Sir Isaac Newton proposed a scale in which the freezing-point of water was taken as zero, and the temperature of the human body as 12°. About the same date (1714) Gabriel Daniel Fahrenheit proposed to take as zero the lowest temperature obtainable with a freezing mixture of ice and salt, and to divide the interval between this temperature and that of the human body into 12°. To obtain finer graduations the number was subsequently increased to 60°. The freezing-point of water was at that time supposed to be somewhat variable, because as a matter of fact it is possible to cool water several degrees below its freezing-point in the absence of ice. Fahrenheit showed, however, that as soon as ice began to form the temperature ceased to rise, and that a mixture of ice or snow with pure water always gave the same temperature.

3. **Comparison of Scales based on Expansion.**—Thermometers constructed in the manner already described will give strictly comparable readings, provided that the tubes be of uniform bore, and that the same liquid and glass be employed in their
construction. But they possess one obvious defect from a theoretical point of view, namely, that the subdivision of the temperature scale depends on the expansion of the particular liquid selected as the standard. A liquid such as water, which, when continuously heated at a uniform rate from its freezing-point, first contracts and then expands, at a rapidly increasing rate, would obviously be unsuitable. But there is no a priori reason why other liquids should not behave to some extent in a similar way. As a matter of fact, it was soon observed that thermometers carefully constructed with different liquids, such as alcohol, oil and mercury, did not agree precisely in their indications at points of the scale intermediate between the fixed points, and diverged even more widely outside these limits. Another possible method, proposed in 1654 by Carlo Renaldini (1615-1698), professor of mathematics at Pavia, was to determine the intermediate points of the scale by observing the temperatures of mixtures of ice-cold and boiling water in varying proportions. On this method, the temperature of 50° C. would be defined as that obtained by mixing equal weights of water at 0° C. and 100° C.; 20° C., that obtained by mixing 80 parts of water at 0° C. with 20 parts of water at 100° C. and so on. Each degree of temperature in a mass of water would then represent the addition of the same quantity of heat. The scale thus obtained would, as a matter of fact, agree very closely with that of a mercury thermometer, but the method would be very difficult to put in practice, and would still have the disadvantage of depending on the properties of a particular liquid, namely, water, which is known to behave in an anomalous manner in other respects. At a later date, the researches of Gay-Lussac (1802) and Regnault (1847) showed that the laws of the expansion of gases are much simpler than those of liquids. Whereas the expansion of alcohol between 0° C. and 100° C. is nearly seven times as great as that of mercury, all gases (excluding easily condensible vapours) expand equally, or so nearly equally that the differences between them cannot be detected without the most refined observations. This equality of expansion affords a strong a priori argument for selecting the scale given by the expansion of a gas as the standard scale of temperature, but there are still stronger theoretical grounds for this choice, which will be indicated in discussing the absolute scale (§ 21). Among liquids mercury is found to agree most nearly with the gas scale, and is generally employed in thermometers for scientific purposes on account of its high boiling-point and for other reasons. The differences of the mercurial scale from the gas scale having been carefully determined, the mercury thermometer can be used as a secondary standard to replace the gas thermometer within certain limits, as the gas thermometer would be very troublesome to employ directly in ordinary investigations. For certain purposes, and especially at temperatures disadvantageous to the range of mercury thermometers, electrical thermometers, also standardized by reference to the gas thermometer, have been very generally employed in recent years, while for still higher temperatures beyond the range of the gas thermometer, thermometers based on the recently established laws of radiation are the only instruments available. For a further discussion of the theory and practice of the measurement of temperature, the reader is referred to the article THERMOMETER.

5. Colorimetry by Latent Heat.—In principle, the simplest and most direct method of measuring quantities of heat consists in observing the effects produced in melting a solid or vaporizing a liquid. It was, in fact, by the fusion of ice that quantities of heat were first measured. If a hot body is placed in a cavity in a block of ice at 0° C., and is covered by a closely fitting slab of ice, the quantity of ice melted will be directly proportional to the quantity of heat lost by the body in cooling to 0° C. None of the heat thus passed from the body to the ice, and conversely no heat can possibly get in from outside. The body must cool almost exactly to 0° C., and every fraction of the heat it loses must melt an equivalent quantity of ice. Apart from heat lost in transferring the heated body to the ice block, the method is theoretically perfect. The only difficulty consists in the practical measurement of the quantity of ice melted. Black estimated this quantity by pouring out the cavity with a sponge before and after the operation. But there is a variable film of water adhering to the walls of the cavity, which gives trouble in accurate work. In 1780 Laplace and Lavoisier used a double-walled metallic vessel containing broken ice, which was in many respects more convenient than the block, but aggravated the difficulty of the film of water adhering to the ice. In spite of this practical difficulty, the quantity of heat required to melt unit weight of ice was for a long time taken as the unit of heat. This unit possesses the great advantage that it is independent of the scale of temperature adopted. At a much later date R. Bunsen (Phil. Mag., 1871), adopting a suggestion of Sir John Herschel's, devised an ice-calorimeter suitable for measuring small quantities of heat, in which the difficulty of the water film was overcome by measuring the change in volume due to the melting of the ice. The volume of unit mass of ice is approximately 1.0930 times that of unit mass of water, so that the diminution of volume
WATT'S INDICATOR DIAGRAM

HEAT

is o-002 of a cubic centimetre for each gramme of ice melted. The method requires careful attention to details of manipulation, which are more fully discussed in the article on CALORIMETRY. For measuring large quantities of heat, such as those produced by the combustion of fuel in a boiler, the most convenient method is the evaporation of water, which is commonly employed by engineers for the purpose. The natural unit in this case is the quantity of heat required to evaporate unit mass of water at the boiling point under atmospheric pressure. In boilers working at a higher pressure, or supplied with water at a lower temperature, appropriate corrections are applied to deduce the quantity evaporated in terms of this unit.

For larger scales a small scale the converse method of comparison has been successfully applied by John Joly, in whose steam-calorimeter the quantity of heat required to raise the temperature of a body from the atmospheric temperature to that of steam condensing at atmospheric pressure is observed by weighing the mass of steam condensed on it. (See CALORIMETRY.)

6. Thermometric Calorimetry.—For the majority of purposes the most convenient and the most readily applicable method of measuring quantities of heat, is to observe the rise of temperature of a known mass of water contained in a suitable vessel or calorimeter. This method was employed from a very early date by Count Rumford and other investigators, and was brought to a high pitch of perfection by Regnault in his extensive calorimetric researches (Mémoires de l'Institut de Paris, 1847); but it is only within comparatively recent years that it has really been placed on a satisfactory basis by the accurate definition of the units involved. The theoretical objections to the method, as compared with latent heat calorimetry, are that some heat is necessarily lost by the calorimeter when its temperature is raised above that of the surroundings, and that some heat is used in heating the vessel containing the water. These are small corrections, which can be estimated with considerable accuracy in practice. A more serious difficulty, which has impaired the value of much careful work by this method, is that the quantity of heat required to raise the temperature of a given mass of water \( t \) C. depends on the temperature at which the water is taken, and also on the scale of the thermometer employed. It is for this reason, in many cases, impossible to say, at the present time, what was the precise value, within \( \frac{1}{2} \) or even \( 1\% \) of the heat unit, in terms of which many of the older results, such as those of Regnault, were expressed. For many purposes this would not be a serious matter, but for work of scientific precision such a limitation of accuracy would constitute a very serious bar to progress. The unit generally adopted for scientific purposes is the quantity of heat required to raise 1 gram (or kilogram) of water \( t \) C., and is called the calorie (or kilo-calorie). English engineers usually state results in terms of the British Thermal Unit (B.Th.U.), which is the quantity of heat required to raise 1 lb of water \( t \) F.

7. Watt's Indicator Diagram; Work of Expansion.—The rapid development of the steam-engine (q.v.) in England during the latter part of the 18th century had a marked effect on the progress of the science of heat. In the first steam-engines the working cylinder served both as boiler and condenser, a very wasteful method, as most of the heat was transferred directly from the fire to the condensing water without useful effect. The first improvement (about 1750) was to use a separate boiler, but the greater part of the steam supplied was still wasted in reheating the cylinder, which had been cooled by the injection of cold water to condense the steam after the previous stroke. In 1759 James Watt showed how to avoid this waste by using a separate condenser and keeping the cylinder as hot as possible. In his earlier engines the steam at full boiler pressure was allowed to raise the piston through nearly the whole of its stroke. Connection with the boiler was then cut off, and the steam at full pressure was discharged into the condenser. Here again there was unnecessary waste, as the steam was still capable of doing useful work. He subsequently introduced "expansive working," which effected still further economy. The connexion with the boiler was cut off when a fraction only, say \( \frac{1}{2} \), of the stroke had been completed, the remainder of the stroke being effected by the expansion of the steam already in the cylinder without the application of fuel. In this way, comparatively little fuel is used, and when connection was made to the condenser, the pressure was so reduced that there was comparatively little waste from this cause. Watt also devised an instrument called an indicator (see STEAM ENGINE), in which a pencil, moved up and down vertically by the steam pressure, recorded the pressure in the cylinder at every point of the stroke on a sheet of paper moving horizontally in time with the stroke of the piston. The diagram thus obtained made it possible to study what was happening in the working cylinder, and to deduce the work done by the steam in each stroke. Thus the indicator and the steam engine proved of great utility in physics in studying the properties of gases and vapours. The work done, or the useful effect obtained from an engine or any kind of machine, is measured by the product of the resistance overcome and the distance through which it is overcome. The result is generally expressed in terms of the equivalent weight raised through a certain height against the force of gravity. If, for instance, the pressure on a piston
is 50 lb per sq. in., and the area of the piston is 100 sq. in., the force on the piston is 5000 lb weight. If the stroke of the piston is 1 ft., the work done per stroke is capable of raising a weight of 5000 lb through a height of 1 ft., or 50 lb through a height of 100 ft. and so on.

Fig. 3 represents an imaginary indicator diagram for a steam-engine, taken from one of Watt's patents. Steam is admitted to the cylinder when the piston is at the beginning of its stroke, at S. SF represents the length of the stroke FT, or the limit of horizontal movement of the paper on which the diagram is drawn. The indicating pencil rises to the point A, representing the absolute pressure of 60 lb per sq. in. As the piston moves outwards the pencil traces the horizontal line AB, the pressure remaining constant till the point B is reached, at which connection to the boiler is cut off. The work done so far is represented by the area of the rectangle ABSF, namely AS × SF, multiplied by the area of the piston in sq. in. The result in foot-pounds is the fraction of the stroke SF is taken in feet. After cut-off at B the steam expands under diminishing pressure, and the pencil falls gradually from B to C, following the steam pressure until the exhaust valve opens at the end of the stroke. The pressure then falls rapidly to that of the condenser, which for an ideal case may be taken as zero, following Watt. The work done during expansion is found by dividing the remainder of the stroke FT into a number of equal parts (say 8, Watt takes 20) and measuring the pressure on the back-stroke or brake-line SF, by dividing by 33,000. If the steam is ejected by the piston at atmospheric pressure (15 lb per sq. in.) instead of being condensed at zero pressure, the area ABSF, under the atmospheric line CD, representing work done on the brake-line SF, is reduced by about 33,000. If the engine repeats the same cycle or series of operations continuously, the indicator diagram will be a closed curve, and the nett work done per cycle will be represented by the included area, whatever the form of the curve.

8. Thermal Efficiency.—The thermal efficiency of an engine is the ratio of the work done by the engine to the heat supplied to it. According to Watt's observations, confirmed later by Clément and Désormes, the total heat required to produce 1 lb of saturated steam at any temperature from water at 0° C. was approximately 650 times the quantity of heat required to raise 1 lb of water 1° C. Since 1 lb of steam represented on this assumption a certain quantity of heat, the efficiency could be measured naturally in foot-pounds of work obtainable per lb of steam, or conversely in pounds of steam consumed per foot-pound of work.

In his patent of 1782 Watt gives the following example of the improvement in thermal efficiency obtained by expansive work—the power of engines. The horse-power-hour, or the work done by one horse in one hour, is nearly 2 million foot-pounds. For electric and scientific purposes the unit of power employed is called the watt. The watt is the work per second done by an electromotive force of 1 volt in driving a current of 1 amper, and is equal to 10 million ergs per second or 1 horse-power-hour. The kilowatt, which is the unit by which electrical energy is sold, is 360 million joules or 265 million foot-pounds, or 360,000 kilogrammetres, and is capable of raising nearly 10 lb of water from the freezing to the boiling point.

Taking the diagram already given, if the quantity of steam represented by AB, or 300 cub. in. at 60 lb pressure, were employed without expansion, the work realized, represented by the area ABSF, would be $6000 × 1/4 = 1500$ foot-pounds. With expansion to 4 times its original volume, as shown in the diagram by the whole area ABCTSA, the mean pressure (as calculated by Watt, assuming Boyle's law) would be $0.58$ of the original pressure, and the work done would be $6000 × 0.58 = 3480$ foot-pounds for the same quantity of steam, or the thermal efficiency would be 2.32 times greater. The advantage actually obtained would not be so great as this, on account of losses by condensation, back-pressure, &c., which are neglected in Watt's calculation, but the main would still be very considerable. Three hundred cub. in. of steam at 60 lb pressure would represent the work of 1 lb of steam, or 287 B.Th.U., so that, neglecting all losses, the possible thermal efficiency attainable with steam at this pressure and four expansions (1 cut-off) would be $3480/287 = 121$ foot-pounds per B.Th.U. At a later date, about 1820, it was usual to include the efficiency of the boiler with that of the engine, and to reckon the efficiency or "duty" in foot-pounds per bushel or cwt. of coal. The best Cornish pumping-engines of that date achieved about 70 million foot-pounds per cwt., or consumed about 3 lb per horse-power-hour, which is roughly equivalent to 100 foot-pounds per B.Th.U. The efficiency gradually increased as higher pressures were used, with more complete expansion, but the conditions upon which the efficiency depended were not fully worked out till a much later date. Much additional knowledge with regard to the nature of heat, and the properties of gases and vapours, was required before the problem could be attacked theoretically.

9. Of the Nature of Heat.—In the early days of the science it was natural to ascribe the manifestations of heat to the action of a subtle imponderable fluid called "caloric," with the power of penetrating, expanding and dissolving bodies, or dissipating their "capacities for heat." In his independence, because the most careful experiments failed to show that heat produced an increase in weight. The opposite property of levitation was often ascribed to heat, but it was shown by more cautious investigators that the apparent loss of weight due to heating was to be attributed to evaporation or to upward currents. The fundamental idea of an imaginary fluid to represent heat was useful as helping the mind to a conception of something remaining invariably in quantity through many transformations, but in some respects the analogy was misleading, and tended greatly to retard the progress of science. The caloric theory was very simple in its application to the majority of caloric manifestations, and gave a fair account of the elementary phenomena of change of state, but it encountered serious difficulties in explaining the production of heat by friction, or the changes of temperature accompanying the compression or expansion of a gas. The explanation which the calorists offered of the production of heat by friction or compression was that some of the latent caloric was squeezed or ground out of the bodies concerned and became "sensible." In the case of heat developed by friction, they supposed that the abraded portions of the material were capable of holding a smaller quantity of heat, or had a "capacity for heat," which could be "evaporated" or "squeezed" out. From a logical point of view, this was a perfectly tenable hypothesis, and one difficult to refute. It was easy to account in this way for the heat produced in boring cannon and similar operations, where the amount of abraded material was large. To refute this explanation, Rumford (Phil. Trans., 1798) made his celebrated experiments with a blunt borer, in one of which he succeeded in boiling by friction 26.5 lb of cold water in 2½ hours, with the production of only 4145 grains of metallic powder. He then showed by experiment that the metallic powder required the same amount of heat to raise its temperature $x°$, as an equal weight of the original metal, or that its capacity for heat $c°$ (in this sense) was unaltered by reducing it to powder; and he argued that "in any case so small a quantity of powder could not possibly account for all the heat generated, that the supply of heat appeared to be inexhaustible.
and that heat could not be a material substance, but must be something of the nature of motion." Unfortunately Rumford's argument was not quite conclusive. The supporters of the caloric theory appear, whether consciously or unconsciously, to have used the phrase "capacity for heat" in two entirely distinct senses without any clear definition of the difference. The phrase "capacity for heat" might very naturally denote the total quantity of heat contained in a body, which we have no means of measuring, but it was generally used to signify the quantity of heat required to raise the temperature of a body one degree, which is quite a different thing, and has no necessary relation to the total heat. In proving that the powder and the solid metal required the same quantity of heat to raise the temperature of equal masses of either one degree, Rumford did not prove that they contained equal quantities of heat, which was the real point at issue in this instance. The metallic tin actually changes into powder below a certain temperature, and in so doing evolves a measurable quantity of heat. A mixture of the gases oxygen and hydrogen, in the proportions in which they combine to form water, evolves when burnt sufficient heat to raise more than thirty times its weight of water from the freezing to the boiling point; and the mixture of gases may, in this sense, be said to contain so much more heat than the water, although its capacity for heat in the ordinary sense is only about half that of the water produced. To complete the refutation of the calorists' explanation of the heat produced by friction, it would have been necessary for Rumford to show that the mass of the tin was not reduced at the expense of the mechanical or the gravitational energy. A piece of solid metal did not absorb a quantity of heat equivalent to that evolved in the grinding; in other words that the heat produced by friction was not simply that due to the change of state of the metal from solid to powder.

Shortly afterwards, in 1799, Davy described an experiment in which he melted ice by rubbing two blocks together. This experiment afforded a very direct refutation of the caloricists' view, because it was a well-known fact that ice required to have a quantity of heat added to it to convert it into water, so that the water produced by the friction contained more heat than the ice. In stating as the conclusion to be drawn from this experiment that "friction consequently does not diminish the capacity of bodies for heat," Davy apparently uses the phrase capacity for heat in the sense of total heat contained in a body, because in a later section of the same essay he definitely gives the phrase this meaning, and uses the term "capacity of temperature" to denote what we now term capacity for heat.

The delay in the overthrow of the caloricistic theory, and in the acceptance of the view that heat is a mode of motion, was no doubt partly due to some fundamental confusion of ideas in the use of the term "capacity for heat" and similar phrases. A still greater obstacle lay in the comparative vagueness of the motion or vibration theory. Davy speaks of heat as being "repulsive motion," and distinguishes it from light, which is "projective motion"; though heat is certainly not a substance—according to Davy in the essay under discussion—and may not even be treated as an imponderable fluid, light as certainly is a material substance, and is capable of forming chemical compounds with ordinary matter, such as oxygen gas, which is not a simple substance, but a compound, termed phosphorescent, of light and oxygen. Accepting the conclusions of Davy and Rumford that heat is not a material substance but a mode of motion, there still remains the question, what definite conception is to be attached to a quantity of heat? What do we mean by a quantity of vibratory motion, how is the quantity of motion to be estimated, and is it remain invariable in many transformations? The idea that the "capacity of temperature" was applicable as a qualitative explanation of many of the effects of heat, but it lacked the quantitative precision of a scientific statement, and could not be applied to the calculation and prediction of definite results. The state of science at the time of Rumford's and Davy's experiments did not admit of a more exact generalization. The way was paved in the first instance by a more complete study of the laws of gases, to which Laplace, Dalton, Gay-Lussac, Dulong and many others contributed both on the experimental and theoretical side. Although the development proceeded simultaneously along many parallel lines, it is interesting and instructive to take the investigation of the properties of gases, and to endeavour to trace the steps by which the true theory was finally attained.

10. Thermal Properties of Gases.—The most characteristic property of a gaseous or elastic fluid, namely, the elasticity for resistance to compression, was first investigated scientifically by Robert Boyle (1662), who showed that the pressure $p$ of a given mass of gas varied inversely as the volume $v$, provided that the temperature remained constant. This is generally expressed by the formula $pv = C$, where $C$ is a constant for any given temperature, and $v$ is taken to represent the specific volume, or the volume of unit mass, of the gas at the given pressure and temperature. Boyle was well aware of the effect of heat in expanding a gas, but he was unable to investigate this property as no thermometric scale had been defined at that date. According to Boyle's law, when a mass of gas is compressed by a small amount at constant temperature, the percentage increase of pressure is equal to the percentage diminution of volume (if the compression is $v/100$, the increase of pressure is very nearly $p/100$). Adopting this law, Newton showed, by a most ingenious piece of reasoning (Principia, ii., sect. 8), that the velocity of sound in air should be equal to the velocity acquired by a body falling under the influence of gravity. He estimated the mean velocity of the atmosphere, considered as being of uniform density equal to that at the surface of the earth. This gave the result 918 ft. per sec. (280 metres per sec.) for the velocity at the freezing point. Newton was aware that the actual velocity of sound was somewhat greater than this, but supposed that the difference might be due in some way to the size of the air particles, of which no account could be taken in the calculation. The first accurate measurement of the velocity of sound by the French Académie des Sciences in 1738 gave the value 332 metres per sec. as the velocity at 0°C. The true explanation of the discrepancy was not discovered till nearly 100 years later.

The law of expansion of gases with change of temperature was investigated by Dalton and Gay-Lussac (1802), who found that the volume of a gas under constant pressure increased by 1/267th part of its volume at 0°C. for each 1° C. rise in temperature. This value was generally assumed in all calculations for nearly 50 years. More exact researches, especially those of Regnault, at a later date, showed that the law was in general correct for all permanent gases, but that the value of the coefficient should be $\frac{1}{273}$ rd. According to this law the volume of a gas at any temperature $t$ °C. should be proportional to $273 + t$, i.e. to the temperature reckoned from a zero 273° below that of the Centigrade scale, which was called the absolute zero of the gas thermometer. If $T = 273 + t$, denotes the temperature measured from this zero, the law of expansion of a gas may be combined with Boyle's law in the simple formula

$$p = \frac{RT}{v},$$

which is generally taken as the expression of the gaseous laws. If equal volumes of different gases are taken at the same temperature and pressure, it follows that the constant $R$ is the same for all gases. If equal masses are taken, the value of the constant $R$ for different gases varies inversely as the molecular weight or as the density relative to hydrogen.

Dalton also investigated the laws of vapours, and of mixtures of gases and vapours. He found that condensible vapours approximately followed Boyle's law when compressed, until the condensation pressure was reached, at which the vapour liquefied without further increase of pressure. He found that when a liquid was introduced into a closed space, and allowed to evaporate until the space was saturated with the vapour and evaporation ceased, the increase of pressure in the space was equal to the condensation pressure of the vapour, and did not depend on the volume of the space or the presence of any other gas or vapour.
provided that there was no solution or chemical action. He showed that the condensation or saturation-pressure of a vapour depended only on the temperature, and increased by nearly the same fraction of itself per degree rise of temperature, and that the pressures of different vapours were nearly the same at equal distances from their boiling points. The increase of pressure per degree C. at the boiling point was about \( \frac{1}{4} \) th of 760 mm. or 27.3 mm., but increased in geometrical progression with rise of temperature. These results of Dalton's were confirmed, and in part corrected, as regards increase of vapour-pressure, by Gay-Lussac, Dulong, Regnault and other investigators, but were found to be as close an approximation to the truth as could be obtained with such simple expressions. More accurate empirical expressions for the increase of vapour-pressure of a liquid with temperature were soon obtained by Thomas Young, J. F. L. A. Roche and others, but the explanation of the relation was not agreed upon.

11. Specific Heats of Gases.—In order to estimate the quantities of heat concerned in experiments with gases, it was necessary in the first instance to measure their specific heats, which presented formidable difficulties. The earlier attempts by Lavoisier and others, employing the ordinary methods of calorimetry, gave very uncertain and discordant results, which were not regarded with any confidence even by the experimentalists themselves. Gay-Lussac (Mémoires d'Arcueil, 1807) devised an ingenious experiment, which, though misinterpreted at the time, is very interesting and instructive. With the object of comparing the specific heats of different gases, he took two equal cylinders A and B connected by a tube with a stop-cock. The globe B was exhausted, the other A being filled with gas. On opening the tap between the vessels, the gas flowed from A to B and the pressure was rapidly equalized. He observed that the rise of temperature in A was nearly equal to the rise of temperature in B, and that for the same initial pressure the change of temperature was very nearly the same for all the gases he tried, except hydrogen, which showed greater changes of temperature than other gases. He concluded from this experiment that equal volumes of gases at the same temperature have the same capacity for heat, except hydrogen, which he supposed to have a larger capacity, because it showed a greater effect. The method does not in reality afford any direct information with regard to the specific heats, and the conclusion with regard to hydrogen is evidently wrong. At a later date (Ann. de Chim., 1812, 8, p. 98) Gay-Lussac adopted A. Crawford's method of mixture, allowing two equal streams of different gases, one heated and the other cooled about 20° C., to mix in a tube containing a thermometer. The resulting temperature was in all cases nearly the mean of the two, from which he concluded that equal volumes of all the gases tried, namely, hydrogen, carbon dioxide, air, oxygen and nitrogen, had the same thermal capacity. This was correct, except as regards an nitric oxide, but did not give any information as to the actual specific heats referred to water or any known substance.

About the same time F. Delaroche and J. E. Bérard (Ann. de chim., 1813, 85, p. 72) made direct determinations of the specific heats of air, oxygen, hydrogen, carbon monoxide, carbon dioxide, nitrous oxide and ethylene, by passing a stream of gas heated to nearly 100° C. through a spiral tube in a calorimeter containing water. Their work was a great advance on previous attempts, and gave the first trustworthy results. With the exception of hydrogen, which presents peculiar difficulties, they found that equal volumes of the permanent gases, air, oxygen and carbon monoxide, had nearly the same thermal capacity, but that the corresponding condensible gases, carbon dioxide, nitrous oxide and ethylene, had larger thermal capacities in the order given. They were unable to state whether the specific heats of the gases increased or diminished with temperature, but from experiments on air at pressures of 740 mm. and 1000 mm., they found the specific heats to be 269 and 245 respectively, and concluded that the specific heat diminished with increase of pressure. The difference they observed was really due to errors of experiment, but they regarded it as proving beyond doubt the truth of the calorists' contention that the heat disengaged on the compression of a gas was due to the diminution of its thermal capacity.

Dalton and others had endeavoured to measure directly the rise of temperature produced by the compression of a gas. Dalton had observed a rise of 50° F. in a gas when suddenly compressed to half its volume, but no other thermometer that he used were sufficiently sensitive to indicate more than a fraction of the change of temperature. Laplace was the first to see in this phenomenon the probable explanation of the discrepancy between Newton's calculation of the velocity of sound and the observed value. The increase of pressure due to a sudden compression, in which no heat was allowed to escape, or as we now call it an "adiabatic" compression, would necessarily be greater than the increase of pressure in a slow isothermal compression, on account of the rise of temperature. As the rapid compressions and rarefactions occurring in the propagation of a sound wave were practically adiabatic, it was necessary to take account of the rise of temperature due to compression in calculating the velocity. To reconcile the observed and calculated values of the velocity, the increase of pressure in adiabatic compression must be 1410 times greater than in isothermal compression. This is the ratio of the adiabatic elasticity of air to the isothermal elasticity.

It was a long time, however, before Laplace saw his way to any direct experimental verification of the value of this ratio. At a later date (Ann. de chim., 1816, 3, p. 238) he stated that he had succeeded in proving that the ratio in question must be the same as the ratio of the specific heat of air at constant pressure to the specific heat at constant volume.

In the method of measuring the specific heat adopted by Delaroche and Bérard, the purpose was to produce the gas sample at practically constant pressure, contracts in cooling, as it gives up its heat to the calorimeter. Part of the heat surrendered to the calorimeter is due to the contraction of volume. If a gramme of gas is heated to a temperature \( T \) at a pressure \( P \), then when it is transferred to a temperature \( T' \) at constant pressure \( P' \), it absorbs a quantity of heat \( S = -238 \text{ caloria} \) (according to Regnault) the specific heat at constant pressure. At the same time the gas expands by a fraction \( \frac{V}{T} \) of \( v \), which is the same as \( \frac{1}{273} \) of its volume at 0° C. If now the air is suddenly compressed by an amount \( \frac{v}{T} \), it will be restored to its original volume, and its temperature will be raised by the liberation of a quantity of heat \( R' \), the latent heat of expansion for an increase of volume \( v/T \). If no heat has been allowed to escape, the air will now be in the same state as if a quantity of heat \( S \) had been communicated to it at its original volume \( v \) without expansion. The ratio of the specific heat of air to the specific heat isothermal is the specific heat at constant volume, which is obviously equal to \( S - R' \). The temperature increased by the ratio \( \frac{v}{T} \) of the specific heat of air, which is the specific heat at constant pressure, and the specific heat produced by a sudden compression \( v/T \), and is seen to be \( \gamma \) times the pressure \( p/T \) produced by the same compression at constant temperature. The ratio of the specific heat of air to the specific heat at constant pressure, and the velocity of sound, is therefore the same as the ratio of the specific heat of air at constant pressure to that at constant volume.

12. Experiments on the Collision of the Ratio of Specific Heats.—This was a most interesting and important theoretical relation to discover, but unfortunately it did not help much in the determination of the ratio required, because it was not practically possible at that time to measure the specific heat of air at constant volume in a closed vessel. Attempts had been made to do this, but they had signalised failure, on account of the small heat capacity of the gas as compared with the containing vessel. Laplace endeavoured to explain some confirmation of his views from the values given by Delaroche and Bérard for the specific heat of air at 1000 and 740 mm. pressure. On the assumption that the quantities of heat contained in a given mass of dry air, when compressed from 1 atmosphere pressure when heated at constant pressure, he deduced, by some rather obscure reasoning, that the ratio of the specific heats \( S \) and \( s \) should be about 1.5 to 1, which he regarded as a fairly satisfactory agreement with the value from the experiments made by Villard. The ratio of the specific heats could not be directly measured, but a few years later, Clément and Désormes (Journal de Phys., Nov., 1819) succeeded in making a direct measurement of the ratio of the specific heats in a gas mixture by adiabatically raising the temperature of the containing air at atmospheric pressure and temperature, and removing a small quantity of air. They then observed the decrease of pressure \( p_0 \) when the air had regained its original volume. By slowly opening the valve and immediately closing it, the pressure was restored almost instantaneously to the atmospheric pressure, the rise of pressure \( p_0 \) corresponding to the sudden compression produced. The air, having been heated by the compression, was

the
temperature, the specific heat per unit volume at a pressure $p$

1

must vary as $p^2$, according to the caloric theory. The specific

heat per unit mass must then vary as $p^2$—1, which was found agreed

precisely with the experiment of Delaroch and Béhar already cited.

This was undoubtedly a strong confirmation of the caloric theory.

Pointing out the limitations (Ann. de chim., 1823, p. 375) of the

obtained the same results, and also showed that the relation between

the pressure and the volume of a gas in adiabatic compression or

expansion must be of the form $p^n = constant$.

Carnot & Welter studied the velocity of sound in various gases

adopting a method due to E. F. F. Chladni, compared the velocities of sound in different gases by observing the pitch of the note given by the same tube when filled with the gases in question. He thus obtained the values of the ratio of the squares of the velocities of sound at constant pressure $s$ and $s', 100$, and showed that the value of this ratio was smaller whenever a gas was experienced a smaller change of temperature in compression. On comparing his results with the values of the specific heats for the same gases found by Delaroch and Béhar, Dulong observed that the changed temperature for the same compression was in the inverse ratio of the specific heats at constant volume, and deduced the important conclusion that "Equal volumes of all gases under

the same conditions evolve on compression the same quantity of heat."

This is equivalent to the statement that the difference of the specific

heats, or the latent heat of expansion $R'$ per $1^3$, is the same for all gases if equal volumes are taken. Assuming the ratio $s = 1:4:10$, and taking Delaroch and Béhar's value for the specific heat of air at constant pressure $s = 267$, we have $s/s' = 1:400$, and the difference of the specific heats per unit mass of air $s - s' = R^8 = 0.078$. Adopting Regnault's temperature as the specific heat of air, namely, we have $s = 0.069$. This quantity represents the heat absorbed by unit mass of air in expanding at constant temperature $T$ by a fraction $1/T$ of its volume $v$, or by $v^2/2v^2$ of its volume $v^2$. If, instead of taking unit mass of air, we take unit volume $v = 22.4$ liter, at $0^\circ$ C. and 760 mm. being the volume of the molecular weight of

the gas in the gramma, the quantity of heat evolved by a compression equal to $n$ will be approximately $2n$ gramales, and is the same for all gases. The work done in this compression is $pT = R$, and is also the same for all gases, namely, $8.3$ joules. Dulong's experimental result, therefore, shows that the heat evolved in the compression of a gas is proportional to the work done. This result had previously been deduced theoretically by Carnot (1824). At a later date it was assumed by Mayer, Clausius and others, on the evidence of these experiments, that the heat evolved in the compression of a gas is proportional to the work done. This further experimental evidence required to justify this assumption was first supplied by Joule.

Latent heat of expansion $R' = 0.069$ caloric per gramma of air, per

$= 2.0$ calories per gramma-molecule of any gas.

Work done in expansion $R = 287$ joules per gramma of air per

$= 8.3$ joules per gramma-molecule of any gas.

13 Carnot: On the Motive Power of Heat.—A practical and

theoretical question of the greatest importance was first answered by Sadi Carnot about this time in his Reflections on the Motive Power of Heat (1824). How much motive power (defined by Carnot as weight lifted through a certain height) can be obtained from heat alone by means of an engine repeating a regular succes-

sion or "cycle" of operations continuously? Is the efficiency

limited, and, if so, how is it limited? Are other agents preferable

to heat for the development of motive power from heat? In discussing

this problem, we cannot do better than follow Carnot's reasoning,

which, in its main features, could hardly be improved at the present
day.

Carnot points out that in order to obtain an answer to this question, it is necessary to consider the essential conditions of the process, apart from the mechanism of the engine and the working substance or agent employed. Work cannot be said to be produced from heat alone unless nothing but heat is supplied, and the working substance and all parts of the engine are at the end of the process in precisely the same state as at the beginning.

Carnot's Axiom.—Carnot here, and throughout his reasoning,

makes a fundamental assumption, which he states as follows:

When a body has undergone any changes and after a certain number of transformations is brought back identically to its original state, considered relatively to density, temperature and mode of aggregation, it must contain the same quantity of heat as it contained originally. 1

Heat, according to Carnot, in the type of engine we are con-

sidering, can evidently be a cause of motive power only by virtue of

changes of volume or form produced by alternate heating and

cooling. This involves the existence of cold and hot bodies to

act as boiler and condenser, or source and sink of heat, respect-

ively. Wherever there exists a difference of temperature, it

is possible to have the production of motive power from heat;

and conversely, production of motive power, from heat alone,

is impossible without difference of temperature. In other words

the production of motive power from heat is not merely a question

of the consumption of heat, but always requires transference of

heat from hot to cold. What then are the conditions which

enable the difference of temperature to be most advantageously

employed in the production of motive power, and how much

motive power can be obtained with a given difference of tempera-

ture from a given quantity of heat?

Carnot's Rule for Maximum Effect.—In order to realize the

maximum effect, it is necessary that, in the process employed,

there should not be any direct interchange of heat between

bodies at different temperatures. Direct transference of heat

by conduction or radiation between bodies at different tempera-

tures is equivalent to wasting a difference of temperature which

might have been utilized to produce motive power. The working

substance must therefore, in every stage of the process be in

equilibrium with itself (i.e., at uniform temperature and pressure)

and also with external bodies, such as the boiler and condenser,

with which it is in contact.

In the actual engine there is always some interchange of heat

between the steam and the cylinder, and some loss of heat to

external bodies. There may be some difference of temperature

between the boiler steam and the cylinder on admission, or

between the waste steam and the condenser at release. These

differences represent losses of efficiency which may be reduced

indefiniately, at least in imagination, by suitable means, and

designers had even at that date been very successful in reducing

1 For instance a mass of compressed air, if allowed to expand in a

cylinder at the ordinary temperature, will do work, and will at the

same time absorb a quantity of heat which, as we now know, is the

thermal equivalent of the work done. But this work cannot be said

to have been produced solely from the heat absorbed in the process,

because the air at the end of the process is in a changed condition,

and could not be restored to its original state at the same temperature

without having work done upon it precisely equal to that obtained

by its expansion. The process could not be expressed by the

mathematical expression $dQ = dw - dW$.

2 Clausius (Pogg. Ann. 79, p. 396) and others have misinterpreted

this assumption, and have taken it to mean that the quantity of heat

which is compressed is effects at a lower temperature than the

expansion.

The work done in the case is work previously done in compressing the air, and all part of the work is really generated at the expense of heat absorbed in the compression is effected at a lower temperature than the expansion.

8 Clausius (Pogg. Ann. 79, p. 396) and others have misinterpreted

this assumption, and have taken it to mean that the quantity of heat

which is compressed is effects at a lower temperature than the

expansion.
them. All such losses are supposed to be absent in deducing the ideal limit of efficiency, beyond which it would be impossible to go.

14. Carnot’s Description of his Ideal Cycle.—Carnot first gives a rough illustration of an incomplete cycle, using steam much in the same way as it is employed in an ordinary steam-engine. After expansion down to condenser pressure the steam is completely condensed to water, and is then returned as cold water to the hot boiler. He points out that the last step does not conform exactly to the condition he laid down, because although the water is restored to its initial state, there is direct passage of heat from a hot body to a cold body in the last process. He points out that this difficulty might be overcome by supposing the difference of temperature to be infinite, and by employing a series of engines, each working through a small range of temperature, to carry on the process at intervals of temperature. Having established the general notions of a perfect cycle, he proceeds to give a more exact illustration employing a gas as the working substance. He takes as the basis of his demonstration the well-established experimental fact that a gas is heated by rapid compression and cooled by rapid expansion, and that if compressed or expanded slowly in contact with conducting bodies, the gas will give out heat in compression or absorb heat in expansion while its temperature remains constant. He then goes on to say:—

This preliminary notion being settled, let us imagine an elastic fluid, the air, or any other such gas, contained in a cylinder and fitted with a movable diaphragm or piston cd. Let there also be two bodies A, B, each maintained at a constant temperature, that of A being more elevated than that of B. Let us suppose the following series of operations to be performed:—

1. Contact of the body A with the air contained within the space abc, or with the bottom of the cylinder, which we will suppose to transmit heat easily. The air is now at a temperature of the body A, and cd is the actual position of the piston.

2. The piston is gradually raised, and takes the position ef. The air remains in contact with the body A, and is thereby maintained at a constant temperature during the expansion. The body A furnishes the heat necessary to maintain the constancy of temperature.

3. The body A is removed, and the air no longer being in contact with any body capable of giving it heat, the piston contains the air, which rises and passes from the position ef to gh. The air expands without receiving heat and its temperature falls. Let it be imagined that A is a constant temperature, or an absolute zero, at which there is no expansion of heat H taken from the source, it would suffice to take a portion W of this motive power (since W is by hypothesis greater than W,) to drive the engine B backwards, and return a quantity of heat H to the source in each cycle. The process might be repeated indefinitely, and we should obtain at each repetition a balance of useful work W-W', without taking any heat from the source, which is contrary to experience. Whether the quantity of heat taken from the condenser by R is equal to that given to the condenser by S is immaterial. The hot body A might be a comparatively small boiler, since no heat is taken from it. The cold body B might be the ocean, or the whole atmosphere. We might thus obtain without any consumption of fuel a practically unlimited supply of motive power. Which is absurd.

Carnot’s Statement of his Principle.—If the above reasoning be admitted, we must conclude with Carnot that the motive power obtainable from heat is independent of the agents employed to realize it. The efficiency is fixed solely by the temperatures of the bodies between which, in the last resort, the transfer of heat is effected. “We must understand here that each of the methods of developing motive power attains the perfection of which it is susceptible. This condition is fulfilled if, according to our rule, the pressure is increased in the cylinder to a temperature which is not due to change of volume, or in other words, if there is no direct interchange of heat between bodies of sensibly different temperatures.”

It is characteristic of a state of frictionless mechanical equilibrium that an indefinitely small difference of pressure suffices to upset the equilibrium and reverse the motion. Similarly in thermal equilibrium between bodies at the same temperature, an indefinitely small difference of temperature suffices to reverse the transfer of heat. Carnot’s rule is therefore the criterion of the reversibility of a cycle of operations as regards transfer of heat. It is assumed that the ideal engine is mechanically perfect.

Carnot’s description of his cycle and statement of his principle have been given as nearly as possible in his own words, because some injustices have been done him by erroneous descriptions and statements.
reversible, that there is not, fora communication
between reservoirs of gas or vapour at sensibly different pressures, and
that to maintain the existence of the heat of friction. If there is
equilibrium both mechanical and thermal at every stage of the
cycle, the ideal engine will be perfectly reversible. That is to say,
all its operations will be exactly reversed as regards transfer of
heat and work, when the operations are performed in the reverse
order and direction. On this understanding Carnot's principle may be put
in a different way, which is often adopted, but is really
only the same thing put in different words: The efficiency of a
perfectly reversible engine is the possible
function of the difference of temperature between which it works.
This result depends essentially on the existence of a state of
thermal equilibrium defined by equality of temperature, and
independent, in the majority of cases, of the state of a body in
other respects. In order to apply the principle to the calculation
and prediction of results, it is sufficient to determine the manner
in which the efficiency depends on the temperature for one
particular case, since the efficiency must be the same for all
reversible engines.

16. Experimental Verification of Carnot's Principle.—Carnot endeavoured to test his principle by a simple device. Suppose
we have a cylinder fitted with a frictionless piston, containing
1 gram of water at 100° C, and that the pressure of the steam, namely 760 mm., is in equilibrium with the external pressure
on the piston. We will consider this case with a boiler or hot body at 105° C. The water will then acquire the temperature of 105° C, and will absorb 1 gram-calorie of heat. Some waste of motive power will be produced this rise in temperature of the
piston; but this waste will be at a different temperature, but the waste in this case is so small as to be immaterial. Keep the cylinder
in contact with the hot body at 105° C, and allow the piston to rise.
It may be made to perform useful work as the pressure is now 27.7
mm. (or 37.7 grams per sq. cm.) in excess of the external pressure.
Continue the process till all the water is converted into steam.
The heat absorbed from the hot body will be numerically equal
calculated from the temperature at this stage. The increase of
volume will be approximately 1620 c.c., the volume of 1 gram
steam at this pressure and temperature. The work done by the
steam, we may assume, is 61 kilo-calories. Remove the hot body, and allow
the steam to expand further till its pressure is 760 mm. and its
temperature has fallen to 100° C. The work which might be done in this
expansion is less than 61/41 of a kilogrammetre. The volume
might be neglected for the present purpose. Place the cylinder in
contact with the cold body at 100° C, and the steam to condense at this
temperature. Again, no heat will be lost. Since there is equilibrium of pressure, but a quantity of heat equal to the latent
heat of steam at 100° C is given to the cold body. The water is
now in its initial condition, and the result of the process is
spontaneously to prepare heat for the cold body of 94.2 gram-calories
of heat to pass from a body at 105° C to a body at 100° C, by means of
an ideally simple steam-engine. The work obtainable in this
way will be nearly 1 kilo-calorie, which would be found to be
1.13 kilogrammetres (= 61 X 1/41).

Taking the same range of temperature, namely 105° to 100° C,
we may perform a similar series of operations with air in the cylinder.
Instead of water and steam. Suppose the cylinder to contain
1 gramme of air at 100° C and 760 mm. pressure instead of water.
Compress it without loss of heat (adiabatically), so as to raise its
temperature to 105° C. Place it in contact with the hot body
at 105° C, and allow it to expand at this temperature, absorbing heat
from the hot body, until its volume is increased by 1/41th part
of the expansion per degree at constant pressure. This quantity
of heat is then taken to be the heat absorbed, as expressed in § 14, will be
the difference of the specific heats or the latent heat of expansion K = 096 calorie. Remove the hot body, and allow the gas to expand further without
loss of heat till its temperature falls to 100° C. Compress it at
100° C to its original volume, abstracting the heat of compression
class contact with the cold body at 100° C. The air is now in its original
state, and the process has been carried out in strict accordance
with Carnot's rule. The quantity of external work done in the
cycle is easily obtained by the aid of the indicator diagram ABCD (fig. 5),
which is approximately a parallelogram in this instance. The area
of the parallelogram is that of the product of the vertical height BE, namely, the increase of pressure
per 1° at constant volume, by the increase of volume BG, which is
1/76 of the volume at 0° C and 760 mm., or 283 c.c., or
of the volume of the body, which is equivalent to 27.6
grams per sq. cm. The work done in the cycle is 27.6 X 8.3 x 7.82
gram-metre. The heat absorbed at 105° C was 0.96 calorie, which
is 0.9782 gram-metre per gram-calorie, or 1.13 kilogrammetre per gram-
calorie. This result is precisely the same as that obtained by using
steam with the same range of temperature, but a very different kind
of cycle. Carnot in making the same calculation did not obtain quite
so good an agreement, because the experimental data at that time
available were not so accurate. He used the value 14/7 for the
specific heat of expansion of water at 0° C for the specific heat per degree.
Moreover, he did not feel justified in assuming, as above, that the difference
of the specific heats was the same at 100° C as at 105° C. As a result
he had been experimentally determined that the specific heat for the
vapour of alcohol, which differed slightly from the vapour of water.
But the agreement he found was close enough to satisfy him that his theoretical
deductions were correct, and that the ratio of work to heat should
be the same for all substances at the same temperature.

17. Carnot's Function, the Carnot's Function. Variation of Efficiency with Temperature.—By making similar
calculations, similar to those given above, Carnot endeavoured to
find the amount of motive power obtainable from any heat
difference degree fall and expansion of steam with various
substances. The value found above, namely 1.13 kilogrammetre per kilo-calorie per 1° fall, is the value of the efficiency per 1° fall at
which Carnot's engine was supposed to be produced. It is therefore concluded that the efficiency of
the engine would probably be diminished with rise of temperature, while the experimental
data at that time were too inconsistent to suggest the true relation. He took as the analytical expression of this principle
W/H of a perfect engine working in heat H at a temperature T C, and rejecting heat at the temperature o° C, must be some function
Ft of the temperature t, which would be the same for all substances.
The function F't of the temperature t would be represented by
F'-t, the derived function of Ft. The function F'-t would be the same
for all substances at the same temperature, but would have different
values at different temperatures. In terms of Carnot's ideal function, the results obtained in the
previous section might be expressed as follows:—
 "The increase of volume of a mixture of liquid and vapour per
unit of steam-vaporized at any temperature, multiplied by the
increase of vapour-pressure per degree, is equal to the product of the function
F't by the latent heat of vaporization.

The difference of the specific heats, or the latent heat of expansion
for any substance multiplied by the function F't, is equal
to the product of the expansion per degree at constant pressure
by the increase of pressure per degree at constant volume.'

Since the last two are in exact proportion we can say that the function is universal and that the specific heats if equal volumes are taken, Carnot concluded that: 'The difference of the specific heats at constant pressure and volume is the same for all volumes of all gases at the same temperature and pressure.'

The expression derived above gives the heat absorbed for the whole work done by a gas obeying the gaseous laws pv = RT in expanding at a temperature T from a volume v (unity) to a volume r, or for a ratio of expansion r, such that log r = H x log o for the work done in a cycle of range T
Carnot obtained the expression for the heat absorbed by a gas in
isothermal expansion

H = R log r x F' (3)

where C and K are unknown constants. A similar result follows from his expression for the difference of the specific heats. If this is assumed to be constant and equal to C, the expression for H becomes

F't = R/C x (t - 1)

(3)

It is easy to reconcile Carnot's principle with the caloric theory of heat by Euler's beautiful expression Fts = R/C x (t - 1) x 143
HEAT

MECHANICAL THEORY OF HEAT

Paris, 1832, 14, p. 153), who also made use of Watt's indicator diagram for the first time in discussing physical problems. Clapeyron gave the general expressions for the latent heat of a vapour, and for the latent heat of isothermal expansion of any substance, in terms of Carnot's function, employing the notation of the calculus. The expressions he gave are the same in form as those in use at the present day. He also gave the general expression for Carnot's function, and endeavoured to find its variation with temperature; but having no better data, he succeeded no better than Carnot. Unfortunately, in describing Carnot's cycle, he assumed the caloric theory of heat, and made some unnecessary mistakes, which Carnot (who, we now know, was a believer in the mechanical theory) had been very careful to avoid. Clapeyron directs one to compress the gas at the lower temperature in contact with the body B until the heat disengaged is equal to that which has been absorbed at the higher temperature. He assumes that the gas at this point contains the same quantity of heat as it contained in its original state at the higher temperature, and that, when the body B is removed, the gas will be restored to its original temperature, when compressed to its initial volume. This mistake is still attributed to Carnot, and regarded as a fatal objection to his reasoning by nearly all writers on thermodynamics.

18. Mechanical Theory of Heat.—According to the caloric theory, the heat absorbed in the expansion of a gas became latent, like the latent heat of vaporization of a liquid, but remained in the gas and was again evolved on compressing the gas. This theory gave no explanation of the source of the motive power produced by expansion. The mechanical theory had explained the production of heat by friction as being due to transformation of visible motion into a brisk agitation of the ultimate molecules, but it had not so far given any definite explanation of the converse production of motive power at the expense of heat. The theory could not be regarded as complete until it had been shown that in the production of work from heat, a certain quantity of heat disappeared, and ceased to exist as heat; and that this quantity was the same as that which could be generated by the expenditure of the work produced. The earliest complete statement of the mechanical theory from this point of view is contained in some notes written by Carnot, about 1830, but published by his brother (Life of Sadi Carnot, Paris, 1835). Taking the difference of the specific heats to be 0.78, he estimated the mechanical equivalent at 370 kilogrammetres. But he fully recognized that there were no experimental data at that time available for a quantitative test of the theory, although it appeared to afford a good qualitative explanation of the phenomena. He therefore planned a number of crucial experiments such as the "porous plug" experiment, to test the equivalence of heat and motive power. His early death in 1836 put a stop to these experiments, but many of them have since been independently carried out by other observers.

The most obvious case of the production of work from heat is in the expansion of a gas or vapour, which served in the first instance as a means of calculating the ratio of equivalence, on the assumption that all the heat which disappeared had been transformed into work. One of the first to make this production was Marc Séguin, in his De l'influence des chemins de fer (Paris, 1839), made a rough estimate in this manner of the mechanical equivalent of heat, assuming that the loss of heat represented by the fall of temperature of steam on expanding was equivalent to the mechanical effect produced by the expansion. He also remarks (loc. cit., p. 382) that it was absurd to suppose that "a finite quantity of heat could produce an indefinite quantity of mechanical action, and that it was more natural to assume that a certain quantity of heat disappeared in the very act of producing motive power." J. R. Mayer (Lieber's Annalen, 1843, 42, p. 253) stated the equivalence of heat and work more definitely, deducing it from the old principle, causa aequat effectum. Assuming that the sinking of a mercury column by which a gas was compressed was equivalent to the heat set free by the compression, he deduced that the warming of a kilogramme of water 1° C. would correspond to the fall of a weight of one kilogramme from a height of about 365 metres. But Mayer did not adduce any fresh experimental evidence, and made no attempt to apply his theory to the fundamental equations of thermodynamics. It has since been urged that the experiment of Gay-Lussac (1827), on the expansion of gas from one globe to another (see above, § 11), was sufficient justification for the assumption tacitly involved in Mayer's calculation. But Joule was the first to supply the correct interpretation of this experiment, and to repeat it on an adequate scale with suitable precautions. Joule was also the first to measure directly the amount of heat liberated by the compression of a gas, and to prove that heat was not merely rendered latent, but disappeared altogether as heat, when a gas did work in expansion.

19. Joule's Determinations of the Mechanical Equivalent.—The honour of placing the mechanical theory of heat on a sound experimental basis belongs almost exclusively to J. F. Joule, who showed by direct experiment that in all the most important cases in which heat was generated by the expenditure of mechanical work, or mechanical work was produced at the expense of heat, there was a constant ratio of equivalence between the heat generated and the work expended and vice versa. His first experiments were on the relation of the chemical and electric energy expended to the heat produced in metallic conductors and voltaic and electrolytic cells; these experiments were described in a series of papers published in the Phil. Mag., 1840–1843. He first proved the relation, known as Joule's law, that the heat produced in a conductor of resistance R by a current C is proportional to CR per second. He went on to show that the total heat produced in any voltaic circuit was proportional to the electromotive force E of the battery and to the number of equivalents electrolysed in it. Faraday had shown that electromotive force depends on chemical affinity. Joule measured the corresponding heats of combustion, and showed that the electromotive force corresponding to a chemical reaction is proportional to the heat of combustion of the electrochemical equivalent. He also measured the E.M.F. required to decompose water, and showed that when part of the electric energy EC is thus expended in a voltameter, the heat generated is less than the heat of combustion corresponding to EC by a quantity representing the heat of combustion of the decomposed gases. His papers so far had been concerned with the relations between electrical energy, chemical energy and heat which he showed to be mutually equivalent. The first paper in which he discussed the relation of heat to mechanical power was entitled "On the Calorific Effects of Magneto-Electricity, and on the Mechanical Value of Heat" (Brit. Assoc., 1843; Phil. Mag., 23, p. 263). In this paper he showed that the heat produced by currents generated by magneto-electric induction followed the same law as voltaic currents. By a simple and ingenious arrangement he succeeded in measuring the mechanical power produced by a given voltaic current. He proved that the product of the current on the electromotive force was equivalent of heat and of electrical energy. The amount of mechanical work required to raise 1 lb of water 1° F. (1 B.Th.U.), as found by this method, was 838 foot-pounds. In a note added to the paper he states that he found the value 770 foot-pounds by the more direct method of forcing water through fine tubes. In a paper "On the Changes of Temperature produced by the Rarefaction and Condensation of Air" (Phil. Mag., May 1845), he made the first direct measurements of the quantity of heat disengaged by compressing air, and also of the heat absorbed when the air was allowed to expand against atmospheric pressure; as the result he deduced the value 798 foot-pounds for the mechanical equivalent of 1 B.Th.U. He also showed that there was no appreciable absorption of heat when air was allowed to expand in such a manner as not to develop mechanical power, and he pointed out that the mechanical equivalent of heat could not be satisfactorily deduced from
HEAT

the relations of the specific heats, because the knowledge of
the specific heats of gases at that time was of so uncertain a
character. He attributed most weight to his later determina-
tions of the mechanical equivalent made by the direct method
of friction of liquids. He showed that the results obtained with
different liquids, water, mercury and sperm oil, were the same,
namely, 782 foot-pounds; and finally repeating the method with
water, using all the precautions and improvements which his ex-
erience had suggested, he obtained the value 777 foot-pounds,
which was accepted universally for many years, and has only
recently required alteration on account of the more exact defini-
tion of the heat unit, and the standard scale of temperature (see
CALORIMETRY). The great value of Joule's work for the general
establishment of the principle of the conservation of energy
lay in the variety and completeness of the experimental evidence
he adduced. It was not sufficient to find the relation between
heat and mechanical work or other forms of energy in one
particular case. It was necessary to show that the same relation
held in all cases which could be examined experimentally, and
that the ratio of equivalence of the different forms of energy,
measured in different ways, was independent of the manner
in which the conversion was effected and of the material or working
substance employed.

As the result of Joule's experiments, we are justified in con-
cluding that heat is a form of energy, and that all its transforma-
tions are subject to the general principle of the conservation of
energy. As applied to heat, the principle is called the first
law of thermo-dynamics, and may be stated as follows: When
heat is transformed into any other kind of energy, or vice versa,
the total quantity of energy remains invariable; that is to
say, the quantity of heat which disappears is equivalent to the
quantity of the other kind of energy produced and vice versa.

The number of units of mechanical work equivalent to one unit
of heat is generally called the mechanical equivalent of heat, or
Joule's equivalent, and is denoted by the letter J. Its numerical
value depends on the units employed for heat and mechanical
energy respectively. The values of the equivalent in the units most commonly employed at the present time are as
follows:

The water for the heat units is supposed to be taken at 20° C.,
or 68° F., and the degree of temperature is supposed to be
measured by the hydrogen thermometer. The accuracy of the
measurement of gravity in latitude 45° is taken as 980.7 G.S. For details of
more recent and accurate methods of determination, the reader
should refer to the article CALORIMETRY, where tables of the
variation of the specific heat of water with temperature are also
given.

The second law of thermodynamics is a title often used to
denote Carnot's principle or some equivalent mathematical
expression. In some cases this title is not conferred on Carnot's
principle itself, but on some axiom from which the principle
may be indirectly deduced. These axioms, however, cannot
as a rule be directly applied, so that it would appear preferable
to take Carnot's principle itself as the second law. It may be
observed that, as a matter of history, Carnot's principle was
established and generally admitted before the principle of the
conservation of energy as applied to heat, and that from this point
of view the titles, first and second laws, are not particularly
appropriate.

20. Combination of Carnot's Principle with the Mechanical
Theory.—A very instructive paper, as showing the state of the
science of heat about this time, is that of C. H. A. Holtzmann,
"On the Heat and Elasticity of Gases and Vapours" (Mannheim,
1845; Taylor's Scientific Memoirs, iv. 189). He points out
that the theory of Laplace and Poisson does not agree with
crash applied to vapours, and that Clapeyron's formulae,
though probably correct, contain an undetermined function
(Carnot's F', Clapeyron's i/C) of the temperature. He deter-
mines the value of this function to be J/T by assuming, with
Seguin and Mayer, that the work done in the isothermal expa-
sion of a gas is a measure of the heat absorbed. From the then
accepted value 0.78 of the difference of the specific heats of air,
he finds the numerical value of J to be 374 kilogrammes per
kilo-calorie. Assuming the heat equivalent of the work to remain
in the gas, he obtains expressions similar to Clapeyron's for the
total heat and the specific heats. In consequence of this assump-
tion, the formulae he obtained for adiabatic expansion were
necessarily wrong, but no data existed at that time for testing
them. In applying his formulae to vapours, he obtained an
expression for the saturation-pressure of steam, which agreed with
the empirical formula of Roche, and satisfied other experimental
data on the supposition that the co-efficient of expansion of steam
was -00423, and its specific heat 1.09—values which are now
known to be impossible, but which appeared at the time to give
a very satisfactory explanation of the phenomena.

The essay of Hermann Helmholtz, On the Conservation of
Force (Berlin, 1847), discusses all the known cases of the trans-
formation of energy, and is justly regarded as one of the chief
landmarks in the establishment of the energy-principle. Helmh-
lots gives an admirable statement of the fundamental principle
as applied to heat, but makes no attempt to formulate the correct
equations of thermodynamics on the mechanical theory. He
points out the fallacy of Holtzmann's (and Mayer's) calculation
of the equivalent, but admits that it is supported by Joule's
experiment, though he does not seem to appreciate the true
value of Joule's work. He considers that Holtzmann's formulae
are well supported by experiment, and are much preferable to
Clapeyron's, because the value of the undetermined function
F' is found. But he fails to notice that Holtzmann's equations
are fundamentally inconsistent with the conservation of energy,
because the heat equivalent of the external work done is supposed
to remain in the gas.

That a quantity of heat equivalent to the work performed
actually disappears when a gas does work in expansion, was first
shown by Joule in the paper on condensation and rarefaction
of air (1845) already referred to. At the conclusion of this paper
he felt justified by direct experimental evidence in reasserting
definitely the hypothesis of Seguin (loc. cit. p. 382) that "the
steam while expanding in the cylinder loses heat in quantity
exactly proportional to the mechanical force developed, and that
on the condensation of the steam the heat thus converted into
power is not given back." He did not see his way to reconcile
these conclusions with the data obtained from Carnot's cycle.

At a later date, in a letter to Professor W. Thomson (Lord Kelvin)
(1848), he pointed out that, since, according to his own experi-
ments, the work done in the expansion of a gas at constant
temperature is equivalent to the heat absorbed, by equating
Carnot's expressions (given in § 17) for the work done and the
heat absorbed, the value of Carnot's function F' must be equal to
J/T, in order to reconcile his principle with the mechanical
theory.

Professor W. Thomson gave an account of Carnot's theory
(Trans. Roy. Soc. Edin., Jan. 1849), in which he recognized the
discrepancy between Clapeyron's statement and Joule's experi-
ments, but did not see his way out of the difficulty. He therefore
adopted Carnot's principle provisionally, and proceeded to
calculate a table of values of Carnot's function F', from the
values of the total-heat and vapour-pressure of steam then
recently determined by Regnault (Memoires de l'Institut de Paris,
1847). In making the calculation, he assumed that the specific
volume of a saturated gas at any temperature is the same as
that given by the gaseous laws, pv = RT. The results are
otherwise correct so far as Regnault's data are accurate, because
the values of the efficiency per degree F' are not affected by
any assumption with regard to the nature of heat. He obtained
the values of the efficiency F' over a finite range from i to 5° C.,
by adding up the values of F' for the separate degrees. This latter
proceeding is inconsistent with the mechanical theory, but is the
HEAT

The resolution of the Clausius-Rankine method.

The Carnot cycle is used to develop the correct equations of thermodynamics on the mechanical theory. When heat was supplied to a body to change its temperature or state, part remained in the body as intrinsic heat energy $E$, but part was converted into external work of expansion $W$ and ceased to exist as heat. The part remaining in the body was always the same for the same change of state, however performed, as required by Carnot's fundamental axiom, but the part corresponding to the external work was necessarily different for different values of the work done. Thus in any cycle in which the body was exactly restored to its initial state, the heat remaining in the body would always be the same, or as Carnot puts it, the quantities of heat absorbed and given out in its diverse transformations are exactly "compensated," so far as the body is concerned. But the quantities of heat absorbed and given out are not necessarily equal. On the contrary, they differ by the equivalent of the external work done in the cycle. Applying this principle to the case of steam, Clausius deduced a fact previously unknown, that the specific heat of steam maintained in a state of saturation is negative, which was also deduced by Rankine (loc. cit.) about the same time. In applying the principle to gases Clausius assumes (with Mayer and Holtzmann) that the heat absorbed by a gas in isothermal expansion is equivalent to the work done, but he does not appear to be acquainted with Joule's experiment, and the reasons he adduces in support of this assumption are not conclusive. This being admitted, he deduces from the energy principle alone the propositions already given by Carnot with reference to gases, and shows in addition that the specific heat of a perfect gas must be independent of the density.

In the second part of his paper he introduces Carnot's principle, which he quotes as follows: "The performance of work is equivalent to a transference of heat from a hot to a cold body without the quantity of heat being thereby diminished." This is not Carnot's way of stating his principle (see § 13), but has the effect of exaggerating the importance of Clapeyron's unnecessary assumption. By equating the expressions given by Carnot for the work done and the heat absorbed in the expansion of a gas, he deduces (following Holtzmann) the value $J/T$ for Carnot's function $F'$ (which Clapeyron denotes by $1/C$). He shows that this assumption gives values of Carnot's function which agree fairly well with those calculated by Clapeyron and Thomson, and that it leads to values of the mechanical equivalent not differing greatly from those of Joule. Substituting the value $J/T$ for $C$ in the analytical expressions given by Clapeyron for the latent heat of expansion and vaporization, these relations are immediately reduced to their modern form (see THERMODYNAMICS, § 4). Being acquainted with Carnot's original work, but recognizing the invalidity of Clapeyron's description of Carnot's cycle, Clausius substituted a proof consistent with the mechanical theory, which he based on the axiom that "heat cannot of itself pass from cold to hot." The proof on this basis involves the application of the energy principle, which does not appear to be necessary, and the axiom to which final appeal is made does not appear more convincing than Carnot's. Strange to say, Clausius did not in this paper give an expression for the efficiency $F'$ of Carnot's cycle (Carnot's $F$) which follows immediately from the value $J/T$ assumed for the efficiency $F'$ of a cycle of infinitesimal range at the temperature $t$ C or T Abs.

Rankine did not make the same assumption as Clausius explicitly, but applied the mechanical theory of heat to the development of his hypothesis of molecular vortices, and deduced from it a number of results similar to those obtained by Clausius. Unfortunately the paper (loc. cit.) was not published till some time later, but in a summary given in the Phil. Mag. (July 1831) the principal results were detailed. Assuming the value of Joule's equivalent, Rankine deduced the value $-304$ for the specific heat of air at constant pressure, in place of $-267$ as found by Delarocche and Bédard. The subsequent verification of this value by Regnault (Comptes rendus, 1853) afforded strong confirmation of the accuracy of Joule's work. In a note appended to the abstract in the Trans. Roy. Soc. Edin., 1852, Rankine succeeded in proving that the maximum efficiency of an engine working in a Carnot cycle of finite range $h$ to $k$ is of the form

$$W = (t_k - t_h)/(t_k - t_1)$$

which, he observed, agrees in form with that found by Rankine.

21. The Absolute Scale of Temperature.—Since Carnot's function is the same for all substances at the same temperature, and is a function of the temperature only, it supplies a means of measuring temperature independently of the properties of any particular substance. This proposal was first made by Lord Kelvin (Phil. Mag., 1848), who suggested that the degree of temperature should be chosen so that the efficiency of a perfect engine at any point of the scale should be the same, or that Carnot's function $F'$ should be constant. This would give the simplest expression for the efficiency on the caloric theory, but the scale so obtained, when the values of Carnot's function were calculated from Regnault's observations on steam, was found to differ considerably from the scale of the mercury or air-thermometer. At a later date, when it became clear that the value of Carnot's function was very nearly proportional to the reciprocal of the temperature $T$ measured from the absolute zero, the absolute zero of the thermocouple method (Phil. Trans., 1854), namely, to define absolute temperature $\theta$ as proportional to the reciprocal of Carnot's function. On this definition of absolute temperature, the expression $(\theta_1 - \theta_2)/\theta_1$ for the efficiency of a Carnot cycle with limits $\theta_1$ and $\theta_2$ would be exact, and it became a most important problem to determine how far the temperature $T$ by gas thermometer differed from the absolute temperature $\theta$. With this object he devised a very delicate method, known as the "porous plug experiment" (see THERMODYNAMICS) of testing the deviation of the gas thermometer from the absolute scale. His experiments were carried out in conjunction with Joule, and finally resulted in showing (Phil. Trans., 1852, "On the Thermal Effects of Fluids in Motion") that the deviations of the air thermometer from the absolute scale as above defined are almost negligible, and that in the case of the gas hydrogen the deviations are so small that a thermometer containing this gas may be taken for all practical purposes as agreeing exactly with the absolute scale at all ordinary temperatures. For this reason the hydrogen thermometer has since been generally adopted as the standard.

22. Absolute Units of Heat of Combustion.—Taking the value $1.3$ kilogrammetres per kilo-calorie for 1° C, fall of temperature at 100° C, Carnot attempted to estimate the possible performance of a steam-engine receiving heat at 100° C and rejecting it at 40° C. Assuming the performance to be simply proportional to the temperature fall, the work done for 100° fall would be 134 kilogrammetres per kilo-calorie. To make an accurate calculation required a knowledge of the variation of the function $F'$ with temperature. Taking the accurate formula of § 20, the work obtainable is $118$ kilogrammetres per kilo-calorie, which is
INTERNAL COMBUSTION]

HEAT

28% of 426, the mechanical equivalent of the kilo-calorie in kilogrammeters. Carnot pointed out that the fall of 120° C. utilized in the steam-engine was only a small fraction of the whole temperature fall obtainable by combustion, and made an estimate of the total power available if the whole fall could be utilized, allowing for the probable diminution of the function PV with rise of temperature. His estimate was 3.9 million kilogrammeters per kilogramme of coal. This was certainly an over-estimate, but was surprisingly close, considering the scanty data at his disposal.

In reality the fraction of the heat of combustion available, even in an ideal engine and apart from practical limitations, is much less than might be inferred from the efficiency formula of the Carnot cycle. In applying this formula to estimate the availability of the heat it is usual to take the temperature obtainable by the combustion of the fuel as the upper limit of temperature in the formula. For carbon buried in air at constant pressure without any loss of heat, the products of combustion might be raised 2300° C. in temperature, assuming that the specific heats of the products were constant and that there was no dissociation. If all the heat could be supplied to the working fluid at this temperature, that of the condenser being 40° C., the possible efficiency by the formula of § 20 would be 89%. But the combustion obviously cannot maintain so high a temperature if heat is being continuously abstracted by a boiler.

Suppose that the maximum temperature of combustion as, above estimated, those the temperature of the boiler, and would be that of the condenser. Of the whole heat supplied by combustion represented by the rise of temperature θ' - θ, the fraction (θ' - θ)/(θ' - θ) is the maximum that could be supplied to the boiler, the fraction (θ' - θ)/(θ' - θ) being carried away with the waste gases. Of the heat supplied to the boiler, the fraction (θ' - θ)/(θ' - θ) might theoretically be converted into work. The problem in the case of an engine using a separate working fluid, like a steam-engine, is to find what must be the temperature θ' of the boiler in order to attain the maximum possible efficiency of the heat of combustion in the form of work. It is easy to show that θ' must be the geometric mean of θ' and θ, or θ' = √θθ. Taking θ' - θ = 2300° C., and θ = 313° Abs. as before, we find θ' = 993° Abs. or 630° C. The heat supplied to the boiler is then 74.4% of the heat of combustion, and of this 65.3% is converted into work, giving a maximum possible efficiency of 49% in place of 89%. With the boiler at 160° C., the possible efficiency, calculated in a similar manner, would be 26.3%, which shows that the possible increase of efficiency by increasing the temperature range is not so great as is usually supposed. If the temperature of the boiler were raised to 300° C., corresponding to a pressure of 1260 lb per sq. in., which is occasionally surpassed in modern flash-boilers, the possible efficiency would be 40%. The waste heat from the boiler, supposed perfectly efficient, would be in this case 11%, of which less than a quarter could be utilized in the form of work. Carnot foresaw that in order to utilize a larger percentage of the heat of combustion it would be necessary to employ a series of working fluids, the waste heat from one boiler and condenser serving to supply the next in the series. This has actually been effected in a few cases, e.g., steam and SO₂, when special circumstances exist to compensate for the extra complication. Improvements in the steam-engine since Carnot's time have been mainly in the direction of reducing waste due to condensation and leakage by multiple expansion, superheating, &c. The gain by increased temperature range has been comparatively small owing to limitations of pressure, and the best modern steam-engines do not utilize more than 20% of the heat of combustion and 5% of the coal.

This means that a fraction of the ideal limit of 40% above calculated on the assumption of 1260 lb initial pressure, with a perfectly efficient boiler and complete expansion, and with an ideal engine which does not waste available motive power by complete condensation of the steam before it is returned to the boiler.

23. Advantages of Internal Combustion.—As Carnot pointed out, the chief advantage of using atmospheric air as a working fluid in a heat-engine lies in the possibility of imparting heat to it directly by internal combustion. This avoids the limitation imposed by the use of a separate boiler, which as we have seen reduces the possible efficiency at least 50%. Even with internal combustion, however, the full range of temperature is not available, because the heat cannot conveniently in practice be communicated to the working fluid at constant temperature, owing to the large range of expansion at constant temperature required for the absorption of a sufficient quantity of heat. Air-engines of this type, such as Stirling's or Ericsson's, taking in heat at constant temperature, though theoretically the most perfect, are bulky and mechanically inefficient. In practical engines the heat is generated by the combustion of an explosive mixture at constant volume or at constant pressure. The heat is not all communicated at the highest temperature, but over a range of temperature from that of the mixture at the beginning of combustion to the maximum temperature. The earliest instance of this type of engine is the lycopodium engine of M.M. Niepe, discussed by Carnot, in which a combustible mixture of air and lycopodium powder at atmospheric pressure was ignited in a cylinder, and did work on a piston. The early gas-engines of E. Lenoir (1860) and N. Otto and E. Langen (1866), operated in a similar manner with illuminating gas in place of lycopodium. Combustion in this case is effected practically at constant volume, and the maximum efficiency theoretically obtainable is 1 - log'r/(r - 1), where r is the ratio of the maximum temperature θ' to the initial temperature θ.

For this engine it would be necessary to follow Carnot's rule, and expand the gas at θ' or gain of heat from θ' down to θ, and then to compress it at θ to its initial volume. If the rise of temperature in combustion were 2300° C., and the initial temperature were 0° C. or 273° Abs., the theoretical efficiency would be 73.3%, which is much greater than that obtainable with a boiler. But in order to reach this value, it would be necessary to expand the mixture to about 270 times its initial volume, which is obviously impossible practically. On the other hand, to incomplete expansion and rapid cooling of the heated gases by the large surface exposed, the actual efficiency of the Lenoir engine was less than 5%, and of the Otto and Langen, with more rapid expansion, about 10%. Carnot foresaw that in order to render an engine of this type practically efficient, it would be necessary to compress the mixture before ignition. Compression is beneficial in three ways: (1) it permits a greater range of expansion after ignition; (2) it raises the mean effective pressure, and thus improves the mechanical efficiency and the power in proportion to size and complexity of engine; (3) it prevents the heat of expansion from being conducted through the surface exposed to the hot gases. In the modern gas or petrol motor, compression is employed as in Carnot's cycle, but the efficiency attainable is limited not so much by considerations of temperature as by limitations of volume. It is impracticable before combustion at constant volume to compress a rich mixture to much less than 1/4th of its initial volume, and, for mechanical simplicity, the range of expansion is made equal to that of compression. The cycle employed was patented in 1862 by Beau de Rochas (d. 1893), but was first successfully carried out by Otto (1876). It differs from the Carnot cycle in employing reception and rejection of heat at constant volume instead of at constant temperature. This cycle is not so efficient as the Carnot cycle for given limits of temperature, but, for the given limits of volume imposed, it gives a much higher efficiency than the Carnot cycle. The efficiency depends only on the range of temperature in expansion and compression, and is given by the formula (θ' - θ)/θ', where θ' is the maximum temperature and θ the lowest temperature. For the Lycopodium engine the formula is the same as that for the Carnot cycle with the same range of temperature in expansion. The ratio θ' - θ is r², where r is the given ratio of expansion or compression, and γ is the ratio of the specific heats of the working fluid. Assuming the working fluid to be a perfect gas with the same properties as air, we should have γ = 1.41. Taking r = 5, the formula gives 48% for the maximum possible efficiency. The actual products of combustion vary with the nature of the fuel.
HEAT [TRANSFER OF HEAT

employed, and have different properties from air, but the efficiency is found to vary with compression in the same manner as for air. For this reason a committee of the Institution of Civil Engineers in 1903 recommended the adoption of the air-standard for estimating the effects of varying the compression ratio, and defined the relative efficiency of an internal combustion engine as the ratio of its observed efficiency to that of a perfect air-engine with the same compression.

24. Effect of Dissociation, and Increase of Specific Heat. — One of the most important effects of heat is the decomposition or dissociation of compound molecules. Just as the molecules of vapour combine with evolution of heat to form the more complicated molecules of the liquid, and as the liquid molecules require the addition of heat to effect their separation into molecules of vapour; so in the case of molecules of different kinds which combine with evolution of heat, the reversal of the process can be effected either by the agency of heat, or indirectly by supplying the requisite amount of energy by electrical or other methods. Just as the latent heat of vaporization diminishes with rise of temperature, and the pressure of the dissociated vapour molecules increases, so in the case of compound molecules in general the heat of combination diminishes with rise of temperature and the pressure of the products of dissociation increases. There is evidence that the compound carbon dioxide, CO₂, is partly dissociated into carbon monoxide and oxygen at high temperatures, and that the proportion dissociated increases with rise of temperature. There is a very close analogy between these phenomena and the vaporization of a liquid. The laws which govern dissociation are the same fundamental laws of thermodynamics, but the relations involved are necessarily more complex on account of the presence of different kinds of molecules, and present special difficulties for accurate investigation in the case where dissociation does not begin to be appreciable until a high temperature is reached. It is easy to see why the gases be in a state to diminish the available temperature of combustion, and all experiments go to show that in ordinary combustible mixtures the rise of temperature actually attained is much less than that calculated as in § 22, on the assumption that the whole heat of combustion is developed and communicated to products of constant specific heat. The defect of temperature observed can be represented by supposing that the specific heat of the products of combustion increases with rise of temperature. This is the case for CO₂ even at ordinary temperatures, according to Regnault, and probably also for air and steam at higher-temperatures. Increase of specific heat is a necessary accompaniment of dissociation, and from some points of view may be regarded as merely another way of stating the facts. It is the most convenient method to adopt in the case of products of combustion consisting of a mixture of CO₂ and steam with a large excess of inert gases, because the relations of equilibrium of dissociated molecules of so many different kinds would be too complex to permit of any other method of expression. It appears from the researches of Dugald Clerk, H. le Chatelier and others that the apparent specific heat of the products of combustion in a gas-engine may be taken as approximately -34 to -33 in place of -24 at working and the pressure of the products of dissociation, and that the ratio of the specific heats is about 1.29 in place of 1.41. This limits the availability of the heat of combustion by reducing the rise of temperature actually obtainable in combustion at constant volume by 30 or 40%, and also by reducing the range of temperature θ₀ - θ₁ for a given ratio of expansion r from r⁻⁴ to r⁻². The formula given in § 21 is no longer quite exact, because the ratio of the specific heats of the mixture during compression is not the same as that of the products of combustion during expansion. But since the work done depends principally on the expansion curve, the ratio of the range of temperature in expansion (θ₁θ₀) to the maximum temperature θ₁ of the gas, and its effect on the possible efficiency. Taking r = 5, as before, for the compression ratio, the possible efficiency is reduced from 48% to 38%, if γ = 1.29 instead of 1.41. A large gas-engine of the present day with r = 5 may actually realize as much as 34% indicated efficiency, which is 90% of the maximum possible, showing how perfectly all avoidable heat losses have been minimized.

It is often urged that the gas-engine is relatively less efficient than the steam-engine, because, although it has a much higher absolute efficiency, it does not utilize so large a fraction of its temperature range, reckoning that of the steam-engine from the temperature of the boiler to that of the condenser, and that of the gas-engine from the maximum temperature of combustion to that of the air. This is not quite fair, and has given rise to the mistaken notion that "there is an immense margin for improvement in the gas-engine," which is not the case if the practical limitations of volume are rightly considered. If expansion could be carried out in accordance with Carnot's principle of maximum efficiency, down to the lower limit of temperature θ₀, with rejection of heat at θ₁ during compression to the original volume v₀, it would no doubt be possible to obtain an ideal efficiency of nearly 80%. But this would be quite impracticable, as it would require expansion to about 100 times v₀, or 500 times the compression volume. Some advantage no doubt might be obtained by carrying the expansion beyond the original volume. This has been done, but is not found to be worth the extra complications. A more practical method, which has been applied to Diesel for liquid fuel, is to introduce the fuel at the end of compression, and adjust the supply in such a manner as to give combustion at nearly constant pressure. This makes it possible to employ higher compression, with a corresponding increase in the ratio of expansion and the theoretical efficiency. With a compression ratio of 14, an indicated efficiency of 40% has been obtained in this way, but owing to additional complications the brake efficiency was only 31%, which is hardly any improvement on the brake efficiency of 30% obtained with the ordinary type of gas-engine. Although Carnot's principle makes it possible to calculate in every case the theoretical possible efficiency, it would be for any kind of cycle if all heat losses were abolished, it is very necessary, in applying the principle to practical cases, to take account of the probability of avoiding the heat losses which are supposed to be absent, and of other practical limitations in the working of the actual engine. An immense amount of time and ingenuity has been wasted in striving to realize impossible margins of ideal efficiency, which a close study of the practical conditions would have shown to be illusory. As Carnot remarks at the conclusion of his essay: "Economy of fuel is only one of the conditions a heat-engine must satisfy; in many cases it is only secondary, and must often give way to considerations of safety, strength and wearing qualities of the machine, or in small cases, or of expense in creting. To know how to appreciate justly in each case the considerations of convenience and economy, to be able to distinguish the essential from the accessory, to balance all fairly, and finally to arrive at the best result by the simplest means, such must be the principal talent of the man called on to direct and co-ordinate the work of his fellows for the attainment of a useful object of any kind."

TRANSFER OF HEAT

25. Modes of Transfer. — There are three principal modes of transfer of heat, namely (1) convection, (2) conduction, and (3) radiation. (1) In convection, heat is carried or conveyed by the motion of heated masses of matter. The most familiar illustrations of this method of transfer are the heating of buildings by the circulation of steam or hot water, or the equalization of temperature of a mass of unequally heated liquid or gas by convection currents, produced by natural changes of density or by artificial stirring. (2) In conduction, heat is transferred by contact between contiguous particles of matter and is passed on from one particle to the next without a visible relative motion of the parts of the body. A familiar illustration of conduction is the passage of heat through the metal plates of a boiler from the fire to the water inside, or the transfer of heat from a soldering bit to the solder and the metal with which it is placed in contact.
(3) In radiation, the heated body gives rise to a motion of vibration in the aether, which is propagated equally in all directions, and is reconverted into heat when it encounters any obstacle capable of absorbing it. Thus radiation differs from conduction and convection in taking place most perfectly in the absence of matter, whereas conduction and convection require material communication between the bodies concerned.

In the majority of cases of transference of heat all three modes of transference are simultaneously operative in a greater or less degree, and the combined effect is generally of great complexity. The different modes of transference are subject to widely different laws, and the difficulty of disentangling their effects and subjecting them to calculation is often one of the most serious obstacles in the experimental investigation of heat. In space void of matter, we should have pure radiation, but it is difficult to obtain so perfect a vacuum that the effects of the residual gas in transferring heat by conduction or convection are inappreciable. In the interior of an opaque solid we should have pure conduction, but if the solid is sensibly transparent in thin layers there must also be an internal radiation, while in a liquid or a gas it is very difficult to eliminate the effects of convection. These difficulties are well illustrated in the historical development of the subject by the experimental investigations which have been made to determine the laws of heat-transference, such as the laws of cooling, of radiation and of conduction.

26. Newton's Law of Cooling.—There is one essential condition common to all three modes of heat-transference, namely, that they depend on difference of temperature, that the direction of the transfer of heat is always from hot to cold, and that the rate of transference is, for small differences, directly proportional to the difference of temperature. Without difference of temperature there is no transfer of heat. When two bodies have been brought to the same temperature by conduction, they are also in equilibrium as regards radiation, and vice versa. If this were not the case, there could be no equilibrium of heat defined by equality of temperature. A hot body placed in an enclosure of lower temperature, e.g., a calorimeter in its containing vessel, generally loses heat by all three modes simultaneously in different degrees. The loss by each mode will depend in different ways on the form, extent and nature of its surface and on that of the enclosure, on the manner in which it is supported, on its relative position and distance from the enclosure, and on the nature of the intervening medium. But provided that the difference of temperature is small, the rate of loss of heat by all modes will be approximately proportional to the difference of temperature, the other conditions remaining constant. The difference of temperature or the rate of fall of temperature will also be nearly proportional to the rate of loss of heat, if the specific heat of the cooling body is constant, or the rate of cooling at any moment will be proportional to the difference of temperature. This simple relation is commonly known as Newton's law of cooling, but is limited in its application to comparatively simple cases such as the foregoing. Newton himself applied it to estimate the temperature of a red-hot iron ball, by observing the time which it took to cool from a red heat to a known temperature, and comparing this with the time taken to cool through a known range at ordinary temperatures. According to this law if the excess of temperature of the body above its surroundings is observed at equal intervals of time, the observed values will form a geometrical progression with a common ratio. Supposing, for instance, that the surrounding temperature was 0° C., that the red-hot ball took 25 minutes to cool from its original temperature to 20° C., and 5 minutes to cool from 20° C. to 10° C., the original temperature may be calculated from the relation that the time of cooling is proportional to the temperature of the body. Newton also derived the law that this time is proportional to the temperature difference above 0° C. It is to be observed that this law is only strictly true for bodies of great heat capacity, and is subject to the air resistance of the body and the convection currents and the presence of non-uniformity of temperature, and that, therefore, its results are of limited value.

27. Dulong and Petit's Empirical Laws of Cooling.—One of the most elaborate experimental investigations of the law of cooling was that of Dulong and Petit (Ann. Chim. Phys., 1817, 7, pp. 225 and 337), who observed the rate of cooling of a mercury thermometer from 300° C. in a water-jacketed enclosure at various temperatures from 0° C. to 80° C. In order to obtain the rate of cooling by radiation alone, they exhausted the enclosure so as to make it perfectly impervious to heat. The rate of cooling was determined by observing the time required for the temperature to fall a given number of degrees, and the results were reduced to the uniform temperature of 0° C. Dulong and Petit used the form of expression

\[ V = A (t - t_0)^n \]

in which \( V \) is the time of cooling, and \( t_0 \) that of the enclosure, \( A \) a constant having the value 1.0075, and the coefficient \( n \) depends on the form of the bulb and the nature of its surface. For the ranges of temperature they employed, this formula gives much better results than Newton's, but it must be remembered that the temperatures were expressed in the arbitrary scale of the mercury thermometer, and were not corrected for the large and uncertain errors of stem-exposure (see THERMOMETRY). Moreover, although the effects of cooling by convection currents are practically eliminated by exhausting to 3 or 4 mm. (since the density of the gas is reduced to 1/200 while its viscosity is not appreciably affected), the rate of cooling by conduction is not materially diminished, since the conductivity, like the viscosity, is nearly independent of pressure. It has since been shown by Sir William Crookes (Proc. Roy. Soc., 1881, 21, p. 239) that the rate of cooling of a mercury thermometer falls off as the vacuum is diminished, the temperature difference being reduced from 1 mm. to 0.001 mm., at which pressure the effect of conduction by the residual gas has practically disappeared.

Dulong and Petit also observed the rate of cooling under the same conditions with the enclosure filled with various gases. They found that the cooling effect of the gas could be represented by adding to the term already given as representing radiation, an expression of the form

\[ V = B P (t - t_0)^m \]

They found that the cooling effect of convection, unlike that of radiation, was independent of the nature of the surface of the thermometer, whether silvered or blackened, that it varied as some power \( c \) of the pressure \( P \), and that it was independent of the absolute temperature of the enclosure, but varied as the excess temperature \( (t - t_0) \) raised to the power 1.25. This highly artificial result undoubtedly contained the truths of nature, but could only be applied to experiments similar to those from which it was derived. F. Hervé de la Provostaye and P. Q. Desmurs (Ann. Chim. Phys., 1846, 16, p. 337), in repeating these experiments under various conditions, found that the coefficients \( A \) and \( B \) were to some extent dependent on the temperature, and that the manner in which the cooling effect varied with the pressure depended on the form and size of the enclosure. It is evident that this should be the case, since the cooling effect of the gas depends partly on convective currents.
which are necessarily greatly modified by the form of the enclosure in a manner which it would appear hopeless to attempt to represent by any general formula.

28. Surface Emissivity.—The same remark applies to many attempts which have since been made to determine the general value of the constant termed by Fourier and early writers the "exterior conductivity," but now called the surface emissivity. This coefficient represents the rate of loss of heat from a body per unit area of surface per degree excess of temperature, and includes the effects of radiation, convection and conduction.

As already pointed out, the combined effect will be nearly proportional to the excess of temperature in any given case provided that the excess is small, but it is not necessarily proportional to the extent of surface exposed except in the case of pure radiation. The rate of loss by convection and conduction varies greatly with the form of the surface, and, unless the enclosure is of the simplest possible type, the effect depends also on the size and form of the enclosure. Heat is necessarily communicated from the cooling body to the layer of gas in contact with it by conduction. If the linear dimensions of the body are small, as in the case of a fine wire, or if it is separated from the enclosure by a thin layer of gas, the rate of loss depends chiefly on conduction. For very fine metallic wires heated by an electric current, W. E. Ayrton and H. Kilgour (Phil. Trans., 1892) showed that the rate of loss is nearly independent of the surface, instead of being directly proportional to it. This should be the case, as Porter has shown (Phil. Mag., March, 1893), since the effect depends mainly on convection. The effects of conduction and radiation may be approximately estimated if the conductivity of the gas and the nature and forms of the surfaces of the body and enclosure are known, but the effect of convection in any case can be determined only by experiment. It has been found that the rate of cooling by a current of air is approximately proportional to the velocity of the current, other things being equal. It is obvious that this should be the case, but the result cannot generally be applied to convection currents. Values which are commonly given for the surface emissivity must therefore be accepted with great reserve. They can be regarded only as approximate, and as applicable only to cases precisely similar to those for which they were experimentally obtained. There cannot be said to be any general law of convection. The loss of heat is not necessarily proportional to the area of the surface, and no general value of the coefficient can be given to suit all cases. The laws of conduction and radiation admit of being more precisely formulated, and their effects predicted, except in so far as they are complicated by convection.

29. Conduction of Heat.—The laws of transference of heat in the interior of a solid body formed one of the earliest subjects of mathematical and experimental treatment in the theory of heat. The theory was finally formulated by Fourier, although it had assumed a simple form at an earlier date. The mathematical application, except in the simplest cases, was so difficult as to require the development of a new mathematical method. Fourier succeeded in showing how, by his method of analysis, the solution of any given problem with regard to the flow of heat by conduction in any material could be obtained in terms of a physical constant, the thermal conductivity of the material, and that the results obtained by experiment agreed in a qualitative manner with those predicted by his theory. But the experimental determination of the actual values of these constants presented formidable difficulties which were not surmounted till a later date. The experimental methods and difficulties are discussed in a special article on Conduction of Heat. It will suffice here to give a brief historical sketch, including a few of the more important results by way of illustration.

30. Comparison of Conducting Powers.—That the power of transmitting heat by conduction varied widely in different materials was probably known in a general way from prehistoric times. Empirical knowledge of this kind is shown in the construction of many articles for heating, cooking, &c., such as the copper soldering-bolt, or the Norwegian cooking-stove. One of the earliest experiments for making an actual comparison of conducting powers was that suggested by Franklin, but carried out by Jan Ingenhousz (Journ. de phys., 1780, 34, pp. 68 and 380). Exactly similar bars of different materials, glass, wood, metal, &c., thinly coated with wax, were fixed in the side of a trough of boiling water so as to project for equal distances through the side of the trough into the external air. The wax coating was observed to melt at the heat travelled along the bars, the distance from the trough to which the wax was melted along each affording an approximate indication of the distribution of temperature. When the temperature of each bar had become stationary the heat which it gained by conduction from the trough must be equal to the heat lost to the surrounding air, and must therefore be approximately proportional to the distance to which the wax had melted along the bar. But the temperature fall per unit length, or the temperature-gradient, in each bar at the point where it emerged from the trough would be inversely proportional to the same distance. For equal temperature-gradients the quantities of heat conducted (or the relative conducting powers of the bars) would therefore be proportional to the squares of the distances to which the wax finally melted on each bar. This was shown by Fourier and Despretz (Ann. chim. phvs., 1822, 19, p. 97).

31. Diffusion of Temperature.—It was shown in connexion with this experiment by Sir H. Davy, and the experiment was later popularized by John Tyndall, that the rate at which wax melted along the bar, or the rate of propagation of a given temperature, during the first moments of heating, as distinguished from the melting-distance finally attained, depends on the specific heat as well as the conductivity. Sir Herschel reported that bars of iron and bismuth coated with wax were placed on a hot metal plate. The wax was observed to melt first on the bismuth, although its conductivity is less than that of iron. The reason is that its specific heat is less than that of iron in the proportion of 3 to 11. The densities of iron and bismuth being 7·8 and 9·8, the thermal capacities of equal prisms will be in the ratio -86 for iron to -29 for bismuth. If the prisms receive heat at equal rates, the bismuth will reach the temperature of melting wax nearly three times as quickly as the iron. It is often stated on the strength of this experiment that the rate of propagation of a temperature wave, which depends on the ratio of the conductivity to the specific heat per unit volume, is greater in bismuth than in iron (e.g. Preston, Heat, p. 628). This is quite incorrect, because the conductivity of iron is about six times that of bismuth, and the rate of propagation of a temperature wave is therefore twice as great in iron as in bismuth. The experiment in reality is misleading because the rates of reception of heat by the prisms are limited by the very imperfect contact with the hot metal plate, and are not proportional to the respective conductivities. If the iron and bismuth bars are properly faced and soldered to the top of a copper box (in order to ensure good metallic contact, and exclude a non-conducting film of air), and the box is then heated by steam, the rates of reception of heat will be nearly proportional to the conductivities, and the wax will melt nearly twice as fast along the iron as along the bismuth. A bar of lead similarly treated will show a faster rate of propagation than iron, because, although its conductivity is only half that of iron, its specific heat per unit volume is 2·5 times smaller.

32. Bad Conductors. Liquids and Gases.—Count Rumford (1792) compared the conducting powers of substances used in clothing, such as wool and cotton, fur and down, by observing the time which a thermometer took to cool when embodied in a globe filled successively with the different materials. The time of cooling observed for a given range varied from 1300 to 900 seconds for different materials. The low conducting power of such materials is principally due to the presence of air in the interstices, which is prevented from forming convection currents by the presence of the fibrous material. Finely powdered silica is a very bad conductor, but in the compact form of rock crystal it is as good a conductor as some of the metals. According to the kinetic theory of gases, the conductivity of a gas depends on molecular diffusion. Maxwell estimated the conductivity of
HEAT BY CONDENSATION

HEAT

There is no abrupt change of temperature in passing from the gas to the metal, but a continuous temperature-gradient from the temperature of the metal to that of the flame. It is true that this gradient may be upwards of 1000° C. per mm., but there is no sharp discontinuity.

34. Resistance of a Gas Film to the Passage of Heat.—It is possible to make a rough estimate of the resistance of such a film to the passage of heat through it. Taking the average conductivity of the gas in the film as 10,000 times less than that of copper (about double the conductivity of air at ordinary temperatures) a millimetre film would be equivalent to a thickness of 10 metres of copper, or about 1-2 metres of iron. Taking the temperature-gradient as 1000° C. per mm. such a film would transmit 1 franc-calorie per sq. cm. per sec., or 360 to 480 times the heat in sq. metre per hour. With an area of 100 sq. cms. the heat transmitted at this rate would raise a litre of water from 20° C. to 100° C. in 800 secs. By experiment with a strong Bunsen flame it takes from 8 to 10 minutes to do this, which would indicate that on the above assumptions the equivalent thickness of quiescent film should be rather less than 1 mm. in this case. The thickness of the film diminishes with the velocity of the burning gases impinging on the surface, a slow Bunsen flame for instance giving but a very small rise in temperature of the film as compared with a Bunsen. Similarly the efficiency of a boiler is but slightly reduced if half the tubes are stopped up, because the increase of draught through the remainder compensates partly for the diminished heated surface. Some resistance to the passage of heat into a boiler is also due to the water film on the inside. But this is of less account, because the conductivity of water is much greater than that of air, and because the film is continually broken up by the formation of steam, which abstracts heat very rapidly.

35. Heating by Condensation of Steam.—It is often stated that the rate at which steam will condense on a metal surface at a temperature below that corresponding to the saturation pressure of the steam is practically infinite (e.g. Osborne Reynolds, Proc. Roy. Soc. Ed., 1873, p. 275), and conversely that the rate at which water will abstract heat from a metal surface by the formation of steam (if the metal is above the temperature of saturation of the steam) is limited only by the rate at which the metal can supply heat by conduction to its surface layer. The rate at which heat can be supplied by condensation of steam appears to be much greater than that at which heat can be supplied by a flame under ordinary conditions, but there is no reason to suppose that it is infinite, or that any discontinuity exists. Experiments by H. L. Calendiar and J. T. Nicolson by three independent methods (Proc. Inst. Civ. Eng., 1898, 131, p. 147; Brit. Assoc. Rep., 1848) showed that the rate of abstraction of heat by evaporation, or that of communication of heat by condensation, depends chiefly on the difference of temperature between the metal surface and the saturated steam, and is nearly proportional to the temperature difference (not to the pressure difference, as suggested by Reynolds) for such ranges of pressure as are common in practice. The rate of heat transmission they observed was equivalent to about 8 calories per sq. cm. per sec., for a difference of 20° C. between the temperature of the metal surface and the saturation temperature of the steam. This would correspond to a condensation of 330 kilogrammes of steam at 100° C. per sq. metre per hour, or 0-01 lb per sq. ft. per hour for the same difference of temperature, values which are many times greater than those actually obtained in ordinary surface condensers. The reason for this is that there is generally some air mixed with the steam in a surface condenser, which greatly retards the condensation. It is also difficult to keep the temperature of the metal as much as 50° C. below the temperature of the steam unless a very free and copious circulation of water is available. For the same difference of temperature, steam can supply heat by condensation about a thousand times faster than at hot air. This rate is not often approached in practice, but the facility of generation and transmission of steam, combined with its high latent heat at ordinary temperatures at about 20,000 times less than that of copper. This has been verified experimentally by Kundt and Warburg, Stefan and Winkelmann, by taking special precautions to eliminate the effects of convection currents and radiation. It has been described by Heldens (Ann. Phys., 1848) appear to possess any true conductivity for heat. The experiment of T. Andrews, repeated by Grove, and Magnus, showing that a wire heated by an electric current was raised to a higher temperature in air than in hydrogen, was explained by Tyndall as being due to the greater mobility of hydrogen which gave rise to stronger convection currents. In reality the effect is due chiefly to the greater velocity of motion of the ultimate molecules of hydrogen, and is most marked if molar (as opposed to molecular) convection is eliminated. Molecular convection or diffusion, which cannot be distinguished experimentally from conduction, as it follows the same law, is also the main cause of conduction of heat in liquids. Both in liquids and gases the effects of convection currents are so much greater than those of diffusion or conduction that the latter are very difficult to measure, and, except in special cases, comparatively unimportant as affecting the transference of heat. Owing to the difficulty of eliminating the effects of radiation and convection, the results obtained for the conductivities of liquids and gases are not very exact, and there is great uncertainty whether the conductivity increases or diminishes with rise of temperature. It would appear, however, that liquids, such as water andlycerin, differ remarkably little in conductivity in spite of enormous differences of viscosity. The viscosity of a liquid diminishes very rapidly with rise of temperature, without any marked change in the conductivity, whereas the viscosity of a gas increases with rise of temperature, and is always nearly proportional to the conductivity.

35. Difficulty of Quantitative Estimation of Heat Transmitted.—The conductive powers of different metals were compared by C. M. Despretz, and later by G. H. Wiedemann and R. Franz, employing an application of the method of Jan Ingenhouz, in which the temperatures at different points along a bar heated at one end were measured by thermometers or thermocouples let into small holes in the bars, instead of being measured at one point only by means of melting wax. These experiments undoubtedly gave fairly accurate relative values, but did not permit the calculation of the absolute amounts of heat transmitted. This was first obtained by J. D. Forbes (Brit. Assoc. Rep., 1852; Trans. Roy. Soc. Ed., 1862, 23, p. 133) by deducting the amount of heat lost to the surrounding air from a separate experiment in which the rate of cooling of the bar was observed (see Conduction of Heat). Clément (Ann. chim. phys., 1841) had previously attempted to determine the conductivities of metals by observing the amount of heat transmitted by a plate with one side exposed to steam at 100° C., and the other side cooled by water at 28° C. Employing a copper plate 3 mm. thick, and assuming that the two surfaces of the plate were at the same temperatures as the water and the steam to which they were exposed, or that the temperature-gradient in the metal was 72° in 3 mm., he had thus obtained a value which we now know to be nearly 200 times too small. The actual temperature difference in the metal itself was really about 0-36° C. The remainder of the 72° drop was in the badly conducting films of water and steam close to the metal surface. Similarly in a boiler plate in contact with flame at 1500° C. on one side and water at, say, 150° C. on the other, the actual difference of temperature in the metal, even if it is an inch thick, is only a few degrees. The metal, unless badly furled with incrustation, is but little hotter than the water. It is immaterial so far as the transmission of heat is concerned, whether the plates are iron or copper. The greater part of the resistance to the passage of heat resides in a comparatively quiescent film of gas close to the surface, through which film the heat has to pass mainly by conduction. If a Bunsen flame, preferably coloured with sodium, is burning over a clean metal plate, it will be seen to be separated from the plate by a dark space of a millimetre or less, throughout which the temperature of the gas is lowered by its own conductivity below the temperature of incandescence.
and the accuracy of control and regulation of temperature afforded, render it one of the most convenient agents for the distribution of large quantities of heat in all kinds of manufacturing processes.

36. Spheroidal State.—An interesting contrast to the extreme rapidity with which heat is abstracted by the evaporation of a liquid in contact with a metal plate, is the so-called spheroidal state. A small drop of liquid thrown on a red-hot metal plate assumes a spheroidal form, and continues swimming about for some time, while it slowly evaporates at a temperature somewhat below its boiling-point. The explanation is simply that the liquid itself cannot come in actual contact with the metal plate (especially if the latter is above the critical temperature), but is separated from it by a badly conducting film of vapour, through which, as we have seen, the heat is comparatively slowly transmitted even if the difference of temperature is several hundred degrees. If the metal plate is allowed to cool gradually, the drop remains suspended on its cushion of vapour, until, in the case of water, a temperature of about 100°C. is reached, at which the liquid comes in contact with the plate and boils explosively, reducing the temperature of the plate, if thin, almost instantaneously to 100°C. The temperature of the metal is readily observed by a thermo-electric method, employing a platinum dish with a platinum-rhodium wire soldered with gold to its under side. The absence of contact between the liquid and the dish in the spheroidal state may also be shown by connecting one terminal of a galvanometer to the drop and the other through a battery to the dish, and observing that no current passes until the drop boils.

37. Early Theories of Radiation.—It was at one time supposed that there were three distinct kinds of radiation—thermal, luminous and actinic, combined in the radiation from a luminous source such as the sun or a flame. The first gave rise to heat, the second to light and the third to chemical action. The three kinds were partially separated by a prism, the actinic rays being generally more refracted, and the thermal rays less refracted than the luminous. This conception arose very naturally from the observation that the feeble luminous blue and violet rays produced the greatest photographic effects, which also showed the existence of dark rays beyond the violet, whereas the brilliant yellow and red were practically without action on the photographic plate. A thermometer placed in the blue or violet showed no appreciable rise of temperature, and even in the yellow the effect was hardly discernible. The effect increased rapidly as the light faded towards the extreme red, and reached a maximum beyond the extreme limits of the spectrum (Herschel), showing that the greater part of the thermal radiation was altogether non-luminous. It is now a commonplace that chemical action, colour sensation and heat are merely different effects of one and the same kind of radiation, the particular effect produced in each case depending on the frequency and intensity of the vibration, and on the nature of the substance on which it falls. When radiation is completely absorbed by a black substance, it is converted into heat, the quantity of heat produced being equivalent to the total energy of the radiation absorbed, irrespective of the colour or frequency of the different rays. The actinic or chemical effects, on the other hand, depend essentially on some relation between the period of the vibration and the properties of the substance acted on. The rays producing such effects are generally those which are most strongly absorbed. The spectrum of chlorophyll, the green colouring matter of plants, shows two very strong absorption bands in the red. The red rays of corresponding period are found to be the most active in promoting the growth of the plant. The sun's rays are not necessarily the shortest. Even photographic plates may be made to respond to the red rays by staining them with pinochrome or some other suitable dye.

The action of light rays on the retina is closely analogous to the action on a photographic plate. The retina, like the plate, is sensitive only to rays within certain restricted limits of frequency. The limits of sensitiveness of each colour sensation are not exactly defined, but vary slightly from one individual to another, especially in cases of partial colour-blindness, and are modified by conditions of fatigue. We are not here concerned with these important physiological and chemical effects of radiation, but rather with the question of the conversion of energy of radiation into heat, and with the laws of emission and absorption of radiation in relation to temperature. We may here also assume the identity of visible and invisible radiations from a heated body in all their physical properties. It has been abundantly proved that the invisible rays, like the visible, are propagated in straight lines in homogeneous media; (2) are reflected and diffused from the surface of bodies according to the same law; (3) travel with the same velocity in free space, but with slightly different velocities in denser media, being subject to the same law of refraction; (4) exhibit all the phenomena of diffraction and interference which are characteristic of wave-motion in general; (5) are capable of polarization and double refraction; (6) exhibit similar effects of selective absorption. These properties are more easily demonstrated in the case of visible rays on account of the greatest sensitiveness of the eye. But with the aid of the thermopile or other sensitive radiometer, they may be shown to be equal in all the radiations from a heated body, even such as are thirty to fifty times slower in frequency than the longest visible rays. The same physical properties have also been shown to belong to electromagnetic waves excited by an electric discharge, whatever the frequency, thus including all kinds of aetherial radiation in the same category as light.

38. Theory of Exchanges.—The apparent concentration of cold by a concave mirror, observed by G. B. Porta and rediscovered by M. A. Pictet, led to the enunciation of the theory of exchanges by Pierre Prevost in 1791. Prevost's leading idea was that all bodies, whether cold or hot, are constantly radiating heat. Heat equilibrium, he says, consists in an equality of exchange. When equilibrium is interfered with, it is re-established by inequalities of exchange. If into a locality at uniform temperature a refracting or reflecting body is introduced, it has no effect in the way of changing the temperature at any point of that locality. A reflecting body, heated or cooled in the interior of such an enclosure, will acquire the surrounding temperature more slowly than would a non-reflecting, and will less affect another body placed at a little distance, but will not affect the final equality of temperature. Apparent radiation of cold, as from a block of ice to a thermometer placed near it, is due to the fact that the thermometer being at a higher temperature sends more heat to the ice than it received back from it. Although Prevost does not make the statement in so many words, it is clear that he regards the radiation from a body as depending only on its own nature and temperature, and as independent of the nature and presence of any adjacent body. Heat equilibrium in an enclosure of constant temperature such as is here postulated by Prevost, has often been regarded as a consequence of Carnot's principle. Since difference of temperature is required for transforming heat into work, no work could be obtained from heat in such a system, and no spontaneous changes of temperature can take place, as any such changes might be utilized for the production of work. This line of reasoning does not appear quite satisfactory, because it is tacitly assumed, in the reasoning by which Carnot's principle was established, as a result of universal experience, that a number of bodies within the same impervious enclosure, which contains no source of heat, will ultimately acquire the same temperature, and that difference of temperature is required to produce flow of heat. Thus although we may regard the equilibrium in such an enclosure as being due to equalizing of the chemical affinities of the opposite streams of radiation annul and neutralize each other in such a way that no actual transfer of energy in any direction takes place. The state of the medium is everywhere the same in such an enclosure, but its energy of agitation per unit volume is a function of the temperature, and is such that it would not be in equilibrium with any body at a different temperature.

39. "Full" and Selective Radiation. Corresponde of Emission and Absorption.—The most obvious difficulties in the
way of this theory arise from the fact that nearly all radiation is more or less selective in character, as regards the quality and frequency of the rays emitted and absorbed. It was shown by J. Leslie, M. Melloni and other experimentalists that many substances such as glass and water, which are very transparent to visible rays, are extremely opaque to much of the invisible radiation of lower frequency; and that polished metals, which are perfect reflectors, are very feeble radiators as compared with dull or black bodies at the same temperature. If two bodies emit rays of different periods in different proportions, it is not at first sight easy to see how their radiations can balance each other at the same temperature. The key to all such difficulties lies in the fundamental conception, so strongly insisted on by Balfour Stewart, of the absolute uniformity (qualitative as well as quantitative) of the full or complete radiation stream inside an impervious enclosure of uniform temperature. It follows from this conception that the proportion of the full radiation stream absorbed by any body in such an enclosure must be exactly compensated in quality as well as quantity by the proportion emitted, or that the emissive and absorptive powers of any body at a given temperature must be precisely equal. A good reflector, like a polished metal, must also be a feeble radiator and absorber. Of the incident radiation it absorbs a small fraction and reflects the remainder, which together with the radiation emitted (being precisely equal to that absorbed) makes up the full radiation stream. A partly transparent material, like glass, absorbs part of the full radiation and transmits part. But it emits rays precisely equal in quality and intensity to all those which it absorbs, which together with the transmitted portion make up the full stream. The ideal black body or perfect radiator is a body which absorbs all the radiation incident on it. The rays emitted from such a body at any temperature must be equal to the full radiation stream in an isothermal enclosure at the same temperature. Lampblack, which may absorb between 98 to 99% of the incident radiation, is generally taken as the type of a black body. But a closer approximation to full radiation may be obtained by employing a hollow vessel the internal walls of which are blackened and maintained at a uniform temperature by a steam jacket or other suitable means. If a relatively small hole is made in the side of such a vessel, the radiation proceeding through the aperture will be the full radiation corresponding to the temperature. Such a vessel is also a perfect absorber. Of radiation entering through the aperture an infinitesimal fraction only could possibly emerge by successive reflection even if the sides were of polished metal internally. A thin platinum tube heated by an electric current appears much like a polished vessel without any visible temperature. But if a small hole is made in the side of the polished tube, the light proceeding through the hole appears brighter than the blackened tube, as though the inside of the tube were much hotter than the outside, which is not the case to any appreciable extent if the tube is thin. The radiation proceeding through the hole is nearly that of a perfectly black body if the hole is small. If there were no hole the internal stream of radiation would be exactly that of a black body at the same temperature, however perfect the reflecting power, or however low the emissive power of the tube walls, because the defect in emissive power would be exactly compensated by the internal reflection.

Balfour Stewart gave a number of striking illustrations of the qualitative identity of emission and absorption of a substance. Pieces of coloured glass placed in a fire appear to lose their colour when at the same temperature as the coals behind them, because they compensate exactly for their selective absorption by radiating chiefly those colours which they absorb. Rocksalt is remarkably transparent to thermal radiation of long period, but it is extremely opaque to radiation of shorter period, as these effects are very much decreased by the insertion of a heated plate of rocksalt, because it emits when heated precisely those rays which it absorbs. A plate of tourmaline cut parallel to the axis absorbs almost completely light polarized in a plane parallel to the axis, but transmits freely light polarized in a perpendicular plane. When heated its radiation is polarized in the same plane as the radiation which it absorbs. In the case of incandescent vapoours, the exact correspondence of emission and absorption as regards wave-length of frequency of the light emitted and absorbed forms the foundation of the science of spectrum analysis. Fraunhofer had noticed the coincidence of a pair of bright yellow lines seen in the spectrum of a candle flame with the dark D lines in the solar spectrum, a coincidence which was afterwards more exactly verified by W. A. Miller. Foucault found that the flame of the electric arc showed the same lines bright in its spectrum, and proved that they appeared as dark lines in the otherwise continuous spectrum when the light from the carbon poles was transmitted through the arc. Stokes gave a dynamical explanation of the phenomenon and illustrated it by the analogous case of resonance in sound. Kirchhoff completed the explanation (Phil. Mag., 1860) of the dark lines in the solar spectrum by showing that the reversal of the spectral lines depended on the fact that the body of the sun giving the continuous spectrum was at a higher temperature than the absorbing layer of gases surrounding it. Whatever be the nature of the selective radiation from a body, the radiation of light of any particular wave-length cannot be greater than a certain fraction $E$ of the radiation $R$ of the same wave-length from a black body at the same temperature. The fraction $E$ measures the emissive power of the body for that particular wave-length, and cannot be greater than unity. The same fraction, by the principle of equality of emissive and absorptive powers, will measure the proportion absorbed of incident radiation $R'$. If the black body emitting the radiation $R'$ is at the same temperature as the absorbing layer, $R = R'$, the emission balances the absorption, and the line will appear neither bright nor dark. If the source and the absorbing layer are at different temperatures, the radiation absorbed will be ER, and that transmitted will be $R' - ER$. To this must be added the radiation emitted by the absorbing layer, namely ER, giving $R' = (R' - R)$. The lines will appear darker than the background if $R'$ is greater than R, but bright if the reverse is the case. The D lines are dark in the sun because the photosphere is much hotter than the reversing layer. They appear bright in the candle-flame because the outside mantle of the flame, in which the sodium burns and combustion is complete, is hotter than the inner reducing flame containing the incandescent particles of carbon which give rise to the continuous spectrum. This qualitative identity of emission and absorption as regards wave-length can be most exactly and easily verified for luminous rays, and we are justified in assuming that the relation holds with the same exactitude for non-luminous rays, although in many cases the experimental proof is less complete and exact.

**Diathermancy.**—A great array of data with regard to the transmissive power or diathermancy of transparent substances for the heat radiated from various sources at different temperatures were collected by Melloni, Tyndall, Magnus and other experimentalists. The measurements were chiefly of qualitative character, and were made by interposing between the source and a thermopile a layer or plate of the substance to be examined. This method lacked quantitative precision, but led to a number of striking and interesting results, which are admirably set forth in Tyndall's *Heat*. It was generally assumed that the hotter the source, the greater the transmission, because some of which were recognized as being due to selective absorption, while others are probably to be explained by imperfections in the methods of experiment adopted. The general result of such researches was to show that substances, like water, alum and glass, which are practically opaque to radiation from a source at low temperature, such as a vessel filled with boiling water, transmit an increasing percentage of the radiation when the temperature of the source is increased. This is what would be expected, as these are very long radiation waves, and would be absorbed by the blackening layer. That the proportion transmitted is not merely a question of the temperature of the source, but also of the quality of the radiation, was shown by a number of experiments. For instance, K. H. Knoblauch (Pogg. Ann., 1847) found that a plate of glass interposed between a spirit lamp and a thermopile intercepts a larger proportion of the radiation from the flame itself than of the radiation from a platinum spiral heated in the flame,
although the spiral is undoubtedly at a lower temperature than the flame. The explanation is that the spiral is a fairly good radiator of the visible rays to which the glass is transparent, but a bad radiator of the invisible rays absorbed by the glass which constitute the greater portion of the heat-radiation from the feebly luminous flame. The radiation from the source under investigation is qualitatively determinate, like that of a black body at a given temperature, the proportion transmitted by plates of various substances may easily be measured and tabulated for given plates and sources. But owing to the highly selective character of the radiation and absorption, it is impossible to give any general relation between the thickness of the absorbing plate or layer and the proportion of the total energy absorbed. For these reasons the relative diathermances of different materials do not admit of any simple numerical statement as physical constants, though many of the qualitative results obtained are very striking. Among the most interesting experiments were those of Tyndall, on the absorptive powers of gases and vapours, which led to a good deal of controversy at the time, owing to the difficulty of the experiments, and the contradictory results obtained by other observers. The arrangement employed by Tyndall for these measurements is shown in Fig. 6. A brass tube AB, polished inside, and closed with plates of highly diathermanous rocksalt at either end, was fitted with stopcocks C and D for exhausting and admitting air or other gases or vapours. The source of heat S was usually a plate of copper heated by a Bunsen burner, or a Leslie cube containing boiling water as shown at E. To obtain greater sensitiveness for differential measurements, the radiation through the tube AB incident on one face of the pile P was balanced against the radiation from a Leslie cube on the other face of the pile by means of an adjustable screen H. The radiation on the two faces of the pile being thus balanced with the tube exhausted, Tyndall found that the admission of dry air into the tube produced practically no absorption of the radiation, whereas compound gases such as carbonic acid, ethylene or ammonia absorbed 20 to 90%, and a trace of aqueous vapour in the air increased its absorption 50 to 100 times. H. G. Magnus, on the other hand, employing a thermopile and a source of heat, both of which were enclosed in the same exhausted receiver, in order to avoid interposing any rocksalt or other plates between the source and the pile, found an absorption of 11% on admitting dry air, but could not detect any difference whether the air were dry or moist. Tyndall suggested that the apparent absorption observed by Magnus might have been due to the cooling of his radiating surface by convection, which is a very probable source of error in this method of experiment. Magnus considered that the remarkable effect of aqueous vapour observed by Tyndall might have been caused by condensation on the polished internal walls of his experimental tube, or on the rocksalt plates at either end. The question of the relative diathermancy of air and aqueous vapour for radiation from the sun to the earth and from the earth into space is one of great interest and importance in meteorology. Assuming with Magnus that at least 10% of the heat from a source at 1000°C is absorbed in passing through a single foot of air, a very moderate thickness of atmosphere should suffice to absorb all the heat radiated from the earth into space. This could not be reconciled with well-known facts in regard to terrestrial radiation, and it was generally regarded as an empirical result found by Magnus must be erroneous. Tyndall's experiment on the great diathermancy of dry air agreed much better with meteorological phenomena, but he appears to have exaggerated the effect of aqueous vapour. He concluded from his experiments that the water vapour present in the air absorbs at least 10% of the heat radiated from the earth within 1 ft. of its surface, and that the absorptive power of the vapour is about 17,000 times that of air at the same pressure. If the absorption of aqueous vapour were really of this order of magnitude, it would exert a far greater effect in modifying climate than is actually observed to be the case. Radiation is thus supposed to take place freely through the atmosphere at times when the proportion of aqueous vapour is such as would practically stop all radiation if Tyndall's results were correct. The very careful experiments of E. Lecher and J. Pernter (Phil. Mag., Jan. 1881) confirmed Tyndall's observations on the absorptive powers of gases and vapours satisfactorily in nearly all cases with the single exception of aqueous vapour. They found that there was no appreciable absorption of heat from a source at 1000°C in passing through 1 ft. of air (whether dry or moist), but that CO and CO₂ at atmospheric pressure absorbed about 8% and ethylene (olefiant gas) about 5% in the same distance. In the vapours of alcohol and ether showed absorptive powers of the same order as that of ethylene. They confirmed Tyndall's important result that the absorption does not diminish in proportion to the pressure, being much greater in proportion for smaller pressures in consequence of the selective character of the effect. They also supported his conclusion that absorptive power increases with the complexity of the molecule. But they could not detect any absorption by water vapour at a pressure of 7 mm., though alcohol at the same pressure absorbed 3% and acetic acid 10%. Later researches, especially those of S. P. Langley with the spectro-bolometer on the infra-red spectrum of sunlight, demonstrated the existence of marked absorption bands, some of which are due to water vapour. From the character of these bands and the manner in which they vary with the state of the air and the thickness traversed, it may be inferred that absorption by water vapour plays an important part in meteorology, but that it is too small to be measurable at the temperature of the plate. Assuming that the vapour pressure of the saturated salt solution is only half that of pure water, it would require an elevation of temperature of 10°C to dry the rocksalt plates in saturated air at 15°C. It is only fair to say that the laws of the vapour pressures of solutions were unknown in Tyndall's time, and that it was usual to assume that the plates would not become wetted until the dew-point was reached. The writer has repeated Tyndall's experiments with a facsimile of one of Tyndall's tubes in the possession of the Royal College of Science, fitted with plates of rocksalt cut from the same block as Tyndall's, and therefore of the same optical quality. Employing a reflecting spectre-bolometer in conjunction with a differential bolometer, which is quicker in its action than Tyndall's pile, there appears to be hardly any difference between dry and moist air, provided that the latter is not more than half saturated. Tyndall's results may have been due to the rocksalt cube as source of heat, both rocksalt plates invariably became wet in a minute or two and the absorption rises to 10 or 20% according to the thickness of the rocksalt plates. Using the Tyndall method as described by Tyndall, without the rocksalt plates, the absorption is certainly less than 1% in 3 ft. of air saturated at 20°C, and if condensation is induced on the walls of the tube. It is possible that the rocksalt plates may have been kept dry in order to obtain the same transmitting power as a vacuum. It is probable that Tyndall's experiments on aqueous vapour were effected by experimental errors of this character.
41. Relation between Radiation and Temperature.—Assuming, in accordance with the reasoning of Balfour Stewart and Kirchhoff, that the radiation stream inside an impervious enclosure at a uniform temperature is independent of the nature of the walls of the enclosure, and is the same for all substances at the same temperature, it follows that the full stream of radiation in such an enclosure, or the radiation emitted by an ideal black body or full radiator, is a function of the temperature only. The form of this function may be determined experimentally by observing the radiation between two black bodies at different temperatures, which will be proportional to the difference of the full radiation streams corresponding to their several temperatures. The law now generally accepted was first proposed by Stefan as an empirical relation. Tyndall had found that the radiation from a white hot platinum wire at 2100° C. was 11.7 times its radiation when dull red at 525° C. Stefan (Wien, Akad. Ber., 1870, 79, p. 421) noticed that the ratio 11.7 is nearly that of the fourth power of the absolute temperature as estimated by Tyndall. On making the somewhat different assumption that the radiation between two bodies varied as the difference of the fourth powers of their absolute temperatures, he found that it satisfied approximately the experiments of Dulong and Petit and other observers. According to this law the radiation between a black body at a temperature $\theta$ and a black enclosure or a black radiometer at a temperature $\theta_0$ should be proportional to $(\theta^4-\theta_0^4)$. The black body was very simple and convenient in form, but it rested so far on very insecure foundations. The temperatures given by Tyndall were merely estimated from the colour of the light emitted, and might have been some hundred degrees in error. We now know that the radiation from polished platinum is of a highly selective character, and varies more nearly as the fifth power of the absolute temperature. The agreement of the fourth power law with Tyndall’s experiment appears therefore to be due to a purely accidental error in estimating the temperatures of the wire. Stefan also found a very fair agreement with Draper’s observations of the intensity of radiation from a platinum wire, in which the temperature of the wire was deduced from the expansion. Here again the apparent agreement was largely due to errors in estimating the temperature, arising from the fact that the coefficient of expansion of platinum increases considerably with rise of temperature. So far as the experimental results available at that time were concerned, Stefan’s law could be regarded only as an empirical expression of doubtful significance. But it received a much greater importance when investigations were extended to a region of higher progress. James Clerk Maxwell (Electricity and Magnetism, 1873) had shown that a directed beam of electromagnetic radiation or light incident normally on an absorbing surface should produce a mechanical pressure equal to the energy of the radiation per unit volume. A. G. Bartoli (1875) took up this idea and made it the basis of a thermodynamic treatment of radiation. P. N. Lebedew in 1900, and E. F. Nichols and G. F. Hull in 1901, proved the existence of this pressure by direct experiments. L. Boltzmann (1884) employing radiation as the working substance in a Carnot cycle, showed that the energy of full radiation at any temperature per unit volume should be proportional to the fourth power of the absolute temperature. This law was first verified in a satisfactory manner by Heinrich Schneebeli (Wied. Ann., 1884, 22, p. 30). He observed the radiation from the bulb of an air thermometer heated to known temperatures through a small aperture in the walls of the furnace. With this arrangement the radiation was very nearly that of a black body, and his results were confirmed by T. H. Trowbridge and W. R. G. Whymper. L. C. H. F. Paschen and others found that the radiation from electrically heated platinum, failed to give concordant results on account of differences in the quality of the radiation, the importance of which was not fully realized at first. Later researches by Paschen with improved methods verified the law, and greatly extended our knowledge of radiation in other directions. One of the most complete series of experiments on the relation between full radiation and temperature is that of O. R. Lummer and Ernst Pringsheim (Ann. Phys., 1897, 65, p. 395). They employed apertures in the side of an enclosure at uniform temperature as the source of radiation and compared the intensities at different temperatures by means of a bolometer. The fourth power law was well satisfied throughout the whole range of their experiments from -190° C. to 2300° C. According to this law, the rate of loss of heat by radiation from a body of emissive power $E$ and surface $S$ at a temperature $\theta$ in an enclosure at $\theta_0$ is given by the formula

$$ R = E \delta^4 (\theta - \theta_0), $$

where $\delta$ is the radiation constant. The absolute value of $\delta$ was determined by F. Kurlbaum using an electric compensation method (Wied. Ann., 1898, 65, p. 740), in which the radiation received by a bolometer from a black body at a known temperature was measured by finding the electric current required to produce the same rise of temperature in the bolometer. K. Angstrom employed a similar method for solar radiation. Kurlbaum gives the value $\delta = 5.32 \times 10^{-7}$ ergs per cm. per sec. C. Christiansen (Wied. Ann., 1883, 19, p. 267) had previously found a value about 5% smaller, by observing the rate of cooling of a copper plate of known thermal capacity, which is probably a less accurate method.

42. Theoretical Proof of the Fourth Power Law.—The proof given by Kurlbaum may be somewhat simplified if we observe that full radiation in an enclosure of constant temperature is analogous to the production of heat in a polished vessel of water, like a saturated vapour, and must therefore obey Carnot’s or Clapeyron’s equation given in section 17. The energy of radiation per unit volume, and the radiation-pressure at any temperature, are functions of the temperature only, like the pressure of a saturated vapour. If the volume of the enclosure is increased by any finite amount, the temperature remaining the same, radiation is given off from the walls so as to fill the space to the same pressure as before. The heat absorbed when the volume is increased corresponds with the latent heat of vaporization. In the case of radiation, as in the case of evaporation, the latent heat of vaporization is the difference of the formation and partly of external work of expansion at constant pressure. Since in the case of full or undirected radiation the pressure is independent of the energy per unit volume, the external work for any expansion is one-third of the internal energy added. The latent heat absorbed is, therefore, four times the external work of expansion. Since the external work is the product of the pressure $P$ and the increase of volume $V$, the latent heat per unit increase of volume is four times the pressure. But by Carnot’s equation the latent heat of a saturated vapour per unit increase of volume is given by the ratio of the expansion-pressure per degree divided by Carnot’s function or multiplied by the absolute temperature. Expressed in symbols we have,

$$ \theta (\delta P/\delta \theta) = L/V = 4P, $$

where $(\delta P/\delta \theta)$ represents the rate of increase of pressure. This equation shows that the percentage rate of increase of pressure is the same percent of the temperature, or that if the temperature is increased by 1%, the pressure is increased by 4%. This is equivalent to the statement that the pressure varies as the fourth power of the temperature, a result which is mathematically deduced by integrating the equation.

43. Wien’s Displacement Law.—Assuming that the fourth power law gives the quantity of full radiation at any temperature, it remains to determine how the quality of the radiation varies with the temperature, since we have seen both quantity and quality are determinate. This question may be regarded as consisting of two parts. (1) How is the wave-length or frequency of any given kind of radiation changed when its temperature is altered? (2) What is the form of the curve expressing the distribution of energy between the various wave-lengths in the spectrum of full radiation, or what is the distribution of heat in the spectrum? The researches of Tyndall, Draper, Langley and other investigators had shown that while the wave-length of radiation increased with rise of temperature, the maximum of intensity was shifted or displaced along the spectrum in the direction of shorter wave-lengths or higher frequencies. W. Wien (Ann. Phys., 1898, 58, p. 662), applying Doppler’s principle to the adiabatic compression of radiation in a perfectly reflecting enclosure, deduced that the wave-length of each constituent of the radiation should be shortened in proportion to the rise of temperature produced.
by the compression, in such a manner that the product \( \lambda \) of wave-length and the absolute temperature should remain constant. According to this relation, which is known as Wien's Displacement Law, the frequency corresponding to the maximum ordinate of the energy curve of the normal spectrum of full radiation should vary directly (or the wave-length inversely) as the absolute temperature, a result previously obtained by H. F. Weber (1888). Paschen, and Lummer and Pringsheim verified this relation by observing with a bolometer the intensity at different points in the spectrum produced by a fluorite prism. The intensities were corrected and reduced to a wave-length scale with the aid of Paschen's results on the dispersion formula of fluorite (Wied Ann., 1894, 53, p. 301). The curves in fig. 7, illustrate results obtained by Lummer and Pringsheim (Ber. deut. phys. Ges., 1899, 1, p. 34) at three different temperatures, namely 1377\(^o\), 1089\(^o\) and 836\(^o\) absolute, plotted on a wave-length base with a scale of microns (\( \mu \)) or millionths of a metre. The wave-lengths \( \lambda_0 \), \( \lambda_0 \), \( \lambda_0 \), corresponding to the maximum ordinates of each curve, vary inversely as the absolute temperatures given. The constant value of the product \( \lambda \) at the maximum point is found to be 2900. Thus for a temperature of 1000\(^o\) Abs. the maximum is at wave-length 2-92\( \mu \); at 2000\(^o\) the maximum is at 1-46\( \mu \).

### 44. Form of the Curve representing the Distribution of Energy in the Spectrum

Assuming Wien's displacement law, it follows that the form of the curve representing the distribution of energy in the spectrum of full radiation should be the same for different temperatures with the maximum displaced in proportion to the absolute temperature, and with the total area increased in proportion to the fourth power of the absolute temperature. Observations taken with a bolometer along the length of a normal or wave-length spectrum, would give the form of the curve plotted on a wave-length base. The height of the ordinate at each point would represent the energy included between given limits of wave-length, depending on the width of the bolometer strip and the slit. Supposing that the bolometer strip had a width corresponding to 0-1\( \mu \), and were placed at 1-0\( \mu \) in the spectrum of radiation at 2000\(^o\) Abs., it would receive the energy corresponding to wave-lengths between 1-00 and 1-01\( \mu \). At a temperature of 1000\(^o\) Abs. the corresponding part of the energy, by Wien's displacement law, would lie between the limits 2-00 and 2-02\( \mu \), and the total energy between these limits would be 16 times smaller. But the bolometer strip placed at 2-01\( \mu \) would receive only half of the energy, or the energy in a band 0-1\( \mu \) wide, and the deflection would be 32 times less. Corresponding ordinates of the curves at different temperatures will therefore vary as the fifth power of the temperature, when the curves are plotted on a wave-length base. The maximum ordinates in the curves already given are found to vary as the fifth powers of the corresponding temperatures. The equation representing the distribution of energy on a wave-length base must be of the form

\[
E = C \lambda^{-5} \cdot F(\lambda) = C \theta(\lambda)^{-5} \cdot F(\lambda)
\]

where \( F(\lambda) \) represents some function of the product of the wave-length and temperature, which remains constant for corresponding wave-lengths when \( \theta \) is changed. If the curves were plotted on a frequency base, owing to the change of scale, the maximum ordinates would vary as the cube of the temperature instead of the fifth power, but the form of the function \( F \) would remain unaltered. Reasoning on the analogy of the distribution of velocities among the particles of a gas on the kinetic theory, which is a very similar problem, Wien was led to assume that the function \( F \) should be of the form \( e^{-\lambda \theta} \), where \( e \) is the base of Napierian logarithms, and \( \lambda \) is a constant having the value 14,600 if the wave-length is measured in microns \( \mu \). This expression was found by Paschen to give a very good approximation to the intensity of the various wave-lengths of the curve observed experimentally for those portions of the visible and infra-red spectrum where observations could be most accurately made. The formula was tested in two ways: (1) by plotting the curves of distribution of energy in the spectrum for constant temperatures as illustrated in fig. 7; (2) by plotting the energy corresponding to a given wave-length as a function of the temperature. Both methods gave very good agreement with Wien's formula for values of the product \( \lambda \) not much exceeding 3000. A method of isolating rays of great wave-length by successive reflection was devised by H. Rubens and E. F. Nichols (Wied Ann., 1897, 60, p. 418). They found that quartz and fluorite possessed the property of selective reflection for rays of wave-length 8-5\( \mu \) and 24\( \mu \) to 32\( \mu \) respectively, so that after four to six reflections these rays could be isolated from a source at any temperature in a state of considerable purity. The residual impurity at any stage could be estimated by interposing a thin plate of quartz or fluorite which completely reflected or absorbed the residual rays, but allowed the impurity to pass. H. Beckmann, under the direction of Rubens, investigated the variation with temperature of the residual rays reflected from fluorite employing sources from -860 to 600\( ^{\circ} \) C., and found the results could not be represented by Wien's formula unless the constant \( c \) were taken as 26,000 in place of 14,600. In their first series of observations extending to 6\( \mu \) O.R. Lummer and E. Pringsheim (Deut. phys. Ges., 1899, 1, p. 34) found systematic deviations indicating an increase in the value of the constant \( c \) for long waves and high temperatures. In a theoretical discussion of the subject, Lord Rayleigh (Phil. Mag., 1900, 49, p. 539) pointed out that Wien's law would lead to a limiting value \( CX^{-5} \) of the radiation corresponding to any particular wave-length when the temperature increased to infinity, whereas according to his view the radiation, of great wave-length should ultimately increase in direct proportion to the temperature. Lummer and Pringsheim (Deut. phys. Ges., 1900, 2, p. 163) extended the range of their observations to 18\( \mu \) by employing a prism of sylvite in place of fluorite. They found deviations from Wien's formula increasing to nearly 70% at 18\( \mu \), whereas, however, the observations were very difficult on account of the smallness of the energy to be measured. Rubens and F. Kurlbaum (Ann. Phys., 1901, 4, p. 649) extended the residual reflection method to a temperature range from -190\( ^{\circ} \) to 1500\( ^{\circ} \) C., and employed the rays reflected from quartz 8-5\( \mu \), and rocksalt 51\( \mu \), in addition to those from fluorite. It appeared from these searches that the rays of great wave-length from a source at a high temperature tended to vary in the limit directly as the absolute temperature of the source, as suggested by Lord Rayleigh, and could not be represented by Wien's formula with any value of the constant \( c \). The simplest type of formula satisfying the required conditions is that proposed by Max Planck (Ann. Phys., 1901, 4, p. 553) namely,

\[
E = CX^{(c/\lambda^{3})}\cdot \lambda^{-5}
\]

which agrees with Wien's formula when \( \theta \) is small, where Wien's formula is known to be satisfactory, but approaches the limiting
form $E = \alpha \cdot X^{\beta} \cdot c / \theta$, when $\theta$ is large, thus satisfying the condition proposed by Lord Rayleigh. The theoretical interpretation of this formula remains to some extent a matter of future investigation to satisfy experiment within the limits of observational error. In order to compare Planck's formula graphically with Wien's, the distribution curves corresponding to both formulae are plotted in fig. 8 for a temperature of 2000° abs., taking the value of the constant $c = 14,600$ with a scale of wave-length in microns $\mu$. The curves in fig. 9 illustrate the difference between the two formulae and show the variation of the radiation corresponding to a fixed wave-length 30 $\mu$. Assuming Wien's displacement law, the curves may be applied to find the energy for any other wave-length or temperature, by simply altering the wave-length scale in inverse ratio to the temperature, or vice versa. Thus to find the distribution curve for 1000° abs., it is only necessary to multiply all the numbers in the wave-length scale of fig. 8 by 2; or to find the variation curve for wave-length 60 $\mu$, the numbers on the temperature scale of fig. 9 should be divided by 2. The ordinate scales must be increased in proportion to the fifth power of the temperature, or inversely as the fifth power of the wave-length respectively in figs. 8 and 9 if comparative results are required for different temperatures or wave-lengths. The results hitherto obtained for cases other than full radiation are not sufficiently detailed to admit of profitable discussion in the present article.

BIBLIOGRAPHY.—It would not be possible, within the limits of an article like the present, to give tables of the specific thermal properties of different substances so far as they have been ascertained by experiment. To be of any use, such tables must be detailed, with very full references and explanations with regard to the value of the experimental evidence, and the limits within which the results may be relied on. The quantity of material available is so enormous and its value so varied, that the most elaborate tables still require reference to the original authorities. Much information will be found collected in Landolt and Bornstein's Physical and Chemical Tables (Berlin, 1908). Shorter tables, such as Everett's Units and Physical Constants, are useful as illustrations of a system, but are not sufficiently complete for use in scientific investigations. Some of the larger works of reference, such as A. A. Winkelmann's Handbuch der Physik, contain tables complete for every known substance, but these tables occupy so much space, and are so misleading if incomplete, that they are generally omitted in theoretical textbooks.

Among older textbooks on heat, Tyndall's Heat may be recommended for its vivid popular interest, and Ballour Stewart's Heat for early theories of radiation. Maxwell's Theory of Heat and Taft's Heat give a broad and philosophical survey of the subject. Among modern textbooks, Preston's Theory of Heat and Poynting and Thomson's Heat are the best known, and have been brought well up to date. Sections on heat are included in all the general textbook of Physics, such as those of Deschanel (translated by Everett), Ganot (translated by Atkinson), Daniell, Watson, &c. Of the original investigations on the subject, the most important have already been cited. Others will be found in the collected papers of Joule, Kelvin and Maxwell. Treatises on special branches of the subject, such as Fourier's Conduction of Heat, are referred to in the separate articles in this encyclopaedic dealing with recent present future thoughts. The following is a list: CALORIMETRY, CONDENSATION OF GASES, CONDUCTION OF HEAT, DIFFUSION, ENERGETICS, FUSION, LIQUID GASES, RADIATION, RADIOMETER, SOLUTION, THERMODYNAMICS, THERMAL ELECTRICITY, THERMOMETRY, VAPORIZATION. For the practical aspects of heating see HEATING.

HEATH, BENJAMIN (1704-1766), English classical scholar and bibliophile, was born at Exeter on the 20th of April 1704. He was the son of a wealthy merchant, and was thus able to devote himself mainly to travel and book-collecting. He became town clerk of his native city in 1732, and held the office till his death on the 13th of September 1766. In 1765 he had published a pamphlet advocating the removal of the indecent tax in Devonshire, and his endeavours led to success three years later. As a classical scholar he made his reputation by his critical and metrical notes on the Greek tragedies, which procured him an honorary D.C.L. from Oxford (31st of March 1752). He also left MS. notes on Burman's and Martyr's editions of Virgil, on Euripides, Catullus, Tibullus, and the greater part of Horace. In some of these he adopted the views of Dr. Desclaux Eichhorn's Revival of Shakespeare's Text (1765) was an answer to the "inconsistent dogmatism" of Bishop Warburton. The Essay towards a Demonstrative Proof of the Divine Existence, Unity and Attributes (1749) was intended to combat the opinions of Voltaire, Rousseau and Hume. Two of his sons (among a family of thirteen) were Benjamin, headmaster of Harrow (1771-1785), and George, headmaster of Eton (1796). His collection of rare classical works formed the nucleus of his son Benjamin's famous library (Bibliotheca Heathiana).

An account of the Heath family will be found in Sir W. R. Drake's Heathiana (1882).

HEATH, NICHOLAS (c. 1501-1578), archbishop of York and lord chancellor, was born in London about 1501 and graduated B.A. at Oxford in 1519. He then migrated to Christ's College, Cambridge, where he graduated B.A. in 1520, M.A. in 1522, and was elected fellow in 1524. After holding minor preferments he was appointed archdeacon of Stafford in 1534 and graduated D.D. in 1537. He then accompanied Edward Fox (q.v.), bishop of Hereford, on his mission to promote a theological and political understanding with the Lutheran princes of Germany. His selection for this duty implies a readiness on Heath's part to proceed some distance along the path of reform; but his dealings with the Lutherans did not confirm this tendency, and Heath's subsequent career was closely associated with the cause of reaction. In 1539, the year of the Six Articles, he was made bishop of Rochester, and in 1543 he succeeded Latimer at Worcester. His Catholicism, however, was of a less rigid type than Gardiner's and Bonner's; he felt something of the force of the national antipathy to foreign influence, whether ecclesiastical or secular, and was always impressed by the necessity of national unity, so far as was possible, in matters of faith. Apparently he made no difficulty about carrying out the earlier reforms of Edward VI., and he accepted the first book of common prayer after it had been modified by the House of Lords in a Catholic direction.

His definite breach with the Reformation occurred on the grounds, on which four centuries later Leo XIII. denied the Catholicity of the reformed English Church, namely, on the question of the Ordinal drawn up in February 1550. Heath refused to accept it, was imprisoned, and in 1551 deprived of his bishopric. On Mary's accession he was released and restored, and made president of the council of the Marches and Wales. In 1555 he was promoted to the archbishopric of York, which he did much to enrich after the Protestant spoliation; he built York House in the Strand. After Gardiner's death he was appointed lord chancellor, probably on Pole's recommendation; for Heath, like Pole himself, disliked the Spanish party in England. Unlike Pole, however, he seems to have been averse from the excessive persecution of Mary's reign, and no Protestants were burnt in his diocese. He exercised, however, little influence on Mary's secular or ecclesiastical policy.

On Mary's death Heath as chancellor at once proclaimed Elizabeth. Like Sir Thomas More he held that it was entirely within the competence of the national state, represented by Parliamen, to determine questions of the succession to the throne; and although Elizabeth did not renew his commission as lord chancellor, he continued to sit in the privy council for two months until the government had determined to complete the breach with the Roman Catholic Church; and as late as April 1559 he assisted the government by helping to arrange the Westminster Conference, and reprobating his more turbulent co-religionists. He refused to crown Elizabeth because she would not have the coronation service accompanied with the elevation of the Host; and ecclesiastical Hesiodism and doctrine of the five altars were altered or abrogated by any mere national authority. Hence he steadfastly resisted Elizabeth's acts of supremacy and uniformity, although he had acquiesced in the acts of 1534 and 1549. Like others of Henry's bishops, he had been convinced by the events of Edward VI.'s reign that Sir
HEATH, W.—HEATH

Thomas More was right and Henry VIII. was wrong in their attitude towards the claims of the papacy and the Catholic Church. He was therefore necessarily deprived of his archbishopric in 1559, but he remained loyal to Elizabeth; and after a temporary confinement he was suffered to pass the remaining nineteen years of his life in peace and quiet, never attending public worship and sometimes hearing mass in private. The queen visited him more than once at his house at Chobham, Surrey; he died and was buried there at the end of 1578.

HEATH, WILLIAM (1737-1814), American soldier, was born in Roxbury, Massachusetts, on the 2nd of March 1737 (old style). He was brought up as a farmer and had a passion for military exercises. In 1765 he entered the Ancient and Honourable Artillery Company of Boston, of which he became commander in 1770. In the same year he wrote to the Boston Gazette letters signed "A Military Countryman," urging the necessity of militia to defend the colonies. As a member of the Massachusetts General Court from 1770 to 1774, of the provincial committee of safety, and in 1774-1775 of the provincial congress. He was commissioned a provincial brig-general in December 1774, directed the pursuit of the British from Concord (April 19, 1775), was promoted to be provincial major-general on the 20th of June 1775, and two days later was commissioned fourth brig-general in the Continental Army. He became major-general on the 9th of August 1776, and was in active service around New York until early the next year. In January 1777 he attempted to take Fort Independence, near Spuyten Duyvil, then garrisoned by about 2000 Hessians, but at the first sally of the garrison his troops became panic-stricken and a few days later he withdrew. Washington reprimanded him and never again entrusted to him any important operation in the field. Throughout the war, however, Heath was very efficient in muster service and in the barrack. From March 1777 to October 1778 he was in command of the Eastern Department with headquarters at Boston, and had charge (Nov. 1777-Oct. 1778) of the prisoners of war from Burgoyne's army held at Cambridge, Massachusetts. In May 1779 he was appointed a commissioner of the Board of War. He was placed in command of the troops on the E. side of the Hudson in June 1779, and of other troops and posts on the Hudson in November of that year, and in the last months of the year met allies under Rochambeau on their arrival in Rhode Island; in October of the same year he succeeded Arnold in command of West Point and its dependencies; and in August 1781, when Washington went south to meet Cornwallis, Heath was left in command of the Army of the Hudson to watch Clinton. After the war he retired to his farm at Roxbury, was a member of the state House of Representatives in 1788, of the Massachusetts convention which ratified the Federal Constitution in the same year, and of the governor's council in 1780-1790, was a state senator (1791-1793), and in 1806 was elected lieutenant-governor of Massachusetts, a post he refused to serve. He died at Roxbury on the 24th of January 1814, the last of the major-generals of the War of American Independence.

See Memoirs of Major-General Heath, containing Anecdotes, Details of Skirmishes, Battles and other Military Events during the American War, written by Himself (Boston, 1798; frequently reprinted, perhaps the best edition being that published in New York in 1901 by William Abbott), particularly valuable for the descriptions of Lexington and Bunker Hill, of the fighting around New York, of the controversies with Burgoyne and his officers during their stay in Boston, and of relations with Rochambeau; and his correspondence, The Heath Papers, vols. i.-v., seventh series, Massachusetts Historical Society Collections (Boston, 1904-1905).

HEATH, the English form of a name given in most Teutonic dialects to the common ling or heather (Calluna vulgaris), but now applied to all species of Erica, an extensive genus of mono-petalous plants, belonging to the order Ericaceae. The heaths are evergreen shrubs, with small narrow leaves, in whors usually set rather thickly on the shoots; the persistent flowers have 4 sepals, and a 4-cleft campanulate or tubular corolla, in many species more or less ventricose or inflated; the dry capsule is 4-celled, and opens, in the true Ericæa, in 4 segments, to the middle of which the partitions adhere, though in the ling the valves separate at the dissepiments. The plants are mostly of low growth, but several African kinds reach the size of large bushes, and a common South European species, E. arborea, occasionally attains almost the aspect and dimensions of a tree.

One of the best known and most interesting of the family is the common heath, heather or ling, Calluna vulgaris (fig. 1), placed by most botanists in a separate genus on account of the peculiar dehiscence of the fruit, and from the coloured calyx, which extends beyond the corolla, having a whorl of sepal-like bracts beneath. This shrub derives some economic importance from its forming the chief vegetation on many of those extensive wastes that occupy so large a portion of the more sterile lands of northern and western Europe, the usually desolate appearance of which is enlivened in the latter part of summer by its abundant pink blossoms. When growing erect to the height of 3 ft. or more, as it often does in sheltered places, its purple stems, close-leaved green shoots and feathery spikes of bell-shaped flowers render it one of the handsomest of the heaths; but on the blaker elevations and more arid slopes it frequently rises only a few inches above the ground. In all moorland countries the ling is applied to many rural purposes; the larger stems are made into brooms, the shorter tied up into bundles that serve as brushes, while the long trailing shoots are woven into baskets. Pared up with thepeat about its roots it forms a good fuel, often the only one obtainable on the drier moors. The shielings of the Scottish Highlanders were formerly constructed of heath stems, cemented together with peat-mud, worked into a kind of mortar with dry grass or straw; hovels and sheds for temporary purposes are still built in a similar way, and roofed in with ling. Laid on the ground, with the flowers above, it forms a soft springy bed, the luxurious couch of the gael, still gladly resorted to at times by the hill shepherd or hardy deer-stalker. The young shoots were in former days employed as a substitute for hops in brewing, while their astringency rendered them valuable as a tanning material in Ireland and the Western Isles. They are said also to have been used by the Highlanders for dyeing woollen yarn yellow, and other colours are assayed to have been obtained from them, but some writers appear to confuse the dyer's-weed, Genista tinctoria, with the heather. The young juicy shoots and the seeds, which remain long in the capsules, furnish the red dye of Scotland; the larger portion of its succulence; the ripe seeds are eaten by many birds. The tops of the ling afford a considerable part of the winter fodder of the hill flocks, and are popularly supposed to communicate the fine flavour to Welsh and Highland mutton, but sheep seldom crop heather while the mountain grasses and rushes are sweet and accessible. Ling has been suggested as a material for paper, but the stems are hardly sufficiently fibrous for that purpose. The purple or fine-leaved heath, E. cinerea (fig. 2), one of the most beautiful of the genus, abounds on the lower moors and commons of Great Britain and western Europe, in such situations being sometimes more prevalent than the ling. The flowers of both these species yield much honey, furnishing a plentiful supply to the bees in moorland districts; from this heath honey the Picts probably brewed the mead said by Boethius to have been made from the flowers themselves.

The genus contains about 420 known species, by far the greater part being indigenous to the western districts of South Africa,
but it is also a characteristic genus of the Mediterranean region, while several species extend into northern Europe. No species is native in America, but ling occurs as an introduced plant on the Atlantic side from Newfoundland to New Jersey. Five species occur in Britain: E. cinerea, E. tetralis (cross-leaved heath), both abundant on heaths and commons, E. vagans, Cornish heath, found only in West Cornwall, and E. scoparia in the west of England and Ireland and E. mediterranea in Ireland. The three last are south-west European species which reach the northern limit of their distribution in the west of England and Ireland. E. scoparia is a common heath in the centre of France and elsewhere in the Mediterranean region, forming a spreading bush several feet high. It is known as breuylere, and its stout underground rootstocks yield the briar-wood used for pipes.

The Cape heaths have long been favourite objects of horticulture. In the warmer parts of Britain several will bear exposure to the cold of ordinary winters in a sheltered border, but most need the protection of the conservatory. They are sometimes raised from seed, but are chiefly multiplied by cuttings "struck" in sand, and afterwards transferred to pots filled with a mixture of black peat and sand; the peat should be dry and free from sourness. Much attention is requisite in watering heaths, as they seldom recover if once allowed to droop, while they will not bear much water about their roots: the heath-house should be light and well ventilated, the plants requiring sun, and soon perishing in a close or permanently damp atmosphere; in England little or no heat is needed in ordinary seasons. The European heaths succeed well in English gardens, requiring a peaty soil and sunny situation to thrive as well as in their native localities: E. carneae, E. mediterraneae, ciliaris, vagans, and the pretty cross-leaved heath of boggy moors, E. tetralis, are among those most worthy of cultivation. The beautiful large-flowered St Dabeoc's heath, belonging to the closely allied genus Daboecia, is likewise often seen in gardens. It is found in boggy heaths in Connemara and Mayo, and is also native in West France, Spain and the Azores.

A beautiful work on heaths is that by H. C. Andrews, containing coloured engravings of nearly 500 species and varieties, with descriptions in English and Latin (4 vols., 1802-1805).

HEATHCOAT, JOHN (1783-1861), English inventor, was born at Duffield near Derby on the 7th of August 1783. During his apprenticeship to a framesmith near Loughborough, he made an improvement in the construction of the warp-loom, so as to produce mitts of a lace-like appearance by means of it. He began business on his own account at Nottingham, but finding himself subjected to the intrusion of competing inventors he removed to Hather. There in 1808 he constructed a machine capable of producing an exact imitation of real pillow-lace. This was by far the most expensive and complex textile apparatus till then existing; and in describing the process of his invention Heathcoat said in 1836, "The single difficulty of getting the diagonal threads to twist in the allotted space was so great that, if now to be done, I should probably not attempt its accomplishment." Some time before perfecting his invention, which he patented in 1809, he removed to Loughborough, where he entered into partnership with Charles Lucy, a manufacturer, but in 1815 the business was attacked by the Luddites and their 55 lace frames destroyed. The damages were assessed in the King's Bench at £10,000; but as Heathcoat declined to expend the money in the county of Leicester he never received any part of it. Undaunted by his loss, he began at once to construct new and greatly improved machines in an unoccupied factory at Tiverton, Devon, propelling them by water-power and afterwards by steam. His claim to the invention of the twisting and traversing lace machine was disputed, and a patent was taken out by a clever workman for a similar machine, which was decided at a trial in 1816 to be an infringement of Heathcoat's patent. He followed his great invention by others of much ability, as, for instance, contrivances for ornamenting net while in course of manufacture and for making ribbons and plated and twisted net upon his machines, improved yarn spinning-frames, and methods for winding raw silk from coccons. He also patented an improved process for extracting and purifying salt. An offer of £10,000 was made to him in 1833 for the use of his processes in dressing and finishing silk nets, but he allowed the highly profitable secret to remain undivulged. In 1832 he patented a steam plough. Heathcoat was elected member of parliament for Tiverton in 1832. Though he seldom spoke in the House he was constantly engaged on committees, where his thorough knowledge of business and sound judgment were highly valued. He retained his seat until 1839, and after two years of declining health he died on the 18th of January 1861 at Bolham House, near Tiverton.

HEATHCOTE, SIR GILBERT (c. 1652-1733), lord mayor of London, belonged to an old Derbyshire family and was educated at Christ's College, Cambridge, afterwards becoming a merchant in London. His trading ventures were very successful; he was one of the promoters of the new East India company and he emerged victorious from a contest between himself and the old East India company in 1693; he was also one of the founders and first directors of the bank of England. In 1700 he was elected an alderman of the city of London and was knighted; he served as lord mayor in 1711, being the last lord mayor to ride on horseback in his procession. In 1706 Heathcote was sent to parliament as member for the city of London, but he was soon expelled for his share in the circulation of some exchequer bills; however, he was again elected for the city later in the same year, and he retained his seat until 1710. In 1714 he was member for Helston, in 1722 for New Lymington, and in 1727 for St Germans. He was a consistent Whig, and was made a baronet eight days before his death. Although extremely rich, Heathcote's meanness is referred to by Pope; and it was this trait that accounts largely for his unpopularity with the lower classes. He died in London on the 25th of January 1733 and was buried at Normanton, Rutland, a residence which he had purchased from the Mackworths.

A descendant, Sir Gilbert John Heathcote, Bart. (1795-1867), was created Baron Aveland in 1856; and his son Gilbert Henry, 2nd baronet, inherited from his mother the barony of Willoughby de Eresby, became 1st earl of Ancaster in 1892.

HEATHEN, a term originally applied to all persons or races who did not hold the Jewish or Christian belief, thus including Mahomedans. It is now more usually given to polytheistic races, thus excluding Mahomedans. The derivation of the word has been much debated. It is common to all Germanic languages; cf. German Heide, Dutch heiden. It is usually ascribed to a Gothic hāλi, heath. In Ulfilas' Gothic version of the Bible, the earliest extant literary monument of the Germanic languages, the Syriaphoeboic woman (Mark vii. 26) is called kāłiνa, where the Vulgate has gentilis. "Heathen," i.e. the people of the heath or open country, would thus be a translation of the Latin paganus, pagan, i.e. the people of the pagus or village, applied to the dwellers in the country where the worship of the old gods still lingered, when the people of the towns were Christians (but see PAGAN for a more tenable explanation of that term). On the other hand it has been suggested (Prof. S. Bugge, Indo-German. Forschungen, v. 178, quoted in the New English Dictionary) that Ulfilas may have adopted the word from the Armenian hetanos, i.e. Greek θηνον, tribes, races, the word used for the "Gentiles" in the New Testament. Gentilis in Latin, properly meaning "tribesman," came to be used of foreigners and non-Roman peoples, and was adopted in ecclesiastical usage for the non-Christian nations and in the Old Testament for non-Jewish races.

HEATHFIELD, GEORGE AUGUSTUS ELIOTT, BARON (1717-1790), British general, a younger son of Sir Gilbert Eliott, Bart,
of Stobs, Roxburghshire, was born on the 25th of December 1717, and educated abroad for the military profession. As a volunteer he fought with the Prussian army in 1735 and 1736, and then entered the Grenadier Guards. He went through the war of the Austrian Succession, and was wounded at Dettingen, rising to be lieutenant-colonel in 1754. In 1759 he became colonel of a new regiment of light horse (afterwards the 15th Hussars) and became well known for the efficiency which it displayed in the subsequent campaigns. He became lieutenant-general in 1795. In 1775 he was selected to be governor of Gibraltar (p.54), and it is in connexion with his magnificent defence in the great siege of 1779 that his name is famous. His portrait by Sir Joshua Reynolds is in the National Gallery. In 1789 he was created Baron Heathfield of Gibraltar, but died on the 6th of July 1790. He had married in 1748 the heiress of the Drake family, to which Sir Francis Drake belonged. His son, the 2nd baron, died in 1813 and the peerage became extinct, but the estates went to the family of Elliott-Drake (baronetcy of 1821) through his sister.

**HEATING.** In temperate latitudes the climate is generally much warmer than that out of doors. The object of the art of heating is to secure this required warmth with the greatest economy and efficiency. For reasons of health it may be assumed that no system of heating is advisable which does not provide for a constant renewal of the air in the locality warmed, and on this account there is a difficulty in treating as separate matters the subjects of heating and ventilation, which in practical schemes should be considered conjointly. (See Ventilation.)

The object of all heating apparatus is the transference of heat from the fire to the various parts of the building it is intended to warm, and this transfer may be effected by radiation, by conduction or by convection. An open fire acts by radiation; it warms the air in a room by first warming the walls, floor, ceiling and articles in the room, and these in turn warm the air. Therefore in a room with an open fire the air is, as a rule, less heated than the walls. In many forms of fireplaces fresh air is brought in and passed around the back and sides of the stove before being admitted into the room. A closed stove acts mainly by convection; though when heated to a high temperature it gives out radiant heat. Windows have a chilling effect on a room, and in calculations extra allowance should be made for window areas.

There are a number of methods available for adoption in the heating of buildings, but it is a matter of considerable difficulty to suit the method of warming to the class of building to be warmed. Heating may be effected by one of the following systems, or installations may be so arranged as to combine the advantages of more than one method: open fires, closed stoves, hot-air apparatus, hot water circulating in pipes at low or at high pressure, or steam at high or low pressure.

The open grate still holds favour in England, though in America and on the continent of Europe it has been superseded by the closed stove. The old form of open fire is certainly wasteful of fuel, and the loss of heat up the chimney and by conduction into the brickwork backing of the stove is considerable. Great improvements, however, have been effected in the design of open fireplaces, and many ingenious contrivances of this nature are now in the market which combine efficiency of heating with economy of fuel. Unless suitable fresh air inlets are provided, this form of stove will cause the room to be draughty, the strong current of warm air up the flue drawing cold air in through the crevices in the tops and windows. The best form of open fireplace is the ventilating stove, in which fresh air is passed around the back and sides of the stove before being admitted through convenient openings into the room. This has immense advantages over the ordinary type of fireplace. The illustrations show two forms of ventilating fireplace, one (fig. 1) similar in appearance to the ordinary domestic grate, the other (fig. 2) with descending smoke flue suitable for hospitals and public rooms, where it might be fixed in the middle of the apartment. The fixing of stoves of this kind entails the laying of pipes or ducts from the open to convey fresh air to the back of the stove.

With closed stoves much less heat is wasted, and consequently less fuel is burned, than with open grates, but they often cause an unpleasant sensation of dryness in the air, and the products of combustion also escape to some extent, rendering this method of heating not only unpleasant but sometimes even dangerous. The method in Great Britain is almost entirely confined to places of public assembly, but in America and on the continent of Europe it is much used for domestic heating. If the flue pipe be carried up a considerable distance inside the apartment to be warmed before being turned into the external air, practically the whole of the heat generated will be utilized. Charcoal, coke or anthracite coal are the fuels generally used in slow combustion heating stoves.

Gas fires, as a substitute for the open coal fire, have many points in their favour, for they are conducive to cleanliness, they need but little attention, and the heat is easily controlled. On the other hand, they may give off unhealthy fumes and produce unpleasant odours. They usually take the form of cast iron open stoves fitted with a number of Bunsen burners which heat perforated lumps of asbestos. The best form of stove is that with which perfect combustion is most nearly attained, and to which a pan of water is affixed to supply a desirable humidity to the air, the gas having the effect of drying the atmosphere. With another form of gas stove the coke is used in place of the perforated asbestos; the fire is started with the gas, which, when the coke is well alight, may be dispensed with, and the fire kept up with coke in the usual way.

Electrical heating appliances have only recently passed the experimental stage; there is, however, undoubtedly a great future for electric heating, and the perfecting of the stove, together with the cheapening of the electric current, may be expected to result in many of the other stoves and convectors being superseded. Hitherto the large bill for electric energy has barred the general use of electrical heating, in spite of its numerous advantages.

Oils are powerful fuels, but the high price of refined petroleum, the oil generally preferred, precludes its widespread use for many purposes for which it is suitable. In small stoves for warming and for cooking, petroleum presents some advantages over other fuels, in that there is no chimney to sweep, and if well managed no unpleasant fumes, and the stoves are easily portable. On the other hand, these stoves need a considerable amount of attention in filling, trimming and cleaning, and there is some risk of explosion and damage by accidental leaking and smoking. Crude or unrefined petroleum needs a special air-spray pressure burner for its use, and this suffers from the disadvantage of being noisy. Gas and oil radiators would be more properly termed "conectors," since they warm mainly by convection currents. They are similar in appearance to a hot-water or steam radiator, and, indeed, some are designed to be filled with water and used as such. They should always be fitted with a pan of water to supply the necessary humidity to the warmed air, and a flue to carry off any disagreeable fumes.
Heating by warmed air, one of the oldest methods in use, has been much improved by attention to the construction of the apparatus, and if properly installed will give as good effects as it is possible to obtain. The system is especially suitable for churches, assembly halls and large rooms. A stove of special design is placed in a chamber in the basement or cellar, and cold fresh air is passed through it, and led by means of flues to the various apartments for distribution by means of easily regulated inlet valves. To prevent the atmosphere from becoming unduly dry a pan of water is fitted to the stove; this serves to moisten the air before it passes into the distributing flues. If each distributing flue is connected by means of a mixing valve with a cold-air flue, the warmth of the incoming air can be regulated to a nicety (see Ventilation).

There are many different systems of heating by hot water circulating in pipes. The oldest and best known is the “two pipe” system, others being the “one pipe” or “simple circuit,” and the “drop” or “overhead.” The high pressure system is of later invention, having been first put to practical use by A. M. Perkins in 1845. All these methods are chiefly by means of convected heat, the amount of true radiation from the pipes being small. The manner in which the circulation of hot water takes place in the tubes is as follows. Fire heats the water in a boiler from the top of which a “flow” pipe communicates with the rooms to be warmed (fig. 3). As the water is heated it becomes lighter, rises to the top of the boiler, and passes along the flow pipe. It is followed by more and more hot water, and so travels along the flow pipe, which is rising all the time, to the farthest point of the circuit, by which time it has in all probability cooled considerably. From this point the “return” pipe drops, usually at the same rate as the flow pipe rises; and in due course the water reaches its starting point, the boiler, and is again heated and again circulated through the system. The connexion of the return pipe is made with the lower part of the boiler. Branches may be made from the main pipes by means of smaller pipes arranged in the same manner as the mains, the branch flow pipe being connected with the main flow pipe and returning into the main return. To obtain a larger heating surface than a pipe affords, radiators are connected with the pipes where desired, and the water passing through them warms the surrounding air.

The “one pipe” system (fig. 4) acts on precisely the same principle, but in place of two pipes being placed in adjacent positions one large main makes a complete circuit of the area to be warmed, starting from and returning to the boiler, and from this main flow and return branches are taken and connected with radiators and other heating appliances.

In the “drop” or “overhead” system (fig. 5) a rising main is taken directly from the boiler to the topmost floor of the building, and from this branches are dropped to the lower floors, and connected by means of smaller branches to radiators or coils. The vertical branches descend to the basement and generally merge in a single return pipe which is connected to the lower part of the boiler.

The rate of circulation in the ordinary low pressure hot-water system may be considerably accelerated by means of steam injections. The water after being heated passes into a circulating tank into which steam is introduced; this, mixing with the hot water, gives it additional motive power, resulting in a faster circulation. This steam condensing adds to the water in the pipe and naturally causes an overflow, which is led back to the boiler and re-used. In districts where the water is hard, this arrangement considerably lengthens the life of the boiler, as

FIG. 4.

FIG. 5.
can be quickly raised and easily controlled. If the weather is mild, a moderate heat may be obtained by using the apparatus as an ordinary hot water system, and shutting off the steam injectors.

The cold-water supply and expansion tank (fig. 3) are often combined in one tank placed at a point above the level of circulation. The tank should be of a size to hold not less than a twentieth part of the total amount of water held in the system. The automatic inlet of cold water to the hot water system from the main house tank or other source is controlled by a ball valve, which is so fixed as to allow the water to rise no more than an inch above the bottom of the tank, thus leaving the remainder of the space clear for expansion. An overflow is provided, discharging into the open air to allow the water to escape should the ball valve become defective.

The “Perkins” or “small bore high pressure” system (fig. 6) has many advantages, for it is safe, the boiler is small and is easily managed, the temperature is well under control and may be regulated to suit the changing weather, and the small pipes present a neat appearance in a room. The whole system is constructed of wrought iron pipe of small diameter, strong enough to resist a testing pressure of 2000 to 2500 lb per sq. in. The boiler consists of similar pipe coiled up to form a fire-box, inside which the furnace is lighted. The coil is encased with firebrick and brickwork, and the smoke from the fire is carried off by a flue in the ordinary way. The flow pipe of similar section (usually having an internal diameter of about 1 in., the metal being nearly ¼ in. thick) continues from the top of the coil, and after traveling round the various apartments returns to, and is connected with, the lowest part of the boiler coil. The joints take a special form to enable them to withstand the great strain to which they are subjected (fig. 7). One end of a pipe is finished flat, the other end of the other pipe being brought to a conical edge. On one end also a right-handed, and on the other a left-handed, screw-thread is turned. A coupling collar is screwed on, and causes the conical edge to impress itself tightly on the flat end, giving a sound and lasting joint. The system is hermetically sealed after being pumped full of water, an expansion chamber in the shape of a pipe of larger dimensions being provided at the top of the system above the highest point of circulation. Upon the application of heat to the fire-box coil the water naturally expands and forces its way up into the expansion chamber; but there it encounters the pressure of the condensation that is constantly built up and ebullition is consequently prevented. Thus at no time can steam form in the system.

This system is trustworthy and safe in working. The smallness of the pipes renders it liable to damage by frost, but this accident may be prevented by always keeping in frosty weather a small fire in the furnace. If this course is inconvenient, some liquid of low freezing-point, such as glycerine, may be mixed with the water.

For large public buildings, factories, &c., heating by steam is generally adopted on account of the rapidity with which heat is available, and the great distance from the boiler at which warming is effected. In the case of factories the exhaust steam from the engines used for driving the working machinery is made use of and forms the most economical method of heating possible. There are several different systems of heating by steam, low pressure, high pressure and minus pressure.

In the low pressure two pipe system the flow pipe is carried to a sufficient height directly above the boiler to allow of its gradual fall to a little beyond the most distant point at which connexion is to be made with the return pipe, which thence slopes towards the boiler. Branches are taken off the flow pipe, and after circulating through coils or radiators are connected with the return pipe. In a well-proportioned system the pressure should not exceed 3 lb per sq. in. for excellent results to be obtained. The one-pipe system is similar in principle, the pipe rising to its greatest height above the boiler and being then carried around as a single pipe falling all the while. It resembles in many points the one-pipe low pressure hot-water system. Radiators are fed directly from the main. Where, as in factories or workshops, there are already installed engines working at a high steam pressure, say 150 to 180 lb per sq. in., a portion of the steam generated in the boilers may be utilized for heating by the aid of a reducing valve. The steam is passed through the valve and emerges at the pressure required generally from 3 lb upwards. It is then used for one of the systems described above.

High-pressure steam-heating, compared with the heating by low pressure, is little used. The principles are the same as those applied to low-pressure work, but all fittings and appliances must, of course, be made to stand the higher strain to which they are subjected.

The “minus pressure” steam system, sometimes termed “atmospheric” or “vacuum,” is of more recent introduction than those just described. It is certainly the most scientific method of steam-heating, and heat can be made to travel a greater distance by its aid than by any other means. The heat of the pipes is great, but can be easily regulated. The system is economical in fuel, but needs skilled attendance to keep the appliances and fittings in order. The steam is introduced into the pipes at about the pressure of the atmosphere, and is sucked through the system by means of a vacuum pump, which at the same operation frees the pipes from air and from condensation water. This pumping action results in an extremely rapid circulation of the heating agent, enabling long distances to be traversed without much loss of heat.

Compared with heating by hot water, steam-heating requires less piping, which, further, may be of much smaller diameter than a similar result, because of the higher temperature of the heat yielding surface. A drawback to the use of steam is the fact that the high temperature of the pipes and radiators attracts and spreads a great deal of dust. There is also a risk that woodwork near the pipes may warp and split. The apparatus needs constant attention, since neglect in stoking would result in stopping the generation of steam, and the whole system would almost immediately cool. To regulate the heat it is necessary either to install a number of small radiators or to divide the radiators into sections, each section controlled by distinct valves; steam may then be admitted to all the sections of the radiator or to any less number of sections as desired. Economic method of heating is given at a lower temperature and is consequently more agreeable than that yielded by a steam-heating apparatus. The joint most commonly used for hot-water pipes is termed the “rust” joint, which is cheap to make, but unfortunately is inefficient. The materials required are iron bORING, sal-ammoniac and sulphur; these are mixed together, moistened with water, and rammed into the socket, which is previously half filled with yarn, well caked. The materials mixed with the iron bORING causes them to rust into a solid mass, and in doing so a slight expansion takes place.
HEATING 163

this account it is necessary to exercise some skill in forming the joint, or the socket of the pipe will be split; numbers of pipes are undoubtedly split in this way. Suitable proportions of materials to form a rust joint are 90 parts by weight of iron borings well mixed with 2 parts of flowers of sulphur, and 1 part of powdered sal-ammoniac. Another joint, less rigid but sound and durable, is made with yarn and white and red lead. The white and red lead are mixed together to form a putty, and are filled into the socket alternately with layers of well-caulked yarn, starting with yarn and finishing off with the lead mixture.

Iron expands when heated to the temperature of boiling water (212° F.) about 1 part in 900, that is to say, a pipe 100 ft. long would expand or increase in length when heated to this temperature about 1½ in., an amount which seems small but which would be quite sufficient to destroy one or more of the joints if provision were not made to prevent damage. The amount of expansion increases as the temperature is raised; at 340° F. it is 2½ in. in 100 ft. With wrought iron pipes bends may be arranged, as shown in fig. 8, to take up this expansion. With cast iron pipe this cannot be done, and no length of piping over 40 ft. should be without a proper expansion joint. The pipes are best supported on rollers which allow of movement without straining the joints.

There are several joints in general use for the best class of work which are formed with the aid of india-rubber rings or collars, any expansion being divided amongst the whole number of joints. In the rubber ring joint an india-rubber ring is used; slightly less in diameter than the pipe. The rubber is circular in section, and about 5 in. thick, and is stretched on the extreme end of a pipe which is then forced into the next socket. This joint is durable, secure and easily made; it allows for expansion and by its use the risk of pipe sockets being cracked is avoided. It is much used for greenhouse heating works. Richardson's patent joint (fig. 9) is a good form of this class of joint. The pipes have specially shaped ends between which a rubber collar is placed, the joint being held together by clips. The result is very satisfactory and will stand heavy water pressure. Messenger's joint (fig. 10) is designed to allow more freedom of expansion and at the same time to withstand considerable pressure; one loose cast iron collar is used, and another is formed as a socket on the end of the pipe itself. One end of each pipe is plain, so that it may be cut to any desired length; pipes with shaped ends obviously must be obtained in the exact lengths required. Jones's expansion joint (fig. 11) is somewhat similar to Messenger's but it is not capable of withstanding so great a pressure. In this case both collars of cast iron are locked together.

Radiator or convectors) were in their primitive design coils of pipe, used to give a larger heating area than the single pipe would afford. They are now usually of special design, and may be divided into three classes—indirect radiators, direct radiators and direct ventilating radiators. Indirect radiators are placed beneath the floor of the apartment to be heated and give off heat through a grating. This method is frequently adopted in combined schemes of heating and ventilating; the fresh air is warmed by being passed over the surfaces previously to being admitted through the gratings into the room. Direct radiators are a development of the early coil of pipe; they are made in various types and designs and are usually of cast iron. Ventilating radiators are similar, but have an inlet arrangement at the base to allow external air to pass over the heating surface before passing out through the perforations. Radiators should not be fixed directly on to the main heating pipe, but always on branches of smaller diameter leading from the flow pipe to one end of the radiator and back to the main return pipe from the other end; they may then be easily controlled by a valve placed on the branch from the flow pipe. To each radiator should be fitted an air tap, which when opened will permit the escape of any air that has accumulated in the coil; otherwise free circulation is impossible, and the full benefit of the heat is not obtained.

A plentiful supply of hot water is a necessity in every house for domestic and hygienic purposes. In small houses all requirements may be satisfied with a boiler heated by the kitchen fire. For large buildings where large quantities of hot water are used an independent boiler of suitable size should be installed. Every installation is made up of a boiler or other water heater, a tank or cylinder to contain the water when heated, and a cistern of cold water, the supply from which to the system is regulated automatically by a ball valve. These containers, proportioned to the required supply of hot water, are connected with each other by means of pipes, a "flow" and a "return" connecting the boiler with the cylinder or tank (fig. 12). The flow pipe starts from the top of the boiler and is connected near the top of the cylinder, the return pipe joining the lower portions of the cylinder and boiler. The supply from the cold water cistern enters the bottom of the cylinder, and thence travels by way of the return pipe to the boiler, where it is heated, and back through the flow pipe to the cylinder, which is thus soon filled with hot water. A flow pipe which serves also for expansion is taken from the top of the cylinder to a point above the cold-water supply and turned down to prevent the ingress of dirt. From this pipe at various points are taken the supply pipes to baths, lavatories, sinks and other appliances. It will be observed that in fig. 12 the cylinder is placed in proximity to the boiler; this is the usual and most effective method, but it may be placed some distance away if desired. The tank system is of much earlier date than this cylinder system, and although the two resemble each other in many respects, the tank system is in practice the less effective. The tank is placed above the level of the topmost draw off, and often in a cupboard which it will warm sufficiently to permit of its being used as a linen airing closet. An expansion pipe is taken from the top of the tank to a point above the roof. All draw off services are taken off from the flow pipe which connects the boiler with the tank. This method differs from that adopted in the cylinder system, where all services are led from the top of the cylinder. A suitable proportion between the size of the tank or cylinder and that of the boiler is 8 or 10 to 1. Water may also be heated by placing a coil of steam or high-pressure hot-water pipes in a water tank (fig. 6), the water heated in this way circulating in the manner already described. An alternative plan is to pass the water through pipes placed in a steam chest.

Cylinders, tanks and independent boilers should be encased in a non-conducting material such as silicate cotton, thick felt or asbestos composition. The two first mentioned are affixed
by means of bands or straps or stitched on; the asbestos is laid on in the form of a plaster from 2 to 6 in. thick.

Taps to baths and lavatories should be connected to the main services by a flow and return pipe so that hot water is constantly flowing past the tap, thus enabling hot water to be obtained immediately. Frequently a single pipe is led to the tap, but the water in this branch cools and must therefore be drawn off before hot water can be obtained.

Two classes of boilers are chiefly used in hot-water heating installations, viz., those heated by the fire of the kitchen range, and those heated separately or independently. Of the first class there are two varieties in common use—a form of "saddle" boiler (fig. 13) and the "boot" boiler (fig. 14). Independent boilers are made in every conceivable size and form of construction, and many of them are capable of doing excellent work. In the choice of a boiler of this description it should be remembered that rapid heating, economical combustion of fuel, and facilities for cleaning, are requisites, the absence of any of which considerably lowers the efficiency of the apparatus. Boilers set in brickwork are sometimes used in domestic work, although they are more favoured for horticultural heating. The shape mostly used is the "saddle" boiler, or some variation upon this very old pattern. The coiled pipe fire-box of the high-pressure hot-water system previously described may also be classed with boilers.

A notable feature of modern boiler construction is the mode of building the apparatus of cast iron in either horizontal or vertical sections. Both the types intended to be set in brickwork and those working independently are formed on the sectional principle, which has many good points. The parts are easy of transport and can be handled without difficulty through narrow doorways and in confined situations. The size of the boiler may be increased or diminished by the addition or subtraction of one or more sections; these, being simple in design, are easily fitted together, and should a section become defective it is a simple matter to insert a new one in its place. Should a defect occur with a wrought iron boiler it is usually necessary for the purpose of repair to disconnect and remove the whole apparatus, the heating system of which it forms a part being in the meantime useless. In a type built with vertical sections each division is complete in itself, and is not directly connected with the next section, but communicates with flow and return drums. A defective section may thus be left in position and stopped off by means of plugs from the drums until it is convenient to fit a new one in its place. A boiler with horizontal sections is shown in fig. 15; it will be seen that each of the upper sections has a number of cross waterways which form a series of gratings over the fire-box and intercept most of the heat generated, effecting great economy of fuel.

In the ordinary working of a hot-water apparatus the expansion pipe already referred to will prevent any undue pressure occurring in the boiler; should, however, the pipes become blocked in any way while the apparatus is in use, or the water in them become frozen, the lighting of the fire would cause the water to expand, and having no outlet it would in all probability burst the boiler. To prevent this a safety valve should be fitted on the top of the boiler, or be connected thereto with a large pipe so as to be visible. The valve may be of the dead weight (fig. 16), lever weight, spring (fig. 17) or diaphragm variety. The three first named are largely used. In the diaphragm valve a thin piece of metal is fixed to an outlet from the boiler, and when a moderate pressure is exceeded this gives way, allowing the water and steam to escape.

Fusible plugs are little used; they consist of pieces of softer metal inserted on the side of the boiler, which melt should the heat of the water rise above a certain temperature.

A "Geyser" is a very convenient form of apparatus for heating a quantity of water in a short time. A water pipe of copper or wrought iron is passed through a cylinder in which gas or oil heating burners are placed. The piping takes a winding or zigzag course, and by the time the outlet is reached, the water it contains has reached a high temperature.

By this means a continuous stream of hot water is obtained, greater or smaller in proportion to the size and power of the apparatus. The improved types of gas geyser are provided with a single control to both gas and water supplies, with a small "pilot" burner to ignite the gas. A flue should in all cases be provided to carry off the fumes of the fuel.

In districts where the water is of a "hard nature," that is, contains bicarbonate of lime in solution, the interior of the boiler, cylinders, tanks and pipes of a hot water system will become incrusted with a deposit of lime which is gradually precipitated as the water is heated to boiling point. With "very hard" water this deposit may require removal every three months; in London it is usual to clean out the boiler every six months and the cylinders and tanks at longer intervals. For this purpose manifolds must be provided (figs. 13 and 14), and pipes should be fitted with removable caps at the heads to allow for periodical cleaning. The lime deposit of "fur" is a poor conductor of heat, and it is therefore most detrimental to the efficiency of the system to allow the interior of the boiler or any other portion to become furred up. Further, if not removed, the fur will in a short time bring about a fracture in the boiler. The use of soft water entails a disadvantage of another character—that of corroding iron and lead work, soft water exercising a very vigorous chemical action.
upon these metals. In districts supplied with soft water, copper should be employed to as large an extent as possible.

The table given below will be useful in calculating the size of the radiating surface necessary to raise the temperature to the extent required when the external air is at freezing point (32° Fahr.).

In closing this account of heating and the practical methods of application of heat, an example may be mentioned to show the great capabilities of a carefully planned system.

At the city of Lockport in New York state, America, an interesting example of the direct application of steam-heating on a large scale has been carried out under the direction of Mr Birdsill Holly of that city. Houses within a radius of 3 m. from the boiler house are supplied with superheated steam at a pressure of 35 lb to the in. The mains, the largest of which are 4 in. in diameter, and the smallest 2 in., are wrapped in asbestos, felt and other non-conducting materials, and are placed in wooden tubes laid under ground like water and gas pipes. The house branches pipes are 1½ in. in diameter, and ½ in. pipes are used inside the houses. The steam is employed for warming apartments by means of pipe radiators, for heating water by steam injection, and for all cooking purposes. The steam mains to the houses are laid by the supply company; the internal pipes and fittings are paid for or rented by the occupier, costing for an installation from £30 for an ordinary eight-roomed house to £100 or more for larger buildings. With the success of this undertaking in view it is a matter of wonder that the example set in this instance has not been adopted to a much greater extent elsewhere.

The principal publications on heating are: Hood, Practical Treatise on Heating Buildings by Hot Water; Baldwin, Hot Water Heating and Fittings; Baldwin, Steam Heating for Buildings; Billings, Ventilation and Heating; Carpenter, Heating and Ventilating Buildings; Jones, Heating by Hot Water; Ventilation and Heating Water Supply; Dyer, Hot Water Supply. (J. Br.)

HEAVEN (O. Eng. hefen, heofon, heofone; this word appears in O.S. heuan; the High. Ger. word appears in Ger. Himmel, Dutch hemel; there does not seem to be any connexion between the two words, and the ultimate derivation of the word is unknown; the suggestion that it is connected with “to heave,” in the sense of something “lifted up,” is erroneous), properly the expanse, the appearance of a domed vault above the earth, in which the sun, moon, planets and stars seem to be placed, the firmament; hence also used, generally in the plural, of the space immediately above the earth; the atmospheric region of winds, rain, clouds, and of the birds of the air. The heaven and the earth together, therefore, to the ancient cosmographers, and still in poetical language, make up the universe. In the cosmogonies of many ancient peoples there was a plurality of heavens, probably among the earlier Hebrews, the idea being elaborated in rabbinical literature, among the Babylonians and in Zoroastrianism. The number of these heavens, the higher transcending the lower in glory, varied from three to seven. Heaven, as in the Hebrew shamanaim, the Greek θανατόν, the Latin caelestis, is the abode of God, and as such in Christian eschatology is the place of the blessed in the next world (see ESCHATOLOGY AND PARADISE).

HEBBEL, CHRISTIAN FRIEDRICH (1813-1863), German poet and dramatist, was born at Wesselsburg in Ditmarschen, Holstein, on the 18th of March 1813. Though only the son of a poor bricklayer, he early showed a talent for poetry, which was first displayed to the world by the publication, in the Hamburg Friedendeutung, of verses which he had sent to Amalie Schoppe (1791-1838), a then popular journalist and author of nursery tales. Through the kindness of this lady, who interested several of her friends on his behalf, Hebbel was enabled to go to Hamburg and there prepare himself for the university. A year later he went to Heidelberg to study law, but finding this uncongenial he passed on to the university of Munich, where he devoted himself to philosophy, history and literature. In 1839 Hebbel left Munich and wandered back to Hamburg on foot, where he resumed his relations with Elise Lensing, whose self-sacrificing assistance had helped him over the darkest days in Munich. In the same year he wrote his first tragedy Judith (published 1841), which in the following year was performed in Hamburg and Berlin and made his name known throughout Germany. In 1840 he wrote the tragedy Genoveva, and the following year finished a comedy, Der Diamant, which he had begun at Munich. In 1842 he visited Copenhagen, where he obtained the appointment of a travelling studentship, which enabled him to study for some time in Paris and two years (1841-1843) in Italy. In Paris he wrote his fine “tragedy of common life” Maria Magdalene (1844). On his return from Italy Hebbel met at Vienna two Polish noblemen, the brothers Zerboni di Sporesiti, who in their enthusiasm for his genius urged him to remain, and supplied him with the means to mingle in the best intellectual society of the Austrian capital. The unwonted life of ease had its effect. The old precarious existence became a horror to him, he made a deliberate breach with it by marrying (in 1846) the beautiful and wealthy actress Christine Enghaus, ruthless sacrificing the girl who had given-up all for him and who remained faithful till her death, on the ground that “a man’s first duty is to the most powerful force within him, that which alone can give him happiness and be of service to the world”; in his case the poetical faculty, which would have perished “in the miserable struggle for existence.” This “deadly sin,” which, “if peace of conscience be the test of action,” was, he considered, the best act of his life, established his fortunes. Elise, however, still provided useful inspiration for his art. As late as 1855, shortly after her death, he wrote the little epic Mutter und Kind, intended to show that the relation of parent and child is the essential factor which makes the quality of happiness among all classes and under all conditions equal. Long before this Hebbel had become famous. German sovereigns bestowed decorations upon him; and in foreign capitals he was feted as the greatest of living German dramatists. From the grand-duke of Saxe-Weimar he received a flattering invitation to take up his residence at Weimar, where several of his plays were first performed. He remained, however, at Vienna until his death on the 13th of December 1863.

Besides the works already mentioned, Hebbel’s principal tragedies are Herodes und Mariamme (1850); Julia (1851); Michel Angelo (1851); Agnes Bernauer (1855); Gyges und sein Ring (1856), and the magnificently conceived trilogy Die Nibelungen (1862), his last work (consisting of a prologue, Der gegebene Siegfried, and the tragedies, Siegfried Tod und Kriemhilds Rache), which won for the author the Schiller prize. Of his comedies Der Diamant (1847), Der Rubin (1850), and the tragi-comedy Ein Trauerspiel in Sidiulen (1845), are the most important, but they are heavy and hardly rise above mediocrity. All his dramatic productions, however, exhibit skill in characterization, great glow of passion, and a true feeling for dramatic situation; but their poetic effect is frequently marred by extravagances which border on the grotesque, and by the introduction of incidents the unpleasant character of which is not sufficiently relieved. In many of his lyrical and dramatic works in Mutter und Kind and Jossehein (1845) and later, Hebbel showed that his poetic gifts were not restricted to the drama.

His collected works were first published by E. Küh (12 vols.,
HEBBURN—HEBER, REGINALD

Hamburg, 1866–1868); revised by H. Krumm (12 vols., Hamburg, 1892). The best critical edition is that by R. M. Werner (12 vols., 1901–1903), to which have been added Hebbel’s Diaries (4 vols.) and Correspondence (6 vols.). Hebbel’s Briefeausch mit Freunden und berühmten Zeitgenossen was issued by F. Bamberger (1890–1892). The chief biographies of Hebbel are those by E. Kuh (1877) and R. M. Werner (1893) and a number of articles by Zürcher (Hebbel’s (1884); T. Poppe, F. Hebbel und sein Drama (1900); A. Scheunert, Der Pantraktismus als System der Weltschauung und Aesthetik Hebbels (1903); E. A. Georgy, Die Tragödie F. Hebbels nach dem Ideengebäude (1904).

HEBBURN, an urban district in the Jarrow parliamentary division of Durham, England, on the right bank of the Tyne, 43 m. below Newcastle, and on a branch of the North-Eastern railway. Pop. (1881), 11,802; (1901), 20,901. It has extensive shipbuilding and engineering works, rope and sail factories, chemical, colour and cement works, and collieries.

HEBDEB BRIDGE, an urban district in the Sovery parliamentary division of the West Riding of Yorkshire, England, on the Calder and Hebben rivers, 7 m. W. by N. of Halifax by the Lancashire and Yorkshire railway. Pop. (1901), 7,536. The town has cotton factories, dye-works, foundries and manufactories of shuttles. The upper Calder valley, between Todmorden and Hebden Bridge, is an extensive waste of conical hills, the summits of which consist of wild moorland. The vale itself is densely populated, but its beauty is not destroyed, and the contrast with its desolate surroundings is remarkable.

HEBE, in Greek mythology, daughter of Zeus and Hera, the goddess of youth. In the Homeric poems she is the female counterpart of Ganymede, and acts as cup-bearer to the gods (IIad, iv. 2). She was the special attendant of her mother, whose horses she harnessed (IIad, v. 772). When Heracles was received amongst the gods, Hebe was bestowed upon him in marriage (Odyssey, xi. 603). When the custom of the heroic age, which permitted female cup-bearers, fell into disuse, Hebe was replaced by Ganymede in the popular mythology. To account for her retirement from her office, it was said that she fell down in the presence of the gods while handing the wine, and was so ashamed that she refused to appear before them again. Hebe exhibits many striking points of resemblance with the pure Greek goddess Aphrodite. She is the daughter of Zeus and Hera, Aphrodite of Zeus and Dione; but Dione and Hera are often identified. Hebe is called Dia, a regular epithet of Aphrodite; at Phlius, a festival called Κυνορρυθος (the days of ivy-cutting) was annually celebrated in her honour (Pausanias, li. 13); and she was also worshiped under the name of Aphrodite. The apothecary of herbs and his marriage with Hebe became a favourite subject with poets and painters, and many instances occur on vases. In later art she is often represented, like Ganymede, caressing the eagle.

See R. Kekulé, Hebe (1867), mainly dealing with the representations of Hebe in art; and P. Decharme in Darmereb and Saglio’s Dictionnaire des antiquités.

The meaning of the word Hebe tended to transform the goddess into a mere personification of the eternal youth that belongs to the gods, and this conception is frequently met with. Then she becomes identical with the Roman Juventas, who is simply an abstraction of an attribute of Jupiter Juventas, the god of increase and blessing and youth. To Juventas, as personifying the eternal youth of the Roman state, a chapel was dedicated in very early times in the cella of Minerva in the temple of Jupiter Capitolinus. With this temple is connected the legend of Juventas and Terminus, who alone of all the gods refused to give way when it was being built—an indication of the eternal solidity and youth of Rome. The cult of Juventas did not, however, become firmly established until the time of the second Punic war. In 218 the Sibylines books ordered a lection- sternium in honour of Juventas and a supplication in honour of Hercules, and in 197 a temple was dedicated in her honour at Rome in the Forum. In later times Juventas became the personification, not of the Roman youth, but of the emperor, who assumed the attributes of a god (Livy v. 54, xxii. 62, xxxvi. 36; Dion. Halic. iii. 69; G. Wissowa in Roscher’s Lexicon der Mythologie).

HEBEL, JOHANN PETER (1760–1826), German poet and popular writer, was born at Basel on the 10th of May 1760. The father dying when the child was little over a year old, he was brought up amidst poverty-stricken conditions in the village of Hausen in the Wiesental, where he received his earliest education. Being of brilliant promise, he found friends who enabled him to complete his school education and to study theology (1778–1780) at Erlangen. At the end of his university course he was for a time a private tutor, then became teacher at a Gymnasium in Karlsruhe, and in 1806 was appointed director of the school. He was elected a fellow of the Royal Society, and was invited to the chair of Consistory and "evangelical prelate." He died at Schwetzingen, near Heidelberg, on the 22nd of September 1826. Hebe is one of the most widely read of all German popular poets and writers. His poetical narratives and lyric poems, written in the "Allemännischen" dialect, are "popular" in the best sense. His Allemannische Gedichte (1803) "hucoliziciz," in the words of Goethe, "the whole world in the most attractive manner" (verbauert das ganze Universum auf die anmutigste Weise). Indeed, few modern German poets surpass him in fidelity, naïveté, humour, and in the freshness and vigour of his descriptions. His poem, Die Wiese, which is sung by farmers a hundred years later, is a splendid example of German idyllic poetry; while his prose writings, especially the narratives and essays contained in the Schatzkästlein des rheinischen Hausfreundes (Tübingen, 1811; new edition, Stuttgart, 1869, 1888), belong to the best class of German stories, and according to August Friedrich Christian Vilm (1800–1868) in his Geschichte der deutschen Literatur are "worth more than a cartload of novels" (wiegen ein ganzes Fuder Romane auf). Memorials have been erected to him at Karlsruhe, Basel and Schwetzingen.

A complete edition of Hebel’s works—Sämtliche Werke—was first published at Stuttgart in 8 vols. (1832–1834); subsequent editions appeared in 1847 (3 vols.), 1868 (2 vols.), 1873 (edited by G. Wendl, 2 vols.), 1883–1885 (edited by O. Behagl, 2 vols.) and 1905 (edited by E. Keller, 5 vols.), as well as innumerable reprints. Hebel’s correspondence has been edited by O. Behagl (1888). See G. Längin, J. P. Hebel, ein Lebensbild (1894), and the introduction to Behagl’s edition.

HEBER, REGINALD (1783–1826), English bishop and hymn-writer, was born at Malpas in Cheshire on the 21st of April 1783. His father, who belonged to an old Yorkshire family, held a moiety of the living of Malpas. Reginald Heber early showed remarkable promise, and was entered in November 1800 at Brasenose College, Oxford, where he proved a distinguished student, and occupied the position of a fellow of the academic society, an English poem on Palestine, and a prose essay on The Sense of Honour. In November 1804 he was elected a fellow of All Souls College; and, after finishing his distinguished university career, he made a long tour in Europe. He was admitted to holy orders in 1807, and was then presented to the family living of Hodnet in Shropshire. In 1809 Heber married Amelia, daughter of Dr Shipley, dean of St Asaph. He was made prebendary of St Asaph in 1812, appointed Bampton lecturer for 1815, preacher at Lincoln’s Inn in 1822, and bishop of Calcutta in January 1823. Before sailing for India he received the degree of D.D. from the university of Oxford. In India Bishop Heber laboured indefatigably, not only for the good of his own diocese, but for the spread of Christianity throughout the East. He undertook numerous tours in India, consecrating churches, founding schools and discharging other Christian duties. His devotion to his work in a trying climate told severely on his health. At Trichinopoly he was seized with an apoplectic fit when in his bath, and died on the 3rd of April 1826. A statue of him, by Chantrey, was erected at Calcutta.

Heber was a pious man of profound learning, literary taste and great practical energy. His fame rests mainly on his hymns, which rank among the best in the English language. The opening line of his best known, "Lord, in Thine ear I lay," is "Gracious Lord, I call upon Thy name;" "Brightest and best of the sons of morning;" "By cool Stioan’s shady rill;" "God, that madest earth and heaven;" "The Lord of might from Sinai’s bow;" "Holy, holy, holy, Lord God Almighty;" "From Greenland’s icy mountains;" "The Lord will come, the earth shall quake;"
HEBER, RICHARD—HEBREW LANGUAGE 167

"The Son of God goes forth to war." Heber’s hymns and other poems are distinguished by finish of style, pathos and soaring aspiration, but the lack of originality, and are rather rhetorical than poetical in the strict sense.

Among Heber’s works are: Palestine: a Poem, to which is added the 5th Chapter of the Psalms, with Notes on the Prophecies (1809); a volume of poems in 1812; The Personality and Office of the Christian Comforter asserted and explained (being the Hampton Lectures for 1815); The Whole Works of Bishop Jeremy Taylor, with a Life of the Author, and a Critical Examination of his Writings (1814); Hymns written and adapted to the Weekly Church Service of the Year; principally by Bishop Heber (1827); A Journey through India (1828); Sermons on the Mission in England, and Sermons preached in India (1830); Sermons on the Lessons, the Gospel, or the Epistle for every Sunday in the Year (1837). The Poetical Works of Reginald Heber were collected in 1841.

The Life of Reginald Heber, D.D. . . . by his widow, Amelia Heber (1830), which also contains a number of Heber’s miscellaneous writings; The Last Days of Bishop Heber, by Thomas Robinson, A.M., archdeacon of Maidras (1830); J. S. Smyth, The Character and Religious Doctrine of Bishop Heber (1831), and Memorials of a Quiet Life, by Augustus J. C. Hare (1874).

HEBER, RICHARD (1773-1822), English book-collector, the half-brother of Reginald Heber, was born in London on the 5th of January 1773. As an undergraduate at Brasenose College, Oxford, he began to collect a purely classical library, but his taste broadening, he became interested in early English drama and literature, and began his wonderful collection of rare books in these departments. He attended continental book-sales, purchasing sometimes single volumes, sometimes whole libraries. Sir Walter Scott, whose intimate friend he was, and who dedicated to him the sixth canto of Marmion, classed Heber’s library as “superior to all others in the world.” Campbell described him as “the foremost and strongest of all the bibliomaniacs.” He did not confine himself to the purchase of a single copy of a work which took his fancy. “No gentleman,” he remarked, “can be without three copies of a book, one for show, one for use, and one for borrowers.” To such a size did his library grow that it overran eight houses, some in England, some on the Continent. It is estimated to have cost over £100,000, and after his death the sale of that part of his collection stored in England realised more than £56,000. He is known to have owned 130,000 volumes, and probably many more. He possessed extensive landed property in Shropshire and Yorkshire, and was sheriff of the former county in 1821, was member of Parliament for Oxford University from 1821–1826, and in 1822 was made a D.C.L. of that University. He was one of the founders of the Athenaeum Club, London. He died in London on the 4th of October 1832.

HEBERDEN, WILLIAM (1710-1801), English physician, was born in London in 1710. In the end of 1724 he was sent to St John’s College, Cambridge, where he obtained a fellowship about 1730, became master of arts in 1732, and took the degree of M.D. in 1739. He remained at Cambridge nearly ten years longer practising medicine, and gave an annual course of lectures on materia medica. In 1746 he became a fellow of the Royal College of Physicians in London; and two years later he settled in London, where he was elected a fellow of the Royal Society in 1749, and enjoyed an extensive medical practice for more than thirty years. At the age of seventy-two he partially retired, spending his summers at a house which he had taken at Windsor, but he continued to practise in London during the winter for some years longer. In 1778 he was made an honorary member of the Paris Royal Society of Medicine. He died in London on the 17th of May 1801. Heberden, who was a good classical scholar, published several papers in the Phil. Trans. of the Royal Society, and among his noteworthy contributions to the Medical Transactions (issued, largely at his suggestion, by the College of Physicians) were papers on chicken-pox (1767) and angina pectoris (1765). His Commentarii de morbis humanis, which were noted in his pocket-book at the bedside of his patients, were published in 1820; in the following year an English translation appeared, believed to be from the pen of his son, William Heberden (1767-1843), also a distinguished scholar and physician, who attended King George III. in his last illness.

HEBERT, EDMOND (1812-1890), French geologist, was born at Villefargau, Vienne, on the 14th of June 1812. He was educated at the Collège de Meaux, Auxerre, and at the École Normale in Paris. In 1836 he became professor at Meaux, in 1838 demonstrator in chemistry and physics at the École Normale, and in 1841 sub-director of studies at that school and lecturer on geology. In 1857 the degree of D. és Sc. was conferred upon him, and he was appointed professor of geology at the Sorbonne. There he was eminently successful as a teacher, and worked with great zeal in the field, adding much to the knowledge of the Jurassic and older strata. He devoted, however, special attention to the subdivisions of the Carnian and Tertiary formations in France, and to their correlation with the strata in England and in southern Europe. To him we owe the first definite arrangement of the Chalk into palaeontological zones (see Table in Geol. Mag., 1869, p. 200). During his later years he was regarded as the leading geologist in France. He was elected a member of the Institute in 1877, Commander of the Legion of Honour in 1885, and he was three times president of the Geological Society of France. He died in Paris on the 4th of April 1890.

HÉBERT, JACQUES RENÉ (1757-1794), French Revolutionist, called "Père Duchesne," from the newspaper he edited, was born at Alençon, on the 15th of November 1757, where his father, who kept a goldsmith’s shop, had held some municipal office. His family was ruined, however, by a lawsuit while he was still young, and Hébert came to Paris, where in his struggle against poverty he endured great hardships; the accusations of theft directed against him later by Camille Desmoulins were, however, without foundation. In 1790 he attracted attention by some pamphlets, and became a prominent member of the club of the Cordeliers in 1791. On the 10th of August 1792 he was a member of the revolutionary Commune of Paris, and became second substitute of the procureur of the Commune on the 2nd of December 1792. His violent attacks on the Girondists led to his arrest on the 24th of May 1793, but he was released owing to the threatening attitude of the mob. Henceforth very popular, Hébert organized with P. G. Chaumette (q.v.) the “worship of Reason,” in opposition to the thritic cult inaugurated by Robespierre, against whom he tried to excite a popular movement. The failure of this brought about the arrest of the Hébertists, or enragés, as his partisans were called. Hébert was guillotined on the 24th of March 1794. His wife, who had been a nun, was executed twenty days later. Hébert’s influence was mainly due to his articles in his journal Le Père Duchesne, which appeared from 1790 to 1794. These articles, while not lacking in a certain cleverness, were violent and often purposely couched in foul language in order to appeal to the mob.

HEBREW LANGUAGE. The name “Hebrew” is derived, through the Greek Ἰσραήλ, from הָיוֹרָעַי, the Aramaic equivalent of the Old Testament word הָיוֹרַה, denoting the people who commonly spoke of themselves as Israel or Children of Israel from the name of their common ancestor (see Jews). The later derivative יִשְׂרָאֵל, Israelite, from יִשְׂרָאֵל, is not found in the Old Testament, but equivalent to the Biblical ישראֵל. The name of Israel are speech of Canaan (Isa. x. 18) and יְהָדִית, Jewish, (as Kings xviii. 26). In later times it was called the holy tongue. The real meaning of the word הָיוֹרַה must ultimately be sought in the root הָיוֹרַה, to pass across, to go beyond, from which is derived the noun הָיוֹר, meaning the “farther bank” of a river. The usual explanation of the term is that of Jewish tradition.

1 There were several journals of this name, the best known of the others that being edited by Lemaire.

2IVERS SAM. xxvi. 25 Isræliite should be Ishmaëlite, as in the parallel passage 1 Chron. ii. 17.
HEBREW LANGUAGE

that 'ibhr means the man “from the other side,” i.e. either of the Ephraimites or the Jordan. Hence the Septuagint in Gen. xiv. 13 render Abram ha-'ibhr by δειπόντης, the “crosser,” and Aquila, following the same tradition, has δειποντης, the man “from beyond.” This view of course implies that the term was originally applied to Abram or his descendants by a people living on the west of the Ephraimites or of the Jordan. It has been suggested that the root 'abhdr is to be taken in the sense of “travelling,” and that Abram the wandering Aramaean (Deut. xxvi. 5) was called ha-'ibhr because he travelled about for trading purposes, his language, 'ibhr, being the lingua franca of Eastern trade. The use of the term ἐποικία for biblical Hebrew is first found in the Greek prologue to Ecclesiasticus (c. 150 B.C.). In the New Testament it denotes the native language of Palestine (Aramaic and Hebrew being popularly confused) as opposed to Greek. In modern usage the name Hebrew is applied to that branch of the northern part of the Semitic family of languages which was used by the Israelites during most of the time of their national existence in Palestine, and in which nearly all their sacred writings are composed. As to the Hebrew texts, there is no parallel in other Semitic languages, and the stock, see SEMITIC LANGUAGES. It also includes the later forms of the same language as used by Jewish writers after the close of the Canon throughout the middle ages (Rabbinical Hebrew) and to the present day (New Hebrew).

Before the rise of comparative philology it was a popular opinion that Hebrew was the original speech of mankind, from which all others were descended. This belief, derived from the Jews (cf. Pal. Targ. Gen. xi. 1), was supported by the etymologies and other data supplied by the early chapters of Genesis. But though Hebrew possesses a very old literature, it is not, as we know it, structurally as early as, e.g. Arabic, or, in other words, it does not come so near to that primitive Semitic language which may be pre-supposed as the common parent of all the Semitic languages. Owing to the imperfection of the Hebrew alphabet, which, like that of most Semitic languages, has no means of expressing vowel-sounds, it is only partly possible to trace the development of the language. In its earliest form it was no doubt most closely allied to the Canaanite or Phoenician stock, to the language of Moab, as revealed by the stele of Mesha (c. 850 B.C.), and to Edomite. The vocalization of Canaanite, as far as it is known to us, e.g. from glosses in the Tell-el-Amarna tablets (15th century B.C.), and much later from the Punic passages in the Poenulun of Plantus, differs in many respects from that of the Hebrew of the Old Testament, as also does the Septuagint transcription of proper names. The uniformity, however, of the Old Testament text is due to the labours of successive schools of grammarians who elaborated the Massorah (see HEBREW LITERATURE), thereby obliterating local or dialectic differences, which undoubtedly existed, and establishing the pronunciation current in the synagogues about the 7th century A.D. The only mention of such differences in the Old Testament is in Judges xii. 6, where it is stated that the Ephraimites pronounced ש (sh) as ζ or e (s). In Neh. xiii. 24, the "speech of Asherim" is more particularly defined (Hebrew: שֶׁכֶל). Certain peculiarities in the language of the Pentateuch (ר for ר, י for יד, and פ for פ), which used to be regarded as archaisms, are to be explained as purely orthographical.2 In a series of writings, however, extending over so long a period as those of the Old Testament, some variation or development in language is to be expected apart from the natural differences between the poetical (or prophetic) and prose styles. The consonantal text sometimes betrays these in spite of the Massorah. In general, the later books of the Old Testament show, roughly speaking, a greater simplicity and uniformity of style, as well as a tendency to Aramaism. For some centuries after the Exile the people of Palestine must have been bilingual, speaking Aramaic for ordinary purposes, but still at least understanding Hebrew. Not that they forgot their own tongue in the Captivity and learnt Aramaic in Babylon, as used to be supposed. In the western provinces of the Persian empire Aramaic was the official language, spoken not only in Palestine but in all the surrounding countries, even in Egypt and among Arab tribes such as the Nabateans. It is natural, therefore, that it should influence and finally supplant Hebrew in popular use, so that translations even of the Old Testament eventually appear in it (Targums). Meanwhile Hebrew did not become a dead language—indeed it can hardly be said ever to have died, since it has continued in use till the present day for the purposes of ordinary life among educated Jews in all parts of the world. It gradually became a literary rather than a popular tongue, as appears from the style of the later books of the Old Testament (Chron., Dan., Eccles.), and from the Hebrew text of Ecclesiasticus (c. 170 B.C.). During the 1st century B.C. and the 1st century A.D. we have no direct evidence of its characteristics. After that period there is a great development in the language of the Mishna. It was still living Hebrew, although mainly confined to the schools, with very clear differences from the biblical language. In the Old Testament the range of subjects was limited. In the Mishna it was very much extended. Matters relating to daily life had to be explained, and popular phrases were adopted from what was no doubt the popular language of an earlier period. By that time many foreign words were also introduced. The language being no longer familiar in the same sense as formerly, greater definiteness of expression became necessary in the written style. In order to avoid the uncertainty arising from the lack of vowels to distinguish forms consisting of the same consonants (for the vowel-points were not yet invented), the aramaizing use of the reflexive conjugations (Hithpa'el, Nithpa'el) for the internal passives (Pu'al, Hoph'al) became common; particles were used to express the genitive and other relations, and in general there was an endeavour to avoid the obscurities of a purely consonantal writing. What produced the most considerable changes was the influence of the Talmuds, which, roughly speaking, were growing contemporaneously with Midrash, is a mixture of Hebrew and Aramaic (Eastern Aram. in the Babylonian, Western in the Jerusalem Talmud), as was also that of the earlier commentators. As the popular use of Aramaic was gradually restricted by the spread of Arabic as the vernacular (from the 7th century onwards), while the disuse of the Jews became wider, biblical Hebrew again came to be the natural standard both of East and West. The cultivation of it is shown and was no doubt promoted by the many philological works (grammars, lexicons and masonals) which are extant from the 10th century onward. In Spain, under Moorish dominion, most of the important works of that period were composed in Arabic, and the influence of Arabic writers both on language and method may be seen in contemporary Hebrew compositions. No other vernacular (except, of course, Aramaic) ever had the same influence upon Hebrew, largely because no other bears so close a relation to it. At the present day in the East, and among learned Jews elsewhere, Hebrew is still cultivated conversationally, and it is widely used for literary purposes. Numerous works on all kinds of subjects are produced in various countries, and knowledge of Hebrew is the vehicle of correspondence between Jews in all parts of the world. Naturally its quality varies with the ability and education of the writer. In the modern pronunciation the principal differences are between the Ashkenazim (German and Polish Jews) and the Sephardim (Spanish and Portuguese Jews), and concern not only the vowels but also certain consonants, and in some cases probably go back to early times. As regards writing, it is most likely that the oldest Hebrew records were preserved in some form of cuneiform script. The alphabet (see Writing) subsequently adopted is seen in its earliest form on the stele of Mesha, and has been retained, with modifications, by the Samaritans. According to Jewish tradition Ezra introduced the Assyrian character (ם, ניו), a much-debated statement which no doubt means that the Aramaic hand in use in Babylonia was adopted by the Jews about the 5th century B.C. Another form of the same hand, allowing for differences of material, is found in Egyptian Aramaic papyri of the 5th and 4th

2 See Gesenius-Kautzsch, Hebr. Gram. § 17 c.
HEBREW LITERATURE

169

centuries B.C. From this were developed (e) the square character used in MSS. of the Bible or important texts, and in most printed books, (b) the Rabbinic (or Rashi) character, used in commentaries and treatises of all kinds, both in MS. and in printed books, (c) the Cursive character, used in letters and for informal purposes, not as a rule printed. In the present state of Hebrew palaeography it is not possible to determine accurately the date of a MS., but it is easy to recognize the country in which it was written. The most clearly marked distinctions are between Spanish, French, German, Italian, Maghrebi, Greek, Syrian (including Egyptian), Yemenite, Persian and Qaraite hands. In the Rabbinic and Cursive characters that the differences are more noticeable. The Hebrew alphabet is also used, generally with the addition of some diacritical marks, by Jews to write other languages, chiefly Arabic, Spanish, Persian, Greek, Tatar (by Qaraites) and in later times German.

The philological study of Hebrew among the Jews is described below, under Hebrew Literature, of which it formed an integral part. Among Christian scholars there was no independent school of Hebraists before the revival of learning. In the Greek and Latin Church the few fathers who, like Origines and Jerome, knew something of the language, were wholly dependent on their Jewish teachers, and their chief value for us is as depositaries of Jewish tradition. Similarly in the East, the Syriac version of the Old Testament is largely under the influence of the synagogue, and the homilies of Aphraates are a mine of Rabbinic lore. In the middle ages some knowledge of Hebrew was preserved in the Church by converted Jews and even by non-Jewish scholars, of whom the most notable were the Dominican controversialist Raymond Martini (in his Pugio fidei) and the Franciscan Nicolaus of Lyra, on whom Luther drew largely in his interpretation of Scripture. But there was no tradition of Hebrew study apart from the Jews, and in the 15th century when an interest in the subject was awakened, only the most ardent zeal could conquer the obstacles that lay in the way. Orthodox Jews refused to teach those who were not of their faith, and on the other hand many churchmen conscientiously believed in the duty of entirely suppressing Jewish learning. Even books were to be had only with the greatest difficulty, at least not far from the Alps. In Italy things were somewhat better. Jews expelled from Spain received favour from the popes. Study was facilitated by the use of the printing-press, and some of the earliest books printed were in Hebrew. The father of Hebrew study among Christians was the humanist Johann Reuchlin (1455-1522), the author of the Rudimenta Hebraica (Pforzheim, 1506), whose contest with the converted Jew Heßfertkorn and the Cologne obscurantists, established the claim of Hebrew literature to the Church. Interest in the subject spread rapidly. Among Reuchlin's own pupils were Melanchthon, Occolampadius and Cellarius, while Sebastian Münster in Heidelberg (afterwards professor at Basel), and Büchlein (Bagius) at Isny, Strasburg and Cambridge, were pupils of the liberal Jewish scholar Elias Levi. France drew teachers from Italy. Santes Pagninus of Lucca was at Lyons; and the trilingual college of Francis I. at Paris, with Vattaibus and le Mercier, attracted, among other foreigners, Geronimo Romanus, then bishop of Nebbio, the editor of the Genoa psalter of 1516. In Rome the converted Jew Felix Praetensis taught under the patronage of Leo X., and did useful work in connexion with the great Bomberger Bibles. In Spain Hebrew learning was promoted by Cardinal Ximenes, the patron of the Complutensian Polyglot. The printers, as J. Froben at Basel and Etienne at Paris, also produced Hebrew books. For a time Christian scholars still leaned mainly on the Rabbis. But a more independent spirit soon arose, of which le Mercier in the 16th., and Drusius early in the 17th. century, may be taken as representatives. In the 17th. century the common languages most studied by J. Selden, E. Castell (Heptaglott lexicon) and E. Porocke (Arabic) in England, Ludovicus de Dieu in Holland, S. Bochart in France, J. Ludolf (Ethiopic) and J. H. Hottinger (Syria) in Germany, with advantage to the Hebrew grammar and lexicon. Rabbinic learning moreover was cultivated at Basel by the elder Buxtorf who was the author of grammatical works and a lexicon. With the rise of criticism Hebrew philology soon became a necessary department of theology. Cappellus (d. 1658) followed Levita in maintaining, against Buxtorf, the late introduction of the vowel-points, a controversy in which the authority of the massoretic text was concerned. He was supported by J. Morin and R. Simon in France. In the 18th century in Holland A. Schultens and N. W. Schroeder used the comparative method, with great success, relying mainly on Arabic. In Germany there was the meritorious J. D. Michaelis and in France the brilliant S. de Sacy. In the 19th century the most important Hebrewists is that of Menchen, at Halle, whose shorter grammar (of Biblical Hebrew) first published in 1813, is still the standard work, thanks to the ability with which his pupil E. Rödiger and recently E. Kautzsch have revised and enlarged it. Important work was also done by G. H. A. Ewald, J. Olschanski and P. A. de Lagarde, not to mention later scholars who have utilized the valuable results of Assyriological research.

BIBLIOGRAPHY.—Among the numerous works dealing with the study of Hebrew, the following are some of the most practically useful.

Comparative Grammar.—Wright, Lectures on the Comp. Grammar of the Sem. Lang. (Cambridge, 1880); Brockelmann, Grundriss der vergleichenden Grammatik (Berlin, 1907, &c.).

HEBREW LITERATURE. Properly speaking, “Hebrew Literature” denotes all works written in the Hebrew language. In catalogues and bibliographies, however, the expression is now generally used, conveniently if incorrectly, as synonymous with Jewish literature, including all works written by Jews in Hebrew characters, whether the language be Aramaic, Arabic or even some vernacular not related to Hebrew.

The literature begins with, as it is almost entirely based upon, the Pentateuch. In the earliest times popular songs orally transmitted and perhaps books of annals and laws, but except in so far as remnants of them are embbeded in the biblical books, they have entirely disappeared. Thus the Book of the Wars of the Lord is mentioned in Num. xxi. 14; the Book of Jasher in Josh. x. 13, 2. Sam. i. 18; the Song of the Well is quoted in Num. xxi. 17, 18, and the song of Sihon and Moab, Ib. 27-30; of Lamech, Gen. iv. 23, 24; of Moses, Exod. xv. As in other literatures these popular elements form the foundation on which greater works are gradually built, and it is one function of literary criticism to show the way in which the component parts were welded into a uniform whole. The traditional view that Moses was the author of the Pentateuch in its present form, would make this the earliest monument of Hebrew literature. Modern inquiry, however, has arrived at other conclusions (see BIBLE, Old Testament, which may be briefly summarized as follows: the Pentateuch is compiled from various documents, the earliest of which is denoted by P (chapter ed.; see p. 329). For popular songs see above. The fact that its author regularly addresses the divine name Jehovah (Yahweh). Its date is now usually given as about 800 B.C. 1 In the next century the document E was composed, so called from its use in

1. The dating of these documents is extremely difficult, since it is based entirely on internal evidence. Various scholars, while agreeing on the actual divisions of the text, differ on the question of priority. The views given here are those which seem to be most generally accepted at the present time. They are not put forward as the result of an independent review of the evidence.
El'ohim (God) instead of Yahweh. Both these documents are considered to have originated in the Northern kingdom, Israel, where also in the 8th century appeared the prophets Amos and Hosea. To the same period belong the book of Micah, the earlier parts of the books of Samuel, of Isaiah and of Proverbs, and perhaps some Psalms. In 722 B.C. Samaria was taken and the Northern kingdom ceased to exist. Judah suffered also, and it is not until a century later that any important literary activity is again manifested. The main part of the book of Deuteronomy was "found," shortly before 621 B.C. and about the same time appeared the prophets Jeremiah and Zephaniah, and perhaps the book of Ruth. A few years later (about 600) the two Pentateuchal documents J and E were woven together. The Books of Kings were compiled, the book of Habakkuk and parts of the Proverbs were written. Early in the next century Jerusalem was taken by Nebuchadnezzar, and the prophet Ezekiel was among the exiles with Jehoiachin. Somewhat later (c. 550) the combined document JE was edited by a writer under the influence of Deuteronomy, the later parts of the books of Samuel were written, parts of Isaiah, the books of Obadiah, Haggai, Zechariah and perhaps the later Proverbs. In the exile, but probably after 500 B.C., an important section of the Hexateuch, usually called the Priest's Code (D), was drawn up. At various times in the same period to be placed the book of Job, the post-exilic parts of Isaiah, the books of Joel, Jonah, Malachi and the Song of Songs. The Pentateuch (or Hexateuch) was finally completed in its present form at some time before 400 B.C. The latest parts of the Old Testament are the books of Chronicles, Ezra and Nehemiah (c. 330 B.C.), Ecclesiastes and Esther (3rd century) and Daniel, composed either in the 3rd century or according to some views as late as the time of Antiochus Epiphanes (c. 168 B.C.). With regard to the date of the Psalms, internal evidence, from the nature of the case, leads to few results which are convincing. The most reasonable view seems to be that the collection was formed gradually and that the process was going on during most of the period sketched above.

It is not to be supposed that all the contents of the Old Testament were immediately accepted as sacred, or that they were ever all regarded as being on the same level. The Torah, the Law delivered to Moses, held among the Jews of the 4th century B.C. as it holds now, a preeminent position. The inclusion of other books in the Canon was gradual, and was effected only after centuries of debate. The Jews have always been, however, an intensely literary people, and the books ultimately accepted as canonical were only a selection from the literature in existence at the beginning of the Christian era. The rejected books received little attention have mostly either been altogether lost or have survived only in translations, as in the case of the Apocrypha. Hence from the composition of the latest canonical books to the redaction of the Mishna (see below) in the 2nd century A.D., the remains of Hebrew literature are very scanty. Of books of this period which are known to have existed in Hebrew or Aramaic up to the time of Jerome (and even later) we now possess most of the original Hebrew text of Ben Sira (Ecclesiasticus) in a somewhat corrupt form, and fragments of an Aramaic text of a recension of the Testaments of the Twelve Patriarchs, both discovered within recent years. Besides definite works of this kind, there was also being formed during this period a large body of exegetical and legal material, for the most part orally transmitted, which only received its literary form much later. As Hebrew became less familiar to the people, a system of translating the text of the Law into the Aramaic vernacular verse by verse, was adopted in the synagogue. The beginnings of it are supposed to be indicated in Neh. viii. 8. The translation was no doubt originally extemporaneous, and varied with the individual translators, but its form gradually became fixed and was ultimately written down. It was called Targum, from the Aramaic term meaning "translating," meant to be the proper name of the Targum of Onkelos (Onqōlēs), the proselyte, on the Law. It received its final form in Babylonia probably in the 3rd century A.D. The Samaritan Targum, of about the same date, clearly rests on the same tradition. Parallel to Onkelos was another Targum on the Law, generally called pseudo-Jonathan, which was edited in the 7th century in Palestine, and is based on the same system of interpretation but is fuller and closer to the original tradition. There is also a fragmentary Targum (Palestinian) the relation of which to the others is obscure. It may be only a series of disconnected glosses on Onkelos. For the other books, the recognized Targum on the Prophets is that ascribed to Jonathan ben Uzziel (4th century?), which originated in Palestine, but was edited in Babylonia, so that it has the same history and linguistic character as Onkelos. Just as there is a Palestinian Targum on the Law parallel to the Babylonian, so there is a Palestinian Targum (called Yerushalmi) on the Prophets parallel to the Targum of Jeremiah. We must now return to the 2nd century. During the period which followed the canonical books, not only was translation, and therefore exegesis, cultivated, but also the amplification of the Law. According to Jewish teaching (e.g. Abboth i. 1) Moses received on Mount Sinai not only the written Law as set down in the Pentateuch, but also the Oral Law, which he communicated personally to the 70 elders and through them by a "chain of tradition" to succeeding ages. The application of this oral law is called Halakah, the rules by which a man's daily "walk" is regulated. The halakah was by no means inferior in prestige to the written Law. Indeed some teachers even went so far as to ascribe a higher value to it, since it was above all the duty with the details of everyday life. It was not independent of the written Law, still less in opposition to it. Rather it was implicitly contained in the Torah, and the duty of the teacher was to show this. It was therefore of the first importance that the chain of tradition should be continuous and trustworthy. The line is traced through biblical teachers to Ezra, the first of the Sopherim, who were the charge to the "men of the Great Synagogue," a much-discussed term for a body or succession of teachers inaugurated by Ezra. The last member of it, Simon the Just (either Simon I, who died about 300 B.C., or Simon II, who died about 200 B.C.), was the first of the next series, called Elders, represented in the tradition by Rabbi. The Sopherim, teachers, with Hillel and Shammai about the beginning of the Christian era. Their pupils form the starting-point of the next series, the Tannaim (from Aram. tanā'a to teach), who occupy the first two centuries A.D.

By this time the collection of halakhic material had become very large and various, and after several attempts had been made to reduce it to uniformity, a code of oral tradition was finally drawn up in the 2nd century by Judah ha-Nasi, called Rabbi par excellence. This was the Mishnah. Its name is derived from the Hebrew shannah, corresponding to the Aramaic 'nēn and therefore a suitable name for a tannaitic work, meaning the "repitition or teaching of the oral law. It is written in the Hebrew of the schools (lesḥon hakhkinim) which differs in many respects from that of the Old Testament (see Hebrew Language). It is divided into six "orders," according to subject, and each order is subdivided into chapters. In making his selection of halakhōth, Rabbi used the earlier compilations, which are quoted as "words of Rabbi 'Aqiba" or of R. Meir, but rejected much which was afterwards collected under the title of Tosefta (addition) and Baraita (outside the Mishnah).

Traditional teaching was, however, not confined to halakah. As Palestinian Onkelos, so the Rabbinists, to show the connexion of practical rules with the written Law, the more so since the Sadducees rejected the authority of the oral law as such. Hence arises Midrash, exposition, from
In the Babylonian Talmud (Babli) there is no gemara to the smaller tractates of Order i, and to parts of ii., iv., v., vi. The language of both gemaras is in the main the vernacular (western Aramaic in Yerushalmi, eastern in Babli), but early halakhic traditions (e.g. of Tannaitic origin) are given in their original form, and the discussion of them is usually also in Hebrew. Babli is not only greater in bulk than Yerushalmi, but has also received far greater attention, so that the name Talmud alone is often used for it. As being a constant object of study numerous commentaries have been written on the Talmud from the earliest times till the present. The most important of them for the understanding of the gemara (Babli) is that of Rashi \(^1\) (Solomon ben Isaac, d. 1104) with the Tosafot (additions, not to be confused with the Toscefta) chiefly by the French school of rabbis following Rashi. These are always printed in the editions on the same page as the Mishnah and Gemara, the whole, with various other matter, filling generally about 12 folio volumes. Since the introduction of printing, the Talmud is usually cited by the number of the leaf in the first edition (Venice, 1520, &c.), to which all subsequent editions conform. In order to facilitate the practical study of the Talmud, it was arranged that the arguments of it should be made. Two of these may be mentioned which are usually found in the larger editions: that by Isaac Alfasi (i.e. of Fez) in the 11th century, often cited in the Jewish manner as Rif; and that by Asher ben Jehiel (d. 1328) of Toledo, usually cited as Rabbeinu Asher. The object of both was to collect all halakhōth having a practical importance, omitting all those which owing to circumstances no longer possess more than an academical interest, and excluding the discussions on them and all agadah. Both add notes and explanations of their own, and both have in turn formed the text of commentaries.

With the Talmud, the anonymous period of Hebrew literature may be considered to end. Henceforward important works are produced not by schools but by particular teachers, Masorah, who, however, no doubt often represent the opinions of a school. There are two branches of work which partake of both characters, the Masorah and the Liturgy. The name Masorah (Masorah) is usually derived from masor, to hand on, and explained as "tradition." According to others it is the word found in Ezek. xx. 37, meaning a "fetter." Its object was to fix the biblical text unalterably. It is generally divided into the Great and the Small Masorah, forming together an apparatus criticus which grew up gradually in the course of centuries and now accompanies the text in most MSS. and printed editions to a greater or less extent. There are also separate masoretic treatises. Some system of the kind was of course necessary to guard against corruptions of copies, while the care bestowed by rabbis, at first and later generations, was invaluable to subsequent lexicographers, while their system of vowel-points and accents not only gives us the pronunciation and manner of reading traditional about the 7th century A.D., but frequently serves also the purpose of an explanatory commentary. (See further under BIBLE.) Most of the Masorah is anonymous, including the Masssekheth Sopherim (of various dates from perhaps the 6th to the 9th century) and the Okhlah ve-Okhlah, but when the period of anonymous literature closes, there appear (in the southern part) several important codices, the greatest authority on the subject, and his opponent Ben Naphthali. Later on, Jacob

---

\(^1\) See especially A. Jellinek's Bet-ha-Midrash (Leipzig, 1853), for these initials. See also the introduction.

\(^2\) That on Genesis was edited for the first time by Schechter (Cambridge, 1902).
partly in Arabic) not only numerous Responsa, but also treatises on law, commentaries on the Mishnah and the Bible, a lexicon called in Arabic Al-Haawi, and poems such as the Masar Haskel, but most of them are now lost or known only from translations or quotations. Though his teaching was largely directed against superstition, he seems to have been inclined to mysticism, and perhaps for this reason various kabbalistic works were ascribed to him in later times. His father-in-law Samuel ben Hophni, last Gaon of Sura (d. 1034), was a voluminously written on law, translated the Pentateuch into Arabic, commented on the author of the Bible, and composed an Arabic introduction to the Talmud, of which the existing Hebrew introduction (by Samuel the Nagid) is perhaps a translation. Most of his works are now lost.

In the Geonic period there came into prominence the sect of the Karaites (Beney nigray, "followers of the Scripture", the opponents of Judaism, who rejected rabbinical authority, basing their doctrine and practice exclusively on the Bible. The sect was founded by 'Anan in the 8th century, and, after many vicissitudes, still exists. Their literature, with which alone we are here concerned, is largely polemical and to a great extent deals with grammar and exegesis. Of their first important authors, Benjamin al-Nehawi and Daniel al-Qumisi (both in the 9th century), little is preserved. In the 10th century Jacob al-Qirqisani wrote his Kitab al-anwar, on law, Solomon ben Yeruham (against Seidah) and Yefet ben 'Ali wrote exegetical works; in the 11th century Abul-faraj Furiqan, exegesis, and Yusuf al-Baqir against Samuel ben Hophni. Most of these were written in Arabic. In the 12th century and in S. Europe, Judah Haddasi composed his Eshkol ha-Kopher, a great theological compendium in the form of a commentary on the Decalogue. Other writers are Aaron (the elder) ben Joseph, 13th century, who wrote the commentary Sepher ha-mishkar; Aaron (the younger) of Nicomedia (14th century), author of Eq Hazayim, on philosophy, Gan Eden, on law, and the commentary Kether Torah; in the 15th century Elijah Bashyazi, on law (Addereth Eliyahu), and Caleb Efendipoil, poet and theologian; in the 16th century Moses Bashyazi, theologian. From the 12th century onward the sect gradually declined, being ultimately restricted mainly to the Crimea and Lithuania, learning disappeared and their literature became merely popular and of little interest. Much of it in later times was written in the new Yiddish dialect. A late writer, Nathan ben Isaac, the author of Tikvat Yisrael (1593) was translated into English by Moses Mocatta under the title of Faith Strengthened (1851); Solomon of Troki, whose Aphiyon, an account of Karaimism, was written at the request of Pufendorf (about 1700); and Abraham Firkovich, who, in spite of his impostures, did much for the literature of his people about the middle of the 19th century. (See also QARAITES.)

To return to the period of the Geonim. While the schools of Babylonia were flourishing as the religious head of Judaism, the West, and especially Spain under Moorish rule, was becoming the home of Jewish scholarship. On the breaking up of the schools many of the fugitives fled to the West and helped to promote rabbinical learning there. The communities of Fez, Karawwan and N. Africa were in close relation with those of Spain; and as early as the beginning of the 9th century Judah ben Qurash of Tahort had composed his Risalah (letter) to the Jews of Fez on grammatical subjects from a comparative point of view, and a dictionary now lost. His work was used in the 10th century by Menahem ben Saruq, of Cordova, in his Maqaresh (dictionary). Menahem's system of bi-literary and uni-literary roots was violently attacked by Dnain in his Tahrut. Among the great representatives of Jewish learning, among them was Judah Hayyuj of Cordova, the father of modern Hebrew grammar, who first established the principle of tri-literary roots. His treatises on the verbs, written in Arabic, were translated into Hebrew by Moses Giquallah (11th century), himself a considerable grammarian and commentator, and by Ibn Ezra. His system was adopted by Abul-walid ibn Janah, of Saragossa (died early in the 11th century), in his lexicon (Kitab al-ushul, in Arabic) and other works.
In Italy appeared the invaluable Talmud-lexicon ("Arīkāh") by Nathan b. Yehiel, of Rome (d. 1160), who was indirectly inlabeled to Babylonian teaching. He does not strictly follow the system of Ḥayyūḥ. Other works of a different kind also originated in Italy about this time: the very popular history of the Jews, called *Yaḥyāyeh* (probably of the 9th or 10th century), ascribed to Joseph ben Gordin (Goroinides); the medical treatises of Shabbethai Donnolo (10th century) and his commentary on the Sefer Yezira, the anonymous and earliest Hebrew kabbalistic work ascribed to the patriarch Abraham.

In North Africa, probably in the 9th century, appeared the book known under the name of *Ekkud ha-Dani*, giving an account of the ten tribes, from which much medieval legend was derived; and in Kairawan the medical and philosophical treatises of Isaac Israel, who died in 933.

The aim of the grammatical studies of the Spanish school was ultimately exegesis. This had already been cultivated in the *Exegesis*. East. In the 9th century Ḥivi of Balkh wrote a rationalistic treatise on difficulties in the Bible, which was refuted by Seadiah. The commentaries of the Geonim have been mentioned above. The impulse to similar work in the West came also from Babylonia. In the 10th century Ḥushiel, one of four prisoners, perhaps from Babylonia, though that is doubtful, and Hebrew Kairawān, where he acquired great reputation as a Talmudist. His book called *Anadak* (d. 1050) wrote a commentary on (probably all) the Talmud, and is perhaps the author of a collection of 12 *asıyyoth* or edifying stories, besides works now lost. The activity in North Africa reacted on Spain. There the most prominent figure was that of Samuel ibn Nagdela (or Nagrella), generally known as Samuel the Nagid or head of the Jewish settlement, who died in 1095. As vizier to the Moorish king at Granada, he was not only a patron of learning, but himself a man of wide knowledge and a considerable author. Some of his poems are extant, and an Introduction to the Talmud mentioned above. In grammar he followed Ḥayyūḥ, whose pupil he was. Among others he was the patron of Solomon ibn Gabirol (q.v.), the poet and philosopher. To this period belong Ḥaft al-Qūtī (the Gotha?) who made a version of the Psalms and Bible, and Bahia ibn Paquda, dayyan at Saragossa, whose Arabic ethical treatise has always had great popularity among the Jews in its Hebrew translation, *līḥbūṭ ha-leḥabābūṭ*. He also composed liturgical poems. At the end of the 11th century Judah ibn Bal'am wrote grammatical works and commentaries (on the Pentateuch, Isaiah, &c.) in Arabic; the liturgist Isaac Gayyath (d. in 1089 at Cordova) wrote on ritual. Moses Gitatilla has been already mentioned.

The Arabic school of the 11th century was hardly less important. Gershon ben Judah, the "Light of the Exile" (d. in 1040 at Mainz), a famous Talmudist and commentator, his pupil Jacob ben Yaqaar, and Moses of Narbonne, called ha-Darshan, the "Exegete," were the forerunners of the greatest of all Jewish commentators, Solomon ben Isaac (Rashi), who died at Troyes in 1105. Rashi was a pupil of Jacob ben Yaqaar, and studied at Worms and Mainz. Unlike his contemporaries in Spain, he seems to have confined himself wholly to Jewish learning, and to have known nothing of Arabic or other languages except his native French. Yet no commentator is more valuable or indeed more voluminous, and for the study of the Talmud he is even now indispensable. He commented on all the Bible and on nearly all the Talmud, has been himself the text of several super-commentaries, and has exercised great influence on Christian exegesis. The biblical commentary was translated into Latin by Breinhaut (Gotha, 1710-1714), that on the Talmud much rather freely into German by L. Dukes (Prag, 1583, in Hebrew-German characters, with the text), and parts by others. Closely connected with Rashi, or of his school, are Joseph Qara, of Troyes (d. about 1130), the commentator, and his teacher Menahem ben Helbô, Jacob ben Me'ir, called Rabbenâ Tâm (d. 1171), the most important of the Tosaphists (s. v.), and later in the 12th century the liberal and rationalizing Joseph Bekhôr Shôr, and Samuel ben Me'ir (d. about 1174) of Ramuper, commentator and Talmudist.

In the 12th and 13th centuries literature maintained a high level in Spain. Abraham bar Ḥyya, known to Christian scholars as Abraham Judaeus (d. about 1136), was a mathematician, astronomer and philosopher much studied in the middle ages. Moses ben Ezra, of Granada (d. about 1140), wrote in Arabic a philosophical work based on Greek and Arabic as well as Jewish authorities, known by the name of the Hebrew translation as *'Arīgāth ha-bosem*, and the *Kitāb al-Mādiṣarah*, of great value for literary history. He is even better known as a poet, for his *Divān* and the *Anaq*, and as a hymn-writer. His name (Abraham ben Ezra, generally called simply Ibn Ezra) was still more distinguished. He was born at Toledo, spent most of his life in travel, wandering even to England and to the East, and died in 1167. Yet he contrived to write his great commentary on the Pentateuch and other books of the Bible, treatises on philosophy (as the *Yesodh mōrā*), astronomy, mathematics, grammar (translation of Havyâʾ), besides a *Divān*. The man, however, who shares with Ibn Gabirol the first place in Jewish poetry is Judah Ha-levi, of Toledo, who died in Jerusalem about 1140. His poems, both secular and religious, contained in his *Divān* and scattered in the liturgy, are all in Hebrew, though he employed Arabic metres. In Arabic he wrote his philosophical work, called in the Hebrew translation *Sefer ha-Kāzârâ*, a defence of revelation as against non-Jewish philosophy and Qaraite doctrine. It shows considerable knowledge of Greek and Arabic thought (Avicenna). Joseph ibn Migâdah (d. 1141 at Lucena), a friend of Judah Ha-levi and of Moses ben Ezra, wrote Responsa and Hiddushim (annota- tions and interlinear glosses) to the Pentateuch, and he is also one of the authors of the *Maymūnah*, of which several recensions have been made of the travellers Benjamin of Tudela (d. after 1153), whose *Massāʾoth* are of great value for the history and geography of his time, and (though not belonging to Spain) Pethahiah of Regensburg (d. about 1190), who wrote short notes of his journeys. Abraham ben David, of Toledo (d. about 1150), in philosophy an Aristotelian (through Avicenna) and the precursor of Maimonides, is chiefly known for his *Sefer ha-gabbarâlah*, written as a polemic against Karaism, but valuable for the history of tradition.

The greatest of all medieval Jewish scholars was Moses ben Maimôn (Rambam), called *Maimonides* by Christians. He was born at Cordova in 1135, fled with his parents from persecution in 1148, settled at Fes in 1160, passing there for a Moslem, fled again to Jerusalem in 1165, and finally went to Cairo where he died in 1204. He was distinguished in his profession as a physician, and wrote a number of medical works in Arabic (including a commentary on the aphorisms of Hippocrates), all of which were translated into Hebrew, and most of them into Latin, becoming the text-books of Europe in the succeeding centuries. But his fame rests mainly on his theological works. Passing over the less important, these are the *Mōrekh Nebḥākhīm* (so the Hebrew translation of the Arabic original), an endeavour to show philosophically the reasonableness of the faith, of which, translated into Latin, were studied by the Christian schoolmen, and the *Miskneh Torah*, also called *Yaḥ yabassagh* (14th century, the number of the parts), a classified compendium of the Law, written in Hebrew.

1. Two different texts of it exist: (1) in the ed. pr. (Mantua, 1476); (2) ed. of Seb. Münster (Basel, 1541). There is also an early Arabic recension, but its relation to the Hebrew and to the Arabic 2 Maccaebes is still obscure. See J. Q. R., x. 355 sqq. The Hebrew text was edited with a Latin translation by Breinhaut (Gotha, 1707).

2. Three various recensions of the text see D. H. Müller in the *Denkschriften der Brenta-Akademie* (Phil.-hist. Cl., xii. 1, p. 41) and Epstein's ed. (Pressburg, 1891).

3. A fragment of such a work, probably emanating from the school of Hīṭī, was found by Schechter and published in *J. Q. R.*, xiii. 345 sqq.
and early translated into Arabic. The latter of these, though generally accepted in the East, was much opposed in the West, especially at the time by the Talmudist Abraham ben David of Posquières (d. 1198). Maimonides also wrote an Arabic commentary on the Mishnah, soon afterwards translated into Hebrew, commentaries on parts of the Talmud (now lost) and a treatise on Logic. His breadth of view and his Aristotelianism were a stumbling-block to the orthodox, and subsequent teachers may be mostly classified as Maimonists or anti-Maimonists. Even his friend Joseph ibn 'Aqīn (d. 1226), author of a philosophical treatise in Arabic and of a commentary on the Song of Solomon, found so much difficulty in the new views that the Mōrekh Nebhākhām was written in order to convince him. Maimonides' son Abraham (d. 1234), also a great Talmudist, wrote in Arabic Ma'āseh Yerushalmi, on oaths, and Kītāb al-Kīfāyah, theology. His grandson David was also an author. A very different person was Moses ben Nahman (Ramban) or Nahmanides, who was born at Gerona in 1194 and died in Palestine about 1270. His whole tendency was as conservative as that of Maimonides was liberal, and like all conservatives he may be said to represent a lost art though not necessarily a less desirable cause. Much of his life was spent in controversy, not only with Christians (in 1293 before the king of Aragon), but also with his own people and on the views of the time. His greatest work is the commentary on the Pentateuch in opposition to Maimonides and Ibn Ezra. He had a strong inclination to mysticism, but whether certain kabalistic works are rightly attributed to him is doubtful. It is, however, not a mere coincidence that the two great kabalistic treatises, the Bahīr and the Zohar (both meaning "brightness"?), appear first in the 13th century. If not due to his teaching they are at least in sympathy with it. The Bahīr, a sort of outline of the Zohar, and traditionally ascribed to Nehunya (1st century), is believed by some to be the work of Isaac the Blind ben Abraham of Posquières (d. early in the 13th century), the founder of the modern Kabbalah and the author of the names for the 10 Sephiroth. The Zohar, supposed to be by Simeon ben Yohai (2nd century), is now generally attributed to Moses of Leon (d. 1303), who, however, drew his material in part from earlier written or traditional sources, such as the Sepher Yeẓirah. At any rate the work was immediately accepted by the kabalists, and has formed the basis of all subsequent study of the subject. Though put into the form of a commentary on the Pentateuch, it is really an exposition of the kabalistic view of the universe, and incidentally shows considerable acquaintance with the natural science of the time. A pupil, though not a follower of Nahmanides, was Solomon Adreth (not Addereoth), of Barcelona (d. 1310), a prolific writer of Talmudic and polemical works (against the Kabbalists and Mahomedans) as well as of responsa. He was opposed by Abraham Abula'la (d. about 1297) and his pupil Joseph Giaqalla (d. about 1305), the author of numerous kabalistic works. Solomon's pupil Baha' ben Asher, of Saragossa (d. 1348) was the author of a very popular commentary on the Pentateuch and of religious discourses entitled Kad ha-ge'mah, in both of which, unlike his teacher, he made large use of the Kabbalah. Other studies, however, were not neglected. In the first half of the 13th century, Abraham ibn Hasdai, a vigorous supporter of Maimonides, translated (or adapted) a large number of philosophical works from Arabic, among them being the Sepher ha-tophōb, based on Aristotle's de Anima, and the Mōrekh Ze'deq of Ghazzali on moral philosophy, of both of which the originals are lost. Another Maimonist was Shem发票 TEBSH, ben Joseph Falquaera (d. after 1250), philosopher (following Avicenna), poet and translator of the Bible. The poet and translator of the Bible, Mōrekh. A curious mixture of mysticism and Aristotelianism is seen in Isaac Aboa (about 1300), whose Menovrath ha-Ma'a'er, a collection of agadot, attained great popularity and has been frequently printed and translated. Somewhat earlier in the 13th century lived Judah al-Harzi, who belongs in spirit to the time of Ibn Gabirol and Judah ha-Levi. He wrote numerous translations, of Galen, Aristotle, Ha'ari, Hunaïn ben Isaac and Maimonides, as well as several original works, a Sepher 'Anaq in imitation of Moses ben Ezra, and treatises on grammar and medicine (Repbḥiath gevīyot), but he is best known for his Tabhunīm, a diwan in the style of Ha'ari's Maqāmat.

Meanwhile the literary activity of the Jews in Spain had its effect on those of France. The fact that many of the most important works were written in Arabic, the vernacular of the Spanish Jews under the Moors, which was not understood in France, gave rise to a number of translations into Hebrew, chiefly by the family of Ibn Tibbon (or Tabbôn). The first of them, Judah ibn Tibbon, translated works of Bahya ibn Paqduq, Judah ha-levi, Seadiah, Abī'Alwālī, and Ibn Gabirol, besides writing works of his own. He was a native of Granada, but migrated to Lunel, where he probably died about 1190. His son Samuel, who died at Marseilles about 1230, was equally prolific. He translated the Mōrekh Nebhākhām during the life of the author, and with some help from him, so that this may be regarded as the authorized version; Maimonides' commentary on the Mishnah tractsate Pirah Ḥabhath, and some minor works; treatises of Averroes and other Arabic authors. His original works are largely commentaries and some additional matter on the Mōrekh. His son Moses, who died about the end of the 13th century, translated the rest of Maimonides, much of Averroes, the lesser Canon of Avicenna, Euclid's Elements (from the Arabic version), Ibn al-Jazā’arī’s Viaticum, medical works of Ḥunaïn ben Isaac (Johannitus) and Razi (Rhazes), besides works of less-known Arabic authors. His original works are commentaries and perhaps a treatise on immortality. His nephew Jacob ben Makhrîr, of Montpelier (d. about 1304), translated Arabic scientific works, such as parts of Averroes and Ghazzali. Arabic versions of the Greek, as Euclid's Data, Autolycus, Menelaus (περὶ τῶν σφαιρῶν) and Theodosius on the Sphere, and Ptolemy’s Almagest. He also compiled astronomical tables and a treatise on the quadrant. The great importance of these translations is that many of them were afterwards rendered into Latin, thus making Arabic and, through it, Greek learning accessible to medieval Europe. Another important family about this time is that of Qimḥi (or Qamhi). It also originated in Spain, where Joseph ben Isaac Qimḥi was born, who migrated to S. France, probably for the same reason which caused the flight of Maimonides, and died there about 1170. He wrote on grammar (Sepher ha-galalot and Sepher Ḥikkaron), commentaries on Proverbs and the Song of Solomon, an introduction to Sepher ha-berith, and a translation of Bahya’s Hōbool ha-lekhabbōbol. His son Moses (d. about 1190) also wrote on grammar and some commentaries, wrongly attributed to Ibn Ezra. A younger son, David (Radaq) of Narbonne (d. 1235) is the most famous of the name. His great work, the Mikḥkāl, consists of a grammar and lexicon; his commentaries on various parts of the Bible are admirably luminous, and, in spite of his anti-Christian remarks, have been widely used by Christian theologians and largely influenced the English authorized version of the Bible. A friend of Joseph Qimḥi, Jacob ben Meïr, known as Jacob ben Tamar of Ramerupt (d. 1271), the grandson of Rashi, wrote the Sepher ha-yasher (hiddūshan and responsa) and was one of the chief Tosaphists. Of the same school were Menahem ben Simeon of Posquières, a commentator, who died about the end of the 12th century, and Moses ben Jacob of Coucy (13th century), author of the Semag (book of precepts, positive and negative) a very popular and valuable halakhic work. A younger contemporary of David Qimḥi was Abraham ben Isaac Bedersi (i.e. of Béziers), the poet, and some time in the 13th century lived Joseph Ezbohi of Perpignan, whose ethical poem, Qerat Ḥoseph, was translated by Reuchlin and later by the Rabbis. Another commentator of note is the "Fox Fables" (which have much in common with the "Ysope," of Marie de France), is generally thought to have lived in Provence in the 13th century, but according to others in England in the 12th century. In Germany, Eleazar ben Judah of Worms (d. 1238), besides being

1 The fullest account of them is to be found in Steinheisner's Hebräische Übersetzungen des Mittelalters (Berlin, 1893).

HEBREW LITERATURE

175

a Talmudist, was an earnest promoter of kabbalistic studies. Isaac ben Moses (d. about 1270), who had studied in France, wrote the famous Or Zar'uta (from which he is often called), a halakhic work somewhat resembling Maimonides’ Mishneh Torah, but more diffuse. In the course of his wanderings he settled for a time at Würzburg, where he had as a pupil Meir of Rothenburg (d. 1293). The latter was a prolific writer of great influence, chiefly known for his Responsa, but also for his halakhic treatises, hiddushim and tōsaphōth. He also composed a number of piyyūṭim. Meir’s pupil, Mordcei ben Hillel of Nürnberg (d. 1298), had an even greater influence through his halakhic work, usually known as the Moredeh. This is a codification of halakhōth, based on all the authorities then known, some of them now lost. Owing to the fact that the material collected by Mordcei was left to his pupils to arrange, the work was current in two recensions, an Eastern (in Austria) and a Western (in Germany, France, &c.). In the East, Tanḥūm ben Joseph of Jerusalem was the author of commentaries (not to be confounded with the Midrash Tanḥum) on many books of the Bible, and of an extensive lexicon (Kittab al-Mursīḥ) to the Mishnah, all in Arabic.

With the 13th century Hebrew literature may be said to have reached the limit of its development. Later writers to a large extent used over again the materials of their predecessors, while secular works tend to be influenced by the surrounding civilization, or even are composed in the vernacular languages. From the 14th century onward only the most notable names can be mentioned. In Italy Immanuel ben Solomon, of Rome (d. about 1350), perhaps the friend and certainly the imitator of Dante, wrote his divan, of which the last part, “Tophet ve-Eden,” is suggested by the Divina Commedia. In Spain Israel Israel, of Toledo (d. 1326), was a translator and the author of an Arabic work on ritual and a commentary on Pirque Abōhā. About the same time Isaac Israel wrote his Yesodh ‘Olam and other astronomical works which were much studied. Asher ben Jehiel, a pupil of Meir of Rothenburg, was the author of the popular Talmudic compendium, generally quoted as Rabbeinu Asher, on the lines of Alfasi, besides other halakhic works. He migrated from Germany and settled at Toledo, where he died in 1328. His son Jacob, of Toledo (d. 1340), was the author of the Ṭur (or the four Tūrīm), a most important manual of Jewish law, serving as an abridgement of the Mishneh Torah brought up to date. His pupil David Abudraham, of Seville (d. after 1340), wrote a commentary on the liturgy. Both the 14th and 15th centuries in Spain were largely taken up with controversy, as by Isaac ibn Pulgar (about 1330), and Shim Tūb ibn Shaprūt (about 1340), who translated St. Matthew’s gospel into Hebrew. In England, in the 14th century (d. about 1430), wrote poems (Beḥinath ha-‘Olam), commentaries on agada and a defense of Maimonides against Solomon Adreth. Levi ben Gershon (d. 1344), called Rabla, the great commentator on the Bible and Talmud, in philosophy a follower of Aristotle and Averroes, known to Christians as Leo Hebraeus, wrote also many works on halakhah, mathematics and astronomy. Joseph Kaspi, i.e. of Largentière (d. 1340), wrote a large number of treatises on grammar and philosophy (mytical), besides commentaries and piyyūṭim. In the first half of the century two translators Qalonymos ben David and Qalonymos ben Qalonymos, the latter of whom translated many works of Galen and Averroes, and various scientific treatises, besides writing original works, e.g. one against Kaspi, and an ethical work entitled Eben Bōhan. At the end of the century Isaac ben Moses, called Profiat Duran (Efodi), is chiefly known as an anti-Christian controversialist (letter to Meir Alguedaz), but also wrote on grammar (Ma‘aseh Efodi) and a commentary on the Mōbreh. In philosophy he was an Aristotelian. About the same time (d. about 1340) his commentaries were very active. Hillel Crescas (d. 1410) wrote against Christianity and in his Or Adomai against the Aristotelianism of the Maimonists. His pupil Joseph Albo in his ʿIqqarim had the same two objects. On the side of the Maimonists was Simeon Duran (d. at Algiers 1444) in his Ḥaggen Abōhā and in his numerous commentaries. Shim Tūb ibn Shen Tōb, the kabbalist, was a strong anti-Maimonist, as was his son Joseph of Castile (d. 1480), a commentator with kabbalistic tendencies but versed in Aristotle, Averroes and Christian doctrine. Joseph’s son Shen Tōb was, on the contrary, a follower of Maimonides and the Aristotelians. In other subjects, Saadyah ibn Danān, of Granada (d. at Oran after 1475), is chiefly important for his grammar and lexicon, in Arabic; Judah ibn Verga, of Seville (d. after 1480), was a mathematician and astronomer; Solomon ibn Verga, somewhat later, wrote Yehudah, of doubtful value historically; Abraham Zakkūth or Zakkuto, of Salamanca (d. after 1510), astronomer, wrote the Sefer Yuhasin, an historical work on Hebrew astronomy. In Italy, Obadiah Bertinoro (d. about 1500) compiled his very useful commentary on the Mishnah, based on those of Rashī and Maimonides. His account of his travels and his letters are also of great interest. Isaac Abravanel (d. 1508) wrote commentaries (not of the first rank) on the Pentateuch and Prophets and on the Mōreh, philosophical treatises and apologetics, such as the Yeshu’ot Meshibh, all of which had considerable influence. Elijah Delmedigo, of Crete (d. 1497), a strong opponent of Kabbalah, was the author of the philosophical treatise Beḥinath ha-Da’ah, but most of his work (on Averroes) was in Latin.

The introduction of printing (first dated Hebrew printed book, Rashi, Reggio, 1475) gave occasion for a number of scholarly compositors and proof-readers, some of whom were also authors, such as Jacob ben Ḥayyym of Tunis (d. about 1530), proof-reader to Bomberg, chiefly known for his masoretic work in connexion with the Rabbinic Bible and his introduction to it; Elias Levi, of Venice (d. 1534), also proof-reader to Bomberg, the author of the Massoret ha-Massoreh and other works on grammar and lexicography; and Cornelius Adelkind, who however was not an author. In the East, Joseph Karo (Qarō), wrote his Bith Yoseph (Venice, 1550), a commentary on the Ṭur, and his Shulḥan ‘Arakh (Venice, 1564) an halakhic work like the Ṭur, which is still a standard authority. The influence of non-Jewish methods is seen in the more modern tendency of Azariah dei Rossi, who was opposed by Joseph Karo. In his Me’or ‘Emeyyim (Mantua, 1573) Dei Rossi endeavoured to investigate Jewish history in a scientific spirit, with the aid of non-Jewish authorities, and even criticizes Talmudic and traditional statements. Another historian living also in Italy was Joseph ben Joshua, whose Diḇbēr ha-yamim (Venice, 1534) is a sort of history of the world, and his ‘Emeq ha-bakkah an account of Jewish troubles to the year 1575. In Germany David Gans wrote on astronomy, and also the historical work Ṭenah David (Prag, 1592). The study of Kabbalah was promoted and the practical Kabbalah founded by Isaac Luria (d. 1572). His pupil Joseph Karo, of Safed, was Moses Cordovero (d. 1570), the kabbalist, whose chief work was the Pardes Rimonim (Cracow, 1591). In the 17th century came the Samuil of Safed and Michael Ḥayyym Luria, and probably Qōl Sḵkal, against traditionalism, besides many controversial works and commentaries. Joseph Delmedigo, of Prag (d. 1655), wrote almost entirely on scientific subjects. Also connected with Prag was Yōm Tōb Lipmann Heller, a voluminous author, best known for the Tōsaphōth Yōm Tōb on the Mishnah (Prag, 1614; Cracow, 1643). Another important Talmudist, Shabbethai ben Meir, of Wilna (d. 1662), commented on the Shulḥan Arakh. In the East, David Conforte (d. about 1659) wrote the hisorical work Hillel ha-‘Ezra (Venice, 1640), using Jewish and other sources; Jacob ben Ḥayyym Zemah, kabbalist and student of Luria, wrote Qōl be-ramah, a commentary on the Zohar and on the liturgy; Abraham Hayyekin, kabbalist, chiefly remembered as a supporter of the would-be Messiah, Shabbethai Zebi, wrote Hōd Malkath (Constantinople, 1655) and sermons. In the 18th century the study of the
HEBREW RELIGION

Introduction: Abrahams, Short History of Jewish Literature (London, 1902); Steinschneider, Jewish Literature (London, 1857); Winter and Wünsche, Die jüdische Literatur (Leipzig, 1893-1895) (containing selections translated into German).

For further study: Graetz, Geschichte der Juden (Leipzig, 1853, &c.); these volumes are in various editions, with special reference to the notes; English translation by B. Löwy (London, 1841-1892) (without the notes); Zunz, Gottesdienstliche Vorträge der Juden (new ed., Frankfort-on-Main, 1892); Zur Geschichte und Literatur der Juden in Deutschland (Berlin, 1852-1860); Poëmes israélites. Further: Steinschneider, Arguthische Literatur der Juden (Frankfort-on-Main, 1892); Hebräische Übersetzungen des Mittelalters (Berlin, 1853).

On particular authors and subjects there are many excellent monographs on the Jewish Enzyklopädie (New York, 1901-6), to which the present article is much indebted.

Periodicals: Jewish Quarterly Review; Revue des études juives; Hebräische Bibliographie. (A. Cy.)

HEBREW RELIGION (1) Introduction.—To trace the history of the religion of the Hebrews is a complex task, because the literary sources from which our knowledge of that history is derived are themselves complex and replete with problems as to age and authorship, some of which have been solved according to the consensus of nearly all the best scholars, but some of which still await solution or are matters of dispute. Even if the analysis of the literature into component documents were complete, we should still possess a most imperfect record, since the documents themselves have passed through many re-dactions, and these re-dactions have proceeded from varying standpoints of religious tradition, successively eliminating or modifying certain elements deemed inconsistent with the canons of religious usage or propriety which prevailed in the age when the re-daction took place. Lastly it should be recollected that the entire body of the fragments of tradition and literature belonging to northern Israel has come down to us through the channel of Judean recensions.

The influence of the Deuteronomistic tradition in redaction is seen in such passages as Genesis xxxiii. 20 (cf. xxxi. 45 fol.); Josh. iv. 29-30, xxv. 26 fol. 1 Sam. vii. 12, where the *massèbah* or stone symbol of deity (forbidden in Deut. xii. 3, xvii. 22) is in some way got rid of (in Gen. xxxiii. 20 the word “altar” is in Hebrew is substituted). Similarly in Gen. xiii. 15, xiv. 7, xviii. 1, the Septuagint shows that the singular form “tèrebynth” stood in the original text. But the Masoretes altered this to the plural as this form was less suggestive of tree-worship (see Smend, A. Tische Religionsgesch. i. p. 134, footnote 1; Nowack, Heb. Archäol. p. 12, footnote 1). Many other examples might be cited by the “suspended isthmus” which transforms the pronunciation of the original Mosheh (Moses) into Menasseh (Manasseh) owing to the irregular practices of his descendant, Jonathan ben Gershom (Jud. xviii. 30). It is not improbable that in 2 Kgs iii. 27 the words “from Kemosh” stood after “great wrath” in the original document, as the phraseology seems bald without them, and the motives for their suppression are obvious.

So far as concerns the critical problems which stand at the threshold of our task, it must suffice to say that the main conclusions reached by the school of Kuenen and Wellhausen as to the literary partition of the Old Testament are assumed. The documents underlying the Pentateuch and book of Joshua, represented by the ciphers J, E, D, and P, are assumed to have been drawn up in the chronological order in which those ciphers are here set down, and the period of their composition extends from the 9th century B.C., in which the earlier portions of J were written, to the 5th century B.C., in which P finally took shape. The view of Professor Dillmann, who placed P before D in the regal period (though he admitted exilic and post-exilic additions in Exod., Levit., and Numb.), a view which he...
maintained in his commentary on Genesis (edition of 1892), has now been abandoned by nearly all scholars of repute. In the following pages we shall not attempt to do more than to sketch in very succinct outline the general results of investigation into the origins and growth of Hebrew religion.

2. Pre-Mosaic Religion.—Can any clear indications be found to guide us as to the religion of the Hebrew clans before the time of Moses? That Moses united the scattered tribes, probably consisting at first mainly of the Josephite, under the common worship of Yahweh, and that upon the religion of Yahweh a distinctly ethical character was impressed, is generally recognized. The tradition of the earliest document J ascribes the worship of Yahweh to much earlier times, in fact to the dawn of human life. A close survey of the facts, however, would lead us to regard it as probable that some of at least the Hebrew clans had patron-deities of their own.

(a) Both Moab and Ammon as well as Edom had their separate tribal deities, viz. Chemosh (Moab) and Milcôm (Milcom), the god of Ammon, and in the case of Edom a deity known from the inscriptions as Kôs (in Assyrian Kaûš). From the patriarchal narratives and genealogies in Genesis we infer that these races were closely allied to Israel. That in early Pre-Mosaic times parallel cults existed among the various Hebrew tribes is by no means improbable. It would be reasonable to assume that Moâb, Ammon, Edom and kindred tribes of Israel in the 15th and preceding centuries were included in the generic term Šhabûr (or Hebrews) mentioned in the Tell el-Amarna inscriptions as forming enemy bands that disturbed the security of the Canaanite dwellers west of the Jordan. Lastly Pre-Mosaic polytheism seems to be implied in the Mosaic prohibition Ex. xx. 3, xxii. 20.

(b) The tribal names Gad and Asher are suggestive of the worship of a deity of fortune (Gâl) and of the male counterpart of the goddess, Ashérâh. Under the name Shaddai (which Nöldeke suggests was originally Sheât "my demon") it is possible to discern the name of a deity who in later times came to be identified with Yahweh. On the other hand, the connection of the name Samson with sun-worship throws light on the period of the Hebrew settlement in Canaan and not on Pre-Mosaic times. Nor is it possible to agree with Baudissin (Studien zur semit. Religionsgesch. i. 55) that Elôhîm as a plural form for the name of the Hebrew deity "can hardly be understood otherwise than as a comprehensive expression for the multitude of gods embraced in the One God of Old Testament religion," in other words that it presupposes an original polytheism. For (1) Elôhîm is also applied in Judges xv. 24 to the Moabite Chemosh (Kôs) or Milcôm (in the place-name Beulah); in 2 Kings i. 3, 21, 25 Kings xi. 2 to Aâsh-toreth; in 2 Kings i. 2, ii. 6, 16 to Bâl-Zebûl of Ekon. (2) It is merely a plural of dignity (plurâlis majestatis) parallel to adônîm (applied to a king in 1 Kings xv. 8, whereas in the previous verse the singular form adôni is applied to the prophet Elijah). (3) The Tell el-Amarna inscriptions indicate that the term Elôhîm might even be applied in abject homage to an Egyptian monarch as the use of the term âlâni in this connexion obviously implies.4

The religion of the Arabian tribes in the days of Mahomet, of which a picture is presented to us by Wellhausen in his Remains of Arabic Hethendom, furnishes some suggestive indications of the religion that prevailed in nomadic Israel before as well as during the lifetime of Moses. It is true that Arabian polytheism in the time of Mahomet was in a state of decay. Nevertheless the life of the desert changes but slowly. We may therefore infer that ancient Israel during the period when they

4 Z.D.M.G. (1886). It is impossible to discuss the other theories of the origin of this name. See Driver, Commentary on Genesis, excursus i. pp. 404-406.
5 The Tell el-Amarna despatches are crowded with evidences of Canaanite forms and idioms impressed on the Babylonian language of the 'associates." See Driver, Commentary on Genesis, ii. 751, on the Canaanite Elôhîm. See opening of the letters of Abimelech of Tyre, Bezold's Oriental Diplomacy, Nos. 28, 29, 30.

inhabited the neghâb (S. of Canaan) stood in awe of the demons (Jinn) of the desert, just as the Arabs at the present day described in Doughty's Arabia deserta. We know that diseases were attributed by the Israelites to malignant demons which they, like the Arabs, identified with serpents. The counterspell took the form of a bronze image of the serpent-demon; see Frazer, Golden Bough, vol. ii. 261; and 1 Sam. v. 6, vi. 4, 5 (LXX. and Heb.), as well as Buchanan Gray's instructive note in Numbers, p. 276. The slaughter of a lamb at the Passover or Easter season, whose blood was smeared on the door-post, as described in Ex. xii. 21-23, probably points back to an immemorial custom. In this case the counterspell assumed a different form. Westermarck has shown from his observations in Morocco that the blood of the victim was considered to visit a curse upon the object to whom the sacrifice is offered and thereby the latter is made amenable to the sacrificer. It is hardly possible to doubt that in the original form of the rite described in Exodus the blood offering was made to the plague demon ("the destroyer") and possessed over him a magical power of arrest.

It is therefore certain that belief in demons and magic spells prevailed in pre-Mosaic times4 among the Israelite clans. And it is also probable that certain persons combined in their own individuality the functions of magician and sacrificer as well as soothsayer. For we know that in Arabic the Kôhîn or soothsayer, is the same partippal form that we meet with in the Hebrew Kôhên, or priest, and in the early period of Hebrew history (e.g. in the days of Saul and David) it was the priest with the ephod who is described as a soothsayer. It is only natural to ask to those who consulted him. How far totemism, or belief in defined animal and plant existst, in prehistoric Israel, as evidenced by the tribal names Simeon (hyena, wolf), Caleb (dog), Hâmâr (ass), Rahêl (ewe) and Leah (wild cow), &c. &c. as well as by the laws respecting clean and unclean animals, is too intricate and speculative a problem to be discussed here. That the food-taboo against eating the flesh of a particular animal would prevail in the clan of which that animal was the deified totem-ancestor is obvious, and it would be a plausible theory to hold that the laws in question arose when the Israelite tribes were to be consoildated into a national unity (i.e. in the time of David and Solomon), but the application of this theory to the list of unclean foods in Deut. xiv. (Lev. xi.) seems to present insuperable difficulties. In fact, while Robertson Smith (in Kinship and Marriage in Early Arabia, as well as his Religion of the Semites, followed by Stade and Benzing) strongly advocated the view that clear traces of totemism can be found in early Israel, later writers, such as Driver, Gesch. der israel. Religion, 4th ed., p. 24, Kautzsch, Beitr., pp. 7 to 9; Driver, Kautzsch's already cited, p. 613, and recently Addis in his Hebrew Religion, p. 33 foll., have abandoned the theory as applied to Israel. On the other hand, the evidence for the existence of ancestor-worship in primitive Israel cannot be so easily disposed of as Kautzsch (ibid. p. 615) appears to think. We have examples (1 Sam. xvii. 15) in which Elôhîm is the term which is applied to departed spirits. Oracles were received from them (Isa. viii. 19, xxvii. 15; Deut. xviii. 15 ff.). At the graves of national heroes or ancestors worship was paid. In Gen. xxxv. 20 we read that a mastâbâ of sacred pillar was erected at Raêl's tomb. The Terâmêh, which we know to have resembled the human form (1 Sam. xix. 13, 16), were ancestral images is a reasonable theory. That they were employed in divination is consonant with the facts already noted. Lastly, the rite of circumcision (q.v.), which the Hebrews practised in common with their Semitic neighbours as well as the Egyptians, belonged to ages long anterior to the time of Moses. This is a fact which has long been recognized; cf. Gen. xvii. 10 foll.,

4 "Magic and Social Relations" in Sociological Papers, ii. 150.
6 See Benzing, Hebräische Archäologie, pp. 152, 287 foll. (1st ed.).
7 The theory was opposed by Nöldeke, 146. (2nd ed.), p. 187., as well as by Wellhausen and recently by Jacob and Zelzatter (Der Totemismus u. die Religion Israelis). See Stanley A. Cook, "Israel and Totemism," in J.Q.R. (April, 1902).
HEREBE RELIGION

Herod. ii. 104, and Barton, Semitic Origins, pp. 98-100. Probably the custom was of African origin, and came from eastern Africa along with the Semitic race. Regarding Arabia, see Doughty, Arabia deserti, i. 340 foll.

It is necessary here to advert to a subject much debated during recent years, viz. the effects of Babylonian culture in western Asia on Israel and Israel's religion in early times even preceding the advent of the Moabites. The great influence exerted by Babylonian culture over Palestine prior to the Persian age is now generally acknowledged. The subsequent discovery of a document written in Babylonian cuneiform at Lachish (Tell el Hesy), and more recently still of another in the excavations at Ta'annek, have established the fact beyond all dispute. The last discovery had tended to confirm the views of Fried. Delitzsch, Jeremias (Monothelitische Strömungen) and Baentsch, that monotheistic tendencies are to be found in the midst of Babylonian polytheism. Page Renouf, in his Hibbert lectures, Origin and Growth of Religion as illustrated by that of Ancient Egypt (1879), p. 80, pointed out this monotheistic tendency in Egyptian religion, as did de Rougé before him. Baentsch draws attention to this feature in his monograph Alltorientalischer u. israelitischer Monotheismus (1906). This tendency, however, he, unlike the earlier conservative writers, rightly considers to have emerged out of polytheism. He ventures into a more disputable region when he penetrates into the obscure realm of the Abrahamic migration and finds in the Abrahamic traditions of Genesis the higher Canaanite monotheistic tendencies evolved out of Babylonian astral religion, and reflected in the name El-Elyon (Gen ii. 18, 2). Whether discoveries like Sellin's find at Ta'annek may elucidate the problem. See Baudissin in Theol. iii. Zeitung (27th October 1906).

3. The Era of Moses.—We are now on safer ground though still obscure. Moses was the first historic individuality who can be said to have welded the Israelite clans into a whole. This could never have been accomplished without unity of worship. The object of this worship was Yahweh. As we have already indicated, the document J assumes that Yahweh was worshipped by the Hebrew race from the first. On the other hand, according to P (Ex. vi. 2), God spoke to Moses and Sinai, 50 foll. "I am Yahweh. But I appeared to Abraham, Isaac and Jacob by the name of Shaddai and by my name Yahweh I did not make myself known to them." According to this later tradition Yahweh was unknown till the days of Moses, and under the aegis of His power the Hebrew tribes were delivered from Egyptian thraldom. The truth probably lies somewhere between these two sharply contrasted traditions. So much is clear. Yahweh now becomes the supreme deity of the Hebrew people, and an ark analogous to the Egyptian and Babylonian ark portrayed by the monuments was constructed as embodiment of the numen of Yahweh and was borne in front of the Hebrew army when it marched to war. It was the signal victory won by Moses at the exodus against the Egyptians and in the subsequent battle at Rephidim against 'Amalek (Ex. xvii.) that consolidated the prestige of Yahweh, Israel's war-god. Indications in the Old Testament itself clearly point to the celestial or atmospheric character of the Yahweh of the Hebrews. The supposition that the name originally contained the notion of permanent or eternal being, and was derived from the verbal root signifying 'to be,' involves too abstract a conception to be probable, though it is based on Ex. iii. 15 (E) representing a tradition which may have prevailed in the 8th century B.C. Kautzsch, however, supports it (Hustiges's D.B., ext. vol. i. 280). A. A. Meyer, in his 'Babylonian Tablets,' p. 38, supports the view proposed by recent scholars (see Jeremjah). That the name also prevailed as that of a god among other Semitic races (or even non-Semitic) is rendered certain by the proper names Jau-bi-di (= Ilu-bi-di) of Hamath in Sargon's inscriptions, Ahi-jawi (mi) in Sellin's discovered tablet at Ta'annek, to say nothing of those which have been found in the documents of Khammurabi's reign. It has generally been held that Stade's suggestion has much to recommend it, that it was derived by Moses from the Kenites, and should be connected with the Sinai-Horeb region. The name Sinai suggests moon-worship and the moon-god Sin; and it also suggests Babylonian influence. (cf. also Meru-Nebo, which was a place-name both in Moab and in Judah, and which connects itself with the name of the Babylonian deity). Several indications favour the view of the connexion in the age of Moses between the Yahweh-cult at Sinai and the moon-worship of Babylonian origin to which the name Sinai points (Sin being the Babylonian moon-god). We note (a) that in the worship of Yahweh the sacred seasons of new moon and Sabbath are obviously lunar. Recent investigations have even been held to disclose the fact that the Sabbath coincided originally, i.e. in early pre-exilian days, with the full moon. (b) It also accords with the name bestowed on Yahweh as "Lord of Hosts" (hashibbath) or stars, which were regarded as personified beings (Jer. xxvii. 5) and attendants on the celestial Yahweh, constituting His retinue (r Kings xxii. 10) which fought on high while the earthly armies of Israel, His people, contended below (Judges v. 20).

The atmospheric and celestial character which belonged from the first to the Hebrew conception of Yahweh explains to us the ease with which the idea of His universal sovereignty arose, which the Yahwistic creation account (belonging to the earlier stratum of J, Gen. ii. 4b foll.) presupposes. How this came to be overlaid by narrow local limitations of His power and province will be considered later. It is important for us here to consider the larger rather than the narrower conception of Yahweh's sphere of influence. While the ark carried with Israel's host symbolized His presence in their midst, He was also known to be present in the cloud which hovered before the host and in the lightning ('esk Yahweh or "fire of Yahweh") and the thunder (kôl Yahweh or "voice of Yahweh") which played around Mount Sinai. Moreover, it is hardly probable that a great leader like Moses remained unaffected by the higher conceptions tending towards monotheism which prevailed in the great empires of the Nile and on the Euphrates. In Egypt we know that Amenophis IV. came under this monotheistic movement, and attempted to suppress all other gods except that of the sun-deity, of which he

8 Cf. Zimmern in Z.D.M.G. (1904), pp. 199 foll., 438 foll. This view is based on Dr Pinches's discovered list in which Se'patti is called the "seer of the Sea of Biblical Archers," p. 868-869. Jeremias, Das A.T. im Lichte des alten Orient (2nd ed.), pp. 182-187. Marti, in his stimulating work Religion des A.T., pp. 5, 72, advocates the exclusive reference of the word Sabbath to the full moon of the first day of the week, in his Conversations sur la relation des Meinhold replies in Z.A.T.W. (1909), p. 81 f. Cf. also Hohn, Siebenzahl and Sabbath. While admitting that a special significance may have been attached in pre-exilian times to the full-moon Sabbath, and that the latter may have been in some way connected "with the moon and Sabbath" in the 8th-century prophets (Hos. ii. 13; Amos viii. 5; Isa. i. 13), we are not prepared to deny that the institution of a seventh-day Sabbath was an ancient pre-exilic tradition. The sanction of the number seven is based on the seven planetary deities to whom each day of the week was respectively dedicated, i.e. was astral in origin. Cf. C.O.T. i. 18 foll., and Winckler, Festschrift, pp. 307, 308, 309. Meinhold replies in Z.A.T.W. (3rd ed.), pp. 620-626. In the Old Testament the sanctity of the number seven is clearly fundamental (e.g. in the Nif'lam form nishbath, to swear," in the derivative substa. for cahath, "in Be'er-sheba, etc.). The day by day of each week of the early Sabaean was connected with the day and of the fallow field. It is, therefore, impossible to detach Ex. xxiii. 12 from Ex. xxii. 2, xxiii. 10 foll.; cf. Ex. xxiv. 21. We therefore hold that the day of the seventh day of each week was the Sabbath. The general coincidence of the Sabbath or seventh day with the easily recognized first quarter and full moon established its sacred character as lunar as well as planetary.
was a devoted worshipper. We also know that between 2000 and 1400 B.C., the Babylonian language as well as Babylonian civilization and ideas spread over Palestine (as the Tell el Amarna tablets clearly testify). The ancient Babylonians clearly reveal that the highest minds were moving out of polytheism into monotheistic identification of various deities as diverse phases of one underlying essence. A remarkable Babylonian tablet discovered by Dr. Pinches represents Marduk, the god of light, as identified in his person with all the chief deities of Babylonia, who are evidently regarded as his varying manifestations.\footnote{The influence of Mosaic teaching and law a definitely ethical character was ascribed to Yahweh. It was His "finger" that wrote the brief code which has come down to us in the divine law (Deut. 6:4). Exod. 35, Interpolating, unassisted by Assyrian or Phoenician, has no distinctive form for "godness." From first to last the true religion of Yahweh was pure of sexual taint. The ke'deshim and ke'deshoth, the male and female priest attendants in the Baal and 'Ashoret shrines (cf. the kadishitu of the temples of the Babylonian Ishtar) were foreign Canaanite elements which became imported into Hebrew worship during the period of the Hebrew settlement in Canaan. Lastly, the earliest codes of Hebrew legislation (Ex. xxii.-xxxix.) bear the distinct impress of the high ethical character of Yahweh's requirements originally set forth by Moses. Of this tradition the Naboth incident in the time of Ahab furnishes a clear example which brings to light the contrast between the Tyrian Baal-cult, which was scarcely ethical, and of which Jezebel and Ahab were devotes, and the moral requirements of the religion of Yahweh of which Elijah was the prophet and impassioned exponent. It was this definite basis of ethical Mosaic religion to which the prophets of the 8th century appealed, and apart from which their denunciations become meaningless. To this early standard of life and practice Ephraim was faithful in the days of the prophet Hosea (see his oracles passim—especially chaps. i.-iv. and iv.), and Judah in the time of Isaiah turned a deaf ear (Isa. i. 2-4, 21).}

\textit{4. Influence of Canaan.}—The entrance of Israel into Canaan marks the beginning of a new epoch in the development of Israel's religious life. For it involved a transition from the simple nomadic relations to those of the agricultural and more highly civilized Canaanite life. This subject has been recently treated with admirable clearness by Marti in his useful treatise Die Religion des A.T. (1906), pp. 25-41.

It is in the festivals of the annual calendar that this agricultural impress is most fully manifested. To the original nodal Pesah (Passover)—sacrifice of a lamb—there was attached a distinct and agricultural festival of unleavened cakes (massahlk) which marks the beginning of the corn harvest in the middle of the month Abib (the name of which points to its Canaanite and Hebrew origin). The close of the corn-harvest was marked by the festival Shabbathoth (weeks) or K'as (harvest) held seven weeks after massoth. The last and most characteristic festival of Canaanite life was that of Asiph or "ingathering" (see Fests., Passover, Pentecost and Tabernacles). Another special characteristic of Israel's religion in Canaan was the considerable increase of sacrificial offerings. Animal sacrifices became much more frequent, and included not only the bloody sacrifice (Zebah) but also burnt offerings (kal'd, 'olah) whereby the whole animal was consumed (see Sacrifice). But we have in addition to the animal sacrifices, vegetable offerings of meal, oil and cakes (massoth, ashishak and kawwan), which last is specially connected with the 'Ashoret cult: Jer. vii. 18, xvii. 19, as well as the "bread of the Presence." (Iechem habbam, 1 Sam. xxvi. 6. Whether the primitive rite of water-offerings (1 Sam. vii. 6; 2 Pet. xxii. 16) belonged to early nomadic Israel (as seems probable) is not now possible to say with certainty. Again, the conception of Yahweh suffered modification. In the desert he was worshipped as an atmospheric deity, who manifested himself in thunder and lightning, whose abode was in the sky, whose sanctuary was on the mountain summit of Horeb-Sinai, and whose movable pavilion was the ark of the covenant. But when the nomadic clans of Israel came to occupy the settled abodes of the agricultural Canaanites who had a stake in the soil which they cultivated, these conditions evidently reacted upon their religion. Now the local Baal was the divine owner of the fertile spot where his sanctuary (godesh) was marked by the upright stone pillar, the symbol of his presence, on which the blood of the slaughtered victim was smeared. To this Baal the productivity of the soil was due. Consequently it was needful to secure his favour, and in order to gain this gifts were made to him by the local resident population who depended on the produce of the land (see Baal especially ad init.). Now when the Hebrews succeeded to these agricultural conditions and acquired possession of the Canaanite abodes, they naturally fell into the same cycle of religious ideas and tradition. Yahweh ceased to be exclusively regarded as god of the atmosphere, worshipped in a distant mountain, Horeb-Sinai, situated in the south country (negebh), and moving in the clouds of heaven before the Israelites in the desert, but he came to be associated with Israel's life in Canaan. He manifested His presence either by a signal victory over Israel's foes (Josh. x. 10, 11; 1 Sam. vii. 10-12) or by a thunderstorm (1 Sam. xii. 18) or through a dream (Gen. xxviii. 16 foll.; cf. 1 Kings iii. 5 foll.) at a sacred spot like Bethel. Accordingly, whenever His presence and power were displayed in places where the Canaanite Baal had been worshipped, they came to be attached to these spots. He had "put his name," "i.e. power and presence (nummen) there, and the same festivals and sacrifices which had previously been devoted to the cult of the Canaanite Baal were now annexed to the service of Yahweh, the war-god of the conquering race. The process of transference was facilitated by two potent causes: (a) Both Canaanite and Hebrew spoke a common language; (b) the name Baal is not in reality an individual proper name like Kemosh (Chemosh), Rammân or Hadad, but is, like El (Ilu) "god," an appellative meaning "lord," "owner" or "husband." The name Baal might therefore be used for any deity such as Milk (Milcom) or Shemesh ("sun") who was the divine owner of the spot. It was simply a covering epithet, and like the word "god" could be transferred from one deity to another. In this way Yahweh came to be called the Baal or "lord" of any sacred object or spot which the Canaanites had consecrated, and Yahweh was naturally identified with the place as "his mighty hand and outstretched arm." (See Kautzsch in Hastings's D.B., extra vol., p. 645 foll.) Such was the path of syncretism, and it was fraught with agricultural origin).
HEBREW RELIGION

180

Israelite tribes by the rallying cry "the sword of Yahweh" (Judges vii. 20). In this way 'Ophrah became the centre of the coalition under Gideon in the tribe of Manasseh. Its importance is attested by Judges viii. 22-28, and we may disregard the "snare" which the Deuteronomist writer condemns in accordance with the later canons of orthodoxy. What 'Ophrah became on a small scale in the days of Gideon, Jerusalem became on a larger scale in the days of David and his successors. It was the religious expression of the unity of Israel which the life and death struggle with the Philistines had gradually wrought out.

Despite the capture of the ark after the disastrous battle of Shiloh, Yahweh had in the end shown himself through a destructive plague superior in might to the Philistine Dagon. There are indeed abundant indications that prove that in the prevalent popular religion of the regal period monotheistic conceptions had no place. Yahweh was god only of Israel and of Israel's land. An invasion of foreign territory would bring Israel under the power of its patron-deity. The wrath with which the Israelite armies believed themselves to be visited (probably an outbreak of pestilence) when the king of Moab had reduced his land to extremity, was obviously the wrath of Chemosh the god of Moab, which the king's sacrifice of human beings had awakened against the invading army (2 Kings viii. 21).

In other-words, the ordinary Israelite worshipper of Yahweh was at this time far removed from monotheism, and still remained in the preliminary stage of henotheism, which regarded Yahweh as sole god of Israel and Israel's land, but at the same time recognized the existence and power of the deities of other lands and peoples. Of this we have recurring examples in pre-exilian Hebrew history. See 1 Sam. xxvi. 10; Judges xi. 23, 24; Ruth i. 16.

Characteristics and Constituent Elements.—It is only possible here to refer in briefest enumeration to the material and external objects and forms of popular Hebrew religion. These were of the simplest character. The upright stone (or massébah) was the material symbol of deity on which the blood of sacrifice was smeared, and in which the number of the god resided. It is probable that in some primitive sanctuaries no real distinction was made between this stone-piller and the altar or place where the animal was slaughtered. In ordinary pre-exilian high places the custom described in the primitive compend of laws (Ex. xx. 24) would be observed. A mound of earth was raised which would serve as a platform on which the victim would be slaughtered in the presence of the concourse of spectators. In the more important shrines, as at Jerusalem or Samaria, there would be an altar of stone or of bronze. Another accomplishment of the sanctuary would be the sacred tree—most frequently a terebinth (cf. Judges ix. 37 "terebinth of soothsayers"), or it might be a palm tree (cf. "palm tree of Deborah" in Judges iv. 5), or a tamarisk ('eshet), or pomegranate (rimmón), as at the high place in Gibeah where Saul abode. Moreover, we have frequent references to sacred springs, as that of Béth-skeba, 'Einharóth (\'eyer-yarod) (Judges vii. 1; cf. also Judges 19, 'En-hakkôrê (\'eyn-haqqôre). On this subject of holy trees, holy waters and holy stones, consult article TREE-WORSHIP, and Robertson Smith's Religion of the Semites, 2nd ed., pp. 165-197."

The wide prevalence of magic and soothsaying may be illustrated from the historical books of the Old Testament as well as from the pre-exilian prophets. The latter indeed tolerated the gôšēm (soothsayer) as they did the seer (rô'eh). The rabhdomancy denounced by Hosea (iv. 12) was associated with idolatry at the high places. But the arts of the necromancer were always and without exception treated as foreign to the religion of Yahweh. The necromancer of bu'âl 'ôbî was held to be possessed of the spirit who spoke through him with a hollow voice. Indeed both necromancer and the spirit that possessed him were sometimes identified, and the former was simply called ôbî. It is probable that necromancy, like the worship of Asherah and 'Ashtoreth, as well as the cult of graven images, was a Canaanite importation into Israel's religious practices. (See Marti, Religion des A.T., p. 32.)

peril to the older and purer faith. For when Yahweh gradually became Israel's local Baal he became worshipped like the old Canaanite deity, and all the sensuous accompaniments of Kedeshhôt, as well as the presence of the ashērâh or sacred pole, became attached to his cult. But the symbol carried with it the numen of the goddess symbolized, and there can be little doubt that Asherah came to be regarded as Yahweh's consort. In the days of Manasseh syncretism went on unchecked even in the Jerusalem temple and its precincts, and it was not until the year of Josiah's reformation (630 B.C.) that the Kedeshim and Kedeshhôt as well as the Ashérah were burnt out, for away from Yahweh's sanctuary (2 Kings xxvii. 2, xxviii. 7), which their presence had profaned.

Now local worship means the differentiation of the personality worshipped in the varied local shrines, in other words Ba'alim or Baals. Just as we have in Assyria an Ishtar of Arbela and an Ishtar of Nineveh (treated in Assur-bani-pal's (Rassam) cylinder like two distinct deities), as we have local Madonnas in Roman Catholic countries, so must it have been with the cults of Yahweh in the regal period carried on in the numerous high places. The Ashérah, the Shiloh (til its destruction by the depredations of lions, and a priest from the depredated Ephraimites is sent to them to teach them the worship of Yahweh, the god of the land. Similarly in the earlier pre-exilian period of Israel's occupation of Canaanite territory the Hebrews were always subject to this tendency to worship the old Baal or 'Ashenting (the goddess who made the cattle and flocks prolific). A few years of drought or of bad seasons would make a Hebrew settler betake himself to the old Canaanite gods. Even in the days of Hosea the rivalry between Yahweh and the old Canaanite Baal still continued. The prophet reproaches his Ephraimite countrymen for going after their "lovers," the old local Baals who would have bestowed on them the bread, water, wool, flax and oil, and for not knowing that "it is I (Yahweh) who have bestowed on her (i.e. Israel) the corn, the new wine and the oil, and have bestowed on her silver and gold in abundance which they have wrought into a Baal image" (Hos. ii. 10).

External danger from a foreign foe, such as Midian or the Philistines, at once brought into prominence the claim and power of Yahweh, Israel's national war-god since the great days of the exodus. The religion of Yahweh (as Wellhausen said) meant patriotism, and in war-time tended to weld the participat-
ing tribes into a national unity. The book of Judges with its "moonicronous tempore—religious declension, oppression, rebellion, ease, peace," to which Wellhausen refers as its ever-recurring cycle, makes us familiar with these alternating phases of action and reaction. Times of peace meant national disintegration and the lapse of Israel into the Canaanite local cults, which is interpreted by the redactor as the prophets of the 8th century would have interpreted it, viz. as defection from Yahweh. On the other hand, times of war against a foreign foe meant on the religious side the unification, partial or complete, of the

1 The allusion in Amos ii. 7; Hos. iv. 13, 14 is sufficiently explicit; cf. Jer. ii. 20, 3; iii. 6-11; vi. 1, 7, 8. The practice is prohibited in Deut. xxvii. 17.

2 Column i. 15, 16, 42, 43, ii. 128, iii. 30, 31, iv. 47, 48, etc. Probably we should regard them as differentiated hypostases.

3 They are the gods of the Anoints in the Babylonian cylinders ii. 15, 18; xxviii. 18. A like function belonged to the Babylonian Ishtar, See "Descent of Ishtar to Hades," Rev. lines 6-10, where universal non-intercourse of sexes follows Ishtar's departure from earth to Hades.

HEBREW RELIGION

The history of the rise of the priesthood in Israel is exceedingly obscure. In the nomadic period and during the earlier years of the settlement of Israel in Canaan the head of every family could offer sacrifices. In the primitive codes, Ex. xx. 23-xxiii. 19 (E), xxxiv. 10-19 (J), we have no allusion to any order of men who were qualified to offer sacrifices. In Ex. xxiv. 5 (E) we read that Moses simply commissioned young men to offer sacrifices. On the other hand the addendum to the book of Judges, chaps. xvii., xviii. (which Budde, Moore and others consider to belong to the two sources of the narratives in Judges, viz. J as well as E), makes reference to a Levite of Bethlehem-Judah, expressly stated in xviii. 7 as belonging to a clan of Judah. This man Micah took into his household as priest. This narrative has all the marks of primitive simplicity. There can be no reasonable doubt that the Levite here was member of a priestly tribe or order, and this view is confirmed by the discovery of what is really the same word in south Arabian inscriptions. The narrative is of some value as it shows that while it was possible to appoint any one as a priest, since Micah, like David, appointed one of his own sons (xviii. 5), yet a special priest-tribe or order also existed, and Micah considered that the acquisition of one of its members was for his household a very exceptional advantage: "Now I know that Yahweh will befriend me because I have the Levite as priest." In other words a priest who was a Levite possessed a superior professional qualification. He is paid ten shekels per annum, together with his food and clothing, and is dignified by the appellation "father" (cf. the like epithet of "mother") applied to the prophetess Deborah, Judges v. 7; see also 2 Kings ii. 12, vi. 21, xili. 14). This same narrative dwells upon the graven images, ephod and teraphim, as forming the apparatus of religious ceremonial in Micah's household. Now the ephod and teraphim are constantly mentioned together (cf. Hos. iii. 4) and were used in divination. The former was the plated image of Yahweh (cf. Judges viii. 26, 27) and the latter were ancestral images (see Marti, op. cit. pp. 27, 29; Harper, Int. Comm. "Amos and Hosen," p. 222). In other words the function of the priest was not merely sacrificial (a duty which Kautzsch unnecessarily detaches from the services which he originally rendered), nor did he merely bear the ark of the covenant and take charge of God's house; but he was also and mainly (as the Arabic name kāhin shows) the soothsayer who consulted the ephod and gave the answers required on the field of battle and to private individuals on other occasions. This is clearly shown in the "blessing of Moses" (Deut. xxxii. 8), where the Levite is specially associated with another apparatus of inquiry, viz. the sacred lots, Urim and Thummim. The true character of Urim (as expressing "eye") and Thummim (as expressing "nay") is shown by the reconstructed text of 1 Sam. xiv. 41 on the basis of the Septuagint. See Driver ad loc.

Gentility of worship.

The chief and most salient characteristic of the worship of the high places was gentility. The sacrifice was a feast of social communion between the deity and his worshippers, and knit both deity and clan-members together in the bonds of a close fellowship. This gentilial aspect of Hebrew worship is nowhere depicted more graphically than in the old narrative (a J section = Budde's G) 1 Sam. ix. 19-24, where a day of sacrifice in the high place is described. Saul and his attendants are invited by the seer-priest Samuel into the banqueting chamber (liskhah) where thirty persons partake of the sacrificial meal. It was the "liskhah or festival of ingathering, when the agricultural operations were brought to a close, which exhibited these genial features of Canaanitic-Hebrew life most vividly. References to them abound in pre-exilic literature: Judges xxi. 21 (cf. ix. 27); Amos viii. 1 foll.; Hos. ix. 1 foll.; Jer. xxxi. 4; Isa. xvi. 10 (Jer. xlviii. 33). These festivals formed the veins and arteries of ancient Hebrew clan and tribal life. 1 Wellhausen's characterization of the Arabian ḥājj 2 applies with equal force to the Hebrew hagg (festival): "They formed the rendezvous of ancient life. Here came under the protection of the peace of God the tribes and clans which otherwise lived apart from one another and only infrequently passed peace and security within their own frontiers." 3 Sam. xx. 28 foll. indicates the strong claims on personal attendance exercised on each individual member by the local clan festival at Bethlehem-Judah.

It is easy to discern from varied allusions in the Old Testament that the Canaanite impress of sensuous life clung to the autumnal vintage festivals. They became orgiastic in character and scenes of drunkenness, cf. Judges ix. 27; 1 Sam. 14-16; Isa. xxviii. 7, 8. Against this tendency the Nasa'ile order and tradition was a protest. Cf. Amos ii. 11 foll.; Judges xiii. 7, 14. As certain sanctuaries, Shilo, Shechem, Bethel, &c., grew in importance, the priesthoods that officiated at them would acquire special prestige. Eli, the head priest at Shilo in the early youth of Samuel, held an important position in what was then the chief religious and political centre of Ephraim; and the office passed by inheritance to the sons in ordinary cases. In the regal period the royal residence gave the priesthood of that place an exceptional position. Thus Zadok, who obtained the priestly office at Jerusalem in the reign of Solomon and was succeeded by his sons, was regarded in later days as the founder of the true and legitimate succession of the priesthood descended from Levi (Ezek. xl. 46, xliii. 10, xlv. 15; cf. 1 Kings ii. 27, 35). His descent, however, from Eleazar, the elder brother of Aaron, can only be regarded as the later artificial construction of the post-exilian chronicler (1 Chron. vi. 15-19, 50-53, xxiv. 1 foll.), who was controlled by the traditions which prevailed in the 4th century B.C. and after.

6. The Prophets.—The rise of the order of prophets, who gradually emerged out of and became distinct from the old Hebrew "see" or augur (1 Sam. ix. 9), 4 marks a new epoch in the religious development of the Hebrews. Over the successive stages of this growth we pass lightly (see Prophet). The life-and-death struggle between Israel and the Philistines in the reign of Saul called forth under Samuel's leadership a new order of "men of God," who were called "prophets" or divinely inspired speakers. 5 These men were distributed in various settlements, and their exercises were usually of an ecstatic character. The close modern tie between modern prophecy and old heresy would be the orders of diviners in Islam. Probably there was little externally to distinguish the prophet of Yahweh in the days of Samuel from the Canaanitic-Phoenician prophets of Baal and Asherah (1 Kings xviii. 19, 26, 28), for the practices of both were ecstatic and orgiastic (cf. 1 Sam. x. 5 foll., xviii. 10, xix. 23 foll.). The special quality which distinguished these prophetic gilds or companies was an intense patriotism combined with enthusiastic devotion to the cause of Yahweh. This necessarily involved in that primitive age an extreme jealousy of foreign importations or innovations in ritual. It is obvious from numerous passages that these prophetic gilds recognized the superior position and leadership of Samuel, or of any other distinguished prophet such as Elijah or Elisha. Thus 1 Sam. xix. 20, 23 et seq. show that Samuel was regarded as head of the prophetic settlement at Naoboth. With reference to Elijah and Elisha, see 2 Kings ii. 3, 5, 15, iv. 1, 38 et seq., vi. 1 et seq. There cannot be any doubt that

2 Wellhausen, Rasse arabischtn Heidentums (2nd ed.), p. 89.

3 Though this be an interpolated gloss (Thenius, Budde), it states a significant truth as Kautzsch clearly shows, op. cit. p. 672. In Micah iii. 7 the ḫērē is mentioned in a sense analogous to the ḫājj known in analogy with the ḫāmēm or "soothsayer," viz. as spurious; cf. Deut. xviii. 10.

4 No better derivation is forthcoming of the word ṣabbē, "prophet," than that it is a Kāftl form of the root ṣēbbē = Assyry. nabbâ, "speak."
such enthusiastic devotees of Yahweh, in days when religion meant patriotism, did much to keep alive the flame of Israel's hope and courage in the dark period of national disaster. It is significant that Saul in his last unavailing struggle against the overwhelming forces of the Philistines sought through the medium of a sorceress for an interview with the deceased prophet Samuel. It was the advice of Elisha that rescued the armies of Jehoram and Jehoshaphat in their war against Moab when they were involved in the waterless wastes that surrounded them (2 Kings iii. 14 foll.). We again find Elisha intervening with effect on behalf of Israel in the wars against Syria, so that his fame spread to Syria itself (2 Kings v.-viii. 7 foll.). Lastly it was the fiery counsels of the dying prophet, accompanied by the acted magic of the arrow shot through the open window, and also of the thrice smitten floor, that gave nerve and courage to Joash, king of Israel, when the armies of Syria pressed heavily on the northern kingdom (2 Kings xii. 14-15).

We see that the prophet had now definitely emerged from the old position of "seer." Prophetic personality now moved in a larger sphere than that of divination, important though that function be in the social life of the ancient Hebrew, as it remained with the Hebrews, in declaring the will of the deity when any enterprise was on foot. For the prophet's function became in an increasing degree a function of mind, and not merely of traditional routine or mechanical technique, like that of the diviner with his arrows or his lots which he cast in the presence of the ephod or plated Yahweh image. The new name nabbi1 became necessary to express this function of more exalted significance, in which human personality played its larger rôle. Even as early as the time of David it would seem that Nathan assumed this more developed function as interpreter of Yahweh's righteous will to David. But both in 2 Sam. xii. 1-15 as well as in 2 Sam. vii. we have sections which are evidently coloured by the conceptions of a later time. We stand on safer ground when we come to Elijah's bold intervention on behalf of righteousness when he declared in the name of Yahweh the divine judgment on Ahab and his house for the judicial murder of Naboth. We here observe a great advance in the vocation of the prophet. He becomes the interpreter and vindicator of divine justice, the vocal exponent of a nation's conscience. For Elijah was in this case obviously no originator or innovator. He represents the old ethical Mosaic views which had disappeared from the national consciousness, but still remained in a sort of ethnographic fact, even as the prophets of the following century based their appeals and denunciations. It is highly significant that Elijah, when driven from the northern kingdom by the threats of the Tyrian Jezebel, retreats to the old sanctuary at Horeb, whence Moses derived his inspiration and his Torah.

We have hitherto dealt with isolated examples of propheticism and its rare and distinguished personalities. The ordinary Hebrew nabbi still remained not the reflective visionary, stirred at times by music into strange raptures (2 Kings iii. 15), but the ecstatic and orgiastic dervish who was meshugoh or "frenzied," a term which was constantly applied to him from the days of Elisha to those of Jeremiah (2 Kings ix. 11; in Hos. ix. 7 and Jer. xxix. 26 it is regarded as a term of reproach). It is only in rare instances that some exalted personality is raised to a higher level. Of this we have an interesting example in the vivid episode that preceded the battle of Ramlot-Gilead described in 1 Kings xxii., when Micahah appears as the true prophet of Yahweh, who in his rare independence stands in sharp contrast with the conventional court prophets, who prophesied then, as their descendants prophesied more than two centuries later, smooth things.

It is clear, however, till the 8th century that prophecy attained its highest level as the interpreter of God's ways to men. This is due to the fact that it for the first time unfolded the true character of Yahweh, implicit in the old Mosaic religion and submerged in the subsequent centuries of Israel's life in Canaan, but now at length made clear and explicit to the mind of the

1 In Isa. iii. 2 the soothsayer is placed on a level with the judge, prophet and elder.
HEBREW RELIGION

Yahweh would be powerless in the presence of Ashur (2 Kings xviii. 33-35). This problem of religion was solved by Amos and by the prophets who succeeded him through a more exalted conception of Yahweh and His sphere of worthiness, which tended to detach Him from His limited realm as a national deity. Amos exhibited Him to his countrymen as lord of the universe, who made the seven stars and Orion and turns the deep midnight darkness into morning. He calls to the waters of the sea and pours them on the earth's surface (chap. v. 8). Such a universal God of the world would hardly make Israel His exclusive concern. Thus He not only brought the Israelites out of Egypt, but also the Philistines from Caphtor and the Syrians from Kir (ix. 7). But Amos what beyond this Yahweh was not only the lord of the universe and possessed of sovereign power. The prophet also emphasized with passionate earnestness that Yahweh was a God whose character was righteous, and God's demand upon His people Israel was not for sacrifices but for righteous conduct. Sacrifice, as this prophet, like his successor Jeremiah, insisted (Amos v. 25; cf. Jer. vii. 22) played no part in Mosaic religion. In words which evidently impressed his younger contemporary Isaiah (cf. esp. Is. chap. i. 11-17), Amos denounced the non-ethical ceremonial formalism of his countrymen which then prevailed (chap. v. 21 foll.):—

"I hate, I contemn your festivals and in your feasts I delight not; for within you are burnt-offerings and sacrifices offered up all day long; and I will not look on your burnt-offerings, nor will I accept your fatted offerings: I will not accept offerings at your hands. Why should you bring me burnt-offerings or burnt offerings, the sacrifices of your sinful offering: I will not accept it, says the Lord of hosts; when you offer burnt-offerings and the sacrifice of the New Moon, and the burnt-offerings of sabbaths, I will not accept it at your hands, says the Lord; and though you offer me burnt-offerings and the sacrifice of the New Moon, and the burnt-offerings of sabbaths, I will not accept it at your hands, says the Lord of hosts; and though you offer me burnt-offerings and the sacrifice of the New Moon, and the burnt-offerings of sabbaths, I will not accept it at your hands, says the Lord. But let judgment roll down like waters, and righteousness like a perilous brook."  

In the younger contemporary prophet of Ephraim, Hosea, the stress is laid on the relation of love (ḥesed) between Yahweh, the divine husband, and Israel, the faithless spouse. Israel's faithlessness is shown in idolatry and the prevailing corruption of the high places in which the old Canaanite Baal was worshipped instead of Yahweh. It is shown, moreover, in foreign alliances, compacts with a powerful foreign state, under whose aegis Israel was glad to shelter, involved covenants sealed by sacrificial rites in which the deity or deities of the foreign state were involved as well as Yahweh, the god of the weaker vassal-state. And so Yahweh's honour was compromised. While these aspects of Israel's relation to Yahweh are emphasized by the Ephraimitic prophet, the larger conceptions of Yahweh's character as universal Lord and the God of righteousness, whose government of the world is ethical, emphasized by the prophet of Tekoa, are scarcely presented. In Isaiah both aspects—divine universal sovereignty and justice, taught by Amos, and divine loving-kindness to Israel and God's claims on His people's allegiance, taught by Hosea—are fully expressed. Yahweh's relation of love to Israel is exhibited under the purer symbol of fatherhood (Isa. i. 2-4), a conception which was as ancient and familiar as that of husband and wife, though perhaps the latter recurs more frequently in prophecy (Isa. i. 21; Ezek. xvi. &c.). Even more insistently does Isaiah present the great truth of God's universal sovereignty. As with his elder contemporary, the foreign peoples—but in Isaiah's oracle Assyr and Egypt as well as the Palestinian races—come within his survey. The "fullness of the earth" is Yahweh's glory (vi. 3) and the nations of the earth are the instruments of His irresistible and righteous will. Assyria is the "bee" and Egypt, the "fly," for which Yahweh bides. Assyria is the "hired razor" (Isa. vii. 18, 19), or the "rod of His wrath," for the chastisement of Israel (x. 5). But the instrument unduly exalts itself, and Assyria itself shall suffer humiliation at the hands of the world's divine sovereign (x. 7-15). And so the old limitations of Israel's popular religion,—the same limitations that encumbered also the religions of all the neighbouring races which succumbed in turn to Assyria's invincible progress,—now began to disappear. There were even those within his own nation who were preoccupied in the nation's overthrow, the religion of Israel survived even amid exile and dispersion. For Amos and Isaiah were able to single out those loftier spiritual and ethical elements which lay implicit in Mosaicism and to lift them into their due place of prominence. National sancta and the ceremonial requirements were made to assume a secondary rôle or were even ignored.‡ The prophecies of the Prophet of the New Covenant transitioned from ceremonial observance to a stricter form of righteousness and conduct. Religion and righteousness were henceforth welded into an indissoluble whole. The religion of Yahweh was no longer to rest upon the narrow perishable basis of locality and national sancta, but on the broad adamantine foundations of a universal divine sovereignty over all mankind and of righteousness as the essential element in the character of Yahweh and in His claims on man. This was the "corner-stone of precious solid foundation" (Ps. ixxv. 17), "I will make judgment the measuring-line and righteousness the plummet" (Isa. xxv. 12). The "reign of the Hebrew race"—properly the Jews—now enters on a new stage, for it should be observed that it was Amos, Isaiah and Micah—prophets of Judah—who laid the actual foundations. The latter half of the 8th century, which witnessed a rapid succession of reigns in the northern kingdom accompanied by dismemberment of its territory and final overthrow, witnessed also the humiliating vassalage and religious decline of the kingdom of Judah. Unlike Assyria, Israel was a nation of prophets both of denunciation but also the prophet of hope. Though Yahweh's chastisements on Ephraim and Judah would continue to fall till scarcely a remnant was left (Isa. vi. 13, LXX.), yet all was not to be lost. A remnant of the people was to return, i.e., be converted to Yahweh. The name given to an infant child—Immanuel—was to become the mystic symbol of a growing hope. God's presence was to abide in Jerusalem, and, as the century drew near its close, "Immanuel" became the watchword and talisman of a strong faith that God would never permit Jerusalem to be captured by the Assyrans. In fact it is not improbable that the words of consolation uttered by the prophet (Isa. viii. 9-10) in the dark days of Ahaz (735-734 b.C.) were among the oracles which God commanded Isaiah "to seal up among his disciples" (verse 16), and that they were quoted once more with effect as the armies of Sennacherib closed around Jerusalem. The telamonic name Immanuel became the nucleus out of which the later Messianic prophecies of Isaiah grew. To this age alone can we probably assign Isa. i. 7-17, xi. 1-9, xxxii. 1-3. The hopes expressed in the word Immanuel, "God with us," were to become embodied in a personality of the royal seed of David, an ideal righteous ruler who was to bring peace to the war-distraught realm. Thus Isaiah became in that troubled age the true founder of Messianic prophecy. The strange contrast between the succession of dynasties and kings cut off by assassination in the northern kingdom, ending in the tragic overthrow of 721 b.c., and the persistent succession through three centuries of the seed of David and those of the House of Jehoiada, as well as the marvellous escape of Jerusalem in 707 b.c. from the fate of Samaria, must have invested the seed of David in the eyes of all thoughtful observers with a mysterious and divine significance. The Messianic prophecies of Isaiah, the prophet of faith and deliverance, were destined to reappear through all subsequent centuries. We hear the echoes in Jeremiah and Ezekiel and lastly in Haggai in ever feebler tones, and they were destined to reawaken in the Psalter (Isa. ii. and lxxiii.), in the psalms of Solomon and in the Gospel of Christ. See Messiah (and also the article "Messianah" in Hastings's Dict. of Christ and the Gospels). The next notable contribution to the permanent growth of Hebrew prophetic religion was made about a century after the lifetime of Isaiah by Jeremiah and Ezekiel. The reaction into idolatry and Babylonian star worship in the long reign of Manasseh synchronized and was connected with vassalage

‡ There is some danger in too strictly construing the language of the prophets and also the psalmists. It is not to be supposed that either Amos or Isaiah would have pronounced the total abolition of all sacrificial observance. It was the existing ceremonial observance divorced from the ethical piety that they denounced. The speech of prophecy is poetical and rhetorical, not strictly defined and logical like that of a modern essayist. See Moore in Eccl. Bm., "Sacrifice," col. 4222.
HEBREW RELIGION

to Assyria, while the reformation in the reign of Josiah (621 B.C.) is conversely associated with the decay of Assyrian power after the death of Assur-bani-pal. That reformation failed to effect its purifying mission. The hurt of the daughter of God's people was but lightly healed (Jer. vi. 14, 15; cf. vii. 11, 12). No possibility of recovery now remained to the diseased Hebrew state. The outlook appeared indeed far darker to Jeremiah than it seemed more than a century before to Isaiah in the evil days of Jotham and Ahaz, "when the whole head was sick and the whole heart faint" (Isa. i. 5). Jeremiah foresaw that there was now no possibility of recovery. The Hebrew state was doomed and even its temple was to be destroyed. This involved an entire reconstruction of theological ideas which went beyond even the actual reconstructions of Amos and Isaiah. In the old religion the race or clan was the unit of religion as well as of social life. Properly speaking, the individual was related to God only through the externalities of the clan or tribal life, its common temple and its common sacra. But now that these external bases of the old religion were to be swept away, a reconstruction of religious ideas became necessary. For the external supports which had vanished Jeremiah substituted a basis which was internal, personal and spiritual (i.e. ethical). In place of the old covenant based on external observance, which had been violated, there was to be a new covenant which was to consist not in outward prescription, but in the law which God would place in the heart (Jer. xxxi. 30-33). This was to take the place by an act of divine grace (Deut. xxxii. 47) which in will give them an heart to know me that I am the Lord" (verse 7). Ezekiel, who borrowed both Jeremiah's language and ideas, expresses the same thought in the well-known words that Yahweh would give the people instead of a heart of stone a heart of flesh (Ezek. xi. 19, 20, xx. 40 foll., xxxvi. 25-27), and would shame them by his loving-kindness into repentance, and there shall ye remember your ways and all your doings wherein ye have been defiled and ye shall loathe yourselves in your own sight" (xx. 43).

Personal religion now became an important element in Hebrew piety and upon this there logically followed the idea of personal responsibility. The solidarity of race or family was expressed in the old tradition reflected in Deut. v. 9, 10, that God would visit the sins of the fathers upon the children, and it lived on in later Judaism under exaggerated forms. The hopes of the individual Jew were based on the piety of holy ancestors. "We have Abraham as our father." But Ezekiel expressed the strong reaction which had set in against this belief in its older forms. He denies that the individual ever dies for the sins of the father. "The soul that sinneth, it (the pronoun emphasized in the original) shall die" (Ezek. xviii. 4). Neither Noah, Daniel nor Job could have escaped by his righteousness any but his own soul (xiv. 14). And as a further consequence individual freedom is strongly asserted. It is possible for every sinner to turn to God and escape punishment, and conversely for a righteous man to backslide and fall. In the presence of these awful truths which Ezekiel preached of individual freedom and of impending judgment, the prophet is weighted with a heavy responsibility. It is his duty to warn every individual, for no sinner is to be punished without warning (Ezek. iii. 16 foll. xxxiii.).

The closing years of the Judaean kingdom and the final destruction of the temple (586 B.C.) shattered the Messianic ideals cherished in the evening of Isaiah's lifetime and again in the opening years of the reign of Josiah. The untimely death of that monarch upon the battlefield of Megiddo (608 B.C.), followed by the inglorious reigns of the kings who succeeded him, who became puppets in turn of Egypt or of Babylonia, silenced for a while the Messianic hopes for a future king or line of kings of Davidic lineage who would rule a renovated kingdom in righteousness and peace. Even in the darkness of the exile period hopes did not die. Yet they no longer remained the same. In the Deutero-Isaiah (chaps. xl.-lv.) we have no longer a Jewish but a foreign messiah. The onward progress of the Persian Cyrus and his anticipated conquest of Babylonia marked him out as Yahweh's anointed instrument for effecting the deliverance of exiled Israel and their restoration to their old home and city (Isa. xlii. 2, xlv. 24, xlvi.). This Deutero-Isaiah, however, but a subsidiary issue and possesses no permanent spiritual significance.

Of far more vital importance is the conception of Israel as God's suffering servant. This is not the place to enter into the prolonged controversy as to the real significance of this term, whether it signifies the nation Israel or the righteous community only, or finally an idealized prophetical individual who, like the prophet Jeremiah, was destined to suffer for the well-being of his people. Duhm, in his epoch-making commentary, distinguishes on the grounds of metre and contents the four servant-passages, in the last of which (lii. 13-liii. 12) the ideal suffering servant in whom Yahweh is portrayed most definitely as an individual. In the "servant-passage" which he is innocent, while in the last of the Deutero-Isaiah he appears as by no means faultless, and the personal traits are not prominent. These views of Duhm, in which a severe distinction is thus drawn between the representation of Yahweh's servant in the servant-passages, and that which meets us in the rest of the Deutero-Isaiah, have been challenged by a succession of critics. It is only necessary for us to take note of the ideal in its general features. It probably arose from the fact that the calamities from which Israel had suffered both before and during the exile had drawn the reflective minds of the race to the contemplation of the problem of suffering. The servant of Yahweh presents one aspect of the problem of suffering. The book of Isaiah, like the Psalms e.g. Pss. xxii., xlix., lxxii., lxxvii., other phases of the problem are presented. In the Deutero-Isaiah the meaning of Israel's sufferings is exhibited as vicarious. Israel is suffering for a great end. He suffers, is despised, rejected, chastened and afflicted that others may be blessed and be at peace through his chastisement. This noble conception of Israel's great destiny is conveyed in Isa. xxxix. 6, in words which may be regarded as perhaps the noblest utterance in Hebrew prophecy: "To establish the tribes of Jacob and bring back the preserved of Israel is less important than being my servant. Yea, I will make you a light to the Gentiles that my salvation may be unto the end of the earth." This passage, which belongs to the second of the brief "servant-songs", sets the mission of Israel in its true relation to the world. It is the necessary corollary to the teaching of Amos, that God is the righteous lord of all the world. If Jerusalem has been chosen as His sanctuary and Israel as His own people, it is only that Israel may diffuse God's blessings in the world even at the cost of Israel's own humiliation, exile and dispersion. The Deutero-Isaiah closes a great prophetic succession, which begins with Amos, continues in Isaiah in even greater splendour with the added elements of hope and Messianic expectation, and receives further accession in Jeremiah with his special teaching on inward spiritual and personal religion which constituted the new covenant of divine grace. Finally the Deutero-Isaiah conveyed to captive Israel the message of Yahweh's unceasing love and care, and the certainty of their return to Judaea and the restoration of the national prosperity which Ezekiel had already announced in the earlier period of the exile. To this is united the noble ideal of the suffering servant, which serves both as a contribution to the great problem of suffering as purifying and vicarious and as the interpretation to the mind of the nation itself of that nation's true function in the future, a lesson which the actual future showed that Israel was slow to receive. Nowhere in the Old Testament does the doctrine taught by Amos of Yahweh's universal power and sovereignty 1

Giesebrecht, Das Knecht-Jahweh des Deutero-Isa. The book of Deuteronomy, which Duhm asserts can be readily detached from the texture of the Deutero-Isaiah without disturbance to its integrity are Isa. xlii. 1-4, xlii. 1-6, 4-9, lii. 13-14, liii. 12. We have here followed Dillmann's construction of a difficult passage which Duhm attempts to simplify by omission of the complicating clause without altering the general sense.
HEBREW RELIGION

receive amplior and more splendid exposition than in the great lyrical passages of chap. xi. It marks the highest point to which the Hebrew race attained in its progress from heathenism to monotheism. Here again we see the wholesome influences of the exile. The Jew had passed from the narrow confines of his homeland into a wider world, and this larger vision of human life reacted on the prophet's theology. This closes the evolution of Hebrew prophetism. What immediately follows is on a descending slope with some striking exceptions, e.g. the book of Job and the book of Isaiah.

7. Deuteronomic Legalism.—The book of Deuteronomy was the product of prophetic teaching operating on traditional custom, which was represented in its essential features by the two codes of legislation contained in Ex. xx. 24–xxii. 19 (E) and Ex. xxxiv. 10–26 (J), but had also become tainted and corrupted by centuries of Canaanite influence and practice which especially infected the cult of the high places. The existence of “high places” is presupposed in those two ancient codes and is also presumed in the narratives of the documents E and J which contain them. But the prevalence of the worship of “other gods” and of graven images in the worship of the “true God” and the moral debasement of life which accompanied these cults, made it clear that the “high places” were sources of grave injury to Israel’s social life. In all probability the reformation instituted in the reign of Hezekiah, to which 2 Kings xviii. 4 (cf. verse 22) refers, was only partial. It is hardly possible that all the high places were suppressed. The idolatrous reaction in the reign of Manasseh appears to have restored all the evils of the past and added to them. Another and more drastic reform than that which had been previously initiated (probably at the instance of Isaiah and Micah) now became necessary to save the state. It is universally held by critics that our present book of Deuteronomy (certainly chaps. xii.–xxvi.) is closely connected with the reformation in the reign of Josiah. It is quite clear that many provisions in the old codes of J and E expanded lie at the basis of the book of Deuteronomy. But new features were added. We note for the first time definite regulations respecting Passover and the close union of that celebration with "Massōth" or "unleavened bread." We note the laws respecting the clean and unclean animals (certainly based on ancient custom). Moreover, the prohibitions are strengthened and multiplied. In addition to the bare interdiction of the sordidess (Ex. xxii. 18), of stone pillars to the Canaanite Baal, of the Asherah-pole, molten images and the worship of other gods than Yahweh (Ex. xxxiv. 13–17), we now have the strict prohibition of any employment whatever of the stone-symbo (Massēbōh), and of all forms of sorcery, soothsaying and necromancy (Deut. xviii. 10, 11. Respecting the stone-pillar see xvi. 22). But of much more far-reaching importance was the law of the central sanctuary which constantly meets us in Deuteronomy in the reference to "the place (i.e. Jerusalem) which Yahweh your God shall choose out of all your tribes to put His name there ("xii. 5, xvi. 5, 11, 16, xxvi. 2). There alone all offerings of any kind were to be presented (xii. 6, 7, xvi. 7). By this positive enactment all the high places outside the one sanctuary in Jerusalem became illegitimate. A further consequence directly followed from the limitation as to sanctuary, viz. limitation as to the officiating ministers of the sanctuary. In the "book of the covenant" (Ex. xx. 22–xxii. 19), as we have already seen, and in the general practice of the regal period, there was no limitation as to the priesthood, but a definite order of priesthood, viz. Levites, priests, and Levites, and Levites, respectively, to whom a higher professional prestige belonged. As it was impossible to find a place for the officiating priests of the high places, non-levitical as well as levitical, in the single sanctuary, it became necessary to restrict the functions of sacrifice to the Levites only as well as to the existing official priesthood of the Jerusalem temple (see PRIEST). Doubtless such a reform met with strong resistance from the disestablished and vested interests, but it was firmly supported by royal influence and by the Jerusalem priesthood as well as by the true prophets of Yahweh who had protested against the idolatrous usages and corruptions of the high places. The strong impress of Hebrew prophecy is to be found in the deeply marked ethical spirit of the Deuteronomic legislation. Love to God and love to man is stamped on a large number of its provisions. Love to God is emphasized in Deut. vi. 5, while love to man meets us in the constant reference to the fatherless and the widow (cf. especially Deut. xvi. 11). This note of philanthropy is frequently found as a mitigating element (e.g. in the laws respecting slavery and war) that subsidies or even removes the harshness of earlier laws or usages. It should be noted, however, that the spirit of brotherly love was confined within national barriers. It did not operate as a rule beyond the limits of race.

The book of Deuteronomy, in conjunction with the reformation of Josiah’s reign (which synchronizes with the rapid decline of Assyria and the reviving prestige of Yahweh) appeared to mark the triumph of the great prophetic movement. It became at once a codified standard of purer religious life and ultimately served as a beacon of light for the future. But there was shadow as well as light. We note (a) that though the book of Deuteronomy bears the prophetic impress, the priestly impress is perhaps more evident. It was, we may suppose, a revision of an earlier draft for the priestly tribe; he guards its privileges (xviii. 1–8), demands obedience for its decisions (xxiv. 8; cf. xvii. 10–12) and earnestly commends its members to the Israelites’ benevolence (xii. 18–19, xiv. 27–29, &c.). (b) In many passages Jewish particularism is painfully manifest. Yahweh’s care for other peoples does not appear. The flesh of a dead (unslaughtered) beast is not to be eaten, but it may be given to the “stranger within the gates!” (Deut. xiv. 11). (c) Prophetic religion was a religion of the spirit which came to the messenger (Isa. ixi. 1) and expressed itself as a word of instruction of Yahweh (1iĕōk); see Isa. i. 10. Now when the Hebrew religion was reduced to written form it began to be a book-religion, and since the book consisted of fixed rules and enactments, religion began to acquire a stereotyped character. It will be seen in the sequel that this was destined to be the growing tendency of Jewish religious life—to conform itself to prescribed rules, in other words, it became legalism. (d) Lastly, the old genial life of the high places, in which the “new moon” or Sabbath or the annual festival was a sacrificial feast of communion, in which the members of the local community or clan enjoyed fellowship with one another—all this picturesque life ceased to be. And though there was positive gain in the removal of idolatrous and corrupt modes of worship, there was also positive loss in the disappearance of this old genial phase of Hebrew social life and worship. It involved a vast difference to many a Judean village when the festival pilgrimage was no longer made to the familiar local sanctuary with its holy associations of ancient heroic or patriarchal story, but to a distant and comparatively unfamiliar city with its stately shrine and priesthood.

8. Ezekiel’s System.—Ezekiel was the successor of Jeremiah and inherited his conceptions. But though the younger prophet adopted the ideas respecting personal religion and individual responsibility from the elder, the characters of the two men were very different. Jeremiah, when he foretold the destruction of the external state and temple ritual, found no resource save in a reconstruction that was internal and spiritual. In this he was true to his prophetic impulse and genius. But Ezekiel was, as Wellhausen well describes him, “a priest in prophet’s mantle.” While Jeremiah’s tendency was spiritual and ideal, Ezekiel’s was constructive and practical. He was the first to foretell with clearness the return of his people from captivity foreshadowed by Jeremiah, and he set himself the task even in

1 Thus in comparison with the “book of the covenant,” Deuteronomy adds the stipulation in reference to the release of the slave; that his master was to provide him liberatory garments (Deut. xvi. 19), (Deut. xx. 10), (Deut. xxiii. 13, 14). See Hastings’s D.B., arts. “Servant,” “Slave,” p. 464, where other examples may be found. In war (fruit-trees are to be spared (Deut. xx. 19 fol.), whereas the ancient practice was to uproot them). Elisha commended (2 Kings lii. 19) of ruthlessly destroying them.

3 It should be noted that in P (Code of Holiness) Lev. xvii. 15 foll., the resident alien (ger) is placed on an equality with the Jew.
HEBREW RELIGION

the midnight darkness of Israel's exile to prepare for the nation's renewed life. The external bases of Israel's religion had been swept away, and in exchange for these Jeremiah had led his counymen to the more permanent internal grounds of a spiritual renewal. But a religion could not permanently subsist, in this world of space and time without some external concrete embodiment. It was the task of Ezekiel to take up once more the broken threads of Israel's religious traditions, and weave them anew into statelier forms of ritual and national policy. The priest-prophet's keen eye for detail, manifested in the elaborate vision of the wheels and living creatures (Ezek. i.) and in his lamentation on Tyre (chap. xxvii.), is also exhibited in the visions contained in chaps. xlv.-xlvi., which describe the ideal reconstructed temple and theocracy of the restored Israel. The foreground is filled by the temple and its precincts. The officiating priest is the person, the incense is the token of Zion and belonging to the tribe of Levi. Thus the priesthood is still further restricted as compared with the restriction already noted in the Deuteronomic legislation. It is the sons of Zadok only that have any right to offer sacrifice at the altar of burnt offering (xiii. 19, xiv. 15 foll.). The Levites, who formerly ministered in the high places, now discharge the subordinate offices of gate-keepers and slaughterers of the sacrificial victims.

Another element in this ideal scheme which comes into prominence is the sharp distinction between holy and profane. The word holiness (qodeš) in primitive Hebrew usage partook of the nature of taboo, and came to be applied to whatever was set apart, not for religious reasons but on account of the sin of which it might be supposed to be the cause. It belonged to him, and could not, therefore, be used or treated like other objects not so related, and so was separated or stood apart. The idea underlying the word, which to us is invested with deep ethical meaning, had only this non-ethical, ritual significance in Ezekiel. Unlike the old temple and city, the ideal temple of Ezekiel is entirely separate from the city of Jerusalem. In the immediate surroundings of the temple there is an open space. Then come two concentric forecourts of the temple. The temple stands in the midst of what is called the ġitah or space severed off. The outer court lies higher than the open space, the inner court higher still, and the temple-building in the centre highest of all. No heathen may tread the outer court; no layman the inner court, while the holiest of all houses, the temple proper, may be entered by the priest Ezekiel but only by the angel who accompanies him. "The temple-house has a graduated series of compartments increasing in sanctity inwards" (Davidson). In the innermost the presence of Yahweh abides.

We are here moving in a realm of ideas prevailing in ancient Israel respecting holiness, uncleanness and sin, which are ceremonial and not ethical; see especially Robertson Smith's Religion of the Semites, 2nd ed., p. 446 foll. (additional note B.) on holiness, uncleanness and taboo. It is, of course, true that the ethical conception of sin as violation of righteousness and an act of rebellion against the divine righteousness had been developed since the days of Amos and Isaiah; but, as we have already observed, cultus and prophetic teaching were separated by an immense gulf, and in spite of the reformation of 621 B.C. still remain separated. In the sacrificial system of sin-offerings (ḥattath and ḥalam) we have to do with sin as ceremonial violation and neglect (frequently involuntary), or violation of holiness in the old sense of the term or as personal uncleanness (touching a corpse, eating unclean food, sexual impurity, &c.). In the historical evolution of Hebrew sacrifice it is remarkable how long this non-ethical and primitive survival of old custom still survived, even far into post-exilic times. (See SACRIFICE; also Moore's art. 2 Sacrifice' in Ency. Bibl.)

One conspicuous feature of Ezekiel's system is the predominance of piacular sacrifice. It undoubtedly existed in pre-exilic Israel, especially in times of crisis or calamity, for the appeasement of an offended deity (2 Sam. xxiv. 18 foll.), and in Deut. xxv. 1-9, we have details of the purificatory rite which was necessary when human blood was shed; but now and in the future propitiatory sacrifice and ideas of propitiation began to overshadow all the other forms of sacrifice and their ideas. Ezekiel prescribes a half-yearly ritual of sin-offering whereby atonement was to be made (xxv. 18-20). We shall see subsequently to what great institutions these were applied.

Ezekiel's system constituted an ecclesiastical in place of a political organization, a church-state in place of a nation. We clearly discern how this reacted on his Messianic conceptions. In his earlier oracles (xxiv. 23 foll.) we find one shepherd ruling over united Israel, viz. Yahweh's servant David, whereas in the ideal scheme detailed in chap. xl. et seq. the rôle of the prince as a ruler is a very shadowy one. The prince, it is true, has a central domain, but his functions are ecclesiastical and subordinate and his powers strictly limited (xlv. 3-8, 12, 16-18).

Thus the exile period marks the parting of the ways in the development of Hebrew religion. In the Deutero-Isaiah we reach the highest point in the evolution of prophecy. It is true that we have some noble resounding echoes in the lyrical passages lx.-lxii. in the Trito-Isaiah during the post-exilian period, and in such psalm literature as Pss. xxii., xxxvii., li., lixi., cvii., cxlv. 9-12 and others; and also in Isa. xxxv., which is obviously a lyrical reproduction of earlier literature. But it cannot be said that we possess in later literature any fresh contribution to the conception of God or any presentation of a higher ideal of human life 1 or national destiny than that which meets us in chap. xl. or in the servant-passages of the Deutero-Isaiah. It may with truth be said that after Jeremiah we discern the parting of the ways. The first is represented by the Deutero-Isaiah, who constitutes the climax and close of Hebrew prophecy, which is henceforth (with the possible exception of the Trito-Isaiah, Malachi and Jonah, who reproduce some features of the earlier prophecy) a virtually arrested development. The second path is that which is traced out by the priest-prophet Ezekiel, and is that of legalism, which was destined to secure a permanent place in the life and literature of the Jewish people. It is essentially the path which may be summed up in the word Judaism, though, as will be shown in the sequel, Judaism came to include many other factors. The statement, however, remains virtually true, since Judaism is mainly constituted by the body of legal precepts called the Torah, and, moreover, by the post-exilian Torah.

9 Post-exilic Law—The Priestcodes. 2 The oracles of Malachi clearly reveal the continued influence of the book of Deuteronomy in his day. But the new conditions created by the return of the exiles and the germinating influence of Ezekiel's ideas developed a process of new legislative construction. The code of holiness (Lev. xvii.-xxvi.) is the most obvious product of that influence. The ideas of expiation and atonement so prevalent in Ezekiel's scheme, which there find expression in the half-yearly sacrificial celebrations, are expressed in Lev. xvi. in the single annual great fast of atonement. It is impossible to enter here into the numerous details of that impressive ceremonial. Two special features, however, which characterize the celebration should here be noted: (a) The person of the high priest, who is throughout the entire drama the chief and indeed the sole actor. This supreme official, who was destined ultimately to take the place of the king in the church-nation of post-exilian Judaism, is mentioned for the first time in Zech. iii. 2 (in the person of Joshua). In the Priestcode he stands at the head of the priests, who are, in the post-exilian system, the sons of Aaron and possessed the sole right to offer the temple sacrifices. On the great day of atonement the high priest appears in a vicarious and representative capacity, and offers on behalf of the whole nation which he was considered to embody in his sacred person. (b) The rite of the goat devoted to Azazel. There can be little doubt that this is the goat destined to Azazel. We shall have to note the emergence of the doctrine of the resurrection of the righteous in later Judaism, which is obviously a fresh contribution of permanent value to Hebrew doctrine. On the other hand, the doctrine of pre-existence is speculative rather than religious, and applies to institutions rather than persons.

1 The legislative portions largely comprised in Ex. xxxvi.-xxxvii. 2 But this term (literally the chief priest) was already in use during the regal period to designate the head priest of an important sanctuary such as Jerusalem (2 Kings xii. 17).
of doubt that Azazel was an evil demon (like an Arabic Jinn) of the desert. The goat set apart for Azazel was in the concluding part of the ceremonial brought before the high priest, who laid both his hands upon it and confessed over it the sins of the people. It was then carried off by an appointed person to a lonely spot and there set free.

In later post-exilian times this great day of atonement became to an increasing degree a day of humiliation for sin and penitent sorrow, as well as the rite of expiation; and the sins confessed were not only of a purely ceremonial character, whether voluntary or inadvertent, but also sins against righteousness and the duties which we owe to God and man. This element of public confession for sin became more prominent in the days when synagogal worship developed, and prayer took the place of the sacrificial offerings which could only be offered in the Jerusalem temple. The development of the priestly code of legislation (Priestcorderex) was a gradual process, and probably occupied a considerable part of the 5th century B.C. The Hebrew race now definitely adhered upon the new path of organized Jewish legalism which had been originally marked out for it by Ezekiel in the preceding century. It became a holy people on holy ground.

Circumcision and Sabbath, separation from marriage with a foreigner, which rendered a Jew unclean, as well as strict conformity to the precepts of the Torah, constituted henceforth an adamantine bond which was to preserve the Jewish communities from disintegration.

10. The later Post-exilian Developments in Jewish Religion.—These may be briefly referred to under the following aspects:

(a) Codified law and the written form of the priestly hierarchy, and the work of the lawgiver Moses (to whom the entire body of law came to be ascribed), assumed an ever greater importance. The reverence felt for the canonized Torah or law (the Pentateuch or so-called five books of Moses) grew even into worship. Of this spirit we find clear expression in some of the later psalms, e.g. the elaborate alphabetic Ps. cxxix. and the latter portion of Ps. xxi. There were various causes which combined to enhance the importance of the written Torah (the "instruction" par excellence communicated by God through Moses). Chief among these were (1) The conception of God as transcendent. We have taken due note of Amos, who unfolded the character of Yahweh as universal righteous sovereign; and also the sublime portrayal of His exalted nature in Isa. xl. (verse 15; cf. 22-26, and Job xxxvi. 22-xxii. 6). The intellectual influence of Greece, manifested in Alexandrian philosophy, tended to remove God still further from the human world of phenomena into that of an inaccessible transcendental abstraction. Little, therefore, was possible for the Jew save strict performance of the requirements of the Torah, once for all given to Moses on Sinai, and, in his approach to the awful hidden unknown, theory, to rely on the written form of performances (see Wundt's Teaching of Jesus, i. 55 foll.). The same tendency led the pious worshippers to avoid His awful name and to substitute Adonai in their scriptures or to use in the Mishna the term "name" (shêm) or "heaven.

(b) The Maccabean conflict (165 B.C.) tended to accentuate the national sentiment of antagonism to Hellenic influence. The Hasidim or pious devotees, who arose at that time, were the originators of the Pharisaic movement which was conservative as well as national, and laid stress on the strict performance of the law.

(c) Eschatology in the Judaism of the Greek period began to assume a new form. The pre-exilian prophets (especially Isaiah) spoke of the forthcoming crisis in the world's history as a "day of the Lord." These were usually regarded as visitations of chastisement for national sins and vindications of divine righteousness or judgments, i.e. assertions of God's power as judge (shâphet). By the older prophets this judgment of God or "day of Yahweh," was never held to be far removed from the horizon of the present or the world in which they lived. But now as we enter the Greek period (320 B.C. and onwards) there is a gradual change from prophecy to apocalyptic. It may be asserted in general terms that whereas prophecy foretells a definite future which has its foundation in the present, apocalyptic directs its anticipations solely and simply to the future, to a new world-period which stands sharply contrasted with the present. The classical model for all apocalyptic is to be found in Dan. vii. It is only after a great war of destruction, a day of Yahweh's great judgment, that the dominion of God will begin. (Ezek. xxxiii. and xxxix. clearly bear the apocalyptic character; so also Isa. xxxiv. and notably Isa. xxiv.-xxvii.

Apocalyptic, as Bardsenberger has shown, formed a counterpoise to the normal current of conformity to law. It arose from a spiritual movement in answer to the yearning of the heart: "O that Thou mightest rend the heavens and come down and the mountains quake at Thy presence!" (Isa. xlv. 1 [Heb. lxxvi. 19]); and it was intended to meet the craving of souls sick with waiting and disappointment. The present outlook was hopeless, but in the enlarged horizon of the apocalyptic the thought of a home was possible as space to the utopic minds in Judaism were directed to the transcendent and ultimate. The present world was corrupt and subject to Satan and the powers of darkness. This they called the "present age" (age). Their hopes were therefore directed to "the coming age." Between the two ages there would take place the advent of the Messiah, who would lead the struggle with evil powers which was called the "agonies of the Messiah." This terrible intermezzo was no longer terrestrial, but was a cosmic and universal crisis in which the Messiah would emerge victorious from the final conflict with the heathen and demonic powers. This view inaugurates the element of the "age to come," in which the faithful Jews would enter their inheritance. In this way we perceive the transformation of the old Messianic doctrine through apocalyptic.

Of apocalyptic literature we have numerous examples extending from the 2nd century B.C. to the 2nd century A.D. (See especially Charles's Book of Enoch.)

The doctrine of the resurrection of the righteous to life in the heavenly world became engrafted on to the old doctrine of Sheol, or the dark shadowy underworld (Hades), where life was joyless and feeble, and from which the soul might be summoned forth by the voice of the ascendant. The most perfect form of resurrection of Sheol is to be found in the exilic passage Isa. xiv. 9-20 (cf. Job x. 21-22). With this also compare the Babylonian Descent of Ishtar to Hades. The added conception of the resurrection of the righteous does not appear in the world of Jewish thought till the early Greek period in Isa. xxvi. 19.

R. H. Charles thinks that in this passage the idea of resurrection is of purely Jewish and not of Mazaadan (or Zoroastrian) origin, but it is otherwise with Dan. xii. 1-2; see his Eschatology, Hebrew, Jewish and Christian. Corresponding to heaven or the home of the righteous, we have the conception of the abode of the just, the "Pleroma," which is regarded by all as a paradise. The most perfect form of this is the Ophel, the scene of the Mosaic rites of human sacrifice, the place of punishment after death for apostate Jews.

(c) Doctrine of Angels and of Hypostases.—In the writings of the pre-exilian period we have frequent references to supernatural personalities good and bad. It is only necessary to refer to them by name. Sebhôth, or "hosts," attached to the name of Yahweh, denoted the heavenly retinue of stars. The seraphim were burning serpentine forms who hovered above the enthroned Yahweh and chanted the Trisagion in Isaiah's conception vision (Isa. vi.). We have already spoken to "angels" (mishaphim) of God, divine messengers who represent Him in portraiture and may be regarded as the manifestation of His power and presence. This especially applies to the "angel of Yahweh" or angel of His Presence (Ex. xxiii. 20, 23 [E]). Note in Ex. xxxiii. 14 (J) he is called "my face" or "presence" 1 (cf. Isa. lixii. 9). We also know that from earliest times Israel believed in the evil as well as good spirits. Like the Arabs they held that demons became incorporated in serpents, as in Gen. iii.

The nephilim were a monstrous brood begotten of the intercourse of the supernatural beings called sons of God with the women of earth. We also read of the "evil spirit" that came upon Saul. Contact with Babylonia tended to stimulate the

1 Cf. the Phoenician parallel of "Face of Baal," worshipped as Tanit, "queen of Heaven" (Bülowitz, Beiträge zur Semit. Religionsgeschichte, p. 55 foll.); also the place Penuel (face of God).
of the spiritual "son of man" destined to found a kingdom of God which was righteousness and peace. The Torah of Jesus was essentially prophetic and in no sense priestly or legal. The arrested prophetic movement of Jeremiah and Deuter-Isaiah reappears in John the Baptist and Jesus after an interval of more than five centuries. The new covenant of redeeming grace—the righteousness which is in the heart and not in externalities of legal observance or ceremonial—are once more proclaimed, and the exalted ideals of the suffering servant of Isa. xli. 6 and Isa. lii. 5 are clearly stated in the Targum of Jonathan) are reasserted and vindicated by the words and life of Jesus. Like Jeremiah He foretold the destruction of the temple and suffered the extreme penalties of anti-patriotism. And thus Israel's old prophetic Torah was at length to achieve its victory, for after Jesus came St Paul. "Many shall come from the east and the west and sit down with Abraham, Isaac and Jacob in the kingdom of heaven" (Matt. viii. 11, 12). The fetters of nationalism were to be broken, and the Hebrew religion in its essential spiritual elements was to become the heritage of all humanity.

AUTHORITIES.—1. On Semitic religion generally: Wellhausen's Reste des arabischen Heidentums (2nd ed.) and Robertson Smith's "The Importance of the Semitic Pre-historic World" (1895). Bousset's Barcit's Ortgissen is extremely ably, but his doctrine of Polytheism, of male from original female deities is pushed to an extreme. Büttgen's Beiträge zur semitischen Religionsgeschichte and Büttgen's "Zur Geschwisterverbindung" (1875) and still valuable. See also Kuten's National Religions and Universal Religions (Hibbert lectures) and Lagrange's Études sur les religions sémitiques (1866 ed.)

2. On Hebrew religion in particular: specially full and helpful is Kautzsch's article "Religion of Israel" in Hastings's D.B., extra vol.; Marti's recent Religion des A.T. (1906) and his Geschichte der israelitischen Religion (1906). Probably the best and most useful of recent works is Baadson's Studien zur semitischen Religionsgeschichte (1876) is still valuable. See also Kuten's National Religions and Universal Religions (Hibbert lectures) and Lagrange's Études sur les religions sémitiques (1866 ed.)

4. On the special department of eschatology the standard works are R. H. Charles, Eschatology, Hebrews, Jewish and Christian, and more especially his "Introduction to the Old Testament and Religion of the Post-Exilic Prophet" (1905 ed.). Also, F. S. Schmiedel's "Wahre Uebersetzung der hebräischen Sprache" (1905 ed.) is highly to be commended. See also ESCHATOGY.

5. On the religion of Babylonia, Jastrow's work is the standard one. Zimmern's Heft ii. in K.A.T. (3rd ed.) is specially important for the Testament student. See also W. Schrader, "Die babylonischen Sühnenn". (O. C. W.)

**HEBREWS, EPITCLE TO THE**

One of the books of the New Testament. In the oldest MSS. it bears no other title than "To Hebrews." This brief heading embraces all that on which Christian tradition from the end of the 2nd century was unanimous; and it says no more than that the readers addressed were Christians of Jewish extraction. This would be a sufficient address for an epistolary writing (xiii. 22) directed to a definite circle of readers, to whose history repeated reference is made, and with whom the author had personal relations (xiii. 19, 23). Probably, then, the original and limited address, or rather salutation, was never copied when this treatise in letter form, like the epistle to the Romans, passed into the wider circulation which
HEBREWS, EPISTLE TO THE

its contents merited. In any case the Roman Church, where the first traces of the epistle occur, about A.D. 96 (1 Clement), had nothing to contribute to the question of authorship except the negative opinion that it was not by Paul (Euseb. Eccl. Hist. iii. 3): yet this central church was in constant connexion with provincial churches.

The earliest positive traditions belong to Alexandria and N. Africa. The Alexandrine tradition can be traced back as far as a teacher of Clement, presumably Pantaenus (Euseb. Eccl. Hist. vi. 14), who sought to explain why Paul did not name himself as usual at the head of the epistle. Clement himself, taking it for granted that an epistle to Hebrews must have been written in Hebrew, supposes that Luke translated it for the Greeks. Origen implies that "the men of old" regarded it as Paul's, and that some churches at least in his own day shared this opinion. But he feels that the language is un-Pauline, though the "admirable" thoughts are not second to those of Paul's unquestioned writings. Thus he is led to the view that the ideas were orally set forth by Paul, but that the language and composition were due to someone giving from memory a sort of free interpretation of his teacher's mind. According to some this disciple was Clement of Rome; others name Luke; but the truth, says Origen, is known to God alone (Euseb. vi. 25, cf. iii. 38). Still from the time of Origen the opinion that Paul wrote the epistle became prevalent in the East. The earliest African tradition, on the other hand, preserved by Tertullian \(3\) (De pudicitia, c. 20), but certainly not invented by him, ascribed the epistle to Barnabas. Yet it was perhaps, like those named by Origen, only an inference from the epistle itself, a reading of exhortation "(xii. 23) by the Son of Exhortation (Acts iv. 36; see BARNABAS). On the whole, then, the earliest traditions in East and West alike agree in effect, viz. that our epistle was not by Paul, but by one of his associates.

This is also the twofold result reached by modern scholarship with growing clearness. The vacillation of tradition and the dissimilarity of the epistle from those of Paul were brought out with great force by Erasmus. Luther (who suggests Apollos and Calvin (who thinks of Luke or Clement) followed with the decisive argument that Paul, who lays such stress on the fact that his gospel was not taught him by man (Gal. i), could not have written Heb. ii. 3. Yet the wave of reaction that so overwhelmed the freer tendencies of the first reformers, brought back the old view until the revival of biblical criticism more than a century ago. Since then the current of opinion has set irrevocably against any form of Pauline authorship. Its type of thought is quite unique. The Jewish Law is viewed not as a code of ethics or "works of righteousness," as by Paul, but as a system of religious rites (vii. 11) shadowing forth the way of access to God in worship, of which the Gospel reveals the archetypal reality. (ix. 1, 11, 15, 23 f., x. 2 ff., 19 f.). The Old and the New Covenants are related to one another as imperfect (earthly) and perfect (heavenly) forms of the same method of salvation, each with its own type of sacrifice and priesthood. Thus the conception of Christ as High Priest emerges, for the first time, as a central point in the author's conception of Christianity. The Old Testament is cited after the Alexandrian version more exclusively than by Paul, even where the Hebrew is divergent. Nor is this accidental. There is every appearance that the author was a Hellenist who lacked knowledge of the Hebrew text, and derived his metaphysic and his allegorical method from the rabbis and later Palestinian schools. Yet the epistle has manifest Pauline affinities, and can hardly have originated beyond the Pauline circle, to which it is referred not only by the author's friendship with Timothy (xii. 23), but by many echoes of the Pauline theology and even, it seems, of passages in Paul's epistles (see Holtzmann, Einleitung in das N.T., 1892, p. 298). These features early suggested Paul as the author of a book which stood in MSS. immediately after the epistles of that apostle, and contained nothing in its title to distinguish it from the preceding books with like headings, "To the Romans," "To the Corinthians," and the like. A similar history attaches to the so-called Second Epistle of Clement (see CLEMENTINE LITERATURE).

Everything turns, then, on internal criticism of the epistle, working on the distinctive features already noticed, together with such personal allusions as it affords. As to its first readers, with whom the author stood in close relations (xii. 19, 23, cf. vi. 10, x. 32-34), it was used generally to be agreed that they were "Hebrews" or Christians of Jewish birth. But, for a generation or so, it has been denied that this can be inferred simply from the fact that the epistle approaches all Christian truth through Old Testament forms. This, it is said, was the common method of proof, since the Jewish scriptures were the Word of God to all Christians alike. Still it remains true that the exclusive use of the argument from Mosaicism, as itself implying the Gospel of Jesus the Christ as final cause (v drunk, does favour the view that the readers were of Jewish origin. Further there is no allusion to baptism, and in it is termed "stranger and foreigners" (De, in ii. 19) with the people of God. Yet the readers are not to be sought in Jerusalem (see e.g. ii. 3), nor anywhere in Judaea proper. The whole Hellenistic culture of the epistle (let alone its language), and the personal references in it, notably that to Timothy in xii. 23, are against any such view: while the doubly emphatic "all" in xiii. 24 suggests that those addressed were but part of a community composed of both Jews and Gentiles. Caesarea, indeed, as a city of mixed population and lying just outside Judaea proper—a place, moreover, where Timothy might be free in his relations with the local Jewish community, would satisfy many conditions of the problem. Yet these various conditions are no more than might exist among intensely Jewish members of the Dispersion, like the Jews of Asia (cf. Sir W.M. Ramsay, The Letters to the Seven Churches, 155 f.), whose zeal for the Temple and the Mosaic ritual customs led to Paul's arrest in Jerusalem (Acts xix. 27 f., cf. 20 f.), in keeping both with his former experiences at their hands and with his forebodings resulting therefrom (xx. 19, 22-24). Our "Hebrews" had obviously high regard for the ordinances of Temple worship. But this was the case with the dispersed Jews generally, who kept in touch with the Temple, and it is their "strangerly worship for all Israel (De, in every possible way; in token of this they sent with great care their annual contribution to its services, the Temple tribute. This bond was doubtless preserved by Christian Hellenists, and must have tended to continue their reliance on the Temple services for the forgiveness of their recurring "sins of ignorance"—subsequent to the great initial Messianic forgiveness coming with faith in Jesus. Accordingly many of them, while placing their hope for the future upon Messiah and His eagerly expected return in power, might seek assurance of present forgiveness of daily offences and cleansing of their sins in the Temple system. In particular the annual Day of Atonement would be relied on, and that in proportion as the expected Parousia tarried, and the first enthusiasm of a faith that was largely eschatological died away, while ever-present temptation pressed the harder as disappointment and perplexity increased.

Such was the general situation of the readers of this epistle, men who rested partly on the Gospel and partly on Judaism. For lack of a true theory as to the relation between the two, they were now shifting away (ii. 1) from effective faith in the Gospel, as being mainly future in its application, while Judaism was the present near and immediate and impressive system of religious aims—to which also their sacred scriptures gave constant witness. The points at which it chiefly touched them may be inferred from the author's counter-argument, with its emphasis in the spiritual ineffectiveness of the whole Temple-system, its high-priesthood and its supreme sacrifice on the Day of Atonement. With passionate earnestness he sets over against these his constructive theory as to the efficacy, the heavenly yet unseen reality, of the definitive "purification of sins" (i. 3) and perfected access to God's inmost presence, secured for Christians as such by Jesus the Son of God (v. 9-23), and these moral feebleness and slackness to want of progressive insight

1 Also in Codex Claromontanus, the Tractatus de libris (x.), Philaristus of Brescia (c. A.D. 380), and a prologue to the Catholic Epistles (Pseudo-benedictum, xxxii. 82 f.). It is defended in a monograph by H. H. B. Ayles (Cambridge, 1899).
HEBREWS, EPISTLE TO THE

into the essential nature of the Gospel as a "new covenant," moving on a totally different plane of religious reality from the now antiquated covenant given by Moses (viii. 13).

The following plan of the epistle may help to make apparent the writer's theory of Christianity as distinct from Judaism, which is related to it as "shadow" to reality:

**Thesis:** The finality of the form of religion mediated in God's Son, i. 1-4.

1. The supreme excellence of the Son's Person (i. 5-iii. 6), as compared with (a) angels, (b) Moses.

2. Practical exhortation, iii. 7-iv. 13, leading up to:

ii. The corresponding efficacy of the Son's High-priesthood (iv. 14-ix.).

(i) The Son has the qualifications of all priesthood, especially sympathy. Exhortation, raising the reader's thought to the height of the topic reached (v. 11-vi. 20).

(ii) The Son as absolute high priest, in an order transcending the Aaronic (vii.) and relative to a Tabernacle of ministry and a Covenant higher than the Mosaic in point of reality and finality (viii., ix.).

(iii) His Sacrifice, then, is definitive in its effects (ereileitao), and supersedes all others (x. 1-18).

iii. Appropriation of the benefits of the High-priesthood, by steadfast faith, the paramount duty (x. 19-xii). More personal epilogue (xii.).

As the human race lay at the root of their troubles, it was not enough simply to enjoin the moral fidelity to conviction which is three parts of the faith of the writer, who has but little sense of the mystical side of faith, so marked in Paul. There was need of a positive theory based on real insight, in order to inspire faith for more strenuous conflict with the influences tending to produce the apostasy from Christ, and so from "the living God," which already threatened some of them (iii. 12). Such "apostasy," was not a formal abjuring of Jesus as Messiah, but the subtle lapse of ceasing to rely on relation to Him for daily moral and religious needs, summed up in purity of conscience and peace before God (x. 19-23, xiii. 20 f.). This "falling aside" (vi. 5, cf. xii. 12 f.), rather than conscious "turning back," is what is implied in the repeated exhortations which show the intensely practical spirit of the whole argument. These exhortations are directed chiefly against the dullness of spirit which hinders progressive moral insight into the genius of the New Covenant (v. 11-vi. 8), and which, in its blindness to the full work of Jesus, amounts to counting His blood as devoid of divine efficacy to consecrate the life (x. 26, 29), and so to a personal "crucifying anew" of the Son of God (vi. 6). The antithesis to such a profane "negligence" (iii. 1, 3, xii. 12 f., 15-17) is not a "anxiety" or "interest" (as the author uses it, especially in the chapter devoted to its illustration by Old Testament examples. His readers needed most the moral heroism of fidelity to the Unseen, which made men "despise shame" due to that iniquity in their unbelief might do to them (xii. 2-11, xiii. 5 f.)—and of which Jesus Himself was at once the example and the inspiration. To quicken this by awakening deeper insight into the real objects of "faith," as these bore on their actual life, he develops his high argument on the lines already indicated.

Their situation was so dangerous just because it combined inward debility and outward pressure, both tending to the same result, viz. practical disuse of the distinctively Christian means of grace, as compared with those recognized by Judaism, and such conformity to the latter as would make the reproach of the Cross to cease (xiii. 13, cf. xi. 26). This might, indeed, relieve the external strain of the context (αδικαίων xii. 1), which had become well-nigh intolerable to them. But the practical surrender of what was distinctive in their new faith meant a theoretic surrender of the value once placed on that element, when it was matter of a living religious experience far in advance of what Judaism had given them (vi. 4 ff., x. 26-29). This twofold "in an," in thought and deed, God, was the "living" God of progress from the "shadow" to the substance, and would require at their hands (x. 30 f., xii. 22-29). For it meant turning away from an appeal that had been known as "heavenly," for something inferior and earthly (xii. 25); from a call sanctioned by the incomparable authority of Him in whom it had reached men, a greater than Moses and all media of the Old Covenant, even the Son of God. Thus the key of the whole exhortation is struck in the opening words, which contrast the piecemeal revelation "to the fathers" in the past, with the complete and final revelation to themselves in the last stage of the existing order of the world's history, in a Son of transcendent dignity (i. 1 f., cf. ii. 1 ff., x. 28 f., xii. 18 f.). This goes to the root of the difficulty, ambiguity as to the relativity of the old and the new elements in Judaism-Christian piety, so that this was constant danger of the old overshadowing the new, since national Judaism remained hostile. At a stroke the author separates the new from the old, as belonging to a new "covenant" or order of God's revealed will. It is a confusion, resulting in loss, not in gain, as regards spiritual power, to try to combine the two types of piety, as his readers were more and more apt to do. There is no use, religiously, in falling back upon the old forms, in order to avoid the social penalties of a sectarian position within Judaism, when the secret of religious "perfection" or maturity (vi. 1, cf. the frequent use of the kindred verb) lies elsewhere. Hence the moral of his whole argument as to the two covenants, though it is formulated only incidentally at first, finally the details of counsel (xiii. 13 f.) is to leave Judaism, and adopt a frankly Christian standing, on the same footing with their non-Jewish brethren in the local church. For this the time was now ripe; and in it lay the true path of safety—eternal safety as before God, whatever man might say or do (xiii. 5 f.).

The obscured section, xiii. 6 f., is to be taken as "only a symptom of the general retrogression of religious energy" (Jülicher), and not as bearing directly on the main danger of these "Hebrews." The "foods" in question probably refer neither to temple sacrifices nor to the Levitical laws of clean and unclean foods, nor yet to ascetic scruples (as in Rom. xiv. Col. ii. 20 ff.), but to some other form of "division" between them and the Jews of the Dispersion, as a sort of substitute for the possibility of offering sacrifices in the Temple—but which would be a lame addition to the Christianity of their own former leaders (xiii. 7 f.)—the author first points his readers to its refutation from experience, and then to the fact that the Christian's "altar" or sacrifice (i.e. the supreme sin-offering) is of the kind which the Law itself forbids to be associated with "eating." If Christians wish to offer any special sacrifice to God, let it be that of grateful praise or deeds of beneficence (xiv. 15 f.).

In trying further to define the readers addressed in the epistle, one must note the stress laid on suffering as part of the divinely appointed discipline of sonship (i. 10, v. 8, xii. 7 f.), and the way in which the analogy in this respect between Jesus, as Messianic Son, and those united to Him by faith, is set in relief. He is not only the inspiring example for heroic faith in the face of opposition due to unbelievers (xii. 3 f.), but also the mediator qualified by his very experience of suffering to sympathize with His tried followers, and so to afford them moral aid (i. 17 f., v. 8 f., cf. iv. 15). This means that suffering for Christianity, at least in respect of possessions (xiii. 5 f., cf. x. 34) and social standing, was imminent for those addressed: and it seems as if they were mostly men of wealth and position (xii. 1-6,
HEBRIDES. THE, or WESTERN ISLES, a group of islands off the west coast of Scotland. They are situated between 55° 35' and 58° 30' N. and 5° 26' and 8° 40' W. Formerly the term was held to embrace not only all the islands off the Scottish western coast, including the islands in the Firth of Clyde, but also the peninsula of Kintyre, the Isle of Man and the Isle of Rathlin, off the coast of Antrim. They have been broadly classified into the Outer Hebrides and the Inner Hebrides, the Minch and Little Minch dividing the one group from the other. Geologically, they have also been differentiated as the Gneiss Islands and the Trap Islands. The Outer Hebrides being almost entirely composed of gneiss the epithet suitably serves them, but, strictly speaking, only the more northerly of the Inner Hebrides may be distinguished as Trap Islands. The chief islands of the Outer Hebrides are Lewis-with-Harris (or Long Island), North Uist, Benbecula, South Uist, Barra, the Shiants, St Kilda and the Flannan Isles, or Seven Hunters, an uninhabited group, about 20 m. N.W. of Gallon Head in Lewis. Of these the Lewis portion of Long Island, the Shiants and the Flannan belong to the county of Ross and Cromarty, and the remainder to Inverness-shire. The total length of this group, from Barra Head to the Butt of Lewis, is 130 m., the breadth varying from less than 1 m. to 30 m. The Inner Hebrides are much more scattered and principally include Skye, Small Isles (Canna, Sanday, Rum, Eigg and Muck), Coll, Tiree, Lismore, Mull, Ulva, Staffa, Iona, Kerrera, the Slate Islands (Seil, Easdale, Luin, Shuna, Torsay), Colonsay, Oronsay, Scarba, Jura, Islay and Gigha. Of these Skye and Small Isles belong to Inverness-shire, and the rest to Argyllshire. The Hebridean islands exceed 500 in number, of which one-fifth are inhabited. Of the inhabited islands 11 belong to Ross and Cromarty, 47 to Inverness-shire, and 44 to Argyllshire, but of the total of 102 islands, one-third have a population of only 10 souls, or fewer, each. The population of the Hebrides in 1901 numbered 78,947 (or 28 to the sq. m.), of whom 41,031 were females, who thus exceeded the males by 10%, and 22,733 spoke Gaelic only and 47,666 Gaelic and English. The most populous island is Lewis-with-Harris (32,160), and next to it are Skye (13,883), Islay (6857) and Mull (4334). Of the total area of 1,800,000 acres, or 2812 sq. m., only one-ninth is cultivated, most of the surface being moorland and mountain. The annual rainfall, particularly in the Inner

further aggression from their compatriots. On the chronology adopted in the article PAUL, this would yield as probable date for the epistle a.d. 61-62. The place of writing would be some spot in Italy ("they of Italy salute you") outside Rome, probably a port of embarkation for Asia, such as Brundisium.

Be this as it may, the epistle is of great historical importance, as reflecting a crisis inevitable in the development of the Jewish-Christian consciousness, when a definite choice between the old and the new forms of religion had to be made, both for internal and external reasons. It seems to follow directly on the situation implied by the appeal of James to Israel in dispersion, in view of Messiah's winning-fan in their midst (i. 1-4, ii. 1-7, v. 1-6, and especially v. 7-11). It may well be the immediate antecedent of that revealed in 1 Peter, an epistle which perhaps shows traces of its influence (e.g. in i. 2, "sprinkling of the blood of Jesus Christ," cf. Heb. ix. 13 f., x. 22, xii. 24). It is also of high interest theologically, as exhibiting, along with affinities to several types of New Testament teaching (see STEPHEN), a type all its own, and one which has had much influence on later Christian thought (cf. Milligan, \textit{ut infra}, ch. i.).

Many attempts have been made to identify the home of the Hellenistic Christians addressed in this epistle. For Alexandria little can be urged save a certain strain of "Alexandrine" idealism and allegorism, mingling with the more Palestinian realism which marks the references to Christ's sufferings, as well as the eschatology, and recalling many a passage in Philo. But Alexandrinism was a mode of thought diffused throughout the Eastern Mediterranean, and the divergences from Philo's spirit are as notable as the affinities (cf. Milligan, \textit{ut infra}, 203 f.). For Rome there is more to be said, in view of the references to Timothy and to "them of Italy" (xii. 23 f.); and the theory has found many supporters. It usually contemplates a special Jewish-Christian house-church (so Zahn), like those which Paul salutes at the end of Romans, e.g. that meeting in the house of Prisca and Aquila (xvi. 5); and Harnack has gone so far as to suggest that they, and especially Prisca, actually wrote our epistle. There is, however, really little that points to Rome in particular, and a good deal that points away from it. The word in xii. 5, "Not yet unto blood have ye resisted," would ill suit Rome after the Neronian "bath of blood" in a.d. 64 (as is usually held), save at a date too late to suit the reference to Timothy. Nor does early currency in Rome prove that the epistle was written to Rome, any more than the words "they of Italy salute you." This clause must in fact be read in the light of the reference to Timothy, which suggests that he had been in prison in Rome and was about to return, possibly in the writer's company, to the region which was apparently the headquarters of both. Now in this Timothy's case, as far as we can trace his steps, was Ephesus; and it is natural to ask whether it will not suit all the conditions of the problem. It suits those of the readers,\footnote{i.e. a house-church of upper-class Jewish Christians, not fully in touch with the attitude even of their own past and present leaders (xii. 17), as distinct from the local church generally (xiii. 24). The Gospel had reached them, as also the writer himself (cf. Acts xviii. 25), through certain hearers of the Lord (ii. 3), not necessarily apostles.} as analysed above; and it has the merit of suggesting to us as author the very person of all those described in the New Testament who seems most capable of the task, Apostol, the learned Alexandrian (Acts xviii. 24 f.), connected with Ephesus and with Paul and his circle (cf. i Cor. xvi. 12), yet having his own distinctive manner of presenting the Gospel (i Cor. iv. 6). That Apostol visited Italy at any rate once during Paul's imprisonment in Rome is a reasonable inference from Titus iii. 13 (see PAUL); and if so, it is quite natural that he should have there again the time of the martyrdom. With that evidence is again natural to connect Timothy's imprisonment, his release from which our author records in closing; while the news of Jewish success in Paul's case would enhance any tendency among Asian Jewish Christians to shirk "boldness" of confession (x. 23, 35, 38 f.), in fear of

191

vi. 10 f., x. 34), who would feel this sort of trial acutely (cf. Jas. i. 10). Such men would also possess a superior mental culture (cf. v. 11 f.), capable of appreciating the form of an epistle "far too learned for the average Christian" (Jülicher), yet for which its author apologized to them as inadequate (xiii. 22). It was now long since they themselves had suffered seriously for their faith (x. 32 f.); but others had recently been harassed even to the point of imprisonment (xiii. 3); and the writer's very impatience to hurry to the salvation of Israel on his own not as the apostle urged. The finished form of the epistle's argument is sometimes urged to prove that it was not originally an epistle at all, written more or less on the spur of the moment, but a literary composition, half treatise and half homily, to which its author—as an afterthought—gave the suggestion of being a Pauline epistle by adding the personal matter in ch. xiii. (so W. Wrede, \textit{Das literarische Rätsel des Hebräerbriefs}, 1906, pp. 70-73). The latter part of this theory fails to explain why the Pauline origin was not made more obvious, \textit{e.g.} in an opening address. But even the first part of it overlooks the probability that our author was fusing into a fresh form materials often used before in his oral ministry of Christian instruction.

stephanus...
HEBRON

Hebrides, is heavy (42-6 in. at Stornoway) but the temperature is high, averaging for the year 41°F. Potatoes and turnips are the only root crops that succeed, and barley and oats are grown in some of the islands. Sheep-farming and cattle-raising are carried on very generally, and, with the fisheries, provide the main occupation of the inhabitants, though they profit not a little from the tourists who flock to many of the islands throughout the summer. The principal industries include distilling, slate-quarrying and the manufacture of tweeds, tartans and other woollens. There are extensive deer forests in Lewis—Harris, Skye, Mull and Jura. On many of the islands there are prehistoric remains and antiquities within the Christian period. The more populous islands are in regular communication with certain points of the mainland by means of steamers from Glasgow, Oban and Mallaig. The United Free Church has a strong hold on the people, but in a few of the islands the Roman Catholics have a great following. In the larger inhabited islands board schools have been established. The islands unite with the counties to which they belong in returning members to parliament (one for each shire).

History.—The Hebrides are mentioned by Ptolemy under the name of Hebrides and also by Pliny under that of Hebrides, the modern spelling having, it is said, originated in a misprint. By the Norwegians they were called Sødreyjar or Southern Islands. The Latinized form was Sodorenæs, preserved to modern times in the title of the bishop of Sodor and Man. The first inhabitants seem to have been of the same Celtic race as those settled on the mainland. In the 6th century Scandinavian hordes poured in with their northern holocaust and lust of plunder, but in time they adopted the language and faith of the islanders. Mention is made of incursions of the Vikings as early as 793, but the principal immigration took place towards the end of the 9th century in the early part of the reign of Harald Fairhair, king of Norway, and consisted of people driven to the Hebrides, as well as to the Orkney and Shetland, to escape from his tyrannous rule. Soon afterwards they made incursions against their mother-country, and on this account Harald fitted out an expedition against them, and placed Orkney, Shetland, the Hebrides and the Isle of Man under Norwegian government. The chief seat of the Norwegian sovereignty was Colonsay. About the year 1005 Godred Crovan, king of Dublin, Man and the Hebrides, died in Islay. His third son, Olaf, succeeded to the government about 1103, and the daughter of Olaf was married to Somerled, who became the founder of the dynasty known as Lords of the Isles. Many efforts were made by the Scottish monarchs to displace the Norwegians. Alexander II. led a fleet and armed forces of Norwegians into the Hebrides, and died in the island of Kerrera. On the other hand, Haakon IV., king of Norway, at once to restrain the independence of his jarl and to keep in check the ambition of the Scottish kings, set sail in 1263 on a great expedition, which, however, ended disastrously at Largs. Magnus, son of Haakon, concluded in 1266 a peace with the Scots, renouncing all claim to the Hebrides and other islands except Orkney and Shetland, and Alexander III. agreed to give him a sum of 4000 marks in four yearly payments. It was also stipulated that Margaret, daughter of Alexander, should be betrothed to Eric, the son of Magnus, whom she married in 1261. She died two years later, leaving an only daughter afterwards known as the Maid of Norway. The race of Somerled continued to rule the islands, and from a younger son of the same potentate sprang the lords of Lorne, who took the patronymic of Macdougall. John Macdonald of Islay, who died about 1386, was the first to adopt the title of Lord of the Isles. He was one of the most potent of the island princes, and was married to a daughter of the earl of Strathearn, afterwards Robert II. His son, Donald of the Isles, was memorable for his rebellion in support of his claim to the earldom of Ross, in which, however, he was unsuccessful. Alexander, son of Donald, resumed the hereditary warfare against the Scottish crown; and in 1402 a treaty was concluded between Alexander’s son and successor John and Edward IV. of England, by which John, his son John, and his cousin Donald Balloch, became bound to assist King Edward and James, earl of Douglas, in subduing the kingdom of Scotland. The alliance seems to have led to no active operations. In the reign of James V. another John of Islay resumed the title of Lord of the Isles, but was compelled to surrender the dignity. The glory of the lordship of the isles—the insular sovereignty—had departed. From the time of Bruce the Campbells had been gaining the ascendancy in Argyll. The Macleans, Macnaghtons, Maclachlans, Lamonts, and other ancient races had sunk before this favoured family. The lordship of Lorne was wrested from the Macdougalls by Robert Bruce, and their extensive possessions, with Dunstaffnage Castle, bestowed on the king’s relative, Stewart, and his descendants, afterwards lords of Lorne. The Macdonalds of Sleat, the direct representatives of Somerled, though driven from Islay and deprived of supreme power by James V., still kept a sort of insular state in Skye. There were also the Macdonalds of Clanranald and Glengarry (descendants of Somerled), with the powerful houses of Macleod of Dunvegan and Macleod of Harris, M’Neill of Barra and Maclean of Mull. Sanguinary feuds continued throughout the 16th and 17th centuries among these rival clans and their dependent tribes, and the turbulent vassals, with their clansmen, quarreled and fought each other. James VI. made an abortive endeavour to colonize Lewis. William III. and Queen Anne attempted to subsidize the chiefs in order to preserve tranquillity, but the wars of Montrose and Dundee, and the Jacobite insurrections of 1715 and 1745, showed how futile were all such efforts. It was not till 1748, when a decisive blow was struck at the power of the chiefs by the abolition of heritable jurisdictions, and the appointment of sheriffs in the different districts, that the arts of peace and social improvement made way in these remote regions. The change was great, and at first not unfelt with evil. A new system of management and high rents were imposed, in consequence of which numbers of the people, either native crofters, or large tenants, emigrated. Matters, however, the exodus continued for many years. Sheep-farming on a large scale was next introduced, and the crofters were thrust into villages or barren corners of the land. The result was that, despite the numbers who entered the army or emigrated to Canada, the standard of civilization sank lower, and the population multiplied in the islands. The people came to subsist almost entirely on potatoes and herrings; and in 1846, when the potato blight began its ravages, nearly universal destitution ensued—embracing, over the islands generally, 70% of the inhabitants. Temporary relief was administered in the shape of employment on roads and other works; and an emigration fund being raised, from 4000 to 5000 of the people in the most distressing cases were removed to Australia. Matters, however, were not really mended, and in 1884 a royal commission reported upon the condition of the crofters of the islands and mainland. As a result of their inquiry the Crofters’ Holdings Act was passed in 1886, and in the course of a few years some improvement was evident and has since been sustained.

Their history under Norwegian rule is given in the Chronica regum Manniae et insularum, edited, with learned notes, from the MS. in the British Museum by Professor P. A. Münch of Christiania (1866).

HEBRON (mod. Khuwil er-Rahman, i.e. "the friend of the Merciful One"—an allusion to Abraham), a city of Palestine some 20 m. S. by S.W. of Jerusalem. The city, which lies 300 ft. above the sea, is of extreme antiquity (see Num. xxxii. 22, and Josephus, War, iv. 9, 7) and until taken by the Calebites (Josh. xv. 13) bore the name Kirjath-Arba. Biblical traditions connect it closely with the patriarch Abraham and make it a "city of refuge." The town figures prominently under David as the headquarters of his early rule, the scene of Abner’s murder.
HECATEUS OF ABDERA—HECATE

and the centre of Absalom’s rebellion. In later days the Edomites held it for a time, but Judas Maccabaeus recovered it. It was destroyed in the great war under Vespasian. In a.d. 1167 Hebron became the see of a Latin bishop, and it was taken in 1187 by Saladin.

In 1384 it joined the rebellion against Ibrahim Pasha, who took the town and pillaged it. Modern Hebron rises on the east slope of a shallow valley—a long narrow town of stone houses, the flat roofs having small stone domes. The main thoroughfare is called Tantil Street, and two smaller groups of houses exist north and south of this. The town behind is terraced, and luxuriant vineyards and fruit plantations surround the place, which is well watered on the north by three principal springs, including the Well Sirah, now ‘Ain Sāra (2 Sam. iii. 26). Three conspicuous minarets rise, two from the Haram, the other in the north quarter. The population (10,000) includes Moslems and about 500 Jews. The Bedouins bring wool and camel’s hair to the market; and glass bracelets, lamps and leather waterkins are manufactured in the town. The most conspicuous building is the Haram built over the supposed site of the cave of Hecate (‘Ain Sāra). It is an encampment measuring 112 ft. east and west by 198 north and south, surrounded with high rampart walls of masonry similar in size and dressing to that of the Jerusalem Haram walls. These ramparts are ascribed by architectural authorities to the Herodian period. The interior area is partly occupied by a 12th-century Gothic church, and contains six modern cenotaphs of Abraham, Isaac, Jacob, Sarah, Rebecca and Leah. The cave beneath the platform has probably not been entered for at least 600 years. The numerous traditional sites around Hebron are traceable generally to medieval legendary topography; they include the Oak of Mamre (Gen. xiii. 18 R.V.) which has at various times been shown in different positions from ½ to 2 m. from the town.

There are a British medical mission, a German Protestant mission with church and schools, and, near Abraham’s Oak, a Russian mission. Since 1886 several notices of the Haram, within which are the tombs of the Patriarchs, have appeared.

HECATEUS OF ABDERA (or of Teos), Greek historian, son of Hegesander, flourished in the 4th century b.c. He accompanied Ptolemy I. Soter in an expedition to Syria, and sailed up the Nile with him as far as Thebes (Diogenes Laëritius vii. 61). The result of his travels was set down by him in two works—Ἀγυντασάκα and Περὶ Τερεσπορίων, which were used by Diodorus Siculus. Accordin to Suidas, he also wrote a treatise on the poetry of Hesiod and Homer. Regarding his authorship of a work on the Jews (utilized by Josephus in Contra Apionem), it is conjectured that portions of the Αγυντασάκα were revised by a Hellenistic Jew from his point of view and published as a special work.

Fragment in C. W. Müller’s Fragmenta historiorum Graecorum.

HECATEUS OF MILETUS (6th-5th century B.C.), Greek historian, son of Hegesander, flourished during the time of the Persian invasion. After having travelled extensively, he settled in his native city, where he occupied a high position, and devoted his time to the composition of geographical and historical works.

When Aristagoras held a council of the leading Ionians at Miletus, to organize a revolt against the Persian rule, Hecateus was one of a group of Ionians who tried to join the Ionian Greeks. (Herodotus v. 36, 125.) In 404, after the defeat of the Ionian Greeks, he was one of the ambassadors to the Persian satrap Artaphernes, whom he persuaded to restore the constitution of the Ionian cities. (Diod. Sic. x. 25.) He is by some credited with a work entitled Πεπόλοδος ("Travels round the Earth"). In two books, one on Europe, the other on Asia, in which were described the countries and inhabitants of the known world, the account of Egypt being especially comprehensive; the descriptive matter was accompanied by a map, based upon Anaximander’s map of the earth, which he corrected and enlarged. An authentic specimen of his work, however, strongly attacked by J. Wells in the Journal of Hellenic Studies, xxix. pi. i. 1900. The only certainly genuine work of Hecateus was the Γενειογλαυς or Τεροσπορία, a systematic account of the traditions and mythology of the Greeks. He was probably the first to attempt a serious prose history and to employ critical method to distinguish myth from historical fact, though he accepts Homer and the other poets as trustworthy authority.

Herodotus, though he once at least controverts his statements, is indebted to Hecateus not only for facts, but also in regard of method and general scheme, but the extent of the debt depends on the genuineness of the Πεπόλοδος.

See fragments in C. W. Müller’s Fragmenta historiorum Graecorum, i.; H. Berger, Geschichte der wissenschaftlichen Erkundung der Griechen (1903); E. H. Bunbury, History of Ancient Geography, i.; W. Mure, History of Greek Literature, iv; especially J. V. Præsk, Hekatæos als Herodots Quelle zur Geschiclle Vorderasiens. Beiträge zur Geschichte (Klio), iv. 193 seq. (1904), and J. Wells in Journ. Hell. Stud., as above.

HECATE (Gr. Ἐκάτη, "she who works from afar"), a goddess in Greek mythology. According to the generally accepted view, she is of Hellenic origin, but Farnell regards her as a foreign importation from Thrace, the home of Bendis, with whom Hecate has many points in common. She is not mentioned in the Ilïad or the Odyssey, but in Hesiod (Theogony, 409) she is the daughter of the Titan Pentes and Asterie, in a passage which may be a later interpolation by the Orphists (for other genealogies see Strabo, v. 26). She is represented as a mighty goddess, having power over all the earth and sea; hence she is the bestower of wealth and all the blessings of daily life. The range of her influence is most varied, extending to war, athletic games, the tending of cattle, hunting, the assembly of the people and the law-courts. Hecate is frequently identified with Artemis, an identification usually justified by the assumption that both were moon-goddesses. Farnell, who regards Artemis as originally an earth-goddess, while recognizing a "genuine lunar element" in Hecate from the 5th century, considers her a chthonian rather than a lunar divinity (see also Warr in Classical Review, ix. 390). He is of opinion that neither borrowed much from, nor exercised much influence on, the cult and character of the other.

Hecate is the chief goddess who presides over magic arts and spells, and in this connexion she is the mother of the sorceresses Circe and Medea. She is constantly invoked, in the well-known idyll (ii.) of Theocritus, in the incantation to bring back a woman’s faithless lover. As a chthonian power, she is worshipped at the Samothracian mysteries, and is closely connected with Demeter. Alone of the gods besides Helios, she witnessed the abduction of Persephone and, torch in hand (a natural symbol for the moon’s light), but also Farnell directed his search for her daughter. On moonlight nights she is seen at the cross-roads (hence her name τρόπος, Lat. Trivia) accompanied by the dogs of the Styx and crowds of the dead. Here, on the last day of the month, eggs and fish were offered to her. Black puppies and she-lambs (black victims being offered to chthonian deities) were also sacrificed (Schol. on Theocritus ii. 12). Pillars like the Hermae, called Hecataea, stood, especially in Athens, at cross-roads and doorways, perhaps to keep away the spirits of women.

Like Artemis, Hecate is also a goddess of fertility, presiding especially over the birth and the youth of wild animals, and over human birth and marriage. She also attends when the soul leaves the body at death, and is found near graves, and on the hearth, where the master of the house was formerly buried. It is to be noted that Hecate plays little or no part in mythological legend. Her worship seems to have flourished especially in the wilder parts of Greece, such as Samothrace and Thessaly, in Caria and on the coasts of Asia Minor. In Greece proper it prevailed on the east coast and especially in Aegina, where her aid was invoked against madness.

In older times Hecate is represented as a single-formed, clad in 1 J. B. Bury, in Classical Review, iv. 1905, p. 169, that the name means "dog," against which see J. H. Vince, ib. iv. p. 47. C. G. Warr, ib. ix. 390, takes the Hesiodic Hecate to be a moon-goddess, daughter of the sun-god Perseus.
a long robe, holding burning torches; later she becomes tripformis, "triple-formed," with three bodies standing back to back—corresponding, according to those who regard her as a moon-goddess, to the new, the full and the waning moon. In her six hands are torches, sometimes a snake, a key (as wardress of the lower world), a whip or a dagger; her favourite animal was the dog, which was sacrificed to her—an indication of her non-Hellenic origin, since this animal very rarely fills this part in genuine Greek ritual.

See H. Steudling in Roscher's Lexikon, where the functions of Hecker are systematically derived from the conception of her as a moon-goddess; L. R. Farnell, Cults of the Greek States, ii., where this view is examined; P. París in Daremberg and Saglio's Dictionnaire des antiquités; O. Gruppe, Griechische Mythologie, ii. (1906) p. 1288.

HECATOMB (Gr. έκατομβιν from έκατόν, a hundred, and βόϊν, an ox), originally the sacrifice of a hundred oxen in the religious ceremonies of the Greeks and Romans; later a large number of any kind of animals devoted for sacrifice. Figuratively, "hecatomb" is used to describe the sacrifice or destruction by fire, tempest, disease or the sword of any large number of persons or animals; and also of the wholesale destruction of inanimate objects, and even of mental and moral attributes.

HECATOMB—RHODES, Greek Stoic philosopher and disciple of Chrysippus (1811-1881), is known chiefly for his views on the nature of his life, but it is clear that he was eminent amongst the Stoics of the period. He was a voluminous writer, but nothing remains. A list is preserved by Diogenes, who mentions works on Duty, Good, Virtues, Ends. The first, dedicated to Tiberus, is eulogized by Cicero in the De officiis, and Seneca refers to him frequently in the De beneficiis. According to Diogenes Laërtius, he divided the virtues into two kinds, those founded on scientific intellectual principles (i.e. wisdom and justice), and those which have no such basis (e.g. temperance and the resultant health and vigour). Cicero shows that he was much interested in casuistical questions, as, for example, whether a good man who had received a coin which he knew to be bad was justified in passing it on. On the whole, his moral attitude is cynical, and he is inclined to regard self-interest as the best criterion. This he modifies by explaining that self-interest is based on the relationships of life; a man needs money for the sake of his children, his friends and the state whose general prosperity depends on the wealth of its citizens. Like the earlier Stoics, Canehanes and Chrysippus, he held that virtue may be taught. (See Stoics and Panætius.)

HECKER, FRIEDRICH FRANZ KARL (1811-1881), German revolutionary, was born at Eichterm in the Palatinate on the 28th of September 1811, his father being a revenue official. He studied law with the intention of becoming an advocate, but soon became absorbed in politics. On entering the Second Chamber of Baden in 1842, he at once began to take part in the opposition against the government, which assumed a more and more openly Radical character, and in the course of which his talents as an agitator and his personal charm won him wide popularity and influence. A speech, denouncing the projected incorporation of Schleswig and Holstein with Denmark, delivered in the Chamber of Baden on the 6th of February 1845, spread his fame beyond the limits of his own state, and his popularity was increased by his expulsion from Prussia on the occasion of a journey to Stettin. After the death of his more moderate-minded friend Adolf Sander (March 9th, 1843), Hecker's tone towards the government became more and more bitter. In spite of the shallowness and his culture and his extremely weak character, he enjoyed an ever-increasing popularity. Even before the outbreak of the revolution he included Socialistic claims in his programme. In 1847 he was temporarily occupied with ideas of emigration, and with this object made a journey to Algiers, but returned to Baden and resumed his former position as the Radical champion of popular rights, later becoming president of the Volkverein, where he was destined to fall still further under the influence of the agitator Gustav von Struve. In conjunction with Struve he drew up the Radical programme carried at the great Liberal meeting held at Offenburg on the 12th of September 1847 (entitled "Thirteen Claims put forward by the People of Baden"). In addition to the Offenburg programme, the Sturmpetition of the 1st of March 1848 attempted to extort from the government the most far-reaching concessions. But it was in vain that on becoming a deputy Hecker endeavoured to carry out its impracticable provisions. He had to yield to the more moderate majority, but on this account was driven still further towards the Left. The proof lies in the new Offenburg demands of the 19th of March, and in the resolution moved by Hecker in the preliminary parliament of Frankfort that Germany should be declared a republic. But neither in Baden nor Frankfort did he at any time gain his point.

This double failure, combined with various energetic measures of the government, which were indirectly aimed at him (e.g. the arrest of the editor of the Constamter Seeblatt, a friend of Hecker's, in Karlsruhe station on the 8th of April), inspired Hecker with the idea of an armed rising under pretext of the foundation of the German republic. The 9th to the 12th of April was secretly spent in preliminaries. On the 12th of April Hecker and Struve sent a proclamation to the inhabitants of the Seekreis and of the Black Forest "to summon the people who can bear arms to Donaueschingen at mid-day on the 14th, with arms, ammunition and provisions for six days." They expected 70,000 men, but not even one-tenth of this number appeared. The grand-ducal government of the Seekreis was dispersed, and Hecker gradually gained reinforcements. But friendly advisers also joined him, pointing out the risks of his undertaking. Hecker, however, was not at all ready to listen to them; on the contrary, he added to violence an absurd defiance, and offered an amnesty to the German princes on condition of their retiring within fourteen days into private life. The troops of Baden and Hesse marched against him, under the command of General Friedrich von Gagern, and on the 20th of April they met near Kandern, where Gagern was killed, it is true, but Hecker was completely defeated. Like many of the revolutionaries of that period, Hecker retired to Switzerland. He was, it is true, again elected to the Chamber of Baden by the circle of Thiengen, but the government, no longer willing to respect his immunity as a deputy, refused its ratification. On this account Hecker resolved in September 1848 to emigrate to North America, and obtained possession of a farm near Belleville in the state of Illinois.

During the second rising in Baden in the spring of 1849 he again made efforts to obtain a footing in his own state, but without success. He only came as far as Strassburg, but had to retreat before the victories of the Prussian troops over the Baden insurgents.

On his return to America he won some distinction during the Civil War as colonel of a regiment which he had himself got together in the Palatinate. In 1864 he was appointed Resident at the French legation in Washington. He died at St Louis on the 24th of March 1881.

Hecker was always very much beloved of all the German democrats. The song and the hat named after him (the latter a broad slouch hat with a feather) became famous as the symbols of the middle-classes in revolt. In America, too, he had won great esteem, not only on political grounds but also for his personal qualities.

HECKER, ISAAC THOMAS (1819-1888), American Roman Catholic priest, the founder of the "Paulist Fathers," was born in New York City, of German immigrant parents, on the 18th of December 1819. When barely twelve years of age, he had to go to work, and pushed a baker's cart for his elder brothers, who had a bakery in Rutgers Street. But he studied...
at every possible opportunity, becoming immersed in Kant's Critique of Pure Reason, and while still a lad took part in certain politico-social movements which aimed at the elevation of the working man. It was at this juncture that he met Orestes Brownson, who exercised a marked influence over him. Isaac was deeply religious, a characteristic for which he gave much credit to his prayerful mother, and remained so amid all the reading and agonizing in which he engaged. Having grown into young manhood, he joined the Brook Farm movement, and in that colony he tarried some six months. Shortly after leaving it (in 1844) he was baptized into the Roman Catholic Church by Bishop McCluskey of New York. One year later he took orders as a Redemptorist at the mission in New York, and there he cultivated to a high degree the spirit of lofty mystical piety which marked him through life.

Ordained a priest in London by Wiseman in 1849, he returned to America, and worked until 1857 as a Redemptorist missionary. With all his mysticism, Isaac Hecker had the wide-awake mind of the typical American, and he perceived that the missionary activity of the Catholic Church in the United States must remain to a large extent ineffective unless it adopted methods suited to the country and the age. In this he had the sympathy of a body of American Catholics, who (in addition to the large number of Irish and German immigrants who were of American birth and converts from Protestantism) managed as acting on their own authority, and with the consent of their local superiors, Hecker went to Rome to beg of the Rector Major of his Order that a Redemptorist novitiate might be opened in the United States, in order thus to attract American youths to the missionary life. In furtherance of this request, he took with him the strong approval of some members of the American hierarchy. The Rector Major, instead of listing to Father Hecker, expelled him from the Order for having made the journey to Rome without sufficient authorization. The outcome of the trouble was that Hecker and the four other American Redemptorists went to Picpus in 1858 to form the separate religious community of the Paulists. Hecker trained and governed this community in spiritual exercises and mission-preaching until his death in New York City, after seventeen years of suffering, on the 22nd of December 1888. He founded and was the director of the Catholic Publication Society, was the founder, and from 1865 until his death the editor, of the Catholic World, and wrote Questions of the Soul (1853), Aspirations of Nature (1857), Catholicity in the United States (1879) and The Church and the Age (1888).

The name of Hecker is closely associated with that of "Americanism." To understand this movement it is necessary to comprehend the tendency of events in Catholic Europe rather than in America itself. It will suffice to state that Hecker's influence in Catholicism since shortly after 1870 is the most remarkable feature of the history of the Third Republic. Not only did the French State assume the energetic attitude against the innovations of the monarchists, and in its undisguised hostility to the Republic; secondly, the Church's aloofness from modern men, methods and thought. The progressive party believed in particular culture, in the education of the individual, independent character, while too much stress was laid upon what might be called the mechanical or routine side of religion. The party perceived, too, that Catholicism was making scarcely any use of modern aggressive modes of propaganda; that, for example, the Church took but an insignificant part in social movements, in the organization of clubs for social study, in the establishing of modern philanthropic embryo. Lack of adaptability to modern needs expresses in short the deficiencies in Catholicism which these men endeavoured to correct. They began a domestic apostolate which had for one of its rallying cries, "Allons ou Mourrons!" (Let's work or die!); and inaugrated social works, for a more intimate mingling of priests with the people, and for general cultivation of personal initiative, both in clergy and in laity.

Not unnaturally, they looked for inspiration to America. There they saw a vigorous Church among a free people, with priests publicly respected, and with a note of aggressive zeal in every project of Catholic enterprise. From the American priesthood, Father Hecker stood out conspicuous for sturdy courage, deep interior piety, an assertive self-initiative and immense love of modern times and modern liberty. So they took Father Hecker for a kind of prophetic figure. When his books were first published in the United States, the works of the Paulist Father Elliott, was translated into French (1897), and speedily became the book of the hour. Under the inspiration of Father Hecker's life, character, the more spirited section of the French clergy undertook the task of organizing priests to accept the actual political establishment, and then, breaking out of their isolation, to put themselves in touch with the interior of the life of the country, and take an active part in the work of social amelioration.

In 1897 the movement received an impetus—and a warning—when Mgr O'Connell, former Rector of the American College in Rome, was appointed by the Pope to the leadership of the Congregational Congress in Friburg. The conservatives took alarm at what they considered to be symptoms of pernicious modernism or "Liberalism." Did it not tend toward breaking down the divinely established distinction between the priest and the layman, and conceding something to the laity in the management of the Church? The insistence upon individual initiative was judged to be incompatible with the fundamental principle of Catholicism, obedience to authority. Moreover, the conservatives were, almost to a man, anti-republicans who distrusted and disliked the democratic abédés. Complaints were made to Rome. A violent polemic against the new direction which was launched in Abbé Maquin's Le père Hecker, est-il un saint? (1898).

Repugnance to American tendencies and influences had a still more determining and in part more definite form in the case of Leo XIII. He was extremely reluctant to pronounce any strictures upon American Catholics, of whose loyalty to the Roman See, and to their faith, he had often spoken in terms of high approbation. But it was only, in a manner, in protest against what he observed in him, and, early in February 1899, addressed to Cardinal Gibbons the Brief Tempor Demoenentialia. This document contained a condemnation of the following doctrines and tendencies: (a) undue insistence on interior initiative in the spiritual life, as leading to disobedience; (b) attacks on religious vows, and disparagement of the value in the present age, of religious orders; (c) minimizing Catholic doctrine; (d) minimizing the spiritual duties of the laity; (e) and finally, he did not assert that any unsound doctrine on the above points had been held by Hecker or existed among Americans. Its tenour was, that if such opinions did exist, the Pope called upon the hierarchy to expel the evil. Cardinal Gibbons, and many other prelates, a year later, replied to Rome. With all but unanimity, they declared that the incriminated opinions had no existence among American Catholics. It was well known that Hecker never had countenanced the slightest departure from Catholic principles in their fullest and most strict application. The disturbance caused by the condemnation was slight: almost the entire laity, and a considerable part of the clergy, preserved good will toward this great leader although he had been blamed. So was-best forgotten, but the result was to strengthen the hands of the conservatives in France. (J. F. M.)

HECKMONDWIKE, an urban district in the Spen Valley parliamentary division of the West Riding of Yorkshire, England, 8 m. S.S.E. of Bradford, on the Lancashire & Yorkshire, Great Northern, and London & North-Western railways. Pop. (1901), 9,459. Like the town of Dewsbury, on the south-east, it is an important centre of the blanket and carpet manufactures, and there are also machine works, dye works and iron foundries. Coal is extensively wrought in the vicinity.

HECTOR, in Greek mythology, son of Priam and Hecuba, the husband of Andromache. Like Paris and other Trojans, he had no Oregon name, Danae or Cassandra is his Greek name, and he is described as an ideal warrior, the champion of the Trojans and the mainstay of the city. His character is drawn in most favourable colours as a good son, a loving husband and father, and a trusty friend. His leave-taking of Andromache in the sixth book of the Iliad, and his departure to meet Achilles for the last time, are most touchingly described. He is an especial favourite of Apollo; and later poets even describe him as son of that god. His chief exploits during the war were his defence of the wounded Sarpedon, his fight with Ajax, son of Telamon (his particular enemy), and the massacre of the Cretan regiment. With Agamemnon, the Greeks deserted the Trojans, Hector drove them back to their ships, which he almost succeeded in burning. Patroclus, the friend of Achilles, who came to the help of the Greeks, was slain by Hector with the help of Apollo. Then Achilles, to revenge his friend's death, returned to the war, slew Hector, dragged his body behind his chariot to the camp, and afterwards round the tomb of Patroclus. Aavrodite and Apollo preserved
HECUBA—HEDGES AND FENCES

it from corruption and mutilation. Priam, guarded by Herms, went to Achilles and prevailed on him to give back the body, which was buried with great honour. Hector was afterwards worshipped in the Troad by the Boeotian tribe Gephyreus, who offered sacrifices at his grave.

HECUBA (Gr. 'Ekubh), wife of Priam, daughter of the Phrygian king Dymas (or of Cisseus, or of the river-god Sangarius). According to Homer she was the mother of nineteen of Priam’s fifty sons. When Troy was captured and Priam slain, she was made prisoner by the Greeks. Her fate is told in various ways, most of which connect her with the promontory Cynossea, on the Thracian shore of the Hellespont. According to Euripides (in the Hecuba), her youngest son Polydorus had been placed during the siege of Troy under the care of Polyimestor, king of Thrace. When the Greeks reached the Thracian Chersonese on their way home Hecuba discovered that her son had been murdered, and in revenge put out the eyes of Polyimestor and murdered his two sons. She was acquitted by Agamemnon; but, as Polyimestor foretold, she was turned into a dog, and her grave became a mark for ships (Ovid, Metam. xiii. 399-275; Juvenal x. 271 and Mayor’s note). According to another story, she fell to the lot of Odysseus, as a slave, and in despair threw herself into the Hellespont; or, she used such insulting language towards her captors that they put her to death (Dictys Cretenensis v. 13. 16). It is obvious from the tales of Hecuba’s transformation and death that she is a form of some goddess to whom dogs were sacred; and the analogy with Scylla is striking.

HEDA, WILLEM CLAASZ. (c. 1594—c. 1670), Dutch painter, born at Haarlem, was one of the earliest Dutchmen who devoted himself exclusively to the painting of still life. He was the contemporary and comrade of Dirk Hals, with whom he had in common pictorial touch and technical execution. But Heda was more careful and finished than Hals, and showed considerable skill and not a little taste in arranging and colouring chased cups and beakers and tankards of precious and inferior metals. Nothing is so appetizing as his “luncheon,” with rare comestibles set out upon rich plate, oysters—seldom without the cut lemon—bread, champagne, oives and pastry. Even the commoner “refection” is also not without charm, as it comprises a cut ham, bread, walnuts and beer. One of Heda’s early masterpieces, dated 1623, in the Munich Finakothek is as homely as a later one of 1651 in the Liechtenstein Gallery at Vienna. A more luxurious repast is a “Luncheon in the Augsburg Gallery,” dated 1644. Most of Heda’s pictures are on the European continent, notably in the galleries of Paris, Parma, Ghent, Darmstadt, Gotha, Munich and Vienna. He was a man of repose in his native city, and filled all the offices of dignity and trust in the gild of Haarlem. He seems to have had considerable influence in forming the younger Franz Hals.

HEDDLE, MATTHEW FORSTER (1828-1887), Scottish mineralogist, was born at Hoy in Orkney on the 28th of April 1828. After receiving his early education at the Edinburgh academy, he entered as a medical student at the university in that city, and subsequently studied chemistry and mineralogy at Klausthal and Freiburg. In 1851 he took his degree of M.D. at Edinburgh, and for about five years practised there. Medical work, however, possessed for him little attraction; he became assistant to Prof. Connell, who held the chair of chemistry at St Andrews, and in 1862 succeeded him as professor. This post he held until in 1880 he was invited to report on some gold mines in South Africa. On his return he devoted himself with great assiduity to mineralogy, and formed one of the finest collections by means of personal exploration in almost every part of Scotland. His specimens are now in the Royal Scottish Museum at Edinburgh. It had been his intention to publish a comprehensive work on the mineralogy of Scotland. This he did not live to complete, but the MSS. fell into able hands, and The Mineralogy of Scotland, in 2 vols., edited by J. G. Goodchild, was issued in 1901. Heddle was one of the founders of the Mineralogical Society, and he contributed many articles on Scottish minerals, and on the geology of the northern parts of Scotland, to the

Mineralogical Magazine, as well as to the Transactions of the Royal Society of Edinburgh. * He died on the 19th of November 1897.

HEDGES, or URCHIN, a member of the mammalian order Insectivora, remarkable for its dentition, its armature of spines and its short tail. The upper jaw is longer than the lower, the snout is long and flexible, with the nostrils narrow, and the claws are long but weak. The animal is about 10 in. long, its eyes are small, and the lower surface covered with hairs of the ordinary character. The brain is remarkable for its low development, the cerebral hemispheres being small, and marked with but one groove, and that a shallow one, on each side. The hedgehog has the power of rolling itself up into a ball, from which the spines stand out in every direction. The spines are sharp, hard and elastic, and form so efficient a defence that there are few animals able to effect a successful attack on this creature. The moment it is touched, or even hears the report of a gun, it rolls itself up by the action of the muscles beneath the skin, while this contraction effects the erection of the spines. The most important muscle is the orbicularis ponniciuli, which extends over the anterior region of the skull, as far down the body as the ventral hairy region, and on to the tail, but three other muscles aid in the contraction.

Though insectivorous, the hedgehog is reported to have a liking for mice, while frogs and toads, as well as plants and fruits, all seem to be acceptable. It will also eat snakes, and its fondness for eggs has caused it to meet with the enmity of game-preservers; and there is no doubt it occasionally attacks leverets and game-chicks. In a state of nature it does not emerge from its retreat during daylight, unless urged by hunger or by the necessities of its young. During winter it passes into a state of hibernation, when its temperature falls considerably; having provided itself with a nest of dry leaves, it is well protected from the influences of the rain, and rolling itself up, remains undisturbed till warmer weather returns. In July or August the female brings forth four to eight young, or, according to others, two to four at a somewhat earlier period; at birth the spines, which in the adult are black in the middle, are white and soft, but soon harden, though they do not attain their full size until the succeeding spring.

The hedgehog, which is known scientifically as Erinaceus europaeus, and is the type of the family Erinaceidae, is found in woods and gardens, and extends over nearly the whole of Europe; and has been found at 6000 to 8000 ft. above the level of the sea. The adult is provided with thirty-six teeth; in the upper jaw are 6 incisors, 2 canines and 12 cheek-teeth, and in the lower jaw 4 incisors, 2 canines and 10 cheek-teeth. The genus is represented by about a score of species, ranging over Europe, Asia, except the Malay countries, and Africa. (R. L.)*

HEDGES AND FENCES. The object of the hedge 1 or fence (abbreviation of "defence") is to mark a boundary or to enclose

1 Hedge is a Teutonic word, cf. Dutch heg, Ger. Hecke; the root appears in other English words, e.g. "haw," "as in" "hawthorn."
an area of land on which stock is kept. The hedge, i.e. a row of bushes or small trees, forms a characteristic feature of the scenery of England, especially in the midlands and south; it is more rarely found in other countries. Its disadvantages as a fence are that it is not portable, that it requires cutting and training while young, that it harbours weeds and vermin and that it occupies together with the ditch which usually borders it a considerable space of ground, the margins of which cannot be harnessed or used as pastures. The reason why hawthorn is used by the fence proper, especially where shelter for cattle is not required. In Great Britain the hawthorn (Crataegus monogyna) is by far the most important of hedge plants. Holly resembles the hawthorn in its amenability to pruning and in its prickly nature and closeness of growth, which make it an effective barrier to, and shelter for, stock, but it is less hardy and more slow-growing than the hawthorn. Hornbeam, beech, myrobalan or cherry plum and blackthorn also have their advantages, hornbeam being proof against great exposure, blackthorn thriving on poor land and possessing great impenetrability, and so on. Box, yew, privet and many other plants are used for ornamental hedging; in the United States the osage orange and honey locust are favourite hedge plants. As fences, wooden posts and rails and stone walls may be conveniently used in districts where the requisite materials are plentiful. But the most modern form of fence is formed of wire strands either smooth or barbed (see Barb Wire), strained between iron standards or wooden or concrete posts. The wire may be interwoven with vertical strands or, if necessary, may be kept apart by iron droppers between the standards. Poles of a lighter description are machine-made with pickets of split cherry wood closely set, woven, or with a few strands of wire; they are braced by posts at intervals.

From the fact that tramps and vagabonds frequently sleep under hedges the word has come to be used as a term of contempt, as in "hedge-priest," an inferior and illiterate kind of parson at one time existing in England and Ireland, and in "hedge-school," a low class school held in the open air, formerly very common in Ireland. From the sense of "hedge" as an enclosure or barrier the verb "to hedge" means to enclose, to form a barrier or defence, to bound or limit. As a sporting term the word is used in betting to mean protection from loss, by betting on both sides, but "laying the odds on another or vice versa. The word was early used figuratively in the sense of to avoid committing oneself.

HEDON, a municipal borough in the Holderness parliamentary division of the East Riding of Yorkshire, England, 8 m. E. of Hull by a branch of the North-Eastern railway. Pop. (1901), 10,10. It stands in a low-lying, flat district bordering the Humber. It is 2 m. from the river, but was formerly reached by a navigable inlet, now dry, and was a considerable port. There is a small harbour, but the prosperity of the port has passed to Hull. The church of St Augustine is a splendid cruciform building with central tower. It is Early English, Decorated and Perpendicular, the tower being of the last period. The west front is particularly fine, and the church, with its noble portions and lofty clerestories, resembles a cathedral in miniature. There is manufacture of bricks and an agricultural trade. The corporation consists of a mayor, 3 aldermen and 24 burgesses or councillors; and possesses a remarkable ancient mace, of 15th-century workmanship. Area, 321 acres.

According to tradition the men of Hedon received a charter of liberties from King Æthelstan, but there is no evidence to prove this or indeed to prove any settlement in the town until after the Conquest. The manor is not mentioned in the Domesday Survey, but formed part of the lordship of Holderness which William the Conqueror granted to Oslo, count of Albermarle. A charter of Henry II., which is undated, contains the first certain evidence of settlement. By it the king granted to William, count of Albermarle, free borough rights in Hedon so that his burgesses there might hold of him as freely and quietly as the burgesses of York or Lincoln held of the king. An earlier charter granted to the inhabitants of York shows that these rights included a trade guild and freedom from many dues not only in England but also in France. King John in 1200 granted a confirmation of these liberties to Baldwin, count of Albermarle, and Hawisia his wife and for this second charter the burgesses of Hedon are described as "the burgesses of the borough and city of Hedon, to the which borough the aforesaid Baldwin had granted to Edmund, earl of Lancaster, and Avellina his wife, then lord and lady of the manor, the right of holding a fair at Hedon on the eve, day, and morrow of the feast of St Augustine and for five following days. After the countess's death the manor came to the hands of Edward I. In 1280 it was found by an inquisition that the men of Hedon were 'few and poor' and that if the town were demised at a fee-farm rent the town might improve. The grant, however, does not appear to have been made until 1346. Besides this charter Edward III. also granted the burgesses the privilege of electing a mayor and bailiffs every year. At that time Hedon was one of the chief ports in the Humber, but the borough was gradually taken by Hull after that town came into the hands of the king. Hedon was incorporated by Charles II. in 1661, and James II. in 1680 gave the burgesses another charter granting among other privileges that of holding two extra fairs, but of this they never appear to have taken advantage. The burgesses returned two members to parliament in 1695, and from 1754 to 1832 when the borough was disfranchised.

HEDONISM (Gr. ἡδωνισμός, pleasure, from ἡδος, sweet, pleasant), in ethics, a general term for all theories of conduct in which the criterion is pleasure of one kind or another. Hedonistic theories of conduct have been held from the earliest times, though they have been by no means of the same character. Moreover, hedonism has, especially by its critics, been very much misrepresented owing mainly to two simple misconceptions. In the first place hedonism may confine itself to the view that, as a matter of observed fact, all men do in practice make pleasure the criterion of action, or it may go further and assert that men ought to seek pleasure as the sole human good. The former statement takes no view as to whether or not there is any absolute good: it merely denies that men aim at anything more than pleasure. The latter statement admits an ideal, summum bonum—namely, pleasure. The second confusion is the tacit assumption that the pleasure of the hedonist is necessarily or characteristically of a purely physical kind; this assumption is in the case of some hedonistic theories a pure perversion of the facts. Practically all hedonists have argued that what are known as the "lower" pleasures are not only ephemeral in themselves but also productive of so great an amount of consequent pain that the wise man cannot regard them as truly pleasurable; the same hedonist will, therefore, seek those so-called "higher" pleasures which are at once more lasting and less likely to be discounted by consequent pain. It should be observed, however, that this choice of pleasures by a hedonist is conditioned not by "moral" (absolute) but by prudential (relative) considerations.

The earliest and the most extreme type of hedonism is that of the Cyrenaic School as stated by Aristippus, who argued that the only good for man is the sentient pleasure of the moment. Sicel, (following Protagoras) knowledge is solely of momentary events. Pleasure is the only criterion; it is useless to make calculations as to future pleasures, and to balance present enjoyment with disagreeable consequences. The true art of life is to crowd as much enjoyment as possible into every moment. This extreme or "pure" hedonism regarded as a definite philosophic theory practically died with the Cyrenics, though the same spirit has frequently found expression in ancient and modern, especially poetical, literature.

The confusion already alluded to between "pure" and "rational" hedonism is nowhere more clearly exemplified than in the misconceptions which have arisen as to the doctrine of
the Epicureans. To identify Epicureanism with Cyrenaicism is a complete misunderstanding. It is true that pleasure is the *sumnum bonum* of Epicurus, but his conception of that pleasure is profoundly modified by the Socratic doctrine of prudence and the eudaemonism of Aristotle. The true hedonist will aim at a life of enduring rational happiness; pleasure is the end of life, but true pleasure can be obtained only under the guidance of reason. Self-control in the choice of pleasures with a view to reducing pain to a minimum is indispensable. “Of all this, the beginning, and the greatest good, is prudence.” The negative side of Epicurean hedonism was developed to such an extent by some members of the school (see HEGESIAS) that the ideal life is held to be rather indiscernible from the positive enjoyment. This pessimistic attitude is far removed from the positive hedonism of Aristippus.

Between the hedonism of the ancients and that of modern philosophers there lies a great gulf. Practically speaking ancient hedonism advocated the happiness of the individual; the modern hedonism of Hume, Bentham and Mill is based on a wider conception of life. The only real happiness is the happiness of the community, or at least of the majority: the criterion is society, not the individual. Thus we pass from Egoistic to Universalistic hedonism, Utilitarianism, Social Ethics, more especially in relation to the still broader theories of evolution. These theories are confronted by the problem of reconciling and adjusting the claims of the individual with those of society. One of the most important contributions to the discussion is that of Sir Leslie Stephen (Science of Ethics), who elaborated a theory of the “social organism” in relation to the individual. The end of the evolution process is the production of a “social tissue” which will be “vitally efficient.” Instead, therefore, of the criterion of “the greatest happiness of the greatest number,” Stephen has that of “the health of the organism.” Life is not “a series of detached acts, in each of which a man can calculate the sum of happiness or misery attainable by different courses.” Each action must be regarded as directly bearing upon the structure of society.

HEEL (1) (O. Eng. hēl, cf. Dutch hiel; a derivative of O. Eng. hōk, hough, hock), that part of the foot in man which is situated below and behind the ankle; by analogy, the calcaneal part of the tarsus in other vertebrates. The heel proper in digitigrades and ungulates is raised off the ground and is commonly known as the "knee" or "hock," while the term "heel" is applied to the hind hoofs. (2) (A variant of the earlier hēlād; cf. Dutch hellen, for helden), to turn over to one side, especially of a ship. It is this word probably, in the sense of "tip-up," used particularly of the tilting or tipping of a cask or barrel of liquor, that explains the origin of the expression "no heel-taps," a direction to the drinkers of a toast to drain their glasses and leave no dregs remaining. "Tap" is a common word for liquor, and a cask is said to be "heeled" when it is tipped and only dregs or muddy liquor are left. This suits the actual sense of the phrase better than the explanations which connect it with tapping the "heel" or bottom of the glass (see Notes and Queries, 4th series, vols. xi.-xii., and 5th series, vol. 1.).

HEEM, JAN DAVIDSZ VAN (or JAHUHES DE), (c. 1560-c. 1633), Dutch painter. He was, if not the first, certainly the greatest painter of still life in Holland; no artist has ever approached him in the composition and quality of his still life pictures. He means more than mere naturalism; he utilized reality in form and colour with brilliance and harmony of tints. No object of stone or silver, no flower humble or gorgeous, no fruit of Europe or the tropics, no twig or leaf, with which he was not familiar. Sometimes he merely represented a festoon or a nosegay. More frequently he worked with a purpose to point a moral or illustrate a motto. Here the snake lies coiled under the grass, there a skull rests on blooming plants. Gold and silver tankards or cups suggest the vanity of earthly possessions; salvation is allegorized in a chalice amidst blossoms, death as a crucifix inside a wreath. Sometimes he depicted scenes from the lives of famous men of his school, Madonnas or portraits surrounded by festoons of fruit or flowers. At one time he signed with initials, at others with Johannes, at others again with the name of his father joined to his own. At rare intervals he condescended to a date, and when he did the work was certainly of the best. De Heem entered the guild of Antwerp in 1635-1636, and became a burgess of that city in 1637. He steadily maintained his residence till 1667, when he moved to Utrecht, where traces of his presence are preserved in records of 1668, 1669 and 1670. It is not known when he finally returned to Antwerp, but his death is recorded in the guild books of that place. A very early picture, dated 1628, in the gallery of Gotha, bearing the signature of Johannes in full, shows that de Heem at that time was familiar with the technical habits of execution peculiar to the youth of Albert Cuyp. In later years he completely shook off dependence, and appears in all the vigour of his own originality.

Out of 100 pictures or more to be met with in European galleries scarcely eighteen are dated. The earliest after that of Gotha is a chased tankard, with a bottle, a silver cup, and a lemon on a marble table, dated 1640, in the museum of Amsterdam. A similar work of 1645, with the addition of fruit and flowers and a distant landscape, is in Lord Radnor’s collection at Longford. A chalice in a wreath, with the radiant host amidst wheatsheaves, grapes and flowers, is a masterpiece of 1648 in the Belvedere of Vienna. A wreath with a Madonnas of life size, dated 1650, in the museum of Berlin, shows that de Heem could paint brightly and harmoniously on a large scale. In the Pinakothek at Munich is the celebrated composition of 1653, in which creepers, beautifully commingled with gourds and blackberries, twigs of orange, myrtle and peach, are enlivened by butterflies, moths and beetles. A landscape with a blooming rose tree, a jug of strawberies, a selection of fruit, and a marble bust of Pan, dated 1655, is in the Hermitage at St Petersburg; an allegory of abundance in a medallion wreathed with fruit and flowers, in the gallery of Brussels, is inscribed with de Heem’s monogram, the date of 1668, and the name of an obscure artist called Lambrechts. All these pieces exhibit the master in full possession of his artistic faculties.

CORNELIUS DE HEEM, the son of Johannes, was in practice as a flower painter at Utrecht in 1658, and was still active in his profession in 1671 at the Hague. His pictures are not equal to those of his father, but they are all well authenticated, and most of them in the galleries of the Hague, Dresden, Cassel, Vienna and Berlin. In the Staedel at Frankfort is a fruit piece, with pot-herbs and a porcelain jug, dated 1658; another, dated 1671, is in the museum of Brussels. DAVID DE HEEM, another member of the family, entered the guild of Utrecht in 1668 and that of Antwerp in 1693. The best piece assigned to him is a table with a lobster, fruit and glasses, in the gallery of Amsterdam; others bear his signature in the museums of Florence, St Petersburg and Brunswick. It is well to guard against the fallacy that David de Heem above mentioned is the father of Jan de Heem. We should also be careful not to make two persons of the first artist, who sometimes signs Johannes, sometimes Jan Davidsz or J. D. Heem.

HEEMS, JOHN (1597-1656), Dutch poet. He was born at Amsterdam in 1597. He was educated as a child at Bayonne, and entered the university of Leiden in 1617. In 1621 he went abroad on the grand tour, leaving behind him his first volume of poems, *Minnewestraet* (The Art of Love), which appeared in 1620. He was absent from Holland four years. He was made master of arts at Bourges in 1623, and in 1624 visited Hugo Grotius in Paris. On his return in 1625 he published *Minnepligt* (The Duty of Love), and began to practise as an advocate in the Hague. In 1628 he was sent to England in his legal capacity by the Dutch East India Company, to settle the dispute respecting Amboyna. In the same year he published
the poem entitled Minnekaunde, or the Science of Love. He proceeded to Amsterdam in 1640, where he married Alida, sister of the statesman Van Beuningen. In 1641 he published a Dutch version of Corneille’s The Cid, a tragi-comedy, and in 1647 his most famous work, the pastoral romance of Batavische Arcadia, which he had written ten years before. During the last twelve years of his life Heemskerk sat in the upper chamber of the states-general. He died at Amsterdam on the 27th of February 1656.

The poetry of Heemskerk, which fell into oblivion during the 18th century, is now more read and valued. His famous pastoral, the Batavische Arcadia, which was founded on the Aesrte of Honoré d’Urfé, enjoyed a great popularity for more than a century, and passed through twelve editions. It provoked a host of more or less imitative, of which the most distinguished were the Dorzuchtische Arcadia (1663) of Lambert van den Bos (1610-1698), the Saamandsche Arcadia (1688) of Hendrik Soetooom (1616-1678) and the Rotterdamsche Arcadia (1703) of Willem den Elger (d. 1703). But the original work of Heemskerk, in which a party of nymphs and shepherds go out from the Hague to Katwijk, and there indulge in polite and pastoral discourse, surpasses all these in brightness and variety.

HEEMSKERK, MARTIN JACOBSZ (1498-1574), Dutch painter, sometimes called Van Veen, was born at Heemskerk in Holland in 1498, and apprenticed by his father, a small farmer, to Cornelisz Willemsz, a painter at Haarlem. Recalled after a time to the paternal homestead and put to the plough or the milking of cows, young Heemskerk took the first opportunity that offered to run away, and proved himself more than a match for a congregation of lads. He settled in Haarlem for ever by walking in a single day the 50 miles which separate his native hamlet from the town of Delft. There he studied under a local master whom he soon deserted for John Schoele of Haarlem. At Haarlem he formed what is known as his first manner, which is both a quaint and gauche imitation of the florid style brought from Italy by Mabuse and others. He then started on a wandering tour, during which he visited the whole of northern and central Italy, stopping at Rome, where he had letters for a cardinal. It is evidence of the facility with which he acquired the rapid execution of a scene that the original master of the battle-pieces is no less than a passage out of the Life of Titus, to which he had recourse in order to provide himself with a studio. At his death, which took place on the 1st of October 1574, he left money and land in trust to the orphanage of Haarlem, with interest to be paid yearly to any couple who should be willing to perform the marriage ceremony on the slab of his tomb in the cathedral of Haarlem. It was a superstition which still exists in Catholic Holland that a marriage so celebrated would secure the peace of the dead within the tomb.

The works of Heemskerk are still very numerous. "Adam and Eve," and "St Luke painting the Likeness of the Virgin and Child" in presence of a poet crowned with ivy leaves, and a parrot in a cage—an altar-piece in the gallery of Haarlem, and the "Ecce Homo" in the museum of Ghent, are characteristic works of the period preceding Heemskerk’s visit to Italy. An altar-piece executed for St Laurence of Alkmaar in 1538-1541, and composed of at least a dozen large panels, would, if preserved, have given us a clue to his style after his return from the south. In its absence we have a "Crucifixion" executed for the Riches Claires at Ghent (now in the Ghent Museum) in 1543, and the altar-piece of the Drapers Company at Haarlem, now in the gallery of the Hague, and finished in 1546. In these we observe that Heemskerk discovered the effect of light and shade, and was the first to indulge in the lights of Michelangelo and Raphael, and in Lombardy in the frescoes of Mantegna and Giulio Romano. But he never forgot the while his Dutch origin or the models first presented to him by Schoele and Mabuse. As late as 1551 his memory still served him to produce a copy from Raphael’s "Madonna di Loretto" (gallery of Haarlem). A "Judgment of Momus," dated 1561, in the Berlin Museum, proves him to have been well acquainted with anatomy, but incapable of selection and insensible of grace, depth and harmony. We can only marvel that he could ever have dared such extraordinary contrivance of colour, and fond of florid architecture. Two altar-pieces which he finished for churches at Delft in 1551 and 1559, complete the other a fragment, in the museum of Haarlem, a third of 1551 in the Brussels Museum, representing "Golgotha," the "Crucifixion," the "Flight into Egypt," the "Christ on the Mount," and scenes from the lives of St Bernard and St Benedict, are all fairly representative of his style. Besides these we have the "Crucifixion" in the Hermitage of St Petersburg, and two "Triumphs of Silenus" in the gallery of Vienna, in which the same relation to Giulio Romano may be noted as we mark in the canvases of Rembrandt. Other pieces of varying importance are in the galleries of Rotterdam, Munich, Cassel, Brunswick, Karlsruhe, Mainz and Copenhagen. In England the master is best known by his drawings. A comparatively feeble picture by him is the "Last Judgment" in the palace of Hampton Court.

HEEREN, ARNOLD HERMANN LUDWIG (1760-1842), German historian, was born at Alzen in the 25th of October 1760 at Aachen, near Bremen. He studied philosophy, theology and history at Göttingen, and afterwards travelled in France, Italy and the Netherlands. In 1787 he was appointed one of the professors of the University of Göttingen, and then of history at Göttingen, and he afterwards was chosen aulic councillor, privy councillor, &c., the usual rewards of successful German scholars. He died at Göttingen on the 6th of March 1842. Heeren’s great merit as an historian was that he regarded the states of antiquity from an altogether fresh point of view. Instead of limiting himself to a narration of their political events, he examined their economic relations, their constitutions, their financial systems, and thus was enabled to throw a new light on the development of the world. He possessed vast and varied learning, perfect calmness and impartiality, and great power of historical insight, and is now looked back to as the pioneer in the movement for the economic interpretation of history.

Heeren’s chief works are: Ideen über Politik, den Verkehr, und den Handel des Mittelalters und der alten Welt (2 vols., 1793-1796); 4th ed., 6 vols., 1824-1826; Eng. trans., Oxford, 1833); Geschichte des Studiums der klassischen Litteratur seit dem Wiederaufblitzen der Wissenschaften (2 vols., Göttingen, 1797-1802; new ed., 1852); Geschichte der Staaten des Alten Reichs (Gottingen, 1799; Eng. trans., Oxford, 1840); Geschichte des europäischen Staatsystems (Göttingen, 1800; 3rd ed., 1830); Eng. trans., 1844); Versuch einer Entwicklung der Griechen und der Griechen (Gottingen, 1808; French trans., Paris, 1808), a prize essay on the
HEFELE—HEGEL

Institute of France. Besides these, Heerle wrote brief biographical sketches of Johann von Müller (Leipzig, 1805); Ludwig Spittler (Breslau, 1819); Christian Heer, whereupon Friedrich August Ukert (1780–1851) he founded the famous historical collection, Geschichte der europäischen Staaten (Gotha, 1819 seq.), and contributed many papers to learned periodicals.

A collection of his earlier bibliographical notices, published in 15 volumes (Göttingen, 1821–1830).

HEFELE, KARL JOSEF VON (1800–1893), German theologian, was born at Unterkochen in Württemberg on the 15th of March 1800, and was educated at Tübingen, where in 1839 he became professor-ordinary of Church history and patristics in the Roman Catholic faculty of theology. From 1842 to 1845 he sat in the National Assembly of Württemberg. In December 1846 he was enthroned bishop of Rottenburg. His literary activity, which had been considerable, was in no way diminished by his elevation to the episcopate. Among his numerous theological works may be mentioned his well-known edition of the Apostolic Fathers, issued in 1830; his Life of Cardinal Ximenes, published in 1844 (Eng. trans., 1860); and his still more celebrated History of the Councils of the Church, in seven volumes, which appeared between 1848 and 1851. History of the Councils of the Church he wrote in his capacity of bishop and theologian, but he nevertheless received considerable signs of favour from its authorities, and was a member of the commission that made preparations for the Vatican Council of 1870. On the eve of that council he published at Naples his Causa Honorii Papae, which aimed at demonstrating the moral and historical impossibility of papal infallibility. About the same time he brought out a work in German on the same subject. He took rather a prominent part in the discussions at the council, associating himself with Félix Dupanloup and with Georges Darboy, archbishop of Paris, in his opposition to the doctrine of Infallibility, and supporting their arguments from his vast knowledge of ecclesiastical history. In the preliminary discussions he voted against the promulgation of the dogma. He was absent from the important sitting of the 18th of June 1870, and did not send in his submission to the decrees until 1871, when he explained in a pastoral letter that the dogma "referred only to doctrine given forth ex cathedra, and therein to the definitions proper only, but not to its proofs or explanations." In 1872 he took part in the council summoned by the Ultramontanes at Fulda, and by his judicious use of minimizing tactics he kept his diocese free from any participation in the Old Catholic schism. The last four volumes of the second edition of his History of the Councils have been described as skillfully adapted to the new situation created by the Vatican decrees. During the later years of his life he undertook no further literary efforts on behalf of his church, but retired into comparative privacy. He died on the 6th of June 1893.

HEGEL, GEORG WILHELM FRIEDRICH (1770–1831), German philosopher, was born at Stuttgart on the 27th of August 1770. His father, an official in the fiscal service of Württemberg, is not otherwise known to fame; and of his mother we hear only that she had scholarship enough to teach him the elements of Latin. He had one sister, Christiana, who died unmarried, and a brother Ludwig, who served in the campaigns of Napoleon. At the grammar school of Stuttgart, where Hegel was educated between the ages of seven and eighteen, he was not remarkable. His main productions were a diary kept at intervals during eighteen months (1785–1787), and translations of the Antigone, the Manual of Epictetus, &c. But the characteristic feature of his studies was the copious extracts which from this time onward he unremittingly made and preserved. This collection, alphabetically arranged, comprised annotations on classical authors, passages from newspapers, treatises on morals and mathematics from the standard works of the period. In this way he absorbed in their integrity the raw materials for elaboration. Yet as evidence that he was not merely receptive we have essays already breathing that admiration of the classical world which he never lost. His chief amusement was cards, and he began the habit of taking snuff.

In the autumn of 1788 he entered at Tübingen as a student of theology; but he showed no interest in theology: his sermons were a failure, and he found more congenial reading in the classics, on the advantages of studying which his first essay was written. After two years he took the degree of Ph.D., and in the autumn of 1793 received his theological certificate, stating him to be of good abilities, but of muddling industry and knowledge, and especially deficient in philosophy.

As a student, his orderly appearance gained him the title "Old man," but he took part in the walks, beer-drinking and love-making of his fellows. He gained most from intellectual intercourse with his contemporaries, the two best known of whom were J. C. F. Hölderlin and Schelling. With Hölderlin Hegel learned to feel for the old Greeks a love which grew stronger as the semi-Kantianized theology of his teachers more and more failed to interest him. With Schelling like sympathies bound him. They both protested against the political and ecclesiastical inertia of their native state, and adopted the doctrines of freedom and reason. The story which tells how the two went out one morning to dance round a tree of liberty in a meadow is an authentic one. Hegel, however, did not participate in their spontaneous action.

On leaving college, he became a private tutor at Bern and lived in intellectual isolation. He was, however, far from inactive. He compiled a systematic account of the fiscal system of the canton Bern, but the main factor in his mental growth came from his study of Christianity. Under the impulse given by Lessing and Kant he turned to the original records of Christianity, and attempted to construe for himself the real significance of Christ. He wrote a life of Jesus, in which Jesus was simply the son of Joseph and Mary. He did not stop to criticize as a philologist, and ignored the miraculous. He asked for the secret contained in the conduct and sayings of this man which made him the hope of the human race. Jesus appeared as revealing the unity with God in which the Greeks in their first days unwittingly rejoiced, and as lifting the eyes of the Jews from a lawyer who metes out punishment on the transgressor, to the destiny which in the Greek conception falls on the just no less than on the unjust.

The interest of these ideas is twofold. In Jesus Hegel finds the expression for something higher than mere morality: he finds a noble spirit which rises above the contrasts of virtue and vice into the concrete life, seeing the infinite always embracing our finitude, and proclaiming the divine which is in man and cannot be overcome by error and evil, unless the man close his eyes and ears to the godlike presence within him. In religious life, in short, he finds the principle which reconciles the opposition of the theological and the rational, and the general source of the doctrine that life is higher than all its incidents is of interest. He does not free himself from the current theology either by rational moralizing like Kant, or by bold speculative synthesis like Fichte and Schelling. He finds his panacea in the concrete life of humanity. But although he goes to the Scriptures, and tastes the mystical spirit of the medieval saints, the Christ of his conception has traits that seem borrowed from Socrates and from the heroes of Attic tragedy, who suffer much and yet smile gently on a destiny to which they were reconciled. Instead of the Hebraic doctrine of a Jesus punished for our sins, we have the Hellenic idea of a man who is calmly tranquil in the consciousness of his unity with God.

During these years Hegel kept up a slack correspondence with Schelling and Hölderlin. Schelling, already on the way to fame, kept Hegel abreast with German speculation. Both of them were intent on forcing the theologians into the daylight, and grudged them any aid they might expect from Kant’s postulation of God and immortality to crown the edifice of ethics. Meanwhile, Hölderlin in Jena had been following Fichte’s career with an enthusiasm with which he infected Hegel.

It is pleasing to turn from these vehement struggles of thought to a tour which Hegel in company with three other tutors made through the Bernese Oberland in July and August 1796. Of this tour he left a minute diary. He was delighted with the strange play of the waterfalls, but no glamour blinded him to the squalor of Swiss peasant life. The glaciers and the rocks called forth no
raptures. “The spectacle of these eternally dead masses gave me nothing but the monotonous and at last tedious idea, ‘Es ist so.’”

Towards the close of his engagement at Bern, Hegel had received hopes from Schelling of a post at Jena. Fortunately his friend Hölderlin, now tutor in Frankfurt, secured a similar situation there for Hegel in the family of Herr Gogol, a merchant (January 1797). The new post gave him more leisure and the society he needed.

About this time he turned to questions of economics and government. He had studied Gibbon, Hume and Montesquieu in France, and found them making extracts from the English newspapers on the Poor-Law Bill of 1796; criticizing the Prussian land laws, promulgated about the same time; and writing a commentary on Sir James Stuart’s Inquiry into the Principles of Political Economy. Here, as in contemporaneous criticisms of Kant’s ethical writings, Hegel aims at correcting the abstract discussion of a topic by treating it in its systematic interconnexions. Church and state, law and morality, commerce and art are reduced to factors in the totality of human life, from which the specialists had isolated them.

Relying on the best evidence of Hegel’s attention to contemporary politics, as two unpublished essays written in 1798, “On the Internal Condition of Würtemberg in Recent Times, particularly on the Defects in the Magistracy,” the other a criticism on the constitution of Germany, written, probably, not long after the peace of Lunéville (1801). Both essays are critical rather than constructive. In the first Hegel showed how the supineness of the committee of estates in Würtemberg had favoured the usurpations of the superior officials in whom the court had found compliant servants. And though he perceived the advantages of change in the constitution of the estates, he still doubted if an improved system could work in the actual conditions of his native province. The main feature in the pamphlet is the recognition that a spirit of reform is abroad. If Würtemberg suffered from a bureaucracy tempered by despotism, the Fatherland in general suffered no less. “Germany,” so begins the second of these unpublished papers, “is no longer a state.” Referring the collapse of the empire to the retention of feudal forms and to the action of religious animosities, Hegel looked forward to reorganization by a central power (Austria) wielding the imperial army, and by a representa
tive or elected by the geographical districts of the empire. But such an issue, he saw well, could only be the outcome of violence—of “blood and iron.” The philosopher did not pose as a practical statesman. He described the German empire in its nullity as a conception without existence in fact. In such a state of things it was the business of the philosopher to set forth the outlines of the coming epoch, as they were already moulding themselves into shape, amidst what the ordinary eye saw only as the disintegration of the old forms of social life.

His old interest in the religious question reappears, but in a more philosophical form. Starting with the contrast between a natural and a positive religion, he regards a positive religion as one imposed upon the mind from without, not a natural growth crowning the round of human life. A natural religion, on the other hand, was not, he thought, the one universal religion of every clime and age, but rather the spontaneous development of the national conscience varying in varying circumstances. A people’s religion completes and consecrates their whole activity: in it the people rises above its finite life in limited spheres to an infinite life where it feels itself all at once. Even philosophy with Hegel at this epoch was subordinate to religion; for philosophy must never abandon the finite in the search for the infinite. Soon, however, Hegel adopted a view according to which philosophy is a higher mode of apprehending the infinite than even religion.

At Frankfurt, meanwhile, the philosophic ideas of Hegel first assumed the proper philosophic form. In a MS. of 102 quarto sheets, of which the first three and the seventh are wanting, there is preserved the original sketch of the Hegelian system, so far as the logic and metaphysics and part of the philosophy of nature are concerned. The third part of the system—the ethical theory—seems to have been composed afterwards; it is contained in its first draft in another MS. of 30 sheets. Even these had been preceded by earlier Pytha
gorean constructions envisaging the divine life in divine triangles.

Circumstances soon put Hegel in the way to complete these outlines. His father died in January 1799; and the slender sum which Hegel received as his inheritance, 3154 gulden (about £60), enabled him to think once more of a studious life. At the close of 1800 we find him asking Schelling for letters of introduction to Hamberg, where with cheap living and good beer he hoped to prepare for the faculty of the University of Jena. The upshot was that Hegel arrived at Jena in January 1801. An end had already come to the brilliant epoch at Jena, when the romantic poets, Tieck, Novalis and the Schlegels made it the headquarters of their fantastic mysticism, and Fichte turned the results of Kant into the banner of revolutionary ideas. Schelling was the main philosophical lion of the time; and in some quarters Hegel was spoken of as a new champion summoned to help him in his struggle with the more prosaic continuators of Kant. Hegel’s first performance seemed to justify this expectation. He wrote two essays, introducing the philosophic systems of Fichte and Schelling, tending in the main to support the latter. Still more striking was the agreement shown in the Critical Journal of Philosophy, which Schelling and Hegel wrote conjointly during the years 1802-1803. So latent was the difference between them at this epoch that in one or two cases it is not possible to determine by whom the essay was written. Even at a later period foreign critics like Cousin saw much that was alike in the two doctrines, and did not hesitate to regard Hegel as a disciple of Schelling. The disserta
tion by which Hegel qualified for the position of Privatdozent (De orbis planetarum) was probably chosen under the influence of Schelling’s philosophy of nature. It was an unfortunate subject. While Hegel, depending on a numerical proportion suggested by Plato, hinted in a single sentence that it might be a mistake to look for a planet between Mars and Jupiter, Giuseppe Piazzii (q.v.) had already discovered the first of the astero
des (Ceres) on the 1st of January 1801. Apparently in August, when Hegel qualified, the news of the discovery had not yet reached him, but critics have made this luckless suggestion the ground of attack on a priori philosophy.

Hegel’s career, judged by the calendar of 1801-1802, on logic and metaphysics were attended by about eleven students. Later, in 1804, we find him with a class of about thirty, lecturing on his whole system; but his average attendance was rather less. Besides philosophy, he once at least lectured on mathematics. As he taught, he was led to modify his original system, and notice after notice of his lectures promised a text-book of philosophy—which, however, failed to appear. Meanwhile, after the departure of Schelling from Jena in the middle of 1803, Hegel was left to work out his own views. Besides philosophical studies, where he now added Aristotle to Plato, he read Homer and the Greek tragedians, made extracts from books, attended lectures on physiology, and dabbled in other sciences. On his own representation at Weimar, he was in February 1805 made a professor extraordinarius, and in July 1806 drew his first and only stipend—100 thalers. At Jena, though some of his hearers became attached to him, Hegel was not a popular lecturer any more than K. C. F. Krause (q.v.). The ordinary student found J. F. Fries (q.v.) more intelligible.

Of the lectures of that period there still remain considerable notes. The language often had a theological tinge (never entirely absent), as when the “idea” was spoken of, or the “night of the divine mystery,” or the dialectic of the absolute called the “course of the divine life.” Still his view was growing clearer, and his difference from Schelling more palpable. Both Schelling and Hegel stand in a relation to art, but while the aesthetic model of Schelling was found in the contemporary world, where art was a special sphere and the artist a separate profession in no intimate connexion with the age and nation, the model of Hegel was found rather in those works of national
art in which art is not a part but an aspect of the common life, and the artist is not a mere individual but a concentration of the passion and power of beauty in the whole community. "Such art," says Hegel, "is the common good and the work of all. Each generation hands it on to the next; each has done something to give utterance to the universal thought. Those who are said to have genius have acquired some special aptitude by which they render the general shapes of the nation their own work, one in one point, another in another. What they produce is not their invention, but the invention of the whole nation; or rather, what they find is that the whole nation has found its true nature. Each, as it were, piles up his stone. So too does the artist. Somehow he has the good fortune to come last, and when he places his stone the arch stands self-supported." Hegel, as we have already seen, was fully aware of the change that was coming over the world. "A new epoch," he says, "has arisen. It seems as if the world-spirit had now succeeded in freeing itself from all foreign objective existence, and finally apprehending itself as absolute mind." These words come from lectures on the history of philosophy, which laid the foundation for his *Phänomenologie des Geistes* (Bamberg, 1828).

On the 14th of October 1806 Napoleon was at Jena. Hegel, like Goethe, felt no patriotic shudder at the national disaster, and in Prussia he saw only a corrupt and concealed bureaucracy. Writing to his friend F. J. Niethammer (1766–1848) on the day before the battle, he speaks with admiration of the "world-soul," the emperor, and with satisfaction of the probable overthrow of the Prussians. The scholar's wish was to see the clouds of war pass away, and leave thinkers to their peaceful work. His manuscripts were his main care; and doubtful of the safety of his last despatch to Bamberg, and disturbed by the French soldiers in his lodgings, he hurried off, with the last pages of the *Phänomenologie*, to take refuge in the pro-rector's house. Hegel's indolent—when he was not in institutions— Chancellor system was obliged to borrow from Niethammer, he had no further hopes from the impoverished university. He had already tried to get away from Jena. In 1805, when several lecturers left in consequence of diminished classes, he had written to Johann Heinrich Voss (q.v.), suggesting that his philosophy might find more congenial soil in Heidelberg; but the application bore no fruit. He was, therefore, glad to become editor of the *Bamberger Zeitung* (1807–1808). Of his editorial work there is little to tell; no leading articles appeared in his columns. It was not a suitable vocation, and he gladly accepted the rectorship of the Aegidien-gymnasium in Nuremberg, a post which he held from December 1800 to August 1812. Bavaria at this time was modernizing its institutions. The school system was reorganized by new regulations, in accordance with which Hegel wrote a series of lessons in the outlines of philosophy—ethical, logical and psychological. They were published in 1840 by Rosenkranz from Hegel's papers.

As a teacher and master Hegel inspired confidence in his pupils, and maintained discipline without pedantic interference in their associations and sports. On prize-days his addresses summing up the history of the school year discussed some topic of general interest. Five of these addresses are preserved. The first is an exposition of the advantages of a classical training, when it is not confined to mere grammar. "The perfection and grandeur of the master-works of Greek and Roman literature must be the intellectual bath, the secular baptism, which gives the first and unfading tone and tincture of taste and science." In another address, speaking of the introduction of military exercises at school, he says: "These exercises, while not intended to withdraw the students from their more immediate duty, so far as they have any calling to it, still remind them of the possibility that every one, whatever rank in society he may belong to, may one day have to defend his country and his king, or help to that end. This duty, which is natural to all, was formerly recognized by every citizen, though whole ranks in the state have become strangers to the very idea of it."

On the 16th of September 1811 Hegel married Marie von Tucher (twenty-two years his junior) of Nuremberg. She brought her husband no fortune, but the marriage was entirely happy. The husband kept a careful record of income and expenditure. His income amounted at Nuremberg to 1500 gulden ( lucr. 200) and a house; at Heidelberg, as professor, he received about the same sum; at Berlin about 3000 thalers ( lucr. 400). Two sons were born to them; the elder, Karl, became eminent as a historian. The younger, Immanuel, was born on the 24th of September 1816. Hegel's letters to his wife, written during his solitary holiday tours to Vienna, the Netherlands and Paris, breathe of kindly and happy affection. Hegel the tourist—recalling happy days spent together; confessing that, were it not because of his sense of duty as a traveller, he would rather be at home, dividing his time between his books and his wife; commenting on the shop windows at Vienna; describing the straw hats of the Parisian ladies—is a contrast to the professor of a profound philosophical system. But it shows that the enthusiasm which in his days of courtship moved him to verse had blossomed into a later age of domestic bliss.

In 1812 appeared the first two volumes of his *Wissenschaft der Logik*, and the work was completed by a third in 1816. This work, in which his system was for the first time presented in what, with a few exceptions, remains its final form, found some audience in the world. Towards the close of his eighth session three professorships were almost simultaneously put within his reach—at Erlangen, Berlin and Heidelberg. The Prussian offer expressed a doubt that his long absence from university teaching might have made him rusty, so he accepted the post at Heidelberg, whence Fries had just gone to Jena (October 1816). Only four hearers turned up for one of his courses. Others, however, on the encyclopaedia of philosophy and the history of philosophy drew classes of twenty to thirty. While he was there Cousin first made his acquaintance, but a more intimate relation dates from Berlin. Among his pupils besides, F. W. Hinrichs (q.v.), to whose *Religion in its Inward Relation to Science* (1822) Hegel contributed an important preface. The strangest of his hearers was an Estonian baron, Boris d'Yrkull, who after serving in the Russian army came to Heidelberg to hear the wisdom of Hegel. But his books and his lectures were alike obscure to the baron, who betook himself by Hegel's advice to simpler studies before he returned to the Hegelian system.

At Heidelberg Hegel was active in a literary way also. In 1817 he brought out the *Encyklopädie d. philos. Wissenschaften im Grundrisse* (4th ed., Berlin, 1817; new ed., 1870) for use at his lectures. It is the only exposition of the Hegelian system as a whole which we have direct from Hegel's own hand. Besides this work he wrote two reviews for the Heidelberg *Jahrbücher*—the first on F. H. Jacobi, the other a political pamphlet which called forth violent criticism. It was entitled a *Criticism on the Transactions of the Estates of Württemberg in 1815–1816*. On the 15th of March 1815 King Frederick of Württemberg, at a meeting of the estates of his kingdom, laid before them the draft of a new constitution, in accordance with the resolutions of the congress of Vienna. Though an improvement on the old constitution, it was unacceptable to the estates, jealous of their old privileges and suspicious of the king's intentions. A decided majority demanded the restitution of their old laws, though the kingdom now included a large population to which the old rights were strange. Hegel in his essay, which was republished at Stuttgart, supported the royal proposals, and animadverted on the backwardness of the bureaucracy and the landed interests. In the main he was right; but he forgot too much the provocation they had received, the usurpations and selfishness of the governing family, and the unpatriotic character of the king.

In 1818 Hegel accepted the renewed offer of the chair of philosophy at Berlin, vacant since the death of Fichte. The hopes which this offer raised of a position less precarious than that of a university teacher of philosophy were in one sense disappointed; for more than a professor Hegel never became. But his influence upon his pupils, and his solidarity with the
Hegel

Prussian government, gave him a position such as few professors had held.

In 1821 Hegel published the *Grundlinien der Philosophie des Rechts* (2nd ed., 1849; ed. G. J. B. Bolland, 1901; Eng. trans., *Philosophy of Right*, by S. W. Dyde, 1866). It is a combined system of moral and political philosophy, or a sociology dominated by the idea of the state. It turns away contemptuously and fiercely from the sentimental aspirations of reformers possessed by the democratic doctrine of the rights of the omnipotent nation, and taught that there is no work of the "ringleaders of shallowness" who were bent on substituting a fancied tie of enthusiasm and friendship for the established order of the state. The disciplined philosopher, who had devoted himself to the task of comprehending the organism of the state, had no patience with feeble or more merciful minds who recklessly laid hands on established ordinances, and set them aside where they contravened humanitarian sentiments. With the principle that whatever is real is rational, and whatever is rational is real, Hegel fancied that he had stopped the mouths of political critics and constitution-mongers. His theory was not a mere forgery of the libertarian state, but a scheme that he considered as necessary to a state was wanting in Prussia; and some of the reforms already introduced did not find their place in his system. Yet, on the whole, he had taken his side with the government. Altenstein even expressed his satisfaction with the book. In his disgust at the crude conceptions of the enthusiasts, who had hoped that the war of liberation might end in a realm of internal liberty, Hegel had forgotten his own youthful vows recorded in verse to Hölderlin, "never, never to live in peace with the ordinance which regulates feeling and opinion." And yet if we look closely we see that this was an existing power. It is neither to an overpowering sense of the value of organization—a sense that liberty can never be disavowed from order, that a vital interconnexion between all the parts of the body politic is the source of all good, so that while he can find nothing but brute weight in an organized public, he can compare the royal person in his ideal form of constitutional monarchy to the dot upon the letter f. A keen sense of how much is at stake in any alteration breeds suspicion of every reform.

During his thirteen years at Berlin Hegel's whole soul seems to have been in his lectures. Between 1823 and 1837 his activity reached its maximum. His notes were subjected to perpetual revisions and additions. We can form an idea of them from the shape in which they appear in his published writings. Those on *Aesthetics*, on the *Philosophy of Religion*, on the *Philosophy of History* and on the *History of Philosophy*, have been published by his editors, mainly from the notes of his students, under their separate heads; while those on logic, psychology and the philosophy of nature are appended in the form of illustrative and explanatory notes to the sections of his *Encyclopädie*. During these years hundreds of hearers from all parts of Germany, and beyond, came under his influence. His fame was carried abroad by eager or intelligent disciples. At Berlin Hennings served to prepare the intending disciple for fuller initiation by the master himself. Edward Gans (q.v.) and Heinrich Gustav Hotho (q.v.) carried the method into special spheres of inquiry. At Halle Hinnichs maintained the standard of Hegelianism amid the opposition or indifference of his colleagues.

Three courses of lectures are especially the product of his Berlin period: those on aesthetics, the philosophy of religion and the philosophy of history. In the years preceding the revolution of 1830, public interest, or rather from political life, returned to theatres, concert-rooms and picture-galleries. At these Hegel became a frequent and appreciative visitor and made extracts from the art-notices in the newspapers. In his holiday excursions, the interest in the fine arts more than once took him out of his way to see some old painting. At Vienna in 1824 he spent every moment at the Italian opera, the ballet and the picture-galleries. In Paris, in 1827, he saw Charles Kemble and an English company play Shakespeare. This familiarity with the facts of art, though neither deep nor historical, gave a freshness to his lectures on aesthetics, which, as put together from the notes of 1820, 1823, 1826, are in many ways the most successful of his efforts.

The lectures on the philosophy of religion are another application of his method. Shortly before his death he had prepared for the press a course of lectures on the proofs for the existence of God. In his lectures on religion he dealt with Christianity, as in his philosophy of morals he had regarded the state. On the one hand he turned his weapons against the rationalistic school, which reduced religion to the medium compatible with any other system of the ordinary worldly mind. On the other hand he criticized the school of Schleiermacher, who elevated feeling to a place in religion above systematic theology. His middle way attempts to show that the dogmatic creed is the rational development of what was implicit in religious feeling. To do so, of course, philosophy becomes the interpreter and the superior. To the new school of E. W. Hengstenberg, which regarded Revelation itself as supreme, such interpretation was an abomination.

A Hegelian school began to gather. The flock included intelligent pupils, empty-headed imitators, and romantic nature was turned philosophy into lyric measures. Opposition and criticism only served to define more precisely the adherence to the new doctrine. Hegel himself grew more and more into a belief in his own doctrine as the one truth for the world. He was in harmony with the government, and his followers were on the winning side. Though he had soon resigned all direct official connexion with the schools of Brandenburg, his real influence in Prussia was considerable, and as usual was largely exaggerated in popular estimate. In the narrower circle of his friends his birthdays were the signal for congratulatory verses. In 1826 a formal festival was got up by some of his admirers, one of whom, and later, spoke of his categories as new gods; and he was presented with much poetry and a silver mug. In 1830 the students struck a medal in his honour, and in 1831 he was decorated by an order from Frederick William III. In 1830 he was rector of the university; and in his speech at the tricentenary of the Augsburg Confession in that year he charged the Catholic Church with regarding the virtues of the pagan world as brilliant vices, and giving the crown of perfection to poverty, continence and obedience.

One of the last literary undertakings in which he took part was the establishment of the *Berlin Jahrbücher* (in *Wissenschaftliche Kritik*, in which he assisted Edward Gans and Varnhagen von Ense. The aim of this review was to give a critical account, certified by the names of the contributors, of the literary and philosophical productions of the time, in relation to the general progress of knowledge. The journal was not solely in the Hegelian interest; and more than once, when Hegel attempted to dominate over the other editors, he was met by vehement and vigorous opposition.

The revolution of 1830 was a great blow to him, and the prospect of democratic advances almost made him ill. His last literary work, the first part of which appeared in the *Preussische Staatszeitung*, was an essay on the English Reform Bill of 1831. It contains primarily a consideration of its probable effects on the character of the new members of parliament, and the measures which they may introduce. In the latter connexion he enlarged on several points in which England had done less than many continental states for the abolition of monopolies and abuses. Surveying the questions connected with landed property, with the game laws, the poor, the Established Church, especially in Ireland, he expressed grave doubt on the legislative capacity of the English parliament as compared with the power of renovation manifest in the other states of western Europe.

In 1831 cholera first entered Europe. Hegel and his family retired for the summer to the suburbs, and there he finished the revision of the first part of his *Science of Logic*. On the beginning of the winter session, however, he returned to his house in the Kupfergraben. On this occasion an altercation occurred between him and his friend Gans, who in his notice of lectures on jurisprudence had recommended Hegel's *Philosophy of Right*. Hegel, indignant at what he deemed patronage, demanded that the note should be withdrawn. On the 14th of November, after one
day’s illness, he died of cholera and was buried, as he had wished, between Fichte and Solger.

Hegel in his class-room was neither imposing nor fascinating. You saw a plain, old-fashioned face, without life or lustre—a figure which had never looked young, and was now prematurely aged; the furrowed face bore witness to concentrated thought; Sitting with his snuff-box before him, and his head bent down, he looked ill at ease, and kept turning the folios of his notes. His utterance was interrupted by frequent coughing; every sentence of a proposition in his book—like the jaws of a teddy—had no longer his usual regular. Sometimes in plain narrative the lecturers would be specially awkward, while in abstruse passages he seemed specially at home, rose into a natural eloquence, and carried away the hearer by the grandeur of his dictum.

**Philosophy.**—Hegelianism is confessedly one of the most difficult of all philosophies. Every one has heard the legend which makes Hegel say, "One man has understood me, and even he has not." He absolutely seizes us into the world where old habits of thought fail us. In three places, indeed, he has attempted to exhibit the transition to his own system from other levels of thought; but in none with much success. In the introductory lectures on the philosophy of religion he gives a rationale of the difference between the modes of consciousness in religion and philosophy (between **Vorstellung** and **Begriff**). In the beginning of the *Encyclopädie* he discusses the defects of dogmatism, empiricism, the philosophies of Kant and Jan-ass, and this he treats in a less destructive aspect of the difference; in the latter he presents his doctrine less in its essential character than in special relations to the prominent systems of his time. The *Phenomenology of Spirit*, regarded as an introductory volume, is the most different and the most searching for the philosophy which it was to introduce was not then fully elaborated. Even to the last, Hegel had not so externalized his system as to treat it as something to be led up to by gradual steps. His philosophy is not a system from one aspect of the life and the time to the other; but there step-templated from others; it was the ripe fruit of concentrated reflection, and had become the one all-embracing form and principle of his thinking. More than most thinkers he had quietly laid himself open to the steps of his time, and from the lessons of history.

The Phenomenology is the picture of the Hegelian philosophy in the making—at the stage before the scaffolding has been removed from the building. For to all the most brilliant and the most difficult of Hegel’s works—the most brilliant because it is to some degree an autobiography of Hegel’s mind—not the abstract record of a logical evolution, but the real history of an intellectual growth; the most difficult because, instead of treating the rise of intelligence (from its first appearance in contrast with the real world to its final recognition of its presence in, and rule over, all things) as a purely subjective process, he treats it as outward and as brought out in historical epochs, national characteristics, forms of culture and faith, and philosophical systems. The theme is identical with the introduction to the *Encyclopädie*; but it is treated in a very different style. From all periods of dogmatism from the Greek to the modern, from the religious, and from the metaphysical, the romantic, and from the rationalistic, Hegel gathers in the vineyards of the human spirit, the grapes from which he crushes the wine of thought. The mind constantly works through a thousand phases of thought and experience, and from a sense and realization of its true position in the universe—is such the drama which is consciously Hegel’s own history, but is represented objectively as the progress of spiritual history which the philosopher reproduces in himself. The *Phenomenology* stands to the *Encyclopädie* somewhat as the dialogues of Plato stand to the Aristotelian treatises. It contains almost all his philosophy—but irregularly and without due proportion. The personal element gives an ominous prominence to recent phenomena of the philosophic atmosphere. It is the account given by an inventor of his own discovery, not the explanation of an outsider. It therefore to some extent assumes from the first the ground which it afterwards fills up and gives. Not a proof of that position, but an account of the experience (Erfahrung) by which consciousness is forced from one position to another till it finds rest in *Absolutes Wissen*.

The *Phenomenology* is neither mere psychology, nor logic, nor moral philosophy, nor history, but is all of these and a great deal more. It needs not distortion, but expansion and illustration from contemporary and antecedent thought and literature. It touches not only the surface but the root of the thing. The mind, which has the six heads of consciousness, self-consciousness, reason (*Vernunft*), spirit (Geist), religion and absolute knowledge. The native attitude of consciousness towards the world of existence is the reflex: if a creature reflection is sufficient to show that the reality attributed to the external world is as much due to intellectual conceptions as to the senses, and that these conceptions cull us where we would not go, confine us to the narrowest object outside itself, so self-consciousness cannot find a permanent subject in itself. It may, like the Stoic, assert freedom by holding aloof from the entanglements of real life, or like the sceptic regard the world as a delusion, or finally, as the “unhappy consciousness” (*Unglückliches Bewusstsein*), may be a recurrent falling short of a perception by the mind, which is the meeting ground of body and mind. But reason finds much in the world recognizing no kindled with, and so turns, as it were, away from this world, and into the realization of its own aims. Either in a crude way she pursues her aims, and finds that necessity counteracts her cravings; or she endeavours to find the world in harmony with the heart, and yet is unwilling to give up the spirit of life for the spirit of the world. Finally, unable to impose upon the world either selfish or humanitarian ends, she folds her arms in pharisaic virtue, with the hope that some hidden power will give the victory to righteousness. But the world sees her, and this world goes on—she must address herself to the world. The principle of nature is to live and let live. Reason abandons her efforts to mould the world, and is content to let the aims of individuals work out their results independently, only stepping in to lay down the rules for the cases where individual actions conflict, and to test these precepts by the rules of formal logic.

So far we have seen consciousness on one hand and the real world on the other. The stage of *Geist* reveals the consciousness no longer as critical and antagonistic but as a community, as no longer isolated from its surroundings but the union of the single and real consciousness with the vital feeling that animates the social whole. The unity of consciousness—life, and not knowledge; the spirit inspires, but does not reflect. It is the age of unconscious morality, when the individual’s life is lost in the society of which he is an organic member. But the world which goes on in this manner only gradually finds that the ethical spirit of its environment, gradually emancipates itself from conventions and superstitions. This *Aufklärung* prepares the way for the rule of conscience, for the moral view of the world as subject of a moral law. From the moral world the numerical is a step; the world of the social and personal is another. Finally, we reach the stage of absolute knowledge; and this absolute knowledge—"the spirit knowing itself as spirit"—is not something which leaves these other forms behind but the full comprehension of them as the same and the same. They are the members and the sepulchre of its history, and at the same time the truth, and certainty and its throne." Here, according to Hegel, is the field of philosophy.
But with this modification on the system another necessarily followed; a mere logical series could not create nature. And thus the postulates of the first period in Hegel's thought became only the result of organic conditions—subjective and humanitarian; and the system of Hegel was no longer an idealization of religion, but a naturalistic theory with a prominent and peculiar logic.

What Aristotle did for the theory of demonstrative reasoning, Hegel attempted to do for the whole of human knowledge. His logic is an enumeration of the methods of which our experience proceeds by.

It carried out Kant's doctrine of the categories developing in synthetic principles, but removed the limitation by which Kant denied them any constitutive value except in alliance with experience. According to Hegel, we think of the whole of ideas. He lays special stress on the point that abstract ideas when held in their abstraction are almost interchangeable with other abstract ideas; this interchangeability is possible in every true and concrete idea there is a coincidence of ideas.

The beginning of the logic is an illustration of this. The logical idea is treated under the three heads of being (Seyn), essence (Wesen) and idea (Vorstellung), and the Hegelian idea, which cannot think less about anything than when we merely say that it is.

Being—the abstract "is"—is nothing definite, and nothing at least is. Being and not being are thus declared identical—a proposition which is in a certain unqualified sense true. According to Hegel, he has not attempted to define the abstractions at all, but has made a science of the relations of ideas.

The Fichteans, in the Spirit of Hegel, is generalized by Hegel into the perpetual law of thought.

The world that we may call their psychological aspect these three stages are known as the abstract stage, or that of understanding (Verstand), the dialectical stage, or that of negative reason, and the speculative stage, or that of positive reason (Vernunft). The first of these attitudes taken alone is dogmatism; the second, when sincerely isolated, is scepticism; the third, when unexplained by its elements, is mysticism. Thus Hegelianism reduces dogmatism, scepticism and mysticism simply to abstract abstractions.

The dialectic is, therefore, a dislocating power; it shaves the solid, reduces the real to idea, and renders it thus latent in such conceptions of the world. It is the spirit of progress and change, the enemy of convention and conservatism; it is absolute and universal unrest. In the realm of abstract thought thought becomes life and action, or thought moves of itself. It is an expression of effort, requiring neither the surrender of the original unity nor the ignoring of the diversity afterwards suggested. The stimulus of contradiction is no doubt a strong one; but the easiest way of escaping it is to shut our eyes to one side of the antithesis. What is required, therefore, is to readjust our original thesis in such a way as to include and give expression to both the elements in the process.

The universe, then, is a process or development, to the eye of philosophy. It is the process of the absolute—in religious language, the manifestation of God. In the background of all the absolute is thus the idea, and, in order to be complete, it must be said that the self-unfolding of the absolute. God reveals Himself in the logical idea, in nature and in mind; but mind is not alike conscious of its absoluteness in every stage of development. Philosophy alone sees God revealing Himself in the ideal organism of thought as it were a possible deity prior to the world and to any relation between God and actuality; in the natural world, as a series of materialized formations or forms of life; and in the spiritual world as the human soul, the legal and social code of society, and the creating civil art; in religion and philosophy.

This introduction of the absolute became a stumbling-block to Fichteans and non-Fichteans alike. Its projectors sought to reduce the absolute to the common intellectual level, thus confounding philosophical language with the common forms of thought; and this was done by giving the logical value of the logical forms—the development of these forms being in their opinion due to the human thinker, not to a self-revealing absolute. Thus they made man the creator of the absolute.
and interdependence, than himself in every case kept to the right way. The day for a fuller investigation of this problem will partly depend upon the progress of the study of language in the direction marked out by W. von Humboldt.

"Lastly, it always the however, appears logical history.

HEGEL

Philosophy of

nature.

The whole falls under the three heads of mechanics, physics, and chemistry. The second, the physical, is divided into the three sections of the Enzyklopädie of the first, of the treatise of space, time, matter, movement; and in the solar system we have the representation of the idea in its general and abstract manner. The laws of nature are the results of the action of the elements, of sound, heat and cohesion, and finally of chemical affinity—presenting the phenomena of material change and inter-change in a series of special forces which generate the variety of the life of the body, elevate the categories of the mind.

In the lectures of the History of Philosophy, edited by Gans and subsequently by Karl Hegel, is the most popular of Hegel's works. The history of the world is a scene where judgment one people and nation after another, until the universal spirit, till another rises in its place, with a fuller measure of liberty—a larger superiority to the bonds of natural and artificial circumstances. Three main periods—the Oriental, the ancient, and the modern, the inhuman despotic, the universal spirit, the rational state, and the man as man possess freedom constitute the history of the world. Inaccuracy in detail and the arrangement of the facts are inevitable in such a scheme. A graver mistake, according to Gassendi, is that Hegel, far from giving a law of progress, seems to suggest that the history of the world is nearing an end, and has merely reduced the past to a logical formula. The answer to this charge is partly that such a law seems unattainable, and partly that the idealistic content of the present which philosophy extracts is always an advance upon actual fact, and so does throw a light into the future. But as with Aristotle so with Hegel—beyond the ethical and political sphere rises the world of absolute spirit in art, religion, and philosophy. The psychological distinction between the spiritual and the corporeal, the fact that from the world of the body the heart and spirit is the organ of the first, presentative conception (Vorstellung) of the second and free thought of the third.

The work of art, the first embodiment of absolute mind, shows a sensuous conformity between the idea and the reality in which it is expressed. The so-called beauty of nature is for Hegel an adventitious beauty. The beauty of art is a beauty born in the spirit of the artist and born again in the spectator; it is not in the nature of things, but in the head of the beholder. "The true mission of art is "essentially a question, an address to a responding breast, a call to the heart and spirit." The perfection of art depends on the degree of knowledge of the idea in the spectator; and the incompleteness of art in the spectator is complete in the idea, and the incompleteness of art in the spectator is complete in the idea, and the incompleteness of art in the spectator.

3. Art, religion and philosophy.

The realisation of the idea in art is the essential function of every soul; it is the expression of the soul's nature.

The body of the work of art is the object, the soul of the work of art is the idea; the aims of the work of art are the result of the object and the idea, which are the cause of the work of art. The work of art is a reproduction of the idea, a reproduction of the idea in the body of the work of art.

The work of art is a reproduction of the idea, a reproduction of the idea in the body of the work of art.

The work of art is a reproduction of the idea, a reproduction of the idea in the body of the work of art.

The work of art is a reproduction of the idea, a reproduction of the idea in the body of the work of art.
places the religion of sorcery. The gradations which follow are apportioned with some uncertainty amongst the religions of the East, and among them, in particular, with the religions of the ancient enigmas we pass to those faiths where Godhead takes the form of a spiritual individuality, i.e. to the Hebrew religion (of sublimity), the Greek (of beauty), the Egyptian (of absolute spirit), the Christian, the Brahmin, God, in the immediate aspect, is the finite world of nature and man, which far from being at one with its Father is originally in an attitude of estrangement. The history of Christianity is the visible representation of that estrangement, and that estrangement of God and Christ, this union, ceasing to be a mere fact, becomes a vital idea, the Spirit of God which dwells in the Christian community.

It is the spirit of Hegel in which we are absorbed. Hegel, like some philosophers, has a feeling for the spirit of a particular age, and his own spirit is exceptionally well adapted to the spirit of his age. We long ago learned to look to Hegel as a philosopher, and we should have learned to look to him, after a more careful analysis in the spirit of a more philosophical age, as a philosopher of the spirit of Hegel's age. Thus, the spirit of Hegel's philosophy is not an accident or whim, but an exponent of its age determined by its antecedents and environments, and handing on its results to the future.

(End of the introduction.)

HEGEMON OF THASOS

G. W. F. Hegel, who was born in 1770, died in 1831, and is one of the most important philosophers of the nineteenth century. He was the son of a lawyer and schoolmaster, and was educated at the University of Tübingen, where he studied law, history, and theology. He was influenced by the ideas of Kant, and was particularly interested in the philosophy of religion. He published several works, including "The Phenomenology of Mind" (1807), "The Science of Logic" (1816), and "The Philosophy of History" (1828). His ideas have had a great influence on later philosophers, including Marx and Nietzsche.
HEGEMONY

Erhard, H. is Caesar Demosthenes, thus significant Hegesias Alexander In generally tinselled, lead, sensational and carnassus states, concerning preserves with conquest, writings question KpobjSuXos treatment Dionysius, a ch. 1870; Eusebius, heresy 208 HEGESIA

HEGESIAS OF MAGNESIA (in Lydia), Greek rhetorician and historian, flourished about 300 B.C. Strabo (xiv. 645), speaks of him as the founder of the florid style of composition known as "Asiatic" (cf. Timaeus). Agatharchides, Dionysius of Halicarnassus and Ciceron all speak of him in disparaging terms, although Varro seems to have approved of his work. He professed to imitate the simple style of Lyssias, avoiding long periods, and speaking himself in short, jumpy sentences, without modulation or finish. His vulgar affectation and bombast made his writings a mere caricature of the old Attic. Dionysius describes his composition as tinselled, ignoble and effeminate. It is generally supposed, from the fragment quoted as a specimen by Dionysius, that Hegesias is to be classed among the writers of lives of Alexander the Great. This fragment describes the treatment of Gaza and its inhabitants by Alexander after its conquest, but it is possible that it is only part of an epicdeitic or show-speech, not of an historical work. This view is supported by a remark of Agatharchides in Phocides (c. 250) that the only aim of Hegesias was to exhibit his skill in describing sensational events.

See Ciceron, Brutus 83, Orator 67, 69, with J. E. Sander's note, ad Ad. xii. 6; Dion. Halic. De verborum comp. iv.; Aulus Gellius ix. 4; Plutarch, Alexander, 3; C. W. Müller, Scriptores rerum Alexandri Magni, p. 138 (appendix to Didot ed. of Arrian, 1846); Norden, Die antike Kunstprosa (1898); J. B. Bury, Ancient Greek Historians (1909), pp. 169-172, on origin and development of "Asiatic" style, with examples from Hegesias.

HEGESIPPUS, Athenian orator and statesman, nicknamed Krêbôdos ("knot"), probably from the way in which he wore his hair. He lived in the time of Demosthenes, of whose anti-Macedonian policy he was an enthusiastic supporter. In 343 B.C. he was one of the ambassadors sent to Macedonia to discuss, amongst other matters, the restoration of the island of Euboea, which had been seized by Philip. The mission was unsuccessful, but soon afterwards Philip wrote to Athens, offering to resign possession of the island or to submit to arbitration the question of ownership. In reply to this letter the oration De Halonneso was delivered, which, although included among the speeches of Demosthenes, is generally considered to be by Hegesippus. Dionysius of Halicarnassus and Plutarch, however, favour the authorship of Demosthenes.

See Demosthenes, De falsa legatione 364, 447, De corona 250, Philippiaca iii. 129; Plutarch, Demosthenes 17, Apollodorismata, 1879; Dionysius Halic. ad Ammaeanum, 1; Grote, History of Greece, ch. 90.

HEGESIPPUS (fl. A.D. 150-180), early Christian writer, was of Palestinian origin, and lived under the Emperors Antoninus Pius, Marcus Aurelius and Commodus. Like Aristo of Pella he belonged to that group of Judaic Christians which, while keeping the law themselves, did not attempt to impose on others the requirements of circumcision and Sabbath observance. He was the author of a treatise (διωκτημα) in five books dealing with such subjects as Christian literature, the unity of church doctrine, paganism, heresy and Jewish Christianity, fragments of which are found in Eusebius, who obtained much of his information concerning early Palestinian church history and chronology from this source. Hegesippus was also a great traveller, and like many other leaders of his time came to Rome (having visited Corinth on the way) about the middle of the 2nd century. His journeys impressed him with the idea that the continuity of the church in the cities he visited was a guarantee of its fidelity to apostolic orthodoxy: "in each succession and in every city, the doctrine is in accordance with that which the Law and the Prophets and the Lord [i.e. the Old Testament and the evangelical tradition] proclaim." To illustrate this opinion he drew up a list of the Roman bishops. Hegesippus is thus a significant figure both for the type of Christianity taught in the circle to which he belonged, and as accentuating the point of view which the church began to assume in the presence of a developing gnosticism.

HEGESIPPUS, the supposed author of a free Latin adaptation of the Jewish War of Josephus under the title De bello Judaico et excidio urbis Hierosolymitanae. The seven books of Josephus are compressed into five, but much has been added from the Antiquities and from the works of Roman historians, while several entirely new speeches are introduced to suit the occasion. Internal evidence shows that the work could not have been written before the 4th century A.D. The author, who is undoubtedly a Christian, describes it in his preface as a kind of revised edition of Josephus. Some authorities attribute it to Ambrose, bishop of Milan (340-397), but there is nothing to settle the authorship definitely. The name Hegesippus itself appears to be a corruption of Josephus, through the stages τοσοστρογονιου, Josippus, Egesippus, Hegesippus, unless it was purposely adopted as reminiscent of Hegesippus, the father of ecclesiastical history (2nd century).

HEGIUS [VON HEER], ALEXANDER (c. 1433-1498), German humanist, so called from his birthplace Heek in Westphalia. In his youth he was a pupil of Thomas à Kempis, at that time canon of the convent of St Agnes at Zwolle. In 1474 he settled down at Deventer in Holland, where he either founded or succeeded to the headship of a school, which became famous for the number of its distinguished alumni. First and foremost of these was Erasmus; others were Hermann von dem Busche, the missionary of humanism, Conrad Goclenius (Gockelen), Conrad Mutianus (Muth von Mudt) and pope Adrian VI. Hegius died at Deventer on the 7th of December 1498. His writings, consisting of short poems, philosophical essays, grammatical notes and letters, were published after his death by his pupil Jacob Faber. They display considerable knowledge of Latin, but less of Greek, on the value of which he strongly insisted. Hegius's chief claim to be remembered rests not upon his published works, but upon his services in the cause of humanism. He succeeded in abolishing the strict rules of Latin grammar and composition, and led his pupils to the study of the classical authors themselves. His generosity in assisting poor students exhausted a considerable fortune, and at his death he left nothing but his books and clothes.

See D. Reichling, "Beiträge zur Charakteristik des Alex. Hegisius," in the Monatschrift für Westdeutschland (1877); H. Hamelmann, Opera genealogico-historica (1714); H. A. Erhardt, Geschichte des Humanismus in Deutschland (Leipzig, 1847); C. G. W. Creecius, "Alexander Hegius und seine Schüler," from the works of Johannes Butzbach, one of Hegius's pupils, in Zeitschrift des bergischen Geschichtsvereins, vii. (Bonn, 1871).

HEIBERG, JONAH LUDVIG (1701-1760), Danish poet and critic, son of the political writer Peter Andreas Heiberg (1758-1841), and of the famous novelist, afterwards the Baroness Gyllenham-Marrensdv, was born at Copenhagen on the 14th of December 1791. In 1800 his father was exiled and settled in Paris, where he was employed in the French foreign office, retiring in 1817 with a pension. His political and satirical writings continued to exercise great influence over his fellow-countrymen. Johan Ludvig Heiberg was taken by K. L. Rahbek and his wife into their house at Bakkehuset. He was educated at the University of Copenhagen, and his first publication, entitled The Theatre for Marionettes (1814), included two romantic dramas. This was followed by Christmas Jokes and New Year's Tricks
HEIDE—HEIDELBERG 209

(1816), The Initiation of Psyche (1817), and The Prophecy of Tycho Brahe, a satire on the eccentricities of the Romantic writers, especially on the sentimentality of Ingemann. These works attracted attention at a time when Baggesen, Oehlenschläger and Ingemann were greater than that of C. H. 1829, a writer of uncommon talent, set out to be the opening of a great career. In 1817 Heiberg took his degree, and in 1819 went abroad with a grant from government. He proceeded to Paris, and spent the next three years there with his father. In 1822 he published his poem of Nina, and was made professor of the Danish language at the university of Kiel, where he delivered a course of lectures, comparing the Scandinavian mythology as found in the Edda with the poems of Oehlenschläger. These lectures were published in 1827.

In 1829 he came back to Copenhagen for the purpose of introducing the vaudeville on the Danish stage. He composed a great number of these vaudevilles, of which the best known are King Solomon and George the Hatmaker (1825); April Fools (1826); A Story in Rosenberg Garden (1827); Kjøge Huskors (1831); The Dames in Paris (1833); No (1836); and Yes (1839). He took his models from the French theatre, but showed extraordinary skill in blending the words and the music; but the subjects and the humour were essentially Danish and even topical. Meanwhile he was producing dramatic work of a more serious kind; in 1825 he brought out the national drama of Elveriet, in which he showed the new realism and the merry coarseness of The Elves, a dramatic version of Tieck's Elfin; and in 1836 Fata Morgana. In 1841 Heiberg published a volume of New Poems containing "A Soul after Death," a comedy which is perhaps his masterpiece, "The Newly Wedded Pair," and other pieces. He edited from 1827 to 1830 the famous weekly, the Flyvende Post (The Flying Post), and subsequently the Interimsblad (1834–1837) and the Intelligensblad (1842–1843). In his journalism he carried on his warfare against the excessive pretensions of the Romanticists, and produced much valuable and penetrating criticism. He was a gifted actor and wrote for the stage the comedies of Johanne Louise Paetges (1812–1890), herself the author of some popular vaudevilles. Heiberg's scathing satires, however, made him very unpopular; and this antagonism reached its height when, in 1845, he published his malicious little drama of The Nut Crackers. Nevertheless he became in 1847 director of the national theatre. He filled the post for seven years, working with great zeal and conscientiousness, but was forced by intrigues from without to resign it in 1854. Heiberg died at Bonderup, near Ringsted, on the 25th of August 1860. His influence upon taste and critical judgment has been great, and for what he did to widen the sphere of his time, and can only be compared with that of Holberg in the 18th century. Most of the poets of the Romantic movement in Denmark were very grave and serious; Heiberg added the element of humour, elegance and irony. He had the genius of good taste, and his witty and delicate productions stand almost unique in the literature of his country.

The poetical works of Heiberg were collected, in 11 vols., in 1861–1862, and his prose writings (11 vols.) in the same year. The last volume of his prose works contains some fragments of autobiography. See also G. Brandes, Essays (1889). For the elder Heiberg see monographs by Thaarup (1883) and by Schwenenflügel (1891).

HEIDE, a town of Germany, in the Prussian province of Schlesiwig-Holstein, on a small plateau which stands between the marshes and moors bordering the North Sea, 35 m. N.N.W. of Glückstadt, at the junction of the railways Elmshorn–Hvidding and Neumünster–Tönning. Pop. (1905), 8738. It has an Evangelical and a Roman Catholic church, a high-grade school, and tobacco and cigar manufactories and breweries. Heide in 1447 became the capital of the Ditmarsh peasant republic, but on the 13th of June 1550 it was the scene of the complete defeat of the peasant forces by the Danish and German arm.

HEIDEGGER, JOHANN HEINRICH (1635–1658), Swiss theologian, was born at Bärenstschwil, in the canton of Zürich, Switzerland, on the 1st of July 1635. He studied at Marburg and at Heidelberg, where he became the friend of J. L. Fabricius (1632–1696), and was appointed "professor extraordinarius of Hebrew and later of philosophy. In 1659 he was called to Steinfurt to fill the chair of dogmatics and ecclesiastical history, and in the same year he became doctor of theology of Heidelberg. In 1660 he revisited Switzerland; and, after marrying, he returned the following year to Holland, where he made the acquaintance of Johannes Cocceius. He returned in 1665 to Zürich, where he was elected professor of moral philosophy. Two years later he succeeded J. H. Hottinger (1620–1667) in the chair of theology, which he occupied till his death on the 18th of January 1671, having declined an invitation in 1669 to succeed J. Cocceius at Leiden, as well as a call to Groningen. Heidegger was the principal author of the Formula Consensus Helvetica in 1675, which was designed to unite the Swiss Reformed churches, but had an opposite effect. W. Gass describes him as the most notable of the Swiss theologians of the time.

His writings are largely controversial, though without being bitter, and are in great part levelled against the Roman Catholic Church. The chief are De historia sacra patriarcharum exercitationes selectae (1667–1671); Dissertatio de Peregrinationibus religious (1670); De ratione studiorum, opuscula aurea, &c. (1670); Historia papaui (1684; under the name Nicander of Hohenegg); Memundato in viam concordiae Protestantism ecclesiae (1686); Titulus concilii Tridentini (1690); Exercitationes bibliicae (1700), with a life of the author prefixed; De ecclesiastico dogmatismo, edited by J. H. Schweitzer; Ethicde Christianae elementa (1711); and lives of J. H. Hottinger (1667) and J. L. Fabricius (1698). His autobiography appeared in 1698, under the title Historia vita J. H. Heidegger.

See the articles in Herzog–Hauck's Realencyclopaedie and the Allgemeine deutsche Biographie; and cf. W. Gass, Geschichte der protestantischen Dogmatik, ii. 333 ff. HEIDELBERG, a town of Germany, on the south bank of the Neckar, 12 m. above its confluence with the Rhine, 13 m. S.E. from Mannheim and 34 m. from Frankfort-on-Main by rail. The situation of the town, lying between lofty hills covered with wood, with the Neckar river winding through the tangle of the hills, and entering the plain of the Rhine, is one of great natural beauty. The town itself consists practically of one long, narrow street—the Hauptstrasse—running parallel to the river, from the railway station on the west to the Karlsrot on the east (where there is also a local station) for a distance of 2 m. To the south of this is the Anlige, a pleasant promenade flanked by handsome villas and gardens, leading directly to the centre of the place. A number of smaller streets intersect the Hauptstrasse at right angles and run down to the river, which is crossed by the bridges of the town. The old bridge on the east, built in 1788, has a fine gateway and statues of Minerva and the elector Charles Theodore of the Palatinate; the other, the lower bridge, on the west, built in 1877, connects Heidelberg with the important suburbs of Neuenheim and Handschuhsheim. Of recent years the town has grown largely towards the west on both sides of the river; but the additions have been almost entirely of the better class of residences. Heidelberg is an important railway centre, and is connected by trunk lines with Frankfort, Mannheim, Karlsruhe, Spires and Würzburg. Electric trams provide for local traffic, and there are several lines joining the chief places in the district. Of the churches the chief are the Protestant Peterskirche dating from the 13th century and restored in 1873, to the door of which Jerome of Prague in 1460 nailed his theses; the Heilig Geist Kirche (Church of the Holy Ghost), an imposing Gothic edifice of the 15th century; the Jesuitenkirche (Roman Catholic), with a sumptuously decorated interior, and the new Evangelical Christuskirche. The town hall and the university buildings, dating from 1712 and restored in 1886, are commonplace erections; but to the south of the Ludwigsplatz, upon which most of the academical buildings lie, stands the new university library, a handsome structure of pink sandstone in German Renaissance style. In addition to the Ludwigsplatz with its equestrian statue of the emperor William I. there are other squares in the town, among them being the Bismarckplatz with a statue of Bismarck, and the jubiläumsplatz.
The chief attraction of Heidelberg is the castle, which overhangs the east part of the town. It stands on the Jettenbühl, a spur of the Königstuhl (1800 ft.), at a height of 330 ft. above the Neckar. Though now a ruin, yet its extent, its magnificence, its beautiful situation and its interesting history render it by far the most noteworthy, as it certainly is the grandest and largest, of the old castles of Germany. The building was begun early in the 13th century. The elector palatine and German king Rupert III. (d. 1419) greatly improved it, and built the wing, Raprechtsbau or Rupert's building, that bears his name. Succeeding electors further extended and embellished it (see Architecture, Plate VII, figs. 78-80); notably Otto Henry "the Magnanimous" (d. 1559), who built the beautiful early Renaissance wing known as the Otto-Heinrichsbau (1556-1559); Frederick IV., for whom the fine late Renaissance wing called the Friedrichsbau was built (1601-1607); and Frederick V., the unfortunate "winter king" of Bohemia, who on the west side added the Elisabethenbau or Englischebau (1618), named after his wife, the daughter of James I. of Great Britain and ancestress of the present English reigning family. In 1648, at the peace of Westphalia, Heidelberg was given back to Frederick V.'s son, Charles Louis, who restored the castle to its former splendour. In 1688, during Louis XIV.'s invasion of the Palatinate, the castle was taken, after a long siege, by the French, who blew part of it up when they found they could not hope to hold it (March 2, 1689). In 1693 it was again captured by them and still further wrecked. Finally, in 1764, it was struck by lightning and reduced to its present ruinous condition.

Apart from the outworks, the castle forms an irregular square with round towers at the angles, the principal buildings being grouped round a central courtyard, the entrance to which is from the south through a series of gateways. In this courtyard, besides the buildings already mentioned, are the oldest parts of the castle, the so-called Alte Bau (old building) and the Bandhaus. The Friedrichsbau, which is decorated with statues of the rulers of the Palatinate, was elaborately restored and rendered habitable between 1897 and 1903. Other noteworthy objects in the castle are the fountain in the courtyard, decorated with four granite columns from Charlemagne's palace at Ingelheim; the Elisabethentor, a beautiful gateway named after the English princess; the beautiful octagonal bell-tower at the N.E. angle; the ruins of the Krauturm, now known as the Gesprengte Turm, or blown-up tower, and the castle chapel and the museum of antiquities in the Friedrichsbau. In a cellar entered from the courtyard is the famous Great Tun of Heidelberg. This vast vat was built in 1751, but has only been used on one or two occasions. Its capacity is 49,000 gallons, and it is 20 ft. high and 31 ft. long. Behind the Friedrichsbau is the Altan (t60), or castle balcony, from which is obtained a view of great beauty, extending from the town beneath to the heights across the Neckar and over the broad luxuriant plain of the Rhine to Mannheim and the dim contours of the Hardt Mountains. The terrace of the beautiful grounds is a statue of Victor von Scheffel, the poet of Heidelberg.

The university of Heidelberg was founded by the elector Rupert I., in 1385, the bull of foundation being issued by Pope Urban VI. in that year. It was constructed after the type of Paris, had four faculties, and possessed numerous privileges. Marsellus von Ingenh was its first rector. The electors Frederick I., the Victorious, Philip the Upright and Louis V. respectively cherished it. Otto Henry gave it a new organization, further endowed it and founded the library. At the Reformation it became a stronghold of Protestant learning, the Heidelberg catechism being drawn up by its theologians. Then the tide turned. Damaged by the Thirty Years' War, it led a struggling existence for a century and a half. A large portion of its remaining endowments was cut off by the peace of Lunéville (1801). In 1803, however, Charles Frederick, grand-duke of Baden, raised it anew and reconstituted it under the name of "Ruperto Carola." The number of professors and teachers is at present about 150 and of students 1700. The library was first kept in the choir of the Heilige Geist Kirche, and then consisted of 3500 MSS. In 1623 it was sent to Rome by Maximilian I., Duke of Bavaria, and stored as the Bibliotheca Palatina in the Vatican. It was afterwards taken to Paris, and in 1815 was restored to Heidelberg. It has more than 900,000 volumes, besides 4000 MSS. Among the other university institutions are the academy hospital, the maternity hospital, the physiological institution, the chemical laboratory, the zoological museum, the botanical garden and the observatory on the Königstuhl.

The other educational foundations are a gymnasium, a modern and a technical school. There is a small theatre, an art and several other scientific societies. The manufactures of Heidelberg include cigars, leather, cement, surgical instruments and beer, but the inhabitants chiefly support themselves by supplying the wants of a large and increasing body of foreign permanent residents, of the considerable number of tourists who during the summer pass through the town, and of the university students. A funicular railway runs from the Korn-Markt up to thezum Jettenbühl (now the Molekpark, or above the town). The town is well lighted and is supplied with excellent water from the Wolfsbrunnen. Pop. (1885), 29,304; (1905), 49,827.

At an early period Heidelberg was a fief of the bishop of Worms, who entrusted it about 1225 to the count palatine of the Rhine, Louis I. It soon became a town and the chief residence of the counts palatine. Heidelberg was one of the great centres of the reformed teaching and was the headquarters of the Calvinists. On this account it suffered much during the Thirty Years' War, being captured and plundered by Count Tilly in 1622, by the Swedes in 1633 and again by the imperialists in 1635. By the peace of Westphalia (1648) restored to the elector Charles Louis. In 1688 and again in 1693 Heidelberg was sacked by the French. On the latter occasion the work of destruction was carried out so thoroughly that only one house escaped; this being a quaintly decorated erection in the Markt- platz, which is now the Hotel zum Ritter. In 1720 the elector Charles II. removed his court to Mannheim, and in 1803 the town became part of the grand-duchy of Baden. On the 5th of March 1848 the Heidelberg assembly was held here, and at this meeting the steps were taken which led to the revolution in Germany in that year.

See Ockert, Stadl, Schloss und Hochschule Heidelberg; Bilder aus ihrer Vergangenheit (Heidelberg, 1885); Ochelhäuser, Das Heidelberger Schloss, Bau- und kunstgeschichtlicher Führer (Heidelberg, 1902); Pflügel, Heidelberg und Umgebung (Heidelberg, 1902);
HEIDELBERG, a town and district of the Transvaal. The district is bounded S. by the Vaal river and includes the south-eastern part of the Witwatersrand gold-fields. The town of Heidelberg is 42 m. S.E. of Johannesburg and 441 m. N.W. of Durban by rail. Pop. (1904), 32,50, of whom 1837 were white. It was founded in 1865, is built on the slopes of the Rand at an elevation of 5000 ft., and is reputed the best sanatorium in the colony. It is the centre of the eastern Rand gold-mines.

HEIDELBERG CATECHISM, THE, the most attractive of all the catechisms of the Reformation, was drawn up at the bidding of Frederick III., elector of the Palatinate, and published on Tuesday the 10th of January 1563. The new religion in the Palatinate had been largely under the guidance of Philip Melancthon, who had revived the old university of Heidelberg and staffed it with sympathetic teachers. One of these, Tillmanns, Melancthon's son-in-law, was general superintendent in 1558, held extreme Lutheran views on the Real Presence, and defended the doctrine of transubstantiation to force the community into his own position excommunicated his colleague Klebels, who held Zwinglian views. When the breach was widening Frederick, "der fromme Kurfürst," came to the succession, dismissed the two chief combatants and referred the trouble to Melancthon, whose guarded verdict was distinctly Swiss rather than Lutheran. In a decree of August 1560 the elector declared for Calvin and Zwingli, and soon after he resolved to issue a new and unambiguous catechism of the evangelical faith. He trusted the task to two young men who have won deserved remembrance by their learning and their character. Zachersius Ursinus was born at Breslau in July 1534 and attained high honour in the university of Wittenberg. In 1558 he was made rector of the gymnasium in his native town, but the incessant strife with the extreme Lutherans drove him to Zürich, whence Frederick, on the advice of Peter Martyr, summoned him to be professor of theology at Heidelberg and superintendent of the Sapientiae Collegium. He was a man of modest and gentle spirit, not endowed with great preaching gift, but unerring in study and consummately able to impart his learning to others. Demoted from the real presence by the elector, Louis in 1537, he lived with John Casimir at Neustadt and found a congenial sphere in the new seminary there, dying in his 49th year, in March 1583.

Caspar Olevianus was born at Treves in 1536. He gave up law for theology, studied under Calvin in Geneva, Peter Martyr in Zürich, and Beza in Lausanne. Urger by William Farel he preached the new faith in his native city, and when banished therefrom found a home with Frederick of Heidelberg, where he gained high renown as preacher and administrator. His ardour and enthusiasm made him the happy complement of Ursinus. When the reaction came under Louis he was defended by Ludwig von Sain, prince of Wittgenstein, and John, count of Nassau, in whose city of Herborn he did notable work at the high school until his death on the 15th of March 1587. The elector could have chosen no better men, young as they were, for the task in hand. As a first step each drew up a catechism of his own composition, that of Ursinus being naturally of a more grave and academic turn than the freer production of Olevianus, while the latter made full use of the earlier catechisms already in use. But when the union was effected it was found that the spirits of the two authors were most happily and harmoniously wedded, the exactness and erudition of the one being blended with the fervency and grace of the other. Thus the Heidelberg Catechism, which was completed within a year of its inception, has an individuality that marks it out from all its predecessors and successors. The Heidelberg synod unanimously approved of it, it was published in January 1563, and in the same year officially turned into Latin by Jos. Lagus and Lambert Pithopruck.

The ultra-Lutherans attacked the catechism with great bitterness, the assault being led by Hesbanius and Ficius Illyricus. Maximilian II. reprimanded against it a denunciation of the peace of Augsburg. A conference was held at Maulbronn in April 1564, and a personal attack was made on the elector at the diet of Augsburg in 1566, but the defence was well sustained, and the Heidelberg book rapidly passed beyond the bounds of the Palatinate (where indeed it suffered eclipse from 1576 to 1583, during the electorate of Louis), and gained an abundant success not only in Germany (Hesse, Anhalt, Brandenburg and Bremen) but also in the Netherlands (1588), among the Reformed churches of Hungary, Transylvania and Poland. It was officially recognized by the synod of Dort in 1619, passed into France, Britain and America, and probably shares with the De imitatione Christi and The Pilgrim's Progress the honour of coming next to the Bible in the number of tongues into which it has been translated.

This wide acceptance and high esteem are due largely to an avoidance of polemical and controversial subjects, and even more to an absence of the controversial spirit. There is no mistake about its Protestantism, even when we omit the unhappy addition made to answer So by Frederick himself (in indignation at the ban passed on the Gnomon of Trent), in which the Mass is described as "nothing else than a denial of the one sacrifice and passion of Jesus Christ, and an accursed idolatry"—an addition which is the one blot on the κουσόμα of the catechism. The work is the product of the best qualities of head and heart, and its prose is frequently marked by all the beauty of a lyric. It follows the plan of the epistle to the Romans (excepting chapters ix.-x.) and falls into three parts: Sin, Redemption and the New Life. This arrangement alone would mark it out from the normal reformation catechism, which runs in the stereotyped order of the Decalogue, Creed, Lord's Prayer, Church and Sacraments. These inhere the three themes more included, but are shown as organically related. The Commandments, e.g., "belong to the first part so far as they are a mirror of our sin and misery, but also to the third part, as being the rule of our new obedience and Christian life." The Creed—a panorama of the sublime facts of redemption—and the sacraments find their place in the second; the Lord's Prayer (with the Decalogue) in the third.

HEIDELOFF, KARL ALEXANDER VON (1788-1862), German architect, the son of Victor Peter Heideloff, a painter, who was called to court at Stuttgart. He studied at the art academy of his native town, and after following the profession of an architect for some time at Coburg, was in 1818 appointed city architect at Nuremberg. In 1822 he became professor at the polytechnical school, holding his post until 1854, and some years later he was chosen conservator of the monuments of art. Heideloff devoted his chief attention to the Gothic style of architecture, and the buildings restored and erected by him at Nuremberg and in its neighbourhood attest both his original skill and his purity of taste. He also achieved some successes in the styles of the Renaissance and Baroque.

He died at Hassfurt on the 28th of September 1865. Among his architectural works should be mentioned the castle of Reinhardsbrunn, the Hall of the Knights in the fortress at Coburg, the castle of Landsberg, the mortuary chapel in Meiningen, the little castle of Rosenburg near Bonn, the chapel of the castle of Rheinstein near Bingen, and the Catholic church in Leipzig. His powers in restoration are shown in the castle of Lichtenstein, the cathedral of Bamberg, and the Knights' Chapel (Ritter Kapelle) at Hassfurt.

Among his writings on architecture are Die Lehre von den Stilartenordnungen (1827); Der Kleine Vignoli (1832); Nürnbergs Baudenkmäler der Vorzeit (1838-1843; complete edition 1894); and Die Ornamentik des Mittelalters (1823-1842).

HEIDENHEIM, a town of Germany, in the kingdom of Württemberg, 31 m. by rail north by east of Ulm. Pop. (1905), 12,173. It has an Evangelical and a Roman Catholic church,
HEIFER—HEILSSBRONN

and several schools. Its industrial establishments include cotton, woolen, tobacco, machinery and chemical factories, bleach-works, dye-works and breweries, and corn and cattle markets. The town, which received municipal privileges in 1356, is overlooked by the ruins of the castle of Hellenstein, standing on a hill 858 ft. high. Heidenheim is also the name of a small place in Bavaria famous on account of the Benedictine abbey which formerly stood there. Founded in 748 by Wilibald, bishop of Eichstätt, this was plunged by a Peasants' War in 1525 and was closed in 1537.

HEIFER, a young cow that has not calved. The O. Eng. heath-fore or heath-fore, from which the word is derived, is of obscure origin. It is found in Bede's History (A.D. 900) as heathfore, and has passed through many forms. It is possibly derived from heah, high, and faren (lare), to go, meaning "high-stepper." It has also been suggested that the derivation is from hea, a stall, and fore, a cow.

HEIGEL, KARL AUGUST VON (1835-1905), German novelist, was born, the son of a régisseur or stage-manager of the court theatre, on the 25th of March 1835 at Bayreuth. In this city he received his early schooling and studied (1854-1858) philosophy at the university. He was then appointed librarian to Prince Heinrich zu Carolath-Beuthen in Lower Silesia, and accompanied the nephew of the prince on travels. In 1863 he settled in Berlin, where from 1865 to 1875 he was engaged in journalism. He next resided at Munich, employed in literary work for the king, Ludwig II., who in 1887 conferred upon him a title of nobility. On the death of the king in 1886 he removed to Riva on the Lago di Garda, where he died on the 6th of September 1905.

Karl von Heigel attained some popularity with his novels: Wohin? (1873), Die Dame ohne Herz (1873), Das Geheimnis des Königs (1891), Der Roman einer Stadt (1898), Der Maharadshah (1900), Die neue Heiligen (1901), and Brömels Glück und Ende (1902). He also wrote some plays, notably Josephine Bonaparte (1892) and Die Zarin (1883); and several collections of short stories, Neue Erzählungen (1876), Neueste Novellen (1878), and Heitere Erzählungen (1893).

HEIEMANN, HERMANN (1864- ), Dutch writer, of Jewish origin, was born on the 3rd of December 1864 at Rotterdam. In the Amsterdam Handelsblad he published a series of sketches of Jewish family life under the pseudonym of "Samuel Falkland," which were collected in volume form. His novels and tales include Trinette (1892), Fles (1893), Kamerjessone (2 vols., 1896), INTHERES (1897), Diamantstadt (2 vols., 1903). Herr Heieman's greatest interest by his play Op Hem, which is always represented at the Théâtre Antoine in Paris, and in English by the Stage Society as The Good Hope. His other plays are: Dora Kramer (1893), Ghetto (1898), Het zevende Gebot (1899), Het Pantser (1901), Ora et labora (1901), and numerous one-act pieces. A Case of Arson, an English version of the one-act play Brand in de Jonge Jan, was notable for the impersonation (1904 and 1905) by Henri de Vries of all the seven witnesses who appear as characters.

HEILBRONN, a town of Germany, in the kingdom of Württemberg, situated in a pleasant and fruitful valley on the Neckar, 33 m. by rail N. of Stuttgart, and at the junction of lines to Jagdsfeld, Crailsheim and Eppingen. Pop. (1907), 40,261. In the older part of the town the streets are narrow, and contain a number of high turreted houses with quaintly adorned gables. The old fortifications have now been demolished, and their site is occupied by promenades, outside of which are the more modern parts of the town with wide streets and many handsome buildings. The principal public buildings are the church of St Kilian (restored 1886-1895) in the Gothic and Renaissance styles, begun about 1019 and completed in 1290, with an elegant tower 210 ft. high, a beautiful choir, and a finely carved altar; the town hall (Rathaus), founded in 1540, and possessing a curious clock made in 1582, and a collection of interesting letters and other documents; the house of the Teutonic knights (Deutsches Haus), now used as a court of law; the Roman Catholic church of St Joseph, formerly the church of the Teutonic Order; the tower (Diebsturm or Götzens Turm) on the Neckar, in which Götzen von Berlichingen was confined in 1519; a fine synagogue; an academy and several museums, among them those to the emperors William I. and Frederick I., to Bismarck, to Schiller and to Robert von Mayer (1814-1878), a native of the town, famous for his discoveries concerning heat. The educational establishments include a gymnasium, a commercial school and an agricultural academy. The town, from a commercial point of view is the most important in Württemberg, and possesses an immense variety of manufactures, of which the principal are gold, silver, steel and iron wares, machines, sugar of lead, white lead, vinegar, beer, sugar, tobacco, soap, oil, cement, chemicals, artificial manure, glue, soda, tapestry, paper and cloth. Grapes, fruit, vegetables and flowering shrubs are largely grown in the neighbourhood, and there are large quarries for sandstone and gypsum and extensive salt-works. By means of the Neckar a considerable trade is carried on in wood, bark, leather, agricultural produce, fruit and cattle.

Heilbronn occupies the site of an old Roman settlement; it is first mentioned in 741, and the Carolingian princes had a palace here. It owes its name—originally Heilichbrorn, or holy-spring—to a spring of water which until 1837 was to be seen rising from under the high altar of the church of St Kilian. Heilbronn obtained privileges from Henry IV. and from Rudolph I. and became a free imperial city in 1360. It was frequently besieged during the middle ages, and it suffered greatly during the Peasants' War, the Thirty Years' War, and the various wars with France. In April 1634 a convention was entered into here between Ostenstier, the Swabian and Franckish estates and the French, English and Dutch ambassadors, as a result of which the Heilbronn treaty, for the prosecution of the Thirty Years' War, was concluded. In 1682 Heilbronn was annexed by Württemberg.

Küsel, Der Heilbronner Konvent (Halle, 1878).

HEILIGENSTADT, a town of Germany, in Prussian Saxony, on the Lene, 32 m. E.N.E. of Cassel, on the railway to Halle. Pop. (1905), 7955. It possesses an old castle, formerly belonging to the electors of Mainz, one Evangelical and two Roman Catholic churches, several educational establishments, and an infantry. The principal manufactures are cotton goods, cigars, paper, cement and needles. Heiligenstadt is said to have been founded by Charles the Great in the eleventh century, but the castle is not of that time. It was burnt by Frederick the Great in 1760, and is now a farm.

HEILSBERG, a town of Germany, in the province of East Prussia, at the junction of the Simser and Alle, 36 m. S. of Königsberg. Pop. (1905), 6042. It has an Evangelical and a Roman Catholic church, and an old castle formerly the seat of the prince-bishops of Ermland, but now used as an infirmary. The principal industries are tanning, dyeing and brewing, and there is considerable trade in grain. The castle founded at Heilsberg by the Teutonic order in 1240 became in 1306 the seat of the bishops of Ermland, an honour which it retained for 500 years. On the 10th of June 1807 a battle took place at Heilsberg between the French under Soult and Murat, and the Russians and Prussians under Bennigsen.

HEILSBRONN (or Kloster-Heilsbronn), a village of Germany, in the Bavarian province of Middle Franconia, with a station on the railway between Nuremberg and Ansbach, has 1200 inhabitants. In the middle ages it was the seat of one of the great monasteries of Germany. This foundation, which belonged to the Cistercian order, owed its origin to Bishop Otto.
HEIM—HEINE

213

of Bamberg in 1132, and continued to exist till 1555. Its sepulchral monuments, many of which are figured by Hocker, Heilsbronner Antiquitätskabinett (Ansbach, 1731-1740), are of exceptionally high artistic interest. It was the hereditary burial-place of the Hohenzollern family and ten burggraves of Nuremberg, five margraves and three electors of Brandenburg, and many other persons of note are buried within its walls. The buildings of the monastery have mostly disappeared, with the exception of the fine church, a Romanesque basilica, restored between 1831 and 1866, and possessing paintings by Albert Dürer. The "Monk of Heilsbronn" is the ordinary appellation of a didactic poet of the 14th century, whose Sieben Gedichte, Todter, Syon und Leben des heiligen Alcestis were published by J. F. L. T. Mezrdorf at Berlin in 1780.

HEIM, ALBERT VON ST. GALLEN (1849— ), Swiss geologist, was born at Zürich on the 12th of April 1849. He was educated at Zürich and Berlin universities. Very early in life he became interested in the physical features of the Alps, and at the age of sixteen he made a model of the Tödi group. This came under the notice of Arnold Escher von der Linth, to whom Heim was indebted for much encouragement and geological instruction in the field. In 1873 he became professor of geology in the polytechnic school at Zürich, and in 1875 professor of geology in the university. In 1882 he was appointed director of the Geological Survey of Switzerland, and in 1884 the hon. degree of Ph. D. was conferred upon him at Berne. He is especially distinguished for his researches on the structure of the Alps and for the light thereby thrown on the structure of mountain masses in general. He traced the plications from minor to major stages, and illustrated the remarkable foldings and overthrust faultings in numerous sections and with the aid of pictorial drawings. His magnificent work, Mechanismus der Gebirgsbildung (1878), is now regarded as a classic, and it served to inspire Professor C. Lapworth in his brilliant researches on the Scottish Highlands (see Geol. Mag., 1883). Heim also devoted considerable attention to the glacial phenomena of the Alpine regions. The Wollaston medal was awarded to him in 1904 by the Geological Society of London.

HEIM, FRANÇOIS JOSEPH (1787-1863), French painter, was born at Belfort on the 16th of December 1787. He early distinguished himself at the École Centrale de Strassburg, and in 1803 entered the studio of Vincent at Paris. In 1807 he obtained the first prize, and in 1812 his picture of "The Return of Jacob" (Musée de Bordeaux) won him a gold medal of the first class, which he again obtained in 1817, when he exhibited, together with other works, a St John—bought by Vivant Denon. In 1819 the "Reconstruction of Lazarus" (Cathédral Autun), the "Martyrdom of St Cyr" (St Germain), and two scenes from the life of Vespasian (ordered by the king) attracted attention. In 1823 the "Re-emergence of the Royal Tombs at St Denis," the "Martyrdom of St Laurence" (Notre Dame) and several full-length portraits increased the painter's popularity; and in 1824, when he exhibited his great canvases, the "Massacre of the Jews" (Louvre), Heim was rewarded with the legion of honour. In 1827 appeared the "King giving away Prizes at the Salon of 1824" (Louvre—engraved by Jazet)—the picture by which Heim is best known—and "Saint Hyacinthe." Heim was now commissioned to decorate the Gallery Charles X. (Louvre). Though ridiculed by the romantics, Heim succeeded Regnault at the Institute in 1834, shortly after which he commenced a series of drawings of the celebrities of his day, which are of much interest. His decorations of the Conference room of the Chamber of Deputies were completed in 1844; and in 1847 his works at the Salon—"Champ de Mai" and "Reading a Play at the Théâtre Français"—were the signal for violent criticisms. Yet something like a turn of opinion in his favour took place at the exhibition of 1857; his powers as a draughtsman and the occasional merits of his composition were recognized, and toleration extended even to his colour. Heim was awarded the great gold medal, and in 1855—having sent to the Salon no less than sixteen portraits, amongst which may be cited those of "Cuvier," "Geoffroy de St Hilaire," and "Madame Hersent"—he was made officer of the legion of honour. In 1859 he again exhibited a curious collection of portraits, sixty-four members of the Institute arranged in groups of four. He died on the 29th of September 1865. Besides the paintings already mentioned, there is to be seen in Notre Dame de Lorette (Paris) a self-portrait, and the museum of Strassburg contains an excellent example of his easel pictures, the subject of which is a "Shepherd Drinking from a Spring."
Heine was also fortunate in having access to the chief literary circles of the capital; he was on terms of intimacy with Varnhagen von Ense and his wife, the celebrated Rahel, at whose house he frequently met such men as the Humboldts, Hegel himself and Schleiermacher; he made the acquaintance of leading men in letters like Robert Chamisso, and was on still more familiar footing with the most distinguished of his co-religionists in Berlin. Under such favourable circumstances his own gifts were soon displayed. He contributed poems to the _Berliner Gesellschaft_, many of which were subsequently incorporated in the _Buch der Lieder_, and in December 1821 a little volume came from the press entitled _Gedichte_, his first avowed act of authorship. He was also employed at this time as correspondent of a Rhenish newspaper, as well as in completing his tragedies _Aimansor_ and _William Katziff_, which were published in 1823 with small success. In that same year Heine, not in the most hopeful spirits, returned to his family, who had meanwhile moved to Lüneburg. He had plans of settling in Paris, but as he was still dependent on his uncle, the latter's consent had to be obtained. As was to be expected, Solomon Heine did not favour the new plan, but promised to continue his support on the condition that Harry completed his course of legal study. He sent the young student for a six weeks' holiday to Cuxhaven, which opened the poet's eyes to the wonders of the sea; and three weeks spent subsequently at his uncle's county seat near Hamburg were sufficient to awaken a new passion in Heine's breast—this time for Amalie's sister, Therese. In January 1824 Heine returned to Göttingen, where, with the exception of a visit to Berlin and the excursion to the Harz mountains in the autumn of 1824 which is immortalized in the first volume of the _Reisebilder_, he remained until his graduation in the summer of the following year. It was on the latter of these journeys that he had the interview with Goethe which was so amusingly described by him in later years. A few weeks before obtaining his degree, he took a step which he had long meditated; he formally embraced Christianity. This "act of apostasy," which has been dwelt upon at unnecessary length both by Heine's enemies and admirers, was actuated wholly by practical considerations, and did not arise from any wish on the poet's part to deny his race. The summer months which followed his examination Heine spent by his beloved sea in the island of Norderney, his uncle having again generously supplied the means for this purpose. The question of his future now became pressing, and for a time he seriously considered the plan of settling as a solicitor in Hamburg, a plan which he later reassessed in the second volume of the _Reisebilder_ with a biting review of Goethe which was so amusingly described by him in later years. Meanwhile he had made arrangements for the publication of the _Reisebilder_, the first volume of which, _Die Harzreise_, appeared in May 1826. The success of the book was instantaneous. Its lyric outbursts and flashes of wit; its rapid changes from grave to gay; its flexibility of thought and style, came as a revelation to a generation which had grown weary of the lumbering literary methods of the later Romanticists.

In the spring of the following year Heine paid a long planned visit to England, where he was deeply impressed by the free and vigorous public life, by the size and bustle of London; above all, he was filled with admiration for Canning, whose policy had realized many a dream of the young German Idealists of that age. But the picture had also its reverse: the sorrows of the capital, and the life in London, at the bidding of a commercial spirit of English life, and brutal egotism of the ordinary Englishman, grated on Heine's sensitive nature; he missed the finer literary and artistic tastes of the continent and was repelled by the sterility of English religious sentiment and observance. Unfortunately the latter aspects of English life left a deeper mark on his memory than the bright side. In October Baron Cotta, the well-known publisher, offered Heine—the second volume of whose _Reisebilder_ and the _Buch der Lieder_ had meanwhile appeared and won him fresh laurels—the joint-editorship of the _Neue allgemeine politische Annalen_. He gladly accepted the offer and betook himself to Munich. Heine did his best to adapt himself and his political opinions to the new surroundings, in the hope of coming in for a share of the good things which Ludwig I. of Bavaria was so generously distributing among artists and men of letters. But the stings of the _Reisebilder_ were not so easily forgotten; the clerical party in particular did not leave him long in peace. In July 1828, the professorship on which he had set his hopes being still not forthcoming, he left Munich for Italy, where he remained until the following November, a holiday which provided material for the third and part of the fourth volumes of the _Reisebilder_.

A blow more serious than the Bavarian king's refusal to establish him in Munich awaited him on his return to Germany—the death of his father. In the beginning of 1829 Heine took up his abode in Berlin, where he resumed old acquaintanceships; in summer he was again at the sea, and in autumn he returned to the city he now loathed above all others, Hamburg, where he virtually remained until May 1831. These years were not a happy period of the poet's life; his efforts to obtain a position, apart from that which he owed to his literary work, met with rebuffs on every side; his relations with his uncle were unsatisfactory and disturbed by constant friction, and for a time he was even seriously ill. His only consolation in these months of discontent was the completion and publication of the _Reisebilder_. When in 1830 the news of the July Revolution in the streets of Paris reached him, Heine hailed it as the beginning of a new era of freedom, and his thoughts reverted once more to his early plan of settling in Paris. All through the following winter the plan ripened, and in May 1831 he finally said farewell to his native land.

Heine's first impressions of the "New Jerusalem of Liberalism" were jubilantly favourable; Paris, he proclaimed, was the capital of the civilized world, to be a citizen of Paris the highest of honours. He was soon on friendly terms with many of the notabilities of the capital, and there was every prospect of a congenial and lucrative journalistic activity as correspondent for German newspapers. Two series of his articles were subsequently collected and published under the titles _Französische Zustände_ (1832) and _Lutesia_ (written 1840–1843, published in the _Vermischte Schriften_, 1854). In December 1835, however, the German Bund, incited by W. Menzel's attacks on "Young Germany," issued its notorious decree, forbidding the publication of any writings by the members of that coterie; the name of Heine, who had been stigmatized as the leader of the movement headed the list. This was the beginning of a series of literary feuds in which Heine was, from now on, involved; but a more serious and immediate effect of the decree was to curtail consider-
intellect as clear and vivacious as ever—seem to have effected what might be called a spiritual purification in Heine's nature, and to have brought out all the good sides of his character, whereas adversity in earlier years only intensified his cynicism. The lyrics of the Romansero (1851) and the collection of Neueste Gedichte (1853–1854) surpass in imaginative depth and sincerity of purpose the poetry of the Buch der Lieder. Most wonderful of all are the poems inspired by Heine's strange mystic passion for the lady he called Die Mouche, a countrywoman of his own—her real name was Elise von Krienitz, but she had written in French under the nom de plume of Camille Selden—who helped to brighten the last months of the poet's life. He died on the 17th of February 1856, and lies buried in the cemetery of Montmartre.

Besides the purely journalistic work of Heine's Paris years, to which reference has already been made, he published a collection of more serious prose writings under the title Der Salon (1833–1839). In this collection will be found, besides papers on French art and the French stage, the essays "Zur Geschichte der Religion und Philosophie in Deutschland," which he had written for the Revue des deux mondes. Here, too, are the more characteristic pronouncements of Heine's genius, Aus den Memoiren des Herrn von Schnabelewopski, Der Rabbi von Bacherach and Florentinische Nachrichten, as well as the most unanswerable personal attack on the elder Schlegel, a less creditable essay in literary criticism. In 1839 appeared Shakespeare's Mädchen und Frauen, which, however, was merely the text to a series of illustrations; and in 1840, the witty and trenchant satire on a writer, who, in spite of many personal disagreements, had been Heine's fellow-fighter in the liberal cause, Ludwig Börne. Of Heine's poetical work in these years, his most important publications were, besides the Romansero, the two admirable satires, Deutschland, ein Wintermärchen (1844), the result of his visit to Germany, and Atta Troll, ein Sommerachtstraum (1876), an attack on the political Tendenzliteratur of the 'forties.

In the forties of the other great German poets it is so hard to arrive at a final judgment as in that of Heinrich Heine. In his Buch der Lieder he unquestionably struck a new lyric note, not merely for Germany but for Europe. No singer before him had so daunted in the use of nature-symbolism as he, none had given such concrete and plastic expression to the spiritual forces of heart and soul; in this respect Heine was clearly the descendant of the Young German poets of the Old Testament. At times, it is true, his imagery is exaggerated to the degree of absurdity, but it exercised, none the less, a fascination over his generation. Heine combined with a spiritual delicacy, a fineness of perception, that firm hold on reality which is so essential to the satirist. His lyric appealed with particular force to foreign peoples, who had little understanding for the intangible, undefinable spirituality which the German people regard as an indispensable element in their national lyric poetry. Thus his fame has always stood higher in England and France than in Germany itself, where his lyric method, his self-consciousness, his cynicism in season and out of season, were little in harmony with the literary traditions. As far, indeed, as the development of the German lyric is concerned, Heine's influence has been of questionable value. But he introduced at least one new and refreshing element into German poetry with his lyrics of the North Sea; no other German poet has felt and expressed so well as Heine the charm of sea and coast.

As a prose writer, Heine's merits were still greater. His work was more than mere journalism, but it was journalism of a high order, and, after all, the best literature of the 'forties sprang from the school to which he belonged was of this character. Heine's light fancy, his agile intellect, his straightforward, clear style stood him here in excellent stead. The prose writings of his French period mark, together with Börne's Brieve aus Paris, the beginning of a new era in German journalism and a healthy revolt against the unwieldy prose of the Romantic period. Above all things, Heine was great as a wit and a satirist. His lyric may not be able to assert itself beside that of the very greatest German singers, but as a satirist he had powers of the highest order. He combined with the holy zeal and passionate righteousness of his "soldier of humanity," with the withering scorn and ineradicable sense of justice common to the leaders of the Jewish race. It was Heine's real mission to be a reformer, to restore with instruments of war rather than of peace the interrupted order of the world. The more's the pity that his magnificent Aristophanic genius should have had so little room for its exercise, and have been frittered away in the petty squabbles of an exiled journal.

The first collected edition of Heine's works was edited by A. Strauss and published in 1866. It was then that the Sämtliche Werke, edited by E. Elster (7 vols., 1887–1890), for biography and criticism see the following works: A. Stratthaus, Heine: Leben und Werke (3rd ed., 1884); H. Huesser, Aus dem Leben H. Heines (1878); and by the same author, H. Heine: Gesammelte Aufsätze (1906); G. Kärpeles, Heine und seine Zeitgenossen (1888), and by the same author, H. Heine: eine Kritik zur Person (1900); W. Bösche, H. Heine: Versuch einer ästhetisch-kritischen Analyse seiner Werke und seiner Weltanschauung (1888); G. B. Schelling, Heine: der Satiriker (1890), Eng. trans., 1905. An English work by W. Stigand, Heine: the German Poet (1890), and by O. W. Craven, Heinrich Heine, appeared in 1875, but it has little value; there is also a short life by W. Sharp (1888). The essays on Heine by George Saintsbury and Michael Veitch also should be read. Heine's contributions to Heine criticism are J. Legras, H. Heine, poète (1867), and H. Lichtenberger, H. Heine, penseur (1905). See also L.P. Betz, Heine in Frankreich (1895).

HEINECIIUS, JOHANN GOTTLIEB (1681–1741), German jurist, was born on the 11th of September 1681 at Eisenberg, Aalenburg. He studied theology at Leipzig, and law at Halle; and at the latter university he was appointed in 1713 professor of philosophy, and in 1718 professor of jurisprudence. He subsequently filled legal chairs at Franeker in Holland and at Frankfurt, but finally returned to Halle in 1733 as professor of philosophy and jurisprudence. He died there on the 31st of August 1741. Heinecius belonged to the school of philosophical jurists. He endeavoured to treat law as a rational science, and not merely as an empirical art whose rules had no deeper source than expediency. Thus he continually refers to first principles, and he develops his legal doctrines as a system of philosophy.

His chief works were Antiquitatum Romanaorum jurisprudentiae illustrantium syntagma (1718), Historia juris civilis Romanorum et Germanicorum (1733), Elementa juris Germanici (1732), Elementa juris naturalis et gentium (1737; Eng. trans. by Turnbull, 2 vols., London, 1761); and lead the reader through all the most important juridical subjects, and edited the works of several of the classical jurists. His Opera omnia (9 vols., Geneva, 1771, &c.) were edited by his son Johann Christian Gottlieb Heineccius (1718–1791).

Heinecius's brother, Johann Michael Heineccius (1674–1722), was a well-known preacher and theologian, but is remembered more from the fact that he was the first to make a systematic study of seals, concerning which he left a book, De sanctis Germanarum aliarumque nationum sigillis (Leipzig, 1710; 2nd ed., 1719).

HEINECKEN, CHRISTIAN HEINRICH (1721–1725), a child remarkable for precocity of intellect, was born on the 6th of February 1721 at Lübeck, where his father was a painter. Able to speak at the age of ten months, by the time he was one year old he knew by heart the principal incidents in the Pentateuch. At two years of age he had mastered sacred history; at three he was intimately acquainted with history and geography, ancient and modern, sacred and profane, besides being able to speak French and Latin; and in his fourth year he devoted himself to the study of religion and church history. This wonderful precocity was no mere feat of memory, for the youthful savant could reason on and discuss the knowledge he had acquired. Crowds of people flocked to Lübeck to see the wonderful child; and in 1724 he was taken to Copenhagen at the desire of the king of Denmark. On his return to Lübeck
HEINICKE–HEIR

He began to learn writing, but his sickly constitution gave way, and he died on the 22nd of June 1725.

The Life, Deeds, Travels and Death of the Child of Lübeck were published in the following year by his tutor Schöneich. See also Teutsche Bibliothek, xvii., and Mémoires de Trévoux (Jan. 1731).

HEINICKE, SAMUEL (1727–1790), the originator in Germany of systematic education for the deaf and dumb, was born on the 10th of April 1727, at Nautschütz, Germany. Entering the electoral bodyguard at Dresden, he subsequently supported himself by teaching. About 1754 his first deaf and dumb pupil was brought him. His success in teaching this pupil was so great that he determined to devote himself entirely to this work. The outbreak of the Seven Years' War upset his plans for a time.

Taken prisoner at Pirna, he was brought to Dresden, but soon made his escape. In 1768, when living in Hamburg, he successfully taught a deaf and dumb boy to talk, following the methods prescribed by Amman in his book Sursus laqueus, but improving on them. Recalled to his own country by the elector of Saxony, he opened in Leipzig, in 1778, the first deaf and dumb institution in Germany. This school he directed till his death, which took place on the 30th of April 1790. He was the author of a variety of books on the instruction of the deaf and dumb.

HEINSE, JOHANN JACOB WILHELM (1749–1803), German author, was born at Langewiesen near Ilmengau in Thuringia on the 16th of February 1749. After attending the gymnasium at Schleusingen he studied law at Jena and Erfurt. In Erfurt he became acquainted with Wieland and through him with “Father” Gleim who in 1772 procured him the post of tutor in a family at Quedlinburg. In 1774 he went to Düsseldorf, where he assisted the poet J. G. Jacobi to edit the periodical Iris. Here the famous picture gallery inspired him with a passion for art, to the study of which he devoted himself with so much zeal and insight that Jacobi furnished him with funds for a stay in Italy, where he remained for three years (1780–1783). He returned to Düsseldorf in 1784, and in 1786 was appointed reader to the elector Frederick Karl Joseph, archbishop of Mainz, who subsequently made him his librarian at Aschaffenburg, where he died on the 22nd of June 1803.

The work upon which Heinse’s fame mainly rests is Ardinghallo und die glückseligen Inseln (1787), a novel which forms the framework for the exposition of his views on art and life, the plot being laid in the Italy of the 16th century. This and his other novels Laidion, oder die eleusinischen Geheimnisse (1774) and Hildegard von Hohenkal (1796) combine the frank vulgarity of Wieland with the enthusiasm of the “Sturm und Drang.” Both as novelist and art critic, Heinse had considerable influence on the romantic school.

Heinse’s complete works (Städtische Schriften) were published by H. Laube in 10 vols. (Leipzig, 1838). A new edition by C. Schuddekop is in course of publication (Leipzig, 1901 sqq.). See H. Pröhle, Leising, Wieland, Heinse (Berlin, 1877), and J. Schober, Johann Jacob Wilhelm Heinse, sein Leben und seine Werke (Leipzig, 1882); also K. D. Jensen, Heinse’s Stellung zur biederen Kunst (Berlin, 1903).

HEINISIUS (or HEINS) DANIEL (1580–1653), one of the most famous scholars of the Dutch Renaissance, was born at Ght on the 9th of June 1580. The troubles of the Spanish war drove his parents to settle first at Veere in Zeeland, then in England, next at Ryswick and lastly at Flushing. In 1594, being already remarkable for his attainments, he was sent to the university of Franeker to perfect himself in Greek under Henricus Schotanus. He stayed at Franeker half a year, and then settled at Leiden for the remaining sixty years of his life. There he studied under Joseph Scaliger, and there he found Marinus de St Aldegonde, Janus Douza, Paulus Merula and others, and was soon taken into the society of these celebrated men as their equal. His proficiency in the classic languages won the praise of all the best scholars of Europe, and offers were made to him, but in vain, to accept honourable positions outside Holland. He soon rose in dignity at the university of Leiden. In 1602 he was made professor of Latin, in 1605 professor of Greek, and at the death of Merula in 1607 he succeeded that illustrious scholar as librarian to the university. The remainder of his life is recorded in a list of his productions. He died at the Hague on the 25th of February 1655. The Dutch poetry of Heinisius is of the school of Roemer Visscher, but attains no very high excellence. It was, however, greatly admired by Martin Opitz, who was the pupil of Heinisius, and who, in translating the poetry of the latter, introduced the German public to the use of the rhyming alexandrine.

He published his original Latin poems in three volumes—Iambi (1602), Elegiae (1603) and Poemata (1609); his Emblemata amatoria, poems in Dutch and Latin, were first printed in 1604. In the same year he edited Theocritus, Bion and Moschus, having edited Hesiod in 1603. In 1609 he printed his Latin Orations. In 1610 he edited Horace, and in 1611 Aristotle and Seneca. In 1613 appeared in Dutch his tragedy of The Massacre of the Innocents; and in 1614 his classical scholar Theophrastus Peripatetec. In 1618 he collected his original Dutch poems into a volume. He edited Terence in 1618, Livy in 1620, published his oration De contemptu mortis in 1621, and brought out the Epistles of Joseph Scaliger in 1627.

HEINISIUS, NIKOLAES (1620–1681), Dutch scholar, son of Daniel Heinisius, was born at Leiden on the 20th of July 1620. His boyish Latin poem of Breda expugnata was printed in 1637, and attracted much attention. In 1642 he began his wanderings with a visit to England in search of MSS. of the classics; but he met with little courtesy from the English scholars. In 1644 he was sent to Spa to drink the waters; his health restored, he continued his travels, sometimes passing through Louvain, Brussels, Mechlin, Antwerp and so back to Leiden, everywhere collating MSS. and taking philological and textual notes. Almost immediately hestayed out again, and arriving in Paris was welcomed with open arms by the French savants. After investigating all the classical texts he could lay hands on, he proceeded southwards, and visited on the same quest Lyons, Marseilles, Pisa, Florence (where he paused to issue a new edition of Ovid) and Rome. Next year, 1647, found him in Naples, from which he fled during the reign of Masaniello; he pursued his labours in Leghorn, Bologna, Venice and Padua, at which latter city he published in 1648 his volume of original Latin verse called Flacina. He proceeded to Milan, and worked for a considerable time in the Ambrosian library; he was preparing to explore Switzerland in the same patient manner, when the news of his father’s illness recalled him hurrily to Leiden. He was soon called away to Stockholm at the invitation of Queen Christina, at whose court he waged war with Salmiasius, who accused him of having supplied Milton with facts from the life of that great but irritable scholar. Heinisius paid a flying visit to Leiden in 1650, but immediately returned to Stockholm. In 1651 he once more visited Italy; the remainder of his life was divided between Upsala and Holland. He collected his Latin poems into a volume in 1653. His latest labours were the editing of Velleius Paterculus in 1678, and of Valerius Flaccus in 1680. He died at the Hague on the 7th of October 1681. Nikolaes Heinisius was one of the purest and most elegant of Latinists, and if his scholarship was not quite so perfect as that of his father, he displayed higher gifts as an original writer.

His illegitimate son, Nikolaes Heinisius (b. 1635), was the author of The Delightful Adventures and Wonderful Life of Mirandor (1675), the single Dutch romance of the 17th century. He had to flee the country in 1677 for committing a murder in the streets of the Hague, and died in obscurity.

HEIR (Lat. heres, from a root meaning to grasp, seen in herus or erus, master of a house, Gr. χέφις, hand, Sans. hasana, hand), in law, technically one who succeeds, by descent, to an estate of inheritance, in contradistinction to one who succeeds to personal property, i.e. next of kin. The word is now used generally to denote the person who is entitled by law to inherit property, titles, &c., of another. The rules regulating the descent of property to an heir will be found in the articles Inheritance, Succession, &c.

An heir apparent (Lat. apparenens, manifest) is he whose right of inheritance is indefeasible, provided he outlives the ancestor, e.g. an eldest or only son.

Heir by custom, or customary heir, he who inherits by a particular and local custom, as in borough-English, whereby
the youngest son inherits, or in gavelkind, whereby all the sons inherit as parners, and made but one heir.

Heir general, or heir at law, he who after the death of his ancestors, &c., seizes the rights to the private property of the intestate. His presumptive, one who is next in succession, but whose right is defeasible by the birth of a heir, e.g., a brother or nephew, whose presumptive right may be defeated by the birth of a child, or a daughter, whose right may be defeated by the birth of a son.

Special heir, one not heir at law (i.e. at common law), but by special custom.

Ultimate heir, he to whom lands come by escheat on failure of proper heirs. In Scots law the technical use of the word "heir" is not confined to the succession to real property, but includes succession to personal property as well.

The heiroon is strictly so called in English law, a chattel ("loom" meaning originally a tool) which by immortal use is regarded as annexed by inheritance to a family estate. Any owner of such heiroon may dispose of it during his lifetime, but he cannot bequest it by will away from the estate. If he dies intestate it goes to his heir-at-law, and if he devises the estate it goes to the devisee. At the present time such heiroons are almost unknown, and the word has acquired a secondary and popular meaning and is applied to furniture, pictures, or articles of personal use. The legal right of the heir, for the time being entitled to the possession of a settled house. Such things are more properly called settled chattels. An heiroon in the strict sense is made by family custom, not by settlement. A settled chattel may, under the Settled Land Act 1882, be sold under the direction of the court, and the money arising under such sale is capital money. The court will only sanction such a sale if it be shown that it is to the benefit of all parties concerned; and if the article proposed to be sold is of unique or historical character, it will have regard to the intention of the testator or the wishes of the remainder men (Re Hooper v. Hooper, 1892, 2 Ch. 679).

Hejaz, a Turkish vilayet and a province of Western Arabia, extending along the Red Sea coast from the head of the Gulf of Akaba in 20° 30' N. to the south of Taif in 20° N. It is bounded N. by the Syrian desert and by Nejd and S. by Asir. Its length is about 750 m. and its greatest breadth from the Harra east of Khaiabar to the coast is 200 m. The name Hejaz, which signifies "separating," is sometimes limited to the region extending from Medina in the north to Taif in the south, which separates the island province of Nejd from the peninsula of Arabia. The name Tahama (Thahama) or mountainous district, but mostly, both Arab and European, define it in the wider sense. Though physically the most desolate and uninhabiting province in Arabia, it has a special interest and importance as containing the two sacred cities of Islam, Mecca and Medina (q.v.), respectively, the birthplace and burial-place of Mahomet, which are visited yearly by large numbers of Moslem pilgrims from all parts of the world.

Hejaz is divided longitudinally by the Tahama range of mountains into two zones, a narrow littoral and a broader upland. This range attains its greatest height in Jebel Sharri, the Mount Seir of scripture, overlooking the Midian coast, which probably reaches 7000 ft., and Jebel Radhwa a little N.E. of Yambu rising to 6000 ft. It is broken through by several valleys which carry off the drainage of the inland zone; the principal of these is the Wadi Ham, the main source of which is on the Harra east of Khaiabar. Its northern tributary the Wadi Jisr drains the Harra et Awerid and a southern branch comes from the neighbourhood of Medina. Farther south the Wadis ES Saliq and Tihama cut through the mountains and afford the principal access to the valley of Medina from Yambu or Jidda. None of the Hejaz Wadis has a perennial stream, but they are liable to heavy floods after the winter rains, and thick groves of date-palms and occasional settlements are met with along their courses where permanent springs are found. The northern part of Hejaz contains but few inhabited sites. Muwela, Damgha and El Wij is are small ports used by coasting craft. The last named was formerly an important station on the Egyptian pilgrimage route, and in ancient days was a Roman settlement, and the port of the Nabataean towns of el Haij 150 m. to the east. Inland lies a sandstone desert of El Hamra which reaches from the Syrian border at Ma'an to Jabel Awerid, where the volcanic tracts known as Harra begin, and extend southwards along the western borders of the Nejd plateau as far as the latitude of Mecca. East of Jabel Awerid lies the oasis of Tema, identified with the Biblical Teman, which belongs to the Shammar tribe; its fertility depends on the famous well, known as Bir El Huda, farther south and on the main pilgrimage route is El 'Ala, the principal settlement of El Haij, the Egra of Potlemy, to whom it was known as an oasis town on the gold and frankincense road. High up in the same range between the routes of Medina Salih, similar to those at Petra and shown by the Nabataean coins and inscriptions discovered there by Doughty and Huber to date from the beginning of the Christian era. To the southeast again is the oasis of Khaiabar, with some 2500 inhabitants, chiefly negroes, the remnants of an earlier slave population. The citadel, known as the Kasr el Yahudi, preserves the tradition of its former Jewish ownership. With these exceptions there are no settled villages between Ma'an and Medina, the stations on the pilgrimage road being merely small fortified posts with reservoirs, at intervals of 30 or 40 m., which are kept up by the Turkish government for the protection of travelers.

The southern part of the province is more favoured by nature. Medina is a city of 25,000 to 30,000 inhabitants, situated in a broad plain between the coast range and the low hills across which lies the road to Nejd. Its altitude above the sea is about 2000 ft. It is well supplied with water and is surrounded by gardens and plantations; barley and wheat are grown, but the staple produce, as in all the cultivated districts of Hejaz, is dates, of which 100 different sorts are said to grow. Yambu has a certain importance as the port for Medina. The route follows for a distance of 15 m. the Wadi Tihama, and, in the rear of Medina, several small settlements with abundant date groves; from Badr Hunen, the last of these, the route usually taken from Medina to Mecca runs near the coast, passing villages with some cultivation at each stage. The eastern route though more direct is less used; it passes through a barren country described by Burton as a succession of low plains and basins surrounded by rolling hills and intersected by torrent beds; the predominant formation is basalt. Suwairikya and Es Salih are the only villages of importance on this route.

The city of Mecca, and its vicinity are described in a separate article; it is about 48 m. from the port of Jidda, the most important trade centre of the Hejaz province. The great majority of pilgrims for Mecca arrive by sea at Jidda. Their transport and the supply of their wants is therefore the chief business of the place; in 1904 the number was 66,500, and the imports amounted in value to £1,400,000.

From the hot lowland in which Mecca is situated the country rises steeply up to the Taif plateau, some 6000 ft. above sea-level, a district resembling in climate and physical character the highlands of Asir and Yemen. Jebel el Kura at the northern edge of the plateau is a fertile well-watered district, producing wheat and barley and fruit. Taif, a day's journey farther south, lies in a sandy plain, surrounded by low mountains. The houses, though small, are well built of stone; the gardens for which it is celebrated lie at a distance of a mile or more to the S.W. at the foot of the mountains.

Hejaz, together with the other provinces of Arabia which on the overthrow of the Bagdad Caliphate in 1258 had fallen under Egyptian domination, became by the conquest of Egypt in 1517 a dependency of the Ottoman empire. Beyond assuming the title Caliphate, neither Salih I., nor his successors intervened much in the government, which remained in the hands of the sharifs of Mecca until the religious upheaval which culminated at the beginning of the 19th century in the pillage of the holy cities by the Wahhabi fanatics. Mehemet Ali, viceroy of Egypt, was entrusted by the sultan with the task of establishing order, and after several arduous campaigns the Wahhabis were routed
HEJIRA, HEGIRA

The dates the Hughes, Gtidrun although in cities about the 326-350; the government to ensure the safe conduct of the annual pilgrimage, otherwise they are practically independent of the Turkish administration, which is limited to the large towns and garrisons. The troops occupying these latter belong to the 16th (Hejaz) division of the Turkish army.

The difficulties of communication with his Arabian provinces, and of relieving or reinforcing the garrisons there, induced the sultan Abdul Hamid in 1900 to undertake the construction of a railway directly connecting the Hejaz cities with Damascus without the necessity of leaving Turkish territory at any point, as hitherto required by the Suez Canal. Actual construction was begun in May 1901 and on the 29th of September 1904 the Damascus-Ma‘an line (285 m.) was officially opened. The line has a narrow gauge of 1·05 metre = 41 in., the same gauge as that of the Damascus-Beirut line; it has a ruling gradient of 1 in 50 and follows generally the pilgrim track, through a desert country presenting no serious engineering difficulties. The graver difficulties due to the scarcity of water, and the lack of fuel, supplies and labour were successfully overcome; in 1906 the line was completed to El Akhdar, 470 m. from Damascus and 350 m. from Medina, in time to be used by the pilgrim caravan of that year; and the section to Medina was opened in 1908. Its military value was shown in the previous year, when it conveyed 28 battalions from Damascus to Ma‘an, from which station the troops marched to Akaba for embarkation en route to Hodeida. The length of the line from Damascus to Medina is approximately 820 m., and from Medina to Mecca 280 m.; the highest level attained is about 4000 ft. at Dar el Hamra in the section Ma‘an-Medina.

HEJIRA, or Hegira (Arab. hijra, flight, departure from one’s country, from ka‘ura, to go away), the name of the Mahomedan era. It dates from 622, the year in which Mahomet “ fled ” from Mecca to Medina to escape the persecution of his kinsmen of the Koreish tribe. The years of this era are distinguished by the initials “ A.H. ” (anno hegirae). The Mahometan year is a lunar one, about 11 days shorter than the Christian; allowance must be made for this in translating Hegira dates into Christian dates; thus A.H. 1321 corresponds roughly to A.D. 933. The actual date of the “ flight ” is fixed as 8 Rabia I., i.e. 20th of September 622, by the tradition that Mahomet arrived at Kufa on the Hebrew Day of Atonement. Although Mahomet himself appears to have dated events by his flight, it was not till seventeen years later that the actual era was systematized by Omar, the second caliph (see Caliphate), as beginning from the 1st day of Muharram (the first lunar month of the year) which in that year (639) corresponded to July 16. The term hijra is also applied in its more general sense to other migrations, ” or the faithful, e.g. Abyssinia (see Mahomet), and to those of Mahomet’s followers to Medina before the conquest of Mecca. These latter are known as Muhajirun.

HEL, or Hela, in Scandinavian mythology, the dead. She was a child of Loki and the giantess Angurboda, and dwelt beneath the roots of the sacred ash, Yggdrasill. She was given dominion over the nine worlds of Helheim. In early myth all the dead went to her: In later legend only those who died of old age or sickness, and she then became synonymous with suffering and horror. Her dwelling was Eidvaldr (dark clouds), her dish Hung (hunger), her knife Sull (starvation), her servants Ganglate (tardy feet), her bed Kör (sickness), and her bed-curtains Blickhardal (splendid misery).

HELDENBUCH, DAS, the title under which a large body of German epic poetry of the 13th century has come down to us. The subjects of the individual poems are taken from national German sagas which originated in the epoch of the Migrations (Völkerwanderung), although doubtless here, as in all purely popular sagas, motives borrowed from the forces and phenomena of nature were, in course of time, woven into events originally historical. While the saga of the Nibelungen crystallized in the 11th century, that of the Hilde-saga and the Hilde-saga into the epic of Gudrun (q.v.), and the poems of the Heldenbuch, in the more restricted use of that term, belong almost exclusively to two cycles, (1) the Ostrogothic saga of Ermannich, Dietrich von Bern (i.e. Dietrich von Verona,Theodorich the Great) and Etzel (Attila), and (2) the cycle of Hugdietrich, Wolfdietrich and Orntit, which like the Nibelungen saga, was probably of Franconian origin. The romances of the Heldenbuch are of varying poetic value; only occasionally do they rise to the height of the two chief epics, the Nibelungenlied and Gudrun.

Dietrich von Bern, the central figure of the first and most important group, was the ideal type of German medieval hero, and, under more favourable literary conditions, he might have become the centre of an epic more nationally German than the Nibelungenlied itself. Of the romances of this group, the chief are Biterolf und Dietlich, evidently the work of an Austrian poet, who introduced many elements from the court epic of chivalry into a milieu and amongst characters familiar to us from the Nibelungenlied. Der Rosenhort tells of the conflicts which took place round Kriemhild’s “ rose garden ” in Worms—conflicts from which Dietrich always emerges victor, even when he is confronted by Siegfried himself. In Laurin und der kleine Rosenhort, the Heldensage is mingled with elements of popular fairy-lore; it deals with the adventures of Dietrich and his chamberlain Witege with the wily dwarf Laurin, who watches over another rose garden, that of the Tyrol. Similar in character are the adventures of Dietrich with the giants Ecke (Eckenholt) and Sigenot, with the dwarf Goldemar, and the deeds of chivalry he performs for queen Virginal (Dietrichs erste Ausfahrt)—all of these romances being written in the fresh and popular tone characteristic of the wandering singers or Spieletuere. Other elements of the Dietrich saga are represented by the poems Alpharts Tod, Dietrichs Flucht und Die Rabenschlacht (” Battle of Ravenna ”). Of these, the first is the most finest poem of the entire cycle and worthy of a place beside the best popular poetry of the Middle High German epoch. Alphart, a young hero in Dietrich’s army, goes out to fight single-handed with Witege and Heine, who had deserted to Ermannich, and he falls in fair battle, but by the treachery of Witege whose life he had spared. The other two Dietrich epics belong to a later period, the end of the 13th century—the author being an Austrian, Heinrich der Vogler—and show only too plainly the decay that had by this time set in in Middle High German poetry.

The second cycle of sagas is represented by several long romances, all of them unmistakably “ popular ” in tone—conflicts with dragons, supernatural adventures, the wonderland of the East providing the chief features of interest. The epics of this group are Orntit, Hugdietrich, Wolfdietrich, the latter with its...
Heldern—Helena 219

pathetic episode of the unwavering loyalty of Wolfdietrich’s vassal Duke Berchtung and his ten sons. Although many of the incidents and motives of this cycle are drawn from the best traditions of the Heldensage, its literary value is not very high.

This collection of poems has not been printed. The date of the first edition is unknown, but the second edition appeared in the year 1491 and was followed by later reprints in 1509, 1514, 1560 and 1590. The last of these forms the text of the edition used by A. von Keller for the Stuttgart Literarische Verein in 1867. In 1472 the Heldenbuch was adapted to the popular tastes of the time by being remodelled in rough Knittelers or doggerel; the author, or at least copyist, of the MS. was a certain Kaspar von der Roven, of Münster in Westphalia.

This version was printed by F. von der Hagen and S. Primisser in their Heldenbuch (1820-1825). Das Heldenbuch, which F. von der Hagen published in 1866, has not been reprinted. Decker has attempted to re-produce the original text by collating the MSS. A critical edition, based not merely on the oldest printed text—the only one which has any value for this purpose, as the others are all copies of—it but also on the MSS., was published in 5 vols. by O. Jäncke, E. Martin, A. Amelang and J. Ziputza at Berlin (1866-1873). A selection, edited by H. Henrieci, will be found in Kürschner’s Deutsche Nationalliteratur, vol. 7 (1887). Recent editions have appeared in G. Grimm, Die deutsche Heldensage (3rd ed., 1889); L. Uhland, “Geschichte der deutschen Poesie im Mittelalter,” Schriften, vol. i. (1866); O. L. Jiriczek, Deutsche Heldensage, vol. i. (1898); and especially the Syllaba Suchtich’s “Sagen des Pauli” in Paul’s Grundriss der germanischen Philologie (2nd ed., 1868).

Helena, a seaport town at the northern extremity of the province of North Holland, in the kingdom of Holland, 51 m. by rail N.N.W. of Amsterdam. Pop. (1900) 25,842. It is situated on the Marsdiep, the channel separating the island of Texel from the mainland, and the main entrance to the Zuider Zee, and besides being the terminus of the North Holland canal from Amsterdam, it is an important naval and military station. On its western side the town of Dieppe, where the town of Ymuiden was situated, the fine harbour, which formerly served, as Ymuiden now does, as the outer port of Amsterdam. In this neighbourhood are the naval wharves and magazines, wet and dry docks, and the naval cadet school of Holland, the name Willemsoord being given to the whole naval establishment. From Nieuwe Diep to Fort Eerprins on the west side of the town, a distance of about 5 m., stretches the great sea-dike which here takes the place of the dunes. This dike descends at an angle of 45° for a distance of 300 ft. into the sea, and is composed of Norwegian granite and Belgian limestone, strengthened in its southern parts by projecting jetties of rock. A circular belt of forts and barracks defends the town and coast, and there is a permanent garrison of 7000 to 9000 men, while 30,000 men can be accommodated within the lines, and the province flooded from this point. Besides several churches and a synagogue, there are a town hall (1836), a hospital, an orphan asylum, the “palace” of the board of marine, a meteorological observatory, a zoological station and a lighthouse. The industries of the town are sustained by the garrison and marine establishments.

Helena, or Helena (Gr. Ἡλένη), in Greek mythology, daughter of Zeus by Leda (wife of Tyndareus, king of Sparta), sister of Castor, Pollux and Clytemnestra, and wife of Menelaus. Other accounts make her the daughter of Zeus and Nemesis, or of Oceanus and Tethys. She was the most beautiful woman in Greece, and indirectly the cause of the Trojan war. When a child she was carried off from Sparta by Theseus to Attica, but was recovered and taken back by her brothers. When she grew up, the most famous of the princes of Greece sought her hand in marriage, and her father’s choice fell upon Menelaus. During her husband’s absence she was induced by Paris, son of Priam, to participate in the concourse of suitors for the hand of Helen. At the marriage of Menelaus and Paris, she fled with Menelaus to Troy. After the death of Paris she married his brother Deiphobus, whom she is said to have betrayed into the hands of Menelaus at the capture of the city (Aeneid, vi. 517 ff.). Menelaus thereupon took her back, and they returned together to Sparta, where they lived happily till their death, and were buried at Thebaid in Laconia. According to another story, Helen survived her husband, and was driven out by her stepsons. She fled to Rhodes, where she was hanged on a tree by her former friend Polyx, to avenge the loss of her husband. Telemachus in the Trojan War (Thucydides iii. 10). After death, Helen was said to have married Achilles in his home in the island of Leukis. In another version, Paris, on his voyage to Troy with Helen, was driven ashore on the coast of Egypt, where King Proteus, upon learning the facts of the case, detained the real Helen in Egypt, while a phantom Helen was carried off to Troy. Menelaus on his way home was also driven by storms of winds to Egypt, where he found his wife and took her home (Herodotus ii. 112-120; Euripides, Helena). Helen was worshipped as the goddess of beauty at Therapnae in Laconia, where a festival was held in her honour. At Rhodes she was worshipped under the name of Demetris (the goddess), where the inhabitants built a temple in her honour to expiate the crime of Polyx. The Rhodian story probably contains a reference to the worship connected with her name (cf. Theocritus xviii. 48 ἐξέδω μ’, Ἐκέλαιον ἐμύλω). She was the subject of a tragedy by Euripides and an epic by Colluthus. Originally, Helen was perhaps a goddess of light, a moon-goddess, who was gradually transformed into the beautiful heroine round whom the action of the Iliad revolves. Like her brothers, the Dioscuri, she was a patron deity of sailors.

St. Helena, The life of St. Fair Helen (1905); J. A. Symonds, Studies of the Greek Poets, i. (1893); F. Deck, Die griechische Helena in Mythos und Epos (1894); Andrew Lang, Helen of Troy (1883); P. Paris in Darmenberg and Saglio’s Dictionnaire des anciennes et modernes monumens et des traditions anciennes, i. 185, and especially the notice of the temple of the goddess, with drawings to the 247-248. E. Saglio’s “La Divine Jérusalem” (1873); F. von der Hagen, Die spielende Helena (1883); E. W. P. von der Hagen, Leben der Helena (1895); H. Sutro, The Helena of Sparta (1880); and especially the article “Helena” in Encyclopaedia Britannica, 5th ed., vol. iii. (1890). The temple of the queen of the gods at Sparta was said to have been founded by Constantine the Great. She was a humble woman, born probably at Drepanum, a town on the Gulf of Nicomedia, which Constantine named Helenopolis in her honour. Very little is known of her history. It is certain that, at an advanced age, she undertook a pilgrimage to Palestine, visited the holy places, and founded several churches. She was still living at the time of the murder of Crispus (326). Constantine had coins struck with the effigy of his mother. The name of Helena is intimately connected with the commonly received story of the discovery of the Cross. But the accounts which connect her with this discovery are of the date of the event. The Pilgrim of Bordeaux (133), Eusebius and Cyril of Jerusalem were unaware of this important episode in the life of the empress. It was only at the end of the 4th century and in the West that the legend appeared. The principal centre of the cult of St. Helena in the West seems to be the abbey of Hautvilliers, near Reims, where since the 9th century they have claimed to be in possession of her body. In England legends arose representing her as the daughter of a prince of Britain. Following these Geoffrey of Monmouth makes her the daughter of Coel, the king who is supposed to have given his daughter to Helen. There is no evidence that Helen was less not been without influence on the cult of the saint in England, where a great number of churches are dedicated either to St. Helena alone, or to St. Cross and St. Helena. Her festival is celebrated in the Latin Church on the 15th of August. The Greeks make no distinction between their festival and that of Constantine, the 21st of May.

See Acta sanctorum, Augusti iii. 543-580; Tixeront, Les Origines de la Hélène (Paris, 1888); F. Arnold-Forster, St. Helena’s Church, Church Dedication or England’s Patron Saints, i. 181-189, ii. 16, 356-366 (1899).

Helena, a city and the county-seat of Phillips county, Arkansas, U.S.A., situated on and at the foot of Crowly’s Ridge, about 150 ft. above sea-level, in the alluvial bottoms of the Mississippi river, about 65 m. by rail S.W. of Memphis, Tennessee. Pop. (1890) 5189, (1900) 5550, of whom 3400
HELENA, a city and the county-seat of Lewis and Clark county, Montana, U.S.A., and the capital of the state, at the E. base of the main range of the Rocky Mountains, 80 m. N.E. of Butte, at an altitude of about 4000 ft. Pop. (1880) 3624; (1890) 13,534; (1900) 10,770, of whom 2793 were foreign-born; (1910 census) 12,515. It is served by the Great Northern and the Northern Pacific railways. Helena is delightfully situated with Mt Helena as a background in the hollow of the Prickly Pear valley, a rich agricultural region surrounded by rolling hills and lofty mountains, and contains many fine buildings, including the state capitol, county court house, the Montana club house, high school, the cathedral of St Helena, a federal building, and the United States assay office. It is the seat of the Montana Wesleyan University (Methodist Episcopal, founded in 1890; St Aloysius College and St Vincent's Academy (Roman Catholic); and has a public library with about 35,000 volumes, the Montana state library with about 40,000 volumes, and the state law library with about 24,000 volumes. The city is the commercial and financial centre of the state (Butte being the mining centre), and is one of the richest cities in the United States in proportion to its population. It has large railway car-shops, extensive smelters and quartz crushers (at East Helena), and various manufacturing establishments; the value of the factory product in 1905 was $1,309,746, an increase of 68.7% over that of 1900. The surrounding country abounds in gold- and silver-bearing quartz deposits, and it is estimated that from these families of gold are brought alone, which runs across the city, a more than $20,000,000 in gold has been taken. The street lighting and the railway system of the city are run by power generated at a plant and 40 ft. dam at Canyon Ferry, on the Missouri river, 18 m. E. of Helena. There is another great power plant at Hauser Plant, 20 m. N. of Helena. Three miles W. of the city is the Broadwater Natatorium with swimming pool, 300 ft. long and 100 ft. wide, the water for which is furnished by hot springs with a temperature at the source of 160°. Fort Harrison, a United States army post, is situated 3 m. W. of the city. Helena was established as a placer mining camp in 1864 upon the discovery of gold in Last Chance Gulch. The town was laid out in the same year, and after the organization of Montana Territory it was designated as the capital. Helena was burned down in 1869 and in 1874. It was chartered as a city in 1881.

HELENSBURGH, a municipal and police burgh and watering-place of Dumbartonshire, Scotland, on the N. shore of the Firth of Clyde, opposite Greenock, 24 m. N.W. of Glasgow by the North British railway. Pop. (1901) 8554. There is a station at Upper Helensburgh on the West Highland railway, and from the railway pier at Craigendoran there is steamer communication with Garelochhead, Dunoon and other pleasure resorts on the western coast. In 1776 the site began to be built upon, and in 1802 the town, named after Lady Helen, wife of Sir James Colquhoun of Luss, the ground landlord, was erected into a burgh of barony, under a provost and council. The public buildings include the burgh hall, municipal buildings, Hermitage schools and two hospitals. On the esplanade stands an obelisk to Henry Bell, the pioneer of steam navigation, who died at Helensburgh in 1830.

HELENUS, in Greek legend, son of Priam and Hecuba, and twin-brother of Cassandra. He is said to have been originally called Scamandrius, and to have received the name of Helenus from a Thracian soothsayer who instructed him in the prophetic art. In the Iliad he is described as the prince of augurs and a brave warrior; in the Odyssey he is not mentioned at all. Various details concerning him are added by later writers. It is related that he and his sister fell asleep in the temple of Apollo Thymbraeus and that snakes came and cleansed their ears, whereby they obtained the gift of prophecy and were able to understand the language of birds. After the death of Paris, Helenus and his brother Deiphobus became rivals for the hand of Helen. Deiphobus was preferred, and Helenus withdrew in indignation to Mount Ida, where he was captured by the Greeks, whom he advised to build the wooden horse and carry off the Palladium. According to other accounts, having heard from the Delphic Pythoness, he withdrew and joined the army of Troy. He is supposed that Philoctetes must be fetched from Lemnos before Troy could be taken; or he surrendered to Diomedes and Odysseus in the temple of Apollo, whither he had fled in disgust at the sacrilegious murder of Achilles by Paris in the sanctuary. After the capture of Troy, he and his sister-in-law Andromache accompanied Neoptolemus (Pyrrhus) as captives to Epirus, where Helenus persuaded him to settle. After the death of Neoptolemus, Helenus married Andromache and became ruler of the country. He was the reputed founder of Bathrustom and Chaonia, named after a brother or companion whom he had accidentally slain while hunting. He was said to have been buried at Argos, where his tomb was shown. When Aeneas, in the course of his wandering, reached Epirus, he hospitably received by Helenus, who predicted his future destiny.

Homer, Iliad, vi, 76, 44, xii. 181, 183; Sophocles, Philoctetes, 604, who probably follows the Little Iliad of Lesches; Paussanias i. 11. ii. 23; Conon, Narrationes, 34; Dictys Cretensis iv. 18; Virgil, Aeneid, i. 294-490; Servius on Aeneid, ii. 166, iii. 334.

HELGAUD, or Helgalus (d. c. 1048), French chronicler, was a monk of the Benedictine abbey of Fleury. Little else is known about him save that he was chaplain to the French king, Robert II. the Pious, whose life he wrote. This Epitoma relicarum regum, which is probably part of a history of the abbey of Fleury, deals rather with the private than with the public life of the king, and its value is not great either from the literary or from the historical point of view. The only existing manuscript is in the Vatican, and the Epitoma has been printed by J. P. Migne in the Patrologia Latina, tome cxxi. (Paris, 1844), and by M. Bouquet in the Recueil des historiens des Gaules, tome x. (Paris, 1760).

HELGEBSEN, PVL1 Danish humanist, was born at Varberg in Halland about 1480, of a Danish father and a Swedish mother. Helgesen was educated first at the Carmelite monastery of his native place and afterwards at another monastery at Elsinore, where he devoted himself to humanistic studies and adopted Erasmus as his model. None had a keener eye for the abuses of the Church; long before the appearance of Luther, he denounced the ignorance and immorality of the clergy, and, as lector at the university of Copenhagen, gathered round him a band of young enthusiasts, the future leaders of the Danish Reformation. But Helgesen desired an orderly, methodical, rational reformation, and denounced Luther, whose ablest opponent in Denmark he subsequently became, as a hot-headed revolutionist. Christian II. was also an object of Helgesen's detestation, and so boldly did he oppose that monarch's measures

1 He wrote his name Heliae or Eliae.
Heliacal—Heliand

that, to save his life, he had to flee to Jutland. Under Frederick I (1523-1533) he returned to Copenhagen and resumed his chair at the university, becoming soon afterwards provincial of the Carmelite Order for Scandinavia. But like all moderate men in a time of crisis, Helgesen could gain the confidence of neither party, and was frequently attacked as hostile by the Catholics as by the Protestants. From 1530 to 1533 he and the Protestant champion Hans Tausen exhausted the whole vocabulary of vituperation in their fruitless polemics. In October 1534, however, Helgesen issued an eirenicon in which he attempted to reconcile the two contending confessions. After that every trace of him is lost. For a long time he was unjustly regarded as a turn-coat, but he was too superior to the prejudices of his age to be understood by his contemporaries. His ideal was a moral internal reformation of the Church on a rational basis, conducted not by ill-informed fanatics, but by an enlightened and well-educated clergy; and from this standpoint he never diverged. Helgesen was indisputably the greatest master of style of his age in Denmark, and as a historian he also occupies a prominent position. He always endeavours to probe down to the very soul of things, though his passionate nature made it very difficult for him to be impartial. His chief works are Danmark's Kongers Historie and Skibby Kroniken.

See Ludwig Schmitt, Der Karmeliter Paulus Holde (Freiburg, 1893); Danmarks Rige Historie (Copenhagen, 1897-1905), vol. III.

Heliand, relating to the sun (helion), a term applied in the New Testament to a star which could be seen after it emerged from the rays of the sun, or the last setting that could be seen before it was lost from sight by proximity to the sun.

Heliand. The 9th-century poem on the Gospel history, to which its first editor, J. A. Schmeller, gave the appropriate name of Heliand (the word used in the text for "Saviour"). Answering to the O. Eng. helend and the Ger. Heland), is, with the fragments of a version of the story of Genesis believed to be by the same author, all that remains of the poetical literature of the old Saxons, i.e. the Saxons who continued in their original home. It contained when entire about 6000 lines, and portions of it are preserved in four MSS. The Cotton MS. in the British Museum, written probably late in the 10th century, is nearly complete, ending in the middle of the story of the journey to Emmaus. The Munich MS., formerly at Bamberg, begins at line 85, and has many lacunae, but continues the history down to the last verse of St Luke's Gospel, ending, however, in the middle of a sentence. A MS. discovered at Prague in 1881 contains lines 928-1106, and another, in the Vatican library, discovered by K. Zangemeister in 1804, completes the work (published in 1894). The poem is based, not directly on the New Testament, but on the pseudo-Tatian's harmony of the Gospels, and it shows acquaintance with the commentaries of Alcuin, Beda and Hrabanus Maurus.

The questions relating to the Heliand cannot be adequately discussed without considering also the poem on the history of Genesis, which, on the grounds of similarity in style and vocabulary, and for other reasons afterwards to be mentioned, may with some confidence be referred to the same author. A part of O. Eng. helend, preserved in the article Cadmon, is extant only in an Old English translation. The portions that have been preserved in the original language are contained in the same Vatican MS. that includes the fragment of the Heliand referred to above. In the one language or the other, there are in existence the following three fragments: (1) The passage which appears as lines 235-851 in the so-called "Cadmon's Genesis," on the revolt of the angels and the temptation and fall of Adam and Eve. Of this the part corresponding to lines 790-820 exists also in the original Old Saxon. (2) The story of Cain and Abel, in 124 lines. (3) The account of the destruction of Sodom, in 187 lines. The main source of the Genesis is the Bible, but Professor E. Sievers has shown that considerable use was made of the two Latin poems by Alcuin, Avitus, De initio mundi and De poccato originali.

The two poems give evidence of genius and trained skill, though the poet was no doubt hampered by the necessity of not deviating too widely from the sacred originals. Within the limits imposed by the nature of his task, his treatment of his sources is remarkably free, the details unsuited for poetic handling being passed over, or, in some instances, boldly altered. In many passages his work (perhaps in the spirit of Beowulf) was not so much an imitation of the ancient Germanic epic, as a genuine example of it, though concerned with the deeds of other heroes than those of Germanic tradition. In the Heliand the Saviour and His Apostles are conceived as a king and his faithful warriors, and the use of the traditional epic phrases appears to be not, as with Cynwulf or the author of Andreas, a mere following of accepted models, but the spontaneous mode of expression of one accustomed to sing of heroic themes. The Genesis fragments have less of the heroic tone, except in the splendid passage describing the reformation of Satan and his host. It is noteworthy that the poet, like Milton, sees in Satan no mere personification of evil, but the fallen archangel, whose awful guilt could not obliterate all traces of his native majesty. Somewhat curiously, but very naturally, Enoch the son of Cain is confused with the Enoch who was translated to heaven—an error which the author of the Old English Genesis avoids, though (according to the existing text) he confounds the names of Enoch and Enos.

Such external evidence as exists bearing on the origin of the Heliand and the companion poem is contained in a Latin document printed by Fricius Illyricus in 1563. This is in two parts; the one in prose, the other in verse, both headed "Prefatio ad librum antiquum in lingua Saxonica conscriptum"; the other in verse, headed "Versus de poeta et Interpretæ huysæ codicis." The Prefatio begins by stating that the emperor Ludwig the Pious, desirous that his subjects should possess the word of God in their own tongue, commanded a certain Saxon, who was esteemed among his countrymen as an eminent poet, to translate poetically into the German language the Old and New Testaments. The poet willingly obeyed, all the more because he had previously received a divine command to undertake the task. He rendered into verse all the most important parts of the Bible with admirable skill, dividing his work into vitteas, a term which, the writer says, may be rendered by "lectiones" or "sententias." The Prefatio goes on to say that it was reported that the poet, till then knowing nothing of the art of poetry, had been admonished in a dream to turn into verse the precepts of the divine law, which he did with so much skill that his work surpasses in beauty all other German poetry (ut canea Thwidsca poëtæa suo vincal decore). The Versus practically reproduce in outline Beda's account of Cadmon's dream, in which he was bidden to write the story of the world's history as a herdsman, and adding that his poems, beginning with the creation, relate the history of the five ages of the world down to the coming of Christ.

The suspicion of some earlier scholars that the Prefatio and the Versus might be a modern forgery is refuted by the occurrence of the word vitteas, which is the Old Saxon filteo, corresponding to the Old English filæ, which means a "canto" or a "poem." It is impossible that a scholar of the 10th century could have been acquainted with this word, and internal evidence points to the conclusion that both the prose and the verse are of early origin. The Versus, considered in themselves, might very well be supposed to relate to Cadmon; but the mention of the five ages of the world in the concluding lines is obviously due to recollection of the opening of the Heliand (lines 46-47). It is therefore certain that the Versus, as well as the Prefatio, attribute to the author of the Heliand a poetic rendering of the Old Testament. Their testimony, if accepted, confirms the ascription to him of the Genesis fragments, which is further supported by the fact that they occur in the same MS., with a portion of the Heliand. As the Prefatio speaks of the emperor Ludwig in the present tense, it is possible that the latter part of it at least was probably written in his reign, i.e. not later than A.D. 840. The general opinion of scholars is that the latter part, which represents the poet as having received his vocation in a dream, is by a later hand, and that the sentences in the earlier part which refer to the dream are
interpolations by this second author. The date of these additions, and of the Versus, is of no importance, as their statements are incredible. That the author of the Helian was, so to speak, another Cælinthus—an unlearned man who turned into poetry what was read to him from the screen writings—is impossible, because in many passages the text of the screen writings is closely followed so that it is clear that the poet wrote with the Latin books before him. On the other hand, there is no reason for rejecting the almost contemporary testimony of the first part of the Prosfatio that the author of the Helian had won renown as a poet before he undertook his great task at the emperor's command. It is certainly not impossible that a Christian Saxon, sufficiently educated to read Latin easily, may have chosen to follow the calling of a scop or minstrel 1 instead of entering the priesthood or the cloister; and if such a person existed, it would be no harm that he should be selected by the emperor to execute his designs.

On the other hand, the tone of many portions of the Helian is that of a man who was no mere imitator of the ancient epic, but who had himself been accustomed to sing of heroic themes.

The commentary on the gospel of Matthew by Hrabanus Maurus was finished about 821, which is therefore the superior limit of date for the composition of the Helian. It is usually maintained that this work was written before the Old Testament poems. The arguments for this view are that the Helian contains no allusion to any foregoing poetical treatment of the antecedent history, and that the Genesis fragments exhibit a higher degree of poetic skill. This reasoning does not appear conclusive, and if we set aside, the limit of date for the beginning of the work is carried back to A.D. 814, the year of the accession of Ludwig.

BIBLIOGRAPHY.—The first complete edition of the Helian was published by J. A. Schmeller in 1830; the second volume, containing the glossary and grammar, appeared in 1840. The standard edition is that of H. Kranz (1878), for which the Cotton and Munich MSS. are printed side by side. It is not provided with a glossary, but contains an elaborate and most valuable analysis of the poem, with synonymy and syntactical features of the poem. Other useful editions are those of M. Heyne (3rd ed., 1903), O. Behagel (1882) and P. Piper (1887, containing also the Genesis fragments). The fragments of the Helian and the Genesis contained in the Vatican MS. were edited in 1894 by K. Zangemeister and W. Braune under the title Bruchstücke der altstreichischen Epbdichtung. Among the works treating of the authorship, sources and place of origin of the poems, the most important are the following: E. Windisch, Der Helian oder Heliand des Helian und die angelsächsische Genesis (1875); R. Kögel, Deutsche Altgermanische Geschicht, Bd. I. (1894) and Die angelsächsische Genesis (1895); R. Kögel and W. Bruckner, Althoch- und altniederdeutsche Literatur und die early German heterologie, Bd. II. (2nd ed., 1901), which contains references to many other editions; Herrmann Collitz, Zum Dialetik des Helian (1901). (H. Br.)

HELICON, a mountain range, of Boeotia in ancient Greece, celebrated in classical literature as the favourite haunt of the Muses, is situated between Lake Copais and the Gulf of Aigion. On the fertile eastern slopes stood a temple and grove sacred to the Muses, and adorned with beautiful statues, which, taken by Constantine the Great to beautify his new city, were consumed by a fire in A.D. 326. Helikon by were the famous fountains, Aganippe and Hippocrene, the latter fabled to have gushed from the earth at the tread of the winged horse Pegasus, the favourite browsing place was there. At the neighboring Ascura dwelt the poet Hesiod, a fact which probably enhanced the poetic fame of the region. Pausanias, who describes Helicon in his ninth book, asserts that it was the most fertile mountain in Greece, and that neither poisonous plant nor serpent was to be found on it, while many of its herbs possessed a miraculous healing virtue. The highest summit, the present Palaeevouni (old hill), rises to the height of about 5000 ft. Modern travellers, sided by ancient remains and inscriptions, and guided by the local descriptions of Pausanias, have succeeded in identifying many of the ancient classical spots, and the French excavators have discovered the temple of the Muses and a theatre.

1 The term Volkssänger, commonly used in German discussions of this question, is misleading; the audience for heroic poetry was not “the people” in the modern sense, but the nobles.

HELICON (Fr. hélicon, bombardin circulaire; Ger. Helikon), the circular form of the Bb contrabass tuba used in military bands, worn round the body, with the enormous bell resting on the left shoulder and towering above the head of the performer. The pitch of the helicon is an octave below that of the euphonium. The idea of winding the long tube of the contrabass tuba and of wearing it round the shoulders was suggested by the ancient Roman buccina and cornu, represented in mosaics and on the sculptured reliefs surrounding Trajan’s Column. The buccina and cornu 2 differed in the diameter of their respective bores, the former having the narrow, almost cylindrical bore and harmonic series of the trumpet and trombone, whereas the cornu, having a bore in the form of a wide cone, was the prototype of the bugle and tubas.

HELIGOLAND (Ger. Helgoland), an island of Germany, in the North Sea, lying off the mouths of the Elbe and the Weser, 28 m. from the nearest point in the mainland. Pop. (1900) 2307. From 1807 to 1830 a British possession, it was ceded in 1830 to Germany, and since 1892 has formed part of the Prussian province of Schleswig-Holstein. It consists of two islets, the smaller, the Dünen-Insel, a quarter of a mile E. of the main, or Rock Island, connected until 1729, when it was severed by a violent eruption of the sea, with the other by a neck of land, and the latter is Rock Island. The latter is nearly triangular in shape and is surrounded by steep red cliffs, the only beach being the sandy spit near the south-east point, where the landing-stage is situated. The rocks composing the cliffs are worn into caves, and around the island are many fantastic arches and columns. The impression made by the red cliffs, fringed by a white beach and supporting the green Oberland, is commonly believed to have suggested the national colours, red, white and green, or, as the old Frisian rhyme goes:—

ar, Grön is dat Land,
Rood is de Kant,
Witt is de Sand,
Dat is de Flagg von’t billige Land.

The lower town of Unterland, on the spit, and the upper town, or Oberland, situated on the cliff above, are connected by a wooden stair and a lift. There is a powerful lighthouse, and since its cession by Great Britain to Germany, the main island is strongly fortified, the old English batteries being replaced by armoured turrets mounting guns of heavy calibre. Inside the Dünen-Insel the largest ships can ride safely at anchor, and take in coal and other supplies. The greatest length of the main island, which slopes somewhat from west to east, is just a mile, and the greatest breadth less than a third of a mile, its average height 198 ft., and the highest point, crowned by the church, with a conspicuous spire, 216 ft. The Dünen-Insel is a sand-bank protected by groynes. It is only about 200 ft. above the sea at its highest point, but the drifting sands make the height rather variable. The sea-bathing establishment is situated here; a shelving beach of white sand presenting excellent facilities for bathing. Most of the houses are built of brick, but some are of wood. There are a theatre, a Kurhaus, and a number of hotels and restaurants. In 1892 a biological institute, with a marine museum and aquarium (1900) attached, was opened.

During the summer some 20,000 people visit the island for sea-bathing. German is the official language, though among themselves the natives speak a dialect of Frisian, barely intelligible to the other islands of the group. There is regular communication with Bremen and Hamburg.

The winters are stormy. May and the early part of June are wet and foggy, so that few visitors arrive before the middle of the latter month.

For illustrations of the cornu see the altar of Julius Victor ex Collegio, reproduced in Hartli, Ditt. antiq. crypt. rom. p. 76, pl. viii.; in Darmen und Saglio, Ditt. des antiq. grecocte et romaine, under "Cornu," the buccina and cornu have not been distinguished.
The generally accepted derivation of Heligoland (or Helgoland) from *Heiligeland*, i.e. "Holy Land," seems doubtful. According to northern mythology, Forseti, a son of Balder and Nanna, the god of justice, bathed in the sea on the island, which was subsequently divided (east and west) by St. Ludger. This legend may have given rise to the derivation "Holy Land." The more probable etymology, however, is that of Hallagun, or Halligland, i.e. "land of banks, which cover and uncover." Here Hertha, according to tradition, had her great temple, and here came from the mainland the Angles to worship at her shrine. Here also lived King Radbod, a pagan, and on this isle St. Willibrord in the 7th century first preached Christianity; and for its ownership, before and after that date, many sea-rovers have fought. Finally, it became a fief of the dukes of Schleswig, though often in the course of time lost by them to these princes by the free city of Hamburg. The island was a Danish possession in 1807, when the English seized and held it until it was formally ceded to them in 1814. In the picturesque old church there are still traces of a painted Dannebrog.

In 1890 the island was ceded to Germany, and in 1892 it was incorporated with Prussia, when it was provided that natives born before the year 1858 should be allowed to elect either for British or German nationality, and until 1901 no additional import duties were imposed.

**Heliocentric**. i.e., referred to the centre of the sun (αυρος) as an origin, a term designating especially co-ordinates or heavenly bodies referred to that origin.

**Heliocorus**, of Emesa in Syria, Greek writer of romance. According to his own statement his father's name was Theodosios, and he belonged to a family of priests of the sun. He was the author of *The Athiopica*, the oldest and best of the Greek romances that have come down to us. It was first brought to light in modern times in a MS. from the library of Matthias Corvinus, king of Hungary († 1490), and the German version of his "Herder's life; at Basel in 1554. Other codices have since been discovered. The title is taken from the fact that the action of the beginning and end of the story takes place in Aethiopia. The daughter of Persine, wife of Hydaspes, king of Aethiopia, was born white through the effect of the sight of a marble statue upon the queen during pregnancy. Fearing an accusation of adultery, the mother gives the babe to the care of Sisimithras, a gymnosophist, who carries her to Egypt and places her in charge of Charicles, a Syrian priest. The child is taken to Delphi, and made a priestess of Apollo under the name of Charicles, She was a noble Thessalian, comes to Delphi and the two fall in love with each other. He carries off the priestess with the help of Calasiris, an Egyptian, employed by Persine to seek for her daughter. Then follow many perils from sea-rovers and others, but the chief personages ultimately meet at Meroë at the very moment when Charicles is about to be sacrificed to the gods by her own father. Her birth is made known, and the lovers are happily married. The rapid succession of events, the variety of the character, the graphic descriptions of manners and of natural scenery, the simplicity and elegance of the style, give the *Aethiopica* great charm. As a whole it offends less against good taste and morality than others of the same class. Homer and Euripides were the favourite authors of Heliodorus, who in his turn was imitated by French, Italian and Spanish writers. The early life of Clorinda in Tasso's *Jerusalem Delivered* (canto xii. 21 sqq.) is almost identical with that of Charicles; Racine meditated a drama on the same subject; and it formed the model of the *Persiles y Sigismunda* of Cervantes. According to the ecclesiastical historian Socrates (*Hist. eccl., v. 22*), the author of the *Aethiopica* was a certain Heliodorus, bishop of Tricca in Thessaly. It is supposed that the work was written in his early years before he became a Christian, and that, when confronted with the alternative of disowning it or resigning his bishrope, he preferred resignation. But it is now generally agreed that the real author was a sophist of the 3rd century A.D.

The best editions are: A. Coraës (1804), G. A. Hirschig (1856); see also M. Qüftering, *H. und seine Bedeutung für die Literatur*, (1891); J. C. Dunlop, *History of Prose Fiction* (1888); and especially E. Rohde, *Der griechische Roman* (1900). There are translations in almost all European languages: In English, the "Bohn's translation" (1825); "Tudor" series (v. i., 1895, containing the old translation by T. Underdowne, 1857, with introduction by C. Whibley); in French by Amyot and Zevort.

**Heligabalus** (Elagabalus), Roman emperor (A.D. 218–222), was born at Emesa about 205. His real name was Varius Avitus. On the murder of Caracalla (217), Julia Maesa, Varius' grandmother and Caracalla's aunt, left Rome and retired to Emesa, accompanied by her grandsons (Varius and Alexander Severus). Varius, though still only a boy, was appointed high priest of the Syrian sun-god Elagabal, one of the chief seats of whose worship was Emesa (Homs). His beauty, his courtly air, and his pandelic character made him at once a great favourite with the troops stationed in that part of Syria, and Maesa increased his popularity by spreading reports that he was in reality the illegitimate son of Caracalla. Macrinus, the successor and instigator of the murder of Caracalla, was very unpopular with the army; an insurrection was secretly set on foot, and on the 16th of May 218 Varius was proclaimed emperor as Marcus Aurelius Antoninus. The troops sent to quell the revolt went over to him, and Macrinus was defeated near Antioch on the 8th of June. Heligabalus was at this time only twelve years of age. After him the name of Heliogabalus is not used in Nicomedia, he proceeded in 219 to Rome, where he made it his business to exalt the deity whose priest he was and whose name he assumed. The Syrian god was proclaimed the chief deity in Rome, and all other gods his servants; splendid ceremonies in his honour were celebrated, at which Heligabalus danced in public, and it was believed that secret rites accompanied by human sacrifice were performed in his honour. In addition to these affronts upon the state religion, he insulted the intelligence of the community by horseplay of the wildest description and by childish practical joking. The shameless profanity with which he employed the money of the taxes brought him into difficulties with the people, and his profligacy with which he employed the army; was the subject of a famous satirical poem by Catullus, in which he is compared to Caesar (221), a step of which he soon repented. An attempt to murder Alexander was frustrated by the watchful Maesa. Another attempt in 222 produced a mutiny among the praetorians, in which Heligabalus and his mother Soemias (Soaeamis) were slain (probably in the first half of March).

**Heligalloph**, from Gr. ἡλιοσ τον, sun, and γράφων to write, an instrument for reflecting the rays of the sun (or the light obtained from any other source) over a considerable distance, these applications is in military signalling (see PHOTOGRAPHY). A similar instrument is the heliotrope, used principally for defining distant points in geodetic surveys, such as in the triangulation of India, and in the verification of the African arc of the meridian. It is necessary to distinguish the method of signalling termed heligalloph from the photographic process of the same name (see PHOTOGRAPHY).
HELIOMETER (from Gr. ἀληθής, sun, and μέτρον, a measure), an instrument originally designed for measuring the variation of the sun's altitude at different seasons of the year, but which, modified now to the modern form of the instrument which is capable of much wider use. The present article also deals with other forms of double-image micrometer.

The discovery of the method of making measures by double images is stated to have been first suggested by O. Roemer about 1766. But no such suggestion occurs in the Basis Astronomiae of Peter Horrobow (Copenhagen, 1735), which contains the only works of Roemer known to the present writer. The first invention of a micrometer for measurement by double image is attributed to Savary (fig. 1). The segments gh and ef so formed were then attached to the end of a tube having an internal diameter represented by the dotted circle (fig. 2). The width of each of the portions aghc and acfe cut away from the circle of greatest width of lens × tangent of sun's greatest diameter. Thus at the focus two images of the sun were formed nearly in contact as in fig. 3. The small interval between the images on the retina was then measured with a wire micrometer.

Savary also describes another form of heliometer, on the same principle, in which the segments aghc and acfe are utilized by cementing their edges gh and ef together (fig. 4), and covering all except the portion indicated by the unshaded circle. Savary expresses preference for this second plan, and seems to have thought that in both these models "the rays of red light in the two solar images will be next to each other, which will render the sun's disk more easy to be observed than the violet ones." This he mentions "because the images in these two parts are somewhat less distinct, but mostly those of the first model, which could therefore bear no great charge (magnifying power)."

A third model proposed by Savary consists of two complete lenses of equal focal length, mounted in cylinders side by side, and attached to a strong brass plate (fig. 5). Here, in order to fulfill the purposes of the previous models, the distance of the centres of the lenses from each other is made great enough to give the tangential length of sun's diameter × focal length of lenses. Savary dwells on the difficulty both of procuring lenses sufficiently equal in focus and of accurately adjusting and centering them.

In the Mémo. Acad. de Paris (1748), Pierre Bouguer describes an instrument which he calls a heliometer. Lalande in his Astronomie (vol. ii. p. 639) mentions such a heliometer which had been in his possession from the year 1735, and of which he gives a representation on Plate XXVIII., fig. 186, of the same volume. Bouguer's heliometer was in fact similar to that of Savary's third model, with the important difference that both object-glasses were fixed, one of them is movable by a screw provided with a divided head. No auxiliary filar micrometer was required, as in Savary's heliometer, to measure the interval between the two images of the sun, for, by turning the tube so that the images of the sun, it being only necessary to turn the screw with the divided head to change the distance between the object-glasses till the two images of the sun are in contact as in fig. 6. The differences of the readings of the screw, when converted into arc, afford the means of measuring the variations of the sun's apparent diurnal movement.

On the 4th of April 1754 John Dollond communicated a paper to the Royal Society of London (Phil. Trans., clv. vii. 551) in which he shows that a micrometer in much more easily constructed by dividing a single object-glass through its axis than by the use of object-glasses. Dollond proceeds: (1) that a telescope with an object-glass so divided still produces a single image of any object to which it may be directed, provided that the optical centres of the segments are in coincidence (i.e., provided the segments retain the same relative positions to each other as before the glass was cut); (2) that if the segments are separated in any direction two images of the object viewed will be formed, and that the most convenient direction of separation for micrometric purposes is to slide those straight edges one along the other as the figure on the margin (fig. 7) presents them: "for thus they may be moved without error, and an error in sliding, such as having a vernier's division fixed to the brass work that is one segment, so as to slide along a scale on the plate to which the other part of the glass is fitted." Dollond then points out that there are three different types in which a glass so divided and mounted may be used as a micrometer:—

It may be fixed at the end of a tube, of a suitable length to its focal distance, as an auxiliary object-glass to the tube having an eye-glass fitted as usual in astronomical telescopes.

2. It may be applied to the end of a tube much shorter than its focal distance by having another convex glass within the tube, to shorten the focal length and the image. The image of the object-glass, cut from a complete negative achromatic combination, may be found within 8° of the sun's disc, and thus used for the more convenient achromatic telescope of 1½ in. aperture and 4½ in. focal length, composed of a double concave flint lens and a double convex crown.

With one of these instruments of somewhat smaller dimensions (telescope 2½ in. aperture and 3½ ft. focus), Franz von Paula Triesneck made a series of measurements at the observatory of Vienna which he communicated in the Acta Astronomica of the year 1833.

Some excellent instruments of the second type were subsequently made by Dollond's eldest son Peter, in which for the "convex glass with the glass into which the glass so divided was made was cut from a complete negative achromatic combination, and thus derived a divided negative achromatic combination of long focus. In the fine example of this instrument at the Cape Observatory the movable negative lenses consist of segments of the shape gach and acfe, and the tube was cut from a complete negative achromatic combination, that is, by a segment of 8½ in. aperture and about 4½ feet focal length, composed of a double concave flint lens and a double convex crown. This was applied to an excellent achromatic telescope of 3½ in. aperture and 42 in. focal length. In the instrument of my own it has been shown that the divided lens corresponds with a comparatively small separation of the double image, so that simple verniers reading to 0.000 in. are sufficiently accurate.

The measurements with these instruments were made by Dollond and others in a period of 50 years (1754-1804).

With one of these instruments of somewhat smaller dimensions (telescope 2½ in. aperture and 3½ ft. focus), Franz von Paula Triesneck made a series of measurements at the observatory of Vienna which he communicated in the Acta Astronomica of the year 1833.

The use of the modern heliometer has been chiefly for the employment of its great value for the determination of the parallax of the sun; this is, of course, the only method by which the distance of the sun can be determined. It is based on the fact that the apparent parallax of the sun is very small, and that it may be accurately measured by comparing it with that of a fixed star, the distance of which is known. The parallax of the sun is obtained by observing the position of the sun and a fixed star at two different times, and computing the angle between their positions. The angle is then multiplied by the number of astronomical units in the distance of the sun, and the result is the parallax of the sun. The parallax of the sun is of great importance in determining the scale of the solar system, and the distance of the sun. It is also used in determining the distances of the planets, and in determining the positions of the stars.

Of the various methods of determining the parallax of the sun, the most accurate is that which is based on the observation of the transit of Mercury. The transit of Mercury is the passage of the planet from east to west across the face of the sun. The parallax of the sun is determined by observing the position of the planet at the time of the transit, and comparing it with the position of the planet at another time. The difference in the position of the planet is then multiplied by the number of astronomical units in the distance of the sun, and the result is the parallax of the sun. The parallax of the sun is of great importance in determining the scale of the solar system, and the distance of the sun. It is also used in determining the distances of the planets, and in determining the positions of the stars.

The modern heliometer has been used extensively in determining the parallax of the sun, and in determining the distances of the planets. It has also been used in determining the positions of the stars, and in determining the positions of the planets. It is an important instrument in the study of astronomy, and is used extensively in the determination of the parallax of the sun, the distances of the planets, and the positions of the stars.

The modern heliometer has been used extensively in determining the parallax of the sun, and in determining the distances of the planets. It has also been used in determining the positions of the stars, and in determining the positions of the planets. It is an important instrument in the study of astronomy, and is used extensively in the determination of the parallax of the sun, the distances of the planets, and the positions of the stars.
The Königsberg heliometer is represented in fig. 8. No part of the equatorial mounting is shown in the figure, as it resembles in every respect the usual Fraunhofer mounting. An adapter is fixed on a telescope-tube, made of wood, in Fraunhofer’s usual fashion.

To this adapter is attached a flat circular flange $h$. The slides carrying the segments of the divided object-glass are fastened to two oblong brass plates, which are mounted on a plate, which is fitted and ground to rotate smoothly on the flange $h$. Rotation is indicated by a pinion, turned by the handle $c$ (concealed in the figure), which works in teeth cut on the edge of the flange $h$. The whole is balanced on a pivot placed about the axis of rotation. The slides are moved by the screws $a$ and $b$, the divided heads of which serve to measure the separation of the segments. These screws are turned from the eye-end by bevelled wheel and pinion, the latter connected with the handles $a’$, $b’$.

The reading micrometers $f$, also serve to measure, independently, the separation of the segments, by scales attached to the slides; such measurements can be employed as a check on those made by the screws. The measurement of position angles is done by a graduated circle attached to the head. There is also a position circle, attached at $m$ to the eye-end, provided with a slide to move the axis of the eye-piece. This axis is also mounted on a micrometer to measure the distance of an object from that axis. The ring $e$, which carries the supports of the handles $a’$, $b’$, is capable of a certain amount of rotation on the tube. The weight of the latter and that of their handles is balanced by counterweights. It is necessary in order to allow the rods to follow the micrometer heads when the position angle is changed. Complete rotation of the head is obviously impossible because of the interference of the declination axis with the rods, and inconvenient even among amateurs. It cannot be measured in two positions of the circle. The object-glass has an aperture of 6¾ in. and 102 in. focal length.

The telescope-tube, with eyepiece, can be used.

First Method.—One of the segments is fixed in the axis of the telescope, and the eye-piece is also placed in the axis. Measures are made with the moving segment displaced alternately on opposite sides of the fixed segment.

Second Method.—One segment is fixed, and the measures are made as in the first method, excepting that the eye-piece is placed symmetrically with respect to the images under measurement. That is to say, the eye-piece is displaced from that of the head, and the eye-piece is displaced from the axis of the tube (in the direction of the movable segment) by an amount equal to half the angle under measurement.

In this way the errors lessening may be due to want of homogeneity of the object-glass; for the lenses will not be turned with respect to each other, but, in measurement, will always have the same relation to the axis which they would have between the objects under observation. It is true that the scale will require to be capable of being read with much greater accuracy than $1\frac{1}{4}$ths of an inch—for that, even in a telescope of 10 ft. focus, would correspond with $2^{*}$ of arc. But, after all, this is no practical difficulty, for screws can be used to separate the lenses, and, by these screws, as in a Gascoigne micrometer, the separation of the lenses can be measured; or we can have scales for this purpose, read by microscopes, of the Troughton $1$ circles of Plazin or Pond, or those of the Carey circle, with almost any required accuracy.

Whether Bessel communicated such a course of reasoning to Fraunhofer, or whether that great artist arrived independently at like conclusions, we have been unable to ascertain with certainty. The fact remains that before 1820$^1$ Fraunhofer had completed one or more of the five heliometers (3 in. aperture and 39 in. focus) which have since become historical litterature. The first Königshelm heliometer was commenced, and it was completed in 1829.

To sum up briefly the history of the development of the heliometer. The first application of the divided object-glass to the employment of double images was made by Bessel. To Bouguer in 1748 is due the true conception of measurement by double image without the auxiliary aid of a flat micrometer, viz. by the aid of the divided object-glass. To Bessel, however, was added the precision. To Dollond in 1754 we owe the combination of Savary’s idea of the divided object-glass with Bouguer’s method of measurement, and the construction of the first really practical heliometers. To Fraunhofer, same time not long previous to 1820. Is due, so far as we can ascertain, the construction of the first heliometer with an achromatic divided object-glass, i.e. the first heliometer of the modern type.

The Modern Heliometer.

Wilhelm Struve, in describing the Pulkowa heliometer, made $^2$

1. The distances of the optical centres of the segments from the eyepiece are: $3$; second, the angle under measurement. In Bessel’s heliometer this would amount to a difference of $1\frac{1}{4}$th of an inch when an angle of $1^{*}$ is measured. For $2^{*}$ the difference would amount to nearly $\frac{1}{4}$th of an inch. Bessel confined his measures to distances considerably less than $1^{*}$.

2. In criticizing Bessel’s choice of methods, and considering the loss of time involved in each, it must be remembered that Fraunhofer provided no means of reading the screws or even the heads from the eye-end. The heliometer, in consequence, required both the observer and the reader to have a head, and then restore the telescope to its former declination reading, the clockwork meanwhile following the stars in right ascension. The setting of the object-glass would symmetrical under such circumstances, be very tedious.

3. This most important improvement would permit any two stars under measurement each to be viewed in the optical axis of each segment. This optical centres of the segments would also remain at the same distance from the eye-piece at all angles of separation. Thus, in measuring the largest as well as the smallest angles, the images of both stars would be equally symmetrical and equally well defined. Modern heliometers made with cylindrical slides measure angles over $2^{*}$, the images remaining as sharp and perfect as when the smallest angles are measured.

4. Bessel found, in course of time, that the original corrections for the errors of his screws were no longer applicable. He considered that the changes were due to wear, which would be much lessened if the screws were protected from dust. This method, being a good one, was probably liable to warp and twist in a very uncertain way.

5. We have been unable to find any published showing how the segments are fitted in their cells.

6. It has long been assumed that the reasons which led Bessel to choose every plane for the end-bearings of his screws. He actually introduced them in the Königshelm heliometer in 1840, and they were retained in 1848 and 1850.

7. A segment of wire was placed in front of the segment through which the fainter star is viewed, was employed by Bessel to equalize the brilliancy of the images under observation. An arrangement, described in his work, for the modern heliometers for placing the screen in front of either segment by a heliometer’s star, was not practiced.
by Merz in 1839 on the model of Bessel's heliometer, submits the following improvements: (1) to give automatically to the two segments simultaneous equal and opposite moveme-
nt; and (2) to make the tube of metal instead of wood; to attach
the heliometer head firmly to this tube; to place the eye-piece per-
daature, and the telescope; and to fix a strong cradle on the
end of the declination axis, in which the tube, with the
attached head and eye-piece, could rotate on its axis.

Both suggestions are important. The first is originally the idea of
Bessel, and the second was seen, and it seems to have been quite forgotten till resuggested by Struve. But the
method is not available if the separation is to be measured by screws; it is found, in that case, that the direction of the final motion of turn-
ing the screw must always be such as to produce motion of the segment against gravity, otherwise the "loss of time" is apt to be
variable. Thus the simple connexion of the two screws by cog-
wheels to give them automatic opposite motion is not an available
method unless the separation of the segments is independently
measured by scales.

Struve's second suggestion has been adopted in nearly all succeed-
ing heliometers. It permits complete rotation of the tube and
measurement of all angles in reversed positions of the circle; the
handles that move the slides can be brought down to the eye-end,
inside the tube, and consequently made to rotate with it; and the
position circle may be placed at the end of the cradle next the eye-
end where it is convenient of access. Struve also points out that
by attaching a fine scale to the focusing slide of the eye-piece, and
knowing the coefficient of expansion of the metal tube, the means would be given of determining the change of the focal
length of the object-glass at any time by the simple process of
focusing on a double star. This, with a knowledge of the tempera-
ture of the screw or scale and its coefficient of expansion, would
enable the observer to find his zero-value at any instant.

It is probable that the Bonn heliometer was in course of con-
struction before these suggestions of Struve were published or discussed, since its construction resembles that of the Königsberg
and Pulkowa instruments. Its dimensions are similar to those of
the former instrument. Bessel, having been consulted by the
celebrated statesman, Sir Robert Peel, on behalf of the Radcliffe
trustees, as to what instrument, added to the Radcliffe Observatory,
would probably give the greatest stimulus to the advancement of astronomy, strongly advised the selection of a heliometer. The order for the
instrument was given to the Repsolds in 1849, but various circum-
stances, for which the makers are not responsible, contributed to delay the completion of the instrument which was not delivered before the winter of 1848. 1 2

The building to receive it was commenced in March 1849 and completed in the end of the same year. This instrument has a superb object-
glass of 7½ in. aperture and 126 in. focal length. The
makers availed themselves of Bessel's suggestion to make the segments move in cylindrical slides, and of Struve's to have the head attached to a brass tube; the eye-piece is set permanently in the axis, and the
whole rotates in a cradle attached to the declination axis. They provided a splendid, rigidly mounted, equatorial stand, fitted with every luxury in the way
of slow motion, and scales for measuring the displac-
ment of the segments were read by powerful micro-
scopes from the eye-end. 3 It is somewhat curious that although Struve's second suggestion was adopted,
his first was overlooked by the makers. But it is
still more curious that it was not afterwards carried out, for the communication of automatic symmetrical movement to both segments only involves a simple
alteration previously described. But, as it came from the hands of the makers in 1849, the Oxford
heliometer was incomparably the most perfect and
powerful instrument in the world for the highest order
of micrometric research. It so remained, unrivalled
in every respect, till 1873.

As the transit of Venus in 1874 approached, prepara-
tions were made on foot in the German Government in good time; a
commission of the most celebrated astronomers was appointed, and it
was resolved that the heliometer should be the instrument chiefly
relied on. The four long-neglected small heliometers made by Fraun-
hofer's in 1814 were restored to their original
advantages by the additions of micrometer scales and Reticles were
made upon them: their wooden tubes were replaced by tubes of metal;

1 Description de l'observatoire central de Pulkova, p. 208.
2 Steinheil applied such motion to a double-image micrometer
made for Struve. This instrument suggested to Struve the above-
mentioned idea of the change of the instrument for the future.
3 Manuel Johnson, M.A., Radcliffe observer, Astronomical Observa-
tions made at the Radcliffe Observatory, Oxford, in the Year 1850,
Introduction, p. iii.
4 The application of electricity to the illumination of astronomical instru-
ments. Thin platinum wire was rendered incandescent by a voltaic
current; a small incandescent electric lamp would now be found
more satisfactory.

These small instruments have since done admirable work in the hands of Schir, Hartwig, Küstner, Elkin, Auwers and others.

The Russian Government ordered three new heliometers (each of 4 in. aperture and 5 ft. focal length) from the Repsolds, and the design for their construction was superintended by Struve, Auwers
and Winnecke, the last-named making the necessary experiments at
Carlshuie. Fig. 9 represents the resulting type of instrument which was finally designed and constructed by Repsolds. The brass tube, strengthened at the bearing points by strong truly turned collars, rotates in the cast iron cradle g attached to the declination axis, a is the eye-piece fixed in the optical axis, b the micrometer for reading both scales. c and d are telescopes for reading the position circle p, e the handle for quick motion in position angle, f the slow motion in position angle, g the handle for changing the separation of the segments by acting on the bevel-wheel g' (fig. 10). h is a milled head connected by a rod with k' (fig. 10), for the purpose of inter-
posing at pleasure the prism w in the axis of the reading micrometer; this enables the observer to view the graduations on the face of the metallic thermometer t (composed of a rod of brass and a rod of zinc), i is a milled head connected with the wheel i' (fig. 10), and
affords the means of placing the screen s (fig. q), counterpoised by w over either half of the object-glass. k clamps the telescope in declination, n clamps it in right ascension, and the handles m and l provide slow motion in declination and right ascension respectively.

The details of the interior mechanism of the "head" will be almost
evident from fig. 10 without description. The screw, turned by the
wheels at g, acts in a toothed arc, whence, as shown in the
figure, equal and opposite motion is communicated to the slides by the
jointed rods s, r. The slides are kept firmly down to their bear-
ings by the rollers r, r, attached to axes which are, in the middle,
very strong springs. Side-shake is prevented by the screws and
pieces k, k, k, k. The scales are at n, n; they are fastened only at the
middle, and are kept down by the brass pieces l. 5

A similar heliometer was made by the Repsolds to the order of
Lord Lindsay for his Mauritius expedition in 1874. It differed only from the three Russian instruments in having a mounting by the
Cooke's in which the declination circle reads from the eye-end. 6
This instrument was afterwards generously lent by Lord
Lindsay to Gill for his expedition to Ascension in 1877. 7

These four Repsold heliometers proved to be excellent instruments.

5 For a detailed description of this instrument see Dunantchi Publica-
tions, vol. ii.
easy and convenient in use, and yielding results of very high accuracy in measuring distances. Their slow motion in position angle, however, was not all that could be desired. When small movements of the observer. This alteration and the new equatorial mounting have been admirably made by Grubb; the result is completely successful. The instrument so altered was in use at the Cape Observatory from March 1881 till 1887 in determining the parallaxes of some of the more interesting southern stars. The instrument then passed, by purchase from Gill, to Lord McLaren, by whom it was presented to the Royal Observatory, Edinburgh.

Still more recently the Repsoldes have completed a new heliometer for Yale College, New Haven, United States. The object-glass is of 6 in. aperture and 98 in focal length; the tube, objective-cell, slides, &c., are all of steel. The instrument is shown in fig. 11. The circles for position angle and declination are read by micrometer microscope. The lamp L; the scales are illuminated by the lamp L, T is part of the tube proper, and turns with the head. The tube V, on the contrary, is attached to the cradle, and merely forms a support for the finder O, the handles at f and p, and the moving ring P. The latter gives quick motion in position angle; the handles at g clamp and give slow motion in position angle, those at f clamp and give slow motion in right ascension and declination. a is the eye-piece, b the handle for moving the segments of the micrometer microscope for reading the scales and scale micrometer, d the micrometer readers of the position and declination circles, e the handle for rotating the large wheel E which carries the screens. The hour circle is also read by microscopes, and the instrument can be used in both positions (tube preceding and following) for elimination of the effect of flexure on the position angles. Elkin found that the chief drawbacks to speed and convenience in working this heliometer were: (1) The loss of time involved in entering the corresponding readings of the micrometer pointings on two scales. (2) That an additional motion intermediate between the quick and slow motion in position angle was necessary, because, whilst the slow motion provided by Repsoldes was admirably adapted for adjusting the pointings in position angle, it was too slow for causing the images to "cross through" each other in the process of measuring distances. To remedy drawback (1) Repsoldes devised the form of printing micrometer which is shown in figs. 12 and 13. This micrometer is provided with two pairs of parallel webs. One fixed pair of webs is attached to the micrometer-box, the other pair is moved by the screw S. The whole micrometer-box is moved by jacks instead of with the necessary smoothness and certainty. When the heliometer-part of Lord Lindsay's heliometer was acquired by Gill in 1879, he changed the manner of imparting the motion in question. A square toothed racked wheel was applied to the tube at r (fig. 9). This wheel is actuated by a tangent screw whose bearings are attached to the cradle; the screw is turned by means of a handle supported by bearings attached to the cradle, and coming within convenient reach of the observer's hand. The tube turns smoothly in the racked wheel, or can be clamped to it at the will of the screw attached to the heads. Accordingly, in reading the scales A and B (attached to the object-glass), it is only necessary to turn the screws until the fixed

1The primary object was to have the object-glass mounted in steel cells, which more nearly correspond in expansion with the glass. It became then desirable to make the head of steel for sake of uniformity of material, and the advantages of steel in lightness and rigidity for the tube then became evident.
double web is pointed symmetrically on one of the divisions of scale A, then to move the other double web by the screw S until it is symmetrically pointed on the adjoining division of scale B. By turning the quick acting screw P (fig. 13) to the right, the cushion C (which is faced with India-rubber) presses the paper ribbon (shown in fig. 13) against the index-edge and type-wheels, and thus the beautifully cut divisions of the micrometer-head, the numbers marking the 10 parts of the head, the index and the total number of revolutions are all sharply embossed together upon the paper ribbon. Fig. 14 shows the record of several successive paintings on the same scale as that given by the micrometer. The reverse motion of P automatically moves the paper ribbon forward, ready to receive the next impression. It must be mentioned that the pressure of the cushion C on the type-wheels has no influence whatever upon the micrometer-screw, because the type-wheels are mounted on a hollow cylindrical axis, concentric with the axis of the screw, but entirely disconnected from the screw itself. The only connexion between the type-wheel and the screw-head S is by the pin p (which is screwed into S), the cylindrical end of which acts in a slot cut in the type-wheel. To remedy drawback (2) Repsold provided for the Yale heliometer an additional handle for motion in position angle, intermediate in velocity between the original quick and slow motions.

In the 7-in. heliometer, completed in 1887 for the Royal Observatory at the Cape of Good Hope, Repsold, on Gill's suggestion, introduced the following improvements: (a) Four different speeds of motion in position angle were provided. The quickest movement is given by the hand-ring, 73 (fig. 15). This ring runs between friction wheels and is provided with teeth on its inner periphery, and these teeth transmit motion to a pinion on a spindle having at its other end another pinion which, through an intermediate wheel, rotates the heliometer tube. The transmission spindle, just mentioned, carries at its end a head, 74, which, if turned directly, gives the second speed. The slowest speed is given by means of a tangent screw which is carried by a ball-bearing on the flange of the telescope.

(b) In lieu of oil-lamps, small, conveniently placed incandescent electric 6-volt lamps are employed; and these are fitted with suitable switches and variable resistances. Thus the scales, the position- and declination-circles, the field of view, the heads of all the micrometer-microscopes, the focusing-screws, the stops, the micrometer, the microscope, the low tension and high tension hand-lamps, and with the aid of a hand-lamp and with an amount of illumination that can be regulated at the observer's pleasure.

(c) A button in the centre of the position-angle handle (74) connects with a chronograph (fig. 15) the head of which includes the clock, the chronograph being a toothed wheel that receives motion from the handle and feeds the clock in a predetermined order and at a constant rate. The time is indicated in seconds, the time of day in minutes. This new apparatus has been adopted at all observatories in which it can be used.

The increase in the magnifying power of the existing microscopes is increased fourfold (viz. to 100 diameters) by a special microscope. It enables the observer to compare any division-interval on one scale with any corresponding interval on the other scale. With this apparatus Gill was enabled (Annals Cape Obs. vii. 29-42, and Monthly Notices, R.A.S., xlix. 105-115) to determine the division error of every line on both scales with a probable error corresponding to 300-0002 arc.

(d) A position-micrometer is attached to the finder to enable the observer to select comparison stars for observation with some unexpected object. Thus a comet may be encountered in the morning dawn or evening twilight, and without sphere or spectroscope the observer may lose the whole available opportunity for observation in the vain endeavour to find a suitable comparison-star. But with such a position-micrometer of large field he has no difficulty. Directing the finder to the comet, he has at once in his sight all available comparison stars. Having selected the most suitable one he directs the axis of the finder to the estimated middle point between the comet and the star, turns the finder-micrometer in position angle until the images of comet and star lie symmetrically between the parallel position wires, and then turns the micrometer screw (which moves the distance metrically from the centre in opposite directions) till one wire bisects the comet and the other the star. The reading of the position-circle of the finder indicates the position-angle at which the position-circle of the heliometer should be set, and from the readings of the micrometer-screw he finds, by a convenient table, the proper settings of the heliometer scales in distance. When the scales and position-circle of the heliometer have been set to these readings, the comet and the selected comparison-star appear together in the field of view.

Fig. 15 shows the very convenient arrangement of the eye-end of the instrument. The disk, 30, with its small projecting handle enables the 2 segments of the object to be moved rapidly or with any required delicacy relative to each other. The disk 32 operates the wire gauge screws for equalizing the two stars under observation. The dial between 30 and 32 indicates the scale in use. 18 clamps and 19 gives slow motion in declination; 20 clamps and 21 gives slow motion in right ascension. The two handles 82 serve for manipulating the instrument. The microscopes adjoining 82 read the position and declination circle, by an ingenious arrangement of prisms and screens, the images of both circles can be read by each single microscope as shown in fig. 16, thus enabling the observer to save time in the employment of two additional micrometers.

Experience has shown that there is little that can be advantageously changed in this micrometer with any advantage to the accuracy or precision of working. A series of observations can be easily and more accurately made with the Oxford heliometer (fig. 9) than with the Cape heliometer in half the time, and with the 4-in. Repsold heliometer (fig. 9) 1 hour. Heliometers of 6 to 8 in. aperture have subsequently been constructed by Repsold on the best of the Cape plans for Göttingen, Bamberg, Leipzig and the Cape Observatory (near Albers) and all of them have made important contributions to astronomy of precision.

Heliometer observations of distance in their most refined sense cannot be considered absolute measures of distance. For all practical purposes the scale-value of the instrument depends on the relation of the focal
length of the object-glass to the length of the unit of the scale. But the eye is tolerant of small changes in the focal adjustment which sensibly affect the scale, and these changes may and do depend on the following causes: (i.) The focal length of the object-glass and the length of the tube are affected by temperature. (ii.) The focal length is sensibly different for objects of different colour. (iii.) The length of the scale is affected by temperature. (iv.) The state of the eye of the observer's eye is dependent on his state of health, on a condition of greater or less fatigue, or on the accommodation of the head in consequence of the direction of the object observed. (v.) The temperature of the handle of the scale and of the tube, cannot be assumed to be identical. Thus, for refined purposes, it cannot be assumed with any certainty that the instantaneous scale-values are the same for each observer at each epoch of observation.

In determinations of stellar or solar parallax, comparison stars, symmetrically situated with respect to the object whose parallax is sought, should be employed, in which case the instantaneous scale-value may be regarded as an unknown quantity which can be derived in the process of the computation of the results. Examples of this mode of procedure will be found, in the case of stellar parallax in the Mem. R.A.S. vol. viii. pp. 1-194, and in the Annals of the Cape Observatory, vol. vili. parts 1 and 2; and in the case of planetary parallax in the Mem. R.A.S. vol. viii. pp. 1-171, and in the Annals of the Cape Observatory, vol. vi. In other operations, such as the triangulation of large groups of stars, it is necessary to select a pair of standard stars, if possible near the middle of the group, and to determine the distance and mass of Jupiter, reference must also be made to measures of standard stars whose relative distance and position angle is accurately determined by independent methods (see Annals of the Cape Observatory, vol. vi. pp. 3-224). In other cases, such as the measurement of the mutual distances and position angles of the satellites of Jupiter, for the determination of the elements of the orbit of the satellites and the mass of Jupiter, reference must also be made to measures of standard stars whose relative distance and position angle is accurately determined by independent methods (see Annals of the Cape Observatory, vol. vi. pp. 3-224).

Gill introduced a powerful auxiliary to the accuracy of heliometer measures in the shape of a reversing prism placed in front of the eye-piece, between the latter and the observer's eyes. The measures are made by placing the image of a star in the centre of the disc of a planet, the observer may have a tendency to do so systematically in error from some acquired habit or from natural astigmatism of the eye. But by rotating the prism 90° the image is presented entirely reversed to the eye, so that in the mean of measures made in two such directions, the error is eliminated. Similarly the prism may be used for the study and elimination of partial errors depending on the angle made by a double star with the vertical. The best plan of measuring such a prism has been found to be the following. P, P (fig. 17) are the eye lens and field lens respectively of a Merz positive eye-piece. In this construction the lenses are much closer together and the diaphragm for the eye is much farther from the lenses than in Ramsden's eye-piece, and is so constructed that it is fitted accurately into brass slides (care has to be taken in the construction to place the prism so that an object in the centre of the field will so remain when the eye-piece is rotated in any direction found necessary). There is a collar, clamped by the screw at S, which is so adjusted that the eye-piece is in focus when pushed home, in its adapter, to this collar. The prism and eye-piece are then rotated together in the adapter.

The Double Image Micrometer.—Thomas Clausen in 1841 (Astr. Nach. No. 444) proposed a form of micrometer consisting of a divided plate of parallel glass placed within the cone of rays from the object-glass at right angles to the telescope axis. One-half of this plane remains fixed, the other half is movable. When the inclination of the movable half with respect to the axis of the telescope is changed by rotation about an axis at right angles to its face, for each division two images are produced. The amount of separation is very small, and depends on the thickness of the glass, the index of which is 1.55. As the length of the telescope. Angelo Secchi (Comptes rendus, xil, 1855, p. 99) gives an account of experiments with a similar micrometer; and Ignazio Porro (Comptes rendus, xil, p. 1058) claims the original invention and construction of such a micrometer to be his. The micrometer is best regarded as a form of double image. Ramsden's dioptic micrometer consists of a divided lens placed in the conjugate focus of the innermost lens of the erecting eye-tube of a terrestrial telescope. The inventor claimed that it could never be used for astronomy. Dollond claims the independent invention and first construction of a similar instrument (Pearson's Practical Astronomy, i, 182). Of these and kindred instruments only two types have proved of practical value. C. B. Amiel de Modena (Mem. Soc. Ital. xvii, 1815, pp. 344-359) describes a micrometer in which a negative lens is introduced between the eye-piece and the object-lens to correct the dioptric error of the lens. The separation of the lenses produces the required double image, and is measured by a screw. W. R. Dawes very successfully used this micrometer in conjunction with a filar micrometer, and made the first measures of the position of the planets for the year 1855 (Monthly Notices, vol. xxvii. p. 58, and Mem. R.A.S. vol. xxxiv. p. 147).

A corrected form of Airy's divided eye-glass micrometer (Mem. R.A.S. vol. xxv. pp. 199-209) the rays from the object-glass pass successively through lenses as follows:

From Engineering, vol. xii.

<table>

</table>

The lens b is divided, and one of the segments is moved by a micrometer screw. The magnifying power is varied by changing the length a for another in which p has a different value. The magnifying power of the eye-piece is that of a single lens of focus = 15.

In 1850 J. B. Valz pointed out that the other optical conditions could be equally satisfied if the divided lens were made concave instead of convex, and the micrometer a fixed, not relative, image of giving a larger field of view (Monthly Notices, vol. x. p. 160).

The last improvement on this instrument is mentioned in the Report of the R.A.S. council, February 1865. It consists in the adoption of a system by Signor Modena of a divided lens, but no satisfactory description has ever appeared. There is only one practical published investigation of Airy's micrometer that is worthy of mention, that of F. B. Davis in Monthly Notices, vol. xxxi. pp. 211-274. The reader is referred to that paper for an exhaustive history and discussion of the instrument. It is somewhat surprising that, after Airy's investigations, observers should continue, as many do, to discuss their observations with this instrument as if the scale-value were constant for all angles.

1 For description of the earliest form see Cambridge Phil. Trans. vol. ii., and Greenwich Observations (Amp), vol. viii. p. 305.
2 Dawes (Monthly Notices, January 1858, and Mem. R.A.S. vol. xxxiv. p. 150) suggested and used a valuable improvement for projection micrometers, in which the elongated images which are otherwise inevitable are avoided by means of a divided lens of which the optical centres are not in coincidence, viz. "the introduction of a diaphragm having two circular apertures touching each other, in a point coincident with the principal focus of the telescope, and the diameter of each aperture exactly equal to the semidiameter of the cone of rays at the distance of the diaphragm from the focal point of the object-glass." Practically the difficulty of making such diaphragms entirely of metal is insuperable; but, if the observer is content to lose a certain amount of light, we see no reason why they may not be made slightly less. Dawes found that the improved method for the purpose in question was to limit the aperture of the object-glass by a diaphragm having a double circular aperture, placing the line joining the centres of the circles approximately in the position angle under observation. It is only necessary here to say that in a micrometer also appear with Amiel's micrometer. The present writer has successfully used such a plan in measuring position angles of a Centauri with the heliometer, viz. by placing circular diaphragms on the two segments of the object-glass.
Steinheil (Journal savant de Munich, Feb. 28, 1843) describes a "helio-mètre-oculaire" which he made for the great Pulkowa refractor, the result of consultations between himself and the elder Struve. It is essentially the same in principle as Arago's micro-meter, except that the divided lens is an achromatic positive instead of a negative lens. Struve (Description de l'Observatoire Central de Pulkowa, pp. 196, 197) adds a few remarks to Steinheil's description, in which he states that these images have not all desirable precision—a fault perhaps inevitable in all microimeters with divided lenses, and which is probably in this case aggravated by the fact that the rays falling upon the divided lens have considerable convergence. He, however, successfully employed the goniometer, "a double star, so close as 10 or 20", and using a power of 300 diameters, with results that agreed satisfactorily amongst themselves and with those obtained with the filar micrometer. If Struve had employed a properly proportioned double circular diaphragm, fixed concentrically with the axis of the telescope in front of the divided lens and turning with the micrometer, it is probable that his report on the instrument itself would have been more complete. The goniometer has historical interest, having led Struve to some of those criticisms of the Pulkowa heliometer which ultimately bore such valuable fruit (see ante).

Ramsden (Phil. Trans., vol. xix. p. 419) suggested the division of the small speculum of a Cassegrain telescope and the production of double image by micrometric rotation of the semispecula in the plane passing through their axis. Brewster (Encycl. Brit. 8th ed. vol. xiv. p. 749) proposed a plan on a like principle, by dividing the plane mirror of a Newtonian telescope. Again, in an oculus heliometer by Steinheil double image is similarly produced by a divided prism of total reflection placed in parallel rays. But practically these last-three methods are failures. In the first the field is full of false light, and it is not possible to give sufficiently minute and steady separation to the images; and there are no means of making a collimator, two prisms of total reflection, and a small telescope through which the divided image could be brought to the eye.

Micrometers Depending on Double Refraction.—To the Abbé Rochon (Jour. de phys. III., 1801, pp. 160-165) is due the happy idea of applying the two images formed by double refraction to the construction of a micrometer. He felt upon a most ingenious plan of doubling the amount of double refraction of a prism by using two prisms of rock-crystal, so cut out of the solid as to give each the same quantity of double refraction, and yet to double the quantity in the effect produced. The combination so formed is known as Rochon's prism. Such a prism he placed between the object-glass and eye-piece of a telescope. The separation of the images increases as the prism is approached to the object-glass, and diminishes as it is approached towards the eye-piece.

D. F. J. Arago (Comptes rendus, xxiv., 1847, pp. 400-402) found that in Rochon's micrometer, when the prism was approached close to the eye-piece for the measurement of very small angles, the smallest imperfections in the crystal or its surfaces were inconveniently magnified. He therefore selected for any particular measurement such a Rochon prism as when fixed between the eye and the eye-piece (i.e., where a sunshade is usually placed) would, combined with the normal eye-piece employed, bring the images about to be measured nearly in contact. He then altered the magnifying power by sliding the field lens of the eye-piece (which was fitted with a slipping tube for the purpose) along the eyepiece till the images were brought into contact. By a scale attached to the sliding tube the magnifying power of the eye-piece was deduced, and this combined with the angle of the prism employed gave the angle measured.

![Fig. 18.](image1.png)

If $\theta'$ is the refracting angle of the prism, and $n$ the magnifying power of the eye-piece, then $\theta' \cdot n$ will be the distance observed. Arago made many measures of the diameter of the planets in this micrometer.

Dollond (Phil. Trans., 1821, pp. 104-105) describes a double-image microscope, in his own invention, in which a sphere of rock-crystal is substituted for the eye-lens of an ordinary eye-piece. In this instrument (figs. 18, 19) $a$ is the sphere, placed in half-holes on the axis $bb$, so that when its principal axis is parallel to the axis of the telescope it gives only one image of the object. $a$ is perpendicular to that axis it must be so placed that when it is moved by rotation of the axis $bb$ the separation of the images shall be parallel to that motion. The angle of rotation is measured on the graduated circle $C$. The angle between the objects measured is $r \sin \theta$, where $r$ is a constant to be determined for each magnifying power employed, and $\theta$ the angle through which the sphere is turned (measured from coincidence of its principal axis with that of the telescope). The maximum separation is consequently at $45^\circ$ from zero. The measures can be made on both sides of zero for eliminating index error. There are considerable difficulties of construction, but they have been successfully overcome by Dollond; and in the hands of Dawes (Mem. R.A.S. xxxv. p. 144 seq.) such instruments have done valuable service. They are liable to the objection that their employment is limited to the measurement of very small angles, viz. $14''$, when the error is only 100, and varying inversely as the power. Yet the beautiful images which these microimeters give permit the measurement of very difficult objects as a check on measures with the parallel-wire micrometer.

(H. G.)

HELIOPOLIS, one of the most ancient cities of Egypt, met with in the Bible under its native name On. It stood 5 m. E. of the Nile at the apex of the Delta. It was the principal seat of sun-worship, and in historic times its importance was entirely religious. There appear to have been two forms of the sun-god at Heliopolis in the New Kingdom—namely, Ra-Harakht, or Ré-Harmakhis, falcon-headed, and Eôtôm, human-headed; the latter was the god of the morning sun, the former of the evening sun. A sacred bull was worshipped here under the name Mnevis (Eg. Mrau), and was especially connected with Eôtôm. The sun-god Ré (see Egypt: Religion) was especially the royal god, the ancestor of all the Pharaohs, who therefore held the temple of Heliopolis in great honour. Each dynasty might give the first place to the god of its residence—Ptah of Memphis, Ammon of Thebes, Néth of Saïs, Babuost of Babuastis, but all alike honoured Ré. His temple became in a special degree a depository for royal records, and Herodotus states that the priests of Heliopolis were the best informed in matters of history of all the Egyptians. The schools of philosophy and astronomy are said to have been frequented by Plato and other Greek philosophers; Strabo, however, found them deserted, and the town itself almost uninhabited, although priests were still there, and cicerones for the curious traveller. The Ptolemies probably took little interest in their "father" Ré, and Alexandria had eclipsed the learning of Heliopolis; thus with the withdrawal of royal favour Heliopolis quickly dwindled, and the students of native lore deserted it for other temples supported by a wealthy population of pious citizens. In Roman times obelisks were taken from its temples to adorn the northern cities of the Delta, and even across the Mediterranean to Rome. Finally the growth of Fostat and Cairo, only 6 m. to the S.W., caused the ruins to be ransacked for building materials. The site was known to the Arabs as 'Ayn ādsh šams, "the fountain of the sun," more recently as Tel Hisn. It has now been brought for the most part under cultivation, but the ancient city walls of crude brick are to be seen in the fields on all sides, and the position of the great temple is marked by an obelisk still standing (the earliest known, being one of a pair set up by Senwosri I., the second king of the Twelfth Dynasty) and a few granite blocks bearing the name of Rameses II.

See Stebbit Alex. cap. l. 27-28; Badecker's Egypt. (F. Ll. G.)

HELIOSTAT (from Gr. ἡλιος, the sun, στάτος, fixed, set up), an instrument which will reflect the rays of the sun in a fixed direction notwithstanding the motion of the sun. It is placed on an axis parallel to the axis of the earth, and rotated with the same angular velocity as the sun. This construction assumes that the sun describes daily a small circle about the pole of the celestial sphere, and ignores any diurnal variation in the declination. This variation is, however, so small that it can be neglected for most purposes.

1 Dollond provides for changing the power by sliding the lens $d$ nearer to or farther from $a$. 
Many forms of heliostats have been devised, the earliest having been described by Wilhelm Jacob's Gravesend in the 3rd edition of his Physique elementa (1742). One of the simplest consists of a plane mirror rigidly connected with a revolving axis so that the angle between the normal to the mirror and the axis of the instrument equals half the sun's polar distance, the mirror being adjusted so that the normal has the same right ascension as the sun. It is easily seen that if the mirror be rotated at the same angular velocity as the sun the right ascensions will remain equal throughout the day, and therefore this device reflects the rays in the direction of the earth's axis; a second fixed mirror reflects them in any other fixed direction. Foucault's heliostat reflects the rays horizontally in any required direction. The principle of the apparatus may be explained by reference to fig. 1. The axis of rotation AB bears a rigidly attached rod DBC inclined to it at an angle equal to the sun's polar distance. By adjusting the right ascension of the plane ABC and rotating the axis with the angular velocity of the sun, it follows that BC will be the direction of the solar rays throughout the day. X is the mirror rotating about the point E, and placed so that, if EB is the horizontal direction in which the rays are to be reflected (1) the normal CE to the mirror is jointed to BC at C and is equal in length to BE, (2) the rod DBC passes through a slot in a rod ED fixed to, and in the plane of, the mirror. Since CE equals BE these directions are equally inclined to, and coplanar with, the normal to the mirror. Hence light incident along the direction BC will be reflected along CE. Silbermann's heliostat reflects the rays in any direction. The principle may be explained by means of fig. 2. AB is the axis of rotation, BC an adjustable rod as in Foucault's construction, and BD is another rod which can be set to the direction in which the rays are to be reflected. The rods BC and DB carry two small rods EF, GF jointed at F; at this joint there is a pin which slides in a slot on the rod BH, which is normal to the mirror X. The to the framework page, the members of which are parallel to the incident and reflected rays SO, OR, and the diagonal OP is perpendicular to the mirror. The framework is attached to two independent circular arcs CS and CR, having their centres at O and provided with clamps D and A on the axis F of the instrument. The arc CS is graduated, and is set so that the angle COD equals the complement of the sun's declination. This can be affected (after setting the axis) by rotating CS until a needle indicates true time on the hour dial B. The arc CR is set so as to reflect the rays in the required direction. The axis F of the instrument is set at an angle equal to the latitude of the place of observation and in the meridian by means of the screw K, and rotated by clockwork contained in the barrel H. The setting in the meridian is effected by turning the instrument after setting for latitude until a pin-hole aperture s and a small screen F, placed so that PR is parallel to CO, are in a line with the sun.

Many other forms of heliostats have been designed, the chief difference consisting in the mechanical devices for maintaining the constant direction of the reflecting ray. One of the most important applications of the heliostat is as an adjunct to the newer forms of horizontal telescopes (q.v.) and in conjunction with spectroscopic telescopes in observations of eclipses.

HELIOTROPE, or TURNSOLE, Heliotropium (Gr. ἥλιος ἀπορρέω, i.e. a plant which follows the sun with its flowers or leaves, or, according to Theophrastus (Hist. plant. vii. 15), which flowers at the summer solstice), a genus of usually more or less hairy herbs or undershrubs of the tribe Heliotropieae of the natural order Boraginaceae, having alternate, rarely almost opposite leaves; small white, lilac or blue flowers, in terminal or lateral one-sided simple or once or twice forked spikes, with a calyx of five deeply divided segments, a salver-shaped, hypogynous, 5-lobed corolla, and entire 4-celled ovary; fruit 2- to 4-separate or lobed, at length separable into four 1-seeded nutlets or into two hard 2-celled carpels. The genus contains 220 species indigenous in the temperate and warmer parts of both hemispheres. A few species are natives of Europe, as H. europaeum, which is also a naturalized species in the southern parts of North America.

The common heliotrope of English hothouses, H. peruvianum, popularly known as "cherry-pie," is on account of the delicious odour of its flowers a great favourite with florists. It was introduced into Europe by the younger Jussieu, who sent seed of it from Peru to the royal garden at Paris. About the year 1757 it was grown in England by Philip Miller from seed obtained from St Germain's. H. cortynosum (also a native of Peru), which was grown in Hammersmith nurseries as early as 1812, has larger but less fragrant flowers than H. peruvianum. The species commonly grown in Russian gardens is H. suaveolens, which has white, highly fragrant flowers. Heliotropes may be propagated either from seed, or, as commonly, by means of cuttings of young growths taken an inch or two in length. Cuttings when sufficiently ripened, are struck in spring or during the summer months; when rooted they should be potted singly into small pots, using as a compost fibry loam, sandy peat and well-decomposed stable manure from an old boiler. The plants soon require to be shifted into a pot a size larger. To secure early-flowering plants, cuttings should be struck in August, potted off before winter sets in, and kept in a warm greenhouse. In the spring larger pots should be given, and the plants shortened back to make them bushy. They require frequent shiftings during the summer, to induce them to bloom freely.

The heliotrope makes an elegant standard. The plants must in this case be allowed to send up a central shoot, and all the side growths must be pinched off until the necessary height is reached, when the shoot must be stopped and lateral growths will be produced to form the head. During winter they should

From Jamin and Bonty, Cours de physique, Gauthier-Villars.

Fig. 3.—Silbermann's Heliostat.
be kept somewhat dry, and in spring the ball of soil should be reduced and the plants repotted, the shoots being slightly pruned, so as to maintain a symmetrical head. When they are planted out against the walls and pillars of the greenhouse or conservatory an abundance of highly perfumed blossoms will be supplied all the year round. From the end of May till October heliotropes are excellent for massing in beds in the open air by themselves or with other plants. Many florists' varieties of the common heliotrope are known in cultivation.

Pliny (Nat. hist. xxii. 20) distinguishes two kinds of "heliotrope," the tricoccum, and a somewhat taller plant, the helioscopium; the former, it has been supposed, is Croton tincturium, and the latter the θηαυτρόπος μωρος of Dioscorides or Heliotropium europaeum. The helioscopium, according to Pliny, was variously employed in medicine; thus the juice of the leaves with salt served for the removal of warts, whence the term herba verrucaria applied to the plant. What, from the perfume of its flowers, is sometimes called winter heliotrope, is the fragrant butterbur, or sweet-scented coltsfoot, Petasites (Tussilago) fragrans, a perennial Composite plant.

HELIOTOPE, in mineralogy, is the mineral commonly called "bloodstone" (q.v.), and sometimes termed girasol—a name applied also to fire-opal. The name, like those of many ancient names of minerals, seems to have had a fanciful origin. According to Pliny the stone was so called because when thrown into the water it turned the sun's light falling upon it into a reflection like that of blood.

HELIOZOA, in zoology, a group of the Sarcodina (q.v.) so named by E. Haeckel, 1866. They are characterized by the radially pseudopods, finely tapering at the apex, springing abruptly from the superficial protoplasm, containing a denser, rather permanent axial rod (figs. 1 (i), 2 (1)); protoplasm without a clear ectoplasm or pellicle, often frothy with large vacuoles, like the alveoli of Radiolaria; nucleus i or numerous; skeleton absent, gelatinous or of separate siliceous fibres, plates or spicules, rarely complete and latticed; reproduction by simple fission or by brood-formation, often syngamous; form usually nearly spherical, rarely changing slowly. This group was formerly included with the Rhizopoda; but was separated from it by Haeckel on account of the character of its pseudopods, and its general adaptation to a semipelagic existence correlated with the frothy cytoplasm (fig. 1 (i)).

**Actinosphaerium sol** and **Actinosphaerium eichhornii** (fig. 2), known as sun animalcules to microscopists, float freely in stagnant or slow-flowing waters, and Myriophrys is able by an investment of long flagelliform cilia to swim freely. The majority, however, lurk among corveae or the light débris of the bottom ooze; and come under the head of "sapropelic" rather than pelagic organisms. The body is usually of constant spherical form in relation to the floating habit. **Nuclearia**, however, shows amoeboid changes of general outline. The pseudopods are retractile, the axial filament being absorbed as the filament grows shorter and thicker and disappearing when the pseudopod merges into the ectoplasm, to be reformed at the same time with the pseudopod. There is often a distinction, clear, but never sharp, between the richly vaculate, almost frothy ectoplasm and the denser endoplasm, or more contractile portion, from the ectoplasm. The endoplasm contains the nucleus or nuclei. The nucleus when single may be central or eccentric: in the latter case, the endoplasm contains a clear central sphere ("centosome ") on which abut the axial filaments of the pseudopods. The ectoplasm contains, in some species, constantly (Raphidiosphaera viridis) or occasionally (Actinosphaerium), green cells belonging to the genera Zoohelotricha and Sphaerocystis, both probably—the latter certainly—vegetative stages of a Chlamydomonad (Flagellata, q.v.) and of symbiotic significance.

The Heliozoa can move by rolling over on their extended pseudopods; **Acanthocystis ludibunda** traversing a path of as much as twenty times its diameter in a minute, according to Penard. Several species (e.g. Raphidiosphaera elegans) remain associated by the union of their pseudopods, whether into social aggregates (due to approximation) or "colonies" due to lack of separation.

**Fig. 1.**—Heliozoa. 1. Actinosphaerium sol, Ehrb.; × 800. a, Food-particle lying in a large food-vacuole; b, deep-lying finely granular protoplasm; c, axial filament of a pseudopodium extended towards the nucleus; d, the central nucleus; e, contractile vacuole; f, superficial much vacuolated protoplasm. 2. Clathruella elegans, Kunk.; × 200. 3. Heliosphyras marina, H. and L. × 600. a, nucleus; b, clearer protoplasm surrounding the nucleus; c, the peculiar felted envelope. 4. Raphidiosphaera palla, F. E. Schultze; × 430. a, food-particle; b, contractile vacuole; c, the nucleus; d, central granule in which all the axis-filaments of the pseudopodia meet. The tangentially disposed spicules are seen arranged in masses on the surface. 5. Acanthocystis turvenca, Carter; × 240. a, probably the central nucleus; b, clear protoplasm around the nucleus; c, more superficial protoplasm with vacuoles and chlorophyll corpuscles; d, coarser siliceous spicule; e, finer forked siliceous spicules; f, finely granular layer of protoplasm. The long pseudopodia reaching beyond the spicules are not lettered. 6. Bi-flagellate "flagellula" of Acanthocystis aculeata. a, nucleus. 7. Id. of Clathruella elegans. a, nucleus; b, granules. 8. Astrodiscus ruber, Greff; × 320. a, red-coloured central sphere (? nucleus); b, peripheral homogeneous envelope.
may increase in size by the fusion ("plastogamic") of small individuals. If a large specimen be cut up or fragment itself under irritation, the small ones so produced soon approach one another and fuse completely.

Reproduction.—Binary fission has been repeatedly observed; in some cases one or both of the daughter cells may swim for a time as a biflagellate zoospore (fig. 1 (6, 7)). The process may take place when the cell is naked or after preliminary encystment. Budding has been well studied in Acanthocystis; the cell nucleus divides and one of the two resulting nuclei migrates to the periphery, and the proplasmic aggregate part of the cytoplasm, and with it are constricted off as independent cells; one nucleus remains central and the process may be repeated. The detached bud may assume the typical character after a time, and the amoeboid (formerly needed by rest, or it may develop 2 flagella and swim off (fig. 1 (6)).

Budding formation is only known here in relation to a syngamic process; this is a sharp contrast to Protosynychia. In Actinosphaerium, budding formation is the commonest mode of reproduction, and plasmodium-formation, rare indeed, is the nearest approach to syngamy observed. Indeed, if we knew the life-history of all the species this difference in the life-cycle would be a convenient critical change.

Equal conjugation was demonstrated fully by F. Schaudinn in Actinophrys; two individuals approach and enter into close contact, and are surrounded by a common cyst wall. The nucleus of either male or female, and one nucleus passes to the surface and is budded off with a small portion of the cytoplasm as an abortive cell; the two remaining nuclei which are the first cousins in cellular relationship now fuse, as is the case with the cytoplasts. The resulting coupled cell or zygote divides into two, which again encyst.

Actinosphaerium (fig. 2) shows a still more remarkable process, fully studied by R. Hertwig. The large multicellular animal withdraws its pseudopods, its vacuoles disappear, it encysts and its nuclei diminish in number to about \( \frac{1}{4} \)th partly by fusion, 2 and 2, and 2, probably by digestion of the majority. Within the primary cyst the body is now resolved into nuclear cells, which again surround themselves with secondary cysts. The cell in each secondary cyst divides (by karyokinesis), and these sister cells, or rather their offspring, pair in much the same way as the individual cells of Actinosphaerium—the principal difference is that after the second budding off of a rudimentary cell, a second division of the same character takes place, with the formation of a second rudimentary cell, which is the niece of the first, absolutely in the same way as the 1st bo 2nd polar bodies are formed in the maturation of the ovum in Metazoa. The actual pairing cells are thus second cousins, great-granddaughters of the original cell of the secondary cysts. Complete fusion now takes place to form the coupled cell, which is now con- tracted and forms a gelatinous wall within the siliceous secondary cyst wall (fig. 2 (4)). During a resting stage, nuclear divisions occur and finally a brood of young 1-nuclear Actinosphaerium leave the cyst.

Classification.

Aphrothoracica. Body naked. Actinophrys Ehrb. (fig. 1 (1)), Actinosphaerium Stein plurinucleate (fig. 2 (1)), Camptonema (plurinucleate) Schaud., Dimorpha Gruber (some- times 2 flagellate).

II. Chalorathoracica. Body protected by an investment of spicules or fibre scattered or approximated, never fused into a continuous skeleton.

§ 1. Spicules netted or free in the protoplasm. Heterophrys Arch. (fig. 1 (3)), Raphidophrys Arch. (fig. 1 (4)), Pinacodocystis, Hertw. and Less.

§ 2. Spicules approximated radially. Pinacochorea Greifl, Pumiphysophrys Arch., Lithocephalura F. Schultz, Elacaranthus Greifl (the two foregoing genera the spicules represented by sand granules), Acanthocystis Carter (fig. 1 (5)), Pinacocystis (?) Hertw. and Less, Myriophrys Penard. (Astrodiscus).

III. Desmothoracica. § 1 attached by a stalk. Chthulina Cienk. (fig. 1 (2, 7)), Hedirocystis, Hertw. and Less.

LITERATURE.—The most important English original papers on this group are those by W. Archer, "On some Freshwater Rhizopoda, new or little known," Quarterly Journal of Microscopic Science, N.S. (IV.) (1866-1871), and "Resume of Recent Contributions to the Knowledge of Freshwater Rhizopods," ibid. xvi. (1876-1877). See also R. Hertwig and Lesser, "Uber Rhizopoden und denselben nahestehenden Organismen," in Archiv für mikroskopische Anatomie, Hertw. (1904); "Die Einlagerungsformen der Actinosphaerien" (1896); E. Penard, Les Heliozoaires d' eau douce (1904); the two last named contain full bibliographies. (M. H.A.)

HELIUM (from Gr. Ηλιος, the sun), a gaseous chemical element, the modern discovery of which followed closely on that of argon (q.v.). The investigations of Lord Rayleigh and Sir William Ramsay had shown that indifference to chemical reagents did not sufficiently characterize an unknown gas as nitrogen, and it became necessary to reinvestigate other cases of the occurrence of "nitrogen" in nature. H. Miers drew Ramsay's attention to the work of W. F. Hillebrand, who had noticed, in examining the mineral uraninite, that an inert gas was evolved when the mineral was decomposed with acid. Ramsay, repeating these experiments, found that the inert gas emitted selected...
to oxidize when sparked with oxygen, and on examining it spectroscopically he saw that the spectrum was not that of argon, but was characterized by a bright yellow line near to, but not identical with, the D line of sodium. This was afterwards identified with the D₂ line of the solar chromosphere, observed in 1868 by Sir J. Norman Lockyer, and ascribed by him to a hypothetical element helium. This name was adopted for the new gas.

Helium is relatively abundant in many minerals, all of which are radioactive, and contain uranium or thorium as important constituents. (For the significance of this fact see Radioactivity.) The richest known source is thorite, which consists mainly of thorium oxide, and contains 9-5 cc. of helium per gram. Monazite, a phosphate of thorium and other rare earths, contains on the average about 1 cc. per gram. Cleveite, samarskite and fergusonosite contain a little more than monazite.

The gas also occurs in minute quantities in the common minerals of the earth's crust. In this case too it is associated with radioactive matter, which is almost ubiquitous. In two cases, however, it has been found in the absence of appreciable quantities of uranium and thorium compounds, namely in beryl, and in sylvine (potassium chloride). Helium is contained almost universally in the gases which bubble up with the water of thermal springs. The proportion varies greatly. In the hot springs of Bath it amounts to about one-thousandth part of the gas evolved.

Much larger percentages have been recorded in some French springs (Compt. rend., 1896, 143, p. 795, and 146, p. 435), and considerable quantities occur in some natural gas (Journ. Amer. Chem. Soc. 29, p. 1524). R. J. Strutt has suggested that helium in hot springs may be derived from the disintegration of common rocks at great depths.

Helium is present in the atmosphere, of which it constitutes four parts in a million. It is conspicuous by its absorption spectrum in many of the white stars. Certain stars and nebulae show a bright line helium spectrum.

Much the best practical source of helium is thorite, a mineral imported from Ceylon for the manufacture of thorium. It dissolves readily in strong nitric acid, and the helium contained is thus liberated. The gas contains a certain amount of hydrogen and oxides of carbon, also traces of nitrogen. In order to get rid of hydrogen, some oxygen is added to the helium, and the mixture exploded by an electric spark. All remaining impurities, including the excess of oxygen, can then be taken out of the gas by Sir James Dewar's ingenious method of absorption with charcoal cooled in liquid air. Helium alone refuses to be absorbed, and it can be pumped off from the charcoal in a state of absolute purity. In the absence of liquid air the helium must be purified by the methods employed for argon (q.v.). If thorium cannot be obtained, monazite, which is more abundant, may be utilized. A part of the helium contained in minerals can be extracted by heat or by grinding (J. A. Gray, Proc. Roy. Soc. 59, 1909, 82A, p. 301).

Properties.—All attempts to make helium enter into stable chemical union have hitherto proved unsuccessful. The gas is in all probability only mechanically retained in the minerals in which it is found. Jacquerod and Perrot have found that quartz-glass is freely permeable to helium below a red-heat (Compt. rend., 1904, 139, p. 789). The effect is even perceptible at a temperature as low as 220° C. Hydrogen, and, in a much less degree, oxygen and nitrogen, will also permeate silica, but only at higher temperatures. They have made this observation the basis of a practical method of separating helium from the other inert gases. M. Travers has suggested that it may explain the liberation of helium from minerals by heat, the gas being retained in the solid siliceous materials in which it is embedded. Thorite, however, contains no silica, and until it is shown that metallic oxides behave in the same way this explanation must be accepted with reserve.

The density of helium has been determined by Ramsay and Travers as 1-98. Its ratio of specific heats has very nearly the ideal value 1-666, appropriate to a monatomic molecule. The accepted atomic weight is accordingly double the density, i.e. approximately four times that of hydrogen. The refractivity of helium is 0-1238 (air = 1). The solubility in water is the lowest known, being, at 18°-2°, only 0073 vols. per unit volume of water. The viscosity is 0-96 (air = 1).

The spectrum of helium as observed in a discharge tube is distinguished by a moderate number of brilliant lines, distributed over the whole visual spectrum. The following are the approximate wave-lengths of the most brilliant lines:

<table>
<thead>
<tr>
<th>Color</th>
<th>Wave-length</th>

</tbody>
</table>

When the discharge passes through helium at a pressure of several millimetres, the yellow line 5876 is prominent. At lower pressures the green line 4922 becomes more conspicuous. At atmospheric pressure the discharge is able to pass through a far greater distance in helium than in the common gases.

M. Travers, G. Senter and A. Jacquierod (Phil. Trans. A. 1903, 200, p. 105) carefully examined the behaviour of a constant volume gas thermometer filled with helium. For the pressure coefficient per degree, between 0° and 100° C., they give the value 0036255, when the initial pressure is 700 mm. This value is indistinguishable from that which they find for hydrogen.

Thus at high temperatures a helium thermometer is of no special advantage. At low temperatures, on the other hand, they find, using an initial pressure of 1000 mm., that the temperatures on the helium scale are measurably higher than on the hydrogen scale, owing to the more perfectly gasous condition of helium. This difference amounts to about 0° at the temperature of liquid oxygen, and about 10° at that of liquid hydrogen.

The liquefaction of helium was achieved by K. Kameringh Onnes at Leiden in 1908. According to him its boiling point is 4-3° abs. (−268-7° C.), the density of the liquid 0-154, the critical temperature 5-5° abs., and the critical pressure 2-3 atmospheres (Communications from the Physical Laboratory at Leiden, No. 108; see also Liquid Gases).

REFERENCES.—A bibliography and summary of the earlier work on helium will be found in a paper by Ramsay, Ann. chim. phys. (1896) 7, 13, p. 433. See also M. Travers, The Study of Gases (1901).

HELIX (Gr. ἅλεξ, a spiral or twist), an architectural term for the spiral tendril which is carried up to support the angles of the abacus of the Corinthian capital; from the same stalk springs a second helix rising to the centre of the capital, its junction with one on the opposite side being sometimes marked by a flower. Sometimes the term " volute" is given to the angle helix, which is incorrect, as it is of a different design and rises from the same stalk as the central helices. Its origin is probably metallic, that is to say, it was copied from the conventional treatment in Corinthian bronze of the tendrils of a plant.

HELIX (O. Eng. hel, a Teutonic word from a root meaning " to cover," cf. Ger. Helle, Dutch hel), the word used in English both of the place of departed spirits, and of the place of torment of the wicked after death. It is used in the Old Testament to translate the Hebrew Sheel, and in the New Testament the Greek θῆκαν, Hades, and γῆς, Hebrew Gehenna (see Eschatology).

HELLANICUS OF LESBOS, Greek logographer, flourished during the latter half of the 5th century B.C. According to Suidas, he lived for some time at the court of one of the kings of Macedon, and died at Perperene, a town on the gulf of Adramyttium opposite Lesbos. Some thirty works are attributed to him—chronological, historical and epistolary. Mention may be made of: The Priestesses of Hera at Argos, a chronological compilation, arranged according to the order of succession of these functionaries; the Carmeides, a list of the victors in the Carmean games (the chief Spartan musical festival), including notices of literary events; an Athikis, giving the history of Attica from 683 to the end of the Peloponnesian War (404), which is referred to by Thucydides (1. 97), who says that he treated the events of the years 480-431 briefly and superficially, and with
Hellebore 235

Little regard to chronological sequence: Phoroneis, chiefly genealogical, with short notices of events from the times of Phoroneis the Argive "first man" to the return of the Heracleidae; Troia et Persica, histories of Troy and Persia.

Hellenicus marks a real step in the development of historiography. He transcended the narrow local limits of the older logographers, and was not content to repeat the traditions that had gained general acceptance through the poets. He tried to give the traditions as they were locally current, and availed himself of the few national or priestly registers that presented something like contemporary registration. He endeavoured to lay the foundations of a scientific chronology, based primarily on the list of the Argive priestesses of Hera, and secondarily on genealogies, lists of magistrates (e.g. the archons at Athens), and Oriental dates, in place of the old reckoning by generations. But his materials were insufficient and he often had recourse to the older methods. On account of his deviations from common tradition, Hellenicus is often called an untrustworthy writer by the ancients themselves, and it is a curious fact that he appears to have made no systematic use of the many inscriptions which were ready to hand. Dionysius of Halicarnassus censures him for arranging his history, not according to the natural connexion of events, but according to the locality or the nation; he used the barbarian and uncivilized, like his contemporary Herodotus, rose to the conception of a single current of events wider than the local distinction of race. His style, like that of the older logographers, was dry and bald.

Preller, De Hellenico Lethio historicc (1862), Mure, Historc of Greek Literature, i. and ii.; late criticism in H. Kullen, "Hellenize" in Jahrbucher fur klass. Philologie (Supplementband, xxvii. 455 sqq.) (1902), which contains a new edition and arrangement of fragments; C. F. Lehmann-Haupt, "Hellenistische Historiker", in Mittei. d. klass. Gesellschaft, v. i. 127 sqq. (1902); J. B. Bury, Ancient Greek Historians (1909), pp. 27 sqq.

Hellebore (Gr. Δάφνιος; mod. Gr. also καθάρις). Ger. Nieswurz, Christwurz; Fr. helébore, and in the district of Avranche, herbe enrogee, a genus (Helleborus) of plants of the natural order Ranunculaceae, natives of Europe and western Asia. They are coarse perennial herbs with palmately or pedately lobed leaves. The flowers have five persistent petaloid sepalas, within the circle of which are placed the minute honey-containing tubular petals of the form of a horn with an irregular opening. The stamens are very numerous, and are spirally arranged; and the carpels are variable in number, sessile or stipitate and slightly united at the base and dehisce by ventral suture.

Helleborus niger, black helébore, or, as from blooming in mid-winter it is termed the Christmas rose (Ger. Schweizer Nieswurz; Fr., rose de Noël or rose d'hiver), is found in southern and central Europe, and with other species was cultivated in the time of Gerard (see Herball, p. 977, ed. Johnson, 1633) in English gardens. Its knotty root-stock is blackish-brown externally, and, as with other species, gives origin to numerous straight roots. The leaves spring from the top of the root-stock, and are smooth, distinctly pedate, dark-green above, and lighter below, with 7 to 9 segments and long petioles. The scarps, which end the branches of the rhizome, have a loose entire bract at the base, and terminate in a single flower, with two bracts, from the axis of one of which a second flower may be developed. The flowers have 5 white or pale-rose, eventually greenish sepalas, 15 to 18 lines in breadth; 8 to 13 tubular green petals containing honey; and 5 to 10 free carpels. There are several forms, the best being maximus. The Christmas rose is extensively grown in many market gardens to provide white flowers forced in gentle heat about Christmas time for decorations, emblems, &c.

H. orientalis, the Lenten rose, has given rise to several fine hybrids with H. niger, some of the best forms being clear in colour and distinctly spotted. H. foetidus, stinking helébore, is a native of England, where like H. viridis, it is confined chiefly to limestone districts; it is common in France and the south of Europe. Its leaves have 7 to 11-toothed divisions, and the flowers are in panicles, numerous, cup-shaped and drooping, with many bracts, and green sepalas tinged with purple, alternating with the five petals.

H. viridis, or green helébore proper, is probably indigenous in some of the southern and eastern counties of England, and occurs also in central and southern Europe. It has bright yellowish-green flowers, 2 to 4 on a stem, with large leaf-like bracts. O. Brunfels and H. Bock (16th century) regarded the plant as the black helébore of the Greeks.

H. lividus, holly-leaved helébore, found in the Balearic Islands, and in Corsica and Sardinia, is remarkable for the handsomeness of its foliage. White helébore is Veratum album (see Veratum), a liliaceous plant.

Helébores may be grown in any ordinary light garden mould, but thrive best in a soil of about equal parts of turfy loam and well-rotted manure, with half a part each of fibrous peat and coarse sand, and in moist but thoroughly-drained situations, more especially where, as at the margins of shrubberies, the plants can receive partial shade in summer. For propagation cuttings of the rhizome may be taken in August, and placed in pans of light soil, with a bottom heat of 60° to 70° Fahr.; helébores can also be grown from seed, which must be sown as soon as ripe, since it quickly loses its vitality. The seedlings usually blossom in their third year. The exclusion of frost favours the production of flowers; but the plants, if forced, must be gradually inured to a warm atmosphere, and a free supply of air must be afforded, without which they are apt to become much affected by greenfly. For potting, H. niger and its varieties, and H. orientalis, atrosulbs and olympicus have been found well suited. After lifting, preferably in September, the plants should receive plenty of light, with abundance of water, and once a week liquid manure, not over-strong. The flowers are improved in delicacy of hue, and are brought well up among the leaves, by preventing access of light except to the upper part of the plants. Of the numerous species of helébore now grown, the deep-purple-flowered H. colchicus is one of the handsomest; by crossing with H. guttatus and other species several valuable garden forms have been produced, having variously coloured spreading or bell-shaped flowers, spotted with crimson, red or purple.

The rhizome of H. niger occurs in commerce in irregular and nodular pieces, from about 1 to 3 in. in length, white and of a horny texture within. Cut transversely it presents internally a circle of 8 to 12 coniform liguose bundles, surrounded by a thick bark. It emits a faint odour when cut or broken, and has a bitter and slightly acrid taste. The drug is sometimes adulterated with the rhizome of handberry, Actaea spicata, which, however, may be recognized by the distinctly cruciate appearance of the central portion of the attached roots when
HELENISM

J. G. Droysen introduced the fashion (1836) of using it to describe particularly the latter phases of Greek culture from the conquests of Alexander to the end of the ancient world. When those over whom this culture extended were largely non-Greek in blood, i.e. Hellenes, but peoples who had adopted the Greek speech and way of life, Hellenistai. Greek culture had, however, both in "Hellenic" and "Hellenistic" times, a common essence, just as light is light whether in the original luminous body or in a reflection, and to describe this by the term Hellenism seems most natural. But whilst using the term in the larger sense, this article, in deference to the associations which have come to be specially connected with it, will devote its principal attention to Hellenism as it appeared in the world after the Macedonian conquests. But it will be first necessary to indicate briefly what Hellenism is.

No verbal formula can really enclose the life of a people or an age, but we can best understand the significance of the old Greek cities and the life they developed, when, looking at the history of mankind as a whole, we see the part played by reason, active and critical, in breaking down the barriers by which custom hinders movement, in guiding movement to definite ends, in dissipating groundless beliefs and leading onwards to fresh scientific conquests—when we see this and then take note that among the ancient Greeks such an activity of reason began in an entirely novel degree and that its activity in Europe ever since is due to their impulsion. When Hellenism came to stand in the world for something concrete and organic, it was, of course, mere a fact principle, but embodied in a language, a literature, an artistic tradition. In the earliest existing monument of the Hellenic genius, the Homeric poems, one may already observe that regulative sense of form and proportion, which shaped the later achievements of the race in the intellectual and artistic spheres. It was not till the great colonizing epoch of the 8th and 7th centuries B.C., when the name "Hellen" came into use as the antithesis of "barbarian," that the Greek race came to be conscious of itself as a peculiar people; it was yet some three centuries more before Hellenism stood fully declared in art and literature, in politics and in thought. There was now a new thing in the world, and to see how the world was affected by it is our immediate concern.

I. THE EXPANSION OF HELLENISM BEFORE ALEXANDER.—In the 5th century B.C. Greek cities dotted the coasts of the Mediterranean and the Black Sea from Spain to Egypt and the Caucasus, and already Greek culture was beginning to pass beyond the limits of the Greek race. Already in the 7th century B.C., when Hellenism was still in a rudimentary stage, the citizens of the Greek city-states had been known to the courts of Babylon and Egypt as admirable soldiers, combining hardihood with discipline, and Greek mercenaries came to be in request throughout the Near East. But as Hellenism developed, its social and intellectual life began to exercise a power of attraction. The proud old civilizations of the Euphrates and the Nile yielded to it, but the rude barbarian peoples in East and West, on whose coasts the Greek colonies had been planted, came in various degrees under its spell. In some cases an outlying colony would coalesce with a native population, and a fusion of Hellenism with barbarian customs take place, as at Emporion in Spain (Strabo iii. p. 160) and at Locri in S. Italy (Polyb. xii. 5. 10). Perinthus included a Thracian phyle. The stories of Anacharids and Scylas (Herod. iv. 75-80) show how the leading men of the tribes in contact with the Greek colonies in the Black Sea might be fascinated by the appeal which the exotic culture made to mind and to eye.

The great developments of the century and a half before Alexander set the Greek people in a very different light before the world. In the sphere of material power the repulse of Xerxes and the extension of Athenian or Spartan supremacy in the eastern Mediterranean were large facts potent to the most obtuse. The kings of the East learnt more than ever upon Greek mercenaries, whose superiority to barbarian levies was sensibly brought home to them by the expedition of Cyrus. But the developments within the Hellenic sphere itself were also of great consequence

HELENISM

From Gr. Ἡλενισμός, to imitate the Greeks, who were known as Ἕλληνες, after Ἑλένη, the son of Deucalion. The term is occasionally employed in a modern sense of the popular adoption of the ancient Greek culture in all its phases, and even those elements in modern civilization which are Greek in origin or in spirit; but, while Matthew Arnold made the term popular in the latter connexion as the antithesis of "Hebraism," the German historian

Hellenism (from Gr. Ἡλενισμός, to imitate the Greeks, who were known as Ἕλληνες, after Ἑλένη, the son of Deucalion). The term is occasionally employed in a modern sense of the popular adoption of the ancient Greek culture in all its phases, and even those elements in modern civilization which are Greek in origin or in spirit; but, while Matthew Arnold made the term popular in the latter connexion as the antithesis of "Hebraism," the German historian

1 For the microscopical characters and for figures of transverse sections of the rhizome, see Lanesan, Hist. des drogues, l. i. (1878).
for its expansion outward. The political disunion of the Greeks was to some extent neutralized by the rise of Athens to a leading position in art, in literature and in philosophy. In Athens the Hellenic genius was focussed, its tendencies drawn together and combined; nor was it a circumstance of small moment that the Attic dialect attained, for prose, a classical authority; for if Hellenism was to be propagated in the world at large, it was obviously convenient that it should have some one definite form of speech to be its medium.

1. The Persians.—The ruling race of the East, the Persian, was but little open to the influences of the new culture. The military qualities of the Greeks were appreciated, and so, too, was Greek science, where it touched the immediately useful; a great demand was put by the Persians upon to the arts of the Indus; a Greek architect bridged the Bosphorus for him. Greek physicians (e.g. Democedes, Ctesias) were retained for enormous fees at the Persian court. The brisk diplomatic intercourse between the Great King and the Greek states in the 4th century may have produced effects that were not merely political. We certainly find among those members of the Persian aristocracy, who came by residence in Asia Minor into closer contact with the Greeks, some traces of interest in the more ideal side of Hellenism. A man like the younger Cyrus invited Greek captives to his friendship, for some reason the works of utility in war, and procured Greek hetaeae for something more than sensual pleasure. There is the Mithradates who presented the Academy with a statue of Plato by Silanion, not improbably identical (though the supposition implies a corroboration in the text of Diogenes Laërtius) with that Mithradates who, together with his father Ariobarzanes, received the citizenship of Athens (Dem. xxiii. 141, 203). Exactly how far Greek influence can be traced in the remains of Persian art, such as the royal palaces of Persepolis and Susa may be doubtful (see Gayet, L'Art personnel; R. Phénix, Spiers, Architecture East and West, p. 245 f.), but it is certain that the engraved gems for which there was a demand in the Persian empire were largely the work of Greek artists (Furtwängler, Antike Gemmen, iii. p. 116 f.).

2. The Phoenicians.—As early as the first half of the 4th century we find communities of Phoenician traders established in the Pelaiuea (C.T.A. ii. 86). In Cyprus, on the frontier between the Greek and Semitic worlds, a struggle for ascendency went on. The Phoenician element seems to have been dominant in the island when Evagoras made himself king of Salamin in 412, and restored Hellenism with a strong hand. The words of Isocrates (even allowing for their rhetorical colour) give us a vivid insight into what such a process meant. "Before Evagoras established his rule, they were so hostile and exclusive, that those of their rulers were actually held to be the best who were the fiercest adversaries of the Greeks; but now such a change has taken place, that it is a matter of emulation who shall show himself the most ardent phil-hellen, that for the mothers of their children most of them choose wives from amongst us, and that they take pride in having Greek things about rather than native, in following the Greek fashion of life, whilst our masters of the fine arts and other branches of culture now resort to them in greater numbers than were once to be found in those quarters they specially frequented" (Isoc. 199 = Evag. §§ 49, 50). Even into the original seats of the Phoenicians Hellenism began to intrude. Evagoras at one time (about 386) made himself master of Tyre (Isoc. Evag. § 62; Diod. xv. 2, 4). His grandson Evagoras II. is found as governor of Sidon for the Persian king 340-336 (Babelon, Perse Archéenées, p. cxxii.; cf. Diod. xvi. 46, 3).

Abdshart, king of Sidon (374-352 B.C.), called Straton by his court. Straton, a Greek, was already engaged into close relations with the Greek states, and the Hellenized princes of Cyprus (Athen. xii. 531; C.I.A. ii. 86; Corp. inscr. Semil. i. 114). The Phoenician colonists in Sardinia purchased or imitated the works of Greek artists (Furtwängler, Antike Gemmen, iii. 109).

3. The Carians and Lycians.—The seats of the Greeks in the East touched peoples more or less nearly related to the Hellenic stock, with native traditions not so far remote from those of the Greeks in a more primitive age, the Carions and the Lycians. It came about in the last century preceding Alexander that the first of these peoples was organized as a strong state under native princes, the line founded by Lyanda, king of Caria in the first decade of the 4th century, but it was under his son Mausolus, who succeeded him in 377-376 that the house rose to its zenith. These Carian princes ruled as satraps for the Great King, but they modelled themselves upon the pattern of the Greek tyrant. The capital of Mausolus was a Greek city, Halicarnassus, and all that we can still trace of his great works of construction and adornment shows conformity to the pure Hellenic type. His famous sepulchre, the Mausoleum (the remains of it are now in the British Museum), was a monument upon which the most eminent Graeco-Egyptian artists were employed; its structure was entrusted to the time of the time of the 3rd century B.C. (cf. 5, § 30; Vitruv. vii. 13). His court gave a welcome to the vagrant Greek philosopher (Diog. Laërt. vii. 8, § 87). Even the Carian town of Mylasa now shows the forms of a Greek city and records its public decrees in Greek (C.I.G. 2691 c, d, e = Michel 471). In Lycia, which in spite of "the son of Harpagus" and King Pericles, had never been brought under one man's rule, the Greek influence is more limited. Here, for the most part in the inscriptions, the native language maintains itself against Greek. The proper names are (if not native) mainly Persian. But the Greek language was classed amongst the Hellenic, and Greek works are borne by others beside Pericles. The coins are Greek in type. And above all the monumental remains of Lycia show strong Greek influence, especially the well-known "Nereid Monument" in the British Museum, whose date is held to go back to the 5th century (Gardner, Handbook of Gr. Sculpt. p. 344).

4. South Russia.—Hellenic influence continued to penetrate the Scythian peoples from the Greek colonies of the Black Sea, at any rate in the matter of artistic fabrication. Our evidence is the actual objects recovered from the soil. (See Scythia.)

5. Egypt.—From the time of Psammetichus (d. 660 B.C.) Greek mercenaries had been used to prop Pharaoh's throne. At the same time Greek merchants had begun to find their way up the Nile and even to the Oases. A Greek city Naucratis (q.v.) was allowed to arise at the Bolbitic mouth of the Nile. But the racial repugnance to the Greek, which forbade an Egyptian even to eat an animal which had been cured with a Greek's knife (Hdt. ii. 41), probably kept the soul of the people more shut against Hellenic influences than was that of the other races of the East.

6. Macedonia.—In Macedonia the native chiefs had been all or most of them Macedonized at the beginning of the 5th century, when Alexander I., surnamed "Phil-hellen," persuaded the judges to Olympia that the Temened house was of good Argive descent (Hdt. v. 22). And, although their enemies might stigmatize them as barbarians, the Macedonian kings maintained that they were not Macedonians, but Greeks (cf. Ἀγαμέμνον Ἱχαρχος, Hdt. v. 20). It was not probably till the reorganization of the kingdom by Archelaus (343-339) that Greek culture found any abundant entrance into Macedonia. Now all that was most brilliant in Greek literature and Greek art was concentrated in the court of Aegae; the palace was decorated by Zeuxis; Euripides spent there the end of his days. From that time, no doubt, a certain degree of literary culture was general among the Macedonian nobility; their names in the days of Philip are largely Greek; the Macedonian service was full of men from the Greek cities within Philip's dominions. The values recognized at the council would naturally be recognized in noble families generally, and Philip chose Aristotle to be the educator of his son. How far the country generally may be regarded as Hellenized is a problem which involves the vexed question what right the Macedonian people (q.v.) had to be classed amongst the Hellenes, and Macedonian to be considered a dialect of Greek. As the literary and official language, Greek alone would seem to have had any status.

1 See, among recent writers, on one side Kaefer, Gesch. des hellenist. Zeitlaufs, pp. 97 f., and on the other Beloch, Griech. Gesch., iii. 131; Kretschmer, Einleitung in die Gesch. d. gr. Sprache, p. 283 f.; O. Hoffmann, Die Makedonen, ihre Sprache u. ihr Volkstum (1906).
In the West: the Native Races of Sicily.—Italy and the south of Gaul had not remained unaffected by the neighbourhood of the Greek colonies. Under the rule of the elder and younger Dionysius in the 4th century, the hellenization of the Sicels in the interior of Sicily seems to have become complete (Freeman, History of Sicily, ii. 387, 388, 422-424; Beloch, Griech. Gesch. iii. [i.] 261).

The alphabet used by the various Italian races from the 3rd century were directly or indirectly learnt from the Greeks. The peoples of the south (Lucanians, Bruttians, Marmatines) show a Greek principle of nomenclature (Mommsen, Untertal. Dialekt, p. 240 f.). The Pythagorean philosophy, whose seat was in southern Italy, won adherents among the native chiefs (Cic. De senec. 12, cf. Dio Chrys. Orat. Cor. 37, § 24). From the Greeks of southern Gaul Hellenic influences penetrated the Celtic races so far that imitations of Greek coins were struck even on the coasts of the Atlantic.

II. After Alexander the Great.—When we review generally the extent to which Hellenism had penetrated the outer world in the middle of the 4th century B.C., it must be admitted that it had not seriously affected any but the more primitive races which dwelt upon the borders of the Hellenic lands, and here it would seem, with the doubtful exception of the Macedonians, to have been an affair rather of the courts than of the life of the people. On the other hand it must be taken into account that Hellenism had as yet only been a very short while in the world. What would have happened had it continued to depend upon its spiritual force only for propagation we cannot say. Everything was changed when by the conquests of Alexander (334-323) it suddenly rose to material supremacy in all the East as far as India, and when cities of Greek speech and constitution were planted by the might of kings at all the cardinal points of intercourse within those lands. The values hurried by the rulers of the world must naturally impress themselves upon the subject multitudes. The Macedonian chiefs found their pride in being champions of Hellenism. Of Alexander there is no need to speak. The courts of his successors in Asia Minor, Syria and Egypt were Greek in language and atmosphere. All kings liked to win the good word of the Greeks by munificence bestowed upon Greek cities and Greek institutions. All of them in some degree patronized Greek art and letters, and some sought fame for themselves as authors. Even the barbarian courts, their neighbours or vassals, were swayed by the dominant fashion to imitation. By the courts alone Hellenism could never have propagated far. Greek culture had been the product of the city-state, and Hellenism could not be carried from the city. It was upon the system of Greek and Macedonian cities, planted by Alexander and his successors, that their work rested, and though their dynasties crumbled, their work remained. Rome, when it stepped into their place, did no more than safeguard its continuance; in the East Rome acted as a Hellenistic power, and if, when the legions had thinned past, the brooding East "plunged in thought again," that thought was largely directed by the Greek schoolmaster who followed in the legions' train. From our present point of view we may therefore regard this work of Hellenism as one continuous process, initiated by the Macedonians and carried on under Roman protection, and ask in the first place what the institution of a Greek city implied.

The Character of the New Greek Cities.—The citizen bodies at the outset were really of Greek or Macedonian blood—soldiers who had served in the royal armies, or men attracted from the older Greek cities to the new lands thrown open to commerce. To fix their European subjects upon the new soil was an obvious necessity for the Macedonian chiefs who had set up kingdoms among the barbarians, and the lots of the veterans (except in Egypt) were naturally attached to various urban centres. The cities, of course, drew in numbers beside of the people of the land; Alexander is specially said to have incorporated large bodies of natives in some of the new cities of the Eastern provinces (Arr. iv. 4, 1; Diod. xvii. 83, 2; Curtius ix. 10, 7). It may generally be taken for granted that the lower strata of the city-populations was mainly native; to be included in the city population was not, however, to be included in the citizen body, and it remains a question how far the latter admitted members of other than European origin (Beloch iii. [i.] 414).

The statements, for instance, of Josephus that the Jews were given full citizen rights in the new foundations are probably false (Willrich, Juden und Griechen vor der makkabäischen Erhebung, 369, p. 191 f.). The social organization of the citizen-body conformed to the regular Hellenic type with a division of the population into phylae and, in Egypt, at any rate, into deme (Lib. Or. xix. 62; Satyrs, frag. 21 = P.H.G. iii. 164; Sir W. M. Ramsay, Cities and Bishops, i. 60; Kenyon, Archiv f. Papyr. ii. 74; Jongnet, Bull. corr. hell. xxi., 1897, 184 f.; Liebenau, Städteverwaltung, 220 f.). The cities appear equally Hellenic in their political organs and functions with boulē and demos and popularly elected magistrates. Life was filled with the universal Hellenic interests, which centred in the gymnasion and the religious festivals, these last including, of course, not only athletic contests but performances of the classical dramas or later imitations of them. The wandering sophist and rhetorician would find a hearing no less than the musical artist. The language of the upper classes was Greek, and the material background of building and decoration, of dress and furniture, was of Greek design. A greater regularity in the street-plans seems to have distinguished the new cities from the older slowly grown cities of the Greek lands, just as it distinguishes the cities of the New World to-day from those of Europe. Alexandria and Antioch were both traversed from end to end by one long straight street, crossed by shorter ones at right angles; Nicaea was a square from the centre of which all the four gates could be seen at the ends of the intersecting thoroughfares (Strabo xiv. 562); similar characteristics are noted in the rebuilt Smyrna (i/i, iv. 640).

Some of the Greek city was not an absolutely new foundation, but an old Oriental city, re-colonized and transformed. And in such cases the old name was often replaced by a Greek one. Thus Seleucia in Phrygia became Apamea; Haleb (Aleppo) in Syria became Beroea; Nisibis in Mesopotamia, Antioch; Rhagae (Rai) in Media, Europus. In some cases the old name was left unchallenged, e.g. Thyatira, Damascus and Samaria. Even where there was no new foundation the older cities of Phoenicia and Syria became transformed from the overwhelming prestige of Hellenic culture. In Tyre and Sidon, no less than in Antioch or Alexandria, Greek literature and philosophy were seriously cultivated, as we may see by the names which they contributed. The process by which Hellenism thus leavened an older city we may trace with peculiar vividness in the case of Jerusalem; we see there the younger generation captivated by its ideals, the appearance of gymnasion and theatre, the eager adoption of Greek political forms (1 Macc. 1. 13 f.; 2 Macc. 4., 10 f.).

A. Characteristics of Hellenism after Alexander.—To the number of Greek city-states existing before Alexander were now therefore added those which extended Hellas as far as India. With the enormous extension of Greek territory a great shifting took place in the old centres of gravity. What changes in the character of Greek culture did the new conditions of the world bring about?

Hellenism had been the product of the free life of the Greek city-state, and after Chaeronea the great days of the city-state were past. Not that all liberty was everywhere extinguished. Under Alexander himself the Greek states were restive, and Aetolia unsubdued; and, with the break-up of the empire at Alexander's death, there was once more scope for the action of the individual cities among the rival great powers. In the history of the next two or three centuries the cities are by no means ciphers. Rhodes takes a great part in Weltpolitik, as a sovereign ally of one or other of the royal courts. In Greece itself the overlordship to which the Macedonian king aspires is imperfect in extent and only maintained to that extent by continual wars. The Greek states on their side show that they are capable even of progressive
political development, the needs of the time being met by the federal system, by larger unions of equal members than the leading cities of the past would have tolerated, with their extreme unwillingness to forego the least shred of sovereign independence. The Achaean and Aetolian Leagues are independent powers, which the Macedonian can indeed check by garrisons in Corinth, Chalcedon and elsewhere, but which keep a field clear for Hellenic freedom within their borders. Sparta also is a power which can cross swords with the Macedonian king, and Cleomenes III. aspires to unite the Peloponnesus under his hegemony, and to the cities outside Greece, within or around the royal realms, Seleucid, Ptolemaic or Attalid, their degree of freedom probably differed widely according to circumstances. At one end of the scale, cities of old renown, e.g. Lampsacus or Smyrna, could still make good their independence against Antiochus III. at the beginning of the 2nd century B.C. At the other end of the scale the cities which were royal capitals, e.g. Alexandria, Antioch and Pergamum, were normally controlled altogether by royal nominees. At Pergamum indeed and (at any rate after Antiochus IV.) at Antioch, formal allegiance was subject subsisted upon which, of course, the court had its hand, whilst at Alexandria even such forms were wanting. Between the two extremes there was variation not only between city and city, but, no doubt, in one and the same city at different times. The extent of the independent action of the cities greatly increased during the last weakness of the Seleucid monarchy. With the extension of the single strong rule of Rome over this Hellenistic world, the conditions were changed. Just as the Macedonian conquest, whilst increasing the domain of Greek culture, had struck Greek liberty, so Rome, whilst bringing Hellenism finally into secure possession of the Near Eastern world, extinguished Greek freedom altogether. Even now the old forms were long religiously respected. Formally, the most illustrious Greek states, Athens, for instance, or Marseilles, or Rhodes, were not subjects of Rome, but free allies. Even in the case of civitates stipendariae (tribute-paying states), municipal autonomy, subject indeed to interference on the part of the Roman governor, was allowed to go on. Boule and demos long continued to function. The old catchword, "autonomy of the Hellenes," was still heard and indeed was solemnly proclaimed by Nero at the Istrian games of A.D. 67. But during the first centuries of the Christian era, this municipal autonomy, by a process which can only be imperfectly traced in detail, decayed. The demos first sank into political annihilation and the council, no longer popularly elected but an aristocratic order, concentrated the whole administration in its hands. By the end of the 2nd century A.D., claims made by the imperial government upon the municipal senate are more and more changing membership of the order from an honour into an intolerable burden; and financial disorganization is calling on imperial officials in one place after another to undertake the business of government. After Diocletian and under the Eastern Empire the Greek world is organized on the principles of a vast bureaucracy. With this long process of political decline from Alexander to Diocletian correspond the inner changes in the temper of the Hellenic and Hellenistic peoples. There were, of course, marked differences between one region and another. But certain general characteristics distinguished at once Greek society after the Macedonian conquests from the society of the Hellenic or Attic age. When the vast field of the East was opened to Hellenic enterprise and the bullion of its treasures flung abroad, fortunes were made on a scale before unparalleled. A new standard of sumptuousness and splendour was set up in the richest stratum of society. This material elaboration of life was furthered by the existence of Hellenistic courts, where the great ministers amassed fabulous riches (e.g. Dionysius, the state secretary of Antiochus IV., Polybi. xxxi. 3, 16; Hermias, the chief minister of Seleucus III., and Antiochus III., Polybi. v. 50. 2; cf. Flutarch, Agis 9), and of huge cities like Alexandria, Antioch and the enlarged Ephesus. It is significant that whereas the earlier Greeks had used precious stones only as a medium for the engraver's art, unengraved gems, valuable for their mere material, now came to be used in profusion for adornment. Already before Alexander pan-Hellenic feeling had in various ways overlaid the internal divisions of the Greek race, but now, with the vast mingling of Greeks of all sorts in the newly-conquered lands, a generalized Greek culture in which the old local characteristics were merged, came to overspread the world. The gradual supersession of the old dialects by the Koine the common speech of the Greeks, a modification of the Attic idiom coloured by Ionic, was one obvious sign of the new order of things (see P. LAM. LAM.).

In its artistic, its literary, its spiritual products the age after Alexander gave evidence of the change. In no department did activity immediately stop; but the old freshness and creative exuberance was gone. Artistic pleasure, more grown less delicate, required the stimulus of a more sensational effect or a more striking realism, as we may see by the Pergamene and Rhodian schools of sculpture, by the bas-reliefs with the genre subjects drawn from the life of the countryside, or, in literature by the sort of historical allegoric which became popular with Cleitarchus and Diodorus. In the studied emotional or rhetorical point of Callimachus, and by the portrayal of country life in Theocritus. At the same time, artists and men of letters were now addressing themselves in most cases, not to their fellow-citizens in a free city, but to kings and courtiers, or the educated class generally of the Greek world. In those departments of intellectual activity which demand no high ideal faculty, in the study of the world of fact, the centuries immediately following Alexander witnessed notable advance. Scientific research might prosper, just as poetry withered, under the patronage of kings, and such research had now a vast amount of new material at its disposal and could profit by the old Babylonian and Egyptian traditions. The medical schools, especially that of Alexandria, really enlarged knowledge of the animal frame. Knowledge of the earth gained immensely by the Macedonian conquests. The literary schools of Alexandria and Pergamum built up grammatical science, and brought literary and artistic criticism to a fine point. If indeed the earlier ages had been those of creative and spontaneous life, the Hellenistic age was that of conscious criticism and book-learning. The classical products were registered, studied, collected and commented upon. Men traveled and did many books in demand and were multiplied. Libraries became a feature of the age, the kings leading the way as collectors, of books, especially the rival dynasties of Egypt and Pergamum. The library attached to the Museum at Alexandria is said to have contained at the time of its destruction in 47 B.C. as many as 700,000 rolls (Aul. Gall. vi. 17. 3). Even smaller cities, like Aphrodias in Caria, had public libraries for the instruction of their youth (Le Bas, III. No. 1618).

With the general decay of ancient civilization under the Roman empire, even scientific research ceased, and though there were literary revivals, like that connected with the new Atticism under the Antonine emperors, these were mainly imitative and artificial, and even learning became at last under the Byzantine emperors a jejun and formal tradition (see GREEK LITERATURE). The diffusion of the Greek race far from the former centres of its life, the mingling of citizens of many cities, the close contact between Greek and barbarian in the conquered lands—all this had made the old sanctions of civic religion and civic morality of less account than ever. New guides of life were needed. The Stoic philosophy, with its cosmopolitan note, its fixed dogmas and plain ethical precepts, came into the world at the time of the Macedonian conquests to meet the needs of the new age. Its ideas became popular among ordinary men as the older philosophies had never been. The Stoic or Cynic preacher, attacking the ways of society, in pungent, often coarse, phrase, became a familiar figure of the Greek market-place (P. Wendland, Beiträge zur Gesch. d. griech. Philosophie, 1850).

Although the cults of the old Greek deities in the new cities, with their splendid apparatus of festivals and sacrifice might still hold the multitude, men turned ever in large numbers to alien
Hellenism religions, felt as more potent because strange, and the various gods of Egypt and the East began to find larger entrance in the Greek world. Even in the old Greek religion before Alexander there had been large elements of foreign origin, and that the Greeks should now do honour to the gods of the lands into which they came, as we find the Cilician and Syrian Greeks doing to Baal-tars and Baal-marrod and the Egyptian Greeks to the gods of Egypt, was only in accordance with the primitive way of thinking. But it was a sign of the times when Serapis and Isis, Osiris and Anubis began to take place among the popular deities in the old Greek lands.
The origin of the cult of Serapis, which Ptolemy I. found, or established, in Egypt is disputed; the familiar type of the god is the invention of a Greek artist, but the name and religion came from somewhere in the East (see discussion under Serapis). Before the end of the 2nd century B.C. there were temples of Serapis in Athens, Rhodes, Delos and Orchomenos in Boeotia. Under the Roman empire the cult of Isis, now furnished with an official priesthood and elaborate ritual, became really popular in the Hellenistic world. King Asoka in the 3rd century B.C. sent Buddhist missionaries from India to the Hellenistic lands; for their preaching has, it is true, left no trace or in our Western records. But other religions of Oriental origin penetrated far, the worship of the Phrygian Great Mother, and in the 2nd century A.D. the religion of the Mithras (Lafaye, *Culte des divinités alexandrines*, 1884; Roscher, articles "Anubis," "Isis," &c.; F. Cumont, *Mystères de Mithra*, Eng. trans., 1933; *Les Religions orientales dans le paganisme romain*, 1936).
The Jews, too, by the time of Christ were finding in many quarters an open door. Besides those who were ready to go the whole length and accept circumcision, numbers adopted particular Jewish practices, observing the Sabbath, for instance, or turned from polytheism to the doctrine of the One God. The synagogues in the Gentile cities became generally attached to them, in many or less close connection a multitude of those "who feared God" and frequented the services (Schürer, *Gesch. d. jüd. Volks*, iii. 102-135).

Among the religions which penetrated the Hellenistic world from an Eastern source, one ultimately overpowered all the rest and made that world its own. The inter-action of Christianity and Hellenism opens large fields of inquiry. The teaching of Christ Himself contained, as it is given to us, no Hellenic element; so far as He built with older material, that material was exclusively the sacred tradition of Israel. So soon, however, as the Gospel was carried in Greek to Greeks, Hellenic elements began to enter into it, in the writings, for instance, of St. Paul, the appeal to what "native" or "Hebrew" was generally admitted to be the adoption of a Greek mode of thought. It was, of course, impossible that speaking in Greek and living among Greeks, Christians should not to some extent use current conceptions for the expression of their faith. There was, at the same time, in the early Church a powerful current of feeling hostile to Greek culture, to the wisdom of the world. What the attitude of the New People should be to it, whether it was all bad, or whether there were good things in it which Christians should appropriate, was a vital question that always confronted them. The great Christian School of Alexandria represented by Clement and Origen effected a durable alliance between Greek education and Christian doctrine. In proportion as the Christian Church had to go deeper into metaphysics in the formulation of its belief as to God, as to Christ, as to the soul, the Greek philosophical terminology, which was the only vehicle then available for precise thought, had to become more and more an essential part of Christianity. At the same time Christian ethics incorporated much of the current popular philosophy, especially large Stoical elements. In this way the Church itself, as we shall see, became a propagator of Hellenism (see Hatch, *Hibbert Lectures*, 1888; Wendland, "Christentum u. Hellenismus" in *Neue Jahrb. f. kl. Alt.* ix. 1902, p. 1 ff.; and *Die hellenistisch-römische Kultur in ihren Beziehungen zu Judentum u. Christentum*, 1907).

B. Effect upon non-Hellenic Peoples.—Hellenism secured by the Macedonian conquest points d'appui from the Mediterranean to India, and brought the system of commerce and intercourse into Greek hands. What effect did it produce in these various countries? What effect again in the lands of the West which fell under the sway of Rome?

(i.) India.—In India (including the valleys of the Kabul and its northern tributaries, then inhabited by an Indian, not, as now, by an Iranian, population) Alexander planted a number of Greek towns. Alexander the Great, in his letter to his half-brother Seleucus, wrote: "I walked from the Caucausus command the road from Bactria over the Hindu-Kush; it lay somewhere among the hills to the north of Kabul, perhaps at Opian near Charikar (MacCrindle, *Ancient India*, p. 87, note 4); that it is the city meant by "Alasadda the capital of the Yona (Greek) country" in the Buddhist Mahavanso, as is generally affirmed, seems doubtful (Tarn, *loc. cit.* below, p. 269, note 7). We hear of a Nicaea in the Kabul valley itself (near Jalalabad?), another Nicaea on the Hydaspe (Jhelum) where Alexander crossed it, with Bucephala (see *Bucephalus* opposite), a city (unnamed) on the Acesines (Chenab) (Arr. vi. 26, 3), and a series of foundations stretching from the Indus to the seas. Soon after 321, Macedonian supremacy extended beyond the Indus collapsed before the advance of the native Maurya dynasty, and about 303 even large districts west of the Indus were ceded by Seleucus. But the chapter of Greek rule in India was not yet closed. The Maurya dynasty broke up about 180 B.C., and at the same time the Greek rulers of Bactria began to lead expeditions across the Hindu-Kush. Menander in the middle of the 2nd century B.C. extended his rule from the Hindu-Kush to the Ganges. Then "Scythian" peoples from central Asia, Sakas and Yue-chi, having conquered Bactria, gradually squeezed within ever-narrowing limits the Greek power in India. The last Greek prince, Hermæus, seems to have succumbed about 30 B.C. It was at just this time that the Graeco-Roman world of the West was consolidated as the Roman Empire, and, though Greek rule in India had disappeared, active commercial intercourse went on between India and the Hellenistic lands.

How far, through these changes, did the Greek population settled by Alexander or his successors in India maintain their distinctive character? What influence did Hellenism during the centuries in which it was in contact with India exert upon the native mind? Only extremely qualified answers can be given to these questions. Capital data are possibly waiting there under ground—the Kabul valley for instance is almost virgin soil for the archaeologist—and any conclusion we arrive at is merely provisional. If certain statements of classical authors were true, Hellenism in India flourished exceedingly. But the philologists and Philologists of Antiquity had no existence outside the world of romance, and the statement of Dio Chrysostom that the Indians were familiar with Homer in their own tongue (Or. iii. 6) is a traveller’s tale. India, the sceptical observer, has yielded no Greek inscription, except, of course, on the coins of the Greek kings and their Scythian rivals and successors. To what extent can it be inferred from legends on coins that Greek was a living speech in India? Perhaps to no large extent outside the Greek courts. The fact, however, that the Greek character was still used on coins for two centuries after the last Greek dynasty had come to an end shows that the language had a prestige in India which any theory, to be plausible, must account for. If we argue by probability from what we know of the conditions, we have to consider that the Greek rule in India was all through fighting for existence, and can have had "little time or energy left for such things as art, science and literature" (Tarn, *loc. cit.* p. 292), and it is pointed out that a casual reference to the Greeks in an Indian work contemporary with Menander characterizes them as "viciously valiant Yonas."

How long is it probable that Greek colonies planted in the midst of alien races would have remained distinct? Mr Tarn builds much upon the fact that the descendants of the Greek Branchidæ settled by Xerxes in central Asia had become bilingual in six generations (Curt. vii. 5, 29). But the Greek race before Alexander had not its later prestige, and we must consider such a sentiment as leads the Eurasian to-day to cling to his Western parentage, so that the instance of the Branchidæ cannot be
used straight away for the time after Alexander. Certainly, had the Greek colonies in India been active political bodies, we could hardly have failed to find some trace of them, in civic architecture or in inscriptions, by this time. Perhaps we should rather think of those at Alexandria being organized by Alexander, in the Greek mode, to-day dispersed over the borders of the East where they remain mainly commercial, and comfortably assimilating themselves to their environment. A notice derived from Agatharchides (about 140 B.C.) possibly refers to the activity of these Indian Greeks in the sea-borne trade of the Indian Ocean (Müller, Geogr. Græci min. i. p. 101; cf. Diod. iii. 47. 9). As to what India derived from Greece there has been a good deal of erudite debate. That the Indian drama took its origin from the Greek is still maintained by some scholars, though hardly proved. There is no doubt that Indian astronomy shows marked Hellenic features, including actual Greek words borrowed. But by far the most signal borrowing is in the sphere of art. The stream of Buddhist art which went out eastwards across Asia had its rise in North-West India, and the remains of architecture and sculpture unearthed in this region enable us to trace its development back to pure Greek types. It remains, of course, a question whether the tradition was transmitted by the Greek dynasties from Bactria or by intercourse with the Roman empire; the latter seems now almost certain; but the fact of the influence is equally striking on either theory. How far to the east the influence of Greece went is shown by the small-impressions with Athena and Eros types found by Dr Stein in the buried cities of Khotan (sand-buried Ruins of Khotan, p. 396), and according to Mr E. B. Havell, there exist "paintings treasured as the most precious relics and rarely shown to Europeans, which closely resemble the Graeco-Buddhist art of India " in some of the oldest temples of Japan (Studie, vol. xxvii. 1903, p. 26).

(ii.) Iran and Babylonia.—The colonizing activity of Alexander and his successors found a large field in Iran where, up till his time, hardly any walled towns seem to have existed. Cities now arose in all its provinces, superseding in many cases native market places and villages, and holding the vantage-points of commerce. Media, Polybius says, was defended by a chain of Greek cities from barbarian incursion (x. 27. 1); in the neighbourhood of Rhages there seem to have stood Hecale and Elam. In eastern Iran the cities continued to increase. It was in the 3rd century B.C. that the kingdom of Parthia rose to great importance by the formation of its chief places to-day then bore Greek names, and looked upon Alexander or some other Hellenic prince as their founder. Khojend, Herat, Kandahar were Alexandrias, Merv was an Alexandria till it changed that name for Antioch. When the farther provinces broke away under independent Greek kings, a Dracatha and a Demetria attested their glory. Even in a town definitely barbaric like Syrince in 209 B.C. there was a resident mercantile community of Greeks (Polyb. x. 31). The bulk of Greek historical literature having perished, and in the absence of both archaeological data from Iran, we can only speculate on the inner life of these Greek cities under a strange sky. One precious document is the decree of Antioch in Persis (about 206 B.C.) cited in a recently discovered inscription (Kern, Inschr. v. Magnesia, No. 61; Dittenberger, Orient. gr. Inschr. i. No. 233). This shows us the normal organs of a Greek city, boulê, ecclesia, prytanēs, &c., in full working, with the annual election of magistrates, and ordinary forms of public action. But more than this, it throws a remarkable light upon the solidarity of the Hellenic Dispersion. Iran had been increased some generations before by colonists from Magnesia-on-the-Meander sent at the invitation of Antiochus I. The Magnesians are instigated by pan-hellenic enthusiasm. And we see a brisk diplomatic intercourse between the scattered Greek cities going on. It is especially the local religious festivals which bind them together. Antioch in Persis, of course, sends athletes to the great games of Greece, but in this decree it determines to take part in the new festival being started in honour of Artemis at Magnesia. The loyalty, too, expressed towards the Seleucid king implies a predominant interest in pan-hellenic unity, natural in colonies isolated among barbarians. A list is given (fragmentary) of other Greek cities in Babylonia and beyond from which similar decrees are taken. As to the number, not over twenty-five, may be regarded as the main commercial...

In the middle of the 3rd century B.C. Bactria and Sogdiana broke away from the Seleucid empire; independent Greek kings reigned there till the country was conquered by nomads from Central Asia (Sacae and Yue-chi) a century later. Alexander had settled large masses of Greeks in these regions (Greeks, it would seem, not Macedonians), whose attempts to return home in 325 and 323 had been frustrated, and it may well be that a racial antagonism quickened the revolt against Macedonian rule in 290. The history of these Greek dynasties is for us almost a blank, and for estimating the amount and quality of Hellenism in Bactria during the 180 years or so of Macedonian and Greek rule, we are reduced to building hypotheses upon the scantiest data. Probably nothing important bearing on the subject has been left out of view in W. W. Tarn's learned discussion (Journ. of Hellen. Stud. xxii., 1902, p. 268 f.), and his result is mainly negative, that palpable evidences of an active Hellenism have not been found; he inclines to think that the Greek kingdoms mainly转弯 on the native Iranian colour. The coins, of course, are used as evidence of the other side, being not only gold in type and legend, but (in many cases) of a peculiarly fine and vigorous execution; and excellence in one branch of art is thought to imply that other branches flourished in the same milieu. Tarn suggests that they may be a "sport," a spasmodic outbreak of genius (see BACTRIA and works there quoted). In these outlying provinces the national Iranian sentiment seems to have been most intense, and it is interesting to see that under Alexander Hellenism appeared as "belligerent civilization," in the attempt to suppress practices like the exposure of the dying to the dogs (buddhist asceticism, or faistranism) and, possibly also, abhorrent forms of marriage (Strabo xi. 577; Porphyry, De abstn. 4. 27; Plut. De fort. Al. 5). The west of Iran slipped from the Seleucids in the course of the 2nd century B.C. to be joined to the Parthian kingdom, or fall under petty native dynasties. Soon after 130 Babylonia too was conquered by the Parthian, and Mesopotamia before 88. Then the reconquest of the nearer East by Oriental dynasties was checked by the advance of Rome. Asia Minor and Syria remained substantial parts of the Roman Empire till the Mahomedan conquests of the 7th century. Only the southern part of the old Hellenistic territory, of which we are able to make a list of the important cities, is included in the present book. Among the first Syrian cities in the Parthian satrapy of Syria we find Antioch, Seleucia, and Ephesus. The Seleucidae, who had controlled the region from Alexander to the death of Seleucus I, now lost their hold. Seleucus II Nicator, who had been installed on the throne by the Parthians, was a "Babylonian," i.e. a citizen of Seleucia on the Tigris; so too was Seleucus, the mathematician and astronomer, being possibly a native Babylonian; Berossus, who wrote a Babylonian history in Greek (before 261 B.C.) was a Hellenized native. Apollodoros, Strabo's authority...
for Parthian history (c. 80 B.C.?), was from the Greek city of Artemis in Assyria. When the Parthians rent away provinces from the Seleucid empire, the Greek cities did not cease to exist by passing under barbarian rule. Gradually no doubt the Greek colonies were absorbed, but the process was a long one. In 140 and 130 B.C. those of Iran were ready to rise in support of the Seleucid invader (Josephus, Ant. xiii. 318; Justin, xvi. 77). Seleucus I Nicator (312-281 B.C.) founded in C. 4. a colony in the Greek cities of Mesopotamia. Seleucia on the Tigris is spoken of by Tacitus as being in a.D. 36 "proof against barbarian influences and mindful of its founder Seleucus" (Ann. vi. 42). How important an element the Greek population of their realm seemed to the Parthian kings we can see by the fact that they claimed to be themselves champions of Hellenism. From the reign of Artabanus I. (128/7-113 B.C.) they bear the epithet of "Phil-Ihellen" as a regular part of their title upon the coins. Under the later reigns the Tychê figure (the personification of a Greek city) becomes common as a coin type (Wroth, Coins of Parthia, pp. ii. ixxiv.). The coinage may, of course, give a somewhat one-sided opulent presentation of the Parthian kingdom, being specially designed for the commercial class, in which the population of the Greek cities was, we may guess, predominant. The state of things which prevails in modern Afghanistan, where trade is in the hands of a class distinct in race and speech (Persian in this case) from the ruling race of fighters is very probably analogous to that which we should have found in Iran under the Parthians. 1 That the Parthian court itself was to some extent Hellenized is shown by the story, often adduced, that a Greek company of actors was performing the Bacchae before the king when the head of Crassus was brought in. This single instance need not, it is true, show a Hellenism of any profundity; still it does show that certain parts of Hellenism had become so essential to the life of a court that even in Arsaces it could not be without them. Artavasdes, king of Armenia (54-34 B.C.) composed Greek tragedies and histories (Plut. Cress. 33). Then the prestige of the Roman Empire, with its prevailing Hellenistic culture, must have told powerfully. The Parthian princes were in many cases the children of Greek mothers who had been taken into the royal hares (Plut. Cress. 32). Musa, the queen-mother, whose head appears on the bronzes Phraataces (3/2 B.C.-A.D. 4) had been an Italian slave-girl. Many of the Parthian princes resided temporarily, as hostages or refugees, in the Roman Empire; but one notes that the nation at large looked with anything but favour upon too liberal an introduction of foreign manners at the court (Tac. Ann. ii. 3; Plut. Ars. 10). Not so far Western literature do not give us any penetrating view into the operation of Hellenism among the Iranians. As an expression of the Iranian mind we have the Avesta and the Pehlevi theological literature. Unfortunately in a question of this kind the dating of our documents is the first matter of importance, and it seems that we can only assign dates to the different parts of the Avesta by processes of fine-drawn conjecture. And even if we could date the Avesta securely, we could only prove borrowing by more or less close coincidences of idea, a tempting but uncertain method of inquiry. Taking an opinion based on such data for what it is worth, we may note that Darmesteter believed in the influence of the later Greek philosophy (Philonian and Neo-Platonic) as one of those which shaped the Avesta as we have it (Sacred Books of the East, iv. 54 f.), but we must also note that such an influence is emphatically denied by Dr J. Mills (Zarathustra and the Greeks, Leipzig, 1906). Outside literature, we have to look to the artistic remains offered by the region to determine Hellenic influence. But here too, the preliminary classification of the documents is beset with doubt. In the case of small objects like gems the place of manufacture may be far from the place of discovery. The architectural remains are solidly in situ, but we may have such vast disagreement as to date as that between Dieuolafy and M. de Morgan with respect to domed buildings of Susa, a disagreement of at least five centuries. It is enough then here to observe that Iran and Babylonia do, as a matter of fact, continually yield the explorer objects of workmanship either Greek or influenced by Greek models, belonging to the age of Alexander, and that we may be certain at any rate such an influence of Hellenism upon the tastes of the richer classes as would create a demand for these things.

For gems see "Gobineau " in the Rev. archol., vol. xxvii., xxviii. (1874): Ménant, Recherches sur la glyptique orientale, ii. 189 f.; E. Babelon, Catalogue des camees de la Bibil. Nat. (1867), p. 56; A. Baumeister, Die antiken Gemmen (1878), pp. 165, 340 f.; Figuren-Museum: Heuzey, Fig. ant. du Louvre (1893) p. 3; J. P. Peters, Nippur, i. 128; Military standard: Heuzey, Comptes rendus de l'Acad. d. Insers. (1895) p. 16; Rev. d'Assyr. v. (1903), p. 103. Albaster cases, Tylor, The Art of the Attic Vase, p. 449 of the procedure of the architectural remains, the Greek tradition is obvious at Hatra (Jacquerel, Rev. archol., 1897 [ii. 343 f.], and in the relics of the temple at Kingawar (Dieuolafy, L'Art antique de la Perse, v. 10 f.). If any vestige of Hellenism still survived under the Sassanian kings, our records do not show it. The spirit of the Sassanian monarch was more jealously national than that of the Seleucid and they may have flourished in Persia but not under it. Of course, if Darmesteter was right in seeing a Greek element in Zoroastrianism, Greek influence must still have operated under the new dynasty, which recognized the national religion. But, as we saw, the Greek influence has been authoritatively denied. At the court a limited recognition might be given, as fashion veered, to the values prevalent in the Hellenistic world. The story of Hormisdas in Zosimus is suggestive in this connexion (Zosim.Hist. nov. ii. 27). Chosroes I. interested himself in Greek philosophy and received its professors from the West with open arms (Agath. ii. 28 f.); according to one account, he had his palace at Ctesiphon built by Greeks (Theophylact Simocat., Hist. synod. iv. 12 f.).

But the account of Chosroes' mode of action makes it plain that the Hellenism once planted in Iran had withered away; representatives of Greek learning and skill have all to be imported from across the frontier.

For Hellenism in Babylonia and Iran, see the useful article of M. Victor Chapot in the Bull. et mémoires de la Soc. Nat. des Antiques de France lor 1902 (published 1904), p. 206 f., which gives an survey of the relevant literature.

Greeck

(iii) Asia Minor.—Very different were the fortunes of Hellenism in those lands which became annexed to the Roman Empire. In Asia Minor, we have seen how, even before Alexander, Hellenism had begun to affect the native races and Persian nobility. During Alexander's own reign, we cannot trace any progress in the Hellenization of the interior, nor can we prove here his activity as a builder of cities. But under the dynasties of his successors a great work of city-building and colonization went on. Antigonus fixed his capital at the old Phrygian town of Celaenae, and the famous cities of Nicaea and Alexandria Troas owed to him their first foundation, each as an Antigonion; they were refounded and renamed by Lysimachus (301-281 B.C.). Then we have the great system of Seleucid foundations. Sardis, the Seleucid capital in Asia Minor, we have seen how, before Alexander, Hellenism had begun to affect the native races and Persian nobility. During Alexander's own reign, we cannot trace any progress in the Hellenization of the interior, nor can we prove here his activity as a builder of cities. But under the dynasties of his successors a great work of city-building and colonization went on. Going west from the Cilician Gates we have Laodicea Catacaecumene, Apamea, the Phrygian capital which absorbed Celaenae, Laodicea on the Lycus, Antioch-on-Meander, Antioch-Nysa, Antioch-Trales. To the south of this high road we have among the Seleucid foundations Antioch in Pisidia (colonized with Magnesians from the Meander) and Stratonicea in Caria; in the region to the north of it the most famous Seleucid colony was Thyatira. Along the southern coast, where the houses of Seleucus and Ptolemy strove for predominance, we find the names of Berenice, Arsiné and Ptolemais confronting those of Antioch and Seleucia. With the establishment of a system of Pergamene foundation begins to oppose the Seleucid in the interior, bearing such names as Attalia, Philacteria, 1 "Ce sont les Tadjik de l'Asie centrale qui constituent les trente-deux groupes... Jusqu'à la fin du temps antique, bon nombre de marchands, représentant, en un mot, la vie industrielle et commerciale de la nation. Ce sont aussi les Tadjik des villes qui forment la classe lettre, et qui ont empêché les Afgans de retomber dans la barbarie." (Reclus, Nouvelle Geographie, vnu. ix. p. 71.)
Eumenia, Apollonis. Of these, one may note for their later celebrity Philadelphia in Lydia and Attalia on the Pamphylian coast. The native Bithynian dynasty became Hellenized in the course of the 3rd century, and in the matter of city building Prusias (the old Cius), Apamea (the old Myrina), probably Prusa, and above all Nicomedia, attempted to rival the rich new Greek cities that were rising in the interior, the older Hellenism of the western coast grew in material splendour under the munificence of Hellenistic kings. Its centres of gravity to some extent shifted. There was a tendency towards concentration in large cities of the new type, which caused many of the lesser towns, like Lebedus, Myus or Colophon, to sink to insignificance, while Ephesus grew in greatness and wealth, and Smyrna rose again after an extinction of four centuries. The great importance of Rhodes belongs to the days after Alexander, when it received the rich returns of Eastern trade which debouched into the Mediterranean at Alexandria and Antioch. In Aeolis, of course, the centre of gravity moved to the Attalid capital, Pergamum. It was the irruption of the Celts, beginning in 278-277 B.C., which checked the Hellenization of the interior. Not only did the Galatian tribes take large tracts towards the north of the plateau in possession, but they were an element of perpetual unrest, which hampered and distracted the Hellenistic monarchies. The wars, therefore, in which the Pergamene kings in the latter part of the 3rd century stemmed their aggressions, had the glory of Hellenism. The mixed dynasties of non-Greek origin, the native Bithynian and the two Persian dynasties in Pontus and Cappadocia, were Hellenized before the Romans drove the Seleucid out of the country. In Bithynia the upper classes seem to have followed the fashion of the court (Beloch iii. [i], 278); the dynasty of Pontus was phil-hellenic by ancestral tradition; the dynasty of Cappadocia, the most conservative, dated its conversion to Hellenism from the time when a Seleucid princess came to reign there early in the 2nd century B.C. as the wife of Ariarathes V. (Diod. xxxi. 10. 8). But Hellenism in Cappadocia was for centuries to come still confined to the castles of the king and the barons, and the few towns.

When Rome began to interfere in Asia Minor, its first action was to break the power of the Gauls (189 B.C.). In 133 B.C. Rome entered formally upon the heritage of the Attalid kingdom and became the dominant power in the Anatolian peninsula for 1200 years. Under Rome the process of Hellenization, which the divisions and weakness of the Macedonian kingdoms had checked, went forward. The coast regions of the west and south the Romans found already Hellenized. In Lycia "not a trace of the material Hellenism has been left in Strabo's time (Strabo xiv. 631); in Lycia, the old language became obsolete in the early days of Macedonian rule (see Kalinka, Tituli Asiae minoris, i. 8). But inland, in Phrygia, Hellenism had as yet made little headway outside the Greek cities. Even the Attalids had not affected much here (Körte, Athen. Mittth. xxiii., 1898, p. 152), and under the Romans, the penetration of the interior by Hellenism was slow. It was not till the reign of Hadrian that city life on the Phrygian plateau became rich and vigorous, with its material correctness of terms (Herodotus iv. 155; Augustine), and the air of Roman elegance and east of Phrygia, Hellenism "was only beginning to make itself felt in the middle of the 3rd century A.D." (Ramsay in Kuhn's Zeitsch. f. vergleich. Sprachforschung, xviii., 1885, p. 382). Gravestones in this region as late as the 4th century curse violators in the old Phrygian speech. The lower classes at Lystra in St Paul's time spoke Lycoanan (Acts xiv. 11). In that part of Phrygia, which by the settlement of the Celtic invaders became Galatia, the larger towns seem to have become Hellenized by the time of the Christian era, whilst the Celtic speech maintained itself in the country villages till the 4th century A.D. (Jerome, Preface to Comment. in Epist. ad Gal. book ii; see J. G. C. Anderson, Journal of Hell. Stud. xiv., 1899, p. 312 f.). Cappadocia at the beginning of the Christian era was still comparatively townless (Strabo xii. 537), a country of large estates with a servile peasantry. Even in the 4th century its Hellenization was still far from complete; but Christianity had assimilated so much of the older Hellenic culture that the Church was now a main propagator of Hellenism in the backward regions. The native languages of Asia Minor all ultimately gave way to Greek (unless Phrygian lingered on in parts till the Christian era), with an inspiration of liberty that extended far beyond the age of Augustus (Jerome, De Virg. exc. cap. iii. 13; 1862, l. p. 30; K. Holl in Hermes, xliii., 1908, p. 240 f.). The effective Hellenization of Armenia did not take place till the 4th century, when the school of Mesrop and Sahak gave Armenia a literature translated from, or imitating, Greek books (Gelzer in I. v. Müller's Handbuch, vol. ix. Abt. p. 916.)

(iv) Syria.—In Syria, which with Cilicia and Mesopotamia, formed the central part of the Seleucid empire, the new colonies were especially numerous. Alexander himself had founded a beginning with Alexandria-by-Issus (mod. Alexandria), Samaria Pella (the later Apamea), Carrhæa, &c. Antigonus founded Antigonia, which was absorbed a few years later by Antioch, and after the fall of Antigonus in 301, the work of planting Syria with Greek cities was pursued effectively north of the Lebanon by the house of Seleucus, and, less energetically, south of the Lebanon by the house of Ptolemy. In the north of Syria four cities stood pre-eminent above the rest, (1) Antioch on the Orontes, the Seleucid capital; (2) Seleucia-in-Pleria near the mouth of the Orontes, of which several inscriptions have been found here; (3) Apamea (mod. Famia), on the middle Orontes, the military headquarters of the kingdom; and (4) Laodicea "on sea" (ad mare), which had a commercial importance in connexion with the export of Syrian wine. Of the Ptolemaic foundations in Coele-Syria only one attained an importance comparable with that of the larger Seleucid foundations, Ptolemais on the coast, which was the old Semitic Acco transformed (mod. Acre). The group of Greek cities east of the Jordan also fell within the Ptolemaic realm during the 3rd century B.C., though their greatness belonged to a later period, that which followed the withdrawal of Syria was brought under the Seleucid sceptre, together with Cilicia, by Antiochus III. the Great (223-187 B.C.). Under his son, Antiochus IV. Epiphanes (175-164), a fresh impulse was given to Syrian Hellenism. In 1 Maccabees he is represented as writing an order to all his subjects to forsake the ways of their fathers and conform to a single prescribed pattern, and though in this form the account can hardly be exact, it does no doubt represent the spirit of his action. Other facts there are which point the same way. We now find a sudden issue of Greek money by a large number of the cities of the kingdom in their own names. The number of inscriptions increased. Many of them exchange their existing name for that of Antioch (Adana, Tarsus, Gadara, Ptolemais), Seleucia (Mopsuestia, Gadara) or Epiphania (Oenianthus, Hamath). At Antioch itself great public works were carried out, such as were involved in the addition of a new quarter to the city, including, we may suppose, the civic council chamber which is afterwards spoken of as being here. With the ever-growing weakness of the Seleucid dynasty, the independence and activity of the cities increased, although, if, on the one hand, they were less suppressed by a military government, which guarded them against the rising tide of military adventurers and barbarian chieftains. Accordingly, when Pompey annexed Syria in 64 B.C. as a Roman province, he found it a chaos of city-states and petty principalities. The Nabataeans and the Jews above all had encroached upon the Hellenistic domain; in the south the Jewish raids had spread desolation and left many cities practically in ruins. Under Roman protection, the cities were soon rebuilt and Hellenism secured from the barbarian peril. Greek city life, with its political forms, its complement of activities, amusements and intellectual exercise, went on more largely than before. The great majority of the Hellenists remains in Syria belong to the Roman period. Such local dynasties as were suffered by the Romans to exist had, of course, a Hellenistic complexion. Especially was this the case with that of the Herods. Not only were such marks of Hellenism as a theatre introduced
by Herod the Great (37-34 B.C.) at Jerusalem, but in the work of city-building this showed itself active. Sebaste (the old Samaria), Caesarea, Antipatris were built by Herod the Great, Tiberias by Herod Antipas (4 B.C.-A.D. 39). The reclaiming of the wild district of Hauran for civilization and Hellenistic life was due in the first instance to the house of Herod (Schürer, Gesch. d. jüd. Volks, 3rd ed., ii. p. 12 f.). In Syria, too, Hellenism under the Romans advanced upon new ground. Palmyra, of which we hear nothing before Roman times, is a notable instance.

As to the effect of this network of Greek cities upon the aboriginal population of Syria, we do not find here the same disappearance of native languages and racial characteristics as in Asia Minor. Still less was this the case in Mesopotamia, where a strong native element in such a city as Edessa is indicated by its epithet μεξόδοσαβαρός.

The old cults naturally went on, and at Carrhae (Harran) even survived the establishment of Christianity. The lower classes at Antioch, and no doubt in the cities generally, were in speech Aramaic or bilingual; we find Aramaic popular nicknames of the later Seleucids (K. O. Müller, Antiq. Ant. p. 29). The villages, of course, spoke Aramaic. The richer natives, on the other hand, who made their way into the educated classes of the towns, and attained official position, would become Hellenized in language and manners, and the "Syrian Code" shows how far the social structure was modified by the Hellenic tradition (Mittei, Reichsrecht und Volksrecht in den öst. Provinzen des röm. Kaiserreichs, 1891; Arnold Meyer, Juss Mutter-sprache, 1896). Of the Syrians who made their mark in Greek literature, some were of native blood, e.g. Lucian of Samosata.

One may notice the great part taken by natives of the Phoenician cities in the history of later Greek philosophy, and in the poetic movement of the last century B.C., which led to fresh cultivation of the epic. Greek, in fact, held the field as the new literature, which followed Greek models. There was an extensive translation of Greek works into Syriac during the next centuries, handbooks of philosophy and science for the most part. The version of Homer into Syriac verses made in the 8th century has perished, all but a few lines (R. Duval, La Litt. syriaque, 1900, p. 325).

(v.) The relation of the Jews to Hellenism in the first century and a half of Macedonian rule is very obscure, since the statements made by later writers like Josephus, as to the visit of Alexander to Jerusalem or the privileges conferred upon the Jews in the new Macedonian realm are justly suspected of being fiction. It has been maintained that Greek influence is to be traced in parts of the Old Testament assigned to this period, as, for instance, the Book of Proverbs; but even in the case of the Ecclesiastes, the canonical writing whose affinity with Greek thought is closest, the coincidence of idea need not necessarily prove a Greek source. The one solid fact in this connexion is the translation of the Jewish Law into Greek in the 3rd century B.C., implying a Jewish Diaspora at Alexandria, so far Hellenized as to have forgotten the speech of Palestine. Early in the 2nd century B.C. we see that the priestly aristocracy of Jerusalem had, like the well-to-do classes everywhere in Syria, been carried away by the Hellenistic current, its strength being evidenced no less by the intensity of the conservative opposition embodied in the party of the "Pious" (Assideans, Ἀσίδειοι).

Under Antiochus IV. Epiphanes (176-165) the Hellenistic aristocracy contrived to get Jerusalem converted into a Greek city; the gymnasion appeared, and Greek dress became fashionable with the young men. But when Antiochus, owing to political developments, interfered violently at Jerusalem, the conservative opposition carried the nation with them. The revolt under the Hasmonaean family (Judas Maccabæus and his brethren) followed, ending in 143-142 in the establishment of an independent Jewish state under a Hasmonaean prince. But whilst the old Hellenistic party had been crushed the Hasmonaean state was of the nature of a compromise. The Mosaic Law was respected, but Hellenism still found an entrance in various forms. The first Hasmonaean "king," Aristobulus I. (104-103), was known to the Greeks as Phil-hellen. He and all later kings of the dynasty bear Greek names as well as Hebrew ones, and after Jannaeus Alexander (103-76) the Greek legends are common on the coins beside the Hebrew. Herod, who supplants the Hasmonaean dynasty (37-34 B.C.), made, outside Judaea, a display of Phil-hellenism, building new Greek cities and temples, or bestowing gifts upon the older ones of fame.

Greek culture in Syria.

Hellenism has been defined as "Greek" by Hellenists like Nicolaus of Damascus. Even in the neighbourhood of Jerusalem, he erected a theatre and an amphitheatre. We have already noticed the work done by the Herodian dynasty in furthering Hellenism in Syria (see Schürer, Gesch. des jüdisch. Volkes, vols. i. and ii.). Meanwhile a great part of the Jewish people was living dispersed among the cities of the Greek world, speaking Greek as their mother-tongue, and absorbing Greek influences in much larger measure than their brethren of Palestine. These are the Jews whom we find contrasted as "Hellenists" with the "Hebrews" in Acts. They still kept in touch with the mother-city, and indeed we hear of special synagogues in Jerusalem where the Hellenists temporarily resident there gathered (Acts vi. 9). It included a large number of foreigners, circilated under the names of famous Greek authors, verses fathered upon Aeschylus or Sophocles, or books like the false Heceatae, or above all the pretended prophecies of ancient Sibyls in epic verse. These frauds were all contrived for the heathen public, as a means of propaganda, calculated to inspire them with respect for Jewish antiquity or turn them from idols to God.

Through the Hellenistic Jews, Greek influences reached Jerusalem itself, though their effect upon the Aramaic-speaking Rabbinical schools was naturally not so pronounced. The large number of Greek words, however, in the language of the Mishnah and Talmud is a significant phenomenon. The attitude of the Rabbinic doctors to a Greek education does not seem to have been hostile till the time of Hadrian. The sect of the Essenes probably shows an intermingling of the Greek with other lines of tradition among the Jews of Palestine.

See Schürer ii. 42-67, 583; S. Krauss, Greek u. latein. Lehnmörter im Talmud (1898); Jewish Encyclopedia, art. "Greek Language."
Hellenism

(vi.) In Egypt the Ptolemy's were hindered by special considerations from building Greek cities after the manner of the other Macedonian houses. One Greek city they found existing; Naukratis; Alexander had called Alexandria into being, the first Ptolemy added Ptolemais as a Greek centre for Upper Egypt. They seem to have suffered no other community in the Nile Valley with the independent life of a Greek city, for the Greek and Macedonian soldier-colonies settled in the Fayum or elsewhere had no political self-existence. And even at Alexandria Hellenism was not allowed full development. Ptolemais, indeed, enjoyed all the ordinary forms of self-government, but Alexandria was governed despotically by royal officials. In its population, too, Alexandria was only semi-Hellenic; for besides the proportion of Egyptian natives in its lower strata, its commercial greatness drew in elements from every quarter; the Jews, for instance, formed a majority of the population in two out of the five divisions of the city. At the same time the prevalent tone of the populace was, no doubt, Hellenistic, as is shown by the fact that the Jews who settled there acquired Greek in place of Aramaic as their mother-tongue, and in its upper circles Alexandrian society under the Ptolemies was not only Hellenistic, but notable among the Hellenes for its literary and artistic brilliance. The state university, the "Museum," was in the close connection of the chief of the Egyptian cities with the same pre-eminence in natural science and literary scholarship which Athens had in moral philosophy.

Probably in no other country, except Judaea, did Hellenism encounter as stubborn a national antagonism as in Egypt. The common description of "the Oriental" as indurated in his antagonism to the alien conqueror here perhaps has some truth in it. The assault made upon the Macedonian devotee in the temple of Serapis at Memphis because he was a Greek is significant (Papyr. Brit. Mus. i. No. 44; cf. Grenfell, "Amhersi Papyri," p. 28). This was the common reaction to the prevalence of the native idea of a Hellenic world. The papyri show us habitual marriage of Greeks and native women and a frequent adoption by natives of Greek names. It has even been thought that some developments of the Egyptian religion are due to Hellenistic influence, such as the deification of Imhotop (Bissing, "Deutsche Literaturzeitung," 1902, col. 2330) or the practice of forming voluntary religious associations (Otto, "Priester und Tempel," i. 125). The worship of Serapis was patronized by the court with the very object of affording a mixed cultus in which Greek and native might unite. In Egypt, too, the triumph of Christianity brought into being a native Christian literature, and if this was in one way the assertion of the native against Hellenistic predominance, one must remember that Coptic literature, like Syriac, necessarily incorporated those Greek elements which had become an essential part of Christian theology.

From the Ptolemaic kingdom Hellenism early travelled up the Nile into Ethiopia. Erganeus, the king of the Ethiopians, in the time of the second Ptolemy, "who had received a Greek education and cultivated philosophy," broke with the native priesthood (Diod. iii. 6), and from that time traces of Greek influence continue to be found in the monuments of the Upper Nile. When Ethiopia became a Christian country in the 4th century, its connexion with the Hellenistic world became closer.

(vii.) Hellenism in the West.—Whilst in the East Hellenism had been sustained by the political supremacy of the Greeks, in Italy Graecia capta had only the inherent power and charm of her culture wherewith to win her way. At Carthage in the 3rd century the educated classes seem generally to have been familiar with Greek culture (Bernhardy, "Grundrisz d. griech. Lit." § 77). The philosopher Clitomachus, who presided over the Academy at Athens in the 2nd century, was a Carchagian. Even before Alexander, as we see, Hellenism had affected the peoples of Italy, but it was not till the Greeks of south Italy and Sicily were brought under the supremacy of Rome in the 3rd century B.C. that the stream of Greek influence entered Rome in any volume. It was now that the Greek freedman, L. Livius Andronicus, laid the foundation of a new Latin literature by his translation of the Odyssey, and that the Greek dramas were recast in a Latin mould. The first Romans who set about writing history wrote in Greek. At the end of the 3rd century there was a circle of enthusiastic phil-hellenes among the Roman aristocracy, led by Titus Quinctius Flamininus, who in Rome's name proclaimed the autonomy of the Greeks at the Isthmian games of 196. In the middle of the 2nd century Roman Hellenism centred in the circle of Scipio Amatus, which included men like Polybius and the philosopher Panetius. The visit of the three great philosophers, Diogenes the "Babylonian," Critolaus and Carneades in 155, was an epoch-making event in the history of Hellenism at Rome. Opposition there could not fail to be, and in 161 a senatus consultum ordered all Greek philosophers and rhetoricians to leave the city. The effect of such measures was, of course, transient. Even though the opposition found so doughty a champion as the elder Cato (censor in 184), it was ultimately of no avail. The Italians did not indeed surrender themselves passively to the Greek tradition. In different departments of culture the degree of their independence was different. The system of government framed by Rome was an original creation. Even in the spheres of art and literature, the Italians, while so largely guided by Greek canons, yet maintained a certain independence so far as they produced a literature in Latin argues a power of creation as well as receptivity. The great Latin poets were imitators indeed, but mere imitators they were no more than Petrarch or Milton. On the other hand, even where the creative originality of Rome was most pronounced, as in the sphere of Law, there were elements of Hellenic origin. It has been often pointed out how the Stoic philosophy especially helped to shape Roman jurisprudence (Schmekel, "Philos. d. mittl. Staat," p. 434 f.).

Whilst the upper classes in Italy absorbed Greek influences by the mere process of history, the literary and artistic tradition, the lower strata of the population of Rome became largely hellenized by the actual influx on a vast scale of Greeks and hellenized Asiatics, brought in for the most part as slaves, and coalescing as freedmen with the citizen body. Of the Jewish inscriptions found at Rome some two-thirds are in Greek. So too the early Christian church in Rome, to which St Paul addressed his epistle, was Greek-speaking, and continued to be till far into the 3rd century.

III. LATER HISTORY.—It remains only to glance at the ultimate destinies of Hellenism in West and East. In the Latin West knowledge of Greek, first-hand acquaintance with the Greek classics, became rarer and rarer as general culture declined, till in the dark ages (after the 5th century) it existed practically nowhere but in Ireland (Sandys, "History of Classical Scholarship," i. 438). In Latin literature, however, a great mass of Hellenistic tradition in a derived form was maintained in currency, wherever, that is, culture of any kind continued to exist. It was a small number of monkish communities whose care of those narrow channels prevented their ever drying up altogether. Then the stream began to rise again, first with the influence of the learning of the Spanish Moors, then with the new knowledge of Greek brought from Constantinople in the 14th century. With the Renaissance and the new learning, Hellenism came in again in flood, to form a chief part of that great river on which the modern world is being carried forward into a future, of which one can only say that it must be utterly unlike anything that has gone before. In the East it is popularly thought that Hellenism, as an exotic, withered altogether away. This view is superficial. During the dark ages, in the Byzantine East, as well as in the West, Hellenism had become little more than a dried and shrivelled tradition, although the closer study of Byzantine culture in latter years has seemed to discover more vitality than was once supposed. Ultimately the Greek East was absorbed by Islam; the popular mistake lies in supposing that the Hellenistic tradition thereby came to an end. The Mahomedan conquerors found a considerable part of it taken
over, as we saw, by the Syrian Christians, and Greek philosophical and scientific classics were now translated from Syriac into Arabic. These were the starting-points for the Mahomedan schools in these subjects. Accordingly we find that Arabic philosophy (q.v.), mathematics, geography, medicine and philology are all based professedly upon Greek works (Broekelmann, Gesch. d. arabischen Literatur, 1858, vol. i.; R. A. Nicholson, A Literary History of the Arabs, 1907, pp. 358-361). Aristotle in the East no less than in the West was the "master of them that know"; and Moslem physicians to this day invoke the names of Hippocrates and Galen. The Hellenistic strain in Mahomedan education has, it is true, flagged and failed, but only as that civilization a whole has; it has not that the Hellenistic element failed, whilst the native elements in the civilization prospered; the culture of Islam has, as a whole (from whatever causes), sunk even lower during the centuries that have witnessed the marvellous expansion of Europe.

AUTHORITIES.—For the inner history of Hellenism after Alexander, the general historical literature dealing with later Greece and Rome supplies material in various degrees. See works quoted in articles GREECE, HISTORY; ROME, HISTORY; TOLERANZ; SELEUCID DYNASTY; BACTRIA, &c.

Different elements (literature, philosophy, art, &c.) are dealt with separately and specially for these; among that those of Susemihl, Wilamowitz-Moellendorf, Erwin Rohde and E. Schwartz are of especial importance for the literature; those of Schreiber and Strzygowski for the later Greek art.

Hellenistic civilization are found in J. P. Mahaffy's Greek Life and Thought (1887), The Greek World under Roman sway (1890), The Silver Age of the Greek World (1906); Julius Koeppel, Geschichte der Klassik (2nd ed., 1909); and in Helmut de Sèze's Griechische Geschichte, vol. iii. (1893; immediately succeeding Alexander). R. von Seals' "The Greeks after Alexander," in Helmut's History of the World (vol. v.), covers the whole period from Alexander to the end of the Byzantine Empire. P. Wendland's Hellenistisch-römische Kultur in ihren Beziehungen zu Judentum u. Christentum (1907) is an illuminating monograph, giving a conspectus of the material. For Hellenistic Egypt, Bouché-Conte's Hellenique (1906), and L'Homme, ibid. (1907) under E. R. B.)

HELLE, STEPHEN (1819-1889), Austrian pianist and composer, was born at Pest on the 25th of May 1815. (Fétis's dictionary says 1814, but this is almost certainly wrong.) He was at first intended for a lawyer, but at nine years of age performed so successfully at a concert that he was sent to Vienna to study under Czerny. Halm was his principal master, and from the age of twelve he gave concerts in Vienna, and made a tour through Hungary, Poland and Germany. At Augsburg he had the good fortune to be befriended when ill by a wealthy family, who practically adopted him and gave him the opportunity to complete his musical education. In 1838 he went to Paris, and soon became intimate with Liszt, Chopin, Berlioz and their set, among whom was Hallé, throughout his life an indefatigable performer of Heller's music. In 1849 he came to England and played a few times, and in 1862 he appeared with Hallé at the Crystal Palace. He outlived the great reputation he had enjoyed among cultivated amateurs for so many years, and was almost forgotten when he died at Paris on the 14th of January 1888. His pianoforte pieces, almost all of them published in sets and provided with fancy names, do not show very startling originality, but their grace and refinement could not but make them popular with players and listeners of all classes.

HELLESPONT (i.e. "Sea of Helle"); variously named in classical literature ΕΛΛΗΣΠΟΝΤΟ, ὁ Ἑλλησπόντος, Helle- σπονίου Πελαγος, and Fratum Hellesponticum), the ancient name of the Dardanelles (q.v.). It was so-called from Helle, the daughter of Athamas (q.v.), who was drowned here. See ARGOS.

HELLEVOETSLUIS, or HELVOETSLUIS, a fortified seaport in the province of South Holland, the kingdom of Holland, on the south side of the island of Voorne and Putten, on the sea-arm known as the Haringvliet, 53 m. S. of Brielle. It has a daily steam-boat connexion with Rotterdam by the Voomschine canal. Pop. (1900), 4152. Hellevoetsluis is an important naval station, and possesses a naval arsenal, dry and wet docks, wharves and a naval college for engineers. Among the public buildings are the communal chambers, a Reformed church (1661), a Roman Catholic church and a synagogue.

HELLEN, a town of south-eastern Spain, in the province of Albacete, on the Albacete-Murcia railway. Pop. (1900), 12,558. Hellen is built on the outskirts of the low hills which line the left bank of the river Mundo. It possesses the remains of an old Roman castle and a beautiful parish church, the monastery and marble pavement at the entrance of which are worthy of special notice. The surrounding country yields wine, oil and saffron in abundance; within the town there are manufactures of coarse cloth, leather and pottery. Sulphur is obtained from the celebrated mining district of Minas del Mundo, 12 m. S., at the junction between the Mundo and the Segura; and there are warm sulphurous springs in the neighbouring village of Azarque. Hellen was known to the Romans who first exploited its sulphur as Illunum.

HELLO, ERNEST (1828-1885), French critic, was born at Tréguier. He was the son of a lawyer who held posts of great importance at Rennes and in Paris, and was well educated at both places, but took no profession and resided much, for a time, in his father's country-house in Brittany. A very strong Roman Catholic, he appears to have been specially excited by his countryman Renan's attitude to religious matters, and coming under the influence of J. A. Barbey d'Aurevilly and Louis Veulliot, the two most brilliant crusaders of the Church in the press, he started a newspaper called L'Echo des Croisés; in 1850, but it only lasted two years. He wrote, however, much under his own name. He had very bad health, suffering apparently from spinal or bone disease. But he was fortunate enough to meet with a wife, Zoe Berthier, who, ten years older than himself, and a friend for some years before their marriage, became his devoted nurse, and even brought upon herself abuse from gutter journalists of the time for the care with which she guarded him. He died in 1885. Hello's work is somewhat varied in form but uniform in spirit. His best-known book, Physionomie de saints (1872), which has been translated into English (1903) as Studies in Saintskip, does not display his qualities best. Contes extraordinaire, published not long before his death, is better and more original. But the real Hello is to be found in a series of philosophical and critical essays, from Renan, l'Allemagne et l'athéisme (1861), through L'Homme (1871) and Les Plauteaux de la balance (1882), perhaps his chief book, to the posthumously published Le Stépèce. The peculiarity of his standpoint and the originality and vigour of his handling make his studies, of Shakespeare, Hugo and others, of abiding importance as literary "triangulations," results of object, subject and point of view.

HELMERS, JAN FREDERIK (1767-1813), Dutch poet, was born at Amsterdam on the 7th of March 1767. His early poems, Nigh (1788) and Socrates (1790), were tame and sentimental, but after 1805 he determined, in company with his brother-in-law, Cornelis Loots (1765-1834), to rouse national feeling by a burst of patriotic poetry. His Poems (3 vols., 1800-1810), but especially his great work The Dutch Nation, a poem in six cantos (1812), created great enthusiasm and enjoyed immense success. Helmers died at Amsterdam on the 26th of February 1813. He owed his success mainly to the integrity of his patriotism and the opportune moment at which he sounded his counterblast to the French oppression. His posthumous poems were collected in 1815.

HELMERSEN, GREGOR VON (1803-1883), Russian geologist, was born at Laugut-Duckershof, near Dorpat, on the 29th of September (O.S.) 1803. He received an engineering training and became major-general in the corps of Mining Engineers. In 1857 he was appointed professor of geology in the mining institute at St. Petersburg. He was author of numerous memoirs on the geology of Russia, especially on the coal and other mineral deposits of the country; and he wrote also some explanations to accompany separate sheets of the geological map of Russia. His geological work was continued to an advanced age, one of the later publications being Studien über die Wanderblöcke und die Diluvialgebilde Russlands (1860 and 1882). Most of his memoirs were published by the Imperial Academy of Sciences at St. Petersburg. He died at St. Petersburg on the 3rd of February (O.S.) 1885.
HELMET (from an obsolete diminutive of O. Fr. helme, mod. heaume; the English word is "helm," as in O. Eng., Dutch and Ger.; all are from the Teutonic base hal-, pre-Teut. hal-, to cover; cf. Lat. celere, to hide, Eng. "hell," &c.), a defensive covering for the head. The present article deals with the helmet during the middle ages down to the close of the period when body armour was worn. For the helmet worn by the Greeks and Romans see Arms and Armour.

The head-dress of the warriors of the dark ages and of the earlier feudal period was far from being the elaborate helmet which is associated in the imagination with the knight in armour and the tourney. It was a mere casque, a cap with or without additional safeguards for the ears, the nape of the neck and the nose (fig. 1). By those warriors who possessed the means to equip themselves fully, the casque was worn over a hood of mail, as shown in fig. 2. In manuscripts, &c., armoured men are sometimes portrayed fighting in their hoods, without casques, basinetts or other form of helmet. The casque was, of course, normally of plate, but in some instances it was a strong leather cap covered with mail or imbricated plates. The most advanced form of this early helmet is the conical steel or iron cap with nasal (fig. 2), worn in conjunction with the hood of mail. This is the typical helmet of the 12th-century warrior, and is made familiar by the Bayeux Tapestry. From this point however (c. 1100) the evolution of war-head-gear follows two different paths for many years. On the one hand the simple casque easily transformed itself into the basinet, originally a pointed iron skull-cap without nasal, ear-guards, &c. On the other hand the knight in armour, especially after the fashion of the tournament set in, found the mere cap with nasal insufficient, and the heaume (or "helmet") gradually came into vogue. This was in principle a large heavy iron pot covering the head and neck. Often a light basinet was worn underneath it—or rather the knight usually wore his basinet and only put the heaume on over it at the last moment before engaging. The earlier (12th-century) war heaumes are intended to be worn with the mail hood and have nasals (fig. 3). Towards the end of the 13th century, however, the basinet grew in size and strength, just as the casque had grown, and began to challenge comparison with the heavy and clumsy heaume. Thereupon the heaume became, by degrees, the special heaume of the tournament, and grew heavier, larger and more elaborate, while the basinet, reinforced with 10th-century cap to the towering helmet of 1356, with its long snouted vizer and ample drooping "camail," is shown in fig. 6, a, b, c, d, and the two latter showing the same helmet with vizer down and up. But the tendency set in during the earlier years of the 13th century to make all parts of the armour thicker. Chain "mail" gradually gave way to plate on the body and the limbs, remaining only in those parts, such as neck and elbows, where flexibility was essential, and even there it was in the end replaced by jointed steel bands or small plates. The final step was the discarding of the "camail" and the introduction of the "armet." The latter will be described later. Soon after the beginning of the 13th century the high-crowned basinet gave place to the salade or sallet, a helmet with a low rounded crown and a long brim or neck-guard at the back. This was the typical head-piece of the last half of the Hundred Years' War as the vizarded basinet had been of the first. Like the basinet it was worn in a simple form by archers and pikemen and in a more elaborate form by the knights and men-at-arms. The larger and heavier salades were also often used instead of the heaume in tournaments. Here again, however, there is a great difference between those worn by light armed men, foot-soldiers and archers and those of the heavy cavalry. The former, while possessing as a rule the bowl shape and the lip or brim of the type, and always destitute of the conical point which is the distinguishing mark of the basinet, are cut away in front of the face (fig. 7 a). In some cases it was remedied in part by the addition of a small pivoted vizer, which, however, could not protect the throat. In the larger salades of the heavy cavalry the wide brim served to protect the whole head, a slit being made in that part of the brim which came in front of the eyes (in some examples the whole of the front part of the brim was made movable). But the chin and neck, directly opposed to the enemy's blows, were scarcely protected at all, and with these helmets a large volant-piece or beaver (mentonnière)—usually a continuation of the body armour up to the chin or even beyond—was worn for this purpose, as shown in fig. 7 b. This arrangement combined, in a rough way, the advantages of freedom of movement for the head with adequate protection for the neck and lower part of the face. The armet, which came into use about 1475-1500 and completely superseded the salade, realized these requirements far better, and later at the zenith of the armurer's art (about 1520) and throughout the period of the decline of armour it remained the standard pattern of helmet, whether for war or for tournament. It figures indeed in nearly all portraits of kings, nobles and

soldiers up to the time of Frederick the Great, either with the suit of armour or half-armour worn by the subject of the portrait or in allegorical trophies, &c. The armet was a fairly close-fitting rounded shell of iron or steel, with a movable visor in front and complete plating over chin, ears and neck, the latter replacing the mentonnière or beaver. The armet was connected to the rest of the suit by the gorget, which was usually of thin laminated steel plates. With a good armet and gorget there was no weak point for the enemy's sword to attack, a roped lower edge of the armet generally fitting into a sort of flange round the top of the gorget. Thus, and in other and slightly different ways, was solved the problem which in the early days of plate armour had been attempted by the clumsy heaume and the flexible, if tough, camail of the vizedor basinet, and still more clumsily in the succeeding period by the salade and its grotesque mentonnière. As far as existing examples show, the wide-brimmed salade itself first gave way to the more rounded armet, the mentonnière being carried up to the level of the eyes. Then the use (growing throughout the 15th century) of laminated armour for the joints of the harness probably suggested the gorget, and once this was applied to the lower edge of the armet by a satisfactory joint, it was an easy step to the elaborate pivoted visor which completed the new head-dress. Types of armets are shown in fig. 8.

The burgonet, often confused with the armet, is the typical helmet of the late 16th and early 17th centuries. In its simple form it was worn by the foot and light cavalry—though the latter must not be held to include the pistol-armed chevaux-légers of the wars of religion, these being clad in half-armour and vizedor burgonet—and consisted of a (generally rounded) cap with a projecting brim shielding the eyes, a neck-guard and ear-pieces. It had almost invariably a crest or comb, as shown in the illustrations (fig. 9). Other forms of infantry head-gear much in vogue during the 16th century are shown in figs. 10 and 11, which represent the morion and cabasset respectively. Both these were lighter and smaller than the burgonet; indeed much of their popularity was due to the ease with which they were worn or put on and off, for in the matter of protection they could not compare with the burgonet, which in one form or another was used by cavalry (and often by pikemen) up to the final disappearance of armour from the field of battle about 1670. Fig. 9 b gives the general outline of richly decorated 16th-century Italian burgonet which is preserved in Vienna. The archetyp of the burgonet is perhaps the casque worn by the Swiss infantry (fig. 9 a) at the epoch of Marignan (1515).

This was probably copied by them from their former Burgundian antagonists, whose connexion with this helmet is sufficiently indicated by its name. The lower part of the more elaborate burgonets worn by nobles and cavalrymen is often formed into a complete covering for the ears, cheek and chin, and connected closely with the gorget. They therefore resemble the armets and have often been confused with them, but the distinguishing feature of the burgonet is invariably the joint peak. Various forms of visor were fitted to such helmets; these as a rule were either fixed bars (fig. 9 c) or mere upward continuations of the chin piece. Often a nasal was the only face protection (fig. 9 d, a Hungarian type). The latest form of the burgonet used in an active service is the familiar Cromwellian cavalry helmet with its straight brim, from which depends the slight vizer of three bars or stout wires joined together at the bottom.

The above are of course only the main types. Some writers class all remaining examples either as casques or as "war-hats," the latter term conveniently covering all those helmets which resemble in any way the head-gear of civil life. For illustrations of many curiosities of this sort, including the famous iron hat of King Charles I. of England, and also for examples of Russian, Mongolian, Indian and Chinese helmets, the reader is referred to pp. 262-269 and 285-286 of Demmín's Arms and Armour (English edition 1894). The helmets in brass, steel or cloth, worn by troops since the general introduction of uniforms and the disuse of armour, depend for their shape and material solely on considerations of comfort and good appearance. From time to time, however, the readoption of serviceable helmets is advocated by cavalrymen, and there is much to be said in favour of this. The burgonet, which was then a type of war helmet evolved by the old armoursers, would certainly appear to be by far the best head-gear to adopt should these views prevail, and indeed it is still worn, in a modified yet perfectly recognizable form, by the German and other cuirassiers.

HELMHOLTZ, HERMANN LUDWIG FERDINAND VON (1821-1894), German philosopher and man of science, was born on the 31st of August 1821 at Potsdam, near Berlin. His father, Ferdinand, was a teacher of philosophy and philosophy in the gymnasium, while his mother was a Hanoverian lady, a lineal descendant of the great Quaker William Penn. Delicate in early life, Helmholtz became by habit a student, and his father at the same time directed his thoughts to natural phenomena. He soon showed mathematical powers, but these were not fostered by the careful training mathematicians usually receive, and it may be said that in after years his attention was directed to the higher mathematics mainly by force of circumstances. As his parents were poor, and could not afford to allow him to follow a purely scientific career, he became a surgeon of the Prussian army. In 1842 he wrote a thesis in which he announced the discovery of nerve-cells in ganglia. This was his first work, and from 1842 to 1849, the year of his death, scarcely a year passed without several important, and in some cases epoch-making, papers on scientific subjects coming from his pen. He lived in Berlin from 1842 to 1849, when he became professor of physiology in Königsberg. There he remained from 1849 to 1855, when he removed to the chair of physiology in Bonn. In 1858 he became professor of physiology in Heidelberg, and in 1871 he was called to occupy the chair of physics in Berlin. To this professorship was added in 1887 the post of director of the physico-technical institute at Charlottenburg, near Berlin,
and he held the two positions together until his death on the 8th of September 1894.

His investigations occupied almost the whole field of science, including physiology, physiological optics, physiological acoustics, chemistry, mathematical physics, electricity, magnetism, meteorology, and theoretical mechanics. At an early age he contributed to our knowledge of the causes of putrefaction and fermentation. In physiological science he investigated quantitatively the phenomena of animal heat, and he was one of the earliest in the field of animal electricity. He studied the nature of muscular contraction, causing a muscle to record its movements on a smoked glass plate, and he worked out the problem of the velocity of the nervous impulse both in the motor nerves of the frog and in the sensory nerves of man. In 1847 Helmholtz read to the Physical Society of Berlin a paper on *Über die Erhaltung der Kraft* (on the conservation of force), which became one of the epoch-making papers of the century; indeed, along with J. R. Mayer, J. P. Joule and W. Thomson (Lord Kelvin), he may be regarded as one of the founders of the now universally received law of the conservation of energy. The year 1851, while he was lecturing on physiology at Königsberg, saw the brilliant invention of the ophthalmoscope, an instrument which has been of inestimable value to medicine. It arose from an attempt to demonstrate to his class the nature of the glow of reflected light sometimes seen in the eyes of the animals such as the cat. When the great ophthalmologist, von Gräfe, first saw the fundus of the living human eye, with its optic disc and blood-vessels, his face flushed with excitement, and he cried, "Helmholtz has unfolded to us a new world!" Helmholtz's contributions to physiological optics are of great importance. He investigated the optical constants of the eye, measured by his invention, the ophthalmometer, the radii of curvature of the crystalline lens for near and far vision, explained the mechanism of accommodation by which the eye can focus within certain limits, discussed the phenomena of colour vision, and gave a luminous account of the movements of the eyeballs so as to secure single vision with two eyes. In particular he revived and gave new force to the theory of colour-vision associated with the name of Thomas Young, showing the three primary colours to be red, green and violet, and he applied the theory to the explanation of colour-blindness. His great work on *Physiological Optics* (1856–1866) is by far the most important book that has appeared on the physiology and physics of vision. Equally distinguished were his labours in physiological acoustics. He explained exactly the mechanism of the bones of the ear, and he discussed the physiological action of the ossicles on the principles of sympathetic vibration. Perhaps his greatest contribution to the science of hearing was his attempt to account for our perception of quality of tone. He showed, both by analysis and by synthesis, that quality depends on the order, number and intensity of the overtones or harmonics that may, and usually do, enter into the structure of a musical tone. He also developed the theory of differential and of summational tones. His work on *Sensations of Tone* (1862) may well be termed the *principia* of physiological acoustics. He may also be said to be the founder of the fixed-fret theory of vowel tones, according to which it is asserted that the pitch of a vowel depends on the relative opening of the mouth, according to the form of the cavity while singing it, and this independently of the pitch of the note on which the vowel is sung. For the later years of his life his labours may be summed up under the following heads: (1) On the conservation of energy; (2) on hydro-dynamics; (3) on electro-dynamics and theories of electricity; (4) on meteorological physics; (5) on optics; and (6) on the abstract principles of dynamics. In all these fields of labour he made important contributions to science, and showed himself to be equally great as a mathematician and a physicist. He studied the phenomena of electrical oscillations from 1865 to 1871, and in the latter year he announced that the velocity of the propagation of electromagnetic induction was about 314,000 metres per second. Faraday had shown that the passage of electrical action involved time, and he also asserted that electrical phenomena are brought about by changes in intervening non-conductors or dielectric substances. This led Clerk Maxwell to frame his theory of electro-dynamics, in which electrical impulses were assumed to be transmitted through the ether by waves. G. F. Fitzgerald was the first to attempt to measure the length of electric waves; Helmholtz put the problem into the hands of his favourite pupil, Heinrich Hertz, and the latter finally gave an experimental demonstration of electromagnetic waves, the "Hertzian waves," on which wireless telegraphy depends, and the velocity of which is the same as that of light. The last investigations of Helmholtz related to problems in theoretical mechanics, more especially as to the relations of matter to the ether, and as to the distribution of energy in mechanical systems. In particular he explained the principle of least action, first advanced by P. L. M. de Marangoni, and developed in modern form by W. R. Hamilton, of quaternion fame. Helmholtz also wrote on philosophical and aesthetic problems. His position was that of an empiricist, denying the doctrine of innate ideas and holding that all knowledge is founded on experience, hereditarily transmitted or acquired.

The life of Helmholtz was uneventful in the usual sense. He was twice married, first, in 1840, to Olga von Velten (by whom he had two children, a son and daughter), and secondly, in 1861, to Anna von Mohl, of a Württemberg family of high social position. Two children were born of this marriage, a son, Robert, who died in infancy, and a daughter, Olga, who showed in experimental physics indications of her father's genius, and in particular in the application of the ophthalmoscope. His son, von Siemens. Helmholtz was a man of simple but refined tastes, of noble carriage and somewhat austere manner. His life from first to last was one of devotion to science, and he must be accounted, on intellectual grounds, one of the foremost men of the 19th century.

HELMOND, an historian of the 12th century, was a priest at Bosau near Plön. He was a friend of the two bishops of Oldenburg, Vicelin (d. 1154) and Gerold (d. 1162), who did much to Christianize the Slavs. At Bishop Gerold's instigation Helmond wrote his *Chronica Slavorum*, a history of the conquest and conversion of the Slavonic countries from the time of Charlemagne. For the life and times of Henry the Lion, duke of Saxony, Helmond's chronicle, as that of a contemporary who had exceptional means for gaining information, is of first-rate importance. The history was continued down to 1209 by Abbot Arnold of Lübeck.

HELMONT, a town in the province of North Brabant, Holland, on the small river Aa, and on the canal (Zuid-Willems Vaart) between 's-Hertogenbosch and Maastricht, 24 m. by rail W.N.W. of Venlo. It is connected by steam tramway with 's-Hertogenbosch (21 m. N.W.), a branch line northwards to Oss being given off at Veghel. Pop. (1900) 11,465. The castle of Helmond, built in 1402, is a beautiful specimen of architecture, and among the other buildings of note in the town are the spacious church of St. Lambert, the Reformed church and the town hall. Helmond is one of the industrial centres of the province, and possesses over a score of factories for cotton and silk weaving, cotton printing, dyeing, iron foundling, brewing, soap boiling and tobacco dressing, as well as engine works and a margarine factory. There is an art school in the town.

HELMONT, JEAN BAPTISTE VAN (1577–1644), Belgian chemist, physician and physician, a member of a noble family, was born at Brussels in 1577. 1 He was educated at Louvain, and after ranging restlessly from one science to another and finding satisfaction in none, turned to medicine, in which he took his doctor's degree in 1590. The next few years he spent in travelling through Switzerland, Italy, France and England. Returning to his own country he was a Antwerp at the time.

1 An alternative date for his birth is 1579 and for his death 1636 (see *Bull. Roy. Acad. Belg.*, 1907, 7, p. 732).
the great plague in 1656, and having contracted a rich marriage settle in 1609 at Vilvorde, near Brussels, where he occupied himself with chemical experiments and medical practice until his death on the 30th of December 1644. Van Helmont presents curious contradictions. On the one hand he was a disciple of Paracelsus (though he scornfully repudiates his errors was well as those of most other contemporary authorities), a mystic with strong leanings to the supernatural, an alchemist who believed that with a small piece of the philosopher's stone he had transmuted 2000 times as much mercury into gold; on the other hand he was touched with the new learning that was producing men like Harvey, Galileo and Bacon, a careful observer of nature, and an exact experimenter who in some cases realized that matter can neither be created nor destroyed. As a chemist he deserves to be regarded as the founder of pneumatic chemistry, even though it made no substantial progress for a century after his time, and he was the first to understand that there are gases distinct in kind from atmospheric air. The very word "gas" he claims as his own invention, and he perceived that his "gas sylvestre" (our carbon dioxide) given off by burning charcoal is the same as that produced by fermenting must and that which sometimes renders the air of caves irrespirable. For him air and water are the two primitive elements of things. Fire he explicitly denies to be an element, and earth is not one because it can be reduced to water. That plants, for instance, are composed of water he sought to show by the ingenious quantitative experiment of planting a willow weighing 5 ft. in a box of dry soil and allowing it to grow for five years; at the end of that time it had become a tree weighing 169 lb., and since it had received nothing but water and the soil weighed practically the same as at the beginning, he argued that the increased weight of wood, bark and roots had been formed from water alone. It was an old idea that the processes of the living body are fermentative in character, but he applied it more elaborately than any of his predecessors. For him digestion, nutrition and even movement are due to fermentations, which convert dead food into living flesh in six stages. But having got so far with the application of chemical principles to physiological problems, he introduces a complicated system of supernatatural agencies like the "arche of Paracelsus, which presides over and directs the affairs of the body. A central arches controls a number of subsidiary arches which move through the fermentations, and just as diseases are primarily caused by some affection (exorbitation) of the arches, so remedies act by bringing it back to the normal. At the same time chemical principles guided him in the choice of medicines—undue acidity of the digestive juices, for example, was to be corrected by alkalies and vice versa; he was thus a forerunner of the iatrochemical school, and did good service to the art of medicine by applying chemical methods to the preparation of drugs. Over and above the arches he taught that there is the sensitive soul which is the husk or shell of the immortal mind. Before the Fall the arches obeyed the immortal mind and was directly controlled by it, but after the Fall and sin and corruption the arches are also the sensitive soul and with it lost immortality, for when it perishes the immortal mind can no longer remain in the body. In addition to the arches, which he described as "aur vitalis semen, vitae directum," Van Helmont had other governing agencies resembling the arches and not always clearly distinguished from it. From these he invented the term blas, defined as the "vis motus tam alteri quam locii." Of blas there were several kinds, e.g. blas humannus and blas aeremon; the heavens he said "constarca gas materiale et blas efficacien." He was a faithful Catholic, but incurred the suspicion of the Church by his tract De magnetica vulnerum curatione (1621), which was thought to derogate from some of the miracles. His works were collected and published at Amsterdam as Ortes medicinale, vol. opuscula et opuscula omnia in 1668 by his son Franz Mercurius (b. 1618 at Vilvorde, d. 1690 at Berlin), in whose own writings, e.g. Cabbalism Denudata (1677) and Opuscula philosophica (1690), mystical theosophy and alchemoy appear still wider confusion.

B. van Helmont (1817); Rixner and Sieber, Beiträge zur Geschichte der Physiologie (1816—1826), vol. ii.; Spiers, Helmont's System der Medicin (1840); Melens, Lecons sur van Helmont (1848); Rommelaere, Études sur J. B. van Helmont (1849).

HELMSTEDT, or more rarely Helmstadt, a town of Germany, in the duchy of Brunswick, 30 m. N.W. of Magdeburg on the main line of railway to Brunswick. Pop. (1905) 15,415. The principal buildings are the Juleum, the former university, built in the Renaissance style towards the close of the 16th century, and containing a library of 40,000 volumes; the fine Stephanskirche dating from the 12th century; the Walpurgiskirche restored in 1803-1804; the Marienberger Kirche, a beautiful church in the Roman style, and the Roman Catholic church. The Augustinian nunnery of Marienberg founded in 1176 is now a Lutheran school. The town contains the ruins of the Benedictine abbey of St Ludger, which was secularized in 1829. The educational institutions include several schools. The principal manufactures are furniture, yarn, soap, tobacco, sugar, vitriol and earthenware. Near the town is Bad Helmstedt, which has an iron mineral spring, and the Lübbensteine, two blocks of granite on which sacrifices to Woden are said to have been offered. Near Bad Helmstedt a monument has been erected to those who fell in the Franco-German War; in the town there is one to those killed at Waterloo. Helmstedt originated, according to legend, in connexion with the monastery founded by Ludger or Ludger (d. 809), the first bishop of Münster. There appears, however, little doubt that this tradition is mythical and that Helmstedt was not founded until about 900. It obtained civic rights in 1099 and, although destroyed by the archbishop of Magdeburg in 1199, it was soon rebuilt. In 1457 it joined the Hanseatic League, and in 1490 it came into the possession of Brunswick. In 1576 Julius, duke of Brunswick, founded a university here, and throughout the 17th century this was one of the chief seats of Protestant learning. It was closed by Jerome, king of Westphalia, in 1690.

See Ludewig, Geschichte und Beschreibung der Stadt Helmstedt (1821).

HELMUND, a river of Afghanistan, in length about 600 m. The Helmund, which is identical with the ancient Ezymander, is the most important river in Afghanistan, next to the Kabul river, which it exceeds both in volume and length. It rises in the recesses of the Koh-i-Baba to the west of Kabul, its infant stream parting the Unai pass from the Irak, the two chief passes on the well-known road from Kabul to Bamian. For 50 m. from its source its course is ascertained, but beyond that point for the next 50 no European has followed it. About the parallel of 33° N. it enters the Zamindawar province which lies to the N.W. of Kandahar, and thenceforward it is a well-mapped river to its termination in the lake of Seistan. Till about 40 m. above Girishk the character of the Helmund is that of a mountain river, flowing through valleys which in summer are the resort of pastoral tribes. On leaving the hills it enters a flat country; over a gravelly bed. Here also it begins to be used in irrigation. At Girishk it is crossed by the principal route from Herat to Kandahar. Forty-five miles below Girishk the Helmund receives its greatest tributary, the Arganhald, from the high Ghilzai country beyond Kandahar, and becomes a very considerable river, with a width of 300 or 400 yds. and an occasional depth of 9 to 12 ft. Even in the dry season it is never without a plentiful supply of water. The course of the river is more or less south-west from its source till in Seistan it crosses meridian 62°, when it turns nearly north, and so flows for 70 or 80 m. till it falls into the Seistan hamuns, or swamps, by various mouths. In this latter part of its course it forms the boundary between Afghanistan and Persia, and is subject to constant changes in its bed by the swampy nature of its borders it has been a fertile source of frontiersquabbles. Persian Seistan was once highly cultivated by means of a great system of canal irrigation; but for centuries, since the country was devastated by Timur, it has been a barren, treeless waste of flat alluvial plain. In years of exceptional flood the Seistan lakes spread southwards into an overflow channel called the
HELM WIND—HELPS, SIR A. 251

Shag which, running parallel to the northern course of the Helmwind in the opposite direction, finally loses its waters in the Goed-i-Zirch swamp, which thus becomes the final bourne of the river. Throughout its course from its confluence with the Arghandab to the ford of Chahar Burjak, where it bends northward, the Helm wind valley is a narrow green belt of fertility sunk in the midst of a wide alluvial desert, with many thriving villages interspersed amongst the remains of ancient cities, relics of Kaiane rule. The recent political mission to Seistan under Sir Henry M't Mahon (1904-1905) added much information respecting the ancient and modern channels of the lower Helm wind, proving that there have been considerable changes in its bed— a very difficult task, changing the level of the country by silt deposits, and in conjunction with the terrific action of Seistan winds actually altering its configuration.

(T. H. H.)

HELM WIND, a wind that under certain conditions blows over the escarpment of the Penines, near Cross Fell from the eastern side, when a helm (helmet) cloud covers the summit. The helm bar is a roll of cloud that forms in front of it, to leeward.

HELOTS (Gr. ḥλῆτος ἢ ἤλετος), the serfs of the ancient Spartans. The word was derived in antiquity from the town of Helos in Laconia, but is more probably connected with ἥλως, a fen, or with the root ḥλᾶω, to capture. Some scholars suppose them to have been of Achaean race, but they were more probably the aborigines of Laconia who had been enslaved by the Achaeans before the Dorian conquest. After the second Messenian war (see SPARTA) the conquered Messenians were reduced to the status of helots, from which Epaminondas liberated them three centuries later after the battle of Leuctra (371 B.C.). The helots were state slaves bound to the soil—adscripti glebas—and assigned to individual Spartiates to till their holdings (ἄνδροι); their masters could neither emancipate them nor sell them off the land, and they were under an oath not to raise the rent payable yearly in kind by the helots. In time of war they served as light-arméd troops or as rowers in the fleet; from the Peloponnesian War onwards they were occasionally employed as heavy infantry (ἄνδροι), distinguished bravery being rewarded by emancipation. That the general attitude of the Spartans towards them was one of distrust and cruelty cannot be doubted. Aristotle says that the ephors of each year on entering office declared war on the helots so that they might be put to death at any time without violating religious scruple (Plutarch, *Lycurgus* 28), and we have a well-attested record of 2000 helots being freed for service in war and then secretly assassinated (Thuc. iv. 80). But when we remember the value of the helots from a military and agricultural point of view we shall not readily believe that the *credito* was really, as some authors represent it, an organized system of massacre; we shall see in it "a good police training, inculcating hardihood and vigour in the young," while at the same time getting rid of any helots who were found to be plotting against the state (see further CRYPTO).

Intermediate between Helots and Spartiates were the two classes of Neodamodes and Mothones. The former were emancipated helots, or possibly their descendants, and were much used in war from the end of the 5th century; they served especially on foreign campaigns, as those of Thibron (400-399 B.C.) and Agesilaus (366-364 B.C.) in Asia Minor. The mothones or *moskaks* were usually the sons of Spartiates and helot mothers; these were free men sharing the Spartan training, but were not full citizens, though they might become such in recognition of special merit.

HELPS, SIR ARTHUR (1813-1872), English writer and clerk of the Privy Council, youngest son of Thomas Helps, a London merchant, was born near London on the 10th of July 1813. He was educated at Eton and at Trinity College, Cambridge, coming out 31st wrangler in the mathematical tripos in 1835. He was recognized by the ablest of his contemporaries there as a man of superior gifts, and likely to make his mark in after life. As a member of the Conversazione Society, better known as the "Apostles," a society established in 1820 for the purposes of discussion on social and literary questions by a few young men attracted to each other by a common taste for literature and speculation, he was associated with Charles Bulver, Frederick Richard Richard (employed in Trench, Monckton Milnes, Arthur Hallam and Alfred Tennyson. His first play, *Plotting in the Cloister and the Crowd* (1835), was a series of aphorisms upon life, character, politics and manners. Soon after leaving the university Arthur Helps became private secretary to Spring Rice (afterwards Lord Montagle), then chancellor of the exchequer.

This appointment he filled till 1839, when he went to Ireland as private secretary to Lord Morpeth (afterwards earl of Carlisle), chief secretary for Ireland. In the meanwhile (28th October 1836) Helps had married Bessy, daughter of Captain Edward Fuller. He was one of the commissioners for the settlement of the Irish and was admitted to the bar in 1840. On the death of the Earl of Colchester in 1841, which dated so far back as the siege of Copenhagen; but with the fall of the Melbourne administration (1841) his official experience closed for a period of nearly twenty years. He was not, however, forgotten by his political friends. He possessed admirable tact and sagacity; his fitness for official life was unmistakable, and in 1860 he was appointed clerk of the Privy Council, on the recommendation of Lord Granville.

His *Essays written in the Intervals of Business* had appeared in 1841, and his *Claims of Labour, an Essay on the Duties of the Emplorers to the Emplorers to the Emplorers* in 1844. Two plays, *King Henry the Second, an Historical Drama, and Captain Dougal, a Tragedy*, published in 1843, have no particular merit. Neither in these, nor in his only other dramatic effort, *Oulita the Serf* (1858) did he show any real qualifications as a playwright.

Helps possessed, however, enough dramatic power to give life and individuality to the dialogues with which he enlivened many of his other books. In his *Friends in Council, a Series of Readings, and Discourse thereon* (1847-1850), Helps varied his presentment of social and moral problems by dialogues between imaginary personages, who, under the names of Milverton (Ellesmere and Dunwich), are to be almost as real to Helps' readers as they certainly became to himself. The book was very popular, and the same expedient was resorted to in *Conversations on War and General Culture*, published in 1871. The familiar speakers, with others added, also appeared in his *Realms* (1868) and in the best of his author's later works, *Talk about Animals and their Masters* (1873).

A long essay on slavery in the first series of *Friends in Council* was subsequently elaborated into a work in two volumes published in 1846 and 1852, called *The Conquerors of the New World and their Bondsmen*. Helps went to Spain in 1847 to examine the numerous MSS. bearing upon his subject at Madrid. The fruits of these researches were embodied in an historical work based upon his *Conquerors of the New World*, and called *The Spanish Conquest in America, and its Relation to the History of Slavery and the Government of Colonies* (4 vols., 1855-1857-1861). But in spite of his scrupulous efforts after accuracy, the success of the book was marred by its obtrusively moral purpose and its discursive character.

The *Life of Las Casas, the Apostle of the Indians* (1868), *The Life of Columbus* (1869), *The Life of Pizarro* (1869), and *The Life of Hernando Cortes* (1871), when extracted from the work and published separately, proved successful. Besides the books which have already been mentioned he wrote: *Organisation in Daily Life, an Essay* (1862), *Casimir Marente* (1870), *Brevio, Short Essays and Aphorisms* (1871), *Thoughts upon Government* (1872), *Life and Labours of Mr Thomas Bray* (1872), *Ivan de Biron* (1874), *Social Pressure* (1875).

His appointment as clerk of the Council brought him into personal communication with Queen Victoria and the Prince
HELSINGBORG, a seaport of Sweden in the district (lään) of Malmöhus, 35 m. N. by E. of Copenhagen by rail and water. Pop. (1900), 24,670. It is beautifully situated at the narrowest part of Öresund, or the Sound, here only 3 m. wide, opposite Helsingør (Elsinore) in Denmark. Above the town the brick tower of a former castle crowns a hill, commanding a fine view over the Sound. On the outskirts are the Öresund Park, gardens containing iodide and bromide springs, and frequented sea-baths. On the coast to the north is the royal château of Sofoero; to the south, the small spa of Ramlösa. A system of electric trams is maintained. North and east of Helsingborg lies the only coalfield in Sweden, extending into the lofty Kullen peninsula, which forms the northern part of the east shore of the Sound. Potter's clay is also found. Helsingborg ranks among the first manufacturing towns of Sweden, having copper works, using ore from Sulitjelma in Norway, india-rubber works and breweries. The artificial harbour has a depth of 24 ft., and there are extensive docks. The chief exports are timber, butter and iron.

The town is the birthplace and residence of the first army division.

The original site of the town is marked by the tower of the old fortress, which is first mentioned in 1135. In the 14th century it was several times besieged. From 1370 along with other towns in the province of Skåne, it was united for fifteen years with the Hanseatic League. The fortress was destroyed by fire in 1418, and about 1425 Eric XIII. built another near the sea, and caused the town to be transported thither, bestowing upon it important privileges. Until 1568 it belonged to Denmark, and it was again occupied by the Danes in 1676 and 1677. In 1684 its fortifications were dismantled. It was taken by Frederick IV. of Denmark in November 1706, but on the 28th of February 1710 the Danes were defeated in the neighbourhood. The town was finally in the possession of Sweden, though in 1711 it was again bombarded by the Danes. A tablet on the quay commemorates the landing of Bernadotte after his election as successor to the throne in 1810.

HELSINGFORS (Finnish Helsinki), a seaport and the capital of Finland and of the province of Nyland, centre of the administrative, scientific, educational and industrial life of Finland. The fine harbour is divided into two parts by a promontory, and is protected at its entrance by a group of small islands, on one of which stands the fortress of Sveaborg. A third harbour is situated on the west side of the promontory, and all three have granite quays. The city, which in 1810 had only 406 inhabitants, has risen to the capital of a country with a population of 2,384,000. The city has a modern library, with rapidity, having 22,228 inhabitants in 1869, 61,550 in 1890 and 111,654 in 1904. It is the centre of an active shipping trade with the Baltic ports and with England, and of a railway system connecting it with all parts of the grand duchy and with St Petersburg. Helsingfors is handsome and well laid out with wide streets, parks, gardens and monuments. The principal square contains the cathedral of St Nicholas, the Senate House and the university, all striking buildings of considerable architectural distinction. In the centre is the statue of the Tsar Alexander II., who is looked upon as the protector of the liberties of Finland, the monument being annually decorated with wreaths and garlands. The university has a teaching staff of 141 with 1,008 students. The students, of whom 328 were women. The university is well provided with museums and laboratories and has a library of over 250,000 volumes. Other public institutions are the Athenaeum, with picture gallery, a Swedish theatre and opera house, a Finnish theatre, the Archives, the Senate House, the Nobles' House (Riddarhuset) and the House of the Estates, the German (Lutheran) church and the Russian church. Some of the scientific societies of Helsingfors have a wide repute, such as the academy of sciences, the geographical, historical, Finno-Ugrian, biblical, medical, law, arts and forestry societies, as also societies for the spread of popular education and of arts and crafts. There are a polytechnic, ten high schools, navigation and trade schools, institutes for the blind and the mentally deficient, and numerous elementary schools. The general standard of education is high, the publication of books, reviews and newspapers being very active. The language of culture is Swedish, but owing to recent manufacturing developments the majority of the population is Finnish-speaking. Helsingfors displays great manufacturing and commercial activity, the imports being coal, machinery, sugar, grain and clothing. The manufactures of the city consist largely of tobacco, beer and spirits, carpets, machinery and soap.

HELSST, BARTHOLOMAEUS VAN DER, Dutch painter, was born in Holland at the opening of the 17th century, and died at Amsterdam in 1670. The date and place of his birth are uncertain; and it is equally difficult to confirm or to deny the time-honoured statement that he was born in 1613 at Amsterdam. It has been urged indeed by competent authority that Van der Helst was not a native of Amsterdam, because a family of that name lived as early as 1607 at Haarlem, and pictures are shown as works of Van der Helst in the Haarlem Museum which might tend to prove that he was in practice there before he acquired repute at Amsterdam. Unhappily Bartholomew has not been traced amongst the children of Severijn van der Helst, who married at Haarlem in 1607, and there is no proof that the pictures at Haarlem are really his; though if they were so they would show that he learnt his art from Frans Hals and became a skilled master as early as 1631. Scheltema, a very competent judge in matters of Dutch art chronology, supposes that Van der Helst was a resident at Amsterdam in 1636. His first great picture, representing a gathering of civic guards at a brewery, is variously assigned to 1639 and 1643, and still adorns the town-hall of Amsterdam. His noble portraits of the burgomaster Bicker and Anders Bicker the younger, in the gallery of Amsterdam, of the same date no doubt as Bicker's wife lately in the Ruhl collection at Cologne, were completed in 1642. From 1642 till his death there is no difficulty in tracing Van der Helst's career; he held the position of a distinguished portrait-painter, producing indeed little or nothing besides portraits at any time, but founding, in conjunction with Nicolaes de Helt Stokade, the painters' guild at Amsterdam in 1654. At some unknown date he married Constance Reynst, of a good patrician family in the Netherlands, bought himself a house in the Doelenstrasse and ended by earning a competence. His likeness of Paul Potter at the Hague, executed in 1654, and his partnership with Backhuysen, who laid in the backgrounds of some of his pictures in 1668, indicate a constant companionship with the best artists of the time. Wagen has said that his portrait of Admiral Kortenaar, in the museum at Amsterdam, is the most complete and the statement need not be gainsaid; yet on the whole Van der Helst's career as a painter was mainly a protest against the systems of Hals and Rembrandt. It is needless to dwell on the pictures which preceded that of 1648, called the Peace of Münster, in the gallery of Amsterdam. The Peace challenges comparison at once with the so-called Night Watch by Rembrandt and the less important but not less characteristic portraits of Hals and his wife in a neighbouring room. Sir Joshua Reynolds was disappointed by Rembrandt, whilst Van der Helst surpassed his expectation. But Bürger asked whether Reynolds had not already been struck with blindness when he ventured on this criticism. The question is still an open one; but certainly Van der Helst's attempts entirely differing from those of Rembrandt and Frans Hals. Nothing can be more striking than the contrast between the strong concentrated light and the deep gloom of Rembrandt and the contempt of chiarosuro.
p ecular to his rival, except the contrast between the rapid sketchy touch of Hals and the careful finish and rounding of van der Helst. The Peace "is a meeting of guards to celebrate the signature of the treaty of Münster. The members of the Dutch and the Swedes meet to feast and congratulate each other not at a formal banquet but in a spot laid out for good cheer, where de Wit, the captain of his company, can shake hands with his lieutenant Waveren, yet hold in solemn state the great drinking-horn of St George. The rest of the company sit, stand or busy, themselves around—some eating, others drinking, others carving or serving—an animated scene on a long canvas, with figures large as life. Well has Bürger said, the heads are full of life and the hands admirable. The dresses and subordinate parts are finished to a nicety without sacrifice of detail or loss of breadth in touch or impact. But the eye glides from shape to shape, arrested here by expressive features, there by a bright stretch of colours, nowhere at perfect rest because of the lack of a central thought in light and shade, harmonies or composition. Great as the qualities of van der Helst undoubtedly are, he remains below the line of demarcation which separates the second from the first-rate masters of art.

His pictures are very numerous, and almost uniformly good; but in his later creations he wants power, and though still amazingly careful, he becomes grey and woolly in touch of guards to celebrate the
signature of the treaty of Münster. The members of the Dutch and the Swedes meet to feast and congratulate each other not at a formal banquet but in a spot laid out for good cheer, where de Wit, the captain of his company, can shake hands with his lieutenant Waveren, yet hold in solemn state the great drinking-horn of St George. The rest of the company sit, stand or busy, themselves around—some eating, others drinking, others carving or serving—an animated scene on a long canvas, with figures large as life. Well has Bürger said, the heads are full of life and the hands admirable. The dresses and subordinate parts are finished to a nicety without sacrifice of detail or loss of breadth in touch or impact. But the eye glides from shape to shape, arrested here by expressive features, there by a bright stretch of colours, nowhere at perfect rest because of the lack of a central thought in light and shade, harmonies or composition. Great as the qualities of van der Helst undoubtedly are, he remains below the line of demarcation which separates the second from the first-rate masters of art.

The Second Helvetic Confession was written by Bullinger in 1562 and revised in 1564 as a private exercise. It came to the notice of the elector palatine Friedrich III., who had it translated into German and published. It gained a favourable hold on the Swiss churches, who had found the First Confession too short and too Lutheran. It was adopted by the Reformed Church not only throughout Switzerland but in Scotland (1566), Hungary (1571), Poland (1578), and next to the Heidelberg Catechism is the most generally recognized Confession of the Reformed Church.

See L. Thomas, La Confession helvétique (Geneva, 1853); P. Schaff, Creeds of Christendom, i. 390-420, iii. 234-306; Müller, Die Bekennnisschriften der reformierten Kirche (Leipzig, 1903).

HELVETII ('Ελληνοι, Ελβέτοι), a Celtic people, whose original home was the country between the Hercynian forest (probably the Raabe Alp), the Rhine and the Main (Tacitus, Germani, 28). In Caesar's time they appear to have been driven further west, since, according to him (Bell. Gall., i. 2, 3), their boundaries were on the W. the Jura, on the S. the Rhein; and the Lake of Geneva, on the N. and E. the Rhine as far as Lake Constance. They thus inhabited the western part of modern Switzerland. They were divided into four cantons (pagi), common affairs being managed by the cantonal assemblies. They possessed the elements of a higher civilization (gold coinage, the Greek alphabet), and, according to Caesar, were the bravest people of Gaul. The reports of gold and plunder spread by the Cimbri and Teutones on their way to southern Gaul induced the Helvetii to follow their example. In 107 under Divico, two of their tribes, the Tigurinorum and the Turonorum, crossed the Jura and made their way as far as Aginnum (Agen on the Garonne), where they utterly defeated the Romans under L. Cassius Longinus, and forced them to pass under the yoke (Liv. Epit. 65; according to a different reading, the battle took place near the Lake of Geneva). In 102 the Helvetii joined the Cimbri in the invasion of Italy, but after the defeat of the latter by Marius they returned home. In 58, hard pressed by the Germans and incited by one of their princes, Orgetorix, they resolved to found a new home west of the Jura. Orgetorix was thrown into prison, but being suspected of a design to make himself king, the Helvetii themselves persisted in their plan. Joined by the Rauraci, Tulungi, Latobrigi and some of the Boii—according to their own reckoning 368,000 in all—they agreed to meet on the 28th of

Saturday market and four fairs. Of these the Saturday market and a fair on the feast of SS. Simon and Jude are still held, also five other fairs of uncertain origin. In 1585 Elizabeth granted a charter of incorporation under the name of the mayor and commonalty of Helston. This was confirmed in 1641, when it was also provided that the mayor and recorder should be ipso facto justices of the peace. From 1264 to 1832 Helston returned two members to parliament. In 1774 the number of electors (which by usage had been restricted to the mayor, aldermen and freemen elected by them) had dwindled to six, and in 1790 to one person only; whose return of two members, however, was rejected and that of the general body of the freemen accepted. Helston was in 1832 returned to Cornwall lost by the Reform Act of 1832, and in 1855 it lost the other and became merged in the county.

HELVEC CONFESSIONS, the name of two documents expressing the common belief of the reformed churches of Switzerland. The first, known also as the Second Confession of Basel, was drawn up at that city in 1536 by Bullinger and Leo Jud of Zürich, Megander of Bern, Oswald Myconius and Grynaeus of Basel, Bucer and Capito of Strassburg, with other representatives from Schaffhausen, St Gall, Mühlhausen and Biel. The first draft was in Latin and the Zürich delegates objected to its Latin phraseology. Leo Jud's German translation was, however, accepted by all, and after Myconius and Grynaeus had modified the Latin form, both versions were agreed to and adopted on the 26th of February 1536.

The Second Helvetic Confession was written by Bullinger in 1562 and revised in 1564 as a private exercise. It came to the notice of the elector palatine Friedrich III., who had it translated into German and published. It gained a favourable hold on the Swiss churches, who had found the First Confession too short and too Lutheran. It was adopted by the Reformed Church not only throughout Switzerland but in Scotland (1566), Hungary (1571), Poland (1578), and next to the Heidelberg Catechism is the most generally recognized Confession of the Reformed Church.
March at Geneva and to advance through the territory of the Allobroges. They were overtaken, however, by Caesar at Bibraect, defeated and forced to submit. Those who survived were sent back home to defend the frontier of the Rhine against German invaders. During the civil wars and for some time after the death of Caesar little is heard of the Helvetii.
