of alkalis or sodium ethylate (L. Claisen, Ann., 1883, 218, pp. 121,
129, 145; 1884, 223, p. 137; S. Kostanecki and G. Rossbach,
Ber., 1896, 29, pp. 1488, 1495, 1893, &c.). On treatment with
the Grignard reagent, in absolute ether solution, they yield
addition products which are decomposed by water with production of tertiary alcohols (V. Grignard, Comptes rendus, 1900,
130, p. 1322 et seq.),

RR'CO-* RR'-C(OMgI)-R*-> RR'R'-C(OH)

+ Mgl-OH.

Ketones do not polymerize in the same way as aldehydes, but
under the influence of acids and bases yield condensation
products; thus acetone
mesitylene (see below).

gives

mesityl

oxide,

phorone and

For dimethyl

ketone or acetone, see ACETONE.
Diethyl ketone,
(C 2 Hj) 2 -CO, is a pleasant-smelling liquid boiling at 102-7 C. With
concentrated nitric acid it forms dinitroethane, and it is oxidized
by chromic acid to acetic and propionic acids. Methylnonylketone,
CHj-CO-CjHi9 is the chief constituent of oil of rue, which also contains methylheptylketone, CH 8 -CO-C 7 His, a liquid of boiling-point
85-90 C. (7 mm.), which yields normal caprylic acid on oxidation
with hypobrpmites.
Mesityl oxide, (CH 3 ) 2 C:CH-CO-CH 3 is an aromatic smelling liquid
of boiling point 129-5-130 C.
It is insoluble in water, but readily
dissolves in alcohol.
On heating with dilute sulphuric acid it yields
acetone, but with the concentrated acid it gives mesitylene, CHi 2
Potassium permanganate oxidizes it to acetic acid and hydroxyisoIt forms hydroxybutyric acid (A. Pinner, Ber., 1882, 15, p. 591).
hydrocollidine when heated with acetamide and anhydrous zinc
chloride (F. Canzoneri and G. Spica, Gazz. chim. Hal., 1884, 14,
p-349). PA0rone,(CH,) 2 C:CH-CO-CH:C(CHj) 2 ,formsycllowcrystals
which melt at 28 C. and boil at 197-2 C. When heated with
phosphorus pentoxide it yields acetone, water and some pseudocumene. Dilute nitric acid oxidizes it to aceticand oxalic acids, while
potassium permanganate oxidizes it to acetone, carbon dioxide and

or by the action of isoamyl nitrite on the isonitrosoketones (O. Manasse.Ber., i888,2i,p.2i77),C 2 H 6 -CO-C:(NOH)-CH 3 -

CO-CHs;

O = C 2 H.-CO-CO-CH,+C6H
H 11 OH+N,O. They condense
with orthodiamines to form quinoxalines(O. Hinsberg, Ann., 1887,237,
p. 327) and with ammoniaand aldehydes to form imidazoles. Diacetyl,
CHi-CO-CO-CH 3 isa yellowish green liquid.which boilsat 87-88C.,
and possesses a pungent smell. Jt combines with sodium bisulphite
and with hydrocyanic acid. Dilute alkalis convert it into paraxyloquinone.
The 0-diketones form characteristic copper salts, and in alcoholic
solution they combine with semicarbazida to form products which on
boiling with ammoniacal silver nitrate solution give pyrazoles
(T. Posner, Ber., 1901, 34, p. 3975); with hydroxylamine they form
isoxazoles, and with phenylhydrazine pyrazoles.
Acetyl acetone,
CH|-CO-CH2-CO-CH 8 may be prepared by the action of aluminium
chloride on acetyl chloride, or by condensing ethyl acetate with
acetone in the presence of sodium (L. Claisen). It is a liquid of
It condenses readily with aniline to give
boiling point IJ6_C.

o-y-dimethyl quinoline.
The |y-diketones are characterized by the readiness with which
they yield furfurane, pyrrol and thiophene derivatives, the furfurane derivatives being formed by heating the ketones with a dehydrating agent, the thiophenes by heating with phosphorus pentasulphide, and the pyrrols by the action of alcoholic ammonia or
amines. Acetonylaeetone,CHi-CO-CH}-C}irCO-CH>,a liquid boiling
at 194 C., may be obtained by condensing sodium aceto-acetate
with mono-chloracetone (C. Paal, Ber., 1885, 18, p. 59),


CH₂COCH₂Na·CH₂COCH₂(CH₂COOR) → CH₂COCH₃·CH₂COCH₂(CH₂CO₂R) or by the hydrolysis of diaceto-succinic ester, prepared by the action of iodine on sodium acetoacetate (L. Knoerv., Ber., 1889, 22, pp. 169, 2100).

1 3-diketones have been prepared by L. Claissen by condensing ethylidene ketone esters with diketene. Many 3-diketones combine with 3-ketonic esters and with 3-diketone esters and with 3-diketones, and 3-ketonic esters in the presence of acetic anhydride (German patents 77354, 79087, 79863). The 1,3-diketones of this type, when heated with aqueous ammonia, form pyridine derivatives. Those in which the keto groups are in combination with phenyl residues give pyridoacetic acid on treatment with hydroxylamine, thus benzamidone, CH₂CH(CH₃)CO₂H gives pentahyrochloropyridine, NCO(CH₃)₂. On the general reactions of the 1,3-diketones, see E. Knoevenagel (Ann., 1894, 281, p. 25 et seq.) and H. Stöbcr (Ber., 1894, 27, 1547).

Many cyclic ketones are known, and in most respects they resemble the ordinary aliphatic ketones (see POLYMETHYLENES; TERPENES).

KETTELER, WILHELM EMMANUEL, BARON VON (1811–1877), German theologian and politician, was born at Harlotten, in Bavaria, on the 25th of December 1811. He studied theology at Göttingen, Berlin, Heidelberg, and Munich, and was ordained priest in 1844. He was elected Bishop of Mainz, by order of the Vatican, in preference to the celebrated Professor Leopold Schmidl, of Giessen, whose Liberal sentiments its sees as compromising the cause of the freedom of the Church from the control of the State. This brought him into collision with the civil power, an attitude which he maintained throughout a stormy and eventful life. Ketteler was rather a man of action than a scholar, and he first distinguished himself as one of the deputies of the Frankfurt National Assembly, a position to which he was elected in 1848, and in which he soon became noted for his decision, foresight, energy and eloquence. In 1850 he was made bishop of Mainz, by order of the Vatican, in preference to the celebrated Professor Leopold Schmidl, of Giessen, whose Liberal sentiments its sees as compromising the cause of the freedom of the Church from the control of the State. This brought him into collision with the civil power, an attitude which he maintained throughout a stormy and eventful life. Ketteler refused to allow the students of theology in his diocese to attend lectures at Giessen, and ultimately founded an opposition seminary in the diocese of Mainz itself. He also founded orders of School Brothers and School Sisters, to work in the various educational agencies he had called into existence, and he laboured to institute orphanages and rescue homes. In 1858 he threw down the gauntlet against the State in his pamphlet on the rights of the Catholic Church in Germany. In 1863 he adopted Lassalle's Socialistic views, and published his Die Arbeiterfrage und das Christentum, to which he was opposed in his opposition. The opponents of the dogma complained at the very outset that he was waving, half converted by his hosts, the members of the Roman College at Rome, and further influenced by his own misgivings. He deserted his anti-Infallibility, and submitted to the decrees in August 1870. He was the warmest opponent of the State in the Kettenkampf provoked by Prince Bismarck after the publication of the Vatican decrees, and was largely instrumental in compelling that statesman to retract the pledge he had rashly given, never to 6 go to Canossa.' To such an extent did Bishop von Ketteler carry his opposition, that in 1874 he forbade his clergy to take part in celebrating the anniversary of the battle of Sedan, and declared the Rhine to be a 'Catholic river.' He died at Burg- hausen, Upper Bavaria, on the 13th of July 1877.

KETTERING, a market town in the eastern parliamentary division of Northamptonshire, England, 72 m. N.W. from London by the Midland railway. It is the seat of an urban district (9556 ac.). The church of SS Peter and Paul, mainly Perpendicular, has a lofty and ornate tower and spire. The chief manufactures are boots, shoes, brushes, stays, clothing and agricultural implements. There are iron-works in the immediate neighbourhood. The privilege of market was granted in 1227 by a charter of Henry III.

KETTLE, SIR RUPERT ALFRED (1847–1904), English county court judge, was born at Birmingham on the 9th of January 1817. His family had for some time been connected with the glass-staining business. In 1845 he was called to the bar, and in 1859 he was made judge of the Worcestershire county courts, becoming also a bencher of the Middle Temple (1884). He acted as arbitrator in several important strikes, and besides being the first president of the Midland iron trade wages board, he was largely responsible for the formation of similar boards in other staple trades. His name thus became identified with the organization of a system of arbitration between employers and employed, and in 1880 he was knighted for his services in this capacity. In 1851 he married; one of his sons subsequently became London's advocate director. Kettle died on the 6th of October 1894 at Wolverhampton.

KETTLEDRUM (Fr. timbale; Ger. Pauken; Ital. timpani; Sp. timbal), the only kind of drum (q.v.) having a definite musical pitch. The kettledrum consists of a hemispherical pan of copper, brass or silver, over which a piece of vellum is stretched tightly by means of screws working on an iron ring, which fits closely round the head of the drum. In the bottom of the pan is a small vent-hole, which prevents the head being rent by the concussion of air. The vellum head may thus be flackencked or tightened at will to produce any one of the notes within its compass of half an octave. Each kettle drum bears but one note at a time, and as it takes some little time to alter all the screws, two or three kettle drums, sometimes more, each tuned to a different note, are used in an orchestra or band. For centuries kettle drums have been made and used in Europe in pairs, one large and one small; the relative proportions of the two instruments being well defined and invariable. Even when pairs of drums, all tuned to different notes, are used, as by Berlioz in his "Grand Requiem," there are still but the two sizes of drums to produce all the notes. Various mechanisms have been tried with the object of facilitating the change of pitch, but the simple old-fashioned model is still the most frequently used in England. Two sticks, of which there are several kinds, are employed to play the kettle drum; the best of these are made of whalebone for elasticity, and have a small wooden knob at one end, covered with a thin piece of fine sponge. Others have the button covered with felt or India-rubber. The kettle drum is struck at about a quarter of the diameter from the ring.

The compass of kettle drums collectively is not much more than an octave, between | and | the larger instruments, which is inadvisable to tune below F, take any one of the following notes:

| C | D | E | F | G | A | B |

and the smaller are tuned to one of the notes completing the chromatic and enharmonic scale from | to | These limits comprise all the notes of artistic value that can be obtained from kettle drums. When there are but two drums—the term "drums" is used by musicians to denote the kettle drums—they are generally tuned to the tonic and dominant or to the tonic and subdominant, these notes entering into the composition of most of the harmonies of the key. Formerly the kettle drums used to be treated as transposing instruments, the notation, as for the horn, being in C, the key to which the kettle drums were to be tuned being indicated in the score. Now composers write the real notes.

Kettle drum is the tone of a good kettle drum is sonorous, rich, and of great power. When noise rather than music is required uncovered sticks are used. The drums may be muffled or covered by placing a piece of cloth or felt over the vellum to damp the sound, a device which produces a lugubrious, mysterious effect and is indicated in the score by the words timpani coperti, timpani con sordino, timbales couvertes, godijnse Pauken. Besides the beautiful effects obtained by means of moderate gradations of tone, numerous rhythmical figures may be executed on one, two or three notes. German drummers who were

1 From "drum" and "kettle," a covered metal vessel for boiling water or other liquid; the O. E. word is cete, cf. Du. ketei, Ger. Kessel, borrowed from Lat. calidus, dim. of calidum, bowl.
renowned during the 17th and 18th centuries, borrowing the terms from the trumpets with which the kettledrums were long associated, recognized the following beats:—

![Kettle Tongue Diagrams](image)

It is generally stated that Beethoven was the first to treat the kettledrum as a solo instrument, but in *Dido*, an opera by C. Graupner performed at the Hamburg Opera House in 1707, there is a short solo for the kettledrum. The tuning of the kettledrum is an operation requiring time, even when the screw-heads, as is now usual, are T-shaped; to expedite the change, therefore, efforts have been made in all countries to invent some mechanism which would enable the performer to tune the drum to a fixed note by a single movement. The first mechanical kettledrums date from the beginning of the 19th century. In Holland a system was invented by J. C. N. Stumpff; in France by Labbaye in 1827; in Germany Eimbügler patented a system in 1842.

1 This rhythmic use of kettledrums was characteristic of the military instrument of percussion, rather than the musical member of the orchestra. During the middle ages and until the end of the 18th century, the two different notes obtainable from the pair of kettledrums were probably more as a means of marking and varying the rhythm than as musical notes entering into the composition of the harmonies. The kettledrums, in fact, approximated to the side drums in technique. The contrast between the purely rhythmic use of kettledrums, given above, and the more modern musical use is well exemplified by the well-known solo for four kettledrums in Meyerbeer's *Robert le Diable*, beginning thus—

2 See Wilhelm Kleefeld, *Das Orchester der Hamburger Oper* (1678-1738); *Internationale Musikgesellschaft*, Sammelband i. 1, p. 278 (Leipzig, 1899).
3 See J. Georges Kastner, *Méthode complète et raisonnée de timbales* (Paris), p. 19, where several of the early mechanical kettledrums are described and illustrated.

*The origin of the kettledrum is remote and must be sought in the East. Its distinctive characteristic is a hemispherical or convex vessel, closed by means of a single parchment or skin drawn tightly over the aperture, whereas other drums consist of a cylinder, having one end or both covered by the parchment, as in the side-drum and tambourine respectively. The Romans were acquainted with the kettledrum, indeed used it in the *tympana*; the *tympanum lev*., like a sieve, was the tambourine used in the rites of Bacchus and Cybele. The comparatively heavy tympanum of bronze mentioned by Catullus was probably the small kettledrum which appears in pairs on monuments of the middle ages. Pliny states that half pearls having one side round and the other flat were called *tympania*. If the name *tympanon* (Gr. *tympanon*, from *tympos*, to strike) was given to pearls of a certain shape because they resembled the kettledrum, this argues that the instrument was well known among the Romans. It is doubtful, however, if it was adopted by them as a military instrument, since it is not mentioned by Vegetius, who defines very clearly the duties of the service instruments *buccina, tuba, cornu* and *limbus*. The Greeks also knew the kettledrum, but as a warlike instrument of barbarians. Plutarch mentions that the Parthians, in order to frighten their enemies, in offering battle used not the horn or *tuba*, but hollow vessels covered with a skin, on which they beat, making a terrifying noise with these tympana. Whether the kettledrum penetrated into western Europe before the fall of the Roman Empire and continued to be included during the middle ages among the tympana is not been definitely ascertained. Isidore of Seville gives a somewhat vague description of tympanum, conveying the impression that his information has been obtained second-hand: "Tympanum est pellis vel corium ligno ex una parte extemum. Est enim pars media symphonica in simulitudinem cibiri. Tympanum autem dictum quod medium est. Unde, et marginitium medium tympanum dictur, et ipsum ut symphonia ad virgulam percutitur." It is clear that in this passage Isidore is comparing to Pliny.

The dates given during the middle ages to the kettledrum are derived from the East. We have *attambal* or *atabal* in Spain.

*See Gustav Schilling's *Encyclopädie der gesammten musikal. Wissenschaften* (Stuttgart, 1840), vol. x., art. "Kettle.

*See Manuale pel Tympanista* (Milan, 1842), where Boracchi describes and illustrates his invention.

from the Persian tambal, whence is derived the modern French timbales; nacaire, naqnaire or nakeres (English spelling), from the Arabic nakkarah or nqqarich (Bengali, nágórá), and the German Pauke, M.H.G. Bäke or Päke, which is probably derived from byk, the Assyrian name of the instrument.

A line in the chronicles of Joinville definitely establishes the identity of the nakeres as a kind of drum: "Lor il fist sonner les tabours que l'on appelle nacaires." The nacaire is among the instruments mentioned by Froissart as having been used on the occasion of Edward III.'s triumphal entry into Calais in 1347: "trumpes, tambours, nacaires, chaleymes, muses." 1 Chaucer mentions them in the description of the tournament in the Knight's Tale (line 2514):

"Pipes, trumpes, nakeres and clarionnes
That in the bataille blown blydy sonnes."

The earliest European illustration showing kettledrums is the scene depicting Pharaoh's banquet in the fine illuminated MS. book of Genesis of the 5th or 6th century, preserved in Vienna. There are two pairs of shallow metal bowls on a table, on which a woman is performing with two sticks, as an accompaniment to the double pipes. 2 As a companion illumination may be cited the picture of an Eastern banquet given in a 14th century MS. at the British Museum (Add. MS. 37,695), illuminated by a skilled Genoese. The potentate is enjoying the music of various instruments, among which are two kettledrums strapped to the back of a Nubian slave. This was the earlier manner of using the instrument before it became inseparably associated with the trumpet, sharing its position as the service instrument of the cavalry. Jost Amman 3 gives a picture of a pair of kettledrums with banners being played by an armed knight on horseback.

As in the case of the trumpet, the use of the kettledrum was placed under great restrictions in Germany and France and to some extent in England, but it was used in churches with the trumpet. 4 No French or German regiment was allowed kettledrums unless they had been captured from the enemy, and the timbalier or the Heerpaucker on parade, in reviews and marches generally, rode at the head of the squadron; in battle his position was in the wings. In England, before the Restoration, only the Guards were allowed kettledrums, but after the accession of James II. every regiment of horse was provided with them. 5 Before the Royal Regiment of Artillery was established, the master-general of ordnance was responsible for the raising of trains of artillery. Among his retinue in time of war were a trumpeter and kettledrummer. The kettledrums were mounted on a chariot drawn by six white horses. They appeared in the field for the first time in a train of artillery during the Irish rebellion of 1689, and the charges for ordnance

include the item, "large kettledrums mounted on a carriage with cloaths marked I.R. and cost £58, 9s." A model of the kettledrums with their carriage which accompanied the duke of Marlborough to Holland in 1702 is preserved in the Rotunda Museum at Woolwich. The kettledrums accompanied the Royal Artillery train in the Vigo expedition and during the campaign in Flanders in 1718. Macbea states that they were mounted on a triumphal car ornamented and gilt, bearing the ornaments and arms of the Army, of which the division of the car on march was in front of the flag gun, and in camp in front of the quarters of the Duke of Cumberland with the artillery guns packed round them. The kettledrummer had by order "to mount the kettledrum carriage every night half an hour before the sun set and beat till gun firing." In 1759 the kettledrums ceased to form part of the establishment of the Royal Artillery, and they were deposited, together with their carriage, in the Tower, at the same time as a pair captured at Malplaquet in 1709. These Tower drums were frequently borrowed by Hanover for performances of his oratorios.

The kettledrums still form part of the bands of the Life Guards and other cavalry regiments. (K. S.)

KEUPER, in geology the third or uppermost subdivision of the Triassic system. The name is a local miners' term of German origin; it corresponds to the French marnes irrésées. The formation is well exposed in Swabia, Franconia, Alsace and Lorraine and Luxembourg; it extends from Basel on the east side of the Rhine into Hanover, and northwards it spreads into Sweden and through England into Scotland and north-east Ireland; it appears flanking the central plateau of France and in the Pyrenees and Sardinia. In the German region it is divided into three groups, the Rhaetic or upper Keuper, the middle, Hauptkeuper or gipskeuper, and the lower, Kohlenkeuper or Lettenkohle. In Germany the lower division consists mainly of grey clays and schiefersteinen with white, grey and brightly coloured sandstone and dolomitic limestone. The upper part of this division is often a grey dolomite known as the Grenz dolomite; the impure coal beds - Lettenkohle - are aggregated towards the base. The middle division is thicker than either of the others (at Göttingen, 450 metres); it consists of a marly series beds - grey and green marls with gypsum and dolomite - this is the gipskeuper in its restricted sense. The higher part of the series is sandy, hence called the Steinmergel; it is comparatively free from gypsum. To this division belong the Myophorida beds (M. Raiblatiana) with galena in places; the Esther beds (E. laxisita); the Schelfsandstein, used as a building-stone; the Lehberg and Berg-gyp beds; Seminomus beds (S. Bergeri) with building-stone of Coburg; and the Burg- and Subensandstein. The salt, which is associated with gypsum, is exploited in south Germany at Dreuzac, Pettoncourt, Vie in Lorraine and in the Nord. A 1.4-metre coal is found on this horizon in the Erzgebirge, and another, 2 metres thick, has been mined in Upper Silesia. The upper Keuper, Rhaetic or Avicula contorta zone in Germany is mainly sandy with dark grey shales and marls; it is seldom more than 25 metres thick. The sandstones are used for building purposes at Bayreuth, Cumbach and Bamberg. In Swabia and the Weserbergland are several "bone-beds," thicker than those in the middle Keuper, which contain a rich assemblage of fossil remains of fish, reptiles and the mammalian teeth of Microlestes antiquus and Tripligypus Fraserti. The name Rhaetic is derived from the Rhaetic Alps where the beds are well developed; they occur also in central France, the Pyrenees and England. In S. Tirol and the Julian Alps the Rhaetic is represented by the Kössener beds. In the Alpine region the presence of coral beds gives rise to the so-called "Lithodendron Kalk." In Great Britain the Keuper contains the following subdivisions: Rhaetic or Penarth beds, grey, red and green marls, black shales and so-called "white lias" (10-150 ft.). Upper Keuper marl, red and grey marls and shales with gypsum and rock salt (800-3000 ft.). Lower Keuper sandstone, marls and thin sandstones at the top, red and white sandstones (including the so-called "waterstones") below, with breccias and conglomerates at the base (150-250 ft.). The basal or "dolomitic conglomerate" is a shore or scree breccia derived from local materials; it is well developed in the Mendip district. The rock-salt beds vary from 1 in. to 100 ft. in thickness; they are extensively worked (mixed and pumped) in Cheshire, Middleborough and Glamorgan. The Keuper covers a large area in the Midlands and around the flanks of the Pennine range; it reaches southwards to the Devonshire coast, eastwards into Yorkshire and northwards into north Ireland and south Scotland. As in Germany, there are one or more "bone beds" in the English Rhaetic with a similar assemblage of fossils. In the "white lias" the upper hard limestone is known as the "sun bed" or "Jew stone"; at the base is the Cotham or landscape marble.

Representatives of the Rhaetic are found in south Sweden, where the lower portion contains workable coals, in the Himalayas, Japan, Tibet, Burma, eastern Siberia and in Spitzbergen. The upper portion of the Karin beds of South Africa and part of the Otapiri series of New Zealand are probably of Rhaetic age.

The Keuper is not rich in fossils; the principal plants are cypress-like conifers (Wolchea, Valtzia) and a few calamites with such forms as Equisetum arenacrum and Pierocystites Jaegeri, Aviculo conderia, Protocystites rhacitum, Terebrulata gregaria, Myophrora costata, M. Goldfussi and Lingula tenestrifera, Anothophora lepatica and A. Sowdeniana. Among the invertebrates, Pseudoheros, Ceratodus, Hybodus and Lepidostoma. Labyrinthodonts represented by the footprints of Cheirotherium and the bones of Labyrinthodon, Mastodonsurus and Labyrinthodont. Among the reptiles are Hypodapsodon, Palaeosaurus, Zancleodon, Nodosaurus and Abidosaurus. Microlestes, the earliest known mammalian genus, has already been mentioned. See also the article TRIASSIC SYSTEM.

KEW, a township in the Kingston parliamentary division of Surrey, England, situated on the south bank of the Thames, 6 m. W.S.W. of Hyde Park Corner, London. Pop. (1901), 2699. A stone bridge of seven arches, erected in 1789, connecting Kew with Brentford on the other side of the river, was replaced by a bridge of three arches opened by Edward VII. in 1905 and named after him. Kew has increased greatly as a residential suburb of London; the old village consisted chiefly of a row of houses with gardens attached, situated on the north side of a green, to the south of which is the church and churchyard and at the west the principal entrance to Kew Gardens. From remains found in the bed of the river near Kew bridge it has been conjectured that the village marks the site of an old British settlement. The name first occurs in a document of the reign of Henry VII., where it is spelt Kayhough. The church of St Anne (1714) has a mausoleum containing the tomb of the duke of Cambridge (d. 1850) and son of George III., and is also the burial-place of Thomas Gainsborough the artist, Jeremiah Meyer the painter of miniatures (d. 1789), John Zoffany the artist (d. 1810), Joshua Kirby the architect (d. 1774), and William Aiton the botanist and director of Kew Gardens (d. 1793).

The free school originally endowed by Lady Capel in 1721 received special benefactions from George IV., and the title of "the king's free school."

The estate of Kew House about the end of the 17th century came into the possession of Lord Capel of Tewkesbury, and in 1721 of Samuel Molyneux, secretary to the prince of Wales, afterwards George II. Upon his death it was leased by Frederick prince of Wales, son of George II., and was purchased about 1789 by George III., who devoted his leisure to its improvement. The old house was pulled down in 1802, and a new mansion was begun from the designs of James Wyatt, but the king's death prevented its completion, and in 1827 the portion built was removed. Dutch House, close to Kew House, was sold by Robert Dudley, earl of Leicester, to Sir Hugh Portman, a Dutch merchant, late in the 17th century, and in 1781 was purchased by George III. as a nursery for the royal children. It is a plain brick structure, now known as Kew Palace.
The Royal Botanic Gardens of Kew originated in the exotic garden formed by Lord Capel and greatly extended by the princess dowager, widow of Frederick, prince of Wales, and by George III., aided by the skill of William Aiton and of Sir Joseph Banks. In 1840 the gardens were adopted as a national establishment, and transferred to the department of woods and forests. The gardens proper, which originally contained only about 11 acres, were subsequently increased to 75 acres, and the pleasure grounds or arboretum adjoining extend to 270 acres. There are extensive conservatories, botanical museums, including the magnificent herbarium and a library.

A large Chinese pagoda was erected in 1761. A flagstaff 150 ft. high is made out of the fine single trunk of a Douglas pine. In the neighbouring Richmond Old Park is the important Kew Observatory.

KEWANEE, a city of Henry county, Illinois, U.S.A., in the N.W. part of the state, about 53 m. N. by W. of Peoria. Pop. (1800), 3832, of whom 2000 were foreign-born; (1910) census, 9307. It is served by the Chicago Burlington & Quincy railroad and by the Galesburg & Kewanee Electric railway. Among its manufactures are foundry and machine-shop products, boilers, carriages and wagons, agricultural implements, pipe and fittings, working-men's gloves, &c. In 1905 the total factory product was valued at $6,729,381, or 61.5% more than in 1900. Kewanee was settled in 1836 by people from Wethersfield, Connecticut, and was first chartered as a city in 1857.

KEY, SIR ASTLEY COOPER (1821-1888), English admiral, was born in London in 1821, and entered the navy in 1833. His father was Charles Aston Key (1793-1849), a well-known surgeon, the pupil of Sir Astley Cooper, and his mother was the latter's niece. After distinguishing himself in active service abroad, on the South American station (1844-1846), in the Baltic during the Crimean War (C.B. 1855) and China (1857), Key was appointed in 1858 a member of the royal commission on national defence, in 1860 captain of the steam reserve at Devonport, and in 1863 captain of H.M.S. "Excellent" and superintendent of the Royal Naval College. He had a considerable share in advising as to the reorganization of administration, and in 1866, having become rear-admiral, was made director of naval ordinance. Between 1869 and 1872 he held the offices of superintendent of Portsmouth dockyard, superintending pay of Marine dockyard, and head of the commission in the Mediterranean. In 1872 he was made president of the projected Royal Naval College at Greenwich, which was organized by him, and after its opening in 1873 he was made a K.C.B. and a vice-admiral. In 1876 he was appointed commander-in-chief on the North American and West Indian station. Having become full admiral in 1878, he was appointed in 1879 principal A.D.C., and soon afterwards first naval lord of the admiralty, retaining this post till 1885. In 1882 he was made G.C.B. He died at Maidenhead on the 3rd of March, 1888.

See Memoirs of Sir Astley Cooper Key, by Vice-Admiral Colomb (1898).

KEY, THOMAS HEWITT (1799-1875), English classical scholar, was born in London on the 20th of March, 1799. He was educated at St John's and Trinity Colleges, Cambridge, and graduated 19th wrangler in 1821. From 1825 to 1827 he was professor of mathematics in the university of Virginia, and after his return to England was appointed (1828) professor of Latin in the newly founded university of London. In 1832 he became joint headmaster of the school founded in connexion with that institution; in 1844 he resigned the professorship of Latin, and took up that of comparative grammar together with the undivided headmastership of the school. These two posts he held till his death on the 29th of November 1875. Key is best known for his introduction of the crude-form (the uninflated form or stem of words) system, in general use among Sanskrit grammarians,into the teaching of the classical languages. This system was embodied in his Latin Grammar (1846). In Language, its Origin and Development (1874), he upholds the onomatopoetic theory. Key was prejudiced against the German "Sanskritists," and the etymological portion of his Latin Dictionary, published in 1888, was severely criticized on this account. He was a member of the Royal Society and president of the Philological Society, to the Transactions of which he contributed largely.

See Proceedings of the Royal Society, vol. xxiv. (1876); R. Ellis in the Academy (Dec. 4, 1875); J. P. Hicks, T. Hewitt Key (1893), where a full list of his works and contributions is given.

KEY (in O. Eng. cæg; the ultimate origin of the word is unknown; it appears only in Old Frisian kei of other Teutonic languages; until the end of the 17th century the pronunciation was kei, as in other words in O. Eng. ending in cæg; cf. daeg, day; clæg, clay; the New English Dictionary takes the change to kee to be due to northern influence), an instrument of metal used for the opening and closing of a lock (see Lock). Until the 14th century bronze and not iron was most commonly used. The terminals of the stem of the keys were frequently decorated, the "how" or loop taking the form sometimes of a trefoil, with figures inscribed within it; this decoration increased in the 16th century, the terminals being made in the shape of animals and other figures. Still more elaborate ceremonial keys were used by the officers of certain institutions; a series of chancellor's keys used during the 18th and 19th centuries in several courts in Europe is in the British Museum. The terminals are decorated with crowns, royal monograms and ciphers. The word "key" is by analogy applied to things regarded as means for the opening or closing of anything, for the making clear that which is hidden. Thus it is used of an interpretation as to the arrangement of the letters or words of a cipher, of a solution of mathematical or other problems, or of a translation of exercises or books, &c., from a foreign language. The term is also used figuratively of a place of commanding strategic position. The "Key of the Mediterranean," was granted in 1462 by Henry IV. of Castile, the arms, gules, a castle proper, with key pendant to the gate, or; these arms form the badge of the 40th regiment of foot (now and Batt. Essex Regiment) in the British army, in memory of the part which it took in the siege of 1782.

The word is also frequently applied to many mechanical contrivances for unfastening or loosening a valve, nut, bolt, &c., such as a spanner or wrench, and to the instruments used in tuning a piano-forte or harp or in winding clocks or watches. Further extension of the word is to appliances or devices which serve to lock or (rarely) to unlock, and "key" is especially applied to devices used for unlocking doors, as the "key-stone" of an arch, the wedge or piece of wood, metal, &c., which fixes a joint, or a small metal instrument, shaped like a U, used to secure the bands in the process of sewing in book-binding.

In musical instruments the term "key" is applied in certain wind instruments, particularly of the wood-wind type, to the levers which open and close valves in order to produce various notes, and in keyboard instruments, such as the organ or the pianoforte, to the exterior white or black parts of the levers which either open or shut the valves to admit the wind from the bellows to the pipes or to release the hammers against the strings (see Keyboard). It is from this application of the word to these levers in musical instruments that the term is also used of the parts pressed by the finger in typewriters and in telegraphic instruments.

A key is the insignia of the office of chamberlain in a royal household (see Chamberlain and Lord Chamberlain). The "power of the keys" (clavis potestas) in ecclesiastical usage represents the authority given by Christ to Peter by the words, "I will give unto thee the keys of the kingdom of heaven" (Matt. xvi. 19). This is claimed by the Roman Church to have been transmitted to the popes as the successors of St Peter. "Key" was formerly the common spelling of "quay," a wharf, and is still found in America for "cay," an island reef or sandbank off the coast of Florida (see Quay).

The origin of the name Keys or House of Keys, the lower branch of the legislature, the court of Tynwald, of the Isle of Man, has been much discussed, but it is generally accepted that it is a particular application of the word "key" by English-and not Manx-speaking
people. According to A. W. Moore, History of the Isle of Man, i. 160 sqq. (1900), in the Manx statutes and records the name of the house of Kiare-at or, the first part of Kiere de legs, Keys of Man, is the house of the King; but the popular and ecclesiastical documents referring to 1358 seems to have been "the 24," in Manx Kiare as fead. From 1385 to 1374 the name was in the statutes, &c., "the 24 Keys," or simply "Kiare." It was suggested by earlier English writers that the name was originally due to an English "clerk of the rolls," the members of the house being called in to "unlock or solve the difficulties of the law." There is no evidence for the suggestion that Keys is an English corruption of the name. In sense, the first part of Kiere de legs, Keys of Man, is a primitive contrivance. The keyboard of the organ, a purely mechanical contrivance, is the external means of communicating with the valves or pallets that open and close the entrances to the pipes. As its action is incapable of variation at the will of the performer, the keyboard of the organ remains without influence on the quality and intensity of the sound. The keyboard of the piano, on the contrary, besides its purely mechanical function, also forms a sympathetic vehicle of transmission for the performer's emotional and mental feeling, in consequence of the faithfulness with which it passes the impulses communicated by the fingers. The keyboard proper does not, in instrument, contain any mechanical apparatus for directly unlocking the sound, but only that external part of it which is accessible to the performer. The first instrument provided with a keyboard was the organ; we must therefore seek for the prototype of the modern keyboard in connection with the primitive instrument which marks the transition between the mere keys provided with bellows, in which all the pipes sounded at once unless stopped by the fingers, and the first organ in which sound was elicited from a pipe only when unlocked by a finger movement. The earliest contrivance was the simple slider, provided with a key or touch, and working in a groove like the lid of a box, which was merely pushed in or drawn out to open or close the hole that formed the communication between the wind and the bellows. Meanwhile the idea of the keyboard had been evolved. These sliders fulfilled in a simple manner the function of the modern keys, and preceded the groove and pallet system of the modern organ. We have no clear or trustworthy information concerning the primitive organ with sliders. Athenaeus Kircher gives a drawing of a small mouth-blown instrument under the name of Magraetha (Masroqitha, Dan. iii. 3), and Ugolin describes a similar one, called the cembalo. The cembalo of Ardishkin. 1 By analogy with the evolution of the organ in central and western Europe from the 8th to the 15th century, in which we are able to study the various stages, we may conclude that in primitive times both the nature and the manner of representation would in no way differ from what is seen in the instruments of the 8th century, i.e. a diatonic with B flat included, but grouped in the space of a sixth instead of appearing as a full octave. In order to carry out this device, the note F was C, instead of E, the missing D and E and the B flat being substituted for the three sharps of F, G and A, and as appearing black notes, thus:—

D E By
C F G A B C
G D E F G A

1 See Mussuraca, bk. ii., iv. § 3.
3 Il. 13 and fol. 10. 2. Ardishkin ("Valuations") is a treatise in the Babylonian Talmud. The word Magraethah occurs in the Miqra'ei Zabur, in the 1st century, 4 See the Civiale Prayere Book of St Elizabeth in Arthur Haseloff's Eine Sachs.-thiiringer Malerschule, pp. 26, 57, also Bible of St Etienne Harding at Dijon (see Organ: History).
KEYSTONE—HAIRPUR

half for the drone note, the back half for the chromatic semitone, thus:

\[
\begin{align*}
\text{F}_# & \quad \text{G}_# \\
\text{D} & \quad \text{E} & \quad \text{B}_9
\end{align*}
\]

This arrangement, which accomplishes its object without sacrifice, was to be found early in the 17th century in the organs of the monasteries of Riddagshausen and of Bayreuth in Vogtland.

See A. J. Hipkiss, History of the Pianoforte (London, 1896), and the older works of Girolamo Diruta (1597), Praetorius (1618), and Mersenne (1636).

KEYSTONE, the central voussoir of an arch (q.v.). The Etruscans and the Romans emphasized its importance by decorating it with figures and busts, and, in their triumphal arches, projected it forward and utilized it as an additional support to the architrave above. Throughout the Italian period it forms an important element in the design, and serves to connect the arch with the horizontal moldings running above it. In Gothic architecture there is no keystone, but the junction of pointed ribs at their summit is sometimes decorated with a boss to mask the intersection.

KEY WEST (from the Spanish Cayo Hueso, "Bone Reef"), a city, port of entry, and the county-seat of Monroe county, Florida, U.S.A., situated on a small coral island (4.3m. long and about 1 m. wide) of the same name, 60 m. S.W. of Cape Sable, the most southerly point of the mainland. It is connected by lines of steamers with Miami and Port Tampa, with Galveston, Texas, with Mobile, Alabama, with Philadelphia and New York City, and with West Indian ports, and by regular schooner lines with New York City, the Bahamas, British Honduras, &c. There is now an extension of the Florida East Coast railway from Miami to Key West (155 m.). Pop. (1880), 9,890; (1890), 18,080; (1900), 17,114, of whom 7,666 were foreign-born and 5,662 were negroes; (1910 census), 19,945. The island is notable for its tropical vegetation and climate. The jasmine, almond, banana, cork and coco-nut palm are among the trees. The oleander grows here to be a tree, and there is a banyan tree, said to be the only one growing out of doors in the United States. There are many species of plants in Key West not found elsewhere in North America. The mean annual temperature is 76° F., and the mean of the hottest months is 82°-8° F.; that of the coldest months is 66° F.; thus the mean range of temperature is only 16°. The precipitation is 35 in.; most of the rain falls in the "rainy season" from May to November, and is preserved in cisterns by the inhabitants as the only supply of drinking water. The number of cloudy days per annum averages 60. The city occupies the highest portion of the island. The harbour accommodates vessels drawing 27 ft.; vessels of 27–30 ft. draft can enter by either the "Main Ship" channel or the south-west channel; the south-east channel admits vessels of 25 ft. draft or less and four other channels may be used by vessels of 15–10 ft. draft. The harbour is defended by Fort Taylor, built on the island of Key West in 1846, and greatly improved and modernized after the Spanish-American War of 1898. Among the buildings are the United States custom house, the city hall, a convent, and a public library.

In 1860 the insignificant population of Key West was greatly increased by Cubans who left their native island after an attempt at revolution; they engaged in the manufacture of tobacco, and Key West cigars were soon widely known. Towards the close of the 19th century this industry suffered from labour troubles, from the competition of Tampa, Florida, and from the commercial improvement of Havana, Cuba; but soon after 1900 the tobacco business of Key West began to recover. Immigrants from the Bahama Islands form another important element in the population. They are known as "Conchs," and engage in sponge fishing. In 1905 the value of factory products was $4,254,024 (an increase of 37.7% over the value in 1900); the exports in 1907 were valued at $52,457; the imports were valued at $994,472, the excess over the exports being due to the fact that the food supply of the city is derived from other Florida ports and from the West Indies.

According to tradition the native Indian tribes of Key West, after being almost annihilated by the Caloosas, fled to Cuba. There are relics of early European occupation of the island which suggest that it was once the resort of pirates. The city was settled about 1822. The Seminole War and the war of the United States with Mexico gave it some military importance. In 1861 Confederate forces attempted to seize Fort Taylor, but they were successfully resisted by General William H. French.

HAIRPUR (KHAIRPUR) (KHAHAROVSK) (known as Khaibara until 1897), a town of Tatar Russia, capital of Khaibara region of the Maritime Province. Pop. (1897), 14,632. It was founded in 1858 and is situated on a high cliff on the right bank of the Amur, at its confluence with the Usuri, in 48° 28' N. and 135° 6' E. It is connected by rail with Vladivostok (480 m.), and is an important entrepot for goods coming down the Usuri and its tributary the Sungacha, as well as a centre of trade, especially in sables. The town is built of wood, and has a large cathedral, a monument (1891) to Count Muraviev-Amursky, a cadet corps (new building 1904), a branch of the Russian Geographical Society, with museum, and a technical railway school.

HAIRAGARH, a feudatory state in the Central Provinces, India. Area, 931 sq. m.; pop. (1901), 1,277,556, showing a decrease of 24% in the decade due to the effects of famine; estimated revenue, £6,000; tribute £4,600. The chief, who is descended from the old Gond royal family, received the title of raja as a hereditary distinction in 1808. The state includes a fertile plain, yielding rice and cotton. Its prosperity has been promoted by the Bengal-Nagpur railway, which has a station at Dongargarh, the largest town (pop. 5,850), connected by road with Khairagarh town. The state is feudatory to the raja of the raja of Tophane.

HAIRREDIN (Khair-ed-Din = "joy of Religion") (d. 1890), Turkish statesman, was of Circassian race, but nothing is known about his birth and parentage. In early boyhood he was in the hands of a Tunisian slave-dealer, by whom he was sold to Hamuda Pasha, then bey of Tunis, who gave him his freedom and a French education. When Khaireddin left school the bey made him steward of his estates, and from this position he rose to be minister of finance. When the prime minister, Mahmut ben Ayad, abdced to France with the treasure-chest of the beylic, Hamuda dispatched Khaireddin to obtain the extradition of the fugitive. When Khaireddin made himself widely known in France, to become acquainted with French political ideas and administrative methods, and, on his return to Tunisia, to render himself more than ever useful to his government. Hamuda died while Khaireddin was in France, but he was highly appreciated by the three beyes—Ahmet (1837), Mohammed (1855), and Sadok (1859)—who in turn followed Hamuda, and to his influence was due the sequence of liberal measures which distinguished their respective reigns. Khaireddin also secured for the reigning family the confiscated property of the sultan of Turkey in their right of succession to the beylic. But although Khaireddin's protracted residence in France had imbued him with liberal ideas, it had not made him a French partisan, and he strenuously opposed the French scheme of establishing a protectorate over Tunisia upon which France embarked in the early 'seventies. This rendered him obnoxious to Sadok's prime minister—an apostate Jew named Mustapha ben Israel—who succeeded in completely undermining the bey's confidence in him. His position thus became untenable in Tunisia, and shortly after the accession of Abdul Hamid he acquainted the sultan with his desire to enter the Turkish service. In 1877 the sultan bade him come to Constantinople, and on his arrival gave him a seat on the Reform Commission then sitting at Topanche. Early in 1879 the sultan appointed him grand vizier, and shortly afterwards he prepared a scheme of constitutional government, but Abdul Hamid refused to have anything to do with it. Thereupon Khaireddin resigned office, on the 28th of July 1879. More than once the sultan offered him the grand vizierate, but Khaireddin persistently refused it, and thus incurred disfavour. He died on the 30th of January 1890, practically a prisoner in his own house.

HAIRPUR, or Khairpur, a native state of India, in the Sind province of Bombay. Area, 6059 sq. m.; pop. (1901),
KHJRAHO—KHAMSIN

showing an apparent increase of 55 % in the decade; estimated revenue, £50,000. Like other parts of Sind, Khairpur consists of a great alluvial plain, very rich and fertile in the neighbourhood of the Indus and the irrigation canals, the remaining area being a continuous series of sand-hill ridges covered with a thin Indian Munjity. The alluvial valley was made impossible. A small ridge of limestone hills passes through the northern part of the state, being a continuation of a ridge known as the Ghar, running southwards from Rohri. The state is watered by five canals drawn off from the Indus, besides the Eastern Nara, a canal which follows an old bed of the Indus. In the desert tracts are pits of natron.

Khairpur town is situated on a canal 15 m. E. of the Indus, with a railway station, 20 m. S. of Sukkur, on the Kotri-Rohri branch of the North-Western railway, which here crosses a crater of the same name. From Sukkur, 14° N. and there are manufactures of cloth, carpets, goldsmiths' work and arms, and an export trade in indigo, grain and oilseeds.

The chief, or mir, of Khairpur belongs to a Baluch family, known as the Talpur, which rose on the fall of the Kalhora dynasty of Sind. About 1813, during the troubles in Kabul incidental to the establishment of the Barakzai dynasty, the mirs were able to withdraw the tribute which up to that date had been somewhat irregularly paid to the rulers of Afghanistan. In 1832 the individuality of the Khairpur state was recognized by the British government in a treaty under which the use of the river Indus and the roads of Sind were secured to it. When the first Kabul expedition was decided on, the mir of Khairpur, Ali Murad, cordially supported the British policy and the result was that, after the battles of Meeanee and Daba had put an end to the dispute, the improve of the British government was recognized by the only state allowed to retain its political existence under the protection of the paramount power. The chief mir, Faiz Mohammed Khan, G.C.I.E., was an enlightened ruler, died in 1899, shortly after returning from a pilgrimage to the Shire shrine of Kerbela.

KHJRAHO, a village of Central India, in the state of Chhatarpur, famous for its old temples; pop. (1901), 1242. It is believed to have been the capital of the ancient kingdom of Jhött, corresponding with modern Bundelkhand. The temples coincide with the site. S. of Sehore, a village, built almost in the 10th and 11th centuries. They are covered outside and inside with elaborate sculptures, and also bear valuable inscriptions.

KHAKI (from Urdu khak, dust), originally a dust-coloured fabric, of the character of canvas, drill or holland, used by the British and native armies in India. It seems to have been first worn by the Guides, a mixed regiment of frontier troops, in 1848, and to have spread to other regiments during the following years. Some at any rate of the British troops had uniforms of khaki drill, 1857–58, and in 1857–58, the Khaki drill on holland (generally called "khaki") which was its colour, became the almost universal dress of British and native troops in Asia and Africa. During the South African War of 1899–1902, drill of a sandy shade of brown was worn by all troops sent out from Great Britain and the Colonies. Khaki drill, however, proved unsuitable material for the cold weather in the uplands of South Africa, and after a time the troops were supplied with dust-coloured serge uniforms. Since 1900 all drab and green-grey uniforms have been, unofficially at any rate, designated khaki.

KHALIFA, THE. Abdullah et Taasha (Seyyid Abdullah ibn Seyyid Mahommed) (1846–1890), successor of the mahdi Mahommed Ahmed, born in 1846 in the south-western portion of Darfur, was a member of the Taasha section of the Baggaro or cattle-owning Arabs. His father, Mahommed et Taki, had determined to emigrate to Mecca with his family; but the unsettled state of the country long prevented him, and he died in Africa after visiting his eldest son, Abdullah, to take refuge with some religious sheik on the Nile, and to proceed to Mecca on a favourable opportunity. Abdullah, who had already had much connexion with slave-hunters, and had fought against the Egyptian conquest of Darfur, departed for the Nile valley with this purpose; hearing on the way of the disputes of Mahommed Ahmed, who had not yet claimed a sacred character, with the Egyptian officials, he went to him in spite of great difficulties, and, according to his own statement, at once recognized in him the mahdi ("guide") divinely appointed to regenerate Islam in the latter days. His advice to Mahommed to stir up revolt in Darfur and Kordofan being justified by the result, he became his most trusted counsellor, and was soon declared principal viceroy of the mahdi; all of whom acted as were to be regarded as the mahdi's own. The mahdi on his deathbed (1889) solemnly named him his successor; and for thirteen years Abdullah ruled over what had been the Egyptian Sudan. Khartum was deserted by his orders, and Omdurman, at first intended as a temporary camp, was made his capital. At length the progress of Sir Herbert (afterwards Lord) Kitchener's expedition compelled him to give battle to the Anglo-Egyptian forces near Omdurman, where on the 2nd of September 1898 his army, fighting with desperate courage, was almost annihilated. The khilifah, who had not left Omdurman since the death of the mahdi, fled to Kordofan with the remnant of his host. On the 29th of November 1899 he gave battle to a force under Colonel (afterwards General Sir) F. R. Wingate, and was slain at Om Debrihat. He met death with great fortitude, refusing to fly, and his principal amirs voluntarily perished with him.

The khilifah was a man of iron will and great energy, and possessed some military skill. By nature tyrannical, he was impatient of all opposition and appeared to delight in cruelty. It must be remembered, however, that he had to meet the secret or open hostility of all the tribes of the Nile valley and that his authority was dependent on his ability to overawe his opponents. He maintained in public the divine character of the power he inherited from the mahdi and inspired his followers to perform prodigies of valour. Although he treated many of his European captives with terrible severity he never had any of them executed. It is said that their presence in Omdurman ministered to his vanity—one of the most marked features of his character. In private life he showed much affection for his family.

Personal sketches of the khilifah are given in Slatin Pasha's Fire and the Sword (1899), and in F. R. Wingate's Ten Years in the Mahdi's Camp (London, 1892). See also Sir F. R. Wingate's Mahdisimt and the Egyptian Sudan (London, 1891).

KHAILIL IBN AHMAD [Abu `Abdullahir`Amil, Khailil Ibn Ahmad Ibn `Amir Ibn Tamim] (1718–1791), Arabian philologist, was a native of Oman. He was distinguished for having written the first Arabic dictionary and for having first-classified the Arabic metres and laid down their rules. He was also a poet, and lived the ascetic life of a poor student. His grammatical work was carried on by his pupil Sibawaih. The dictionary known as the Khailil, it is ascribed, however, that he had to meet the secret or open hostility of all the tribes of the Nile valley and that his authority was dependent on his ability to overawe his opponents. He maintained in public the divine character of the power he inherited from the mahdi and inspired his followers to perform prodigies of valour. Although he treated many of his European captives with terrible severity he never had any of them executed. It is said that their presence in Omdurman ministered to his vanity—one of the most marked features of his character. In private life he showed much affection for his family.

Personal sketches of the khilifah are given in Slatin Pasha's Fire and the Sword (1899), and in F. R. Wingate's Ten Years in the Mahdi's Camp (London, 1892). See also Sir F. R. Wingate's Mahdisimt and the Egyptian Sudan (London, 1891).

KHAMGAON, a town of India, in the Buldana district of Berar, 340 m. N.E. of Bombay. Pop. (1901), 18,341. It is an important centre of the cotton trade. The cotton market, the second in the province, was established about 1820. Khamgaon was connected in 1870 with the Great Indian Peninsula railway by a short branch line.

KHAMSEH, a small but important province of Persia, between Kazvin and Tabriz. It consisted formerly of five districts, whence its name Khamsch, "the five," but is now subdivided into seventeen districts. The language of the inhabitants is Turkish. The province pays a revenue of about £2,000,000 per annum, and its capital is Zanjan.

KHAMSIN (Arabic for "fifty"), a hot oppressive wind arising in the Sahara. It blows in Egypt at intervals for about fifty days during March, April and May, and fills the air with sand. In Guinea the wind from the Sahara is known as harmattan (g.t.).
KHANTIS—KHARGA

KHANTIS, a tribe of the north-east frontier of India, dwelling in the hills bordering the Lakhnudip district of Assam. They are of Shan origin, and appear to have settled in their present abode in the middle of the 18th century. In 1839 they raided the British outpost of Sadiya, but they have since given no trouble. Their headquarters are in a valley 200 m. from Sadiya, which can be reached only over high passes and through dense jungles. In 1901 the number of speakers of Khamti was returned as only 1,450, mostly in Burmese.

KHAN (from the Turkā, hence Persian and Arabic Khān), a title of respect in Mahomedan countries. It is a contracted form of khaqān (khakan), a word equivalent to sovereign or emperor, used among the Mongol and Turki-nomad bords. The title was assumed by Jenghis when he became supreme ruler of the Mongols; his successors became known in Europe as the Great Khans (sometimes as the Chams, &c.) of Tatar or Cathay. Khan is still applied to semi-independent rulers, such as the Khans of Russian Turkestan, or the Khan of Kalat in Baluchistan, and is also used immediately after the name of rulers such as the sultan of Turkey; the meaning of the term has also extended downwards, until in Persia and Afghanistan it has become an affix to the name of any Mahomedan gentleman, like Esquire, and in India it has become a part of many Mahomedan names, especially when Pathan descent is claimed. The title of Khan Bahadur is conferred by the British government on Mahomedans and also on Parsis.

KHANDESHE, EAST and WEST, two districts of British India, in the central division of Bombay. They were formed in 1896 by the division of the old district of Khandesh. Their areas are respectively 4,544 sq. m. and 5,497 sq. m., and the population on these areas in 1901 was 957,728 and 469,654. The headquartes of East Khandesh are at Jalgaon, and those of West Khandesh at Dhulia.

The principal natural feature is the Tapti river, which flows through both districts from east to west and divides each into two unequal parts. Of these the larger lies towards the south, and are drained by the rivers Girna, Bori and Panjira. Northwards beyond the alluvial plain, which contains some of the richest tracts in Khandesh, the land rises towards the Satpura hills. In the centre and east the country is level, save for some low ranges of barren hills, and in general an arid, unfertile appearance. Towards the north and west, the plain rises into a difficult and rugged country, thickly wooded, and inhabited by wild tribes of Bhils, who chiefly support themselves on the fruits of the forests and by wood-cutting. The drainage of the district centres in the Tapti, which receives thirteen principal tributaries in its course through Khandesh. None of the rivers is navigable, and the Tapti flows in too deep a bed to be useful for irrigation. The district on the whole, however, is fairly well supplied with surface water, though it is not rich in minerals. A large area is under forest; but the jungles have been denuded of most of their valuable timber. Wild beasts are numerous. In 1901 the population of the old single district was 1,427,382, showing an increase of less than 1% in the decade. Of the aboriginal tribes the Bhils are the most important. They number 167,000, and formerly were a wild and lawless robber tribe. Since the introduction of British rule, the efforts made by kindly treatment, and by the offer of suitable employment, to win the Bhils from their disorderly life have been most successful. Many of them are now employed in police duties and as village watchmen. The principal crops are millets, cotton, pulse, wheat and oilseeds.

There are many factories for ginning and pressing cotton, and a cotton-mill at Jalgaon. The eastern district is traversed by the Great Indian Peninsula railway, which branches at Bhussawal (an important centre of trade) towards Jubbulpore and Nagpur. Both districts are crossed by the Tapti Valley line from Surt. Khandesh suffered somewhat from famine in 1896-1897, and more severely in 1899-1900.

KHANDWA, a town of British India, in the Nimar district of the Central Provinces, of which it is the headquarters 353 m. N.E. of Bombay by rail. Pop. (1901), 19,401. Khandwa is an ancient town, with Jain and other temples. As a centre of trade, it has superseded the old capital of Burhanpur. It is an important railway junction, where the Malwa line from Indore meets the main line of the Great Indian Peninsula. There are factories for ginning and pressing cotton, and raw cotton is exported.

KHANSA ( Tunmir sin 'Amr, known as al-Khansa) (d. c. 645), Arabian poetess of the tribe Sulaim, a branch of Qais, was born in the latter part of the 6th century and brought up in wealth and luxury as the desert could give. Refusing the offer of Duraid ibn uq-Simma, a poet and prince, she married Mirdas and had by him three sons. Afterwards she married again. Before the time of Islam she lost her brothers Sakhr and Moawiyah in battle. Her elegies written on these brothers and on her father made her the most famous poetess of her time. At the fair of 'Ukáz Nábíghá Dhubýámi is said to have placed a 'sha' first among the poets then present and Khansa second above Hassán ibn Thábít. Khansa with her tribe accepted Islam somewhat late, but persisted in wearing the heathen sign of mourning, against the precepts of Islam. Her four sons fought in the armies of Islam and were slain in the battle of Kádiýáma. Omar wrote her a letter congratulating her on their heroic end and assigned her a pension. She died in her tent c. 645. Her daughter 'Amra also wrote poetry. Opinion was divided among later critics as to whether Khansa or Laila (see Arabic literature: § Poetry) was the greater.

Her diwan has been edited by L. Cheikho (Beirut, 1895) and translated into French by De Coppier (Beirut, 1886). C. Fr. Noldeke's Beiträge zur Kenntnis der Poesie der altten Araber (Hanover, 1864). Stories of her life are contained in the Kitáb al-Akhání, XIII, 136-147 (G. W. T.).

KHAR, a small but very fertile province of Persia, known by the ancients as Choara and Choræren; pop. about 10,000. The governor of the province resides at Khishk Khar, a large village situated 62 m. S.E. of Teheran, or at Aradán, a village 10 m. farther E. The province has an abundant water-supply from the Hableh-rūd, and produces great quantities of wheat, barley and rice. Of the 16,000 which it pays to the state, more than 14,000 is paid in kind—wheat, barley, straw and rice.

KHARAGHODA, a village of British India, in the Ahmedabad district of Bombay, situated on the Little Rann of Cutch, and the terminus of a branch railway; pop. (1901), 2105. Here is the government factory of salt, known as Baragra salt, producing nearly 2,000,000 cwt. a year, most of which is exported to other provinces in Central and Northern India.

KHARGA (Wâit el-Khargâ, the outer oasis), the largest of the Egyptian oases, and hence frequently called the Great Oasis. It lies in the Libyan desert between 24° and 26° N. and 30° and 31° E., the chief town, also called Kharga, being 435 m. by rail S. by W. of Cairo. It is reached by a narrow-gauge line (opened in 1893) from Kharga junction, a station on the Nile valley line near Farshut. The oasis consists of a depression in the desert some 2,100 sq. m. in extent, and is about 100 m. long N. to S. and from 12 to 50 broad E. to W. Formerly, and into historic times, a lake occupied a considerable part of the depression, and the thick deposits of clay and sand then laid down now form the bulk of the cultivated lands of the oasis. It includes, however, a good deal of desert land. The inhabitants numbered (1907 census) 8348. They are of Berber stock. Administratively the oasis forms part of the mudiria of Assiut. It is practically rainless, and there is not now a single natural flowing spring. There are, however, numerous wells, water being obtained freely from the porous sandstone which underlies a great part of the Libyan desert. Some very ancient wells are 400 ft. deep. In water-bearing sandstones near the surface there are underground aqueducts dating from Roman times. The oasis contains many groves of date palms, there being over 60,000 adult trees in 1907. The dom palm, tamarik, acacia and wild senna are also found. Rice, barley and wheat are the chief cereals cultivated, and lucerne for fodder. Besides agriculture there is an industry in snuff and mat-making—from palm leaves and fibres. Since 1906 extensive boring and land reclamation works have been undertaken in the oasis.
The name of the oasis appears in hieroglyphics as Kenen, and that of its capital as Hōi (the plough). In Pharaonic times it supported a large population, but the numerous ruins are mostly of later date. The principal ruin, a temple of Ammon, built under Darius, is of sandstone, 142 ft. long by 63 ft. broad and 30 ft. in height. South-east is another temple, a square stone building with the name of Antoninus Plus over one of the entrances. On the eastern escarpment of the oasis on the way to Girga are the remains of a large Roman fort with twelve bastions. On the road to Assiut is a fine Roman columbarium or dove-cote. Next to the great temple the most interesting ruin in the oasis is, however, the necropolis, a burial-place of the early Christians, placed on a hill 3 m. N. of the town of Kharga. There are some two hundred rectangular tomb buildings in unburnt brick with ornamented fronts. In most of the tombs is a chamber in which the most notable peculiarity, the inscriptions of the Coptic Christians, are engraven and in this method of preserving the bodies of their dead. In several of the tombs and in the chapel of the cemetery is painted the Egyptian sign of life, which was confounded with the Christian cross. The chapel is basilican; in it and in another building in the necropolis are crude frescoes of biblical subjects.

Kharga town (pop. 1907 census, 5362) is picturesquely situated amid palm groves. The houses are of sun-dried bricks, the streets narrow and winding and for the most part roofed over, the roofs carrying upper storeys. Some of the streets are cut through the solid rock. South of the village is the village of Sit, which contains a well dedicated to Amon, Mut and Khonsu, Bull (pop. 1012), Bakain, Birs (pop. 1954), Dush (with remains of a fine temple bearing the name of Domitian and Hadi). Kharga is usually identified with the city of Oasis mentioned by Herodotus as being seven days' journey from Thebes and called in Greek the Island of the Blessed. The oasis was traversed by the army of Cambyses when on its way to the oasis of Ammon (Siwa), the army perishing in the desert before reaching its destination. During the Roman period, as it had also been in Pharaonic times, Kharga was used as a place of banishment, the most notable being the Egyptian Christians but after his condemnation by the council of Ephesus. Later it became a halting-place for the caravans of slaves brought from Darfur to Egypt.

About 100 m. W. of Kharga is the oasis of Dakhla, the inner or receding oasis, so named in contrast to Kharga as being farther from the Nile. Dakhla has a population (1907) of 18,368. Its chief town, El Ksar, has 3602 inhabitants. The principal ruin, of Roman origin and now called Deir el Hagar (the stone convent), is of considerable size. The Theban triad were the chief deities worshipped here. Some 120 m. N.W. of Dakhla is the oasis of Farafra, a population about 1000, said to be the first of the oases conquered by the Moslems from the Christians. It is noted for the fine quality of its olives. The Baharia, or Little Oasis (pop. about 6000), lies 80 m. N.E. of Farafra. Many of its inhabitants, who are of Berber race, are Senussites. Baharia is about 250 m. E.S.E. of the oasis of Siwa (see Egypt: The Oases; and Siwa).

(London, 1912); Geographical and Topographical Report on the Oasis of 1809, on Farafra Oasis (1809), on Dakhla Oasis (1809), on Baharia Oasis (1809), all issued by the Public Works Department, Cairo. (F. R. C.)

KHARKOV, a government of Little Russia, surrounded by those of Kursk, Poltava, Ekatarninoslav, territory of the Don Cossacks, and Voronezh, and belonging partly to the basin of the Don and partly to that of the Dnieper. The area is 21,935 sq. m. In general the government is a table-land, with an elevation of 500 to 400 ft., traversed by deep-cut river valleys. The soil is for the most part of high fertility, about 57%, of the surface being arable land and 24% natural pasture; and though the winter is rather severe, the summer heat is sufficient for the ripening of grapes and melons in the open air. The bulk of the population is engaged in agricultural pursuits and the breeding of sheep, cattle and horses, though various manufacturing industries have developed rapidly, more especially since the middle of the 19th century. Horses are bred for the army, and the yield of wool is of special importance. The ordinary cereals, maize, buckwheat, millet hemp, flax, tobacco, peas, potatoes, and beetroot are all grown, and bee-keeping and silkworm-rearing are of considerable importance. Sixty-three per cent. of the land is owned by the peasants, 25% by the nobility, 6% by owners of other classes, and 6% by the crown and public institutions. Beetroot sugar factories, cotton-mills, distilleries, flour-mills, tobacco factories, brickworks, breweries, woolen factories, ironworks, pottery-kilns and tanneries are the leading industrial establishments. Gardening is actively prosecuted. Salt is extracted at Slavyansk. The mass of the people are Little Russians, but there are also great Russians, Kalmyks, Germans and Jews in Gipsies. In 1876 the total population was 3,681,486, and in 1897 2,527,277, of whom 1,242,892 were women and 367,602 lived in towns. The estimated population in 1906 was 2,983,900. The government is divided into eleven districts. The chief town is Kharkov (q.v.). The other district towns, with their populations in 1897, are Akhtyrka (15,065 in 1900), Bogodukhov (11,228), Lyzum (12,959), Kupiansk (7255), Lebedin (15,684), Starobylinsk (13,128), Sumy (28,519 in 1900), Valki (8842), Volchansk (11,322), and Zmiyev (4952).

Kharkov, a town of southern Russia, capital of the above government, in 1781 was a Bourbon fortress, and in 1796 it was captured by the Russian armies of Mong/Kartushov, Corbulo (13,128), Sumy (28,519 in 1900), Valki (8842), Volchansk (11,322), and Zmiyev (4952).

Kharkov, a town of southern Russia, capital of the above government, in 1781 was a Bourbon fortress, and in 1796 it was captured by the Russian armies of Mong/Kartushov, Corbulo (13,128), Sumy (28,519 in 1900), Valki (8842), Volchansk (11,322), and Zmiyev (4952). Kharkov is an archiepiscopal see of the Orthodox Greek Church, and the headquarters of the X. army corps. The four annual fairs are among the busiest in Russia, more especially the Kreshchen-skaya or Epiphany fair, which is opened on the 6th (19th) of January, and the Pokrovsky fair in the autumn. The turnover at the former is estimated at £3,000,000 to £4,000,000. Thousands of horses are bought and sold. At the Trinity (Tru'tsa) fair in June an extensive business (£800,000) is done in wool. A great variety of manufactured goods are produced in the town—linen, felt, beetroot sugar, tobacco, brandy, soap, candles, cast-iron. Kharkov is an educational centre for the higher and middle classes. Besides a flourishing university, instituted in 1805, and attended by from 1600 to 1700 students, it possesses a technological institute (400 students), a railway engineering school, an observatory, a veterinary college, a botanical garden, a theological seminary, and a commercial school. The university building was formerly a royal palace. The library contains 170,000 volumes; and the zoological collections are especially rich in the birds and fishes of the southern Russian steppes. In the Public gardens there is a large menagerie, together with many of the finer military works; and the government has a model farm in the neighbourhood. Of the Orthodox churches one has the rank of cathedral (1751). Among the public institutions are a people's palace (1903) and an industrial museum.

The foundation of Kharkov is assigned to 1659, but there is archaeological evidence of a much earlier occupation of the district, if not of the site. The Cossacks of Kharkov remained faithful to the tsar during the rebellions of the latter part of the 17th century; in return they received numerous privileges, and continued to be a strong advance-guard of the Russian power, till the final subjugation of Ukraine. The government consists of a governor, who during the establishment Kharkov was placed on a new footing in 1765; and at the same time it became the administrative centre of the Ukraine.

KHARKUT, the most important town in the Kharkut (or Mamuret el-Aziz) vilayet of Asia Minor, situated at an altitude of 4350 ft., a few miles south of the Murad Su or Eastern Euphrates, and almost as near the source of the Tigris, on the Samsun-Sivas-Diarbekr road. Pop. about 24,000. The town is built on a hill terrace about 1000 ft. above a still-watered plain. Under the government, in 50th line to and out of its extent, a large population. Kharkut probably stands on or near the site of Carcass-o-certa in Sophene, reached by Corbulo in a.d. 65. The early Moslem geographers knew it as Hisn Ziyad, but the Armenian name was Kartahburt or Kahrhurt, whence Kharkut. Cedrenus (11th century) writes Xapọna. There is a story that in 1122
Joscelin (Jocelyn) of Courtenay, and Baldwin II, king of Jerusalem, both prisoners of the Amir Balak in its castle, were murdered by being cast from its cliffs after an attempted rescue. The story is told by William of Tyre, who calls the place Quart Pier or Pierre, but it is a mere romance. Khartoum is an important station of the American missionaries, who have built a college, a theological seminary, and boys' and girls' schools. In November 1805 Kurds looted and burned the Armenian village of Deir; and in the same month Khartoum was attacked and the American schools were burned down. A large number of the Gregorian and Protestant Armenian clergy and people were massacred, and churches, monastery and houses were looted. The vilayet Khartoum was founded in 1888, being the result of a provincial rearrangement, designed to ensure better control over the disturbed districts of Kurdistan. It has much mineral wealth, a healthy climate and a fertile soil. The seat of government is Mezere, on the plain 3 m. of Khartoum.

KHARSAWAN, a feudatory state of India, within the Chota Nagpur division of Bengal; area 153 sq. m.; pop. (1901), 36,540; estimated revenue £6,000. Since the opening of the main line of the Bengal-Nagpur railway through the state trade has been stimulated, and it is believed that both iron and copper can be worked profitably.

Khartum, the capital of the Anglo-Egyptian Sudan, on the left bank of the Blue Nile immediately above its junction with the White Nile in 15° 36' N., 33° 25' E., and 152 ft. above the sea. It is 432 m. by rail S.W. of Port Sudan, on the Red Sea, and 1,345 m. S. of Cairo by rail and steamer. Pop. (1907) with suburbs, 30,000.

The city, laid out on a plan drawn up by Lord Kitchener in 1898, has a picturesque aspect with its numerous handsome stone and brick buildings surrounded by gardens and its groves of palms and other trees. The river esplanade, 2 m. long, contains the chief buildings. Parallel with it is Khedive Avenue, of equal length. The rest of the city is in squares, the streets forming the design of the union jacks. In the centre of the esplanade is the governor-general's palace, occupying the site of the palace destroyed by the Mahdists in 1885. It is a three-storied building with arcaded verandas and a fine staircase leading to a loggia on the first floor. Here a tablet indicates the spot in the old palace where General Gordon fell. In the gardens, which cover six acres, is a colossal stone "lamb" brought from the ruins of Soba, an ancient Christian city on the Blue Nile. The "lamb" is in reality a ram of Ammon, and has an inscription in Ethiopian hieroglyphs. In front of the southern façade, which looks on to Khedive Avenue, is a bronze statue of General Gordon seated on a camel, a copy of the statue by Onslow Ford at Chatham, England. Government offices and private villas are on either side of the palace, and beyond, on the east, are the Sudan Club, the military hospital, and the Gordon Memorial College. The college, the chief educational centre in the Sudan, is a large, many-windowed building with accommodation for several hundred scholars and research laboratories and an economic museum. At the western end of the esplanade are the zoological gardens, the chief hotel, the Coptic church and the Mudiria House (residence of the governor of Khartum). Running south from Khedive Avenue at the spot where the Gordon statue stands, is Victoria Avenue, leading to Abbas Square, in the centre of which is the great mosque with two minarets. On the south-east side of the square are the public markets. The Anglican church, dedicated to All Saints, the principal banks and business houses, are in Khedive Avenue. There are Maronite and Greek churches, an Austrian Roman Catholic mission, a large and well-equipped civil hospital and a museum for Sudan archaeology. Outside the city are a number of model villages (each of the principal tribes of the Sudan having its own settlement) in which the dwellings are built after the tribal fashion. Adjacent are the parade ground and racecourse and the golf-links. A line of fortifications extends south of the city from the Blue to the White Nile.

For British troops occupy the end of the line facing the Blue Nile.

On the right (northern) bank of the Blue Nile is the suburb of Khartoum North, formerly called Halfaya, where is the principal railway station. It is joined to the city by a bridge (completed 1910) containing a roadway and the railway, Khartoum itself being served by steam trams andrickshaws. The steamers for the White Nile start the Blue Nile from the Nile steamer station on the right of the town.

The zoo, situated to the east of the town, is in the grounds of the Omdurman (q.v.) on the west bank of the White Nile a mile or two below Khartum. In the river immediately below Khartum is Tuti Island, on which is an old fort and an Arab village.

From its geographical position Khartum is admirably adapted as a commercial and political centre. It is the great entrepôt for the trade of the Anglo-Egyptian Sudan. By the Nile waterways there is easy transport from the southern and western equatorial provinces and from Sennar and other eastern districts. Through Omdurman come the exports of Kordofan and Darfur, while by the Red Sea railway there is ready access to the markets of the world. The only important manufacture is the making of bricks.

The population is heterogeneous. The official class is composed chiefly of British and Egyptians; the traders are mostly Greeks, Syrians and Copts, while nearly all the tribes of the Sudan are represented in the negro and Arab inhabitants.

At the time of the occupation of the Sudan by the Egyptians a small fishing village existed on the site of the present town. The Egyptians established a permanent camp here and out of this grew the city, which in 1830 was chosen as the capital of the Sudanese possessions of Egypt. It got its name from the resemblance of the pyramid-like confluence at the confluence of the two Niles to an elephant's trunk, the meaning of khar- tum in the dialect of Arabic spoken in the locality. The city rapidly acquired importance as the Sudan was opened up by travellers and traders, becoming, besides the seat of much legitimate commerce, a great slave mart. It was chosen as the headquarters of Protestant and Roman Catholic missions, and had a population of 50,000 or more. Despite its size it contained few buildings of any architectural merit; the most important were the palace of the governor-general and the church of the Austrian mission.

The history of the city is intimately bound up with that of the Sudan generally, but it may be recalled here that in 1884, at the time of the Mahdist rising, General Gordon was sent to Khartum to arrange for the evacuation by the Egyptians of the Sudan. At Khartum he was besieged by the Mahdists, whose headquarters were at Omdurman. Khartum was captured and Gordon killed on 26th January 1885, 25 days before the arrival off the town of a small British relief force, which withdrew on seeing the city in the hands of the enemy. Nearly every building in Khartum was destroyed by the Mahdists, the burning of Omdurman, which place remained the headquarters of the mahdi's successor, the khilifa Abdullah, till September 1898, when it was taken by the Anglo-Egyptian forces under General (afterwards Lord) Kitchener and the expedition was accomplished. Khartum was burned by the Mahdists in 1899, but it speedily rose from its ruins, being rebuilt on a much finer scale than the original city. In 1899 the railway from Wadi Halfa was completed to Khartum, and in 1906 through communication by rail was established with the Red Sea.

KHASI AND JAITIA HILLS, a district of British India, in the Hills division of Eastern Bengal and Assam. It occupies the central plateau between the valleys of the Brahmaputra and the Surma. Area, 6027 sq. m.; pop. (1901), 202,250, showing an increase of 3% in the decade.

The district consists of a succession of steep ridges running east and west, with elevated table-lands between. On the southern side, towards Sylhet, the mountains rise precipitously from the valley of the Bārk or Surna. The first plateau is about 4000 ft. above sea-level. Further north is another plateau, on which is situated the station of Shillong, 4900 ft. above sea-level; below the hills the highest peak rises to 6450 ft. On the north side, towards Kamrup, are two similar plateaus of lower elevation.

1 The village of Halfaya, a place of some importance before the foundation of Khartum, is 4 m. to the N.W. on the eastern bank of the Nile. From the 15th century up to 1821 it was the capital of a small state, tributary to Sennar, regarded as a continuation of the Christian kingdom of Alost (see Dongola).
general appearance of all these table-lands is that of undulating downs, covered with grass, but destitute of large timber. At 3000 ft. elevation the indigenous pine predominates over all other vegetation, and forms almost pure pine forests. The highest ridges are clothed with magnificent clumps of timber trees, which occasioned railway lines being laid through the woods of the western slope. The characteristic trees in these sacred groves chiefly consist of oaks, chestnuts, magnolias, &c. Beneath the shade grow rare orchids, rhododendrons, and wild cinnamon. The streams are merely mountain torrents; many of them pass through narrow gorges of wild beauty. From time immemorial, Lower Bengal has drawn its supply of lime from the Khasi Hills, and the quarries along their southern slope are inexhaustible. Coal of fair quality crops out at several places, and there are a few small coal-mines.

The Khasi hills were conquered by the British in 1834. They are inhabited by a tribe of the same name, who still live in primitive communities under elective chiefs in political subordination to the British government. There are 25 of these chiefs called Siems, who exercise independent jurisdiction and pay no tribute. According to the census of 1901 the Khasis numbered 107,500. They are a peculiar race, speaking a language that belongs to the Mon-Anam family, following the rule of matriarchal succession, and erecting monolithic monuments over their dead. The Jaintia Hills used to form a petty Hindu principality which was annexed in 1834. The inhabitants, called Kharas, have little intercourse with the plains, and, like the Khazars, are tempted to a moderate income tax, an innovation against which they rebelled in 1860 and 1862. The revolt was stamped out by the Khasi and Jaintia Expedition of 1862–63. The headquarters of the district were transferred in 1864 from Cherrapunjy to Shillong, which was afterwards made the capital of the province of Assam. A good cart-road runs north from Cherrapunjy through Shillong to Gauhati on the Brahmaputra; total length, 97 m. The district was the focus of the great earthquake of the 12th of June 1897, which not only destroyed every permanent building but broke up the roads and caused many landslips. The loss of life was put at only 916, but hundreds died subsequently of a malignant fever. In 1901 the district had 17,321 Christians, chiefly converts of the Welsh Calvinistic Mission.

KHAHKOY—KHAZARS
(Tarkhu), the older capital, Khamlidje or Khalendjas, Belendcher, the outpost towards Armenia, and Sarkel on the Don. They were the Venetians of the Caspian and the Euxine, the organizers of the transit between the two basins, the universal carriers between East and West; and till was the meeting-place of the commerce of Persia, Kaukasus, Armenia, Russia, and the Bulgarians of the middle Volga. The title of the Caspian Sea is divided and flowed repeatedly, but the normal Khazar may be taken as the territory between the Caucasus, the Volga and the Don, with the outlying province of the Crimea, or Little Khazaria. The southern boundary never greatly altered; it did at times reach the Kur and the Aras, but on that side the Khazars were confronted by Byzantium and Persia, and were for the most part restrained within the passes of the Caucasus by the fortifications of Dariel. Amongst the nomadic Ugrians and agricultural Slavs they emerged from their frontier fluctuated widely, and in its zenith Khazaria extended from the Dnieper to the Ural upon the middle Volga, and along the eastern shore of the Caspian to Astrakhan.

Ethnology.—The origin of the Khazars has been much disputed, and they have been variously regarded as akin to the Georgians, Finno-Ugrics and Turks. This last view is perhaps the most probable. Their king Joseph, in answer to the inquiry of Hadsai Ibn Shaprut of Cordova (c. 958), stated that his people sprang from the Pophr (l.e. Khazar), a god of the Khazars west of the Iupal (the Terek), that their grandfather was a Kharazy (a. 70), and that their king (i.e. Joseph) was the grandson of a second Kharazy (Ibn Tarkhu), the first Khazar king. Ibn Tarkhu, who was captain of the Volga and Don, converted first and foremost of the people of the Caucasus. The Arab geographers who knew the Khazars best connect them either with the Georgians (Ibn Athir) or with the Armenians (Dimashki, ed. Mehren, p. 263); the latter are regarded by some as the matriarchal sisters of the Khazars. Ibn Tarkhu's mission to the caliph Moqtadir (A.D. 921), positively asserts that the Khazar tongue differed not only from the Turkish, but from the Scyth and Cimmerian tongues, which were Ugric.

Nevertheless there are some points of contact between the Khazars which indicate a close connexion with Ugrian or Turkish peoples. The official titles recorded by Ibn Fa'ilân are those in use amongst the Khazars at that time, whether Hungarians, Bulgarians, or Mongols. The names of their cities can be explained only by reference to Turkish or Ugrian dialects (Kaproth, Mém. sur les Khazars; Howorth, Khazars). Some too amongst the medieval authorities appear to connect the Khazars and Hungarians in use amongst the Khazars and the Bulgarians; and the modern Magyar—a Ugrian language—can be traced back to a tribe which in the 9th century was a part of the Khazar kingdom. These characteristics, however, are accounted for by the fact that the Khazars were at one time subject to the Huns (A.D. 448 et seq.), at another to the Turks (c. 580), which would sufficiently explain the signs of Turkish influence in their polity, and also by the testimony of all observers, Greeks, Arabs and Russians, that there was a double strain within the Khazar nation. There were Khazars and Kara (black) Khazars. The Khazars were fair-skinned, black-haired and black-eyed. The Kara Khazars, however, had no particular culture beyond the culture which they sought as wives equally at Byzantium and Bagdad; while the Kara Khazars were ugly, short, and were reported by the Arabs almost as dark as Indians. The latter were indubitably the Ugrian nomads who, as mentioned above, were akin to the Tatars. They first invaded the Greek armies and convoked the caravans of the ruling caste. But the Khazars proper were a civic commercial people, the founders of the most remarkable of the Volga Turko-Mongol confederacies. For persistence and for good faith—all qualities foreign to the Hunnic character.

They have been identified with the ʿAmrātār (perhaps Akr Khazar), or White Khazars who appear upon the lower Volga in the Byzantine annals, and thence they have been deduced, though with less convincing proof, either from the ʿʌgāyasa (Agathyrsi) or the Kertâs. If, however, it is inferred that there was throughout historic times a close connexion which eventually led to political identity between the Khazars and the Barsileums (or the Posses of Moses of Chorene) who occupied the delta of the Volga; if in this sense the Barsileums can be regarded as equivalent to the Ugres of the Caspian (Geg, v. 9, of Pliny (iv. 26), of Strabo (vii. 306), and of Pomponius Mela (ii. c. 1, p. 110) to the so-called Royal Scythes, ʿūdā enabari, who were known to the Greek colonies upon the Euxine, and whose presence in the Eastern Baltic is supposed to have been due to the Kharazy and the Khazars of the East European coast, it seems that the name was chosen in this sense the new Khazars, or White Khazars (Sar-goours), White Bulgarians. Owing to climatic causes the tract they occupied was slowly drying up. They were the outposts of the Khazars and the Barsileums, just as the hunter is the outposts of the nomad that advanced with it. They held in precarious subjection the hordes whom the conditions of the climate and the soil made it impossible to subdue. They bore the brunt of each wave of Tatar conquests, and were eventually overwhelmed.

Khattak, an important Pathan tribe in the North-West Frontier Province of India, inhabiting the southern-eastern portion of the Peshawar district and the south-eastern and eastern portions of Kohat. They number 24,000, and have always been quiet and loyal subjects of the British government. They furnish many recruits to the Indian army, and make most excellent soldiers.

KHAZARS (known also as Chazars, as ʿAmrātār or ʿʌrātār in Byzantine writers, as Khazars in Arabian and Khvalissai in Russian chronicles, and Ugri Bielii in Nestor), an ancient people who occupied a prominent place among the secondary powers of the Byzantine state-system. In the epic of Firdousi Khazar is the representative name for all the northern foes of Persia, and legendary invasions long before the Christian era are vaguely attributed to them. But the Khazars are an historic figure upon the borderland of Europe and Asia for at least 900 years (A.D. 190–1190). The epoch of their greatness is from A.D. 600 to 920. Their homeland was in the spurs of the Caucasus and along the shores of the Caspian—called by medieval Moslem geographers Bahr-al-Khazar ("sea of the Khazars"); their cities, all populous and civilized commercial centres, were Itil, the capital, upon the delta of the Volga, the "river of the Khazars," Semender
KAHRABS

History.—Amidst this white race of the steppes the Khazar clans can be not historically distinguished at the end of the 2nd century A.D. They burst into the Crimea, from which they were repulsed and attacked in turn. The pressure of the nomads of the steppe, the quest of plunder or revenge, these seemed the only motives of action. The Khazar state was a product of the clash of the Roman and Persian empires, of which Armenia was often the battlefield, and eventually the prize, the attitude of the Khazars assumed political importance. Armenia inclined to the civilization and the authority of the Persian empire, tried to maintain an amicable relationship with Persia. The Khazar state maintained an inverte feud with the Sassanids of Persia. It became therefore the policy of the Persian kings to call in the Khazars, as the fashion of the times, to hold their own (600-605). During the 4th century however, the growing power of Persia culminated in the annihilation of eastern Armenia. The Khazars, entangled by so powerful a neighbour, passed from under Persian influence into that of Byzantium. They were won over by Byzantium, and they accepted their policy, and they aided Julian in his invasion of Persia (363). Simultaneously with the approach of Persia to the Caucasus the Khazar empire of the Huns sprawled up among the Ugrians on the northern steppes. The Khazars were passive till the danger culminated in the accession of Attila (434). The emperor Theodosius sent envoys to bribe the Khazar (464) to divert the Huns from the empire by an attack upon the Danube, but there was a Hunnic party amongst the Khazar chiefs. The design was betrayed to Attila, and he extinguished the independence of the nation in a moment. Khazaria became the apogee of his elder brother, who has arrived at the subjects of the Hun (445). Even the iron rule of Attila was preferable to the time of anarchy that succeeded it. Upon his death (454) the Khazars, still nominally faithful, who had arrested revived. The Khazars and the Saracens (i.e. White Ocean) and the Volga delta were swept along in a flood of mixed Tatar peoples which the conquests of the Avars had set in motion. The Khazars and the Avars moved through the steppes of the Caspian to the Caucasus. They appropriated the territory up to the Kura and the Aras, and roamed at large through Iberia, Georgia and Armenia. The Persian king invited the emperor Leo I. to help him defending Asia Minor against the raiding hordes of the Khazars and the Avars. The Khazars, from the Caucasus, were driven back and the pass of Derbent fortified against them (c. 507).

Meanwhile the Caucasian frontier was the highway for the wild hordes to whom the Huns had opened the passage into Europe, and the Khazars took refuge (like the Venetians from Attila) amongst the seventy mouths of the Volga. The pressure of the invasion of Fadlan, which had conquered Turkestan, and the conquering Turks followed in their footsteps (560-565). They beat down all opposition, wrested even Bosphorus in the Crimea from the empire, and by the annihilation of the Ephphalites completed the ruin of the White Race of the plains from the Oxus to the Don. The empire of the Turks and Avars, however, ran swiftly their barbaric course, and the Khazars arose out of the chaos to more than their ancient renown. They issued from the land of Bursil and extended their rule over the Bulgarian hordes left masterless by the Turks, compelling the more stubborn to migrate to the Danube (641). The agricultural Slavs of the Don and the Oka were reduced to tributary status, of which was crowned by the event that the annexed the Crimea, had won complete command of the Sea of Azov, and, seizing upon the narrow neck which separates the Volga from the Don, had organized the portage which has continued since an interchange of goods and of ideas. The Khazars, more and more allied with Byzantium, had regained the status of a nation. The advance of the Petchenegs from the East gave the Russians their opportunity. Before the onset of those fierce invaders the Khazars, for fear of a double suction, from the Caucasus to the Black Sea, were forced to the Caspian to avenge the losses. The people of the Khazars is a representative of a people, which had been driven into the steppes of the Caspian, and fought for the Roman Empire of Bulgaria; and the Khazars was indeed dislodged from the position they had seized in the heart of the kingdom of the Volga and the Don, but only to drive them onwards to the Dnieper. The Hungarian, severs from their kindred and the contact, is at this moment in the Uz, the Khazars joined the Russians, whilst Oleg, the Russ prince of Kiev, passed through the Slav tribes of the Dnieper basin with the cry: "Pay nothing to the Khazars." (884). The kingdom dwindled rapidly to its former limits between the Don and the Kazan. The Khazars, however, the Don, whilst the Russian traders of Novgorod and Kiev suppressed the Khazars as the carriers between Constantinople and the North. With the end of the 10th century forty thousand of them were said to have been yet a great city, with baths and market-places and thirty mosques. But there was no domestic product nor manufacture; the kingdom depended solely upon the now precarious transit duties, and administration was in the hands of a major domus also called khakan. The assimilation with the Swistowskie of Kiev the rotten fabric crumbled into dust. His troops were equally at home on land and water. Sarkel, Itil and Semender surrendered to him (965-966). He pushed his conquests to the Caucasian, and established friendly relations with the Sea of Azov. The principality of Tmutarakan, founded by his grandson Mstislav (988), replaced the kingdom of Khazaria; the last trace of the Khazars, of which was the Chukhara, and the name of the Khazars and Byzantines (1016). The last of the khakans, George, Tzula, was taken prisoner. A remnant of the nation took refuge in an island of the Caspian (Shiacony); others retired to the Caucasus; part of the nation fled to the Kizil-Orum in the east, and the last of the khakans appeared in the last time joining with Georgia in her successful effort to throw off the yoke of the Seljuk Turks (1085). But the name is thought to survive in Karsaz, the German title for Mingrelia, and in Kazarde, the Turkish word for the Lazis. Till the 13th century the Crimea was known to European travellers as Gaziaria; the "remnants of the Khazars" are still distinguished in the Ukraine; and the record of their dominion survives in the names of Kars, Kazarshichi, Kazarinovod, Kozar-owka, Kozar, and perhaps in Kazan.

Anachronisms.—Khazar: The letter of King Joseph to R. Hasdai Ibn Shaprut, first published by J. Akrish, in the Wisia (Constantinople, 1577), and often reprinted in editions of Jehuda hal-Levy’s Kazar. German translations by Zedner (Berlin, 1840) and Cassel, Mariae Alther, (Berlin, 1848); French by Carmoly, Rev. (1841). Harckay, Russische, Revue, iv; Graetz, Geschichte der, v. 24, and Carmoly, Itineraires de la Terre Sainte (Brussels, 1847). Armenian: Moses of Chorene; cf. Saint-Martin, Memoires historiques sur les Arméniens, Paris, 1818; Arabian: The Kazar interview of Ibn Fadlan (921) is preserved by Yäkit, 1. 436 seq. See also Ístakhry (ed. de Goeye, pp. 220 seq.), Mas‘ûdy, ch. xvi. pp. 46 seq. The name of the Khazars is translated by de Goeye, pp. 279 seq. and the histories of Ibn el Athir and Tabary. It is to be observed that the material has been collected and translated from Franch, "Veteres Memoria: Chasaronum" in Mém. de St Pél. (1822); Dorn (from the Kazar, 1834); Moulhibier, Mém. de l’Acad., viii. 1828; The account of Ibn Fadlan is preserved by Yäkit, 11. 436 seq. See also D’Ossach’s imaginary Voyage d’Abd Caddin, based on these sources. Byzantine Historians: The relative passages are collected in Stritters, Memoriae popularis (St Petersburg, 1778). Russian: The Chronicle ascribed to Nestor.
KHEDIVE, a Persian word meaning prince or sovereign, granted as a title by the sultan of Turkey in 1867 to his viceroy in Egypt. Ismail, in place of that of "Khazars," traversed the vast reserves. The Khedive is a title used by the British in India, in the Lucknow division of the United Provinces, which takes its name from a small town with a railway station 81 m. N.W. of Lucknow. The area of the district is 2963 sq. m., and its population in 1901 was 905,138. It consists of a series of fairly elevated plateaus, separated by rivers flowing from the north-west, each bordered by alluvial land. North of the river UI, the country is considered very unhealthy. Through this tract, probably the bed of a lake, flow two rivers, the Kaurihala and Chauka, changing their courses constantly, so that the surface is weathed with desert river beds much built up by the surmises of winds. The vegetation is very dense, and the stagnant waters are the cause of endemic fevers. The people reside in the neighbourhood of the low ground, as the soil is more fertile and less expensive to cultivate than the forest-covered uplands. South of the UI, the scene changes. Between every two rivers or tributaries stretches a plain, considerably less elevated than the tract to the north. There is very little slope in any of these plains for many miles, and marshes are formed, from which emerge the headwaters of many secondary streams, which in the rains become dangerous torrents, and frequently cause devastating floods. The drainage of the country is to south-east. Several large lakes exist, some formed by the ancient channels of the northern rivers, being fine sheets of water, from 10 to 20 ft. deep and from 3 to 4 m. long; in places they are fringed with magnificent groves. The whole north of the district is covered with vast forests, of which a considerable portion are government reserves. It occupies about two-thirds of the forest area. The district is traversed by a branch of the Oudh & Rohilkhand railway from Lucknow to Bareilly.

KHerson, a government of south Russia, on the N. coast of the Black Sea. The headwaters of the rivers Kherson and Bessarabia, and Podolia, N. by Kičev and Poltava, S. by Ekaterinoslav and Taurida. The area is 27,407 sq. m. The aspect of the country, especially in the south, is that of an open steppe, and almost the whole government is destitute of forest. The Dniester marks the western and the Dnieper the south-eastern boundary; the Bug, the Ingluv and several minor streams drain the intermediate territory. Along the shore stretch extensive lagoons. Iron, kaolin and salt are the principal minerals. Nearly 43% of the land is owned by the peasants, 41% by the nobility, 12% by other classes, and 12% by the crown, municipals, and general institutions. The peasants rent 1,730,000 acres more from the landlords. Agriculture is well developed and 9,000,000 acres (51.1%) are under crops. Agricultural machinery is extensively used. The vine is widely grown, and yields 1,220,000 gallons of wine annually. Some tobacco is grown and manufactured. Besides the ordinary cereals, maize, hemp, flax, tobacco and mustard are commonly grown; the fruit trees in general cultivation include the cherry, plum, peach, apricot and mulberry; and gardening receives considerable attention. Agriculture has been greatly improved by some seventy German colonies. Cattle-breeding, horse-breeding and sheep-farming are pursuits on a large scale. Some sheep farmers own 30,000 or 40,000 merinos each. Fishing is an important occupation. There are manufactures of wool, hemp and leather; also iron-work, machinery and especially agricultural machinery works, sugar factories, steam flour-mills and chemical works. The ports of Kherson, Ochakov, Nikolayev, and especially Odessa, are among the principal outlets of Russian commerce; Berislav, Alexandriya Elissavetgrad, Voznesensk, Oliopol and Tiraspol play an important part in the inland traffic. In 1871 the total population was 1,661,820, and in 1897 2,744,040, of whom 1,335,175 were women and 785,004 lived in towns. The estimated pop. in 1906 was 3,257,600. Besides Great and Little Russia, it comprises Rumanians, Greeks, Germans (123,453), Bulgarians, Bohemians, Swedes, and Jews (30% of the total), and some Gypsies. About 84% belong to the Orthodox Greek Church; there are also numerous Stundists. The government is divided into six districts, the chief towns of which are: Kherson (q.v.), Alexandriya (14,002 in 1897), Ananiev (16,713), Elissavetgrad (66,192 in 1900), Ochakov (30,492), and Tiraspol (37,972). The region was long subject to the sway of the Tatar khans of the Crimeas, and owes its rapid growth to the colonizing activity of Catherine II., who between 1778 and 1792 founded the cities of Kherson, Odessa and Nikolayev. Down to 1803 this government was called Nikolayev.

KHERSON, a town of south Russia, capital of the above government, on a hill above the right bank of the Dnieper, about 19 m. from its mouth. Founded by the courtier Potemkin in 1778 as a naval station and seaport, it had become by 1786 a place of 10,000 inhabitants, and, although its progress was checked by the rise of Odessa and the decline of the naval establishments to Nikolayev, it had in 1900 a population of 73,185. The Dnieper at this point breaks into several arms, forming islands overgrown with reeds and bushes; and vessels of burden must anchor at Stanislavskoe-selo, a good way down the stream. Of the traffic on the river the largest share is due to the timber, wool, cereals, cattle and hides trade; wool-dressing, soap-boiling, tallow-melting, brewing, flour-milling and the manufacture of tobacco are the chief industries. Kherson is a substantially built and regular town. The cathedral is the burial-place of Potemkin, and near it stands the Emmanuel Cathedral, founded by John Howard, the English philanthropist, who died here in 1790. The fortifications have fallen into decay. The name Kherson was given to the town from the supposition that the site was formerly that of Chersonesus Heracleotica, the Greek city founded by the Dorians of Heraclia.

KHEVENHÜLLER, LUDWIG ANDREAS (1863–1744), Austrian field-marshal, Count of Aschberg-Frankenburg, came of a noble family, which, originally Franconian, settled in Carinthia in the 11th century. He first saw active service under Prince Eugène in the War of the Spanish Succession, and by 1716 had passed to the Orange-Nassau service. In 1724 he was given command of the footdragoons and was recommended to the King of Prussia. He distinguished himself greatly at the battles of Peterwardein and Belgrade, and became in 1723 major-general of cavalry (General-Wachtmeister), in 1726 proprietary colonel of a regiment and in 1733 lieutenant field-marsh. In 1734 the War of the Polish Succession brought him into the field again. He was present at the battle of Parnia (June 29), where Count Mercy, the Austrian commander, was killed, and after Mercy's death he held the chief command of the army in Italy till Field Marshal Königsegg's arrival. Under Königsegg he again distinguished himself at the battle of Guastalla (September 19). He was once more in command during the operations which followed the battle, and his skilful generalship won for him the grade of general of cavalry. He continued in military and diplomatic employment in Italy to the close of the war. In 1737 he was made field marshal, Prince Eugène recommending him to his sovereign as the best general in the service. His chief exploit in the Turkish War, which soon followed his promotion, was at Radiojevatz (September 28,1737), where he cut his way through a greatly superior Turkish army. It was in the Austrian Succession War that his most brilliant work was done. As commander-in-chief of the army on the Danube he not only drove out the French and Bavarian invaders of Austria in a few days of rapid marching and sharp engagements (January, 1742), but overran southern Bavaria, captured Munich, and forced a large French corps in Linz to surrender. Later in the summer of 1742, owing to the inadequate forces at his disposal, he had to evacuate his conquests, but in the following campaign, though now subordinated to Prince Charles of Lorraine, Khevenhüller...
reconquered southern Bavaria, and forced the emperor in June to conclude the unfavourable convention of Nieder-Schönfeld. He dispelled the advance beyond the Rhine, which the Turks had begun in the successes, and the event justified his fears, for the Austrians had to fall back from the Rhine through Franconia and the Breisgau, Khevenhüller himself conducting the retreat with admirable skill. On his return to Vienna, Maria Theresa decorated the field marshal with the order of the Golden Fleece. He died suddenly at Vienna on the 26th of January 1744.

He was the author of various instructional works for officers and soldiers. He wrote a number of Josefine Observationspunkte für sein Dragoner-regiment (1734 and 1748) and a reglement for the infantry (1737), and of an important work on war in general, Kurzer Begriff aller militärischen Operationen (Vienna, 1756; French version, Maximes de guerre, Paris, 1771).

KHEVURS, a people of the Caucasus, Kinsfolk of the Georgians. They live in scattered groups in East Georgia to the north and west of Mount Borjalo. Their name is Georgian and means "People of the Valleys." For the most part nomadic, they are still in a semi-barbarous state. They have not the beauty of the Georgian race. They are gaunt and thin to almost a ghastly extent, their generally repulsive aspect being accentuated by their large hands and feet and their ferocious expression. In complexion and colour of hair and eyes they vary greatly. They are very muscular and capable of bearing extraordinary fatigue. They are fond of fighting, and still wear armour of the true medieval type. This panoply is worn when the law of vendetta, which bound almost most of the Khevsurs, compelled them to seek or avoid their enemy. They carry a spiked gauntlet, the terrible marks of which are borne by a large proportion of the Khevsur faces.

Many curious customs still prevail among the Khevsurs, as for instance the imprisonment of the woman during childbirth in a lonely hut, round which the husband parades, firing off his musket at intervals. After delivery, food is surreptitiously brought to the mother, who is kept in her prison a month, after which her hut is burnt. The boys are usually named after some wild animal, e.g. bear or wolf, food and drink for a time. They are married in the church of the Sun, Sun of my Heart. Marriages are arranged by parents when the bride and bridegroom are still in long clothes. The chief ceremony is a forcible abduction of the girl. Divorce is very common, and some Khevsurs are polygamous. Formerly no Khevsur might die in a house, but was always carried out under the sun or stars. The Khevsurs like to call themselves Christians, but their religion is a mixture of Christianity, Mahommedanism and heathenism. They keep the Sabbath in the Montenegrin manner on the Thursday or Friday, which is their national day. They are附件・aba・attachments・addenda・additaments・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented・additamenta・additamented•
The population is composed of four divisions: Uzbeks (150,000 to 200,000), the dominating race among the settled inhabitants of the oasis, from whom the officials are recruited; Sarts and Tajiks, agriculturists and tradespeople of mixed race; Turkomans (c. 170,000), who live in the steppes, south and west of the oasis, and formerly plundered the settled inhabitants by their raids; and the Kara-kalpak, or Black Bonnets, a Turki tribe some 50,000 in number. They live south of Lake Aral, and in the towns of Kungrad, Khodshêli and Kipchak form the prevailing element. They once made the southern Orenburg frontier and their women made carpets. There are also about 10,000 Kirghiz, and when the Russians took Khiva in 1873 there were 20,300 Persian slaves, stolen by Turkoman raiders, and over 6500 liberated slaves, mostly Kizil-bashes. The former were set free and the slave trade abolished. Of domestic industries, the embroidery of cloth, silks and leather is worth of notice. The trade of Khiva is considerable: cotton, wool, rough woollen cloth and silk cocoons are exported to Russia, and various animal products to Bokhara. Cottons, velveteen, hardware and pepper are imported from Russia, and silks, cotton, china and tea from Bokhara. Khivan merchants habitually attend the Orenburg and Nizhny-Novgorod fairs.

History.—The present khanate is only a meagre relic of the great kingdom which under the name of Chorasmia, Kharazm (Khâwarzam) and Urgenj (Jurfânîa, Gurganî) held the keys of the mightiest river in Central Asia. Its possession has consequently been much disputed from early times, but the country has undergone great changes, geographical as well as political, which have lessened its importance. The Oxus (Amu-darya) has changed its outlet, and no longer forms a water-way to the Caspian and thence to Europe, while Khiva is entirely surrounded by territory either directly administered or protected by Russia.

Chorasmia is mentioned by Herodotus, it being then one of the Persian provinces, over which Darius placed satraps, but no material of it is known till it was seized by the Arabs in a.d. 680. When the power of the caliphs declined the governor of the province probably became independent; but the first king known to history is Mamun-ibn-Mahammed in 993. Khâwrizm fell under the power of Mahmud of Ghazni in 1017, and subsequently under that of the Seljuk Turks. In 1097 the governor Kuth-ud-din assumed the title of king, and one of his descendants, Ala-ud-din-Mahammed, conquered Persia, and was the greatest prince in Central Asia when Jenghiz Khan appeared in 1219. Khiva was conquered again by Timur in 1370; and finally fell under the rule of the Uzbeks in 1512, who are still the dominant race under the protection of the Russians.

Russia established relations with Khiva in the 17th century. The Cossacks of the Yaik during their raids across the Caspian learnt of the existence of this rich territory and made more than one plundering expedition to the chief town Urgenj. In 1717 Peter the Great, having heard of the presence of auriferous sand in the bed of the Oxus, desiring also to "open mercantile relations with India through Turan", and to release from slavery some Russian subjects, sent a military force to Khiva. When within 100 miles of the capital they encountered the troops of the khan. The battle lasted three days, and ended in victory for the Russian arms. The Khivans, however, induced the victors to break up their army into small detachments and treacherously annihilated them in detail. It was not until the third decade of the 19th century that the attention of the Muscovite government was again directed to the khanate. In 1839 a force under General Perovsky moved from Orenburg across the large plateau to the Khivan frontiers, to occupy the khanate, liberate the captives and open the way for trade. This expedition likewise terminated in disaster.

In 1847 the Russians founded a fort at the mouth of the Jaxartes or Syr-darya. This advance deprived the Khivans not only of territory, but of a large number of tax-paying Kirghiz, and also gave the Russians a base for further operations. For the next few years, however, the attention of the Russians was taken up with Khokand, their operations on that side culminating in the capture of Tashkent in 1869. Free in this quarter, they directed their thoughts once more to Khiva. In 1869 Krasnovodsk on the east shore of the Caspian was founded, and in 1871-1872 the country leading to Khiva from different parts of Russian Turkestan was thoroughly explored and surveyed. In 1873 an expedition to Khiva was carefully organized on a large scale. The army of 10,000 men placed at the disposal of General Kaufmann started from three different bases of operation—Krasnovodsk, Orenburg and Tashkent. Khiva was occupied almost without opposition. All the territory (35,700 sq. m. and 110,000 souls) on the right bank of the Oxus, from Orenburg to Russia, while a heavy war indemnity was imposed upon the Khivans. The Russians thereby so crippled the finances of the state that the khan is in complete subjection to his more powerful neighbour.

KHIVA, capital of the khanate of Khiva, in Western Asia, 25 m. W. of the Amu-darya and 240 m. W.N.W. of Bokhara. Pop. about 10,000. It is surrounded by a low earthen wall, and has a Citadel, the residence of the Khan and the higher officials. It is navigable by the Oxus. It is the chief point on the overland routes between Bokhara and the Saffarids. The Khan is a despot, assisted by one chief minister and twenty-nine members of a council. He is personally inclined to a policy of peace, and is desirous of maintaining the friendly relations which his dominion has hitherto enjoyed with Russia. He is, however, a religious despot and has the power of life and death over his vassals. He is still, however, essentially a pagan, and takes care that his townsmen should observe his religious observances. The devotional life of the mosque is not interfered with by the ravages of the sand-dunes. The town is well provisioned and comfortable and the air is wholesome. It is watered by the Oxus, and the surrounding country has a rich and diverse agricultural produce. It is customarily supplied with fresh water by an aqueduct 1300 feet long, and is well supplied with water-borne transport. The khan's palace is ornately decorated, and is surrounded by gardens. The town is well provided with public buildings, Government buildings, churches, colleges, judicial halls, and the like, and is well supplied with schools, prisons and factories.

KHINOFF, FERNAND EDMOND JEAN MARIE (1858— ), Belgian painter and etcher, was born at the château de Grenbergen (Termonde), on the 12th of September 1858, and studied under X. Mellery. He developed a very original talent, his work being characterized by great delicacy of colour, tone and harmony, as will be seen in his best work, "A Crisis" (1887), which was exhibited at the New Gallery, London, in 1892 and there attracted much attention, was purchased by the Pinakothek at Munich. Other works are "Silence" (1890), "The Idea of Justice" (1905) and "Jesule" (1906), together with a polychrome bust "Sibyl" (1894) and an ivory mask (1897). In quiet intensity of feeling Khnoff was influenced by Rossetti, and in simplicity of line by Burne-Jones, but the poetry and the delicate mystic and enigmatic note of his work are entirely individual. He did good work also as an etcher and dry-pointist.

See L. Dumont-Wilden, Fernand Khinoff (Brussels, 1897).

KHOI, a district and town in the province of Azerbaijan, Persia, towards the extreme north-west frontier, between the Urmi Lake and the river Aras. The district contains many flourishing villages, and consists of an elevated plateau 60 m. by 10 to 15, highly cultivated by a skilful system of drainage and irrigation, producing fertile meadows, gardens and fields yielding rich crops of wheat and barley, cotton, rice and many kinds of fruit. In the northern part and bounding on Maku lies the plain of Chaldaran (Kalderan), where in August 1314 the Turks under Sultan Selim I. fought the Persians under Shah Ismaill and gained a great victory.

The town of Khoi lies in 38° 37' N., 45° 15' E., 77 m. (by road) N.W. of Tabriz, at an elevation of 3300 ft., on the great trade route between Trebizond and Tabriz, and about 2 m. from the left bank of the Kotur Chai (river from Kotur) which is crossed there by a seven-arched bridge and is known lower down as the Kizil Chai, which flows into the Aras. The walled part of the town is a quadrilateral with faces of about 1200 yds. in length and fortifications consisting of two lines of bastions, ditches, &c., much out of repair. The population numbers about 35,000, a third living inside the walls. The Armenian quarter, with about 500 families and an old church, is outside the walls. The city within the walls forms one of the best laid out towns in
Persia, cool streams and lines of willows running along the broad and regular streets. There are some good buildings, including the governor’s residence, several mosques, a large brick bazaar and a fine caravanserai. There is a large transit trade, and considerable local traffic across the Turkish border. The city surrendered to the Russians in 1827 without fighting and after the treaty of peace (Turkman Chai, Feb. 1828) was held for some time by a garrison of 3000 Russian troops as a guarantee for the payment of the war indemnity. In September 1861 Khol suffered a heavy loss from a violent earthquake. It has post and telegraph offices.

KOJENT, or KOIEND, a town of the province of Syr-darya, in Russian Turkestan, on the left bank of the Syr-darya or Jaxartes, 144 m. by rail S.S.E. from Tashkent, in 40° 17' N. and 69° 36' E., and on the direct road from Bokhara to Khokand. Pop. (1900), 31,881. The Russian quarter lies between the river and the native town. Near the river is the old citadel, on the top of an artificial square mound, about 100 ft. high. The banks of the river are so high as to make its water useless to the town in the absence of pumping gear. Formerly there was a ford between the khantes of Bokhara and Khokand passed through this town, but since the Russian occupation (1866) much of it has been diverted. Silkworms are reared, and silk and cotton goods are manufactured. A coarse ware is made in imitation of Chinese porcelain. The district immediately around the town is taken up with cotton plantations, fruit gardens and vineyards. The majority of the inhabitants are Tajiks.

Khjent has always been a bone of contention between Kho- kand and Bokhara. When the amir of Bokhara assisted Khudayar Khan to regain his throne in 1864, he kept possession of Khjent. In 1866 the town was stormed by the Russians; and during their war with Khokand in 1875 it played an important part.

KOHKAND, or KOKAN, a town of Asiatic Russia, in the province of Ferghana, on the railway from Samarkand to Andijan, 85 m. by rail S.W. of the latter, and 20 m. S. of the Syr-darya. Pop. (1900), 86,704. Situated at an altitude of 1375 ft., it has a severe climate, the average temperatures being—year, 56°; January, 27°; July, 65°. Yearly rainfall, 3-6 in. It is the centre of a fertile irrigated oasis, and consists of a citadel, enclosed by a wall near of 112 m. in circumference of suburbs containing luxuriant gardens. The town is modernized, has broad streets and large squares, and a particularly handsome bazaar. The former palace of the khans, which recalls by its architecture the mosques of Samarkand, is the best building in the town. Khokand is one of the most important centres of trade in Turkestan. Raw cotton and silk are the principal exports, while manufactured goods are imported from Russia. Coins bearing the inscription “Khokand the Charming,” and known as khokands, have or had a wide currency.

The khante of Khokand was a powerful state which grew up in the 18th century. Its early history is not well known, but the town was founded in 1732 by Abd-ur-Rahim under the name of Iski-kurgan, or Kali-i-Rahimbai. This must relate, however, to the fort only, because Arab travellers of the 10th century mention Hovakend or Hokand, the position of which has been identified with that of Khokand. Many other populous and wealthy towns existed in this region at the time of the Arab conquest of Ferghana. In 1758-1759 the Chinese conquered Dzungaria and East Turkestan, and the kings or rulers of Ferghana recognized Chinese suzerainty. In 1807 or 1808 Alim, son of Narbuta, brought to the kings of Ferghana his authority, and conquered Tashkent and Chimgan. His attacks on the Bokhara fortress of Ura-tyube were however unsuccessful, and the country rose against him. He was killed in 1817 by the adherents of his brother Omar. Omar was a poet and patron of learning, but continued to enlarge his kingdom, taking the sacred town of Azret (Turkestan), and to protect Ferghana from the raids of the nomad Kirghiz built fortresses on the Syr-darya, which became a basis for raids of the Khokand people into Kirghiz land. This was the origin of a conflict with Russia. Several petty wars were undertaken by the Russians after 1847 to destroy the Khokand forts, and to secure possession, first, of the Ili (and so of Dzungaria), and next of the Syr-darya region, the result being that in 1866, after the occupation of Ura-tyube and Jizakh, the khante of Khokand was separated from Bokhara. During the forty-five years after the death of Omar (he died in 1822) the khante of Khokand was the seat of continuous wars between the settled Sarts and the nomad Kipchaks, the two parties securing the upper hand in turns, Khokand falling under the dominion of the suzerainty of Bokhara, which supported Khudayar-khan, the representative of the Kipchak party, in 1838-1866; while Alim-kul, the representative of the Sarts, put himself at the head of the gazawat (Holy War) proclaimed in 1860, and fought bravely against the Russians until killed at Tashkent in 1865. In 1868 Khudayar-khan, having secured independence from Bokhara, concluded a commercial treaty with the Russians, but was compelled to flee in 1875, when a new Holy War against Russia was proclaimed. It ended in the capture of the strong fort of Makhram, the occupation of Khokand and Marghelan (1875), and the recognition of Russian superiority by the khan of Bokhara, who conceded to Russia all the territory north of the Naryn river. War, however, was renewed in the following year. It ended, in February 1876, by the capture of Andijan and Khokand and the annexation of the Khokand khante to Russia. Out of it was made the Russian province of Ferghana.

Makshesw, Historical Sketch of Turkestan and the Advance of the Russians (St Petersburg, 1869); N. Petrovskiy, Old Arabian Journals of Travel (Tashkent, 1864); Russian Encyclopaedic Dictionary, vol. xv. (1895). (P. A. K.; J. T. BE.)

KOHL (Polish Chełm), a town of Russian Poland, in the government of Lublin, 45 m. by rail E.S.E. of the town of Lublin. Pop. (1897), 19,236. It is a very old city and the see of a bishop, and has an archaeological museum for church antiquities.

KHONGS, or KANDIS, an aboriginal tribe of India, inhabiting the tributary states of Orissa and the Ganjam district of Madras. At the census of 1901 they numbered 701,956. Their main divisions are the Bokhara, the Chanti, and the Khonds; the landowners are known as Raj Khonds. Their religion is animistic, and their pantheon includes eighty-four gods. They have given their name to the Khondmals, a subdivision of Angul district in Orissa; area, 800 sq. m.; pop. (1901), 64,214. The Khond language, Kui, spoken in 1901 by more than half a million persons, is much more closely related to Telugu than is Gondi. The Khonds are a finer type than the Gonds. They are as tall as the average Hindu and not much darker, while in features they are very Aryan. They are undoubtedly a mixed Dravidian race, with much Aryan blood.

The Khonds became notorious, on the British occupation of their district about 1835, from the prevalence and cruelty of the human sacrifices they practised. These "Meriah" sacrifices, as they were called, were intended to further the fertilization of the earth. It was incumbent on the Khonds to purchase their victims. Unless bought with a price they were not deemed acceptable. They seldom sacrificed Khonds, though in hard times Khonds were obliged to sell their children and they could then be purchased as Meriahs. Persons of any race, age or sex, were acceptable if purchased. Numbers were bought and kept and well treated; and Meriah women were encouraged to become mothers. Ten or twelve days before the sacrifice the victim’s hair was cut off, and the villagers having bathed, went with the priest to the sacred grove to forewarn the goddess. The festival lasted three days, and the wildest orgies were indulged in.

See Major Macpherson, Religious Doctrines of the Khonds; his account of their religion in Jour. R. Asiatic Soc. xiii, 220-221 and his Report upon the Khonds of Ganjam and Cuttack (Calcutta, 1842); also District Gazetteer of Angul (Calcutta, 1908).

KHORASAN, or KHORASAN (i.e. "land of the sun"), a geographical term originally applied to the eastern of the four
quarters (named from the cardinal points) into which the ancient monarchy of the Sassanians was divided. After the Arab conquest, the name was retained both as the designation of a definite province and in a looser sense. Under the new Persian empire the expression has gradually become restricted to the northeastern portion of Persia which forms one of the five great provinces of that state. The province is conterminous E. with Afghanistan, N. with Russian Transcaspian territory, W. with Astarabad and Shahhrud-Bostam, and S. with Kerman and Yazd.

It lies mainly within 29° 45′–38° 15′ N. and 45°–61° E., extending about 320 m. east and west and 570 m. north and south, with a total area of about 150,000 sq. m. The surface is mountainous. The ranges generally run in parallel ridges, inclosing extensive valleys, with a normal direction from N.W. to S.E. The whole of the north is occupied by an extensive highland system composed of a part of the Elburz and its continuation extending to the Paropamisus. This system, when spoken of collectively as the Kuren Dagh, or Kopet Dagh from its chief sections, forms in the east three ranges, the Hazar Masjed, Binalud Kuh and Jagatani, enclosing the Meshed-Kuchan valley and the Jovain plain. The former is watered by the Kash-kud (Tortoise River), or river of Meshed, flowing east to the Hari-rud, their junction forming the Tejen, which sweeps round the Daman-i-Kuh, or northern skirt of the outer range, towards the Caspian but loses itself in the desert long before reaching it. The Jovain plain is watered by the Kali-i-mura, an important river which flows south through the Great Kavir, and runs south-east into the Kuren Dagh, stretching through the Great and Little Balkans to the Caspian at Krasnovodsk Bay. The Ala Dagh, forming a continuation of the Binalud Kuh and joining the mountains between Bujurd and Astarabad, which form part of the Elburz system. The Kuren Dagh and Ala Dagh enclose the valley of the Atrek River, which flows west and south-west into the Caspian at Hassan Kuli Bay. The western offshoots of the Ala Dagh in the north and the mountains of Astarabad in the south enclose the valley of the Gurgen River, which also flows westwards and parallel to the Atrek to the south-eastern corner of the Caspian. The outer range has probably a mean altitude of 800 ft., the highest known summits being the Hazar Masjed (10,500) and the Kara Dagh (9800). The central range seems to be higher, culminating with the Shah-Jehan Kuh (11,000) and the Ala Dagh (11,500). The southern ridges, although generally much lower, have the highest point of the whole system in the Shah Kuh (13,000) between Shahrud and Astarabad. South of this northern highland several parallel ridges run diagonally across the province in a N.W.-S.E. direction as far as Tach. Beyond the Atrek and other rivers watered the northern valleys a few brackish and intermittent rivers lose themselves in the Great Kavir, which occupies the central and western parts of the province. The true character of the kavir, which forms the distinctive feature of east Persia, has scarcely been determined, some regarding it as the bed of a dried-up sea, others as developed by the saline streams draining to it from the surrounding highlands. Collecting in the central depressions, which have a mean elevation of scarcely more than 350 ft. above the Caspian, the waters thereupon superincumbent evaporation form a thin hard crust, beneath which the moisture is retained for a considerable time, thus producing those dangerous and slimy quagmires which in winter are covered with brine, in summer with a treacherous incrustation of salt. Dr Sven Hedin explored the central depressions in 1906.

The surface of Khorasan thus consists mainly of highlands, saline, swampy deserts and upland valleys, some fertile and well-watered. Of the last, occurring mainly in the north, the chief are the longitudinal valley stretching from near the Herat frontier through Meshed, Kuchan and Shirvan to Bujurd, the Derrehgez district, which lies on the northern skirt of the outer range projecting into the Akhal Tekkeh domain, now Russian territory, and the districts of Nishapur and Sabzevar which lie south of the Binalud and Jagatani ranges. These fertile tracts produce rice and other cereals, cotton, tobacco, opium and fruits in profusion. Other products are melons, sunflowers, asafetida and other gums. The chief manufactures are stones, stone ware, carpets and rugs, woollens, cottons, silks and sheepskin pelisses. 

The population consists of Iranians (Tajiks, Kurds, Baluchis), Mongols, Tatars and Arabs, and is estimated at about a million. The Persians proper have always represented the settled, industrial and trading elements of the city. The Kurds and the Arabs have become largely assimilated. Even many of the original Tatar, Mongol and other nomad tribes (balav), instead of leading their former resinous and unsettled life of the sahhr-nishin (dwellers in the desert) are settled and peaceful shahhr-nishin (dwellers in towns). In religion all except some Tatars and Mongols and the Baluchis have confessed to the national Shiite faith. The revenues (cash and kind) of the province amount to about £180,000 a year, but very little of this amount reaches the Teheran treasury. The value of the exports and imports from and into the whole province is a little under a million sterling a year. The province produces about 100,000 tons of wool and a third of this quantity, or rather more, valued at £70,000 to £80,000, is exported via Russia to the markets of western Europe, notably to Marseilles, Russia keeping only a small portion. Other important articles exported are cotton, carpets, shawls and turquoise, the last from the mines near Nishapur.

**KHORREMABAD—KHORSABAD**

KHORREMABAD, a town of Persia, capital of the province of Luristan, in 33° 39′ N., 48° 15′ E., and at an elevation of 4250 ft. Pop. about 6000. It is situated 138 m. W.N.W. of Isfahan and 117 m. S.E. of Kermanshah, on the right bank of the broad but shallow Khorraberd river, also called Ab-i-istaneh, and, lower down, Khashgin Rud. On an isolated rock between the town and the river stands a ruined castle, the Diz-i-siyah (black castle), the residence of the governor of the district (then called Samha) in the middle ages, and, with some modern additions, one of them consisting of rooms on the summit, called Felsheh (heaven of heavens), the residence of the governors of Luristan in the beginning of the 19th century. At the foot of the castle stands the modern residence of the governor, built c. 1830, with several spacious courts and gardens. On the left bank of the river opposite the town are the ruins of the old city of Samha. There are a minaret 60 ft. high, parts of a mosque, an aqueduct, a number of walls of other buildings and a four-sided monolith, measuring 9½ ft. in height, by 3 ft. long and 2½ broad, with an inscription partly illegible, commemorating Mahmund, a grandson of the Seljuk king Malik Shah, and dated A.H. 517, or 519 (A.D. 1121, or 1122), and a long arc of a bridge which led over the river from Samha on to the road to Shapur-kast, a city situated some distance west.

KHORSABAD, a Turkish village in the vilayet of Mosul, 123 m. N.E. of that town, and almost 20 m. N. of ancient Nineveh, on the left bank of the little river Korsar. Here, in 1843, P. E. Botta, then French consul at Mosul, discovered the remains of an Assyrian palace and town, at which excavations were conducted by him and Flinders in 1843–1844, and again by Victor Place in 1851–1855. The ruins proved to be those of the town of Korsar (Assyrian), the lineal descendant of Sardis, the capital of Assyria, as a royal residence. The town, in the shape of a rectangular parallelogram, with the corners pointing approximately toward the cardinal points of the compass, covered 741 acres of ground. On the north-west side, half within and half without the circuit of the walls, protruding into the plain like a great bastion, stood the royal palace, on a terrace, 45 ft. in height, covering about 25 acres. The palace proper was divided into three sections, built around three sides of a large court on the south-east or city side, into which opened the great outer gates, protected each on the wing by a bastion extending into the river, of rooms built around several smaller inner courts. In the centre was the serai, occupied by the king and his retinue, with an extension towards the north, opening on a large inner court, containing the public reception rooms, elaborately decorated with
sculptures and historical inscriptions, representing scenes of hunting, worship, feasts, battles, and the like. The harem, with separate provisions for four wives, occupied the south corner, the domestic quarters, including stables, kitchen, bakery, wine cellar, &c., being at the east corner, to the north-east of the great entrance court. In the west corner stood a temple, with a stage-
tower (siggurat) adjoining. The walls of the rooms, which stood only one storey high, were from 3 to 25 ft. In thickness, of clay, faced with brick, in the reception rooms ornamented with stone slabs or tiles, elsewhere plastered, or, in the harem, adorned with fresco paintings and arabesques. Here and there the floors were formed of tiles or alabaster blocks, but in general they were of stamped clay, on which were spread at the time of occupancy mats and rugs. The exterior of the palace wall exhibited a system of groups of half columns and stepped recesses, an orna-
ment familiar in Babylonian architecture. The palace and city were completed in 707 B.C., and in 706 Sargon took up his resi-
dence there. He died the following year, and palace and city seem to have been abandoned shortly thereafter. In 1909, this was the only Assyrian palace which had ever been explored systematically, in its entirety, and fortunately it was found on the whole in an admirable state of preservation. An immense number of statues and bas-reliefs, excavated by Botta, were transported to Paris, and formed the first Assyrian museum opened to the world. The objects excavated by Place, together with the objects found by Fresnel's expedition in Babylon and a part of the results of Rawlinson's excavations at Nineveh, were unfortunately lost in the Tigris, on transport from Bagdad to Basra. Flandin had, however, made careful drawings and copies of all objects of importance from Khorsabad. The whole material was published by the French government in two monumental publications.

See P. E. Botta and E. Flandin, Monument de Ninive (Paris, 1849-1850; 5 vols. 400 plates); Victor Place, Ninive et l'Assyrie, avec des essais de restauration par F. Thomas (Paris, 1866-1869; 3 vols.).

J. P. Fl.

Khotan (locally Iicca), a town and oasis of East Turkestan, on the Khotan-darya, between the N. foot of the Kunlun and the edge of the Takla-makan desert, nearly 200 m. by caravan road 3 h. from Yarkand and 10 h. by rail. The town con-

sists of a labyrinth of narrow, winding, dirty streets, with poor, square, flat-roofed houses, half-a dozen madrasas (Mahomedan colleges), a score of mosques, and some masors (tombs of Mahomed-

man saints). Dotted about the town are open squares, with tanks or ponds overhung by trees. For centuries Khotan was famous for jade or nephrite, a semi-precious stone greatly esteemed by the Chinese for making small fancy boxes, bottles and cups, manuscript covers for pipes, bracelets, &c. The stone is still exported to China.

Other local products are carpets (silk and felt), silk goods, hides, grapes, rice and other cereals, fruits, tobacco, opium and cotton. There is an active trade in these goods and in wool with India, West Turkestan and China. The oasis contains two small towns, Kara-kash and Yurun-kash, and over 300 villages, its total population being about 150,000.

Khotan, known in Sanskrit as Kustana and in Chinese as Yu-than, Yu-tien, Kiu-sa-tan-na, and Khio-tan, is mentioned in Chinese chronicles of the 2nd century B.C. In A.D. 73 it was conquered by the Chinese, and ever since has been generally dependent upon the Chinese empire. During the early centuries of the Christian era, and long before that, it was an important and flourishing place, the capital of a kingdom to which the Chinese sent embassies, and famous for its glass-wares, copper tankards and textiles. About the year A.D. 400 it was a city of some magnificence, and the seat of a flourishing cult of Buddha, with temples rich in paintings and ornaments of the precious metals; but from the 5th century it seems to have declined. In the 8th century it was conquered, after a struggle of 25 years, by the Arab chief Iftin Kotaila Ibn Moslim, from West Turkestan, who imposed Islam upon the people. In 1220 Khotan was destroyed by the Mongols under Jenghiz Khan. Marco Polo, who passed through the town in 1274, says that "Everything is to be had there [at Cutan, i.e. Khotan] in plenty, including abundance of cotton, with flax, hemp, wheat, wine, and the like. The people have vineyards and gardens and estates. They live by commerce and manufactures, and are no soldiers." The place suffered severely during the Dungan revolt against China in 1854-1875, and again a few years later when Yakub Beg of Kashgar made himself master of East Turkestan.

The Khotan-darya rises in the Kuen-lun Mountains in two headstreams, the Karakash and the Yurun-kash, which unite towards the middle of the desert, some 90 m. N. of the town of Khotan. The conjoint stream then flows 150 m. northwards across the desert of Takla-makan, though it carries water only in the early summer, and empties itself into the Tarim a few miles below the confluence of the Ak-su with the Yarkand-darya (Tarim). In crossing the desert it falls 1250 ft. in a distance of 270 m. Its total length is about 300 m. and it area it drains probably nearly 40,000 sq. m.

See J. P. A. Remusat, Histoire de la ville de Khotan (Paris, 1820); and Sven Hedin, Through Asia (Eng. trans., London, 1898), chs. ix. to xii., and the Scientific Results of a Journey in Central Asia, 1899-

Khotin, or Khotten (variously written Khobim, Chocizim, and Chocim), a fortified town of South Russia, in the government of Bessarabia, in 48° 30' N. and 26° 30' E., on the right bank of the Dniester, near the Austrian (Galician) frontier, and opposite the Podolian Kamenzis. Pop. (1897), 18,126. It possesses a few manufactures (leather, candles, beer, shoes, bricks), and carries on a considerable trade, but has always been of importance mainly as a military post, defending one of the most frequented passages of the Dniester. In the middle ages it was the seat of a Genoese colony, and it has been noted in Polish, Turkish and Austrian possession.

The chief events in its annals are the defeat of the Turks in 1621 by Ladislaus IV., of Poland, in 1673 by John Sobieski, of Poland, and in 1739 by the Russians under Münich; the defeat of the Russians by the Turks in 1768; the capture by the Russians in 1796, and by the Austrians in 1788; and the occupation by the Russians in 1806. It finally passed to Russia with Bessarabia in 1822 by the peace of Bucharest.

Kulna, a town and district of British India, in the Presi-
dency division of Bengal. The town stands on the river Bhairab, and is the terminus of the Bengal Central railway, 105 m. E. of Calcutta. Pop. (1901), 10,426. It is the most important centre of river-borne trade in the delta.

The District of Kulna lies in the middle of the delta of the Ganges, including a portion of the Sundarbans or seaside fringe of swamps. It was formed out of Jessore in 1882. Area (excluding the Sundarbans), 2077 sq. m. Besides the Sundarbans, the north-east part of the district is swampy; the north-
west is more elevated and drier, while the central part, though low-lying, is cultivated. The whole is alluvial. In 1901 the population was 1,253,043, showing an increase of 6% in the decade. Rice is the principal crop; mustard, jute and tobacco are also grown, and the fisheries are important. Sugar is manufactured from the date palm.

The district is entered by the Bengal Central railway, but by far the greater part of the traffic is carried by water.

See District Gazetteer (Calcutta, 1908).

Kunsar, a town of Persia, sometimes belonging to the province of Isfahan, at others to Irak, 96 m. N.W. of Isfahan, in 33° 9' N., 50° 23' E., at an elevation of 7600 ft. Pop., about 10,000. It is picturesquely situated on both sides of a narrow valley through which the Kunsar River, a stream about 12 ft. wide, flows in a north-east direction to Kusm. The town and its fine gardens and orchards straggle some 6 m. along the valley with a mean breadth of scarcely half a mile. There is a great profusion of fruit, the apples yielding a kind of cider which, however, does not keep longer than a month. The climate is cool in summer and cold in winter. There are five caravanserais, three mosques and a post office.

Kurja, a town of British India, in the Bulandshahr district of the United Provinces, 27 m. N.W. of Aligarh, near the main

line of the East Indian railway. Pop. (1901), 29,277. It is an important centre of trade in grain, indigo, sugar and ghee, and has cotton gins and presses and a manufacture of pottery. Jain traders form a large and wealthy class; and the principal building in the town is a modern Jain temple, a fine domed structure richly carved and ornamented in gold and colours.

**KHYBER PASS**, the most important of the passes which lead from Afghanistan into India. It is a narrow defile, winding between cliffs of shale and limestone 600 to 1000 ft. high, stretching up to more lofty mountains behind. No other pass in the world has possessed such strategic importance or retains so many historic associations as this gateway to the plains of India. It has probably been Persian and Greek, Seljuk, Tatar, Mongol and Durani conquerors, with the hosts of Alexander the Great, Mahmud of Ghazni, Jenghiz Khan, Timur, Baber, Nadir Shah, Ahmed Shah, and numerous other warrior chiefs and repass through its rocky defiles during a period of 2000 years. The mountain barrier which separates the Peshawar plains from the Afghan highlands differs in many respects from the mountain barrier which intervenes between the Indus plains and the plateau farther south. To the south this barrier consists of a series of flexures folded parallel to the river, through which the plateau drainage breaks down in transverse lines forming gorges and clefts as it cuts through successive ridges. West of Peshawar the strike of the mountain systems is roughly from west to east, and this formation is maintained with more or less regularity as far south as the Tochi River and Waziristan. Almost immediately west of Peshawar, and stretching along the same parallel of latitude from the meridian of Kabul to within ten miles of the Peshawar cantonment, is the great central range of the Safed Koh, which forms throughout its long, straight line of rugged peaks the southern wall, or water-divide, of the Kabul River basin. About the meridian of 71° E. it fork, sending off to the north-east what is locally known as a spur to the Kabul River, but which is geographically only partly of that stupendous water-divide which hedges in the Kunar and Chitrals valleys, and, under the name of the Shandur Range, unites with the Hindu Kush near the head of the Taghduombash Pamir. The Kabul River breaks through this northern spur of the Safed Koh; and in breaking through it is forced to the northward in a curved channel or trough, deeply sunk in the mountains between terrific cliffs and precipices, where its narrow waterway affords no foothold to man or beast for many miles. To reach the Kabul River within Afghan territory it is necessary to pass over this water-divide; and the Khyber stream, flowing down from the pass at Landi Kotal to a point in the plains opposite Jamrud, 9 m. W. of Peshawar, affords the opportunity.

Passing the main road from Peshawar to Kabul, the fort of Jamrud, which commands the British end of the Khyber Pass, lies some 12 m. W. of Peshawar. The road leads through a barren stony plain, cut up by water-courses and infested by all the worst cut-throats in the Peshawar district. Some three miles beyond Jamrud the road enters the mountains at an opening called Shadi Bagar, and here the Khyber proper begins. The highway runs for a short distance through the bed of a ravine, and then joins the road made by Colonel Mackeson in 1839-42, until it ascends on the left-hand side to a plateau called Shagai. From here can be seen the fort of Ali Masjid, which commands the centre of the pass and has been the scene of more than one famous siege. Still going westward the road turns to the right, and by an easy zigzag descends to the river of Ali Masjid, and runs along its bank. The new road along this cliff was made by the British during the Second Afghan War (1879-80), and here is the narrowest part of the Khyber, not more than 15 ft. broad, with the Rhoitas hill on the right fully 2000 ft. overhead. Some three miles farther on the valley widens, and on either side lie the hamlets and some sixty towers of the Zaka Khel Afridis. Then comes the Loourgi Shai, and plateau 20 miles long, divided in three of its widest part, ending at Landi Kotal, where is another British fort, which closes this end of the Khyber and overlooks the plains of Afghanistan. After leaving Landi Kotal the great Kabul highway passes between low hills, until it debouches on the Kabul River and leads to Dakka. The whole of the Khyber Pass from end to end lies within the country of the Afridis, and is now recognized as under British control. From Shadi Bagar on the east to Landi Kotal on the west is about 20 m. in a straight line.

The Khyber has been adopted by the British as the main road to Kabul, but its difficulties (before they were overcome by British engineers) were such that it was never so regarded by former rulers of India. The old road to India left the Kabul River near its junction with the Kunar, and crossed the great divide between the Kunar valley and Bajour; then it turned southwards to the plains. During the first Afghan War the Khyber was the scene of many skirmishes with the Afridis and some disasters to the British troops. In July 1839 Colonel Wade captured the fortress of Ali Masjid. In 1842, when Jalalabad was blockaded, Colonel Moseley was sent to occupy the same fort, but was compelled to evacuate it after a few days owing to scarcity of provisions. In April of the same year it was recaptured by General Pollock in his advance to Kabul. It was at Ali Masjid that Sir Neville Chamberlain's friendly mission to the amir Shere Ali was stopped in 1878, thus causing the second Afghan War; and on the outbreak of that war Ali Masjid was captured by Sir Samuel Browne. The treaty which closed the war in May 1879 left the Khyber tribes under British control. From that time the pass was protected by jezailchis drawn from the Afridi tribe, who were paid a subsidy by the British government. From 1885, the year in which Sir Charles Napier entered the Khyber, and for the greater part of that time secured its safety; but his term of office came to an end synchronously with the wave of fanaticism which swept along the north-west border of India during 1897. The Afridis were persuaded by their mullahs to attack the pass, which they themselves had guaranteed. The British government were warned of the intended movement, but only withdrew the British officers belonging to the Khyber Rifles, and left the pass to its fate. The Khyber Rifles, deserted by their officers, made a half-hearted resistance to their fellow tribesmen, and the pass fell into the hands of the Afridis, and remained under Afridi control for some months. This was the chief cause of the Tirah Expedition of 1897. The Khyber Rifles were afterwards strengthened, and divided into two battalions commanded by four British officers.

See *Eighteen Years in the Khyber*, by Sir Robert Warburton (1900); *Indian Borderland*, by Sir T. Holdich (1901).

**KIACKHA**, a town of Siberia, one of the chief centres of trade between Russia and China, on the Kiackha, an affluent of the Selenga, and on an elevated plain surrounded by mountains in the Russian government of Transbaikalia, 3000 ft. above M. of Chita, the capital, and close to the Chinese frontier, in 50° 20' N., 106° 40' E. Besides the lower town or Kiackha proper, the municipal jurisdiction comprises the fortified upper town of Troitskosavsk, about 2 m. N., and the settlement of Ust-Kiackha, 10 m. farther distant. The lower town stands directly opposite to the Chinese emporium of Maimachin, is surrounded by walls, and consists principally of one broad street and a large exchange courtyard. From 1689 to 1727 the trade of Kiackha was a government monopoly, but in the latter year it was thrown open to private merchants, and continued to improve until 1860, when the right of commercial intercourse was extended along the whole Russian-Chinese frontier. The annual December fairs for which Kiackha was formerly famous, and also the regular traffic passing through the town, have considerably fallen off since that date. The Russians exchange here leather, sheepskins, furs, horns, woollen cloths, coarse linens and cattle for teas (in value 95% of the entire imports), porcelain, rhubarb, manufactured silks, nankeens and other Chinese produce. The population, including Ust-Kiackha (5000), is about 15,000. Troitskosavsk (9213 in 1857), is nearly 20,000.

**KIANG-SI**, an eastern province of China, bounded N. by Hu-peh and Ngan-hui, S. by Kwang-tung, E. by Fukien, and
KIANG-SU—KIDD 783

W. by Hu-nan. It has an area of 72,176 sq. m., and a population returned at 22,000,000. It is divided into fourteen prefectures. The provincial capital is Nan-ch'ang Fu, on the Kan Kiang, about 35 m. from the Po-yang Lake. The whole province is traversed in a south-westerly and north-easterly direction by the Nan-shan ranges. The largest river is the Kan Kiang, which rises in the mountains in the south of the province and flows north-east to the Po-yang Lake. It was over the Meiling Pass that the Portuguese to this part of China, landing at Canton proceeded to Peking. During the summer time it has water of sufficient depth for steamers of light draft as far as Nan-ch'ang, and it is navigable by native craft for a considerable distance beyond that city. Another river of note is the Chang Kiang, which has its source in the province of Ngan-hui and flows into the Po-yang Lake, connecting in its course with the Wu-yuen district, whence come the celebrated "Moyune" green teas, and the city of King-te-ch'en, celebrated for its pottery, with Jao-chow Fu on the lake. The black "Kaisow" teas are brought from the Ho-kow district, where they are in the river Kin to Juy-hung on the lake, and the Ssu-ho connects by a navigable stream I-ning Chow, in the neighbourhood of which city the best black teas of this part of China are produced, with Wu-ching, the principal port of trade on the lake. The principal products of the province are tea, China ware, grass-cloth, hemp, paper, tobacco and tallow. Kiu-kiang, the treaty port of the province, opened to foreign trade in 1861, is on the Yangtse-kiang, a short distance above the junction of the Po-yang Lake with that river.

KIANG-SU, a maritime province of China, bounded N. by Shan-tung, S. by Cheb-kiang, W. by Ngan-hui, and E. by the sea. It has an area of 45,000 sq. m., and a population estimated at 21,000,000. Kiang-su forms part of the great plain of northern China. There are no mountains within its limits, and few hills. It is watered as no other province in China is watered. The Grand Canal runs through it from north to south; the Yangtse-kiang crosses its southern portion from west to east; it possesses several lakes, of which the T'ai-hu is the most noteworthy, and numberless streams connect the canal with the sea. Its coast is studded with low islands and sandbanks, the results of the deposits brought down by the Huai-ho. Kiang-su is rich in places of interest. Nanking, "the Southern Capital," was the seat of the Chinese court until the beginning of the 19th century, and it was the headquarters of the T'ai-p'ing rebels from 1853, when they took the city by assault, to 1864, when its garrison yielded to Colonel Gordon's army. Hang-chow Fu and Su-chow Fu, situated on the T'ai-hu, are reckoned the most beautiful cities in China. "Above there is Paradise, below are Su and Hang," says a Chinese proverb. Shang-hai is the chief port in the province. In 1909 it was connected by railway (270 m. long) via Su-Chow and Chin-kiang with Nanking. Tea and silk are the principal articles of commerce produced in Kiang-su, and next in importance are cotton, sugar and medicines. The silk manufactured in the looms of Su-chow is famous all over the empire. In the mountains near Nanking, coal, plumbago, iron ore and marble are found. Shang-hai, Chin-kiang, Nanking and Su-chow are the treaty ports of the province.

KIAOCHOW BAY, a large inlet on the south side of the promontory of Shantung, in China. It was seized in November 1897 by the German fleet, nominally to secure reparation for the murder of two German missionaries in the province of Shantung. In the negotiations that followed, it was arranged that the bay and the land on both sides of the entrance within certain defined lines should be leased to Germany for 99 years. During the continuance of the lease Germany exercises all the rights of territorial sovereignty, including the right to erect fortifications. The area leased is about 175 sq. m., and over a further area, comprising a zone of some 32 m., measured from any point on the shore of the bay, the Chinese government may not issue any ordinances without the consent of Germany. The native population in the ceded area is about 60,000. The German government in 1899 declared Kiaochow a free port. By arrangement with the Chinese government a branch of the Imperial maritime customs has been established there for the collection of duties upon goods coming from or going to the interior, in accordance with the general treaty tariff. Trade centres at Tsingtao, a town within the bay. The country in the neighbourhood is mountainous and bare, but the lowlands are well cultivated. Tsingtao is connected by railway with Chinan Fu, the capital of the province; a continuation of the same line provides for a junction with the main Lu-Han (Peking-Hankow) railway. The value of the trade in 1904 was £5,712,145 ($1,808,113 imports and £504,922 exports).

KICKAPOO ("he moves about"), the name of a tribe of North American Indians of Algonquian stock. When first met by the French they were in central Wisconsin. They subsequently removed to the Ohio valley. They fought on the English side in the War of Independence and that of 1812. In 1852 a large band went to Texas and Mexico and gave much trouble to the settlers; but in 1873 the bulk of the tribe was settled on its present reservation in Oklahoma. They number some 800, of whom about a third are still in Mexico.

KIDD, JOHN (1775-1831), English physician, chemist and geologist, born at Westminster on the 10th of September 1775, was the son of a naval officer, Captain John Kidd. He was educated at Bury St Edmunds and Westminster, and afterwards at Christ Church, Oxford, where he graduated B.A. in 1797 (M.D. in 1804). He also studied at Guy's Hospital, London (1797-1801), where he was a pupil of Sir Astley Cooper. He became reader in chemistry at Oxford in 1801, and in 1803 was elected the first Aldrichian professor of chemistry. He then voluntarily gave courses of lectures on mineralogy and geology; these were delivered in the chamber of the Ashmolean Museum, and there J. and W. D. Conybeare, W. Buckland, C. G. B. Daubeny and others gained their first lessons in geology. Kidd was a popular and instructive lecturer, and through his efforts the geological chair, first held by Buckland, was established. In 1818 he became a F. R. C. P.; in 1822 regius professor of medicine in succession to Sir Christopher Pegge; and in 1834 he was appointed keeper of the Radcliffe Library. He delivered the Harveian oration before the Royal College of Physicians in 1834. He died at Oxford on the 7th of September 1851.

PUBLICATIONS.—Outlines of Mineralogy (2 vols., 1804); A Geological Essay on the Imperfect Evidence in Support of a Theory of the Earth (1815); On the Adaptation of External Nature to the Physical Condition of Man, 1833 (Bridgewater Treatise).

KIDD, THOMAS (1770-1859), English classical scholar and schoolmaster, was born in Yorkshire. He was educated at Giggleswick School and Trinity College, Cambridge. He held numerous scholastic and clerical appointments, the last being the rectory of Croxton, near Cambridge, where he died on the 27th of August 1850. Kidd was an intimate friend of Porson and a professor of Greek at Cambridge. When Charles Bardin, the younger, he contributed largely to periodicals, chiefly on classical subjects, but his reputation mainly rests upon his editions of the works of other scholars: Opuscula Ruhrkeniana (1807), the minor works of the great Dutch scholar David Ruhnken; Miscellanea Critica of Richard Dawes (2nd ed., 1827); Tracts and Miscellaneous Criticisms of Richard Porson (1810). He also published an edition of the works of Horace (1817) based upon Bentley's recension.

KIDD, WILLIAM [CAPTAIN KIDD] (c. 1645-1701), privateer and pirate, was born, perhaps, in Greenock, Scotland, but his origin is quite obscure. He told Paul Lorraine, the ordinary of Newgate, that he was "about 60" at the time of his condemnation for piracy in 1701. In 1691 an award from the council of New York of £150 was given him for his services during the disturbances in the colony after the revolution of 1688. He was commissioned later to chase a hostile privateer off the coast, is described as an owner of ships, and is known to have served with credit against the French in the West Indies. In 1695 he came to London with a sloop of his own to trade. Colonel R. Livingston (1654-1724), a well-known New York landowner, recommended him to the newly appointed colonial governor Lord Bellomont, as a fit man to command a vessel to cruise against the pirates in the Eastern seas (see PIRATE).
Accordingly the "Adventure Galley," a vessel of 30 guns and 277 tons, was privately fitted out, and the command given to Captain Kidd, who received the king's commission to arrest and bring to trial all pirates, and a commission of reprimals against the French. Kidd sailed from Plymouth in May 1696 for New York, where he filled up his crew, and in 1697 reached Madagascar, the principal part of which he plundered. He then proceeded to the islands, and effort whatever to hunt them down. On the contrary he associated himself with a notorious pirate named Culliford. The fact would seem to be that Kidd meant only to capture French ships. When he found none he captured native trading vessels, under pretence that they were provided with French passes and were fair prize, and he plundered on the coast of Malabar. During 1697-1699 complaints reached the British government as to the character of his proceedings. Lord Bellomont was instructed to apprehend him if he should return to America. Kidd deserted the "Adventure," in Madagascar, and sailed for America in one of his prizes, the "Quedah Merchant," which he also left in the West Indies. He reached New England in a small sloop with several of his crew and wrote to Bellomont, professing his ability to justify himself and sending the governor booty. He was arrested in July 1699, was sent to England and tried, first for the murder of one of his crew, and then with others for piracy. He was found guilty on both charges, and hanged at Execution Dock, London, on the 23rd of May 1701. The evidence against him was that of two members of his crew, the surgeon and a sailor who turned king's evidence, but which the court would not act on in such circumstances, as the judge told him when he protested. "Captain Kidd's Treasure" has been sought by various expeditions and about £14,000 was recovered from Kidd's ship and from Gardiner's Island (off the E. end of Long Island); but its magnitude was palpably exaggerated. He left a wife and child at New York. The so-called ballad about him is a poor imitation of the authentic chant of Admiral Benbow.

Much has been written about Kidd, less because of the intrinsic interest of his career than because the agreement made with him by Bellomont was the subject of violent political controversy. The best popular account is in An Historical Sketch of Robin Hood and Captain Kidd, by W. C. Campbell (New York, 1853), in which the essential documents are quoted. But see PIRATE.

KIDDERMINSTER, a market town and municipal and parliamentary borough of Worcestershire, England, 135 m. N.W. from London and 15 m. N. of Worcester by the Great Western railway, on the river Stour and the Staffordshire and Worcestershire canal. Pop. (1901), 24,692. The parish church of All Saints, well placed above the river, is a fine Early English and Decorated building, with Perpendicular additions. Of other buildings are the town hall (1870), the town hall and buildings, and the school of science and a medical and free library. There is a free grammar school founded in 1637. A public recreation ground, Brinton Park, was opened in 1887. Richard Baxter, who was elected by the townfolk as their minister in 1641, was instrumental in saving the town from a reputation of ignorance and depravity caused by the laxity of their clergy. He is commemorated by a statue, as is Sir Rowland Hill, the introducer of penny postage, who was born here in 1795. Kidderminster is chiefly celebrated for its carpets. The "permanent" is the coarsest of the kinds distinguished is attributed to the properties of the water of the Stour, which is impregnated with iron and fuller's earth. Worsted spinning and dyeing are also carried on, and there are iron foundries, tinfoil works, breweries, malthouses, &c. The parliamentary borough returns one member. The town is governed by a mayor, 6 aldermen and 18 councillors. Area, 1214 acres. In 1763 lands upon the river Stour, called Stour in Usmere, which have been identified with the site of Kidderminster (Cheddinemere), were given to Earl Cynesberht by King Æthelbald to found a monastery. If this monastery was ever built, it was afterwards annexed to the church of Worcesters, and the lands on the Stour formed part of the gift of Coenwulf, king of the Mercians, to Deneberht, bishop of Worcester, but were exchanged with the same king in 816 for other property.

At the Domesday Survey, Kidderminster was still in the hands of the king and remained a royal manor until Henry II. granted it to Manser Bisset. The poet Edmund Waller was one of the 17th century lords of the manor. The town was possibly a borough in 1187 when the men paid £4 to an aid. As a royal possession it appears to have enjoyed various privileges in the 16th century, among them the right of choosing a bailiff to collect the toll and render it to the king, and to elect six burgesses and send them to the view of frankpledge twice a year. The first charter of incorporation, granted in 1636, appointed a bailiff and 12 capital burgesses forming a common council. The town was governed under this charter until the Municipal Reform Act of 1835. Kidderminster sent two members to the parliament of 1295, but was not again represented until the privilege of sending one member was conferred by the Reform Act of 1832. The first mention of the cloth trade for which Kidderminster was formerly noted occurs in 1334, when it was enacted that no one should make woollen cloth in the borough without the bailiff's seal. At the end of the 18th century the trade was still important, but it began to decline after the invention of machinery, probably owing to the poverty of the manufacturers. The manufacture of woollen goods was however replaced by that of carpets, introduced in 1735. At first only the "Kidderminster" carpets were made, but in 1749 a Brussels loom was set up in the town and Brussels carpets were soon produced in large quantities.

Kidderminster—Kidney Diseases.

1 The word "kiddene" first appears in the early part of the 14th century in the form kitenes, with plural kitenen, kitenere. It has been assumed that the second part of the word is "near" or "near" (cf. Ger. Niere), the common dialect word for "kiddene" in northern, north midland and eastern counties of England (see J. Wright, English Dialect Dictionary, 1903, s. v. Near), and that the first part represents the O.E. cun, becoming "kun." The English Dialectary considers improbable; there is only one doubtful instance of singular kiden in the ordinary form end in -in or -ey. Possibly this represents M.E. ey, plur. eyren, egg, the name being given from the resemblance in shape. The first part is uncertain.
and the effects of the kidney-lesion on the body at large. Affec-
tions of the kidney are congenital or acquired. When acquired they may be the result of a pathological process limited to the kidney, in which case they are spoken of as primary, or an accompaniment of disease in other parts of the body, when they may be spoken of as secondary.

Congenital Affections.—The principal congenital affections are anomalies in the number or position of the kidneys or of their ducts: atrophy; cystic disease and growths. The most common abnormality is the effacement of a single kidney; rarely may one of these anomalies be present. The presence of a single kidney may be due to failure of development, or to atrophy in foetal life; it may also be the result of being originally separate kidneys in such a way as to lead to the formation of a horseshoe kidney with both kidneys organs being connected at their lower ends. In some cases of horse-
shoe kidney the organs are united merely by fibrous tissue. Occa-
sional cases are recorded of the true horseshoe kidney, with end, and two ureters. A third variety is that where the fusion is more complete, producing a disk-like mass with two urerets. The kidneys may be situated in abnormal positions; they may be in front of the sacro-ilac articulation, in the pelvis, or in the iliac fossae. In emaciation such displacements lies in the fact that the organs may be mistaken for tumours. In some cases atrophy is associated with mal-develop-
ment, in the so-called agenesis of the peritoneum, so that the organ has a partial mesentery; and to this condition, where the kidney can be moved freely from one part of the abdomen to another, the term floating kidney is applied. But more usually the organ is loose upon the peritoneum and is supported in its position by the muscles of the back. Movements produce a variety of symptoms, such as pain in the loin and back, faintness, nausea and vomiting—and the function of the organ may be interfered with, owing to the ureter becoming kinked. In this way hydrophrenitis, or disease of the kidney with urine, may be produced. The return of blood through the renal vein may also be hindered, and temporary vascular engorgement of the kidney, with haematuria, may be produced.

In some cases the movable kidney may be satisfactorily kept in its place by a pad and belt, but in other cases an operation has to be undertaken. This consists in exposing the kidney (generally the right) through an incision below the last rib, and fixing it in its proper position by several permanent sutures of silk or silkworm gut. The operation is neither difficult nor dangerous, and its results are excellent.

Embolism.—The arrangement of the blood-vessels of the kidney is peculiarly favourable to the production of wedge-shaped areas of necrosis, the result of a blocking by clots. Sometimes the clot is detached; the effect being the arrest of the circulation in the part of the kidney supplied by the blocked artery. In other cases, the plug is infective owing to the presence of septic micro-organisms, and this is likely to lead to the formation of an abscess in the substance of the kidney, unless the artery to be blocked, so that the symptoms produced in the ordinary cases are only the temporary appearance of blood or albumen in the urine, or of longer duration, the result of disease of the walls of the vessels may lead to disorganization of the kidneys. Blocking of the veins, leading to extreme constriction of the kidney, also occurs. It is seen in cases of extreme weakness and debility and in women in the last weeks of pregnancy. In these cases, where a clot, formed first in one of the pelvic veins, may spread up the vena cava and secondarily block the renal veins. Thrombosis of the renal vein also occurs in malignant disease of the kidney and in certain forms of chronic Bright’s disease.

Passive congestion of the kidneys occurs in heart-diseases and lung-diseases, where the return of venous blood is interfered with. It may also be produced by tumours pressing on the vena cava. Acute congestive kidney-haemorrhage is a congested, enlarged and friable, and they secrete a scanty, high-coloured urine.

Active congestion is produced by the excretion of the urine of such materials as turpentine and cantharides and the toxins of various poisons. These irritants produce an increased vascular supply of the kidney, much as they would that of any other structures with which they come in contact. Renal disturbance is often the result of the excretion of microbic poisons. Extreme congestion of the kidneys with an urine in which the albumen is present is sometimes called Bright’s disease. The effect of the physical changes in the anatomy of the kidney, much as they would that of any other structures with which they come in contact. The urine is high-coloured, and the kidney-centered renal disease. This is most common as a result of scarlet fever.

Bright’s disease is the term applied to certain varieties of acute and chronic inflammation of the kidney. Three forms are usually recognized—acute, chronic and the granular or chro- nicotic kidney. In the more common form of granular kidney the renal lesion is only a part of a widespread affection involving the whole arterial system, and is not usually seen in the kidney itself. The disease—Bright’s disease is sometimes the sequel to acute Bright’s disease, but in a great number of cases the malady is chronic from the beginning. The lesions of the kidney are probably produced by the blood-vessels of the kidney being exposed to toxic substances either ingested or formed in the body; it is thought by some that the malady may arise as a result of exposure to cold. The causes of the disease are toxins, microbic agents and cold. The kidneys are usually enlarged, covered with a light, yellowish film, and having a more or less yellowish discoloration, and having a more or less yellowish discoloration, and having a more or less yellowish discoloration. The kidneys are usually enlarged, covered with a light, yellowish film, and having a more or less yellowish discoloration, and having a more or less yellowish discoloration. The kidneys are usually enlarged, covered with a light, yellowish film, and having a more or less yellowish discoloration, and having a more or less yellowish discoloration.
KIDNEY DISEASES

tubercle in two ways: *saxatilis*, in which the primary lesion is in the stone, itself, epididymis, or urinary bladder, the lesion travelling up by the ureter or the lymphatics to the kidney; *descending*, where the tubercule bacillus reaches the kidney through the blood-vessels. In the latter case, tubercles are found especially in the cortex of the kidney; the lesion is likely to be bilateral. In primary tuberculosis, and in ascending tuberculosis, the lesion is at first unilateral. *Malignant disease of the kidney* takes the form of a tumor-based or carcinoma, depending on the malignant growths starting in what are spoken of as "adrenal rests" in the cortex of the kidney. Sarcoma is most often seen in the young; carcinoma in the middle-aged and elderly. Carcinoma may be primary or secondary, but the kidney is not a common malignant disease as other organs, such as the stomach, bowel or liver.

Cystic Kidneys.—Cysts may be single—sometimes of large size. Scattered small cysts are met with in chronic Bright's disease and in congenital disease, whilst, when the disease is of long standing, they may be found in a high degree. Certain growths, such as adenomata, are liable to cystic degeneration, and cysts are also found in malignant disease. Finally, there is a rare condition of general cystic disease somewhat similar to the congenital affection. In this form the kidneys, greatly enlarged, consist of a congeries of cysts separated by the remnants of renal tissue.

Parasitic Affections. The more common parasites affecting the kidney, or the pelvis of the kidney, as the tract is called, are filaria, bilharzia and the cysticercus form of the *taenia echinococcus* (hydatids). The presence of *filaria* in the thoracic duct and other lymph-channels may determine the presence of cysts in the kidney, the cysts being formed of the filaria, owing to the distension and rupture of a lymphatic vessel into some portion of the urinary tract. This is the common cause of chyluria in children, but chyluria is occasionally seen in the United Kingdom without filaria. *Bilharzia*, especially in Egypt and South Africa, causes haematuria. The cysticercus form of the *taenia echinococcus* leads to the production of hydatid cysts in the kidney; this is not so often seen as in the liver.

Stone in the Kidney.—Calculi are frequently found in the kidney, consisting usually of uric acid, sometimes of oxalate, more rarely of phosphates. Calculous disease of the bladder (q.v.) is generally the cause of stone in the kidneys, but chyluria is occasionally seen in the United Kingdom without filaria. *Bilharzia*, especially in Egypt and South Africa, causes haematuria. The cysticercus form of the *taenia echinococcus* leads to the production of hydatid cysts in the kidney; this is not so often seen as in the liver.

The symptoms of renal calculus may be very slight, or they may be entirely absent if the stone is moulding itself into the interior of the kidney; but if the stone is movable, heavy and rough, it may cause great distress, especially during exercise. There will probably be blood in the urine; and there will be pain in the loin and thigh, and down into the testicle. The testicle also may be drawn up by its suspensory muscle, and there may be irritability of the bladder. With stone in one kidney the pains may be actually referred to the kidney of the other side. Generally, but not always, there is tenderness in the loin. If the stone is composed of lime it may throw a shadow on the X-ray plate; but other stones give no shadow. *Renal colic* is the acute pain felt when a small stone is travelling down the ureter to the bladder. The pain is at times so acute that foaming expectoration, vomiting and hot baths fail to ease it, and nothing short of chloroform gives relief.

For the operative treatment of renal calculus an incision is made a little below the last rib, and, the muscles having been traversed, the surgeon makes the incision in the peritoneum. Most likely the stone is then felt, so it is cut down upon and removed. If it is not discoverable on gently pinching the kidney between the finger and thumb, the kidney had better be opened. Generally the kidney is enclosed in the peritoneum. If this has happened when a man has presented most of the symptoms of renal calculus and has been operated on with a negative result as to stone, it is probable that some change has taken place, and, nevertheless, disappeared as the direct result of the blank operation.

Pyelitis.—Inflammation of the pelvis of the kidney is generally produced by the extension of gonorrhoeal or other septic inflammation upwards from the bladder and lower urinary tract. The presence of stone or of tubercle in the pelvis of the kidney. Pyonephrosis, or distension of the kidney with pus, may result as a sequel to acute calculous inflammation, or the inflammation spreads to the capsule of the kidney, and leads to the formation of an abscess outside the kidney—a perinephritic abscess. In some cases a perinephritic abscess results from a septic condition in one of the ducts or uriniferous tubules. In such cases an abscess forms on the surface of the cortex of the kidney, and, if left unremoved, it will gradually spread, giving rise to an injury to the loose cellular tissue surrounding the kidney, without lesion of the kidney.

Hydrophrenesis, or distension of the kidney with pent-up urine, results as a sequel to obstruction, either of the ureter, although all obstructions of the ureter are not followed by it, calculus obstruction, as already noted, often causing complete suppression of urine. Obstruction of the ureter, causing hydrophrenesis, is likely to be due to the impac- tion of a stone in the ureter, or to the presence of a stone in the pelvis—as, for instance, a cancer of the uterus—or to some abnor- mality of the ureter. Sometimes a kink of the ureter of a movable kidney causes hydrophrenesis. The hydrophrenes is produced by obstruction of the ureter may be intermittent, that is to say, with a certain degree of distension is produced; either as a result of the shifting of the calculus or of some other cause, the obstruction is temporarily relieved. When the hydrophrenes has long existed the kidney is converted into a sac, the remains of the renal tissues being spread out as a thin layer.
The damage is obviously past repair, the kidney should not be removed without giving nature a chance. (J. R. B.; E. O.)*

KIDWELLY (Cydwelly), a decayed market-town and municipal borough of Carmarthenshire, Wales, situated (as its name implies) near the junction of two streams, the Gwendraeth Fawr and the Gwendraeth Fach, a short distance from the shores of Carmarthen Bay. Pop. (1801), 2,385. It has a station on the Great Western railway. The chief attraction of Kidwelly is its magnificent and well-preserved castle, one of the finest in South Wales, dating chiefly from the 13th century and admirably situated on a knoll above the Gwendraeth Fach. The parish church of St Mary, of the 14th century, possesses a lofty tower with a spire. The quiet little town has had a stirring history. It was a place of some importance when William de Londres, a companion of Fitz Hamon and his conquering knights, first erected a castle here. In 1135 Kidwelly was furiously attacked by Gwenllian, wife of Griffith ap Rhys, prince of South Wales, and a battle, fought close to the town at a place then known as Maes Gwenllian, ended in the total defeat and subsequent execution of the Welsh princess. Later, the extensive lordship of Kidwelly became the property through marriage of Henry, earl of Lancaster, and to this circumstance is due the exclusive jurisdiction of the town. Kidwelly received its first charter of incorporation from Henry VI.; its present charter dating from 1618. The decline of Kidwelly is due to the accumulation of sand at the mouth of the river, and to the consequent prosperity of the neighbouring Llanelli.

KIEP, Kir or Kiel (a colloquial form of the Arabic keif, "pleasure, comfort") is situated on the 173d Kiei of the Holsteinisches Kriegsregister und Geschichtsbuch (Kiel, 1873). The town and adjacent villages, e.g. Kiel, Heikendorf and Laboe, are resorted to for sea-bathing, and in June of each year a regatta, attended by yachts from all countries, is held. The Kieler Woche is one of the principal social events in Germany, and corresponds to the "Cowes week" in England. Kiel is connected by day and night services with Korsör in Denmark by express passenger boats. The harbour yields sprats which are in great repute. The principal industries are those connected with the imperial navy and shipbuilding, but embrace also flour-mills, oil-works, iron-foundries, printing-works, saw-mills, breweries, brick-works, soap-making and fish-curing. There is an important trade in coal, timber, cereals, fish, butter and cheese.

The name of Kiel appears as early as the 10th century in the form Kyl (probably from the Anglo-Saxon Kylle = a safe place for ships). Kiel is mentioned as a city in the next century; in 1242 it received the Lübeck rights; in the 14th century it acquired various trading privileges, having in 1284 entered the Hanseatic League. In recent times Kiel has been associated with the peace concluded in January 1814 between Great Britain, Denmark and Sweden, by which Norway was ceded to Sweden as a part of Denmark and in 1865 it passed with the rest of Schleswig-Holstein to Prussia. Since being made a great naval arsenal, Kiel has rapidly developed in prosperity and population.

Hasse, Das Kieler Stadtbuch, 1264-1889 (Kiel, 1873); Das dritte Kieler Rentbuch 1300, 1387, edited by A. Schilling and A. Schilling (Kiel, 1874); the Kielische Hofmark (1476, 1570, edited by W. Stern (Kiel, 1904); and the Mittellungen der Gesellschaft für Kieler Stadtgeschichte (Kiel, 1877, 1904).

KIELCE, a government in the south-west of Russian Poland, surrounded by the governments of Piotrkow and Radom and by Austrian Galicia. Area, 386 sq. m. Its surface is an elevated plateau 800 to 1000 ft. in altitude, intersected in the north-east by a range of hills reaching 1350 ft. and deeply trenched in the south. It is drained by the Vistula on its south-eastern border, and by its tributaries, the Nida and the Płiva, which have a very rapid fall and give rise to inundations. Silurian and Devonian quartzites, dolomite, limestones and sandstones prevail in the north, and contain rich iron ores, lead and copper ores. Carboniferous deposits containing rich coal seams occur chiefly in the south, and extend into the government of Piotrkow. Permian limestones and sandstones exist in the south. The Triassic deposits contain very rich zinc ores of considerable thickness and lead. The Jurassic deposits consist of iron-clays and limestones, containing large caves. The Cretaceous deposits yield gypsum, chalk and sulphur. White and black marble are also extracted. The soil is of great variety and fertile in parts, but owing to the proximity of the Carpathians, the climate is more severe than might be expected. Rye, wheat, oats, barley and buckwheat are grown; modern intensive culture is spreading, and land fetches high prices, the more so as the peasants' allotments were small at the outset and are steadily decreasing. Out of a total of 2,103,300 acres suitable for cultivation 53.4% are actually cultivated. Grain is exported. Gardening is a thriving industry in the south; beet is grown for sugar in the south-east. Industries are considerably developed: zinc ores are extracted, as well as some iron and a little sulphur. Tiles, metallic goods, leather, timber goods and flour are the chief products of the manufactures. Pop. (1897), 755,212, for the greater part Poles, with 11% Jews; (.906, estimated), 910,900. By religion 88% of the people are Roman Catholics. Kielce is divided into seven districts, the chief towns of which, with the town, between Gaarden and Ellerbeck, and comprise basins capable of containing the largest war-ships afloat. The imperial yard employs 7000 hands, and another 7000 are employed in two large private ship-building works, the Germania (Krupp's) and Howaldt's. The Kaiser Wilhelm Canal, commonly called the Kiel Canal, connecting the Baltic with the North Sea at Brunsbüttel, has its eastern entrance at Wik, 13 m. N. of Kiel (see GERMANY: Waterways). The town and adjacent villages, e.g. Wik, Heikendorf and Laboe, are resorted to for sea-bathing, and in June of each year a regatta, attended by yachts from all countries, is held. The Kieler Woche is one of the principal social events in Germany, and corresponds to the "Cowes week" in England. Kiel is connected by day and night services with Korsör in Denmark by express passenger boats. The harbour yields sprats which are in great repute. The principal industries are those connected with the imperial navy and shipbuilding, but embrace also flour-mills, oil-works, iron-foundries, printing-works, saw-mills, breweries, brick-works, soap-making and fish-curing. There is an important trade in coal, timber, cereals, fish, butter and cheese.
KIELCE—KIEV

populations in 1897, are Kielce (q.v.), Jedrzejow (Russ. Andreyev, 1910), Miechow (416b), Olkusz (349), Pinczow (8095), Stopnica (4659) and Włocławek (23,065).

KIELCE, a town of Russian Poland, capital of the above government, 152 m. by rail S. of Warsaw, situated in a picturesque hilly country. Pop. (1860), 12,775; (1867), 23,189. It has a castle, built in 1639 and for some time inhabited by Charles XII; it was renovated for its portrait gallery and the library of Zaluski, which was taken to St Petersburg. The squares and boulevards are lined with handsome modern buildings. The principal factories are hemp-spinning, cotton-printing and cement works. The town was founded in 1173 by a bishop of Cracow. In the 16th century it was famous for its copper mines, but they are no longer worked.

H. BLASCHICH (1818-1899), German geographer, was born at Berlin on the 21st of July 1818. He was educated at the university there, studying especially history, philology and geography. In 1840-1846, in collaboration with Karl Ritter, he issued his first work, Atlas von Hellas und den hellenischen Kolonien, which brought him at once into eminence in the sphere of ancient historical cartography. In 1848 his Historisch-geographischer Atlas der alten Welt appeared, and in 1854 the first edition of the Atlas antiquus, which has obtained very wide recognition, being issued in English, French, Russian, Dutch and Italian. In 1854 Kiepert produced the first part of a larger atlas of the ancient world under the title Formae orbis antiqui; his valuable maps in Corpus inscriptionum latinarum must also be mentioned. In 1877-1878 his Lehrbuch der alten Geographie was published, and in 1879 Leitfaden der alten Geographie, which was translated into English (A Manual of Ancient Geography, 1881) and into French. Among Kiepert's general works one of the most important was the excellent Neuer Handatlas über alle Teile der Erde (1855 et seq.), and he also compiled a large number of special and educational maps. Asia Minor was an area in which he took particular interest. His maps of Asia Minor in 1843-1898; and his first map (1843-1846), together with his Karte des osmanischen Reiches in Asien (1844 and 1886), formed the highest authority for the geography of the region. Kiepert was professor of geography in the university of Berlin from 1854. He died at Berlin on the 21st of April 1899. He left unpublished considerable material in various departments of his work, and with the assistance of this his son Richard (b. 1846), who followed his father's career, was enabled to issue a map of Asia Minor in 24 sheets, on a scale of 1:400,000 (1902 et seq.), and to carry on the issue of Formae orbis antiqui.

KIERKEGAARD, Sören Aaby (1813-1855), Danish philosopher, the seventh child of a Jutland hosier, was born in Copenhagen on the 5th of May 1813. As a boy he was delicate, precocious and morbid in temperament. He studied theology at the university of Copenhagen, where he graduated in 1840 with a treatise On Irony. For two years he travelled in Germany, and in 1842 settled finally in Copenhagen, where he died on the 11th of November 1855. He had lived in studious retirement, subject to physical suffering and mental depression. His first volume, Papers of a Still Living Man (1838), a characterization of Hans Andersen, was a failure, and he was for some time unnoticed. In 1843 he published, under the pseudonym of Ferdinand Tietjen, a series of essays, the first of which, Et studium i 1843 (4th ed., 1878), the work on which his reputation mainly rests; it is a discussion of the ethical and aesthetic ideas of life. In his last years he carried on a feverish agitation against the theology and practice of the state church, on the ground that religion is for the individual soul, and is to be separated absolutely from the state and the world. In general his philosophy was a reaction against the speculative thinkers—Steffens (q.v.), Niels Treschow (1751-1833) and Frederik Christian Sibbern (1785-1872); it was based on the absolute dualism of Faith and Knowledge. His chief follower was Kasmus Nielsen (1809-1884) and he was opposed by Georg Brandes, who wrote a brilliant account of his life and works. As a dialectician he has been described as little inferior to Plato, and his influence on the literature of Denmark is considerable both in style and in matter. To him Ibsen owed his character Brand in the drama of that name.

See his posthumous autobiographical sketch, Synpunktfor min Forfatterets Indkendelse ("Standpoint of my Literary Work") by Georg Brandes. Sören Kierkegaard (Copenhagen, 1857); A. Hartland, Noten zu K.'s Lebensgeschichte (Halle, 1870). Die Bedeutung der ästhetischen Schriften S. Kierkegaarde (Halle, 1879) and S. K.'s Kritik des Schicksals in seiner Werke und Ideen (Copenhagen, 1880); F. Petersen, S. K.'s Christendomsforkyndelser (Christiania, 1877). For Kierkegaard's relation to recent Danish thought, see Hoffding's Archiv für Geschichte der Philosophie (1888), vol. ii.

KIEV, Kieff, or Kievsk, a government of south-western Russia, conterminous with those of Minsk, Poltava, Chernigov, Podolia, Kherson and Volhynia; area 19,686 sq. m. It represents a deeply trenched plateau, 600 to 800 ft. in altitude, reaching 1,000 ft. to 1,200 ft. in the west, assuming a steep character in the middle, and sloping gently northwards to the marshy regions of the Prietip, while on the east it falls abruptly to the valley of the Dnieper, which lies only 250 to 300 ft. above the sea. General A. Tillo has shown that neither geologically nor tectonically can "spurs of the Carpathians" penetrate into Kiev. Many useful minerals are extracted, such as granites, gabbro, labradorites of a rare beauty, syenites and gneiss, marble, grinding stones, pottery clay, phosphorites, iron ore and mineral colours. Towards the southern and central parts the surface is covered by deep rich "black earth." Nearly the whole of the great alluvial basin of the Dnieper, that river forming part of its eastern boundary. In the south-west are a few small tributaries of the Bug. Besides the Dnieper the only navigable stream is its confluence the Prietip. The climate is more moderate than in middle Russia, the average temperatures at the city of Kiev being—year, 44·5°; January, 21°; July, 68°; yearly rainfall, 22 inches. The lowlands of the north are covered with woods; they have the flora of the Poleyesie or marshy woodlands of Minsk, and are peopled with animals belonging to higher latitudes. The population, which was 2,017,652 in 1893, reached 3,575,457 in 1897, of whom 1,791,503 were women, and 1,783,954 lived in towns; and in 1904 it reached 4,042,536, of whom 2,030,744 were women. The estimated population in 1906 was 4,206,100. In 1897 there were 2,738,977 Orthodox Greeks, 14,888 Nonconformists, 91,831 Roman Catholics, 423,875 Jews, and 68,320 Protestants.

No less than 41% of the land is in large holdings, and 45% belongs to the peasants. Out of an area of 12,600,000 acres, 11,100,000 acres are available for cultivation, 4,758,000 acres are under crops, 630,000 acres under meadows, and 1,880,000 acres under woods. About 290,000 acres are under beetroot, one of the crops principally grown is wheat, barley, millet, barley and buckwheat, with, in smaller quantities, hemp, flax, vegetables, fruit and tobacco. Camels have been used for agricultural work. Bee-keeping and gardening are general. The chief factories are sugar works and distilleries. The produce consists of 890,000 tons of sugar and over 50,000 tons of molasses annually. The factories include machinery works and iron foundries, tanneries, steam flour-mills, petroleum refiners and tobacco factories. Two main railways, starting from Kiev and Cherkasy respectively, cross the government from N.E. to S.W., and two lines traverse its principal part from N.W. to S.E., parallel to the Dnieper. Steamers ply on the Dnieper and some of its tributaries. Wheat, rye, oats, barley and flour are exported. There are two great fairs, at Kiev and Berdichef respectively, and many of minor importance. Trade is very brisk, the river traffic alone being valued at over one million sterling annually. The Dnieper is divided into twelve districts. The chief town is Kiev (q.v.) and the district towns, with their populations in 1897, Berdichef (53,728), Cherkassy (29,619), Chigirin (3,809), Kanev (8,892), Lipovert (6,068), Radomysl (11,54), Skvira (16,265), Tarashcha (11,45), Uman (68,528), Vinnitsa (7,153), and Novgorodka (16,759).

The claims on the Dnieper have been inhabited since probably the Palaeolithic period, and the burial-gounds used since the 1

1 Schmalhausen's Flora of South-West Russia (Kiev, 1886) contains a good description of the flora of that name.
Stone Age. The burial mounds (kurgans) of both the Scythians and the Slavs, traces of old forts (gorodische), stone statues, and more recent coves offer abundant material for anthropological and ethnographical study.

**Kiev**, a city of Russian, capital of the above government, on the right or west bank of the Dnieper, in 50° 27′ 12″ N. and 30° 30′ 18″ E., 628 m. by rail S.W. of Moscow and 406 m. by rail N.E. of Odessa. The site of the greater part of the town consists of hills or bluffs separated by ravines and hollows, the elevation of the central portions being about 300 ft. above the ordinary level of the Dnieper. On the opposite side of the river the country spreads out low and level like a sea. Having received all its important tributaries, the Dnieper is here a broad (400 to 580 yds.) and navigable stream; but as it approaches the town it forms and arms of great breadth, and is crossed by numerous isles of considerable extent called Tukhanov. During the spring floods there is a rise of 16 or even 20 ft., and not only the island but the country along the left bank and the lower grounds on the right bank are laid under water. The bed of the river is sandy and shifting, and it is only by costly engineering works that the main stream has been kept from returning to the more eastern channel, along which it formerly flowed. Opposite the southern part of the town, where the currents have again united, the river is crossed by a suspension bridge, which at the time of its erection (1848-1853) was the largest enterprise of the kind in European Russia. Its length is 2 miles, its width 52 ft. in breadth, and the four principal spans are each 440 ft. The bridge was designed by Vignoles, and cost about 400,000£. Steamers ply in summer to Kremenchug, Ekaterinoslav, Mogilev, Pinsk and Chernigov. Altogether Kiev is one of the most beautiful cities in Russia, and the vicinity too is picturesque.

Until 1837 the town proper consisted of the Old Town, Pechersk and Podoli; but in that year three districts were added, and in 1879 the limits were extended to include Kurenevka, Lukyanovka, Shulyavka and Solomenka. The administrative area of the town is 13,500 acres. Its external walls are of red bricks, and the main street (Kreshchatik) fine structures have been erected since 1836. In the 11th century the area was enclosed by earthen ramparts, with bastions and gateways; but of these the only surviving remnant is the Golden Gate. In the centre of the Old Town stands the cathedral of St Sophia, the oldest cathedral in Russia, now a museum. Its external walls are of red brick, and its fine spires are of white marble. Its length is 423 ft., its breadth 150 ft., and its height 485 ft. The highest point of the town is 602 ft.

The Old Town, or Kiev Quarter (Starokievskaya Chast), occupies the highest of the range of hills. Here the houses are most closely built, and stone structures most abundant. In some of the principal streets are buildings of three to five storeys, a comparatively rare thing in Russia, indeed, in the main street (Kreshchatik) fine structures have been erected since 1836. In the 11th century the area was enclosed by earthen ramparts, with bastions and gateways; but of these the only surviving remnant is the Golden Gate. In the centre of the Old Town stands the cathedral of St Sophia, the oldest cathedral in Russia, now a museum. Its external walls are of red bricks, and its fine spires are of white marble. Its length is 423 ft., its breadth 150 ft., and its height 485 ft. The highest point of the town is 602 ft.

The Podol district lies on the low ground at the foot of the bluffs. It is the industrial and trading quarter of the city, and the seat of the great fair of the “Contracts,” the transference of which from Parnawa in 1709 largely stimulated the commerce and prosperity of Kiev. The present regular arrangement of its streets arose after the great fire of 1711. Lipki district (from the lipki or lime trees, destroyed in 1833) is of recent origin, and is mainly inhabited by the well-to-do classes. It is sometimes called the palace quarter, from the royal palace erected between 1868 and 1870, on the site of the older structure dating from the time of Tsaritsa Elizabeth. Gardens and parks abound; the palace garden is exceptionally fine, and in the same neighbourhood are the public gardens with the place of amusement Flôret the Chateau des Fleurs.

In the New Buildings, or the Lybed quarter, are the university and botanical gardens. The Ploskaya Chast (Flat quarter) or Obolon contains the lunatic asylum; the Lukyanovka Chast, the penitentiary and the camp and barracks; and the Bulvanayaya Chast, the military gymnasiunum of St. Vladimir and the
railway station. The educational and scientific institutions of Kiev rank next to those of the two capitals. Its university, removed from Vilna to Kiev in 1834, has about 2500 students, and is well provided with observatories, laboratories, libraries and museums. The tax upon society and two societies for aid to poor students are attached to it. There are, besides, a theological academy, founded in 1615; a society of church archaeology, which possesses a museum built in 1900, very rich in old icons, crosses, &c., both Russian and Oriental; an imperial academy of music; university courses for ladies; a polytechnical, with 1300 students—the building was completed in 1900 and stands on the side of Old Kiev, away from the river. Of the learned societies the more important are the medical (1840), the naturalists' (1860), the juridical (1870), the historical (1872), the horticultural (1875), and the dramatic (1879), the archaeological commission (1843), and the society of church archaeology.

Kiev is the principal centre for the sugar industry of Russia, as well as for the general trade of the region. Its Streitenskaya fair is important. More than twenty caves were discovered on the slope of a hill (Kirilov Street), and one of them, excavated in 1876, proved to have belonged to neolithic troglodytes. Numerous graves, both from the pagan and the Christian periods, the latter containing more than 2000 skeletons, with a great number of small articles, were discovered in the same year in the same region. The coin of the 3rd and 4th centuries, and silver dirhems, stamped at Samarkand, Balkh, Merv, &c., were also found in 1869. In 1862 the population of Kiev was returned as 70,341; in 1874 the total was given as 127,251; and in 1902 as 319,000. This includes 20,000 Poles and 12,000 Jews. Kiev is the headquarters of the IX. Army Corps, and of a metropolitan of the Orthodox Greek Church.

The history of Kiev cannot be satisfactorily separated from that of Novgorod. Nestor's legend was founded in 864 by three brothers, Kiy, Shchek and Rurik. After their death the principality was seized by two Varangians (Scandinavians), Askold and Dir, followers of Rurik, also in 864. Rurik's successor Oleg conquered Kiev in 882 and made it the chief town of his principality. It was in the waters of the Dnieper opposite the town that Prince Vladimir, the first saint of the Russian church, caused his people to be baptised (988), and Kiev became the seat of the first Christian church, of the first Christian school, and of the first library in Russia. For three hundred and seventy-six years it was an independent Russian city; for eighty years (1240-1320) it was subject to the Mongol khan and for forty-nine years (1320-1369) belonged to the Lithuanian principality; and for eighty-five years to Poland (1569-1654). It was finally united to the Russian empire in 1686. The city was devastated by the Khan of Crimea in 1491, but was soon restored and fortified. The colonists were abolished in 1835, and the ordinary form of town government introduced; and in 1840 it was made subject to the common civil law administered by a prince.

The Russian literature concerning Kiev is voluminous. Its bibliography will be found in the Russian Geographical Dictionary of P. Semenov, and in the Russian Encyclopaedic Dictionary, published by Brokhaus and Efron (vol. xx., 1895). Among recent publications are: Rambaud's La Russe époque (Paris, 1876); Avenarius, Kniga d Kievskih Bogatyrykh (St Petersburg, 1876), dealing with the early Kiev heroes; Zakrevsky, Opiisnie Kiev (1868); the materials issued by the commission for the investigation of the ancient records of the city; Tarasovskiy, Gorod Kiev (Kiev, 1881); De Baye, Kiev, la mère des villes russes (Paris, 1896); Goetz, Das Kloster Kievo-Pecherskoje der Kiewischen Russen (Pansau, 1904). See also Count Bobrinski, Kurgans of Smola (1897); and N. Bychlyashovski, The Mints of Kiev.

KILBACHAN, a burgh of barony of Renfrewshire, Scotland, 1 m. from Millicen Park station on the Glasgow & South-Western railway, 13 m. W. by S. of Glasgow. Pop. (1901), 886. The public buildings include a hall, library and Masonic lodge (1812). The churchyard is bounded on the town steeple (erected in 1755) is the statue of the famous piper, who died about the beginning of the 17th century and is commemorated in the elegy on " The Life and Death of Habbie Simson, Piper of Kilbarchan " by Robert Sempill of Beltrees (1595-1665). The chief industries are manufactures of linen (introduced in 1739 and dating the rise of the prosperity of the town), cotton, silks and " Paisley " shawls, and calico-printing, besides quarries, coal and iron mines in the neighbourhood. Two miles south-west is a great rock of greenstone called Clochderrick, 12 ft. in height, 22 ft. in length, and 17 ft. in breadth. About 2 m. north-west on Gryfe Water, lies Bridge of Weir (pop. 2242), the industries of which comprise tanning, currying, calico-printing, thread-making and wood-turning. It has a station on the Glasgow & South-Western railway. Immediately to the south-west of Bridge of Weir are the ruins of Ranfurly Castle, the ancient seat of the Knoxes. Sir John de Knocks (fl. 1422) is supposed to have been the great-grandfather of John Knox; and Andrew Knox (1559-1633), one of the most distinguished members of the family, was successively bishop of the Isles, abbot of Icolmkill (Iona), and bishop of Raphoe. About 1 m. N.W. of Bridge of Weir lies the holiday resort of Kilmacolm (pronounced Kilmaulm), situated on the bank of the Clyde, has a station on the Glasgow & South-Western railway. It has a golf-course, public park and hydro pathetic establishment. Several charitable institutions have been built in and near the town, amongst them the well-known Quarrier's Orphan Homes of Scotland.

KILBIRNIE, a town in north Ayrshire, Scotland, on the Garnock, 203 m. S.W. of Glasgow, with stations on the Glasgow & South-Western and the Caledonian railways. Pop. (1901), 4571. The industries include flax-spinning, rope works, engineering works, iron and steel works, and sawmills. There are numerous flaxen, corn, and iron works and coal mines in the vicinity. The parish church is of historical interest, most of the building dating from the Reformation. In the churchyard are the recumbent effigies of Captain Thomas Crawford of Jordanhill (d. 1603), who in 1575 effected the surprise of Dumbarton Castle, and his lady. Near Kilbirnie Place, a modern mansion, are the ruins of Kilbirnie Castle, an ancient seat of the earls of Crawford, destroyed by fire in 1757. About 1 m. E. is Kilbirnie Loch, 15 m. long.

KILBRIDE, formerly Kilbride, on the south coast of Ayrshire, Scotland, near the mouth of Kilbride Burn, 4 m. N.N.W. of Ardrossan and 352 m. S.W. of Glasgow by the Glasgow & South-Western railway. Pop. (1901), 2315. It has been growing in repute as a health resort; the only considerable industry is weaving. In the neighbourhood are the ruins of Law Castle, Crosbie Castle and Portincross Castle, the last, dating from the 13th century, said to be a seat of the Stuart kings. Farland Head, with cliffs 300 ft. high, lies 2 m. W. by N.; and the inland country is hilly, one point, Kain Hill, being 1720 ft. above sea-level.

KILDARE, a county of Ireland in the province of Leinster, bounded on the north by the counties of Meath and Louth, and on the south by the counties of Westmeath, Offaly, and Tipperary, and on the west by Dublin and Wicklow. The area is 418,496 acres or about 654 sq. m. The greater part of Kildare belongs to the great central plain of Ireland. In the east of the county this plain is bounded by the foot-hills of the mountains of Dublin and Wicklow; in the centre it is interrupted by an elevated plateau terminated on the south by the hills of Dunmurry, and on the north by the Hill of Allen (300 ft.) which rises abruptly from the Bog of Allen. The principal rivers are the Boyne, which with its tributary the Blackwater rises in the north part of the county, but soon passes into Meath; the Barrow, which forms the boundary of Kildare with Queen’s County, and receives the Greese and the Lane shortly after entering Kildare; the Lesser Barrow, which flows southward from the Bog of Allen to near Rathangan; and the Liffey, which enters the county near Ballymore Eustace, and flowing north-west and then north-east quits it at Leixlip, having received the Morrel between Celbridge and Clane, and the Rye-water at Leixlip. Trout are taken in the upper waters, and there are salmon reaches near Leixlip.

Geology.—The greater part of the county is formed of typical grey Carboniferous limestone, well seen in the flat land about Clane. The natural steps at the Salmon Falls at Leixlip are formed from similar strata. Along the south-east the broken ground of Silurian shales forms the higher country, rising towards the Leinster chain. The granite core of the latter, with its margin of mica-schist produced by the metamorphism of Silurian beds, appears in the south round Castledermot. A parallel ridge of Silurian rocks,
including an interesting series of basic lavas, rises from the plain north of Kildare town (Hill of Allen and Chair of Kildare), with some Old Red Sandstone benches. In the limestone hills to the north, rich in fossils of Hals age, and has been connected with that of Portarne in county Dublin. The low ground is diversified by eskers and masses of glaciel gravel, notably at the dry sandy plateau of Lough Cosogue, which traversed the territory, but the limestone of the Liffey valley is very mild and healthy. The soil, whether resting on the limestone or on the clay slate, is principally a rich deep loam inclining occasionally to clay, easily cultivated and often enriched with lime. The drainage of 1,000 square miles of the northern part of the county are included in the Bog of Allen, which is, however, intersected in many places by elevated tracts of farm ground. To the east of the town of Kildare is the Carragh, an un- dulating down upwards of 4000 acres in extent. The most fertile and highly cultivated districts of Kildare are the valleys of the Liffey and a tract in the south watered by the Greese. The demesne lands along the valley of the Liffey are finely wooded. More attention is paid to drainage and the use of manures on the larger farms than is done in many other parts of Ireland. The pastures which are not subjected to the plough are generally very rich and fattening. The propor- tion of Ireland’s grain is supplied by Kildare. The principal crops are oats, barley, turnips and potatoes are all considerably cultivated. Cattle and sheep are grazed extensively, and the number of sheep are large, with fat sheep’s for the short horn or the Durham are the commonest breed. Leicesters are the principal breed of sheep. Poultry farming is a growing industry.

To possess a good supply of water-power the county is almost entirely surrounded by watercourse, support springs at well-woolen and paper mills, as well as breweries and distilleries, and several corn mills. Large quantities of turf are exported to Dublin by canal. The main line of the Midland Great Western follows the northern border of the county, with a branch to Carbury and Edenderry; and that of the Great Southern & Western crosses the county by way of Newbridge and Kildare, with southward branch lines to Naas (and Tullow-Country Carbury) and to Athy, and the Carlow line to the south. The northern border is traversed by the Royal Canal which connects Dublin with the Shannon at Clondonara. Farther south the Grand Canal, which connects Dublin with the Shannon at Shannon Harbour, occupies the valley of the Liffey until at Sallins it enters the Bog of Allen, passing into King’s County near the source of the Boyne. Several branch canals afford communication with the southern districts.

Population and Administration.—The decreasing population (70,206 in 1819; 63,566 in 1901) shows an unusual excess of males over females, in spite of an excess of male emigrants. About 86% of the population are Roman Catholics. The county comprises 14 baronies and contains 110 civil parishes. Assizes are held at Naas, and quarter sessions at Athy, Kildare, Maynooth and Naas. The military stations at Newbridge and the Curragh connect with the main line, and the barracks at Athy and Naas are included in the Dublin military district. The principal towns are Athy (pop. 3,590), Naas (3,536) and Newbridge (1903), with Maynooth (which is the seat of a Roman Catholic college), Celbridge, Kildare (the county town), Monasterevan, Kilcullen and Leixlip. Ballitore, one of the larger villages, is a Quaker settlement, and at a school here Edmund Burke was educated. Kildare returned ten members to the Irish parliament, of whom eight represented boroughs; it sends only two (for the north and south divisions of the county) to the parliament of the United Kingdom. The county is represented in the Oxford diocese and in the Roman Catholic dioceses of Dublin and of Kildare and Leighlin.

History and Antiquities.—According to a tale in the Book of Leinster the original name of Kildare was Drum Cridhach (Drumtree), which it retained until the time of St Brigit, after which it was changed to Cilldara, the church of the oak, from an old oak under whose shadow the saint had constructed her cell. For some centuries it was under the government of the Maemroughs, kings of Leinster, but with the remainder of Leinster it was granted by Henry II. to Strongbow. On the division of the palatinate of Leinster among the five grandsons of Strongbow, Kildare fell to William de Ferrars, the eldest daughter, who married William de Ferrars, earl of Derby. Through the marriage of the only daughter of William de Ferrars it passed to William de Vescy—who, when challenged to single combat by John Fitz Thomas, baron of Offaly, for accusing him of treason, fled to France. His lands were thereupon in 1297 bestowed on Fitz Thomas, who in 1316 was created earl of Kildare, and in 1317 was appointed sheriff of Kildare, the office remaining in the family until the attainer of Gerald, the ninth earl. Thus the reign of Henry VIII. Kildare was a liberty of Dublin until 1206, when its act was passed constituting it a separate county.

There are several old gigantic pillar-stones, the principal being those at Punchestown, Harristown, Jigginstown and Mullamast. Among remarkable earthworks are the mounds at Mullamast, Knockcassagh near Kilcullen, Ardsull near Naas, and the numerous sepulchral mounds in the Curragh. Of the round towers the finest is that of Kildare; there are remains of others at Taghadoe, Old Kilcullen, Oughterard and Castlelach. Formerly there were an immense number of religious houses in the county. There are remains of a Franciscan abbey at Castlelach. At Graney are ruins of an Augustinian nunnery and portions of a building said to have belonged to the Knights Templars. The town of Kildare has ruins of four monastic buildings, including the nunnery founded by St Brigit. The site of a monastery at Old Kilcullen, said to date from the time of St Patrick, is marked by two stone crosses, one of which is curiously sculptured. The fine abbey of Monasteran is now the seat of the marquess of Drogheda. On the Liffey are the remains of Great Connel Abbey near Celbridge, of St Helen’s near Nangor, and of Nangor and Kilcullen. Where there was a Franciscan monastery, are the remains of an ancient cross with curious sculpturing. Among castles may be mentioned those of Athy and Castlelach, built about the time of the Anglo-Norman invasion; Maynooth Castle, built by the Fitzgeralds; Kilkea, originally built by the seventh earl of Kildare, and restored within the 19th century; and Timolin, erected in the reign of King John.

KILDARE, a market town and the county town of county Kildare, Ireland, in the south parliamentary division, a junction on the main line of the Great Southern & Western railway m. S.W. from Dublin, the branch line to Athy, Carlow and Kilkenny diverging southward. Pop. (1901), 1,756. The town is of high antiquarian interest. There is a Protestant cathedral church, the diocese of which was united with Dublin in 1846. St Brigit or Bridget founded the religious community in the 5th century, and a fire sacred to the memory of the saint is said to have been kept incessantly burning for centuries (until the Reformation) in a small ancient chapel called the Fire House, part of which remains. The cathedral suffered with the town from frequent burnings and destructions at the hands of the Danes and the Irish, and of the after the English restoration. The church was partially in ruins when an extensive restoration was begun in 1875 under the direction of G.E. Street; while the choir, which dated from the latter part of the 17th century, was rebuilt in 1866. Close to the church are an ancient cross and a very fine round tower (its summit unhappily restored with a modern battlement) 105 ft. high, with a doorway with unusual ornament of Romanesque character. There are remains of a castle of the 13th century, and of a Carmelite monastery. From the elevated situation of the town, a striking view of the great central plain of Ireland is afforded. The castle was destroyed by James II., and returned two members to the Irish parliament.

KILHAM, ALEXANDER (1752-1788), English Methodist, was born at Epworth, Lincolnshire, on the 13th of July 1752. He was admitted by John Wesley in 1758 into the regular itinerant ministry. He became the leader and spokesman of the democratic party in the Connexion which claimed for the laity the free election of class-leaders and stewards, and equal representation with ministers at Conference. They also contended that the ministry should possess no official authority or pastoral prerogative, but hold merely that service which the church should give the nation in the different meetings. Kilham further advocated the complete separation of the Methodists from the Anglican Church. In the violent controversy that ensued he
KILIA

wrote many pamphlets, often anonymous, and frequently not in the best of taste. For this he was arraigned before the Conference of 1796 and expelled, and he then founded the Methodist New Connexion (1798, merged since 1906 in the United Methodist Church). He died in 1798, and the success of the church he founded is a tribute to his personality and to the principles for which he strove. Kilham’s wife (Hannah Spurt, 1774–1832), whom he married only a few months before his death, became a Quaker, and worked as a missionary in the Gambia and at Sierra Leone; she reduced to writing several West African vernaculars.

KILIA, a town of S. Russia, in the government of Bessarabia, 100 m. S.W. of Odessa, on the Kilia branch of the Danube, 20 m. from its mouth. Pop. (1897), 11,793. It has steam flour-mills and a rapidly increasing trade. The town, anciently known as Chilia, Chele, and Lycostomium, was a place of banishment for political criminals and Lycostumum in the 12th-17th centuries. After belonging to the Genoese from 1381–1496, it was occupied successively by Wallachia and Moldavia, until in 1848 it fell into the hands of the Ottoman Turks. It was taken from them by the Russians in 1790. After being bombarded by the Anglo-French fleet in July 1854, it was given to Rumania on the conclusion of the war; but in 1878 was transferred to Russia with Bessarabia.

KILIAN (Chilian, Kilian), ST., British missionary bishop and the apostle of eastern Francia, where he began his labours towards the end of the 7th century. There are several biographical sketches of him 2nd and 6th centuries which have been handed down to us by the Bibliotheca hagiographica latina, Nos. 4660–4663. The oldest texts which refer to him are an 8th century necrology at Würzburg and the notice by Hrabanus Maurus in his martyrology. According to Maurus Kilian was a native of Ireland, whence with his companions he went to eastern Francia. After having preached the gospel in Würzburg, the whole party were put to death by the orders of an unjust judge named Gozbert. It is difficult to fix the period with precision, as the judge (or duke) Gozbert is not known through other sources. Kilian’s companions, Coloman and Totman, were, according to the Würzburg necrology, respectively priest and deacon. The elevation of the relics of the three martyrs is performed by Burchard, the first bishop of Würzburg, and they are venerated in the church of that town. His festival is celebrated on the 8th of July.

KILIMANJARO, a great mountain in East Africa, its centre lying in 3° 5′ S. and 37° 23′ E. It is the highest known summit of the world, rising to a height of which there are a plateau of about 5000 ft. to 19,321 ft. Though completely isolated it is but one of several summits which crown the eastern edge of the great plateau of equatorial Africa. About 200 m. almost due north, across the wide expanse of the Kapte and Kikuyu uplands, lies Mount Kenya, somewhat inferior in height and mass to Kilimanjaro; and some 25 m. due west rises the noble mass of Mount Meru.

The major axis of Kilimanjaro runs almost east and west, and on it rise the two principal summits, Kibo in the west, Mawenzi (Kikuyu) in the east. Kibo, the higher, is a truncated cone with a nearly perfect extinct crater and marks a comparatively recent period of volcanic activity; while Mawenzi (16,892 ft.) is the very ancient core of a former summit, of which the crater walls have been removed by denudation. The two peaks, about 7 m. apart, are connected by a saddle or plateau, about 14,000 ft. in altitude, below which the vast mass slopes with great regularity in a typical volcanic curve, especially in the south, to the plains below. The sides are furrowed on the south and east by a large number of narrow ravines, down which flow streams which feed the Parkani and other streams. Jipe in the south and the Tsva tributary of the Sabaki in the east. South-west of Kibo, the Shira ridge seems to be of independent origin, while in the north-west a rugged group of cones, of comparatively recent origin, has poured forth vast lava-flows. In the south-east the regularity of the outline is likewise broken by a ridge running down from Mawenzi.

The lava slopes of the Kibo peak are covered to a depth of some 200 ft. with an ice-cap, which, where ravines occur, takes the form of a genuine glacier. The crater walls are the highest on the south, three small peaks, uncovered by ice, rising from the rim on this side. To the central and highest of these, the culminating point of the mountain, the name Kaiser Wilhelm Spitzc has been given. The rim here sinks precipitously some 600 ft. to the interior of the crater, which measures rather over 2000 yds. in diameter, and is in part covered by ice, in part by a bare cone of ashes. On the west the rim is breached, allowing the passage of an important glacier formed from the snow which falls within the crater. Lower down this cleft, which owed its origin to dislocation, is occupied by two glaciers, one of which reaches a lower level (13,500 ft.) than any other on Kilimanjaro. On the north-west three large glaciers reach down to 16,000 ft.

Mawenzi peak has no permanent ice-cap, though at times snow lies in patches. The rock of which it is composed has become very jagged by denudation, forming stupendous walls and precipices. On the east the peak falls with great abruptness some 6500 ft. to a vast ravine, due apparently to dislocation and sinking of the ground. Below this the slope is more gradual and more symmetrical. Like the other high mountains of eastern Africa, Kilimanjaro presents well-defined zones of vegetation. The lowest slopes are arid and scantily covered with scrub, but between 3000 and 6000 ft. the vegetation becomes more luxuriant and watered and cultivated. The forest zone begins, on the south, at about 6200 ft., and extends to 9500, but in the north it is narrower, and in the north-west, the driest quarter of the mountain, almost disappears. In the alpine zone, marked especially by tree lobelias and Senecio, flowering plants extend up to 15,700 ft. on the sheltered south-west flank of Mawenzi, but elsewhere vegetation grows only in dwarfed patches beyond 13,000 ft. The special fauna and flora of the upper zone are akin to those of other high African mountains, including Cameches.

The southern slopes between 4000 and 6000 ft., form the well-peopled country of Chaga, divided into small districts.

As the natives believe that the summit of Kilimanjaro is composed of silver, it is conjectured that Aristotle’s reference to "the so-called Silver Mountain" from which the Nile flows was based on reports about this mountain. It is possible, however, that the "Silver Mountain" was Ruwenzi (6,500 ft.), from whose snow-capped heights dreams of the Nile do descend. It is also possible, though improbable, that Ruwenzi and not Kilimanjaro nor Kenya may be the range known to Ptolemy and to the Arab geographers who visited it in the 15th century. Reports of the existence of mountains covered with snow were brought to the western world about 1845 by Arab traders. Attracted by these reports Johannes Rebmann of the Church Missionary Society journeyed inland from Victoria Nyanza (1848 and 1849). It was Rebmann who first put Kilimanjaro on the map of Africa. Reports of the existence of mountains covered with snow were brought to the western world about 1845 by Arab traders. Attracted by these reports Johannes Rebmann of the Church Missionary Society journeyed inland from Victoria Nyanza (1848 and 1849). It was Rebmann who first put Kilimanjaro on the map of Africa. Rebmann’s account, though fully borne out by his colleague Dr Ludwig Kraep, was at first received with great incredulity by professional geographers. The matter was finally set at rest by the visits paid to the mountain by Baron Karl von der Decken (1861 and 1862) and Charles New (1867), the latter of whom reached the lower edge of the snow, Kilimanjaro has since been explored by Joseph Thomson (1885), Sir H. H. Johnston (1894), and others. It has been the special study of Dr Hans Meyer, who made four expeditions to it, accomplishing the first ascent to the summit in 1889. In the partition of Africa between the powers of western Europe, Kilimanjaro was secured by Germa by (1888) through her colonies, which was confirmed with native chiefs in that region had been made in 1884 by Sir H. H. Johnston on behalf of a British company. On the southern side of the mountain at Moshi is a German government station.

See R. Thornton (the geologist of von der Decken’s party) in Proc. Roy. Geog. Soc. (1861–1862); Ludwig Kraep, Travels in East Africa (1861–1867); Charles New, Travels in South-Eastern Africa (1867); D. B. Hooker in Journal of Linnean Society (1875); Sir H. H. Johnston, The Kilimanjaro Expedition (1886); Hans Meyer, Across East African Patoes (1891); Der Kilimanjaro (Berlin, 1900). Except the last mentioned these works were published in London.

KILIN, or Chi’-lin, one of the four symbolic creatures which in Chinese art are believed to keep watch and ward over the Celestial Empire. It is pictured in Chinese art as having the body and legs of a deer and an ox’s
tail. Its advent on earth heralds an age of enlightened government and civic prosperity. It is regarded as the noblest of the animal creation and as the incarnation of fire, water, wood, metal and earth. It lives for a thousand years, and is believed to step so softly as to leave no footprints and to crush no living thing.

KILKEE, a seaside resort of county Clare, Ireland, the terminus of a branch of the West Clare railway. Pop. (1891), 1,661. It lies on a small and picturesque inlet of the Atlantic named Moore Bay, with a beautiful sweep of sandy beach. The coast, fully exposed to the open ocean, abounds in fine cliff scenery, including numerous caves and natural arches, but is notoriously dangerous to shipping. Moore Bay is safe and attractive for bathers. Bishop's Island, a bold isolated rock in the vicinity, has remains of an oratory and house ascribed to the recluse St. Senan.

KILKENNY, a county of Ireland, in the province of Leinster, bounded N. by Queen's County, E. by Carlow and Wexford, S. by Waterford, and W. by Waterford and Tipperary. The area is 511,775 acres, or about 800 sq. m. The greater part of Kilkenny forms the south-eastern extremity of the great central plain of Ireland, but in the south-east occurs an extension of the mountains of Wicklow and Carlow, and the plain is interrupted in the north by a hilly region forming part of the Castlecomer coal-field, which extends also into Queen's County and Tipperary. The principal rivers, the Suir, the Barrow and the Nore, have their origin in the Slieve Bloom Mountains (county Tipperary and Queen's County), and after widely divergent courses southward discharge their waters into Waterford Harbour. The Suir forms the boundary of the county with Waterford, and is navigable for small vessels to Carrick. The Nore, which is navigable to Innisgioge, enters the county at its north-western boundary, and flows by Kilkenny to the Barrow, 9 m. above Ross, having received the King's River at Jerpoint and the Argula near Innisgioge. The Barrow, which is navigable beyond the limits of Kilkenny into Kildare, forms the eastern boundary of the county from near the village of Trench. There are no lakes of any extent, but turloughs or temporary lakes are occasionally formed by the bursting up of underground streams.

The coal of the Castlecomer basin is anthracite, and the most productive portions of the bed are in the centre of the basin at Castlecomer. Hematitic iron of a rich quality is found in the Cambro-Silurian rocks at several places; and tradition asserts that silver shields were made about 850 B.C. at Argetros and Silverwood on the Nore. Manganese is obtained in some of the limestone quarries, and also near the Barrow. Marl is abundant in various districts. Pipeclay and potter's clay are found, and also water-carboniferous limestone occurs at Callan.

The high syenitic coal-field forms the most important feature of the north of the county. A prolongation of the field runs out south-west by Tullaroan. The lower ground is occupied by Carboniferous limestone. The Old Red Sandstone, with a Silurian core, forms the high ridge of Slieverenan in the south; and its upper laminated beds contain Archanodon, the earliest known freshwater mollusc, and plant-remains, at Kilroe near Ballyhale. The Leinster granite appears mainly as inliers in the Silurian of the south-east. The Carboniferous sandstones furnish the hard pavement-slabs sold as "Carlow flags." The black limestone with white shells in it at Kilkenny is quarried as an ornamental marble. Good slates are quarried at Kilmoganny, in the Silurian inlier on the Silieverenan range.

On account of the slope of the country, and the nature of the soil, the surface occupied by bog or wet land is very small, and the air is dry and healthy. So temperate is it in winter that the myrtle and arbutus grow in the open air. There is less rain than at Dublin, and vegetation is earlier than in the adjacent counties. Along the banks of the Suir, Nore and Barrow a very rich soil has been formed by alluvial deposits. Above the Coal-measures in the northern part of the county there is a moorland tract devoted chiefly to pasture. The soil above the limestone is for the most part a deep and rich loam admirably adapted for the growth of wheat. The heath-covered hills afford honey with a flavour of peculiar excellence. Proportionately to its area, Kilkenny has an exceptionally large cultivable area. The proportion of tillage to pasture is roughly as 1 to 2. Oats, barley, turnips and potatoes are all grown; the cultivation of wheat has very largely lapsed. Cattle, sheep, pigs and poultry are extensively reared, the Kerry cattle being in considerable request.

The woollen manufacture introduced into the county in the 17th century by the duke of Ormonde to supersede the woollen manufacture gradually became extinct, and the woollen manufacture now carried on is also very small. There are, however, breweries, distilleries, tanneries and flour-mills, as well as marble polishing works. The county is traversed from N. to S. by the Maryborough, Kilkenny and Waterford branch of the Great Southern & Western railway, with a connexion from Kilkenny to Bagenalstown on the Kildare and Carlow line; and the Waterford and Limerick line of the same company runs for a short distance through the southern part of the county.

The population (87,406 in 1891; 70,159 in 1901) includes about 94% of Roman Catholics. The decrease of population is a little above the average, though emigration is distinctly below it. The chief towns and villages are Kilkenny (p.r.), Callan (1840), Castlecomer, Thomastown and Graigue. The county comprises 10 baronies and contains 134 civil parishes. The county includes the parliamentary borough of Kilkenny, and is divided into north and south parliamentary divisions, each returning one member. Kilkenny returned 16 members to the Irish parliament, two representing the county. Assizes are held at Kilkenny, and the circuit sessions of the Carmelites had a manorial court at Knocktopher. There were an Augustinian monastery at Innisgioge, and priories at Callan and Kells, of all of which there are remains. There are also ruins of several old castles, as those of Callan, Legan, Grenan and Clonamery, besides the ancient portions of Kilkenny Castle.

KILKENNY, a city and municipal and parliamentary borough (returning one member), the capital of county Kilkenny, Ireland, finely situated on the Nore, and on the Great Southern and Western railway, 81 m. S.W. of Dublin. Pop. (1891), 10,985; 12,211 in 1901. The town consists of (1) the east or town of Kilkenny, and (2) the west or town of Irishtown, which are separated by a small rivulet, but although Irishtown retains its name, it is now included in the borough of Kilkenny. The city is irregularly built, possesses several spacious streets with many good houses, while its beautiful environs and imposing ancient buildings give it an unusual interest and picturesque appearance. The Nore is crossed by two handsome bridges. The cathedral of St Canice, from whom the town takes its name, dates in its present form from about 1255. The see of Ossory, which originated in the monastery of Aghaboe founded by St. Canice in the 6th century, and took its name from the early kingdom of Ossory, was moved to Kilkenny (according to conjecture) about the year 1200. In 1835 the diocese of Ferns and Leighlin was united to it. With the exception of St Patrick's, Dublin, the cathedral is the largest
The original expression "to fight like Kilkenny cats," which, according to the legend, fought till only their tails were left, has been the subject of many conjectures. It is said to be an allegory of the method of overturning the various monuments of Kilkenny and Irish cathedrals, which lasted from the end of the 14th to the end of the 17th centuries (Notes and Queries, 1st series, vol. ii. p. 71). It is referred also to the brutal sport of some Hessian soldiers, quartered in Kilkenny during the rebellions of 1798 or 1803, who tied two cats together by their tails, hung them over a line and left them to fight. A soldier is said to have freed them by cutting off their tails to escape censure from his officers (ibid. 3rd series, vol. vi. p. 394).

Kilkenny, Statute of, the name given to a body of laws promulgated in 1566 with the object of strengthening the English authority in Ireland. In 1561, when Edward III. was on the English throne, he sent one of his younger sons, Lionel, duke of Clarence, who was already married to an Irish heiress, to represent him in Ireland. From the English point of view the country was in a most unsatisfactory condition. Lawless conditions flourished, and the English settlers were hardly distinguishable from the native Irish, and the authority of the English king over both had been reduced to vanishing point. In their efforts to cope with the prevailing disorder Lionel and his advisers summoned a parliament to meet at Kilkenny early in 1566 and here the statute of Kilkenny was passed into law. This statute was written in Norman-French, and nineteen of its clauses are merely repetitions of some ordinances which had been drawn up at Kilkenny fifteen years earlier. It began by relating how the existing state of lawlessness was due to the malign influence exercised by the Irish over the English, and, like Magna Carta, its first positive provision declared that the church should be free. As a prime remedy for the prevailing evils all marriages between the two races were forbidden. Englishmen must not speak the Irish tongue, nor receive Irish minstrels into their dwellings, nor even ride in the Irish fashion; while to give or sell horses or armour to the Irish was made a treasonable offence. Moreover English and not Breton law was to be employed, and no Irishman could legally be receiv'd into a religious house, nor presented to a benefice. The statute also contained clauses for compelling the English settlers to keep the laws. For each count of non-compliance, the party was to be happily disposed, while the sheriffs were to hold their tours twice a year and were not to oppress the people by their exactings. An attempt was made to prevent the emigration of labourers, and finally the spiritual arm was invoked to secure obedience to these laws by threats of excommunication. The statute, although marking an interesting stage in the history of Ireland, had very little practical effect.

The full text is published in the Statutes and Ordinances of Ireland. John to Henry V., by H. F. Berry (1907).

Killala (pron. Killála), a small town on the north coast of county Mayo, Ireland, in the northern parliamentary division, on the western shore of a fine bay to which it gives name. Pop. (1901), 510. It is a terminus of a branch of the Midland Great Western railway. Its trade is almost wholly diverted to Ballina on the river Môr, which enters the bay, but Killala is of high antiquarian and historical interest. It was for many centuries a bishop's see, the foundation being attributed to St Patrick in the 5th century, but the diocese was joined with Achonry early in the 17th century and with Tuam in 1833. The cathedral church of St Patrick is a plain structure of the 17th century. There is a fine souterrain, evidently connected with a rath, or encampment, in the graveyard. A round tower, 84 ft. in height, stands boldly on an isolated eminence. Close to Killala the French under Humbert landed in 1798, being diverted by contrabands f ear. The town had much to do with the French War of 1813. Killala are the abbeys of Moyne and Roserok or Rosserick, both Decorated in style, and both possessing fine cloisters. At Rathfran, 2 m. N., is a Dominican abbey (1274), and in the neighbourhood are camps, cromlechs, and an inscribed ogham stone, 12 ft. in height. Killala gives name to a Roman Catholic diocese, the seat of which, however, is at Ballina.
KILLALOE—KILLIGREW, SIR H.

KILLALOE, a town of county Clare, Ireland, in the east parliamentary division, at the lower extremity of Lough Derg on the river Shannon, at the foot of the Slieve Bernagh mountains. Pop. (1901), 583. It is connected, as so to form one town, with Ballina (county Tipperary) by a bridge of 13 arches. Ballina is the terminus of a branch of the Great Southern and Western railway, 15 m. N.E. of Limerick. Slate is quarried in the vicinity, and there were formerly numerous manufactories. The cathedral of St Flannan occupies the site of a church founded by St Dalua in the 6th century. The present building is mainly of the 12th century, a good cruciform example of the period, preserving, however, a magnificent Romanesque doorway. It was probably completed by Donall O'Brien, king of Munster, but part of the fabric dates from a century before his time. In the churchyard is an ancient oratory said to date from the period of St Dalua. Near Killaloe stood Brian Ború's palace of Kincora, celebrated in verse by O'Donoghues; for this was the capital of the kings of Munster. Killaloe is frequented by anglers for the Shannon salmon-fishing and for trout-fishing in Lough Derg. Killaloe gives name to Protestant and Roman Catholic dioceses.

KILLARNEY, a market town of county Kerry, Ireland, in the east parliamentary division, on a branch line of the Great Southern & Western railway, 185 m. S.W. from Dublin. Pop. of urban district (1901), 5566. On account of the beautiful scenery in the neighbourhood the town is much frequented by tourists. The buildings are the Roman Catholic cathedral and bishop's palace, the Old Royal Palace, and the Spa Hotel, designed by A. W. Pugin, a large Protestant church and several hotels. Adjoining the town is the mansion of the earl of Kenmare. There is a school of arts and crafts, where carving and inlaying are prosecuted. The only manufacture of importance now carried on at Killarney is that of fancy articles from arbutus wood; but it owed its origin to iron-smelting works, for which abundant fuel was obtained from the neighbouring forests.

The lakes of Killarney, about 13 m. from the town, lie in a basin between several lofty mountain groups, some of which rise abruptly from the water's edge, and all clothed with trees and shrubbery almost to their summits. The lower lake, or Lough Leane (area 5000 acres), is studded with finely wooded islands, on the largest of which, Ross Island, are the ruins of Ross Castle, an old fortress of the O'Donoghues; and on another island, the "sweet Inisfallen" of Moore, are the picturesque ruins of an abbey founded by St Finian the leper at the close of the 6th century. Between the lower lake and the middle or Torc lake (680 acres in extent) stands Muckross Abbey, built by Francisians about 1440. With the upper lake (430 acres), thickly studded with islands, and the close shrunken in by many small lakes, the lower and middle lakes are connected by the Long Rbine, a winding and finely wooded channel, 23 m. in length, and commanding magnificent views of the mountains. Midway in its course is a famous echo caused by the Eagle's Nest, a lofty pyramidal rock.

Besides the lakes of Killarney themselves, the immediate neighbourhood includes many features of natural beauty and of historic interest. Among the first are Maglicfidducy's Reeks and the Torc and Purple Mountains, the famous pass known as the Gap of Dunloe, Mount Mangerton, with a curious depression (the Devil's Punchbowl) near its summit, between the lower and middle lakes, and Dunloe and Derrycunihy, and Lough Guitane, above Lough Leane. Notable ruins and remains, besides Muckross and Inisfallen, include Aghadoe, with its ruined church of the 12th century (formerly a cathedral) and remains of a round tower; and the Ogbam Cave of Dunloe, a souterrain containing inscribed stones. The waters of the neighbourhood provide trout and salmon, and the flora is of high interest to the botanist. Innumerable legends centre round the traditional hero O'Donoghue.

KILDARE, a common American plover, so called in imitation of its whistling cry, the Charadrius vociferus of Linnaeus, and the Aegialitis vocifer a of modern ornithologists. About the size of a snipe, it is mostly sooty-brown above, but showing a bright buff on the tail coverts, and in flight a white bar on the wings; beneath it is pure white except two pectoral bands of deep black. It is one of the finest as well as the largest of the group commonly known as ringed plovers or ring dotterels, forming the genus Aegialitis of Boie. Mostly wintering in the south or only on the sea-shore of the more northern states, in spring it spreads widely over the interior, breeding on the newly ploughed lands or on open grass-fields. The nest is made in a slight hollow, and is often surrounded with small pebbles and fragments of shells. Here the hen lays her pear-shaped, stone-coloured eggs, four in number, and always arranged with their pointed ends touching each other, as is the custom of most Limicoline birds. The parents exhibit the greatest anxiety for their offspring on the approach of an intruder. It is the best-known bird of its family in the United States, where it is less abundant in the north-east than farther south or west. In Canada it does not range farther northward than 56° N.; it is not known in Greenland, and hardly in Labrador, though it is a passenger in Newfoundland every spring and autumn. In winter it finds its way to Bermuda and to some of the Antilles, but it is not recorded from any of the islands to the windward of Porto Rico. In the other direction, however, it travels down the Isthmus of Panama and the west coast of South America to Peru. The kilder is said to have a very musical voice, and to have a number of the habits of the kilder, but is much less often found away from the sea-shore, though a few colonies may be found in dry warrens in certain parts of England many miles from the coast, and in Lapland at a still greater distance. In such localities it paves its nest with small stones (whence it is locally known as Stone hatch), a habit almost unaccountable unless regarded as an inherited instinct from shingle-haunting ancestors.

(K. N.)

KILLIECRANKIE, a pass of Perthshire, Scotland, 32 m. N.N.W. of Pitlochry by the Highland railway. Beginning close to Killiecrankie station it extends southwards to the bridge of Garry for nearly 13 m. through the narrow, extremely beautiful, densely wooded glen in the channel of which flows the Garry. A road constructed by General Wade in 1732 runs up the pass, and the Great North railway, built in 1863. The battle of the 27th of July 1689, between some 3000 Jacobites under Viscount Dundee and the royal force, about 4000 strong, led by General Hugh Mackay, though named from the ravine, was not actually fought in the pass. When Mackay emerged from the gorge he found the Highlanders already in battle array on the high ground on the right bank of the Giraig, a tributary of the Garry, within half a mile of where the railway station now is. Before the battle he had time to form on the more open table-land, the clansmen charged into the gorge, their single files of muskets sweeping his troops back into the pass and the Garry. Mackay lost nearly half his force, the Jacobites about 900, including their leader. Urrard House adjoins the spot where Viscount Dundee received his death-wound.

KILLIGREW, SIR HENRY (d. 1603), English diplomatist, belonged to an old Cornish family and became member of parliament for Launceston in 1553. Having lived abroad 1

1 The word dotterel seems properly applicable to a single species only, the Charadrius martinetus of Linnaeus, which, from some of its osteological characters, may be fitly regarded as the type of a distinct genus, Eudromias. Whether any other species agree with it in the peculiarity alluded to is at present uncertain.

2 The single example is said to have been shot near Christchurch, in Hampshire, England, in April 1857 (1860, 1862, p. 276).
KILLIGREW, T.—KILLYBEGS

KILLIGREW, enjoying a greater reputation as a wit than as a dramatist. Sir John Denham said of him—

Had Cowley’s ear spoke, Killigrew’s ear writ,
Combined in one, they’d made a matchless wit.

Many stories are related of his bold speeches to Charles I. Pepys (Feb. 12, 1668) records that he was said to hold the title of King’s Fool or Jester, with a cap and bells at the expense of the king’s wardrobe, and that he might therefore revile or jear anybody, even the greatest, without offence.

His elder brother, Sir WILLIAM KILLIGREW (1666–1695), was a court official under Charles I. and Charles II. He attempted to drain the Lincolnshire fens, and was the author of four plays (printed 1665 and 1666) of some merit.

A younger brother, Dr HENRY KILLIGREW (1613–1700), was a master of the queen’s household and a member of parliament; he died in November 1622. Sir Robert was a member of all the parliaments between 1603 and his death, but he came more into prominence owing to his alleged connexion with the death of Sir Thomas Overbury.

A man of some scientific knowledge, he had been in the habit of supplying powders to Robert Carr, earl of Somerset, but it is not certain that the fatal powder came from the hands of Killigrew. He died early in 1633, leaving five sons, three of whom attained some reputation (see below).

KILLIGREW, THOMAS (1612–1685), English dramatist and wit, was born at London, on the 7th of February 1612. Pepys says that as a boy he satisfied his love of the stage by volunteering at the Red Bull to take part of a devil, thus seeing the play for nothing. In 1633 he became page to Charles I., and was faithfully attached to the royal house throughout his life. In 1635 he was in France, and has left an account (printed in the European Magazine, 1803) of the exorcizing of an evil spirit from some nuns at Loudun. In 1641 he published two tragi-comedies, The Prisoners and Claracilla, both of which had probably been produced before the date of their publication. In 1650 he published a volume of a collection of verse, and in 1651 his Buskin’s Mistakes. His wit, easy morals and accommodating temper recommended him to Charles, who sent him to Venice in 1651 as his representative. Early in the following year he was recalled at the request of the Venetian ambassador in Paris. At the Restoration he became groom of the bedchamber to Charles II., and later chamberlain to the queen. He received in 1660, with Sir William Davenant, a patent to erect a new playhouse, the performances in which were to be independent of the censorship of the master of the revels. This infringement of his prerogative caused a dispute, and he was transferred to the office of almoner, but Killigrew settled the matter by generous concessions. He acted independently of Davenant, his company being known as the King’s Servants. They played at the Red Bull, until in 1663 he built for them the original Theatre Royal in Drury Lane. Pepys writes in 1664 that Killigrew intended to have four opera seasons of six weeks each during the year, and with this end in view paid several visits to Rome to secure singers and scene decorators.

In 1665 his plays were published as Comedies and Tragedies. Written by Thomas Killigrew. They are Claracilla; The Princess, or Love at First Sight; The Parson’s Wedding; The Pilgrim; Cecilia and Clarinda, or Love in Arms; Thomaso, or the Wanderer; and Bellamira, her Dream, or Love of Shadows. The Parson’s Wedding (acted c. 1649, reprinted in the various editions of Dodgley’s Old Plays and in the Ancient British Drama) is an unsavoury play, which displays nevertheless considerable wit, and some of its jokes were appropriated by Congreve. It was revived after the Restoration in 1664 and 1672 or 1673, all the parts being in both cases taken by women. Killigrew succeeded Sir Henry Herbert, second son of Sir Robert Killigrew, in 1657–1719, who was the author of a successful little piece, Chit-Chat, played at Drury Lane on the 14th of February 1710, with Mrs Oldfield in the part of Florinda.

Killigrew enjoyed a greater reputation as a wit than as a dramatist. Sir John Denham said of him—

Had Cowley’s ear spoke, Killigrew’s ear writ,
Combined in one, they’d made a matchless wit.

Many stories are related of his bold speeches to Charles I. Pepys (Feb. 12, 1668) records that he was said to hold the title of King’s Fool or Jester, with a cap and bells at the expense of the king’s wardrobe, and that he might therefore revile or jear anybody, even the greatest, without offence.

His elder brother, Sir WILLIAM KILLIGREW (1666–1695), was a court official under Charles I. and Charles II. He attempted to drain the Lincolnshire fens, and was the author of four plays (printed 1665 and 1666) of some merit.

A younger brother, Dr HENRY KILLIGREW (1613–1700), was a master of the queen’s household and a member of parliament; he died in November 1622. Sir Robert was a member of all the parliaments between 1603 and his death, but he came more into prominence owing to his alleged connexion with the death of Sir Thomas Overbury.

A man of some scientific knowledge, he had been in the habit of supplying powders to Robert Carr, earl of Somerset, but it is not certain that the fatal powder came from the hands of Killigrew. He died early in 1633, leaving five sons, three of whom attained some reputation (see below).

KILLIGREW, THOMAS (1612–1685), English dramatist and wit, was born at London, on the 7th of February 1612. Pepys says that as a boy he satisfied his love of the stage by volunteering at the Red Bull to take part of a devil, thus seeing the play for nothing. In 1665 his plays were published as Comedies and Tragedies. Written by Thomas Killigrew. They are Claracilla; The Princess, or Love at First Sight; The Parson’s Wedding; The Pilgrim; Cecilia and Clarinda, or Love in Arms; Thomaso, or the Wanderer; and Bellamira, her Dream, or Love of Shadows. The Parson’s Wedding (acted c. 1649, reprinted in the various editions of Dodgley’s Old Plays and in the Ancient British Drama) is an unsavoury play, which displays nevertheless considerable wit, and some of its jokes were appropriated by Congreve. It was revived after the Restoration in 1664 and 1672 or 1673, all the parts being in both cases taken by women. Killigrew succeeded Sir Henry Herbert, second son of Sir Robert Killigrew, in 1657–1719, who was the author of a successful little piece, Chit-Chat, played at Drury Lane on the 14th of February 1710, with Mrs Oldfield in the part of Florinda.
KILLYLEAGH—KILPATRICK

KILLYLEAGH, a small seaport and market town of county Down, Ireland, in the east parliamentary division, on the western shore of Strangford Lough. Pop. (1901), 1410. Linen manufacture is the principal industry, and agricultural produce is exported. Killyleagh was an important stronghold in early times of importance in Elizabeth's reign, but its fortifications were rebuilt. Sir John de Courcy erected this among many other fortresses in the neighbourhood; it was besieged by Shane O'Neill (1567), destroyed by Monk (1648), and subsequently rebuilt. The town was incorporated by James L. and returned two members to the Irish parliament.

KILMAINE, CHARLES EDWARD (1751-1799), French general, was born at Dublin on the 10th of October 1751. At the age of eleven he went with his father, whose surname was Jennings, to France, where he changed his name to Kilmaine, after a village in Mayo. He entered the French army as an officer in a dragoon regiment in 1774, and afterwards served as a volunteer in the Navy (1778), during which period he was engaged in the fighting in Senegal. From 1780 to 1783 he took part in the War of American Independence under Rochambeau, rejoining the army on his return to France. In 1791, as a retired captain, he took the civic oath and was recalled to active service, becoming lieutenant-colonel in 1792, and colonel, brigadier-general, and lieutenant-general in 1793. In this last capacity he distinguished himself in the wars on the northern and eastern frontiers. But he became an object of suspicion on account of his foreign birth and his relations with England. He was suspended on the 4th of August 1793, and was not recalled to active service till 1795. He then took part in the Italian campaigns of 1796 and 1797, and was made commander of Lombardy. He afterwards received the command of the cavalry in Bonaparte's "army of England," of which, during the absence of Desaix, he was temporarily commander-in-chief (1798). He died on the 15th of December 1799.

See J. G. Alger, Englishmen in the French Revolution (1886); Eugène Fieffé, Histoire des troupes étrangères au service de France (1854); Etienne Charavay, Correspondance de Carnot, tome iii.

KILMALLOCK, a market town of county Limerick, Ireland, in the east parliamentary division, 1243 m. S.W. of Dublin by the Great Southern & Western main line. Pop. (1901), 1206. It commands a natural route (now followed by the railway) through the hills to the south and south-west, and is a site of great historical interest. It received a charter in the reign of Edward III., at which time it was walled and fortified, and entered by four gates, two of which remain. It was a military post north and south of the Irish dominions, and one of its three churches was for the most part demolished by order of Cromwell.

Two castellated mansions are still to be seen. The church of St Peter and St Paul belonged to a former abbey, and has a tower at the north-west corner which is a converted round tower. The Dominican Abbey, of the 13th century, has Early English remains of great beauty and a tomb to Edmund, the last of the White Knights, a branch of the family of Desmond intimately connected with Kilmallock, who received their title from Edmund III., at the battle of Halidon Hill. The foundation of Kilmallock, however, is attributed to the Geraldines, who had some mansion here. Within its walls are the ruins of the Earls of Limerick's residence. Eight miles from the town is Lough Gur, near which are numerous stone circles and other remains. Kilmallock returned two members to the Irish parliament.

KILMARNOCK, a municipal and police burgh of Ayrshire, Scotland, on Kilmarnock Water, a tributary of the Irvine, 24 m. S.W. of Glasgow by the Glasgow & South-Western railway. Pop. (1901), 35,091. Among the chief buildings are the town hall, court-house, corn-exchange (with the Albert Tower, 150 ft. high), observatory, academy, corporation art gallery, institute (containing a free library and a museum), Kay schools, School of Science and Art, Athenaeum, theatre, infirmary, Agricultural Hall, and Philosophical Institution. The grounds of Kilmarnock House, presented to the town in 1803, were laid out as a public park. In Kay Park (482 acres), purchased from the duke of Portland for £9000, stands the Burns Memorial, consisting of two storeys and a tower, and containing a museum in which have been placed many important MSS. of the poet and the McKie library of Burns's books. The marble statue of the poet, by W. G. Stevenson, stands on a terrace on the southern face. A Reformers' monument was unveiled in 1861. Kilmarnock rose into importance in the 17th century by its production of striped woolen "Kilmarnock cloths" and broad blue bonnets, and afterwards acquired a great name for its Brussels, Turkey and Scottish carpets. Tweeds, blankets, shawls, tartans, lace curtains, cottons and wincyes are also produced. The boot and shoe trade is prosperous, and there are extensive engineering and hydraulic machinery works. But the iron industry is prominent, the town being situated in the midst of a rich mineral region. Here, too, are the workshops of the Glasgow & South-Western railway company. Kilmarnock is famous for its dairy produce, and every October holds the largest cheese-show in Scotland. The neighbourhood abounds in freestone and coal. The burgh, which is governed by a provost and council, unites with Dumfartoon, Port Glasgow, Renfrew and Rutherglen in returning one member to parliament. Alexander Smith, the poet (1830-1867), whose father was a lace-pattern designer, and Sir James Shaw (1764-1843), lord mayor of London in 1806, to whom a statue was erected in the town in 1848, were natives of Kilmarnock. It dates from the 15th century, and in 1591 was made a burgh of barony under charters of that king. The last Boyd who bore the title of Lord Kilmarnock was beheaded on Tower Hill, London, in 1746, for his share in the Jacobite rising. The first edition of Robert Burns's poems was published here in 1786.

KILMAURS, a town in the Cunninghame division of Ayrshire, Scotland, on the Carmel, 215 m. S. by W. of Glasgow by the Glasgow & South-Western railway. Pop. (1901), 1803. Once noted for its cutlery, the chief industries now are shoe and bonnet factories, and there are iron and coal mines in the neighborhood. The town was granted burgh status in 1555, and many of the old houses remain. The last Boyd to bear the title of Lord Kilmarnock was beheaded on Tower Hill, London, in 1746, for his share in the Jacobite rising. The first edition of Robert Burns's poems was published here in 1786.

KILN (O. E. cylena, from the Lat. culina, a kitchen, cooking-stove), a place for burning, baking or drying. Kilns may be divided into two classes—those in which the materials come into actual contact with the flames, and those in which the furnace is beneath or surrounding the oven. Lime-kilns are of the first class, and brick-kilns, pottery-kilns, &c., of the second, which also includes places for merely drying materials, such as hop-kilns, usually called "oast" or "oast-houses."

KILPATRICK, NEW, or EAST, also called BRANSDEN, a town of Dumfartoonshire, Scotland, 33 m. N.W. of Glasgow by rail, with a station on the North British railway company's branch line from Glasgow to Milngavie. Pop. (1901), 2705. The town is largely inhabited by business men from Glasgow. The public buildings include the Shaw convalescent home, Buchanan Retreat, house of refuge for girls, library, and St Peter's College, a fine structure, presented to the Roman Catholic Church in 1892 by the archbishop of Glasgow. There is some coal-mining, and lime is manufactured. Remains of the Wall of Antoninus are close to the town. At Garscube and Garscadden, both within 14 m. of New Kilpatrick, are ironworks, and at the former place coal is mined and stone quarried.

KILPATRICK, OLD, a town of Dumbartonshire, Scotland, on the right bank of the Clyde, 10½ m. N.W. of Glasgow by rail, with stations on the North British and Caledonian railways. Pop. (1901), 1533. It is traditionally the birthplace of St Patrick,
whose father is said to have acted there as a Roman magistrate. Roman remains occur in the district, and the Wall of Antoninus ran through the parish. To the north, occupying an area of about 6 m. from east to west and 5 m. from north to south run the Kilpatrick Hills, of which the highest points are Duncomb and Fylnoch Hill (each 1315 ft.).

KILRUSH, a seaport and watering-place of county Clare, Ireland, in the west parliamentary division, on the north shore of the Shannon estuary 45 m. below Limerick. Pop. of urban district (1901), 4179. It is the terminus of a branch of the West Clare railway. The only seaport of importance in the county, it has a considerable export trade in pent fuel, extensive fisheries, and slagstone quarries; while general fairs, horse fair and annual cattle fair are held. The town harbour admits only small vessels, but there is a good pier a mile south of the town. Off the harbour lies Scattery Island (Inis Cathaigh), where St Senan (d. 544) founded a monastery. There are the remains of his oratory and house of and of seven rude churches or chapels, together with a round tower and a holy well still in repute. The island also received the epithet of Holy, and was a favourite burial-ground until modern times.

KILSYTH, a police burgh of Stirlingshire, Scotland, on the Kelvin, 13 m. N.N.E. of Glasgow by the North British railway, and close to the Parish Church of Pop. (1901), 1137. The principal buildings are the town and public halls, and the academy. The chief industries are coal-mining and iron-works; there are also manufactures of paper and cotton, besides quarrying of whinstone and sandstone. There are considerable remains of the Wall of Antoninus south of the town, and to the north the ruins of the old castle. Kilsyth dates from the middle of the 17th century and became a burgh of barony in 1826. It was the scene of Montrose's defeat of the Covenanters on the 13th of August 1645. The town was the centre of remarkable religious revivals in 1742 and 1859; the latter conducted by William Chalmers Burns (1815–1863), the missionary to China.

KILT, properly the short loose skirt or petticoat, reaching to the knees and usually made of tartan, forming part of the dress of a Scottish Highlander (see Costume). The word means that which is "girded or tucked up," and is apparently of Scandinavian origin, cf. Danish kille, to tuck up. The early kilt was not a separate garment but was merely the lower part of the plaid, in which the Highlander wrapped himself, hanging down in folds below the belt.

KILWA (Quila), a seaport of German East Africa, about 900 m. S. of Zanzibar. There are two Kilwas, one on the mainland—Kilwa Kivinje; the other, the ancient city, on an island—Kilwa Kiswani. Kilwa Kivinje, on the northern side of Kilwa Bay, is regularly laid out, the houses in the European quarter being large and substantial. The government house and barracks are fortified and are surrounded by fine public gardens. The adjacent country is fertile and thickly populated, and the trade of the port is considerable. Much of it is in the hands of Banyans. Kilwa is a starting-point for caravans to Lake Nyasa. Pop. about 5000. Most of the inhabitants are Swahili.

Kilwa Kiswani, 18 m. to the south of the modern town, possesses a deep harbour sheltered from all winds by projecting coral reefs. The island on which it is built is separated from the mainland by a shallow and narrow channel. The ruins of the city include massive walls and bastions, remains of a palace and of two large mosques, of which the domed roofs are in fair preservation, besides several Arab forts. The new quarter contains a customs house and a few Arab buildings. Pop. about 600. On the island of Songa Manara, at the southern end of Kilwa Bay, hidden in dense vegetation, are the ruins of another city. Fragments of palaces, tombs, and mosques in carved limestone exist, and on the beach are the remains of a lighthouse. Chinese coins and pieces of porcelain have been found on the sea-shore, washed up from the reefs.

The sultanate of Kilwa is reputed to have been founded about A.D. 1000 by Ali ibn Hajj, a Persian prince from Shiraz, in the former dominions of the ancient Greek colony of Raphia. The new state, at first confined to the town of Kilwa, extended its influence along the coast from Zanzibar to Sofala, and the city came to be regarded as the capital of the Zenj "empire" (see ZANZIBAR: "Sultanate"). An Arab chronicle gives a list of over forty sovereigns who reigned at Kilwa in a period of five hundred years (cf. A. M. H. Stokey, Manuel d'Echard, Berlin, 1854, l. 558). A Portuguese navigator, who was the first European to visit it. His fleet, on its way to India, anchored in Kilwa Bay in 1500. Kilwa was then a small and wealthy city, possessing a palace. The Arabs and the Portuguese, the city was destroyed; and in 1512 the Portuguese, whose ranks had been decimated by fever, temporarily abandoned the place. Subsequently Kilwa became one of the chief centres of slave traffic. Wars are reported to have occurred in the 17th century and fell under the dominion of the imams of Muscat, and on the separation in 1856 of their Arablan and African possessions became the capital of the sultanate of the coastal part of the sultan's continental dominions Kilwa was acquired by Germany in 1890 (see AFRICA, § 5; and GERMAN EAST AFRICA).

KILWARDBY, ROBERT (d. 1279), archbishop of Canterbury and cardinal, studied at the university of Paris, where he soon became famous as a teacher of grammar and logic. Afterwards joining the order of St Dominic and turning his attention to theology, he was chosen provincial prior of his order in England in 1264, and in October 1272 Pope Gregory X. terminated a monastery and a college there, and left the see of Canterbury, which he occupied until his death. He was consecrated bishop of Southwell and coronated by the Pope in Canterbury by appointing Kilwardby. Although the new archbishop crowned Edward L. and his queen Eleanor in August 1274, he took little part in business of state, but was energetic in discharging the spiritual duties of his office. He was charitable to the poor, and showed liberality to the Dominicans. In 1278 Pope Nicholas III. made him cardinal-bishop of Porto and Santa Rufina; he resigned his archbishopric and left England, carrying with him the registers and other valuable property belonging to the see of Canterbury. He died in Italy on the 11th of September 1279. Kilwardby was the first member of a mendicant order to attain a high position in the English Church. Among his numerous writings, which became very popular among students, are De ortu scientiarum, De tempore, De Universali, and some commentaries on Aristotle.

KILWINNING, a municipal and police burgh of Ayrshire, Scotland, on the right bank of the Garnock, 24 m. S.W. of Glasgow, and the crossing-place of the Edinburgh & South-Western railway. Pop. (1901), 4490. The chief buildings include the public library, the Masonic hall and the district hospital. The centre of interest, however, is the ruined abbey, originally one of the richest in Scotland. Founded about 1140 by Hugh de Morville, lord of Cunninghame, for Tyronesian monks of the Benedictine order, it was dedicated to St Winnin, who lived on the spot in the 8th century and has given his name to the town. This beautiful specimen of Early English architecture was partly destroyed in 1561, and its present aspect as it is regarded to the east of Eglinton and others. Kilwinning is the traditional birthplace of the Scottish Freemasons, the lodge, believed to have been founded by the foreign architects and masons who came to build the abbey, being regarded as the mother lodge in Scotland. The royal company of archers of Kilwinning—dating, it is said, as far back as 1488—meet every July to shoot at the popinjay. The industry in weaving shawls and lighter fabrics has died out; and the large iron, coal and fire-clay works at Eglinton, and worsted spinning, employ most of the inhabitants. About a mile from Kilwinning is Eglinton Castle, the seat of the earls of Eglinton, built in 1708 in the English castellated style.

KIMBERLEY, JOHN WODEHOUSE, 1ST EARL OF (1826–1902), English statesman, was born on the 7th of January 1826, being the eldest son of the Hon. Henry Wodehouse and grandson of the 2nd Baron Wodehouse (the barony dating from 1707), whom he succeeded in 1846. He was educated at Eton and Christ Church, Oxford, where he took a first-class degree in
KIMBERLEY—KIMBERIDGIAN

Classics in 1847; in the same year married Lady Florence Fitzgibbon (d. 1895), daughter of the last earl of Clare. He was by inheritance a Liberal in politics, and in 1852–1856 and 1859–1861 he was under secretary of state for foreign affairs in Lord Aberdeen's and Lord Palmerston's ministries. In the interval (1856–1858) he had been envoy-extraordinary to Holstein; and in 1863 he was sent on a special mission to Copenhagen on the forlorn hope of finding a peaceful solution of the Schleswig-Holstein question. The mission was a failure, but probably nothing else was possible. In 1864 he became under secretary for India, but towards the end of the year was made Lord-Lieutenant of Ireland. In that capacity he had to grapple with the first manifestations of Fenianism, and in recognition of his vigour and success he was created (1866) earl of Kimberley. In July 1866 he vacated his office and the fall of Lord Russell's ministry, but in 1868 he became Lord Privy Seal in Mr Gladstone's cabinet, and in July 1870 was transferred from that post to be secretary of state for the colonies. It was the moment of the great diamond discoveries in South Africa, and the new town of Kimberley was named after the colonial secretary of the day. After an interval of opposition from 1874 to 1888, Lord Kimberley returned to the Colonial Office in Mr Gladstone's next ministry; but at the end of 1882 he exchanged this office first for that of chancellor of the duchy of Lancaster and then for the secretoryship of state for India, a post he retained during the remainder of Mr Gladstone's power (1882–1886, 1892–1894), though in 1892–1894 he combined it with that of the lord presidency of the council. In Lord Rosebery's cabinet (1894–1895) he was foreign secretary. Lord Kimberley was an admirable departmental chief, but it is difficult to associate his own personality with any ministerial act during his occupation of all these posts. He was at the colonial office when responsible government was granted to Cape Colony, when British Columbia was added to the Dominion of Canada, and during the Boer War of 1880–81, with its conclusion at Majuba; and he was foreign secretary when the misunderstanding arose with Germany over the proposed lease of the Kimberley mine by the Congo Free State for the Cape to Cairo route. He was essentially a loyal Gladstonian party man. His moderation, common sense, and patriotism had their influence, nevertheless, on his colleagues. As leader of the Liberal party in the House of Lords he acted with undeviating dignity; and in opposition he was a courteous antagonist and a critic of weight and experience. He took considerable interest in education, and after being for many years a member of the senate of the University of London, he became its chancellor in 1890. He died in London on the 8th of April 1902, being succeeded in the earldom by his eldest and only surviving son, Lord Wodehouse (b. 1848).

KIMBERLEY, a town of the Cape province, South Africa, the centre of the Griqualand West diamond industry, 647 m. N.E. of Cape Town and 310 m. S.W. of Johannesburg by rail. Pop. (1904), 34,331, of whom 13,556 were whites. The town is built on the bare veld midway between the Modder and Vaal Rivers and is 4012 ft. above the sea. Having grown out of camps formed round the diamond mines, its plan is very irregular and in striking contrast with the rectangular outline common to South African towns. Grouped round market square are the chief buildings and the chief streets. In 1847 the town was named Kimberley in honour of Lord Kimberley, who ordered the vacating of his office in the colony. The public library and the hospital are in Du Toits Pan Road. In the district of Newton, laid out during the siege of 1890–1900, a monument to those who fell during the operations has been erected where four roads meet. Sieve Avenue, in the suburb of Kenilworth, 250 ft. wide, a mile and a quarter long, and planted with 16 rows of trees, was also laid out during the siege. In the public gardens are statues of Queen Victoria and Cecil Rhodes. The diamond mines form, however, the chief attraction of the town (see DIAMOND). Of these the Kimberley is within a few minutes' walk of market square. The De Beers mine is one mile east of the Kimberley mine. The other principal mines, Bultfontein, Du Toits Pan and Wesselton, are still farther distant from the town. Barbed wire fencing surrounds the mines, which cover about 180 acres.

The Kaffirs who work in the mines are housed in large compounds. Wire netting is spread over these enclosures, and every precaution taken to prevent the illicit disposal of diamonds. Ample provision is made for the comfort of the inmates, who in addition to food and lodging earn from 175. to 210. a week for the white work, employed live at Kenilworth, laid out by the De Beers company as a "model village." Beaconsfield, near Du Toits Pan Mine, is also dependent on the diamond industry.

Kimberley was founded in 1870 by diggers who discovered diamonds on the farms of Du Toits Pan and Bultfontein. In 1871 richer diamonds were found on the neighbouring farm of Vooruitzicht at places named De Beers and Colebs Kopje. There were at first three distinct mining camps, one at Du Toits Pan, another at De Beers (called De Beers Rush or Old De Beers) and the third at the Colebs Kopje (called De Beers New Rush, or New Rush simply). The Colebs Kopje mine was in July 1873 renamed Kimberley in honour of the then secretary of state for the colonies, the 1st earl of Kimberley, by whose direction the mines were— in 1871—taken under the protection of Great Britain. Kimberley was also chosen as the name of the town into which the mining camps developed. Doubt having arisen as to the rights of the crown to the minerals on Vooruitzicht farm, litigation ensued, ending in the purchase of the farm by the state for £100,000 in 1875. In 1880 the town was incorporated in Cape Colony (see GRIQUALAND). In 1880 a great addition of the population left for the newly discovered gold diggings in the Lydenburg district of the Transvaal, but others took their place. Among those early attracted to Kimberley were Cecil Rhodes and "Barney" Barnato, who in time came to represent two groups of financiers controlling the mines.

The amalgamation of their interests in 1886—when the De Beers group purchased the Kimberley mine for £5,338,650—put the whole diamond production of the Kimberley fields in the hands of one company, the De Beers Consolidated Mines, Ltd., so named after the former owners of the farms on which are the Kimberley mines. The De Beers company is largely dependent on the good-will of the De Beers corporation, the town having practically no industries other than diamond mining. Horse-breeding is carried on to a limited extent. The value of the annual output of diamonds averages about £4,500,000. The importance of the industry led to the building of a railway from Cape Town, opened in 1885. On the outbreak of war between the British and the Boers in 1899 Kimberley was invested by a Boer force. The siege began on the 12th of October and lasted until the 15th of February 1900, when the town was relieved by General Sir John French. Among the besieged were Cecil Rhodes, who planned the resources of the De Beers company at the disposal of the defenders. In 1906 the town was put in direct railway communication with Johannesburg, and in 1908 the completion of the line from Bloemfontein gave Natal direct access to Kimberley, which thus became an important railway centre.

KIMBERIDGIAN, in geology, the basal division of the Upper Oolites in the Jurassic system. The name is derived from the hamlet of Kimeridge or Kimberidge near the coast of Dorsetshire, England. It appears to have been first suggested by the Reverend H. H. Travers in 1802. The oolites of the Kimeridge Clay, it was used by Buckland. From the Dorsetshire coast where it is splendidly exposed in the fine cliffs from St Alban's Head to Gad Cliff, it follows the line of Jurassic outcrop through Wiltshire, where there is a broad expanse between Westbury and Devizes, as far as Yorkshire, thence it appears in the vale of Pickering and on the coast in Filey Bay. It generally occupied broad valleys, of which the vale of Aylesbury may be taken as typical. Good exposures occur at Seend, Calne, Swindon, Wootton Bassett, Faringdon, Abingdon, Culham, Shotover Hill, Minster, Ely and Market Rasen. Traces of the formation are found as far north as the east coast of Cromarty and Sutherland at Eathie and Helmsdale.

In England the Kimberidgian is usually divisible into an Upper Series, 600-650 ft. in the south, dark bituminous shales, paper
shales and clays with layers and nodules of cement-stones and sep- taria. These beds merge gradually into the overlying Portlandian formation. The Lower Series, with a maximum thickness of 400 ft., consists of clays and dark shales with septaria, cement-stones and calcareous nodules. These lieuate to the chalk and are persistent. The Upper Kimeridgian is distinguished as the zone of *Perispinites biceps*, with the sub-zone of *Discina latissima* in the higher part of the zone and *Toborothyrella* in the lower part of the zone, with the sub-zone of *Ostrea deloides* in the lower portion. *Exogyra virgula* is common in the upper part of the lower zone and in the lower part of the Upper Kimeridgian. A large number of ammonites is reported from this formation, including *Reineckia eudoxus*, *R. Thurmanni*, *Aspidoceras longispinus*, &c. Large dinosaurian reptiles are abundant, *Cetiosaurus*, *Giganto- zaurus*, *Megaloglossus*, also plesiosaurs and Ichthyosaurus; chor- doid plates of *Phyllopterus*, *Proarchosuchus*, *Thracia depressa*, *Blesemnites aberratius*, *B. Blainvillei*, *Lingula ovalis*, *Rhynchoelasma incomans* and *Exogyra nana* are characteristic fossils. Alum has been obtained from the Kimeridge Clay, and some stones have been employed in Purbeck; coprolites are found in small quantities. Bricks, tiles, flower-pots, &c., are made from the clay at Swindon, Gillingham, Brill, Ely, Horncastle, and other places. The so-called "Kimeridge coal" is a highly bituminous shale cap- able of being used as fuel, which has been worked on the cliff at Little Kimeridge.

The "Kimeridgien" of continental geologists is usually made to contain the three sub-divisions of A. O. and W. Waagen, viz.:

1. **Upper (Virgulian)** with *Exogyra virgula*
2. **Kimeridgien** (Middle) with *Plioceras oceanica* (Asiatic)
3. **Lower (Astari subrugosus)**: but the upper portion of this continental Kimeridgian is equivalent to some of the British Portlandian; while most of the Asiatic corresponds to the Corallian. A. de Lapparent now recognizes only the upper subdivisions in the Corallian of the Kimeridgian. Other beds marked with occasional limestones and sandstones represent the Kime- ridgien of most of northern Europe, including Russia. In Swabia and other parts of Germany the curious uniform marble *Felsenkalke* occurs on this horizon, and most of the Kimeridgien of southern Europe, including the Alps, is calcareous. Representatives of the formation occur in Caucasus, Algeria, Abyssinia, Madagascar; in South America with volcanic rocks, and possibly in California (Mariano beds), Alaska, and King Charles' Land.

(J. A. H.)

**KIMHI**, or KIMHAY, the family name of three Jewish grammarians and biblical scholars who worked at Narbonne in the 12th century and the beginning of the 13th, and exercised great influence on the study of the Hebrew language. The name, as is shown by manuscript testimony, was also pronounced KEM cheering, and further mention is made of the French surname Petit.

**Joseph Kimhi** was a native of southern Spain, and settled in Provence, where he was one of the first to set forth in the Hebrew language the results of Hebrew philology as expounded by the Spanish Jews in their Arabic treatises. He was acquainted moreover with Latin grammar, under the influence of which he resorted to the innovation of dividing the Hebrew vowels into five long vowels and five short, previous grammarians having simply spoken of seven vowels without distinction of quantity. His grammatical textbook, *Sefer Ha-Zikaron*, "Book of Remembrance" (ed. W. Bacher, Berlin, 1888), was marked by methodical comprehensiveness, and introduced into the theory of the verbs a new classification of the stems which has been retained by later scholars. In the far more ample *Sefer Ha- Galuy*, "Book of Demonstration" (ed. Matthews, Berlin, 1887), Joseph Kimhi attacks the philological work of the greatest French Talmud scholar of that day, R. Jacob Tam, who espoused the antiquated system of Menahem b. Saruq, and this he supplements by an independent critique of Menahem. This work is a mine of varied exegetical and philological details. He also wrote commentaries—the majority of which are lost—on a great number of the scriptural books. Those on Proverbs and Job have been published. He composed an apologetic work under the title *Sefer Ha-Berith* ("Book of the Bond"), a fragment of which is extant, and translated into Hebrew the ethico-philosophical work of Bahya ibn Paquda ("Duties of the Heart"). In his commentaries he also made contributions to the comparative philology of Hebrew and Arabic.

Moses Kimhi was the author of a Hebrew grammar, known—after the first three words—as *Mahalak Shemite Ha-daai*, or briefly as *Mahalak*. It is an elementary introduction to the study of Hebrew, the first of its kind, in which only the most indispensable definitions and rules have a place, the remainder being almost wholly occupied by paradigms. Moses Kimhi was the first who made the verb *paqad* a model for conjugation, and the first also who introduced the now usual sequence in the enumeration of stem-forms. His handbook was of great historical importance as in the first half of the 16th century it became the favourite manual for the study of Hebrew among non-Judaic scholars (1st ed., Pesaro, 1508). Elias Levi (q.v.) wrote Hebrew explanations, and Sebastian Munster translated it into Latin. Moses Kimhi's various compositions included Alphabetic books; those on Proverbs, Ezra and Nehemiah are in the great rabbinical bibles falsely ascribed to Abraham ben Ezra.

**David Kimhi** (c. 1160–1235), also known as *Redag* (r. David Kimhi), eclipsed the fame both of his father and his brother. From the writings of the former he quotes a great number of explanations, some of which are known only from this source. His *magnum opus* is the *Sefer Mihol*, "Book of Completeness." This falls into two divisions: the grammar, to which the title of the whole, *Mihol*, is usually applied (first printed in Constanti- nople, 1534, and 1555); and the lexicography, viz. *Sefer Haschorashim*, "Book of Roots," which was first printed in Italy before 1480, then at Naples in 1490, and at Venice in 1546 with the annotations of Elias. The model and the principal source for this work of David Kimhi's was the book of R. Jonah (Abulwaid), which was cast in a similar bipartite form; and it was chiefly due to Kimhi's grammar and lexicon that, while the contents of Abulwaid's works were common knowledge, they themselves remained in oblivion for centuries. In spite of this dependence on his predecessors his work shows originality, especially in the arrangement of his material. In the grammar he combined the classic method of his brother Moses with the procedure of the older scholars who devoted a close attention to details. In his dictionary, again, he recast the lexicographical materials indepen- dently, and enriched lexicography itself, especially by his numerous etymological explanations. Under the title Et Sofer, "Pen of the Writer" (Lyk, 1864), David Kimhi composed a sort of grammatical compendium as a guide to the correct punctuation of the biblical manuscripts; it consists, for the most part, of extracts from the *Mihol*. After the completion of his great work, he began to write a handbook to the *Psalms* and *Proverbs*. The first was on Chronicles, then followed one on the Psalms, and finally his exegetical masterpiece—the commentary on the prophets. His annotations on the Psalms are especially interesting for the polemical excurses directed against the Christian interpretation. He was also responsible for a commentary on Genesis (ed. A. Günsburg, Pressburg, 1842), in which he followed Moses Maimonides in explaining biblical narratives as visions. He was an enthusiastic adherent of Maimonides, and, though far advanced in years, took an active part in the battle which raged in southern France and Spain round his philosophico- religious writings. The popularity of his biblical exegesis is demonstrated by the fact that the first printed texts of the Hebrew Bible were accompanied by his commentary: the Psalms 1477, perhaps at Bologna; the early Prophets, 1485; Soncino; the later Prophets, ibid. 1486. His commentaries have been frequently reprinted, many of them in Latin translations. A new edition of that on the Psalms was begun by Schiller-Szinessay (First Book of Psalms, Cambridge, 1883). A. Geiger wrote of the three Kimhi in the Hebrew bibliographical *Ozar Ne mish* (vol. ii., 1857–A. Geiger, Gesammele Schriften, v. 1–47). See further the Jewish Encyclopedia. (W. B.A.)

**KIN** (O. E. cyn, a word represented in nearly all Teutonic languages, cf. Du. *kynne*, Dan. and Swed. *kön*, Goth. *kuins*, tribe; the Teutonic base is *kynja*; the equivalent Aryan root *gon-* beget, produce, is seen in Gr. *γόνος*, Lat. *genus*, cf. "kind"), a collective word for persons related by blood, as descended from a common ancestor. In law, the term "next of kin" is applied to the person or persons who, as being in the nearest degree of blood relationship to a person dying intestate, share according to
degree in his personal estate (see Intestacy, and Inheritance). "Kith" is frequently associated with "kith" in the phrase "kith and kin," now used as an emphasized form of "kin" for family relatives. It properly means one's "country and kin," or one's "friends and kin." Kith (O.E. cyðde and ðwe, native land, acquaintances) comes from the stem of cūnan, to know, and is thus associated with the other terms which are familiarly.

The suffix -kin, chiefly surviving in English surnames, has been early used as a diminutive ending to certain Christian names in Flanders and Holland. The termination is represented by the diminutive -chen in German, as in Kindchen, Sinnschen, &c. Many English words, such as "pumpkin," "arkin," have been diminished in significance, and may have been assimilated from earlier forms, e.g., "pumpkin" from "pumption.

KINCARDINESHIRE, or THE MEARKS, an eastern county of Scotland, bounded E. by the North Sea, S. and S.W. by Firth of Forth and N.W. and N. by Aberdeenshire Area. 243,574 acres, or 381 sq. m. In the west and north-west the Grampians are the predominant feature. The highest of their peaks is Mount Battock (2555 ft.), where the counties of Aberdeen, Forfar and Kincardine meet, but there are a score of hills exceeding 1000 ft. in height. In the extreme north, on the confines of Aberdeenshire, the Hill of Fasg, famous for its sheep walks, attains an altitude of 1545 ft. In the north the county slopes from the Grampians to the picturesque and finely-wooded valley of the Dee, and in the south it falls to the Howe (Hollow) of the Mearns which is a continuation of the Grampian range. The main Dee valley extends from fruiting (20 m.) taking a north-easterly direction and falling into the Dee at Banchory, and forming near its mouth a beautiful cascade; the Dye (15 m.) rising in Mount Battock and ending its course in the Feugh; Luther Water (14 m.) spraying not far from the castle of Drumtocht and meandering pleasantly to its junction with the North Esk; the Cowie (13 m.) and the Carron (8½ m.) entering the sea at Stonehaven. The Dee and North Esk serve as boundary streams during part of their course, while the river Ladder, a minor feeder of the Dee, falls into Loch Leiriston, in the parish of Nigg, and Loch Lumsaig, in Dunnottar parish, both small, are the only lakes in the shire. Of the glens Glen Dye in the north centre of the county is remarkable for its beauty, and the small Den Fenella, to the south-east of Laurencekirk, contains a picturesque waterfall. Its name perpetuates the memory of Fenella, daughter of a thane of Angus, who was slain here after betraying Kenneth II. to his enemies, who (according to local tradition) made away with him in Kincardine Castle. Excepting in the vicinity of St Cyrus, the coast from below Johnshaven to Montrose may be regarded as a Geologic Novelle, Scenic interest and sublimity being generally the prevailing characteristics. A mean average height of from 100 to 250 ft., interrupted only by occasional creeks and bays, as at Johnshaven, Gourdon, Bervie, Stonehaven, Port- lethen, Findon, Cove and Nigg.

Geology.—The great fault which traverses Scotland from shore to shore passes through this county from Craigieven Bay, about a mile north of Stonehaven, by Fenella Hill to Edzell. On the norther side of this line are the old crystalline schists of the Dalradian group; on the southern side Old Red Sandstone occupies all the remaining space. Good exposures of the schists are seen, repeatedly folded, in the hills southwards of Stonehaven and Findon. These consist of a lower series of greenish slates and a higher, more micaceous and schistose series with grits; bands of limestone occur in these rocks near Bunchory. Besides the numerous minor flexures the schists are bent into a broad synclinal fold which crosses the county, its axis lying in a south-western-north-easterly direction. Rising through the schists are several granite masses, the largest being that forming the high ground around Mt Battock; south of the Dee an average height of 400 ft., interrupted only by occasional creeks and bays, as at Johnshaven, Gourdon, Bervie, Stonehaven, Portlethen, Findon, Cove and Nigg.

History.—The annals of Kincardineshire as a whole are almost blank. The county belonged of old to the district of Pictavia and apparently was overrun for a brief period by the Romans. In the parish of Findon, near the little warren of Balnagask, lies the camp of Raedykes, in which, according to tradition, the Caledonians under Galgacus were lodged before their battle with Agricola. It is also alleged that in the same district Malcolm I. was killed (954) whilst endeavouring to reduce the unruly tribes of this region. Means, the alternative name for the county, is believed to have been derived from Mernia, a Scottish king, to whom the land was granted, and whose brother, Angus, had adjoining the shire of Forfar. The antiquities consist mostly of stone circles, cairns, tumuli, standing stones and a structure in the parish of Dunnottar vaguely known as a "Ficts" or "Ficts." The famous "Ficts" camp is an extraneous fact; the town which gave the shire its name has practically vanished. It stood about 2 m. N.E. of Fettercairn, and by the end of the 16th century had declined to a mere hamlet, being represented now only by
KINCHINJUNGA, or Kanchanjunga, the third (or second; see K.) highest mountain in the world. It is a peak of the eastern Himalayas, situated on the boundary between Sikkim and Nepal, with an elevation of 8,644 ft. Kanchanjunga is best seen from the Indian hill-station of Darjeeling, where the view of this stupendous mountain, dominating all intervening ranges and rising from regions of tropical undergrowth to the altitude of eternal snows, is one of the grandest in the world.

**KIND** (O. E. ge-cynede, from the same root as is seen in "kin, surp," a word in origin meaning birth, nature, or as an adjective, natural. From the application of the term to the natural disposition or characteristic which marks the class to which an object belongs, the general and most common meaning of "class," genus or species easily develops; that of race, natural order or grouping of animals and plants into such classes. The phrase "payment in kind," i.e. in goods or produce as distinguished from money, is used as equivalent to the Latin in specie; in ecclesiastical usage "communion in both kinds" or "in one kind" refers to the elements of bread and wine (Lat. species) in the Eucharist. The present main sense of the adjective "kind," i.e. gentle, friendly, benevolently, has developed from the meaning "born," "natural," through "of good birth, disposition or nature," "naturally well-disposed.

**KINDERGARTEN**, a German word meaning "garden of children," occupied by them to form a kind of "play-school" invented by him for furthering the physical, moral and intellectual growth of children between the ages of three and seven. For the theories on which this type of school was based see Froebel. Towards the end of the 18th century Pestalozzi planned, and Oberlin formed, day-asylums for young children. Schools of this kind took in the Netherlands the name of "play school," and in England, where they have especially thriven, of "infant schools" (q.v.). But Froebel's idea of the "Kindergarten" differed essentially from that of the infant schools. The child required to be prepared for society by being early associated with in such expressions as "mankind." The phrase "payment in kind," i.e. in goods, produce as distinguished from money, is used as equivalent to the Latin in specie; in ecclesiastical usage "communion in both kinds" or "in one kind" refers to the elements of bread and wine (Lat. species) in the Eucharist. The present main sense of the adjective "kind," i.e. gentle, friendly, benevolently, has developed from the meaning "born," "natural," through "of good birth, disposition or nature," "naturally well-disposed.

Froebel therefore invented a course of occupations, most of which are social games. Many of the games are connected with the "gifts," as he called the simple playthings provided for the children. These "gifts" are, in order, six coloured balls, a wooden ball, a cylinder and a cube, a cube cut to form eight smaller cubes, another cube cut to Froebel to a kind of "play-school" invented by him for furthering the physical, moral and intellectual growth of children between the ages of three and seven. For the theories on which this type of school was based see Froebel. Towards the end of the 18th century Pestalozzi planned, and Oberlin formed, day-asylums for young children. Schools of this kind took in the Netherlands the name of "play school," and in England, where they have especially thriven, of "infant schools" (q.v.). But Froebel's idea of the "Kindergarten" differed essentially from that of the infant schools. The child required to be prepared for society by being early associated with in such expressions as "mankind." The phrase "payment in kind," i.e. in goods, produce as distinguished from money, is used as equivalent to the Latin in specie; in ecclesiastical usage "communion in both kinds" or "in one kind" refers to the elements of bread and wine (Lat. species) in the Eucharist. The present main sense of the adjective "kind," i.e. gentle, friendly, benevolently, has developed from the meaning "born," "natural," through "of good birth, disposition or nature," "naturally well-disposed.

**KINDI** [Abū Yūsuf Ya'qūb ibn Ishāq ul-Kindi, sometimes called pre-eminently "The Philosopher of the Arabs"] flourished in the 9th century, the exact dates of his birth and death being unknown. He was born in Kufa, where his father was governor under the Caliphs Mahdi and Harun al-Rashid. His studies were made in Basra and Bagdad, and in the latter place he remained until he was past 60, after which he returned to Kufa. Frockel, the first kindergarten was established in St. Louis in 1873 by Miss Susan Blow and Dr W. T. Harris. In Belgium the mistresses of the Ecoles gardennes **are** instructed in the "idea of the kindergarten" and "Froebel's method," and in 1880 the minister of public instruction issued a programme for the "Ecoles Gardennes Coeducatives," which is both in fact and in profession a kindergarten manual.

**KING, CHARLES WILLIAM** (1818-1888), English writer on ancient gems, was born at Newport (Mon.) on the 4th of September 1818. He entered Trinity College, Cambridge, in 1836; graduated in 1840, and obtained a fellowship in 1842; he was senior fellow at the time of his death in London on the 25th of March 1888. He took holy orders, but never held any cure. He spent much time in Italy, where he laid the foundation of his collection of gems, which, increased by subsequent purchases made in London, was sold by him in consequence of his failing eyesight and was purchased in 1881 by the Metropolitan Museum of Art, New York. King was recognized universally as one of the greatest authorities in this department of art. His chief works on the subject are: Antiqua Gemmae, their Origin, Uses and Value (1860), a complete and exhaustive treatise; The Gnomoties and their Remains (2nd ed. by J. Jacobs, 1887, which

---

KINCHINJUNGA—KING, C. W. the ruins of the royal castle and an ancient burial-ground. The Bruses, earls of Elgin, also bear the title of earl of Kincardine. See A. Jervise, History and Traditions of the Lands of the Lindsays (1853), History and Antiquities of the Mearns (1858), Memorials of Angus and the Mearns (1861); J. Anderson, The Black Book of Kinchinarshire (Stonehaven, 1879); C. A. Mollyph, The Parish of For- doun (Aberdeen, 1893); A. C. Cameron, The History of Petercain (Paisley, 1899).
led to an animated correspondence in the *Athenaeum*; The Natural History of Precious Stones and Gems and of the Precious Metals (1805); The Handbook of Engraved Gems (2nd ed., 1855); Early Christian Numismatics (1873). King was thoroughly familiar with the works of Greek and Latin authors, especially Plutarch and Sannazaro, whose works he had studied at Cambridge, and which upon his return to the United States he read in the original. He was also a devoted student of Plutarch’s *Moralia* (1882) and the theological works of the Emperor Julian (1888) for Bohn’s Classical Library.

**KING, CLARENCE** (1842–1900), American geologist, was born at Newport, Rhode Island, U.S.A., on the 6th of January 1842. He graduated at Yale in 1862. His most important work was the geological exploration of the forty-eighth parallel, of which the main reports (1876 and 1877) comprised the geographical and topographical atlas of the Rocky Mountains, the Green River and Utah basins, and the Nevada plateau and basin. When the United States Geological Survey was consolidated in 1879 King was chosen director, and he vigorously conducted investigations in Colorado, and in the Eureka district and on the Comstock lode in Nevada. He held office for a year only; in later years his only noteworthy contribution to geology was an essay on the age of the earth, which appeared in the annual report of the Smithsonian Institution for 1893. He died at Phoenix, Arizona, on the 24th of December 1901.

**KING, CLARENCE** (1637–1708), the subject of Milton’s *Lycidas*, was born in Ireland in 1612, the son of Sir John King, a member of a Yorkshire family which had migrated to Ireland. Edward King was admitted a pensioner of Christ’s College, Cambridge, on the 6th of June 1626, and four years later was elected a fellow. Milton, though two years his senior and himself anxious to secure a fellowship, remained throughout on terms of the closest friendship with his rival, whose amiable character seems to have endeared him to the whole college. King served from 1633 to 1634 as preceptor and tutor of his college, and was to have entered the church. His career, however, was cut short by the tragic event which inspired Milton’s poem. In 1637 he set out for Ireland to visit his family, but on the 20th of August the ship in which he was sailing struck on a rock near the Welsh coast, and King was drowned. Of his own writings many Latin poems contributed to different collections of Cambridge verse survive, but they are not of sufficient merit to explain the esteem in which he was held.

A collection of Latin, Greek and English verse written in his memory by his Cambridge friends was printed at Cambridge in 1638, with the title *Justa Edentibus King naupheo, in amicis modestissimo amoris et muellas xaros*. The second part of this collection has a separate title-page, *Obsequies to the Memorie of Mr Edward King, Anno Domini 1637* and contains thirteen English poems, of which *Lycidas* (sign. M.J.) is the last.

**KING, EDWARD** (1829–1910), English bishop, was the second son of the Rev. Walter King, archdeacon of Rochester and rector of Stone, Kent. Graduating from Oriel College, Oxford, he was ordained in 1854, and four years later became chaplain and lecturer at Cuddesdon Theological College. He was principal at Cuddesdon from 1863 to 1873, when he became regius professor of pastoral theology at Oxford and canon of Christ Church. To the world outside he was only known at this time as one of Dr Pusey’s most intimate friends and as a leading member of the English Church Union. But in Oxford, and especially among the younger men, he exercised an exceptional influence, due not to special profundity of intellect, but to his remarkable charm in personal intercourse, and his abounding sincerity and goodness. In 1883 Dr King was made bishop of Lincoln. The most eventful episode of his episcopate was his prosecution (1888–1890) for ritualistic practices before the archbishop of Canterbury, Dr Benson, and, on appeal, before the judicial committee of the Privy Council (see LINCOLN JUDGMENT). Dr King, who loyalty conformed his practices to the archbishop’s judgment, devoted himself unspuringly to the work of his diocese; and, irrespective of He was treasured, and beloved by the affection and reverence of all classes by his real saintliness of character. The bishop, who never married, died at Lincoln on the 8th of March 1910.

See the obituary notice in *The Times*, March 9, 1910.

**KING, HENRY** (1591–1669), English bishop and poet, eldest son of John King, afterwards bishop of London, was baptized on the 16th of January 1591. With his younger brother John he proceeded from Westminster School to Christ Church, Oxford, where both matriculated on the 20th of January 1609. Henry King entered the church, and after receiving various ecclesiastical preferments he was made bishop of Chichester in 1642, receiving at the same time the rich living of Petworth, Sussex. On the 29th of December of that year Chichester surrendered to the Parliamentary army, and King was among the prisoners. After his release he found an asylum with his brother-in-law, Sir Richard Hobart of Langley, Buckinghamshire, and afterwards at Rickkings near by, with Lady Salter, said to have been a sister of Dr Brian Dupp (1588–1662). King was a close friend of Dupp and personally acquainted with Charles I. In one of his poems dated 1649 he speaks of the *Eikon Basilike* as the king’s own work. Restored to his benefice at the Restoration, King died at Chichester on the 30th of September 1669. His works include Poems, Elegies, Paradoxes and Sonnets (1657), *The Psalms of David from the New Translation of the Bible, turned into Meter* (1651), and several sermons. He was one of the executors of John Donne, and prefaced an elegy to the 1663 edition of his friend’s poems.

King’s Poems and Psalms were edited, with a biographical sketch, by the Rev. J. Hannah (1843).

**KING, RUFUS** (1755–1827), American political leader, was born on the 24th of March 1755 at Scarborough, Maine, then a part of Massachusetts. He graduated at Harvard in 1777, read law at Newburyport, Mass., with Theophilus Parsons, and was admitted to the bar in 1780. He served in the Massachusetts General Court in 1783–1784 and in the Confederation Congress in 1784–1787. During these critical years he adopted the “states’ rights” attitude. It was largely through his efforts that the General Court in 1784 rejected the amendment to the Articles of Confederation authorizing Congress to levy a 5% impost. He was one of the three Massachusetts delegates in Congress in 1785 who recommended the General Court proposing a convention to amend the articles. He was also out of sympathy with the meeting at Annapolis in 1786. He did good service, however, in opposing the extension of slavery. Early in 1787 King was moved by the Shays Rebellion and by the influence of Alexander Hamilton to take a broader view of the general situation, and it was he who introduced the resolution in Congress, on the 21st of February 1787, sanctioning the call for the Philadelphia constitutional convention. In the convention he supported the large-state party, favoured a strong executive, advocated the suppression of the slave trade, and opposed the counting of slaves in determining the apportionment of representatives. In 1788 he was one of the most influential members of the Massachusetts convention which ratified the Federal Constitution. He married Mary Alsop (1769–1810) of New York in 1786 and removed to that city in 1788. He was elected a member of the New York Assembly in the spring of 1789, and at a special session of the legislature held in July of that year was chosen one of the first representatives of New York in the United States Senate. In this body he served in 1789–1796, supported Hamilton’s financial measures, Washington’s neutrality proclamation, and the Jay Treaty, and became one of the recognized leaders of the Federalist party. He was minister to Great Britain in 1796–1803 and again in 1825–1826, and was the Federalist candidate for vice-president in 1804 and 1808, and for president in 1816, when he
received 34 electoral votes to 183 cast for Monroe. He was again returned to the Senate in 1813, and was re-elected in 1819 as the result of a struggle between the Van Buren and Clinton factions of the Democratic-Republican party. In the Missouri Compromise debates he supported the anti-slavery programme in the main, but for constitutional reasons voted against the second clause of the Tallmadge Amendment providing that all slaves born in the state after its admission into the Union should be free at the age of twenty-five years. He died at Jamaica, Long Island, on the 29th of April 1827.

King, Thomas—King, William

KING, THOMAS (1730-1805), English poet, was born in 1730, probably at Drury Lane, though this is by no means a certain statement. His father, by whom he was educated, was the Rev. George King, master of the grammar school at Oxford. The boy, which was a valuable help to our knowledge of the Ireland of his day.

KING, WILLIAM (1650-1729), Anglican divine, the son of James King, an Aberdeen man who migrated to Antrim, was born in May 1650. He was educated at Trinity College, Dublin, and after being presented to the parish of St. Wulfrun, Whitchurch, in 1679, became dean of St Patrick's in 1689, bishop of Derry in 1691, and archbishop of Dublin in 1702. In 1718 he founded the divinity lectureship in Trinity College, Dublin, which bears his name. He died in May 1729. King was the author of The State of the Protestants in Ireland under King James's Government (1691), but is best known by his De Origine Mali (1702; Eng. trans., 1731), an essay deemed worthy of a reply by Bayle and Leibnitz. King was a strong supporter of the Revolution, and his voluminous works on Union, 1826. He became known as a humorous writer on the Tory and High Church side.

King, Thomas (1730-1805), English poet, was born in 1730, probably at Drury Lane, though this is by no means a certain statement. His father, by whom he was educated, was the Rev. George King, master of the grammar school at Oxford. The boy, which was a valuable help to our knowledge of the Ireland of his day.
Yet enough. That it theory. This canning. any.

"Mully anonymously lord London appointed returned Ockham, Dr Johnstone included him in his Lines of the Poets, and his works appear in subsequent collections."

King is not to be confused with another William King (1685-1769), author of a mock-heroic poem called The Toast (1756) satirizing the countess of Newburgh, and principal of St Mary Hall, Oxford.

King [of Ockham], Peter King, 1st Baron (1669-1734), lord chancellor of England, was born at Exeter in 1669. In his youth he was interested in early church history, and published anonymously in 1691 An Enquiry into the Constitution, Discipline, Unity and Worship of the Primitive Church that flourished within the first Three Hundred Years after Christ. This treatise engaged the interest of his cousin, John Locke, the philanthropist, by whose advice his father sent him to the University of Leiden, where he stayed for nearly three years. He entered the Middle Temple in 1694 and was called to the bar in 1698. In 1700 he was returned to parliament for Beer Alston in Devonshire; he was an appointed recorder of Glastonbury in 1705 and recorder of London in 1708. He was chief justice of the common pleas from 1714 to 1725, when he was appointed speaker of the House of Lords and was raised to the peerage. In June of the same year he was made lord chancellor, holding office until compelled by a paralytic stroke to resign in 1733. He died at Ockham, Surrey, on the 23rd of July 1734. Lord King's chancellor failed to sustain the reputation which he had acquired at the common law bar. Nevertheless he left his mark on English law by establishing the principles that a will of immovable property is governed by the lex loci sitae, and that where a husband had a legal right to the personal estate of his wife, which must be asserted by a suit in equity, the court would not help him unless he made a provision out of the property for the wife, if she required it. He was also the author of the Act (4 Geo. II. c. 26) by virtue of which English superseded Latin as the language of the courts. Lord King published in 1702 a History of the Apostles' Creed (Leipzig, 1705; Base, 1750) which went through several editions and was also translated into Latin.

His great-grandson, William (1805-1893), married in 1835 the only daughter of Lord Byron the poet, and was created earl of Lovelace in 1838. Another descendant, Peter John Locke King (1811-1895), was member of parliament for East Surrey from 1847 to 1874, won some fame as an advocate of reform, being responsible for the passing of the Real Estate Charges Act of 1854, and for the repeal of a large number of obsolete laws.

King, O. Eng. cyning, abbreviated into cyng, cing; cf. O. H. G. cauc, kung, konung, kuning, konung, kung, chun-king, M.H.G. könic, kúts, köt, Mod. Ger. König, O. Norse konung, konr, Swed. konung, kung), a title, in its actual use generally implying sovereignty of the most exalted rank. Any inclusive definition of the word "king" is, however, impossible. It always implies sovereignty, but in no special degree or sense; e.g., the sovereigns of the British Empire and of Servia are both kings, and so too, at least in popular parlance, are the chiefs of many barbarous peoples, e.g. the Zulus. The use of the title is, in fact, involved in considerable confusion, largely the result of historic causes. Freeman, indeed, in his Cosmic and Pastoral Poetry (p. 124) says: "There is a common idea of kingship which is at once recognized however hard it may be to define it. This is shown among other things by the fact that no difficulty is ever felt as to translating the word king and the words which answer to it in other languages. This, however, is subject to considerable modification. "King," for instance, is used to translate the Homeric βασιλεύς equally with the Athenian βασιλεύς or the Roman rex. Yet the Homeric "kings " were but tribal chiefs; while the Athenian and Roman kings were kings in something more than the modern sense, as supreme priests as well as supreme rulers and lawgivers (see Achaeans; and Rome: History). In the English Bible, too, the title of king is given indiscriminately to the great king of Persia and to potentates who were little more than Oriental sheiks. A more practical difficulty, moreover, presented itself in international intercourse, before diplomatic conventions became, in the 19th century, more or less stereotyped. Originally the title of king was superior to that of emperor, and it was to avoid the assumption of the superior title of rex that the chief magistrates of Rome adopted the names of Caesar, imperator, and princeps to signalize their authority. But with the development of the divine imperial ideas the title emperor came to mean more than had been involved in that of rex; very early in the history of the Empire there were subject kings; while with the Hellenizing of the East Roman Empire its rulers assumed the style of basileus, no longer to be translated "king" but "emperor." From this Roman conception of the supremacy of the emperor the medieval Empire of the West inherited its traditions. With the barbarian invasions the Teutonic idea of kingship had come into touch with the Roman idea of empire and with the theocratic conceptions which this had absorbed from the old Roman and political theory of medieval Europe pope and emperor were sun and moon, kings but lesser satellites; though the theory only partially and occasionally corresponded with the facts. But the elevation of Charlemagne had had a profound effect in modifying the status of kingship in nations that never came under his sceptre nor under that of his successors. The shadowy claim of the emperors to universal dominion was in theory everywhere acknowledged; but independent kings hastened to assert their own dignity by surrounding themselves with the ceremonial forms of the Empire and occasionally, as in the case of the pope, in the Teutonic Empire, by assuming the imperial style. The mere fact of this usurpation showed that the title of king was regarded as inferior to that of emperor; and so it continued, as a matter of sentiment at least, down to the end of the Holy Roman Empire in 1806 and the cheapening of the imperial title by its multiplication in the 19th century. To the

1 Max Müller, Lect. Sci. Lang., 2nd series, p. 255, "All people, save those who fancy that the same king has something to do with a Tartar khan or with a 'canning'... man, are agreed that the English 'kning' and the Sanskrit gana, kana both come from the same root, from that widely spread root whence come on the one hand the Latin cym or kit, and on the other the Greek γίος. The only question is whether there is any connexion between 'cying' and gana, closer than that which is implied in their both coming from the same original root. That is to say, are we to suppose that cying and gana are strictly the same word common to Sanskrit and Teutonic, or is it enough to think that cying is an independent formation made after the Teutons had subjugated themselves to the Roman yoke and that the influence between the two derivations is not very remote, as the cym is the ruling idea in any case; but if we make the word immediately cognate with gana we bring in a notion of the father of people which has no place if we simply derive cying from cyn?" See also O. Schrader, Reallexikon der Indogermanischen Alterthumskunde (Strassburg, 1901) s. v. "König": the chunni (Kin) is but the chunni (Kin) personified; cf. A.S. bædl. masc. = prince; bæld fem. = "racy," i.e. Lat. geni.
King-Bird

Last, moreover, the emperor retained the prerogative of creating kings, as in the case of the king of Prussia in 1701, a right borrowed and freely used by the emperor Napoleon. Since 1814 the title of king has been assumed or bestowed by a consensus of the powers, e.g. the elector of Hanover was made king by the congress of Vienna (1814), and per contra the title of king was refused to the elector of Hesse by the congress of Aix-la-Chapelle (1818). In general the title of king is now taken to imply a sovereign and independent international position. This was implied in the recognition of the title of king in the rulers of Greece, Rumania, Servia and Bulgaria when these countries were declared absolutely independent of Turkey. The fiction of this independent sovereignty is preserved even in the case of the kings of Bavaria, Saxony and Württemberg, who are technically members of a free confederation of sovereign states, but are not independent, since they deal separately with foreign powers are practically controlled by the king of Prussia as German emperor.

The theory of the "divine right" of kings, as at present understood, is of comparatively modern growth. The principle that the kingship is "descendible in one sacred family," as George Canning put it, is not only still that of the British constitution, as that of all monarchical states, but is practically that of kingship from the beginning. This is, however, quite a different thing from asserting with the modern upholders of the doctrine of "divine right" not only that "legitimate" monarchs derive their authority from, and are responsible to, God alone, but that this is a divine ordnance hereditary in a certain order of succession. The power of popular election remained, even though popular choice was by custom or by religious sentiment confined within the limits of a single family. The custom of primogeniture grew up owing to the obvious convenience of a simple rule that should avoid ruinous contests; the so-called "Salic Law" went further, and by excluding females, removed another possible source of weakness. Neither did the Teutonic kingship imply absolute power. The idea of kingship as a theocratic function which they set out as part of the political controversies of the 17th century, is due ultimately to Oriental influences brought to bear through Christianity. The crowning and anointing of the emperors, borrowed from Byzantium and traceable to the influence of the Old Testament, was imitated by lesser potentates; and this "sacring" by ecclesiastical authority gave to the king a character of special sanctity. The Christian king thus became, in a sense, like the Roman rex, both king and priest. Shakespeare makes Richard II. say, "Not all the water in the rough rude sea can wash the balm off from an anointed king" (act iii. sc. 2); and this conception of the kingship tended to gainsay the power weakened by the vestiges of papal and of the clergy generally. Before the Reformation the anointed king was, within his realm, the accredited vicar of God for secular purposes; after the Reformation he became this in Protestant states for religious purposes also. In England it is not without significance that the sacerdotal vestments, generally discarded by the clergy—dalmatic, alb and stole—continued to be among the insignia of the sovereign (see Coronation). Moreover, this sacrosanct character he acquired not by virtue of his "sacring," but by hereditary right; the coronation, anointing and other outward signs as the visible symbol of a divine grace adherent in the sovereign by virtue of his title. Even Roman Catholic monarchs, like Louis XIV., would never have admitted that their coronation by the archbishop constituted any part of their title to reign; it was no more than the consecration of their title. In England the doctrine of the divine right of kings was developed to its extreme logical conclusions during the political controversies of the 17th century. Of its exponents the most distinguished was Hobbes, the most exaggerated Sir Robert Filmer. It was the main issue to be decided by the Civil War, the royalists holding that "all Christian kings, princes and governors" derive their authority direct from God, the parliamentarians that this authority is the outcome of a contract, actual or implied, between sovereign and people. In one case the king's power would be unlimited, according to Louis XIV.'s famous saying: "L'état, c'est moi!" or limitable only by his own free act; in the other his actions would be governed by the advice and consent of the people, to whom he would be ultimately responsible. The victory of this latter principle was proclaimed to all the world by the execution of Charles I. The doctrine of divine right, indeed, for a while nourished from the blood of the royal "martyr"—it was the guiding principle of the Anglican Church of the restoration; but it suffered a rude blow when James II. made it impossible for the clergy to obey both their conscience and their king; and the revolution of 1688 made an end of it as a great political force. These events had effects far beyond England. They served as precedents for the crusade of republican France against kings, and later for the substitution of the democratic kingship of Louis Philippe, "king of the French by the grace of God and the will of the people," for the "legitimate" kingship of Charles X., "king of France by the grace of God."

The theory of the crown in Britain, as held by descent modified and modifiable by parliamentary action, and yet also "by the grace of God," is in strict accordance with the earliest traditions of the English kingship; but the rival theory of inalienable divine right is not dead. It is strong in Germany and especially in Prussia; it survives as a militant force among the Carlists in Spain and the Royalists in France (see Legitimists); and even in England a remnant of enthusiasts still maintain the claims of a remote descendant of Charles I. to the throne (see Jacobites).

King-Bird, the Lonius tymannus of Linnaeus, and the Tyrannus carolinensis or T. picipil of most later writers, a common and characteristic inhabitant of North America, ranging as high as 57° N. lat. or farther, and westward to the Rocky Mountains, beyond which it is found in Oregon, in Washington (State), and in British Columbia, though apparently not occurring in California. In Canada and the northern states of the Union it is a summer visitor, wintering in the south, but also reaching Cuba; and, passing through Central America, it has been found in Bolivia and eastern Peru. Both the scientific and common names of this species are taken from the way in which the cock will at times assume despotic authority over other birds, attacking them furiously as they fly, and forcing them to divert or altogether desist from their course. Yet it is love of his mate or his young that prompts this bellicose behaviour, for it is only when it is long separated that he indulges in it but then almost every large bird that approaches his nest, from an eagle downwards, is assaulted, and those alone that possess greater command of flight can escape from his repeated charges, which are accompanied by loud and shrill cries. On these occasions it may be that the king-bird displays the emblem of his dignity, which is commonly concealed; for, being otherwise rather plainly coloured—dark-ashy grey above and white beneath—the erectile feathers of the crown of the head, on being parted, form as it were a deep furrow, and reveal their base, which is of a bright golden-orange in front, deepening into scarlet, and then passing into silvery white. This species seems to live entirely on insects, which it captures on the wing; it is in bad repute with bee-keepers, though, according to Dr E. Coues, it "destroys a thousand noxious insects for every bee it eats." It builds, often in an exposed situation, a rather large nest, coarsely constructed outside, but neatly lined with fine roots or grasses, and lays five or six eggs of a pale salmon colour, beautifully marked with blotches and spots of purple, brown and orange, generally disposed in a zone near the larger end.

Nearer akin to the king-bird is the petchary or chichare, so-called from its loud and pestulant cry, T. dominicensis, or T. griseus, one of the most characteristic and conspicuous birds of the West Indies, and the earliest to give notice of the break of day. In habits, except that it eats a good many berries, it is the very counterpart of its congeners, and is possibly even more jealous of any intruder. At all events its pugnacity extends to 1It is called in some parts the bee-martin.
animals from which it could not possibly receive any harm, and is hardly limited to any season of the year.

In several respects both of these birds, with several of their allies, resemble some of the shrikes; but it must be clearly understood that the likeness is but of analogy, and that there is no near affinity between the two families Laniidae and Tyrannidae, which belong to wholly distinct sections of the great Passerine order; and, while the former is a comparatively homogeneous group, much diversity of form and habits is found among the latter. Similarly many of the smaller Tyrannidae bear some analogy to certain Muscicapidae, with which they are at one time confounded (see FLYCATCHERs), but the difference between them is deep seated.1 Nor is this all, for out of the seventy genera, or thereabouts, into which the Tyrannidae have been divided, comprehending perhaps three hundred and fifty species, all of which are peculiar to the New World, a series of forms can be selected which find a kind of parallel to a series of forms to be found in the other group of Passeres; and the genus Tyrannus, though that from which the family is named, is by no means a fair representative of it; but it would be hard to say which genus should be so accounted. The birds of the genus Muscicarpus have the habits and almost the appearance of wheat-eats; the genus Alectorus calls to mind a water-wagtail; Entosornus may suggest a titmouse. Elanus perhaps a willow-wren; but the greatest number of forms have no analogous bird of the Old World with which they can be compared; and, while the combination of delicate beauty and peculiar external form possibly attains its utmost in the long-tailed Milvulus, the glory of the family may be said to culminate in the king of bird-birds, Muscicora regia. (A. N.)

KING-CRAB, the name given to an Arachnid, belonging to the order Xiphosurae, of the grade Delobranchia or Hydroprostata. King-crabs, of which four, possibly five, existing species are known, were formerly referred to the genus Limulus, a name still applied to them in all zoological text-books. It has recently been shown, however, that the structural differences between

1 Two easy modes of discriminating them externally may be mentioned. All the Laniidae and Muscicapidae have but nine primary quills in their wings, and their tarsi are covered with scales in front only; while in the Tyrannidae there are ten primaries, and the tarsal scales extend the whole way round. The more recondite distinction in the structure of the trachea seems to have been first detected by Macgillivray, who wrote the anatomical descriptions published in 1839 by Audubon (Orn. Biography, v. 421, 422); but its value was not appreciated till the publication of Johannes Müller's classical treatise on the vocal organs of Passerine birds (Abhandl. k. Akad. Wissensch. Berlin, 1845, pp. 321, 405).

some of the species are sufficiently numerous and important to warrant the recognition of three genera—Xiphosura, of which Limulus is a synonym, Tachypleus and Carcinoscorpius. In Xiphosura the genital operculum structurally resembles the gill-bearing appendages in that the inner branches consist of three distinct segments, the distal of which is lobate and projects freely beyond the margin of the adjacent distal segment of the outer branch; the entosternite (see ARACHNIDA) has two pairs of antero-lateral processes, and in the male only the ambulatory appendages of the second pair are modified as claspers. In Tachypleus and Carcinoscorpius, on the other hand, the genital operculum differs from the gill-bearing appendages in that the inner branches consist of two segments, the distal of which are apically pointed, partially or completely fused in the middle line, and do not project beyond the distal segments of the outer branches; the entosternite has only one pair of antero-lateral processes, and in the male the second and third pairs of ambulatory limbs are modified as claspers. Tachypleus differs from Carcinoscorpius in possessing a long movable spur on the fourth segment of the sixth ambulatory limb, in having the postanal spine triangular in section instead of round, and the claspers in the male heuciletale, owing to the suppression of the immovable finger, which is well developed in Carcinoscorpius. At the present time king-crabs have a wide but discontinuous distribution. Xiphosura, of which there is but one species, X. polyphemus, ranges along the eastern side of North America from the coast of Maine to Yucatan. Carcinoscorpius, which is also represented by a single species, C. rotundicauda, extends from the Bay of Bengal to the coast of the Moluccas and the Philippines, while of the two better-known species of Tachypleus, T. gigas ( = mutaceanus) ranges from Singapore to Torres Straits, and T. tridentatus from Borneo to southern Japan. A third species, T. hoveni, has been recorded from the Moluccas. But although Xiphosura is now so widely distributed geographically from Tachypleus and Carcinoscorpius, the occurrence of the remains of extinct species of king-crabs in Europe, both in Tertiary deposits and in Triassic, Jurassic and Cretaceous strata, suggests that there was formerly a continuous coast-line, with tropical or temperate conditions, extending from Europe westward to America, and eastward to southern Asia. There are, however, no grounds for the assumption that the supposed coast-line between America and Europe synchronized with that between Europe and south Asia. King-crabs do not appear to differ from each other in habits. Except in the breeding season they live in water ranging in depth from about two to six fathoms, and creep about the bottom or bury themselves in the sand. Their food consists for the most part of soft marine worms, which are picked up in the nippers, thrust into the mouth, and masticated by the basal segments of the appendages between which the mouth lies. At the approach of the breeding season, which in the case of Xiphosura polyphemus is in May, June and July, king-crabs advance in pairs into very shallow water at the time of the high tides, the male holding securely to the back of the female by means of his clasping nippers. No actual union between the sexes takes place, the spawn of the female being fertilized by the male at the time of being laid in the sand or soon afterwards. This act accomplished, the two retreat again into deeper water. Deposited in the mud or sand near high-water mark, the eggs are eventually hatched by the heat of the sun, to which they are exposed every day for a considerable time. The newly hatched young is minute and subcircular in shape, but bears a close resemblance to its parents except in the absence of the caudal spine and in the presence of a fringe of stiff bristles round the margin of the body. During growth it undergoes a succession of moults, making its exit from the old integument through a wide split running round the edge of the carapace. Moulting is effected in exactly the same way in scorpians, Pedipalpi, and normally in spiders. The caudal spine appears at the second moult and gradually increases in length with successive changes of the skin. This organ is of considerable importance, since it enables the king-crab to right itself when overturned by rough water or other causes. Without it the
animal would remain helpless like an upturned turtle, because it is unable to reach the ground with its legs when lying on its back. Before the tail is sufficiently developed to be used for that purpose, the young king-crab succeeds in regaining the normal position by flapping its flattened abdominal appendages and rising in the water by that means. The king-crab fishery

to the sea-shore, but a severe winter is sure to occasion a great mortality in the species, for many of its individuals seem unable to reach the tidal waters where only in such a season they could obtain sustenance; and to this cause rather than any other is perhaps to be ascribed its general scarcity. Very early in the year it prepares its nest, which is at the end of a tunnel bored by itself in a bank, and therein lays six or eight translucent eggs, sometimes on the bare soil, but often on the fishes which, being indigestible, are thrown up in pellets by the birds; and, in any case, before incubation is completed these rejectamenta accumulate so as to form a pretty cup-shaped structure that increases in bulk after the young are hatched, but, mixed with their fluid excretions and with decaying fishes brought for their support, soon becomes a dripping fetid mass.

The kingfisher is the subject of a variety of legends and superstitions, both classical and medieval. Of the latter one of the most curious is that having been originally, but the affinity it acquired its present bright colours by flying towards the sun on its liberation from Noah's ark, when its upper surface assumed the hue of the sky above it and its lower plumage was scorchèd by the heat of the setting orb to the tint it now bears. More than this, the kingfisher was supposed to possess many virtues. Its dried body would avert thunderbolts, and if kept in a wardrobe would preserve from moths the woollen stuffs wherein laid, or hung by a thread to the ceiling of a chamber would point with its bill to the quarter whence the wind blew. All readers of Orlando (Milan, bk. xi.) know how the faithful but unfortunate Ceyx and Alycone were changed into kingfishers—birds which bred at the winter solstice, when through the influence of Aeolus, the wind-god and father of the wind, all gales were hushed and the sea calmed so that their floating nest might ride uninjured over the waves during the seven proverbial “Halcyon days”; while a variant or further development of the fable assigned to the halcyon itself the power of quelling storms.

The common kingfisher of Europe is the representative of a well-marked family of birds, the Alcedinidae or Halcyonidae of ornithologists, which is, if not the most beautiful or the most interesting, one of the most industrious, of which thirty-one species are known, and divides into two sub-families, Alcedininae and Daceloninae, the one containing five and the other fourteen genera. With existing anatomical materials perhaps no better arrangement could have been made, but the method afterwards published by Sundevall (Tentamen, pp. 95, 96) differs from it not insconsiderably. Here, however, it will be convenient to follow Sharpe. Externally, which is almost all we can at present say, kingfishers present a great uniformity of structure. One of their most remarkable features is the development of their feet, and the separation of the third and fourth digits for the greater part of their length; while, as if still

KINGFISHER

is an industry of some importance in the United States, and in the East Indies the natives eat the animal and tip their lances and arrows with the caudal spine. They also use the hollow empty shell as a water-ladle or pan—hence the name “pan-fish” or “saucepan-crab” by which the animal is sometimes known. Fossil king-crabs have been recorded from strata of the Tertiary and Secondary epochs, and related but less specialized types of the same order are found in rocks of Palaeozoic age. Of these the most important are *Belinus* of the Carboniferous, *Protolimulus* of the Devonian, and *Hemiaspis* of the Silurian periods. These ancient forms differ principally from true king-crabs in having the segments of the opisthosoma or hinder half of the body distinctly defined instead of welded into a hexagonal shield.

(R. I. P.)

**KINGFISHER** (Ger. *Königsvogel*; Walloon *Roi-pêcheur*), the *Alcedo isipa* of ornithologists, one of the most beautiful and well-known of European birds, being found, though nowhere very abundantly, in every European country, as well as in North Africa and South-Western Asia as far as Sindh. Its blue-green back and rich chestnut breast render it conspicuous as it frequents the streams and ponds whence it procures its food, by plunging almost perpendicularly into the water, and emerging a moment after with the prey—whether a small fish, crustacean, or an aquatic insect—it has captured. In hard frosts it resorts

1 But more commonly called *Eisvogel*, which finds its counterpart in the Anglo-Saxon *Ivern* or *Izen*. 

1 In many of the islands of the Pacific Ocean the prevalent kingfisher is the object of much veneration.

3 A Monograph of the Alcedinidae or Family of the Kingfishers, by R. B. Sharpe, 4to (London, 1856-1871). Some important points were briefly noticed by Professor Cunningham (*Proc. Zool. Soc.*, 1870, p. 280).

4 The name of this latter sub-family as constituted by Sharpe would seem to be more correctly *Ceyxinae*—the genus *Ceyx*, found in 1801 by Lacépède, being the oldest included in it. The word *Ducelo*, invented by Leach in 1815, is simply an anagram of *Alcedo*, though of course without any etymological meaning, has been very generally adopted.
further to show the comparatively functionless character of these members, in two of the genera, Alcedo and Ceryle, the second digit is aborted, and the birds have but three toes. In most forms the bill does not differ much from that of the common Alcedo ispida, but in Syma its edges are serrated, while in Carcinetus, Dacelo and Melidora the maxilla is prolonged, becoming in the last a rather pronounced hook. Generally the wings are short and rounded, and the tail is in many forms inconspicuous; but in Tanyptera, one of the most beautiful groups, the middle pair of feathers is greatly elongated and spathulate, while this genus possesses only ten rectrices, all the rest having twelve. Sundevall relies on a character not noticed by Sharpe, and makes it the dividing line between the true kingfisher and the scops, which in one form a mantle, and in the other are so small as not to cover the back. The Alcedinidae are a cosmopolitan family, but only one genus, Ceryle, is found in America, and that extends as well over a great part of the Old World, though not into the Australian region, which affords by far the greater number both of genera and species, having no fewer than ten of the former and fifty-nine of the latter peculiar to it.1

In habits kingfishers display considerable diversity, though all, it would seem, have it in common to sit at times motionless on the watch for their prey, and, on its approach, to dart at it, seize it, and carry it off alive, and return to a perch where it may be conveniently swallowed. But some species, and especially that which is the type of the family, are not always content to await at rest their victim's showing itself. They will hover like a hawk over the waters that conceal it, and, in the manner already described, precipitate themselves upon it. This is particularly the way with those that are fishers in fact as well as in name; but no inconsiderable number live almost entirely in forests, feeding on insects, while reptiles furnish the chief sustenance of others. The last is characteristic of at least one Australian form, which manages to thrive in the driest districts of that country, where not a drop of water is to be found for miles, and the air is at times heated to a degree that is insupportable by most animals. The belted kingfisher of North America, Ceryle alcyon, is a characteristic bird of that country, though its habits greatly resemble those of the European species; and the so-called "laughing jackass" of New South Wales and South Australia, Dacelo gigas—with its kindred forms, D. leachi, D. cervina and D. occidentalis, from other parts of the country—deserve special mention. Attention must also be called to the speculations of Dr Bowdler Sharpe (op. cit.) and also to that of the late Sir R. Owen (Br. Foss. Mamm. and Birds, p. 554) from the Eocene of Shropshire. The very specimen said to have been previously placed by König (Icon. foss. sectiles, fig. 153) in the genus Alcedo, (A. N.)

KINGHORN, a royal and police burgh of Fifeshire, Scotland. Pop. (1901), 1550. It is situated on the Firth of Forth, 22 m. E. by N. of Brougham, on the North British railway. The public buildings include a library and town-hall. It enjoys some repute as a summer resort. The leading industries are ship-building, bleaching and the making of flax and glue. At the time of his visit Daniel Defoe found thread-making in Vogue, which employed the women while the men were at sea. Alexander III. created Kinghorn a burgh, but his connexion with the town proved fatal to him. As he was riding from Inverkeithing on the 12th of March 1286 he was thrown by his horse and fell over the cliffs, since called King's Wad End, a little to the west of the burgh, and killed. A monument was erected in 1887 to mark the supposed scene of the accident. The Witch Hill used to be the place of execution of those poor wretches. Kinghorn belongs to the Kirkcaldy district group of parliamentary burghs. At PETTYYCOUR, 1 m. to the south, is a good harbour for its size, and at Kinghorn Ness a battery has been established in connexion with the fortifications on Inchkeith. The hill above the battery was purchased by government in 1903 and is used as a point of observation. About 1 m. to the north of Kinghorn is the estate of Grange, which belonged to Sir William Kirkcaldy. INCHKEITH, an island in the fairway of the Firth of Forth, 2½ m. S. by E. of Kinghorn and 3½ m. N. by E. of Leith, belongs to the parish of Kinghorn. It has a north-westerly and south-easterly trend, and is nearly 1 m. long and ¾ m. wide. It is a barren rock, on the summit of which stands a lighthouse visible at night for 21 m. In 1881 forts connected by a military road were erected on the northern, western and southern headlands.

KINGLATE, ALEXANDER WILLIAM (1809–1891), English historian and traveller, was born at Taunton on the 9th of August 1809. His father, a successful solicitor, intended his son for a legal career. Kinglake went to Eton and Trinity College, Cambridge, where he matriculated in 1828, being a contemporary and friend of Tennyson and Thackeray. After leaving Cambridge he joined Lincoln's Inn, and was called to the bar in 1837. While still a student he travelled, in 1835, throughout the East, and the impression made upon him by his experiences was so powerful that he was seized with a desire to record them in literature. Etohun, a sensitive and witty record of impressions keenly felt, was published in 1834, and enjoyed considerable reputation. In 1834 he went to the Crimea, and was present at the battle of the Alma. During the campaign he made the acquaintance of Lord Raglan, who was so much attracted by his talents that he suggested to Kinglake the plan for an elaborate History of the Crimean War, and placed his private writers at the writer's disposal. For the rest of his life Kinglake was engaged upon the task of completing this monument history. Thirty-two years elapsed between its commencement and the publication of the last volume, and eight volumes in all appeared at intervals between 1863 and 1887. Kinglake lived principally in London, and sat in parliament for Bridgewater from 1857 until the disfranchisement of the borough in 1868. He died on the 2nd of January 1891. Kinglake's life-work, The History of the Crimean War, is in scheme and execution too minute and conscientious to be altogether in proportion, but it is a wonderful example of painstaking and talented industry. It is not without errors of partisanship, but it shows remarkable skill in the moulding of vast masses of despatches and technical details into an absorbingly interesting narrative; it is illumined by natural descriptions and character-sketches of great fidelity and truthfulness. It remained one of the most picturesque, most vivid and most successful pieces of historical narrative in the English language.

KINGLET, a name applied in many books to the bird called by Linnaeus Motacilla regulus, and by most modern ornithologists Regulus cristatus, the golden-crested or golden-crowned wren of ordinary persons. This species is the type of a small group which has been generally placed among the Sylviaeidae or true warblers, but by certain systematists it is referred to the titmouse family, Paridae. That the kinglets possess many of the habits and actions of the latter is undeniable, but on the other hand they are not known to differ in any important points of organization or appearance from the former—the chief distinction being that the nest is covered by a single brightly feather directed forwards. The golden-crested wren is the smallest of British birds, its whole length being about 3½ in., and its wing measuring only 2 in. from the carpal joint. Generally of an olive-green colour, the top of its head is bright yellow, deepening into orange, and banded on either side by a black line, while the wing coverts are dull black, and some of them tipped with white, forming a somewhat conspicuous bar. The cock has a pleasant but weak song. The nest is a beautiful object, thickly felted of the softest moss, wood, and spiders' webs, lined with feathers, and usually built under and near the end of the branch of a yew, fir or cedar, supported by the interweaving of two or three laterally diverging and pendent twigs, and sheltered by the rest. The eggs are from six to ten in number, of a dull white sometimes finely flecked with reddish-brown. The species is particularly social, living for the most part of the

year in family parties, and often joining bands of any species of titmouse in a common search for food. Though to be met with in Britain at all seasons, the bird in autumn visits the east coast in enormous flocks, apparently emigrants from Scandinavia, while hundreds perish in crossing the North Sea, where they are well known to the fisherman as "woodcock's pilots." A second and more local European species is the fire-crested wren, R. ignicapillus, easily recognizable by the black streak on each side of the head, before and behind the eye, as well as by the deeper colour of its crown. A third species, R. maderensis, inhabits the Madeiras, to which it is peculiar; and examples from the Himalayas and Japan have been differentiated as R. himalayensis. The North American well-known species, R. satrapa, very like the European R. ignicapillus, and the ruby-crowned wren, R. calendula, which is remarkable for a loud song that has been compared to that of a canary-bird or a skylark, and for having the characteristic nasal feather in a rudimentary or aborted condition. (A. N.)

KINGS, FIRST AND SECOND BOOKS OF, two books of the Bible, the last of the series of Old Testament histories known as the Earlier or Former Prophets. They were originally reckoned as a single book (Josephus; Origen a.p. Eus. H.E. vi. 25; Papias, though through the fault of an interpolation which is derived from the Septuagint. In that version, they are called the third and fourth books of "kingdoms" (βασιλείων), the first and second being our books of Samuel. The division into two books is not felicitous, and even the old Hebrew separation between Kings and Samuel must not be taken to mean that the history of the birth of Samuel to the exile was treated by two distinct authors in independent volumes. We cannot speak of the author of Kings or Samuel, but only of an editor or of successive editors whose main work was to arrange in a continuous form extracts or abstracts from earlier sources. The introduction of a chronological scheme and of a series of editorial comments and additions, chiefly designed to enforce the religious meaning of the history, gives a kind of unity to the book of Kings as we now read it; but beneath this we can still distinguish a variety of documents, which, though sometimes mutilated in the process of piecing together, retain sufficient individuality of style and colour to prove their original independence.

Of these documents one of the best defined is the vivid picture of David's court at Jerusalem (2 Sam. ix.—xx.) from which the first two chapters of 1 Kings may in part be reconstructed. As it would be unreasonable to suppose that the editor of the history of David closed his work abruptly before the death of the king, breaking off in the middle of a valuable memoir which lay before him, this observation leads us to conclude that the books of Samuel and Kings are not independent histories. They have at least one source in common, and a single editorial hand was at work on both. From an historical point of view, however, the division which makes the beginning of Solomon's reign the beginning of a new book is very convenient. The conquest of Palestine by the Israelite tribes is recounted in the book of Joshua, bears up to the era of the "judges" (Judg. ii. 6—23; iii. 9 sqq.), and the books of Samuel follow with the institution of the monarchy and the first kings. The books of Kings bring to a close the life of David (c. 975 B.C.), which forms the introduction to the reign of Solomon (1 Kings ii. 12—xi.), the troubles in which time prepared the way for the separation into the two distinct kingdoms, viz. Judah and the northern tribes of Israel (xii. sqq.). After the fall of Samaria, the history of these Israelites is rounded off with a review (2 Kings xvii.—xviii. 12). The history of the surviving kingdom of Judah is then traced down to the destruction of Jerusalem and the exile (5 and 6), and, after an account of the Chaldean government, concludes with the release of the captive king Jehoiachin (561 B.C.) and with an allusion to his kind treatment during the rest of his lifetime.

The most noticeable feature in the book is the recurring interest in the centralization of worship in the Temple at Jerusalem as prescribed in Deuteronomy and enforced by Josiah. Amidst the great variety in style and manner which marks the several parts of the history, features which are imbued with the teaching of Deuteronomy recur regularly in similar stereotyped forms. They point in fact to a specific redaction, and thus it would seem that the editor who, with the restoration of the Temple, the central event of Solomon's life, as a religious historian, placed the first importance, regarded this as the beginning of a new era—the history of Israel under the one sanctuary.

When we assume that the book of Kings was thrown into its present form by a Deuteronomistic redactor we do not affirm that he was the first who digested the sources of the history into a continuous work, nor must we ascribe absolute finality to his work. He gave the book a definite shape and character, but the recognized methods of the redactor, viz., the literary additions and modifications by later hands. Even the redaction in the spirit of Deuteronomy seems itself to have had more than one stage, as Ewald long ago recognized.

The evidence to be detailed presently shows that there was a certain want of definiteness about the redaction. The mass of disjointed materials, not always free from inconsistencies, which lay before the editor or the editors at the beginning of his work, are not yet arranged into a continuous work, nor yet is it clear that the redactor had in his mind any single final result.

(a) The continued efforts of successive redactors can be traced in the commentary on the history. The chronological method of the narrative appears most clearly in the history after Solomon, where the events of each king's reign are thrown into a kind of stereotyped framework on this type: "In the twelfth year of Jeroboam, king of Israel, Asa began to reign over Judah, and reigned in Jerusalem forty-one years." . . . "In the third year of Asa, king of Judah, Baasha began to reign over Israel in Tirzah twenty-four years." The history moves between Judah and Israel according to the date of the accession; as if the narrative formed a continuous historical scheme, and the events that happened in his reign is discussed, and wound up by another stereotyped formula as to the death and burial of the sovereign, and to this mechanical arrangement the natural connexion of events is often sacrificed. In this scheme the elaborate synchronisms between contemporary monarchs of the north and south give an aspect of great precision to the chronology. But in reality the data from Judah and Israel do not agree, and remarkable deviations are sometimes found. The key to the chronology is 1 Kings vi. 1, which, as Wellhausen has shown, was not found in the original Septuagint, and contains internal evidence of post-Chaldean date. In one system and another the first fixed point from which it counts back, and although the numbers for the duration of the reigns may be based upon early sources, the synchronisms appear to have been inserted at a much later stage in the narrative of the text.

(b) Another aspect in the redaction may be called theological. Its characteristic is the retrospective application to the history of a standard framework belonging to the propagandists of Old Testament religion. Thus the redactor regards the sins of Jeroboam as the real cause of the downfall of Israel (2 Kings xvii. 21 seq.), and passes an unfavourable judgement upon all its rulers, not merely to the effect that they did evil in the sight of Yahweh but that they followed in the way of Jeroboam. But his opinion was manifestly not shared by Eliah or Elisha, nor by the original narrator of the lives of these prophets. Moreover, the redactor in 1 Kings seems to have retained the worship at the high places as sinful after the building of the Temple, although even the best kings before Hezekiah made no attempt to suppress these shrines. This feature in the redaction displays itself only in occasional omissions or humbler excursus, but in that part of the narrative in which all ancient historians allowed themselves free scope for the development of their reflections—the speeches placed in the mouths of actors in the history. Here there is often a redactional feature which is somewhat loosely attached to the earlier narrative and underwritten successive additions.

Consequently it is necessary to distinguish between the older sources and the peculiar setting in which the history has been placed; between earlier records and that specific colouring which, from its affinity to Deuteronomy and to other portions of the Old Testament which appear to have been similarly treated under the influence of its teaching, may be conveniently termed "Deuteronomistic." For
his sources the compiler refers chiefly to two distinct works, the "words or chronicles" of the kings of Israel and those of the kings of Judah. Precisely how much is copied from these works and how much has been expressed in the compiler's own language is of course uncertain. It is found on inspection that the present history consists usually of an epitome of each reign. It states the king's age at succession (so Judah only), length of reign, death and burial, with allusions to his buildings, wars, and other political events. In the case of Judah, also, the name of the royal or queen-mother is specifically mentioned. The references to the respective "chronicles," made as though they were still accessible, are wanting in the case of Jehoram and Hoshea of Israel, and of Solomon, Ahaziah, Athaliah, and Ahab of Judah. But for Solomon the authority cited, "book of the acts of Solomon" (1 Kings xi. 41), presumably presupposes Judaean chronicles and the remaining cases preserve details of an annalistic character. Moreover, distinctive annalistic material is found for the Israelite kings Saul and Ishbosheth in 1 Sam. xiii.; xiv. 47-51; 2 Sam. ii. 8-10a (including even their age at accession), and for David in 2 Sam. ii. 11 and parts of v. and vii.

The use which the compiler makes of his sources shows that his aim is not the history of the past but its religious significance. It is rare that even qualified praise is bestowed upon the kings of Israel (Jehoram, 2 Kings ii. 2; Jehu x. 30; Hoshea xvii. 2). Kings of great historical importance are treated with extreme brevity (Omri, Jeroboam (2), Uzziah), and similar meagreness of historical information is apparent when the editorial details and the religious judgments are eliminated from the accounts of Nadab, Baasha, and the successors of Jeroboam (2) in Israel or of Abijam and Manasseh in Judah.

To gain a more exact idea of the character of the book we may divide it into three sections: (1) the life of Solomon, (2) the kingdoms of Ephraim (or Samaria) and Judah, and (3) the separate history of Judah after the fall of Samaria. I. Solomon.—The events which lead up to the death of David and the accession of Solomon (1 Kings i., ii.) are closely connected with 2 Sam. ix.-xx. The unity is broken by the appendix 2 Sam. xxi.-xxiv. which is closely connected, as regards general subject-matter, with ibid. v.-viii.; the literary questions depend largely upon the structure of the books of Samuel (q.v.). It is evident, at least, that either the compiler drew upon other sources for the occasion and has amalgamated them, or less briefly elsewhere, or that these episodes have been supplemented by the later insertion of material not necessarily itself of late origin. At present 1 Kings i., ii. are both the close of David's life (no source is cited) and the necessary introduction to Solomon. But Lucian's recession of the Septuagint (ed. Lagarde), as also Josephus, begin the book at ii. 12, thus separating the annalistic accounts of the two. Since the contents of 1 Kings iii.-xi. do not form a continuous narrative, the compiler's authority ("Acts of S." xi. 41) can hardly have been an ordinary chronicle. The chapters comprise (a) sundry notices of the king's prosperous and peaceful career, severed by (b) a description of the Temple and other buildings; and they conclude with (c) some account of the external troubles which prove to have unsettled the whole of his reign. After an introduction (iii.), a contains generalizing statements of Solomon's might, wealth and wisdom (v. 20 seq., 25, 29-34; x. 23-25, 27) and stories of a distinctly late and popular character (iii. 16-28, x. 1-10, 13). The present lack of unity can in some cases be remedied by the Septuagint, which offers many deviations from the Hebrew text; this feature together with the present form of the parallel texts in Chronicles will exemplify the persistence of fluctuation to a late period (4th-2nd cent. B.C.).

Thus iii. the same name is used r. 4, and v. 2 is parallel to later Deut. gloss upon r. 3 (earlier Deut.), which represents the compiler's view and (on the analogy of the framework) comes closely after ii. 12. Ch. iii. 1 can scarcely be severed from ix. 16, 17 (some suggestions in connection with historical criticism are mentioned in the later Septuagint, 1 Kings iv. 26-29, 33-34 (officers), 27 seq. (their duties), 22-24 (the daily provision), 29-34 (Solomon's reputation), iii. 1; ix. 16-17a (alliance with Egypt); iv. 20 seq. 25 are of a generalizing character and recur in the Septuagint (so the compiler's text is particularly related to x. 26 (cf. 2 Chron. i. 14) and takes its place in Lucian's recension (cf. 2 Chron. ix. 25). There is considerable variation again in ix. 10-15, 29-30 and 30-31. The whole of Ch. iv. 25 has the advantage of recording continuously Solomon's dealings with Hiram. The intervening verses belong to a class of floating notices (in a very unnatural order) which seem to have got stranded by the way, e.g. the several accounts in the two recensions contrast also 2 Chron. viii. Solomon's preliminary arrangements with Hiram in ch. v. have been elaborated to emphasize the importance of the Temple (v. 3-5, cf. 2 Sam. vii.); further difficulty is caused by the relation between 13 seq. and 14 seq. (see 2 Chron. ii. 17 seq.) and between both of these and ix. 20 seq. xi. 28. The account of the royal buildings now sandwiched in between the related fragments of a is descriptive rather than narrative, and the accurate details might have been obtained by actual observation of the Temple at a date long subsequent to Solomon. It is not all due to a single hand, Ch. vii. 11-15 (with several late phrases) break the connexion and are certainly posterior (cf. 1 Kings x. 22), notably the description of the Temple in its two conspicuous parts (Solomon's portion), a simple and intelligible form in the Septuagint. The account of the dedication contains many signs of a late date; xvii. 14-53, 54-61 are due to a Deuteronic writer, and that the temple was dedicated by the fact that the ancient fragment, vi. 12, 13 (imperfect in the Hebrew) appears in the Septuagint after viii. 53 in complete form and with a reference to the book of Psalms. The verse (52) immediately following the traditional insertion displaced it in one recension and led to its mutilation in the other. With vii. 27-30, cf. generally Is. xlvi.-lxi.; vi. 44-51 presuppose the exile, vi. 51-Cf. are wanting in Chron., and even the latter parts of this chapter have also been reclothed in conformity with later (even post-exilic) ritual and law. The Levites who appear at v. 4 in contrast to the priests, in a way unknown to the pre-exilic history, are not named in the Septuagint, which also omits the post-exilic "congregation" ("community") in v. 5. There is a general similarity of subject with Deut. xxviii.

The account of the end of Solomon's reign deals with (a) his religious laxity (xi. 1-13, now in a Deuteronomic form), as the punishment for which the separation of the two kingdoms is announced; and (b) the rise of the adversaries who, according to xi. 23, had troubled the whole of his reign, and therefore cannot have been related originally as the penalty for the sins of his old age. Both, however, form an introduction to subsequent events, and the life of Solomon concludes with a brief annalistic notice of Seba's arrival and the length of Solomon's reign, successor, and place of burial. (See further Solomon.)

II. Ephraim and Judah.—In the history of the two kingdoms the redactor follows a fixed scheme determined, as has been seen, by the order of succession. The fluctuation of tradition concerning the circumstances of the schism is evident from a comparison with the Septuagint, and all that is related of Ahijah falls under suspicion of being foreign to the oldest history. The story of the man of God from Judah (xiii.) is shown to be later by its general tone (conceptions of prophetism and revelation), and by the term "cities of Samaria" (v. 32, for Samaria as a province, cf. 2 Kings xviii. 24, 26; for the building of the city by Omri see 1 Kings xvi. 24). It is a late Judaean narrative inserted after the Deuteronomic redaction, and

1 See art. JEROBOAM also W. R. Smith, Old Test. in Jen. Church, pp. 177 sqq.; H. Winckler, Altes. Untersuchungen, pp. 1 sqq., and Recent Historical Criticism, p. 71, n. 2. J. Skinner (Kings, pp. 443 sqq.) and Ed. Meyer (Israeliten u. Nachbarstämme, pp. 357 sqq.)

2 Here and elsewhere a careful study (e.g. of the marginal references in the Revised Version) will prove the close relation between the "Deuteronomic" passages and the book of Deuteronomy itself in determining the meaning of this upon the traditional date of that book should not be overlooked.
breaks the connexion between xii. 31 and xiii. 33 seq. The latter describe the idolatrous worship instituted by the first king of the schismatic north, and the religious attitude occurs regularly throughout the compiler's epitome, however brief the reigns of the kings. In the account of Nadab, xv. 25 seq., 26b, 30 seq. are certainly the compiler's, and the synchronism in v. 28 must also be editorial; xv. 32 (Septuagint omit) and 16 are duplicates leading up to the Israëlite and Judaean accounts of Baasha respectively. But xv. 33-xvi. 7 contains little relevant information, and the prophecy in xvi. 1-4 is very similar in the two groups. Then in turn, when the connexion between vv. 6 and 7, Ch. xvi. 7 is a duplicate to vv. 1-4 and out of place; the Septuagint inserts it in the middle of v. 8. The brief reign of Elah preserves an important extract in xvi. 9, but the date in v. 10 (LXX omits) presupposes the late finished chronological scheme. Zimri's seven days receive the inevitable condemnation, but the other material embedded in the framework (xvi. 15b-18) is closely connected with v. 9 and is continued in the non-editorial portions of Omri's reign (xvi. 21 seq., length of reign in v. 25, and v. 24). The achievements of Omri to which the editor refers can fortunately be gathered from external sources (see infra). Under Omri's son Ahab the separate kingdoms converge.

Next, as to Judah: the vivid account of the accession of Rehoboam in xii. 1-16 is reminiscent of the full narratives in 2 Sam. ix.-xx.; 1 Kings i., ii. (cf. especially v. 16 with 2 Sam. x. 1); xii. 15b refers to the prophecy of Abijah (see above), and "unto this day," v. 19, cannot be by a contemporary author; v. 17 (LXX omits) forms a parallel in 2 Chron. xi. 16 seq. and could represent an Ephraimite standpoint. The Judaean standpoint is prominent in vv. 21-24, where (a) the inclusion of Benjamin and Judah in the list of kings (15b above); and (b) the contrast in Judah and Shemariah conflict with (a) xi. 32, 36, xii. 20 and (b) xiv. 39 respectively. Rehoboam's history, resumed by the redactor in xiv. 21-24, continues with a brief account of the spoiling of the Temple and palace by Sheshonk (Shishak). (The incident appears in 2 Chron. xii. in a rather different context before the details which now precede v. 21 seq.) The reign of Abijam is entirely due to the editor, whose brief statement of the war in xv. 7b is supplemented by a lengthy story in 2 Chron. xiii. (where the name is Abijah). Ch. xv. 5b (last clause) and 6 are omitted by the Septuagint, the former is a unique gloss (see 2 Sam. xi. seq.), the latter is a mere repetition, with xvi. 2 cf. v. 10. The account of Asa's long reign contains a valuable summary of his war with Baasha, xv. 16-22; the isolated v. 15 is quite obscure and is possibly related to v. 18 (but cf. v. 51). His successor Jehoshaphat is now dealt with, completely in xiiii. 41-50 after the death of Ahab; but the Septuagint, which follows a different chronological scheme (placing his accession in the reign of Omri), gives the summary (with some variations) after xvi. 28. Another light is thrown upon the incomplete annalistic fragments (xiiii. 44, 47-49) by 2 Chron. xx. 35-37; the friendship between Judah and Israel appears to have been displeasing to the redactor of Kings.

The history of the few years between the close of Ahab's life and the accession of Jehu covers about one-third of the entire book of Kings. This is due to the inclusion of a number of narratives which are partly of a more supernatural additions have been compared with the late story in 1 Sam. xiv. 18-24. The accession of Eliah (2 Kings ii. 7 seq.) concerns the introduction of the new work of Elisha, which apparently begins before the death of Jehoshaphat (see xiiii. 1 seq., contrast 2 Chron. loc. cit.). Among the stories of Eliah which is found in the prophetic gilds (iv. 1, 38-44, vi. 1-7), whilst in others he has friendly relations with the king of Israel (2 Kings x. 35). As a person of almost superhuman dignity he moves in certain narratives where political records appear to have been used to describe the activity of the prophet. The Moabite campaign (iii.) concerns a revolt already referred to in the isolated i. 11; there are parallels with the story of Jehoshaphat and Ahab (iii. 7, 11 seq. cf. 1 Kings xvi. 4 seq., 7 seq.), contrast, however, xiiii. 7 (where Eliah is not even named) and iii. 11 seq. But Jehoshaphat's death has been already recorded (1 Kings xxii. 50), and, while Lucian's recension in 2 Kings iii. reads Ahabiah, i. 17 presupposes the accession of the Judaean Jehoram. Other political narratives may underlie the stories of the wars of the north against the Ammonites (xv. 1 seq.) and complete cessation of hostilities in vi. 23 compare the general style of 1 Kings xxii., xvi.; with the same pattern in Samaria, vi. 25; cf. ibid. xxi.; with the victory, cf. ibid. xx. The account of Eliah and Hazael (vii. 1 seq.) implies (in connexion with Damascas (v. 12 the terrors of war are in the future), but the description of Jehu's accession (iv.) in the midst of hostilities. Ch. ix. 7-10 are a Deuteronomism insertion amplifying the message in v. 3-6 (cf. 1 Kings xvi. 20 seq.) The origin of the repetition in ix. 14-15 (cf. viii. 28 seq.) is not clear. The oracle in ix. 25 seq. is not that in v. 15 seq., and mentions the additional detail that Naboth's sons were slain. Here his field is prepared and then located on the east border of the land, with the command that the land be divided among the king's officers. To the immediate king, viz. the war against the Aramaeans at Ramoth-Gilead (a) by Jehoshaphat and Ahab, and (b) by Ahabiah and Jehoram, in each

The division of the two books at this point is an innovation first made in the LXX. and Vulgate.
In the annals of Jehu's dynasty the editorial introduction to Jehu himself is wanting (x. 32 seq.), although Lucian's recession in x. 36 concludes in annalistic manner the lives of Jehoram of Israel and Ahaziah of Judah. The summary mentions the beginning of the Arabanah dynasty the conclusion of which is found in the redactor of the account of his sons' reigns (xii. 1-9).

But xii. 4-6 modify the disasters, and by pointing to the 'saviour' or deliverer (cf. Judg. iii. 9, 15) anticipate xiv. 27. The self-contained account of his son Jehoash (xii. 10-13) is superseded (a) by the story of the death of Elisha (xv. 4-21) and (b) by some account of the Arabanah wars (xv. 22-25), where v. 23, like v. 4-6 (Lucian's recession actually reads it after v. 7), is noteworthy for the sympathy towards the northern kingdom. Further (c) the defeat of Amaziah of Judah appears in xii. 14-14 after the annals of Judah, although from an Israelite source (xii. 16) Amaziah is defined as belonging to Judah, see also x. 15, and with the repetition of the Old Testament statements in x. 15 seq., see xii. 12 seq.). These features and the transference of xii. 12 seq. after xii. 25 in Lucian's recession point to late adjustment. In Judaean history, Jehu's reform and the overthrow of Jezabel in the north (ix. x. 15-28) find their counterpart in the murder of Athaliah and the destruction of the temple of Baal in Judah (xi. 18). But the framework is incomplete. The editorial conclusion of the reign of Ahaziah, the introduction to that of Athaliah, and the sources for both are wanting. A long Judaean document is incorporated detailing the accession of Joash and the consecration of the young introduced priest Jehoiada. The interest in the Temple and temple-procedure is obvious; and both xi. and xii. have points of resemblance with xii. seq. (see below and cf. also xi. 4, 7, 11, 19, with 1 Kings xiv. 27 seq.).

The usual epitome is found in xii. 21-xii. 3 (the age at accession should follow the synchronism, so Lucian), with fragments of annalistic matter in xii. 17-21 (another version in 2 Chron. xxiv. 23 seq.). For Joash's son Amaziah see above; xiv. 6 refers to Deut. xxiv. 16, and 2 Chron. xxiv. 16 replaces v. 7 by a lengthy narrative with some interesting details. Amaziah is briefly summarized in xv. 1-7, hence the notice in xiv. 22 seems out of place; perhaps the usual statements of Amaziah's death and burial (cf. xiv. 26b, 28b), which were to be expected after v. 18, have been supplemented by the account of the rebellion (v. 19, 201, 21).1 The chronological notes for the accession of Azariah imply different views of the history of Judah after the defeat of Amaziah; with xiv. 17, cf. xiii. 10, xiv. 2, 23, but contrast xiv. 1, and again v. 8.2

The important reign of Jeroboam (2) is dismissed as briefly that of Azariah (xv. 23-29). The end of the Arabanah war presupposed by v. 25 is supplemented by the sympathetic addition in x. 26 seq. (cf. xiii. 23 seq.). Of his successors Zachiath, Shallum and Menahem only the briefest records remain, now imbedded in the editorial framework (xv. 8-23). The summary of Pekah (perhaps the same as Pekahiah, the confusion being due to the compiler) contains excerpts which form the continuation of the older material in v. 25 (cf. also vv. 10, 14, 16, 19, 20). For an apparently similar adjustment of an earlier record to the framework see above on 1 Kings xv. 25-31, xvi. 8-25. The account of Hoshea's conspiracy (xv. 29 seq.) gives the Israelite version with which Tlgith-Pileser's own statement can now be compared. Two accounts of the fall of Samaria are given, one of which is under the reign of the contemporary Judaeans

1 Both xiv. 22 and xv. 3 presuppose fuller records of which 2 Chron. xxvi. 6-7, 16-20 may represent mostly later and less trustworthy versions.

2 See F. Ruhl, Deutsche Zeit., Geschichtswiss. xiii. 54 sq.; also Jews: History, § 12.
KINGS, BOOKS OF

The anonymous notice in xxiii. 29 seq. (contrast xxii. 29) should precede v. 28; 2 Chron. xxv. 20-27 gives another version in the correct position and ignores 2 Kings xxiii. 24-27 (see however the Septuagint). For the last four kings of Judah, the references to the history at the beginning also are obliterated by Josiah, who is wanting, and the literary source is only cited for Jehoiachin; xxiv. 3 seq. (and probably v. 2), which treat the fall of Judah as the punishment of Jehoiachin's sin. The Deuteronomic introduction (2 Chron. xxxvi. 6 seq.) differs widely; see, however, the Septuagint; v. 13 seq. and v. 15 seq. are duplicates. With xxiv. 18-xxv. 21 cf. Jer. lii. 1-27 (the text of the latter, especially vv. 19 seq. is superior); and the fragments in ibid. xxxix. 1-10, Ch. xxv. 22-26 appears in much fuller form in Jer. xl. seq. (see xi. 7-9, xii. 1-3, 17 seq.). It is noteworthy that Jeremiah does not enter into the history in Kings (contrast Isaiah above). The book of Chronicles in general has a brief reference to these places, and in particular the post-exilic annals. They also appear in Jeremiah and the concluding hopeful note struck by the restoration of Jehoiachin (xxv. 27-30). This last, with the addition of statistical data, forms the present conclusion also of the book of Jeremiah.

Conclusions.—A survey of these narratives as a whole strengthens our impression of the merely mechanical character of the redaction by which they are united. Though editors have written something of their own in almost every chapter, generally from the standpoint of religious pragmatism, there is not the least attempt to work the materials into a history in our sense. But in particular the post-exilic annals, of which the histories are practically independent, being merely pieced together in a sort of mosaic in consonance with the chronological system, which we have seen to be really later than the main redaction. It is very probable that the order of the pieces was considerably readjusted by the author of the chronology; of this indeed the Septuagint still shows traces. But with all its imperfections as judged from a modern standpoint, the redaction has the great merit of preserving material nearer to the actual history than would have been the case had narratives been rewritten from much later annals. More often in the book of Chronicles questions of date and of the growth of the literary process are still unsettled, but it is clear that there was an independent history of (north) Israel with its own chronological scheme. It was based upon annals and fuller political records, and at some period apparently passed through circles where the purely domestic stories of the prophets (Elisha) were current.1 This was ultimately taken over by a Judaeanic editor who was under the influence of the far-reaching reforms ascribed to the 18th year of Josiah (642 B.C.). Certain passages seem to imply that in his time the Temple was still standing and the Davidic dynasty not altogether destroyed. Also the annals sometimes apparently presuppose a pre-exilic date. On the other hand, the history is carried down to the end of Jehoiachin's life (xxv. 27 refers to his fifty-fifth year, vv. 29 seq. look back on his death), and a number of allusions point decisively to the post-exilic period. Consequently, most scholars are agreed that an original pre-exilic Deuteronomic compilation made shortly after Josiah's reforms received subsequent additions from a later Deuteronomic writer.

These questions depend upon several intricate literary and historical problems. At the outset (a) the compiler deals with history from the Deuteronomic standpoint, selecting certain notices and referring further to separate chronicles of Israel and Judah. The canonical book of Chronicles refers to such a combined work, but is confined to Judah; it follows the religious judgment passed upon the kings, but it introduces new details apparently derived from extant annals, replacing the annalistic excerpts found in Kings by other passages, or uses new narratives which at times are clearly based upon older sources. Next (b) the Septuagint proves that Kings did not reach present form till a very late date; "a book represents a stage and not always the same stage in the long protracted labours of the redactors" (Kuenen).2 In agreement with this are the unambiguous indications of the post-exilic age (especially in the LXX. of Kings is not a corrupt reproduction of the Hebrew receive... For, among other considerations, such a recension can claim absolute superiority. The defects of the LXX. lie on the surface, and are greatly aggravated by the condition of the Greek text, which has suffered much in transmission, and in the Judæan history) consisting of complete passages, obvious interpolations, and also sporadic phrases in narratives whose pre-exilic origin is sometimes clear and sometimes only to be presumed. Further (c), the Septuagint supports the independent conclusion that the elaborate synchronisms belong to a late stage in the redaction. Consequently it is necessary to allow that the previous arrangement of the material may have been different; the actual wording of the introductory notices was necessarily also affected. In general, it becomes ever more difficult to distinguish between passages incorporated by an early redactor and those which may have been inserted later, while in the case of Kings the original material may have been disturbed and the redaction was enlivened to a greater extent, and those who have reference to the affairs of the Temple. This suggests a connexion between the chronology and the incorporation of those narratives in which the Temple is clearly the centre of interest. (d) But, apart from the question of the origin of the more detailed Judæan records, the arguments for a pre-exilic Jewish Deuteronomic compilation are not quite decisive. The phrase "unto this day" is not necessarily valid (cf. 2 Chron. v. 9, vii. 5, xx. 10 with 1 Kings viii. 8, ix. 21, 2 Kings vii. 29), and depends largely upon the compiler's sagacity. Also, it is impossible to find the Deuteronomic origins of (1) Kings vii. 10; (2) Kings viii. 19; (3) Kings xi. 4; (4) Kings xii. 19; (5) Kings xiii. 10; (6) 2 Chron. xii. 15-23; ix. 3; xi. 35-38; xv. 4; 2 Kings vii. 19; cf. 2 Chron. xiii. 5) is equally applicable to the time of the second temple when Zerubbabel, the Davideic representative, kindled new hopes and aspirations. Indeed, if the object of the Deuteronomic compiler is to show from past history that "the sovereign is responsible for the purity of the national religion" (Moore, Ercy. Bib. col. 2109), a date somewhere after the death of Jehoiachin (released in 651 in the age of Zerubbabel and the new Temple equally satisfies the conditions. With this in mind (f) the question whether, on historical grounds, the account of the restoration of the Temple is really by Josiah is trustworthy.4 Moreover, although a twofold Deuteronomic redaction of Kings is generally recognized, the criteria for the presumably pre-exilic form are not so decisive as those which certainly distinguish the post-exilic portions, and it is frequently very difficult to assign Deuteronomic passages to the earlier rather than to the later. Again, apart from the contrast between the Israelite detailed narratives (relatively early) and those of Judahian origin (rarely secondary), it is noteworthy that the sympathetic treatment of northern history in 2 Kings xiii. 4 seq. 23, xiv. 26 has literary parallels in the Deuteronomic redaction of Judges (where Israelite tradition is again predominant), but is quite distinct from the hostile feeling to the north which is also Deuteronomic. Even the northern prophet Hosea (q.v.) approximates the Deuteronomic standpoint, and the possibility that the first Deuteronomic redaction of Kings could originate outside Judah is particularly has in many places been corrected after the later Greek versions that express the Hebræan receptus of the 2nd century of our era. Yet the LXX. not only preserves many good readings in 2 Kings which, though late, have been long and generally supported, but also renditions which correct the Hebrew text. Even the false readings of the Greek are instructive, for both recensions were exposed to competing influences of precisely the same kind "(W. R. Smith)."5

1 Cf. similarly the prophetic narratives in the books of Samuel (q.v.).

2 See W. R. Smith, Journal of Philology, x. 200 seq.; Prophets of Israel, p. 147 seq.; and K. Marti, Ency. Bib. art. "Chronology." Against the distortions of the documentary hypothesis, Smith has observed that the redaction at the hand of successive editors or copies of which the extant Hebrew of Kings is the outcome. Even the false readings of the Greek are instructive, for both recensions were exposed to competing influences of precisely the same kind "(W. R. Smith)."

3 cf. W. E. Addis, Documents of the Exile, ii. 2 seq.; but the whole question has been reopened by E. Day (loc. cit., above) and R. H. Kennett (Journ. Theol. Stud., July 1960, 481 sqq.).
strengthened by the fact that an Israelite source could be drawn upon for an impartial account of Judaean history (2 Kings xvi. 13–15). The conflict of the two historical problems some converge. Although Judaean writers ultimately rejected as heathen a people who could claim to be followers of Yahweh (Eza iv. 2; 2 Kings xvii. 28, 33; contrast ibid, 34–40, a secondary insertion), the anti-Samaritan feeling had previously been at most only in an incipient stage, and there is reason to infer that relations between the peoples of north and south had been closer.\footnote{1} The book of Kings reveals changing historical conditions in its literary features, and it is significant that the very age where the background is to be sought is that which has been considered one of the most superficial — most chronicle, as the history of the Judaean monarchy (Chron. — Ezra—Nehemiah), as any comparison will show, has its own representation of the course of events, and has virtually superseded both Kings and Chronicles, which have now an abrupt conclusion. (See further S. A. Cook, *Jew. Q. Rev* (1907), pp. 158 sqq.; and the articles on Jews: *History*, §§ 20, 22; Palestine: *History*).

**KING’S BENCH, COURT OF,** in England, one of the superior courts of common law. This court, the most ancient of English courts — in its correct legal title, "the court of the king before the king himself," *coram ipso rege* — is far older than parliament itself, for it can be traced back clearly, both in character and in the essence of its jurisdiction, to the reign of King Alfred. The king’s bench, and the two offshoots of the *aula regia*, the common pleas and the exchequer, for many years possessed co-ordinate jurisdiction, although there were a few cases in which each had exclusive authority, and in point of dignity precedence was given to the court of king’s bench, the lord chief justice of which was also styled lord chief justice of England, being the highest paid man in the realm. The judges exercised at times over the revenue, the common pleas to private actions between citizens, and the king’s bench retained criminal cases and such other jurisdiction as had not been divided between the other two courts. By an act of 1830 the court of exchequer chamber was constituted as a court of appeal for errors in law in all three courts. Like the court of exchequer, the king’s bench assumed by means of an ingenious fiction the jurisdiction in civil matters which properly belonged to the common pleas.

Under the Judicature Act 1873 the court of king’s bench became the king’s bench division of the High Court of Justice. It consists of the lord chief justice and fourteen puisne judges. It exercises original jurisdiction and also appellate jurisdiction from the county courts and other inferior courts. By the act of 1873 (sec. 45) this appellate jurisdiction is conferred upon the High Court generally, but in practice it is exercised by a divisional court of the king’s bench division only. The determination of such appeals by the High Court is final, unless leave to appeal is given by the court which heard the appeal or by the court of appeal. There was an exception to this rule as regards certain orders of quarter sessions, the history of which involves certain curious problems. Finally by sec. 1 (5) of the Court of Session Act 1894 some of the rules applies to all cases where there is a right of appeal to the High Court from any court or person. It may be here mentioned that if leave is given to appeal to the court of appeal there is a further appeal to the House of Lords, except in bankruptcy

There are masters in the king’s bench division. Unlike the masters in the chancery division, they have original jurisdiction, and are not attached to any particular judge. They hear applications in chambers, act as taxing masters and occasionally as referees to conduct inquiries, take accounts, and assess damages. There is an appeal from the master to the judge in chambers. Formerly there was an appeal from the judge to the divisional court in every case and thence to the court of appeal, until the multiplication of appeals in small interlocutory matters became too great a scandal. Under the Supreme Court of Judicature (Procedure) Act 1894 there is no right of appeal to the court of appeal in any interlocutory matters (except those mentioned in subs. (b)) without the leave of the judge or of the court of appeal, and in matters of "practice and procedure" the appeal lies (with leave) directly to the court of appeal from the judge in chambers.

**KINGSBRIDGE,** a market town in the Totnes parliamentary division of Devonshire, England, 48 m. S.S.W. of Exeter, on a branch of the Great Western railway. Pop. of urban district (1901), 3247. It lies on the English Channel, at the head of an estuary or estuary which receives only small streams, on a sharply sloping site. The church of St. Edmund is a Perpendicular church, but there are Transitional Norman and Early English portions. The town-hall contains a natural history museum. A house called Pindar Lodge stands on the site of the birthplace of John Wyclif ("Peter Pindar," 1738–1819). William Cookworthy (1705–1780), a porcelain manufacturer, the first to exploit the deposits of kaolin in the south-west of England, was also born at Kingsbridge. The township of Dodbrooke, included within the civil parish, adjoins Kingsbridge on the north-west; some iron-foundering and ship-building, with a coasting trade, are carried on.

Kingsbridge (Kyngebriggge) was formerly included in the manor of Churchstow, the first trace of its separate existence being found in the Hundred Roll of 1276, which records that in the manor of Churchstow there is a new borough, which has a Friday market and a separate assize of bread and ale. The name Kingsbridge however does not appear till half a century later. When Kingsbridge became a separate parish is not certainly known, but it was before 1414 when the church was rebuilt and consecrated to St. Edmund. In 1617 the abbot of Buckfastleigh obtained a Saturday market at Kingsbridge and a three-days fair at the feast of St. Margaret, both of which are still held. The manor remained in possession of the abbot until the Dissolution, when it was granted to Sir William Petre. Kingsbridge was never represented in parliament or incorporated by charter, the government being by a portreeve, and down to the present day the steward of the manor holds a court leet and court baron and appoints a portreeve and constables. In 1798 the town mills were converted into a woollen manufactory, which up to recent times produced large quantities of cloth, and the serge manufacture was introduced early in the 19th century. The town has been famous from remote times for its beverage called "white ale." Included in Kingsbridge is the little town of Dodbrooke, which at the time of the Domesday Survey had a population of 42, and a flock of 108 sheep and 27 goats; and in 1257 was granted a Wednesday market and a fair at the Feast of St Mary Magdalene.

See "Victoria County History" : Devonshire: Kingsbridge and Salcombe, with the Intermediate Estuary, historically and topographically described (Kingsbridge, 1893); S. F. Fox, *Kingsbridge Estuary* (Kingsbridge, 1864).
boundary between King's County and Queen's County, and run into the former county from south-west to north-east for a distance of about 20 m. consisting of a mass of lofty and precipitous crags through which there are two narrow passes, the Black Gap and the Gap of Gländine. In the north-east Croghan Hill, a beautiful green eminence, rises to a height over 700 ft. The remainder of the county is flat, but a range of low hills crosses its north-eastern division to the north of the Barrow. In the centre of the county from east to west a large portion is occupied by the Bog of Allen. The county shares in the advantage of the navigation of the Shannon, which skirts its western side. The Barrow and its tributaries empty into Loch Farrell in Westmeath, but as it enters the county near the town of Clara, and flowing south-westwards across its north-west corner, discharges itself into the Shannon after receiving the Clodagh and the Broughill. A small portion of the north-eastern extremity is skirted by the upper Boyne. The Barrow forms the south-eastern boundary with Queen's County. The Little Brosna, which rises in the Slieve Bloom Mountains, forms the boundary of King's County with Tipperary, and falls into the Shannon.

This county lies in the great Carboniferous Limestone plain, with a slight upthrow upon its surface, and many drier deposits of esker-gravels rising as green hills above the general level. The Slieve Bloom Mountains, consisting of Old Red Sandstone with Silurian inliers, form a bold feature in the south. North of Phlipstown, the prominent mass of Croghan Hill is formed of basic volcanic rocks contemporaneous with the Carboniferous Limestone, and comparable with those in Co. Limerick. Notwithstanding the large area occupied by bogs, the climate is generally healthy, and less moist than that of several neighbouring districts. The whole of the county would appear to have been covered formerly by a vast forest, and the district bordering on Tipperary is still richly wooded. The soil naturally is not of great fertility except in special cases, but is capable of being rendered so by the judicious application of bog and lime manures according to its special defects. It is generally either a deep bog or a shallow gravelly loam. On the borders of the Slieve Bloom Mountains there are some very rich and fertile pastures, and there are also extensive grazing districts on the pastures of Westmeath, which are chiefly occupied by sheep. Along the banks of the Shannon there are some fine tracts of meadow land. With the exception of the tract occupied by the Bog of Allen, the remainder of the county is nearly all under tillage, the most productive portion being that to the north-west of the Hill of Croghan. The percentage of tillage to pasture is roughly as 1 to 24. Oats, barley and rye, potatoes and turnips, are all considerably grown; wheat is almost neglected, and the acreage of all crops has a decreasing tendency. Cattle, sheep, pigs and poultry are bred increasingly; dairy cows are numerous in the north of the county, and the sheep are pastured chiefly in the hilly districts.

The county is traversed from S.E. to N.W. by the Portratlington, Tullamore, Clara and Athlone line of the Great Southern and Western railway, with a branch from Clara to Banagher; from Roscrea (Co. Tipperary) a branch of this company runs to Parsonstown (Birr); while the Midland Great Western has branches from its main line from Enfield (Co. Kildare) to Edenderry, and from Streamstown (Co. Westmeath) to Clara. The Grand Canal runs through the length of the county from east to west, entering the Shannon at Shannon harbour.

The population (65,563 in 1891; 66,187 in 1901), decreasing through emigration, includes about 89% of Roman Catholics. The decrease is rather below the average. The chief towns are Tullamore (the county town, pop. 4693) and Birr or Parsonstown (4438), with Edenderry and Clara. Phlipstown near Tullamore was formerly the capital of the county and was the centre of the kingdom of Offaly. The county comprises 12 baronies and 46 civil parishes. It returns two members to parliament, for the Birr and Tullamore divisions respectively. Previous to the Union, King's County returned six members to parliament, two for the county, and two for each of the boroughs of Phlipstown and Banagher. Assizes are held at Tullamore and quarter sessions at Parsonstown, Phlipstown and Tullamore. The county is divided into the Protestant dioceses of Killaloe, Meath and Ossory; and the Roman Catholic dioceses of Ardagh, Kildare and Leighlin, Ossory and Clonfert.

King's County, with portions of Tipperary, Queen's County and Kildare, at an early period formed one kingdom under the name of Offaly, a title which it retained after the landing of the English. Subsequently it was known as Glennamally, Western Glennamally pretty nearly corresponding to the present King's County, and Eastern Glennamally to Queen's County. By a charter of 1236 the county was constituted a shire under the name of King's County in honour of Philip, consort of Queen Mary—the principal town, formerly the seat of the O'Connors, being called Phlipstown; and the eastern district at the same time received the name of Queen's County in honour of Mary. Perhaps the oldest antiquarian relic is the large pyramid of white stones in the Slieve Bloom Mountains called the Temple of the Sun or the White Obelisk. There are a considerable number of Danish roads, and a chain of moats commanding the passes of the bogs extended throughout the county. On the borders of Tipperary is an ancient causeway leading presumably to a crannog or lake dwelling. The most important ecclesiastical ruins are those of the seven churches of Clonmacnoise (g.v.) on the Shannon in the north-west of the county, where an abbey was founded by St Kieran in 648, and where the remains include those of churches, two round towers, crosses, inscribed stones and a castle. Among the more famous religious houses in addition to Clonmacnoise were Durrow Abbey, founded by St Columba in 590; Monasteroris founded in the 14th century by John Bermingham, earl of Louth; and Seirkyran Abbey, founded in the beginning of the 7th century. The principal old castles are Rathmore, probably the most ancient in the county; Banagher, commanding an important post on the Shannon; Leap Castle, in the Slieve Bloom Mountains; and Birr or Parsonstown, now the seat of the earl of Rosse.

KING'SOWN, THOMAS PEMBERTON LEIGH, BARON (1793-1867), the eldest son of Thomas Pemberton, a chancery barrister, was born in London on the 11th of February 1793. He was called to the bar at Lincoln's Inn in 1816, and at once acquired a lucrative equity practice. He sat in parliament for Rye (1831-1832) and for Ripon (1835-1843). He was a king's counsel in 1829. Of a retiring disposition, he seldom took part in parliamentary debates, although in 1838 in the case of Stock and Hansard he took a considerable part in upholding the privileges of parliament. In 1841 he accepted the post of attorney-general for the duchy of Cornwall. In 1842 a relative, Sir Robert H. Leigh, left him a life interest in his Wigan estates, amounting to some £15,000 a year; he then assumed the additional surname of Leigh. Having accepted the chancellorship of the duchy of Cornwall and a privy councilorship, he became a member of the judicial committee of the privy council, and for nearly twenty years devoted his energies and talents to the work of that body; his judgments, more in the duclary than in prize cases, of which he took especial charge, are remarkable not only for legal precision and accuracy, but for their form and expression. In 1858, on the formation of Lord Derby's administration, he was offered the Great Seal, but declined; in the same year, however, he was raised to the peerage as Baron Kingsdown. He died at his seat, Lorry Hill, near Sittingbourne, Kent, on the 7th of October 1867. Lord Kingsdown never married, and his title became extinct.

See Recollections of Life at the Bar and in Parliament, by Lord Kingsdown (privately printed for friends, 1868); The Times (8th of October 1867).

KING'S EVIL, an old, but not yet obsolete, name given to the scrofula, which in the popular estimation was deemed capable of cure by the royal touch. The practice of "touching" for the scrofula, or "King's Evil," was confined amongst the nations of Europe to the two Royal Houses of England and France. As the monarchs of both these countries owned the exclusive right of being anointed with the pure chrism, and not with the ordinary sacred oil, it has been surmised that the common belief in the sanctity of the chrism was in some manner inextricably connected
with faith in the healing powers of the royal touch. The kings both of France and England claimed a sole and special right to this supernatural gift: the house of France deducing its origin from Clovis (5th century) and that of England declaring Edward the Confessor the first owner of this virtue. That the Saxon origin of the royal power of healing was the popular theory in England is evident from the striking and accurate description of the ceremony in Macbeth (act vi. scene iii.). Nevertheless the practice of this rite cannot be traced back to an earlier date than the reign of Edward III. in England, and of St Louis (Louis IX.) in France; consequently, it is believed that the performance of healing by the touch of the king began with the consecration of the English King, whose miraculous powers were subsequently transmitted to his descendant and representative, Isabella of Valois, wife of Edward II. of England. In any case, Queen Isabella’s son and heir, Edward III., claimant to the French throne through his mother, was the first English king to order a public display of an attribute that had hitherto been associated with the Valois kings alone. From his reign dates the use of the “touch-piece,” a gold medal given to the sufferer as a kind of talisman, which was originally the angel coin, stamped with designs of St Michael and of a thistle and sword.

The actual ceremony seems first to have consisted of the sovereign’s personal act of washing the diseased flesh with water, but under Henry VII. the use of an ablation was omitted, and a regular office was drawn up for insertion in the Service Book. At the “Ceremonies for the Healing” the king now merely touched his afflicted subject in the presence of the court chaplain who offered up certain prayers and afterwards presented the touch-piece, pierced so that it might be suspended by a ribbon round the patient’s neck. Henry VII.’s office was henceforth issued with variations from time to time under successive kings, not that it disappeared from certain editions of the Book of Common Prayer until the middle of the 18th century. The practice of the Royal Healing seems to have reached the height of its popularity during the reign of Charles II., who is stated on good authority to have touched over 100,000 strumous persons. So great a number of applicants becoming a nuisance to the Court, it was afterwards enacted that special certificates should in future be granted to individuals demanding the touch, and such certificates are occasionally to be found amongst old parish registers of the close of the 17th century. After the Revolution, William of Orange refused to touch, and referred in 1688 to the French King James II. at St Germain; but Queen Anne touched frequently, one of her patients being Dr Samuel Johnson in his infancy. The Hanoverian kings declined to touch, and there exists no further record of any ceremony of healing henceforward at the English court. The practice, however, was continued by the exiled Stuarts, and was constantly performed in Italy by James Stuart, “the Old Pretender,” and by his two sons, Charles and Henry (Cardinal York).

(H. M. V.)

KINGSFORD, WILLIAM (1819–1898). British engineer and Canadian historian, was born in London on the 23rd of December 1819. He first studied architecture, but disliking the confinement of an office enlisted in the 1st Dragoon Guards, obtaining his discharge in Canada in 1841. After serving for a time in the office of the city surveyor of Montreal he made a survey for the Lachine canal (1846–1848), and was employed in the United States in the building of the Hudson River railroad in 1849, and in Panama on the railroad being constructed there in 1851. In 1853 he was surveyor and, afterwards district superintendent for the Grand Trunk railroad, remaining in the employment of that company until 1864. The following year he went to England but returned to Canada in 1869 in the hope of taking part in the construction of the Intercolonial Railway. In this he was unsuccessful, but from 1872 to 1879 he held a government post in charge of the harbours of the Great Lakes and the St Lawrence. He had previously written books on engineering and topographical subjects, and in 1880 he began to study the records of Canadian history at Ottawa. Among other books he published Canadian Archaeology (1886) and Early Bibliography of Ontario (1892). But the great work of his life was a History of Canada in 10 volumes (1887–1897), ending with the union of Upper and Lower Canada in 1841. Kingsford died on the 28th of September 1898.

KINGSLEY, CHARLES (1819–1875). English clergyman, poet and novelist, was born on the 12th of June 1819, at Holne vicarage, Dartmoor, Devon. His early years were spent at Barnack in the Fen country and at Clovelly in North Devon. The scenery of both made a great impression on his mind, and was afterwards described with singular vividness in his writings. He was educated at private schools and at King’s College, London, after his father’s promotion to the rectory of Cooling near Sandwich. He entered Jesus College, Cambridge, and in 1842 was ordained to the curacy of Eversley in Hampshire, to the rectory of which he was not long afterwards presented, and this, with short intervals, was his home for the remaining thirty-three years of his life. In 1844 he married Fanny, daughter of Pascoe Grevill, and in 1848 he published his first volume, The Saint’s Tragedy. In 1859 he became chaplain to Queen Victoria; in 1860 he was appointed to the professorship of modern history at Cambridge, which he resigned in 1869; and soon after he was appointed to a canonry at Chester. In 1873 this was exchanged for a canonry at Westminster. He died at Eversley on the 23rd of January 1875.

With the exception of occasional changes of residence in England, generally for the sake of his wife’s health, one or two short holiday trips abroad, a tour in the West Indies, and another in America to visit his eldest son settled there as an engineer, his life was spent in the peaceful, if active, occupations of a clergyman who did his duty earnestly, and of a vigorous and prolific writer. But in spite of this apparently uneventful life, he was for many years one of the most prominent men of his time, and by his personality and his books he exercised considerable influence on the thought of his generation. Though not profoundly learned, he was a man of wide and various information, whose interests and sympathies embraced many branches of human knowledge. He was an enthusiastic student in particular of natural history and geology. Sprung on the father’s side from an old English race of country squires, and on his mother’s side from a good West Indian family who had been slaveholders for generations, he had a keen love of sport and a genuine sympathy with country-folk, but he had at the same time something of the scorn for lower races to be found in the members of his class.

With the sympathetic organization which made him keenly sensible of the wants of the poor, he threw himself heartily into the movement known as Christian Socialism, of which Frederick Denison Maurice was the recognized leader, and for many years he was considered as an extreme radical in a profession the traditions of which were conservative. While in this phase he wrote his novels Yeast and Alton Locke, in which, though he pointed out unsparingly the folly of extremes, he certainly sympathized not only with the poor, but with much that was done and said by the leaders in the Chartist movement. Yet even then he considered that the true leaders of the people were a peer and a dean, and there was no real inconsistency in the fact that at a later period he was among the most strenuous defenders of Governor Eyre in the measures adopted by him to put down the Jamaican disturbances. He looked rather to the extension of the co-operative principle and to sanitary reform for the amelioration of the condition of the people than to any radical political change. His politics might therefore have been described as Toryism tempered by sympathy, or as Radicalism tempered by hereditary scorn of subject races. He was bitterly opposed to what he considered to be the medievalism and narrowness of the Oxford Tractarian Movement. In Macmillan’s Magazine for January 1864 he asserted that truth for its own sake was not obligatory with the Roman Catholic clergy, quoting as his authority John Henry Newman (q.v.). In the ensuing controversy Kingsley was completely discomfited. He was a broad churchman, who held what would be called a liberal theology, but the Church, its organization, its creed, its dogma, had ever an increasing hold upon him. Although at one
period he certainly shrank from reciting the Athanasian Creed in church, he was towards the close of his life found ready to join an association for the defence of this formula. The more orthodox and conservative elements in his character gained the upper hand as time went on, but careful students of him and his writings will find a deep conservatism underlying the most radical utterances of his earlier years, while a passionate sympathy for the poor, the afflicted and the weak held possession of him till the last hour of his life.

Both as a writer and in his personal intercourse with men, Kingsley was a thoroughly stimulating teacher. As with his own brothers, Mark and Charles, he was a man remarkable in inducing them to think for themselves than in leading them to adopt his own views, never, perhaps, very definite. But his healthy and stimulating influence was largely due to the fact that he interpreted the thoughts which were stirring in the minds of many of his contemporaries.

As a preacher he was vivid, eager and earnest, equally plain-spoken and uncompromising when preaching to a fashionable congregation or to his own village poor. One of the very best of his writings is a sermon called The Message of the Church to the World. Few of his published discourses are the Twenty-five Village Sermons which he preached in the early years of his Eversley life.

As a novelist his chief power lay in his descriptive faculties. The descriptions of South American scenery in Westward Ho!, of the Egyptian desert in Hypatia, of the North Devon scenery in Two Years Ago, are among the most brilliant pieces of word-painting in English prose-writing; and the American scenery is even more vividly and more truthfully described when he had seen it only by the eye of his imagination than in his work A Last, which was written after he had visited the tropics. His sympathy for children taught him how to secure their interests. His version of the old Greek stories entitled The Heroes, and Water-babies and Madam How and Lady Why, in which he deals with popular natural history, has high rank among books for children.

As a poet he wrote but little, but there are passages in The Stain's Tragedy and many isolated lyrics, which are worthy of a place in all standard collections of English literature. Andromeda is a very successful attempt at naturalizing the hexameter as a form of English verse, and reproduces with great skill the song of the original.

In person Charles Kingsley was tall and spare, sinewy rather than powerful, and of a restless excitable temperament. His complexion was swarthy, his hair dark, and his eye bright and piercing. His temper was hot, kept under rigid control; his disposition tender, gentle and loving, with flashing scorn and indignation against all that was ignoble and impure; he was a good husband, father and friend. One of his daughters, Mary St Leger Kingsley (Mrs Harrison), has become well known as a novelist under the pseudonym of "Lucas Malet."

Kingsley's life was written by his widow in 1877; entitled Charles Kingsley, his Letters and Memories of his Life, and presents a very touching and beautiful picture of her husband, but perhaps hardly does justice to his humour, his wit, his overflowing vitality and boyish fun.

The following is a list of Kingsley's writings:—Saint's Tragedy a drama (1848); Alon Locke, a novel (1849); Yeast, a novel (1849) Twenty-five Village Sermons (1849); Phaeton, or Loose Thoughts for Loose Thinkers (1852); Sermons on National Subjects (1st series, 1852); Hypatia, a novel (1853); Claucus, or the Wonders of the Shore (1853); Sermons on National Subjects (2nd series, 1854); Alexandria and her Schools (1854); Westward Ho I a novel (1855); Sermons for the Times (1855); The Heroes, Greek fairy tales (1856); Two Years Ago, a novel (1857); Andromeda and other Poems (1858); The Good News of God (1859); Miscellaneous (1859); Limits of Exact Science applied to History (Inaugural Lectures, 1860); Town and Country Sermons (1866); Sermons on the Pentateuch (1865); Water-babies (1863); The Roman and the Teuton (1864); David and other Sermons (1866); Hereward the Wake, a novel (1866); The Ancient Régime (Lectures at the Royal Institution, 1867); Water of Life and other Sermons (1867); Sermons on the Love of God (1869); Madam How and Lady Why (1870); At last (1871); Town Geology (1872), Discipline and other Sermons (1872); Prose Idylls (1873); Plays and Puritans (1873); Health and Education (1874); Westminster Sermons (1874); Lectures delivered in America (1875). He was a large contributor to periodical literature; many of his essays are included in Prose Idylls and other works in the above list. But no collection has been made of some of his more characteristic writings in the Christian Socialism and Politics for the People, many of them signed by the pseudonym he then assumed, "Parson Lot."

Charles Kingsley, Henry (1830-1876), English novelist, younger brother of Charles Kingsley, was born at Barnack, Northamptonshire, on the 2nd of January 1850. In 1855 he left Oxford, where he was an undergraduate at Worcester College, for the Australian goldfields. This venture, however, was not a success, and in 1857 he returned to England, and was appointed inducting them to think for themselves than in leading them to adopt his own views, never, perhaps, very definite. But his healthy and stimulating influence was largely due to the fact that he interpreted the thoughts which were stirring in the minds of many of his contemporaries.

As a preacher he was vivid, eager and earnest, equally plain-spoken and uncompromising when preaching to a fashionable congregation or to his own village poor. One of the very best of his writings is a sermon called The Message of the Church to the World. Few of his published discourses are the Twenty-five Village Sermons which he preached in the early years of his Eversley life.

Charles Kingsley, Henry (1830-1876), English novelist, younger brother of Charles Kingsley, was born at Barnack, Northamptonshire, on the 2nd of January 1850. In 1855 he left Oxford, where he was an undergraduate at Worcester College, for the Australian goldfields. This venture, however, was not a success, and in 1857 he returned to England, and was appointed...
decided to go first to South Africa to nurse fever cases. She died of enteric fever at Simon's Town, where she was engaged in tending Boer prisoners, on the 3rd of June 1900. Miss Kingsley's works, besides her Travels, include West African Studies, The Story of West Africa, a memoir of her father prefixed to his Notes on Sport and Travel (1890), and the contributions to the study of West African law and folklore. To continue the investigation of the subjects Miss Kingsley had made her own "The African Society" was founded in 1901. Valuable biographical information from the pen of Mr George A. Macmillan is prefixed to a second edition (1901) of the Studies.

**KING'S LYNN (LYNN or LYNN REGIS), a market town, sea-port and municipal and parliamentary borough of Norfolk, England, on the estuary of the Great Ouse near its outflow into the Wash. Pop. (1901), 20,286. It is 97 m. N. by E. from London by the Great Eastern railway, and also by the lines Midland and Great Northern joint line. On the land side the town was formerly defended by a fosse, and there are still considerable remains of the old wall, including the handsome South Gate of the 15th century. Several by-channels of the river, passing through the town, are known as fleets, recalling the similar fliehe of Hamburg. The Public Walks forms a pleasant promenade parallel to the wall, and in the centre of it stands a picturesque octagonal Chapel of the Red Mount, exhibiting ornate Perpendicular work, and once frequented by pilgrims. The church of St Margaret, formerly the priory church, is a fine building, 7th century, 12th century, 13th century, and many contributions from the town, which was formerly surrounded by a spire, blown down in 1741. Norman or transitional work appears in the base of both towers, of which the southern also shows Early English and Decorated work, while the northern is chiefly Perpendicular. There is a fine Perpendicular east window of circular form. The church possesses two of the finest monumental brasses in existence, dated respectively 1349 and 1364. St Nicholas chapel, at the north end of the town, is also of rich Perpendicular workmanship, with a tower of earlier date. All Saints' church in South Lynn is a beautiful Decorated cruciform structure. Of a Franciscan friary there remains the Perpendicular Grey Friars' Steeple, and the doorway remains of a priests' college founded in 1502. At the grammar school, founded in the reign of Henry VIII., but occupying modern buildings, Eugene Aram was usher. Among the other public buildings are the guildhall, with Renaissance front, the corn exchange, the picturesque custom-house of the 17th century, the athenaeum (including a museum, hall and other departments), the Stanley Library and the municipal buildings. The fisheries of the town are important, including extensive mussel-fisheries under the jurisdiction of the corporation, and there are also iron and brass foundries, agricultural implement manufacturers, ship-building yards, rope and sail works. Lynn Harbour has an area of 30 acres and an average depth at low tide of 10 ft. There is also good anchorage in the roads leading from the Wash to the docks. There are two docks of 6½ and 10 acres area respectively. A considerable traffic is carried on by barges on the Ouse. The municipal and parliamentary boroughs of Lynn are co-extensive; the parliamentary borough returns one member. Area, 3,061 acres. As Lynn (Lun, Lenne, Bishop's Lynn) owes its origin to the trade which its early settlers carried by the Ouse and its tributaries its history dates from the period of settled occupation by the Saxons. It belonged to the bishops of Thetford before the Conquest and remained with the see when it was translated to Norwich. Herbert de Losegna (c. 1054-1110) granted its jurisdiction to the cathedral of Norwich but this right was resumed by a later bishop, John de Gray, who in 1204 had obtained from John a charter establishing Lynn as a free borough. A fuller grant in 1206 gave the burgesses a gild merchant, the hunting right to be held once a week only, and general liberties according to the customs of Oxford, saving the rights of the bishop and the earl of Arundel, whose ancestor William D'Aubigny had received from William II. the moiety of the tolbooth.

Among numerous later charters one of 1268 confirmed the privilege granted to the burgesses by the bishop of choosing a mayor; another of 1416 re-established his election by the aldermen alone. Henry VIII. granted Lynn two charters, the first (1524) incorporating it under mayor and aldermen; the second (1539) changing its name to King's Lynn and transferring to the corporation all the rights hitherto enjoyed by the bishop. Edward VI. added the possessions of the gild of the Trinity, or gild merchant, and St George's gild, while Queen Mary annexed South Lynn. Admiralty rights were granted by James I. Lynn, which had declined for the Crown in 1643, surrendered its privileges to Charles II. in 1664, but recovered its charter on the eve of the Revolution. A fair held on the festival of St Margaret (July 20) was included in the grant to the monks of Norton about 1100. Three charters of John granting the bishop fairs on the feast of St Nicholas, St Ursula and St Margaret are extant, and another of Edward I., changing the last to the feast of St Peter ad Vincula (Aug. 1). A local act was passed in 1558-1559 for keeping a mart or fair once a year. In the eighteenth century besides the pleasure fair, still held in February, there was another in October, now abolished. A royal charter of 1524 established the cattle, corn and general provisions market, still held every Tuesday and Saturday. Lynn has ranked high among English seaports from early times.

See E. M. Beloe, Our Borough (1859); H. Harrold, Report on the Records of King's Lynn (1874); Victoria County History: Norfolk.

**KING'S MOUNTAIN**, a mountainous ridge in Gaston county, North Carolina and York county, South Carolina, U.S.A. It is an outlier of the Blue Ridge running parallel with it, i.e. N.E. and S.W., but in contrast with the other mountains of the Blue Ridge, King's Mountain has a crest marked with sharp and irregular notches. Its highest point and great escarpment are in North Carolina. About 13½ m. S. of the line between the two states, where the ridge is about 60 ft. above the surrounding country and very narrow at the top, the battle of King's Mountain was fought on the 7th of October 1780 between a force of about 100 Provincial Rangers and about 1000 Loyalist militia under Major Patrick Ferguson (1744-1780), and an American force of about 900 backwoodsmen under Colonels William Campbell (1745-1781), Benjamin Cleveland (1738-1806), Isaac Shelby, John Sevier and James Williams (1740-1780), in which the Americans were victorious. The British loss is stated as 110 killed (including the commander), 123 wounded, and 664 prisoners; the American loss was 28 killed (including Colonel Williams) and 62 wounded. The victory largely contributed to the success of General Nathanael Greene's campaign against Lord Cornwallis. The site of the battle was not marked until the exact spot of the engagement, but the weight of evidence is in favour of the monument mentioned above, on the South Carolina side of the line. A monument erected in 1815 was replaced in 1850 by a much larger one, and a monument for which Congress appropriated $30,000 in 1906, was completed in 1909.

See L. C. Draper, King's Mountain and its Heroes (Cincinnati, 1881); and Edward McCready, South Carolina in the Revolution 1775-1780 (New York, 1901).

**KINGSTON, ELIZABETH, DUCHESS OF (1770-1788), sometimes called countess of Bristol, was the daughter of Colonel Thomas Chudleigh (d. 1726), and was appointed maid of honour to August, princess of Wales, in 1743, probably through the good offices of her friend, William Pulteney, earl of Bath. Being a very beautiful woman Miss Chudleigh did not lack admirers, among whom were James, 6th duke of Hamilton, and Augustus John Hervey, afterwards 3rd earl of Bristol. Hamilton, however, left England, and on the 4th of August 1744 she was privately married to Hervey at Lainston, near Winchester. Both husband and wife being poor, their union was kept secret to enable Elizabeth to retain her post at court, while Hervey, who was a naval officer, rejoined his ship, returning to England towards the close of 1746. The marriage was annulled by a suit brought by Hervey one, and the pair soon ceased to live together; but when it appeared probable that Hervey would succeed his brother as earl
of Bristol, his wife took steps to obtain proof of her marriage. This did not, however, prevent her from becoming the mistress of Evelyn Pierrepont, and duke of Kingston, and she was not only a very prominent figure in London society, but in 1765 in Berlin she was honoured by the attentions of Frederick the Great. By this time Hervey wished for a divorce from his wife; but Elizabeth, although equally anxious to be free, was unwilling to face the publicity attendant upon this step. However she began a suit of jactitation against Hervey. This case was doubtless collusive, and after Elizabeth had sworn she was unmarried, the court in February 1769 pronounced her a spinster. Within a month she married Kingston, who died four years later, leaving her all his large and highly influential public and personal effects. In Visiting Rome the duchess was received with honour by Clement XIV.; after which she hurried back to England to defend herself from a charge of bigamy, which had been preferred against her by Kingston's nephew, Evelyn Meadows (d. 1826). The house of Lords in 1776 found her guilty, and retaining her fortune she hurriedly left England to avoid further proceedings on the part of the Meadows family, who had a reversionary interest in the Kingston estates. She lived for a time in Calais, and then repaired to St Petersburg, near which city she bought an estate which she named "Chudleigh." Afterward she lived in Paris, and she married Charles Pompiljus Foote, a merchant, in the church of the Madeleine, Paris on the 26th of August 1788. The duchess was a coarse and licentious woman, and was ridiculed as Kitty Crocodile by the comedian Samuel Foote in a play A Trip to Calais, which, however, he was not allowed to produce. She is said to have been the original of Thackeray's characters, Beatrice and Baroness Bernstein.

KINGSTON, WILLIAM HENRY GILES (1814-1880), English novelist, son of Lucy Henry Kingston, was born in London on the 21st of February 1814. Much of his youth was spent at Opoow, where his father was a merchant, but when he entered the business, he made his headquarters in London. He early wrote newspaper articles on Portuguese subjects. These were translated into Portuguese, and the author received a Portuguese order of knighthood and a pension for his services in the conclusion of the commercial treaty of 1842. In 1844 his first book, The Circassian Chief, appeared, and in 1845 The Prime Minister, a Story of the Days of the Great Marquis of Pombal. The Lusitanian Sketches describe Kingston's travels in Portugal. In 1851 Peter the Whaler, his first book for boys, came out. These books proved so successful that Kingston turned from his factory and devoted himself to the production of tales of adventure for boys. Within thirty years he wrote upwards of one hundred and thirty such books. He had a practical knowledge of seamanship, and his stories of the sea, full of thrilling adventures and hairbreadth escapes, exactly hit the taste of his boy readers. Characteristic specimens of his work are The Three Midshipmen; The Three Lieutenants; The Three Commanders; and The Three Admirals. He also wrote popular accounts of famous travellers by land and sea, and translated some of the stories of Jules Verne.

In all philanthropic schemes Kingston took deep interest; he was the promoter of the mission to seamen; and he acted as secretary of a society for promoting an improved system of emigration. He was editor of the Colonist for a short time in 1844 and of the Colonial Magazine and East Indian Review from 1840 to 1851. He was a supporter of the volunteer movement in England from the first. He died at Willesden on the 5th of August 1880.

KINGSTON, the chief city of Frontenac county, Ontario, Canada, at the north-eastern extremity of Lake Ontario, and the mouth of the Cataraqui River. Pop. (1901), 17,601. It is an important station on the Grand Trunk railway, the terminus of the Kingston & Pembroke railway, and has steamboat communication with other ports on Lake Ontario and the Bay of Quinte, on the St Lawrence and the Rideau canal. It contains a fine stone graving dock, 280 ft. long, 100 ft. wide, and with a depth of 30 ft. at low water on the sill. The fortifications, which at one time made it one of the strongest fortresses in Canada, are now out of date. The fertility of the surrounding country, and the growth of railways have lessened its commercial importance, but it still contains a number of small factories, and important locomotive works and ship-building yards. As an educational and residential centre it retains high rank, and is a popular summer resort. It is the seat of an Anglican and of a Roman Catholic bishopric, of the Royal Military College (founded by the Dominion government in 1872), of an artillery school, and of Queen's University, an institution founded in 1859 under the nominal control of the Presbyterian church, now including about 1200 students. In the suburbs are a Dominion penitentiary, an asylum for the insane, and a lunatic asylum. The Industrial Home founded by Lawrence Hervey, son of the first Governor of Frontenac, it played an important part in the wars between England and France. Taken and destroyed by the English in 1758, it was refounded in 1782 under its present name, and was from 1841 to 1844 the capital of Canada.

KINGSTON, a city and the county-seat of Ulster county, New York, U.S.A., on the Hudson River, at the mouth of Rondout Creek, about 90 m. N. of New York and about 53 m. S. of Albany. Pop. (1900), 24,535—5551 being foreign-born; (1910 census) 25,908. It is served by the West Shore (which becomes Rondout Creek on a high bridge), the New York Ontario & Western, the Ulster & Delaware, and the Walkill Valley railways, by a ferry across the river to Rhinecliff, where connexion is made with the New York Central & Hudson River railroad, and by steamboat lines to New York, Albany and other river points. The principal part of the city is built on a level plateau about 150 ft. above the river; other parts of the site vary from flatlands to rough highlands. To the N.W. is the mountain scenery of the Catskills, to the S.W. the Shawangunk Mountains and Lake Mohonk, and in the distance across the river are the Berkshire Hills. The most prominent public buildings are the post office and the city hall; in front of the latter is a Soldiers' and Sailors' Monument. The city has a Carnegie library. The "Senate House"—now the property of the state, with a colonial museum—was erected about 1876; it was the meeting place of the first State Senate in 1777, and was burned (except the walls) in October of that year. The court house (1818) stands on the site of the old court house, in which Governor George Clinton was inaugurated in July 1777, and in which Chief Justice John Jay held the first term of the New York Supreme Court in September 1777. The Elmendorf Tavern (1723) was the meeting place of the New York Council of Safety in October 1777. Kingston Academy was organized in 1773, and in 1864 was transferred to the Kingston Board of Education and became part of the city's public school system; its present building dates from 1866. Kingston's principal manufactures are tobacco, cigars and cigarettes, street railway cars and boats; other manufactures are Rosendale cement, bricks, shirts, lace curtains, brushes, motor wheels, sash and blinds. The city ships large quantities of building and flag stones quarried in the vicinity. The total value of the factory product in 1905 was $5,000,022, an increase of 56% since 1900. In 1854 a small fort was built by the Dutch at the mouth of Rondout Creek, and in 1652 a settlement was established in the vicinity and named Esopus after the Esopus Indians, who were a subdivision of the Munsee branch of the Delawares, and whose name meant "small river," referring possibly to Rondout Creek. The settlement was deserted in 1653-56 on account of threatened Indian attacks. In 1658 a stockade was built by the order of Governor Peter Stuyvesant, and from this event the actual founding of the city is generally dated. In 1659 the massacre of several drunken Indians by the soldiers caused a general rising of the Indians, who unsuccessfully attacked the stockade, killing some of the soldiers and inhabitants, and capturing and torturing others. Hostilities continued into the following year. In 1661 the governor named the place Willettvock and gave it a municipal charter. In 1663 it suffered from another Indian attack, a number of the inhabitants being slain or taken prisoners. The English took possession
in 1604, and in 1669 Wiltwyck was named Kingston, after Governor Francis Lovelace. In the same year the English garrison was removed. In 1673-1674 Kingston was again temporarily under the control of the Dutch, who called it Swanenburg. In 1777 the convention which drafted the new state constitution met in Kingston, and during part of the year Kingston was the seat of the new state government. On the 16th of October 1777 the British under General Sir John Vaughan (1748-95) sacked it and burned nearly all its buildings. In 1908 the body of George Clinton was removed from Washington, D.C., and reinterred in Kingston on the 290th anniversary of the building of the college. In 1885, Kingston was one of the places contemplated as a site for the national capital. In 1825 it was incorporated as a village, and in 1872 it absorbed the villages of Rondout and Wilbur and was made a city.

Kingston, a borough of Luzerne county, Pennsylvania, U.S.A., on the North Branch of the Susquehanna river, opposite Wilkes-Barre. Pop. (1900), 38,46 (1900 foreign-born); (1910) 64,49. Kingston is served by the Delaware, Lackawanna & Western and the Atlantic & Susquehanna railways. It is the site of Wyoming Seminary (1844; co-educational), a well-known secondary school. Anthracite coal is mined here; there are railway repair and machine-shops; and among the borough's manufactures are hosiery, silk, goods, underwear and adding machines. Kingston (at first called "Kingstown," from Kings Towne, Rhode Island) was commonly known in its early days as the "Forty Township," because the first permanent settlement was made by forty pioneers from Connecticut, who were sent out by the Susquehanna Company and took possession of the district in its name in 1765. In 1772 the famous "Forty Fort," a stockade fortification, was built here, and in 1777 it was rebuilt, strengthened and enlarged. Here on the 3rd of July 1778 about 400 men and boys met, and under the command of Colonel Zebulon Butler (1731-95) went out to meet a force of about 1100 British troops and Indians, commanded by Major John Butler and Old King (Sayenqueraghte). The Americans were defeated in the engagement that followed, and many of the prisoners taken were massacred or tortured by the Indians. A monument near the site of the fort commemorates the battle and massacre. Kingston was incorporated as a borough in 1857.

Kingston, the capital and chief port of Jamaica, West Indies. Pop. (1901), 46,542, mostly negroes. It is situated in the county of Surrey, in the south-east of the island, standing on the north shore of a land-locked harbour—for its size one of the finest in the world—and with its suburbs occupying an area of 1200 acres. The town contains the principal government offices. It has a good water supply, a telephone service and a supply of both gas and electric light, while electric trams ply between the town and its suburbs. The Institute of Jamaica maintains a public library, museum and art gallery especially devoted to local interests. The old parish church in King Street, dating probably from 1602 was the burial-place of William Hall (1600) and Admiral Benbow (1702). The suburbs are remarkable for their beauty. The climate is dry and healthy, and the temperature ranges from 93° to 66°F. Kingston was founded in 1603, after the neighbouring town of Port Royal had been ruined by an earthquake in 1602. In 1703, Port Royal having been again laid waste by fire, Kingston became the commercial, and in 1782 the political, capital of the island. On several occasions Kingston was almost entirely consumed by fire, the conflagrations of 1751, 1795, and the Lepanto of 1828 being particularly severe. On the 14th of January 1907 it was devastated by a terrible earthquake. A long immunity had led to the erection of many buildings not specially designed to withstand such shocks, and these and the fire which followed were so destructive that practically the whole town had to be rebuilt. (See Jamaica.)

Kingston-on-Thames, a market town and municipal borough in the Kingston parliamentary division of Surrey, England, 11 m. S.W. of Charing Cross, London; on the London and South-Western railway. Pop. (1901), 34,375. It has a frontage with public walks and gardens upon the right bank of the Thames, and is in close proximity to Richmond and Bushy Parks, its pleasant setting rendering it a favourite residential district. The ancient wooden bridge over the river, which was in existence as early as 1223, was superseded by a structure of stone in 1827. The parish church of All Saints, chiefly Perpendicular in style, contains several brasses of the 15th century, and monuments by Chantrey and others; the grammar school, rebuilt in 1708, was originally founded as a charity by Edward Lovelock in 1305, and converted into a college in 1872. At the northern edge of the parish church stood the chapel of St Mary, where it is alleged the Saxon kings were crowned. The ancient stone said to have been used as a throne at these coronations was removed to the market-place in 1850. At Norbiton, within the borough, is the Royal Cambridge Asylum for soldiers' widows (1854). At Kingston Hill is an industrial and training school for girls, opened in 1892. There are large market gardens in the neighbourhood, and the town possesses oil-mills, flour-mills, breweries and brick and tile works. The borough is under a mayor, 8 aldermen and 24 councillors. In 1872 act the Borough of Kingston (Constitution, Charter, &c). On the Thames where there was probably a ford accounts for its origin; its later prosperity was due to the bridge which existed in 1223 and possibly long before. In 836 or 838 it was the meeting-place of the council under Ecgbert, and in the 10th century some if not all of the West Saxon kings were crowned at Kingston. In the time of Edward the Confessor it was a royal manor, and in 1086 included a church, five mills and three fisheries. Domesday also mentions bedels in Kingston. The original charters were granted by John in 1200 and 1209, by which the free men of Kingston were empowered to hold the town in fee-farm for ever, with all the liberties that it had while in the king's hands. Henry III. sanctioned the gild-merchant which had existed previously, and granted other privileges. These charters were confirmed and extended by many succeeding monarchs down to Charles I. Henry VI. incorporated the town under two bailiffs. Except for temporary surrender of their corporate privileges under Charles II. and James II. the government of the borough continued in its original form until 1835, when it was reincorporated under the title of mayor, aldermen and burgesses. Kingston returned two members to parliament in 1331, 1343, 1353 and 1373, but never afterwards. The market, still held on Saturdays, was granted by James I., and the Wednesday market by Charles II. To these a cattle-market on Thursdays has been added by the corporation. The only remaining fair, now held on the 15th of November, was granted by Henry III., and was then held on the morrow of All Souls and seven days following.

Kingston-upon-Hull, Earls and Dukes of. These titles were borne by the family of Pierpont, or Pierpoint, from 1626 to 1773.

Robert Pierpont (1584-1643), second son of Sir Henry Pierpont of Holme Pierpont, Nottinghamshire, was member of parliament for Nottingham in 1601, and was created Baron Pierpont and Viscount Newark in 1627, being made earl of Kingston-upon-Hull in the following year. He remained neutral on the outbreak of the Civil War; but afterwards he joined the king, and was appointed lieutenant-general of the counties of Lincoln, Rutland, Huntington, Cambridge and Norfolk. Whilst defending Gainsborough he was taken prisoner, and was accidentally killed on the 25th of July 1643 while being conveyed to Hull. The earl had five sons, one of whom was Francis Pierpont (d. 1659) a colonel in the parliamentary army and afterwards a member of the Long Parliament; another was William Pierpont (qv.), a leading member of the parliamentary party.

His son Henry Pierpont (1665-1689), 2nd earl of Kingston and 1st marquess of Dorchester, was member of parliament for Nottinghamshire, and was called to the House of Lords as Baron Pierpont in 1641. During the earlier part of the Civil War he was at Oxford in attendance upon the king, whom he represented at the negotiations at Uxbridge. In 1643 he was made a privy
councillor and created marquess of Dorchester; but in 1647 he compounded for his estates by paying a large fine to the parliamentarians. Afterwards the marquess, who was always fond of books, spent his time mainly in London engaged in the study of medicine and law; his devotion to the former science bringing upon him a certain amount of ridicule and abuse. After the Restoration he was restored to the privy council, and was made recorder of Nottingham and a fellow of the Royal Society. Dorchester had two daughters, but no sons, and when he died in London on the 8th of December 1680 the title of marquess of Dorchester became extinct. He was succeeded as 3rd earl of Kingston by Robert (d. 1682), a son of Robert Pierrepont of Thoresby, Nottinghamshire, and as 4th earl by Robert's brother William (d. 1690).

EVELYN PIERREPONT (c. 1655-1726), 5th earl and 1st duke of Kingston, another brother had been member of parliament for East Retford before his accession to the peerage. While serving as one of the commissioners for the union with Scotland he was created marquess of Dorchester in 1706, and took a leading part in the business of the House of Lords. He was made a privy councillor and in 1715 was created duke of Kingston; afterwards served as lord-lieutenant and lord president of the council. The duke, who died on the 5th of March 1726, was a prominent figure in the fashionable society of his day. He was twice married, and had five daughters, among whom was Lady Mary Wortley Montagu (q.v.), and one son, William, earl of Kingston (d. 1713).

The latter's son, EVELYN PIERREPONT (1711-1773), succeeded his grandfather as second duke of Kingston. When the rebellion of 1745 broke out he raised a regiment called "Kingston's light horse," which distinguished itself at Culloden. The duke, who attained the rank of general in the army, is described by Horace Walpole as "a very weak man, of the greatest beauty and finest person in England." He is chiefly famous for his connexion with Elizabeth Chudleigh, who claimed to be duchess of Kingston (q.v.). The Kingston titles became extinct on the duke's death without children on the 23rd of September 1773, but on the death of the duchess in 1788 the estates came to his nephew Charles Meadows (1737-1816), who took the name of Pierrepont and was created Baron Pierrepont and Viscount Newark in 1796, and Earl Manvers in 1806. His descendant, the present Earl Manvers, is thus the representative of the dukes of Kingston.

KINGSTOWN, a seaport of Co. Dublin, Ireland, on the south parliamentary division, at the south-eastern extremity of Dublin Bay, 6 m. S.E. from Dublin by the Dublin & South-Eastern railway. Pop. of urban district (1901), 17,377. It is a large seaport and favourite watering-place, and possesses several fine streets, with electric trams, and terraces commanding picturesque sea views. The original name of Kingstown was Dunleary, which was exchanged for the present designation after the embarkation of George IV. at the port on his return from Ireland in 1821, an event which is also commemorated by a granite obelisk erected near the harbour. The town was a mere fishing village until the construction of an extensive harbour, begun in 1817 and finally completed in 1859. The eastern pier has a length of 3,500 ft. and the western of 4,920 ft., the total area enclosed being about 250 acres, with a varying depth of from 15 to 27 ft. Kingstown is the station of the City of Dublin Steam Packet Company's mail steamer to Holyhead in connection with the London & North-Western railway. It has large export and import trade both with Great Britain and foreign countries. The principal export is cattle, and the principal imports corn and provisions. Kingstown is the centre of an extensive sea-fishery, and there are three yacht clubs: the Royal Irish, Royal St George and Royal Alfred.

KING-TÉ CHÉN, a town near Fu-liang Hien, in the province of Kiang-si, China, and the principal seat of the porcelain manufacture in that empire. Being situated on the south bank of the river Chang, it was in ancient times known as Chang-nan Chén, or "town on the south of the river Chang." It is unwalléd, and straggles along the bank of the river. The streets are narrow, and crowded with a population which is reckoned at a million, the vast majority of whom find employment at the porcelain factories. Since the Ch'in dynasty (257-209) this has been the great trade of the place, which was then called by its earlier name. In the reign of King-té (Chén-tsung) of the Sung dynasty, early in the 11th century A.D., a manufactory was founded there for making vases and objects of art for the use of the emperor. Hence its adoption of its present title. Since the time of the Ming dynasty a magistrate has been specially appointed to superintend the factories and to despatch at regulated intervals the imperial porcelain to Peking. The town is situated on a vast plain surrounded by mountains, and boasts of three thousand kilns, and in the furnaces. These constantly burning fires are the causes of frequent conflagrations, and at night give the city the appearance of a place on fire. The people are as a rule orderly, though they have on several occasions shown a hostile bearing towards foreign visitors. This is probably to be accounted for by a desire to keep their art as far as possible a mystery, which appears less unreasonable when it is remembered that the two kinds of earth of which the porcelain is made are not found at King-té Chén, but are brought from K'i-mun in the neighbouring province of Nanch, and that there is therefore no reason why the trade should be necessarily maintained at that place. The two kinds of earth are those of the K'un-lun Mountains, and kaulin, which is not fusible, and is said to give strength to the ware. Both materials are prepared in the shape of bricks at K'i-mun, and are brought down the Chang to the seat of the manufacture.

KINGUSSIE, a town of Inverness-shire, Scotland. Pop. (1901), 987. It lies at a height of 750 ft. above sea-level, on the left bank of the Spey, here crossed by a bridge, 46½ m. S. by S.E. of Inverness by the Highland railway. It was founded towards the end of the 18th century by the duke of Gordon, in the hope of its becoming a centre of woollen manufactures. This expectation, however, was not realized, but in time the place grew popular as a health resort, the scenery in every direction being remarkably picturesque. On the right bank of the river is Ruthven, where James Macpherson was born in 1736, and on the left bank, some 2½ m. from Kingussie, is the house of Bellevue (previously known as Raits) which he acquired from Mackintosh of Borlum and where he died in 1796. The mansion, renamed Balavil by Macpherson's great-grandson, was burned down in 1903, when the fine library (including some MSS. of Sir David Brewster, who had married the poet's second daughter) was destroyed. Of an old mansion on a height, which is a fine fine quire powder, only the ruins of the walls remain. Here the Jacobites made an in extremity rally under Lord George Murray after the battle of Culloden.

KING WILLIAM'S TOWN, a town of South Africa, in the Cape province and on the Buffalo River, 42 m. by rail W.N.W. of the port of East London. Pop. (1904), 9526, of whom 5087 were whites. It is the headquarters of the Cape Mounted Police. "King," as the town is locally called, stands 1275 ft. above the sea at the foot of the Amatola Mountains, and in the midst of a thickly populated and woollen districts. The town is well laid out and most of the public buildings and merchants' stores are built of stone. There are manufactories of sweets and jams, candles, soap, matches and leather, and a large trade in wool, hides and grains is done with East London. "King" is also an important entrepot for trade with the natives throughout Kaffrraria, with which there is direct railway communication. Founded by Sir Benjamin D'Urban in May 1853 during the Kaffir War of that year, the town is named after William IV. It was abandoned in December 1836, but was reoccupied in 1846 and was the capital of British Kaffraria from its creation in 1847 to its incorporation in 1865 with Cape Colony. Many of the present buildings in the neighbouring districts are descendants of members of the German legion disbanded after the Crimean War and provided with homes in Cape Colony; hence such names as Berlin, Potsdam, Braunschweig, Frankfurt, given to settlements in this part of the country.

KINKAJOU (Cercocepus coudoiolus or Potos flavus), the single species of an aberrant genus of the raccoon family (Procyonidae). It has been split up into a number of local races. A
native of the forests of the warmer parts of South and Central America, the kinkajou is about the size of a cat, of a uniform pale, yellowish-brown colour, nocturnal and arboreal in its habits, feeding on fruit, honey, eggs and small birds and mammals, and is of a tolerably gentle disposition and easily tamed. (See Carnivora.)

KINDEL, JOHANN GOTTFRIED (1857–1882), German poet, was born on the 11th of August 1815 at Obercasel near Bonn. Having studied theology at Bonn and afterwards in Berlin, he established himself at Bonn in 1836 as privat docent of theology, later became master at the gymnasium there, and was for a short time assistant preacher in Cologne. Changing his religious opinions, he abandoned theology and delivered lectures on the history of art, in which he had become interested on a journey to Italy in 1837. In 1846 he was appointed extraordinary professor of the history of art at Bonn University. For his share in the revolution in the Palatinate in 1848 Kinkel was arrested and, sentenced to penal servitude for life, was interned in the fortress of Spandau. His friend Carl Schurz contrived in November 1850 to effect his escape to England, whence he went to the United States. Returning to London in 1853, he for several years taught German and lectured on German literature, and in 1858 founded the journal Der Heimann. In 1866 he accepted the professorship of archaeology and the history of art at the Polytechnium in Zürich, in which city he died on the 13th of November 1882.

The popularity which Kinkel enjoyed in his day was hardly justified by his talent; his poetry is of the sweetly sentimental type which was much in vogue in Germany about the middle of the 19th century. His Gedichte first appeared in 1843, and have gone through several editions. He is to be seen to most advantage in the verse romances, Otto der Schütz, eine rheinische Geschichte in zwölf Abenteuern (1846) which in 1896 had attained its 75th edition, and Der Grobschmied von Antwerp (1860). Among Kinkel’s other works may be mentioned the tragedy Ninrod (1857), and his history of art, Geschichte der bildenden Künste bei den christlichen Völkern (1845). Kinkel’s first wife, Johanna, née Mockel (1810–1858), assisted her husband in his literary work, and was herself an author of considerable merit. Her admirable autobiographical novel Hans Ihles in London was not published until 1860, after her death. She also wrote on musical subjects.

See A. Strodte, Gottfried Kinkel (2 vols., Hamburg, 1851); Reinemann, am Gymnasium Kinkel, ein Lebensbild (Zürich, 1885).

KINNING PARK, a southern suburb of Glasgow, Scotland. Pop. (1901), 13,852. It is situated on the left bank of the Clyde between Glasgow, with which it is connected by tramway and subway, and Govan. Since 1850 it has grown from a rural village to a busy centre mainly inhabited by artisans and labourers. Its principal industries are engineering, bread and biscuit baking, soap-making and paint-making.

KINNO (Gr. κίννος), the Hebrew name for an ancient stringed instrument, the first mentioned in the Bible (Gen. iv. 21), where it is now always translated “harp.” The identification of the instrument has been much discussed, but, from the standpoint of the history of musical instruments, the weight of evidence is in favour of the view that the Semitic kinnor is the Greek cithara (q.v.). This instrument was already in use before 2000 B.C. among the Semitic races and in a higher state of development than it ever attained in Greece during the best classic period. It is unlikely that an instrument (which also appears on Hebrew coins) so widely known and used in various parts of Asia Minor in remote times, and occurring among the Hittite sculptures, should pass unmentioned in the Bible, with the exception of the verses in Dan. iii.

KINO, the W. African name of an astringent drug introduced into European medicine in 1757 by John Fothergill. When described by him it was believed to have been brought from the river Gambia in West Africa, and when first imported it was sold in England as Gummi rubrum astringens gambicen. It was obtained from Pierocarpus erinaceus. The drug now recognized as the legitimate kind is East Indian, Malabar or Amboyna kino, which is the evaporated juice obtained from incisions in the trunk of Pierocarpus Marrupium (Leguminosae), though Botany Bay or eucalyptus kino is used in Australia. When exuding from the tree it resembles red-currant jelly, but hardens in a few hours after exposure to the air and sun. When sufficiently dried it is packed into wooden boxes for exportation. When these are opened it breaks up into angular brittle fragments of a blackish-red colour and shining surface. In cold water it is only partially dissolved, leaving a pale flocculent residue which is soluble in boiling water but deposited again on cooling. It is soluble in alcohol and caustic alkalis, but not in ether.

The chief constituent of the drug is kino-tannic acid, which is present to the extent of about 75%; it is only very slightly soluble in cold water. It is not absorbed at all from the stomach and only very slowly from the intestine. Other constituents are gum, pyrocatechin, and kino, a crystalline neutral principle. Kino-red is also present in small quantity, being an oxidation product of kino-tannic acid. The useful preparations of this drug are the tincture (dose ½–1 drachm), and the pulvis kino compositus (dose 5–20 gr.) which contains one part of opium in twenty. The drug is frequently used in diarrhoea, its value being due to the relative insolubility of kino-tannic acid, which enables it to affect the lower part of the intestine. In this respect it is parallel with catechu. It is not now used as a gargle, antiseptics being recognized as the rational treatment for sore-throat.

KINORHYNCHA, an isolated group of minute animals containing the single genus Echinoecus F. Dujardin, with some eighteen species. They occur in mud and on sea-weeds at the bottom of shallow seas below low-water mark and devour organic débris.

The body is enclosed in a stout cuticle, prolonged in places into spines and bristles. These are especially conspicuous in two rings round the proboscis and in the two posterior caudal spines. The body is divided into eleven segments and the protrusible proboscis apparently into two, and the cuticle of the central segment is thickened to form three plates, one dorsal and two ventral.

The cuticle is secreted by an epidermis in which no cell boundaries are to be seen; it sends out processes into the bristles. The mouth opens at the tip of the retractile proboscis; it leads into a short thin-walled tube which opens into an oval muscular gizzard lined with a thick cuticle; at the posterior end of this are some minute glands and then follows a large stomach slightly sacculated in each segment, this tapers through the rectum to the terminal anus. A pair of pear-shaped, ciliated glands inside lie in the eighth segment and open on the ninth. They are regarded as kidneys. The nervous system consists of a ganglion or brain, which lies dorsally about the level of the junction of the pharynx and the stomach, a nerve ring and a segmented neutral cord. The only sense organs described are eyes, which occur in some species, and may number one to four pairs.
The Kinorhyncha are dioecious. The testes reach forward to the fifth and even to the second segment, and open one each side of the anus. The ovaries open in a similar position but never reach farther forward than the fourth segment. The external openings in the male are armed with a pair of hollowed spines. The animals are probably oviparous.

KINROSS-SHIRE, a county of Scotland, bounded N. and W. by Perthshire, on the extreme S.W. by Clackmannanshire and S. and E. by Fifeshire. Its area is 5,446 acres or 81°9 sq. m. Excluding Clackmannan it is the smallest county in Scotland both in point of area and of population. On its confines the shire is hilly. To the N. and W. are several peaks of the Ochils, the highest being Innerdouny (1,621 ft.) and Mellock (1,573); to the E. are the heights of the Lomond group, such as White Craigs (1,492 ft.) and Bishop Hill; to the S. are Benarty (1,311 ft.) on the Fife border and farther west the Cleish Hills, reaching in Dumbog an altitude of 1,241 ft. With the exception of the Leven, which drains Loch Leven and of which only the first mile of its course belongs to the county, all the streams are short. Green's Burn, the North and South Queich, and the Gairnies are the principal. Loch Leven, the only lake, is remarkable rather for its associations than for its natural features. The scenery on the Devon, west of the Crook, the river here forming the boundary with Perthshire, is of a lovely and romantic character. At Alloa the Crook spreads out into the Leven, which has the rocky gorge with a long clacking sound which has given to the spot the name of the Devil's Mill, and later it flows under the Rumbling Bridge. In reality there are two bridges, one built over the other, in the same vertical line. The lower one dates from 1713 and is unused; but the loftier and larger one, erected in 1816, commands a beautiful view. A little farther west is the graceful cascade of the Calder Linn, the fall of which was lessened, however, by a collapse of the rocks in 1885.

Geology.—The northern higher portion of the county is occupied by the Lower Old Red Sandstone volcanic lavas and agglomerates of the Ochils. The coarse character of some of the lower agglomerate beds is well seen in the gorge at Rumbling Bridge. The beds dip gently towards the S.S.E.; in a north-easterly direction they contain more sandy sediments, and the agglomerates and breccias frequently become conglomerates. The plain of Kinross is occupied by the soft sandstones, marls and conglomerates of the upper Old Red Sandstone, the best uncrossed by the courses of the Loon and Benarty. From near this we have the rocky gorge with a strong clacking sound, which has given to the spot the name of the Devil's Mill, and later it flows under the Rumbling Bridge. In reality there are two bridges, one built over the other, in the same vertical line. The lower one dates from 1713 and is unused; but the loftier and larger one, erected in 1816, commands a beautiful view. A little farther west is the graceful cascade of the Calder Linn, the fall of which was lessened, however, by a collapse of the rocks in 1885.

Climate and Industries.—The lower part of the county is generally well sheltered and adapted to all kinds of crops; and the climate, though wet and cold, offers no hindrance to high farming. The average annual rainfall is 35.5 inches, and the temperature for the year 1928° F., for January 38° F. and for July 50° F. More than half of the holdings exceed 50 acres each. Much of the land is uncrossed, the mossy moors being drained and cultivated being very fertile. Barley is the principal crop, and oats also is grown largely, but the acreage under wheat is small. Turnips and potatoes are the chief green crops, the former being more important. The raising of livestock is pursued with great enterprise, the hilly land being well suited for this industry, although many cattle are pastured on the lowland farms. The cattle are mainly a native breed, which has been much improved by crossing. The number of sheep is high for the area. Although most of the horses are used for agricultural work, a considerable proportion are kept solely for breeding.

Tartans, plaids and other woollens, and linen are manufactured at Kinross and Milnathort, which is besides an important centre for livestock sales. Brewing and milling are also carried on in the county town, but stock-raising and agriculture are the staple interests. The North British railway company's lines, from the south and west run through the county via Kinross, and the Mid-Fife line branches off at Mawwarce Junction.

Population and Government.—The population in 1801 was 6,673 and in 1881 7,358 in 1,828 inhabited houses. 55 persons spoke Gaelic and 3,360 persons spoke English.

The only towns are Kinross (pop. in 1901, 2,136) and Milnathort (1,052). Kinross is the county town, and of considerable antiquity. The county unites with Clackmannanshire to return one member to the Scots parliament. It forms a sheriffdom with Fifeshire and a sheriff-substitute sits at Kinross. The shire is under school-board jurisdiction.

History.—For several centuries the shire formed part of Fife, and during that period shared its history. Towards the middle of the 15th century, however, the parishes of Kinross and Orwell seem to have been constituted into a shire, which, at the date (1506) of Edward I's ordinance for the government of Scotland, had become an hereditary sheriffdom, John of Kinross then being named for the office. James I dispensed with the attendance of small barons in 1427 and introduced the principle of representation, when the shire returned one member to the Scots parliament. The inclusion of the Fife parishes of Portmoak, Cleish and Tulibole in 1685, due to the influence of Sir William Bruce, the royal architect and heritable sheriff, converted the older shire into the modern county. Excepting, however, the dramatic and romantic episodes connected with the castle of Loch Leven, the annals of the whole of the peninsula of Kinross are vacant. As to its antiquities, there are traces of an ancient fort or camp on the top of Dumbog, and on a hill on the northern boundary of the parish of Orwell a remarkable cairn, called Cairn-a-vain, in the centre of which a stone cist was discovered in 1810 containing an urn full of bones and charcoal. Close to the town of Kinross, on the margin of Loch Leven, stands Kinross House, which was built in 1685 by Sir William Bruce as a residence for the Duke of York (James II.) in case the Exclusion Bill should debar him from the throne of England. The mansion, however, was never occupied by royalty.

See E. T. Mackay, History of Fife and Kinross (Edinburgh, 1879); W. J. N. Liddall, The Place Names of Fife and Kinross (Edinburgh, 1893); C. Ross, Antiquities of Kinross-shire (Perth, 1886); R. B. Begg, History of Lochleven Castle (Kinross, 1887).

KINSALE, a market town and seaport of Co. Cork, Ireland, in the south-east parliamentary division, on the east shore of Kinross Harbour (the estuary of the Bandon river) 24 m. south of Cork by the Cork Bandon & South Coast railway, the terminus of a branch line. Pop. of urban district (1901), 4,250. The town occupies chiefly the acclivity of Compass Hill, and while of picturesque appearance is built in a very irregular manner, the streets being narrow and precipitous. The Charles Fort was completed by the duke of Ormonde in 1657 and captured by the earl of Marlborough in 1690. The parish church of St Multose is an ancient but ineluctable structure, said to have been founded as a conventional church in the 12th century by the saint to whom it is dedicated. Kinsale, with the neighbouring villages of Scilly and Cove, is much frequented by summer visitors, and is the headquarters of the South of Ireland Fishing Company, with a fishery pier and a commodious harbour with 6 to 8 fathoms of water; but the general trade is of little importance owing to the proximity of Queenstown and Cork. The Old Head of Kinsale, at the west of the harbour entrance, affords fine views of the coast, and is commonly the first British land sighted by ships bound from New York, &c., to Queenstown.

Kinsale is said to derive its name from eacn taile, the headland in the sea. At an early period the town belonged to the De Courcys, a representative of whom was created baron of Kinsale or Kingsale in 1187. It received a charter of incorporation from Edward III., having previously been a borough by prescription, and its privileges were confirmed and extended by
various subsequent sovereigns. For several centuries previous to the Union it returned two members to the Irish parliament. It was the scene of the territorial struggle between the French and English fleets in 1380, was forcibly entered by the English in 1458, captured by the Spaniards and retaken by the English in 1601, and entered by the English in 1641, who expelled the Irish inhabitants. Finally, it was the scene of the landing of James II. and of the French army sent to his assistance in 1689, and was taken by the English in the following year.

**KINTORE**, a royal and police burgh of Aberdeenshire, Scotland. Pop. (1901), 789. It is situated on the Don, 133 m. N.W. of Aberdeen by the Great North of Scotland railway. It is a spot of great antiquity, having been made a royal burgh in the reign of William the Lion (d. 1214). Kintore forms the site of the Elgin group of parliamentary burghs, the others being Banff, Cullen, Elgin, Inverurie and Peterhead. One mile to the south-west are the ruins of Halfarton Castle, of which two storeys still exist, once a hunting-seat of Robert Bruce and afterwards a residence of the Keiths, earls marischal. There are several examples of sculptured stones and circles in the parish, and 2 m. to the north-west is the site of Bruce's camp, which is also ascribed to the period of the Romans. Near it is Thainstone Hospital, founded by Sir Andrew Mitchell (1758-1771), the British envoy to Frederick the Great. Kintore gives the title of earl in the Scottish, and of baron in the British peerage to the head of the Keith-Falconer family.

**KIOTO** (KYOTO), the former capital of Japan, in the province of Yamashiro, in 35° 01' N., 135° 46' E. Pop. (1903), 379,404. The Kamo-gawa, upon which it stands, is a mere rivulet in ordinary times, trickling through a wide bed of pebbles; but the city is traversed by several aqueducts, and was connected with Lake Biwa in 1890 by a canal 64 m. long, which carries an abundance of water for manufacturing purposes, brings the great lake and the city into navigable communication, and forms with the Kamo-gawa canal and the Kamo-gawa itself a through route to Osaka, from which Kioto is 25 m. distant by rail. Founded in the year 793, Kioto remained the capital of the empire during nearly eleven centuries. The emperor Kwammu, when he selected this remarkably picturesque spot for the residence of his court, caused the city to be laid out with mathematical accuracy, after the model of the Tang dynasty's capital in China. Its area, 3 m. by 34, was intersected by 18 principal thoroughfares, 9 running due north and south, and 9 due east and west, the two systems being connected by smaller streets by the middle of the northern face stood the palace, its enclosure covering three-quarters of a square mile, and from it to the centre of the south face ran an avenue 283 ft. wide and 33 m. long. Conflagrations and subsequent reconstructions modified the regularity of this plan, but much of it still remains, and its story is perpetuated in the nomenclature of the streets. In its days of greatest prosperity Kioto contained only half a million inhabitants, thus never even approximating to the size of the Tokugawa metropolis, Yedo, or the Hojo capital Kamakura. The emperor Kwammu called it Heian-jo, or the "city of peace," when he made it the seat of government; but the people knew it as Miyako, or Kyoto, terms both of which signify "capital," and in modern times it is often spoken of as Saiyko, or western capital, in opposition to Tokyo, or eastern capital. Having been so long the imperial, intellectual, political and artistic metropolis of the realm, the city abounds with evidences of its unique career. Magnificent temples and shrines, grand monuments of architectural and artistic skill, beautiful gardens, gorgeous festivals, and numerous ateliers where the traditions of Japanese art are obeyed with attractive results, offer to the foreign visitor a fund of interest. The clear waters ripples everywhere through the city, and to this water Kioto owes something of its importance, for nowhere else in Japan can fabrics be bleached so white or dyed in such brilliant colours. The people, like their neighbours of Osaka, are full of manufacturing energy. Not only do they preserve, amid all the progress of the age, their old-time eminence as producers of the finest porcelain, faience, embroidery, brocades, bronze, cloisonné enamel, fans, toys and metal-work of all kinds, but they have also adapted themselves to the foreign market, and weave and dye quantities of silk fabrics, for which a large and constantly growing demand is found in Europe and America. Nowhere else can be traced with equal clearness the part played in Japanese civilization by Buddhism, with its magic paraphernalia and impos- impos- ceremonialspectacles; nowhere else, side by side with this luxurious factor, can be witnessed in more striking juxtaposition the austere purity and simple severity of the Shinto cult; and nowhere else can be more intelligently observed the fine faculty of the Japanese for utilizing, emphasizing and enhancing the beauties of nature. The citizens' dwellings and the shops, on the other hand, are insignificant and even sombre in appearance, their exterior conveying no idea of the pretty chambers within, and of the tastefully laid-out grounds upon which they open behind. Kioto is celebrated equally for its cherry and azalea blossoms in the spring, and for the colours of its autumn foliage.

**KIOWAS**, a tribe and stock of North American Indians. Their former range was around the Arkansas and Canadian rivers, in Indian Territory (Oklahoma), Colorado and New Mexico. A fierce people, they made raids upon the settlers in western Texas until 1868, when they were placed on a reservation in Indian Territory. In 1874 they broke out again, but in the following year were finally subdued. In number about 3000, they and the Oksahoma are the sole representatives of the Kiowan linguistic stock.

**KIPLING, RUDYARD** (1865-1936), British author, was born in Bombay on the 30th of December 1865. His father, John Lockwood Kipling (1837-1911), an artist of considerable ability, was appointed, in 1869, to the Lahore museum in India. In 1870 Kipling was sent to school in Bombay. His mother was Miss Alice Macdonald of Birmingham, two of whose sisters were married respectively to Sir E. Burne-Jones and Sir Edward Poynter. He was educated at the United Services College, Westward Ho, North Devon, of which a somewhat lurid account is given in his story Stalky and Co. On his return to India he became at the age of seventeen the sub-editor of the Lahore Civil and Military Gazette. In 1886, in his twenty-first year, he published Departmental Ditties, a volume of light verse chiefly satirical, only in two or three poems giving promise of his authentic poetical note. In 1887 he published Plain Tales from the Hills, a volume of stories based on actual experiences, and which was immediately translated into several languages, as far as Italy, Egypt and China; and which was immediately translated into several languages, as far as Italy, Egypt and China; and which was immediately translated into several languages, as far as Italy, Egypt and China; and which was immediately translated into several languages, as far as Italy, Egypt and China; and which was immediately translated into several languages, as far as Italy, Egypt and China; and which was immediately translated into several languages, as far as Italy, Egypt and China; and which was immediately translated into several languages, as far as Italy, Egypt and China; and which was immediately translated into several languages, as far as Italy, Egypt and China; and which was immediately translated into several languages, as far as Italy, Egypt and China. This volume contained five short stories which were afterwards published in his collection The Ingoldsby Legends. He was now forty, and he had two children, John andUuid:951a3684-466c-43b3-b5ec-e1d09f29f3ce

**KINTORE**—KIPLING

825

also disfigured by jerkiness and mannered tricks. But Mr Kipling possessed the supreme spell of the story-teller to entrance and transport. The freshness of the invention, the variety of character, the vigour of narrative, the raciness of dialogue, the magic of atmosphere, were all remarkable. The soldier-stories, especially the seventeen vital chapter of the cycle which contains the immortal Mulvaney, established the author's fame throughout the world. The child-stories and tales of the British official were not less masterly, while the tales of native life and of adventure "beyond the pale" disclosed an even finer and deeper vein of romance. India, which had been an old story for generations of Englishmen, was revealed in these brilliant pictures as if seen for the first time in its variety, colour and passion, vivid as mirage, enchanting as the Arabian Nights. The new author's talent was quickly
recognized in India, but it was not till the books reached England that his true rank was appreciated and proclaimed. Between 1887 and 1889 he travelled through India, China, Japan and America, finally arriving in England to find himself already famous. His travel sketches, contributed to The Civil and Military Gazette and The Pioneer, were afterwards collected (the author's hand having been forced by unauthorized publication) in the two volumes From Sea to Sea (1890). A further set of Indian tales, equal to the best, appeared in Macmillan's Magazine and were republished with others in Life's Handicap (1891).

In The Light that Failed (1891, after appearing with a different ending in Lippincott's Magazine), Mr. Kipling established himself in the literary world (his story had been rejected in 1903), but with what was to prove an unfortunate success. In his subsequent work his delight in the display of descriptive and verbal technicalities grew on him. His polemic against "the sheltered life" and "little Englandism" became more didactic. His terseness sometimes degenerated into abruptness and obscurity. But in the meanwhile his genius became prominent in verse. Readers of The Plain Tales had been impressed by the snatches of poetry prefixed to them for motto, certain of them being subscribed "Barrack Room Ballad." Mr. Kipling now contributed to The Illustrated London News, and in 1892 he realized a dream of Barrack Room Ballads. These vigorous verses in soldier slang, when published in a book in 1892, together with the fine ballad of "East and West," and other poems, won for their author a second fame, wider than he had attained as a story-teller. In this volume the Ballads of the "Bolivar" and of the "Clamperdown," introducing Mr. Kipling's poetry of the ocean and the engine-room, and The Flag of England, finding a voice for the Imperial sentiment, which—largely under the influence of Mr. Kipling's own writings—had been rapidly gaining force in England, gave the key-note of much of his later verse. In 1898 Mr. Kipling paid the first of several visits to South Africa, and became imbued with a type of imperialism that reacted on his literature, not altogether to its advantage. Before finally settling in England Mr. Kipling lived some years in America and in 1892 Miss Caroline Starr Balestier, sister of the Wolcott Balestier to whom he dedicated Barrack Room Ballads, and with whom in collaboration he wrote the Nautalka (1891), one of his less successful books. The next collection of stories, Many Inventions (1893), contained the splendid Mulvaney extravaganza, "My Lord the Elephant," a vividly realized tale of metamypsico in the Wild World; "The Rugg," in that fascinating tale "In the Rugg," the prelude to the next novel, exhibited the author's genius. This came in 1894 with The Jungle Book, followed in 1895 by The Second Jungle Book. With these inspired beast-stories Mr. Kipling conquered a new world and a new audience, and produced what many critics regard as his most flawless work. His chief subsequent publications were The Seven Seas (poems), 1896; Captains Courageous (a yarn of deep-sea fishery), 1897; The Day's Work (collected stories), 1898; A Fleet in Being (an account of a cruise in a man-of-war), 1898; Stalky and Co. (mentioned above), 1899; From Sea to Sea (mentioned above), 1899; Kim, 1901; Just So Stories (for children), 1902; The Five Nations (poems, concluding with what proved Mr. Kipling's most universally known and popular poem, "Recessional," originally published in The Times on the 17th of July 1897 on the occasion of Queen Victoria's second Jubilee, 1902; Traffics and Discoveries (collected stories), 1904; Puck of Pook's Hill (stories), 1906; Actions and Reactions (stories), 1906. Of these Kim was notable as far the most successful of Mr. Kipling's longer narratives, though it is itself rather in the nature of a string of episodes. But everything he wrote, even to a farcical extravaganza inspired by his enthusiasm for the motor-car, breathed the meteoric energy that was the nature of the man. A vigorous and unconventional poet, a pioneer in the modern phase of literary Imperialism, and one of the rare masters in English prose of the art of the short story, Mr. Kipling had already by the opening of the 20th century won the most conspicuous place among the creative literary forces of his day. His position in English literature was recognized in 1907 by the award to him of the Nobel prize.

KIPPER, properly the name by which the male salmon is known at some period of the breeding season. At the approach of breeding the male salmon, having previously spent a year, generally known as the "kip," from which the name "kipper" is said to be derived. The earliest uses of the word (in Old English cypera and Middle English kypre) seem to include salmon of both sexes, and there is no certainty as to the etymology. Skewt derives it from the Old English kippean, "to spawn." The term has been applied by various writers to salmon both during and after milting; early quotations leave the precise meaning of the word obscure, but generally refer to the unwholesomeness of the fish as food during the whole breeding season. It has been usually accepted, without much direct evidence, that from the practice of removing the male after the female had spawned, the splitting, salting and smoke-drying them, the term "kipper" is also used of other fish, particularly herrings cured in the same way. The "bloter" as distinct from the "kipper" is a herring whole without being split open.

KIPPS, ANDREW (1725–1765), English nonconformist divine and biographer, son of Robert Kipps, a silk-hosier, was born at Nottingham on the 28th of March 1725. From school at Sleaford in Lincolnshire he passed at the age of sixteen to the nonconformist academy at Northampton, of which Dr Doddridge was then president. In 1740 he graduated at a church at Boston; in 1750 he removed to Dorking in Surrey; and in 1753 he became pastor of a Presbyterian congregation at Westminster, where he remained till his death on the 8th of October 1755. Kipps took a prominent part in the affairs of his church. In 1765 till 1784 he was classical and philological tutor in Coward's training college at Hoxton; and subsequently for some years at another institution of the same kind at Hackney. In 1778 he was elected a fellow of the Antiquarian Society, and a fellow of the Royal Society in 1779. Kipps was a very voluminous writer. He contributed largely to New Man's Magazine, where he was the correspondent in England, and he had a good deal to do with the establishment and conduct of The New Annual Register. He published also a number of sermons and several pamphlets with a view to the establishment of religion. In 1762 he was appointed a member of a committee of five, consisting of Mr. Kipps, Mr. Spence, Mr. Hall, Mr. Barr, Mr. Green, for the purpose of obtaining subscriptions to a collection of works, containing the Political Discourses of Mr. Locke. For his labours in this enterprise, which he undertook as a matter of amusement, he lived to publish 5 vols. (folio, 1778–1793). In this work he had the assistance of Dr Towers. See notice by A. Rees, D.D., in The New Annual Register for 1795.

KIRBY, WILLIAM (1759–1830), English entomologist, was born at Witnesham, in Suffolk, on the 18th of September 1759. From the village school of Witnesham he passed to Ipswich grammar school, and thence to Camus College, Cambridge, where he graduated in 1781. Taking holy orders in 1782, he spent his entire life in the peaceful seclusion of an English country parsonage at Barham in Suffolk. His favourite study was natural history; and eventually entomology engrossed all his leisure. His first work of importance was his Monographia Apum Angliae (2 vols. 8vo, 1802), which as the first scientific treatise on its subject brought him into notice with the leading entomologists of his own and foreign countries. The practical result of a friendship formed in 1805 with William Spence, of Hull, was the jointly written Introduction to Entomology (4 vols., 1815–1826; 7th ed., 1850), one of the most popular books of science that have ever appeared. In 1825 he was chosen to write one of the Bridgewater Treatises, his subject being The History, Habits, and Instincts of Animals (2 vols., 1835). This undeniably fell short of his earlier works in point of scientific value. He died on the 4th of July 1850.
Besides the books already mentioned he was the author of many papers in the *Transactions of the Lennian Society*, the *Zoological Journal* and other periodicals; *Strictures on Sir James Smith's Hypothesis respecting the Lilies of the Field of our Saviour and the Arcticregion* (Londino, 1834); and he wrote the sections on insects in the *Account of the Animals seen by the late Northern Expedition while within the Arctic Circle* (1831), and in *Pamphlet-Americana* (1837). His work *By the Rev. John Freeman, published in 1832, contains a list of his works.*

**KIRCHER, ATHANASIUS** (1601–1680), German scholar and mathematician, was born on the 2nd of May 1601, at Geisa near Fulda. He was educated at the Jesuit college of Fulda, and entered upon his noviciate in that order in Mainz in 1618. He became professor of philosophy, mathematics, and Oriental languages at Würzburg, whence he was driven (1631) by the troubles of the Thirty Years' War to Avignon. Through the influence of Cardinal Barberini he next (1659) settled in Rome, where for eight years he taught mathematics in the Collegio Romano, but ultimately resigned this appointment to study hieroglyphics and other archaeological subjects. He died on the 28th of November 1680.

Kircher was a man of wide and varied learning, but singularly devoid of judgment and critical discernment. His voluminous works on philological, historical, and theological subjects have often accordingly a good deal of the historical interest which attaches to pioneering work, however imperfectly performed; otherwise they now take rank as curiosities of literature merely. They include *Arte Magna* (1644); *Magnes, sive de arte magnetica sive tripartitum* (1641); and *Magneticae rerum regna* (1667); *Prodrumus Copticus* (1636); *Lingua Aegyptiaca restituit* (1643); *Oeciolicus Pamphilus* (1660); and *O edsus Aegyptiacus, hoc est universalis, doctrinae philosophicae instauratio* (1662–1665)—works which made him the meritor of having first called attention to Egyptian hieroglyphics; *Ars magna lucis et umbrae in mundo* (1645–1646); *Musurgia universa, sive ars magna consors et dissonis* (1650); *Polygraphia, seu ars* *linguarius quo cum omnibus mundi populis poeris quis respondere* (1663); *Mundus subterraneus, qua subterraneis mundi opificium, universae denique naturae divinitate, abditum effectuum causae demonstratur.* *De umbris naturae* (1667); *Ars magna scienti* (1669); and *Latinum* (1669), a work which may still be consulted with advantage. *The Specula Mundiens Enycyclia* (1638) gives an account of a kind of calculating machine of his invention. The valuable collection of antiquities which he bequeathed to the Collegio Romano has been described by Buonanni (*Museum Kirchianum, 1799*; republished by Battara in 1773).

**KIRCHHEIM-UNTER-TECK, a town of Germany, in the kingdom of Württemberg, is pretty situated on the Lauter, at the north-west foot of the Rauhe Alb, 15 m. S.E. of Stuttgart by rail. Pop. (1905), 8852. The town has a royal castle built in 1573. The manufactures include cotton goods, damask, pianofortes, machinery, furniture, chemicals and cement. The town also has wool-spinning establishments and breweries, and a corn exchange. It is the most important wool market in South Germany, and has also a trade in fruit, timber and pigs. In the vicinity are the ruins of the castle of Teck, the hereditary stronghold of the dukes of that name. Kirchheim has belonged to Württemberg since 1581.**

**KIRCHHOFF, GUSTAV ROBERT** (1824–1887), German physicist, was born at Königsberg (Prussia) on the 1st of March 1824, and was educated at the university of his native town, where he graduated Ph.D. in 1847. After acting as *privat-docent* at Berlin for some time, he became extraordinary professor of physics at Breslau in 1850. Four years later he was appointed professor of physics at Heidelberg, and in 1875 he was transferred to Berlin, where he died on the 17th of October 1887. Kirchhoff's contributions to mathematical physics were numerous and important, his strength lying in his powers of stating a new physical problem in terms of mathematics, not merely in working out the solution of the problem he had been led to consider. A large portion of his papers were concerned with electrical questions. One of the earliest was devoted to electrical conductivity in a thin plate, and especially in a circular one, and it also contained a theorem which enables the distribution of currents in a network of conductors to be ascertained. Another discussed conduction in curved sheets; a third the distribution of electricity in two influencing spheres; a fourth the determination of the constant on which depends the intensity of induced currents; while others were devoted to Ohm's law, the motion of electricity in submarine cables, induced magnetism, &c. In other parts of his work, again, various miscellaneous topics were treated—the thermal conductivity of iron, crystalline reflection and refraction, certain propositions in the thermodynamics of solution and vaporization, &c. An important part of his work was contained in his *Vorlesungen über mathematische Physik* (1876), in which the principles of dynamics, as well as various special problems, were treated in a somewhat novel and original manner. But his name is best known for the researches, experimental and mathematical, in radiation which led him, in company with R. W. von Bunsen, to the development of spectrophotometry as a means of analysing the flux of light 1859–1860. He can scarcely be called its inventor, for not only had many investigators already used the prism as an instrument of chemical inquiry, but considerable progress had been made towards the explanation of the principles upon which spectrum analysis rests. But to him belongs the merit of having, most probably without knowing what he had already been done, enunciated a complete account of its theory, and of thus having firmly established it as a means by which the chemical constituents of celestial bodies can be discovered through the comparison of their spectra with those of the various elements that exist on this earth.

**KIRCHHOFF, JOHANN WILHELM ADOLF** (1862–1908), German classical scholar and epigraphist, was born in Berlin on the 6th of January 1862. In 1886 he was appointed professor of classical philology in the university of his native city. He died on the 26th of February 1908. He is the author of *Die Homerische Odyssee* (1859), putting forward an entirely new theory as to the composition of the Odyssey; editions of *Plutinus* (1860), *Euripides* (1855 and 1877–1878), *Aeschylus* (1888), *Hesiod (Works and Days, 1888), Xenophon, On the Athenian Constitution (3rd ed., 1889); *Ueber die Entstehung des Herodoteischen Geschichtswerkes* (2nd ed., 1878); *Thukydides und sein Urkundenmaterial* (1893).

The following works are the result of his epigraphical and paleographical studies: *Die Umbrischen Sprechdenkmäler* (1851); *Das Stadtrecht von Bantia* (1853), on the tablet discovered in 1790 at Oppido near Banzì, containing a plebiscite relating to the municipal affairs of the ancient Bantia; *Das Gotische Runenalphabet* (1852); *Die Fränkischen Runen* (1855); *Studien zur Geschichte des Griechischen Alphabets* (4th ed., 1887). The second part of vol. iv. of the *Corpus Inscriptionum Graecarum* (1859), containing the Christian inscriptions, and vol. i. of the *Corpus Inscriptionum Cattarum* (1873), containing the inscriptions before 403 with supplements thereto (vol. iv. pts. 1–3; 1877–1891) are edited by him.

**KIRGHIZ, a large and widespread division of the Turkish family, of which there are two main branches, the Kara-Kirghiz of the uplands and the Kirghiz-Kazaks of the steppe. They jointly number about 3,000,000, and occupy an area of perhaps the same number of square miles, stretching from Kulja westwards to the lower Volga, and from the headstreams of the Ob southwards to the Pamir and the Turkoman country. They seem closely allied ethnically to the Mongolians and in speech to the Tartars. But both Mongols and Tartars belonged to themselves originally to one racial stock and formed part of the same hordes or nomadic armies: also the Western Turks have to a large extent lost their original physique and become largely assimilated to the regular "Caucasian" type. But the Kirghiz have either remained nearly altogether unmixed, as in the uplands, or else have intermingled in the steppe mainly with the Volga Kalimucks in the west, and with the Dzungarian nomads in the east, all alike of Mongol stock. Hence they have everywhere to a large extent preserved the common Mongolian features, while retaining their primitive Tartar speech. Physically they are a middle-sized, square-built race, inclined to stoutness, especially in the steppe, mostly with long black hair, scant beard or none, small, black and oblique eyes, though blue or grey also occur in the south, broad Mongoloid features, high cheekbones, broad, flat nose, small mouth, brachycephalous head, very small hands and feet, dirty brown or swarthy complexion,
often yellowish, but also occasionally fair. These characteristics, while affiliating them directly to the Mongol stock, also betray an admixture of foreign elements, probably due to Finnish influences in the north, and Tajik or Iranian blood in the south. Their speech also, while purely Turkic in structure, possesses, not only many Mongolian and a few Persian and even Arabic words, but also some terms unknown to the other branches of the Mongolo-Tatar linguistic family, and which should perhaps be traced to the Kirgian-Kuan, Wu-sun, Tingling, and other peoples of South Siberia partly absorbed by them.

The Kara-Kirghiz.—The Kara or "Black" Kirghiz, so called from the colour of their tents, are known to the Russians either as Cherynie (Black) or Dikokammenievy (Wild Stone or Rocky) Kirghiz, and are the Block Kirghiz of some English writers. They are on the whole the purest and best representatives of the race, and properly speaking to them alone belongs the distinctive national name Kirghiz or Kirghiz. This term is commonly traced to a legendary chief, Kirghiz, sprung of Oghuz-Khan, ninth in descent from Japheth. It occurs in its present form for the first time in the account of the embassy sent in 669 by the East Roman emperor Justin II. to the Uighur Khan, Dugla-Ditubul, where it is stated that this prince presented a slave of the Kirghiz tribe to Zemark, head of the mission. In the Chinese chronicles the word assumes the form Ki-li-kii-tz', and the writers of the Yuan dynasty (1280-1367) place the territory of these people 10,000 li north-west of Pekin, about the head-streams of the Yenisei. In the records of the T'ang dynasty (618-907) they are spoken of under the name of Kha-kiu-tz' (perhaps Haya, sometimes transliterated Haka), and it is mentioned that these Khakas were of the same speech as the Khoei-khu. From this it follows that they were of Mongolo-Tatar stock, and are wrongly identified by some ethnologists with the Kirgian-Kuan, Wu-sun, or Tingling, all of whom are described as tall, with red hair, "green" or grey eyes, and fair complexion, and must therefore have been of Finnish stock, akin to the present Soyotes of the upper Yenisei.

The Kara-Kirghiz are by the Chinese and Mongolians called Bursal, where w is the Mongolian plural ending, as in Tangut, Yakut, modified to yil in Burut, the collective name of the Siberian Mongolians of the Baikal district. Thus the term Bur is the common Mongolian designation both of the Baikal Mongols and of the Kara-Kirghiz, who occupied this very region and the upper Yenisei valley generally till conquered by the Russians. Their ancestors, the Khakas, lay in the south of the present governments of Yeniseisk and Tomsk, stretching thence southwards beyond the upper courses of the Tannoula, a branch of the Chinese territory. Here the Russians first met them in the 17th century, and at that time, all of the Kazakstans exterminated all those of the Irtysh, driving the rest farther west and south-westwards. Most of them took refuge with the Kirghiz or Kar-Kirkis, or with the two tribes of the Jaxartes, and so homes, at least since the 13th century, have been the Al-tau range, the Issyk-kul basin, the Terek, Chu and Talass river valleys, the Tian-shan range, the uplands draining both to the Tarim and to the Jaxartes and Oxus, including Khokand, Karataghi and Shingan southwards to the Pamir table-land, visited by them in summer. They thus occupy most of the uplands along the Russo-Chinese frontier, between 35° and 50° N. lat. and between 70° and 85° E. long.

The Kara-Kirghiz are all grouped in two main sections—the On or "Right" and the On or "Left." The first, with seven branches (Bogu, Sary-Bagishch, Son-Bagishch, Sary-Bagishch, Chak-Chak, Basinsk, and the Son or "Left" in the west, with four branches (Konko or Kheche, Soru, Mundus, Kaitai or Kintai). The Sol section occupies the region between the Talass and Oxus head-streams in Ferghana (Khokand and Bokhara, where they are intermingled in contact with the Galchars or Highland Tajiks. The On section lies on both sides of the Tien-shan, about Lake Issyk-kul, and in the Chu, Terek and Nart (upper Nart). The total number of Kara-Kirghiz exceeds 800,000. All are essentially nomads, occupied mainly with stock breeding, chiefly sheep, which is by far the most important, but also herds of a few horses, and particularly of a fine breed, the very hardy breed, sheep of the fat-tailed species, oxen used also for ploughing, and camels of both species. Agriculture is limited chiefly to the cultivation of wheat, barley and millet, from the last of which a considerable quantity is distilled. Trade is carried on chiefly by barter, cattle being taken by the dealers from China, Turkestan and Russia in exchange for manufactured goods.

The Kara-Kirghiz are governed by the "manaps," or tribal rulers, who enjoy almost unlimited authority, and may even sell or kill their subjects. In religious matters they differ little from the Kazaks, whose practices are described below. Although generally recognizing Russian sovereignty since 1864, they pay no taxes.

The Kazaks.—Though not unknown to them, the term Kirghiz is never used by the steppe nomads, who always call themselves simply Kazaks, commonly interpreted as riders. The first authentic reference to this name is by the Persian poet and historian Firdousi (1020), who speaks of the Kazak tribes as much dreaded steppe marauders, all mounted and armed Khita, who, from his description, and from the circumstance the term Kazak came to be gradually applied to the tribes of the Cossack Siberia, equipped, and it thus spread from the Aralo-Caspian basin to the Central parts of South Siberia, where it still survives under the form of Cossack, spelt Kaz or Kokz in Russian. Hence though Kazak and Cossack are originally the same word, the former now designates a Mongolo-Tatar nomad race, the latter various members of the Slav family. Since the 18th century the Russians have used the compound expression Kirghiz-Kazakk, chiefly in order to distinguish them from their own Cossacks, at that time overrunning Siberia. Siegmund Herberstein (1486-1566) is the first European who mentions them by name, and it is noteworthy that he speaks of them as "Tartars," that is, a people rather than Turkic than Mongol stock.

In their present homes, the so-called "Kirghiz steppes," they are far more numerous and widespread than their Kara-Kirghiz, stretching almost uninterrupted from Lake Balkhash round the Aral and Caspian Seas westwards to the lower Volga, and from the Ural mountains southwards to the Caspian Sea and Ust-Ulute plateau. Their domain, which is nearly 2,000,000 sq. miles in extent, lies mainly between 45° and 55° N. lat. and from 45° to 80° E. long. Here they came under the sway of Jenghiz Khan, after whose death they fell to the share of his son, the Juki, head of the Golden Horde, and continued to retain their own Khans. When the Uzbegs acquired the ascendancy, many of the former subjects of the Juki and Juggati revolted and joined the Kazaks. Thenceforward the year 1500 were formed two powerful steppes, the Khiva and the Keri-stan, with the Mogul-Ulus and the Kazak, the latter of whom, under their Khan Arslan, are said by Sultan Baber to have had as many as 400,000 fighting men. Their numbers have been swollen by voluntary or enforced accessions from the fragments of the Golden Horde, such as the Kipchaks, Naimans, Konrats, Jalairs, Kankals, whose names are still preserved in the tribal divisions of the Kazaks. And as some of these peoples were undoubtedly of true Mongol stock, their names have given a colour to the statement that all the Kazaks were either of Mongol than of Turki origin. But the universal practice is a mere variety of the Turki speech throughout the Kazak steppes is such as to make it difficult to say that any element must at all times have been in the ascendancy. Very various accounts have been given of the relationship of the Kipchak to the Kazak, but put together they form a subdivision of the Kirghiz-Kazaks. The Kara-Kalpaks are an allied but apparently separate tribe.

The Kirghiz-Kazaks have long been grouped in three large "divisions," the Kiskeisk or "Golden Horde," the Khiva, or Kipchak, and the Keri-stan or "Black Horde." These are the so-called "races," which are again grouped in tribes, and these in sections, branches and auls, or communities of from five to fifteen. The division into hordes has been traditionally referred to a powerful Khan, who divided his state amongst his three sons, the eldest of whom became the founder of the Ulu-Yuz, or Great Horde, the second of the Urtu-Yuz, or Middle Horde, and the third of the Kipchak-Yuz, or Little Horde. The last two under their common Khan Abulchurair voluntarily submitted in 1730 to the Empress Anne. Most of the Great Horde were subdued by Yunn, Khan of Fergana, in 1798, and all the still independent tribes finally accepted Russian sovereignty in 1819.

Since 1801 a fourth division, known as the Inner or Buksey-skaya Horde, from the name of their first khan, Bukei, has been settled on the Orenburg steppe. But these divisions affect the common people alone, all the higher orders and ruling families being broadly classed as White and Black Kost or Bones. The White Bones comprise only the khan and his descendants, besides a class of "saints." The Black Bones include all the rest, except the Telengut or servants of the khan, and the Kuli or slaves.

The Kazaks are an honest and trustworthy people, but busy, sluggish, sullen and unfriendly. Even the hospitality enjoyed by the Koran is displayed only towards the orthodox Sunnite sect. So essentially nomadic are all the tribes that they cannot adopt a settled life without losing the very sentiment of their nationality, and becoming rapidly absorbed in the Slav population. They dwell exclusively in semicircular tents consisting
of a light wooden framework, and red cloth or felt covering, with an opening above for light and ventilation.

The camp life of the Kazaks seems almost unendurable to Europeans in winter, when they are confined altogether to the tent, and exposed to endless discomforts. In summer the day is spent mostly in sleeping or drinking koumiss, followed at night by feasting and the recital of tales, varied with songs accompanied by the music of the flute and balalaika. But horsemanship is the great amusement of all true Kazaks, who may almost be said to be born in the saddle. Hence, though excellent riders, they are bad walkers. Though hardy and long-lived, they are uncommon in their habits and often decimated by small-pox and Siberian plague. They have no fixed meals, and live mainly on mutton and goat and horse flesh, and instead of bread use the so-called balamaky, a mess of flour fried in dripping and diluted in water. The universal drink is koumiss, which is wholesome, nourishing and a specific against all chest diseases.

The dress consists of the chapán, a flowing robe of which one or two are worn in summer and several in winter, fastened with a silk or leather girdle, in which are stuck a knife, tobacco pouch, seal and a few other trinkets. Broad silk or cotton pants are also worn over the chapán, which is of velvet, silk, cotton or felt, according to the rank of the wearer. Large black or red leather boots, with round white felt pointed caps, complete the costume, which is much the same for both sexes.

Like the Kara-Kirghiz, the Kazaks are nominally Sunnites, but Shamanists at heart, worshipping, besides the Kudal or good divinity, the Shaitan or bad spirit. Their faith is strong in the talchi or soothsayer and other charlatans, who know everything, can do everything, and heal all disorders at pleasure. But they are not fanatics, though holding the abstract doctrine that the "Kafir" may be lawfully oppressed, including in this category not only Buddhists and Christians, but even Mahomedans of the Shia sect. There are no fasts or ablations, mosques or mollahs, or regular prayers. Although Musulmans since the beginning of the 16th century, they have scarcely yet found their way to Mecca, their pilgrims visiting instead the more convenient shrines of the "saints" scattered over eastern Turkestan. Unlike the Mongolians, the Kazaks treat their dead with great respect, and the low steppe hills are often entirely covered with monuments raised above their graves.

Letters are neglected to such an extent that whoever can mention a few verses is regarded as a savant, while he becomes a prodigy of learning if able to read the Koran in the original. Yet the Kazaks are naturally both musical and poetical, and possess a considerable number of national songs, which are usually repeated with variations from mouth to mouth.

The Kazaks still choose their own khans, who, though confirmed by the Russian government, possess little authority beyond their respective tribes. The real rulers are the elders or umpires and sultans, all appointed by public election. Brigandage and raids arising out of tribal feuds, which were formerly recognized institutions, are now severely punished, sometimes even with death. Capital punishment, usually by hanging or strangling, is inflicted for murder and adultery, while three, nine or twenty-seven times the value of the stolen property is exacted for theft.

The domestic animals, daily pursuits and industries of the Kazaks differ but slightly from those of the Kara-Kirghiz. Some of the wealthy steppe nomads own as many as 20,000 of the large fat-tailed sheep. Goats are kept chiefly as guides for these flocks; and the horses, though small, are hardy, swift, light-footed and capable of covering from 50 to 60 miles at a stretch. Amongst the Kazaks there are a few workers in silver, copper and iron, the chief arts besides, being skin dressing, wool spinning and dyeing, carpet and felt weaving. Trade is confined mainly to an exchange of live stock for woven and other goods from Russia, China and Turkestan.

Since their subjection to Russia the Kazaks have become less lawless, but scarcely less nomadic. A change of habit in this respect is opposed alike to their tastes and to the climatic and other outward conditions. See also Turks.

Various Russian works by Nalivkin, published in St Petersburg, contain much valuable information, and N. N. Pantusov, *Specimens of Kirghiz Popular Poetry*, with Russian translations (Kazan, 1903-1904).

**KIRIN,** a province of central Manchuria, with a capital bearing the same name. The province has an area of 90,000 sq. m., and a population of 6,500,000. The chief towns besides the capital are Kwang-chang-tze, 80 m. N.W. of the capital, and Harbin on the Sungari river. The city of Kirin is situated at the foot of the Lau-Ye-Ling mountains, on the left bank of the Sungari or Giren-ula, there 300 yds. wide, and is served by a number of small industries. It contains a considerable number of European residents, the larger part of whom are Russian. The city is somewhat modern in appearance. The houses are white brick, with tiled roofs, in the Russian style, and the streets are well paved and clean. There is a good railway connection with Mukden and Hsinking, and with the Pacific line. Kirin is a large grain growing district, and contains some fine gardens. There are some good European and Chinese buildings, and the city is well supplied with water.

**KIRK, SIR JOHN** (1832-1887), British naturalist and administrator, son of the Rev. John Kirk, was born at Barry, near Arbroath, on the 19th of December 1832. He was educated at Edinburgh for the medical profession, and after serving on the civil medical staff throughout the Crimean War, was appointed in February 1858 physician and naturalist to David Livingstone's second expedition to Central Africa. He was by Livingstone's side in most of his journeys during the next five years, and was one of the first four white men to behold Lake Nyassa (Sept. 16, 1859). He was finally invalided home on the 9th of May 1863. The reputation he gained during this expedition led to his appointment in January 1866 as acting surgeon to the political agency at Zanzibar. In 1868 he became assistant political agent, being raised to the rank of consul-general in 1873 and agent in 1880. He retired from that post in 1887. The twenty-one years spent by Kirk in Zanzibar covered the most critical period of the history of European intervention in East Africa; and during the greater part of that time he was the virtual ruler of the country. With Seyyid Bargash, whom he became Sultan in 1870, he had a controlling influence, and after the failure of Sir Bartle Frere's efforts he succeeded in obtaining (June 5, 1873) the sultan's signature to a treaty by which the slave trade on his dominions was prohibited. In 1877 Bargash offered to a British merchant—Sir W. MacKinnon—a lease of his mainland territories, and he gave Kirk a declaration in which he bound himself not to cede territory to any other power than Great Britain, a declaration ignored by the British government. When Germany in 1885 claimed districts considered by the sultan to belong to Zanzibar, Kirk intervened to prevent Bargash going in person to Berlin to protest and induced him to submit to the dismemberment of his dominions. In the delicate negotiations which followed
Kirk used his powers to checkmate the German designs to supplant the British in Zanzibar itself; this he did without destroying the Arab form of government. He also directed the efforts, this time successful, to obtain for Britain a portion of the mainland—Bargash in May 1887 granting to Mackinnon a lease of territory which led to the foundation of British East Africa. Having thus served both Great Britain and Zanzibar, Kirk resigned his post (July 1887), retiring from the consular service. In 1889–1890 he was a plenipotentiary at the slave trade conference in Brussels, and was one of the delegates who fixed the tariff duties to be imposed in the Congo basin. In 1895 he was sent by the British government on a mission to the Niger; and on his return he was appointed a member of the Foreign Office committee for constructing the Uganda railway. As a naturalist Kirk took high rank, and many species of the flora and fauna of Central Africa were made known by him, and several bear his name, e.g. the Ologale kirkii (a lemuroid), the Madoqua kirkii (a diminutive antelope), the Landolphia kirkii and the Clematis kirkii. For his services to geography he received in 1892 the patrons' medal of the Royal Geographical Society, of which society he became foreign secretary. Kirk was created K.C.B. in 1900. He married, in 1867, Miss Helen Cooke.

KIRKBY, JOHN (d. 1290), English ecclesiastic and statesman, entered the public service as a clerk of the chancery during the reign of Henry III. Under Edward I. he acted as keeper of the great seal during the frequent absences of the chancellor, Robert Burnell, being referred to as vice-chancellor. In 1262 he was employed by the king to make a tour through the counties and boroughs for the purpose of collecting money; this and his other services to Edward were well rewarded, and although not yet ordained priest he held several valuable benefices in the church. In 1283 he was chosen bishop of Rochester, but owing to the opposition of the archbishop of Canterbury, John Peckham, he did not press his claim to this see. In 1286, however, two years after he had become treasurer, he was elected bishop of Ely, and he was ordained priest and then consecrated by Peckham. He died at Ely on the 26th of March 1290. Kirkby was a benefactor to his see, to which he left some property in London, including the locality now known as Ely Place, where for many years stood the London residence of the bishop of Ely.

Kirkby's Quest is the name given to a survey of various English counties which was made under the bishop's direction probably in 1284 and 1285. For this see Inquisitions and Assessments relating to Feudal Aids, 1284–1341, vol. i. (London, 1899).

KIRKCALDY (locally pronounced Kirkkaldi), a royal, municipal and police burgh and seaport of Fife, Scotland. Pop. (1901), 34,079. It lies on the Firth of Forth, 26 m. N. of Edinburgh by the North British railway, via the Forth Bridge. Although Columba is said to have planted a church here, the authoritative history of the town does not begin for several centuries after the era of the saint. In 1240 the church was bestowed by David, bishop of St Andrews, on Dunfermline Abbey, and in 1334 the town with its harbour was granted by David II. to the same abbey, by which it was conveyed to the bailies and council in 1450, when Kirkcaldy was created a royal burgh. In the course of another century it had become an important commercial centre, the salt trade of the district being then the most important in Scotland. In 1644, when Charles I. raised it to a free port, it owned a hundred vessels, and six years later it was assessed as the sixth town in the kingdom. After the Union its shipping fell off, and the salt traffic and the Arbroath fisheries, the dependence accelerating the decline. But its linen manufactures, begun early in the 18th century, gradually restored prosperity; and when other industries had taken root its fortunes advanced by leaps and bounds, and there is now no more flourishing community in Scotland. The chief topographical feature of the burgh is its length, from which it is called the "lang loun." Formerly it consisted of little besides High Street, with closes and wynds branching off from it; but now that it has absorbed Invertil, Linktown and Abbotshall on the west, and Pathhead, Sinclairstown and Gallatown on the east, it has reached a length of nearly 4 m. Its public buildings include the parish church, in the Gothic style, St Bryce and United Free church, with a spire 200 ft. high, a town-hall, corn exchange, public libraries, assembly rooms, fever hospital, sheriff court buildings, people's club and institute, high school (1894)—on the site of the ancient burgh school (1382)—the Beveridge hall and free library, and the Adam Smith memorial hall. To the west lies Beveridge Park of 110 acres, including a large sheet of water, where there is a pleasure ground to the town in 1802. The harbour has an inner and outer division, with wet dock and wharves. Plans for its extension were approved in 1903. They include the extension of the east pier, the construction of a south pier 800 ft. in length, and of a tidal harbour 5 acres in area and a dock of 4 acres. Besides the manufacture of sheeting, towelling, ticks, dowlas and sail-cloth, the principal industries include flax-spinning, net-making, bleaching, dyeing, tanning, brewing, brass and iron founding, and there are potteries, flour-mills, engineering works, fisheries, and factories for the making of oil-cloth and linoleum. In 1847 Michael Nairn conceived the notion of utilizing the fibre of cotton and wool to produce a flooring-covering more lasting than carpet and yet capable of taking a pattern. The result of his experiments was oil-cloth, in the manufacture of which Kirkcaldy has kept the predominance to which Nairn's enterprise entitled it. Indeed, this and the kindred linoleum business (also due to Nairn, who in 1877 built the first linoleum factory in Scotland) were for many years the monopoly of Kirkcaldy. There is a large direct export trade with the United States. Among well-known natives of the town were Adam Smith, Henry Balnaves of Halhill, the Scottish reformer and lord of session in the time of Queen Mary; George Gillespie, the theologian and a leading member of the Westminster Assembly, and his younger brother Patrick (1617–1675), a friend of Cromwell and principal of Glasgow University; John Ritchie (1775–1870), one of the founders of the Scotsman; General Sir John Oswald (1771–1840), who had a command at San Sebastian and Vittoria. Sir Michael Scott of Balwearie castle, about 14 m. W. of the town, was sent with Sir David Wemyss to bring the Maid of Norway to Scotland in 1290; Sir Walter Scott was therefore in error in adopting the tradition that identified him with the wizard of the same name, who died in 1334. The Kirkcaldy Academy is under the control of the town, where Irving spent seven years, and where he made the acquaintance of the lady he afterwards married. Kirkcaldy combines with Dysart, Kinghorn and Burntisland to return one member to parliament.

KIRKCALDY OF GRANGE, SIR WILLIAM (c. 1520–1573), Scottish politician, was the eldest son of Sir James Kirkcaldy of Grange (d. 1556), a member of an old Fifeshire family. Sir James was lord high treasurer of Scotland from 1537 to 1543 and was a determined opponent of Cardinal Beaton, for whose murder in 1546 he was partly responsible. William Kirkcaldy assisted to compass this murder, and when the castle of St Andrews surrendered to the French in July 1547 he was sent as a prisoner to Normandy, whence he escaped in 1550. He was then employed in France as a secret agent by the advisers of Edward VI., being known in the cyphers as Corax; and later he served in the French army, where he gained a lasting reputation for skill and bravery. The sentence passed on Kirkcaldy for his share in Beaton's murder was removed in 1556, and returning to Scotland in 1557 he came quickly to the front; as a protestant he was one of the leaders of the lords of the conclave who attempted to murder the regent Mary 4th June, and he assisted to harass the French troops in Fife. He opposed Queen Mary's marriage with Darnley, being associated at this time with Murray, and was forced for a short time to seek refuge in England. Returning to Scotland, he was accessory to the murder of Rizzio, but he had no share in that of Darnley; and he was one of the lords who banded themselves together to rescue Mary after her marriage with Bothwell. After the fight at Carberry Hill the queen surrendered herself to Kirkcaldy, and his generalship was mainly responsible for her defeat at Langside.
He seems, however, to have believed that an arrangement with Mary was possible, and coming under the influence of Maitland of Lethington, whom in September 1560 he released by a stra- 

tegem from his confinement in Edinburgh, he was soon “vehe-
mently suspected of his fellows.” After the murder of Murray Kirckaldy ranged himself definitely among the friends of the imprisoned queen. About this time he forcibly released one of 

his supporters from imprisonment, a step which led to an alter-
cation with his former friend John Knox, who called him a “murderer and throat-cutter.” Defying the regent Lennox, Kirckaldy began to strengthen the fortifications of Edinburgh castle, of which he was governor and which he held for Mary, and early in 1573 he refused to come to an agreement with the 

regent Morton because the terms of peace did not include a section of his friends. After this some English troops arrived to 

help the Scots, and in May 1573 the castle surrendered. 

Strenuous efforts were made to save Kirckaldy from the vengeance of his foes, but they were unavailing; Knox had prophesied that he would be hanged, and he was hanged on the 3rd of August 

1573.

See Sir James Melville’s Memoirs, edited by T. Thomson (Edin-

burgh, 1827); J. Grant, Memoirs and Adventures of W. Kirckaldy (Edinburgh, 1849); L. A. Barbé, Kirckaldy of Grange (1897); and A. Lang, History of Scotland, vol. ii. (1902).

**KIRKCUDBRIGHT** (pron. Ker-kú-brít), a royal and police burgh, and county town of Kirkcudbrightshire, Scotland. Pop. (1901), 3586. It is situated on the west coast at the mouth of the river Dee, 6 m. from the sea and 30 m. S.W. of Dumfries by the Glasgow & South-Western railway, being the terminus of a branch line. The old form of the name of the town was Kilicudbright, from the Gaelic Cill Cudbert, “the chapel of Cuthbert,” the saint’s body having lain here for a short time during the seven years that lapsed between its exhumation and the re-interment at Chester-le-

Street. The estuary of the Dee is divided at its head by the peninsula of St Mary’s Isle, but though the harbour is the best in south-western Scotland, the great distance to which the tide reaches impairs its usefulness. Among the public buildings are the academy, Johnstone public school, the county buildings, 

town-hall, museum, Mackenzie hall and market cross, the last-

named standing in front of the old court-house, which is now used as a drill hall and fire-station. No traces remain of the 

greyfriars’ or Franciscan convent founded by Alexander II., 

nor of the nunnery that was erected in the parish of Kirkcud-

bright. The ivy-clad ruins of Bomby castle, founded in 1582 

by Sir Thomas Macellan, ancestor of the barons of Kirkcud-

bright, stand at the end of the chief street. The town, which 

witnessed much of the international strife and Border lawless-

ness of the reign of James I., is a little town which received its 

charter in 1555. After the battle of Towton, Henry VI. crossed 

the Solway (August 1461) and landed at Kirkcudbright to join 

Queen Margaret at Linlithgow. It successfully withstood the 

English siege in 1547 under Sir Thomas Carleton, but after the 

country had been overrun was compelled to surrender at dis-

cretion. Lord Maxwell, earl of Morton, as a Roman Catholic, 

mustered his tenants here to act in concert with the Armada; 

but on the approach of King James VI. to Dumfries he took ship 
at Kirkcudbright and was speedily captured. The burgh is one of the Dumfries district groups of parliamentary burhs. On St Mary’s Hallow is situated the seat of the earl of Selkirk, at whose house Robert Burns gave the famous Selkirk grace:—

“Some ha’me eat, and canna eat, 

And some wad eat that want it; 

But we ha’me eat, and we can eat, 

And see the Lord be frank.”

Fergus, lord of Galloway, a celebrated church-builder of the 12th century, had his principal seat on Palace Isle in a lake called 

after him Loch Fergus, near St Mary’s Isle, where he erected the 

priory de Traye, in token of his penitence for rebellion against 

David I. The priory was afterwards united as a dependent 

cell to the abbey of Holyrood. **DUNDEEANN ABBEY**, 43 m. S.E., 

was, however, his greatest achievement. It was a Cistercian 

house, colonized from Rievaulx, and was built in 1140. There 

now remain only the transept and choir, a unique example of 

the Early Pointed style. **TONGUELAND** (or Tungland), 21 m. 

N. by E., has interesting historical associations. It was the site of a Premonstratensian abbey built by Fergus, and it was here that 

Queen Mary rested in her flight from the field of Langside (May 13, 1568). The well near Tongueland bridge from which 

she drank still bears the name of the Queen’s Well.

**KIRKCUDBRIGHTSHIRE** (also known as the Stewardry of **KIRKCUDBRIGHT** and **EASE GALLOWAY**), a south-western county of Scotland, bounded N. and N.W. by Ayrshire, W. and S.W. by Wigtownshire, S. and S.E. by the Irish Sea and Solway Firth, and E. and N.E. by Dumfriesshire. It includes the small 

islands of Heant and Littleross, which are utilized as light- 

house stations. It has an area of 575,565 acres or 890 sq. m. 

The north-western part of the shire is rugged, wild and desolate. 

In this quarter the principal mountains are Merrick (2764 ft.), 

the highest in the south of Scotland, and the group of the 

Rinns of Kells, the chief peaks of which are Coscure (2669), 

Carlings Cairn (2650), Meikle Millilie (2446) and Millilie (2350). 

Towards the south-west the chief eminences are Lamachan (2349), 

Larg (2216), and the bold mass of Cairnsmore of Fleet (2332). 

In the south-east the only imposing height is Crieff (1860). In 

many places the river Ettrick rises the fleets of Carnie and of 

Kirkcudbright (2612), and close to the Ayrshire border is the Windy Standard (2287). The southern section of the shire is mostly level or undulating, but characterized by much picturesque scenery. The shore is generally bold and rocky, indented by numerous estuaries forming natural harbours, which however are of little use for commerce owing to the shallowness of the sea. Large 

stretches of sand are exposed in the Solway at low water and the 

rapid flow of the tide has often occasioned loss of life. The 

number of “burns” and “waters” is remarkable, but their 

length seldom exceeds 7 or 8 m. Among the longer rivers are 

the Cree, which rises in Loch Mean and reaches the sea near 

Creetown after a course of about 30 m., during which it forms 

the boundary, at first of Ayrshire and then of Wigtownshire; 

the Dee or Black Water of Dee (so named from the peat by which it is coloured), which rises in Loch Dee and after a course mainly S.E. and finally S., enters the sea at St Mary’s Isle below Kirk-

cudbright, its length being nearly 36 m.; the Urr, rising in Loch 

Urr on the Dumfriesshire border, falls into the sea a few miles 

south of Dalbeattie 27 m. from its source; the Ken, rising on the 

confines of Ayrshire, flows mainly in a southerly direction and 

joins the Dee at the maritime hill of Cairnsmore of Kirkcudbright; 

the River of 24 m. through lovely scenery; and the Deugh which, rising on the northern flank of the Windy Standard, pursues an extra-

ordinarily winding course of 20 m. before reaching the Ken. 

The Nith, during the last few miles of its flow, forms the boundary 

with Dumfriesshire, to which county it almost wholly belongs. 

The lochs and mountain tarns are many and well distributed; 

but except Loch Ken, which is about 6 m. long by ½ m. wide, few 

of them attain noteworthy dimensions. There are several passes 

in the hill regions, but the only well-known gap is Glen Trool, 

not far from the district of Carrick in Ayrshire, the fame of which 

rests partly on the romantic character of its scenery, which is 

very wild around Loch Trool, and more especially on its associa-

tions with Robert Bruce. It was here that when most closely 

beset by his enemies, who had tracked him to his fastness by 

sleuth hounds, Bruce with the aid of a few faithful followers won 

a surprise victory over the English in 1307 which proved the 

turning-point of his fortunes.

**Geology.**—Silurian and Ordovician rocks are the most important in this county; they are thrown into oft-repeated folds with their axes lying in a N.E.-S.W. direction. The Ordovician rocks are 

graptolitic shales and grits of Lanarkshire age, but the same are also found around Dalry, Croyburn, New Galloway, Castle Douglas and Kirkcudbright. Overlying the 

Llandovery beds on the south coast are strips of Wenlock rocks; they are found between Kirkcudbright and Girvan and are well exposed in Kirkcudbright Bay, and they can be traced farther round the coast between the granite and the younger rocks. Carboniferous rocks 

appear in small faulted tracts, unformable on the Silurian, on
the shores of the Solway Firth. They are best developed about Kirkbean, where they include a basal red breccia followed by conglomerates, grits and limestone. A large number of the small- to medium-sized rounded boulders of Permian age just come within the counties on the W. side of the Nith at Dumfries. Volcanic necks occur in the Permian and basalt dikes penetrate the Silurian at Borgue, Kirkandrews, and Kirkcudbright. The highest point of the county is formed by the masses of granite which have been intruded into the Ordovician and Silurian rocks; the Criffel mass lies about Dalbeattie and Bengairn, another mass extends east and west between the Caimsmore of Fleet and Loch Ken, and between the Criffel and Loch Doon and the Dee, and a small form mass the Cairnsmore of Carsphairn. Glacial deposits occupy much of the low ground; the ice, having travelled in a southerly or south-easterly direction, has left abundant striæ on the other ground to indicate its course. Radiation of the ice streams took place from the heights of Merrick, Kells, &c.; local moraines are found near Carsphairn and in the Deagh and Minnoch valleys. Glacial drumlins of boulder clay lie in the vales of the Dee, Cree and Urr.

**Climate and Agriculture.** The climate and soil are better fitted for grass and green crops than for grain. The annual rainfall averages 45 inches, for January 38 inches; for July 59 inches. The major part of the land is either waste or poor pasture. More than half the holdings consist of 50 acres and over. Oats is the predominant grain crop, the acreage under barley being small and that under wheat insignificant. Turnips are successfully cultivated, and potatoes are the only other green crop raised on a moderately large scale. Sheep-rearing has been pursued with great enterprise. The average is considerably in excess of that for Scotland. Black-faced and Cheviots are the most common on the high ground, and a crossing of Largers with either is used for mountain breeding is followed with steady success; the black polled Galloway is the general breed, but Argyshires have been introduced for dairying, cheese-making occupying much of the farmers' attention. Horses are extensively raised, a breed of small-sized hardy and spirited animals being specifically known as Galloways. Most of the horses are used in agricultural work, but a large number are also kept for stock; Clydesdales are bred to some extent. Pig-rearing is an important pursuit, pork being supplied to the English markets in considerable quantities. During the last quarter of the 19th century the number of pigs increased 50 per cent. Bee-keeping has been followed with special care and the honey of the shire is consequently in good repute.

The proportion of woodland in the county is small.

**Industries.**—The shire ranks next to Aberdeen as a granite-yielding county and the quarries occupy a large number of hands. In some towns and villages there are manufactures of linen, woollen and cotton goods; at various places distilling, brewing, tanning and paper-making are carried on, and at Dalbeattie there are brick and tile works. There is a little ship-building at Kirkcudbright. The Solway fishery is of small account, but salmon-fishing is of importance. Fishing is also carried on in several rivers, the Dee fish being notable for their excellence.

The only railway communication is by the Glasgow & South-Western railway running from Dumfries to Castle Douglas, from which there is a branch to Kirkcudbright, and the Portpatrick and Wigtownshire railway, beginning at Castle Douglas and leaving the county at Newton Stewart. These are supplemented by coachages between various points, as from New Galloway to Carsphairn, from Dumfries to New Abbey and Dalbeattie, and from Auchencarvie to Dalbeattie.

**Population.**—The population was 39,985 in 1891 and 39,938 in 1901, when 98 persons spoke Gaelic and English. The chief towns are Castle Douglas (pop. in 1901, 3018), Dalbeattie (3469), Kirkcudbright (2386), Maxwelltown (2750) with Creetown (91), and Gatehouse of Fleet (1013). The shire returns one member to parliament, and the county town (Kirkcudbright) belongs to the Dumfries district group of parliamentary boroughs, and Maxwelltown is combined with Dumfries. The county forms part of the sheriffdom of Dumfries and Galloway, and there is a resident sheriff-substitute at Kirkcudbright. The county is under school-board jurisdiction. There is an academy at Kirkcudbright, high schools at Dumfries and Newton Stewart, and technical classes at Kirkcudbright, Dalbeattie, Castle Douglas and Dumfries.

**History.**—The country west of the Nith was originally peopled by a tribe of Celtic Gaels called Novantae, or Atectics, or the Saxonat Acquae, owing to their geographical position, which prevented any ready intermingling with the other Pictish tribes farther north, long retained their independence. After Agricola's invasion in A.D. 79 the country nominally formed part of the Roman province, but the evidence is against there ever having been a prolonged occupation. After the return of the Saxons in 850, the Novantae remained for a time under their own chieftain, but in the 7th century accepted the overlordship of Northumbria. The Saxons, soon engaged in struggles with the Norsemen, had no leisure to look after their tributaries, and early in the 9th century the Atectics made common cause with the Vikings. Henceforward they were styled, probably in contempt, Gall- gaedhel, or stranger Gaels (i.e. Gaels who fraternized with the foreigners), the Welsh equivalent for which, Galluwydd, gave rise to the name of Galloway (of which Galway is a variant), which was applied to their territory and still denotes the Stewartry of Kirkcudbright and the shire of Wigtown. When Scotland was consolidated under Kenneth MacAlpine (crowned at Scone in 844), Galloway was the only district in the south that did not form part of the kingdom; but in return for the services rendered to him at this crisis Kenneth gave his daughter in marriage to the Galloway chief, Olaf the White, and also conferred upon the men of Galloway the privilege of marching in the van of the Scottish armies, a right exercised and recognized for several centuries. During the next two hundred years the effective man-occupation of the land was in the hands of the Galloway manor in the person of the Earl of Galloway, who had the continual lawlessness of the Scandinavian rovers. When Malcolm Canmore defeated and slew Macbeth in 1057 he married the dead king's widow Ingiborg, a Pictish princess, an event which marked the beginning of the decay of Norse influence. The Galloway chiefs hesitated for a time whether to throw in their lot with the Northumbrians or with Malcolm; but language, race and the situation of their country at length induced them to become lieges of the Scottish king. By the close of the 12th century the boundary between England and Scotland was roughly delimited on existing lines. The feudal system ultimately arrogated the power of the Galloway chiefs, who resisted the innovation to the last. Several of the lords or "kings" of Galloway, a line said to have been founded by Fergus, the greatest of them all, asserted in vain their independence of the Scottish crown; and in 1234 the line became extinct in the male branch on the death of Fergus's great-grandson Alan. One of Alan's daughters, Dervoigula, had married John de Biali (father of the John de Biali who was king of Scotland from 1292 till his abdication in 1306), and the people, out of affection for Alan's daughter, were lukewarm in support of Robert Bruce. In 1307, however, the Bruce party got into the ascendant, and when their treason became apparent their territory was overthrown by the king's men in 1455; Douglas was attainted, and his honours and estates were forfeited. In that year the great stronghold of the Thieve, the most important fortress in Galloway, which Archibald the Grim had built on the Dee immediately to the west of the modern town of Castle Douglas, was reduced and converted into a royal keep. (It was dismantled in 1640 by order of the Estates in consequence of the hostility of its keeper, Lord Nithsdale, to the Covenant.) The famous cannon Mons Meg, now in Edinburgh Castle, is said apparently on insufficient evidence, to have been constructed in order to aid James III. in this siege. As the Douglases went down the Maxwells rose, and the debateable land on the south-east of
Dumfrieshire was for generations the scene of strife and raid, not only between the two nations but also among the leading families, of whom the Maxwells, Johnstones and Armstonges were always conspicuous. After the battle of Solway Moss (1542) the shires of Kirkcudbright and Dumfries fell under English rule for a short period. The treaty of Norham (March 24, 1550) established a truce between the nations for ten years; and in 1552, the Wardens of the Marches consenting, the debateable land ceased to be a matter for debate, the parish of Canobie being annexed to Dumfrieshie, that of Kirkandrews to Cumberland. Though at the Reformation the Stewarties became fervent in its Protestantism, it was to Galloway, through the machinations of the great landowners and the attachment of the people to them, that Mary owed her warmest adherents, and it was from the coast of Kirkcudbright that she made her luckless voyage to England. Even when the crowns were united in 1603 turbulence continued; for trouble arose over the attempt to establish episcopacy, and nowhere were the Covenanters more cruelly persecuted than in Galloway. After the union things mended slowly but surely, curious evidence of growing commercial prosperity being the enormous extent to which smuggling was carried on. No coast could serve the “free traders” better than those of Kirkcudbright and Galloway, which continued till the 17th century. The Jacobite risings of 1715 and 1745 elicited small sympathy from the inhabitants of the shire.

McKerlie, History of the Lands and Their Owners in Galloway (Edinburgh, 1870–1879); Galloway Ancient and Modern (Edinburgh, 1891); J. A. H. Murray, Dialysis of the Southern Counties of Scotland (London, 1873).

KIRKE, PERCY (c. 1646–1691), English soldier, was the son of George Kirke, a court official to Charles I. and Charles II. In 1666 he obtained his first commission in the Lord Admiral’s regiment, and subsequently served in the Blues. He was with Monmouth at Maastricht (1673), and was present during two campaigns with Turenne on the Rhine. In 1680 he became lieutenant-colonel, and soon afterwards colonel of one of the Tangier regiments (afterwards the King’s Own Royal Lancaster Regt.). In 1682 Kirke became governor of Tangier, and colonel of the old Tangier regiment (afterwards the Orkney regiment, West Surrey). He distinguished himself very greatly as governor, though he gave offence by the roughness of his manners and the wildness of his life. On the evacuation of Tangier “Kirke’s Lambs” (so called from their badge) returned to England, and a year later their colonel served as a brigadier in Faversham’s army. After Sedgemoor the rebels were treated with great severity; but the charges so often brought against the “Lambs” are now known to be exaggerated, though the regiment shared to the full in the ruthless hunting down of the fugitives. It is often stated that it formed Jeffrey’s escort in the “Bloody Assize,” but this is erroneous. Brigadier Kirke took a notable part in the Revolution three years later, and William III. promoted him. He commanded at the relief of Derry, and made his last campaign in Flanders in 1691. He died, a lieutenant-general, at Brussels in October of that year. His eldest son, Lieut.-General Percy Kirke (1684–1741), was also colonel of the “Lambs.”

KIRKE (or KIRK), a town and military cantonment of British India in Poona district, Bombay, 4 m. N.W. of Poona city. pop. (1901), 10,797. It is the principal military station in the Bombay presidency, and has a large armament factory. It was the scene of a victory over Baji Rao, the last peshwa, in 1817.

KIRKINTILLOCH, a municipal and police burgh of Dumbartonshire, Scotland. Pop. (1901), 10,680. It is situated 8 m.N.E. of Glasgow, by the North British railway, a portion of the parish extending into Lanarkshire. It lies on the Forth & Clyde canal, and the Kelvin—from which Lord Kelvin, the distinguished scientist, took the title of his barony—flows past the town, where it receives from the north the Glazert and from the south the Luggie, commemorated by David Gray. The Wall of Antoninus ran through the site of the town, the Gaelic name of which (Caer, a fort, not Kirk, a church) means “the fort at the end of the ridge.” The town became a burgh of barony under the Comyns in 1170. The cruciform parish church with crow-stepped gables dates from 1644. The public buildings include the town-hall, with a clock tower, the temperance hall, a convalesce home, the Broomhill home for incurables (largely due to Miss Beatrice Clugston, to whom a memorial was erected in 1891), and the Westermain asylum. In 1898 the burgh acquired as a private park the portion of the Roman Wall, behind the foundation of Comyn’s Castle. The leading industries are chemical manufactures, iron-founding, mason-weeping, coal mining and timber sawing.

KIRK- KLISSEH (Kirk-Klisse or Kirk-Klissia), a town of European Turkey, in the eyalet of Adrianople, 19 m. E. of Don. (1898), about 16,000, of whom about half are Greeks, and the remainder Bulgarians, Turks and Jews. Kirk-Klisseh is built near the headwaters of several small tributaries of the river Ergene, and on the western slope of the Istranja Dagh. It owes its chief importance to its position at the southern outlet of the Fakhi defile over these mountains, through which passes the shortest road from Shumla to Constantiopolis. The name Kirk-Klisseh signifies “four churches, and the town possesses many mosques and Greek churches. It has an important trade with Constantinople in butter and cheese, and also exports wine, brandy, cereals and tobacco.

KIRKSVILLE, a city and the county-seat of Adair county, Missouri, U.S.A., about 120 m. N. by W. of Jefferson City. Pop. (1900), 5066, including 112 foreign-born and 291 negroes; (1910), 6347. It is served by the Wabash and the Quincy, Omaha & Kansas City railways. It lies on a rolling prairie at an elevation of 975 ft. above the sea. It is the seat of the First District Missouri State Normal School (1870); of the American School of Osteopathy (opened 1892); and of the related A. T. Still Infirmary (incorporated 1895), named in honour of its founder, Adrían A. Still, the originator of osteopathic treatment, who settled here in 1875. In 1908 the School of Osteopathy had 18 instructors and 358 students. Grain and fruit are grown in large quantities, and much coal is mined in the vicinity of Kirkville. Its manufactures are shoes, bricks, lumber, ice, agricultural implements, wagons and handles. Kirkville was laid out in 1842, and was named in honour of Jesse Kirk. It was incorporated as a town in 1857 and chartered as a city of the third class in 1892. In April 1899 a cyclone caused serious damage to the city.

KIRKWALL (Norse Kirkjubryan, “church bay”), a royal, municipal and police burgh, seaport and capital of the Orkney Islands, county of Orkney, Scotland. Pop. (1901), 3711. It is situated at the head of a bay of the same name on the east of the island of Pomona, or Mainland, 247 m. N. of Leith and 54 m. N. of Wick by steamer. Much of the city is quaint-looking and old-fashioned, its main street (nearly 1 m. long) being in parts so narrow that two vehicles cannot pass each other. The more modern quarters are built with great regularity and the suburbs contain several substantial villas surrounded by gardens. Kirkwall has very few manufactures. The linen trade introduced in the middle of the 16th century is extinct, and a like fate has overtaken the kelp and straw-plaiting industries. Distilling however prospered, and the town is important not only as regards its shipping and the deep-sea fishery, but also as a distributing centre for the islands and the seat of the superior law courts. The port has two piers. Kirkwall received its first charter from James III. in 1486, but the provisions of this instrument being disregarded by such men as Robert (d. 1592) and Patrick Stewart (d. 1614), 1st and 2nd earls of Orkney, and others, the Scottish
parliament passed an act in 1670 confirming the charter granted by Charles II in 1661. The prime object of interest is the cathedral of St Magnus, a stately cruciform red sandstone structure in the severest Norman, with touches of Gothic. It was founded by Jarl Rognvald (Earl Ronald) in 1137 in memory of his uncle Jarl Magnus who was assassinated in the island of Eglishay in 1115, and afterwards canonized and adopted as the patron saint of the Orkneys. The remains of St Magnus were ultimately interred in the cathedral. The church is 234 ft. long from east to west and 56 ft. broad, 71 ft. high from floor to roof, and 133 ft. to the top of the present spire—the transepts being the oldest portion. The choir was lengthened and the beautiful eastern window flanked by Bishop Stewart in 1508, and the porch and the western end of the nave were finished in 1540 by Bishop Robert Reid. Saving that the upper half of the original spire was struck by lightning in 1671, and not rebuilt, the cathedral is complete at all points, but it underwent extensive repairs in the 19th century. The disproportionate height and narrowness of the building lend it a certain distinction which otherwise it would have lacked. The sandstone has not resisted the effects of weather, and much of the external decorative work has perished. The choir is used as the parish church. The *skellat*, or human skull, is now preserved. The church of St Olaf was the old parish church, and the town took its name, was burned down by the English in 1502; and of the church erected on its site by Bishop Reid—the greatest building the Orkneys ever had—little more than the merest fragment survives. Nothing remains of the old castle, a fortress of remarkable strength founded by Sir Henry Sinclair (d. 1400), earl and prince of Orkney and 1st earl of Caithness, its last vestiges having been demolished in 1805 to provide better access to the harbour; and the earthwork to the east of the town thrown up by the Cromwellians has been converted into a battery of the Orkney Artillery Volunteers. Adjoining the cathedral are the ruins of the bishop's palace, in which King Haco died after his defeat at Largs in 1263. The round tower, which still stands, was added in 1550 by Bishop Reid. It is known as the Mass Tower and contains a niche in which is a small effigy believed to represent the founder, who also endowed the grammar school which is still in existence. To the east of the remains of the bishop's palace are the ruins of the earl's palace, a structure in the Scottish Baronial style, built about 1600 for Patrick Stewart, 2nd earl of Orkney, and on his forfeiture given to the bishops for a residence. Tankerness House is a characteristic example of the mansion of an Orkney laird of the olden time. Other public buildings include the municipal buildings, the sheriff court and county buildings, Balfour hospital, and the fever hospital. There is daily communication with Scrabster pier ( Thurso), via Scapa pier, on the southern side of the waist of Pomona, about 1½ m. to the S. of Kirkwall; and steamers sail at regular intervals from the harbour to Wick, Aberdeen and Leith. Good roads place the capital in touch with most places in the island and a coach runs twice a day to Stromness. Kirkwall belongs to the Wick district group of parliamentary burghs, the others being Cromarty, Dingwall, Dornoch and Tain.

KIRRIEMUIR, a police burgh of Forfarshire, Scotland. Pop. (1901), 4096. It is situated on a height above the glen through which the Gairie flows, 61 m. N.W. of Forfar by a branch line of the Caledonian railway of which it is the terminus. There are libraries, a public hall and a park. The staple industry is linen-weaving. The hand-loom lingered longer here than in any other place in Scotland and is not yet wholly extinct. The Rev. Dr Alexander Whyte (b. 1837) and J. M. Barrie (b. 1860) are natives, the latter having made the town famous under the name of "Thrums." The original Sesscion church—the kirk of the Auld Licht—was founded in 1606 and rebuilt in 1803. Kinmory, 1½ m. N.W., was the birthplace of Sir Charles Lyell the geologist, and Cortachy castle, a fine mansion in the Scottish Baronial style, about 4 m. N., is the seat of the earl of Airlie.

KIRSCH (or KIRSCHENWASSER), a potable spirit distilled from cherries. Kirsch is manufactured chiefly in the Black Forest in Germany, and in the Voges and Jura districts in France. Generally the raw material consists of the wild cherry known as *Cerasus avium*. The cherries are subjected to natural fermentation and subsequent distillation. Occasionally a certain quantity of sugar and water are added to the cherries after crushing, and the mass so obtained is filtered or pressed prior to fermentation. The spirit is usually "run" at a strength of about 50% of absolute alcohol. Compared with brandy or whisky the characteristic features of kirsch are (a) that it contains relatively large quantities of higher alcohols and compound ethers, and (b) the presence in this spirit of small quantities of hydrocyanic acid, partly as such and partly in combination as benzaldelycyanhydrine, to which the distinctive flavour of kirsch is largely due.

KIR-SHEHER, the chief town of a sanjak of the same name in the Angora vilayet of Asia Minor, situated on a tributary of the Kizil Irnak (Hyaly), on the Angora-Kaisarieh road. It is on the line of the projected railway from Angora to Kaisarieh. The town gives its name to the excellent carpets made in the vicinity. On the outskirts there is a hot chalybeate spring. Population about 9000 (700 Christian, mostly Armenians). Kir-sheher represents the ancient Mochissur, a small town which became important in the Byzantine period: it was enlarged by the emperor Justinian, who re-named it Justinianopolis, and made it the capital of a large division of Cappadocia, a position it still retains.

KIRWAN, RICHARD (1733-1812), Irish scientist, was born at Cloughballymore, Co. Galway, in 1733. Part of his early life was spent abroad, and in 1754 he entered the Jesuit novitiate either at St Omer or at Hesdin, but returned to Ireland in the following year, when he succeeded to the family estates through the death of his brother in a duel. In 1766, having conformed to the established religion two years previously, he was called to the Irish bar, but in 1768 abandoned practice in favour of scientific pursuits. During the next nineteen years he resided chiefly in London, enjoying the society of the scientific men living there, and corresponding with many savants on the continent of Europe, as his wide knowledge of languages enabled him to do with ease. His experiments on the specific gravities and attractive powers of various saline substances formed a substantial contribution to the methods of analytical chemistry, and in 1782 gained him the Copley medal from the Royal Society, of which he was elected a fellow in 1783; and in 1784 he was engaged in a controversy with Cavendish in regard to the latter's experiments on air. In 1787 he removed to Dublin, where four years later he became president of the Royal Irish Academy. To its proceedings he contributed some thirty-eight memoirs, dealing with meteorology, pure and applied chemistry, geology, magnetism, philology, &c. One of these, on the primitive state of the globe and its subsequent catastrophe, involved him in a lively dispute with the upholders of the Huttonian theory. His geological work was marred by an implicit belief in the universal deluge, and through finding fossils associated with the trap rocks near Portrush he maintained basalt was of aqueous origin. He was one of the last supporters in England of the phlogistic hypothesis, for which he contended in his Essay on Phlogiston and the Constitution of Acids (1787), identifying phlogiston with hydrogen. This work, translated by Madame Lavoisier, was published in French with critical notes by Lavoisier and some of his associates; Kirwan attempted to refute their arguments, but they proved too strong for him, and he acknowledged himself a convert in 1791. His other books included Elements of Mineralogy (1784), which was the first systematic work on that subject in the English language, and which long remained standard; An Estimate of the Temperature of Different Latitudes (1785); Essay on the Analysis of Mineral Waters (1790); and Geological Essays (1790). In his later years he turned to philosophical questions, producing a paper on human liberty in 1798, a treatise on logic in 1807, and a volume of metaphysical essays in 1811, none of any worth. Various stories are told of his eccentricities as well as of his conversational powers. He died in Dublin in June 1812.

KISFALUDY, KÁROLY (Charles) (1788-1830), Hungarian author, was born at Tété, near Raab, on the 6th of February
1788. His birth cost his mother her life and himself his father’s unyielding hatred. He entered the army as a cadet in 1804; saw active service in Italy, Servia and Bavaria (1805–1809), especially distinguishing himself at the battle of Leoben (May 25, 1809), and returned to his quarters at Pest with the rank of first lieutenant. It was during the war that he composed his first poems, e.g. the tragedy Gylkos ("The Murder," 1808), and numerous martial songs for the encouragement of his comrades. It was now, too, that he fell hopelessly in love with the beautiful Katalin Heppler, the daughter of a wealthy tobacco merchant.

Tiring of the monotony of a soldier’s life, yet unwilling to sacrifice his liberty to follow commerce or enter the civil service, Kisfaludy, contrary to his father’s wishes, now threw up his commission and made his home at the house of a married sister at Vöröskere, where he could follow his inclinations. In 1812 he studied painting at the Vienna academy and supported himself precariously by his brush and pencil, till the theatre at Vienna proved a still stronger attraction. In 1812 he wrote the tragedy Klara Zách, and in 1815 went to Italy to study art more thoroughly. But he was back again within six months, and for the next three years flitted from place to place, living on the charity of his friends, lodging in hovels and dashing off sonnets and comic verses for the various literary periodicals (e.g. Somla). Innumerable and repeated petitions of the whole Kisfaludy family failed to bring about a reconciliation between the elder Kisfaludy and his prodigal son. It was the success of his drama Ilka, written for the Fehérvár dramatic society, that first made him famous and prosperous. The play was greeted with enthusiasm both at Fehérvar and Buda (1819). Subsequent plays, The Voivode Stiber and The Petitioners (the first original Magyar dramas), were equally successful. Kisfaludy’s fame began to spread. He had found his true vocation as the creator of the Hungarian drama. In May 1820 he wrote three new plays for the dramatic society (he could always turn out a five-act drama in four days) which still further increased his reputation. From 1820 onwards, under the influence of the great critic Kazinczy, he learnt to polish and refine his style, while his friend and adviser György Gaál (who translated some of his dramas for the Vienna stage) introduced him to the works of Shakespeare and Goethe. By this time Kisfaludy had evolved a literary theory of his own which inclined towards romanticism; and in collaboration with his elder brother Alexander (see below) he founded the periodical Aurora (1822), which he edited to the day of his death. The Aurora was a notable literary periodical of the period.

It attracted towards it many of the rising young authors of the day (including Vörösmarty, Bajza and Czuczor) and speedily became the oracle of the romanticists. Kisfaludy’s material position had now greatly improved, but he could not shake off his old recklessness and generosity, and he was never able to pay a tithe of his debts. The publication of Aurora so engrossed his time that practically he abandoned the stage. But he contributed to Aurora ballads, epigrams, short epic pieces, and, best of all, his comic stories. Kisfaludy was in fact the founder of the school of Magyar humorists and his comic types amuse and delight to this day. When the folk-tale became popular in Europe, Kisfaludy set to work upon folk-tales also and produced (1828) some of the masterpieces of that genre. He died on the 21st of November 1830. Six years later the great literary society of Hungary, the Kisfaludy Társaság, was founded to commemorate his genius. Apart from his own works it is the supreme merit of Kisfaludy to have revived and nationalized the Magyar literature, giving it a range and scope undreamed of before his time.

The first edition of Kisfaludy’s works, in 10 volumes, appeared at Buda in 1831, shortly after his death, and the 7th edition (Budapest 1893) is the best and fullest. See Ferenc Toldy, Lives of the Magyar Poets (Hung.) (Budapest, 1870); Zoltó Böthy, The Father of Hungarian Comedy (Budapest, 1882).

KISH, or KÁIS (the first form is Persian and the second Arabic), an island in the Persian Gulf. It is mentioned in the 12th century as being the residence of an Arab pirate from Oman, who exacted a tribute from the pearl fisheries of the gulf and had the title of "King of the Sea," and it rose to importance in the

KISH
19th century with the fall of Siraf as a transit station of the trade between India and the West. In the 14th century it was supplanted by Hormuz and lapsed into its former insignificance.

The island is nearly 10 m. long and 5 m. broad, and contains a number of small villages, the largest, Mashl, with about 100 houses, being situated on its north-eastern corner in 26° 34' N. and 35° 2' E. The highest part of the island has an elevation of 120 ft. The inhabitants are Arabs, and nearly all pearl fishers, possessing many boats, which take to the pearl banks on the Arabian coast. The water supply is scanty and there is little vegetation, but sufficient for sustaining some flocks of sheep and goats and some cattle. Near the centre of the north coast stands the old city, enclosed by a wall, remains of a mosque, with octagonal columns, masonry, water-cisterns (two 50 ft. long, 40 ft. broad, 24 ft. deep) and a fine underground canal, or aqueduct, half a mile long and cut in the solid rock 20 ft. below the surface. Fragments of glazed tiles and brown and white pottery, of thin white and blue Chinese porcelain, of green celadon (some with white scroll-work or figures in relief), glass beads, bangles, &c., are abundant. Kish is the Kataia of Arrian; Chisì and Quiss of Marco Polo; Quixi, Quis, Cæs, Caes, &c., of Portuguese writers; and Khenni, or Khish, is its Arabic name.

KISHMAGRHR, a native state of India, in the Rajputana agency. Area, 828 sq. m.; pop. (1901), 90,970, showing a decrease of 27% in the decade, due to the famine of 1899-1900; estimated revenue, £34,000; there is no tribute. The state was founded in the reign of the emperor Akbar, by a younger son of the raja of Jodhpur. In 1818 Kishangarh first came into direct relations with the British government, by entering into a treaty, together with the other Rajput states, for the suppression of the Pindari marauders by whom the country was at that time overrun. The chief, whose title is maharaja, is a Rajput of the Rathor clan. Maharaja Madan Singh ascended the throne in 1890 at the age of sixteen, and attended the Delhi Durbar of 1903 as a cadet in the Imperial Cadet Corps. The administration, under the diwan, is highly spoken of. Irrigation from tanks and wells has been started; factories for ginning and pressing cotton have been started; and the social reform movement, for discouraging excessive expenditure on marriages, has been very successful.

The state is traversed by the Rajputana railway. The town of Kishangarh is 18 m. N.W. of Ajmere by rail. Pop. (1901), 12,663. It is the residence of many Jain merchants.

KISLOVODSK, a town and health-resort of Russian Caucasus, in the province of Terek, situated at an altitude of 2600 ft., in a deep caldron-shaped valley on the N. side of the Caucasus, 40 m. by rail S.W. of Pyatigorsk. Pop. (1897), 4078. The limestone hills which surround the town rise by successive steps or terraces, and contain numerous caves. The mineral waters are strongly impregnated with carbonic acid gas and have a temperature of 31° F. The principal spring is known as Narsan, and its water is called by the Circassians the "drink of heroes."

KISMET, fate, destiny, a term used by Mahomedans to express all the incidents and details of man's lot in life. The
KISS—KISTNA

word is the Turkish form of the Arabic gismat, from gasama, to divide.

KISS, the act of pressing or touching with the lips, cheek, hand or lips of another, as a sign or expression of love, affection, reverence or greeting. Skeat (Elym. Dict., 1858) connects the Teut. base *hak, husat, gustus, and with Goth. kastus, test, from *kisans, to choose, and takes "kiss" as ultimately a double of "choice."

For the liturgical ecusus pacis or "kiss of peace," see PAX. See further C. Nyrop, The Kiss and its History, trans. by W. F. Harvey (1902); J. J. Claudius, Dissertatio de salvationibus velereum (Utrecht, 1702); and "Baiser d'Etiquette" (1896) in Archives curieuses de l'histoire de France (1834-1890, series ii. tom. 12).

KISSAR, or GTYARAH BARBAERI, the ancient Nubian lyre, still in use in Egypt and Abyssinia. It consists of a body having instead of the traditional tortoiseshell back a shallow, round bowl of wood, covered with a soundboard of sheepskin, in which are three small round sound-holes. The arms of wood, set within the sound-board at points distant about the third of the diameter from the circumference, have the familiar fan shape. Five gut strings, knotted at the bar and raised from the sound-board by means of a bridge tailspine similar and, in the black, are plucked by means of a plectrum by the right hand for the melody, while the left hand sometimes twangs some of the strings as a soft drone accompaniment.

KISSINGEN, a town and watering-place of Germany, in the kingdom of Bavaria, delightfully situated in a broad valley surrounded by high and well-wooded hills, on the Franconian Saale, 656 ft. above sea-level, 62 m. E. of Frankfort-on-Main, and 43 N.E. of Würzburg by rail. Pop. (1900), 4757.

Its streets are regular and its houses attractive. It has an Evangelical, an English, a Russian and three Roman Catholic churches, a theatre, and various benevolent institutions, besides all the usual buildings for the lodging, cure and amusement of the numerous visitors who are attracted to this, the most popular watering-place in Bavaria. In the Kurgarten, a tree-shaded expanse between the Kurhaus and the handsome colonnaded Konversations-Saal, are the three principal springs, the Rákóczy, the Pandur and the Maxbrunnen, of which the first two, strongly impregnated with iron and salt, have a temperature of 52-26° F.; the last (50-72°) is like Selters or Seltzer water. At short distances from the town are the intermediate spring Solensprudel, the Schönbrunspрудel and the Theresiensee; all the springs within the same valley as Kissingen are the minor spas of Boelkot and Brückenau. The waters of Kissingen are prescribed for both internal and external use in a great variety of diseases. They are all highly charged with salt, and productive government salt-works were at one time stationed near Kissingen. The number of persons who visit the place amounts to about 20,000 a year. The manufactures of the town, chiefly carriages and furniture, are unimportant; there is also a trade in fruit and wine.

The salt springs were known in the 9th century, and their medicinal properties were recognized in the 16th, but it was only during the 19th century that Kissingen became a popular resort. The town belonged to the counts of Henneberg until 1394, when it was sold to the bishop of Würzburg. With this bishopric it passed later to Bavaria. On the 10th of July 1866 the Prussians defeated the Bavarians with great slaughter near Kissingen. On the 13th of July 1874 the town was the scene of the attempt of the fanatic Kullmann to assassinate Prince Bismarck, to whom a statue has been erected. There are also monuments, two bars with Lays and Maximilian I. of Bavaria.

Sotier, Bad Kissingen (Leipzig, 1883); Werner, Bad Kissingen als Kurort (Berlin, 1904); Leisser, Kissingen für Herzleidige (Würzburg, 1903); Drift, Kissingen und seine Heilquellen (Würzburg, 1891); and Roth, Bad Kissingen (Würzburg, 1901).

KISTNA, or KRISHNA, a large river of southern India. It rises near the Bombay sanatorium of Mahabaleshwar in the Western Ghats, only about 40 m. from the Arabian Sea, and, as it discharges into the Bay of Bengal, it thus flows across almost the entire peninsula from west to east. It has an estimated basin area of 97,000 sq. m., and its length is 800 m. Its source is held sacred, and is frequented by pilgrims in large numbers. From Mahabaleshwar the Kistna runs southward in a rapid course into the nizam's dominions, then turns to the east, and ultimately falls into the sea by two principal mouths, carrying with it the waters of the Bhima from the north and the Tungabhadra from the south-west. Along this part of the coast runs an extensive strip of land which has been formed by the detritus washed down by the Kistna and Godavari. The river channel is throughout too rocky and the stream too rapid to allow navigation even by small native craft. In utility for irrigation the Kistna is also inferior to its two sister streams, the Godavari and Cauvery. By far the greatest of its irrigation works is the Bezawada anicut, begun by Sir Arthur Cotton in 1852.

Bezwada is a small town at the entrance of the gorge by which the Kistna bursts through the Eastern Ghats and immediately spreads over the alluvial plain. The channel there is 1300 yds. wide. During the dry season the depth of water is barely 6 ft., but sometimes it rises to as much as 36 ft., the maximum flood discharge being calculated at 1,188,000 cub. ft. per second. Of the two main canals connected with the dam, that on the left bank breaks into two branches, the one running 39 m. to Ellore, the other 49 m. to Masulipatam. The canal on the right bank proceeds nearly parallel to the river, and also sends off two principal branches, to Nizampatam and Comamur. The total length of the main channels is 372 m. and the total area irrigated in 1903-1904 was about 700,000 acres.

KISTNA (or UISTANA), a district of British India, in the N.E. of the Madras Presidency. It contains the chief head-quarters. Area, 8490 sq. m. The district is generally a flat country, but the interior is broken by a few low hills, the highest being 1857 ft. above sea-level. The principal rivers are the Kistna, which cuts the district into two portions, and the Muneru, Paleru and Naguleru (tributaries of the Gundlakamma and the Kistna); the last only is navigable. The Kolar lake, which covers an area of 21 by 14 m., and the Romparu swamp are natural receptacles for the drainage on the north and south sides of the Kistna respectively.

In 1901 the population was 2,154,803, showing an increase of 16% in the decade. Subsequently the area of the district was reduced by the formation of the new district of Guntur (q.v.), though Kistna received an accretion of territory from Godavari district. The population in 1901 on the area as reconstituted (5809 sq. m.) was 1,744,138.

The Kistna delta system of irrigation canals, which are available also for navigation, connect with the Godavari system. The principal crops are rice, millets, pulse, oil-seeds, cotton, indigo, tobacco and a little sugar-cane. There are several factories for ginning and pressing cotton. The peasants in England as Lankas are partly made from tobacco grown on lankas or islands in the Kistna. The manufacture of chintzes at Masulipatam is a decaying industry, but cotton is woven everywhere for domestic use. Salt is evaporated, under government supervision, along the coast. Bezwada, at the head of the delta, is a place of growing importance, as the central junction of the East Coast railway system, which crosses the inland portion of the district in three directions. Some seaborne trade, chiefly coasting, is carried on at the open roadsteads of Masulipatam and Nizampatam, both in the delta. The Church Missionary Society supports a college at Masulipatam.

The early history of Kistna is inseparable from that of the northern Circars. Dharanikota and the adjacent town of Amravati were the seats of early Hindu and Buddhist governments; and the more modern Rajahmundry owed its importance to later dynasties. The Chulukyas here gave place to the Cholas, who in turn were ousted by the Reddi kings, who flourished during the 14th century, and built the forts of Bellamkonda, kondavi and Kondapalli in the north of the district, while the Gajapati dynasty of Orissa ruled in the north. Afterwards the country passed to the Koth Shashis of Golconda, until annexed to the Mogul empire by Ahmednugger in 1697. Meanwhile the English had in 1651 established a small factory at Masulipatam, where they traded with varying fortune from 1759, when,
Masulipatam being captured from the French by Colonel Forde, with a force sent by Lord Clive from Calcutta, the power of the English in the greater part of the district was complete.

KIT (1) (probably an adaptation of the Middle Dutch kīte, a wooden tub, usually with a lid and handles; in modern Dutch kil means a tankard), a tub, basket or pail used for holding milk, butter, egg, fish and other goods; also applied to similar receptacles for various domestic purposes, or for holding a workman's tools, &c. By transference "kit" came to mean the tools themselves, but more commonly personal effects such as clothing, especially that of a soldier or sailor, the word including the knapsack or other receptacle in which the effects are packed.

(2) The name (perhaps a corruption of "citizen" Gr. καταγενές) of a small violin, about 16 in. long, and played with a bow of nearly the same length, much used at one time by dancing-masters. The French name is pochette, the instrument being small enough to go into the pocket.

KITAZATO, SHIBASABURO (1856- ), Japanese doctor of medicine, was born at Kumamoto in 1856 and studied in Germany under Koch from 1885 to 1891. He became one of the foremost bacteriologists of the world, and enjoyed the credit of having discovered the bacillus of tetanus, diphtheria and plague, the last in conjunction with Dr Aoyama, who accompanied him to Hong-Kong in 1894 during an epidemic at that place.

KIT-CAT CLUB, a club of Whig wits, painters, politicians and men of letters, founded in London about 1705. The name was derived from that of Christopher Cat, the keeper of the pie-hunters' club, whose name was often met with in the Stab Long (see Cox's Anatomy and Heating). The meetings were afterwards held at the Fountain tavern in the Strand, and latterly in a room specially built for the purpose at Barn Elms, the residence of the secretary, Jacob Tonson, the publisher. In summer the club met at the Upper Flask, Hampstead Heath. The club originally consisted of thirty-nine, afterwards of forty-eight members, and included among others the duke of Marlborough, Lords Halifax and Somers, Sir Robert Walpole, Vanbrugh, Congreve, Steele and Addison. The portraits of many of the members were painted by Sir Godfrey Kneller, himself a member, of a uniform size suited to the height of the Barn Elms room in which the club dined. The canvas, 36 X 28 in., admitted of less than a half-length portrait but was sufficiently long to include a hand, and this is known as the kit-cat size. The club was dissolved about 1720.

KITCHEN (O.E. ceces; this and other cognate forms, such as Dutch keuken, Ger. Küche, Dan. køkken, Fr. cuisine, are formed from the Low Lat. cucina, Lat. coquina, coquere, to cook), the room or place in a house set apart for cooking, in which the culinary and other domestic utensils are kept. The range or cooking-stove fitted with boiler for hot water, oven and other apparatus is called a kitchen-range, or a "kitchen range" (see Cox's Anatomy and Heating). Archaeologists have used the term "kitchen-maid," i.e. kitchen rubbish-heap (Dansk køkken-mænding) for the rubbish heaps of prehistoric man, containing bones, remains of edible shells, fish, implements, &c. (see Shell-heaps). "Midden," in Middle English mydding, is a Scandinavian word, from mygg, muck, filth, and dyng, heap; the latter word gives the English "dung.

KITCENER, HORATIO HERBERT KITCHENER, VISCOUNT (1850- ), British field marshal, was the son of Lieut.-Colonel H. H. Kitchener and was born at Bally Longford, Co. Kerry, on the 26th of June 1850. He entered the Royal Military Academy, Woolwich, in 1868, and was commissioned second lieutenant, Royal Engineers, in 1871. As a subaltern he was employed in survey work in Cyprus and Palestine, and on promotion to captain in 1883 was attached to the Egyptian army, then in course of re-organization under British officers. In the following year he served on the staff of the British expeditionary force on the Nile, and was promoted successively major and lieutenant-colonel by brevet for his services. From 1886 to 1888 he was commandant at Suakin, commanding and receiving a severe wound in the action of Handub in 1888. In 1888 he commanded the force in the Sudan and was made a baronet. From 1889 to 1892 he served as adjutant-general of the army. He had become brevet-colonel in the British army in 1888, and he received the C.B. in 1889 after the action of Toski. In 1892 Colonel Kitchener succeeded Sir Francis (Lord) Grenfell as sirdar of the Egyptian army, and three years later, when he had completed his predecessor's work of re-organizing the forces of the khedive, he began the formation of an expeditionary force on the basis of military frontier troops of Wady Halfa. The advance into the Sudan (see EVNP, Military Operations) was prepared by thorough administrative work on his part which gained universal admiration. In 1896 Kitchener won the action of Ferket (June 7) and advanced the frontier and the railway to Dongola. In 1897 Sir Archibald Hunter's victory of Abu Hamed (Aug. 7) carried the Egyptian flag one stage farther, and in 1898 the resolve to destroy the Mahdist power was openly indicated by the despatch of a British force to co-operate with the Egyptians. The sirdar, who in 1896 became a British major-general and received the K.C.B., commanded the united force, which stormed the Mahdist zarebo on the river Atbara on the 8th of April, and the outposts being soon afterwards advanced to Metemmem and Shendy, the British force was augmented to the strength of a division for the final advance on Khartoum. Kitchener's work was crowned and the power of the Mahdists utterly destroyed by the victory of Omdurman (Sept. 2), for which he was raised to the peerage as Baron Kitchener of Khartoum, received the G.C.B., the thanks of parliament and a grant of £30,000. Little more than a year afterwards, while still sirdar of the Egyptian army, he was promoted lieutenant-general and appointed chief-of-staff to Lord Roberts in the South African War (see TRANS. N.G. in London) and served in the advance to Paardeberg, the advance on Bloemfontein and the subsequent northward advance to Pretoria, and on Lord Roberts' return to England in November 1900 succeeded him as commander-in-chief, receiving at the same time the local rank of general. In June 1902 the long and harassing war came to its close, and Kitchener was rewarded by advancement to the dignity of viscount, promotion to the substantive rank of general for distinguished service, the thanks of parliament and a grant of £50,000. He was also included in the Order of Merit.

He immediately after the peace he went to India as commander-in-chief in the East Indies, and in this position, which he held for seven years, he carried out not only many far-reaching administrative reforms but a complete re-organization and strategical redistribution of the British and native forces. On leaving India in 1909 he was promoted field marshal, and succeeded the duke of Connaught as commander-in-chief and high commissioner in the Mediterranean. This post, not of great importance in itself, was regarded as a virtual command of the colonial as distinct from the home and the Indian forces, and on his appointment Lord Kitchener (after a visit to Japan) undertook a tour of inspection of the forces of the empire, and went to Australia and New Zealand in order to assist in drawing up local schemes of defence. In this mission he was highly successful, and earned golden opinions. But soon after his return to England in April 1910 he declined to take up his Mediterranean appointment, owing to his dislike of its inadequate scope, and he was succeeded in June by Sir Ian Hamilton.

KIT, the Paleo milvis of Linnaeus and Milvus icinus of modern ornithologists, once probably the most familiar bird of prey in Great Britain, and now one of the rarest. Three or four hundred years ago foreigners were struck with its abundance in the streets of London. It was doubtless the scavenger in ordinary of that and other large towns (as kindred species now are in Eastern lands), except where its place was taken by the raven; for Sir Thomas Browne (c. 1662) wrote of the latter at Norwich—"in good plente about the city which makes so few kites to be seen hereabout." John Wolley has well remarked of the modern Londoners that few who see the paper toys hovering over the parks in fine days of summer, have any idea that the bird from which they derive their name used to flit all day in hot weather high over the heads of their ancestors. Even at the beginning of the 19th century the kite formed a feature of many festivities, as Glede, cognate with "glide," is also another English name.

1 In O.E. is cyfen; no related word appears in cognate languages. Glede, cognate with "glide," is also another English name.
a rural landscape in England, as they had done in the days when the poet Cowper wrote of them. But an evil time soon came upon the species. It must have been always hated by the henwife, but the resources of civilization in the shape of the gun and the gun dogs were effective, too. They were, however, employed with fatal zeal by the gamekeeper; for he who affords the supreme sport to the falconer, was now left friendless, and in a very few years it seems to have been exterminated throughout the greater part of England, certain woods in the Western Midlands, as well as Wales, excepted. In these latter a small remnant still exists; but the well-wishers of this beautiful species are naturally chary of giving information that might lead to its further persecution. In Scotland there is no reason to suppose that its numbers suffered much diminution until about 1835; or even later, when the systematic destruction of “vermin” on agricultural lands became general. In Scotland, however, it is now as much restricted to certain districts as in England or Wales, and those districts it would be most inexpedient to indicate.

The kite is, according to its sex, from 25 to 27 in. in length, about one half of which is made up by its deeply forked tail, capable of great expansion, and therefore a powerful rudder, enabling the bird to soar on its wide wings, more than 5 ft. in extent, to direct its circling course with scarcely a movement that is apparent to the spectator below. Its general colour is pale reddish-brown or cinnamon, the head being greyish-white, but almost each feather has the shaft black. The tail is black and broad, of a light red, barred with deep brown, and furnish the salmon fisher with one of the choicest materials of its “flies.” The nest, nearly always built in the crotch of a large tree, is formed of sticks intermixed with many strange substances collected as chance may offer, but among them rags seem always to have a place. The eggs, three or four in number, are of a dull white, spotted and blotched with several shades of brown, and often lilac. It is especially mentioned by old authors that in Great Britain the kite was resident throughout the year; whereas on the Continent it is only a summer bird. Its migration time is in the spring of the year, stretching its wings towards the south in autumn, wintering in Africa, and returning in spring to the land of its birth.

There is a second European species, not distinctly related, the Milvus migrans or M. aer. of most authors,2 smaller in size, with a general dull blackish-brown plumage and a less forked tail. In some districts this is much commoner than the red kite, and on one occasion it has appeared in England. Its habits are very like those of the species already described, but it seems to be more addicted to fishing. Nearly allied to this black kite are the M. agestis of Africa, the M. genista (the common pariah kite of India),3 the M. melanotis of Eastern Asia, and the M. affinis and M. isurus; the last is by some authors removed to another genus or sub-genus as Lophotibinia, and is peculiar to Australia, while M. affinis also occurs in Ceylon, Burma, and some of the Malay countries as well. All these kites bear the marks which, while they are mentioned are more aberrant forms. First there is Elanus, the type of which is E. caeruleus, a beautiful little bird, the black-winged kite of English authors, that comes to the south of Europe from Africa, and has several congeners—E. axillaris and E. scriptus of Australia being most worthy of notice. An extreme development of this form is found in the African Naucelus ricoueri, as well as in Elanoides furcatus, the swallow-tailed kite, a widely-ranging bird in America, and remarkable for its length of wing and tail, which gives it a marvellous power of flight, and serves to explain the unfathomable fact of its having twice appeared in Great Britain. To Elanus also Ictinia, another American form, is allied, though perhaps more remotely, and it is represented by I. mississippiensi, the Mississippi kite, which is by some considered to be but the northern race of the Neotropic I. plumbea. Campeonyx, Rosthomanus and Cymindis, all belonging to the Neotropical region, complete the series of forms that seem to compose the sub-family Milvinae, though there may be doubt about the last, and some systematists would thereto add the pew or honey-buzzards, Perninae.

KITE-FLYING, the art of sending up into the air, by means of the wind, light frames of varying shapes covered with paper or cloth (called kites, after the bird—in German Drohne, dragon), which are attached to long cords or wires held in the hand or wound on a drum. When made in the common diamond form, or triangular with a semicircular head, kites usually have a pendulous tail appended for balancing purposes. The tradition is that kites were invented by Archytas of Tarentum four centuries before the Christian era, but they have been in use among Asiatic peoples and savage tribes like the Maoris of New Zealand, and the Chinese, Japanese, and Malayan peoples, among whom they are frequently used as a sport. To the Chinese kites are attached to the temples in celebration of certain festivals, and being dames, are let up to the sky, and at the close of the ceremony are cut down, and the rival rivals or the owner of them come to the house of the owner of them and fly their kites. Kite-fighting is a feature of the pastime in Eastern Asia. The cord near the kite is usually stiffened with a mixture of glue and crushed glass or porcelain. The kite-flyer manœuvres to get his kite to windward of that of his adversary, then allows his cord to drift against his enemy’s, and by a sudden jerk to cut it through and bring its kite to grief. The Malays possess a large variety of kites, mostly without tails. The Sultan of Johor sent to the Columbian Exposition at Chicago in 1893 a collection of fifteen different kinds. Asiatic musical kites bear one or more perforated reeds or bamboo which emit a pleasant sound that can be heard for great distances. The ignorant, believing that these kites frighten away evil spirits, often keep them flying all night over their houses.

The Brahminy kite of India, Haliastur indus, seems to be rather a fishing eagle.
There are various metaphorical uses of the term "kite-flying," such as in commercial slang, when "flying a kite" means raising money on credit (cf. "raising the wind"), or in political slang for seeing "how the wind blows." And "flying-kites," in nautical language, are the topsails. Kites, hanging from scientific purposes, began in the 18th century. In 1752 Benjamin Franklin made his memorable kite experiment, by which he attracted electricity from the air and demonstrated the electrical nature of lightning. A more systematic use of kites for scientific purposes may, however, be said to date from the experiments made in the last quarter of the 19th century.

(E. B.)

Meteorological Use.—Many European and American meteorological services employ kites regularly, and obtain information not only of the temperature, but also of the humidity and velocity of the air above. The kites used are mostly modifications of the so-called box-kites, invented by L. Hargrave. Roughly these kites may be said to resemble an ordinary box with the two ends removed, and also the middle part of each of the four sides. The original Hargrave kite, the form generally used, has a rectangular section; in Russia a semicircular section with the curved part facing the wind is most in favour; in England the diamond-shaped section is preferred for meteorological purposes owing to its simplicity of construction. Stability depends on a multitude of small details of construction, and long practice and experience are required to make a really good kite. The sizes required in use vary from the barest to 80 sq. ft. There is no difficulty about raising a kite to a vertical height of one or even two miles on suitable days, but heights exceeding three miles are seldom reached. On the 20th of November 1905 at Lindenberg, the Prussian Aeronautical Observatory, the upper one of a train of six kites attained an altitude of just four miles. The total lifting surface of these six kites was nearly 300 sq. ft., and the length of wire a little over nine miles. The kites are invariably flown on a steel wire line, for the hindrance to obtaining great heights is not due so much to the weight of the line as to the wind pressure upon it, and thus it becomes of great importance to use a material that possesses the greatest possible strength, combined with the smallest possible size. Steel piano wire meets this requirement, for a wire of \(\frac{1}{32}\) in. diameter will weigh about 16 lb to the mile, and stand a strain of some 250–280 lb before it breaks. Some stations prefer to use one long piece of wire of the same gauge throughout without a join, others prefer to start with a thin wire and join on thicker and thicker wire as more kites are added. The process of kite-flying is as follows. The first kite is started either with the self-recording instruments secured in it, or with a shutter or the like in the tail. As soon as the kite is out of sight it is then paid out, whether quickly or slowly depends on the strength of the wind, but the usual rate is from two to three miles per hour. The quantity that one kite will take depends on the kite and on the wind, but roughly speaking it may be said that each 10 sq. ft. of lifting surface on the kite should carry 1000 ft. of \(\frac{1}{32}\) in. wire without difficulty. When as much wire as can be carried comfortably has run out another kite is attached to the line, and the paying out is continued; after a time a third is added, and so on. Each kite increases the strain upon the wire, and thus the height of the line and makes it move more, so what kind of wind the upper kites will encounter; it also adds to the time that is necessary to haul in the kites. In each way the risk of their breaking away is increased, for the wind is very uncertain and is liable to alter in strength. Since to attain an exceptional height the wire must be strained nearly to its breaking point, and under such conditions a small increase in the strength of the wind will break the wire, it follows that great heights can only be attained by those who are willing to risk the trouble and expense of frequently having their wire and train of kites break away. The weather is the essential factor in kite-flying. In the S.E. of England in winter it is possible on about two days out of three, and in summer on about one day out of three. The usual cause of failure is want of wind, but there are a few days when the wind is too strong. (For meteorological results, &c., see Meteorology.)

(W. H. D.)

Military Use.—A kite forms so extremely simple a method of lifting anything to a height in the air that it has naturally been suggested as being suitable for various military purposes, such as signalling to a long distance, carrying up flags, or lamps, or semaphores. Kites have been used both in the army and in the navy for floating torpedoes on hostile positions. As much as two miles of line have been paid out. For purposes of photography a small kite carrying a camera to a considerable height may be caused to float over a fort or other place of which a bird's-eye view is required, the shutter being operated by electric wire, or slow match, or clockwork. Many successful photographs have been thus obtained in England and America.

The problem of lifting a man by means of kites instead of by a captive balloon is a still more important one. The chief military advantages to be gained are: (1) less transport is required; (2) they can be used in a strong wind; (3) they are not so liable to damage, either from the enemy's fire or from trees, &c., and are easier to mend; (4) they can be brought into use more quickly; (5) they are very much cheaper, both in construction and in maintenance, not requiring any costly gas.

Captain B. F. S. Baden-Powell, of the Scots Guards, in June 1894 constructed, at Pirbright Camp, a huge kite 36 ft. high, with which he successfully lifted a man on different occasions. He afterwards improved the contrivance, using five or six smaller kites attached together in preference to one large one. With this arrangement he frequently ascended as high as 300 ft. The kites were hexagonal, being 12 ft. high and 7 ft. across. The apparatus, which could be packed in a few minutes into a simple roll, weighed in all about 1 cwt. This appliance was proved to be capable of raising a man even during a dead calm, the retaining line being fixed to a wagon and towed along. Lieut. H.D. Wise made some trials in America in 1897 with some large kites of the Hargrave pattern (Hargrave having previously himself ascended in Australia), and succeeded in lifting a man 40 ft. above the ground. In the Russian army a military kite apparatus has also been tried, and was in evidence at the manoeuvres in 1908. Experiments have also been carried out by most of the European powers.

KITTO, JOHNN (1804–1854), English biblical scholar, was the son of a mason at Plymouth, where he was born on the 4th of December 1804. An accident brought on deafness, and in November 1810 he was sent to the workhouse, where he was employed in making list shoes. In 1823 a fund was raised on his behalf, and he was sent to board with the clerk of the guardians, having his time at his own disposal, and the privilege of making use of a public library. After preparing a small volume of school book, which he did by subscription, he studied dentistry with Anthony Norris Groves in Falmouth. Having obtained congenial employment in the printing office of the Church Missionary Society at Islington, and in 1827 was transferred to the same society's establishment at Malta. There he remained for eighteen months, but shortly after his return to England he accompanied Groves and other friends on a private missionary enterprise to Bagdad, where he obtained personal knowledge of Oriental life and habits which he afterwards applied with tact and skill in the illustration of biblical scenes and incidents. Plague broke out, the missionary establishment was broken up, and in 1832 Kitto returned to England. On arriving in London he was engaged in the preparation of various serial publications of the Society for the Diffusion of Useful Knowledge, the most important of which were the Pictorial History of Palestine and the Pictorial Bible. The Cyclopaedia of Biblical Literature,
KITTUR

KIU-KIANG FU, a prefecture and prefectural city in the province of Kiang-si, China. The city, which is situated on the south bank of the Yangtsze-kiang, 15 m. above the point where the Kan Kiang flows into that river from the Po-yang lake, stands in 29° 42' N. and 116° 8' E. The north face of the city is separated from the river by only the width of a roadway, and two large lakes lie on its west and south fronts. The walls are from 5 to 6 m. in circumference, and are more than usually strong and broad. As is generally the case with old cities in China, Kiu-Kiang has repeatedly changed its name, under the following names: Kiang Kiang, Kiang Chow, under the Liang dynasty (502-577) as Kiang Chow, under the Suy dynasty (580-618) as Kiu Kiang, under the Sung dynasty (960-1127) as Ting-Kiang, and under the Ming dynasty (1368-1664) it assumed the name of Kiu Kiang. Kiu-Kiang has played its part in the history of the empire, and has been repeatedly besieged and taken, the last time being in February 1853, when the Tai-ping rebels gained possession of the city. After their manner they looted and utterly destroyed it, leaving only the remains of a single street to represent the once flourishing town. The position of Kiu Kiang on the Yangtsze-kiang and its proximity to the channels of internal communication through the Po-yang lake, more especially to those leading to the green-tea-producing districts of the provinces of Kiang-si and Ngan-hui, induced Lord Elgin to choose it as one of the treaty ports to be opened under the terms of his treaty (1861). Unfortunately, however, it stands above instead of below the outlet of the Po-yang lake, and this has proved to be a decided drawback to its success as a commercial port. The immediate effect of opening the town to foreign trade was to raise the population in one year from 10,000 to 40,000. The population in 1908, exclusive of foreigners, was officially estimated at 36,000. The foreign settlement extends westward from the city, along the bank of the Yangtsze-kiang, and is bounded on its extreme west by the P'um river, which there runs into the Yangtsze. The bund, which is 500 yards long, was erected by the foreign community. The climate is good, and though hot in the summer months is invariably cold and bracing in the winter. According to the customs returns the value of the trade of the port amounted in 1902 to £2,854,704, and in 1904 to £3,489,816, of which £1,726,506 were imports and £1,763,310 exports. In 1904 322,260 lb. of opium were imported.

KIUSTENDIL, the chief town of a department in Bulgaria, situated in a mountainous country, on a small affluent of the Struma, 43 m. S.W. of Sofia by rail. Pop. (1906), 12,533. The streets are narrow and uneven, and the majority of the houses are of clay or wood. The town is chiefly notable for its hot mineral springs, in connexion with which there are nine bathing establishments. Small quantities of gold and silver are worked from mines near Kiustendil, and tobacco and fruit are largely cultivated. Some remains survive of the Roman period, when the town was known as Pautalia, Ulcia Pautalia, and Pautalia Aurelii. In the 10th century it became the seat of a bishopric, being then and during the later middle ages known by the Slavonic name of Velbuszid. After the overthrow of the Servian kingdom it came into the possession of Constantine, brother of the despot Yovan Dragash, who ruled over northern Macedonia. Constantine was expelled and killed by the Turks in 1394. In the 16th century Kiustendil was known as Velshaska Banya, and more commonly as Constantine Banya (Kitzingen, or Kitzingen), from which has developed the Turkish name Kiustendil.

KIVU, a considerable lake lying in the Central African (or Albertine) rift-valley, about 60 m. N. of Tanganyika, into which it discharges its waters by the Rusizi River. On the north it is separated from the basin of the Nile by a line of volcanic peaks. The length of the lake is about 55 m., and its greatest breadth over 30, giving an area, including islands, of about 1100 sq. m. It is about 1480 ft. above sea-level and is roughly triangular in outline, the longest side lying to the west. The coast-line is much broken, especially on the south-east, where the indentations present a fjord-like character. The lake is deep, and the shores are everywhere high, rising in places to bold precipitous cliffs of volcanic rock. A large island, Kwihwi or Kwichiwi, oblong in shape and traversed by a hilly ridge, runs in the direction of the major axis of the lake, south-west of the centre, and there are many smaller islands. The lake has many fish, but no crocodiles or hippopotami. South of Kivu the rift-valley is blocked by huge ridges, through which the Rusizi now breaks its way in a succession of steep gorges, emerging from the lake in a foaming torrent, and descending Belgo to the Lake Kivu plain, at the head of Tanganyika. The lake fauna is a typically fresh-water one, not having any affinities with the marine or "halolimic" fauna of Tanganyika and other Central African lakes, but is similar to that shown by fossils to have once existed in the more northern parts of the rift-valley. The former outlet or extension in this direction seems to have been blocked in recent geological times by the elevation of the volcanic peaks which dammed back the water, causing it finally to overflow to the south. This volcanic region is of great interest and has various names, that most used being Mufumbiro (q.v.), though this name is sometimes restricted to a single peak. Kivu and Mufumbiro were first heard of by J. H. Speke in 1861, but not visited by a European until 1894, when Count von Gützen passed through the country on his journey across the continent. The lake and its vicinity were subsequently explored by Dr R. Kandt, Captain Bette, E. S. Grogan, J. E. S. Moore, and Major St Hill Gibbons. The ownership of Kivu and its neighbourhood was claimed by the Congo Free State and by Germany, the dispute being settled in 1910, after Belgium had taken over the Congo State. The frontier agreed upon was the west bank of the Rusizi, and the west shore of the lake. The island of Kwihwi also fell to Belgium.

See R. Kandt, Cape of Good Hope, and Karte des Kivus, 1: 285,000, with text by A. v. Bockelmann (Berlin, 1902); E. S. Grogan and A. H. Sharpe, From the Cape to Cairo (London, 1900); J. E. S. Moore, The Mountains of the Moon (London, 1901); A. St H. Gibbons, Africa from South to North, ii. (London, 1904).

KIWI, or Kiwa-Kiwi, the Maori name—first apparently introduced to zoological literature by Lesson in 1828 (Man.
into the possession of Lord Stanley, afterwards 13th earl of Derby, and president of the Zoological Society, and it is now with the rest of his collection in the Liverpool Museum. Considering the state of systematic ornithology at the time, Shaw's assignment of a position to this new and strange bird, of which he had but the skin, does him great credit, for he said it seemed to approach more nearly to the Struthious and Gallinaceous tribes than to any other. And his credit is still greater when we find the venerable John Latham, who is said to have identified the specimen with Shaw, placing it some years later among the penguins (Gen. Hist. Birds, x. 394), being apparently led to that conclusion through its functionless wings and the backward situation of its legs. In this false allocation, James Francis Stephens also in 1826 acquiesced (Gen. Zoology, xiii. 70). Meanwhile in 1820 K. J. Temminck, who had never seen a specimen, had ascribed it to the dodo with a word in an order to which he applied the name of Insectes (Mon. d'Ornithologie, i. cit.). In 1831 R. P. Lesson, who had previously (loc. cit.) made some blunders about it, placed it (Traité d'Ornithologie, p. 12), though only, as he says, "par analogie et a priori," in his first division of birds, "Oiseaux Anomaux," which is equivalent to what we now call Ratitae, making of it a separate family "Nullipennes." At that time no second example was known, and some doubt was felt, especially on the Continent, as to the very existence of such a bird—though Lesson had himself in the Bay of Islands in April 1824 (Voy. "Coquille," ut supra) heard of it; and a few years later J. S. C. Dumont d'Urville had seen its skin, which the naturalists of his expedition procured, worn as a tippet by a Maori chief at Tonga Bay (Houa-hou), and in 1836 gave what proves to be on the whole very accurate information concerning it (Voy. "Astralebe," ii. 107). To put all suspicion at rest, Lord Derby sent his unique specimen for exhibition at a meeting of the Zoological Society, on the 12th of February 1833 (Proc. Zool. Society, 1833, p. 24), and a few months later (loc. cit., p. 80) William Yarrell communicated to that body a complete description of it, which was afterwards published in full with an excellent portrait (Trans. Zool. Society, vol. i. p. 71, pl. 10). Herein the systematic place of the species, as akin to the Struthious birds, was placed beyond cavil, and the author called upon all interested in zoology to aid in further research as to this singular form. In consequence of this appeal a legless skin was brought within two years sent to the society (Proceedings, 1835, p. 61) obtained by W. Yate of Waitaki, who said it was the second he had seen, and that he had kept the bird alive for nearly a fortnight, while in less than another couple of years additional information (op. cit., 1837, p. 24) came from T. K. Short to the effect that he had seen two living, and that all Yarrell had said was substantially correct, except underrating its progressive powers. Not long afterwards Lord Derby received and in March 1838 transmitted to the same society the trunk and viscera of an Apteryx, which, he afterwards entrusted to Sir R. Owen, furnished that eminent anatomist, in conjunction with other specimens of the same kind received from Drs Lyon and George Bennett, with the materials of the masterly monograph laid before the society in instalments, and ultimately printed in its Transactions (ii. 257; iii. 277). From this time the whole structure of the kiwi has certainly been far better known than that of nearly any other bird, and by degrees other examples found their way to England, some of which were distributed to the various museums of the Continent and of America. 1

The naturalists were much interested in the reported discovery of another species of the genus (Proceedings, 1837, p. 51), and though the story was not confirmed, a second species was really soon after made known by John Gould (Zoologists, p. 370, pl. 57) under the name of Apteryx oweni—a just tribute to the great master who had so minutely explained the anatomy of the group. Three years later A. D. Bartlett drew attention to the manifest difference existing among certain examples, all of which had hitherto been regarded as specimens of A. australis, and the examination of a large series of them proved to him that the genus under that name two distinct species were confounded. To the second of these was given, besides one of the real A. australis (Proceedings, 1850, p. 274), and it soon turned out that to this new form the majority of the specimens already obtained belonged. In 1851 the first kiwi known to have reached England alive was presented to the Zoological Society by Eyre, then lieutenant-governor of New Zealand. This was found to belong to the newly described A. mantelli, and some careful observations on its habits in captivity were published by John Wollaston and another (Zoologist, pp. 3509, 3602). 2 Subsequently the society has received another specimen of this form, besides one of the real A. australis (Proceedings, 1872, p. 164), some of A. oweni, and one of a supposed fourth species, A. haastii, characterized in 1871 by Potts (Ibis, 1872, p. 35; Trans. N. Zool. Institute, iv. 204; v. 195). 3

The kiwi form a group of the subclass Ratitae to which the rank of an order may fitly be assigned, as they differ in many important particulars from any of the other existing forms of Ratite birds. The most obvious feature the Apteryges afford is the presence of a back toe, while the extremely aborted condition of the wings, the position of the nostrils—almost at the tip of the maxilla—and the absence of an after-shaft in the feathers, are characters nearly as manifest, and others not less determinative, though more recondite, will be found on examination. The kiwis are peculiar to New Zealand, and it

1 Cuvier in the second edition of his Règne Animal only referred to it in a footnote (i. 498).
2 Cruise in 1822 (Journ. Residence in New Zealand, p. 313) had spoken of an "enorm" found in that island, which must of course have been an Apteryx.

The fine series of figures of all these supposed species is given by Rowley (Orn. Miscellany, vol. i. pls. 1-6). Some others, as A. maxima, A. molis, and A. fusca have also been indicated, but proof of their validity has yet to be adduced.
is believed that *A. mantelli* is the representative in the North Island of the southern *A. australis*, both being of a dark reddish-brown, longitudinally striped with light yellowish-brown, while *A. oenei*, of a light greyish-brown transversely barred with black, is said to occur in both islands. About the size of a medium-sized domestic fowl, they are birds of nocturnal habit, sleeping, on the ground, and are placid during the day, feeding about cautiously and as noiselessly as a rat, to which, indeed, at this time it bears some outward resemblance. In a quiescent posture, the body generally assumes a perfectly round appearance; and it sometimes, but only rarely, supports itself by resting the point of its bill on the ground. It often yawns when disturbed in the daytime, gaping its mandibles in a very grotesque manner. When provoked it erects the body, and, raising the foot to the breast, strikes downwards with considerable force and rapidity, thus using its sharp and powerful claws as weapons of defence. While hunting for its food the bird makes a continual sniffling sound through the nostrils, and is placed at the extremity of the upper mandible. Whether it is guided as much by touch as by smell I cannot safely say; but it appears to me that both senses are used in the action. That the sense of touch is highly developed seems quite certain, because when it touches anything in it runs may be audibly sniffling, whereas I always first touch an object with the point of its bill, whether in the act of feeding or of surveying the ground; and when shut up in a cage it will spend hours and hours knocking through the doors of the cage, tapping softly at the walls. It is interesting to watch the bird, in a state of freedom, foraging for worms, which constitute its principal food: it moves about with a slow action of the body; and the long, flexible bill is driven into the soft ground, generally home to the very root, and is either immediately withdrawn with a worm held at the extreme tip of the mandibles, or it is gently moved to and fro, by an action of the head and neck, the body of the bird being perfectly steady. It is amusing to observe the extreme care and deliberation with which the bird draws the worm from its hiding-place, coaxing it out as it were by degrees, instead of pulling roughly or breaking it. On getting the worm fairly out of the ground, it throws up its head with a jerk, and swallows it whole.

The foregoing extract refers to *A. mantelli*, but there is little doubt of the remarks being equally applicable to *A. australis*, and probably also to *A. oenei*, though the different proportion of the bill in the last points to some diversity in the mode of feeding.

**KIZILBASHES**—**KLADNO**

(KIRULA, **Red-Heads**), the nickname given by the Orthodox Turks to the Shitite Turkish immigrants from Persia, who are found chiefly in the plains from Kara-Hissar along Tokat and Amasia to Angora. During the wars with Persia the Turkish sultans settled them in these districts. They are strictly speaking Persianized Turks, and speak pure Persian. There are many Kizilbashes in Afghanistan. Their immigration dates only from the time of Nadir Shah (1737). They are an industrious honest folk, chiefly engaged in trade and as physicians, scribes, and so on. They form the bulk of the amir's cavalry. Their name seems to have been first used in Persia of the Shitites in allusion to their red caps.

**KIZILIRMAK**, i.e. "Red River" (anc. *Halys*), the largest river in Asia Minor, rising in the Kizil Dagh at an altitude of 6000 ft., and running south-west west Zara to Sivas. Below Sivas it flows south to the latitude of Kaisarich, and then curves gradually round to the north. Finally, after a course of about 600 m., it discharges its waters into the Black Sea between Sinope and Samsun, where it forms a large delta. The only important tributary is the Delije Irmark on the right and the Guk Irmark on the left bank.

**KIZLYAR** (Kizliyar, or Kizlar), a town of Russia, in Caucasus, in the province of Terek, 120 m. N.E. of Vladikavkaz, in the low-lying delta of the river Terek, about 35 m. from the Caspian. The population decreased from 8509 in 1861 to 7353 in 1877. The town lies to the east of the main stream between two of the larger secondary branches, and is subject to flood- ing. The town proper, which spreads out round the citadel, has Tatar, Georgian and Armenian quarters. The public buildings include the Greek cathedral, dating from 1786; a Greek nunnery, founded by the Georgian chief Daniel in 1736; the Armenian church of SS Peter and Paul, dating from 1723.

The population is mainly supported by the gardens and vineyards irrigated by canals from the river. A government vineyard and school of viticulture are situated 3½ m. from the town. About 1,200,000 gallons of Kizlyar wine are sold annually at the fair of Nizhny-Novgorod. Silk and cotton are woven. Kizlyar is mentioned as early as 1616, but the most notable accession of inhabitants (Armenians, Georgians and Persians) took place in 1715. Its importance as a fortress dates from 1736, but the fortress is no longer kept in repair.

**KIZLY-KUM** is a desert in W.H., stretching partly on the Aral Lake between the river Syr-darya on the N.E. and the river Amu-darya on the S.W. It measures some 370 by 220 m., and in part covered with drift-sand or dunes, many of which are advancing slowly but steadily towards the S.W. In character they resemble those of the neighbouring Karakum desert (see *Kara-kum*). On the whole the Kizly-kum slopes S.W. towards the Aral Lake, where its altitude is only about 160 ft. as compared with 2000 in the S.E. In the vicinity of that lake the surface is covered with Aralo-Caspian deposits; but in the S.E., as it ascends towards the Tien-shan system, it is intersected with deep accumulations of fertile loess.

**KJERULF, HALFDAN** (1815-1868), Norwegian musical composer, the son of a high government official, was born at Christiania on the 15th of September 1815. His early education was at Christiania University, for a legal career, and not till he was nearly 20—on the death of his father—was he able to devote himself entirely to music. As a fact, he actually started on his career as a music teacher and composer of songs before ever having seriously studied music at all, and not for ten years did he attract any particular notice. Then, however, his Government paid him an official visit, and sent him to Copenhagen, but after his return to Norway Kjerulf tried in vain to establish serial classical concerts, while he himself was working with Bjørnson, and other writers at the composition of lyrical songs. His fame rests almost entirely on his beautiful and many national part-songs and solos; but his pianoforte music is equally charming and simple. Kjerulf died at Grefsen, on the 11th of August 1868.

**KJERULF, THEODOR** (1825-1888), Norwegian geologist, was born at Christiania on the 9th of March 1825. He was educated in the university at Christiania, and subsequently studied at Heidelberg, where he was working on geology under the noted professor of geology in the university of his native city, and he was afterwards placed in charge of the geological survey of the country, then established mainly through his influence. His contributions to the geology of Norway were numerous and important, especially in reference to the southern portion of the country, and to the structure and relations of the Archæan and Palæozoic rocks, and the glacial phenomena. His principal results were embodied in his work *Udsigt over det sydlige Norges Geologi* (1879). He was also active as a poetical worker. He died at Christiania on the 25th of October 1888.

**KLADNO**, a mining town of Bohemia, Austria, 18 m. W.N.W. of Prague by rail. Pop. (1900), 18,600, mostly Czech. It is situated in a region very rich in iron-mines and coal-fields and possesses some of the largest iron and steel works in Bohemia. Near it is the mining town of Buschtěhrad (pop. 3510), situated in the centre of very extensive coal-fields. Buschtěhrad was originally the name of the castle only. This was from the 15th century to 1630 the property of the lords of Kolovrat, and came by devious inheritance through the grand-dukes of Tuscany, to the emperor Francis Joseph. The name Buschtěhrad was first given to the railway, and then to the town, which had been called Buckow since its foundation in 1700. There is another castle of Buschtěhrad near Hôfci. Kladno, which for centuries had been a village of no importance, was sold in 1705 by the grand-duchess Anna Maria of Tuscany to the cloister in
KLAFSKY—Klaproth

Bynum, to which it still belongs. The mining industry began in 1842.

KLAFSKY, KATHARINA (1855–1860), Hungarian operatic singer, was born at Sát János, Wieselburg, of humble parents. Being employed at Vienna as a nurserymaid, her fine soprano voice led to her being engaged as a chorus singer, and she was given good lessons in music. By 1882 she became well-known in Wagenerian rôles at the Leipzig theatre, and she increased her reputation at other German musical centres. In 1892 she appeared in London, and had a great success in Wagner’s operas, notably as Brünhilde and as Isolde, her dramatic as well as vocal gifts being of an exceptional order. She sang in America in 1895, but had to return because of failing health. See A Life, by L. Ordemann, was published in 1903 (Leipzig).

KLAGENFURT (Slovene, Celovec), the capital of the Austrian duchy of Carinthia, 212 m. S.W. of Vienna by rail. Pop. (1900), 24,314. It is picturesquely situated on the river Glan, which is in communication with the Wörther-see by the 3 m. long Lend canal. Among the more noteworthy buildings are the palace of St Egidius (1790), with a tower 208 ft. in height; the cathedral of SS Peter and Paul (1582–1593, burnt 1723, restored 1725); the churches of the Benedictines (1613), of the Capuchins (1646), and of the order of St Elizabeth (1710). To these must be added the palace of the prince-bishop of Gurk, the burg or castle, existing in its present form since 1777, and the Landhaus or house of assembly, dating from the end of the 14th century, and containing a museum of natural history, and collection of minerals, antiquities, seals, paintings and sculptures. The most interesting public monument is the great Lindwurm or Dragon, standing in the principal square (1590). The industrial establishments comprise white lead factories, machine and iron foundries, and commerce is active, especially in the mineral products of the region.

Upon the Zollfeld to the north of the city once stood the ancient Roman town of Virunum. During the Middle Ages Klagenfurt became the property of the crown, but by a patent of Maximilian I. of the 24th of April 1518, it was conceded to the Carinthian estates, and has since then taken the place of St Veit as capital of Carinthia. In 1535, 1636, 1723 and 1796 Klagenfurt suffered from destructive fires, and in 1690 from the effects of an earthquake. On the 29th of March 1797 the French took the city, and upon the following day it was occupied by Napoleon as his headquarters.

KLÁJUS (Hungarian, or Klaüs, JOHANN (1616–1656), German poet. He was born at Mócsen in Saxony. After studying theology at Wittenberg he went to Nuremberg as a “candidate for holy orders,” and there, in conjunction with Georg Philipp Harsdörffer, founded in 1644 the literary society known as the Pegnitz order. In 1647 he received an appointment as master in the Sebaldis school in Nuremberg, and in 1650 became preacher at Kitzingen, where he died in 1656. Klaj's poems consist of dramas, written in stilted language and redundant with adventures, among which are Hellen- und Himmelfahrt Christi (Nuremberg, 1644), and Herodes, der Kindermörder (Nuremberg, 1643), and a poem, written jointly with Harsdörffer, Peguexeische Schülergedicht (1643), which gives in allegorical form the story of his settlement in Nuremberg. See Tittmann, Die Nürnbergische Dichterschule (Göttingen, 1847).

KLAPKA, GEORG (1820–1892), Hungarian soldier, was born at Temesvár on the 7th of April 1820, and entered the Austrian army in 1838. He was still a subaltern when the Hungarian revolution of 1848 broke out, and he offered his services to the patriot party. He served in important staff appointments during the earlier part of the war which followed; then, early in 1849, he was ordered to replace General Mészáros, who had been defeated at Kaschau, and as general commanding an army corps he had a conspicuous share in the victories of Kapánya, Aszagos, Tantza, Nagy Sarlo and Komárom. Then, as the fortunes of war turned against the Hungarians, Klapka, after serving for a short time as minister of war, took command at Komárom, from which fortress he conducted a number of successful expeditions until the capitulation of Világos in August put an end to the war in the open field. He then brilliantly defended Komárom for two months, and finally surrendered on honourable terms. Klapka left the country at once, and lived thenceforward for many years in exile, at first in England and afterwards chiefly in Switzerland. He continued by every means in his power to work for the independence of Hungary, especially at moments of European war, such as 1859, when he offered Count Golycki’s embassy to him seed to him to promise success. After the war of 1866 (in which as a Prussian major-general he organized a Hungarian corps in Silesia) Klapka was permitted by the Austrian government to return to his native country, and in 1867 was elected a member of the Austrian Chamber of Deputies, in which he belonged to the Dáék party. In 1877 he made an attempt to reorganize the Turkish army in view of the war with Russia. General Klapka died at Budapest on the 17th of May 1892. A memorial was erected to his memory at Komárom in 1896.

Klaproth, Heinrich Julius (1783–1848), German orientalist and traveller, was born in Berlin on the 11th of October 1783, the son of the chemist Martin Heinrich Klaproth (q.v.). He devoted his energies in quite early life to the study of Asiatic languages, and published in 1802 his Asiatisches Magazin (Weimar, 1802–1803). He was in consequence called to St Petersburg and given an appointment in the academy there. In 1805 he was a member of Count Golovkin’s embassy to China. On his return he was despached by the academy to the Caucasus on an ethnographical and linguistic exploration (1807–1808), and was afterwards employed for several years in connexion with the academy’s Oriental publications. In 1812 he moved to Berlin; but in 1815 he settled in Paris, and in 1816 Humboldt procured him from the king of Prussia the title and salary of professor of Asiatic languages and literature, with permission to remain in Paris as long as was requisite for the publication of his works. He died in that city on the 28th of August 1835.

Klaproth’s most conspicuous feature of Klaproth’s erudition was the vastness of the field which it embraced. His great work Asia polyglotta (Paris, 1823 and 1831, with Sprachbess) not only served as a résumé of all that was known on the subject, but formed a new departure for the conqueror of the Eastern languages, more especially those of the Russian Empire. To a great extent, however, his work is now superseded. The Itinerary of a Chinese Traveller (1821), a series of documents in the military archives of St Petersburg purporting to be the travels of George Ludwig von —, and a similar work obtained from him in the London foreign office, are all regarded as spurious.

Klaproth’s other works include: Reise in den Russischen Georgien in den Jahren 1807 und 1808 (Halle, 1812–1814; French translation, Paris, 1823), Geographisch-historische Beschreibung des ästlichen Kindaus (Weimar, 1814); Tableaux historiques de l’Asie (23 vol., Paris, 1812–1818); Mémoirs relatifs à la géographie et à l’histoire de la Turquie (2 vol., Paris, 1821–1822); Traité historique, géographique, ethnographique et politique de la France (1827), and Vocabulaire et grammaire de la langue géorgienne (Paris, 1827).

Klaproth, Martin Heinrich (1743–1817), German chemist, was born at Wernigerode on the 8th of December 1743. During a large portion of his life he followed the profession of an apothecary. After acting as assistant in pharmacies at Quedlinburg, Hanover, Berlin and Danzig, he came to Berlin on the death of Valentin Rose the elder in 1771 as manager of his business, and in 1780 he established an establishment on his own account in the same city, where from 1782 he was pharmaceutical assessor of the Ober-Collegium Medicum. In 1787 he was appointed lecturer in chemistry to the Royal Artillery, and when the university was founded in 1810 he was selected to be the professor of chemistry. He died in Berlin on the 1st of January 1817. Klaproth was the leading chemist of his time in Germany.
An exact and conscientious worker, he did much to improve and systematize the processes of analytical chemistry and mineralogy, and his appreciation of the value of quantitative methods led him to become one of the earliest adherents of the Lavoisieran doctrines outside France. He was the first to discover uranium, zirconium and titanium, and to characterize them as distinct elements, though he did not obtain any of them in the pure metallic state; and he elucidated the composition of numerous substances till then imperfectly known, including organic compounds of the then unrecognized elements: tellurium, strontium, cerium and chromium.

His papers, over 200 in number, were collected by himself in Beiträge zur chemischen Kenntniss der Mineralkörper (5 vols., 1795-1810) and Chemische Abhandlungen gemischten Inhalts (1813). He also published a Chemisches Wörterbuch (1807-1810), and edited a revised edition of F. A. C. Gren's Handbuch der Chemie (1806).

KLÉBER, JEAN BAPTISTE (1753-1800), French general, was born on the 9th of March 1753, at Strassburg, where his father was a builder. He was trained, partly at Paris, for the profession of architect, but his opportune assistance to two German nobles in a tavern in 1773 and again in 1776 led him to the military school of Munich. Thence he obtained a commission in the Austrian army, but resigned it in 1783 on finding his humble birth in the way of his promotion. On returning to France he was appointed inspector of public buildings at Belfort, where he studied fortification and military science. In 1792 he enlisted in the Haut-Rhin volunteers, and was from his military knowledge at once elected adjutant and soon afterwards lieutenant-colonel. At the defence of Mainz he so distinguished himself that though disgraced along with the rest of the garrison and imprisoned, he was promptly reinstated and in August 1793 promoted general of brigade. He won considerable distinction in the Vendéan war, and two months later was made a general of division. In these operations began his intimacy with Marceau, with whom he defeated the Royalists at Le Mans and Savenay. For openly expressing his opinion that lenient measures ought to be pursued towards the Vendéans he was recalled; but in April 1794 he was once more reinstated and sent to the Army of the Sambre-and-Meuse. He displayed his skill and bravery in the numerous actions around Charleroi, and especially in the crowning victory of Fleurus, after which in the winter of 1794-95 he besieged Mainz. In 1795 he was appointed chief of the army temporarily, but declined a permanent appointment as commander-in-chief. On the 13th of October 1795 he fought a brilliant rear-guard action at the bridge of Neuwied, and in the offensive campaign of 1796 he was Jourdan's most active and successful lieutenant. Having, after the retreat to the Rhine (see FRENCH REVOLUTIONARY WARS), declined the chief command, he withdrew into private life early in 1798. He accepted a division in the expedition to Egypt under Bonaparte, but was wounded in the head at Alexandria in the first engagement, which prevented, his taking any further part in the campaign of the Pyramids, and caused him to be appointed governor of Alexandria. In the Syrian campaign of 1799, however, he commanded the vanguard, took El-Arish, Gaza and Jaffa, and won the great victory of Mount Tabor on the 15th of April 1799. When Napoleon returned to France towards the end of 1799 he left Kléber in command of the French forces. In this capacity, seeing no hope of bringing his army back to France or of consolidating his conquests, he made the convention of El-Arish. But when Lord Keith, the British admiral, refused to ratify the terms, he attacked the Turks at Heliospolis, though with but 10,000 men against 60,000, and utterly defeated them on the 20th of March 1800. He then retook Cairo, which had revolted from the French. Shortly after these victories he was assassinated at Cairo by a fanatic on the 14th of June 1800, the same day on which his friend and comrade Desaix fell at Marengo. Kléber was undoubtedly one of the greatest generals of the French revolutionary epoch. Though he distrusted his powers and declined the responsibility of supreme command, there is nothing in his career to show that he would have been unequal to it. As a second in command he was not excelled by any general of his time. His conduct of affairs in Egypt at a time when the treasury was empty and the troops were discontented for want of pay, shows that his powers as an administrator were little—if at all—inferior to those he possessed as a general.

Ernouf, the grandson of Jourdan’s chief of staff, published in 1867 a valuable biography of Kléber. See also Reynaud, Life of Merlin de Thionville; Noy, Mémoires; Dumas, Souvenirs; Les archives de l’administration de Saint Domingue chronicled by Charivaray, Les Généraux morts pour la patrie; General Pajol, Kléber; lives of Marceau and Desaix; M. F. Rousseau, Kléber et Menou en Egypte (Paris, 1900).

KLEIN, JULIUS LEOPOLD (1810-1876), German writer of Jewish origin, was born at Miskolcz, in Hungary. He was educated at the gymnasium in Pest, and studied medicine in Vienna and Berlin. After travelling in Italy and Greece, he settled as a man of letters in Berlin, where he remained until his death on the 2nd of August 1876. He was the author of many dramatic works, among others the historical tragedies Maria von Medici (1841); Luises (1842); Zenobia (1847); Moreto (1859); Mario (1862); Strafford (1862) and Heliodora (1867); and the comedies Die Herzogin (1848); Ein Schätzling (1859); and Voltaire (1862). The tendency of Klein as a dramatist was to become sentimental and obscure, but many of his characters and situations are well conceived, and in nearly all his tragedies there are passages of brilliant rhetoric. He is chiefly known as the author of the elaborate though unfinished Geschichte des Dramas (1856-1876), in which he undertook to record the history of the drama from the earliest times. He died when about to enter upon the Elizabethan period, to the treatment of which he had looked forward as the chief part of his task. The work, which is in thirteen bulky volumes, gives proof of immense learning, but is marred by eccentricities of style and judgment.

Klein's Dramatische Werke were collected in 7 vols. (1871-1872).

KLEIST, BERND HEINRICH WILHELM VON (1777-1811), German poet, dramatist and novelist, was born at Frankfort-on-Oder on the 18th of October 1777. After a scanty education, he entered the Prussian army in 1792, served in the Rhine campaign of 1796 and retired from the service in 1799 with the rank of lieutenant. He next studied law and philosophy at the university of Frankfort-on-Oder, and in 1800 received a subordinate post in the ministry of finance at Berlin. In the following year his roving, restless spirit got the better of him, and procuring a lengthened leave of absence he visited Paris and then settled in Switzerland. Here he found congenial friends in Heinrich Zschokke (q.v.) and Ludwig Friedrich August Wieland (1777-1819), son of the poet; and to them he read his first drama, a gloomy tragedy, Die Familie Schroffenstein (1803), originally entitled Die Familie Ghonors. In the autumn of 1802 Kleist returned to Germany; he visited Goethe, Schiller and Wieland in Weimar, stayed for a while in Leipsig and Dresden, again proceeded to Paris, and returning in 1804 to his post in the administration of crown lands at Königsberg. On a journey to Dresden in 1807 Kleist was arrested by the French as a spy, and being sent to France was kept for six months a close prisoner at Chalons-sur-Marne. On regaining his liberty he proceeded to Dresden, where in conjunction with Adam Heinrich Müller (1779-1829) he published in 1808 the journal Phöbus. In 1809 he went to Prague, and ultimately settled in Berlin, where he edited (1810-1811) the Berliner Abendblätter. Captivated by the intellectual and musical accomplishments of a certain Frau Henriette Vogel, Kleist, who was himself more disheartened and embittered by his lot, agreed to do her bidding and die with her, carrying out this resolution by first shooting the lady and then himself on the shore of the Wannsee near Potsdam, on the 21st of November 1811. Kleist's whole life was filled by a restless striving after ideal and illusory happiness, and this is largely reflected in his work. He was by far the most important North German dramatist of the Romantic movement, and no other of the Romanticists approaches him in the energy with which he expresses passionate indignation.
His first tragedy, *Die Familie Schroffenstein*, has been already referred to; the material for the second, *Penitentes* (1868), queen of the Amazons, is taken from a Greek source and presents a picture of war and of the battle of Sardis. Of these, the former has a successful modern play, *Das Käthchen von Heilbronn*, or *Die Feuerprobe* (1808), a poetic drama full of medieval bustle and mystery, which has retained its popularity, and *Kleist* is associated with *Die Räuber* (1811), while *Amphitryon* (1808), an adaptation of Molière's comedy, is, of less importance. Of Kleist's other dramas, *Die Hermannsleuchte* (1806) is a dramatic treatment of an historical subject and is full of references to the political conditions of his own time.

In it he gives vent to his hatred of his country's oppressors. This, together with the drama *Prinz Friedrich von Homburg*, the latter accounted Kleist's best work, was first published by Ludwig Tieck in *Kleists hinterlassene Schriften* (1811). Roger, Guiscard, the hero conceived on a grand plan, was left a fragment. Kleist was also a master in the art of narrative, and of his *Gesammelte Erzählungen* (1809), Michael Kohlhaas (1810) and *Verborgene Seele* (1811) have the gentleman of the *Die Räuber* horse dealer in Luther's day (see *Kohlhaase*) is immortalized, is one of the best German stories of its time. He also wrote some patriotic lyrics. His *Gesammelte Schriften* were published by Ludwig Tieck (5 vols. 1826) and by T. Zöllig (4 vols. 1885); also by K. Siegen (4 vols. 1895); and in a critical edition by E. Schmidt (5 vols. 1903-1905). His Ausgeübte Dramen were published by K. Siegen (Leipzig, 1877) and his letters were first published by E. von Bölow, *Heinrich von Kleists Leben und Briefe* (1848).

KLEIST, EWALD CHRISTIAN VON (1715-1759), German poet, was born at Zeblin, near Kœlln in Pomerania, on the 7th of March 1715. After attending the Jesuit school in Deutschchor and the gymnasium in Danzig, he proceeded in 1731 to the university of Königsberg, where he studied law and mathematics. On the completion of his studies, he entered the Danzig army, and after being returned to Prussia by Frederick II. in 1740, he was appointed lieutenant in a regiment stationed at Potsdam, where he became acquainted with J. W. L. Gleim (q.v.), who interested him in poetry. After distinguishing himself at the battle of Mollyritz (April 10, 1741) and the siege of Neisse (1741), he was promoted captain in 1749 and major in 1756. Quartered during the winter of 1757-1758 in Leipzig, he found relief from his irksome military duties in the society of Gotthold Ephraim Lessing (q.v.). Shortly afterwards in the battle of Kunersdorf, on the 12th of August 1759, he was severely wounded, which, while producing no immediate attack, and died at Frankfurt-on-Oder on the 24th of August following.

Kleist's chief work is a poem in hexameters, *Der Frühlings* (1749), for which Thomson's *Seasons* largely supplied ideas. In his description of the beauties of nature Kleist shows real poetical genius, an almost modern sentiment and fine taste. He also wrote some charming odes, idylls and elegies, and a small epic poem *Cissides und Pachus* (1759), the subject being two Thessalian friends who die a heroic death for their country in a battle against the Athenians.

KLERDSORP, a town of the Transvaal, 118 m. S.W. of Johannesburg and 102 m. N.E. of Kimberley by rail. Pop. (1904), 4276 of whom 2203 were whites. The town, built on the banks of the Schoonspruit 10 m. above its junction with the Vaal, possesses several fine public buildings. In the neighbourhood are gold-mines, the reef appearing to form the western boundary of the Witwatersrand basin. Diamonds (green in color) and copper are also found in the district. Klerksdorp was one of the villages found in 1874-1875 by the Boers who crossed the Vaal, dating from 1838. The modern town, which is on the site of the *spruit* opposite the old village, was founded in 1888.

KLESL (or KHESL), MELCHIOR (1552-1630), Austrian statesman and ecclesiastic, was the son of a Protestant baker, and was born in Vienna. Under the influence of the Jesuits he was converted to Roman Catholicism, and having finished his education at the universities of Vienna and Ingolstadt, he was made chancellor of the university of Vienna; and as official and vicar-general of the bishop of Passau he exhibited the zeal of a convert in forwarding the progress of the counter-reformation in Austria. When, in 1612, he became a cardinal, his pontificate has been associated with the archduke Matthias which began about the same time. Both before and after 1612, when Matthias succeeded his brother Rudolph II, as emperor, Klesl was the originator and director of his policy, although he stoutly opposed the concessions to the Hungarian Protestants in 1606. He assisted to secure the election of Matthias to the imperial throne, and sought, but without success, to strengthen the new emperor's position by making peace between the Catholics and the Protestants.

When during the short reign of Matthias the question of the imperial succession demanded prompt attention, the bishop, although quite as anxious as his opponents to retain the empire in the house of Habsburg and to preserve the dominance of the Roman Catholic Church, advised that this question should be shelved until some arrangement with the Protestant princes had been reached. This counsel was displeasing to the archduke Maximi- llian and to Ferdinand, afterwards the emperor Ferdinand II. who believed that Klesl was hostile to the candidature of the latter prince. It was, however, impossible to shake his influence with the emperor; and in June 1618, a few months before the death of Matthias, he was seized by order of the archdukes and sent to the abbey of St. Florian. Klesl was, however, restored to his See of Passau and was consecrated archbishop of Vienna on the 17th of December 1618. For more than forty years he remained a cardinal since 1619, was transferred to Rome by order of Pope Gregory XV., and was released from imprisonment. In 1627 Ferdinand II. allowed him to return to his episcopal duties in Vienna, where he died on the 18th of September 1630.

KLINGER, FRIEDRICH MAXIMILIAN VON (1752-1831), Austrian dramatist and novelist, was born of humble parentage at Frankfort-on-Main, on the 17th of February 1752. His father died when he was a child, and his early years were a hard struggle. He was enabled, however, in 1774 to enter the university of Giessen, where he studied law; and Goethe, with whom he had been acquainted since childhood, helped him in many ways. In 1775 Klinger gained with his tragedy *Die ZweiLinge* a prize offered by the Hamburg theatre, under the auspices of the actress Sophie Charlotte Ackermann (1714-1792) and her son the famous actor and playwright, Friedrich Ludwig Schröder (1744-1816). In 1776 Klinger was appointed *Theaterdichter* to the *Seyshersche Schauspiel-Gesellschaft* and held this post for two years. About 1778 he entered the Austrian military service and took part in the Bavarian war of succession. In 1780 he went to St Petersburg, became an officer in the Russian army, was ennobled and attached to the Grand Duke Paul, whom he accompanied on a journey to Italy and France. In 1785 he was appointed director of the corps of cadets, and having married a natural daughter of the empress Catharine, was made præses of the Academy of Knights in 1799. In 1803 Klinger was nominated by the emperor Alexander curator of the university of Dorpat, an office he held until 1817; in 1814 he became librarian at St Petersburg. He then gradually gave up his official posts, and after living for many years in honourable retirement, died at Dorpat on the 25th of February 1831.

Klinger was a man of vigorous moral character and full of fine feeling, though the bitter experiences and depredations of his youth are largely reflected in his dramas. It was one of his earliest works, *Sturm und Drang* (1776), which gave its name to this literary epoch. In addition to this tragedy and *Die ZweiLinge* (1776), the chief plays of his early period of passionate fervour and restless "storm and stress", "Die neue Arise" (1779), *Simone Grisaldo* (1779) and *Rubipo und seine Kinder* (1780). To
a later period belongs the fine double tragedy of Medea in Korinth and Medea auf dem Kaukasos (1791). In Russia he devoted himself mainly to the writing of philosophical romances, of which the best known are Fausts Leben, Taten und Hllensafahrt (1797) Geschichtskrafte des Bestenmenschen (1792) and Geschichte Raphaels de Aquilas (1793). This series was closed in 1803 with Betrachtungen und Gedanken über verschiedene Gegenstände der Welt und der Literatur. In these works Klinger gives calm and dignified expression to the leading ideas which the period of Sturm und Drang had bequeathed to German classical literature.

Klinger’s works were published in twelve volumes (1809-1815), also 1832-1833 and 1842. The most recent edition is in eight volumes (1878-1880); but none of these is complete. A selection will be found in his Schriften (1837). Driger, C. Schmidt, Lenz and Klinger (1878); M. Rieger, Klinger in der Sturm- und Drangperiode (1880); and Klinger in seiner Reife (1896).

KLINGER, MAX (1857-1906), German painter, etcher and sculptor, was born at Flaggwitz near Leipzig. He attended the classes at the Carlsruhe art school in 1874, and went in the following year to Berlin, where in 1878 he created a sensation at the Academy exhibition with two series of pen-and-ink drawings—the "Series upon the Theme of Christ," and "Fantasies upon the Finding of a Glove." The darling originality of these imaginative and eccentric works created an outburst of indignation, and the artist was voted insane; nevertheless the "Glove" series was bought by the Berlin National Gallery. His painting of "The Judgment of Paris" caused a similar storm of indignant protest in 1887, owing to its rejection of all conventional attributes and the naïve directness of the conception. His vivid and somewhat morbid imagination, with its leaning towards the gruesome and disagreeable, and the Goyaesque turn of his mind, found their best expression in his "cycles" of etchings: "Deliverances of Sacrificial Victims told in Ovid," "A Phrahas Phantasy," "Eve and the Future," "A Life," and "Of Death," but in his use of the needle he paid at the hands of the great masters; it supplies him merely with means of expressing his ideas. After 1886 Klinger devoted himself more exclusively to painting and sculpture. In his painting he aims neither at classic beauty nor modern truth, but at grim impressiveness not without a touch of mysticism. His "Pietà" at the Dresden Gallery, the frescoes at the Leipzig University, and the "Christ in Olympia," at the Modern Gallery in Vienna, are characteristic examples of his art. The Leipzig Museum contains his sculptured "Salome" and "Cassandra." In sculpture he favours the use of various eccentric works in the manner of the Greek and Roman masters; it supplies him merely with means of expressing his ideas.

KLIAPSPRINGER, the Boer name of a small African mountain-antelope (Oreotragus saltator), ranging from the Cape through East Africa to Somaliland and Abyssinia, and characterized by its blunt rounded hoofs, thick pithy hair and gold-spangled colouring. The kliapspringer represents a genus by itself, the various local forms not being worthy of more than racial distinction. The activity of these antelopes is marvellous.

KLONDIKE, a district in Yukon Territory, north-western Canada, approximately in 64° N. and 140° W. The limits are rather indefinite, but the district includes the country to the south of the Klondike River, which comes into the Yukon from the east and has several tributaries, as well as Indian River, a second branch of the Yukon, flowing into it some distance above the Klondike. The richer gold-bearing gravels are found along the creeks tributary to these two rivers within an area of about 800 sq. m. The Klondike district is a dissected peneplain with low ridges of rounded forms rising to 4250 ft. above the sea at the Dome which forms its centre. All of the gold-bearing creeks rise at the Dome and wind in various directions toward the Klondike and Indian rivers, the most productive being Bonanza with its tributary Eldorado, Hunker, Dominion and Gold Run. Of these, Eldorado, for the two or three miles in which it was gold-bearing, was much the richest, and for its length probably surpassed any other known placer deposit.

Rich gravel was discovered on Bonanza Creek in 1866, and a wild rush to this almost inaccessible region followed, a population of 30,000 coming in within the next three or four years with a rapidly increasing output of gold, reaching in 1900 the climax of $25,000,000. After that the production has steadily declined, until in 1917 it fell to $1,100,000. The richest gravels were worked out before 1910, and most of the population had left the Klondike for Alaska and other regions; so that Dawson, which for a time was a bustling city of more than 10,000, dwindled to about 3000 inhabitants. As the ground was almost all frozen, the mines were worked by a thawing process, first by setting fires, afterwards by using steam, new methods being introduced to meet the unusual conditions. Later dredges and hydraulic mining were resorted to with success.

The Klondike, in spite of its isolated position, brought together miners and adventurers from all parts of the world, and it is greatly to the credit of the Canadian government and of the mounted police, who were entrusted with the keeping of order, that life and property were as safe elsewhere and that no lawless methods were adopted by the miners as in placer mining camps in the western United States. The region was at first difficult of access, but can now be reached with perfect comfort in summer, travelling by well-appointed steamers on the Pacific and the Yukon River. Owing to its perpetually frozen soil, summer roads were excessively bad in earlier days, but good roads have since been laid out to all the important mining centres. Dawson itself has all the resources of a civilized city in spite of being founded on a frozen peat-bog; and is supplied with ordinary market vegetables from farms just across the river. During the winter, when for some time the sun does not appear above the hills, the cold is intense, though usually without wind, but the well-chinked log houses can be kept comfortably warm. When winter travel is necessary dog teams and sledges are generally made use of, except on the stage route south to White Horse, where horses are used. A telegraph line connects Dawson with St. Michael, British Columbia, but the line south to the Yukon begins at a place where the ground is so soft that it is necessary to build it in order so great over the long intervening wilderness that communication is often broken. Gold is practically the only economic product of the Klondike, though small amounts of tin ore occur, and lignite coal has been mined lower down on the Yukon. The source of the gold seems to have been small stringers of quartz in the silicious and sericitic schists which form the bed rock of much of the region, and no important quartz veins have been discovered; so that unlike most other placer regions the Klondike has not developed lode mines to continue the production of gold when the gravels are exhausted.

KLOPP, ONNO (1822-1903), German historian, was born at Leer on the 9th of October 1822, and was educated at the universities of Bonn, Berlin and Götingen. For a few years he was a teacher at Leer and at Osnabrück; but in 1858 he settled at Hanover, where he became intimate with King George V., who made him his Archirep. Thoroughly disliking Prussia, he was in hearty accord with George in resisting her aggressive policy; and after the annexation of Hanover in 1866 he accompanied the exiled king to Hüttingen. He became a Roman Catholic in 1874. He died at Penzing, near Vienna, on the 9th of August 1903. Klopp is best known as the author of Der Fall des Hauens Stuart (Vienna, 1875-1888), the fullest existing account of the later Stuarts.

His Der König Friedrich II. und seine Politik (Schaffhausen, 1867) and Geschichte Ostfrieslands (Hanover, 1854-1868) show his dislike of Prussia. His other works include Der dreissigjahrigige Krieg bis zum Tode Gustav Adolfs (Paderborn, 1832-1861); a revised edition of his Tilly im dreissigjahrigigen Kriege (Stuttgart, 1861); a life of George V., König Georg V. (Hanover, 1878); W. Philipp Melanchthon (1782); and Geschichte der protestantischen episkopalen iwa Leopold I. imperatori ed il P. Marco l’Attavio capuccino (Gratz, 1888). Klopp also wrote much in defence of George V. and his claim to Hanover, including the Offizialer Bericht über die Kriegsereignisse zwischen Hannover und Preussen in Juni und Julii 1866 (Vienna, 1867) and he edited the works of Leibnitz in eleven volumes (1861-1864). See W. Klopp, Onno Klopp: ein Lebensab (Wehberg, 1907).

KLOPSTOCK, GOTTLIEB FRIEDRICH (1724-1803), German poet, was born at Quedlinburg, on the 2nd of July 1724, the eldest
son of a lawyer, a man of sterling character and of a deeply religious mind. Both in his birthplace and on the estate of Friedeburg on the Saale, which his father later rented, young Klopstock passed a happy childhood; and more attention having been given to his physical than to his mental development he grew up a strong healthy boy and was an excellent horseman and skater. In his thirteenth year he was sent to Quillenburg where he attended the gymnasium, and in 1739 proceeded to the famous classical school of Schulpforta, and he soon became an adept in Greek and Latin versification, and wrote some meritorious idylls and odes in German. His original intention of making the emperor Henry I. ("The Fowler") the hero of an epic, was, under the influence of Milton's *Paradise Lost*, with which he became acquainted through Bodmer's translation, abandoned in favour of the religious epic. While yet at school, he had already drafted the plan of *Der Messias*, upon which his fame mainly rests. On the 21st of September 1745 he delivered on quitting school a remarkable "learning oration" on epic poetry—*Abschiedsrede über die epische Poesie, kultur- und literarisch-geschichtlich erläutert*—and next proceeded to Jena as a student of theology, where he elaborated the first three cantos of the *Messias* in prose. In the life at this university being ungenial to him, he removed in the spring of 1746 to Leipzig, and there joined the circle of young men of letters who contributed to the *Bremer Beiträge*. In this periodical the first three cantos of the *Messias* in hexameters were anonymously published in 1748. A new era in German literature had commenced, and the name of the author soon became known. In Leipzig he also wrote his best poem, the best parts of which are in an epistle, *Freunde* (1747), afterwards recast as *Wingolf* (1766). He left the university in 1748 and became a private tutor in the family of a relative at Langensalza. Here unrequited love for a cousin (the "Fanny" of his odes) disturbed his peace of mind. Gladly therefore he accepted in 1750 an invitation from Jakob Bodmer (q.v.), the translator of *Paradise Lost*, to visit him in Zürich. Here Klopstock was at first treated with every kindness and respect and rapidly recovered his spirits. Bodmer, however, was disappointed in finding to his young poet of the *Messias* a man of strong worldly interests, and a coolness sprang up between the two friends.

At this juncture Klopstock received from Frederick V. of Denmark, on the recommendation of his minister Count von Bernstorff (1711-1772), an invitation to settle at Copenhagen; with an annuity of 400 talers, with a view to the completion of the *Messias*. The offer was accepted; on his way to the Danish capital Klopstock met at Hamburg the lady who in 1754 became his wife, Margareta (Meta) Moller, (the "Cidii" of his odes), an enthusiastic admirer of his poetry. His happiness was short; she died in 1756, leaving him almost broken-hearted. His grief at her loss finds pathetic expression in the 19th canto of the *Messias*. The poet subsequently published his wife's writings, *Hinterlassene Werke von Margareta Klopstock* (1759), which give evidence of a tender, sensitive and deeply religious spirit. Klopstock now relapsed into melancholy; new ideas failed him, and his poetry became more and more vague and unintelligible. He still continued to live and work at Copenhagen, and next, following Heinrich Wilhelm von Gerstenberg (q.v.), turned his attention to northern mythology, which he conceived should replace classical subjects in a new school of German poetry. In 1770, on the death of King Christian VII. of Count Bernstorff from office, he retired with the latter to Hamburg, but retained his pension together with the rank of councillor of legation. Here, in 1773, he issued the last five cantos of the *Messias*. In the following year he published his strange scheme for the regeneration of German letters, *Die Gelehrtenrepublik* (1774). In 1775 he travelled south, and making the acquaintance of Goethe on the way, spent a year at the court of the margrave of Baden at Karlsruhe. Thence, in 1776, with the title of Hofrat and a pension from the margrave, which he retained together with what from the king of Denmark, he returned to Hamburg where he spent the remainder of his life. His latter years he passed, as he always was his inclination, in retirement, only occasionally relieved by association with his most intimate friends, busied with philological studies, and hardly interested himself in the new developments of German literature. The American War of Independence and the Revolution in France aroused him, however, to enthusiasm. The French Republic sent him the diploma of honourary citizenship; but, horrified at the terrible scenes the Revolution had enacted in the place of liberty, he returned. When 67 years of age he contracted a disagreement with Johann Gottfried Herder, a niece of his late wife, who for many years had been one of his most intimate friends. He died at Hamburg on the 14th of March 1803, mourned by all Germany, and was buried with great pomp and ceremony by the side of his first wife in the churchyard of the village of Ottensen.

Klopstock's nature was best attuned to lyrical poetry, and in it he deplored his found its truest expression. He was less suited for epic and dramatic representation; for, wrapt up in himself, a stranger to the outer world, without historical culture, and without even any interest in the events of his time, he was lacking in the art of plastic representation such as a great epic requires. Thus the *Messias*, despite the magnificent passages which especially the earlier cantos contain, cannot satisfy the demands such a theme must necessarily make. The subject matter, the Redemption, present serious difficulties to adequate epic treatment. The *Gesinnung der Menschheit* was too lofty a subject which might have been imported from without and interwoven with it was a penitence by the prophet of profane. He had accordingly to resort to Christian mythology; and here again, circumscribed by the dogmas of the Church, he was in a measure the victim of a compromise, of a plastic faith. The personality of Christ could scarcely be treated in an individual form, still less could angels and devils—and in the case of God Himself it was impossible. The result was that, despite the groundwork—the four gospels, the Apocalypse of St John, and the model ready to hand in Milton's *Paradise Lost*—material elements are largely wanting and the actors in the poem, Divinity and Humanity, lack plastic form. That the poem to twenty years to complete could not but be detrimental to its unity of design, the original enthusiasm was not sustained until the end, and the earlier cantos are far superior to the latter. Thus the intense public interest the poem aroused in its earlier portion soon vanished before its completion. It was translated into seventeen languages and led to numerous imitations. In his odes Klopstock had more scope for his peculiar talents. Among the best are *An Fanny; Der Zürchersee; Die tote Klara; An Cidii; Die beiden Musen; Der Rheinwein; Die frühen Grüben; Mein Vaterland*. His religious odes mostly take the form of hymns, of which the most beautiful is *Die Frühlingsfeier*. His dramas, in some of which, notably *Hermann und Dorothea* (1766), and *Hermann und die Fürsten* (1784), he celebrated the deeds of the ancient German hero Arminius, and in others, *Der Tod Adams* (1757) and *Salomo* (1764), took his materials from the Old Testament. They are written with a manneristic manner in action. In addition to *Die Gelehrtenrepublik*, he was also the author of *Fragmente über Sprache und Dichtkunst* (1779) and *Grammatische Gedichte* (1794), where he made important contributions to philology and to the history of German poetry.

KLOSTERNEUBURG, a town of Austria, in Lower Austria, 55 m. N.W. of Vienna by rail. Pop. (1900), 11,595. It is situated on the right bank of the Danube, at the foot of the Kahlenberg, and is divided by a small stream into an upper and a lower town. As an important pioneer station Klosternuburg has various military buildings and stores, and among the stores it possesses an academy of wine and fruit cultivation.

On a hill rising directly from the banks of the Danube stand the magnificent buildings (erected 1730-1834) of the Augustine canonry, founded in 1106 by Margrave Leopold the Holy. This foundation is the oldest and richest of the kind in Austria; it
owns much of the land upon which the north-western suburbs of Vienna stand. Among the points of interest within it are the old chapel of 1318, with Leopold's tomb and the altar of Verdun, dating from the 12th century, the treasury and relic-chamber, the Matterjoch—with its 600 volumes and many MSS., the picture gallery, the collection of coins, the theological hall and the wine-cellar, containing an immense tune like that at Heidelberg. The inhabitants of Klosterneuburg are mainly occupied in making wine, of excellent quality. There is a large cement factory out-side the town. In Roman times the castle of Ctinum stood in the region of Klosterneuburg. The town was founded by Charlemagne, and received its charter as a town in 1298.

KLOTZ, REINHOLD (1807-1876). German classical scholar, was born near Chemnitz in Saxony on the 13th of March 1807. In 1849 he became professor in the university of Leipzig in succession to Gottfried Hermann, and held this post till his death on the 30th of August 1870. Klotz was a man of unwarrieded industry, and devoted special attention to Latin literature. He was the author of editions of several classical authors, of which the most important were: the complete works of Cicero (2nd ed., 1869-1874); Clement of Alexandria (1831-1834); Euripides (1841-1867), in continuation of Pfliigel's edition, but unfinished; Terence (1838-1840), with the commentaries of Domatus and Euergusius. Mention should also be made of: Handzwerkerbuch der lateinischen Litteratur (1847), of which only the introductory volume appeared; an edition of the treatise De Graeco linguæ particularis (1835-1842) of Matthias Deverius (Devaros), a learned Cornite (c. 1500-1570), and corrector of the Greek MSS. in the Vatican; the publication of the Duke Ciceronianus (1871) and Handbuch der lateinischen Stilistik (1874). From 1831-1855 Klotz was editor of the Neue Jahrbiicher fur Philologie (Leipzig). During the troubled times of 1848 and the following years he showed himself a strong conservative. A memoir by his son Richard will be found in the Jahrbiicher for 1871, pp. 154-163.

KNARESBOURGH, a market town in the Ripon parliamentary division of the West Riding of Yorkshire, England, 163 m. W. by N. from York by a branch of the North Eastern railway. Pop. of urban district (1901), 4970. Its situation is most picturesque, on the steep left bank of the River Nidd, which here follows a well-wooded valley, hemmed in by limestone cliffs. The church of St. John the Baptist is Early English, but has numerous Decorated and Perpendicular additions; it is a cruciform building containing several interesting monuments. Knaresborough Castle was probably founded in 1070 by Serlo de Burgh. Its remains, however, are of the 14th century, and include a massive keep rising finely from a cliff above the Nidd. After the battle of Marston Moor it was taken by Fairfax, and in 1648 it was ordered to be dismantled. To the south of the castle is St. Robert's church, a construction of the 14th century, ecclesiastical edifice in the reign of Richard II. Several of the excavations in the limestone, which is extensively quarried, are incorporated in dwelling-houses. A little farther down the river is St. Robert's cave, which is supposed to have been the residence of the hermit, and in 1744 was the scene of the murder of Daniel Clarke by Eugene Aram, whose story is told in Lytton's well-known novel. Opposite the castle is the Dropping Well, the waters of which are impregnated with lime and have petrifying power, this action causing the curious and beautiful incrustations, that have given the district its name. A school was opened in 1816. There is a large agricultural trade, and linen and leather manufactures and the quarries also employ a considerable number of persons.

Knaresborough (Canariesborough, Charnobre, Charnrobber), which belonged to the Crown before the Conquest, formed part of William the Conqueror's grant to his follower Serlo de Burgh. Being forfeited by his grandson Eustace FitzJohn in the reign of Stephen, Knaresborough was granted to Robert de Stuteville, from whose descendants it passed through marriage to Hugh de Morville—the son of the murderers of Thomas Becket, who with his three accomplices remained in hiding in the castle for a whole year. During the 13th and 14th centuries the castle and lordship changed hands very frequently; they were granted successively to Hubert de Burgh, whose son forfeited them after the battle of Evesham, to Richard, earl of Cornwall, whose son Edmund died without issue; to Piers Gaveston, and lastly to John of Gaunt, duke of Lancaster, and so to the Crown as parcel of the duchy of Lancaster. In 1317 John de Lilieburn, who was holding the castle of Knaresborough for Thomas duke of Lancaster against the king, surrendered it; William de Ros of Rosedale, but before leaving the castle managed to destroy all the records of the liberties and privileges of the town which were kept in the castle. In 1368 an inquisition was taken to ascertain these privileges, and the jurors found that the burgeses held "all the soil of their borough yielding 7s. 4d. yearly and doing suit at the king's court." In the reign of Henry VIII. Knaresborough is said by Leland to be "no great thing and meanly builded but the market there is quik." During the civil wars Knaresborough was held for some time by the Royalists, but they were obliged to surrender, and the castle was among those ordered to be destroyed by parliament in 1646. A market on Wednesday and a fortnightly fair on the same day from the Feast of St Mark to that of St Andrew are claimed under a charter of Charles II. confirming earlier charters. Lead ore was found and worked on Knaresborough Common in the 16th century. From 1555 to 1587 the town returned two members to parliament, but in the latter year the number was reduced to one, and in 1885 the representation was merged in that of the West Riding.

KNAVE (O.E. ena, cognate with Ger. Knabe, boy), originally a translation of a boy, member of a boy's club, "Comierbury Tales," " Clerk's Tale," etc., a person. A cryptic use of the word for a man who is dishonest and crafty, a rogue, was however an early usage, and is found in Layamon (c. 1205). In playing-cards the lowest court card of each suit, the "jack," representing a medieval servant, is called the "knave." (See also VALET.)

KNEBEL, KARL LUDWIG VON (1744-1834), German poet and translator, was born at the castle of Wallerstein in Franconia in 1744 and died in November 1744. At a short while at Halle, he entered the regiment of the crown prince of Prussia in Potsdam and was attached to it as officer for ten years. Disconnected in his military career, owing to the slowness of promotion, he retired in 1774, and accepting the post of tutor to Prince Konstantin of Weimar, accompanied him and his elder brother, the hereditary prince, on a tour to Paris. On this journey he visited Goethe in Frankfort-on-Main, and introduced him to the hereditary prince, Charles Augustus. This meeting is memorable as being the immediate cause of Goethe's later intimate connection with the Weimar court. After Knebel's return and the premature death of his pupil he was pensioned, receiving the rank of major. In 1798 he married the singer Luise von Rudorff, and retired to Ilmenau; but in 1806 he removed to Jena, where he lived until his death on the 23rd of February 1834. Knebel's Sammlung kleiner Gedichte (1815), issued anonymously, and Distichien (1827) contain many graceful sonnets, but it is as a translator that he is best known. His translation of the elegies of Propertius, Elegien des Propers (1798), and that of Lucretius De rerum natura (2 vols., 1831) are deservedly praised. Since their first acquaintance Knebel and Goethe were intimate friends, and not the least interesting of Knebel's writings is his correspondence with the eminent poet, Briefwechsel mit Goethe (ed. G. E. Guhrauer, 2 vols., 1851). Knebel's Literarischer Nachlass und Briefwechsel was edited by K. A. Varhagen von Ehse and T. Mundt in 3 vols. (1835; 2nd ed., 1840). See Hugo von Knebel-Döberitz, Karl Ludwig von Knebel (1860).

KNEE (O. E. cnéow, a word common to Indo-European languages, e.g. Ger. Knie, Fr. genou, Span. hinojo, Lat. genu, Gr. γέφυρα, S nak. j nonce), in human anatomy, the articulation of the upper and lower parts of the leg, the joint between the femur and the tibia (see JOINT). The word is also used for an articulation resembling the knee-joint in shape or position in other animals; it is thus applied to the carpal articulation of the fore leg of a horse, answering to the ankle in man, or to the tarsal articulation or heel of a bird's foot.
KNELLER, SIR GODFREY (1646–1723), a portrait painter whose celebrity belongs chiefly to England, was born in Lübeck in the duchy of Holstein, of an ancient family, on the 8th of August 1648. He was at first intended for the army, and was sent to Leyden to learn mathematics and fortification. Showing, however, a marked preference for the fine arts, he studied in the school of Rembrandt, and under Ferdinand Bol in Amsterdam. In 1672 he removed to Italy, directing his chief attention to Titian and the Caracci; Carlo Maratta gave him some guidance and encouragement. In Rome, and more especially in Venice, Kneller earned considerable reputation by historical paintings as well as portraits. He next went to Hamburg, painting with still increasing success. In 1674 he came to England at the invitation of the duke of Monmouth, was introduced to Charles II., and painted that sovereign, much to his satisfaction, several times. Charles also sent him to Paris, to take the portrait of Louis XIV. When Sir Peter Lely died in 1680, Kneller, who produced in England little or nothing in the historical department, remained without a rival in the ranks of portraiture; and he was no native-born competition worth speaking of. Charles appointed him court painter; and he continued to hold the same post into the days of George I. Under William III. (1692) he was made a knight, under George I. (1715) a baronet, and by order of the emperor Leopold I. a knight of the Roman Empire. Not only his court favour but his general fame likewise was large: he was lauded by Dryden, Addison, Steele, Prior, Tickell and Pope. Kneller's gains also were very considerable; aided by habits of frugality which approached stinginess, he left property yielding an income of £3,000 a year which was retained till the last. His studio had at first been in Covent Garden, but in his closing years he lived in Kneller Hall, Twickenham. He died of fever, the date being generally given as the 7th of November 1723, though some accounts say 1726. He was buried in Twickenham church, and has a monument in Westminster Abbey. An elder brother, John Zachary Kneller, an ornamental painter, had accompanied Godfrey to England, and had died in 1702. The style of Sir Godfrey Kneller as a portrait painter represented the decline of that art as practised by Van Dyck; Lely marks the first grade of descent, and Kneller the second. His portraits have much freedom, and are well drawn and correct; but they are mostly slight in manner, and to a great extent monotonous, this arising partly from the habit which he had of lengthening the oval of all his heads. The colouring may be called brilliant rather than true. He indulged much in the commonplace of allegory; and, though he had a quality of dignified elegance not unalloyed with simplicity, genuine simple nature is seldom to be traced in his works. His fame has greatly declined, and could not but do so after the advent of Reynolds. Among Kneller's principal paintings are the "Forty-three Celebrities of the Kit-Cat Club," and the "Ten Portraits of the Court of William III.," now at Hampton Court; these were painted by order of the queen; they match, but match unequally, the " Beauties of the Court of Charles II.," painted by Lely. He executed altogether the likenesses of ten sovereigns, and fourteen of his works appear in the National Portrait Gallery. It is said that Kneller's own favourite performance was the portrait of the " Converted Chinese " in Windsor Castle. His later works are confined almost entirely to England, not more than two or three specimens having gone abroad after he had settled here.

KNICKERBOCKER, HARMEN JANSEN (c. 1659–c. 1720), Dutch colonist of New Netherland (New York), was a native of Wyhe (Wie), Overijssel, Holland. Before 1683 he settled near what is now Albany, New York, and there in 1704 he bought through Harne Ganevoort one-fourth of the land in Dutchess county near Red Hook, which had been patented in 1668 to Peter Schuyler, who in 1722 deeded seven (of thirteen) lots in the upper fourth of his patent to the seven children of Knickerbocker. The eldest of these children, Johannes Harmensen, received from the common council of the city of Albany a grant of 50 acres of meadow and 10 acres of upland on the south side of Schaghticoke Creek. This Schaghticoe estate was held by Johannes

Harmsen's son Johannes (1723–1802), a colonel in the Continental Army in the War of Independence, and by his son Harmen (1770–1855), a lawyer, a Federalist representative in Congress in 1809–1811, a member of the New York Assembly in 1816, and a famous gentleman of the old school, who for his courtly hospitality in his manor was called "the prince of Schaghticoke" and whose name was borrowed by Washington Irving for one of his (Diedrich) Knickerbocker's "History of New York" (1809). Largely owing to this book, the name "Knickerbocker" has passed into current use as a designation of the early Dutch settlers in New York and their descendants.

The son of Johannes, David Buel Knickerbacker (1833–1894), who returned to the earlier spelling of the family name, graduated at Trinity College in 1853 and at the General Theological Seminary in 1856, was a rector for many years at Minneapolis, Minnesota, and in 1883 was consecrated Protestant Episcopal bishop of Indiana.

KNIFE (O. E. ciff, a word appearing in different forms in many Teutonic languages, cf. Du. kniff, Ger. Kneift, a shoemaker's knife, Swed. knif; the ultimate origin is unknown; Skeit finds the origin in the root of "nip," formerly "kniep"; Fr. canif is also of Teutonic origin), a small cutting instrument, with the blade either fixed to the handle or fastened with a hinge so as to clasp into the handle (see CUTLERY). For the knives chipped from flint by prehistoric man see ARCHAEOLOGY and 1. PREHISTORY.

KNIGGE, ADOLF FRANZ FRIEDRICH, FREIHERN VON (1752–1796), German author, was born on the family estate of Bredenbeck near Hanover on the 16th of October 1752. After studying law at Göttingen he was attached successively to the courts of Hesse-Cassel and Weimar as gentleman-in-waiting. Retiring from court service in 1777, he lived a private life with his family in Frankfort-on-Main, Hanau, Heidelberg and Hanover until 1791, when he was appointed Oberhauptmann (civil administrator) in Bremen, where he died on the 6th of May 1796. Knigge, under the name "Philob," was one of the most active members of the Illuminati, a mutual moral and intellectual improvement society founded by Adam Weishaupt (1748–1830) at Ingolstadt, and which later became affiliated to the Freemasons. Knigge is known as the author of several novels, among which Der Roman meines Lebens (1781–1787; new ed., 1805) and Die Reise nach Braunschweig (1792), the latter a rather coarsely comic story, are best remembered. His chief literary achievement was, however, Über den Umgang mit Menschen (1788), in which he lays down rules to be observed for a peaceful, happy and useful life; it has been often reprinted.

Knigge's Schriften were published in 12 volumes (1801–1806). See K. Goeckelc, Adolf, Freiherr von Knigge (1842); and H. Kleincke, Aus einer altertus Kiste (Briefe, Handschriften and Dokumente aus dem Nachhause Knigges) (1853).

KNIGHT, CHARLES (1791–1873), English publisher and author, the son of a bookseller and printer at Windsor, was born on the 15th of March 1791. He was apprenticed to his father; but on the completion of his indentures he took up journalism and interested himself in several newspaper speculations. In 1823, in conjunction with friends he had made as publisher (1820–1821) of The Etonian, he started Knight's Quarterly Magazine, to which W. M. Praed, Derwent Coleridge and Macaulay contributed. The venture was brought to a close with its sixth number, but it initiated for Knight a career as publisher and author which extended over forty years. In 1827 Knight was compelled to give up his publishing business, and became the superintendent of the publications of the Society for the Diffusion of Useful Knowledge, for which he projected and edited The British Almanack and Companion, begun in 1828. In 1838 he resumed business as a bookseller at the Grant of the exclusive privilege of Entertaining Knowledge, writing several volumes of the series himself. In 1832 and 1833 he started The Penny Magazine and
The Penny Cyclopaedia, both of which had a large circulation. The Penny Cyclopaedia, however, on account of the heavy excise duty, was only completed in 1844 at a great pecuniary sacrifice. Besides many illustrated editions of standard works, including in 1842 The Pictorial Shakespeare, which had appeared in parts (1838–1841), Knight published a variety of illustrated works, such as Old England and The Land we Live in. He also undertook a work known as Weekly Volumes. He himself contributed the first volume, a biography of William Caxton. Many famous books, Miss Martincau’s Tales, Mrs Jameson’s Early Italian Painters and G. H. Lewes’s Biographical History of Philosophy, appeared for the first time in this series. In 1833 he became editor of The English Cyclopaedia, which was practically only a revision of The Penny Cyclopaedia, and at about the same time he began his Popular History of England (8 vols., 1856–1862). In 1864 he withdrew from the business of publisher, but he continued to write nearly to the close of his long life, publishing The Sketches of the Old Booksellers (1863), an autobiography under the title Passages of a Working Life during Half a Century (2 vols., 1864–1865), and an historical novel, Begg’d at Court (1867). He died at Addlestone, Surrey, on the 9th of March 1873.

See A. A. Clowes, Knight, a Sketch (1892); and F. Espinaisse, in The Critic (May 1860).

KNIGHT, DANIEL RIDGWAY (1845– ), American artist, was born at Philadelphia, Penn., in 1845. He was a pupil at the École des Beaux-Arts, Paris, under Gleyre, and later worked in the private studio of Mme. Clowes, Philadelphia, in France, having a house and studio at Poissy on the Seine. He painted peasant women out of doors with great popular success. He was awarded the silver medal and cross of the Legion of Honour, Exposition Universelle, Paris, 1889, and was made a knight of the Royal Order of St Michael of Bavaria, Munich, 1893, receiving the gold medal of honour from the Pennsylvania Academy of Fine Arts, Philadelphia, 1893. His son, Ashton Knight, is also known as a landscape painter.

KNIGHT, JOHN BUXTON (1843–1908), English landscape painter, was born at Sevenoaks, Kent; he started as a schoolmaster, but painting was his hobby, and he subsequently devoted himself to it. In 1861 he had his first picture hung at the Academy. He was essentially an open-air painter, constantly going on sketching tours in the most picturesque spots of England, and all his pictures were painted out of doors. He died at Dover on the 2nd of January 1908. The Chantry trustees bought his “December’s Bareness Everywhere” for the nation in the following month. Most of his best pictures had passed into the collection of Mr Ickon of Putney (including “White Walls of Old England” and “Hereford Cathedral”), Mr Walter Scott of Ingham in Wiltshire (especially “Plover”), and Mr S. M. Phillips of Wrotham (especially two water-colours of Richmond Bridge).

KNIGHTHOOD and CHIVALRY. These two words, which are nearly but not quite synonymous, designate a single subject of inquiry, which presents itself under three different although connected and in a measure intermingled aspects. It may be regarded in the first place as a mode or variety of feudal tenure, in the second place as a personal attribute or dignity, and in the third place as a scheme of manners or social arrangements. The first two aspects are discussed in the headings FEUDALISM and KNIGHT SERVICE; we are concerned here only with the second and third. For the more important religious as distinguished from the military orders of knighthood or chivalry the reader is referred to the headings ST JOHN OF JERUSALEM, KNIGHTS OF; TESUTON KNIGHTS; and TEMPLARS.

“... The growth of knighthood” (writes Stubbs) “is a subject on which the greatest obscurity prevails” ; and, though J. H. Round has done much to explain the introduction of the system into England,1 its actual origin on the continent of Europe is still obscure in many of its most important details. The words knighted and knighthood are merely the modern forms of the Anglo-Saxon or Old English cniht and cnihted. Of these the primary signification of the first was a boy or youth, and of the second that period of life which intervenes between childhood and manhood. But some time before the middle of the 12th century they had acquired the meaning they still retain of the French chevalier and cavalier. In a secondary sense cniht meant a servant or attendant answering to the German knecht, and in the Anglo-Saxon Gospels a disciple is described as a knyht. In its literary sense the word appears to have been occasionally employed as equivalent to the Latin miles—usually translated by tesign—which in the earlier middle ages was used as the designation of the domestic as well as of the martial officers or retainers of sovereigns and princes or great personages.2 Sharon Turner suggests that cniht from meaning an attendant simply may have come to mean more especially a military attendant, and that in this sense it may have gradually superseded the word theng. But the word theng itself, that is, when it was used as the description of an attendant of the king, appears to have meant more especially a military attendant. As Stubbs says “the theng seems to be primarily the warrior gesith”—the gesiths forming the chosen band of companions (comites) of the German chiefs (principes) noticed by Tacitus—“he is probably the gesith who had a particular military duty in his master’s service”; and he adds that from the reign of Athelstan “the gesith is lost sight of except very occasionally, the more important class having become thengs, and the lesser sort sinking into the rank of mere servants of the king.” It is pretty clear, therefore, that the word cniht could never have superseded the word theng in the sense of a military attendant, at all events of the king. But besides the king, the earls, bishops and king’s thengs themselves had their thengs, and to these it is more than probable that the name of cniht was applied. Around the Anglo-Saxon magnates were collected a crowd of retainers and dependants of all ranks and conditions; and there is evidence enough to show that among them were some called cnihtas; who were not always the humblest or least considerable of their number. The testimony of Domesday also establishes the existence in the reign of Edward the Confessor of what Stubbs describes as a large class of landholders who had commended themselves to some lord, and he regards it as doubtful whether their tenure had not already assumed a really feudal character. But in any event it is manifest that their condition was in many respects similar to that of a vast number of unquesionably feudal and military tenants who made their appearance after the Norman Conquest. If consequently the former were called cnihtas under the Anglo-Saxon régime, it seems sufficiently probable that the appellation should have been continued to the latter—practically their successors—under the Anglo-Norman régime. And if the designation of knights was first applied to the military tenants and earls, and barons—who although they held their lands of mesne lords owed their services to the king—the extension of that designation to the whole body of military tenants need not have been a very violent or prolonged process. Assuming, however, that knight was originally used to describe the military tenant of a noble person, as cniht had sometimes been used to describe the theng of a noble person, it would, to begin with, have defined rather his social status than the nature of his services. But those whom the English called knights the Normans called chevaliers, by which term the nature of their services themselves were termed, and indeed the reward for them was termed out of consideration. And at first chevalier in its general and honorary signification seems to have been rendered not by knight but by rider, as may be inferred from the Anglo-Saxon Chronicle, wherein it is recorded under the year 1085 that William the Conqueror “dubbade his sune Henric to rider.” But, as E. A. Freeman says, “no such title is heard of in the earlier days of England. The theng, the earlman, the king himself, fought on foot; the horse might bear him to the field, but when the fighting

KNIGHTHOOD

itself came to stand on its native earth to receive the onslaught of her enemies.”

In this perhaps we may behold one of the most ancient of British insular prejudices, for on the Continent the importance of cavalry in warfare was already abundantly understood. It was by means of their horsemen that the Austrrians Franks established their superiority over their neighbours, and in time created the Western Empire anew, while from the word caballarius, which occurs in the Capitularies in the reign of Charlemagne, came the words for knight in all the Romance languages. In France the cavalryman was called chevalier, but neither rider nor cavalier prevailed against knight in England. And it was long after knighthood had acquired its present meaning with us that chivalry was incorporated into our language. It may be remarked too in passing that in official Latin, not only in England but all over Europe, the word miles held its own against both eques and caballarius.

Concerning the origin of knighthood or chivalry as it existed in the middle ages—implying as it did a formal assumption of knighthood and initiation into the profession of arms—nothing beyond mere or less probable conjecture is possible.

The medieval knights had nothing to do in the way of derivation with the “equites” of Rome, the knights of King Arthur’s Round Table, or the Paladin of Charlemagne. But there are grounds for believing that some of the rudiments of chivalry are to be detected in early Teutonic customs, and that they may have made some advance among the Franks of Gaul. We know from Tacitus that the German tribes in his day were wont to celebrate the admission of their young men into the ranks of their warriors with much circumstance and ceremony. The people of the district to which the candidate belonged were called together; his qualifications for the privileges about to be conferred upon him were inquired into; and, if he were deemed fit and worthy to receive them, his chief, his father, or one of his near kinsmen presented him with a shield and a lance. Again, among the Franks we find Charlemagne girding his son Louis the Pious, and Louis the Pious girding his son Charles the Bald with the sword, when they arrived at manhood. It seems certain here that some ceremony was observed which was deemed worthy of record not for its novelty, but as a thing of recognized importance. It does not follow that a similar ceremony extended to persons more or less exalted than the sons of kings and emperors. But if it did we must naturally suppose that it applied in the first instance to the mounted warriors who formed the most formidable portion of the warlike army of the Franks. It was among the Franks indeed, and possibly through their experiences in war with the Saracens, that cavalry first acquired the pre-eminent place which it long maintained in every European country. In early society, where the army is not a paid force but the armed nation, the cavalry must necessarily consist of the noble and wealthy, and cavalry and chivalry, as Freeman observes, will be the same. Since then we discover in the Capitularies of Charlemagne actual mention of “caballarii” as a class of warriors, it may reasonably be concluded that formal investiture with arms applied to the “caballarii” if it was a usage extending beyond the sovereign and his heir-apparent. “But,” as Hallam says, “he who fought on horseback and had been invested with peculiar arms in a solemn manner wanted nothing more to render him a knight;” and so he concludes, in view of the verbal identity of “chevalier” and “caballarius,” that we may refer chivalry in a general sense to the age of Charlemagne.

Yet, if the “caballarii” of the Capitularies are really the precursors of the later knights, it remains a difficulty that the Latin name for a knight is “miles,” although “caballarius” became in various forms the vernacular designation.

Before it was known that the chronicle ascribed to Ingulf of Croyland is really a fiction of the 13th or 14th century, the knighting of Heward or Hereward by Brand, abbot of Burgh (now Peterborough), was accepted from Selden to Hallam as an historical fact, and knighthood was supposed, not only to have been known among the Anglo-Saxons, but to have had a distinctively religious character which was contended by the Norman invaders. The genuine evidence at our command altogether fails to support this view. When William of Malmsbury describes the knighting of Athelstan by his grandfather Alfred the Great, that is, his investiture “with a purple garment set with gems and a sword with a golden sheath,” there is no hint of any religious observance. In spite of the silence of our records, Dr Stubbs thinks that kings so well acquainted with foreign usages as Ethelred, Canute and Edward the Confessor could hardly have failed to introduce into England the institution of chivalry then springing up in every country of Europe; and he is supported in this opinion by the circumstance that it is nowhere mentioned as a Norman innovation. Yet the fact that Harold received knighthood from William of Normandy makes it clear either that Harold was not yet a knight, which in the case of so tried a warrior would imply that “dubbing to knighthood” was not yet known in England even under Edward the Confessor, or, as Freeman thinks, that in the middle of the 11th century the custom had grown in Normandy into “something of a more special meaning” than it bore in England.

Regarded as a method of military organization, the feudal system of tenures was always far better adapted to the purposes of defensive than of offensive warfare. Against invasion it furnished a permanent provision both in men-at-arms and strongholds; nor was it unsuited for the campaigns of neighbouring counts and barons which lasted for only a few weeks, and extended over considerable distances. But when kings and kingdoms were in conflict, and distant and prolonged expeditions became necessary, it was speedily discovered that the unassisted resources of feudalism were altogether inadequate. It became therefore the manifest interest of both parties that personal services should be commuted into pecuniary payments. Then there grew up all over Europe a system of fining the knights who failed to respond to the sovereign’s call or to stay their full time in the field; and in England this fine developed, from the reign of Henry II. to that of Edward II., into a regular war-tax called escrow or scutage (q.v.). In this way funds for war were placed at the free disposal of sovereigns, and, although the feudalatories and their retainers still formed the most considerable portion of their armies, the conditions under which they served were altogether changed. Their military service was now far more the result of special agreement. In the reign of Edward I., whose warlike enterprises after he was king were confined within the four seas, this alteration does not seem to have proceeded very far, and Scotland and Wales were subjugated by what was in the main, if not exclusively, a feudal militia raised as of old by writ to the ears and barons and the sheriffs. But the armies of Edward III., Henry V. and Henry VI. during the century of intermittent war fare between England and France were recruited and sustained to a very great extent on the principle of contract. On the Continent the systematic employment of mercenaries was both an early and a common practice.

Besides consideration for the mutual convenience of sovereigns and their feudatories, there were other causes which materially contributed towards bringing about those changes in the military system of Europe which were finally accomplished in the 13th and 14th centuries. During the Crusades vast armies were set on foot in which feudal rights were commuted, Const. Antiqu., ii. 278; also compare Grosse, Military Antiquities, i. 65 sq.

6 There has been a general tendency to ignore the extent to which the armies of Edward III. were raised by compulsory levies even after the system of raising troops by free contract had begun. Luce (ch. vi.) points out how much England relied at this time on what would now be called conscription: and his remarks are entirely borne out by the Norwegian documents published by M. Halvorsen (Nor. and North Archæological Soc. xiv. 263 sq.), and by a Lynn corporation document of 13th Edw. III. (Hist. MSS. Commission Report XI. Appendix pt. iii. p. 189), and by Smyth’s Lives of the Berkeleys, i. 312, 319, 320.
KNIGHTHOOD

and obligations had no place, and it was seen that the volunteers who flocked to the standards of the various commanders were not less but even more efficient in the field than the vassals they had hitherto been accustomed to lead. It was thus established that pay, the love of enterprise and the prospect of plunder— if the leave of the lords cause which they had espoused for the moment out of sigh— were used for the purpose of enlisting troops and keeping them together as the tenure of land and the solemnities of homage and fealty. Moreover, the crusaders who survived the difficulties and dangers of an expedition to Palestine were seasoned and experienced although frequently impoverished and landless soldiers, ready to hire themselves to the highest bidder, and well worth the wages they received. Again, it was owing to the crusades that the church took the profession of arms under her peculiar protection, and thereforewas a rise in the importance of initiation into it assumed a religious as well as a martial character.

To distinguish soldiers of the cross the honours and benefits of knighthood could hardly be refused on the ground that they did not possess a sufficient property qualification— the conception of knighthood as of something distinct from feudalism both as a social condition and a personal dignity arose and rapidly gained ground. It was then that the analogy was first detected between the order of knighthood and the order of primogeniture, and that the union of monachism and chivalry was effected by the establishment of the religious orders of which the Knights Templars and the Knights Hospitallers were the most eminent examples. As comprehensive in their polity as the Benedictines or Francisans, they gathered their members from, and soon scattered their possessions over every country in Europe. And in their indifference to the distinctions of race and nationality they merely accommodated themselves to the spirit which had become characteristic of chivalry itself, already recognized, like the saintliness of a universal institution which knit together the whole warrior caste of Christendom into one great fraternity irrespective of feudal subordination and territorial boundaries. Somewhat later the adoption of hereditary surnames and armorial bearings marked the existence of a large and noble class who either from the subdivision of fiefs or from the effects of the custom of primogeniture were very insufficiently provided for. To them only two callings were generally open, that of the churchman and that of the soldier, and the latter as a rule offered greater attractions than the former in an era of much licence and little learning. Hence the favourite expedient for free from monastic obligations, and that an actual existence as a prince or magnate in whose military service they were sure of an adequate maintenance and might hope for even a rich reward in the shape of booty or of ransom. It is probably to this period and these circumstances that we must look for at all events the rudimentary beginnings of the military as well as the religious orders of chivalry. Of the existence of any regularly constituted companionships of the first kind there is no trustworthy evidence until between two and three centuries after the second kind had been organized. Soon after the greater crusading orders were founded, and those of St James of Compostella, Calatrava and Alcantara, were established to fight the Moors in Spain instead of the Saracens in the Holy Land. But the members of these orders were not less monks than knights, their statutes embodied the rules of the cloister, and they were bound by the ecclesiastical vows of celibacy, poverty and obedience. From a very early stage in the development of chivalry, however, we meet with the singular institution of brotherhood in arms; and from it the ultimate origin if not of the religious fraternities at any rate of the military companionships is usually derived. By this institution a relation was created between two or more monks by voluntary agreement, which was regarded as of far more intimacy and stringency than any which the mere accident of consanguinity implied. Brothers in arms were supposed to be partners in all things save the affections of their "lady-loves." They shared in every danger and in every success, and each was expected to vindicate the honour of another as promptly as smaller divisions under the shield of the feudal romance of Amis and Amilus is built entirely on such a brotherhood. Their engagements usually lasted through life, but sometimes for a specified period or during the continuance of specified circumstances, and they were always ratified by oath, occasionally reduced to writing in the shape of a solemn bond and often sanctified by their reception of the Eucharist together. Romance and tradition speak of strange rites—the mingling and even the drinking of blood—as having in remote and rude ages marked the inception of these martial and fraternal associations. But in later and less barbarous times they were generally evidenced and celebrated by a formal and reciprocal exchange of weapons and armour. In warfare it was customary for knights who were thus allied to appear similarly accoutered and bearing the same badges or cognisances, to the end that their enemies might not know with which of them they were in conflict, and that their friends might be unable to accord more applause to one than to the other for his prowess in the field. It seems likely enough therefore that there should grow up bodies of knights banded together by engagements of fidelity, although free from monastic obligations; wearing a uniform or livrée, and naming themselves after some special symbol or some patron saint of their adoption. And such bodies placed under the command of a sovereign or grand master, regulated by statutes, and enriched by ecclesiastical endowments would have been precisely what in after times such orders as the Garter in England, the Golden Fleece in Burgundy, the Annunziata in Savoy and the St Michael and Holy Ghost in France actually were.

During the 14th and 15th centuries, as well as somewhat earlier and later, the general arrangements of a European army were always and everywhere pretty much the same. Under the sovereign the constable and the marshal or marshals held the chief commands, their authority being partly joint and partly several. Attendant on them were the heralds, who were the officers of their military court, wherein offences committed in the camp and field were tried and adjudged, and among whose duties it was to carry orders and messages, to deliver challenges and call truces, and to identify and number the wounded and the slain. The main principal standards, the distribution of the banners and the bannermen, were distinct from the knights bannermen and men of greater nobility or of knights bannermen, and smaller divisions still under the pennons of knights or, as in distinction from knights bannermen they came to be called, knights bachelors. All knights whether bachelors or bannermen were escorted by their squires. But the banner of the bannerman always implied a more or less extensive command, while every knight was entitled to bear a pennon and every squire a pennel. All three flags were of such a size as to be conveniently attached to and carried on a lance, and were ensigned with the arms or some portion of the bearings of the holders such as but while the banner was square the pennon, which resembled it in other respects, was either pointed or forked at its extremity, and the pennel, which was of considerably less than the others, always terminated in a single tail or streamer.

If indeed we look at the scale of chivalric subordination from another point of view, it seems to be more properly divisible into four than into three stages, of which two may be called provisional and two final. The bachelor and the bannerman were both equally knights, only the one was of greater distinction and authority.

than the other. In like manner the squire and the page were both in training for knighthood, but the first had advanced further in the process than the second. It is true that the squire was a combatant while the page was not, and that many squires voluntarily served as squires all their lives owing to the insufficiency of their fortunes to support the costs and charges of knighthood. But in the ordinary course of a chivalrous education the successive conditions of page and squire were passed through in boyhood and youth, and the condition of knighthood was reached in early or late manhood. Every feudal court and castle was in fact a school of chivalry, and although princes and great personages were rarely actually pages or squires, the moral and physical discipline through which they passed was not in any important particular different from that to which less exalted candidates for knighthood were subjected. The page, or, as he was more anecdotally and more correctly called, the "valet" or "dameoiseau," commenced his service and instruction when he was between seven and eight years old, and the initial phase continued for seven or eight years longer. He acted as the constant personal attendant of both his master and mistress. He waited, but his military exercises and athletic training were to chase, not to supply him with another or his own horse if his was disabled or killed, to recover and keep any prisoners he might take, to fight by his side if he was unequally matched, to rescue him if captured, to bear him to a place of safety if wounded, and to bury him honourably when dead. And after he had worthily and bravely, borne himself for six or seven years as a squire, the time came when it was fitting that he should be made a knight. This, at least, was the current theory; but it is specially dangerous in medieval history to assume too much correspondence between theory and fact. In many castles, and perhaps in most, the discipline followed simply a natural and unwritten code of "fagging" and seniority, as in public schools or on board merchant ships; but there some sort of formal ceremony was sometimes observed.  

Two modes of conferring knighthood appear to have prevailed from a very early period in all countries where chivalry was known. In both of them the essential portion seems to have been the accolade or stroke of the sword. But, while in one the accolade constituted the whole or nearly the whole of the ceremony, in the other it was surrounded with many additional observances. The former and simpler of these modes was naturally that used in war: the candidate knelt before the chief of the army or some very great lord, who struck him thrice with the flat of a sword, pronouncing a brief formula of creation and of exhortation which varied at the creator's will. In this form a number of knights were made before and after almost every battle between the 11th and the 16th centuries, and its advantages on the score of both convenience and economy gradually led to its general adoption both in time of peace and time of war. On extraordinary occasions indeed the more elaborate ritual continued to be observed. But recourse was had to it so rarely that in England about the beginning of the 15th century it came to be exclusively appropriated to a special kind of knighthood bestowed by the sovereign to his friends. When Sager, garder of arms, wrote in the reign of Queen Elizabeth, this had been accomplished with such completeness that he does not even mention that there were two ways of creating knights bachelors. "He that is to be made a knight," he says, "is strike by the prince with a sword drawn upon his back or shoulder, the prince saying, 'Sois Chevalier,' and in times past was added 'Saint George.' And when the knight rises the prince sayeth 'Avenez.' This is the manner of dubbing knights at this present, and that term 'dubbing' was the old term in this instance, not 'creating.' This sort of knighthood is by the heralds called knights bachelors." In our days when a knight is personally made he kneels before the sovereign, who lays a sword drawn, ordinarily the sword of state, on either of his shoulders and says, "Rise," calling him by his Christian name with the addition of "Sir" before it.

1 Sainte Palaye, Mémoires, i. 36; Froissart, bk. iii. ch. 9.
3 See the long sermon in the romance of Petit Jehan de Sainté, pt. i. ch. v., and compare the theory there set forth with the actual behaviour of the chief personages. Even Gautier, while he contends that the squire is always represented as the inheritor of the prevailing immorality to which medieval romances testify, and the extraordinary free behaviour of the unmarried ladies. No doubt these romances, taken alone, might give us an unfair idea as modern French novels give of Parisian morals, but we have abundant evidence for placing the moral standard of the age of chivalry definitely below that of educated society in the present day.

1 V._v._, i. 31. After the term "squire" is seen to have been in at least two important ceremonies, it is curious to find it used by a contemporary, and the etymology is unsatisfactory.
2 C'est peut être à cette cérémonie non à celles de la chevalerie qu'on doit rapporter ce qui se lit dans nos historiens de la première et de la seconde race au sujet des premières armes que les Rois et les Princes remettent avec solennité au jeunes Princes leurs lances.
Very different were the solemnities which attended the creation of a knight when the complete procedure was observed. “The ceremonies and circumstances at the giving this dignity,” says Selden, “in the elder time were of two kinds especially, which we may call courtly and sacred. The courtly were the festivals held at the creation, giving of robes, arms, spurs and the like. The sacred were the holy devotions and what else was used in the creation ceremony. The former were called ‘battlements’, the latter the ‘knighthood’. But the leading authority on the subject is an ancient and well-writ writer, Segar, Dugdale, Bythu and Nicolas, among other English writers. Daniel explains his reasons for transcribing it, ‘taint à cause du détail que de la nature du stile et encore plus de la bizarrie des ceremonies que se faisoient pourtant alors fort séruesement,’ while he adds that these ceremonies were essentially identical in England, France, Germany, Spain and Italy.

The process of inauguration was commenced in the evening by the placing of the candidate under the care of two “esquires of honour guard and well seen in courtship and martial arts,” who were to be “governors in all things relating to him.” Under their direction, to begin with, a barber shaved him and cut his hair. He was then conducted by them to his appointed chamber, where he was dressed without weapons or armor, and covered with rich cloths, into which after they had undressed him he entered. While he was in the bath two “ancient and grave knights” attended him to inform, instruct and counsel him touching his new dignity. “In these two ancient and grave knights,” he was led to the chapel, the esquires going before them “sporting and dancing” with “the minstrels making melody.” And when they had finished served with wines and spices they went away leaving the candidate and his knights alone. After all this, “the candidate, clad in a single tunic or ‘magnum tunicum’, which he had put on himself, was led to the church, and accompanied by the esquires and knights and the people, entered the church in the mass, offering a taper and a piece of money stuck in it as near the lighted end as possible, the first “to the honour of God” and the second “to the honour of the person that makes a knight. Afterwards he was taken back to his chamber, and remained in bed chivalry,” were to be “governors in all things relating to him.”

He then dressed him in distinctive garments, and they then mounted their horses and rode to the hall where the candidate was to read an oration, dedicated to the King and entitled “The knighthood.” The candidate was then given a sword and hilt, and the two esquires put on it a white shirt and over that “a robe of russet with long sleeves having a hood thereto unto that of an hermit.” Then the two ancient and grave knights, “returned and led him to the chapel, the esquires going before them “sporting and dancing” with “the minstrels making melody.” And when they had finished served with wines and spices they went away leaving the candidate and his knights alone. After all this, “the candidate, clad in a single tunic or ‘magnum tunicum’, which he had put on himself, was led to the church, and accompanied by the esquires and knights and the people, entered the church in the mass, offering a taper and a piece of money stuck in it as near the lighted end as possible, the first “to the honour of God” and the second “to the honour of the person that makes a knight. Afterwards he was taken back to his chamber, and remained in bed chivalry,” were to be “governors in all things relating to him.”

The knighthood is the most important of the military orders, and it is the only one that has been in existence since the time of the Crusades. The knighthood was originally a military order, and its members were expected to be skilled in the arts of war. The knighthood was also a symbol of chivalry, and its members were expected to live according to the principles of chivalry. The knighthood was also a symbol of nobility, and its members were expected to be members of the nobility.

was originally created by him, for it was a question whether the recipients of the new dignity should be designated by that or some other name.1 But there is no doubt that as previously used it was merely a corrupt synonym for banneret, and not the name of any separate dignity. On the Continent, however, there are several recorded examples of bannerets who had an hereditary claim to that honour and its attendant privileges on the ground of the nature of their feudal tenure.2 But, generally, at any rate to contemporaries, it seems probable that such bannerets were in every country merely the more important class of feudatories, the “ricos hombres” in contrast to the knights bachelors, who in France in the time of St Louis were known as “pauvres homens.” In England all the barons or greater nobility were entitled to bear banners, and therefore Du Cange’s observations would apply to them as well as to the barons or greater nobility of France and Spain. But it is clear that from a comparatively early period bannerets whose claims were founded on personal distinction rather than on feudal tenure gradually came to the front, and much the same process of substitution appears to have gone on in their case as that which we have just passed in the case of simple knights. According to the Saltade and the Division du Monde, as cited by Selden, bannerets were clearly in the beginning feudal tenants of a certain magnitude and importance and nothing more, and different forms for their creation are given in time of peace and in time of war.3 But in the French Gesta Romanorum the warlike form alone is given, and it is quoted by both Selden and Du Cange. From the latter a more modern version of it is given by Daniel as the only one generally in force.

Sir Ralph Daubeney and Sir Philip Daubeney are entered as bannerets on the roll of the garrison of Caermoneth Castle in 1282, and the roll of Carlaverton records the names and arms of eighty-five bannerets who accompanied Edward I. in his expedition into Scotland in 1300.

What the exact contingent was which bannerets were expected to supply to the royal host is doubtful.4 But, however this may be, in the reign of Edward III. and afterwards bannerets appear as the commanders of a military force raised by themselves and marshalled under their banners; their status and their relations both to the crown and to their followers were mainly the consequences of voluntary contract not of feudal tenure. It is from the reigns of Edward III. and Richard II. also that the two best descriptions we possess of the actual creation of a banneret have been transmitted to us.5 Sir Thomas Smith, writing towards the end of the 16th century, says, after noticing the conditions to be observed in the creation of bannerets, “but this order is almost grown out of use in England”; and, during the controversy which arose between the new order of baronets and the crown early in the 17th century respecting their precedence, it was alleged without contradiction in an argument on behalf of the baronets before the privy council that “there are not bannerets now in being, peradventure never shall be.”6 Sir Ralph Fane, Sir Francis Bryan and Sir Ralph Sadler were created bannerets by the Lord Protector Somerset after the battle of Papple in 1547, and the better opinion is that this was the last occasion on which the dignity was thus conferred. It has not been stated indeed that Selden6 created Sir John Smith a banneret after the battle of Edgehill in 1642 for having rescued the royal standard from the enemy. But of this there is no sufficient proof. It was also supposed that George III. had created several naval officers bannerets towards the end of the last century, because he knighted them on board ship under the royal standard displayed. This, however, is unquestionably an error.7

On the continent of Europe the degree of knight bachelor disappeared with the military system which had given rise to it. It is now therefore peculiar to the British Empire. Existing Orders of Knighthood. The word, although very frequently conferred by letters of patent, is yet the only dignity which is still occasionally created—as every dignity was formerly created—by means of a ceremony in which the sovereign and the subject personally take part. Everywhere else dubbing or the accolade seems to have become obsolete, and no other species of knighthood, if knighthood it can be called, is known except that which is dependent on admission to some particular order. It is a common error to suppose that baronets are hereditary knights. Baronets are not knights unless they are knighted like anybody else; and, so far from being knights because they are baronets, one of the privileges granted to them shortly after the institution of their dignity was that, not being knights, and their successors and their eldest sons and heirs-apparent should, when they attained their majority, be entitled if they desired to receive knighthood.8 It is a maxim of the law indeed that, as Coke says, “the knight is by creation and not by descent,” and, although we hear of such designations as the “knight of Kerry” or the “knight of Glin,” they are no more than traditional nicknames, and do not by any means imply that the persons to whom they are applied are knights in a legitimate sense. Nevertheless, however, that simple knighthood has gone out of use abroad, there are innumerable grand crosses, commanders and companions of a formidable assortment of orders in almost every part of the world.9 (See the section on “Orders of Knighthood” below.)

The United Kingdom has eight orders of knighthood—the Garter, the Thistle, St Patrick, the Bath, the Star of India, St Michael and St George, the Indian Empire and the Royal Victorian Order; and, while the first is undoubtedly the oldest as well as the most illustrious anywhere existing, a fictitious antiquity has been claimed and is even still frequently conceded

to the second and fourth, although the third, fifth, sixth, seventh, and eighth appear to be as contentedly as they are unquestionably recent.

It is, however, certain that the "most noble" Order of the Garter at least was instituted in the middle of the 14th century, when English chivalry was outwardly brightest and the court most magnificent. But in what particular year this event occurred is and has been the subject of much difference of opinion. All the original records of the order up to 1416 have perished, and consequently the question depends for its settlement not on direct testimony but on inference from circumstances. The dates which have been selected vary from 1344 (given by Froissart, but almost certainly mistaken) to 1351. The evidence may be examined at length in Nicolas and Beltz; it is indisputable that in the wardrobe account from September 1347 to January 1349, the 21st and 23rd Edward III., the issue of certain habits with garters and the motto embroidered on them is marked for St George's Day; that the letters patent relating to the execution of the royal chapel of Windsor was given in August 1348; and that in the treasury accounts of the prince of Wales there is an entry in November 1348 of the gift by him of "twenty-four garters to the knights of the Society of the Garter." But that the order, although from this manifestly already fully constituted in the autumn of 1348, was not in existence before the summer of 1346 Sir Harris Nicolas proves pretty conclusively by pointing out that nobody who was not a knight could under its statutes have been admitted to it, and that neither the prince of Wales nor several others of the original companions were knighted until the middle of that year.

Regarding the occasion there has been almost as much controversy as regarding the date of its foundation. The "vulgar and more general story," as Ashmole calls it, is that of the countess of Salisbury's garter. But commentators are not at one as to which countess of Salisbury was the heroine of the adventure, whether she was Katherine Montacute or Joan the Fair Maid of Kent, while Heylyn rejects the legend as "a vain and idle romance derogatory both to the founder and the order, first published by Polydor Vergil, a stranger to the affairs of England, and by that taken on no better grounds than from vulgare, the tradition of the common people, too trifling a foundation for so great a building." Another legend is that contained in the preface to the Register or Black Book of the order, compiled in the reign of Henry VIII., by what authority supported is unknown, that Richard I., while his forces were employed against Cyprus and Acre, had been inspired through the instrumentality of St George with renewed courage and the means of animating his fatigue soldiers by the device of tying about the legs of a chosen number of knights a leathern thong or garter, to the end that being thereby reminded of the honour of their enterprise they might be encouraged to redoubled efforts for victory. This was supposed to have been in the mind of Edward III. when he fixed on the garter as the emblem of the order, and it was stated so to have been by Taylor, master of the rolls, in his address to Francis I. of France on his investiture in 1537. According to Ashmole the true account of the matter is that "King Edward having given forth his own garter as the signal for a battle which sped fortunately (which with Du Chesne we conceive to be that of Crécy), the victory, we say, being happily gained, he thence took occasion to institute this order, and gave the garter (assumed by him for the symbol of unity and society) pre-eminence among the ensigns of it. But, as Sir Harris Nicolas points out—although Ashmole is not open to the correction—this hypothesis rests for its plausibility on the assumption that the order was established before the invasion of France in 1346. And he further observes that "a great variety of devices and mottos were used by Edward III.; they were chosen from the most trivial causes and were of an amorous rather than of a military character. Nothing," he adds, "is more likely than that in a crowded assembly a lady should accidentally have dropped her garter; that the circumstance should have caused a smile in the bystanders; and that on its being taken up by Edward he should have reproved the levity of his courtiers by so happy and chivalrous an exclamation, placing the garter at the same time on his own leg, that it was sworn by him who thinks ill of it. Such a circumstance occurring at a time of general festivity, when devices, mottos and conceits of all kinds were adopted as ornaments or badges of the habits worn at jousts and tournaments, would naturally have been commemorated as other royal expressions seem to have been by its conversion into a device and motto for the dresses at an approaching haistilude." Moreover, Sir Harris Nicolas contends that the order had no loftier immediate origin than a joust or tournament. It consisted of the king and the Black Prince, and knighthood divided into two bands of 12 like the tilting haistilude—at the head of the one being the first, and of the other the second; and to the companions belonging to each, when the order had superseded the Round Table and had become a permanent institution, were assigned stalls either on the sovereign's or the prince's side of St George's Chapel. That Sir Harris Nicolas is accurate in this conjecture seems probable from the selection which was made of the "founder knights." As Beltz observes, the fame of Sir Reginald Cobham, Sir Walter Manny and the earls of Northampton, Hereford and Suffolk was already established by their wars and exploits, and they would certainly have been among the original companions had the order been then regarded as the reward of military merit only. But, although these eminent warriors were subsequently elected as vacancies occurred, their admission was postponed to that of several very young and in actual warfare comparatively unknown knights, whose claims to the honour may be most rationally explained on the assumption that they had excelled in the particular feats of arms which preceded the institution of the order. The original companionship had consisted of the sovereign and 25 knights, and no change was made in this respect until 1376, when the sons of George III. and his successors were made eligible notwithstanding that the charter might be complete. In 1805 another alteration was effected by the provision that the lineal descendants of George II. should be eligible in the same manner, except the Prince of Wales for the time being, who was declared to be a "constituent part of the original institution"; and again in 1831 it was further ordained that the privilege accorded to the lineal descendants of George II. should extend to the lineal descendants of George I. Although, as Sir Harris Nicolas observes, nothing is now known of the form of admitting ladies into the order, the description applied to them in the records during the 14th and 15th centuries leaves no doubt that they were regularly received into it. The queen consort, the wives and daughters of knights, and some other women of exalted position, were designated "Dames de la Fraternité de St George," and entries of the delivery of robes and garters to them are found at intervals in the Wardrobe Accounts from the 50th Edward III. (1356) to the 10th of Henry VII. (1495), the first being Isabel, countess of Bedford, the daughter of the one king, and the last being Margaret and Elizabeth, the daughters of the other. The effigies of Margaret Byron, wife of Sir Robert Harcourt, K.G., at Stanton Harcourt, and of Alice Chaucer, wife of William de la Pole, duke of Suffolk, K.G., at Ewelme, which date from the reigns of Henry VI. and Edward IV., have garters on their left arms. (See further under "Orders of Knighthood" below.)

It has been the general opinion, as expressed by Sainte Palaye and Mills, that formerly all knights were qualified to confer knighthood. But it may be questioned whether the privilege

5 Memoirs, i. 67, l. 22; History of Chivalry; Gibbon, Decline and Fall, vi. 200.
was thus indiscriminately enjoyed even in the earlier days of chivalry. It is true that as much might be inferred from the testimony of the romance writers; historical evidence, however, tends to limit the proposition, and the sounder conclusion appears to be, as Sir Harris Nicol says, that the right was always restricted in operation to sovereign princes, to those acting under their authority or sanction, and to a few other personages of exalted rank and station. In several of the writs for distraint of knighthood from Henry III. to Edward III. a distinction is drawn between those who are to be knighted by the king himself or by the sheriffs of counties respectively, and bishops and abbots could make knights in the 11th and 12th centuries. At all periods the commanders of the royal armies had the power of conferring knighthood; as late as the reign of Elizabeth it was exercised among others by Sir Henry Sidney in 1583, and Robert, earl of Essex, in 1595, while under James I. an ordinance of 1622, confirmed by a proclamation of 1623, for the registration of knights in the college of arms, is rendered applicable to all who should receive knighthood from either the king or any of his lieutenants. Many sovereigns, too, both of England and of France, have been knighted after their accession to the throne by their own subjects, as, for instance, Edward III. by Henry, earl of Lancaster, Edward VI. by the lord protector Somerset, Louis XI. by Philip, duke of Burgundy, and Francis I. by the Chevalier Bayard. But when in 1543 Henry VIII. appointed Sir John Wallop to be captain of Guines, it was considered necessary that he should be authorized in express terms to confer knighthood, which was also done by Edward VI. in his own case when he received knighthood from the duke of Somerset. But at present the only subject to whom the right of conferring knighthood belongs is the lord-lieutenant of Ireland, and to him it belongs merely by long usage and established custom. But, by whosoever conferred, knighthood at one time endowed the recipient with the same status and attributes in every country wherein chivalry was recognized. In the middle ages it was a common practice for sovereigns and princes to dub each other knights much as they were afterwards, and are now, in the habit of exchanging the stars and ribbons of their orders. Henry II. was knighted by his great-uncle David I. of Scotland, Alexander III. of Scotland by Henry III., Edward I. when he was prince by Alphonso X. of Castile, and Ferdinand of Portugal by Edmund of Langley, earl of Cambridge. And, long after the military importance of knighthood had practically disappeared, what may be called its cosmopolitan character was maintained: a knight's title was recognized in all European countries, and not only in that country in which he had received it. In modern times, however, by certain regulations, made in 1823, and repeated and extended, it is now the case when he received knighthood from the duke of Somerset. So that the sovereign's permission by royal warrant shall be necessary for the reception by a British subject of any foreign order of knighthood, but further that such permission shall not authorize "the assumption of any style, appellation, rank, precedence, or privilege appertaining to a knight bachelor of the United Kingdom." Since knighthood was accorded either by actual investiture or its equivalent, a counter process of degradation was regarded as necessary for the purpose of depriving anybody who had once received it of the rank and condition it implied. The cases in which a knight has been formally degraded in England are exceedingly few, so few indeed that two only are mentioned by Segar, writing in 1602, and Dallaway says that only three were on record in the College of Arms when he wrote in 1793. The last case was that of Sir Francis Michell in 1621, whose spurs were hacked from his heels, his sword-belt cut, and his sword broken over his head by the heralds in Westminster Hall.

Roughly speaking, the age of chivalry properly so called may be said to have extended from the beginning of the crusades to the close of the Wars of the Roses. Even in the way of pageantry and life and limb and limb might be lost in the due course of events. But in the Continent they were discredited by the fatal accident which befell Henry II. of France in 1559. The golden age of chivalry has been variously located. Most writers would place it in the early 13th century, but Gautier would remove it two or three generations further back. It may be true that, in the comparatively scarcity of historical evidence, the romancers present a more favourable picture of chivalry at that earlier time; but even such historical evidence as we possess, when carefully scrutinized, is enough to dispel the illusion that there was any period of the middle ages in which the unkillable chivalry of "God and the ladies" anything but a rare exception.

It is difficult to describe the true spirit and moral influence of knighthood, if only because the ages in which it flourished differed so widely from our own. At its best, it was always hampered by the limitations of medieval society. Moreover, many of the noblest precepts of the knighthood code were a legacy from earlier ages, and have survived the decay of knighthood just as they will survive all transitory human institutions, forming part of the eternal heritage of the race. Indeed, the most important of these precepts did not even attain to their highest development in the middle ages. As a conscious effort to bring religion into daily life, chivalry was less successful than later puritanism; while the educated classes of our own day far surpass the average medieval knight in discipline, self-control and outward or inward refinement. Freeman's estimate comes far nearer to the historical facts than Burke's: "The chivalrous spirit is above all things a class spirit. The good knight is bound to endless fantastic courtesies towards men and still more towards women of a certain rank; he may treat all below that rank with any degree of scorn and cruelty. The spirit of chivalry implies the arbitrary choice of one or two virtues to be practiced in such an exaggerated degree as to become vices, while the ordinary laws of right and wrong are forgotten. The false code of honour supplanted the laws of the commonwealth, the law of God and the eternal principles of right. Chivalry again in its military aspect not only encourages private wars but encourages a war which is to carry on in the face of war, which is to carry on as a war against the commonwealth, which is to carry on as a war which is waged, it encourages also an extravagant regard for a fantastic show of personal daring which cannot in any way advance the objects of the siege or campaign which is going on. Chivalry in short is in morals very much what feudalism is in law: each substitutes purely personal obligations devised in the interests of an exclusive class, for the more homely duties of an honest man and a good citizen." (Norman Conquest, p. 482.) The chivalry from which Burke drew his ideas, was so far as it existed at all, the product of a far later age. In its own age, chivalry rested practically, as the highest civilization of ancient Greece and Rome, on slave labour; and if many of its...
most brilliant outward attractions have now faded for ever, this is only because modern civilization tends so strongly to remove social barriers. The knightly ages will always enjoy the glory of having formulated a code of honour which aimed at rendering the upper classes worthy of their exceptional privileges; yet we must judge chivalry not only by its formal code but also by its practical fruit. The ideal was well embodied up by F. W. Crofton: "Chivalry taught the world the duty of noble service willingly rendered. It upheld courage and enterprise in obedience to rule; it consecrated military prowess to the service of the Church, glorified the virtues of liberality, good faith, unselfishness and courtesy, and above all, courtesy to women. Against these may be set the vices of pride, ostentation, love of bloodshed, contempt of inferiors, and loose manners. Chivalry was an imperfect discipline, but it was a discipline, and one fit for the times. It may have existed in the world too long: it did not come into existence too early; and with all its shortcomings it exercised a great and wholesome influence in raising the medieval world from barbarism to civilization" (p. 27). This was the ideal, but to give the reader a clear view of the actual features of knightly society in their contrast with that of our own day, it is necessary to bring out one or two very significant shadows.

Far too much has been made of the extent to which the knightly code, and the reverence paid to the Virgin Mary, raised the position of women (e.g. Gautier, p. 360). As Gautier himself admits, the feudal system made it difficult to separate the lady's woman's person from her feudal lord. The freedom of Christian marriage on which the Church in theory insisted, lands and women were handed over together, as a business bargain, by parents or guardians. In theory, the knight was the defender of widows and orphans; but in practice wardships and marriages were bought and sold as a matter of everyday routine like stocks and shares in the modern market. Lord Thomas de Berkeley (1245-1321) counted on this as a regular and considerable source of income (Smyth, Lives, i. 137). Late in the 15th century, in spite of the somewhat greater liberty of that age, we find Stephen Scrope writing nakedly to a familiar correspondent "for very need [of money], I was fain to sell a little daughter I have for much less than I should have done by possibility," i.e. than the fair market price (Gairden, Passton Letters, Introduction, p. clxxvi; cf. ccclxxi). Startling as such words are, it is perhaps still more startling to find how frequently and naturally, in the highest society, ladies were degraded by personal violence. The proofs of this which Schultze and Gautier adduce from the Chansons de Geste might be multiplied indefinitely. The Knight of La Tour-Landry (1372) relates, by way of warning to his daughters, a tale of a lady's woman's person from her husband: she was caught discovering that he struck her to the earth with his fist and kicked her in the face, breaking her nose. Upon this the good knight moralizes: "And this she had for her cueille and gret langage, that she was wont to sale to her husbunde. And therfor the wight aught to suffre and lete her husbunde haue the words, and to be maister, for that is her worshippe; for it is shame to here strifve between hem, and in especial before folk. But y saie not but whanne thei be alone, but she may tolle hym with goodly wordes, and consuaille hym to amende yef he do amys." (La Tour, chap. xviii.; cf. xvii. and xix.) "The righte righe and righte wife-borne birth whereby they are naturally recognized by more than one code of laws, and it was already a forward step when, in the 13th century, the Coutumes du Beauvaisis provided "que le mari ne doit battre sa femme que raisonnablement" (Gautier, p. 340). This was a natural consequence not only of the want of self-control which we see everywhere in the middle ages, but also of the custom of contracting child-marriages for unsentimental considerations. Between 1288 and 1300 five marriages are recorded in the direct line of the Berkeley family in which the ten contracting parties averaged less than eleven years of age: the marriage contract of another Lord Berkeley was drawn up before he was six years old. Moreover, the same business considerations which dictated those early marriages clashed equally with the strict theory of knighthood. In the same Berkeley family, the lord Maurice IV. was knighted in 1338 at the age of seven to avoid the possible evils of wardship, and Thomas V. for the same reason in 1476 at the age of five. Smyth's record of this great family shows that, from the middle of the 13th century onwards, the lords were not only statesmen and warriors, but still more distinguished as gentle farmers on a great scale, even selling fruit from the medieval gardens. Scarlet lilies were imposed as a badge of fourteen years of inspection from dairy to dairy. The lord Thomas III. (1326-1361), who was noted as a special lover of tournaments, spent in two years only £50, or an average of about £15 per tournament; yet he was then laying money by at the rate of £450 a year, and, a few years later, at the rate of £1150, or nearly half his income! Indeed, economic causes contributed much to the decay of romantic chivalry. The old families had lost heavily from generation to generation, partly by personal extravagances, but also by gradual alienations of land to the Church and by the enormous expenses of the crusades. Already, in the 13th century, they were hard pressed by the growing wealth of the burgage, and the greates nobles could scarcely keep up their state without careful business management.

It is not surprising therefore, to find that at least as early as the middle of the 13th century the commercial side of knighthood became very prominent. Although by the code of chivalry no candidate could be knighted before the age of twenty-one, we have seen how great nobles like the Berkeleys obtained that honour for their infant heirs in order to avoid personal wardship. Saulnier de la Tour, a French writer of the 14th century, complained of this knightly of infants as a common and serious abuse. Moreover, after the knight's liability to personal service in war had been modified in the 12th century by the scutage system, it became necessary in the first quarter of the 13th to compel landowners to take up the knighthood which in theory they should have coveted as an honour—a compulsion which was soon systematically enforced (Distraint of Knighthood, 1278), and became a recognized source of royal income. An indirect effect of this system was to break down another rule of the chivalrous code—that none could be dubbed who was not of gentle birth. This rule, however, had often been broken before; even the romances of chivalry speak not infrequently of the knightings of serfs or jougeois, and other causes besides distrust of knighthood tended to level the old distinctions. While knighthood was avoided by poor nobles, it was coveted by rich citizens. It is recorded in 1298 as an "immemorial custom" in Provence that rich burghers enjoyed the honour of knighthood; and less than a century later we find Sacchetti complaining that the dignity is open to any rich start, however disreputable his antecedents. Similar causes contributed to the rise of "knighted" who were not in warlike. Even in the 15th century, when war was still rather the pastime of kings and knights than

1. Sainte Palaye, ii. 90.
2. Medley, English Constitutional History (2nd ed., pp. 291, 466), suggests that Edward might have deliberately calculated this degrada-
3. of the older feudal ideal.
4. "Being made to 'ride the barriers' was the penalty for anybody who attempted to take part in a tournament without the qualification of name and arms. Gilliam (Display of Heraldry, p. 66) and Nisbet (System of Heraldry, ed. ii., p. 284) mention England and Scotland. See also Ashmole's Order of the Garter, p. 284. But in England knighthood has always been conferred to a great extent independently of these considerations. At most every period there have been men of obscure and illegitimate birth who have been knighted. Ashmole cites authorities for the con-
5. tention that knighthood ennobles, insomuch that whosoever is a knight necessarily follows that he is also a gentleman; "for, when a king gives the dignity to an ignoble person whose merit he would thereby recompense, he is understood to have conferred whatsoever is requisite for the completing of that which he bestows." By the contraction of marriage, a knight was "debarred" from being chiselled and accentuated a gentleman, and if a person under age and in wardship were knighted both his minorit and wardship termi-
6. nated. (Order of the Garter, p. 43; Nicolas, British Orders of Knife-
7. thood, i. 2.)
8. Du Cange, s.v. miles (ed. Didot, t. iv. p. 402); Sacchetti, Novelle, clxxii. All the medieval orders of knighthood, however, insisted in the statutes on the noble birth of the candidate.
a national effort, the strict code of chivalry was more honoured
in the breach than in the observance.1 But when the Hundred
Years' War brought a real national conflict between England
and France, when archery became of supreme importance, and
a large proportion even of the cavalry were mercenary soldiers,
then the exigencies of serious warfare swept away much of that
outward display and those conventions on which chivalry had
always rested. Siméon Luce (chap. vi.) has shown how
much the English successes in this war were due to strict business
methods. Several of the best commanders (e.g. Sir Robert
Knolles and Sir Thomas Dagworth) were of obscure birth, while
on the French side, Du Guesclin, who had always been a
special knight because he belonged only to the lesser nobility.
The tournament again, which for two centuries had been under the
ban of the Church, was often almost as definitely discouraged
by Edward III. as it was encouraged by John of France; and
while John's father opened the Crécy campaign by sending
Edward a challenge in due form of chivalry, Edward took
advantage of this formal delay to amuse the French king with
negotiations while he withdrew his army by a rapid march from
an almost hopeless position. A couple of quotations from
Freissart will illustrate the extent of which he has been
admired as he admired the French chivalry, he recognized their
impotence at Crécy. "The sharp arrows ran into the men of arms and into their horses, and many fell, horse and men. . . . And also among the Englisshmen there were certain rascals that went about with great knives, and they went in among the men of arms, and slew and murdered many as they lay on the ground, both earls, barons, knights and
squires, whereof the king of England was after dispelled, for he had rather they had been taken prisoners." How far
Edward's solicitude was disinterested may be gauged from
Freissart's parallel remark about the battle of Aljubarrota,
where, as at Agincourt, the handful of victors were obliged by
a sudden panic to slay their prisoners. "Lo, behold the great
evil adventure that fell that Saturday. For they slew as many
good prisoners as would well have been worth, one with another,
four hundred thousand francs." In 1492 Lord Thomas de
Berkeley bought, as a speculation, 24 Scottish prisoners.
Similar practical considerations forced the nobles of other
European countries either to conform to less sentimental
methods of warfare and to growing conceptions of nationality,
or to have their military emblems which symbolized the middle ages in Götz von Berlichingen and his compatriots.

BIBLIOGRAPHY.—Freissart is perhaps the source from which we may gather much of chivalry in its double aspect, good and bad.
The brilliant side comes out most clearly in Joinville, the Chronique
de Du Guesclin, and the Histoire de Bayard; the darker side appears
in the earlier chronicles of the crusades, and is especially emphasized
by preachers and moralists like Jacques de Vitry, Etienne de
Bourbon, Nicole Bozon and John Gower. John Smyth's Lives of
the Bardeis (Bristol and Gloucester. Archaeol. Soc., 2 vols.) and
the Book of the Knight of La Tour-Landry (ed. A. de Montaignon,
or in the old English trans. published by the Early English Text Soc.)
throw a very vivid light on the inner life of noble families. Of
modern books, besides those quoted by their full titles in the notes,
the best are A. Schulte's Hoheits Leben. Zeit der Minnesänger
(Leipzig, 1879); S. Luce, Histoire de Du Guesclin et son Époque (2nd
ed., Paris, 1882), masterly but unfortunately unfinished at the author's death; F. Lauter (Par., 1895), written with a strong apologetic bias, but full and correct in its references;
and F. W. Cornish, Chivalry (London, 1901), too little reference to
the more prosaic historical documents, but candid and without
intentional partiality. (G. G. Co.)

ORDERS OF KNIGHTHOOD

When orders ceased to be fraternities and became ever more and more marks of favour and a means of recognizing meritorious

 services to the Crown and country, the term "orders" became
loosely applied to the insignia and decorations themselves.
Thus "orders," irrespective of the title or other specific designation
they confer, fall in Great Britain generally into three main categories, according as the recipients are made "knights grand cross," "knights commander," or "companions." In
some orders the classes are more numerous, as in the Royal
Victoria, for instance, which has five, numerous foreign orders
like number, some six, while the Chinese "Dragon" beasts no
less than eleven degrees. Generally speaking, the insignia of the
"knights grand cross" consist of a star worn on the left breast
and a ribbon of the same form either of the cross patée, or of the
Maltese cross, worn suspended from a ribbon over the
shoulder or, in certain cases, on days of high ceremonial
from a collar. The "commanders" wear the badge from a ribbon round the neck, and the star on the breast; the "companions"
have no star and wear the badge from a narrow ribbon
at the button-hole.

Orders may, again, be grouped according as they are (1) PRIME
ORDERS OF CHRISTENDOM, conferred upon an exclusive class
only. Here belong, Inter alia, the well-known orders of the
Golden Fleece (Austria), Order of the Garter (England), Order of
the Holy Sepulchre (England), Order of St John of Jerusalem (Johannitzer Orden), Malteser Orden, for the history of which and the
several states, see Azemar and St John of Jerusalem, Knights of the
ORDER OF THE THISTLE, Wellington, Windsor. The insignia of the order are
illustrated on plate I.

The "most ancient" Order of the Thistle was founded by
James I. in 1607, and dedicated to St Andrew. It consisted of
the sovereign and eight knights companions, and fell into
abeyance at the Revolution of 1688. In 1703 it was revived by
Queen Anne, and was elaborated to consist of the
sovereign and 12 knights companions, the number being increased
to 16 by statute in 1827. The officers of the order are the
queen, the lady, the secretary, Lyon King of Arms and the
gentleman usher of the Green Rod. The chapel, in St Giles',
Edinburgh, was begun in 1809. The star, badge and ribbon of the
order are illustrated on Plate II., figs. 5 and 6. The collar is
formed of thistles, alternating with sprigs of rue, and the
motto is Nemo me impune lacessit.

KNIGHTHOOD

The "most illustrious" Order of St Patrick was instituted by George III. in 1788, to consist of the sovereign, the lord lieutenant of Ireland as grand master and 15 knights companions, enlarged to 22 in 1833. The chancellor of the order is the chief secretary to the lord lieutenant of Ireland, and the king of arms is Ulster King of Arms; Black Rod is the usher. The chapel is in St Patrick's Cathedral, Dublin. The star, badge and ribbon are illustrated on Plate II., figs. 1 to 8. The collar is formed of alternate roses with red and white leaves, and gold harps linked by gold knots; the badge is suspended from a harp surmounted by an imperial jewelled crown. The motto is Quis separabit?
The "most honourable" Order of the Bath was established by George I. in 1725, to consist of the sovereign, a grand master and 36 knights companions. This was a pretended revival of an order supposed to have been created by Henry IV. at his coronation in 1399. But, as has been shown in the preceding section, no such order existed. Knights of the Bath, although allowed precedence before knights bachelors, were merely knights bachelors who were knighted with more elaborate ceremonies than others and on certain great occasions. In 1815 the order was instituted, in three classes, "to commemorate the auspicious termination of the long and arduous contest in which the Empire has been engaged"; and in 1847 the civil knights commanders and companions were added. Exclusive of the sovereign, royal princes and distinguished foreigners, the order is limited to 35 military and 27 civil knights grand cross, 135 military and 108 civil knights commanders, and 725 military and 675 civil knights companions. The order of chivalry originally consisted of the dean (the dean of Westminster), Bath King of Arms, the registrar, and the usher of the Scarlet Rod. The ribbon and badges of the knights grand cross (civil and military) and the stars are illustrated on Plate II., figs. 1, 2, 3 and 4.
The "most distinguished" Order of St Michael and St George was founded by the prince regent, afterwards George IV., in 1818, in commemoration of the British protectorate of the Ionian Islands, "for natives of the Ionian Islands and of the island of Malta and its dependencies, and for such other subjects of his majesty as may hold high and confidential situations in the Mediterranean." By statute of 1832 the lord high commissioner of the Ionian Islands was to be the grand master, and the order was directed to consist of 15 knights grand crosses, 20 knights commanders and 25 cavaliers or companions. After the repudiation of the British protectorate of the Ionian Islands, the order was placed on a new basis, and by letters patent of 1868 and 1877 it was extended and provided for such of "the natural born subjects of the Crown of the United Kingdom as may hold high and confidential offices within her majesty's colonial possessions, and in reward for services rendered to the crown in relation to the foreign affairs of the Empire." It is now (by the enlargement of 1902) limited to 100 knights grand cross, of whom the first or principal is grand master, exclusive of extra and honorary members, of 300 knights commanders and 600 companions. The officers are the prelate, chancellor, registrar, secretary and officer of arms. The chapel of the order, in St Paul's Cathedral, was dedicated in 1906. The badge of the knights grand cross and the ribbon are illustrated on Plate II., figs. 9 and 10. The star of the knights grand cross is a seven-rayed star of silver with a small ray of gold between each, in the centre is a red St George's cross bearing a medallion of St Michael encountering Satan, surrounded by a blue fillet with the motto Auspicium melioris aevi.
The Order of St Michael and St George ranks between the "most excited" Order of the Star of India and the "most eminent" Order of the Indian Empire, of both of which the viceroy of India for the time being is ex officio grand master. Of these the first was instituted in 1861 and enlarged in 1876. 1897 and 1903, in three classes, knights grand commanders, knights commanders and companions, and the second was established (for "companions" only) in 1878 and enlarged in 1887, 1892, 1897 and 1932, also in the same three classes, in commemoration of Queen Victoria's assumption of the imperial style and title of the Empress of India. The badges, stars and ribbons of the knights grand commanders of the two orders are illustrated on Plate III., figs. 3, 4, 5 and 6. The collar of the Star of India is composed of alternate links of the lotus flower, red and white roses and palm branches enamelled on gold, with an imperially carved in the centre with the words 'The Indian Empire is composed of elephants, persons and Indian roses.
The Royal Victorian Order was instituted by Queen Victoria on the 25th of April 1896, and conferred for personal services rendered to her majesty and her successors on the throne. It consists of the sovereign, chancellor, secretary and five classes—knights grand commanders, knights commanders, commandants and members of the fourth and fifth classes, the distinction between these last divisions lying in the badge and in the precedence enjoyed by the members. The knights of this order rank in their respective classes immediately after those of the Indian Empire. The numbers are unlimited. The badge, star and ribbon of the knights grand cross are illustrated on Plate III., figs. 1 and 2.
To the class of orders without the titular appellation "knight" belongs the Order of Merit, founded by King Edward VII. on the occasion of his coronation. The order is founded on the lines of the Prussian Ordre pour le Mérite (see below), yet more comprehensive, including those who have gained distinction in the military and naval services of the Empire, and such as have made themselves a great name in the fields of science, art and literature. The motto of the order is fixed somewhat vaguely, "For Merit," but it is surrounded by a wreath of laurel. The badge of the military and naval members bears two crossed swords in the angles of the cross. The ribbon is scarlet blue and crimson and is worn round the neck.
The Distinguished Service Order, an order of military merit, was founded on the 6th of September 1886 by Queen Victoria, its object being to recognize the special services of officers in the army and navy. Numbers are unlimited, and its designation is "D.S.O. It consists of one class only, who take precedence immediately after the 4th class of the Royal Victorian Order. The badge is a white and gold cross with a red centre bearing the imperial crown surmounted by the royal badge. In the centre is a red medallion with blue. The Imperial Service Order was likewise instituted on the 26th of June 1902, and finally revised in 1908, to commemorate King Edward's coronation, and is specially designed as a recognition of faithful and meritorious services rendered to the British Crown by the administrative members of the civil service in various parts of the Empire, and is to consist of companions only. The numbers are limited to 475, of whom 230 belong to the home and 225 to the civil services of the colonies and protectorates (Royal Warrant, June 1909). Women as well as men are eligible. The members of the order have the distinction of adding the letters I.S.O. after their names. In practice the order is never conferred on the Colonies.
The badge is a gold medallion bearing the royal cipher and the words "For Faithful Service," in blue; for men it rests on a silver star, for women it is surmounted by a silver wreath. The ribbon is one blue between two crimson stripes.
In addition to the above, there are two British orders confined to ladies. The Royal Order of Victoria and Albert, which was instituted in 1862, is a purely court distinction. It consists of four classes, and it has as designation the letters V.A. The Imperial Order of the Crown of India is conferred for like purposes as the Order of the Indian Empire. Its primary object is to recognize the services of Indians connected with the court of India. The letters C.I. are its designation.
The sovereign's permission by royal warrant is necessary before a lady subject can be made a member of any foreign order of knighthood. For other decorations, see under Medals.
The Golden Fleece (La Toison d'Or) ranks historically and in distinction as one of the great knighthly orders of Europe. It is
now divided into two branches, of Austria and Spain. It was founded on the 16th of January, 1429/30 by Philip the Good, duke of Burgundy, on the day of his marriage with Isabella of Portugal at Bruges, in her honour and dedicated to the Virgin and St Andrew. No certain origin can be given for the name. It seems to have been in dispute even in the early history of the order. Four different sources have been suggested; the classical myth of the voyage of Jason and the Argonauts for the golden fleece, the scriptural story of Gideon, the staple trade of Flanders in wool, and the fleece of golden hair of Marie de Rambrugge, the duke's mistress. Motley (Rise of Dutch Rep., i. 48) says, it could be more than a practical and more than a theoretical. Did not the Lamb of God, suspended at each knight's heart, symbolize at once the woolen fabrics to which so much of Flemish wealth and Burgundian power was owing, and the gentle humility of Christ which was ever to characterize the order? At its constitution the number of the knights was limited to 24, exclusive of the grand master, the sovereign. The members were to be gentilshommes de nom et d'armes et sans reproche, not knights of any other order, and vowed to join their sovereign in the defence of the Catholic faith, the protection of the Low Countries, and the defense of all their rights and amours. The sovereign undertook to consult the knights before embarking on a war, all disputes between the knights were to be settled by the order, at each chapter the deeds of each knight were held in review, and punishments and admonitions were dealt out to offenders; thus the sovereign was expressly subject. Thus we find that the emperor Charles V. accepted humbly the criticism of the knights of the Fleece on his over-centralization of the government and the wasteful personal attention to details (E. A. Armstrong, Charles V., 1902, ii. 372). The knights could claim as of right to be tried by their fellow on charges of rebellion, heresy and treason, and Charles V. conferred on the order exclusive jurisdiction over all crimes committed by the knights. The arrest of the offender had to be by warrant signed by at least six knights, and during the process of charge and trial he remained not in prison but dans l'aimable compagnie du dit ordre. It was in defiance of this right that Alva refused the claim of Counts Egmont and Horn to be tried by the knights of the Fleece in 1568. During the 16th century the order frequently acted as a consultative body in the state; thus in 1530 and 1540 Charles summons the knights to the war against the Turks. The inscriptions in what steps should be taken in face of the revolt of Ghent (Armstrong, op. cit., i. 302), in 1562 Margaret of Parma, the regent, summons them to Brussels to debate the dangerous condition of the provinces (Motley, i. 48), and they were present at the abdication of Charles in the great hall at Brussels in 1555. The history of the order and its subsequent division into the two branches of Austria and Spain may be briefly summarized. By the marriage of Mary, only daughter of Charles the Bold of Burgundy to Maximilian, archduke of Austria, 1477, the grand mastership of the order came to the house of Habsburg and with the Netherlands provinces, to Spain in 1504 on the accession of Philip, Maximilian's son, to Castile. On the extinction of the Habsburg dynasty in Spain by the death of Charles II. in 1700 the grand-mastership, which had been filled by the kings of Spain after the loss of the Netherlands, was claimed by the emperor Charles VI., and he instituted the order in Vienna in 1713. Protests were made at various times by Philip V., but the question has never been finally decided by treaty, and the Austrian and Spanish branches have continued as independent orders ever since as the principal order of knighthood in what are now the countries of Austria, Belgium and Spain, respectively. It may be noticed that while the Austrian branch excludes any other than Roman Catholics from the order, the Spanish Fleece may be granted to Protestants. The badges of the two branches vary slightly in detail, more particularly in the attachment of fire-stones (fusils or furisons) and steels by which the fleece is attached to the ribbon of the collar. The Spanish form is given on Plate IV., fig. 2. The collar is composed of alternate links of furisons and double steels interlaced to form the letter B for Burgundy. A magnificent exhibition of relics, portraits of knights and other objects connected with the order of the Golden Fleece was held at Bruges in 1907.

The chief history of the order is Baron de Reiffenberg's Histoire de l'Ordre de la Toison d'Or (1830); see also an article by Sir J. Ballfour Paul, Lyon King of Arms, in the Scottish Historical Review (July 1908).

Austria-Hungary.—The following are the principal orders other than that of the Golden Fleece (supra). The Order of St Stephen of Hungary, the royal Hungarian order, founded in 1764 by the emperor Francis I., in memory of the Auspicious Monogram of Leopold I., and of the Austrian house; by the after- the corresponding classes of the order of St Stephen. The badge is a red enamelled cross bordered with white and gold and surmounted by the imperial crown; the red enamelled medallion in the centre bears the monogram of Francis I. and the inscription Integrali et Merti. When conferred for service in war the cross rests on a green laurel wreath. The ribbon is scarlet with two white stripes. The number of grand masters, the insignia F. and L. and oak wreaths. The Order of Francis Joseph, i.e. of Lombard, was founded by Napoleon as king of Italy in 1809, and refounded as an Austrian order of civil and military merit in 1816 by the emperor Francis II. The number of grand masters was fixed to 100-20 grand cross, 50 commanders, 50 knights. The badge consists of the double-headed imperial eagle with sword and orb; below it is the jewelled iron crown of Lombardy, and above the imperial crown of Austria. The badge is the imperial crown of Austria, with shield with the letter F. in gold. The military decoration for war service also bears two green laurel branches. The ribbon is yellow edged with narrow blue stripes. The badge is a crowned imperial crown with the monogram F. P. (Franci concessit). The Order of Francis Joseph, for personal merit of every kind, was founded in 1849 by the emperor Francis Joseph I. It is of the three usual classes and is unlimited in numbers. The badge is a black and gold imperial eagle surmounted by the imperial crown. The eagle bears a red cross with a white medallion, containing the letters F. [ ], and to the beaks of the heads of the eagle is attached a chain of three links, which form with the cross a triangle. The Order of Maria Theresa was founded by the empress Maria Theresa in 1757. It is a purely military order and is given to officers for personal distinguished conduct in the field. There are three classes of which there were only two were awarded. The emperor Joseph II. added a commanders' class in 1765. The badge is a white cross with gold edge, in the centre a red medallion with the imperial crown of Austria, the inscription Fortitudini. The ribbon is red with a white central stripe. The Order of Elizabeth Theresa, also a military order for officers, was founded in 1756 by the will of Elizabeth Christina, widow of the emperor Charles VI. It was revived in 1771 by her daughter, the empress Maria Theresa. The order is limited to 21 knights in three divisions. The badge is an oval star with eight points, enamelled half red and white, dependent from a gold imperial crown. The central medallion bears the initials of the founders, with the encircling inscription M. Theresa parentis gratias parvum volui. The ribbon is black. The Order of the Starry Cross, for high-born ladies, was founded by the Roman Catholic faith. The order is limited to four works, spiritual and temporal, was founded in 1668 by the empress Eleanor, widow of the emperor Ferdinand III., and mother of Leopold I., to commemorate the recovery of a relic of the true cross from the Turks in 1664. The badge is a black double-headed eagle surrounded by a crown and is gold and red. The Order of St Sigismund, for orders of merit in the service of the crown, is a blue and gold. The Order of St Joseph, for the service of the crown, is a red and gold. The Order of Maria Theresa, for military and civil merit, was founded in 1823 by Leopold I., with four classes, a fifth being added in 1838. The badge is a white enamelled cross, with gold borders and lettering, suspended from the neck by a black ribbon with white laurel and oak wreath. In the centre a medallion, surrounded by a red medallion with the motto of the order, L'unison fait la force, bears a golden Belgian lion on a black field. The ribbon is watered red.
INSIGNIA OF SOME OF THE PRINCIPAL ORDERS OF KNIghTHOOD, DRAWN BY GRACIOUS PERMISSION FROM THOSE IN THE POSSESSION OF HIS LATE MAJESTY KING EDWARD VII AND ARRANGED IN ACCORDANCE WITH HIS MAJESTY'S WISHES AND COMMAND.
ROYAL VICTORIAN ORDER. (i.) Grand Cross; (ii.) Star. ORDER OF THE INDIAN EMPIRE. (iii.) Badge of Knight Grand Commander; (iv.) Star. THE STAR OF INDIA. (v.) Star; (vi.) Badge of Knight Grand Commander.

Drawn by William Gibb.
The Order of the Lion Cross, the badge of which is a black cross with gold borders, with a gold centre bearing a crown, was instituted by Leopold II in 1867 as an order of civil merit. The military order was instituted by Leopold II in 1867. The following orders were instituted by Leopold II, for service in the Congo State: the Order of the African Star (1888), the Royal Order of the Lion (1861) and the Order of the Infanta of Spain (1863).

Bulgaria.—The Order of SS Cyril and Methodius was instituted in 1906 by King Ferdinand to commemorate the elevation of the principalities to the position of an independent kingdom. It carries a gold cross of the Order of SS Alexander, which was founded by Prince Alexander in 1881, and reconstituted by Prince Ferdinand in 1888. There are six classes.

The white cross, suspended from the Bulgarian crown, bears the name of the patron saint in old Cyrillic letters on the centre.

Denmark.—The Order of the Elephant, one of the chief European orders of knighthood, was, it is said, founded by Christian I in 1463; a silver elephant ornamented with the royal arms. Its regular predecessor was that of Christian V in 1693.

The order, exclusive of the sovereign and his sons, is limited to 30 knights, who must be of the Protestant religion. The badge of the order is illustrated on Plate IV, fig. 5. The ribbon is light watered blue, the collar of all gold, with blue housings and towers, the star of silver with a purple medallion bearing a silver or brilliant cross surrounded by a silver laurel wreath. The motto is Magnusmo pretium. The Order of the Dannebrog, according to Danish tradition, of miraculous origin, and was founded by Valdemar II. in 1210 as a memorial of a victory over the Esthionans, won by the appearance in the sky of a silver and yellow cross with a red central cross. The original order was founded in 1671 by Christian V. at the birth of his son, Frederick, the statutes being published in 1693. Originally restricted to 50 knights and granted as a family or court decoration, it was extended by Frederick V. to an unlimited number of merit in 1808 by Frederick VI.; alterations have been made in 1811 and 1864. It now consists of three classes—grand cross, commander (two grades), knight (two grades). The badge of the order was illustrated on Plate IV, fig. 6.

France.—The Legion of Honour, the only order of France, and one which in its higher grades ranks in estimation with the highest European orders, was instituted by Napoleon Bonaparte on the 19th of May 1802 (20 Floréal of the year X.) as a general military and civil order of merit. All soldiers on whom "swords of honour" were conferred, all officers of the Anhalt-Berleburg, and all citizens after 25 years' service were declared eligible, whatever their birth, rank or religion. On admission all were to swear co-operate so far as in them lay for the assertion of the principles of liberty and equality. The organization as laid down by Napoleon in 1804 was as follows: Napoleon was grand master; a grand council of 7 grand officers administered the order; the order was divided into 15 "cohorts" of 7 grand officers, 20 commanders, 30 officers and 350 legionaries, and at the headquarters of the cohorts, for which the territory of France was separated into 7 military divisions, were stationed the officers-in-charge of the sick and infirmary legionaries. Salaries (traitements) varying in each rank were attached to the order. In 1805 the rank of "Grand Eagle" (now Grand Cross, Grand Cordon) was instituted, taking precedence of the grand officers. At the Restoration many changes were made, the old military and religious orders were restored, and the Legion of Honour, now Ordre Royal de la Legion d'Honneur, took the lowest rank. The revolution of July 1830 restored the order to its unique place. The constitution of the order now rests on the decrees of the 16th of March and 24th of November 1815, the 25th of July 1873, the laws of the 29th of December 1892, and the laws of the 16th of April 1895 and the 28th of January 1897, and a decree of the 26th of June 1900. The president of the republic is the grand master of the order; the administration is in the hands of a grand chancellor, who has a council of the order nominated by the grand master. The chancellery is housed in the Palais de la Legion de l'Honneur, which, burnt during the Commune, was rebuilt in 1878. The order consists of the five classes of grand cross (limited to 50), grand officer (200), commander (1000), officers (4000), and chevalier or knight, in which the number is unlimited. These limitations in number do not affect the foreign recipients of the order. Salaries (traitements) are attached to the military and naval recipients of the order when on the active list, viz. 3000 francs for grand cross, 2500 francs for grand officers, 1000 francs for commanders, 250 francs for chevaliers. The numbers of the recipients of the order sans traitement are limited through all classes.

Among the orders swept away at the French Revolution, restored in part at the Restoration, and finally abolished at the revolution of July 1830 were the following: The Order of St Michael was founded by Louis XI. in 1459 for a limited number of knights of noble birth. Later, members were made eligible, and it was increased in number so that it became known as Le Collier a toutes têtes. In 1816 the order was granted for services in art and science. In view of the low esteem in which the Ordre de la Légion d'honneur, created by Napoleon Bonaparte in 1802, was held, the French government created in 1848 the Ordre de la Légion d'Honneur, which was founded by the emperor in 1802, and which was reconstituted and made a national order by Napoleon Bonaparte in 1804. It was first instituted by the king of France, and was reconstituted and made a national order by Napoleon Bonaparte in 1802. The badge of the order was a white Maltese cross decorated in gold, with the gold lilies of France at the angles, in the centre a white dove with wings outspread, the ribbon being red. In 1806 the order was Dues et auspices. The Order of St Louis was founded by Louis XIV. in 1693 for military merit, and the Order of Military Merit by Louis XV. in 1759, originally for Protestant officers.

Greece.—The Order of the Redeemer (see Dictionnaire de l'administration francaise, by M. Block and E. Magnéro, 1905, s.v. "Decorations").

Among the orders swept away at the French Revolution, restored in part at the Restoration, and finally abolished at the revolution of July 1830 were the following: The Order of St Michael was founded by Louis XI. in 1459 for a limited number of knights of noble birth. Later, members were made eligible, and it was increased in number so that it became known as Le Collier a toutes têtes. In 1816 the order was granted for services in art and science. In view of the low esteem in which the Ordre de la Légion d'Honneur, created by Napoleon Bonaparte in 1802, was held, the French government created in 1848 the Ordre de la Légion d'Honneur, which was founded by the emperor in 1802, and which was reconstituted and made a national order by Napoleon Bonaparte in 1802. The badge of the order was a white Maltese cross decorated in gold, with the gold lilies of France at the angles, in the centre a white dove with wings outspread, the ribbon being red. In 1806 the order was Dues et auspices. The Order of St Louis was founded by Louis XIV. in 1693 for military merit, and the Order of Military Merit by Louis XV. in 1759, originally for Protestant officers.

Baden.—The Order of Fidelity or Loyalty (Hausorden der Treue) was instituted by William, margrave of Baden-Durlach in 1770. It was reconstituted by the elector of Baden in 1812 in commemoration of the descent of the reigning house of Baden from the dukes of Zähringen. It has been reconstituted in 1840 and 1877. It now consists of five classes. The badge is a green enamel cross with gold clasps in the angles; in the centre a white medallion with red monogram over a green mound surrounded by the word Fidelitas in black; the cross is suspended from a ducal crown. The ribbon is orange with silver edging. The military Order of Charles Frederick was founded in 1807. There are three classes. The badge is a white cross resting on a green laurel wreath, the ribbon is red with a yellow stripe bordered with white. The order is conferred for long and meritori- ous service in the military service. The Order of the Zähringen Lion was created in 1812 in commemoration of the descent of the reigning house of Baden from the dukes of Zähringen. It has been reconstituted in 1840 and 1877. It now consists of five classes. The badge is a green enamel cross with gold clasps in the angles; in the centre a white medallion with red monogram over a green mound surrounded by the word Fidelitas in black; the cross is suspended from a ducal crown. The ribbon is green with two orange stripes. Since 1896 the Order of Berthold I has been a distinct order; it was founded in 1877 as a higher class of the Zähringen Lion.

Bavaria.—The Order of St Hubert, one of the oldest and most distinguished knightly orders, was founded in 1444 by duke William V of Jülich-Berg in order to encourage a visit to the church of Egmont at Ravensberg on the 3rd of November, St Hubert's day. The knights wore a collar of golden hunting horns, whence the order was also known as the Order of the Horn. Statutes were granted in 1447. The order was abolished during the secularization of the Catholic Church in 1802. It was revived in 1708 by the elector palatine John William of Neuberg, and its constitution was altered at various times, its final form being given by the elector Maximilian Joseph, first king of Bavaria, in 1568. Exclusive of the sovereign and...

KNIGHTHOOD 863

ORDERS
The badge of the order and the ribbon are illustrated in Plate IV. The arms of the order are those of St. Hubert. The collar is composed of gold and blue enamel figures of the conversion linked by the Gothic monogram I.T.V., Isabella, the motto of the order, alternately surrounded by red and blue edging. The Order of St. George, said to have been founded in the 12th century as a crusading order and revived by the emperor Maximilian I. in 1494, dates historically from its institution in 1729 by the elector of Brandenburg. Charles VI. of Austria, and was confirmed by the elector Charles Theodore in 1778 and by the elector Maximilian Joseph IV. as the second Bavarian order. Various new statutes have been granted from 1827 to 1875. The order is divided into two branches, "officers and ladies." The order is composed of two classes, a merit; and it also has a "spiritual society." The members of the order must be Roman Catholics. The badge is a blue enamelled cross of two divisions of gold, and the motto engraved on the centre is "Sparta urbs et fides," and it resembles the badge of the Black Eagle. The central medallion contains a figure of the Immaculate Conception. The medallion on the reverse contains a figure of St. George, the Dragon, and the corresponding initials J.U.P.F., Justus ut Palma Floreat, the motto of the order. There are also the two illustrious orders for ladies, the Order of Elizabeth (1772), and the Order of Theresa (1796), of the foundations of St Anne of Munich and of St Anne of Wurzburg for ladies are not properly orders.

iv. Brunswick. The Order of Henry the Lion, for military and civil merits, was founded in 1834, in four classes, and a cross of merit; these orders have not been conferred since 1866, when Hanover ceased to be a kingdom, and the Royal Guelph Order, which from its institution was more British than Hanoverian, was raised in the death of William IV. in 1837. The last British grand cross was the late duke of Cambridge.

vi. Hesse. Of the various orders founded by the houses of Hesse-Cassel and Hesse-Darmstadt the following are still bestowed in the grand duchy of Hesse. The Order of Louis, founded in 1839 as the family order of the house of Hanover, the Royal Guelph Order (three classes) by George prince regent, afterwards George IV. of Great Britain, in 1815, and the Royal Order of the Lion, founded in 1844 and 1846.

The orders have not been conferred since 1866, when Hanover ceased to be a kingdom, and the Royal Guelph Order, which from its institution was more British than Hanoverian, was raised in the death of William IV. in 1837. The last British grand cross was the late duke of Cambridge.

vii. Mecklenburg. The grand duchy of Mecklenburg-Schwerin and Mecklenburg-Strelitz, founded in 1864 by the grand dukes Frederick Francis II. of Schwerin and Frederick William of Strelitz, there are four classes, with two divisions of the grand cross, and also an affiliated cross of merit; the grand cross can be granted to ladies. The white cross bearing on a blue centre the Wendish crown, surrounded by the motto, for the Schwerin knigeh, Per aspera ad astra, for the Strelitz knigeh, Aufl den sturen honore. The Order of the Griffin, founded in 1864 by Frederick Francis of Schwerin, was made conversion of the duchies in 1904.

viii. Oldenburg. The Order of Duke Peter Frederick Louis, a family order and order of merit, was founded by the grand duke Paul Frederick Augustus in memory of his father in 1835. It has two divisions, each of five classes, of capitular knights and honorary knights. The badge is a white gold bordered cross suspended from a blue ribbon, the badge of a grand cross can be granted to ladies. The white cross bearing on a blue centre the Wendish crown, surrounded by the motto, for the White Lion, Per aspera ad astra, for the Blue Lion, Aufl den sturen honore. The Order of the Black Eagle, one of the most distinguished of European orders, was founded in 1701 by the elector of Brandenburg. Frederick I., in memory of his coronation as king of Prussia. The order consists of one class only and the original number of 48 has been increased, subject to the princes of the sovereign house and foreign members, so to 30. But the number has been exceeded. It is only conferred on those of royal lineage and upon high officers of state. It confers the nobiliary particle von. Only those who have received the Order of the Black Eagle are eligible. An illustration of the badge of the order with ribbon is given on Plate IV. fig. 3. The star of silver bears the black eagle on an orange ground surrounded by a blue ribbon on which is the motto of the order Stum Cuisne. The collar is formed of alternate black eagles and a circular medallion with the motto on a white centre surrounded by a circle of blue with four gold crowns on the exterior rim. The Order of the Black Eagle, the second of the Prussian orders, was founded originally as the Order of Sincerity (L'Ordre de la Sincerite) in 1705 by George William, Duke of Brunswick-Wolfenbuttel, the order, however, was later instituted and insignia are now entirely changed, with the exception of the red eagle which formed the centre of the cross of the badge. The order had almost fallen into oblivion when it was revived in 1734 and confirmed in 1744 by Frederick the Great, but was again transferred and King Frederick William made it a Prussian order which it has since maintained. The order was divided into four classes in 1810 and there are now five classes with numerous subdivisions. It is an order of civil and military merit. The grand cross resembles the badge of the Black Eagle, but is white and the eagles in the corners red, the central medallion bearing the initials W.K. (those of William I.) surrounded by a blue fillet with the motto Sincere de Constantia. The numbers and subdivisions have exceedingly complicated distinguishing marks, some bearing crossed swords, a crown, or an oak-leaf surmounting the cross. The ribbon is white with two orange stripes.

The Order for Merit (Ordre pour le Mérite), one of the most highly prized by European sovereigns, is an order for civil and military merit and for science and art. It was originally founded by the electoral prince Frederick, afterwards Frederick I. of Prussia, in 1667 as the Order of Merit; generally; and the Order of Merit, and was granted for civil and military distinction by Frederick the Great in 1785. In 1810 the order was made one for military merit against the enemy in the field exclusively. In 1840 the class for distinction for science and art, or peace class (Kunst- und Friedensklasse), was added by King William IV., for those "who have gained an illustrious name by wide recognition in the spheres of science and art." The number is limited to 30 German and 30 foreign members. The Academy of Sciences and Arts, founded in 1701, can confer the order with the same distinction which one is selected by the king. It is interesting to note that this was the only distinction which Thomas Carlyle would accept. The badge is a military one, consisting of a crowned eagles in the angles; on the topmost arm is the initial F., which is on the other arm the inscription Pour le Mérite. The ribbon is black with a silver stripe at the edges. In 1866 a special grand cross was instituted for the crown prince (afterwards Frederick III.) and Prince Frederick Charles. It was in 1879 granted to Count von Molcke as a special distinction. The badge of the class for science or art is an oval medallion of white, with a gold eagle in the centre surrounded by a blue border. The white ribbon has the letters 3.F. II. four times repeated, and four crowns in gold projecting from the rim. The ribbon is the same as for the military class, and the division is the same as the military class. In 1861, ranks with the Red Eagle. There are four classes, with four subdivisions. Other Prussian orders are the Order of William, instituted by William II. in 1869; a Prussian branch of the knights of St. John one of Jerusalem, founded in 1833 by the last king of Hanover, and the family Order of the House of Hohenzollern, founded in 1831 by Frederick William IV. There are two divisions, military and civil, divided into four classes. The military badge is a white cross with black and gold edging, resting on a green oak and laurel wreath; the central medallion bears the Prussian eagle with the arms of Hohenzollern, and is surrounded by a blue fillet with the motto Zion Pels zu Meur; the civil badge is a black eagle with the head encircled with a blue fillet with the motto. There are also for ladies the Order of Service, founded in 1814 by Frederick William III., in one class, but enlarged in 1850 and in 1863. The decoration of the order for ladies (Verdienstkreuz) was instituted in 1878, and one to an order in 1907. For the famous military decoration, the Iron Cross, see MEDALS.
INSCRIPTION OF SOME OF THE PRINCIPAL ORDERS OF KNIGHTHOOD,
DRAWN BY GRACIOUS PERMISSION FROM THOSE IN THE POSSESSION OF HIS LATE MAJESTY KING EDWARD VII AND ARRANGED IN ACCORDANCE WITH HIS MAJESTY'S WISHES AND COMMAND.
I. The St. Andrew (Russia)
II. The Golden Fleece (Spain)
III. The Black Eagle (Prussia)
IV. The Tower and Sword (Portugal)
V. The Elephant (Denmark)
VI. The Legion of Honour (France-Napoleonic)
VII. The Annunziata (Italy)

Drawn by William Gibb.
KNIGHTHOOD

1815. For ladies there are the Order of S widow, 1870, in memory of the wife of Albert the Bold, the mother (Stamm-Mutter) of the Albrecht of Nassau-Weilburg, 1858.

The Duchies of Saxe-Altenburg, Saxe-Coburg and Saxe-Meiningen have in common the family Order of Ernest, founded in 1852.

The Order of the Phoenix, instituted in Naples (1316), is the national Order of that country (1816), and was revived in the Order of German Imperial Order (Orden der deutschen Ritterlichkeit) founded in 1900. Saxe-Coburg and Saxe-Meiningen have also separate crosses of merit in science and art.

Sacred Art. The Order of the White Falcon or of Vigilance was founded in 1732 and renewed in 1815.

xiii. Württemberg.—The Order of the Crown of Württemberg was founded in 1859 by Prince Charles, former Order of the Golden Eagle and an order of civil merit. It has five classes, the crimson cross surmounted by the royal crown, in the centre the initial F surrounded by a crimson fillet on which is the motto Fuchslos und Treu; in the angles are the coats of arms of Württemberg combined with the øre of Sweden, a black eagle with two black stripes. Besides the military Order of Merit founded in 1759, and the silver cross of merit, 1900, Württemberg has also the Order of Frederick, 1830, and the Order of Olga, 1871, which is granted to ladies as well as men.

xvi. Greece.—The Order of the Redeemer was founded as such in 1833 by King Otto, being a conversion of a decoration of honour instituted in 1788 by the National Assembly at Argos. There are five classes, the numbers being regulated for each. An illustration of the badge and ribbon of the grand cross is given on Plate V. fig. 1.

xvii. Holland.—The Order of William, for military merit, was founded in 1801. The badge consists of a square medallion, with a cross resting on a green laurel Burgundian cross, in the centre the Burgundian flint-stone, as in the order of the Golden Fleece. The motto Voor Moed, Belief, Troost (For Valor, Devotion, Loyalty), appears on each of the four crosses. The badge is surmounted by a white jewelled crown; the ribbon is orange with dark blue edging. The Order of the Netherlands Lion, for civil merit, was founded in 1818; there are four classes. The family Order of the Golden Lion of Nassau passed in 1890 to the grand duchy of Luxembourg (see under Luxembourg).

In 1892 Queen Wilhelmina instituted the Order of Orange-Nassau with five classes. The Tenenon Order (q.v.), surviving in the Ballarde (Ballarde) Order, was officially established in the Netherlands by the States General in 1850. It was abolished by Napoleon in 1811 and was restored in 1815.

xviii. Italy.—The Order of the Annunziata, the highest order of knighthood of the Italian kingdom, was instituted by Amadeus VI., count of Savoy, as the Order of the Collar or Collar, from the silver collar made up of love-knots and roses, which was its badge, in honour of the marriage of the king. The number of the knights was restricted to fifteen, the fifteen chaplains recited fifteen masses each day, and the clauses of the original statute of the order were fifteen (Amadeus VIII. added five others in 1543). Charles III. decreed that the order should be called the Annunziata, and made some other alterations in 1518. His son and successor, Emmanuel Philibert, made further modifications in the statute and the costume.

The church of the order was originally the Carthusian monastery of Pierre-châlet in the district of Bugey, but after Charles Emmanuel I. had given Bugey and Bresse to France in 1601 the church of the order was transferred to the Camaldolese monastery near Turin. Thus the order is also called the Order of Turin. The church of the Carthusian monastery of Collegno should be the chapel of the order. The knights of the Annunziata have the title of 'counts of the king of Savoy,' while the ladies are called 'counts of Savoy.'

The costume of the order is of white satin embroidered in silver, with a purple velvet cloak adorned with roses and gold embroidery, but it is now never worn; in the collar the motto First is inserted, on the meaning of which there is great uncertainty,1 and from it hangs a pendant enclosing a medallion representing the Annunciation (see Plate IV. fig. 7). An account of the order is given in Count Luigi Ciarrocchi's Ordini Cavallereschi (Turin, 1846) with coloured plates of the costume and badges.

The Order of St Maurice and St Lazarus (SS Maurizio e Lazzaro), is a combination of two ancient orders. The Order of St Maurice was founded by Pope Anastasius IV. in 1248, and was also established in France by St Louis in 1252 when he retired to the hermitage of Ripaille, and consisted of a group of half-a-dozen councillors who were to advise him on such affairs of state as were not within his control. When he became pope as Felix V., the order practically ceased to exist. It was re-established at the instance of Emmanuel Philibert by Pope Pius V. in 1572 as a military and religious order, and the following year it was united to that of St Lazarus (St Lazzaro). The former order had been founded as a military and religious community at the time of the Latin kingdom of Jerusalem with the object of assisting lepers, many of whom were among its members. Popes, princes and nobles endowed it with property, and in 1187 it procured a grant from Pope Alexander III, giving it a fixed endowment for the perpetual support of its religious. The last knight of the order died in 1218, and the possession of the order was extinguished. The order was revived by Pope Benedict XIII. in 1475, and the last official recognition of this revival was that of Pius V. in 1572.

With the advance of the Saracens the knights of St Lazarus, when driven from the Holy Land and Egypt, migrated to France (1291) and were granted extensive domains in the order in Naples, which alone was afterwards recognized as the legitimate descendant of the Jerusalem community, was empowered to establish a dominion anywhere in Europe, and on the establishment of a regular inquisitorial system of blackmail. In the 15th and 16th centuries dissensions broke out among the knights, and the order declined in credit and wealth, until finally the Grand Master, Giannetto de' Giannetti, by the express permission of Emperor Maximilian I., in 1510, obtained a papal bull in favour of Emmanuel Philibert, duke of Savoy, in 1571. Two years later the orders of St Lazarus and St Maurice were incorporated into one community, the members of which were to devote themselves to the service of the Holy See and to fight against heretics and to continue assisting lepers. The galleys of the order subsequently took part in various expeditions against the Turks and the Barbary pirates. The order was suppressed by Pope Urban VIII. in 1640, break out once more in the 18th, and in 1773 a hospital was established by the order at Aosta, made famous by—Xavier de Maistre's tale, Le Prieuré de la Côte d'Aoste. The statutes were published in 1616, by Pius V., and later by Urban VIII. and Clement XIII.

See L. Ciarrocchi, Descrizione storica degli Ordini Cavallereschi, vol. i. (Turin, 1846); Calendario Reale, an annual publication issued in Rome.

The military Order of Savoy was founded in 1815 by Victor Emmanuel I. of Sardinia; it was modified 1836 and 1852 and has five classes. The badge is a white cross, the arms of which expand and terminate in an obtuse angle; round the cross is a green laurel and oak wreath; the central medallion is red, bearing in gold two crossed swords, the initials of the founder's name; the outer border of the ribbon is red with a central stripe of blue. The Civil Order of Savoy, founded in 1831 by Charles Albert of Sardinia, is of one class, and in statutes of 1866 is limited to 60 members. The badge is the plain Savoy cross. The Grand Cross is in blue, with a crimson ribbon bearing a white border. The Order of the Crown of Italy was founded in 1868 by Victor Emmanuel II. in commemoration of the union of Italy with the former states.

Luxemburg.—The Order of the Golden Lion was founded as family order of the house of Nassau by William III. of the Netherlands and Adolphus of Nassau jointly. On the death of William in 1809 it passed to the grand duke of Luxembourg; it has only one class. The Order of Adolphus of Nassau, for civil and military merit, in four classes, was founded in 1838, and the Order of the Oak Crown as a general order of merit, in five classes, in 1841, modified 1852. The Order of the Golden Lion was founded in 1858 by Prince Charles III. and remodelled in 1863. It is a general order of merit.

Norway.—The Order of St Peter, founded in 1852, is a family order, in one class, and only given to members of the princely family; the Order of Danilo, or of the Independence of Montenegro, is a general order of merit, in four classes, with subdivisions, also founded in 1852. In honour of St Olaf, the founder of Christianity in Norway, as a general order of merit, and civil and military. There are three classes, the badge being in 1873 and 1890, subdivided into two grades. The badge and ribbon is illustrated on Plate V. fig. 8. The reverse bears the motto Ret og Sandhed (Right and Truth). The Order of the Norwegian Lion, founded in 1904 by Oscar II., has only one class; formerly on whom the order was conferred must be sovereigns or heads of states or members of reigning houses.

Papal.—The arrangement and constitution of the papal orders was remodelled by a brief of Pius X. in 1905. The Order of Christ, the highest pontifical order of the Church, is the only order which in the history of the Church there is an old order, which in 1905 was reorganized as a military order of the Church. The Constitutio Apostolica of Pius IX. in 1883 founded the Order of the Golden Spur by Paul IV. in 1559 as a military body, though tradition assigns it to Constantine the Great and Pope Sylvester. It was reorganized as a military order by Pius IX. in 1841. In 1905 the order was divided into three classes, and a separate order, that of the Golden Spur or Golden Legion (Militia Legio Aurea) was established, in one class, with the numbers limited to a hundred. The cross Pro Ecclesia et Pontifici, instituted by Leo XIII.
in 1888 is a decoration, not an order. There remains the venerable Order of the Holy Sepulchre, of which tradition assigns the foundation to Godfrey de Bouillon. It was, however, probably founded about a century later by King Edward the Sixth. In 1197 the right to nominate the order was shared with the pope as grand master by the guardian of the Pater Minores in Jerusalem, later by the Franciscans, and then by the Lateran, in 1523, by the pope. In any case, it is not a grand master, but the pope reserves the joint right of nomination. The badge of the order is a red Jerusalem cross with red Latin crosses in the angles.

—The Order of Christ was founded on the abolition of the Templars by Dionysius or Diniz of Portugal and in 1318 in conjunction with Pope John XXII, both having the right to nominate to the order and its three classes of knights. It was originally a secular order but was soon treated as a religious order and all was transferred by the Council of Trent in 1563 to the bishop of Braga. The badge of the order was a red cross on a red border, as illustrated in Plate IV, fig. 4. The Order of St Benedict of Nursia (earlier of Ewora), founded in 1126 as a religious order, was restored by Pius VII in 1799 as an order of military merit, in four classes.

The badge is green and gold.

The Order of St James of the Sword, or James of Compostella, is a branch of the Spanish order of that name (see under Spain). It was established in 1793, and in 1862 was constituted an order of merit for science, literature and art, in five classes. The badge is yellow-gilt with a red cross.

Rumania —The Order of the Star of Rumania was founded in 1877, and the Order of the Crown of Rumania in 1881, both in five classes, for civil and military merit; the ribbon of the first is red with blue borders, of the second light blue with two silver stripes.

Russia —The Order of St Andrew was founded in 1698 by Peter the Great. It is the chief order of the empire, and admission carries with it the title of Prince of Russia. The badge of the order is a red ribbon bearing a white and a red cross.

The Order of St Anne was founded in 1744 by Peter the Great in honour of the empress Catherine and the part she had taken in rescuing him at the battle of Parnawa in 1711. There are four classes, and the grand cross is for men of the imperial house and ladies of the highest nobility. The order was established in 1797. The badge of the order is a cross of diamonds bearing in a medallion the effigy of St Catherine. The ribbon is red with a blue border.

The Order of St Anne was founded in 1744 by Peter the Great. It is a Russian order in 1831; there is one class. The Order of St Anne was founded by Charles Frederick, duke of Holstein- Gottorp in 1735 in honour of his wife, Anna Petrovna, daughter of Peter the Great. It was adopted as a Russian order in 1797 by their grandson, the emperor Paul. There are four classes, and of St Stanislaus, founded originally as a Polish order by Stanislaus Leszczynski in 1701, there are three classes of the same order.

In 1798 by Peter the Great in honour of the empress Catherine II. in 1799 for military service on land and sea, with four classes; a fifth class for non-commissioned officers and men, the St George's Cross, was added in 1807. The badge is a white cross with a red crown, the symbol of St George slaying the dragon. The ribbon is orange with three black stripes.

Spain —The Order of the White Eagle, the principal order, was founded by Milan I. in 882, statutes 1883, in five classes; the ribbon is blue and red; the Order of St Sava, founded 1883, also in five classes, is blue and red. The Order of St Nicholas, founded 1522, in four classes, is blue and red. The Order of the Three Henrys, founded 1835, in four classes, is red. The Order of Merit and Naval Merit, 1866, and of Maria Christina, 1891; the Order of Beneficencia for civil merit, 1856; that of
INSIGNIA OF SOME OF THE PRINCIPAL ORDERS OF KNIGHTHOOD,
DRAWN BY GRACIOUS PERMISSION FROM THOSE IN THE POSSESSION OF HIS LATE MAJESTY KING EDWARD VII AND ARRANGED IN ACCORDANCE WITH HIS MAJESTY'S WISHES AND COMMAND.

Drawn by William Gibb.
Alfonso XII. for merit in science, literature and art, 1902, and the Civil Order of Alfonso XIII, 1902.

The Order of the Blue Ribbon (the "Blue Ribbon"). Tradition attributes the foundation of this most illustrious order of knighthood to Magnus I. in 1280, more certainty attaches to the fact that the order was forbiddingly prescribed by Pope Sixtus V. in 1586. In its modern form the order dates from its reconstitution on Plate V. fig. 6. A gold cross is suspended by alternate gold and red silken ribbons of alternate gold seraphim and blue enamelled patriarchal crosses. The motto is Jesus Hominum Salvator. The Order of the Sword (the "Blue Ribbon") was founded, it is said, by Gustavus I. Vasa, and the badge of the order is a double-headed eagle. The Order of the Sword of the Pole Star. There is a prelate of the order which is administered by a chapter; the chapter of the knights in the Riddar Holmskyrka at Stockholm. The badge and ribbon of the order is a blue ribbon with the figure of the crowned and draped king of Sweden, in coronet, standing on a shield charged with the head of a dragon, and below it, motto: 'Sverige van Blåa' (Sweden is blue). The order is said to have been founded by Frederick I., with the Seraphim and the Pole Star in 1748; modifications have been made in 1798, 1814 and 1889. There are five classes with subdivisions. The badge is a white cross, in the angles gold crowns, the points of the cross being joined by gold swords entwined with gold and blue belts. In the centre there is an upright sword with the three crowns in gold, the whole surmounted by the royal crown. The ribbon is yellow with blue edging. The Order of the Pole Star (Polar Star, North Star, the "Black Ribbon"), founded in 1748 for civil merit, has since 1844 three classes. The white ribbon is worked with silk of green, red and blue. The Order of Vasa (the "Green Ribbon"). Vasa, founded by Gustavus III., in 1772 as an order of merit for services rendered to the national industries and manufactures, has three classes. The ribbon is yellow with white edging. The centre is the charge of the house of Vasa, a gold sheaf shaped like a vase with two handles. The ribbon is green. The Order of Charles XIII., founded in 1811, is granted to Freemasons of high degree. It is a white ribbon, with a black border.

Turkey. The Nishan-i-Imtiyaz, or Order of Privilege, was founded by Abdul Hamid II. in 1879 as a general order of merit in one class; the badge has a black ribbon, founded 1831 by Mahmoud II.; the Nishan-i-Mejidi, the Mejidi Order, founded in 1851 by Abdul Medjid. There are three classes; the badge is a silver sun of seven points, red in the middle, surrounded by the word trilingual in Arabic: "Za'idat, Devotion, Loyalty;" the centre is the sultan's name in black Turkish lettering, surrounded by a red fillet inscribed with the words Za'idat, Devotion, Loyalty; it is suspended from a red crescent and star; the ribbon is red with green borders. The Khedive of Egypt has authority, delegated by the sultan, to grant this order. The Nishan-i-Osmanie, the Ottoman order, for civil and military merit, was founded by Abdul Aziz in 1862; it has four classes. The badge is a gold sun with seven gold-bordered green rays; the red centre bears the crescent, and it is also suspended from a gold crescent and star; the ribbon is green bordered with red. The Nishan-i-Scheffaid of Compassion or Benevolence, was instituted in 1869 by a circular plaque on a gold mount, a repetition of the work done for the non-combatant victims of the Russo-Turkish war of 1877 in connexion with the Turkish Compassionate Fund started by the late Baroness Burdett-Coutts. She was one of the first to acknowledge the value of the new "blue ribbon" orders. For noncombatant officers and princes, the Humdanli-Ali-Osman, founded in 1893, and the Ertogrul, in 1903.

No European Orders. Of the various states of Central and South America. Nicaragua has the American Order of San Juan or Grey Town, founded in 1857, in three classes; and Venezuela that of the East of Bahia, 1854, five classes; the ribbon is yellow, blue and red. Mexico has abolished its former orders, the Mexican Eagle, 1865, and Our Lady of Guadalupe, 1853; as has Brazil those of the Southern Cross, 1822, Dom Pedro I., 1826, the Rose, 1829, and the Brazilian branches of the Portuguese orders of Christ, St. Benedict of Ars and St. James. The republican Order of Columbus, founded in 1890, was abolished in 1891.

China. There are no orders for natives, and such distinctions as are made are of the colour of the porcupine's quills. The grades are indicated by the number of peacock's feathers, the gift of the yellow jacket and the like, are rather insignia of rank or personal marks of honour than orders, whether of knighthood or merit, in the European sense. Thebadge, that of the order of 1882 established the sole order, that of the Imperiale Double Dragon, in five classes, the first three of which are further divided into three grades each, making eleven grades in all. The recipients are entitled to the various grades of the first class for reigning sovereigns down to the fifth class for merchants and manufacturers. The insignia of the order are quite in shape and matter of explanation. The first class consists of a rectangular gold and yellow enamel plaque, decorated with two upright blue dragons, with details in green and white, between the heads for the first grade a pearl, for the second a ruby, for the third a sapphire, and the size of the plaque varies for the different classes. The badges of the other four classes are round plaques, the first three with indented edges, the last plain; in the second class the dragons are in silver on a yellow and gold ground, the jewel is a cut coral; the grades differ in the colour, shape, &c., of the borders and indentations; in the third class the dragons are gold on a silver ground, the jewel a lapis lazuli; in the fifth green dragons on a silver ground, the jewel a pearl. The badges, decorated with embroidered dragons, differ for the various grades, and the dragons are of silver for the sovereigns, of gold for the other grades.

Japan. The Japanese orders have all been instituted by the emperor Mutsu Hito. In design and workmanship the insignia of the Imperial Order of the Chrysanthemum, founded in 1877, has only one class. It is but rarely conferred on others than members of the royal house or foreign rulers or princes. The badge is a large chrysanthemum flower in enamel set in a gold wreath representing the sun issue 32 white gold-bordered rays in four sharply projecting groups, between the angles of which are four yellow conventional chrysanthemum flowers with green leaves and red stems. The wreath is suspended by a gold ribbon from a larger yellow chrysanthemum. The ribbon is red bordered with purple. The collar, which may be granted with the order or later, is composed of four members repeated, two gold chrysanthemums, one with green leaves, the other surrounded by a wreath of palm, and two elaborate arabesque designs. The Order of the Paulownia Sun (Tokeia Daisho), founded in 1888, in one class, may be in a sense regarded as the highest chivalric form. The Order of the Chrysanthemum (Kikujitsasho) founded in 1875. The badge of both orders is essentially the same, viz. the red sun with white and gold rays. The former the lilac flowers of the Paulownia tree, the latter the flower of the Tycoon. The Order of the Rising Sun (Kokujitsasho) founded in 1875. There is another class of the Order of the Mirror or Happy Sacred Treasure (Zoshikosho) was founded in 1888, with eight classes. The cross of white and gold clustered rays bears in a blue centre a silver star-shaped mirror. The badge is a white and orange medallion, alluding to the sun, the centre being that of the Crown, founded in five classes in 1888. The military order of Japan is the Order of the Golden Kite, founded in 1890, in seven classes. The badge is a diamond-shaped design; it consists of a star of purple, red, yellow, gold and silver rays, on which are displayed old Japanese weapons, banners and shields in various coloured enamels, the whole surmounted by a golden kite with outstretched wings.

The Conqueror, it is now held, divided the lay lands of Japan among his followers, to be held by the service of a fixed number of knights in his host, and imposed the same service on most of the great ecclesiastical bodies which retained their landed endowments. No record evidence exists of this action on his part, and the quota of knight-service exacted was not determined by the

Knight-service, the dominant and distinctive tenure of land under the feudal system. It is associated in its origin with that development in warfare which made the mailed horseman, armed with lance and sword, the most important factor in battle. Till within recent years it was believed that knight-service was developed out of the liability, under the English system, of every five hides to provide one soldier in war. It is now held that, on the contrary, it was a novel system which was introduced after the Conquest by the Normans, who relied essentially on their mounted knights, while the English fought on foot. They were already familiar with the principle of knight-service, the knight's fee, as it came to be termed in England, being represented in feudal law by the feu du hauert, so termed from the hauberck or coat of mail (lorica) which was worn by the knight. Allusion is made to this in the coronation charter of Henry I. (1100), which speaks of those holding by knight-service as militias qui per loricae terras suas deserviunt.

The Conqueror, it is now held, divided the lay lands of his followers, to be held by the service of a fixed number of knights in his host, and imposed the same service on most of the great ecclesiastical bodies which retained their landed endowments. No record evidence exists of this action on his part, and the quota of knight-service exacted was not determined by the
area or value of the lands granted (or retained), but was based upon the unit of the feudal host, the constableship of ten knights. Groat, his tenants-in-chief or barons (i.e. those who held directly of the crown), the principal were called on to find one or more of these units, while of the lesser ones some were called on for five knights, that is, half a constableship. The same system was adopted in Ireland when that country was conquered under Henry II. The baron who had been enfeoffed by his sovereign on these terms could provide the knights required either by hiring them for pay or, more conveniently when wealth was mainly represented by land, by a process of subinfeoffment, analogous to that by which he himself had been enfeoffed. That is to say, he could assign to an under-tenant a certain portion of his fief to be in the service of five knights. The land so held would then be described as consisting of one or more knights' fees, but the knight's fee had not, as was formerly supposed, any fixed area. This process could be carried farther till there was a chain of mesne lords between the tenant-in-chief and the actual holder of the land; but the liability for performance of the knight-service was always carefully defined.

The primary obligation incumbent on every knight was service in the field, when called upon, for forty days a year, with specified arms and armour. There was, however, a standing dispute as to the number of knights sworn to be called (half, a third, or an eighth of the whole realm, as the case might be). In this respect, there was the question of his expenses free from difficulty. In addition to this primary duty he had, in numerous cases at least, to perform that of "castle ward" at his lord's chief castle for a fixed number of days in the year. On certain baronies also was incumbent the duty of providing knights for the guard of royal cities, such as Windsor, Rockingham and Dover. Under the feudal system the tenant by knight-service had also the same pecuniary obligations to his lord as had his lord to the king. These consisted of (1) "relief," which he paid on the death of his lord; (2) "wardship," that is, the profits from his lands during a minority; (3) "marriage," that is, the right of giving in marriage, unless bought off, his heir, his heir (if a minor) and his widow; and also of the three " aids" (see Aids).

The chief sources of information for the extent and development of the knight-service are the returns (cartae) of the barons (i.e. the tenants-in-chief) in 1166, informing the king, at his request, of the names of their tenants by knight-service with the number of fees they held, supplemented by the payments for "scutage" (see Scutage) rendered on the pipe rolls, by the later returns printed in the Testa de Nevill, and by the still later ones collected in Feudal Aids. In the returns made in 1166 some of the barons appear as having enfeoffed more and some less than the number of knights they had to find. In the latter case they described the balance as being chargeable on their "desmesne," that is, on the portion of their fief which remained in their own hands. These returns further prove that lands had already been granted for the service of a fraction of a knight, such service being in practice already commuted for a proportionate money payment; and they show that the total number of knights with which land held by military service was charged was not, as formerly supposed, sixty thousand, but, probably, somewhere between five and six thousand. Similar returns were made for Normandy, and are valuable for the light they throw on its system of knight-service.

The principle of commuting for money the obligation of military service was a step at the root of the whole system, and so complete was the change of conception that "tenure by knight-service of a mesne lord becomes, in fact and then in law, tenure by escuage (i.e. scutage)." By the time of Henry III., as in later states, the test of tenure was scutage; liability, however small, to scutage payment made the tenure military.

The disintegration of the system was carried farther in the latter half of the 13th century as a consequence of changes in warfare, which were increasing the importance of foot soldiers and making the service of a knight for forty days of less value to the king. The barons, instead of paying scutage, compounded for their service by the payment of lump sums, and, by a process which is still obscure, the nominal quotas of knight-service due from each had, by the time of Edward I., had been largely reduced. The knight's fee, however, remained a knight's fee, and the pecuniary incidents of military tenure, especially wardship, marriage, and fines on alienation, long continued to be a source of revenue to the crown. But at the Restoration (1660) tenure by knight-service was abolished by law (12 Car. II. c. 24), and with it these vexatious exactions were abolished.

BIBLIOGRAPHY.—The returns of 1166 are preserved in the Liber Niger (13th cent.), edited by Hearne, and the Liber Rubus or Red Book of the Exchequer (13th cent.), edited by H. Hall for the Rolls Series in 1896. The later returns are in Testa de Nevill (Record Commission, 1807) and in the Record Office volumes of Feudal Aids, arranged under counties. For the financial side of knight-service the reader is referred to the paper on "The Pipe Roll" by Mr. H. P. Morton in the Pipe Roll Society, and abstracts of later ones will be found in The Red Book of the Exchequer, which may be studied on the whole question by any editor's view must be received with caution and treated by J. H. Round's Studies on the Red Book of the Exchequer (for private circulation). The Baronia Anglica de Madox may also be consulted. The existing theory on knight-service was enunciated by J. P. Collier in his Feudal England (1895). It is accepted by Pollock and Maitland (History of English Law, who discuss the question at length; by Mr. J. B. Baldwin in his Scutage and Knight-service in 15th-century England (Manchester University Press, 1911) with bibliography; and by Petit-Dutaillis, in his Studies supplementary to Stubbs' Constitutional History (Manchester University Series, 1918).

KNIGHTS OF THE GOLDEN CIRCLE, a semi-military secret society in the United States in the Middle West, 1851-1864, the purpose of which was to bring the Civil War to a close and restore the Union as it stood in 1860. The first of its kind before the Civil War there was a Democratic secret organization of the same name, with its principal membership in the Southern States. After the outbreak of the Civil War many of the Democrats of the Middle West, who were opposed to the war policy of the Republicans, organized the Knights of the Golden Circle, a society to devote its efforts to prevent the Union from falling into the hands of the South. The total membership of this order probably reached 250,000 to 300,000, principally in Ohio, Illinois, Iowa, Wisconsin, Kentucky, and southern Pennsylvania. Fernando Wood of New York seems to have been the chief officer and in 1864 Clement L. Vallandigham became the second in command. The great importance of the Knights of the Golden Circle and its successors was due to its opposition to the war policy of the Republican administration. The plan was to overthrow the Lincoln government in the elections and give to the Democrats the control of the state and Federal governments, which would then make peace and invite the Southern States to come back into the Union on the old footing. In order to obstruct and embarrass the Republican administration the members of the order held peace meetings to incite public opinion against the continuance of the war; purchased arms to be used in uprisings, which were to place the peace party in control of the Federal government, or failing in that to establish a north-western confederacy; and took measures to set free the Confederate prisoners in the north and bring the war to a forced close. All these plans failed at the critical moment, and the most effective work done by the order was in encouraging desertion from the Federal armies, preventing enlistments, and resisting the draft. Wholesale arrests of leaders and numerous seizures of arms by the United States authorities resulted in the general collapse of the order late in 1864. Three of the leaders were sentenced to death by military commissions, but sentence was suspended until 1866, when they were released under the decision of the United States Supreme Court in the famous case Ex parte Milligan.

KNIPPERDOLLINGK (or KNIPPERDOLING), BERNT (BEREND or BERNHARDT) (c. 1400–1536), German divine, was a prosperous cloth-merchant at Münster when in 1524 he joined Melchior Röck and Melchior Hofman in a business journey to Stockholm, which developed into an abortive religious errand. Knipperdollingk, a man of fine presence and glib tongue, noted from his youth for eccentricity, had the ear of the Münster populace when in 1527 he helped to break the prison of Tonnes Kruse, in the teeth of the bishop and the civic authorities. For this he made his peace with the latter; but, venturing on another business journey, he was arrested, imprisoned for a year, and released on condition of payment of which he began an action before the Imperial Chamber. Though his aims were political rather than religious, he attached himself to the reforming movement of Bernhardt Rothmann, once (1529) chaplain of St Mauritz, outside Münster, now (1532) pastor of the city church of St Lamberti. A new bishop directed a mandate (April 17, 1532) against Rothmann, which had the effect of alienating the moderates in Münster from the democrats. Knipperdollingk was a leader of the latter in the surprise (December 26, 1532) which made prisoners of the negotiating nobles at Telgast, in the terms of which treatment he was by charter of Philip of Hesse (February 14, 1533) constituted an evangelical city. Knipperdollingk was made a burgomaster in February 1534. Anabaptism had already (September 8, 1533) been proclaimed at Münster by a journeyman smith; and, before this, Heinrich Roll, a refugee, had brought Rothmann (May 1533) to a rejection of infant baptism. From the 1st of January 1534 Roll preached Anabaptist doctrines in a city pulpit; a few days later, two Dutch emissaries of Jan Matthysz, or Matthyszen, the master-baker and Anabaptist prophet of Haarlem, came on a mission to Münster. They were followed (January 13) by Jan Beukels (or Bockelsoon, or Buchholdt), better known as John of Leiden. It was his second visit to Münster; he came now as an apostle of Matthysz. He was twenty-five, with a winning personality, great gifts as an organizer, and plenty of ambition. Knipperdollingk, whose daughter Clara was ultimately enrolled among the wives of John of Leiden, came under his influence. Matthysz himself came to Münster (1534) and lived in Knipperdollingk’s house, which became the centre of the new movement to substitute Münster for Strassburg (Melchior Hofmann’s choice) as the New Jerusalem. On the death of Melchior Telgast, in the terms of which treatment he was made supreme, Knipperdollingk, with one attempt at revolt, when he claimed the kingship for himself, was his subservient henchman, wheedling the Münster democracy into subjection to the fantastic rule of the “king of the earth.” He was made second in command, and executioner of the refractory. He fell in with the polygamy innovation, the protest of his wife being visited with a penance. In the military measures for resisting the siege of Münster he took no leading part. On the fall of the city (June 25, 1535) he hid in a dwelling in the city wall, but was betrayed by his landlady. After six months’ incarceration, his trial, along with his comrades, took place on the 19th of January, and his execution, with fearful tortures, on the 22nd of January 1536. Knipperdollingk attempted to strangle himself, but was forced to endure the worst. His body, like those of the others, was hung in a cage on the tower of St Lamberti, where the cages are still to be seen. An alleged portrait, from an engraving of 1607, is reproduced in the appendix to A. Ross’s Fanebeln, 1635.

See L. Keller, Geschichte der Wiedertäuferei und ihres Reichs zu Münster (1889); C. A. Cornelius, Historische Arbeiten, ii. p. 765 (1853). (A. Go.)

KNITTING (from O. Fr. cyster, to knit; cf. Ger. Knüten; the root is seen in “knot”), the art of forming a single thread or strand of yarn into a texture or fabric of a loop structure, by employing needles or wires. “Crochet” work is an analogous art in its simplest form. It consists of forming a single thread into a single chain of loops. All warp knit fabrics are built on this structure. Knitting may be said to be divided into two principles, viz. (1) hand knitting and (2) frame-work knitting (see HOSIERY). In hand knitting, the wires, pins or needles used are of different lengths or gauges, according to the class of work wanted to be produced. They are made of steel, bone, wood or ivory. Some are headed to prevent the loops from slipping over the ends. Flat or selvedge work can only be produced on them. Others are pointed at both ends, and by employing three or more a circular or circular-shaped fabric can be made. In hand knitting each loop is formed and thrown off individually and in rotation and is left hanging on the new loop formed. The cotton, wool and silk fibres are the principal materials from which knitting yarns and wool have been the most important and largely used. “Lamb’s-wool,” “wheeling,” “finger ing” and worsted yarns are all produced from the wool fibre, but may differ in size or fineness and quality. Those yarns are largely used in the production of knitted underwear. Hand knitting is to-day principally practised as a domestic art, but in some of the remote parts of Scotland and Ireland it is prosecuted as an industry to some extent. In the Shetland Islands the wool of the native sheep is spun, and used in its natural colour, being manufactured into shawls, scarfs, ladies’ jackets, &c. The principal trade of other districts is hose and half-hose, made from the wool of British sheep and from sterilized sheep’s wool. The knitter of old made no provision for the stitches in knitting may be varied in a great many ways, by “purling” (knitting or throwing loops to back and front in rib form), “slipping” loops, taking up and casting off and working in various coloured yarns to form stripes, patterns, &c. The articles may be shaped according to the manner in which the wires and yarns are manipulated.

KNOBKERRIE (from the Taal or South African Dutch, knop- kirle, derived from Du. knop, a knob or button, and kerrie, a Bushman or Hottentot word for stick), a strong, short stick with a rounded knob or head used by the natives of South Africa in warfare and the chase. It is employed at close quarters, or as a missile, and in time of peace serves as a walking-stick. The name has been extended to similar weapons used by the natives of Australia, the Pacific islands, and other places.

KNOLLES, RICHARD (c. 1545–1610), English historian, was a native of Northamptonshire, and was educated at Lincoln College, Oxford. He became a fellow of his college, and at some date subsequent to 1571 left Oxford to become master of a school at Sandwich, Kent, where he died in 1610. In 1603 Knolles published his Generall Historie of the Turkes, of which several editions subsequently appeared, accompanied by Sir Paul Rycart (1700), who brought the history down to 1609. It was dedicated to King James I., and Knolles availed himself largely of Jean Jacques Boissard’s Vitae et Itineres Subiani Turcici (Frankfort, 1596). Although now entirely superseded, it has considerable merits as regards style and arrangement. Knolles published a translation of J. Bodin’s De République in 1606, but the Grammatica Latina, Graeca et Hebraica, attributed to him by Anthony Wood and others, is the work of the Rev. Hanserd Knolles (c. 1599–1691), a Baptist minister.

See the Athenaeum, August 6, 1881.

KNOLLES (or KNOLLYS), SIR ROBERT (c. 1345–1407), English soldier, belonged to a Cheshire family. In early life he served in Brittany, and he was one of the English survivors who were taken prisoners by the French after the famous “combat of the thirty” in March 1351. He was, however, quickly released and was among the soldiers of fortune who took advantage of the distracted state of Brittany, at this time the scene of a savage civil war, to win fame and wealth at the expense of the wretched inhabitants. After a time he transferred his operations to Normandy, where he served under the allied standards of England and of Charles II. of Navarre. He led the “great company” in their work of devastation along the valley of the Loire, fighting at this time for his own hand and for booty, and winning a terrible reputation by his ravages. After the conclusion of the treaty of Brétigny in 1360 Knolles returned to Brittany and took part in the struggle for the possession of the duchy between John of Montfort (Duke John IV.) and Charles of Blois, gaining great fame by his conduct in the fight at Auray (September 1364), where
Du Guesclin was captured and Charles of Blois was slain. In 1367 he marched with the Black Prince into Spain and fought at the battle of Nájera; in 1369 he was with the prince in Aquitaine. In 1370 he was placed by Edward III. at the head of an expedition which invaded France and marched on Paris, but after exacting large sums of money as a ransom for the prince's life, he marched back to England. He determined to make a fortune at the temple and the Black Prince forced him to leave the castle of Derval and to appease the disappointed English king with a large monetary gift. Emerging from his retreat Knollys again assisted John of Montfort in Brittany, where he acted as John's representative; later he led a force into Aquitaine, and he was one of the leaders of the fleet sent against the Spaniards in 1377. In 1380 he served in France under Thomas of Woodstock, afterwards duke of Gloucester, distinguishing himself by his valour at the siege of Nantes; and in 1381 he went with Richard II. to meet Wat Tyler at Smithfield. He died at Sculthorpe in Norfolk on the 15th of August 1387. Sir Robert devoted much of his great wealth to charitable objects. He built a college and an almshouse at Pontefract, his wife's birthplace, where the almshouse still exists; he restored the churches of Sculthorpe and Harpley; and he helped to found an English hospital in Rome. Knollys won an immense reputation by his skill and valour in the field, and ranks as one of the foremost captains of his age. French writers call him Canoles, or Canole.

**Knollys**, the name of an English family descended from Sir Thomas Knollys (d. 1435), lord mayor of London. The first distinguished member of the family was Sir Francis Knollys (c. 1514-1596), English statesman, son of Robert Knollys, or Knolles (d. 1521), a courtier in the service and favour of Henry VII. and Henry VIII. Robert had also a younger son, Henry, who took part in public life during the reign of Elizabeth and who died in 1583.

Francis Knollys, who entered the service of Henry VIII. before 1540, became a member of parliament in 1543 and was knighted in 1547 while serving with the English army in Scotland. A strong and somewhat aggressive supporter of the reformed doctrines, he retired to Germany soon after Mary became queen, returning to England to become a privy councillor, vice-chamberlain of the royal household and a member of parliament under Queen Elizabeth, whose cousin Catherine (d. 1596), daughter of William Carey and niece of Anne Boleyn, was his wife. After serving as governor of Plymouth, Knollys was sent in 1556 to Ireland, his mission being to obtain for the queen confidential reports about the conduct of the lord-deputy Sir Henry Sidney. Approving of Sidney's actions he came back to England, and in 1568 he was sent to Carlisle to take charge of Mary Queen of Scots, who had just fled from Scotland; afterwards he was in charge of the queen's wards in England and discussed religious questions with his prisoner, although the extreme Protestant views which he put before her did not meet with Elizabeth's approval, and he gave up the position of guardian just after his wife's death in January 1569. In 1574 he entered into the House of Commons, where since 1572 he had represented Oxfordshire, the bill legalizing the national association for Elizabeth's defence, and he was treasurer of the royal household from 1572 until his death on the 10th of July 1596. His monument may still be seen in the church of Rotherfield Greys, Oxfordshire, where he was regularly a March tree and frank in his objections to Elizabeth's tortuous foreign policy; but, possibly owing to his relationship to the queen, he did not lose her favour, and he was one of her commissioners on such important occasions as the trials of Mary Queen of Scots, of Philip Howard earl of Arundel, and of Anthony Babington. An active and lifelong Puritan, his attacks on the bishops were not lacking in vigour, and he was also very hostile to heretics. He received many grants of land from the queen, and was chief steward of the city of Oxford and a knight of the garter.

Sir Francis's eldest son was Francis Knollys (d. 1583), and his sons Edward (d. c. 1580), Robert (d. 1625), Richard (d. 1606), Francis (d. c. 1648), and Thomas, were all courtiers and served the queen in parliament or in the field. His daughter Lettice (1540-1634) married Walter Devereux, earl of Essex, and then Robert Dudley, earl of Leicester; she was the mother of Elizabeth's favourite, the 2nd earl of Essex.

Some of Knollys's letters are in *T. Wright's Queen Elizabeth and her Times* (1838) and the *Burghead Papers*, edited by S. Haynes (1740); and a few of his manuscripts are still extant. A speech which Knollys delivered in parliament against some claims made by the bishops was printed in 1608 and again in *W. Stoughton's Assertion for True and Christian Church Policie* (London, 1643).

Sir Francis Knollys's second son William (c. 1547-1632), served as a member of parliament and a soldier during the reign of Queen Elizabeth, being knighted in 1586. His eldest brother Henry, having died without sons in 1583, William inherited his father's estates in Oxfordshire, becoming in 1596 a privy councillor and comptroller of the royal household; in 1602 he was made treasurer of the household. Sir William enjoyed the favour of the new king James I., who in 1603 had visited in Scotland in 1595, and was made Baron Knollys in 1606. His reign of a year and a half, and his relative, and it is unlikely that he could have been a more active or popular political figure. Knollys's house at Banbury was destroyed by fire in 1612, and he was deprived of his parliamentary seat in 1616. But in this latter year his fortunes suffered a temporary reverse. Through his second wife Elizabeth (1586-1638), daughter of Thomas Howard, earl of Suffolk, Knollys was connected with Frances, countess of Somerset, and when this lady was tried for the murder of Sir Thomas Overbury her relatives were regarded with suspicion; consequently Lord Wallingford resigned the treasurership of the household and two years later the mastership of the court of wards, an office which he had held since 1614. However, he regained the royal favour, and was created earl of Banbury in 1622, and again in 1623, and lord high treasurer of England in 1625.

His wife, who was nearly forty years her husband's junior, was the mother of two sons, Edward (1627-1645) and Nicholas (1631-1874), whose paternity has given rise to much dispute. Neither is mentioned in the earl's will, but in 1641 the law courts decided that Edward was earl of Banbury, and when he was killed in June 1645 his brother Nicholas took the title. In the Convention Parliament of 1660 some objection was taken to the earl sitting in the House of Lords, and in 1661 he was not summoned to parliament; he had not succeeded in obtaining his writ of summons when he died on the 4th of March 1674.

Nicholas's son Charles (1662-1740), who had not been summoned to parliament when in 1692 he killed Captain Philip Lawson in a duel. This raised the question of his rank in a new form. Was he, or was he not, entitled to trial by the peers? The House of Lords declared that he was not a peer and therefore not so entitled, but the court of king's bench released him from his imprisonment on the ground that he was the earl of Banbury and not Charles Knollys a commoner. Nevertheless the House of Lords refused to move from its position, and Knollys had not received a writ of summons when he died in April 1740. His son Henry (1702-1761), vicar of Burford, Oxfordshire, and his grandsons, William (1726-1776) and Thomas (1777-1818), were successively titular earls of Banbury, but they took no steps to prove their title. However, in 1866 Thomas Woodson's son William (1763-1824), who attained the rank of general in the British army, asked for a writ of summons as earl of Banbury, but in 1813 the House of Lords decided against the claim. Several peers, including the great Lord Erskine, protested against this decision, but General Knollys himself accepted it and ceased to call himself earl of Banbury. He died in Paris on the 20th of March 1834. His eldest son, Sir William Thomas Knollys (1797-1883), entered the army and served with the Guards during the Peninsular War. Remaining in the army after the conclusion of the peace of 1815 he won a good reputation and rose high in his profession. From 1855 to 1860 he was in charge of the military camp at Aldershot, then in its infancy, and in 1861 he was made president of the council of military education. From 1862 to 1877 he was commissary of the household of the prince of Wales, afterwards King Edward VII. From 1877 until his death on the 23rd of June 1883 he was gentleman usher of the black rod; he was also a privy councillor and colonel of the Scots Guards. His son Francis (b. 1857), private secretary to Edward VII. and George V., was created Baron Knollys in 1902; another son, Sir Henry Knollys (b. 1840), became private secretary to King Edward's daughter Maud, queen of Norway.
KNOT

See Sir N. H. Nicolas, Treatise on the Law of Adulterine Bastardy (1833); and G. E. C. (Okayne), Complete Peerage (1887), vol. i.

KNOT, a Limicoline bird very abundant at certain seasons on the shores of Britain and many countries of the northern hemisphere. Camden in the edition of his Britannia published in 1607 (p. 408) inserted a passage not found in the earlier issues of that work, connecting the name with that of King Canute, and this account of its origin has been usually received. But no other evidence in its favour is forthcoming, and Camden's statement is merely the expression of an opinion, so that there is no certain reason for believing him to have been mistaken, and that the value afforded by Sir Thomas Browne, who (c. 1672) wrote the name "Gnatts or Knots," may be the true one.a Still the statement was so determinedly repeated by successive authors that Linnaeus followed them in calling the species Tringa canusus, and so it remains with nearly all modern ornithologists.b Rather larger than a snipe, but with a shorter bill and legs, the knot visits the coasts of some parts of Europe, Asia and North America at times in vast flocks; and, though in temperate climates a good many remain throughout the winter, these are nothing in proportion to those that arrive toward the end of spring, in England generally about the 1st of May, and after staying a few days pass northward to their summer quarters, while early in autumn the young of the year throng to the same places in still greater numbers, being followed a little later by their parents. In winter the plumage is ash-grey above (save the rump, which is white) and white beneath. In summer the feathers of the back are black, broadly margined with light orange-red, mixed with white, those of the rump white, more or less tinged with red, and the lower parts are of a nearly uniform deep bay or chestnut. The birds which winter in temperate climates seldom attain the brilliancy of colour exhibited by those which arrive from the south; the luxuriance generated by the heat of a tropical sun seems needed to develop the full richness of hue. The young when they come from their birthplace are clothed in ash-grey above, each feather banded with dull black and ochreous, while the breast is more or less deeply tinged with warm buff. Much curiosity has long existed among zoologists as to the egg of the knot, of which not a single identified or authenticated specimen is known to exist in collections. The species was found breeding abundantly on the North Georgian (now commonly called the Party) Islands by Parry's Arctic expedition as soon as seen on Melville Peninsula by Captain Lyons, and again during the voyage of Sir George Nares on the northern coast of Grinnell Land and the shores of Smith Sound, where Major Fildes obtained examples of the newly hatched young (Ibis, 1877, p. 407), and observed that the parents fed largely on the buds of Saxifraga oppositifolia. These are the only localities in which this species is known to breed, for on none of the arctic lands lying to the north of Europe or Asia has it been unquestionably observed.c In winter its wanderings are very extensive, as it is recorded from Surinam, Brazil, Walhach Bay in South Africa, China, Queensland and New Zealand. Formerly this species was extensively netted in England, and the birds fattened for the table, where they were esteemed a great delicacy, as witness the entries in the Northumberland and Le Strange Household Books; and the British Museum contains an old treatise on the subject: "The maner of kepyng of knots, after Sir William Askew and my Lady, given to my Lord Darcy, 25 Hen. VIII." (MSS. Sloane, 1592, 8 cat. 663). (A. N.)

KNOT (O. E. cnotta, from a Teutonic stem knuit; cf. "knot," and Ger. knoten), an intertwined loop of rope, cord, string or other flexible material, used to fasten two such ropes, &c., to one another, or to another object. (For the various forms which such "knots" may take see below.) The word is also used to refer to the distance-mark on a log-line, and hence as the equivalent of a nautical mile (see Loc), and for any hard mass, resembling a knot drawn tight, especially one formed in the trunk of a tree at the place of insertion of a branch. Knots in wood are the remains of dead branches which have become buried in the wood of the trunk or branch on which they were borne. When a branch dies down or is broken off, the dead stump becomes grown over by a healing tissue, and, as the stem which bears it increases in thickness, gradually buried in the newer wood. When a section is made of the stem the dead stump appears in the section as a knot; thus in a board it forms a circular piece of wood, liable to be split out and leave a "knot-hole." "Knot" or "knoob" is an architectural term for a bunch of flowers, leaves or ornamentation carved on a corbel or on a boss. The word is also applied figuratively to any intricate problem, hard to disentangle, a use stereotyped in the proverbial "Gordian knot," which, according to the tradition, was cut by Alexander the Great (see GORDIUM).

Knots, Bends, Hitches, Splices and Seizings are all ways of fastening cords or ropes, either to some other object such as a spar, or a ring, or to one another. The "knot" is formed to make a knob on a rope, generally at the extremity, and by untwisting the strands at the end and weaving them together. But it may be made by turning the rope on itself through a loop, as for instance, the "overhand knot" (fig. 1). A "bend" (from the same root as "bind"), and a "hitch" (an O. E. word), are ways of fastening or tying ropes together, as in the "Carick bend" (fig. 21), or round spars as the Studding Sail Halyard Bend (fig. 19), and the timber Hitch (fig. 20). A "splice"

---

a

FIG. 1.

b

FIG. 2.

---

(c from the same root as "split") is made by untwisting two rope ends and weaving them together. A "seizing" (Fr. saisir) is made by fastening two spars to one another by a rope, or two ropes by a third, or by using one rope to make a loop on another —as for example the Rucking Seizing (fig. 41), the Round Seizing (fig. 40), and the Midshipman's Hitch (fig. 20). The use of the words is often arbitrary. There is, for instance, no difference in principle between the Fisherman's Bend (fig. 18) and the Timber Hitch (fig. 20). Speaking generally, the Knot and the Seizing are meant to be permanent, and must be unwoven in order to be fastened, while the Bend and Hitch can be undone at once by pulling the ropes in the reverse direction from that in which they are meant to hold. Yet the Rcef Knot (figs. 3 and 4) can be cast loose with ease, and is wholly different in principle, for instance, from the Diamond Knot (figs. 42 and 43). These various forms of fastening are employed in many kinds of industry, as for example in scaffolding, as well as in seamanship. The general principle is that the strain which pulls against them shall draw them tighter. The ordinary "knots and splices" are described in every book on seamanship.

Overhand Knot (fig. 1).—Used at the end of ropes to prevent their unreeling and as the commencement of other knots. Take the end a round the end b.
**Figure-of-Eight Knot (fig. 2).**—Used only to prevent ropes from unreeving; it forms a large knot.

**Reef Knot (figs. 3, 4).**—Form an overhand knot as above. Then take the end a over the end b and through the bight. If the end a were taken under the end b, a *granny* would be formed. This knot is named from being used in tying the reef-points of a sail.

**Bowline (figs. 5–7).**—Lay the end a of a rope over the standing part b. Form with b a bight c over a. Take a round behind b and down through the bight c. This is a most useful knot employed to form a loop which will not slip. *Running bowlines* are formed by making a bowline round its own standing part above b. It is the most common and convenient temporary running noose.

**Bowline on a Bight (figs. 8, 9).**—The first part is made similar to the above with the double part of the rope; then the bight a is pulled through sufficiently to allow it to be bent over past d and come up in the position shown in fig. 9. It makes a more comfortable slinging for a man than a single bight.

**Half-Hitch (fig. 10).**—Pass the end e of the rope round the standing part b and through the bight.

**Two Half-Hitches** (fig. 11).—The half-hitch repeated; this is commonly used, and is capable of resisting to the full strength of the rope. A stop from a to the standing part will prevent it jamming.

**Clove Hitch** (figs. 12, 13).—Pass the end a round a spar and cross it over b. Pass it round the spar again and put the end a through the second bight.

**Blackwall Hitch** (fig. 14).—Form a bight at the end of a rope, and put the hook of a tackle through the bight so that the end of the rope may be jammed between the standing part and the back of the hook.

**Double Blackwall Hitch** (fig. 15).—Pass the end a twice round the hook and under the standing part b at the last cross.

**Cat's-paw** (fig. 16).—Twist up two parts of a lanyard in opposite directions and hook the tackle in the eyes i, i. A piece of wood should be placed between the parts at g. A large lanyard should be clove-hitched round a large toggle and a strap passed round it below the toggle.

**Marling-spike Hitch** (fig. 17).—Lay the end a over c; fold the loop over on the standing part b; then pass the marline-spike through, over both parts of the bight and under the part b. Used for tightening each turn of a seizing.

**Fisherman's Bend** (fig. 18).—Take two turns round a spar, then a half-hitch round the standing part and between the spar and the turns, last a half-hitch round the standing part.

**Studding-sail Halyard Bend** (fig. 19).—Similar to the above, except that the end is tucked under the first round turn; this is more snug. A *magnus hitch* has two round turns and one on the other side of the standing part with the end through the bight.

**Timber Hitch** (fig. 20).—Take the end a of a rope round a spar, then round the standing part b, then several times round its own part c, against the lay of the rope.

**Carrick Bend** (fig. 21).—Lay the end of one hawser over its own part to form a bight as a, b; pass the end of another hawser up through that bight, a, b, going out over the first end at c, crossing under the first long part and over its end at d, then under both long parts, forming the loops, and above the first short part at b, terminating at the end e, in the opposite direction vertically and horizontally to the other end. The ends should be securely stopped to their respective standing parts, and also a stop put on the becket or extreme end to prevent it catching a pipe or chock; in that form this is the best quick means of uniting two large hawsers, since they cannot jam. When large hawsers have to work through small pipes, good security may be obtained either by passing ten or twelve taut tacking turns with a suitable strand and securing each end to a standing part of the hawser, or by taking half as many round turns taut, crossing the ends between the hawsers over the seizing and reef-knotting the ends. This should be repeated in three places and the extreme ends well stopped. Connecting hawsers by bowline knots is very objectionable, as the bend is large and the knots jam.

**Sheet Bend** (fig. 22).—Pass the end of one rope through the bight of another, round both parts of the other, and under its own standing part. Used for bending small sheets to the clews of sails, which present bights ready for the hitch. An ordinary net is composed of a series of sheet bends. A *wooler's knot* is made like a sheet bend.

**Single Wall Knot** (fig. 23).—Unlay the end of a rope, and with the strand a form a bight. Take the next strand b round the end of a.
Take the last strand $c$ round the end of $b$ and through the bight made by $a$. Haul the ends taut.

**FIG. 22. Double Wall and Double Crown** (fig. 22).—Form a single wall, and lay one of the ends, $a$, over the knot. Lay $b$ over $a$, and $c$ over $b$ and through the bight of $a$. Haul the ends taut.

**FIG. 23.**

**FIG. 24.**

Two ends with the part which goes round the mast-head. Used to sling lower yards. For boat's yards it should be a grummet with a thimble formed in it. If the tendency of all yards is to cant forward with the weight of the sail, the part marked by an arrow should be the fore-side easily illustrated by a round ruler and a piece of twine.

**Spirit-Sail Sheet Knot** (fig. 33).—This knot consists of a double wall and double crown made by the two ends, consequently with six strands, with the ends turned down. Used formerly in the cloths of sails, and as an excellent stopper or lash for shackle being placed at $s$ and a lanyard round the head at $l$.

**Turning in a Dead-Man Cutter-Stay fashion** (fig. 34).—A bend is made in the stay or shroud round its own part and hove together with a bar and strand; two or three seizings diminishing in size (one round and one or two either round or flat) are hove on taut and snug, the end being at the side of the fellow part. The dead-eye is put in and the eye driven down with a commander.

**Fig. 25.**

**Fig. 26.**

**Fig. 27.**

**Fig. 28.**

If the eye were formed outside the bight an outside clinch would be made, depending entirely on the seizings, but more ready for slipping.

**Midshipman's Hitch** (fig. 29).—Take two round turns inside the bight, the same as a half-hitch repeated; stop up the end or let another half-hitch be taken or held by hand. Used for hooking a tackle for a temporary purpose.

**FIG. 29.**

**FIG. 30.**

**FIG. 31.**

**FIG. 32.**

With fine line (very dry) make a clove hitch round the rope; cross the bights twice, passing an end the reverse way (up or down) each time; then keeping the whole spread flat, let each end follow its own part round and round till it is too tight to receive any more. Used as an ornament variously on side-ropes and foot-ropes of jibbooms. It may also be made with three ends, two formed by the same piece of line secured through the rope and one single piece. Form with a diamond knot; then each end crossed over its neighbour follows its own part as above.

**Spanish Windlass** (fig. 31).—An iron bar and two marling-splices are taken; two parts of a seizing are twisted like a cat's-paw (fig. 16), passed round the bar, and bight round till sufficiently taut. In leaving shrouds together to form an eye two round turns are taken with a strand and the two ends hove upon. When a lever is placed between the parts of a long lashing or frapping and hove round, we have what is also called a Spanish windlass.

**Slings** (fig. 32).—This is simply the bight of a rope turned up over its own part; it is frequently made of chain, when a shackle (bow up) takes the place of the bight at $a$ and another at $y$, connecting the

two ends with the part which goes round the mast-head. Used to sling lower yards. For boat's yards it should be a grummet with a thimble formed in it. If the tendency of all yards is to cant forward with the weight of the sail, the part marked by an arrow should be the fore-side easily illustrated by a round ruler and a piece of twine.

**Spirt-Sail Sheet Knot** (fig. 33).—This knot consists of a double wall and double crown made by the two ends, consequently with six strands, with the ends turned down. Used formerly in the cloths of sails, and as an excellent stopper or lash for shackle being placed at $s$ and a lanyard round the head at $l$.

**Turning in a Dead-Man Cutter-Stay fashion** (fig. 34).—A bend is made in the stay or shroud round its own part and hove together with a bar and strand; two or three seizings diminishing in size (one round and one or two either round or flat) are hove on taut and snug, the end being at the side of the fellow part. The dead-eye is put in and the eye driven down with a commander.
KNOT

the vacant space with the corresponding strand of the other part, fitting it firmly into the rope till only a few inches remain. Treat the other side in a similar manner. There will then appear two long strands in the centre and a long and a short one on each side. The splice is practically divided into two distinct parts. If the strands are divided and the corresponding halves knotted (as shown on the top of fig. 38) and turned in twice. The half strand may, if desired, be still further reduced before the halves are turned in for the second time. This will make the splice be more firmly hammered into shape before the ends are cut off. The long splice alone is adapted to running ropes.

Shroud Knot (fig. 37).—Pass a stop at such distance from each end of the broken shroud as to afford sufficient length of strands, when it is unlaid, to form a single wall knot on each side after the splice is made. The strand then appears as represented in the figure, the strands having been well tarked and hove taut separately. The part of the rope referred to must be carefully stretched and the ends b, b; the part c provides the knot and the ends d, d. After the knot has been well set, stretch the ends of the splices firmly, laid smoothly between the strands of the shroud, and firmly set over. This knot is used when shrouds or stays are broken.

French Shroud Knot.—Marry the parts with a similar amount of end as before; stop one set of strands taut up on the ship (to keep the ship in line), and pass the other strands back on their own part, forming hitches. Make a single wall knot with the other three strands round the said hitches and shroud; haul the knot taut first and stretch the whole; then heave down the hips strands round the single wall knot, and this knot will be found to hold firmly and not likely to slip. If the ends by which the wall knot is made after being hove are passed through the hitches, it will make the knot stronger. The ends would be tailed and served with a splice, as in fig. 26, to double twice the circumference of the rope intended to be tord over the eye; unlay the rope which is to form the eye about the hitches and the circumference of the knot, part place a strong whipping. Point the rope vertically under the eye, and bind it taut by the core if it is four-strand rope, and otherwise by a four-strand or single wall knot. While doing so arrange six or twelve pieces of spun-yarn at equal distances on the wood and exactly halve the number of strands that have been unlaid. If it is a small rope, select two or three yarns from each side near the centre; cross them over the top at a, and half-knot them together. So continue till all are expended and drawn down tightly on the opposite side to that from which they came, being thoroughly intermingled. Tie the pieces of the rope in which the rope is tied under the half-knot the tightly round them, to keep the eye in shape when taken off the spar, till they are replaced by turns of marline hove as taut as possible, the hitches forming a central line outside the eye. Heave on a good seizing of spun-yarn close below the eye, and another between six and twelve inches below the first; it may then be parcell and served; the eye is served over twice, and well tarked each time. As large ropes are concerned, a greater number of throws must be used. It is usual to toggle the eye (see fig. 37) a 4-in. rope has 132 yarns, which would require 22 knotings of six each time; a 10-in. rope has 834 yarns, therefore, if ten are taken from each side every time, about twice that number of hitches will be required; sometimes only half the yarns are hitched, the others being merely passed over. The chief use of these eyes has been to form the collars of stays, the whole stay in each case having to be made over through it—a very inconvenient device. It is almost superfluous for that purpose, by a loop spliced in the stay and lashing eyes abate the mast, for which it is commonly used at present. This eye is not always called by the same name, but the weight of evidence is in favour of calling it a shroud loop. For this purpose, which also has alternative names, is formed by taking out of a rope one strand longer by 6 in. or a foot than the required eye, then placing the ends of the two strands a similar distance below the disturbance of the one strand, that is, at the same height as the splice was laid back through the vacant space it left till it arrives at the neck of the eye, with a similar length of spare end to the other two strands. They are all seized together, scraped, tarded, marked, and served. The principle of this eye is the same as that of the Shroud Loop. (See fig. 37.)

Diamond Knot (figs. 42, 43).—The rope must be unlaid as far as the centre if the knot is required there, and the strands handled with great care to keep the lay in them. Three bights are turned up as in fig. 42, and the end of a is taken over b and up the bight of; the end of b is taken over c and up through a. The end c is taken over a and through b. When hauled taut and the strands are laid up again it will appear as in fig. 43. Any number of knots may be made on the same rope. The were used on main-ropes, the foot-ropes on the jib-boom, and similar places, where it was necessary to give a hafe hold for the hands or feet. Turk's heads are now generally used. Double Diamond.—Instead of the ends of a single diamond following their own part till the knot is repeated. Used at the upper end of a side rope as an ornamental stopper-knot.

Stripping-Blocks.—There are various modes of securing blocks to ropes, the most simplest is to splice them on, or to follow a little longer than the block and pass a round seizing to keep it in place; such is the case with jib-pendants. As a general rule, the parts of a stop combined should possess greater strength than the parts of the fall which act against it. The shell of an ordinary block

hitch on the other side of the hauling part. This is very useful, as it can be put on and off quickly.

Round Seizing (fig. 40).—So named when the rope it secures does not cross another and there are three sets of turns. The size of the seizing line is about one-sixth (nominal) that of the ropes to be secured, but varies according to the number of turns to be taken. An average may be one and a half turn on a 4-in. rope, two and a half turns on a 6-in. rope, and one and a half turns on a 8-in. rope. If either part is to be spread open, commence farther from that part; place turred canvas under the seizing; pass the line round as many times (with much slack) as it is intended to have under-turns, and pass the end back through them all and through the eye. Secure the eye from rendering round by the ends of its splice; heave the turns on with a marling-splice (see fig. 17), perhaps seven or nine; haul the end through taut, and commence again the riding turns in the hollows of the first. If the end is not taken back through the eye, but pushed up between the last two turns (as is sometimes recommended), the riders must be passed the opposite way in order to embrace the end. Four-under-turns, which are always one more in number than the riders. When the riders are complete, the end is forced between the last lower turns and two cross turns are taken, the end coming up where it went down, when a wall knot is made with the strands and the ends cut close; or the end may be taken once round the shroud. Thread Seizing.—Two ropes or parts of ropes are laid on each other parallel and receive a seizing similar to that shown in fig. 35—that is with upper and riding but no cross turns. As the two parts of the rope are intended to turn up at right angles to the direction in which they were secured, the seizing should be of stouter line and short, not exceeding seven lower and six riding turns. The seizing is much better secured with a turn round the standing part. Used for turning in dead-eyes and variously. Flat Seizing.—Com-
should be about three times the circumference of the rope which is to be used through it, as a 6-in. block for a 3-in. rope; but small ropes require larger blocks in proportion, as a 4-in. block for a 1-in. rope. When the work to be done is very important the blocks are much larger: brace-blocks are more than five times the nominal size of the brace. Leading-blocks and sheaves in racks are generally smaller than the blocks through which the ropes pass farther astern, which appears to be a mistake, as more power is lost by friction. A clumsy block should be double the nominal size of the rope. A single strop may be made by joining the ends of a rope of sufficient length to go round the block and fastened by a common sheer splice, which rests on the crown of the block (the opposite end to the thimble) and is stretched into place by a jigger; a strand is then passed twice round the space between the block and the thimble and hove taut by a Spanish windlass to crate the parts together ready for the reception of a small round seizing. The cramping or pinching into shape is sometimes done by machinery invented by a Rigger in Portobello dockyard. The strop may be made the required length by a long splice, but it would not possess any advantage.

**Double Strop (fig. 44).** Made by unlaying a piece of rope of the desired size about a foot more than three times the length required for the strop. Place the centre of the rope round the block and thimble; mark with chalk where the parts cross; take one strand out of the rope; bring the two chalk marks together; and cross the strands in the lay on both sides, continuing round and round till the two ends meet the third time; they are then halved, and the upper halves half-knotted and passed over and under the next strands, exactly as one part of a long splice. A piece of worn or well-stretched rope will better retain its shape, upon which success entirely depends. The object is neatness, and if three or multiples of three strops are to be made it is economical.

**Single Strop (fig. 45).** Made with one piece of rope, the splice being brought as usual to the crown of the block \( f \), the bights fitting into scores some inches apart, converging to the upper part, above which the thimbles receive the bights \( a, g \) and the four parts of the strop are secured at \( s, b \) by a round seizing doubly crossed. If the block be not then on the right shelf (the shell horizontal or vertical) a union thimble is used with another strop, which produces the desired effect; thus the rope, being very long and thin, are required (for appearance) to lie horizontally; a single strop round the yard vertically has a union thimble between it and the double strop round the block. The double strop is used for large blocks; it gives more support to the shell than the single strop and admits of smaller rope being used. Wire rope is much used for block-strops; the fitting is similar. Metal blocks are also used in fixed positions; durability is their chief recommendation. Great care should be taken that they do not chafe the ropes which pass by them as well as those which revolve through.

**Selvage Strop.** Twine, rope, yarn or rope is warped round two or more pegs placed at the desired distance apart, till it assumes the requisite size and strength; the two ends are then knotted or spliced. Temporary firm selvages are spliced in several places to bind the parts together before the rope or twine is removed from the pegs, after which it is marled with suitable material. A large strop should be warped round four or six pegs in order to give it the shape in which it is to be used. This description of strop is much stronger for making more than one rope of similar size. Wire ropes (covered with duck) are used for boats' blocks and in similar places requiring neatness. Rope-yard and spun-yard strops are used for attaching self-action tackles to shrouds and for many similar purposes. To bring to a shrud or hawser, the centre of the strop is passed round the rope and each part crossed three or four times before hoisting the "hull," a spun-yard stop above the centre will prevent slipping and is very necessary with wire rope. As an instance of a large selvage block-strop being used—when the "Melville" was hove down at Chusan (China), the main-purchase-block was double stopped with a selvage containing 56 parts of 3-in. rope; that would produce 112 parts in the neck, equal to a breaking strain of 260 tons, which is more than four parts of a 19-in. cable. The estimated strain it bore was 80 tons.

**Stopers for ordinary running ropes are made by splicing a piece of rope to a bolt or to a hook and thimble, unlaying 3 or 4 ft., tapering it by cutting away some of the yarns, and marling it down securely, with single whipping also on the ends. It is used by taking a half-hitch round the rope, which is to be hauled upon, dogging the end up in the lay and holding it by hand. The rope can come through it when hauled, but cannot go back.**

**Whipping and Pointing.** The ends of every working rope should at least be whipped to prevent it faggling out; in ships of war and yachts they are invariably pointed. Whipping is done by placing the end of a piece of twine or knitted stuff on a rope about an inch from the end. This is then folded three or four times (with the back end of the end); the twine is then laid on the rope again lengthways contrary to the first, leaving a slack bigit of twine; and taut turns are made round the same as before, passing the twine at the point of the point, till there are in all six to ten turns; then haul the tight bight through between the turns and cut it close. To point a rope, place a good whipping a few inches from the end, according to size; open out the end entirely; select all the outer yarns and twist them into knittles either singly or two or three together; scrape down and taper the central part, marling it firmly. Turn every alternate knittle and secure the remainder down by a turn of twine or a smooth yarn close up, which acts as the core of the whipping. The knittles are then reversed and another turn of the weft taken, and this is continued till far enough to look well. At the last turn the ends of the knittles are laid back are led forward under the weft and hauled through tightly, making it present a circle of small bigits, length with which the core is cut off smoothly. Hawers and large ropes have a becket formed in their ends during the process of whipping. A piece of rope, rope-yard, rope-strop, a rope, when a long splice is taken into the core by each end while it is open: from four to seven yarns (equal to a strand) are taken at a time and twisted up; open the ends of the becket only sufficient to marl them close in; turn in the twisted lengthways between the block (stopping) three times, and stop it above and below. Both ends are treated alike; when the point is completed a loop a few inches in length will protrude from the end of the rope, which is very useful for receiving it. A hauling line or reeling line should only be rope through the becket as a fair lead.

**Grafting** is very similar to pointing, and frequently done the whole length of a rope, as a side-rope. Pieces of white line more than double the length of the rope, sufficient in number to encircle it,

are made up in hanks called foxes; the centre of each is made fast by twine and the weaving process continued as in pointing. Block-strops are sometimes so covered; but, as it causes decay, a small wove mat which can be taken off occasionally is preferable.

**Sheep-Shank (fig. 46).** Formed by making a long bight in a topgallant-mast block-chock or any rope which it is desirable to shorten and taking a half-hitch near each end, as at \( a, a \). Rope-yard stops at \( b, b \) are desirable to keep it in place till the strain is brought on it. Wire rope cannot be so treated, and it is injurious to hemp rope that is large and stiff.

**Knotting Yarns (fig. 47).** This operation becomes necessary when a comparatively short piece of junk is to be made into spun-yard, or large rope into small, which is called twice laid. The end of each yarn is divided, rubber smooth and married (as for splicing). Two of the divided parts, as \( c, c \) and \( d, d \), are passed in opposite directions round all the other parts and knotted. The ends and \( e, f \) remain passable. The figure is drawn open, but the forks of \( A \) and \( B \) should be pressed close together, the knot hauled taunt and the ends cut off.

**Boat Slingss (fig. 48).** Made of 4-in. rope, each pair being 26 ft. in length, with an eye spliced in one end, through which the other is rove before being placed over one end of the cask; the rope is then passed through the opening of the cask and two half-hitches made with the end, forming another running eye, both of which are taken down taut as the tackle receives the weight. Slings for smaller casks requiring care should be of this description, though of smaller size.

**Bale Slings are made by splicing the ends of about 3 fathoms of 3-in. rope together, when the larger line looks like a long strop, similar to the double strop represented in fig. 45—the bigits being placed under the cask or bale and one of the
bights a, a rove through the other and attached to the whip or tackle. For a complete treatise on the subject the reader may be referred to the Society of Camp, "Being a Complete Treatise on the Art of Cordage, illustrated by 172 Diagrams, showing the Manner of making every Knot, Tie and Splicer," by Tom Bowling (London, 1890).

Mathematical Theory of Knots.

In the scientific sense a knot is an endless physical line which cannot be deformed into a circle. A physical line is flexible and inextensible, and must be cut—so that no lap of it can be drawn through another. The founder of the theory of knots is undoubtedly Johann Benedict Listing (1808-1882). In his "Vorstudien zur Topologie" (Göttinger Studien, 1847), a work in many respects of startling originality, a few pages only are devoted to the subject. He treats knots from the elementary notion of twisting one physical line (or thread) round another, and shows that from the projection of a knot on a surface we can thus obtain a notion of the relative situation of its coils. He distinguishes "reduced" from "reducible" forms, the number of crossings in the reduced knot being the smallest possible. The simplest form of reduced knot is of two species, as in figs. 49 and 50. Listing points out that these are formed, the first by right-handed, the second by left-handed twisting. In fact, if three half-twists be given to a long strip of paper, and the ends be then pasted together, the two edges become one line, which is the knot in question. We may free it by slitting the paper along its middle line; and then we have the juggler's trick of putting a knot on an endless unknotted band. One of the above forms cannot be deformed into the other. The one is, in Listing's language, the "perversion" of the other, i.e., its image in a plane mirror. He gives a method of symbolizing reduced knots, but shows that in this method the same knot may, in certain cases, be represented by different symbols. It is clear that the brief notice he published contains a mere sketch of his investigations.

The most extensive dissertation on the properties of knots is that of Peter Guthrie Tait (Trans. Roy. Soc. Edin., xxviii, 145, where the substance of a number of papers in the Proceedings of the same society is reproduced). It was for the most part written in ignorance of the work of Listing, and was suggested by an inquiry concerning vortex atoms.

Tait starts with the almost self-evident proposition that, if any plane closed curve have double points only in the passing continuously along the curve from one of these to the same again an even number of double points has been passed through. Hence the crossings may be taken alternately over and under. On this he bases a scheme for the representation of knots of every kind, and employs it to find all the distinct forms of knots which have, in their simplest project-

![Fig. 49.](image)

![Fig. 50.](image)

![Fig. 51.](image)

![Fig. 52.](image)

(tions, 3, 5, 6 and 7 crossings only. Their numbers are shown to be 1, 1, 2, 4 and 8. The unique knot of three crossings has been already given as drawn by Listing. The unique knot of four crossings merits a few words, because its properties lead to a very singular conclusion. Being deformed into one of the four forms—figs. 51 and 52 and their permutations. Knots which can be deformed into their own perversion Tait calls "amphicheiral" (from the Greek ἀμφι, on both sides, around, xip, hand), and he has shown that there is at least one knot of this kind for every even number of crossings. He shows also that "links" (in which two endless physical lines are linked together) possess a similar property; and he then points out that there is a third mode of making a complex figure, which he calls "knotting". This may be called "lacing" or "locking". Its nature is obvious from fig. 53, in which it will be seen that no one of the three lines is knotted, no two are linked, and yet the three are inseparably fastened together.

The rest of Tait's paper deals chiefly with numerical characteristics of knots, such as their "knotiness," "beknotteness" and "knotfulness." He also shows that any knot, however complex, can be fully represented by three closed plane curves, none of which has double points and no two of which intersect. It may be stated here that the notion of beknottedness is founded on a remark of Gauss, who in 1833 considered the problem of the number of interlinkings of two closed circuits, and expressed it by the electrodynamic measure of the work required to carry a unit magnetic pole round one of the interlinked curves, while a unit electric current is kept circulating in the other. This original suggestion has been developed at considerable length by Otto Boedicker (Erwerbung der Gauß'schen Theorie der Verschlingungen (Stuttgart, 1876). This author treats also of the connexion of knots with Riemann's surfaces.

It is to be noticed that, although every knot in which the crossings are amphicheiral, and under is irreducible, the converse is not generally true. This is obvious at once from fig. 54, which is merely the three-crossing knot with a doubled string—what Listing calls "triple." Christian Felix Klein, in the Mathematische Annalen, ix. 478, has proved the remarkable proposition that knots cannot exist in space of four dimensions. (P. G. T.)

KNOUT (from the French transliteration of a Russian word of Scandinavian origin; cf. A.-S. knoot, Eng. knot), the whip used in Russia for flogging criminals and political offenders. It is said to have been introduced under Ivan III. (1462-1505). The knout had different forms. One was a lash of raw hide, 16 in. long, attached to a wooden handle, 9 in. long. The lash ended in a metal ring, to which was attached a second lash as long, ending also in a ring, to which in turn was attached a few inches of hard leather ending in a beak-like hook. Another kind consisted of many thongs of skin plated and interwoven with wire, ending in loose wired ends, like the cat-o'-nine tails. The victim was tied to a post or on a triangle of wood and stripped, receiving the specified number of strokes on the back. A sentence of 100 or 120 lashes was equivalent to a death sentence; but few lived to receive so many. The executioner was usually a criminal who had to pass through a probation and regular training; being let off his own penalties in return for his services. Peter the Great is traditionally accused of knoutting his son Alexis to death, and there is little doubt that the boy was actually beaten till he died, whoever was the executioner. The emperor Nicholas I. abolished the earlier forms of knout and substituted the pléti, a three-thonged lash. Ostensibly the knout has been abolished throughout Russia and reserved for the penal settlements.

KNOWLES, SIR JAMES (1831-1908), English architect and editor, was born in London in 1831, and was educated, with a view to following his father's profession, as an architect at University College and in Italy. His literary tastes also brought him at an early age into the field of authorship. In 1860 he published The Story of King Arthur. In 1867 he was introduced to Tennyson, whose house, Aldworth, on Blackdown, he designed; this led to a close friendship, Knowles assisting Tennyson in business matters, and among other things helping to design scenery for The Cup, when Irving produced that play in 1880. Knowles became intimate with a number of the most interesting men of the day, and in 1869, with Tennyson's cooperation, he started the Metaphysical Society, the object of which was to attempt some intellectual approration between religion and science by getting the leading representatives of faith and unfaith to meet and exchange views.

The members from first to last were as follows: Dean Stanley, Seeley, Roden Noel, Martineau, W. B. Carpenter, Hinton, Huxley, Pritchard, Hutton, Ward, Bagchet, Froude, Tennyson, Tyndall, Alfred Barry, Lord Arthur Russell, Gladstone, Manning, Knowles. Lord Avebury, Dean Alfred, Alex. Grant, Bishop Thirlwall, F. Harrison, Father Dalgarins, Sir G. Grove, Shadworth Hodgson,

Papers were read and discussed at the various meetings on such subjects as the ultimate grounds of belief in the objective and moral sciences, the immortality of the soul, &c. An interesting description of one of the meetings was given by Magee (then bishop of Peterborough) in a letter of 13th of February 1849: 

"Archbishop Manning in the chair was flanked by two Protestant bishops right and left; on my right was Hutton, editor of the Spectator, an Arrian; then came Father Dalgairns, a very able Roman Catholic priest; opposite him Lord A. Russell, a Deist; then two Scotch metaphysical writers, Freerackers; then Knowles, the very broad editor of the Contemporaneous; then, dressed as a layman and looking like a country squire, was Ward, formerly Rev. Ward, and earliest of the prelates to Rome; then Greg, author of The Creed of Christendom, a Deist; then Freode, the historian, once a deacon in our Church, now a Deist; then Roden Noel, an actual Atheist and red republican, and looking very like one! Lastly Ruskin, who read a paper on miracles, which we discussed for an hour and a half. Nothing could be calmer, fairer, or even, on the whole, more reverent then the discussion. In my opinion, we, the Christian, had much the best of it: Dalgairns, the priest, was very masterly; Manning, eleemosynary integrity; Freerackers very acute; Freode was Greg. We only wanted a Jew and a Mahommedan to make our Religious Museum complete " (Life, i. 284).

The last meeting of the society was held on 16th May 1886. Huxley said that it died " of too much love"; Tennyson, "because after ten years of strenuous effort no one had succeeded in even defining metaphysics." According to Dean Stanley, "We all meant the same thing if we only knew it." The society formed the nucleus of the distinguished list of contributors who supported Knowles in his capacity as an editor. Knowles became editor of the Contemporaneous Review, but left it in 1877 and founded the Nineteenth Century, of which he was the title of which, in 1901, were added the words And After). Both periodicals became very influential under him, and formed the type of the new sort of monthly review which came to occupy the place formerly held by the quarterlies. In 1904 he received the honour of knighthood. He died at Brighton on the 13th of February 1908.

KNOWLES, JAMES SHERIDAN (1784-1862), Irish dramatist and actor, was born in Cork, on the 12th May 1784. His real name was the lexicographer, James Knowles (1759-1840), contemporary of Richard Brinsley Sheridan. The family removed to London in 1793, and at the age of fourteen Knowles published a ballad entitled The Welsh Harper, which, set to music, was very popular. The boy's talents secured him the friendship of Hazlitt, who introduced him to Lamb and Coleridge. He remained for some time in the Wiltshire and afterwards in the Tower Hamlets militia, leaving the service to become pupil of Dr Robert Willan (1757-1812). He obtained the degree of M.D., and was appointed vaccinator to the Jennerian Society. Although, however, Dr Willan generously offered him a share in his practice, he resolved to forsake medicine for the stage, making his first appearance probably at Bath, and playing Hamlet at the Crow Theatre, Dublin. At Wexford he married, in October 1809, Maria Charters, an actress from the Edinburgh Theatre. In 1810 he wrote Lea, in which Edmund Kean acted with great success; another play, Brian Borohime, written for the Belfast Theatre in the next year, also drew crowded houses, but his earnings were so small that he was obliged to become assistant to his father at the Belfast Academical Institution. In 1817 he removed from Belfast to Glasgow, where, besides conducting a flourishing school, he wrote for the stage. His first important success was Cainus Gracibus, produced at Belfast in 1815; and his Virginins, written for Edmund Kean, was first performed in 1820 at Covent Garden. In William Tell (1825) Macready found one of his favourite parts. His best-known play, The Hunchback, was produced at Covent Garden in 1837; The Wife was brought out at the same theatre in 1838; and The Love Chase in 1837. In his later years he forsook the stage for the pulpit, and as a Baptist preacher attracted large audiences at Exeter Hall and elsewhere. He published two polemical works—the Rock of Rome and the Idol Demolished by its own Prince by both of which the name and the special doctrines of the Roman Catholic Church. Knowles was for some years in the receipt of an annual pension of £200, bestowed by Sir Robert Peel. He died at Torquay on the 30th of November 1862.

A full list of the works of Knowles and of the various notices of him will be found in the Life (1872), privately printed by his son, Richard Brinsley Knowles (1820-1882), who was well known as a journalist.

KNOWLE NOTHING (or AMERICAN) PARTY, in United States history, a political party of great importance in the decade before 1860. Its principle was political proscription of naturalized citizens and of Roman Catholics. Distrust of alien immigrants, because of presumptive attachment to European institutions, has always been more or less widely diffused, and race antagonisms have been recurrently of political moment; while anti-Catholic sentiment went back to colonial sectarianism. These were the elements of the political nativism "—i.e. hostility to foreign influence in politics—of 1830-1860. In these years Irish immigrants came to be more numerous, and that of Catholics was even more so. The geographical segregation and the clannishness of foreign voters in the cities gave them a power that Whigs and Democrats alike (the latter more successfully) strove to control, to the great aggravation of naturalization and election frauds. "No one can deny that ignorant foreign suffrage had grown to be an evil of immense proportions." (J. F. Rhodes). In labour disputes, political feuds and social clannishness, the alien elements—especially the Irish and German—displayed their power, and at times gave offence to the Whig leaders of American institutions. In immigration centres like Boston, Philadelphia and New York, the Catholic Church, very largely foreign in membership and proclaiming a foreign allegiance of disputed reality, was really "the symbol and strength of foreign influence" (Scisco); many regarded it as a transplanted foreign institution, un-American in organization and ideas. Thus it became involved in politics. The decade 1830-1840 was marked by anti-Catholic (anti-Irish) riots in various cities and by party organization of nativists in many places in local elections. Thus arose the American Republican (later the Native-American) Party, whose national organization practically in 1844 became the Whig party. Whig Whig were in 1841 first received a state organization. New York City and Boston in 1845 were carried by the nativists, but their success was due to Whig support, which was not continued, and the national organization was by 1847—in which year it endorsed the Whig nominee for the presidency—practically dead. Though some Whig leaders had strong nativist leanings, and though the party secured a few representatives in Congress, it accomplished little at this time in national politics. In the early 'fifties nativism was revivified by an unparalleled inflow of aliens. Catholics, moreover, had contested the Native-Americans decisively. In 1852 both Whigs and Democrats were forced to defend their presidential nominations against charges of anti-Catholic sentiment. In 1853-1854 there was a wide-spread "anti-papery" propaganda and riots against Catholics in various cities. Meanwhile the Know-Nothing Party had sprung from nativist secret societies, whose relations remain obscure. Its organization was secret; and hence its name—for a member, when interrogated, always

1 E.g. for some extraordinary "reform" programmes among German immigrants see Schmeckebier (as below), pp. 48-50.

2 The actual offence of the Catholic Church was its non-conformity to American methods of church administration and popular education " (Scisco).

3 The Whigs bargained aid New in New York for "American" support of the state, and charged that the latter was not given. Millard Fillmore at this time was Whig leader of the state (New York Party) to the disaffection of Catholic Whigs angered by the alliance with the nativists.

4 The number of United Americans and the Order of the Star Spangled Banner, established in New York respectively in 1843 and 1850, were the most important sources of its membership.
answered that he knew nothing about it. Selecting candidates secretly from among those nominated by the other parties, and giving them no public endorsement, the Know Nothings, as soon as they gained the balance of power, could shatter at will Whig and Democratic calculations. Their power was evident by 1852—from which time, accordingly, “Know-Nothingism” is most properly dated. The charges they brought against naturalization abuses were only too well founded; and those against election frauds not less so—though, unfortunately, the Know Nothings themselves followed scandalous election methods in some cities. The proposed proscription of the foreign-born knowing no exceptions; many wished never to concede any of the rights of natives, nor to their children unless educated in the public schools. As for Catholics, the real animus of Know Nothingism was against political Romanism; therefore, secondarily, against papal allegiance and episcopal church administration (in place of administration by lay trustees, as was earlier common practice in the United States); and, primarily, against public aid to Catholic schools, and the alleged greed (i.e., the power and success) of the Irish in politics. The times were propitious for the success of an aggressive third party; for the Whigs were split by the death of Clay and Webster and the crushing defeat of 1852, and both the Whig and Democratic parties were disintegrating on the slavery issue. But the Know Nothings lacked aggression. In entering national politics the party abandoned its mysteries, without making compensatory gains; when it was compelled to publish a platform of principles, factions arose in its ranks; moreover, to draw recruits the faster from Whigs and Democrats, it “straddled” the slavery question, and this, although a temporary success, ultimately meant ruin. In 1854, however, Know Nothing gains were remarkable. The Know Nothings spread like wildfire in the South, in which section there were almost no aliens, and the Whig dissolution was far advanced. The Virginia election of May 1855 proved conclusively, however, that Know Nothingism was no stronger against the Democrats than was the Whig party it had absorbed; it was the same organization under a new name. In the North it was even clearer that slavery must be faced. Know Nothing evasion probably helped the South, but neither Republicans nor Democrats would endure the evasion; Douglas and Seward, and later (1855-1856) their parties, denounced it. In the North-West the Know Nothings were swept into the anti-slavery movement in 1854 without retaining the organization. In the state campaigns of 1855 professions were measured to the latitude. The national platform of 1856 (adopted by a secret grand council), besides including anti-alien and anti-Catholic planks, offered oases to the North, the South and the “doughfaces” on the slavery issue. Millard Fillmore was nominated for the presidency. The anti-slavery delegates of eight Northern states bolted the convention, and eight months later the Republican wave swept the Know Nothings out of the North. The national field being thus lost, the state councils became supreme, and local opportunism fostered variation and weakness. By 1859 the party was confined almost entirely to the border states. The Constitutional Union—the “Do Nothing”—Party of 1850 was mainly composed of Know Nothing remnants. The year 1860 practically marked, also, the disappearance of the party as a local power.

Except in city politics nativism had no vitality; in state and national politics it really had no excuse. Race antipathies gave it local cohesive power in the North; various causes, already mentioned, advanced it in the South; and as a device to win offices it was of wide-spread attraction. Its only real contribution to government was the proof that nativism is not Americanism. Public opinion has never accepted its estimate of the alien nor of Catholic citizens. Some of its anti-Church principles, however—as the non-support of denominational schools—have been generally accepted; others—as the refusal to exclude the (Protestant) Bible from public schools—have been generally ignored; others—as the taxation of all Church property—remained disputed.

KNOX, HENRY (1759-1866), American general, was born in Bozeman,Massachusetts, of Scottish-Irish parentage, on the 25th of July 1759. He had been trained in the military art, and tried to keep the Boston crowd and the British soldiers from the clash known as the Boston massacre (1770). In 1781 he opened the “London Book-Store” in Boston. He had read much of tactics and strategy, joined the American army at the outbreak of the War of Independence, and fought at Bunker Hill, planned the defences of the camps of the army before Boston, and brought from Lake George and border forts much-needed artillery. At Trenton he crossed the river before the main body, and in the attack rendered such good service that he was made brigadier-general. He was then in command of the chief of artillery in the Continental army on the following day. He was present at Princeton; was chiefly responsible for the mistake in attacking the “Chew House” at Germantown; urged New York as the objective of the campaign of 1778; served with efficiency at Monmouth and at Yorktown; and after the surrender of Cornwallis was promoted major-general, and served as a commissioner on the exchange of prisoners. His services throughout the war were of great value to the American cause; he was one of General Washington’s most trusted advisers, and he brought the artillery to a high degree of efficiency. From December 1783 until July 1784 he was the senior officer of the United States army. In 1784-1785 he was one of the commissioners of a society to be formed by the American officers and the French officers who had served in America during the war, and to which he called the “Cincinnati”; of this society he was the first secretary-general (1783-1799) and in 1805 became vice-president-general. In 1785-1794 Knox was secretary of war, being the first man to hold this position after the organization of the Federal government in 1789.

He urged ineffectually a national militia system, to enroll all citizens over 18 and under 60 in the “advanced corps,” the “main corps” or the “reserve,” and for this and his close friendship with Washington was bitterly assailed by the Republicans. In 1793 he had begun to build his house, Montpelier, at Thomaston, Maine, where he speculated unsuccessfully in the holdings of the Eastern Land Association; and he lived there until his death on the 25th of October 1806.

See F. S. Drake, Memoir of General Henry Knox (Boston, 1873); and Noah Brooks, Henry Knox (New York, 1900) in the “American Men of Energy” series.

KNOX, JOHN (c. 1505-1572), Scottish reformer and historian. Of his early life very little is certainly known, in spite of the fact that his Historie of the Reformacion and his private letters, especially the latter, are often vividly graphic. He was born in Edinburgh before the year of his birth, usually given as 1505, is matter of dispute. Beza, in his Icones, published in 1580, makes it 1515; Sir Peter Young (tutor to James VI. of Scotland), writing to Beza from Edinburgh in 1579, says 1513; and a strong case has been made out for holding that the generally accepted date is due to an error in transcription (see Dr Hay Fleming in the Bookman, Sept. 1905). But Knox seems to have been reticent about his early life, even to his contemporaries. What is known is that he...
was a son of William Knox, who lived in or near the town of Haddington, that his mother's name was Sinclair, and that his forefathers on both sides had fought under the banner of the Bothwells. William Knox was "simple," not "gentle"—perhaps a prosperous East Lothian peasant. But he sent his son John to school (no doubt the well-known grammar school of Haddington), and thereafter to the university, where, like his contemporary George Buchanan, he sat "at the feet" of John Major. Major was a native of Haddington, who had recently returned to Scotland from Paris with a great academical reputation. He retained to the last, as his History of Greater Britain shows, the repugnance characteristic of the university of Paris to the tyranny of kings and nobles; but like it, he was now alarmed by the revolt of Luther, and ceased to urge its ancient protest against the supremacy of the pope. He exchanged his "regency" or professorship in Glasgow University for one in that of St Andrews in 1553. If Knox's college time was later than that date (as it must have been, if he was born near 1545), he no doubt spent, as Beza narrates, at St Andrews, and probably exclusively there. But in Major's last Glasgow session a "Joannes Knox" (not an uncommon name, however, at that time in the west of Scotland) matriculated there; and if this were the future reformer, he may thereafter either have followed his master to St Andrews or returned from Glasgow straight to Haddington. But till twenty years after that date his career has not been again traced. Then he reappears in his native district as a priest without a university degree (Sir John Knox) and a notary of the diocese of St Andrews. In 1543 he certainly signed a peticionary to his bishop, the then archbishop of St Andrews. But in 1546 he was carrying a two-handed sword in defence of the reformer George Wishart, on the day when the latter was arrested by the archbishop's order. Knox would have resisted, though the arrest was by his feudal superior, Lord Bothwell; but Wishart himself commanded his submission, with the words "One is sufficient for a sacrifice," and was handed over for trial at St Andrews. And next year the archbishop himself had been murdered, and Knox was preaching in St Andrews a fully developed Protestantism.

Knox gives us no information as to how this startling change in himself was brought about. During those twenty years Scotland had been slowly tending to freedom in religious profession, and to friendship with England rather than with France. The Scottish hierarchy, by this time corrupt and even profligate, saw the twofold danger and met it firmly. James V., the "Commons' King" had put himself into the hands of the Beatonists, who in 1528 burned Patrick Hamilton. On James's death there was a slight reaction, but the cardinal-archbishop took possession of the weak regent Arran, and in 1546 burned George Wishart. England had by this time rejected the party-speaking of Scotland by a recent statute it was his archbishop who declared him a common enemy and passed sentence of death on the Scottish preacher. This Knox also passed sentence of death on—whatever he thought of the speaker's books. But he gave Knox a free hand, and Knox made the most of his opportunity. In 1547 Knox was elected archbishop of St Andrews. He made all haste to bring to fruition a movement, which was well started, that had been gathering force during the last years of the reign of James V. A party of Puritans had already found, and were in possession of, the castle of St Andrews, and Knox gladly joined them. In St Andrews he taught "John's Gospel" and a certain catechism—probably that which Wishart had got from "Helvetia" and translated; but his teaching was supposed to be private and tutorial and for the benefit of his friends' "bairns." The men about him however—among them Sir David Lindsay of the Mount, "Lyons King," and his own father—had probably not "bairns" to teach. Knox therefore prepared a public catechism, in which he says: "I am not a private man, but a public man. I am not the teacher of a few. I am the teacher of the many. I have been called to a place of power, and the power is given to me to rule and to reign over a kingdom that is not of this world. I am not a private man, but a public man. I am not the teacher of a few. I am the teacher of the many. I have been called to a place of power, and the power is given to me to rule and to reign over a kingdom that is not of this world.

KNOX, JOHN

John Rough, who spoke it, died a few years after in the flames at Smithfield. But it was a call which many in that ardent dawn were ready to accept, and it had now at length found, or made, a statesman and leader of men. For what to the others was chiefly a promise of personal salvation became for the indomitable will of Knox an assurance also of victory, even in this world, over embattled forces of ancient wrong. It is certain at least that this providence of Knox, while never changed and constantly renewed its public course. And looking back upon that course afterwards, he records with much complacency how his earliest St Andrews sermon built up a whole fabric of aggressive Protestantism upon Puritan theory, so that his startled hearers muttered, "Others sned (snipped) the branches; this man strikes at the root.

Meantime the system attacked was safe for other thirteen years. In June 1547 St Andrews yielded to the French fleet, and the prisoners, including Knox, were thrown into the galleys on the Loire, to remain in from and under the lash for at least nineteen months. Released at last (apparently through the influence of the young English king, Edward VI.), Knox was appointed one of the licensed preachers of the new faith for England, and stationed in the great garrison of Berwick, and afterwards at Newcastle. In 1551 it seems to have been made a royal chaplain; in 1552 he was certainly offered an English bishopric, which he declined; and during most of this year he used his influence, as preacher at court and in London, to make the new English settlement more Protestant. To him at least is due the Prayer-book rubric which explains that, when kneeling at the sacrament, "if the adoration is intended, it is for that which is to be done." While in Northumberland Knox had been betrothed to Margaret Bowes, one of the fifteen children of Richard Bowes, the captain of Norham Castle. Her mother, Elizabeth, co-heiress of Aske in Yorkshire, was the earliest of that little band of women-friends whose correspondence with Knox on religious matters throws an unexpected light on his discriminating tenderness of heart. But now Mary Tudor succeeded her brother, and Knox in March 1554 escaped into five years' exile abroad, leaving Mrs. Bowes a fine treatise on "Affliction," and sending back to England two editions of a more acrid "Faithful Admonition" on the crisis there. He first drifted to Frankfort, where the English congregation divided as English Protestants have always done, and the party opposed to Knox got rid of him at last by a complaint to the authorities of treason against the emperor Charles V. as well as Philip and Mary. At Geneva he found a more congenial pastorise. Christopher Goodman (c. 1500-1603) and he, with other exiles, began there the Puritan tradition, and prepared the earlier English version of the Bible, "the household book of the Englishman," which was better known in England than in England until six years later. Here, and afterwards at Dieppe (where he preached in French), Knox kept in communication with the other Reformers, studied Greek and Hebrew in the interest of theology, and having brought his wife and her mother from England in 1555 lived for years a peaceful life.

But even here Knox was preparing for Scotland, and facing the difficulties of the future, theoretical as well as practical. In his first year abroad he consulted Calvin and Bullinger as to the right of the civil authority to prescribe religion to his subjects—in particular, whether the godly should obey "a magistrate who enforces idolatry and condemns true religion, and whom should they join" in the case of a religious nobility resisting an idolatrous sovereign. In August 1555 he visited his native country and found the queen-mother, Mary of Lorraine, acting as regent in place of the real "sovereign," the youthful and better-known Mary, now being brought up at the court of France. Scripture-reading and the new views had spread widely, and the regent was disposed to wink at this in the case of the "religious nobility." Knox was accordingly allowed to preach privately for six months throughout the south of Scotland, and disillusioned with the enthusiasm which made him break out, "O sweet were the death which should follow such forty days in Edinburgh as here I have had three!" Before leaving he...
even addressed a letter to the regent, urging her to favour the Evangel. She accepted it jocularly as a "pasquilt," and Knox on his departure was condemned and burned in effigy. But he left behind him a "Wholesome Counsel" to Scottish heads of families, reminding them that within their own houses they were "bishop and kings," and recommending the institution of something like the early apostolic worship in private congregations. Of the Protestant barons Knox, though in exile, seems to have been henceforward the chief adviser; and before the end of 1557 they, under the name of the "Lords of the Congregation," had entered into the first of the religious "hands" or covenants" afterwards famous in Scotland. In 1558 he published his "Appellation" to the nobles, estates and commonalty against the sentence of death recently pronounced upon him, and along with it a stirring appeal: "To his beloved brethren, the Commonalty of Scotland," urging that the care of religion fell to them also as being "God's creatures, created and formed in His own image," and having a right to defend their conscience against persecution. About this time, indeed, there was in Scotland a remarkable approximation to that solution of the toleration difficulty which later ages have approved; for the regent was "no favourite" of the queen; and the time had arrived when at least the penal statutes against heretics "be suspended and abrogated," and "that it be lawful to us to use ourselves in matters of religion and conscience as we must answer to God." It was a consummation too ideal for that early date; and next year the regent, whose daughter was now queen of France and there mixed up with the persecuting policy of the Guises, forbade the reformed preaching in Scotland. A rupture ensued at once, and Knox appeared in Edinburgh on the 2nd of May 1559 "even in the brunt of the battle." He was promptly "blown to the horns" at the Cross thing as an outlaw, or "the charge against him," and escaped to Dundee, and commenced public preaching in the chief towns of central Scotland. At Perth and at St Andrews his sermons were followed by the destruction of the monasteries, institutions disliked in that age in Scotland alike by the devout and the profane. But while he notes that in Perth the act was that of "the rascal multitude," he was glad to claim in St Andrews the support of the civic "authority"; and indeed the burghs, which were throughout Europe generally in favour of freedom, soon became in Scotland a main support of the Reformation. Edinburgh was still doubtful, and the queen regent held the castle; but a truce between her and the lords for six months to the 1st of January 1560 was arranged on the footing that every man there "may have freedom to use his own conscience to the day foresaid" —a freedom interpreted to let Knox and his brethren preach publicly and incessantly.

Scotland, like its capital, was divided. Both parties lapsed from the freedom-of-conscience solution to which each when unsuccessful appealed; both betook themselves to arms; and the immediate future of the little kingdom was to be decided by its external alliances. Knox now took a leading part in the great transaction by which the friendship of France was exchanged for that of England. He had one serious difficulty. Before Elizabeth's accession to the English crown, and after the queen mother in Scotland had disappointed his hopes, he had published a treatise against what he called "The Monstrous Regimen (regimem or government) of Women"; though the despotism of that despotic age was scarcely appreciably worse when it happened to be in female hands. Elizabeth never forgave him; but Cecil corresponded with the Scottish lords, and their answer in July 1559, in Knox's handwriting, assures England not only of their own constancy, but of "a charge and commandment to our posterity, that the amity and league between you and us, contracted and begun in Christ Jesus, may by them be kept inviolated for ever." The league was promised by England; but the army of France was first in the field, and towards the end of the year drove the forces of the "congregation" from Leith into Edinburgh, and then out of it in a midnight rout to Stirling—"that dark and dolorous night," as Knox long afterwards said, "wherein all ye, my lords, with shame and fear left this town," and from which only a memorable sermon by their great preacher roused the despairing multitude into new hope. Their leaders renounced allegiance to the regent; she ended her not unkindly, but as Knox calls it "unhappy," life in the castle of Edinburgh; the English troops, after the usual Elizabethan delays and evasions, joined their Scots allies; and the French embarked from Leith. On the 6th of July 1560 a treaty was at last made, nominally between Elizabeth and the queen of France and Scotland; while Cecil instructed his mistress's plenipotentiaries to agree "that the government of Scotland be granted to the nation of the land." The revolution was in the meantime complete; and Knox, who takes credit for having ended the enmity with England which was so long thought necessary for Scotland's independence, was strangely enough destined, beyond all other men, to leave the stamp of a more inward independence upon his country and its history.

At the first meeting of the Estates, in August 1560, the Protestants were invited to present a confession of their faith. Knox and three others drafted it, and were present when it was offered and read to the parliament. The statute-book says it was "by the estates of Scotland ratified and approved, as wholesome and sound doctrine grounded upon the infallible word of God, drawn from the Scriptures of the Old and New Testament, and the acts of the prophets and apostles, and drawn up independently, is in substantial accord with the others then springing up in the countries of the Reformation, but is Calvinist rather than Lutheran. It remained for two centuries the authorized Scottish creed, though in the first instance the faith of only a fragment of the people. Yet its approval became the basis for three acts passed a week later; the first of which, abolishing the pope's authority and jurisdiction in Scotland, may perhaps have been consistent with toleration, as the second, rescinding old statutes which had established and enforced that and other Catholic tenets, undoubtedly was. But the third, inflicting heavy penalties, with death on a third conviction, on those who should celebrate mass or even be present at it, showed that the reformer and his friends had crossed the line, and that their position could no longer be described as, in Knox's words, "requiring nothing but the liberty of conscience, and our religion and fact to be tried by the word of God." He was prepared indeed to fall back upon that, in the event of the Estates at any time refusing sanction to either church or creed, as their sovereign in Paris promptly refused it. But the parliament of 1560 gave no express sanction to the Reformed Church, and Knox did not wait until it should do so. Already in our towns and parishes Reformed, as the Confession puts it, there were local or particular kirk's, and these grew and spread and were provincially united, till, in the last month of this memorable year, the first General Assembly of their representatives met, and became the "universal kirk," or "the whole church convened." It had before it the plan for church government and maintenance, drafted in August at the same time with the Confession, under the name of The Book of Discipline, and by the same framers. Knox was even more clearly in this case the chief author, and he had by this time come to desire a much more rigid Presbyterianism than he had sketched in his "Wholesome Counsel" of 1555. In planning it he seems to have used his acquaintance with the "Ordonnances" of the Genevan Church under Calvin, and with the "Forma" of the German Church in London under John Laski (or A. Lascio). Starting with "truth" contained in Scripture as the church's foundation, and the Word and Sacraments as means of building it up, it provides ministers and elders to be elected by the congregations, with a subordinate class of "readers," and by their means sermons and prayers each Sunday in every parish. In large towns these were to be also on other days, with a weekly meeting for conference or "prophesying." The "plantation" of new churches is to go on everywhere under the guidance of higher church officers called superintendents. All are to help their brethren, "for no man may be permitted to live as best pleaseth him within the Church of God." And above all things the young and the ignorant are to be instructed, the former by a regular gradation or ladder of parish or elementary schools, secondary schools and universities. Even the poor were to be fed by the Church's hand; and behind
its moral influence, and a discipline over both poor and rich, was to be not only the coercive authority of the civil power but itself.

Knox had from the first proclaimed that "the teinds (tithe of yearly fruits) by God's law do not appertain of necessity to the kirkmen." And this book now demands that out of them "must not only the ministers be sustained, but also the poor and schools." But Knox broadens his plan so as to claim also the property which had been really gifted to the Church by princes and nobles—given by them indeed, as he held, without any moral right and to the injury of the people, yet so as to be enjoyed for an annual income and not property, whether land or the sheaves and fruits of land, and also from the property of burghers in the towns, Knox now held that the state should authorize the kirk to claim the salaries of the ministers, and the salaries of teachers in the schools and universities, but above all, the relief of the poor—not only of the absolutely "indigent" but of "your poor brethren, the labourers and handworkers of the ground." For the danger now was that some gentlemen were already cruel in exactions of their tenants, "requiring of them whatever before they paid to the Church, so that and papistical exactions were growing into the tyranny of the lords or of the laird." The danger was now to be turned from the new Church, and to the commonalty and poor, began to be fulfilled a month later, when the lords, some of whom had already acquired, as others were about to acquire, much of the Church property, declined to make any of it over for Knox's magnificent scheme. It was, they said, "a devout imagination." Seven years afterwards, however, when the contest with the Crown was ended, the kirk was expressly acknowledged as the only Church in Scotland, and jurisdiction given it over all who should attempt to be outsiders; while the preaching of the Evangel and the planting of congregations went on in all the accessible parts of Scotland. Gradually too stipends for most Scottish parishes were assigned to the ministers out of the yearly teinds; and the Church received—what it retained even down to recent times—the administration both of the public schools and of the Poor Law of Scotland. But the victorious rush of 1560 was already somewhat stayed, and the very next year raised the question whether the transfer of intolerance to the side of the new faith was as wise as it had at first seemed to be successful.

Mary Queen of Scots had been for a short time also queen of France, and had been returned to her native land, a young widow, on whom the eyes of Europe were fixed. Knox's objections to the "regiment of women" were theoretical, and in the present case he hoped at first for the best, favouring rather his queen's marriage with the heir of the house of Hamilton. Mary had put herself into the hands of her half-brother, Lord James Stuart afterwards earl of Moray, the only man who could perhaps have pulled her through. A proclamation now continued the "state of religion" begun the previous year; but mass was celebrated in the queen's household, and Lord James himself defended it with his sword against Protestant intrusion. Knox publicly protested; and Moray, who probably understood and liked both parties, brought the preacher to the presence of his queen. There is nothing revealed to us by "the broad clear light of that wonderful book,"1 The History of the Reformation in Scotland, more remarkable than the four Dialogues or interviews, which, though recorded only by Knox, bear the strongest stamp of truth, and do almost more justice to his opponent than to himself. Mary took the aggressive and very soon raised the real question. "Ye have taught the people to receive another religion than their princes can allow; and how can that doctrine be God, seeing not God and common subjects to obey their princes?" The point was made keener by the fact that Knox's own Confession of Faith (like all those of that age, in which an unbalanced monopolical power culminated) had held kings to be appointed "for maintenance of the true religion," and suppression of the false; and the reformer now fell back on his more fundamental principle, that "right religion took neither original nor authority from worldly princes, but from the Eternal God alone." All through this dialogue too, as in another at Lochleven two years afterwards, Knox was driven to axioms, not of religion but of constitutionalism, which Buchanan and he may have learned from their teacher Major, but which were not to be accepted till a later age. "'Think ye,' quoth she, 'that subjects, having power, may resist their princes?' 'If their princes exceed their bounds, Madam, they may be resisted and even deposed,'" Knox replied. But these dicta, creditable to both parties, had little effect upon the situation. Knox had gone too far in intolerance, and Moray and Maitland of Lethington gradually withdrew their support. The court and parliament, guided by them, declined to press the queen or to pass the Book of Discipline; and meantime the negotiations as to the queen's marriage with a Spanish, a French or an Austrian prince revealed the real difficulty and peril of the situation. Her marriage to a great Catholic prince would be ruinous to Scotland, probably also to England, and perhaps to all Protestantism. Knox had already by letter formally broken with the earl of Moray, "committing you to your own conscience and to the conscience of those who shall follow you," and now, in one of his greatest sermons before the assembled lords, he drove at the heart of the situation—the risk of a Catholic marriage. The queen sent for him the last time and burst into passionate tears as she asked, "What have you to do with my marriage? Or what are you within this commonwealth?" "A subject born within the same," was the answer of the son of the East Lothian peasant; and the Scottish nobility, while thinking him bold, refused to find him guilty of any crime, even when, later on, he had "convocated the legions to Edin- burgh to meet a crown prosecution. In 1564 a change came. Mary had wearied of her guiding statesmen, Moray and the more pliant Maitland; the Italian secretary David Rizzio, through whom she had corresponded with the pope, now more and more usurped their place; and a weak fancy for her handsome cousin, Henry Darnley, brought about a sudden marriage in 1565 and swept the opposing Protestant lords into exile. Darnley, though a Catholic, thought it well to go to Knox's preaching; but was so unfortunate as to hear a very long sermon, with allusions not only to "babes and women " as rulers, but to Ahab who did not control his strong-minded wife. Mary and the lords still in her court ordered Knox not to preach in Edinburgh, and he was absent or silent during the weeks in which the queen's growing distaste for her husband, and advancement of Rizzio over the nobility remaining in Edinburgh, brought about the conspiracy by Darnley, Morton and Ruthven. Knox does not seem to have known beforehand of Rizzio's "slaughter," which had been intended to be a semi-judicial act; but soon after it he records that "that vile knave Davie was justly punished, for abusing of the commonwealth, and for other villainy which we list not to express." The immediate effect however of what Knox thus approved was to bring his cause to its lowest ebb, and on the very day when Mary rode from Holyrood to her army, he sat down and penned the prayer, "Lord Jesus, put an end to this my miserable life, for justice and truth are not to be found among the sons of men!" He added a short autobiographic fragment, whose mingled self-abasement and exultation are not unworthy of its striking title—"John Knox, with deliberate mind, to his God." During the rest of the year he was hidden in Ayrshire or elsewhere, and throughout 1566 he was forbidden to preach when the court was in Edinburgh. But he was influential at the December Assembly in the capital where a greater tragedy was now preparing for Mary's infatuation for Bothwell was visible to all. At the Assembly's request, however, Knox undertook a long visit to England, where his two sons by his first wife were being educated, and were afterwards to be Fellows of St John's, Cambridge, the younger becoming a parish clergyman. It was thus during the reformer's absence that the murder of Darnley, the abduction and subsequent marriage of Mary, the flight of Bothwell, and the imprisonment in Lochleven of the queen, unrolled themselves

1John Hill Burton (Hist. of Scotland, iii. 339). Mr Burton's view (differing from that of Professor Hume Brown) was that the dialogues—the earlier of them at least—must have been spoken in the French tongue, in which Knox had recently preached for a year.
KNOX, P. C.

before the eyes of Scotland. Knox returned in time to guide the Assembly which sat on the 25th of June 1567 in dealing with this unparalleled crisis, and to wind up the revolution by preaching at Stirling on the 9th of July 1567, after Mary's abdication, at the coronation of the infant king. His main work was now really done; for the parliament of 1567 made back on that stormy life, that Knox had only too glad to have his old friend back in power, though they seem to have differed on the question whether the queen should be allowed to pass into retirement without trial for her husband's death, as they had differed all along on the question of tolerating her private religion. Knox's victory had not come too early, for his physical strength soon began to fail. But Mary's escape in 1568 resulted only in her defeat at Langside, and in a long imprisonment and death in England. In Scotland the regent's assassination in 1570 opened a miserable civil war, but it made no permanent change. The massacre of St Bartholomew roused united English and Scottish Protestantism; and Knox in St Giles' pulpit, challenging the French ambassador to report his words, denounced God's vengeance on the crown murder and his posterity. When open war broke out between Edinburgh Castle, held by Mary's friends, and the town, held for her son, both parties agreed that the reformer, who had already had a stroke of paralysis, should remove to St Andrews. While there he wrote his will, and published his last book, in the preface to which we says, "I heartily take my good-night of the faithful of both realms... for as the thief is worse than I am I O

But Knox himself had a short time before put in writing a larger claim for the historic future, "What I have been to my country, though this unthankful age will not know, yet the ages to come will be compelled to bear witness to the truth." Knox was a rather small man, with a well-knit body; he had a powerful face, with dark blue eyes under a ridge of eyebrow, high cheek-bones, and a long black beard which latterly turned grey. This description, taken from a letter in 1570, by his junior contemporary Sir Peter Young, is very like Beza's fine engraving of him in the *Icones*—an engraving probably founded on a portrait which was to be sent by Young to Beza along with the letter. The portrait, which was unfortunately adopted by Carlyle, has neither pedigree nor probability. After his two years in the French galleries, if not before, Knox suffered per

2. On Protestantism: an Answer to an Anabaptist (London, 1591). 3. On Prayer (1554). 4. On Affliction (1556). 5. Epistles, to Martin Bucer, John Brown, and others (1566). 6. The Blast of the Trumpet against the Monstrous Regiment of Women (1555). 7. An Answer to a Scottish Jesuit (1572). Knox's life is more or less touched upon by all the Scottish historians and Church historians which include his period, as well as in the mass of literature as to Queen Mary. Dr Laing's edition of the *Works* contains important biographical material. But among the many biographies two especially should be consulted—those by Thomas McCrie (Edinburgh, 1811; revised and enlarged in 1813, the later editions containing valuable notes by the author); and by P. Hume Brown (Edinburgh, 1895). John Knox and the Reformer (London and Edinburgh, 1883) is a biography as a collection of materials, bearing upon many parts of the life, but nearly all on the unfavourable side. (A. T. L.)

KNOX, PHILANDER CHASE (1835-1906), American lawyer and political leader, was born in Brownsville, Pennsylvania, on the 4th of May 1835. He graduated from Mount Union College (Ohio) in 1852, and was admitted to the Pennsylvania bar in 1875. He settled in Pittsburg, where he continued in private practice, with the exception of two years' service (1876-1877) as assistant United States district attorney, acquiring a large practice as a corporation lawyer. In April 1891 he became the law general of Pennsylvania (1891-1895) under Governor McKinley, and retained this position after the accession of President Roosevelt until June 1904, when he was appointed by Governor Pennypacker of Pennsylvania to fill the unexpired term of Matthew S. Quay in the United States Senate; in 1905 he
was re-elected to the Senate for the full term. In March 1909 he became secretary of state in the cabinet of President Taft.

KNOXVILLE, a city and the county-seat of Knox county, Tennessee, U.S.A., in the E. part of the state, 160 m. E. of Nashville, and about 100 m. S.E. of Louisville, Kentucky, on the right bank of the Tennessee river, 4 m. below the point where it is formed by the junction of the French Broad and Holston Rivers. Pop. (1880), 9603; (1890), 22,525; (1900), 32,637, of whom 7359 were negroes and 895 were foreign-born; (1910 census), 36,346. It is served by the main line and by branches of the Louisville & Nashville and the Southern railways, by the Knoxville &互联铁路 (Morristown to Knoxville, 33 m.), by the short Knoxville & Augusta railroad (Knoxville to Walland, 26 m.), and by passenger and freight steamboat lines on the Tennessee river, which is here navigable for the greater part of the year. A steel and concrete street-car bridge crosses the Tennessee at Knoxville. Knoxville is picturesquely situated at an elevation of from 850 to 1000 ft. in the valley between the Smoky Mountains and the Cumberland Mountains, and is one of the healthiest cities in the United States. There are several beautiful parks, of which Chilhowie and Fountain City are the largest. The city has public buildings, academy and boys' school, an old state capitol, a court-house, the Knoxville general hospital, the Lincoln memorial hospital, the Margaret McClung industrial home, a Young Men's Christian Association building and the Lawson-McGhee public library. A monument to John Sevier stands on the site of the blockhouse first built there. Knoxville is the seat of Knoxville College (United Presbyterian, 1873) for negroes, East Tennessee institute, a secondary school for girls, the Baker-Hitel school for boys, Tennessee Medical College (1886), two commercial schools and the university of Tennessee. The last, a state co-educational institution, was chartered as Blount College in 1794 and as East Tennessee College in 1807, but not opened until 1820—the present name was adopted in 1879. It had in 1867-1868 166 instructors, 755 students (556 in academic departments), and a library of 25,000 volumes. With the university is combined the state college of agriculture and engineering; and a large summer school for teachers is maintained. At Knoxville are the Eastern State insane asylum, state asylums for the deaf and dumb (for both white and negro), and a national cemetery in which more than 3200 soldiers are buried. Knoxville is an important commercial and industrial centre, and has a large tobacco business. It is near hardwood forests and is an important market for hardwood mantels. Coal-mines in the vicinity produce more than 2,000,000 tons annually, and neighbouring quarries furnish the famous Tennessee marble, which is largely exported. Excellent building and pottery clays are found near Knoxville. Among the city's industrial establishments are flour and gist mills, cotton and woollen mills, furniture, desk, office supplies and sash, door, and blind factories, meat-packing establishments, clothing factories, iron, steel and boiler works, foundries and machine shops, stove works and brick and cement works. The value of the factory produce increased from $6,201,840 in 1900 to $14,437,856 in 1905, or 100.5%, in 1905 the value of the flour and gist mill products alone being $2,048,509. Just outside the city the Southern railway maintains large car and repair shops. Knoxville was settled in 1786 by James White (1737-1813), a North Carolina pioneer, and was first known as "White's Fort"; it was laid out as a town in 1791, and named in honour of General Henry Knox, then secretary of war in Washington's cabinet. In 1791 the "Knoxville Gazette," the first newspaper in Tennessee (the early issue, printed at Rogersville) began publication. It was in 1792 that the "Knoxville Republican," the first paper in the state, was established at the "Territory South of the Ohio," and until 1811 and again in 1817 it was the capital of the state. In 1796 the convention which framed the constitution of the new state of Tennessee met here, and here later in the same year the first state legislative session was convened. Knoxville was chartered as a city in 1815. In its early years it was several times attacked by the Indians, but was never captured. During the Civil War there was considerable Union sentiment in East Tennessee, and in the summer of 1863 the Federal authorities determined to take possession of Knoxville as well as Chattanooga and to interrupt railway communications between the Confederates of the East and West through this region. As the Confederates had erected only slight defences for the protection of the city, Burnside, with about 12,000 men, easily possessed possession on the 2nd of September 1863. Fortifications were immediately begun for its defence, and on the 4th of November, Bragg, thinking his position at Chattanooga impregnable against Grant, Sherman, Thomas and Hooker, despatched a force of 20,000 men under Longstreet to engage Burnside. Longstreet arrived in the vicinity on the 16th of November, and on the 18th of that day began a long artillery duel which continued without success until the 28th, when a desperate but unsuccessful attack was made on Fort Sanders, and upon the approach of a relief force under Sherman, Longstreet withdrew on the night of the 4th of December. The Confederate losses during the siege were 182 killed, 768 wounded and 192 captured or missing; the Union losses were 92 killed, 394 wounded and 207 captured or missing. West Knoxville (incorporated in 1888) and North Knoxville (incorporated in 1886) were annexed to Knoxville in 1898.

See the sketch by Joshua W. Caldwell in "Historic Towns of the Southern States," edited by L. P. Powell (New York, 1900); and W. Rule, G. F. Mellen and J. Cookridge, "Standard History of Knoxville" (Chicago, 1900).

KNUCKLE (apparently the diminutive of a word for "bone," found in Ger. Knöchel), the joint of a finger, which, when the hand is shut, is brought into prominence. In mechanical use the word is applied to the round projecting part of a hinge through which the pin is run, and in ship-building to an acute angle on some of the timbers. A "knuckle-duster," said to have originally come from the criminal slang of the United States, is a brass or metal instrument fitting on to the hand across the knuckles, with projecting studs and used for inflicting a brutal blow.

KNUCKLEBONES (HUCKLEBONES, DIBS, JACKSTONES, CHUCK-STONES, FIVE-STONES), a game of very ancient origin, played with five small objects, originally the knucklebones of a sheep, which are thrown up and caught in various ways. Modern "knucklebones" consist of six points, or knobs, proceeding from a common base, and are usually of metal. The winner is he who first completes successfully a prescribed series of throws, which, while of the same general character, differ widely in detail. The simplest consists in tossing up one stone, the face, and picking up one or more from the table while it is in the air; and so on until all five stones have been picked up. Another consists in tossing up first one stone, then two, then three and so on, and catching them on the back of the hand. Different throws have received distinctive names, such as "riding the elephant," "peas in the pod," and "horses in the stable." The origin of knucklebones is closely connected with that of dice, of which it is probably a primitive form, and is doubtless Asiatic. Sophocles, in a fragment, ascribed the invention of draughts and knucklebones (στρατεύματα) to Palamedes, who taught them to his Greek countrymen during the Trojan War. Both the Iliad and the Odyssey contain allusions to games similar in character to knucklebones, and the Palamedes tradition, as flatteringly to the national pride, was generally accepted throughout Greece, as is indicated by numerous literary and plastic evidences. Thus Pausanias (Corinth xx.) mentions a temple of Fortune in which Palamedes made an offering of his newly invented game. According to a still more ancient tradition, Zeus, perceiving that Ganymede longed for his playmates upon Mount Ida, gave him Eros, for a companion and golden dils with which to play, and even descended sometimes to join in the game (Apollonius). It is significant, however, that both Herodotus and Plato ascribe to the game a foreign origin. Plato (Phaedrus) names the Egyptian god Theuth as its inventor, while Herodotus relates that the Lydians, during a period of famine in the days of King Atys, originated this game and indeed almost all other games except chess. There were two methods of playing in ancient times. The first, and probably the primitive method, consisted in tossing up and catching the bones on the
back of the hand, very much as it is played to-day. In the Museum of Naples may be seen a painting excavated at Pompeii, which represents the goddesses Latona, Niobe, Phoebe, Aglaia and Hileaera, the last two being engaged in playing at knucklebones (see Greek Art, fig. 42). According to an epigram of Asclepiodotus, astragals were given as prizes to school-children, and we are reminded of Platarch's anecdote of the youthful Alciabdes, who, when a teamster threatened to drive over some of his knucklebones that had fallen into the wagon-ruts, boldly threw himself in front of the advancing team. This simple form of the game was generally played only by women and children, and was called *pentalitha* or five-stones. There were several varieties of it besides the usual toss and catch, one being called *tropaia*, or bowl-game, the object having been to toss the bones into a hole in the earth. Another was the simple and primitive game of "odd or even."

The second, probably derivative, form of the game was one of pure chance, the stones being thrown upon a table, either with the hand or from a cup, and the values of the sides upon which they fell counted. In this game the shape of the pastern-bones used for astragali, as well as for the *tali* of the Romans, with whom knucklebones was also popular, determined the manner of counting. The pastern-bone of a sheep, goat or calf has, besides two rounded ends upon which it cannot stand, two broad and one thin; one of each of being concave and one convex. The convex narrow side, called *chias* or "the dog" counted 1; the convex broad side 3; the concave broad side 4; and the concave narrow side 6. Four astragals were used and 35 different scores were possible at a single throw, many receiving distinctive names such as Aphyrodite, Midas, Solon, Alexander, and, among the Romans, Venus, King, Vulture, &c. The highest throw in Greece, counting 40, was the Euripides, and was probably a combination throw, since more than four sides could not be thrown at one time. The lowest throw, both in Greece and Rome, was the Dog.

See Cassell's *Book of Sports and Pastimes* (London, 1896); *Games and Songs of American Children*, by W. W. Newell (1893); and *The Young Folks' Cyclopedia of Games and Sports* (New York, 1890), for the modern children's game. For the history see *Les Jeux des Anciens*, by L. Becq de Fouquieres (Paris, 1866); *Das Knochenspiel der Alten*, by Boite (Wismar, 1886); *Die Spiele der Griechen und Römer*, by W. Richter (Leipzig, 1887).

**KNUTSFORD**, a market town in the Knutsford parliamentary division of Cheshire, England; on the London & North Western and Great Central railways, 24 m. E.N.E. of Chester, on the Chesire Lines and London & North-Western railway. Pop. of urban district (1901), 5172. It is pleasantly situated on an elevated ridge, with the fine domains of Tatton Park and Tabley respectively north and west of it. The meres in these domains are especially picturesque. Knutsford is noted in modern times as the scene of Mrs Gaskell's novel *Cranford*. Among several ancient houses the most interesting are a cottage with the date 1411 carved on its woodwork, and the Rose and Crown tavern, dated 1641. A number of curious old customs linger in the town, such as the practice of working designs in coloured sand, when a wedding takes place, before the bride's house. In what is probably the oldest Unitarian graveyard in the kingdom Mrs Gaskell lies buried; and in a churchyard a mile from the town stood the ancient church, which, though partially rebuilt in the time of Henry VIII., fell into ruin in 1743. The church of St John, built in 1744, and enlarged in 1789, was supplemented, in 1850, by St Cross Church, in Perpendicular style. The town has a grammar school, founded before the reign of Henry VIII., but reorganized in 1882. Lord Egerton built the grammar schools in 1893. The industries comprise cotton, worsted and leather manufactures; but Knutsford is mainly a residential town, as many Manchester merchants have settled here, attracted by the fine climate and surroundings. Knutsford was the birthplace of Sir Henry Holland, Physician Extraordinary to Queen Victoria (1788-1873); and his son, the second Sir Henry, who was secretary of state for the colonies (1887-1892), was raised to the peerage in 1888 with the title of Baron Knutsford.

The name Knutsford (*Cunetoeorf*, *Knutesford*) is said to signify *Cnut's ford*, but there is no evidence of a settlement here previous to Domesday. In 1686 Erthebrand held Knutsford immediately of William FitzNigel, baron of Halton, who was himself a vassal of the lord of Hugh Lupus earl of Chester. In 1292 William de Tabley, lord of both Over and Nether Knutsford, granted free burbage to his burgesses in both Knutsfords. This charter is the only one which gives Knutsford a claim to the title of borough. It provided that the burgesses might elect a bailiff from amongst themselves every year. The office however carried little real power with it, and soon lapsed. In the same year as the charter to Knutsford the king granted to William de Tabley a market every Saturday at Nether Knutsford, and a three days' fair at the Feast of St Peter and St Paul. When this charter was confirmed by Edward III. and enlarged (1366) and another three days' fair (Feast of St Simon and St Jude) were added. The Friday market was certainly dropped by 1592, if it was ever held. May-day revels are still kept here and attract large crowds from the neighbourhood. A silk mill was erected here in 1770, and there was also an attempt to foster the cotton trade, but the lack of means of communication made the undertaking impossible.

**KOALA** (*Phascolarctus cinereus*), a stoutly built marsupial, of the family *Phascolomyidae*, which also contains the wombats. This animal, which inhabits the south-eastern parts of the Australian continent, is about 2 ft. in length, and of an ash-grey colour, an excellent climber, residing generally in lofty eucalyptus trees. It is of medium size. It is not only a useful animal, and a source of food, but occasionally it descends to the ground to eat and browse on vegetation. The flesh is highly prized by the natives, and is palatable to Europeans. The skins are largely imported into England, for the manufacture of articles in which a cheap and durable fur is required.

**KOBDO**, a town of the Chinese Empire, in north-west Mongolia, at the northern foot of the Mongolian Altai, on the right bank of the Buyantu River, 13 m. from its entrance into Lake Khara-uss; 500 m. E.S.E. of Biysk (Russian), and 470 m. W. of Ulyasutai. It is situated amidst a dreary plain, and consists of a fortress, the residence of the governor of the Kobdo district, and a small trading town, chiefly peopled by Chinese and a few Mongols. It is, however, an important centre for trade between the cattle-breeding nomads and Peking. It was founded by the Chinese in 1731, and pillaged by the Musulmans in 1872. The district of Koboo occupies the north-western corner of Mongolia, and is peopled chiefly by Mongols, and also by Kirghiz and a few Soyotes, Uryankhees and Khadis. It is governed by a Chinese commissioner, who has under him a special Mongol functionary (*Mongol, Dawson*). The chief monastery is at Ulangom. Considerable numbers of sheep (about 1,000,000), sheepkins, sheep and camel wool are exported to China, while Chinese cottons, brick tea and various small goods are imported. Leather, velvet, cotton, iron and copper goods boxes, &c., are imported from Russia in exchange for cattle, furs and wool. The absence of a cart road to Biysk hinders the development of this trade.

**WOLFGANG XAVER FRANZ**, Baron von (1803-1882), German mineralogist, was born at Munich on the 19th of July 1803. He studied chemistry and mineralogy at Landshut (1820-1823), and in 1826 became professor of mineralogy in the university of Munich. He introduced some new methods of mineral analyses, and in 1855 invented the stauroscope for the study of the optical properties of crystals. He contributed numerous papers to scientific journals, and described many new minerals. He died at Munich on the 11th of November, 1882.

**KOPELL**
Koch, Robert (1843–1910), German bacteriologist, was born at Klausenthal, Hanover, on the 11th of December 1843. He studied medicine at Göttingen, and it was while he was practising as a physician at Wollstein that he began those bacteriological researches that made his name famous. In 1876 he obtained a pure culture of the bacillus of anthrax, announcing a method of preventive inoculation against that disease seven years later. He became a member of the Sanitary Commission at Berlin and a professor at the School of Medicine in 1880, and five years later he was appointed to a chair in Berlin University and director of the Institute of Health. In 1882, largely as the result of the improved methods of bacteriological investigation that he was able to elaborate, he discovered the bacillus of tuberculosis; and in the following year, having been sent on an official mission to Egypt and India to study the aetiology of Asiatic cholera, he identified the comma bacillus as the specific organism of that malady. In 1890 great hopes were aroused by the announcement that in tuberculin he had prepared an agent which exercised an inimical influence on the growth of the tubercle bacillus, but the expectations that were formed of it as a remedy for consumption were not fulfilled, though it came into considerable vogue as a means of discarding the existence of the bacillus in animals intended for food. At the Congress on Tuberculosis held in London in 1901 he maintained that tuberculosis in man and in cattle is not the same disease, the practical inference being that the danger to men of infection from milk and meat is less than from other human subjects suffering from the disease. This statement, however, was not regarded as properly proved, and one of its results was the appointment of a British Royal Commission to study the question. Dr Koch also investigated the nature of rinderpest in South Africa in 1896, and found means of combating the disease. In 1897 he went to Bombay at the head of a commission formed to investigate the bubonic plague, and he subsequently undertook extensive travels in pursuit of his studies on the origin and treatment of malaria. He was summoned to South Africa a second time in 1903 to give expert advice on other cattle diseases, and on his return was elected a member of the Berlin Academy of Sciences. In 1906–1907 he spent eighteen months in East Africa, investigating sleeping-sickness. He died at Baden-Baden of heart-disease on the 28th of May 1910. Koch was undoubtedly one of the greatest bacteriologists ever known, and a great benefactor of humanity by his work in the field of bacteriology. These discoveries were brought to his own people in Germany, and in 1905 he was awarded the Nobel prize for medicine.

Among his works may be mentioned: Weitere Mitteilungen über ein neues Infektions-Mittel (Hamburger Beiträge, 1883); and Mitteilungen über Rinderpest, Bubonepsis in Indien und Afrika, Tsetse- oder Sura-Krankheit, Texasfeber, tropische Malaria, Schneeuferzferber (Berlin, 1893). From 1880 onwards he edited, with Dr Karl Flugge, the Zeitschrift für Hygiene und Infektionskrankheiten (published at Leipzig). See Loeffler, "Robert Koch, zum 60ten Geburtstage" in Deutsch. Medizin. Wochenschr. (No. 50, 1903).

Koch, a tribe of north-eastern India, which has given its name to the state of Kuch Behar (q.v.). They are probably of Mongolian stock, akin to the Mech, Kachari, Garo and Tippera tribes, and originally spoke, like these, a language of the Bodo group. But since one of their chiefs established a powerful kingdom at Kuch Behar in the 16th century they have gradually become Hinduised, and now adopt the name of Rajbangs ("of royal blood"). In 1901 the number in Eastern Bengal and Assam was returned at nearly 2½ millions.

Koch, Charles Paul de (1753–1871), French novelist, was born at Paris on the 21st of May 1753. He was a posthumous child, his father, a banker of Dutch extraction, having been a victim of the Terror. Paul de Koch began life as a banker's clerk. For the most part he resided on the Boulevard St Martin, and was one of the most inveterate of Parisians. He died in Paris on the 27th of April 1871. He began to write for the stage very early, and composed many operatic libretti. His first novel, Le Enfant de ma femme (1811), was published at his own expense. In 1820 he began his long and successful series of novels dealing with Parisian life with Georgette, ou la mère du tabac. His period of greatest and most successful activity was the Restoration and the early days of Louis Philippe. He was relatively less popular in France itself than abroad, where he was considered as the special painter of life in Paris. Major Pendennis's remark that he had read nothing of the novel kind for thirty years except Paul de Koch, "who certainly made him laugh," is likely to remain one of the most durable of his testimonials, and may be classed with the legendary question of a foreign sovereign to a Frenchman who was paying his respects, "Vous venez de Paris et vous devez savoir des nouvelles. Comment se porte Paul de Kock?" The disappearance of the romance and of the cheque dissipation described by Henri Murger practically made Paul de Koch obsolete. But to the student of manners his portraiture of low and middle class life in the first half of the 19th century at Paris still has its value.

The works of Paul de Kock are very numerous. With the exception of a few not very felicitous excursions into historical romance and some miscellaneous works of which his share in La Grande ville, Paris (1842), is the chief, they are all stories of middle-class Parisian life, of guignoltes and cabarets and equivoval adventures of one sort or another. The most famous are André le Savoyard (1825) and Le Barbier de Paris (1826).

His Mémoires were published in 1873. See also Th. Trimm, La Vie de Charles Paul de Kock (1873).

KODAIKANAL, a sanatorium of southern India, in the Madura district of Madras, situated in the Palni hills, about 7000 ft. above sea-level; pop. (1911), 1972, but the number in the hot season would be much larger. It is difficult of access, being 44 m. from a railway station, and the last 1 m. are impracticable for wheeled vehicles. It contains a government observatory, the appliances of which are specially adapted for the study of terrestrial magnetism, seismology and solar physics.

KODAMA, Gentaro, Count (1852–1907), Japanese general, was born in Choshu. He studied military science in Germany, and was appointed vice-minister of war in 1892. He became governor-general of Formosa in 1900, holding at the same time the portfolio of war. When the conflict with Russia became imminent in 1903, he gave up his portfolio to become vice-chief of the general staff, a sacrifice which elicited much public applause. Throughout the Russo-Japanese War (1904–5)he served as chief of staff to Field Marshal Oyama, and it was well understood that his genius guided the strategy and execution of the campaign, as that of General Kawakami had done in the war with China ten years previously. General Kodama was raised in rapid succession to the ranks of baron, viscount and count, and his death in 1907 was regarded as a national calamity.

KODUNGALUR (or CRANGANUR), a town of southern India, in Cochin state, within the presidency of Madras. Though now a place of little importance, its historical interest is considerable. Tradition assigns to it the double honour of having been the first field of St Thomas's labours (A.D. 52) in India and the seat of Cheraman Perumal's government. The visit of St Thomas is generally considered mythical; but it is certain that the Syrian Church was firmly established here before the 9th century (Burnell), and probably the Jews' settlement was still earlier. The latter, in fact, claim to hold grants dated A.D. 378. The cruelty of the Portuguese drove most of the Jews to Cochín. Up to 1314, when the Vypin harbour was formed, the only opening in the Cochin backwater, and outlet for the Periyar, was at Kodungalur, which must then have been the best harbour on the coast. In 1502 the Syrian Christians invoked the protection of the Portuguese, who in the latter built their first fort there, and in 1565 enlarged it. In 1661 the Dutch took the fort, the possession of which for the next forty years was contested between this nation, the zamorin, and the raja of Kodungalur. In 1776 Tippoo seized the stronghold. The Dutch recaptured it two years later, and, having ceded it to Tippoo in 1784, sold it to the Travancore raja, and again in 1789 to Tippoo, who destroyed it in the following year. The country round Kodungalur now forms an autonomous principality, tributary to the raja of Cochin.
KOEING—KOHLHASE

KOEING, KARL DIETRICH EBERHARD (1774–1851), German palaeontologist, was born at Brunswick in 1774, and was educated at Göttingen. In 1807 he became assistant keeper, and in 1813 he was appointed keeper, of the department of natural history in the British Museum, and northward of frontier tracts, reticulating the period until the close of his life. He described many fossils in the British Museum in a classic work entitled Icones fossilium sectiles (1820–1825). He died in London on the 6th of September 1851.

KOESFELD, a town of Germany, in the Prussian province of Westphalia, on the Berkel, 38 m. by rail N.W. of Dortmund. Pop. (1900), 8440. It has three Roman Catholic churches, one of which—the Gymnasial Kirche—is used by the Protestant community. Here are the ruins of the Ludgeri Castle, formerly the residence of the bishops of Münster, and also the west end of Varlar, the residence of the princes of Salms-Horstmar. The leading industries include the making of linen goods and machinery.

KOHAT, a town and district of British India, in the Peshawar division of the North-West Frontier Province. The town is 37 m. south of Peshawar by the Kohat Pass, along which a military road was opened in 1901. The population in 1901 was 30,762, including 12,670 in the cantonment, which is garrisoned by artillery, cavalry and infantry. In the Tirah campaign of 1897–98 Kohat was the starting-point of Sir William Lockhart's advance against the Afridis, and as it was the military base for the southern Afridi frontier as Peshawar is for the northern frontier of the same tribe, and it lies in the heart of the Pathan country.

The District of Kohat has an area of 2973 sq. m. It consists chiefly of a bare and intricate mountain region east of the Indus, deeply scored with river valleys and ravines, but enclosing a few scattered patches of cultivated lowland. The eastern or Kohattak country especially comprises a perfect labyrinth of ranges, which fall, however, into two principal groups, to the north and south of the Indus, the Miranzai, in the Miran Valley, in the river Indus, which is the military base for the northern Afridi frontier as Peshawar is for the northern frontier of the same tribe, and it lies in the heart of the Pathan country.

The District of Kohat has an area of 2973 sq. m. It consists chiefly of a bare and intricate mountain region east of the Indus, deeply scored with river valleys and ravines, but enclosing a few scattered patches of cultivated lowland. The eastern or Kohattak country especially comprises a perfect labyrinth of ranges, which fall, however, into two principal groups, to the north and south of the Indus, the Miranzai, in the Miran Valley, in the river Indus, which is the military base for the northern Afridi frontier as Peshawar is for the northern frontier of the same tribe, and it lies in the heart of the Pathan country.

KOHAT PASS, a mountain pass in the North-West Frontier Province of India, connecting Kohat with Peshawar. From the north side the defile commences at 4½ m. S.W. of Fort Mackeson, whence it is about 12 or 13 m. to the Kohat entrance. The pass varies from 400 yds. to 1 m. in width, and its summit is some 600 to 700 ft. above the plain. It is inhabited by the Akram Khel Afridis, a nearly all British relations with that tribe have been concerned with this pass, which is the only connexion between two British districts without crossing and recrossing the Indus (see ARAKIN). It is now traversed by a cart-road.

KOHISTAN, a tract of country on the Peshawar border of the North-West Frontier Province of India. Kohistan means the "country of the hills" and corresponds to the English word highlands; but it is specially applied to a district, which is very little known, to the south and west of Chilas, between the Kagan Kohistan and the river Indus. It comprises an area of over 1000 sq. m., and is bounded on the N.W. by the river Indus, on the N.E. by Chilas, and on the S. by Kagan, the Chor Glen and Allai. It consists roughly of two main valleys running east and west, and separated from each other by a mountain range over 16,000 ft. high. Like the mountains of Chilas, those in Kohistan are snow-bound and rocky wastes from their crests downwards to 12,000 ft. Below this the hills are covered with fine forest and grass to 5000 or 6000 ft., and in the valleys, especially near the Indus, are fertile basins under cultivation. The Kohistanis are Mahomedans, but not of Pathan race, and adhere to the Hindu Kush, and they are a quiet, brave but quiet people who carry on a trade with British districts and have never given the government much trouble. There is little doubt that the Kohistanis are like the Kafirs of Kafiristan, the remnants of old races driven by Mahomedan invasions from the valleys and plains into the higher mountains. The majority have been converted to Islam within the last 200 years. The total population is about 16,000.

An important district also known as Kohistan lies to the north of Kabul in Afghanistan, extending to the Hindu Kush. The Kohistanis are a powerful, well-organized people, and it is impossible to prove the great city of Alexander's founding, known to be to the north of Kabul, but which had hitherto escaped identification.

The name of Kohistan is also applied to a tract of barren and hilly country on the east border of Karachi district, Sindh.

KOHL, (1) The name of the cosmetic used from the earliest times in the East by women to darken the eyelids, in order to increase the lustre of the eyes. It is usually composed of finely powdered antimony, but smoke black obtained from burnt almond-shells or frankincense is also used. The Arabic word kohl, from which has been derived "alcohol," is derived from kabula, to stain. (2) "Kohl" or "kohl-ralbi" (cole-rape, from Lat. coulis, cabbage) is a kind of cabbage (q.v.), with a turnip-shaped top, cultivated chiefly as food for cattle.

KOHLHASE, HANS, a German historical figure about whose personality some controversy exists. He is chiefly known as the hero of Heinrich von Kleist's novel, Michael Kohlhäus. He was a merchant, and not, as some have supposed, a horsedealer, and he lived at Köln in Brandenburg. In October 1532, so the story runs, whilst proceeding to the fair at Leipzig, he was attacked and his horses were taken from him by the servants of a Saxon nobleman, one Günter von Zaschwitz. In consequence of the delay the merchant suffered some loss of business at the fair and on his return he refused to pay the small sum which Zaschwitz demanded as a condition of returning the horses. Instead Kohlhase asked for a substantial amount of money as compensation for his loss, and failing to secure this he invoked the aid of his sovereign, the elector of Brandenburg. Finding however that it was impossible to recover his horses, he paid Zaschwitz the sum required for them, but reserved to himself the right to take further action. Then unable to obtain redress
KOKOMO—KOLAR

in the courts of law, the merchant, in a Feledbrief, threw down a challenge, not only to his aggressor, but to the whole of Saxony. Acts of lawlessness were soon attributed to him, and after an attempt to settle the feud had failed, the elector of Saxony, John Frederick I., set a price upon the head of the angry merchant. Kohlhaase now sought revenge in earnest. Gathering around him a band of criminals and of desperadoes he spread terror throughout the whole of Saxony; travellers were robbed, villages were burned and cattle plundered. For some time the authorities were practically powerless to stop these outrages, but in March 1849 Kohlhaase and his principal associate, Georg Nagelschmidt, were seized, and on the 22nd of the month they were broken on the wheel in Berlin.

The life and fate of Kohlhaase are dealt with in several dramas. See Burkhart, Der historische Hans Kohlhaase und H. von Kleist, Michael Kohlhaase (Leipzig, 1864).

KOKOMO, a city and the county-seat of Howard county, Indiana, U.S.A., on the Wildcat River, about 30 m. N. of Indianapolis. Pop. (1890), 8,621; (1900), 10,600 of whom 499 were foreign-born and 359 negroes; (1910 census), 17,010. It is served by the Lake Erie & Western, the Pittsburg, Cincinnati, Chicago & St. Louis, and the Toledo St. Louis & Western railways, and by two interurban electric lines. Kokomo is a centre of trade in agricultural products, and has various manufactures, including flint, plate and opalescent glass, &c. The total value of the factory product increased from $2,682,156 in 1904 to $3,051,105 in 1905, and 77.1%; and in 1905 the glass product was valued at $864,567, or 23.7% of the total. Kokomo was settled about 1840 and became a city (under a state law) in 1863.

KOKO-NOR (or KUKU-NOR) (Tsing-hai of the Chinese, and Tsso-ngombo of the Tanguts), a lake of Central Asia, situated at an altitude of 997 ft., in the extreme N.E. of Tibet, 30 m. from the W. frontier of the Chinese province of Kan-suh, in 100° E. and 37° N. It lies amongst the eastern ranges of the Kuen-lun, having the Nan-shan Mountains to the north, and the southern Kokonor range (10,000 ft.) on the south. It measures 66 m. by 40 m., and contains half a dozen islands, on one of which is a Buddhist (i.e. Lamaist) monastery, to which pilgrims resort. The water is salt, though an abundance of fish live in it, and it often remains frozen for three months together in winter. The surface is at times subject to considerable variations from season to season. The lake is entered on the west by the river Bu-hain-gol. The nomads who dwell round its shores are Tanguts.

KOKSHAROV, NIKOLAI IVANOVICH VON (1818-1893), Russian mineralogist and major-general in the Russian army, was born at Usti-Kamengorek in Tomsk, on the 4th of December 1818 (o.S.). He was educated at the military school of mines in St Petersburg. At the age of twenty-two he was selected to accompany R. I. Marchiron and De Veurne, and afterwards De Keyserling, in their geological survey of the Russian Empire. Subsequently he devoted his attention mainly to the study of mineralogy and mining, and was appointed director of the Institute of Mines. In 1865 he became director of the Imperial Mineralogical Society of St Petersburg. He contributed numerous papers on euclase, zircon, epidote, orthite, monazite and other mineralogical subjects to the St Petersburg and Vienna academies of science, to Poggendorff's Annalen, Leonhard and Brown's Jahrbuch, &c. He also issued as separate works Materialien zur Mineralogie Russlands (10 vols., 1833-1893), and Vorlesungen über Mineralogie (1893). He died in St Petersburg on the 3rd of January 1893 (o.S.).

KOKSTAD, a town of South Africa, the capital of Griqualand East, 236 m. by rail S.W. of Durban, 110 m. N. by W. of Port Shepstone, and 150 m. N. of Port St John, Pondoland. Pop. (1904), 2,003, of whom a third were Griquas. The town is built on the outer slopes of the Drakensberg and is 4270 ft. above the sea. Behind it Mount Currie rises to a height of 7207 ft. An excellent water supply is derived from the mountains. The town is well laid out, and possesses several handsome public buildings. It is the centre of a thriving agricultural district and has a considerable trade in wooll, grain, cattle and horses with Basutoland, Pondoland and the neighbouring regions of Natal. The town is named after the Griqua chief Adam Kok, who founded it in 1869. In 1879 it came into the possession of Cape Colony and was granted municipal government in 1893. It is the residence of the Headman of the Griqua nation. (See KAFFRARIA and GRIQUALAND.)

KOLA, a peninsula of northern Russia, lying between the Arctic Ocean on the N., and the White Sea on the S. It forms part of the region of Lapland and belongs administratively to the government of Archangel. The Arctic coast, known as the Murman coast (Murman being a corruption of Norman), is 260 m. long; and being subject to the influence of the North Atlantic drift, is free from ice all the year round. It is a rocky coast, built of granite, and rising to 650 ft., and is broken by several excellent bays. On one of these, Kola Bay, the Russian government founded in 1895 the naval harbour of Alexandrovsk. From May to August a productive fishery is carried on along this coast. Inland the peninsula rises up to a plateau, 1000 ft. in general elevation, and crossed by several ranges of low mountains, which go up to over 3000 ft. in altitude. The lower slopes of these mountains are covered with forests up to 3500 ft., and in places thickly studded with lakes, some of them of very considerable extent, e.g. Imandra (330 sq. m.), Ump-jaur, Nuorti-järv, Guolle-jaur and Kola Lake, and Lu-jaur. From these issue streams of appreciable magnitude, such as the Tuloma, Voronya, Yovyyok or Yokanka, and Pondoi, all flowing into the Arctic, and the Varsuga and Umbo, into the White Sea. The area of the peninsula is estimated at 50,000 sq. m.

See A. O. Kohlmann and Palém, Die Expedition nach der Habinsel Kola (1887-1892) (Helsingfors); A. O. Kohlmann, Bericht einer naturwissenschaftlichen Reise durch Russisch-Lappland (Helsingfors, 1890); and W. Kamays, Geologische Beobachtungen auf der Habinsk Kola (Helsingfors, 1899).

KOLABA (or COLABA), a district of British India, in the southern division of Bombay. Area, 2131 sq. m.; pop. (1901), 605,566, showing an increase of 2% in the decade. The head-quarters are at Allighar. Lying between the Western Ghats and the sea, Kolaba district abounds in hills, some being spurs running at right angles to the main range, while others are isolated peaks or lofty detached ridges. The sea frontage, of about 20 m., is throughout the greater part of its length fringed by a narrow belt of coconut and betel nut palms. Behind this belt lies a stretch of flat country devoted to rice culture. In many places along the banks of the salt-water creeks there are extensive tracts of salt marshland, some of them reclaimed, some still subject to tidal inundation, and others set apart for the manufacture of salt. The district is traversed by a few small streams. Tidal inlets, of which the principal are the Nagothna on the north, the Koha or Chaul in the west, and the Bankot creek in the south, run inland for 30 or 40 m., forming highways for a brisk trade in rice, salt, firewood, and dried fish. Near the coast especially, the district is well supplied with reservoirs. The Western Ghats have two remarkable peaks—Raigarh, where Sivaji built his capital, and Miradongar. There are extensive teak and black wood forests, the value of which is increased by their proximity to Bombay. The Great Indian Peninsula railway crosses part of the district, and communication with Bombay is maintained by a steam ferry. Owing to its nearness to that city, the district has suffered severely from plague. Kolaba district takes its name from a little island off Allighar, which was one of the strongholds of Angria, the Mah- ratts pirate of the 18th century. The same island has given its name to Kolaba Point, the spur of Bombay Island running south that protects the entrance to the harbour. On Kolaba Point are the terminus of the Bombay & Baroda railway, barracks for a European regiment, lunatic asylum and observatory.

KOLAR, a town and district of India, in the state of Mysore. The town is 43 m. E. of Bangalore. Pop. (1901), 12,210. Although of ancient foundation, it has been almost completely modernized. Industries include the weaving of blankets and the breeding of turkeys for export.
The District of Kol or has an area of 3180 sq. m. It occupies the portion of the Mysore table-land immediately bordering the Eastern Ghats. The principal watershed lies in the north-west, around the hill of Nandidrug (1810 ft.), from which rivers radiate in all directions; and the whole country is broken by numerous hill ranges. The chief rivers are the Palur, the South Pinakini or Pennar, the North Pinakini, and the Papagani, which are industriously utilized for irrigation by means of anicuts and tanks. The rocks of the district are mostly syenite or granite, with a small admixture of mica and feldspar. The soil in the valleys consists of a fertile loam; and in the higher levels sand and gravel are found. The hills are covered with scrub, jungle and brushwood. In a population of 38,204, it has an increase of 12.5% for the decade. The district is traversed by the Bangalore line of the Madras railway, with a branch 10 m. long, known as the Kolar Goldfields railway. Gold prospecting in this region began in 1876, and the industry is now settled on a secure basis. Here are situated the mines of the Mysore, Champion Reef, Ooregum, and Nandidrug companies. To the end of 1904 the total value of gold produced was 21 million sterling, and there had been paid in dividends 9 millions, and in royalty to the Mysore state one million. The municipality called the Kolar Goldfields was formed in 1903, and the population is 5820, showing an increase of 72.5% for the decade.

Kolbe, Adolphe Wilhelm Hermann (1818-1884), German chemist, was born on the 27th of September 1818 at Elbshausen, near Göttingen, where in 1838 he began to study chemistry under F. Wöhler. In 1842 he became assistant to R. W. von Bunsen at Marburg, and three years later to Lyon Playfair at London. From 1847 to 1851 he was engaged at Brunswick in editing the "Dictionary of Chemistry" started by Liebig, but in the latter year he went to Marburg as successor to Bunsen in the chair of chemistry. In 1865 he was called to Leipzig in the same capacity, and he died in that city on the 25th of November 1884. Kolbe had an important share in the great development of chemical theory that occurred about the middle of the century, the so-called substitution of organic compounds, which he viewed as derivatives of inorganic ones, formed from the latter—in some cases directly—by simple processes of substitution. Unable to accept Berzelius's doctrine of the unalterability of organic radicals, he also gave a new interpretation to the meaning of copulae under the influence of his fellow-worker Edward Frankland's conception of definite atomic saturation-capacities, and thus contributed in an important degree to the subsequent establishment of the structure theory. Kolbe was a very successful teacher, a ready and vigorous writer, and a brilliant experimentalist whose work revealed the nature of many compounds the composition of which had not previously been understood. He published a "Lekbuch der organischen Chemie" in 1854, smaller textbooks of organic and inorganic chemistry in 1877-1883, and "Zur Entwicklungsgeschichte der theoretischen Chemie" in 1881. From 1870 he was editor of the "Jahr für praktische Chemie," in which many trenchant criticisms of contemporary chemists and their doctrines appeared from his pen.

Kolberg, or Kolberg, a town of Germany, and seaport of the Prussian province of Posen, on the right bank of the Pomesania, at the junction of the railway lines to Belgrad and Gollnow. Pop. (1905), 22,804. It has a handsome market-place with a statue of Frederick William III.; and there are extensive suburbs, of which the most important is Münde. The principal buildings are the huge red-brick church of St. Mary, with five aisles, one of the most remarkable churches in Pomernia, dating from the 14th century; the council-house (Rathaus), erected after the plans of Ernst F. Zürnner; and the castle. Kolberg also possesses four other churches, a theatre, a gymnasiurn, a school of navigation, and an exchange. Its bathing establishments are largely frequented and attract a considerable number of summer visitors. It has a harbour at the mouth of the Persante, where there is a lighthouse. Woollen cloth, machinery and spirits are manufactured; there is an extensive salt-mine in the neighbouring Zilgenberg; the salmon and lampreys are important; and a fair amount of commercial activity is maintained. In 1903 a monument was erected to the memory of Gneisenau and the patriot, Joachim Christian Nettelbeck (1735-1824), through whose efforts the territories saved from the French in 1807.

Originally a Slavonic fort, Kolberg is one of the oldest places of Pomerania. At an early date it became the seat of a bishop, and although it soon lost this distinction it obtained municipal privileges in 1225. From about 1276 it ranked as the most important place in the episcopal principality of Kamian, and from 1284 it was a member of the Hanseatic League. During the Thirty Years' War it was captured by the Swedes in 1631, passing by the treaty of Westphalia to the elector of Brandenburg, Frederick William I., who strengthened its fortifications. The town was a centre of conflict during the Seven Years' War. In 1756 and again in 1760 the Russians besieged Kolberg in vain, but in 1762 they succeeded in capturing it. Soon restored to Brandenburg, it was vigorously attacked by the French in 1806 and 1807, but it was saved by the long resistance of its inhabitants. In 1887 the fortifications of the town were razed, and it has since become a fashionable watering-place, receiving annually nearly 15,000 visitors.

See Riemann, Geschichte der Stadt Kolberg (Kolberg, 1873); Stöwe, Geschichte der Stadt Kolberg (Kolberg, 1877); Schöllken, Geschicht der Belagerungen Kolberg (2 vols., 1758, 1760, 1762, 1765, 1806, and 1807) (Kolberg, 1878); and Kempin, Führer durch Bad Kolberg (Kolberg, 1899).

Kölcsey, Ferencz (1790-1838), Hungarian poet, critic and orator, was born at Szomoder, in Transylvania, on the 8th of August 1790. In his fifteenth year he made the acquaintance of Kazinczy and zealously adopted his linguistic reforms. In 1809 Kölcsey went to Pest and became a "notary to the royal board." Law proved distasteful, and at Csek in Szatmár county he devoted his time to aesthetic study, poetry, criticism, and the defense of the theories of Kazinczy. Kölcsey's critical and metrical pieces contributed to the "Transylvanian Museum" did not attract much attention, whilst his severe criticisms of Csokonai, Kis, and especially Berzsenyi, published in 1817, rendered him very unpopular. From 1821 to 1826 he published many separate poems of great beauty in the "Aurora, Hécuba, Apotheos," and other magazines of polite literature. He joined Paul Szemere in a new periodical, styled "Élet és literatúra" ("Life and Literature"), which appeared from 1826 to 1829, in 4 vols., and gained for Kölcsey the highest reputation as a critical writer. From 1832 to 1835 he sat in the Hungarian Diet, where his extreme liberal views and his singular eloquence soon rendered him famous as a parliamentary leader. Elected on the 17th of November 1830 a member of the Hungarian Academy of Sciences, he took part in its first grand meeting; in 1832, he delivered his famous oration on Kazinczy, and in 1836 that on his former opponent Daniel Berzsenyi. When in 1838 Baron Wesselényi was unjustly thrown into prison upon a charge of treason, Kölcsey eloquently though unsuccessfully conducted his defence; and he died about a week afterwards (August 24) from internal inflammation. His collected works, in 6 vols., were published at Pest, 1840-1848, and his journal of the diet of 1836-1838 appeared in 1848. A monument erected to the memory of Kölcsey was unveiled at Szatmár-Német on the 25th of September 1864.

See G. Steinacker, Ungarische Lyriker (Leipzig, and Pest, 1874); F. Toldy, Magyar Kölökök életé (2 vols., Pest, 1871); J. Ferenczy and J. Danielik, Magyar érés (2 vols., Pest, 1890-1898).

Kolding, a town of Denmark in the amt (county) of Vejle, on the east coast of Jutland, on the Koldingfjord, an inlet of the
The town of Kolhapur, or Karwar, is the terminus of a branch of the Southern Maharatta railway, 30 m. from the main line. Pop. (1901), 54,473. Besides a number of handsome modern public buildings, the town has many evidences of antiquity. Originally it appears to have been an important religious centre, and numerous Buddhist remains have been discovered in the neighbourhood.

KOLHAPUR, or New-Kolin (also Kölpin; Czech, Nový Kolín), a town of Bohemia, Austria, 40 m. E. of Prague by rail. Pop. (1900), 5,025, mostly Czech. It is situated on the Elbe, and amongst its noteworthy buildings may be specially mentioned the beautiful early Gothic church of St Bartholomew, erected during the latter half of the 14th century. The industries of the town include sugar-refining, steam mills, brewing, and the manufacture of starch, syrup, spirits, potash and tin ware. The neighbourhood is known for the excellence of its fruit and vegetables.

Kolin is chiefly famous on account of the battle here on 18th of June 1757, when the Prussians under Frederick the Great were defeated by the Austrians under Daun (see Seven Years' War). The result was the raising of the siege of Prague and the evacuation of Bohemia by the Prussians. Kolin was colonized in the 13th century by German settlers and made a royal city. In 1421 it was captured by the men of Prague, and the German inhabitants who refused to accept "the four articles" were expelled. In 1427 the town declared against Prague, was besieged by Prokop the Great, and surrendered to him upon conditions at the close of the year.

Kolhapur, a native state of India, within the Deccan division of Bombay. It is the fourth in importance of the Maharatta principalities, the other three being Baroda, Gwalior and Indore; and it is the principal state under the political control of the government of Bombay. Together with its jagirs or feudatories, it covers an area of 3,105 sq. m. In 1901 the population was 910,011. The estimated revenue is £5,000,000. Kolhapur stretches along the bank of the river which is still known by its ancient name, and the plain of the Deccan. Along the spurs of the main chain of the Ghats lie wild and picturesque hill slopes and valleys, producing little but timber, and till recently covered with rich forests. The centre of the state is crossed by several lines of low hills running at right angles from the main range. In the east the country becomes more open and presents the unpicturesque uniformity of a well-cultivated and treeless plain, broken only by an occasional river. Among the western hills are the ancient Maharatta strongholds of Panhala, Vishalgarg, Bavda and Rungna. The ancient capital of Colaba, destroyed in 1669 by the Dutch, was the scene of a famous battle of 2,000 bards, but are all fordable during the hot months. Iron ore is found in the hills, and smelting was formerly carried on to a considerable extent; but now the Kolhapur mineral cannot compete with that imported from Europe. There are several gold stone quarries. The principal agricultural products are rice, millets, sugar-cane, tobacco, cotton, safflower and vegetables.

The rajas of Kolhapur trace their descent from Raja Ram, a younger son of Sivaji the Great, the founder of the Maharatta power. The prevalence of piracy caused the British government to send expeditions against Kolhapur in 1766, and 1772; and in the early years of the 19th century the Mahommedan chieftains of the chief compelled the British to resort to military operations, and ultimately to appoint an officer to manage the state. In recent years the state has been consistently well governed, on the pattern of British administration. The raja Shahu Chhatrapati, G.C.S.I. (who is entitled to a salute of 21 guns) was born in 1874, and ten years later succeeded to the throne by adoption. The principal institutions are the Rajaram college, the high school, a technical school, an agricultural school, and training-schools for both masters and mistresses. The state railway from Miraj to Kolhapur stands on a line built by the Southern Maharatta company. In recent years the state has suffered from both famine and plague.
microscopic investigation. Into this new learning Kölliker threw himself with all the zeal of youth, wisely initiated into it by his great teacher Henle, whose sober and exact mode of inquiry went far at the time to give the new learning a right direction and to counteract the somewhat fantastic views which, under the name of the cell theory, were tending to be prominent. Henle's labours were for the most part limited to the microscopic investigation of the minute structure of the tissues of man and of the higher animals, the latter being studied by him mainly with the view of illustrating the former. But Kölliker had another teacher besides Henle, the even greater Johannes Müller, whose active mind was sweeping over the whole animal kingdom, the structural secrets of which contain something great or small of all sorts, and keeping steadily in view the wide biological problems of function and of origin, which the facts of structure might serve to solve. We may probably trace to the influence of these two great teachers, strengthened by the spirit of the times, the threefold character of Kölliker's long-continued and varied labours. In all of them, or in almost all of them, the microscope was the instrument of inquiry, but the problem to be solved by means of the instrument belonged now to one branch of biology, now to another.

At his death at Würzburg, the title of the chair which he held laid upon him the duty of teaching comparative anatomy, and very many of the numerous memoirs which he published, including the very first paper which he wrote, and which appeared in 1841 before he graduated, "On the Nature of the so-called Seminal Animalculae," were directed towards elucidating, by help of the microscope, the structure of animals of the most varied kinds—that is to say, were zoological in character. Notable among these were his papers on the Medusae and allied creatures. His activity in this direction led him to make zoological excursions to the Mediterranean Sea and to the coasts of Scotland, as well as to undertake, conjointly with his friend C. T. E. von Siebold, the editorship of the Zeitschrift für Wissenschaftliche Zoologie, which, founded in 1848, continued under his hands to be one of the most important zoological periodicals.

At the time when Kölliker was beginning his career the influence of Karl Ernst von Baer's embryological teaching was already being widely felt, men were learning to recognize the importance to morphological and zoological studies of a knowledge of the development of animals; and Kölliker plunged with enthusiasm into the relatively new line of inquiry. His earlier efforts were directed to the invertebrata, and his memoir on the development of cephaliopods, which appeared in 1844, is a classical work; but he soon passed on to the vertebrata, and studied not only the amphibian embryo and the chick, but also the mammalian embryo. He was among the first, if not the very first, to introduce into this branch of biological inquiry the newer microscopic technique—the methods of hardening, section-cutting and staining. By doing so, not only was he enabled to make rapid progress himself, but he also placed in the hands of others the means of a like advance. The remarkable strides forward which embryology made during the middle and during the latter half of the 19th century will always be associated with his name. His Lectures on Development, published in 1861, at once became a standard work.

But neither zoology nor embryology furnished Kölliker's chief claim to fame. If he did much for these branches of science, he did still more for histology, the knowledge of the minute structure of the animal tissues. This he made emphatically his own. It may indeed be said that there is no fragment of the body of man or of animals which he did not leave his mark, and in more places than one his mark was a mark of fundamental importance. Among his earlier results may be mentioned the demonstration in 1847 that smooth or unstriated muscle is made up of distinct units, of nucleated muscle-cells. In this work he followed in the footsteps of his master Henle. A few years before this men were doubting whether arteries were muscular, and no solid histological basis as yet existed for those views as to the action of the nervous system on the circulation, which were soon to be put forward, and which had such a great influence on the progress of physiology. By the above discovery Kölliker completed that basis.

Even to enumerate, certainly to dwell on, all his contributions to histology would be impossible here: smooth muscle, striated muscle, skin, bone, teeth, blood-vessels and viscera were all investigated by him; and he touched none of them without striking out some new truths. The results at which he arrived were recorded partly in separate memoirs, partly in his great textbook on microscopical anatomy, which first saw the light in 1850, and by which he advanced histology no less than by his own researches. In the case of almost every tissue our present knowledge has been increased. Kölliker, more than any of all the histologists, gave us that system of histological knowledge which we owe to Kölliker; but it is on the nervous system that his name is written in largest letters. So early as 1845, while still at Zürich, he supplied what was as yet still lacking, the clear proof that nerve-fibres are continuous with nerve-cells, and so furnished the absolutely necessary basis for all sound speculations as to the actions of the central nervous system. From that time onward he continually laboured, and always fruitfully, at the histology of the nervous system, and more especially at the difficult problems presented by the intricate patterns in which these nerve-cells are associated, and the nerves unite to form the trunk, the spinal cord, and the brain. In his old age, at a time when he had fully earned the right to fold his arms, and to rest and be thankful, he still enriched neurological science with results of the highest value. From his early days a master of method, he saw at a glance the value of the new Golgi method for the investigation of the central nervous system, and, to the great benefit of science, took up once more in his old age, with the aid of a new means, the studies for which he had done so much in his youth. It may truly be said that much of that exact knowledge of the inner structure of the brain, which is rendering possible new and faithful conceptions of its working, came from his hands, tilled by Kölliker.

Lastly, Kölliker was in his earlier years professor of physiology as well as of anatomy; and not only did his histological labours almost always carry physiological lessons, but he also enriched physiology with the results of direct researches of an experimental kind, notably those on curare and some other poisons. In fact, we have to go back to the science of centuries ago to find a man of science of so many-sided an activity as he. His life constituted in a certain sense a protest against that specialized differentiation which, however much it may under certain aspects be regretted, seems to be one of the necessities of modern development. In Johannes Müller's days no one thought of parting anatomy and physiology; nowadays no one thinks of joining them together. Kölliker did in his work join them together, and indeed said himself that he thought they ought never to be kept apart.

Naturally a man of so much accomplishment was not left without honours. Formerly known simply as Kölliker, the title "von" was added to his name. He was made a member of the learned societies of many countries; in England, which he visited more than once, and where he became well known, the Royal Society made him a fellow in 1860, and in 1897 gave him its highest token of honour, the Copley medal. (M.F.)

KOLLONTAJ, HUGO (1750-1812), Polish politician and writer, was born in 1750 at Nieszlawice in Sandomir, and educated at Pinczow and Cracow. After taking orders he went (1770) to Rome, where he obtained the degree of doctor of theology and common law, and devoted himself enthusiastically to the study of the fine arts, especially of architecture and painting. At Rome too he obtained a canonry attached to Cracow cathedral, and on his return to Poland in 1755 threw himself heart and soul into the question of educational reform. His efforts were impeded by the obstruction of the clergy of Cracow, who regarded him as an adventurer; but he succeeded in reforming the university after his own mind, and was its rector for three years (1782-1785). Kollontaj then turned his attention to politics. In 1786 he was appointed referendarius of Lithuania, and during the Four Years' Diet (1788-1792) displayed an amazing and many-sided activity as one of the reformers of the constitution. He grouped around him all the leading writers, publicists and progressive young men
of the day; declaimed against prejudices; stimulated the timid; inspired the lukewarm with enthusiasm; and never rested till the constitution of the 3rd of May 1791 had been carried through. In June 1791 Kollontaj was appointed vice-chancellor. On the triumph of the reactionaries and the fall of the national party, he secretly placed in the king's hands his adhesion to the triumphant Confederation of Targowica, a false step, much blamed at the time, but due not to personal ambition but to a desire to save something from the wreck of the constitution. He then offered to the new government the services which it afterwards regarded as an ethnocentric insurrection he returned to Poland, and as member of the national government and minister of finance took a leading part in affairs. But his radicalism had now become of a disruptive quality, and he quarreled with and even thwarted Kosciuszko because the dictator would not admit that the Polish republic could only be saved by the methods of Jacobinism. On the other hand, the more conservative section of the Poles regarded Kollontaj as 'a second Robespierre,' and he was even suspected of complicity in the outrages of the 17th and 18th of June 1794, when the Warsaw mob massacred the political prisoners. On the collapse of the insurrection Kollontaj emigrated to Austria, where from 1795 to 1802 he was detained as a prisoner. He was finally released through the mediation of Prince Adam Czartoryski, and returned to Poland utterly discredited. The remainder of his life was a ceaseless struggle against privation and prejudice. He died at Warsaw on the 28th of February 1812.

Of his numerous works the most notable are: Political Speeches as Vice-Chancellor (Pol.) (in 6 vols., Warsaw, 1791); On the Erection and Fall of the Constitution of May 3rd (Leipzig, 1806); Correspondence with T. Czacki (Pol.) (Cracow, 1854); Letters written during Emigration, 1792-1794 (Pol.) (Posen, 1872).

See I. Badeni, Necrology of Iliego Kollontaj (Pol.) (Cracow, 1819); Henryk Schmitt, Review of the Life and Works of Kollontaj (Pol.) (Lemberg, 1866); Wojciek Grochowski, "Life of Kollontaj" (Pol.) in Tygodn. Il. (Warsaw, 1861). (R. N. B.)

Kolomja (Polish, Kolomyja), a town of Austria, in Galicia, 122 m. S. of Lemberg by rail. Pop. (1900), 34,188, of which half were Jews. It is situated on the Pruth, and has an active trade in agricultural products. To the N.E. of Kolomea, near the Dniepers, lies the village of Czerenlica, with ruins of a strongly fortified castle, which served as the residence of John Sobieski during his campaigns against the Turks. Kolomea is a very old town and is mentioned already in 1240, but the assertion that it was a Roman settlement under the name of Colonie is not proved. It was the principal town of the Polish province of Pokutia, and it suffered severely during the 15th and 16th centuries from the attacks of the Moldavians and the Tatars.

Kolomna, a town of Russia, in the government of Moscow, situated on the railway between Moscow and Ryazan, 72 m. S.E. of Moscow, at the confluence of the Moskva river with the Kolomna. Pop. (1897), 20,700. It is an old town, mentioned in the annals in 1177, and until the 14th century was the capital of the Ryazan principality. It suffered greatly from the invasions of the Tatars in the 13th century, who destroyed it four times, as well as from the wars of the 17th century; but it always recovered and has never lost its commercial importance. During the 19th century it became a centre for the manufacture of silks, cottons, ropes and leather. Here too are railway workshops, where locomotives and wagons are made. Kolomna carries on an active trade in grain, cattle, tallow, skins, salt and timber. It has several old churches of great architectural interest, dating from the 14th century, one being the cathedral. One gate (restored in 1805) of the fortifications of the Kremlin still survives.

Kolozsvar (Ger. Klausenburg; Rum. Chis), a town of Hungary, in Transylvania, the capital of the county of Kolozs, and formerly the capital of the whole of Transylvania, 248 m. E.S.E. of Budapest by rail. Pop. (1900), 46,670. It is situated in a picturesque valley on the banks of the Little Szamos, and comprises the inner town (formerly surrounded with walls) and five suburbs. The greater part of the town lies on the right bank of the river, while on the other side is the so-called Bridge Suburb and the citadel (erected in 1715). Upon the slopes of the citadel hill there is a gypsy quarter. With the exception of the old quarter, Kolozsvár is generally well laid out, and contains many broad and fine streets, several of which diverge at right angles from the principal square. In this square is situated the Gothic church of St Michael (1360-1432); in front is a bronze equestrian statue of King Matthias Corvinus by the Hungarian sculptor Fadrusz (1902). Other noteworthy buildings are the Reformed church, built by Matthias Corvinus in 1486 and ceded to the Calvinists by Bethlen Gabor in 1622; the house in which Matthias Corvinus was born (1443), which contains a perpetual museum; the county and national halls, a museum, and the university buildings. A feature of Kolozsvár is the large number of handsome mansions belonging to the Transylvanian nobles, who reside here during the winter. It is the seat of a Unitarian bishop, and of the superintendent of the Calvinists for the Transylvanian circle. Kolozsvár is the literary and scientific centre of Transylvania, and is the seat of numerous literary and scientific associations. It contains a university (founded in 1872), with four faculties—theology, philosophy, law and medicine—frequented by about 1900 students in 1905; and among its other educational establishments are a seminary for Unitarian priests, an agricultural college, two training schools for teachers, a commercial academy, and several secondary schools for boys and girls. The industry comprises establishments for the manufacture of woollen and linen cloth, paper, sugar, candles, soap, earthenwares, as well as breweries and distilleries.

Kolozsvár is believed to occupy the site of a Roman settlement named Napoca. Colonized by Saxons in 1178, it then received its German name of Klausenburg, from the old word Klaue, signifying a "mountain pass." Between the years 1545 and 1772 large numbers of Transylvanian population left the town in consequence of the introduction of Unitarian doctrines. In 1796 the town was to a great extent destroyed by fire. As capital of Transylvania and the seat of the Transylvanian diets, Kolozsvár from 1830 to 1848 became the centre of the Hungarian national movement in the grand principality; and in December 1848 it was taken and garrisoned by the Hungarians under General Bem. Kolpino, one of the chief iron-works of the crown in Russia, in the government of St Petersburg, 16 m. S.E. of the city of St Petersburg, on the railway to Moscow, and on the Obhara river. Pop. (1867), 8076. A sacred image of St Nicholas in the Trinity church is supposed to have been brought by numerous pilgrims on the 22nd of May every year. Here is an iron-foundry of the Russian admiralty.

Kols, a generic name applied by Hindus to the Munda, Ho and Oraon tribes of Bengal. The Mundas are an aboriginal tribe of Dravidian physical type, inhabiting the Chota Nagpur division, and numbering 438,000 in 1901. The majority of them are animists in religion, but Christianity is making rapid strides among them. The village community in its primitive form still exists among the Mundas; the discontent due to the oppression of their landlords led to the Munda rising of 1899, and to the remedy of the alleged grievances by a new settlement of the district. The Ho's, who are closely akin to the Mundas, also inhabit the Chota Nagpur division; in 1901 they numbered 386,000. They were formerly a very pugnacious race, who successfully defended their territory against all comers until they were subdued by the British in the early part of the 19th century, being known as the Larka (or fighting) Kols. They are still great sportsmen, using the bow and arrow. Like the Mundas they are animists, but they show little inclination for Christianity. Both Mundas and HOs speak dialects of the obscure linguistic family known as Munda or Kol.

Kolyvan. (1) A town of West Siberia, in the government of Tomsk, on the Chaus river, 5 m. from the Ob and 120 m. S.S.W. of the city of Tomsk. It is a wealthy town, the merchants carrying on a considerable export trade in cattle, hides, tallow, corn and fish. It was founded in 1713 under the name of Chausky Ostrog, and has grown rapidly. Pop. (1897), 11,703. (2) Kolyvanskoye Zavod, another town of the same government, in the district of Bysk, Altai region, on the Belaya river, 192 m.
S.E. of Barnaul; altitude, 1290 ft. It is renowned for its stone-cutting factory, where marble, jasper, various porphyries and brecillas are worked into vases, columns, &c. Pop., 3000. (3) Old name of Reval (q.e.).

KOMÁROM (Ger., Komor), the capital of the county of Komárom, Hungary, 65 m. W.N.W. of Budapest by rail. Pop. (1890), 16,816. It is situated at the eastern extremity of the island Csallóköz or Grosse Schütt, at the confluence of the Wang with the Danube. Just below Komárom the two arms into which the Danube separates below Presburg, forming the Grosse Schütt island, unite again. Since 1866 the market-town of Uj-Szén, which lies on the opposite bank of the Danube, has been joined with the town of Komárom; it is chiefly for its fortifications, which form the centre of the inland fortifications of the Austro-Hungarian monarchy. A brisk trade in cereals, timber, wine and fish is carried on. Komárom is one of the oldest towns of Hungary, having received its charter in 1265. The fortifications were begun by Matthias Corvinus, and were enlarged and strengthened during the Turkish wars (1526-64). New forts were constructed in 1663 and were greatly enlarged between 1805 and 1809. In 1543, 1594, 1598 and 1663 it was beleaguered by the Turks. It was raised to the dignity of a county town in 1751. During the war of 1848-49 Komárom was a principal point of military operations, and was long unsuccessfully besieged by the Austrians, who on the 11th of July 1849 were defeated there by General Görgei, and on the 3rd of August by General Klappka. On the 27th of September the fortress capitulated to the Austrians upon honourable terms, and on the 3rd and 4th of October was evacuated by the Hungarian troops. The treasure of the Austrian national bank was removed here from Vienna in 1866, when that city was threatened by the Prussians.

KOMATI (q.v.), a river of south-eastern Africa. It rises at an elevation of about 3000 ft. in the Ermelo district of the Transvaal, 11 m. W. of the source of the Vaal, and flowing in a general N. and E. direction reaches the Indian Ocean at Delagoa Bay, after a course of some 500 miles. In its upper valley near Stenysdorp are gold-fields, but the reefs are almost entirely of low grade ore. The river descends the Drakensberg by a pass 30 m. S. of Barberton, and at the eastern border of Swaziland is deflected northward, keeping a course parallel to the Lebombo mountains. Just W. of 3° 2' E. and in 25° 25' S. it is joined by one of the many rivers of South Africa named Crocodile. This tributary rises, as the name indicates, in the Bergendal (617 ft.) near the upper waters of the Komati, and flows E. across the high veld, being turned northward as it reaches the Drakensberg escarpment. The fall to the low veld is over 2000 ft. in 30 m., and across the country between the Drakensberg and the Lebombo (100 m.) there is a further fall of 3500 ft. A mile below the junction of the Crocodile and Komati, the united stream, which from this point is also known as the Manhissa, passes to the coast plain through a cleft 626 ft. high in the Lebombo known as Komati Poort, where are some picturesque falls. At Komati Poort, which marks the frontier between British and Portuguese territory, the river is less than 60 m. from its mouth in a direct line, but in crossing the plain it makes a wide sweep of 200 m., first N. and then S., forming lagoon-like expanses and backwaters and receiving from the north several tributaries. In flood time there is a connexion northward through the swamps with the basin of the Limpopo. The Komati enters the sea 15 m. N. of Lourenço Marques. It is navigable from its mouth, where the water is from 12 to 18 ft. deep, to the foot of the Lebombo.

The railway from Lourenço Marques to Pretoria traverses the plain in a direct line, and at mile 45 reaches the Komati. It follows the south bank of the river and enters the high country at Komati Poort. At a small town with the same name, 2 m. W. of the Poort, on the 23rd of September 1900, during the war with England, 3000 Boers crossed the frontier and surrendered to the Portuguese authorities. From the Poort westward the railway skirts the south bank of the Crocodile river throughout its length.

KOMOTAU (Czech, Chomáty), a town of Bohemia, Austria 79 m. N.N.W. of Prague by rail. Pop. (1890), 1307. It was almost exclusively German. It has an old Gothic church, and its town-hall was formerly a commandery of the Teutonic knights. The industrial establishments comprise manufactories of woollen cloth, linen and paper, dyeing houses, distilleries, vinegar works and the central workshops of the BUSCHTHÄRD railway. Lignite is worked in the neighbourhood. Komotau was originally a Czech market-place, but in 1524 it came into the possession of the Teutonic Order and was completely Germanized. In 1596 it received a town charter; and in 1416 the knights sold both town and lordship to Wenceslaus IV. On the 16th of March 1849 Komotau was besieged by the Russians. After several changes of ownership, Komotau came in 1858 to Popel of Lobkovic, who established the Jesuits here, which led to trouble between the Protestant burghers and the over-lord. In 1594 the lordship fell to the crown, and in 1605 the town purchased its freedom and was created a royal city.

KOMURA, JUTARO, COUNT (1855- ), Japanese statesman, was born in Hiuga. He graduated at Harvard in 1877, and entered the foreign office in Tokyo in 1884. He served as chargé d'affaires in Peking, as Japanese minister in Seoul, in Washington, St. Petersburg, and in Pекin during the war; during that war he earned in every post a high reputation for diplomatic ability. In 1901 he received the portfolio of foreign affairs, and held it throughout the course of the negotiations with Russia and the subsequent war (1904-5), being finally appointed by his sovereign to meet the Russian plenipotentiaries at Portsmouth, and subsequently the Chinese representatives in Peking, on which occasions the Portsmouth treaty of September 1905 and the Peking treaty of November in the same year were concluded. For these services, and for negotiating the second Anglo-Japanese alliance, he received the Japanese title of count and was made a K.C.B. by King Edward VII. He resigned his portfolio in 1906 and became privy councillor, from which post he was transferred to the embassy in London, but he returned to Tokyo in 1908 and resumed the portfolio of foreign affairs in the second Katsura cabinet.

KONARAK or KANARAK, a ruined temple in India, in the Puri district of Orissa, which has been described as for its size "the most richly ornamented building—externally at least—in the whole world." It was erected in the middle of the 13th century, and was dedicated to the sun-god. It consisted of a square tower, 284 ft. high, with a porch in front 140 ft. high, sculptured with figures of lions, elephants, horses, &c.

KONG, the name of a town, district and range of hills in the N.W. of the Ivory Coast colony, French West Africa. The hills are part of the band of high ground separating the inner plains of West Africa from the coast regions. In maps of the first half of the 19th century the range is shown as part of a great mountain chain supposed to run east and west across Africa, and is thus made to appear a continuation of the Mountains of the Moon, or the snow-clad heights of Ruwenzori. The culminating point of the Kong system is the Pic des Komomo, 4737 ft. high. In general the summits of the hills are below 2000 ft. and not more than 700 ft. above the level of the country. The "circle of Kong," one of the administrative divisions of the Ivory Coast colony, covers 46,000 sq. m. and has a population of some 400,000. The inhabitants are negroes, chiefly Barbares and Mandingo. About a fourth of the population profess Mahomedanism; the remainder are spirit worshippers. The town of Kong, situated in 6° N., 4° 20' W., is not now of great importance. Probably René Caillié, who spent some time in the western part of the country in 1827, was the first European to visit Kong. In 1888 Captain L. G. Binger induced the native chiefs to place themselves under the protection of France, and in 1893 the protectorate was attached to the Ivory Coast colony. For a time Kong was overrun by the armies of Samory (see SENEGAL), but the capture of that chief in 1898 was followed by the peaceful development of the district by France (see IVORY COAST).

KONGSBERG, a mining town of Norway in Buskerud amt (county), on the Laagen, 500 ft. above the sea, and 61 m. W.S.W.
of Christiania by rail. Pop. (1900), 5585. With the exception of the church and the town-house, the buildings are mostly of wood. The origin and whole industry of the town are connected with the government silver-mines in the neighbourhood. Their first discovery was made by a peasant in 1623, since which time they have been worked with varying success. During the 18th century Kongsberg was more important than now, and contained double its present population. Within the town are situated the smelting-works, the mint, and a Government weapon factory. Three miles below the Laagen forms a fine fall of 140 ft. (Lahrofs). The neighbouring Jonksnut (2950 ft.) commands extensive views of the Telemark. A driving-road from Kongsberg follows a favourite route for travellers through this district, connecting with routes to Sand and Odde on the west coast.

KONIA. (1) A vilayet in Asia Minor which includes the whole, or parts of, Pamphylia, Pisidia, Phrygia, Lycaonia, Cilicia and Cappadocia. It was formed in 1864, by adding to the old eyalet of Karamania the western half of Adana, and part of south-eastern Anatoli. It is divided into five sanjaks: Adalia, Boulidur, Hamid-abad, Konia and Nigdeh. The population (900,000 Moslems and 80,000 Christians) is for the most part agricultural and pastoral. The only inductions are carpet-weaving and the manufacture of cotton and silk stuffs. There are mines of chrome, mercury, cinnaabar, argentiferous lead and rock salt. The principal exports are salt, minerals, opium, cotton, cereals, wool and live stock; and the imports cloth-goods, coffee, rice and petroleum. The vilayet is now traversed by the Anatolian railway, and contains the railhead of the Ottoman line from Smyrna.

(2) The chief town [anc. Iconium (q.v.)], altitude 3320 ft., situated at the S.W. edge of the vast central plain of Asia Minor, amidst luxuriant orchards famous in the middle ages for their yellow plums and apricots and watered by streams from the hills. Pop. 45,000, including 5000 Christians. There are interesting remains of Seljuk buildings, all showing strong traces of Persian influence in their decorative details. The principal ruin is that of the palace of Kilij Arslan II., which contained a famous hall. The most important mosques are the great Tekke, which contains the tomb of the poet Mevlana Jelal ed-din Rumi, a mystic (sufi) poet, founder of the order of Mevlevi (whirling) dervishes, and those of his successors, the "Golden" mosque and those of Ala ed-Din and Sultan Selim. The walls, largely the work of Ala ed-Din I., are preserved in great part and notable for the number of ancient inscriptions built into them. They once had twelve gates and were 30 ells in height. The climate is good—hot in summer and cold, with snow, in winter. Konia is connected by railway with Constantinople and is the starting-point of the line to Tarsus and Bagdad. At the capture of Nicea by the Crusaders (1097), Konia became the capital of the Seljuk Sultans of Rum (see SELJUKS and TURKS). It was temporarily occupied by Godfrey, and again by Frederick Barbarossa, but this scarcely affected its prosperity. During the reign of Ala ed-Din I. (1219—1236) the city was thronged with artists, poets, historians, jurists and dervishes, driven westwards from Persia and Bokhara by the advance of the Mongols, and there was a brief period of great splendour. After the break up of the empire of Rum, Konia became a secondary city of the amirate of Karamania and in part fell to ruin. In 1472 it was annexed to the Ottoman empire by Mahomed II. In 1832 it was occupied by Ibrahim Pasha who defeated and captured the Turkish general, Reshid Pasha, not far from the walls. It had come to fill only part of its ancient circuit, but of recent years it has revived considerably, and, since the railway reached it, has acquired a semi-European quarter, with a German hotel, cafes and Greek shops, &c.

See W. M. Ramsay, Historical Geography of Asia Minor (1890); Sir Paul the Traveller (1893); G. Le Strange, Land of the E. Caliphate (1908).

KONIEPOLSKI, STANISLAUS (1591—1646), Polish soldier, was the most illustrious member of an ancient Polish family which rendered great services to the Republic. Educated at the academy of Cracow, he learned the science of war under the great Jan Chodkiewicz, whom he accompanied on his Muscovite campaigns, and under the equally great Stanislaus Zolkiewski, whose daughter Catherine he married. On the death of his first wife he wedded, in 1619, Christina Lubomirska. In 1619 he took part in the expedition against the Turks which terminated so disastrously at Cecora, and after a valiant resistance was captured and sent to Constantinople, where he remained a close prisoner for three years. On his return he was appointed commander of all the forces of the Republic, and at the head of an army of 25,000 men routed 60,000 Tatars at Martynow, following up this success with fresh victories, for which he received the thanks of the diet and the patriciate of Sandomeria from the king. In 1625 he was appointed guardian of the Ukraine against the Turks, but in 1626 was transferred to Prussia to check the victorious advance of Gustavus Adolphus. Swedish historians have too often ignored the fact that Koniepolski's superior strategy neutralized all the efforts of the Swedish king, and that he defeated again and again, notably at Hermosin (April 1627) and at Trzcland (April 1628). But for the most part the fatal parsimony of his country compelled Koniepolski to confine himself to the harassing guerrilla warfare in which he was an expert. In 1632 he was appointed to the long vacant post of hetman wielki coronny, or commander in chief of Poland, and in that capacity routed the Tatars at Sasowy Rogi (April 1633) and at Panawiec (April and October 1633), and the Turks, with terrific loss, at Abadz Basha. To keep the Cossacks of the Ukraine in order he also built the fortress of Kudak. As one of the largest proprietors in the Ukraine he suffered severely from the rack depressions, and on his return was appointed commander-in-chief there. Only after years of conflict, however, did he succeed in reducing these unruly desperadoes to something like obedience. In 1644 he once more routed the Tatars at Ockmatow, and again in 1646 at Brody. This was his last exploit, for he died the same year, to the great grief of Wladislaus IV., who had already concerted with him the plan for a campaign on a grand scale against the Turks, and relied principally upon the Grand Hetman for its success. Thoughless famous than his contemporaries Zolkiewski and Chodkiewicz, Koniepolski was fully their equal as a general, and his inexorable severity made him an ideal lord-marcher.

See an unfinished biography by Stanislaw Przybliński, Memorials of the Koniepolsks (Pol.) (Lemberg, 1842). (R. N. B.)

KÖNIG, KARL RUDOLPH (1832—1901), German physicist, was born at Königsberg (Prussia) on the 26th of November 1832, and studied at the university of his native town, taking the degree of Ph.D. About 1842 he went to Paris, and became apprentice to the famous violin-maker, J. B. Vuillaume, and some six years later he started business on his own account. He called himself a "maker of musical instruments," but the instruments for which his name is best known are tunemeters, for which he speedily gained a high reputation among physicists for their accuracy and general excellence. From this business König derived his livelihood for the rest of his life. He was, however, very far from being a mere tradesman, and even as a manufacturer he regarded the quality of the articles that he left his workshop as a matter of greater solicitude than the profits they yielded. Acoustical research was his real interest, and to that he devoted all the time and money he could spare from his business. An exhibit which he sent to the London Exhibition of 1862 gained a gold medal, and at the Philadelphia Exposition at 1876 great admiration was expressed for a tonometric apparatus of his manufacture. This consisted of about 670 tuning-forks, of as many different pitches, extending over four octaves, and it afforded a perfect means for testing, by enumeration of the beats, the number of vibrations producing any given note and for accurately tuning any musical instrument. An attempt was made to secure this apparatus for the university of Pennsylvania, and König was induced to leave it behind him in America on the assurance that it would be purchased; but, ultimately, the money not being forthcoming, the arrangement fell through, to his great disappointment and pecuniary loss. Some of the forks he disposed of to the university of Toronto and the remainder he used as a
The discussion of the authenticity of the MS. of Dvur Kralove lasted with short interruptions about seventy years, and the Bohemian works written on the subject would fill a considerable library. Count Lützow's History of Bohemian Literature gives a brief account of the controversy.

KÖNIGSBERG (Polish Kralovce), a town of Germany, capital of the province of East Prussia and a fortress of the first rank. Pop. (1880), 140,800; (1890), 161,666; (1905), 219,862 (including the incorporated suburbs). It is situated on rising ground, on both sides of the Pregel, 43 m. from its mouth in the Frische Haff, 597 m. N. E. of Berlin, on the railway to Eydtkuhnen and Breslau, and 106 m. N. E. of the Old Haff, at the junction of three parts, which were formerly independent administrative units, the Altstadt (old town), to the west, Lübenicht to the east, and the island Kneiphof, together with numerous suburbs, all embraced in a circuit of 95 miles. The Pregel, spanned by many bridges, flows through the town in two branches, which unite below the Grüne Brücke. Its greatest breadth within the town is from 80 to 90 yards, and it is usually frozen from November to March. Königsberg does not retain many marks of antiquity. The Altstadt has long and narrow streets, but the Kniphof, and possesses the site of the old town. Among the more interesting buildings are the Schloss, a long rectangle begun in 1255 and added to later, with a Gothic tower 277 ft. high and a chapel built in 1592, in which Frederick I. in 1701 and William I. in 1861 crowned themselves kings of Prussia; and the cathedral, begun in 1333 and restored in 1856, a Gothic building with a tower 164 ft. high, adjoining which is the tomb of Kant. The Schloss was originally the residence of the Grand Masters of the Teutonic order and later of the dukes of Prussia. Behind is the parade-ground, with the statues of Albert I. and of Frederick William III. by August Kist, and the grounds also contain monuments to Frederick I. and William I. To the east is the Schloßsteich, a long narrow ornamental lake covering 12 acres. The north-west side of the parade-ground is occupied by the new university buildings, completed in 1865; these and the new exchange on the south side of the Pregel are the finest architectural features of the town. The university (Collegium Albertinum) was founded in 1544 by Albert I., duke of Prussia, as a "purely Lutheran" place of learning. It is chiefly distinguished for its mathematical and philosophical departments. The library, designed by the elder Bessel, contains 240,000 volumes, a zoological museum, a botanical garden, laboratories and valuable mathematical and other scientific collections. Among its famous professors have been Kant (who was born here in 1724 and to whom a monument was erected in 1864), J. G. von Herder, Bessel, F. Neumann and J. F. Herbart. It is attended by about 1000 students and has a teaching staff of over 100. Among other educational establishments, Königsberg numbers four classical schools (gymnasium) and three commercial schools, an academy of painting and a school of music. The hadithals and benevolent institutions are numerous. The town is less well equipped with museums and similar institutions, the most noteworthy being the Prussia museum of antiquities, which is especially rich in East Prussian finds from the Stone age to the Viking period. Besides the cathedral the town has fourteen churches.

Königsberg is a naval and military fortress of the first order. The fortifications were begun in 1843 and were only completed in 1905, although the place was surrounded by walls in early times. The works consist of an inner wall, brought into connection with an esplanade system of works, and of twelve detached forts, of which six are on the right and six on the left bank of the Pregel. Between them lie two great forts, that of Friedrichsburg on an island in the Pregel and that of the Kaserne Kronprinz on the east of the town, both within the environing ramparts. The protected position of its harbour has made Königsberg one of the most important commercial cities of Germany. A new channel has recently been made between it and its port, Pillau, 20 miles distant, on the outer side of the Frische Haff, so as to admit vessels drawing 20 feet of water right up to the quays of

KONIGGRATZ (Czech, Hradec Králové), a town and episcopal see of Bohemia, Austria, 74 m. E. of Prague by rail. Pop. (1900), 9773, mostly Czech. It is situated in the centre of a very fertile region called the "Golden Road," and contains many buildings of historical and architectural interest. The cathedral was erected 1323 by Elizabeth of Wenceslas II; and the church of St. John, built in 1710, still stands on the ruins of the old castle. The industries include the manufacture of musical instruments, machinery, colours, and carton-pierre, as well as gloves and wax candles. The original name of Königgratz, one of the oldest settlements in Bohemia, was Chlumec Dobroslavský; the name Hradec, or "the Castle," was given to it when it became the seat of a count, and Králove, "of the crown," (Ger. König, was prefixed when it became one of the dower towns of the queen of Wenceslas II, Elizabeth of Poland, who lived here for thirty years. It remained a dower town till 1620. Königgratz was the first of the towns to declare for the national cause during the Hussite wars. After the battle of the White Mountain (1620) a large part of the Protestant population left the place. In 1639 the town was occupied for eight months by the Swedes. Several churches and convents were pulled down to make way for the fortifications erected under Joseph II. The fortress was finally dismantled in 1834. Near Königgratz took place, on the 3rd of July 1866, the decisive battle (formerly called Sadowa) of the Austro-Prussian war (see Seven Weeks' War).

KÖNIGINHOF (Dvur Kralove in Czech), the seat of a provincial district and of a provincial law-court, is situated in north-eastern Bohemia on the left bank of the Elbe, about 160 kilometres from Prague. Brewing, corn-milling and cotton-weaving are the principal industries. Pop. about 11,000. The city is of very ancient origin. Founded by King Wenceslas II. of Bohemia (1278-1305), it was given by him to his wife Elizabeth, and thus received the name of Dvur Kralove (the court of the queen). During the Hussite wars, Dvur Kralove was several times taken and retaken by the contending parties. In a battle fought partly within the streets of the town, the Austrian army was totally defeated by the Prussians on the 29th of June 1866. In the 19th century Dvur Kralove became widely known as the spot where a MS. was found that was long believed to be one of the oldest written documents in the Czech language. In 1817 Wenceslas Hanka, afterwards for a long period librarian of the Bohemian museum, declared that he had found in the church tower in the town of Dvur Kralove when on a visit there, a very ancient MS. containing epic and lyric poems. Though Dobrovsky, the greatest Czech philologist of the time, from the first expressed suspicions, the MS., known as the Kralodvorsky Rukopsis manuscript of Königshof was long accepted as genuine, frequently printed and translated into most European languages. Doubts as to the genuineness of the document never, however, ceased, and they became stronger when Hanka was convicted of having fabricated other false Bohemian documents. A series of works and articles written by Professors Goll, Gebauer, Masaryk, and others have recently proved that the MS. is a forgery, and hardly any Bohemian scholars of the present day believe in its genuineness.
KÖNIGSBORN—KÖNIGSSEE

Königsberg, and the result has been to stimulate the trade of the city. It is protected for a long distance by moles, in which a break has been left in the Fischhauser Wiek, to permit of free circulation of the water and to prevent damage to the mainland. The industries of Königsberg have made great advances within recent years, notable among them are printing-works and manufactures of machinery, locomotives, carriages, chemicals, toys, sugar, cellulose, beer, tobacco and cigars, pianos and amber wares. The principal exports are cereals and flour, cattle, horses, hemp, flax, timber, sugar and oilcake. There are two pretty public parks, one in the Hufen, with a zoological garden attached, another the Luisenwähle which commemorates the sojourn of Queen Louisa of Prussia in the town in the disastrous year 1866. The Altstadt of Königsberg grew up around the castle built in 1255 by the Teutonic Order, on the advice of Oktavier II. King of Bohemia, after whom the place was named. Its first site was near the fishing village of Steindamm, but after its destruction by the Prussians in 1265 it was rebuilt in its present position. It received civic privileges in 1286, the two other parts of the present town—Löbenicht and Kneiphof—receiving them a few years later. In 1340 Königsberg entered the Hanseatic League. From 1457 it was the residence of the grand master of the Teutonic Order, and from 1525 till 1618 of the dukes of Prussia. The trade of Königsberg was much hindered by the industries shifting and setting up of the channels leading to its harbour; and the great northern wars did it immense harm, but before the end of the 17th century it had almost recovered. In 1724 the three independent parts were united into a single town by Frederick William I.

Königsberg suffered severely during the war of liberation and was occupied by the French in 1807. In 1813 the town was the scene of the deliberations which led to the successful uprising of Prussia against Napoleon. During the 19th century the opening of a railway system in East Prussia and Russia gave a new stimulus to its commerce, making it the principal outlet for the Russian staples—grain, seeds, flax and hemp. It has now regular steam communication with Memel, Stettin, Kiel, Amsterdam and Hull.

G. Prutz, Die königliche Albertus-Universität zu Königsberg im 19. Jahrhundert (Königsberg, 1894); Armstedt, Geschichte der königlichen Haupt- und Residenzstadt Königsberg (Stettin, 1894); M. Schmid, Geschichte zu Anfang 1813 (Berlin, 1901); and Gordiek, Wegweiser durch Königsberg (Königsberg, 1904).

KÖNIGSBORN, a spa of Germany, in the Prussian province of Westphalia, immediately to the N. of the town of Unna, of which it practically forms a suburb. It has large saltworks, producing annually over 15,000 tons. The brine springs, in connexion with which there is a hydro pathetic establishment, have a temperature of 93° F., and are efficacious in skin diseases, rheumatism and scrofula.

See Wegele, Bad Königsborn und seine Heilmittel (Essen, 1902).

KÖNIGHÜTTE, a town of Germany, in the Prussian province of Silesia, situated in the middle of the Upper Silesian coal and iron district, 3 m. S. of Beuthen and 122 m. by rail S.E. of Breslau. Pop. (1852), 4,495; (1875), 26,042; (1900), 57,919. In 1860 it was incorporated with various neighbouring villages, and raised to the dignity of a town. It has two Protestant and three Roman Catholic churches and several schools and benevolent institutions. The largest iron-works in Silesia is situated at Könighütte, and includes puddling works, rolling-mills, and zinc-works. Founded in 1797, it was formerly in the hands of government, but is now carried on by a company. There are also manufactures of bricks and glass and a trade in wood and coal. Nearly one-half of the population of the town consists of Poles.

See Mohr, Geschichte der Stadt Könighütte (Könighütte, 1890).

KÖNISLOUTHER, a town of Germany, in the duchy of Brunswick, on the Lutter 36 m. E. of Brunswick by the railway to Eisleben and Magdeburg. Pop. (1905), 3,260. It possesses an Evangelical church, a castle and some interesting old houses. Its chief manufactures are sugar, machinery, paper and beer. Near the town are the ruins of a Benedictine abbey founded in 1135. In its beautiful church, which has not been destroyed, are the tombs of the emperor Lothair II., his wife Richenza, and of his son-in-law, Duke Henry the Proud of Saxony and Bavaria.

KÖNIGSMARK, MARIA AURORA, COUNTESS OF (1662-1728), mistress of Augustus the Strong, elector of Saxony and king of Poland, belonged to a noble Swedish family, and was born on the 8th of May 1662. Having passed some years at Hamburg, where she attracted attention both by her beauty and her talents, her father and uncle, who desired to make her marry her brother Philipp Christoph, count of Königsmark, who had suddenly and mysteriously disappeared from Hanover. Here she was noticed by Augustus, who made her his mistress; and in October 1666 she gave birth to a son Maurice, afterwards the famous marshal de Saxe. The elector however quickly tired of Aurora, who then spent her time in efforts to secure the position of abbess of Quedlinburg, an office which carried with it the dignity of a princess of the Empire, and to recover the lost inheritance of her family in Sweden. She was made regent abbess and lady-provost (Provintials-Königsmark) in the abbey of Quedlinburg, but died in Dresden, Berlin, Hamburg and Hanover. In 1717 she went on a diplomatic errand to Charles XII. of Sweden on behalf of Augustus, but her adventurous journey ended in failure. The countess, who was described by Voltaire as "the most famous woman of two centuries," died at Quedlinburg on the 16th of February 1728.

See F. Cramer, Denkwürdigkeiten der Gräfin M. A. Königsmark (Leipzig, 1836); and Biographische Nachrichten von der Gräfin M. A. Königsmark (Quedlinburg, 1833); W. F. Palmblad, Aurora Königsmark und ihre Verwandte (Leipzig, 1848-1853); C. L. de Poliniitz, La Saxe galante (Amsterdam, 1734); and O. J. B. von Corvin-Wiersitzki, Maria Aurora, Gräfin von Königsmark (Rudolstadt, 1900).

KÖNIGSMARK, PHILIPP CHRISTOPH, COUNT OF (1665-1700), was a member of a noble Swedish family, and is chiefly known as the lover of Sophia Dorothea, wife of the English king George I. then electoral prince of Hanover. Born on the 14th of March 1665, Königsmark was a brother of the countess noticed above. After wandering and fighting in various parts of Europe he entered the service of Ernest Augustus, elector of Hanover. Here he made the acquaintance of Sophia Dorothea, and assisted her in one or two futile attempts to escape from Hanover. Regarded, rightly or wrongly, as the lover of the princess, he was seized, and disappeared from history, probably by assassination, on the 1st of July 1704. One authority states that George I. was accustomed to boast about this deed, and that his statement is doubted, and the Hanoverian court absolutely opposed all efforts to clear up the mystery. It is not absolutely certain that Sophia Dorothea was guilty of a criminal intrigue with Königsmark, as it is probable that the letters which purport to have passed between the pair are forgeries. The question of her guilt or innocence, however, has been and still remains a fruitful and popular subject for romance and speculation.

KÖNIGSEE, or LAKE OF ST Bartholomew, a lake of Germany, in the kingdom of Bavaria, province of Upper Bavaria, about 3½ m. S. from Berchtesgaden, 180 ft. above sea-level. It has a length of 5 m., and a breadth varying from 900 yards to a little over a mile, and attains a maximum depth of 600 ft. The Königsee is the most beautiful of all the lakes in the German Alps, pent in by limestone mountains rising to an altitude of 6500 ft., the flanks of which descend precipitously to the green waters below. The lake abounds in trout, and the surrounding
country is rich in game. On a promontory by the side of the lake is a chapel to which pilgrimages are made on St Bartholomew’s Day. Separated by a narrow strip of land from the Königsee is the Obersee, a smaller lake.

**Königstein**, a town of Germany, in the kingdom of Saxony, situated in a deep valley on the left bank of the Elbe, at the influx of the Billa, in the centre of Saxony Switzerland, 25 m. S. S. E. of Dresden by the railway. It contains a Roman Catholic and a Protestant church, a monument to the composer Julius Otto, and has some small manufactures of machinery, celluloid, paper, vinegar and buttons. It is chiefly remarkable for the huge fortress, lying immediately to the north-west of the town, which crowns a sandstone rock rising abruptly from the Elbe to a height of 750 ft. Across the Elbe lies the Lilienstein, a similar formation, but unfortified. The fortress of Königstein was probably a Slav stronghold as early as the 12th century, but it is not mentioned in chronicles before the year 1241, when it was a fief of Bohemia. In 1401 it passed to the margraves of Meissen and by the treaty of Eger in 1450 it was formally ceded by Bohemia to Saxony. About 1540 the works were strengthened, and the place was used as a point d’appui against invasions from Bohemia. Hence the phrase frequently employed by historians that Königstein is “the key to Bohemia.” As a fact, the main road from Dresden into that country lies across the hills several miles to the south-west, and the fortress has exercised little, if any, influence in strategic operations, either during the middle ages or in modern times. It was further strengthened under the Elector of Saxony in 1592, and in 1662, when the Union of Bohemia was dissolved, the provinces of Bohemia and Moravia were united into the principality of Bohemia. Königstein was then placed under the administration of the Duke of Saxony, the last of whom completed it in its present form. During the Prussian invasion of Saxony in 1756 it served as a place of refuge for the King of Poland, Augustus III., as it did also in 1849, during the Dresden insurrection of May in that year, to the King of Saxony, Frederick Augustus II. and his ministers. It was occupied by the Prussians in 1807, who retained possession of it until the peace of 1815. It is garrisoned by detachments of several Saxony infantry regiments, and serves as a treasure house for the state and also as a place of detention for officers sentenced to fortress imprisonment. A remarkable feature of the place is a well, hewn out of the solid rock to a depth of 470 ft.

See Klemm, Der Königstein in alter und neuer Zeit (Leipzig, 1880); and Gaucht, Ausfahrt ins südliche Schlesien (Dresden, 1889).

**KönigsWinter**, a town and summer resort of Germany, in the Prussian Rhine province, on the right bank of the Rhine, 4 m. N. E. of Cologne by the railway to Frankfort-on-Main, at the foot of the Siebengebirge. Pop. (1895), 3044. The romantic Drachenfels (1010 ft.), crowned by the ruins of a castle built early in the 12th century by the archbishop of Cologne, rises behind the town. From the summit, to which there is a funicular railway, there is a magnificent view, celebrated by Byron in Childe Harold’s Pilgrimage. A cave in the hill is said to have sheltered the dragon which was slain by the hero Siegfried. The mountain is quarried, and from 1267 onward supplied stone (trachyte) for the building of Cologne cathedral. The castle of Drachenburg, built in 1853, is on the north side of the hill. Königswinter has a Roman Catholic and an Evangelical church, some small manufactories and a little shipping. It has a monument to the poet, Wolfgang Müller. Near the town are the ruins of the abbey of Heisterbach.

**Koninc, Laurent Guillaume DE** (1809–1887), Belgian palaeontologist and chemist, was born at Louvain on the 3rd of May 1809. He studied medicine in the university of his native town, and in 1831 he became assistant in the chemical schools. He pursued the study of chemistry in Paris, Berlin and Giessen, and at Giessen he engaged in teaching the sciences at Göttingen and Liége. In 1856 he was appointed professor of chemistry in the Liége University, and he retained this post until the close of his life. About the year 1835 he began to devote his leisure to the investigation of the Carboniferous fossils around Liége, and ultimately he became distinguished for his researches on the palaeontology of the Palaeozoic rocks, and especially for his descriptions of the mollusca, brachiopods, crustacea and crinoids of the Carboniferous limestone of Belgium. In recognition of this work the Wollaston medal was awarded to him in 1875 by the Geological Society of London, and in 1876 he was appointed professor of palaeontology at Liége. He died at Liége on the 16th of July 1887.

See Notice sur L. G. de Koninck, by E. Dupont; Annuaire de l’Acad. roy. de Belgique (1891), with portrait and bibliography.**

**Koninck, Philip DE** (de Ceninck, de Koninck, van Koeing) (1619–1688), Dutch landscape painter, was born in Amsterdam in 1619. Little is known of his history, except that he was a pupil of Rembrandt, whose influence is to be seen in all his work. He painted chiefly broad sunny landscapes, full of space, light and atmosphere. Portraits by him, somewhat in the style of Rembrandt, also exist; there are examples of these in the galleries at Copenhagen and Christianity. Of his landscapes the principal are “Vue de l’embouchure d’une rivière,” at the Hague; a slightly larger replica is in the National Gallery, London; “Lisière d’un bois,” and “Paysage” (with figures by A. Van de Veld) at Amsterdam; and landscapes in Brussels, Florence (Uffizi), Berlin and Cologne.

Several of his works have been falsely attributed to Rembrandt, and many more to his nameake and fellow-townsman Salomon De Koninck (1600–1656), who was also a disciple of Rembrandt; his paintings and etchings consist mainly of portraits and biblical scenes.

Both these painters are to be distinguished from David De Koninck (1636–1687), who is also known as “Rammelaar.” He was born in Antwerp. He studied there under Jan Fyt, and later settled in Rome, where he is stated to have died in 1687; this, however, doubtful. His pictures are chiefly landscapes with animals, and still-life.

**Konitz, a town of Germany, in the province of West Prussia, at the junction of railways to Schneidemühl and Gnesen, 68 m. S.W. of Danzig. Pop. (1905), 11,014. It is still surrounded by its old fortifications, has also existed; there are examples of the paintings in the galleries at Copenhagen and Christianity. Of his landscapes the principal are “Vue de l’embouchure d’une rivière,” at the Hague; a slightly larger replica is in the National Gallery, London; “Lisière d’un bois,” and “Paysage” (with figures by A. Van de Veld) at Amsterdam; and landscapes in Brussels, Florence (Uffizi), Berlin and Cologne.**

had the pirates become in the 18th century, that all ships suffered which did not receive a pass from their chiefs. The Great Mogul maintained a fleet for the express purpose of checking them, and they were frequently attacked by the Portuguese. British commerce was protected by occasional expeditions from Bombay; but the piratical system was not finally extinguished until 1812. The southern Konkan has given its name to a dialect of Marathi, which is the vernacular of the Konkan province of Goa.

**KONTAGORA**, a province in the British protectorate of Northern Nigeria, on the east bank of the Niger to the north of Nupe and opposite Borgu. It is bounded W. by the Niger, S. by the province of Nupe, E. by that of Zaria, and N. by that of Sokoto. It has an area of 14,500 sq. m. and a population estimated at about 80,000. At the time of the British occupation of Northern Nigeria the province formed a Fula emirate. Before the Fula domination, which was established in 1864, the ancient pagan kingdom of Yauri was the most important of the lesser kingdoms which occupied the territory. The Fula conquest was made from Nupe on the south and a tribe of independent and warlike pagans continued to hold the country between Kontagora and Sokoto on the north. The province was brought under British domination in 1901 as the result of a military expedition sent to prevent audacious slave-raiding in British protected territory and of threats directed against the British military station at Jebba on the Niger. The town of Kontagora was taken in January of 1901. The emir Ibrahim fled, and was not captured till early in 1902. The province, after having been held for a time in military occupation, was organized for administration on the same system as the rest of the protectorate. In 1903 Ibrahim, after agreeing to take the oath of allegiance to the British crown and to accept the usual conditions of appointment, which include the abolition of the slave trade within the province, was reinstated as emir and the British garrison was withdrawn. Since then the development of the province has progressed favourably. Roads have been opened and Kontagora connected by telegraph with headquarters at Zungeru. British courts of justice have been established at the British headquarters, and native courts in every district. In 1904 an expedition reduced to submission the hitherto independent tribes in the northern belt, who had up to that time blocked the road to Sokoto. Their arms were confiscated and their country organized as a district of the province under a chief and a British assistant resident.

**KOORINGA** [Burrak], a town of Burrca county, South Australia on Burrca Creek, 101 m. by rail N. by E. of Adelaide. Pop. [1901], 1994. It is the centre of a mining and agricultural district in which large areas are devoted to wheat-growing. The famous Burrca Burrca copper mine, discovered by a shepherd in 1844, is close to the town, while silver and lead ore is also found in the vicinity.

**KÖPENICK** (Cöpenick), a town of Germany, in the Prussian province of Brandenburg, on an island in the Spree, 9 m. S.E. from Berlin by the railway to Fürstenwalde. Pop. [1905], 27,721. It contains a royal residence, which was built on the site of a palace which belonged to the great elector, Frederick William. This is surrounded by gardens and contains a fine banqueting hall and a chapel. Other buildings are a Roman Catholic and a Protestant church and a teachers’ seminary. The varied industries embrace the manufacture of glass, linoleum, scaling-wax and ink. In the vicinity is Spindlersfeld, with important dye-works.

Köpenick, which dates from the 12th century, received municipal rights in 1225. Shortly afterwards, it became the bone of contention between Brandenburg and Meissen, but, at the issue of the feud, remained with the former, becoming a favourite residence of the electors of Brandenburg. In the palace the famous court martial was held in 1730, which condemned the crown-prince of Prussia, afterwards Frederick the Great, to death. In 1906 the place derived ephemeral fame from the daring feat of a cobbler, one Wilhelm Voigt, who, attired as a captain in the army, accompanied by soldiers, whom his apparent rank deceived, took the mayor prisoner, on a fictitious charge of having falsified accounts and absconded with a considerable sum of municipal money. The “captain of Köpenick” was arrested, tried, and sentenced to a term of imprisonment.

See Graf zu Dohna, Kurfürstliche Schlösser in der Mark Brandenburg (Berlin, 1890).

**KOPISCH, AUGUST** (1799–1853), German poet, was born at Breslau on the 26th of May 1799. In 1815 he began the study of painting at the Prague academy, but an injury to his hand precluded the prospects of any great success in this profession, and he turned to literature. After a residence in Dresden Kopisch proceeded, in 1822, to Italy, where, at Naples, he formed an intimate friendship with the poet August, count of Platén Hallermund. He was an expert swimmer, a quality which enabled him in company with Ernest Fries to discover the blue grotto of Capri. In 1828 he settled at Berlin and was granted a pension by Frederick William IV., who in 1838 conferred upon him the title of professor. He died at Berlin on the 3rd of February 1853. Kopisch produced some very original poetry, light in language and in form. He especially treated legends and popular subjects, and among his Gedichte (Berlin, 1833) are some famous literary pieces, Die Historie von Noah, Die Heimatsmännchen, Das grüne Tier und Der Scheiderjunge von Krippstadt, which became widely popular. He also published a translation of Dante’s Divina Comedy (Berlin, 1840), and under the title Agrami (Berlin, 1838) a collection of translations of Italian folk songs.

Kopisch’s collected works were published in 5 vols. (Berlin, 1856.)

**KOPP, HERMANN FRANZ MORITZ** (1817–1892), German chemist, was born on the 30th of October 1817 at Hanau, where his father, Johann Heinrich Kopp (1777–1838), a physician, was professor of chemistry, physics and natural history at the Lyceum.

After attending the gymnasium of his native town, he studied at Marburg and Heidelberg, and then, attracted by the fame of Liebig, went in 1839 to Giessen, where he became a privatdozent in 1841, and professor of chemistry twelve years later. In 1864 he was called to Heidelberg in the same capacity, and he remained there till his death on the 20th of February 1892. Kopp devoted himself especially to physico-chemical inquiries, and in the history of chemical theory his name is associated with several of the most important corollations of the physical properties of substances with their chemical constitution. Much of his work was concerned with specific volumes, the conception of which he set forth in a paper published when he was only twenty-two years of age; and the principles he established have formed the basis of subsequent investigations in that subject, although his results have in some cases undergone modification. Another question to which he gave much attention was the connexion of the boiling-point of compounds, organic ones in particular, with their composition. In addition to these and other laborious researches, Kopp was a prolific writer. In 1843–1847 he published a comprehensive History of Chemistry, in four volumes, to which three supplements were added in 1869–1875. The Development of Chemistry in Recent Times appeared in 1871–1874, and in 1886 he published a work in two volumes on Alchemy in Ancient and Modern Times. In addition he wrote (1859) on theoretical and physical chemistry for the Graham-Otto Lehrbuch der Chemie, and for many years assisted Liebig in editing the Annalen der Chemie and the Jahresbericht.

He must not be confused with Emil Kopp (1817–1875), who, born at Warselhem, Alsace, became in 1847 professor of toxicology and chemistry at the École supérieure de Pharmacie at Strasbourg, in 1849 professor of physics and chemistry at Lausanne, in 1852 chemist to a Turkey-red factory near Manchester, in 1856 professor of technology at Turin, and finally, in 1871, professor of technical chemistry at the Polytechnic of Zürich, where he died in 1875.

**KOPRULU, or Kuprus** (Bulgarian Valësa, Greek Vellësa), a town of Macedonia, European Turkey, in the vilayet of Salonica.
situated 600 ft. above sea-level, on the river Vardar, and on the Salonika-Mitrovitsa railway, 25 m. S.E. of Uskub. Pop. (1905), about 22,000. Koprülü has a flourishing trade in silk, maize, and mulberries are cultivated in the neighbourhood. The Greek and Bulgarian names of the town may be corrupt forms of the ancient Bylazora, described by Polybius as the chief city of Paeonia.

KORA, or CORA, an ancient town of Northern India, in the Fatehpur district of the United Provinces. Pop. (1901), 2866. As the capital of a Mahomedan province, it gave its name to part of the tract (with Allahabad) granted by Lord Clive to the titular Mogul emperor, Shah Alam, in 1765.

Kora (Kor' an) is the sacred Book of Islam, on which the religion of more than two hundred millions of Mahomedans is founded, being regarded by them as the immediate word of God. And since the use of the Koran in public worship, in schools and otherwise, is much more extensive than, for example, the reading of the Bible in most Christian countries, it has been truly described as the most widely-read book in existence. This circumstance alone is sufficient to give it an urgent claim on our attention, whether it suit our taste and fall in with our religious and philosophical views or not. Besides, it is the work of Mahomet, and as such is fitted to afford a clue to the spiritual and ethical development of the most successful of all prophets and religious personalities. It must be owned that the first perusal leaves on a European an impression of chaotic confusion—not that the book is so very extensive, for it is not quite as large as the New Testament. This impression can in some degree be modified only by the application of a critical analysis with the assistance of Arabian tradition.

To the faith of the Moslems, as has been said, the Koran is the word of God, and such also is the claim which the book itself advances. For except in sur. I.—which is a prayer for men—and some few passages where Mahomet (vi. 104, 174; xxvii. 93; xlii. 8) or the angels (lix. 63; xxxvii. 164 sqq.) speak in the first person without the intervention of the usual imperative “say” (sing. or pl.), the speaker throughout is God, either in the first person singular or more commonly the plural of majesty “we.” The same mode of address is familiar to us from the prophets of the Old Testament; the human personality disappears, in the moment of inspiration, behind the God by whom it is filled. But all the greatest of the Hebrew prophets fall back speedily upon the unassuaging human “I”; while in the Koran the divine “we” is the stereotyped form of address. Mahomet, however, really felt that the spiritual element be the immediate word of God. This consciousness was no doubt brighter at his first appearance than it afterwards became, but it never entirely forsook him. Nevertheless we cannot doubt his good-faith, not even in the cases in which the moral quality of his actions leaves most to be desired. In spite of all, the dominant fact remains, that to the end he was zealous for his God and for the salvation of his people, nay, of the whole of humanity, and that he never lost the unconquerable certainty of his divine mission.

The rationale of revelation is explained in the Koran itself as follows: In heaven is the original text (“the mother of the book,” xiii. 3; “a concealed book,” lv. 77; “a well-guarded tablet,” lxxv. 22). By the process of “sending down” (tawaff), one piece after another was communicated to the Prophet. The mediator was an angel, who is called sometimes the “Spirit” (xvi. 193), sometimes the “Holy Spirit” (xvi. 104), and at a later time “Gabriel” (only in ii. 91, 92; lxi. 4). This angel dictates the revelation to the Prophet, who repeats it after him, and afterwards proclaims it to the world (lxxv. 6, &c.). It is plain that we are here somewhat crude attempt of the Prophet to represent to himself the more or less unconscious process by which his ideas arose and gradually took shape in his mind. It is no wonder if in such confused imagery the details are not always self-consistent. When, for example, this heavenly archetype is said to be in the hands of “exalted scribes” (lxx. 13 sqq.), this seems a transition to a quite different set of ideas, namely, the books of fate, or the record of all human actions—conceptions which are actually found in the Koran. It is to be observed, at all events, that Mahomet’s transcendental idea of God, as a Being exalted altogether above the world, excludes the thought of direct intercourse between the Prophet and God.

It is an explicit statement of the Koran that the sacred book was revealed (“sent down”) by God, not all at once, but piece by piece, and gradually (xxv. 34). This is evident component from the actual composition of the book, and is Parts of the confirmed by Moslem tradition. That is to say, Mahomet issued his revelations in fly-leaves of greater or less extent. A single piece of this kind was called either, like the entire collection, kor' an, i.e. “recitation,” or “reading,” or, better, "verse," the equivalent of Aramic геъда ("lectionary"), or klillation, "writing," or, finally, in modern Arabic, Cuộc, and means literally “series.” The last became, in the lifetime of Mahomet, the regular designation of the individual sections as distinguished from the whole collection; and accordingly it is the name given to the separate chapters of the existing Koran. These chapters are of very unequal length. Since many of the shorter ones are undoubtedly complete in themselves, it is natural to assume that the longer, which are sometimes very comprehensive, have arisen from the amalgamation of various originally distinct revelations. This supposition is favoured by the numerous traditions which, according to the circumstances under which this or that short piece, now incorporated amongst the whole book, was revealed; and also by the fact that the connexion of thought in the present suras often seems to be interrupted. And in reality many pieces of the long suras have to be severed out as originally independent; even in the short ones parts are often found which cannot have been there at first. At the same time we must beware of carrying this splitting operation too far,—as Nöldeke now believes himself to have done in his earlier works, and as Spranger also sometimes seems to do. That some suras were of considerable length from the first is seen, for example, from xlii. 8 sqq. in a single day’s vision, and from the very beginning, the history of Joseph, and then a few concluding observations, which are not entirely homogeneous. In like manner, xx., which is mainly occupied with the history of Moses, forms a complete whole. The same is true of xviii., which at first sight seems to fall into several pieces; the history of the seven sleepers, the grotesque narrative about Moses, and that about Alexander "the Horned," are all connected together, and the same rhyme through the whole sura. Even in the separate narrations we may observe how readily the Koran passes from one subject to another, how little care is taken to express all the transitions of thought, and how frequently clauses are omitted, which are almost indispensable. We are not at liberty, therefore, in every case where the connexion in the Koran is obscure, to say that it is really broken, and set it down as the clumsy patchwork of a later hand. Even in the old Arabic poetry such abrupt transitions are of very frequent occurrence. It is not uncommon for the Koran, after a new subject has been entered on, to return gradually or suddenly to the former theme,—a proof that there at least separation is not to be thought of. In short, however imperfectly the Koran may have been redacted, in the majority of cases the present suras are identical with the original.

How these revelations actually arose, Mahomet’s mind is a question which it is almost as idle to discuss as it would be to analyse the workings of the mind of a poet. In his early career, sometimes perhaps in its later stages also, many revelations must have burst from him in uncontrollable excitement, so that he could not possibly regard them otherwise than as divine inspirations. We must bear in mind that he was no cold systematic thinker, but an Oriental visionary, brought up in close superstition, and without intellectual discipline; a man whose nervous temperament had been powerfully worked on by ascetic austerities, and who was all the more irritated by the opposition he encountered, because he had little of the heroic in his nature. Filled with his religious ideas and visions, he might well fancy he heard the angel bidding him recite what was said to him. There may have been many a revelation of this kind which no one ever heard but himself, as he repeated it to himself in the silence.
of the night (lxiii. 4). Indeed the Koran itself admits that he forgot some revelations (lxxvii. 7). But by far the greatest part of the book is undoubtedly the result of deliberation, touched more or less with emotion, and animated by a certain rhetorical rather than poetical glow. Many passages are based upon purely intellectual reflection. It is said that Mahomet occasionally uttered such revelations immediately after one of those epileptic fits which not only befell him himself, but also regarded as tokens of intercourse with the higher powers. If that is the case, it is impossible to say whether the trick was in the utterance of the revelation or in the fit itself.

How the various pieces of the Koran took literary form is uncertain. Mahomet himself, so far as we can discover, never wrote down anything. The question whether he could read and write has been much debated among Moslems, unfortunately more with dogmatic arguments and spurious traditions than authentic proofs. At present one is inclined to say that he was not altogether ignorant of these arts, but that from want of practice he found it convenient to employ some one else whenever he had anything to write. After the migration to Medina (A.D. 622) we are told that short pieces—chiefly legal decisions—were taken down immediately after they were revealed, by an adherent whom he summoned for the purpose; so that nothing stood in the way of their publication. Hence it is probable that in Mecca, where the art of writing was commoner than in Medina, he had already begun to have his oracles committed to writing. That even long portions of the Koran existed in written form (a time at least) before he himself, may be pretty safely inferred from various indications; especially from the fact that in Mecca the Prophet had caused insertions to be made, and pieces to be erased in his previous revelations. For we cannot suppose that he knew the longer suras by heart so perfectly that he was able after a time to lay his finger upon any particular passage. In some instances, indeed, he may have relied too much on his memory. For example, he seems to have occasionally dictated the same sūra to different persons in slightly different terms. In such cases, no doubt, he may have partly intended to introduce improvements; and so long as the difference was merely in expression, without affecting the sense, it could occasion no perplexity to his followers. None of them had literary pedantry enough to question the consistency of the divine revelation on that ground. In particular instances, however, the difference of reading was too important to be overlooked. Thus the Koran itself confesses that the unbelievers cast it up as a reproach to the Prophet that God sometimes substituted one verse for another (xvi. 103). On one occasion, when a dispute arose between two of his own followers as to the true reading of a passage both of which had received from the Prophet himself, the latter sent to the inferior of the two copies of the Koran he had revealed in seven forms. This in apparently genuine dictum seven stands, of course, as in many other cases, for an indefinite but limited number. But one may imagine what a world of trouble it has cost the Moslem theologians to explain the saying in accordance with their dogmatic beliefs. A great number of explanations are current, some of which claim the authority of the Prophet himself; as, indeed, fictitious utterances of Mahomet play throughout a conspicuous part in the exegesis of the Koran.

The following is among the most common: To a question whose settlement was urgently required at the moment. The same návēt appears in a remark of the Caliph Othman about a doubtful case: "If the Apostle of God were still alive, methinks there had been a Koran passage revealed on this point." Not unfrequently the divine word was found to coincide with the advice which Mahomet had received from his most intimate disciples. "Omar was many a time of a certain opinion," says one tradition, "and the Koran was then revealed accordingly."

The contents of the different parts of the Koran are extremely varied. Many passages consist of theological or moral reflections. We are reminded of the greatness, the goodness, the righteousness of God as manifested in Nature, in history, and in revelation through the prophets, especially through Mahomet. God is magnified as the One, the All-powerful. Idolatry and all deification of created beings, such as the worship of Christ as the Son of God, are unsparingly condemned. The joys of heaven and the pains of hell are depicted in vivid sensuous imagery, as is also the terror of the whole creation at the advent of the last day and the judgment of the world. Believers receive general moral instruction, as well as directions for special cases. Sometimes, when lukewarm are rebuked, the enemies threatened with terrible punishment, both temporal and eternal. To the sceptical the truth of Islam is held forth; and a certain, not very cogent, method of demonstration predominates. In many passages the sacred book falls into a diffuse preaching style, others seem more like proclamations or general orders. A great number contain ceremonial or civil laws, or even special commands to individuals down to such matters as the regulation of Mahomet's harem. In not a few definite questions are answered which had actually been inquired after by believers or infidels. Mahomet himself, too, repeatedly receives direct injunctions, and does not escape an occasional rebuke. One sūra (i, 28) is a prayer, two (xxiii. cxxxiv.) are magical formulas. Many sūras treat of a single topic, others embrace several.

From the mass of material comprised in the Koran—and the account we have given is far from exhaustive—we should select the histories of the ancient prophets and saints as possessing a peculiar interest. The purpose of Mahomet is to show from these histories how God in former times had rewarded the righteous and punished their enemies. For the most part the old prophets only serve to introduce a little variety in point of form, for they are almost in every case facsimiles of Mahomet himself. They preach exactly like
them, they have to bring the very same charges against their opponents, who on their part behave exactly as the unbelieving inhabitants of Mecca. The Koran even goes so far as to make Noah contend against the worship of certain false gods, mentioned by name, who were worshipped by the Arabs of Mahomet's time. In an address which is put in the mouth of Abraham (xxvi. 75 sqq.), the reader quite forgets that it is Abraham, and not Mahomet (or God himself), who is speaking. Other narratives are intended rather for amusement, although they are always well seasoned with edifying phrases. It is no wonder that the godless Korishites thought these stories of the Koran not nearly so entertaining as those of Rostam and Ispanfâr, related by Na'dr the son of Hâdî who learned them from old men on the Euphrates the heroic mythology of the Persians. But the Prophet was so exasperated by this rivalry that when Na'dr fell into his power after the battle of Badr, he caused him to be executed; although in all other cases he readily pardoned his fellow-countrymen.

These histories are chiefly about Scripture characters, especially those of the Old Testament. But the deviations from the Biblical narratives are very marked. Many of the alterations are found in the legendary anecdotes of the Apocryphal or New Testament Apocrypha; but many more are due perhaps to misconceptions such as only a listener (not the reader of a book) could fall into. One would suppose that the most ignorant Jew could never have mistaken Haman, the minister of Ahashuerus, for the minister of Pharaoh, as happens in the Koran, or identified Miriam, the sister of Moses, with Mary (= Marîmî), the mother of Christ. So long, however, as we have no closer acquaintance with Arab Judaism and Christianity, we must always reckon with the possibility that many of these mistakes were due to adherents of these religions who were his authorities, or were a native reproduction of versions already widely accepted by his contemporaries. In addition to his misconceptions there are sundry capricious alterations, some of them very grotesque, due to Mahomet himself. For instance, in his ignorance of everything out of Arabia, he makes the fertility of Egypt—where rain is almost never seen and never missed—depend on rain instead of the inundations of the Nile (xli. 49).

It is uncertain whether his account of Alexander was borrowed from Jews or Christians, since the romance of Alexander belonged to the stereotyped literature of that age. The description of Alexander as "the Hornead" in the Koran is, however, in accordance with the result of recent researches, to be traced to a Syrian legend dating from A.D. 514-515 (Th. Nohlke, "Beiträge zur Gesch. des Alexanderromanes" in Denkschriften Akad. Wien, vol. xxxviii. No. 5, p. 27, &c.). According to this, God caused horns to grow on Alexander's head to enable him to overthrow all things. This detail of the legend is ultimately tractable, as Hottinger long ago supposed, to the numerous coins on which Alexander is represented with the ram's horns of Ammon.1 Besides Jewish and Christian histories there are a few about old Arabian prophets. In these he seems to have handled his materials even more freely than in the others. The opinion has already been expressed that Mahomet did not make use of written sources. Coincidences and divergences alike can always be accounted for by oral communications from Jews who knew a little and Christians who knew next to nothing. Even in the rare passages where we can trace direct resemblances to the text of the Old Testament (cf. xxi. 105 with Ps. xxxvii. 29; 1. 5 with Ps. xxvii. 11) or the New (cf. vii. 48 with Luke xvi. 24; xlv. 19 with Luke xvi. 25), there is nothing more than might be expected by being picked up in conversation with any Jew or Christian. In Medina, where he had the opportunity of becoming acquainted with Jews of some culture, he learned some things out of the Mishna, e.g. v. 35 corresponds almost word for word with Mishna Sanhedrin iv. 5; compare also ii. 183 with Mishna Berakoth i. 2. That these are only cases of oral communication will be admitted by any one with the slightest knowledge of the circumstances. Otherwise we might even conclude that Mahomet had studied the Talmud; e.g. the regulation as to ablation by rubbing with sand, where water cannot be obtained (iv. 46), corresponds to a talmudic ordinance (Berakoth 5 a). Of Christianity he can have been able to learn very little, even in Medina; as may be seen from the absurd travesty of the institution of the Eucharist in v. 112 sqq. For the rest, it is highly improbable that before the Koran any real literary production existed that could be strictly called a book— existed in the Arabic language. Style.

In point of style and artistic effect, the different parts of the Koran are of very unequal value. An unprejudiced and critical reader will certainly find very few passages where his aesthetic susceptibilities are thoroughly satisfied. But he will often be struck, especially in the older pieces, by a wild force of passion, and a vigorous, if not rich, imagination. Descriptions of heaven and hell, and allusions to God's working in nature, not infrequently show a certain amount of poetic power. In other places also the style is sometimes lively and picturesque, though often stiff and prosaic. It is a rare stroke across such strains of touching simplicity as in the middle of xclii. The greater part of the Koran is decidedly prosaic; much of it indeed is still in style. Of course, with such a variety of material, we cannot expect every part to be equally vivacious, or imaginative, or poetic. A decree about the right of inheritance, or a point of ritual, must necessarily be expressed in prose, if it is to be intelligible. No one complains of the civil laws in Exodus or the sacrificial ritual in Leviticus, because they want the fire of Isaiah or the tenderness of Deuteronomy. But Mahomet's mistake consists in persistent and slavish adherence to the semi-prosaic form which he had at first adopted in accordance with his own taste and that of his hearers. For instance, he employs rhyme in dealing with the most prosaic subjects, and thus produces the disagreeable effect of incongruity between style and matter. It has to be considered, however, that many of those sermonizing pieces which are so tedious to us, especially when we read two or three in succession (perhaps in a very inadequate translation), must have had a quite different effect when recited under the burning sky and on the barren soil of Mecca. There, thoughts about God's greatness and man's duty, which are familiar to us, were new to the hearers—it is hearers; we have to think of in the first instance, not readers—to whom, at the same time, every allusion had a meaning which often escapes our notice. When Mahomet spoke of the goodness of the Lord in creating the clouds, and bringing them across the cheerless desert, and pouring them out on the earth to restore its rich vegetation, that must have been a picture of thrilling interest to the Arabs, who are accustomed to see from three to five years elapse before a copious shower comes to clothe the wilderness once more with luxuriant pastures. It requires an effort for us, under our clouded skies, to realize in some degree the intensity of that impression.

The fact that scraps of poetical phraseology are specially numerous in the earlier strata, enables us to understand why the prosaic mercantile community of Mecca regarded their eccentric townsman as a "poet," or even a "possessed poet." Mahomet himself had to disclaim such titles, because he felt himself to be a divinely inspired prophet; but we too, from our standpoint, shall fully acquit him of poetic genius. Like many other predominantly religious characters, he had no appreciation of poetic beauty; and if we may believe one anecdote related of him, at a time when every one made verses, he affected ignorance of the most elementary rules of prosody. Hence the style of the Koran is not poetical but rhetorical; and the powerful effect which some portions produce on us is gained by rhetorical means. Accordingly the sacred book has not even the artistic form of poetry; which, among the Arabs, includes a stringent metre, as well as rhyme. The Koran is never metrical, and only a few exceptionally

1 Reproductions of such Ptolemaic and Lysimachian coins are to be found in J. J. Bemoulli, Die erhaltenen Darstellungen Alexanders d. Grossen, (Munich, 1757), Tab. VIII; also in Theodor Schreiber, "Studien über das Bildniss Alexanders des Gr." in der Abh. Sächs. Gesellschaft der Wissenschaften, Bd. xxi. (1903), Tab. XIII.
eloquent portions fall into a sort of spontaneous rhythm. On the other hand, the rhyme is regularly maintained; although, especially in the later pieces, after a very slovenly fashion. Rhymed prose was a favourite form of composition among the Arabs of that day, and Mahomet adopted it; but if it imparts a certain sprightliness to some passages, it proves on the whole a burdensome yoke. The Moslems themselves have observed that the tyranny of the rhyme often makes itself apparent in derangement of the order of words, and in the choice of verbal forms which would not otherwise have been employed; e.g. an imperfect instead of a perfect. In one place, to save the rhyme, he calls Mount Sinai سَجَن (xcv. 2) instead of سَجَن (xxii. 20); in another Elijah is called إِبْرَاهِيم (xxxvii. 130) instead of إِبْرَاهِيم (vi. 85; xxxvii. 125). The substance even is modified to suit exigencies of rhyme. Thus the Prophet would scarcely have fixed on the unusual number of eight angels round the throne of God (lxxxv. 17) if the word الإِمَامِيّات, "eight," had not happened to fall in so well with the rhyme. And when Iw. speaks of two heavenly gardens, each with two fountains and two kinds of fruit, and again of two similar gardens, all this is simply because the word termination (أَرْيَة) do not find a steady rhyme that controls the rhyme in that whole sûra. In the later pieces, Mahomet often inserts edifying remarks, entirely out of keeping with the context, merely to complete his rhyme. In Arabic it is such an easy thing to accumulate masses of words with the same termination, that the gross negligence of the rhyme in the Koran is doubly remarkable. One may say that this is another mark of the Prophet's want of mental training, and incapacity for introspective criticism.

On the whole, while many parts of the Koran undoubtedly have considerable rhetorical power, even over an unaided reader, the book, aesthetically considered, is by no means a first-rate performance. To begin with what we are most competent to criticize, let us look at some of the more extended narratives. It has already been noted how vehement and abrupt they are where they ought to be characterized by epic repose. Indispensable links, both in expression and in the sequence of events, are often omitted, so that to understand these histories is sometimes far easier for us than for those who heard them first, because we know most of them from better sources. Along with this, there is a great deal of superficial constabulary; and (they) do we find a steady instance in the narration. Contrast in these respects the history of Joseph (xii.) and its glaring improprieties with the admirably conceived and admirably executed story in Genesis. Similar faults are found in the non-narrative portions of the Koran. The connexion of ideas is extremely loose, and even the syntax betrays great awkwardness. Anacolutha are of frequent occurrence, and cannot be explained as conscious literary devices. Many sentences begin with a "when" or "on the day when" which seems to hover in the air, so that the commentators are driven to supply a "think of this" or some such elision. Again, there is no great literary skill evinced in the frequent and needless harping on the same words and phrases; in xvi., for example, "till that" (كَذَا حَدَث) occurs no fewer than eight times. Mahomet, in short, is not in any sense a master of style. This opinion will be endorsed by any European who reads through the book with an impartial spirit and some knowledge of the language, without taking into account the terrorsome effect of its endless iterations. But in the ears of every pious Moslem such a judgment will sound almost as shocking as downright atheism or polytheism. Among the Moslems, the Koran has always been looked on as the infallible word of God. This feature of it is in their dogmatic the greatest of all miracles, the incontestable proof of its divine origin. Such a view on the part of men who knew Arabic infinitely better than the most accomplished European Arabist will ever do, may well startle us. In fact, the Koran boldly challenged its opponents to produce ten sûras, or even a single one, like those of the sacred book, and they never did so. That, to be sure, on calm reflection, is not so very surprising. Revelations of the kind which Mahomet uttered, no unbeliever could produce without making himself a laughing-stock. However little real originality there is in Mahomet's doctrines, as against his own countrymen he was thoroughly original, even in the form of his oracles. To compose such revelations at will was beyond the power of the most expert literary artist; it would have required either a prophet or a shameless impostor. And if such a character appeared after Mahomet, still he could never be anything but an imitator, like the false prophets who arose about the time of his death and afterwards. That the adversaries should produce any sample whatsoever of poetry or rhetoric equal to the Koran is preposterous; but if they could, it might be that case he would have been put to shame, even in the eyes of many of his own followers, by the first poem that came to hand. Nevertheless, it is on a false interpretation of this challenge that the dogma of the incomparable excellence of the style and diction of the Koran is based. The rest has been accomplished by dogmatic prejudice, which is quite capable of working other miracles besides turning a defective literary production into an unrivalled masterpiece in the eyes of believers. This view once accepted, the next step was to find everywhere evidence of the that time of the style with old ideas. And if here and there, as one can scarcely doubt, there was among the old Moslems a lover of poetry who had his difficulties about this dogma, he had to beware of uttering an opinion which might have cost him his head. We know of at least one rationalistic theologian who defined the dogma in such a way that we can see he did not believe it (Shahristânî, p. 39). The truth is, it would have been a miracle indeed if the style of the Koran had been perfect. For although there was at that time a recognized poetical style, already degenerating to mannerism, a developed prose style did not exist. All beginnings are difficult; and it can never be esteemed a serious charge against Mahomet that his book, the first prose work of a high order in the language, testifies to the awkwardness of the beginner. And further, we must always remember that entertainment and aesthetic effect were at most subsidiary objects. The great aim was persuasion and conversion; and, say what we will, that aim has been realized on the most imposing scale.

Mahomet repeatedly calls attention to the fact that the Koran is not written, like other sacred books, in a strange language, but in Arabic, and therefore is intelligible to all. At the time of its composition, many foreign words had crept into the language; a great number of Aramaic terms for religious conceptions of Jewish or Christian origin. Some of these had already passed into general use, while others were confined to a more limited circle. Mahomet, who could not fully express his new ideas in the common language of his countrymen, but had frequently to find out new terms for himself, made free use of such Jewish and Christian words, as was done, though perhaps to a smaller extent, by certain thinkers and poets of that age who had more or less risen above the level of heathenism. In Mahomet's case this is the less wonderful because he was indebted to the instruction of Jews and Christians, whose Arabic—as the Koran pretty clearly intimates with regard to one of them—was very defective. On the other hand, it is yet more remarkable that several of such borrowed words in the Koran have a sense which they do not possess in the original language. It is not necessary that this phenomenon should in every case be due to the same cause. Just as the prophet often misunderstood traditional traits of the sacred history, he may, as an unlearned man, likewise have often employed foreign expressions wrongly. Other remarkable senses of words were perhaps already acquired in the language of Arabian Jews or Christians. Thus،* frr means really "redemption," but Mahomet uses it for "revelation." The widespread opinion that this sense first asserted itself in reference to the Arab root فَرَقُ (farq), "sever," or "decide," is open to considerable doubt. There is, for instance, no difficulty in deriving the Arab meaning of "revelation" from the common Aramaic "salvation," and this transference must have taken place in a community for which salvation formed the central object of faith, i.e. either amongst those Jews who looked to the coming of a Messiah or,
more probably, among Christians, since Christianity is in a very peculiar sense the religion of salvation. Millô is properly "worship" (= Aramaic mellthâ), but in the Koran "religion." It is actually used of the religion of the Jews and Christians (once), of the heathen (5 times), but mostly (8 times) of the religion of Abraham, which Mahomet in the Medina period places on the same level with Islam. Although of the Aramaic dialects none employs the term mellthâ in the sense of religion, it appears that the prophet found such a use. Tîyûn, which Mahomet uses of a heavenly book (Sûra 83; 18, 19), is clearly the Hebrew elûyn, "high" or "exalted." It is, however, doubtful in what sense this word appeared to him, either as a name of God, as in the Old Testament passages and remnant of the old Shintô which still occurs actually as the epithet of a heavenly book, although this use cannot be substantiated from Jewish literature. So again the word mahthâni is, as Geiger has conjectured, the regular plural of the Aramaic mahthâlûhâ, which is the same as the Hebrew mishnah, and denotes in Jewish usage a legal decision of some of the ancient Rabbins. But in the Koran Mahomet appears to have understood it in the sense of "saying" or "verse" (cf. xxxix. 24). On the other hand, it is by no means certain that by "the Seven Mathanî" (xxv. 87) the seven verses of Sûra 1. are meant of which undoubted Korâni origin are less frequent in the Koran. It is an interesting fact that few have come over from the Abyssinian; such as kawâryân "apostles," mâyâdî "table," mu'dâqì "doubter, sceptic," ragân "cursed," mahirât "temple"; the first three of these make their first appearance in sûras of the Medina period. The word shajîn "Satan," which was likewise borrowed, at least in the first instance, from the Abyssinian, had probably been already introduced into the language. Spranger has rightly observed that Mahomet makes a certain parade of these foreign terms, as of other peculiarly constructed expressions; in this he followed a favourite practice of contemporary poets. It is the tendency of the imperfectly educated to delight in out-of-the-way expressions, and on such minds they readily produce a remarkably solemn and mysterious impression. This was exactly the kind of effect that Mahomet desired, and to secure it he seems even to have invented a few odd vocables, as gisîlîn (lxix. 36), zijjîn (lxxxiii. 7, 8), lâsîmîn (lxxxiii. 27), and salsabîl (lxvii. 18). But, of course, the necessity of enabling his hearers to understand ideas which they must have found sufficiently novel in themselves, imposed tolerably narrow limits on such eccentricities.

The two periods of our present narrative belong partly to the Mecca period (before A.D. 622), partly to the period commencing with the migration to Medina (from the autumn of 622 to 8th June 632). Mahomet's position in Medina was entirely different from that which he had occupied in his native town. In the former he was from the first the leader of a powerful party, and gradually became the autocratic ruler of Arabia; in the latter he was only the despised preacher of a small congregation. This difference, as was to be expected, appears in the Koran. The Medina pieces, whether entire sûras or isolated passages interpolated in Meccan sûras, are accordingly pretty broadly distinct, as to their contents, from those issued in Mecca. In the great majority of cases there can be no doubt whatever whether a piece first saw the light in Mecca or in Medina; and for the most part the internal evidence is borne out by Moslem tradition. And since the revelations given in Medina frequently take notice of events about which we have fairly accurate information, and whose dates are at least approximately known, we are often in a position to fix their date with at any rate considerable certainty; here again tradition renders valuable assistance. Even with regard to the Medina passages, however, a great deal remains uncertain, partly because the allusions to historical events and circumstances are generally rather obscure, partly because traditions about the occasion of the revelation of the various pieces are often fluctuating, and often rest on misunderstanding or arbitrary conjecture. An important criterion for judging the period during which individual sûras, interpolated in Medina revelations, arose (e.g. Sûr. xvi. 134, vi. 162) is provided by the Ibrâhim legend, the great importance of which, as throwing light on the evolution of Mahomet's doctrine in its relation to older revealed religions, has been convincingly set forth by Dr Snouck Hurgronje in his dissertation for the doctor's degree and in later essays. According to this, Ibrâhim, after the controversy with the Jews, first of all became Mahomet's special forerunner in Medina, then the first Moslem, and finally the founder of the Ka'ba. But at all events it is far easier to arrange in some sort of chronological order the Medina sûras than those composed in Mecca. There is, indeed, one tradition which professes to furnish a chronological arrangement of these sûras, and this shows that it occurs in several divergent forms, and that it takes no account of the way the present sûras are partly composed of pieces of different dates, it contains so many suspicious or undoubtedly false statements, that it is impossible to attach any great importance to it. Besides, it is a priori unlikely that a contemporary of Mahomet should have drawn up such a list; and if any one had made the attempt he would have found it almost impossible to obtain reliable information as to the order of the earlier Meccan sûras. We have in this list no genuine tradition, but rather the lucubrations of an undoubtedly conscientious Moslem critic, who may have been about the ear system, and who being ignorant of the state of the Koran at the time of Mahomet, has to decide between alternative opinions by the opinion that these form a distinct group. At the opposite extreme from them stands another cluster, showing quite obvious affinities with the style of the Medina sûras, which must therefore be assigned to the later part of the Prophet's work in Mecca. Between these two groups stand a number of other Meccan sûras, which in every respect mark the transition from the first period to the third. It need hardly be said that the three periods—which were first distinguished by Professor Well—are not separated by sharp lines of division. With regard to some sûras, the boundary is indeterminate, the division falling between the middle group, or with one or other of the extremes. And it is altogether impossible, within these groups, to establish even a probable chronological arrangement of the individual revelations. In default of clear allusions to well-known events, or events whose date can be determined, we might indeed endeavour to trace the psychological development of the Prophet by means of the Koran, and arrange its parts accordingly. But in such an undertaking one is always apt to take subjective assumptions or mere fancies for established data. Good traditions about the origin of the Meccan revelations are not very numerous. In fact the whole history of Mahomet previous to the Flight is so imperfectly related that we are not even sure in what year he appeared as a prophet. Probably it was in A.D. 610; it may have been somewhat earlier, but scarcely later. If, as one tradition says, xxx. 1 seq. ("The Romans are overcome in the nearest neighbouring land") refers to the defeat of the Byzantines by the Persians, not far from Damascus, about the spring of 614, it would follow that the third group, to which this passage belongs, covers the greater part of the Meccan period. And it is not in itself unlikely that the passionate vehemence which characterises the first group was of short duration. Nor is the assumption contradicted by the tolerably well attested, though far from incontestable, statement, that when Omar was converted (A.D. 615 or 616), xx., which belongs to the second group, already existed in writing. But the reference of xxx. 1 seq. to this particular battle is by no means so certain that positive conclusions

1 For the schemes of Nöldeke and Grimm see Mahomedan Religion.

2 See Bibliography at end.
can be drawn from it. It is the same with other allusions in the Meccan sūras to occurrences whose chronology can be partially ascertained. It is better, therefore, to rest satisfied with a merely relative determination of the order of even the three great clusters of Meccan revelations.

In the pieces of the first period the convulsive excitement of the Prophet often expresses itself with the utmost vehemence. He is so carried away by his emotion that he cannot choose his words; they seem rather to burst from him. Many of these pieces remind us of the oracles of the old heathen soothsayers, whose style is known to us from imitations, although we have perhaps not a single genuine specimen. Like those other oracles, the sūras of this period, which are never very long, are composed of short sentences with tolerably pure but rapidly changing rhymes. The oaths, too, with which many of them begin were largely used by the soothsayers. Some of these oaths are very uncouth and hard to understand, some of them perhaps were not meant to be understood, for indeed all sorts of strange things are met with in these chapters. Here and there Mahomet speaks of visions, and appears even to see angels before him in boilly form. There are some intensely vivid descriptions of the resurrection and the last day which seem to have exercised a demonic power over men, a fact which arises naturally from the silence regarding angelic visits. Here and there,Mahomet describes the oceans, the heavens, and the earth. These visions, whether poetical or visionary, are, one must repeat, it is exceedingly difficult to make out any strict chronological sequence. For instance, it is by no means certain whether the beginning of xcvii. is really, what a widely circulated tradition calls it, the oldest part of the whole Koran. That tradition goes back to the Prophet's favourite wife Ayeshah; but as she was not born at the time when the revelation is said to have been made, it can only contain the best what Mahomet told her years afterwards, from his own not very clear recollection, with or without fictitious additions, and this woman is little trustworthy. Moreover, there are other pieces mentioned by others as the oldest. In any case xcvii. 1 sqq. is certainly very early. According to the traditional view, which appears to be correct, it treats of a vision in which the Prophet receives an injunction to recite a revelation conveyed to him by the angel. It is interesting to observe that here already two things are brought forward as proofs of the omnipotence and care of God: one is the creation of man out of a sexual drop; the other is the then recently introduced art of writing, which the Prophet instinctively seizes on as a means of propagating his doctrines. It was only after Mahomet encountered obstinate resistance that the tone of the revelations became thoroughly passionate. In such cases he was not slow to utter terrible threats against those who ridiculed the preaching of the unity of God, of the resurrection, and of the judgment. His own uncle Abū Labor had rudely repelled him, and in a brief special sūra (cxiv.) he and his wife are consigned to hell.

The sūras of this period form almost exclusively the concluding portions of the present text. One is disposed to assume, however, that they were not in the time when they were composed. In that many of the chapters seem to be superseded at an early period.

Since Mahomet's strength lay in his enthusiastic and fiery imagination rather than in the wealth of ideas and clearness of abstract thought on which exact reasoning depends, it follows that the older sūras, in which the former qualities have free scope, must be more attractive to us than the later. In the sūras of the second period the imaginative glow perceptibly diminishes; there is still fire and animation, but the tone becomes gradually more prosaic. As the feverish restlessness subsides, the periods are drawn out, and the revelations as a whole become longer. The truth of the new doctrine is proved by accumulated instances of God's working in nature and in history; the objections of opponents, whether advanced in good faith or in jest are controverted by arguments; but the demonstration is often confused or even weak. The histories of the earlier prophets, which had occasionally been briefly touched on in the first period, are now related, sometimes at great length. On the whole, the charm of the style is passing away.

There is one piece of the Koran, belonging to the beginning of this period, if not to the close of the former, which claims particular notice. This is Sūra li, the Lord's Prayer of the Moslems, a vigorous hymn of praise to God, the Lord of both worlds, which ends in a petition for aid and true guidance (inṣāda). The words of this sūra, which is known as al-fātiha ("the opening one"), are as follows:

(1) In the name of God, the compassionate compassioner. (2) Praise be [literally "is"] to God, the Lord of the worlds, (3) the compassionate compassioner, (4) the Sovereign of the day of judgment. (5) Thee do we worship and of Thee do we beg assistance. (6) Direct us in the right way: (7) In the way of those who hast been gracious, on whom there is no wrath, and who go not astray.

The thoughts are so simple as to need no explanation; and yet the prayer is full of meaning. It is true that there is not a single original idea of Mahomet's in it. Of the seven verses of the sūra no less than five (verses 1, 2, 3, 4, 6) have an extremely suspicious relationship with the stereotyped formulae of Jewish and Christian liturgies. Verse 6 agrees, word for word, with Ps. xxvii. 11. On the other hand, the question must remain open whether Mahomet only gave free renderings of the several borrowed formulae, or whether in actually composing them he kept existing models. The designation of God as the "Compas-

The sūras of the third Meccan period, which form a fairly large part of the present text, are almost entirely prosaic. Some of the revelations are of considerable extent, and the single verses also are much longer than in the older sūras. Only now and then a gleam of poetic power flashes out. A sermonizing tone predominates. The sūras are very edifying for one who is already reconciled to their import, but to us at least do they not seem very well fitted to carry conviction to the minds of unbelievers. That impression, however, is not correct, for in reality the demonstrations of these longer Meccan sūras appear to have been peculiarly influential for the propagation of Islam. There was at this time, there was at this time, a certain extent of restlessness among the Moslems, but to a people who, though quick-witted and receptive, were not accustomed to logical thinking, while they had outgrown their ancient religion.

When we reach the Mediain period it becomes, as has been indicated, much easier to understand the revelations in their historical relations, since our knowledge of the history of

1 Since in Arabic also the root جوز signifies "to have pity," the Arabs must have at once perceived the force of the new name. While the foreign word Rashīd is, in accordance with its origin, everywhere in the Koran to be understood as "Merciful," there is some doubt as to Rashīm. The close connexion of the two expressions, it is true, makes it probable that Mahomet only added the adjective Rashīm to the substantive Rashīda in order to strengthen the conception. But the genuine Arabic meaning of Rashīd is "gracious," and thus, the old Mahomedean Arab papyri render this word by گمز"مذو.

Mahomet in Medina is tolerably complete. In many cases the historical occasion is perfectly clear, in others we can at least recognize the general situation from which they arose, and thus approximately fix their time. There still remains, however, a remnant, of which we can only say that it belongs to the Meccan period.

The style of this period bears a fairly close resemblance to that of the latest Meccan period. It is for the most part pure prose, enriched by occasional rhetorical embellishments. Yet even here there are many bright and impressive passages, especially in those sections which may be regarded as proclamations to the army of the faithful. For the Moslems Mahomet has many different messages. At one time it is a summons to battle for the faith; at another, a series of reflections on recently experienced success or misfortune, or a rebuke for their weak faith; or an exhortation to virtue, and so on. He often addresses himself to the "skeptics," some of whom vacillate between faith and unbelief, others make a pretence of faith, while others scarcely take the trouble even to do that. They are no consolidated party, but to Mahomet they are all equally vexatious, because, as soon as danger has to be encountered, or a contribution is levied, they all alike fall away. There are frequent outbursts, ever increasing in bitterness, against the Jews, who were very numerous in Medina and its neighbourhood when Mahomet arrived. He has much less to say against the Christians, with whom he never came closely in contact; and as for the idolaters, there was no reason why Mahomet should take up the cudgel against them. A part of the Medinan pieces consists of formal laws belonging to the ceremonial, civil and criminal codes; or directions about certain temporary complications. The most objectionable parts of the whole Koran are those which treat of Mahomet's relations with women. The laws and regulations were generally very concise revelations, but most of them have been amalgamated with other pieces of similar or dissimilar import, and are now found in very long suras.

Such is an imperfect sketch of the composition and the interpretation of the Koran, but it is probably sufficient to show that the book is a very heterogeneous collection. If only those passages had been preserved which had a permanent value for the theology, the ethics, or the jurisprudence of the Moslems, a few fragments would have been amply sufficient. Fortunately for knowledge, respect for the sacredness of the letter has led to the collection of all the revelations that could possibly be collected—the "abrogating" along with the "abrogated," passages referring to passing circumstances as well as those of lasting importance. Every one who takes up the book in the proper religious frame of mind, like most of the Moslems, reads pieces directed against long-obsolete absurd customs of Meccan life, just as devoutly as the weightiest moral precepts—perhaps even more devoutly, because he does not understand them so well.

At the head of twenty-nine of the suras stand certain initial letters, from which no clear sense can be obtained. Thus, before ii. iii. xxxi. xxxii. we find Jāli (Ajāf Lām Mīm), before xl-xlv. Ḥā (Hā Mīm). Nöldeke at one time suggested that these initials did not belong to Mahomet's text, but might have been added by persons of eminence, whose carelessness in the matter of the editors, were incorporated in the final form of the Koran; he now deems it more probable that they are to be traced to the Prophet himself, either Sprenger, Loth or others. One cannot indeed admit the truth of Loth's statement that in the proper opening words of these suras we may generally find an allusion to the accompanying initials; but it can scarcely be accidental that the first verse of the great majority of them (in iii. it is the second verse) contains the word "book," "revelation," or some equivalent. They usually begin with: 'This is the book,' or 'this revelation ('down sending') of the book,' or something similar. Of sūras which commence in this way only a few (xxvii. xxiv. xxxix.) want the initials, while only xxxi. and xxx. have the initials and begin differently. These few exceptions may easily have proceeded from late or corrupt copies; at all events they cannot neutralize the evidence of the greater number. Mahomet seems to have meant these letters for a mystic reference to the archetypal text in heaven. To a man who regarded the art of writing, of which at the best he had but a slight knowledge, as something supernatural, and who lived amongst illiterate people, an A B C may well have seemed more significant than to us who have been initiated into the mysteries of modern cryptography. The conjecture of Sprenger, who has very clearly and distinctively attached a particular meaning to these symbols; they declared their purpose if they conveyed an impression of solemnity and enigmatical obscurity. In fact, the Koran admits that it contains a cipher "out of which it has not been possible to decipher" (iii. 5). To regard these letters as ciphers is a precarious hypothesis, for the simple reason that cryptography is not looked for in the very infancy of Arabic writing. If they are actually disguised, every possible explanation at once precludes the hope of a plausible interpretation. None of the efforts in this direction, whether by Moslem scholars or by Europeans, has led to anything satisfactory. This remark applies even to the ingenious conjecture of Sprenger, that the letters (کاپیتیکس) are "Kaf He Ya Ain Sad" before xii.) (which treats of John and Jesus, and, according to tradition, was sent to the Christian king of Abyssinia) stand for Jesus Naasernas Rex Judaeorum. Sprenger arrives at this explanation by a curious and adroit method; and besides, Mahomet was not so simple as the Moslem traditionalists, who imagined that the Abyssinians could read a piece of the Arabic Koran. It need hardly be said that the Moslems have from of old applied themselves with great assiduity to the decipherment of these initials, and have sometimes found the deepest mysteries in them. Generally, however, they are content with the prudent conclusion that God alone knows the meaning of these letters.

It is probable (see above) that Mahomet had already caused revelations to be written down at Mecca, and that this began from the moment when he felt certain that he was the transmitter of the actual text of a heavenly book to mankind. It is evident that he must have had some conception of the intention of collecting these revelations. The idea of a heavenly model would in itself have suggested such a course and, even in a lower degree, the necessity of setting a new and uncorrupted document of the divine will over against the sacred scriptures of the Jews and Christians, the people of the Book, as the Koran calls them. In any case, when Mahomet died, the separate pieces of the Koran, notwithstanding their theoretical sacredness, existed only in scattered copies; they were consequently in great danger of being partially or entirely destroyed. The Koran was not destroyed, but preserved by heart, but certainly no one knew the whole; and a merely oral propagation would have left the door open to all kinds of deliberate and inadvertent alterations. But now, after the death of the Prophet, most of the Arabs revolted against his successor, and had to be reduced to submission by force. Especially sanguinary was the struggle against the prophet Maslama (Mubarrad, Kāmil 443, 5), commonly known by the derivative diminutive Mosalima. At that time (A.D. 653) many of the most devoted Moslems fell, the very men who knew most Koran pieces by heart. Omar then began to fear that the Koran might be entirely forgotten, and he induced the Caliph Ābu Bekr to undertake the collection of all its parts. The Caliph laid the duty on Zaid ibn Thābit, a native of Medina, then about twenty-two years of age, who had often acted as amanuensis to the Prophet, in whose service he is even said to have learned the Jewish letters.

The account of this collection of the Koran has reached us in several substantially identical forms, and goes back to Zaid himself. According to it, he collected the revelations from copies written on flat stones, pieces of leather, ribs of palm-leaves cut into strips, or leaves which he wrapped around his bare arm, just as if from the breasts of men, i.e. from their memory. From these he wrote a fair copy, which he gave to Ābu Bekr, from whom it came to his successor Omar, who again bequeathed it to his daughter Ḥafṣa, one of the widows of the Prophet. This redaction, commonly called al-zohof ("the leaves"), had from the first no canonical authority; and its internal arrangement can only be conjectured.

The Moslems were as far as ever from possessing a uniform text of the Koran. The bravest of their warriors sometimes knew deplorably little about it; distinction on that field they cheerfully accorded to pious men like Ibn Mas'ūd. It was inevitable, however, that discrepancies should emerge between the texts of professors, and as these men in their several localities were authorities on the reading of the Koran, quarrels began to break out between the lines from different districts about the true form
of the sacred book. During a campaign in A.H. 30 (A.D. 650-651), Hudhafa, the victor in the great and decisive battle of Nehâveând (see CALIPHATE; and PERSIA: History) perceived that such disputes might become dangerous, and therefore urged on the caliph Othman for the necessity for the otherwise binding text. The matter was entrusted to Zaid, who had made the former collection, with three leading Koreishites. These brought together as many copies as they could lay their hands on, and prepared an edition which was to be canonical for all Moslems. To prevent any further disputes, they burned all the other codices except that of Hafsa, which, however, was soon afterwards destroyed by Merwan the governor of Medina. The destruction of the earlier codices was an irreparable loss to criticism; but, for the essentially political object with which an end to controversies by admitting only one form of the common book of religion and of law, this measure was necessary.

The result of these labours is in our hands; as to how they were conducted we have no trustworthy information, tradition being here too much under the influence of dogmatic presuppositions. The critical methods of a modern scientific commission will not be expected of an age when the highest literary education for an Arab consisted in ability to read and write. It now appears highly probable that this second redaction took this simple form: Zaid read off from the codex which he had previously written, and his associates, simultaneously, wrote one copy each to his dictation. These three manuscripts will therefore be those which the caliph, according to trustworthy tradition, sent in the first instance as standard copies to Damascus, Basra and Kufa to the warriors of the provinces of which these were the capitals, while he retained one at Medina. Be that as it may, it is impossible now to distinguish in the present form of the book what belongs to the first redaction from what is due to the second.

In the arrangement of the separate sections, a classification according to contents was impracticable because of the variety of subjects which were dealt with in one sura. A chronological arrangement was out of the question, because the chronology of the older pieces must have been imperfectly known, and because in some cases passages of different dates had been joined together. Indeed, systematic principles of this kind were altogether disregarded at that period. The pieces were accordingly arranged in indiscriminate order, the only rule observed being to place the long suras first and the shorter towards the end, and even that was far from strictly adhered to. The two magic formulae, suras cxii., cxiv. owe their position at the end of the collection to their peculiar contents, which differ from all the other suras; they are protecting spells, one of the faithful, for the faithful, similarly it is by reason of its contents that sura i. stands at the beginning; not only because it is in praise of Allah, as Psalm i. is in praise of the righteous man, but because it gives classical expression to important articles of the faith. These are the only special traces of design. The combination of pieces of different origin may proceed partly from the possessors of the codices from which Zaid compiled his first complete copy, partly from Zaid himself. The individual suras are separated simply by the superscription: "In the name of God, the compassionate Compassioner," which is the opening of every sura. The additional headings found in our texts (the name of the suras, the number of verses, &c.) were not in the original codices, and form no integral part of the Koran.

It is said that Othman directed Zaid and his associates, in cases of disagreement, to follow the Koreish dialect; but, though well attested, this account can scarcely be correct. The extremely primitive writing of those days was quite incapable of rendering such minute differences as can have existed between the pronunciation of Mecca and that of Medina.

Othman's Koran was not complete. Some passages are evidently fragmentary; and a few detached pieces are still extant which were originally parts of the Koran, although they have been omitted by Zaid. Amongst these are some which there is no reason to suppose Mahomet desired to suppress. Zaid may easily have overlooked a few stray fragments, but that he purposely omitted anything which he believed to belong to the Koran is very unlikely. It has been conjectured that in deference to his superiors he kept out of the book the names of Mahomet's enemies, if they or their families came afterwards to be respected. But it must be remembered that it was never Mahomet's practice to refer explicitly to contemporary persons and affairs in the Koran. Only a single friend, his adopted son Zaid (xxviii. 37), and a single enemy, his uncle Abû Lahab (cix.)—and these very special reasons—are mentioned by name; and the name of the latter has been left in the Koran with a fearful curse annexed to it, although his son had embraced Islam before the death of Mahomet, and his descendants became longed to the noblest families. So, on the other hand, there is no single verse or clause which can be plausibly made out to be an interpolation by Zaid. His position was that of the houri, or Othman. Slight clerical errors there may have been, but the Koran of Othman contains none but genuine elements—though sometimes in very strange order. All efforts of European scholars to prove the existence of later interpolations in the Koran have failed.

Of the four exemplars of Othman's Koran, one was kept in Medina, and one was sent to each of the three metropolitan cities, Kufa, Basra, and Damascus. It can still be pretty clearly shown in detail that these four codices deviated from one another in points of orthography, in the insertion or omission of a word ("and") and such-like minutiae; but these variations nowhere affect the sense. All later manuscripts are derived from these four originals.

At the same time, the other forms of the Koran did not at once become extinct. In particular we have some information about the codex of Ubay ibn Ka'b. If the list which gives the order of its suras is correct, it must have contained substantially the same materials as our text; in that case Ubay ibn Ka'b must have used the original collection of Zaid. The same is true of the codex of Ibn Mas'îd, of which we have also a catalogue. It appears that the principle of compilation of both took the longer time. At one stage, it was expressly carried out by him than by Zaid. He omits i. and the magical formulae of cxiii., cxiv. Ubay, on the other hand, had embodied two additional short prayers, which we may regard as Mahomet's. One can easily understand that differences of opinion may have existed as to whether and how far formularies of this kind belonged to the Koran. Some of the divergent readings of both these texts have been preserved as well as a considerable number of other ancient variants. Most of them are decidedly inferior to the received readings, but some are quite as acceptable and carry a few desirable preferences.

The only man who appears to have seriously offended the general introduction of Othman's text is Ibn Mas'îd. He was one of the oldest disciples of the Prophet, and had often rendered him personal service; but he was a man of contracted views, although he is one of the pillars of Moslem theology. His opposition had no effect. Now when we consider that at that time there were many Moslems who had heard the Koran from the mouth of the Prophet, that other measures of the imbecile Othman met with the most vehement resistance on the part of the biggest champions of the faith, that these were still further increased against him was more of his ambitious old comrades until at last they murdered him, and finally that in the civil wars after his death the several parties were glad of any pretext for branding their opponents as infidels;—when we consider all this, we must regard it as a strong testimony in favour of Othman's Koran that no party found fault with his conduct in this matter, or repudiated the text formed by Zaid, who was one of the most devoted adherents of Othman and his family, and that even among the Shite critics the calliph's action is only met with as a rare exception.

But this redaction is not the close of the textual history of the Koran. The ancient Arabic alphabet was very imperfect; it not only wanted marks for the short and in part even for the long vowels, but it often expressed several consonants by the same sign, e.g. one and the same character could mean B, T, Th at the beginning and N and J (I) in the middle of words. Hence there were
many words which could be read in very different ways. This
ty of possible readings was at first very great, and many
wers had to have it all translated; it made the text very
Lack of diacritical marks meant that the pronunciation of
words could be very different. However, by the 19th century,
presses were able to print manuscripts with diacritical marks,
allowing for more accurate pronunciation and translation.

The Koran is the central text of Islam, and its translation
into different languages has been a subject of great interest
and debate. Various translations have been made, each with
its own strengths and weaknesses. One of the most well-known
translations is the Koran by Mahomed Sale, which has been
widely used and is still in print today. Other notable
translations include those by Adolf Donner, Ernst...
Kordofan, a country of north-east Africa, forming a
mu'diria (province) of the Anglo-Egyptian Sudan. It lies
mainly between 12° and 16° W. and 26° and 34° E., and has
an area of about 135,000 sq. m., being bounded W. by Darfur,
N. by the Kingdom of Kordofan, S. by the White Nile mu'diria and
S. by the country of the Shilluk and other negro tribes, forming
part of the Upper Nile mu'diria.

The greater part of Kordofan consists of undulating plains,
riveller, barren, monotonous, with an average altitude of
1750 ft. Thickets and small acacias dot the steppes, which,
green during the kharif or rainy season, at other times present
a dull burnt-up aspect. In the west, isolated peaks, such as Jebel
Abu Senum and Jebel Kordofan, rise from 150 to 600 ft. above the plain.
North-west are the mountain groups of Kasa and el Majal (2000 ft.),
the two, the Jebel Dajar and Jebel Tagale (Togale), ragged granite
ranges with precipitous sides. In the south are flat, fertile
and thickly wooded plains, which give place to jungle at the
foot of the hills of Dar Nuba, the district forming the south-
eastern part of Kordofan. Dar Nuba is well-watered, the scenery
is diversified and pretty, affording a welcome contrast to that
of the rest of the country. Some of the Nuba hills exceed
3000 ft. in height. The south-western part of the country, a
vast and almost level plain, is known as Dar Hamid. A granitic
sand with abundance of mica and feldspar forms the upper
stratum, broken down, perhaps, on the eastern part of Kordofan;
but an admixture of clay, which is observable in the north, becomes
strongly marked in the south, where there are also stretches of black vegetable mould. Beneath there appears to be an
unbroken surface of mica schist. Though there are no perennial
rivers, there are watercourses (khors or wadis) in the rainy season;
the chief being the Khor Abu Habi, which traverses the south-
central region. In Dar Hamid the Wadi el Ghalla and the Khor
Shalango drain towards the Homr affluent of the Bahr el Gazal.
During the rainy season there is a considerable body of water in
these channels, but otherwise rapidly to rapid evaporation
three to the southwestern corner of the soil the surface of the country dries
rapidly. The water which has found its way through the
granitic sand flows over the surface of the mica schist and
settles in the hollows, and by sinking wells to the solid rock a
supply of water can generally be obtained. It is estimated that
(apart from those in a few areas where the sand stratum is thin
and water is reached at the depth of a few feet) there are about
900 of these wells. They are narrow shafts going down usually
30 to 50 ft., but some are over 200 ft. deep. The water is raised
by rope and bucket at the cost of enormous labour, and in few
cases is any available for irrigation. The very cattle are trained
go a long time without drinking. Entire villages migrate
after the harvest to the neighbourhood of some plentiful well.
In a few localities the surface depressions hold water for the
greater part of the year but there is only one permanent lake—
Kellat, which is some four miles by two. As there is no highland
area draining into Kordofan, the underground reservoirs are
dependent on the local rainfall, and a large number of the wells
are dry during many months. The rainy season lasts from mid-
or four days in brief but violent showers. In general the climate
is healthy except in the rainy season, when large tracts are
converted into swamps and fever is very prevalent. In the
shita or cold weather (October to February inclusive) there is a
cold wind from the north. The self or hot weather lasts from
March to mid-June; the temperature rarely exceeds 105° F.

The chief constituent of the low scrub which covers the northern
part of the country is the grey gum acacia (hashob). In the south
the red gum acacias (lahk) are abundant. In Dar Hamid, in the
N.W. of Kordofan, date, dom and other palms grow. The basbash
or calabash tree, known in the eastern Sudan as the tebeldi and
locally Homr, is fairly common and being naturally hollow the trees
collect water which the natives regularly tap. The chief source
of water supply is a small kind of water melon which grows
wild and is also cultivated. In the dense jungles of the south are
immense creepers, some of them rubber-vines. The cotton plant
is wild. The fauna includes the elephant throughout Kordofan
and southern districts. The or addra gazelle found in N. and N.W.
Kordofan are not known elsewhere in the eastern Sudan. Reptiles,
many of them poisonous, are plentiful in the country. In the
northern steppes the chief wealth of the people consists in the
gum obtained from the grey acacias, in oxen, camels and ostrich
feathers. The finest cattle are of the humped variety, the bulls of
the Baggar being trained to the saddle and to carry burdens.
There are large herds of camel, the camel-owned Arabs usually
owning also large numbers of sheep and goats. Dukhan, a species
of millet which can grow in the arid northern districts is there the
chief grain crop, its place in the south being taken by durra. Dukhn
is, however, the only crop cultivated in Dar Homr. From this
grain a beer called merisse is brewed. Barley and cotton are culti-
vated in some districts. A little gold dust is obtained, but the old
gold and other mines in the Tagale country have been, apparently,
worked out. Iron is found in many districts and is smelted in
a few places. In the absence of fuel the industry is necessarily a small
one. There are large numbers of antelope, hyena, porcupine, and
large birds of prey which the inhabitants naturally utilize (some 60 m. N.W. and the same
distance N.E. of El Obeid.

Inhabitants.—The population of Kordofan was officially
estimated in 1903 to be 550,000. The inhabitants are roughly
divisible into two types—Arabs in the plains and Nubas in the
hills. Many of the villagers of the plains are however of very
mixed blood—Arab, Egyptian, Turkish, Levantine and Negro.
It is said that some village communities are descended from the
original negro inhabitants. They all speak Arabic. The most
important village tribe is the Gowa, who own most of the
gum-producing country. Other large tribes are the Dar Hamid
and the Bederia—the last-named living round El Obeid. The
nomad Arabs are of two classes, camel owners (Siat El Ibil) and
cattle owners (Baggara), the first-named dwelling in the dry
northern regions, the Baggara in southern Kordofan. Of the
camel-owning tribes the chief are the Hamar and the Kabba-
bash. Many of the Hamar have settled down in villages. The
Baggara are great hunters, and formerly were noted slave
raiders. They possess many horses, but when journeying
into the highlands for their Baggar they travel in twos and
threes, small throwing spears, and a broad-bladed short sword. Some
of the richer men possess suits of chain armour. The principal
Baggara tribes are the Hawazma, Meserla, Kenana, Habbania,
and Homr. The Homr are said to have entered Kordofan from Wadai about the end of the 18th century and to have
come from North Africa. They speak a purer Arabic than the
riverain tribes. The Nubas are split into many tribes, each
under a mek or king, who is not uncommonly of Arab descent.
The Nubas have their own language, though the inhabitants of
each hill have usually a different dialect. They are a primitive
race, very black, of small build but distinctive negro features.
They have feuds with one another and with the Baggara. During
the mokdia they maintained their independence. The Nubas
appear to have been the aboriginal inhabitants of the country
and are believed to be the original stock of the Nubians of the
Nile Valley (see Nubia). In the northern hills are communities
of black people with woolly hair but of non-negro features. They
speak Arabic and are called Nuba Arabs. Some of the
southern hills are occupied by Arab-speaking negroes, escaped
slaves or their descendants, who called themselves after the
tribe they formerly served and who have little intercourse with the
Nubas.

The capital, El Obeid (q.v.), is centrally situated. It on
converge various trade routes, notably from Darfur and from
Dueim, a town on the White Nile 125 m. above Khartum,
which served as port for the province. Thence was despatched
the gun for the Omdurman market. But the railway from
Khartum to El Obeid, via Sennar, built in 1909–1911, crosses
the Nile some 60 m. farther south above Abba Island. Nahud
KOREA

(porp. about 10,000), 165 m. W.S.W. of El Obeid, is a commercial centre which has sprung into importance since the fall of the dervishes. All the trade with Darfur passes through the town, the chief commerce being in cattle, feathers, ivory and cotton goods. Trade is largely in the hands of Greeks, Syrians, Danagla and Jaalil. Tafta, on the route between El Obeid and the Nile, was destroyed by the dervish, but has been rebuilt and is a thriving mart for the gum trade. El Obeid, the capital, is the headquarters of the Homr country. It and Baraka in the Muglad district are on the trade road between Nahud and Shakka in Darfur.

Bara is a small town some 50 m. N.N.E. of Obeid. Talodi and Tendek are government stations in the Nubia country. The Nubas have no large towns. They live in villages on the hillsides or summits. The usual habitation built both by Arabs and Nubas is the tuki, a conical-shaped hut made of stone, mud, wattle and hub or straw. The Nuba tuklis are the better built. In the chief towns houses are built of mud bricks with flat roofs.

History.—Of the early history of Kordofan there is little record. It never formed an independent state. About the beginning of the 16th century Funj from Sennar settled in the country; towards the end of that century Kordofan was conquered by Suleiman Solon, sultan of Darfur. About 1775 it was conquered by the Funj, and there followed a considerable immigration of Arab tribes into the country. The Sennari however suffered a decisive defeat in 1784 and thereafter under Darfur viceroys the country enjoyed prosperity. In 1821 Kordofan was subdued by Mahat but was averted by the defender son-in-law of Mehemet Ali, pasha of Egypt. It remained under Egyptian rule till 1882 when Mahomed Ahmed, the mahdi, raised the country to revolt. It was in Kordofan that Hicks Pasha and his army, sent to crush the revolt, were annihilated (Nov. 1883). The Baggara of Kordofan from that time onward were the chief supporters of the mahdi, and his successor, the khalifa Abdullah, was a Baggara. In Kordofan in 1890 the khalifa met his death, the country having already passed into the hands of the new Sudan government. The chief difficulty experienced by the administration was to habituate the Arabs and Nubas, both naturally warlike, to a state of peace. In consequence of the anti-slave raiding measures adopted, the Arabs of Talodi in May 1906 treacherously massacred the mamur of that place and 40 men of the Sudanese regiment. The promptness with which this disturbance was suppressed averted what otherwise might have been a serious rising. (See Sudan: Anglo-Egyptian, § "History."

Travels in Kordofan, London, 1844); Major H. G. Prout, General Report on Province of Kordofan (Cairo, 1877); Ernst Marbo, Reise in der egypt. Equit. Provinz (Vienna, 1879); papers (with maps) by Capt. W. Lloyd in the Geog. Journ. (June 1907 and March 1910); and the bibliography given under Sudan: Anglo-Egyptian.

KOREA, or COREA (CH'AO HSIEN, DAI HAN). Its mainland portion consists of a peninsula stretching southwards from Manchuria, with an estimated length of about 600 m., an extreme breadth of 135 m., and a coast-line of 1740 m. It extends from 34° 18' to 43° N., and from 124° 36' to 130° 47' E. Its northern boundary is marked by the Tumen and Yalu rivers; the eastern boundary by the Sea of Japan; the southern boundary by Korea Strait; and the western boundary by the Yalu and the Yellow Sea. For 11 m. along the Tumen the river front is conterminous with Russia (Siberia); otherwise it lies within China (Manchuria) on its land frontier. Nearly the whole surface of the country is mountainous. (For map, see Japan.) The south and west coasts are fringed by about 200 islands (exclusive of islets), two-thirds of which are inhabited; 100 of them are from 100 to 2000 ft. in height, and many consist of bold bare masses of volcanic rock. The most important are Quelpart and the Nan Hau group. The latter, 36 m. from the eastern end of Quelpart, possesses the deep, well-sheltered and rocky harbour of Port Hamilton, which lies between the north points of the large and well-cultivated islands of Sun-ho-dan and So-dan, which have a population of 2000. Altan, between their south-east points, completes this noble harbour. The east coast of Korea is steep and rock-bound, with deep water and a tidal rise and fall of 1 ft. The west coast is often low and shelving, save at Chemulpo and a few other places, and in mud flats, three species of take fish, 20 to 36 ft. Korean harbours, except two or three which are closed by drift ice for some weeks in winter, are ice-free. Among them are Port Sheshakov, Port Lazarev, and Wén-san (Gensan), in Broughton Bay; 1 Fusun, Ma-san-po, at the mouth of the Nak-tong, on the south coast; Mok-po, Chin-nampo, near the mouth of the T'ai-dong; and Chemulpo, near the mouth of the Han, the port of the capital and the sea terminus of the first Korean railway on the west coast.

Korea is distinctly mountainous, and has no plains deserving the name. In the north there are mountain groups with definite centres, the most notable being Paik-tu San or P'el-shan (8700 ft.), which contains the sources of the Yalu and Tumen. From these groups a lofty range runs southwards, dividing the empire into two unequal parts. On its east, between it and the coast, which it follows at a moderate distance, is a fertile strip difficult of access, and on the west it throws off so many lateral ranges and spurs as to break up the country into a chaos of corrugated and precipitous hills and steep-sided valleys, each with a rapid perennial stream. Farther south this axial range, which includes the Diamond Mountain group, falls away towards the sea in terraced spurs. Along the northern groups and the Diamond Mountain are heavily timbered, but the hills are covered mainly with coarse, sour grass and oak and chestnut scrub. The rivers are shallow and rocky, and are usually only navigable for a few miles from the sea. Among the exceptions are the Yalu (Amnok), Tumen, T'ai-dong, Nak-tong, Mok-po, and Han. The last, rising in Kang-wŏn-do, 30 m. from the east coast, cuts Korea nearly in half, reaching the sea on the west coast near Chemulpo; and, in spite of many serious rapids, is a valuable highway for commerce for over 120 miles.

Geology.—The geology of Korea is very imperfectly known. Crystalline schists occur a large part of the country, forming all the higher mountain ranges. They are always strongly folded and it is in them that the mineral wealth of Korea is situated. Towards the Manchurian frontier they are covered unconformably by some 160 feet of sandstone and sandshale, which are largely of Cambrian fossil and are the equivalents of a part of theMANHATTAN system of China. Carboniferous beds, consisting chiefly of slates, sandstones and conglomerates, are found in the south-eastern provinces. They contain a few seams of coal, but the most important coal-bearing deposits of the country belong to the Tertiary period. Recent eruptive and volcanic rocks are met with in the interior of Korea and also in the island of Quelpart. The principal mountain in the latter, Hál-ba-san (or Mount Auckland), according to Chinese stories, was in eruption in the year 1007. With this possible exception there are no active volcanoes in Korea, and the region has also been remarkably free from earthquakes throughout historic times.

Climate.—The climate is superb for nine months of the year, and is three months of rain, heat and damp are not injurious to health. Koreans suffer from malaria, but Europeans and their children are fairly free from climatic maladies, and enjoy robust health. The summer mean temperature of Seoul is about 75°F, that of winter about 33°; the average rainfall, 350 in. in the year, and of the rainy season 21-86 in. The rains come in July and August on the west and north-east coasts, and from April to July on the south coast, the approximate mean annual rainfall of these localities being 30, 35 and 42 in, respectively. These averages are based on the observations of seven years only.

Flora.—The plants and animals await study and classification. Among the indigenous trees are the Abies excelsa, Abies micro- sphyrica, Tsuga sieboldiana, pine, fir, larch, maple, lime, birch, juniper, mountain ash, walnut, Spanish chestnut, hazel, willow, hornbeam, hawthorn, plum, pear, peach, Rhus vernici, Amelanchier, Fraxinus semipendula, Lonicera orientalis, Elaeagnus, Sophora japonica, &c. Azaleas and rhododendrons are widely distributed, as well as other flowering shrubs and creepers. Amelopetalus Veitchii being universal. Lilaceous plants

1 Named after William Robert Broughton (1762-1821), an English navigator who explored these seas in 1795-1798.
KOREA

and cruciferous are numerous. The native fruits, except walnuts and chestnuts, are worthless. The persimmon attains perfection, and experiment has proved the suitability of the climate to many foreign fruits. The indigenous economic plants are few, and consist of hemp and bamboo, which is applied to countless uses, and "tak-pul" (%ibiscus Manihot), used in the manufacture of paper.

The tiger is the first place among wild animals. He is of great size, his skin is magnificent, and he is so widely distributed as to be a peril to man and beast. Tiger-hunting is a profession with special privileges. Leopards are numerous, and have even been shot within the walls of Seoul (deer, gazelle, antelopes, species, boars, bears, antelopes, beavers, otters, badgers, tiger-cats, marten, an inferior sable, striped squirrels, &c. Among birds there are black eared pheasants (largely used in hawk-ing), and, specially protected by law, turkey bustards, three varieties of phasians, swans, geese, common and spectated teal, mallards, mandarin ducks white and pink ibis, cranes, storks, egrets, herons, curlews, pigeons, doves, nightjars, ibises (common and blue magpies, rooks, crows, orioles, halycons, and kingfishers, jays, nut-hatches, redstarts, swift, grey shrikes, hawks, kites, &c. But, pending further observations, it is not possible to say which of the smaller birds actually breed in Korea and which only make it a halting-place in their annual migrations.

Area and Population.—The estimated area is 83,000 sq. m., somewhat under that of Great Britain. The first complete census was taken in 1897, and returned the population in round numbers at 17,000,000, females being in the majority. It was subsequently, however, estimated at a maximum of 12,000,000. There is a foreign population of about 65,000, of whom 60,000 are Japanese. It is estimated that little more than half the arable land is under cultivation, and that the soil could support an additional 7,000,000. The native population is absolutely homogeneous. Northern Korea, with its severe climate, is thinly peopled, while the rich and warm provinces of the south and west are populous. A large majority of the people are engaged in agriculture. Their chief emigration, except into Russian and Chinese territory, but some Koreans have emigrated to Hawaii and Mexico.

The capital is the inland city of Seoul, with a population of nearly 200,000. Among other towns, Songdo (Kaisong), the capital from about 910 to 1392, is a walled city of the first rank, 25 m. N.W. of Seoul, with a population of 60,000. It possesses the stately remains of the palace of the Korean kings of the Wang dynasty, is a great centre of the grain trade and the sole centre of the Ginseng manufacture, makes wooden shoes, coarse pottery and fine matting, manufactures with sesame oil the oiled paper for which Korea is famous.

Ph'yong-yang, a city on the Tai-dong, had a population of 60,000 before the war of 1894, in which it was nearly destroyed; but it fast regained its population. It lies on rocky heights above a region of stoneless alluvium on the east, and with the largest and richest plain in Korea on the west. It has five coal-mines within ten miles, and the district is rich in iron, silk, cotton, and grain. It has easy communication with the sea (its port being Chin-nampo), and is important historically and commercially. Auriferous quartz is worked by a foreign company in its neighbourhood. Near the city is the illustrated standard of land measurement cut by Klissow in 1124 B.C.

With the exceptions of Kang-hwa, Chang-ju, Tung-nai, Fusan, and Won-san, it is very doubtful if any other Korean towns reach a population of 15,000. The provincial capitals and many other cities are walled. Most of the larger towns are in the warm and fertile southern provinces. One is very much like another, and nearly all their streets are replicas of the better avenues of Seoul. The actual antiquities of Korea are dolmens, sepulchral pottery, and Korean and Japanese fortified stones.

Rice.—The chief takes the lion's share in Korea; its use is unknown. They are of the Majo family; their language belongs to the so-called Turanian group, is polysyllabic, possesses an alphabet of 17 vowels and 14 consonants, and a script named En-man. Literature of the higher class and official and upper class correspondence are exclusively in Chinese characters, but since 1895 official documents have contained an admixture of En-man. The Koreans are distinct from both Chinese and Japanese inPhysognomy, though Dark straight hair, dark oblique eyes, and a tinge of bronze in the skin are always present. The cheek-bones are high; the nose inclined to flatness; the mouth thin-lined and refined among patricians, and wide and full-lipped among plebeians; the ears are small, and the brow fairly well developed. The expression indicates quick intelligence rather than force and mental calibre. The male height averages 5 ft. 4½ in. The hands and feet are small and well-formed. The physique is good, and porters carry on journeys from 100 to 200 lb. Men marry at from 15 to 20 years, girls at 16, and have large families, in which a strumous tint is nearly universal. Women are secluded and occupy a very inferior position. The Koreans are rigid monogomists, but concubinage has a recognized status.

Production and Industries. i. Minerals.—Extensive coal-fields, producing coal of fair quality, as yet undeveloped, occur in Hwang-hai Do and elsewhere. Iron is abundant, especially in Ph'yong-an Do, and rich Copper ore, silver and galena are found. Crystal is a noted product of Korea, and talc of good quality is also present. In 1893 the rudest process of "placer" washing produced an export of gold dust amounting to £150,000; quartz-mining methods were subsequently introduced, and the production doubled within a year. The implements used were 45,000; but much is believed to have been sent out of the country clandestinely. The reefs were left untouched till 1897, when an American company, which had obtained a concession in Ph'yong-an Do in 1895, introduced the latest mining appliances, and raised the declared export of 1895 to £240,000, believed to represent a yield for that year of £600,000. Russian, German, English, French and Japanese applicants subsequently obtained concessions. The concessionnaires regard Korean labour as docile and intelligent. The privilege of owning mines in Korea was extended to aliens under the Mining Regulations of 1906.

ii. Agriculture.—Korean soil consists largely of light sandy loam, disintegrated lava, and rich, stoneless alluvium, from 3 to 10 ft. deep. The rainfall is abundant during the neccessary months of the year, facilities for the irrigation of the rice crop are ample, and drought and floods are seldom known. Land is held from the proprietors on the terms of receiving seed from them and returning half the produce, the landlord paying the taxes. Any Korean can become a landowner by reclaiming and cultivating unoccupied crown land for three years free of taxation, after which he pays taxes annually. Good land can be obtained for 50 y. to 100 y. per acre. The implements used are two makes of iron-shod wooden ploughs; a large shovel, worked by three or five men, one working the handle, the others jerking the blade by ropes attached to it; a short sharp-pointed hoe, a bamboo rake, and a wooden barrow, all of rude construction. Rice is threshed by beating the ears on a log; other grains, with floats on mud threshing-floors. Winnowing is performed by throwing up the grain on windy days. Rice is hulled and grain coarsely ground in stone querns or by water pestles. There are provincial horse-breeding stations, where pony stallions, from 10 to 12 hands high, are bred for carrying burdens. Magnificent red bulls are bred by the farmers for ploughing and other farming operations, and for the transport of goods. Sheep and goats are bred on the imperial farms, but only for sacrifice. Small, hairy, black pigs, and fowls, are universal. The cultivation does not compare in neatness and thoroughness with that of China and Japan. There are no trustworthy estimates of the yield of any given measurement of land. The farmers put the average yield of rice at thirty-fold, and of other grain at twenty-fold. Korea produces all cereals and root crops except the tropical, along with cotton, tobacco, a species of the Rhae plant used for making grass-cloth, and Brachylopous papyrifera. The articles chiefly cultivated are rice, millet, beans, ginseng (at Songdo), cotton, hemp, oil-seeds, bearded wheat, oats, barley, sorghum, and sweet and Irish potatoes. Korean agriculture suffers from infamous roads, the want of the exchange of seed, and the insecurity of the gains of labour. It occupies about three-fourths of the population.

iii. Other Industries.—The industries of Korea, apart from supplying the actual necessities of a poor population, are few and rarely collective. They consist chiefly in the manufacture
Korea of sea-salt, of varied and admirable paper, thin and poor silk, horse-hair crinoline for hats, fine split bamboo blinds, hats and mats, coarse pottery, cloth for mourners, brass bowls and grass-cloth. Won-san and Fusan are large fishing centres, and the catches of these important imports; but the
prolific fishing-grounds are worked chiefly by Japanese labour
and capital. Paper and ginseng are the only manufactured
articles on the list of Korean exports. The arts are nil.

Commence.—A commercial treaty was concluded with Japan
in 1876, and treaties with the European countries and the
United States of America were concluded subsequently. An
empire edict of the 20th of May 1904 annulled all Korean
treaties with Russia. After the opening of certain Korean ports
to foreign trade, the customs were placed under the management
of European commissioners nominated by Sir Robert Hart from
Peking. Five chief western ports open are Seoul, Chemulpo,
Fusan, Won-san, Chin-nampo, Mok-po, Kun-san, Ma-san-po,
Song-chin, Wiju, Yong-ampo, and Pyhong-yang. The value of
foreign trade of the open ports has fluctuated considerably,
but has shown a tendency to increase on the whole. For
example, in 1884 imports were valued at £170,113 and exports
at £95,377. By 1890 imports had risen to £790,261, and there-
after fluctuated greatly, standing at only £473,598 in 1893, but
at £1,017,238 in 1897, and £1,583,332 in 1901, but under
abnormal conditions in 1904 this last amount was nearly doubled.
Exports, which they had fallen to £1,749,066 in 1893, rose
greatly, falling to £316,072 in 1893, but standing at £863,828 in
1901, and having a further increase in some subsequent years.
These figures exclude the value of gold dust. The principal
imports are cotton goods, railway materials, mining supplies
and metals, tobacco, kerosene, timber, and clothing. Japanese
cotton yarns are imported to be woven into a strong cloth on
Korean hand-looms. Beans and peas, rice, cowhides, and
ginseng are the chief exports, apart from gold.

Communications.—Under Japanese auspices a railway from Chem-
ulpo to Seoul was commenced in 1899 on the lines of the longer line from Fusan to Seoul (286 m.), the concession for which
was granted in 1898. This line was pushed forward rapidly on the
outbreak of the Russo-Japanese War, and the whole was opened
early in 1905. A railway from Seoul to Wiju was planned under
French engineers, but the work was started by the Korean govern-
ment. This line also, however, was taken over by the Japanese
military authorities, and the first trains ran through early in 1905,
in which year Japan obtained control of the whole of the Korean
internal communications. The main roads centring in Seoul are
seldom fit even for the passage of ox-carts, and the secondary roads
are often impassable. A system of roads from Seoul into Korea, with
some improvements, however, have been effected under Japanese
influence. The inland transit of goods is almost entirely on the
backs of bulls carrying from 450 to 600 lb, on ponies carrying 200 lb,
and on pack-animals, which are strung along the roads in hundreds
up to a fraction over 81. per mile per ton. The corive exists,
with its usual hardships. Bridges are made of posts, carrying a framework
either covered with leather or with pine branches and earth. They
are removed at the beginning of the rainy season, and are not
replaced for three months. The larger rivers are unbridged, but
there are numerous government ferries. The infamous roads and
the risks during the bridgeless season greatly hamper trade. Japanese
steamers ply on the Han between Chemulpo and Seoul.

A postal system, established in 1894–1895, has been gradually extended.
There are postage stamps of four values. The Japanese,
unfortunately, took over the system in 1895, took over the
administration of telephone services. Korea is connected with the Chinese
and Japanese telegraph systems by a Japanese line from Chemulpo via
Seoul to Fusan, and by a line acquired by the empire between Seoul
and Wiju. The state has also lines from Seoul to the ports of Dandong,
Kimon, Dandong, and others. Korea has regular steam communication
ports in ports in Japan, the Gulf of Pecheli, Shanghai, &c. Her own mercantile marine is considerable.

Government.—From 1895, when China renounced her claims
to sovereignty, to 1910, the king (since 1897 emperor)
practiced a constitutional theory, an independent government for Japan was
organized in 1900, guaranteeing the welfare and dignity of the imperial house. Under a treaty
signed at Seoul on the 17th of November 1905, Japan directed
the external relations of Korea, and Japanese diplomatic and
consular representatives took charge of Korean subjects and
interests in foreign countries. Japan undertook the maintenance
of existing treaties between Korea and foreign powers; and
Korea agreed that her future foreign treaties should be
concluded through the medium of Japan. A resident-general
represented Japan at Seoul, to direct diplomatic affairs, the first
being the Marquis Ito. Under a further convention of July 1907,
the resident-general's powers were enormously increased. In ad-
dition, a皇宫 (The Hall of Supreme and Universal
unity) was founded by the Emperor. He appointed his
agents; laws could not be enacted nor administrative
measures undertaken without his consent; the appointment and dis-
mission of high officials, and the engagement of foreigners
in government employ, were subject to his pleasure. Each depart-
ment of state has a Japanese vice-minister, and a large propor-
tion of Japanese officials were introduced into these departments
as well as Japanese chiefs of the bureaus of police and customs.
By a treaty dated August 22nd 1910, which came into effect
seven days later the emperor of Korea made "complete and per-
fuse, and absolute surrender to Japan of all rights of sover-
eignty over the whole of Korea." The entire direction of the
administration was then taken over by the Japanese resident-
general, who was given the title of governor-general. The
jurisdiction of the consular courts was abolished but Japan
 guaranteed the continuance of the existing Korean tariff for
 ten years.

Local Administration.—Korea for administrative purposes is
divided into provinces and prefectures or magistracies. Japanese
reforms in this department have been complete. Each provincial
government has a Japanese secretary, police inspector and clerks.
There is a secretary, chief of police, district court, and
premier, and a whole staff of officials. Local government is

Law.—A criminal code, scarcely equaled for barbarity, though
twice mitigated by royal edict since 1875, remained in force in its
primitive form. The government continues to have a mixed commission of revisi
on carried out some good work. Elsewhere legal machinery
was devised, though its provisions were constantly violated by the
imperial will and the gross corruption of officials. Five classes
of courts, varying from the civil court to the supreme court,
were established in both civil and criminal cases. Absuses in legal administration and
in tax-collecting were the chief grievances which led to local insurrec-
tions. Oppression by the throne and the official and noble classes
was complete, and the framework of a man-made government
was left by the Japanese without any serious limitation. All
use of the Kyei, or principle of association, which developed among
Koreans into powerful trading guilds, trades-unions, mutual benefit
associations, money-lending guilds, &c. Nearly all traders, porters
and artisans were members of guilds, powerfully bound together and
strong by combined action and mutual helpfulness in time of need.
Under the Japanese regime the judiciary and the executive were
rigidly separated. The law courts, including the court of cassation,
three courts of appeal, eight local courts, and 115 district courts,
were put under Japanese judges, and the codification of the laws
were undertaken. The prison system was also reformed.
consequently, financial crises. The new regulations require the amount of the notes to be expressed in yen, not to be payable in old nickels. These notes caused alarm among merchants and banks, and a note association, a body constituted under government regulations, whose members must uphold the credit and validity of their notes. The notes must also be made payable to a definite person and require endorsement. Under which lacking of administrative reform was also taken in hand; the large number of superfluous and badly paid officials was considerably reduced, and the status and salary of all existing government officials considerably improved. Government revenue and expenditure, which are largely in which the revenue and expenditure should accurately represent the sums actually received and expended. Regulations were framed for the supervision of government revenue and expenditure for the abolition of irregular taxation and extortions, as well as the practice of farming out the collection of the revenue to individuals, and, generally, to adapt the whole college, and the practice of the revenue of the Choson government to the necessities of public finance. Down to 1910 the sum expended by Japan on Korean reforms was estimated to approach fifteen millions sterling. Among reforms not specifically referred to may be mentioned the improvement of coastwise navigation, the provision of post stations, roads, railways, public buildings, hospitals and sanitary works, and the official advancement of industries.

Religion.—Buddhism, which was brought toward Korea from the tenth to the fourteenth century, has been diplomatically for three centuries, and its priests are ignoble, immoral and despised. Confucianism is the official cult, and all officials offer sacrifices and homage at stated seasons to the tomb of Confucius, with whom ethics are united with morality and social order. Ancestor-worship is universal. The popular cult is, however, the propitiation of demons, a modification of the Roman doctrine of demons. First in demand is the spirit that keeps the Koreans in constant terror, and much of their substance is spent on propitiations. Sorceresses and blind sorcerers are the intermediaries. At the close of the tenth century the fees and fees of these sorceresses were augmented, and at 1592, the fees of the principal were in Seoul 1000 sorceresses, and very large sums are paid to the male sorcerers and geomancers.

Putting aside the temporary Christian work of a Jesuit chaplain to the Christian General, Konishi, in 1594 during the Japanese invasion, as well as that on a larger scale by students who received the evangel in the Roman form from Peking in 1792, and had entered the 1795 movements by the end of 1793, the first surgeon at the conversion of Korea was made by the French Société des Missions Étrangères in 1835. In spite of frequent persecutions, there were 16,000 converts in 1837 and 20,000 in 1856, in which year the French Bishops and priests were martyred by order of the emperor's father, and several thousand native Christians were beheaded, banished or imprisoned. This mission 1900 had about 40 missions and 40,000 converts. In 1884, and 1885, toleration was established. Protestant missionaries of the American Presby- terian and Methodist Episcopal Churches entered Korea, and were followed by a large number of agents of other denominations. An English bishop, clergy, and nurses arrived in 1890. Hospital and orphanage schools and an admirable college in Seoul have been founded, along with tri-lingual (Chinese, Korean and English) printing-presses; religious, historical and scientific works and the Bible of the Protestant Churches have been translated into English. Periodicals of an enlightened nature in the Korean script are also circulated. The progress of Protestant missions was very slow for some years, but from 1895 converts multiplied.

Examination in Chinese literature, held in Seoul up to 1894, which were the entrance to official position, being abolished, the desire for a purely Chinese education diminished. In Seoul there were established an imperial English school with two foreign teachers, a reorganized Confucian college, a normal college under a very efficient foreign principal, Japanese, Chinese, Russian and French schools, chiefly linguistic, several Korean primary schools, mission boarding-schools, and the Pat Chok College connected with the American Methodist Episcopal Church, under imperial patronage, and subsidized by government, in which a liberal education of a high class is given and the students are prepared for such attainment. The students are expert linguists, and the government made liberal grants to the linguistic schools. In the primary schools boys learn arithmetic, and geography and Korean history are taught, with the outlines of the governmental systems of other civilized countries. The education department has been entirely reorganized under the Japanese régime, Japanese models being followed.

History.—By both Korean and Chinese tradition Ki-tze—a councillor of the last sovereign of the 3rd Chinese dynasty, a sage, and the reputed author of parts of the famous Chinese classic, the Shu-King—is represented as entering Korea in 1122 B.C. with several thousand Chinese emigrants, who made him their king. The peninsula was then peopled by savages living in caves and subterranean holes. By both learned and popular belief in Korea, Ki-tze is recognized as the founder of Korean political and social order, and is greatly revered. He called the new kingdom Ch'ao-Hsien, pacified and policed its borders, and introduced laws and Chinese etiquette and polity. Korean ancient history is far from satisfying the rigid demands of modern criticism, but it appears that Ki-tze's dynasty ruled the peninsula until the 4th century B.C., from which period until the 10th century A.D. civil wars and foreign aggressions are prominent. Nevertheless, Hsia-kii, which with Kora and Shinra thereafter constituted Korea, was a centre of literary culture in the 4th century, through which the Chinese classics and the Buddhist texts are transmitted to the Chinese kingdoms. Buddhism, a forceful civilizing element, reached Hsia-kii in A.D. 384, and from it the sutas and images of northern Buddhism were carried to Japan, as well as Chinese letters and ethics. Intermediate wars were terminated about 914 by Wang the Founder, who unified the peninsula under the name Kora, made Song-do its capital, and endowed Buddhism as the state religion. In the 11th century Korea was stripped of its territory west of the Yalu by a warlike horde of Tungus stock, since which time her frontiers have been stationary. The Wang dynasty perished in 1392, an important epoch in the peninsula, when Ni Taio, or Litan, the founder of the present dynasty, ascended the throne, after his country had suffered severely from Jenghiz and Kubblai Khan. He tendered his homage to the first Ming emperor of China, received from him his investiture as sovereign, and accepted from him the Chinese calendar and chronology, in itself a declaration of fealty. He revived the name Ch'ao-Hsien, changed the capital from Song-do to Seoul, organized an administrative system, which with some modifications continued till 1895, and exists partially still, carried out vigorous reforms, disseminated Buddhism, made merit in Chinese literature, and, in the midst of Confucianism the state religion, abolished human sacrifices and the burying of old men alive, and introduced that Confucian system of education, polity, and social order which has dominated Korea for five centuries. Either this king or an immediate successor introduced the present national costume, the dress worn by the Chinese before the Manchou conquest. The early heirs of this vigorous and capable monarch used their power, like him, for the good of the people; but later decay set in, and Japanese buccaneers ravaged the coasts, though for two centuries under Chinese protection Korea was free from external aggression. In 1592 occurred the epoch-making invasion of Korea by a Japanese army of 300,000 men, by order of the great regent Hideyoshi. China came to the rescue with 60,000 men, and six years of a gigantic and bloody war followed, in which Japanese used firearms for the first time against a foreign foe. Seoul and several of the oldest cities were captured, and in some instances destroyed, the country was desolated, and the art treasures and the artists were carried to Japan. The Japanese troops were recalled in 1598 at Hideyoshi's death. The port and fishing privileges of Fusan were transferred to Japan. Possession, a heavy tribute was exacted, and until 1700 the Korean king stood in humiliating relations towards Japan. Korea never recovered from the effects of this invasion, which bequeathed to all Koreans an intense hatred of the Japanese.

In 1856, 1867, and 1871 French and American punitive expeditions attacked parts of Korea in which French missionaries and American adventurers had been put to death, and inflicted much loss of life, but retired without securing any diplomatic successes, and Korea continued to preserve her complete isolation. The first indirect step towards breaking it down had been taken in 1860, when Russia obtained from China thecession of the Usuri province, thus bringing a European power down to the Tumen. A large emigration of famine-stricken Koreans and persecuted Christians into Russian territory followed. The emigrants were very kindly received, and many of them became thrifty and prosperous farmers. In 1876 Japan, with the consent of China, wrung a treaty from Korea by which Fusan was fully opened to Japanese settlement and trade, and Won-san (Gensan) and Inchien (Chennip) were opened to her in 1882. In 1882 China promulgated her "Trade and Frontier Regulations," and America negotiated a commercial treaty, followed by Germany and Great Britain in 1884, Italy and Russia in 1884,
France in 1886, and Austria in 1892. A "Trade Convention" was also concluded with Russia. Seoul was opened in 1884 to foreign residence, and the provinces to foreign travel, and the diplomatic agents of the contracting powers obtained a recognized status at the capital. These treaties terminated the absolute isolation which Korea had effectually preserved. During the negotiations, although under Chinese suzerainty, she was treated with as an independent state. Between 1897 and 1899, under diplomatic pressure, a number of ports were opened to foreign trade and residence. From 1882 to 1894 the chief event in the newly opened kingdom was a plot by the Tai-won-Kun, the father of the emperor, to seize on power, which led to an attack on the Japanese legation, the members of which were compelled to fight their way, and that not bloodlessly, to the sea. Japan secured ample compensation; and the Chinese resident, aided by Chinese troops, deported the Tai-won-Kun to Tientsin. In 1884 at an official banquet the leaders of the progressive party assassinated six leading Korean statesmen, and the intrigues in Korea of the banished or escaped conspirators created difficulties which were very slow to subside. In spite of a constant struggle for ascendency between the queen and her ministers, such as, to the south, the influence of the French or the north, the Japanese, the position of 1889 was one of quiet. China, always esteemed in Korea, consolidated her influence under the new conditions through a powerful resident; prosperity advanced, and certain reforms were projected by foreign "advisers." In May 1894 a more important insurrectionary rising than usual led the king to ask armed aid from China. She landed 2000 troops on the 10th of June, having previously, in accordance with treaty provisions, notified Japan of her intention. Soon after this Japan had 12,000 troops in Korea, and occupied the capital and the treaty ports. Then Japan made three sensible proposals for Korean reform, to be undertaken jointly by herself and China. China replied that Korea must be left to reform herself, and that the withdrawal of the Japanese troops must precede negotiations. Japan rejected this suggestion, and on the 23rd of July attacked and occupied the royal palace. After some further negotiations and fights by land and sea between Japan and China war was declared formally by Japan, and Korea was for some time the battle-ground of the belligerents. The Japanese victories resulted for Korea in the solemn renunciation of Chinese suzerainty by the Korean king, the substitution of Japanese for Chinese influence, the introduction of many important reforms, by under Japanese advisers, and of checks on the absolutism of the king. Everything promised well. The finances flourished under the capable control of Mr (afterwards Sir) M'Leavy Brown, C.M.G. Large and judicious retrenchments were carried out in most of the government departments. A measure of judicial and prison reform was granted. Taxation was placed on an equable basis. The pressure of the trade gilds was relaxed. Postal and educational systems were introduced. An approach to a constitution was made. The distinction between patrician and plebeian, domestic slavery, and beating and slicing to death were abolished. The age for marriage of both sexes was raised. Chinese literary examinations ceased to be a passport to office. Classes previously degraded were enfranchised, and the alliance between two essentially corrupt systems of government was severed. For about eighteen months all the departments were practically under Japanese control. On the 8th of October 1895 the Tai-won-Kun, with Korean troops, aided by Japanese troops under the orders of Viscount Miura, the Japanese minister, captured the palace, assassinated the emperor and made a prisoner of the king, who, however, four months later, escaped to the Russian legation, where he remained till the spring of 1897. Japanese influence waned. The engagements of the advisers were not renewed. A strong retrograde movement set in. Reforms were dropped. The king, with the checks upon his absolutism removed, reverted to the worst traditions of his dynasty, and the control and arrangements of finance were upset by Russia.

At the close of 1897 the king assumed the title of emperor, and changed the official designation of the empire to Dui Han—Great Han. By 1898 the imperial will, working under partially new conditions, produced continual chaos, and by 1900 succeeded in practically overriding all constitutional restraints. Meanwhile Russian intrigue was constantly active. At last Japan resorted to arms, and her success against Russia in the war of 1904-5 enabled her to resume her influence over Korea. On the 23rd of February 1904 an agreement was determined whereby Japan resumed her position as administrative adviser to Korea, guaranteed the integrity of the country, and bound herself to maintain the imperial house in its position. Her interests were recognized by Russia in the treaty of peace signed 5, November 1905. On the 26th of October 1905, the Anglo-Japanese agreement of the 12th of August 1905. The Koreans did not accept the restoration of Japanese influence without demur. In August 1905 disturbances arose owing to an attempt by some merchants to obtain special assistance from the treasury on the pretext of embarrassment caused by Japanese financial reforms; these disturbances spread to some of the provinces, and the Japanese were compelled to make a show of force. Prolonged negotiations were necessary to the completion of the treaty of the 17th of November 1905, whereby Japan undertook to undertake foreign affairs and relations, and the confirmation of previous arrangements, the far-reaching results of which have been indicated. Nor was opposition to Japanese reforms confined to popular demonstration. In 1907 a Korean deputation, headed by Prince Yong, a member of the imperial family, was sent out to lay before the Hague conference of that year, and before all the principal governments, a protest against the treatment of Korea by Japan. While this was of course fruitless from the Korean point of view, it indicated that the Japanese must take strong measures to suppress the intrigues of the Korean court.

At the instigation of the Korean ministry the emperor abdicated on the 15th of July 1907, handing over the crown to his son. Somewhat serious émeutes followed in Seoul and elsewhere, and the Japanese proposals for a new convention, increasing the powers of the resident general, had to be presented to the cabinet under a strong guard. The convention was signed on the 25th of July. One of the reforms immediately undertaken was the disbanding of the Korean standing army, which led to an insurrection and an intermittent guerrilla warfare which, owing to the nature of the country, was not easy to control. The work of reform was vigorously prosecuted. In July 1909, General Teranchi, Japanese minister of war, became resident-general, with the mission to bring about annexation. This was effected peacefully in August 1910, the emperor of Korea by formal treaty surrendering his country and crown. (See Japan.)

Authorities.—The first Asiatic notice of Korea is by Khoradbech, an Arab geographer of the 9th century A.D., in his Book of Roads and Provinces, quoted by Baron Richthofen in his great work on China, p. 575. The earliest European source of information is a narrative by H. Hamel, a Dutchman, who was shipwrecked on the coast of Quelpart in 1564, and held in captivity in Korea for thirteen years. The amount of papers on Korea scattered through English, German, French and Russian magazines, and the proceedings of geographical societies, is very great, and for the last three centuries Japanese writers have contributed largely to the sum of general knowledge on the country. The following are some of the more recent works which illustrate the history, manners and customs, and awakening of Korea: British Foreign Office Reports on Korean Trade, Annual Series (London): Bibliographie karolien (3 vols., Paris, 1897); Mrs. J. L. Bishop, Korea and her Neighbours (2 vols., London, 1897); M. von Brandt, Ostasiatische Fragen (Leipzig, 1897); A. E. J. Cavendish and H. E. Good Adams, Korea, and the Sacred White Mountain (London, 1894); Stewart Culin, Korean Games (Philadelphia, 1888); Curzon, the Eastern Question (London, 1897); J. G. Dallot, Histoire de l'Empire de Coree (2 vols., Paris, 1874); J. S. Gale, Korean Sketches (Edinburgh, 1868); W. E. Grills, The Hermit Kingdom of Korea (London, 1899); and the works and reminiscences of C. Culin, and the publications of the Société des Amis de la Chine, of the Korean Academy, and of the Russian Consul in Seoul.

Jametel, "La Korée: ses ressources, son avenir commercial," L'Economiste français (Paris, July 1881); Percival Lowell, Chosön: The Land of the Morning Calm (London, Boston, 1886); L. J. Milin,
Quaint Koro (Harper, New York, 1895); V. de Laguerre, La Korée indépendante, russe ou japonaise? (Paris, 1896); J. Ross, Korea: Its History, Manners and Customs (Palfrey, 1880); W. H. Wilkinson, The Kingdom of the Corin: Constitutional Changes in Korea during the period 23rd July 1893—10th June 1896 (Shanghai, 1896); A. Hamilton, Korea (London, 1903); C. J. D. Taylor, Koreans at Home (London, 1904); E. Boudaret, En Coree (Paris, 1904); Laurent- Crémary, Le Japon (Gonthier, Paris, 1904); G. T. Ladd, In Korea was Marquis Ito (London, 1908); Dictionaries and vocabularies by W. F. Myers (English secretary of Legation at Peking), the French missionaries, and others, were published in 1898 by a large and learned volume by the Rev. J. S. Gale, a Presbyterian missionary, who devoted some years to the work. On geology, see C. Gottschke, "Geologische Skizze von Korea," Sitz. preuss. Akad. Wiss. (Berlin, 1898, pp. 575—587, Pl. viii). A summary of this paper, with a reproduction of the map, is given by L. Pervinquière in Rev. sci. Paris, 5th series, vol. i. (1904), pp. 545—552. (J. L. B. O. J. R. H.)

KOREA, a tributary state of India, transferred from Bengal to the Central Provinces in 1905; area, 16,621 sq. m.; pop. (1901), 35,113, or only 22 persons per sq. m.; estimated revenue, £1,260. It consists of a elevated table-land, with hills rising to above 3000 ft. Such traffic as there is is carried by means of pack-bullocks.

KORESHAN ECCLESIA, THE, or CHURCH ARCHITRUMPHANT, a communistic body, founded by Cyrus R. Teed, a medical doctor, who declared himself an angel. He worked in Kentucky 1844—50. He was regarded by his adherents as "the new Messiah now in the World," and many other extravagant views both in science and economics are held by them. Two communities were founded: in Chicago (1886) and at Estero, in Lee county, Florida (1894), where in 1903 the Chicago community removed. Their name is derived from Koresh, the Hebrew form of Cyrus, and they have a journal, The Flaming Sword.

KÖRIN, OGATA (c. 1657—1716), Japanese painter and lacquerer, was born at Kōtō, the son of a wealthy merchant who had a taste for the arts and is said to have given his son some elementary instruction therein. Körin also studied under Soken Yammoto, Kōnō, Tsunenobu and Gueki Sumiyoshi; and he was greatly influenced by his predecessors Köyetsu and Sōtatsu. On arriving at maturity, however, he broke away from all tradition, and developed a very original and quite distinctive style of his own, both in painting and in the decoration of lacquer. The characteristic of this is a bold impressionism, which is expressed in few and simple highly idealized forms, with an absolute disregard either of realism or of the usual conventions. In lacquer Körin’s use of white ground is perhaps most distinctive, and he is probably, with Köyetsu, the best painter of Japanese lacquer in the 18th century. Körin died on the 2nd of June 1716, at the age of fifty-nine. His chief pupils were Kagei Tatebashi and Shikō Tōdō; but the present knowledge and appreciation of his work are largely due to the efforts of Hōitsu Sakai, who brought about a revival of Körin’s style.

See A. Morrison, The Painters of Japan (1902); S. Tajima, Masterpieces selected from the Körin School (1903); S. Hōitsu, The 100 Designs by Körin (1815) and More Designs by Körin (1827). (E. F. S.)

KORKUS, an aboriginal tribe of India, dwelling on the Satpura hills in the Central Provinces. They are of interest as being the westernmost representatives of the Munda family of speech. They are rapidly becoming hinduized, as may be gathered from the figures of the census of 1901, which show 140,000 Korkus by race, but only 88,000 speakers of the Korku language.

KÖRMÖCZBÁNYA (German, Kremnitz), an old mining town, in the county of Bars, in Hungary, 158 m. N. of Budapest by rail. (Pop. 1900, 4290). It is situated in a deep valley in the Hungarian Ore Mountains region. Among its principal buildings are the castle, several Roman Catholic (from the 13th and 14th centuries) and Lutheran churches, a Franciscan monastery (founded 1614), the town-hall, and the mint where the celebrated Kremnitz gold ducats were formerly struck. The bulk of the inhabitants find employment in connexion with the gold and silver mines. By means of a tunnel 9 m. in length, constructed in 1851—1852, the water is drained off from the mines into the river Gran. According to tradition, Körméczbanőya was founded in the 8th century by Saxons. The place is mentioned in documents in 1317, and became a royal free town in 1328, being therefore one of the oldest free towns in Hungary.

KÖRNER, KARL THEODOR (1791—1815), German poet and patriot, often called the German "Tyraeus," was born at Dresden on the 23rd of September 1791. His father, Christian Gottfried Körner (1756—1831), a distinguished Saxon jurist, was Schiller’s most intimate friend. He was educated at the Kreuzschule in Dresden and entered at the age of seventeen the mining academy at Freiburg in Saxony, where he remained two years. Here he occupied himself less with science than with verse, a collection of which appeared under the title Kreupfen in 1810. In the course of the year he went to the university of Leipzig, in order to study law; but he became involved in a serious conflict with the police and was obliged to continue his studies in Berlin. In August 1811 Körner went to Vienna, where he devoted himself entirely to literary pursuits; he became engaged to the actress Antonie Adamberger, and, after the success of several plays produced in 1812, he was appointed poet to the Hofburgtheater. When the German nation rose against the French yoke, in 1813, Körner gave up all his prospects at Vienna and joined Lützow’s fearless corps of volunteers at Breslau. On his march to Leipzig he was brought before the authorities, and was ordered to "sagen an die Sache," in which he called upon his countrymen to rise against their oppressors. He became lieutenant towards the end of April, and took part in a skirmish at Kützen near Leipzig on the 7th of June, when he was severely wounded. After being nursed by friends at Leipzig and Cobsbad, he rejoined his corps and fell in an engagement outside a wood near Gadebusch in Mecklenburg on the 26th of August 1813. He was buried by his comrades under an oak close to the village of Wöbbelin, where there is a monument to him.

The abiding interest in Körner is patriotic and political rather than literary. His fame as a poet rests upon his patriotic lyrics, which were published by his father under the title Leiter und Schwerdt in 1814. These songs, which fired the poet’s comrades to deeds of heroism in 1813, bear eloquent testimony to the intensity of the national feeling against Napoleon, but judged as literature they contain more bombast than poetry. Among the best known are "Lützow’s wilde verwegene Jagd," "Gehe zu einem Mandelbau," and, "Das Schwert," etc. This last was written immediately before his death, and the last stanza added on the fatal morning. As a draughtsman Körner was remarkably proficient, but he barely touched the level of Kotzebue’s and his tragedies, of which the best is Zirny (1814), are rhetorical imitations of Schiller’s.

His works have passed through many editions. Among the more recent are: Sämliche Werke (Stuttgart, 1890), edited by Adolf Bohm; Einige fragmentarische Schriften (Zatzendorf, 1892); and Historische Studien (Berlin, 1900). The most valuable contributions to our knowledge of the poet have been furnished by E. Peschel, the founder and director of the Körner Museum in Dresden, in Theodor Körner’s Tagebuch and Kriegskriege, aus dem Jahre 1813 (Freiburg, 1893) and, in conjunction with E. Willenow, Theodor Körner und die Seinen (Leipzig, 1895).

KORNEBORG, a town of Austria, in Lower Austria, 9 m. N.W. of Vienna by rail. (Pop. 1900, 8298). It is situated on the left bank of the Danube, opposite Klosterneuburg, a steamship station and an importantemporium of the salt and corn trade. The industry comprises the manufacture of coarse textiles, pasteboard, &c. Its charter as a town dates from 1298, and it was a much frequented market in the preceding century. At the beginning of the 15th century it was surrounded by walls, and in 1450 a fortress was erected. It was frequently involved in the conflict between the Hungarian king Matthias Corvinus and the emperor Friedrich William III., and also during the Turkish Wars.

KOROCHA, a town of central Russia, in the government of Kursk, 75 m. S.S.E. of the city of Kursk, on the Korocha river. (Pop. 1897, 14,405). It’s inhabitants live by gardening, export large quantities of dried cherries, by making candles and leather, and by trade; the merchants purchase cattle, grain and salt in the south and send them to Moscow. Founded in 1638, Korocha was formerly a small fort intended to check the Tatar invasions.
KORSØR, a seaport of Denmark, in the amt (county) of Zealand, 69 m. by rail W.S.W. of Copenhagen, on the east shore of the Great Belt. Pop. (1901), 60,054. The harbour, which is formed by a bay of the Baltic, has a depth throughout of 20 ft. It is ten miles from the departure and arrival of the steam ferry to Nyborg on Fünen, lying on the Hamburg, Schleswig, Fredericia and Copenhagen route. There is also regular communication by water with Kiel. The chief exports are fish, cereals, bacon; imports; petroleum and coal. A market town since the 14th century, Korsør has ruins of an old fortified castle, on the south side of the channel, dating from the 14th and 17th centuries.

KORTECHA (Slavonic, Goritsa or Koritsa), a city of Albania, European Turkey, in the vilayet of Iannina, in a wide plain watered by the Devol and Dunavitva rivers, and surrounded by mountains on every side except the north, where Lake Maliç constitutes the boundary. Pop. (1905), about 10,000, including Greeks, Albanians and Slavs. Kortecha is the site of an Orthodox Greek metropolitan, whose large cathedral is richly decorated in the interior with paintings and statues. The Kortecha school for girls, conducted by American missionaries, is the only educational establishment in which the Turkish government permits the use of Albanian as the language of instruction. The local trade is chiefly agricultural.

KORYAKS, a Mongolid people of north-eastern Siberia, inhabiting the coast-lands of the Bering Sea to the south of the Andyr basin and the country to the immediate north of the Kamchatka Peninsula, the southernmost limit of their range being Tigliks. They are akin to the Chukchis, whom they closely resemble in physique and in manner of life. Thus they are divided into the settled fishing tribes and the nomad reindeer breeders and hunters. The former are described as being more morally and physically degraded even than the Chukchis, and hopelessly poor. The Koryaks of the interior, on the other hand, still own enormous reindeer herds, to which they are so attached that they would exchange anything, even their own family, for additional reindeer. They are in disposition brave, intelligent and self-reliant, and recognize no master. They have ever tenaciously resisted Russian aggression, and in their fights with the Cossacks have proved themselves recklessly brave. When outnumbered they would kill their women and children, set fire to their homes, and die fighting. Families usually gather in groups of sixes or sevens, forming miniature states, in which the nominal chief has no predominating authority, but all are equal. The Koryaks are polygamous, earning their wives by working for their fathers-in-law, and the women and children are treated well, and Koryak courtesy and hospitality are proverbial. The chief wedding ceremony is a forcible abduction of the bride. They kill the aged and infirm, in the belief that thus to save them from protracted sufferings is the highest proof of affection. The victims choose their mode of death, and young Koryaks practise the art of giving the fatal blow quickly and mercifully. Infanticide was formerly common, and one of twins was always sacrificed. They burn their dead. The prevailing religion is Shamanism; sacrifices are made to evil spirits, the heads of the victims being placed on stones facing east.

KOSCIUSKO, the highest mountain in Australia, in the range of the Australian Alps, towards the south-eastern extremity of New South Wales. Its height is 7,328 ft. An adjacent peak to the south, Muller's Peak, long considered the highest in the continent, is 7,265 ft. high. A meteorological station was established on Kosciusko in 1861.

KOSCIUSZKO, TADEUSZ ANDRZEJ BONAWENTURA (1746–1817), Polish soldier and statesman, the son of Ludwik Kosciusko, sword-bearer of the patriciate of Brzez, and Tekla Ratomska, was born in the village of Mereczowczzycno. After being educated at home he entered the corps of cadets at Warsaw, where his unusual ability and energy attracted the notice of Prince Adam Casimir Czartoryski, by whose influence in 1760 he was sent abroad at the expense of the state to complete his military education. In Germany, Italy and France he studied diligently, completing his course at Brest, where he learnt fortification and naval tactics, returning to Poland in 1774 with the rank of captain of artillery. The while engaged in teaching the daughters of the Grand Hetman, Sosnowski of Sosnowo, gave the enemies of mathematics, he fell in love with the youngest of them, Ludwika, and not venturing to hope for the consent of her father, the lovers resolved to fly and be married privately. Before they could accomplish their design, however, the wooer was attacked by Sosnowski's retainers, but defended himself valiantly till, covered with wounds, he was ejected from the house. This was in 1776. Equally unfortunate was Kosciusko's wooing of Tekla Zuworska in 1791, the father of the lady in this case also refusing his consent.

In the interval between these amorous episodes Kosciusko won his spurs in the New World. In 1776 he entered the army of the United States as a volunteer, and brilliantly distinguished himself, especially during the operations about New York and at Yorktown. Washington promoted Kosciusko to the rank of a colonel of artillery and made him his adjutant. His humanity and charm of manner made him moreover one the most popular of the American officers. In 1785 Kosciusko was rewarded for his services and his devotion to the cause of American independence with the thanks of Congress, the privilege of American citizenship, a considerable annual pension with landed estates, and the rank of brigadier-general, which he retained after the Peace of Versailles. In the war following upon the proclamation of the constitution of the 3rd of May 1791 and the formation of the reactionary Confederation of Targowica (see Poland: History), Kosciusko took a leading part. As the commander of a division under Prince Joseph Poniatowski he distinguished himself at the battle of Zielone in 1792, and at Dublenka (July 18) with 4000 men and 10 guns defended the line of the Bug for five days against the Russians with 18,000 men and 60 guns, subsequently retiring upon Warsaw un molested. When the king acceded to the Targowica constitution, he at once issued a general order, threw up his commission and retired to Leipzig, which specifically became the centre of the Polish emigration. In January 1793, provided with letters of introduction from the French agent Perandier, Kosciusko went on a political mission to Paris to induce the revolutionary government to espouse the cause of Poland. In return for assistance he promised to make the future government of Poland as close a copy of the French government as possible; but the Jacobins, already intent on detaching Prussia from the anti-French coalition, had no serious intention of fighting Poland's battles. The fact that Kosciusko's visit synchronized with the execution of Louis XVI was interpreted as a plausible pretext for accusing her of Jacobinism, and thus prejudicing Europe against her. On his return to Leipzig Kosciusko was invited by the Polish insurgents to take the command of the national armies, with dictatorial power. He hesitated at first, well aware that a rising in the circumstances was premature. "I will have nothing to do with Cossack raiding," he replied; "if war we have, it must be a regular war." He also insisted that the war must be conducted on the model of the American War of Independence, and settled down in the neighbourhood of Cracow to train events. He insisted, however, that the insurgents must act in concert, and that the Russian armies were concentrating to crush it, Kosciusko hesitated no longer, but hastened to Cracow, which he reached on the 23rd of March 1794. On the following day his arms were consecrated according to ancient custom at the church of the Capucins, by way of giving the insurrection a religious sanction incompatible with Jacobinism. The same day, amidst a vast concourse of people in the market-place, Kosciusko took an oath of fidelity to the Polish nation; swore to wage war against the enemies of his country; promised to act at the single time that he would fight only for the independence and territorial integrity of Poland.

The insurrection had from the first a purely popular character. We find none of the great historic names of Poland in the lists of the original confederates. For the most part the confederates of Kosciusko were small squires, traders, peasants and men of
used the Khelm; Solothurn, war Nevertheless, bloody his marched The the required 1869, a Russia of and his members were Polish against the a 25,000 potential Prussia. He regulars, by Russian, of Cracow and the former was in a pitiable condition. There was nothing to feed the troops in the very provinces they occupied, and provisions had to be imported from Galicia. Money could only be obtained by such desperate expedients as the melting of the plate of the churches and monasteries, which was brought to Kosciuszko's camp at Piancow and subsequently coined at Warsaw, minus the royal effigy, with the inscription: "Freedom, Integrity and Independence of the Republic, 1794." Moreover, Poland was left with the remnants of the immense army stationed in the Russian army, from which it was very difficult to hang away, and until these soldiers came in Kosciuszko had principally to depend on the valor of his scythe-men. But in the month of April the whole situation improved. On the 17th of that month the 2000 Polish troops in Warsaw expelled the Russian garrison after days of street fighting, chiefly through the ability of General Mokronowski, and a provisional government was formed. Five days later Jakob Jasinski drove the Russians from Wilna.

By this time Kosciuszko's forces had risen to 14,000, of whom 10,000 were regulars, and he was thus able to resume the offensive. He had captured and burned Warsaw, and was ready to march into Prussia. The former was described in his manifestoes as a potential friend; the latter he never alluded to as an enemy. "Remember," he wrote, "that the only war we have upon our hands is war to the death against the Muscovite tyranny."

Nevertheless Austria remained suspicious and obstructive; and the Prussians, while professing neutrality, very speedily effected a junction with the Russian forces. This Kosciuszko, misled by the treacherous assurances of Frederick William's ministers, never anticipated, when on the 4th of June he marched against them with an army of 40,000 men, to be met by the 4th of June at Szczekociny, and then discovered that his 14,000 men had to do not merely with a Russian division but with the combined forces of Russia and Prussia, numbering 25,000 men. Nevertheless, the Poles acquitted themselves manfully, and at dusk retreated in perfect order upon Warsaw unpursued. Yet their losses had been terrible, and of the six Polish generals present three, whose loss proved to be irreparable, were slain, and two of the others were seriously wounded. A week later another Polish division was defeated at Kholm; Cracow was taken by the Prussians on the 22nd of June; and the mob at Warsaw broke upon the gales and murdered the political prisoners in cold blood. Kosciuszko summarily punished the ringleaders of the massacres and had 10,000 of the rank and file drafted into his camp, which measures had a quieting effect. But now dissensions broke out among the members of the Polish government, and it required all the tact of Kosciuszko to restore order amidst this chaos of suspicions and recriminations. At this very time too he had need of all his ability and resource to meet the external foes of Poland. On the 9th of July Warsaw was invested by Frederick William Prussia with an army of 25,000 men and 170 guns, and the Russian general Fersen with 16,000 men and 74 guns, while a third force of 11,000 occupied the right bank of the Vistula. Kosciuszko for the defence of the city and its outlying fortifications could dispose of 35,000 men, of whom 10,000 were regulars. But the position, defended by 200 inferior guns, was a strong one, and the valour of the Poles and the engineering skill of Kosciuszko, who was now in his element, frustrated all the efforts of the enemy. Two unsuccessful assaults were made upon the Polish positions on the 26th of August and the 1st of September, and on the 6th the Prussians, alarmed by the progress of the Polish army, in secret Poland, where Jao Henrik Don Adalberti plundered the Russian fortress of Bylogosczcz and compelled General Scherwin with his 20,000 men to retire upon Kalisz, raised the siege. Elsewhere, indeed, after a brief triumph the Poles were everywhere worsted, and Suvarov, after driving them before him out of Lithuania was advancing by forced marches upon Warsaw. Even now, however, the situation was not desperate, for the Polish forces were still numerically superior to the Russian. But the Polish generals proved unequal to carrying out the plans of the dictator; they allowed themselves to be beaten in detail, and could not prevent the junction of Suvarov and Fersen. Kosciuszko himself, relying on the support of Poninski's division 4 m. away, attacked Fersen at Maciejowice on the 10th of October. But Poninski never appeared, and after a bloody encounter the Polish army of 7000 was almost annihilated by the 16,000 Russians; and Kosciuszko, seriously wounded and insensible, was made a prisoner on the field of battle. The long credited story that he cried "Finis Poloniae!" as he fell is a fiction.

Kosciuszko was conveyed to Russia, where he remained till the accession of Paul in 1796. On his return on the 19th of December 1796 he paid a second visit to America, and lived at Philadelphia till May 1798, when he went to Paris, where the First Consul earnestly invited his co-operation against the Allies. But he refused to draw his sword unless Napoleon undertook to give the restoration of Poland a leading place in his plans; and to this, as he no doubt foresaw, Bonaparte would not consent. Again and again he received offers of high commands in the French army, but he kept aloof from public life in his house at Berville, near Paris, where the emperor Alexander visited him in 1814. At the Congress of Vienna his importunities on behalf of Poland were finally wearied Alexander, who preferred to follow the counsels of Czartoryski; and Kosciuszko retired to Solothurn, where he lived with his friend Zeltner. Shortly before his death, on the 2nd of April 1817, he emancipated his serfs, insisting only on the maintenance of schools on the liberated estates. His remains were carried to Cracow and buried in the cathedral; while the people, reviving an ancient custom, raised a huge mound to his memory near the city.

Kosciuszko was essentially a democrat, but a democrat of the school of Jefferson and Lafayette. He maintained that the republic could only be regenerated on the basis of absolute liberty and equality before the law; but in this respect he was far in advance of his age, and the aristocratic prejudices of his countrymen compelled him to resort to half measures. He wrote Maneuvers of Horse Artillery (New York, 1808) and a description of the campaign of 1792 (in vol. xi of E. Raczyński's Sketch of the Poles and Poland (Posen, 1843).

See Józef Załuscy, History of the Revolution of 1794 (Pol.) (Lemberg, 1881); Leonard Jakob Bożek Chodzko, Biographie du général Kosciusko (Fontainebleau, 1837); Karl Falkenstein, Thaddäus Kosciusko (2nd ed., Leipzig, 1834; French ed., Paris, 1839); Antoni Chmielowski, Padesau Kosciusko (Pol.) KÖSEN, a village and summer resort of Germany, in the Prussian province of Saxony, 33 m. by rail S. by W. of Halle, on the Saale. Pop. (1905), 2900. The town has a mineral spring, which is used for bathing, being efficacious for rheumatism and other complaints. Kösen, which became a town in 1860, has large mill-works; it has a trade in wood and wine. On the adjacent Rudelsburg, where there is a ruined castle, the German students have erected a monument to their comrades who fell in the Franco-German War of 1870-71. Hereon are also memorials to Bismarck and to the emperor William I. Kösen is famous as the central meeting-place of the German students' corps, which hold an annual congress here every Whitsuntide.

See Teichow, Führer durch Kösen und Umgegend (Kösen, 1889); and Rosenberg, Kösen (Naumburg, 1877).
KOSHER—KOSUTH, L.

KOSHER, or Kasher (Hebrew clean, right, or fit), the Jewish term for any food or vessels for food made ritually fit for use, in contradistinction to those pasuk, unfit, and terfeleh, forbidden. Thus the vessels used at the Passover are “kosher,” as are also new metal vessels bought from a Gentile after they have been washed in a ritual bath. But the term is specially used of meat slaughtered in accordance with the law of Moses. The slaughters of Greeks, Turks, Vlachs are forbidden to Jew and of high moral character, and he duly licensed by the chief rabbi. The slaughtering—the object of which is to insure the complete bleeding of the body, the Jews being forbidden to eat blood—is done by severing the windpipe with a long and razor-sharp knife by one continuous stroke backwards and forwards. No unnecessary force is permitted, and no stoppage must occur during the operation. The knife is then carefully examined, and if there be the slightest flaw in its blade the meat cannot be eaten, as the cut would not have been clean, the uneven blade causing a thrill to pass through the heart and thus driving the blood again through the arteries. After this every portion of the animal is thoroughly examined, for if there is any organic disease the devout Jew cannot taste the meat. In order to soften meat before it is salted, so as to allow the salt to extract the blood more freely, the meat is soaked in water for about half an hour. It is then covered with salt for about an hour and afterwards washed three times. Kosher meat is labelled with the name of the slaughterer and the date of killing.

KSÖL, or Cöslin, a town of Germany, in the Prussian province of Posen, at the foot of the Gollenberg (4,09 ft.), 5 m. from the Baltic, and 105 m. N.E. of Stettin by rail. Pop. (1905), 21,474. The town has two Evangelical and a Roman Catholic church, a gymnasia, a cadet academy and a deaf and dumb asylum. In the large market place is the statue of the Prussian king Frederick William I., erected in 1821, and there is a war memorial on the Friedrich Wilhelm Platz. The industries include the manufacture of soap, tobacco, machinery, paper, bricks and tiles, beer and other goods. Köslin was built about 1188 by the Saxons, and raised to the rank of a town in 1266. In 1534 it accepted the doctrines of the Reformation. It was the scene of the Thirty Years’ War and in the Seven Years’ War, and in 1720 it was burned down. On the Gollenberg stands a monument to the memory of the Pomeranians who fell in the war of 1813–15.

KOSOVO, or Kosovo, a vilayet of European Turkey, comprising the sanjaks of Uskub in Macedonia, and the sanjaks of Prizren and Novibazar (q.v.) in northern Albania. Pop. (1905), about 1,100,000; area, 12,700 sq. m. For an account of the physical features of Kossово, see ALBANIA and MACEDONIA. The inhabitants are chiefly Albanians and Slavs, with smaller communities of Greeks, Turks, Vlachs and gypsies. A few good roads traverse the vilayet (see Uskub’s), and the railway from Salonica northward bifurcates at Uskub, the capital, one branch going to Mitrovitsa in Albania, the other to Nish in Servia. Despite the undue natural mineral wealth of the vilayet, the only mines working in 1907 were two chrome mines, at Orasha and Verbehtitza. In the volume of its agricultural trade, however, Kosovo is unsurpassed by any Turkish province. The exports, worth about £500,000, include livestock, large quantities of grain and fruit, tobacco, vegetables, opium, hemp and skins. Rice is cultivated for local consumption. For the export trade, growing industry is encouraged by the Administration of the Ottoman Debt. The yearly value of the imports is approximately £1,500,000; these include machinery and other manufactured goods, metals, groceries, chemical products and petroleum, which is used in the flour-mills and factories on account of the prohibitive price of coal. There is practically no trade with Adriatic ports; two-thirds of both exports and imports pass through Salonica, the remainder going by rail into Servia. The chief towns, Uskub (32,000), Prizren (30,000), Kopriulli (22,000), Ishtib [Slav. Stib] (17,000), Novibazar (1,000), and Pristhina (11,000) are described in separate articles.

In the middle ages the vilayet formed part of the Servian Empire, its northern districts are still known to the Serbs as Old Servia (Stara Srbija). The plain of Kossovo (Kossovo polje, “Field of Blackbirds”), a long valley lying west of Prishtina and watered by the Sbitnita, a tributary of the Servian Ibar, is famous in Balkan history and legend as the scene of the battle of Kossovo (1389), in which the power of Servia was destroyed by the Turks. (See Serbia: History.)

KOSUTH, Ferencz LAJOS KÁOS (1819–1895), Hungarian statesman, the son of Lajos Kossuth, was born on the 16th of November 1841, and educated at the Paris Polytechnic and the London University, where in 1859 he won a prize for political economy. After working as a civil engineer on the Dean Forest railway he went (1861) to Italy, where he resided for the next thirty-three years, taking a considerable part in the railway construction of the peninsula, and at the same time keeping alive the Hungarian independence question by a whole series of pamphlets and newspaper articles. At Cesena in 1875 he married Emily Hoggins. In 1883 he was decorated for his services by the Italian government. His last great engineering work was the construction of the steel bridges for the Nile. In 1894 he escorted his father’s remains to Hungary, and the following year resolved to settle in his native land and took the oath of allegiance. As early as 1887 he had been twice elected a member of the Hungarian diet, but on both occasions refused to accept the mandate. On the 10th of April 1895 he was returned for Tapolca and in 1896 for Cegléd, and from that time took an active part in Hungarian politics. In the autumn of 1898 he became the leader of the Revolutionists or “Independence Party,” against the successive Szell, Károlyi, and Steindorff governments. During the disturbances (1898–1904), exercising great influence not only in parliament but upon the public at large through his articles in the Égyetértés. The elections of 1905 having sent his party back with a large majority, he was received in audience by the king and helped to construct the Wekerle ministry, of which he was one of the most distinguished members.

Kossuth, L.

importance which they had not had when each was ignorant of the proceedings of the others. The fact that he embellished with his own great literary ability the speeches of the Liberals and Reformers only added to the influence of his news-letters. The government in vain attempted to suppress the letters, and other means having failed, he was in May 1831 arrested, in company with several others, on a charge of high treason. After spending a year in prison at Osten, he was tried and condemned to four more years' imprisonment. His confinement was strict and injurious to his health, but he was allowed the use of books. He greatly increased his political information, and also acquired, from the study of the Bible and Shakespeare, a wonderful knowledge of English. His arrest caused great indignation. The Diet, which met in 1839, supported the agitation for the release of the prisoners, and refused to pass any government measures; Metternich long remained obdurate, but the danger of war in 1840 obliged him to give way. Immediately after his release Kossuth married Teresa Meszleny, a Catholic, who during his prison days had shown great interest in him. Henceforward she strongly urged him on in his political career; and it was the refusal of the Roman priests to bless their union that first prompted Kossuth to take up the defence of mixed marriages.

He had now become a popular leader. As soon as his health was restored he was appointed (January 1841) editor of the Pestis Hirlap, the newly founded organ of the party. Strangely enough, the government did not refuse its consent. The success of the paper was unprecedented. The circulation soon reached what was then the immense figure of 7000. The attempts of the government to counteract his influence by founding a rival paper, the Vilag, only increased his importance and added to the political excitement. The warning of the great reformer Szchenyi that by his appeal to the passions of the people he was leading the nation to revolution was neglected. Kossuth, indeed, was not content with advocating those reforms—the abolition of estates, the liberation of village communities, that which were demanded by all the Liberals. By insisting on the superiority of the Magyars to the Slavonic inhabitants of Hungary, by his violent attacks on Austria (he already discussed the possibility of a breach with Austria), he raised the national pride to a dangerous pitch. At last, in 1844, the government succeeded in breaking his connexion with the paper. The proprietor, in obedience to orders from Vienna (this seems the most probable account), took advantage of a dispute about salary to dismiss him. He then applied for permission to start a paper of his own. In a personal interview Metternich offered to take him into his new founded organ of the party; strangely enough, the government did not refuse its consent. He continued the agitation with the object of attaining both the political and commercial independence of Hungary. He adopted the economic principles of List, and founded a society, the "Vede-gyelt," the members of which were to consume none but home produce. He advocated the creation of a Hungarian port at Fiume. With the autumn of 1847 the great opportunity of his life came. Supported by the influence of Louis Batthyany, after a keenly fought struggle he was elected member for Budapest in the new Diet. "Now that I am a deputy, I will cease to be an agitator," he said. He at once became chief leader of the Extreme Liberals. Deak was absent. Batthyany, Szchenyi, Szemere, Eotvos, his rivals, saw how his intense personal ambition and egoism led him always to assume the chief place, and to use his parliamentary position to establish himself as leader of the nation; but before his eloquence and energy all apprehensions were useless. His eloquence was of that nature, in its impassioned appeals to the strongest emotions, that it required for its full effect the highest themes and the most dramatic situations. In a time of rest, though he could not have been obscure, he would never have attained the highest power. It was therefore a necessity of his nature, perhaps unconsciously, always to drive things to a crisis. The crisis came, and he used it to the full.

On the 3rd of March 1848, as soon as the news of the revolution in Paris had arrived, in a speech of surpassing power he demanded parliamentary government for Hungary and constitutional government for the rest of Austria. He appealed to the hope of the Habsburgs, "our beloved Archduke Francis Joseph," to perpetuate the ancient glory of the dynasty by making half-way a revolution. He at once became the leader of the European revolution; his speech was read aloud in the streets of Vienna to the mob by Metternich was overthrown (March 13), and when a deputation from the Diet visited Vienna to receive the assent of the emperor to their petition it was Kossuth who received the chief ovation. Batthyany, who formed the first responsible ministry, could not refuse to admit Kossuth, but he gave him the ministry of finance, probably because that seemed to open to him fewest prospects of engrossing popularity. If that was the object, it was in vain. When he began developing the internal resources of the country: he established a separate Hungarian coinage—as always, using every means to increase the national self-consciousness; and it was characteristic that on the new Hungarian notes which he issued his own name was the most prominent inscription; hence the name of Kossuth Notes, which was long celebrated. A new paper was started, to which was given the name of Kossuth Hirilap, so that from the first it was Kossuth rather than the Palatine or the president of the ministry whose name was in the minds of the people associated with the new government. Much more was his great ambition; it would have been well if Kossuth had had some Serbs and the reaction at Vienna increased. In a great speech of 11th July he asked that the nation should arm in self-defence, and demanded 200,000 men; amid a scene of wild enthusiasm this was granted by acclamation. When Jellachich was marching on Pesth he went from town to town rousing the people to the defence of the country, and the popular force of the Howed was his creation. When Batthyany resigned he was appointed with Szemere to carry on the government provisionally, and at the end of September he was made President of the Committee of Ministers. For the time he was the highest officer of the state, and second to the dictator. With marvellous energy he kept in his own hands the direction of the whole government. Not a soldier himself, he had to control and direct the movements of armies; can we be surprised if he failed, or if he was unable to keep control over the generals or to establish that military co-operation so essential to success? Especially it was Görgei (q.v.) whose great abilities he was the first to recognize, who refused obedience; the two men were in truth the very opposite to one another: the one all feeling, enthusiasm, sensibility; the other cold, stoical, reckless of life. Twice Kossuth deposed him from the command; twice he had to resign it. Other times he was the friend of any one who offered him anything more of Görgei's calculated ruthlessness, for, as has been truly said, the revolutionary power he had seized could only be held by revolutionary means; but he was by nature soft-hearted and always merciful; though often audacious, he lacked decision in dealing with men. It has been said that he showed a want of personal courage; this is not improbable, the excess of feeling which made him so great an orator could hardly be combined with the coolness in danger required of a soldier; but no one was able, as he was, to diffuse courage into others. During all the terrible winter which followed his energy and spirit were not relaxed. He overcame the reluctance of the army to march to the relief of Vienna; after the defeat of Schwechat, at which he was present, he sent Bem to carry on the war in Transylvania. At the end of the year, when the Austrians were approaching Pesth, he asked for the mediation of Mr Stiles, the American envoy. Windischgrätz, however, refused all terms, and the Diet and government fled to Debreczen; Kossuth taking with him the regalia of St Stephen, the sacred Palladium of the Hungarian nation. Immediately after the accession of the Emperor Francis Joseph all the demands of March had been revoked and Kossuth with his colleagues outlawed. In April 1849, when the Hungarians had won many successes, after sounding the army, he issued the celebrated declaration of Hungarian independence, in which he declared that "the house of Habsburg-Lorraine, perjured in the sight of God and man, had forfeited
the Hungarian throne." It was a step characteristic of his love for extreme and dramatic action, but it added to the dissensions between him and those who wished only for autonomy under the old dynasty, and his enemies did not scruple to accuse him of aiming at the crown himself. For the time the future form of government was left undecided, but Kossuth was appointed responsible governor. The hopes of ultimate success were frustrated by the Union of Russia; all appeals to the western powers were vain, and on the 11th of August Kossuth abdicated in favour of Gőrgő, on the ground that in the last extremity the general alone could save the nation. How Gőrgő used his authority to surrender is well known; the capitulation was indeed inevitable, but a greater man than Kossuth would not have avoided the last duty of conducting the negotiations so as to get the best terms.

With the capitulation of Villagó Kossuth's career was at an end. A solitary fugitive, he crossed the Turkish frontier. He was hospitably received by the Turkish authorities, who defended by Great Britain, refused, notwithstanding the threats of the allied governs to surrender him and the other fugitives to the merciless vengeance of the Austrians. In January 1849 he was removed from Widdin, where he had been kept in honourable confinement, to Shumla, and thence to Katalia in Asia Minor. Here he was joined by his children, who had been confined at Pressburg; his wife (a price had been set on her head) had joined him earlier, having escaped in disguise. In September 1851 he was liberated and embarked on an American man-of-war. He first landed at Marseilles, where he received an enthusiastic welcome from the people, but the prince-presidential refusal to allow him to cross France. On the 23rd of October he landed at Southampton and spent three weeks in England, where he was the object of extraordinary enthusiasm, equalled only by that with Garibaldi was received ten years later. Addresses were presented to him at Southampton, Birmingham and other towns; he was officially entertained by the lord mayor of London; at each place he pleaded the cause of his unhappy country. Speaking in English, he displayed an eloquence and command of the language scarcely excelled by the greatest orators in their own tongue. The agitation had no immediate effect, but the indignation which he aroused against Russian policy had much to do with the strong anti-Russian feeling which came the Crimean War possible.

From England he went to the United States of America; there his reception was equally enthusiastic, if less dignified; an element of charlatanism appeared in his words and acts which soon destroyed his real influence. Other Hungarian exiles protested against the claim he appeared to make that he was the one national hero of the revolution. Count Casimir Batthyany and others, on the one side, and Count Chotek, who had been prime minister under him, published a bitter criticism of his views and character, accusing him of arrogance, cowardice and duplicity. He soon returned to England, where he lived for eight years in close connexion with Mazzini, by whom, with some misgiving, he was persuaded to join the Revolutionary Committee. Quarrels of a kind only too common among exiles followed; the Hungarians were especially offended by his claim still to be called governor. He watched with anxiety every opportunity of once more freeing his country from Austria. An attempt to organize a Hungarian legion during the Crimean War was stopped; but in 1859 he entered into negotiations with Napoleon, left England for Italy, and began the organization of a Hungarian legion, which was to make a descent on the coast of Dalmatia. The Peace of Villafranca made this impossible. From that time he resided in Italy; he refused to follow the other Hungarian patriots, who, under the lead of Deak, accepted the composition of 1867; for him there could be no reconciliation with the house of Habsburg, nor would he accept less than full independence and a republic. He would not avail himself of the amnesty, and, though elected to the Diet of 1867, never took his seat. He never lost the affections of his countrymen, but he refrained from an attempt to give practical effect to his opinions, nor did he allow his name to become a new cause of dissension.

A law of 1879, deprived of citizenship all Hungarians who had voluntarily been absent ten years, was a bitter blow to him.

He died in Turin on the 2oth of March 1894; his body was taken to Pesth, where he was buried amid the mourning of the whole nation, Maurus Jokai delivering the funeral oration. A bronze statue, erected by public subscription, in the Kerepes cemetery, commemorates Hungary's purest patriot and greatest orator. His public career and character will probably always remain the subject of controversy. His complete works were published in Hungarian at Budapest in 1880-1895. The fullest account of the Revolution is given in Helfert, Geschichle Oesterreichs (Leipzig, 1868); Biddle, American and British, 1850-1870, 2. (Leipzig, 1867); Maurice, Revolutions of 1848-1849; W. H. Stiles, Austria in 1848-1849. (New York, 1852); Szemere, Politische Charakterzissen: III. Kossuth (Hamburg, 1853); Louis Kossuth, Memoirs of my Exile (London, 1880); Oelkhy, Meine Zeit, mein Lebos und mein Kostw. (1886); A. Somogyi, Ludwig Kossuth (Berlin, 1894). (J. W. He.)

Koster (or Coster), Laurens (c. 1550-1540). Dutch printer, whose claims to be considered as one of the inventors of the art (see TYPOGRAPHY) have been recognized by many investigators. His real name was Laurens Janssens-Koster (i.e. sacrificant) being merely the title which he bore as an officer of the great parish church of Haarlem. We find him mentioned several times between 1417 and 1434 as a member of the great council, as an assessor (scabinus), and as the city treasurer. He probably perished at the storm of Haarlem in 1439-1440; his widow is mentioned in the latter year, and his descendants, through his daughter Lucia, can be traced down to 1724.

See Peter Schriver, Beschrijvingen der Stad Haarlem (Haarlem, 1628); Scheltema, Levenschets van Laurens d. Koster (Haarlem, 1834); Van der Linde, De Haarlemse Costelegende (Haage, 1870).

Kostroma, a government of central Russia, surrounded by those of Vologda, Vyatka, Nizhniy-Novgorod, Vladimir and Yaroslav, lying mostly on the left bank of the upper Volga. It has an area of 32,480 sq. m. Its surface is generally undulating, with hilly tracts on the right bank of the Volga, and extensive flat marshy districts in the east. Rocks of the Permian system predominate, though a small tract belongs to the Jurassic, and both are overlain by thick deposits of Quaternary clays. The soil in the east is for the most part sand or a sandy clay; a few patches, however, are fertile black earth. Forests, yielding excellent timber for ship-building, and in many cases still untouched, occupy 49% of the area of the government. The export of timber is greatly facilitated by the navigable tributaries of the Volga, e.g. the Kostroma, Unaha, Neya, Vioksa and Vetluga. The climate is severe; frosts of -22° F. are common in January, and the mean temperature of the year is 41.1 (summer, 64.5°; winter, -13.3°). The population, which numbered 1,176,000 in 1870 and 1,244,717 in 1897, is almost entirely Russian. The estimated population in 1906 was 1,566,700. Out of 20,000,000 acres, 7,561,500 acres belong to private owners, 6,379,500 to the peasant communities, 3,660,800 to the crown, and 1,243,000 to the imperial family. Agriculture is at a low ebb; only 4,000,000 acres are under crops (rye, oats, wheat and barley), and the yield of corn is insufficient for the wants of the population. Plax and hops are cultivated to an increasing extent. But market-gardening is of some importance. Bee-keeping was formerly an important industry. The chief articles of commerce are timber, fuel, pitch, tar, mushrooms, and wooden wares for building and household purposes, which are largely manufactured by the peasantry and exported to the steppe governments of the lower Volga and the Don. Boat-building is also carried on. Some other small industries, such as the manufacture of silver and copper wares, leather goods, bat mats and sacks, lace and felt boots, are carried on in the villages; but the trade in linen and towelling, formerly the staple, has probably perished in the plague that visiteth engineering and chemical works, distilleries, tanneries and paper mills. The government of Kostroma is divided into twelve districts, the
KOSTROMA-KOTZEBUE, A. F. F. VON

KOSTROMA, a town of Russia, capital of the government of the same name, 230 m. N.E. of Moscow and 57 m. E.N.E. from Yaroslav, on the left bank of the Volga, at the mouth of the navigable Kostroma, with suburbs on the opposite side of the Volga. Pop. (1897), 41,668. Its glittering gilded cupolas make it a conspicuous feature in the landscape as it climbs up the terraced river bank. It is one of the oldest towns of Russia, having been founded in 1535, when the refuge of the princes of Moscow during war, but the town was not more than once by the Tatars. The cathedral, built in 1239 and rebuilt in 1773, is situated in the Kremlin, or citadel, and is a fine monument of old Russian architecture. In the centre of the town is a monument to the peasant Ivan Susanin and the tsar Michael (1831). The former sacrificed his own life in 1668 by leading the Poles astray in the forests in order to save the life of his own tsar Michael Fecedorovich. On the opposite bank of the Volga, close to the water’s edge, stands the monastery of Ipatiev, founded in 1353, with a cathedral built in 1586, both associated with the elevation of Tsar Michael (1669). Kostroma has been renowned since the 16th century for its linen, which was exported to Holland, and the manufacture of linen and linen-yarn is still kept up to some extent. The town has also cotton-mills, tanneries, saw-mills, an iron-foundry and a machine factory. It carries on an active trade—importing grain, and exporting linen, linen yarn, leather, and especially timber and wooden wares.

KÖSZEG (Ger. Göns), a town in the county of Vas, in Hungary, 173 m. W. of Budapest by rail. Pop. (1900) 7,422. It is pleasantly situated in the valley of the Göns, and is dominated towards the west by the peaks of Altenhaus (2,000 ft.) and of the Geschriebene Stein (2,000 ft.). It possesses a castle of Count Esterhazy, a modern Roman Catholic Church in Gothic style and two convents. It has important cloth factories and a lively trade in fruit and wine. The town has a special historical interest for the heroic and successful defence of the fortress by Nicolas Jurisics against a large army of Sultan Soliman, in July—August 1532, which frustrated the advance of the Turks to Vienna for that year.

The south-east of Köszeg, at the confluence of the Göns with the Raab, is situated the town of Sárkóz (pop. 31,585), formerly fortified, where in 1526 the first printing press in Hungary was established.

KOTÁ, a native state of India, in the Rajputana agency, with an area of 5684 sq. m. The country slopes gently northwards from the high table-land of Malwa, and is drained by the Chambal with its tributaries, all flowing in a northerly or north-easterly direction. The Mokandarra range, from 1200 to 1600 ft. above sea-level, runs from south-east to north-west. The Mokandarra Pass through these hills, in the neighbourhood of the highest peak (1671 ft.), has been rendered memorable by the passage of Colonel Monson’s army on its disastrous retreat in 1804. There are extensive game preserves, chiefly covered with grass. In addition to the usual Indian grains, wheat, cotton, poppy, and a little tobacco of good quality are cultivated. The manufactures are very limited. Cotton fabrics are woven, but are being rapidly superseded by the cheap products of Bombay, and Manchester. Articles of wooden furniture are also constructed. The chief articles of export are opium and grain; salt, cotton and woollen cloth are imported.

Kotah is an offshoot from Bundi state, having been bestowed upon a younger son of the Bundi rajya by the emperor Shah Jahan in return for services rendered him when the latter was in rebellion against his father Jahangir. In 1687 a considerable portion of the area taken to form Jhalawar (q.v.) in 1838 was restored to Kotah. In 1901 the population was 544,879, showing a decrease of 24% due to the results of famine. The estimated revenue is £206,000; tribute, £28,000. The maharao Umad Singh, was born in 1873, and succeeded in 1889. He was educated at the Mayo College, Ajmere, and became a major in the British army. A continuation of the branch line of the Indian Midland Railway from Goona to Baran passes through Kotah, and it is also traversed by a new line, opened in 1909. The state suffered from drought in 1896—1897, and again more severely in 1899—1900.

The town of Kotah is on the right bank of the Chambal. Pop. (1901), 32,679. It is surrounded and also divided into three parts by massive walls, and contains an old and a new palace of the maharao and a number of fine temples. Muslims are the chief articles of manufacture, but the town has no great trade, and this and the unhealthiness of the site may account for the entire population of the town being more than once by the Tatars. The town has also cotton-mills, tanneries, saw-mills, an iron-foundry and a machine factory. It carries on an active trade—importing grain, and exporting linen, linen yarn, leather, and especially timber and wooden wares.

KOTAS (Kotar, Koter, Kobatur, Gauhatar), an aboriginal tribe of the Nilgiri hills, India. They are a well-made people, of good features, tall, and of a dull copper colour, but some of them are among the fairest of the hill tribes. They recognize no caste among themselves, but are divided into keris (streets), and a man must marry outside his keri. Their villages (of which there are seven) are large, averaging from thirty to sixty huts. They are agriculturists and herdsman, and the only one of the hill tribes who practise industrial arts, being excellent at basket-making and brick-making. They are also noted for their metal work for the Todas, to whom they pay a tribute. They worship ideal gods, which are not represented by any images. Their language is an old and rude dialect of Kanarese. In 1901 they numbered 1,267.

KOTKA, a seaport of Finland, in the province of Viborg, 35 m. by rail from Kivulova junction on the Helsingfors railway, on an island of the same name at the mouth of the Kymmen river. Pop. (1904), 7,628. It is the chief port for exports from and imports to east Finland and a centre of the timber trade.

KOTRI, a town of British India, in Karachi district, Sind, situated on the right bank of the Indus. Pop. (1901), 7,671. Kotri is the junction of branches of the North-Western railway, serving each bank of the Indus, which is here crossed by a railway bridge. It was formerly the station for Hyderabad, which lies across the Indus, and the headquarters of the Indus steam flotilla, now abolished in consequence of the development of railway facilities. Besides its importance as a railway centre, however, Kotri still has a considerable general transit trade by river.

KOTZEBUE, AUGUST FRIEDRICH FERDINAND VON (1761—1819), German dramatist, was born on the 3rd of May, 1761, at Weimar. After attending the gymnasium of his native town, he went in his sixteenth year to the university of Jena, and afterwards studied about a year in Duisburg. In 1780 he completed his legal course and was admitted an advocate. Through the influence of Graf Görtz, Prussian ambassador at the Russian court, he became secretary of the governor-general of St Petersburg, In 1783 he received the appointment of assessor to the high court of appeal in Reval, where he married the daughter of a Russian lieutenant-general. He was ennobled in 1785, and became president of the magistracy of the province of Estonia. In Reval he acquired considerable reputation by his novels, Die Leiden der Ortenburgischen Familie (1785) and Geschichte meines Vetters (1788), and still more by the plays Adelheid von Wulffen (1790), Menschenshna und Reue (1790) and Die Indianer in England (1790). The good impression produced by these works was, however, almost effaced by a cynical dramatic satire, Doktor Bährd mit der eisernen Stirn, which appeared in 1790 with the name of Kniige on the title-page. After the death of his first wife Kotzebue retired from the public service, and lived for a time in Paris and Münich; he then settled in 1795 on an estate which he had acquired near Reval and gave himself up to literary work. Within a few years he published six volumes of miscellaneous sketches and stories (Die jüngsten Kinder meiner Laune, 1793—1796) and more than twenty plays, the majority of which were translated into several European languages. In 1798 he accepted the office of dramatist to the court theatre in Vienna, but owing to differences with the actors he was soon obliged to resign. He now returned to
his native town, but as he was not on good terms with Goethe, and had opened angrily the Romantic school, his position in Weimar was not a pleasant one. He had thought of returning to St Petersburg, and on his journey thither he was, for some unknown reason, arrested at the frontier and transported to Siberia. It is not unlikely that Kotzebue is to be the vanity of the emperor Paul I; he was consequently speedily brought back, presented with an estate from the crown lands of Livonia, and made director of the German theatre in St Petersburg. He returned to Germany when the emperor Paul died, and again settled in Weimar; he found it, however, as impossible as ever to gain a footing in literary society, and turned his steps to Berlin, where, in association with Garilö Merkel (1760–1830) he edited Der Freimüthige (1803–1807) and began his Almanach dramatischischer Spitzen (1803–1809). Towards the end of 1826 he was seen more in Russia, and in the security of his estate in Estonia wrote many satirical articles against Napoleon in his journals Die Biene and Die Grille. As councillor of state he was attached in 1816 to the department for foreign affairs in St Petersburg, and in 1817 went to Germany as a kind of spy in the service of Russia, with a salary of 15,000 roubles. In a weekly journal (Literarisches Wochenblatt) which he published in Weimar he scoffed at the pretensions of those Germans who demanded free institutions, and became an object of such general dislike that he was obliged to move to Mannheim. He was especially disliked by the young Karl Ludwig Sand, a theological student, who stabled him, in Mannheim, on the 23rd of March 1819. Sand was executed, and the government made his crime an excuse for placing the universities under strict supervision.

Besides his plays, Kotzebue wrote several historical works, which, however, are too one-sided and prejudiced to have much value. Of more interest are his autobiographical writings, Meine Flucht nach Paris im Winter 1790 (1791), Über meinen Aufenthalt in Wien (1790). Dar merkwürdigste Jahr meines Lebens (1841: Erinnerungen aus Paris (1804), and Erinnerungen von meiner Reise aus Ließand nach Rom und Neapel (1805). As a dramatist he was extraordinarily prolific, his plays numbering over 200; his popularity, not merely on the German, but on the European stage, was unprecedented. His success, however, was due to any conspicuous literary or poetic ability than to an extraordinary facility in the invention of effective situations; he possessed, as few German playwrights before or since, the unerring instinct for the theatre; and his influence on the technique of the modern drama from Schiller to Sardou and from Ibsen to Strindberg is unthought of by the best advantage in his comedies, such as Der Waldläufer, Die beiden Klingsberg and Die deutschen Kleinstädter, which contain admirable genre pictures of German life. These plays held the stage in Germany long after the once famous Menschenhass und Reue (known in England as The Stranger), Graf Benjowitsy, or ambitious exotic tragedies like Die Sonnenjungfrau and Die Spanier in Peru (which Sheridan adapted as Pizarro) were forgotten.

**KOTZEBOE, OTTO VON** (1787–1846), Russian navigator, second son of the foregoing, was born at Reval on the 30th of December 1787. After being educated at the St Petersburg school of cadets, he accompanied Krusenstern on his voyage of 1803–1806. After his promotion to lieutenant Kotzebue was placed in command of an expedition, fitted out at the expense of the imperial chancellor, Count Rumantsoff, in the brig "Rarick." In this vessel, with only twenty-seven men, Kotzebue set out on the 30th of July 1815 to find a passage across the Arctic Ocean and explore the less-known parts of Oceania. Proceeding by Cape Horn, he discovered the Romanzov, Kurik and Krusenstern Islands, then made for Kamchatka, and in the middle of July proceeded northward, coasting along the north-west coast of America, and discovering and naming Kotzebue Gulf or Sound and Krusenstern Cape. Returning by the coast of Asia, he again sailed to the south, and made for the treasuries at the Sandwich Islands, and on the 1st of January 1817 discovered New Year Island. After some further cruising in the Pacific he again proceeded north, but a severe attack of illness compelling him to return to Europe, he reached the Neva on the 3rd of August 1818, bringing home a large collection of previously unknown plants and much new ethnological information. In 1823 Kotzebue, now a captain, was entrusted with the command of an expedition in two ships of war, the main object of which was to take reinforcements to Kamchatka. There was, however, a great scientific interest in the, who collected much valuable information and material in geography, ethnography and natural history. The expedition, proceeding by Cape Horn, visited the Radak and Society Islands, and reached Petropavlovsk in July 1824. Many positions along the coast were rectified, the Navigator islands visited, and several discoveries made. The expedition returned by the Marianna, Philippine, New Caledonia and Hawaiian Islands, reaching Kronstadt on the 9th of July 1826. There are English translations of both Kotzebue’s narratives: A Voyage of Discovery into the South Sea and Bering’s Straits for the Purpose of exploring a North-East Passage to China and Japan (1825); or A Voyage of Discovery and Settlement Round the World in the Years 1823–1826 (1830). Three years after his return from his second voyage, Kotzebue died at Reval on the 15th of February 1846.

**KOUMISS, milk-wine, or milk brandy, a fermented alcoholic beverage prepared from milk. It is of very ancient origin, and according to Herodotus was known to the Scythians. The name is said to be derived from an ancient Asiatic tribe, the Kumanes or Komans. It is one of the staple articles of diet of the Siberian and Caucasian races, but of late years it has also been manufactured on a considerable scale in western Europe, on account of its valuable medicinal properties. It is generally made from mares’ or camels’ milk by a process of fermentation set up by the addition to the fresh milk of a small quantity of the finished article. This fermentation, which appears to be of a symbiotic nature, being dependent on the action of two distinct types of organisms, the one a fermentation fungus, the other a true yeast, eventuates in the conversion of a part of the milk sugar into lactic acid and alcohol. Koumiss generally contains 1 to 2% of alcohol, 0.5 to 1.5% of lactic acid, 2 to 4% of milk sugar and 1 to 2% of fat. Kefir is similar to koumis, but is usually prepared from cow’s milk, and is also thought about by the so-called Kefir Grains (derived from a plant).

**KOUMOUNDOUROS, ALEXANDROS** (1814–1883), Greek statesman, whose name is commonly spelt Koumoundourou, was born in 1814. His studies at the university of Athens were repeatedly interrupted for lack of means, and he began to earn his living as a clerk. He took part in the Cretan insurrection of 1841, and in the demonstration of 1843, by which the Greek constitution was obtained from King Otto, he was secretary to General Theodorakis Grivas. He then settled down to the bar at Athens, and was successively a member of the Chamber of Deputies, a member of the Executive of the Mavromichalis family. He was elected to the chamber in 1854, and four years later his eloquence and ability had secured the president’s chair for him. He became minister of finance in 1856, and again in 1857 and 1859. He adhered to the moderate wing of the Liberal party until the revolution of 1862 and the dethronement of King Otto, when he was minister of justice in the provincial government. He was twice minister of the interior under Karanis, in 1864 and in 1865. In March 1865 he became prime minister, and he formed several subsequent administrative in the intervals of the ascendancy of Tricou. During the Cretan insurrection of 1866–68 he made active warlike preparations against Turkey, but was dismissed by King George, who recognized that Greece could not act without the support of the Powers. He was again premier at the time of the outbreak
of the insurrection in Thessaly in January 1878, and supported by Delessen as minister of foreign affairs he sent an army of 10,000 men, then open to insurgents against Turkey, which were recalled on the understanding that Greece should be represented at the Congress of Berlin. In October 1880 the fall of the Tricoupi ministry restored him to power, when he resumed his warlike policy, but repeated appeals to the courts of Europe yielded little practical result, and Koumoundouros was obliged to reduce his territorial demands and to accept the limited cessions in Thessaly and Epirus, which were carried out in July 1881. His ministry was overthrown in 1882 by the votes of the new Thessalian deputies, who were dissatisfied with the administratively.

KOUSSO (Kosso or Cusso), a drug which consists of the panicles of the pistillate flowers of Brayera anthelmintica, a handsome rosaceous tree 60 ft. high, growing throughout the table-land of Abyssinia, at an elevation of 3000 to 8000 ft. above the sea-level. The drug as imported is in the form of cylindrical rolls, about 18 in. in length and 2 in. in diameter, and comprises the entire florescence or panicle kept in form by a band wound transversely round it. The active principle is known as coumarin, and is a white, amorphous, acid. It is used medicinally as an antihelminthic and for the treatment of rheumatism.

KOVALEVSKY, SOPHIE (1850–1915), Russian mathematician, daughter of General Corvin-Krukovsky, was born at Moscow on the 15th of January 1850. As a young girl she was fired by the aspiration after intellectual liberty that animated so many young Russian women at that period, and drove them to study at foreign universities, since their own were closed to them. This led her, in 1868, to contract one of those conventional marriages in vogue at the time, with a young student, Waldemar Kovalevsky, and the two went together to Germany to continue their studies. In 1869 she went to Heidelberg, where she studied under H. von Helmholtz, G. Kirchhoff, L. Königberger and P. du Bois-Reymond, and from 1871–1874 read privately with Karl Weierstrass at Berlin, as the public lectures were useless.

In 1873 the university of Göttingen granted her a degree in absentia, excusing her from the oral examination on account of the remarkable excellence of the three dissertations sent in, one of which, on the theory of partial differential equations, is one of her most remarkable works. Another was an elucidation of P.S. Laplace’s mathematical theory of the form of Saturn’s rings. Soon after this she returned to Russia with her husband, who was appointed professor of palaeontology at Moscow, where he died in 1883. At this time Madame Kovalevsky was at Stockholm, where Gustav Mittag-Leffler, also a pupil of Weierstrass, who had recently appointed her to the chair of mathematics at the newly founded university, had procured for her a post as lecturer. She discharged her duties so successfully that in 1884 she was appointed full professor. This post she held till her death on the 10th of February 1891. In 1888 she achieved the greatest of her successes, gaining the Prix Bordin offered by the Paris Academy. The problem set was “to perfect in one important point the theory of the movement of a solid body round an immoveable point,” and her solution added a result of the highest interest to those transmitted to us by Leonhard Euler and J. Lagrange. So remarkable was this work that the value of the prize was doubled as a recognition of unusual merit. Unfortunately Madame Kovalevsky did not live to reap the full reward of her labours, for she died just as she had attained the height of her fame and had won recognition even in her own country by election to membership of the St Petersburg Academy of Science.

KOVO (in Lithuanian Kauno), a government of northwestern Russia, bounded N. by the governments of Courland and Vitebsk, S.E. by that of Vila, and S. and S.W. by Suwalki and the province of East Prussia, a narrow strip touching the Baltic near Memel. It has an area of 15,687 sq. m. The level uniformity of its surface is broken only by two low ridges which nowhere rise above 800 ft. The geological character is varied, the Silurian, Devonian, Jurassic and Tertiary systems being all represented: the Devonian is that which occurs most frequently, and all are covered with Quarternary boulder-clays. The soil is either a sandy clay or a fine light loam. The chief crop is that of grain, especially barley, the district is drained by the Nenien, Windau, Courland Aa and Dvina, which have navigable tributaries. In the flat depressions covered with boulder-clays there are many lakes and marshes, while forests occupy about 25% of the surface. The climate is comparatively mild, the mean temperature at the city of Kovno being 44° F. The population was 1,156,406 in 1870, and 1,553,344 in 1887. The estimated population in 1906 was 1,683,600.

It is varied, consisting of Lithuanians proper and Zmuds (together 74%), Jews (14%), Germans (23%), Poles (9%), with Latins and other Romans; 7.3% belong to the Greek Church. Of the total 288,102 were women in 1897 and 147,878 were classed as urban. The principal occupation of the inhabitants is agriculture, 63% of the surface being under crops; both grain (wheat, rye, oats and barley) and potatoes are exported. Flax is cultivated and the linned exported. Dairying flourishes, and horse and cattle breeding are attracting attention. Fishing is important, and the navigation on the rivers is brisk. A variety of petty domestic industries are carried on by the Jews, but only to a slight extent in the villages. As many as 18,000 to 24,000 men are compelled every year to migrate in search of work. The factories consist principally of distilleries, tobacco and steam flour-mills, and hardware manufacturers. Trade, especially the transit trade, is brisk, from the situation of the government on the Russian frontier, the custom-houses of Yerburg and Tauraggen being amongst the most important in Russia. The chief towns of the seven districts into which the government is divided, with their populations in 1897, are Kovno (92,576), Novo-Alexandrovsk (6376), Ponevysz (13,044), Rosieny (7453), Shavli (15,014), Telšiai (6215) and Vilkctm (13,590).

The territory which now constitutes the government of Kovno was formerly known as Samogitia and formed part of Lithuania. During the 13th, 14th and 15th centuries the Livonian and Teutonic Knights continually invaded and plundered it, especially in the western part, which was peopled with Tsymuds. In 1569 it was annexed, along with the rest of the principality of Lithuania, to Poland; and it suffered very much from the wars of Russia with Sweden and Poland, and from the invasion of Charles XII. in 1703. In 1795 the principality of Lithuania was annexed to Russia, and until 1872, when the government of Kovno was constituted, the territory now forming it was a part of the government of Vilna.

KOVO, a town and fortress of Russia, capital of the government of the same name, stands at the confluence of the Niemen with the Vilija, 530 m. S.W. of St Petersburg by rail, and 55 m. from the Prussian frontier. Pop. (1863), 73,937; (1903), 73,743; nearly one-half being Jews. It consists of a cramped Old Town and a New Town stretching up the side of the Niemen. It is a first-class fortress, being surrounded at a mean distance of 2½ m. by a girdle of forts, eleven in number. The town lies for the most part on a flat fork and is, therefore, a natural centre. In the direction of Vilna, one covers the Vilna bridge, while the southern approaches are protected by seven. Kovno commands and bars the railway Vilna-Eydtkuchens. Its factories produce nails, wire-work and other metal goods, meal and bone-meal. It is an important entrepôt for timber, cereals, flax, flour, spirits, bone-meal, fish, coal and building-stone passing from and to Prussia. The city possesses some 15th-century churches. It was founded in the 11th century; and from 1384 to 1398 belonged
to the Teutonic Knights. Tsar Alexis of Russia plundered and burnt it in 1655. Here the Russians defeated the Poles on the 26th of June 1831.

Kovrov, are at Nuremberg. The date last works, 1000 m. N.E. of the city of Vladimir by the railway (from Moscow to Nizhniy-Novgorod, and on the Klyazma River. It has railway carriage works, cotton mills, steam flour mills, tallow works and quarries of limestone, and carries on an active trade in the export of wooden wares and in the import of grain, salt and fish, brought from the Volga governments. Pop. (1890), 6600; (1900), 16,806.

KOWTOW, or KOTOU, the Chinese ceremonial act of prostration as a sign of homage, submission, or worship. The word is (from Hokkaido), and so called. To the emperor, the "kowtow" is performed by kneeling three times, each act accompanied by touching the ground with the forehead.

KOZLOV, a town of Russia, in the government of Tavom, on the Lyensov Voronezh River, 45 m. W.N.W. of the city of Tavom by rail. Pop. (1900), 41,555. Kozlov had its origin in a small monastery, founded in the forest in 1627; nine years later, an earthwork was raised close by, for the protection of the Russian frontier against the Tatars. Situated in a very fertile country, on the highway to Astrakhan and at the head of water communication with the Don, the town soon became a centre of trade; as the junction of the railways leading to the Sea of Azov, to Tsarskoye on the lower Volga, to Saratov and to Orel, its importance has recently been still further increased. Its export of cattle, grain, meat, eggs (23,000,000), tallow, hides, &c., is steadily growing, and it possesses factories, flour mills, tallow works, distilleries, tanneries and glue works.

KRALA, also spelt kraal, kraid, &c. (South African Dutch, derived possibly from a native African word, but probably from the Spanish corral, Portuguese corral, an enclosure for horses, cattle and the like), in South and Central Africa, a native village, or kraal, a palisaded wall, roughly circular in form; by transference, the community living within the enclosure. Folds for animals and enclosures made specially for defensive purposes are also called kraals.

KRAFFT (or KRAFT), ADAM (c. 1455-1507), German sculptor, of the Nuremberg school, was born, probably at Nuremberg, about the middle of the 15th century, and died, some say in the hospital, at Schwabach, about 1507. He seems to have emerged as sculptor about 1490, the date of the seven reliefs of scenes from the life of Christ, which, like almost every other specimen of his art, are preserved at Nuremberg. The date of his last work, an Entombment, with fifteen life-size figures, in the Holzschuherschapel of the St. John's cemetery, is 1507. Besides these, Kraf'ts chief works are several monumental reliefs in the various churches of Nuremberg; he produced the great Schreyer monument (1492) for Sebald's at Nuremberg, a skilful though mannered piece of sculpture opposite the Rathaus, with realistic figures in the costume of the time, carved in a way more suited to wood than stone, and too pictorial in effect; Christ bearing the Cross, above the altar of the same church; and various works made for public and private buildings, as the relief over the door of the Wagenhaus, St. George and the Dragon, several Madonnas, and some purely decorative pieces, as coats of arms. His masterpiece is perhaps the magnificent tabernacle, 62 ft. high, in the church of St. Laurence (1493-1500). He also made the great tabernacle for the Host, 80 ft. high, covered with statuettes, in Ulm Cathedral, and the very spirited "Stations of the Cross" on the road to the Nuremberg cemetery.

KRAGUEVATZ (also written Kraguevatc and Krugujevac), the capital of the Kraguevatc district of Serbia; situated 99 m. S.S.W. of Belgrade, in a valley of the Shumadia, or "forest-land," and on the Lepenista, a small stream flowing north-east to join the Morava. On the opposite bank stands the picturesque hamlet of Obilichevo, with a large powder factory.
dust as to bury their forests and greatly to increase the area of the land. So much was the sea filled up that a number of new islands rose above its level. But a vast body of the fine dust was carried far and wide by aerial currents, while the floating pumice was transported for many hundreds of miles on the surface of the ocean. At Batavia, 100 m. from the centre of eruption, the sky was darkened by the quantity of ashes borne across it, and lamps had to be used in the houses at midday. The darkness even reached as far as Bandong, a distance of nearly 150 miles. It was computed that the column of stones, dust and ashes projected from the volcano shot up into the air for a height of 17 m. or more. The finer particles coming into the higher layers of the atmosphere were diffused over a large part of the surface of the earth, and showed their presence by the brilliant sunset glows to which they gave rise. Within the tropics they were at first borne along by air-currents at an estimated rate of about 73 m. an hour from east to west, until within a period of six weeks they were diffused over nearly the whole space between the latitudes 30° N. and 45° S. Eventually they spread northwards and southwards and were carried over North and South America, Europe, Asia, South Africa and Australasia. In the Old World they spread from the north of Scandinavia to the Cape of Good Hope.

Another remarkable result of this eruption was the world-wide disturbance of the atmosphere. The culminating paroxysm on the morning of the 27th of August gave rise to an atmospheric wave or oscillation, which, travelling outwards from the volcano as a centre, became a great circle at 180° from its point of origin, whence it continued travelling northwards and southwards till it reached a node at the antipodes to Krakatoa. It was then reflected or reprojected, travelling backwards again to the volcano, whence it once more returned in its original direction. "In this manner its repetition was observed not fewer than seven times at many of the stations, four passages having been those of the wave travelling from Krakatoa, and three those of the wave travelling from its antipodes, subsequently to which its traces were lost" (Sir R. Strachey).

The actual sounds of the volcanic explosions were heard over a vast area, especially towards the west. Thus they were noticed at Rodriguez, nearly 3000 English miles away, at Bangkok (1413 m.), in the Philippine Islands (about 1450 m.), in Ceylon (2058 m.) and in West and South Australia (from 1360 to 2250 m.). On no other occasion have sound-waves ever been perceived at anything like the extreme distances to which the detonations of Krakatoa reached.

Not less manifest and far more serious were the effects of the successive explosions of the volcano upon the waters of the ocean. A succession of waves was generated which appear to have had a centre, became a great circle at 180° from its point of origin, and travelled outwards with periods of more than an hour, and shorter but higher waves, with irregular and much briefer intervals. The greatest disturbance, probably resulting from a combination of both kinds of waves, reached a height of about 50 ft. The destruction caused by the rush of such a body of sea-water along the coasts and low islands was enormous. All vessels lying in harbour or near the shore were smashed, the towns, villages and settlements close to the sea were either at once, or by successive inundations, entirely destroyed, and more than 35,000 human beings perished. The sea-waves travelled to vast distances from the centre of propagation. The last wave reached Cape Horn (7818 geographical miles) and possibly the English Channel (11,040 m). The shorter waves reached Ceylon and perhaps Mauritius (2000 m.).

KRAKEN, in Norwegian folk-lore, a sea-monster, believed to haunt the coasts of Norway. It was described in 1759 by the Norwegian bishop Pontoppidan as having a back about a mile and a half round and a body which showed above the sea like an island, and its arms were long enough to enclose the largest ship. The further assertion that the kraken darkened the water around it by an excretion suggests that the myth was based on the appearance of some gigantic cuttle-fish.

KRALJEVO (sometimes written Kraljevo or Kraljevo), a city of Servia, and capital of a department bearing the same name. Kraljevo is built beside the river Ibar, 4 m. W. of its confluence with the Servian Morava; and in the midst of an upland valley, between the Kotelnik Mountains, on the north, and the Stoloci Mountains, on the south. Formerly known as Karanovats, Kraljevo received its present name, signifying "the King's Town," from King Milan (1868-1880), who also made it a bishopric, instead of Chachak, 22 m. W. by N. Kraljevo is a garrison town, with a prefecture, court of first instance, and an agricultural school. But by far its most interesting feature is the Coronation church belonging to Jicha monastery. Here six or seven kings are said to have been crowned. The church is Byzantine in style, and has been partially restored; but the main tower dates from the year 1210, when it was founded by St Sava, the patron saint of Servia. Pop. (1900), about 3500.

The famous monastery of Studenitsa, 24 m. S. by W. of Kraljevo, stands high up among the south-western mountains, overlooking the Studenitsa, a tributary of the Ibar. It consists of a group of old-fashioned timber and plaster buildings, a tall belfry, and a diminutive church of white marble, founded in 1190 by King Stephen Nemanya, who himself turned monk and was canonized as St Simeon. The carvings round the north, south and west doors have been partially defaced by the Turks. The inner walls are decorated with Byzantine frescoes, among which only a painting of the Last Supper, and the portraits of five saints, remain unrestored. The dome and narthex are modern additions. Besides the silver shrine of St Simeon, many church vestments and old manuscripts, there are a set of vestments and a reliquary, believed by the monks to have been the property of St Sava.

KRANTZ (or Crantz), Albert (c. 1450-1517), German historian, was a native of Hamburg. He studied law, theology and history at Rostock and Cologne, and after travelling through western and southern Europe was appointed professor, first of philosophy and subsequently of theology, in the university of Rostock, of which he was rector in 1482. In 1493 he returned to Hamburg as theological lecturer, canon and prebendary in the cathedral. By the success of Hamburg he was employed on more than one diplomatic mission abroad, and in 1506 was chosen by the king of Denmark and the duke of Holstein as arbiter in their dispute regarding the province of Dithmarschen. As dean of the cathedral chapter, to which office he was appointed in 1508, Krantz applied himself with zeal to the reform of ecclesiastical abuses, but, though opposed to various corruptions connected with church discipline, he had little sympathy with the drastic measures of Wycliffe or Huss. With Luther's protest against the abuse of indulgences he was in general sympathy, but with the reformer's later attitude he could not agree. When, on his death-bed, he heard of the ninety-five theses, he is said, on good authority, to have exclaimed: "Brother, Brother, go into thy cell and say, God have mercy upon me!" Krantz died on the 7th of December 1517.

Krantz was the author of a number of historical works which for the period when they were written are characterized by exceptional impartiality and research. The principal of these are Chronica regorum augsburgiensium Daniae, Sueciae, et Norvegiae (Strassburg, 1546); Vandallia, sive Historia de Vandalorum vera origine, &c. (Cologne, 1518); Saxonia (1520); and Metropolis, sive Historia de under Carolo Magno (Saxonia (Basel, 1548). See life by N. Wilcken (Hamburg, 1722).
industry, and salt and sulphur are obtained. Krasnovodsk, which is the capital of the Transcaspian province, was founded in 1850.

Krasnoyarsk, a town of Eastern Siberia, capital of the government of Yeniseisk, on the left bank of the Yenisei River, at its confluence with the Kacha, and on the highway from Moscow to Irkutsk, 670 m. by rail N.W. from the latter. Pop. (1900), 33,337. It has a municipal museum and a railway technical school. It was founded by Cossacks in 1828, and during the early years of its existence it was more than once besieged by the Tatars and the Kirghiz. Its commercial importance depends entirely upon the mid-waters of the Yenisei, and Brick-making, soap-boiling, tanning and iron-founding are carried on. The climate is very cold, but dry. The Yenisei River is frozen here for 160 days in the year.

Kraszewski, Joseph Ignatius (1812-1887), Polish novelist and miscellaneous writer, was born at Warsaw on the 28th of July 1812, of an aristocratic family. He showed a precocious talent for authorship, beginning his literary career with a volume of sketches from society as early as 1829, and for more than half a century scarcely ever interrupting his literary productivity, with topics of human nature. Kraszewski's literary activity fell into two well-marked epochs, the earlier when, residing upon his estate, he produced romances like Jermola, Ulaña (1843), Kordecki (1852), devoid of any special tendency, and that after 1863, when the suspicions of the Russian government compelled him to settle in Dresden. To this period belong several political novels published under the pseudonym of Boleslawie, historical fictions such as Countess Casel, and the "culture" romances Mortiuri (1874-1875) and Resurrecturi (1876), by which he is perhaps best known out of his own country. In 1884 he was accused of plotting against the German government and sentenced to seven years' imprisonment in a fortress, but was released in 1886, and withdrew to Geneva, where he died on the 10th of March 1887. His remains were brought to Poland and interred at Cracow.

Krause, Karl Christian Friedrich (1781-1832), German physician, was born at Eisenberg on the 4th of May 1781, and died at Munich on the 27th of September 1832. Educated at first at Eisenberg, he proceeded to Jena, where he studied philosophy under Hegel and Fichte and became privatdozent in 1802. In the same year, with characteristic imprudence, he married a wife without dowry. Two years after, lack of pupils compelled him to move to Rudolstadt and later to Dresden, where he gave lessons in music. In 1805 his ideal of a universal world-society led him to join the Freemasons, whose principles seemed to tend in the direction he desired. He published two books on Freemasonry, Die drei ältesten Kunsturkunden der Freimaurerbruderschaft and Höhere Vergeistigung der echt überlieferten Grundsymbole der Freimaurerei, but his opinions drew upon him the opposition of the Masons. He lived for a time in Berlin and became a privadozent, but was unable to obtain a professorship. He therefore proceeded to Göttingen, and after returning to Munich, where he died of apoplexy at the very moment when the influence of Franz von Baader had at last obtained a position for him.

One of the so-called "Philosophers of Identity," Krause endeavoured to reconcile the ideas of a God known by Faith or Conscience and the world as known to sense. God, intuitively known by Conscience, is not a personality (which implies limitations), but an all-inclusive essence (Wesen), which contains the Universe within itself. This system he called Panenheit, a combination of Theism and Pantheism. His theory of the world and of humanity is universal and idealistic. The world itself and man are regarded as an expression of the highest power of the independent Will, and the universe is therefore a divine organism (Wesenbündeb). The process of development is the formation of higher units, and the last stage is the identification of the world with God. The form which this development takes, according to Krause, is Right or the Perfect Law. Right is not the sum of the conditions of external liberty but of absolute liberty, and embraces all the existence of nature, reason and humanity. It is the mode, or rationale, of all progress from the lower to the highest unity or identification. By its operation the reality of nature and reason rises into the reality of humanity. God is the reality which transcends and includes both nature and humanity. Right is, therefore, at once the dynamic and the safeguard of progress. Ideal society results from the widening of the organic operation of this principle from the individual man to small groups of men, and finally to mankind as a whole. The differences disappear as the inherent identity of structure predominates in an ever-increasing degree, and in the final unity Man is merged in God.

The comparatively small area of Krause's influence was due partly to the overshadowing brilliance of Hegel, and partly to the small number of books he published during his life, and by no means easy to follow, and this difficulty is accentuated, even to German readers, by the use of artificial terminology. He makes use of germanized foreign terms which are unintelligible to the ordinary man. His principal works are (beside those quoted above): Entwurf des Systems der Philosophie (1804); System der Sittenlehre (1810); Das Urhild der Menschheit (1811); and Vorlesungen über das System der Philosophie (1828). He left behind him at his death a mass of unpublished notes, part of which has been collected and published by his disciples, H. Ahrens (1858-1874), Leonhardi, Tiberghien and others.

See H. S. Lindemann, Uberblicktliche Darstellung des Lebens ... Krauses (1859); P. Hoffeld, Die Krausesche Philosophie (1879); A. Procksch, Krause, ein Lebensbūd durch seinen Briefen (1880); R. Eucken, Zur Entwicklung an Krause (1881); B. Martin, Krauses Leben und Bedeutung (1881), and Histories of Philosophy by Zeller, Windelland and Höfling.

Krawang, a residency of the island of Java, Dutch East Indies, bounded E. and S. by Charbon and the Preanger, W. by Batavia, and N. by the Java Sea, and comprising a few insignificant islands. The natives are Sundanese, but contain a large admixture of Middle Javanese and Bantamers in the interior where they established colonies in the 17th century. Like the residency of Batavia, the northern half of Krawang is flat and occasionally marshy, while the southern half is mountainous and volcanic. Warm and cold mineral, salt and sulphur springs occur in the hills. Salt is extracted by the government, though in smaller quantities now than formerly. The principal products are rice, coffee, sugar, vanilla, indigo and nutmeg. Fishing is practised along the coast and forest culture in the hills, while the
industries also include the manufacture of coarse linen, sacks and leather tanning. Gold and silver were formerly thought to be hidden in the Parang mountains in the Gundasoli district south-west of Purwakarta, and mining was begun by the Dutch East India Company in 1722. The largest part of the residency consists of private lands, and only the Purwakarta and Krawang divisions forming the island, but his enemies held him directly under government control. The remainder of the residency is divided between the Pamanukan-Chiasem lands occupying the whole eastern half of the residency and the Tegalwaru lands in the south-western corner. The former is owned by a company and forms the largest estate in Java. The Tegalwaru is chiefly owned by Chinese proprietors. Purwakarta is the capital of the residency. Subang and Pnamhusan both lie at the junction of several roads near the borders of Chiribon and are the chief centres of activity in the east of the residency.

**KRAY VON KRAJOVA, PAUL, FREIHERR (1735-1804).** Austrian soldier. Entering the Austrian army at the age of nineteen, he arrived somewhat rapidly at the grade of major, but it was many years before he had any opportunity of distinguishing himself. In 1784 he suppressed a rising in Transylvania, and in the Turkish wars he took an active part at Porcezy and the Vulcan Pass. Made major-general in 1790, three years later he commanded the advanced guard of the Allies operating in France. He distinguished himself at Famars, Charleroi, Fleury, Weissenberg, and indeed at almost every encounter with the troops of the French Republic. In the celebrated campaign of 1796 on the Rhine and Danube he did conspicuous service as a corps commander. At Wetzlar he defeated Kléber, and at Amberg and Würzburg he was largely responsible for the victory of the archduke Charles. In the following year he was less successful, being twice defeated on the Lahn and the Main. Krav commanded in Italy in 1799, and reconquered from the French the plain of Lombardy. For his victories of Verona, Mantua, Legnano and Magnano he was promoted Feldzeugmeister, and he ended the campaign by further victories at Novi and Fornov. Next year he commanded on the Rhine against Moreau. (For the events of this memorable campaign see French Revolutionary Wars.) As a consequence of the defeats he underwent at Biberach, Meskirch, &c., Krav was driven into Ulm, but by a skilful march round Moreau's flank succeeded in escaping to Bohemia. He was relieved of his command by the Austrian government, and passed his remaining years in retirement. He died in 1804. Krav was one of the best representatives of the old Austrian army. Tied to an obsolete system and unable from habit to realize the changed conditions of warfare, he failed, as a general, to rise to the highest peak. He was skilful and chivalrous opponent. He was he who at Altenkirchen cared for the dying Marceau, and the white uniforms of Krav and his staff mingled with the blue of the French in the funeral procession of the young general of the Republic.

**KREMECHUG,** a town of south-west Russia, in the government of Poltava, on the left bank of the Dnieper (which periodically overflows its banks), 73 m. S.W. of the city of Poltava, on the Kharkov-Nikolayeiv railway. Pop. (1887), 31,000; (1897, with Kryukov suburb), 38,500; (1900, with and is reached by the cathedral (built in 1808), the arsenal and the town-hall. The town is supposed to have been founded in 1571. From its situation at the southern terminus of the navigable course of the Dnieper river, and on the highway from Moscow to Odessa, it early acquired great commercial importance, and by 1625 it was a wealthy town. From 1765 to 1789 it was the capital of "New Russia." It has a suburb, Kryukov, on the right bank of the Dnieper, united with the town by a railway bridge. Nearly all commercial transactions in salt with White Russia are effectuated at Kremenchug. The town is also the centre of the iron trade with a busy iron and coal. In the town considerable quantities of timber are floated down to this place. Nearly all the trade in the brandy manufactured in the government of Kharkov, and destined for the governments of Ekaterinoslav and Taurida, is concentrated here, as also is the trade in linseed between the districts situated on the left affluents of the Dnieper and the southern ports. Other articles of commerce are rye, rye-flour, wheat, oats and buckwheat, which are sent partly up the Dnieper to Finland, partly by land to Odessa and Berislav, but principally to Ekaterinoslav, on light boats floated down during the spring formed by the Dnieper is crossed at Kremenchug by a tubular bridge 1687 yds. long; there is also a bridge of boats. The manufactures consist of carriages, agricultural machinery, tobacco, steam flour-mills, steam saw-mills and forges.

**KREMEZET (Polish, Kremieniec), a town of south-west Russia, in the government of Volhynia, 130 m. W. of Zhitomir, and 25 m. E. of Brody railway station (Austrian Galicia). Pop. (1900), 16,534. It is situated in a gorge of the Kremenset Hills. The Jews, who are numerous, carry on a brisk trade in tobacco and grain exported to Galicia and Odessa. The picturesque ruins of an old castle on a crag close by the town are generally known as the castle of Queen Bona, i.e., Bona Sforza (wife of Sigismund I of Poland); it was built, however, in the 8th or 9th century. The Mongols vainly besieged it in 1241 and 1255. From that time Kremenset was under the dominion alternately of Lithuania and Poland, till 1648, when it was taken by the Zaporogian Cossacks. From 1803 to 1832 its Polish lyceum was the centre of superior instruction for the western provinces of Little Russia; but after the Polish insurrection of 1831 the lyceum was transferred to Kiev, and is now the university of that city.

**KREMS, a town of Austria, in lower Austria, 40 m. W.N.W. of Vienna by rail. Pop. (1900), 12,657. It is situated at the confluence of the Kres with the Danube. The manufactures comprise steel goods, mustard and vinegar, and a special kind of white lead (Kremser Weiss) is prepared from deposits in the neighbourhood. The trade is mainly in these products and in wine and saffron. The Danube harbour of Krems is at the adjoining town of Stein (pop., 4299).

**KREMSIER, (Czech, Kreméř), a town of Austria, in Moravia, 37 m. E. by N. of Brünn by rail. Pop. (1900), 13,991, mostly Czech. It is situated on the March, in the fertile region of Lower Austria, and is a market-place on the Dniester.

**KREUTZER, KONRADIN (1780-1849), German musical composer, was born on the 22nd of November 1780 in Messkirch in Baden, and died on the 14th of December 1849 in Riga. He owes his fame almost exclusively to one opera, *Das Nachtlager von Granada* (1834), which kept the stage for half a century in spite of the changes in musical taste. It was written in the style of the Italian opera, and is especially notable for genuine melody and depth of feeling. The same qualities are found in Kreutzer's part-songs for men's voices, which at one time were extremely popular in Germany, and are still listened to with pleasure. Amongst these "Der Tag des Herrn" ("The Lord's Day") may be named as the most excellent. Kreutzer was a prolific composer, and wrote a number of operas for the theatre at Vienna, which have disappeared from the stage and are not likely to be revived. He was from 1812 to 1816 Kapellmeister to the king of Württemberg, and in 1840 became conductor of the opera at Cologne. His daughter, Cecilia Kreutzer, was a singer of some renown.

**KREUTZER, RUDOLPH (1766-1831),** French violinist, of German extraction, was born at Versailles, his father being a musician in the royal chapel. Rudolph gradually became
famous as a violinist, playing with great success at various continental capitals. It was to him that in 1803 Beethoven dedicated his famous violin sonata (op. 47) known as the "Kreutzer." Apart, however, from his fame as a violinist, Kreutzer was also a prolific composer; he wrote twenty-nine operas, many of which were successfully produced, besides nineteen violin concertos and chamber music. He died at Geneva in 1831.

KREUZBURG, a town of Germany, in the Prussian province of Silesia, on the Stoiber, 24 m. N.N.E. of Oppeln. Pop. (1905), 10,919. It has an Evangelical and a Roman Catholic church, a gymnasium and a teacher’s seminary. Here are flour-mills, flour-mills, sugar and brewing factories, iron-works, machinery. Kreuzburg, which became a town in 1258, was the birthplace of the novelist Gustav Freytag.

KREUZNACH (CREUZNACH), a town and watering-place of Germany, in the Prussian Rhine province, situated on the Nahe, a tributary of the Rhine, 9 m. by rail S. of Bingerbrück. Pop. (1900), 21,321. It consists of two parts, the town on the right bank of the river, the new town on the left, and the Bade-Insel (hath island), connected by a fine stone bridge. The town has two Evangelical and three Roman Catholic churches, a gymnasium, a physical school and a hospital. There is a collection of Roman and medieval antiquities, among which is preserved a fine Roman mosaic discovered in 1853. On the Bade-Insel is the Kurhaus (1872) and also the chief spring, the Elisabethquelle, impregnated with iodine and bromine, and prescribed for scrofulous, bronchial and rheumatic disorders. The chief industries are marble-polishing and the manufacture of leather, glass and tobacco. Vines are cultivated on the neighbouring hills, and there is a trade in wine and corn.

The earliest mention of the springs of Kreuznach occurs in 1458, and it was only in the early part of the 19th century that Dr Friger, to whom there is a statue in the town, brought them into prominence. Now the annual number of visitors amounts to several thousands. Kreuznach was evidently a Roman town, as the ruins of a Roman fortification, the Heidenmauer, and various antiquities have been found in its immediate neighbourhood. In the 9th century it was known as Crucinacum, and it had a palace of the Carolingian kings. In 1065 the emperor Henry IV. presented it to the bishopric of Spire; in the 11th century it obtained civic privileges and passed to the counts of Spohnheim; in 1426 it became part of the patriminate. The town was destroyed by the Prussians in 1814. In 1869 the French reduced the strong castle of Kauzenberg to the ruin which now stands on a hill above Kreuznach.

See Schneeggs, Historisch-topographische Beschreibung Kreuznachs und seiner Umgebung (7th ed., 1904); Engelmann, Kreuznach und seine Heilquellen (8th ed., 1890); and Stabel, Das Salbad Kreuznach für Ärzte dargestellt (Kreuznach, 1887).

KRIGSPIEL (Kriegsspiel), the original German name, still used to some extent in England, for the War Game (q.v.).

KRIEMHILD (Grimhild), the heroine of the Nibelungenlied and wife of the hero Siegfried. The name (from O. H. Ger. getiaga, a mask or helm, and hiliga or hilaio, war) means "the masked warrior woman," and has been taken to prove her to have been originally a mythical, daemonic figure, an impersonation of the powers of darkness and of death. In the north, indeed, the name Grimhildr continued to have a purely mythical character and to be applied only to daemonic beings; but in Germany, the original home of the Nibelungen myth, it certainly lost all trace of this significance, and in the Nibelungenlied Kriemhild is no more than a beautiful princess, the daughter of King Dancræt and Queen Unter, and sister of the Burgundian kings Gunther, Giselher and Gernot, the masters of the Nibelungen hoard. As she appears in the Nibelungen legend, however, Kriemhild would seem to have had an historical origin, as the wife of Attila, king of the Hunns, as well as sister of the Nibelung kings. According to Jordanes (c. 49), who takes his information from the contemporary and trustworthy account of Priscus, Attila died of a violent hemorrhage at night, as he lay beside a girl named Ildico (i.e. O. H. Ger. Hildik). The story got abroad that he had perished by the hand of a woman in revenge for her relations slain by him; according to some (e.g. Saxo Poeta and the Quedlinburg chronicle) it was her father whom she revenged; but when the treacherous overthrow of the Burgundians by Attila had become a theme for epic poets, she figured as a Burgundian princess, and her act as done in revenge for her brothers. Now the name Hildik is the diminutive of Hilda or Hild, which again—in accordance with a custom common enough—may have been used as an abbreviation of Grimhild (cf. Hildr for Brynhildr).

It has been suggested (Symons, Heldensage, p. 55) that when the legend of the overthrow of the Burgundians was told in 1437, the place was attached to that of the death of Attila (453). Hild, the supposed sister of the Burgundian kings, was identified with the daemonic Grimhild, the sister of the mythical Nibelung brothers, and thus helped the process by which the Nibelung myth became fused with the historical story of the fall of the Burgundian kingdom. The older story, according to which Grimhild slays her husband Attila in revenge for her brothers, is preserved in the Norse tradition, though Grimhild’s part is played by Gudrun, a change probably due to the fact, mentioned above, that the name Grimhild still retained in the north deuterogist from that of the sister of Attila (453), Hild, the supposed sister of the Burgundian kings, was identified with the daemonic Grimhild, the sister of the mythical Nibelung brothers, and thus helped the process by which the Nibelung myth became fused with the historical story of the fall of the Burgundian kingdom. (W. A. P.)

KRILLOV (or KRILOV), IVAN ANDREEVICH (1768–1844), the great national fabulist of Russia, was born on the 14th of February 1768, at Moscow, but his early years were spent at Orenburg and Tver. His father, a distinguished military officer, died before his son was born. From 1812 to 1847 he held a commission as a lieutenant in an infantry regiment, but, together with his plays, they served to make the author known in society. For about four years (1797–1801) Krilov lived at the court of Prince Sergius Galitzin, and when the prince was appointed military governor of Livonia he accompanied him as official secretary. Of the years which follow his resignation of this post little is known, the common opinion being that he wandered from town to town under the influence of a passion for card-playing. Before long he found his place as a fabulist, the first collection of his Fables, 23 in number, appearing in 1809. From 1812 to 1847 he held a commission in the Imperial Public Library—first as assistant, and then as head of the Russian books department. He died on the 21st of November 1844. His statue in the Summer Garden is one of the finest monuments in St Petersburg.

Honours were showered upon Krilov while he yet lived: the Academy of Sciences admitted him a member in 1811, and bestowed upon him its gold medal; in 1838 a great festival was held under imperial sanction to celebrate the jubilee of his first
appearance as an author; and the emperor assigned him a handsomely paid pension. Before his death about 77,000 copies of his Fables had been sold in Russia; and his wisdom and humour had become the common possession of the many. He was at once poet and sage. His fables for the most part struck root in some actual event, and they told at once by their grip and by their beauty. Though he began as a translator and imitator he soon showed himself a master of invention, who found abundant material in the life of his native land. To the Russian ear his verses exhibit matchless quality; while word and phrase are direct, simple and eminently idiomatic, colour and cadence vary with the theme.

A collected edition of Krylov’s works appeared at St Petersburg, 1844. Of the numerous editions of his Fables, which have been often translated, may be mentioned that illustrated by Trutovsky, 1872. The author’s life has been written in Russian by Pletneff, by Lesanoff and by Grot, Liter. schriften of authors, “Krylov,” by which his life are published in vol. vi. of the Sbornik Statei of the literary department of the Academy of Sciences. W. R. S. Railston prefixed an excellent sketch to his English preserves of the Fables (1868; and ed. 1871). Another translation, by T. H. Harrison, appeared in 1883.

KRISHNA (the Dark One), an incarnation of Vishnu, or rather the form in which Vishnu himself is the most popular object of worship throughout northern India. In origin, Krishna, like Rama, was undoubtedly a delfied hero of the Kshatriya caste. In the older framework of the Mahabharata he appears as a great chieftain and ally of the Pandava brothers; and it is only in the interpolated episode of the Bhagavad-gita that he is identified with Vishnu and becomes the revealer of the doctrine of the great universe. He is the centre of the mythologies of the popular developed of the modern cult of Krishna connected with Radha, as found in the Vrishna Purana. Here he is represented as the son of a king saved from a slaughter of the innocents, brought up by a cowherd, sporting with the milkmaids, and performing miraculous feats in his childhood. The scene is laid in the neighbourhood of Muttra, on the right bank of the Jumna, where the whole country to the present day is holy ground. Another place associated with incidents of his later life is Dwarka, the westernmost point in the peninsula of Kathiawar. The two most famous preachers of Krishna-worship and founders of sects in his honour were Vallabha and Chaitanya, both born towards the close of the 15th century. The followers of the former are now found chiefly in Rajputana and Gujarat. They are known as Vallabhsachyars, and their gosains or high priests as maharajas, to whom semi-divine honours are paid. The licentious practices of this sect were exposed in a lawsuit before the high court at Bombay in 1862. Chaitanya was the Vaishnav reformer of Bengal, with his home at Nadiya. A third influential Krishna-preacher of the 19th century was Swami Narayan, who was encountered by Bhosop Heber in Gujarat, where his followers at this day are numerous and wealthy. Among the names of Krishna are Gopal, the cowherd; Gopinath, the lord of the milkmaids; and Malluranaath, the lord of Muttra. His legitimate consort was Rukmin, daughter of the king of Bera; but Radha is always associated with him in his temples. (See Hinduism.)

KRISHNAGAR, a town of British India, headquarters of Nadia district in Bengal, situated on the left bank of the river Jalangi and connected with Ranaghat, on the Eastern Bengal railway, by a light railway. Pop. (1901), 24,547. It is the residence of the raja of Nadia and contains a government college. Coloured clay figures are manufactured.

KRISTIANSTAD (Christianstad), a port of Sweden, chief town of the district (län) of Kristianstad, on a peninsula in Lake Sjövik, an expansion of the river Helge, 10 m. from the Baltic. Pop. (1900), 10,318. Its harbour, custom-house, &c., are at Ähus at the mouth of the river. It is among the first twelve manufacturing towns of Sweden as regards value of output, having engineering works, flour-mills, distilleries, weaving mills and sugar factories. Granite and wood-pulp are exported, and coal and grain imported. The town is the seat of the district court of appeal for the provinces of Skane and Blekinge. It was founded and fortified in 1614 by Christian IV. of Denmark, who built the fine ornate church. The town was ceded to Sweden in 1658, retaken by Christian V. in 1676, and again acquired by Sweden in 1678.

KRIVOV ROG, a town of south Russia, in the government of Kherson, on the Inulets River, near the station of the same name on the Ekaterinoslav railway, 115 m. S.W. of the city of Ekaterinoslav. Pop. (1900), about 10,000. It is the centre of a district very rich in minerals, obtained from a narrow stretch of crystalline schists underlaying the Tertiary deposits. Iron ores (60 to 70% of iron), copper ores, colours, brown coal, graphite, slate, and lithographic stone are obtained—nearly 2,000,000 tons of iron ore annually.

KRUCHMAL, NAHMAN (1783-1840), Jewish scholar, was born at Brody in Galicia in 1783. He was one of the pioneers in the revival of Jewish learning which followed on the age of Moses Mendelssohn. His chief work was the Moreh Neboche ha-hazon ("Guide for the Perplexed of the Age"), a title imitated from that of the 12th-century "Guide for the Perplexed" of Solomon ibn Gabirol. This work was not published till after the author's death, when it was edited by Zunz (1851). The book is a philosophy of Jewish history, and has a double importance. On the one side it was a critical examination of the Rabbinic literature and much influenced subsequent investigators. On the other side, Kruchmal, in the words of N. Slouschz, "was the first Jewish scholar who views Judaism, not as a distinct and independent entity, but as a part of the whole of civilization." Kruchmal, under Hegelian influences, regarded the nationality of Israel as consisting in its religious genius, its spiritual gifts. Kruchmal held the idea of the mission of the Jewish people, "cultural Zionism" as it has more recently been termed. He died at Tarnopol in 1840.

KRONENBERG, a town of Germany in the Prussian Rhine Province, 6 m. S.W. from Elberfeld, with which it is connected by railway and by an electric tramway line. Pop. (1905), 11,340. It is a scattered community, consisting of an agglomeration of seventy-three different hamlets. It has a Roman Catholic and two Protestant churches, a handsome modern town-hall and considerable industries consisting mainly of steel and iron manufactures.

KRONSTADT, a strongly fortified seaport town of Russia, the chief naval station of the Russian fleet in the northern seas, and the seat of the Russian admiralty. Pop. (1867), 45,115; (1897), 59,530. It is situated on the island of Kotlin, near the head of the Gulf of Finland, 20 m. W. of St Petersburg, of which it is the chief port, in 59° 50’ N. and 29° 46’ 30” E. Kronstadt, always strong, has been thoroughly refortified on modern principles. The old "three-decker" forts, five in number, which formerly constituted the principal defences of the place, and defended the Anglo-French fleets during the Crimean War, are now of secondary importance. From the plans of Todeleben a new fort, Constantine, and four batteries were constructed (1856-1871) to defend the principal approach, and seven batteries to cover the shallower northern channel. All these modern fortifications are low and thickly armoured earthworks, powerfully armed with heavy Krupp guns in turrets. The town itself is surrounded with an encintas. The island of Kotlin, or Kettle (Finn., Retusari, or Rat Island) in general outline forms an elongated triangle, 2½ m. in length by about 1 m. in breadth, with its base towards St Petersburg. The eastern or broad end is occupied by the town of Kronstadt, and shoals extend for a mile and a half from the western point of the island to the rock on which the Tolbakan lighthouse is built. The island thus divides the seaward approach to St Petersburg into two channels; that on the northern side is obstructed by shoals which extend across it from Kotlin to Liisyns on the Finnish mainland, and is only passable by vessels drawing less than 15 ft. of water; the southern channel, the highway to the capital, is narrowed by a spit which projects from
opposite Oranienbaum on the Russian mainland, and, lying close to Kronstadt, has been strongly guarded by batteries. The approach to the capital has been greatly facilitated by the construction in 1875–1885 of a canal, 23 ft. deep, through the shallows at the mouth of the railroad which is level ground and is thus exposed to inundations, from one of which it suffered in 1824. On the south side of the town there are three harbours—the large western or merchant harbour, the western flank of which is formed by a large mole joining the fortifications which traverse the breadth of the island on this side; the middle harbour, used chiefly for fitting out and repairing vessels; and the eastern or war harbour for vessels of the Russian navy. The Peter and Catherine canals, communicating with the merchant and middle harbours, traverse the town. Between them stood the old Italian palace of Prince Menshikov, the site of which is now occupied by the pilot school. Among other public buildings are the naval hospital, the British seaman’s hospital (established in 1867), the civic hospital, admiralty (founded 1785), arsenal, dockyards and foundries, school of marine engineering, the cathedral of St Andrew, and the English church. The port is ice-bound for 140 to 160 days in the year, from the beginning of December till April. A very large proportion of the inhabitants are sailors, and large numbers of artisans are employed in the dockyards. Kronstadt was founded in 1710 by Peter the Great, who took the island of Krons from the Swedes in 1723, when the first fortifications were constructed. (P. A. K.; J. T. Br.)

**KROONSTAD**, a town of Orange River Colony, 127 m. by rail N.E. of Bloemfontein and 130 m. S.W. of Johannesburg. Pop. (1904), 7191, of whom 3708 were whites. Kronstadt lies 448 ft. above the sea and is built on the banks of the Vaal River, a perennial tributary of the Vaal. It is a busy town, being the centre of a rich agricultural district and of the diamond and coal-mining industry of the north-western parts of the colony. It is also a favourite residential place and resort for the more prosperous residents of the Transvaal. It enjoys a warm climate, affords opportunities for boating rare in South Africa, and boasts a golf-links. The principal building is the Dutch Reformed church in the centre of the market square.

On the capture of Bloemfontein by the British during the Anglo-Boer War of 1899–1902 Kronstadt was chosen by the Orange Free State Boers as the capital of the state, a dignity it held from the 13th of March to the 11th of May 1900. On the following day the town was occupied by Lord Roberts. The linking of the town in 1906 with the Natal system made the route via Kronstadt the shortest route to the Cape Town and Durban. Another line goes N.W. from Kronstadt to Klerksdorp, passing (17 miles) the Laco diamond mine and (45 miles) the coal mines at Vierfontein.

**KROPOTKIN, PETER ALEXEIVICH**, Prince (1842— ), Russian geographer, author and revolutionary, was born at Moscow in 1842. His father, Prince Alexei Petrovich Kropotkin, belonged to the old Russian nobility; his mother, the daughter of a general in the Russian army, had remarkable literary and liberal tastes. At the age of fifteen Prince Peter Kropotkin, who had been designed by his father for the army, entered the Corps of Pages at St Petersburg (1857). Only a hundred and fifty boys—mostly children of the nobility belonging to the court—were educated in this privileged corps, which combined the character of a military school endowed with special rights and of a Court institution attached to the imperial household. Here he remained till 1862, reading widely on his own account, and giving special attention to the works of the French encyclopaedists and to modern French history. Before he left Moscow Prince Kropotkin had developed an interest in the condition of the Russian peasant, and this interest increased as he grew older. The years 1857–1861 witnessed a rich growth in the intellectual forces of Russia, and Kropotkin came under the influence of the new Liberal-revolutionary literature, which indeed largely expressed his own aspirations. In 1862 he was promoted from the Corps of Pages to the army. The members of the corps had the prescriptive right of choosing the regiment to which they would be attached. Kropotkin had never wished for a military career, but, as he had not the means to enter the St Petersburg University, he elected to join a Siberian Cossack regiment in the recently annexed Amur district, where there were prospects of administrative work. For some time he was aide de camp to the governor of Transbaikalia at Chita, subsequently being appointed attaché for Cossack affairs to the governor-general of East Siberia at Irkutsk. Opportunities for administrative work, however, were scanty, and in 1864 Kropotkin accepted charge of a geographical survey expedition, crossing North Manchuria from Transbaikalia to the Amur, and shortly afterwards was attached to another expedition which proceeded up the Sungari River into the heart of Manchuria. Both these expeditions yielded most valuable geographical results. The impossibility of obtaining any astute administrative reforms in Siberia, induced Kropotkin to devote himself almost entirely to scientific exploration, in which he continued to be highly successful. In 1867 he quitted the army and returned to St Petersburg, where he entered the university, becoming at the same time secretary to the physical geography section of the Russian Geographical Society. In 1873 he published an important contribution to science, a map and paper in which he proved that the existing maps of Asia entirely misrepresented the physical formation of the country, the main structural lines being in fact from south-west to north-east, not from north to south, or from east to west as had been subsequently supposed. In 1875 he explored the glacial deposits of Finland and Sweden for the Russian Geographical Society, and while engaged in this work was offered the secretarialty of that society. But by this time he had determined that it was his duty not to work at fresh discoveries but to aid in diffusing existing knowledge among the people at large, and he accordingly refused the offer, and returned to St Petersburg, where he joined the revolutionary party. In 1872 he visited Switzerland, and became a member of the International Workingmen's Association at Geneva. The socialism of that time had been thoroughly advanced through Kropotkin's writings, and after studying the programme of the more violent Jura Federation at Neuchâtel and spending some time in the company of the leading members, he definitely adopted the creed of anarchism (q.v.) and, on returning to Russia, took an active part in spreading the nihilist propaganda. In 1874 he was arrested and imprisoned, but escaped in 1876 and went to England, removing after a short stay to Switzerland, where he joined the Jura Federation. In 1877 he went to Paris, where he helped to start the socialist movement, returning to Switzerland in 1878, where he contributed for the Jura Federation a revolutionary newspaper, Le Révolutionnaire, which was subsequently suppressed. In 1881 he explored Siberia, and in 1882 he wrote his programme of the more violent Jura Federation at Neuchâtel. He was arrested in Switzerland in 1885, and after a short stay at Thonon (Savoy) went to London, where he remained for nearly a year, returning to Thonon towards the end of 1882. Shortly afterwards he was arrested by the French government, and, after a trial at Lyons, sentenced by a police-court magistrate (under a special law passed on the fall of the Commune) to five years' imprisonment, on the ground that he had belonged to the International Workingmen's Association. He escaped in 1886 however, as the result of repeated agitation on his behalf in the French Chamber, he was released, and settled near London.

Prince Kropotkin's authority as a writer on Russia is universally acknowledged, and he has contributed largely to the *Encyclopædia Britannica*. Among his other works he may be named *Paroles d'un révolté* (1884); *La Conquête du pain* (1888); *L'Anarchie: sa philosophie, son idéal* (1893); *The State, its Part in History* (1898); *Fields, Factories and Workshpots* (1899); *Memoirs of a Revolutionist* (1900); *Mutual Aid, a Factor of Evolution* (1902); *Modern Science and Anarchism* (Philadelphia, 1903); *The Destication of Asia* (1904); *The Geography of Asia* (1904); and *Russian Literature* (1903).
and a steam brewery, and carries on trade in grain and seeds. The castle of Krüdener is the chief place of a mediatized principality which was formed in 1819 out of the domains of the Prussian crown and was granted to the prince of Thurn and Taxis in compensation for the relinquishment by him of the monopoly of the Prussian postal system, formerly held by his family.

**KRÜDENER, BARBARA JULIANA, BARONESS VON (1764–1824), Russian religious mystic and author, was born at Riga in Livonia on the 11th of November 1764. Her father, Otto Hermann von Vietinghoff, who had fought as a colonel in Catherine II.'s wars, was one of the two councillors for Livonia and a man of immense wealth; her mother, née Countess Anna Ulrike von Müllnich, was a great-granddaughter of the colonel's religious and decorated field marshal. Juliana, as she was usually called, was one of a numerous family. Her education, according to her own account, consisted of lessons in French spelling, deportment and sewing; and at the age of eighteen (Sept 29, 1782) she was married to Baron Burckhard Alexis Constantin von Krüdener, a widower sixteen years her senior. The baron, a diplomatist of distinction, was cold and reserved; the baroness was frivolous, pleasure-loving, and possessed of an insatiable thirst for attention and flattery; and the strained relations due to this incompatibility of temperament were very distressing to the helpless character which constantly involved herself and her husband in financial difficulties. At first indeed all went well. On the 31st of January 1784 a son was born to them, named Paul after the grand-duke Paul (afterwards emperor), who acted as godfather. The same year Baron Krüdener became ambassador at Venice, where her husband went in 1786 to transferred to Copenhagen in 1786.

In 1787 the birth of a daughter (Juliette) aggravated the nervous disorders from which the baroness had for some time been suffering, and it was decided that she must go to the south for her health; she accordingly left, with her infant daughter and her step-daughter Sophie. In 1788 she was at Paris when the states general met; a year later, at Montpellier, she met a young cavalry captain, Charles Louis de Fréville, and a passionate attachment sprang up between them. They returned together to Copenhagen, where the baroness told her husband that her heart could no longer be his. The baron was coldly kind; he refused to hear of a divorce and attempted to arrange a modus vivendi, which was facilitated by the departure of de Fréville for the war. All was useless; Juliana refused to remain at Copenhagen, and, setting out on her travels, visited Riga, St. Petersburg, Berlin, Leipzig and Switzerland. In 1798 her husband became ambassador at Berlin, and she joined him there. But the stiff court society of Prussia was irksome to her; money difficulties continued; and by way of climax, the murder of the tsar Paul, in whose favour Baron Krüdener had stood high, made the position of the ambassador extremely precarious. The baroness seized the occasion to leave for the baths of Teplitz, whence she wrote to her husband that the doctors had ordered her to winter in the south. He died on the 14th of June 1802, without ever having seen her again.

Meanwhile the baroness had been revelling in the intellectual society of Coppel and of Paris. She was now thirty-six; her charms were fading, but her passion for admiration survived. She had tried the effect of the shawl dance, in imitation of Emma, Lady Hamilton; she now sought fame in literature, and in 1803, after consulting Chateaubriand and other writers of distinction, published her Valérie, a sentimental romance, of which under a thin veil of anonymity she herself was the heroine. In January 1804 she returned to Livonia.

At Riga occurred her conversion. "A gentleman of her acquaintance when about to saddle her horse fell dying at her feet. The shock so overpowered her not too well balanced mind; she sought for consolation, and found it in the ministrations of her shoemaker, an ardent disciple of the Moravian Brethren. Though she had "found peace," however, the disorder of her nerves continued,

1 A portrait of Madame de Krüdener and her son as "Venus disarming Cupid," by Angelica Kauffmann, of this period, is in the Louvre.

2 He died while she was there in 1792.

and she was ordered by her doctor to the baths of Wiesbaden. At Königsberg she had an interview with Queen Louise, and, more important still, with one Adam Miller, a rough peasant, to whom the Lord had revealed a prophetic mission to King Frederick William III. "Chiliasm" was in the air. Napoleon was evidently Antichrist; and the "latter days" were about to be accomplished. Under the influence of the pietistic movement the belief was widely spread, in royal courts, in country parsonages, in peasants' hovels: a man would be raised up "from the north . . . from the rising of the sun" (Isa. xli. 25); Antichrist would be overthrown, and Christ would come to reign a thousand years upon the earth. The interview determined the direction of Madame Lichtenthal, Kruener's religious grandmother, and the Moravians at Herhenhout followed; then she went, via Dresden, to Karlsruhe, to sit at the feet of Heinrich Jung-Stilling (q.v.), the high priest of occultist pietism, whose influence was supreme at the court of Baden and infected those of Stockholm and St Petersburg. By him she was instructed in the chilastic faith and in the mysteries of the supernatural world. Then, hearing that a certain pastor in the Voges, Jean Frédéric Fontaines, was prophesying and working miracles, she determined to go to him. On the 5th of June 1803, accordingly, she arrived at the half-charlatan parsonage of Sainte Marie-aux-Mines, accompanied by her daughter Juliette, her step-daughter Sophie and a Russian valet.

This remained for two years her headquarters. Fontaines, half-charlatan, half-dupe, had introduced into his household a prophetess named Marie Gottliebin Kummer, whose visions, carefully calculated for her own purposes, became the oracle of the divine mysteries for the baroness. Under this influence she believed more firmly than ever in the approaching millennium and her own mission to proclaim it. Her rank, her reckless charities, and her exuberant eloquence produced a great effect on the simple country folk; and when, in 1806, it was decided to found a colony of the "elect" in order to wait for "the coming of the Lord," many wretched peasants sold or distributed all they possessed and followed the baroness and Fontaines into Württemberg, where the settlement was established at Catharinen-plaisir and the château of Bönningheim, only to be dispersed (May 1) by an unsympathetic government. Further wanderings followed: to Lichtenthal near Baden; to Karlsruhe and the congenial society of pietistic princesses; to Riga, where she was present at the deathbed of her mother (Jan. 24, 1811); and finally in 1812, she moved to Karlsruhe. The influence of the baroness in her household, as long as the baroness's funds lasted, had now waned, and she had fallen under that of Johann Kaspar Wegelin (1766–1833), a pious linen-dyer of Strassburg, who taught her the sweetness of "complete annihilation of the will and mystic death." Her preaching and her indiscriminate charities now began to attract curious crowds from afar; and her appearance everywhere was accompanied by an epidemic of visions and prophecies, which culminated in the appearance in 1811 of the comet, a sure sign of the approaching end. In 1812 she was at Strassburg, whence she paid more than one visit to J. F. Oberlin (q.v.), the famous pastor of Waldbach in Steinthal (Ban de la Roche), and where she had the glory of converting her host, Adrien de Lazay-Marnesia, the prefect. In 1813 she was at Geneva, where she established the faith of a band of young pietists in revolt against the Calvinist Church authorities—notably Henri Louis Empeytaz, afterwards destined to be the companion of her crowning evangelistic triumph. In September 1814 she was again at Waldbach, where Empeytaz joined her; she then moved back to Karlsruhe. The influence of the baroness had waned, where the party was

3 The consorts of Alexander I. of Russia and of Gustavus Adolphus IV. of Sweden were princesses of Baden.

4 She had been condemned some years previously in Württemberg to the pillory and three years' imprisonment as a "swindler" on her own confession. Her curious history is given in detail by M. Muhlenbeck.

5 In 1808 it was obviously inconvenient to have people proclaiming Napoleon as "the Beast."
Juliette. At the end of the year she returned with her daughters and Empeytaz to Baden, a fateful migration.

The empress Elizabeth of Russia was now at Karlsruhe; and she and the pietist ladies of her entourage hoped that the emperor Alexander might find at the hands of Madame de Krüdener the peace which an interview with Jung-Stilling had failed to bring him. The baroness herself wrote urgent letters to Roxane de Stourdza, sister of the tsar's Russian secretary, begging her to procure an interview. There seemed to be no result; but the correspondence paved the way for the opportunity which a strange chance was to give her of realizing her ambition. In the spring of 1815 the baroness was settled at Schlüchttern, a piece of Baden territory enclavé in Württemberg, busy persuading the peasants to sell all and by from the wrath to come. Near this, at Hellbronn, the emperor Alexander established his headquarters on the 4th of June. That very night the baroness sought and obtained an interview. To the tsar, who had been brooding alone over an open Bible, her sudden arrival seemed an answer to his prayers; for three hours the prophetic preached her strange gospel, while the most powerful man in Europe sat, his face buried in his hands, sobbing like a child; until at last he declared that he had "found peace." At the tsar's request she followed him to Heidelberg and later to Paris, where she was lodged at the Hotel Montchenu, next door to the imperial headquarters in the Elysée Palace. A private door connected the establishments, and every evening the emperor went to take part in the prayer-meetings conducted by the baroness and Empeytaz. Believing himself perceived an end to his troubles, the tsar determined to bring the high councils of Europe, and the baroness von Krüdener had become a political force to be reckoned with. Admission to her religious gatherings was sought by a crowd of people celebrated in the intellectual and social world; Chateaubriand came, and Benjamin Constant, Madame Récamier, the duchesse de Bourbon, and Madame de Duras. The fame of the wonderful conversion, moreover, attracted other members of the chiliasmatic fraternity, among them Fontaines, who brought with him the prophetess Marie Kummer.

In this religious fornication house the idea of the Holy Alliance germinated and grew to rapid maturity. On the 26th of September the portentous proclamation, which was to herald the opening of a new age of peace and goodwill on earth, was signed by the sovereigns of Russia, Austria and Prussia (see Holy Alliance; and Europe: History). Its authorship has ever been a matter of dispute. Madame de Krüdener herself claimed that she had suggested the idea, and that Alexander had submitted the draft for her approval. This is probably correct, though the tsar, later, when he had recovered his mental equilibrium, reproved her for her indiscretion in talking of the matter. His eyes, indeed, had been on the tsar before he left Paris, and Marie Kummer was the unintentional cause. At the very first sané the prophetess, whose revelations had been praised by the baroness in extravagant terms, had the evil inspiration to announce in her trance to the emperor that it was God's will that she should endow the religious colony to which she belonged! Alexander merely remarked that he had received too many such revelations before to be impressed. The baroness's influence was shaken but not destroyed, and before he left Paris Alexander gave her a passport to Russia. She was not, however, destined to see him again.

She left Paris on the 22nd of October 1815, intending to travel to St Petersburg by way of Switzerland. The tsar, however, offended by her indiscretions and sensible of the ridicule which his relations with her had brought upon him, showed little disposition to hurry her arrival. She remained in Switzerland, where she presently fell under the influence of an unscrupulous adventurer named J. G. Kellner. For months Empeytaz, an honest enthusiast, struggled to save her from this man's clutches, but in vain. Kellner too well knew how to flatter the baroness's inmost vanity. For years the author of the Holy Alliance could be none other than the "woman clothed with the sun" of Rev. xii. 1. She wandered with Kellner from place to place, proclaiming her mission, working miracles, persuading her converts to sell all and follow her. Crowds of beggars and rascals of every description gathered wherever she went, supported by the charities squandered from the common fund. She became a mouth from the intrinsic value of his work, it is admitted, that it had the effect of promoting the study of philosophy and of stimulating freedom of thought in religion and politics. His principal works are: Briefe über den neuesten Idealismus
KRUGER

(1801): Versuch über die Principien der philosophischen Erkenntnis (1801); Fundamentalphilosophie (1803); System der theoretischen Philosophie (1806-1810), System der praktischen Philosophie (1817-1819); Handbuch der Philosophie (1820; 3rd ed., 1828); Logik oder Denklehre (1827); Geschichte der Philos. alter Zeit (1815; 2nd ed., 1825); Allgemeines Handwörterbuch der philosophischen Wissenschaften (1827-1834; 2nd ed., 1832-1838); Universal-philosophische Vorlesungen für Gebilde beiderlei Geschlechts. His work Beiträge zur Geschichte der Philos. des XIX. Jahrh. (1835-1837) contains interesting criticisms of Hegel and Schelling.

See also his autobiography, Meine Lebensreise (Leipzig, 2nd ed., 1840).

KRUGER, STEPHANUS JAN HENDRICK (1825-1904), president of the Transvaal Republic, was born in Colesberg, Cape Colony, on the 20th of October 1825. His father was Caspar Jan Hendrick Kruger, who was born in 1796, and whose wife bore the name of Steyn. In his ancestry on both sides occur Huguenot names. The founder of the Kruger family appears to have been a German named Jacob Kruger, who in 1713 was sent with others by the Dutch East India Company to the Cape. As he was a townswoman he was known—accompanied his parents in the migration, known as the Great Trek, from the Cape Colony to the territories north of the Orange in the years 1835-1840. From boyhood his life was one of adventure. Brought up on the borderland between civilization and barbarism, constantly trekking, fighting and hunting, his education was necessarily of the most primitive character. He learnt to read and to write, and was taught the narrowest form of Dutch Presbyterianism. His literature was almost confined to the Bible, and the Old Testament was preferred to the New. It is related of Kruger, as indeed it has been said of Piet Retief and others of the early Boer leaders, that he believed himself the object of special Divine guidance. At about the age of twenty-five he is said to have disappeared into the veldt, where he remained alone for several days, under the influence of deep religious fervour. During this sojourn in the wilderness Kruger stated that he had been especially favoured by God, who had communed with and inspired him. Throughout his life he professed this faith in God's will and guidance, and much of his influence over his followers is attributable to their belief in his sincerity and in his enjoyment of Divine favour. At the age of ten Paul Kruger—then he was—twenty-eight, according to the best information which has been found, was an intimate associate of God's free agent in the Transvaal, pervaded by a spirit and faith not unlike those which distinguished the Covenanters, was divided in the early days into three sects. Of these the narrowest, most puritanical, and most bigoted was the Dopper sect, to which Kruger belonged. His Dopper following was always unserving in its support, and at all critical times in the internal quarrels of the state rallied round him. The charge of hypocrisy, frequently made against Kruger—if by this charge is meant the mere juggling with religion for purely political ends—does not appear entirely just. The subdivision of reason to a sense of the fanaticism is the keynote of his character, and largely the explanation of his life. Where faith is so profound as to believe the Divine guidance all, and the individual intelligence nil, a man is able to persuade himself that any course he chooses to take is the one he is directed to take. Where bigotry is so blind, reason is but dust in the balance. At the same time there were incidents in Kruger's life which but ill conform to any Biblical standard he might choose to adopt or feel imposed upon him. Even van Oort, his eloquent historian and apologist, is cognisant of this fact.

When the lad, who had already taken part in fights with the Matabele and the Zulus, was fourteen his family settled north of the Vaal and were among the founders of the Transvaal state. At the age of seventeen Paul found himself an assistant field cornet, at twenty he was field cornet, and at twenty-seven held a command in an expedition against the Bechuanaland chief Sechele—the expedition in which David Livingstone's mission-house was destroyed.

In 1853 he took part in another expedition against Montsioa. When not fighting natives in those early days Kruger was engaged in distant hunting excursions which took him as far north as the Zambezi. In 1852 the Transvaal secured the recognition of its independence from Great Britain in the Sand River convention. For many years after this date the condition of the country was one bordering upon anarchy, and into this situation he was an almost continual go-between in pursuance of the interests of his country. In 1856-1857 he joined M.W. Pretorius in his attempts to abolish the district governments in the Transvaal and to overthrow the Orange Free State government and compel a federation between the two countries. The raid into the Free State failed; the Orange Free State was saved by the Kaffir attempt of the Pretorius and Kruger party to induce the Basuto to harass the Free State forces behind, while they were attacking them in front.

From this time forward Kruger's life is so intimately bound up with the history of his country, and even in later years of South Africa, that a study of that history is essential to an understanding of it (see Transvaal and South Africa). In 1864, when the faction fighting ended and Pretorius was president, Kruger was elected commandant-general of the forces of the Transvaal. In 1870 a boundary dispute arose with the British. The faction of which he was a prominent member was chiefly responsible for bringing about that impression in the government of the country which drew such bitter protest from Burgers and terminated in the annexation by the British in April 1877. At this period of Transvaal history it is impossible to trace any true patriotism in the action of the majority of the inhabitants. The one idea of Kruger and his faction was to oust Burgers from office on any pretext, and, if possible, to put Kruger in his place. When the downfall of Burgers was assured and annexation offered itself as the alternative resulting from his downfall, it is true that Kruger opposed it. But matters had gone too far. In 1877 annexation became an accomplished fact, and Kruger accepted paid office under the British government. He continued, however, so openly to agitate for the retrocession of the country, being a member of two deputations which went to England endeavouring to get the annexation annulled, that in 1878 Sir Theophilus Shepstone, the British administrator, dismissed him from his service. In 1880 the Boer rebellion occurred, and Kruger was one of the famous triumvirs, of which General Piet Joubert and Pretorius were two of the members, who, after Majuba, negotiated the terms of peace on which the Pretoria convention of August 1881 was drafted. In 1883 he was elected president of the Transvaal, receiving 3,431 votes as against 1,171 recorded for Joubert.

In November 1883 President Kruger again visited England, this time for the purpose of getting another convention. The visit was successful, the London convention, which for years was a subject of controversy, being granted by Lord Derby in 1884 on behalf of the British government. The convention of the Transvaal being once more in the hands of the Boers, the country rapidly drifted towards that state of national bankruptcy from which it had only been saved by annexation in 1877. In 1886, the year in which the Rand mines were discovered, Pretorius, the President, was by no means a popular man even among his own followers: as an administrator of internal affairs he had shown himself grossly incompetent, and it was only the specious success of his negotiations with the British government which had retained him any measure of support. In 1888 he was elected president for a second term of office. In 1889 Dr. Leyds, a young Helderlander, was appointed state secretary, and the system of state monopolies around which so much corruption grew up was soon
in full course of development. The principle of government monopoly in trade being thus established, President Kruger now turned his attention to the further securing of Boer political monopoly. The Uitlanders were increasing in numbers, as well as providing the state with a revenue. In 1890, 1891, 1892, and 1894 the franchise laws (which at the time of the convention were on a liberal basis) were so modified that all Uitlanders were practically excluded altogether. In 1893 Kruger had to face a third presidential election, and of the Uitlander the opposition he had raised among the burguers, largely by the favouritism he displayed to the Hollander party, was so strong that it was fully anticipated that his more liberal opponents, General Joubert, would be elected. Before the election was decided Kruger took care to conciliate the volksraad members, as well as to see that at all the volksraad elections, which occurred shortly before the presidential election, his supporters were returned, or, if not returned, that his opponents were objected to on some trivial pretext, and by this means prevented from actually sitting in the volksraad until the presidential election was over. The Hollander and concessionnaire influence, which had become a strong power in the state, was all in favour of President Kruger.

In spite of these facts Kruger's position was insecure. "General Joubert was, without any doubt whatever, elected by a very considerable majority,"1 but the figures as announced gave Kruger a majority of about 700 votes. General Joubert accused the government of tampering with the returns, and appealed to the volksraad. The appeal, however, was fruitless, and Kruger retained office. The action taken by President Kruger at this election, and his previous actions in ousting President Burgers, was absolutely excluding the Uitlanders from the franchise, all show that at any cost, in his opinion, the government must remain a close corporation, and that while he lived he must remain at the head of it.

From 1877 onward Kruger's external policy was consistently anti-British, and on every side—in Bechuanaland, in Rhodesia, in Zululand—he attempted to enlarge the frontiers of the Transvaal at the expense of Great Britain. In these disputes he usually gained something, and it was not until 1895 that he was definitely defeated in his endeavours to obtain a seaport. His internal policy was blind, reckless and unscrupulous, and inevitably excluding the Uitlanders, all show that at any cost, in his opinion, the government must remain a close corporation, and that while he lived he must remain at the head of it.

In 1886 Kruger was elected president of the Transvaal for the fourth and last time. In 1896 relations between the Transvaal and Great Britain had become so strained, by reason of the oppression of the foreign population, that a conference was arranged at Bloemfontein between Sir Alfred (afterwards Lord) Milner, the high commissioner, and President Kruger. Kruger was true to his principles. At every juncture in his life his object had been to gain for himself and his own narrow policy everything that he could, while the Uitlanders were being made to suffer. It was for this reason that he invariably failed to come to any arrangement with Sir John Brand while the latter was president of the Free State. In 1889, the very year following President Brand's death, he was able to make a treaty with President Reitz, his successor, which bound each of the Boer republics to assist the other in case its independence was menaced, unless the quarrel could be shown to be an unjust one on the part of the state so menaced. In effect it bound the Free State to share all the dangerous risk of the reckless anti-British Transvaal policy, without the Free State itself receiving anything in return. Kruger thus achieved one of the objects of his life. With such a history of apparent success, it is not to be wondered at that the Transvaal president came to Bloemfontein to meet Sir Alfred Milner in no mood for concession. It is true that he made an ostensible offer on the franchise question, but that proposal was made dependent on so many conditions that it was a palpable sham. Every proposition which Sir Alfred made to the Transvaal in the way of concession was met by the Transvaal's demand that the independence of the Transvaal be guaranteed. The retort was that the Transvaal's rallying cry whenever he found himself in the least degree pressed, either from within or without the state. To admit Uitlanders to the franchise, to no matter how moderate a degree, would destroy the independence of the state. In October 1899, after a long and fruitless correspondence with the British government, war with Great Britain was ushered in by an ultimatum from the Transvaal. Immediately after the ultimatum Natal and the Cape Colony were invaded by the Boers both of the Transvaal and the Free State. Yet one of the most memorable utterances made by Kruger at the Bloemfontein conference was couched in the following terms: "We follow out what God says, 'Accursed be he that removeth his neighbour's landmark.' As long as your Excellency lives you will see that we shall never be the attacking party on another man's land."

The course of the war that followed is described under TRANSVAAL. In 1900, Bloemfontein and Pretoria having been occupied by British troops, Kruger, too old to go on commando, with the consent of his executive proceeded to Europe, where he endeavoured to induce the European powers to intervene on his behalf, but without success.

From this time he ceased to have any political influence. He took up his residence at Utrecht, where he dictated a record of his career, published in 1902 under the title of The Memoirs of Paul Kruger. He died on the 14th of July 1904 at Clarens, near Veyon, on the shores of the Lake of Geneva, whither he had gone for the sake of his health. He was buried at Pretoria on the following 16th of December, Dingaan's Day, the anniversary of the day in 1838 when the Boers crushed the Zulu king Dingaan—a fight in which Kruger, then a lad of thirteen, had taken part. Kruger was thrice married, and had a large family. When he went to Europe he left his third wife in Lord Robert's custody at Pretoria, but she gradually failed, and died there (July 1901). It was in her grave that the body of her husband was laid. It is recorded that when a statue to President Kruger at Pretoria was erected, it was by Mrs. Kruger's wish that the hat was left open at the top, in order that the rain-water might collect there for the birds to drink.

See J. E. van Oordt, P. Kruger en de ophoombd d. Zuid-Afrikaansche Republiek (Amsterdam, 1898); the Memoirs already mentioned; F. R. Stattham, Paul Kruger and his Times (1898); and, among works with a wider scope, G. M. Thiel, History of South Africa (for events down to 1872 only); Sir J. P. Fitzpatrick, The Transvaal from Wilkin (1899); The Times History of the War in South Africa (1900-9); and A. P. Hillier, South African Studies (1900).

1 Sir Percy Fitzpatrick, in The Transvaal from Witkin, ch. iii.
was restored by the British authorities. It was at Doornkop, near Krugersdorp, that Dr L. S. Jameson and his "raiders" surrendered to Commandant Piet Cronje on the 2nd of January 1896 (see Transvaal: History). At Sterksfontein, 8 m. N.W. of Krugersdorp, are limestone caves containing beautiful stalactites.

**KRUMAU** is a town in Bohemia situated on the banks of the Moldau (Vitava). It has about 8000 inhabitants, partly of Czech, partly of German nationality. Krumau is principally celebrated because its ancient castle was long the stronghold of the Rosenberg family, known also as pani z ruse, the lords of the rose. Henry II. of Rosenberg (d. 1310) was the first member of the family to reside at Krumau. His son Peter I. (d. 1349) raised the place to the rank of a city. The last two members of the family were two brothers, William, created prince of Ursini-Rosenberg in 1556 (d. 1592), and Peter Vok, who played a very large part in Bohemian history. His librarian was Wenceslas Brezan, who has left a valuable work on the annals of the Rosenberg family. Peter Vok of Rosenberg, a strong adherent of the Utraquist party, sold Krumau shortly before his death (1611), because the Jesuits had established themselves in the neighbourhood.

The lordship, one of the most extensive in the monarchy, was bought by the emperor Rudolph II. for his natural son, Julius of Austria. In 1622 the emperor presented the lordship to his minister, Hans Ulrich von Eggensberg, and in 1625 raised it to the rank of an hereditary duchy in his favour. From the Eggensberg family Krumau passed in 1719 to Prince Adam Franz Karl of Schwarzenberg, who was created duke of Krumau in 1723. The head of the Schwarzenberg family bears the title of duke of Krumau. The castle, one of the largest and finest in Bohemia, preserves much of its ancient character.

See W. Brezan, Zivot Vilena z Rosenberga (Life of William of Rosenberg), 1847; also Zivot Petra Voka z Rosenberga (Life of Peter Vok of Rosenberg), 1880.

**KRUMBACHER, CARL** (1856-1900), German Byzantine scholar, was born at Kürnach in Bavaria on the 23rd of September 1856. He was educated at the universities of Munich and Leipzig, and held the professorship of the middle age and modern Greek language and literature in the former from 1897 to his death. His greatest work is his Geschichte der byzantinischen Literatur (from Justinian to the fall of the Eastern Empire, 1453), a second edition of which was published in 1897, with the collaboration of A. Ehrhard (section on theology) and H. Gelzer (general sketch of Byzantine history, A.D. 395-1453). The value of the work is greatly enhanced by the elaborate bibliographies contained in the body of the work and in a special supplement. Krumbacher also founded the Byzantinische Zeitschrift (1892) and the Byzantinisches Archiv (1898). He travelled extensively and the results of a journey to Greece appeared in his Griechische Reise (1886). Other works by him are: *Casia* (1867), a treatise on a 9th-century Byzantine poetess, with the fragments; *Michael Glykas* (1894); "Die griechische Literatur des Mittelalters" in P. Hinneberg's *Die Kultur der Gegenwart, i.* 8 (1905); *Das Problem der nephridienlosen Fauna der des Nephridienlosen Fauna der Welt* (1902), in which he strongly opposed the efforts of the purists to introduce the classical style into modern Greek literature, and *Pepudre Aufsätze* (1909).

**KRUMAN** (Kromoen, Krooboyos, Krus, or Croos), a negro people of the West Coast of Africa. They dwell in villages scattered along the coast of Liberia from below Monrovia nearly to Cape Palmas. The name has been wrongly derived from the English word "crew," with reference to the fact that Krumen were the first West African people to take service in European vessels. It is probably from the Dutch name of one of the tribes. Under Krumen are now grouped many kindred tribes, the Grebo, Bassa, Nifu, &c., who collectively number some 40,000. The Krus proper live in the narrow strip of coast between the Sino river and Cape Palmas, where are their five chief villages, Kruber, Little Krue, Settra Krue, Nana Krue and King William's Town. They are traditionally from the interior, but have long been noted as skilful seamen and daring fishermen. They are a stout, muscular, broad-chested race, probably the most robust of African peoples. They have true negro features—skin of a blue-black hue and woolly and abundant hair. They are lighter skinned than negro women generally, and in several respects come much nearer to a European standard. Morally as well as physically the Krumen are one of the most remarkable races in Africa. They are honest, brave, proud, so passionately fond of freedom that they will starve or drown themselves to escape capture, and have never trafficked in slaves. Politically the Krus are divided into small commonwealths, each with an hereditary chief whose duty is simply to represent the people in their dealings with strangers. The real government is vested in the chief, who wears an insignia iron rings on their legs. Their president, the head fetish-man, guards the national symbols, and his house is sanctuary for offenders till their guilt is proved. Personal property is held in common by each family. Land also is communal, but the rights of the actual cultivator cease only when he fails to farm it. At 14 or 15 the Krus "boys" eagerly contract themselves for voyages of twelve or eighteen months. Generally they prefer work near at home, and are to be found on almost every ship trading on the Guinea coast. As soon as they have saved enough to buy a wife they return home and settle down. Their principle home is at the mouth of the Sino river.

His brother Gottfried Daniel Krumphacker (1774-1837), who studied theology at Duisburg and became pastor successively in Bär (1798), Wülfrath (1801) and Elberfeld (1816), was the leader of the "pietists" of Wupperthal, and published several volumes of sermons, including one entitled *Die Wanderungen Israels durch d. Wuste nach Kanaan* (1834). Friedrich Wilhelm Krumphacker (1796-1858), son of Friedrich Adolf, studied theology at Halle and Jena, and became pastor successively at Frankfurt (1819), Ruhrtort (1823), Gernarke, near Barmen in the Wupperthal (1825), and Elberfeld (1834). In 1847 he received an appointment to the Trinity Church in Berlin, and in 1853 he became court chaplain at Potsdam. He was an influential promoter of the Evangelical Alliance. His best-known works are *Elías der Thünderer* (1828-1833; 6th ed., 1874; Eng. trans., 1838); *Elisa* (1837) and *Das Passionabuch, der leidende Christus* (1854, in English *The Suffering Saviour*, 1870). His *Autobiography* was published in 1869 (Eng. trans. 1871).

Emil Wilhelm Krumphacker (1798-1880), another son, was born at Mörs in 1798. In 1841 he became pastor in Duisburg. He wrote, amongst other works, *Herzensmann aus Luthers
KRUPP—KUBAN

Werken (1852). His son Hermann (1828-1890), who was appointed Consistorialrat in Stettin in 1877, was the author of Deutsches Lebne in Nordamerika (1874).

KRUPP, ALFRED (1812-1887), German metallurgist, was born at Essen on the 14th of July 1812. His father, Friedrich Krupp (1757-1826), had purchased a small forge in that town about 1810, and devoted himself to the problem of manufacturing cast steel, but the fourteenth patent was put on the market by him in 1815, it commanded but little sale, and the firm was far from prosperous. After his death the works were carried on by his widow, and Alfred, as the eldest son, found himself obliged, a boy of fourteen, to leave school and undertake their direction. For many years his efforts met with little success, and the concern, which in 1845 employed only 122 workmen, did scarcely more than pay its way. But in 1847 Krupp made a 3 prd. muzzle-loading gun of cast steel, and at the Great Exhibition of London in 1851 he exhibited a solid flawless ingot of cast steel weighing 2 tons. This exhibit caused a sensation in the industrial world, and the Essen works sprang into fame. Another successful invention, the manufacture of weldless steel tires for railway vehicles, was introduced soon afterwards. The profits derived from these and other steel manufactures were devoted to the expansion of the works and to the development of the artillery with which the name of Krupp is especially associated (see Ordnance). The model settlement, which is one of the best-known features of the Krupp works, was started in the 'sixties, when difficulty began to be found in housing the increasing number of workmen; and now there are various "colonies," practically separate villages, dotted about in the south and south-west of the town, with schools, libraries, recreation grounds, clubs, stores, &c. The policy was also adopted of acquiring iron and coal mines, so that the firm might have command of supplies of the raw material required for its operations. Alfred Krupp, who was known as the "Cannon King," died at Essen on the 14th of July 1887, and was succeeded by his only son, Friedrich Alfred Krupp (1854-1902), who was born at Essen on the 17th of February 1854. The latter devoted himself to the financial rather than to the technical side of the business, and under him it again underwent enormous expansion. Among other things he in 1866 leased the "Germania" shipbuilding yard at Kiel, and in 1902 it passed into the complete ownership of the firm. In the latter year, which was also the year of his death, on the 22nd of November, the total number of men employed at Essen and its associated works was over 40,000. His elder daughter Bertha, who succeeded him, was married in October 1906 to Dr Gustav von Bohlen und Halbach, who on that occasion received the right to bear the name Krupp von Bohlen und Halbach. The enormous increase in the Geopolitical significance of the city, which was historically a center of the world's steel industry, made it necessary for the Krupp firm as manufacturers of the armour plate and guns required for the new ships, and in 1908 its capital, then standing at £5,000,000, was augmented by £5,500,000.

KRUSENSTERN, ADAM IVAN (1770-1846), Russian navigator, hydrographer and admiral, was born at Haggud in Estonia on the 19th of November 1770. In 1785 he entered the corps of naval cadets, after leaving which, in 1788, with the grade of midshipman, he served in the war against Sweden. Having been appointed to serve in the British fleet for several years (1793-1799), he visited America, India and China. After publishing a paper pointing out the advantages of direct communication between Russia and China by Cape Horn and the Cape of Good Hope, he was appointed by the emperor Alexander I. to make a voyage to the east coast of Asia to endeavour to carry out the project. Two English ships were bought, in which the expedition left Kronstadt in August 1803 and proceeded by Cape Horn and the Sandwich Islands to Kamchatka, and thence to Japan. Returning to Europe by the Cape of Good Hope, after an extended series of explorations, Krusenstern reached Kronstadt in August 1806, his being the first Russian expedition to circumnavigate the world. The emperor conferred several honours upon him, and he ultimately became admiral. As director of the Russian naval school Krusenstern did much useful work. He was also a member of the scientific committee of the marine department, and his contrivance for counteracting the influence of the iron in vessels on the compass was adopted in the navy. He died at Reval on the 24th of August 1846.

Krusenstern's Voyage Round the World in 1807-1808 was published at St. Petersburg in 1810-1814, in 3 vols., with folio atlas of 104 plates and maps (Eng. ed., 6 vols.; French ed., 2 vols., and atlas of 30 plates, 1820). His narrative contains a good many important discoveries and rectifications, especially in the region of Japan, and the contributions made by the various savants were of much scientific importance. A valuable work is his Atlas de l'Ocean Pacifique, with its accompanying Recueil des Memoires hydrographiques (St. Petersburg, 1814-1827). See Memoirs by his daughter, Madame Charlotte Bernhardt, translated by Sir John Ross (1856).

KRUSHEVATS (or Kroševac), a town of Servia, lying in a fertile region of hills and dales near the right bank of the Servian Morava. Pop. (1900), about 10,000. Krushevats is the capital of a department bearing the same name, and has an active trade in tobacco, hemp, flax, grain and livestock, for the sale of which it possesses about a dozen markets. It was in Krushevats that the last Servian tsar, Lazar, assembled his army to march against the Turks, and lose his empire, at Kosovo, in 1389. The site of his palace is marked by a ruined enclosure containing a fragment of the tower of Queen Milita, whither, according to legend, tidings of the defeat were brought her by crows from the battlefield. Within the enclosure stands a church, dating from the reign of Stephen Dushan (1336-1356), with beautiful rose windows and with a perforated porch, decorated with peacocks and eagles sculptured on the walls. Several old Turkish houses were left at the beginning of the 20th century, besides an ancient Turkish fountain and bath.

KSHATRIYA, one of the four original Indian castes, the other three being the Brahman, the Vaisya and the Sudra. The Kshatriya was the warrior caste, and their function was to protect the people and abstain from sensual pleasures. On the rise of Brahmin ascendency the Kshatriyas were repressed, and their consequent revolt gave rise to Buddhism and Jainism, the founders of both these religions belonging to the Kshatriya caste. Though, according to tradition, the Kshatriyas were all exterminated by Parasurama, the rank is now conceded to the modern Rajputs, and also to the ruling families of native states. (See Caste.)

KUBAN, a river of southern Russia, rising on the W. slope of the Elbruz, in the Caucasus, at an altitude of 13,930 ft., races down the N. face of the Caucasus as a mountain torrent, but upon getting down to the lower-lying steppe country S. of Stavropol it turns, at 1075 ft. altitude, towards the N.W., and eventually, assuming a westerly course, enters the Gulf of the Sea of Azov, near the village of Ovidievka, in the district of Kerch. Its lower course lies for some distance through marshes, where in times of overflow its breadth increases from the normal 700 ft. to over half a mile. Its total length is 500 m., the area of its basin 21,480 sq. m. It is navigable for steamers for 73 m., as far as the confluence of its tributary, the Laba (200 m. long). This, like its other affluents, the Byelaya (155 m.), Urup, and Great and Little Zelenchuk, joins it from the left. The Kuban is the ancient Hyphasis and Vardanes and the Phashiche of the Circassians.

KUBAN, a province of Russian Caucasus, having the Sea of Azov on the W., the territory of Don Cossacks on the N., the government of Stavropol and the province of Terek on the E., and the government of Kutiass and the Black Sea district on the S. and S.W. It thus contains the low and marshy lowlands on the Sea of Azov, the western portion of the fertile steppes of northern Caucasus, and the northern slopes of the Caucasus range from its north-west extremity to the Elbruz. The area is 36,370 sq. m. On the south the province includes the parallel ranges of the Black Mountains (Kara-daghi), 3000 to 6000 ft. high, which are intersected by gorges that grow deeper and wider as the main range is approached, on a relatively wet climate and numerous streams, these mountains are densely clothed with woods, under the shadow of which a thick
undergrowth of rhododendrons, "Caucasian palms" (*Buxus sempervirens*), ivy, Clematis, &c., develops, so as to render the forests almost impassable. These cover altogether nearly 20% of the aggregate area. Wide, treetless plains, from 1000 to 2000 ft. high, stretch north of the Kubań, and are profusely watered by that river and its many tributaries—the Tchernaya, Great Zelenchak, Urup, Laba, Bydayla, Peshin—mountain torrents that rush through narrow gorges from the Caucasus range. In its lower course the Kubań forms a wide, low delta, covered with rushes, haunted by wild boar, and very unhealthy. The same characteristics mark the low plains on the east of the Sea of Azov, dotted over with numerous semi-stagnant lakes. Malaria is the enemy of these regions, and is especially deadly on the Tana Peninsula, as also along the left bank of the lower and middle Kuban.

There is considerable mineral wealth. Coal is found on the Kuban and its tributaries, but its extraction is still insignificant (less than 10,000 tons per annum). Petroleum wells exist in the district of Maikop, but most of the young are in the Tana Peninsula, where they range over 570 sq. m. Iron ores, silver and zinc are found; alabaster is extracted, as also some salt, soda and epsom salts. The best mineral waters are at Pseukup and Tama, where there are also numbers of mud volcanoes, ranging from small hillocks to hills 365 ft. high and more. The soil is very fertile in the plains, parts of which consist of black earth and are extensively cultivated.

The population reached 1,928,419 in 1897, of whom 1,788,622 were Russians, 13,926 Armenians, 28,737 Greeks and 20,778 Germans. There were at the same date 945,873 women, and only 1,356,486 people lived in towns. The estimated population in 1906 was 2,275,400. The aborigines were represented by 100,000 Circassians, 5000 Nogai Tatars and some Ossetes. The Circassians or Adyghe, who formerly occupied the mountain valleys, were compelled, after the Russian conquest in 1861, either to settle on the flat land or to emigrate; those who refused to move voluntarily were driven across the mountains to the Black Sea coast. Most of them (nearly 200,000) emigrated to Turkey, where they formed the Bashi-bazouks. Peasants from the interior provinces of Russia occupied the plains of the Kuban, and they now number over 1,000,000, while the Kuban Cossacks in 1897 numbered 804,372 (45,428 women). In point of religion 90% of the population were in 1897 members of the Orthodox Greek Church, 4% Raskolniks and other Christians and 5% of Mahomedans, the rest being Jews.

Wheat is by far the chief crop (nearly three-quarters of the total area under crops are under wheat); rye, oats, barley, millet, Indian corn, some flax and potatoes, as also tobacco, are grown. Agricultural machinery is largely employed, and the province is a reserve granary for Russia. Livestock, especially sheep, is kept in large numbers on the steppes. Bee-keeping is general, and gardening and vine-growing are spreading rapidly. Fishing in the Black Sea and Sea of Azov, as also in the Kuban, is important.

Two main lines of railway intersect the province, one running N.W. to S.E., from Rostov to Vladivokaz, and another starting from the former south-westwards to Novorossiysk on the north coast of the Black Sea. The region is divided into provinces, the districts, the okrugs, and okrugs of which, with their populations in 1897, are Ekaterinodar, capital of the province (65,697), Anapa (6675), Labinsk (6388), Bataplashinsk (8100), Maikop (34,101), Temryuk (14,476) and Yeisk (35,445).

The history of the original settlements of the various native tribes, and their language and worship before the introduction of Mahomedanism, remain a blank page in the legends of the Caucasus. The peninsula of Tamań, a land teeming with relics of ancient Greek colonists, has been occupied successively by the Circumiers, Sarmatians, Khazars, Mongols and other nations. The Genoese, who established an extensive trade in the 13th century, were expelled by the Turks in 1484, and in 1498 Russia obtained by treaty the entire peninsula and the territory on the right bank of the Kuban, the latter being granted by Catherine II. in 1792 to the Cossacks of the Donier. Then commenced the bloody struggle with the Circassians, which continued for more than half a century. Not only domestic, but even field work, is conducted mostly by the women, who are remarkable for their physical strength and endurance. The native moun-

---

**Kubelik, Jan** (1880-1950), Bohemian violinist, was born son of Praga of humble parentage. He began the violin at childhood, and appeared in public at Prague in 1888, subsequently being trained at the Conservatorium by the famous teacher Ottakar Sevcik. From him he learnt an extraordinary technique, and from 1908 onwards his genius was acclaimed at concerts throughout Europe. He first appeared in London in 1909, and in America in 1901, creating a furore everywhere. In 1903 he married the Countess Czaky Szell.

**KUBERA** (or KUVERA), in Hindu mythology, the god of wealth. Originally he appears as king of the powers of evil, a kind of king of death. He also was Akath (in Pandita Kalasa, and his garden, the world's treasure-house, is Chattrakatha, on Mount Mandara. Kuber is half-brother to the demon Ravana, and was driven from Ceylon by the latter.

**KUBLAI Khan** (or KAN, as the supreme ruler descended from Jenghiz was usually distinctively termed in the 13th century (1276-1294), the most eminent of the successors of Jenghiz (Chinghiz), and the founder of the Mongol dynasty in China. He was the second son of Tule, youngest of the four sons of Jenghiz by his favourite wife. Jenghiz was succeeded in the khanship by his third son Okkodai, or Ogdi (1239), he by his son Kuyuk (1246), and Kuyuk by Mangu, eldest son of Tule (1252). Kublai was born in 1216, and, young as he was, took part with his younger brother Hulagu (afterwards conqueror of the caliph and founder of the Mongol dynasty in Persia) in the last campaign of Jenghiz (1226-27). The Mongol poetical chronicler, Sanang Setzen, records a tradition that Jenghiz himself on his deathbed discerned young Kublai's promise and predicted his distinction.

Northern China, Cathay as it was called, had been partially conquered by Jenghiz himself, and the conquest had been followed by the pillage of the Chinese. Tatars, reigning at K'ai-feng Fu on the Yellow River, were completely subjugated (1234). But China south of the Yangtsze-kiang remained many years later subject to the native dynasty of Sung, reigning at the great city of Lingan, or Kinsai ("King's-ze", "capital"), now known as Hang-chow Fu. Operations to subdue this region had commenced in 1235, but languished till Mungo's accession. Kublai was then named his brother's lieutenant in Cathay, and operations were resumed. By what seems a vast and risky strategy, of which the motives are not quite clear, the Kinsai of Sung was destroyed to the subjugation of the remote western province of Yunnan. After the capture of Tali Fu (well known in recent years as the capital of a Mahomedan insurgent sultan), Kublai returned north, leaving the war in Yunnan to a trusted general. Some years later (1257) the khan Mungo himself entered on a campaign in west China, and died there, before Ho-chow in Szech 'uen (1259).

Kublai assumed the succession, but it was disputed by his brother Arikbugha and by his cousin Kaidu, and wars with these retarded the prosecution of the southern conquest. Doubtless, however, this was untenable before Kublai as a great task to be accomplished, and its fulfilment, in his mind, he selected as the future capital of his empire the Chinese city that we now know as Peking. Here, in 1264, to the north-east of the old city, which under the name of Yenking had been an occasional residence of the Kins sovereigns, he founded his new
capital, a great rectangular plot of 18 m. in circuit. The (so-called) "Tatar city" of modern Peking is the city of Kublai, with about one-third at the north cut off, but Kublai's walls are also on this retrenched portion still traceable.

The new city, officially termed T'ai-tu ("great court"), but known among the Mongols and western people as Kuanbalagh ("city of the khan") was finished in 1267. The next year was prosperous, and Kublai, now in the prime of his life, was triumphant, but was long retarded by the strenuous defense of the twin cities of Siang-yang and Fan-chêng, on opposite sides of the river Han, and commanding two great lines of approach to the basin of the Yangtse-kiang. The siege occupied nearly five years. After this Bayan, Kublai's best lieutenant, a man of high military genius and noble character, took command. It was not, however, till 1276 that the Sung capital surrendered, and Bayan rode into the city (then probably the greatest in the world) as its conqueror. The young emperor, with his mother, was sent prisoner to Kuanbalagh, but two younger princes had been despatched to the south before the fall of the city, and these successively were proclaimed emperor by the adherents of the native throne. An attempt to maintain their cause was made in Fu-kien, and afterwards in the province of Kwantung; but in 1279 these efforts were finally extinguished, and the faithful minister who had inspired them terminated the struggle by jumping with his young lord into the sea.

Even under the degenerate Sung dynasty the conquest of southern China had occupied the Mongols during half a century of intermittent campaigns. But at last Kublai was ruler of China, and probably the sovereign (at least nominal) of a greater population than had ever acknowledged one man's supremacy. For, though his rule was disputed by the princes of his house in Turkestan, it was acknowledged by those on the Volga, whose rule reached to the frontier of Poland, and by the family of his brother Hulagu, whose dominion extended from the Oxus to the Arabian desert. For the first time in history the name and character of an emperor of China were familiar as far west as the Black Sea and not unknown in Europe. The Chinese seals which Kublai conferred on his kinsmen are stamped upon their letters to the kings of France, and survive in the archives of Paris. Adventurers from Turkestan, Persia, Armenia, Byzantium, even from Venice, served him as ministers, generals, governors, envoys, astronomers or physicians; soldiers from all Asia to the Caucasus fought his battles in the south of China. Once in his old age (1287) Kublai was compelled to take the field in person against a serious revolt, raised by Nayan, a prince of his family, who held a vast domain on the borders of Manchuria. Nayan was taken and executed. The revolt had been stirred up by Kublai's lieutenant, who, in his impiety in 1301, Kublai himself died in 1294, at the age of seventy-eight.

Though a great figure in Asiatic history, and far from deserving a niche in the long gallery of Asiatic tyrants, Kublai misses a record in the short list of the good rulers. His historical locus was a happy one, for, whilst he was the first of his race to rise above the innate barbarism of the Mongols, he retained the force and warlike character of his ancestors, which vanished utterly in the effeminacy of those who came after him. He had great intelligence and a keen desire for knowledge, with apparently a good deal of natural benevolence and magnanimity. But his love of splendour, and his fruitless expeditions beyond sea, created enormous demands for money, and he shut his eyes to the character and methods of those whom he employed to raise it. A remarkable narrative of the oppressions of one of these, Ahmed of Fenâket, and of the revolt which they provoked, is given by Marco Polo, in substantial accordance with the Chinese annals.

Kublai patronized Chinese literature and culture generally. The great astronomical instruments which he caused to be made were long preserved at Peking, but were carried off to Berlin in 1900. Though he put hardly any Chinese into the highest ranks of his administration, he attached many to his confidence, and was personally popular among them. Had his endeavour to procure European priests for the instruction of his people, of which we know through Marco Polo, prospered, the Roman Catholic church, which gained some ground under his successors, might have taken stronger root in China. Failing this momentary effort, Kublai probably saw in the organized force of Tibetan Buddhism the readiest instrument in the civilization of his countrymen, and that system received his special countenance.

An early act of his reign had been to constitute a young Lama of intelligence and learning the head of the Lamaite Church, and eventually also prince of Tibet, an act which may be regarded as a precursory form of the rule of the "grand lamas" of Lassa. The same ecclesiastics, Mati Dhwaja, was employed by Kublai to devise a special alphabet for use with the Mongol language. It was chiefly based on Tibetan forms of Nagari; some coins and inscriptions in it are extant; but it had no great vogue, and soon perished. Of the splendour of his court and entertainments, of his palaces, summer and winter, of his great hunting expeditions, of his revenues and extraordinary paper currency, of his elaborate system of posts and much else, an account is given in the book of Marco Polo, who passed many years in Kublai's service.

We have alluded to his foreign expeditions, which were almost all disastrous. Nearly all arose out of a hankering for the nominal extension of his empire by claiming submission and tribute. Expeditions against Japan were several times repeated; the last, in 1281, on an immense scale, met with huge discomfiture. Kublai's preparations to avenge it were appreciated by the intense discon tent which they created. In 1278 he made a claim on the island of Japan, pistons an island state representing what we now call Cochin China. This eventually led to an attempt to invade the country through Tongking, and to a war with the latter state, in which the Mongols had much the worst of it. War with Burma (or Mien, as the Chinese called it) was provoked in very similar fashion, but the result was more favourable to Kublai's arms. The country was overrun as far as the Irrawaddy delta, the ancient capital, Pagan, with its magnificent temples, destroyed, and the old royal dynasty overthrown. The last attempt of the kind was against Java, and occurred in the last year of the old khan's reign. The envoy whom he had commissioned to claim homage was sent back with ignominy. A great armament was equipped in the ports of Fu-kien to avenge this insult; but after some temporary success the force was compelled to re-embark with a loss of 3000 men. The death of Kublai prevented further action.

Some other expeditions, in which force was not used, gratified the khan's vanity by bringing back professions of homage, with presents, and with the curious reports of foreign countries in which Kublai delighted. Such expeditions extended to the states of southern India, to eastern Africa, and even to Madagascar.

Of Kublai's twelve legitimate sons, Chingkim, the favourite and designated successor, died in 1284/5; and Timur, the son of Chingkim, took his place. No great king arose in the dynasty after Kublai. He had in all nine successors of his house on the throne of Kuanbalagh, but the long and imbecile reign of the ninth, Toghon Timur, ended (1360) in disgrace and expulsion, and the native dynasty of Ming reigned in their stead. (H. Y.)

KUBUS, a tribe inhabiting the central parts of Sumatra. They are nomadic savages living entirely in the forests in clusters of branches and leaves built on platforms. It has been suggested that they represent a Sumatran aboriginal race; but Dr J. G. Garson, reporting on Kubu skulls and skeletons submitted to him by Mr. H. O. Forbes, declared them decidedly Malay, though the flax in the hair might indicate a certain mixture of negro blood (Journ. Anthrop. Inst., April 1884). They are of a rich olive-brown tint, their hair jet black and inclined to curl, and though not dwarfs, are below the average height.

KUCHAN, a fertile and populous district of the province abandoned owing to a desertification. It was occupied by the Russian Transcaspian territory, W. by Bujurud, S. by Isfaran, and extending in the E. to near Radkan. Its area is about 3000 sq. m. and its
population, principally composed of Zafaranlu Kurds, descendants of tribes settled there by Shah Abbas I. in the 17th century, is estimated at 100,000. About 3000 families are nomads and live in tents. The district produces much grain, 25,000 to 30,000 tons yearly, and contains two towns, Kuchan and Shirvan (pop. 6000), and many villages.

Kuchan, the capital of the district, has suffered much from the effects of earthquakes, notably in 1875, 1894 and 1895. The last earthquake laid the whole town in ruins and caused considerable loss of life. About 8000 of the survivors removed to a site 75 m. E. and there built a new town named Nasseriyeh after Nasr-ud-din Shah, but known better as Kuchan i Jadid, i.e. New Kuchan, and about 1000 remained in the ruined city in order to be near their vineyards and gardens. The geographical position of the old town is 35° 8'N., 58° 5'2"E., elevation 4100 ft. The new town has been regularly laid out with broad streets and spacious bazaars, and, situated as it is half-way between Meshed and Askabad on the Karakoram connecting those two places, has much trade. Its population is estimated at 10,000.

There are telegraph and post offices.

KUCH BEHAR, or COOCH BEHAR, a native state of India, in Bengal, consisting of a submontane tract, not far from Darjeeling, entirely surrounded by British territory. Area, 1507 sq. m. Pop. (1901), 566,974; estimated revenue, £140,000.

The state forms a level plain of triangular shape, intersected by numerous rivers. The greater portion is fertile and well cultivated, but tracts of jungle are to be seen in the north-east corner. The abuts upon Assam. The soil is uniform in character throughout, consisting of a light, friable loam, varying in depth from 6 in. to 3 ft., superimposed upon a deep bed of sand. The whole is detritus, washed down by torrents from the neighbouring Himalayas. The rivers all pass through the state from north to south, to join the main stream of the Brahmaputra. Some half-dozen are navigable for small trading boats throughout the year, and are nowhere fordable; and there are about twenty minor streams which become navigable only during the rainy season. The streams have a tendency to cut new channels for themselves after every annual flood, and they communicate with one another by cross-country watercourses. Rice is grown on three-fourths of the cultivated area. Jute and tobacco are also largely grown for export. The only special industries are the weaving of a strong silk obtained from worms fed on the castor-oil plant, and of a coarse jute cloth used for screens and bedding.

The external trade is chiefly in the hands of Marwari immigrants from Rajputana. Among other improvements a railway has been constructed, with the assistance of a loan from the British government. The earthquake of the 13th February 1897 caused damage to public buildings, roads, &c., in the state to the estimated amount of £700,000.

The Koch or Rajbansi, from which the name of the state is derived, are a widely spread tribe, evidences of aboriginal descent, found throughout all northern Bengal, from Purnea district to the Assam valley. They are akin to the Indo-Chinese races of the north-east frontier; but they have now become largely Hinduized, especially in their own home, where the appellation "Koch" has come to be used as a term of reproach. Their total number in all India was returned in 1901 as nearly 24 millions.

As in the case of many other small native states, the royal family of Kuch Behar lays claim to a divine origin in order to conceal an impure aboriginal descent. The greatest monarch of the dynasty was Nar Narayan, the son of Visu Singh, who began to reign about 1550. He conquered the whole of Kamrup, built temples in Assam, of which ruins still exist bearing inscriptions with his name, and extended his power southwards over what is now part of the British districts of Rangpur and Purnea. His son, Lakshmi Narayan, who succeeded him in Kuch Behar, became tributary to the Mogul Empire. In 1772 a competitor for the throne, having been driven out of the country by his rivals, applied for assistance to Warren Hastings. A detachment of sepoys was accordingly marched into the state; the Bhutias, whose interference had led to this intervention, were expelled, and forced to sue for peace through the mediation of the lama of Tibet. By the treaty made on this occasion, April 1773, the raja acknowledged subjection to the Company, and made over to it one-half of his annual revenues. In 1863, on the death of the raja, leaving a son and heir only ten months old, a British commissioner was appointed to undertake the direct management of affairs during the minority of the prince, and many important reforms were successfully introduced.

The maharaja Sir Nripendra Narayan, G.C.I.E., born in 1862, was educated under British guardianship at Patna and Calcutta, and became hon. lieutenant-colonel of the 6th Bengal Cavalry. In 1897-98 he served in the Tirah campaign on the staff of General Younghusband-Biggs, and received the distinction of a C.B. He was present at the Jubilee in 1887, the Diamond Jubilee of 1897, and King Edward's Coronation in 1902, and became a well-known figure in London society. In 1878 he married a daughter of Keshub Chunder Sen, the Brahmo leader. His eldest son was educated in England.

The town of Kuch Behar is situated on the river Turas, and has a railway station. Pop. (1901), 36,458. It contains a college affiliated to the Calcutta University.

KUDU (kooldo), the native name for a large species of African antelope (g.v.), with large corkscrew-like horns in the male, and the body marked with narrow vertical white lines in both sexes. The female is hornless. *Strepsiceros capensis* (or *S. strepsiceros*) is the scientific name of the true kudu, which ranges from the Cape to Somaliland; but there is also a much smaller species (*S. imberbis*) in East and North-East Africa.

**KUENEN, ABRAHAM** (1828–1891), Dutch Protestant theologian, the son of an apothecary, was born on the 16th of September 1828, at Haarlem, North Holland. On his father's death it became necessary for him to leave school and take a humble place in the business. By the generosity of friends he was educated at the gymnasion at Haarlem and afterwards at the university of Leiden. He studied theology, and won his doctor's degree by an edition of thirty-four chapters of Genesis from the Arabic version of the Samaritan Pentateuch. In 1853 he became professor extraordinarius of theology at Leiden, and in 1855 full professor. He married a daughter of W. Muurling, one of the founders of the Groningen school, which made the first pronounced breach with Calvinistic theology in the Reformed Church of Holland. Kuenen himself soon became one of the main supports of the modern theology, of which J. N. Scholten (1811–1885) and Karl Willem Opzoomer (b. 1841) were the chief founders, and of which Leiden became the headquarters. His first great work, an historico-critical introduction to the Old Testament, *Historisch-kritisch onderzoek naar het ontslaan en de versameling van de boeken des Ouden Verbands* (3 vols., 1861–1865; 2nd ed., 1885–1893; German by T. Weber and C. T. Müller, 1885–1894), followed the lines of the
KUEN-LUN

Kuen-lun, or Kuen-lun, a term used to designate generally the mountain ranges which run along the northern edge of the great Tibetan plateau in Central Asia. In a wider application it means the succession of ranges which extend from the Pamirs on the W. to 113° E., until it strikes against the range of S. E. Tibet, and thence again on the broad Mongolian plateau. In the narrower acceptance it applies only to those ranges which part the desert of Takla-makan on the N. from the Tibetan plateau on the S. between the Pamirs and the transverse glen of the Kara-muren, that is, nearly to the longitude of the town of Cherchen (about 85° E.). Although the use of the name is thus restricted in geographical usage, the mountain system so designated does, as a fact, extend eastwards as far as the great depression of Tsaidam (say 95° E.), though it is uncertain whether its direct orographical continuation eastwards is to be identified with the Asin-tagh, or, as F. Grenard and K. Bogdanovich believe—and with them Sven Hedin is inclined to agree—with the parallel ranges of Kalka-alaghan and Arkatagh, which lie S. of the Asin-tagh. At any rate the Asin-tagh, whether it is the principal continuation of the Kuen-lun or only a subsidiary slinking system, is itself the westward continuation of the Nan-shan or Southern Mountains, which reach down far into China (1013° E.). Taken in its widest meaning, the Kuen-lun Mountains thus stretch in a wavy line for nearly 2500 m. from E. to W., and while in the W. their constituent ranges are folded and squeezed by lateral compression in a breadth of some 150–200 m., their summits being forced up to correspondingly higher altitudes, in the E. they spread out to a breadth of some 600 m., the ranges being in that quarter less folded, and consequently both flatter and lower. In the tectonic structure of Asia the Kuen-lun forms, as it were, the backbone of the continent. In point of age it is very much older than either the Himalayas to the S. or the Tian-shan to the N. But although the crests of its component ranges reach altitudes of 21,500 to 22,000 ft., they are not as a rule overlain by individual peaks of commanding and towering elevation, as the Himalayas. On the whole they are tolerably uniform, and relatively at little greater altitude than the lofty valleys which separate them one from another. It is strikingly marked characteristic of the northern edge of the Tibetan plateau that its outermost border-range (e.g. Western Kuen-lun and Asin-tagh) is throughout double; and this “winning” of the mountain-ranges, as also of the intermont lake-basins among the Kuen-lun ranges, is a peculiar feature of the Tibetan plateau.

The supreme orographic importance of this great Central Asian mountain system has been recognized both by the geographers of ancient Greece. They used to suppose that an immense range of mountains crossed Asia from west to east on the parallel of the island of Rhodes, extending through Asia Minor, the Kurdish highlands, the N. of Persia, the N. of Bactria (Afghanistan), the Hindu-kush, and so on into China. This long range they supposed to separate the waters which flow N. to the Arctic from those which flow S. to the Indian Ocean. K. Ritter (Asien, ii.) was the first of modern geographers to recognize the existence of this range as a border range of the Tibetan plateau; and Baron von Richthofen (China, i. 1876) still further defined and accentuated the conception of it, and also, by reason of his maps, has been the chief pupil Wegener1 require now very considerable revision, and need even to be in part recast, as a consequence of explorations and investigations made since they wrote; amongst others, the N. E. Expedition of 1890–1895, the explorations of the Mongol–Russian Commission, those of the Russian Princeton Expedition, of the American W. W. Rockhill; the Frenchmen J. L. Dutreuil de Rhins, F. Grenard, P. G. Bonvalot and Prince Henri d’Orléans; by the Hungarian L. von Loczy and Count Szecshényi; and above all by the Swede Sven Hedin.

Western Kuen-lun.—On the east the Pamir highlands are fenced off from the East Turkestan lowlands by the double border-range of Sarik-kol (the Sarik-kol range and the Muztagh or Kasgar range), which runs along the border between the Russian and Chinese Turkestan, and its western up on the Pamirs at 10,500 to 13,000 ft. above sea-level, while its own summits, e.g. the Muztagh-ata (25,780 ft.), shoot out over the limit of the perpetual snows. The second range, the Altyn-tagh, is continued eastward of the meridian of Yarkent or Yarkent (77° E.) by a succession of twin ranges, all running, though under different names, from the W.N.W. to the E.S.E. According to W. Richthofen and to Dutreuil de Rhins, they are the Keriya Mountains in the more northerly range and the Raskem or Raskan, the Sughet and the Ullugh-tagh Mountains in the more southerly range. Although they all decrease in altitude from west to east, they nevertheless reach elevations of 19,000 ft. with individual peaks ascending some 2000–2500 ft. higher. From the East Turkestan lowlands on the north the ascent is very steep, and the passes across both sets of ranges lie at great altitudes; for example, the pass of Sanju-davan in the lower range is 16,325 ft. above sea-level, and the Kyzyl-davan, farther east, is 16,000 ft., while the Sughet-davan in the higher range is 17,825 ft. The latter range is separated from the Karakorum Mountains by the deeply trenched gorge of the Raskem or Yarkand-darya, while the deep glen of the Kara-kash or Khotan-darya intervenes between the upper (Sughet Mountains) and the lower (Kilian Mountains) border-ranges. Altogether this western ooromity of the Turkestanian region, a consequence partly of the intricacy of the flanking ranges and spurs, partly of the powerful lateral compression to which they have been subjected, and partly of the differences in vertical elevation between the crests of the ranges and the bottoms of the deep, narrow, rugged gorges between them. In the broad orographical disposition of the ranges there is considerable similarity between north-west and Persia, in that in both the ranges are crowded together in the west, but spread out wider as they advance towards the east. To the two principal ranges in this part of the system F. Grenard, who accompanied J. L. Dutreuil de Rhins on his journey in 1890—1895, gives the names the Altyn-tagh and Ustun-tagh, though, he names them less than six parallel ranges altogether. Now as Altyn-tagh is accepted, though in point of fact it is synonymous, neither for Asin-tagh, nor for Khotan-tagh, Grenard considers the main Kuen-lun ranges to be continued directly by the Asin-tagh.

From the transverse breach of the Keriya-darya (about 813° E.) to the Kari-ko-gun, in the lower course of the Cherchen (about 853° E.) the parallel border-ranges of the Tibetan plateau tend to the E.N.E., and here occur in the lower or outer range the passes of Dalai-lun Kordon (14,290 ft.), Choke-davan, i.e. Little lake’s Chokur Pass (16,530 ft.) and others at altitudes ranging from 8600 to

---

2 For instance, on the map of "Inner-Asien" (No. 63) of Stieler's "Hand-atlas" (ed. 1905) and in the Atlas of the Russian General Staff. Etymologically the correct form is Asin-tagh or Asstun-tagh, meaning the Lower or Nearer Mountains. Ustun-tagh, which appears in W. Richthofen's "China," is the right name for Farther Mountains, and though not used locally of any specific range, would be appropriately employed to designate the higher and more southerly of the twin border-ranges of the Tibetan plateau.

---
939

11,500 ft.; while in the upper range are the At-to-davan (16,600 ft.), Yapkaliklik-davan (15,550 ft.), Singlat-davan (15,680 ft.) and others, not named at 16,500 and 17,300 ft.

Middle Kuen-lun.—Between the upper transverse gles of the Kara-
mus are the Cheren-darya and the Cheren-darya stretches the short
range of Tokuz-davan. From the Tokuz-davan on the left side of the
principal ranges or groups of ranges admit of being discriminated,
mostly the Arka-tagh, the Chimen-tagh, the Kalta-alaghan and the
Arka-tagh, all belonging to the mountainous country which borders
on the Gobi plateau. It is in these ranges, or systems of ranges, differ considerably in their
orographic characteristics, the following description will apply
generally to the region from the Arka-tagh southwards to the
Arka-tagh. The broad features of the surface are a series of nearly parallel mountain-ranges, running from W.S.W. to E.N.E. to W.N.W. to E.S.E., and separated by high intermont
valleys, which have been cut northwards from the Gobi to the plateau of Tibet, the
ranges when viewed from the north frequently appear like veritable upstanding mountain ranges,
and this appearance is accentuated by the general steepness of the appearance, viewed on the north only. In general the several ranges, owing to their long and gentle slope in that
direction, have the appearance of comparatively gentle swallets of the
Astin-tagh, or the Cheren-darya valleys, into the upper reaches of the
the Cheren-darya, which are mostly choked with their debris in the form either of gravel-and-shingle or loose blocks of stone. As one proceeds southwards in these ranges, the slopes become more precipitous, and the

up to the mountains on both north and south. Its surface slopes from altitudes of 10,100 to 10,600 ft. in the west, where is the lake of Usunshar, which lies in the Chikan depression, 6,200 ft. as far as the Anambarun-ula (see below) and the plain or flat basin of Särting, a north extension of Tsaidam. This range of Akato-tagh, the Altun Range of Carey, is the same as that which on the map of the Chicheng-bara (see above) is called the Altun-dagh. As the Astin-tagh it stretches towards the E., N.E., and, like it, appears to be built up of granite and schists, but its crest is greatly denuded, so that it resembles a great plate of the land covered with the mantle of disintegrated material which masks its flanks. The slopes on both north and south are extremely gentle, but that on the south is eight to ten times as long as that on the north. In the east the range is much steeper and cuts away to the south of the Kuen-lun mountain range; but in the west it swells out into the lofty and imposing mass of the Iine-chimen or Shaia-mangly, which is capped with perpetual snow. This part of the range is crossed by the pass of Choupur-ulak at 16,100 ft., where it is possible to ascend the range or to cut across it by means of the pass of 13,380 to 10,520 ft. The latitudinal valley that intervenes between the Akato-tagh and the next great range on the south, the Chimen-tagh, slopes for the most part eastwards, from 12,600 ft. down to the shallow salt lake of Giazkhol or Chimen-koli (9305 ft.).

In the western part of this valley occurs the very important transverse water-divide of Guleha-davan (14,150 ft.), which separates the basin of the Cherchen-darya that goes down into the Tarim basin from the area that drains down to the Giazkhol, which belongs to the Tsaidam depression. This, the Chimen valley, contains in places a good deal of drift-sand, probably due to the looseness and instability of the moraines up to the northern foot of the Chimen-tagh. Nevertheless the Akato-tagh is only of secondary importance in the general Kuen-lun system, being nothing more than a central ridge running along the border of the Kikir valley that separates the Astin-tagh from the Chimen-tagh.

The latter range, the Chimen-tagh, is identical in its western parts with the Fiazil-tagh and in the east must be equated with the Tsaidam chain of Przhevalsky: and it is probably continued westwards by the range which the Russian explorers call the Moscow Range or the Achik-tagh, running north of the Akato-koli and, according to Przhevalsky, the vertical rise of which is 20,000 ft. The Chimen-tagh rises into imposing summits, some rounded, some pyramidal in outline, which are capped with snow, though the snow melts in summer. This range acts as a "breakwater" to the cold south winds which approach the basin of the Pamirs through the southwinds. Hence its slopes are not so arid as those of the Akato-tagh and the Astin-tagh. Snow falls all the year round on the Chimen-tagh, even in July, and water is abundant everywhere. The northern slope is long and steep. Grass is able to grow, and animal life is more abundant. The range is crossed by passes at 15,970, 13,230 and 13,760 ft., and the Fiazil-tagh by a pass at an altitude of 13,640 ft.

The next important range, still going south, is the Kaila-alaghan, Carey's Chimen-tagh Range, Przhevalsky's Cumberland Range and the Astin-tagh. It is entirely disintegrated, being formed of red Ambal-ashkan, Kalga-fragans and Astin-tagh. This last is, however, properly the name of a short secondary range which rises along the middle (ara-middle) of the valley between the Chimen-tagh and the Kaila-alaghan, and is composed of great masses, only in one place, the pass of Avraz-davan, are any of these ranges but a secondary one. Both, but it dies away towards the west, the valleys on each side of it meeting round its extremity to form one broad, open valley, with an altitude of 10,750 ft., which is crossed by the Azer-dawan pass at an altitude of 14,345 ft. In the Kaila-alaghan, which is the culminating range of this part of the Kuen-lun, and is overlapped by towering, snow-clad peaks, the passes climb to considerahly higher altitudes, namely, 14,560, 14,470, 14,340 and 14,190 ft., while the pass of Avraz-davan ascends to 15,700 ft. This range appears to be linked on to the Tukuz-dawan by the Muzlik-tagh, in which case it has altitudes of 16,870 and 15,440 ft. It is possible however that the Muzlik-tagh belongs more intimately to the Chimen-tagh system, that is, to the Moscow or Achik-kol ranges. Indeed Bogdanovich considers that the Tukuz-dawan, the Muzlik-tagh, the Kaila-alaghan and the Astin-tagh form a closely connected chain, in which he also places Przhevalsky's isolated peak of Mount Kremel (15,055 ft.). Sven Hedin, whilst agreeing that this may possibly be the true conception, inclines to the view that the Chimen-tagh and the Kaila-alaghan merge westwards into the border-ranges that lie north of the Muzlik-tagh and the Tukuz-dawan and that these other ranges form a separate and entirely disintegrated range from the Kaila-alaghan. That the Kaila-alaghan does not decrease, but it increases in elevation towards the east, where, like the Chimen-tagh, it abuts upon and merges in the ranges that border Tsaidam on the south.

The total length of this deeply depressed depression, the Kum-kol valley, forming a very well-marked feature in the physical conformation of this region. It is crossed transversely by the main line of the Tsaidam depression. The main line of the Kaila-kol (12,700 ft.) from the basin of Tsaidam, some 3500 ft. lower. The floor of the valley consequently slopes away in both directions, like the Chimen valley between the Akato-tagh and the Chimen-tagh; and in so far as it slopes westwards towards the Kum-
kol lakes it differs from nearly all the other great latitudinal valleys that run parallel with it, because they slope generally towards the east. The greater part of the lower valley is between the two ranges. The main line of the Kaila-kol is extended in a north-south direction between the Astin-tagh and the Kaila-alaghan, and the southerly of the two ranges amounts to nearly 7500 ft. With one exception, namely the cliff out of the Kaila-kol valley to the Arka-tagh, the first three steps are

1This is the correct form, Arka-tagh meaning the Farther or Remoter Mountains. The form Akka-tagh is incorrect.
2The form Tumenlik-tagh is erroneous.
individuality the biggest; whereas the Upper还会-ting exceed the Lower还会-ting by an altitude of some 1350 ft., it is itself exceeded by the Akato-ting to the extent of 1700 ft. There is also a considerable rise of 880 ft. from the Akato-ting to the Chimen-ting. But the Akato-ting, when compared with the Chimen-ting, and the Chimen-ting with the Kung-lun, there is comparatively little difference in point of elevation, namely, 730 ft. in all. The biggest ascent is that from the Kala-hahan to the Kung-lun; namely, 14,670 to 17,260 ft. When the altitudes of the intermont latitudinal valleys are compared, the significance orographicly of these valleys is shown. Of the many valleys of the Kung-lun system, two are considerably more pronounced
than the others, namely, 2900 ft. In these ten parallel ranges of the middle Kuen-lun system may be grouped in three divisions—(1) the more strictly border ranges of the Upper and Lower还会-ting and the Akato-ting; (2) the three ranges of Chimen-ting,还会-ting and Kala-hahan, which may be considered as forming a transitional system between the foregoing and the third division; (3) the Arka-ting, which constitute the elevated rampart of the Tibet plateau proper.

The Nan-shan Highlands overlook Tisadam on the N.E. They embrace a region 930 m. long and 260 m. wide, entirely occupied with parallel ranges all between, 12,000 ft. and 14,000 ft. (9000 to 10,000 at the south-western border) and dotted with lakes (Koko-nor, 9970 ft.; Khara-nor, 13,285 ft.); fill up the space between the mountain ranges and the N.E. highlands abut upon the highlands of the Chinese province of Kansuh, and near the great northward bend of the Huang-ho they meet the regions which the Tsinhsu range. The Nan-shan ranges are continued, and by which the Mongolian plateau steps down to the lowlands of China. On the N.E. the Nan-shan highlands have their foot on the Mongolian plateau (average altitude, 4000 ft.), i.e. in the Ala-shan. On the N.W. they are by a border range, the Da-sue-shan, a continuation of the还会-ting, which rises to 12,200-13,000 ft. in its passes, and is preceded by several rivers, which from the border range which continues on to the 7th meridian, separates the Nan-shan range from the Pe-shan range.

On the S.W. the Nan-shan mountains consist of short irregular chains, separated by broad plains, dotted with lakes, which differ but slightly in altitude from Tisadam (8800-9000 ft.). Next a succession of narrow ranges intervene between this lower border terrace and the higher terrace (12,000-15,500 ft.). The first mountain range on this higher terrace is Kitter’s range, covered in part with extensive snow-fields. The passes at both ends of this snow-clad massif lie at altitudes of 15,990 ft. and 14,680 ft. The most important of these passes, or Aranzhuog, lies from 15,200 ft. to 14,900 ft., between the S.W. and the S. E.

The mutual relations of the western portion of the Kung-lun, the eastern portion of the Nan-shan mountains, and the Kala-hahan range, is shown in the chart on p. 941. The Kala-hahan range, which is the lowest of the three, extends from 5000 to 4000 ft., so that the Lungs-han Oubruch in the neighboring valley of the Kala-hahan, which lies on the lower side of the Mongolian plateau (4000 to 5000 ft.), so that the Lungs-han must be regarded as a continuation of the Pe-shan mountains of the Gobi. Generally speaking, the Nan-shan highlands are region raised 12,000 to 14,000 ft. above the sea, and intersected by wild, stony and partly snow-clad mountains, towering another 4000 to 7000 ft. above its surface, and arranged in its several parallel divisions. From the middle to the western portion of the Kung-lun, the western portion of the mountains are several from 8 to 17 m. wide, seldom as much as 35, while the broad flats valleys between them attain widths of 20 to 27 m. As a general rule, a greater altitude (i.e. 14,000 ft.) is reached only in the eastern most peaks reach 18,000 to 20,000 ft. in the western portion of the highlands, while in the eastern portion they may be about 2000 ft. lower. The glaciers also attain a greater development in the western part of the Kung-lun, and the valleys, which are furrowed by deep ravines, are devoid of vegetation. Good pasture grounds are only found near the streams. The soil is dry gravel and clay, upon which bushes of Ephedra, Nitaria and Salidocarca grow sparsely. In the north-eastern Nan-shan, on the contrary, a steam runs through each gorge, and both the mountain slopes and the bottoms of the valleys are covered with grass, and the vegetation generally consists of prominent and deciduous trees—Przhevalsky’s popular, birch, mountain ash, &c., and a variety of bushes—are common everywhere. Higher up, in the picturesque gorges, grows Spiraea, Cornus, &c., and the rains must evidently be more copious and better distributed. In the central Nan-shan it is only the north-eastern slopes that bear forests. In the south, where the Nan-shan enters Kansu province, extensive accumulations of loose make their appearance, and it is only the northern slopes of the hills that are clothed with trees.

KUFAN,

KUFAN, a Moslem city, situated on the shore of the Hindisch canal, about 4 m. E. by N. of Neje, was founded by the Arabs after the battle of Kadesiya in A.D. 638 as one of the two capitals of the new district of Irak, the whole country being divided into the subdivided, or districts, of Bara and Kufa. The caliph ‘Ali made it his residence and the capital of his caliphate. After the removal of the capital to Bagdad, in the middle of the following century, Kufa lost its importance. At the beginning of the 19th century, travellers reported extensive and important ruins as marking the ancient site. Since then the ruins have served as quarries for bricks for the building of Neje, and at the present time little remains but holes in the ground, representing excavations for bricks, with broken fragments of brick and glass strewn over a considerable area. A mosque still stands on the spot where ‘Ali is reputed to have worshipped. (For history see CALIPHA.)

KUHN, FRANZ FELIX ADALBERT (1832-1881), German philologist, was born at Schlossberg in Neumark on the 19th of November 1812. From 1841 he was connected with the Künigliches Gymnasium at Berlin, of which he was appointed director in 1870. He died at Berlin on the 5th of May 1881. Kuhn was the founder of a new school of comparative mythology, based upon comparative philology. Inspired by Grimm’s Deutsche Mythologie, he first devoted himself to German stories and legends, and published Märkische Sagen und Märchen (1842), Norddeutsche Sagen, Märchen und Gebärde (1848), and Sagen, Gebärde und Märchen aus Westfalen (1850). But it is on his researches into the language and history of the Indo-Germanic peoples as a whole that his reputation is founded. His chief works in this connexion are: Zur ältesten Geschichte der Indogermanischen Völker (1854), in which he endeavoured to give an account of the earliest civilization of the Indo-Germanic peoples before their separation into different families, by comparing and analysing the original meaning of the words and stems common to the different languages; Die Herkunft des Feuers und des Götertrakts (1859); new ed. by E. Kuhn, under title of Mythologische Studien, 1880; and Uber Entwickelungs-}

See obituary notice by C. Bruchmann in Burins’s Biographisches Jahrbuch (1881) and J. Schmidt in the above Zeitschrift, xxvi. 8. n. 6.
KÜHNE, WILLY (1837–1900), German physiologist, was born at Hamburg on the 28th of March 1837. After attending the gymnasia at Lüneburg, he went to Göttingen, where his master in chemistry was F. Wohler and in physiology R. Wagner. Having graduated in 1856, he studied under various famous physiologists, including E. Du Bois-Reymond at Berlin, Claude Bernard in Paris, and K. F. W. Ludwig and E. W. Brücke in Vienna. At the end of 1863 he was put in charge of the chemical department of the pathological laboratory at Berlin, under R. von Virchow; in 1868 he was appointed professor of physiology at Amsterdam; and in 1871 he was chosen to succeed H. von Helmholtz in the same capacity at Heidelberg, where he died on the 10th of June 1900. His original work falls into two main groups—the physiology of muscle and nerve, which occupied the earlier years of his life, and the chemistry of digestion, which he began to investigate while at Berlin with Virchow. He was also known for his researches on vision and the chemical changes occurring in the retina under the influence of light. The visual purple, described by Franz Boll in 1876, he attempted to make the basis of a photophysical theory of vision, but though he was able to establish its importance in connexion with vision in light of low intensity, its absence from the retinal area of most distant vision detracted from the completeness of the theory and precluded its general acceptance.

KUKA, or KUKAWA, a town of Bornu, a Mahomedan state of the central Sudan, incorporated in the British protectorate of Nigeria (see Bornu). Kuka is situated in 12° 55′ N. and 5° 34′ E., 43 m. from the west. The plural Kukawa became the ordinary name of an extensive plain. It is the headquarters of the British administration in Bornu, and was formerly the residence of the native sovereign, who in Bornu bears the title of shuhi.

The modern town of Kuka was founded c. 1810 by Sheikh Mshommed al Amin al Kanemi, the deliverer of Bornu from the Fula invaders. It is supposed to have received its name from the kuka or monkey bread tree (Adansonia digitata), of which there are extensive plantations in the neighbourhood. Kuka or Kaoukaou was a common name in the Sudan in the middle ages. The number of towns of this name gave occasion for much geographical confusion, but Idris, writing in the 12th century, and Ibn Khaldun in the 14th century, both mention two important towns called Kaou Kaoou, of which one would seem to have occupied a position very near to that of the modern Kuka. Ibn Khaldun speaks of it as the capital of Bornu and as situated on the meridian of Tripoli. In 1840 the present town was laid waste by Mahommed Sherif, the sultan of Wadai; and when it was restored by Sheikh Omar he built two towns separated by more than half a mile of open country, each town being surrounded by walls of white clay. It was probably owing to there being two towns instead of one that the plural Kukawa became the ordinary designation of the town in Kano and throughout the Sudan, though the inhabitants used the singular Kuka. The town became wealthy and populous (containing some 60,000 inhabitants), being a centre for caravans to Tripoli and a stopping-place of pilgrims from the Hausa countries going across Africa to Mecca. The chief building was the great palace of the shuhi. Between 1823 and 1872 Kuka was visited by several English and German travellers. In 1863 Bornu was seized by the ex-slave Rabah (q.v.), an adventurer from the Bahr-el-Ghaazal, who chose a new capital, Dikwa, Kuka falling into complete decay. The town was found in ruins in 1902 by the British expedition which replaced on the throne of Bornu a descendant of the ancient rulers. In the same year the rebuilding of Kuka was begun and the town speedily regained part of its former importance. It is now one of the principal British stations of eastern Bornu. Owing, however, to the increasing importance of Maiyadori, a town 80 m. S.S.W. of Kuka, the court of the shuhi was removed thither in 1908.

For an account of Kuka before its destruction by Rabah, see the Travels of Heinrich Barth (new ed. London, 1862); Sahara und Sudan, by Gustav Nachtigal (Berlin, 1879), i. 581–748.

KU KLUX KLAN, the name of an American secret association of Southern whites united for self-protection and to oppose the Reconstruction measures of the United States Congress, 1865–1876. The name is generally applied not only to the order of Ku Klux Klan, but to other similar societies that existed at the same time, such as the Knights of the White Camelia, a larger order than the Klan; the White Brotherhood; the White League; Palé Faces; Constitutional Union Guards; Black Cavalry; White Rose; the 76th Association; and hundreds of smaller societies that sprang up in the South after the Civil War. The object was to protect the whites during the disorders that followed the Civil War, and to oppose the policy of the North towards the South, and the result of the whole movement was a more or less successful revolution against the Reconstruction and an overthrow of the governments based on negro suffrage. It may be compared in some degree to such European societies as the Carbonara, Young Italy, the Tugendbund, the Confréries of France, the Freemasons in Catholic countries, and the Vehmgerichte.

The most important orders were the Ku Klux Klan and the Knights of the White Camelia. The former began in 1865 in Pulaski, Tennessee, as a social club of young men. It had an absurd ritual and a strange uniform. The members accidentally discovered that the fear of it had a great influence over the lawless but superstitious blacks, and soon the club expanded into a great federation of regulators, absorbing numerous local bodies that had been formed in the absence of civil law and partaking of the nature of the old English neighbourhood police and the ante-bellum slave patrol. The White Camelia began in 1867 in the Confederate States of the late Confederacy. The period of organization and development of the Ku Klux movement was from 1865 to 1868; the period of greatest activity was from 1868 to 1870, after which came the decline.

The various causes assigned for the origin and development of this movement were: the absence of stable government in the South for several years after the Civil War; the corrupt and tyrannical rule of the alien, renegade and negro, and the belief that it was supported by the Federal troops which controlled elections and legislative bodies; the disfranchisement of whites; the spread of ideas of social and political equality among the negroes; fear of negro insurrections; the arming of negro militia and the disarming of the whites; outrages upon white women by black men; the influence of Northern adventurers in the Freedmen’s Bureau (q.v.) and the Union League (q.v.) in alienating the races; the humiliation of Confederate soldiers after they had been paroled—in general, the insecurity felt by Southern whites during the decade after the collapse of the Confederacy.

In organization the Klan was modelled after the Federal Union of Its Prescript or constitution, adopted in 1867, and revised in 1868, provided for the following organization: The entire South was the Invisible Empire under a Grand Wizard, General N. B. Forrest; each state was a Realm under a Grand Dragon; several counties formed a Dominion under a Grand Titan; each county was a Province under a Grand Giant; the smallest division being a Den under a Grand Cyclops. The staff officers bore similar titles, relies of the time when the order existed only for amusement: Genii, Hydras, Furies, Goblins, Night Hawks, Magi, Monks and Turks. The private members were called Ghouls and the Klansman was twice reorganized, in 1867 and in 1868, each time being more centralized; in 1869 the central organization was disbanded and the order then gradually declined. The White Camelia with a similar history had a similar organization, without the queer titles. Its members were called Brothers and Knights, and its officials Commanders.

The constitutions and rituals of these secret orders have declarations of principles, of which the following are characteristic: to protect and succour the weak and unfortunate, especially the widows and orphans of Confederate soldiers; to protect members of the white race from the incursions of the blacks; to oppose the Radical Republican party and the Union League; to defend constitutional liberty, to prevent usurpation, emancipate the whites, maintain peace
and order, the laws of God, the principles of 1776, and the political and social supremacy of the white race—in short, to oppose African influence in government and society, and to prevent any intermingling of the races.

During the Reconstruction the people of the South were divided thus nearly all native whites (the most prominent of whom were disfranchised) on the one side, irrespective of former political faith, and on the other side the colored races, led and by a few native and Northern whites called respectively scalawags and carpet-baggers, who were supported by the United States government and who controlled the Southern state governments. The Ku Klux movement in its wider aspects was the effort of the first class to destroy the control of the second class. To control the negro the Klan played upon his superstitious fears by having night parades, parades and drills of silent horsemen covered with white sheets, carrying skulls with coals of fire for eyes, sacks of bones to rattle, and wearing hideous masks. In calling upon dangerous blacks at night they pretended to be the spirits of dead Confederates, "just from Hell," and to quench their thirst would pretend to drink gallons of water which was poured into rubber sacks concealed under their robes. Mysterious signs and warnings were sent to disorderly negro politicians. The whites who were responsible for the conduct of the blacks were warned or driven away by social and business ostracism or by violence. Nearly all southern whites (except "scalawags"), whether members of this secret, in some cases in the Ku Klux movement. As the work of the societies succeeded, they gradually passed out of existence. In some communities they fell into the control of violent men and became simply bands of outlaws, dangerous even to the former members; and the anarchical aspects of the movement excited the North to vigorous condemnation.\(^1\) The United States Congress in 1871-1872 enacted a series of "Force Laws" intended to break up the secret societies and to control the Southern elections. Several hundred arrests were made, and a few convictions were secured. The elections were controlled for a few years, and violence was checked, but the Ku Klux movement went on until it accomplished its object by giving protection to the whites, reducing the blacks to order, replacing the whites in control of society and state, expelling the worst of the carpet-baggers and scalawags, and nullifying those laws of Congress which had resulted in placing the Southern whites under the control of a party composed principally of ex-slaves.

KUKU KHOTO (Chinese Ku-ki-ho), a city of the Chinese province of Shan-si, situated to the north of the Great Wall, in 45° 50' N. and 111° 45' E., about 160 m. W. of Kalgan. It lies in the valley of a small river which joins the Hwang-ho 50 m. to the south. There are two distinct walled towns in Kuku Khto, at an interval of a mile and a half; the one is the seat of the civil governor and is surrounded by the trading town, and the other is the seat of the military governor, and stands in the open country. In the first or old town more especially there are strong traces of western Asiatic influence; the houses are not in the Chinese style; being built all round with brick or stone and having flat roofs, while a large number of the people are still Mahomedans and, there is little doubt, descended from western settlers. The town at the same time is a great seat of Buddhism, the temples of which are filled with 20,000 persons devoted to a religious life. As the southern terminus of the route across the desert of Gobi from Ulasutai and the Tian Shan, Kuku Khto is a great mart for the exchange of flour, millet and manufactured goods for the raw products of Mongolia. A Catholic and a Protestant mission are maintained in the town. Lieut. Watts-Jones, R.E., was murdered at Kweil-hwa during the Boxer outbreak in 1900.

Early notices of Kuku Khto will be found in Gerbillon (1688-1698, in Du Halde (vol. ii., Eng. ed.), and in Astley's Collection (vol. iv.).

KULJA (Chinese, Il-ho), a territory in north-west China; bounded, according to the treaty of St Petersburg of 1881, on the W. by the Semirycchensk province of Russian Turkestan, on the N. by the Boro-khor Mountains, and on the S. by the mountains Khan-tengri, Muz-art, Terskei, Eshik-bashi and Narat. It comprises the valleys of the Tekez (middle and lower portion), Kunghez, the IlI as far as the Russian frontier and its tributary, the Kunghez with the Tekez, and turned towards the rivers. The area occupies about 1,000 sq. m. (Grum-Griziamo). The valley of the Kasbas is about 160 m. long, and is cultivated in its lower parts, while the Boro-khor Mountains are snow-clad in their eastern portion, and fall with very steep slopes to the valley. The Avar Mountains, which separate the Kasbas from the Kunghez, are lower, but rocky, naked and difficult of access. The valley of the Kunghez is about 120 m. long; the river flows first in a gorge, then amidst thickets of rushes, and very small pools. If its valley are fit for cultivation. The Narat Mountains in the south are also very wild, but are covered with forests of deciduous trees (apple tree, apricot tree, birch, poplar, &c.) and pine trees. The Tekez flows in the mountains, and pierces narrow gorges. The mountains which separate it from the Kunghez are also snow-clad, while those to the south of it reach 24,000 ft. of altitude in Khan-tengri, and are covered with snow and glaciers—the only pass through them being the Muzart. Forests and alpine meadows cover their northern slopes. Agriculture was formerly developed on the Tekez, as is testified by old irrigation canals. The IlI is formed by the junction of the Kunghez with the Tekez, and for 12 m. it flows through Kulja, its valley reaching a width of 50 m. at Horgos-kolot. This valley is famed for its fertility, and is admirably irrigated by canals, part of which, however, fell into decay after 55,000 of the inhabitants migrated to Russian territory in 1881. The climate of this part of the valley is, of course, continental—frosts of —22° F. and heats of 170° F. being experienced—but snow lasts only for one and a half months, and the summer heat is tempered by the proximity of the high mountains. Apricots, peaches, pears and some vines are grown, and also some cotton-trees near the town of Kulja, where the average yearly temperature is 48°-5° F. (January 15°, July 77°). Barley is grown up to an altitude of 6900 ft.

The population may number about 125,000, of whom 75,000 are settled and about 50,000 nomads (Grum-Griziamo). The Taranchis from East Turkestan represent about 40% of the population; about 40,000 of them left Kulja when the Russian troops evacuated the territory, and the Chinese government sold some of them to a number of Chinese merchants from different towns of Kashgaria to take their place. There are, besides, about 20,000 Siberians and Solons, 3,500 Kara-kidans, a few Dungans, and more than 10,000 Chinese. The nomads are represented by about 18,000 Kalmucks, and the remainder by Kirghiz. Agriculture is insufficient to satisfy the needs of the population, and food is imported from Semiryechens. Excellent beds of coal are
found in different places, especially about Kulja, but the fairly rich copper ores and silver ores have ceased to be worked.

The chief towns are Suidun, capital of the province, and Kulja. The latter (Old Kulja) is on the Ili river. It is one of the chief cities of the region, owing to the importance of its bazaars, and is the seat of the Russian consul and a telegraph station. The walled town is nearly square, each side being about a mile in length; and the walls are not only 30 ft. high, but broad enough on the top to serve as a carriag drive. Two broad streets cut the enclosed area into four nearly equal sections. Since 1870 a Russian suburb has been laid out on a wide scale. The houses of Kulja are almost all clay-built and flat-roofed, and except in the special Chinese quarter in the southern part of the town only a few public buildings show the influence of Chinese architecture. Of these the most noteworthy are the Taranchi and Dungan mosques, both with turned-up roofs, and the latter with a pagoda-looking minaret. The population is mainly Mahomedan, and there are only two Buddhist pagodas. A small Chinese Roman Catholic church has maintained its existence through all the vicissitudes of modern times. Paper and vermicheli are manufactured with rude appliances in the town. The outskirts are richly cultivated with wheat, barley, lucerne and poppies. Schuyler estimated the population of 1864, which includes Taranchis, Dungans, Sarts, Chinese, Kalmucks and Russians, at 10,000 in 1873; it has since increased.

New Kulja, Manchu Kulja, or Ili, which lies lower down the valley on the same side of the stream, has been a pile of ruins since the terrible massacre of all its inhabitants by the insurgent Dungans in 1868. It was previously the seat of the Chinese government for the province, with a large penal establishment and strong garrison; its population was about 70,000.

History.—Two centuries B.C. the region was occupied by the fair and blue-eyed Usuns, who were driven away in the 6th century of our era by the northern Huns. Later the Kulja territory became a dependency of Dzungaria. The Uighurs, and in the 12th century the Kara-Khitai, took possession of it in turn. Jenghiz Khan conquered Kulja in the 13th century, and the Mongol Khans resided in the valley of the Ili. It is supposed (Grun-Grzimalo) that the Oirats conquered it at the end of the 16th or the beginning of the 17th century; they kept it till 1755, when the Chinese annexed it. During the initial occupation of the Ili by the Dungans and the Taranchis formed here the Taranchi sanate, and this led to the occupation of Kulja by the Russians in 1871. Ten years later the territory was restored to China.

KULM (Culm). (1) A town of Germany, in the province of West Prussia, 33 m. by rail N.W. of Thorn, on an elevation above the plain, and 1 m. E. of the Vistula. Pop. (1905), 17,605. It is surrounded by old walls, dating from the 13th century, and contains some interesting buildings, notably its churches, of which two are Roman Catholic and two Protestant, and its medieval town-hall. The cadet school, founded here in 1776 by Frederick the Great, was removed to Kloster in 1850. There are large oil mills, also iron foundries and machine shops, as well as an important trade in agricultural produce, including fruit and vegetables. Kulm gives name to the oldest bishopric in Prussia, although the bishop resided at Pelplin. It was presented about 1220 by Duke Conrad of Masovia to the bishop of Prussia. Frederick II. pledged it in 1226 to the Teutonic order, to whom it owes its early development. By the second peace of Thorn in 1466 it passed to Poland, and it was annexed to Prussia in 1772. It joined the Populous League, and used to carry on very extensive manufactures of cloth.

(2) A village of Bohemia about 3 m. N.E. of Teplice, at the foot of the Erzgebirge, celebrated as the scene of a battle in which the French were defeated by the Austrians, Prussians and Russians on the 29th and 30th of August 1813 (see Napoleonische Kriege).

KULMBACH, or CULMBACH, a town of Germany, in the Bavarian province of Upper Franconia, picturesquely situated on the Weisser Main, and the Munich-Bamberg-Hof railway, 11 m. N.W. from Bayreuth. Pop. (1900), 4528. It contains a Roman Catholic and three Protestant churches, a museum and several schools. The town has several linen manufactories and a large cotton spinnery, but is chiefly famed for its many extensive breweries, which mainly produce a black beer, not unlike English porter, which is largely exported. Connected with these are malting and bottling works. On a rocky eminence, 1300 ft. in height, to the south-east of the town stands the former fortress of Plassenburg, during the 14th and 15th centuries the residence of the margraves of Bayreuth, called also marl-burgh. It is now in ruins and is now used as a prison. Kulmbach and Plassenburg belonged to the dukes of Meran, and then to the counts of Orlamunde, from whom they passed in the 14th century to the Hohenzollerns, burggravies of Nuremberg, and thus to the margraves of Bayreuth.

See F. Stein, Kulmbach und die Plassenburg in alter und neuer Zeit (Kulmbach, 1903); Huther, Kulmbach und Umgebung (Kulmbach, 1866); and C. Meyer, Quellen zur Geschichte der Stadt Kulmbach (Munich, 1858).

KULMSEE, a town of Germany, in the Prussian province of West Prussia, on a lake, 14 m. by rail N. of Thorn and at the junction of railways to Bromberg and Marienburg. Pop. (1900), 8987. It has a fine Roman Catholic cathedral, which was built in the 15th, and restored in the 17th century, and an Evangelical church. Until 1823 the town was the seat of the bishops of Kulm.

KULP, a town of Russian Transcaucasia, in the government of Erivan, 60 m. W.S.W. from the town of Erivan and 2 m. S. of the Aras river. Pop. (1897), 3074. Close by is the Kul salt mountain, about 1500 ft. high, consisting of beds of clay with projecting eaves and carved wooden verandas. The place, worked from time immemorial, is cut in the transparent, horizontal salt layers, from which cubes of about 70 lb. weight are extracted, to the amount of 27,500 tons every year.

KULU, a subdivision of Kangra district, Punjab, British India, which nominally includes the two Himalayan cantons or waziris of Lahul and Spiti. The taksil of Kulu has an area of 1054 sq. m., of which only 60 sq. m. are cultivated; pop. (1901), 68,954. The Sainj, which joins the Beas at Largi, divides the tract into two portions, Kulu proper and Soraj. Kulu proper, north of the Sainj, together with inner Soraj, forms a great basin of depression in the midst of the Himalayan system, having the narrow gorge of the Beas at Largi as the only outlet for its waters. North and east the Bara Bangahal and mid-Himalayan ranges rise to a mean elevation of 18,000 ft., while southward the Jalori and Dhaodladhar ridges attain a height of 11,000 ft. The higher villages stand 9000 ft. above the sea, and even the cultivated tracts have probably an average elevation of 5000 ft. The houses consist of four-storied chalets in little groups, huddled closely together on the ledges or slopes of the valleys, picturesquely built with projecting eaves and carved wooden verandas. The Beas, which, with its tributaries, drains the entire basin, rises at the crest of the Rohtang pass, 15,326 ft. above the sea, and has an average fall of 125 ft. per mile. Its course presents a succession of magnificent scenery, including cataracts, gorges, precipitous cliffs, and mountains clad with forests of deodar, towering above the tiers of pine on the lower rocky ledges. It is crossed by several suspension bridges. Great mineral wealth exists, but the difficulty of transport and labour prevents its development. Hot springs occur at three localities, much resorted to as places of pilgrimage. The character of the hillmen resembles that of most other mountaineers in its mixture of simplicity, independence and superstition. Tibetan polyandry still prevails in Soraj, but has almost died out elsewhere. The temples are dedicated rather to local deities than to the greater gods of the Hindu pantheon. Kulu is an ancient Rajput principality, which was conquered by Ranjit Singh about 1812. Its hereditary ruler,
KUM—KUMISHAH

945

years on the non-regulation system by three most successful administrators—Mr. Traill, Mr. J. H. Batten and Sir Henry Ramsay.

KUMASI, or COOMASIE, the capital of Ashanti, British West Africa, in 6° 34' 50" N., 2° 12' W., 168 m. by rail N. of Sekondi and 120 m. by road N.N.W. of Cape Coast. Pop. (1906), 6,820; including suburbs, over 12,000. Kumasi is situated on a low rocky eminence, from which it extends across a valley to the hill opposite. It lies in a clearing of the dense forest which covers the greater part of Ashanti, and occupies an area about 1½ m. in length and over 3 m. in circumference. The land immediately around the town, once marshy, has been drained. On the northwestern edge of the small river Omo, one of the headstreams of the Pra, the name Kumasi, more correctly Kum-ase (under the okum tree) was given to the town because of the number of those trees in its streets. The most imposing building in Kumasi is the fort, built in 1806. It is the residence of the chief commissioner and is capable of holding a garrison of several hundred men. There are also officers' quarters and cantonments outside the fort, European and native hospitals, and stations of the Basel and Wesleyan missions. The native houses are built with red clay in the style universal throughout Ashanti. They are somewhat thickly built, and the houses are divided into several compounds within which are several separate buildings. Near the railway station are the leading mercantile houses. The principal Ashanti chiefs own large houses, built in European style, and these are leased to strangers.

Before its destruction by the British in 1874 the city presented a handsome appearance and bore many marks of a comparatively high state of culture. The king's palace, built of red sandstone, had been modelled, it is believed, on Dutch buildings at Elmina. It was blown up by Sir Garnet (subsequently Viscount) Wolseley's forces on the 6th of February 1874, and but scanty vestiges of it remain. The town was only partially rebuilt on the withdrawal of the British troops, and it is difficult from the meagre accounts of early travellers to obtain an adequate idea of the capital of the Ashanti kingdom when at the height of its prosperity (middle of the 18th to middle of the 19th century). The streets were numerous, broad and regular; the main avenue was 70 yds. wide. A large market-place existed on the south-east, and behind it in a grove of trees was the Spirit House. This was the place of execution. Of its population before the British occupation there is no trustworthy information. It appears not to have exceeded 20,000 in the first quarter of the 19th century. This is owing partly to the fact that the imperial capital of Ashanti, and the meeting-place of several caravan routes from the north and east, was Kintampo, a town farther north. The decline of Kumasi after 1874 was marked. A new royal palace was built, but it was of clay, not brick, and within the limits of the former town we were wide stretches of grass-grown country. In 1866 the town again suffered at the hands of the British, when several of the largest and most ancient houses in the royal and priestly suburb of Bantama were destroyed by fire. In the revolt of 1900 Kumasi was once more injured. The railway from the coast, which passes through the Tarkwa and Obuasi gold-fields, reached Kumasi in September 1903. Many merchants at the Gold Coast ports thereupon opened branches in Kumasi. A marked revival in trade followed, leading to the rapid expansion of the town. By 1906 Kumasi had supplanted the coast towns and had become the distributing centre for the whole of Ashanti.

KUMISHAH, a district and town in the province of Isfahan, Persia. The district, which has a length of 50 and a breadth of 16 m., and contains about 45 villages, produces much grain. The town is situated on the high road from Isfahan to Shiraz, 52 m. S. of the former. It was a flourishing city several miles in circuit when it was destroyed by the Afghans in 1722, but is now a decayed place, with crumbled walls and mouldering towers and a population of barely 15,000. It has post and telegraph offices. South of the city and extending to the village Maksudbegi, 16 m. away, is a level plain, which in 1835 (February 28) was the scene of a battle in which the army (2,000 men, 16 guns)
of Mahommed Shah, commanded by Sir H. Lindsay-Bethune, routed the much superior combined forces (6000 men) of the shah's two rebellious uncles, Firman-Firma and Shuja es Saltana.

**Kumquat** (*Citrus japonica*), a much-branched shrub from 8 to 12 ft. high, the branches sometimes bearing small thorns, with dark green glossy leaves and pure white orange-like flowers standing singly or clustered in the leaf-axils. The bright orange-yellow fruit is round or ellipsoidal, about 1 in. in diameter, with a thick minutely tuberculate rind, the inner lining of which is sweet, and a watery acidulous pulp. It has long been cultivated in China and Japan, and was introduced to Europe in 1846 by Mr Fortune, collector for the London Horticultural Society, and shortly after into North America. It is much harder than most plants of the orange tribe, and succeeds well when grafted on the wild species, *Citrus trifoliata*. It is largely used by the Chinese as a sweetmeat preserved in sugar.

**Kumta**, or Coompta, a sea-coast town of British India, in the North Kanara district of Bombay, 40 m. S. of Karwar. Pop. (1901), 10,818. It has an open roadstead, with a considerable trade. Carving in sandal-wood is a specialty. The commercial importance of Kumta has declined since the opening of the Southern Mahtratta railway system.

**Kumyks**, a people of Turkish stock in Caucasia, occupying the Kumyk plateau in north Daghestan and south Terek, and the lands bordering the Caspian. It is supposed that Ptolemy knew them under the name of 'Kumy' as one of the northern tribes on the borders of the Caspian Sea. Various explanations have been given of their name. A. Vambéry supposes that they settled in their present quarters during the flourishing period of the Khazar kingdom in the 8th century. It is certain that some Kabardians also settled later. The Russians built forts in their territory in 1559 and under Peter I. Having long been more civilized than the surrounding Caucasian mountaineers, the Kumyks have always enjoyed some respect among them. The upper terraces of the Kumyk plateau, which the Kumyks occupy, leaving its lower parts to the Nogai Tatars, are very fertile.

**Kunene**, a river and valley of Afghanistan, on the north-west frontier of British India. The Kunar valley (Khoaspes in the classics) is the southern section of that great river system which reaches from the Hindu Kush to the Kabul river near Jalalabad, and which, under the names of Yarkhan, Chitral, Kashkar, &c., is more extensive than the Kabul basin itself. The lower reaches of the Kunar are wide and comparatively shallow, the river meandering in a multitude of channels through a broad and fairly open valley, well cultivated and fertile, with large flourishing villages and a mixed population of Mohmand and other tribes of Afghan origin. Here the hills to the eastward are comparatively bare, although they shut in the valley closely. Beyond them are the Bajour uplands. To the west are the great mountains of Kafiristan, called Kunshund, snow-capped, and running to 14,000 ft. of altitude. Amongst them are many wild but beautiful valleys occupied by Kafirs, who are rapidly submitting to Afghan rule. From 20 to 30 miles up the river on its left bank, under the Bajour hills, are thick clusters of villages, amongst which are the ancient towns of Kunar and Pasht. The chief tributary from the Kafiristan hills is the Pechdarra, which joins the river close to Chagan Sarai. It is a fine, broad, swift-flowing stream, with an excellent bridge over it (part of Abdur Rahman's military road developments), and has been largely utilized for irrigation. The Pechdarra finds its sources in the Kafir hills, amongst forests of pine and deodar and thick tangles of wild vine and ivy, wild figs, pomegranates, olives and oaks, and dense masses of sweet-scented shrubs. Above Chagan Sarai, as far as Aranawi, where the Afghan boundary crosses the river, and above which the valley belongs to Chitral, the river narrows to a swift mountain stream obstructed by boulders and hedged in with steep cliffs and difficult "parirs" or slopes of rocky hill-side. Wild almond here sheds its blossoms in the dawm of summer much of the floral beauty of Kashmir is to be found. At Asmar there is a slight widening of the valley, and the opportunity for a large Afghan military encampment, spreading to both sides of the river and connected by a very creditable bridge built on the cantilever system. There are no apparent relics of Buddhism in the Kunar, such as are common about Jalalabad or Chitral, or throughout Swat and Dir. This is probably due to the late occupation of the valley by Kafirs, who spread eastwards into Bajour within comparatively recent historical times, and who still adhere to their fastnesses in the Kunshund hills. The Kunar valley route to Chitral and to Kafiristan is being developed by Afghan engineering. It may possibly extend ultimately unto Badakshan, in which case it will form the most direct connexion between the Oxus and India, and become an important feature in the strategical geography of Asia. (T. H. H.)*

**Kunbis**, the great agricultural caste of Western India, corresponding to the Kurmis in the north and the Kurutis of Telugu country. Ethnically they cannot be distinguished from the Mahrattas, though the latter name is sometimes confined to the class who claim higher rank as representing the descendants of Sivaji's soldiers. In some districts of the Deccan they form an actual majority of the population, which is not the case with any other Indian caste. In 1901 the total number of both Kunbis and Mahrattas in all India was returned at nearly 84 millions.

**Kundt, August Adolph Eduard Eberhard** (1839—1894), German physicist, was born at Schwerin in Mecklenburg on the 18th of November, 1839, the son of a poor retired professor of physics in Hamburg, but afterwards went to Berlin. At first he devoted himself to astronomy, but coming under the influence of H. G. Magnus, he turned his attention to physics, and graduated in 1864 with a thesis on the depolarization of light. In 1867 he became privatdozent in Berlin University, and in the following year was chosen professor of physics at the Zürich Polytechnic; then, after a year or two at Würzburg, he was called in 1872 to Strassburg, where he took a great part in the organization of the new university, and was largely concerned in the erection of the Physical Institute. Finally in 1888 he went to Berlin as successor to H. von Helmholtz in the chair of experimental physics and directorship of the Berlin Physical Institute. He died after a protracted illness at Jerusalem, near Lübeck, on the 21st of May 1894. As an original worker Kundt was especially successful in the domains of sound and light. In the former he developed a valuable method for the investigation of aerial waves within pipes, based on the fact that a finely divided powder—lycopodium, for example—when dusted over the interior of a tube in which is established a vibrating column of air, tends to collect in heaps at the nodes, the distance between which can thus be ascertained. An extension of the method renders possible the determination of the velocity of sound in different gases. In light, Kundt's name is widely known for his inquiries in anomalous dispersion, not only in liquids and vapours, but even in metals, which he obtained in very thin films by means of a laborious process of electrolytic deposition upon platinized glass. He also carried out many experiments in magneto-optics, and succeeded in showing, what Faraday had failed to detect, the rotation under the influence of magnetic force of the plane of polarization in certain gases and vapours.

**Kunduz**, a khanate and town of Afghan Turkestan. The khanate is bounded on the N. by Badakshan, on the W. by Tashkurgan, on the N. by the Oxus and on the S. by the Hindu Kush. It is inhabited mainly by Uzbegs. Very little is known about the town, which is the trade centre of a considerable district, including Kataghan, where the best horses in Afghanistan are bred.

**Kunene**, formerly known also as Nourse, a river of South-West Africa, with a length of over 700 m., mainly within Portuguese territory, but in its lower course forming the boundary between Angola and German South-West Africa. The upper basin of the river lies on the inner versant of the high plateau region which runs southwards from Bihe parallel to the coast, forming in places ranges of mountains which give rise to many streams running south to swell the Kunene. The main stream rises in 2° 30′ S. and about 160 m. in a direct line from the sea. 
at Benguela, runs generally from north to south through four degrees of latitude, but finally flows west to the sea through a break in the outer highlands. A little south of 16° S. it receives the Kuolonga from the east, and in about 16° 30' the Kakulovar from the west. The Kakulovar has its sources in the Serra da Chella and other ranges of the Humapata district behind Mosa- matudes, but (though not) longest tributary of the Kunene, is but a small river in its lower course, which traverses the arid region comprised within the lower basin of the Kunene. Between the mouths of the Kuolonga and Kakulovar the Kunene traverses a swampy plain, inundated during high water, and containing several small lakes at other parts of the year. From this swampy region divergent branches run S.E. They are mainly inter- mittent, but the Kwamatuo, which leaves the main stream in about 15° 8' E., 17° 15' S., flows into a large marsh or lake called Etosha, which occupies a depression in the inner table-land about 3400 ft. above sea-level. From the S.E. end of the Etosha lake streams issue in the direction of the Okavango, to which in times of great flood they contribute some water. From the existence of this divergent system it is conjectured that at one time the Kunene formed part of the Okavango, and thus of the Zambezi basin. (See Ngami.)

On leaving the swampy region the Kunene turns decidedly to the west, and descends to the coast plain by a number of cataracts, of which the chief (in 17° 25' S., 14° 20' E.) has a fall of 330 ft. The river becomes smaller in volume as it passes through the sandy desert region with little or no vegetation. The stream is sometimes shallow and fordable, at others confined to a narrow rocky channel. Near the sea the Kunene traverses a region of sand-hills, its mouth being completely blocked at low water. The river enters the Atlantic in 17° 18' S., 11° 40' E. There are indications that a former branch of the river once entered a bay to the south.

KUNERSDORF, a village of Prussia, 4 m. E. of Frankfort- on-Oder, the scene of a great battle, fought on the 12th of August 1759, between the Prussian army commanded by Frederick the Great and the allied Russians under Saltykov and Austrians under von Louron, in which Frederick was defeated with enormous losses and his army temporarily ruined. (See Seven Years' War.)

KUNGRAD, a trading town of Asiatic Russia, in the province of Syr-darya, in the delta of the Amu-darya, 50 m. S. of Lake Aral; altitude 260 ft. It is the centre of caravan routes leading to the Caspian Sea and the Uralak province.

KUNGR, a town of eastern Russia, in the government of Perm, on the highway to Siberia, 58 m. S.E. of the city of Perm. Pop. (1892), 12,400; (1897), 14,424. Tanneries and the manufacture of glass are important local industries; iron- works and machinery are the chief industries. It has trade in boots, iron wares, caskets, tallow and linseed exported, and in tea imported direct from China.

KUNKEL (or KUNCEKEL) VON LOENSTJERN, JOHANN (1630-1703), German chemist, was born in 1630 (or 1638), near Rendsburg, his father being alchimist to the court of Holstein. He became chemist and apothecary to the dukes of Lauenburg, and then to the elector of Saxony, Johann Georg II., who put him in charge of the royal laboratory at Dresden. Intrigues engineered against him caused him to resign this position in 1677, and for a time he lectured on chemistry at Annaberg and Wittenberg. Invited to Berlin by Frederick William, in 1679 he became director of the laboratory and glass works of Brandenburg, and in 1688 Charles XI. brought him to Stockholm, giving him the title of Baron von Loenstjern in 1693 and making him a member of the council of mines. He died on the 20th of March 1703 (others say 1702) at Dreisibghufen, his country house near Pernau. Kunkel shares with Boyle the honour of having discovered the secret of the process by which Brand of Hamburg had prepared phosphorus in 1669, and he found how to make artificial ium by the incorporation of purple of Cassius. His work also included observations on putrefaction and fermentation, which he spoke of as sisters, on the nature of salts, and on the preparation of pure metals. Though he lived in an atmosphere of alchemy, he derived the notion of the alkahest or universal solvent, and denounced the deceptions of the adepts who pretended to effect the transmutation of metals; but he believed mercury to be a constituent of all metals and heavy minerals, though he held there was no proof of the presence of "sulphur comburesens."

His chief works were Oeffentliche Zuschriften von dem Phosphor Mirabilz (1678); Ars viillaria experimentalis (1689) and Laboratorium chymicum (1716).

Kunlong, the name of a district and ferry on the Salween, in the northern Shan States of Burma. Both are insignificant, but the place has gained notoriety from being the nominal terminus in British territory of the railway across the northern Shan States to the borders of Yunnan, with its present terminus at Lashio. In point of fact, however, this terminus will be 7 m. below the ferry and outside of Kunlong circle. At present Kunlong ferry is little used, and the village was burnt by Kachins in 1893. It is served by dug-outs, three in number in 1890, and capable of carrying about fifteen men on a trip. Formerly the trade was very considerable, and the Burmese had a customs station on the island, from which the place takes its name; but the rebellion in the great state of Theinni, and the southward movement of the Kachins, as well as the Mahommedan rebellion in Yunnan, diverted the caravans to the northern route to Bhamo, which is still chiefly followed. The Wa, who inhabit the hills immediately overlooking the Nam Ting valley, now make the route dangerous for trade. The great majority of these Wa live in a desolated British territory.

Kunzite, a transparent lilac-coloured variety of spodumene, used as a gem-stone. It was discovered in 1902 near Pala, in San Diego county, California, not far from the locality which yields the fine specimens of rubellite and lepidolite, well known to mineralogists. The mineral was named by Dr C. Baskerville after Dr George F. Kunz, the gem expert of New York, who first described it. Analysis by R. O. E. Davis showed it to be a spodumene. Kunzite occurs in large crystals, some weighing as much as 1000 grams each, and presents delicate hues from rose lilac to deep pink. It is strongly dichroic. Near the surface it may lose colour by exposure. Kunzite becomes strongly phosphorescent under the Röntgen rays, or by the action of radium or on exposure to ultra-violet rays. (See Spodumene.)

Kuopio, a province of Finland, which includes northern Karelia, bounded on the N.W. and N. by Uleåborg, on the E. by Oinonets, on the S.E. by Viborg, on the S. by St Michel and on the W. by Vasa. Its area covers 16,500 sq. m., and the population (1900) was 353,951, of whom 312,875 were Finnish-speaking, 31,828 Swedes, 1,846 Germans, 1,734 Russians and 1,785 Jews. The province is richer agriculturally than many other parts of the north (Suomenselkä hills), and from 300 to 400 ft. in the north. It is built up of gneissio-granites, which are covered, especially in the middle and east, with younger granites, and partly of gneisses, quartzite, and tali schists and augitic rocks. The whole is covered with glacial and later lacustrine deposits. The soil is of moderate fertility, but often full of boulders. Large lakes cover 16% of surface, marshes and peat bogs over 39% of the area, and forests occupy 2,672,240 hectares. Farmers ply along the lakes as far as Joensuu. The climate is severe, the average temperature being for the year 36°F., for January 13° and for July 63°. Only 2-3% of the whole surface is under cultivation. Rye, barley, oats and potatoes are the chief crops, and in good years these meet the needs of the population. Dairy farming and cattle breeding are of rapidly increasing importance. Nearly 38,800 tons of iron ore are extracted every year, and nearly 12,000 tons of pig iron and 6420 tons of iron and steel are obtained in ten iron-works. Engineering and chemical works, tanneries, saw-mills, paper-mills and distilleries are the chief industrial establish-ments. The preparation of carts, sledges and other wooden goods is an important domestic industry. Timber, iron, butter, furs and game are exported. The chief towns of the government are Kuopio (13,510), Joensuu (3054) and Iisalmi (1871).
KUPIO—KUPRILI

KUPIO, capital of the Finnish province of that name, situated on Lake Kalla-vest, 180 m. by rail from the Kuivola junction of the St Petersburg-Helsingfors main line. Pop. (1904), 13,510. It is picturesquely situated, is the seat of a bishop, and has a cathedral, two lyceums and two gymnasia (both for boys and girls), a commercial and several professional schools. There is an agricultural school at Leväli, close by. Kuopio, in consequence of its steamer communication with middle Finland and the sea (via Salma Canal), is a trading centre of considerable importance.

KUPRILI, spelt also Kuprili, Koepruli, Kepruli, &c., the name of a family of Turkish statesmen.

1. MAHOMMED KUPRILI (c. 1586–1661) was the grandson of an Albanian who had settled at Kupri in Asia Minor. He began life as a scullion in the imperial kitchen, became cook, then purveyor to Khosrev Pasha, and so, by wit and favour, rose to be master of the horse, "pasha of two tails," and governor of a series of important cities and sanjaks. In 1656 he was appointed governor of Tripoli; but before he had set out the Turkish sea-power, he was nominated to the grand vizierate at the instance of powerful friends. He accepted office only on condition of being allowed a free hand. He signalled his accession to power by suppressing an émeute of orthodox Mussulman fanatics in Constantinople (Sept. 22), and by putting to death certain favourites of the powerful Valide Sultan, by whose corruption and intrigues the administration had been confused. A little later (January 1657) he suppressed with ruthless severity a rising of the spahis; a certain Sheikh Salim, leader of the fanatical mob of whom he was accused, was burned in the Greek Patriarch, who had written to the voivode of Wallachia to announce the approaching downfall of Islam, was hanged. This impartial severity was a foretaste of Kuprili's rule, which was characterized throughout by a vigour which belied the expectations based upon his advanced years, and by a ruthlessness which in time grew to be almost blood-lust. His justification was the new life which he breathed into the decaying bones of the Ottoman empire.

Having cowed the disaffected elements in the state, he turned his attention to foreign enemies. The victory of the Venetians off Chios (May 2, 1657) was a severe blow to the Turkish sea-power, which Kuprili set himself energetically to repair. A second battle, fought in the Dardanelles (July 17–19), ended by a lucky shot blowing up the Venetian flag-ship; the losses of the Ottoman fleet were repaired, and in the middle of August Kuprili appeared off Tenedos, which was captured on the 31st and reincorporated permanently in the Turkish empire. Thus the Ottoman prestige was restored at sea, while Kuprili's ruthless enforcement of discipline in the army and suppression of revolts, whether in Europe or Asia, restored it also on land. It was, however, due to his haughty and violeto nature of his Machiavellan statecraft.

Kuprili's restless energy continued to the last, exhibiting itself on one side in wholesale executions, on the other in vast building operations. By his orders castles were built at the mouth of the Don and on the bank of the Dnieper, outworks against the ever-aggressive Tatars, as well as on either shore of the Dardanelles. His last activity as a statesman was to spur the Sultan on to press the war against Hungary. He died on the 31st of October, and it is related, on his death-bed, he is said to have given to the Sultan is characteristic of his Machiavellian statecraft.

This was: never to pay attention to the advice of women, to allow nobody to grow too rich, to keep his treasury well filled, and himself and his troops constantly occupied. Had he so desired, Kuprili might have taken advantage of the revolts of the Janissaries to place himself on the throne; instead, he recommended the Sultan to appoint his son as his successor, and so founded a dynasty of able statesmen who occupied the grand vizierate almost without interruption for half a century.

2. FAZ'Az Ahmed KUPRILI (1615–1676), son of the preceding, succeeded his father as grand vizier in 1661 (this being the first instance of a son succeeding his father in that office since the time of the Chenderëlis). He began life in the clerical career, which he left, at the age of twenty-three, when he had attained the rank of Mudderris. Usually humane and generous, he sought to relieve the people of the excessive taxation and to secure them against unlawful exactions. Three years after his accession to office Turkey suffered a crushing defeat at the battle of St Gothard and was obliged to make peace with the Empire. But Kuprili's influence with the Sultan remained unshaken, and five years later was recognized as quick as he could. His wisdom was shown upon a question of limiting the power of the Grand Vizier, with the effect that the position was formed a marked contrast to the cruelty of his father; but he was given to intemperance, and the cause of his death was dropsy brought on by alcohol abuse.

3. ZADE MUSTAPA KUPRILI (1637–1691), surnamed Fazil, son of Mahomed Kuprili, became grand vizier to Suleiman II. in 1689. Called to office after disaster had driven Turkey's forces from Hungary and Poland and her fleets from the Mediterranean, he began by ordering strict economy and reform in the taxation; himself setting the example, which was widely followed, of voluntary contributions for the army, which with the navy he reorganized as quickly as he could. His wisdom was shown by the prudent measures which he took by enacting the Niwami-jeiid, or new regulations for the improvement of the condition of the Christian rayas, and for affording them security for life and property; a conciliatory attitude which at once bore fruit in Greece, where the people abandoned the Venetian cause and returned to their allegiance to the Porte. He met his death at the battle of Salankamen in 1691, when the total defeat of the Turks by the Austrians under Prince Louis of Baden led to their expulsion from Hungary. 

HUSSEIN KUPRILI (surnamed AHMED-ZADE) was the son of Hassan, a younger brother of Mahomed Kuprili. After occupying various important posts he became grand vizier in 1697, and owing to his ability and energy the Turks were able to drive the Austrians back over the Save, and Turkish fleets were sent into the Black Sea and the Mediterranean. The efforts of European diplomacy succeeded in inducing Austria and Turkey to come to terms by the treaty of Carlowitz, whereby Turkey was shorn of her chief conquests (1699). After this event Hussein Kuprili, surnamed "the Wise," devoted himself to the suppression of the revolts which had broken out in Arabia, Egypt and the Crimea, to the reduction of the Janissaries, and to the institution of administrative and financial reform. Unfortunately the intrigues against him drove him from office in 1702, and soon afterwards he died.

5. NUMAN KUPRILI, son of Mustafa Fazil, became grand vizier in 1710. The expectations formed of him were not fulfilled, as although he was tolerant, wise and just like his father, he judicially sought to take upon himself all the details of administration, a task which proved to be beyond his powers. He failed to introduce order into the administration and was dismissed from office in less than fourteen months after his appointment.
KURAKIN—KÜRDISTAN

949

6. Abdullah Kuprili, a son of Mustafa Fazil Kuprili, was appointed Kaimmakam or locum tenens of the grand vizier in 1703. He commanded the Persian expedition in 1723 and captured Tabriz in 1725, resigning his office in 1726. In 1735 he again took up his pursuit against the Persians, but fell at the disastrous battle of Bagaiever, thus emulating his father's heroic death at Selankamen.

KURAKIN (Kurakin), Boris Ivanovich, Prince (1676–1727), Russian diplomatist, was the brother-in-law of Peter the Great, their wives being sisters. He was one of the earliest of Peter's pupils. In 1697 he was sent to Italy to learn navigation. His long and honourable diplomatic career began in 1707, when he was sent to Rome to induce the pope not to recognize Charles XII's candidate, Stanislaus Leszczyński, as king of Poland. From 1708 to 1712 he represented Russia at London, Hanover, and the Hague successively, and, in 1713, was the principal Russian plenipotentiary at the peace congress of Utrecht. From 1716 to 1722 he held the post of ambassador at Paris, and when, in 1724, Peter set forth on his Persian campaign, Kurakin was appointed the supervisor of all the Russian ambassadors accredited to the various European courts. "The father of Russian diplomacy," as he has justly been called, was remarkable throughout his career for infinite tact and insight, and a wonderfully correct appreciation of men and events. He was most useful to Russia during the eleven years of the Seven Years' War (see SWEDEN, History) was drawing to a close. Notably he prevented Great Britain from declaring war against Peter's close ally, Denmark, at the crisis of the struggle. Kurakin was one of the best-educated Russians of his day, and his autobiography, carried down to 1709, is an historical document of the first importance. He intended to write a history of his own times with Peter the Great as the central figure, but got no further than the summary, entitled History of Tsar Peter Alekseevich and the People Nearest to Him (1685–1694) (Rus.).

See Archives of Prince A. T. Kurakin (Russ.) (St Petersburg, 1890); A. Bruckner, Kurakin as Diplomatist in Western Europe in the beginning of the XVIIIth Century (Russ.) (St Petersburg, 1892). (R. N. B.)

KURBASH, or KOURBASH (from the Arabic kurbash, a whip; Turkish girbach, and French courbache), a whip or strap about a yard in length, made of the hide of the hippopotamus or rhinoceros. It is an instrument of punishment and torture used in various Mahomedan countries, especially in the Turkish empire. "Government by kurbash" denotes the oppression of a people by the constant abuse of the kurbash to maintain authority, to collect taxes, or to pervert justice. The use of the kurbash dates back to the Ottoman empire, once common in Egypt, has been abolished by the British authorities.

KÜRDISTAN, in its wider sense, the "country of the Kurds" (Koords), including that part of Mount Taurus which buttresses the Armenian table-land (see ARMENIA), and is intersected by the Batum Su, the Bohtan Su, and other tributaries of the Tigris; and the wild mountain district, watered by the Great and Little Zab, which marks the western termination of the great Iranian plateau.

Population.—The total Kurdish population probably exceeds two and a half millions, namely, Turkish Kurds 1,650,000, Persian 800,000 and Russian 50,000, but there are no trustworthy statistics. The great mass of the population has its home in Kurdistan. But Kurds are scattered irregularly over the country from the river Sakaria on the west to Lake Urnia on the east, and from Kars on the north to Jebel Sinjar on the south. There is also an isolated settlement in Khorasan. The tribes, ashiret, into which the Kurds are divided, resemble in some respects the Highland clans of Scotland. Very few of them number more than 10,000 souls, and the average is about 3,000. The sedentary and pastoral Kurds, Yezdis, who live in villages in winter and encamp on their own pasture-grounds in summer, form an increasing majority of the population. The nomad Kurds, Kocher, who always dwell in tents, are the wealthiest and most independent. They spend the summer on the mountains and high plateaus, which they enter in May and leave in October; and pass the winter on the banks of the Tigris and on the great plain north of Jebel Sinjar, where they purchase right of pasturage from the Shammar Arabs. Each tribe has its own pasture-grounds, and trespass by other tribes is a fertile source of quarrel. During the periodical migrations Moslem and Christian alike suffer from the predatory instincts of the Kurd, and disturbances are frequent on this district of theTriplebraid. In Turkey they are required to pay taxes; but the nomads only pay the sheep tax, which is collected as they cross the Tigris on their way to their summer pastures.

Character.—The Kurd delights in the bracing air and unrestricted liberty of the mountains. He is rarely a muleteer or camel-man, and does not take kindly to handicrafts. The Kurds generally bear a very indifferent reputation, a worse reputation perhaps, than they really deserve. Being aliens to the Turks in language and to the Persians in religion, they are everywhere treated with mistrust, and live as it were in a state of chronic warfare with the powers that be. Such a condition is not of course favourable to the development of the better qualities of human nature. The Kurds are thus wild and lawless; they are much given to brigandage; they oppress and frequently maltreat the Christian populations with whom they are brought in contact,—these populations being the Armenians in Diarbekr, Erzerum, Van, the Jacobites and Syrians in the Jebel-Tür, and the Nestorians and Chaldeans in the Hakkari country.

Perhaps the most distinguishing characteristic of the Kurdish chiefs is their isolation from the rest of an ancient people, and the appearance of a people, whose ancestors, in the course of centuries, have preserved, in spite of the steadily repeated utter extermination attempted by the Kurds, every family, every man, every woman, and every child, as there are none in the history of the world to whom the very name of death is a thing of wonder. Thus the tribe has always been able to remain an alien, and a people of the time, and has been able to maintain itself against all external invasions, and has been able to maintain itself in the face of the invasions of the nomads, even though the latter often killed the majority of each tribe. This is the reason why the tribe remained for nearly two thousand years a distinct people, and was able to preserve its language, its literature, its culture, its history, and its traditions. The tribe has always been able to maintain itself against all external invasions, and has been able to maintain itself in the face of the invasions of the nomads, even though the latter often killed the majority of each tribe. This is the reason why the tribe remained for nearly two thousand years a distinct people, and was able to preserve its language, its literature, its culture, its history, and its traditions. The tribe has always been able to maintain itself against all external invasions, and has been able to maintain itself in the face of the invasions of the nomads, even though the latter often killed the majority of each tribe. This is the reason why the tribe remained for nearly two thousand years a distinct people, and was able to preserve its language, its literature, its culture, its history, and its traditions.

Though ignorant and unsophisticated the Kurd is not wanting in natural intelligence. In recent years educated Kurds have held high office under the sultan, including that of grand vizier, have assisted in translating the Bible into Turkish, and in editing a newspaper. The men are lithe, active and strong, but rarely of unusual stature. The women do not veil, and are allowed

1 See Notices et Extraits des MSS., xiii, 305. Of the tribes enumerated in this work of the 14th century who still retain a leading place among the Kurds, the following names may be quoted: Guranieh of Darrang, modern Gurun; Zengeneh, in Hamadan hills, now in Kermanshah; Hasnani of Kerku and Arbil, now in the Dersim mountains, having originally come from Khorasan according to tradition; Sobreh of Shokalada and Tel-Hafed, modern Arbil, from whom descend the Balban of Suleimanieh; Zerzorei of Hinnir mountains, modern Zeras of Ushnu (cuneiform pillars of Kel-i-shin and Sidek noticed by author); Salamereh, modern Julumerik, said to be descended from the caliph Merwan-il-Hakam; Hakkarieh, Khakkarieh inhabiting Zanun of Arab geography; Bokhtieh, modern Bohtan. The Rowadi, to whom Saladin belonged, are probably modern Rawendi, as they held the fortress of Arbil (Arbela). Some other names are mentioned, but the orthography is so doubtful that it is useless to try to identify them.

2 The Sherif-nama, a history of the Kurds dating from the 16th century, tells us that "whenever the Persians, Turkmens, or European invaders or the Roman Turks came to take the lands of the Kurds, the Kurds always defended the land with their lives. The Turks, however, in their greed for wealth and power, often went to war with the Kurds, and the Kurds were often defeated, but they never yielded. They always fought with great valor, and their bravery was well known."

3 The gradual extension of their power over Persian Kurdistan, is then traced down to the Safavid period.
KURDISTAN

great freedom. The Kurds as a race are proud, faithful and hospitable, and have rude but strict feelings of honour. They are, however, much under the influence of dervishes, and when their fanaticism is aroused their habitual lawlessness is apt to degenerate into savage barbarity. They are not deficient in martial spirit, but have an innate dislike to the restraint of military discipline, and are described by legends, and in lyric and in epic poems, which have been handed down from earlier times and are recited in a weird melancholy tone.

Antiquities.—Kurdistan abounds in antiquities of the most varied and interesting character. But it has been very little opened up to modern research. A series of rock-cut cuneiform inscriptions extend from Malatia on the west to Miandoab (in Persia) on the east, and from the banks of the Aras on the north to Rowanduz on the south, which record the glories of a Turanian dynasty, who ruled the country of Naírî during the 8th and 7th centuries, n.c., contemporaneously with the lower Assyrian empire. Intermingled with these are a few genuine Assyrian inscriptions of an earlier date; and in one instance, at Van, a later tablet of Xerxes brings the record down to the period of Grecian history. The most ancient monuments of this class, however, are to be found at Holwán and in the neighbourhood, where the sculptures and inscriptions belong probably to the Gutti and Luli tribes, and date from the early Babylonian period. In the northern Kurdish districts which represent the Arzanene, Arzile, Zabîlîne, and Mizane of the ancients, the very intermixed dialects, e.g. at Arzen, Mîyasîlîn (anc. Martyropolis), Sisauronon, and the ruins of Dunisir near Dara, which Sachau identified with the Armenian capital of Tigranocerta. Of the Macedonian and Parthian periods there are remains both sculptured and inscribed at several points in Kûrdistan; at Bîsitun or Behistan (q.v.), in a cave at Amadâ, at the Mithraic temple of Kerkêî, on the rocks at Sir Pûl-ê-Zohab near the ruins of Holwân, and probably in some other localities, such as the Balkîn country between Lâhîlîn and Koî-Sânjâk; but the most interesting site in all Kûrdistan, perhaps in all western Asia, is the ruin-fire temple of Pî Kollî on the southern frontier of Suleimâna. Among the débris of this temple, which is scattered over a bare hillsides, are to be found above one hundred slabs, inscribed with Parthian and Pahlavi characters, the fragments of a wall which formerly supported the eastern face of the edifice, and bore a bilingual legend of great length, dating from the Sassanian period. There are also remarkable Sassanian remains in other parts of Kûrdistan—at Salîmûs to the north, and at Kermânsî and Kasr-i-Shîrîn on the Turkish frontier to the south.

Language.—The Kurdish language, Kermânji, is an old Persian tongue. It is spoken north and west of the Arzilean words and to the south with a certain Turanian element which may not improbably have come down from Babylonian times. Several peculiar dialects are spoken in secluded districts in the mountains, but the only varieties which, from their extensive use, require to be specified are the Zara and the Gurân. The Zara is spoken throughout the western portion of the Dersim country, and is said to be unintelligible to the Kermânî-speaking Kurds. It is largely intermingled with Armenian, and may contain some trace of the old Cappadocian, but is no doubt of the same Aryan stock as the standard Kûrdish. The Gurân, which is spoken throughout eastern and Kermânshâh chiefly differs from the northern Kurdish in being entirely free from any Semitic intermixture. It is thus somewhat nearer to the Persian than the Kermânî dialect, but is essentially the same language. It is a mistake to suppose that there is no

1 The Gurân are mentioned in the Mesûlîk-ê-Abâr as the dominant tribe of the southern Kûrdistan in the 14th century, occupying the same seats as at present, from the Hamadân frontier to Shah- rizar. Their name probably signifies merely "the mountainers," being derived from Gur or Gari, "a mountain," which is also found in the during all the Kurdish dialects, and the name is translated in Persian. They are a fine, active and hardy race, individually brave, and make excellent soldiers, though in appearance very inferior to the tribal Kûrdîs of the northern districts. These latter indeed delight in gay colours, while the Gurân dress in the most homely costume, wearing coarse blue cotton vests, with felt caps and coats. In a great part of Kûrdistan the name Gurân has become synonymous with an agricultural peasantry, as opposed to the migratory shepherds.

Kûrdish literature. Many of the popular Persian poets have been translated into Kûrdish, and there are also books relating to the Kûrdish language, history, country, etc., in the Kûrdîs of the north, and of the Gurâns of Kermânshâh to the south. The New Testament in Kûrdish was printed at Constantinople in 1857. Professor Reha published a grammar and vocabulary of the Hakkârî dialect in 1879 in the Proceedings of the academy of St Petersburg and a French-Kurdish dictionary compiled originally by Mons. Jaba, many years Russian consul at Arzan. 

Religion.—The great body of the nation, in Persia as well as in Turkish Armenia, are Moslems, and in the Shafti sect, but the recesses of the Dersim to the north and of Zara to the south there are large half- pagan communities, who are called indifferently Ali-Illâhi and Ali-Shafi'I, and whose religious beliefs are of a mixed character. Among the Gurâns of the south the village of Baba Yâdgâr, in a gorge of the hills above the old city of Holwân, is thus regarded with a supreme veneration. Similar little sanctuaries in the tribal communities are to be seen in the country, which may be compared with the tenets of the Druses and Nosairis in Syria and the Ismailis in Persia.

History.—With regard to the origin of the Kurds, it was formerly considered sufficient to describe them as the descendants of the Carduchi, who opposed the retreat of the Ten Thousand through the mountains, but modern research traces them for the most part back to the tribes of the Gurân. A clown of the mountains. The mountains overhanging Assyria were held by the Gurân, a title which signified a "warrior," and which was rendered in Assyrian by the synonym of Gards or Kûrdw, the precise term quoted by Strabo to explain the name of the Cardaces (Kûdaxas). These Gurân were a Turanian tribe of such power as to be placed in the early cuneiform records on an equality with the other nations of western Asia, that is, with the Syrians and Hitites, the Sâusên, Elâmîtes, and Akkadians of Babylonia; and during the whole period of the Assyrian empire they seem to have preserved a more or less independent existence. Nevertheless, the Gurân, who had become friends with the Medes, and, in common with all the nations inhabiting the high plateaus of Asia Minor, Armenia and Persia, became gradually Aryanized, owing to the immigration at this period of history of tribes in overwhelming numbers which, from whatever quarter they may have sprung, belonged certainly to the Aryan family.

The Gûtû or Kûrûd were reduced to subjection by Cyrus before he descended upon Babylon, and furnished a contingent of fighting men to his successors, being thus mentioned under the names of Sâsâpirans and Alarôdians in the muster roll of the army of Xerxes which was preserved by Herodotus.

In later times they passed successively under the sway of the Macedonians, the Parthians, and Sassanians, being especially befriended, if we may judge from tradition as well as from the remains still existing in the country, by the Arsacid monarchs, who were probably of a cognate race. Gotarzes indeed, whose name may perhaps be translated "chief of the Gurân," was traditionally believed to be the founder of the Gurân, the principal tribe of southern Kûrdistan, and his name and titles are still preserved in a Greek inscription at

The Kûhû tribe are traditionally descended from Cudarz-Ibn-Ghûo, whose son Rohâm was sent by Bahman Kâlîn to destroy Jerusalem and bring the Jews into captivity. This Rohâm is the individual usually called Bukhî-i-nasser (Nebuchadrezzar) and he was a distant descendant of the ruler of al-Maîn, "the neighbouring country" who had ever since remained in the hands of his descendants, under whose names Gurân "(Sheref-Nâmâ, Persian MS.). The same popular tradition still exists in the country, and the PÎTAPZHÎ GÎROGPOPO2 is found on the rock at Bejestân, showing that Cudarz-Ibn-Ghûo was really an historic personage. See Journ. Roy. Geog. Soc. ix. 114.
KURDISTAN—KURILES

Behistun near the Kurdish capital of Kermānshāh. Under the caliphs of Bagdad the Kurds were always giving trouble in one quarter or another. In a.d. 838, and again in 905, there were Armenian-Turkish War of 1827–29 was followed by the massacre of Armenians at Sassan and other places, 1804–96, in which the Kurds took an active part.

KURDISTAN, in the narrower sense, a province of Persia, situated in the hilly districts between Azerbaidjan and Kermanshah, and extending to the Turkish frontier on the W., and bounded on the E. by Persia and Hamadan. In proportion to its size and population it pays a very small yearly revenue—only about £1,400—due to the fact that a great part of the population consists of wild and disorderly nomad Kurds. Some of these nomads pass their winters in Turkish territory, and have their summer pasture-grounds in the highlands of Kurdistan. This adds much to the difficulty of collecting taxation. The province is divided into sixteen districts, and its eastern part, in which the capital is situated, is known as Ardelan. The capital is Senendij, usually known as Sinna (not Sina, or Sanna, as some writers have it), situated 60 m. N.W. of Hamadan, in 33° 15' N., 47° 38' E., at an elevation of 3,500 ft. The city has a population of about 35,000 and manufactures great quantities of carpets and felts for the supply of Turkey and for export. Some of the carpets are very fine and expensive, rugs 2 yards by 1½ costing £15 to £20. Post and telegraph offices have been established since 1879.

KURGAN, a town (founded 1553) of West Siberia, in the government of Tobolsk, on the Ob river, 160 m. E. of Chelyabinsk, and on the left bank of the Tobol, in a wealthy agricultural district. Pop. (1897), 10,579. Owing to its position at the terminus of steam navigation up the river Tobol, it has become second only to Tyumen as a commercial centre. It is a market town and a centre of trade in furs and fells for the supply of Muscat in Britain since 1834 for the purposes of a cable station.

KURIA MURIA ISLANDS, a group of five islands in the Arabian Sea, close under the coast of Arabia, belonging to Britain and forming a dependency of Aden. They are lofty and rocky, and have a total area of 28 sq. m., that of the largest, Hallaism, being 22 sq. m. They are identified with the ancient Insulae Zenobitae, and have been mentioned by Ptolemy. The Kuria Muria was called a large trade in cabbages in Sweden, and considerable export of grain, tallow, meat, hides, butter, game and fish, there being three large fairs in the year. In the vicinity are a great number of prehistoric kurgans or burial-mounds.

KURLIES (Jap. Chishima, “thousand islands”), a chain of small islands belonging to Japan, stretching in a north-easterly direction from Nemuro Bay, on the extreme east of the island of Yezo, to Chishima-kaiyu (Kurile Strait), which separates them from the southernmost point of Kamchatka. They extend from 4° 45' to 50° 56' N. and from 145° 25' to 160° 45' E. Their coast-line measures 1,496 m.; their area is 650 sq. m.; their total number is 32, and the names of the eight principal islands, counting from the south, are Kunashiri, Shikotan, Etorofu (generally called Etorop, and known formerly to Europe as Staten Island), Urup, Simusir, Onoketan, Paramoshiri (Paramusir) and Shumshiri. From Noshapzaki (Notsu-no-ake or Notsu Cape), the most easterly point of Nemuro province, to Tomari, the most westerly point in Kunashiri, the distance is 75 m., and the Kurile Strait separating Shumshiri from Kamchatka is about the same width. The Kuriles is derived from the Russian kuril (to smoke), in allusion to the active volcanic character of the group. The dense fogs that envelop these islands, and the violence of the currents in their vicinity, have greatly hindered exploration, so that little is known of their physiography. They lie entangled in a vast net of sea-weed; are the resort of innumerable birds, and used to be largely frequented by seals and sea-otters, which, however, have been
KURISCHES HAFF—KUROPATKIN

almost completely driven away by unregulated hunting. Near the south-eastern coast of Kunashir stands a mountain called Rausunobori (2005 ft. high), round whose base sulphur bubbles up in large quantities, and hot springs as well as a hot stream are found. On the west coast of the same island is a boiling lake, called Ponto, which deposits on its bed and round its shores black sand, consisting almost entirely of pure sulphur. This island has several lofty peaks; Ponnobori-yama near the east coast, and Chachenobori and Kurindake in the north. One of these latter, called Naibo-wan, has for its bed a plateau covered with forest, and has a number of streams abounding with salmon. Shana, the chief port, is in Rubeys Bay. This island, the principal of the group, is divided into four provinces for administrative purposes, namely, Etorofu, Furubesu, Shana and Shibetaro. Its mountains are Atosha-nobori (4035 ft.) in Etorofu; Chiripunpuri (3000 ft.) in Shana; and Mokoro-nobori (3930 ft.) and Atulyadake (3932 ft.) in Shibetaro. Among the other islands three only call for notice on account of their altitudes, namely, Ketoi-jima, Rashua-jima and Matua-jima, which rise to heights of 3944, 3504 and 5140 ft. respectively.

Population.—Not much is known about the aborigines. By some authorities Ainu colonists are supposed to have been the first settlers, and to have arrived therevia Yezo; by others, the earliest comers are believed to have been a hyperborean tribe travelling southwards by way of Kamchatka. The islands themselves have not been sufficiently explored to determine whether they furnish any ethnological evidences. The present population aggregates about 4400, or 0.7 per sq. m., of whom about 600 are Ainu (q.v.). There is little disposition to emigrate thither from Japan proper, the number of settlers being less than 100 annually.

History.—The Kurile Islands were discovered in 1634 by the Dutch navigator Martin de Vries. The three southern islands, Kunashir, Etorofu, and Shikotan, are believed to have belonged to Japan from a remote date, but at the beginning of the 18th century the Russians, having conquered Kamchatka, found their way to the northern part of the Kuriles in pursuit of fur-bearing animals, with which the islands then abounded. Gradually these encroachments were pushed farther south, simultaneously with aggressions imperilling the Japanese settlements in the southern half of Sakhalin. Japan's occupation was far from effective in either region, and in 1875 she was not unwilling to conclude a convention by which she agreed to withdraw altogether from Sakhalin provided that Russia withdrew from the Kuriles.

An officer of the Japanese navy, Lieut. Gunji, left Tokyo with about forty comrades in 1892, his intention being to form a settlement on Shumshir, the most northerly of the Kurile Islands. They embarked in open boats, and for that reason, as well as because they were going to constitute themselves their country's extreme outpost, the enterprise attracted public enthusiasm. After a long struggle the immigrants became fairly prosperous.

KURISCHES HAFF, a lagoon of Germany, on the Baltic coast of East Prussia, stretching from Labiau to Memel, a distance of 60 m., has an area of nearly 680 sq. m. It is mostly shallow and only close to Memel attains a depth of 23 ft. It is thus un navigable except for small coasting and fishing boats, and sea-going vessels proceed through the Memeler Tief (Memel Deep), which connects the Baltic with Memel and has a depth of 90 ft. and a breadth of 800 to 1000 ft. The Kurisches Haff is separated from the Baltic by a long spit, or tongue of land, the so-called Kurische Nehrung, 72 m. in length and with a breadth of 1 to 2 miles. The latter is fringed throughout its whole length by a chain of dunes, which rise in places to a height of nearly 200 ft. and threaten, unless checked, to be pressed farther inland and silt up the whole Haff.

See Berendt, Geologie des Kurischen Haffs (Königsberg, 1869); Sommer, Das Kurische Haff (Danzig, 1890); A. Bezenberger, Die Kurische Nehrung (Stuttgart, 1880); and Lindner, Die Preussischen Wäste einst und jetzt, Bilder von der Kurischen Nehrung (Oesterweck, 1898).

KURNIEL, or KARNEL, a town and district of British India, in the Madras presidency. The town is built on a rocky site at the junction of the Hindir and Tungabhadra rivers 33 m. from a railway station. The old Hindu fort was levelled in 1865, with the exception of one of the gates, which was preserved as a specimen of ancient architecture. Cotton cloth and carpets are manufactured. Pop. (1891), 25,376, of whom half are Mussalmans.

The District of Kurnool has an area of 7758 sq. m., pop. (1901), 872,055, showing an increase of 6% in the decade. Two long mountain ranges, the Nallamalais and the Yellamalais, extend in a line from north to south, through its centre. The principal heights of the Nallamalai range are Biranikonda (3140 ft.), Gundlabrahmeswaram (3053 ft.), and Durugapukonda (3086 ft.). The Yellamalai is a low range, generally flat-toped with scarped sides; the highest point is about 2000 ft. Several low ridges run parallel to the Nallamalais, broken here and there by gorges, through which mountain streams take their course. Several of these gaps were dammed across under native rule, to form tanks for purposes of irrigation. The principal rivers are the Tungabhadra and Kistna, which bound the district on the north. Not much in flood, the Tungabhadra averages 900 yards broad and 15 ft. deep. The Kistna here flows chiefly through uninhabited jungles, sometimes in long smooth reaches, with intervening shingly rapids. The Bhavanesar rises on the Nallamalais, and falls into the Kistna at Sunagamwar, a place of pilgrimage. During the 18th century Kurnool formed the jagir of a semi-independent Pathan Nawab, whose descendant was dispossessed by the British government for treason in 1838. The principal crops are cotton, oil-seeds, and rice, with a little indigo and tobacco. Kurnool suffered very severely from the famine of 1876-1877, and to a slight extent in 1896-1897. It is the chief centre of the operations at the Madras Irrigation Company taken over by government in 1882. The canal, which starts from the Tungabhadra river near Kurnool town, was constructed at a total cost of two millions sterling, but has not been a financial success. A more successful work is the Cumbum tank, formed under native rule by damming a gorge of the Gundakramma river. Apart from the weaving of coarse cotton cloth, the chief industrial establishments are cotton presses, indigo vats, and saltpetre refiners. The district is served by the Southern Maharatta railway.
and in 1881 he won further fame by a march of 500 miles from Tashkent to Gök-Tepê, taking part in the storming of the latter place. In 1882 he was promoted major-general, at the early age of 34, and he henceforth was regarded by the government as the natural successor of Skobelev. In 1890 he was promoted lieutenant-general, and thirteen years later, having acquired in peace and war the reputation of being one of the foremost soldiers in Europe, he quitted the post of minister of war which he then held and took command of the Russian army then gathering in Manchuria for the contest with Japan. His ill-success in the great war of 1904–5, astonishing as it seemed at the time, was largely attributable to his subjection to the superior command of Admiral Alexeiev, the tsar's viceroy in the Far East, and to internal friction amongst the officers and the Russian people, history of the (Eng. tran. 1893) he frankly admitted his own mistakes and paid the highest tribute to the gallantry of the troops who had been committed to battle under conditions unfavourable to success. After the defeat of Mukden and the retirement of the whole army to Tieling he resigned the command to General Linievich, taking the latter officer's place at the head of one of the three armies in Manchuria. (See Russo—Japanese War.)

KURO SIWO, or Kuro Shio (literally blue salt), a stream current in the Pacific Ocean, easily distinguishable by the warmer waters of the Kurram valley the colour of its waters, flowing northeastwards along the east coast of Japan, and separated from it by a strip of cold water. The current persists as a stream to about 40 N., between the meridians of 150° E. and 160° E., when it merges in the general easterly drift of the North Pacific. The Kuro Siwo is the analogue of the Gulf Stream in the Atlantic.

KURRAM, a river and district on the Kohat border of the North-West Frontier province of India. The Kurram river drains the southern flanks of the Safed Koh, enters the plains a few miles above Banoo, and joins the Indus near Iks Azulaha after a course of more than 200 miles. The district has an area of 1,278 sq. m.; pop. (1901), 54,257. It lies between the Miranazai Valley and the Afghan border, and is inhabited by the Turis, a tribe of Turki origin who are supposed to have subjugated the Bangash Pathans five hundred years ago. It is highly irrigated, well peopled, and crowded with small fortified villages, orchards and groves, to which a fine background is afforded by the dark pine forests and alpine snows of the Safed Koh. The beauty and climate of the valley attracted some of the Mogul emperors of Delhi, and the remains exist of a garden planted by Shihab-ud-Din. Fortunately for the well-being of the inhabitants of Kabul, and every five or six years a military expedition was sent to collect the revenue, the soldiers living meanwhile at free quarters on the people. It was not until about 1848 that the Turis were brought directly under the control of Kabul, when a governor was appointed, who established himself in Kurram. The Turis, being Shiah Mohammedans, never liked the Afghan rule. During the second Afghan War, when Sir Frederick Roberts advanced by way of the Kurram valley and the Peiwar Kotal to Kabul, the Turis lent him every assistance in their power, and in consequence their independence was granted them in 1880. The Administration of the Kurram valley was finally undertaken by the British government, at the request of the Turis themselves, in 1890. Technically it ranks, not as a British district, but as an agency or administered area. Two expeditions in the Kurram valley also require mention: (1) The Kurram expedition of 1856 under Brigadier Chamberlain. The Turis on the first annexation of the Kohat district by the British had given much trouble. They had repeatedly league with other tribes to bar the Miranazai valley, harbouring fugitives, encouraging resistance, and frequently attacking Bangash and Khattak villages in the Kohat district. Accordingly in 1856 a British force of 480 troops traversed their country, and the tribe entered into engagements for future good conduct. (2) The Kohat-Kurram expedition of 1897 under Colonel W. Hill. During the frontier risings of 1897 the inhabitants of the Kurram valley, chiefly the Massozi section of the Orakzais, were infected by the general excitement, and attacked the British camp at Sada and other posts. A force of 14,530 British troops traversed the country, and the tribesmen were severely punished. In Lord Curzon’s reorganization of the frontier in 1900–1901, the British troops were withdrawn from the forts in the Kurram valley, and were replaced by the Kurram militia, reorganized in two battalions, and chiefly drawn from the Turi tribe.

KURSEONG, or Karsiang, a sanatorium of northern India, in the Darjeeling district of Bengal, 20 m. S. of Darjeeling and 4860 ft. above sea-level; pop. (1901), 4496. It has a station on the mountain railway, and is a centre of the tea trade. It also contains boys’ and girls’ schools for Europeans and Eurasians.

KURSK, a government of middle Russia, bounded N. by the government of Orel, E. by that of Voronezh, S. by Kharkow and W. by Chernigov. Area, 17,932 sq. m. It belongs to the central plateau of middle Russia, of which it mostly occupies the southern slope, the highest parts being in Orel and Kaluga, to the north of Kursk. Its surface is 700 to 1100 ft. high, deeply trenched by ravines, and consequently assumes a hilly aspect when viewed from the river valleys. Cretaceous and Eocene rocks prevail, and chalk, iron-stone, potters’ clay and phosphates are among the economic minerals. No fewer than four hundred streams are counted within its borders, but none of them is of any service as waterways. A layer of fertile loess covers the whole surface, and the Kursk belongs almost entirely to the black-earth region. Its flora is distinct from that of the governments to the north, not only on account of the black-earth flora which enters into its composition, but also of the plants of south-western Russia which belong to it, a characteristic which is accentuated in the southern portion of the government. The climate is milder than that of middle Russia generally, and winds from the south-east and the south-west prevail in winter. The average temperatures are—for the year 42°F., for January 14°F. and for July 67°F. The very interesting magnetic phenomenon, known as the Byelgorod anomaly, covering an oval area 20 m. long and 12 m. wide, also prevails in the vicinity of Kursk.

The population, 1,593,597 in 1862, was 2,391,001 in 1897, of whom 1,268,488 were women and 199,676 lived in towns. The estimated pop. in 1906 was 2,797,000. It is thoroughly Russian (76% Great Russians and 24% Little Russians), and 94% are peasants who own over 59% of the land, and live mostly in large villages. Owing to the rapid increase of the peasantry and the small size of the allotments given at the emancipation of the serfs in 1861, emigration, chiefly to Siberia, is on the increase, while 80,000 to 100,000 men leave home every summer to work in the meat and dairy-farming governments. Three-quarters of the available land is under crops, chiefly rye, other crops being wheat, oats, barley, buckwheat, millet, potatoes, sugar-beets, hemp, flax, sunflowers and fruits. Grain is exported in considerable quantities. Bees are commonly kept, as also are large numbers of livestock. Factories (steam flour-mills, sugar-factories, distilleries, wool-washing, tobacco factories) give occupation to about 23,000 workers. Domestic and petty trades are on the increase in the villages, and new ones are being introduced, the chief products being boots, ikons (sacred images) and shrines, toys, caps, vehicles, baskets, and pottery. About 17 m. from the chief town is held the Kornennaya fair, formerly the greatest in South Russia, and still with an annual trade valued at £1,000,000. The Kursk district contains more than sixty old town sites; and barrows or burial mounds (kurgans) are extremely abundant. Notwithstanding the active efforts of the local councils (zemstvos), less than 10% of the population read and write. The government is crossed from north to south and from east to south by two main lines of railway. The trade in grain, hemp, hemp-seed oil, sheepkins, hides, tallow, felt goods, wool, hemp, hemp and leather goods is very brisk. There are fifteen districts, the chief towns of which, with their populations in 1897, are Kursk (g. o. Byelgorod (21,850), Dmitrov (2731), Fatezh (4959), Graivoron (7660), Korocha (14,405), Lgov (5376), Novyi Oskol (2762), Oboya (11872), Putliv (8062), Rylko (11,415), Staroi Oskol (16,662), Shchigry (3329), Suja (12,850) and Tim (7386). There are more than twenty villages which have from 5000 to 12,000 inhabitants each.

(P. A. K.; J. T. B.)
KURSK, a town of Russia, capital of the government of the same name, at the junction of the railways from Moscow, Kiev and Kharkov, 330 m. S.S.W. from Moscow. Pop. (1807), 52,806. It is built on two hills (750 ft.), the slopes of which are planted with orchards. The environs all round are well wooded and the woods are famous for their nightingales. Among the public buildings the more noticeable are a monastery with an image of the Virgin, Metropolitan Palaces, and a cathedral, the Orthodox Greek cathedral (18th century); and the episcopal palace, Kursk being a bishopric of the national church. It is essentially a provincial town, and is revered as the birthplace of Theodosius, one of the most venerated of Russian saints. It has a public garden, and has become the seat of several societies (medical, musical, educational and for sport). Its factories include steam flour-mills, distilleries, tobacco-works, hemp-crushing mills, tanneries, soap-works and iron-works. It has a great yearly fair (Korennya), and an active trade in cereals, linen, leather, fruit, horses, cattle, hides, sheepskins, furs, down, bristles, wax, tallow and manufactured goods.

Kursk was in existence in 1032. It was completely destroyed by the Mongols in 1240. The defence of the town against an incursion of the Turkish Polovtsi (or Comans or Cumans) is celebrated in The Triumph of Igor, an epic which forms one of the most valuable relics of early Russian literature. From 1586 to the close of the 18th century the citadel was a place of considerable strength; the remains are now comparatively few.

KURTZ, JOHANN HEINRICH (1809–1890), German Lutheran theologian, was born at Montjoie near Aix-la-Chapelle on the 17th of December 1809, and was educated at Halle and Boppard. Abandoning the idea of a commercial career, he gave himself to the study of theology and became religious instructor at the gymnasium of Mitau in 1835, and ordinary professor of theology (church history, 1852; exegesis, 1859) at Dorpat. He resigned his chair in 1870 and went to live at Marburg, where he died on the 26th of April 1890. Kurtz was a prolific writer, and many of his books, especially the Lehrbuch der heiligen Geschichte (1843), became very popular. In the field of biblical criticism he wrote a Geschichte des Alten Bundes (1848–1852), Zur Theologie der Psalmen (1865) and Erklärung des Briefs an die Hebräer (1866). His chief work was done in church history, among his productions being Lehrbuch der Kirchengeschichte für Studierende (1849), Abriss der Kirchengeschichte (1852) and Handbuch der allgemeinen Kirchengeschichte (1853–1896). Several of his books have been translated into English.

KURUMAN, a town in the Bechuanaland division of Cape Colony, 120 m. N.W. of Kimberley and 85 m. S.W. of Vryburg. It is a station of the London Missionary Society, founded in 1818, and from 1821 to 1870 was the scene of the labours of the Rev. John Moffat (q.v.) who became the first chief of the Bechuana tongue. In the middle period of the 19th century Kuruman was the rendezvous of all travellers going north or south. Of these the best known is David Livingstone. The trunk railway line passing considerably to the east of the town, Kuruman is no longer a place of much importance. It is pleasantly situated on the upper course of the Kuruman river, being beautified by gardens and orchards, and presents a striking contrast to the desert conditions of the surrounding country. Its name is that of the son and heir of Mosilikaatze, the founder of the Matabele nation. Kuruman disappeared during his father’s lifetime and the succession passed to Lobengula (see Rhodesia: History). In November 1890 the town was besieged by a Boer force. The garrison, less than a hundred strong, held out for six weeks against over 1000 of the enemy, but was forced to surrender on the 1st of January 1900. In June following it was recaptured by the British.

KURUMBAS and KURUBAS, aboriginal tribes of southern India, by some thought to be of distinct races. The British are two types of Kurumbas, those who live on the Nilgiri plateau, speak the Kurumba dialect and are more savage; and those who live in the plains, speak Kanarese and are civilized. The Kurumbas are a small people, with wild matted hair and scanty beard, sickly-looking, pot-bellied, large-mouthed, with projecting jaws, prominent teeth and thick lips. Their villages are called mottas, groups of four or five huts, built in mountain glens or forests. At the 1901 census the numbers were returned at 4083.

KURUNEGALA, the chief town in the north-western province of Ceylon. Pop. of the town, 6423; of the district, 240,470. It was the residence of the kings of Ceylon from A.D. 1310 to 1347, and is romantically situated under the shade of Adagalla (the rock of the Tusked Elephant), which is 600 ft. high. It was in 1902 the terminus of the Northern railway (59 m. from Colombo, which has since been extended 200 m. farther, to the northernmost coast of the Jaffna Peninsula. Kurunegala is the centre of rice, coco-nut, tea, coffee and cocoa cultivation.

KURUNTWAD, or KURANDVAD, a native state of India, in the Deccan division of Bombay, forming part of the Southern Maharatta jagirs. Originally created in 1772 by a grant from the peshwa, the state was divided in 1811 into twoparts, one of which, called Shedial, lapsed to the British government in 1857. In 1853 Kuruntwad was further divided between a senior and a junior branch. The territory of both is widely scattered among other native states and British districts. Area of the senior branch, 185 sq. m.; pop. (1901), 42,474; revenue, £13,000. Area of junior branch, 114 sq. m.; pop. (1901), 34,003; revenue, £9,000. The joint tribute is £940. The chiefs are Brahmins by caste, of the Patwardhan family. The town of Kuruntwad, in which both branches have their residence, is on the right bank of the Panchganga river near its junction with the Kistna. Pop. (1901), 19,451.

KURZ, HERMANN (1813–1873), German poet and novelist, was born at Reutlingen on the 30th of November 1813. Having studied at the theological seminary at Maulbronn and at the university of Tübingen, he was for a time assistant pastor at Ehningen. He then entered upon a literary career, and in 1863 was appointed university librarian at Tübingen, where he died on the 10th of October 1873. Kurz is less known to fame by his poems, Gedichte (1836) and Dichtungen (1839), than by his historical novels, Schillers Heimatjahre (1843, 3rd ed. 1890) and Der Sonnenwirt (1854, 2nd ed., 1862), and his excellent translations from English, Italian and Spanish. He also published a successful modern German version of Gottfried von Strassburg's Tristan und Isolde (1844). His collected works were published in ten volumes (Stuttgart, 1874), also in twelve volumes (Leipzig, 1904).

His daughter, ISOLDE KURZ, born on the 21st of December 1853 at Stuttgart, takes a high place among contemporary lyric poets in Germany with her Gedichte (Stuttgart, 1888, 3rd ed. 1893) and Neue Gedichte (1903). Her short stories, Florensische Noedeln (1890, 2nd ed. 1893), Phantasten und Mächten (1890), Italienische Erzählungen (1895) and Von Dazumal (1900) are distinguished by a fine sense of form and clear-cut style.

KUSAN ("lake" or "inland bay"), a small group of North American Indian tribes, formerly living on the Coos river and the coast of Oregon. They call themselves Anasitch, and other names given them have been Ka-us or Kwo-Kwoos, Cowes and Cook-koo-oose. They appear to be in no way related to their neighbours. The few survivors, mostly of mixed blood, are on the Umpqua reservation, Oregon.

KUSHALGARH, a village in the Kohat district of the North-West Frontier province of India. It is only notable as the point at which the Indus is bridged to permit of the extension of the strategic frontier railway from Rawalpindi to the Miranazer and Kurram valleys.

KUSHK, a river of Afghanistan, which also gives its name to the chief town in the Afghan province of Badghis, and to a military post on the border of Russian Turkestan. The river Kushk, during a portion of its course, forms the boundary between Afghan and Russian territory; but the town is some 20 m. from the border. Kushk, or Kushkinski Post, is now a fourth-class Russian fortress, on a Russian branch railway from Merv, the
KUSTANAIISK—KUTTENBERG

955
termius of which is 12 m. to the south, at Chahil Dukteran. It is served by both the Transcaspian and the Orenburg-Tashkent railways. The terminus is that of the former branch, and in the event of war would become an important base for a Russian advance. Some confusion has arisen through the partial application of the name of Kuskh to this terminus, though it is situated neither at the Russian post nor at the old town.

(T. H. H.)

KUSTANAIISK, a town of Asiatic Russia, in the province of Turgai, on the Tobol river, 410 m. E.N.E. of Orenburg, in a very fertile part of the steppes. Pop. (1897), 14,065. The first buildings were erected in 1871, and it has since grown with American-like rapidity. The immigrants from Russia built a large village, which became the centre of the district administration in 1884, and a town in 1893, under the name of Nicolaevsk, changed later into Kustanaisk. It is an educational centre, and a cathedral has been built. There are tanneries, tallow works, pottery, and a fair for cattle, while its trade makes it a rival to Orenburg and Troitsk.

KÜSTENLAND (coast-land or littoral), a common name for the three crown-lands of Austria, Géiz and Gradsica, Istrià and Trieste. Their combined area is 506 sq. m., and their population is 856,000. They contain certain administrative purposes under the governor of Trieste, the legal and financial authorities of which also exercise jurisdiction over the entire littoral.

KUTAIAH, KUTAYA, or KUTAHIA, the chief town of a sanjak in the vilayet of Brusa (Khudavendikia), Asia Minor, is situated on the Pursaksu, an affluent of the Sakaria (anc. Sangarius). The town lies at an important point of the great road across Asia Minor from Constantinople to Aleppo, and is connected by a branch line with the main line from Eske-sherh to Ahum Kara-Hissar, of the Anatolian railway. It has a busy trade; pop. estimated at 22,000. Kutahia has been identified with the ancient Cotecaum.

KUTAIS, a government of Russian Transcaucasia, situated between the Caucasus range on the N. and the Black Sea on the W., the government of Tiflis on the E. and the province of Kars on the S. Area, 14,313 sq. m. The government includes the districts of Guria, Mingrelia, Imeretia, Abkhasia and Svanetia, and consists of four distinct parts: (1) the lowlands, drained by the Rion, and continued N.W. along the shore of the Black Sea; (2) the southern slopes of the Caucasus range, which separate Kutais from Tiflis; (3) the slopes of the Armenian highlands, as well as a portion of the highlands themselves, drained by the Chorokh and its tributary, the Ajarsk-tskhal, which formerly constituted the Batum province. Generally speaking, the government is mountainous in the north and south. Many secondary ridges and spurs issue from the main range, forming high, narrow valleys (see CAUCASUS). The district of Batum and Artvin in the S.W., which in 1903 were in part separated for administration as the semi-military district of Batum, are filled up by spurs of the Pontic range, 9,000 to 12,000 ft. high, the Arzani ridge separating them from the plateau of Kars. Deep gorges, through which tributaries of the Chorokh force their passage to the main river, intersect these highlands, forming most picturesque gorges. The lowlands occupy over 2,000 sq. m. They are mostly barren in the littoral region, but extremely fertile higher up the Rion.

The climate is very moist and warm. The winters are often without frost at all in the lowlands, while the lowest temperatures observed are 18° F. at Batum and 6° at Poti. The mountains condense the moisture brought by the west winds, and the yearly amount of rain varies from 50 to 120 in. The chief rivers are the Rion, which enters the Black Sea at Poti; the Chorokh, which enters the same see at Batum; and the Ingur, the Kodor and the Bzyb, also flowing into the Black Sea in Abkhasia. The vegetation is extremely rich, its character suggesting the sub-tropical regions of Japan (see CAUCASIA). The population belongs almost entirely to the Kartvelian or Georgian group, and is distributed as follows: Imeretians, 41.2%; Mingrelians and Lazèes, 22.5%; Gurians, 7.3%; Ajars, 5.8%; Svanetians, 1.3%; of other nationalities there are 6% of Abkhassians, 2.6% of Turks, 1.3% of Armenians, Greeks, Persians, Turks, Greeks, Persians, Kurds, Ossetes and Germans. By religion 87% of the population are Greek Orthodox and only 10% Musulmans. The total population was 933,773 in 1897, of whom 508,468 were women and 77,702 lived in towns. The estimated population in 1906 was 924,800. The land is excessively subdivided, and, owing to excellent cultivation, fetches very high prices. The chief crops are maize, wheat, barley, beans, rye, hemp, potatoes and tobacco. Maize, wine and timber are largely exported. Some cotton-trees have been planted. The crops of fruits, which are cultivated, as also many exotic plants (eucalyptus, cork-oak, camellia, and even tea). Manganes ore is the chief mineral, and is extracted for export to the extent of 150,000 to 180,000 tons annually, besides coal, lead and silver ores, copper, naphtha, some gold, lithographic stone and marble. Factories are still in infancy, but silk is spun. A railway runs from the Caspian Sea, via Tiflis and the Suram tunnel, to Kutais, and thence to Poti and Batum, and from Kutais to the Tkvibuli coal and manganese mines. The export of both local produce and goods shipped by rail from new points of Transcaucasia is very considerable, the chief being the two chief ports of Caucasia. Kutais is divided into seven districts, of which the chief towns, with their populations in 1897, are Kutais, capital of the province (g.); Laibashi (834), chief town of Lechum, of which Svanetia makes a separate administrative unit; Ozurgeti (4,064), Oni, chief town of Racha; Senaki (101); Kvirili, of Sharopan district; Zugdidi; and two semi-military districts—Batum (28,512) with Artvin (1900) and Sukhum-kaleh (7800).

(P. A. K.—J. T. B.)

KUTAIS, a town of Russian Caucasus, capital of the government of the same name, 60 m. by rail E. of Poti and 3 m. from the Rion station of the railway between Poti and Tiflis. Pop. (1897), 32,492. It is one of the oldest towns of Caucasia, having been the ancient capital (Aea or Kutasa) of Colchis, and later the capital of Imeretia (from 792); Procopius mentions it under the name of Kotatission. Persians, Mongols, Turks and Russians have again and again destroyed the town and its fortress. In 1810 it became Russian. It is situated on both banks of the Rion river, which is spanned by three bridges. Its most remarkable building is the ruined cathedral, erected in the 11th century by the Bagratische, the ruling dynasty of Georgia, and destroyed by the Turks in 1594, and thence to the present day is the most representative extant of Georgian architecture. The fort, mentioned by Procopius, is now a heap of ruins, destroyed by the Russians in 1770. The inhabitants make hats and silks, and trade in agricultural produce and wine. On the right bank of the Rion is a government model garden, with a model farm.

KUT-EL-AMARA, a small town in Turkish Asia, on the east bank of the Tigris (32° 20' 19" N., 44° 45' 37" E.) at the point where the Shatt-el-Hai leaves that stream. It is a coaling station of the steamers plying between Basra andBagdad, and an important Turkish post for the control of the lower Tigris.

KUTENAI (Kutonaga), a group of North-American Indian tribes forming the distinct stock of Kitunahan. Their former range was British Columbia, along the Kootenay lake and river. They were always friendly to the whites and noted for their honesty. In 1904 there were some 550 in British Columbia; and in 1908 there were 606 on the Flathead Agency, Montana.

KUTTALAM, or COURTALLAM, a sanatorium of southern India, in the Tinnevelly district of Madras; pop. (1901), 1,197. Though situated only 450 ft. above sea-level, it possesses the climate of a mountain, owing to its elevation to the breezes that reach it through the Ghatas. It has long been a favourite resort for European visitors, the season lasting from July to September; and it has recently been made more accessible by the opening of the railway from Tinnevelly into Travancore. The scenery is most picturesque, including a famous waterfall.

KUTTENBERG (Czech, Kutná Hora), a town of Bohemia, Austria, 45 m. E. by S. of Prague. Pop. (1900), 14,799, mostly
KUTUSOV—KVASS

Czech. Amongst its buildings are the Gothic five-naved church of St Barbara, begun in 1368, the Gothic church of St Jacob (14th century) and the Late Gothic Trinity church (end of 15th century). The Wälscher Hof, formerly a royal residence and mint, was built at the end of the 13th century, and the Gothic Steinerne Haus, which since 1419 serves as town-hall, contains one of the richest archives in Bohemia. The industry includes sugar-refining, brewing, the manufacture of cotton and woollen stuffs, leather goods and agricultural implements.

The town of Kuttenberg owes its origin to the silver mines, the existence of which can be traced back to the first part of the 13th century. The city developed with great rapidity, and at the outbreak of the Hussite troubles, early in the 14th century, was next to Prague the most important in Bohemia, having become the favourite residence of several of the Bohemian kings. It was here that, on the 18th of January 1419, Wenceslaus IV, signed the famous decree of Kuttenberg, by which the Bohemian nation was given three votes in the elections to the faculty of Prague University as against one for the three lower towns. In the autumn of the same year Kuttenberg was the scene of horrible atrocities. The fierce mining population of the town was mainly German, and fanatically Catholic, in contrast with Prague, which was Czech and ultraquist. By way of reprisals for the Hussite outrages in Prague, the miners of Kuttenberg seized on any Hussites they could find, and burned, beheaded or threw them alive into the shafts of disused mines. In this way 1600 people are said to have perished, including the magistrates and clergy of the town of Kauflin, which the Kuttenbergers had taken after this they had made the city the base for their unsuccessful attack on the Taborites; Kuttenberg was taken by Žižka, and after a temporary reconciliation of the warring parties was burned by the imperial troops in 1422, to prevent its falling again into the hands of the Taborites. Žižka none the less took the place, and under Bohemian auspices it awoke to a new period of prosperity. In 1541 the richest mine was hopelessly flooded; in the insurrection of Bohemia against Ferdinand I. the city lost all its privileges; repeated visitations of the plague and the horrors of the 'Thirty Years' War' completed its ruin. Half-hearted attempts after the peace to repair the ruined mines failed; the town became impoverished, and in 1729 was devastated by fire. The mines were abandoned at the end of the 18th century; one mine was again opened by the government in 1874, but the work was discontinued in 1903.

KUSNETZ, Golenishchev-Kutusov, Mikhail Larionovich, Prince of Smolenisk (1745-1813), Russian field marshal, was born on the 16th of September 1745 at St Petersburg, and entered the Russian army in 1759 or 1760. He saw active service in Poland, 1762-69, and against the Turks, 1770-74; lost an eye in action in the latter year; and after that travelled for some years in central and western Europe. In 1784 he became major-general, in 1787 governor-general of the Crimea; and under Suworov, whose constant companion he became, he won considerable distinction in the Turkish War of 1788-91, at the taking of Ochakov, Odessa, Benda and Ismail, and the battles of Rímnik and Mashin. He was now (1791) a lieutenant-general, and successively occupied the positions of ambassador at Constantinople, governor-general of Finland, commandant of the corps of cadets at St Petersburg, ambassador at Berlin, and governor-general of St Petersburg. In 1803 he commanded the Russian corps which opposed Napoleon's advance on Vienna (see NAPOLEONIC CAMPAIGNS), and won the hard-fought action of Dürenstein on the 18th-19th of November. On the eve of Austerlitz (9th) he tried to prevent the Allied generals from fighting a battle, and when he was overruled took so little interest in the event that he fell asleep during the reading of the orders. He was, however, present at the battle itself, and was wounded. From 1806 to 1811 Kutusov was governor-general of Lithuania and Kiev; and in 1811, then being commander-in-chief in the war against the Turks, he was made a prince. Shortly after this he was called by the Emperor to the army and the people to command the army that was retreating before Napoleon's advance. He gave battle at Borodino (9th), and was defeated, but not decisively, and after retreating to the south-west of Moscow, he forced Napoleon to begin the celebrated retreat. The old general's cautious pursuit evoked much criticism, but at any rate he allowed only a remnant of the Grand Army to regain Prussian soil. He was now field marshal and prince of Smolensk—this title having been given him for a victory over part of the French army at that place in November 1812. Early in the following year he carried the war into Germany, took command of the allied Russians and Prussians, and prepared to raise all central Europe in arms against Napoleon's domination, but before the opening of the campaign he fell ill and died on the 25th of March 1815 at Bunzlau. Memorials have been erected to him at that place and at St Petersburg.

Mikhailovsky-Danilevsky's life of Kutusov (St Petersburg, 1850) was translated into French by A. Fizelier (Paris, 1850).

KUWET (Kuweit, Kuwait), a port in Arabia at the north-western angle of the Persian Gulf in 29° 20' N. and 48° E., about 80 m. due S. of Basra and 60 m. S. of the mouth of the operands by the English government in 1819. The name Kuwet is the diminutive form of Kust, a common term in Trak for a walled village; it is also shown in some maps as Grane or Grain, a corruption of Ku'ain, the diminutive of Korn, a horn. It lies on the south side of a bay 20 m. long and 5 m. wide, the mouth of which is protected by two islands, forming a fine natural harbour, with good anchorage in from 4 to 9 fathoms of water. The town has 15,000 inhabitants and is clean and well built; the country around being practically desert, it depends entirely on the sea and its trade, and its sailors have a high reputation as the most skilful and trustworthy on the Persian Gulf; when they visit Europe the notoriety of the Upper Nejd has given it great importance as the port of entry for rice, piece goods &c., and of export for horses, sheep, wool and other products of the interior. Kuwet was recommended in 1850 by General F. R. Chesney as the terminus of his proposed Ephrates Valley railway, and since 1858, when the extension of the Anatolian railway to Bagdad and the Gulf has been under discussion, attention has again been directed to it. An alternative site for the terminus has been suggested in Um Khassa, at the head of the Khor 'Abdallah, where a branch of the Shat al Arab formerly entered the sea; it lies some 20 m. N.E. of Kuwet and separated from it by the island of Bahrain. The town was for some time known in Turkish by the name of Kowiet. An attempt by Turkey to occupy Kuwet in 1858 was met by a formal protest from Great Britain against any infringement of the status quo, and in 1859 Sheikh Mubarak of Kuwet placed his interests under British protection.

The total trade passing through Kuwet in 1904-1905 was valued at £160,000. The imports include arm and ammunition, piece goods, rice, coffee, sugar, &c.; and the exports, horses, pearls, dates, wool, &c. The steamers of the British India Steamship Company call fortnightly. (R. A. W.)

KVASS, or Kvass (a Russian word for "leaven"), one of the national alcoholic drinks of Russia, and popular also in eastern Europe. It is made, by a simultaneous acid and alcoholic fermentation, of wheat, rye, barley and buckwheat meal or of rye-bread, with the addition of sugar or fruit. It has been a universal drink in Russia since the 16th century. Though in the large towns it is made commercially, elsewhere it is frequently sold as a"domestic production." Kvass is of very low alcoholic content (0.7 to 2-2°). There are, beside the ordinary kind, superior forms of the drink, such as apple or raspberry kvass.
KWAKIUTL—KWANZA

KWAKIUTL, a tribe of North-American Indians of Wakashan stock. They number about 2000. Formerly the term was used of the one tribe in the north-east of Vancouver, but now it is the collective name for a group of Wakashan peoples. The Kwakiutls and Indians are remarkable for their conservatism in all matters and specially their adherence to the custom of Potlatch, which it is sometimes suggested originated with them. Tribal government is in the hands of secret societies. There are three social ranks, hereditary chiefs, middle and third estates, most of the latter being slaves or their descendants. Entry to the societies is forbidden the latter, and can only be obtained by the former after torture and fasting. The hamatsa or cannibal society is only open to those who have members in the society for eight years.

KWANGCHOW BAY (KWANGCHOW WAN), a coaling station on the south coast of China, acquired, along with other concessions, by the French government in April 1808. It is situated on the east side of the peninsula of Lienchow, in the province of Kwangtung, and directly north of the island of Hainan. It is held on lease for 90 years on similar terms to those by which Kiaochow is held by Germany, Port Arthur by Japan and Wei-hai-wei by Great Britain. The concession includes the islands lying in the bay; these enclose a roadstead 18 m. long by 6 m. wide, with admirable natural defences and a demand at no part of less than 33 ft. It forms the estuary of the Ma-Tse river, navigable by the largest men-of-war for 12 m. from the coast. The limits of the concession inland were fixed in November 1890. On the left bank of the Ma-Tse's France gained from Kow Chow Fu a strip of territory 11 m. by 6 m., and on the right bank a strip 15 m. by 11 m. from Lei Chow Fu. The country is well populated; the capital and chief town is Lei Chow. The cession carries with it full territorial jurisdiction during the continuance of the lease. In January 1906 it was placed under the authority of the government of Indo-China, who in the same year appointed a civil administrator over the country, which was divided into three districts. The population of the territory is about 185,000. A mixed tribunal has been instituted, but the local organization is maintained for purposes of administration. In addition to the territory acquired, the right has been given to connect the bay by railway with the city and harbour of Ompon, situated on the west side of the peninsula, and in consequence of difficulties which were offered by the provincial government on the occasion of taking possession, and which compelled the French to have recourse to arms, the latter took a preponderating position and the tariff rights in the three adjoining prefectures. Two lines of French steamships call at the bay. By reason of the great strategical importance of the bay, and the presence of large coal-beds in the near neighbourhood, much importance is attached by the French to the acquirement of Kwangchow Wan.

KWANG-SI, a southern province of China, bounded N. by Kwei-chow and Hu-nan, E. and S. by Kiang-yung, S.W. and W. by French Indo-Chino and Yun-nan. It covers an area of 89,000 sq. m. It is the least populous province of China, its inhabitants numbering (1908) little over 5,000,000. The Skias, an aboriginal race, form two-thirds of the prefectural cities. The provincial capital is Kwei-Lin Fu, or City of the Forest of Cinnamon Trees, and there are besides ten prefectural cities. The province is largely mountainous. The principal rivers are the Si-kiang and the Kwei-chow, or Cinnamon River, which takes its rise in the district of Hing-gan, in the north of the province, and in the neighbourhood of that of Shan river, which flows northward through Hu-nan to the Tung-ching Lake. The Kwei-chow, on the other hand, rises in the southern course, and passes the towns of Kwei-lin, Yang-so Hien, P'ing-le Fu, Chao-p'ing Hien, and so finds its way to Wu-chow Fu, where it joins the waters of the Si-kiang. Another considerable river is the Liu-kiang, or Willow River, which rises in the mountains inhabited by the Miao-tsze, in Kwei-chow. Leaving its source it takes a south-easterly direction, and enters Kwang-si, in the district of Hwai-yuen. After encircling the city of that name, it flows south as far as Liu-ch'eng Hien, where it forms a junction with the Lung-kiang, or Dragon River. Adopting the trend of this last-named stream, which has its head-waters in Kwei-chow, the mingled flow passes eastward, and farther on in a south-easterly direction, by Lai-chow Fu, Wu-suan Hien, and Sin-chow Fu, where it receives the waters of the Si-kiang, and thenceforth changes its name for that of its affluent. The treaty ports in Kwang-si are Wuchow Fu, Lung-chow and Nanning Fu.

KWANG-TUNG, a southern province of China, bounded N. by Hu-nan, Kiang-si and Fu-kien, S. and E. by the sea, and W. by Kwang-si. It contains an area, including the island of Hainan, of 75,500 sq. m., and is divided into nine prefectures; and the population is estimated at about 30,000,000. Its name, which signifies "east of Kwang" is derived, according to Chinese writers, from the fact of its being to the east of the old province of Hu-kwang, in the same way that Kwang-si derives its name from its position to the west of Hu-kwang. Kwang-tung extends for more than 600 m. from east to west, and for about 420 from north to south. It may be described as a hilly region, forming part as it does of the Nan Shan ranges. These mountains, speaking generally, trend in a north-east and south-westerly direction, and are divided by valleys of great fertility. The principal rivers of the province are the Si-kiang, the Pei-chow, or North River, which rises in the mountains to the north of the province, and after a southerly course joins the Si-kiang at San-shui Hien; the Tung-kiang, or East River, which, after flowing in a south-westerly direction from its source in the north-east of the province, empties itself into the estuary which separates the city of Canton from the sea; and the Han River, which runs a north and south course across the eastern portion of the province, taking its rise in the mountains on the western frontier of Fu-kien and emptying itself into the China Sea in the neighbourhood of Swatow. Kwang-tung is the wealthiest of the southern provinces of China, being the term of the North Indian empire. Its mineral wealth is very considerable, and the soil of the valleys and plains is extremely fertile. The principal article of export is silk, which is produced in the district forming the river delta, extending from Canton to Macao and having its apex at San-shui Hien. Three large coal-fields exist in the province, namely, the Shao-chow Fu field in the north; the Hwa Hien field, distant about 30 m. from Canton; and the west coast field, in the south-west. The last is by far the largest of the three and extends over the districts of Wu-chuen, Si-kiang and Yang-chow. It is divided into three districts, Sin-hing, Ho-shan, Sin-hwang, and Sin-ning. The coal from the two first-named fields is of an inferior quality, but that in the west coast field is of a much more valuable kind. Iron ore is found in about twenty different districts, notably in Ts'ung-yuen, Ts'ung-hwa, Lung-mên, and Lu-fêng. None, however, is exported in its raw state, as all which is produced is manufactured in the province, and principally at Fat-shan, which has been called the Birmingham of China. The Kwang-tung coast abounds with islands, the largest of which is Hainan, which forms part of the prefecture of K'iang-chow Fu. This island extends for about 100 m. from north to south and the same distance from east to west. The southern and eastern portions of Hainan are mountainous, but on the north there is a plain of some extent. Gold is found in the central part; and sugar, coco-nuts, betel-nuts, birds' nests, and agar agar, or sea vegetable, are among the other products of the island. Canton, Swatow, K'iang-chow (in Hainan), Pakhoi, San-shui are among the treaty ports. Three ports in the province have been ceded or leased to foreign powers—Macao to Portugal, Hong-Kong (Ten-pai, Kowloon) to Great Britain, and Kwangchow to France.

KWANZA (COANZA or QUANZA), a river of West Africa, with a course of about 700 m. entirely within the Portuguese territory of Angola. The source lies in about 13° 40' S., 17° 30' E. on the Bihe plateau, at an altitude of over 5000 ft. It runs first N.E. and soon attains fairly large dimensions. Just north of it is about 60 yds. wide and 13 to 16 ft. deep. From this point to 16° 20' it flows N.W., receiving many tributaries.
especially the Luando from the east. In about 10°, and at intervals during its westerly passage through the outer plateau escarpments, its course is broken by rapids, the river flowing in a well-defined valley flanked by higher ground. The lowest fall is that of Kambamba, or Livingstonia, with a drop of 70 ft. Thence, the main distance is about 160 m., it is navigable by small steamers, though very shallow in the dry season. The river enters the sea in 0° 15' S., 13° 20' E., 40 m. S. of Loanda. There is a shifting bar at its mouth, difficult to cross, but the river as a waterway has become of less importance since the fertile district in its middle basin has been served by the railway from Loanda to Ambaca (see Angola).

KWEI-CHOW, a south-western province of China, bounded N. by Sze-ch'uen, E. by Hu-nan, S. by Kwang-si, and W. by Yun-nan. It contains 67,000 sq. m., and has a population of about 8,000,000. Kwei-yang Fu is the provincial capital, and besides this there are eleven prefectural cities in the province. With the exception of plains in the neighbourhood of Kwei-yang Fu, Ta-ting Fu, and Tsun-i Fu, in the central and northern regions, the province may be described as mountainous. The mountain ranges in the south are largely inhabited by Miao-tze, who are the original owners of the soil and have been constantly goaded into a state of rebellion by the oppression to which they have been subjected by the Chinese officials. To this disturbing cause was added another in 1861 by the spread of the Mahommedan rebellion in Yun-nan, which has also reached the south-western districts of the province. The devastating effects of these civil wars were most disastrous to the trade and the prosperity of Kwei-chow. The climate is by nature unhealthy, the supply of running water being small, and that of stagnant water, from which arises a fatal malaria, being considerable. The agricultural products of the province are very limited, and its chief wealth lies in its minerals. Copper, silver, lead, and zinc are found in considerable quantities, and as regards quicksilver, Kwei-chow is probably the richest country in the world. This has arisen from old the chief product of the province, and the belt in which it occurs extends through the whole district from south-west to north-east.

One of the principal mining districts is K'ai Chow, in the prefecture of Kwei-yang Fu, and this district has the advantage of being situated near Huang-p'ing Chow, from which place the products can be conveniently and cheaply shipped to Hankow. Cinna- bar, realgar, orpiment and coal form the rest of the mineral products of Kwei-chow. Wild silk is another valuable article of export. It is chiefly manufactured in the prefecture of Tsun-i Fu.

KYAUKPYU, a district in the Arakan division of Lower Burma, on the eastern coast of the Bay of Bengal. It consists of, first, a strip of mainland along the Bay of Bengal, extending from the An pass, across the main range, to the Ma-t River, and, secondly, the large islands of Ramree and Cheduba, with many others to the south, lying off the coast of Sandoway. The mainland in the north and east is highly mountainous and forest-clad, and the lower portion is cut up into numerous islands by a network of tidal creeks. Between the mainland and Ramree lies a group of islands separated by deep, narrow, salt-water inlets, forming the easternmost group of Kyaukpyu islands for nearly 30 m. along Ramree in a south-easterly direction, and has an average breadth of 3 m. The principal mountains are the Arakan Yomas, which send out spurs and sub-spurs almost to the sea-coast. The An pass, an important trade route, rises to a height of 466 ft. above sea-level. The Dha-let and the An rivers are navigable by large boats for 25 and 45 m. respectively. Above these distances they are mere mountain torrents. Large forests of valuable timber cover an area of about 650 sq. m. Kyaukpyu contains numerous "mud volcanoes," from which marsh gas is frequently discharged, with occasional issue of flame. The largest of these is situated in the centre of Cheduba island. Earth-oil wells exist in several places in the district. The oil when brought to the surface has the appearance of a whisht-blue water, which gives out brilliant straw-coloured rays, and emits a strong pungent odour. Limestone, iron and coal are also found. Area 4,387 sq. m.; pop. (1901), 168,627, showing an increase in the decade of 2.3%.

The chief town, Kyaukpyu, had a population in 1901 of 3,145. It has a municipal committee of twelve members, three ex officio and nine appointed by the local government, and there is a three-class district gaol. Kyaukpyu is a port under the Indian Ports Act (X. of 1889), and the steamers of the British India Navigation Company call there once a week going and coming between Rangoon and Calcutta.

KYAUKSE, a district in the Meiktilla division of Upper Burma, with an area of 1,274 sq. m., and a population in 1901 of 141,253. It is also known as the Ko-kayaing, so called from the original nine canals of the district. It consists of a generally level strip running north and south at the foot of the Shan Hills, and is very hilly regioning up these hills to the east, and including the Yeyamyan tract, which lies between 2° 37' and 2° 40' N. and 96° 15' and 96° 45' E., with peaks rising to between 4500 and 5000 ft. This tract is rugged and scored by ravines, and is very sparsely inhabited. The Panluang and Zawgyi rivers from the Shan States flow through the district and are utilized for the numerous irrigation canals. Notwithstanding this, much timber is floated down, and the Panluang is navigable for small boats all the year round. Rain is very scarce, but the canals supply ample water for cultivation and all other purposes. They are said to have been dug by King Nawrahk in 1092. He is alleged to have completed the eleven canals in the north and south-western districts of the province.

Kyauske town is situated on the Zawgyi River and on the Rangoon-Mandalay railway line, and is well laid out in regular streets, covering an area of about a square mile. It has a population (1901) of 5420, mostly Burmese, with a colony of Indian traders. Above it are some bare rocky hillocks, picturesquely studded with pagodas.

KYD, THOMAS (1558-1594), one of the most important of the English Elizabethan dramatists who preceded Shakespeare. Kyd remained until the last decade of the 19th century in what appeared likely to be impenetrable obscurity. Even his name was forgotten until Thomas Hawkins about 1773 discovered it in connexion with The Spanish Tragedy in Thomas Heywood's Apology for Actors. But by the industry of English and German scholars a great deal of light has since been thrown on his life and writings. He was the son of Francis Kyd, citizen and scrivener of London, and was baptized in the church of St Mary Woolnoth, Lombard Street, on the 6th of November 1558. His mother, who survived his son, was named Agnes, or Anna. In October, 1577, Kyd entered the foundation Merchant Taylors' School, where Edmund Spenser and perhaps Thomas Lodge were at different times his school-fellows. It is thought that Kyd did not proceed to either of the universities; he apparently followed, soon after leaving school, his father's business as a scrivener. But Nashe describes him as a "shifting companion that ran through every art and thrive by none." He showed a fairly wide range of reading in Latin. The author on whom he draws most freely is Seneca, but there are many reminiscences, and occasionally mistranslations of other authors. Nashe contemptuously said that "English Seneca read by candlelight yeeldes many good sentences," no doubt exaggerating his indebtedness to Thomas Newton's translation. John Lyly had a more marked influence on his manner than any of his contemporaries. It is believed that he produced his famous play, The Spanish Tragedy; between 1584
and 1589; the quarto in the British Museum (which is probably earlier than the Göttingen and Ellesmere quartos, dated 1594 and 1599) is undated, and the play was licensed for the press in 1592. The full title runs, The Spanish Tragedie containing the Lamentable End of Don Horatio and Bel-imperio; with the Pitiful Death of Old Hieronimo, and the play is commonly referred to by Henslowe and other contemporaries as Hieronimo. This drama enjoyed all through the age of Elizabeth and even of James I. and Charles I. so unflagging a success that it has been styled the most popular of all English plays. Certain expressions in Nashe's preface to the 1606 edition of Robert Greene's Menaphon may be adduced in support of this view, which is very strong and unwarranted. It is really understood why Ben Jonson called him "sporting Kyd." In 1592 there was added a sort of prelude to The Spanish Tragedy, called The First Part of Jeronimo, or The Worres of Portugal, not printed till 1605. Professor Boas concludes that Kyd had nothing to do with this melodramatic production, which gives a different version of the story and presents Jeronimo as little more than a buffoon. On the other hand, it becomes more and more certain that what German criticism calls the Ur-Hamlet, the original draft of the tragedy of the prince of Denmark, was written by a man named Kyd and revised by his friend, Thomas Kyd. This theory has been very elaborately worked out by Professor Sarrazin, and confirmed by Professor Boas; these scholars are doubtless right in holding that traces of Kyd's play survive in the first two acts of the 1603 first quarto of Hamlet, but they probably go too far in attributing much of the actual language of the last three acts to Kyd. Kyd's next work was in all probability the tragedy of Soliman and Perseda, written perhaps in 1588 and licensed for the press in 1592, which, although anonymous, is assigned to him on strong internal evidence by Mr. Boas. No copy of the first edition has come down to us but it was reprinted, after Kyd's death, in 1599. In the summer or autumn of 1599 Kyd seems to have given up writing for the stage, and to have entered the service of an unnamed lord, who employed a troop of "players." Kyd was probably the private secretary of this nobleman, in whom Professor Boas sees Robert Radcliffe, afterwards fifth earl of Sussex. To the wife of the earl (Bridget Morison of Cassibury) Kyd dedicated in the last year of his life his translation of Garnier's Cornelia (1594), to the dedication of which he attached his initials. Two prose works of the dramatist have survived, a treatise on domestic economy, The Householder's Philosophy, translated from the Italian of Cassioli, and (cf. the sensational account of The Most Wicked and Secret Murdering of John Brewer, Goldsmith (1592). His name is written on the title-page of the unique copy of the last-named pamphlet at Lambeth, but probably not by his hand. That many of Kyd's plays and poems have been lost is proved by the fact that fragments exist, attributed to him, which are found in no surviving context. Towards the close of his life Kyd was brought into relations with Marlowe. It would seem that in 1599, soon after he entered the service of this nobleman, Kyd formed his acquaintance. If he is to be believed, he shrank at once from Marlowe as a man "intemperate and of a cruel heart" and "irreligious." This, however, was said by Kyd with the rope round his neck, and is scarcely consistent with a good deal of apparent intimacy between him and Marlowe. When, in May 1593, the "Jews libels" and "blasphemies" of Marlowe came before the notice of the Star Chamber, Kyd was immediately arrested, papers of his having been found "shuffled" with some of Marlowe's, who was imprisoned a week later. A visitation on Kyd's papers was made in consequence of his having attached a seditious libel to the wall of the Dutch churchyard in Austin Friars.

Of this he is innocent, but there was found in his chamber a paper of "vile heretical conceits denying the deity of Jesus Christ." Kyd was arrested and put to the torture in Bridewell. He asserted that he knew nothing of this document and tried to shift the responsibility of it upon Marlowe, but he was kept in prison until after the death of that poet (June 1, 1593). When he was at length dismissed, his patron refused to take him back into his service. He fell into utter destitution, and sank under the weight of "bitter times and privy broken passions." He must have died late in 1594, and on the 30th of December of that year his parents recognized the administration of the goods of their deceased son, in a document of great importance discovered by Professor Schick.

The importance of Kyd, as the pioneer in the wonderful movement of secular drama in England, gives great interest to his works, and we are now able at last to assert what many critics have long conjectured, that he takes in that movement the position of a leader and almost of an inventor. Regarded from this point of view, The Spanish Tragedy is a work of extraordinary value, since it is the earliest specimen of effective stage poetry existing in English literature. It had been preceded only by the pageants of the Earl of Surrey, and very probably, in which all that constitutes in the modern sense theatrical value and figure was entirely absent. These gifts, in which the whole power of the theatre as a place of general entertainment was to consist, were supplied earliest among English playwrights to Kyd, and were first exercised by him, so far as we can see, in 1586. This, then, is a more or less definite starting date for Elizabethan drama, and of peculiar value to its historians. Curiously enough, The Spanish Tragedy, which was the earliest stage-play of the great period, was also the most popular, and held its own right through the careers of Shakespeare, Ben Jonson, and Fletcher. It was not any shortcoming in its humouring and its dramatic group that kept Kyd's work from reaching the Elizabethan stage, and the reason of this was its archaic, rival to that of Shakespeare, and the bold way in which scenes of violent crime were treated on the Elizabethan stage appears to be directly owing to the example of Kyd's innovating genius. His relation to Hamlet has already been noted, and Titus Andronicus presents and exaggerates so many of his characteristics that Mr Sidney Lee and others have supposed that tragedy to be a work of Kyd's touched up by Shakespeare. Professor Boas, however, brings cogent evidence against this theory, founding them on what he considers the imitative inferiority of Titus Andronicus to The Spanish Tragedy. He has also attempted to find indications of Kyd's influence on later plays of Shakespeare. The extraordinary interest felt for Kyd in Germany is explained by the fact that The Spanish Tragedy was long the best known of all Elizabethan plays abroad. It was acted at Frankfort in 1601, and published soon afterwards at Nuremberg. It continued to be a stock piece in Germany until the beginning of the 18th century; it was equally popular in Holland, and potent in its effect upon Dutch dramatic literature.

Kyd's works were first collected and his life written by Professor F. S. Boas in 1901. Of modern editions of The Spanish Tragedy may be mentioned that by Professor M. Mainly in Specimens of the Pre-Shakespearean Drama, vol. ii. (Boston, 1897), and by J. Schick in the Temple Dramatists (1898). See also Cornelis (ed. H. Gassner, 1899), Koppel's The Spanish Tragedy (1903), and the very important work by Thomas Kynd und sein Kreis (1902); G. O. Fischer, "Bemerkungen über Thomas Kyd's Spanish Tragedy," Jahresbericht der Drei-Königsschule zu Dresden-Neustadt (1885); J. Schick, "T. Kyd's Spanish Tragedy" (Literaturhistorische Forschungen, vol. 16, 1901); and R. Koppel, in Prölls, Allengr. Theater (vol. i., 1904).
high and the height of the whole 210 ft. This was erected in 1856. According to an old and popular legend, the emperor Frederick Barbarossa sits asleep beside a marble table in the interior of the mountain, surrounded by his knights, awaiting the destined day when he shall awaken and lead the united peoples of Germany against her enemies, and so inaugurate an era of unexampled glory. But G. Vogt has advanced cogent reasons (see Hist. Zeitsschrift, xxvi. 131-187) for believing that the real hero of the legend is the other great Hohenstaufen emperor, Frederick II., not Frederick I. Around him gradually crystallized the hopes of the German peoples, and to him they looked for help in the hour of their sorest need. But this is not the only legend of a slumbering future deliverer which lives on in Germany. Similar hopes cling to the memory of Charlemagne, sleeping in a hill near Paderborn; to that of the Saxon hero Widukind, in a hill in Westphalia; to Siegfried, in the hill of Geroldsee; and to Henry I., in a hill near Goslar.

KYNASTON, EDWARD (c. 1640-1700), English actor, was born in London and first appeared in Rhodes's company, having been, like Betterton, a clerk in Rhodes's book-shop before he set up a company in the Cockpit in Drury Lane. Kynaston was probably the last and certainly the best of the male actors of female parts, for which his personal beauty admirably fitted him. His last female part was Evadne in The Maid's Tragedy in 1661 with Killigrew's company. In 1665 he was playing important male parts at Covent Garden. He joined Betterton at Lincoln's Inn Fields in 1665, after which he received less important roles, retiring in 1699. He died in 1706, and was buried on the 18th of January.

KYNETON, a town of Dalhousie county, Victoria, Australia, on the river Campaspe, 56 m. by rail N.N.W. of Melbourne. Pop. (1901), 3724. It is the centre of a prosperous agricultural and pastoral district. Important stock sales and an annual exhibition of stock are held. There are, moreover, some rich gold quartz reefs in the neighbourhood. Kyneton lies at an elevation of 1685 ft., and the scenery of the district, which includes some beautiful waterfalls, attracts visitors in summer.

KYOSAI, SHO-PU (1831-1886), Japanese painter, was born at Koga in the province of Shimotsuke, Japan, in 1831. After working for a short time, as a boy, with Kuniyoshi, he received his artistic training in the studio of Kanô Dôkô, but soon abandoned the formal traditions of his master for the greater freedom of the popular school. During the political ferment which produced and followed the revolution of 1867, Kyôsai attained a considerable reputation as a caricaturist. He was three times arrested and imprisoned by the authorities of the shogunate. Soon after the assumption of effective power by the mikado, a great congress of painters and men of letters was held, at which Kyôsai was present. He again expressed his opinion of the new movement in a caricature, which had a great popular success, but also brought him into the hands of the police—this time of the opposite party. Kyôsai must be considered the greatest successor of Hokusai (of whom, however, he was not a pupil), and as the first political caricaturist of Japan. His work—like his life—is somewhat wild and undisciplined, and "occasionally smacks of the saké cup." But if he did not possess Hokusai's dignity, power and reticence, he substituted an exuberant fancy, which always lends interest to draughtsmanship of very great technical excellence. In addition to his caricatures, Kyôsai painted a large number of pictures and sketches, often choosing subjects from the folk-lore of his country. A fine collection of these works is preserved in the British Museum; and there are also good examples in the National Art Library at South Kensington, and the Musée Guimet at Paris. Among his illustrated books may be mentioned Yekai Taka-kagami, Illustrations of Hawks (5 vols., 1870, &c.); Kyôsai Gofû (1880); Kyôsai Dongwa; Kyôsai Rakan-gwa; Kyôsai Rikaku-gwa; Kyôsai Mangwa (1881); Kyôsai Suigawa (1882); and Kyôsai Gwaden (1887). The latter is illustrated by him under the name of Kawanabe Kyôyô, and two of its four volumes are devoted to an account of his own art and life. He died in 1880.

KYRLE, JOHN (1637-1724), "the Man of Ross," English philanthropist, was born in the parish of Dymock, Gloucestershire, on the 22nd of May 1637. His father was a barrister and M.P., and the family had lived at Ross, in Herefordshire, for many generations. He was educated at Balliol College, Oxford, and having succeeded to the property at Ross took up his abode there. In everything that concerned the welfare of the little town in which he lived he took a lively interest—in the education of the children, the distribution of alms, in improving and embellishing the town. He delighted in mediating between those who had quarrelled and in preventing lawsuits. He was generous to the poor and spent all he had in good works. He lived a great deal in the open air working with the labourers on his farm. He died on the 7th of November 1724, and was buried in the chancel of Ross Church. His memory is preserved by the Kyrle Society, founded in 1877, to better the lot of working people, by laying out parks, encouraging house decoration, window gardening and flower growing. Ross was eulogized by Pope in the third Moral Epistle (1732), and by Coleridge in an early poem (1794).

KYSHYTOM, a town of Russia, in the government of Perm, 56 m. by rail N.N.W. of Chelyabinsk, on a river of the same name which connects two lakes. Pop. (1897), 12,331. The official name is Verkhne-Kyshtymskiy-Zavod, or Upper Kyshtym Works, to distinguish it from the Lower (Nizhne) Kyshtym Works, situated two miles lower down the same river.
