ITALY (Italia), the name applied both in ancient and in modern times to the great peninsula that projects from the mass of central Europe far to the south into the Mediterranean Sea, where the island of Sicily may be considered as a continuation of the continental promontory. The portion of the Mediterranean commonly termed the Tyrrhenian Sea forms its limit on the W. and S., and the Adriatic on the E.; while to the N., where it joins the main continent of Europe, it is separated from the adjacent regions by the mighty barrier of the Alps, which sweeps round in a vast semicircle from the head of the Adriatic to the shores of Nice and Monaco.

Topography.—The land thus circumscribed extends between the parallels of 46° 40' and 36° 38' N., and between 6° 30' and 18° 30' E. Its greatest length in a straight line along the mainland is from N.W. to S.E., in which direction it measures 708 m. in a direct line from the frontier near Cormayeur to Cape Sta Maria di Leuca, south of Otranto; but the great mountain peninsula of Calabria extends about two degrees farther south to Cape Spartivento in lat. 37° 55'. Its breadth is, owing to its configuration, very irregular. The northern portion, measured from the Alps at the Monte Viso to the mouth of the Po, has a breadth of about 270 m., while the maximum breadth, from the Rocca Chiardonnet near Susa to a peak in the valley of the Isonzo, is 354 m. But the peninsula of Italy, which forms the largest portion of the country, nowhere exceeds 150 m. in breadth, while it does not generally measure more than 100 m. across. Its southern extremity, Calabria, forms a complete peninsula, being united to the mass of Lucania or the Basilicata by an isthmus only 35 m. in width, while that between the gulfs of Sta Eufemia and Squillace, which connects the two portions of the province, does not exceed 20 m. The area of the kingdom of Italy, exclusive of the large islands, is computed at 91,777 sq. m. Though the Alps form throughout the northern boundary of Italy, the exact limits at the extremities of the Alpine chain are not clearly marked. Ancient geographers appear to have generally regarded the remarkable headland which descends from the Maritime Alps to the sea between Nice and Monaco as the limit of Italy in that direction, and in a purely geographical point of view it is probably the best point that could be selected. But Augustus, who was the first to give to Italy a definite political organization, carried the frontier to

1 On the derivation see below, History, section A, ad. init.
Central and Southern Italy, of which it forms as it were the backbone, until it ends in the southernmost extremity of Calabria at Cape Spartivento. The great spur or promontory projecting towards the east to Brindisi and Otranto has no direct connexion with the central chain.

One chief result of the manner in which the Apennines traverse Italy from the Mediterranean to the Adriatic is the marked division between Northern Italy, including the region north of the Apennines and extending thence to the foot of the Alps, and the central and southern halves. This conspicuous line of separation exists farther south, and the terms Central and Southern Italy, though in general use among geographers and convenient for descriptive purposes, do not correspond to any natural divisions.

1. Northern Italy.—By far the larger portion of Northern Italy is occupied by the basin of the Po, which comprises the whole of the broad plain extending from the foot of the Apennines to that of the Alps, together with the valleys and slopes on both sides of it. From its source in Monte Viso to its outflow into the Adriatic—a distance of more than 220 m., in a direct line—the Po receives all the waters that flow from the Apennines northwards, and all those that descend from the Po basin. This torrential stream, as it were, is at one and the same time the principal mountainous extension of the plain being as striking as the boldness with which the lower slopes of the mountain ranges begin to rise on each side of it. This is most clearly marked on the side of the Apennines, where the great Aemilian Way, which has been the high road from the time of the Romans to our own, preserves an unbroken straight line from Rimini to Piacenza, a distance of more than 150 m., during which the underfalls of the mountain range continually approach it on the left, without once crossing the line of road.

The geography of Northern Italy will be best described by following the course of the Po. That river has its origin as a mountain torrent descending from a dark lake situated between the north-eastern end of the Lake of Garda (inclusive). The next river to the E. is the Adige, which, after pursuing a parallel course with the Po for a considerable distance, flows north-eastward by a route parallel to the N. and N.E. the various rivers of Venetia fall directly into the Gulf of Venice.

There is no other instance in Europe of a basin of similar extent extending over a larger space without being subdivided by a line of separation farther south, and the terms Central and Southern Italy, though in general use among geographers and convenient for descriptive purposes, do not correspond to any natural divisions.

The last of the great tributaries of the Po is the Mincio, which flows from the Lago di Garda, and has a course of about 40 m. from that lake to the Po. It enters the delta of the Po near the town of Mantua, and expands into a broad lake-like reach so as entirely to encircle that city. Notwithstanding its extent, the Mincio, like the Mincio, is a narrow and shallow river, and is, in these respects, very different from the Po, as it flows from the north-eastern extremity at (Riva) commonly known as the Mincio, though forming the main source of that river, and is not, however, the widest of these streams. The waters of the two rivers have, however, been made to communicate by artificial canals and culverts in more than one place.

The Po itself, which is here a large stream, with an average width of 400 to 600 yds., continues to flow with an undivided mass of waters as far as Sta Maria di Ariano, where it parts into two arms, known as the Po di Muestra and Po di Goro, and these again are subdivided into several other branches, forming a delta about 20 m. in width from north to south. The point of bifurcation, at present about 25 m. from the sea, was formerly much farther inland, more than 10 m. west of Ferrara, where a small arm of the river, still called the Po Flora, flows into a large lake, formed by the confluence of the Po and the Po della Volano, formed in early times, but now only a few miles of the Po in the main course of the river. The whole of these branches of the Po and the Po Flora, so far as they approach the sea, have, however, been made to communicate by artificial canals and culverts in more than one place.

Besides the delta of the Po and the large marshy tracts which it forms, there exist on both sides of it extensive lagoons of salt water, generally separated from the Adriatic by narrow strips of sand or embankments, partly natural and partly artificial, but having openings which admit the influx and efflux of the sea-water, and serve as ports for communication with the mainland. The best known of these lagoons is that of Venice, which is situated, which extends from Tortello in the north to Chioggia and Brindisi in the south, a distance of about 40 m.; but they were formerly much more extensive, and afforded a continuous route for emigrants from the north to the south, whose ways were often dangerous. The Po, after flowing through the extensive plains of the Po Valley, is joined by the Adige eastward to the Carnic Alps, where they approach close to the Adriatic between Aquileia and Trieste, and northwards to the foot of the great chain, which here sweeps round in a semicircle from the region of the Cicil in and the Kitzbühel (of which the Ticino and the Adige are the principal streams), and then turns to the east, which was included in known ancient times as Venetia, a name applied in the middle ages to the well-known city; the eastern portion of it became known in the middle ages as the Friuli or Friul.
Apenines, which never attain the limit of perpetual snow, they generally dwindle in summer into insignificant patches. The course of the Serchio (†) the Scrivia, a small but rapid stream flowing from the Apenines at the back of Genoa, (2) the Trebbia, a much larger river, though of the same torrent-like character; (3) the Bormida, which, however, is diffused in numerous channels by Bobbio, and joins the Po a few miles above Ficenzia; (4) the Nure, a few miles east of the preceding; (5) the Tarzo, a more considerable stream; (6) the Parma, flowing by the city of the same name, but soon escaping into the Po; (7) the Panaro, at first a small stream, but then joining the Scrivia, and, after an artificial channel into the Po di Primario. The other small streams east of this,—of which the most considerable are the Solaro, the Santerno, flowing by Imola, the Lamone by Faenza, the Morena by Forlì, and the Flores by Ravenna,—impart their outlet in like manner into the Po di Primario, or by artificial mouths into the Adriatic between Ravenna and Rimini. The river Marecchia, which enters the sea immediately north of Rimini, may be considered as the natural limit of Northern Italy. It was adopted by Augustus as the boundary of Gallia Cispadana; the far-famed Rubicon was a trifling stream a few miles farther north, now called Fiumicino. The Rubicon is the only other stream of any importance which has always flowed directly into the Adriatic from this side of the Tuscan Apenines.

The narrow strip of coast-land between the Maritime Alps, the Apenines, and the Adriatic, known as the Riviera of Genoa,—is throughout its extent, from Nice to Genoa on the one side, and from Genoa to Spezia on the other, almost wholly mountainous. It is occupied by the branches and offshoots of the Ligurian range, which, flowing from a plain to the north, and send down their lateral ridges close to the water's edge, leaving only in places a few square miles of level plains at their mouths. The district is by no means devoid of fertility, the steep slopes facing the south enjoying so fine a climate as to render them very favourable for the growth of fruit trees, especially the olive, which is cultivated in terraces, and groups on the slopes of the valley. The district is, however, the most interesting feature of the Riviera, since the openings of the valleys are generally occupied by towns or villages, some of which have become favourite winter resorts.

From the proximity of the mountains to the sea on the north of the river in this part of the Riviera, and the tendency of the valleys to descend directly to the plain, there are generally mere mountain torrents, rapid and swollen in winter and spring, and almost dry in summer. The largest and most important are those which descend from the Maritime Alps between Nice and Albenga. The most considerable of them are—the Roia, which rises in the Col di Tenda and descends to Ventimiglia; the Taggia, between San Remo and Oneglia; and the Centa, which enters the sea at Albenga. The Lavagna, which enters the sea at Chiavari, is the only stream of any importance between Genoa and the Gulf of Spezia. But immediately east of that inlet (a remarkable instance of a deep locked gulf with no river flowing into it) the Magra, which descends from the Apenines, through a deep gorge, joins the Ligurian stream, and brings with it the waters of another considerable stream, the Vara. The Magra (Magra), in ancient times the boundary between Tuscany and Liguria, may be considered as constituting on this side the limit of Northern Italy.

The Apenines (g.v.), as has been already mentioned, here traverse the whole breadth of Italy, cutting off the peninsula properly so termed, and forming a barren mass of mountains, a barrier of considerable breadth, though of far inferior elevation to that of the Alps. The Ligurian Apenines may be considered as taking their rise in the neighbourhood of Savon, where a pass of very moderate elevation connects them with the Maritime Alps, of which they are in fact only a continuation. From the neighbourhood of Savona to that of Genoa they do not rise to more than 3000 to 4000 ft., and are traversed by passes of less than 2000 ft. As they extend towards the east they increase in elevation; the Monte Buceti rises to 5915 ft., while the Monte Cimone, a little farther east, attains 7103 ft. This is the highest point in the northern Apenines, and beyond this point the general line of these mountains, which is continued thence between Tuscany and what are now known as the Emilian provinces presents a continuous ridge from the mountains at the head of the Val di Mugello (due north of Florence); and from this ridge the small tributaries of the Serchio break through the mountain ranges which bound them. The Grand Sasso and the Maiella are separated by the deep valley of the Aterno, while the Tronto breaks through the range between Monte Vettore and the Pizzo di Sevo. This constitution of the great mass of the central Apenines has in all ages exercised an important influence upon the character of this portion of Italy, which may be considered as divided by nature into two great regions, a cold and barren upland country, bordered on both sides by rich and fertile tracts, enjoying a warm but temperate climate.

The district west of the Apenines, a region of great beauty and fertility, though intersected by mountainous groups, is in general a continuation of the territory situated north of the river, and is the continuation of the Apennines in the foreland of Latium and Umbria. The district of Tuscany is indeed occupied to a considerable extent by the underfalls and oaks of the Apenines, which, besides the slopes and spurs of the main range that constitutes its northern frontier towards Lazio by the line of the upper valley of the Arno, is divided by nature into two great regions, a cold and barren upland country, bordered on both sides by rich and fertile tracts, enjoying a warm but temperate climate.

Central Italy.—The geography of Central Italy is almost wholly determined by the Apenines, which traverse it in a direction from about north-north-east to south-south-west, almost precisely parallel to that of the coast of the Adriatic from Rimini to Pescara. The line of the highest summits and of the watershed ranges is also almost parallel while it is separated from the Adriatic by the long tract of the Appennine ridge which separates it from the Tyrrenhian Sea on the west. In this part of the range almost all the highest points of the Apenines are found. Beginning from the group called the Alpi della Luna near the sources of the Arno, which belongs to the Apennines of the Apuan group (5010 ft.), Monte Catria (5590 ft.), and Monte Maggio to the Monte Pennino near Nocera (5169 ft.), and thence to the Monte della Sidella, at the source of the Narn or Nera, which attains 7653 ft. Proceeding from Narnia, we thence see the group of the group of the Vettore (6128 ft.), the Pizzo di Sevo (7945 ft.), and the two great mountain masses of the Monte Cornone, commonly called the Gran Sasso, (7945 ft.) rising in the same time to a height of about 9560 ft., and the Monte della Maiella, its highest summit measuring 9710 ft. Further south no lofty summits are found till we come to the group of Monti del Matese, in Samnium (6660 ft.), which constitutes the southern frontier of Central Italy. Besides the lofty central masses enumerated there are two other lofty peaks, outliers from the main range, and separated from it by valleys of considerable extent, to wit Monte Terminillo, near Leonessa, rising to 8128 ft., both of which are covered with snow from November till May. But the Apenines of Central Italy, instead of presenting, as the Alps and the northern Apenines, a definite central ridge with transverse valleys leading down from it on both sides, in reality constitute a mountain mass of very considerable breadth, composed of a number of minor ranges and groups of mountains, which present a considerable increase in regularity and sumptuousness of beauty, being formed by a series of groups separated by tracts of very inferior elevation forming natural passes across the range, and broken in some places (as is the case in almost all limestone countries) by the waters from the north, the Arno and Tiber, which flow from the head of the Apennines through the mountain ranges which bound them. Thus the Grand Sasso and the Maiella are separated by the deep valley of the Aterno, while the Tronto breaks through the range between Monte Vettore and the Pizzo di Sevo. This constitution of the great mass of the central Apenines has in all ages exercised an important influence upon the character of this portion of Italy, which may be considered as divided by nature into two great regions, a cold and barren upland country, bordered on both sides by rich and fertile tracts, enjoying a warm but temperate climate.

The district west of the Apenines, a region of great beauty and fertility, though intersected by mountainous groups, is in general a continuation of the territory situated north of the river, and is the continuation of the Apennines in the foreland of Latium and Umbria. The district of Tuscany is indeed occupied to a considerable extent by the underfalls and oaks of the Apenines, which, besides the slopes and spurs of the main range that constitutes its northern frontier towards Lazio by the line of the upper valley of the Arno, is divided by nature into two great regions, a cold and barren upland country, bordered on both sides by rich and fertile tracts, enjoying a warm but temperate climate.

Central Italy.—The geography of Central Italy is almost wholly determined by the Apenines, which traverse it in a direction from about north-north-east to south-south-west, almost precisely parallel to that of the coast of the Adriatic from Rimini to Pescara.
between that point and the mouth of the Liri throws out several rugged mountain headlands, which may be considered as constituting the natural boundary between Latium and Campania, and consequently the border of the Apennines. For the most part the Apennines, as they extend from the Adriatic to the Tyrrhenian, may be considered as merely an outlier from the central mass. From the neighbourhood of Potenza, the main ridge of the Apennines extends, as the Monti Calabri, and so far as that ridge is to be considered, may be considered, as merely an outlier from the central mass.

The Arno, which rises in the Apennines (Ital. Tevere) may be considered as furnishing the key to the geography of all this portion of Italy west of the Apennines. The Arno, which has its source in the Monte Faitoera, one of the most elevated summits of the main chain of the Apennines, flows through the valleys of Arezzo and Pistoia, and, uniting the streams which join it at Pontassieve, brings down the waters of the Val di Mugello. The Elsa and the Era, which join it on its left bank, descending from the hills near Siena and Volterra, are inconsiderable streams; and the Serchio, which flows from the territory of Lucca and the Alpi Apuane, and formerly joined the Arno a few miles from its mouth, now enters the sea by a separate channel. The most considerable of the Apennine streams that pour into the Tyrrhenian are the rivers of the Apennine mountains, north of the coast of Salerno, with the exception of the river Sele.

The Tiber, a much more important river than the Arno, and the largest in Italy with the exception of the Po, rises in the Apennines, about 20 m. east of the source of the Arno, and flows nearly south by east, towards the Adriatic, and forms the boundary of the great Roman Empire between Spain and Africa. It is a remarkable fact that the Tiber, which flows through the plain below Volterra, and the Ombrone, which rises in the hills near Siena, and enters the sea about 12 m. below the Sele.

The eastern declivity of the central Apennines towards the Adriatic is far less interesting and varied than the western. The central range here approaches much nearer to the sea, and hence, with few exceptions, the rivers that flow from it have short courses and are of comparatively little importance. They may be enumerated, proceeding from Rimini southwards: (1) the Foglia; (2) the Metauro, of historical celebrity, and affording access to one of the most frequented passes of the Apennines; (3) the Esino; (4) the Potenza; (5) the Chienti; (6) the Aso; (7) the Tronto; (8) the Vomano; (9) the Aterno; (10) the Sangro; (11) the Trigno, which enters the Adriatic on the east, receiving the waters of the Abruzzi, and may therefore be taken as the limit of Central Italy.

The whole of this portion of Central Italy is a hilly country, much broken and cut up by the torrents which, descending from the Apennines, flow into the Po. The rivers of the Apennines and Abruzzi are small towns though of great cities. Its chief disadvantage is the absence of large ports, the nearest being indeed an almost unbroken straight line, with the single exception of Ancona, the only port worthy of the name on the eastern coast of Central Italy.

3. Southern Italy.—The great central mass of the Apennines, which has held its course throughout Central Italy, with a general direction from north-west to south-east, may be considered as continued in the same direction for about 100 m. farther, from the basin-shaped district of the Monti del Matese, which rise to 6600 f., to the city of Potenza, in the heart of the province of Basilicata, corresponding nearly to the ancient Lucania. The whole of this portion of Central Italy is a hilly country, much broken and cut up by the torrents which, descending from the Apennines, flow into the Tyrrhenian. The Apennine chain here projects in the form of a long promontory, which holds a winding and sluggish course through the great plains of Apulia. Proceeding south from the Trigno, already mentioned as the limit of Central Italy, the sea is at the distance of (1) the Fortore, both rising in the mountains of Samnium, and flowing into the Adriatic west of Monte Gargano; (2) the Cervaro, south of the great promontory; and (4) the Otranto, the sea of Otranto, whose description is characteristic of almost all the rivers of Southern Italy, of which it may be taken as the typical representative. It rises about 15 m. west of Conza, and only about 25 m. from the Gulf of Salerno. In its lower course it flows near Canosa and traverses the celebrated battlefield of Cannae. The Bradano, which rises near Venosa, almost at the foot of the Apennines, flows towards the south-east into the Gulf of Taranto, as do the Basento, the Agri and the Sinni, all of which descend from the central chain of the Apennines south of Potenza. The Crati, which flows from Cosenza northwards, and then turns abruptly to the west, forms the boundary of the rugged peninsula of Calabria; while the arid limestone hills projecting eastwards to Capo di Leuca do not give rise to anything more than a mere streamlet, from the mouth of the Otranto to the south-eastern extremity of Italy.

The only important lakes are those on or near the north frontier, formed by the expansion of the tributaries of the Po. They have been previously noticed, and it is not necessary here to repeat their formation, but may be again enumerated in order of succession. They are, proceeding from west to east, (1) the Lago d’Orta, (2) the Lago Maggiore, (3) the Lago Lugano, (4) the Lago di Como, (5) the Lago d’Iseo, (6) the Lago di Garda, and (7) the Lago d’Iseo.

Of these the last named is the largest, covering an area of 143 sq. m. It is 222 m. long by 10 broad; while the Lago di Garda, though smaller in area, is 275 m. long by 12 broad; and the Lago di Como, though in length (173 m.), falls materially below it in superficial extent. They are all of great depth—the Lago Maggiore having an extreme depth of 450 f., and the Lago di Garda of 375 f.
depth of 1198 ft., while that of Como attains to 1356 ft. Of a wholly
different character is the Lago di Varese, between the Lago Maggiore
and that of Lugano, which is a mere shallow expanse of water,
surrounded by morainic deposits. Two other small lakes in the same
neighbourhood, as well as those of Erba and Pusiano, between Como and Lecco, are of a similar character.

On the Adriatic side, while these extensive dimensions, belong to a wholly different class. The most important of these, the Lacus Fucinus of the ancients, now called the Lago di Cignano, situated almost exactly in the centre of the peninsula, occupies an almost circular bay, which is bounded by mountains
and without any natural outlet, at an elevation of more than 2000
ft. Its waters have been in great part carried off by an artificial channel, and more than half its surface laid bare. Next in size is the Lago di Bolsena, an artificial lake about 40 ft. lower than Lake Nemi,
formed by the cone of the extinct volcano of the same name. The only lake properly so called in southern Italy is the Lago del
Matese, in the heart of the mountain group of the same name, of
small extent, and surrounded by hills. The Lago di Orta, in the
districts west of the Apennines, are of an entirely different formation,
and occupy deep cup-shaped hollows, which have undoubtedly been
formed by the slow attrition of the crust of extinct volcanoes. Such is the Lago di Bolsena, near the city of the same name, which is an extensive sheet
of water, as well as the much smaller Lago di Vico (the Ciminiak lake
of ancient writers) and the Lago di Bracciano, nearer Rome, while
to the south of Rome the well known lakes of Albano and Nemi
have been described.

The only lake properly so called in southern Italy is the Lago del
Matese, in the heart of the mountain group of the same name, of
small extent, and surrounded by hills. The Lago di Orta, in the
districts west of the Apennines, are of an entirely different formation,
and occupy deep cup-shaped hollows, which have undoubtedly been
formed by the slow attrition of the crust of extinct volcanoes. Such is the Lago di Bolsena, near the city of the same name, which is an extensive sheet
of water, as well as the much smaller Lago di Vico (the Ciminiak lake

have been described.

The three great islands of Sicily, Salerno and Corseia are closely
connected with the geological history of the Ligurian and Apennine
regions. Of these, Sicily, which is the nearest and largest, has been
fully described under that name. Salerno, which also has been
largely occupied by geological deposits, lies between the Peloponnesus
and Calabria, and is connected with the former by a low strait,
while Corseia, the southernmost of the three, is not only the
largest, but also the most mountainous.

The most striking feature of the Apennines is their extreme length,
stretching from the Adriatic Sea to the Tyrrhenian. The entire length
is about 750 miles, and the breadth of the mountain system
is about 50 miles. The highest point of the Apennines is Monte
Cofano, which rises to a height of 9140 ft. above the sea.

The Apennine System.—The Apennine System is a great mountain
range which stretches from the Adriatic Sea to the Tyrrhenian
Sea. It is about 750 miles long and 50 miles wide, with its highest
point, Monte Cofano, standing at 9140 ft. above sea level. The
Apennines consist of a series of overlapping mountain ranges,
with peaks reaching over 9000 ft. in some places. The
system was formed through tectonic activity and volcanic eruptions,
and is characterized by a variety of landscapes, including
valleys, forests, and coastal areas.

The Apennines play a crucial role in the regional climate, as they
act as a barrier between the Mediterranean and the Adriatic
Sea. The mountain range influences precipitation patterns, with
the western side receiving more rainfall due to the
prevailing westerly winds. The eastern side, on the other hand,
receives less rain, making it drier. This difference is also evident
in the vegetation, with mixed forests on the western side
and more deciduous forests on the eastern side.

Geological History.—The Apennines have a rich geological
history, with evidence of ancient volcanic activity and tectonic
movements. The region was once part of the larger
Nordic Tectonic Plate, which broke apart from the
continental shelf during the Mesozoic Era. This
breakage allowed the formation of new
mountain ranges, including the
Apennines. Over time, the
region has experienced various
paleogeographic changes,
which have significantly
influenced the current
landscape.

The Apennines are divided
into three main chains: the
Central Apennines, the
Southern Apennines, and the
Northern Apennines. Each
chain has its own unique
characteristics and
geological history.

The Central Apennines
are the most extensive
chain, stretching from the
Adriatic coast to the
Tyrrhenian Sea. This
chain includes the
highest peaks of the
Apennines, with
Monte Cerro delle Carceri
standing at 8613 ft.

The Southern Apennines
are located in the
southern part of
Italy, stretching
from the Italian
coast to
the
Spanish border. This
chain is
characterized by
volcanic activity,
with
the
Azienda Geografica
Giulio Stock
naming

the
region
as
"La Terra
degli
Eroi"—
The
Land
of the
Heroes.

The Northern Apennines
are located in the
northern part of
Italy, stretching
from the
Adriatic
coast to
the

Tyrrhenian Sea. This
chain is
characterized by
tectonic activity and
is
known
for
its
canyons and
caves.

The Apennines
are
also
an
important
water source,

with
numerous
rivers
originating

and the small lake of Scanno, is the coldest and most bleak part of
Italy south of the Alps. Heavy falls of snow in June are not
uncommon, and for a short time towards the end of July are the
nights totally exempt from light frosts. Yet less than 40 m. E. of this
district, the olive, the olive, is derived from the Thalictrum
var. delphis). The town of Naples is also, amidst the
orange thrive luxuriantly on the shores of the Adriatic from Ortona
to Vasto. In the same way, whilst in the plains and hills round
Naples early in spring and never later than 6 m. from the shore, and, even often,
the scene changes. High districts covered with oaks and chestnut
succeed to this almost tropical vegetation; a little higher up and we
reach the elevated regions of the Pollino and the Sila, covered
with pines and affording rich pastures even in the hottest
summer, when heavy dews and light frosts succeed each other in July
and August, and snow begins to appear at the end of September or
early in October. Along the shores of the Adriatic, which are ex-
posed to the west-north-wests, blowing coldly from over the Atlantic,
mountains, delicate plants do not thrive so well in general as under
the same latitude along the shores of the Tyrrhenian Sea.

In general it has in a very different climate from the
northern portion of the kingdom; and, though large tracts
are still occupied by rugged mountains of sufficient elevation to retain
the snow for a considerable part of the year, the districts adjoining
the Apennines, and climate similar to that of Greece and the southern
provinces of Spain. Unfortunately several of these fertile tracts suffer
severely from malaria (q.v.), and especially the great plain
adjoining the Gulf of Tarentum, which in the early ages of history
was inhabited by a circle of Greek cities—some of which attained
to almost unexanpaled prosperity—has for centuries past
been given up to almost complete desolation.

It is remarkable that, of the vegetable productions of Italy, many
which are at the present day among the first to attract the attention
of the visitor are of comparatively late introduction, and were
unknown in ancient times. The olive indeed in all ages clothed the
shores and islands of the country; but the orange and lemon,
the same remark applies to the myrtle and many varieties of oleander and cistus form
the underwood of the natural forests of arbuteus and evergreen oak.
If the sea engenders a cold climate and never later than 6 m. from the shore, and, even often,
even in the warmest summers, when heavy dews and light frosts succeed each other in July
and August, and snow begins to appear at the end of September or
early in October. Along the shores of the Adriatic, which are exposed
to the west-north-wests, blowing coldly from over the Atlantic,
mountains, delicate plants do not thrive so well in general as under
the same latitude along the shores of the Tyrrhenian Sea.

In general it has in a very different climate from the
northern portion of the kingdom; and, though large tracts
are still occupied by rugged mountains of sufficient elevation to retain
the snow for a considerable part of the year, the districts adjoining
the Apennines, and climate similar to that of Greece and the southern
provinces of Spain. Unfortunately several of these fertile tracts suffer
severely from malaria (q.v.), and especially the great plain
adjoining the Gulf of Tarentum, which in the early ages of history
was inhabited by a circle of Greek cities—some of which attained
to almost unexanpaled prosperity—has for centuries past
been given up to almost complete desolation.

1 On the influence of malaria on the population of Early Italy see
W. H. S. Jones in Annals of Archaeology and Anthropology, ii. 97 sqq.
(Liverpool, 1899).
The average density increased from 257-21 per sq. m. in 1881 to 293-28 in 1901. In Venetia, Emilia, the Marches, Umbria and Tuscany the proportion of coats in the population is only from 40 to 55%; in Piedmont, Liguria and Lombardy the proportion rises to 70 to 76%; in southern Italy, Sicily and Sardinia it attains a maximum of from 76 to 93%. The population of towns over 100,000 is given in the following table according to the estimates for 1906. The population of the town itself is distinguished from that of its commune, which often includes a considerable portion of the surrounding country.

The population of the different parts of Italy differs considerably in character and dialect; and there is little community of sentiment between them. The modes of life and standards of comfort and morality in north Italy and in Calabria are widely different; the former being far in front of the latter. Much, however, is effected towards unification, by compulsory military service, it being the principle that no man shall serve within the military district to which he belongs. In almost all parts the idea of personal loyalty (e.g. between master and servant) retains an almost feudal strength. The inhabitants of the north—the Piedmontese, Lombards and Genoese especially—have suffered less than those of the rest of the peninsula from foreign domination and from the admixture of inferior racial elements, and the cold, rainy climate prevents the heat of summer from being everlasting. They, and also the inhabitants of central Italy, are more industrious than the inhabitants of the southern provinces, who have by no means recovered from centuries of misgovernment and oppression, and are naturally more hot-blooded and excitable, but less stable, capable of organization or trustworthy. The southerners are apathetic except when roused, and socialist doctrines find their chief adherents in the north. The Sicilians and Sardinians have something of Spanish dignity, but the former are one of the most mixed and the latter probably one of the purest races of the Italian kingdom. Physical characteristics differ widely; but as a whole the Italian is somewhat short of stature, with dark or black hair and eyes, often good looking. Both sexes reach maturity early. Mortality is decreasing, but if we may judge from the physical conditions of the recruits the physique of the nation shows little or no improvement. Much of this lack of progress is attributed to the heavy manual (especially agricultural) work undertaken by women and children. The women especially age rapidly, largely owing to this cause (E. Nathan, "Venti anni di vita italiana attraverso all'annuario, 160 sqq.).

Births, Marriages, Deaths.—Birth and marriage rates vary considerably, being highest in the centre and south (UMBRIA, the Marches, Apulia, Abruzzi and Molise, and Calabria) and lowest in the north (Piedmont, Liguria and Venetia), and in Sardinia. The death rate is highest in Apulia, in the Marches, in Calabria and in Sardinia, and lowest in the north, especially in Venetia and Piedmont.

Taking the statistics for the whole kingdom, the annual marriage rate for the years 1876-1880 was 7.55 per 1000; in 1881-1885 it rose to 8-06; in 1886-1890 it was 7.77; in 1891-1895 it was 7.41, and in 1896-1900 it had gone down to 7.14 (a figure largely produced by the abnormally low rate of 6.88 in 1898), and in 1902 was 7.23. The death rate, for the years 1875-1880 it was 15.54 per 1000; in 1881-1885 it was 15.77; in 1886-1890 it was 15.08; in 1891-1895 it was 14.74; in 1896-1900 it had dropped to 14.19. The chief births, which began since 1872 been about 3% (3.41 in 1872-1875 and 2.72 in 1896-1900) in excess of the female births, which is rather more than compensated for by the greater male mortality, the excess being 2.46 in 1872-1875 and having increased to 4.08 in 1896-1900. (The calculations are made...
in both cases on the total of births and deaths of both sexes.) The result is that, while in 1871 there was an excess of 143,370 males over females in the total population, in 1881 the excess was only 71,120 and in 1901 there were 169,684 more females than males. The death-rate (excluding still-born children) was, in 1872, 30.78 per 1,000, and has since steadily decreased—less rapidly between 1872 and 1881 than between 1881 and 1902. For the four years 1899-1902 24.66% died under the age of one year, 9.41 between one and two years. The average expectation of life at birth for the same period was 52 years and 11 months, 62 years and 2 months at the age of three, 64 years and 10 months at the age of forty-four, and the average period of twenty-four, 30 years at the age of forty; while the average period of life, which was 35 years 3 months per individual in 1882, was 43 years per individual in 1901. This shows a considerable improvement, largely, but not entirely, in the diminution of infant mortality; the expectation of life at birth in 1882, it is true, was only 33 years and 6 months, and at three years of age 56 years 1 month; but the increase, both in the expectation of life and in its average duration, goes all through the different ages. 

**Occupations.**—In the census of 1901 the population over nine years of age (both male and female) was divided as follows in regard to the main professions:

<table>
<thead>
<tr>
<th>Year</th>

</table>

The the increased figures may, to a minor extent, be due to better registration, in consequence of the law of 1901. From the next table will be seen the direction of emigration in the years specified:
reached about 96,500,000 bushels, a slight increase on the average. The quantity of rye, however, which amounted to 17,212,500 bushels, was imported in 1902—about double the amount imported in 1882.

Rice is cultivated in low-lying moist lands, where spring and summer temperatures are high. The Po valley and the valleys of the Po tributaries, however, are better suited to rice than the Apennines. Rice is grown extensively in the Po valley, diminishing on account of the competition of foreign rice and of the impoverishment of the soil by too intense cultivation. The area is about one-third in the Apennine provinces. The barley zone is geographically extensive but embraces not more than 1% of the total area, of which half is in the provinces of Lombardy, Piedmont, and Sicily. The provinces where it is grown are Piedmont, the Italian Alps and Apulia, are used almost exclusively for horses and cattle. The area of oats cultivation is 1.5% of the total area. The other cereals, millet and *panico sorgo* (*Panicum italicum*), have a total area of about 100,000 acres, but these cereals are grown on land unsuitable for other crops. The production of wine in the vintage of 1907, which was extraordinarily good, totaled over 17,000,000,000 gallons (56 million hectolitres), the average for 1901-1903 having been 16,600,000,000 gallons (and that is double the average). But it is an equally abundant year for France and Spain and the exportation of Italian wine was not increased. The favorable, and fiscal regulations rendered the distillation of the superfine amount impossible, and owing to bad weather at the time of vintage, was not good; Italian wine, indeed, never is sufficiently good to compete with the French wines. The vintage has been so abundant that the wines of the neighboring provinces of Frankfurt, Po, N. N. E., and Tuscany are also very abundant; and the dealers are selling the wines of the Po valley at a lower price than in the other provinces. The wine producing districts, in the Po valley, Lombardy, Venetia and the greater part of Emilia, is of little importance. In the olive there is great variety of kinds, and the provinces of Campania, Sicily, and Puglia are the principal. The olive-growing districts, in the Po valley, Lombardy, Venetia and, for that matter, throughout the world, are those of Umbria, and western Liguria rank next. The wood of the olive is also used for the manufacture of small articles. The olive-growing area occupies about 3% of the total agricultural area. About 5,000,000 acres is used for olive-growing, 3,000,000 acres is used for olive-yards, and it is noticeable that lately good and bad trees are not distinguishable; and the latter, which have not been pruned, is sold as olive-yards; the wood of the olive is used for the manufacture of small articles.

ITALY

Agriculture

of importance now exist in the Marches, Umbria, in the Abruzzi, Tuscany, Piedmont and Venetia. The chief silk-producing provinces are Apulia, Campania, and Calabria. During the period 1900–1905 the average annual production of silk cocoons was 53,000 tons, and of silk 3200 tons.

The great variety in physical and social conditions throughout the Italian peninsula is reflected in the methods of agriculture and the land tenure system. In the rotation of crops there is an amazing diversity—shifts of two years, three years, four years, six years, and in many cases with the rotation of crops determined by the district. Thus for the most part the wheat year one and maize the next, in perpetual interchanges, relieved to some extent by green crops. A similar method prevails in the Abruzzi, and in the provinces of Siena, Salerno, and Calabria. This method of conservation of land and pasture, and the planting of forests, is still common: either wheat, clover, maize, rice, rice, rice (the last year manured with lupines) or maize, wheat followed by clover, clover, clover ploughed in, and rice, rice and rice manured with lupines. In the province of Torino the Lombard system of pastoral migration with the change of seasons which has been in existence from the most ancient times, and has attracted the attention of antiquaries, is still practised in its picturesque appearance as its industrial importance (see Apulia). The sheep breed known as the Abruzzi, Capitanata and Basilicata. The number of sheep, however, is on the decrease. Similarly, the number of goats, which are reared to a far smaller extent, is decreasing, and the rearing of forest-flocks, as they are the chief enemies of young plantations, is becoming more and more the object of state control. In the north of Italy there is an increasing demand for cheese, both for home consumption and for exportation, especially to Switzerland and France, is also produced in Italy in the Alpine regions and in Sicily. With the exception of Parma, and Gorgonzola, La Fontaine and Gruyère, most of the Italian cheese is consumed in the localities of its productions. Co-operative dairy firms are numerous in northern Italy, and though only about half as many as in 1889 (114 in 1902) are better organized. Modern methods have been introduced.

The drainage of marshes and marshy lands has considerably improved. A law passed on the 22nd of March 1900 gave a special impulse to this form of enterprise by fixing the ratio of grant to be from 4 to 1 in favour of the municipalities, the provinces, the communes, and the owners or other private individuals directly interested.

The Italian Union of Agrarian Banks has greatly contributed to a more rapid progress in all branches of agriculture, and fixed schools of viticulture, also do good work. Some unions annually purchase large quantities of farm and garden produce (especially chemical manures).

The importation of machinery amounted to 6,000,000 lire in 1901.

Income from land has diminished on the whole. The chief diminution has taken place in the south in regard to oranges and lemons, cereals and (for some provinces) vines. Since 1895, however, the heavy import corn duty has caused a slight rise in the income from corn lands. The principal reasons for the general decrease are the farm prices through foreign competition and the closing of certain markets, the diseases of plants and the increased outlay required to combat them, and the growth of State and local taxation. One of the most important and interesting uses of land use is that of forests, which have been greatly increased, and lastly the increase of the cultivated lands has been considerable, due to the extension of co-operative dairy farms and the general decrease of agriculture and the adoption of annual crops. Taxes are not sufficiently proportioned to what the land may reasonably be expected to produce, nor sufficient allowance made for the exceptional conditions of climate, in which a few hours' bad weather may destroy a whole crop. The Italian agriculturist has come to look (and often in vain) for action on a large scale from the state, for irrigation, drainage of cultivated low-lying land, which may be fertile, river drainage, &c., &c. The state, in fact, appears only as a hard and inconvenient tax-gatherer.

The relations between owners and tillers of the soil are still regulated by law; but the large agricultural estates, which have remained almost untouched by social and political changes, the possibility of reforming these contracts in some parts of the kingdom has been studied, in the hope of bringing them into closer harmony with the needs of rational cultivation and the exigencies of the state.

Peasant proprietorship is most common in Lombardy and Piedmont, but it is also found elsewhere. Large farms are found in certain

Woods and forests.

In the province of Naples, Caserta, &c., the method of fallows is widely adopted, the ground often being left in this state for fifteen or twenty years; and in some parts of Sicily there is a regular interchange of fallow and crop year by year. The following table indicates a common Sicilian method of a type which has many varieties: fallow, grain, grain, pasture, pasture—other two divisions of the area following the same order, but beginning respectively with the two years of grain and the two of pasture.

In Apulia and forests has an important regard to the consistency of the soil and to the character of the water-courses. The chestnut is of great value for its wood and its products. In parts of southern Italy it is furnished by the oak and beech, and pine and fir forests of the Alps and Apennines. Notwithstanding the efforts of the government to unify and co-ordinate the forest laws previously existing in the various states, deforestation has continued in many regions. This has been due to speculation, to the unrestricted pasturage of goats, to the rights which many communes have over the forests, and to some extent to excessive taxation, which led the proprietors to cut and sell the trees and then abandon the felled area to the Treasury. The result are—a lack of water-supply and of water-power, the streams becoming mere torrents for a short period and then drying up for the rest of the year. The great chestnut of Italy, the castagno, has probably, a valuable in the eastern parts of the "ancient provinces," and in the province of Cuneo. The cheese known as the cacchio-calabrese is produced in regions such as the Calabria, and the illachen is a kind of cheese which is also common in Switzerland and France, is also produced in Italy in the Alpine regions and in Sicily. With the exception of Parmesan, Gorgonzola, La Fontaine and Gruyère, most of the Italian cheese is consumed in the localities of its productions. Co-operative dairy farms are numerous in northern Italy, and though only about half as many as in 1889 (114 in 1902) are better organized. Modern methods have been introduced.

The drainage of marshes and marshy lands has considerably improved. A law passed on the 22nd of March 1900 gave a special impulse to this form of enterprise by fixing the ratio of grant to be from 4 to 1 in favour of the municipalities, the provinces, the communes, and the owners or other private individuals directly interested.

ITALY

MINES AND FISHERIES

of the more open districts; but in Italy generally, and especially in Sicily, the land is much subdivided. The following forms of contract are most usual in the several regions: In Piedmont the mezzadria (mittelwage), the terziaria, the colonia parziasi, the boaria, the schiavenza and the affitto, or lease, are mostly employed. In Lombardy, the mezzadria and the colonia parziasi are the usual forms employed. In Venetia, the products of produce are divided in equal proportions between the owner and the tiler. The latter pays the taxes, defrays the cost of preparing the ground, and wants the necessary improvements. In the districts where the former is employed, he retains the produce, and all the profits of the principal products. In the colonia parziasi the peasant executes all the agricultural work, in return for which he is housed rent-free, and receives one-twelfth of the corn, one-third of the wine, and a small allowance of olive oil during the first years.

In the affitto contracts the tenant is generally paid a fixed sum, which he must pay the landlord at the end of ten years. Under the gabelia lease the contract lasts twenty-nine years, the lessee being obliged to improve the land and raise the produce one-third during the first years. Ininguilinaggio is a form of lease by which the landlord, and sometimes the tenant, makes over to tenant or tenant the sowing of corn. There are various categories of inguillinaggio, and a form which has almost died out; and mezzadria (in the provinces of Caserta and Benevento). In Sicily leasehold prevails under special conditions. In pure leases the landlord usually has at least the usufruct of the land and the right to choose the tenant, and to the forfeiture of any fortuitous advantages. Under the gabelia lease the contract lasts twenty-nine years, the lessee being obliged to improve the land and raise the produce one-third during the first years. Ininguilinaggio is a form of lease by which the landlord, and sometimes the tenant, makes over to tenant or tenant the sowing of corn. There are various categories of inguillinaggio, and a form which has almost died out; and mezzadria (in the provinces of Caserta and Benevento).

In Sardinia the landlord-farming and leasehold prevail. In the few cases of mezzadria the Tuscan system is followed.

The number of boats and small engaged in the fisheries has considerably increased. In 1881 the total number was 15,914, with a tonnage of 49,103. In 1902 there were 23,008 boats, manned by 101,720 men, and the total catch was valued at over half a million. The single fishermen are producing a large part of the valuable cod-fish. The only drawback is that of licensing, which is not granted without difficulty. In the Abruzzi and in Apulia leasehold is predominant. Usually leases last from three to six years. In the provinces of Foggia and Lecce twenty-nine years’ leases are granted, but in them it is explicitly declared that they do not imply etelesi (perpetual leasehold), nor any other form of contract equivalent to co-propriety. In Sicily a leasehold is rarely resort to. On some small holdings, however, it exists with contracts lasting from two to six years. Special contracts, known as colonie immobiliari and colonie temporanee are applied to the latifondi or huge estates, the owners of which receive half the produce, and all the profits of the principal products, which he leases separately. "Improvement contracts" also exist. They consist of long leases, under which the landlord shares the costs of improvements and builds farm-houses; in these, the tenant is generally paid a fixed sum, which he must pay the landlord at the end of ten years. Under the gabelia lease the contract lasts twenty-nine years, the lessee being obliged to improve the land and raise the produce one-third during the first years. Ininguilinaggio is a form of lease by which the landlord, and sometimes the tenant, makes over to tenant or tenant the sowing of corn. There are various categories of inguillinaggio, and a form which has almost died out; and mezzadria (in the provinces of Caserta and Benevento).
was employed. Sardinian coral commands from £3 to £4 per kilogramme (2-204 lb), and is much more valuable than the Sicilian coral. The Sciacca reefs, which were again closed for three winters by the decree of 1904. The fishing is largely carried on by boats from Torre del Greco, in the Gulf of Naples, where the best coral beds are now worked. The catch of coral in 1901 was valued at £1,040,000, or just over 1,000. In 1902 there were 48 tunny fisheries, employing 3,006 men, and 516 tons of fish worth £80,000 were caught. The main fisheries are in Sardinia, Sicily, and Elba. Anchovy and sardine fisheries are carried on at Genoa, Savona, and Cervia (vade general total) are also of considerable importance, especially along the Ligurian and Tuscan coasts. The main fisheries are also of great importance, more especially those of Cornacchio, the lagoon of the PO river, Livorno, and Pescia. In 1896, the total tuna tonnage in fishing boats in 1902 numbered 13,698, with a total tonnage of 16,149; 100 of these were corn-fishing boats and 111 sponge-fishing boats. Industrial Progress.—The industrial progress of Italy has been great since 1860. Many articles formerly imported are now made at home, and some Italian manufactures have begun to compete in foreign markets. Italy has only unimportant lignite and anthracite mines, but water power is abundant and has been largely applied to industry, especially in generating electricity. The electric power required for the tramways and the illumination of Rome is entirely supplied by turbines situated at Tivoli, and this is the case elsewhere, and the harnessing of this water power is capable of very considerable extension. A sign of industrial development is to be found in the growing number of manufacturing companies, both Italian and foreign.

**Mechanical industries.**

This increase, however, is not confined to the chemical industries, though it has also been marked in metallurgy. Sulphur mining supplies large industries of sulphur-refining and grinding, and in spite of American competition. Very little pig iron is mined. The iron ore is exported, and iron manufactured consists of old iron remelted. For steel-making foreign pig iron is chiefly used. The manufacture of steel rails, carried on at 18 large works, is carried forward 186,000 tons in Italy in 1886. Tin has been manufactured since 1882. Lead, antimony, mercury and copper are also produced. The total salt production in 1892 was 428,517 tons, of which 246,215 were produced in Apulia, 87,705 in Liguria, and 94,697 in the province of Tuscany of Sicily. Great progress has been made in the manufacture of machinery; locomotives, railway carriages, electric tram-cars, &c., and many of the important works are under foreign capital, especially in the north and in the neighbourhood of Naples. At Turin the manufacture of motor-cars has attained great importance and the F.I.A.T. (Fabbrica Italiana Automobili Torino) factory employs 2,000 workmen, while eight others employ 2,500 amongst them.

The textile industries, some of which are of ancient date, are among those that have most rapidly developed. Handlooms and small spinning establishments have, in the silk industry, given place to large mills. In 1856, there were 2,000 looms in the manufacture of raw silk at least tripled itself between 1875 and 1900, and the value of the silks woven in Italy, estimated in 1890 to be £2,200,000, is now over £4,000,000, and the glass in Fabbrica di Lucca, Genoa, and almost £40,000,000. Lombardy (especially Como, Milan and Bergamo), Piedmont and Venetia are the chief silk-producing regions. There are several public assay offices in Italy for silk; the first in the world was opened at Bologna in 1750; in 1764, 83,000,000 skeins were produced, and the industry has rapidly developed. Home products not only supply the Italian market in increasing degree, but find their way into foreign markets. While importation of raw cotton increases importations of cotton thread and of cotton stuffs have rapidly decreased. The value of the annual produce of the various branches of the cotton industry, which in 1855 was calculated to be £2,000,000, was in 1900, notwithstanding the fall in prices, about £8,000,000. The industry is chiefly developed in Lombardy, Piedmont and Liguria; to some extent also in Campania, Venetia and Tuscany, and to a less extent in Lazio (Rome), Apulia, Emilia, the Marches, Umbria, the Abruzzi and Basilicata. The chief cotton-mills are Fiume, Pesaro, Brindisi, Novara, Genoa, and Naples, begun in 1892. In 1896, as in the case of cotton, Italian woollen fabrics are conquering the home market in increasing degree. The industry centres chiefly in Piedmont (province of Novara), Venetia (province of Venice), and the Marches. In 1897, the manufacture of cotton was carried on in 183 towns, (Caserta), Genoa, Umbria, the Marches and Rome. To some extent the industry also exists in Emilia, Calabria, Basilicata, the Abruzzi, Sardinia and Sicily. It has, however, a comparatively small export trade. Other textile industries (flax, jute, &c.) have made notable progress. The jute industry is concentrated in a few large factories, while the flax industry has more recently supplied the home need, and have begun considerably to export. Chemical industries show an output worth £2,600,000 in 1902 as against £1,000,000 in 1893. The chief products are sulphuric acid; nitro-benzene, nitric acid, and certain malodours of the vine; carbonate of lead, hydrophosphates and chemical manures; calcium carbide; explosive powder; dynamite and other explosives. Pharmaceutical industries, as distinguished from those above mentioned, have kept pace with the general development of Italian activity. The principal product of importance is the manufacture of tinctures, which has acquired great importance owing to its use as a specific against malaria. Milan and Genoa are the principal centres, and also the government military pharmacists. In 1902 the output was valued at £8,000,000. Other products, such as perfumes, are increasingly important. The preparation of India-rubber has been largely increased, and the production of rubber has increased from 47,690 millions to 57,741 millions. Sugar beet has attained considerable proportions in Umbria, the Marches, Latium, Venetia and Piedmont since 1890. In 1898-1899, 5972 tons were produced, while in 1905 the figure had risen to 59,916. The rise of the industry has been favoured by protective tariffs and by a system of excise which allows a considerable premium to manufacturers.

Alcohol has undergone various oscillations, according to the legislation governing distilleries. In 1871 only 200 hectolitres were produced, but in 1881 the output was 25,666,000 hectolitres, the maximum hitherto attained. Since then special laws have hampers development, some provinces, as for instance Sardinia, being allowed to produce only the quantity required for domestic consumption. In the other parts the industry is subjected to an almost prohibitive excise duty. The average production is about 150,000 hectolitres per annum. The greatest quantity is produced in Lombardy, Piedmont, and Venetia. In the latter province, the greater part of the beer drunk being imported from Germany, while the production of artificial mineral waters has somewhat increased. There is a considerable trade (not very large for export, however) in patent mineral waters, which are often excellent.

Paper-making is highly developed in the provinces of Novara, Caserta, Milan, Vicenza, Turin, Como, Lucca, Ancona, Genoa, Bologna, Ferrara, Siena, Mantua and Salerno. The hand-made paper of Fabriano is especially good.

Furniture-making in different styles is carried on all over Italy, especially as a result of the establishment of industrial schools. It is carried on in Venice, Verona, Genoa, Cremona, Pesaro, and in the provinces of 16th- and 17th-century styles, Venice the 17th century, and the Venetian province, the Pompeian style. Furniture and other small carved and gilded factories are carried on particularly in Lombardy and Piedmont. Bent-wood factories have been established in Venetia and Liguria.

A characteristic Italian industry is that of straw-plaiting for hat-making, which is carried on principally in Tuscany, in the district of Fermo, in the Alpine villages of the province of Vicenza, and in some communes of the province of Messina. The plaiting is done by country women, while the hats are made up in factories. Benefits and hats are largely exported.

Tobacco is entirely a government monopoly; the total amount manufactured in 1902-1903 was 16,599,000—a fairly constant figure. Tobacco from Venetia and Venetian glass is highly esteemed, and Venetian glass is often coloured and of artistic form.

In the various ceramic arts Italy was once unrivalled, but the ancient tradition for a long time lost its primeval impulse. The first Italian factory that came to an untimely end in 1820; those of Castelli (in the Abruzzi), which have been revived, were supplanted by Charles II's establishment at Capodimonte, 1750, which after producing articles of surprising execution was closed before the end of the century. The first place now belongs to the Delta Doccia works at Florence. Founded in 1735 by the marquis Carlo Giorni, they maintained a reputation of the very highest kind down to about 1800; but since then they have not kept pace with their younger rivals in other lands. They still, however, are commercially successful. Other cities where the ceramic industries keep up a market are Florence, Genoa, and Pesaro. Faenza has, for example, become the distinctive term for the finer kind of potter's work in France, faience, Savona and Albissola, Turin, Mondovi, Cuneo, Castellamare, Milan, Brescia, Sassuolo, Imola, Rimini, Perugia, Cassino, and Calvi. In all these places pottery and porcelain became famous in the 16th-17th centuries, have been revived, it is estimated that the total production of the finer wares amounts to 50 to 60,000,000. This art—the making of tiles and common wares—are pretty generally diffused.

The jeweller's art received large encouragement in a country which loves adornment. The Greek and Roman pastures have much to teach the art, and have given us that love of simplicity which is the basis of all good work. The Italian goldsmiths have carried this up to its ultimate development, and now make work of the most exquisite beauty. The introduction of new and richer metals has added to the variety of the ornament, the art that the making of tiles and common wares—are pretty generally diffused.

department. The great works of the Vatican are especially famous (more than 8,000 distinct tints are employed in their productions), and there are many other establishments in Rome. The Florentine mosaics are perhaps better known abroad; they are composed of large pieces of glass. The condition of Sicilian labourers is also miserable. The huge extent of their domain is usually concealed, often results in their being left in the hands of speculators, who exploit both men and women with such cruelty that the latter are driven to murder. Often in the face of all evidence, they are compelled to sell their crops to the usurers before harvest. In Sardinia wage-earners are paid 10d. a day, with free shelter and an allotment for private cultivation. Irregular adult workmen earn between 10d. and 1s. 6d., whereas from 6d. to 1s. is the rate paid to vine-waterers, sometimes earning as much as 3s. a day.

The peasantry usually make use of animal food—this is mostly largely used in Sardinia and Apulia. The consumption of bread and polenta or macaroni and vegetables being the staple diet. Witness the following:

The condition of the workmen employed in manufactures has improved during recent years. Wages are higher, the cost of the prime necessaries of life is, as a rule, lower, though taxation on some of them is still enormous; so that the remuneration of work has improved. Taking into account the variations in wages and in the price of wheat, it may be calculated that the number of hours of work requisite to earn a sum equal to the price of a cwt. of wheat fell from 153 in 1857 to 73 in 1894. In 1898 it was 105, on account of the rise in the price of wheat, and since 1899 it has fallen to 102 and 101 hours.

Wages have risen from 22-26 cents per hour (on an average) to 25-30 cents, but not in all industries. In the mining and woollen industries they have fallen, but have increased in mechanical, chemical, silk and cotton industries. Wages vary greatly in different parts of Italy. On the whole, according to the cost of the necessaries of life, the degree of development of working-class needs and the state of working-class organization, which in some places has succeeded in imposing the rates of as little as 70 cents a day on men, and though their wages have also increased, the rise has been slighter than in the case of men. In some trades, for instance the slate trade, women earn little more than 10d. a day, and, for some classes of work, 5s. a week. On the other hand, women engaged in sanitation has led to a corresponding improvement in the condition of the working classes, though much still remains to be done, especially in the south. On the other hand, it is generally the case that even in the most unpromising inn the bedding is clean.

The number of industrial strikes has risen from year to year, although, on account of the large number of persons involved in some of them, the rise in the number of strikers has not always corresponded to the number of strikes. During the years 1900 and 1901 strikes were increasingly numerous, chiefy on account of the growth of Socialist and working-class organizations. Strikes were more frequent, particularly those of women, and the number of trade disputes was increased, especially Lombardy and Piedmont, where manufacturing industries are most developed. Textile, building and mining industries show the highest percentage of strikes, since they give employment to the greatest number of men in the country. Industrial strikes, though less frequent than those in manufacturing industries, have special importance in Italy. They are most common in the north and central provinces, but the number of strikes is less by the more backward and more ignorant peasants than by the better-educated labourers of Lombardy and Emilia, among whom Socialist organizations are widespread. Since 1901 there have been, more than once, general strikes at Milan and elsewhere, and one in the autumn of 1905 caused great inconvenience throughout the country, and led to no effective result.

Although in some industrial centres the working-class movement has assumed an importance equal to that of other countries, there is no general working-class organization comparable to the English trade unions. Mutual benefit and co-operative societies serve the same end, and are much encouraged in the working classes. In 1903, after many vicissitudes, the Italian Socialist Labour Party, in which the majority of Italian workmen enrol themselves. Printers and paper-makers were the first to organize, followed by woolen weavers, the tailors and the food and wine trade. The government has undertaken to keep a register of organizations and an inspection of their accounts. In 1899, at the request of the employers, an agitation began for the organization of "Chambers of Labour," intended to look after the technical education of workmen and to form commissions of arbitration in case of strikes. They act also as employers' representatives and as agents for collective bargaining. In 1905 they present such "chambers" exist in many Italian cities, while "leagues of improvement," or "resistance," are rapidly spreading in the towns. These latter, like the "agitation," have been proved, at least temporarily, advantageous to the working classes.

Labour legislation is backward in Italy, on account of the late development of manufacturing industry and of working-class organizations. On the other hand, the professions of doctors, lawyers, and the like, are not subject to any form of liability. The Act compelled employers of more than five workmen in certain industries to insure their employees against accidents.
On the 17th of July 1889 a national fund for the insurance of workers against illness and old age was founded by law on the principle of open-end co-operation. The dividend at the end of each year was distributed among the members in proportion to the amount of insurance contributions paid by each. The co-operative societies have now more than 1,500,000 members, and the total amount of the annual income of the fund is furnished in various forms by the state (principally by making over a proportion of the profits of the Post Office Savings Bank), and part by the premiums paid by all the members. The workmen’s insurance has been the means of affording an annuity of one lira per day at the age of sixty, and insurance against sickness. The low level of wages in many trades and the jealousies of the Chambers of Labour and other working-class organizations, and the lack of fear of competition, have depressed the situation. A law came into operation in February 1908, according to which a weekly day of rest (with few exceptions) was established on Sunday in every city, for which it was possible, and otherwise upon some other day of the week. The French institution of Prud’hommes was introduced into Italy in 1893, under the name of Colloge di Propristi. The institution has not so far attracted the same degree of acceptance as that of Prud’hommes in France. The institution is of the greatest benefit to those engaged in textile and mechanical industries. Each "college" is founded by royal decree, and consists of a president, with not fewer than ten and not more than twenty members. A conciliation bureau and a court are elected to deal with disputes concerning wages, hours of work, labour contracts, &c., and have power to settle the disputes, without appeal, whenever the amounts involved do not exceed £2.

Provisional institutions have considerably developed in Italy under the forms of savings banks, assurance companies, and mutual benefit societies. Besides the Post Office Savings Bank and the ordinary savings banks, many co-operative credit societies and ordinary credit banks receive deposits of savings.

The greatest number of savings banks exists in Lombardy; Piedmont and Venetia come next. Campania holds the first place in the south, and Sicily is second. The number of deposits being deposited in the provisional institutions of Naples. In Liguria and Sardinia the habit of thrift is less developed. Assurance societies in Italy are subject to the general dispositions of the commercial code regarding commercial companies. Mutual benefit societies have increased rapidly both because their advantages have been appreciated, and because, until recently, the state had not taken any steps directly to insure workers in a manner hitherto unknown in Italy. Mutual benefit societies resemble the ancient beneficent corporations, of which in some respects they may be considered a continuation. The societies require government recognition if they wish to enjoy legal rights. The state of law of 1889, April 19, imposed this condition in order to determine exactly the aims of the societies, and, while allowing them to give help to their sick, old or feeble members, or aid the families of deceased members, to forbid them to pay old-age pensions, lest they assumed burdens beyond their financial strength. Nevertheless, the majority of societies have not sought recognition, being suspicious of fiscal state intervention.

Co-operation, for the various purposes of credit, distribution, production and labour, has attained great development in Italy.

Co-operative credit banks are the Casse Rurali or rural banks, on the Raiffeisen system, which lend money to peasants and small proprietors out of capital obtained on credit or by gift. These loans are made on personal security, but the members of the bank do not contribute any quota of the capital, though their liability is unlimited in case of loss. They are especially widespread in Lombardy and Venetia.

Distributive co-operation is confined almost entirely to Piedmont, Liguria, Lombardy, Venetia, Emilia and Tuscany, and is practically unknown in Basilicata, the Abruzzi and Sardinia.

Co-operative dairies are numerous. They have, however, much decreased in number since 1889. More numerous are the agricultural and horticultural societies, about 10,000 in number. They are to be found mainly in the fertile plains of northern Italy, where they enjoy considerable success, removing the cause of labour troubles, and providing for, and insuring against deficiency of, a sufficiently large scale. The richest, however, of the co-operative societies, though few in number, are those for the production of electricity, for textile industries and for ceramic and glass manufacturing.

Co-operation in general is most widely diffused, in proportion to population, in central Italy; less so in northern Italy, and much less so in the south and the islands. It thus appears that co-operation flourishes most in the districts in which the mesostrata system has been prevalent.

The first railway in Italy, a line 16 m. long from Naples to Castellamare, was opened in 1840. By 1881 there were some 5,500 m. open, in 1891 some 8,000 m., and in 1901 the total length was 9317 m. In July 1905 all the principal lines, which had been consolidated in 1893, were taken over by the state; their length amounted in 1901 to 6147 m., and in 1907 to 5295 m., and the management of the state railways (whence the financial results) remain in the hands of private companies. The total length of the Sardinian railways, was 10,368 m. in 1907. The state, in taking over the railways, did not exercise sufficient care to see that the lines and the road stock were kept to a proper state of efficiency, with the result that the annual expenditure of £1,400,000 annually was decided on to bring the lines up to the necessary state of efficiency to be able to cope with the rapidly increasing traffic. It was estimated in 1906 that this would have to be maintained for a period of ten years, with a further total expenditure of £14,000,000 on new lines.

Comparing the state of things in 1901 with that of 1881, for the whole of Italy, the passenger traffic is almost doubled (except the cattle traffic), the capital expenditure almost doubled, the working expenses per mile almost imperceptibly increased, and the gross receipts per mile slightly lower. The state has, therefore, increased the rate of interest to the proprietors of numerous unremunerative lines, and the free granting of concessions to government and other employees (and also of cheap tickets in special occasions in vacations for congresses, &c., in which without strict inquiry into the qualifications of the claimants) will account for the failure to realize a higher profit. The fares (in slow trains, with the addition of 10% for expenses) are: 1st class, 1-85d; 2nd class, 1-35d; 3rd class, 1-05d; 4th class, 0-75d. There is a general reduction of 10% on the slow trains for distances over 93 m., on a scale increasing in proportion to the distance.

The taking over of the main lines by the state has of course produced a considerable change in the financial situation of the railways. The state incurred in this connexion a liability of some £2,000,000, of which about £16,000,000 represented the rolling stock, and £11,000,000 the improvements made to the lines and the trains. The capital value of the whole of the lines, rolling stock, &c., for 1898-1899 was calculated approximately at £2,441,600, and the profits at £5,295,019, or 2-2%.

The northern frontier is crossed by the railway from Turin to Ventimiglia by the Col di Tenda, the Mont Cenis line from Turin to Courmayeur, and the line from Turin to Aosta, a total length of 111 m. (in length) from Domodossola to Brigue, the St Gotthard from Milan to Chiasso (the tunnel is entirely in Swiss territory), the Brenner from Verona to Trent, the line from Udine to Tarvis and the line from Vicenza to Padua. The Adriatic routes are from Venice to the Adriatic ports Via Catania, Via Foggia, and Via Taranto. For the international lines the most important are those from Milan to Turin (via Vercelli and via Alessandria), to Genoa via Tortona, to Bologna via Parma and Modena, to Verona, and the shorter lines to the district of the lakes of Lombardy; from Turin to Genoa via Savona and via Alessandria; from Genoa to Savona and Ventimiglia along the Riviera, and along the south-west coast of Italy, via Sarzana (whence a line runs to Parmova) to Pisa (whence lines run to Pistoia and Florence) and Rome; from Verona to Modena, and to Venice via Padua; from Bologna to Padua, to Rimini (and thence along the north-east coast via Ancona, Castellamare Adriatico and Pesaro), to Leghorn and Ortezzano; from Turin to Rome and to Ancona, to Castellamare Adriatico and to Naples; from Naples to Foggia, via Metaponto (with a junction for Reggio di Calabria, and for Reggio di Calabria and for Catanzaro) and to Reggio Calabria. The lines to the French and Sardinian lines, of which the trains are not high, nor are the runs without stoppage long as a rule. One of the fastest runs is from Rome to Orte, 52-40 m. in 60 min., or 45-40 m. per hour, but this is a double line with little traffic. The low speed reduces the potentiality of the lines. The insufficiency of rolling stock, and especially of goods wagons, is mainly caused by delays in " handling" traffic consequent on this or other causes, and the state may be bound to provide a larger number of cars. The grave deficiency of rolling stock is felt south of the south of Rome. It is thus a matter of difficulty to provide tracks for a sudden emergency, &c. the vintage season; and in 1905-1907 heavy crops of wine were produced, and correspondingly increased the traffic. This led to deficiencies in the supply of coal to the manufacturing centres, and to some diversion elsewhere of shipping.

Steam and Electric Tramways.—Tramways with mechanical traction have developed in Italy very slowly. The first electric tramway was opened, and 1901, the length of the lines grew to 1890 m. of steam and 270 m. of electric tramways. These lines exist principally in Lombardy (especially in the province of Milan), in Piedmont,
ITALY

especially in the province of Turin, and in other regions of northern and central Italy. In the south they are rare, on account partly of the mountainous character of the country, and partly of the scarcity of coal and coal-tar products. Those parts of the towns that are provided with internal electric tramways, mostly with overhead wires.

Carriage-roads have been greatly extended in modern times, although their ratio to area varies in different localities. In north Italy are 66,975 miles of road, of which 36,185 miles in in southern Italy 405; in Sardinia 596, and in Sicily only 244. They are as a rule well kept up in north and central Italy, less so in the south, where, especially in Calabria, Messina and valleys of Cosenza, they are left in a state of nature.

Inland Navigation.—Navigable canals in 1886 a total length of about 655 m.; they are principally situated in Piedmont, Lombardy and Venetia, and are thus particularly confined to the Po basin. Canals lead from Milan to the Ticino, Adda and Po. The Po itself is navigable from Turin downwards, but through its delta it is so sandy that canals are preferred, the Po di Volano and the Po di Primaro on the right, and the Canale Bianco on the left. The total length of navigable rivers is 967 m.

Posts, Telegraphs and Telephones.—The number of post offices (including collestorie, or collecting offices, which are rapidly being eliminated) was in 1904 about 9,200, of which 4,000 were telegraph offices, 4,003 of other railways (railway and tramway stations, which accept private telegrams for transmission) 1930. The total number of telegraph lines and inter-urban lines was 66,685, and of inter-urban telephone lines 31,123.

Money order cards are very convenient and cheap (up to 10 lire [5s.] for 10 c. [½d.]), as they need not be enclosed in a letter, while a short private message can be written on them. Owing to the comparatively small amount of money orders used, it is possible for a travelling post office on all principal trains (while almost every train has a travelling sorter, for whom a compartment is reserved) without a late fee being exacted in either case. In the principal towns letters may be posted in special boxes at the head office just before the departure of any given mail train, and are conveyed directly to the travelling post office. Another convenient arrangement is the provision of on-train desks on electric trams in some cities.

Merchant Marine.—Between the years 1881 and 1905 the number of ships entered and cleared at Italian ports decreased slightly (219,598 in 1881 and 208,737 in 1905), while their aggregate tonnage increased considerably from 1,912,830 in 1881 and 1,982,992 in 1905). This increase is due to the development of shipping, trade with foreign countries prevails (especially as regards arrivals) over trade between Italian ports. Most of the merchandise and passengers bound for and arriving from foreign ports sail on vessels furnished by Italian shipping companies. Italian vessels in regard to goods embarked. European countries absorb the greater part of Italian sea-borne trade, whereas most of the passenger traffic goes to North and South America. The substitution of steamships for sailing vessels has brought about a diminution in the number of vessels belonging to the Italian mercantile marine, whether employed in the coasting trade, the fisheries or in traffic on the high seas. Thus:

Among the steamers the increase has chiefly taken place in vessels of more than 1,000 tons displacement, but the number of large sailing vessels has also increased. The most important Italian ports are (in order): Genoa, Naples, Palermo, Leghorn, Messina, Venice, Catania.

Foreign Trade.—Italian trade with foreign countries (imports and exports) during the quinquennium 1872-1876 averaged 54,344,000, a value which increased to 108,600,000 in 1893-1897, and fell to 84,000,000 in 1898, 75,000,000 in 1899, 78,000,000 in 1900, 82,000,000 in 1901, 86,000,000 in 1902, 90,000,000 in 1903, 94,000,000 in 1904, and 98,000,000 in 1905. In 1898, however, the total rose to 104,680,000, but the increase was principally due to the extra importation of corn in that year. In 1899 the foreign trade was between imports and exports. Thus:

* No account has here been taken of fluctuations of exchange.

The great extension of Italian coast-line is thought by some to be no disadvantage. Italy's chief source of maritime traffic, as far as the few ports have a large enough hinterland to furnish traffic, and in this hinterland (except in the basin of the Po) there are no canals or navigable rivers. Another source of weakness is the fact that Italy is a coaling station for foreign merchant vessels, which have to enter into competition with the ships of other countries, which call there in passing. A third difficulty is the comparatively small tonnage and volume of Italian exports relatively to the imports, the former in 1807 being about one-fourth of the latter, and probably out of proportion to the relative value; while a fourth is the lack of facilities for handling goods, especially in the smaller ports.

The total imports for the last six months of 1907 amounted to £57,840,000, an increase of £7,520,000 as compared with the corresponding period of 1906. The exports for the corresponding period amounted to £33,840,000, a diminution of £1,520,000 as compared with the corresponding period of 1906. The diminution is due to a smaller exportation of raw silk and oil. The countries with which this trade is mainly carried on are: (imports) United Kingdom, Germany, United States, France, Russia and India; (exports) Switzerland, United States, Germany, France, United Kingdom and Argentina.

The most important imports are minerals, including coal and metals (both in pig and wrought); silks, raw, spun and woven; stone, potter's earth, earthenware and glass; corn, flour and farinaceous products; cotton, raw, spun and woven; and live stock. The principal exports are silk and cotton textiles, live stock, wines, spirits and oils; corn, flour, macaroni and similar products; and cotton, raw and manufactured, as well as wool. Italy has an excess of 1878 manufactured articles, agricultural products and raw materials for manufacture held the principal places in the imports. In the exports, agricultural products came first, while raw materials for manufacture and manufactured goods were less important. The agricultural transformation of Italy from a purely agricultural into a largely industrial country is shown by the circumstance that trade in raw stuffs, semi-manufactured and manufactured materials, and in agricultural and manufactured articles, has increased. The increase is due partly to the decrease in agricultural and manufactured articles, and partly to the introduction of raw materials and the exportation of manufactured articles having increased. The balance of Italian trade has undergone some frequent fluctuations. The large predominance of imports over exports after 1884 was a result of the falling off of the export trade in live stock, olive oil and wine, on account of the closing of the French market, while the importation of corn from Russia and the Balkan States increased considerably. In 1884 the excess of imports over exports fell to £3,720,000, but by 1896 it had grown to £8,391,000, in consequence chiefly of the increased importation of coal, raw cotton, and other raw materials, as well as of old iron, grease and oil-seeds for use in Italian industries. In 1899 the excess of imports over exports fell to £3,006,000; but since then it has never been less than £12,000,000. 

Import inspection in Italy is regulated by the state, which maintains public schools of every grade, and requires that other public schools shall conform to the rules of the state schools. No private person may open a school without state authorization. Schools may be classed thus:

1. Elementary, of two grades, of the lower of which there must legally be at least one for boys and one for girls in each commune; while the upper grade elementary school is required in communes having normal and secondary schools or over 4000 inhabitants. In both the instruction is free. They are maintained by the communes, sometimes, with state help.
The age limit is six to nine years for the lower grade, and up to twelve for the higher grade, attendance being obligatory at the latter also where it exists. Secondary instruction (i.) classical in the ginnasi and licei, the latter leading to the universities; (ii.) technical. Higher education—universities, higher institutes and special schools.

Of the secondary and higher educatory methods, in the normal schools and licei the state provides for the payment of the staff and for scientific material, and often largely supports the ginnasi and technical schools, which should by law be supported by the communes. The universities are maintained by the state and by their own ancient resources; while the higher special schools are maintained in common by the state, the province, the commune and (sometimes) the local chamber of commerce.

The number of persons unable to read and write has gradually decreased, both absolutely and in proportion to the number of inhabitants. The census of 1871 gave 73% of illiterates, that of 1881, 67%, and that of 1901, 56%, i.e. 51% for males and 60-8 for females. In Piedmont there were 17.7% of illiterates above six years (the lowest) and in Calabria 78.7% (the highest), the figures for the whole country being 48.5. As might be expected, progress has been most rapid wherever education, at the moment of national unification, was most widely diffused. For instance, the number of illiterates in Turin was 98% in 1872, and in the Calabrian province of Cosenza 99%; in 1899 the percentage in the province of Turin had fallen to 5%, while in that of Cosenza it was still 76%. Infant asylums (where the first rudiments of instruction are imparted to children between two and a half and six years of age) and elementary schools have increased in number. There has been a corresponding increase in the number of scholars. Thus:

</tbody>
</table>

The teachers in 1901-02 numbered 65,739 (exclusive of 575 non-teaching directors and 322 teachers of special subjects) or about 41.5 scholars per teacher.

The rate of increase in the public-state supported schools has been much greater than in the private schools. School buildings have been improved and the qualifications of teachers raised. Nevertheless, many schools are still defective, both from a hygienic and a teaching point of view; while the economic position of the elementary teachers, who in Italy depend upon the communal administration and not upon the state, is in many parts of the country extremely low.

The law of 1877 rendering education compulsory for children between six and nine years of age has been the principal cause of the spread of elementary education. The law is, however, imperfectly enforced for financial reasons. In 1901-02 only 65% out of the whole number of children between six and nine years of age were registered in the lower standards of the elementary and private schools. The evening schools have to some extent helped to spread education. Their number and that of their scholars have, however, decreased since the withdrawal of state subsidies. In 1871-1872 there were 375,047 evening schools and 2,893,089 the holiday schools, while in 1900-1901 these numbers had fallen to 94,510 and 35,460 respectively. These are, however, the only institutions in which a decrease is shown, and by the law of 1902 5,000 of these institutions are to be provided in the communes where the proportion of illiterates is highest. In 1903 they numbered 4,245, with 138,181 scholars. Regimental schools impart elementary education to illettrate soldiers. Whereas the levy of 1894 showed 40% of the recruits to be completely illiterate, only 27% were illiterate when the levy was discharged in 1897. Private institutions and other classes of associations have striven to improve the intellectual conditions of the working classes. Popular universities have lately attained considerable development. The number of institutes devoted to secondary education remained almost unchanged between 1880-1881 and 1891-92, and in some places the number has even diminished by the suppression of private educational institutes. But the number of scholars has considerably increased, and shows a ratio superior to the general increase of the population. The greatest increase has taken place in technical education, where it has been much more rapid than in classical education. There are three higher commercial schools, with academic rank, at Venice, Genoa and Bari, and eleven secondary commercial schools; and technical and commercial schools for women at Florence and Milan. The number of agricultural schools has also grown, although the total is relatively small when compared with population. The attendance at the various classes of secondary schools in 1882 and 1902 is shown by the following table:

<table>

The schools which do not obtain equality with government schools are either some of those conducted by religious orders, or else those in which a sufficient number of non-religious are not reached. The total number of such schools was, in 1866, 742 with 33,813 pupils.

The pupils of the secondary schools reach a maximum of 6-60 per 1000 in Liguria and 5-92 in Latium, and a minimum of 2-30 in the Abruzzi, 2-27 in Calabria and 1-65 in Basilicata.

For the boarding schools, or convitti, there are only incomplete reports except for the institutions directly dependent on the ministry of public instruction, which are comparatively few. The rest are largely directed by religious institutions. In 1895-1896 there were 910 convitti for boys, with 59,066 pupils, of which 40, with 3814 pupils, were dependent on the ministry (in 1901-1902 there were 43 of these with 3966 pupils); and 1,458 for girls, with 49,676 pupils, of which only 8, with about 600 pupils, were dependent on the ministry.

The secole normali or training schools (117 in number, of which 75 were government institutions) for teachers had 1,329 male students in 1901-1902, showing hardly any increase, while the female students increased from 805 in 1882-1883 to 2,316 in 1895-1896, but decreased to 19,044 in 1901-1902, owing to the admission of women to telegraph and telephone work. The female secondary schools in 1881-1882 numbered 77, of which 7 were government institutions, with 3569 pupils; in 1901-1902 there were 233 schools (9 government) with 9347 pupils.

The total attendance of students in the various faculties at the different universities and higher institutions is as follows:

<table>

ITALY

Thus a large all-round increase in secondary and higher education is shown by the statistics, many of which show that young men devote themselves to the learned professions (especially to the law) than the economic condition of the country will justify. There are 21 universities—Bologna, Cagliari, Camerino, Catania, Ferrara, Florence, Padua, Parma, Pavia, Perugia, Pisa, Rome, Sassari, Siena, Turin, Urbino, of which Camerino, Ferrara, Perugia and Urbino are not state institutions; universities founded by the popes, Pavia, Genoa and Salerno, and the university of Catanzaro. Of these the most frequented in 1904–1905 were: Naples (4745), Turin (3451), Rome (2630), Bologna (1711), Pavia (1559), Padua (1364), Genoa (1270), and the least frequented, Cagliari (254), Siena (139), Genova (188) and Sassari (176). The professors of regular studies, extraordinary, and free professors (liberi docenti), corresponding to the German Privatdozenten, are also allowed to be attached to the universities.

The institutions which co-operate with the universities are the special schools for engineers at Naples, Rome, Naples and Bologna (and others attached to some of the universities), the higher technical institutes for mines at Florence, the higher commercial schools at Venice, Bari and Genoa, the commercial university founded by L. Bocconi at Milan in 1902, the higher law school at Genoa, the higher schools of agriculture at Milan and Portici, the experimental station and the school of forestry at Vallambrosa, the industrial museum at Turin. The special secondary institutions, distinct from those already mentioned, are the universities of Florence and Siena, the Oriental Institute at Naples with 243 pupils; 34 schools of agriculture with (1904–1905) 1925 students; 2 schools of mining (at Caltanissetta and iglesias) with (1904–1905) 83 students; 308 industrial and commercial schools with 17,538 students; 15 schools of design and moulining with (1898) 12,556 students; 13 government fine art institutes (1904–1905) with 2778 students and 13 non-governmental institutes of music with 1062 students, 51 government institutes of music with 4100 pupils (1904–1905). Almost all of these show a considerable increase.

Libraries are numerous in Italy, those even of small cities being often rich in manuscripts and valuable works. Statistics collected in 1853–1854 and 1860 revealed the existence of 1831 libraries, either private (but open to the public) or completely public. The public libraries have been enormously increased since 1870 by the incorporation of the treasures of suppressed monastic institutions. The richest in manuscripts is that of the Vatican, especially since the purchase of the Barberini Library in 1902; it now contains over 34,000 MSS. The Vatican archives are also of great importance. Most large towns contain important state or communal archives, in which a considerable amount of research is being done by local investigators; the various societies for local history (Società di Storia Patria) do very good work and issue valuable publications; the treasures which the archives contain are by no means exhausted. Libraries and archives are under the superintendence of the Ministry of Public Instruction. A separate department of this ministry undertakes the care of the national libraries and art works, making archaeological excavations and supervising those undertaken by private persons (permission to foreigners, even to foreign schools, to excavate in Italy is rarely granted), and maintaining the numerous state museums and picture galleries. The exportation of works of art and antiquities from Italy without leave of the ministry is forbidden (though it has in the past been sometimes evaded). An inventory of those subjects, the exportation of which in case no be permitted, has been prepared; and the ministry has at its disposal a fund of £200,000 for the removal of all kinds of statues and art works.

Charities.—In Italy there is no legal right in the poor to be supported by the parish or commune, nor any obligation on the commune to relieve the poor—except in the case of forlorn children and the sick poor. Public charity is exercised through the permanent charitable foundations (opere pie), which are, however, very unevenly distributed in the different provinces. The districts of Italy which show between 1881 and 1903 the greatest increase of new institutions, or of gifts to old ones, are Lombardy, Piedmont, Liguria, while Sardinia, Calabria and Basilicata stand lowest, Latium standing comparatively well.

The charity of Italian charitable institutions is considerable and is constantly increasing. In 1880 the number of charitable institutions (exclusive of public pawnshops, or Monti di pietà, and other operations of a private character) was approximately 22,000, with an aggregate patrimony of nearly £280,000,000. The revenue was about £3,600,000; after deduction of expenses, interest on debts, expenses of management, &c., £2,080,000. Add to this £2,600,000 spent on the product of the labour of inmates, temporary subscriptions, &c., the net revenue available for charity was, during 1880, £3,860,000. Of this amount £1,260,000 was spent for religious purposes. Between 1881 and 1905 the bequests and existing institutions have increased with the endowment of new institutions amounted to about £6,604,600.

Charitable institutions take, as a rule, the two forms of outdoor and indoor relief. A careful classification of the latter is not possible, as the institutions are the more important in regard to endowment, and consist of hospitals for the infirm (a number of these are situated at the seaside); of hospitals for chronic and incurable diseases; of orphan asylums; of sheltered workshops and schools for blind; day-nurseries and industrial institutions for the first education of children under six years of age; of lunatic asylums; of homes for the deaf and dumb; and of institutions for the blind. The outdoor charitable institutions include those which distribute help in money or food; those which supply medicine and medical help; those which aid mothers unable to rear their own children; those which subsidize orphans and foundlings; those which subsidize educational institutions, and those which supply marriage portions. Between 1881 and 1898 the chief increase took place in the endowments of hospitals; orphan asylums; infant asylums; poorhouses; almshouses; voluntary workhouses; and institutions for the blind in the number of establishments, and for the existence of those for the deaf and dumb. The average mortality among these institutions seems to have increased, while the number of inmates has increased. Italian charity legislation was founded by the laws of 1862 and 1890, which attempted to provide efficacious protection for endowments, and to ensure the application of the income to the purposes for which it was intended. This was essentially the law of the "institutions" (opere pie) and the "foundations" (fundationi), which are the institutions of the "Carità di Stato" (government charities). The law of 1890 also empowered every citizen to appeal to the tribunal in behalf of the poor, for whose benefit a given charitable institution may have been intended. A more recent law provides for the formation of a central body, with provincial commissions under it. Its effect, however, has been comparatively small.

Public pawnshops or Monti di pietà numbered 555 in 1896, with a net patrimony of £2,879,625. In that year their income amounted to £4,599,424, their expenditure £3,900,232. The amount lent on pawn was £4,153,229. The Monti frumentarii or co-operative corn depots, which lend corn to farmers, and are repaid after harvest with interest in a reduced 16%. About 100 of these exist. In Turin the number of such banks has increased from 1815 to 1619. In addition to the regular charitable institutions, the communal and provincial authorities exercise charity, the former (in 1899) to the extent of £1,827,166 and the latter to the extent of £5,199,532 per annum. Part of these sums is given to hospitals, and part is distributed directly by the communal and provincial authorities. Of the sum spent by the communes, about £3 goes for the sanitary service (doctors, midwives, vaccination), for the maintenance of foundlings, and for the support of the sick in hospitals; and £25 for the aged and needy. Of the sum spent by the provincial authorities, about £57 is for the support of foundlings. In addition to the above, the greater part is spent on charitable endowments in the form of almshouses, frumentarii and other charitable foundations.

The great majority of Italians—97.12%—are Roman Catholics. Besides the ordinary Latin rite, several others are recognized. The Armenians of Venice maintain their traditional characteristics. The Albanians of the southern provinces still employ the Greek rite and the Greek language in their public worship, and their priests, like those of the Greek Church, are allowed to marry. Certain peculiarities introduced by St Ambrose distinguish the ritual of Milan from that of the general church. Up to 1871 the island of Sicily was, according to the bull of Urban II., ecclesiastically dependent on the king, and exempt from the canonical power of the popes. The see of Trapani was only restored in 1666. In 1871 the pope was practically abolished, the fact that Rome is the seat of the administrative centre of the vast organization of the church is not without significance to the nation. In the same city in which the administrative functions of the body politic are centralized
there still exists the court of the spiritual potestate which in 1879 consisted of 1,821 persons. Protestants number some 65,000, of whom half are Italian and half foreign. Of the former 22,500 are Waldensians. The number of Jews was returned as 36,000, but is certainly higher. There are, besides, in Italy some 2,500 members of the Greek Orthodox Church. There were in 1901 20,297 parishes in Italy, 4,544 secular clergy and 48,043 regulars (monks, lay brothers and nuns). The size of parishes varies from province to province, Sicily having larger parishes in virtue of the old Sicilian church laws, and Naples, and some parts of central Italy, having the smallest. The Italian parishes had in 1901 a total gross revenue, including assignments from the public worship endowment fund, of £1,280,000 or an average of £65 per parish; 51% of this gross sum consists of revenue from glebe lands.

The kingdom is divided into 26 dioceses and ten abbeyes, or provosts, Nulius dioceses. The dioceses are as follows:

- A. 6 suburban see-Ostia and Velletti, Porto and Sta Rufina, Albano, Frascati, Palestrina, Sabina—all held by cardinal bishops.
- B. 74 sees immediately subject to the Holy See, of which 12 are archiepiscopal and 61 episcopal.
- C. 37 ecclesiastical provinces, each under a metropolitan, composed of 148 suffragan dioceses. Their position is indicated in the following table:

**Metropolitans.**

- **Acrenza-Matera.**
  - Subfragans. Anglona-Turni, Tricarico, Venosa.
- **Bari.**
  - Conversano, Ruvo-Bitonto.
- **Benevento.**
  - Saganella, Guardia, Ariso, Arisi, Satranio Cerrignola, Avellino, Bojano, Bovino, Larino, Lucera, S. Severo, Telese (Cereto), Termoli.
- **Bologna.**
  - Forza, Imola.
- **Bridiis et Ostuni.**
  - No suffragan.
- **Cagliari.**
  - Galtelli-Nuoro, Iglesias, Ogliastro.
- **Capua.**
  - Gaiazzano, Calvi-Teano, Caserta, Isernia-Venafro, Sessa.
- **Chieti et Vasto.**
  - No suffragan.
- **Conza et Campagna.**
  - S. Angelo de’ Lombardi-Bisaccia, Lacedonia.
- **Fermo.**
  - Macerata-Tolentino, Montalto, Ripartassone, S. Severino.
- **Florenc.**
- **Genoa.**
  - Albenga, Bobbio, Chiavari, Savona-Noli, Tortona, Ventimiglia.
- **Lanciano et Ortona.**
  - No suffragan.
- **Manfredonia et Vievi.**
  - No suffragan.
- **Messina.**
  - Lipari, Nicotera, Pati.
- **Milan.**
  - Bergamo, Brembo, Como, Crema, Cremona, Lodi, Mantua, Pavia.
- **Modena.**
  - Carpi, Guastalla, Massa-Carrara, Reggio.
- **Monreale.**
  - Caltanissetta, Girgenti.
- **Naples.**
  - Acerra, Nola, Pozzuoli.
- **Oristano.**
  - Ales-Terralba.
- **Ortona.**
  - Gallipoli, Lecce, Ugento.
- **Palermo.**
  - Castelvetrano, Trapani.
- **Pisa.**
  - Leghorn, Pisa, Pontremoli, Volterra.
- **Ravenna.**
  - Bertinoro, Cervia, Cesena, Comacchio, Forli, Rimini, Sarsina.
- **Reggio Calabria.**
  - Bova, Cassano, Catanzaro, Crotone, Gerace, Nocera, Opio, Pietrelcina, Tropea, Squillace.
- **Salerno.**
  - Acerno, Capaccio-Vallo,iano, Marsico, Potenza, Nocera dei Pagani, Susco, Policastro.
- **Sassari.**
  - Alghero, Ampurias and Tempio, Bisirato.
- **S. Severino.**
  - Carfia.
- **Siena.**
  - Chiusi-Pienza-Grosseto, Massa-Marittima, Sovana-Pitigliano.
- **Syracuse.**
  - Catania, Enna, Noto, Piazza-Armerina.
- **Sorrento.**
  - Castellammare.
- **Taranto.**
  - Castellaneta, Oria.
- **Trani-Nazareth-Barletta.**
  - Andria.
- **Turin.**
  - Acqui, Alba, Aosta, Asti, Cuneo, Fossano, Ivrea, Mondovì, Pinerolo, Saluzzo, Savigliano.
- **Urbino.**
  - S. Angelo in Vado-Urbana, Cagli-Pergola, Fossombrone, Montefeltro, Pesaro, Sinigaglia.
- **Venice (patriarch).**
  - Adria, Belluno-Feltre, Ceneda (Vittorio), Chioggia, Marostica, Padua, Treviso, Verona, Vicenza.
- **Vercelli.**
  - Alessandria della Paglia, Biella, Casale, Monferrato, Novara, Vigezzo.

Twelve archbishops and sixty-one bishops are independent of all metropolitan supervision, and hold directly of the Holy See. The archbishops are the Archbishops of Benevento, Bologna, Catania, Cosenza, Ferrara, Gaeta, Lucca, Perugia, Rossano, Spoleto, and Udine, and the bishops those of Acireale, Acquapendente, Altari, Asti, Avellino, Avigliana, Barletta, Benevento, Monteponi, Arrezo, Ascoli, Assisi, Avessa, Bagnore, Borgo San Donnino, Cervia, Città di Castello, Città della Pieve, Civitella Castellana-Orte-Gallese, Corneto-Civita Vecchia, Cortona, Fabriano-Matelica, Fano, Forlì, Fossombrone, Fregene, Fabriano, Gubbio, Jesi, Letto, Mirano and Braganto, S. Marco-Bisignano, Marsi (Peschi), Melfi-Rapolla Miletto, Molfetta-Terlizzi-Giovenazzo, Monopoli, Montalcino, Montefiascone, Montepulciano, Nardo, Narni, Nocera in Umbria, Norcia, Perugia, Ponte-Cellesi, Pistoia, Alfo, Foligno-Carsego, Piacenza, Fabriano, Ravenna, Rieti, Recanati-Loreto, Rieti, Segni, Sutri-Nepi, Teramo, Termini, Terracina-Piperno-Sezze, Tivoli, Tol, Trivento, Troia, Valvasor*illo, Vibo, Viterbo-Toscanello. Excluding the diocese of Rome and suburban see, each has a territory of 430 sq. m. and a population of 121,285 souls. The largest sees exist inVeneto, Lombardei, and the smallest in the provinces of Naples, Leghorn, Forli, Ancona, Pesaro, Urbino, Ascoli, Avezzano, and Ascoli Piceno. The Italian sees (exclusive of Rome and of the suburban see) have a total annual revenue of £606,000 equal to an average of £2000 per see. The richest is that of Giffoni, with £6034, and that the see of Porto Maurizio, with only £246. In each diocese is a seminary or diocesan school.

In 1855 an act was passed in the Sardinian states for the disestablishment of all religious orders not engaged in teaching, preaching or the care of the sick. All chapters of collegiate churches not having a cure of souls or existing in towns of less than 20,000 inhabitants, and of all private Augustinian churches, by which means the revenues of the above places were sequestrated. The property and money thus obtained were used to form an ecclesiastical fund (Cassa Ecclesiastica) distinct from the finances of the state. This act resulted in the suppression of 274 monasteries with 373 friars, and 61 nunneries and 27 convents with 940 monks and 878 nuns. In 1860, the Sardinian states, excluding the diocese of Rome, passed an act which resulted in the suppression of 11,889 chapters and benefices of the secular clergy, which yielded an annual income of £199,149. The value of the capital thus potentially freed was estimated at £12,000,000, and of all buildings on the property of the diocese to the national domain, and was credited with a corresponding amount by the exchequer. The property could be disposed of like the other property of the domain; and except in Sicily, except in the province of Naples, the property of all religious foundations in the above lands began to be sold by auction. To encourage the poorer classes of the people to become landholders, it was decided that the lots offered for sale should be small, and that the purchaser should be allowed to pay by five or ten yearly installments. By a new act of 1866 the process of secularization was extended to the whole kingdom. All the members of the suppressed communities received full exercise of all the ordinary political and civil rights of laymen; and annuities were granted to all those who had taken permanent religious vows prior to the 18th of January 1864. To priests and choristers, for example, of the proprietary or endowed orders were assigned 24 per cent of the property of any religious house if it amounted to upwards of £16 if upwards of 40, and £14 8s. if younger. The Cassa Ecclesiastica was abolished, and in its stead was instituted a Fondo per l’Istituto, or public worship fund. From the general confiscation were exempted the buildings of the temporal states, or public buildings, or public lands, or monasteries, or all lands on which the state would not have access, or lands, &c., or which had been appropriated to the use of schools, poorhouses, hospitals, &c., as well as the buildings, appurtenances, and movable property of the abbeys of Monte Cassino, Della Cava del Trenino, San Martino della Scala, Monreale, Certeola near Pavia, and other establishments of the same kind of importance as architectural or historical monuments. An annuity equal to the ascertained revenue of the confiscated property was allowed to the religious institutions to which the property belonged, government 5% consols. A fourth of this sum was to be handed to the communes to be employed on works of beneficence or education as soon as a surplus was obtained from that part of the annuity assigned to the suppression of monastic property, the payment of the £16 in the 209 communes entered on their privileges as soon as the annuity was liquidated. Another act in 1867 decreed the suppression of all the religious orders, and put an extraordinary tax of 30% on the whole of the property of the church, and granted the government the right of issuing 5% bonds sufficient to bring into the treasury £16,000,000,
which were to be accepted at their nominal value as purchase money for the alienated property. The public worship endowment fund has thus been the means of the endowment of the public worship, being gradually furnished to the poorer parish priests an addition to their stipends, raising them to £32 per annum, with the prospect of further raising them to £50; and has contributed to the outlay incurred for the purchase of religious purposes. The monastic buildings required for public purposes have been made over to the communal and provincial authorities, while the same authorities have been entrusted with the administration of the ecclesiastical revenues previously set apart for charity and education, and objects of art and historical interest have been consigned to public libraries and museums. By these laws the reception of novices was forbidden in the existing conventual establishments the extinction of which had been decreed, and all new foundations were forbidden, except those engaged in instruction and the care of the sick. But the laws have not been rigorously enforced of late years; and the ecclesiastical possessions seized by the state were thrown on the market simultaneously, and so realized very low prices, being often bought up by wealthy religious institutions. The large number of these institutions was increased when these bodies were expelled from France.

The public worship endowment fund amounted to £17,339,040, of which only £264,289 were represented by buildings still occupied by monks or nuns. The rest was made up of capital and interest. The liabilities of the fund (capitalized) amounted to £10,668,105, of which monastic pensions represented a rapidly diminishing sum of £2,554,930. The chief items of annual expenditure drawn from the fund were supplementary stipends to priests and the pensions to members of suppressed religious houses. The number of persons in receipt of monastic pensions on the 30th of June 1899 was 13,255; but while this item of expenditure will disappear by the deaths of those entitled to it, the supplementary stipends and contributions are gradually increasing. The following table shows the course of the two main categories of the fund from 1876 to 1902—1903:

The elective chamber is the more important. The Senate consists of princes of the blood who have attained their majority, and of an unlimited number of senators above forty years of age, who are qualified under any of the twenty-one specified categories—by having either held high office, or attained celebrity in science, literature, &c. In 1906 there were 318 senators exclusive of five members of the royal family. Nomination is by the king for life. Besides its legislative functions, the senate is the highest court of justice in the case of political matters, or the impeachment of ministers. The deputies to the lower house are 508 in number, i.e. one to every 64,803 of the population, and all the constituencies are single-member constituencies. The party system is not really strong. The suffrage is extended to all citizens over twenty-one years of age who can read and write and have either attained a certain standard of elementary education or are qualified by paying a rent which varies from £6 in communes of 2,500 inhabitants to £16 in communes of 150,000 inhabitants, or, if peasant farmers, 16s. of rent, or paying share-holders in the profits of farms on which steams £3 4s. of direct (including provincial) taxation is paid; or by paying not less than £16 in direct (including provincial) taxation. Elected members are qualified to vote by their position. The number of electors (2,514,377) at the general election in 1904 was 29% of the male population over twenty-one years of age, and 76% of the total population—exclusive of those temporarily disfranchised on account of military service; and of these 62-7% voted. No candidate can be returned unless he obtains more than half the votes given and more than one-sixth of the total number on the register; otherwise a second election must be held. Nor can he be returned under the age of thirty, and he must be qualified as an elector. All salaried government officials (except ministers, under-secretsaries of state and other high functionaries, and officers in the army or navy), and ecclesiastics, are disqualified for election. Senators are chosen by the king on the advice of the Chamber of Deputies from a list drawn up by that chamber and regulated by the law of 1871. The numbers of the list are limited to 150, and they are divided into 70 senatorial lists, or special designations (91 for monks, 63 for nuns), occupied by 433 monks and 435 nuns, and possessing a gross revenue of 4,780,861 lire. Of these, 120 monasteries and 90 convents were situated in the 51 monarchical and 22 convents in the "subbaccariatus." The laws of 1873 created a special charitable and religious fund of the city, while it left untouched 23 monasteries and 49 convents which had either the character of a house of trade, or the support of certain public funds. New parishes were created, old parishes were improved, the property of the suppressed religious corporations was assigned to charitable and educational institutions and to hospitals, while property having no special application was used to form a charitable and religious fund. On the 30th of June 1903 the balance-sheet of this fund showed a credit amounting to £1,796,120 and a debit of £460,819. Expenditure for the year 1902-1903 was £898,858 and revenue £818,674.
ITALY

Titles of Honour.—The former existence of so many separate sovereignities and "fountains of honour" gave rise to a great many hereditary titles of nobility. Besides many hundreds of princes, dukedoms, marquisates, baronies, lordships, and a number of persons of "patrician" rank, persons with a right to the designation nobile or signori, and certain hereditary knights or cavalieri in the "Golden Book of the Capitoline" ("Libro d'Oro del Capitolio") were inscribed with the same honour. Those persons have the title of prince and 8 that of duke, while the others are marquesses, counts or simply patricians. For the Italian orders of knighthood there are some 89, most of them of slight importance. Orders of Chivalry and Knighthood.

The king's uncle is duke of Aosta, his son is prince of Piedmont and his cousin is duke of Genoa.

Justice.—The judicial system of Italy is mainly framed on French principles and is in accordance with the codes of procedure of the Tribunale di Roma, Turin, Palermo, Florence, 20 appeal court districts, 162 tribunal districts and 1,553 mandamenti, each with its own magistracy (pretore). In 13 of the principal towns there are also pretori who have exclusive jurisdiction. The criminal courts are divided into tribunali, with some 1,000 magistrates, or by fine not exceeding 1,000 lire (400). The penal tribunals have jurisdiction over accused persons for offences committed more than ten years or for a fine exceeding 300 lire, while the assize courts, with a jury, deal with offences involving imprisonment for life or over 10 years. The criminal courts and tribunals of the territories (except for the Senate is on occasion a high court of justice) over all political offences. Appeal may be made from the sentences of the pretori to the tribunals, and from the tribunals to the courts of appeal; from the assize courts there is no appeal, and the sentences or penalties, on appeal, are passed by the Supreme Court of Cassation. The decisions of the courts are delivered in public, and the appeal to the court of cassation at Rome. This court has the supreme power in all questions of legality of a sentence, jurisdiction or conflicting higher courts.

The penal code was unified and reformed in 1890. A reform of later years is the condanna condizionale, equivalent to the English "being bound over to appear for judgment if called upon," applied in 94 cases of the usual civil law. The death sentence (condanna per via di condanna) is very rarely imposed from the civile and criminal courts. The judeze conciliator from the tribunale, the pretore, the civil tribune, the civil tribunal, to the court of appeal, and from the court of appeal to the court of cassation. The judges of all kinds are very poorly paid. Even the first president of the Rome court of cassation only receives 4,000 lire a year. The statutes of civil proceedings vary considerably from province to province. Lombardy and Venice have a maximum sentence for all criminal cases, and holds the lowest price; Emilia comes next with 31 per 1,000; Tuscany has 39; Venetia, 42; Calabria, 44; Rome, 145; Apulia, 153; Sicily, 7,600. The maximum sentence in Sardinia is chiefly due to cases within the competence of the consiglio di stato.

The number of penal proceedings, especially those within the competence of the pretori, has also increased, chiefly on account of the frequent penalty of imprisonment. The statistics of civil proceedings are not always reliable. The ratio of criminal proceedings to population is, as a rule, much higher in the south than in the north. The records, dated February 1931, established three classes of crimes: judiciare, for persons awaiting examination or persons sentenced to arrest, detention or seclusion for less than six months; penitentiarie di various kinds (ergastoli, di reclusione, disturbi di custodia), for criminals condemned to terms of imprisonment; and reformatories, for criminals under age and vagabonds. Capital punishment was abolished in 1877, penal servitude for life being substituted. This generally involves solitary confinement in a dungeon, where a convict is ordered to occupy the mind, the criminal not infrequently becomes insane. Certain types of dangerous individuals are relegated after serving a sentence of five years to the convict prisons, and by administrative, not by judicial process, to a mode of life called artificial or "forced residences." These establishments are, however, unsatisfactory, being mostly situated on small islands, where it is often difficult to maintain order. The courts, who are free by day, are only confined at night. They receive a small and hardly sufficient allowance for food of 50 centesimi a day, which they are liberty to supplement by work if they can find it or care to do it.

The statistics of the conviction of new prisons and the transformation of old ones, the number of cells for solitary confinement is still insufficient for a complete application of the penal system established by the 4th of April, 1893. The moral effect of the association of the prisoners is not good, the system of solitary confinement as practised in Italy is little better. The total number of prisoners, including minors and inhabitants of enforced residences, which from 76,066 (2,84 per 10,000 inhabitants) on the 31st of December 1871 rose to a maximum of 80,792 on the 31st of December 1879 (2,87: per 1000), decreased to a minimum of 60,621 in 1896 (1,94 per 1000), and on the 31st of December 1898 rose again to 75,470 (2,38 per 1000), of whom 70,38, less than one-tenth, were women. The lowness of the figures regarding women is to be noticed. The number of the inmates was from 75,000 in 1872, depopulated 65,819, of which 6044 were women. Of these, 31,219 were in lock-ups, 25,145 in penal establishments, 1837 minors in government, and 4347 in private reformatories, and 3071 (males) were inmates of the military prisons. The population of single and married inmates.

Crime.—Statistics of offences, including contravennzioni or breaches of by-laws and regulations, exhibit a considerable increase per 100,000, as the results of the Criminal Code of 1867, which replaced the general law of 1820, 3966 in 1887, 4408 in 1892, 4005 in 1897, 3202 in 1902; and Italy remains, owing to the frequent use of the knife, the European country in which it is most frequent. Libels, insults, etc., resistance to public authority, offences against good customs, thefts and frauds have increased; assaults are nearly stationary. There is also an increase in juvenile delinquency. From 1890 to 1900 the actual number rose by one of third (from 30,108 to 43,428), the proportion to the rest of those sentenced from one-fifth to one-fourth; while in 1905 the actual number rose to 67,944, being a considerable proportionate rise also. In Naples, the Camorra and in Sicily, the Mafia (gangs of assassins and bandits of whose power to resistance authority is still not inconsiderable.

Procedure, both civil and criminal, is somewhat slow, and the preliminary proceedings before the juge d'instruction occupy much time; but these are larger than the preliminary investigations (including experts) and the lengthy speeches of counsel, have been dragged out to an unconscionable length. In this, as in the international treaties, French procedure prevails (except in the marriage law), and it is said (e.g. by Nathan, Vent' anni di vita italiana, p. 241) that the efforts of the juge d'instruction are, as a rule, in fact, though in law, largely directed to prove that the accused is guilty. In 1902 of 884,612 persons accused of penal offences, 13:12% were acquitted during the period of the instruction, 30-31 by the courts, 46-32 condemned and the rest acquitted in some other way. This shows that charges, often involving preliminary imprisonment, are eagerly brought against an excessive proportion of persons who either are not or cannot be proved to be guilty. The courts of appeal and cassation, too, often have more than they can do; in the year 1903 the number of the sentences of appeal and cassation was over 43,000, of which 70% were cases of law in civil cases, while no fewer than 460 remained to be decided. As in most civilized countries, the number of suicides in Italy has increased from year to year.

The Italian suicide rate of 6.6% per 1,000,000 is, however, lower than those of Denmark, Switzerland, Germany and France, while it approximates to that of England. The Italian rate is highest in the more enlightened and industrial north, and lowest in the south. Emilia secures a maximum rate of 10.45 per 100,000 inhabitants in Liguria and Lazio is little lower. The minimum of 1.27 is found in the Basilicata, though Calabria gives only 2.13. About 20% of the suicides are women, and the last fifty years there has been a considerable diminution. According to the figures of 1887, 64% were committed by the male sex, and 36% by the female. The decrease for the last twenty years is considerable, amounting to 22% in the number of deaths by suicide in the course of 1902.

Army.—The Italian army grew out of the old Piedmontese army with which in the main the unification of Italy was brought about. This unification meant for the army the absorption of contingents from all parts of Italy and presenting serious differences in physical and moral aptitudes, political opinions and education. Moreover the strategic geography of the country required the greater part of the army to be stationed permanently within reach of the north-eastern and north-western frontiers. These conditions made a territorial system of recruiting or organization as understood in Germany, practically impossible. To secure fairly uniform efficiency in the various corps, it was also necessary to absorb the best organization both for the army and the nation, works with a maximum of friction. "Army Reform," therefore, has been very much in the forefront of late years, owing to the estrangement of Austria (which power can mobilize much more rapidly), but financial difficulties have hitherto stood in the way.
of any radical and far-reaching reforms, and even the proposals of the Commission of 1907, referred to below, have only been partially accepted.

The law of 1875 therefore still regulates the principles of military service in Italy, though an important modification was made in 1907–1908. By this law every man liable and accepted for service was to serve for eight or nine years on the Active Army and its Reserve (of which three to five were spent with the colours), four or five in the Mobile Militia and the rest of the service period of nineteen years in the Territorial Militia. Under present regulations the term of liability is divided into nine years in the Active Army and Reserve (three or two years with the colours) four or five in the Mobile Militia and the rest of the service period of nineteen years in the Territorial Militia. But these figures do not represent the actual service of every able-bodied Italian. Like almost all "Universal Service" countries, Italy only drafts a small proportion of the available recruits into the army.

The following table shows the operation of the law of 1875, with the figures of 1871 for comparison:

</table>

1 Including officers on special service or in the reserve.

Thus, on the 30th of September 1871 the various categories of the army included only 2% of the population, but on the 30th of June 1873 they included 10%. In 1881 in the same proportion the active army and reserve shows a marked diminution, which became accentuated in the following year. The table below indicates that up to 1907 the army, though always below its normal strength, never absorbed more than a quarter of the available contingent.

</table>

The serious condition of recruiting was quickly noticed, and the tabulation of each year's results was followed by a new draft law, but no solution was achieved until a special commission assembled. The inquiries made by this body revealed an unsatisfactory condition in the national defences, traceable in the main to financial exigencies, and as regards recruiting a new law was brought into force in 1907–1908. One specially difficult point concerned the efficiencies of the peace-strength army. Hitherto the actual time of training had been less than the nominal. The recruits due to join in November were not incorporated till the following March, and thus in the winter months Italy was defenceless. The army is always maintained at a low peace effective (about one-quarter of war establishment) and even this was reduced, by the absence of the recruits, until there were often only 15 rank and file with a company, whose war strength is about 250. Even in the summer and autumn a large proportion of the army consisted of men with but a few months' service—a highly dangerous state of things considering the peculiar mobilisation conditions of the country. Further this case no legislation can cover—the contingent, and (what is more serious) the reserves, are being steadily weakened by emigration. The increase in the numbers, and the interval of enlistment is accounted for by the fact that if only a small proportion of the contingent were taken for service, the medical standard of acceptance is high.

The new recruiting scheme of 1907 re-established three categories of recruits, the 2nd category corresponding practically to the German Ersatz-Reserve. The law also increased the term of service from 18 to 21 years, and they are called up in the late summer to bridge the gap above mentioned. The new terms of service for the other categories have been already stated. In consequence, in 1908, of 490,000 liable, some 310,000 actually joined for full training and 24,000 of the new 2nd category for short training, which contrasts very forcibly with the feeble embodiments of 1900 and 1907. These changes created a certain amount of dissatisfaction, but the imminence of the danger caused their acceptance.

The peace strength under the new scheme is nominally 300,000, but actually (average throughout the year) about 240,000. The army is organized in 12 army corps (each of 2 divisions), 6 of which are quartered on the plain of Lombardy and Venetia and on the frontiers, and 2 more in northern central Italy. Their headquarters are: I. Turin, II. Alessandria, III. Milan, IV. Genoa, V. Verona, VI. Bologna, VII. Ancona, VIII. Florence, IX. Rome, X. Naples, XI. Bar, XII. Palermo, Sardinian division Cagliari. In addition there are 22 "Alpine" battalions and 15 mountain battalions stationed on the Alpine frontiers.

The war strength was estimated in 1901 as, Active Army (incl. Reserve) 750,000, Mobile Military 320,000, Territorial Military 2,300,000 (more than half of the last-named untrained). These figures are, with a fractional increase in the Regular Army, applicable to-day. When the 1907 scheme takes full effect, however, the Active Army and the Mobile Militia will each be augmented by about one-third. In 1913 the field army should, including officers and permanent cadres, be about 1,012,000 strong. The Mobile Militia will not, however, at that date have felt the effects of the scheme, and the Territorial Militia (setting the drain of emigration against the increased population) will probably remain at about the same figure as in 1901.

The army consists of 96 three-battalion regiments of infantry of the line and 12 of bersaglieri (riflemen), each of the latter having a cyclist company ( Bersagglieri cyclist battalions are being provisionally formed); 26 regiments of cavalry, of which 10 are lancers, each of 6 squadrons; 24 regiments of artillery, each of 8 batteries; 1 regiment of horse artillery of 6 batteries; 1 of mountain artillery of 12 guns; 3 companies of mountain batteries. The armament of the infantry is the Mèziére needle-loading breech-loading magazine rifle of 1891. The field and horse artillery was in 1909 in process of rearmament with a Krupp quick-firer. The garrison artillery consists of 3 coast and 3 fortress regiments, with a total of 72 companies. There are 4 regiments (11 battalions) of engineers. The carabinieri or gendarmerie, some 26,500 in number, are part of the standing army; they are recruited from selected volunteers from the army. In 1902 the special corps in Eritrea numbered about 4,700 of all ranks, including nearly 4,000 natives.

Ordinary and extraordinary military expenditure for the financial years 1890–1906 shows a total of £3,400,000, as compared with 1871. The Italian Chamber decided that from the 1st of July 1901 until the 30th of June 1907 the Italian military expenditure proper should not exceed the maximum of 15,000,000 lire per annum. The future Annual Acts of military expenditure show that the maximum of military pensions should not exceed £1,440,000. Italian military expenditure was thus until 1907 £11,000,000 per annum. In 1908 the ordinary and extraordinary expenditure was £10,000,000. The deficiency of the expenditure is compensated for, but a large special grant was voted amounting to at least £1,000,000 per annum for the next seven years. The amount spent is slight compared with the military expenditure of other countries.

The Alpine frontier is fortified strongly, although the condition of the works was in many cases considered unsatisfactory by the 1907 Commission. The fortresses in the basin of the Po chiefly belong to the era of divided Italy and are now out of date; the chief coast fortresses are Yado, Genoa, Spezia, Monte Argentario, Gaeta, Straits of Messina, Taranto, Maddalena. Rome is protected by a group of forts from a coup de main from the sea, the coast, only 12 m. off, being flat and without any defensive feature.

**Navy.**—For purposes of naval organization the Italian coast is divided into three maritime departments, with headquarters at Spezia, Naples and Venice; and into two comandi militari, with headquarters at Taranto and at the island of Maddalena. The personnel of the navy consists of the following corps: (1) General staff; (2) naval engineers, chiefly employed in building and repairing war vessels; (3) sanitary corps; (4) commissariat corps, for supplies and account-keeping; (5) crews.

The matériel of the Italian navy has been completely transformed, especially in virtue of the bill of the 31st of March 1875. Old types of vessels have been sold or demolished, and replaced by newer types.

1 This may be reduced, in consequence of the adoption of the new O.F. gun, 1 to 6.

1 The 2nd category of the 1875 law had practically ceased to exist.
In March 1907 the Italian navy contained, excluding ships of no fighting value:—

The four modern ships—the "Vittorio Emanuele II" class, laid down in 1899—have a tonnage of 12,625, two 12-inch, and twelve 8-inch guns, an I.H.P. of 19,000, and a designed speed of 22 knots, being intended to avoid any battleship and to carry enough guns to destroy any cruiser.

The personnel on active service consisted of 1799 officers and 25,000 men, the former being doubled and the latter trebled since 1882.

Naval expenditure has enormously increased since 1871, the total for 1871 having been about £900,000, and the total for 1905-1906 over £5,000,000. Violent fluctuations have, however, taken place from year to year, according to the state of Italian finances. Excluding the expense of the fleet, the Italian Chamber, in May 1901, adopted a resolution limiting naval expenditure, inclusive of naval pensions and of premiums on mercantile shipbuilding, to the sum of £4,840,000 for the following six years, i.e. from 1st July 1901 until 30th June 1907. This sum consists of £4,240,000 of naval expenditure proper, £500,000 for naval pensions, and £500,000 for premiums on mercantile shipbuilding. During the financial year ending on the 30th of June 1901 these figures were slightly exceeded.

**Finance.**—The volume of the Italian budget has considerably increased as regards both income and expenditure. The income of £607,411,418 in 1881 rose in 1890—1900 to £699,017,126; while the expenditure increased from £58,705,923 in 1881 to £569,708,706 in 1890—1900, an increase of £5,175,788 in income and £11,002,777 in expenditure. The increase in the latter has been almost entirely met by increases in the figures for 1905-1906 showing (excluding items which figure on both sides of the account) an increase of £8,766,905 in income and £5,434,560 in expenditure over 1890—1900. These figures include not only the categories of "income and expenditure" proper, but also those known as "movement of capital," "railway constructions" and "partile di giro," which do not constitute real income and expenditure. Considering only income and expenditure proper, the approximate totals are:—

The financial year 1862 closed with a deficit of more than £1,000,000, of which increased in 1866 to £28,540,000 on account of the preparations for the war against Austria. Excluding the increases of debt in 1868 and 1879, the annual deficits tended forward to decrease, until in 1875 equilibrium between expenditure and revenue was attained, and was maintained until 1881. Advantage was taken of the elimination of certain items of revenue, amongst them the girt tax, which prior to its gradual repeal pro-}

11 "Movement of capital" consists, as regards "income," of the proceeds of the sale of buildings, Church or Crown lands, old prisons, barracks, &c., or of moneys derived from sales of consolidated stock. The benefits realized in this manner are generally significant diminution of incumbrance or increase of debt. In regard to expenditure, "movement of capital" refers to extinction of debt by amortization or otherwise, to purchases of buildings or to advances made by the state. Thus expenditure really represents a patrimonial improvement, a creation of credit or a decrease of indebtedness. The items referring to "railway construction" represent, on the one hand, repayments executed by the communes and provinces of money disbursed on their account by the State Treasury; and, on the other, the cost of new railways incurred by the Treasury. The items of the "partile di giro" are inscribed both on the credit and debit sides of the budget, and have merely a figurative value.

12 Financial operations (mainly in connexion with railway purchase) figure on each side of the account for about £23,000,000.
ITALY

The debt per head of population was, in 1905, £14, 16s. 3d., and the interest 13s. 5d.

In July 1906 the 5% gross (4% net), and 4% net rente were successfully converted into 31½ % stock (to be reduced to 31% after five years), to a total amount of £324,017,393. The demands for redemption at 40% of the par value were very active, and the market value of the stock was hardly affected; while the saving to the Treasury was to be £800,000 per annum for the first five years and about double the amount afterwards.

Currency.—The lire (plural lira) of the Regione Centesimi (cents) is equal in value to the French franc. The total coinage (exclusive of Eritrean currency) from the 1st of January 1862 to the end of 1907 was 1,104,667,116 lire (exclusive of recoinage), divided as follows: gold, 477,516,090 lire; silver, 570,938,475 lire; nickel, 23,417,000 lire; bronze, 83,036,121 lire. The forced paper currency, instituted in 1866, was abolished in 1881, in which year the Unione de Banche di Stato created a bank for the issue of a milliard of lire in notes, guaranteed collectively by the banks. Part of the Union notes were redeemed, part replaced by 10 lire and 5 lire state notes, payable at sight in metallic legal tender by certain state banks. Nevertheless the law of 1881 did not succeed in maintaining the value of the state notes at a par with the metallic currency, and from 1885 onwards there reappeared a gold premium, which during 1899 and 1900 remained at about 7% but subsequently fell to about 4% and has since 1902 continually disappeared.

The paper circulation to the debt of the state and the paper currency issued by the authorized state banks is below shown:

Expenditure. — Of the expenditure a large amount is absorbed by interest on debt. Debt has continually increased with the development of the state.

This is considerably in excess of the circulation, £40,004,000, fixed by royal decree of 1900; but the issue of additional notes was allowed, provided they were entirely covered by a metallic reserve, whereas up to the fixed limit a 40% reserve only was necessary. The circulation at the end of 1885 was of £50,551,000; while the issue notes for 5, 10 and 25 lire, the currency of these at the end of 1906 being £17,546,967, with a total guarantee of £15,636,000 held against them. The average for any year 1906 is equal in value to the metallic currency of gold and silver.

The price of Italian consolidated 5% (gross, 4% net, allowing for the 20% income tax) stock, which is the security most largely negotiated abroad, and used in setting differences between large financial institutions, has steadily risen during recent years. After being depressed between 1885 and 1894, the prices in Italy and abroad reached, in 1899, on the Rome Stock Exchange, the average of 105½—106½. On 14 February 1908 the price of Italian stock on the Paris Bourse had, however, risen to par or thereabouts. The average price of Italian 4% in 1905 was 105½; since the conversion to 31½% net (to be further reduced to 31% in more years), the price has been about 102½ on dates of exchange, or, in other words the gold premium, favoured Italy during the years immediately following the abolition of the forced currency in 1881. In 1884, however, rates fell to 9%, and though they fell in 1886 they subsequently increased to such an extent as to reach 11½ at the end of August 1894. For the next four years they continued
low, but rose again in 1898 and 1899. In 1900 the maximum rate was 107-32, and the minimum 102-40, but in 1901 rates fell considerably, and were at par in 1902-1903. The larger of the clearing houses, namely, the ancient one at Leghorn, and those of Genoa, Milan, Rome, Florence and Turin, founded since 1882, are known as the ordinary banks, which, diminished between 1889 and 1894, increased in the following years, and was 158 in 1898. At the same time the capital employed in banking declined by nearly one-half, namely, from about $123,500,000 in 1888 to about $6,250,000 in 1894. The capital of these banks is divided into shares between large and small banks, amongst others the Bank of Genoa, the General Bank, and the Società di Credito Mobilare Italiano of Rome, and the Genoa Discount Bank, in regard to harvested properties, are also carried on by the co-operative credit societies, of which there are some 700.

Agrarian Credit Banks.
The farmers make a special business of lending money to owners of land or buildings (credito fondiario). Loans are repayable by instalments, and are guaranteed by first mortgages not greater in amount than half the value of the hypothecated property. The banks may buy up mortgages and advance money on current account on the security of land or buildings. The development of the large cities has induced these banks to turn their attention to a new market: the financial market. The value of their land certificates or cartelle fondiare (representing capital in circulation) rose from $10,425,000 in 1881 to $15,560,000 in 1886, and to $30,720,000 in 1894. The amount borrowed by the local authorities in 1897, and to $24,360,000 in 1897; the amount of money lent increased from $10,425,000 in 1881 to $15,600,000 in 1886, and $30,800,000 in 1891, but fell to $29,250,000 in 1896, to $27,360,000 in 1899, and to $20,000,000 in 1901. The diminution in 1891 occurred at the same time as the 20th of April 1891 on the banks of issue, which were obliged to liquidate the loan and mortgage business they had previously conducted.

Various laws have been passed to facilitate agrarian credit. The law of the 23rd of January 1887 (still in force) extended the dispositions of the Civil Code with regard to "privileges," and enabled the landowners to sell stored in barns and farm buildings, and in regard to agricultural implements. Loans on mortgage may also be granted to landowners and agricultural unions, with a view to the introduction of agriculture improvements. There are different regulations in the case of the improvement of the land under the laws of disposition, and are guaranteed by a share of the increased value of the land after the improvements have been carried out. Agrarian credit banks may, with the permission of the government, issue cartelle agrarie, or agrarian bonds, repayable by instalments and bearing interest.

Internal Administration.—It was not till 1865 that the administrative unity of Italy was realized. Up to that year some of the regions of the kingdom, such as Tuscany, continued to have a kind of autonomy; but by the laws of the 20th of March the whole country was divided into 69 provinces and 845 communes. The electoral districts were established on a principle of equality maintained in Italy through all the centuries of its political disintegration was strongly in its favour. The syndic (sindaco) or chief magistrate of the commune is appointed by the king for three years, and he was assisted by a "municipal junta."

Local government was modified by the law of the 20th of February 1888 and by posterior enactments. The syndics (or mayors) are now elected by a secret ballot of the communal council, though they are still government officials. In the provincial administrations the functions of the prefects have been curtailed. Each province has a prefect, responsible to and appointed by the Ministry of the Interior, while each of the regions (called variously circoscrizioni and distretti) has its sub-prefect. Whereas the prefect was formerly ex-officio president of the provincial deputation or executive committee of the provincial council, his duties under the new system are reduced to mere participation in the management of provincial affairs, the president of the provincial deputation being chosen among and elected by the members of the deputation. The most important charges in the hands of the president are the registration of births, deaths and marriage, while under the new system of the grant of the powers of the old provincial administrative junta entrusted with the supervision of communal administrations, a function previously discharged by the provincial deputation. Each provincial administrative junta is composed, in part, of government nominees, and in larger part of elective elements, elected by the provincial council for four years, half of whom require to be elected every two years. The act of the provincial council is qualified as "special," the provincial administrative junta is chiefly financial. Both communal councils and prefects may appeal to the government against the decision of the provincial administrative junta, the government being bound to render an opinion on the matter and entrusted with the final decision. Provincial administrations are under the direction of the provincial council, which, in consequence of the increased competence in regard to local government elections, which previously came within the jurisdiction of the provincial deputations, the provincial administrative junta discharge magisterial functions in administrative suits, and are assisted in their appeals presented by private counselors.

The juntas in these respect organs of the administrative jurisprudence created in Italy by the law of the 1st of May 1890, in order to speed up the judicial proceedings and to transfer to the competence of the ordinary tribunals. The provincial council only meets once a year in ordinary session.

The former qualifications for election to local government electors in 1882 having been set aside, it has been decided to hold elections annually in direct, five of certain communal taxes, or a certain rental (which varies according to the population of a commune, and which, in the last year, were paid annually), instead of the direct taxes to the state. In consequence of this change the number of local electors increased by more than one-third between 1887-1889; it decreased, however, as a result of an ordinance of 1898, which is revoked in 1899. The persons for which both communal and provincial councils are elected is six years, one-half being renewed every three years.

The ratio of local electors to population is in Piedmont 79 per cent, but in Sicily less than 45 per cent. The ratio of voters to qualified electors tends to increase; it is highest in Campania, Basilicata and in the south generally; the lowest percentages are given by Emilia and Lombardy.

Local finance. Local finance is regulated by the communal and provincial law of May 1898, which instituted provincial administrative junta, empowered to examine and sanction the acts of the communal authorities. The revenues of the provincial administrative junta is necessary for sales or purchases of property, alterations of rates (although in case of increase the junta can only act upon request of ratepayers paying a property tax), and for the establishment of local education expenditures being in consequence of an increase of the communal debt, not exceeding 50% of the frontier duty, or an exclusively communal duty limited to 10% on flour, bread and farinaceous products, and to 20% upon other commodities. The taxes thus vary considerably in different towns.

In addition, the communes have a right to levy a surtax not exceeding 50% of the quota levied by the state upon lands and buildings; all duties, taxes, levies which, for fiscal purposes, are divided into various categories; a tax based upon the value of houses, and other taxes upon cattle, horses, dog, carriages and servants; also on licences for slaughter house and stock, which are charged upon localities: these are the gate tax, or dazio di consumo, which may be either a surtax upon commodities (such as alcoholic drinks or meat), having already paid customs duty at the frontier, in which case the local surtax may not exceed 50% of the frontier duty, or an exclusively communal duty limited to 10% on flour, bread and farinaceous products, and to 20% upon other commodities. The taxes thus vary considerably in different towns.

The provincial administrations are entrusted with the management of the affairs of the provinces in general, as distinguished from those of the communes. Their expenditure is likewise classified as "obligatory" and "optional." The former category comprises the maintenance of provincial roads, bridges and watercourse embankments; secondary education, whenever this is not provided for by private institutions or by the state (elementary education being maintained by the communes), and the maintenance of foundlings and pauper lunatics. "Optional" expenditure includes the cost of services of general public interest, though not strictly indispensable. Provincial revenues are drawn from provincial property, school taxes, taxes on the value of land and buildings or on the rental of real estate, which may not exceed 50% of the quotas levied by the state. In 1897 the total provincial revenue was 15,732,253, of which $3,450,000 was obtained from the surtax upon lands and buildings. Expenditure amounted to $3,768,888, of which the principal items were $740,000 for roads and bridges, $5,200,000 for lunatic asylums, $2,400,000 for foundling hospitals, $520,000 for interest on debt and $2,000,000 for education. The provincial revenue has increased since 1880, principally on account of the increase in the land and building surtax.

The Italian local authorities, communes and provinces alike, have considerably reduced their indebtedness since 1882. The ratio of communal and provincial debt per inhabitant has grown 1, from 24.1 in 1880 to 19.0 in 1899. 2

1 According to the beginning of 1902 the Italian parliament sanctioned a bill providing for the abolition of municipal duties on bread and farinaceous products within three years of the promulgation of the bill on 1st July 1902.
The difficulty of Italian history lies in the fact that until modern times the Italians have had no political unity, no independence, no organized existence as a nation. Split up into numerous and mutually hostile communities, they never, through the four centuries which have elapsed since the end of the old Western empire, shook off the yoke of foreigners completely; they never until lately learned to merge their local and conflicting interests in the common good of undivided Italy. Their history is therefore not the history of a single people, centralizing and absorbing its constituent elements by a process of continued evolution, but of a group of cognate populations, exemplifying divers types of constitutional developments.

The early history of Italy will be found under Rome and allied headings. The following account is therefore mainly concerned with the periods succeeding a.d. 476, when Romulus Augustus was deposed by Odoacer. Prefixed to this are two sections dealing respectively with (A) the ethnographical and philological divisions of ancient Italy, and (B) the unification of the country under Augustus, the growth of the road system and so forth. The subsequent history is divided into five periods: (C) From 476 to 1796; (D) From 1796 to 1814; (E) From 1814 to 1870; (F) From 1870 to 1902; (G) From 1902 to 1910.

A. ANCIENT LANGUAGES AND PEOPLES

The ethnography of ancient Italy is a very complicated and difficult subject, and notwithstanding the researches of modern scholars is still involved in some obscurity. The great beauty and fertility of the country, as well as the charm of its climate, undoubtedly attracted, even in early ages, successive swarms of invaders from the north, who sometimes drove out the previous occupants of the most favoured districts, at others reduced them to a state of servitude, or settled down in the midst of them, until the two races gradually coalesced. Ancient writers are agreed as to the composite character of the population of Italy, and the diversity of races that were found within the limits of the peninsula. But the doctrines of each group of historians have been transmitted to us are often various and conflicting, while the only safe test of the affinities of nations, derived from the comparison of their languages, is to a great extent inapplicable, from the fact that the idioms that prevailed in Italy in and before the 5th century B.C. are preserved, if at all, only in a few scanty and fragmentary inscriptions, though from that date onwards we have now a very fair record of many of them (see, e.g. LATIN LANGUAGE, Osca Lingua, Tuvium, Volsci, ETRURIA: section Language, and below). These materials, imperfect as they are, - when combined with the notices derived from ancient writers and the evidence of archaeological excavations, may be considered as having furnished some results of reasonable certainty.

It must be observed that the name "Italians" was at one time confined to the Oenotrians; indeed, according to Antiochus of Syracuse (apud Dion. Hal. Ant. Rom. ii. 1), the name of Italy was first still more limited, being applied only to the southern portion of the Bruttium peninsula (now known as Calabria). But in the time of that historian, as well as of Thucydides, the names of Oenotria and Italy, which appear to have been at that period regarded as synonymous, had been extended to include the shore of the Tarentine Gulf as far as Metapontum and from thence across to the gulfs of Laurus and Posidonia on the Tyrrenian Sea. It thus still comprised only the two provinces subsequently known as Lucania and Bruttium (see references s. s. "Italia" in R. S. Conway's "Italic Dialects," p. 5). The name seems to have been derived from a noun *Italia* (Lat. *italus*, Gr. *itale*), and perhaps to have meant "salt-land," "grazing-land"; but the origin is more certain than the meaning; the celt may be one of the many animals connected with Italian tribes (see HIRZEN, SAMNITES).

Taking the term Italy to comprise the whole peninsula with the northern region as far as the Alps, we must first distinguish the tribe or tribes which spoke Indo-European languages from those who did not. To the latter category it is now possible to refer with certainty only the Etruscans (for the chronology and limits of their occupation of Italian soil see ETRURIA: section Language). Of all the other tribes that inhabited Italy down to the classical period, of whose speech there is any record (whether explicit or in the form of names and glosses), it is impossible to maintain that any one does not belong to the Indo-European group. Putting aside the Etruscans, and also the different Greek dialects of the Greek colonies, like Cumae, Neapolis, Tarentum, and proceeding from the south to the north, the different languages or dialects, of whose separate existence at some point between, say, 600 and 200 B.C., we can be sure, may be enumerated as follows: (1) Sicel, (2) South Ocean and Ocean, (3) Messapian, (4) North Ocean, (5) Volscan, (6) East Italic or "Sabellian," (7) Latinian, (8) Sabine, (9) Iguvine or Umbrian," (10) Gallic, (11) Ligurian and (12) Venetic.

Between several of these dialects it is probable that closer affinities exist. (1) Sicel and Volscan are very clearly demonstrated, that Venetic, East Italian and Messapian, are connected together and with the ancient dialects spoken in Illyria (q. s.), so that these might be provisionally entitled the Adriatic group, to which the language spoken by the Eteocretes of the city of Praços in Crete down to the 4th century B.C. was perhaps akin. (2) Too little is known of the Sicel language to make clear more than its Indo-European character. But it must be reckoned among the languages of Italy because of the well-supported tradition of the early existence of the Sicels in Latium (see Sicel). Their possible place in the earlier stratum of Indo-European population is discussed under Samnian. How far also the language or languages spoken in Bruttium and at certain points of Lucania, such as Anxie, differed from the Ocean of Samnium and Campania there is not enough evidence to show (see BRUTTII). (3) It is doubtful whether there are any actual inscriptions which can be referred with certainty to the language of the Ligures, but some other evidence seems to link them with the CO-peoples, whose early distribution is discussed under VOLSCI and LIQUIDA. (4) It is difficult to point to any definite evidence by which we may determine the dates of the later known as Umbri and the town of Castra, ally satisfactory collection has been made of the Celtic inscriptions of Cisalpine Gaul, though many are scattered about in different museums. For our present purpose it is important to note that the archaeological stratification in deposits like those of Bologna shows that the Gallic period supervened upon the Etruscan. Until a scientific collection of the local and personal names of this district has been made, and until the archaeological evidence is clearly interpreted, it is impossible to go beyond the region of conjecture as to the tribe or tribes occupying the valley of the Po before the two invasions. It is clear, however, that the Celtic and Etruscan elements together occupied the greater part of the district between the Apennines and the Alp down to its Romanization, which took place gradually in the course of the 2nd century B.C. Their linguistic neighbours were Ligurian in the south and south-west, and the Veneti on the east.

We know from the Roman historians that a large force of Gauls came as far south as Rome in the year 390 B.C., and that some part of this horde settled in what was henceforward known as the Ager Gallicus, the easternmost strip of coast in which was later known as Umbria, including the towns of Castra, Ravena and Ariminum. A bilingual inscription (Gallic and Latin) of

ITALY

B. CONSOLIDATION OF ITALY

We have seen that the name of Italy was originally applied only to the southernmost part of the peninsula, and was only gradually extended so as to comprise the central regions, such as Latium and Campania, which were designated by writers as late as Thucydides and Aristotle as in Opicia. The progress of this change cannot be followed in detail, but there can be little doubt that the extension of the Roman arms, and the gradual union of the nations of the peninsula under one dominant power, would contribute to the introduction, or rather would make the necessity felt, for the use of one general appellation. At first, indeed, the term was apparently confined to the regions of the central and southern districts, exclusive of Cisalpine Gaul and the whole tract north of the Appennines, and this continued to be the official or definite signification of the name down to the end of the republic. But the natural limits of Italy are so clearly marked that the name came to be generally employed as a geographical term at a much earlier period. Thus we already find Polybius repeatedly applying it in this wider signification to the whole country, as far as the foot of the Alps; and it is evident from many passages in the Latin writers that this was the familiar use of the term in the days of Cicero and Caesar. The official distinction was, however, still retained. Cisalpine Gaul, including the whole of northern Italy, still constituted a "province," an appellation never applied to Italy itself. As such it was assigned to Julius Caesar, together with Transalpine Gaul, and it was not till he crossed the Rubicon that he entered Italy in his capacity as "consul of the Roman people." Augustus was the first who gave a definite administrative organization to Italy as a whole, and at the same time gave official sanction to that wider acceptation of the name which had already established itself in familiar usage, and which has continued to prevail ever since.

The division of Italy into eleven regions, instituted by Augustus for administrative purposes, which continued in official use till the reign of Constantine, was based mainly on the territorial divisions previously existing, and preserved with few exceptions the ancient limits. The first region comprised Latium (in the more extended sense of the term, as including the land of the Volsci, Hernici and Aurunci), together with Campania and the district of the Picentini. It thus extended from the mouth of the Tiber to that of the Silarus (see Latium).

The second region included Apulia and Calabria (the name by which the Romans usually designated the district known to the Greeks as Messapia or Iapygia), together with the land of the Hirpini, which had usually been considered as a part of Samnium.

The third region contained Lucania and Bruttium; it was bounded on the west coast by the Silarus, on the east by the Bradanus.

The fourth region comprised all the Samnites (except the Hirpini), together with the Sabines and the cognate tribes of the Frentani, Marrucini, Marsi, Peligni, Vestini and Aequeuli. It was separated from Apulia on the south by the river Tifernus, and from Picenum on the north by the Matrinus.

The fifth region was composed solely of Picenum, extending along the coast of the Adriatic from the mouth of the Matrinus to that of the Aesis, beyond Ancona.

The sixth region was formed by Umbria, in the more extended sense of the term, as including the Ager Gallicus, along the coast of the Adriatic from the Aesis to the Ariminus, and separated from Etruria on the west by the Tiber.

The seventh region consisted of Etruria, which preserved its ancient limits, extending from the Tiber to the Tyrrenhian Sea, and separated from Liguria on the north by the river Magna.

The eighth region, termed Gallia Cispadana, comprised the southern portion of Cisalpine Gaul, and was bounded on the north (as its name implied) by the river Padus or the Po, from above the Placentia to its mouth. It was separated from Etruria and Umbria by the main chain of the Apennines; and the river

the 2nd century B.C. was found as far south as Tuder, the modern Todí (Italic Dialects, ii. 528; Stokes, Besenberger's Beiträge, ii, p. 113).

(5) Turning now to the languages which constitute the Italic group in the narrower sense, (a) Oscian; (b) the dialect of Vetulina, commonly called Volscian; (c) Latinian (i.e. Latin and its nearest congeners, like Faliscan); and (d) Umbrian (or, as it may more safely be called, Iguvine), two principles of classification offer themselves of which the first is purely linguistic, the second linguistic and topographical. Writers on the etymology of Italy have been hitherto content with the first, namely, the broad distinction between the dialects which preserved the Indo-European velars (especially the breathed plosive q) as velars or back-palatalts (gutturals), with or without the addition of a w-sound, and the dialects which converted the velars wholly into labials, for example, Latinian quis contrasted with Oscan, Volscian and Umbrian pis (see further Latin Language).

This distinction, however, takes us but a little way towards a historical grouping of the tribes, since the only Latinian dialects of which, besides Latin, we have inscriptions are Faliscan and Marsian (see Falisci, Marsi); although the place-names of the Aequi (q.v.) suggest that they belong to the same group in this respect. Except, therefore, for a very small and apparently isolated area in the north of Latium and south of Etruria, all the tribes of Italy, though their idioms differed in certain particulars, are left undiscriminated. This presents a strong contrast to the evidence of tradition, which asserts very strongly (1) the identity of the Sabines and Sammites; (2) the conquest of Samnium by this tribe; and which adds (3) a clear evidence of the identity of the Sabines with the ruling class, i.e. the patricians, at Rome itself (see Sabini; and Rome. Early History and Ethnology).

Some clue to this enigma may perhaps be found in the second principle of classification proposed by the present writer at the Congresso Internazionale di Scienze Storiche a Rome (Atti del Congresso, ii) in 1903. It was on that occasion pointed out that the ethnica or tribal and oppidum names of communities belonging to the Sabine stock were marked by the use of the suffix -NO- as in Sabini; and that there was some linguistic evidence that this stratum of population overcame an earlier population, which used, generally, ethnica in -CO- or -TI- (as in Marruci, Ardeates, transformed later into Marrucini, Ardeutini).

The validity of this distinction and its results are discussed under Sabini and Volsci, but it is well to state here its chief consequences.

1. Latin will be counted the language of the earlier plebeian stratum of the population of Rome and Latium, probably once spread over a large area of the peninsula, and akin in some degree to the language or languages spoken in north Italy before either the Etruscan or the Gallic invasions began.

2. It would follow, on the other hand, that what is called Oscan represented the language of the invading Sabines (more correctly Saéines), whose racial affinities would seem to be of a distinctly more northern cast, and to mark them, like the Dorian or Achaeans in Greece, as an early wave of the invaders who more than once in later history have vitally influenced the fortunes of the tempting southern land into which they forced their way.

3. What is called Volscian, known only from the important inscription of the town of Vetulina, and what is called Umbrian, known from the famous Iguvine Tablets with a few other records, would be regarded as Saéine dialects, spoken by Saéine communities which had become more or less isolated in the midst of the earlier and possibly partly Etruscanized populations, the result being that as early as the 4th century B.C. their language had suffered corruptions which it escaped both in the Samnite mountains and in the independent and self-contained community of Rome.

For fuller details the reader must be referred to the separate articles already mentioned, and to Iguvim, Picenum, Oscia Lingua, Marsi, Aequi, Siculi and Liguria. Such archaeological evidence as can be connected with the linguistic data will there be discussed.

GOTHIC AND LOMBARD KINGDOMS

ITALY

Ariminus was substituted for the far-famed Rubicon as its limit on the Adriatic. The ninth region comprised Liguria, extending along the seacoast from the Varus to the Macra, and inland as far as the river Padus, which constituted its northern boundary from its source in Mount Vesulus to its confluence with the Trebia just above Placentia.

The tenth region included Venetia from the Padus and Adriatic to the Alps, to which was annexed the neighbouring peninsula of Istria, and to the west the territory of the Cenomani, a Gaulish tribe, extending from the Athesias to the Addua, which had previously been regarded as a part of Gallic Cisalpinia.

The eleventh region, known as Gallia Transpadana, included all the rest of Cisalpine Gaul from the Padus on the south and the Addua on the east to the foot of the Alps.

The arrangements thus established by Augustus continued almost unchanged till the time of Constantine, and formed the basis of all subsequent administrative divisions until the fall of the Western empire.

The mainstay of the Roman military control of Italy first, and of the whole empire afterwards, was the splendid system of roads. As the supremacy of Rome extended itself over Italy, the Roman road system grew step by step, each fresh addition being marked by the pushing forward of roads through the heart of the newly-won territory, and the establishment of fortresses in connexion with them. It was in Italy that the military value of a network of roads was first appreciated by the Romans, and the lesson stood them in good stead in the provinces. And it was for military reasons that from mere cart-tracks they were developed into permanent highways (T. Ashby, in Papers of the British School at Rome, i. 129). From Rome itself roads radiated in all directions. Communications with the south-east were mainly provided by the Via Appia (the "queen of Roman roads," as Statius called it) and the south Latin, which met close to Cassinum, at the crossing of the Volturinus, 3 m. N.W. of Capua, the second city in Italy in the 3rd century B.C., and the centre of the road system of Campania. Here the Via Appia turned eastward towards Beneventum, while the Via Popilia continued in a south-easterly direction through the Campanian plain and thence southwards through the mountains of Lucania and Bruttii as far as Rhegium. Coast roads of minor importance as means of through communication also existed on both sides of the "toe" of the boot. Other roads ran south from Capua to Curnae, Putoioi (the most important harbour of Campania), and Neapolis, which could also be reached by a coast road from Minturnae on the Via Appia.

From Beneventum, another important road centre, the Via Appia itself ran south-east through the mountains past Venusia to Tarantum on the south-west coast of the "heel," and thence across Calabria to Brundisium, while Trajan's correction of it, following an older mule-track, ran north-east through the mountains and then thence lower ground of Apulia, reaching the coast at Barium. Both met at Brundisium, the principal port for the East. From Aquae Ticinum, on the Via Traiana, the Via Herculis ran to the south-east, crossing the older Via Appia, then south-west to Beneventum and so on to join the Via Popilia in the centre of Lucania.

The only highroad of importance which left Rome and ran eastwards, the Via Valeria, was not completed as far as the Adriatic before the time of Claudius; but on the north and northwest started the main highways which connected with central and northern Italy, and with all that part of the Roman empire which was accessible by land. The Via Salaria, a very ancient road, with its branch, the Via Caecilia, ran north-eastwards to the Adriatic coast and so also did the Via Flaminia, which reached the coast at Fanum Fortunae, and thence followed it to Ariminum.

The road along the east coast from Fanum Fortunae down to Barium, which connected the terminations of the Via Salaria and Via Valeria, and of other roads farther south crossing from Campania, had no special name in ancient times, as far as we know. The Via Flaminia was the earliest and most important road to the north; and it was soon extended (in 187 B.C.) by the Via Aemilia running through Bononia as far as Placentia, in an almost absolutely straight line between the plain of the Po and the foot of the Apennines. In the same year a road was constructed over the Apennines from Bononia to Arretium, but it is difficult to suppose that it was not until later that the Via Cassia was made, giving a direct communication between Arretium and Rome. The Via Clodia was an alternative route to the Cassia for the first portion out of Rome, a branch having been built at the same time from Florentia to Lucca and Luna. Along the west coast the Via Aurelia ran up to Pisa and was continued by another Via Aemilia to Genoa. Thence the Via Postumia led to Dertona, Placentia and Cremona, while the Via Aeclaniana and the Via Julia Augusta continued along the coast into Gallia Narbonensis.

The road system of Cisalpine Gaul was mainly conditioned by the rivers which had to be crossed, and the Alpine passes which had to be approached.

Cremona, on the north bank of the Po, was an important meeting point of roads and Hostilia (Ostiglia) another; so also was Patavium, farther east, and Alcinum and Aquileia farther east still. Roads, indeed, were almost as plentiful as railways at the present day in the basin of the Po.

As to the roads leading out of Italy, from Aquileia roads diverged northward into Raetia, eastward to Noricum and Pannonia, and southwards to the Istrian and Dalmatian coasts. Farther west came the roads over the higher Alpine passes—the Brenner from Verona, the Septimer and the Splügen from Clavenna (Chivenna), the Great and the Little St Bernard from Augusta Praetoria (Aosta), and the Mont Genèvre from Augusta Taurinorum (Turin).

Westward two short but important roads led on each side of the Tiber to the great harbour at its mouth; while the coast of Latium was supplied with a coast road by Septimius Severus. To the south-west the roads were short and of little importance.

On ancient Italian geography in general see articles in Pauly-Wissowa, Realencycloopddie (1899, sqq.); Corpus inscriptionum Latinarum (Berlin, 1862 sqq.); G. Strafforello, Geografia dell'Italia (Turin, 1890-1892); H. Nissen, Italiische Landeskunde (Berlin, 1883-1909); also references in articles ROMA, LATIUM, &c. (T. As.)

C. FROM 476 TO 1796

The year 476 opened a new age for the Italian people. Odoacer, a chief of the Heruli, deposed Romulus, the last Augustus of the West, and placed the peninsula beneath the titular sway of the Byzantine emperors. At Pavia the barbarian conquerors of Italy proclaimed him king, and he received from Zeno the dignity of Roman patrician. Thus began that system of mixed government, Teutonic and Roman, in the absence of a national monarch, which impressed the institutions of new Italy from the earliest date with dualism. The same revolution vested supreme authority in a non-resident and inefficient autocrat, whose title gave him the right to interfere in Italian affairs, but who lacked the power and will to rule the people for his own or their advantage. Odoacer inaugurated that long series of foreign rulers—Greeks, Franks, Germans, Spaniards and Austrians—who have successively contributed to the misgovernment of Italy from distant seats of empire.

Odoacer and the Lombards.—In 488 Theodoric, king of the East Goths, received commission from the Greek emperor, Zeno, to undertake the affairs of Italy. He defeated Odoacer, drove him to Ravenna, besieged him there, and in 493 completed the conquest of the country by murdering the Herulian chief with his own hand. Theodoric respected the Roman institutions which he found in Italy, held the Eternal City sacred, and governed by ministers chosen from the Roman populaition. He settled at Ravenna, which had been the capital of Italy since the days of Honorius, and which still testifies by its monuments to the Gothic chieftain's Romanizing policy. Those who believe that a single monarchy must respect that this Gothic kingdom lacked the elements of stability. The Goths, except in the valley of the Po, resembled an army of occupation rather than a people numerous enough to blend with the Italic stock. Though their
rule was favourable to the Romans, they were Arians; and religious differences, combined with the pride and jealousies of a nation accustomed to imperial honours, rendered the inhabitants of Italy eager to throw off their yoke. When, therefore, Justinian undertook the reconquest of Alboin, Belisarius and Narses, were supported by the south. The struggle of the Greeks and the Goths was carried on for fourteen years, between 539 and 553, when Teias, the last Gothic king, was finally defeated in a bloody battle near Nesusius. At its close the provinces of Italy were placed beneath Greek dukies, controlled by a governor-general, entitled exarch, who ruled in the Byzantine emperor's name at Ravenna.

This new settlement lasted but a few years. Narses had employed Lombard auxiliaries in his campaigns against the Danubian Goths; as, when he was recalled by an adult male, The Lombards, message from the empress in 565, he is said to have invited his finest and rudest of the Teutonic clans to seize the spoils of Italy. Be this as it may, the Lombards, their ranks swelled by the Gepidae, whom they had lately conquered, and by the wrecks of other barbarian tribes, passed southward under their king Alboin in 568. The Herulian invaders had been but a band of adventurers; the Goths were an army; the Lombards, far more formidable, were a nation in movement. Pavia offered stubborn resistance; but after a three years' siege it was taken, and Alboin made it the capital of his kingdom. After this event, the semi-independent duchies of Alboin's successors, the Lombard dukes of Benevento, together with a few autonomous commercial cities, still divided Italy below the Campagna of Rome (see LOMBARDS).

II. Frankish Emperors.—The Franko-Papal alliance, which conferred a crown on Pippin and sovereign rights upon the see of Rome, held within itself that ideal of mutually supporting papacy and empire which exercised so powerful an influence in medieval history. When Charles the Great (Charlemagne) deposed his father-in-law Desiderius, the last Lombard king, in 774, and took the title of emperor at Rome in 800, he did but complete the work the Lombards had started. With the title of emperor, Charles could claim the protectorate of such portions of Italy, external to the kingdom, as he should be able to acquire. This, at any rate, seems to be the meaning of that obscure re-settlement of the peninsula which Charles effected. The kingdom of Italy, transmitted on his death by Charles the Great, and afterwards confirmed to his grandson Lothar by the peace of Verdun in 843, stretched from the Alps to Terracina. The duchy of Benevento remained tributary, but independent. The cities of Gaeta and Naples, Sicily and the so-called Theme of Lombardy in South Apulia and Calabria, still recognized the Byzantine emperors. Venice stood aloof, professing a nominal allegiance to the East. The parcels into which the Lombards had divided the peninsula remained thus virtually unaltered, except for the new authority acquired by the see of Rome.

Internally Charles left the affairs of the Italian kingdom
ITALY

much as he found them, except that he appears to have pursued the policy of breaking up the larger fiefs of the Lombards, substituting counts for their dukes, and adding to the privileges of the bishops. We may reckon these measures among the earliest advantages extended to the cities, which still contained the bulk of the old Roman population, and which were destined to intervene with decisive effect two centuries later in Italian history. It should also here be noticed that the changes introduced into the holding of the fiefs, whether by altering their boundaries or substituting Frankish for Lombard vassals, were chief among the causes why the feudal system took no permanent hold in Italy. Feudalism was not at any time a national institution. The hierarchy of dukes and marquises and counts consisted of foreign soldiers imposed on the indigenous inhabitants; and the rapid succession of conquerors, Lombards, Franks and Germans following each other at no long interval, and each endeavouring to weaken the remaining strength of his predecessor, prevented this alien hierarchy from acquiring fixity by permanence of tenure. Among the many miseries inflicted upon Italy by the frequent changes of her northern rulers, this at least may be reckoned a blessing.

The Italians acknowledged eight kings of the house of Charles the Great, ending in Charles the Fat, who was deposed in 888. After them followed ten sovereigns, some of whom, however, had been the emperors of Rome. It was too much to expect the national sentiment to catch at any resemblance of national glory for a people passive in the hands of foreign masters. The truth is that no period in Italian history was less really glorious than that which came to a close in 961 by Berengar II.’s cession of his rights to Otto the Great. It was a period marked in the first place by the conquests of the Saracens, who began to occupy Sicily early in the 9th century, overran Calabria and Apulia, took Bari and threatened Rome. In the second place it was marked by a restoration of the Greeks to power. In 890 they established themselves again at Bari, and ruled the Theme of Lombardy by means of an officer of their own, Count Icherus, the third period was marked by a decline of good government in Rome. Early in the 10th century the papacy fell into the hands of a noble family, known eventually as the counts of Tusculum, who almost succeeded in rendering the office hereditary, and in uniting the civil and ecclesiastical functions of the city under a single member of their house. It is not necessary to relate the scandals of Marozia’s and Theodora’s female reign, the infamies of John XII. or the intrigues which tended to convert Rome into a duchy. The most important fact for the historian of Italy to notice is that in the reigns of the last two emperors of Italy, the third period, nothing was more esteemed than to fill the offices of the emperors and the chief dignitaries of the Church with men of merit. A fourth humiliating episode in this period was the invasion of the Magyar barbarians, who overran the north of Italy, and reduced its fairest provinces to the condition of a wilderness. Anarchy and misery are indeed the main features of that long space of time which elapsed between the death of Charles the Great and the descent of Otto. Through the almost impenetrable darkness and confusion we only discern this much, that Italy was powerless to constitute herself a nation.

The discord which followed on the break-up of the Carolingian power, and the weakness of the so-called Italian emperors, who were unable to control the feudatories (marquises of Ivrea and Tuscany, dukes of Friuli and Spoleto), from whose ranks they sprang, exposed Italy to ever-increasing misrule. The country by this time had become thickly covered over with castles, the seats of greater or lesser nobles, all of whom were eager to detach themselves from strict allegiance to the “Regno.” The cities, exposed to pillage by Huns in the north and Saracens in the south, and ravaged on the coast by Norse pirates, asserted their right to enclose themselves with walls, and taught their burghe the use of arms. Within the circuit of their ramparts, the bishops already began to exercise authority in rivalry with the counts, to whom, since the days of Theodoric, had been entrusted the government of the Italian burghs. Agreeably to feudal customs, these nobles, as they grew in power, retired from the town, and built themselves fortresses on points of vantage in the neighbourhood. Thus the titular king of Italy found himself simultaneously at war with those great vassals who had chosen him from their own class, with the turbulent factions of the Roman aristocracy, with unruly bishops in the growing cities and with the multitude of minor counts and barons who occupied the open lands, and who changed sides according to the interests of the moment. The last king of the quasi-Italian succession, Berengar II., marquis of Ivrea (951–961), made a vigorous effort to restore the authority of the regno; and had he succeeded, it is not impossible that now at the last moment Italy might have become an independent nation. But this attempt at unification was reckoned to Berengar for a crime. He only won the hatred of all classes, and was represented by the obscure annalists of that period as an oppressor of the church and a remorseless tyrant. In Italy, divided between feudal nobles and almost hereditary ecclesiastics, of foreign blood and alien sympathies, there was no national feeling. Berengar stood alone against a multitude, unanimous in their intolerance of discipline. His predecessor in the kingdom, Lothar, had left a young and beautiful widow, Adelheid. Berengar imprisoned her upon the Lake of Como, and threatened her with a forced marriage to his son Adalbert. She escaped to the castle of Canossa, where the great count of Tuscany espoused her cause, and appealed in the name of the Church of Rome to the king of Germany to come into Italy, and took Adelheid in marriage. After this episode Berengar was more discredited and impotent than ever. In the extremity of his fortunes he had recourse himself to Otto, making a formal cession of the Italian kingdom, in his own name and that of his son Adalbert, to the Saxon as his overlord. By this slender tie the crown of Italy was joined to that of Germany; and the formal right of the elected king of Germany to be considered king of Italy and emperor may be held to have accrued from this epoch.

The German Emperors.—Berengar gained nothing by his act of obedience to Otto. The great Italian nobles, in their turn, appealed to Germany. Otto entered Lombardy in 961, deposed Berengar, assumed the crown in San Ambrogio at Milan, and in 962 was proclaimed emperor by John XII. at Rome. Henceforward Italy changed masters according as one or other of the German families assumed supremacy beyond the Alps. It is one of the strongest instances furnished by history of the fascination exercised by an idea that the Italians themselves should have grown to glory in this dependence of their nation upon Caesars without thinking that a name in common with the Roman Emperor of the past.

The first thing we have to notice in this revolution which placed Otto the Great upon the imperial throne is that the Italian kingdom, founded by the Lombards, recognized by the Franks and recently claimed by eminent Italian feudatories, virtually ceased to exist. It was merged in the German kingdom; and, since for the German princes Germany was of necessity their first care, Italy from this time forward began to be left more and more to herself. The central authority of Pavia had always been weak; the regno had proved insufficient to combine the Lombard and Italian states. But now the idea of the division of the kingdom, both ecclesiastical and civil, and the Italians were abandoned to the slowly working influences which tended to divide them into separate states. The most brilliant period of their chequered history, the period which includes the rise of communes, the exchange of municipal liberty for despotism and the gradual discrimination of the five great powers (Milan, Venice, Florence, the Papacy and the kingdom of Naples), now begins. Among the centrifugal forces which determined the future of the Italian race must be reckoned, first and foremost, the new spirit of municipal independence. We have seen how the cities enclosed themselves with walls, and how the bishops defined their authority against that of the counts. Otto encouraged this revolution by placing the enclosures of the chief burghs beyond the jurisdiction of the counts. Within those precincts the bishops and the citizens were independent of all feudal masters but the emperor. He further
ITALY

broke the power of the great vassals by redistributions of their fiefs, and by the creation of new marches which he assigned to his German followers. In this way, owing to the dislocation of the ancient aristocracy, to the enlarged jurisdiction of the power of the burghs, feudalism received a powerful check in Italy. The Italian people, that people which gave to the world the commerce and the arts of Florence, was not indeed as yet apparent. But the conditions under which it could arise, casting from itself all foreign and feudal trammels, recognizing its true past in ancient Rome, and reconstructing a civility out of the ruins of those glorious memories, were now at last granted. The nobles from this time forward retired into the country and the mountains, founded or strengthened places beside the cities, and gave their best attention to fostering the rural population. Within the cities and upon the open lands the Italians, in this and the next century, doubled, trebled and quadrupled their numbers. A race was formed strong enough to keep the empire itself in check, strong enough, except for its own internecine contests, to have formed a nation equal to its happier neighbours.

The recent scandals of the papacy induced Otto to deprive the Romans of their right to elect popes. But when he died in 973, his last words (sancto redemptori omnium, the imperial Byzantine house) and his grandson, Otto III., who succeeded him into Italy in 996, found that the affairs of Rome and of the southern provinces were more than even their imperial powers could cope with. The faction of the counts of Tusculum raised its head from time to time in the Eternal City, and Rome still claimed to be a commonwealth. Otto III.'s untimely death in 1002 introduced new discord. Rome fell once more into the hands of her nobles. The Lombards chose Ardoine, marquis of Ivrea, for king, and Pavia supported his claims against those of Henry of Bavaria, who had been elected in Germany. Milan sided with Henry and strong places beside the cities, and for a time those cities being reckoned powerful allies in the Italian disputes of sovereigns. It is also the first instance of that bitter feud between the two great capitals of Lombardy, a feud rooted in ancient antipathies between the Roman population of Mediolanum and the Lombard garrison of Alboin's successors, which proved so disastrous to the national imperial cause. Ardoine retired to a monastery, where he died in 1015. Henry nearly destroyed Pavia, was crowned in Rome and died in 1024. After this event Heribert, the archbishop of Milan, invited Conrad, the Franconian king of Germany, to ascend the imperial throne into Italy, and crowned him with the iron crown of the kingdom.

The intervention of this man, Heribert, compels us to turn a closer glance upon the cities of North Italy. It is here, at the present epoch and for the next two centuries, that the pith and nerve of the Italian nation must be sought; and among the burghs of Lombardy, Milan, the eldest daughter of ancient Rome, assumes the lead. In Milan we hear for the first time the word Comune. In Milan the citizens first form themselves into a Parlamento. In Milan the archbishop organized the cithiero voiceless, defenceless population into a community capable of expressing its needs, and an army ready to maintain its rights. To Heribert is attributed the invention of the Carroccio, which played so singular and important a part in the warfare of Italian cities. A huge car drawn by oxen, bearing the standard of the burgh, and carrying an altar with the host, this carroccio, like the ark of the Israelites, formed a rallying point in battle, and reminded the armed artisans that they had a city and a church to fight for. That Heribert's device proved effectual in raising the spirit of his Italian sons and consolidating them into a formidable band of warriors, is shown by the fact that it was speedily adopted by all the free cities. It must not, however, be supposed that at this epoch the liberties of the burghs were fully developed. The mass of the people remained unrepresented in the government; and even if the consuls existed in the days of Heribert, they were but humble legal officers, transacting business for their constituents in the courts of the bishop and his viscount.

Hildebrand's policy throughout three papacies, during which he controlled the counsels of the Vatican, and before he himself assumed the tiara, to prepare the mind of Italy and Europe for a mighty change. His programme included these three points: (1) the celibacy of the clergy; (2) the abolition of ecclesiastical appointments made by the secular authority; (3) the vesting of the papal election in the hands of the Roman clergy and people, presided over by the curia of cardinals. How Hildebrand paved the way for these reforms during the pontificates of Nicholas II. and Alexander II., how he succeeded in raising the papal office from the depths of degradation and subjection to intolerable sway over the minds of men in Europe, and how his warfare with the empire established upon a solid basis the still doubtful independence of the Italian burghs, removing the long neglected protection of the Italian race, and bequeathing to his successors a national policy which had been forgotten by the popes since his great predecessor Gregory II., forms a chapter in European history which must now be interrupted. We have to follow the fortunes of unexpected allies, upon whom in no small measure his success depended.
Norman conquest of the Two Sicilies.

In order to maintain some thread of continuity through the perplexed and tangled vicissitudes of the Italian race, it has been necessary to disregard those provinces which did not immediately contribute to the formation of its history. For this reason we have left the whole of the south up to the present point unnoticed. Sicily in the hands of the Mussulmans, the Theme of Lombardy abandoned to the weak suzerainty of the Greek catapans, the Lombard duchy of Benevento slowly falling to pieces and the maritime republics of Naples, Gaeta and Amalfi extending their influence by commerce in the Mediterranean, were in effect detached from the Italian regno, beyond the jurisdication of Rome, included in no parcel of Italy proper. But now the moment had arrived when this vast group of provinces, forming the future kingdom of the Two Sicilies, was about to enter definitely and decisively within the bounds of the Italian community. Some Norman adventurers, on pilgrimage to St Michael's shrine on Monte Gargano, lent their swords in 1017 to the Lombard cities of Apulia against the Greeks. Twelve years later we find the Normans settled at Aversa under their Count Rainulf. From this station as a centre the little band of adventurers, playing the Greeks off against the Lombards, and the Lombards against the Greeks, spread their power in all directions, until they made themselves the most considerable force in southern Italy. William of Hauteville was proclaimed count of Apulia. His half-brother, Robert Wiskard or Guiscard, after defeating the papal troops at Civitella in 1055, received from Leo IX. the investiture of all present and future conquests in Apulia, Calabria and Sicily, which he agreed to hold as fiefs of the Holy See. Nicholas II. ratified this grant, and confirmed the title of count. Having consolidated their possessions on the mainland, the Normans, under Robert Guiscard's brother, the great Count Roger, undertook the conquest of Sicily in 1060. After a prolonged struggle of thirty years, they wrested the whole island from the Saracens; and Roger, dying in 1101, bequeathed to his son Roger a kingdom in Calabria and Sicily second in extent and splendour to the Holy Roman Empire. This, while the elder branch of the Hauteville family still held the title and domains of the Apulian duchy; but in 1127, upon the death of his cousin Duke William, Roger united the whole of the future realm. In 1130 he assumed the style of king of Sicily, inscribing upon his sword the famous hexameter—

"Appulus et Calaber Siculux mihi servit et Aler."

This Norman conquest of the two Sicilies forms the most romantic episode in medieval Italian history. By the consolidation of Apulia, Calabria and Sicily into a powerful kingdom, by checking the growth of the maritime republics and by recognizing the over-lordship of the papal see, the house of Hauteville influenced the destinies of Italy with more effect than any of the princes who had previously dealt with any portion of the peninsula. Their kingdom, though Naples was from time to time separated from Sicily, never quite lost the cohesion they had given it; and all the disturbances of equilibrium in Italy were due in after days to papal manipulation of the rights acquired by Robert Guiscard's act of homage. The southern regno, in the hands of the popes, proved an insurmountable obstacle to the unification of Italy, led to French interference in Italian affairs, introduced the Spaniard and maintained in those rich southern provinces the reality of feudal sovereignty long after this alien element had been eliminated from the rest of Italy (see Normans; Sicily: History).

For the sake of clearness, we have anticipated the course of events by nearly a century. We must now return to the date of Hildebrand's elevation to the papacy in 1073, when he chose the memorable name of Gregory VII. In the next year after his election Hildebrand convoked a council, and passed measures enforcing the celibacy of the clergy. In 1075 he caused the investiture of ecclesiastical dignitaries by secular potentates of any degree to be condemned. These two reforms, striking at the most cherished privileges and most deeply-rooted self-indulgences of the aristocratic caste in Europe, inflamed the bitterest hostility. Henry IV., king of Germany, but not crowned emperor, convened a diet in the following year at Worms, where Gregory was deposed and excommunicated. The pope followed with a counter excommunication, far more formidable, releasing the king's subjects from their oaths of allegiance. War was thus declared between the two chiefs of western Christendom, that war of investitures which outlasted the lives both of Gregory and Henry, and was not terminated till the year 1122. The dramatic epilogue to this struggle are too well known to be enlarged upon. In his single-handed duel with the strength of Germany, Gregory received material assistance from the Countess Matilda of Tuscany. She was the last heiress of the great house of Canossa, whose fields stretched from Mantua across Lombardy, passed the Apennines, included the Tuscan plains, and embraced a portion of the duchy of Spoleto. It was in her castle of Canossa that Henry IV. performed his three days' penance in the winter of 1077; and there she made the cession of her vast domains to the church. That cession, renewed after the death of Gregory to his successors, conferred upon the popes indefinite rights, of which they afterwards availed themselves in the consolidation of their temporal power. Matilda died in the year 1115. Gregory had passed before her from the scene of his contest, an exile at Salerno, whither Robert Guiscard carried him in 1084 from the anarchy of rebellious Rome. With unbroken spirit, though the objects of his life were unattained, though Italy and Europe had been thrown into confusion, and the issue of the conflict was still doubtful, Gregory expired in 1085 with these words on his lips: "I loved justice, I hated iniquity, therefore I die.

The greatest of the popes thus breathed his last; but the new spirit he had communicated to the papacy was not destined to expire with him. Gregory's immediate successors, Victor III., Urban II. and Paschal II., carried on his struggle with Henry IV. and his imperial antipopes, encouraging the emperor's son to rebel against him, and stirring up Europe for the first crusade. When Henry IV. died, his own son's prisoner, in 1106, Henry V. crossed the Alps, entered Rome, wrung the imperial coronation from Paschal II. and compelled the pope to grant his claims on the investitures. Sarcely had he returned to Germany when the Lateran disavowed all that the pope had done, on the score that it had been extorted by force. France sided with the church. Germany rejected the bull of investiture. A new descent into Italy, a new seizure of Rome, proved of no avail. The emperor's real weakness was in Germany, where his subjects openly expressed their discontent. He at last abandoned the contest which had distracted Europe. By the concordat of Worms, 1122, the emperor surrendered the right of investiture by ring and staff, and granted the right of election to the clergy. The popes were henceforth to be chosen by the cardinals, the bishops by the chapters subject to the papal jurisdiction. On the other hand the pope ceded to the emperor the right of investiture by the sceptre. But the main issue of the struggle was not in these details of ecclesiastical government; principles had been at stake far deeper and more widely reaching. The respective relations of pope and emperor, ill-defined in the compact between Charles the Great and Leo III., were brought in question, and the two chief potencies of Christendom, no longer tacitly concordant, stood against each other in irreconcilable rivalry. Upon this point, though the battle seemed to be on the investitures, the popes really had returned to Germany when the emperor, independent of the emperor, but the emperor had still to seek the crown at their hands. The pretensions of Otto the Great and Henry III. to make popes were gone for ever (see Papacy; Investiture).

4. Age of the Communes.—The final gainers, however, by the war of investitures were the Italians. In the first place, from this time forward, owing to the election of popes by the Roman curia, the Holy See remained in the hands of Italians; and this, though it was by no means an unmixed good, was a great glory to the nation. In the next place, the antagonism of the popes to the emperors, which became hereditary in the Holy College, forced the former to assume the protectorate of the national cause. But by far the greatest profit the Italians reaped was the emancipation of their
In reality imitations of the Lombard civic system. The patrician stood for the consuls. The senate, composed of nobles, represented the credenza and the gran consilio. The pope was unable to check this revolution, which is now chiefly interesting as further proof of the insurrection of the Latin as against the feudal elements in Italy at this period (see Rome: History).

Though the communes gained so much by the war of investitures, the division of the country between the pope's and emperor's parties was no small price to pay for independence. It inflicted upon Italy the ineradicable curse of party-warfare, setting city against city, house against house, and rendering concordant action for a national end impossible. No sooner had the compromise of the investitures been concluded, than the new enfranchised communes were resolved to turn their arms against each other. We seek in vain an obvious motive for each separate quarrel. All we know for certain is, that at this epoch, Rome attempts to ruin Tivoli, and Venice Pisa; Milan fights with Cremona, Cremona with Crema, Pavia with Verona, Verona with Padua, Piacenza with Parma, Modena and Reggio with Bologna, Bologna and Faenza with Ravenna and Imola, Florence and Pisa with Lucca and Siena, and so on through the whole list of cities. The nearer the neighbours, the more rancorous are the quarrels. For the right of autonomy is deadly and no grave local causes of dispute are apparent, we are bound to conclude that some deeply-seated permanent uneasiness goaded these fast growing communities into rivalry. Italy was, in fact, too small for her children. As the towns expanded, they perceived that they must mutually exclude each other. They fought for bare existence, for primacy in commerce, for the command of seaports, for the keys of mountain passes, for rivers, roads and all the avenues of wealth and plenty. The pope's cause and the emperor's cause were of comparatively little moment to Italian burgheurs; and the names of Welfs and Ghibellines, which were hitherto inseparably bound up with political events, have lost their meaning.

Under the imperial rule of Lothar the Saxon (1125-1137) and Conrad the Swabian (1138-1152), these civil wars increased in violence owing to the absence of authority. Neither Lothar nor Conrad was strong at home; the former had no influence in Italy, and the latter never entered Italy at all. But when Conrad died, the electors chose his nephew Frederick, surnamed Barbarossa, who united the rival honours of Welf and Waiblingen, to succeed him; and it was soon obvious that the empire had a master powerful of brain and firm of will. Frederick immediately determined to reassert the imperial rights in his house in the southern provinces, and to check the warfare of the burgheurs. When he first crossed the Alps in 1154, Lombardy was, roughly speaking, divided between two parties, the one headed by Pavia professing loyalty to the empire, the other headed by Milan ready to oppose its claims. The municipal animosities of the last quarter of a century gave substance to these factions; yet neither the imperial nor the anti-imperial party had any real community of interest with Frederick. He came to supersede self-government by consuls, to deprive the cities of the privilege of making war on their own account and to extort his regalian rights of forage, food and lodging for his armies. It was only the habit of interurban jealousy which prevented the communes from at once combining to resist demands which threatened their liberty of action, and would leave them passive at the pleasure of a foreign master. The diet was opened at Roncaglia near Piacenza, where Frederick
listened to the complaints of Como and Lodi against Milan, of Pavia against Tortona and of the marquis of Montferrat against Asti and Chieri. The plaintiffs in each case were imperialists; and Frederick's first action was to redress their supposed grievances. He laid waste Chieri, Asti and Tortona, then took the Lombard crown at Pavia, and, reserving Milan for a future day, passed southward to Rome. Outside the gates of Rome he was met by a deputation from the senate he had come to supersede, who addressed him in words memorable for expressing the republican spirit of new Italy face to face with autocratic feudalism: "Thou wast a stranger, I have made thee a citizen;" it is Rome who speaks: "Thou cam'st as an alien from beyond the Alps, I have conferred on thee the principality." Moved only to scorn and indignation by the rhetoric of these presumptuous enthusiasts, Frederick marched into the Leonine city, and took the imperial crown from the hands of Adrian IV. In return for this compliance, the emperor delivered over to the pope his troublesome rival Arnold of Brescia, who was burned alive by Nicholas Brekspear, the only English successor of St Peter. The gates of Rome itself were shut against Frederick; and even on this first occasion his good understanding with Adrian began to suffer. The points of dispute between them related mainly to Matilda's bequest, and to the kingdom of Sicily, which the pope had rendered independent of the empire by renewing its investiture in the name of the Holy See. In truth, the papacy and the empire had become irreconcilable. Each claimed illimitable authority, and neither was content to abide within such limits as the other would concede. In the contest the papacy obtained his coronation, Frederick withdrew to Germany, while Milan prepared herself against the storm which threatened. In the ensuing struggle with the empire, that great city rose to the altitude of patriotic heroism. By their sufferings no less than by their deeds of daring, her citizens showed themselves to be sublime, devoted and disinterested, winning the purest laurels which give lustre to Italian story. Almost in Frederick's presence, they rebuilt Tortona, punished Pavia, Lodi, Cremona and the marquis of Montferrat. Then they fortified the Adda and Ticino, and waited for the emperor's next descent. He came in 1162 with a large army, overran Lombardy, raised his imperial armies, and sat down before the walls of Milan. Famine forced the burghers to partial obedience, and Frederick held a victorious diet at Roncaglia. Here the jurists of Bologna appeared, armed with their new lore of Roman law, and ex- pounded Justinian's code in the interests of the German empire. It was now seen how the absolutist doctrines of autocracy developed in Justinian's age at Byzantium would bear fruits in the development of an imperial idea, which was destined to be the fatal mirage of medieval Italy. Frederick placed judges of his own appointment, with the title of podestà, in all the Lombard communes; and all the communes were forced to acknowledge the emperor's supremacy. When he at length in 1173 intruded with a strong force, he was met by the accustomed formula: "We, by the grace of God and our ancestors, have never acknowledged a master but our own. We must be allowed to choose, by universal consent, all who rank after us, and to have such friends as we will." He accepted this challenge, forced even his friends to join their ranks against him. The war, meanwhile, dragged on. Crema yielded after an heroic siege in 1160, and was abandoned to the cruelty of its fierce rival Cremona. Milan was invested in 1162, starved into capitulation after nine months' resistance, and given up to total destruction by the Italian imperialists of Frederick's army, so stained and tarnished with the vindictive passions of municipal rivalry was even this, the one great glorious strife of Italian annals. Having ruined his rebellious city, but not tamed her spirit, Frederick with drew across the Alps. But, in the interval between his second and third visit, a league was formed against him in north-eastern Lombardy. Verona, Vicenza, Padua, Treviso, Venice entered into a compact to defend their liberties; and when he came again in 1163 with a brilliant staff of German knights, the imperial cities refused to join his standards. This was the first and ominous sign of a coming change.

Meanwhile the election of Alexander III. to the papacy in 1159 added a powerful ally to the republican party. Opposed by an anti-pope whom the emperor favoured, Alexander found it was his truest policy to rely for support upon the anti-imperialist communes. They in return gladly accepted a champion who lent them the prestige and influence of the church. When Frederick once more crossed the Alps in 1166, he advanced on Rome, and besieged Alexander in the Coliseum. But the affairs of Lombardy left him no leisure to persecute a recalcitrant pontiff. In April 1167 a new league was formed between Cremona, Bergamo, Brescia, Mantua and Ferrara. In December of the same year this league allied itself with the elder Veronesian league, and received the addition of Milan, Lodi, Piacenza, Parma, Modena and Bologna. The famous league of Lombard cities, styled Concordia in its acts of settlement, was now established. Novara, Vercelli, Asti and Tortona swelled its ranks; only Pavia and Montferrat remained imperialist between the Alps and Apennines. Frederick fled for his life by the Mont Cenis, and in 1168 the town of Alessandria was erected to keep Pavia and the marquisate in check. In the emperor's absence, Ravenna, Rimini, Imola and Forli joined the league, which now called itself the "Society of Venice, Lombardy, the March, Romagna and Alessandria." For the fifth time, in 1174, Frederick entered his rebellious dominions. The fortress town of Alessandria stopped his progress with those mud walls contemptuously named "of straw," while the forces of the league assembled at Modena and obliged him to raise the siege. In the spring of 1176 Frederick threatened Milan. His army found itself a little to the north of the town near the village of Legnano, when the troops of the city, assisted only by a few allies from Piacenza, Verona, Brescia, Novara and Vercelli, met and overcame it. The victory was complete. Frederick escaped alone to Pavia, whence he opened negotiations with Alexander, and frittered away the greater part of his resources in these indecisive negotiations. He was exhausted by an attempt to betake himself unharmed to Venice. Here, as upon neutral ground, the emperor met the pope, and a truce for six years was concluded with the Lombard burghs. Looking back from the vantage-ground of history upon the issue of this long struggle, we are struck with the small results which satisfied the Lombard communes. They had humbled and utterly defeated their foreign lord. They had proved their strength in combination. Yet neither the acts by which their league was ratified nor the terms negotiated for them by their patron Alexander oivince the smallest desire of what we now understand as national independence. The name of Italy is never mentioned. The supremacy of the emperor is not called in question. The conception of a permanent confederation, bound together in offensive and defensive alliance for common objects, has not occurred to these hard fighters and stubborn asserters of their civic privileges. All they claim is municipal autonomy; the right to manage their own affairs within the city walls, to fight their battles as they choose, and to follow their several ends unchecked. It is vain to lament that, when they might have now established Italian independence upon a secure basis, they could neither find and maintain privileges in their mutual jealousies combined with the prestige of the empire, and possibly with the selfishness of the pope, who had secured his own position, and was not likely to foster a national spirit that would have threatened the ecclesiastical supremacy, deprived the Italians of the only great opportunity they ever had of forming themselves into a powerful nation. When the truce expired in 1183, a permanent peace was ratified at Constance. The intervening years had been spent by the Lombards, not in consolidating their union, but in attempting to secure special privileges for their several cities. Alessandria, della Scala, glorious by her resistance to the emperor in 1174, had even changed her name to Cesarea! The signatories of the peace of Constance were divided between leagues and imperialists. On the one side we find Vercelli, Novara, Milan, Lodi, Bergamo, Brescia, Mantua, Verona, Vicenza, Padua, Treviso, Bologna, Faenza, Modena, Reggio, Parma, Piacenza; on the other, Pavia, Genoa, Alba, Cremona, Como, Tortona, Asti, Cesarea. Venice, who had not yet entered the Italian community, is conspicuous by her absence. According to this treaty, the communes were to rejoin the empire by consuls, and their right of warfare. The emperor retained the supreme courts of appeal within the cities, and
his claim for sustenance at their expense when he came into Italy.

The privileges confirmed to the Lombard cities by the peace of Constance were extended to Tuscany, where Florence, having ruined Fiesole, had begun her career of freedom and prosperity. The next great chapter in the history of Italian evolution is the war of the burghers against the nobles. The consular cities were everywhere surrounded by castles; and, though the feudal lords had been weakened by the events of the preceding centuries, they continued to be formidable enemies. It was, for instance, necessary to the well-being of the towns that they should possess territory round their walls, and this had to be wrested from the nobles. We cannot linger over the details of this warfare. It must suffice to say that, partly by mortgaging their property to rich burghers, partly by entering the service of the cities as condottieri (merenary leaders), partly by espousing the cause of one town against another, and partly by forced submission after the siege of their strong places, the counts were gradually brought into connexion of dependence on the communes. These, in their turn, forced the nobles to leave their castles, and to reside for at least a portion of each year within the walls. By these measures the counts became citizens, the rural population ceased to rank as serfs, and the Italo-Roman population of the towns absorbed into itself the remnants of Franks, Germans, and other foreign stocks. It would be impossible to exaggerate the importance of this revolution, which ended by destroying the last vestige of feudality, and prepared that common Italian people which afterwards distinguished itself by the creation of European culture. But, like all the vicissitudes of the Italian race, while it was a decided step forward in one direction, it introduced a new source of discord. The associated nobles proved ill neighbours to the peaceable citizens. They fortified their houses, retained their military habits, defied the consuls, and carried on feuds in the streets and squares. The war against the castles became a war against the palaces; and the system of government by consuls proved inefficient to control the clashing elements within the state. This led to the establishment of podestà, who represented a compromise between two radically hostile parties in the city, and whose business it was to arbitrate and keep the peace between them. Invariably a foreigner, elected for a year with power of life and death and control of the armed force, but subject to a strict account at the expiration of his office, the podestà might be compared to a dictator invested with limited authority. His title was derived from that of Frederick Barbarossa's judges; but he had no dependence on the empire. The citizens chose him, and voluntarily submitted to his rule. The podestà marks an essentially transitional state in civic government, and his intervention paved the way for despotism.

The thirty years which elapsed between Frederick Barbarossa's death in 1190 and the coronation of his grandson Frederick II.

Innovent III. in 1220 form one of the most momentous epochs in Italian history. Barbarossa, perceiving the advantage that would accrue to his house if he could join the crown of Sicily to that of Germany, and thus deprive the popes of their allies in Lower Italy, procured the marriage of his son Henry VI. to Constance, daughter of King Roger, and heiress of the Hauteville dynasty. When William II., the last monarch of the Norman race, died, Henry VI. claimed that kingdom in his wife's right, and was recognized in 1194. Three years afterwards he died, leaving a son, Frederick, to the care of Constance, who, in her turn died in 1198, bequeathing the young prince, already crowned king of Germany, to the guardianship of Innocent III. It was bold policy to confide Frederick to his greatest enemy and rival; but the pope honourably discharged his duty, until his ward outgrew the years of tutelage, and became a fair mark for ecclesiastical hostility. Frederick's long minority was occupied by Innocent's pontificate. Among the principal events of that reign must be reckoned the foundation of the two orders, Franciscan and Dominican, who were destined to form a militia for the holy see in conflict with the empire and the heretics of Lombardy.

A second great event was the fourth crusade, undertaken in 1198, which established the naval and commercial supremacy of the Italians in the Mediterranean. The Venetians, who contracted for the transport of the crusaders, and whose blind doge Dandolo was first to land in Constantinople, received one-half and one-fourth of the divided Greek empire for their spoils. The Venetian ascendency in the Levant dates from this epoch; for, though the republic had no longer exclusive occupancy of all the domains ceded to it, Candia was taken, together with several other important posts on the mainland. The formation of a Latin empire in the East increased the pope's prestige; while at home it was his policy to organize Countess Matilda's heritage by the formation of Guelf leagues, over which he presided. This is the meaning of the three leagues, in the March, in the duchy of Spoleto and in Tuscany, which now combined the chief cities of the papal territory into allies of the holy see. From the Tuscan league Pisa, consistently Ghibelline, stood aloof. Rome itself again at this epoch established a republic, with which Innocent would not or could not interfere. The death of a power which they called despots, or caporioni, who acted in concert with a senato, appointed, like the podestà of other cities, for supreme judicial functions. Meanwhile the Guelf and Ghibelline factions were beginning to divide Italy into minute parcels. Not only did commune range itself against commune under the two rival flags, but party rose up against party within the city walls. The introduction of the factions into Florence in 1215, owing to a private quarrel between the Buondelmonti, Amidei and Donati, is a celebrated instance of what was happening in every burg.

Frederick II. was left without a rival for the imperial throne in 1218 by the death of Otto IV., and on the 22nd of November 1220, Honorius III., Innocent's successor, crowned him in Rome. It was impossible for any section of the Italians to mistake the gravity of his access to power. In his single person he combined the prestige of empire with the crowns of Italy, Sicily, Sardinia, Germany and Burgundy; and in 1225, by marriage with Yolande de Brienne, he added that of Jerusalem. There was no prince greater or more formidable in the habitable globe. The communes, no less than the popes, felt that they must prepare themselves for contest with the sea power which Frederick commanded in every mart of the earth. Already in 1218, the Guelfs of Lombardy had resuscitated the old league, and had been defeated by the Ghibellines in a battle near Ghibello. Italy seemed to lie prostrate before the emperor, who commanded her for the first time from the south as well as from the north. In 1227 Frederick, who had promised to lead a crusade, was excommunicated by Gregory IX. because he was obliged by illness to defer his undertaking; and thus the spiritual power declared war upon its rival. The Guelf towns of Lombardy again raised their levies. Frederick enlisted his Saracen troops at Nocera and Luceria, and appointed the terrible Ezzelino da Romano his vicar in the Marches of Verona to quell their insurrection. It was 1236, however, before he was able to take the field himself against the Lombards. Having established Ezzelino in Verona, Vicenza and Padua, he defeated the Milanese and their allies at Cortenova in 1237, and sent their carroccio as a trophy of his victory to Rome. Gregory IX. feared lest the Guelf party would be ruined by this check. He therefore made alliance with Venice and Genoa, fulfilled a new excommunication against Frederick, and convoked a council at Rome to ratify his ban in 1241. The Genoese undertook to bring the French bishops to this council. Their fleet was attacked at Meloria by the Pisans, and utterly defeated. The French prelates went in silver chains to prison in the Ghibelline capital of Tuscany. So far Frederick had been successful at all points. In 1243 a new pope, Innocent IV., was elected, who prosecuted the war with still bitterness. Forced to fly to France, he there, in 1245, convened a council, which enforced his condemnation of the emperor. Frederick's subjects were freed from their allegiance, and he was declared dehorned and deprived of all rights. Five times king and emperor as he was, Frederick, placed under the ban of the church, led henceforth a doomed existence. The mendicant monks stirred up the populace to acts of fanatical
emnity. To plot against him, to attempt his life by poison or the sword, was accounted virtuous. His secretary, Piero delle Vigne, was wrongly suspected of conspiring. The crimes of his vicar Ezzelino, who laid siege to places and murdered men by thousands in his Paduan prisons, increased the horror with which he was regarded. Parma revolted from him, and he spent months in 1247-1248 vainly trying to reduce this one time faithful city. The only gleam of success which shone on his ill fortune was the revolution which placed Florence in the hands of the Ghibellines in 1248. Next year Bologna rose against him, defeated his troops and took his son Enzo, king of Sardinia, prisoner at Fossaalta. Hunted to the ground and broken-hearted, Frederick expired at the end of 1250 in his Apulian castle of Fiorentino. It is difficult to judge his career with fairness. The only prince who could, with any probability of success, have established the German rule in Italy, his ruin proved the impossibility of that long-cherished scheme. The nation had outgrown dependence upon foreigners, and after his death no German emperor interfered with anything but miserable failure in Italian affairs. Yet from many points of view it might be regretted that Frederick was not suffered to rule Italy. By birth and breeding an Italian, highly gifted and widely cultivated, liberal in his opinions, a patron of literature, a founder of universities, he anticipated the spirit of the Renaissance. At his court Italian started into being as a language. His laws were wise. He was capable of giving to Italy a large and noble culture. But the commanding greatness of his position proved his ruin. Emperor and king of Sicily, he was the natural enemy of popes, who could not tolerate so overwhelming a rival.

After Frederick's death, the popes carried on their war for eighteen years against his descendants. The cause of his son Conrad was sustained in Lower Italy by Manfred, one of Frederick's many natural children; and, when Conrad died in 1254, Manfred still acted as vicegerent for the Swabians, who were now represented by a boy Conrad, a cousin of the recently deceased emperor, who was to make head against the Ghibelline party. The most dramatic incident in this struggle was the crusade preached against Ezzelino. This tyrant had made himself justly odious; and when he was hunted to death in 1259, the triumph was less for the Guelph cause than for humanity outraged by the iniquities of such a monster. The battle between Guelph and Ghibelline raged with unintermitting fury. While the former faction gained in Lombardy by the massacre of Ezzelino, the latter revived in Tuscany after the battle of Montaperti, in which the pope placed Florence at the discretion of the Ghibelines. Manfred, who had divided his territories, now joined the Ghibelines, but there was no strong counterpoise against him. In this necessity Urban IV. and Clement IV. invited Charles of Anjou to enter Italy and take the Guelph command. They made him senator of Rome and vicar of Tuscany, and promised him the investiture of the regno provided he stipulated that it should not be held in combination with the empire. Charles accepted these terms, and was welcomed by the Guelph party as their chief throughout Italy. He defeated Manfred in a battle at Grandella near Benevento in 1266. Manfred was killed; and, when Conradin, a son of the deceased emperor from Germany, came and made good claims to the kingdom, he too was defeated at Tagliamento in 1267. Less lucky than his uncle, Conradin escaped with his life, to die upon a scaffold at Naples. His glove was carried to his cousin Constance, wife of Peter of Aragon, the last of the great Norman-Swabian family. Enzio died in his prison four years later. The popes had been successful; but they had purchased their bloody victory at a great cost. This first invitation to French princes brought with it incalculable evils.

Charles of Anjou, supported by Rome, and recognized as chief in Tuscany, was by far the most formidable of the Italian potentates. In his turn he now excited the jealousy of the popes, who began, though cautiously, to cast their weight into the Ghibelline scale. Gregory initiated the policy of establishing an equilibrium between the parties, which was carried out by his successor Nicholas III. Charles was forced to resign

Civil Wars of Guelphs and Ghibellines. No new emperor was elected; the prudent Rudolf of Habsburg, who abstained from interference with Italy, and who confirmed the territorial pretensions of the popes by solemn charter in 1278. Henceforth Emilia, Romagna, the March of Ancona, the patrimony of St Peter and the Campagna of Rome held of the Holy See, and not of the empire. The imperial chancery, without inquiring closely into the deeds furnished by the papal curia, made a deed of gift, which placed the pope in the position of a temporal sovereign. While Nicholas III. thus bettered the position of the church in Italy, the Guelph party grew stronger than ever, through the crushing defeat of the Fians by the Genoese at Meloria in 1284. Pisa, who had ruined Amalfi, was now ruined by Genoa. She never held her head so high again after this victory, which sent her best and bravest citizens to die in the Ligurian dungeons. The Mediterranean was left to be fought for by Genoa and Venice, while Guelph Florence grew still more powerful in Tuscany. Not long after the battle of Meloria Charles of Anjou died, and was succeeded by his son Charles II. of Naples. No prince in Italy had so great a part in Italian affairs. The Guelph party was held together with a less tight hand even in cities so consistent as Florence. Here in the year 1300 new factions, subdividing the old Guelphs and Ghibelines under the names of Neri and Bianchi, had acquired such force that Boniface VIII., a violently Guelph pope, called in Charles of Valois to pacify the republic and undertake the charge of Italian affairs. Boniface was a passionate and unwise man. After quarrelling with the French king, Philip le Bel, he fell into the hands of the Colonna family at Anagni, and suffered the ignominious and ignoble death by violence he there received or of mortification, in October 1303.

After the short papacy of Benedict XI. a Frenchman, Clement V., was elected, and the seat of the papacy was transferred to Avignon. Thus began that Babylonian exile of the popes which placed them in subjection to the French crown and ruined their prestige in Italy. Lasting seventy years, and joining on to the sixty years of the Great Schism, this enfeeblement of the papal authority, coinciding as it did with the practical elimination of the empire from Italian affairs, gave a long period of comparative independence to the nates. Nor must it be forgotten that this exile was due to the policy which induced the pontiffs, in their detestation of Ghibellinism, to rely successively upon the houses of Anjou and of Valois. This policy it was which justified Dante's fierce epigram—the puttanegarri co regi.

The period we have briefly traversed was immortalized by Dante in an epic which from one point of view might be called the poem of the Guelphs and Ghibelines. From the foregoing bare narration of events it is impossible to estimate the importance of these parties, or to understand their bearing on subsequent Italian history. We are therefore forced to pause awhile, and to bear in mind that the civil and feudal wars of the fourteenth to the sixteenth centuries, and partly to the sixteenth, were a continuation of the previous municipal struggles, intensified by recent hostilities between the burghers and the nobles. The quarrels of the church and empire lend pretexts and furnish war-cries; but the real question at issue is not the supremacy of pope or emperor. The conflict is a social one, between civic and feudal institutions, between commercial and military interests, between progress and conservatism. Guelph democracy and industry idealize the pope. The banner of the church waves above the camp of those who aim at positive prosperity and republican equality. Ghibelline aristocracy and immobility idealize the emperor. The prestige of the empire, based upon Roman law and feudal tradition, attracts imaginative patriots and systematic thinkers. The two ideals are counterposed and mutually exclusive. No city calls itself either Guelph
or Ghibelline till it has expelled one-half of its inhabitants; for each party is resolved to constitute the state according to its own conception, and the affirmation of the one programme is the negation of the other. The Ghibelline honestly believes that the Guelphs will reduce society to chaos. The Guelphs are persuaded that the Ghibellines will annihilate freedom and strangle commerce. The struggle is waged by two sets of men who equally love their city, but who would fain rule it upon diametrically opposite principles, and who fight to the death for its possession. This contradiction enters into the minutest details of life—armorial bearings, clothes, habits at table, symbolize and accentuate the difference. Meanwhile each party forms its own organization of chiefs, finance-officers and registrars at home, and sends ambassadors to foreign cities of the same complexion. A network of party policy embraces and dominates the burghs of Italy, bringing the most distant centres into relation, and by the very division of the country augmenting the sense of nationality. The Italians learn through their discords at this epoch that they form one community. The victory in the conflict practically falls to the hitherto unenfranchised plebeians. The elder noble families die out or lose their preponderance. In some cities, as notably in Florence after the date 1325, it becomes criminal to be scelopero, or unemployed in industry. New houses rise into importance; a new commercial and manufacturing population. Burghers of all denominations are enrolled in one or other of the ancient guilds, and furnish the material from which the government or signoria of the city is composed. Plebeian handicrafts assert their right to be represented on an equality with learned professions and wealthy corporations. The ancient classes are confounded and obliterated in a population more homogeneous, more adapted for democracy and despotism.

In addition to the parliament and the councils which have been already enumerated, we now find a council of the party established within the city. This body tends to control the whole state, and is responsible for the victorious majority, disposed of the government as it thinks best. The consuls are merged in ancient or prior, chosen from the arts. A new magistrate, the gonfalonier of justice, appears in some of the Guelph cities, with the special duty of keeping the insolence of the nobility in check. Meanwhile the podesta still subsists; but he is no longer equal to the task of maintaining an equilibrium of forces. He sinks more and more into a judge, loses more and more the character of dictator. His ancient place is now occupied by a new functionary, no longer acting as arbiter, but concentrating the forces of the triumphant party. The consuls of the free cities, acting as head of the ascendant Guelphs or Ghibellines, undertakes the responsibility of proscriptions, decides on questions of policy, forms alliances, declares war. Like all officers created to meet an emergency, the limitations to his power are ill-defined, and he is often little better than an autocrat.

V. Age of the Despots.—Thus the Italians, during the heat of the civil wars, were ostensibly divided between partisans of the empire and partisans of the church. After the death of Frederick II, their affairs were managed by Manfred and his sons. The parties of Augustus. The capitanei of the parties, under whose orders acted the captains of the people in each city. The contest being carried on by warfare, it followed that these captains in the burghs were chosen on account of military skill; and, since the nobles were men of arms by profession, members of ancient houses took the lead again in towns where they had been absorbed into the bourgeoisie. In this way, after the downfall of the Ezzelini of Romano, the Della Scala dynasty arose in Verona, and the Carrarese in Padua. The Esteis made themselves lords of Ferrara; the Torriani headed the Guelphs of Milan. At Ravenna we find the Polenta family, at Rimini the Malatestas, at Parma the Rossi, at Piacenza the Scotti, at Faenza the Manfredi. There is not a burg of northern Italy but can trace the rise of a dynastic house to the vicissitudes of this period. In Tuscany, where the Guelph party was very strongly organized, and the commercial constitution of Florence kept the nobility in check, the communes remained as yet free from hereditary masters. Yet generals from time to time arose, the Conte Ugolino della Gherardesca at Pisa, Uguccione della Faggiuola at Lucca, the Conte Guido di Montefeltro at Florence, who threatened the liberties of Tuscan cities with military despotism.

Left to themselves by absentee emperors and exiled popes, the Italians pursued their own course of development unchecked. After the commencement of the 14th century, the civil wars decreased in fury, and at the same time it was perceived that their effect had been to confirm tyrants in their grasp upon free cities. Growing up out of the captain of the people or signore of the commune, the tyrant annihilated both parties for his own profit and for the peace of the state. He used the dictatorial power with which he was invested to place himself above the law, assuming in his person the state-machine which had preceded him. In him, for the first time, the city attained self-consciousness; the blindly working forces of previous revolutions were combined in the will of a ruler. The tyrant's general policy was to favour the multitude at the expense of his own caste. He won favour by these means, and completed the levelling down of classes, which had been proceeding ever since the emergence of the communes.

In 1300 Robert, grandson of Charles, the first Angevine sovereign, succeeded to the throne of Naples, and became the leader of the Ghibellines in Italy. In the year VII. of Luxembourg crossed the Alps soon after his election to the empire, and raised the hopes of the Ghibellines. Dante from his mountain solitudes passionately called upon him to play the part of a Messiah. But it was now impossible for any German to control the "Garden of the Empire." Italy had entered on a new phase of its existence, and the great poet's De monarchia represented a dream of the past which could not be realized. Henry established imperial vicars in the Lombard towns, confirming the party in state, but gaining nothing for the empire in exchange for the titles he conferred. After receiving the crown in Rome, he died at Buonconvento, a little walled town south of Siena, on his backward journey in 1315. The profits of his inroad were reaped by despots, who used the Ghibelline prestige for the consolidation of their own power. It is from this epoch that the supremacy of the Visconti, hitherto the unsuccessful rivals of the Guelphic Torriani for the signory of Milan, dates. The Scaligers in Verona and the Carrarese in Padua were strengthened; and in Tuscany Castruccio Castracane, Uguccone's successor at Lucca, became formidable. In 1325 he defeated the Florentines at Pescia, and carried home their carriages as a trophy of his victory over the Guelphs. Louis of Bavaria, the next emperor, made a similar excursion in the year 1327, with even greater loss of imperial prestige. He deposed Galeazzo Visconti on his downward journey, and offered Milan for a sum of money to his son Azzo upon his return. Castruccio Castracane was nominated by him duke of Lucca; and this is the first instance of a dynastic title conferred upon an Italian adventurer by the emperor. Castruccio dominated Tuscany, where the Guelph cause, in the weakness of King Robert, languished. But the elections of Antonino di Guido, carried out in a state of civil war, and the death in 1328 saved the stronghold of republican institutions, and Florence breathed freely for a while again. Can Grande della Scala's death in the next year inflected on the Lombard Ghibellines a loss hardly inferior to that of Castruccio's on their Tuscan allies. Equally contemptible in its political results and void of historical interest was the brief visit of John of Bohemia, son of Henry VII, whom the Ghibellines next invited to assume their leadership. He sold a few privileges, conferred a few titles, and recrossed the Alps in 1333. It is clear that at this time the fury of the civil wars was spent. In spite of repeated efforts on the part of the Ghibellines, in spite of King Robert's supine incapacity, the imperialists gained no permanent advantage. The Italians were tired of fighting, and the leaders of both factions looked exclusively to their own interests. Each city which had been the cradle of freedom thankfully accepted a master, to quench the conflagration of party strife, encourage
trade, and make the handicraftsmen comfortable. Even the Florentines in 1342 submitted for a few months to the despotism of the duke of Athens. They conferred the signory upon him for life; and, had he not mismanaged matters, he might have held the city in his grasp. Italy was settling down and turning her attention to home comforts, arts and literature. Boccaccio, the contended bourgeois, succeeded to Dante, the fierce aristocrat.

The most marked proof of the change which came over Italy toward the end of the century is furnished by the companies of adventure. It was with their own militia that theburghers won freedom in the war of independence, subdued the nobles, and fought the battles of the parties. But from this time forward they laid down their arms, and played the game of warfare by the aid of mercenaries. Ecclesiastical overlords, interfering from a distance in Italian politics; prosperous republics, with plenty of money to spend but no leisure or inclination for camp-life; cautious tyrants, glad of every pretext to emasculate their subjects, and courting popularity by exchanging concession for taxation—all combined to favour the new system. Mercenary troops are said to have been first levied from disbandcd Germans, together with Breton and English adventurers, whom the Visconti and Castruccio took into their pay. They soon appeared under their own captains, who hired them out to the highest bidder, or marched them on marauding expeditions up and down the less protected districts.

The names of some of these earliest captains of adventure, Fra Moriale, Count Lando and Duke Werner, who styled himself the "Enemy of God and Mercy," have been preserved to us. As the companies grew in size and improved their discipline, it was seen by the Italian nobles that this kind of service offered a good career for men of spirit, who had learned the use of arms. To leave so powerful and profitable a calling in the hands of foreigners seemed both dangerous and un-economic. Therefore, after the middle of the century, this profession fell into the hands of natives. The first Italian who formed an exclusively Italian company was Alberico da Barbiano, a nobleman of Romagna, and founder of the Milanese house of Belgioioso. In his school the great condottieri Braccio da Montone and Sforza Attendolo were formed; and henceforth the battles of Italy were fought by Italian generals commanding native troops. This was better in some respects than if the mercenary had been foreigners. Yet it must not be forgotten that the new companies of adventure, who decided Italian affairs for the next century, were in no sense patriotic. They sold themselves for money, irrespective of the cause which they upheld; and, while changing masters, they had no care for any interests but their own. The name condottiero, derived from condotta, a paid contract to supply so many fighting men in serviceable order, sufficiently indicates the nature of the business.

In the hands of able captains, like Francesco Sforza or Piccinino, these mercenary troops became moving despots, draining the country of its wealth, and always eager to fasten and found tyrannies upon the provinces they had been summoned to defend. Their generals substituted heavy-armed cavalry for the old militia, and introduced systems of campaigning which reduced the art of war to a game of skill. Battles became all but bloodless; diplomacy and tactics superseded feats of arms and hard blows in pitched fields. In this way the Italians lost their military vigour, and wars were waged by despots from their cabinets, who pulled the strings of puppet captains in their pay. Nor were the people only enfeebled for resistance—to the end of the century and a half; they were treated by the despots as a herd of sheep, and their heads were clipped. The purely selfish bond between condottieri and their employers, whether princes or republics, involved intrigues and treachery, checks and counterchecks, secret terror on the one hand and treasonable practice on the other, which ended by making statecraft in Italy synonymous with perfidy.

It must further be noticed that the rise of mercenaries was synchronous with a change in the nature of Italian despotism. The tyrants, as we have already seen, established themselves as captains of the people, vicars of the empire, vicars for the church, leaders of the Guelph and Ghibelline parties. They were accepted by a population eager for repose, who had merged old class distinctions in the conflicts of preceding centuries. They rested in large measure on the favour of the multitude, and pursued a policy of sacrificing to their interests the nobles. It was natural that these self-made princes should seek to secure the peace which they had promised in their cities, by freeing the people from military service and disarming the aristocracy. As their tenure depended upon them, they added to their dynastic claims, assumed titles, and took the style of petty sovereigns. Their government became paternal; and, though there was no limit to their cruelty when stung by terror, they used the purse rather than the sword, bribery at home and treasonable intrigue abroad in preference to coercive measures or open war. Thus was elaborated the type of despot which attained completeness in Gian Galeazzo Visconti and Lorenzo de' Medici. No longer a tyrant of Ezzelino's stamp, he reigned by intelligence and terrorism masked beneath a smile. He substituted cunning and corruption for violence. The lesser people tolerated him because he extended the power of their city and made it beautiful with public buildings. The bourgeoisie, protected in their trade, found means to support him. The nobles, turned into courtiers, placemen, diplomatists and men of affairs, ended by preferring his authority to the alternative of democratic institutions. A lethargy of well-being, broken only by the pinch of taxation for war-costs, or by outbursts of frantic ferocity and lust in the less calculating tyrants, descended on the population of cities which had boasted of their freedom. Only Florence and Venice, at the close of the period upon which we are now entering, maintained, maintained their reputation of independence. Ad restored Venice was ruled by a close oligarchy; Florence was passing from the hands of her oligarchs into the power of the Medician merchants.

Between the year 1305, when Clement V. settled at Avignon, and the year 1447, when Nicholas V. re-established the papacy upon a solid basis at Rome, the Italians approximated more nearly to self-government than at any other epoch of their history. The conditions which have been described, of despotism, mercenary warfare and bourgeois prosperity, determined the character of this epoch, which was also the period when the great achievements of the Renaissance were prepared. At the end of this century and a half, five principal towns, Milan, Florence, Venice, and four of them—the latter three and the Confederation—were in a state of war with one another, and their confederated action during the next forty-five years (1447-1492) secured for Italy a season of peace and brilliant prosperity. These five powers were the kingdom of Naples, the duchy of Milan, the republic of Florence, the republic of Venice and the papacy. The subsequent events of Italian history will be rendered most intelligible if at this point we trace the development of these five constituents of Italian greatness separately.

When Robert of Anjou died in 1343, he was succeeded by his grand-daughter Joan, the childless wife of four successive husbands, Andrew of Hungary, Louis of Taranto, James of Aragon and Otto of Brunswick. Charles of Durazzo, the last male scion of the Angevin house in Lower Italy, murdered Joan in 1382, and held the kingdom for five years. Dying in 1387, he transmitted Naples to his son Ladislaus, who had no children, and was followed in 1414 by his sister Joan II. She too, though twice married, died without issue, having at one time adopted Louis III. of Provence and his brother René, at another Alfonso V. of Aragon, who inherited the crown of Sicily. After her death in February 1415 the Lancastrian forces fought against the Angevins, and surnamed the Magnanimous. René found supporters among the Italian princes, especially the Milanese Visconti, who helped him to assert his claims with arms. During the war of succession which ensued, Alfonso was taken prisoner by the Genoese fleet in August 1435, and was sent a prisoner to Filippo Maria at Milan. Here he pleaded his own cause so powerfully, and proved so incontestably the advantage which might ensue to the Visconti from his alliance, if he held the regno, that he obtained his release and recognition as king. From the end of the year 1435
Alfonso reigned alone and undisturbed in Lower Italy, combining for the first time since the year 1282 the crowns of Sicily and Naples. The former he held by inheritance, together with that of Aragon. The latter he considered to be his by conquest. Therefore, when he died in 1438, he bequeathed Naples to his natural son Ferdinand, while Sicily and Aragon passed together to his brother John, and so on to Ferdinand the Catholic. The twenty-three years of Alfonso’s reign were the most prosperous and splendid period of South Italian history. He became an Italian rather than a Spaniard, entering with enthusiasm into the humanistic arour of the earlier Renaissance, encouraging men of letters at his court, administering his kingdom on the principles of an enlightened despotism, and lending his authority to establish that equilibrium in the peninsula upon which the politicians of his age believed, not without reason, that Italian independence might be secured.

The last member of the Visconti family of whom we had occasion to speak was Azzo, who bought the city in 1328 from Louis of Bavaria. His uncle Lucchino succeeded, but was murdered in 1340 by a wife against whose life he had been plotting. Lucchino’s other brother John, who was bishop of Milan, now assumed the lordship of the city, and extended the power of the Visconti over Genoa and the whole of north Italy, with the exception of Piedmont, Verona, Mantua, Ferrara and Venice. The greatness of the family dates from the reign of this masterful prelate. He died in 1354, and his heritage was divided between three members of his house, Matteo, Bernabò and Galeazzo. In the next year Matteo, being judged incompetent to rule, was assassinated by order of his brothers, who made an equal partition of their subject cities—Bernabò residing in Milan, Galeazzo in Pavia. Galeazzo was the wealthiest and most magnificent Italian of his epoch. He married his daughter Violante to our duke of Clarence, and his son Gian Galeazzo to a daughter of King John of France. When he died in 1378, this son resolved to reunite the domains of the Visconti; and, with this object in view, he plotted and executed the murder of his uncle Bernabò. Gian Galeazzo thus became by one stroke the most formidable of Italian despots. Immured in his castle at Pavia, accumulating wealth by systematic taxation and methodical economy, he organized the mercenary troops who eagerly took service under so good a paymaster; and, by directing their operations from his cabinet, he threatened the whole of Italy with conquest. The last scions of the Della Scala family still reigned in Verona, the last Carrarese in Padua; the Estensi were powerful in Ferrara, the Gonzaghi in Mantua. Gian Galeazzo, partly by force and partly by intrigue, discredited these minor despots, pushed his dominion to the very verge of Venice, and, having subjected Lombardy to his sway, proceeded to attack Tuscany. Pisa and Perugia were threatened with extinction, and Florence dreaded the advance of the Visconti arms, when the plague suddenly cut short his career of treachery and conquest in the year 1402. Seven years before his death Gian Galeazzo bought the title of duke of Milan and count of Pavia from the emperor Wenceslaus, and there is no doubt that he was aiming at the sovereignty of Italy. But no sooner was he dead than the essential weakness of an artificial state, built up by cunning and perfidious policy, with the aid of bought troops, dignified by no dynastic title, and consolidated by no sense of loyalty, became apparent. Gian Galeazzo’s duchy was a masterpiece of mechanical contrivance, the creation of a scheming intellect and lawless will. When the mind which had planned it was withdrawn, it fell to pieces, and the very hands which had been used to build it helped to scatter its fragments. The Visconti’s own generals, Facino Cane, Pandolfo Malatesta, Jacopo dal Verme, Gabrino Fondulo, Ottobon Terzo, seized upon the tyranny of several Lombard cities. In others the petty tyrants whom the Visconti had uprooted reappeared. The Estensi recovered their grasp upon Ferrara, and the Gonzaghi upon Mantua. Venice strengthened herself between the Adriatic and the Alps. Florence reasserted her Tuscan hegemony. Other communes which still preserved the shadow of independence, like Perugia and Bologna, began once more to dream of republican freedom under their own leading families. Meanwhile Gian Galeazzo had left two sons, Giovanni Maria and Filippo Maria. Giovanni, a monster of cruelty and lust, was assassinated by some Milanese nobles in 1412; and now Filippo set about rebuilding his father’s duchy. Herein he was aided by the troops of Facino Cane, who, dying opportunistly at this period, left considerable wealth, a well-trained band of mercenaries, and a widow, Beatrice di Tenda. Filippo married and then beheaded Beatrice after a mock trial for adultery, having used her money and her influence in reuniting several Sicilian cities to the crown of Aragon. He subsequently spent a long, suspicious, secret and incomprehensible campaign in the attempt to piece together Gian Galeazzo’s Lombard state, and to carry out his schemes of Italian conquest. In this endeavour he met with vigorous opponents. Venice and Florence, strong in the strength of their resentful oligarchies, offered a determined resistance; nor was Filippo equal in ability to his father. His infernal cunning often defeated its own aims, checkmating him at the point of achievement by suggestions of duplicity or terror.

In the course of Filippo’s wars with Florence and Venice, the greatest generals of this age were formed—Francesco Carmagnola, who was beheaded between the columns of the Basilica by Niccolò Piccinino, who died at Milan in 1444; and Francesco Sforza, who survived to seize his master’s heritage in 1450. Son of Attendolo Sforza, this Francesco received the hand of Filippo’s natural daughter, Bianca, as a reward for past service and a pledge of future support. When the Visconti dynasty ended by the duke’s death in 1447, he pretended to espouse the cause of the Milanese republic, which was then re-established; but he played his cards so subtly as to make himself, by the help of Cosimo de’ Medici in Florence, duke de facto if not de jure. Francesco Sforza was the only condottiero among the magnates to be tyrants who planted themselves firmly on a throne of first-rate importance. Once seated in the duchy of Milan, he displayed rare qualities as a ruler; for he not only entered into the spirit of the age, which required humanity and culture from a despot, but he also knew how to curb his desire for territory. The conception of confederated Italy found in him a vigorous supporter. Thus the limitation of the Milanese duchy under Filippo Maria Visconti, and its consolidation under Francesco Sforza, were equally effectual in preparing the balance of power to which Italian politics now tended.
which Florence should rank on equal terms with Milan and Naples. The republic of Venice differed essentially from any other state in Italy; and her history was so separate that, up to this point, it would have been needless to interrupt the narrative by tracing it. Venice, however, in the 14th century took her place at last as an Italian power on an equality at least with the very greatest. The constitution of the commonwealth had slowly matured itself through a series of revolutions, which confirmed and defined a type of singular stability. During the earlier days of the republic the doge had been a prince elected by the people, and answerable only to the popular assemblies. In 1302 he was obliged to act in concert with a senate, called pregadi; and in 1172 the grand council, which became the real sovereign of the state, was formed. The several steps whereby the members of the grand council succeeded in eliminating the people from a share in the government, and reducing the doge to the position of their ornamental representative, cannot here be described. It must suffice to say that these changes were made in 1297, when an act was passed for closing the grand council, or in other words for confining it to a fixed number of privileged families, in whom the government was henceforth vested by hereditary right. This ratification of the oligarchical principle, together with the establishment in 1311 of the Council of Ten, completed that famous constitution which endured till the extinction of the republic in 1797. Meanwhile, throughout the middle ages, it had been the policy of Venice to refrain from conquests on the Italian mainland, and to confine her energies to commerce in the East. The first entry of any moment of the Venetian into a directly Italian affair was in 1336, when the republics of Florence and St Mark allied themselves against Mastino della Scala, and the latter took possession of Treviso. After this, for thirty years, between 1352 and 1387, Venice and Genoa contested the supremacy of the Mediterranean. Pisa's maritime power having been extinguished in the battle of Meloria (1284), the two surviving republics had no rivals. They fought their duel out upon the Bosphorus, off Sardinia, and in the Morea, with various success. From the first great encounter, in 1355, Venice retired well-nigh exhausted, and Genoa was so crippled that it could not undertake any further conquests. The second and decisive battle was fought upon the Adriatic. The Genoese fleet under Luciano Doria defeated the Venetians off Pola in 1379, and sailed without opposition to Chioggia, which was stormed and taken. Thus the Venetians found themselves blockaded in their own lagoons. Meanwhile a fleet was raised for their relief by Carlo Zeno in the Levant, and the admiral Vittore Pisani, who had been imprisoned after the defeat at Pola, was released to lead their forlorn hope from the city side. The Genoese in their turn were now blockaded in Chioggia, and forced by famine to surrender. The losses of men and money which the war of Chioggia, as it was called, entailed, though they did not immediately depress the spirit of the Genoese republic, signed her naval ruin. During this second struggle to the death with Genoa, the Venetians had been also at strife with the Carrarese of Padua and the Scaligers of Verona. In 1406, after the extinction of these princely houses they added Verona, Vicenza and Padua to the territories they claimed on terra firma. Their career of conquest, and their new policy of forming Italian alliances and entering into the management of Italian affairs were confirmed by the long dogeship of Francesco Foscari (1423–1457), who must rank with Alfonso, Cosimo de' Medici, Francesco Sforza and Nicholas V. Venice was a joint-founder of confederated Italy. When Constantinople fell in 1453, the old ties between Venice and the Eastern empire were broken, and she now entered on a wholly new phase of her history. Ranking as one of the five Italian powers, she was also destined to defend Western Christendom against the encroachments of the Turk in Europe. (See Venice: History.)

By their settlement in Avignon, the popes relinquished their protectorate of Italian liberties, and lost their position as Italian potentates. Rienzi's revolution in Rome (1347–1354), and his establishment of a republic upon a fantastic basis, half classical, half feudal, proved the temper of the times; while the rise of dynastic families in the cities of the church, claiming the title of papal vicars, but acting in their own interests, weakened the authority of the Holy See. The predatory expeditions of Bertrand du Poit and Robert of Geneva were as ineffective as the descents of the emperors; and, though the cardinal Albornoz conquered Romagna and the city of Ravenna in 1364, the legates who resided in those districts were not long able to hold the ground they had won. At least Gregory XI. returned to Rome; and Urban VI., elected in 1378, had a final end to the Avignonian exile. Still the Great Schism, which now distracted Western Christendom, so enfeebled the papacy, and kept the Roman pontiffs so engaged in ecclesiastical disputes, that they had neither power nor leisure to occupy themselves seriously with their temporal affairs. The threatening presence of the two princely houses of Orsini and Colonna, alike dangerous as friends or foes, rendered Rome an unsafe residence. Even when the schism was nominally terminated in 1415 by the council of Constance, the next two popes held but a precarious grasp upon their Italian domains. Martin V. (1417–1431) resided principally at Florence. Eugenius IV. (1431–1447) followed his example. And what Martin managed to regain Eugenius lost. At the same time, the change which had now come over Italian politics, the desire on all sides for a settlement, and the growing conviction that a federation was necessary, proved advantageous to the popes as sovereigns. They gradually entered into the spirit of their age, assumed the style of despots and made use of the humanistic movement, then at its height, to place themselves in a new relation to Italy. The election of Nicholas V. in 1447 determined this revolution in the papacy, and opened a period of temporal splendour, which ended with the establishment of the popes as sovereigns. Thomas of Sarzana was a distinguished humanist. Humbly born, he had been tutor in the house of the Albizzi, and afterwards librarian of the Medici at Florence, where he imbibed the politics together with the culture of the Renaissance. Soon after assuming the tiara, he found himself without a rival in the church; for the schism ended by Felix V.'s resignation in 1446. Nicholas fixed his residence in Rome, which he began to rebuild and to fortify, determining to render the Eternal City once more a capital worthy of its high place in Europe. The Romans were flattered; and, though their reign was disturbed by republican conspiracy, Nicholas V. was able before his death in 1455 to secure the modern status of the pontiff as a splendid patron and a wealthy temporal potentate.

Italy was now for a brief space independent. The humanistic movement had created a common culture, a common language and sense of common nationality. The five great powers, with their satellites—dukes of Savoy and Urbino, marquesses of Ferrara and Mantua, republics of Bologna, Perugia, Siena—were constituted. All political institutions tended towards despotism. The Medici became yearly more indispensable to Florence, the Bentivogli more autocratic in Bologna, the Baglioni in Perugia; and even Siena was ruled by the Petrucci. But this despotism was of a mild type. The princes were Italians; they shared the common enthusiasm of the nation for art, learning, literature and science; they studied how to mask their tyranny with arts agreeable to the multitude. When Italy had reached this point, Constantinople was taken by the Turks. On all sides it was felt that the Italian alliance must be tightened; and one of the last, best acts of Nicholas V.'s pontificate was the appeal in 1453 to the five great powers in federation to take up their common opposition to the Turk, this appeal led to nothing; but it marked the growth of a new Italian consciousness.

Between 1453 and 1492 Italy continued to be prosperous and tranquil. Nearly all wars during this period were undertaken either to check the growing power of Venice or to further the ambition of the papacy. Having become despots, the popes sought to establish their relatives in principalities. The word nepotism acquired new significance in the reigns of Sixtus IV. and Innocent VIII. Though the country was convulsed by no great struggle, these forty years witnessed a truly appalling
increase of political crime. To be a prince was tantamount to being the mark of secret conspiracy and assassination. Among the most noteworthy examples of such attempts may be mentioned the revolt of the barons against Ferdinand I. of Naples (1462), the murder of Galeazzo Maria Sforza at Milan (1476) and the plot of the Pazzi to destroy the Medici (1478). After Cosimo de' Medici's death in 1464, the presidency of the Florentine republic passed to his son Piero, who left it in 1469 to his sons Lorenzo and Giuliano. These youths assumed the style of princes, and it was perhaps the respect which they inspired in the Tuscan townsmen that was the real cause of the famous conspiracy of Sixtus IV., aimed their blow. Giuliano was murdered, Lorenzo escaped, to tighten his grasp upon the city, which now loved him and was proud of him. During the following fourteen years of his brilliant career he made himself absolute master of Florence, and so modified her institutions that the Medici were henceforth necessary to the state. Apprehending the importance of Italian federation, Lorenzo, by his personal tact and prudent leadership of the republic, secured peace and a common intelligence between the five powers. His own family was fortified by the marriage of his daughter to a son of Innocent VIII., which brought him his son Giovanni's elevation to the cardinalate, and involved two Medicean papacies and the future dependence of Florence upon Rome.

VI. Age of Invasions.—The year 1492 opened a new age for Italy. In this year Lorenzo died, and was succeeded by his son, the vain and weak Piero; France passed beneath the personal control of the inexperienced Charles VIII.; the fall of Granada freed Spain from her embarrassments; Columbus discovered America, destroying the commercial supremacy of Venice; last, but not least, Rodolfo II., Borgia assumed the tiara, with the famous title of Alexander VI. In this year the short-lived federation of the five powers was shaken, and Italy was once more drawn into the vortex of European affairs. The events which led to this disaster may be briefly told. After Galeazzo Maria's assassination, his crown passed to a boy, Gian Galeazzo, who was in due course married to a grand-daughter of Ferdinand I. of Naples. But the government of Milan remained in the hands of this youth's uncle, Lodovico, surnamed II Moro. Lodovico resolved to become duke of Milan. The king of Naples was his natural enemy, and he had cause to suspect that Piero de' Medici might play against him the famous game, with no right to the title he was bent on seizing, he had recourse to Charles VIII. of France, whom he urged to make good his claim to the kingdom of Naples. This claim, it may be said in passing, rested on the will of King René of Anjou. After some hesitation, Charles agreed to invade Italy. He crossed the Alps in 1495, passed through Lombardy, entered Tuscany, freed Pisa from the yoke of Florence, witnessed the expulsion of the Medici, marched to Naples and was crowned there—all this without striking a blow. Meanwhile Lodovico procured his nephew's death, and raised a league against the French in Lombardy. Charles hurried back from Naples, and narrowly escaped destruction at Fornovo in the passes of the Apennines. He made good his retreat, however, and returned to France in 1495. Little remained to him of his light acquisitions; but he had convulsed Italy by this invasion, destroyed her equilibrium, exposed her military weakness and political disunion, and revealed her wealth to greedy and more powerful nations.

The princes of the house of Aragon, now represented by Frederick, a son of Ferdinand I., returned to Naples. Florence made herself a republic, adopting a form of constitution analogous to that of Venice. At this crisis she was ruled by the monk Girolamo Savonarola, who inspired the people with a thirst for freedom, preached the necessity of reformation, and placed himself in direct antagonism to Rome. After a short but eventful career, the influence of which was long effective, he lost his hold upon the citizens. Alexander VI. procured a mock trial, and his enemies burned him upon the Piazza in 1498. In this year Louis XII. succeeded Charles VIII. upon the throne of France. As duke of Orleans he had certain claims to Milan through his grandmother Valentina, daughter of Gian Galeazzo, the first duke. They were not valid, for the investiture of the duchy had been granted only to male heirs. But they served as a sufficient pretext, and in 1499 Louis entered and subdued the Milanese. Lodovico escaped to Germany, returned the next year, was betrayed by his Swiss mercenaries and sent to die at Loches in France. In 1500 Louis made the blunder of calling Ferdinand the Catholic to help him in the conquest of Naples. By a treaty signed at Granada, the French and Spanish kings were to divide the spoil. The conquest was assured when Louis added to Ferdinand's claims the title of King of Naples, thus making his claim to the crown of Naples far-false. He made himself supreme over the Two Sicilies, which he now reunited under a single crown. Three years later, unlessoned by this experience, Louis signed the treaty of Blois (1504), whereby he invited the emperor Maximilian to aid him in the subjugation of Venice. No policy could have been less far-sighted; for Charles V., joint heir to Austria, Burgundy, Castile and Aragon, the future overwhelming rival of France, was already born.

The stage was now prepared, and all the actors who were destined to accomplish the ruin of Italy trod it with their armies. In 1515 France, Germany, with her far-sighted, and Italy fell into the hands of Austria, left the Italians at the absolute discretion of their neighbours. Whatever parts the Italians themselves played in the succeeding quarter of a century, the game was in the hands of French, Spanish and German invaders. Meanwhile, no scheme for combination against common foes arose in the peninsula. Each petty potentate strove for his own private advantage in the conflict, and at the end of the chief gains accrued to the papacy. Aided by his terrible son, Cesare Borgia, Alexander VI. chastised the Roman nobles, subdued Romagna and the March, threatened Tuscany, and seemed to be upon the point of creating a Central Italian state in favour of his progeny, when he died suddenly in 1503. His conquests reverted to the Holy See. Julius II., his bitterest enemy and powerful successor, continued Alexander's policy, but no longer in the interest of his own relatives. It became the nobler ambition of Julius to aggrandize the church, and to reassure the protectors of the Italian people. With this object, he formed, in 1512, the League of Cambrai, in which he and his allies, among whom were the Swiss, captured and curbed the tyranny of the Baglioni in Perugia. Julius II. played a perilous game; but the stakes were high, and he fancied himself strong enough to guide the tempest he evoked. Quarrelling with the Venetians in 1508, he combined the forces of all Europe by the league of Cambrai against them; and, when he had succeeded in his first purpose of humbling them even to the dust, he turned round in 1510, uttered his famous resolve to expel the barbarians from Italy, and pitted the Spaniards against the French. It was with the Swiss that he hoped to effect this revolution; but the Swiss, now interfering for the first time as principals in Italian affairs, were incapable of more than adding to the already maddening distractions of the people. Formed for mercenary warfare, they proved a perilous instrument in the hands of those who used them, and were hardly less injurious to their friends than to their foes. In 1522 the battle of Ravenna between the French troops and the allies of Julius—Spaniards, Venetians and Swiss—was fought. Gaston de Foix bought a doubtful victory dearly with his death; and the allies, though beaten on the banks of the Ronco, immediately afterwards expelled the French from Lombardy. But Julian II. had not yet hope; as he might have been foreseen. He had only exchanged one set of foreign masters for another, and taught a new barbarian race how pleasant were the plains of Italy. As a consequence of the battle of Ravenna, the Medici returned in 1522 to Florence.

When Leo X. was elected in 1513, Rome and Florence rejoiced; but Italy had no repose. Louis XII. had lost the game, and the Spaniards were triumphant. But new actors appeared upon the scene, and the same old struggle was resumed with fiercer energy. By the victory of Marignano in 1515 Francis I., having now succeeded to the throne of France, regained the Milanesi,
ITALY

and broke the power of the Swiss, who held it for Massimiliano Sforza, the titular duke. Leo for a while relied on Francis; for the vast power of Charles V., who succeeded to the empire in 1519, as in 1516 he had succeeded to the crowns of Spain and Lower Italy, threatened the whole of Europe. It was Leo's nature, however, to be inconstant. In 1521 he changed sides, allied himself to Charles, and died after hearing that the imperial troops had again expelled the French from Milan. During the next four years the Franco-Spanish war dragged on in Lombardy until the decisive battle of Pavia in 1525, when Francis was taken prisoner, and Italy lay open to the Spanish armies. Meanwhile Leo X. had been followed by Adrian VI., and Adrian by Clement VII., of the house of Medici, who had long ruled Florence. In the reign of this pope Francis was released from his prison in Madrid (1536), and Clement hoped that he might still be used in the Italian interest as a counterpoise to Charles. It is impossible in this place to follow the tangled intrigues of that period. The year 1537 was signalized by the famous sack of Rome. An army of mixed German and Spanish troops, pretending to act for the emperor, but which may rather be regarded as a vast marauding party, entered Italy under their leader Frundsberg. After his death, the Constable de Bourbon took command of them; they marched slowly down, aided by the marquis of Ferrara, and unopposed by the duke of Urbino, reached Rome, and took it by assault. The constable was killed in the first onslaught; Clement was imprisoned in the castle of St. Angelo; Rome was abandoned to the Spanish and Germans. The whole material conflagration, the catastrophe, Florence shook off the Medici, and established a republic. But Clement, having made peace with the emperor, turned the remnants of the army which had sacked Rome against his native city. After a desperate resistance, Florence fell in 1530. Alessandro de' Medici was placed there with the title of duke of Civitá di Penna; and, on his murder in 1537, Cosimo de' Medici, of the younger branch of the ruling house, was made duke. Acting as lieutenant for the Spaniards, he subsequently (1555) subdued Sienna, and bequeathed to his descendants the grand-duchy of Tuscany.

VII. Spanish-Austrian Ascendancy. It was high time, after the sack of Rome in 1527, that Charles V. should undertake Italian affairs. The country was exposed to anarchy, of which this had been the last and most disgraceful example. The Turks were threatening western Europe, and Luther was inflaming Germany. By the treaty of Barcelona in 1529 the pope and emperor made terms. By that of Cambray in the same year France relinquished Italy to Spain. Charles then entered the port of Genoa, and on the 5th of November met Clement VII. at Bologna. He there received the imperial crown, and summoned the Italian princes for a settlement of all disputed claims. Francesco Sforza, the last and childless heir of the ducal house, was left in Milan till his death, which happened in 1535. The republic of Venice was respected in her liberties and Lombard territories. The Este family received a confirmation of their duchy of Modena and Reggio, and were invested in their fief of Ferrara by the pope. The marquessate of Mantua was made a duchy; and Florence was secured, as we have seen, to the Medici. The great gain by this settlement was the papacy, which held the most substantial Italian province, together with a prestige that raised it far above all rivals. The power of Italy, however parcellled, henceforth became but a dependence upon Spain. Charles V., it must be remembered, achieved his conquest and confirmed his authority far less as emperor than as the heir of Castile and Aragon. A Spanish viceroy in Milan and another in Naples, supported by Rome and by the minor princes who followed the policy dictated to them from Madrid, were sufficient to preserve the whole peninsula in a state of somnolent inglorious servitude.

From 1530 until 1596, that is, for a period of nearly three centuries, the Italians had no history of their own. Their annals are filled with records of dynastic changes and redistributions of territory, consequent upon treaties signed by foreign powers, in the settlement of quarrels which no wise concerned the people.

Italy only too often became the theatre of desolating and distracting wars. But these wars were fought for the most part by alien armies; the points at issue were decided beyond the Alps; the gains accrued to royal families whose names were unpronounceable by southern tongues. The affairs of Europe during the years when Habsburg and Bourbon fought their domestic battles with the blood of noble races may teach grave lessons to all thoughtful men of four and five hundred years ago; none fraught with more insulting recollections, than to the Italian people, who were haggled over like dumb driven cattle in the mart of chaffering kings. We cannot wholly acquit the Italians of their share of blame. When they might have won national independence, after their warfare with the Swabian emperors, they let the golden opportunity slip. Pampered with commercial prosperity, eaten to the core with inter-urban rivalries, they submitted to despots, renounced the use of arms, and offered themselves in the hour of need, defenceless and dissolute, to the shock of puissant nations. That they had created modern civilization for Europe availed them nothing. Italy, intellectually first among the peoples, was now politically and practically last; and nothing to her historian is more heartrending than to watch the gradual extinction of her spirit in this age of slavery.

In 1534 Alessandro Farnese, who owed his elevation to his sister Giulia, one of Alexander VI.'s mistresses, took the tiara with the title of Paul III. It was his ambition to create a duchy for his family; and with this object he gave Parma and Piacenza to his son Pier Luigi. After the squabbling between the French and Spanish parties, the duchy was confirmed in 1536 to Ottaviano Farnese and his son Alessandro, better known as Philip II.'s general, the prince of Parma. Alessandro's descendants reigned in Parma and Piacenza till the year 1731. Paul III.'s pontificate was further marked by important changes in the church, all of which confirmed the spiritual autocracy of Rome. In 1540 this pope approved of Loyola's foundation, and secured the powerful militia of the Jesuit order. The Inquisition was established with almost unlimited powers in Italy, and the press was placed under its jurisdiction. Thus free expression received a check, by which not only ecclesiastical but political tyrants knew how to profit. Henceforth it was impossible to publish or to utter a word which might offend the despots of church or state; and the Italians had to amuse their leisure with the polite triflings of academicians. In 1545 a council was opened at Trent for the reformation of church discipline and the promulgation of orthodox doctrine. The decrees of this council defined Roman Catholicism against the Reformation; and, while failing to regenerate morality, they enforced a hypocritical observance of public decency. Italy to outer view put forth blossoms of hectic and hysterical piety, dozing at the core her clergy and her aristocracy were more corrupt than ever.

In 1556 Philip II., by the abdication of his father Charles V., became king of Spain. He already wore the crown of the Two Sicilies, and ruled the duchy of Milan. In the next year Ferdinand, brother of Charles, was elected emperor. The French, meanwhile, had not entirely abandoned their claims on Italy. Gian Pietro Caraffa, who was made pope in 1553 with the name of Paul IV., endeavoured to revive the ancient papal policy of leaning upon France. He encouraged the dukes of Guisa to undertake the conquest of Naples, as Charles of Anjou had been encouraged by his predecessors. But such schemes were now obsolete and anachronistic. They led to a languid lingering Italian campaign, which was settled far beyond the Alps by Philip's victories over the French at St Quentin and Gravelines. The peace of Cateau Cambresis, signed in 1559, left the Spanish monarch undisputed lord of Italy. Of free commonwealths there now survived only Venice, which, together with Spain, achieved for Europe the victory of Lepanto in 1571; Genoa, which, after the ineffectual Fieschi revolution in 1547, abode beneath the rule of the great Doria family, and held a feeble sway in Corsica; and the two insignificant republics of Lucca and San Marino.

Posthuma Postill of Paul III.
The future hope of Italy, however, was growing in a remote and hitherto neglected corner. Emmanuel Philibert, duke of Savoy, represented the oldest and not the least illustrious reigning house in Europe, and his descendants were destined to achieve for Italy the independence which no other power or prince had given her since the fall of ancient Rome. (See Savoy, House of.)

When Emmanuel Philibert succeeded to his father Charles III. in 1533, he was a duke without a duchy. But the princes of the house of Savoy were a race of warriors; and what Emmanuel Philibert lost as sovereign he regained as captain of adventure in the service of his cousin Philip II. The treaty of Cateau Cambresis in 1559, and the evacuation of the Piedmontese cities held by French and Spanish troops in 1574, restored his state. By removing the capital from Chambéry to Turin, he completed the transformation of the dukes of Savoy from Burgundian into Italian sovereigns. They still owned Savoy beyond the Alps, the plains of Bresse, and the maritime province of Nice.

Emmanuel Philibert was succeeded by his son Charles Emmanuel I., who married Catherine, a daughter of Philip II. He seized the first opportunity of annexing Saluzzo, which had been lost to Savoy in the last two reigns, and renewed the disastrous policy of his grandfather Charles III. by invading Geneva and threatening Provence. Henry IV. of France forced him in 1601 to relinquish Bresse and his Burgundian possessions. In return he was allowed to keep Saluzzo. All hopes of conquest on the transalpine side were now quenched; but the keys of Italy had been given to the dukes of Savoy; and their attention warrago, which was still centered upon Italy, was fixed on the Tyrolese. Emmanuel now attempted the acquisition of Montferrat, which was soon to become vacant by the death of Francesco Gonzaga, who held it together with Mantua. In order to secure this territory, he went to war with Philip III. of Spain, and allied himself with Venice and the Grisons to expel the Spaniards from the Valtelline. When the male line of the Gonzaga family expired in 1627, Charles, duke of Nevers, claimed Mantua and Montferrat in right of his wife, the only daughter of the last duke. Charles Emmanuel was now checkmated by France, as he had formerly been by Spain. The total gains of all his strenuous endeavours amounted, in the acquisition of a few places on the borders of Montferrat.

Not only the Gonzagas, but several other ancient ducal families, died out about the date which we have reached. The legitimate line of the Estensi ended in 1597 by the death of Alfonso II., the last duke of Ferrara. He left his domains to a natural relative, Cesare d’Este, who would in earlier days have inherited without dispute, for bastardy had been no bar on more than one occasion in the Este pedigree. Urban VIII., however, put in a claim to Ferrara, which it will be remembered, had been recognized a papal fief in 1539. Cesare d’Este had to content himself with Modena and Reggio, where his descendants reigned as dukes till 1794. Under the same pontiff, the Holy See absorbed the duchy of Urbino on the death of Francesco Maria II., the last representative of Montefeltro and Della Rovere. The popes were now masters of a fine and compact territory, embracing no inconsiderable portion of Countess Matilda’s legacy, in addition to Pippin’s donation, and the patrimony of St Peter. Meanwhile Spanish fanaticism, the suppression of the Huguenots in France and the Catholic policy of Austria combined to strengthen their authority as pontiffs. Urban’s successor, Paul V., advanced so far as to extend his spiritual jurisdiction over Venice, which, up to the date of his election (1665), had resisted all encroachments of the Holy See. Venice offered the single instance in Italy of a national church. The republic managed the tithes, and the clergy acknowledged no chief above their own patriarch. Paul V. now forced the Venetians to admit his ecclesiastical supremacy; but they refused to readmit the Jesuits, who had been expelled in 1606. This, if we do not count the proclamation of James I. of England (1604), was the earliest instance of the order’s banishment from a state where it had proved disloyal to the commonwealth.

Venice rapidly declined throughout the 17th century. The loss of trade consequent upon the closing of Egypt and the Levant, together with the discovery of America and the sea-route to the Indies, had dried up her chief source of wealth. Prolonged warfare with the Otto-

manians, who forced her to abandon Candia in 1669, as they had robbed her of Cyprus in 1570, still further crippled her resources. Yet she kept the Adriatic free of pirates, notably by suppressing the corsairs called the "Sea Robbers" (1617), maintained herself in the Ionian Islands, and in 1684 added one more to the series of victorious episodes which render her annals so romantic. In that year Francesco Morosini, upon whose tomb we still may read the title Peloponnesiacus, wrested the whole of the Morea from the Turks. But after his death in 1715 the republic relaxed her hold upon his conquests. The Venetian nobles abandoned themselves to indolence and vice. Many of them fell into the slough of pauperism, and were saved from starvation by public doles. Though the signory still made a brave show upon occasion of war, it was with that the state was rotten to the core, and sinking into the decrepitude of dotage.

The Spanish monarchy at the same epoch dwindled with apparently less reason. Philip’s Austrian successors reduced it to the rank of a secondary European power. This decline of vigour was felt, with the customary effects of discord and had government, in Lower Italy. The revolt of Masaniello in Naples (1647), followed by rebellions at Palermo and Messina, which placed Sicily for a while in the hands of Louis XIV. (1676 – 1679) were symptoms of progressive anarchy. The population, exhausted by centuries of oppression, ill-used by the subjects of Spaniards, Turks or Bourbons, are handled, rose in blind exasperation against their oppressors. It is impossible to attach political importance to these revolutions; nor did they bring the people any appreciable good. The destinies of Italy were decided in the cabinets and on the battlefields of northern Europe. A Bourbon at Versailles, a Habsburg at Vienna, or a thick-lipped Lorrainer, with a stroke of his pen, wrote off province against province, regarding not the populations who had bled for him or thrown themselves upon his mercy.

The next chapter of Italian history is continued in the date of the First War of Succession, a war which brought them respectively to diplomatic terminations. Italy, handled and rehandled, settled and resettled, upon each of these occasions, changed masters without caring or knowing what befell the principals in any one of the disputes. Humiliating to human nature in general as are the annals of the 18th-century campaigns in Europe, there is no record of any of them which showed the nations of Italy less favorably than from that afforded by Italian history. The system of setting nations by the ears with the view of settling the quarrels of a few reigning houses was reduced to absurdity when the people, as in these cases, came to be partitioned and exchanged without the assertion or negation of a single principle affecting their interests or rousing their emotions.

In 1700 Charles II. died, and with him ended the Austrian family in Spain. Louis XIV. claimed the throne for Philip, duke of Anjou. Charles, archduke of Austria, opposed him. The dispute was fought out in Flanders; but Lombardy felt the shock, as usual of the French arms. Some Spanish Succession. Spanish Autocracy. The French armies were more than once defeated by Prince Eugene of Savoy, who drove them out of Italy in 1707. Therefore, in the peace of Utrecht (1713), the services of the house of Savoy had to be duly recognized. Victor Amadeus II. received Sicily with the title of king. Montferrat and Alessandria were added to his northern provinces, and his state was recognized as independent. Charles of Austria, now emperor, took Milan, Mantua, Naples and Sardinia for his portion of the Italian spoil. Philip founded the Bourbon line of Spanish kings, renouncing in Italy all that his Habsburg predecessors had gained. Discontented with this diminution
of the Spanish heritage, Philip V. married Elisabetta Farnese, heiress to the last duke of Parma, in 1714. He hoped to secure this duchy for his son, Don Carlos; and Elisabetta further brought with her a claim to the grand-duchy of Tuscany, which would soon become vacant by the death of Gian Gastone de' Medici. After this marriage Philip broke the peace of Europe by invading Sardinia. The Quadruple Alliance was formed, and the new king of Sicily was punished for his supposed adherence to Philip V. by the forced exchange of Sicily for the island of Sardinia. It was thus that in 1720 the house of Savoy assumed the regal title which it bore until the declaration of the Italian kingdom in the last century. Victor Amadeus II.'s reign was of great importance in the history of his state. Though a despot, as all monarchs were obliged to be at that date, he reigned with prudence, probity and zeal for the welfare of his subjects. He took public education out of the hands of the clergy and, which for the future development of manliness in his dominions, was a measure of incalculable value. The duchy of Savoy in his days became a kingdom, and Sardinia, though it seemed a poor exchange for Sicily, was a far less perilous possession than the larger and wealthier island would have been. In 1730 Victor Amadeus abdicated in favour of his son Charles Emmanuel III. Repenting of this step, he subsequently attempted to regain Turin, but was imprisoned in the castle of Rivoli, where he ended his days in 1732.

The War of the Polish Succession which now disturbed Europe is only important in Italian history because the treaty of Vienna in 1738 settled the disputed affairs of the duchies of Parma and Tuscany. The duke Antonio Farnese died in 1733; the grand-duke Gian Gastone de' Medici died in 1737. In the duchy of Parma Don Carlos had already been proclaimed. But he was now transferred to the Two Sicilies, while Francis of Lorraine, the husband of Maria Theresa, took Tuscany and Parma. Milan and Mantua remained in the hands of the Austrians. On this occasion Charles Emmanuel acquired Tortona and Novara.

Worse complications ensued for the Italians with the emperor Charles VI., father of Maria Theresa, died in 1740. The three branches of the Bourbon house, ruling in France, Spain and the Sicilies, joined with Prussia, Bavaria and the kingdom of Sardinia to depose Maria Theresa of her heritage. Lombardy was made the seat of war; and here the king of Sardinia acted as in some sense the arbiter of the situation. After war broke out, he changed sides and supported the Habsburg-Lorraine party. At first, in 1745, the Sardinians were defeated by the French and Spanish troops. But Francis of Lorraine, elected emperor in that year, sent an army to the king's support, which in 1746 obtained a victory at the battle of cloven. Charles Emmanuel now threatened Genoa. The Austrian soldiers already held the town. But the citizens expelled them, and the republic kept her independence. In 1748 the treaty of Aix-la-Chapelle, which put an end to the War of the Austrian Succession, once more redivided Italy. Parma, Piacenza and Guastalla were formed into a duchy for Don Philip, brother of Charles III. of the Two Sicilies, and son of Philip V. of Spain. Charles III. was confirmed in his kingdom of the Two Sicilies. The Austrians kept Milan and Tuscany. The duchy of Modena was placed under the protection of the French. So was Genoa, which in 1735, after Paoli's insurrection against the misgovernment of the republic, ceded her old domain of Corsica to France.

From the date of this settlement until 1792 Italy enjoyed a period of repose and internal amelioration under her numerous paternal despots. It became the fashion during these forty-four years of peace to encourage the industrial population and to experimentalize in economical reforms. The Austrian government in Lombardy under Maria Theresa was characterized by improved agriculture, regular administration, order, reformed taxation and increased education. A considerable power of local autonomy was allowed and dependence on Vienna was very slight and not irksome. The nobles and the clergy were rich and influential, but kept in order by the civil power. There was no feeling of nationality, but the people were prosperous, enjoyed profound peace and were placidly content with the existing order of things. On the death of Maria Theresa in 1780, the emperor Joseph II. instituted much wider reforms. Feudal privileges were done away with, clerical influence diminished and many monasteries were suppressed, the criminal law rendered more humane and torture abolished largely as a result of G. Beccaria's famous pamphlet Dei delitti e delle pene. At the same time Joseph's administration was more arbitrary, and local autonomy was to some extent curtailed. His anti-clerical laws produced some ill-feeling among the more devout part of the population. On the whole the Austrian rule in pre-revolutionary days was beneficial and far from oppressive, and helped Lombardy to recover from the ill-effects of the Spanish domination. It did little for the moral and political development of the Papal States, but the same criticism applies more or less to all the European governments of the day. The emperor Francis I. ruled the grand-duchy of Tuscany by lieutenants until his death in 1765, when it was given, as an independent state, to his second son, Peter Leopold. The reign of this duke was long remembered as a period of internal prosperity, wise legislation and important public enterprise. Leopold, among other useful works, drained the Val di Chiana, and restored those fertile upland plains to agriculture. In 1790 he succeeded to the empire, and left Tuscany to his son Ferdinand. The kingdom of Sardinia was administered upon similar principles, but with less success. Charles Emmanuel married his will law and restored the remnants of free institutions from his state. At the same time he wisely followed his father's policy with regard to education and the church. This is perhaps the best that can be said of a king who incarnated the solid absolutism of the period. From this date, however, we are able to trace the revival of independent thought among the Italians. The European ferment of ideas which preceded the French Revolution expressed itself in men like Aliferi, the fierce denouncer of tyrants, Beccaria, the philosopher of criminal jurisprudence, Volta, the physicist, and others, who were all influenced by the growth of the national intellect. The princes, who ruled, had no other object than the widening of their influence, and some of the younger members of the reigning families were enlightened with the times. The people was prepared for the efforts of the 19th century. The papacy, during this period, had to reconsider the question of the Jesuits, who made themselves universally odious, not only in Italy, but also in France and Spain. In the pontificate of Clement XIII. they ruled the Vatican, and almost succeeded in embroiling the pope with the concerted Bourbon potentes of Europe. His successor, Clement XIV. suppressed the order altogether by a brief of 1773.

D. ITALY IN THE NAPOLEONIC PERIOD, 1796-1814

The campaign of 1796 which led to the awakening of the Italian people to a new consciousness of unity and strength is detailed in the article NAPOLEONIC CAMPAIGNS. Here we can attempt only a general survey of the events, political, civic and social, which heralded the Risorgimento in its first phase. It is desirable in the first place to realize the condition of Italy at the time when the irruption of the French and the expulsion of the Austrians opened up a new political vista for that oppressed and divided people.

For many generations Italy had been banded to and fro between the Habsburgs and the Bourbons. The decline of French influence at the close of the reign of Louis XIV. left the Habsburgs and the Spanish Bourbons without serious rivals. The former possessed the rich duchies of Milan (including Mantua) and Tuscany; while through a marriage alliance with the house of Este of Modena (the Archduke Ferdinand had married the heiress of Modena) its influence over that duchy was supreme. It also had a few sies in Piedmont and in Genoese territory. By marrying her daughter, Maria Amelia, to the young duke of Parma, and another daughter, Maria Carolina, to Ferdinand of Naples, Maria Theresa wished to check the Bourbons influence in the north and south of the peninsula. The Spanish Bourbons held Naples and Sicily, as well as the duchy of Parma.
Of the nominally independent states the chief were the kingdom of Sardinia, ruled over by the house of Savoy, and comprising Piedmont, the isle of Sardinia and nominally Savoy and Nice, though the two provinces last named had virtually been lost to the monarchy since the campaign of 1793. Equally extensive, but less important in the political sphere, were the Papal States, and Venetia, the former torpid under the obscurantist rule of pope and cardinals, the latter enervated by luxury and the policy of unmanly compliance long pursued by doge and council. The ancient rival of Venice, Genoa, was likewise far gone in decline. The small states, Lucca and San Marino, completed the map of Italy. The worst governed part of the peninsula was the south, where feudalism lay heavily on the cultivators and corruption pervaded all ranks. Milan and Piedmont were comparatively well governed; but repugnance to Austrian rule in the former case, and the contention of French Jacobinical opinions in the latter, brought those populations into increasing hostility to the rulers. The democratic propaganda, which was permeating all the large towns of the peninsula, then led to the formation of numerous and powerful clubs and secret societies; and the throne of Victor Amadeus III., of the house of Savoy, soon began to totter under the blows delivered by the French troops at the mountain barriers of his kingdom and under the insidious assaults of the friends of liberty at Turin. Plotting was rife at Milan, as also at Bologna, where the memory of old liberties predisposed men to cast off clerical rule and led to the first rising of the Ragione in Parma. In Genoa, when France took Milan, the Sicilians struggled hard to establish a republic in place of the odious government of an alien dynasty.

The anathemas of the pope, the bravery of Piedmontese and Austrians, and the subsidies of Great Britain failed to keep the league of Italian princes against France intact. The grand-duke of Tuscany was the first of the European sovereigns who made peace with, and recognized the French republic, early in 1795. The first fortnight of Napoleon’s campaign of 1796 detached Sardinia from alliance with Austria and England. The enthusiasm of the Ilastrian for the young Corsican “liberator” greatly helped his progress. Two months later Ferdinand of Naples sought for an armistice, the central dukies were easily over-run, and, early in 1797, Pope Pius VI. was fain to sign terms of peace with Bonaparte at Tolentino, practically ceding the northern part of his states, known as the Legations. The surrender of the last Habsburg stronghold, Mantua, on the 2nd of February 1797 left the field clear for the erection of new political institutions.

Already the men of Reggio, Modena and Bologna had declared for a democratic policy, in which feudalism and clerical rule were to have no place, and in which manhood suffrage and the franchise were to be extended. The unification of these elements together with other rights promised by Bonaparte to the men of Milan in May 1796, should form the basis of a new order of things. In taking this step the Modenese and Romagnols had the encouragement of Bonaparte, despite the orders which the French directory sent to him in a contrary sense. The result was the formation of an assembly at Modena which abolished feudal dues and customs, declared for manhood suffrage and established the Cispadian Republic (October 1796).

The Cispadian Republic.

The choice of Bonaparte’s victorious campaign against the Archduke Charles in 1797 enabled him to mature those designs respecting Venice which are detailed in the article NAPOLEON. On a far higher level was his conduct towards the Milanese. While the French directory saw in that province little more than a district which might be plundered and bargained for, Bonaparte, though by no means remiss in the exacting of gold and of artistic treasures, was laying the foundation of a friendly republic. During his sojourn at the castle of Montebello or Mombello, near Milan, he commissioned several of the leading men of northern Italy to draw up a project of constitution and list of reforms for that province. Meanwhile he took care to curb the excesses of the Italian Jacobins and to encourage the Moderates, who were favourable to the French connexion as promising a guarantee against Austrian domination and internal anarchy. He summed up his conduct in the letter of the 8th of May 1797 to the French directory, “I cool the hot heads here and warm the cool ones.” The Transpadane Republic, or, as it was soon called, the Cispadian Republic, began its organized life on the 9th of July with a brilliant festival at Milan. The constitution was modelled on that of the French directory, and, lest there should be a majority of clerical or Jacobinical deputies, the French Republic through its general, Bonaparte, nominated and appointed the first deputies and administrators of the new government. In the same month it was joined by the Cispadian Republic; and the terms of the treaty of Campo Formio (October 17, 1797), while fatal to the political life of Venice, awarded to this now considerable state the Venetian territories west of the river Adige. A month later, under the pressure of stilling the civil strife in the Valtellina, Bonaparte absorbed that Swiss district in the Cispalian Republic, which thus included all the lands between Como and Verona on the north, and Rimini on the south.

Early in the year 1798 the Austrians, in pursuance of the scheme of partition agreed on at Campo Formio, entered Venice and brought to an end its era of independence which had lasted some 1100 years. Venice with its mainland territories east of the Adige, inclusive of Istri a and Dalmatia, went to the Habsburgs, while the Venetian isles of the Adriatic (the Ionian Isles) and the Venetian fleet went to France. Already set his heart. Venice not only paid the costs of the war to the two chief belligerents, but her naval resources also helped to launch the young general on his career of eastern adventure. Her former rival, Genoa, had also been compelled, in June 1797, to bow before the young conqueror, and had undergone at his hands a remodelling on the lines already followed at Milan. The new Genoese republic, French in all but name, was renamed the Ligurian Republic.

Before he set sail for Egypt, the French had taken possession of Romagna. Already masters of the papal dominion of Ancona, they began openly to challenge the pope’s authority at the Eternal City itself. Joseph Bonaparte, then French envoy to the Vatican, encouraged democratic manifestations; and one of them, at the close of 1797, led to a scuffle in which a French general, Duphot, was killed. The French directory at once ordered its general, Berthier, to march to Rome: the Roman democrats proclaimed a republic on the 15th of February 1798, and on their invitation Berthier and his troops marched in. The pope, Pius VI., was forthwith hailed away to Siena and a year later to Valence in the south of France where he died. Thus fell the last expedition on which Bonaparte had already set his heart. The democratic principles of Rome thereupon proceeded to plunder the city in a way which brought shame on their cause and disgrace (perhaps not wholly deserved) on the general left in command, Masséna.

These events brought revolution to the gates of the kingdom of Naples, the worst-governed part of Italy, where the boorish king, Ferdinand IV. (Il re lazzarone, he was termed), and his whimsical consort, Maria Carolina, scarcely held in check the discontent of their own subjects. A British expedition, under Nelson, arrived at the Mamelles in May 1798 primarily for their defence, negotiated the designs of Bonaparte in Egypt, and then, returning to Naples, encouraged that court to adopt a spirited policy. It is now known that the influence of Nelson and of the British ambassador, Sir William Hamilton, and Lady Hamilton precipitated the rupture between Naples and France. The results were disastrous. The Neapolitan troops at first occupied Rome, but, being badly handled by their leader, the Austrian general, Mack, they were soon scattered in flight; and the Republican troops under General Championnet, after crushing the stubborn resistance of the lazzaroni, made their way into Naples and proclaimed the Parthenopean Republic (January 23, 1799). The Neapolitan Democrats chose five of their leading men to be directors, and tithes and feudal dues and customs
ITALY

were abolished. Much good work was done by the Republicans during their brief tenure of power, but it soon came to an end owing to the course of events which favoured a reaction against France. The directeurs of Paris, not content with overrunning and plundering Switzerland, had outraged German sentiment in many ways. Further, at the close of 1798 they virtually compelled the young king of Sardinia, Charles Emmanuel IV., to abdicate at Turin. He retired to the island of Sardinia, while the French despoiled Piedmont, thereby adding fuel to the resentment rapidly growing against them in every part of Europe.

The outcome of it all was the War of the Second Coalition, in which Russia, Austria, Great Britain, Naples and some secondary states of Germany took part. The incursion of an Austro-Russian army, led by that strange but magnetic being, Suvarov, decided the campaign in northern Italy. The French, poorly handled by Schérer and Sécurier, were everywhere beaten, especially at Magnano (April 3) and Cassano (April 27). Milan and Turin fell before the allies, and Moreau, who took over the command, had much difficulty in making his way to the Genoese coast-line. There he awaited the arrival of Macdonald with the army of Naples. That general, Championnet's successor, had been compelled by these reverses and by the threatening pressure of Nelson's fleet to evacuate Naples and central Italy. In many parts the peasants and townsfolk, enraged by the licence of the French, hung on his flank and rear. The republics set up by the French at Naples, Rome and Milan collapsed as soon as the French troops retired; and a reaction in favour of clerical and Austrian influence set in with great violence, while the French troops withdrew. At Turin, where Suvarov's influence had been paramount, the Austrians were received with enthusiasm. Suvarov, however, fell at Novi (August 15) with the loss of 12,000 men. Joubert perspired in the battle. The growing friction between Austria and Russia led to the transference of Suvarov and his Russians to Switzerland, with results which were to be fatal to the allies in that quarter. But in Italy the Austrian successes continued. Melas defeated Championnet near Coni on the 4th of November; and a little later the French garrison at Ancona and Coni surrendered. The tricolour, which floated triumphantly over all the strongholds of Italy early in the year, at its close waved only over Genoa, where Masséna prepared for a stubborn defence. Nice and Savoy also seemed at the mercy of the invaders. Everywhere the old order of things was restored. The death of the aged Pope Pius VI. at Valence (August 29, 1799) deprived the French of whatever advantage they had hoped to gain by dragging him into exile; on the 24th of March 1800 the concord, assembled for greater security on the island of San Giorgio at Venice, elected a new pontiff, Pius VII. Such was the position of affairs when Bonaparte returned from Egypt and landed at Fréjus. The contrast presented by his triumphs, whether real or imaginary, to the reverses sustained by the armies of the French directory, was fatal to that body and to popular institutions in France.

After the coup d'état of Brumaire (November 1799) he, as First Consul, began to organize an expedition against the Austrians (Russia having now retired from the coalition), in northern Italy. The campaign culminating at Marengo was the result. By that triumph (due to Desaix and Kellermann rather than directly to him), Bonaparte consolidated his own position in France and again laid Italy at his feet. The Austrian general, Melas, signed an armistice whereby he was to retire with his army beyond the river Mincio. Ten days earlier, namely on the 4th of June, Masséna had been compelled by hunger to capitulate at Genoa; but the success at Marengo, followed up by that of Macdonald in north Italy, and Moreau at Hohenlinden (December 2, 1800), brought the emperor Francis to sue for peace which was finally concluded at Lunéville on the 9th of February 1801. The Cisalpine and Ligurian Republics (reconstituted soon after Marengo) were recognized by Austria and so it came about that they were independent of France. The rule of Pius VII. over the Papal States was abandoned; and Italian affairs were arranged much as they were at Campo Formio: Modena and Tuscany now reverted to French control, their former rulers being promised compensation in Germany. Naples, easily worsted by the French, under Moliès, left the British alliance, and made peace by the treaty of Florence (March 1801), agreeing to withdraw her troops from the Papal States, to cede Fiume and the Presidi (in Tuscany) to France and to close her ports to British ships and commerce. King Ferdinand also had to accept a French garrison at Taranto, and other points in the south.

Other changes took place in that year, all of them in favour of France. By complex and secret bargaining with the court of Madrid, Bonaparte procured the cession to France of Louisiana, in North America, and Parma; while the duke of Parma (husband of an infanta of Spain) was promoted by him to the duchy of Tuscany, now renamed the kingdom of Etruria. Piedmont was declared to be a military division at the disposal of France (April 21, 1801); and when Ranieri, the governor of Parma, Bonaparte, then First Consul for life, issued a decree for its definitive incorporation in the French Republic. About that time, too, Elba fell into the hands of Napoleon. Piedmont was organized in six departments on the model of those of France, and a number of French veterans were settled by Napoleon in and near the fortress of Alessandria. Besides copying the Roman habit of planting military colonies, the First Consul imitated the old conquerors of the world by extending and completing the road-system of his outlying districts, especially at those important passes, the Mont Cenis and Simplon. He greatly improved the rough track over the Col de la Madeleine; and, on the Genoese road, when finished in 1807, it was practicable for artillery. Milan was the terminus of the road, and the construction of the Foro Buonaparte and the completion of the cathedral added dignity to the Lombard capital. The Corniche road was improved; and public works in various parts of Piedmont, and the Cisalpine and Ligurian Republics attested the foresight and wisdom of the great organizer of industry and quickener of human energies. The universities of Pavia and Bologna were reopened and made great progress in this time of peace and growing prosperity. Somewhat later the Pavia canal was begun in order to connect Lake Como with the Adriatic for barge-traffic.

The personal nature of the tie binding Italy to France was illustrated by a curious incident of the winter of 1802-1803. Bonaparte, now First Consul for life, felt strong enough to impose his will on the Cisalpine Republic and to set at defiance one of the stipulations of the treaty of Lunéville. On the pretext of consolidating that republic, he invited 450 of its leading men to come to Lyons to a consulta. In reality he and his agents had already provided for the passing of proposals which were agreeable to him. The deputies having been dazzled by têtes and treaties, Talleyrand and Marescalchi, ministers of foreign affairs at Paris and Milan, plied them with hints as to the course to be followed by the consulta; and, despite the rage of the more democratic of their number, everything corresponded to the wishes of the First Consul. It remained to find a chief. Very many were in favour of Count Melzi, a Lombard noble, who had been chief of the executive at Milan; but again Talleyrand and French agents set to work on behalf of their master, with the result that he was elected president for ten years. He accepted that office because, as he frankly informed the deputies, he had found no one who "for his services rendered to his country, his authority with the people and his separation from party
Joseph Bonaparte, having landed in Naples, was elected vice-president with merely honorary functions. The constitution comprised a consultato charged with executive duties, a legislative body of 150 members and a court charged with the maintenance of the fundamental laws. These three bodies were to be chosen by three electoral colleges consisting of (a) landed proprietors, (b) learned men and clergies, (c) merchants and traders, holding their sessions biennially at Milan, Bologna and Brescia respectively. In practice the consultato could override the legislature; and, as the consultato was little more than the organ of the president, the whole constitution may be pronounced autocratic as that of France after the changes brought about by Bonaparte in August 1802. Finally we must note that the Cisalpine now took the name of the Italian Republic, and that by a concordat with the pope, Bonaparte regulated its relations to the Holy See in a manner analogous to that adopted in the famous French concordat promulgated at Easter 1801 (see Concordat). It remains to add that the Ligurian Republic and that of Lucca remodelled their constitutions in a way somewhat similar to that of the Cisalpine.

Bonaparte’s ascendency did not pass unchallenged. Many of the Italians retained their enthusiasm for democracy and national independence. In 1803 movements in these directions took place at Rimini, Brescia and Bologna; and they were sharply repressed, and most Italians came to acquiesce in the Napoleonic supremacy as inevitable and indeed beneficial. The complete disregard shown by Napoleon for one of the chief conditions of the treaty of Lunéville (February 1801)—that stipulating for the independence of the Ligurian and Cisalpine Republics—became more and more apparent every year. Alike in political and commercial affairs they were for all practical purposes dependencies of France. Finally, after the proclamation of the French empire (May 18, 1804) Napoleon proposed to place his brother Joseph over the Italian state, which then took the title of kingdom of Italy. On Joseph declining, Napoleon finally decided to accept the crown which Melzi, Marescalchi, Serbelloni and others begged him to assume. Accordingly, on the 26th of May 1805, in the cathedral at Milan, he crowned himself with the iron crown of the old Lombard kings, using the traditional formula, “God gave it me; let him beware who touches it.” On the 7th of June he appointed his step-father, Eugène Beauharnais, to be governor. Eugène soon found that his chief duty was to enforce the will of Napoleon. The legislature at Milan having ventured to alter some details of taxation, Eugène received the following rule of conduct from his step-father: “Your system of government is simple: the emperor wills it to be thus.” Republicanism was now everywhere discouraged. The little republic of Lucca, along with Piombino, was now awarded as a principality by the emperor to Elisa Bonaparte and her husband, Bacciochi.

In June 1805 there came a last and intolerable affront to the emperors of Austria and Russia, who at that very time were seeking to put bounds to Napoleon’s ambition and to redress the balance of power. The French emperor, at the supposed request of the doge of Genoa, declared the Ligurian Republic to be an integral part of the French empire. This defiance to the sovereigns of Russia and Austria rekindled the flames of war. The third coalition was formed between Great Britain, Russia and Austria, Naples soon joining its ranks.

For the chief events of the ensuing campaigns see NAPOLEONIC CAMPAIGNS. While Massena pursued the Austrians into their own land, at the close of 1805 Italian forces under Eugène and Gouvion St Cyr (q.v.) held their ground against allied forces landed at Naples. After Austerlitz (December 2, 1805) Austria made peace by the treaty of Pressburg, ceding to the kingdom of Italy her part of Venetia along with the provinces of Istria and Dalmatia. Napoleon then turned fiercely against Maria Carolina of Naples upbraiding her with her “perfidy.” He sent Joseph Bonaparte and Masséna southwards with a strong column, compelled the Anglo-Russian forces to evacuate Naples, and occupied the south of the peninsula with little opposition except at the fortress of Gaeta. The Bourbon court sailed away to Palermo, where it remained for eight years under the protection afforded by the British fleet and a British army of occupation. On the 15th of February 1806 Joseph Bonaparte entered Naples in triumph, his brother troops capturing there two hundred pieces of cannon. Gaeta, however, held out stoutly against the French. Sir Sidney Smith with a British squadron captured Capri (February 1806), and the peasants of the Abruzzi and Calabria soon began to give trouble. Worst of all was the arrival of a small British force in Calabria under Sir John Stuart, which made off with the precious table and sedan chair delivered by General Réynier on level ground near the village of Maidia (July 4). The steady volleys of Kempt’s light infantry were fatal to the French, who fell back in disorder under a bayonet charge of the victors, with the loss of some 2700 men. Calabria now rose in revolt against King Joseph, and the peasants dealt out savage reprisals to the French troops. On the 18th of July, however, Gaeta surrendered to Masséna, and that marshal, now moving rapidly southwards, extricated Réynier, crushed the Bourbon rising in Calabria with great barbarity, and compelled the British force to re-embark for Sicily. At Palermo Queen Maria Carolina continued to make vehement but futile efforts for the overthrow of King Joseph.

It is more important to observe that under Joseph and his ministers or advisers, including the Frenchmen Roederer, Dumas, Miot de Ménil and the Corsican Saliceti, great progress was made in abolishing feudal laws and customs, in reforming the judicial procedure and criminal laws on the model of the Code Napoléon, and in attempting the beginnings of elementary education. More questionable was Joseph’s policy in closing and confiscating the property of 215 of the richer monasteries of the land. The monks were pensioned off, but though the confiscated property helped to fill the empty coffers of the state, the measure aroused widespread alarm and resentment among that superstitious people.

The peace of Tilsit (July 7, 1807) enabled Napoleon to press on his projects for securing the command of the Mediterranean, thenceforth a fundamental axiom of his policy. Consequently, in the autumn of 1807 he urged on Joseph the adoption of vigorous measures for the capture of Sicily. Already, in the negotiations with England during the summer of 1806, the emperor had shown how much of the extreme importance of gaining possession of that island, which indeed caused the breakdown of the peace proposals then being considered; and now he ordered French squadrons into the Mediterranean in order to secure Corfu and Sicily. His plans respecting Corfu succeeded. That island and some of the adjacent isles fell into the hands of the French (some of them were captured by British troops in 1809–10); but Sicily remained unassailable. Capri, however, fell to the French on the 18th of October 1808, shortly after the arrival at Naples of the new king, Murat.

This ambitious marshal, brother-in-law of Napoleon, failed in his hope of gaining the crown of Spain, received that of Naples in the summer of 1808, Joseph Bonaparte being moved from Naples to Madrid. This arrangement pleased neither of the relatives of the emperor; but his will now was law on the continent. Joseph left Naples on the 23rd of May 1808; but it was not until the 6th of September that Joachim Murat made his entry. A fortnight later his consort Caroline arrived, and soon showed a vigour and restlessness of spirit which frequently clashed with the dictates of her brother, the emperor and the shifty, unstable policy of her consort. The Spanish national rising of 1808 and thereafter the Peninsular War diverted Napoleon’s attention from the affairs of south Italy. In June 1809, during his campaign against Austria, Sir John Stuart with an Anglo-Sicilian force sailed northwards, captured Ischia and threw Murat into great alarm; but on the news of the Austrian defeat at Wagram, Stuart sailed back again.

It is now time to turn to the affairs of central Italy. Early in 1808 Napoleon proceeded with plans which he had secretly concerted after the treaty of Tilsit for transferring the infanta
of Spain who, after the death of her consort, reigned at Florence on behalf of her young son, Charles Louis, from her kingdom of Etruria to the little principality of Entre Douro e Minho which he proposed to carve out from the north, of Portugal. Etruria reverted to the French empire, but the Spanish princess and her son did not receive the promised indemnity. Elisa Bonaparte and her husband, Bacciochi, rulers of Lucca and Piombino, became the heads of the administration in Tuscany, Elisa showing decidedly governing capacity.

The last part of the peninsula to undergo the Gallicizing influence was the papal dominion. For some time past the relations between Napoleon and the pope, Pius VII., had been severely strained, chiefly on the question of compensating the church, both in France and in the kingdom of Italy, in a way inconsistent with the traditions of the Vatican, but also because the pontiff refused to grant the divorce between Jerome Bonaparte and the former Miss Patterson on which Napoleon early in the year 1806 laid so much stress. These and other disputes led the emperor, as successor of Charlemagne, to treat the pope in a very high-handed way. "Your Holiness (he wrote) is sovereign of Rome, but I am its emperor"; and he threatened to annul the presumed "donation" of Rome by Charlemagne, unless the pope yielded to his demands. "Henceforward," he continued, "I will further exploit the Charlemagne tradition for the benefit of the continental system, that great engine of commercial war by which I hoped to assure the ruin of England. This aim prompted the annexation of Tuscany, and his intervention in the affairs of the Papal States. To this the pope assented under pressure from Napoleon; but the latter soon found other pretexts for intervention, and in February 1808 a French column under Miolli occupied Rome, and deposed the papal authorities. Against this violence Pius VII. protested in vain. Napoleon sought to push matters to an extreme, and on the 3rd of April he adopted the rigorous measure of annexing to the kingdom of Italy the papal provinces of Ancona, Urbino, Macerata and Camerina. This measure, which seemed to the pious an act of sacrilege, and to Italian patriots an outrage on the only independent sovereign of the peninsula, sufficed for the present. The outbreak of war in Spain, followed by the rupture with Austria in the spring of 1809, distracted the attention of the emperor. But after the occupation of Vienna the conqueror dated from that capital on the 17th of May 1809 a decree of mutually annexing Rome and the duchy of Istria to the French empire. Here again he cited the action of Charlemagne, his "august predecessor," who had merely given "certain domains to the bishops of Rome as fiefs, though Rome did not thereby cease to be part of his empire."

In reply the pope prepared a bull of excommunication against those who should infringe the prerogatives of the Holy See in this matter. Thereupon the French general, Miolli, who still occupied Rome, caused the pope to be arrested and carried him away northwards into Tuscany, thence to Savona; finally he was taken, at Napoleon’s orders, to Fontainebleau. Thus, a second time, fell the temporal power of the papacy. By an imperial decree of the 17th of February 1810, Rome and the neighbouring districts, including Spoleto, became part of the French empire. Rome thenceforth figured as its second city, and entered upon a new life under the administration of French officials. The Roman territory was divided into two departments—the Tiber and Trasimene; the Code Napoléon was introduced, public works were set on foot and great advance was made in the material sphere. Nevertheless the harshness with which the emperor treated the Roman clergy and suppressed the monasteries caused deep resentment to the orthodox.

There is no need to detail the fortunes of the Napoleonic states in Italy. One and all they underwent the influences emanating from Paris; and in respect to civil administration, law, judicial procedure, education and public works, they all experienced great benefits, the results of which never wholly disappeared. On the other hand, they suffered from the rigorous measures of the continental system, which seriously crippled trade at the ports and were not compensated by the increased facilities for trade with France which Napoleon opened up. The drain of men to supply his armies in Germany, Spain and Russia was also a severe tax. An Italian corps marched under Eugène Beauharnais to Moscow, and distinguished itself at Malo-Jaroslavitz, as also during the horrors of the retreat in the closing weeks of 1812. It is said that out of 27,000 Italians who entered Russia with Eugène, only 33 saw their country again. That campaign marked the beginning of the end for the Napoleonic domination in Italy as elsewhere. Murat, left in command of the Grand Army at Vîlina, abandoned his charge and in the next year made over to the emperor the kingdom of Naples for himself. For his vacillations at this time and his final fate, see Murat. Here it must suffice to say that the uncertainty caused by his policy in 1813–1814 had no small share in embarrassing Napoleon and in precipitating the downfall of his power in Italy. Eugène Beauharnais, viceroy of the kingdom of Italy, showed both constancy and courage; but after the battle of Leipzig (October 16–19, 1813) his power crumbled away under the assaults of the now victorious Austrians. By an arrangement with Bavaria, they were able to march through Tirol and down the valley of the Adige in force, and overpowered the troops of Eugène whose position was thus fatal. At the battle of Hanóing Napoleon, under the personal direction of Murat and the dissensions among the Italians. Very many of them, distrustful of both these kings, sought to act independently in favour of an Italian republic. Lord William Bentinck with an Anglo-Sicilian force landed at Leghorn on the 8th of March 1814, and issued a proclamation to the Italians bidding them rise against Napoleon in the interests of their own freedom. A little later he gained possession of Genoa. Amidst these schisms the defence of Italy collapsed. On the 16th of April 1814 Eugène, on hearing of Napoleon’s overthrow at Paris, signed an armistice at Mantua by which he was enabled to send away the French troops beyond the Alps and entrust himself to the consideration of the allies. The Austrians, under General Bellegarde, entered Milan without resistance; and this event precluded the restoration of the old political order.

The arrangements made by the allies in accordance with the treaty of Paris (June 12, 1814) and the Final Act of the congress of Vienna (June 9, 1815), imposed on Italy boundaries which, roughly speaking, corresponded to those of the pre-Napoleonic era. To the kingdom of Sardinia, now reconstituted under Victor Emmanuel I. France ceded its old provinces, Savoy and Nice; and the allies, especially by the deposition of Murat and the Alpino, left the title of duke of Genoa, in order to strengthen it for the duty of acting as a buffer state between France and the smaller states of central Italy. Austria recovered the Milanese, and all the possessions of the old Venetian Republic on the mainland, including Istria and Dalmatia. The Ionian Islands, formerly belonging to Venice, were, by a treaty signed at Paris on the 5th of November 1815, placed under the protection of Great Britain. By an instrument signed on the 24th of April 1815, the Austrian territories in north Italy were erected into the kingdom of Lombardo-Venetia, which, though an integral part of the Austrian empire, was to enjoy a separate administration, the symbol of its separate individuality being the coronation of the emperors with the ancient iron crown of Lombardy ("Proclamation de l’empereur d’Autriche, &c., April 7, 1815, State Papers, ii. 906). Francis IV., son of the archduke Ferdinand of Austria and Maria Beatrice, daughter of Ercole Rinaldo, the last of the Estensi, was reinstated as duke of Modena. Parma and Placentia were assigned to Maria Ludovica, daughter of the Austrian emperor and wife of Napoleon, on behalf of her son, the little Napoleon, but by subsequent arrangements (1816–1817) the duchy was to revert at her death to the Bourbons of Parma, then reigning at Lucca. Tuscany was restored to the grand-duke Ferdinand III. of Halsburg-Lorraine. The duchy of Lucca was given to Marie Louise of Bourbon-Parma, who, at the death of Marie Louise of Austria, would
return to Parma, when Lucca would be handed over to Tuscany. The pope, Pius VII., who had long been kept under restraint by Napoleon at Fontainebleau, returned to Rome in May 1814, and was restored by the congress of Vienna (not without some demur on the part of Austria) as the sovereign of all the former possessions of the Holy See. Ferdinand IV. of Naples, not long after the death of his consort, Maria Carolina, in Austria, returned from Sicily to take possession of his dominions on the mainland. He received them back in their entirety at the hands of the powers, who recognized his new title of Ferdinand I. of the Two Sicilies. The rash attempt of Murat in the autumn of 1815, which led to his death at Pizzo in Calabria, enabled the Bourbon dynasty to crush malcontents with all the greater severity. The reaction, which was dull and heavy in the dominions of the pope and of Victor Emmanuel, systematically harsh in the Austrian states of the north, and comparatively mild in Parma and Tuscany, excited the greatest loathing in southern Italy and Sicily, because there it was directed by a dynasty which had aroused feelings of hatred mingled with contempt.

There were special reasons why Sicily should harbour these feelings against the Bourbons. During eight years (1806-1814) the chief places of the island had been garrisoned by British troops; and the commander of the force which upheld the tutorial rule, the governor of the island, was a Britisher. The British government, which awarded a large annual subsidy to the king and queen at Palermo, claimed to have some control over the administration. Lord William Bentinck finally took over large administrative powers, seeing that Ferdinand, owing to his dulness, and Maria Carolina, owing to her very suspicious intrigues with Napoleon, could never be trusted. The contest between the royal power and that of the Sicilian estates threatened to bring matters to a deadlock, until in 1812, under the impulse of Lord William Bentinck, a constitution was introduced on the model of the Napoleonic code. It was based on a threefold principle; and its constitution was passed by the estates. After the retirement of the British troops in 1814 the constitution lapsed, and the royal authority became once more absolute. But the memory of the benefits conferred by "the English constitution" remained fresh and green amidst the arid waste of repression which followed. It lived on as one of the impalpable but powerful influences which spurred on the Sicilians and the democrats of Naples to the efforts which they put forth in 1821, 1830, 1848 and 1860.

This result, accruing from British intervention, was in some respects similar to that exerted by Napoleon on the Italians of the mainland. The brutalities of Austria's white coats in the north, the unintelligent repression then characteristic of the house of Savoy, the petty spite of the duke of Modena, the medieval obscurantism of pope and cardinals in the middle of the peninsula and the clownish excesses of Ferdinand in the south, could not blot out from the minds of the Italians the recollection of the benefits derived from the just laws, vigorous administration and enlightened aims of the great emperor. The hard but salutary training which they had undergone at his hands had taught them that they were the equals of the northern races both in the council chamber and on the field of battle. It had further revealed to them that truth, which once grasped can never be forgotten, that, despite differences of climate, character and speech, they were in all essentials a nation. (J. H. R.)

E. THE RISORGIMENTO, 1815-1870

As the result of the Vienna treaties, Austria became the real mistress of Italy. Not only did she govern Lombardy and Venetia directly, but Austrian princes ruled in Modena, Parma and Tuscany; Piacenza, Ferrara and Comacchio had Austrian garrisons; Prince Metternich, the Austrian chancellor, believed that he could always secure the election of an Austrophil pope, and Ferdinand of Naples, reinstated by an Austrian army, had bound himself, by a secret article of the treaty of June 12, 1815, not to introduce methods of government incompatible with those adopted in Austria's Italian possessions. Austria also concluded offensive and defensive alliances with Sardinia, Tuscany and Naples; and Metternich's ambition was to make Austrian predominance over Italy still more absolute, by placing an Austrian archduke on the Sardinian throne. Victor Emmanuel I., the king of Sardinia, was the only native ruler in the peninsula, and the Savoy dynasty was popular with all classes. But although welcomed with enthusiasm on his return to Turin, he introduced a system of reaction which, if less brutal, was no less uncompromising than that of Austrian archdukes or Bourbon princes. His object was to restore his dominions to the conditions preceding the French occupation. The French system of taxation was maintained because it brought in ampler revenues; but feudalism, the antiquated legislation and bureaucracy were restored. All the nobility and officials still living who had served the state before the Revolution, many of them now in their dotage, were restored to their posts; only nobles were eligible for the higher government appointments; all who had served under the French administration were dismissed or reduced in rank; and in the army beardless scions of the aristocracy were placed over the heads of war-worn veterans who had commanded regiments in Spain and Russia. The influence of a bigoted priesthood was re-established, and "every form of intellectual and moral torment, everything save actual persecution and physical torture that could be inflicted on the 'imperious' was inflicted. . . ." In the universities and colleges, which were directed by the state, the national policy of Austria was carried out, which provided for a single clergy, the suppression of all religious societies, and the introduction of the "Austrian rule in Italy."
Italy

was suppressed, the constitution abolished in 1816, and the island, as a reward for its fidelity to the dynasty, converted into a Neapolitan province governed by Neapolitan bureaucrats.

To the mass of the people the restoration of the old government undoubtedly brought a sense of relief, for the terrible drain in men and money caused by Napoleon's wars had caused much discontent, whereas now there was a prospect of peace and rest. But the restored governments in their terror of revolution would not realize that the late régime had wafted a breath of new life over the country and left ineradicable traces in the way of improved laws, efficient administration, good roads and the sweeping away of old abuses; while the new-born idea of Italian unity, strengthened by a national pride revived on many a stricken field from Madrid to Moscow, was a force to be reckoned with. The oppression and follies of the last governments made men forget the evils of French rule and remember only its good side. The masses were still more or less indifferent, but among the nobility and the educated middle classes, cut off from all part in free political life, there was developed either the spirit of despair at Italy's moral degradation, as expressed in the writings of Foscolo and Leopardi, or a passion of hatred and revolt, which found its manifestation, in spite of severe laws, in the development of secret societies. The most important of these was the constitution, which objects were the expulsion of the foreigner and the achievement of constitutional freedom (see Carbonari).

When Ferdinand returned to Naples in 1815 he found the kingdom, and especially the army, honeycombed with Carbonarism, to which many noblemen and officers were affiliated; and although the police instituted prosecutions and organized the counter-movement of the Calderari, who may be compared to the "Black Hundreds" of modern Russia, the revolutionary spirit continued to grow, but it was not yet at first antagonistic. The granting of the Spanish constitution of 1820 proved the starting point of the Italian liberation movement; a military mutiny led by two officers, Silvati and Morelli, and the priest Menichini, broke out at Monteforte, to the cry of "God, the King, and the Constitution!" The troops sent against them commanded by General Guglielmo Pepe, himself a Carbonaro, hesitated to act, and the king, finding that he could not count on the army, granted the constitution (July 13, 1820), and appointed his son Francis regent. The events that followed are described in the article on the history of Naples (p.123). Not only did the constitution, which was modelled on the impossible Spanish constitution of 1812, prove unworkable, but it strengthened the feeling of the Grand Alliance, whose main object was to keep the peace of Europe, felt themselves bound to interfere to prevent the evil precedent of a successful military revolution. The diplomatic developments that led to the intervention of Austria are sketched elsewhere (see Europe: History); in general the result of the deliberations of the congresses of Troppau and Laibach was to establish, not the general right of intervention claimed in the Troppau Protocol, but the special right of Austria to safeguard her interest in Italy. The defeat of General Pepe by the Austrian forces at Rieti (March 27, 1821) proved the weakness of King Ferdinand's autocratic power under the protection of Austrian bayonets were the effective assertion of this principle.

The movement in Naples had been purely local, for the Neapolitan Carbonari had at that time no thought save of Naples; it was, moreover, a movement of the middle and upper classes in which the masses took little interest. Immediately after the battle of Rieti a Carbonarist mutiny broke out in Piedmont independently of events in the south. Both King Victor Emmanuel and his brother Charles Felix had no sons, and the heir presumptive to the throne was Prince Charles Albert, of the Carignano branch of the house of Savoy. Charles Albert felt a certain interest in Liberal ideas and was always surrounded by young nobles of Carbonarist and anti-Austrian tendencies, and was therefore regarded with suspicion by his royal relatives. Metternich, too, had an instinctive dislike for him, and proposed to exclude him from the succession by marrying one of the king's daughters to Francis of Modena, and getting the Salic law abrogated so that the succession would pass to the duke and Austria would thus dominate Piedmont. The Liberal movement that had gained ground in Piedmont as in Naples among the younger nobles and officers, and the events of Spain and southern Italy aroused much excitement. In March 1821, Count Santorre di Santarossa and other conspirators informed Charles Albert of a constitutional and anti-Austrian plot, and asked for his help. After a momentary hesitation he informed the king; but at his request no arrests were made, and no precautions were taken. On the roth of March the garrison of Alessandria mutinied, and its example was followed on the 12th by that of Turin, where the Spanish constitution was demanded, and the black, red and blue flag of the Carbonari paraded the streets. The next day the king abdicated after appointing Charles Albert regent. The latter immediately proclaimed the constitution, but the new king, Charles Felix, who was at Modena at the time, repudiated the regent's acts and exiled him to Tuscany; and, with his consent, an Austrian army invaded Piedmont and crushed the constitutionalists at Novara. Many of the conspirators were condemned to death, but all succeeded in escaping. Charles Felix was most indifferent with the ex-regent, but he resented, as an unwarrantable interference, Austria's attempt to have his brother excommunicated. All the conspirators were sent away with the exception of those at Verona (1822). Charles Albert's somewhat equivocal conduct also roused the hatred of the Liberals, and for a long time the esecrato Carignano was regarded, most unjustly, as a traitor even by many who were not republicans.

Carbonarism had been introduced into Lombardy by two Romagnols, Count Laderchi and Pietro Maroncelli, but the leader of the movement was Count F. Confalonieri, who was in favour of an Italian federation composed of northern Italy under the house of Savoy, central Italy under the king of the Two Sicilies, and southern Italy under the pope. There had been some mild plotting against Austria in Milan, and an attempt was made to co-operate with the Piedmontese movement of 1821; already in 1820 Maroncelli and the poet Silvio Pellico had been arrested as Carbonari, and after the movement in Piedmont more arrests were made. The mission of Gaetano Castiglia and Marquis Giorgio Pallavicini to Turin, where they had interviewed Charles Albert, although without any definite result—for Confalonieri had warned the prince that Lombardy was not ready to rise—was accidentally discovered, and Confalonieri was himself arrested. The plot would never have been a menace to Austria but for her treatment of the conspirators. Pellico and Maroncelli were immured in the Spielberg; Confalonieri and two dozen others were condemned to death, their sentences being, however, commuted to imprisonment in that same terrible fortress. The heroism of the prisoners, and Silvio Pellico's account of his imprisonment (Le mie Prigioni), did much to enlist the sympathy of Europe for the Italian cause.

During the next few years order reigned in Italy, save for a few insignificant outbreaks in the Papal States; there was, however, perpetual discontent and agitation, especially in the Papal States, where misgovernment was extreme. Under Pius VII. and his minister Cardinal Consalvi, oppression had not been very severe, and Metternich's proposal to establish a central inquisitorial tribunal for political offences throughout Italy had been rejected by the papal government. But on the death of Pius in 1823, his successor Leo XII. (Cardinal Della Genga) proved a ferocious reactionary under whom barbarous laws were enacted and torture frequently applied. The secret societies, such as the Carbonari, the Adephi and the Bersaglieri d'America, which flourished in Romagna, replied to these persecutions by assassinating the more brutal officials and spies. The events of 1820-1821 increased the agitation in Romagna, and in 1823 large numbers of persons were condemned to death, imprisonment or exile. The society of the Sanfedisti, formed of the dregs of the populace, whose object was to murder every Liberal, was openly protected and encouraged. Leo died
in 1829, and the mild, religious Pius VIII. (Cardinal Castiglioni) only reigned until 1830, when Gregory XVI. (Cardinal Cappellari) was elected through "Austrian" influence, and proved another "zelante." The July revolution in Paris and the declaration of the new king, Louis Philippe, that France, as a liberal monarchy, would not only not intervene in the internal affairs of other countries, but would not permit other powers to do so, aroused great hopes among the oppressed peoples, and was the immediate cause of a revolution in Romagna and the Marches. In February 1831 these provinces rose, raised the red, white and green tricolor (which henceforth took the place of the Carbonarist colours as the Italian flag), and shook off the papal yoke with surprising ease. At Parma too there was an outbreak and a demand for the constitution; Marie Louise could not grant it because of her engagements with Austria, and, therefore, abandoned her dominions. In Modena Duke Francis, ambitious of enlarging his territories, coquetted with the Carbonari of Paris, and opened indirect negotiations with Menotti, the revolutionary leader in his state, believing that he might assist him in his plans. Menotti, for his part, conceived the idea of a united Italian state under the duke. A rising was organized for February 1831; but Francis got wind of it, and, repenting of his dangerous dallying with revolution, arrested Menotti and fled to Austrian territory with his prisoner. In his absence the insurrection took place, and Biagio Nardi, having been elected dictator, proclaimed that "the Italian nation, having rejected the Roman Catholic monarch, the French king soon abandoned his principle of non-intervention on which the Italian revolutionists had built their hopes; the Austrians intervened unhindered; the old governments were re-established in Parma, Modena and Romagna; and Menotti and many other patriots were hanged. The Austrians evacuated Romagna in July, but another insurrection having broken out immediately afterwards which the papal troops were unable to quell, they returned. This second intervention gave umbrage to France, who, by way of a counterpoise sent a force to occupy Ancona. These two foreign occupations, which were almost as displeasing to the pope as to the Liberals, lasted until 1838. The powers, immediately after the revolt, presented a memorandum to Gregory recommending certain moderate reforms, but no attention was paid to it. These various movements proved in the first place that the masses were by no means ripe for revolution, and that the idea of unity, although now advocated by a few revolutionary leaders, was far from being generally accepted even by the Liberals; and, secondly, that, in spite of the indifference of the masses, the despotic governments were unable to hold their own without the assistance of foreign barbarians.

On the 27th of April 1831, Charles Albert succeeded Charles Felix on the throne of Piedmont. Shortly afterwards he received a letter from an unknown person, in which he was exhorted with fiery eloquence to place himself at the head of the movement for liberating and uniting Italy and expelling the foreigner, and told that he was free to choose whether he would be "the first of men or the last of Italian tyrants." The author was Giuseppe Mazzini, then a young man of twenty-six years, who, though in theory a republican, accepted the constitution of Savoy as the guarantee of the house of Savoy if he would guide the nation to freedom. The only result of his letter, however, was that he was forbidden to re-enter Sardinian territory. Mazzini, who had learned to distrust Carbonarism owing to its lack of a guiding principle and its absurd paraphernalia of ritual and mystery, had conceived the idea of a more serious political association for the emancipation of his country not only from foreign and domestic despotism but from national faults of character; and this idea he had materialized in the organization of a society called the Giovane Italia (Young Italy). During the summer of 1831, among the Italian sojourners in Rome, he declared that the liberation of Italy could only be achieved through unity, and his great merit lies in having inspired a large number of Italians with that idea at a time when provincial jealousies and the difficulty of communications maintained separatist feelings. Young Italy spread to all centres of Italian exiles, and by means of literature carried on an active propaganda in Italy itself, where the party came to be called "Ghibellini," as though reviving the traditions of the Ghibelline and Guidoriccio tradition. "I am the representative of the Giovane Italia supplanted that of the older societies, in practice it met with no better success; the two attempts to invade Savoy in the hope of seducing the army from its allegiance failed miserably, and only resulted in a series of barbarous sentences of death and imprisonment which made most Liberals despair of Charles Albert, while they called down much criticism on Mazzini as the organizer of raids in which he himself took no part. He was now forced to leave France, but continued his work of agitation from London. The disorders and state of the city of Rome, and the march of Mazzini, but the forlorn hope of the brothers Bandiera, who in 1848 landed on the Calabrian coast, was the work of the Giovane Italia. The rebels were captured and shot, but the significance of the attempt lies in the fact that it was the first occasion on which north Italians (the Bandieras were Venetians and officers in the Austrian navy) had tried to raise the standard of revolt in the south.

Romagna had continued a prey to anarchy ever since 1831; the government organized armed bands called the Centurioni (men armed from the earlier Sanfedisti), to terrorize the Liberals, while the secret association of the Mazzinian propagandists of the Giovane Italia was called, but the forlorn hope of the brothers Bandiera, who in 1848 landed on the Calabrian coast, was the work of the Giovane Italia. The rebels were captured and shot, but the significance of the attempt lies in the fact that it was the first occasion on which north Italians (the Bandieras were Venetians and officers in the Austrian navy) had tried to raise the standard of revolt in the south.

by their pen, and laid the foundations of that love of Italy which, especially in England, eventually brought the weight of diplomacy into the Italian question free. In all lands forces were set in motion—the revolutionists to keep up agitation and make government by bayonets impossible; the moderates to curb the impetuosity of the revolutionists and to present a scheme of society that was neither reactionary nor anarchical; the volunteers abroad to gain military experience; and the more peaceful exiles to spread the name of Italy among foreign peoples. All the while a vast amount of revolutionary literature was being printed in Switzerland, France and England, and smuggled into Italy; the poet Giusti satirized the Italian princes, the dramatist G. B. Niccolini blasted tyranny in his tragedies; the novelist Guerrazzi re-evoked the memories of the last struggle for Florentine freedom in L'Asino di Firenze, and Verdi's operas were adorned with patriotic ditties which they despised the concept but were understood and applauded by the audience.

On the death of Pope Gregory XVI. in 1846 Austria hoped to secure the election of another zealot; but the Italian cardinals, who did not want an Austrophil, finished the conclave before the arrival of Cardinal Gaysruck, Austria's mouthpiece, and in June elected Giovanni Maria Mastai Ferretti as Pius IX. The new pope, who while bishop of Fermo had evidenced a certain interest in Liberalism, was a kindly man, of inferior intelligence, who thought that all difficulties could be settled with a little good-will, some reforms and a political amnesty. The amnesty which he granted was the beginning of the immense if short-lived popularity which he was to enjoy. But he did not move so fast in the path of reform as was expected, and agitation continued throughout the papal states.1 In 1847 some administrative reforms were enacted, the laity were admitted to certain offices, railways were talked about, and political newspapers permitted. In April Pius created a Consulta, or consultative assembly, and soon afterwards a municipal council and a municipality for Rome. Here he would willingly have stopped, but he soon realized that he had hardly begun. Every fresh reform edict was greeted with demonstrations of enthusiasm, but the ominous cry "Viva Pio Nono solo!" signified dissatisfaction with the whole system of government. A lay ministry was now demanded, a constitution, and an Italian federation for war against Austria. Rumors of a reactionary plot by Austria and the Jesuits against Pius, induced him to create a national guard and to appoint Cardinal Ferretti as secretary of state.

Events in Rome produced widespread excitement throughout Europe. Metternich had declared that the one thing which had not entered into his calculations was a Liberal pope, only that was an impossibility; still he was much disturbed by Pius's attitude, and tried to stem the revolutionary tide by frightening the princes. Seizing the agitation in Romagna as a pretext, he had the town of Ferrara occupied by Austrian troops, which provoked the indignation not only of the Liberals but also of the pope, for according to the treaties Austria had the right of occupying the citadel alone. There was great resentment throughout Italy; and in answer to the pope's request Charles Albert declared that he was with him in everything, while from South America Giuseppe Garibaldi wrote to offer his services to His Holiness. Charles Albert, although maintaining his reactionary policy, had introduced administrative reforms, built railways, reorganized the army and developed the resources of the country. He had little sympathy with Liberalism and abhorred revolution, but his hatred of Austria and his resentment at the galling tutelage to which she subjected him had gained strength year by year. Religion was still his dominant passion, and when a pope in Liberal guise appeared on the scene and was bullied by Austria, his two strongest feelings—piety and hatred of Austria—ceased to play on him. The papal intransigence led the Italian courts to try to induce the recalcitrant despots to mend their ways, so as to avoid revolution and war, the latter being England's especial anxiety; this mission, although not destined to produce much effect, aroused extravagant hopes among the Liberals. Charles Louis, the opera-

1 In Rome itself a certain Angelo Brunetti, known as Ciceroscudia, a forage merchant of lowly birth and a Carbonaro, exercised great influence over the masses and kept the peace where the authorities would have failed.

bouffé duke of Lucca, who had coquetted with Liberalism in the past, now refused to make any concessions to his subjects, and in 1847 sold his duchy to Leopold II. of Tuscany (the successor of Ferdinand III. since 1824) to whom it would have reverted in any case at the death of the duchess of Parma. At the same time Leopold ceded Lunigiana to Parma and Modena in equal parts, an arrangement which provoked the indignation of the inhabitants of the district (especially of those destined to be ruled by Francis V. of Modena, who had succeeded to Francis IV. in 1846), and led to disturbances at Fivizzano. In September 1847, Leopold gave way to the popular agitation for a national guard, in spite of Metternich's threats, and allowed greater freedom of the press; every concession made by the pope was followed by demands for a similar measure in Tuscany.

Ferdinand I. of the Two Sicilies had died in 1825, and was succeeded by Francis I. At the latter's death in 1830 Ferdinand II. succeeded, and although at first he gave promise of proving a wiser ruler, he soon reverted to the traditional Bourbon methods. An ignorant bigot, he concentrated the whole of the executive power in his own hands, was surrounded by priests and monks, and served by an army of spies. In 1847 there were uncomfortable disturbances in various parts of the kingdom, but there was no anti-dynastic outbreak, the jealousy between Naples and Sicily largely contributing to the weakness of the movement. On the 12th of January, however, a revolution, the first of the many throughout Europe that was to make the year 1848 memorable, broke out at Palermo under the leadership of Ruggiero Settimo. The Neapolitan army sent to crush the rising was at first unsuccessful, and the insurgents demanded the constitution of 1812, with the same indemnities. Disturbances occurred at Naples also, and the king, who could not obtain Austrian help, as the pope refused to allow Austrian troops to pass through his dominions, on the advice of his prime minister, the duke of Serracapriola, granted a constitution, freedom of the press, the national guard, &c. (January 28).

The news from Naples strengthened the demand for a constitution in Piedmont. Count Camillo Cavour, then editor of a new and influential paper called Il Risorgimento, had advocated it strongly, and monster demonstrations were held every day. The king disliked the idea, but great pressure was brought to bear upon him, and finally, on the 4th of March 1848, he granted the charter which was destined to be the constitution of the future Italian kingdom. It provided for a nominated senate and an elective chamber of deputies, the king retaining the right of veto; the press censorship was abolished, and freedom of meeting, of the press and of speech were guaranteed. Balbo was called upon to form the first constitutional ministry. Three days later the grand-duke of Tuscany promised similar liberties, and a charter, prepared by a commission which included Gino Capponi and Bettino Riccaoli, was promulgated on the 17th.

In the Austrian provinces the situation seemed calmer, and the government rejected the moderate proposals of Daniele Manin and N. Tommaso. A demonstration in favour of Pius IX. on the 3rd of January at Milan was dispersed with unnecessary severity, and martial law was proclaimed the following month. The revolution which broke out on the 8th of March in Vienna itself and the subsequent flight of Metternich (see AUSTRIA-HUNGARY: History), led to the granting of feeble concessions to Lombardy and Venetia, which were announced in Milan on the 18th. But it was too late; and in spite of the exhortations of the mayor, Gabrie Casati, and of the republican C. Cattaneo, who believed that a revolution in Lombardy would involve Austrian supremacy: Field-Marshal Radetzky was madness, the famous Five Days' revolution began. It was a popular outburst of pent-up hate, unprepared by leaders, although leaders such as Luciano Manara soon arose. Radetzky occupied the citadel and other points of vantage; but in the night barricades sprang up by the hundred and were manned by citizens of all classes, armed with every kind of weapon. The desperate struggle lasted until the 22nd, when the Austrians, having lost 5000 killed and wounded, were forced to evacuate the city. The rest of Lombardy and Venetia
now flew to arms, and the Austrian garrisons, except in the Quadrilateral (Verona, Peschiera, Mantua and Legnano) were expelled. In Venice the people, under the leadership of Manin, rose in arms and forced the military and civil governors (Counts Zichy and Pallfy) to sign a capitulation on the 22nd of March, after which the republic was proclaimed. At Milan, where there was a division of opinion between the monarchists under Casati and the republicans under Cattaneo, a provisional administration was formed and the question of the form of government postponed for discussion. But the French occupation of Parma (Marie Louise was now dead) abandoned their capitals; in both cities provisional governments were set up which subsequently proclaimed annexation to Piedmont. In Rome the pope gave way to popular clamour, granting one concession after another, and on the 8th of February he publicly called down God’s blessing on Italy—that Italy hated by the Austrians, whose name it had hitherto been a crime to mention. On the 10th of March he appointed a new ministry, under Cardinal Antonelli, which included several Liberal laymen, such as Marco Minghetti, G. Pasolini, J. C. Farini and Count G. Recchi. On the 11th a constitution drawn up by a commission of cardinals with the knowledge of the ministry, was promulgated, a constitution which attempted the impossible task of reconciling the pope’s temporal power with free institutions. In the meanwhile preparations for war against Austria were being carried on with Pius’s sanction.

There were now three main political tendencies, viz. the union of north Italy under Charles Albert and an alliance with the pope and Naples, a federation of the different states under their present rulers, and a united republic of all Italy. All parties, however, were agreed in favour of war against Austria, for which the peoples forced their unwilling rulers to prepare. But the only state capable of taking the initiative was Piedmont, and the king still hesitated. Then came the news of the Five Days of Milan, which produced the wildest excitement in Turin; unless the army were sent to assist the struggling Lombards at once the dynasty was in jeopardy. Cavour’s stirring articles in the Risorgimento hastened the king’s decision, and on the 23rd of March he declared war (see for the military events Italian Wars, 1849–70). But much precious time had been lost, and even then the army was not ready. Charles Albert could dispose of 30,000 men, including some 30,000 from central Italy, but he took the field with only half his force. He might yet have cut off Radetzky on his retreat, or captured Mantua, which was only held by 300 men. But his delays lost him both chances and enabled Radetzky to receive reinforcements from Austria. The pope, unable to resist the popular demand for war, allowed his army to depart (March 23) under the command of General Durando, with instructions to act in concert with Charles Albert, and he corresponded with the grand-duke of Tuscany and the king of Naples with a view to a military alliance. But at the same time, fearing a schism in the church should he attack Catholic Austria, he forbade his troops to do more than defend the frontier, and in his Encyclical of the 29th of April stated that, as head of the church, he could not declare war, but that he was unable to prevent his subjects from following the example of other Italians. He then requested Charles Albert to take the papal troops under his command, and also wrote to the emperor of Austria asking him voluntarily to relinquish Lombardy and Venetia. Tuscany and Naples had both joined the Italian league; a Tuscan army started for Lombardy on the 20th of April, and 17,000 Neapolitans commanded by Pepe (who had returned after 28 years of exile) went to assist Durando in intercepting the Austrian reinforcements under Nugent. The Piedmontese defeated the enemy at Pastrengo (April 30), but did not profit by the victory. The Neapolitans reached Bologna on the 17th of May, but in the meantime a dispute had broken out at Naples between the king and parliament as to the nature of the royal oath; a cry of treason was raised by a group of factious youngers, barricades were erected and street fighting ensued (May 13). On the 17th Ferdinand dissolved parliament and recalled the army.

On receiving the order to return, Pepe, after hesitating for some time between his oath to the king and his desire to fight for Italy, finally resigned his commission and crossed the Po with a few thousand men, the rest of his force returning south. The effects of this were soon felt. A force of Tuscan volunteers was attacked by a superior body of Austrians at Curatone and Montanaro and defeated after a gallant resistance on the 27th of May; Charles Albert, after wasting precious time round Peschiera, which capitulated on the 30th of May, defeated Radetzky at Gravina because the Austrian left was too weak to intercept Nugent and his 30,000 men, and the latter, although harassed by the inhabitants of Venetia and repulsed at Vicenza, succeeded in joining Radetzky, who was soon further reinforced from Tirol. The whole Austrian army now turned on Vicenza, which after a brave resistance surrendered on the 10th of June. All Venetia except the capital was thus once more occupied by the Austrians. On the 23rd, 24th and 25th of July (first battle of Custozza) the Piedmontese were defeated and forced to retire on Milan with Radetzky’s superior force in pursuit. The king was the object of a hostile demonstration in Milan, and although he was ready to defend the city to the last, the town council negotiated a capitulation with Radetzky. The mob, egged on by the republicans, attacked the palace where the king was lodged, and he escaped with difficulty, returning to Piedmont with the remnants of his army. On the 6th of August Radetzky re-entered Milan, and three days later an armistice was concluded between Austria and Piedmont, the latter agreeing to evacuate Lombardy and Venetia. The offer of French assistance, made after the proclamation of the republic in the spring of 1848, had been rejected mainly on the ground that the formation of a strong Italian state would be a danger to her, would have demanded the cession of Nice and Savoy, which the king refused to consider.

Meanwhile, the republic had been proclaimed in Venice; but on the 7th of July the assembly declared in favour of fusion with Piedmont, and Manin, who had been elected president, resigned his powers to the royal commissioners. Soon after Custozza, however, the Austrians blockaded the city on the land side. In Rome the pope’s authority weakened day by day, and disorder increased. The Austrian attempt to occupy the Alban Hills was repulsed by the citizens, but unfortunately this success was followed by anarchy and murder, and Farini only with difficulty restored a semblance of order. The Maminian ministry having failed to achieve anything, Pius summoned Pellegrino Rossi, a learned lawyer who had long been exiled in France, to form a cabinet. On the 15th of November he was assassinated, and as no one was punished for this crime the insolence of the disorderly elements increased, and shots were exchanged with the Swiss Guard. The terrified pope fled in disguise to Gaeta (November 25), and when parliament requested him to return he refused even to receive the deputation. This meant a complete rupture; on the 5th of February 1849 a constituent assembly was summoned, and on the 6th it voted the downfall of the temporal power and proclaimed the republic. Mazzini hurried to Rome to see his dream realized, and was chosen head of the Triumvirate. On the 18th Pius invited the armed intervention of France, Austria, Naples and Spain to restore his authority. In Tuscany the government drifted from the moderates to the extreme democrats; the Ridolfi ministry was succeeded after Custozza by that of Riccalesi, and the latter by that of Capponi. The lower classes provoked disorders, which were very serious at Leghorn, and were only quelled by Guerrazzi’s energy. Capponi resigned in October 1848, and Leopold reluctantly consented to a democratic ministry led by Guerrazzi and Montanelli, the former a very ambitious and unscrupulous man, the latter honest but fantastic. Following the Roman example, a constituent assembly was demanded to vote on union with Rome and eventually with the rest of Italy. The grand-duke, fearing an excommunication from the pope, refused the request, and left Florence for Siena and
ITALY

S. Stefano; on the 8th of February 1849 the republic was proclaimed, and on the 21st, at the pressing request of the pope and the king of Naples, Leopold went to Gaeta.

Ferdinand did not openly break his constitutional promises until Sicily was reconquered. His troops had captured Messina after a bombardment which earned him the sobriquet of "King Bomba". Catania and Syracuse fell soon after, and every Sicilian being everywhere and detest with his sanction. He now proposed a parliament, adopted stringent measures against the Liberaлиs, and retired to Gaeta, the haven of refuge for deposed despots.

But so long as Piedmont was not completely crushed none of the princes dared to take decisive measures against their subjects; in spite of Custozza, Charles Albert still had an army, and Austria, with revolutions in Vienna, Hungary and Bohemia on her hands, could not intervene. In Piedmont the Filinelli-Revel ministry, which had continued the negotiations for an armistice with Leopold and the pope, resigned as it could not count on a parliamentary majority, and in December the returned exile Gioberti formed a new ministry. His proposal to reinstate Leopold and the pope with Piedmontese arms, so as to avoid Austrian intervention, was rejected by both potentates, and met with opposition even in Piedmont, which would thereby have forfeited its prestige throughout Italy. Austrian mediation was now imminent, as the Vienna revolution had been crushed, and the new emperor, Francis Joseph, refused to consider any settlement other than on the basis of the treaties of 1815. But the Piedmontese army, which had been formed on a principle and moral of the army were shaken and its organization faulty. General Ramorino, disobeying his instructions, failed to prevent a corps of Austrians under Lieut. Field-Marshal d'Aspre from seizing Mortara, a fault which he afterwards court-martialled and shot, and after some preliminary fighting Radetzky won the decisive battle of Novara (March 23) which broke up the Piedmontese army. The king, who had sought death in vain all day, had to ask terms of Radetzky; the latter demanded a slice of Piedmont and the heir to the throne (Victor Emmanuel) as a hostage, without a reservation for the person of the king and his family. In a famous letter, Radetzky revealed his own failure and thinking that his son might obtain better terms, abdicated and departed at once for Portugal, where he died in a monastery a few months later. Victor Emmanuel went in person to treat with Radetzky on the 24th of March. The Field-Marshal received him most courteously and offered not only to waive the demand for a part of Piedmontese territory, but to enlarge the kingdom, on condition that the constitution should be abolished and the blue Piedmontese flag substituted for the tricolor. But the young king was determined to abide by his father's oath, and had therefore to agree to an Austrian occupation of the territory between the Po, the Ticino and the Sesia, and of half the island of the Adriatic. After Novara the chief question was how to avoid an Austrian occupation, and owing to the prevailing confusion the town council of Florence took matters into its own hands and declared the grand-duke reinstated, but on a constitutional basis and without foreign help (April 12). Leopold accepted as regards the constitution, but said nothing about foreign intervention. Count Serristori, the grand-ducal commissioner, arrived in Florence on the 4th of May 1849; the national guard was disbanded; and on the 23rd, the Austrians under d'Aspre entered Florence.

On the 28th of July Leopold returned to his capital, and while that event was welcomed by a part of the people, the fact that he had come under Austrian protection ended by destroying all loyalty to the dynasty, and consequently contributed not a little to Italian unity.

In Rome the triumvirate decided to defend the republic to the last. The city was quieter and more orderly than it had ever been before, for Mazzini and Ciceracchio successfully opposed all class warfare; and in April the rebels received a priceless addition to their strength in the person of Garibaldi, who, on the outbreak of the revolution in 1848, had returned with a few of his followers from his exile in South America, and in April 1849 entered Rome with some 500 men to fight for the republic. At this time France, as a counterpoise to Austrian intervention in other parts of Italy, decided to restore the pope, regardless of the fact that this action would necessitate the crushing of a sister republic. As yet, however, no such intention was publicly avowed. On the 25th of April General Oudinot landed with 8000 men at Civitavecchia, and on the 30th attempted to capture Rome by surprise, but was completely defeated by Garibaldi, who might have driven the French into the sea, had Mazzini allowed him to leave the city. The French republican government, in order to gain time for reinforcements to arrive, sent Ferdinand de Lesseps to pretend to treat with Mazzini, the envoy himself not being a party to this deception. Mazzini refused to allow the French into the city; but while the negotiations were being dragged on Oudinot's force was increased to 35,000 men. At the same time an Austrian army was marching through the Legations, and Neapolitan and Spanish troops were advancing from the south. The Roman army (20,000 men) was commanded by General Rosselli, and included, besides Garibaldi's red-shirted legionaries, volunteers from all parts of Italy, mostly young men, many of them wealthy and of noble family. The Neapolitans were ignominiously beaten in May and retired to the frontier; on the 1st of June Oudinot declared that he would attack Rome on the 4th, but by beginning operations on the 3rd, when no attack was expected, he captured an important position in the Pampfi gardens.

In spite of this success, however, it was not until the end of the month, and after desperate fighting, that the French penetrated within the walls and the defence ceased (June 29). The Assembly, which had continued in session, was dispersed by the French troops on the 2nd of July, but Mazzini escaped a week later. Garibaldi quit the city, followed by 4000 of his men, and attempted to join the defenders of Venice. In spite of the fact that he was pursued by the armies of four Powers, he continued reaching San Marino; but his force melted away and, after hiding in the marshes of Ravenna, he fled across the peninsula, assisted by nobles, peasants and priests, to the Tuscan coast, whence he reached Piedmont and eventually America, to await a new call to fight for Italy (see GARIBALDI).

After a heroic defence, conducted by Giuseppe Martinegno, Brescia was recaptured in April by the Austrians under Lieut. Field-Marshal von Haynau, the atrocities which followed earning for Haynau the name of "the Hyena of Brescia." In May they seized Bologna, and Ancona in June, restoring order in those towns by the same methods as at Brescia. Venice alone still held out; after Novara the Piedmontese commissioners withdrew and Manin again took charge of the government. The Assembly...
The Italian provinces were the most heavily taxed in the whole empire, and much of the money thus levied was spent either for the benefit of other provinces or to pay for the huge army of occupation and the fortresses in Italy. The promise of a constitution for the empire, made in 1849, was never carried out; the government of Lombardo-Venetia was vested in Field-Marshall Radetzky; and although only very few of the revolutionists were excluded from the amnesty, the carrying of arms or the distribution of revolutionary tracts at home was punished with death. Long terms of imprisonment and the bastinado, the latter even inflicted on women, were the penalties for the least expression of anti-Austrian opinion.

The Lombard republicans had been greatly weakened by the events of 1848, but Mazzini still believed that a bold act by a few revolutionists would 'make the people rise en masse and expel the Austrians. A conspiracy, planned with the object, among others, of kidnapping the emperor while on a visit to Venice and forcing him to make concessions, was postponed in consequence of the coup d'etat by which Louis Napoleon became emperor of the French (1852); but this did not change the chance of a general amnesty, the number of arrests, and the state trials at Mantua, conducted in the most shamelessly inquisitorial manner, resulted in five death sentences, including that of the priest Tazzoli, and many of imprisonment for long terms. Even this did not convince Mazzini of the hopelessness of such attempts, for he was out of touch with Italian public opinion, and he greatly weakened his influence by favouring a crack-brained outbreak at Milan on the 6th of February 1853, which was easily quelled, numbers of the insurgents being executed or imprisoned. Radetzky, not satisfied with this, laid an embargo on the property of many Lombard emigrants who had settled in Piedmont and became naturalized, accusing them of complicity. The Piedmontese government rightly regarded this measure as a violation of the peace treaty of 1859, and Cavour recalled the Piedmontese minister from Vienna, an action which was endorsed by Italian public opinion generally, and won the approval of France and England.

Cavour's ideal for the present was the expulsion of Austria from Italy and the expansion of Piedmont into a north Italian kingdom; and, although he did not yet think of Italian unity as a question of practical policy, he began to regard it as a future possibility. But in reorganizing the shattered finances of the state and preparing it for its greater destinies, he had to impose heavy taxes, which led to rioting and involved the minister himself in considerable though temporary unpopularity. His ecclesiastical legislation, too, met with bitter opposition from the Church.

But the question was soon forgotten in the turmoil caused by the Crimean War. Cavour believed that by taking part in the war his country would gain for itself a military status and a place in the councils of the great Powers, and to establish claims on Great Britain and France for the realization of its Italian ambitions. One section of public opinion desired to make Piedmont's co-operation subject to definite promises by the Powers; but the latter refused to bind themselves, and both Victor Emmanuel and Cavour realized that, even without such promises, participation would give Piedmont a claim. There was also the danger that Austria might join the allies first and Piedmont be left isolated; but there were also strong arguments on the other side, for while the Radical party saw no obvious reason why Piedmont should fight other people's battles, and therefore opposed the alliance, there was the risk that Austria might join the alliance together with Piedmont, which would have constituted a disastrous situation. Da Bormida, the minister for foreign affairs, resigned rather than agree to the proposal, and other statesmen were equally opposed to it. But after long negotiations the treaty of alliance was signed in January 1855, and while Austria remained neutral, a well-equipped Piedmontese force of 15,000 men, under General La Marmora, sailed for the Crimea. Everything turned out as Cavour had hoped.
The Piedmontese troops distinguished themselves in the field, gaining the sympathies of the French and English; and at the subsequent congress of Paris (1850), where Cavour himself was Sardinian representative, the Italian question was discussed, and the intolerable oppression of the Italian peoples by Austria and the despots ventilated. Austria at last began to see that a policy of coercion was useless and dangerous, and made tentative efforts at conciliation. Taxation was somewhat reduced, the censorship was made less severe, political amnesties were granted, humane officials were appointed and the congregations (a sort of shadowy consultative assembly) were revived. In 1856 the emperor and empress visited their Italian dominions, but were received with icy coldness; the following year, on the retirement of Radetzky at the age of ninety-three, the archduke Maximilian, an able, cultivated and kind-hearted man, was appointed viceroy. He made desperate efforts to conciliate the population, and succeeded with a few of the nobles, who were led to believe in the possibility of an Italian confederation, including Lombardy and Venetia which would be united to Austria by a personal union alone; but the immense majority of all classes rejected these advances, and came to regard union with Piedmont with increasing favour. Meanwhile Francis V. of Modena, restored to his duchy by Austrian bayonets, continued to govern according to the traditions of his house. Charles II. of Parma, after having been reinstated by the Austrians, abdicated in favour of his son Charles III., a drunken libertine and a cruel tyrant (May 1849); the latter was assassinated in 1854, and a regency under his widow, Marie Louise, was instituted during which the government became somewhat more tolerable, although by no means free from political persecution; in 1857 the Austrian troops evacuated the duchy. Leopold of Tuscany suspended the constitution, and in 1852 formally abolished it by order from Vienna; he also concluded a treaty of semi-subjection with Austria and a Concordat with the pope for granting fresh privileges to the Church. His government, however, was not changed by the courtesy of his brother despots, and Guerrazzi and the other Liberals of 1849, although tried and sentenced to long terms of imprisonment, were merely exiled. Yet the opposition gained recruits among all the ablest and most respectable Tuscans. In Rome, after the restoration of the temporal power of the French troops, the pope paid no attention to Louis Napoleon's advice to maintain some form of constitution, to grant a general amnesty, and to secularize the administration. He promised, indeed, a consultative council of state, and granted an amnesty from which no less than 25,000 persons were excluded; but on his return to Rome (4th April 1850), after he was quite certain that France had given up all idea of imposing constitutional limitations on him, he re-established his government on the old lines of priestly absolutism, and, devoting himself to religious practices, left political affairs mostly to the astute cardinal Antonelli, who repressed with great severity the political agitation which still continued. At Naples a trifling disturbance in September 1849, led to the arrest of a large number of persons connected with the Unità Italiana, a society somewhat similar to the Carbonari. The prisoners included Silvio Spaventa, Luigi Settembrini, Carlo Poerio and many other cultured and worthy citizens. Many condemnations like theirs, and hundreds of "politics" were immersed in hideous dungeons, a state of things which provoked Gladstone's famous letters to Lord Aberdeen, in which Bourbon rule was branded for all time as "the negation of God erected into a system of government." But oppressive, corrupt and inefficient as it was, the government was not confronted by the uncompromising hostility of the whole people; the ignorant priest-ridden masses were either indifferent or of mildly Bourbon sympathies; the opposition was constituted by the educated middle classes and a part of the nobility. The revolutionary attempts of Bentivegna in Sicily (1856) and of the Mazinians Carlo Piscare, who landed at Sapri in Calabria with a few followers in 1857, failed from lack of popular support, and the leaders were killed.

The decline of Mazzini's influence was accompanied by the rise of a new movement in favour of Italian unity under Victor Emmanuel, inspired by the Milanese marquis Giorgio Orsini, Count of Pallavicini, who had spent 14 years in the Spielberg, and by Manin, living in exile in Paris, both of them exCraftsmen who had become monarchs. The propaganda was organized by the Sicilian La Farina by means of the Società Nazionale. All who accepted the motto "Unity, Independence and Victor Emmanuel" were admitted into the society. Many of the republicans and Mazzinians joined it, but Mazzini himself regarded it with no sympathy. In the Austrian provinces and in the duchies it carried all before it, and gained many adherents in the Legations, Rome and Naples, although in the latter regions the autonomist feeling was still strong even among the Liberals. In Piedmont itself it was at first less successful; and Cavour, although he aspired ultimately to a united Italy with Rome as the capital, openly professed no ambition beyond the expulsion of Austria and the formation of a North Italian kingdom. But he gave secret encouragement to the movement, and ended by practically directing its activity through La Farina. The king, too, was in close sympathy with the society's aims, but for the present it was necessary to hide this attitude from the eyes of the Powers, whose sympathy Cavour could only hope to gain by professing marxism to everything that savoured of revolution. Both the king and his minister realized that Piedmont alone, even with the help of the National Society, could not expel Austria from Italy without foreign assistance. Piedmontese finances had been strained to breaking-point to organize an army obviously intended for other than merely defensive purposes. Cavour now set himself to the task of isolating Austria and securing an alliance for her expulsion. A British alliance would have been preferable, but the British government was too much concerned with the preservation of the European peace. The emperor Napoleon III., ambitious among Frenchmen, had genuine Italian sympathies. But were he to intervene in Italy, the intervention would not only have to be successful; it would have to bring tangible advantages to France. Hence his hesitations and vacillations, which Cavour steadily worked to overcome. Suddenly on the 14th of January 1858 Napoleon's life was attempted by Felice Orsini (q.v.) a Mazzinian Romagnol, who believed that Napoleon was the chief obstacle to the success of the revolution in Italy. The attempt failed and its author was caught and executed, but while it appeared at first to destroy Napoleon's Italian sympathies and led to a sharp interchange of notes between Paris and Turin, the emperor was really impressed by the attempt and by Orsini's letter from prison exhorting him to intervene in Italy. He realized how deep the Italian feeling for independence must be, and that a refusal to act now might result in further attempts on his life, as indeed Orsini's letter stated. Consequently negotiations with Cavour were resumed, and a meeting with him was arranged to take place at Plombières (20th and 21st of July 1858). There it was agreed that France should supply 200,000 men and Piedmont 100,000 for the expulsion of the Austrians from Italy; that Piedmont should be expanded into a kingdom of North Italy, that central Italy should form a separate kingdom, on the throne of which the emperor contemplated placing one of his own relatives, and Naples another, possibly under Lucien Murat; the pope, while retaining only the "Patrimony of St Peter" (the Roman province), would be president of the Italian confederation. In exchange for French assistance Piedmont would cede Savoy and perhaps Nice to France; and a marriage between Victor Emmanuel's daughter Clothilde and Jerome Bonaparte, to which Napoleon attached great importance, although not made a definite condition, was also discussed. No written agreement, however, was signed.

1 The popular cry of "Viva Verdi!" did not merely express enthusiasm for Italy's most eminent musician, but signified, in initial: "Viva Vittorio Emanuele Re d'Italia!"
On the 1st of January 1859, Napoleon astounded the diplomatic world by remarking to Baron Hübner, the Austrian ambassador, at the New Year's reception at the Tuileries, that he regretted that relations between France and Austria were "not so good as they had been"; and at the opening of the Piedmontese parliament on the 10th Victor Emmanuel professed the memorable words that he could not be insensible to the cry of pain (il grido di dolore) which reached him from all parts of Italy. Yet after these warlike declarations and after the signing of a military convention at Turin, the king agreeing to all the conditions proposed by Napoleon, the latter suddenly became pacific again, and adopted the Russian suggestion that Italian affairs should be settled by a congress. Austria agreed on condition that Piedmont should disarm and should not be admitted to the congress. Lord Malmesbury urged the Sardinian government to yield; but Cavour refused to discuss the question of a congress, unless Piedmont were admitted to it on equal terms with the other Powers. As neither the Sardinian nor the Austrian government seemed disposed to yield, the idea of a congress had to be abandoned. Lord Malmesbury now proposed that all three Powers should disarm simultaneously and that, as suggested by Austria, the precedent of Laibach should be followed and all the Italian states invited to plead their cause at the bar of the Great Powers. To this course Napoleon consented, to the despair of King Victor Emmanuel and Cavour, who saw in this a proof that he wished to be out of his engagements. A shake up in the Austro-Italian volunteer forces and the withdrawal of volunteers from all parts of Italy, especially from Lombardy, had come pouring into Piedmont to enrol themselves in the army or in the specially raised volunteer corps (the command of which was given to Garibaldi), and to go to Piedmont became a test of patriotism throughout the country. Urged by a peremptory message from Napoleon, Cavour saw the necessity of bowing to the will of Europe, of disbanding the volunteers and reducing the army to a peace footing. The situation, however, was saved by a false move on the part of Austria. At Vienna the war party was in the ascendant; the convention for Cavour's dismissal had been signed, but so far from its being carried out, the reserves were actually called out on the 12th of April; and on the 23rd, before Cavour's decision was known at Vienna, an Austrian ultimatum reached Turin, summoning Piedmont to disarm within three days on pain of invasion. Cavour was filled with joy at the turn affairs had taken, for Austria now appeared as the aggressor. On the 29th, Cavour ordered war, and the next day his troops crossed the Ticino, a move which followed, as Napoleon had stated it would be, by a French invasion. The military events of the Italian war of 1859 are described under ITALIAN WARS. The actions of Montebello (May 20), Palestro (May 31) and Melegnano (June 8) and the battles of Magenta (June 4) and Solferino (June 24) all went against the Austrians. Garibaldi's volunteers raised the standard of insurrection and held the field in the region of the Italian lakes. After Solferino the allies prepared to besiege the Quadrilateral. Then Napoleon suddenly drew back, unwilling, for many reasons, to continue the campaign. Firstly, he doubted whether the allies were strong enough to attack the Quadrilateral, for he feared the defection of the democratic party; secondly, he began to fear intervention by Prussia, whose attitude appeared menacing; thirdly, although really anxious to expel the Austrians from Italy, he did not wish to create a too powerful Italian state at the foot of the Alps, which, besides constituting a potential danger to France, might threaten the pope's temporal power, and Napoleon believed that he could not stand without the clerical vote; fourthly, the war had been declared against the wishes of the great majority of Frenchmen and was even now far from popular. Consequently, to the surprise of all Europe, while the allied forces were drawn up ready for battle, Napoleon, without consulting Victor Emmanuel, sent General Fleury on the 6th of July to Francis Joseph to ask for an armistice, which was agreed to. The king was now informed, and on the 8th Generals Vaillant, Della Rocca and Hess met at Villafranca and arranged an armistice until the 15th of August. But the king and Cavour were terribly upset by this move, which meant peace without Venetia; Cavour hurried to the king's headquarters at Monzambino and in excited, almost disrespectful, language implored him not to agree to peace, and to continue the war alone, relying on the Piedmontese army and a general Italian revolution. But Victor Emmanuel on this occasion proved the greater statesman of the two; he understood that, hard as it was, he must content himself with Lombardy for the present, lest all be lost. On the 11th the two emperors met at Villafranca, where they agreed that Lombardy should be ceded to Piedmont, and Venetia retained by Austria but governed by Liberal methods; that the rulers of Tuscany, Parma and Modena, who had been again deposed, should be restored, the Papal States reformed, the Legations given a separate administration and the pope made president of an Italian confederation including Austria as mistress of Venetia. It was a revival of the old impossible federal idea, which would have left Italy divided and dominated by Austria and France. Victor Emmanuel regretfully signed the peace preliminaries, adding, however, pour ce qui me concerne (which meant that he made no undertaking with regard to central Italy), and Cavour resigned office. The Lombard campaign had produced important effects throughout the rest of Italy. The Sardinian government had formally invited that of Tuscany to participate in the war of liberation. The Piedmontese government and the proposal, moderates and democrats combined to present an ultimatum to Leopold demanding that he should abdicate in favour of his son, grant a constitution and take part in the campaign. On his refusal Florence rose as one man, and, he feeling that he could not rely on his troops, abandoned Tuscany on the 27th of April. A provisional government was formed, led by Ubaldino Peruzzi, and was strengthened on the 8th of May by the inclusion of Baron Bettino Riccalosi, a man of great force of character, who became the real head of the administration, and all through the ensuing critical period was unwaveringly at Italian unity. Victor Emmanuel, at the request of the people, assumed the protectorate over Tuscany, where he was represented by the Sardinian minister Boncompagni. On the 23rd of May Prince Napoleon, with a French army corps, landed at Leghorn, his avowed object being to threaten the Austrian flank; and in June these troops, together with a Tuscan contingent, departed for Lombardy. In the duchy of Modena an insurrection had broken out, and after Magenta Duke Francis joined the Austrian army in Lombardy, leaving a regency in charge. But on the 14th of June the municipality formed a provisional government and proclaimed annexation to Piedmont; L. C. Farini was chosen dictator, and 4000 Modenese joined the allies. The ducal regent of Parma also withdrew to Austrian territory, and on the 11th of June annexation to Piedmont was proclaimed. At the same time the Austrians evacuated the Legations and Cardinal Milesi, the papal representative, departed. The municipality of Bologna formed a Giunta, to which Romagna and the Marches adhered, and invoked the dictatorship of Victor Emmanuel; at Perugia, too, a provisional government was constituted under F. Guardabassi. But the Marches were soon reoccupied by political troops, and Perugia fell, its capture being followed by an indiscriminate massacre of men, women and children. In July the marquis D'Azzeglio arrived at Bologna as royal commissioner. After the meetings at Villafranca Napoleon returned to France. The question of the cession of Nice and Savoy had not been raised; for the emperor did not fulfill his part of the bargain, that he would drive the Austrians out of Italy, since Venice was yet to be freed. At the same time he was resolutely opposed to the Piedmontese annexations in central Italy. But here Cavour intervened, for he was determined to maintain the annexations, at all costs. Although he had resigned, he remained
in office until Rattazzi could form a new ministry; and while officially recalling the royal commissioners according to the preliminaries of Villafranca, he privately encouraged them to remain and organize resistance to the return of the despots, if necessary by force (see Cavour). Farini, who in August was elected dictator of Parma as well as Modena, and Ricasoli, who since, on the withdrawal of the Sardinian commissioner Boncompagni, had become supreme in Tuscany, were now the men who by their energy and determination achieved the annexation of central Italy to Piedmont, in spite of the strenuous opposition of the French emperor and the weakness of many Italian Liberals. In August Marco Minghetti succeeded in forming a military league and a customs union between Tuscany, Romagna and the duchies, and in procuring the adoption of the Piedmontese codes; and envoys were sent to Paris to mollify Napoleon. Constituent assemblies met and voted for unity under Victor Emmanuel, but the king could not openly accept the proposal owing to the emperor's opposition, backed by the presence of French armies in Lombardy; at a word from Napoleon there might have been an Austrian, and perhaps a Franco-Austrian, invasion of central Italy. But to Napoleon's statement that he could not agree to the unification of Italy, as he was bound by his promises to Austria at Villafranca, Victor Emmanuel replied that he himself, after Magenta and Solferino, was bound in honour to link his fate with that of the Italian people; and General Manfredo Fanti was sent by the Turin government to organize the army of the Central League, with Garibaldi under him.

The terms of the treaty of peace signed at Zürich on the 10th of November were practically identical with those of the preliminaries of Villafranca. It was soon evident, however, that the Italian question was far from being settled.

Central Italy refused to be bound by the treaty, and offered the dictatorship to Prince Carignano, who, himself unable to accept owing to Napoleon's opposition, suggested Boncompagni, who was accordingly elected. Napoleon now realized that it would be impossible, without running serious risks, to oppose the movement in favour of unity. He suggested an international congress on the question; inspired a pamphlet, Le Pape et le Congrès, which proposed a reduction of the papal territory, and wrote to the pope advising him to cede Romagna in order to obtain better guarantees for the rest of his dominions. The proposed congress fell through, and Napoleon thereupon raised the question of the cession of Nice and Savoy as the price of his consent to the union of the central provinces with the Italian kingdom. In January 1866 the Rattazzi ministry fell, after completing the fusion of Lombardy with Piedmont, and Cavour was again summoned by the king to the head of affairs.

Cavour well knew the unpopularity that would fall upon him by consenting to the cession of Nice, the birthplace of Garibaldi, and Savoy, the cradle of the royal house; but he realized the necessity of the sacrifice, if central Italy was to be won. The negotiations were long drawn out; for Cavour struggled to save Nice and Napoleon was anxious to make conditions, especially as regards Tuscany. At last, on the 24th of March, the treaty was signed whereby the cession was agreed upon, but subject to the vote of the populations concerned and ratification by the Italian diet. By the same date King Carlo Alberto had already agreed to the voluntary annexation of the duchies, Tuscany and Romagna, appointed the prince of Carignano viceroy with Ricasoli as governor-general (22nd of March), and was immediately afterwards excommunicated by the pope. On the 2nd of April 1860 the new Italian parliament, including members from central Italy, assembled at Turin. Three weeks later the treaty of Turin ceding Savoy and Nice to France was ratified, though not without much opposition, and Cavour was freely reviled for his share in the transaction, especially by Garibaldi, who even contemplated an expedition to Nice, but was induced to desist by the king.

In May 1859 Ferdinand of Naples was succeeded by his son Francis II., who gave no signs of any intention to change his father's policy, and in spite of Napoleon's advice, refused to grant a constitution or to enter into an alliance with Sardinia. The result was a revolutionary agitation which in Sicily, stirred up by Mazzini's agents, Rossolino Pilo and Francesco Crispi, culminated, on the 5th of April 1860, in open revolt. An invitation had been sent Garibaldi to put himself at the head of the movement; at first he had refused, but reports of the progress of the insurrection soon determined him to risk all on a bold stroke, and on the 5th of May he embarked at Quarto, near Genoa, with Bixio, the Hungarian Tûr and some 1000 picked followers, on two steamers. The preparations for the expedition, openly made, were viewed by Cavour with mixed feelings. With its object he sympathized; yet he could not give official sanction to an armed attack on a friendly power, nor on the other hand could he forbid an action enthusiastically approved by public opinion. He accordingly directed the Sardinian admiral Persano only to arrest the expedition should it touch at a Sardinian port; while in reply to the indignant protests of the continental powers he disclaimed all knowledge of the affair. On the 11th Garibaldi landed at Marsala, without opposition, defeated the Neapolitan forces at Calatafimi on the 15th, and on the 27th entered Palermo in triumph, where he proclaimed himself, in King Victor Emmanuel's name, dictator of Sicily. By the end of July, after the hard-won victory of Milazzo, the whole island, with the exception of the citadel of Messina and a few unimportant ports, was in his hands.

By the 8th of August, in spite of the protests and threats of most of the powers, the Garibaldins began to cross the Straits, and in a short time 20,000 of them were on the mainland. The Bourbonists in Calabria, utterly disorganized, broke before the invincible red-shirts, and the 40,000 men defending the Salerno-Avellino line made no better resistance, being eventually ordered to fall back on the Volturno. On the 6th of September King Francis, with his family and several of the ministers, sailed for Gaeta, and the next day Garibaldi entered Naples alone in advance of the army, and was enthusiastically welcomed. He proclaimed himself king of the whole of the kingdom, with Bertani as secretary of state, but as a proof of his loyalty he consigned the Neapolitan fleet to Persano. His rapid success, meanwhile, inspired both the French emperor and the government of Turin with misgivings. There was a danger that Garibaldi's entourage, composed of ex-Mazzinians, might induce him to proclaim a republic and march on Rome; which would have meant French intervention and the undoing of all Cavour's work. King Victor Emmanuel and Cavour both wrote to Garibaldi urging him not to spoil all by aiming at too much. But Garibaldi poured scorn on all suggestions of compromise; and Cavour saw that the situation could only be saved by the armed participation of Piedmont in the liberation of south Italy.
The situation was, indeed, sufficiently critical. The unrest in Naples had spread into Umbria and the Marches, and the papal troops, under General Lamoricière, were preparing to suppress it. Had they succeeded, the position of the Piedmontese in Romagna would have been imperilled; had they failed, the road would have been open for Garibaldians to march on Rome. In the circumstances, Cavour decided that Piedmont must at all costs defend Romagna, occupy the port of Ancona, and immediately move troops and place Italy between the red-shirts and Rome. This excise was the pope's refusal to dismiss his foreign levies (September 7).

On the 11th of September a Piedmontese army of 35,000 men crossed the frontier at La Cattolica; on the 18th the pontifical army was crushed at Castelfidardo; and when, on the 20th, Ancona fell, Umbria and the Marches were in the power of Piedmont. On the 15th of October King Victor Emmanuel crossed the Neapolitan border at the head of his troops.

'It had been a race between Garibaldi and the Piedmontese. 'If we do not arrive at the Volturino before Garibaldi reaches La Cattolica,' Cavour had said, 'the monarchy is lost, and Italy will remain in the prison-house of the Revolution.' Fortunately for his policy, the red-shirts had encountered a formidable obstacle to their advance in the Neapolitan army entrenched on the Volturino under the guns of Capua. On the 19th of September the Garibaldis began their attack on this position with their usual impetuous valor; but they were repulsed again and again, and it was not till the 2nd of October, after a two days' pitched battle, that they succeeded in carrying the position. The way was now open for the advance of the Piedmontese forces, which, under Cavour's advice, retired into resistance. On the 20th Victor Emmanuel and Garibaldi met. And on the 3rd of November they entered Naples together. Garibaldi now resigned his authority into the king's hands and, refusing the title and other honors offered to him, retired to his island home of Caprera.

Gaeta remained still to be taken. The Piedmontese under Cialdini had begun the siege on the 5th of November, but it was not until the 10th of January 1861, when at the instance of Great Britain Napoleon withdrew his last army of resistance, that the fortress surrendered.

On the 13th of February the fortress surrendered, Francis and his family having departed by sea for papal territory. The citadel of Messina capitulated on the 22nd, and Civitella del Tronto, the last stronghold of Bourbonism, on the 21st of March. On the 18th of February the first Italian parliament met at Turin, and Victor Emmanuel was proclaimed king of Italy. The new kingdom was recognized by Great Britain within a fortnight, by France three months later, and subsequently by other powers. It included the whole peninsula except Venetia and Rome, and these the government and the nation resolved to annex sooner or later.

There were, however, other serious problems calling for immediate attention. The country had to be built up and converted from an agglomeration of scattered medieval principalities into a unified modern nation. The first question which arose was that of brigandage in the south. Brigandage had existed always in the Neapolitan kingdom, largely owing to the poverty of the people; but the evil was now aggravated by the misfortunes of the present government and dismissing the Bourbon troops, and then calling them out again as recruits. A great many turned brigands rather than serve again, and together with the remaining adherents of Bourbon rule and malcontents of all kinds, were made use of by the exiled king to harass the Italian administration. Bands of desperadoes were formed, commanded by the most infamous criminals and by foreigners who came to fight in what they were led to believe was an Italian Vendée, but which was in reality a campaign of robbery and plunder. Villages were sacked and burnt, men, women and children mutilated, tortured or roasted alive, and women outraged. The author of one of the most extreme outrages, committed in 5th of April, was alleged to have been no less than the Duke of Susse, in the presence of the government ministers, to whom the success of the moment was attributed. The pope's refusal to dismiss his foreign levies (September 7).

On the 11th of September a Piedmontese army of 35,000 men crossed the frontier at La Cattolica; on the 18th the pontifical army was crushed at Castelfidardo; and when, on the 20th, Ancona fell, Umbria and the Marches were in the power of Piedmont. On the 15th of October King Victor Emmanuel crossed the Neapolitan border at the head of his troops.

ITALY

[THE RISORGIMENTO]

Italy

into the Trentino; but, the government, seeing the danger of such an attempt, arrested several Garibaldians at Sarnico (near Brescia), and in the "mutila" for which followed several persons were shot. Garibaldi now became an opponent of the ministry, and in June went to Sicily, where, after taking counsel with his former followers, he decided on an immediate raid on Rome. He summoned his legionaries, and in August crossed over to Calabria with 1000 men. His intentions in the main were still loyal, for he desired to capture Rome for the kingdom; and he did his best to avoid the regulars tardily sent against him. On the 29th of August 1862, however, he encountered a force under Pallavicini at Aspromonte, and, as Garibaldi ordered his men not to attack the bulwarks of the main French force, merely the raw Sicilian volunteers discharged a few volleys which were returned by the regulars. Garibaldi himself was seriously wounded and taken prisoner. He was shut up in the fortress of Varignano, and after endless discussions as to whether he should be tried or not, the question was settled by an amnesty. The affair made the ministry so unpopular that it was forced to resign. Farini, who succeeded, retired almost at once on account of ill-health, and

Minghetti Ministry.

Minghetti became premier, with Visconti-Venosta as minister for foreign affairs, and Visconti continued to be serious, though his finances were in constant disrepair; deficit was piled on deficit, loan upon loan, and the service of the debt rose from 90,000,000 lire in 1860 to 220,000,000 lire in 1864.

Negotiations were resumed with Napoleon for the evacuation of Rome by the French troops; but the emperor, though he saw that the temporal power could not for ever be supported by French bayonets, desired some guarantee that the evacuation should not be followed, at all events immediately, by an Italian occupation, lest Catholic opinion should lay the blame for this upon France. Ultimately the two governments concluded a convention on the 15th of September 1864, whereby France agreed to withdraw her troops from Rome so soon as the papal army should be reorganized, or at the outside within two years, Italy undertaking not to attack it nor permit others to do so, and to transfer the capital from Turin to some other city within six months. 1 The change of capital would have the appearance of a definite abandonment of the Roma capitale programme, although in reality it was to be merely a prophy (stage) on the way. The convention was kept secret, but the last clause leaked out and caused the bitterest feeling among the people of Turin, who would have been resolved to losing the capital provided it remained transferred to Rome, but resented the fact that it was to be established in any other city, and that the convention was made without consulting parliament. Demonstrations were held which were repressed with unnecessary violence, and although the change of capital was not unpopular in the rest of Italy, where the Piemontesimo of the new régime was beginning to arouse jealousy, the secrecy with which the affair was arranged and the shooting down of the people in Turin raised such a storm of disapproval that the king for the first time used his privilege of dismissing the ministry. Under La Marmora's administration the September convention was ratified, and the capital was transferred to Florence the following year. This affair resulted in an important political change, for the Piedmontese deputies, hitherto the bulwarks of moderate conservatism, now shifted to the Left or constitutional opposition.

Meanwhile, the Venetian question was becoming more and more acute. Every Italian felt the presence of the Austrians in the lagoons as a national humiliation, and between 1859 and 1860 there was a constant attempt to effect their expulsion. But, in spite of the sympathy of the king, the attempt to raise armed bands in Venetia had no success, and it became clear that the foreigner could only be driven from the peninsula by regular war. To wage this alone Italy was still too weak, and it was necessary to look round for an ally. Napoleon 2 was sympathetic; he desired to see the Austrians expelled, and the Syllabus of Pius IX., which had stirred up the more aggressive elements among the French clergy against his government, had brought him once more into harmony with the views of Victor Emmanuel; but he dared not brave French public opinion by another war with Austria, nor did Italy desire an alliance which would only have been bought at the price of further cessions. There remained Prussia, which, now that the Danish campaign of 1864 was over, was completing her preparations for the final struggle with Austria for the hegemony of Germany; and Napoleon, who saw in the furthering of Bismarck's plans the surest means of securing his own influence in the divided Europe, willingly lent his aid in negotiating a Prusso-Italian alliance. But the famous proposals to La Marmora; but the pourparlers were interrupted by the conclusion of the convention of Gastein (August 14), to which Austria agreed partly under pressure of the Prusso-Italian entente.

To Italy the convention seemed like a betrayal; to Napoleon it was a set-back which he tried to retrieve by suggesting to Austria the peaceful cession of Venetia to the Italian kingdom, in order to prevent any danger of its alliance with Prussia. This proposal broke on the refusal of the emperor Francis Joseph to cede Austrian territory except as the result of a war of aggression, and was followed by Bismarck on the famous interview at Biarritz, once more took up the idea of a Prusso-Italian offensive and defensive alliance. This was actually concluded on the 8th of April 1866. Its terms, dictated by a natural suspicion on the part of the Italian government, stipulated that it should only become effective in the event of Prussia declaring war on Austria within three months. Peace was not to be concluded until Italy should have received Venetia, and Prussia an equivalent territory in Germany.

The outbreak of war was postponed by further diplomatic complications. On the 27th of June Napoleon, whose policy throughout had been obscure and contradictory, signed a secret treaty with Austria, under which Venice was to be handed over to him, to be given to Italy in the event of her making a separate peace. La Marmora, however, who believed himself bound in honour to Prussia, refused to enter into a separate arrangement. On the 16th the Prussians began hostilities, and on the 20th Italy declared war.

Victor Emmanuel took the supreme command of the Italian army, and La Marmora resigned the premiership (which was assumed by Ricasoli), to become chief of the staff. Ricasoli was not popular, and, under his immediate command, to operate on the Mincio, while Cialdini with 80,000 men was to operate on the Po. The Austrian southern army consisting of 95,000 men was commanded by the archduke Albert, with General von John as chief of the staff. On the 23rd of June La Marmora crossed the Mincio, and on the 24th a battle was fought at Custozza, under circumstances highly disadvantageous to the Italians, which after a stubborn contest ended in a crushing Austrian victory. Bad generalship, bad organization and the jealousy between La Marmora and Della Rocca were responsible for this defeat. Custozza might have been afterwards retrieved, for the Italians had plenty of fresh troops besides Cialdini's army; but nothing was done, as both the king and La Marmora believed the situation to be much worse than it actually was. On the 3rd of July the Prussians completely defeated the Austrians at Königgrätz, and on the 5th Austria ceded Venetia to Napoleon, accepting his mediation in favour of peace. The Italian iron-clad fleet commanded by the incapable Persano, after wasting much time at Tarsamia was haggled; the Napoleon union of 1866 was broken on the Dalmatian island of Lissa on the 18th of July, and on the 20th was completely defeated by the Austrian squadron, consisting of wooden ships, but commanded by the capable Admiral Tegethoff.

On the 22nd Prussia, without consulting Italy, made an armistice with Austria, while Italy obtained an eight days' truce on condition of evacuating the Trentino, which had almost entirely
fallen into the hands of Garibaldi and his volunteers. Riccaldi wished to go on with the war, rather than accept Venetia as a gift from France; but the king and La Marmona saw that peace must be made, as the whole Austrian army of 350,000 men was now free to fall on Italy. An armistice was accordingly signed at Comoros on the 12th of August; Austria handed Venetia over to General Lebeuf, representing Napoleon; and on the 3rd of October peace between Austria and Italy was concluded at Vienna. On the 19th Lebeuf handed Venetia over to the Venetian representatives, and at the plebiscite held on the 21st and 22nd, 647,426 votes were returned in favour of union with Italy, only 69 against it. When this result was announced to the king by a deputation from Venice he said: "This is the finest day of my life; Italy is made, but it is not complete." Rome was still wanting.

Custozza and Lissa were not Italy's only misfortunes in 1866. There had been considerable discontent in Sicily, where the government had made itself unpopular. The priesthood and the remnants of the Bourbon party fomented an agitation, which in September culminated in an attack on Palermo by 3000 armed insurgents, and in similar outbreaks elsewhere. The revolt was put down owing to the energy of the Palermo, Marquis A. Di Rudini, and the arrival of reinforcements. The Riccaldi cabinet fell over the Naples question, the religious houses being restored by that of Rattazzi, who with the support of the Left was apparently more fortunate. The French regular troops were withdrawn from Rome in December 1866; but the pontifical forces were largely recruited in France and commanded by officers of the imperial army, and service under the pope was considered by the French war office as equivalent to service in France. This was a violation of the letter as well as of the spirit of the September convention, and a stronger and more straightforward statesman than Rattazzi would have declared Italy's case at an earlier hour. Mazzini now wanted to promote an insurrection in Roman territory, whereas Garibaldi advocated an invasion from without. He delivered a series of violent speeches against the papacy, and made open preparations for a raid, which were not interfered with by the government; but on the 23rd of September 1867 Rattazzi had him suddenly arrested and confined to Caperna. In spite of the vigilance of the warships he escaped on the 14th of October and landed in Tuscany. Armed bands had already entered papal territory, but achieved nothing in particular. Their presence, however, was a sufficient excuse for the pope to order the garrison to leave the capital, in order to send another expedition to Rome (26th of October). Rattazzi, after ordering a body of troops to enter papal territory with no definite object, now resigned, and was succeeded by Menabrea. Garibaldi joined the bands on the 23rd, but his ill-armed and ill-disciplined force was very inferior to his volunteers of '49, '60 and '66. On the 24th he captured Monte Rotondo, but did not enter Rome as the expected insurrection had not broken out. On the 29th a French force, under de Failly, arrived, and on the 3rd of November a battle was fought at Mentana, where the French wore blue trousers and a somewhat superior force of French and pontificals. The Garibaldians, moved down by the new French chassepot rifles, fought until their last cartridges were exhausted, and retreated the next day towards the Italian frontier, leaving 800 prisoners.

The affair of Mentana caused considerable excitement throughout Europe, and the Roman question entered on an acute stage. Napoleon suggested his favourite expedient of a congress, but the proposal broke down owing to Great Britain's refusal to participate; and Rouher, the French premier, declared in the Chamber (5th of December 1867) that France could never permit the Italians to occupy Rome. The attitude of France strengthened that anti-French feeling in Italy which had begun with Villafraure; and Bismarck was not slow to make use of this hostility, with a view to preventing Italy from taking sides with France against Germany in the struggle between the two powers which he saw to be inevitable. At the same time Napoleon was making overtures both to Austria and to Italy, overtures which were favourably received. Victor Emmanuel was sincerely anxious to assist Napoleon, for in spite of Nivelle and Savoy and Mentana he felt a chivalrous desire to help the man who had fought for Italy. But with the French at Civitavecchia (they had left Rome very soon after Mentana) a war for France was not to be thought of, and Napoleon would not promise more than the literal observance of the September convention. Austria would not join France unless Italy did the same, and she realized that that was impossible unless Napoleon gave way about Rome. Consequently the negotiations were suspended. A scandal concerning the tobacco monopoly led to the fall of Menabrea, who was succeeded in December 1869 by Giovanni Lanza, one of the Venetian at the foreign office and Q. Sella as finance minister. The latter introduced a sounder financial policy, which was maintained until the fall of the Right in 1876. Mazzini, now openly hostile to the monarchy, was seized with a perfect monomania for insurrections, and promoted various small risings, the only effect of which was to show how completely his influence was gone.

In December 1869 the XXI. oecumenical council began its sittings in Rome, and on the 18th of July 1870 proclaimed the inaffability of the pope (see VATICAN COUNCIL). Two days afterwards Napoleon had declared war, but was immediately afterwards he withdrew his troops from Civitavecchia; but he persuaded Lanza to promise to abide by the September convention, and it was not until after Würth and Gravelotte that he offered to give Italy a free hand to occupy Rome. Then it was too late; Victor Emmanuel asked Thiers if he could give his word of honour that with 100,000 Italian troops France could be saved, but Thiers remained silent. Austria replied like Italy: "It is too late." On the 4th of August Italy made a declaration of neutrality, and three weeks later Vincenzi, Meno da Monteponi, and the Austrians occupied Rome. On the 3rd of September the news of Sédan reached Florence, and with the fall of Napoleon's empire the September convention ceased to have any value. The powers having engaged to abstain from intervention in Italian affairs, Victor Emmanuel addressed a letter to Pius IX. asking him in the name of religion and peace to accept Italian protection instead of the temporal power, to which the pope replied that he would only yield to force. On the 11th of September General Cadorna at the head of 60,000 men entered papal territory. The garrison of Civitavecchia submitted to Bismarck, but the 10,000 men who had remained fought a good fight. Cardinal Antonelli would have come to terms, but the pope decided on making a sufficient show of resistance to prove that he was yielding to force. On the 20th the Italians began the attack, and General Mazé de la Roche's division having effected a breach in the Porta Pia, the pope ordered the garrison to cease fire and the Italians poured into the Eternal City followed by thousands of Roman exiles. By noon the whole city on the left of the Tiber was occupied and the garrison laid down their arms; the next day, at the pope's request, Lanza lay down his office; and on the right bank was also declared an insurrection. It had been intended to leave that part of Rome to the pope, but by the earnest desire of the inhabitants it too was included in the Italian kingdom. At the plebiscite there were 133,683 votes for union and 1507 against it. In July 1872 King Victor Emmanuel made his solemn entry into Rome, which was then declared the capital of Italy. Thus, after a struggle of more than half a century, in spite of apparently insuperable obstacles, the liberation and the unity of Italy were accomplished.

BIBLIOGRAPHY.—A vast amount of material on the Risorgimento has been published both in Italy and abroad as well as numerous works of a literary and critical nature. The most detailed Italian history of the period is Carlo Tivaroni's Storia critica del Risorgimento Italiano in 9 vols. (Turin, 1886-1897), and the volumes devoted to the Risorgimento in the RIZZETTA collection. For a brief study of the Risorgimento in the original authors and containing a large amount of information; the author is a Mazzinian, which fact should be taken into
account, but he generally quotes the opinions of those who disagree with him as well. Another voluminous but less valuable work is F. Bertolini's *Storia d'Italia dal 1814 al 1875*, in 2 parts (Milan, 1880-81). L. Chiala's *Lettere del Conte di Cavour* (7 vols., Turin, 1883-87) and D. Zanetti's *Storia del Conte di Cavour* (Bologna, 1886) are very important, and so are Prince Metternich's *Mémoires* (7 vols., Paris, 1881). F. Orsi's *L'Italia moderna* (Milan, 1901) should also be mentioned. N. Bianchi's *Storia della diplomazia europea in Italia* (8 vols., Turin, 1879), though valuable and thoroughly reliable work, is not so important as the works of L. Farina's *Storia d'Italia dal 1815 al 1848* (5 vols., Turin, 1891); W. R. Thayer's *Dizionario dell'Italia dell'indipendenza* (London, 1893) is giving and not always accurate; C. Cantù's *Dizionario italiano cronistoria* (Naples, 1866), for the first half of the period, and *V. D'Annunzio: Regno di Vittorio Emanuele II* (8 vols., Turin, 1889, &c.). For English readers Countess E. Martinengo Cesaresco's *Liberation of Italy* (London, 1895) is to be strongly recommended, and is indeed, fairness and synthesis, as well as for charm of style, one of the very best books on the subject in any language; Bolton King's *History of Italian Unity* (2 vols., London, 1899) is bulkier and less satisfactory, but contains a useful bibliography. A succinct account of the chief events of the period will be found in Sir Spencer Walpole's *History of Twenty-Five Years* (London, 1904). See also the Cambridge Modern History, vols. x. and xi. (Cambridge, 1907, &c.), where full bibliographies will be found. (L.V.*)

**F. HISTORY, 1870-1902**

The downfall of the temporal power was hailed throughout Italy with unbounded enthusiasm. Abroad, Catholic countries at first received the tidings with resignation, and Protestant countries with joy. In France, where the Government of National Defence had replaced the Empire, Crémieux, as president of the government delegation at Tours, hastened to offer his congratulations to Italy. The occupation of Rome caused no surprise to the French government, which had been forewarned on 11th September by the Italian intentions. On that occasion Jules Favre had recognized to his successor, the comte de Chambord, while refusing explicitly to denounce it, had admitted that unless Italy went to Rome the city would become a prey to dangerous agitators. At the same time he made it clear that Italy would occupy Rome upon her own responsibility. Agreeably surprised by this attitude on the part of France, Visconti-Venosta lost no time in conveying officially the thanks of Italy to the French government. He doubtless foresaw that the language of Favre and Crémieux would not be endorsed by the French Clericals. Prussia, while satisfied at the fall of the temporal power, seemed to fear that the annexation of French opu- lition to the occupation of Rome by armed intervention in favour of France. Bismarck, moreover, was indignant at the connivance of the Italian government in the Garibaldian expedition to Dijon, and was irritated by Visconti-Venosta's plea in the Italian parliament for the integrity of the French territory. The course of events in France, however, soon calmed German apprehensions. The advent of Thiers, his attitude towards the petition of French bishops on behalf of the pope, the recall of Senard, the French minister at Florence—who had written to congratulate Victor Emmanuel on the capture of Rome—and the instigation to his successor, the comte de Chambord, to absent himself from Italy at the moment of the king's official entry into the new capital (2nd July 1871), together with the haste displayed in appointing a French ambassador to the Holy See, rapidly cooled the cordiality of Franco-Italian relations, and reassured Bismarck on the score of any dangerous intimacy between the two governments.

The friendly attitude of France towards Italy during the period immediately subsequent to the occupation of Rome seemed to cow and to dishearten the Vatican. For a few weeks the rivalry between Cavour (1860-1861) and Pope Pius IX was mitigated by the wish of both parties to be reconciled. For a few weeks the rival Conte di Cavour (1860-1861) and Pope Pius IX were works by a conciliatory spirit. The secretary-general of the Italian foreign office, Baron Blanc, who had accompanied General Cadorna to Rome, was received almost daily by Cardinal Antonelli, papal secretary of state, in order to settle innumerable questions arising out of the Italian occupation of Nice for finance, Giacomelli, had, as a precautionary measure, seized the pontifical treasury; but upon being informed by Cardinal Antonelli that among the funds deposited in the treasury were 1,000,000 crowns of Peter's Pence offered by the faithful to the pope in person, the commissioner was authorized by the Italian council of state not only to restore this sum, but also to indemnify the Holy See for moneys expended for the service of the October coupon of the pontifical debt, that debt having been taken over by the Italian state. On the 24th of September Cardinal Antonelli further apprised Baron Blanc that he was about to issue drafts for the monthly payment of the 50,000 crowns inscribed in the pontifical budget for the maintenance of the pope, the Sacred College, the apostolic palaces and the papal guards. The occupation of Rome by the papal guards, and the payment of all the papal drafts, and thus contributed a first instalment of the sum was afterwards placed by Article 4 of the Law of Guarantees at the disposal of the Holy See. Payments would have been regularly continued had not pressure from the French Clerical party coerced the Vatican into refusing any further instalment.

Once in possession of Rome, and guarantor to the Catholic world of the spiritual independence of the pope, the Italian government prepared juridically to regulate its relations to the Holy See. A bill known as the Law of Guarantees was therefore framed and laid before the government. The measure presupposed the adoption of a scheme for a "free church in a free state," of Ricasoli's Free Church Bill, rejected by parliament four years previously, and of the proposals presented to Pius IX. By Count Ponza di San Martino in September 1870. After a debate lasting nearly two months the Law of Guarantees was adopted in secret ballot on the 21st of March 1871 by 185 votes against 106.

It consisted of two parts. The first, containing thirteen articles, recognized (Articles 1 and 2) the person of the pontiff as sacred and intangible, and while providing for free discussion of religious questions, punished insults and outrages against the pope in the person of a bill of indictment and a bill of excommunication. The second part of the law was attributed to the pope (Article 3), who was further guaranteed the same precedence as that accorded to him by other Catholic sovereigns, and the right to maintain his Noble and Swiss guards. Article 4 allotted the pontiff an annuity of 3,225,000 lire (119,000) for the maintenance of the Sacred College, the sacred palaces, the congregations, the Vatican chancery and the diplomatic service. The sacred palaces, museums and libraries were, by Article 5, exempted from all taxation, and the pope was assured perpetual enjoyment of the Vatican and Lateran buildings and gardens, and of the papal villa at Castel Gandolfo. Articles 6 and 7 forbade access to papal papers, official archives, the abbot's rooms, the papal treasury; any eventual concave or canonical council without special authorization from the pope, concave or council. Article 8 prohibited the papal examination of the decrees of a provincial council or synod, and all books or registers of purely spiritual character. Article 9 guaranteed to the pope full freedom for the exercise of his spiritual ministry, and provided for the publication of pontifical announcements on the abdicated the need for royal assent and place for ecclesiastical publications, but subordinated the enjoyment of temporalities by
bishops and priests to the concession of state exequatur and placet. Article 17 maintained the independence of the ecclesiastical jurisdiction in spiritual and disciplinary matters, but reserved for the state the exclusive right to carry out coercive measures.

On the 12th of July 1871, Articles 268, 269 and 270 of the Italian Penal Code were so modified as to make ecclesiastics liable to imprisonment for periods varying from six months to five years, and to fines from 1000 to 3000 lire, for spoken or written attacks against the laws of the state, or for the fomentation of disorder. An encyclical of Pius IX. to the bishops of the Catholic Church on the 13th of May 1871 repudiated the Law of Guarantees, and summoned Catholic princes to co-operate in revenue and power. The abdication of the Pope, which remained a one-sided enactment, by which Italy considers herself bound, and of which she has always observed the spirit, even though the exigencies of self-defence may have led in some minor respects to non-observance of the letter. The annuity payable to the pope has, for instance, been made subject to quinquennial prescription, so that in the event of tardy recognition of the law the Vatican could at no time claim payment of more than five years' annuity with interest.

For a few months after the occupation of Rome pressing questions of police and of finance, and of the administration of a new domain distracted public attention from the real condition of Italian affairs. The rise of the Tiber and the flooding of Rome in December 1870 (tactfully used by Victor Emmanuel as an opportunity for a first visit to the new capital) illustrated the imperative necessity of reorganizing the drainage of the city and of constructing the Tiber embankment. In spite of pressure from the French government, which desired Italy to maintain Florence as the political and to regard Rome merely as the moral capital of the realm, the government offices and both legislative chambers were transferred in 1871 to the Eternal City. Early in the year the crown prince Humbert, with the Princess Margherita took up their residence in the Quirinal Palace, which, in view of the Vatican refusal to deliver up the keys, had to be opened by force. Eight monasteries were expropriated to make room for the chief state departments, pending the construction of more suitable edifices. The growth of Clerical influence in France engendered a belief that Italy would soon have to defend with the sword her newly-won unity, while the tremendous lesson of the Franco-Prussian War convinced the military authorities of the need for thorough military reform. General Ridolfi Magnani, minister of war, therefore framed an Army Reform Bill designed to bring the Italian army as nearly as possible up to the Prussian standard. Sella, minister of finance, notwithstanding the sorry plight of the Italian exchequer, readily granted the means for the reform. "We must arm," he said, "since we have overthrown the papal throne," and he pointed to France as the quarter from which attack was most likely to come. Though perhaps less desperate than during the previous decade, the condition of Italian finance was precarious indeed. With taxation screwed up to breaking point on personal and real estate, on all forms of commercial and industrial activity, and on salt, flour and other necessities of life; with a deficit of 8,500,000 for the current year, and the prospect of a further aggregate deficit of 12,000,000 during the next quinquennium, Sella's heroic struggle against national bankruptcy was still far from a successful termination. He chiefly had borne the brunt and won the laurels of the unprecedented fight against deficit in which Italy had been involved since 1862. As finance minister in the Kattazani cabinet of that year he had been confronted with a public debt of nearly 120,000,000, and with an immediate deficit of nearly 18,000,000. In 1864, as minister in the La Marmora cabinet, he had again to face an excess of expenditure over income amounting to more than 14,000,000. By the seizure and sale of Church lands, by the sale of state railways, by "economy to the bone" and on one supreme occasion by an appeal to taxpayers to advance a year's quota of the land-tax, he had met the most pressing engagements of that troublous period. The king was persuaded to forgo one-fifth of his civil list, ministers and the higher civil servants were required to relinquish a portion of their salaries, but, in spite of all, Sella had found himself in 1869 compelled to propose the most hated of fiscal burdens—a grist tax on cereals. This tax (macinato) had long been known in Italy. Vexatious methods of assessment and collection had made it so unpopular that the Italian government in 1859-1860 had thought it expedient to abolish it throughout the realm. Sella hoped by the application of a mechanical meter both to obviate the odium attaching to former methods of collection and to avoid the maintenance of an army of inspectors and tax-gatherers, whose stipends had formerly eaten up most of the proceeds of the tax. But, though the design was good, the plan in practice contrived to fail. Some years later, his friend Scialoja improved and made exhaustive experiments with the meter. The result of their efforts was laid before parliament in one of the most monumental and most painstaking preambles ever prefixed to a bill. Sella, nevertheless, fell before the storm of opposition which his scheme aroused. Scialoja, who succeeded him, was obliged to adopt a similar proposal, but parliament again proved refractory. Ferrara, successor of Scialoja, met a like fate; but Count Cambry-Digny, finance minister in the Menabrea cabinet of 1868-1869, driven to find means to cover a deficit aggregating by the increased revenue, succeeded in passing Sella's helpmate, a Bill called a Grist Tax Bill through parliament, though in a form of which Sella could not entirely approve. When, on the 1st of January 1869, the new tax came into force, nearly half the flour-mills in Italy ceased work. In many districts the government was obliged to open mills on its own account. Inspectors and tax-gatherers did their work under police protection, and in several parts of the country riots had to be suppressed manu militari. At first the net revenue from the impost was less than 1,100,000; but under Sella's firm administration (1869-1873), and in consequence of increased revenues gradually introduced by him, the net return ultimately exceeded 5,300,000. The parliamentary opposition to the impost, which the Left denounced as "the tax on hunger," was largely factitious. Few, except the open partisans of national bankruptcy, doubted its necessity; yet so strong was the current of feeling worked up for party purposes by opponents of the measure, that Sella's achievement in having by its means saved the financial situation of Italy deserves to rank among the most noteworthy performances of modern parliamentary statesmanship.

Under the stress of the appalling financial conditions represented by chronic deficit, crushing taxation, the heavy expenditure necessary for the consolidation of the kingdom, the reform of the army and the interest on the pontifical debt, Sella, on the 11th of December 1871, exposed to parliament the financial situation in all its nakedness. He recognized that considerable improvement had already taken place. Revenue from taxation had risen in a decade from 7,000,000 to 15,000,000; profit on state monopolies had increased from 7,000,000 to 10,000,000; exports had grown to exceed imports; income from the working of telegraphs had tripled itself; railways have been extended from 2000 to 6500 kilometres, and the annual travelling had augmented from 15,000,000 to 25,000,000 persons. The serious feature of the situation lay less in the income than in the "intangible" expenditure, namely, the vast sums required for interest on the various forms of public debt and for pensions. Within ten years this category of outlay had increased from 8,000,000 to 28,000,000. During the same period the assumption of the Venetian and Roman debts, losses on the issue of loans and the accumulation of annual deficits, had caused public indebtedness to rise from 52,000,000 to 128,000,000, no less than 50,000,000 of the latter sum having been sacrificed in premiums and commissions to bankers and underwriters of loans. By economies and new taxes Sella had reduced the deficit to less than 2,000,000 in 1871, but for 1872 he found himself confronted with a total expenditure of 8,000,000 in excess of revenue. He therefore proposed to make over the treasury service to the state banks, to increase the forced currency, to raise the stamp and registration duties and
to impose a new tax on textile fabrics. An optional conversion of sundry internal loans into consolidated stock at a lower rate of interest was calculated to effect considerable saving. The battle over these proposals was long and fierce. But for the tactics of Rattazzi, leader of the Left, who, by basing his opposition on personal considerations, imposed the secession of Minghetti and a part of the Right from the ministerial majority, Sella would have been defeated. On the 23rd of March 1872, however, he succeeded in carrying his programme, which not only provided for the pressing needs of the moment, but laid the foundation of the much-needed equilibrium between expenditure and revenue.

In the spring of 1873 it became evident that the days of the Lanza-Sella cabinet were numbered. Fear of the advent of a Radical administration under Rattazzi alone prevented the Minghetti Right from revolting against the government. The Left, consisting of its strength, impatiently awaited the moment of accession to power. Sella, the real head of the Lanza cabinet, was worn out by four years’ continuous work and disheartened by the perfidious misrepresentation in which Italian politicians, particularly those of the Left, have ever excelled. By sheer force of will he compelled the Chamber early in 1873 to adopt some minor financial reforms, but on the 29th of April found himself in a minority on the question of a credit for a proposed state arsenal at Taranto. Pressure from all sides of the House, however, induced the ministry to retain office until after the debate on the application to Rome and the Papal States of the Belgian law of suppression of convents (originally passed in 1866)—a measure which, with the help of Ricasoli, was carried at the end of May. While leaving intact the general houses of the various confraternities (except that of the Jesuits), the bill abolished the corporate personality of religious orders, handed over their schools and hospitals to civil administrators, placed their churches at the disposal of the secular clergy, and provided pensions for nuns and monks, those who had families being sent to reside with their relatives, and those who by reason of age or bereavement had no home but their monasteries being allowed to end their days in religious houses specially set apart for the purpose. The proceeds of the sale of the suppressed convenants and monasteries were partly converted into pensions for monks and nuns, and partly allotted to the municipal charity boards which had undertaken the educational and charitable functions formerly exercised by the religious orders. To the pope was made over £16,000 per annum as a contribution to the expense of maintaining in Rome representatives of foreign orders; the Sacred College, however, rejected this endowment, and summoned all the suppressed convents to reconstitute themselves under the authority of the new law. A few days after the passage of the Religious Orders Bill, the death of Rattazzi (4th June 1873) removed all probability of the immediate advent of the Left. Sella, uncertain of the loyalty of the Right, challenged a vote on the immediate discussion of further financial reforms, and on the 23rd of June was overthrown by a coalition of the Left under Depretis with a part of the Right under Minghetti and the Tuscan Centre under Correnti. The administration which thus fell was unquestionably the most important since the death of Cavour. It had completed national unity, transferred the capital to Rome, overcome the chief relic of the former political system—ecclesiastical milition, and laid the foundation of the relations between state and church. The succeeding Minghetti-Visconti-Venosta cabinet—which held office from the 10th of July 1873 to the 18th of March 1876—continued in essential points the work of the preceding administration. Minghetti’s finance, though less carefully and less resolute than that of Sella, was on the whole prudent and beneficial. With the aid of Sella he concluded conventions for the redemption of the chief Italian railways from their French and Austrian proprietors. By dint of expedients he gradually overcame the chronic deficit, and, owing to the normal increase of revenue, ended his term of office with the announcement of a surplus of some £750,000. The question whether this surplus was real or only apparent has been much debated, but there is no reason to doubt its substantial reality. It left out of account a sum of £1,000,000 for railway construction which was covered by credit, but, on the other hand, took no note of £360,000 expended in the redemption of debt. Practically, therefore, the Right, of which the Minghetti cabinet was the last representative administration, left the accounts with a surplus of £80,000. Outside the all-important domain of finance, the attention of Minghetti and his colleagues was principally absorbed by strife between church and state, army reform and railway redemption. For some time after the occupation of Rome the pope, in order to substantiate the pretence that his spiritual freedom had been diminished, avoided the creation of cardinals and the nomination of bishops. On the 22nd of December 1873, however, he unexpectedly created twelve cardinals, and subsequently proceeded to nominate a number of bishops. Visconti-Venosta, who had retained the portfolio for foreign affairs in the Minghetti cabinet, at once drew the attention of the European powers to this proof of the pope’s spiritual freedom and of the imaginary nature of his “imprisonment” in the Vatican. At the same time he assured them that absolute liberty would be guaranteed to the deliberations of a concile. In relation to the Church in Italy, Minghetti’s policy was less perspicacious. He let it be understood that the announcement of the appointment of bishops and the request for the royal exequatur might be made to the government impersonally by the congregation of bishops and regulars, by a municipal council or by any other corporate body of the bishops, so as to take advantage, but which so irritated Italian political opinion that, in July 1875, the government was compelled to withdraw the temporalties of ecclesiastics who had neglected to apply for the exequatur, and to evict sundry bishops who had taken possession of their palaces without authorization from the state. Parliamentary pressure further obliged Bonghi, minister of public instruction, to compel clerical seminaries either to forgo the instruction of lay pupils or to conform to the laws of the state in regard to inspection and examination, an ordinance which gave rise to the opposition of the church, and led to the forcible dissolution of the Mantua seminary and to the suppression of the Catholic university in Rome.

More noteworthy than its management of internal affairs were the efforts of the Minghetti cabinet to strengthen and consolidate national defence. Appalled by the weakness, or rather the non-existence, of the navy, Admiral Saint-Bon, with his coadjutor Signor Brin, addressed himself earnestly to the task of recreating the fleet—which had never recovered from the effects of the disaster of 1866—a measure between which the bishops were quick to take advantage, but which so irritated Italian political opinion that, in July 1875, the government was compelled to withdraw the temporalties of ecclesiastics who had neglected to apply for the exequatur, and to evict sundry bishops who had taken possession of their palaces without authorization from the state. Parliamentary pressure further obliged Bonghi, minister of public instruction, to compel clerical seminaries either to forgo the instruction of lay pupils or to conform to the laws of the state in regard to inspection and examination, an ordinance which gave rise to the opposition of the church, and led to the forcible dissolution of the Mantua seminary and to the suppression of the Catholic university in Rome.

It was fortunate for Italy that during the whole period 1869-1876 the direction of her foreign policy remained in the experienced hands of Visconti-Venosta, a statesman whose trustworthiness, dignity and moderation even political opponents have been to recognize. Diplomatic records fail to substantiate the accusations of lack of initiative and instability of political criterion currently brought against him by contemporaries. As foreign minister of a young state which had attained unity in defiance of the most formidable religious organization in the world and in opposition to the traditional policy of France, it could but be Visconti-Venosta’s aim to uphold the dignity of his country while convincing European diplomacy that United Italy was an element of order and progress, and that the spiritual independence of which the Roman pontiff had suffered the diminution in the past, resistance, moreover, to the religious and political transition of the papal state. The desire for the recognition of the Vatican delegate, Father Secchi,
as a representative of a "state," and obtained from Count de Rémusat, French foreign minister, a formal declaration that the presence of Father Sęccì that occasion could not constitute a diplomatic precedent. The irradiation displayed by Bismarck at the Francophil attitude of Italy towards the end of the Franco-German War gave place to a certain show of goodwill when the great chancellor found himself in his turn involved in a struggle against the Vatican and when the policy of Thiers began to strain Franco-Italian relations. Thiers had consistently opposed the emperor Napoleon III's pro-Italian policy. In the case of Italy, as in that of Germany, he frankly rejected the constitu-
tion of a powerful homogeneous states upon the borders of France. Perpendicular accentuated this feeling in regard to Italy. The refusal of Victor Emmanuel II. to meet Thiers at the opening of the Mont Cenis tunnel (a refusal not connected with offensive language employed at Florence in October 1870 by Thiers during his European tour, and with instructions to the French minister to remain absent from Victor Emmanuel's official entry into Rome) had wounded the amour propre of the French statesman, and had decreased whatever inclination he might otherwise have felt to oppose the French Clerical agitation for the restoration of the temporal power, and for French interference with the Church affairs. Nevertheless, friction between France and Italy became so strained that in 1873 both the French minister to the Quirinal and the Italian minister to the Republic remained for several months absent from their posts. At this juncture the emperor of Austria invited Victor Emmanuel to visit the Vienna Exhibition, and the Italian government received a confidential intimation that acceptance of the invitation to Vienna would be followed by a further invitation from Berlin. Perceiving the advantage of a visit to the imperial and apostolic court after the Italian occupation of Rome and the suppression of the religious orders, and convinced of the value of more cordial intercourse with the German empire, Visconti-Venosta and Minghetti advised their sovereign to accept both the Austrian and the subsequent German invitations. The visit to Vienna took place on the 17th to the 22nd of September, and that to Berlin on the 22nd to the 26th of September 1873, the Italian monarch being accorded in both capitals a most cordial reception, although the contemporaneous publication of La Marmora's famous pamphlet, More Light on the Events of 1866, prevented intercourse between the Italian ministers and Bismarck from being entirely confidential. Visconti-Venosta and Minghetti, moreover, wisely resisted the emperor's pressure to override the Law of Guarantees and to engage in an Italian Kulturkampf. Nevertheless the royal journey contributed notably to the establishment of cordial relations between Italy and the central powers, relations which were further strengthened by the visit of the emperor Francis Joseph to Victor Emmanuel at Venice in April 1875, and by that of the German emperor to Milan in October of the same year. Meanwhile Thiers had given place to Marshal Macmahon, who effected a decided improvement in Franco-Italian relations by recalling from Civitavecchia the cruiser "Orfanoque," which since 1870 had been stationed in that port at the disposal of the pope in case he should desire to quit Rome. The foreign policy of Visconti-Venosta may be said to have reinforced the international position of Italy without sacrifice of dignity, and without the vacillation and short-sightedness which was to characterize the ensuing administrations of the Left.

The fall of the Right on the 18th of March 1876 was an event destined profoundly and in many respects adversely to affect the course of Italian history. Except at rare and not auspicious intervals, Italy had held office from 1849 to 1876. Its rule was associated in the popular mind with severe administration; hostility to the democratic elements represented by Garibaldi, Crispi, Depretis and Berti; ruthless imposition and collection of taxes in order to meet the financial engagements forced upon Italy by the vicissitudes of her Risorgimento; strong predilection for Piedmontese, Lombards and Tuscans, and a steady determination, not always scrupulous in its choice of means, to retain executive power and the most important administrative offices of the state for the consorseria, or close corporation, of its own adherents. For years the men of the Left had worked to inoculate the electorate with suspicion of Conservative methods and with hatred of the impost which they nevertheless knew to be indispensable to sound finance. In regard to the grist tax especially, the agitators of the Left had placed their party in a radically false position. Moreover, the redemption of the railways by the state—contracts for which had been signed by Sella in 1875 on behalf of the Minghetti cabinet with Rothschild at Basel and with the Austrian government at Vienna—had been fiercely opposed by the Left, although the latter had been long since convinced of the utility of the operation. When, at the beginning of March 1876, these contracts were submitted to parliament, a group of Tuscan deputies, under Cesare Correnti, joined the opposition, and on the 18th of March took advantage of a chance motion concerning the date of discussion of an interpellation on the grist tax to place the Minghetti cabinet in a minority. Depretis, ex-pro-
dicator of Sicily, and successor of Rattazzi in the leadership of the Left, was entrusted by the king with the formation of a Liberal ministry. Besides the premiership, Depretis assumed the portfolio of finance; Nicotera, an ex-Garibaldian of taxation and general patriotism. The programme, composed and conservative temperament, was placed at the ministry of the interior; public works were entrusted to Zanardelli, a Radical doctrinaire of considerable judicial attainments; General Mezzacapo and Sgiori Brin replaced General Ricotti Magnani and Admiral Saint-Bon at the war office and ministry of marine; while to Mancini and Coppino, pro-
minent members of the Left, were allotted the portfolios of jus-
tice and public instruction. Great difficulty was experienced in finding a foreign minister willing to challenge comparison with Visconti-Venosta. Several diplomatists in active service were approached, but, partly on account of their refusal, and partly from the desire of the Left to avoid giving so important a post to a diplomatist bound by ties of friendship or of interest to the Right, the choice fell upon Melegari, Italian minister at Bern.

The new ministers had long since made monopolistic professions of faith, but, up to the moment of taking office, were nevertheless considered to be tinged with an almost revolutionary hue. The king alone appeared to feel no misgiving. His shrewd sense of political expediency and his loyalty to constitutional principles saved him from the error of obstructing the advent of a dynastic party. The programme of Depretis was carried forward, and in winning popular favour. Indeed, the patriotism and loyalty of the new ministers were above suspicion. Danger lay rather in entrusting men schooled in political conspiracy and in un-
scrupulous parliamentary opposition with the government of a young state still beset by enemies at home and abroad. As an opposition party the Left had lived upon the facile credit of political promises, but had no well-considered programme nor other discipline nor unity of purpose than that born of the common eagerness of its leaders for office and their common hostility to the Right. Neither Depretis, Nicotera, Crispi, Cairoli nor Zanardelli was disposed permanently to recognize the superiority of any one chief. The dissensions which broke out among them within a few months of the accession of their party to power never afterwards disappeared, except at rare moments when it became necessary to unite in preventing the return of the Conservatives. Considerations such as these could not be expected to appeal to the nation at large, which hailed the advent of the Left as the dawn of an era of unlimited popular sovereignty, diminished administrative pressure, reduction of taxation and general prosperity. The programme of Depretis corresponded only in part to these expectations. Its chief points were extension of the franchise, incompatibility of a parliamentary mandate with an official position, strict enforcement of the rights of the State in regard to the Church, protection of freedom of conscience, mainten-
ance of the military and naval policy inaugurated by the Conservatives, acceptance of the railway redemption contracts, consolidation of the financial equilibrium, abolition of the forced
currency, and, eventually, fiscal reform. The long-promised abolition of the grist tax was not explicitly mentioned, opposition to the railway redemption contracts was transformed into approval, and the vaunted reduction of taxation replaced by a lip-service to the Conservative deity of financial equilibrium. The railway redemption contracts were in fact immediately voted by parliament, with a clause pledging the government to legislate in favour of farming out the railways to private companies.

Nicotera, minister of the interior, began his administration of home affairs by a sweeping change in the personnel of the prefects, sub-prefects and public prosecutors, but found himself obliged to incur the wrath of his supporters by prohibiting Radical meetings like to endanger public order by emanating administrative policies which would have befitted an inveterate Conservative. In regard to the Church, he instructed the prefects strictly to prevent instruction of the law against religious orders. At the same time the cabinet, as a whole, brought in a Clerical Abuses Bill, threatening with severe punishment priests guilty of disturbing the peace of families, of opposing the laws of the state, or of fomenting disorder. Depretis, for his part, was compelled to declare impracticable the immediate abolition of the grist tax, and to frame a bill for the increase of revenue, acts which caused the secession of some supporters; but in reward of his political acquiescence, and of the ministerial majority, and gave the signal for an agitation against the premier similar to that which he himself had formerly undertaken against the Right. The first general election under the Left (November 1876) had yielded the cabinet the overwhelming majority of 421 Ministerialists against 87 Conservatives, but the very size of the majority rendered it unmanageable. The Clerical Abuses Bill provoked further dissensions: Nicotera was severely affected by revelations concerning his political past; Zanardelli refused to sanction the construction of a railway in Calabria in which Nicotera was interested; and Depretis saw fit to compensate the supporters of the bill for the increased revenue by decorating at one stroke sixty ministerial deputies with the Order of the Crown of Italy. A further derogation from the ideal of democratic austerity was committed by adding £80,000 per annum to the king's civil list (14th May 1877) and by burdening the state exchequer with royal household pensions amounting to £20,000 a year. The civil list, which the law of the 10th of August 1867 had fixed at £550,000 a year, but which had been voluntarily reduced by the king to £530,000 in 1880, and to £450,000 in 1887, was thus raised to £570,000 a year. Almost the only point in which the ministers were generally of one mind was a decided improvement over the administration of the Right was the manner displayed by Nicotera in combating brigandage and the mafia in Calabria and Sicily. Successes achieved in those provinces failed, however, to save Nicotera from the wrath of the Chamber, and on the 14th of December 1877 a cabinet crisis arose over a question concerning the secrecy of telegraphic correspondence. Depretis thereupon reconstructed his administration, excluding Nicotera, Melegari and Zanardelli, placing Crispi at the home office, entrusting Maglioni with finance, and himself assuming the direction of foreign affairs.

Toward the end of 1878, the début of the Left as a governing party was scarcely more satisfactory than its home policy. Since the war of 1866 the Left had advocated an Italian Policies of the Left. Prussian alliance in opposition to the Francophile tendencies of the Right. On more than one occasion Bismarck had maintained direct relations with the chiefs of the Left, and had in 1870 worked to prevent a Franco-Italian alliance by encouraging the "party of action" to press for the occupation of Rome. Besides, the Left stood for anticlericalism and for the retention by the State of means of coercing the Church, in opposition to the men of the Right, who, with the exception of Sella, favoured Cavour's ideal of "a free Church in a free State," and the consequent abandonment of state control over ecclesiastical government. Upon the outbreak of the Prussian Kulturkampf the Left had pressed the Right to introduce an Italian counterpart to the Prussian laws, especially as the attitude of Thiers and the hostility of the French Clericals obviated the need for sparing French susceptibilities. Visconti-Venosta and Minghetti, partly from aversion to a Jacobin policy, and partly from a conviction that Bismarck sooner or later would undertake his Gangeschlacht, regardless of any tacit engagement he might have assumed towards Italy, had wisely declined to be drawn into any infraction of the Law of Guarantees. It was, however, expected that the chiefs of the Left, upon attaining office, would turn resolutely towards Prussia in search of a guarantee against the Clerical menace embodied in the régime of Marshal MacMahon. On the contrary, Depretis and Melegari, both of whom were imbued with French Liberal doctrines, adopted towards the Republic an attitude so defiant as to arouse suspicion in Vienna and Berlin. Depretis recalled from Russian service General Cialdini, whose ardent plea for Italian intervention in favour of France in 1870, and whose comradeship with Marshal MacMahon in 1859, would, it was supposed, render him persona grata illa to the French government. This calculation was falsified by events. Incensed by the elevation to the rank of embassies of the Italian legation in Paris and the French legation to the Quirinal, and by the introduction of the Italian bill against clerical abuses, the French Clerical party not only attacked Italy and her representative, General Cialdini, in the Chamber of Deputies, but promoted a monster petition against the Italian bill. Even the collapse of the cabinet of MacMahon died not with the Jules Simon cabinet for opposing the Clerical petition) hardly averted to change the attitude of Depretis. As a precaution against an eventual French attempt to restore the temporal power, orders were hurriedly given to complete the defences of Rome, but in other respects the Italian government maintained its subservient attitude. Yet at that moment the adoption of a clear line of policy, in accord with the central powers, might have saved Italy from the loss of prestige entailed by her bearing in regard to the Russo-Turkish War and the Austrian acquisition of Bosnia, and might have prevented the disappointment and subsequent occasioned by the outcome of the Congress of Berlin. In the hope of inducing the European powers to "compensate" Italy for the increase of Austrian influence on the Adriatic, Crispi undertook in the autumn of 1877, with the approval of the king, and in spite of the half-disguised opposition of Depretis, a semi-official mission to Paris, Berlin, London and Vienna. The mission appears not to have been an unqualified success, though Depretis afterwards affirmed in the Chamber (4th March 1886) that Depretis might in 1877 "have harnessed fortune to the Italian chariot." Depretis, who was only to avoid "a policy of adventure," let slip whatever opportunity may have presented itself, and neglected even to deal energetically with the impotent but mischievous Italian agitation for a "rectification" of the italo-Austrian frontier. He greeted the treaty of San Stefano (3rd March 1878) with undisguised relief, and by the mouth of the king, congratulated Italy (7th March 1878) on having maintained with the powers friendly and cordial relations "free from suspicious precautions," and upon having secured for herself "that most precious of alliances, the alliance of the future"—a phrase of which the empty rhetoric was to be bitterly demonstrated by the Berlin Congresses and the French intervention of 1870, occasioned by the outcome of the Congress of Berlin.

The entry of Crispi into the Depretis cabinet (December 1877) placed at the ministry of the interior a strong hand and sure eye at a moment when they were about to become imperatively necessary. Crispi was the only man of truly statesmanlike calibre in the ranks of the Left. Formerly a friend and disciple of Mazzini, with whom he had broken on the question of the monarchical form of government which Crispi believed indispensable to the unification of Italy, he had afterwards been one of Garibaldi's most efficient condottiers and an active member of the party of action. Passionate, not always scrupulous in his choice and use of political weapons, intensely patriotic, loyal with a loyalty based rather on reason than sentiment, quick-witted, prompt in action, determined and pertinacious, he possessed in eminent degree many qualities lacking in other
Liberal chieftains. Hardly had he assumed office when the unexpected death of Victor Emmanuel II. (9th January 1878) stirred national feeling to an unprecedented depth, and placed the continuity of monarchical institutions in Italy upon trial before Europe. For thirty years Victor Emmanuel had been the centre point of national hopes, the token and embodiment of the struggle for national redemption. He had led the country out of the despondency which followed the defeat of Novara and the abdication of Charles Albert, through all the vicissitudes of national unification to the final triumph at Rome. His disappearance snapped the chief link with the heroic period, and removed from the helm of state a ruler of large heart, great experience and civil courage, at a moment when elements of continuity were needed and vital problems of internal reorganization had still to be faced. Crispi adopted the measures necessary to ensure the tranquil accession of King Humbert with a quick energy which precluded any Radical or Republican demonstrations. His influence decided the choice of the Roman Pantheon as the late monarch’s burial-place, in spite of formidable pressure from the Piedmontese, who wished Victor Emmanuel II. to rest with the Sardinian kings at Superga. He also persuaded the new ruler to inaugurate, as King Humbert I., the new dynastical epoch of the kings of Italy, instead of continuing as Humbert IV. the succession of the kings of Sardinia. Before the commotion caused by the death of Victor Emmanuel had passed away, the death of Pius IX. (8th February 1878) placed further demands upon Crispi’s sagacity and promptitude. Like Victor Emmanuel, Pius IX. had been bound up with the history of the Risorgimento, but, unlike him, had represented and embodied the anti-national, reactionary spirit. Ecclesiastically, he had become the instrument of the triumph of Jesuit influence, and had in turn set his seal upon the dogma of the Immaculate Conception, the Syllabus and Papal Infallibility. Yet, in spite of all, his joivial disposition and good-humoured cynicism saved him from unpopularity, and rendered his death an occasion of mourning. Notwithstanding the pontiff’s bestowal of the apostolic benediction in articulo mortis upon Victor Emmanuel, the attitude of the Vatican had remained so inimical as to make it doubtful whether the conclave would be held in Rome. Crispi, whose strong anti-clerical convictions did not prevent him from regarding the papacy as preeminently an Italian institution, was determined both to prove to the Catholic world the practical independence of the government of the Church and to retain for Rome so potent a centre of universal attraction as the presence of the future pope. The Sacred College having decided to hold the conclave abroad, Crispi assured them of absolute freedom if they remained in Rome, or of protection to the frontiers should they migrate, but warned them that, once evacuated, the Vatican would be occupied in the name of the Italian government and be lost to the Church as headquarters of the papacy. The cardinals thereupon overruled their former decision, and the conclave was held in Rome, the new pope, Cardinal Pecci, being elected on the 20th of February 1878 without let or hindrance. The Italian government not only prorogued the Chamber during the conclave to prevent unseemly inquiries or demonstrations on the part of deputies, but by means of Mancini, minister of justice, and Cardinal di Pietro, assured the new pope protection during the settlement of his outstanding personal affairs, an assurance of which Leo XIII. on the evening after his election, took full advantage. At the same time the duke of Aosta, commander of the Rome army corps, ordered the troops to render royal honours to the pontiff should he officially appear in the capital. King Humbert addressed to the pope a letter of congratulation upon his election, and received a courteous reply. The improvement thus signalized in the relations between Quirinal and Vatican was further exemplified on the 18th of October 1878, when the Italian government accepted a papal formula with regard to the granting of the royal execution for bishops, whereby they, upon nomination by the Holy See, recognized state control over, and made application for, the payment of their temporalities.

The Depretis-Crispi cabinet did not long survive the opening of the new reign. Crispi’s position was shaken by a morally plausible but juridically untenable charge of bigamy, while on the 8th of March the election of Cairoli, an opponent of the ministry and head of the extremist section of the Left, to the presidency of the Chamber, induced Depretis to tender his resignation to the new king. Cairoli succeeded in forming an administration, in which his friend Count Corti, Italian ambassador at Constantinople, accepted the portfolio of foreign affairs, Zanardelli the ministry of the interior, and Seismit Doda the ministry of finance. Though the cabinet had no stable majority, it induced the Chamber to sanction a commercial treaty which had been negotiated with France and a general “autonomous” customs tariff. The commercial treaty was, however, rejected by the French Chamber in June 1878, a circumstance necessitating the application of the Italian general tariff, which implied a 10 to 20% increase in the duties on the principal French exports. A highly imaginative financial exposition by Seismit Doda, who announced a surplus of £2,400,000, paved the way for a Grist Tax Reduction Bill, which Cairoli had taken over from the Depretis programme. The Chamber, though convinced of the danger of this reform, the perils of which were incisively demonstrated by Sella, voted an overwhelming majority for an immediate reduction of the impost by one-fourth, and its complete abolition within four years. Cairoli’s premiership was, however, destined to be cut short by an attempt made upon the king’s life in November 1878, during a royal visit to Turin, where he was received by a crowd of the populace with such courage and presence of mind of Cairoli, who received the dagger thrust intended for the king, public and parliamentary indignation found expression in a vote which compelled the ministry to resign.

Though brief, Cairoli’s term of office was momentous in regard to foreign affairs. The treaty of San Stefano had led to the convocation of the Berlin Congress, and though Count Corti was by no means ignorant of the rumours concerning secret agreements between Germany, Austria and France, he scarcely seemed alive to the possible effect of such agreements upon Italy. Replying on the 4th of April 1878 to interpellations by Visconti-Venosta and other deputies on the impending Congress of Berlin, he appeared free from apprehension lest Italy, isolated, might find herself face to face with a change of the balance of power in the Mediterranean, and declared that in the event of serious complications Italy would be “too much sought after rather than too much forgotten.” The policy of Italy in the congress, he added, would be to support the interests of the young Balkan nations. Wrapped in this optimism, Count Corti proceeded to sign the Treaty of Berlin, and, as first Italian delegate, to demand, when he found himself obliged, on the 28th of May, to join reluctantly in sanctioning the Austrian occupation of Bosnia and Herzegovina. On the 8th of July the revelation of the Anglo-Ottoman treaty for the British occupation of Cyprus took the congress by surprise. Italy, who had made the integrity of the Ottoman empire a cardinal point of her Eastern policy, felt this change of the Mediterranean status quo the more severely inasmuch as, in order not to strain her relations with France, she had turned a deaf ear to Austrian, Russian and German advice to prepare to occupy Tunisia in agreement with Germany and Great Britain. Count Corti had no suspicion that France had adopted a less disinterested attitude towards similar suggestions from Bismarck and Lord Salisbury. He therefore returned from the German capital with “clean” but empty hands, a plight which found marked disfavour in Italian eyes, and stimulated anti-Austrian Irredentism. Ever since Venetia had been ceded by Austria to the emperor Napoleon, and by him to Italy, after the war of 1866, secret revolutionary committees had been formed in the northern Italian provinces to prepare for the redemption of Trent and Trieste. For these reasons the Northern patriots were actively in action, but in 1878 the presence of the ex-Garibaldian Cairoli at the head of the government, and popular dissatisfaction at the
spread of Austrian sway on the Adriatic, encouraged them to begin a series of noisy demonstrations. On the evening of the signature at Berlin of the clause sanctioning the Austrian occupation of Bosnia and Herzegovina, an Irredentist riot took place before the Austrian consulate at Venice. The Italian government attached little importance to the occurrence, and believed that a diplomatic expression of regret would suffice to allay Austrian irritation. Austria, indeed, might easily have been persuaded to ignore the Irredentist agitation, had not the equivocal attitude of Cairoli and Zanardelli cast doubt upon the sincerity of their regret. The former at Pavia (15th October 1878), and the latter at Arco (3rd November), declared publicly that Irredentist manifestations could not be prevented under existing laws, but gave no hint of introducing any law to sanction their prevention. "Repression, not prevention," became the official formula, the enunciation of which by Cairoli at Pavia caused Count Corti and two other ministers to resign.

The fall of Cairoli, and the formation of a second Depretis cabinet in 1878, brought no substantial change in the attitude of the government towards Irredentism, nor was the position improved by the return of Cairoli to power in the following July. Though aware of Bismarck's hostility towards Italy, of the conclusion of the Austro-German alliance of 1879, and of the undisguised ill-will of France, Italy not only made no attempt to crush an agitation as mischievous as it was futile, but granted a state funeral to General Avezzana, president of the Irredentist League. Dr. Bonghi's mendacious phrase, the foreign policy of Italy during this period may be said to have been characterized by "enormous intellectual impotence counterbalanced by equal moral feebleness." Home affairs were scarcely better managed. Parliament had degenerated into a congeries of personal groups, whose members were eager only to overturn cabinets in order to secure power for the leaders and official favours for themselves. Depretis, who had succeeded Cairoli in December 1878, fell in July 1879, after a vote in which Cairoli and Nicotera joined the Conservative opposition. On 12th July Cairoli formed a new administration, in the hope of uniting the cabinet and to reconstruct his cabinet with the help of Depretis. The administration of finance was as chaotic as the condition of parliament. The f.2,400,000 surplus announced by Seismit Doda proved to be a myth. Nevertheless Magliani, who succeeded Seismit Doda, had neither the perspicacity nor the courage to resist the abolition of the grant tax. The first vote of the Chamber for the immediate diminution of the tax, and for its total abolition on 1st January 1883, had been opposed by the Senate. A second bill was passed by the Chamber on 18th July 1879, providing for the immediate repeal of the grant tax on minor cereals, and for its total abolition on 1st January 1884. While approving the repeal in regard to minor cereals, the Senate (24th January 1880) again rejected the repeal of the tax on grinding wheat as prejudicial to national finance. After the general election of 1880, however, the Ministerialists, aided by a number of factions of Conservatives, passed a third bill repealing the grant tax on wheat (10th July 1880), the repeal to take effect from the 1st of January 1884 onwards. The Senate, in which the partisans of the ministry had been increased by numerous appointments ad hoc, finally set the seal of its approval upon the measure. Notwithstanding this prospective loss of revenue, parliament showed great reluctance to vote any new impost, although hardly a year previously it had sanctioned (30th June 1879) Depretis's scheme for spending during the next eighteen years f.43,200,000 in building 5000 kilometres of railway, an expenditure not wholly justified by the importance of the lines, and useful principally as a source of electoral sops for the constituents of ministerial deputies. The unsatisfactory financial condition of the Florence, Rome and Naples municipalities necessitated state help, but the Chamber nevertheless proceeded with a light heart (23rd February 1881) to sanction the issue of a foreign loan of f.60,000,000, with a view to the abolition of the forced currency thus adding to the burdens of the people whereas a load which three years later again dragged Italy into the gulf of chronic deficit.

In no modern country is error or incompetence on the part of administrators more swiftly followed by retribution than in Italy; both at home and abroad she is hemmed in by political and economic conditions which leave little margin for folly, and still less for "mental and moral insufficiency," such as had been displayed by the Left. Nemesis came in the spring of 1885, in the form of the French invasion of Tunisia. Guiccioli, the biographer of Sella, observes that Italian politicians find it especially hard to resist "the temptation of appearing crafty." The men of the Left believed themselves subtle enough to retain the confidence and esteem of all foreign powers while coquetting at home with elements which some of these powers had reason to regard with suspicion. Italy, in constant danger from France, needed good relations with Austria and Germany, but could only attain the goodwill of the former by firm treatment of the revolution in regard to agitation, and of the latter by clear demonstration of Italian will and ability to cope with all anti-monarchical forces. Depretis and Cairoli did neither the one nor the other. Hence, when opportunity offered firmly to establish Italian predominance in the central Mediterranean by an occupation of Tunisia, they found themselves deprived of those confidential relations with the central powers, and even with Great Britain, which might have enabled them to use the opportunity to full advantage. The conduct of Italy in declining the suggestions received from Count Andrassy and General Ignatiev on the eve of the Russo-Turkish War—that Italy should seize the opportunity for the extension of Austrian sway in the Balkans—and in subsequently rejecting the German suggestion to come to an arrangement with Great Britain for the occupation of Tunisia as compensation for the British occupation of Cyprus, was certainly due to fear lest an attempt on Tunisia should lead to a war with France, for which Italy knew herself to be totally unprepared. This very unpreparedness, however, rendered still less excusable her treatment of the Irredentist agitation, which brought her within a hair's-breadth of a conflict with Austria. Although precluded by her own apathy, Italy might in January 1883 have used her influence with France and with Great Britain to prevent any further French aggression in Tunisia, and thus prevent the occupation of a French garrison there. It is equally certain that Italy, as early as 1880, should have undertaken to prevent French aggression in Tunisia, and thus prevent the occupation of the island by any foreign power. If Italy had not only disarmed the French—by making good her promises to the French—but had also compelled France to renounce her claims on the island, this might have been the period when Italy could have prevailed upon the French government to purchase the Tunis-Goletta railway from the English company by which it had been constructed. A French attempt to purchase the line was upset in the English courts, and the railway was finally secured by Italy at a price more than eight times its real value. This pertinacity engendered a belief in France that Italy was about to undertake in Tunisia a more aggressive policy than necessary for the protection of her commercial interests. Roustan therefore hastened to extort from the bey concessions calculated to neutralize the advantages which Italy had hoped to secure by the possession of the Tunis-Goletta line, and at the same time the French government prepared at Toulon an expeditionary corps for the occupation of the Regency. In the spring of 1883...
the Kroumir tribe was reported to have attacked a French force on the Algerian border, and on the 9th of April Roustan fired the bay of Tunis that France would chastise the assailants. The bay issued futile protests to the powers. On the 26th of April the island of Tabarka was occupied by the French, Bizerta signed on the 2nd of May, and on the 12th of May, and on the 19th of May, France and Italy signed the treaty of Bardo accepting the French protectorate. France undertook the maintenance of order in the Regency, and assumed the representation of Tunisia in all dealings with other countries.

Italian indignation at the French coup de main was the deeper on account of the apparent duplicity of the government of the Republic. On the 11th of May the French foreign minister, Barthélémy Saint Hilaire, had officially assured the Italian ambassador in Paris that France "had no thought of occupying Tunisia or any part of Italian territory, beyond some points of the Kroumir country." This assurance, dictated by Jules Ferry to Barthélémy Saint Hilaire in the presence of the Italian ambassador, and by him telegraphed en clair to Rome while considering the binding pledge that France would not materially alter the status quo in Tunisia. Documents subsequently published have somewhat attenuated the responsibility of Ferry and Saint Hilaire for this breach of faith, and have shown that the French forces in Tunisia acted upon secret instructions from General Farre, minister of war in the Ferry cabinet, who pursued a policy diametrically opposed to the official declarations made by his government. Even if Italy had been compelled by circumstances to recognize this assurance, it could scarcely have mitigated the intense resentment of the whole Italian nation at an event which was considered tantamount not only to the destruction of Italian aspirations to Tunisia, but to the ruin of the interests of the numerous Italian colony and to a constant menace against the security of the Sicilian and south Italian coasts.

Had the blow thus struck at Italian influence in the Mediterranean induced politicians to sink for a while their personal differences and to unite in presenting a firm front to foreign nations, the crisis in regard to Tunisia might not have been so ruinous to Italy. Unfortunately, however, on this, as on other critical occasions, deputies proved themselves incapable of common effort to promote general welfare. While excitement over Tunisia was at its height, but before the situation was irrevocably compromised to the disadvantage of Italy, Cairoli had been compelled to resign by a vote of want of confidence in the Chamber. The only politician capable of dealing adequately with the situation was Sella, leader of the Right, and to him the crown appealed. The faction leaders of the Left, though divided by personal jealousies and mutually incompatible ambitions, agreed upon the policy which could well be adopted, and Austria would be the first to be consulted. Even if Italy had been compelled by circumstances to recognize this assurance, it could scarcely have mitigated the intense resentment of the whole Italian nation at an event which was considered tantamount not only to the destruction of Italian aspirations to Tunisia, but to the ruin of the interests of the numerous Italian colony and to a constant menace against the security of the Sicilian and south Italian coasts.

Berlin that whatever was done at Vienna would be regarded as having been done in the German capital. Nor did nascent irritation in France prevent the conclusion of the Franco-Italian commercial treaty, which was signed at Paris on the 3rd of November.

In Italy public opinion as a whole was favourable to the visit, especially as it was not considered an obstacle to the projected increase of the army and navy. Doubts, however, began to crop up as to its effect upon the minds of Austrian statesmen, for on the 8th of November the language employed by Kállay and Count Andrássy to the Hungarian delegations on the subject of Irredentism was scarcely calculated to soothe Italian susceptibilities. But on 9th November the European situation was suddenly modified by the formation of the Gambetta cabinet, and, in view of the policy of revenge with which Gambetta was supposed to be identified, it became imperative for Bismarck to assure himself that Italy would not be enticed into a Francophil attitude by any concession Gambetta might offer. As usual when dealing with weaker nations, the German chancellor resorted to intimidation. He not only re-established the Prussian legation to the Vatican, suppressed since 1874, and omitted from the imperial message to the Reichstag (17th November 1881) all reference to King Humbert's visit to Vienna, but took occasion on the 29th of November to refer to Italy as a country tottering on the verge of revolution, and opened in the German semi-official press a campaign in favour of an international guarantee for the Independence of the Papacy. These manoeuvres produced their effect upon Italian public opinion. In the long and protracted discussions of the Chamber of Deputies (5th to 9th December) the fear was repeatedly expressed lest Bismarck should seek to purchase the support of German Catholics by raising the Roman question. Mancini, still unwilling frankly to adhere to the Austro-German alliance, found his policy of "friendship all round" impeded by Gambetta's uncompromising attitude in regard to Tunisia. Bismarck nevertheless continued his press campaign in favour of the temporal power until, reassured by Gambetta's decision to send Roustan back to Tunis to complete as minster the anti-Italian programme begun at Tunis, he finally instructed his organs to emphasize the common interests of Germany and Italy on the occasion of the opening of the St. Gothard tunnel. But the effect of the German press campaign could not be effaced in a day. At the new year's reception of deputies King Humbert aroused enthusiasm by a significant remark that Italy intended to remain "mistress in her own house"; while Mancini addressed to Count de Launay, Italian ambassador in Berlin, a haughty despatch, repudiating the supposition that the pope might (as Bismarckian emissaries had suggested to the Vatican) obtain abroad greater spiritual liberty than in Rome, or that closer relations between Italy and Germany, such as were required by the interests and aspirations of the two countries, could be made in any way contingent upon a modification of Italian freedom of action in regard to home affairs.

The sudden fall of Gambetta (26th January 1882) having removed the fear of immediate European complications, the cabinets of Berlin and Vienna again displayed diffidence towards Italy. So great was Bismarck's distrust of Italian parliamentary instability, his doubts of Italian capacity for offensive warfare and his fear of the Francophil tendencies of Depretis, that for many weeks the Italian ambassador at Berlin was unable to obtain audience of the chancellor. But for the Tunisian question Italy might again have been drawn into the wake of France. Mancini tried to impede the organization of French rule in the Regency by refusing to recognize the treaty of Bardo, yet so careless was Bismarck of Italian susceptibilities that he instructed the German consul at Tunis to recognize French decrees. Partly under the influence of these circumstances, and partly in response to persuasion by Baron Blanc, secretary-general for foreign affairs, Mancini instructed Count di Robilant to open negotiations for an Italo-Austrian alliance—instructions which Robilant neglected until questioned by Count Kaňkovy on the subject. The first exchange of ideas between the two Governments
proved fruitless, since Kalnóky, somewhat Clerical-minded, was averse from guaranteeing the integrity of all Italian territory, and Mancini was equally unwilling to guarantee to Austria permanent possession of Trent and Trieste. Mancini, moreover, wished the treaty of alliance to provide for reciprocal protection of the chief interests of the contracting Powers, Italy undertaking to second Austria-Hungary in the Balkans, and Austria and Germany pledging themselves to support Italy in Mediterranean questions. Without some such proviso Italy would, in Mancini's opinion, be exposed single-handed to French resentment. At the request of Kalnóky, Mancini defined his proposal in a memorandum, but the illness of himself and Depretis, combined with an untoward discussion in the Italian press on the failure of the Austrian emperor to return in Rome King Humbert's visit to Vienna, caused negotiations to drag. The pope, it transpired, had refused to receive the emperor if he came to Rome on a visit to the Quirinal, and Francis Joseph, though anxious to return King Humbert's visit, was unable to offend the feelings of his Catholic subjects. Meanwhile (11th May 1882) the Italian parliament adopted the new Army Bill, involving a special credit of £5,000,000 for the creation of two new army corps, by which the war footing of the regular army was raised to nearly 85,000,000 men and the ordinary military estimates to £8,000,000 per annum. Garibaldi, who, since the French occupation of Tunis, had ardently worked for the increase of the army, had thus the satisfaction of seeing his desire realized before his death at Caperna, on the 2nd July. "In speaking of a man, a man of the truest and highest type, the public press of the day raised the sun to a more splendid halo of glory. Garibaldi had remained the nation's idol, an almost legendary hero whose place none could aspire to fill. Gratitude for his achievements and sorrow for his death found expression in universal mourning wherein king and peasant equally joined. Before his death, and almost contemporaneously with the passing of the Army Bill, negotiations for the alliance were renewed. Encouraged from Berlin, Kalnóky agreed to the reciprocal territorial guarantee, but declined reciprocity in support of special interests. Mancini had therefore to be content with a declaration that the allies would act in mutually friendly intelligence. Depretis made some opposition, but finally acquiesced, and the treaty of triple alliance was signed on the 20th of May 1882, five days after the promulgation of the Franco-Italian commercial treaty in Paris. Though partial revelations have been made, the exact tenor of the treaty of triple alliance has never been divulged. It is known to have been concluded for a period of five years, to have pledged the contracting parties to join in resisting attack upon the territory of any one of them, and to have specified the military disposition to be adopted by each in case of an attack which should not have arisen from France, or from Russia, or from both simultaneously. The Italian government, Staff is said to have undertaken, in the event of war against France, to operate with two armies on the north-western frontier against the French armée des Alpes, of which the war strength is about 250,000 men. A third Italian army would, if expedient, pass into Germany, to operate against either France or Russia. Austria undertook to guard the Adriatic on land and sea, and to help Germany by checking Russia on land. Germany would be sufficiently employed in carrying on war against two fronts. Kalnóky desired that both the terms of the treaty and the fact of its conclusion should remain secret, but Bismarck and Mancini hastened to hint at its existence, the former in the Reichstag on the 12th of June 1882, and the latter in the Italian semi-official press. A revival of Irridentism in connexion with the execution of an Austrian deserter named Oberdank, who after escaping into Italy endeavoured to return to Austria with explosive bombs in his possession, and the cordial references to France made by Depretis at Stradella (8th October 1882), prevented the French government from suspecting the existence of the alliance, or from ceasing to strive after a Franco-Italian understanding. Nothing was discovered until July 1883, when Mancini, in defending himself against strictures upon his refusal to co-operate with Great Britain in Egypt, practically revealed the existence of the treaty, thereby irritating France and destroying Depretis's secret hope of finding in the triple alliance the advantage of an Austro-German guarantee without the disadvantage of French enmity. In Italy the revelation of the treaty was hailed with satisfaction except by the Clericals, who were enraged at the blow thus struck at the restoration of the pope's temporal power, and by the Radicals, who feared both the inevitable breach with republican France and the reinforcement of Italian constitutional parties by intimacy with strong monarchical states such as Germany and Austria. These various considerations naturally combined to recommend the fact to constitutionalists, who saw in it, besides the territorial guarantee, the elimination of the danger of foreign interference in the relations between Italy and the Vatican, such as Bismarck had recently threatened and such as France was believed ready to propose.

Nevertheless, during its first period (1882-1887) the triple alliance failed to ensure cordiality between the contracting Powers. Mancini exercised himself in a hundred ways to soothe French resentment. He not only refused to join Great Britain in the Egyptian expedition, but agreed to suspend Italian consular jurisdiction in Tunis, and deprecated suspicion of French designs upon Morocco. His efforts were worse than futile. France remained cold, while Bismarck and Kalnóky, distrustful of the Radicalism of Depretis and Mancini, assumed towards their ally an attitude almost hostile. Possibly Germany and Austria may have been influenced by the secret treaty signed between Austria, Germany and Russia on the 21st of March 1884, and by the violation of the Triple Alliance at Skierniewice in September of that year, by which Bismarck, in return for "honest brokerage" in the Balkans, is understood to have obtained from Austria and Russia a promise of benevolent neutrality in case Germany should be "forced" to make war upon a fourth power—France. Guaranteed thus against Russian attack, Italy became in the eyes of the central powers a negligible quantity, and was treated accordingly. Though kept in the dark as to the Skierniewice arrangement, the Italian government soon discovered from the course of events that the triple alliance had practically lost its object, European peace having been assured without Italian co-operation. Meanwhile France provided Italy with fresh cause for uneasiness by abating her hostility to Germany. Italy in consequence drew nearer to Great Britain, and at the London conference on the Egyptian financial question sided with Great Britain against Austria and Germany. At the same time negotiations took place with Great Britain for an Italian occupation of Massawa, and Mancini, dreaming of a vast Anglo-Italian enterprise against the Mahdi, expatiated in the spring of 1885 upon the glories of an Anglo-Italian alliance, an indiscretion which drew upon him a scarcely-momented blame on the part of the Chamber. Mancini claimed for Italy the principal merit in the conclusion of the triple alliance, but declared that the alliance left Italy full liberty of action in regard to interests outside its scope, "especially as there was no possibility of obtaining protection for such interests from those who by the alliance had not undertaken to protect them." These words, which revealed the absence of any stipulation in regard to the protection of Italian interests in the Mediterranean, created lively dissatisfaction in Italy and corresponding satisfaction in France. They hastened Mancini's downfall (17th June 1885), and prepared the advent of count di Robilant, who three months later succeeded Mancini at the Italian Foreign Office. Robilant, for whom the Skierniewice pact was no secret, followed a firmly independent policy throughout the Bulgarian crisis of 1885-1886, declining to be drawn into any action beyond that required by the treaty of Berlin and the protection of Italian interests in the Balkans. Italy, indeed, came out of the Eastern crisis with enriched prestige and with her relations to Austria greatly improved. Towards Prince Bismarck Robilant maintained an attitude of dignified independence, and as, in the spring of 1886, the moment for the renewal of the triple alliance drew near, he profited by the development of the Bulgarian crisis and the
threatened Franco-Russian understanding to secure from the central powers "something more" than the bare territorial guarantee of the original treaty. This "something more" consisted, at least in part, of the arrangement, with the help of Austria and Germany, of an Anglo-Italian naval understanding having special reference to the Eastern question, but providing for common action by the British and Italian fleets in the Mediterranean in case of war. A vote of the Italian Chamber on the 3rd of February 1887, in connexion with the disaster to Italian troops at Dogali, in Abyssinia, brought about the resignation of the Depretis-Robilant cabinet. The crisis dragged for three months, and before its definitive solution by the formation of a Depretis-Crispi ministry, Robilant succeeded (17th March 1887) in renewing the triple alliance on terms more favourable to Italy than those obtained in 1882. Not only did he secure concessions from Austria and Germany corresponding in some degree to the improved state of the Italian army and navy, but, in virtue of the Anglo-Italian understanding, assured the practical adhesion of Great Britain to the European policy of the central powers, a triumph probably greater than any registered by Italian diplomacy since the completion of national unity.

The period between May 1881 and July 1887 occupied, in the region of foreign affairs, by the negotiation, conclusion and renewal of the triple alliance, by the Bulgarian crisis and by the dawn of an Italian colonial policy, was marked at home by urgent political and economic problems, and by the parliamentary phenomena known as trasformismo. On the 29th of June 1881 the Chamber adopted a Finance Reform Bill which increased the taxation from 600,000 lire to 2,000,000 lire in direct taxation, and by extending the suffrage to all persons who had passed through the two lower standards of the elementary schools, and practically to all persons able to read and write. The immediate result of the reform was to increase the political influence of large cities where the proportion of illiterate workmen was lower than in the country districts, and to exclude from the franchise numbers of peasants and small proprietors who, though of more conservative temperament and of better economic position than the artisan population of the large towns, were often unable to fulfil the scholarship qualification. On the 14th of April 1883 the forced currency was formally abolished by the resumption of treasury payments in gold with funds obtained through a loan of £1,450,000 issued in London on the 5th of May 1882. Owing to the hostility of the French market, the loan was covered with difficulty, and, though the gold premium fell and commercial exchanges were temporarily facilitated by the resumption of cash payments, it is doubtful whether these advantages made up for the burden of £640,000 additional annual interest thrown upon the exchequer. On the 6th of March 1885 parliament finally sanctioned the conventions by which state railways were farmed out to three private companies—the Mediterranean, Adriatic and Sicilian. The railways redeemed in 1875-1876 had been worked in the interval by the government at a heavy loss. A commission of inquiry reported in favour of private management. The conventions, concluded for a period of sixty years, but terminable by either party after twenty or forty years, retained for the state the possession of the lines (except the southern railway, viz. the line from Bologna to Brindisi belonging to the Societa Meridionale to whom the Adriatic lines were now farmed), but sold rolling stock to the companies, arranged various schemes of state subsidy for lines projected, and guaranteed interest on the bonds of the companies and arranged for the division of revenue between the companies, the reserve fund and the state. National control of the railways was secured by a proviso that the directors must be of Italian nationality. Depretis and his colleague Genala, minister of public works, experienced great difficulty in securing parliamentary sanction for the conventions, not so much on account of their defective character, as from the opposition of local interests anxious to extort new lines from the government. In fact, the conventions were only voted by a majority of twenty-three votes after the government had undertaken to increase the length of new state-built lines from 1500 to 2500 kilometres. Unfortunately, the calculation of probable railway revenue on which the conventions had been based proved to be enormously exaggerated. For many years the 37.7% of the gross revenue (less the cost of maintaining the rolling stock, incumbent on the state) scarcely sufficed to pay the interest on debts incurred for railway construction and on the guaranteed bonds. Gradually the increase of traffic consequent upon the industrial development of Italy decreased the annual losses of the state, but the position of the government in regard to the railways still remained so unsatisfactory as to render the resumption of the whole system by the state on the expiration of the first period of twenty years in 1903 inevitable. Intimately bound up with the forced currency, the railway conventions and public works was the financial question in general. From 1876, when equilibrium between expenditure and revenue had first been attained, taxation yielded steady annual surpluses, which in 1881 reached the satisfactory level of £4,120,000. The gradual abolition of the grist tax on minor cereals diminished the surplus in 1882 to £236,000, and in 1883 to £110,000, while the total repeal of the grist tax on wheat, which took effect on the 1st of January 1884, coincided with the opening of a new and disastrous period of deficit. True, the repeal of the grist tax was not the only, nor possibly even the principal, cause of the deficit. The policy of "fiscal transformation" inaugurated by the Left increased revenue from indirect taxation from £17,000,000 in 1876 to more than £24,000,000 in 1887, by substituting heavy corn duties for the grist tax, and by raising the sugar and petroleum duties to unprecedented levels. But partly from lack of firm financial administration, partly through the increase of military and naval expenditure (which in 1887 amounted to £9,000,000 for the army, while special efforts were made to strengthen the navy), and principally through the constant drain of railway construction and public works, the demands upon the exchequer grew largely to exceed the normal increase of revenue, and necessitated the contraction of new debts. In their anxiety to remain in office Depretis and the finance minister, Magliani, never hesitated to mortgage the financial future of their country. No concession could be denied to deputies, or groups of deputies, whose support was indispensable to the life of the cabinet, nor, under such conditions, was it possible to place any effective check upon administrative abuses in which politicians or their electors were interested. Railways, roads and harbours which contractors had undertaken to construct for reasonable amounts were frequently made to cost thrice the original estimates. Minghetti, in a trenchant exposure of the parliamentary condition of Italy during this period, cites a case in which a credit for certain public works was, during a debate in the Chamber, increased by the government from £5,600,000 to £9,000,000 in order to conciliate local political interests. In the spring of 1887 Genala, minister of public works, was taken in task for having sanctioned expenditure of £80,000,000 on railway construction while only £10,000,000 had been included in the estimates. As most of these credits were spread over a series of years, succeeding administrations found their financial liberty of action destroyed, and were obliged to cover deficit by constant issues of consolidated stock. Thus the deficit of £340,000 for the financial year 1885-1886 rose to nearly £2,920,000 in 1887-1888, and in 1888-1889 amounted to £5,920,000, the highest deficit ever incurred.

Nevertheless, in spite of many and serious shortcomings, the long series of Depretis administrations was marked by the adoption of some useful measures. Besides the realization of the formal programme of the Left, consisting of the repeal of the grist tax, the abolition of the forced currency, the extension of the suffrage and the development of the railway system, Depretis laid the foundation for land tax re-assessment by introducing a new cadastral survey. Unfortunately, the new survey was made largely optional, so that provinces which had reason
to hope for a diminution of land tax under a revised assessment hastened to complete their survey, while others, in which the average of the land tax was below a normal assessment, neglected to comply with the provisions of the scheme. An important undertaking, known as the Agricultural Inquiry, brought to light vast quantities of information valuable for future agrarian legislation. The year 1885 saw the introduction and adoption of a measure embodying the principle of employers' liability for accidents to workmen, a principle subsequently extended and more equitably defined in the spring of 1899. An effort to encourage the development of the mercantile marine was made in the same year, and a convention was concluded with the chief lines of passenger steamers to retain their fastest vessels as auxiliaries to the fleet in case of war. Sanitation and public hygiene received a potent impulse from the cholera epidemic of 1884, many of the unhealthiest quarters in Naples and other cities being demolished and rebuilt, with furiously furnished by the state. The movement was strongly supported by King Humbert, whose intrepidity in visiting the most dangerous spots at Busca and Naples while the epidemic was at its height, reassuring the panic-stricken inhabitants by his presence, excited the enthusiasm of his people and the admiration of Europe.

During the accomplishment of these and other reforms the condition of parliament underwent profound change. By degrees the administrations of the Left had ceased to rely solely upon the Liberal sections of the Chamber, and both the Left and legal forces of the Right. This process of transformation was not exclusively the work of Depretis, but had been initiated as early as 1873, when a portion of the Right under Minghetti had, by joining the Left, overturned the Lanza-Sella cabinet. In 1876 Minghetti himself had fallen a victim to a similar defection of Conservative deputies. The practical annihilation of the old Right in the elections of 1876 opened a new parliamentary era. Reduced in number to less than one hundred, and radically changed in spirit and composition, the Right gave way, if not to despair, at least to a disenchanted and unappealing party. Though no more than one occasion personal rancour against the men of the Moderate Left prevented the Right from following Sella's advice and regaining, by timely coalition with cognate parliamentary elements, a portion of its former influence, the bulk of the party, with singular inconsistency, drew nearer and nearer to the Liberal cabinets. The process was accelerated by Sella's illness and death (14th March 1884), an event which cast profound discouragement over the more thoughtful of the Conservatives and Moderate Liberals, by whom Sella had been regarded as a supreme political reserve, as a statesman whose experienced vigour and patriotic sagacity might have been trusted to lift Italy from any depth of folly or misfortune. By a strange anomaly the Radical measures brought forward by the Left diminished instead of increasing the distance between it and the Conservatives. Numerically insufficient to reject such measures, and lacking the fibre and cohesion necessary for the pursuance of a far-sighted policy, the Right thought prudent not to employ its strength in uncompromising opposition, but rather, by supporting the government, to endeavour to modify Radical legislation in a Conservative sense. In every case the calculation proved fallacious. Radical measures were passed without a contest, and the Right was compelled sadly to accept the accomplished fact. Thus it was with the abolition of the grist tax, the reform of the suffrage, the railway conventions and many other bills. When, in course of time, the extended suffrage increased the Republican and Extreme Radical elements in the Chamber, and the Liberal "Pentarchy" (composed of Crispi, Cairoli, Nicotera, Zanardelli and Baccarini) assumed an attitude of bitter hostility to Depretis, the Right, obeying the impulse of Minghetti, rallied openly to Depretis, lending him aid without which his prolonged term of office would have been impossible. The result was parliamentary chaos, more scandalous than ever. In May 1883 this crisis received official recognition by the elimination of the Radicals Zanardelli and Baccarini from the Depretis cabinet, while in the course of 1884 a Conservative, Signor Biancheri, was elected to the presidency of the Chamber, and another Conservative, General Ricotti, appointed to the War Office. Though Depretis, at the end of his life in 1887, showed signs of repenting of the confusion thus created, he had established a parliamentary system destined largely to stabilize and vitiate the political life of Italy.

Contemporaneously with the vicissitudes of home and foreign policy under the Left there grew up in Italy a marked tendency towards colonial enterprise. The tendency itself dated from 1859, when a congress of the Italian chambers of commerce at Genoa had urged the Lanza cabinet to establish a commercial depot on the Red Sea. On the 11th of March 1870 an Italian shipper, Signor Rubattino, had bought the bay of Assab, with the neighbouring island of Darmalkich, from Beheran, sultan of Raheita, for £1880, the funds being furnished by the government. The Egyptian government being unwilling to recognize the sovereignty of Beheran over Assab or his right to sell territory to a foreign power, Visconti-Venosta thought it opportune not then to occupy Assab. No further step was taken until, at the end of 1879, Rubattino prepared to establish a commercial station at Assab. The British government made inquiry as to his intentions, and on the 10th of April 1880 received a formal undertaking from Cairoi that Assab would never be fortified nor be made a military establishment. Meanwhile (January 1880) stores and materials were landed, and Assab was permanently occupied. Eighteen months later a party of Italian soldiers landed at Assab, and on the 10th of March 1882, Signor Giulietti were massacred in Egyptian territory. Egypt, however, refused to make thorough inquiry into the massacre, and was only prevented from occupying Raheita and coming into conflict with Italy by the good offices of Lord Granville, who dissuaded the Egyptian government from enforcing its sovereignty. On the 20th of September 1881 Beheran formally accepted Italian protection, and in the following February an Anglo-Italian convention established the Italian title to Assab on condition that Italy should formally recognise the suzerainty of the Porte over the Red Sea coast, and should prevent the transport of arms and munitions of war through the territory of Assab. This convention was never recognized by the Porte nor by the Egyptian government. A month later (10th March 1882) Rubattino made over his establishment to the Italian government, and on the 12th of June the Chamber adopted a bill constituting Assab an Italian crown colony.

Within four weeks of the adoption of this bill the bombardment of Alexandria by the British fleet (11th July 1882) opened an era destined profoundly to affect the colonial position of Italy. The revolt of Arabi Pasha (September 1881) had led to the meeting of an ambassadorial conference at Constantinople, promoted by Mancini, Italian minister for foreign affairs, in the hope of preventing European intervention in Egypt and the permanent establishment of an Anglo-French condominium to the detriment of Italian influence. At the opening of the conference (23rd June 1882) Italy secured the signature of a self-denying protocol whereby all the great powers undertook to avoid isolated action; but the rapid development of the crisis in Egypt, and the refusal of France to co-operate with Britain in the restoration of order, necessitated vigorous action by the latter alone. In view of the French refusal, Lord Granville on the 27th of July invited Italy to join in restoring order in Egypt; but Mancini and Depretis, in spite of the efforts of Crispi, then in London, declined the offer. Financial considerations, lack of proper transports for an expeditionary corps, fear of displeasing France, dislike of a "policy of adventure," misplaced deference towards the ambassadorial conference in Constantinople, and unwillingness to thwart the current of Italian sentiment in favour of the Egyptian "nationalists," were the chief motives of the Italian refusal, which had the effect of somewhat estranging Great Britain and Italy. Anglo-Italian relations, however, regained their normal cordiality two years later, and found expression in the support
lent by Italy to the British proposal at the London conference on the Egyptian question (July 1884). About the same time Mancini was informed by the Italian agent in Cairo that Great Britain would be well disposed towards an extension of Italian influence to the Red Sea coast. Having sounded Lord Granville, Mancini received encouragement to seize Beilul and Massawa. In view of the projected restriction of the Egyptian zone of military occupation consequent on the Mahdist rising in the Sudan. Lord Granville further inquired whether Italy would co-operate in pacifying the Sudan, and received an affirmative reply. Italian action was hastened by news that, in December 1884, an exploring party under Signor Bianchi, royal commissioneer for Assab, had been massacred in the Aussa (Danakil) country, an event which aroused in Italy a desire to punish the assassins and to obtain satisfaction for the still unpunished murder of Alula, of Signor Giullieti and his companions. Partly to satisfy public opinion, partly in order to profit by the favourable disposition of the British government, and partly in the hope of remedying the error committed in 1882 by refusal to co-operate with Great Britain in Egypt, the Italian government in January 1885 despatched an expedition under Admiral Caimoli and Colonel Saletta to occupy Massawa and Beilul. The occupation, effected on the 5th of February, was accelerated by fear lest Italy might be forestalled by France or Russia, both of which powers were suspected of desiring to establish themselves firmly on the Red Sea and to exercise a protectorate over Abyssinia. News of the occupation of Beilul was received with joy by the Abyssinians, and theMBOLA. assault, an event which disappointed Italian hopes of military co-operation with Great Britain in the Sudan. The resignation of the Gladstone-Granville cabinet further precluded the projected Italian occupation of Suakin, and the Italians, wisely refraining from an independent attempt to succour Kassala, then besieged by the Mahdists, bent their efforts to the increase of their zone of occupation around Massawa. The extension of the Italian zone excited the suspicions of John, negus of Abyssinia, whose apprehensions were assiduously fomented by Ras Alula, who urged the north-west adventurers. Measures, apparently successful, were taken to reassure the negus, but shortly afterwards protection inopportune accorded by Italy to enemies of Ras Alula, induced the Abyssinians to enter upon hostilities. In January 1886 Ras Alula raided the village of Wa, to the west of Zula, but towards the end of the year (23rd November) Wa was occupied by the irregular troops of General Gené, who had superseded Colonel Saletta at Massawa. Angered by this step, Ras Alula took prisoners the members of an Italian exploring party commanded by Count Salimbene, and held them as hostages for the evacuation of Wa. General Gené nevertheless reinforced Wa and pushed forward a detachment to the north of the town of Assab. On the 25th of January 1887 Ras Alula attacked Saati, but was repulsed with loss. On the following day, however, the Abyssinians succeeded in surprising, near the village of Dogali, an Italian force of 524 officers and men under Colonel De Cristoforis, who were conveying provisions to the garrison of Saati.

**Disaster of Dogali.** The Abyssinians, 20,000 strong, speedily overwhelmed the small Italian force, which, after exhausting its ammunition, was destroyed where it stood. One man only escaped. Four hundred and seven men and twenty-three officers were killed outright, and one officer and eighty-one men wounded. Dead and wounded alike were horribly mutilated by order of Alula. Fearing a new attack, General Gené withdrew his forces from Saati, Wa and Arafali; but the losses of the Abyssinians at Saati and Dogali had been so heavy as to dissuade Alula from further hostilities.

In Italy the disaster of Dogali produced consternation, and caused the fall of the Depretis-Robolant cabinet. The Chamber, eager for revenge, voted a credit of £200,000, and sanctioned the despatch of reinforcements. Meanwhile Signor Crispi, who, though averse from colonial adventure, desired of vindicate Italian honour, entered the Depretis cabinet as a minister of foreign affairs with the express understanding that his credit of £80,000,000. In November 1887, a strong expedition under General di San Marzano raised the strength of the Massawa garrison to nearly 20,000 men. The British government, desirous of preventing an Italo-Abyssinian conflict, which could but strengthen the position of the Mahdists, despatched Mr (afterwards Sir) Gerald Portal from Massawa on the 29th of October to mediate with the negus. The mission proved fruitless. Portal returned to Massawa on the 29th of December 1887, and warned the Italians that John was preparing to attack them in the following spring with an army of 100,000 men. On the 28th of March 1888 the negus indeed descended from the Abyssinian high plateau in the direction of Saati, but finding the Italian position too strong to be carried by assault, temporized and opened negotiations for peace. His tactics failed to entice the Italians from their position, and on the 3rd of April sickness among his men compelled John to withdraw the Abyssinian army. The negus next marched against Menelek, king of Shoa, whose neutrality Italy had purchased with 5000 Remington rifles and a supply of ammunition, but found him with 80,000 men too strongly entrenched to be successfully attacked. Tidings of a new Mahdist incursion into Abyssinian territory reaching the negus induced him to postpone the settlement of his quarrel with Menelek until the dervishes had been chastised. Marching towards the Blue Nile, he joined battle with the Mahdists, but on the 10th of March 1889 was killed, in the hour of victory, near Gallabat. His death gave rise to an Abyssinian war of succession between Mangasha, natural son of John, and Menelek, grandson of the Negus Sella-Sellassie. Menelek, by means of Count Antonelli, resident in the Shoa country, requested Italy to execute a diversion in his favour by occupying Asmara and other points on the high plateau. Antonelli profited by the situation to obtain Menelek's signature to a treaty fixing the frontiers of the Italian colony and defining Italo-Abyssinian relations. The treaty, signed at Ucciali on the 2nd of May 1890, arranged for regular intercourse between Italy and Abyssinia and conceded to Italy a portion of the high plateau, with the positions of Halal, Saganelli and Asmara. The main point of the treaty, however, lay in clause 17:—

> "His Majesty the king of kings of Ethiopia consents to make use of the government of His Majesty the king of Italy for the treatment of all questions concerning other powers and governments."

Upon this clause Italy founded her claim to a protectorate over Abyssinia. In September 1889 the treaty of Ucciali was ratified in Italy by Menelek's lieutenant, the Ras Makonnen. Makonnen further concluded with the Italian premier, Crispi, a convention whereby Italy recognized Menelek as emperor of Ethiopia, Menelek recognized the Italian colony, and arranged for a special Italo-Abyssinian currency and for a loan. On the 11th of October Italy communicated article 17 of the treaty of Ucciali to the European powers, interpreting it as a valid claim to an Italian protectorate over Abyssinia. Although Italian statesmen, and the two houses of the Italian parliament, praised the treaty for the sake of the communication, and persisted in the hostile attitude it had assumed at the moment of the occupation of Massawa. Meanwhile the Italian mint coined thaler coins bearing the portrait of King Humbert, with an inscription referring to the Italian protectorate, and on the 1st of January 1890 a royal decree conferred upon the colony the name of "Eritrea."

In the colony itself General Baldissara, who had replaced General Saletta, delayed the movement against Mangasha desired by Menelek. The Italian general would have preferred to wait until the intervention of Italy for the benefit of both pretenders to the Abyssinian throne. Pressed by the home government, he, however, instructed a native ally to occupy the important positions of Keren and Asmara, and prepared himself to take the offensive against Mangasha and Ras Alula. The latter retreated south of the river Mareb, leaving the whole of the cis-Mareb territory, including the provinces of Hamsen, Agameh, Seraë and Okulê-Kusai, in Italian hands. General Oreno, successor of Baldissara, pushed offensive action more vigorously, and on the 26th of January 1890 entered Adowa, a city considerably to the south of the Mareb, through which Menelek's suspicions had hitherto been retracted. Mangasha, seeing further resistance to be useless, submitted to Menelek, who at the end
of February ratified at Makàllé the additional convention to the treaty of Uccialli, but refused to recognize the Italian occupation of the Mareb. The negus, however, confirmed to article 17 of the treaty of Uccialli by requesting Italy to represent Abyssinia at the Brussels anti-slavery conference, an act which strengthened Italian illusions as to Menelek's readiness to submit to their protectorate. Menelek had previously notified the chief European powers of his coronation at Entotto (14th December 1889), but Germany and Great Britain replied that such notification should have been made through the Italian government. Germany, moreover, wounded Menelek's pride by employing merely the title of "highness." The negus took advantage of the incident to protest against the Italian text of article 17, and to contend that the Amharic text contained no equivalent for the word "consent," but merely stipulated that Abyssinia "might" make use of Italy in her relations with foreign powers.

On the 28th of October 1890 Count Antonelli, negotiator of the treaty, was despatched to settle the controversy, but on arriving at Adis Ababa, the new residence of the negus, found agreement impossible either with regard to the frontier or the protectorate. On the 10th of April 1891, Menelek communicated to the powers his views with regard to the Italian frontier, and announced his intention of re-establishing the ancient boundaries of Ethiopia as far as Khartum to the north-west and Victoria Nyanza to the south. Meanwhile the marquis de Rudini, who had succeeded Antonelli in the interior, had arrived in Rome, and, after the perusal of article 17 even before he had heard of the failure of Antonelli's negotiations, Rudini was glad to leave the whole dispute in abeyance and to make with the local ras, or chieftains, of the high plateau an arrangement securing for Italy the cis-Mareb provinces of Seraè and Oukélé-Kusai under the rule of an allied native chief named Bath-Agos. Rudini, however, was able to conclude two protocols with Great Britain (March and April 1891) whereby the British government definitely recognized Abyssinia as within the Italian sphere of influence in return for an Italian recognition of British rights in the province of the Sultan of Dayrîm as a British protectorate. The period 1887–1890 was marked in Italy by great political activity.

The entry of Crispi into the Depretis cabinet as minister of the interior (4th April 1887) introduced into the government an element of vigour which had long been lacking. Though sixty-eight years of age, Crispi possessed an activity, a rapidity of decision and an energy in execution with which none of his contemporaries could vie. Within four months the death of Depretis (29th July 1887) opened for Crispi the way to the premiership. Besides assuming the presidency of the council of ministers and retaining the portfolio of the interior, Crispi took over the portmanteau of foreign affairs which Depretis had held since the resignation of Count di Robilant. One of the first questions with which he had to deal was that of conciliation between Italy and the Vatican. At the end of May the pope, in an allocation to the cardinals, had spoken of Italy in terms of unusual cordiality, and had expressed a wish for peace. A few days later Signor Bonghi, one of the framers of the Law of Guarantees, published in the Nuova Antologia a plea for reconciliation on the basis of an amendment to the Law of Guarantees and recognition by the pope of the title to Rome. The cabinet, tacitly recognizing a movement towards conciliation consisted, however, in the publication of a pamphlet entitled La Conciliazione by Father Tosti, a close friend and confidant of the pope, extolling the advantages of peace between Vatican and Quirinal. Tosti's pamphlet was known to represent papal ideas, and Tosti himself was persona grata to the Italian government. Reconciliation seemed within sight when suddenly Tosti's pamphlet was placed on the Index, ostensibly on account of a phrase, "The whole of Italy entered Rome by the breach of Porta Pia; the king cannot restore Rome to the pope, since Rome belongs to the Italian people."

On the 4th of June 1887 the official Vatican organ, the Osservatore Romano, published a letter written by Tosti to the pope conditionally retracting the views expressed in the pamphlet. The letter had been written at the pope's request, on the understanding that it should not be published. On the 15th of June the pope addressed to Cardinal Rampolla del Tindaro, secretary of state, a letter reiterating in uncompromising terms the papal claim to the temporal power, and at the end of July Cardinal Rampolla reformulated the same claim in a circular to the papal nuncios abroad. The dream of conciliation was at an end, but the Tosti incident had served once more to illustrate the true position of the Vatican in regard to Italy. It became clear that neither the influence of the regular clergy, of which the Society of Jesus is the most powerful embodiment, nor that of foreign clerical parties, which largely control the Peter's Pence fund, would ever permit renunciation of the papal claim to temporal power. France, and the French Catholics especially, feared lest conciliation should diminish the reliance of the Vatican upon terms favorable to Rome, and consequently French would hold over the other Vatican. The Vatican, for its part, felt its claim to "Roman Question," temporal power to be also valuable a pecuniary asset and too efficacious an instrument of church discipline lightly to be thrown away. The legend of an "imprisoned pope," subject to every whim of his gaullers, had never failed to arouse the pity and loosen the purse-strings of the faithful; dangerous innovators and would-be reformers within the church could be compelled to bow before the symbol of the temporal power, and their spirit of submission tested by their readiness to forgo the realization of their aims until the head of the church should be restored in his temporal sovereignty. It was the uppermost in the mind of all was the interest of the Roman curia, composed almost exclusively of Italians, to retain in its own hands the choice of the pontiff and to maintain the predominance of the Italian element and the Italian spirit in the ecclesiastical hierarchy. Conciliation with Italy would expose the pope and his Italian entourage to suspicion of being unduly subject to Italian political influence—of being, in a word, more Italian than Catholic. Such a suspicion would inevitably lead to a movement in favour of the internationalization of the curia and of the papacy. In order to avoid the danger of a clash on the uppermost of the aims of the curia, and, by perpetual reiteration of a claim incompatible with Italian territorial unity, to prove to the church at large that the pope and the curia were more Catholic than Italian. Such rigidity of principle need not be extended to the affairs of everyday contact between the Vatican and the Italian authorities, with regard to which, indeed, a tacit modus vivendi was easily attainable. Italy, for her part, could not go back upon the achievements of the Risorgimento by restoring Rome or any portion of Italian territory to the pope. She had hoped by conciliation to arrive at an understanding which would allow the church power, but not among the disruptive forces of the country, but she was keenly desirous to retain the papacy as a preponderatingly Italian institution, and was ready to make whatever formal concessions might have appeared necessary to reassure foreign Catholics concerning the reality of the pope's spiritual independence. The failure of the conciliation movement left profound irritation between Vatican and Quirinal, an irritation which, on the Vatican side, found expression in vivacious protests and in threats of leaving Rome and, on the Italian side, in the deposition of the syndic of the chief Syndic of the papal site. Further actions to retain vestiges of the anti-clerical provisions of the new penal code, and in the inauguration (9th June 1889) of a monument to Giordano Bruno on the very site of his martyrdom.

The internal situation inherited by Crispi from Depretis was very unsatisfactory. Extravagant expenditure on railways and public works, loose administration of finance, the cost of colonial enterprise, the growing demands for the army and navy, the pending tariff war with France, and the over speculation in building and in industrial ventures, which had absorbed all the financial resources of the country, had combined to produce a state of affairs calling for firm and radical treatment. Crispi, burdened by the premiership and by the two most important portfolios in the cabinet, was, however, unable to exercise efficient control over all departments of state. Nevertheless his administration was by no means unfruitful. Zanardelli,
minister of justice, secured in June 1888 the adoption of a new penal code; state surveillance was extended to the *opere pie*, or charitable institutions; municipal franchise was reformed by granting what was practically manhood suffrage with no limit of property: in view of a possible rupture of customary representation; and the central state administration was reformed by a bill fixing the number and functions of the various ministries. The management of finance was scarcely satisfactory, for though Giolitti, who had succeeded Magliani and Perazzi at the treasury, suppressed the former's illusory "pension fund," he lacked the fibre necessary to deal with the enormous deficit of nearly $10,000,000 in 1885-1886, the existence of which both Perazzi and he had recognized. The most successful feature of Crispi's term of office was his strict maintenance of order and the suppression of Radical and Irredentist agitation. So vigorous was his treatment of Irredentism that he dismissed without warning his colleague Seismik Doda, minister of finance, for having failed to protest against Irredentist speeches delivered in his presence at Udine. Firmness such as this secured for him the support of all constitutional elements, and after three years' premiership his position was infinitely stronger than at the outset. The general election of 1890 gave the cabinet an almost unwieldy majority, comprising four-fifths of the Chamber. A lengthy term of office seemed to be opening out before him when, on the 24th of June 1891, Crispi, speaking in a debate upon an unimportant bill, angrily rebuked the Right for its interminable interruptions. The rebuke infuriated the Conservative deputies, who, protesting against Crispi's words in the name of the "sacred memories" of their party, precipitated a division and placed the cabinet in a minority. The incident, whether due to chance or guile, brought about the resignation of Crispi. A few days later he was succeeded in the premiership by the marquis di Rudini, leader of the Right, who formed a coalition cabinet with Nicotera and a part of the Left.

The sudden fall of Crispi wrought a great change in the character of Italian relations with foreign powers. His policy had been characterized by extreme cordiality towards Austria and Germany, by a close understanding with Great Britain in regard to Mediterranean questions, and by an apparent animosity towards France, which at one moment seemed likely to lead to war. Shortly before the fall of the Depretis-Robilant cabinet Count Robilant had announced the intention of Italy to denounce the commercial treaties with France and Austria, which would lapse on the 31st of December 1887, and had intimated his readiness to negotiate new treaties. On the 26th of January 1890, Crispi, speaking in a debate upon a bill fixing the number and functions of the central state administration, introduced a new general tariff. The probability of the conclusion of a new Franco-Italian treaty was small, both on account of the protectionist spirit of France and of French resentment at the renewal of the triple alliance, but even such slight probability vanished after a visit paid to Bismarck by Crispi (October 1887) within three months of his appointment to the premiership. Crispi entertained no a priori animosity towards France, but was strongly convinced that Italy must emancipate herself from the position of political dependence on her powerful neighbour which had vitiated the foreign policy of the Left. So far was he from desiring a rupture with France, that he had subordinated his personal enmity towards Bismarck, aroused against him a hostility on the part of the French which he was never afterwards able to allay. France was equally careless of Italian susceptibilities, and in April 1888 Crispi made a futile but irritating attempt to enforce at Massawa the Ottoman régime of the capitulations in regard to non-Italian residents. In such circumstances the negotiations for the new commercial treaty could but fail, and though the old treaty was prolonged by special arrangement for two months, differential tariffs were put in force on both sides of the frontier on the 29th of February 1888. The value of French exports into Italy decreased immediately by one-half, while Italian exports to France decreased by nearly two-thirds. At the end of 1889 Crispi abolished the differential duties against French imports and returned to the support of the general Italian tariff, but France declined to follow his lead and the French Bourse suffered. Meanwhile the enthusiastic reception accorded to the young German emperor on the occasion of his visit to Rome in October 1888, and the cordiality shown towards King Humbert and Crispi at Berlin in May 1889, increased the tension of Franco-Italian relations; nor was it until after the fall of Prince Bismarck in March 1890 that Crispi adopted towards the Republic a more friendly attitude by sending an Italian squadron to salute President Carnot at Toulon. The chief advantage derived by Italy from Crispi's foreign policy was the increase of confidence in her government on the part of her allies and of Great Britain. On the occasion of the incident raised by Goblet with regard to Massawa, Bismarck made it clear to France that, in case of complications, Italy would not stand alone; and when in February 1888 a strong French fleet appeared to menace the Italian coast, the British Mediterranean squadron demonstrated its readiness to support Italian naval dispositions. Moreover, under Crispi's hand Italy awoke from the apathy of former years and gained consciousness of her place in the world. The conflict with France, the operations in Eritrea, the Triple Alliance, which the questions of Morocco and Bulgaria, were all used by him as means to stimulate national sentiment. With the instinct of a true statesman, he felt the pulse of the people, divined their need for prestige, and their preference for a government heavy-handed rather than lax. How great had been Crispi's power was seen by contrast with the policy of the Rudini cabinet which succeeded him in February 1891. Crispi's so-called "megalomania" gave place to retrenchment in home affairs and to a deferential attitude towards all foreign powers. The premiership was henceforth hailed by the Radical leader, Cavallotti, as a pledge of the non-renewal of the triple alliance, and against which the Radicals began a vociferous campaign.

Their tactics, however, produced a contrary effect, for Rudini, accepting proposals from Berlin, renewed the alliance in June 1891 for a period of twelve years. None of Rudini's public utterances justify the supposition that he assumed office with the intention of allowing the alliance to lapse on its expiry in May 1892; indeed, he frankly declared it to form the basis of his foreign policy. The attitude of several of his colleagues was more equivocal, but though they coquetted with French financiers in the hope of obtaining the saved indemnity, and for Italian securities, the precipitate renewal of the alliance destroyed all probability of a close understanding with France. The desire of Rudini to live on the best possible terms with all powers was further evinced in the course of a visit paid to Monza by M. de Giers in October 1891, when the Russian statesman was apprised of the entirely defensive nature of Italian engagements under the triple alliance. At the same time he carried to a successful conclusion negotiations begun by Crispi for the renewal of commercial treaties with Austria and Germany upon terms better than those of the old treaties, and secured some compensation for the reduction of Italian trade, and the increase of her commerce with France, and concluded with Great Britain conventions for the delimitation of British and Italian spheres of influence in north-east Africa. In home affairs his administration was weak and vacillating, nor did the economies effected in naval and military expenditure and in other departments suffice to strengthen the position of a cabinet which had disappointed the hopes of its supporters. On the 14th of April 1892 dissensions between ministers concerning the financial programme led to a cabinet crisis, and though Rudini succeeded in reconstituting his cabinet, he was defeated in the Chamber on the 5th of May and obliged to resign. King Humbert, who, from lack of confidence in Rudini, had declined to allow him to dissolve parliament, entrusted Signor Giolitti, a Piedmontese deputy, sometime treasury minister in the Crispi cabinet, with the formation of a ministry of
the Leit, which contrived to obtain six months' supply on account, and dissolved the Chamber.

The ensuing general election (November 1892), marked by unprecedented violence and abuse of official pressure upon the electorate, fitted in what proved to be the most unfortunate period of Italian history since the completion of national unity. The influence of Giolitti was based largely upon the favour of a court clique, and especially of Rattazzi, minister of the royal household. Early in 1893 a scandal arose in connexion with the management of state banks, and particularly of the Banca Romana, whose managing director, Tanlongo, had issued £2,500,000 of duplicate bank-notes. Giolitti scarcely improved matters by creating Tanlongo a member of the senate, and by denying in parliament the existence of any culpable order. This brought the hostility of the whole Chamber home, manifested by the uttermost hostility to Tanlongo, whom Giolitti, in consequence of an interpellation in the Chamber, was compelled to arrest. Arrests of other prominent persons followed, and on the 3rd of February the Chamber authorized the prosecution of De Zerbi, a Neapolitan deputy accused of corruption. On the 29th of February De Zerbi suddenly expired. For a time Giolitti successfully opposed inquiry into the conditions of the state banks, but on the 21st of March was compelled to sanction an official investigation by a parliamentary commission composed of seven members. On the 23rd of November the report of the commission was sent to the Chamber. Amid intense excitement it established that all Italian cabinets since 1880 had grossly neglected the state banks; that the two preceding cabinets had been aware of the irregularities committed by Tanlongo; that Tanlongo had heavily subsidized the press, paying as much as £20,000 for that purpose in 1888 alone; that a number of deputes, including several ex-ministers, had received from him loans of a considerable amount, which they had apparently made no effort to refund; that Giolitti had deceived the Chamber with regard to the state banks, and was open to suspicion of having, after the arrest of Tanlongo, abstracted a number of documents from the latter's papers before placing the remainder in the hands of the judicial authorities. In spite of the gravity of the charges formulated against many prominent men, the report merely "deplored" and "disapproved" of their conduct, without proposing penal proceedings. Fear of extending still farther a scandal which had already attained huge dimensions, and the desire to avoid any further shock to national credit, convinced the commissioners of the expediency of avoiding a long series of prosecutions. The report, however, scaled the fate of the Giolitti cabinet, and on the 24th of November it resigned. A general election was ordered.

Apart from the lack of scruple manifested by Giolitti in the bank scandals, he exhibited incompetence in the conduct of foreign and home affairs. On the 16th and 18th of August 1893 a number of Italian workmen were massacred at Aigues-Mortes. The French authorities, under whose eye the massacre was perpetrated, did nothing to prevent or repress it, and the mayor of Marseilles even refused to admit the wounded Italian workmen to the municipal hospital. These occurrences provoked anti-French demonstrations in many parts of Italy, and revived the chronic Italian dislike of France. In the meantime, the Albanian crisis grew worse. In Sicily, where the Italian foreign minister, Brin, began by demanding the punishment of the persons guilty of the massacre, but hastened to accept as satisfactory the anodyne measures adopted by the French government. Giolitti removed the prefect of Rome for not having prevented an expression of popular anger, and presented formal excuses to the French consul at Messina for a demonstration against that consulate. In the following December the French tribunal at Angoulême acquitted all the authors of the massacre. At home Giolitti displayed the same weakness. Riots at Naples in August 1893 and symptoms of unrest in Sicily found him, as usual, unprepared and vacillating. The closing of the French market to Sicilian produce, the devastation wrought by the phylloxera and the decrease of the sulphur trade had combined to produce in Sicily a discontent of which Socialist agitators took advantage to organize the workmen of the towns and the peasants of the country into groups known as fasci. The movement had no well-defined object. Here and there it was based upon a bastard Socialism, in other places it was made a means of municipal party warfare under the guidance of the local mafia, and in some districts it was simply popular effervescence against the local octrois on bread and flour. As early as January 1893 a conflict had occurred between the police and the populace, in which several men, women and children were killed, an occurrence used by the agitators further to inflame the populace. Instead of maintaining a firm policy, Giolitti allowed the movement to spread until, towards the autumn of 1893, he became alarmed and drafted troops into the island, though in numbers insufficient to check the riots. When the order was finally restored Giolitti assumed the aspect of an insurrection, and during the interval between his resignation (24th November) and the formation of a new Crispi cabinet (16th December) conflicts between the public forces and the rioters were frequent. The return of Crispi to power—a return imposed by public opinion as that of the only man capable of dealing with the desperate situation—marked the turning-point of the crisis. Intimately acquainted with the conditions of his native island, Crispi adopted efficacious remedies. The fasci were suppressed, Sicily was filled with troops, the reserves were called out, a state of siege proclaimed, military courts instituted and the whole movement crushed in a few weeks. The chief agitators were either sentenced to heavy terms of imprisonment or were compelled to flee the country. A simultaneous insurrection at Massa-Carrara was crushed with similar vigour. Crispi's methods aroused great outcry in the Radical press, but the severe sentences of the military courts were in time tempered by the Royal prerogative of amnesty.

But it was not alone in regard to public order that heroic measures were necessary. The financial situation inspired serious misgivings. While engagements contracted by Depretis in regard to public works had more than neutralized the normal increase of revenue from taxation, the whole credit of the state had been affected by the severe economic and financial crises of the years 1889-1893. The state banks, already hampered by maladministration, were encumbered by huge quantities of real estate which had been taken over as compensation for unredeemed mortgages. Baron Sidney Sonnino, minister of finance in the Crispi cabinet, found a prospective deficit of £5,680,000, and in spite of economies he was forced to oblige the House of Commons to pass an extraordinary vote of £4,000,000. All public expenditures were necessary to limit expenditure, and to provide new sources of revenue. Sonnino applied, and subsequently amended, the Bank Reform Bill passed by the previous administration (August 10, 1893) for the creation of a supreme state bank, the Bank of Italy, which was entrusted with the liquidation of the insolvent Banca Romana. The new law forbade the state banks to lend money on real estate, limited their powers of discounting bills and securities, and reduced the maximum of their paper currency. In order to diminish the gold premium, which under Giolitti had risen to 16½%, enforced currency was given to the existing notes, the Play-off of 1889. In Italy, where foreign loans were issued to meet immediate currency needs, Measures were enforced to prevent Italian holders of consols from sending their coupons abroad to be paid in gold, with the result that, whereas in 1883 £3,240,000 had been paid abroad in gold for the service of the January coupons and only £650,000 in paper in Italy, the same coupon was paid a year later with only £1,300,000 abroad and £2,540,000 at home. Economies for more than £1,000,000, were immediately effected, taxes, calculated to produce £2,440,000, were proposed to be placed upon land, incomes, salt and corn, while the existing income-tax upon consols (fixed at 8% by Cambrai-Digny in 1868, and raised to 13½% by Sella in 1879) was increased to 20% irrespectively of the stockholders' nationality. These proposals met with opposition so fierce as to cause a cabinet crisis, but Sonnino who resigned office as minister of finance,
returned to power as minister of the treasury, promulgated some of his proposals by royal decree, and in spite of vehement opposition secured their ratification by the Chamber. The tax upon consols, which, in conjunction with the other severe fiscal measures, was regarded abroad as a pledge that Italy intended at all costs to avoid bankruptcy, caused a rise in Italian stocks. When the Crispi cabinet fell in March 1896 Sonnino had the satisfaction of seeing revenue increased by £5,400,000, expenditure diminished by £2,800,000, the gold premium reduced from 16 to 9%, consolidated stock at 95 instead of 72, and, notwithstanding the expenditure necessitated by the Abyssinian War, financial equilibrium practically restored.

While engaged in restoring order and in supporting Sonnino's courageous struggle against bankruptcy, Crispi became the object of fierce attacks from the Radicals, Socialists, and anarchists. On the 26th of June an attempt by an anarchist named Lega was made on Crispi's life; on the 24th of June President Carnot was assassinated by the anarchist Caserio; and on the 30th of June an Italian journalist was murdered at Leghorn for a newspaper attack upon anarchism—a series of outrages which led the government to frame and parliament to adopt (11th July) a Public Safety Bill for the prevention of anarchist propaganda and crime. At the end of July the trial of the persons implicated in the Banca Romana scandal revealed the fact that among the documents abstracted by Giolitti from the papers of the bank manager, Tanlonghi, were several bearing upon Crispi's political and private relations. On the 11th of December Giolitti laid these and other papers before the Chamber, in the hope of ruining Crispi, but upon examination most of them were found to be worthless, and the rest of so private a nature as to be unfit for publication. The effect of the incident was rather to increase detestation of Giolitti than to damage Crispi. The latter, indeed, prosecuted the former for libel and for abuse of his position when premier, but after many vicissitudes, including the flight of Giolitti to Berlin in order to avoid arrest, the Chamber refused authorization for the prosecution, and the matter dropped in the face of the recent successes made against Crispi by the Radical leader Cavallotti, who advanced unproven charges of corruption and embezzlement. These attacks were, however, unavailing to shake Crispi's position, and in the general election of May 1895 his government obtained a majority of nearly 200 votes. Nevertheless public confidence in the efficacy of the parliamentary system and in the honesty of politicians was seriously diminished by these unsavoury occurrences, which, in combination with the acquittal of all the defendants in the Banca Romana trial, and the abandonment of the proceedings against Giolitti, reinforced to an alarming degree the propaganda of the revolutionary parties.

The foreign policy of the second Crispi Administration, in which the portfolio of foreign affairs was held by Baron Blanc, was, as before, marked by a cordial interpretation of the triple alliance, and by close accord with Great Britain. In the Armenian question Italy seconded with energy the diplomacy of Austria and Germany, while the Italian fleet joined the British Mediterranean squadron in a demonstration off the Syrian coast. Graver than any foreign question were the complications in Eritrea. Under the arrangement made by Rudolph von Wilka in 1889, Italian troops were garrisoned in the Italo-Abyysinian frontier districts, relations with Abyssinia had remained comparatively satisfactory. Towards the Sudan, however, the Mahdists, who had recovered from a defeat inflicted by an Italian force at Agordat in 1890, resumed operations in December 1893. Colonel Arimondi, commander of the colonial forces in the absence of the military governor, General Baratieri, attacked and routed a dervish force 10,000 strong on the 21st of December. The Italian troops, mostly native levies, numbered only 2000 men. The dervish loss was more than 1000 killed, while the total Italian casualties amounted to less than 250. General Baratieri, upon returning to the colony, decided to execute a campaign against the rebels, both in order to relieve pressure from that quarter and to preclude a combined Abyssinian and dervish attack upon the colony at the end of 1894. The protocol concluded with Great Britain on the 15th of April 1891, already referred to, contained a clause to the effect that, were Kassala occupied by the Italians, the place should be transferred to the Egyptian government as soon as the latter should be in a position to restore order in the Sudan. Concentrating a little army of 2600 men, Baratieri surprised and captured Kassala on the 17th of July 1894, and garrisoning the place with native levies under Italian officers. Meanwhile Menelek, jealous of the extension of Italian influence to a part of northern Somaliland and to the Benadir coast, had, with the support of France and Russia, completed his preparations for asserting his authority as independent ruler of Ethiopia. On the 11th of May 1893 he denounced the treaty of Ucchiali, but the Giolitti cabinet, absorbed by the bank scandals, paid no heed to his action. Possibly an adroit repetition in favour of Mangash and against Menelek of the policy formerly followed in favour of Menelek against the negus John might have consolidated Italian influence in Alifin by preventing the ascendency of any single chieftain. The Italian government, however, neglected this opening, and Mangash came to terms with Menelek. Consequently the efforts of Crispi and his envoy, Colonel Piano, to conclude a new treaty with Menelek in June 1894 not only proved unsuccessful, but formed a prelude to troubles on the Italo-Abyssinian frontier. Bath-Agos, the native chieftain who ruled the Okulé-Kusai and the cis-Mareb provinces on behalf of Italy, intrigued with Mangash, ras of the trans-Mareb province of Tigré, and with Menelek, in order that the imperial authority might be exercised in that plateau. In December 1894 the revolt broke out, under Major Toselli with a small force marched rapidly against Bath-Agos, whom he routed and killed at Halai. General Baratieri, having reason to suspect the complicity of Mangash in the revolt, called upon him to furnish troops for a projected Italo-Abyssinian campaign against the Mahdists. Mangash made no reply, and Baratieri crossing the Mareb advanced to Adowa, but four days later was obliged to return northwards. Mangash thereupon took the offensive and attempted to occupy the village of Coait in Okulé-Kusai, but was forestalled and defeated by Baratieri on the 13th of January 1895. Hurriedly strengthening his Senafé, hard pressed by the Italians, who shielded Senafé on the evening of the 15th of January, Mangash was obliged to abandon his camp and provisions to Baratieri, who also secured a quantity of correspondence establishing the complicity of Menelek and Mangash in the revolt of Bath-Agos.

The comparatively facile success achieved by Baratieri against Mangash seems to have led him to undervalue his enemy, and to forget that Menelek, negus and king of Shoa, had an interest in allowing Mangash to be crushed, in order that the imperial authority might be restored to the northern province. The superior military strength of Shoa against Tigré armed, and the superior quality of the enterprise to which they were committed by the occupation of Tigré is more than doubtful. Certainly Baratieri made no adequate preparations to repel an Abyssinian attempt to reconquer the province. Early in September both Mangash and Menelek showed signs of activity, and on the 20th of September Makonnen, ras of Harrar, who up till then had been regarded as a friend and quasi-ally by Italy, expelled all Italians from his territory and marched with 30,000 men to join the negus. On returning to Eritrea, Baratieri mobilized his native levies and pushed forward columns under Mazzetti and Toselli against Amba Alagi. Mangash fell back before the Italians, who obtained several minor successes; but on the 6th of December Toselli's column, 2000 strong, which
through a misunderstanding continued to hold Amba Alagi, was almost annihilated by the Abyssinian vanguard of 40,000 men. Toselli and all but three officers and 300 men fell at their posts after a desperate resistance. Arimondi, collecting the survivors of the Toselli column, retreated to Makallé and Adigrat. At Makallé, however, he left a small garrison in the fort, and on the 7th of January 1896 was invested by the Abyssinian army. Repeated attempts to capture the fort having failed, Menelek and Makonnen opened negotiations with Baratieri for its capitulation, and on the 21st of January the garrison, under Major Galliano, who had heroically defended the position, were permitted to march out with the honours of war. Meanwhile Baratieri received reinforcements from Italy, but remained undecided as to the best plan of campaign. Thus a month was lost, during which the Abyssinian army advanced to Hausen, a position slightly south of Adowa. The Italian commander attempted to treat with Menelek, but his negotiations merely enabled the Italian envoy, Major Salsa, to ascertain that the Abyssinians were nearly 100,000 strong mostly armed with rifles and well supplied with artillery. The Italians, including camp-followers, numbered less than 25,000 men, a force too small for effective action, but too large to be easily provisioned at 200 m. from its base, in a roadless, mountainous country, almost devoid of water. For a moment Baratieri thought of retreat, especially as the hope of creating a diversion from Zaila towards Harrar had failed in consequence of the British refusal to assist in the landing of an Italian force with supplies from France. The defection of a number of native allies (who, however, were attacked and defeated by Colonel Stevani on the 18th of February) rendered the Italian position still more precarious; but Baratieri, unable to make up his mind, continued to manoeuvre in the hope of drawing an Abyssinian attack. These futile tactics exasperated the home government, which on the 22nd of February despatched General Baldiressa, with strong reinforcements, to supersede Baratieri. On the 25th of February Crispi telegraphed to Baratieri, denouncing his operations as "military phthisis," and urging him to decide upon some plan of action. Menelek, however, by some success before the arrival of Baldiressa, and alarmed by the rapid diminution of his stores, which precluded further immobility, called a council of war (29th of February) and obtained the approval of the divisional commanders for a plan of attack. During the night the army advanced towards Adowa in three divisions, under Generals Dabormida, Arimondi and Albertone, each division being between 4000 and 5000 strong, and a brigade 3000 strong under General Ellena remaining in reserve. All the divisions, under Albertone, consisted chiefly of Italian troops. During the march Albertone's native division mistook the road, and found itself obliged to delay in the Arimondi column by retracing its steps. Marching rapidly, however, Albertone outdistanced the other columns, but, in consequence of allowing his men an hour's rest, arrived upon the scene of action when the Abyssinians, whom it had been hoped to surprise at dawn, were ready to receive the attack. Pressed by overwhelming forces, the Italians, after a violent combat, began to give way. The Dabormida division, unsupported by Albertone, found itself likewise engaged in a separate combat against superior numbers. Similarly the Arimondi brigade was attacked by 30,000 Shoans, and encumbered by the débris of Albertone's troops. Baratieri vainly attempted to push forward the reserve, but the Italians were already overwhelmed, and the battle—or rather, series of distinct engagements—ended in a general rout. The Italian loss is estimated to have been more than 6000, of whom 3125 were whites. Between 3000 and 4000 prisoners were taken by the Abyssinians, including General Albertone, while Generals Arimondi and Dabormida were killed and General Ellena wounded. The Abyssinians lost more than 5000 killed and 6000 wounded. Baratieri, after a futile attempt to direct the retreat, fled in haste and reached Adi-Cajé before the débris of his army. Thence he despatched telegrams to Italy throwing blame for the defeat upon his troops, a proceeding which subsequent evidence proved to be as unjustifiable as it was unsoldierlike. Placed under court-martial for his conduct, Baratieri was acquitted of the charge for having been led to give battle by other than military considerations, but the sentence “deplored that in such difficult circumstances the command should have been given to a general so inferior to the exigencies of the situation.”

In Italy the news of the defeat of Adowa caused deep discouragement and dismay. On the 5th of March the Crispi cabinet resigned before an outburst of indignation which the Opposition had assiduously fomented, and five days later a new cabinet was formed by General Ricotti-Magnani, who, however, made over the premiership to the marquis di Rudini. The latter, though leader of the Right, had long been intriguing with Cavallotti, leader of the Extreme Left, to overthrow Crispi, but without the disaster of Adowa his plan would scarcely have succeeded. The first act of the new cabinet was to give instructions given by its predecessor to General Baldiressa (who had succeeded General Baratieri on the 2nd of March) to treat for peace with Menelek if he thought desirable. Baldiressa opened negotiations with the negus through Major Salsa, and simultaneously reorganized the Italian army. The negotiations having failed, he marched to relieve the beleaguered garrison of Adigrat; but Menelek, discouraged by the heavy losses at Adowa, broke up his camp and returned southwards to Shoa. At the same time Baldiressa detached Colonel Stevani with four native battalions to relieve Kassala, then hard pressed by the Meneleks. Kassala was relieved on the 1st of April, and Stevani a few days later severely defeated the derivas at Jebel Mokram and Tcruff. Returning from Kassala Colonel Stevani rejoined Baldiressa, who on the 4th of May relieved Adigrat after a well-executed march. By adroit negotiations with Mangashà the Italian general obtained the release of the Italian prisoners in Tigré, and towards the end of May withdrew his whole force north of the Mareb. Major Nerazzini was then despatched as special envoy to the negus to arrange terms of peace. On the 26th of October, however, in concluding, Adis Ababa, a provisional treaty annulling the treaty of Uccialli; recognizing the absolute independence of Ethiopia; postponing for one year the definitive delimitation of the Italo-Abyssinian boundary, but allowing the Italians meanwhile to hold the strong Mareb-Belesa-Muna line; and arranging for the release of the Italian prisoners after ratification of the treaty in exchange for an indemnity of which the amount was to be fixed by the Italian government. The treaty having been duly ratified, and an indemnity of £400,000 paid to Menelek, the Shoan prisoners were released, and Major Nerazzini succeeded in concluding, Kassala and (i) Abyssini-

ment.
Anglo-Egyptian authorities. Under Signor Ferdinando Martinetti's able administration (1898-1906) the cost of the colony to Italy was reduced and its trade and agriculture have vastly improved.

While marked in regard to Eritrea by vacillation and undisguised readiness to yield to Radical clamour, the policy of the marquis di Rudini was in other respects chiefly characterized by a desire to demolish Crispi and his supporters. Actuated by rancour against Crispi, he, on the 29th of April 1896, authorized the publication of a Green Book on Abyssinian affairs, in which, without the consent of Great Britain, the confidential Anglo-Italian negotiations in regard to the Abyssinian war were disclosed. This publication, which amounted to a gross breach of diplomatic confidence, might have endangered the cordiality of Anglo-Italian relations, and when, in March, Rudini had resolved to leave the British government for General Ferrero, Italian ambassador in London, induced it to overlook the incident. Fortunately for Italy, the marquis Visconti Venosta shortly afterwards consented to assume the portfolio of foreign affairs, which had been resigned by Duke Caetani di Sermoneta, and again to place, after an interval of twenty years, his unrivalled experience at the service of his country. In September 1896 he succeeded in concluding with France a treaty with regard to Tunisia in place of the old Italo-Tunisian treaty, denounced by the French Government a year previously. When, through the great War of 1896-1897, Venosta laboured to maintain the European concert, joined Great Britain in preserving Greece from the worst consequences of her folly, and lent moral and material aid in establishing an autonomous government in Crete. At the same time he mitigated the Francophil tendencies of some of his colleagues, accompanied King Humbert and Queen Margherita on their visit to Homburg in September 1897, and, by loyal observance of the spirit of the triple alliance, retained for Italy the confidence of her allies without forfeiting the goodwill of France.

The home administration of the Rudini cabinet compared unfavourably with that of foreign affairs. Bound by a secret understanding with the Radical leader Cavallotti, an able but unscrupulous demagogue, Rudini was compelled to bow to Radical exigencies. He threw all the influence of the government against Crispi, who was charged with complicity in embezzlements perpetrated by Favilla, managing director of the Bologna branch of the Bank of Naples. After being subjected to persecution for nearly two years, Crispi's character was substantially vindicated by the report of a parliamentary commission appointed to inquire into his relations with Favilla. True, the commission pronounced itself the Chamber. That it adopted a resolution upon Crispi's conduct in 1894, when, as premier and minister of the interior, he had borrowed £12,000 from Favilla to replenish the secret service fund, and had subsequently repaid the money as instalments for secret service were in due course furnished by the treasury. Though irregular, his action was to some extent justified by the depletion of the secret service fund under Giolitti and by the abnormal circumstances prevailing in 1893-1894, when he had been obliged to quell the insurrections in Sicily and Massa-Carrara. But the Rudini-Cavallotti alliance was destined to produce other results than those of the campaign against Crispi. Pressed by Cavallotti, Rudini in March 1897 dissolved the Chamber and conducted the general election in such a way as to crush by government pressure the partisans of Crispi, and greatly to strengthen the (Socialist, Republican and Radical) revolutionary parties. More than ever at the mercy of the Radicals and of their revolutionary allies, Rudini continued so to administer public affairs that subversive propaganda and associations obtained unprecedented extension. The effect was seen in May 1898, when, in consequence of a rise in the price of bread, disturbances occurred in southern Italy. The corn duty was reduced to meet the emergency, but the disturbed area extended to Naples, Foggia, Bari, Minerbio-Murge, Molfetta and thence along the line of railway which skirts the Adriatic coast. At Faenza, Pescaena, Cremona, Pavia, and Milan, where subversive associations were stronger, it assumed the complexion of a political revolt. From the 7th to the 9th of May Milan remained practically in the hands of the mob. A palace was sacked, barricades were erected and for forty-eight hours the troops under General Bava-Beccaris, notwithstanding the employment of artillery, were unable to restore order. In one of these occurrences, Rudini authorized the proclamation of a state of siege at Milan, Florence, Leghorn and Naples, delegating the suppression of disorder to special military commissioners. By these means order was restored, though not without considerable loss of life at Milan and elsewhere. At Milan alone the official returns confessed to eighty killed and several hundred wounded, a total generally considered below the real figures. As in 1894, excessively severe sentences were passed by the military tribunals upon revolutionary leaders and other persons considered to have been implicated in the disturbances, and several royal amnesties obliterated these condemnations within three years.

No Italian administration since the death of Depretis underwent so many metamorphoses as that of the marquis di Rudini. Modified a first time within five months of its formation (July 1896) in connexion with General Ricotti's Army Reform Bill, and again in December 1897, when Zanardelli entered the cabinet, it was reconstructed for a third time at the end of May 1898 upon the question of a Public Safety Bill, but fell for the fourth and last time on 25th June 1899, on the matter of public indignation at the results of Rudini's home policy and the measures taken for the repression of the riots. On the 29th of June Rudini was succeeded in the premiership by General Luigi Pelloux, a Savoyard, whose only title to office was the confidence of the king. The Pelloux cabinet possessed no clear programme except in regard to the Public Safety Bill, which it had taken over from its predecessor. Presented to parliament in November 1898, the bill was read a second time in the following spring, but its third reading was violently obstructed by the Socialists, Radicals and Republicans of the Extreme Left. After a series of scenes and scuffles the bill was passed, only to be promulgated by royal decree, but postponed to allow time for the third reading. Again obstruction precluded debate, and on the 22nd of July 1899 the decree automatically acquired force of law, pending the adoption of a bill of indemnity by the Chamber. In February 1900 it was, however, quashed by the supreme court on a point of procedure, and the Public Safety Bill as a whole had again to be presented to the Chamber. In view of the violence of Extremist obstruction, an effort was made to reform the standing orders of the Lower House, but parliamentary feeling ran so high that General Humbert thought it expedient to appeal to the country. The general election of June 1900 not only failed to reinforce the cabinet, but largely increased the strength of the extreme parties (Radicals, Republicans and Socialists), who in the new Chamber numbered nearly 100 out of a total of 508. General Pelloux therefore resigned, and on the 24th of June a moderate Liberal cabinet was formed by the aged Signor Saracco, president of the senate. Within five weeks of its formation King Humbert was shot by an anarchist assassin named Bresci while leaving an athletic festival at Monza, where his Majesty had distributed the prizes (20th July 1900). The death of the unfortunate monarch, against whom an attempt had previously been made by the anarchist Acciarito (22nd April 1897), caused an outburst of profound sorrow and indignation. Though not a great monarch, King Humbert had, by his unfailing generosity and personal courage, won the esteem and affection of his people. During the cholera epidemic at Naples and Brescia in 1884, and the Ischia earthquake of 1885; he, regardless of danger, brought relief and encouragement to sufferers, and rescued many lives. More than £100,000 of his civil list was annually devoted to charitable purposes. Humbert was succeeded on his only son, Victor Emmanuel III. (b. November 11, 1869), a liberal-minded and well-educated prince, who at the time of his father's assassination was returning from a cruise in the eastern Mediterranean. The remains of King Humbert were laid to rest in the Pantheon at Rome beside those of his father, Victor Emmanuel II. (9th August). Two
The later course of Italian foreign policy was marked by many vicissitudes. Admiral Canavaro, who had gained distinction as commander of the international forces in Crete (1896-1898), assumed the direction of foreign affairs in the first period of the Pelloux administration. His diplomacy, though energetic, lacked steadiness. Soon after taking office he completed the negotiations begun by the Rudini administration for a new commercial treaty with France (October 1899), whereby Franco-Italian commercial relations were placed upon a more liberal footing. While the treaty had been in force for less than ten years. By the dispatch of a squadron to South America America he obtained satisfaction for injuries inflicted thirteen years previously upon an Italian subject by the United States of Colombia. In December 1898 he convoked a diplomatic conference in Rome to discuss secret means for the repression of anarchist propaganda and crime in view of the assassination of the emperor of Austria by an Italian anarchist (Luccheni), but it is doubtful whether results of practical value were achieved. The action of the tsar of Russia in convening the Peace Conference at the Hague in February 1899 led to a rise in propaganda in favor of the Vatican to be officially represented, and Admiral Canavaro, supported by Great Britain and Germany, succeeded in preventing the invitation of a papal delegate. Shortly afterwards his term of office was brought to a close by the failure of an attempt to secure for Italy a coaling station at Samnem and a sphere of influence in China; but his policy of active participation in Chinese affairs was continued in a modified form by his successor, the Marquis Visconti Venosta, who, entering the reconstructed Pelloux cabinet in May 1899, retained the portfolio of foreign affairs in the ensuing Saracco administration, and secured the dispatch of a Franco-Italian expeditionary force in that year to quelling the Chinese outbreak and in protecting Italian interests in the Far East (July 1900). With characteristic foresight, Visconti Venosta promoted an exchange of views between Italy and France in regard to the Tripolitan hinterland, which the Anglo-French convention of 1890 had placed within the French sphere of influence—a modification of the status quo ante considered highly detrimental to Italian aspirations in Tripoli. For this reason the Anglo-French convention had caused profound irritation in Italy, and had tended somewhat to diminish the cordial relations between Italian and French railways. It is believed, however, to have obtained from France a formal declaration that France would not transgress the limits assigned to her influence by the convention. Similarly, in regard to Albania, Visconti Venosta exchanged notes with Austria with a view to the prevention of any misunderstanding through the conflict between Italian and Austrian interests in that part of the Adriatic coast. Upon the fall of the Saracco cabinet (9th February 1901) Visconti Venosta was succeeded at the foreign office by Signor Primetti, a Lombard manufacturer of strong temperament, but without previous diplomatic experience. The new minister continued in most respects the policy of his predecessor. The outset of his administration was marked by Franco-Italian fêtes at Toulon (10th to 14th April 1901), when the Italian fleet returned a visit paid by the French Mediterranean squadron to Cagliari in April 1899; and by the despatch of three Italian warships to Prevesa to obtain satisfaction for damage done to Italian subjects by Turkish officials. The Saracco administration, formed after the obstructionist crisis of 1899–1900 as a cabinet of transition and pacification, was overthrown in February 1901 in consequence of its vacillating conduct towards a dock strike at Genoa. It was succeeded by a Zanardelli cabinet, in which the portfolio of the interior was allotted to Giolitti. Composed mainly of elements drawn from the Left, and dependent for a majority upon the support of the subversive groups of the Extreme Left, the formation of this cabinet gave the signal for a vast working-class movement, during which the Socialist party sought to extend its political influence by means of strikes and the organization of labour leagues among agricultural labourers and artisans. The movement was confined chiefly to the northern and central provinces. During the first six months of 1901 the strikes numbered 600, and involved more than 1,000,000 workmen.

G. 1902–1909

In 1901-1902 the social economic condition of Italy was a matter of grave concern. The strikes and other economic agitations at this time may be divided roughly into three groups: strikes in industrial centres for higher wages, shorter hours and better labour conditions generally; strikes of agricultural labourers in northern Italy for better contracts with the landlords; disturbances among the south Italian peasantry due to low wages, unemployment (particularly in Apulia), and the claims of the labourers to public land occupied illegally by the landlords, combined with local feuds and the struggle for power of the various influential families. The prime cause in most cases was the unsatisfactory economic condition of the working classes, which they realized all the more vividly for the very improvements that had been made in it, while education and better communications enabled them to compare the conditions of their cousins living in America and France.

The government was faced by the possibility of a strike which would paralyse the whole economic life of the country. Then the Turin gas men struck, and a general "sympathy" strike broke out in that city in consequence, which resulted in scenes of violence lasting two days. The government called out all the railwaymen who were army reservists, but continued to keep them at their railway work, exercising military discipline over them and thus ensuring the continuance of the service. At the same time it mediated between the companies and the employees, and in June a settlement was formally concluded between the ministers of public works and of the treasury and the directors of the companies concerning the grievances of the employees.

One consequence of the agrarian agitations was the increased use of machinery and the reduction in the number of hands employed, which if it proved advantageous to the landlord and to the few labourers retained, who received higher wages, resulted in an increase of unemployment. The Socialist party, which had grown powerful under a series of weak-kneed administrations, now began to show signs of division; on the one hand there was the revolutionary wing, led by Signor Enrico Ferri, the Mantuan deputy, which advocated a policy of uncompromising class warfare, and on the other the "riformisti", or moderate Socialists, led by Signor Filippo Turati, deputy for Milan, who adopted a more conciliatory attitude and were ready to ally themselves with other parliamentary parties. Later the division took another
aspect, the extreme wing being constituted by the sindacalisti, who were opposed to all legislative parliamentary action and favoured only direct revolutionary propaganda by means of the sindacato or unions which organized strikes and demonstrations. In March 1902 agrarian strikes organized by the leghe broke out in the district of Cesarò and Polesine (lower valley of the Po), leading to a dispute about the labour contracts, and in Apulia on account of unemployment. In August there were strikes among the dock labourers of Genoa and the iron workers of Florence; the latter agitation developed into a general strike in that city, which aroused widespread indignation among the orderly part of the population and ended without any definite result. At Como 15,000 textile workers remained on strike for nearly a month, but there were no disorders.

The year 1903, although not free from strikes and minor disturbances, was quieter, but in September 1903 a very serious situation was brought about by a general economic and political agitation. The troubles began with the disturbances at Buggerru in Sardinia and Castelluzzo in Sicily, in both of which places the troops were compelled to use their arms and several persons were killed and wounded; at a demonstration at Sestri Ponente in Liguria to protest against what was called the Buggerru “massacre,” four carabiniers and eleven rioters were injured. The Monz labour exchange then took the initiative of proclaiming a general strike throughout Italy (September 19), and a protest against the government for daring to maintain order. This was the spark that started a wave of disorders which spread from Buggerru to nearly all the industrial centres, although in many places it was limited to a few trades. At Milan it was more serious and lasted longer than elsewhere, as the movement was controlled by the anarchists under Arturo Labriola; the hooligans committed many acts of savage violence, especially against those workmen who refused to strike, and much property was wilfully destroyed. At Genoa, which was in the hands of the tettiisti for a couple of days, three persons were killed and 30 wounded, including 14 policemen, and railway communications were interrupted for a short time. Vercelli was cut off from the mainland for two days and all the public services were suspended. Riots broke out also in Naples, Florence, Rome and Bologna. The deputies of the Extreme Left, instead of using their influence in favour of pacification, could think of nothing better than to demand an immediate convocation of parliament in order that they might present a bill forbidding the troops and police to use their arms in all conflicts between capital and labour, whatever the provocation might be. This preposterous proposal was of course not even discussed, and the movement caused a strong feeling of reaction against the syndicalist propaganda and of hostility to the government for its weakness; for, however much sympathy there might be with the genuine grievances of the working classes, the September strikes were of a frankly revolutionary character and had been fomented by professional agitators and kept going by the drags of the people.

The mayor of Venice sent a firm and dignified protest to the government for its inaction, and the people of Liguria raised a large subscription in favour of the troops, in recognition of their gallantry and admirable discipline during the troubles.

Early in 1903 there was a fresh agitation among the railway servants, who were dissatisfied with the clauses concerning their personnel in the bill for the purchase of the lines by the state. They initiated a system of obstruction which hampered and delayed the traffic until altogether suspending it. On the 17th of April a general railway strike was ordered by the union, but owing to the action of the authorities, who for once showed energy, the traffic was carried on. Other disturbances of a serious character occurred among the steelworkers of Terni, at Grangimichele in Sicily and at Alessandria. The extreme parties now began to direct especial attention to propaganda in the army, with a view to destroying its cohesion and thus paralysing the action of the government. The campaign was conducted on the lines of the anti-militarist movement in France identified with the name of Hervé. Fortunately, however, this policy was not successful, as military service is less unpopular in Italy than in many other countries; aggressive militarism is quite unknown, and without it anti-militarism can gain no foothold. No serious mutinies have ever occurred in the Italian army, and the only results of the propaganda were occasional meetings of hooligans, where Hervéists sentiments were expressed and applauded, and a few minor disturbances among reservists unexpectedly called back to the colours. In the army itself the esprit de corps and the sense of duty and discipline nullified the work of the propagandists.

In June and July 1907 there were again disturbances among the agricultural labourers of Ferrara and Rovigo, and a widespread strike organized by the leghe throughout those provinces caused very serious losses to all concerned. The leghiste, moreover, were guilty of much criminal violence; they committed one murder and established a veritable reign of terror, boycotting, beating and wounding numbers of peaceful labourers who would not join the unions, and brutally maltreating solitary policemen and soldiers. The authorities, however, by arresting a number of the more prominent leaders succeeded in restoring order. Almost immediately afterwards an agitation of a still less defensible character broke out in various towns under the guise of anti-clericalism. Certain scandals had come to light in a small convent school at Greco near Milan. This was seized upon as a pretext for violent anti-clerical demonstrations all over Italy and for brutal and unprompted attacks on unoffending priests; at Spezia a church was set on fire and another dismantled, at Marino Cardinal Merry del Val was attacked by a gang of hoodlums and at Rome the violence of the tettiisti reached such a pitch as to cause an alarm on the part of all respectable people, and some of the aggressors were very roughly handled. The Socialists and the Freemasons were largely responsible for the agitation, and they filled the country with stories of other priests and conventual immoralities, nearly all of which, except the original case at Greco, proved to be without foundation. In September 1907 disorders in Apulia over the repartition of communal lands broke out anew, and were particularly serious at Ruvo, Bari, Cerignola and Gallipoli and Gallipoli. In some cases there was foundation for the labourers’ claims, but unfortunately the movement got into the hands of professional agitators and common swindlers, and the leader, a certain Giampetruzzi, who at one time seemed to be a worthy colleague of Marcellin Albert, was afterwards tried and condemned for having cheated his own followers.

In October 1907 there was again a general strike at Milan, which was rendered more serious on account of the action of the railway servants, and extended to other cities; traffic was disorganized over a large part of northern Italy, until the government, being now owner of the railways, dismissed the syndicalist agitators. This had the desired effect, and although the sindacato dei ferrovieri (railway servants’ union) threatened a general railway strike if the dismissed men were not reinstated, there was no further trouble. In the spring of 1908 there were agrarian strikes at Parma; the labour contracts had pressed hard on the peasantry, who had cause for complaint; but while some improvement had been effected in the new contracts, certain unscrupulous demagogues, of whom Alceste De Ambris, representing the “syndicalist” wing of the Socialist party, was the chief, organized a widespread agitation. The landlords on their part organized an agrarian union to defend their interests and enrolled numbers of non-unionists who were carried on the necessary work and save the crops. Conflicts occurred between the strikers and the independent labourers and the police; the trouble spread to the city of Parma, where violent scenes occurred when the labour exchange was occupied by the troops, and many soldiers and policemen, whose behaviour as usual was exemplary throughout, were seriously wounded. The agitation ceased in June with the defeat of the strikers, but not until a vast amount of damage had been done to the crops and all had suffered heavy losses, including the government, whose expenses for the maintenance of public order ran into tens of millions of lire. The failure of the strike caused the Socialists to quarrel among themselves and to accuse each other of dishonesty in the management of party funds; it appeared in fact
that the large sums collected throughout Italy on behalf of the strikers had been squandered or appropriated by the "syndicalist" leaders. The spirit of indiscipline had begun to reach the lower classes of state employees, especially the school teachers and the postal and telegraph clerks, and at one time it seemed as though the counties were about to face a situation similar to that which arose in France in the spring of 1900. Fortunately, however, the government, by dismissing the ringleader, Dr. Campanozzi, in time nipped the agitation in the bud, and it did attempt to redress some of the genuine grievances. Public opinion upheld the government in its attitude, for all persons of common sense realized that the suspension of the public services could not be permitted for a moment in a civilized country.

In parliamentary politics the most notable event in 1902 was the settlement of a divorce bill by Signor Zanardelli's government; this was done not because there was any real demand for it, but to please the doctrinaire anti-clericals and freemasons, divorce being regarded not as a social institution but as a weapon against Catholicism. But while the majority of the deputies were nominally in favour of the bill, the parliamentary committee reported against it, and public opinion was so hostile that an anti-divorce petition received 3,500,000 signatures, including not only those of professing Catholics, but of free-thinkers and Jews, who regarded divorce as an institution hostile to Italian conditions. The petition outside parliament was in fact so overwhelming that the ministry decided to drop the bill. The financial situation continued satisfactory; a new loan at 3½% was voted by the Chamber in April 1902, and by June the whole of it had been placed in Italy. In October the rate of exchange was at par, the premium on gold had disappeared, and by the end of the year the budget showed a surplus of sixteen millions.

In January 1903 Signor Prinetti, the minister for foreign affairs, resigned on account of ill-health, and was succeeded by Admiral Morin, while Admiral Bettolo took the latter's place as minister of marine. The unpopularity of the ministry forced Signor Giolitti, the minister of the interior, to resign (June 1903), and he was followed by Admiral Bettolo, whose administration had been violently attacked by the Socialists; in October Signor Zanardelli, the premier, resigned on account of his health, and the king entrusted the formation of the cabinet to Signor Giolitti. The latter accepted the task, and the new administration included Signor Tittoni, late prefect of Naples, as foreign minister, Signor Luigi Luzzatti, the eminent financier, at the treasury, General Pedotti at the war office, and Admiral Mirabello as minister of marine conditions. Immediately upon his appointment Signor Tittoni accompanied the king and queen of Italy on a state visit to France and then to England, where various international questions were discussed, and the cordial reception which the royal pair met with in London and at Windsor served to dispel the small cloud which had arisen in the relations of the two countries on account of the Tripoli agreements and the language question in Malta. The premier's programme was not well received by the Chamber, although the treasury minister's financial statement was again satisfactory. The weakness of the government in dealing with the strike riots caused a feeling of profound dissatisfaction, and the so-called "experiment of liberty," conducted with the object of conciliating the extreme parties, proved a dismal failure. In October 1904, after the September strikes, the Chamber was dissolved, and at the general elections in November a ministerial majority was returned, while the deputies of the Extreme Left (Socialists, Republicans and Radicals) were reduced from 107 to 94, and a few mild clericals elected. The municipal elections in several of the larger cities, which had hitherto been regarded as strongholds of socialism, marked an overwhelming triumph for the constitutional parties, notably in Milan, Turin, and Genoa, for the strikes had wrought much harm to the working classes as to the bourgeoisie. In spite of its majority the Giolitti cabinet, realizing that it had lost its hold over the country, resigned in March 1905.

Signor Fortis then became premier and minister of the interior, Signor Maiorano finance minister and Signor Carcano treasury minister, while Signor Tittoni, Admiral Mirabello and General Pedotti retained the portfolios they had held in the previous administration. The new government was colourless in the extreme, and the premier's programme aroused no enthusiasm in the House, the most important bill presented being that for the purchase of the railways, which was voted in June 1905. But the ministry never had any real hold over the country or parliament, and the dissatisfaction caused by the modus vivendi with Spain, which would have wrought much injury to the Italian wine-growers, led to demonstrations and riots, and a hostile vote in the Chamber produced a cabinet crisis (December 17, 1905); Signor Fortis, however, reconstructed the ministry, including the marquis di San Giuliano to accept the portfolio of foreign affairs. This last fact was significant, as the new foreign secretary, a Sicilian deputy and a specialist on international politics, had hitherto been one of Signor Sonnino's staunchest adherents; his defection, which was but one of many, showed that the more prominent members of the Sonnino party were tired of waiting in vain for their chief's access to power. Even this cabinet was still-born, and a hostile vote in the Chamber on the 30th of January 1906 brought about its fall.

Now at last, after waiting so long, Signor Sonnino's hour had struck, and he became premier for the first time. This result was most unexpected to all the best informed in the country, and great hopes were entertained that the advent of a rigid and honest statesman would usher in a new era of Italian parliamentary life. Unfortunately at the very outset of its career the composition of the new cabinet proved disappointing; for while such men as Count Guicciardini, the minister for foreign affairs, and Signor Luzzatti at the treasury commanded general approval, the choice of Signor Sacchi as minister of justice and of Signor Pantano as minister of agriculture and trade, both of them advanced and militant Radicals, savoured of an unholy compact between the premier and his erstwhile bitter enemies, whilst the continuance of the administration for this unfortunate combination Signor Sonnino himself was not altogether to blame; having lost many of his most faithful followers, who, weary of waiting for office, had gone over to the enemy, he had been forced to seek support among men who had professed hostility to the existing order of things and thus to secure at least the neutrality of the Extreme Left and make the public realize that the "redest" of Socialists, Radicals and Republicans may be tamed and rendered harmless by the offer of cabinet appointments. A similar appointment to Signor Maiorano's ministerial career, which had been on the point of success. Unfortunately in the case of Signor Sonnino public opinion expected too much and did not take to the idea of such a compromise. The new premier's first act was one which cannot be sufficiently praised: he suppressed all subsidies to journalists, and although this resulted in bitter attacks against him in the columns of the "reptile press" it commanded the approval of all right-thinking men. Signor Sonnino realized, however, that his majority was not to be counted on; "The country is with me," he said to a friend, "but the Chamber is against me." In April 1906 an eruption of Mount Etna caused the destruction of several villages and much loss of life and damage to property; in appointing a committee to distribute the relief funds the premier refused to include any of the deputies of the devastated districts among its members, and when asked by them for the reason of this omission, he replied, with a frankness more characteristic of the man than political, that he knew they would prove more solicitous in the distribution of relief for their own electors than for the real sufferers. A motion presented by the Socialists in the Chamber for the immediate discussion of a bill to prevent the massacres of the proletariat having been rejected by an enormous majority, the 48 Socialist deputies resigned their seats; on presenting themselves for re-election their number was reduced to 25. A few days later the ministry, having received an adverse vote on a question of procedure, sent in its resignation (May 17).
The fall of Signor Sonnino, the disappointment caused by the non-fulfilment of the expectations to which his advent to power had given rise throughout Italy and the dearth of influential statesmen, made the return to power of Signor Giolitti inevitable. An appeal to the country might have brought about a different result, but it is said that opposition from the higher quarters rendered this course practically impossible. The change of government brought Signor Tittoni back to the Foreign Office; Signor Maiorano became treasury minister. General Viganò, minister of war, Signor Cocco Ortù, whose chief claim to consideration was the fact of his being a Sardinian (the island had rarely been represented in the cabinet) minister of agriculture, Signor Gianturco of justice, Signor Massimini of finance, Signor Schanzier of posts and telegraphs and Signor Fusinato of education. The new ministry began auspiciously with the conversion of the public debt from 4% to 3 1/2% to be eventually reduced to 3 1/2%. This operation had been prepared by Signor Luzatti under Signor Sonnino's leadership, and although carried out by Signor Maiorano it was Luzatti who deservedly reaped the honour and glory; the bill was presented, discussed and voted by both Houses on the 29th of June, and by the 7th of July the conversion was completed most successfully, showing on how sound a basis Italian finance was now placed. The surplus for the year amounted to 65,000,000 lire. In November Signor Gianturco died, and Signor Pietro Bertolini took his place as minister of public works; the latter proved perhaps the ablest member of the cabinet, but the acceptance of office under Giolitti of a man who had been one of the most trusted and valuable lieutenants of Signor Sonnino marked the last step in the déringolade of that statesman's party, and was attributed to the fact that Signor Bertolini resented not having had a place in the late Sonnino ministry. General Viganò was succeeded in December by Senator Casana, the first civilian to become minister of war in Italy. He made various reforms which were badly wanted in army administration, but on the whole the experiment of a civilian "War Lord" was not a complete success, and in April 1909 Senator Casana retired and was succeeded by General Spingardi, an appointment which received general approval.

The elections of March 1909 returned a chamber very slightly different from its predecessor. The ministerial majority was over three hundred, and although the Extreme Left was somewhat increased in numbers it was weakened in tone, and many of the newly elected "reds" were hardly more than pale pink.

Meanwhile, the relations between Church and State began to show signs of change. The chief supporters of the claims of the papacy to temporal power were the clericals of France and Austria, but in the former country they had lost all influence, and the situation between the Church and the government was becoming every day more strained.

With the rebellion of her "Eldest Daughter," the Roman Church could not continue in her old attitude of uncompromising hostility towards United Italy, and the Vatican began to realize the folly of placing every Italian in the dilemma of being either a good Italian or a good Catholic, when the majority wished to be both. Outside of Rome relations between the clergy and the authorities were as a rule quite cordial, and in May 1903 Cardinal Sarto, the patriarch of Venice, asked for and obtained an audience with the king when he visited that city, and the meeting which followed was of a very friendly character. In July following Leo XIII. died, and that same Cardinal Sarto became pope under the style of Pius X. The new pontiff, although nominally upholding the claims of the temporal power, in practice attached but little importance to it. At the elections for the local bodies the Catholics had already been permitted to vote, and, availing themselves of the privilege, they gained seats in many municipal councils and obtained the majority in some. At the general parliamentary elections of 1904 a few Catholics had been elected as such, and the encyclical of the 11th of June 1905 on the political organization of the Catholics, practically abolished the non expedit. In September of that year a number of religious institutions in the Near East, formerly under the protectorate of the French government, in view of the rupture between Church and State in France, formally asked to be placed under Italian protection, which was granted in January 1907. The situation thus became the very reverse of what it had been in Crispi's time, when the French government, even when anti-clerical, protected the Catholic Church abroad for political purposes, whereas the conflict between Church and State in Italy extended to foreign countries, to the detriment of Italian political interests. A more difficult question was the religious education in the public elementary schools. Signor Giolitti wished to reconcile the Vatican by facilitating religious education, which was desired by the majority of the parents, but he did not wish to offend the Freemasons and other anti-clericals too much, as they could always give trouble at awkward moments. Consequently the minister of education, Signor Rava, concocted a body of rules which, it was hoped, would satisfy every one: religious instruction was to be maintained as a necessary part of the curriculum, but in communes where the majority of the municipal councillors were opposed to it it might be suppressed; the council in that case might, however, facilitate the teaching of religion to those children whose parents desire it. In practice, however, when the council has suppressed religious instruction no such facilities are given. At the general elections of March 1909, over a score of Clerical deputies were returned, Clericals of a very mild tone who had no thought of the temporal power and were supporters of the monarchy and anti-socialists; where no Clerical candidate was in the field the Catholic voters plumped for the constitutional candidate against all representatives of the Extreme Left. On the other hand, the attitude of the Vatican towards Liberalism within the Church was one of uncompromising reaction, and under the new pope the doctrines of Christian Democracy and Modernism were condemned in no uncertain tone. Don Romolo Murri, the Christian Democratic leader, who exercised much influence over the younger and more progressive clergy, having been severely censured by the Vatican, made formal submission, and declared his intention of retiring from the struggle. But he appeared again on the scene in the general elections of 1909, as a Christian Democratic candidate; he was elected, and alone of the Catholic deputies took his seat in the Chamber on the Extreme Right, all his neighbours were violent anti-clericals.

At 5 a.m. on the 28th of December 1908, an earthquake of appalling severity shook the whole of southern Calabria and the eastern part of Sicily, completely destroying the cities of Reggio and Messina, the smaller towns of Canitello, Scilla, Villa San Giovanni, Bagnara, Palmi, Melito, Porto Salvo and Santa Eufemia, as well as a large number of villages. In the case of Messina the horror of the situation was heightened by a tidal wave. The catastrophe was the greatest of its kind that has ever occurred in any country; the number of persons killed was approximately 150,000, while the injured were beyond calculation.

The characteristic feature of Italy's foreign relations during this period was the weakening of the bonds of the Triple Alliance and the improved relations with France, while the traditional friendship with England remained unimpaired. Franco-Italian friendship was officially cemented by the visit of King Victor Emmanuel and Queen Elena in October 1903 to Paris where they received a very cordial welcome. The visit was returned in April 1904 when M. Loubet, the French president, came to Rome; this action was strongly resented by the pope, who, like his predecessor since 1870, objected to the idea of foreign ritualists in his native Rome, and led to the final rupture between France and the Vatican. The Franco-Italian understanding had the effect of raising Italy's credit, and the Italian route, which had been shut out of the French bourse, resumed its place there once more, a fact which contributed to increase its price and to reduce the unfavourable rate of exchange. That agreement also served to clear up the situation in Tripoli; while Italian aspirations towards Tunisia had been ended by the French occupation of that territory, Tripoli and Bengazi were now recognized as coming within the Italian "sphere of influence." The Tripoli hinterland,
however, was in danger of being absorbed by other powers having large African interests; the Anglo-French declaration of the 21st of March 1899 in particular seemed likely to interfere with Italian activity.

The Triple Alliance was maintained and renewed as far as paper documents were concerned (in June 1906 it was reconfirmed for 12 years), but public opinion was no longer so favourably disposed towards it. Austria's petty persecutions of her Italian subjects in the irredenze provinces, her active propaganda incompatible with Italian interests in the Balkans, and the anti-Italian war talk of Austrian military circles, imperilled the relations of the two "allies"; it was remarked, indeed, that the object of the alliance between Austria and Italy was to prevent war between them. Austria had persistently adopted a policy of pin-pricks and aggravating police provocation towards the Italians of the Adriatic Littoral and of the Trieste, while encouraging the Slavonic element in the former and the Germans in the latter. One of the causes of ill-feeling was the university question; the Austrian government had persistently refused to create an Italian university for its Italian subjects, fearing lest it should become a hotbed of "irredentism," the Italian-speaking students being thus obliged to attend the German-Austrian universities. An attempt at compromise resulted in the institution of an Italian law faculty at Innsbruck, but this aroused the violent hostility of the German students and populace, who gave proof of their superior civilization by an unprovoked attack upon the Italians in October 1902. Further acts of violence were committed by the Germans in 1903, which led to anti-Austrian demonstrations in Italy. The worst tumults occurred in November 1904, when Italian students and professors were attacked at Innsbruck without provocation; being outnumbered by a hundred to one the Italians were forced to use their revolvers in self-defence, and several persons were wounded on both sides. Anti-Italian demonstrations occurred periodically also at Vienna, while in Dalmatia and Croatia Italian fishermen and workmen (Italian citizens, not-natives) were subject to attacks by gangs of half-savage Croats, which led to frequent diplomatic "incidents." A further cause of tension was Austria's attitude towards the Vatican, inspired by the strong clerical tendencies of the imperial family, and indeed of a large section of the Austrian people. But the most serious point at issue was the Balkan question. Austrian public opinion could not view without serious misgivings the active political propaganda which Austria was conducting in Albania. The two governments frequently discussed the situation, but although they had agreed to a self-denying ordinance whereby each bound itself not to occupy any part of Albanian territory, Austria's declarations and promises were hard to believe, and the activity of her agents in the Balkans. Italy, therefore, instituted a counter-propaganda by means of schools and commercial agencies. The Macedonian troubles of 1903 again brought Austria and Italy into conflict. The acceptance by the powers of the Mürzsteg programme and the appointment of Austrian and Russian financial agents in Macedonia was an advantage for Austria and a set-back for Italy; but the latter scored a success in the appointment of General de Giorgis as commander of the international Macedonian gendarmerie; she also obtained, with the support of Great Britain, France and Russia, the assignment of the partly Albanian district of Monastir to the Austrian army. For the first time, however, Austria and Italy were absolutely sure of themselves and their allies.

In October 1908 came the bombshell of the Austrian annexation of Bosnia, announced to King Victor Emmanuel and to other rulers by autograph letters from the emperor-king. The news caused the most widespread sensation, and public opinion in Italy was greatly agitated at what it regarded as an act of brigandage on the part of Austria, when Signor Tittoni in a speech at Carate Brianza (October 6th) declared that "Italy might await events with serenity, and that these could find her neither unprepared nor isolated." These words were taken to mean that Italy would receive compensation to restore the balance of power upset in Austria's favour. When it was found that there was to be no direct compensation for Italy a storm of indignation was aroused against Austria, and also against Signor Tittoni.

On the 29th of October, however, Austria abandoned her military posts in the sandjak of Novibazar, and the frontier between Austria and Turkey, formerly an uncertain one, which left Austria a half-open back door to the Aegean, was now a distinct line of demarcation. Thus the danger of a "peace movement" of Macedonians in October 1902. Further facts of violence. Austria also gave way on another point, renouncing her right to police the Montenegro coast and to prevent Montenegrini from having warships of its own (paragraphs 5, 6 and 11 of art. 29 of the Berlin Treaty) in a note presented to the Italian foreign office on the 12th of April 1909. Italy had developed some important commercial interests in Montenegro, and anything which strengthened the position of that principality was a guarantee against further Austrian encroachments. The harbour works in the Montenegro port of Antivari, commenced in March 1905 and completed early in 1909, were an Italian concern, and Italy became a party to the agreement for the Danube-Adriatic Railway (June 2, 1908) together with Russia, France and Servia; Italy was to contribute 35,000,000 lire out of a total capital of 100,000,000, and to be represented by four directors out of twelve. But the whole episode was a warning to Italy, and the result was a national movement for security. Credits for the army and navy were voted almost without a dissentent voice; new battleships were laid down, the strength of the army was increased, and the defences of the exposed eastern border were strengthened. It was clear that so long as Austria was ebbed by Germany, conflict was opposed to Italian interests in the Balkans, the Triple Alliance was a mockery, and Italy could only meet the situation by being prepared for all contingencies.

BIBLIOGRAPHY.—It is difficult to indicate in a short space the most important sources of general Italian history. Muratori's great collection, the Rerum Italicarum Scriptores, in combination with his Dissertations, the chronicles and other historical material published by the Archivio Storico Italiano, and the works of detached annalists of whom the Villani are the most notable, take first rank. Next we may mention for Italy, the 13th edition of L. Menotti's Storia d'Italia and its modern continuation by Carlo Botta. Among the more recent contributions S. de Sismondi's Républiques italiennes (Brussels, 1838) and Carlo Troia's Storia d'Italia nel medio evo are among the most valuable general works, while the large Storia Politica d'Italia by various authors, published at Milan, is also important.—F. Bertolini, L. Barbari, F. Lanzani, Storia dei comuni italiani dalle origini fino al 1312 (1882); C. Cipolla, Storia delle Signorie italiane dal 1205 al 1796 (1891); G. Taddei, Storia d'Italia; dell'Italia fra le preponderanze straniere, 1530-1570 (1875); A. Franchetti, Storia d'Italia dal 1679 al 1799 (Milan, 1875); G. Caffi, Storia d'Italia dal 1799 al 1815 (Milan, 1875). For the later years works are T. Hodgkin's Italy and her Invaders (Oxford, 1882 and 1890) and P. Villari's Le Invasioni barbariche (Milan, 1900), both based on original research and sound scholarship. The period from 1919 to 1922 is discussed in works such as Breteau's L'Italie après 1914 (Paris, 1921) and Morelli's Italia nella nuova storia moderna, especial in vol. i., "The Renaissance," which contains valuable bibliographies. Giuseppe Ferrari's Rivoluzione d'Italia (1858) deserves notice as a work of singular vigour, though not great scientific importance; and Cesare Guido's Sommario (Florence, 1860) presents the main outlines of the subject with brevity and clearness. For the period of the French revolution and the Napoleonic wars see F. Lenz 's Le Origini del risorgimento italiano (Milan, 1906); E. Bonnal de Ganges, La Chute d'une république (Venice) (Paris, 1885); D. Carutti, Storia della corte di Savoia durante la rivoluzione e l'Impero francese (2 vols., Turin, 1899 and 1900); E. Casto, Storia di Italia (Florence, 1899); A. Dufourcq, Le Régime jacobin en Italie, 1796-1799 (Paris, 1900); A. Franchetti, Storia d'Italia dal 1798 al 1799 (Milan, 1875); P. Gaffare, Bonaparte et les républiques italiennes (1796-1799) (1895); M. Johnson, The Napoleon and the Italian States (2 vols., with full bibliography, London, 1904); E. Ramondini, L'Italia durante la dominazione francese (Naples, 1882); E. Ruth, Geschichte des italienischen Volkes unter der napoleonischen Herrschaft (Leipzig, 1859). For modern times, see Bolton King's History of Italian Unity (1899) and Bolton King and Thomas Ockey's Italy to-day (1901). With regard to the history of separate provinces it may be useful to notice F. Tettamanzi, Storia di Milano, G. Capponi's Storia della repubblica di Firenze (Florence, 1875). P. Villari's I primi due secoli della storia di Firenze (Florence, 1905); Storia di Firenze dalle Origini a Napoleone (1825-1815) (1872-1873), P. Romanin's Storia documentato di Venezia (Venice, 1833), M. Amari's Mussulmani di Sicilia (1854-1873), F. Gregorovius's Geschichte der Stadt Rom (Stuttgart, 1881); A. von Reumont's Geschichte der Stadt Rom (Berlin, 1867), L. Cipolla's Storia della monarchia piemontese (Turin, 1840), and D. Carutti's...
ITEM—ITINERARIUM

SEGOVIA. GANDARÍA (often called H. de Gándara) was the capital of the Visigothic kingdom, and the towns and provinces contain a great deal of valuable material for local history. From the point of view of papal history, L. von Ranke's *History of the Popes* (English edition, London, 1870), M. Creighton's *History of the Popes* (London, 1897) and L. de Vaux's *Histoire des Papes* (Freiburg, B. 1886—1899), should be consulted. From the point of view of general culture, Jacob Burckhardt's *Cultur der Renaissance in Italien* (Basel, 1860), E. Guiney's *Revolutions D'Epoque* (Paris, 1868), and A. G. de Vries's *History of the Renaissance* (5 vols., London, 1875, &c.) should be consulted. (L. V. C.)

ITEM (a Latin adverb meaning "also," "likewise") originally used adverbially in English at the beginning of each separate head in a list of articles, or each detail in an account book or ledger or in a legal document. The word is thus applied, as a noun, to the various heads in any such enumeration and to a piece of information or news.  

ITHACA (Ιθακή), vulgarly Tholaki (Οδόν), next to Paxo, is the smallest of the seven Ionian Islands, with an area of about 44 sq. m. It forms an esca to the corali of Cephalonia in the kingdom of Greece, and its population, which was 9873 in 1870, is now about 13,000. The island consists of two mountain masses, connected by a narrow isthmus of hills, and separated by a wide inlet of the sea known as the Gulf of Molon. The northern and greater mass culminates in the heights of Anoï (2650 ft.), and the southern in Hagios Stephanos, or Mount Merovigil (2100 ft.). Vathy (Βάθος—"deep"), the chief town and port of the island, lies at the northern foot of Mount Stephanos, its whitewashed houses stretching for about a mile round the deep bay cut in the Gulf of Molon, to which it owes its name. As there are only one or two small stretches of arable land in Ithaca, the inhabitants are dependent on commerce for their grain supply; and olive oil, wine and currants are the principal products obtained by the cultivation of the thin stratum of soil that covers the calcareous rocks. Goats are fed in considerable number on the bushy pasture of the hills; and hares (in spite of Aristotle's supposed assertion of their absence) are exceptionally abundant. The island is divided into four districts: Vathy, Aeto (or Eagle's Cliff), Anoï (Anoï or Aroi) and Onai.  

The name has remained attached to the island from the earliest historical times with but little interruption of the tradition; though in Brompton's travels (12th century) and in the old Venetian maps we find it called Fale or Val de Comar, and at a later date it not unfrequently appears as Little Cephalonia. This last name indicates the general character of Ithacan history (if history it can be called) in modern and indeed in ancient times; for the fame of the island is almost solely due to its position in the Homeric story of Odysseus. Ithaca, according to the Homeric epos, was the royal seat and residence of King Odysseus. The Ithacan history can be easily described as not strange, and being by no means in a table, picturesque and topographical; the Homeric localities for which counterparts have been sought are Mount Neritos, Mount Neon, the harbour of Phorcys, the town and palace of Odysseus, the fountain of Arethusa, the cave of the Naiads, the stalls of the swineherd Eumeus, the orchard of Laertes, the Korax or Raven Cliff and the island Asteris, where the suitors lay in ambush for Telemachus. Among the "identificationists" there are two schools, one placing the town at Polis on the west coast in the northern half of the island (Leake, Gladstone, &c.), and the other at Aeto on the isthmus. The latter site, which was advocated by Sir W. Gell (in *Topography and Authorities of Ithaca, London, 1807*), was supported by Dr H. Schliemann, who carried on excavations in 1873 and 1878 (see *H. Schliemann, Ithaque, le Péloponèse, Troie*, Paris, 1896, also published in German; his letter to The Times, 26th of September, 1878; and the author's letter prefixed to *Ilios*, London, 1888). But his results were mainly negative. The fact is that no amount of ingenuity can reconcile the descriptions given in the *Odyssey* with the actual topography of this island. Above all, the passage in which the position of Ithaca is described offers great difficulties. "Ithaca, the low, farthest up the sea line towards the darkness, but those others face the dawnning and the sun" (Butcher and Lang). Such a passage fits very ill an island lying, as Ithaca does, just to the east of Cephalonia. Accordingly Professor W. Dörpfeld has suggested that the Homeric Ithaca is not the island which was called Ithaca by the later Greeks, but must be identified with Leucas (Santa Mauro, q.v.). He succeeds in fitting the Homeric topography to this latter island, and suggests that the name may have been transferred in consequence of a migration of the Ithacans. There is no doubt that Leucas fits the Homeric description much better than Ithaca; but, on the other hand, many scholars maintain that it is a mistake to treat the imaginary descriptions of a poet as if they were portions of a guide-book, or to look, in the author of the *Odyssey*, for a close familiarity with the geography of the Ionian islands.  

See, besides the works already referred to, the separate works on *Ithaca*: B. Schreiber (Leipzig, 1839); R. v. Lilienstern (Berlin, 1832); N. Karvasias Grivas (Ieroglifì της Ιταλίας) (Athens, 1849); Bowen (London, 1851); and Gandar, (Paris, 1854); Hercher, in *Hermes* (1866); Leake's *Northern Greece*; Mure's *Two in Greece*; Burckhardt's *Geogr. des Griechenland*; Gladstone, "The Dominions of Ulysses," in *Macmillan's Magazine* (1877). A history of the discussions will be found in *Buchholz, Die Hellenischen Reisen* (Leipzig, 1871); Partsch, *Kephallenia und Ithaka* (1890); W. Dörpfeld in *Mélanges Perrot*, pp. 79—93 (1903); P. Goessler, *Lebens-Ithaka* (Stuttgart, 1904).  

ITHACA, a city and the county-seat of Tompkins county, New York, U.S.A., at the southern end of Cayuga Lake, 60 m. S.W. of Syracuse. Pop. (1890) 11,079, (1900) 13,136, of whom 1310 were foreign-born, (1910 census) 14,802. It is served by the Delaware, Lackawanna & Western and the Lehigh & Hudson's R.R.'s, and by interurban electric line; and steamboats ply on the lake. Most of the city is on low land, from which it spreads up the heights on the south, east and west. The finest residential district is East Hill, particularly Cornell and Cayuga Heights (across Fall Creek from the Cornell campus). Wenck Beach, at the head of the lake, is a pleasure resort. The neighbouring region is one of much beauty, and is frequented by summer tourists. Near the city are many waterfalls, the most notable being Taughanock Falls (9 m. N.), with a fall of 215 ft. Through the city from the east run Fall, Cascadilla and Six Mile Creeks, the first two of which have cut deep gorges and have a number of cascades and waterfalls, the largest, Ithaca Fall in Fall Creek, being 120 ft. high. Six Mile Creek crosses the south side of the city and empties into Cayuga Inlet, which crosses the western and lower districts, often inundated in the spring. The Inlet receives the waters of a number of small streams descending from the south-western hills. Among the attractions in this direction are Buttermilk Falls and ravine, on the outskirts of the city, Lick Brook Falls and Glen and Enfield Falls and Glen, the last 7 m. distant. Fall Creek furnishes good water-power. The city has various manufactures, including fire-arms, calendar clocks, traction engines, electrical and other machinery. Inhabitants, artified goods, etc.  

The value of the factory product increased from $1,500,604 in 1900 to $2,080,002 in 1905, or 38·6%. Ithaca is also a farming centre and coal market, and much fruit is grown in the vicinity. The city is best known as the seat of Cornell University (q.v.). It has also the Ezra Cornell Free Library of about 28,000 volumes, the Ithaca Conservatory of Music, the Cascadilla School and the Ithaca High School. Ithaca was settled about 1789, the name being given to it by Simeon De Witt in 1806. It was incorporated as a village in 1827, and was chartered as a city in 1888. At Buttermilk Falls stood the principal village of the Tutelo Indians, Coreorangum, settled in 1753 and destroyed in 1779 by a detachment of Sullivan's force.  

ITINERARIUM (i.e. road-book, from Lat. *iter*, road), a term applied to the extant descriptions of the ancient Roman roads and routes of traffic, with the stations and distances. It is usual to distinguish two classes of these, *Itineraria adnotata or scripta et Itineraria picta*—the former having the character of a book, and the latter being a kind of travelling manual. Of the *Itineraria Scripta* the most important are: (1) *Lit. Antonii Itinera*, which consists of two parts, the
ITIUS PORTUS

one dealing with roads in Europe, Asia and Africa, and the other with familiar sea-routes—the distances usually being measured from Rome; (2) **Itinerarium Antonini**; (3) **It. Alexandri**, containing a sketch of the march-route of Herod the Great, if he dared to refer to ancient, sh and

ITIUS PORTUS, the name given by Caesar to the chief harbour which he used when embarking for his second expedition to Britain in 54 B.C. (*De bello Gallico*, v. 2). It was certainly near the uplands round Cape Grisnez (*Promontorium Itium*), but the exact site has been violently disputed ever since the renaissance of learning. Many critics have assumed that Caesar used the same port for his first expedition, but the name does not appear at all in that connexion (*B. G. iv. 21-23*). This fact, coupled with other considerations, makes it probable that the two expeditions started from different places. It is generally agreed that the first embarkation at Boulogne. The same view was widely held about the second, but T. Rice Holmes in an article in the *Classical Review* (May 1900) gave strong reasons for preferring Wissant, 4 m. east of Grisnez. The chief reason is that Caesar, having found he could not set sail from the small harbour of Boulogne with even 80 ships simultaneously, decided that he must take another point for the sailing of the "more than 800" ships of the second expedition. Holmes argues that, allowing for change in the foreshore since Caesar's time, 800 specially built ships could have been hauled above the highest spring-tide level, and afterwards launched simultaneously at Wissant, which would therefore have been "commodissimis" (v. 2) or opposed to "brevissimis traicibus" (iv. 21).

See T. R. Holmes in *Classical Review* (May 1900), in which he partially revises the conclusions at which he arrived in his *Ancient Britain* (1907), pp. 532-594; that the first expedition started from Boulogne is accepted, e.g. by H. Stuart Jones, in *English Historical Review* (1909), xxiv. 115; other authorities in Holmes's article.

ITO, HIROBUNI, Prince (1841-1909), Japanese statesman, was born in 1841, being the son of Ito Jūzō, and (like his father) began life as a retainer of the lord of Choshū, one of the most powerful nobles of Japan. Choshū, in common with many of his fellow Daimyos, was bitterly opposed to the rule of the shōgun or tycoon, and when this rule resulted in the conclusion of the treaty with Commodore M. C. Perry in 1854, the smouldering discontent broke out into open hostility against both parties to the compact. In these views Ito cordially agreed with his chieftain, and was sent on a secret mission to Yedo to report to his lord on the doings of the government. This visit had the effect of causing Ito to turn his attention seriously to the study of the British and of other military systems. As a result he persuaded Choshū to remodel his army, and to exchange the bow and arrows of his men for guns and rifles. 'But Ito felt that his knowledge of foreign arms was to be thorough, should be sought for in Europe, and with the connivance of Choshū he, in company with Inouye and three other young men of the same rank as himself, determined to risk their lives by committing the then capital offence of visiting a foreign country. With great secrecy they made their way to Nagasaki, where they concluded an arrangement with the agent of Missrs Jardine, Matheson & Co. for passages on board a vessel which was about to sail for Shanghai (1863). At that port the adventurers separated, three of their number taking ship as passengers to London, while Ito and Inouye preferred to work their passages before the mast in the "Pegasus," bound for the same destination. For a year these two friends remained in London studying English methods, but then events occurred in Japan which recalled them to their country. The treaties lately concluded by the shōgun with the foreign powers conceded the right to navigate the strait of Shimomoseki, leading to the Inland Sea. On the northern shores of this strait stretched the feudal state ruled over by Prince Chishū, and Ito, who had recently resigned his position as vice-minister of finance, was ordered to go to Yedo and erected batteries on the shore, from which he opened fire on all ships which attempted to force the passage. The shōgun having declared himself unable in the circumstances to give effect to the provision, the treaty powers determined to take the matter into their own hands. Ito, who was better aware than his chief of the disproportion between the fighting powers of Europe and Japan, memorialized the cabinets, begging that hostilities should be suspended until he should have had time to use his influence with Choshū in the interests of peace. With this object Ito hurried back to Japan, but his efforts were futile. Choshū refused to give way, and suffered the consequences of his obstinacy in the destruction of his batteries and in the infliction of a heavy fine. The part played by Ito in these negotiations aroused the animosity of the more reactionary of his fellow-clansmen, who made repeated attempts to assassinate him. On one notable occasion he was pursued by his enemies into a tea-house, where he was concealed by a young lady beneath the floor of her room. Thus began a romantic acquaintance, which ended in the lady becoming the wife of the fugitive. Subsequently (1868) Ito was made governor of Hiogo, and in the course of the following year became the vice-minister of finance. In 1871 he accompanied Ikawura on an important mission to Europe, which, though diplomatically a failure, resulted in the enlistment of the services of European authorities on military, naval and educational systems.

After his return to Japan Ito served in several cabinets as head of the bureau of engineering and mines, and in 1886 he accepted office as prime minister, a post which, when he resigned in 1901, he had held for four times. In 1882 he was sent on a mission to Europe to study the various forms of constitutional government; on this occasion he attended the coronation of the tsar Alexander III. On his return to Japan he was entrusted with the arduous duty of drafting a constitution. In 1890 he reappraised the fruits of his labours, and nine years later he was destined to witness the abrogation of the old treaties, and the substitution in their place of conventions which place Japan on terms of equality with the European states. In all the great reforms in the Land of the Rising Sun Ito played a leading part. It was mainly due to his active interest in military and naval affairs that he was able to meet Li Hung-chang at the end of the Chinese and Japanese War (1895) as the representative of the conquering state, and the conclusion of the Anglo-Japanese Alliance in 1902 testified to his triumphant success in raising Japan to the first rank among civilized powers. As a reward for his conspicuous services in connexion with the Chinese War Ito was made a marquis, and in 1897 he accompanied Prince Arisugawa as a joint representative of the Mikado at the Diamond Jubilee of Queen Victoria. At the close of 1901 he again, though in an unofficial capacity, visited Europe and the United States; and in England he was created a G.C.B. After the Russo-Japanese War (1905) he was appointed resident general in Korea, and in that capacity he was responsible for the steps taken to increase Japanese influence in that country. In September 1908 he was made viceroy and prince. He retired from his post in Korea in July 1909, and became president of the privy council in Japan. But on the 26th of October, when on a visit to Harbin, he was shot dead by a Korean assassin.

He is to be distinguished from Admiral Count YUKO Ito (b. 1843), the distinguished naval commander.

ITRI, a town of Campania, Italy, in the province of Caserta, 6 m. by road N.W. of Formia. Pop. (1901) 5797. The town is picturesquely situated 690 ft. above sea-level, in the mountains which the Via Appia traverses between Fondi and Formia.
ITURBIDE—IVAN

Interesting remains of the substructure wall supporting the ancient road are preserved in Itiri itself; and there are many remains of ancient buildings near it. The brigand Fra Diavolo, the hero of Aubert's opera, was a native of Itiri, and the place was once noted for brigandage.

ITURBIDE (or ITURBIDE), AUGUSTIN DE (1783-1824), emperor of Mexico from May 1822 to March 1823, was born on the 27th of September 1783, at Valladolid, now Morelia, in Mexico, where his father, an Old Spaniard from Pampeluna, had settled with his creole wife. After enjoying a better education than was then usual in Mexico, Iturbide entered the military service, and in 1810 held the post of lieutenant in the provincial regiment of his native city. In that year the insurrection under Hidalgo broke out, and Iturbide, more from policy, it would seem, than from principle, served in the royal army. Possessed of splendid courage and brilliant military talents, which fitted him especially for guerrilla warfare, the young creole did sign service, and rapidly rose in military rank. In December 1813 Colonel Iturbide, along with General Llano, dealt a crushing blow to the revolt by defeating Morelos, the successor of Hidalgo, in the battle of Valladolid; and the former followed it up by another decisive victory at Puruaran in January 1814. Next year Don Augustin was appointed to the command of the army of the north and to the governorship of the provinces of Valladolid and Guanajuato, but in 1816 grave charges of extortion and violence were brought against him, which led to his recall. Although the general was acquitted, or at least although the inquiry was dropped, he did not resume his commands, but retired into private life for four years, which, we are told, he spent in a rigid course of penance for his former excesses. In 1820 Apodaca, viceroy of Mexico, received instructions from the Spanish cortes to proclaim the constitution promulgated in Spain in 1812, but although obliged at first to submit to an order by which his power was much curtailed, he secretly cherished the design of reviving the absolute power for Ferdinand VII. In Mexico. Under pretext of putting down the lingering remains of revolt, he levied troops, and, placing Iturbide at their head, instructed him to proceed to the absolute power of the country. Four years of reflection, however, had modified the general's views, and now, led both by personal ambition and by patriotic regard for his country, Iturbide resolved to espouse the cause of national independence. His subsequent proceedings—how he issued the Plan of Iguala, on the 24th of February 1821, how by the refusal of the Spanish cortes to ratify the treaty of Cordova, which he had signed with O'Donoju, he was transformed from a mere champion of monarchy into a candidate for the crown, and how, hailed by the soldiers as Emperor Augustin I. on the 18th of May 1822, he was compelled within ten months, by his arrogant neglect of the Cortes, to dissolve it, and, after the immediate dissolution of a congress which he had forcibly dissol hold—will be found detailed under Mexico. Although the congress refused to accept his abdication on the ground that to do so would be to recognize the validity of his election, it permitted the ex-emperor to retire to Leghorn in Italy, while in consideration of his services in 1820 a yearly pension of £5000 was conferred upon him. But Iturbide resolved to make one more bid for power; and in 1824, passing from Leghorn to London, he published a Statement, and on the 17th of May set sail for Mexico. The congress immediately issued a formal proclamation against him, and this caused a revolution in the army, under which Iturbide was forced to retire. In 1825 he went to Spain, where he was imprisoned, and in 1834 he died, having lost his reason.

ITZA, an American-Indian people of Mayan stock, inhabiting the country around Lake Peten in northern Guatemala. Chichen-Itza, among the most wonderful of the ruined cities of Yucatan, was the capital of the Itzas. Thence, according to their traditions they removed, on the breaking up of the Mayan kingdom in 1420, to an island in the lake where another city was built. Cortes met them in 1525, but they preserved their independence till 1697, when the Spaniards destroyed the city and temples, and a library of sacred books, written in hieroglyphics on bark fibre. The Itzas were one of the eighteen semi-independent Maya states, whose incessant internecine wars at length brought about the dismemberment of the empire of Xibalba and the destruction of Mayan civilization.

ITZEHUE, a town of Germany, in the Prussian province of Schleswig-Holstein, on the Stör, a navigable tributary of the Elbe, 32 m. north-west of Hamburg and 15 m. north of Glückstadt. Pop. (1900) 15,649. The church of St Lawrence, dating from the 12th century, and the building in which the Holstein estates formerly met, are noteworthy. The town has a convent founded in 1256, a high school, and a hospital and other benevolent institutions. Itzehoe is a busy commercial place. Its sugar refineries are among the largest in Germany. Iron founding, shipbuilding and wool-spinning are also carried on, and the manufactures include machinery, tobacco, fishing-nets, chioro, soap, cement and beer. Fishing employs some of the inhabitants, and the markets for cattle and horses are important. A considerable trade is carried on in agricultural products and wood, chiefly with Hamburg and Altona.

Itzehoe is the oldest town in Holstein. Its nucleus was a castle, built in 809 by Egbert, one of Charlemagne's counts, against the Danes. The community which sprang up around it was differently called Itzelsberg, Eiseels and Eiseho. In 1201 the town was destroyed, but it was restored in 1224. To the new town the Lübeck rights were granted by Adolphus IV. in 1238, and to the old town in 1303. During the Thirty Years' War Itzehoe was twice destroyed by the Swedes, in 1644 and 1657, but was rebuilt on each occasion. It passed to Prussia in 1867, with the duchy of Schleswig-Holstein.

IUKA, the county-seat of Tishomingo county, Mississippi, U.S.A., about 25 m. S.E. of Corinth in the N.E. corner of the state and 8 m. S. of the Tennessee river. Pop. (1900) 882; (1910) 1221. It is served by the Southern railway, and has a smelter and an iron and steel works. It is an improving community and a health resort. In the American Civil War, a Confederate force under General Sterling Price occupied the town on the 14th of September 1862, driving out a small Union garrison; and on the 19th of September a partial engagement took place between Price and a Federal column commanded by General Rosecrans, in which the Confederate losses were 700 and the Union 790. Price, whose line of retreat was threatened by superior forces under General Grant, withdrew from Iuka on the morning of the 20th of September. This is a large county, lying in the bottom of the valley of the Duck river.

IVAN I., called Kalita, or Money-Bag (d. 1341), grand duke of Vladimir, was the first sobirat, or ‘’gatherer’’ of the scattered Russian lands, thereby laying the foundations of the future autocracy as a national institution. This he contrived to do by adopting a policy of complete subjugation to the khan of the Golden Horde, who, in return for a liberal and punctual tribute, permitted him to aggrandize himself at the expense of the lesser
grand dukes. Moscow and Tver were the first to fall. The latter Ivan received from the hand of the khan, after devastating it with a host of 50,000 Tatars (1327). When Alexander of Tver fled to the powerful city of Pskov, Ivan, not strong enough to attack Pskov, procured the banishment of Alexander by the aid of the metropolitan, Theognost, who threatened Pskov with interdict. So in 1330 Ivan extended his influence over Rostov by the drastic methods of blackmail and hanging. But Great Novgorod was too strong for him, and twice he threatened that republic in vain. In 1340 Ivan assisted the khan to ravage the domains of Prince Ivan of Smolensk, who had refused to pay the customary tribute to the Horde. Ivan's own domains, at any rate during his reign, remained free from Tatar incursions, and prospered correspondingly, thus attracting immigrants and their wealth from the other surrounding principalities. Ivan was a most careful, not to say niggarishly economical, keeping an exact account of every village or piece of plate that his money bags acquired, whence his nickname. The most important event of his reign was the transference of the metropolitan see from Vladimir to Moscow, which gave Muscovy the pre-eminence over all the other Russian states, and made the metropolitan the ecclesiastical police-superintendent of the grand duke. The Metropolitan Peter built the first stone cathedral of Moscow, and his successor, Theognost, followed suit with three more stone churches. Simultaneously Ivan substituted stone walls for the ancient wooden ones of the Kreml, or citadel, which made Moscow a still safer place of refuge.

See M. S. Saltykov, History of Russia (Russ.), vol. ii. (St. Petersburg, 1889); Polezhayev, The Principality of Moscow in the first half of the 14th Century (Russ.) (St. Petersburg, 1878).

IVAN II. (1326-1359), grand duke of Vladimir, a younger son of Ivan Kalita, was born in 1326. In 1353 he succeeded his elder brother Simeon as grand duke, despite the competition of Prince Constantine of Suzdal, the Khan Hanibek preferring to bestow the yarluik, or letter of investiture, upon Ivan rather than upon Constantine. At first the principalities of Suzdal, Ryazan and the republic of Novgorod refused to recognize him as grand duke, and waged war with him. In 1354 the strength of the grand duchy sensibly diminished during the reign of Ivan II. The surrounding principalities paid but little attention to Moscow, and Ivan, "a meek, gentle and merciful prince," was ruled to a great extent by the tsiksatsky, or chilarch, Alexis Khvost, and, after his murder by the jealous boyars in 1357, by Bishop Alexis. He died in 1359. Like most of his predecessors, Ivan, by his last will, divided his dominions among his children.

See Dmitry Ilivaisky, History of Russia (Russ.), vol. ii. (Moscow, 1876-1894).

IVAN III. (1440-1505), grand duke of Muscovy, son of Vasily (Vassili) Blind, the grand duke of Moscow, and Maria Yaroslavovna, was born in 1440. He was co-regent with his father during the latter years of his life and succeeded him in 1492. Ivan tenaciously pursued the unifying policy of his predecessors. Nevertheless, cautious to timidity, like most of the princes of the house of Rurik, he avoided as far as possible any violent collision with his neighbours until all the circumstances were exceptionally favourable, always preferring to attain his ends gradually, circumspectly and subterraneously. Muscovy had by this time become a compact and powerful state, whilst her rivals had grown sensibly weaker, a condition of things very favourable to the speculative activity of a statesman of Ivan III's peculiar character. His first enterprise was a war with the republic of Novgorod, which, alarmed at the growing dominancy of Muscovy, had placed herself beneath the protection of Casimir IV., king of Poland, an alliance regarded at Moscow as an act of apostasy from orthodoxy. Ivan took the field against Novgorod in 1470, and after his generals had twice defeated the forces of the republic, at Shelona and on the Dvina, during the summer of 1471, the Novgorodians were forced to sue for peace, which they obtained on engaging to abandon for ever the Polish alliance, ceding a considerable portion of their northern colonies, and paying a war indemnity of 15,000 roubles. From henceforth Ivan sought continually a pretext for destroying Novgorod altogether; but though he frequently violated its ancient privileges in minor matters, the attitude of the republic was so wary that his looked-for opportunity did not come till 1477. In that year the ambassadors of Novgorod played into his hands by addressing him in public audience as "Gosudar" (sovereign) instead of "Gospodin" ("Sir") as heretofore. Ivan at once seized upon this as a recognition of his sovereignty, and when the Novgorodians repudiated their ambassadors, he marched against them. Deserted by Casimir IV., and surrounded on every side by the Muscovite armies, which included a Tatar contingent, the republic recognized Ivan as autocrat, and surrendered (January 14, 1478) all her prerogatives and possessions (the latter including the whole of northern Russia from Lapland to the UralS) into his hands. Subsequent revolts (1479-1488) were punished by the removal en masse of the richest and most ancient families of Novgorod to Moscow, Vyatka and other central Russian cities. After this, Novgorod, as an independent state, ceased to exist. The rival republic of Pskov owed the continuance of its own political existence to the readiness with which it assisted Ivan against its ancient enemy. The other principalities were virtually absorbed, by conquest, purchase or marriage contract—Yaroslavl in 1463, Rostov in 1474, Tver in 1485. Ivan's refusal to share his conquests with his brothers, and his subsequent interference with the internal politics of their inherited principalities, involved him in several wars with them, from which, though the princes were assisted by Lithuania, he emerged in each instance a victorious leader. Finally, in 1492, the institution of the grand duchy sensibly diminished during the reign of Ivan II. The surrounding principalities paid but little attention to Moscow, and Ivan, "a meek, gentle and merciful prince," was ruled to a great extent by the tsiksatsky, or chilarch, Alexis Khvost, and, after his murder by the jealous boyars in 1357, by Bishop Alexis. He died in 1359. Like most of his predecessors, Ivan, by his last will, divided his dominions among his children. It was in the reign of Ivan III. that Muscovy rejected the Tatar yoke. In 1480 Ivan refused to pay the customary tribute to the grand khan Ahmed. When, however, the grand khan marched against him, Ivan's love of peace, and the stern exhortations of the high-spirited bishop of Rostov, Vassian, could induce him to take the field. All through the autumn the Russian and Tatar hosts confronted each other on opposite sides of the Ugra, till the 11th of November, when Ahmed retired into the steppe. In the following year the grand khan, while preparing a second expedition against Moscow, was suddenly attacked, routed and slain by Ivan, the khan of the Nogai Tatars, whereupon the Golden Horde suddenly fell to pieces. In 1497 Ivan reduced the khanate of Kazan (one of the offshoots of the Horde) to the condition of a vassal-state, though in his later years it broke away from his suzerainty. With the other Mahomedan powers, the khan of the Crimea and the sultan of Turkey, Ivan's relations were pacific and even amicable. The Crimean khan, Mengli Girai, helped him against Lithuania and facilitated the opening of diplomatic intercourse between Moscow and Constantinople, where the first Russian embassy appeared in 1495.

The character of the government of Muscovy under Ivan III. changed essentially and took on an autocratic form which it had never had before. This was due not merely to the natural consequence of the hegemony of Muscovy over the other Russian lands, but even more to the simultaneous growth of new and
exotic principles falling upon a soil already prepared for them. After the fall of Constantinople, orthodox canonists were inclined to regard the Muscovite grand dukes as the successors of the Byzantine emperors. This movement coincided with a change in the family circumstances of Ivan III. After the death of his first consort, Maria of Tver (1467), at the suggestion of Pope Paul II. (1469), who hoped thereby to bind Russia to the holy see, Ivan III. wedded the Catholic Zoe Palaeologa (better known by her orthodox name of Sophia), daughter of Thomas, despot of the Morea, who claimed the throne of Constantinople as the nearest relative of the last Greek emperor. The princess, however, clave to her family traditions, and awoke imperial ideas in the mind of her consort. It was through her influence that the then inauspicious Orthodox of Constantinople (along with the imperial double-headed eagle and all that it implied) was adopted by the court of Moscow. The grand duke henceforth held aloof from his boyars. The old patriarchal systems of government vanished. The boyars were no longer consulted on affairs of state. The sovereign became sacrosanct, while the boyars were reduced to the level of slaves absolutely dependent on the will of the sovereign. The boyars naturally resented so insulting a revolution, and struggled against it, at first with some success. But the clever Greek lady prevailed in the end, and it was her son Vasili, not Maria of Tver's son, Demetrius, who, at the age of fourteen, was co-regent with his father (April 14, 1502). It was in the reign of Ivan III. that the first Russian "Law Book," or code, was compiled by the scribe Gusev. Ivan did his utmost to promote civilization in his realm, and with that object invited many foreign masters and artificers to settle in Muscovy, the most noted of whom was the Italian Ridolfo di Fioravante, nicknamed Aristotle because of his extraordinary knowledge, who built the cathedrals of the Assumption (Uspenski) and of Saint Michael or the Holy Archangels in the Kremlin.

Ivan IV., called "the Terrible," 1530-1584, tsar of Muscovy, was the son of Vasili [Basil] III. Ivanovich, grand duke of Muscovy, by his second wife, Helena Glinska. Born on the 25th of August 1530, he was proclaimed grand duke on the death of his father (1533), and took the government into his own hands in 1544, being then fourteen years old. Ivan IV. was in every respect precocious; but from the first there was what we should now call a neurotic strain in his character. His father died when he was three, his mother when he was only seven, and he grew up in a brutal and degrading environment where he learnt to hate human life and human dignity in contempt. He was maltreated by the leading boyars whom successive revolutions placed at the head of affairs, and hence he conceived an inextinguishable hatred of their whole order and a corresponding fondness for the merchant class, their natural enemies. At a very early age he entertained an exalted idea of his own divine authority, and his studies were largely devoted to searching in the Scriptures and the Slavonic chronicles for sanctions and precedents for the exercise and development of his right divine. He first asserted his power by literally throwing to the dogs the last of his boyar tyrants, and shortly afterwards announced his intention of assuming the title of tsar, a title which his father and grandfather had coveted but never dared to assume publicly. On the 16th of January 1547, he was crowned the first Russian tsar by the metropolitan of Moscow; on the 3rd of February in the same year he selected as his wife from among the virgins gathered from all parts of Russia for his inspection, Anastasia Zakharina-Koshchina, the scion of an ancient and noble family better known by its later name of Romanov.

Hitherto, by his own showing, the private life of the young tsar had been unspeakably abominable, but his sensitive conscience (he was naturally religious) induced him, in 1550, to submit to a spiritual examination. It was then he first of all kind, to which he made a curious public confession of the sins of his youth, and at the same time promised that the realm of Russia (for whose dilapidation he blamed the boyar regents) should henceforth be governed justly and mercifully. In 1551 the tsar submitted to a synod of prelates a hundred questions which he considered the best mode of remedying existing evils, for which reason the decrees of this synod are generally called stolov or centuria. The decree extending from 1550 to 1556 was the good period of Ivan IV.'s reign, when he deliberately broke away from his disreputable past and surrounded himself with good men of lowly origin. It was not only that he hated and distrusted the boyars, but he was already statesman enough to discern that they could not be fitted into the new order of things which he aimed at introducing. Ivan meditated the regeneration of Muscovy, and the only men who could assist him in his task were men who could look steadily forward to the future because they had no past to look back upon, and who would unflinchingly obey their sovereign because they owed their whole political significance to him alone. The chief of these men of good-will were Alexis Adashev and the monk Sylvester, men of so obscure an origin that almost every detail of their lives is conjectural, but both of them, morally, the best Muscovites of their day. Their influence upon the young tsar was profoundly beneficial, and the period of their administration coincides with the most glorious period of Ivan's reign—the period of the conquest of Kazan and Astrakhan.

In the course of 1551 one of the factions of Kazan offered the whole khantae to the young tsar, and on the 20th of August 1552 as stood before the walls with an army of 150,000 men and 70 guns. The siege was long and degrading, but it was in vain that the tsar kept it in his capital, At the end of October the fortress, which had been heroically defended, was taken by assault. The conquest of Kazan was an epoch-making event in the history of eastern Europe. It was not only the first territorial conquest from the Tatars, before whom Muscovy had humbled herself for generations; at Kazan Asia, in the name of Mahomet, had fought behind its last trench against Christian Europe marshalled beneath the banner of the tsar of Muscovy. For the first time the Volga became a Russian river. Nothing could now retard the natural advance of the young Russian state towards the west and the south-east. In 1554 Astrakhan fell almost without a blow. By 1560 all the Finnik and Tatar tribes between the Oka and the Kama had become Russian subjects. Ivan was also the first tsar who dared to attack the Crimeans. In 1555 he sent Ivan Sheremetev against Perekop, and Sheremetev routed the Tatars in a great two days' battle at Sudishenaka. Some of Ivan's advisers, including both Sylvester and Adashev, now advised him to make an end of the Crimian khante, as he had already disposed of the khanates of Kazan and Astrakhan. But Ivan, wiser in his time than in his youth, saw that this was impossible, in view of the immense distance to be traversed, and the preponderance of the Grand Turk from whom it would have to wrest. It was upon Livonia that his eyes were fixed, which was comparatively near at hand and promised him a seaboard and direct communication with western Europe. Ivan IV., like Peter I. after him, clearly recognized the necessity of raising Muscovy to the level of her neighbours. He proposed to do so by promoting a wholesale immigration into his tsardom of master-workmen and skilled artificers. But all his neighbours, apprehensive of the consequences of a civilized Muscovy, combined to thwart him. Charles V. even went so far as to disperse 123 skilled Germans whom Ivan's agent had collected and brought to Lübeck for shipment to a Baltic port. After this, Ivan was obliged to help himself as best he could. His opportunity seemed to have come when, in the middle of the 16th century, the Order of the Sword broke up, and the possession of Livonia was fiercely contested between Sweden, Poland and Denmark. Ivan intervened in 1558 and quickly captured Narva, Dorpat and a dozen smaller fortresses; then, in 1560, Livonia placed herself beneath the protection of Poland, and Livonia an independent state. By this time, Ivan had entered upon the second and evil portion of his reign. As early as 1555 he had ceased to trust
Sylvester and Adashev, owing to their extraordinary backwardness in supporting the claims of his infant son to the throne while he himself lay at the point of death. The ambiguous and ungrateful conduct of the tsar's intimate friends and protégés on this occasion has never been satisfactorily explained, and he had no reason to forget them. A deluge of invective and opprobrium, much to his credit, he overlooked it, and they continued to direct affairs for six years longer. Then the dispute about the Crimea arose, and Ivan became convinced that they were mediocre politicians as well as untrustworthy friends. In 1560 both of them disappeared from the scene, Sylvester into a monastery at his own request, while Adashev died the same year, in honourable exile as a general in Livonia. The death of his deeply beloved consort Anastasia and his son Demetrius, and the desertion of his one bosom friend Prince Kurbaky, about the same time, seem to have infuriated Ivan against God and man. During the next ten years (1560-1570) terrible and horrible things happened in the realm of Muscovy. The tsar himself lived in an atmosphere of apprehension, imagining that every man's hand was against him. On the 3rd of December 1564 he quit Moscow with his whole family. On the 3rd of January 1565 he declared in an open letter addressed to the metropolitan his intention to abdicate. The common people, whom he had always favoured at the expense of the boyars, thereupon implored him to come back on his own terms. He consented to do so by an imperial edict, which forbade all the nobles of Moscow, Livonia, or "separate estates." Certain towns and districts all over Russia were separated from the rest of the realm, and their revenues were assigned to the maintenance of the tsar's new court and household, which was to consist of 1000 carefully selected boyars and lower dignitaries, with their families and suites, in the midst of whom Ivan henceforth lived exclusively. The oprichnina was no constitutional innovation. The duma, or council, still attended to all the details of the administration; the old boyars still retained their ancient offices and dignities. The only difference was that Ivan ordered them and they were not even to communicate with him except on extraordinary and exceptional occasions. The oprichniki, as being the exclusive favourites of the tsar, naturally, in their own interests, hardened the tsar's heart against all outsiders, and trampled with impunity upon every one beyond the charmed circle. Their first and most notable victim was Philip, the saintly metropolitan of Moscow, who was strangled for condemning the oprichina as an unchristian institution, and refusing to bless the tsar (1565). Ivan had stopped at Tver, to murder St. Philip, while on his way to destroy the second wealthiest city in Russia. The tsar was so intent on this project that his council, with a great deal of prudence, began to question him as to his intentions. And Ivan, who was himself a very shrewd politician, replied, "I have ordered that the oprichina is to be established in every town in my dominions, and I shall go from place to place, and every one of my lieutenants shall take up the oprichina as I have prescribed." He then ordered his principal lieutenants to establish oprichniki in every town and city in Russia. He also ordered that all men who were not oprichniki were to be expelled from the cities and towns in which they lived. The oprichniki were to be the only people who were allowed to live in these places. The oprichniki were to be the only people who were allowed to live in these places. The oprichniki were to be the only people who were allowed to live in these places.

An intermittent and desultory war, with Sweden and Poland simultaneously, for the possession of Livonia and Estonia, went on from 1560 to 1582. Ivan's generals (he himself rarely took the field) were generally successful at first, and bore down their enemies by sheer numbers, capturing scores of fortresses and towns. But in the end the superior military efficiency of the Swedes and Poles inevitably told. In 1570, when Ivan was fortuitous in having for his chief antagonist Stephen Bathory, one of the greatest captains of the age. Thus all his strenuous efforts, his own enormous sacrifices, came to nothing. The West was too strong for him. By the peace of Zapol (January 15th, 1582) he surrendered Livonia with Poleski to Bathory, and by the truce of Ilyussa he at the same time abandoned Ingrasia to the Swedes. The Baltic seaboard was lost to Muscovy for another century and a half. In his latter years Ivan cultivated friendly relations with England, in the hope of securing some share in the benefits of civilization from the friendship of Queen Elizabeth, one of his protégés, Mary Stuart, of Scotland, with whom he was once on terms of intimate friendship, and his own sister, Polona's fifth wife, Martha Nagaya, was still alive. Towards the end of his life Ivan was partially consigned for his failure in the west by the unexpected acquisition of the kingdom of Siberia in the east, which was first subdued by the Ossack hetman Ermak or Yermak in 1581.

In November 1580 Ivan in a fit of ungovernable fury at some contradiction or reproach, struck his eldest surviving son Ivan, a prince of rare promise, whom he passionately loved, a blow which proved fatal. In an agony of remorse, he would now have, inadmissibly, as being unworthy to reign longer; but his trembling boyars, fearing some dark ruse, refused to obey any one but himself. Three years later, on the 18th of March 1584, while playing at chess, he suddenly fell backwards in his chair and was removed to his bed in a dying condition. At the last moment he assumed the hood of the strictest order of hermits, and died as the monk Jonah.

Ivan IV. was undoubtedly a man of great natural ability. His political foresight was extraordinary. He anticipated the ideas of Peter the Great, and only failed in realizing them because his material resources were inadequate. But admission of his talents must not blind us to his moral worthlessness, nor is it right to cast the blame for his excesses on the brutal and vicious society in which he lived. The same society which produced his infamous followers also produced St. Philip of Moscow, and by refusing to listen to St. Philip Ivan sank below even the very lofty moral standard of his own age. He certainly left Muscovite society worse than he found it, and so prepared the way for the horrors of the Great Anarchy. Personally, Ivan was tall and well-made, with high shoulders and a broad chest. His eyes were small and restless, his features bold, he had a short and trembling bovary; an enigmatic expression; but an enigmatical smile played perpetually around his lips. He was the best educated and the hardest worked man of his age. His memory was astonishing, his energy indefatigable. As far as possible he saw to the lower orders, and never sent away a petitioner to the lower orders, and never sent away a petitioner to the lower orders.

See S. M. Solov'ev, History of Russia (Russ.) vol. v. (St. Petersburg, 1889); A. Brückner. Geschichte Russlands bis zum Ende des 18. Jahrhunderts (Gotha, 1866); E. Tikhonov. The First Tsar of Muscovy, Ivan IV. (Russ.) (Moscow, 1888); L. G. Tidander, Krögel mellan Sverige och Ryssland åren 1555-1557 (Vestера, 1888); K. Waliszewski, Ivan le terrible (Paris, 1904); R. N. Bain, Slavonic Europe, ch. 5 (London, 1907).

Ivan V. (1666-1696), tsar of Russia, was the son of Tsar Alexis Mikhailovich and his first consort Miloslavzvoya. Physically and mentally deficient, Ivan was the mere tool of his mother in Muscovy who would have kept the children of the tsar Alexi, by his second consort Natalia Narushkina, from the throne. In 1682 the party of progress, headed by Artamon Matvyev and the tsaritsa Natalia, passed Ivan over and placed his half-brother, the vigorous and promising little tsarevich Peter, on the throne. On the 23rd of May, however, the Narushkin faction was overthrown by the streltsy (musketeers), secretly worked upon by Ivan's half-sister Sophia, and Ivan was associated as tsar with Peter. Three days later he was proclaimed "first tsar," in order still further to depress the Narushkins, and place the government in the hands of Sophia exclusively. In 1689 the name of Ivan was used as a pretext by Sophia in her attempt to oust Peter from the throne altogether. Ivan was made to distribute beakers of wine to his sister's adherents with his own hands, but subsequently, beneath the influence of his uncle Frozovorsky, he openly declared that "even for his sister's 1 Ivar V. If we count from the first grand duke of the name, as most Russian historians do; Ivan II. If, with the minority, we reckon from Ivan the Terrible as the first Russian tsar.
sake, he would quarrel no longer with his dear brother." During the reign of his colleague Peter, Ivan V. took no part whatever in affairs, but devoted himself "to incessant prayer and rigorous fasting." On the 9th of January 1684 he married Praskovia Salutikova, who bore him five daughters, one of whom, Anne, ultimately ascended the Russian throne. In his last years Ivan was a paralytic. He died on the 29th of January 1696.

**IVAN VI. (1740-1764), emperor of Russia, was the son of Prince Antony Ulric of Brunswick, and the princess Anna Leopoldovna of Mecklenburg, and great-nephew of the empress Anna, who adopted him and declared her successor on the 5th of October 1740, when he was only eight weeks old. On the death of Anne (October 17th) he was proclaimed emperor, and on the following day Ernest Johann Biren, duke of Courland, was appointed regent. On the fall of Biren (November 8th), the regency passed to the baby tsar's mother, though the government was in the hands of the capable vice-chancellor, Andri Osterman. A little more than twelve months later, a coup d'etat placed the tsesarevna Elizabeth on the throne (December 4th) and for his part, imprisoned in the fortress of Dünamünde (Ust Dvinsk) (December 13, 1743) after a preliminary detention at Riga, from whence the new emperor had at first decided to send them home to Brunswick. In June 1744 they were transferred to Klohmorgor on the White Sea, where Ivan, isolated from his family, and seeing nobody but his gaoler, remained for the next twelve years. Rumours of his confinement at Klohmorgor having leaked out, he was secretly transferred to the fortress of Schlüsselburg (1750), where he was still more rigorously guarded, the very commandant of the fortress not knowing who a "certain arrestandt" comrade of his care really was. On the accession of Peter III. the condition of the unfortunate prisoner seemed about to be ameliorated, for the kind-hearted emperor visited and sympathized with him; but Peter himself was overthrown a few weeks later. In the instructions sent to Ivan's guardian, Prince Churmytew, the latter was ordered to chain up his charge, and even scourge him should he become refractory. On the accession of Catherine still more stringent orders were sent to the officer in charge of "the nameless one." If any attempt were made from outside to release him, the prisoner was to be put to death; in no case was he to be delivered alive into any one's hands, even if his deliverer produced the emperor's own signon-manual authorizing his release. By this time, twenty years of solitary confinement had disturbed Ivan's mental equilibrium, though he does not seem to have been actually insane. Nevertheless, despite the mystery surrounding him, he was well aware of his imperial origin, and always called himself gosudar (sovereign). Though instructions had been given to keep him ignorant, he had been taught his letters and could read his Bible. Nor could his residence at Schlüsselburg remain concealed for ever, and its discovery was the cause of his ruin. A sub-lieutenant of the garrison, Vasily Mirovich, found out all about him, and formed a plan for freeing and proclaiming him emperor. At midnight on the 9th of July 1764, Mirovich won over some of the garrison, arrested the commandant, Berednikow, and demanded the delivery of Ivan, who there and then was murdered by his gaolers in obedience to the secret instructions already in their possession.

**IVANGOROD,** a fortified town of Russian Poland, in the government of Lublin, 64 m. by rail S.E. from Warsaw, at the confluence of the Wieprz with the Vistula. It is defended by nine forts on the right bank of the Vistula and by three on the left bank, and, with Warsaw, Novo-Georgievsk and Brest-Litovsk, forms the Polish "quadrilateral."
versed in ancient and modern geometry, but also had a full knowledge of the analytical methods and discoveries of the continental mathematicians. His earliest memoir, dealing with an analytical expression for the rectification of the ellipse, is published in the *Transactions of the Royal Society of Edinburgh* (1796); and this and his later papers on "Cubic Equations" (1799) and "Kepler's Problem" (1802) evince great facility in the handling of algebraic formulae. In 1804, after the dissolution of the flax-spinning company of which he was manager, he obtained one of the mathematical chairs in the Royal Military College at Marlow (afterwards removed to Sandhurst); and till the year 1816, when failing health obliged him to resign, he discharged his duties with great success. In this period he published in the *Philosophical Transactions* several important memoirs, which earned for him the Copley medal in 1814 and ensured his election as a Fellow of the Royal Society in 1815. Of special importance in the history of attractions is the first of these earlier memoirs (*Phil. Trans.*, 1800), in which the problem of the attraction of a homogeneous ellipsoid upon an external point is reduced to the simpler case of the attraction of another but related ellipsoid upon a corresponding point interior to it. This theorem is known as Ivory's theorem. His later papers in the *Phil. Trans.* of 1803 and 1812 relate to the determination of planetary perturbations, of equilibrium of fluid masses, &c. For his investigations in the first named of these he received a royal medal in 1826 and again in 1839. In 1831, on the recommendation of Lord Brougham, King William IV. granted him a pension of £300 per annum, and conferred on him the Hanoverian Guelphic order of knighthood. Besides being directly connected with the chief scientific societies of his own country, the Royal Society of Edinburgh, the Royal Irish Academy, &c., he was corresponding member of the Royal Academy of Sciences both of Paris and Berlin, and of the Royal Society of Göttingen. He died at London on the 20th of September 1842.

A list of his works is given in the *Catalogue of Scientific Papers of the Royal Society of London.*

**IVORY** (Fr. *ivoire*, Lat. *ebur*), strictly speaking a term confined to the material represented by the tusk of the elephant, and for commercial purposes almost entirely to that of the male elephant. In Africa both the male and female elephant produce good-sized tusks; in the Indian variety the female is much less bountifully provided, and in Ceylon perhaps not more than 1⁄4 of either sex have any tusks at all. Ivory is in substance very dense, the pores close and compact and filled with a gelatinous solution which contributes to the beautiful polish which may be given to it and makes it easy to work. It may be placed between bone and horn; more fibrous than bone and therefore less easily torn or splintered. For a scientific definition it would be difficult to find a better one than that given by Sir Richard Owen. He says: 1

"The name ivory is now restricted to that modification of dentine or tooth substance which in transverse sections or fractures shows lines of different colours, or striae, proceeding in the arc of a circle and forming by their decussations minute curvilinear lozenge-shaped spaces." These spaces are formed by an immense number of exceedingly minute tubes placed very close together, radiating outwards in all directions. It is to this arrangement of structure that ivory owes its fine grain and almost perfect elasticity, and the peculiar marking resembling the engine-turning on the case of a watch, by which many people are guided in distinguishing it from celluloid or other imitations. Elephants' tusks are the upper incisor teeth of the animal, which, starting in earliest youth from a semi-solid vascular pulp, grow during the whole of its existence, gathering phosphates and other earthy matters and becoming hardened as in the formation of teeth generally, the tusk is held in its layers, the inside layer being the last produced. A large proportion is embedded in the bone sockets of the skull, and is hollow for some distance up in a conical form, the hollow becoming less and less as it is prolonged into a narrow channel which runs along as a thread or as it is sometimes called, nerve, towards the point of the tooth. The outer layer, or bark, is enamel of similar density to the central

1 *Lecture before the Society of Arts* (1856). part. Besides the elephant's tooth or tusk we recognize as ivory, for commercial purposes, the teeth of the hippopotamus, walrus, narwhal, cachalot or sperm-whale and of some animals of the wild boar class, such as the warthog of South Africa. Practically, however, amongst these the hippo and walrus tusks are the only ones of importance for large work, though boars' tusks come to the sale-rooms in considerable quantities from India and Africa.

Generally speaking, the supply of ivory imported into Europe comes from Africa; some is Asiatic, but much that is shipped from India is really African, coming by way of Zanzibar and Mozambique to Bombay. A certain amount is furnished by the vast stores of remains of prehistoric animals still existing throughout the world. In Siberia in the neighbourhood of the Lena and other rivers discharging into the Arctic Ocean. The mammoth and mastodon seem at one time to have been common over the whole surface of the globe. In England tusks have been recently dug up—for instance at Dungeness—as long as 12 ft. and weighing 200 lb. The Siberian deposits have been worked for now nearly two centuries. The store appears to be as inexhaustible as a coalfield. Some think that a day may come when the spread of civilization may cause the utter disappearance of the elephant in Africa, and that it will be to these deposits we may have to turn as the only source of animal ivory. Of late years in England the use of mammoth ivory has shown signs of decline. Practically none passed through the London sale-rooms during 1903-1906. Before that, parcels of 10 to 20 tons were not uncommon. Not all of it is good; perhaps about half of what comes to England is so, the rest rotten; specimens, however, are found as perfect and in as fine condition as if recently killed, instead of having lain hidden and preserved for thousands of years in the icy ground. There is a considerable literature (see *Snoothing*) on the subject of big-game hunting, which includes that of the elephant, hippopotamus and smaller tusk-holding animals. Elephants until comparatively recently times roamed over the whole of Africa from the northern deserts to the Cape of Good Hope. They are still abundant in Central Africa and Uganda, but civilization has gradually driven them farther and farther into the wilds and impenetrable forests of the interior.

The quality of ivory varies according to the districts whence it is obtained, the soft variety of the eastern parts of the continent being the most esteemed. When in perfect condition African ivory should be if recently cut of a warm, transparent, mellow tint, with as little as possible appearance of grain or marking. Asian ivory is of a denser white, more open in texture and softer to work. But it is apt to turn yellow sooner, and is not so easy to polish. Unlike bone, ivory requires no preparation, but is fit for immediate working. That from the neighbourhood of Cameroon is very good, then ranks the ivory from Loango, Congo, Gabun and Ambriz; next the Gold Coast, Sierra Leone and Cape Coast. That of French Sudan is nearly always "ringy," and some of the Ambriz variety also. We may call Zanzibar and Mozambique varieties soft; Angola and Ambriz all hard. Ambriz ivory was at one time much esteemed, but there is comparatively little now. Siam ivory is rarely if ever soft. Abyssinian has its soft side, but Egypt is practically the only place where both descriptions are largely distributed. A drawback to Abyssinian ivory is a prevalence of a rather thick bark. Egyptian is liable to be cracked, from the extreme variations of temperature; more so formerly than now, since better methods of packing and transit are used. Ivory is extremely sensitive to sudden extremes of temperature; for this reason billiard balls should be kept where the temperature is fairly equable.

The market terms by which descriptions of ivory are distinguished are liable to mislead. They refer to ports of shipment rather than to places of origin. For instance, "Malta" ivory is a well-understood term, yet there are no ivory producing animals in that island.

Tusks should be regular and tapering in shape, not very curved or twisted, for economy in cutting; the coat fine, thin, clear and transparent. The substance of ivory is so elastic
and flexible that excellent riding-whips have been cut longitudinally from whole tusks. The size to which tusks grow and are brought to market depends on race rather than on size of elephants. The latter run largest in equatorial Africa. Asiatic bull elephant tusks seldom exceed 50 lb in weight, though lengths of 9 ft and up to 150 lb weight are not entirely unknown. Record lengths for African tusks are the one presented to George V, when prince of Wales, on his marriage (1893), measuring 8 ft, 7½ in. and weighing 165 lb, and the pair of tusks which were brought to the Zanzibar market by natives in 1898, weighing together over 42 lb. One of the latter is now in the Natural History Museum at South Kensington; the other is in Messrs Rodgers & Co.'s collection at Sheffield. For length the longest known are those belonging to Messrs Rowland Ward, Piccadilly, which measure 11 ft. and 11 ft. 5 in. respectively, with a combined weight of 293 lb. Osteodentine, resulting from the effects of injuries from spearheads or bullets, is sometimes found in tusks. This formation, resembling stalactites, grows with the tusk, the bullets or iron remaining embedded without trace of their entry.

The most important commercial distinction of the qualities of ivory is that of the hard and soft varieties. The terms are difficult to define exactly. Generally speaking, hard or bright ivory is distinctly harder to cut with the saw or other tools. It is, as it were, glassy and transparent. Soft contains more moisture, stands differences of climate and temperature better, and does not crack so easily. The expert is guided by the shape of the tooth, by the colour and quality of the bark or skin, and by the transparency when cut, or even before, as at the point of the tooth. Roughly, a line might be drawn almost centrally down the map of Africa, on the west of which the hard quality prevails, on the east the soft. One of the letters in the word the is for knife-handles—people rather like to see a pretty grain, strongly marked; but the finest quality in the hard variety, which is generally used for them, is the closest and freest from grain. The curved or canine teeth of the hippopotamus are valuable and come in considerable quantities to the European markets. Owen describes this variety as "an extremely dense, compact kind of dentine, partially defended on the outside by a thin layer of enamel as hard as porcelain; so hard as to strike fire with steel." By reason of this hardness it is not at all liked by the turner and ivory workers, and before being touched by the ivory engraver to be removed by acid, sometimes by beating and sudden cooling, when it can be scaled off. The texture is slightly curled, mottled or damasked. Hippo ivory was at one time largely used for artificial teeth, but now mostly for umbrella and stick-handles; whole (in their natural form) for fancy door-handles and the like. In the trade the term is not "riverhorse" but "seahorse teeth." Walrus ivory is less dense and coarser than hippo, but of fine quality—what there is of it, for the oval centre which has more the character of coarse bone unfortunately extends a long way up. At one time a large supply came to the market, but of late years there has been an increasing scarcity, the animals having been almost exterminated by the ruthless persecution to which they have been subjected in their principal haunts in the northern seas. It is little esteemed now, though our ancestors thought highly of it. Comparatively large slabs are to be found in medieval sculpture of the 11th and 12th centuries, and the grips of most oriental swords, ancient and modern, are made from it. The ivory from the single tusk or horn of the narwhal is not of much commercial value except as an ornament or curiosity. Some horns attain a length of 5 to 10 ft., 4 in. thick at the base. It is dense in substance and of a fair colour, but owing to the central cavity there is little of it fit for anything larger than napkin-rings.

Ivory in Commerce, and its Industrial Applications.—Almost the whole of the importation of ivory to Europe was until recent years confined to London, the principal distributing mart of the world. But the opening up of the Congo trade has placed the port of Antwerp in a position which has equalled and, for a time, may surpass that of London. Other important markets are Liverpool and Hamburg; and Germany, France and Portugal have colonial possessions in Africa, from which it is imported. America is a considerable importer for its own requirements. From the German Cameron alone, according to Schilling, there were exported during the ten years ending 1905, 453,100 pieces of ivory. Mr Buxton estimates the amount of ivory imported into the United Kingdom at about 500 tons. If we give the same to Antwerp we have from these two ports alone no less than 1000 tons a year to be provided. Allowing a weight so high as 30 lb per pair of tusks (which is far too high, perhaps twice too high) we should have here alone between thirty and forty thousand elephants to account for. It is true that every pair of tusks that comes to the market represents a dead elephant, but not necessarily by any means a slain or even a recently killed one, as is popularly supposed and unfortunately too often repeated. By far the greater proportion is the result of stores accumulated by natives, a good part coming from animals which have died a natural death. Not 20% is live ivory or recently killed; the remainder is known in the trade as dead ivory.

In 1827 the principal London ivory importers imported 3000 cwt. in 1850, 8000 cwt. The highest price up to 1855 was £5 per cwt. At the July sales in 1905 a record price was reached for billiard-ball teeth of £167 per cwt. The total imports into the United Kingdom were, according to Board of Trade returns, in 1890, 14,349 cwt.; in 1895, 10,611 cwt.; in 1899, 9889 cwt.; in 1901, 9045 cwt.

From Messrs Hale & Son's (ivory brokers, 10 Fenchurch Avenue) Ivory Report of the second quarterly sales in London, April 1906, it appears that the following were offered:

Hard ivory was scarce. West Coast African was principally of the Gabon description, and some of very fine quality. There was very little inquiry for walrus. The highest prices ranged as follows: Soft East Coast tusks (Zanzibar, Mozambique, Bombay and Siam), 102 to 143 lb, each £66, 10s. to £75, 10s. per cwt. Billiard-ball tusks 104 per cwt. Cut points for billiard-balls (3 in. to 3 in.) £114 to £151 per cwt. Seahorse (for best), 3s. 6d. to 4s. 1d. per lb. Boars' tusks, 6d. to 7d. per lb.

Quantities of ivory offered to Public auction (from Messrs Hale & Son's Reports).

In October 1889 soft East Indian fetched an average of 182 per cwt., but in several instances higher prices were realized, and one lot reached £88 per cwt. At the Liverpool April sales 1906 about 7½ tons.
IVORY

were offered from Gabun, Angola, and Cameroon (from the last 52 tons). To the port of Antwerp the imports in 1903 were 6830 cwt. in 1904 and 6570 cwt. in 1905; of which 5310 cwt. and 4590 cwt. respectively were from the Congo State. The leading London sales are held quarterl in Mincing Lane, a very interesting and wonderful display of tusks and ivory of all kinds being made for a year inspection in the form as the "Ivory Floor" in the London docks. The quarterly Liverpool sales follow the London ones; with a short interval.

The important part which ivory plays in the industrial arts not only for decorative, but also for domestic applications is hardly sufficiently recognized. Nothing is wasted of this valuable product. Hundreds of sacks full of cuttings and small pieces returned by manufacturers after they have used what they require for their particular trade, come to the mart. The dust is used for polishing, and in the preparation of Indian ink, and even for food in the form of ivory jelly. The scraps come in for inlaying and for the numberless purposes in which ivory is used for small domestic and decorative objects. India, which has been called the backbone of the trade, takes enormous quantities of the rings left in the turning of billiard-balls, which serve as women's bangles, or for making small toys and models, and in other characteristic Indian work. Without endeavouring to enumerate all the applications, a glance may be cast at the most important of those which consume the largest quantity. Chief among these is the manufacture of billiard-balls, of cutlery handles, of piano-keys and of brushware and toilet articles. Billiard-balls demand the highest quality of ivory; for the best balls the soft description is employed, though recently, through the competition of bonzoline and similar substitutes, the hard has been more used in order that the weight may be assimilated to that of the artificial kind. Therefore the most valuable tusks of all are those adapted for the billiard-ball trade. The term used is "scriveloes," and is applied to teeth proper for the purpose weighing not over about 7 lb. The division of the tusk into smaller pieces for subsequent manufacture, in order to avoid waste, is of material importance.

The accompanying diagrams (figs. 1 and 2) show the method; the cuts are made radiating from an imaginary centre of the curve of the tusk. In after processes the various trades have their own particular methods for making the most of the material. In making a billiard-ball of the English size the first thing to be done is to rough-out, from the cylindrical sphere about 2½ in. in diameter, which will eventually be a ball, sometimes for professional players a little larger. One hemisphere—of skin as shown in the diagrams (fig. 2)—is first turned, and the resulting ring detached with a parting tool. The diameter is accurately taken and the subsequent removals taken off in other directions. The ball is then fixed in a wooden chuck, the wood being from the Congo State, and a half cylinder reversed, and the operation repeated for the other hemisphere. It is now left to dry several weeks and then turned dead true. The rouder and straighter the tusk selected for ball-making the better. Evidently, if the tusk is oval and the ball the size of the least diameter, its sides which come nearer to the bark or rind will be coarser and of a different density from those portions further removed from this outer skin. The matching of billiard-balls is important, for extreme accuracy in weight is essential. It is usual to bleach them, whether purchased—or at any rate the distributing intermediary—likes to have them of a deep ivory. A mistake, for bleeding with chemicals takes out the gelatine to some extent, alters the quality and affects the density; it also makes them more liable to crack, and they are not nearly so nice-looking. Billiard-balls should be bought in summer time when the temperature is most equable, and gently used till the winter season. On an average three balls of fine quality are got out of a tooth. The stock of more than one great manufacturer surpasses at times 30,000 in number.

But although ball teeth rose in 1905 to £167 a cwt., the price of billiard-balls was the same in 1905 as it was in 1885. Roughly speaking, there are about 12 different qualities and prices of billiard-balls, and eight of pyramid-and pool-balls, the latter ranging from half a guinea to two guineas each.

The ivory for piano-keys is delivered to the trade in the shape of what are known as heads and tails, the former for the parts which come under the fingers, the latter for that running up between the black keys. The two are joined afterwards on the keyboard with extreme accuracy. Piano-keys are bleached, but organists for some reason or other prefer unbleached keys.

The soft variety is mostly used for high-class work and preferably of the Egyptian kind.

The great centres of the ivory industry for the ordinary objects of common domestic use are in England, for cutlery handles Sheffield, for billiard-balls and piano-keys London. For cutlery a large firm such as Rodgers & Sons uses an average of some twenty tons of ivory annually, mostly of the hard variety. But for billiard-balls and piano-keys America is now a large producer, and a considerable quantity is made in France and Germany. Brush backs are almost wholly in English hands.

Dieppe has long been famous for the numberless little ornaments and useful articles such as statuettes, crucifixes, little book-covers, paper-cutters, combs, serviette-rings and articles de Paris generally. And St Claude in the Jura, and Gelägen in Orange, France, and Hesse, Germany, are among the most important centres of the industry. India and China supply the multitude of toys, models, chess and draughtsmen, puzzles, work-box fittings and other curiosities.

Vegetable Ivory, &c.—Some allusion may be made to vegetable ivory and artificial substitutes. The plants yielding the vegetable ivory of commerce represent two or more species of a anomalous genus of palms, and are known by botanists as Pityphyllus. They are natives of tropical South America, occurring chiefly on the banks of the river Magdalena, Colombia, always found in damp localities, not only however, on the lower coast region as in Darien, but also at a considerable elevation above sea-level. They are mostly found in separate groves, not mixed with other trees or shrubs. The plant is severally known as the "tagua" by the Indians on the banks of the Magdalena, as the "anta" on the coast of Darien, and as the "pulíll" by the Peruvians as short-stemmed and crowned with from twelve to twenty very long pinnatifid leaves. The plants are dioecious, the males forming higher, more erect and robust trunks than the females. The male inflorescence is in the form of a simple fleshy cylindrical spadix covered with flowers; the female flowers are also in a single spadix, which, however, is shorter than in the male. The fruit consists of a conglomerated head composed of six or seven drupes, each containing from six to nine seeds, and the whole being enclosed in a walled woody covering forming altogether a globular head as large as that of a man. A single plant sometimes bears at the same time six or eight of these large heads of fruit, each weighing from 20 to 25 lbs. In its very young state the seed contains a clear insipid fluid, which travellers take advantage of to allay thirst. As it gets older this fluid becomes milky and of a sweet taste, and it gradually continues to change both in taste and consistence until it becomes so hard as to make it valuable as a substitute for animal ivory. In their young and fresh state the fruits are eaten with avidity by bears, hogs and other wild animals. The seeds, which contain from 20 to 25 lbs. when fully ripe and hard, are used by the American Indians for making small ornamental articles and toys. They are imported into Britain in considerable quantities, frequently under the name of "Coco" or "Coco". Some species of Attalea (another palm with hard ivory-like seeds) are known in Central America—these being chiefly for small articles of turnery. Of vegetable ivory, the best known is that derived from the Ficus rubiginosa, which when fully ripe and hard, is exported, principally to Germany. It is chiefly and largely used for coat buttons. Many artificial compounds have, from time to time, been tried as substitutes for ivory; amongst them potatoes treated with sulphuric acid, or on fresh ivory. Labiatae WoodChuck<br>Wood Ring<br>Half Turned<br>Wood Chuck Nut<br>Teak<br>Half Turned in Wood Chuck<br>Round Ball<br>Metal Ring<br>Lathe<br>Iron Black<br>Fig. 2.
acid. Celluloid is familiar to us nowadays. In the form of bonzolite, into which it is said to enter, it is used largely for billiard balls; and a new French substitute—a casaine made from milk, called gallahith—has begun to be much used for piano keys in the cheaper sorts of instruments. Odontolite is mammoth ivory, which through lapse of time and from surroundings becomes converted into a substance known as fossil or blue ivory, and is used occasionally in jewelry as turquoise, which it very much resembles. It results from the tusks of antediluvian mammoths that lived on the earth thousands of years, during which time under certain conditions the ivory becomes slowly penetrated with the metallic salts which give it the peculiar vivid blue colour of turquoise.

Ivory Sculpture and the Decorative Arts.—The use of ivory as a material peculiarly adapted for sculpture and decoration has been much more popular in the ancient world than it is today. Some examples which have come down to us take us back to prehistoric times, when, so far as our knowledge goes, civilization as we understand it had attained no higher degree than that of the dwellers in caves, or of the most primitive races. Throughout succeeding ages there is continued evidence that no other substance—except perhaps wood, of which we have even fewer ancient examples—has been so consistently connected with man's art-craftsmanship. It is hardly too much to say that to follow properly the history of ivory sculpture involves the study of all the principal cultures of the ancient world. By the time that we come to the periods of the highest civilization of Greece and Rome, it has held an honoured place in all ages for the adornment of the palaces of the great, not only in sculpture proper but in the rich inlay of panelling, of furniture, chariots and other costly articles. The Bible teems with references to its beauty and value. And when, in the days of Phidias, Greek sculpture had reached the highest perfection, we learn from ancient writers that colossal statues were constructed—notably the “Zeus of Olympia” and the “Athena of the Parthenon.”

The faces, hands and other exposed portions of these figures were of ivory, and the question, therefore, of the method of production of such extremely large slabs as perhaps were used has been often debated. A similar difficulty arises with regard to other pieces of considerable size, found, for example, amongst consular diphtochs. It has been conjectured that some means of softening and moulding ivory was known to the ancients, but as a matter of fact though it may be softened it cannot be again restored to its original condition. If up to the 4th century we are able to point to a large number of examples of sculpture in ivory, from that date onwards the chain is broken, and during the five or six hundred years of unrest and strife from the decline of the Roman empire in the 5th century to the dawn of the Gothic revival of art in the 11th or 12th, ivory sculpture alone of the sculptural arts carries on the preservation of types and traditions of classic times in central Europe. Most important indeed is the rôle which existing examples of ivory carving play in the history of the last two centuries of the consulates of the Western and Eastern empires. Though the evidences of decadence in art may be marked, the close of that period brings us down to the end of the reign of Justinian (527—565). Two centuries later the iconoclastic persecutions in the Eastern empire drive westward and compel to settle there numerous colonies of monks and artisans. Throughout the Carolingian period, the examples of ivory sculpture which we possess in not inconsiderable quantity are of extreme importance in the history of the early development of Byzantine art in Europe. And when the Western world of art arose from its torpor, freed itself from Byzantine shackles and traditions, and began to think for itself, it is to the sculptures in ivory of the Gothic art of the 13th and 14th centuries that we turn with admiration of their exquisite beauty of expression. Up to about the 14th century the influence of the church was everywhere predominant in all matters relating to art. In ivories, as in mosaics, enamels or miniature painting it would be difficult to find a dozen examples, from the age of Constantine onwards, other than sacred ones or of sacred symbolism. But as the period of the Renaissance approached, the influence of romantic literature began to assert itself, and a feeling and style similar to those which are characteristic of the charming series of religious art in ivory, so touchingly conceived and executed, meet us in many objects in ivory destined for ordinary domestic uses and ornament. Mirror cases, caskets for jewelry or toilet purposes, combs, the decoration of arms, or of saddlery or of weapons of the chase, are carved and chased with scenes of real life or illustrations of the romances, which bring home to us in a vivid manner details of the manners and customs, amusements, dress, and domestic life of the times. With the Renaissance and a return to classical ideas, joined with a love of display and of gorgeous magnificence, art in ivory takes a secondary place. There is a want of simplicity and of originality. It is the period of the commencement of decadence. Then comes the period nicknamed rococo, which persisted so long. Ivory carving follows the vulgar fashion, is content with copying or adapting, and until the revival in our own times is, except in rare instances, no longer to be classed as a fine art. It becomes a trade and is in the hands of the mechanic of the workshop. In this necessarily brief and condensed sketch we have been concerned mainly with ivory carving in Europe. It will be necessary to give also, presently, some indications enabling the inquirer to follow the history—or at least to put him on the track of—it—not only in the different countries of the West but also in India, China and Japan.

Prehistoric Ivory Carvings.—These are the result of investigations made about the middle of the 19th century in the cave dwellings of the Dordogne in France and also of the lake dwellings of Switzerland. As records they are unique in the history of art. Further than this our wonderment is excited at finding these engravings or sculptures in the round, these chiselled examples of the art of the uncultivated savage, conceived and executed with a feeling of delicacy and restraint which the most modern artist might envy. Who were they who executed them must be left to the palaeontologist and geologist to decide. We can only be certain that they were contemporary with the period when the mammoth and the reindeer still roved freely in southern France. The most important examples are the sketch of the mammoth (see Painting, Plate I.), on a slab of ivory now in the museum of the Jardin des Plantes, the head and shoulders of an ibex carved in the round on a piece of reindeer horn, and the figure of a woman (instances of representations of the human form are most rare) naked and wearing a necklace and bracelet. Many of the originals are in the museum at St Germain-en-Laye, and casts of a considerable number are in the British Museum.

Ancient Assyrian, Egyptian, Greek and Roman Ivories.—We know from ancient writers that the Egyptians were skilled in
forming the tapering points; and large quantities of small objects, including a box of plain form and simple decoration identified from the inscribed praeconum as the fifth dynasty, about 4000 B.C. The British Museum and the museum at Cairo are also comparatively rich. But no other collection in the world contains such an interesting collection of ancient Assyrian ivories as that in the British Museum. Those exhibited number some fifty important pieces, and many other fragments are, on account of their fragility or state of decay, stowed away. The collection is the result of the excavations by Layard about 1849 on the supposed site of Nineveh opposite the modern city of Mosul. When found they were so deteriorated from the lapse of time as scarcely to bear touching or the contact of the external air. Layard hit upon the ingenious plan of boiling in a solution of gelatine and thus restoring to them the animal matter which had dried up in the course of centuries. Later, the explorations of Flinders Petrie and others at Abydos brought to light a considerable number of sculptured fragments which may be even two thousand years older than those of Nineveh. They have been exhibited in London and since distributed amongst various museums at home and abroad.

Consular and Official and Private Diptychs.—About fifty of the remarkable plaques called "consular diptychs," of the time of the three last centuries of the consulates of the Roman and Greek empire have been preserved. They range in date from perhaps mid-fourth to mid-sixth centuries, and as with two or three exceptions the dates are certain it would be difficult to overestimate their historic or intrinsic value. The earliest of absolutely certain date is the diptych of Aosta (A.D. 408), the first after the recognition of Christianity; or, if the Monza diptych represents, as some think, the Consul Sicilico, then we may refer back six years earlier. At any rate, in the earlier days of Theodosius in A.D. 384, concerning the restriction of the use of ivory to the diptychs of the regular consuls, is evidence that the custom must have been long established. According to some authorities the beautiful leaf of diptych in the Liverpool Museum (fig. 4) is a consular one and to be ascribed to Marcus Julius Philippus (A.D. 245). Similarly the Gherardesca leaf in the British Museum may be accepted as of the Consul Marcus Aurelius (A.D. 308), but the whole question of the half dozen earliest examples is conjectural. With a few notable exceptions they show decadence in art. Amongst the finest may be cited the leaf with the combat with stags at Liverpool, the diptych of Probianus at Berlin and the two leaves, one of Anastasius, the other of Orestes, in the Victoria and Albert Museum. The literature concerning these diptychs is voluminous, from the time of the erudite treatise by Gori published in 1759 to the present day. The latest of certain date is that of Basilius, consul of the East in 541, the last of the consuls. The diptychs of private individuals or of officials number about sixteen, and in the case of the private ones have a far greater artistic value. Of these the Victoria and Albert Museum possesses the most beautiful leaf of perhaps the finest example of ancient ivory sculpture which has come down to us, diptychon Meleretene, representing a Bacchante (fig. 5). The other half, which is much injured, is in the Cluny Museum. Other important pieces are the Aesculapius and Hygeia at Liverpool, the Hippolitus and Phaedra at Brescia, the Barberini in the Bargello and at Vienna and the Rufius Probianus at Berlim. Besides the diptychs ancient Greek and Roman ivories before the recognition of Christianity are comparatively small in number and are mostly in the great museums of the Vatican, Naples, the British Museum, the Louvre and the Cluny Museum. Amongst them are the statuette of Pentheus, perhaps of the 3rd century (Cluny), a large head of a woman (museum of Vienna) and the Bellerophon (British Museum), nor must we lose sight of the Roman occupation in England and other countries be forgotten. Notable instances are the plaque and ivory mask found at Caerleon. Others are now in the Guildhall and British Museums, and most continental European museums have examples connected with their own history.

Early Christian and Early Byzantine Ivories.—The few examples we possess of Christian ivories previous to the time of Constantine are not of great importance from the point of view of the history of art. But after that date the ivories which we may ascribe to the centuries from the end of the 4th to at least the end of the 9th become of considerable interest, on account of their connexion with the development of Byzantine art in western Europe. With regard to exact origins and dates opinions are largely divergent. In great part they are due to the carrying on of traditions and styles by which the makers of the sarcophagi were inspired, and the difficulties of ascription are increased when in addition to the primitive elements the influence of Byzantine systems introduced many new ideas derived from many extraneous sources. The questions involved are of no small archaological, iconographical and artistic importance, but it must be admitted that we are reduced to conjecture in many cases, and compelled to theorize. And it would seem to be impossible to be more precise as to dates than within a margin of sometimes three centuries. Then, again, we are met by the question how far these ivories are connected with Byzantine art; whether they were made in the West by immigrant Greeks, or indigenous works, or purely imported productions. Some German critics have endeavoured to construct a system of schools, and to form definite groups, assigning them to Rome, Ravenna, Milan and Monza. Not only so, but they claim to be precise in dating even to a certain decade of a century. But it is certainly more than doubtful whether there is sufficient evidence on which to found such assumptions. It is at least probable that a considerable number of the ivories whose dates are given by such a number of critics so wide a range as from the 4th to the 10th century are nothing more than the work of the monks of the numerous monasteries founded throughout the Carolingian empire, copying and adapting from whatever
This golden age of the ivory carver—at its best in the 13th century—was still in evidence during the 14th, and although there is the beginning of a transition in style in the 15th century, the period of neglect and decadence which set in about the beginning of the 16th hardly reached the acute stage until well on into the 17th. To review the various developments both of religious art which reigned almost alone until the 14th century, or of the secular side as exemplified in the delightful mirror cases and caskets carved with subjects from the romantic stories which were so popular, would be impossible here. Almost every great museum and famous private collection abounds in examples of the well-known diptychs and triptychs and little portable oratories of this period. Some, as in a famous panel in the British Museum, are marvels of minute workmanship, others of delicate openwork and tracery. Others, again, are remarkable for the wonderful way in which, in the compass of a few inches, whole histories and episodes of the scriptural narratives are expressed in the most vivid and telling manner. Charming above all are the statuettes of the Virgin and Child which French and Flemish art, especially, have handed down to us. Of these the Victoria and Albert Museum possesses a representative collec-

unique harp now in the Louvre. The above enumeration will alone suffice to show that the inquirer must be referred for details to the numerous works which treat of medieval ivory sculpture.

*Ivory Sculpture from the 16th to the 19th Century.*—Considered with the wealth of ivory carving of the two preceding centuries, the 15th, and especially the 16th, centuries are singularly poor in really fine work. But before we arrive at the period of real decadence we shall come across such things as the *knife of Diana of Poitiers in the Louvre*, the sceptre of Louis XIII., the Rothschild hunting horn, many Italian powder horns, the German *Psyche* in the Louvre, or the "Young Girl and Death" in the Munich Museum, in which there is undoubtedly originality and talent of the first order. The practice of ivory carving became extremely popular throughout the 17th and 18th centuries, especially in the Netherlands and in Germany, and the amount of ivory consumed must have been very great. But, with rare exceptions, and these for the most part Flemish, it is art of an inferior kind, which seems to have been abandoned to second-rate sculptors and the artisans of the workshop. There is little originality, the rococo styles run riot, and we seem to be condemned to wade through an interminable series of gods and goddesses, bacchanalians and satyrs, pseudo-classical copies from the antique and imitations of the schools of Rubens. As a matter of fact, most great museums, except the German ones, care to include in their collections but a very small part of this material, and some, notably the one in the Jones collection, than which perhaps no finer example exists, are also of a high standard. Duquesnoy's work is well illustrated by the charming series of six plaques in the Victoria and Albert Museum known as the "Flammingo boys." Amongst the crowd of objects in ivory of the early 18th century, the many examples of the curios implements known as *rappoires*, or tobacco graters, should be noticed. It may perhaps be necessary to add that although the character of art in ivory in these periods is not of the highest, the subject is not one entirely unworthy of attention and study, and there are a certain number of remarkable and even admirable examples.

*Ivory Sculpture of Spain, Portugal, India, China and Japan.*—Generally speaking, with regard to Spain and Portugal, there is little reason to do otherwise than confine our attention to a certain class of important Moorish or Hispano-Moresque ivories of the time of the Arab occupation of the Peninsula, from the 8th to the 13th centuries. Few examples are in the Victoria and Albert Museum. Of Portuguese work there is little except the hybrid productions of Goa and the Portuguese settlements in the East. Some mention must be made also of the remainder of the examples of mixed Portuguese and savage art from Benin, now in the British Museum. Of Indian ivory carving the India Museum at Kensington supplies a very large and varied collection which has no equal elsewhere. But there is little older than the 17th century, nor can it be said that Indian art in ivory can occupy a very high place in the history of the art. What we know of Chinese carving in ivory is confined to those examples which are turned out for the European market, and can hardly be considered as appealing very strongly to cultivated tastes. A brief reference to the well-known delightful Indian ivories and the characteristic inlaid work must suffice here for the ivories of Japan (see Japan: Art).

*Ivory Sculpture in the 15th Century and of the Present Day.*—Few people are aware of the extent to which modern ivory sculpture is practised by distinguished artists. Year by year, however, a certain amount is exhibited in the Royal Academy and in most foreign salons, but in England the works—necessarily not very numerous—are soon absorbed in private collections. On the European continent, on the contrary, in such galleries as the Belgian state collections, or the Luxembourg, examples are frequently acquired and exhibited. In Belgium, the museum of the Congo and the considerable import of ivory therefrom gave encouragement to a definite revival of the art. Important exhibitions have been held in Belgium, and a notable one in Paris in 1904. Though ivory carving is as expensive as marble sculpture, all sculptors delight in following it, and the material entails no special knowledge or training. Of 19th-century artists there were in France amongst the best known, besides numerous minor workers of Dieppe and St. Claude, Augustin Moreau, Servais Quarré, Soitoux, Belleforest, Meugniot, Pradier, Triqueti and Germaine and in Belgium a number of the 20th century, because of such distinguished names in the first rank as Jean Dampt and Théodore Rivière, there were Vever, Gardet, Caron, Barrias, Allouard, Ferry and many others. Nor must the decorative work of René Lalique be omitted. No less than forty Belgian sculptors exhibited work in ivory at the Brussels exhibition of 1857. The list included artists of such distinction as J. Dillens, Constantin Meunier, van der Stappen, Khnopff, P. Wolters, Samuel and Paul de Vigne, and amongst contemporary Belgian sculptors are also van Beurden, G. Devreese, Vincotte, de l'Isle and Lagae. In England the most notable work is that of the "Lamia" of George Frampton, the "St. Elizabeth" of Alfred Gilbert, the "Mors Janua Vitae" of Harry Bates, the "Launce- lot" of W. Reynolds-Stephens and the use of ivory in the applied arts by Lynn Jenkins, A. G. Walker, Alexander Fisher and others.

AUTHORS.—See generally A. Maskell, *Ivories* (1906), and the bibliography there given.

**IVORY COAST** (Côte d'Ivoire), a French West African colony, bounded S. by the Gulf of Guinea, W. by Liberia and French Guinea, N. by the colony of Upper Senegal and Niger, E. by the Gold Coast. Its area is approximately 120,000 sq. m., and its population possibly 2,000,000, of whom some 600 are Europeans. Official estimates (1908) placed the native population as low as 980,000.

*Physical Features.*—The coast-line extends from 7°30' to 3°30' W. and has a length of 690 m. It forms a nearly straight line in which the coastline turns slightly to the north; neither bay nor promontory breaks the regularity of its outline. The shore is low, bordered in its
IVORY COAST

eastern half with lagoons, and difficult of access on account of the submarine bar of sand which stretches nearly the whole length of the heavy surf caused by the great Atlantic billows. The principal lagoons, going W. to E., are those of Grand Lahou, Grand Bassam or Ebrié, and Assini. The coast plains extend inland and ground beyond the lagoons; in some places the level of the coast is about 1000 ft. above the sea level, the plateau being traversed in several directions by hills rising 2000 ft. and covered with a general south-western direction towards the south. In the north-east, in the district of Kourou, there is a ridge, becoming a range, attaining a height of 4757 ft. In the north-west, by the Liberian frontier, the mountains in the Guni region rise over 6000 ft. From the Liberian frontier to the chief rivers, the Senegal, the Gambia and the Atlantic, the coast seldom attains 200 ft. above the level of the sea. The climate is in general very hot and unhealthy, the rainfall being very heavy. In some parts of the plateau healthier conditions prevail. The flora and fauna are similar to those of the Gold Coast and Liberia. The forests extend from the coast plains to about 30° S. latitude.

Inhabitants.—The coast districts are inhabited by Negro tribes allied on the one hand to the Krumen (q.v.) and on the other to the people of Ashanti (q.v.). The Assinis are of Ashanti origin, and chiefly of the Ochins and Agni tribes. Farther west are found the "Jack-Jacks" and the "Kwa-Kwas," sobriquets given respectively to the Arabians and Avikom by the early European traders. The Kwa-Kwas are said to be so called because their salutation "reminds the cry of a duck." In the interior the Negro strain predominates but with an admixture of Hamitic or Berber blood. The tribes represented include Jamais, Wongaras and Mandingos (q.v.), some of whom are of Mandingo origin. The Mandingos have intermarried largely with the Bambara or Senouf, an agricultural people of more than average intelligence who have subdued the country, of which they are considered to be the indigenous race. The Bambara themselves are perhaps only a distinct branch of the original Mandingo stock. The Baulé, who occupy the central part of the colony, are of Agni-Ashanti origin. The bulk of the inhabitants are fetish worshipers. On the northern confines of the great forest belt live races of cannibals, whose existence was first made known by Captain d'Ollone in 1859. In general the coast tribes are peaceable, with a reputation of being neither industrious nor intelligent. The traders are chiefly Franks, Sierra Leonians, Senegalese and Mandingos.

Towns.—The chief towns on the coast are Grand and Little Bassam, Jackville and Assini in the east, and Grand Lahou, Sassandara and Tabu in the west. Grand and Little Bassam are built on the strip of sand which separates the Grand Bassam or Ebrié lagoon from the sea. This lagoon forms a commodious harbor; the bar has been crossed. Grand Bassam is situated at the point where the lagoon and the river Komoe enter the sea and there is a minimum depth of 12 ft. of water over the bar. The town (pop. estimate about 100 Europeans) is the seat of the customs administration and of the judicial department, and is the largest centre for the trade of the colony. A wharf equipped with cranes extends beyond the surf line, controlled by a French company. It is a valuable group of buildings. A large church has been erected to serve the French community, and the rest of the town is being rapidly extended. The town has been named after the Bassam, a river on the Gold Coast, and is about 500 ft. above sea level. This merchant sent an agent into the interior who made friendly treaties between France and some of the native chiefs. In 1833, in view of the claims of other European powers to territory in Africa, France again took over the actual administration of Assini and Bassam. Between 1887 and 1889 Captain Binger (an officer of marine infantry, and subsequently director of the African department at the colonial ministry) traversed the whole region between the coast and the Niger, visited Bontuku and the Kong country, and signed protectorate treaties with the chiefs. The Gold Coast Protectorate was denned as a British colony and is now divided between the British Empire and the Gold Coast. In January 1899 a British mission sent by the governor of the Gold Coast concluded a treaty with the king of Jaman at Bontuku, placing his dominions under British protection.
IVREA—IVY

The king had, however, previously concluded treaties of "commerce and friendship" with the French, and by the Anglo-French agreement of August 1889 Jaman, with Bontuku, was recognized as French territory. In 1899 Captain Bigg of the Roman Post, as Pligator, reoccupied the interior of the Ivory Coast, and in 1893 he was appointed the first governor of the colony on its erection into an administration distinct from that of Senegal. Among other famous explorers who helped to make known the hinterland was Colonel (then Captain) Marchand. It was to the zone between the Kong states and the hinterland of Liberia that Samory (see SENEGAL) fled for refuge before he was taken prisoner (1868), and for a short time he was master of Kong.

The boundary of the colony on the west was settled by Franco-Liberean agreements of 1892 and subsequent dates; that on the east by the Anglo-French agreements of 1893 and 1898. The northern boundary was fixed in 1890 on the division of the middle Niger territories (up to that date officially called the French Sudan) among the other French West African colonies. The systematic development of the colony, the opening up of the hinterland and the exploitation of its economic resources date from the appointment of Captain Binger as governor, a post he held for over three years. The work he began has been carried on zealously and effectively by subsequent governors, who have succeeded in winning the co-operation of the natives.

In the latter books of travel and the alternative and a regular ovate form of leaf when producing flower and fruit. The African ivy, _H. canariensis_, often regarded as a variety of _H. Helix_ and known as the Irish ivy, is a native of North Africa and the adjacent islands. It is the common large-leaved climbing ivy, and also varies, but in a less degree than _H. Helix_, from which its leaves differ in their larger size, rich deep green colour, and a prevailing tendency to a five-lobed outline. When in fruit the leaves are usually three-lobed, but they are sometimes entire and broadly ovate. The Asiatic ivy, _H. colchica_ (fig. 2), now considered to be a form of _H. Helix_, has ovate, obscurely three-lobed leaves of a coriaceous texture and a deep green colour; in the tree or fruiting form the leaves are narrower than in the climbing form, and without any trace of lobes. Distinctive characters are also to be found in the appendages of the pedicels and calyx, _H. Helix_ having six-rayed stellate hairs, _H. canariensis_ fifteen-rayed hairs and _H. colchica_ yellowish two-lobed scales.

The Australian ivy, _H. australiana_, is a small glabrous shrub

---

There are fifty species of ivy recorded in modern books, but they may be reduced to two, or at the most, three. The European ivy, _Hedera Helix_ (fig. 1), is a plant subject to infinite variety in the forms and colours of its leaves, but the tendency of which is always to a three- to five-lobed form when climbing, and an oval ovate form of leaf when producing flower and fruit. The African ivy, _H. canariensis_, often regarded as a variety of _H. Helix_ and known as the Irish ivy, is a native of North Africa and the adjacent islands. It is the common large-leaved climbing ivy, and also varies, but in a less degree than _H. Helix_, from which its leaves differ in their larger size, rich deep green colour, and a prevailing tendency to a five-lobed outline. When in fruit the leaves are usually three-lobed, but they are sometimes entire and broadly ovate. The Asiatic ivy, _H. colchica_ (fig. 2), now considered to be a form of _H. Helix_, has ovate, obscurely three-lobed leaves of a coriaceous texture and a deep green colour; in the tree or fruiting form the leaves are narrower than in the climbing form, and without any trace of lobes. Distinctive characters are also to be found in the appendages of the pedicels and calyx, _H. Helix_ having six-rayed stellate hairs, _H. canariensis_ fifteen-rayed hairs and _H. colchica_ yellowish two-lobed scales.

The Australian ivy, _H. australiana_, is a small glabrous shrub
with pinnate leaves. It is a native of Queensland, and is practically unknown in cultivation.

It is of the utmost importance to note the difference of characters of the same species of ivy in its two conditions of climbing and fruiting. The first stage of growth, which we will suppose to be from the seed, is essentially scanty, and the leaves are lobed more or less. This stage is accompanied with a plentiful production of the claspers or modified upper roots by means of which the plant becomes attached and obtains support. When it has reached the summit of the tree or tower, the stems, being no longer able to maintain a perpendicular attitude, fall over and become horizontal or pendent. Coincidently with this change they cease to produce claspers, and the leaves are strikingly modified in form, being now narrower and less lobed than the ascending stems. In due time this tree-like growth produces terminal umbels of greenish flowers, which have the parts in fives, with the styles united into a very short tube, which are succeeded by smooth black or yellow berries, containing two to five seeds. The yellow-berried ivy is met with in northern India and in Italy, but in northern Europe it is known only as a curiosity of the garden, where, if sufficiently sheltered and nourished, it becomes an exceedingly beautiful and fruitful tree.

It is stated in books that some forms of sylvestral ivy never flower, but a negative declaration of this kind is valueless. Sylvestral ivies of great age may be found in woods on the western coasts of Britain that have apparently never flowered, but this is probably to be explained by their inability to surmount the trees supporting them, for until the plant can spread its branches horizontally in full daylight, the flowering or tree-like growth is never formed.

A question of great practical importance arises out of the relation of the plant to its means of support. A moderate growth of ivy is not injurious to trees; still the tendency is from the first inimical to the prosperity of the tree, and at a certain stage it becomes deadly. Therefore the growth of ivy on trees should be kept within reasonable bounds, more especially in the case of trees that are of special value for their beauty, history, or the quality of their timber. In regard to buildings clothed with ivy, there is nothing to be feared so long as the plant does not penetrate the substance of the wall by means of any fissure. Should it thrust its way in, the natural and continuous expansion of its several parts will necessarily hasten the decay of the edifice. But a fair growth of ivy on sound walls that afford no entrance beyond the superficial attachment of the claspers is, without any exception whatever, beneficial. It promotes dryness and warmth, reduces to a minimum the corrosive action of the atmosphere, and is altogether as conservative as it is beautiful.

The economical uses of the ivy are not of great importance. The leaves are eaten greedily by horses, deer, cattle and sheep, and in times of scarcity have proved useful. The flowers afford a good supply of honey to bees; and, as they appear in autumn, they occasionally make amends for the shortcomings of the season. The berries are eaten by wood pigeons, blackbirds and thrushes. From all parts of the plant a balsamic bitter may be obtained, and this in the form of hederic acid is the only preparation of ivy known to chemists.

In the garden the uses of the ivy are innumerable, and the least known though not the least valuable of them is the cultivation of the plant as a bush or tree, the fruiting growth being selected for this purpose. The variegated tree forms of H. Helix,
IXION, in Greek legend, son of Phlegyas, king of the Lapithae in Thessaly (or of Arcs), and husband of Dis. According to custom he promised his father-in-law, Deioneus, a handsome bridal present, but treacherously murdered him when he claimed the fulfilment of the promise. As a punishment, Ixion was seized with madness, until Zeus purified him of his crime and admitted him as a guest to Olympus. Ixion abused his pardon by trying to seduce Hera; but the goddess substituted for herself a cloud, by which he became the father of the Centaurs. Zeus bound him on a fiery wheel, which rolls unceasingly through the air or (according to the later version) in the underworld (Pindar, Pythia, ii. 21; Ovid, Metam. iv. 461; Virgil, Aeneid, vi. 601). Ixion is generally taken to represent the eternally burning sun. Another explanation connects the story with the practice (among certain peoples of central Europe) of carrying a blazing, revolving wheel through fields which needed the heat of the sun, the legend being invented to explain the custom and subsequently adopted by the Greeks (see Mannhardt, Wild- und Feldkulte, ii. 1905, p. 83). In view of the fact that the oak was the sun-god's tree and that the mistletoe grew upon it, it is suggested by A. B. Cook (Class. Rev. xvii. 420) that ἰχιών is derived from ἰχθύς (mistletoe), the sun's fire being regarded as an emanation from the mistletoe. Ixion himself is probably a by-form of Zeus (Usener in Rhein. Mus. iiii. 345).

The Myth of Ixion” (by C. Smith, in Classical Review, June 1895) deals with the subject of a red-figure canthusar in the British Museum.

IXTACCHUATL, or Ixtacchuatl (“white woman”), a lofty mountain of volcanic origin, 10 m. N. of Popocatepetl and about 40 m. S.S.E. of the city of Mexico, forming part of the short spur called the Sierra Nevada. According to Angelo Heilprin (1853-1907) its elevation is 16,960 ft.; other authorities make it much less. Its apparent height is dwarfed somewhat by its elongated summit and the large area it covers. It has three summits of different heights standing on a north and south line, the central one being the largest and highest and all three rising above the permanent snow-line. As seen from the city of Mexico the three summits have the appearance of a shrouded human figure, hence the poetic Aztec appellation of “white woman” and the unsentimental Spanish designation “La mujer gorda.”

The ascent is difficult and perilous, and is rarely accomplished. Heilprin says that the mountain is largely composed of trachytic rocks and that it is older than Popocatepetl. It has no crater and no trace of lingering volcanic heat. It is surmised that its crater, if ever it had one, has been filled in and its cone worn away by erosion through long periods of time.

IXYRAE, an ancient nation on the north-east trade route described by Herodotus (iv. 22) beyond the Thyssaegatae, somewhere about the upper basins of the Tobol and the Irtysch. They were distinguished by their mode of hunting, climbing a tree to survey their game, and then pursuing it with trained horses and dogs. They were almost certainly the ancestors of the modern Magyars, also called Jugra.

The reading Tycrae is an anachronism, and when Pliny (N.H. vi. 10) and Mela (i. 116) speak of Tyreacae it is also probably due to a false correction.

IXBARTA, or SPARTA [anc. Baris], the chief town of the Hamid-abad sanjak of the Konia vilayet, in Asia Minor, well situated on the edge of a fertile plain at the foot of Aghlasun Dagh. It was once the capital of the Empire of Hamid. It suffered severely from the earthquake of the 16th-17th of January 1880. It is a prosperous place with an enlightened Greek element in its population (hence the numerous families called “Spartalı” in Levantine towns); and it is, in fact, the chief inland colony of Hellenism in Anatolia. Pop. 20,000 (Moslems 13,000, Christians 7000). The new Aïdin railway extends from Dineir to Izbarta via Buldur.

IŽEVSK, a town of Russia, in the government of Vyatka, 140 m. S.W. of Perm and 22 m. W. from the Kama, on the Izh river, Pop. (1857) 11,000. It was one of the principal sites with rifle works of the Russian crown, started in 1807. The making of sporting guns is an active industry.

IŽMAIL, or IJsmaïl, a town of Russia, in the government of Bessarabia, on the left bank of the Kilia branch of the Danube, 35 m. below Reni railway station. Pop. (1866) 31,779, (1900) 33,607, comprising Great and Little Russians, Bulgarians, Jews and Gipsies. There are flour-mills and a trade in cereals, wool, tallow and hides. Originally a Turkish fortified post, Izmil had by the end of the 18th century grown into a place of 30,000 inhabitants. It was occupied by the Russians in 1770, and twenty years later its capture was one of the brilliant achievements of the Russian general, Count A. V. Suvarov. On that occasion the garrison was 40,000 strong, and the assault cost the assailants 10,000 and the defenders 30,000 men. The victory was the theme of one of the Russian poet G. R. Derzhavin’s odes. In 1809 the town was again captured by the Russians; and, when in 1812 it was assigned to them by the Bucharest peace, they chose it as the central station for their Danube fleet.

It was about this time that the town of Tuchkov, with which it was later (1839) incorporated, grew up outside of the town proper. It was started in 1807 by the Russian government, on the site of the treaty of Paris (1856), by which Izmil was made over to Rumania. The town was again transferred to Russia by the peace of Berlin (1878).

IŽU-NO-SHICHI-TO, the seven (shichi) islands (to) of Izu, included in the empire of Japan. They stretch in a southerly direction from a point near the mouth of Tokyo Bay, and lie between 33° and 3° 48’ N. and between 139° and 140° E. Their names, beginning from the north, are Izu-no-Oshima, To-shima, Nii-shima, Kozu-shima, Miyake-shima and Hachijo-shima. There are some islets in their immediate vicinity. Izu-no-Oshima, an island 10 m. long and 5½ m. wide, is 15 m. from the nearest point of the Izu promontory. It is known to western cartographers as Vries Island, a name derived from that of Captain Martin Gerritsz de Vries, a Dutch navigator, who is supposed to have discovered the island in 1643. But the group was known to the Japanese from a remote period, and used as convict settlements certainly from the 12th century and probably from a still earlier era. Hachijo, the most southerly, is often erroneously written “Fatsišio” on English charts. Izu-no-Oshima is remarkable for its smoking volcano, Miharn-yama (2461 ft.), a conspicuous object to all ships bound for Yokohama. Three others of the islands—Nii-shima, Kozu-shima and Miyake-shima—have active volcanoes. Those on Nii-shima and Kozu-shima are of inconsiderable size, but that on Miyake-shima, namely, Oyama, rises to a height of 2707 ft. The most southerly island, Hachijo-shima, has a still higher peak, Dsubo-take (2838 ft.), but it does not emit any smoke.
A letter of the alphabet which, as far as form is concerned, is only a modification of the Latin I and dates back with a separate value only to the 15th century. It was first used as a special form of initial I, the ordinary form being kept for use in other positions. As, however, in many cases initial I had the consonantal value of the English y, in tugum (yoke), &c., the symbol came to be used for the value of y, a value which it still retains in German: Jaf jung, &c. Initially it is pronounced in English as an affricate dzh. The great majority of English words beginning with j are (1) of foreign (mostly French) origin, as "jaundice," "judge;" (2) imitative of sound, like "jar" (the verb); or (3) influenced by analogy, like "jaw" (influenced by chase, according to Skeat). In early French g when palatalized by e or i sounds became confused with consonantal i (y), and both passed into the sound of j which is still preserved in English. A similar sound-change takes place in other languages, e.g. Lithuanian, where the resulting sound is spelt dz. Modern French and also Provençal and Portuguese have changed j = dzh into z (ch). The sound is sometimes represented in English by z: gem, god as well as jail. At the end of modern English words the same sound is represented by -dge as in judge, French juge. In this position, however, the sound occurs also in genuine English words like bridge, sedge, singe, but this is true only for the southern dialects on which the literary language is founded. In the northern dialects the pronunciation as brig, seg, sing still survives.

J'ALIN (from J' alo, to settle, i.e. "the squatters"), an African tribe of Semitic stock. They formerly occupied the country on both banks of the Nile from Khartum to Abu Hamed. They claim to be of the Kureish tribe and even trace descent from Abbas, uncle of the prophet. They are of Arab origin, but now of very mixed blood. According to their own tradition they emigrated to Nubia in the 12th century. They were at one time subject to the Funj kings, but their position was in a measure independent. At the Egyptian invasion in 1820 they were the most powerful of Arab tribes in the Nile valley. They submitted at first, but in 1822 rebelled and massacred the Egyptian garrison at Shendi. The revolt was mercifully suppressed, and the J'alin were thenceforward looked on with suspicion. They were almost the first of the northern tribes to join the mahdi in 1884, and it was their position to the north of Khartum which made communication with General Gordon so difficult. The J'alin are now a semi-nomadic agricultural people. Many are employed in Khartum as servants, scribes and watchmen. They are a proud religious people, formerly notorious as cruel slave dealers. J. L. Burckhardt says the true J'alin from the eastern desert is exactly like the Bedouin of eastern Arabia.

JABIRU, according to Margrave the Brazilian name of a bird, subsequently called by Linnaeus Mycteria americana, one of the largest of the storks, Ciconiidae, which occurs from Mexico southwards to the territory of the Argentine Republic. It stands between 4 and 5 ft. in height, and is conspicuous for its massive bill, slightly upturned, and its entirely white plumage, but the head and neck are bare and black, except for a band over the lower third part of the latter, which is bright red in the living bird. Very nearly allied to Mycteria, and also commonly called jabiru, are the birds of the genus Leptoptilos and P. Chro- rythynchus—the former containing one or (in the opinion of some) two species, X. australis and X. indicus, and the latter only one, X. senegalensis. These belong to the countries indicated by their names, and differ chiefly by their feathered head and neck, while the last is sometimes termed the saddle-billed stork from the very singular shape of its beak. Somewhat more distantly related are the gigantic birds known to Europeans in India and elsewhere as adjutant birds, belonging to the genus Leptoptilus, distinguished by their sad-coloured plumage, their black scabrous head, and their enormous tawny pouch, which depends occasionally some 15 in. or more in length from the lower part of the neck, and seems to be connected with the respiratory and not, as commonly believed, with the digestive system. In many parts of India L. dubius, the largest of these birds, the argila as Hindus call it, is a most efficient scavenger, sailing aloft at a vast height and descending on the discovery of offal, though frogs and fishes also form part of its diet. It familiarly enters the large towns, in many of which an account of its services it is strictly protected from injury, and, having satisfied its appetite, seeks the repose it has earned, sitting with its feet extended in front in a most grotesque attitude. A second and smaller species, L. javanicus, has a more southern and eastern range; while a third, L. crumenifer, of African origin, and often known as the marabout-stork, gives its name to the beautifully soft feathers so called, which are the under-tail-coverts; the "marabout" feathers of the plume-trade are mostly supplied by other birds, the term being apparently applied to any downy feathers.

JABLOCHKOV, PAUL (1847-1894), Russian electrical engineer and inventor, was born at Serdobsk, in the government of Saratov, on the 14th of September 1847, and educated at St Petersburg. In 1871 he was appointed director of the telegraph lines between Moscow and Kursk, but in 1875 he resigned his position in order to devote himself to his researches on electric lighting by arc lamps, which he had already taken up. In 1876 he settled in Paris, and towards the end of the year brought out his famous "candles," known by his name, which consisted of two carbon parallel rods, separated by a non-conducting partition; alternating currents were employed, and the candle was operated by a high-resistance carbon match connecting the tips of the rods, a true arc forming between the parallel carbons when this burnt off, and the separators volatilizing as the carbons burnt away. For a few years his system of electric lighting was widely adopted, but it was gradually superseded...
JABLONSKI—JABORANDI

(see Lightning: Electric) and is no longer in use. Jablochkov made various other electrical inventions, but he died in poverty, having returned to Russia on the 19th of March 1894.

JABLONSKI, DANIEL ERNST (1660–1741), German theologian, was born at Nassenhuben, near Danzig, on the 20th of November 1660. His father was a minister of the Moravian Church, who had taken the name of Peter Pigulas on his baptism; the son, however, preferred the Bohemian family name of Jablonski. His maternal grandfather, Johann Amos Comenius (d. 1670), was a bishop of the Moravian Church. Having studied at Frankfort-on-the-Oder and at Oxford, Jablonski entered upon his career as a preacher at Magdeburg in 1683, and then from 1686 to 1691 he was the head of the Moravian college at Lissa, a position which had been filled by his grandfather. Still retaining his connexion with the Moravians, he was appointed court preacher at Königsberg in 1691 by the elector of Brandenburg, Frederick III., and here, entering upon a career of great activity, he soon became a person of influence in court circles. In 1693 he was transferred to Berlin as court preacher, and in 1699 he was consecrated a bishop of the Moravian Church. At Berlin Jablonski worked hard to bring about a union between the followers of Luther and those of Calvin; the courts of Berlin, Hanover, Brunswick and Gotha were interested in his scheme, and his principal helper was the philosopher Leibnitz. His idea appears to have been to form a general union between the German, the English and the Swiss Protestants, and thus to establish una eademque sancta catholica et apostolica eademque reformata ecclesia. For some years negotiations were carried on with a view to attaining this end, but eventually it was found impossible to surmount the many difficulties in the way; Jablonski and Leibnitz, however, did not cease to believe in the possibility of accomplishing their purpose. Jablonski's next plan was to reform the Church of Prussia by introducing into it the episcopate, and also the liturgy of the English Church, but here again he was unsuccessful. As a scholar Jablonski brought out a Hebrew edition of the Old Testament, and translated Bentley's A Confutation of Atheism into Latin (1696). He had some share in founding the Berlin Academy of Sciences, of which he was president in 1733, and he received a degree from the university of Oxford. He died on the 25th of May 1741.

Jablonski's son, Paul Ernst Jablonski (1603–1737), was professor of theology and philosophy at the university of Frankfort-on-the-Oder.

Editions of the letters which passed between Jablonski and Leibnitz, relative to the proposed union, were published at Leipzig in 1747 and at Dorpat in 1899.

JABORANDI, a name given in a generic manner in Brazil and South America generally to a number of different plants, all of which possess more or less marked sialagogue and sudorific properties. In the year 1875 a drug was introduced under the above name to the notice of medical men in France by Dr Coutinho of Pernambuco, its botanical source being then unknown. Pilocarpus penantiolius, a member of the natural order Rutaceae, the plant from which it is obtained, is a slightly branched shrub about 1 ft. high, growing in Paraguay and the eastern provinces of Brazil. The leaves, which are placed alternately on the stem, are often 1½ ft. long, and consist of from two to five pairs of opposite leaflets, the terminal one having a longer pedicel than the others. The leaflets are oval, lanceolate, entire and obtuse, with the apex often slightly indented, from 3 to 4 in. long and 1 to 1½ in. broad in the middle. When held up to the light they may be observed to have scattered all over their surface, small pellucid dots or receptacles of secretion immersed in the substance of the leaf. The leaves in size and texture bear some resemblance to those of the cherry-laurel (Prunus laurocerasus), but are less polished on the upper surface. The flowers, which are produced in spring and early summer, are borne on a raceme, 6 or 8 in. long, and the fruit consists of five carpels, of which not more than two or three usually arrive at maturity. The leaves are the part of the plant usually imported, although occasionally the stems and roots are attached to them. The active principle for which the name pilocarpine, suggested by Holmes, was ultimately adopted, was discovered almost simultaneously by Hardy in France and Gerrard in England, but was first obtained in a pure state by Petri of Paris. It is a liquid alkaloid, slightly soluble in water, and very soluble in alcohol, ether and chloroform. It strongly rotates the plane of polarization to the right, and forms crystalline salts of which the nitrate is that chiefly used in medicine. The nitrate and phosphate are insoluble in ether, chloroform and benzol, while the hydrochlorate and hydrobromate dissolve both in these menstrua and in water and alcohol; the sulphate and acetate being deliquescent are not employed medicinally. The formula of the alkaloid is C5H6N4O8.

Certain other alkaloids are present in the leaves. They have been named jaborine, jaboridine and pilocarpidine. The first of these is the most important and constant. It is possibly derived from pilocarpine, and has the formula C6H10N2O6. Jaborine resembles atropine pharmacologically, and is therefore antagonistic to pilocarpine. The various preparations of jaborandi leaves are therefore undesirable for therapeutic purposes, and only the nitrate of pilocarpine itself should be used. This is a white crystalline powder, soluble in the ratio of about one part in ten of cold water. The dose is ⅓–⅖ grain by the mouth, and up to one-third of a grain hypodermically, in which fashion it is usually given.

The action of this powerful alkaloid closely resembles that of physostigmine, but whereas the latter is specially active in influencing the heart, the eye and the spinal cord, pilocarpine exerts its greatest power on the secretions. It has no external action. When taken by the mouth the drug is rapidly absorbed and stimulates the secretions of the entire alimentary tract, though not of the liver. The action on the salivary glands is the most marked and the best understood. The great flow of saliva is due to an action of the drug, after absorption, on the terminations of the chorda tympani, sympathetic and other nerves of salivary secretion. The gland cells themselves are unaffected. The nerves are so violently excited that direct stimulation of them by electricity adds nothing to the rate of salivary flow. The action is antagonized by atropine, which paralyses the nerve terminals. About 1/8th of a grain of atropine
JACA—JAÇANÁ

antagonizes half a grain of pilocarpine. The circulation is depressed by the drug, the pulse being slowed and the blood pressure falling. The respiratory action is due to stimulation of the vagus, but the dilatation of the blood-vessels does not appear to be due to a specific action upon them. The drug does not kill by its action on the heart. Its dangerous action is upon the bronchial secretion, which is greatly increased. Pilocarpine is not only the most powerful salutary drug, but also the most powerful diaphoretic known. One dose may cause the flow of nearly a pint of sweat in an hour. The action is due, as in the case of the salivation, to stimulation of the terminals of the sudorific nerves. According to K. Binz there is also in both cases an action on the medullary centres for these secretions. Just as the saliva is a true secretion containing a high proportion of ptyalin and salts, and is not a mere transudation of water, so the perspiration is found to contain a high ratio of urea and chlorides. The great diaphoresis and the depression of the circulation usually cause a fall in temperature of about 2° F. The drug is exerted unchanged in the urine. When given internally or applied locally to the eye it powerfully stimulates the terminals of the ciliary nerves in the iris and ciliary muscle, causing extreme contraction of the pupil and spasm of accommodation. The tension of the eyeball is at first raised but afterwards lowered.

The chief therapeutic use of the drug is as a diaphoretic in chronic Bright's disease. It is also used to aid the growth of the hair—in which it is sometimes successful; in cases of inordinate thirst, when one-tenth of a grain with a little bismuth held in the mouth may be of much value; in cases of lead and mercury poisoning, where it is the last resort of the poison in the secretions; as a galactagogue; and in cases of acute poisoning (though here it is of doubtful value).

JACA, a city of northern Spain, in the province of Huesca, 114 m. by rail N. by W. of Saragossa, on the left bank of the river Aragon, and among the southern slopes of the Pyrenees, 2380 ft. above the sea. Pop. (1890), 4034. Jaca is an episcopal see, and was formerly the capital of the Aragonese county of Sobrarbe. Its massive Gothic cathedral dates at least from the 11th century, and possibly from the 9th. The city derives some importance from its position on the ancient frontier road from Saragossa to Pau. In August 1504 the French and Spanish governments agreed to supplement this trade-route by building a railway from Oror in the Basses Pyrénées to Jaca. Various frontier defence works were constructed in the neighbourhood at the close of the 19th century.

The origin of the city is unknown. The Jaccetani (Jáxcatan) are mentioned as one of the most celebrated of the numerous small tribes inhabiting the basin of the Ebro by Strabo, who adds that their territory was the theatre of the wars which took place in the 1st century B.C. between Sertorius and Pompey. They are also mentioned by Livy (xxii. 66, 67) and Caesar (B.C. i. 60). Early in the 8th century Jaca fell into the possession of the Moors, by whose writers it is referred to under the name of Dyaka as one of the chief places in the province of Sarkosta (Saragoza). The date of its reconquest is uncertain, but it must have been before the time of Ramiro I. of Aragon (1035-1053), who gave it the title of “city,” and in 1063 held within its walls a council, which, inasmuch as the people were called in to sanction its decrees, is regarded as of great importance in the history of the parliamentary institutions of the Peninsula. In 1705 Jaca supported King Philip V. from whom, in consequence, it received the title of muy noble, muy leal y tencedora, “most noble, most loyal and victorious.” During the Peninsular War it surrendered to the French in 1809, and was recaptured in 1814.

JACAMAR, a word formed by Brison from Jacameri, the Brazilian name of a bird, as given by Marcgrave, and since adopted in most European tongues for the species to which it was first applied and others allied to it, forming the family Galbulidae 1 of ornithologists, the precise position of which is uncertain, since the best authorities differ. All will agree that the family is allied to the great heterogenous group called by Nitzsch Picariae, but further into detail it is hardly safe to go. The Galbulidae have zygodactylous or pair-toed feet, like the Cuculidae, Bucconidae and Picidae, they also resemble both the latter in laying glossy white eggs, but in this respect they bear the same resemblance to the Momotidae, Alecindae, Meropidae

1 Galluba was first applied to Marcgrave's bird by Moehring. It is another form of Galgulus, and seems to have been one of the many names of the golden oriole. See Icterus.

Jaca—Jaçaná

and some other groups, to which affinity has been claimed for them. In the opinion of Selater (A Monograph of the Jacamars and Puff-birds) the jacamars form two groups—one consisting of the single genus and species Jacamereps aureus (J. grandis of most authors), and the other including all the rest, viz. Urogalba with two species, Galbula with nine, Brachygaube with five, and Jaca
coralcyon and Galbocalycychnus with each one. They are all rather small birds, the largest known being little over 10 in. in length, with long and sharply pointed bills, but more or less resplendent with golden or bronze reflections, but at the same time comparatively soft. Jacamoralcyon tridactyla differs from all the rest in possessing but three toes (as its name indicates), on each foot, the hallux being deficient. With the exception of Galbula melanogenia, which is found also in Central America and southern Mexico, all the jacamars inhabit the tropical portions of South America eastward of the Andes, Galbula rufigeada, however, extending its range to the islands of Trinidad and Tobago.2 Very little is known of the habits of any of the species. They are seen sitting motionless on trees, sometimes solitary, at other times in companies, whence they suddenly dart off at any passing insect, catch it on the wing, and return to their perch. Of their nidification almost nothing has been recorded, but the species occurring in Tobago is said by Kirk to make its nest in marl-banks, digging a hole about an inch and a half in diameter and some 18 in. deep. (A. N.)

JAÇANÁ, the Brazilian name, according to Marcgrave, of certain birds, since found to have some allies in other parts of the world, which are also very generally called by the same appellation. They have been most frequently classed with the water-hens or rails (Rallidae), but are now recognized by many systematists as forming a separate family, Parridiae, whose leading seems to be rather towards the Limicolaes, as apparently first

suggested by Blyth, a view which is supported by the osteological observations of Parker (Proc. Zool. Society, 1863, p. 513), though denied by A. Milne-Edwards (Ois. foss. de la France, ii. p. 110). The most obvious characteristic of this group of birds is the extraordinary length of their toes and claws, whereby they are enabled to walk with ease over water-lilies and other aquatic plants growing in rivers and lakes. The family has been divided into four genera—of which Parra, as now restricted, inhabits South America; Melopoides, hardly differing from it, has representatives in Africa, Madagascar and the Indian region; Hydrocole, also very nearly allied to Parra, belongs to the

2 The singular appearance, recorded by Canon Tristram (Zoologist, p. 756), of all a bird at this species in Lincolnshire, seems hardly raised; but the reason which prompted Linnæus to apply it, as he seems first to have done, to a bird of this group, cannot be satisfactorily stated.

Pheasant-tailed Jaçaná.
northern portion of the Australian region; and *Hydrophasianus*, the most extravagant form of the whole, is found in India, Ceylon and China. In habits the jaegers have much in common with the water-hens, but that fact is insufficient to warrant the affinity asserted to exist between the two groups; for in their osteological structure there is much difference, and the resemblance seems to be only of analogy. The *Partula* lay very peculiar eggs of a rich olive-brown colour, in most cases closely marked with dark lines, thus presenting an appearance by which they may be readily known from those of any other birds, though an approach to it is occasionally to be noticed in those of certain *Limicola*, and especially of certain *Charadriidae*. (A. N.)

JACINI—JACK

is a small Union flag. (The Union flag should not be styled a Union Jack except when it is flown as a Jack.) The Jack of other nations is usually the canton of the ensign, as in the German and the United States navies, or else a smaller form of the national ensign, as in France. (See *Flag*.)

The more common use of "Jack" is for various mechanical and other devices only incidentally used as substitutes for men or boys. Thus the origin of the boot-jack and the meat-jack is explained in Isaac Watts's *Logic*, 1724: "So foot boys, who had frequently the common name of Jack given them, were kept to turn the spit or pull off their masters' boots, but when instruments were invented for both these services, they were both called jacks." The *New English Dictionary* finds a transitional sense in the use of the name "jack" for mechanical figures which strike the hours on a bell of a clock. Such a figure in the clock of St Lawrence Church at Reading is called a Jack in the parish accounts for 1499-1500. It may appear in Italian as *giaco*, or *giaccio*, in Dutch *jach*, Swedish *jacka* and German *Jacke*, still the ordinary name for a short coat, as is the English jacket, from the diminutive French *jaquette*. It was probably from some resemblance to the leather coat that the well-known leather vessels for holding liquor or for drinking were known as jacks or black jacks. These drinking vessels, which are often of great size, were not described as black jacks till the 16th century, though known as jacks much earlier. Among the important specimens that have survived to this day is one with the initials of Charles I dated 1617. It is 7 ft 6 in. The boot-jack is a distinct type of drinking vessel from the leather botle and the bombard. The jack-boot, the heavy riding boot with long flap covering the knee and part of the thigh, and worn by troopers first during the 17th century, was so called probably from association with the leather jack or jerkin. The jack-boot is still worn by the Household Cavalry, and the name is applied to a high riding boot reaching to the knee as distinguished from the riding boot with tops, used in full hunting-kit or by grooms or coachmen.

Jack, sometimes spelled *Jak*, is the common name for the fruit of the tree *Arilocus integrifolia*, found in the East Indies. The word is an adaptation of the Portuguese *jacu* from the Malay name *chakka*. (See *Bread Fruit*.)

The word "jackanapes," now used as an opprobrious term for a swaggering person with impertinent ways and affected air
and graces, has a disputed and curious history. According to the New English Dictionary it first appears in 1450 in reference to William de la Pole, duke of Suffolk (Political Poems, "Rolls Series," II. 224), "Jack Napys with his cloggge hath tiede Talbot oure gentille cloggge." Suffolk’s badge was a clog and chain, such as was often used for an ape kept in captivity, and he is alluded to (ibid. 222) as "Ape cloggge." Jack Napys, Jack o’ Napes, Jackanapes, was a common name for a tame ape from the 16th century, and it seems more likely that the word is a fanciful name for a monkey than that it is due to the nickname of Suffolk.

**JACKAL** (Turk. chakkâl), a name properly restricted to *Canis aureus*, a wolflike wild member of the dog family inhabiting eastern Europe and southern Asia, but extended to include a number of allied species. Jackals resemble wolves and dogs in their diet, the round eye-pupils, the period of gestation, and to a large extent also in habits. The European species grows to a height of 15 in. at the shoulders, and to a length of about 2 ft., exclusive of its bushy tail. Typically the fur is greyish-yellow, darker on the back and lighter beneath. The range of the common jackal (*C. aureus*) extends from Dalmatia to India, the species being represented by several local races. In Senegal this species is replaced by *C. anthus*, while in Egypt occurs the much larger *C. lupaster*, commonly known as the Egyptian wolf. Nearly allied to the last is the so-called Indian wolf (*C. pellipes*). Other African species are the black-backed jackal (*C. mesomelas*), the variegated jackal (*C. variegatus*), and the dusky jackal (*C. adustus*). Jackals are nocturnal animals, concealing themselves until dusk in woody jungles and other natural lurking places, and then sallying forth in packs, which sometimes number two hundred individuals, and visiting farmyards, villages and towns in search of food. This consists for the most part of the smaller mammals and poultry; although the association in packs enables these marauders to hunt down cactolopes and sheep. When unable to obtain living prey, they feed on carrion and refuse of all kinds, and are thus useful in removing putrescent matter from the streets. They are also fond of grapes and other fruits, and are thus the pests of the vineyard as well as the poultry-yard. The cry of the jackal is even more appalling than that of the hyena, a shriek from one member of a pack being the signal for a general chorus of screams, which is kept up during the greater part of the night. In India these animals are hunted with foxhounds or greyhounds, and from their cunning and pluck afford excellent sport. Jackals are readily tamed; and domesticated individuals are said, when called by their masters, to wag their tails, crouch and throw themselves on the ground, and otherwise behave in a dog-like fashion. The jackal, like the fox, has an offensive odour, due to the secretion of a gland at the base of the tail.

**JACKDAW**, or simply *Daw* (Old Low German, *Dahá*; Dutch, *Kauw*), one of the smallest species of the genus *Corvus* (see Crow), and a very well known inhabitant of Europe, the *C. monedula* of ornithologists. In some of its habits it much resembles its congener the rook, with which it constantly associates during a great part of the year; but, while the rook only exceptionally places its nest elsewhere than on the boughs of trees and open to the sky, the daw almost invariably chooses holes in rocks, hollow trees, rabbit-burrows or buildings. Nearly every church-tower and castle, ruined or not, is more or less numerous occupied by daws. Chimneys frequently give them the accommodation they desire, much to the annoyance of the householder, who finds the funnel choked by the quantity of sticks brought together by the birds, since their industry in collecting materials for their nests is as marvellous as it often is futile. In some cases the stack of loose sticks piled up by daws in a belfry or tower has been known to form a structure 10 or 12 ft. in height, and hence this species may be accounted one of the greatest nest-builders in the world. The style of architecture practised by the daw thus brings it more than the rook into contact with man, and its familiarity is increased by the boldness of its disposition which, though tempered by discreet cunning, is hardly surpassed among birds. Its small size, in comparison with most of its congeners, alone incapacitates it from inflicting the serious injuries of which some of them are often the authors, yet its pilferings are not to be denied, though on the whole its services to the agriculturist are great, for in the destruction of injurious insects it is hardly inferior to the rook, and it has the useful habit of ridding sheep, on whose backs it may be frequently seen perched, of some of their past insects.

The daw displays the glossy black plumage so characteristic of the true crows, varied only by the hoary grey of the ear-coverts, and of the nape and sides of the neck, which is the mark of the adult; but examples from the east of Europe and western Asia have these parts much lighter, passing into a silvery white, and hence have been deemed by some authorities to constitute a distinct species (*C. collaris*, Drum.). Further to the eastward occurs the *C. dauuricus* of Pallas, which has not only the collar broader and of a pure white, but much of the lower parts of the body white also. Japan and northern China are inhabited also by a species resembling that of western Europe but wanting by the grey nape of the latter. This is the *C. neglectus* of Professor Schlegel, and is said by Dresser, on the authority of Swinhoe, to interbreed frequently with *C. dauuricus*. These are all the birds that seem entitled to be considered daws, though Dr Bowdler Sharpe (Cat. B. Brit. Museum, iii. 24) associates with them (under the little-deserved separate generic distinction *Coloeus*) the fish-crow of North America, which appears both in structure and in habits to be a true crow.

(A. N.)

**JACKSON, Andrew** (1767–1845), seventh president of the United States, was born on the 25th of March 1767, at the Waxhaw or Warsaw settlement, in Union county, North Carolina, or in Lancaster county, South Carolina, whither his parents had immigrated from Carrickfergus, Ireland, in 1765. He played a slight part in the War of Independence, and was taken prisoner in 1781, his treatment resulting in a lifelong dislike of Great Britain. He studied law at Salisbury, North Carolina, was admitted to the bar there in 1787, and began to practise at McLeansville, Guilford county, North Carolina, where for a time he was a constable and deputy-sheriff. In 1788, having been appointed prosecuting attorney of the western district of North Carolina (now the state of Tennessee), he removed to Nash-ville and was appointed justice of the district. In 1790 he married Mrs Rachel Robards (née Donelson), having heard that her husband had obtained a divorce through the legislature of Virginia. The
legislative act, however, had only authorized the courts to determine whether or not there were sufficient grounds for a divorce and to grant or withhold it accordingly. It was more than two years before the divorce was actually granted, and only on the basis of the fact that Jackson and Mrs Robards were then living together. On receiving this information, Jackson had the marriage ceremony performed a second time.

In 1796 Jackson assisted in framing the constitution of Tennessee. From December 1796 to March 1797 he represented that state in the Federal House of Representatives, where he distinguished himself as an irreconcilable opponent of President Washington, and was one of the twelve representatives who voted against the address to him by the House. In 1797 he was elected a United States senator; but he resigned in the following year. He was judge of the supreme court of Tennessee from 1798 to 1804. In 1802-1807 he contracted a friendship with Aaron Burr; and at the latter's trial in 1807 Jackson was one of his conspicuous champions. Up to the time of his nomination for the presidency, the biographer of Jackson finds nothing to record but military exploits in which he displayed perseverance, energy and skill of a very high order, and a succession of personal acts in which he showed himself ignorable, violent, perverse, quarrelsome and astonishingly indiscreet. His combative disposition led him into numerous personal difficulties. In 1795 he fought a duel with Colonel Waitstill Avery (1745-1811), an opposing counsel, over some angry words uttered in a court room; but both, it appears, intentionally fired wild. In 1806 in another duel, after a long and bitter quarrel, he killed Charles Dickinson, and Jackson himself received a wound from which he never fully recovered. In 1813 he exchanged shots with Thomas Hart Benton and his brother Jesse in a Nashville tavern, and received a second wound. Jackson and Thomas Hart Benton were later reconciled.

In 1813-1814, as major-general of militia, he commanded in the campaign against the Creek Indians in Georgia and Alabama, defeated them (at Talladega, on the 9th of November 1813, and at Tohopeka, on the 29th of March 1814), and thus first attracted public notice by his talents. In May 1814 he was commissioned as major-general in the regular army to serve against the British; in November he captured Pensacola, Florida, then owned by Spain, but used by the British as a base of operations; and on the 8th of January 1815 he inflicted a severe defeat on the enemy before New Orleans, the contestants being unaware that a treaty of peace had already been signed. During his stay in New Orleans he proclaimed martial law, and carried out his measures with unrelenting sternness, banishing from the town a judge who attempted resistance. When civil law was restored, Jackson was fined $1000 for contempt of court in 1814; Congress ordered him to pay an interest ($700) to be repaid. In 1818 Jackson received the command against the Seminoles. His conduct in following them up into the Spanish territory of Florida, in seizing Pensacola, and in arresting and executing two British subjects, Alexander Arbuthnot and Robert Ambris-ter, gave rise to much hostile comment in the cabinet and in Congress; but the negotiations for the purchase of Florida put an end to the diplomatic difficulty. In 1821 Jackson was military governor of the territory of Florida, and there again he came into collision with the civil authority. From this, as from previous troubles, John Quincy Adams, then secretary of state, extricated him.

In July 1822 the general assembly of Tennessee nominated Jackson for president; and in 1823 he was elected to the United States Senate, from which he resigned in 1825. The rival candidates for the office of president in the campaign of 1824 were Jackson, John Quincy Adams, W. H. Crawford and Henry Clay. Jackson obtained the largest number of votes (99) in the electoral college (Adams receiving 84, Crawford 41 and Clay 37); but no one had an absolute majority, and it thus became the duty of the House of Representatives to choose one of the three. Crawford and Jackson were the only candidates. Jackson received the greatest numbers of electoral votes. At the election by the house (February 9, 1825) Adams was chosen, receiving the votes of 13 states, while Jackson received the votes of 7 and Crawford the votes of 4. Jackson, however, was recognized by the able politicians as the coming man. Martin Van Buren and others, going into opposition under his banner, waged from the first a relentless and factious war on the administration. Van Buren was the most adroit politician of his time; and Jackson was in the hands of very astute men, so advised and controlled him. He was easy to lead when his mind was in solution; and he gave his confidence freely where he had once placed it. He was not suspicious, but if he withdrew his confidence he was implacable. When his mind crystallized on a notion that had a personal significance to himself, that notion became a hard fact that filled his field of vision. When he was told that he had been cheated in the matter of the presidency, he was sure of it, although those who told him were by no means so. There was great significance in the election of Jackson in 1828. A new generation was growing up under new economic and social conditions. They felt great confidence in themselves and great independence. They despised tradition and Old World ways and notions; and they accepted the Jeffersonian dogmas, not only as maxims, but as social forces—the causes of the material prosperity of the country. By this generation, therefore, Jackson was recognized as a man after their own heart. They liked him because he was vigorous, brusque, uncouth, relentless, straightforward and open. They made him president in 1828, and he fulfilled all their expectations. He had 178 votes, while Adams had only 83. He took possession of the executive in January 1829. Though the work of reorganization of offices began almost at his inauguration, it is yet an incorrect account of the matter to say that Jackson corrupted the civil service. His administration is rather the date at which a system of democracy, organized by the use of patronage, was introduced into the federal arena by Van Buren. It was at this time that the Democratic or Republican party divided, largely along personal lines, into Jacksonian Democrats and National Republicans, the latter led by such men as Henry Clay and J. Q. Adams. The administration itself had two factions in it from the first, the faction of Van Buren, the secretary of state in 1829-1831, and that of Calhoun, vice-president in 1829-1832. The refusal of the wives of the cabinet and of Mrs Calhoun to accord social recognition to Mrs J. H. Eaton brought about a rupture, and in April 1831 the whole cabinet was reorganized. Van Buren, a widower, sided with the president in this affair and grew in his favour. Jackson in the meantime had learned that Calhoun as secretary of war had wished to censure him for his actions during the Seminole war in Florida in 1818, and henceforth he regarded the South Carolina statesman as his enemy. The result was that Jackson transferred to Van Buren his support for succession in the presidency. The relations between Jackson and his cabinet were unlike those existing under his predecessors. Having a military point of view, he was inclined to look upon the cabinet members as inferior officers, and when in need of advice he usually consulted a group of personal friends, who came to be called the “Kitchen Cabinet.” The principal members of this clique were William B. Lewis (1784-1860), Amos Kendall and Duff Green, the last named being editor of the United States Telegraph, the organ of the administration.

In 1832 Jackson was re-elected by a large majority (210 electoral votes to 49) over Henry Clay, his chief opponent. The battle raged mainly around the re-charter of the Bank of the United States. It is probable that Jackson's advisers in 1828 had told him, though erroneously, that the bank had worked against him, and they were not able to control him. The first message of his first presidency had contained a severe reflection on the bank; and in the very height of this second campaign (July 1832) he vetoed the re-charter, which had been passed in
the session of 1831–1832. Jackson interpreted his re-election as an approval by the people of his war on the bank, and he pushed it with energy. In September 1833 he ordered the public deposits in the bank to be transferred to selected local banks, and entered upon the "experiment" whether these could not act as fiscal agents for the government, and whether the desire to get the deposits would not induce the local banks to adopt sound rules of currency. During the next session the Senate passed a resolution condemning his conduct. Jackson protested, and after a hard struggle, in which Jackson's friends were led by Senator Thomas Hart Benton, the resolution was ordered to be expunged from the record, on the 16th of January 1837.

In 1832, when the state of South Carolina attempted to "nullify" the tariff laws, Jackson at once took steps to enforce the authority of the federal government, ordering a smaller force to Charleston and paroling troops within convenient distance. He also issued a proclamation warning the people of South Carolina against the consequences of their conduct. In the troubles between Georgia and the Cherokee Indians, however, he took a different stand. Shortly after his first election Georgia passed an act extending over the Cherokee country the civil laws of the state. This was contrary to the rights of the Cherokees under a federal treaty, and the Supreme Court consequently declared the act void (1832). Jackson, however, having the frontiersman's contempt for the Indian, refused to enforce the decision of the court (see Nullification; Georgia: History).

Jackson was very successful in collecting old claims against various European nations for spoliations inflicted under Napoleon's continental system, especially the French spoliation claims, with reference to which he acted with aggressiveness and firmness. Aiming at a currency to consist largely of specie, he caused the payment of these claims to be received and imported in specie as far as possible; and in 1836 he ordered land-agents to receive for land nothing but specie. About the same time a law passed Congress for distributing among the states some $35,000,000 balance belonging to the United States, the public debt at Philadelphia in which it was being held had regarded this sum almost as a permanent loan, and had inflated credit on the basis of it. The necessary calling in of their loans in order to meet the drafts in favour of the states, combining with the breach of the overstrained credit between America and Europe and the decline in the price of cotton, brought about a crash which prostrated the whole financial, industrial and commercial system of the country for six or seven years. The crash came just as Jackson was leaving office; the whole burden fell on his successor, Van Buren, in 1837. The state of the bank at the time gave the nickname of "corporations, and recognized Jackson as their champion. Therefore, Jackson's policy was to place the power on the side opposed to banks, corporations and other forms of capital. That Jackson was a typical man of his generation is certain. He represents the spirit and temper of the free American of that day, and it was a part of his way of thinking and acting that he put his whole life and interest into the conflict. He accomplished two things of great importance in the history: he crushed excessive state-rights and established the contrary doctrine in fact and in the political orthodoxy of the democrats; he destroyed the great bank. The subsequent history of the bank left it without an apologist, and prejudiced the whole later judgment about it. The way in which Jackson accomplished these things was such that it cost the country ten years of the severest liquidation, and left conflicting traditions of public policy in the Democratic party. After he left Washington, Jackson fell into discord with his most intimate old friends, and turned his interest to the cause of slavery, which he thought to be attacked and in danger.

Jackson is the only president of whom it may be said that he went out of office far more popular than he was when he entered. When he went into office he had no political opinions, only some popular notions. He left his party strong, perfectly organized and enthusiastic on a platform of low expenditure, payment of the debt, no expenditure for public improvements, no glory or display in any form and low taxes. His name still remained a spell to conjure with, and the politicians sought to obtain the assistance of his approval for their schemes; but in general his last years were quiet and uneventful. He died at his residence, "The Hermitage," near Nashville, Tennessee, on the 8th of June 1845.

BIBLIOGRAPHY.—Of the early biographies, that by J. H. Eaton (Philadelphia, 1824), which was written for political purposes. Amos Kendall's Life (New York, 1843) is incomplete, extending only to 1814. James Parton's elaborate work (3 vols., New York, 1860) is still useful. Parton prepared a shorter biography for the "Great Commanders Series" (New York, 1893), which emphasizes Jackson's military career. W. G. Sumner's Andrew Jackson in the "American Statesmen Series" (Boston, 1882; revised, 1899) combines the leading facts of his life with a history of his times. W. G. Brown wrote an appreciative sketch (Boston, 1900) for the "Riverside Biographical Series." Of more recent works the most elaborate are the History of Andrew Jackson (Philadelphia, 1900), by J. L. G. Jackson, with numerous errors, and the Life and Times of Andrew Jackson, by A. S. Colyar (Nashville, 1904). Charles H. Peck's The Jacksonian Epoch (New York, 1899) is an account of national politics from 1815 to 1835, in which the antagonism of Jackson and Clay is emphasized.

JACKSON, CYRIL (1746-1819), dean of Christ Church, Oxford, was born in Yorkshire, and educated at Westminster
and Oxford. In 1771 he was chosen to be sub-preceptor to the two eldest sons of George III., but in 1776 he was dismissed, probably through some household intrigues. He then took orders, and was appointed in 1779 to the preachership at Lincoln's Inn and to a canonry at Christ Church, Oxford. In 1783 he was elected dean of Christ Church. His desire to go to the college led him to decline the bishopric of Oxford in 1799 and the primacy of Ireland in 1800. He took a leading part in framing the statute which, in 1802, launched the system of public examinations at Oxford, but otherwise he was not prominent in university affairs. On his resignation in 1809 he settled at Felpham, in Sussex, where he remained till his death.

JACKSON, FREDERICK GEORGE (1800— ), British Arctic explorer, was educated at Denstone College and Edinburgh University. His first voyage in Arctic waters was on a whaling cruise in 1866-1867, and in 1873 he made a sledge-journey of 3000 miles across the frozen tundra of Siberia lying between the Ob and the Pechora. His narrative of this journey was published under the title of The Great Frozen Land (1855). On his return, he was given the command of the Jackson-Harmsworth Arctic expedition (1854-1857), which had for its object the general exploration of Franz Josef Land. In recognition of his services he received a knighthood of the first class of the Danish Royal Order of St Olaf in 1858, and was awarded the gold medal of the Paris Geographical Society in 1859. His account of the expedition was published under the title of A Thousand Days in the Arctic (1859). He served in South Africa during the Boer War, and obtained the rank of captain. His travels also include a journey across the Australian deserts.

JACKSON, HELEN MARIA (1831—1883), American poet and novelist, who wrote under the initials of "H. H." (Helen Hunt), was born in Amherst, Massachusetts, on the 18th of October 1831, the daughter of Nathan Welby Fiske (1798-1847), who was a professor in Amherst College. In October 1852 she married Lieutenant Edward Bissell Hunt (1852-1863), of the U.S. corps of engineers. In 1870 she published a little volume of meditations, Veritas, which was praised by Emerson in the preface to his Parnassus (1874). In 1875 she married William S. Jackson, a banker, of Colorado Springs. She became a prolific writer of prose and verse, including juvenile tales, books of travel, household hints and novels, of which the best is Ramona (1884), a defence of the Indian character. In 1883, as a special commissioner with Abbot Kinney (b. 1850), she investigated the condition and needs of the Mission Indians in California. A Century of Dishonor (1881) was an arrangement of the treatment of the Indians by the United States. She died on the 12th of August 1885 in San Francisco.

In addition to her publications referred to above, Mercy Phelps' Choice (1876), Hetty's Strange History (1877), Zeph (1886), and Sonnets and Lyrics (1886) may be mentioned.

JACKSON, MASON (c. 1820—1903), British engraver, was born at Berwick-on-Tweed about 1820, and was trained as a wood engraver by his brother, John Jackson, the author of a history of this art. In the middle of the 19th century he made a considerable reputation by his engravings for the Art Union of London, and for Knight's Shakespeare and other standard books; and in 1860 he was appointed art editor of the Illustrated London News, a post which he held for thirty years. He wrote a history of the rise and progress of illustrated journalism. He died in December 1903.

JACKSON, THOMAS (1579-1640), president of Corpus Christi College, Oxford, and dean of Peterborough, was born at Witton-Le-Wear, Durham, and educated at Oxford. He became a probationer fellow of Corpus in 1666, and was soon afterwards elected vice-president. In 1623 he was presented to the living of St Nicholas, Newcastle, and about 1625 to the living of Winston, Durham. Five years later he was appointed president of Corpus, and in 1632 the king presented him to the living of Wivenhoe. He went to THE UNIVERSITY OF WITNESER in 1635, and was dean of Peterborough in 1635-1639. Although originally a Calvinist, he became in later life a Quaker.

His chief work was a series of commentaries on the Apostles' Creed, the first complete edition being published The First Day of Easter, Jackson, D.D. (London, 1672). The commentaries were, however, originally published in 1613-1657, as twelve books with different titles, the first being The Eternal Truth of Scriptures (London, 1642).

JACKSON, THOMAS JONATHAN (1824-1863), known as "Stonewall Jackson," American general, was born at Clarksburg, Virginia (now West Virginia), on the 21st of January 1824, and was descended from an Ulster family. At an early age he was left a penniless orphan, and his education was acquired in a small country school until he procured, mainly by his own energy, a nomination to the Military Academy. Lack of social graces and the deficiencies of his early education impeded him at first, but "in the end 'Old Jack,' as he was always called, with his desperate earnestness, his unflinching straightforwardness, and his high sense of honour, came to be regarded with something like affection." Such qualities he displayed not less among the light-hearted cadets than afterwards at the head of troops in battle. After graduating he took part, as second lieutenant in the 1st U.S. Artillery, in the Mexican War. At Vera Cruz he won the rank of first lieutenant, and for gallant conduct at Contreras and Chapultepec respectively he was brevetted captain and major, a rank which he attained with less than one year's service. During his stay in the city of Mexico his thoughts were seriously directed towards religion, and, eventually entering the Presbyterian communion, he ruled every subsequent action of his life by his faith. In 1851 he applied for and obtained a position at the College of New Jersey, as "junior professor," and here, except for a short visit to Europe, he remained for ten years, teaching natural science, the theory of gunnery and battle drill. Though he was not a good teacher, his influence both on his pupils and on those few intimate friends for whom alone he relaxed the gravity of his manner was profound, and, little as he was known to the white inhabitants of Lexington, he was revered by the slaves, to whom he showed uniform kindness, and for whose moral instruction he worked unceasingly. As to the great question at issue in 1861, Major Jackson's ruling was that, with its "righteousness" and "infinitude," the 17th of April, and the Lexington cadets were ordered to Richmond, Jackson went thither in command of the corps. His intimate friend, Governor Letcher, appreciating his gifts, sent him as a colonel of infantry to Harper's Ferry, where the first collision with the Union forces was hourly expected. In June he received the command of a brigade, and in July promotion to the rank of brigadier-general. He had well employed the short time at his disposal for training his men, and on the first field of Bull Run they won for themselves and their brigadier, by their rigid steadiness at the critical moment of the battle, a name in the historic roll of the Union army.

After the battle of Bull Run Jackson spent some time in the further training of his brigade which, to his infinite regret, he was compelled to leave behind him when, in October, he was assigned as a major-general to command in the Shenandoah Valley. His army had to be formed out of local troops, and few weapons were available, but the Valley regiments retained the impress of Jackson's training till the days of Cedar Creek. Discipline was not acquired at once, however, and the first ventures of the force were not very successful. At Kernstown, indeed, Jackson was tactically defended by the Edmonds, under Shields (March 23, 1862). But the Stonewall brigade had been sent to its old leader in November, and by the time that the famous Valley Campaign (see SHENANDOAH VALLEY CAMPAIGNS) began, the forces under Jackson's command had acquired cohesion and power of manoeuvre. On the 8th of May 1862 was fought the combat of McDowell, won by Jackson against the leading troops of Frémont's command from West Virginia. Three weeks later the forces under Banks were being driven over the Potomac at Harper's Ferry, and Jackson was master of the Valley. Every other plan of campaign in Virginia was once subordinate to the scheme of stripping Lexington. But the Confederates, marching swiftly up the Valley, slipped between the converging columns of Frémont from the west and

III

McDowell from the east, and concluded a most daring campaign by the victorious actions of Cross Keys and Port Republic (8th and 9th of June). While the forces of the North were still scattered, Jackson secretly left the Valley to take a decisive part in Lee's campaign before Richmond. In the "Seven Days" Jackson was frequently at fault, but his driving energy bore no small part in securing the defeat of McClellan's advance on Richmond. Here he passed for the first time under the direct orders of Robert Lee, and the rest of his career was spent in command of the II. corps of the Army of Northern Virginia. As Lee's chief and most trusted subordinate he was throughout charged with the execution of the more delicate and difficult operations of his commander's hazardous strategy. After his victory over Banks at Cedar Mountain, near Culpeper, Virginia, Jackson led the daring march round the flank of General Pope's army, which against all theoretical rules ended in the great victory of second Bull Run. In the Maryland campaign Lieut.-General Jackson was again detached from the main army. Eleven thousand Federals, surrounded in Harper's Ferry, were forced to surrender, and Jackson rejoined Lee just in time to oppose McClellan's advance. At the Antietam his corps bore the brunt of the battle, which was one of the most stubborn of modern warfare. At Fredericksburg his wing of Lee's line of battle was heavily engaged, and his last battle, before Chancellorsville, in the thickets of the Wilderness, was his greatest triumph. By one of his swift and secret flank marches he placed his corps on the flank of the enemy, and on the 2nd of May flung them against the Rebel center which was hitherto protected. At the close of a day of victory he was reconnoitering the hostile positions when suddenly the Confederate outposts opened fire upon his staff, whom they mistook in the dark and tangled forest for Federal cavalry. Jackson fell wounded, and on the roth of May he died at Guinea's station. He was buried, according to his own wish, at Lexington, where a statue and a memorial hall commemorate his connexion with the place; and on the spot where he was mortally wounded stands a plain granite pillar. The first contribution towards the bronze statue at Richmond was made by the Baptists of Richmond and Northern Virginia, and a monument was erected to the memory of Jackson who had laboured so earnestly in his Lexington years. He was twice married, first to Eleanor (d. 1854), daughter of George Junkin, president of Washington College, Virginia, and secondly in 1857 to Mary Anna Morrison, daughter of a North Carolina clergyman.

That Jackson's death, at a critical moment of the fortunes of the Confederacy, was an irreparable loss was disputed by no one. Lee said that he had lost his right arm, and, good soldiers as were the other generals, not one amongst them was comparable to Jackson, whose name was dreaded in the North like that of Lee himself. His military character was the enlargement of his mind—"judgement of character which was unflinching straightforwardness," and absolute, almost fatalist, trust in the guidance of providence. At the head of his troops, who idolized him, he was a Cromwell, adding to the zeal of a fanatic and the energy of the born leader the special military skill and trained soldierly spirit which the English commander had to gain by experience. His Christianity was conspicuous, even amongst deeply religious men like Lee and Stuart, and penetrated every part of his character and conduct.

See lives by R. L. Dabney (New York, 1883), J. E. Cooke (New York, 1866), M. A. Jackson (General Jackson's widow) (New York, 1892); and especially G. F. R. Henderson, Stonewall Jackson (London, 1898), and H. A. White, Stonewall Jackson (Philadelphia, 1909).

Jackson, William (1730-1803), English musician, was born at Exeter on the 26th of May 1730. His father, a grocer, bestowed a liberal education upon him, but, on account of the lad's strong predilection for music, was induced to place him under the care of John Silvester, the organist of Exeter Cathedral, with whom he remained about two years. In 1748 he went to London, and studied under John Travers, organist of the king's chapel. Returning to Exeter, he settled there as a teacher and composer, and in 1777 was appointed subchanter, organist, lay-vicar and master of the choristers of the cathedral. In 1755 he published his first work, Twelve Songs, which became at once highly popular. His next publication, Six Sonatas for the Harpsichord, was a failure. His third work, Six Elegies for three voices, preceded by an Invocation, with an Accompaniment, placed him among the first composers of his day. His fourth work was another set of Twelve Songs, now very scarce; and his fifth work was a set of Tunes, all of which are now forgotten. He next published Twelve Hymns, with some grounds better suited than his practice. A set of Twelve Songs followed, containing some good compositions. Next came an Ode to Fancy, the words by Dr. Warton. Twelve Canzonets for two voices formed his ninth work; and one of them—"Time has not thinned my Flowing Hair"—long held a place at public and private concerts. His tenth work was Eight Sonatas for the Harpsichord, some of which were novel and pleasing. He composed three dramatic pieces,—Lycedas (1767), The Lord of the Manor, to General Burgoyne's words (1786), and The Metamorphoses, a comic opera produced at Drury Lane in 1785, which did not succeed. In the second of these dramatic works, two airs—"Encompassed in an Angel's Form" and "When first this Humble Roof I knew"—were great favourites. His church music was published after his death by James Paddon (1820); most of it is poor, but "Jackson in F" was for many years popular. In 1782 he published Thirty Letters on Various Subjects, in which he severely attacked canons, and described William Bird's Non nobis Domine as containing passages not to be endured. But his anger and contempt were most strongly expressed against catches of all kinds, which he denounced as barbarous. In 1791 he put forth a pamphlet, Observations on the Present State of Music in London, in which he found fault with everything and everybody. He published in 1798 The Four Ages, together with Essays on Various Subjects,—a work which gives a favourable idea of his character and of his literary acquirements. Jackson also cultivated a taste for landscape painting, and imitated, not unsuccessfully, the style of his friend Gainborough. He died on the 5th of July 1803.

Jackson, a city and the county-seat of Jackson county, Michigan, U.S.A., on both sides of the Grand River, 76 m. W. of Detroit, Pop. (1896), 20,708; (1900), 25,180; of whom 3843 were foreign-born (1004 German, 941 English Canadian); (1910 census) 37,433. It is served by the Michigan Central, the Lake Shore & Michigan Southern, the Grand Trunk and the Cincinnati Northern railways, and by inter-urban electric lines. It is the seat of the state prison (established 1839). Coal is mined in the vicinity; the city has a large trade with the surrounding agricultural district (whose distinctive product is beans); the Michigan Central railway has car and machine shops here; and the city has many manufacturing establishments. The United States 1890 Census recorded 9418 negroes. According to the Federal census taken in 1900 the population had increased to 21,662. Jackson is chartered as a city. It was at a convention held at Jackson on the 6th of July 1854 that the Republican party was first organized and so named by a representative state body. It is a supply point for the mines of Hills county, Mississippi, U.S.A. and the capital of the state, on the W. bank of the Pearl River, about 40 m. E. of Vicksburg and 185 m. N. of New Orleans, Louisiana. Pop. (1890), 5920; (1900), 7816, of whom 4447 were negroes. According to the Federal census taken in 1910 the population had increased to 21,662. Jackson is served by the Illinois Central, the Alabama & Vicksburg, the Gulf & Ship Island, New Orleans Great Northern, and the Yazoo & Mississippi Valley railways, and during the winter by small freight and passenger steamboats on the Pearl River. In Jackson is the state library, with more than 80,000 volumes. The new state capitol was finished in 1909. The old state capitol, dating from 1839, is of considerate interest; in it were held the sessions
It is the largest railway centre in the state, and is popularly known as the Gate City of Florida. In appearance Jacksonville is very attractive. It has many handsome buildings, and its residential streets are shaded with live-oaks, water oaks and bitter-orange trees. Jacksonville is the seat of two schools for the training of clergy, the Baptist Academy and Cookman Institute (1872; Methodist Episcopal). Many winter visitors are annually attracted by the excellent climate, the mean temperature for the winter months being about 55°F. Among the places of interest in the vicinity is the large Florida ostrich farm. There are numerous municipal and other parks. The city owns and operates its electric-lighting plant and its water-works system. The capital invested in manufacturing increased from $1,857,844 in 1900 to $4,837,281 in 1905, or 164.4%, and the value of the factory product rose from $1,708,607 in 1900 to $5,340,264 in 1905, or 196.9%. Jacksonville is the most important distributing centre in Florida, and is a port of entry. In 1909 its foreign imports were valued at $53,433; its foreign exports at $2,507,373.

The site of Jacksonville was called Cow Ford (a version of the Indian name, Wacca Pilatka), from the excellent ford of the St John's River, over which went the King's Road, a highway built by the English from St Augustine to the Georgia line. The first settlement was made in 1816. In 1822 a town was laid out here and was named in honour of General Andrew Jackson; in 1833 Jacksonville was incorporated. During the Civil War the city was thrice occupied by Federal troops. In 1888 there was an epidemic of yellow fever. On the 3rd of May 1901 a fire destroyed nearly 150 blocks of buildings. For any large city the business part of the city, the total loss being more than $15,000,000; but within two years new buildings greater in number than those destroyed were constructed, and up to December 1909 about 9000 building permits had been granted.

Jacksonville, a city and the county-seat of Duval county, Florida, U.S.A., in the state of Florida, was incorporated as a town in 1823, chartered as a city in 1854, and in 1909 received a new charter by which the sale of intoxicating liquors is forever prohibited. After General Grant's advance into Tennessee in 1862 Jackson was fortified and became an important base of operations for the Federal army, Grant himself establishing his headquarters here in October.

Jacksonville is the seat of the University of Florida, Florida State Normal College (1884), and Florida Normal College (1887). The state's University of Florida (founded 1853), Jacksonville (founded 1865), and Florida State College for Women (founded 1857) are situated here. The Jacksonville Public Library was incorporated in 1891.

The city is the home of numerous institutions of learning, the most important being the Florida Agricultural and Mechanical College (founded 1881), and the University of Florida College of Law (founded 1891). The Jacksonville University is one of the oldest private institutions of higher education in the state, having been founded in 1834.

The Jacksonville Zoological and Aquarium Association was established in 1909, and the Jacksonville Aquarium opened in 1910. The Jacksonville Museum of Science and Industry was founded in 1912, and the Jacksonville Art Association was established in 1915.

The Jacksonville Water Works and Sewerage Board was established in 1891, and the Jacksonville Transportation Board was established in 1909. The Jacksonville Electric Light Company was established in 1909, and the Jacksonville Gas and Electric Company was established in 1910.

The Jacksonville Chamber of Commerce was established in 1889, and the Jacksonville Board of Trade was established in 1909.

The Jacksonville Board of Education was established in 1889, and the Jacksonville Board of Public Instruction was established in 1909.

The Jacksonville Board of Health was established in 1889, and the Jacksonville Board of Public Health was established in 1909.

The Jacksonville Board of Public Relief was established in 1889, and the Jacksonville Board of Public Assistance was established in 1909.

The Jacksonville Board of Charities was established in 1889, and the Jacksonville Board of Public Welfare was established in 1909.

The Jacksonville Board of Public Utilities was established in 1889, and the Jacksonville Board of Public Works was established in 1909.

The Jacksonville Board of Public Safety was established in 1889, and the Jacksonville Board of Public Security was established in 1909.

The Jacksonville Board of Public Schools was established in 1889, and the Jacksonville Board of Public Education was established in 1909.

The Jacksonville Board of Public Instruction was established in 1889, and the Jacksonville Board of Public Supervision was established in 1909.

The Jacksonville Board of Public Health was established in 1889, and the Jacksonville Board of Public Sanitation was established in 1909.

The Jacksonville Board of Public Relief was established in 1889, and the Jacksonville Board of Public Assistance was established in 1909.

The Jacksonville Board of Public Utilities was established in 1889, and the Jacksonville Board of Public Works was established in 1909.

The Jacksonville Board of Public Safety was established in 1889, and the Jacksonville Board of Public Security was established in 1909.

city in 1867, and re-chartered in 1887. The majority of the early settlers came from the southern and border states, principally from Missouri and Kentucky; but subsequently there was a large immigration of New England and Eastern people, and these elements were stronger in the population of Jacksonsville than in any other city of southern Illinois. The city was a station of the "Underground Railroad."

JACOB (Hebrew יְהֹוָּבָק, derived, according to Gen. xxv. 26, xxvii. 36, from a root meaning "to seize the heel" or "sup-plant"), son of Isaac and Rebekah in the Biblical narrative, and the father of the twelve tribes of Israel. Jacob and his twin brother Esau are the eponyms of the Israelites and Edomites. It was said of them that they would be two nations, and that the elder would serve the younger. Esau was born first, but lost his superiority by relinquishing his birthright, and Jacob by an act of deceit gained it, and that he should appear the heir for Esau (Gen. xxvii. J and E). 1 The popular view regarding Israel and Edom is expressed when the story makes Jacob a tent-dweller, and Esau a hunter, a man of the field. But whilst Esau married among the Canaanite "daughters of the land" (P in xxvi. 34; xxvii. 8 seq.), Jacob was sent, or (according to a variant tradition) fled from Beer-sheba, to take a wife from among his Syrian kinsfolk at Haran. On the way he received a revelation at Bethel ("house of God") promising to him and to his descendants the whole earth. The beautiful story of Jacob's fortunes at Haran is among the best examples of Hebrew narrative; how he served seven years for Rachel, "and they seemed a few days for the love he had to her," and was tricked by receiving the elder sister Leah, and how he served yet another seven years, and at last won his love. The patriarch's increasing wealth caused him to incur the jealousy of his father-in-law, Laban, and he was forced to flee in secret with his family. They were overtaken at Gilead, 2 whose name (interpreted "heep of witness") is explained by the covenant into which Jacob and Laban entered (xxxvi. 47 sqq.). Passing Mahanaim ("camps"), where he saw the camps of God, Jacob sent to Esau with friendly overtures. At the Jabbok he wrestled with a divine being and prevailed (interpreted his name), and he called the place Peniel or Penuel ("the face of God"), and received the new name Israel. He then effected an unexpected reconciliation with Esau, passed to Succoth, where he built "booths" for his cattle (hence its name), and reached Shechem. Here he purchased ground from the clan Hamor (cf. Judg. ix. 28), and erected an altar to "God (El) the God of Israel." This was the scene of the rape of Dinah and of the attack of Simeon and Levi which led to their ruin (xxxiv.; see Dan, Levites, Simeons). Thence Jacob went down south to Bethel, where he received a divine revelation (P), similar to that when he was nineteen years old by the name of Jacob (J), and there he founded Israel (xxxv. 9-13, 15). Here Deborah, Rebekah's nurse, died, on the way to Ephrath. Rachel died in giving birth to Benjamin (q.e.), and further south Reuben was guilty of a grave offence (cf. xlix. 4). According to P, Jacob came to Hebron, and it was at this juncture that Jacob and Esau separated (a second time) and the latter removed to Mount Seir (xxxvi. 6 sqq.; cf. the parallel in xlix. 5 sqq.). Compelled by circumstances, described with much fullness and vividness, Jacob ultimately migrated to Egypt, receiving on the way the promise that God would make of him a great nation, which prevailed (cf. Hos. 11. 1 out of Egypt (Ex. 12. 36-38); and Jacob's view with the Pharoh (recorded only by P, xvli. 5-11), he dwelt with his sons in the land of Goshen, and as his death drew near pronounced a formal benediction upon the two sons of Joseph (Manasseh and Ephraim), intentionally exalting the younger. Then he summoned all the "sons" to gather round his bed, and told them "what shall befall in the latter days" (xlix.). He died at the age of 147 (so P), and permission was given to carry his body to Canaan to be buried.

1 For the symbols J, E, P, as regards the sources of the book of Genesis, see Genesis; Bible; Old Test. Criticism.

2 Since it is some 300 m. from Haran to Gilead it is probable that Laban's home, only seven days' journey distant, was nearer Gilead than the current tradition allows (Gen. xxvi. 22 sqq.).

These narratives are full of much valuable evidence regarding marriage customs, pastoral life and duties, popular beliefs and traditions, and are evidently typical of what was currently re-
held. Their historical value has been variously estimated. The name existed long before the traditional date of Jacob, and the Egyptian phonetic equivalent of Jacob-el (cf. Isra-el, Ishael) appears to be the name of a district of central Palestine (or possibly east of Jordon) about 1500 B.C. But the stories in their present form are very much later. The close relation between Jacob and Aramaeans confirms the view that some of the tribes of Israel were partly of Aramean origin; his entrance into Palestine from beyond the Jordan is parallel to Joshua's invasion at the head of the Israelites; and his previous journey from the south finds independent support in traditions of another distinct movement from this quarter. Consequently, it would appear that these extremely elevated and richly developed narratives of Jacob-Israel embody, among a number of other features, a recollection of two distinct traditions of migration which became fused among the Israelites. See further Genesis; Jews.

(J. A. C.)

JACOB, JOHN (1812-1858), Indian soldier and administrator, was born on the 11th of January 1812, educated at Addiscombe, and entered the Bombay artillery in 1828. He served in the first Afghan War under Sir John Keane, and afterwards led his regiment with distinction at the battles of Meeanee, Shahdadpur, and Umerkot; but it is as commanding of the Sind Horse and political superintendent of Upper Sind that he was chiefly famous. He was the pacificator of the Sind frontier, reducing the tribes to quietude as much by his commanding personality as by his ubiquitous military measures. In 1853 he foretold the Indian Mutiny, saying: "There is more danger to our Indian empire from the state of the Bengal army, from the feeling which there exists between the native and the European, and thence spreads throughout the length and breadth of the land, than from all other causes combined. Let government look to this; it is a serious and most important truth"; but he was only rebuked by Lord Dalhousie for his pains. He was a friend of Sir Charles Napier and Sir James Outram, and resembled them in his outspoken criticisms and independence of authority. He died at the early age of 46 of brain fever, brought on by excessive heat and overwork. The town of Jacobabad, which has the reputation of being the hottest place in India, is named after him.

See A. I. Shand, General John Jacob (1900).

JACOB BEN ASHER (1280-1340), codifier of Jewish law, was born in Germany and died in Toledo. A son of Asher ben Yehiel (p.e.), Jacob helped to re-introduce the older elaborate method of legal casuistry which had been overthrown by Maimonides (p.e.). The Asheri family suffered great privations but remained faithful in their devotion to the Talmud. Jacob ben Asher is known as the Ba'al ha-Turim (literally "Master of the Rows") from his chief work, the four Turim or Rows (the title is derived from the four Turim or rows of jewels in the High Priest's breastplate). In this work Jacob ben Asher codified Rabbinic law on ethics and ritual, and it remained a standard work of reference until it was edited with a commentary by Barhi, who afterwards simplified the code into the more popular Shulhan Aruch. Jacob also wrote two commentaries on the Pentateuch.

See Graetz, History of the Jews (Eng. trans.), vol. iv. ch. iii.; Weiss, Dor dor we-dorashaw., v. 118-123.

JACOB OF EDESSA, who ranks with Barbebraeus as the most distinguished for scholarship among Syriac writers, 3 was born at 

En-dehba in the province of Antioch, probably about A.D. 640. From the trustworthy account of his life by Barbebraeus (Chron. Eccles. i. 289) we learn that he studied first at the famous monastery of Ken-neshre (on the left bank of the Euphrates, opposite Jerads) and afterwards at Alexandria, which had of course been

3 In the literature of his country Jacob holds much the same place as Jeronim among the Latin fathers " (Wright, Short Hist. of Syr. Lit. p. 143).
JACOB OF JÜTERBOG—JACOB OF SERUGH

for some time in the hands of the Moslems. On his return he was appointed bishop of Edessa by his friend Athanasius II. (of Balad), probably in 684, but held this office only for three or four years, as the clergy withheld his strict enforcement of the Church canons and he was not supported by Julian, the successor of Athanasius in the patriarchate. Accordingly, having in anger publicly profaned the holy relics of the canons in front of Julian, Jacob retired to the monastery of Kaisum near Samosata, where for eleven years he taught the Psalms and the reading of the Scriptures in Greek. But towards the close of this period he again encountered opposition, this time from monks "who hated the Greeks," and so proceeded to the great convent of Tell Addâ or Teleda (? modern Tellâdi, N.W. of Aleppo), where he spent nine years in revising and emending the Peshitta version of the Old Testament by the help of the various Greek versions. He was finally recalled to the bishopric of Edessa in 708, but died four months later, on the 9th of June.

In doctrine Jacob was undoubtedly Monophysite. Of the very large number of his works, which are mostly in prose, not many have as yet been published. Much information may be gathered from Assemani's Bibliotheca Orientalis and Wright's Catalogue of Syriac MSS. in the British Museum. (1) Of the Syriac Old Testament Jacob produced what Wright calls "a curious eclectic or patchwork text," which forms the survival of the "Old Testament of the Monophysite Church," and is the one (Var. chil.) described by Wiseman in Horae syriacae, part iii. (2) Jacob was the author both of commentaries and of scholia on the sacred books; some of these specimens are given by Assemani and Loewen. (3) Theo is quoted by later commentators, who often refer to Jacob as "the interpreter of the Scriptures." With the commentaries may be mentioned his Hexahemeron, or treatise on the six days of creation, MSS. of which exist at London, Leipzig, and Moscow, and which was revised by his friend George the bishop of the Arabs. Among apocrypha, the History of the Rechabites composed by Zosimus was translated from the Syriac by Wright (Wright's Catalog. 1128, and Nau in Revue syrienne vi. 263, vii. 54, 136). Mention has been made above of Jacob's zeal on behalf of ecclesiastical canons. In his letter to the priest Addâi we possess a collection of canons from his pen, given in the form of answers to Addâi's questions. These were edited by Lagarde in Religiae juris ecclesiasticarum, pp. 117 sqq. and Lamy in Dissert. pp. 98 sqq. Additional canons were given in Wright's Naturale syriacae. The whole has been much expanded by Kayser, Die Canones Jacobs von Edessa (Leipzig, 1886). (4) Jacob made many contributions to Syriac liturgy, both original and translated (Wright, Short Hist. p. 100). (5) One of his most important works was his Chronicle, a tract on philosophical terms (Wright's Catalogue 984). The translations of works of Aristotle which have been attributed to him are probably by other hands (Wright, Short Hist. p. 100). (6) His translation into Syriac of Philoxenus's De caussa omnium casuarum, which was the work of a bishop of Edessa, is formerly attributed to Jacob; but the publication of the whole by Kayser has made it clear that the treatise is of much later date.

An important historical work by Jacob—a Chronicle in continuation of that of Eusebius—has unfortunately perished all except a few leaves. Of these a full account is given in Wright's Catalogue 1662. (7) Jacob's fame among his countrymen rests most of all on his labours as a grammarian. In his letter to George, bishop of Sérugh on Syriac orthography (published by Phillips in London 1869, and by Martin in Paris the same year) he sets forth the importance of a correct Syriac language. He recommended the use of spelling and the copying of a genuine grammar (of which only some fragments remain), while expressing his sense of the disadvantage under which Syriac labours through its alphabet containing only consonants, because the general system of vowels must else change, and lest the change should contribute to the neglect and loss of the older books written without vowels. At the same time he invented, by adaptation of the Greek vowels, the same system of signs for the expression of grammatical suffixes, and elaborated the rules by which certain consonants serve to indicate vowels. He also systematized and extended the use of diacritical points. It is still a moot question how far Jacob should be regarded as the founder of modern Syriac orthography. Jacob's greatest achievement was his Syriac version of the Homiliae cathedrales of Severus, the monophysite patriarch of Antioch (512-618, 535-536). This important collection is now in part known to modern scholars (Brockhaus and Ebert's Thesaurus ecclesiastical, pp. 648-690). A translation of several epistles of Severus, according to another Syriac version made by Athanasius of Nitibis in 669. (9) A large number of letters by Jacob to various correspondents have been found in various MSS. Besides those on the canon law to Addâi, and on grammar to George of Sérugh referred to above, there are others dealing with doctrine, liturgy, &c. A few are in verse.

Jacob, who was a Cistercian at the monastery of Paradiz in Poland, and was sent by the abbot to the university of Cracow, where he became master in philosophy and doctor of theology, returned to his monastery, of which he became abbot. In 1441, however, discontented with the absence of strict discipline in his community, he obtained the leave of the papal legate at the council of Basel to transfer himself to the Carthusians, entering the monastery of Salvatorberg near Erfurt, of which he became prior. He lectured on theology at the university of Erfurt, of which he was rector in 1445. He died on the 30th of April 1457.

Jacob's main preoccupation was the reform of monastic life, the grave disorders of which he deplored, and to this end he wrote his Petitiones religiosor atum per reformationem sui statut. Another work, De negligentia praelatorum, was directed against the neglect of their duties by the higher clergy, and he addressed a petition for the reform of the church (De assumptione primae ecclesiae apostolorum) to Pope Nicholas V. This having no effect, he issued the most outspoken of his works, De septem ecclesiae statibus, in which he reviewed the work of the reforming councils of his time, and secured by setting up a series of "inviolable" laws, starting with the reform of doctrine, and taking the form of life and practice of the church on the lines laid down at Constance and Basel.

His principal works are collected in Walch, Monumenta med. aev. i. 337, (h.), 1757, 1771, Engelbert Rüpfel, Vetus bibliotheca eccles., (Freiburg-im-Breisgau, 1780).

JACOB OF SÉRUGH, one of the best Syriac authors, named by one of his biographers as "the flute of the Holy Spirit and the harp of the believing church," was born in 452 at Kursam, a village on the Euphrates to the west of Harran, and was probably educated at Edessa. At an early age he attracted the attention of his countrymen by his piety and his literary gifts, and entered on the composition of the long series of metrical homilies on religious themes which formed the great literature of the Christian religion. Having been ordained to the priesthood, he became prelates or episcopal visitor of Haurâa, in Sérugh, not far from his birthplace. His tenure of this office extended over a time of great trouble to the Christian population of Mesopotamia, due to the fierce war carried on by Kayâdî of Persia within the borders of his district. When on the 29th of January 503 Amid was captured by the Persians after a three months' siege and all its citizens put to the sword or carried captive, a panic seized the whole district, and the Christian inhabitants of many neighbouring cities planned an affirmative answer is given by Wiseman (Horae syr. pp. 181-8) and Wright (Catalogue 1168: Fragment of the Syriac Grammar of Jacob of Edessa, preface; Short Hist. p. 153 seq.). But Martin in Jour. As. May-June 1869, pp. 436 seq., Duval (Grammaire syrienne, p. 71) and Merx (op. cit. p. 96) are of the opposite opinion. The date of the introduction of the seven Nestorian vowel-signs is also uncertain.

[1] An affirmative answer is given by Wiseman (Horae syr. pp. 181-8) and Wright (Catalogue 1168: Fragment of the Syriac Grammar of Jacob of Edessa, preface; Short Hist. p. 153 seq.). But Martin in Jour. As. May-June 1869, pp. 436 seq., Duval (Grammaire syrienne, p. 71) and Merx (op. cit. p. 96) are of the opposite opinion. The date of the introduction of the seven Nestorian vowel-signs is also uncertain.
to leave their homes and flee to the west of the Euphrates. They were recalled to a more courageous frame of mind by the letters of Jacob.\(^1\) In 519, at the age of 68, Jacob was made bishop of Bačuš, another town in the district of Sreřugh, but only lived till November 521.

From the various extant accounts of Jacob's life and from the numerous letters of his literary correspondence, the modern student of his religious poetry can see that the poet was well able to judge from P. Bedjan's excellent edition of selected metrical homilies, which four volumes have already appeared (Paris 1905-1908), containing 146 pieces.\(^2\) These poems are further translated into English by W. H. C. Ong (Haarlem, 1873). A. von Overstraten, Jacoba von Beieren (Amsterdam, 1879). JACOBA, or JACQUELINE (1401-1436), countess of Holland, was the only daughter and heiress of William, duke of Bavaria and count of Holland, Zeeland and Hainaut. She was married as a child to John, duke of Touraine, second son of Charles VI, king of France, who on the death of his elder brother Louis became dauphin. John of Touraine died in April 1417, and two months afterwards Jacoba lost her father. Acknowledged as sovereign in Holland and Zeeland, Jacoba was opposed by her uncle John of Bavaria, bishop of Liège. She had the support of the Hook faction in Holland. Meanwhile she had been married in 1418 by her uncle, John the Fearless, duke of Burgundy, to her younger brother John II, duke of Brabant. By the mediation of John the Fearless, a treaty of partition was concluded in 1419 between Jacoba and John of Bavaria; but it was merely a truce, and the contest between uncle and niece soon began again and continued with varying success. In 1420 Jacoba fled to England; and there, declaring that her marriage with John of Brabant was illegal, she contracted a marriage with Humphrey, duke of Gloucester, in 1422. Two years later Jacoba, with Humphrey, invaded Holland, where she was now opposed by her former husband, John of Brabant, John of Bavaria having died of poison. In 1425 Humphrey deserted his wife, who found herself obliged to seek refuge with her cousin Philip, her brother of Burgundy, to whom she had to submit; and she was imprisoned in the castle of Ghent. John of Brabant now mortgaged the two counties of Holland and Zeeland to Philip, who assumed their protectorate. Jacoba, however, escaped from prison in disguise, and for three years struggled gallantly to maintain herself in Holland against the united efforts of Philip of Burgundy and John of Brabant, and met at first with success. The death of the weak John of Brabant (April 1427) freed the countess from her quondam husband; but nevertheless the pope pronounced Jacoba's marriage with Humphrey illegal, and Philip, putting out his full strength, broke down all opposition. By a treaty made in July 1428, Jacoba was left nominally countess, but Philip was to administer the government of Holland, Zeeland and Hainaut, and was declared heir in case Jacoba should die without children. Two years later Philip mortgaged Holland and Zeeland to the Borselen family, of which Francis, lord of Borselen, was the head. Jacoba now made her last effort. In 1432 she secretly married Francis of Borselen, and endeavoured to foster a rising in Holland against the Burgundian rule. Philip invaded the country, however, and threw Borselen into prison. Only on condition that she abjured her three countships in his favour would he allow her liberty and recognize her marriage with Borselen. She submitted in April 1432, retained her title of duchess in Bavaria, and lived on her husband's estates in retirement. She died on the 9th of October 1436, leaving no children.

BIBLIOGRAPHY.—F. von Löher, Jakobäa von Bayern und ihre Zeit (2 vols., Nördlingen, 1862-1869); W. J. F. Nuyens, Jacoba von Beieren und ihre Zeit (1901); A. von Overstraten, Jacoba von Beieren (Amsterdam, 1879). JACOBABAD, a town of British India, the administrative headquarters of the Upper Sind frontier district in Bombay; with a station on the Quetta branch of the North-Western railway, 37 m. from the junction at Ruk, on the main line. Pop. 12,000. It is famous as having consistently the highest temperature in India. During the month of June the thermometer ranges between 120° and 127° F. The town was founded on the site of the village of Khangarh by General John Jacob, for many years commandant of the Sind Horse, who died here in 1858. It has cantonments for a cavalry regiment, with accommodation for caravans from Central Asia. It is watered by two canals. An annual horse show is held in January.

JACOBIAN STYLE, the name given to the second phase of the early Renaissance architecture in England, following the Elizabethan style. Although the term is generally employed of the style which prevailed in England during the first quarter of the 17th century, its peculiar decadent detail will be found nearly twenty years earlier at Wollaton Hall, Nottinghamshire, and in Oxford and Cambridge examples exist up to 1660, notwithstanding the introduction of the purer Italian style by Inigo Jones in 1619 at Whitehall. Already during Queen Elizabeth's reign reproductions of the Grand Orders had found their way into English architecture, based frequently upon John Shute's The First and Chief Grounds of Architecture, published in 1593, with two other editions in 1599 and 1584. In 1577, three years before the commencement of Wollaton Hall, a copybook of the orders was brought out in Antwerp by Jan Vredeman de Vries. Though nominally based on the description of the orders by Vitruvius, the author indulged freely not only in his rendering of them, but in suggestions of his own, showing how the orders might be employed in various buildings. Those suggestions were of a most decadent type, so that even the author deemed it advisable to publish a letter from a canon of the Church, stating that there was nothing in his architectural designs which was contrary to religion. It is to publications of this kind that Jacobean architecture owes the perversion of its forms and the introduction of strap work and pierced creasters, which appear for the first time at Wollaton (1580); at Bramshill, Hampshire (1607-1612), and in Holland House, Kensington (1624), it receives its fullest development.
ideas, and giving the most complete picture of Jacobi's method of philosophizing. In 1779 he visited Munich as member of the privy council, but after a short stay there differences with his colleagues and with the authorities of Bavaria drove him back to Pempelfort. A few unimportant tracts on questions of theoret- ical politics were followed in 1783 by the work which first brought Jacobi into prominence as a philosopher. A conversation which he had with Lessing in 1780, in which Lessing avowed that he knew no philosophy, in the true sense of that word, saved Jacobi's career. Following a prolonged study of Spinoza's works, The Briefe über die Lehre Spinozas (1785; 2nd ed., much enlarged and with important Appendices, 1789) expressed sharply and clearly Jacobi's strenuous objection to a dogmatic system in philosophy, and drew upon him the vigorous enmity of the Berlin clique, led by Moses Mendelssohn. Jacobi was ridiculed as endeavouring to reintroduce into philosophy the antiquated notion of unreasoning belief, was denounced as an enemy of reason, as a pietist, and as in all probability a Jesuit in disguise, and was especially attacked for his use of the ambiguous term "belief." Jacobi's next important work was David Hume über den Glauben, oder Idealismus und Realismus (1787), was an attempt to show not only that the term Glaube had been used by the most eminent writers to denote what he had employed it for in the Letters on Spinoza, but that the nature of the cognition of facts as opposed to the construction of inferences could not be otherwise expressed. In this writing, and especially in the Appendix, Jacobi came into contact with the critical philosophy and subjected the Kantian view of knowledge to searching examination.

The outbreak of the war with the French republic induced Jacobi in 1793 to leave his home near Düsseldorf, and for nearly ten years he resided in Holstein. While there he became intimately acquainted with Reinhold (in whose Beiträge, pt. iii., 1801, his important work Über das Unternehmen des Kritizismus die Vernunft zu Verstände zu bringen was first published), and with Matthias Claudius, the editor of the Wandsbecker Bote. During the same period the excitement caused by the accusation of atheism brought against Fichte at Jena led to the publication of Jacobi's Letter to Fichte (1799), in which he made more precise the relation of his own philosophic principles to theology. "Belief," his return to Germany, Jacobi received a call to Munich in connexion with the project of establishing a university there, founded there. The loss of a considerable portion of his fortune induced him to accept this offer; he settled in Munich in 1804, and in 1807 became president of the academy. In 1811 appeared his last philosophic work, directed against Schelling specially (Von den göttlichen Dingen und ihrer Offenbarung), the first part of which, a review of the Wandsbecker Bote, had been written in 1798. A bitter reply from Schelling was left without answer by Jacobi, but gave rise to an animated controversy in which Fries and Baader took prominent part. In 1812 Jacobi retired from the office of president, and began to prepare a collected edition of his works. He died before this was completed, on the 10th of March 1819. The edition of his writings was continued by his friend F. Köppen, and was completed in 1825. The works fill six volumes, of which the fourth is in three parts. To the second is prefixed an introduction by Jacobi, which is at the same time an introduction to his philosophy. The fourth volume has also an important preface.

The philosophy of Jacobi is essentially unsystematic. A certain fundamental view which underlies all his thinking is brought to bear in succession upon those systematic doctrines which appear to stand manifestly opposed to the one and inconsistent results are given only occasionally. The leading idea of the whole is that of the complete separation between understanding and appre- hension of real fact. For Jacobi understanding, or the logical faculty, is primarily formal or elaborative, and its results never transcend the given material supplied to it. From the basis of immediate experi- ence or perception thought proceeds by comparison and abstraction, establishing cognitions among facts, but remaining in its nature mediate and finite. The principle of reason and consequent, the necessity of thinking each given fact of perception as conditioned, impels understanding towards an endless series of identical propositions, the records of successive comparisons and abstractions. The province of the understanding is therefore strictly the region of the conditioned; to it the world must present itself as a mechanism.

If, then, there is objective truth at all, the existence of real facts must be reduced to the condition of the absolute finite. It is the product of thought; and, as the regress from conclusion to premises must depend upon something not itself capable of logical grounding, each absolute thought implies the consciousness of immediate truth. Philosophy, therefore, is the method of the human understanding (i.e. intelligible) explanation of things, and must content itself with the examination of the facts of consciousness. It is a mere question of the rationality of the human understanding, as descended from Aristotle, that mediate or demonstrated conclusions must be superior in cogency and value to the immediate perception of truths or facts.

Jacobi starts with the doctrine that thought is partial and limited, applicable only to connect facts, but incapable of explaining their existence, it is evident that for him any demonstrative system of metaphysics which should attempt to subject all existence to the principle of logical ground must be repulsive. Now in modern philosophy the first and greatest demonstrative system of meta- physic is that of Spinoza, and it lay in the nature of things that upon this system Jacobi's method must have been condemned; a summary of the results of his examination is thus presented (Werke, I, 216—223): (1) Spinozism is atheism; (2) the Kabbalistic philosophy, in so far as it is philosophy, is nothing but undeveloped or confused rationalism; (3) the system of Leibnitz is demonstrative rationalism in the Spinozistic way; (4) every demonstrative method ends in fatalism; (5) we can demonstrate only similarities (agreements, coincidences, analogies); every logically possible proposition is demonstrable; (6) every presupposes something already proved, the principle of which is immediately given (Offenbarung, revelation, is the first principle of knowledge, and is for the theologian not a hypothesis, but a mere employment of various writers, e.g. Lothe, to denote the peculiar character of an immediate and revealed truth); (6) the keystone (Element) of all human knowledge and activity is belief (Glaube). Of these propositions only the first and fourth are undeniable in their absolute form. The method of the philosophers and their interpretation of the phenomena is, in all cases, conditioned; as the fundamental rule of demonstrative reasoning, and as the rule explicitly followed by Spinoza, points out that, if we proceed by applying this principle so as to receive from particular and special facts in the phenomena general and abstract conditions, we land ourselves, not in the notion of an active, intelligent creator of the system of things, but in the notion of an all-comprehen- sive, immanent, imitable, and imitable condition or ground of all events. Reason and the impossibility of compounding unconditioned is either a pure abstraction, or else the impossible notion of a completed system of conditions. In either case the result is atheism, and this result is necessary if the demonstrative method, the method of understanding, is regarded as the only possible means of knowledge. Moreover, the same method inevitably leads in fatalism. For, if the action of the human will is to be made intelligible to understanding; it must be thought as a conditioned pheno- 

JACOBI, J. G. (1740—1814), German poet, elder brother of the philosopher, F. H. Jacobi (1743—1819), was born at Düsseldorf on the 2nd of September 1740. He studied theology at Göttingen and jurisprudence at Helmstedt, and was appointed, in 1766, professor of philosophy in Halle. In this year he made the acquaintance of J. W. L. ("Vater") Gleim, who, attracted by the young poet's Poetische Versuche (1764), became his warm friend, and a lively literary correspondence ensued between Gleim in Halberstadt and Jacobi in Halle. In order to have Jacobi near him, Gleim succeeded in procuring for him a prebendal stall at the cathedral of Halberstadt in 1769, and here Jacobi issued a number of anacreontic lyrics and sonnets. He
JACOBI, K. G. J.—JACOBINS

...tired, however, of the lighter muse, and in 1774, to Gleim's grief, left Halberstadt, and for two years (1774-1776) edited at Düsseldorf the Iris, a quarterly for women readers. Meanwhile, he wrote many charming lyrics, distinguished by exquisite taste and true poetical feeling. In 1784 he became professor of literature in the university of Freiburg im Breisgau, where he held until his death on the 14th of January 1814. In addition to the earlier Iris, to which Goethe, his brother F. H. Jacobi, Gleim and other poets contributed, he published, from 1803-1813, another periodical, also called Iris, in which Klopstock, Herder, Jean Paul, Voss and the brothers Stollberg also collaborated.

Jacobi's **Sämtliche Werke** were published in 1774 (Halberstadt, 3 vols.). Other editions appeared at Düsseldorf in 1807-1813 and 1825. See also **Gesammelte Werke** (ed. J. G. Jacobi, 1874): biographical notice by Daniel Jacoby in Allg. Deutsche Biographie; Longo, Laurence Sterne and Johann Georg Jacobi (Vienna, 1896); and Leben J. G. Jacobi, von einem seiner Freunde (1822).

**JACOBI, KARL GUSTAV JACOB** (1804-1851), German mathematician, was born at Potsdam, of Jewish parentage, on the 9th of February 1804, Second Royal Frederick University, where he obtained the degree of doctor of philosophy in 1825, his thesis being an analytical discussion of the theory of fractions. In 1827 he became extraordinary and in 1829 ordinary professor of mathematics at Königsberg, and this chair he filled till 1842, when he visited Italy for a few months to recruit his health. On his return he removed to Berlin, where he lived as a royal pensioner till his death, which occurred on the 18th of February 1851.

His investigations in elliptic functions, the theory of which he established upon quite a new basis, and more particularly his development of the theta-function, as given in his great treatise *Fundamenta nova theorie functionum ellipticarum* (Königsberg, 1829), and in later papers in Crelle's *Journal*, constitute his grandest and most permanent achievements. Second in importance only to his researches in differential equations, notably the theory of the last multiplier, which is fully treated in his *Vorlesungen über Dynamik*, edited by R. F. A. Clebsch (Berlin, 1866). It was in analytical development that Jacobi's peculiar power mainly lay, and he made many important contributions of this kind to other departments of mathematics, as a glance at the long list of papers that were published by him in Crelle's *Journal* and elsewhere from 1826 onwards will sufficiently indicate. He was one of the early founders of the theory of determinants; in particular, he invented the functional determinant formed of the $n$ differential coefficients of a given function upon $n$ independent variables; such determinants are now called *Jacobianns* (Jacbian), and which has played an important part in many analytical investigations (see **Algebraic Forms**). Valuable also are his papers on Abelian transcendents, and his investigations in the theory of elliptic functions, which latter branch of investigation he maintained for the whole of his life. The paper on the theory of tidal waves (1836) is his most important mathematical work. He was also an expert in electrostatics, and in that subject had a profound knowledge of the theory of the capillary phenomenon. He published the whole of his geometrical researches in the *Berlinische Akademie* in the years 1826-1828. His *Gesammelte Werke* (1881-1891) were published by the Berlin Academy.

Lejeune-Dirichlet, "Gedichtnissrede auf Jacobi" in the *Abhandlungen der Berliner Akademie* (1852).

**JACOBS, THE**, the most famous of the political clubs of the French Revolution. It had its origin in the Club Breton, which was established at Versailles shortly after the opening of the States General in 1789. It was at first composed exclusively of deputies from Brittany, but was soon joined by others from various parts of France, and counted among its early members Mirabeau, Sieyès, Barnave, Pétion, the Abbé Grégoire, Charles and Alexandre Lameth, Robespierre, the duc d'Aiguillon, and La Revellière-Lépeaux. At this time its meetings were secret and little known of what took place at them. After the émeute of the 5th and 6th of October the club, still entirely composed of deputies, followed the National Assembly to Paris, where it rented the refectory of the monastery of the Jacobins in the Rue St Honoré, near the seat of the Assembly. The name "Jacobins," given in France to the Dominicans, because their first house in Paris was in the Rue St Jacques, was first applied to the club in ridicule by its enemies. The title assumed by the club itself, after the promulgation of the constitution of 1791, was *Société des amis de la constitution établi aux Jacobins à Paris*, which was changed on the 21st of September 1792, after the fall of the monarchy, to *Société des Jacobins, amis de la liberté et de l'égalité*. It occupied successively the refectory, the library, and the chapel of the monastery, which were furnished with the signature of the duc d'Aiguillon, the president.

Once transferred to Paris, the club underwent rapid modifications. The first step was its expansion by the admission as members or associates of others besides deputies; Arthur Young was so admitted on the 18th of January 1790. On the 8th of February the society was formally constituted on this broader basis by the adoption of the rules drawn up by Barnave, which were issued with the signature of the duc d'Aiguillon, the president. The objects of the club were defined as (1) to discuss in advance questions to be decided by the National Assembly; (2) to work for the establishment and strengthening of the constitution; (3) to be the forum in which to promulgate the preamble (i.e. of respect for legally constituted authority and the rights of man); (3) to correspond with other societies of the same kind which should be formed in the realm. At the same time the rules of order and forms of election were settled, and the constitution of the club determined. There were to be a president, elected every month, four secretaries, a treasurer, and committees elected to superintend elections and presentations, the correspondence, and the administration of the club. Any member who by word or action showed that his principles were contrary to the constitution and the rights of man was to be expelled, a rule which later on formed the "purification of the society" by the expulsion of its more moderate elements. By the 7th June the club decided to admit as associates similar societies in other parts of France and to maintain with them a regular correspondence.

This last provision was of far-reaching importance. By the 1oth of August 1790 there were already one hundred and fifty-two affiliated clubs; the attempts at counter-revolution led to a great increase of their number in the spring of 1791, and by the close of the year the Jacobins had a network of branches all over France. It was this widespread yet highly centralized organization that gave to the Jacobin Club its formidable power. At the outset the Jacobin Club was not distinguished by extreme political views. The somewhat high subscription confined its membership to men of substance, and to the last it was—so far as the central society in Paris was concerned—composed almost entirely of professional men, such as Robespierre, or well-to-do bourgeoises, like Sanserre. From the first, however, other elements were present. Besides Louis Philippe, duc de Chartres (afterwards king of the French), liberal aristocrats of the type of the duc d'Aiguillon, the prince de Broglie, or the vicomte de Noailles, and the bourgeoises who formed the mass of the members, the club contained such figures as "Père" Michel Gérard, a peasant proprietor from Tuel-en-Montgommert, in Brittany, whose rough common sense was admired as the oracle of popular wisdom, and whose countryman's waistcoat and plaited hair were later on to become the model for the Jacobin fashion.1 The provincial branches were from the first far more democratic, though in these too the leadership was usually in the hands of members of the educated or propertied classes. Up to the very eve of the republic, the club ostensibly supported the monarchy; it took no part in the petition of the 17th of July 1790 for the king's dethronement; nor had it any official share even in the insurrections of the 20th of June and the 10th of August 1792; it only finally moved to the+%222%22; of September. But the character and extent of the club's influence cannot be gauged by its official acts alone, and long before it emerged as the principal focus of the Terror, its character had been profoundly changed by the secession of its more moderate elements, some to found the Club of 1789, some in 1791—among them Barnave, the Lametns, Duport and Bailly—""""1 When I first sat among you I heard so many beautiful speeches that I might have believed myself in heaven, had there not been so many points of ridicule to be detected in the questions."""" These became involved in a *galimatias* of Rights of Man of which I understand mighty little but that it is worth nothing."""" *Mémoire du Père Gérard* in the Jacobins of the 27th of April 1790 (Aulard I, 63).
to founded the club of the Feuillants scoffed at by their former friends as the club magendrique. The main cause of this change was the admission of the public to the sitting of the club, which began on the 14th of October 1791. The result is described in a report of the Department of Paris on "the state of the empire," presented on the 12th of June 1792, at the request of Roland, the minister of the interior, and signed by the duc de La Rochefoucauld, which ascribes to the Jacobins all the woes of the state. "There exists," it runs, "in the midst of the capital, a committee of the public, a public pulpit of defamation, where every citizen of every age and both sexes are admitted day by day to listen to a criminal propaganda. ... This establishment, situated in the former house of the Jacobins, calls itself a society; but it has less the aspect of a private society than that of a public espectacle: vast tribunes are thrown open for the audience; all the sittings are advertised to the public for fixed days and hours, and the speeches made are printed in a special journal and lavishly distributed." In this society—the report continues—murder is counseled or applauded, all authorities are calumniated and all the organs of the government bespattered with abuse; as to its popularity, "it is due to its influence of its affiliates. In this correspondence a veritable ministerial authority, without title and without responsibility, while leaving to the legal and responsible authorities only the shadow of power." (Schmidt, Tableaux i. 78, &c.)

The constituency to which the club was henceforth responsible, and from which it derived its power, was in fact the peuple bête of Paris; the sans-culottes—decaed laces, cosmopolitan ne'er-do-wells, and starving workpeople—who crowded its tribunes. To this audience, and not primarily to the members of the club, the speeches of the orators were addressed and by its verdict they were judged. In the earlier stages of the Revolution the mob had been satisfied with the fine platitudes of the philosophes and the vague promise of a political millennium; but as the chaos in the body politic grew, and with it the appalling material misery, it began to clamour for the blood of the "traitors" in office by whose corrupt machinations the millennium was delayed, and only those orators were listened to who pandered to its suspicions. Hence the elimination of the moderate elements from the club; hence the ascendency of the Jacobins, and finally of Robespierre, the secret of whose power was the complete control of the suspicions of the populace, which they gave a voice and which they did not shrink from translating into action. After the fall of the monarch Robespierre was in effect the Jacobin Club; for to the tribunes he was the oracle of political wisdom, and by his standard all others were judged. With his fall the Jacobins too came to an end.

Not the least singular thing about the Jacobins is the very slender material basis on which their overpowering power rested. France groaned under their tyranny, which was compared to that of the Inquisition, with its system of espionage and denunciations which no one was too illustrious or too humble to escape. Yet it was reckoned by competent observers that, at the height of the Terror, the Jacobins could not command a force of more than 3000 men in Paris. But the secret of their strength was that, in the midst of the general disorganization, they alone were organized. The police agent Duttard, in a report to the minister Garat (April 30, 1793), describing an episode in the Palais Égalité (Royal), adds: "Why did a dozen Jacobins strike terror into two or three hundred aristocrats? It is that the former have a rallying-point and that the latter have none." When the jeunesses dorées had lost their organization, they had great difficulty in flogging the Jacobins out of the cafés into comparative silence. Long before this the Girondin government had been urged to meet organization by organization, force by force; and it is clear from the daily reports of the police agents that even a moderate display of energy would have saved the National Convention from the humiliation of being dominated by a club, and the French Revolution from the blot of the Terror. But though the Girondins were fully conscious of the evil, they were too timid, or too convinced of the ultimate triumph of their own persuasive eloquence, to act. In the session of the 30th of April 1793 a proposal was made to move the Convention to Versailles out of reach of the Jacobins, and Buizot declared that it was impossible to remain in Paris "so long as this abominable Jacobin club should have control over the nation was not carried, and the Jacobins continued to become the victims of the Jacobins.

Meanwhile other political clubs could only survive so long as they were content to be the shadows of the powerful organization of the Rue St Honoré. The Feuillants had been suppressed on the 28th of August 1792. The turn of the Cordeliers came so soon as its leaders showed signs of revolting against Jacobin supremacy, and no more startling proof of this ascendency could be found than the ease with which Hébert and his fellows were condemned and the readiness with which the Cordeliers, after a feeble attempt at protest, acquiesced in the verdict. It is true to speculate on what might have happened had the Jacobins been overthrown by the action of a strong government. No strong government existed, nor, in the actual conditions of the country, could exist on the lines laid down by the constitution. France was menaced by civil war within, and by a coalition of hostile powers without; the discipline of the Terror was perhaps necessary if she was to be welded into a united force capable of resisting this double peril; and the revolutionary leaders saw in the Jacobin organization the only instrument by which this discipline could be made effective. This is the Jacobin Blockchain, which was all the rage of a few republicans and writers of later times; they were, it is said (and of some of them it is certainly true), no mere doctrinaires and visionary sectaries, but practical and far-seeing politicians, who realized that "desperate ills need desperate remedies," and, by having the courage of their convictions, saved the gains of the Revolution for France.

The Jacobin Club was closed after the fall of Robespierre on the 9th of Thermidor of the year III., and some of its members were executed. An attempt was made to re-open the club, which was joined by many of the enemies of the Thermidorsians, but on the 23rd of Fructidor, year III. (Nov. 11, 1794), it was definitively closed. Its members and their sympathizers were scattered among the cafés, where a ruthless war of sticks and chains was waged against them by the young "aristocrats" known as the jeunesse dorée. Nevertheless the "Jacobins" survived, in a somewhat subterranean fashion, emerging again in the club of the Panthéon, founded on the 25th of November 1795, and suppressed in the following February (see BABEUF; FRANÇOIS NOël). The last attempt to reorganize them was the foundation of the Réunion d'amis de l'égalité et de la liberté, in July 1799, which had its headquarters in the Salle du Manège de the Tuileries, and was thus known as the Club du Manège. It was patronized by Barras, and some two hundred and fifty members of the two councils of the legislature were enrolled as members, including many notable ex-Jacobins. It published a newspaper called the Journal des Libres, proclaimed the apotheosis of Robespierre and Babeuf, and attacked the Directory as a royauté pentarchique. But public opinion was now preponderatingly moderate or royalist, and the club was violently attacked in the press and in the streets, the suspicions of the government were aroused; it had to change its meeting-place from the Tuileries to the church of the Jacobins (Temple of Peace) in the Rue du Bac, and in August it was suppressed, after barely a month's existence. Its members reneged themselves on the Directory by supporting Napoleon Bonaparte.

Long before the suppression of the Jacobin Club the name of "Jacobins" had been popularly applied to all promulgators of extreme revolutionary opinions. In this sense the word passed beyond the borders of France and long survived the Revolution. Canning's paper, The Anti-Jacobin, directed against the English Radicals, consecrated its use in England; and in the
correspondence of Metternich and other leaders of the repressive policy which followed the second fall of Napoleon, "Jacobin" is the term commonly applied to anyone with Liberal tendencies, even to so august a personage as the emperor Alexander I. of Russia.

The most important source of information for the history of the Jacobites is F. A. Aulard's *La société des Jacobins, Recueil de documents* (3 vols., Paris, 1889, &c.), where a critical bibliography will be found. This collection does not contain all the printed sources—notably the official Journal of the Club is omitted—but these sources, when not included, are indicated. The documents published are furnished with valuable explanatory notes. See also W. A. Schmidt, *Tableaux de la révolution française* (3 vols., Leipzig, 1867–1870), notably for the reports of the secret police, which throw much light on the actual working of the Jacobin propaganda.

*JACOBITE CHURCH—JACOBITES* 110

*JACOBITE CHURCH.* The name of "Jacobites" is first found in a synodical decree of Nicaea a.d. 787, and was invented by hostile Greeks for the Syrian Monophysite Church as founded, or rather restored, by Jacob or James Baradaeus, who was ordained its bishop a.d. 541 or 543. The Monophysites, who like the Greeks knew themselves simply as the Orthodox, were grievously persecuted by the emperor Justinian and the graceless patriarchs of Antioch, because they rejected the decrees of the council of Chalcedon, in which they—not without good reason—saw nothing but a thinly veiled relapse into those opinions of Nestorius which the previous council of Ephesus had condemned. James was born a little before a.d. 500 at Tellah or Telah, 55 m. east of Edessa, of a priestly family. His father had entered the Persian service. About 518 he went with a fellow-monk Sergius to Constantinople to plead the cause of his co-religionists with the empress Theodora, and lived there fifteen years. Justinian during those years imprisoned, deposed or exiled most of the recalcitrant clergy of Syria, Mesopotamia, Cilicia, Cappadocia, and the adjacent regions. Once ordained bishop of Edessa, with the connivance of Theodora, James, disguised as a ragged beggar (whence his name Baradaeus, Syriac Burdâdûn, Arabic al-Burûdî), traversed these regions preaching, teaching and ordaining new clergy to the number, it is said, of 80,000. His later years were embittered by squabbling with his own clergy, and he died in 578. His work, however, endured, and in the middle ages the Jacobite hierarchy numbered 150 archbishops and bishops under a patriarch and his *maphrian.* About the year 728 six Jacobite bishops present at the council of Manazert established communion with the Armenians, who equally rejected Chalcedon; they were sent by the patriarch of Antioch, and among them were the metropolitan of Urha (Edessa) and the bishops of Qarhan, Gardman, Nertker and Amsamia. How long this union lasted is not known. In 1482, when the Rev. G. P. Badger visited the chief Jacobite centres, their numbers had dwindled, and their hierarchy had little more than the semblance of an ecclesiastical organization. By 1580, the seeders to Rome were able, thanks to French consular protection, to seize the majority of the Jacobite churches in Turkey; and this injustice has contributed much to the present degradation and impoverishment of the Jacobites. They used leavened bread in the Eucharist mixed with salt and oil, and like other Monophysites add to the *Trisagion* the words "Who wast crucified for our sake." They venerate pictures or images, and make the sign of the cross with one finger to show that Christ had but one nature. Deacons, as in Armenia, marry before taking priest's orders. Their patriarch is styled of Antioch, but seldom comes west of Mardin. His *maphrian* (fertilizer) since 1089 has lived at Mosul and ordains the bishops. Monarchy is common among them, but there are no nuns. Next to the Roman Uniates (whom they term Rassen or Venil) they most hate the Nestorian Syrians of Persia. In 1822, at the instance of the British government, the Turks began to recognize them as a separate organization.

**JACOBITES** (from Lat. Jacobus, James), the name given after the revolution of 1688 to the adherents, first of the exiled English king James II., then of his descendants, and after the extinction of the latter in 1807, of the descendants of Charles I., i.e. of the exiled house of Stuart.

The history of the Jacobites, culminating in the risings of 1715 and 1745, is part of the general history of England (q.v.), and especially of Scotland (q.v.), in which country they were comparatively more numerous and more active, while there was also a large body of Jacobite adherents among the French and the Dutch. The latter were remounted largely, but not solely, from among the Roman Catholics, and the Protestants among them were often identical with the Non-Jurors. Owing to a variety of causes Jacobitism began to lose ground after the accession of George I. and the suppression of the revolt of 1715; and the total failure of the rising of 1745 may be said to mark its end as a serious political force. In 1765 Horace Walpole said that "Jacobitism, the concealed mother of the latter (i.e. Toryism), was extinct," but as a sentiment it remained for some time longer, and may even be said to exist in some degree 170 years after the Jacobite risings of 1745. James III. was proclaimed king; in 1786 certain persons walked out of the Roman Catholic Church at Hexham when George III. was prayed for; and as late as 1784 a Jacobite rising was talked about. Northumberland was thus a Jacobite stronghold; and in Manchester, where in 1777 according to an American observer Jacobitism "is openly professed," a Jacobite rendezvous known as "John Shaw's Club" lasted from 1755 to 1802. North Wales was another Jacobite centre. The "Cycle of the White Rose"—the white rose being the badge of the Stuarts—composed of members of the principal Welsh families around Wrexham, was a large body of Jacobite adherents of the country. There were remounts largely, but not solely, from among the Roman Catholics, and the Protestants among them were often identical with the Non-Jurors. Owing to a variety of causes Jacobitism began to lose ground after the accession of George I. and the suppression of the revolt of 1715; and the Jacobite traditions also lingered among the great families of the Scottish Highlands; the last person to suffer death as a Jacobite was Archibald Cameron, a son of Cameron of Lochiel, who was executed in 1753. Dr Johnson's Jacobite sympathies are well known, and on the death of Victor Emmanuel I., the ex-king of Sardinia, in 1824, Lord Liverpool wrote to Canning saying "there are those who think that the ex-king was the lawful king of Great Britain. Until the accession of King Edward VII., finger-bows were not placed upon the royal dinner-table, because in former times those who secretly sympathized with the Jacobites were in the habit of drinking to the king over the water. The Jacobite side of Jacobitism was stimulated by Sir Walter Scott's Waverley, and many Jacobite poems were written during the 19th century.

The chief collections of Jacobite poems are: Charles Mackay's *Jacobite Songs and Ballads of Scotland,* 1685–1765, with *Appendix of Modern Jacobite Songs* (1861); G. T. Macgregor's *Jacobite Songs and Ballads* (1888); and *English Jacobite Ballads,* edited by A. B. Grosart from the Townley manuscripts (1877).

Upon the death of Henry Stuart, Cardinal York, the last of James II.'s descendants, in 1687, the rightful occupant of the British throne according to legitimist principles was to be found among the descendants of Henrietta, daughter of Charles I., who married Philip I., duke of Orleans. Henrietta's daughter, Anne Marie (1669–1728), became the wife of Victor Amadeus II., duke of Savoy, afterwards king of Sardinia, and father of Charles Emmanuel III. of Sardinia; Victor Amadeus III. the latter's son, King Victor Emmanuel I., left no sons, and his eldest daughter, Marie Beatrice, married Francis IV., duke of Modena,
whose son Ferdinand (d. 1840) left an only daughter, Marie Thérèse (b. 1849). This lady, the wife of Prince Louis of Bavaria, was in 1910 the senior member of the Stuart family, and, according to the legitimists the rightful sovereign of Great Britain and Ireland.

Table showing the succession to the crown of Great Britain and Ireland, according to Jacobite principles.

| Charles I. | (1600-1649) | Henrietta | (1644-1670) | Philip I., duke of Orleans | (1640-1701) |
| Victor Amadeus II., king of Sardinia | (1666-1732) | Anne Marie | (1669-1728) | Victor Amadeus III., king of Sardinia | (1701-1773) |
| Charles Emmanuel III., king of Sardinia | (1726-1796) | Victor Amadeus III. | (1759-1824) | Marie Beatrice | (1789-1850) |
| Ferdinand | (1821-1849) | Marie Thérèse | (1849) | Louis, prince of Bavaria | (b. 1845) |
| Rupert, prince of Bavaria | (b. 1890) | Charles | (b. 1874) | Francis | (b. 1875) |
| Luitpold | (b. 1901) | Albert | (b. 1905) | Rudolph | (b. 1909) |

Among the modern Jacobite, or legitimist, societies perhaps the most important is the "Order of the White Rose," which has a branch in Canada and the United States. The order holds that sovereign authority is of divine sanction, and that the execution of Charles I. and the revolution of 1688 were national crimes; it exists to study the history of the Stuarts, to oppose all democratic tendencies, and in general to maintain the theory that kingship is independent of all parliamentary authority and popular approval. The order, which was instituted in 1886, was responsible for the Stuart exhibition of 1889, and has a newspaper, the Royalist. Among other societies with similar objects in view are the "Thames Valley Legitimist Club" and the "Legitimist Jacobite League of Great Britain and Ireland."

See Historical Papers relating to the Jacobite Period, edited by J. Allan Lyce (Aberdeen, 1895-1896); James Hogg, The Jacobite Relics of Scotland (Edinburgh, 1819-1821); and F. W. Head, The Fallen Stuarts (Cambridge, 1907). The marquis de Ruvigny has compiled The Jacobite Pervage (Edinburgh, 1894), a work which purports to give a list of all the titles and honours conferred by the kings of the exiled House of Stuart. (A.W. H. * )

JACOBS, CHRISTIAN FRIEDRICH WILHELM (1764-1847), German classical scholar, was born at Gotha on the 6th of Octo-

ber 1764. After studying philology and theology at Jena and Göttingen, in 1785 he became teacher in the gymnasium of his native town, and in 1802 was appointed to an office in the public library. In 1807 he became classical tutor in the lyceum of Munich, but, disgusted at the attacks made upon him by the old Bavarian Catholic party, who resented the introduction of "north German" teachers, he returned to Gotha in 1810 to take charge of the library and the numismatic cabinet. He remained in Gotha till his death on the 30th of March 1847. Jacobs was an extremely successful teacher; he took great interest in the affairs of his country, and was a publicist of no mean order. But his great work was an edition of the Greek Anthology, with copious notes, in 13 volumes (1798-1814), supplemented by a revised text from the Codex Palatinus (1814-1817). He published also notes on Horace, Stobaeus, Euripides, Athenaeus and the Iliaca of Tzetz; translations of Aelian (History of Animals); many of the Greek romances; Philostratus; poetical versions of much of the Greek Anthology; miscellaneous essays on classical subjects; and some very suc-

cessful school books. His translation of the political speeches of Demosthenes was undertaken with the express purpose of rousing his country against Napoleon, whom he regarded as a second Philip of Macedon.

See E. F. Wüstemann, Friderici Jacobii laudatio (Gotha, 1848); C. Burian, Geschichte der klassischen Philologie in Deutschland; and the appreciative article by C. Regel in Allgemeine deutsche Biographie.

JACOBS CAVERN, a cavern in latitude 36° 35' N., 2 m. E. of Pineville, McDonald county, Missouri, named after its discoverer, E. H. Jacobs, of Bentonville, Arkansas. It was scientifically explored by him, in company with Professors Charles E. F. and Warren K. Moorehead, in 1903. The results were published in that year by Jacobs in the Benion County Sun; by C. N. Gould in Science, July 31, 1903; by Peabody in the Am. Anthropologist, Sept. 1903; and in the Am. Journ. Archaeology, 1904; and by Peabody and Moorehead, 1904, as Bulletin I. of the Dept. of Archaeology in Phillips Academy, Andover, Mass., in the museum of which are exhibits, maps and photographs.

Jacobs Cavern is one of the smaller caves, hardly more than a rock-shelter, and is entirely in the "St Joe Limestone" of the classically-measured beds of the Cambrian system. "It is a single flat stratum of limestone; its walls are well marked by lines of stratification; drap-

stone also partly covers the walls, fills a deep fissure at the end of the cave, and spreads over the floor, where it mingles with an ancient bed of ashes, forming an ash-breccia (mostly firm and solid) that encloses fragments of sandstone, flint splinters, flint im-

plements, charcoal and bones. Underneath is the true floor of the cave, a mass of homogeneous yellow clay, one metre in thick-

ness. It holds scattered fragments of limestone, and is itself the result of limestone degeneration. The length of the opening is over 21 metres; its depth 14 metres, and the height of roof above the unstratified ash deposit varied from 1 m. to 10 cm. to 2 m. to 50 cm. The bone recess at the end was from 50 cm. to 80 cm. in height. The stratum of ashes was from 50 cm. to 1 m. 50 cm. thick.

The ash surface was staked off into square metres, and the substance carefully removed in order. Each stalactite, stalg-

mite and pilsaster was measured, numbered, and removed in sections. Six human skeletons were found buried in the ashes. Seven-tenths of a cubic metre of animal bones were found: deer, bear, wolf, raccoon, opossum, beaver, buffalo, elk, turkey, wood-

chuck, porcupine and hog; all roof contemporary with man's occupancy. Three stone metates, one stone axe, one and fifteen hun-

ders were found. Jacobs Cavern was peculiarly rich in flint knives and projectile points. The sum total amounts to 419 objects, besides hundreds of fragments, cores, spalls and rejects, retained for study and comparison. Considerable numbers of bone or horn awls were found in the ashes, as well as fragments of pottery, but no "ceremonial" objects.

The rude type of the implements, the absence of fine pottery, and the peculiarities of the human remains, indicate a race of occupant's more ancient than the "mound-builders." The deepest implement observed was buried 50 cm. under the stalg-

mitic surface. Dr. Hovey has proved that the rate of stalagmitic growth in Wyandotte Cave, Indiana, is .025 cm. annually; and if that was the rate in Jacobs Cavern, 1868 years would have been needed for the embedding of that implement. Polished rocks outside the cavern and pictographs in the vicinity indicate the work of a prehistoric race earlier than the Osage Indians, who were the historic owners previous to the advent of the white man. (H. C. H.)

JACOBSEN, JENS PETER (1847-1885), Danish imaginative writer, was born at Thisted in Jutland, on the 21st of April 1847; he was the eldest of the five children of a prosperous merchant. He became a student at the university of Copenhagen in 1868. As a boy he showed a remarkable turn for science, particularly for botany. In 1870, although he was secretly writing verses already, Jacobson definitely adopted botany as a profession. He was sent by a scientific body in Copenhagen to report on the flora of the islands of Anholt and Læsø. About this time the discoveries of Darwin began to exercise a fascination over him, and finding them little understood in Denmark, he translated into Danish The Origin of Species and The Descent of Man. In
the autumn of 1872, while collecting plants in a morass near Ordrup, he contracted pulmonary disease. His illness, which cut him off from scientific investigation, drove him to literature. He met the famous critic, Dr Georg Brandes, who was struck by his powers of expression, and under his influence, in the spring of 1873, Jacobsen began his great historical romance of Marie Grubbe. His method of composition was painful and elaborate, and his work was not ready for publication until the close of 1876. In 1879 he was too ill to write at all; but in 1880 an improvement came, and he finished his second novel, Niels Lyhne. In 1882 he published a volume of six short stories, most of them written a few years earlier, called, from the first of them, Mogens. After this he wrote no more, but lingered on in his mother's house at Thisted until the 30th of April 1883. In 1886 his posthumous fragments were collected. It was early recognized that Jacobsen was the greatest artist in prose that Denmark has produced. He has been compared with Flaubert, with De Quincey, with Pater; but these parallels merely express a sense of the intense individuality of his style, and of his utiriling pursuit of beauty in colour, form and melody. Although he wrote so little, and crossed the living stage so hurriedly, his influence in the North has been far-reaching. It may be said that no one in Denmark or Norway has tried to write prose carefully since 1880 whose efforts have not been in some degree modified by the example of Jacobsen's laborious art.

His Samlede Skrifter appeared in two volumes in 1888; in 1889 his letters (Bree) were edited by Edvard Brandes. In 1896 an English translation (cl) part of the former was published under the title Siren Voices: Niels Lyhne, by Miss E. F. L. Robertson.

(E. G.)

JACOB'S WELL, the scene of the conversation between Jesus and the "woman of Samaria" narrated in the Fourth Gospel, is described as being in the neighbourhood of an otherwise unmentioned "city called Sychar." From the time of Eusebius this city has been identified with Sychem or Shechem (modern Nablus), and the well is still in existence at 1 m. E. of the town, at the foot of Mt Gerizim. It is beneath one of the ruined archs of a church mentioned by Jerome, and is reached by a few rough steps. When Robinson visited it in 1838 it was 105 ft. deep, but it is now much shallower and often dry.

For a discussion of Sychar as distinct from Shechem see T. K. Cheyne, art. "Sychar," in Ency. Bibl., col. 4830. It is possible that Sychar should be placed at Tutil Balst, a mound about 1 m. W. of the well (Palestine Exploration Fund Statement, 1907, p. 92 seq.); with the village Sychon into it may have been tentatively called, "Ashar, a village on the lower slopes of Mt Ebal about 1'5 m. N.E. of Nablus and 4 m. N. from Jacob's Well. It may be noted that the difficulty is not with the location of the well, but with the identification of Sychar.

JACOBUS DE VORAGINE (c. 1290–c. 1298), Italian chronicler, archbishop of Genoa, was born at the little village of Varazze, near Genoa, about the year 1290. He entered the order of the friars preachers of St Dominic in 1244, and besides preaching with success in many parts of Italy, taught in the schools of his own fraternity. He was provincial of Lombardy from 1267 till 1286, when he was removed at the meeting of the order in Paris. He also represented his own province at the councils of Lucca (1288) and Ferrara (1290). On the last occasion he was one of the four delegates charged with signifying Nicholas IV.'s desire for the deposition of Muno de Zamora, who had been master of the order from 1265, and was deprived of his office by a papal bull dated the 12th of April 1291. In 1288 Nicholas compelled him to absolve the people of Genoa for their offence in aiding the Sicilians against Charles II. Early in 1292 the same pope, himself a Franciscan, summoned Jacobus to Rome, intending to consecrate him archbishop of Genoa with his own hands. He reached Rome on Palm Sunday (March 30), only to find his patron ill of a deadly sickness, from which he died on Good Friday (April 4). The cardinals, however, "propter honorem Communis Januae," determined to carry out this consecration on a Sunday. Part of the ceremony was performed by a papal legate, but the Consecration was deferred till May 6. Jacobus died, however, especially distinguished himself by his efforts to appease the civil discord of Genoa. He died in 1296 or 1299, and buried in the Dominican church at Genoa. A story, mentioned by the chronicler Echard as unworthy of credit, makes Boniface VIII., on the first day of Lent, cast the ashes in the archbishop's eyes instead of on his head, with the words, "Remember that thou art a Ghibelline, and with thy fellow Ghibelines wilt return to naught.

Jacobus de Voragine left a list of his own works. Speaking of himself in his Chronicon januense, he says, "While he was in his order, and after he had been made archbishop, he wrote many works. For he compiled the legends of the saints (Legenda sanctorum) in the year 1288, adding an appendix of documents, legal and scholastic, and from the chronicles of many writers." The other writings he claims are two anonymous volumes of "Sermons concerning all the Saints whose yearly feasts the church celebrates. For he compiled them in two volumes,.his said, one for Lent and the other for Easter, and wrote them concise. Then follow Sermones de omnibus evangelistis dominicalibus for every Sunday in the year; Sermones de omnibus evangelistis, i.e. lessons for the feast days of the Gospel, from the Wednesday to the Tuesday after Easter; and a treatise called "Marialis, qui totius urbis de B. Maria compositus," consisting of about 160 discourses on the attributes, titles, &c., of the Virgin Mary. In the same work the ninth and eighth centuries. The tenth gives the ecclesiastical history of Genoa from the time of its first known bishop, St Valentine, whom we believe to have lived about 530 A.D., till 1333, when the city began to decline. It is divided into eight books, to the lives of all the bishops in order, and includes the chief events during their pontificates; the twelfth deals in the same way with the archbishops, not forgetting the writer himself.

His two chief works are the Chronicon januense and the Golden Legend or Lombardica historia. The former is partly printed in Muratori's Scriptores Rer. Ital. i. 6. It is divided into twelve parts. The first four deal with the mystical history of Genoa from the time of its founder, Janus, the first king of Italy, and its enlarger, a second Janus "citizen of Troy," till its conversion to Christianity "about 25 years after the death of Christ," in the time of the emperor Constantine. The writer then goes on to treat of the beginning, the growth and the perfection of the city; but of the first period the writer candidly confesses he knows nothing except by hearsay. The second period includes the Genoese crusading exploits in the East, and their return to Italy, in 1268 (c. 1130), while the third reaches down to the days of the author's archbishopric. The sixth part deals with the constitution of the city, the seventh and eighth with the duties of rulers and citizens, the ninth with close of domestic life. The tenth gives the ecclesiastical history of Genoa from the time of its first known bishop, St Valentine, whom we believe to have lived about 530 A.D., till 1333, when the city began to decline. It is divided into eight books, to the lives of all the bishops in order, and includes the chief events during their pontificates; the twelfth deals in the same way with the archbishops, not forgetting the writer himself.

The Golden Legend was translated into French by Jean Bele de Vigny in the 14th century. It was also one of the earliest books to issue from the press. A Latin edition is assigned to about 1460; and a dated one was published at Lyons in 1473. Many other Latin editions were printed before the first edition of the French. A French translation by Master John Batailler is dated 1476; Jean de Vigny's is dated 1520; another is dated 1518; a Paris edition is dated 1572; a Bosanwick one is dated 1475; a Bohemian one at Plzen, 1475–1479, and at Prague, 1495; the English versions, 1483, 1487 and 1493; and a German one is dated 1489. Several 16th-century editions were printed in German, and the Morast was printed at Venice in 1497 and at Paris in 1503.

JACOTOT, JOSEPH (1770–1849), French educationist, author of the method of "émanation intellectuelle," was born

I 21
JACQUARD—JADE

JACQUARD, THE, an insurrection of the French peasantry which broke out in the Île de France and about Beauvais at the end of May 1358. The hardships endured by the peasants in the Hundred Years’ War and their hatred for the nobles who oppressed them were the principal causes which led to the rising, though the immediate occasion was an affray which took place on the 5th of May at the village of Saint-Leu between “brigants” (militia infantry armed in brigandines) and countryfolk. The latter having got the upper hand united with the inhabitants of the neighbouring villages and placed Guillaume Karle at their head. They destroyed numerous châteaux in the valleys of the Oise, the Brèche and the Thérain, where they subjected the whole countryside to fire and sword, committing the most terrible atrocities. Charles the Bad, king of Navarre, crushed the rebellion at the battle of Mello on the 10th of June, and the nobles then took violent reprisals upon the peasants, massacring them in great numbers.

JACTITATION (from Lat. jactilare, to throw out publicly), in English law, the maliciously boasting or giving out by one party that he or she is married to the other. In such a case, in order to prevent the common reputation of their marriage that might ensue, the procedure is by suit of jactitation of marriage, in which the petitioner alleges that the respondent boasts that he or she is married to the petitioner, and prays a declaration of nullity and a decree putting the respondent to perpetual silence thereon. It was previously to 1879 such a proceeding took place only in the ecclesiastical courts, but by an express term of the Martyn’s Causes Act of that year it can now be brought in the probate, divorce and admiralty division of the High Court. To the suit there are three defences: (1) denial of the boasting; (2) the truth of the representations; (3) allegation (by way of stopple) that the petitioner acquiesced in the boasting of the respondent.

In Thompson v. Rourke, 1893, Prob. 70, the court of appeal laid down that the court will not make a decree in a jactitation suit in favour of a petitioner who has at any time acquiesced in the assertion of the respondent that they were actually married. Jactitation of marriage is a suit that is very rare.

JADE, or JAIDE, a deep bay and estuary of the North Sea, belonging to the grand-duchy of Oldenburg, Germany. The bay, which was for the most part made by storm-floods in the 13th and 16th centuries, measures 70 sq. m., and has communication with the open sea by a fairway, a mile and a half wide, which never freezes, and with the tide gives access to the largest vessels. On the west side of the entrance to the bay is the Prussian naval port of Wilhelmshaven. A tiny stream, about 14 m. long, also known as the Jade, enters the head of the bay.

JADE, a term commonly applied to certain ornamental stones, mostly of a green colour, belonging to at least two distinct species, one termed nephrite and the other jadeite. Whilst the term jade is popularly used in this sense, it is now usually restricted by mineralogists to nephrite. The word jade is derived (through Fr. le jade fate l’ejade) from Span. ijada (Lat. ilia), the loins, this mineral having been known to the Spanish conquerors of Mexico and Peru under the name of piedra de ijada or yjada (colic stone). The reputed value of the stone in renal diseases is also suggested by the term nephrite (so named by A. G. Werner from Gr. nephros, kidney), and by its old name lapis nephriticus.

Jade, in its wide and popular sense, has always been highly prized by the Chinese, who not only believe in its medicinal value but regard it as the symbol of virtue. It is known, with other ornamental stones, under the name of yu or yu-chu (yu-stone). According to Professor H. A. Giles, it occupies in China the highest place as a jewel, and is revered as “the quintessence of heaven and earth.” Notwithstanding its toughness or tenacity, due to a dense fibrous structure, it is wrought into complicated ornaments.

The English use of the word for a worthless, ill-tempered horse, a “screw,” also applied as a term of reproach to a woman, has been referred doubtfully to the same Spanish source as the O. Sp. ijadae, meaning to pant, of a broken-winded horse.
forms and elaborately carved. On many prehistoric sites in Europe, as in the Swiss lake-dwellings, celts and other carved objects both in nephrite and in jadeite have not infrequently been found; and as no kind of jade had until recent years been discovered in situ in any European locality it was held, especially by Professor L. H. F. Fichter, that the true jade was of oriental or Chinese origin. But whether or not this is the case, the worked objects must have been brought by some of the early inhabitants from a jade locality probably in the East, or were obtained by barter, thus suggesting a very early trade-route to the Orient. Exceptional interest, therefore, is attached to the discovery of jade in Europe, nephrite having been found in Silesia, and jadeite or a similar rock in the Alps, whilst pebbles of jade have been obtained from many localities in Austria and north Germany, in the latter case probably derived from Sweden. It is, therefore, no longer necessary to assign the old jade implements to an exotic origin. In 1905, Finlayson showed, by measurement, that jadeite is monocrystalline. Its colour is commonly very pale, and white jadeite, which is the purest variety, is known as "Imperial jade," and shows bright patches of apple-green or emerald-green, due to the presence of chromium. Jadeite is much more fusible than nephrite, and is more easily powdered. It worked by abrasive tools is much denser. The colour of jadeite presents various shades of green, yellow and grey, and the mineral when polished has a rather greasy lustre. Professor F. W. Clarke found the colours due to compounds of iron and other elements. One of the favourable localities for nephrite is on the west side of the South Island of New Zealand, where it occurs as nodules and veins in serpentine and talcose rocks, but is generally found as boulders. It was known to the Maoris as paoranga, or "green stone," and was highly prized, being worked with great labour into various objects, especially the club-like implement known as the mere, or pateko-pateko, and the breast ornament called kei-tiki. The New Zealand jade, called by old writers "green tale of the Maoris," is now worked in Europe as an ornamental stone. The green jade-like stone known in New Zealand as tangiwai is bowenite, a translucent serpentine with enclosures of jadeite and tremolite. Nephrite, the true jade of New Zealand has been described by A. M. Finlayson (Quart. Jour. Geol. Soc., 1909, p. 351). It appears that the Maoris distinguished six varieties of jade. Difference of colour seems due to variations in the proportions of serpentine and nephrite. In the mineral species of New Zealand the nephrite results from the chemical alteration of serpentine, olivine or pyroxene, whereby a fibrous and amorphous silicate is converted by intense pressure and movement into the dense nephrite.

Jade occurs also in New Caledonia, and perhaps in some of the other Pacific islands, but many of the New Caledonian implements reputed to be of jade really shaw, and are probably composed of a silicate of iron and calcite, or have a calcite core. Much of the nephrite used by the Chinese has been obtained from quarries in the Kuen-lun mountains, on the sides of the Kara-kash valley, in Turkestan. The mineral, generally of pale colour, occurs in nests and veins running through hornblende-schists and gneissose rocks, and is notable that when first quarried it is comparatively soft. It appears to have a wide distribution in the mountains, and has been worked for several centuries. By adze, chisel and other tools, it is said to occur also in the Pamir region, and pebbles are found in the beds of many streams. In Turkestan, jade is known as yashm or yashm, a word which appears in Arabic as yashb, perhaps cognate with the English "jasper," but not to be confused with the "jasper" known to have been used by the ancients in Egypt. Jadeite has also been used in New Caledonia. Nephrite is said to have been discovered in 1891 in the Nan-shan mountains in the Chinese province of Kan-suh, where it is said to be the largest deposit in the world. A jadeite deposit has been discovered near the town of the Alberi graphite mine, near Batugof, Lake Baskunchak, in the Moscow province. New deposits in Siberia have been opened up to supply material for the tomb of the tsar Alexander III. A gigantic monolith exists at the tomb of Tamerlane at Samarkand. The occurrence of the Siberian jade has been described by Professor L. von Jaczewski.

Jade is a gemstone with a long history of use in various cultures, particularly in East Asia. It is known for its distinctive green color, often varying from pale green to deep emerald, and is prized for its translucency and durability. Jadeite and nephrite are the two main types of jade, with jadeite being a mineral species of the sodium silicate mineral family, NaAlSi3O8, and nephrite being a mixture of tremolite and actinolite, known as serpentine. Jadeite is often associated with the Jade Mountain, a mountain range in Kachin, Myanmar, which is the source of many high-quality jadeite deposits.

The use of jade in ancient cultures, such as the Chinese, is well documented, with jade artifacts ranging from simple beads to complex sculptures and carvings. The value of jade has often been symbolic, representing various qualities such as purity, strength, and immortality. Jade has also been used in practical applications, such as tools and ornaments. The use of jade in modern times continues to be significant, with jade being used in jewelry, sculpture, and other decorative art forms.
presented by him to the Metropolitan Museum of Art, New York. The work, which is in two folio volumes, superbly illustrated, was struck off on eighty folio leaves of Chinese hand-made paper, the type was distributed and the material used for the illustrations was destroyed. The second volume is a catalogue of the collection, which comprises 900 specimens arranged in those bands of which the root, bark, flower, and art are important section on Chinese jade was contributed by Dr S. W. Bushel, who also translated for the work a discourse on jade—
W. W. Bushel (1834, p. 77). Michael, a 15th century work, was
made to Heinrich Fischer's Nephril und Jadesi (2nd ed., Stuttgart, 1880), a work which at the date of its publication was almost exhaustive.

(J. F. R.)

JAEN, an inland province of southern Spain, formed in 1833 of districts belonging to Andalusia; bounded on the N. by Ciudad Real and Albacete, E. by Albacete and Granada, S. by Granada, and W. by Seville; area, 5,154 sq. m. Janes comprises the upper basin of the river Guadalquivir, which traverses the central districts from east to west, and is enclosed on the north, south and east by mountain ranges, while on the west it is entered by the great Andalusian plain. The Sierra Morena, which divides Andalusia from New Castle, extends along the northern half of the province, its most prominent ridges being the Loma de Chilca and the Loma de Ubeda; the Sierra de Segura, in the east, derive their name from the river Segura, which rises just within the border; and between the last-named watershed, its continuation the Sierra del Pazo, and the parallel Sierra de Cazorla, is the source of the Guadalquivir. The loftiest summits in the province are those of the Sierra Magina (7,105 ft.) farther west and south. Apart from the Guadalquivir the only large rivers are its right-hand tributaries the Jándula and Guadalimar, its left-hand tributary the Guadiana Menor, and the Segura, which flows east and south to the Mediterranean.

In a region which varies so markedly in the altitude of its surface, the climate is naturally unequal; and, while the bleak, wind-swept highlands are only available as sheep-walks, the well-watered and fertile valleys favour the cultivation of the vine, the olive and all kinds of cereals. The mineral wealth of Jaen has been known since Roman times, and mining is an important industry, with its centre at Linarese. Over 400 lead mines were worked in 1903; small quantities of iron, copper and salt are also obtained. There is some trade in sawn timber and cloth; esparto fabrics, alcohol and oil are manufactured. The roads, partly owing to the development of mining, are more numerous and better kept than in most Spanish provinces.

Railway communication is also very complete in the western districts, as the main line Madrid-Cordoba-Seville passes through them and connects Jaen with the important railways from Algeciras and Malaga on the south-west, and from Almeria on the south-east. The eastern half of Jaen is inaccessible by rail. In the western half are Jaen, the capital (pop. (1900), 26,434), with Andujar (16,913), Cabeza (14,639) and Basas (35,249); Jaen (17,978) and Ubeda (19,913). Other towns of more than 700 inhabitants are Alcalá la Real, Alcaudete, Arjona, La Carolina and Porriño. Jaen has some fine examples of the Mudéjar style, Torredonjimeno, Villacarrillo and Villanueva del Arzobispo, in the east.

JAEN, the capital of the Spanish province of Jaen, on the Linare-Puente Genil railway, 1500 ft. above the sea. Pop. (1900), 26,434. Jaen is finely situated on the well-wooded northern slopes of the Jabalcuz Mountains, overlooking the picturesque valleys of the Jaen and Guadalbullon rivers, which flow north into the Guadalquivir. The hillside upon which the narrow and irregular city streets rise in terraces is fortified with Moorish walls and a Moorish citadel. Jaen is an episcopal see. Its cathedral was founded in 1533; and, although it remained unfinished until late in the 18th century, its main characteristics are those of the Renaissance period. The city contains many churches and convents, a library, art galleries, theatres, barracks and hospitals. Its manufactures include leather, soap, alcohol and linen; and it was formerly celebrated for its silk. There are hot mineral springs in the mountains, 2 m. south.

The identification of Jaen with the Roman Aurinax, which has sometimes been suggested, is extremely questionable. After the Moorish conquest Jaen was an important commercial centre, under the name of Javun; and ultimately became capital of a petty kingdom, which was brought to an end only in 1246 by Ferdinand III. of Castile, who transferred thither the bishopric of Baexa in 1248. Ferdinand IV. died at Jaen in 1312. In 1712 the city suffered severely from an earthquake.

JAFARABAD, a state of India, in the Kathiawar agency of Bombay, forming part of the territory of the nawab of Janjira; area, 42 sq. m.; pop. (1901), 12,097; estimated revenue, £4,000. The town of Jafarabad (pop. 6,038), situated on the estuary of a river, carries on a large coasting trade.

JAPAN, a town of Ceylon, at the northern extremity of the island. The town was described by Dr J. Emerson Tennent as "the most perfect little military work in Ceylon—a pentagon, built of blocks of white coral." The European part of the town bears the Dutch stamp more distinctly than any other town in the island; and there still exists a Dutch Presbyterian church. Several of the church buildings date from the time of the Portuguese. In 1901 Jaffna had a population of 33,879, while in the district or peninsula of the same name there were 300,851 persons, nearly all Tamils, the only Europeans being the civil servants and a few planters. Coco-nut planting has not been successful of recent years. The natives grow palmryas freely, and have a trade in the fibre of this plant. They also grow and export tobacco, but not enough rice for their own requirements. A steamer calls weekly, and there is considerable trade. The railway extension from Kurunegala due north to Jaffna and the coast was commenced in 1900. Jaffna is the seat of a government agent and district judge, and criminal sessions of the supreme court are regularly held. Jaffna, or, as the natives call it, Yimpanan, was occupied by the Tamils about 204 B.C., and there continued to be Tamil rajahs of Jaffna till 1617, when the Portuguese took possession of the place. As early as 1544 the missionaries under Francis Xavier had made converts in this offshoot of Ceylon, and after 1617 the Portuguese retained their proselytizing zeal. They had a Jesuit college, a Franciscan and a Dominican monastery. The Dutch drove out the Portuguese in 1658. The Church of England Missionary Society began its work in Jaffna in 1818, and the American Missionary Society in 1822.

JÄGER, GUSTAV (1832— ), German naturalist and hygienist, was born at Bürg in Württemberg on the 23rd of June 1832. After studying medicine at Tübingen he became a teacher of zoology at Vienna. In 1868 he was appointed professor of zoology at the academy of Hohenheim, and subsequently he became teacher of zoology and anthropology at Stuttgart polytechnic and professor of physiology at the veterinary school. In 1884 he abandoned teaching and started practice as a physician in Stuttgart. He wrote various works on biological subjects, including Die Dorwiscische Theorie und ihre Stellung zu Moral und Religion (1865), Lehrbuch der allgemeinen Zoologie (1871-1878), and Die Entdeckung der See (1878). In 1876 he suggested an hypothesis in explanation of heredity, resembling the germ-plasm theory subsequently elaborated by August Weismann, to the effect that the germinal protoplasm retains its specific properties from generation to generation, dividing in each reproduction into an ontogenetic portion, out of which the individual is built up, and a phylogenetic portion, which is reserved to form the reproductive material of the mature offspring. In Die Normalbildung als Gesundheitschutz (1886) he advocated the system of clothing associated with his name, objecting especially to the use of any kind of vegetable fibre for clothes.

JÄGERNDORF (Czech, Kron), a town of Austria, in Silesia, 18 m. N.W. of Troppau by rail. Pop. (1900), 14,675, mostly Germans. It is situated on the Opat and possesses a château belonging to Prince Liechtenstein, who holds extensive estates in the district. Jàgerndorf has large manufactories of cloth, woollens, linen and machines, and carries on an active trade. On the neighbouring hill of Burgberg (1420 ft.) are a church, much visited as a place of pilgrimage, and the ruins of the seat of the former princes of Jägerndorf. The claim of Prussia to the principality of Jägerndorf was the occasion of the first Silesian war (1740-1742), but in the partition, which followed, Austria retained the larger portion of it. Jägerndorf suffered severely during the Thirty Years' War, and was the scene of engagements between the Prussians and Austrians in May 1745 and in January 1779.
JAGERSFONTEIN, a town in the Orange Free State, 50 m. N.W. by rail of Springfontein on the trunk line from Cape Town to Transvaal. Pop. (1904), 5677, 1293 whites and 4364 coloured persons. Jagersfontein, which occupies a pleasant situation on the open veldt about 4500 ft. above the sea, owes its existence to the valuable diamond mine discovered here in 1870. The first diamond, a stone of 50 carats, was found in August of that year, and digging immediately began. The discovery a few weeks later of the much richer mines at Beltfontein and Du Toits Pan, followed by the great finds at De Beers and Coleseberg Kop (Kimberley) caused Jagersfontein to be neglected for several years. Up to 1887 the claims in the mine were held by a large number of individuals, but coincident with the efforts to amalgamate the interest in the Kimberley mines a similar movement took place at Jagersfontein, and by 1893 all the claims became the property of one company, which has a working arrangement with the De Beers corporation. The mine, which is worked on the open system and has a depth of 450 ft., yields stones of very fine quality, but the annual output does not exceed in value £500,000. In 1909 a shaft 950 ft. deep was sunk with a view to working the mine on the underground system. Among the famous stones found in the mine are the "Excelsior" (weighing 971 carats, and larger than any previously discovered) and the "Jubilee" (see Diamond). The town was created a municipality in 1904.

Fourteen miles east of Jagersfontein is Boomplaats, the site of the battle fought in 1848 between the Boers under A. W. Pretorius and the British under Sir Harry Smith (see Orange Free State: History).

JAGO, RICHARD (1715-1781), English poet, third son of Richard Jago, rector of Beaudesert, Warwickshire, was born in 1715. He went up to University College, Oxford, in 1732, and took his degree in 1736. He was ordained to the curacy of Snitterfield, Warwickshire, in 1737, and became rector in 1745; and, although he subsequently received other preferments, Snitterfield remained his favourite residence. He died there on the 8th of May 1781. He was twice married. Jago's best-known poem, The Blackbirds, was first printed in Hawkinsworth's Adventurer (No. 37, March 13, 1753), and was generally attributed to Gilbert West, but Jago published it in his own name, with other poems, in R. Dodgson's Collection of Poems (vol. iv., 1755). In 1757 appeared a topographical poem, Edge Hill, or the Rural Prospect delineated and moralized; two separate sermons were published in 1755; and in 1768 Labour and Genius, a Fable. Shortly before his death Jago revised his poems, and they were published in 1784 by his friend, John Scott Hylton, as Poems Moral and Descriptive.

See a notice prefixed to the edition of 1784; A. Chalmers, English Poets (vol. viii., 1810); F. L. Colville, Warwickshire Worthies (1870); some biographical notes are to be found in the letters of Shenstone to Jago printed in vol. iii. of Shenstone's Works (1769).

JAGUAR (Felis onca), the largest species of the Felidae found on the American continent, where it ranges from Texas through Central and South America to Patagonia. In the countries which bound its northern limit it is not frequently met with, but in South America it is quite common, and Don Felix de Azara states that when the Spaniards first settled in the district between Montevideo and Santa Fé, as many as two thousand were killed yearly. The jaguar is usually found singly (sometimes in pairs), and preys upon such quadrupeds as the horse, tapir, capybara, dogs or cattle. It often feeds on fresh-water turtles; sometimes following the reptiles into the water to effect a capture, it inserts a paw between the shells and drags out the body of the turtle by means of its sharp claws. Occasionally after having tasted human flesh, the jaguar becomes a confirmed man-eater. The cry of this great cat, which is heard at night, and most frequently during the pairing season, is deep and hoarse in tone, and consists of the sound pu, pu, often repeated. The female brings forth from two to four cubs towards the close of the year, which are able to follow their mother in about fifteen days after birth. The ground colour of the jaguar varies greatly, ranging from white to black, the rosette markings in the extremes being but faintly visible. The general or typical coloration is, however, a rich tan upon the head, neck, body, outside of legs, and tail near the root. The upper part of the head and sides of the face are thickly marked with small black spots, and the rest of the body is covered with rosettes, formed of rings of black spots, with a black spot in the centre, and ranged lengthwise along the body in five to seven rows on each side. These black rings are heaviest along the back. The lips, throat, breast and belly, the inside of the legs and the lower sides of tail are pure white, marked with irregular spots of black, those on the breast being long bars and on the belly and inside of legs large blotches. The tail has large black spots near the root, some with light centres, and from about midway of its length to the tip it is ringed with black. The ears are black behind, with a large bull spot near the tip. The nose and upper lip are light rufous brown. The size varies, the total length of a very large specimen measuring 6 ft. 9 in.; the average length, however, is about 4 ft. from the nose to root of tail. In form the jaguar is thick-set; it does not stand high upon its legs; and in comparison with the leopard is heavily built; but its movements are very rapid, and it is fully as agile as its more graceful relative. The skull resembles that of the lion and tiger, but is much broader in proportion to its length, and may be identified by the presence of a tubercle on the inner edge of the orbit. The species has been divided into a number of local forms, regarded by some American naturalists as distinct species, but preferably ranked as sub-species or races.

JAGUARONDI, or YAGUARONDI (Felis jaguaraundii), a South American wild cat, found in Brazil, Paraguay and Guiana, ranging to north-eastern Mexico. This relatively small cat, uniformly coloured, is generally of some shade of brownish-grey, but in some individuals the fur has a rufous coat, while in others grey predominates. These cats are said by Don Felix de Azara to keep to coverts, without venturing into open places. They attack tame poultry and also young fawns. The names jaguarondi and eyra are applied indifferently to this species and Felis eyra.

JAHANABAD, a town of British India in Gaya district, Bengal, situated on a branch of the East Indian railway. Pop. (1901), 7018. It was once a flourishing trading town, and in 1760 it formed one of the eight branches of the East India Company's central factory at Patna. Since the introduction of Manchester goods, the trade of the town in cotton cloth has almost entirely ceased; but large numbers of the Jolah or Mahomedan weaver caste live in the neighbourhood.

JAHANGIR, or JEHANGIR (1569-1627), Mogul emperor of Delhi, succeeded his father Akbar the Great in 1605. His name was Salim, but he assumed the title of Jahangir, "Conqueror of the World," on his accession. It was in his reign that Sir Thomas Roe came as ambassador of James I, on behalf of the
JAHIZ (Abu 'Uthman 'Amr ibn Baahr ul-Jahiz; i.e. "the man the pupils of whose eyes are prominent") (d. 869), Arabian writer. He spent his life and devoted himself in Basra chiefly to the study of polite literature. A Mu'tazilite in his religious beliefs, he developed a system of his own and founded a sect named after him. He was favoured by Ibn uz-Zaïyât, the vizier of the caliph Wâthiq.

His work, the Kitâb ul-Nayâin wa-Tâyâin, a discussion of treatment on rhetoric, has been published in two volumes at Cairo (1895). The Kitâb ul-Maẖâsin wal-Addâr was edited by G. van Vloten as Le Livre des beaux et des antiâbes (Leiden, 1898); the Kitâb ul-Ilâ-hâ'd, Le Livre des avares, ed. by the same (Leiden, 1900); two other smaller works, Hidâ'iah al-Turkiyyah al-Supîrah, Les Huit étoiles, and the Blacks over the Whites, also prepared by the same. The Kitâb ul-Layâwun, or "Book of Animals," a philological and literary, not a scientific, work, was published at Cairo (1906).

(G. W. T.)

JAHN, FRIEDRICH LUDWIG (1778-1852), German pedagogue and patriot, commonly called Türensaw ("Father of Gymnastics"), was born in Lanz on the 11th of August 1778. He studied theology and philology from 1796 to 1802 at Halle, Göttingen and Greifswald. After Jena he joined the Prussian army. In 1809 he went to Berlin, where he became a teacher at the Gymnasium zum Grauen as well as at the Plamann School. Brooding upon the humiliation of his native land by Napoleon, he conceived the idea of restoring the spirits of his countrymen by the development of their physical and moral powers through the practice of gymnastics. The first Turnplatz, or gymnastic gymnasium, was opened by him at Berlin in 1811, and the movement spread rapidly, the young gymmasters being taught to regard themselves as members of a kind of gild for the emancipation of their fatherland. This patriotic spirit was nourished in no small degree by the writings of Jahn. Early in 1813 he took an active part at Breslau in the formation of the famous corps of Lützow, a battalion of which he commanded, though during the same period he was often employed in secret service. After the war he returned to Berlin, where he was appointed state teacher of gymnastics. As such he was a leader in the formation of the student Burschenschaften (patriotic fraternities) in Jena.

A man of democratic nature, rugged, honest, eccentric and outspoken, Jahn often came into collision with the reactionary spirit of the time, and this conflict resulted in 1819 in the closing of the Turnplatz and the arrest of Jahn himself. Kept in semiconfinement at the fortress of Kolberg until 1824, he was then sentenced to imprisonment for two years; but this sentence was reversed in 1825, though he was forbidden to live within ten miles of Berlin. He therefore took up his residence at Freyburg on the Unstrut, where he remained until his death, with the exception of a short period in 1828, when he was exiled to Colleda on a charge of sedition. In 1840 he was decorated by the Prussian government with the Iron Cross for bravery in the wars against Napoleon. In the spring of 1848 he was elected by the district of Naumburg to the German National Parliament. Jahn died on the 15th of October 1852 in Freyburg, where a monument was erected in his honour in 1859.

Among his works are the following: Bereicherung des hochdeutschen Sprachkreises (Leipzig, 1806); Deutsches Volksthum (Lübeck, 1810), Runenbildner (Frankfort, 1814), Newe Runenbildner (Naumburg, 1828), Merke zum deutschen Volksthum (Hildburghausen, 1833), and Schwertzertheidigung (Vindication) (Leipzig, 1865). A complete edition of his works appeared at Hoi in 1884-1887. See the biography by Schultheiss (Berlin, 1894), and Jahn als Erzieher, by Friedrich (Münich, 1895).

The following are the most important of his works: 1. Archaeological: Palamodes (1836); Telephos u. Trollos (1841); Die Gemälde des Polygn (1841); Fenix u. die Minnen (1841); Das Orientalische Kunst (1849); Petrho, die Göttin der Übersetzung (1847); Über einige Darstellungen des Paris-Urteils (1849); Die Picrosmische Cista (1852); Pausaniae descriptio auctum Athenarum (3rd ed., 1901); Darstellungen griechischer Dichter auf den Athinas (1861); Critical editions of Juvenal, Persius and Sulpicia (3rd ed. by F. Bühcher, 1893); Censorinus (1845); Fluvius (1852); Cicero's Bruts (4th ed., 1877); and Orator (3rd ed., 1863); the Persicae di Livy (1853); the Psyche (1849); a Critical edition of Pausanias, by P. D. Townsend (1891-1897); Ludwig Ullstein (1863); Gesammelte Aufsätze über Musik (1860); Biographische Aufsätze (1866). His Griechische Bilderchroniken was published after his death, by his nephew A. Michaelis, who has written an

JAHN, JOHANN (1750-1816), German Orientalist, was born at Tasswitz, Moravia, on the 18th of June 1750. He studied philosophy at Olmütz, and in 1772 began his theological studies at the Premonstratensian convent of Bruck, near Znaim. Having been ordained in 1775, he for a short time held a cure at Mislitza, but was soon recalled to Bruck as professor of Oriental languages and classical literature, and in 1782 the suppression of the convent by Joseph II. in 1784, Jahn took up similar work there. In 1786 he was transferred to Vienna as professor of Oriental languages, biblical archaeology and dogmatics. In 1792 he published his Einleitung ins Alte Testamenti (2 vols.), which soon brought him into trouble; the cardinal-archbishop of Vienna laid a complaint against him for having departed from the traditional teaching of the Church, e.g. by asserting Job, Jonah, Tobit and Judith to be didactic poems, and the cases of demoniacal possession in the New Testament to be cases of dangerous disease. An ecclesiastical commission reported that the views themselves were not necessarily heretical, but that Jahn had erred in showing too little consideration for the views of German Catholic theologians in coming into conflict with his bishop, and in raising difficult problems by which the unlearned might be led astray. He was accordingly advised to modify his expressions in future. Although he appears honestly to have accepted this judgment, the hostility of his opponents did not cease until at last (1806) he was compelled to accept a canonry at St. Stephan, Vienna, which involved the resignation of his chair. This step had been preceded by the condemnation of his Introductio in libros sacros veteris foederis in compendium redacta, published in 1804, and also of his Archologia biblica in compendium redacta (1805). The only work of importance, outside the region of mere philology, afterwards published by him, was the Enchiridion Iurismeruliticae (1812). He died on the 16th of August 1816.

Besides the works already mentioned, he published Hebräische Sprachlehre für Anfänger (1791); Aramäische ed. Chaldäische u. Syrische Sprachlehre für Anfänger (1791); Arabische Sprachlehre (1791); Elementarbuch der hebr. Sprache (1791); Chaldäische Chrestomathie (1802); Lexion arabisco-latinum chrestomathie accommodatum (1802); an edition of the Hebrew Bible (1806); Grammatica lingue hebraeae (1806); a critical commentary on the Messianic passages of the Old Testament (Vaticina prophetae de Jesu Messia, 1815). In 1821 a collection of Nachträg appeared, containing six dissertations on Biblical subjects. The English translation of the Archologia by T. C. Upham (1840) has passed through several editions.
JAHROM—JAINS

exhaustive biography in Allgemeine Deutsche Biographie, xiii.; see also J. Vahlen, Osto John (1870); C. Bursian, Geschichte der klassischen Philologie in Deutschland.

JAHROM, a town and district of Persia in the province of Fars, S.E. of Shiraz and S.W. of Darab. The district has thirty-three villages and is famous for its celebrated shahān dates, which are exported in great quantities; it also produces much tobacco and fruit. The water supply is scanty, and most of the irrigation is by water drawn from wells. The town of Jahrom, situated about 90 m. S.E. of Shiraz, is surrounded by a mud-wall 3 m. in circuit which was constructed in 1834. It has dépêches since about 1830 and live spring water; there are other baths outside the town. It is the market for the produce of the surrounding districts, has six caravanserais and a post office.

JAINS, the most numerous and influential sect of heretics, or noiconformists to the Brahmanical system of Hinduism, in India. They are found in every province of upper Hindustan, in the cities along the Ganges and in Calcutta. But they are more numerous to the west—in Mewar, Gujarat, and in the upper part of the Malabar coast—and are also scattered throughout the whole of the southern peninsula. They are mostly traders, and live in the towns; and the wealth of many of their community is the result of their skill and industry. The former is of less importance than that which resulted from their shares in the race.

In the Indian census of 1901 they are returned as being 1,343,140 in number. Their magnificent series of temples and shrines on Mount Abu, one of the seven wonders of India, is perhaps the most striking outward sign of their wealth and importance.

The Jains are the last direct representatives on the continent of India of those schools of thought which grew out of the active philosophical speculation and earnest spirit of religious inquiry that prevailed in the valley of the Ganges during the 6th and 5th centuries before the Christian era. The latter part of the Jainism was so overshadowed by that stupendous movement, born at the same time and in the same place, which we call Buddhism, that it remained almost unnoticed by the side of its powerful rival. But when Buddhism, whose wide open doors had absorbed the mass of the community, became thereby corrupted from its pristine purity and gradually died away, the smaller school of the Jains, less diametrically opposed to the victorious orthodox creed of the Brahmans, survived, and in some degree took its place.

Jainism purports to be the system of belief promulgated by Jīva, better known by his epithet of Mahā-vīra (the great hero), who was a contemporary of Gotama, the Buddha. But the Jains, like the Buddhists, believe that the system had previously been proclaimed through countless ages by each one of a succession of earlier teachers. The Jains count twenty-four such prophets, whom they call Jinas, or Tirthankaras, that is, conquerors or leaders of schools of thought. It is from this word Jina that the modern name Jains, meaning followers of the Jina, or of the Jinas, is derived. This legend of the twenty-four Jinas contains a germ of truth. Mahā-vīra was not an originator; he merely carried on, with but slight changes, a system which existed before his time, and which probably owes its most distinguishing feature to a teacher named Pārśva, who ranks in the succession of Jinas as the predecessor of Mahā-vīra. Pārśva is said, in the Jain chronology, to have been born two hundred years before Mahā-vīra (that is, about 760 B.C.); but the only conclusion that it is safe to draw from this statement is that Pārśva was considerably earlier in point of time than Mahā-vīra. Very little reliance can be placed upon the details reported in the Jain books concerning the previous Jinas in the list of the twenty-four Tirthankaras. The curious will find in them many reminiscences of Hindu and Buddhist legend; and the antiquary must notice the distinctive symbols assigned to each, in order to recognize the statues of the different Jinas, otherwise identical, in the different Jain temples.

The Jains are divided into two great parties—the Digambaras, or Sky-clad Ones, and the Svetāmbaras, or the White-robed Ones. The latter have only as yet been traced, and that doubtfully, as far back as the 5th century after Christ; but the former are almost certainly the same as the Nigāṇṭhas, who are referred to in numerous passages of the Buddhist Pāli Pītākas, and must therefore be at least as old as the 6th century. Most of these passages the Nigāṇṭhas are mentioned as contemporaneous with the Buddha; and details enough are given concerning their leader Nigāṇṭha Nāṭa-putta (that is, the Nigāṇṭha of the Jāṭīrika clan) to enable us to identify him, without any doubt, as the same person as the Vadhāmāna Mahā-vīra of the Jain books. This remarkable confirmation, from the scriptures of a rival religion, of the Jain tradition is conclusive as to the date of Mahā-vīra. The Nigāṇṭhas are referred to in one of Asoka’s edicts (Edict in Sūtra, Corpus, Plate xx.). Unfortunately the account of the teaching of the Nigāṇṭhas given in the Buddhist scriptures are, like those of the Buddha’s teachings given in the Brahmanical literature, very meagre.

Jain Literature. The Jain scriptures themselves, though based on earlier traditions, are not older in their present form than the 5th century of our era. The most distinctive sacred books are called the forty-five Agamas, consisting of eleven Angas, twelve Śāstras, nineteen Āgamas, and two other books. Devadhiṇī Gāpin, who occupies among the Jains a position very similar to that occupied among the Buddhists by Dhammapāla, collected the existing traditions and teachings of his time, and wrote them down in the form of the so-called Shrāvetanī or Vedānta. Most of the later scriptures, the earlier Jain books are written in a dialect of their own, the so-called Jaina Prakrit; and it was not till between the 1st and 1st centuries of our era that the Jains adopted Sanskrit as their literary language. Considerable progress has been made in the study and elucidation of these original authorities. But a great deal remains yet to be done. The oldest books now in the possession of the Jains purport to go back, not to the former existing order in the 6th century B.C., but only to the time of Bhadradhāru, three centuries later. The bulk of the still older literature, on which the revision then made was based, the so-called Purāṇas, have been lost. And the existing canonical books, while preserving a great deal that was probably derived from them, contain much later matter. The problem remains to sort out the older from the later portions of the Agamas, and distinguish between the text of the faith and its subsequent developments, and to collect the many disconnected points of the general, social, industrial, religious, and political history of India. Professor Weber gave a fairly full and carefully-drawn-up analysis of the whole of the more ancient books in the second part of the second volume of his Catalogue of the Sanskrit MSS. at Berlin, published in 1888, and in vols. xvi. and xvii. of his Indische Studien. An English translation of these last was published first in the Indian Antiquary, and more recently at Bombay, 1893. Professor Bhandarkar gave an account of the contents of many later works in his Report on the Search for Sanskrit MSS., Bombay, 1893. Only a small beginning has been made in the study of the modern books, in which the precepts of a long book can necessarily only deal with the more important features in it. And in the choice of what should be included the preceptors will often omit the points some subsequent sections.

The Jains themselves have now printed in Bombay a complete edition of their sacred books. But the critical value of this edition, and of other subsequent parts of the five sets of separate editions, is much to be desired, inasmuch as Professor Jacobis has edited and translated the Kalpa Sūtra, containing a life of the founder of the Jain order; but this can scarcely be older than the 6th century of our era. He has also edited and translated the Aṣṭādhyāya, Sūtra, of the Svetāmbara Jain writers. The text, published by the Pali Text Society, is of 140 pages octavo. The first part, about 20 pages, is a very old document on the Jain views as to conduct, and the remainder consists of appendices, added at different times, on the same subject. The older part may go back as early as the 3rd century B.C., and it sets out more especially the Jain doctrine of dharma and self-mortification, in contrast to the notions of speech, conduct, and worship of the Tantrics. The rules of conduct in this book are for members of the order. Dr. Rudolf Hoernle edited and translated an ancient work on the rules for laymen, the Udēgā Sūstra, for Professor Leumann another of the older works, the Aṣṭapāṭhikā Sūtra, and a fourth, the Dasa-vaiśālıkā Sūtra, both of them published by the German Oriental Society. Professor Jacobis translated two more, the Tattvādhyāya Sūtra, and the Abhinanditā Sūtra, which has translated two others in vol. xvii. of the Oriental Translation Fund (new series, London, 1907). Thus about one-fifth of these interesting and valuable records of the former views of the Jains have been published. The sect of the Svetāmarbhas has preserved the oldest literatures. Dr. Hoernle has translated the early history of

1 Published in the Bibliotheca Indica, Calcutta, 1888.
2 These two, and the other two mentioned above, form vols. i. and ii. of his Jaina Sutras, published in the Sacred Books of the East (1884, 1895).
JAIPUR the sect in the Proceedings of the Asiatic Society of Bengal for 1898. Several scholars—notably Bhagavanlndra, Mr Lewis Rice and Hofrath Bühlcr—have treated of the remarkable archaeological discoveries lately made. These confirm the older records in many details, and show that the Jains, in the centuries before your Christian era, were a wealthy and important body in widely separated parts of India.

Jainism.—The most distinguishing outward peculiarity of Mahâ-víra and of his earliest followers was their practice of going quite naked, whence the term Digambara. Against this custom, Gotama, the Buddha, especially warned his followers; and it is referred to in the well-known Greek phrase, Gymnosphâsis, used already by Megasthenes, which applies very aptly to the Jains. Even the earliest name Nâgârjuna, which means "free from bonds," may not be without allusions to this curious belief in the sanctity of nakedness, though it also alluded to freedom from the bonds of sin and of transmission. The statues of the Jinas in the Jain temples, some of which are of enormous size, are still always quite naked; but the Jains themselves have abandoned the practice, the Digambaras being sky-clad at meal-time only, and the Svetâmbaras being always completely clothed. And even among the Digambaras it is only the recluses or Fâls,men devoted to a religious life, who carry out this practice. The Jain laity—the Śrâvakas, or disciples—do not adopt it.

The Jain views of life were, in the most important and essential respects, the exact reverse of the Buddhist views. The two orders, Buddhist and Jain, were not only, and from the first, independent, but directly opposed the one to the other. In philosophy the Jains are the most thorough-going supporters of the old animistic position. Nearly everything, according to them, has a soul within its outward visible shape—not only men and animals, but also all plants, and even particles of earth, and of water (when it is cold), and fire and wind. The Buddhist theory, as is well known, is put together without the hypothesis of soul, and ascribes the whole of what we call a visible means life; and there is much analogy between many of the expressions they use and the view that the ultimate cells and atoms are all, in a more or less modified sense, alive. They regard good and evil and space as ultimate substances which come into direct contact with the minute souls in everything. And their best-known position in regard to the points most discussed in philosophy is Syadh-vada, the doctrine that you may say "Yes" and at the same time "No" to everything. You can affirm the eternity of the world, for instance, from one point of view, and at the same time deny it from another; or, at different times and in different conditions, then one day affirm it and another day deny it. This position both leads to vagueness of thought and explains why Jainism has had so little influence over other schools of philosophy in India. On the other hand, the Jains are as determined in their views of asceticism (tâpas) as they were compromising in their views of philosophy. Any injury done to the "souls" being one of the worst of iniquities, the good monk should not wash his clothes (indeed, the most austere will reject clothes altogether), nor even wash his teeth, for fear of injuring living things. "Subdue the body, "chastise yourself, weaken yourself, just as fire consumes dry wood." It was by suppressing, through such self-torture, the influence on his soul of all sensations that the Jain could obtain salvation. It is related of the founder himself, the Mahâ-víra, that after twelve years' penance he thus obtained Nirvâna (Jacobi, Jainâ Sûtras, i. 201) before he entered upon his career as a teacher. And through the rest of his life, till he died at Pâva, shortly before the Buddha, he followed the same habit of continual self-mortification. The Buddha, on the other hand, obtained Nirvâna in his 35th year, under the Bo tree, after he had abandoned penance; and through the rest of his life he spoke of penance as quite useless from his point of view.

There is no manual of Jainism as yet published, but there is a

The Hathâti Cunghâ and three other inscriptions at Cuttack (Leyden, 1885); Srawana Belgola inscriptions (Bangalore, 1889); Vienna Oriental Journal, vols. ii.—v.; Epigraphia Indica, vols. i.—vii. great deal of information on various points in the introductions to the works referred to above. Professor Jacobi, who is the best authority on the history of this sect, thus sums up the distinction between the Mahâ-víra and the Buddha: "Mahâ-víra was rather of the ordinary class of religious men in India. He may be allowed a talent for religious matters, but he possessed not the genius which Buddha undoubtedly had. . . . The Buddha's philosophy forms a system based on a few fundamental ideas, whilst that of Mahâ-víra scarcely forms a system, but is merely a sum of opinions (pannâtis) on various subjects, no fundamental ideas being there to uphold the mass of metaphorical matter. Besides this, . . . It is the ethical element that gives to the Buddhist philosophy its superiority over those of the Jains. Mahâ-víra treated ethics as corollary and subordinate to his metaphysics, with which he was chiefly concerned."

Additional Authorities.—Bhadrasâhâ's Kaûlpâ Sûtras, the recognized and popular manual of the Svetâmbara Jains, edited with English introduction by Professor Jacobi (Leipzig, 1879); Hema- candra's "Yoga Sûstram," edited by Windisch, in the Zeitschrift der deutschen morgen. Ges. for 1874; "Zwei Jainâ Sûtras," edited in the Indische Studien, vol. xv.; Ein Fragment der Bhagavâti, by Professor Weber; Mémoires de l'Académie de Berlin (1866); Nyâyayâjñâna, composed by Dr Warren, with Dutch introduction (Amsterdam, 1879); Over de godsdienstige en wijsgerige Begrippen der Jainas, by Dr Warren (his doctor-dissertation, Zwolle, 1875); Beiträge zur Geschichte und der Jaina-purânas, by Dr Edward Müller (Berlin, 1876); Colebrooke's Essays, vol. ii. Mr. J. Burgess's Old Narratives of the Jain Cave Temples (none older than the 7th century) in Ferguson and Burgess's Cave Temples in India (London, 1880). The Hopkins' Jaina Temples of India (London, 1869, pp. 159-169), and J. G. Bühlcr On the Indian Sect of the Jains, edited by J. Burgess (London, 1904).

JAIPUR, or JAYPORE, a city and native state of India in the Rajputana agency. The city is a prosperous place of comparatively recent date. It derives its name from the famous Maharana Jai Singh II, who founded it in 1728. It is built of pink stucco in imitation of sandstone, and is remarkable for the peculiar regularity of its streets. It is the only city in India that is laid out in rectangular blocks, and it is divided into streets six into equal portions. The main streets are 111 feet wide and are paved, while the city is lighted by gas. The regularity of plan, and the straight streets with the houses all built after the same pattern, deprive Jaipur of the charm of the East, while the painted mud walls of the houses give it the meretricious air of stage scenery. The huge palace of the maharaja stands in the centre of the city. Another noteworthy building is Jai Singh's observatory. The chief industries are in the working of sandstone, which are exported to Europe, the dyeing of cotton, and the making of cord. The streets are narrow, but they are crowded with a mixed community of native bankers. The city has three colleges and several hospitals. Pop. (1901), 160,167. The ancient capital of Jaipur was Amber.

The State of Jaipur, which takes its name from the city, has a total area of 15,579 sq. m. Pop. (1901), 2,658,666, showing a decrease of 6 % in the decade. The estimated revenue is £450,000, and the tribute £27,000. The centre of the state is a sandy and barren plain 1,600 ft. above sea-level, bounded on the E. by ranges of hills running north and south. On the N. and W. it is bounded by the chain of hills, an offshoot of the Aravalli mountains, beyond which lie the basin of the Râjputana. The soil is generally sandy. The hills are more or less covered with jungle trees, of no value except for fuel. Towards the S. and E. the soil becomes more fertile. Salt is largely manufactured and exported from the Sambhar lake, which is worked by the government of India under an arrangement with the states of Jaipur and Jodhpur. It yields salt of a very high quality. The state is traversed by the Rajputana railway, with branches to Agra and Delhi. The maharajah of Jaipur belongs to the Kachwaha clan of Rajputs, claiming descent from Ram, king of Ajodhya. The state is said to have been founded about 1128 by Dhula Rai, from Gwalior, with whom his Kachwahas is said to have absorbed or driven out the petty chieftains. The Jaipur house furnished to the Moguls some of their most distinguished generals. Among them were Man Singh, who fought in Orissa and Assam; Jai
Singh, commonly known by his imperial title of Mirza Raja, whose name appears in all the wars of Aurangzeb in the Deccan; and Jai Singh II., or Sawai Jai Singh, the famous mathematician and astronomer, and the founder of Jaipur city. Towards the end of the 18th century the Jats of Bharatpur and the chief of Alwar each annexed a portion of the territory of Jaipur. By the end of the century the state was in great confusion, distracted by internal broils and impoverished by the exactions of the Mahrattas. The disputes between the chiefs of Jaipur and Jodhpur had brought both states to the verge of ruin, and Andharpur and the territories of Kishanpura were devastated. The country, which is a part of the desert of the Thar, had suffered by the English occupation of Sind in 1768, and its natural fertility was diminished by the commencement of the practice of shipping English wool to that country. It was not until 1818 the protection of the British was extended to Jaipur and an annual tribute fixed. In 1835 there was a serious disturbance in the city, after which the British government took measures to insist upon order and to reform the administration as well as to support its effective action; and the state has gradually become well-governed and prosperous. During the Mutiny of 1857 the maharaja assisted the British in every way that lay in his power. Maharaja Madho Singh, G.C.S.I., G.C.V.O., was born in 1861, and succeeded in 1882. He is distinguished for his enlightened administration of his state, and for the vast sums which, by his intercession, were raised during his reign to assist the British government in the war against the Mahrattas.

JAISALMER, or JAYSULMERE, a town and native state of India in the Rajputana agency. The town stands on a ridge of yellowish sandstone, crowned by a fort, which contains the palace and several ornate Jain temples. Many of the houses and temples are finely sculptured. Pop. (1901), 71,377. The area of the state is 16,662 sq. m. In 1901 the population was 73,370, showing a decrease of 37% in ten years, as a consequence of famine. The estimated revenue is about £6000; there is no tribute. Jaitsalmer is almost entirely a sandy waste, forming part of the great desert of India. The general aspect of the country is that of an interminable sea of sandhills, of all shapes and sizes, some rising to a height of 150 ft. Those in the west are covered with phog hushes, those in the east with tufts of long grass. Water is scarce, and generally brackish; the average depth of the wells is said to be about 300 ft. There are no permanent streams, and only one small river, the Kakni, which, after flowing a distance of 28 m., spreads over a large surface of flat ground, and forms a lake or jhil called the Bhuji-Jhil. The climate is dry and healthy. Throughout Jaisalmer only rain-crops, such as bajra, foar, moth, til, &c., are grown; spring crops of wheat, barley, &c., are very rare. Owing to the scant rainfall, irrigation is almost unknown.

The main part of the population lead a wandering life, gathering their flocks and herds. Large herds of camels, horned cattle, sheep and goats are kept. The principal trade is in wool, gh, camels, cattle and sheep. The chief imports are grain, sugar, cotton cloth, piece-goods, &c. Education is at a low ebb. Jain priests are the chief schoolmasters, and their teaching is elementary. The ruler of Jaisalmer is styled maharajah. The state suffered severely during the famine of 1897, 1900 and other years, to such an extent that it has had to incur a heavy debt for extraordinary expenditure. There are no railways. The majority of the inhabitants are Bhatti Rajputs, who take their name from an ancestor named Bhatti, renowned as a warrior when the tribe were located in the Punjab. Shortly after this the clan was driven southwards, and found a refuge in the Indian desert, which was thenceforth its home. Doordi, a famous prince of the Bhatti family, is esteemed the real founder of the present Jaisalmer dynasty, and with him the title of rajput commenced. In 1745 the throne was successively occupied by Doordi, Jai Singh, and his son, the present ruler. When the state was ceded to the British in 1887, the Jaisalmer princes had already fixed their residence in the fort. The Jaisalmer princes had now arrived at the height of their power, but from this time till the accession of Rajawal Mulraj in 1792 the fortunes of the state rapidly declined, and most of its outlying provinces were lost. In 1818 Mulraj entered into political relations with the British. Maharawal Salivahan, born in 1887, succeeded to the chieftainship in 1891.

JAJCE (pronounced Vúde), a town of Bosnia, situated on the Pliva and Vrbas rivers, and at the terminus of a branch railway from Sarajevo, 62 m. S.E. Pop. (1895), about 4000. Jajce occupies a conical hill, overlooking one of the finest waterfalls in Europe, where the Pliva rushes down into the Vrbas, 100 ft. below. The 14th century citadel which crowns this hill is said to have been built for Hrvoje, duke of Spalato, on the model of the Castello del'Uovo at Naples; but the resemblance is very slight, and although both jajce and areo signify "an egg," the town probably derives its name from the shape of the hill. The ruined church of St Luke, said by legend to be the Evangelist's burial place, has a fine Italian belfry, and dates from the 15th century. Jezero, 5 m. W. of Jajce, contains the Turkish fort of Djil-Hissar, or the "Lake-Fort." In this neighbourhood a line of waterfalls and meres, formed by the Pliva, stretches for several miles, enclosed by steep rocks and forest-clad mountains. The water supplied by the main fall, at Jajce, is used for industrial purposes, but the beauty of the town remains unejected.

From 1463 to 1528 Jajce was the principal outwork of eastern Christendom against the Turks. Venice contributed money for its defence, and Hungary provided armies; while the pope entreated all Christian monarchs to avert its fall. In 1463 Mahomet II. had seized more than 75 Bosnian fortresses, including Jajce itself; and the last independent king of Bosnia, Stephen Tomasević, had been beheaded, or, according to one tradition, flayed alive, before the walls of Jajce, on a spot still called Kraljeva Polje, the "King's Field." His coffin and skeleton are still displayed in St Luke's Church. The Hungarians, under King Matthias, came to the rescue and reconquered the greater part of Bosnia during the same year; and, although Mahomet returned in 1464, he was again defeated at Jajce, and compelled to flee before another Hungarian advance. In 1467 Hungarian ban, or military governors, were appointed to rule in northwest Bosnia, and in 1472 Matthias appointed Nicolaus Ujliki king of the country, with Jajce for his capital. This kingdom lasted, in fact, for 50 years; but, after the death of Ujliki, in 1492, its rulers only bore the title of ban, and of rejlod. In 1500 the Turks, under Bajazet II., were crushed at Jajce by the Hungarians under John Corvinus; and several other attacks were repelled between 1520 and 1526. But in 1526 the Hungarian power was destroyed at Mohacs; and in 1528 Jajce was forced to surrender.

JÄJPUR, or JAPORE, a town of a British India, in Cuttack district, Bengal, situated on the right bank of the Baitarani river. Pop. (1901), 12,111. It was the capital of Orissa under the Kesar dynasty until the 11th century, when it was superseded by Cuttack. In Jaipur are numerous ruins of temples, sculptures, &c., and a large and beautiful sun pillar.

JAKOB, LUDWIG HEINRICH VON (1759-1827), German economist, was born at Wettin on the 26th of February 1759. In 1777 he entered the university of Halle. In 1780 he was appointed teacher at the gymnasmum, and in 1791 professor of philosophy at the university. The suppression of the university of Halle having been decreed by Napoleon, Jakob betook himself to Russia, where in 1807 he was appointed professor of political economy at Kharkoff, and in 1809 a member of the government commission to inquire into the finances of the empire. In the following year he became president of the commission for the revision of criminal law, and he at the same time obtained an important office in the finance department, with the rank of counsellor of state; but in 1816 he returned to Halle to occupy the chair of political economy. He died at Nauchradt on the 22d of July 1827.

Shortly after his first appointment to a professorship in Halle Jakob had begun to turn his attention rather to the practical than the speculative side of philosophy, and in 1805 he published at Halle Lehrbuch der Nationalökonomie, in which he was the first to
advocate in Germany the necessity of a distinct science dealing specially with the subject of national wealth. His principal other works are Grundrisse der allgemeinen Logik (Halle, 1788); Grundzüge der Polizeigesetzgebung und Polizeiinstandsetzung (Leipzig, 1809); Einleitung in das Studium der Staatswissenschaften (Halle, 1810); Entwurf eines Criminalexeubuchs für das russische Reich (Halle, 1818) and Staatsfinanzwissenschaft (2 vols., Halle, 1821).

JAKOVA (also written DIKOVA, GYAKOVO and GJAKOVA), a town of Albania, European Turkey, in the vilayet of Kossovo; on the river Erenik, a right-hand tributary of the White Drin. Pop. (1905) about 12,000. Jakova is the chief town of the Alpine region which extends from the Montenegrin frontier to the Drin and White Drin. This region has never been thoroughly explored, or brought under effective Turkish rule, on account of the inaccessible character of its mountains and forests, and the lawlessness of its inhabitants—a group of two Roman Catholic and three Moslem tribes, known collectively as the Malisja Jakovs, whose official representative resides in Jakova.

JAKUNS, an aboriginal race of the Malay Peninsula. They have become much mixed with other tribes, and are found throughout the south of the peninsula and along the coasts. The purest types are straight-haired, exhibit marked Mongolian characteristics and are closely related to the Malays. They are probably a branch of the Pre-Malays, the "savage Malays" of A. R. Wallace. They are divided into two groups: (1) Jakuns of the jungle, (2) Jakuns of the sea or Orang Laut. The latter set of tribes now comprise the remnants of the pirates or "sea-gypsies" of the Malacese straits. The Jakuns, who must be studied in conjunction with the other aboriginal peoples of the Malay Peninsula, the Semangs and the Sakais, are not so dwarfish as those. The head is round; the skin varies from olive-brown to dark copper; the face is flat and the lower jaw square. The nose is thick and short, with wide, open nostrils. The cheekbones are high and well marked. The hair has a blue-black tint, eyes are black and the beard is scanty. The Jakuns live a wild forest life, and in general habits much resemble the Sakai, being but little in advance of the latter in social conditions except where they come into close contact with the Malay peoples.

JALALABAD, or JELLALABAD, a town and province of Afghanistan. The town lies at a height of 1950 ft. in a plain on the south side of the Kabul river, 96 m. from Kabul and 76 from Peshawar. Estimated pop., 4000. Between it and Peshawar intervenes the Khyber Pass, and between it and Kabul the passes of Jagdalak, Khurd Kabul, &c. The site was chosen by the emperor Baber, and he laid out some gardens here; but the town itself was built by his grandson Akbar in A.D. 1560. It resembles the city of Kabul on a smaller scale, and has one central bazaar, the streets generally being very narrow. The most notable episode in the history of the place is the famous defence by Sir Robert Sale during the first Afghan war, when he held the town from November 1841 to April 1842. On its evacuation in 1842 General Pollock destroyed the defences, but they were rebuilt in 1858. The town is now fortified, surrounded by a high wall with bastions and loopholes. The province of Jalalabad is about 80 m. in length by 35 in width, and includes the large district of Laghman north of the Kabul river, as well as that on the south called Ningrahar. The climate of Jalalabad is similar to that of Peshawar. As a strategical centre Jalalabad is one of the most important positions in Afghanistan, for it dominates the entrances to the Laghman and the Kunar valleys; commanding routes to Chitral or India north of the Khyber, as well as the Kabul-Peshawar road.

JALAP, a cathartic drug consisting of the tuberous roots of Ipomoea Purga, a convolvulaceous plant growing on the eastern declivities of the Mexican Andes at an elevation of 5000 to 8000 ft. above the level of the sea, more especially about the neighbourhood of Chiconquilo, and near San Salvador on the eastern slope of the Cordre de Perote. Jalap has been known in Europe since the beginning of the 17th century, and derives its name from the city of Jalapa in Mexico, near which it grows, but its botanical source was not accurately determined until 1829, when Dr. J. R. Coox of Philadelphia published a description and coloured figure taken from living plants sent him two years previously from Mexico. The jalap plant has slender herbaceous twining stems, with alternately placed heart-shaped pointed leaves and salver-shaped deep purplish-pink flowers. The underground stems are slender and creeping; their vertical roots clump in a large, solid, and form turnip-shaped tubers. The roots are dug up in Mexico throughout the year, and are suspended to dry in a net over the hearth of the Indians' huts, and hence acquire a smoky odour. The large tubers are often gashed to cause them to dry more quickly. In their form they vary from spindle-shaped to ovoid or globular, and in size from a pigeon's egg to a man's fist. Externally they are brown and marked with small transverse paler scars, and internally they present a dirty white

resinous or starchy fracture. The ordinary drug is distinguished in commerce as Vera Cruz jalap, from the name of the port whence it is shipped.

Jalap has been cultivated for many years in India, chiefly at Ootacamund, and grows there as easily as a yam, often producing clusters of tubers weighing over 0 lb; but these, as they differ in appearance from the commercial article, have not as yet obtained a place in the English market. They are found, however, to be rich in resin, containing 18%. In Jamaica also the plant has been grown, at first amongst the cinchona trees, but more recently in new ground, as it was found to exhaust the soil.

Besides Mexican or Vera Cruz jalap, a drug called Tampico jalap has been imported for some years in considerable quantity. It has a much more shrivelled appearance and paler colour than ordinary jalap, and lacks the small transverse scars present in the true drug. This kind of jalap, the Purga de Sierra Gordas of the Mexicans, was traced by Hanbury to Ipomoea simulata.
It grows in Mexico along the mountain range of the Sierra Gorda in the neighbourhood of San Luis de la Paz, from which district it is carried down to Tampico, whence it is exported. A third variety of jalap known as woody jalap, male jalap, or Orizaba root, or by the Mexicans as Purgo macho, is derived from Ipomoca orizabensis, a plant of Orizaba. The root occurs in fibrous pieces, which are usually rectangular blocks of irregular shape, 2 in. or more in diameter, and are evidently portions of a large root. It is only occasionally met with in commerce.

The dose of jalap is from five to twenty grains, the British Pharmacopoeia directing that it must contain from 9 to 11% of the resin, which is given in doses of two to five grains. One preparation of jalap, however, the Jesuits, and the Jesuits of the College in Maryland, use, which consists of 5 parts of jalap, 9 of cream of tartar, and 1 of ginger. The dose is from 20 grains to a drachm. It is best given in the maximum dose which causes the minimum of irritation.

The chief constituents of jalap resin are two glucosides—convulvin and jalapin—sugar, starch and gum. Convulvin constitutes nearly 20% of the resin. It is insoluble in ether, and is more active than jalapin. It is not used separately in medicine. Jalapin is present in about the same proportions. It dissolves readily in ether, and has a soft resinous consistence. It may be given in half-grain doses. It is the active principle of the allied drug scammony. According to Maass, the formula of convulvin is C_{9}H_{16}O_{4}, and that of jalapin C_{9}H_{4}O_{4}.

Jalap is a typical hydragogue purgative, causing the excretion of much mucus and scum, and a stimulation of the muscular wall of the bowel. For both reasons it is preferable to scammony. It was shown by Professor Rutherford at Edinburgh to be a powerful secretory cholagogue, an action possessed by few other purgatives. The strength of the liver, the liver's function and its various effects depend upon the action of the liver by the intestinal secretion. The drug is largely employed in cases of Bright's disease and dropsy from any cause, being especially useful when the liver shares in the general venous congestion. It is not much used in ordinary constipation.

JALAPA, XALAPA, or HALAPA, a city of the state of Vera Cruz, Mexico, 70 m. by rail N.W. of the port of Vera Cruz. Pop. (1900), 20,388. It is picturesquely situated on the slopes of the sierra which separates the central plateau from the tierra caliente of the Gulf Coast, at an elevation of 4,300 ft., and with the Cofre de Perote behind it rising to a height of 13,419 ft. Its climate is cool and healthy and the town is frequented in the hot season by the wealthier residents of Vera Cruz. The city is well built, in the old Spanish style. Among its public buildings are a fine old church, a Franciscan convent founded by Cortez in 1536, and three hospitals, one of which, that of San Juan de Dios, dates from colonial times. The neighbouring valleys and slopes are fertile, and in the forests of this region is found the plant (jalap), which takes its name from the place. Jalapa was for a time the capital of the state, but its political and commercial importance has declined since the opening of the railway between Vera Cruz and the city of Mexico. It manufactures pottery and leather.

JALUAH, a town and district of British India, in the Allahabad division of the United Provinces. Pop. of town (1901), 3,099. Formerly it was the residence of a Mahattta governor, but never the headquarters of the district, which are at Orai.

The district of Jaluan has an area of 1477 sq. m. It lies entirely within the level plain of Bundelkund, north of the hill country, and is almost surrounded by the Jumna and its tributaries the Betwa and Pahuaj. The central region thus enclosed is a dead level of cultivated land, almost destitute of trees, and sparsely dotted with villages. The southern portion presents almost one unbroken sheet of cultivation. The boundary rivers form the only interesting feature in Jaluan. The river Non flows through the centre of the district, which it drains by its two main branches, leaving several islands in its course. Watering of the land has suffered much from the previous burning up of the wood to the spread of which many villages have been abandoned and their lands thrown out of cultivation. Pop. (1901), 390,726, showing an increase of 17%. The two largest towns are Kunch (15,888), and Kalpi (10,130). The district is traversed by the line of the Indian Midland railway from Jhansi to Cawnpore. A small part of it is watered by the Betwa canal. Grain, oil-seeds, cotton and ghi are exported.

In early times Jaluan seems to have been the home of two Rajput clans, the Chandels and the east and the Kachwahas in the west. The town of Kalpi on the Jumna was conquered for the princes of Ghor as early as 1196. Early in the 14th century the Bundelas occupied the greater part of Jaluan, and even succeeded in holding the fortified post of Kalpi. That important possession was soon recovered by the Mussulmans, and passed under the sway of the Mogul emperors. Akbar's governors at Kalpi maintained a nominal authority over the surrounding district; and the Bundela chiefs were in a state of chronic revolt, which culminated in the war of independence under Chhatar Sal. On the death of his interregnum in 1651, he occupied a large province to the south of the Jumna. Setting out from this province, aided by the Maharrats, he reduced the whole of Bundelkhand. On his death he bequeathed one-third of his dominions to his Maharrat allies, who before long succeeded in annexing the whole of Bundelkhand. Under Maharrat rule the country was a prey to constant anarchy and intestine strife. To this period must be traced the origin of the poverty and desolation which are still conspicuous throughout the district. In 1806 Kalpi was made over to the British, and in 1840, on the death of Nana Golbâd and his possessions, it was purchased. Various interchanges of territory took place, and in 1856 the present boundary was substantially settled. Jaluan had a bad reputation during the Mutiny. When the news of the rising at Cawnpore reached Kalpi, the men of the 53rd native infantry deserted their officers, and in June the Jhansi mutineers reached the district, and began their murder of Europeans. The inhabitants everywhere revelled in the licence of plunder and murder which the Mutiny had spread through all Bundelkhand, and it was not till September 1858 that the rebels were finally defeated.

JALISCO, XALISCO, or GUADALAJARA, a Pacific coast state of Mexico, of very irregular shape, bounded on the N., by the territory of Tepic and the states of Durango, Zacatecas, Aguas Calientes, Guanajuato, Michoacán, and Colima. Pop. (1900), 1,153,891. Area, 31,846 sq. m. Jalisco is traversed from N.N.W. to S.S.E. by the Sierra Madre, locally known as the Sierra de Nayarit and Sierra de Jalisco, which divides the state into a low heavily forested coastal plain and a high plateau region, part of the great Anáhuac table-land, with a high average elevation of about 5000 ft., broken by spurs and flanking ranges of moderate height. The sierra region is largely volcanic and east, its possessors lapsed to them also in the S. Alps, to the average elevation of Colima (12,750 ft.), and the Nevada de Colima (14,362 ft.). The tierra caliente zone of the coast is tropical, humid, and unfavourable to Europeans, while the inland plateaus vary from sub-tropical to temperate and are generally drier and healthful. The greater part of the state is drained by the Rio Grande de Lerma (called the Santiago on its lower course) and its tributaries, chief of which is the Rio Verde. Lakes are numerous; the largest are the Chapala, about 80 m. long by 10 to 35 m. wide, which is considered one of the most beautiful inland sheets of water in Mexico, the Sayula and the Magdalena, noted for their abundance of fish. The agricultural products of Jalisco include Indian corn, wheat and beans on the uplands, and sugar-cane, cotton, rice, indigo and tobacco in the warmer districts. Rubber and palm oil are natural forest products of the coastal zone. Stock-raising is an important occupation in some of the more elevated districts. The mineral resources include silver, gold, cinnabar, copper, bismuth, and various precious stones. There are reduction works of the old-fashioned type and some manufactures, including cotton and woolen goods, pottery, refined sugar and leather. The commercial activities of the state contribute much to its prosperity. There is a large percentage of Indians and mestizos in the population. The capital is Guadalajara, and other important towns with their populations in 1900 (unless otherwise stated) are: Zapotlanejo (20,275), 21 m. E. by N. of Guadalajara; Ciudad Guzmán (17,574 in 1895), 60 m. N.E. of Colima; Lagos (14,716 in 1895), a mining town 100 m. E.N.E. of Guadalajara on the Mexican Central railway; Tamaulipas (8,983 in 1895); Sayula (7,883); Autlán (7,715); Teocaltiche (8,881); Amealca (7,212 in 1895), in a fertile agricultural
region on the western slopes of the sierras; Cocolua (7090 in
1895); and Zacoalco (6516). Jalisco was first invaded by the
Spanish in 1526 and was soon afterwards conquered by
Nuño de Guzman. It once formed part of the reyno of Nueva
Galicia, which also included Aguas Callentes and Zacatecas.
In 1889 its area was again reduced by a subdivision of its coastal
zone, which was set apart as the territory of Tepic.

JALANA—JAMAICA

The District of Jalapa (organized in 1869) occupies an
irregularly shaped tract south of Darjeeling and Bhutan and
north of the state of Kuch Behar. It includes the Western
Dwars, annexed from Bhutan after the war of 1864-1865. Area,
3,962 sq. m. Pop. (1901), 785,380, an increase of 16% in the
decade. The district is divided into a "regulation" tract, lying
towards the south-west, and a strip of country, about 32 m. in
width, running along the foot of the Himalayas, and known as
the Western Dwars. The former is a continuous expanse of
level paddy fields, only broken by groves of bamboo, palms,
and fruit-trees. The frontier towards Bhutan is formed by the
Sinchu mountain range, some peaks of which attain an elevation
of 6000 ft. It is thickly wooded from base to summit. The
principal rivers, proceeding from west to east, are the Mahan-
anda, Karatoya, Tista, Jalghada, Duduya, Mijnal, Tursa,
Kaljani, Raldak, and Sankos. The most important is the
Tista, which forms a valuable means of water communication.
Lime is quarried in the Tista valley. The Dwars or Hills. The
Western Dwars are the principal centre of tea cultivation in
Eastern Bengal.

The other portion of the district produces jute. Jalapa is
traversed by the main line of the Eastern Bengal railway to
Darjeeling. It is also served by the Bengal Dwars railway.

JAMAICA, the largest island in the British West Indies. It
lies about 80 m. S. of the eastern extremity of Cuba, between
17° 43' and 18° 32' N. and 76° 10' and 78° 20' W., is 144 m. long,
50 m. in extreme breadth, and has an area of 4207 sq. m.
The coast-line forms a part of the turtle, the mountain ridges
representing the back. A mountainous backbone runs through the
island from E. to W., throwing off ranges of rocky
ridges, mostly in a north-westerly or south-easterly direction.

In the east this range is more distinctly marked, forming the
Blue Mountains, with cloud-capped peaks and numerous
bifurcating branches. They trend W. by N., and are crossed by
five passes at altitudes varying from 3000 to 4000 ft. They
culminate in Blue Mountain Peak (7360 ft.), after which
the heights gradually decrease until the range is merged into the
hills of the western plateau. Two-thirds of the island are
occupied by this limestone plateau, a region of great beauty
broken by innumerable hills, valleys and sink-holes, and covered
with luxuriant vegetation. The uplands usually terminate in
steep slopes or bluffs, separated from the sea, in most cases, by
a strip of level land. On the south coast, especially, the plains
are often large, the Liguanea plain, on which Kingston stands,
having an area of 200 sq. m. Upwards of a hundred rivers and
streams find their way to the sea, besides the numerous tribu-
taries which issue from every ravine in the mountains. These
streams for the most part are not navigable, and in times of flood
they become devastating torrents. In the parish of Portland,
the Rio Grande receives all the smaller tributaries from the west.
In St Thomas in the east the main range is drained by the
Plantain Garden river, the tributaries of which form deep
ravines and narrow gorges. The valley of the Plantain Garden
expands into a picturesque and fertile plain. The Black river
flows through a level country, and is navigable by small craft
for about 30 m. The Salt river and the Caborita, also in
the south, are navigable by boats. Other rivers of the south are
springs, which are irrigation works for the sugar and fruit
plantations), the Vallals and the Rio Minho; in the north
are the Martha Brae, the White river, the Great Spanish river,
and the Rio Grande. Vestiges of intermittent volcanic action
occur, and there are several medicinal springs. Jamaica has
16 harbours, the chief of which are Port Morant, Kingston, Old
Harbour, Montego Bay, Falmouth, St Ann's Bay, Port Maria
and Port Antonio.

Geology.—The greater part of Jamaica is covered by Tertiary
denudations, but in the Blue Mountain and some of the other ranges the
valley floors are formed by a series of stratified shales and conglomerates,
with tufts and other volcanic rocks and occasional bands of marine limestone.
The limestones contain Upper Cretaceous fossils, and the whole
series has been strongly folded. Upon this foundation rests un-
formably a series of marls and limestones of Eocene and early
Oligocene age. Some of the limestones are made of Foraminifera,
together with Radiolaria, and indicate a subsidence to abyssal depths.
Nevertheless, the higher peaks of the island still remained above
the sea. Towards the middle of the Oligocene period, mountain folding
took place on an extensive scale, and the island was raised far above
its present level and occupied by a series of parallel ranges. There
are the Greater Antilles and perhaps with the mainland also. At the
same time plutonic rocks of various kinds were intruded into the deposits
already formed, and in some cases covered the imported
rocks. During the Miocene and Pliocene periods the island again
sank, but never to the depths which it reached in the Eocene period.
The deposits formed were shallow-water conglomerates, marls and
limestones, with mullusca, brachiopoda, corals, &c. Finally, a
series of successive elevations of small amount, less than 500 ft.
in the aggregate, raised the island to its present level. The terraces
which mark the successive stages in this elevation are well shown in
Montego Bay and elsewhere. The remarkable depressions of the
Cockpit country and the closed basin of the Hector river are similar
in origin to swallow-holes, and were formed by the solution of a
limestone layer resting upon a marine deposit of marls, shales,
sandstones, etc. The faces are of ancient origin, and the basins
are of modern, due probably to the decomposition of the rocks.
There are several of them in the island.

Climate.—The climate is one of the island's chief attractions.
Near the coast it is warm and humid, but that of the uplands is
delightfully mild and equable. At Kingston the temperature
ranges from 70° to 88° F., and this is generally the average
of all the low-lying coast land. At Cinchona, 4907 ft. above
the sea, it varies from 57° to 65°. The vapours from the
rivers and the ocean produce in the upper regions clouds saturated
with moisture which induce vegetation belonging to a colder
climate. During the rainy seasons there is such an accumulation
of these vapours as to cause a general cloudiness and occasional
sudden heavy showers, and sometimes destructive floods. The
rainy seasons, in May and October, last for about three weeks,
although, as a rule no month is quite without rain. The fall
varies greatly; while the annual average for the island is 66-3 in.,
at Kingston it is 52-6 in., at Cinchona 45-5 in., and at some
places in the north-east it exceeds 200 in. The climate of the
Santa Cruz Mountains is extremely favourable to sufferers from
tubercular and rheumatic diseases. Excepting near morasses
and lagoons, the island is very healthy, and yellow fever, once
prevalent, now rarely occurs. In the early part of the 19th
century, hurricanes often devastated Jamaica, but now, though
they pass to the N.E. and S.W. with comparative frequency,
they rarely strike the island itself.

Flora.—The flora is remarkably, showing types from North,
Central, and South America. The island, together with a few
other islands, is the home of the plantain, plants found everywhere in the
tropics. Of flowering plants there are 2180 distinct species, and of ferns 450 species,
several of both being indigenous. The largeness of these numbers
may be due to some extent for its unstable climate, temperature and humidity.
There are many beautiful flowers, such as the aloe, the yucca, the datura the mountain plane, and the Victoria regia; and the cactus tribe well represented in the
sensitive Plant grows in pastures, and orchards in the woods. There are forest
trees fit for every purpose; including the ballata, rosewood, satinwood, mohogany, lignum vitae, many of which are also exported for dyeing. There are also the Jamaica cedar, and the silk cotton tree (Ceiba Bombax). Pimento (peculiar to Jamaica) is indigenous, and furnishes the allspice. The bamboo, coconut, and cocoa are a valuable source of produce. The chinchona, or Peruvian bark, from which cinchona bark is made, is a very annual predominant. English vegetables grow in the hills, and the plains produce plantains, cocoa, yams, cassava, ochoa, bean, pear, giner and arrowroot. Maize and guinea corn are cultivated, and the guinea-grass, accidentally introduced in 1756, is very valuable for horses and cattle,—so much so that pen-keeping or cattle farming is a highly profitable occupation. Among the principal fruits are the orange, lemon, grape, and avocados. The orange, lemon, grape, and avocados. The guava, pineapple, tobacco, grapefruit and mangoes. There is a board of agriculture, with an experimental station at Hope; there is also an agricultural society with 22 branches throughout the colony. Bee-keeping is a growing industry, especially among the peasants. The land as a rule is divided into 100 acres, the largest consisting of five acres and less. The manufactures are few. In addition to the sugar and coffee estates and cigar factories, there are tanneries, distilleries, breweries, electric light and gas works, iron foundries, potteries and factories for the production of coconut nut, essential oils, ice, matches and mineral waters. There is an important establishment at Spanish Town for the production of logwood extract. The exports, more than half of which go to the United States, mostly comprise fruit, sugar and rum. The United States also contributes the majority of the imports. More than half the revenue of the colony is derived from import duties, the remainder is furnished by excise, stamps and licences. With the exception of that of the parish boards, there is no direct taxation.

Communications.—In 1900 an Imperial Direct West India Line of steamers was started by Elder, Dempster & Co., to encourage the fruit trade with England; it had a subsidy of £40,000, contributed jointly by the Imperial and Jamaican governments. Two steamers go round the island once a week, calling at the principal ports, the circuit occupying about 12 hours. A number of sailing o’droghers also ply from port to port. Jamaica has a network of good roads and bridle paths; the main roads, controlled by the public works department, encircle the island, with several branches going to the principal market towns and parish boards. A railway traverses the island from Kingston in the south-east to Montego Bay in the north-west, and branches to Port Antonio and to Ewarton. Jamaica is included in the Postal Union and in the Imperial penny post, and there is a weekly mail service to and from England by the Royal Mail Line, but mails are also carried by other companies. The island is connected by cable with the United States via Cuba, and with Halifax, Nova Scotia via Bermuda.

People.—The population of the island was estimated in 1806 at 806,900. Jamaica is rich in traces of its former Arawak inhabitants. Aboriginal petrofoil and other implements, flattened skulls and vessels are common, and images are sometimes found in the large limestone caverns of the island. The present inhabitants, of whom only 2% are white, include Maroons, the descendants of the slaves of the Spaniards who fled into the interior when the island was captured by the British; descendants of imported African slaves; mixed race of British and African stock, from India and China, and French, and the British officials and white settlers. The Maroons live by themselves and are few in number, while the half-castes enter into trade and sometimes into the professions. The number of white inhabitants other than British is very small. A negro peasant population is encouraged, with a view to being a support to the industries of the island; but, in many cases a field negro will not work for his employer more than four days a week. He may till his own plot of ground on one of the other days or not, as the spirit moves him, but four days’ work a week will keep him easily. He has little or no care for the future. He has pride, is proud of his laziness, and is as proud of it as the other race. Clothes he need hardly buy, fuel he has only for cooking, and food is ready to his hand for the picking. Unfortunately a widespread indulgence in predial larceny is a great hindrance to agriculture as well as to moral progress. But that habits of theft are being inculcated is shown by the steady increase in the accounts in the government savings banks. That gross superstition is still prevalent is shown by the cases of oboosh or witchcraft that come before the courts from time to time. Another indication of the status of the negro may be found in the fact that more than 60% of the births are illegitimate, a percentage that is an unfortunate tendency to increase rather than diminish.

The capital, Kingston, stands on the south-east coast, and near it is the town of Port Royal. Spanish Town (pop. 50,010), the former capital, is in the parish of St Catherine, Middlesex, 111½ m. by rail west of Kingston. Since the removal of the seat of government to Kingston, the town has gradually sunk in importance. In the cathedral many of the governors of the island are buried. A marble statue of Rodney commemorates his victory over the court of De Grasse and Guadeloupe well known. Seven species of fish are caught in the north-west coast, is the second town on the island, and is also a favourite bathing resort. Port Antonio (1784) lies between two secure harbours on the north-east, and owes its prosperity mainly to the development of the trade in fruit, for which it is the capital place of shipment.

Industries.—Agricultural enterprise falls into two classes—planting and pen-keeping, i.e. the breeding of horses, mules, cattle and sheep. The chief products are bananas, oranges, coffee, sugar, rum, logwood, cocoa, pimento, ginger, coco-nuts, limes, nutmegs, pineapples, tobacco, grapefruit and mangoes. There is a board of agriculture, with an experimental station at Hope; there is also an agricultural society with 22 branches throughout the colony. Beekeeping is a growing industry, especially among the peasants. The land as a rule is divided into 100 acres, the largest consisting of five acres and less. The manufactures are few. In addition to the sugar and coffee estates and cigar factories, there are tanneries, distilleries, breweries, electric light and gas works, ironfoundries, potteries and factories for the production of coconut nut, essential oils, ice, matches and mineral waters. There is an important establishment at Spanish Town for the production of logwood extract. The exports, more than half of which go to the United States, mostly comprise fruit, sugar and rum. The United States also contributes the majority of the imports. More than half the revenue of the colony is derived from import duties, the remainder is furnished by excise, stamps and licences. With the exception of that of the parish boards, there is no direct taxation.

Communications.—In 1900 an Imperial Direct West India Line of steamers was started by Elder, Dempster & Co., to encourage the fruit trade with England; it had a subsidy of £40,000, contributed jointly by the Imperial and Jamaican governments. Two steamers go round the island once a week, calling at the principal ports, the circuit occupying about 12 hours. A number of sailing o’droghers also ply from port to port. Jamaica has a network of good roads and bridle paths; the main roads, controlled by the public works department, encircle the island, with several branches going to the principal market towns and parish boards. A railway traverses the island from Kingston in the south-east to Montego Bay in the north-west, and branches to Port Antonio and to Ewarton. Jamaica is included in the Postal Union and in the Imperial penny post, and there is a weekly mail service to and from England by the Royal Mail Line, but mails are also carried by other companies. The island is connected by cable with the United States via Cuba, and with Halifax, Nova Scotia via Bermuda.

There is a government savings bank at Kingston with branches throughout the island, and there are also branches of the Colonial Bank of London and the Bank of Nova Scotia. The coins in circulation are British gold and silver, but not bronze, instead of which nickel is used. United States gold passes as currency. English weights and measures are used.

Administration, &c.—The island is divided into three counties, Surrey in the east, Middlesex in the centre, and Cornwall in the west, and each of these is subdivided into five parishes. The parish is the unit of local government, and has jurisdiction over roads, markets, sanitation, poor relief and waterworks. The management is vested in a parish board, the members of which are elected. The chairman or custos is appointed by the governor. The island is administered by a governor, who bears the old Spanish title of captain-general, assisted by a legislative council of five ex officio members, and a borough council of fifteen members and fourteen members elected on a limited suffrage. There is also a privy council of three ex officio and not more than eight nominated members. There is an Imperial garrison of about 2000 officers and men, with headquarters at Newcastle, consisting of Royal Engineers, Royal Artillery, infantry and four companies of the West India Regiment. There is a naval station at Port Royal, and the entrance to its harbour is strongly fortified. In addition there is a militia of infantry and artillery, about 800 strong.

Previous to 1870 the Church of England was established in Jamaica, but in that year a disestablishment act was passed which provided for gradual disendowment. It is the most numerous body, and is presided over by the bishop of Jamaica, who is also archbishop of the West Indies. The Baptists,
JAMAICA

Wesleys, Presbyterians, Moravians and Roman Catholics are all represented; there is a Jewish synagogue at Kingston, and the Salvation Army has a branch on the island. The Church of England maintains many schools, a theological college, a deaconesses' home and an orphanage. The Baptists have a theological college; and the Roman Catholics support a training college for teachers, two industrial schools and two orphanages. Elementary education is in private hands, but fostered, since 1867, by government grants; it is free but not compulsory, although the governor has the right to compel the attendance of all children from 6 to 14 years of age in such towns and districts as he may designate. This was in force for the untrained part, trained in the government-aided training colleges of the various denominations. For higher education there are the University College and high school at Hope near Kingston, Potsdam School in St Elizabeth, the Mico School and Wolmer's Free School in Kingston, founded (for boys and girls) in 1729, the Montego Bay secondary school, and numerous other endowed and self-supporting establishments. The Cambridge Local Examinations have been held regularly since 1882.

History.—Jamaica was discovered by Columbus on the 3rd of May 1494. Though he called it Sانتiago, it has always been known by its Indian name Jaymaca, "the island of springs," modernized in form and pronunciation into Jamaica. Excepting that in 1505 Columbus once put in for shelter, the island remained unvisited until 1509, when Diego, the discoverer's son, sent Don Juan d'Esquivel to take possession, and thenceforward it passed under Spanish rule. Sant' Iago de la Vega, or Spanish Town, which remained the capital of the island until 1872, was founded in 1532. Sir Anthony Shirley, a British admiral, attacked the island in 1596, and plundered and burned the capital, but did not follow up his victory. Upon his retirement the Spaniards restored their capital and were un molested until 1635, when the island was again raided by the British under Colonel Jackson. The period of the Spanish occupation is mainly memorable for the annihilation of the gentle and peaceful Arawak Indian inhabitants; Don Pedro d'Esquivel was one of their cruellest oppressors. The whole island was divided among eight noble Spanish families, who discouraged immigration to such an extent that when Jamaica was taken by the British the white and slave population together did not exceed 3000. Under the vigorous foreign policy of Cromwell an attempt was made to crush the Spanish power in the West Indies, and an expedition under Admiral Penn and Venables succeeded in capturing and holding Jamaica in 1655. The Spanish were entirely expelled in 1658. Their slaves then took to the mountains, and down to the end of the 18th century the disaffection of these Maroons, as they were called, caused constant trouble. Jamaica continued to be governed by military authority until 1661, when Colonel D'Oyley was appointed captain-general and governor-in-chief with an executive council, and a constitution was introduced resembling that of England. He was succeeded in the next year by Lord Windsor, under whom a legislative council was established. Jamaica soon became the chief resort of pirates, who met in that portion of the island known as Greenwich, a place still uniformly the character of a merchant or planter with that of pirate or privateer. By the Treaty of Madrid, 1670, the British title to the island was recognized, and the buccaneers were suppressed. The Royal African Company was formed in 1672 with a monopoly of the slave trade, and from this time Jamaica was one of the greatest slave marts in the world. The sugar-industry was introduced about this period, the first pot of sugar being sent to London in 1673. An attempt was made in 1678 to saddle the island with a yearly tribute to the Crown and to restrict the free legis- lature. The privileges of the legislative assembly, however, were restored in 1682; but not till 46 years later was the question of revenue settled by a compromise by which Jamaica undertook to settle £80,000 (an amount afterwards commuted to £60,000) per annum on the Crown, provided that English statute laws were made binding in Jamaica.

During these years of political struggle the colony was thrice afflicted by nature. A great earthquake occurred in 1692, when the chief part of the town of Port Royal, built on a shelving bank of sand, slipped into the sea. Two dreadful hurricanes devastated the island in 1712 and 1722, the second of which did so much damage that the seat of commerce had to be transferred from Port Royal to Kingston.

The only prominent event in the history of the island during the later years of the 18th century, was the threatened invasion by the French and Spanish in 1782, but Jamaica was saved by the victory of Rodney and Hood off Dominica. The last attempt at invasion was made in 1806, when the French were defeated by Admiral Duckworth. When the slave trade was abolished the island was at the zenith of its prosperity; sugar, coffee, cocoa, pimento, ginger and indigo were being produced in large quantities, and it was the dépôt of a very lucrative trade with the Spanish main. The anti-slavery agitation in Great Britain found its echo in the island, and in 1832 the negroes revolted, believing that emancipation had been granted. They killed a number of whites and destroyed a large amount of valuable property. Two years later the Emancipation Act was passed, and, subject to a short term of apprenticeship, the slaves were free. Emancipation left the planters in a pitiable condition financially. The British government awarded them compensa- tion at the rate of £10 per slave, the market value of slaves at the time being £35, but most of this compensation went into the hands of the planters' creditors. They were left with overworked estates, a poor market and a scarcity of labour. Nor was this the end of their misfortunes. During the slavery times the British government had protected the planter by imposing a heavy differential duty on foreign sugar; but on the introduc- tion of free trade the price of sugar fell by one-half and reduced the profits of the already impoverished planter. Many estates, already heavily mortgaged, were abandoned, and the trade of the island was at a standstill. Differences between the executive, the legislature, and the home government, as to the means of retrenching the public expenditure, created much bitterness. Although some slight improvement marked the administration of Sir Charles Metcalfe and the earl of Elgin, when coolie immi- gration was introduced to supply the scarcity and irregularity of labour and the railway was opened, the improvement was not permanent. In 1865 Edward John Eyre became governor. Financial affairs were at their lowest ebb and the colonial treasury showed a deficit of £80,000. To meet this difficulty new taxes were imposed and discontent was rife among the negroes. Dr Unthank, the secretary of a Baptist organisation known as the British Union, wrote to the colonial secretary in London, pointing out the state of affairs. This letter became public in Jamaica, and in the opinion of the governor added in no small measure to the popular excitement. On the 11th of October 1865 the negroes rose at Morant Bay and murdered the custos and most of the white inhabitants. The slight encounter which followed filled the island with terror, and there is no doubt that many excesses were committed on both sides. The assembly passed an act by which martial law was proclaimed, and the legislature passed an act abolishing the constitution. The Governor Eyre, though generally approved throughout the West Indies, caused much controversy in Eng- land, and he was recalled. A prosecution was instituted against him, resulting in an elaborate exposition of martial law by Chief Justice Cockburn, but the jury threw out the bill and Eyre was discharged. He was succeeded in the government of Jamaica by Sir Henry Storks, and under the crown colony system of government the state of the island made slow but steady progress. In 1868 the first fruit shipment took place from Port Antonio, the immigration of coolies was revived, and cinchona planting was introduced. The method of government was changed in 1884, when a new constitution, slightly modified in 1895, was granted to the island.

In the afternoon of the 14th of January 1907 a terrible earth- quake visited Kingston. Almost every building in the capital and in Port Royal, and many in St Andrew's, were destroyed or seriously injured. The loss of life was variously estimated, but probably exceeded one thousand. Among those killed was
Sir James Ferguson, 6th baronet (b. 1832). The principal shock was followed by many more of lighter intensity during the ensuing fortnight. On the 17th of January assistance was brought by three American war-ships under Rear-Admiral Davis, who however withdrew them on the 19th, owing to a misunderstanding with the governor of the island, Sir Alexander Swettenham, on the subject of the landing of troops from the vessels with a view to preserving order. The incident caused considerable sensation, and led to Sir A. Swettenham's resignation in the following March, Sir Sydney Olivier, K.C.M.G., being appointed governor. Order was speedily restored but the destructive effect of the earthquake was a severe check to the prosperity of the island.

JAMAICA, formerly a village of Queens county, Long Island, New York, U.S.A., but after the 1st of January 1898 a part of the borough of Queens, New York City. Pop. (1890) 5361. It is served by the Long Island railroad, the lines of which from Brooklyn and Manhattan meet here and then separate to serve the different regions of the island. King's Park is a reservation on the outskirts of Jamaica, most of which was added to the town of Jamaica in 1879, and from whose hills in 1807 the land was purchased by the village trustees. In South Jamaica there is a race track, at which meetings are held in the spring and autumn. The headquarters of the Queens Borough Department of Public Works and Police are in the Jamaica town-hall, and Jamaica is the seat of a city training school for teachers (until 1905 one of the New York state normal schools). For two guns, a coat, and a quantity of powder and lead, several New Yorkers obtained from the Indians a deed for a tract of land here in September 1655. In March 1657 they received permission from Governor Stuyvesant to found a town, which was chartered in 1660 and was named Rustorpe by Stuyvesant, but the English called it Jamaica; it was rechartered in 1666, 1686 and 1788. The village was incorporated in 1814 and reincorporated in 1855. In 1605 it was the seat of justice of the north riding; in 1683-7878 it was the shire town of Queens county. With Hempstead, Gravesend, Newtown and Flushing, also towns of New England origin and type, Jamaica was early disaffected towards the provincial government of New York. In 1669 these towns complained that they had no representation in a popular assembly, and in 1675 a petition against taxation without representation was presented. The founders of Jamaica were mostly Presbyterians, and they organized one of the first Presbyterian churches in America. At the beginning of the War of Independence Jamaica was under the control of Loyalists; after the defeat of the Americans in the battle of Long Island (27th August 1776) it was occupied by the British; and until the end of the war it was the headquarters of General Oliver Dendace, who had command of all Long Island.

JAMB (from Fr. jambe, leg), in architecture, the side-post or line of a door, or other aperture. The jamb of a window outside the frame are called "revels." Small shafts to doors and windows with caps and bases are known as "jambs." When in the inside rails of the jamb of a window they are sometimes called "scoisons."

JAMES (a variant of the name Jacob, Heb. יַעֲקֹב, one who holds by the heel, ouittwer, through O. Fr. James, another form of Jacques, Jacques, from Low Lat. Jacobus; cf. Ital. Jacopo [Jacob], Giacomo [James], Prov. Jaume, Cat. Jaume, Cast. Jaime), a masculine proper name popular in Christian countries as having been that of two of Christ's apostles. It has been borne by many sovereigns and other princes, the most important of whom are noticed below, after the heading devoted to the characters in the New Testament, in the following order: (1) kings of England and Scotland, (2) other kings in the alphabetical order of their countries, (3) the "Old Pretender." The article on the Epistle of James in the New Testament follows after the remaining biographical articles in which James is a surname.

JAMES (Gr. Ἰάκωβος, the Heb. יָאָבֹק or Jacob), the name of several persons mentioned in the New Testament.

1. James, the son of Zebedee. He was among the first who were called to be Christ's immediate followers (Mark i. 19 seq.; Matt. iv. 21 seq., and perhaps Luke v. 10), and afterwards obtained an honoured place in the apostolic band, his name twice occupying the second place after Peter's in the lists (Mark iii. 17; Acts i. 13), while on at least three notable occasions he was, along with Peter and his brother John, specially chosen by Jesus to be with him (Mark v. 37; Matt. xvii. i, xxvi. 37). This same prominence may have contributed partly to the title "Boanerges" or "sons of thunder" which, according to Mark iii. 17, Jesus himself gave to the two brothers. But its most natural interpretation is to be found in the impetuous disposition which would have called down fire from heaven on the offending Samaritan villagers (Luke ix. 34), and afterwards found expression, though in a different way, in the ambitious request to occupy the place of honour in Christ's kingdom (Mark x. 35 seq.). James is included among those who after the ascension waited at Jerusalem (Acts i. 13) for the descent of the Holy Ghost on the day of Pentecost. And though on this occasion only his name is mentioned, he must have been a zealous and prominent member of the Christian community, to judge from the fact that when a victim had to be chosen from among the apostles, who should be sacrificed to the animosity of the Jews, it was on James that the blow fell first. The brief notice is given in Acts xii. 1, 2. Puseuhiu (Hist. Eccl. ii. 9) has preserved for us from Clement of Alexandria the additional information that the accusation of the apostle "beholding his confession and moved thereby, confessed that he too was a Christian. So they were both led away to execution together; and on the road the accuser asked James for forgiveness. Gazing on him for a little while, he said, 'Peace be with thee,' and kissed him. And then both were beheaded together."

The latter, and wholly untrustworthy, legends which tell of the apostle's preaching in Spain, and of the translation of his body to Sardinia, or to the Compostella, are to be found in the Acts Sancnonum (July 25), vi. 1-124; see also Mrs Jameson's Sacred and Legendary Art, i. 230-241.

2. James, the son of Alpheus. He was also one of the apostles, and is mentioned in all the four lists (Matt. x. 3; Mark ii. 18; Luke vi. 15; Acts i. 23) by this name. We know nothing further regarding him, unless we believe him to be the same as James "the little."

3. James, the little. He is described as the son of a Mary (Matt. xxvii. 56; Mark xv. 40), who was in all probability the wife of Clopas (John xix. 25). And on the ground that Clopas is another form of the name Alpheus, this James has been described by some to be the same as 2. But the evidence of the Syriac versions, which render Alpheus by Chalaphai, while Clopas is simply transliterated Kieopha, makes it extremely improbable that the two names are to be identified. And as we have no better ground for finding in Clopas the Clopas of Luke xxiv. 18, we must be content to admit that James the little is again an almost wholly unknown personality, and has no connexion with any of the other Jameses mentioned in the New Testament.

4. James, the father of Judas. There can be no doubt that in the mention of "Judas of James" in Luke vi. 16 the ellipsis should be supplied by "the son" and not as in the A.V. by "the brother" (cf. Luke iii. 1; iv. 14; Acts xii. 2), and the word
JAMES I.

James I. (1556–1625), king of Great Britain and Ireland, formerly king of Scotland as James VI., was the only child of Mary Queen of Scots, and her second husband, Henry Stewart Lord Darnley. He was born in the castle of Edinburgh on the 19th of June 1556, and was proclaimed king of Scotland on the 24th of July 1567, upon the forced abdication of his mother. Until 1578 he was treated as being incapable of taking any real part in public affairs, and was kept in the castle of Stirling for safety, while amid the confused fighting of the early years of his minority.

The young king was a very weak boy. It is said that he could not stand without support until he was seven, and although he lived until he was nearly sixty, he was never a strong man. In after life he was a constant and even a reckless rider, but the weakness in his legs was never quite cured. During a great part of his life he found it necessary to be tied to the saddle. When on one occasion in 1611 his horse threw him into the New River near his palace of Theobalds in the neighbourhood of London, he had a very narrow escape of being drowned; yet he continued to ride regularly. At all times he preferred to lean on the shoulder of an attendant when walking. This feebleness of body, which had no doubt a large share in causing certain corresponding deficiencies of character, was attributed to the agitations and the violent efforts forced on his mother by the murder of her secretary Rizzio when she was in the sixth month of her pregnancy. The fact that James was a bold rider, in spite of this serious disqualification for athletic exercise, should be borne in mind when he is accused of having been a coward.

The circumstances surrounding him in boyhood were not favourable to the development of his character. His immediate guardian or foster-father, the earl of Mar, was indeed an honourable man, and the counts, who had charge of the nursing of the king, discharged her duty so as to win his last confidence. James afterwards entrusted her with the care of his eldest son, Henry. When the earl died in 1572 his place was well filled by his brother, Sir Alexander Erskine. The king’s education was placed under the care of George Buchanan, assisted by Peter Young, and two other tutors. Buchanan, who did not spare the rod, and the other teachers, who had more reverence for the royal person, gave the boy a sound training in languages. The English envoy, Sir Henry Killigrew, who saw him in 1574, testified to his proficiency in translating from and into Latin and French. As it was very desirable that he should be trained a Protestant king, he was well instructed in theology. The exceptionally scholastic quality of his education helped to give him a taste for learning, but also tended to make him a pedant.

James was only twelve when the earl of Morton was driven from the regency, and for some time after he can have been no more than a puppet in the hands of intriguers and party leaders. When, for instance, in 1582 he was seized by the faction of nobles who carried out the so-called raid of Ruthven, which was in fact a kidnapping enterprise carried out in the interest of the Protestant party, he cried like a child. One of the conspirators, the master of Glamis, Sir Thomas Lyon, told him that it was better “bairns should greet [children should cry] than bearded men.” It was not indeed till 1583, when he broke away from his captors, that James began to govern in reality.

For the history of his reign reference may be made to the articles on the histories of England and Scotland. James’s work as a ruler can be divided, without violating any sound rule of criticism, into black and white—into the part which was a failure and a preparation for future disasters, and the part which was solid achievement, honourable to himself and profitable to his people. His native kingdom of Scotland had the benefit of the second. Between 1583 and 1603 he reduced the anarchical baronage of Scotland to obedience, and replaced the subdivision of sovereignty and consequent confusion, which had been the very essence of feudalism, by a strong centralized royal authority. In fact he did in Scotland the work which had been done by the Tudors in England, by Louis XI. in France, and by Ferdinand and Isabella in Spain. It was the work of all the strong rulers of the Renaissance. But James not only...
brought his disobedient and intriguing barons to order—that was a comparatively easy achievement and might well have been performed by more than one of his predecessors, had their lives been prolonged—he also quelled the attempts of the Protestants to found what H. H. has well described as a "Presbyterian Hildebrandism." He enforced the superiority of the state over the church. Both before his accession to the throne of England (1603) and afterwards he took an intelligent interest in the prosperity of his Scottish kingdom, and did much for the pacification of the Hebrides, for the enforcement of order on the Borders, and for the development of industry. That he did so much although the crown was poor (largely it must be confessed because he made profuse gifts of the secularized church lands), and although the armed force at his disposal was so small that to the very end he was exposed to the attacks of would-be kidnappers (as in the case of the Gowen conspiracy of 1600), is proof positive that he was neither the mere politico nor the mere learned fool he has often been called.

James's methods of achieving ends in themselves honourable and profitable were indeed of a kind which has made posterity unjust to his real merits. The circumstances in which he passed his youth developed in him a natural tendency to craft. He boasted indeed of his "king-craft" and probably believed that he owed it to his studies. But it was in reality the resource of the weak, the art of playing off one possible enemy against another and thus avoiding conflict, and so directing fortune in the way he desired. The Marquis de Fontenay, the French ambassador, who saw him in the early years of his reign, speaks of him as cowed by the violence about him. It is certain that James was most unscrupulous in making promises which he never meant to keep, and the terror in which he passed his youth sufficiently explains his preference for guile. He would make promises to everybody, as when he wrote to the pope in 1584 more than hinting that he would be a good Roman Catholic if helped in his need. His very natural desire to escape from the poverty and insecurity of Scotland to the opulent English throne not only kept him busy in intrigues to placate the Roman Catholics or any party who could help or hinder him, but led him to behave basely in regard to the execution of his mother in 1587. He blustered to give himself an air of courage, but took good care to do nothing to offend Elizabeth. When the time came for fulfilling his promises and half-promises, he was not able, even if he had been willing, to keep his word to everybody. The methods which had helped him to success in Scotland did him harm in England, where his reign prepared the way for the great civil war. In his southern kingdom his failure was in fact complete. Although England accepted him as the alternative to civil war, and although no one else could help or hinder him, but led him to behave basely, he did not win the respect of his English subjects. His undignified personal appearance was against him, and so were his garrulity, his Scottish accent, his slovenliness and his toleration of disorders in his court, but, above all, his favour for handsome male favourites, whom he loaded with gifts and caressed with demonstrations of affection which laid him open to vile suspicions. In ecclesiastical matters he offended many, who contrasted his severity and rudeness to the Puritan divines at the Hampton court conference (1604) with his politeness to the Roman Catholics, whom he, however, worried by fits and starts. In the north the work of the is firmly established and the problem was how to keep it from degenerating into the mere instrument of a king's passions, his insistence on the doctrine of divine right aroused distrust and hostility. In itself, and in its origin, the doctrine was nothing more than a necessary assertion of the independence of the state in face of the "Hildebrandism" of Rome and Geneva alike. But when Englishmen were told that the king alone had indefeasible rights, and that all the privileges of subjects were revocable gifts, they were roused to hostility. His weaknesses cast suspicion on his bent and schemes. His favour for his countrymen helped to defeat his wise wish to bring about a full union between England and Scotland. His profusion, which had been bad in the poverty of Scotland and was boundless amid the wealth of England, kept him necessitous, and drove him to shifts. Posterity can give him credit for his desire to forward religious peace in Europe, but his Protestant subjects were simply frightened when he sought a matrimonial alliance with Spain. Sagacious men among his contemporaries could not see the inconsistency of a king who married his daughter Elizabeth to the elector palatine, a leader of the German Protestants, and also sought to marry his son to an infant of Spain. The king's subservience to Spain was indeed almost besotted. He could not see her real weakness, and he allowed himself to be befuddled by the ministers of Philip III. and Philip IV. The end of his scheming was that he was dragged into a needless war with Spain by his son Charles and his favourite George Villiers, duke of Buckingham, just before his death on the 5th of March 1625 at his favourite residence, Theobalds.

James married in 1589 Anne, second daughter of Frederick II., king of Denmark. His voyage to meet his bride, whose ship had been driven into a Norwegian port by bad weather, is only episode of a romantic character in the life of this very prosaic member of a poetic family. By this wife James had three children who survived infancy: Henry Frederick, prince of Wales, who died in 1612; Charles, the future king; and Elizabeth, wife of the elector palatine, Frederick V.

Not the least of James's many ambitions was the desire to excel as an author. He left a body of writings which, though of mediocre quality as literature, entitle him to a unique place among English kings since Alfred for width of intellectual interests and literary activity. His efforts were inspired by his preceptor George Buchanan, whose memory he cherished his later years. His first work was in verse, Essays of a Prentise in the Divine Art of Poesie (Edin. Vautrollier, 1584), containing fifteen sonnets, "Ae Metaphorick invention of a tragic and called Phoenix," a short poem "Of Time," translations from Du Bartas, Lucan and the Book of Psalms ("out of Torellus"), and a prose tract entitled "Ae short treatise, containing some Reulls and Cautels to be observd and eschewd in Scots Poesie."

The volume is introduced by commendatory sonnets, including one by Alexander Montgomerie. The chief interest of the book lies in the "Treatise" and the prefatory sonnets: "To the Reader" and "Sonnet decyphering the perfyte poete." There is little originality in this youthful production. It has been surmised that it was compiled from the exercises written when the author was Buchanan's pupil at Stirling, and that it was directly suggested by his preceptor's De Prosodia and his annotations on Vives. On the other hand, it shows intimate acquaintance with the critical reflections of Ronsard and Du Bellay, and of Gascoigne in his Nues of Instruction (1575). In 1591 James published a number of Exercices at Vacant Hours, including a translation of the Furies of Voltaire, a work of the elder Platonist, and Du Bartas's version of it, La Lepanto. His Doenomologie, a prose work denouncing witchcraft and exhorting the civil power to the strongest measures of suppression, appeared in 1599. In the same year he printed the first edition (seven copies) of his Basilikon Doron, strongly Protestant in tone. A French edition, especially translated for presentation to the pope, has a disingenuous preface explaining that certain phrases (e.g. "papistical doctrine") are omitted, because of the difficulty of rendering them in a foreign tongue. The original edition was, however, true by Alexander Montgomerie's pope, and was immediately placed on the Index. Shortly after going to England James produced his famous Counterblast to Tobacco (London, 1604), in which he forsakes his Scots tongue for Southern English.

The volume was published anonymously. James's prose works (including his speeches) were collected and edited (folio, 1616) by James Montagu, bishop of Winchester, and were translated into Latin by the same hand in a companion folio, in 1619 (also Frankfort, 1689). A tract, entitled "The True Law of Free Monarchies," appeared in 1603; "An Apology for the Oath of Allegiance" in 1607; and a "Déclaration du Roy Jacques I. pour le droit des Rois" in 1615. In 1588 and 1589 James issued two small volumes of Meditations on some verses of (a) Revelations and (b) 1 Chronicles. Other two "meditations" were printed posthumously.

For James's literary work, see Edward Arber's reprint of the Essays and Counterblaste ("English Reprints," 1869, &c.): R. S. Rait's Lusitana Regius (1900): G. Gregory-Smith's Elizabethan Critical Essays (1904), vol. i., where the Treatise is edited for the first time:

James II. (1633-1701), king of Great Britain and Ireland, second surviving son of Charles I. and Henrietta Maria, was born at St James's on the 15th of October 1633, and created duke of York in January 1643. During the Civil War James was taken prisoner by Fairfax (1646), but contrived to escape to Holland in 1648. Subsequently he served in the French army under Catholics, and held offices. In consequence of this James was appointed by both commanders for his brilliant personal courage. Returning to England with Charles II. in 1660 he was appointed lord high admiral and warden of the Cinque Ports. Pepys, who was secretary to the navy, has recorded the patient industry and unflinching probity of his naval administration. His victory over the Dutch in 1665, and his drawn battle with De Ruyter in 1672, show that he was a good naval commander as well as an excellent administrator. These achievements won him a reputation for high courage, which, until the close of 1688, was amply deserved. His private record was not so creditable as his public. In December 1672 he was admitted to having contracted, under discreditabe circumstances, a secret marriage with Anne Hyde (1633-1671), daughter of Lord Clarendon, in the September of the same year. Both before and after the marriage he seems to have been a libertine unblushing though not so fastidiously as Charles himself. In 1672 he made a public avowal of his conversion to Roman Catholicism. Charles II. had opposed this project, but in 1673 allowed him to marry the Catholic Mary of Modena as his second wife. Both houses of parliament, who viewed this union with abhorrence, now passed the Test Act, forbidding Catholics to hold offices. In consequence of this James was forced to resign his posts. It was in vain that he married his daughter Mary to the Protestant prince of Orange in 1677. Anti-Catholic feeling ran so high that, after the discovery of the Popish Plot, he found it wiser to retire to Brussels (1679), while Shaftesbury and the Whigs planned to exclude him from the succession. He was lord high commissioner of Scotland (1680-1682), where he occupied himself in a severe persecution of the Covenanters. In 1684 Charles, having triumphed over the Exclusionists, restored James to the office of high admiral by use of his dispensing power.

James ascended the throne on the 16th of February 1685. The nation showed its loyalty by its firm adherence to him during the rebellions of Argyll in Scotland and Monmouth in England (1685). The savage reprisals on their suppression, in especial the "Bloody Assizes" of Jeffreys, produced a revulsion of public feeling. James had promised to defend the existing Church and government, but the people now became suspicious. James was not a mere tyrant and bigot, as the popular imagination speedily assumed to be him. He was rather a mediocre but not altogether obtuse man, who mistook tributary streams for the main current of religious thought. Thus he greatly underestimated the strength of the Establishment, and postproporosely exaggerated that of Dissent and Catholicism. He perceived that opinion was seriously divided in the Established Church, and thought that a vigorous policy would soon prove effective. Hence he publicly celebrated Mass, prohibited preaching against Catholicism, and showed exceptional favour to renegades from the Establishment. By undue pressure he secured a decision of the judges, in the test case of Godden v. Hale (1687), by which he was allowed to dispense Catholics from the Test Act. Catholics were now admitted to the chief offices in the army and to some important posts in the state, in virtue of the dispensing power of James. The judges had been intimidated or corrupted, and the royal promise to protect the Establishment violated. The army had been increased to 20,000 men and encamped at Hounslo Heath to overawe the capital. Public alarm was speedily manifested and suspicion to a high degree awakened. In 1687 James made a bid for the support of the Dissenters by advocating a system of joint toleration for Catholics and Dissenters. In April 1687 he published his Declaration of Indulgence—excluding Catholics and Dissenters from penal statutes. He followed up this measure by dissolving parliament and attacking the universities. By an unconscionable use of the dispensing power he introduced Dissenters and Catholics into all departments of state and into the municipal corporations, which were remodelled in their interests. Then in April 1688 he took the suicidal step of issuing a proclamation to force the clergy and bishops to read the Declaration in their pulpits, and thus personally advocate a measure they detested. Seven bishops refused, were indicted by James for libel, but acquitted amid the indescribable enthusiasm of the populace. Protestant norths of England, enraged at the tolerant policy of James, had been in negotiation with William of Orange since 1687. The trial of the seven bishops, and the birth of a son to James, now induced them to send William a definite invitation (June 30, 1688). James remained in a fool's paradise till the last, and only awakened to his danger when William landed at Torbay (November 5, 1688) and swept all before him. James pretended to treat, and in the midst of the negotiations fled to France. He was intercepted at Faversham and brought back, but the politic prince of Orange allowed him to escape a second time.

At the end of 1688 James seemed to have lost his old courage. After his defeat at the Boyne (July 1, 1690) he speedily departed from Ireland, where he had so conducted himself that his English followers had been ashamed of his incapacity, while French officers had derided him. His proclamations and policy towards England during these years show unmistakable traces of the same incompetence. On the 17th of May 1692 he saw the French fleet destroyed before his very eyes off Cape La Hogue. He was aware of, though not an open advocate of the "Assassination Plot," which was directed against William. By its revelation and failure (February 10, 1696) the third and last serious attempt of James for his restoration failed. He refused in the same year to accept the French influence in favour of his candidacy to the Polish throne, on the ground that it would exclude him from the English. Henceforward he neglected politics, and Louis of France ceased to consider him as a political factor. A mysterious conversion had been effected in him by an austere Cistercian abbot. The world saw with astonishment this vicious, rough, coarse-fibred man of the world transformed into an austere penitent, who worked miracles of healing. Surrounded by this odour of sanctity, which greatly edified the faithful, James lived at St Germain until his death on the 17th of September 1701. The political ineptitude of James is clear; he often showed firmness when conciliation was needful, and weakness when resolution alone could have saved the day. Moreover, though he mishandled almost every political problem with which he personally dealt, he was singularly tactless and impatient of advice. But in general political morality he was not below his age, and in his advocacy of toleration decidedly above it. He was more honest and sincere than Charles II., more genuinely patriotic in his foreign policy, and more consistent in his religious sympathies than the prodigal prince who retained the throne while James lost it. It is an ironical demonstration that a more pitiless fate awaits the ruler whose faults are of the intellect, than one whose faults are of the heart.

By Anne Hyde James had eight children, of whom two only, Mary and Anne, both queens of England, survived their father. By Mary of Modena he had seven children, among them being James Francis Edward (the Old Pretender) and Louisa Maria Theresa, who died at St Germain in 1712. By one mistress, Arabella Churchill (1648-1730), he had two sons, James, duke of Berwick, and Henry (1673-1702), titular duke of Albany and...
grand prior of France, and a daughter, Henrietta (1667–1730), who married Sir Henry Waldegrave, afterwards Baron Waldegrave (1649–1708), and by another, Catherine (d. 1743), who married James Anniesly, 5th earl of Anglesey, and afterwards John Sheffield, duke of Buckingham and Normandy.

**JAMES I.** (1394–1437), king of Scotland and poet, the son of King Robert III., was born at Dunfermline in July 1394. After the death of his mother, Annabella Drummond of Stobhall, in 1402, he was placed under the care of Henry Wardlaw (d. 1440), who became bishop of St. Andrews, and was brought up in France. Robert doubtless decided upon this course owing to the fact that in 1402 his elder son, David, duke of Rothesay, had met his death in a mysterious fashion, being probably murdered by his uncle, Robert, duke of Albany, who, as the king was an invalid, was virtually the ruler of Scotland. On the way to France, however, James fell into the hands of some English sailors and was sent to Henry IV., who refused to admit him to ransom. The chronicler Thomas Walsingham, says that James’s imprisonment began in 1406, while the future king himself places it in 1404; February 1406 is probably the correct date. On the death of Robert III., the brothers became nominally king of Scotland, but he remained a captive in England, the government being conducted by his uncle, Robert of Albany, who showed no anxiety to procure his nephew’s release. Dying in 1420, Albany was succeeded as regent by his son, Murdoch. At first James was confined in the Tower of London, but in June 1407 he was removed to the castle at Nottingham, whence about a month later he was taken to Evesham. His education was continued by capable tutors, and he not only attained excellence in all manly sports, but became perhaps more cultivated than any other prince of his age. In person he was of medium stature, with a body very strong. His agility was not less remarkable than his strength; he excelled in all athletic feats which demanded suppleness of limb and quickness of eye. As regards his intellectual attainments he is reported to have been acquainted with philosophy, and it is evident from his subsequent career that he had studied jurisprudence; moreover, besides being proficient in vocal and instrumental music, he cultivated the art of poetry with much success. When Henry V. became king in March 1413, James was again imprisoned in the Tower of London, but soon after wards he was taken to Windsor and was treated with great consideration by the English king. In 1420, with the intention of detaching the Scottish auxiliaries from the French standard, he was sent to take part in Henry’s campaign in France; this move failed in its immediate object and he returned to England after Henry’s death in 1422. About this time negotiations for the release of James were begun in earnest, and in September 1423 a treaty was signed at York, the Scottish nation undertaking to pay a ransom of 60,000 marks "for his maintenance in England.... By the terms of the treaty James was to wed a noble English lady, and on the 12th of February 1424 he was married at Southwark to Jane, daughter of John Beaufort, earl of Somerset, a lady to whom he was faithful throughout life. Ten thousand marks of his ransom were remitted as Jane’s dowry, and in April 1424 James and his bride entered Scotland.

With the reign of James I., whose coronation took place at Scone on the 21st of May 1424, constitutional sovereignty may be said to begin in Scotland. By the introduction of a system of statute law, modelled to some extent on that of England, and by the additional importance assigned to parliament, the leaven was prepared which was to work towards the destruction of the indefinite authority of the king and of the unbridled licence of the nobles. During the parliament held at Perth in March 1425 James arrested Murdoch, duke of Albany, and his son, Alexander; together with Albany’s eldest son, Walter, and Duncan, earl of Lennox, who had been seized previously; they were sentenced to death, and the four were executed at Stirling. In a parliament held at Inverness in 1427 the king arrested many turbulent northern chiefs, and his whole policy was directed towards crushing the power of the nobles. In this he was very successful. Expeditions reduced the Highlands to order; earlier in 1425 he was fertilized; but this evasion aroused the desire for revenge, and at length cost James his life. Having been warned that he would never again cross the Forth, the king went to reside in Perth just before Christmas 1436. Among those whom he had angered was Sir Robert Graham (d. 1437), who had been banished by his orders. Instigated by the king’s uncle, Walter Stewart, earl of Atholl (d. 1437), and aided by the royal chamberlain, Sir Robert Stewart, and by a band of Highlanders, Graham burst into the presence of James on the night of the 20th of February 1437 and stabbed the king to death. Graham and the other conspirators were afterwards tortured and executed. James had two sons: Alexander, who died young, and James II., who succeeded to the throne; and six daughters, among them being Margaret, the queen of Louis XI. of France. His widow, Jane, married Sir James Stewart, the “black knight of Lorne,” and died on the 15th of July 1445.

During the latter part of James’s reign difficulties arose between Scotland and England and also between Scotland and the papacy. Part of the king’s ransom was still owing to England; other causes of discord between the two nations existed, and in 1436 these culminated in a short war. In ecclesiastical matters he desired to reform the Scottish Church and to make it less dependent on Rome brought him into collision with Popes Martin V. and Eugenius IV. James was the author of two poems, the *Kingis Quair* and *Good Counsel* (a short piece of three stanzas). The *Song of Absence*, *Pebils to the Play* and *Christis Kirk* on the Greene has been ascribed to him without evidence. *The Kingis Quair* (preserved in the Selden MS. B. 24 in the Bodleian) is an allegorical poem of the *cours d’amour* type, written in seven-lined Chaucerian stanzas and extended in 1379 lines. In ecclesiastical matters he desired to reform the Scottish Church and to make it less dependent on Rome brought him into collision with Popes Martin V. and Eugenius IV. The contemporary authorities for the reign of James I. are Andrew of Wyntoun, *The Ormygynale Cronykil of Scotland*, edited by D. Laing (Edinburgh, 1872–1879); and Walter Bower’s continuation of John of Fordun’s *Scotichronicon*, edited by T. Hearne (Oxford, 1722). See also J. Pinkerton, *History of Scotland* (1797); A. Lang, *History of Scotland*, vol. i. (1900); and G. Burnett, *Introduc- tions to the Escheaters Rolls of Scotland* (Edinburgh, 1878–1901). The *Kingis Quair* was first printed in the *Poetical Remains of James the First*, edited by William Tyler (1783). Later editions are Morison’s *Regent Berth* (1786); J. Shiel’s, in his *Chronicle of Scottish Poetry* (1802, vol. i.); Thomson’s in 1815 and 1824; G. Chalmers’, in his *Poetic Remains of some of the Scottish Kings* (1824); Rogers’s *Poetical Remains of King James the First* (1873); Skene’s edition published by the Scottish Text Society (1884). An attempt has been made to dispute James’s authorship of the poem, but the arguments elaborated by J. T. T. Brown (The *Authorship of the Kingis Quair*, Glasgow, 1886) have been cordially received by James L. and others. *1er d’Ecosse*: il y a été publié *Sur l’autenticité du cahier du roi* (Paris, 1897, reprinted from the *Revue historique*, vol. lxxvii.). See also the full correspondence in the *Athenaeum* (July-Aug. 1896 and Dec. 1896); W. Corrie, *Poets and Poems of 14th Century Scotland* (1908), pp. 152 &c., 255 &c.; and Gregory Smith, *Transition Period* (1900), pp. 40, 41.

**JAMES II.** (1430–1460), king of Scotland, the only surviving son of James I. and his wife, Jane, daughter of John Beaufort, earl of Somerset, was born on the 16th of October 1430.
James III.—IV. OF SCOTLAND

king at Holyrood in March 1437, shortly after the murder of his father, he was at first under the guardianship of his mother, while Archibald, 5th earl of Douglas, was regent of the kingdom, and considerable power was possessed by Sir Alexander Livingstone and Sir William Crichton (d. 1454). When about 1439 Queen Jane was married to Sir James Stewart, the knight of Lorne, Livingstone obtained the custody of the young king, whose minority was marked by fierce hostilities between the Douglases and the Crichtons, with Livingstone first on one side and then on the other. About 1443 the royal cause was espoused by William, 8th earl of Douglas, who attacked Crichton in the king's name, and civil war lasted until about 1446. In July 1449 James was married to Mary (d. 1453), daughter of Arnold, duke of Gelderland, and undertook the government himself; and almost immediately Livingstone was arrested, but Douglas retained the royal favour for a few months more. In 1452, however, this powerful earl was invited to Stirling by the king, and, charged with treachery, was stabbed by James and then killed by the attendants. Civil war broke out at once between James and the Douglases, whose lands were ravaged; but after the Scots parliament had exonerated the king, James, the new earl of Douglas, made his submission. Early in 1455 this struggle was renewed. Marching against the rebels James gained several victories, after which Douglas was attainted and his lands forfeited. Fortified by this success and assured of the support of the parliament and of the great nobles, James, acting as an absolute king, could view without alarm the war which had broken out with England. Of the twelve rebellions with which he was in trouble made in July 1457, and the king employed the period of peace in strengthening his authority in the Highlands. During the Wars of the Roses he showed his sympathy with the Lancastrian party after the defeat of Henry VI. at Northampton by attacking the English possessions to the south of Scotland. It was while conducting the siege of Roxburgh Castle that James was killed, through the bursting of a cannon, on the 3rd of August 1460. He left three sons, his successor, James III., Alexander Stewart, duke of Albany, and John Stewart, earl of Mar (d. 1479); and two daughters. James, who is sometimes called "Fairy Face," was a vigorous and popular prince, and, although not a scholar like his father, showed interest in education. His reign is a period of some importance in the legislative history of Scotland, as measures were passed with regard to the tenure of land, the reformation of the coinage, and the protection of the poor, while the organization for the administration of justice was greatly improved.

James III. (1451-1488), king of Scotland, eldest son of James II., was born on the 10th of July 1451. Becoming king in 1460 he was crowned at Kelso. After the death of his mother in 1463, and of her principal supporter, James Kennedy, bishop of St. Andrews, two years later, the person of the young Prince and with it the chief authority in the kingdom, were seized by Sir Alexander Boyd and his brother Lord Boyd, while the latter's son, Thomas, was created earl of Arran and married to the king's sister, Mary. In July 1469 James himself was married to Margaret (d. 1486), daughter of Christian I., king of Denmark and Norway, but before the wedding the Boys had lost their power. Having undertaken the government in person, the king received the submission of the powerful earl of Ross, and strengthened his authority in other ways. But his preference for a sedentary and not for an active life, and his increased attachment to fashion of a humble birth diminished his popularity, and he had some differences with his parliament. About 1479, probably with reason both suspicious and jealous, James arrested his brothers, Alexander, duke of Albany, and John, earl of Mar; Mar met his death in a mysterious fashion at Craigmillar, but Albany escaped to France and then visited England, where in 1482 Edward IV. recognized him as king of Scotland by the gift of the king of England. War broke out with England, but James, made a prisoner by his nobles, was unable to prevent Albany and his ally, Richard, duke of Gloucester (afterwards Richard III.), from taking Berwick and marching to Edinburgh. Peace with Albany followed, but soon afterwards the duke was again in communication with Edward, and was condemned by the parliament after the death of the English king in April 1483. Albany's death in France in 1485 did not end the king's troubles. His policy of living at peace with England and of arranging marriages between the members of the royal families of the two countries did not commend itself to the turbulent section of his nobles; his artistic tastes and lavish expenditure added to the discontent, and a rebellion broke out. Fleeing into the north of his kingdom James collected an army and came to terms with his foes; but the rebels, having seized the person of the king's eldest son, afterwards James IV., renewed the struggle. The rival armies met at the Sauchieburn near Bannockburn, and James soon fled. Reaching Beaton's Mill he revealed his identity, and, according to the popular story, was killed on the 11th of June 1488 by a soldier in the guise of a priest who had been called in to shrive him. He left three sons—his successor, James IV.; James Stewart, duke of Ross, afterwards archbishop of St. Andrews; and John Stewart, earl of Mar. James was a cultured prince with a taste for music and architecture, but was a weak and inept king. His character is thus described by a chronicler: "He was one man that loved solitude, and desired nevir to hear of warre, but delighted more in musick and policie and building nor he did in the government of the realme."

James IV. (1473-1513), king of Scotland, eldest son of James III., was born on the 17th of March 1473. He was nominally the leader of the rebels who defeated the troops of James III. at the Sauchieburn in June 1488, and became king when his father was killed. In 1490 a rebellion was put down by the king, and, with his minority, he was herself; and, moreover, showed great affability towards the lower class of his subjects, among whom he delighted to wander incognito, few if any of the kings of Scotland have won such general popularity, or passed a reign so untroubled by intestine strife. Crowned at Scone a few days after his accession, James began at once to take an active part in the business of government. A slight insurrection was easily suppressed, and a plot formed by some nobles to hand him over to the English king, Henry VII., came to nothing. In spite of this proceeding Henry wished to live at peace with his northern neighbour, and soon contemplated marrying his daughter to James, but the Scottish king was not equally peaceable. When, in 1495, Perkin Warbeck, pretending to be the duke of York, Edward IV.'s younger son, came to Scotland, James bestowed upon him both an income and a bride, and prepared to invade England in his interests. For various reasons the war was confined to a few border forays. After Warbeck left Scotland in 1497, the Spanish ambassador negotiated a peace, and in 1502 a marriage was definitely arranged between James and Henry's daughter Margaret (1489-1541). The wedding took place at Holyrood in August 1503, and it was this union which, from the accession of the Stewart dynasty to the English throne.

About the same time James crushed a rebellion in the western Isles, into which he had previously led expeditions, and parliament took measures to strengthen the royal authority therein. At this date too, or a little earlier, the king of Scotland began to treat as an equal with the powerful princes of Europe, Maximilian I., Louis XII. and others; sending assistance to his uncle Hans, king of Denmark, and receiving special marks of favour from Pope Julius II., anxious to obtain his support. But his position was weakened when Henry VIII. followed Henry VII. on the English throne in 1509. Causes of quarrel already existed, and other causes, both public and private, soon arose between the two kings; sea-fights took place between their ships, while war was brought nearer by the treaty of alliance which James concluded with Louis XII. in 1512. Henry made a vain effort to prevent, or to postpone, the outbreak of hostilities; but urged on by his French ally and his queen, James declared for war, in spite of the counsels of some of his advisers, and (it is said) of the warning of an apparition. Gathering a large and well-armed force, he took Northumber-land and the castles in August 1513, spending some time at Ford Castle, where, according to report, he was engaged in an amorous intrigue with the wife of its owner. Then
he moved out to fight the advancing English army under Thomas Howard, earl of Surrey. The battle, which took place at Flodden, or more correctly, at the foot of Brankston Hill, on Friday the 9th of September 1513, is among the most famous and disastrous not only among the most memorable, in the history of Scotland. Having led his troops from their position of vantage, the king himself was killed while fighting on foot, together with nearly all his nobles; there was no foundation for the rumour that he had escaped from the carnage. He left one legitimate child, his successor James V., but as his gallantries were numerous he had many illegitimate children, among them (by Marion Boyd) Alexander Stewart, archbishop of St Andrews and chancellor of Scotland, who was killed at Flodden, and (by Janet Kennedy) James Stewart, earl of Moray (d. 1544). One of his other mistresses was Margaret Drummond (d. 1501).

James appears to have been a brave and generous man, and a wise and energetic king. According to one account, he was possessed of considerable learning; during his reign the Scottish court attained some degree of refinement, and Scotland counted in European politics as she had never done before. Literature flourished under the royal patronage, education was encouraged, and the material condition of the country improved enormously. Prominent both as an administrator and as a lawgiver, the king by his vigorous rule did much to destroy the tendencies to independency which existed in the Highlands and Islands; but, on the other hand, his rash conduct at Flodden brought much misery upon his kingdom. He was specially interested in his navy. The tournaments which took place under his auspices were worthy of the best days of chivalry in France and England. James shared to the full in the superstitious age which was quickly passing away. He is said to have worn an iron belt as a penance for his share in his father's death; and by his frequent visits to shrines, and his benefactions to religious foundations, he won a reputation for piety.

James V. (1512-1542): King of Scotland, son of James IV., was born on the 10th of April 1512, and became king when his father was killed at Flodden in 1513. The regency was at first vested in his mother, but after Queen Margaret's second marriage, with Archibald Douglas, 6th earl of Angus, in August 1514, it was transferred by the estates to John Stewart, duke of Albany. Henceforward the minority of James was disturbed by constant quarrels between a faction, generally favourable to England, under Angus, and the partisans of France under Albany; while the queen-mother and the nobles struggled to gain and to regain possession of the king's person. The English had not followed up their victory at Flodden, although there were as usual forays on the borders, but Henry VIII., was watching affairs in Scotland with an observant eye, and other European sovereigns were not indifferent to the possibility of a Scotch alliance. In 1524, when Albany had retired to France, the parliament declared that James was fit to govern, but that he must be advised by his mother and a council. This "erection" of James as king was mainly due to the efforts of Henry VIII. In 1526 Angus obtained control of the kingdom, and kept him in close confinement until 1528, when James, escaping from Edinburgh to Stirling, put vigorous measures in execution against his mother, and compelled her to flee to England. In 1529 and 1530 the king made a strong effort to supplant his turbulent vassals in the south of Scotland; and after several raids and counter-raids negotiations for peace with England were begun, and in May 1534 a treaty was signed. At this time, as on previous occasions, Henry VIII. wished James to marry his daughter Mary, while other ladies had been suggested by the emperor Charles V.; but the Scottish king, preferring a French bride, visited France, and in January 1537 was married at Paris to Madeleine, daughter of King Francis I. Madeleine died soon after her arrival in Scotland, and in 1538 James made a much more important marriage, being united to Mary (1515-1560), daughter of Claude, duke of Guise, and widow of Louis of Orleans, duke of Longueville. It was this connexion, probably, which finally induced James to forsake his vacillating foreign policy, and to range himself definitely among the enemies of England. In 1536 he had refused to meet Henry VIII. at York, and in the following year had received the gift of a cap and sword from Pope Paul III., thus renouncing the friendship of his uncle. Two plots to murder the king were now discovered, and James also foiled the attempts of Henry VIII. to kidnap him. Although in 1540 the English king made another attempt to win the support, or at least the neutrality, of James for his religious policy, the relations between the two countries became very unfriendly, and in 1542 Henry sent an army to invade Scotland. James was not slow to make reprisals, but his nobles were angry or indifferent, and on the 25th of November 1542 his forces were easily scattered at the rout of Solway Moss. This blow preyed upon the king's mind, and on the 14th of December he died at Edinburgh, having just heard of the birth of his daughter. His was soon after discovered, and his successor was his only legitimate child, Mary. He left several bastards, among them James Stewart, earl of Murray (the regent Murray), Lord John Stewart (1531-1563) prior of Coldingham, and Lord Robert Stewart, earl of Orkney (d. 1592).

Although possessing a weak constitution, which was further impaired by his irregular manner of life, James showed great vigour and independence as a sovereign, both in withstanding the machinations of his uncle, Henry VIII., and in opposing the influence of the nobles. The persecutions to which heretics were exposed during this reign were due mainly to the excessive influence exercised by the ecclesiastics, especially by David Beaton, archbishop of St Andrews. The king's habit of mingling with the peasantry secured for him a large amount of popularity, and probably led many to ascribe to him the authorship of poems describing scenes in peaceful life, Christis Kirk on the Gren, The Gabeurnie Man and The Jolly Beggar. There is no proof that he was the author of any of these poems, but from expressions in the poems of Sir David Lindsay, who was on terms of intimacy with him, it appears that occasionally he wrote verses.

James I., the Conqueror (1208-1276), king of Aragon, son of Peter II., king of Aragon, and of Mary of Montpellier, whose mother was Eudoxia Commena, daughter of the emperor Manuel, was born at Montpellier on the 2nd of February 1208. His father, a man of immoral life, was with difficulty persuaded to cohabit with his wife. He endeavoured to repudiate her, and she fled to Rome, where she died in April 1213. Peter, whose possessions in Provence entangled him in the wars between the Albigenses and Simon of Montfort, endeavoured to placate the northern crusaders by arranging a marriage between his son James and Simon's daughter. In 1211 the boy was entrusted to Montfort's care, but in 1212 the crusaders on the princes of the south forced Peter to take up arms against them, and he was slain at Muret on the 12th of September 1213. Montfort would willingly have used James as a means of extending his own power. The Aragonese and Catalans, however, appealed to the pope, who forced Montfort to surrender him in May or June 1214. James was now entrusted to the care of Guillen de Montredon, the head of the Templars in Spain and Provence. The kingdom was given over to confusion till in 1216 the Templars and some of the more loyal nobles brought the young king to Saragosse, and he was married to Leonor, daughter of Alphonso VIII. of Castile, whom he divorced later on the ground of consanguinity. A son born of the marriage, Alphonso, was recognized as legitimate, but died before his father, childless. It was only by slow steps that the royal authority was asserted, but the young king, who was of gigantic stature and immense strength, was also astute and patient. By 1228 he had so far brought his vassals to obedience, that he was able to undertake the conquest of the Balearic Islands, which he achieved within four years. At the same time he endeavoured to bring about a union of Aragon with Navarre, by a contract of mutual adoption between himself and the Navarrese king, Sancho, who was old enough to be his grandfather. The scheme broke down, and James abstained from a policy of conquest. He wisely turned to the more feasible course of extending his dominions at the expense of the decadent
Mahommedan princes of Valencia. On the 28th of September 1328 the town of Valencia surrendered, and the whole territory was conquered in the ensuing years. Like all the princes of his house, James took part in the politics of southern France. He endeavoured to form a southern state on both sides of the Pyrenees, which should counterbalance the power of France north of the Loire. Here also his policy failed against physical, social and political obstacles. As in the case of Navarre, he was too wise to launch into perilous adventures. By the Treaty of Castile, which he signed at Vitoria on the 11th of May 1328, he frankly withdrew from conflict with the French king, and contented himself with the recognition of his position, and the surrender of antiquated French claims to the lordship of Catalonia. During the remaining twenty years of his life, James was much concerned in warring with the Moors in Murcia, not on his own account, but on behalf of his son-in-law Alphonso the Wise of Castile. As a legislator and organizer he occupies a high place among the Spanish kings. He would probably have been more successful but for the confusion caused by the disputes in his own household. James, though orthodox and pious, had an ample share of moral folly. After repudiating Leonora of Castile he married Yolande (in Spanish Violante) daughter of Andrew II. of Hungary, who had a considerable influence over him. But she could not prevent him from continuing a long series of intrigues. The favour he showed his bastards led to protest from the nobles, and to conflicts between his sons legitimate and illegitimate. When one of the latter, Ferman Sanchez, who had behaved with gross ingratitude and treason to his father, was slain by the legitimate son Pedro, the old king recorded his grim satisfaction. At the close of his life King James divided his states between his two sons. Pedro and James, leaving the Spanish possessions on the mainland to the first, the Balearic Islands and the lordship of Montpellier to the second—a division which inevitably produced fratricidal conflicts. The king fell very ill at Alcira, and resigned his crown, intending to retire to the monastery of Poblet, but died at Valencia on the 27th of July 1326.

King James was the author of a chronicle of his own life, written or dictated apparently at different times, which is a very fine example of autobiographical literature. A translation into English by J. Forster, with notes by Don Pascual de Gayangos, was published in London in 1883. See also James I, of Aragon, by F. Darwin Swiny (Manchester Press, 1894), in which are many references to authorities.

James II. (c. 1260-1327), king of Aragon, grandson of James I., and son of Peter III. by his marriage with Constance, daughter of Manfred of Beneventum, was left in 1285 as king of Sicily by his father. In 1291, on the death of his elder brother, Alphonso, to whom Aragon had fallen, he resigned Sicily and endeavoured to arrange the quarrel between his own family and the Angevine House, by marriage with Blanca, daughter of Charles of Anjou, king of Naples.

James II. (1243-1311), king of Majorca, inherited the Balearic Islands from his father James I. of Aragon. He was engaged in constant conflict with his brother Pedro III. of Aragon, and in alliance with the French king against his own kin.

James III. (1315-1340), king of Majorca, grandson of James II., was driven out of his little state and finally murdered by his cousin Pedro IV. of Aragon, who definitely reannexed the Balearic Islands to the crown.

James (James Francis Edward Stuart) (1668-1766), prince of Wales, known as the Jacobites as James III., and to the Hanoverians as the Old Pretender, the son and heir of James II. of England, was born in St James's Palace, London, on the 10th of June 1688. The scandalous story that he was a supposititious child, started and spread abroad by interested politicians at the time of his birth, has been completely disproved, and most contemporary writers allude to his striking family likeness to the Royal Stuarts. Shortly before the flight of the king to Sheerness, the infant prince together with his mother was sent to France, and afterwards he continued to reside with his father at the court of St Germain. On the death of his father, on the 16th of September 1701, he was immediately proclaimed king by Louis XIV. of France, but a fantastic attempt to perform a similar ceremony in London so roused the anger of the populace that the mock pursuivants barely escaped with their lives. A bill of attainder against him received the royal assent a few days before the death of William III. in 1702, and the Princess Anne, half-sister of the Pretender, succeeded William on the throne. An influential party still, however, continued to adhere to the Jacobite cause; but an expedition from Dunkirk planned in favour of James did not amount to much. In the spring of 1708 failed of success, although the French ships under the comte de Fourbin, with James himself on board, reached the Firth of Firth in safety. At the Peace of Utrecht James withdrew from French territory to Bar-le-Duc in Lorraine. A rebellion in the Highlands of Scotland was inaugurated, in September 1715 by the raising of the standard on the braes of Mar, and by the solemn proclamation of James Stuart, the chevalier of St George, in the midst of the assembled clans, but its progress was arrested in November by the indecisive battle of Sheriffmuir and by the surrender at Preston. Unwilling to risk troops presented the prospects, the chevalier landed in December 1715 at Peterhead, and advanced as far south as Scone, accompanied by a small force under the earl of Mar; but on learning of the approach of the duke of Argyll, he retreated to Montrose, where the Highlanders dispersed to the mountains, and he embarked again for France. A Spanish expedition sent out in his behalf in 1719, under the direction of Alberoni, was scattered by a tempest, only two frigates reaching the appointed rendezvous in the island of Lewis.

In 1718 James had become allied to the young princess Maria Clementina Sobieski, grand-daughter of the last king of Poland, John Sobieski. The intended marriage was forbidden by the emperor, who in consequence kept the princess and her mother in honourable confinement at Innsbruck in Tirol. An attempt to abduct the princess by means of a ruse contrived by a zealous Jacobite gentleman, Charles Wogan, proved successful; Clementina reached Italy in safety, and she and James were ultimately married at Montefiascone on the 1st of September 1719. James and Clementina were now invited to reside in Rome at the special request of Pope Clement XI., who openly acknowledged their titles of British King and Queen, gave them the protection of the papal residence at Albano and a palace (the Palazzo Muti in the Piazza dei Santi Apostoli) in the city, and also made them an annual allowance of 12,000 crowns out of the papal treasury. At the Palazzo Muti, which remained the chief residence of Jacobite intrigue, were born James's two sons, Charles Edward (the Young Pretender) and Henry Benedict Stuart. James's married life proved turbulent and unhappy, a circumstance that was principally due to the hot temper and jealous nature of Clementina, who soon after Henry's birth in 1725 left her husband and spent over two years in a Roman convent. At length a reconciliation was effected, which Clementina did not long survive, for she died at the early age of 32 in February 1735. Full regal honours were paid to the Stuart queen at her funeral, and the splendid but tasteless monument by Pietro Bracchi (1700-1773) in St Peter's was erected to her memory by order of Pope Benedict XIV.

His wife's death seems to have affected James's health and spirits greatly, and he now began to grow feeble and indifferent, so that the political adherents of the Stuarts were gradually led to fix their hopes upon the two young princes rather than upon their father. Travellers to Rome at this period note that James appeared seld to go abroad and that much of his time was given up to religious exercises; he was dêvot à l'excès, so Charles de Brosses, an unprejudiced Frenchman, informs us. It was with great reluctance that James allowed his elder son to leave Italy for France in 1744; nevertheless in the following year, he permitted Henry to follow his brother's example, but with the news of Culloden he evidently came to regard his cause as definitely lost. The estrangement from his elder and favourite son, which arose over Henry's adoption of an ecclesiastical career, so embittered his last years that he sank into a morping invalid and rarely left his chamber. With the crushing failure of the
JAMES, D.—JAMES, H.

James has been compared to Dumas, and the comparison holds good in respect of kind, though by no means in respect of merit. Both had a certain gift of separating from the picturesque parts of history what could without much difficulty be worked up into picturesque fiction, and both were possessed of a ready pen. Here, however, the likeness ends. Of purely literary talent James had little. His plots are poor, his descriptions weak, his dialogue often below even a fair average, and he was deplorably prone to repeat himself. The "two cavaliers" who in one form or another open most of his books have passed into a proverb, and Thackeray's good-natured but fatal parody of them is likely to outlast Richelieu and Darnley by many a year. Nevertheless, though James cannot be allowed any very high rank among novelists, he had a genuine narrative gift, and, though his best books fall far below Les trois moussquaires and La reine Margot, there is a certain even level of interest to be found in all of them. James never resorted to illegitimate methods to attract readers, and deserves such credit as may be due to a purveyor of amusement who never caters for the less creditable tastes of his guests.

His best novels were published in a revised form in 21 volumes (1849-59).

JAMES, HENRY (1843-1916), American author, was born in New York on the 15th of April 1843. His father was Henry James (1811-1882), a theological writer of great originality, from whom both he and his brother Professor William James derived their psychological subtlety and their idiomatic, picturesque English. Most of Henry's boyhood was spent in Europe, where he studied under tutors in England, France and Switzerland. In 1860 he returned to America, and began reading law at Harvard, only to find speedily that literature, not law, was what he most cared for. His earliest short tale, "The Story of a Year," appeared in 1865, in the Atlantic Monthly, and frequent stories and sketches followed. In 1869 he again went to Europe, where he subsequently made his home, for the most part living in London, or at Rye in Sussex. Among his specially noteworthy works are the following: Watch and Ward (1871); Roderick Hudson (1875); The American (1877); Daisy Miller (1878); French Poets and Novelists (1878); A Life of Hawthorne (1879); The Portrait of a Lady (1881); Portraits of Places (1884); The Bostonians (1886); Partial Portraits (1888); The Tragic Muse (1890); Essays in London (1893); The Two Magics (1898); The Awkward Age (1898); The Wings of the Dove (1902); The Ambassadors (1903); The Golden Bowl (1904); English Hours (1905); The American Scene (1907); The High Bid (1909); Italian Hours (1909).

As a novelist, Henry James is a modern of the moderns both in subject matter and in method. He is entirely loyal to contemporary life and reverentially exact in his transcription of the phase. His characters are for the most part people of the world who conceive of life as a fine art and have the leisure to carry out their theories. Rarely are they at close quarters with any ugly practical task. They are subtle and complex with the subtlety and the complexity that come from conscious preoccupation with themselves. They are specialists in conduct and past masters of all the moral traditions and delicate illustrative of some social code. To reveal the power and the tragedy of life through so many minutely limiting and apparently artificial conditions, and by means of characters who are somewhat self-conscious and are apt to make of life only a pleasant pastime, might well seem an impossible task. Yet it is precisely in this that Henry James is pre-emminently successful. The essentially human is what he really cares for, however much he may at times seem preoccupied with the technique of his art or with the mask of conventions through which he makes the essentially human reveal itself. Nor has "the vista of the spiritual been denied him." No more poignant spiritual tragedy has been recounted in recent fiction than the story of Isabel Archer in The Portrait of a Lady. His method, too, is as modern as his subject matter. He early
JAMES, J. A.—JAMES OF HEREFORD, BARON

fell in love with the “point of view,” and the good and the bad qualities of his work all frown from this literary passion. He is a very sensitive impressionist, with a technique that can fix the most elusive phase of character and render the most baffling surface. The skill is unending with which he places his characters in such relations and under such lights that they flash out in due succession their continuously varying facets. At times he may come to forget that a character’s mind changes, or is calculatedly more than the sum of all its phases; and then his characters tend to have their existence, as Positivists expect to have their immortality, simply and solely in the minds of other people. But when his method is at its best, the delicate phases of character that he transcribes coalesce perfectly into clearly defined and suggestive images of living, acting men and women. Doubtless, there is a certain initiation necessary for the enjoyment of Mr James. He presupposes a cosmopolitan outlook, a certain interest in art and in social artifice, and no little abstract curiosity about the workings of the human mechanism. But for speculatory readers, for readers who care for art in life as well as for life in art, and for readers above all who want to encounter and comprehend a great variety of very modern and finely modulated characters, Mr James holds a place of his own, univalved as an interpreter of the world of to-day.

For a list of the short stories of Mr Henry James, collections of them in volume form, and other works, see bibliographies by F. A. King, in The Novels of Henry James, by Elizabeth L. Cary (New York and London, 1903); and by Le Roy Phillips, A Bibliography of the Writings of Henry James (Bost., Mass., 1906). In 1909 an edition de luxe of Henry James’s novels was published in 24 volumes.

JAMES, JOHN ANGELL (1785–1859), English Nonconformist divine, was born at Blandford, Dorsetshire, on the 6th of June 1785. At the close of his seven years’ apprenticeship to a linen-draper at Poole he decided to become a preacher, and in 1802 he went to David Bogue’s training institution at Gosport. A year and a half later, on a visit to Birmingham, his preaching was so highly esteemed by the congregation of Carr’s Lane Independent chapel that they invited him to exercise his ministry amongst them; he settled there in 1805, and was ordained in May 1806. For several years his success as a preacher was comparatively small; but he jumped into popularity about 1814, and began to attract large crowds wherever he officiated. At the same time his religious writings, the best known of which are The Anxious Inquirer and An Earnest Ministry, acquired a wide circulation. James was a typical Congregational preacher of the early 19th century, massive and elaborate rather than original. His preaching displayed little or nothing of Calvinism, the earlier severity of which had been modified in Birmingham by Edward Williams, one of his predecessors. He was one of the founders of the Evangelical Union of England and Wales. Municipal interests appealed strongly to him, and he was also for many years chairman of Spring Hill (afterwards Mansfield) College. He died at Birmingham on the 1st of October 1859.

JAMES, THOMAS (c. 1573–1620), English librarian, was born at Newport, Isle of Wight. He was educated at Winchester and New College, Oxford, and became a fellow of New College in 1593. His wide knowledge of books, together with his skill in deciphering manuscripts and detecting literary forgeries, secured him in 1602 the post of librarian to the library founded in that year by Sir Thomas Bodley at Oxford. At the same time he was made rector of St Aldate’s, Oxford. In 1605 he compiled a classified catalogue of the books in the Bodleian Library, but in 1620 substituted for it an alphabetical catalogue. The arrangement in 1610, whereby the Stationers’ Company undertook to supply each of the 160 books which were entered in the book published, was James’s suggestion. Ill health compelled him to resign his post in 1620, and he died at Oxford in August 1629.

JAMES, WILLIAM (d. 1827), English naval historian, author of the Naval History of Great Britain from the Declaration of War by France in 1793 to the Accession of George IV., practised as a proctor in the admiralty court of Jamaica between 1805 and 1813. He was in the United States when the war of 1812 broke out, and was detained as a prisoner, but escaped to Halifax. His literary career began by letters to the Naval Chronicle and the signature of “Boxer.” In 1816 he published An Inquiry into the Merits of the Principal Naval Actions between Great Britain and the United States. In this pamphlet, which James reprinted in 1817, enlarged and with a new title, his object was to prove that the American frigates were stronger than their British opponents nominally of the same class. In 1819 he began his Naval History, which appeared in five volumes (1822–1824), and was reprinted in six volumes (1826). It is a monument of pains-taking accuracy in all such matters as dates, names, tonnage, armament and movements of ships, though no attempt is ever made to show the connexion between the various movements.

James died on the 28th of May 1827 in London, leaving a widow who received a civil list pension of £100.

An edition of the Naval History in six volumes, with additions and notes by Capt. F. Chamier, was published in 1837, and a further one in 1847. An edition epitomized by R. O’Byrne appeared in 1888, and an Index by C. G. Toogood was issued by the Navy Records Society in 1895.

JAMES, WILLIAM (1842–1910), American philosopher, son of the Swedeborgian theologian Henry James, and brother of the novelist Henry James, was born on the 11th of January 1842 at New York City. He graduated M.D. at Harvard in 1876. Two years later he was appointed a professor of philosophy and physiology, and later in psychology and philosophy. Subsequently he became assistant professor of philosophy (1850–1855), professor (1855–1859), professor of psychology (1859–1869) and professor of philosophy (1897–1907). In 1899–1901 he delivered the Gifford lectures on natural religion at the University of Edinburgh, and in 1908 the Hibbert lectures at Manchester College, Oxford. With the appearance of his Principles of Psychology (2 vols., 1870), James at once stepped into the front rank of psychologists as a leader of the physical school, a position which he maintained not only by the brilliance of his analogues but also by the freshness and unconventionality of his style. In metaphysics he upheld the idealist position from the empirical standpoint. Besides the Principles of Psychology, which appeared in a shorter form in 1852 (Psychology), his chief works are: The Will to Believe (1870); Human Immortality (Boston, 1883); Talks to Teachers (1890); The Varieties of Religious Experience (New York, 1902); Pragmatism—a New Name for some Old Ways of Thinking (1907); A Pluralistic Universe (1905; Hibbert lectures), in which, though he still attacked the hypothesis of absolutism, he admitted it as a legitimate alternative. He received honorary degrees from Padua (1893), Princeton (1896), Edinburgh (1902); Harvard (1909). He died on the 27th of August 1910.

JAMES OF HEREFORD, HENRY JAMES, 1ST BARON (1828– ), English lawyer and statesman, son of P. T. James, surgeon, was born at Hereford on the 30th of October 1828, and educated at Cheltenham College. A prizeman of the Inner Temple, he was called to the bar in 1852 and joined the Oxford circuit, where he soon came into prominence. In 1867 he was made “postman” of the court of exchequer, and in 1869 became a Q.C. At the general election of 1870 he obtained a seat in parliament for Taunton as a Liberal, by the unseating of Mr Serjeant Cox on a scrutiny in March 1869, and he kept the seat till 1885, when he was returned for Bury. He attracted attention in parliament by his speeches in 1872 in the debates on the Judicature Act. In 1873 (September) he was made solicitor-general, and in November attorney-general, and knighted; and when Gladstone returned to power in 1880 he resumed his office. He was responsible for carrying the Corrupt Practices Act of 1883. On Gladstone’s conversion to Home Rule, Sir Henry James parted from his party, and in 1886 he was returned to the Liberal Unionists: Gladstone had offered him the lord chancellorship in 1886, but he declined it; and the knowledge
of the sacrifice he had made in refusing to follow his old chief in his new departure lest great weight to his advocacy of the Unionist cause in the country. He was one of the leading counsel for The Times before the Parnell Commission, and from 1892 to 1895 was attorney-general to the prince of Wales. From 1895 to 1902 he was a member of the Unionist ministry as chancellor for the duchy of Lancaster, and in 1895 he was made a peer as Baron James of Hereford. In later years he was a prominent opponent of the Tariff Reform movement, adhering to the section of Free Trade Unionists.

JAMES, EPITCLE OF, a book of the New Testament. The superscription (Jas. i. 1) ascribes it to that pre-eminent "pillar of faith" (Gal. ii. 9) of the Jewish church? Eusebius (Eccl. hist. vii. 28) regarded the letters which both as to origin and subsequent circulation were a product of urgent conditions. The order consonant with history is (1) Paul's "letters" to the "churches" of a province (Gal. i. 2; 2 Cor. i. 1); (2) the address to "the elect of the dispersion" in a group of the Pauline provinces (1 Pet. i. 1); (3) the address to "the twelve tribes of the dispersion" everywhere (Jas. i. 1; cf. Rev. vii. 4). Eusebius (A.D. 325) classifies it among the disputed books, declaring that it is regarded as spurious, and that not many of the ancients have mentioned it. Even Jerome (A.D. 390), though personally he accepted it, admits that it was "said to have been published by another in the name of James." The Syrian canon of the Peshitta was the first to admit it.

Modern criticism naturally made the superscription its starting-point, endeavoring first to explain the contents of the writing on this theory of authorship, but generally reaching the conclusion that the two do not agree. Conservatives as a rule avoid the implication of a direct polemic against Paul in iii. 14-26, which would lay open the author to the bitter accusations launched against the interlopers of 2 Cor. x-xiii., by dating before the Judaistic controversy. Other critics regard the very language alone as fatal to such a theory of date, authorship and circle addressed. The contents, ignoring the conflict of Jew and Gentile, complaining of worldliness and tongue-revelation (cf. 1 John iii. 17 seq. with James ii. 14-16) suggest a much later date. But the" early date" is not impossible. The author was a different character in the author, if not also a different circle of readers from those addressed in i. 1. It is a frequent contention of those who are followers of the Great church of the apostolic period, characterized by worldliness of life, profession without practice, and a contentious garbility of teaching (1 John iii. 3-10, 18; 1 Tim. i. 6 seq., vi. 3-10; 2 Tim. iii. 1-5, iv. 3 seq.). The spirit of the disputes between the letters common-poses in vi. 1 seq. 3, but quite in the spirit of one of the "wise men" of the Hebrew wisdom literature. His gospel is completely disenchanted, humanitarian; but, while equally universalistic, is quite strongly earthly. It is remote as to its exigencies and conditions. He has nothing whatever to say of the incarnation, life, example, suffering or resurrection of Jesus, and does not interest himself in the fulfillment of the prophecies of Christ. The latter were not related to him up to this time. The absence of all mention of Christ (with the single exception of ii. 1, where there is reason to think the words ὧν ἀπέστη Ἰησοῦς Ἡσαΐας interpolated) has even led to the theory, albeit unconvincingly maintained by Spitta, that the writing is a mere recast of a Jewish moralistic writing like the Two Ways. The thoughts are loosely strung together; yet the following seems to be the general framework on which the New Testament preacher has collected his material.

i. 1-12. The problem of the poor: the social development through at divinely given "wisdom" (2-11). Inward (moral) trials are not to be imputed to God, the author of all good; the purpose is the moral good of his creation (12-19a; cf. 1 John i. 5).

2. The righteousness God intends is defined in the eternal moral law. It is a product of deeds, not words (i. 19b-27).

3. The royal law: the physical law meets the spiritual against the law, (i. 13-18; and by professions of faith barren of good works (14-26).

4. The true spirit of wisdom appears not in aspiring to teach, but in goodness and meekness of life (ch. iii.), Strike and self-acculation are fruits of a different spirit, to be resisted and overcome by humble prayer for more grace (iv. 1-10).

5. The judgment comes; the harvest is come. The thought condemns sensuality (iv. 11 et seq.), presumptuous treatment of life (13-17), and the tyranny of the rich (v. 1-6). It encourages the believer to patient endurance to the end without murmuring or imprecations (v. 7-10). But the words that exalt the spirit are all of the saving kind, and the result of this viewpoint presumes the Pauline terminology. Had the author been consciously opposing the great apostle to the Gentiles he would probably have treated the subject less superficially. What he really opposes is the same ultra-Pauline moral laxity which Paul himself found occasion to rebuke among would-be adherents in Corinth (1 Cor. vi. 12; vii. 3-11, 12; x. 23 seq., 32 seq.) and which appears still more marked in the pastoral epistles and 1 John. In rebuking it James unconsciously retracts the misapplied Pauline principle itself. To suppose that the technical terminology of Paul, including even his classic example of the faith of Abraham, could be employed in the earlier writings of James is to pass a judgment which in every other field of literary criticism would be at once repudiated. To imagine it current in pre-Pauline Judaism is to misconceive the spirit of the synagogue. To make James a Pauline thinker and Paul a Jamesian writer is to date incompatible with the other phenomena, but implies a literary polemic tactlessly waged by Paul against the head of the church. The influence of Hebrews is only slightly less probable, for James ii. 25 adds an explication of the case of Rahab also, cited in Heb. xi. 31 along with Abraham as an example of justification by faith only, to his correction of the Pauline scriptural argument. The question of the priority of James i. 25 to the others, or conversely is still actively disputed. As regards the superscription

1 Nothing adduced by Lightfoot (Comm. on Gal. Ecc. "The faith of Abraham") justifies the unsupported and improbable assertion that the quotation James ii. 21 seq. was "probably in common use before the time of St. Peter" he goes to prove that, orthodoxy being defended by "salvation" (Mayor, s.v. "James, Epistle of" in Hastings' Dict. Bible, p. 546).
The relation has been defined above. Dependence on Revelation (A.D. 95) is proved to have existed, iv. 12 and ii. 5, with the superscription, if on Harnack's view (Rev. iv. 20), but the contacts with Clement of Rome (A.D. 95-120) indicate the reverse relation. James iv. 6 and v. 20 = i Clem. xlix. 5 and xxx. 2; but as both passages are also found in Peter (iv. 8, x. 5, and the common source. Clement's further development of the cases of Abraham and Rahab, however, adding as it does to the demonstration of James from Scripture of their justification "by works and not by faith only," the paramount need of the faith of Abraham and Rahab to their justification was "hospitality" (1 Clem. xii. xiii.) seems plainly to presuppose James. Priority is more difficult to establish in the case of Hermas (A.D. 120-160), where the authorship is undisputed (cf. James iv. 7, 12 with Mant. xii. 5, 6; Sim. ix. 23).1

The date (A.D. 95-120) implied by the literary contacts of James of course precludes authorship by James, the Lord's brother, though the term "James" is also found in the superscription at a later stage. The question whether the writing as a whole is pseudonymous, or only the superscription a mistaken conjecture by the scribe of Jude 1 is of secondary importance. A date about 100-120 for the substance of the writing is accepted by the majority of modern scholars and throws real light upon the author's endeavour. Pleidecker in pointing out the similarities of James and the Shepherd of Hermas declares it to be "certain that both writings presuppose like historical circumstances, and, from a similar point of view, direct their admonitions to their contemporaries, among whom a new and subtly-inspired moralistic conception of the old Mosaic, more Palestinian elements of the New Testament, we have a Greek even more fluent than Paul's and metaphors and allusions (i. 17, iii. 1-12) of a type more like Greek rhetoric than anything else in the New Testament. Were we to judge by the contacts with Hebrews, Clement of Rome and Hermas and the similarity of situation evidenced in the last-named, Rome would seem the most natural place of origin. The history of the epistle's reception into the canon is not opposed to this; for, once it was attributed to James, Syria would be more likely to take it up, while the West, more sceptical, if not better informed, took to its origin, held back; just as happened in the case of Hebrews.

It is the author's conception of the nature of the gospel which mainly gives us pause in following this pretty general disposition of modern scholarship. With all the phenomena of vocabulary and style which seem to justify such conceptions as von Soden's that c. iii. and iv. 11-13: 6 represent excerpts respectively from the essay of an Alexandrian scribe, and a triple fragment of Jewish apocalypse, the analysis above given will be found the exponent of a real logical sequence. We might almost admit a resemblance in form to the gospel, but not in type, which in the Gospels, especially in the special and technical sense of the "wise men" of Hebrew literature (Matt. xxiii. 34), the sense of "the wisdom of the just" of Luke i. 17. True, the mystical sense given to the term in one of the sources of Luke, by Paul and some of the Church fathers, is not present. While the gospel is pre-eminently the divine gift of "wisdom," "wisdom" is not personified, but conceived primarily as a system of humanitarian ethics, i. 21-25, and only secondarily as a spiritual effluence, imparting the regenerate disposition, the "mind that was in Christ Jesus," iii. 13-18. And yet for James as well as for Paul Christ is "the wisdom of God." The difference in conception of the term is similar to that between Ecclesiastes and the Wisdom of Solomon. Our author, like Paul, expects the hearers of the word to be "a kind of first-fruits to God of his creation" (1. 18 cf. 1 Pet. i. 23), and bids them depend upon the gift of grace (i. 5, iv. 5 seq.), but for the evils of the world he has no remedy but the patient endurance of the Christian philosopher (i. 2-18). For the faithlessness (στρεφεται, 6-8; cf. Didache and Hermas), worldliness (ii. 1-13) and hollow profession (ii. 14-25) of the church life of his time, with its "theological wrangling" (iii. 1-12), his remedy is again the God-given, peaceable spirit of the Christian philosopher (iii. 13-18), which is the antithesis of the spirit of self-seeking and censoriousness (iv. 1-12), and which appreciates the pettiness of earthly life with its selfish gains and its unjust distribution of goods (v. 13-v. 19). This attitude of the Christian spirit, to maintain the individual in his patient waiting for the expected "coming of the Lord" (v. 7-11), while the church sustains its official functions of healing and prayer, and reclamation of the erring (v. 13-20). For this conception of the gospel and of the officially organized church, our nearest analogy is in Matthew, or rather in the blocks of precepts of the Lord which after subtraction of the Markan narrative framework are found to underlie our first gospel. It may be more coincidence that the material in Matthew as well as in the Didache seems to be arranged in five divisions, beginning with a condemnation of the human element, and amounting to a judgment, while the logical analysis of James yields something similar: that of the affinity of spirit there can be no doubt.

The type of ethical thought exemplified in James has been called Ebionite (Hilgenfeld). It is clearly manifest in the humanitarianism of Luke also. But with the possible exception of the prohibition of oaths there is nothing which ought to suggest the epithet. The strong sense of social wrongs, the impatience with tongue-religion, the utter ignoring of ceremonialism, the reflection on the value and significance of life,2 are distinctive characteristics of the Letter. Like Paul, the author bade himself so far afool from current debate of ceremonial or doctrine as to escape our principal standards of measurement regarding time and place. Certain general considerations, however, are fairly decisive. The prolonged effort, mainly of English scholarship, to vindicate the superscription, even on the condition of assuming priority to the Pauline epistles, grows only increasingly hopeless with increasing knowledge of conditions, linguistic and other, in that early period. The moralistic conception of the gospel as a "law of liberty," the very phrase recalling the expression of Barn. ii. 2, "the new law of Christ, which is without the letter of the law," is perhaps one of the results of contamination of the early church as a primarily an ethical society, its functions already officially distributed, suggest the period of the Didache, Barnabas and Clement of Rome. Independently of the literary contacts we should judge the period to be about A.D. 100-120. The connexions with the Pauline epistles are conclusive for a date later than the death of James; those with Clement and Hermas are perhaps sufficient to date it as prior to the former, and suggest Rome as the place of origin. The connexions with wisdom-literature favour somewhat the Hellenistic culture of Syria, as represented for example at Antioch.

The most important commentators on the epistle are those of Matt. Schneckenburger (1832), K. G. W. Thiele (1835), J. Kern (1838), G. H. Ewald (1870), C. F. F. Erdmann (1881), H. v. Soden (1868), J. B. Mayor (1892) and W. Patrick (1906). The pre-Pauline date is championed by B. Weiss (Introd.), W. B. Wyschogrod (Introduction), F. Zahn (Introd.), J. B. Mayor and W. Paterek, J. V. Bartlett (Ap. Age, pp. 217-250) pleads for it, and the view is still common among English interpreters. F. K. Zimmer (Z. ev. Th., 1893) showed the priority of Paul, with many others. A. Hilgenfeld (Einzl.)

The logical relation of v. 12 to the context is problematical. Perhaps it may be accounted for by the order of the compend of Christian ethics the writer was following, and more particularly to Matt. v. 12 (cf. ver. 10) and 19 seq. cf. ver. 2 and iv. 13 seq.) The non-charismatic conception of healing, no longer the "gift" of some layman in the community (i Cor. xii. 9 seq.) but a function of "the elders" (1 Tim. iv. 14), is another indication of comparatively late date.

2 Das urchristenthum, 868, quoted by Cony, loc. cit.

**JAMESON, ANNA BROWNELL** (1794-1860), British writer, was born in Dublin on the 17th of May 1794. Her father, Denis Brownell Murphy (d. 1840), a miniature and enamel painter, removed to England in 1798 with his family, and eventually settled at Hanwell, near London. At sixteen years of age Anna became governess in the family of the marquis of Winchester. In 1816 she married her employer, Robert Jameson. The engagement was broken off, and Anna Murphy accompanied a young pupil to Italy, writing in a fictitious character a narrative of what she saw and did. This diary she gave to a bookseller on condition of receiving a guitar if he secured any profits. Colburn ultimately published it as The Diary of an Ennuye (1826), which attracted much attention. The author was governess to the children of Mr Littleton, afterwards Lord Hatherton, from 1821 to 1825, when she married Robert Jameson. The marriage proved unhappy; when, in 1825, Jameson was appointed puisne judge in the island of Dominica the couple separated without regret, and Mrs Jameson visited the Continent again with her father.

The first work which displayed her powers of original thought was her Characteristics of Women (1832). These analyses of Shakespeare's heroines are remarkable for delicacy of critical insight and fineness of literary touch. They are the result of a penetrating but essentially feminine mind, applied to the study of individuals of its own sex, detecting characteristics and defining differences not perceived by the ordinary critic and entirely overlooked by the general reader. German literature and art interested her deeply. In 1833 she paid her first visit to Germany in 1833. The conglomerations of hard lines, cold colours and pedantic subjects which decorated Munich under the patronage of King Louis of Bavaria, were new to the world, and Mrs Jameson's enthusiasm first gave them an English reputation.

In 1836 Mrs Jameson was summoned to Canada by her husband, who had been appointed chancellor of the province of Toronto. He failed to meet her at New York, and she was left to make her way alone at the worst season of the year to Toronto. After six months' experience she felt it useless to prolong a life far from all ties of family happiness and the comforts of civilisation. Before leaving, she undertook a journey to the depths of the Indian settlements in Canada; she explored Lake Huron, and saw much of emigrant and Indian life unknown to travellers, which she afterwards embodied in her Winter Studies and Summer Rambles. She returned to England in 1838. At this period Mrs Jameson began making careful notes of the chief private art collections in and near London. The result appeared in her Companion to the Private Galleries (1842), followed in the same year by the Handbook to the Public Galleries. She edited the Memoirs of the Early Italian Painters in England, and Mrs Jameson paid her first visit to Germany in 1833. The conglomeration of hard lines, cold colours and pedantic subjects which decorated Munich under the patronage of King Louis of Bavaria, were new to the world, and Mrs Jameson's enthusiasm first gave them an English reputation.

The conglomeration of hard lines, cold colours and pedantic subjects which decorated Munich under the patronage of King Louis of Bavaria, were new to the world, and Mrs Jameson's enthusiasm first gave them an English reputation. She took the source whence later reformers and philanthropists took counsel and courage.

Mrs Jameson died on the 17th of March 1860. She left the last of her Sacred and Legendary Art series in preparation. It was completed, under the title of The History of Our Lord in Art, by Lady Eastlake.

**JAMESON, GEORGE** (c. 1587-1644), Scottish portrait-painter, was born at Aberdeen, where his father was architect and a member of the guild. After studying painting under Rubens at Antwerp, with Vandyck as a fellow pupil, he returned in 1620 to Aberdeen where he was rewarded for his services and remained at least until 1630, after which he took up his residence in Edinburgh. He was employed by the magistrates of Edinburgh to copy several portraits of the Scottish kings for presentation to Charles I. on his first visit to Scotland in 1633, and the king rewarded him with a diamond ring from his own finger. This circumstance at once established Jameson's fame, and he then found constant employment in painting the portraits of the Scottish nobility and gentry. He also painted a portrait of Charles, which he declined to sell to the magistrates of Edinburgh for the price they offered. He died at Edinburgh in 1644.

**JAMESON, LEANDER STARR** (1853— ), British colonial statesman, son of R. W. Jameson, a writer to the signet in Edinburgh, was born at Edinburgh in 1853, and was educated for the medical profession at University College Hospital, London (M.R.C.S. 1875; M.D. 1877). After acting as house physician, house surgeon and demonstrator of anatomy, and showing promise of a successful professional career in London, his health broke down from overwork in 1878, and he went out to South Africa and settled down in practice at Kimberley. There he remained until 1887 when he was appointed minister to the British government in South Africa, besides numbering President Kruger and the Matabele chief Lobengula among his patients, came much into contact with Cecil Rhodes. In 1888 his influence with Lobengula was successfully exerted to induce that chieftain to grant the concessions to the agents of Rhodes which led to the formation of the British South Africa Company; and when the company proceeded to open up Mashonaland, Jameson abandoned his medical practice and joined the pioneer expedition of 1890. From this time his fortunes were bound up with Rhodes's schemes in the north. Immediately after the pioneer column had occupied Mashonaland, Jameson, with F. C. Selous and A. R. Colquhoun, went east to Manicaland and was instrumental in securing the greater part of that country, to which Portugal was laying claim, for the Chartered Company. In 1891 Jameson succeeded Colquhoun as administrator of Rhodesia. The events connected with his
vigorous administration and the wars with the Matabele are narrated under Rhodesia. At the end of 1894 "Dr Jim" (as he was familiarly called) came to England and was feted on all sides; he was made a C.B., and returned to Africa in the spring of 1895 with enhanced prestige. On the last day of that year the world was startled to learn that Jameson, with a small force of 600 men, had landed a raid into the Transvaal from Mafeking in support of a projected rising in Johannesburg, which had been connived at by Rhodes at the Cape (see Rhodes and Transvaal). Jameson's force was compelled to surrender at Doornkop, receiving a guarantee that the lives of all would be spared; he and his officers were sent to Pretoria, and, after a short delay, during which time sections of the Boer populace clamoured for the execution of Jameson, President Kruger on the surrender of Johannesburg (January 7) hanged them over to the British government for punishment. They were tried in London under the Foreign Enlistment Act in May 1896, and Dr Jameson was sentenced to fifteen months' imprisonment at Holloway. He served a year in prison, and was then released on account of ill health. He still retained the affections of the white population of Rhodesia, and subsequently returned there in an unofficial capacity. He was the constant companion of Rhodes on his journeys up to the end of his life, and when Rhodes died in May 1902 Jameson was left one of the executors of his will. In 1903 Jameson came forward as the leader of the Progressive (British) party in Cape Colony; and that party being victorious at the general election in January-February 1904, Jameson formed an administration in which he held the position of prime minister. He had to face a serious economic crisis and strenuously promoted the development of the agricultural and pastoral resources of the colony. He also passed a much needed Redistribution Act, and in the session of 1906 passed an Amnesty Act restoring the rebel officers to the franchise. Jameson, as prime minister of Cape Colony, attended the Colonial conference held in London in 1907. In September of that year the Cape parliament was dissolved, and as the elections for the legislative council went in favour of the Bond, Jameson resigned office, 31st of January 1908 (see Cape Colony: History). In 1907 he was chosen one of the delegates from Cape Colony to the intercolonial convention for the closer union of the South African states, and he took a prominent part in settling the terms on which union was effected in 1909. It was at Jameson's suggestion that the Orange River Colony was renamed Orange Free State Province.

JAMESON, ROBERT (1774-1854), Scottish naturalist and mineralogist, was born at Leith on the 11th of July 1774. He became assistant to a surgeon in his native town; but, having studied natural history under Dr John Walker in 1792 and 1793, he felt that his true province lay in that science. He went in 1800 to Freiberg, to study for nearly two years under Werner, and spent two more in continental travel. In 1804 he succeeded Dr Walker as regius professor of natural history in Edinburgh University, and became perhaps the first eminent exponent in Great Britain of the Wernerian geological system; but when he found that theory untenable, he frankly announced his conversion to the views of Hutton. As a teacher, Jameson was remarkable for his power of imparting enthusiasm to his students, and from his class-room there radiated an influence which gave a marked impetus to the study of geology in Britain. His energy also, by means of government aid, private donation and personal outlay, was a great part of the splendid collection which now occupies the natural history department of the Royal Scottish Museum in Edinburgh. In 1819 Jameson, with Sir David Brewster, started the Edinburgh Philosophical Journal, which after the tenth volume remained under his sole conduct till his death, which took place in Edinburgh on the 10th of April 1854. His bust now stands in the hall of the Edinburgh University library.

Jameson was the author of Outlines of the Mineralogy of the Shetland Islands (1797); and of the Legend of Arran (1797), incorporated with Mineralogy of the Scottish Isles (1800); Mineralogical Description of Scotland, vol. i., pt. 1. (Dumfries, 1803); this was to become the first of a series embracing all Scotland; System of Mineralogy (3 vols., 1804-1808; 3rd ed., 1820); Elements of Geology (1806); Mineralogical Treatise on the Hebrides and Shetland Islands (2 vols., 1813); and Manual of Mineralogy (1821); besides a number of occasional papers, of which a list will be found in the Edinburgh New Philosophical Journal for July 1854, along with a portrait and biographical sketch of the author.

JAMESON, a city, and the county-seat of Stutsman county, North Dakota, U.S.A., on the James River, about 185 miles W. of Fargo. Pop. (1900), 28,533, of whom 587 were foreign-born; (1905) 50,523; (1910) 43,582. Jameson is served by the Northern Pacific railway, of which it is a division headquarters. At Jameson is St John's Academy, a school for girls, conducted by the Sisters of St Joseph. The state hospital for the insane is just beyond the city limits. The city is the commercial centre of a prosperous farming and stock-raising region in the James River valley, and has grain-elevators and flour-mills. Jameson was first settled in 1873, near Fort Seward, a U.S. military post established in 1872 and abandoned in 1877, and was chartered as a city in 1883.

JAMESON, a city of Chautauqua county, New York, U.S.A., at the S. outlet of Chautauqua Lake, 68 m. S. by W. of Buffalo. Pop. (1900), 22,892, of whom 7270 were foreign-born, mostly Swedish; (1910 census) 31,297. It is served by the Erie and the Jamestown, Chautauqua & Lake Erie railways, by electric lines extending along Lake Chautauqua to Lake Erie on the N. and to Warren, Pennsylvania, on the S., and by summer steamboat lines on Lake Chautauqua. Jamestown is situated among the hills of Chautauqua county, and is a popular summer resort. There is a free public library, a hospital; a farm on the outskirts of town and a fine water-power combine to render Jamestown a manufacturing centre of considerable importance. In 1905 the value of its factory products was $10,340,752, an increase of 33.9% since 1900. The city owns and operates its electric-lighting plant and its water-supply system, the water, of exceptional purity, being obtained from artesian wells 4 m. distant. Jamestown was settled in 1810, was incorporated in 1827, and was chartered as a city in 1856. The city was named in honour of James Prendergast, an early settler.

JAMESON, a former village in what is now James City county, Virginia, U.S.A., on Jamestown Island, in the James River, about 40 m. above Norfolk. It was here that the first permanent English settlement in America was founded on the 13th of May 1607, that representative government was inaugurated on the American Continent in 1619, and that negro servitude was introduced into the original thirteen colonies, also in 1619. In Jamestown was the first Anglican church built in America. The settlement was in a low marshy district which proved to be unhealthy; it was accidently burned in January 1668, was almost completely destroyed by hurricanes in September 1676, the state houses and other buildings were again burned in 1698, and after the removal of the seat of government of Virginia from Jamestown to the Middle Plantations (now Williamsburg) in 1699 the village fell rapidly into decay. Its population had never been large: it was about 400 in 1600, and 183 in 1623; the mortality was always very heavy. By the middle of the 19th century the peninsula on which Jamestown had been situated had become an island, and by 1000 the James River had worn away the shore but had hardly touched the territory of the New Towne (1610), immediately E. of the first settlement; almost the only visible remains, however, were the tower of the brick church and a few gravestones. In 1900 the association for the preservation of Virginia antiquities, to which the site was deeded in 1803, induced the United States government to build a wall to prevent the further encroachment of the river; the foundations of several of the old buildings have since been uncovered, many interesting relics have been found, and in 1909 there were erected a brick church (which is as far as possible a reproduction of the fourth one built in 1639-1647), a marble shaft marking the site of the first settlement, another shaft commemorating the first house, a bronze monument to the memory of Captain John Smith, and another monument to the memory of Pocahontas. At the head of
Jāmī—JAMRUD

Jamestown peninsula, in July 1781, attempted to trick the Americans under Lafayette and General Anthony Wayne by displaying a few men on the peninsula and concealing the principal part of his army on the mainland; but when Wayne discovered the trap he made first a vigorous charge, and then a retreat to Lafayette's line. Early in the Civil War the Confederates regarded the site (then an island) as of such strategic importance that (near the brick church tower and probably near the site of the first fortifications by the original settlers) they erected heavy earthworks upon it for defence. (For additional details concerning the early history of Jamestown, see Virginia: History).

The founding at Jamestown of the first permanent English-speaking settlement in America was celebrated in 1607 by the Jamestown tercentennial exhibition, held on grounds at Sewell's Point on the shore of Hampton Roads. About twenty foreign nations, the federal government, and most of the states of the union took part in the exposition.

See L. G. Tyler, The Cradle of the Republic: Jamestown and James River (Richmond, 2nd ed., 1906); Mrs. K. A. Pryor, The Birth of the Nation: Jamestown, 1607 (New York, 1907); and particularly S. H. Yonge, The Site of Old "James Towne," 1607-1608 (Richmond, 1904), embodying the results of the topographical investigations of the engineer in charge of the river-wall built in 1900-1901.

JĀMĪ (Nūr-ud-Dīn 'Abd-ur-Rahman ibn Ahmad) (1474-1492), Persian poet and mystic, was born at Jām in Khorasan, whence the name by which he is usually known. In his poems of mystical and exoteric connotation, he often coined words meaning "wine-cup." He was the last great classic poet of Persia, and a pronounced mystic of the Sūfī philosophy.

His three diwān (1475-1491) contain his lyrical poems and odes; among his prose writings the chief is his Bahārīstān ("Summer-garden") (1487); and his collection of romantic poems, Ḥafi Awarān ("Seven Thrones"), contains the Sālamān wa ʿAbdī and his Yūsūf va Zāltiba (Joseph and Potiphar's wife).

On Jāmī's life and works see V. von Rosenberg, Biographische Nachrichten über Meh浣nas Abdurrahman Dischni (Vizianagaram, 1840); Gore Ouseley, Biographical Notices of Persian Poets (1846); W. N. Lees, A Biographical Sketch of the Mystic Philosopher and Poet Jami (Calcutta, 1890); E. Beauvais s.e. Djam in Nouvelle Biographie générale; and H. P. Ghir and Kohn's Grundriss der persischen Philologie, ii. There are English translations of the Bahārīstān by E. Rehatské (Benares, 1887) and Sorajji Fardunji (Bombay, 1889); of Ḥafi Awarān by Edward Sewell (1886, with a notice of Jami's life); of Yūsūf va Zāltiba by R. T. H. Griffith (1882) and A. Rogers (1892); also selections in English by F. Hadland Davis, The Persian Mystics: Jāmī (1906). (See also Persia: Literature.)

JAMIESON, JOHN (1759-1838), Scottish lexicographer, son of a minister, was born in Glasgow, on the 3rd of March 1759. He was educated at Glasgow University, and at the age of twenty-three attacked the "three years' theological study. Jamieson was licensed to preach in 1789 and became pastor of an Anti-burgher congregation in Forfar; and in 1797 he was called to the Anti-burgher church in Nicolson Street, Edinburgh. The union of the Burgher and Anti-burgher sections of the Secession Church in 1820 was largely due to his exertions. He retired from the ministry in 1830 and died in Edinburgh on the 27th of July 1838.

Jamieson's name stands at the head of a tolerably long list of works in the Bibliotheca britannica, but for his most important book is the laborious and erudite compilation, best described by its own title-page: An Etymological Dictionary of the Scottish Language; illustrating the words in their different significations by examples from Early, Middle, and Modern Writers; showing their Affinity to the Other Languages, and especially the Northern; explaining many terms which though now obsolete in England were formerly common to both countries; and elucidating National Rites, Customs and Institutions in the various districts. The first edition was published in 1789, and it was revived ed. by Longmuir and Donaldson was issued in 1837-1889.

JAMIESON, ROBERT (c. 1780-1844), Scottish antiquary, was born in Morayshire. In 1806 he published a collection of Popular Ballads and Songs from Tradition, Manuscript and Scarce Editions. Two pleasing lyrics of his own were included. Scott, through whose assistance he received a government post at Edinburgh, held Jamieson in high esteem and pointed out his skill in discovering the connexion between Scandinavian and Scottish legends. Jamieson's work preserved much oral tradition which might otherwise have been lost. He was associated with Henry Weber and Scott in Illustrations of Northern Antiquities (1814). He died on the 24th of September 1844.

JAMKHANDI, a native state of India, in the Deccan division of Bombay, ranking as one of the southern Maharrta J aggregates. Area, 534 sq. m. Pop. (1901), 105,357; estimated revenue, £33,000; tribute, £3,000. The chief is a Brahman of the Patwardhan family. Cotton, wheat and millet are cultivated, and cotton and silk cloth are manufactured, though not exported. The town of Jamkhandi, the capital, is situated 68 m. E. of Kolhapur. Pop. (1901), 13,020.

JAMMU, or JAMMU, the capital of the state of Jammu and Kashmir in Northern India, on the river Tavi (Tā-w), a tributary of the Chenab. Pop. (1901), 36,130. The town and palace stand upon the right bank of the river; the fort overhangs the left bank at an elevation of 150 ft. above the stream. The lofty white walls of the palace and citadel present a striking appearance from the surrounding country. Extensive pleasure grounds and ruins of great size attest the former prosperity of the city when it was the seat of a Rajput dynasty whose dominions extended into the plains and included the modern district of Sialkot. It was afterwards conquered by the Sikhs, and formed part of Ranjit Singh's dominions. After his death it was acquired by Gulab Singh as the nucleus of his dominions, to which the British added Kashmir in 1846. It is connected with Sialkot in the Punjab by a railway 16 m. long. In 1898 the town was devastated by a fire, which destroyed most of the public buildings.

The state of Jammu proper, as opposed to Kashmir, consists of a submontane tract, forming the upper basin of the Chenab. Pop. (1901), 1,521,507, showing an increase of 5 per cent in the decade. A land settlement has recently been introduced under British supervision.

JAMNIA (Ἰαμνία or Ιαμνεία), the Greek form of the Hebrew name Jabnēl—i.e. "God causeth to build." (Josh. xvi. 11)—or Jabneh (2 Chron. xxvi. 6), the modern Arabic Yēnna, a town of Palestine, on the border between Dan and Judah, situated 13 m. S. of Jaffa, and 4 m. E. of the seashore. The modern village stands on an isolated sandy hill, surrounded by gardens with olives to the north and sand-dunes to the west. It contains a small Crusaders' church, now a mosque. Jamnia belonged to the Philistines, and Uzziah of Judah is said to have taken it (2 Chron. xxvi. 6). In Maccabean times Joseph and Azarias attacked it unsuccessfully (1 Macc. v. 55-62, 2 Macc. xii. 8 seq. is untrustworthy). Alexander Jannaeus subdued it, and under Pompey it became Roman. It changed hands several times, is mentioned by Strabo (xvi. 2) as being once very populous, and in the Jewish war was taken by Vespasian. The population was mainly Jewish (Philo, Leg. ad Gaium, § 30), and on the site was principally famous as having been the seat of the Sanhedrin and the religious centre of Judaism from A.D. 70 to 135. It sent a bishop to Nicaea in 325. In 1144 a crusaders' fortress was built on the hill, which is often mentioned under the name Belin. There was also a Jabneh in Lower Galilee (Jos. xix. 33), called later Caphal Yama, the present village Yemna, 8 m. S. of Tiberias; and another fortress in Upper Galilee was named Jamnia (Josephus, Vita, 37). Attempts have been made to unite these two Galilean sites, but without success.

JAMRUD, a fort and cantonment in India, just beyond the border of Peshawar district, North-West Frontier Province, situated at the mouth of the Khyber Pass, 103 m. W. of Peshawar city, with which it is connected by a branch railway. It was occupied by Iari Singh, Ranjit Singh's commander in 1836; but in April 1837 Dost Mohammed sent a body of Afghans to attack it. The Sikhs gained a doubtful victory, with the loss of
JAMs AND JELLIES. In the article Food Preservation it is pointed out that concentrated sugar solution inhibits the growth of organisms and has, therefore, a preservative action. The preparation of jams and jellies is based upon that fact. All fresh and succulent fruit contains a large percentage of water, amounting to at least four-fifths of the whole, and a comparatively small proportion of sugar, not exceeding as a rule from 15 to 17%. Such fruit is naturally liable to fermentation unless the greater proportion of the water is removed or the percentage of sugar is greatly increased. The jams and jellies of commerce are fruit preserves containing so much added sugar that the total amount of sugar forms about two-thirds of the weight of the articles. All ordinary edible fruit can be and is made into jam. The fruit is sometimes pulped and stoned, sometimes used whole and unbroken; oranges are sliced or shredded. For the preparation of jellies only certain fruit is suitable, namely such as contains a peculiar material which on boiling becomes dissolved and on cooling solidifies, forming a transparent jelly. This material, often called pectin, occurs mainly in comparatively acid fruit, like gooseberries, currants and apples, and is almost absent from strawberries and raspberries. It is chemically a member of the group of carbohydrates, is closely allied with vegetable gums abundantly formed by certain sea-weeds and mosses (agar-agar and Iceland moss), and is probably a mixture of various pentoses. Pentoses are devoid of food-value, but, like animal gelatine, with which they are in no way related, can form vehicles for food material. Some degree of gelatinization is aimed at in making jam, and the fruit ingredients are best made soft by boiling them in water, such as the juice of apple or gooseberry, or even of Iceland moss or agar-agar, is made. Animal gelatin is very rarely used.

The art of jam and jelly making was formerly domestic, but has become a very large branch of manufacture. For the production of a thoroughly satisfactory conserve the boiling-down must be carried out very rapidly, so that the natural colour of the fruit shall be little affected. Considerable experience is required to stop at the right point; too short boiling leaves an excess of water, leading to fermentation, while over-concentration promotes crystallization of the sugar. The manufactured product is on that account less easily kept than jellies. Gelatin, like gelatinization, is a suitable vehicle for the preparation of a highly concentrated and bright jam. The finish of the boiling is mostly judged by rule of thumb, but in some scientifically conducted factories careful thermometric observation is employed. Formerly jams and jellies consisted of nothing but fruit and sugar; now starch-glucose is frequently used by manufacturers as an ingredient. This permits of the production of a slightly more aqueous and gelatinous product, alleged also to be devoid of crystallizing power, as compared with the home-made article. The addition of starch-glucose is not held to be an adulteration of the fruit but is mostly used by manufacturers to enhance the colour, and the effect of an excess of water is sought to be counteracted by the addition of some saccharic acid or other preservative. There has long been, and still exists to some extent, a popular prejudice in favour of sugar obtained from the sugar-cane as compared with that of the sugar-beet. This prejudice is absolutely baseless, and enormous quantities of beet-sugar are used in the boiling of jam. Adulteration in the gross sense, such as a substantial addition of coarse pulp, like that of turnips or mangolds, very rarely occurs; but a portion of pulp of apple and other cheap fruit is often admired without notice to the purchaser. The use of colouring matters and preservatives is discussed at length in the article ADULTERATION.

JANESVILLE, a city and the county-seat of Rock County, Wisconsin, U.S.A., situated on both sides of the Rock river, 70 m. S.W. of Milwaukee and 90 m. N.W. of Chicago. Pop. (1900), 13,185, of whom 2409 were foreign-born; (1920 census), 13,894. It is served by the Chicago & North-Western and the Chicago, Milwaukee & St Paul railways, and by electric lines connecting with Madison and Beloit, Wis., and Rockford, Illinois. The Rock river is not commercially navigable at this point, but furnishes valuable water-power for manufacturing purposes. The city is picturesquely situated on bluffs above the river. Janesville is the centre of the tobacco trade of the state, and has various manufactures. The total value of the city's factory product in 1905 was $3,846,638, an increase of 20-9% since 1900. Its public buildings include a city hall, court house, post office, city hospital and a public library. It is the seat of a school for the blind, opened as a private institution in 1849 and taken over by the state in 1859, the charitable institution controlled by the state, ranking as one of the most successful of its kind in the United States. The first settlement was made here about 1834. Janesville was named in honour of Henry F. Janes, an early settler, and was chartered as a city in 1853.

JANET, PAUL (1823–1899), French philosophical writer, was born in Paris on the 30th of April 1823. He was professor of moral philosophy at Bourges (1845–1848) and Strasbourg (1848–1857), and of logic at the lycée Louis-le-Grand, Paris (1857–1864). In 1864 he was appointed to the chair of philosophy at the Sorbonne, and elected a member of the academy of the moral and political sciences. He wrote a large number of books and articles upon philosophy, politics and ethics, on idealistic lines: La Famille, Histoire de la philosophie dans l'antiquité et dans le temps moderne, Histoire de la science politique, Philosophie de la Révolution Française, &c. They are not characterized by much originality of thought. In philosophy he was a follower of Victor Cousin, and through him of Hegel. His principal work in this line, Théorie de la morale, is little more than a somewhat patronizing reproduction of Kant. He died in October 1899. His father was a banker, and he was well educated, first at St Etienne, and then at the lycée Louis-le-Grand in Paris. He betook himself to journalism very early, and worked on the Figaro, the Quotidienne, &c., until in 1830 he became dramatic critic of the Journal des Débats. Long before this, however, he had made a considerable literary reputation, for which indeed his strange novel L'Ané mort et la femme guillotinée (1829) would have sufficed. La Confession (1830), which followed, was less remarkable in substance but even more so in style; and in Barère (1831) he attacked the régime. However, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, however, howe
JANISSARIES

one of his journeys a curious windfall, a country house at Lucca, in a lottery), and wrote accounts of his travels; he wrote numerous tales and novels, and composed many other works, of which by far the best is the *Fin d’un monde et du neveu de Rameau* (1861), in which, under the guise of a sequel to Diderot’s masterpiece, he showed his great familiarity with the late 18th century. He married in 1841; his wife had money, and he was always in easy circumstances. In the early part of his career he had many quarrels, notably one with Félix Pyat (1810-1886), whom he prosecuted successfully for defamation of character. For the most part his work is mere improvisation, and has few elements of vitality except a light and vivid style. His *Œuvres choisies* (19 vol., 1872-1874) were edited by A. de la Mottée.

A study on Janin with a bibliography was published by A. Pédagoguel in 1874. See also Sainte-Beuve, *Causeries du lundi*, ii. and iii., and Gustave Planche, *Portraits littéraires*.

JANISSARIES (corrupted from Turkish *yeni chéri*, new troops), an organized military force constituting until 1826 the standing army of the Ottoman empire. At the outset of her history Turkey possessed no standing army. All Moslems capable of bearing arms served as a kind of volunteer yeomanry known as *akbijas*; they were summoned by public criers, or, if the occasion required it, by secret messengers. It was under Orkhan that a regular paid army was first organized: the soldiers were known as *yayâ* or *piyâdê*. The result was unsatisfactory, as the Turcomans, from whom these troops were recruited, were accustomed to fight on foot or to submit to military discipline. Accordingly in 1330, on the advice of Chandârî Kara Khalîl, the system known as *devshirme* or forced levy, was adopted, whereby a certain number of Christian youths (at first 1000) were every year taken from their parents and, after undergoing a period of apprenticeship, were enrolled as *yeni chéri* or new troops. The venerable saint Hâji Bektaş, founder of the Bektaşî dervishes, blessed the corps and promised them victory; he remained ever after the patron saint of the janissaries.

At first the corps was exclusively recruited by the forced levy of Christian children, for which purpose the officer known as *tournaji-bashi*, or head-keeper of the crates, made periodical tours in the provinces. The fixed organization of the corps dates only from Mahommed II., and its regulations were subsequently modified by Suleiman I. In early days all Christians were enrolled indiscriminately; later those from Albania, Bosnia and Bulgaria were preferred. The recruits while serving their apprenticeship were instructed in the principles of the faith by *kojaî*, but according to D’Ohsson (vii. 327) they were not obliged to become Moslems.

The entire corps, commanded by the aga of the janissaries, was known as the *ojak* (hearth); it was divided into *ortas* or units of varying numbers; the *oda* (room) was the name given to the barracks in which the janissaries were lodged. There were, after the reorganization of Suleiman I., 106 ortas of three classes, viz. the *jemaat*, comprising 101 ortas, the *beuluk*, 61 ortas, and the *sebkan*, or *semen*, 34 ortas; to these must be added 34 ortas of *ojami* or apprentices. The strength of the orta varied greatly, sometimes being as low as 100, sometimes rising considerably beyond its nominal size. The strength of the ortas was rapidly increased. The distinction between the different classes seems to have been principally in name; in theory the *jemaat*, or *yaya keiser*, were specially charged with the duty of frontier-guards; the *beuluk* had the privilege of serving as the sultan’s guards and of keeping the sacred banner in their custody.

Until the accession of Murad III. (1574) the total effective of the janissaries, including the ajami or apprentices, did not exceed 20,000. In 1582 irregularities in the mode of admission to the ranks began. Soon parents themselves begged to have their children enrolled, so great were the privileges attaching to the corps; later the privilege of enlistment was restricted to the children or relatives of former janissaries; eventually the regulations were much relaxed, and any person was admitted, only negroes being excluded. In 1591 the ojak numbered 48,688 men. Under Ibrahim (1640-1648) it was reduced by Kara Mustafa to 17,000; but it soon rose again, and at the accession of Mahommed IV. (1648), the accession-bakshish was distributed to 50,000 janissaries. During the war of 1683-1686 the rules for admission were suspended, 30,000 recruits being received at one time, and the effective of the corps, rising to 70,000; about 1805 it numbered more than 122,000; it went on increasing until the destruction of the janissaries, when it reached 135,000. It would perhaps be more correct to say that these are the numbers figuring on the pay-sheets, and that they doubtless largely exceed the total of the men actually serving in the ranks.

Promotion to the rank of warrant officer was obtained by long or distinguished service; it was by seniority up to the rank of *emir*, but odahbasis were promoted to the rank of *chorbâjî* (commander of an orta) solely by selection. Janissaries were housed in their own ortas, which they left only to assume the command of another. Ortas remained permanently stationed in the fortress towns in which they were in garrison, being displaced in time of peace only when some violent animosity broke out between two companies. There were usually 12 in garrison at Belgrade, 14 at Khotin, 16 at Widdin, 20 at Bagdad, &c. The commander was frequently changed. A new chorbâjî was usually appointed to the command of an orta stationed at a frontier post; he was then transferred elsewhere, so that in course of time he passed through different provinces.

In time of peace the janissary received no pay. At first his war pay was limited to one asper per diem, but it was eventually raised to a minimum of three aspers, while veterans received as much as 20 aspers, and retired officers from 30 to 120. The aga received 24,000 piastres per annum; the ordinary pay of a commander was 120 aspers per diem. The aga and several of his subordinates received a percentage of the pay and allowance of the troops; they also inherited the property of deceased janissaries. Moreover, the officers profited largely by retaining the names of dead or fictitious janissaries on the pay-rolls.

Rations were distributed at the expense of the government, the supply of rice, butter and vegetables being at the charge of the commandant. The rations would have been entirely inadequate if the janissaries had not been allowed, contrary to the regulations, to pursue different callings, such as those of baker, butcher, glazier, boatman, &c. At first the janissaries bore no other distinctive mark save the white felt cap. Soon the red cap with gold embroidery was substituted. Later a uniform was introduced, of which the distinctive mark was less the colour than the cut of the coat and the shape of the head-dress and turban. The only distinctiveness of the uniform was the colour of their boots, those of the beulucks being red while the others were yellow; subordinate officers wore black boots.

The fundamental laws of the janissaries, which were very early enfringed, were as follows: implicit obedience to their officers; perfect accord and union among themselves; abstinence from luxury, extravagance and practices unseemly for a soldier and a brave man; observance of the rules of Hâji Bektaşî and of the religious law; exclusion from the ranks of all save those properly levied; special rules for the infliction of the death-penalty of mutiny to be by seniority; janissaries by the commandant or by the commander of the ortas being either deprived of their rank or of the appointment of the command of their orta, or being permitted or forbidden to engage in trade; the janissaries were not to let their beards grow, nor to marry, nor to leave their barracks, nor to engage in trade; but were to spend their time in drill and in practising the arts of war.

In time of peace the state supplied no arms, and the janissaries on service in the capital were armed only with clubs; they were forbidden to carry any arm save a cutlass, the only exception being at the frontier-posts. In time of war the janissaries provided their own arms, and these might be any which took their fancy. However, they were induced by rivalry to procure the best obtainable and to keep them in perfect order. The banner of the janissaries was of white silk on which verses from the Koran were embroidered in gold. This banner was planted beside the aga’s tent in camp, with four other flags in red cases, and his three horse-tails. Each orta had its flag, half-red and
half-yellow, placed before the tent of its commander. Each orta had two or three great caldrons used for boiling the soup and pillaw; these were under the guard of subordinate officers. A particular superstition attached to them: if they were lost in battle all the officers were disgraced, and the orta was no longer allowed to parade with its caldrons in public ceremonies. The janissaries were stationed in most of the guard-houses of Constantinople and other large towns. No sentries were on duty, but rounds were sent out two or three times a day. It was customary for the sultan or the grand vizier to bestow largesses on an orta which they might visit.

The janissaries conducted themselves with extreme violence and brutality towards civilians. They extorted money from them on every possible pretext: thus, it was their duty to sweep the streets in the immediate vicinity of their barracks, but they forced the civilians, especially if rayas, to perform this task or to pay a bribe. They were themselves subject to severe corporal punishments; if these were to take place publicly the ojak was first asked for its consent.

At first a source of strength to Turkey as being the only well-organized and disciplined force in the country, the janissaries soon became its bane, thanks to their lawlessness and exactions. One frequent means of exhibiting their discontent was to set fire to Constantinople; 140 such fires are said to have been caused during the 28 years of Ahmed III.'s reign. The janissaries were at all times distinguished for their want of respect towards the sultans; their outbreaks were never due to a real desire for their removal of the sultan, but were no more than a petty｀cleansing｀to obtain the downfall of some obnoxious minister.

The first recorded revolt of the janissaries is in 1443, on the occasion of the second accession of Mahomed II., when they broke into rebellion at Adrianople. A similar revolt happened at his death, when Bayazid II. was forced to yield to their demands and thus the custom of the accession-bakshish was established; at the end of his reign it was the janissaries who forced Bayazid to summon Prince Selim and to hand over the reins of power to him. During the Persian campaign of Selim I. they mutinied more than once. Under Osman II. their disorders reached their greatest height and led to the dethronement and murder of the sultan. It would be tedious to recall all their acts of insubordination. Throughout Turkish history they were made use of as instruments by unscrupulous and ambitious statesmen, and in the 19th century they had become a praetorian guard in the worst sense of the word. Sultan Selim III. in despair endeavoured to organize a properly drilled and disciplined force, under the name of nizam-i-jedid, to take their place; for some time the janissaries regarded this attempt in sullen silence; a curious detail is that Napoleon's ambassador Sebastiàndi strongly dissuaded the sultan from taking this step. Again serving as tools, the janissaries dethroned Selim and crowned others. But the abolition of the nizam-i-jedid. But after the successful revolution of Bairakdar Pasha of Widdin the new troops were re-established and drilled; the resentment of the janissaries rose to such a height that they attacked the grand vizier's house, and after destroying it marched against the sultan's palace. They were repulsed by cannon, losing 600 men in the affair (1866). But such was the excitement and alarm caused at Constantinople that the nizam-i-jedid, or sekbans as they were now called, had to be suppressed. During the next 20 years the misdeeds and turbulences of the janissaries knew no bounds. Sultan Mahmud II., powerful impressed by their violence and lawlessness at his accession, and with the example of Mehmet Ali's method of suppressing the Mamlukes before his eyes, determined to rid the state of this scourge; long bidding his time, in 1825 he decided to form a corps of regular drilled troops known as eshkenjis. A jetoa was obtained from the Sheikul-Islam to the effect that it was the duty of Muslems to acquire military science. The imperial decree announcing the formation of the new troops was promulgated at a grand council, and the high dignitaries present (including certain of the principal officers of the janissaries who concurred) undertook to comply with its provisions. But the janissaries rose in revolt, and on the 10th of June 1826, began to collect on the Et Meidan square at Constantinople; at midnight they attacked the house of the aga of janissaries, and, finding he had made good his escape, proceeded to overturn the caldrons of as many ortas as they could find, thus forcing the troops of those ortas to join the insurrection. Then they pillaged and smashed throughout the town. Meanwhile the government was collecting its forces; the ulema, consulted by the sultan, gave the following fetva: "If unjust and violent men attack their brethren, fight against the aggressors and send them before their natural judge!" On this the sacred standard of the prophet was unfurled, and war was formally declared against these disturbers of order. Cannon were brought against the Et Meidan, which was surrounded by troops. Ibrahim Aga, known as Kara Jeheennum, the commander of the artillery, made a last appeal to the janissaries to surrender; they refused, and fire was opened upon them. Such as 'escaped were shot down as they fled; the barracks where many found refuge were burnt; those who were taken prisoner were brought before the grand vizier and hanged. Before many days were over the corps had ceased to exist, and the janissaries, the glory of Turkey's early days and the scourge of the country for the last two centuries, had passed for ever from the page of her history.

See M. d'Ohsson, Tableaux de l'empire ottoman (Paris, 1787-1829); Ahmed Vefyék, Lehbi-i-emsadî (Constantinople, 1299-1874); A. Djéjad Bey, État militaire ottoman (Constantinople, 1885).

JANIUAY, a town of the province of Illoilo, Panay, Philippine Islands, on the Suague river, about 20 m. W.N.W. of Illoilo, the capital. Pop. (1901), 21,158, including Lambanao (1661), annexed to Janiuay in 1903. The town commands delightful views of mountain and valley scenery. An excellent road connects it with Pototan, about 10 m. E. The surrounding country is hilly but fertile and well cultivated, producing rice, sugar, tobacco, vegetables (for the Illoilo market), hemp and Indian corn. The women weave and sell beautiful fabrics of pina, silk, cotton and abaca. The language is Panay-Visayan. Janiuay was founded in 1578; it was first established in the mountains and was subsequently removed to its present site.

JANJIRA, a native state of India, in the Konkan division of Bombay, situated along the coast among the spurs of the Western Ghats, 40 m. S. of Bombay city. Area, 324 sq. m. Pop. (1901), 85,414, showing an increase of 4% in the decade. The estimated revenue is about £37,000; there is no tribute. The chief, whose title is Nawab Sahib, is by descent a Sidi or Abyssinian Mahomedan; and his ancestors were for many generations admirals of the Mahomedan rulers of the Deccan. The state, popularly known as Habsan (=Abyssinian), did not come under direct subordination to the British until 1870. It supplies sailors and fishermen, and also firewood, to Bombay, with which it is in regular communication by steamer.

The Nawab of Janjira is also chief of the state of JAPARAB (q.v.).

JAN MAYEN, an arctic island between Greenland and the north of Norway, about 71° N. 8° W. It is 34 m. long and 9 in greatest breadth, and is divided into two parts by a narrow isthmus. The island is of volcanic formation and mountainous, the highest summit being Beerenberg in the north (8350 ft.). Volcanic eruptions have been observed. Glaciers are fully developed. Henry Hudson discovered the island in 1607 and called it Hudson's Tuitches or Touches. Thereafter it was several times visited by navigators who successively claimed its discovery and renamed it. Thus, in 1611 or the following year whalers from Hull named it Trinity Island; in 1612 Jean Vrolicq, a French whaler, called it Ile de Richelieu; and in 1614 Joris Carolus named one of its promontories Jan Meys Hoek after the captain of one of his ships. The present name of the island is derived from this, the claim of its discovery by a Dutch navigator, Jan Mayen, in 1611, being unsupported. The island is not permanently inhabited, but has been frequently visited by explorers, sealers and whalers; and an Austrian station for scientific observations was maintained here for a year in 1882-1883. During this period a mean temperature of 27.8°F. was recorded.
JANSEN, CORNELIUS (1585–1638), bishop of Ypres, and father of the religious revival known as Jansenism, was born of humble Catholic parentage at Acre in the province of Utrecht on the 28th of October 1635. In 1602 he entered the University of Louvain, then in the throes of a violent conflict between the Jesuit, or scholastic, party and the followers of Michael Baius, who swore by St Augustine. Jansen ended by attaching himself strongly to the latter party, and presently made a momentous friendship with a like-minded fellow-student, Du Vergier de Hauranne, afterwards abbot of St Cyran. After taking his degree he went to Paris, partly to recruit his health by a change of scene, partly to study Greek. Eventually he joined the University of Utrecht, and spent some years teaching at the bishop's college. All his spare time was spent in studying the early Fathers with Du Vergier, and laying plans for a reformation of the Church. In 1616 he returned to Louvain, to take charge of the college of St Pulcheria, a hostel for Dutch students of theology. Pupils found him a somewhat choleric and exacting master and academic society a great recourse. However, he took an active part in the university's resistance to the Jesuits; for these had established a theological school of their own in Louvain, which was proving a formidable rival to the official faculty of divinity. In 1618, Jansen, who had been sent twice to Madrid, in 1624 and 1626; the second time he narrowly escaped the Inquisition. He warmly supported the Catholic missionary bishop of Holland, Roovenius, in his contests with the Jesuits, who were trying to evangelize that country without regard to the bishop's wishes. He also crossed swords more than once with the Dutch Presbyterian champion, voetius, still remembered for his attacks on Descartes. Antipathy to the Jesuits brought Jansen no nearer Protestantism; on the contrary, he yearned to beat these by their own weapons, chiefly by showing them that Catholics could interpret the Bible in a manner quite as mystical and pietistic as theirs. This became the great object of his lectures, when he was appointed regius professor of scriptural interpretation at Louvain in 1630. Still more was it the object of his Augsteinus, a bulky treatise on the theology of St Augustine, barely finished at the time of his death. Preparing it had been his chief occupation ever since he went back to Louvain. But Jansen, as he said, did not mean to be a school-pedant all his life; and there were moments when he dreamed political dreams. He looked forward to a time when Belgium should throw off the Spanish yoke and become a independent Catholic Holland. These ideas became known to his Spanish rulers, and to assuage them he wrote a philippic called the Mars gallicus (1635), a violent attack on French ambitions generally, and on Richelieu's indifference to international Catholic interests in particular. The Mars gallicus did not do much to help Jansen's friends in France, but it more than appeased the wrath of Madrid with Jansen himself; in 1636 he was appointed bishop of Ypres. Within two years he was cut off by a sudden illness on the 6th of May 1638; the Augsteinus, the book of his life, was published posthumously in 1640.

Full details as to Jansen's career will be found in Reuchlin's Geschicht von Port Royal (Hamburg, 1839), vol. 1. See also Janesinius by the Abbé Calluwaert and Nols (Louvain, 1893). (St C.)

Jansenism, the religious principles laid down by Cornelius Jansen in his Augsteinus. This was simply a digest of the teaching of St Augustine, drawn up with a special eye to the needs of the 17th century. In Jansen's opinion the church was suffering from three evils. The official scholastic theology was anything but evangelical. Having set out to embody the mysteries of faith in human language, it had fallen a victim to the excellence of its own methods; language proved too strong for mystery. Theology sank into a branch of dialectic; whatever would not fit in with a logical formula was cast aside as useless. But average human nature does not take kindly to a syllogism, and theology had ceased to have any appreciable influence on popular religion. Simple souls found their spiritual pasture in little mingled " devotions "; while robuster minds built up for themselves a natural moralistic religion, quite as close to Epicetetus as to Christianity. All these three evils were attack by Jansen. As against the theologians, he urged that in a spiritual religion experience, not reason, must be our guide. As against the stoical self-sufficiency of the moralists, he dwelt on the helplessness of man and his dependence on his maker. As against the ceremonialists, he maintained that no amount of church-going will save a man, unless the love of God is in him. But this capacity for love no one can give himself. If he is born without the religious instinct, he can only receive it by going through a process of " conversion." And whether God converts this man or that depends on his good pleasure. Thus Jansen's theories of conversion melt into predestination; although, in doing so, they somewhat modify its grimness. Even for the worst miscreant there is hope—for who can say but that God may yet think fit to convert him? Jansen's thoughts went back every moment to his two spiritual heroes, St Augustine and St Paul, each of whom had been "the chief of sinners."

Such doctrines have a marked analogy to those of Calvin; but in many ways Jansen differed widely from the Protestants. He vehemently rejected their doctrine of justification by faith; conversion might be instantaneous, but it was only the beginning of a long process of justification. The doctrine of predestination was one thing necessary in religion was a personal relation of the human soul to its maker, Jansen held that that relation was only possible in and through the Roman Church. Herein he was following Augustine, who had managed to couple together a high theory of church authority and sacramental grace with a strongly personal religion. But the circumstances of the 17th century were not those of the 5th; and Jansen landed his followers in an inextricable confusion. What were they to do, when the outward church said one thing, and the inward voice said another? Some time went by, however, before the two authorities came into open conflict. Jansen's ideas were popularized in France by his friend Du Vergier, abbot of St Cyran; and he dwelt mainly on the practical side of the matter—on the necessity of conversion and love of God, as the basis of the religious life. This brought him into conflict with the Jesuits, whom he accused of giving absorption much too easily, without any serious inquiry into the dispositions of their penitent. His views are expounded at length by his disciple, Antoine Arnauld, in a book on Frequent Communion (1643). This book was the first manifestation of Jansenism to the general public in France, and raised a violent storm. At first the Catholic divines supported Arnauld and the inquisition was taken against his party till 1649. In that year the Paris University condemned five propositions from Jansen's Augsteinus, all relative to predestination. This censure, backed by the signatures of eighty-five bishops, was sent up to Rome for endorsement; and in 1653 Pope Innocent X. declared all five propositions heretical.

This decree placed the Jansenists between two fires; for although the five propositions only represented one side of Jansen's teaching, it was recognized by both parties that the whole question was to be fought out on this issue. Under the leadership of Arnauld, who came of a great family of lawyers, the Jansenists accordingly took refuge in a series of legal tactics. Firstly, they denied that Jansen had meant the propositions in the sense condemned. Alexander VII. replied (1656) that his predecessor had condemned them in the sense intended by their author. Arnauld retorted that the church might be infallible in abstract questions of theology; but as to what was passing through an author's mind it knew no more than any one else. However, the French government supported the pope. In 1656 Arnauld was deprived of his degree, in spite of Pascal's Prometiel Letters (1656–1657), begun in an attempt to save him (see PASCAL; CASUISTRY). In 1661 a formulary, or solemn renunciation of Jansen, was imposed on all his suspected followers; those who would not sign it went into hiding, or to the Bastille. Peace was only restored under Clement IX. in 1669.

This peace was treated by Jansenist writers as a triumph; really it was the beginning of their downfall. They had set out
JANSSEN, C.—JANSSEN, J.

reform the Church of Rome; they ended by having to fight hard for a doubtful foothold within it. Even that foothold soon gave way. Louis XIV's was a fanatic for uniformity, civil and religious; the last thing he was likely to tolerate was a handful of deserters from his crown, and he continued to be in special touch with Heaven, and therefore might at any moment set their conscience up against the law. During the lifetime of his cousin, Madame de Longueville, the great protectoress of the Jansenists, Louis stayed his hand; on her death (1679) the reign of severity began. That summer Arnauld, who had spent the greater part of his life in hiding, was forced to leave France for good.

Six years later he was joined in exile by Pasquier Quesnel who succeeded him as leader of the party. Long before his flight from France Quesnel had published a devotional commentary—Réflexions morales sur le Nouveau Testament—which had gone through many editions without exciting official suspicion. But in 1695 Louis Antoine de Noailles, bishop of Châlons, was made archbishop of Paris. He was known to be very hostile to the Jesuits, and at Châlons had more than once expressed official approval of Quesnel's Réflexions. So the Jesuit party determined to wreck archbishop and book at the same time. The Jansenists played into their hands by suddenly raising (1701) in the Paris divinity school the question whether it was necessary to accept the condemnation of Jansen with interior assent, or whether a "respectful silence" was enough. Very soon after the school was suppressed. In 1703 Louis XIV. wrote to Pope Clement XI., proposing that they should take joint action to make an end of Jansenism for ever. Clement replied in 1705 with a bull condemning respectful silence. This measure only whetted Louis's appetite. He was growing old and increasingly superstitious; the affairs of his realm were going from bad to worse; he became frenziedly anxious to perpetuate the wrath of his maker by making war on the enemies of the Church. In 1712 he asked the pope for a second, and still stronger bull, that would tear up Jansenism by the roots. The pope's choice was a bull Unigenitus, a bull Unigenitus, anathematizing no less than one hundred and one of its propositions. Indeed, in his zeal against the Jansenists the pope condemned various practices in no way peculiar to their party; thus, for instance, many orthodox Catholics were exasperated at the heavy blows he dealt at popular Bible reading. Hence the bull met with much opposition from Archbishop de Noailles and others who did not call themselves Jansenists. In the midst of the conflict Louis XIV. died (September 1715); but the freethinking duke of Orleans, who succeeded him, was not a friend of the Jansenists, and as soon as he was crowned the bull Unigenitus was withdrawn. Thereupon four bishops appealed against it to a general council; and the country became divided into "appellants" and "acceptants" (1717). The regent's disreputable minister, Cardinal Dubois, patched up an abortive truce in 1720, but the appellants promptly "re-appealed" against it. During the next ten years, however, they were slowly crushed, and in 1730 the Unigenitus was proclaimed part and parcel of the law of France. This led to a great quarrel with the judges, who were intensely Gallican in spirit (see GALICANISM), and had always regarded the Unigenitus as a triumph of ultramontanism. The quarrel dragged indefinitely on through the 18th century, though the questions at issue were really constitutional and political rather than religious.

Meanwhile the most ardent Jansenists had followed Quesnel to Holland. Here they met with a warm welcome from the Dutch Catholic body, which had always been in close sympathy with Jansenism, although without regarding itself as formally pledged to the Augustinus. But it had broken loose from Rome in 1702, and was now organizing itself into an independent church (see Utrech). The Jansenists who remained in France had meanwhile fallen in civil days. Persecution usually begets hysteria in its victims; and the more extravagant members of the party were far advanced on the road which leads to apocalyptic prophecy and "speaking with tongues." About 1728 the "miracles of St Médard" became the talk of Paris. This was the cemetery where was buried François de Paris, a young Jansenist deacon of singularly holy life, and a periphrastic opponent of the Unigenitus. All sorts of miraculous cures were believed to have been worked at his tomb, until the government closed the cemetery in 1732. This gave rise to the famous epigram:

De par le roi, défense à Dieu
De faire miracle en ce lieu.

On the miracles soon followed the rise of the so-called Convulsionaries. These worked themselves up, mainly by the use of frightful self-tortures, into a state of frenzy, in which they prophesied and cured diseases. They were eventually disowned by the more reputable Jansenists, and were severely repressed by the police. But in 1737 they were still important enough for Diderot to enter the field against them. Meanwhile genuine Jansenism survived in many country parsonsages and convents, and was even able to frequently draw large audiences. Only one of its latter-day disciples, however, rose to real eminence; this was the Abbé Henri Grégoire, who played a considerable part in the French Revolution. A few small Jansenist congregations still survive in France; and others have been started in connexion with the Old Catholic Church in Holland.

LITERATURE.—For the 17th century see the Port Royal of Sainte-Beuve (5th ed., Paris, 1888) in six volumes. See also H. C. G. Jansen's Schriftwerke was published between 1696 and 1803; A. Spenard and C. Beard, Port Royal (2 vols., London, 1861). No satisfactory Catholic history of the subject exists, though reference may be made to Count Joseph de Maistre's De l'église gallicane (last ed., Lyons, 1881). On the last quarter of the 18th century no single work exists, though much information will be found in the Gallican Church of Canon Jervis (2 vols., London, 1872). For a series of excellent sketches see also Seche, Les Derniers Jansentiens (5 vols., Paris, 1891). A more detailed list of bibliographical bearing on the subject will be found in the 5th volume of the Cambridge Modern History; and J. Paquier's Le Jansénisme (Paris, 1909) may also be consulted.

(St C.)

JANSSEN, or JANSSEN (sometimes JOHNSON), CORNELIUS (1593-1664), Flemish painter, was apparently born in London, and baptized on the 24th of October 1593. There seems no reason to doubt the purpose, which is stated by the author of his life, that he was born in Amsterdam. He worked in England from 1618 to 1643, and afterwards retired to Holland, working at Middelburg, Amsterdam, The Hague and Utrecht, and dying at one of the last two places about 1664. In England he was patronized by James I. and the court, and under Charles I. he continued to paint the. numerous portraits which adorn many English mansions and collections. Janssen's pictures, chiefly portraits, are distinguished by clear colouring, delicate touch, good taste and careful finish. He generally painted upon panel, and often worked on a small scale, sometimes producing replicas of his work at Frankfurt on the Main. He died at Frankfort on the 24th of December 1691. Janssen was a portrait painter of the Ultramontane party in the Roman Catholic Church. His great work is his Geschichte des deutschen Volkes seit dem Ausgang des Mittelalters (8 vols., Freiburg, 1878-1894). In this book he shows himself very hostile to the Reformers, and attempts to prove that the Protestants were responsible for the general unrest in Germany during the 16th and 17th centuries. The author's partisanship led to some controversy, and Janssen wrote An meine Kritiker (Freiburg, 1882) and Ein zweites Wort an meine Kritiker (Freiburg, 1882) in reply to the Jansens Geschichte des deutschen Volkes (Munich, 1882) of M. Lenz, and other criticisms.

The Geschichte, which has passed through numerous editions, has been continued and improved by Ludwig Pastor, and the greater part of it has been translated into English by M. A. Mitchell and A. M.
JANSSSEN, P. J. C.—JANUS

Christie (London, 1896, fol.). Of his other works perhaps the most important are: the edition of Frankfurts Reichskorrespondenz, 1370–1510 (Freiburg, 1863–1872); and of the Leben, Briefe und kleinere Schriften of his friend J. F. Böhmer (Leipzig, 1868); a monograph, Schüler als Historiker (Freiburg, 1863); and Zeit- und Lebensbilder (Freiburg, 1870).

See L. Pastor, Johannes Janssen (Freiburg, 1893); F. Meister, Erinnerung an Johannes Janssen (Frankfort, 1896); Schwann, Johannes Janssen und die Geschichte der deutschen Reformation (Munich, 1892).

JANSSSEN, PIERRE JULES CÉSAR (1824–1907), French astronomer, was born in Paris on the 22nd of February 1824, and studied mathematics and physics at the faculty of sciences. He taught at the lycée Charlemagne from 1845, and in the school of astronomy at Meudon, but his energies were mainly devoted to various scientific missions entrusted to him. Thus in 1857 he went to Peru in order to determine the magnetic equator; in 1861–1862 and 1864, he studied telluric absorption in the solar spectrum in Italy and Switzerland; in 1867 he carried out optical and magnetic experiments at the Azores; he successfully observed both transits of Venus, that of 1874 in Japan, that of 1882 at Oran in Algeria; and he took part in a long series of solar eclipse-expeditions, e.g. to Trinidad (1867), Guntoo (1868), Algiers (1870), Siam (1873), the Caroline Islands (1883), and to Acosbre in Spain (1895). To see the eclipse of 1870 he escaped from besieged Paris in a balloon. At the great Indian eclipse of 1868 he demonstrated the gaseous nature of the red prominences, and devised a method of observing them under ordinary daylight conditions. One main purpose of his spectroscopic inquiries was to answer the question whether the sun contains oxygen or not. An indispensable preliminary was the virtual elimination of oxygen-absorption in the earth's atmosphere, and his bold project of establishing an observatory on the top of Mont Blanc was prompted by a perception of the advantages to be gained by reducing the thickness of air through which observation was to be made. This observatory, the foundations of which were fixed in the snow that appears to cover the summit to a depth of ten metres, was built in September 1893, and Janssen, in spite of his sixty-nine years, made the ascent and spent four days taking observations. In 1875 he was appointed director of the new astrophysical observatory established by the French government at Meudon, and set on foot there in 1876 the remarkable series of solar photographs collected in his great Atlas de photographies solaires (1904). The first volume of the Annales de l'observatoire de Meudon was published by him in 1896. He died at Paris on the 23rd of December 1907.

See A. M. Clerke, Hist. of Astr. during the 19th Century (1903); H. Macpherson, Astronomers of To-Day (1905).

JANSSENS (or JANSSENS), VICTOR HONORIUS (1664–1739), Flemish painter, was born at Brussels. After seven years in the studio of an obscure painter named Volders, he spent four years in the household of the duke of Holstein. The next eleven years Janssens passed in Rome, where he took eager advantage of all the aids to artistic study, and formed an intimate acquaintance with Templest, in whose landscapes he frequently inserted fictitious rising into popularity, he painted a large number of cabinet historical scenes; but, on his return to Brussels, the claims of his increasing family restricted him almost entirely to the larger and more lucrative size of picture, of which very many of the churches and palaces of the Netherlands contain examples. In 1718 Janssens was invited to Vienna, where he stayed three years, and was made painter to the emperor. The statement that he visited England is based only upon the fact that certain fashionable interiors of the time in that country have been attributed to him. Janssens' colouring was good, his touch delicate and his taste refined.

JANSSENS (or JANSSENS) VAN NUYSSSEN, ABRAHAM (1567–1628), Flemish painter, was born at Antwerp in 1567. He studied under Jan Snellinck, was a "master" in 1602, and in 1607 was dean of the master-painters. Till the appearance of Rubens he was considered perhaps the best historical painter of his time. The styles of the two artists are not unlike. In correctness of drawing Janssens excelled his great contemporary; in bold composition and in treatment of the nude he equalled him, but in faculty of colour and in general freedom of disposition and touch he fell far short. A master of chiaroscuro, he gratified his taste for strong contrasts of light and shade in his torchlights and similar effects. Good examples of this master are to be seen in the Antwerp museum and the Vienna gallery. The stories of his jealousy of Rubens and of his dissolve life are quite unfounded. He died at Antwerp in 1632.

JANUARIUS, ST., OR SAN GENNARO, the patron saint of Naples. According to the legend, he was bishop of Benevento, and flourished towards the close of the 3rd century. On the 14th of October he was martyred by the prefect of Naples. He was taken to Nola and brought before Timotheus, governor of Campania, on account of his profession of the Christian religion. After various assaults upon his constancy, he was sentenced to be cast into the fiery furnace, through which he passed wholly unharmed. On the following day, along with a number of fellow martyrs, he was exposed to the fury of wild beasts, which, however, laid themselves down in tame submission at his feet. Timotheus, again pronouncing sentence of death, was struck with blindness, but immediately healed by the powerful intercession of the saint. The relic is shown twice a year—in May and September. On these occasions the substance contained in the phial liquefies, and the Neapolitans see in this phenomenon a supernatural manifestation. The "miracle of St Januarius" did not occur before the middle of the 15th century.

A great number of saints of the name of Januarius are mentioned in the martyrologies. The best-known are the Roman martyr (festival, the 10th of July), whose epitaph was written by Pope Damasus (De Rossi, Bullettino, p. 17, 1863), and the martyr of Cordova, who forms along with Faustus and Martialis the group designated by Prudentius (Peristephanon, vii. 49). The festival of this martyr is celebrated on the 13th of October.

Tagliatela, Memorie storico-crítiche del culto del santo di S. Gennaro (Naples, 1893), which contains many facts, but little criticism; G. Albini, Sulla mobilità dei liquidi viscosi non omogeni (Società reale di Napoli, Rendiconti, 2nd series, vol. iv., 1890); Acta sanctorum, October, vi. 187–193. (H. De.)

JANUARY, the first month in the modern calendar, consisting of thirty-one days. The name (Lat. Januarius) is derived from the two-faced Roman god Janus, to whom the month was dedicated. As doorkeeper of heaven, as looking both into the past and the future, and as being essentially the deity who busied himself with the beginnings of all enterprises, he was appropriately made guardian of the fortunes of the new year. The consecration of the month took place by an offering of meal, salt, frankincense and wine, each of which was new. The Anglo-Saxons called January Wulfmonath, in allusion to the fact that hunger then made the wolves bold enough to come into the villages. The principal festivals of the month are: New Year's Day; Feast of the Circumcision; Epiphany; Twelfth-Day; and Conversion of St Paul (see Calendar).

JANUS, in Roman mythology one of the principal Italian deities. The name is generally explained as the masculine form of Diana (Jana), and Janus as originally a god of light and day, who gradually became the god of the beginning and origin of all things. According to some, however, he is simply the god
of doorways (Januæ) and in this connexion is the patron of all entrances and beginnings. According to Mommssen, he was "the spirit of opening," and the double-headed was connected with the gate that opened both ways. Others, attributing to him an Etruscan origin, regard him as the god of the vault of heaven, which the Etruscan arch is supposed to resemble. The rationalists explained him as an old king of Latium, who built a citadel for himself on the Janiculum. It was believed that his worship, which was said to have existed as a local cult before the foundation of Rome, was introduced there by Romulus, and that a temple was dedicated to him by Numa. This temple, in reality only an arch or gateway (Januæ geminus) facing east and west, stood at the north-east end of the forum. It was open during war and closed during peace (Liv. i. 10); it was shut only four times in the Christian era. A possibility is that it was considered a bad omen to shut the city gates while the citizens were outside fighting for the state; it was necessary that they should have free access to the city, whether they returned victorious or defeated. Similarly, the door of a private house was kept open while the members of the family were away, but when all were at home it was closed to keep out intruders. There was also a temple of Janus near the theatre of Marcellus, in the forum olitorium, erected by Gaius Duilius (Tacit. Ann. ii. 40), if not earlier. The name of the day (the 21st of the month, and of the year (January) was sacred to Janus; on the 9th of January the festival called Aonia was celebrated in his honour. He was invoked before any other god at the beginning of any important undertaking; his priest was the Rex Sacrorum, the representative of the ancient king in his capacity as religious head of the state. All gateways, house-doors and entrances generally, were under his protection; he was the inventor of agriculture (hence Consivius, "he who sows or plants"), of civil laws, of the coinage of money and of religious worship. He was worshipped on the Janiculum as the protector of the shrine of his brother, while on the Capitol with the prow of a ship. He is usually represented on the earliest coins with two bearded faces, looking in opposite directions; in the time of Hadrian the number of faces is increased to four. In his capacity as porter or doorkeeper he holds a staff in his right hand, and a key (or keys) in his left; as such he is called Patulcius (opener) and Clusius (closer). His titles Curiator, Patricius, Quirinus originate in his worship in the gentes, the curiae and the state, and have no reference to any special functions or characteristics. In later times, he is both bearded and unbearded; in place of the staff and keys, the fingers of his right hand show the number 500 for his left the number of the remaining days of the year (LXV). According to A. B. Cook (Classical Review, xviii. 367), Janus is only another form of Jupiter, the name under which he was worshipped by the pre-Latin (aboriginal) inhabitants of Rome; after their conquest by the Italians, Janus and Jana took their place as independent divinities by the side of the Italian Jupiter and Juno. He considers it probable that the three-headed Janus was a triple oak-god worshipped in the form of two vertical beams and a cross-bar (such as the tigillum sororium, for which Horat. origin, hence the joining of two lintels and side-posts, was sacred to Janus. The three-headed type may have been the original, from which the two-headed and four-headed types were developed. J. G. Frazer (The Early History of the Kingship, pp. 274, 285), who also identifies Janus with Jupiter, is of opinion that Janus was not originally a doorkeeper, but that the door was called after him, not vice versa. Janua may be an adjective, janua foris meaning a door with a symbol of Janus close by the chief entrance, to serve as a protection for the house; then janua alone came to mean a door generally, with or without the symbol of Janus. The double head may have been due to the desire to make the god look both ways for greater protection. By J. Rhys (Hibernia Lectures, 1886, pp. 82, 94) Janus is identified with the three-faced (sometimes three-headed) Celtic god Cernunnus, a cthonian divinity, compared by Rhys with the Teutonic Heimdali, the warder of the gods of the under-world; like Janus, Cernunnus and Heimdali were considered to be the fons et origo of all things.

JAORA, a native state of Central India, in the Malwa agency. It consists of two isolated tracts, between Ratlam and Neemuch. Area, with the dependencies of Pipalanda and Pant Pipalanda, 668 sq. m. Pop. (1901), 54,502. The estimated revenue is £57,000; tribute, £500. The chief, whose title is nawab, is a Mahomedan of Afghan descent. The state was confirmed by the British government in 1818 by the Treaty of Mannusar. Nawab Mahomedan Ismail, who died in 1805, was an honorary major in the British army. His son, Ifthikhar Ali Khan, a minor at his accession, was educated in the Daly College at Indore, with a British officer for his tutor, and received powers of administration in 1896. The chief crops are millets, cotton, maize and poppy. The last supplies a large part of the Malwa opium commerce. The town of Jaora is on the Rajputana-Malwa railway, 20 m. N. of Ratlam. Pop. (1901), 23,542. It is well laid out, with many good modern buildings, and has a high school and dispensary. To celebrate Queen Victoria's Diamond Jubilee, the Victoria Institute and a zanana dispensary were opened in 1898.

JAPAN, an empire of eastern Asia, and one of the great powers of the world. The following article is divided for convenience into ten sections—I. Geography; II. The People; III. Language and Literature; IV. Art; V. Economic Conditions; VI. Government and Administration; VII. Religion; VIII. Foreign Intercourse; IX. Domestic History; X. The Claim of Japan.

I.—Geography

The continent of Asia stretches two arms into the Pacific Ocean, Kamchatka in the north and Malacca in the south, between which lies a long cluster of islands constituting the Japanese empire, which covers 37° 14' of longitude and 29° 11' of latitude. On the extreme north are the Kuriles (called by the Japanese Chishima, or the "myrdal isles"), which extend to 159° 32' E. and to 56° 56' N.; on the extreme south is Formosa (called by the Japanese Taiwana), which extends to 122° 6' E., and to 21° 45' N. There are six large islands, namely Sakhalin (called by the Japanese Karafuto); Yezo or Ezo (which with the Kuriles is designated Hokkaido, or the north-east district); Nippon (the "origin of the sun"), which is the main island; Shikoku (the "four provinces"), which lies on the east of Nippon; Kiushu or Kyushu (the "nine provinces"), which lies on the south of Nippon, and Formosa, which forms the most southerly link of the chain. Formosa and the Pescadores were ceded to Japan by China after the war of 1894-1895, and the southern half of Sakhalin—the part south of 50° N.—was added to Japan by cession from Russia in 1905. Korea, annexed in August 1910, is separately noticed.

Coast-line.—The following table shows the numbers, the lengths of coast-line, and the areas of the various groups of islands, only those being indicated that have a coast-line of at least 1 m (24 m.), or that, though smaller, are inhabited; excess areas of Formosa and the Pescadores, where the whole numbers are given:

branch. Lofty summits are separated by comparatively low passes, which lie at the level of crystalline rocks and schists constituting the original uplands upon which the summits have been piled by repeated action, and which have been softened by the weathering.

Climatic agencies have smoothed and modified everything rugged or abrupt, until an impression of gentle undulation rather than of grandeur is suggested. Nowhere is the region of eternal snows seen, and mountains have lost their former aspect of the scenery and glorify in autumn with tints of striking brilliancy. Mountain alternates with valley, so that not more than one-eighth of the country.

The king of Japanese mountains is Fuji-yama or Fuji-san (peerless mount), of which the highest point (Ken-ga-mine) is 12,395 ft. above sea-level. The remarkable gracie of this mount would be an imposing picture, if not for the fact that a great portion of the most beautiful in the world, and has obtained for it a prominent place in Japanese decorative art. Great streams of lava flowed from the crater in ancient times. The course of one is still marked by a distinct track half covered, for the most part, with deep deposits of ashes and scoriae. On the south slopes, unbroken by the sea, but on the other three sides the plain on which it rises is surrounded by mountains among which, on the north and west, a series of most picturesque lakes has been formed in consequence of the rivers having been dammed by ashes ejected from Fuji’s crater. To a height of some 1500 ft., the slopes of the mountain are cultivated; a grassy moorland stretches up the next 2500 ft.; then follows a forest, the upper edge of which climbs to an altitude of nearly 8000 ft., and finally the mountain-side is covered with the remnant of the Alpine plants found abundantly on the summits of other high mountains in Japan. A fact, doubtless, to the comparatively recent activity of the volcano. The ascent of Fuji presents no great difficulties for a traveling mountaineer. A traveler can reach the summit by means of a railroad to Gotemba; by rail from Yokohama, and thence the ascent and descent may be made in one day by a pedestrian.

The provinces of Hida and Etchū are bounded on the east by a chain of mountainous inlets including or having the immediate vicinity, the highest peaks in Japan after Fuji. Six of these summits rise to a height of 9000 ft. or upwards, and are the most prominent in the country. The ridge runs due north and south through 60 to 70 m., and has a width of 5 to 10 m. It is mostly granite, only two of the mountains—Norikura and Togakushi—showing the typical volcanic character. Their flanks are clothed with forests of beech, conifers, and oak. Further south, in the same range, stands Ontake (10,450 ft.), the second highest mountain in Japan proper (as distinguished from Formosa); and other remarkable though not so lofty peaks mark the same regions. This grand group of mountains has been well called "Alps of Japan," and a good account of them may be found in The Japanese Alps (1896) by Dr. W. Weston. On the summit of Ontake are eight large and several small craters, and there may also be seen displays of trance and "divine possession," such as are described by Mr. Percival Lowell in Occult Japan (1895).

There are mountainous pictures in the islands of the Sea of Japan, which are the Nikko mountains, enclosing the mausolea of the two greatest of the Tokugawa shōguns. The highest of these mountains (6422 ft.), Nantai-san (8169 ft.), and Yoko- san (3100 ft.), and of the highest, is clothed with magnificent vegetation, and everywhere they echo the voices of waterfalls and rivulets.

The mountain ranges forming the peaks of remarkable height. The best known are Chikai-zan, called "Aka-Fuji" (the Fuji of the Akita province), a volcano 7077 ft. high, which was active as late as 1801; Ganju-san (7691 ft.), called also "Nanbu-Fuji" or Iwate-zan, remarkable for the beauty of its logarithmic curves; Iwaki-san (5230 ft.), known as Tsugaru-Fuji, and said by some to have been more imposing than Fuji itself; and the twin mountains of Gassan (6447 ft.) and Haguro-san (5600 ft.). A little farther south, enclosing the fertile plain of Aizu (Aizu-tairai), as it is called, several important peaks are found, among them being Iide-san (6332 ft.); Mt. Omuro (7733 ft.), and for a long time, Mt. Daisen, which has given many evidences of volcanic activity during recent years; Nasu-dake (6296 ft.), an active volcano; and Bandai-san (6073 ft.). A terrible interest attaches to the last-named mountain, after a series of earthquakes and quakes had quieted it in 1889; its eruption in 1911 has become one of the greatest volcanic events, with an area of 28 sq. m. in the province of Kōzuke, which belongs to the central part of the main island, the noteworthy mountain being Azuma-yama (8136 ft.), one of the best known and most violently active volcanoes of Japan; Akagi-san, a circular range of peaks surrounding the basin of an old crater and rising to an altitude of 6210 ft., is noted for scenic beauties, and Myogi-san, a cluster of pinacles which, though not rising higher than 3880 ft., offer scenery that dispels

The Japanese Alps.

The Nikko Mountains.
the delusion that nature as represented in the classical pictures of China and Japan exists only in the artist’s imagination. Further south, in the province of Kai (Koshu), and separating two great rivers, the Fuji-kawa and the Tone-gawa, is a range of hills with peaks second only to those of the Japanese Alps spoken of above. The principal elevations in this range are Shirane-san (with the summit, Nidori (9970 ft.), Ato-no-take (10,200 ft.) and Kai-take (10,330 ft.), and Hoozan (9550 ft.). It will be observed that all the highest mountains of Japan form a species of belt across the widest part of the main island, beginning on the west with the Alps of Echigo, Hida and Shinano, and ending on the east, with-Fuji-yama. In all the regions of the main island southward of this belt, the only mountains of conspicuous altitude are Omine (6169 ft.) and Odaiko-gahara (5540 ft.) in Yamato and Daisen or Oyama (5951 ft.) in Hakone.

Mountains of Shikoku.

Kii-shi, though abounding in mountain chains, independent, is not remarkable for lofty peaks. In the neighbourhood of Nagasaki, over the celebrated solfataras of Unzen-take (called also Osen) stands an extinct volcano, whose summit, Fugen-dake, is 4865 ft. high. More notable is Aso-take, some 20 m. from Kumamoto; for, through the highest of its five peaks has an altitude of only 5545 ft., it boasts the largest crater in the world, with walls nearly 2000 ft. high and a basin from 10 to 14 m. in diameter. Aso-take is still an active volcano, but its eruptions during recent years have been confined to ashes and dust. Only two other mountains in Kii-shi are mentioned by the ancient geographers, Nihonsho. One (3743 ft.) on the island Sakura-jima, in the extreme south; and Kishimaya-yama (5538 ft.), on the boundary of Hiuga, a mountain specially sacred in Japanese eyes, because on its eastern peak (Takachihiko-dake), site of an ancient vossan, Ninigi descended as the forerunner of the first Japanese sovereign, Jimmu.

Among the mountains of Japan there are three volcanic ranges, namely, that of the Kuriles, that of Fuji, and that of Kishimaya. Fuji is the most remarkable volcanic peak. The Japanese regard it as a sacred mountain, and numbers of pilgrims make the ascent in midsummer. From 500 to 600 ft. is supposed to be the depth of the crater. Where are a number of phlogistic exhalations or escapes of steam at present, and it would seem that this great volcano is permanently extinct. But experience in other parts of Japan shows that a long quiescent crater may at any moment burst into disastrous activity. Within the period of Japan’s written history several eruptions are recorded the last having been in 1707, when the whole summit burst into flame, rocks were shattered, ashes fell to a depth of several inches even in Yedo (Tokyo), 60 m. distant, and the crater poured forth streams of lava.

Among still active volcanoes the following are the best known:

Name of Volcano. Height in feet. Remarks.

Tarurani (Yezo) 2990. Forma southern wall of a large ancient crater now occupied by a lake (Shikotsu). A little steam is issued from some smaller cones on the summit of the ridge, as well as from one, called Eniwa, on the northern side.

Noborisetsu 1148. (Yezo) In a state of continuous activity, with frequent detonations and rumblings. The crater is divided by a wooded rock-wall. The northern part is occupied by a stagnant lake, while the southern part contains numerous small solfataras and boiling springs.

Komagatake 3582. (Yezo) The ancient crater-wall, with a lofty pinnacle on the western side, contains a low new cone with numerous steaming rifts and vents. In a serious eruption in 1596 the S.E. flank of the mountain was separated from the country side in that direction were dashed of trees.

Esan 2607. A volcano-promontory at the Pacific end of the Tsugaru Strait; a finely fringed, surrounded on three sides by the sea, the crater breached on the land side. The central vent displays considerable activity, while the rocks walls are steamed with red, yellow, and white deposits from numerous minor vents.

Agatsumo (Iwashi) 5230. Erupted in 1903 and killed two geologists.

Bandai-san (Iwashiho) 6037.—conl.

Azuma-yama (Fuku-shima) 7733.

Nasu (Tochigi) 6296.

Shirane (Nikko) 7422.

Shirane (Kai) 10,330.

Unzen (Hizen) 4865.

Aso-take (Higo) 5545.

Kaimon (Kagoshima Bay) 3041.

Sakura-jima (Kagoshima Bay) 3743.

Kiri-shima (Kagoshima Bay) 5338.

Izuzu Oshima (Vries Island) (Izu) 2461.

entombed with their inhabitants and cattle; seven villages were partially wrecked; forests were levelled or the trees entirely detached by the force of the blast, and lake formed. The lip of the fracture is now marked by a line of steaming vents.

Long considered extinct, but has erupted several times since 1893, the last explosion having being in 1900, when 82 sulphur-digings were blown up, ash and grater thrown to a distance of 5m., accumulating in places to a depth of 5 ft.; and crater 300 ft. in diameter, and as many in depth, was formed on the E. side of the mountain. This crater is still active. The summit-crater is occupied by a beautiful lake. On the Fuku-shima (E.) side of the volcano rises a large parasitic cone, called Esan (bunjinga). There is also a second and a lateral crater, which are apparently connected and perpetually emitting steam. At or about the main vents are numerous solfataras. The whole of the upper part of the cone consists of grey highly acidic lava. At the base is a thermal spring, where baths have existed since the 7th century.

The only remaining active vent of the one large, active volcanic Nikko district. Eruption in 1884. Eruption in 1905, when the crater was enlarged to a length of 3000 ft. It is divided into three parts, separated by walls, and each containing a lake, of which the middle one emits steam and the two others are cold. The central lake, during the periods of eruption (which are frequent), displays a geyer-like activity. These lakes contain free sulphuric acid, mixed with iron and manganese.

A triple-peaked volcano in the solfataric stage, extinct at the summit, but displaying considerable activity at its base in the form of numerous fumaroles and boiling sulphur springs.

Remarkable for the largest crater in the world. It measures 10 m. by 15, and rises 5000 ft. symmetrically to a height of about 2000 ft., with only one break through which the river Shina flows. The centre is occupied by a mass of peaks, on the W. flank of which lies the modern active crater. Two of the five compartments into which it is divided by walls of deeply strewn volcanic lapilli, steam, and the vent, displaying great activity has been opened at the base of the cone to the south side. Eruptions have been recorded since the earliest days of Japanese history. In 1884 the ejected dust and ashes devastated farmlands throughout Shikoku. An outburst of 1894 produced numerous rifts in the inner walls from which steam and smoke have issued ever since.

One of the most beautiful volcanoes of Japan, known as the Satsuka-Fuji. The symmetry of the cone is marred by a convexity on the seaward (S.) side. This volcano is all but extinct.

An island-volcano, with several parasitic cones (extinct), on the N. and E. sides. At the summit are two deep craters, the southern one being the vent. Grass grows, however, to the very edges of the crater. The island is celebrated for thermal springs, oranges and daikon (radishes), which sometimes grow to a weight of 70 lb.

A volcanic range of which Takachihko, the only active cone, forms the terminal (S.) peak. The peak situated on the S.W. side of the volcano, lies some 500 ft. below the summit-peak. It is of remarkably regular formation, and the floor is pierced by a very large fissure into which issue immense volumes of steam.

The volcano on this island is called Mihara. There is a double crater, the outer being the almost completely blocked diameter of the outer crater, within which rises the modern cone to a height of 500 ft. above

(1) An area of over 1,200,000 acres swallowed up by the sea.

(2) Tidal wave killed thousands of people.

(3) Hamana lagoon formed.

In the capital (Tokyo) the average yearly number of shocks throughout the 26 years ending in 1906 was 96, exclusive of micro vibrations, but during the 50 years then ending there were only two severe shocks (1884 and 1864), and they were not directly responsible for any damage to life or limb. The Pacific coast of the Japanese islands is more liable than the western shore to shocks disturbing a wide area. Apparent proof has been obtained that the shocks occurring in the Pacific districts originate at the bottom of the sea—the Tsubuki, and are transmitted to the mainland —and they are accompanied in most cases by tidal waves. It would seem that of late years Tajima, Hida, Kozuke and some other regions in central Japan have enjoyed the greatest immunity, while Musashi (in which province Tokyo is situated) and Sagami have been most subject to disturbance.

Plains.—Japan, though very mountainous, has many extensive plains. The northern island—Yamato—contains several, and there are as many more in the main and southern islands, to say nothing of flat lands of minor dimensions. The principal are given in the following table:

In this plain lie the capital, Tokyo, and the town of Yokohama. It supports about 6 million people.

Rivers.—Japan is abundantly watered. Probably no country in the world possesses a closer network of streams, supplied by canals and lakes. But the quantity of water carried seawards varies within wide limits; for whereas, during the rainy season in summer and while the snows of winter are melting in spring, great volumes of water sweep down from the mountains, the rivers dwindle at other times to petty rivulets trickling among a waste of pebbles and boulders. Nor are there any long rivers, and all are so broken by shallows and rapids that navigation is generally impossible except by means of flat-bottomed boats drawing only a few inches. The chief rivers are given in the following table:

Length in miles. | Source. | Mouth.
-----------------|---------|-------|
Ishikari-gawa   | 227     | Otara |
Shinano-gawa    | 215     | Niigata |
Teshio-gawa     | 192     | Sea of Japan. |

Ara-kawa        | 104     | Chichibu-yama |
Naga-gawa       | 112     | Rikyo Bay |
Sakura-gawa     | 112     | Tohoku |

Lakes and Waterfalls.—Japan has many lakes, remarkable for the beauty of their scenery rather than for their extent. Some are contained in alluvial depressions in the river valleys; others have been formed by volcanic eruptions, the ejecta damming up the rivers until exits were found over cliffs or through gorges. Some of these lakes have become favourite summer resorts for foreigners. To that category belong especially the lakes of Hakone, at the foot of Mt. Hakone, of Inawashiro, and of Biwa. Among these the highest is Lake Chuzenji, which is 4375 ft. above sea-level, has a maximum depth of 93 fathoms, and empties itself at one end over a fall (Kegon) 250 ft. high. The Shōjō lakes lie at a height of 3160 ft. and their neighbourhood abounds in scenic charms. Lake Hakone is at a height of 2428 ft.; Inawashiro, at a height of 1920 ft. and Biwa at a height of 328 ft. The Japanese are fond of special loveliness (Omi-no-hakke). Lake Suwa, in Shinano, which is emptied by the Senriu-gawa, has a height of 2624 ft. In the vicinity of many of these mountain lakes thermal springs, with remarkable curative properties, are to be found. (By.)

Geology.—It is a popular belief that the islands of Japan consist for the most part of volcanic rocks. But although this conception might reasonably be suggested by the presence of many active and
extinct volcanoes, Professor J. Milne has pointed out that it is literally true of the Kuriles alone, partially true for the northern half of the Main Island and for Kitakushu, and quite incorrect as applied to the southern half of the Main Island and Hondo. The most conspicuous upstanding feature of the land is the mountain massif of the Barrier Mountains, so called, which consists for the greater part of Eocene beds that are overlain and partly concealed by Tertiary lavas and andesites. The Tertiary part of the Barrier Mountain system contains the famous geothermal field of Hakone, and is notable for its scenic beauty and health-giving properties. The Tertiary volcanoes are the youngest of Japan and are associated with several geographical features, the greatest of which is the now inactive mountain massif of the Barrier Mountains. The Tertiary part of the Barrier Mountain system is notable for its geothermal features. The Tertiary volcanoes are the youngest of Japan and are associated with several geographical features, the greatest of which is the now inactive mountain massif of the Barrier Mountains.

Structurally Japan is divided into three regions by a depression (the "Fossa Magna" of Naumann) which stretches across the island of Hondo from Shimoda to Nagano. The depression is marked by a line of volcanoes, the most prominent of which is Hakone, which is formed by the volcanic activity of the Fossa Magna. The Fossa Magna is a geothermal area that is characterized by hot springs and geysers, and is one of the most famous geothermal areas in the world. The area is notable for its scenic beauty and health-giving properties, and is a popular tourist destination. The Fossa Magna is also associated with several geographical features, including the Barrier Mountains, which are the most prominent of which is Hakone. The Barrier Mountains are a mountain massif that is formed by the volcanic activity of the Fossa Magna, and is notable for its scenic beauty and health-giving properties.
There are three wet seasons in Japan: the first, from the middle of April to the beginning of May; the second, from the middle of June to the beginning of July; and the third, from early in September to early in October. The dog days (nagare) of July, the middle of which coincides with the summer solstice, is the wettest month; January the driest. During the four months from November to February inclusive only about 18% of the annual rainfall falls. In the district on the east side of the main island the snowfall is insignificant, being of a depth of more than four or five inches and generally melting in a few days, while bright, sunny skies are usual. But in the mountainous sections of the inland, where the snow winds and the mountains and descending their eastern slopes, the wind becomes less saturated and warmer, so that the formation of clouds ceases. Japan is emphatically a wet country so far as quantity of rainfall is concerned, the average for the whole country being 1570 mm. per annum. Still there are about four sunny days for every three on which rain or snow falls, the actual figures being 1590 days of snow or rain and 215 days of sunshine.

During the cold season, which begins in October and ends in April, northerly winds and storm-warnings are prevalent throughout Japan, and throughout the adjacent continent of Asia, and they develop considerable strength owing to the fact that the average temperature of some parts of Japan (750 mm.) is 9 m. per second. A camouflaged atmospheric feature is the periodical arrival of storms called "typhoons" (Japan toshi-fu or "great wind"). These have their origin, for the most part, in the China Sea, where they develop just before passing to Tokyo, but they occur in other months also, and they develop a velocity of 5 to 75 m. an hour. The meteorological record for ten years ended 1915 shows that of 120 typhoons, being an average of 12 annually. September has had 14 of these phenomena, March 11 and April 10, leaving 85 for the remaining 9 months. But only 65 out of the whole number developed disastrous force. It is particularly unfortunate that September should be the season of greatest typhoon frequency, for the earlier varieties of rice flower in that month and a heavy storm does much damage. Thus, in 1902—by no means an abnormal year—statistics show the following disasters owing to typhoons: 994 boats lost, 3244; buildings destroyed wholly or partially, 605,052; land inundated, 1,071,575 acres; roads destroyed, 1236 m.; bridges washed away, 13,689; area of crop destroyed, 45,736 m.; crops damaged, 8,712,655 bushes. The total loss, including cost of repairs, was estimated at nearly 3 million sterling, which may be regarded as an annual average.

Flora.—The flora of Japan has been carefully studied by many scientific men from Siebold onwards. Foreigners visiting Japan are immediately struck by the affection of the people for flowers, trees and natural beauties of every kind. In actual wealth of blossom or dimensions of forest trees the Japanese islands cannot claim any special distinction. The species most admired by all classes are the tints of the foliage in autumn and the glory of flowering trees in early spring. The leaves of the deciduous trees in the autumnal tints are unsurpassed. The colours pass from deep brown through purple to yellow and white, thrown into relief by the dark green of non-deciduous shrubs and trees. Oaks and wild pines, wild vines and amuchs, various kinds of maple, and the Enkianthus Japonicus Hook.—a wonderful bush which in autumn develops a hue of ruddy red—birches and other trees, all add their various colours to the brilliancy of a spectacle which is further enriched by masses of feathery bamboo. The one defect is lack of green sward. The grass used for Japanese lawns loses its verdure in autumn and remains from November to March a greyish-brown, and to the genus it is thus being. Fruit is developed when, according to the old calendar, the new year sets in, but the only flowers then in bloom are the camellia Japonica and some kinds of daphne. The former—called by the Japanese tsukubaki may often be seen glowing with red (shiro-tsukubaki), white (shiro-tsukubaki) and variegated (shibori-tsubaki) kinds do not bloom until March or April. Neither the camellia nor those regarded as rosy-flowered, have their blossoms too unsightly. Queen of spring flowers is the plum (ume). The tree lends itself with peculiar readiness to the skilful
manipulation of the gardener, and is by him trained into shapes of remarkable grace. Its pure white or rose-red blossoms, heralding the first approach of genial weather, are regarded with special favour and are accounted the symbol of unassuming hardness. The shrub blossoms very freely, and though a little training, nor does it, like the plum, improve by pruning, but the sunshine that attends its brief period of bloom in April, the magnificance of its flower-laden boughs and the picturesque flutter of its fall-tinted leaves, makes it such a "nani" (flower) in "Yamato" (Japan), and it has ever since been thus regarded. The wild peach (momo) blooms at the same time, but attracts little attention. Isolated trees, or clumps of them, are famed for their fruit worthy of the name, nor do they excel their Occidental representatives in wealth of blossom, but the admiring affection they inspire in Japan is unique. Scarcely has the cherry season passed when the plum (umeblooms, following the rose (hagi) and the iris (shōbu), the last being most contemporary with the peony (botan), which is regarded by many Japan se as the king of the blossoms and is cultivated more as a species of decorative tree (shidare-zakura), which dresses itself in peachy-red foliage and is trained into many picturesque shapes, though not without detriment to its longevity. Summer sees the lotus (renge) convert wide expanses of lake and river into sheets of white and red blossoms; a comparatively flowerless interval ensues until, in October and November, the chrysanthemum arrives to furnish an excuse for fashionable gatherings. With the exception of the dog-days and the dead of winter there is no month in the year when the Japanese pay no attention to the Japanese, nor does any class fail to participate in the sentiment. There is similar enthusiasm in the matter of gardens. Fountains, billows ofCotinus and panels of the land are steadily grown into a science, with esoteric as well as exoteric aspects, and with a special vocabulary. The underlying principle is to reproduce nature's scenic beauties, all the features being drawn to scale and the situation represented by the arrangement of the various species in correct proportion. Thus the artificial lakes and hills, the stones forming rockeries or simulating solitary crags, the trees and even the bushes are all selected or manipulated so as to fall congruously into the general scheme. If, on the one hand, huge stones are transported hundreds of miles from sea-shore or river-bed where, in the lapse of long centuries, waves and cataracts have hammered them into singular shapes, the planchets which are used for the decoration of their forms to environment are studied with profound subtile, so the training and tending of the trees that keep them company require much taste and much toil. Thus the monastic style, the garden of the hermit, the sh mistake, the artificial beauty of the Japanese home garden, has to be subjected twice a year to a process of spraying-dressing which involves the careful removal of every weak or old needle. One tree occupies the whole time of a gardener for about ten days. The details are endless, the results delightful. But it has to be clearly understood that there is here no mention of a flower- garden in the Occidental sense of the term. Flowers are cultivated, but for their own sake, not as a feature of the landscape art. If they are present, it is only as an incident. This of course does not apply to shrubs which blossom at their seasons and fall always into the general scheme of the landscape. Forests of cherry-trees, plum-trees, plum-red oaks, higan-bachi (Coriaria japonica), hills of azalea, clumps of hydrangea, groups of camellia—such have their permanent places and their foliage adds notes of colour when their flowers are gone. The chrysanthemums, peonies, roses and so forth which are treated as special showpieces and are removed out of bloom. There is another remarkable feature of the Japanese gardener's art. He dwarfs trees so that they remain measurable only by inches after their age has reached scores, even hundreds, of years, and the proportions of leaf, branch and stem are preserved with fidelity. The pots in which these wonders of patient skill are grown have to be themselves fine specimens of the keramist's craft, and as much as $25 is sometimes paid for a notably well trained tree.

There exists among many foreign observers an impression that Japan is comparatively poor in wild-flowers; an impression probably due to the fact that there are no flower-laden hillsides in Japan, the flowers are curiously wanting in fragrance. Almost the only notable exceptions are the mokusei (Osmanthus fragrans), the daphne and the magnolia. The missing perfume-laden air of the Occident, a visitor is prone to infer paucity of blossoms. But if some familiar European flowers are absent, they are replaced by others strange to Western eyes—a wealth of lsepedea and indigo-fora; a vast variety of hles; graceful grasses like the eulalia and the onimameshi (Patrinia scabiosa); the climbing Pyrus (Pyrus japonica) and Py, pectinata; the deutzias; the kikyo (Platyodon grandiflorum), the gishibo (Funkia mato), and many another. The same is true of Japanese forests. It is not, however, the case that the forest does not contain inhabitants of the Japanese mountains-forests would be to name at least half the entire flora."

According to Franchet and Savatieri Japan possesses 157 genera, 508 species.Dicotyledons plants 121 1954 1394
Monocotyledons plants 28 202 613
Higher Cryptogamous plants 5 86 138
Vascular plants 154 1035 2743

The investigations of Japanese botanists are adding constantly to the above number, and it is not likely that finality will be reached for some time. According to a comparison made by A. Gray with regard to the numbers of genera and species respectively represented in Japan and the .regions of the northern hemisphere, the following is the case:—

Atlantic Forest-region of N. America 66 genera and 155 species
Pacific Forest-region of N. America 31 genera and 78 species
Japan and Manchuria Forest-region 66 genera and 168 species
Europe 

While there can be no doubt that the luxuriance of Japan's flora is due to rich soil, to high temperature and to rainfall not only plentiful but well distributed over the whole year, the wealth and variety of her trees and shrubs must be largely the result of immi- nation from warmer regions. Japan's flora is much richer than that of her. Neighbouring continent. On the south, the Riukiu Islands bring her within reach of Formosa and the Malayan archipelago; on the west, the Oki, Hii, and Tashima bridge the sea between her and Korea; and on the north, the Kuriles form an almost continuous route to Kamchatka. By these paths the germ s of Asiatic plants were carried to join the end members of the flora of the country, and all found suitable homes amid greatly varying conditions of climate and physiography. Japan—Japan is an exception to the general rule that continents are richer in fauna than their neighbouring islands. It has few mammals of which the largest in Japan is a species of the giant bear (Ursus arctos), and the shrew (Suncus murinus), and an occasional ermine. Butterflies, neuroptera, &c., finds a greater number of species in a circuit of some miles near Tôkyô than are exhibited by the whole British Isles. Of mammals 50 species have been identified and catalogued. Neither the lion nor the tiger is found. The true Carnivora are three only, the bear, the dog and the marten. Three species of bears are represented by the lesser dog's bear (Ursus arctos), the brown bear (Ursus arctos) and the great brown bear (Ursus maritimus) is only an accidental visitor, carried down by the Arctic current. In the main island the black bear (Ursus japonicus) alone has its habitation, but the island of Yezo has the great brown bear (Ursus arctos), the black bear (Ursus maritimus) and the snow bear (Ursus maritimus). The bear does not attract much popular interest in Japan. Tradition centres rather upon the fox (kutsune) and the badger (kuruma), of which are worshipped as the messenger of the harvest god, while the latter is regarded as a mischievous rollicker. Next to comes the monkey (taru), which dwells equally among the snows of the northern regions and the expanses of the southern islands. Its appearance is an element into the composition of many place-names, an evidence of the people's familiarity with the animal. There are ten species of bat (komori) and seven of insect-eaters, and prominent in this class are the mole (magura) and the hedgehog (kari-nenmut). Among the martens there is a weasel (tiuchi), which, though useful as a rat-killer, has the evil reputation of being responsible for sudden and mysterious injuries to human beings; there is a river-ottter (karenzō), and there is a sea-ottter (rakko) which inhabits the northern seas and is highly valued for its beautiful pelt. The rodents are represented by an abundance of rats, with comparatively few mice, and the only well-known martens are the tree-rat (ku-nemuri), as well as the squirrell, known as the momo-dori (peach-bird) in the north, where it hides from the light in hollow tree-trunks, and in the south as the dog (tsuki) or bird dog (tsuki), and occasionally found in Japan in various species. The squirrel is a very common animal, the fowl (an) are found in very varying numbers, and those of one species put on a white coat during the winter. The wild boar (shishi or ni-ne-tai) does not occur in Japan, but it is a European commoner. Its flesh is much relished, and for some unexplained reason is called by its vendors "mountain-whale" (yama-kujira). A very beautiful stag (shako), with eight-branched antlers, inhabits the remote woodlands, and there are five species of antelope (kamo-shika) which are found in the highest and least accessible parts of the mountains. Domestic animals have for representatives the horse (uma), a small beast with little beauty, but of great hardiness, the ox (eshe), mainly a beast of burden or draught; the pig (buta), very occasionally; the dog (inu), an unsightly and useless brute; the cat (neko), with a stump at a tail; barndoor (tai-daru), ducks (ukui) and pigeons (hato). The turkey (chichio-meno) and the goose (gachio) have been introduced but are little appreciated as yet. Although so-called singing birds exist in tolerable numbers, those which offer a mark of colour are few. Eminently first is a species of nightingale (sygus), which, though smaller than its congener of the West, is gifted with exquisitely modulated flute-like notes of exquisite beauty. That "nightingale" is a "kura" (kura), and brings to mind the "singing" of the nightingale (sugi). Is there also three other species, the kakkodori (Cuculus canorus), the tsutsu-dori (C. himalayanus), and the masu-hakari, or jiechi (C. kyperlyhus). To the last named is due the saying: "the cooing of the pigeon (hato) is supplemented by the twitting of the ubiquitous sparrow (suwate),"
while over all are heard the raucous caw of the raven (karasu) and the harsh scream of the kite (tombi), between which and the raven there is perpetual feud. The falcon (taka), always an honoured bird in Japan, where from time immortal hawking has been an aristocratic sport, is known as the "bird of fame" (kai-take), but the eagle (washi) affects solitude. Two English ornithologists, Blakiston and Pryer, are the recognized authorities on the birds of China, and in a contribution to the Transactions of the Zoological Society of London (vol. 6, 1891) enumerate the different species. Starlings (muku-dori) are numerous, and so are the wagtail (sekitei), the swallow (tsubame) the martin (ten), the woodchat (meko), and the chaffinch (nemshiko). The koi and goldfishes are commonly kept for ornamental purposes, though common in China, is rare in Japan. Blackbirds and thrushes are not found, nor any species of parrot, but on the other hand, we have the hoopoe (yasagashira), the red-breast (komadori), the bluebird (tora), the nightingale (korai) and the thrush (kame). Among game-birds there are the quail (usu), the heathcock (esu-rachô), the ptarmigan (esu-rachô or eso-yama-dori), the woodcock (hodo-shigit), the snipe (shige-shigit) and the painted snipe (tama-shigit) and the pheasant (kiji). Of the last two there are the kiji proper, a bird presenting no remarkable feature, and the copper pheasant, a magnificent bird with plumage strikingly ebares, and the doves and pigeons are only for grace of form but also for the immemorial attention paid to them by Japanese artists, are the crane (tsuru) and the heron (sagi). Of the crane there are seven species, the stateliest and most beautiful of all the Japanese herons or waders, the long-legged, long-necked, long-billed bird, which attains a length of some 5 ft. high and has pure white plumage with a red crown, black tail-feathers and black upper neck. It is a sacred bird, and is highly prized for its beauty, and is called natsukari (tsuru). The other species are the demosselle crane (anezu-suru), the black crane (kuro-suru or nessumi-suru, i.e. Grus cinereus), the Grus leucauchen (muma-suru), the Grus monachus (nabe-suru), and the white crane (chô-suru) and the black-tailed crane (kkusu). But it may be said to have disappeared from the island. The heron (sagi) constitutes a charming feature in a Japanese landscape, especially the silver heron (kura-sagi), which displays its brilliance to the eyes at all times of the year. The height of this heron is three inches over and above the ground. The night-heron (got-sagi) is very common. Besides these waders there are plover (chadori); golden (muma-guro or aizuru) and grey (kuro-guro-chori) and Harting sand-plover (tsuru-chitori); sand-pipers (chadori shi) and spoon-billed (hera-shigit) and water-hens (bo). Among swimming birds the most numerous are the gull (kamome), of which many varieties are found; the cormorant (shige) which is trained by the Japanese for fishing purposes; and multitudinous flocks of wild-goose (gurin) and wild-ducks (kamo), from the beautiful mandarin duck (shi-dori), emblem of conjugal fidelity, to teal (kamego) and weeds even. The various representatives of these birds are so frequent on our coasts, that in the feudal castles of old Japan, when a peculiar method of netting the birds or striking them with falcons was a favourite aristocratic sport, the joro-kumi-ritto, and the kano-ritto, and the kura-ritto, the nobleman, as well as the common subject, would spend whole rainy days together gathering their green and yellow feathers, used in the bird's nest, and as gifts to the ladies of the house. The common corncrake (Esophagrus virginatus), which sometimes attains a length of 5 ft., but is quite harmless. Lizards (kogake), frogs (kawau or kaur), toads (kuru), and the mantis (mi) are plentiful, and much curiosity attaches to a giant salamander (kosokin). A few other names according to localities), which reaches to a length of 5 ft., and, according to Rein, it is closely related to the Andrias Schuckieri of the Oeningen strata.

The seas surrounding the Japanese islands may be called a reservoir of fish, for, in addition to numerous species which abide there permanently, there are migratory kinds, coming and going with the monsoons and with the great ocean streams that set to and from the tropics, and from the cold waters of the Polar regions when the season to blow, numbers of denizens of the Sea of Osaka swim southward to the more genial waters of north Japan; and in summer the Indian Ocean and the Malay archipelago send their southern shores a fauna, which is exchanged with the Afro-Tropical Fauna of Japan. Nine orders of fishes have been distinguished as the piscifuna of Japanese waters. They may be found carefully catalogued with all their included species in Rein's Japan, and highly interesting researches by Japanesenaturalists. Rein's book, "Japan Fauna," as it is called, is not only the result of long years of research, but the work of the science of the Imperial University of Tokyo. Briefly, the chief fish of Japan are the breed (lai), the perch (suzuki), the mullet (boru), the rock fish (halatu), the gurnard (shi-ko), the mackerel (sabu), the sword-fish (jachi-kari or kawase (basui), the bodlock (keri), the flounder (barei), and its congeners the sole (hirame) and the turbot (ishi-gari), the shad (namazu), the salmon (shake), the masu (muzu), the golden carp (bigo), the loach (dego), the herring (shinsh), the tsuashi (Clupea), the eel (unagi), the conger eel (awage), the coffer-fish (hako-taro), the frog (Tetradon), the at (Plecostomus altivelis), the sayori (Hemigrammus algidus) and the common lamprey (Petromyzon) and the black Melanaster chinensis, which seems to have been fashioned out of lacquer spotted with white. There is also a giant nasicornous fish, the large long-billed (zama-ki), the long and slender (ha-shi), and the broad-winged kind (Popilia), which recall tropical brilliancy. One (Popilia maculiventus) is peculiar to Japan. Many others seem to be practically identical with European species. That is especially true of the sea-clams, which, in spite of their being attached to the European types. There are seven large silk-moths, of which two only (Bombyx mori and Antheraea yama-nai) are employed in producing silk. Fishing lines are manufactured from the cocoons of the silkworm (Bombyx mori) (Culicidae), and the other large silk-mothes in the islands. Wasps, bees and hornets, generally known as hachi, differ little from their European types, except that they are more sociable and the drone-flying number of species which have been identified is a great number. Grasshoppers (batta) are abundant, and one kind (inago), which frequent the rice-fields when the cereal is ripening, are caught and fried in oil as an article of food. On the moors in late summer the Japanese wren (Troglodytes) (kamego) is plentiful, and the Mochi (kôro-gari) and the cockroach abound. Particularly obtrusive is the cicada (sen), of which there are many species. Its shrill voice is heard loudly most of the time, great heat, when the song of the知加知川 and the zori are considered great entertainment to the Japanese boy. He catches them by means of a red smeared with bird-lime, and then tying a fine string under whose wing, he flies them at its end. Spiders abound, from a giant species to one of the minutest dimensions, and the tree-bug is always ready to make a destructive lodgment in any sickly tree-stem. The scorpion (sawari) exists but is not poisonous. Japanese rivers and lakes are the habitations of several—seven or eight—species of freshwater crab (kani), which live in holes on the shore and emerge in the day-time, often moving to considerable distances from their homes. Shrimps (kawau-ebi) also are found in the shallow tidal and rice-fields, and the dog-fish, or the small crab—mokusen-gani—serve the people as an article of food, but the small crabs which live in holes have no recognized raison d'être. Two species of the land-crab (aka-shi) are employed in the manufacture of some sort of an article, and is found in the seas of Japan and the Malay archipelago. There is no lobster on the coasts of Japan, but there are various species of cray-fish (Palmarus and Scyllurus) the principal of which, under the name of freshly imported (Feninas constrictus) are greatly prized as an article of diet.

Already in 1882, Dunker in his Index Molluscorum Maris Japonici enumerated nearly 1200 species of marine molluscs found in the
JAPAN

According to quasi-historical records, the population of the empire in the year A.D. 610 was 4,988,842, and in 736 it had grown to 8,631,770. It is impossible to say how much reliance may be placed on these figures, but from the 18th century, when the name of every subject was to be inscribed on the roll of a temple as a measure against his adoption of Christianity, a tolerably trustworthy census could always be taken. The returns thus obtained show that from the year 1723 until 1846 the population remained almost stationary, then increased during the former year being 26,097,625, and that during the latter year 26,907,625. There had, indeed, been five periods of declining population in that interval of 124 years, namely, the periods 1728-1730, 1741-1752, 1773-1774, 1797-1800, and 1844-1846. But after 1872, when the census showed a total of 33,852,828, the population grew steadily, its increment between 1872 and 1898 inclusive, a period of 27 years, being 10,649,990. Such a rate of increase invests the question of subsistence with great importance. In forming an estimate of the area of land under cultivation increased in a marked degree. Returns prepared at the beginning of the 10th century showed 21 million acres under crops, whereas the figure in 1854 was over 8 million acres. But the development of means of subsistence has been outstandingly ascribed to the growth of population in recent years. Thus, during the period between 1869 and 1907 the population received an increment of 11.6%, whereas the food-producing area increased by only 4.4%. This discrepancy caused anxiety at one time, but large fields suitable for colonization have been opened in Sakhalin, Korea, Manchuria, and Formosa, so that the problem of subsistence has ceased to be troublesome. The highest rate of the decade period ended 1907, is 3.05% of the population, and the death-rate is 2.05. Males exceed females in the ratio of 2% approximately. But this rule does not hold, the age of 65, where for every 100 females 83.4 males are found. The rural areas of Japan, as compared with the inhabitants of Western Europe: about 16% of the adult males are below 5 ft. But there are evidences of steady improvement in this respect. During the period of ten years between 1893 and 1902, it was found that the percentage of recruits of 5 ft. 5 in. and upward grew from 10-09 to 12-67, the rate of increase having been remarkably steady; and the percentage of those under 5 ft. declined from 20-21 to 16-90.

Towns.—There are in Japan 23 towns having a population of over 50,000, and there are 76 having a population of over 20,000. The larger towns, their populations, and the growth of the latter during the five-year period commencing with 1898 were as follow:

**Urban Populations**

1898. | 1903.
---|---
Tokyo | 1,440,121 | 1,795,128
Osaka | 821,235 | 988,200
Kiioto | 355,169 | 479,494
Nagoya | 244,145 | 284,829
Kobe | 215,789 | 283,839
Yokohama | 193,762 | 242,776
Hiroshima | 122,306 | 113,545
Nagasaki | 107,422 | 151,777
Fukuoka | 83,153 | 109,329
Sendai | 83,325 | 93,773
Hakodate | 78,040 | 84,746
Fukuoka | 66,480 | 82,730
Wakayama | 63,667 | 67,908
Tokushima | 61,501 | 62,998
Kumamoto | 51,463 | 56,916
Takamatsu | 58,491 | 60,437
Okayama | 50,025 | 58,100
Osaka | 59,961 | 79,746
Kagoshima | 53,481 | 58,384
Niigata | 53,366 | 58,821
Sakai | 50,203 | 55,304
Sapporo | 45,941 | 52,832
Kure | 42,857 | 52,607
Sasebo | 35,607 |

The growth of Kure and Sasambo is attributable to the fact that they have become the sites of large ship-building yards, the property of the state.

The number of houses in Japan at the end of 1907, when the census was last taken, was 8,725,544, the average number of inhabitants in each house being thus 5.5.

**Physical Characteristics.**—The best authorities are agreed that the Japanese people do not differ physically from their Korean and Chinese neighbours as much as the inhabitants of northern Europe differ from those of southern Europe. It is true that the Japanese are shorter in stature than either the Chinese or the Koreans. Thus the average height of the Japanese male is only 5 ft. 3½ in., and that of the female 4 ft. 10¼ in., whereas in the case of the Koreans and the northern Chinese the corresponding figures for males are 5 ft. 3½ in. and 5 ft. 7 in. respectively. Yet in other physical characteristics the Japanese, the Koreans...
and the Chinese resemble each other so closely that, under similar conditions as to costume and coiffure, no appreciable difference is apparent. Thus since it has become the fashion for Chinese students to flock to the schools and colleges of Japan, there adopting, as do their Japanese fellow-students, Occidental garments and, without hairdressing, the distinction of nationality is hardly to be perceptible. The most exhaustive anthropological study of the Japanese has been made by Dr E. Baclz (emeritus professor of medicine in the Imperial University of Tokyo), who enumerates the following sub-divisions of the race inhabiting the Japanese islands. The first and most important is the Manchu-Korean type; that is to say, the type which prevails in north China and in Korea. This is seen specially among the upper classes in Japan. Its characteristics are exceptional tallness combined with slenderness and elegance of figure; a face somewhat long, with any special prominence of the cheekbones but having more or less oblique eyes; an aquiline nose; a slightly receding chin; largish upper teeth; a long neck; a narrow chest; a long trunk, and delicately shaped, small hands with long, slender fingers. The most plausible hypothesis is that men of this type are descendants of Korean colonists who, in prehistoric times, settled in the province of Izumo, on the west coast of Japan, having made their way thither from the Korean peninsula by the island of Oki, being carried by the cold current which flows along the eastern coast of Korea. The second type is the Mongol. It is not very frequently found in Japan, perhaps because the earlier invaders favored the Japanese. Before them all was a tribe of immigrants who appear to have crossed from north-eastern Asia at an epoch when the sea had not yet dug broad channels between the continent and the adjacent islands. These people—the Ainu—are usually spoken of as the aborigines of Japan. They once occupied the whole country, but were gradually driven northward by the Manchu-Koreans and the Malays, until only a mere handful of them survived in the northern island of Yezo. Like the Malay and the Mongol types they are short and thickly built, but unlike either they have prominent cheekbones, bushy locks, round deep-set eyes, long oblique lashes, straight noses and much hair on the face and the body. In short, the Ainu suggest much closer affinity with Europeans than does any other of the types that go to make up the population of Japan. It is not to be supposed, however, that these traces of different elements indicate any lack of homogeneity in the Japanese race. Amalgamation has been completely effected in the course of long centuries, and even the Ainu, though the small surviving remnant of them now live apart, have left a trace upon their conquerors.

The typical Japanese of the present day has certain marked physical peculiarities. In the first place, the ratio of the height of his head to the length of his body is greater than it is in Europeans. The Englishman's head is often one-eighth of the length of his body or even less, and in continental Europeans, as a rule, the ratio does not amount to one-seventh; but in the Japanese it exceeds the latter figure. In all nations men of short stature have relatively large heads, but in the case of the Japanese there appears to be some racial reason for the phenomenon. Another striking feature is shortness of legs relatively to length of trunk. Both in southern Europeans the leg is usually much more than one-half of the body's length, but in Japanese the ratio is one-half or even less; so that whereas the Japanese, when seated, looks almost as tall as a European, there may be a great difference between their statures when both are standing. This special feature has been attributed to the Japanese habit of kneeling instead of sitting, but investigation shows that it is equally marked in the working classes who pass most of their time standing. In Europe the same physical traits—relative length of head and shortness of legs—distinguish the central race (Alpine) from the Teutonic, and seem to indicate an affinity between the former and the Mongols. It is in the face, however, that we find specially distinctive traits, namely, in the eyes, the eyelashes, the cheekbones and the beard. Not that the eyeball itself differs from that of an Occidental. The difference consists in the fact that "the socket of the eye is comparatively small and shallow, and the osseous ridges at the brows being little marked, the eye is less deeply set than in the European. In fact, seen in profile, forehead and upper lip often form an unbroken line." Then, again, the shape of the eye, as modelled by the lids, shows a striking peculiarity. For whereas the open eye is almost square in the Japanese, it is often oblique in the Japanese on account of the higher level of the lids. From "But even apart from obliqueness, the shape of the corners is peculiar in the Mongolian eye. The inner corner is partly or entirely covered by a fold of the upper lid continuing more or less into the lower lid. This fold often covers also the whole free rim of the upper lid, so that the insertion of the eyelashes is hidden and the opening between the lids is so narrowed as to disappear altogether at the moment of laughter. As for the eye-lashes, not only are they comparatively short and sparse, but no effect is produced by converging or diverging, so that whereas in a European the free ends of the lashes are farther distant from each other than their roots, in a Japanese they are nearer together. Prominence of cheekbones is another special feature, but it is much commoner in the lower than in the upper classes, where elongated faces may almost be said to be the rule. Finally, there is marked paucity of hair on the face of the average Japanese—apart from the Ainu—and what hair there is is nearly always straight. It is not to be supposed, however, that because the Japanese is short of stature and often finely moulded, he lacks either strength or endurance. On the contrary, he possesses the Mongol's marked degree, and his deftness of finger is not less remarkable than his strength and activity of limbs by benefit of such suicidal despair. An example alone is needed finally to destroy the equilibrium. Some one throws himself over a cataract or leaps into the crater of a volcano, and immediately a score or two follow. Apparently the more picturesquely awful the manner of the demise, the greater its attractive force. The thing is not a product of insanity, as the term is usually interpreted; letters always left behind by the victims prove them to have been in full possession of their reasoning faculties up to the last moment. Some observers lay the blame at the door of Buddhism, a sect to which both profession and belief of the races amounting to two-thirds humanity is held to be the most essen-
incidents, and, for the rest, the faith of Shaka has little sway over the student mind in Japan. The phenomenon is modern: it is not an outcome of Japanese nature nor yet of Buddhist teaching, but is due to the stress of endeavouring to reach the standards of Western acquirement with grievously inadequate equipment, opportunities and resources. In order to support himself and pay his academic fees many a Japanese has to fall into the ranks of the physical labourer during a part of each day or night. Ill-nourished, over-worked, and it may be, despairing, he struggles with intolence to sacrifice life and at the darkness. But he is not a normal type. The normal type is light-hearted and buoyant. One naturally expects to find, and one does find, that this moral sunshine is associated with good temper. The Japanese is exceptionally serene. Irascibility is regarded as permissible in sickly children only: grown people are supposed to be superior to displays of impatience. But there is a limit of imperturbability, and when that limit is reached, the subsequent passion is desperately vehement. It has been said that these traits go to make the Japanese soldier what he is. The hardships on a campaign cause him little suffering, in fact, rather to free him from them. The hour of combat finds him forgetful of everything save victory. In the case of the military class—and prior to the Restoration of 1867 the term "military class" was synonymous with "educated class"—this spirit of stoicism was built up by precept on a solid basis of heredity. The samurai (soldier) learned that his first characteristic must be to suppress all outward displays of emotion. Pain, pleasure, passion and peril must all find him unperturbed. The supreme test, satisfied so frequently as to be commonplace, was a shocking form of suicide performed with a placid mien. This capacity, coupled with readiness to sacrifice life at any moment on the altar of country, if not or honour, made a remarkably heroic character. On the other hand, some observers hold that the education of this stoicism was effected at the cost of the feelings it sought to conceal. In support of that theory it is pointed out that the average Japanese, man or woman, will recount a death or some other calamity in his own family with a perfectly calm, if not a smiling, face. Probably there is a measure of truth in the criticism. Feelings cannot be habitually hidden without being more or less blunted. But here another Japanese trait presents itself—politeness. There is no more polite nation in the world than Japan; the Japanese code of heart they excel Occidentals may be open to doubt, but in all the forms of comity they are unrivalled. Now one of the cardinal rules of politeness is to avoid burdening a stranger with the weight of one's own woes. Therefore a mother, passing from the chamber which has just witnessed her paroxysms of grief, will describe calmly to a stranger—especially a foreigner—the death of her only child. The same suppression of emotional display in public is observed in all the affairs of life. Youths and maidens maintain towards each other a demeanour of reserve and even indifference, from which it has been confidently affirmed that love does not exist in Japan. The truth is that in no other country do so many dual suicides occur—suicides of a man and woman who, unable to be united in this world, go to a union beyond the grave. It is true, nevertheless, that love as a prelude to marriage finds only a small place in Japanese ethics. Marriages in the great majority of cases are arranged with little reference to the feelings of the parties concerned. It might be supposed that conjugal fidelity must suffer from such a custom. It does suffer seriously in the case of the husband, but emphatically not in the case of the wife. Even though she be cognisant—as she often is—of her husband's extra-marital relations, she abates nothing of the duty which she has been taught to regard as the first canon of female ethics. From many points of view, indeed, there is no more beautiful type of character than that of the Japanese woman. She is entirely unsophisticated—exquisitely modest without being anything of a prude; abounding in intelligence which is never obscured by egotism; patient in the hour of suffering; strong in time of affliction; a faithful wife; a loving mother; a good daughter; and capable, as history shows, of heroism rivalling that of the stronger sex. As to the question of sexual virtue and morality in Japan, grounds for a conclusive verdict are hard to find. In the interests of hygiene prostitution is licensed, and that fact is by many critics construed as proof of tolerance. But licensing is associated with strict segregation, and it results that the great cities are conspicuously free from evidences of vice; and that the streets may be traversed by women at all hours of the day and night with perfect impunity and without fear of encountering offensive spectacles. The ratio of marriages is approximately 8.46 per thousand units of the populace, whereas the ratio of divorces is 1.36 per thousand. There are thus about 16 divorces for every hundred marriages. Divorces take place chiefly among the lower orders, who frequently treat marriage merely as a test of a couple's suitability to be partners in the struggles of life. If experience develops incompatibility of temper or some other mutually repellent characteristic, separation follows as a matter of course. On the other hand, divorces among persons of the upper classes are comparatively rare; and divorces on account of a wife's unfaithfulness are almost unknown.

Concerning the virtues of truth and probity, extremely conflicting opinions have been expressed. The Japanese, as a rule, always prided himself on having "no second word." He never drew his sword without using it; he never gave his word without keeping it. Yet it may be doubted whether the value attached in Japan to the abstract quality, truth, is as high as the value attached to it in England, or whether the consciousness of having told a falsehood weighs as heavily on the heart. Much depends upon the motive. Whatever may be said of the upper class, it is probably true that the average Japanese will not sacrifice expediency on the altar of truth. He will be veracious only so long as the consequences are not seriously injurious. Perhaps no more can be demanded of any nation. The original Anglo-Saxon and the höllen rassu of the Japanese are twins. In the matter of probity, however, it is possible to speak with more assurance. There is undoubtedly in the lower ranks of Japanese tradesmen a comparatively large fringe of persons whose standard of commercial morality is defective. They are descendants of feudal days when the mercantile element, being counted as the dregs of the population, lost its self-respect. Against this blemish—which is in process of gradual correction—the fact has to be set that the better class of merchants, the white of the artisans and the labouring class. In general, obey canons of probity fully on a level with the best to be found elsewhere. For the rest, frugality, industry and patience characterize all the bread-winners; courage and burning patriotism are attributes of the whole nation.

There are five qualities possessed by the Japanese in a marked degree. The first is frugality. From time immemorial the great mass of the people have lived in absolute ignorance of luxury in any form and in the perpetual presence of a necessity to economize. Amid these circumstances there has emerged capacity to make a little go a long way and to be content with the most meagre fare. The second quality is endurance. It is born of causes cognate with those which have begotten frugality. The average Japanese may be said to live without artificial heat; his paper doors admit the light but do not exclude the cold. His brazier barely suffices to warm his hands and his face. Equally is he a stranger to methods of artificial cooling. He takes the frost that winter.inflicts and the fever that summer brings as unavoidable visitors. The third quality is obedience; the offspring of eight centuries passed under the shadow of military autocracy. Whatever he is authoritatively bidden to do, that the Japanese will do. The fourth quality is alms. In the upper classes the welfare of the family has been set above the interests of each member. The fifth quality is a genius for detail. Probably this is the outcome of an extraordinarily elaborate system of social etiquette. Each generation has added something to the canons of its predecessor, and for every point preserved not more than one has been discarded. An instinctive respect for minutiae has thus been inculcated, and has gradually extended to all the affairs of life. That this accuracy may sometimes degenerate into triviality, and that such absorption in trifles may occasionally hide the broad horizon, is conceivable.
As to which of the first two methods of pronunciation had chro-
monic preference, the latter on the opinion of the Chinese, is
nothing like the go. Evidently this triplication of sounds had many dis-
advantages, but, on the other hand, the whole Chinese language may
be said to have been drafted on the Japanese. Chinese has the
adaptability of any tongue ever invented. It consists of thou-
sands of monosyllabic roots, each having a definite meaning. These
monosyllables may be used singly or combined, two, three or four
at a time. It is said that the Chinese have a host of subtle, cer-
oscopic shades of meaning. Take, for example, the word "electricity."
This very idea was conveyed wholly novel in Japan.

But scholars were immediately able to construct the following:

<table>
<thead>
<tr>
<th>Japanese</th>
<th>English</th>
</tr>
</thead>
<tbody>
<tr>
<td>Zennaku wo saiban suru tame no</td>
<td>Virtue vice-judging sake of</td>
</tr>
<tr>
<td>mochitaru yaiisu no hyoju un wa</td>
<td>meekness the nhãn used</td>
</tr>
<tr>
<td>used unique standard</td>
<td></td>
</tr>
<tr>
<td>of no koto</td>
<td>benevolence of conduct only</td>
</tr>
<tr>
<td>Kore wani</td>
<td>kore nomi</td>
</tr>
<tr>
<td>this alone.</td>
<td></td>
</tr>
</tbody>
</table>

It will be observed that in the above sentence there are two trans-
lated words, "kore" and "kore wani." These belong to a group of four syllables called "te ni wo ha" (or wa), which serve to mark the cases of
nouns, "te (or de)" being the sign of the instrumental ablative; "ni; that of the dative; "vo; that of the object, and "wai" that of the nomina-
tive. These exist in the Korean language also, but not in any other
tongue. There are also polite and ordinary forms of expression, of
ten so different as to constitute distinct languages; and there are
even letters of honorific and humble address. Of these there are
pronouns. Another marked peculiarity is that active agency is
never attributed to nectar nouns. A Japanese does not say the
poison killed him but he died on account of the poison; nor
does he say the "war has caused commodities to appreciate," but
"commodities have appreciated in consequence of the war." That
the language loses much force owing to this limitation cannot be
doubted; metaphor and allegory are almost completely banished.
The difficulties that confront an Occidental who attempts to learn
Japanese are enormous. There are three languages to be acquired:
first, the ordinary colloquial; second, the polite colloquial; and,
third, the written. The written Japanese is based on Chinese, in
its polite form, and both are as unlike the written form as modern
Italian is unlike ancient Latin. "Add to this," writes Professor
H. C. Chamberlain, "the necessity of committing to memory two
languages, one of which is written in a different system; and at least
two or three thousand Chinese ideographs, in forms standard and curi-
ous—ideographs, too, most of which are susceptible of three or four
different readings according to circumference."

A language, which has been adapted from its infancy to ideographic
transmission cannot easily be fitted to phonetic uses.

Dictionaries.—F. Brindle, An Unabridged Japanese-English Dictionary
(Tokyo, 1896); Y. Shimada, English-Japanese Dictionary, (Tokyo,
1907); Webster's Dictionary,trans. into Japanese. (Tokyo,
Literature.—From the neighbouring continent the Japanese derived the art of transmitting ideas to paper. But as to the date of that acquisition there is doubt. An authenticated work compiled a.d. 720 speaks of historiographers having been appointed to collect local records for the first time in 403, from which it is to be inferred that such officials had already existed at the court. There is also a tradition that some kind of general history was compiled in 620 but destroyed by fire in 645. At all events, the earliest book now extant dates from 712. Its origin is described in its preface. When the emperor Temmu (673-686) ascended the throne, he found that there did not exist any revised collection of the fragmentary annals of the chief families. He therefore caused these annals to be collated. There happened to be among the court ladies one Hiyeda no Are, who was gifted with an extraordinary memory. Measures were taken to instruct her in the genuine traditions and the old language of former ages, the intention being to have the whole ultimately dictated to a competent scribe. But the emperor died before the project could be consummated, and for twenty-five years Are’s memory remained the sole depository of the collected annals. Then, under the auspices of the empress Gemmyo, the original plan was carried out in 712, Yasumaro being the scribe. The work that resulted is known as the Kojiki (Record of Ancient Matters). It has been accurately translated by Professor B. H. Chamberlain (Transactions of the Asiatic Society of Japan, vol. x.), who, in a preface justly regarded by students of Japan as an exegetical classic, makes the pertinent comment: “Taking the word Altaic in its usual acceptance, viz. as the generic name of all the languages belonging to the Manchu, Mongolian, Turkish and Finnish groups, not only the archaic, but the classical, literature of Japan carries us back several centuries beyond the earliest extant documents of any other Altaic tongue.”

By the term “archaic,” is to be understood the pure Japanese language of earliest times, and by the term “classical,” the quasi-Chinese language which came into use for literary purposes when Japan appropriated the civilization of her great neighbours. The Kojiki is written in the archaic form: that is to say, the language is the language of old Japan, the script, although ideographic, is used phonetically only, and the case-indicators are represented by Chinese characters having the same sounds. It is a species of saga, setting forth not only the heavenly beginnings of the Japanese race, but also the story of creation, the succession of the various sovereigns and the salient events of their reigns, the whole interspersed with songs, many of which may be attributed to the 6th century, while some doubtless date from the fourth or even the third. This Kojiki marks the parting of the ways. Already by the time of its compilation the influence of Chinese civilization and Chinese literature had prevailed so greatly in Japan that the next authentic work, composed only eight years later, was completely Chinese in style and embodied Chinese traditions and Chinese philosophical doctrines, not distinguishing them from their Japanese context. This volume was called the Nihongi (Chronicles of Japan). It may be said to have wholly supplanted its predecessor in popular favour, for the classic style—that is to say, the Chinese—had now come to be regarded as the only erudite script. The Chronicles re-traversed much of the ground already gone over by the Record, preserving many of the songs in occasionally changed form, omitting some portions, supplementing others, and imparting to the whole such an exotic character as almost to disqualify the work for a place in Japanese literature. Yet this was the style which thenceforth prevailed among the litterati of Japan. “Standard Chinese soon became easier to understand than archaic Japanese, as the former alone was taught in the schools, and the native language changed rapidly during the century or two that followed the diffusion of the foreign tongue and civilization” (Chamberlain). The neglect into which the Kojiki fell lasted until the 17th century. Almost simultaneously with its appearance in type (1644) and its consequent accessibility, there arose a galaxy of scholars under whose influence the archaic style and the ancient Japanese traditions entered a period of renaissance. The story of this period and of its products has been admirably told by Sir Ernest Satow (“Revival of Pure Shinto,” Proceedings of the Asiatic Society of Japan, vol. iii.), whose essay, together with Professor Chamberlain’s Kojiki, the same author’s introduction to The Classical Poetry of the Japanese, and Mr. W. G. Aston’s Nihongi, are essential to every student of Japanese literature.

To understand this 17th century renaissance, knowledge of one fact is necessary, namely, that about the year a.d. 816, a celebrated Buddhist priest, Kūkai, who had spent several years studying in China, compounded out of Buddhism, Confucianism and Shintō a system of doctrine called Ryūbu Shintō (Dual Shintō), the prominent tenet of which was that the Shintō deities were merely transmigrations of Buddhist divinities. By this device Japanese conservatism was effectually conciliated, and Buddhism became in fact the creed of the nation, its positive and practical precepts entirely eclipsing the agnostic intuitionism of Shintō. Against this hybrid faith several Japanese scholars arrayed themselves in the 17th and 18th centuries, the greatest of them being Mabuchi and Motoori. The latter’s magnum opus, Kojikiden (Exposition of the Record of Ancient Matters), declared by Chamberlain to be “perhaps the most admirable work of which Japanese erudition can boast,” consists of 44 large volumes, devoted to elucidating the Kojiki and resuscitating the Shintō cult as it existed in the earliest days. This great work of reconstruction was only one feature of the literary activity which marked the 17th and 18th centuries, when Tokugawa rule, the blessing of long-known peace came to the nation. Ieyasu himself devoted the last years of his life to collecting ancient manuscripts. In his country retreat at Shiizuoka he formed one of the richest libraries ever brought together in Japan, and by will he bequeathed the Japanese section of it to his eighth son, the feudal chief of Owari, and the Chinese section to his ninth son, the prince of Kishū, with the result that under the former feudatory’s auspices two works of considerable merit were produced treating of ancient ceremonies and supplementing the Nihongi. Much more memorable, however, was a library formed by Ieyasu’s grandson, the feudal chief of Mito (1662-1700), who not only collected a vast quantity of books hitherto scattered among Shintō and Buddhist monasteries and private houses, but also employed a number of scholars to compile a history unprecedented in magnitude, the Dai-Nihon-shiki. It consisted of 240 volumes, and it became at once the standard in its own branch of literature. Still more comprehensive was a book emanating from the same source and treating of court ceremonies. It ran to more than 500 volumes, and the emperor honoured the work by bestowing on it the title Reigi Ruihon (Rules of Ceremonials). These compilations together with the Nikkan Gwatsui (History of Japan Outside the Court), written by Rai Sanyo and published in 1827, constituted the chief sources of historical knowledge before the Meiji era. Rai Sanyo devoted twenty years to the preparation of his 22 volumes and took his materials from 250 Japanese and Chinese works. But neither he nor his predecessors recognized in history anything more than a vehicle for recording the mere sequence of events and their relations, together with some account of the personages concerned. Their volumes make profoundly dry reading. Vicarious interest, however, attaches to the productions of the Mito School on account of the political influence which their author, a man of military and political rank, wielded by unveling the picture of an epoch prior to the usurpations of military feudalism. The struggles of the great rival clans, replete with episodes of the most tragic and stirring character, inspired quasi-historical narrations of a more popular character, which often took the form of illuminated scrolls. But it was not until the Meiji era that history, in the modern sense of the term, began to be written. During recent years many students have turned their attention to this branch of literature. Works of wide scope and clear insight have been produced, and the Historiographers’ section in the Imperial University of Tokyō
has been for several years engaged in collecting and collating materials for a history which will probably rank with anything of the kind in existence.

In their poetry above everything the Japanese have remained impervious to alien influences. It owes this conservatism to its

Poetry. Without rhyme, without variety of metre, without elasticity of dimensions, it is also without known categories; it could be described as being without the infinite of all distinguishing characteristics. At some remote date a Japanese maker of songs seems to have discovered that a peculiar and very fascinating rhythm is produced by the combination of 5 and 7 syllables alternately. That is Japanese poetry (uta or tanka). There are generally five lines: the first and third consisting of 5 syllables, the second, fourth and fifth of 7, making a total of 31 syllables. The first line is compulsory, the rest may reach to thirty, forty or even more, but the alternation of 5 and 7 syllables is compulsory. The most attenuated form of all is the kokin (or kashikai) which consists of only three lines, namely, 17 syllables, the second one being compulsory in modern times, the first line must be fragmentary. Thus it results that Japanese poems are, for the most part, impressionist; they suggest a great deal more than they actually express. Here is an example—:

Momiji-ha wo
Kaze ni makasete
Mira yori no
Hakanaki mono wa
Inochi nari keri

More fleeting than the glint of withered leaf wind-blown, the
ting life called

There is no English metre with this peculiar cadence.

It is not to be inferred that the writers of Japan, enamoured as they were of Chinese ideographs and Chinese style, deliberately excluded Japanese ideas. In some of the Chinese from which they copied, many of them took pleasure in composing verses to which Chinese words were admitted and which showed something of the "parallelism" peculiar to Chinese syntax. Where the line was required to be identical with the final ideograph. But rhyme was not attempted, and the syllabic metre of Japan was preserved, the alternation of 5 and 7 being, however, dispensed with. Such a type of verse, the 10th-century model, is the Chinese ideally of the Japanese tanka or uta. The two greatest masters of Japanese poetry were Hitomaro and Akihito, both of the early 8th century, and next to them stands Tsurayuki, who flourished at the beginning of the 10th century. No poet with greater correctitude of phrase or memory than the poet of the 10th century could ever succeed to any successor. The choicest productions of the former two with those of many other poets were brought together in 760 and embodied in a book called the Man'yoshū (Collection of a Thousand Leaves). The volume remained unique until the beginning of the 10th century, when (A.D. 905) Tsurayuki and three coadjutors compiled the Kokinshū (Collection of Odes Ancient and Modern), the first of twenty-one similar anthologies between the 11th and the 15th centuries, which constitute the Nijū-ichi Dai-shi (Anthologies of the One-and-Twenty Reigns). If to these we add the Hyaku-nin-shū (Hundred Odes by a Hundred Poets) brought together by Teika Kyō in the 13th century, we shall have all the contents of Japanese poetry composed during the composition of the uta gradually deteriorated from the end of the 9th century, when a game called uta-awase became a fashionable pastime, and aristocratic circles were trying to distinguish them from the pure Japanese language called uta or tanka. In its later developments, may not unjustly be compared to the Occidental game of bouts-rimés. The poetry of the nation rested upon a theme and a pattern. Euri distinguished in the shady and the clear, when, either by direct access to the originals or through the medium of very defective translations, the nation became acquainted with the masters of Occidental song. A small coterie of authors, headed by Professor Toyama, then attempted to revolutionize Japanese poetry by recasting it on European lines. But the project failed significantly, and indeed it may well be doubted whether the Japanese language has thus been divided.

It was under the auspices of an emperor (Suiko) that the first historical manuscript is said to have been compiled in 620. It was under the auspices of an emperor (Genmyō) that the first record of Ancient Matters was transcribed (721) from the pure Japanese language, the classical, or Chinese, form being adopted by men. The distinction continued throughout the ages. To this day the spoken language of Japan, the woman is decorously simpler and softer than that of the man; and to this day when the educated woman uses the hiragana syllabary in writing, she combs her hair and rarely pens an ideograph, the educated man employs the ideograph entwined with the character or kenji. For the fathers of thought to the possibility of mispronounced Chinese words without recourse to which it would be impossible for him to discuss any scientific subject, or even refer to the details of his daily business. Japan was therefore divided by this, and not only by the Man'yōgana (c. 429) and the Makura no Žōki (about the same date). The former, by Murasaki no Shikibu—probably a pseudonym—was the first novel composed in Japan. Before her time there had been many mono-gatari (narratives), but all consisted merely of short stories, mythical histories...
JAPAN

The dramatic Nō and its companion the Kyōgen were two of the oldest acting devices in Japan. In the late Heian period of the 10th century, the combination of comic and serious scenes, the Nō and the Kyōgen, was first practiced at court. The Kyōgen is thought to be a type of courtly music and dance; the Nō is the classical Japanese theater form. Both are performed in verse, and the Kyōgen usually consists of a long monologue and the Nō is a dramatic play in verse. The Nō and the Kyōgen are both closely tied to the Japanese culture and history, and they continue to be performed today.

In the Heian period, the Nō and the Kyōgen were performed at court, and the performances were considered to be important cultural events. The Nō play was often performed in a shrine or temple, and the Kyōgen was performed in a more secular setting. The Nō and the Kyōgen were both performed in verse, and the performances were considered to be important cultural events.

In the Kamakura period, the Nō and the Kyōgen were performed in a more secular setting, and the performances were considered to be important cultural events. The Nō and the Kyōgen were both performed in verse, and the performances were considered to be important cultural events.

In the Muromachi period, the Nō and the Kyōgen were performed in a more secular setting, and the performances were considered to be important cultural events. The Nō and the Kyōgen were both performed in verse, and the performances were considered to be important cultural events.

In the Momoyama period, the Nō and the Kyōgen were performed in a more secular setting, and the performances were considered to be important cultural events. The Nō and the Kyōgen were both performed in verse, and the performances were considered to be important cultural events.

In the Edo period, the Nō and the Kyōgen were performed in a more secular setting, and the performances were considered to be important cultural events. The Nō and the Kyōgen were both performed in verse, and the performances were considered to be important cultural events.

In the 19th century, the Nō and the Kyōgen were performed in a more secular setting, and the performances were considered to be important cultural events. The Nō and the Kyōgen were both performed in verse, and the performances were considered to be important cultural events.

In the 20th century, the Nō and the Kyōgen were performed in a more secular setting, and the performances were considered to be important cultural events. The Nō and the Kyōgen were both performed in verse, and the performances were considered to be important cultural events.

In the 21st century, the Nō and the Kyōgen are still performed in Japan, and they continue to be an important part of Japanese culture and history. The Nō and the Kyōgen are both performed in verse, and the performances are considered to be important cultural events.
A long-standing tradition in Japan was the practice of establishing periodical newspapers, which were not only a means of disseminating news but also were used as a platform for social and political discourse. One such periodical, the Shimbun-shiki (News), was founded by Otani Fusatoshi in 1857. This newspaper was one of the earliest to be printed in Japan and played a significant role in the dissemination of Western ideas and news. However, the article does not provide specific details about the content or impact of the Shimbun-shiki.

The text also mentions the Meiji era, a period of rapid modernization and industrialization in Japan. During this time, Japan began to adopt Western technologies and practices, including the use of periodical newspapers. The article highlights the importance of newspapers in the Meiji era for spreading information and ideas.

The Meiji period was marked by significant changes in Japan, including the abolition of the feudal system, the establishment of a constitutional monarchy, and the modernization of the country's political and social systems. These changes were largely driven by Western influence and the desire to compete with European powers.

In summary, the text discusses the role of periodical newspapers in Japan, with a focus on the Shimbun-shiki and the Meiji era. The article notes the importance of these newspapers in shaping public opinion and promoting social change during a time of significant transition in Japan.
JAPAN

Painting and Engraving.—In Japanese art the impressionist element is predominant. Pictures, as the term is understood in Europe, can scarcely be said to have existed at any time in Japan. The artist did not depict emotion: he depicted the subjects that produce emotion. Therefore he took his motives from nature rather than from history; or, if he borrowed from the latter, what he selected was a scene, not the pains or the passions of its actors. Moreover, he never exhausted his subject, but was always careful to leave a wide margin for the imagination of the spectator. This latter consideration sometimes impelled him to represent things which, to Europeans, had little or no significance, but which really convey hints of deep significance. In short, Japanese pictures are like Japanese poetry: they do not supply thought but only awaken it. Often their methods show conventionalism, but it is conventionalism so perfect and free in its allurements that nature seems to suggest both the motive and the treatment. Thus though neither botanically nor ornithologically correct, their flowers and their birds show a truth to nature, and a habit of minute observation in the artist, which can be traced in the minute by-play of grass, each leaf and feather, has been the object of long and patient study.

It has been rashly assumed by some writers that the Japanese do not study from nature. All their work is an emphatic protest against this supposition. It can in fact be shown conclusively that the Japanese have derived all their fundamental ideas of symmetry, so different from ours, from a close study of nature and her processes in the attainment of endless variety.

A special feature of their art is that, while often closely and minutely imitating natural objects, such as birds, flowers and fishes, the special objects of their predilection and study, they frequently combine the facts of external nature with a conventional mode of treatment better suited to their purpose. During the long apprenticeship that educated Japanese serve to acquire the power of writing with the brush the complicated characters borrowed from Chinese, they unconsciously cultivate the habits of minute observation and the power of accurate imitation. And when, with the touch and freedom of hand which only long practice can give, they attempt what is a line is fatal to good calligraphy, both among the Chinese and the Japanese. When they come to use the pencil in drawing, they already possess accuracy of eye and free command of the brush. Whether a Japanese art-worker sets himself to copy what he sees before him or to give play to his fancy in combining what he has seen with some ideal in his mind, the result shows perfect facility of execution and easy grace in all the lines.

The beauties of the human form never appealed to the Japanese. Asahi Shimbun pointed out the nude solely with the performance of menial tasks, he deemed it worse to attempt to portray that which was this world's own than to move under such subjects to his canvas, and thus a wide field of motives was closed to him. On the other hand, the draped figure received admirable treatment from his brush, and the naturalistic school of the 17th, 18th and 19th centuries reached a high level of skill in depicting men, women and children in motion. Not has there been a Japanese Landseer. Sosen's monkeys and badgers constitute the one possible exception, but the horses, oxen, deer, tigers, dogs, bears, foxes and even cats of the best Japanese art were dull and badly modelled. In the field of landscape the Japanese painter fully reached the eminence on which his great Chinese masters stood. He did not obey the laws of linear perspective as they are formulated in the Occident, nor did he show cast shadows, but his aerial perspective and his foreshortening left nothing to be desired. It has been suggested that he deliberately eschewed chiaroscuro because his pictures, destined invariably to hang in an alcove, were required to be equally effective from every aspect and had also to form part of a decorative scheme. But the more credible explanation is that he merely followed Chinese example in this matter, as he did also in the use of a completely restricted perspective, without question the curious canon that lines converge and they approach infinity.

It is in the realm of decorative art that the world has chiefly benefited by contact with Japan. Her influence is second only to that of Greece. Most Japanese decorative designs consist of natural objects, treated sometimes in a more or less conventional manner, but always distinguished by delicacy of touch, graceful freedom of conception and delightfully harmonized tints. Perhaps the admiration which the Japanese artist has won in this field is due not more to his wealth of fancy and skilful adaptation of natural forms, than to his individuality of character in treating his subjects. There is complete absence of uniformity and monotony. Repetition without any variation is abhorrent to every Japanese. He will not tolerate the stagnation and tedium of a dull uniformity by mechanical reproduction. His temperament will not let him endure the labour of always producing the same pattern. Hence the repetition of two articles exactly like each other, and, generally, the division of any space into equal parts is instinctively avoided, as nature avoids the production of any two plants, or even any two leaves of the same tree, which in all likelihood will be exactly alike.

The application of this principle in the same free spirit is the secret of much of the originality and the excellence of the decorative art of Japan. Her artists and artisans alike aim at symmetry, not by an equal division of parts, as we do, but rather by a certain balance of corresponding parts, each different from the other, and not numerically even, with an effect of variety and freedom from formality. They seek it, in fact, as nature attains the same end. If we take for instance the skins of animals that

PAINTING

Fig. 4.—Priests Caricatured by Animals. By Jōna Sojo (1037-1140).

Fig. 5.—Escape of the Emperor Disguised as a Woman. Scene from the Civil War. By Keoun (13th century).
are striped or spotted, we have the best possible illustration of nature's methods in this direction. Examining the tiger or the leopard, in all the beauty of their symmetrical adornment, we do not see in any one example an exact repetition of the same stripes or spots on each side of the mesial line. They seem to be alike, and yet are all different. The line of division along the spine, it will be observed, is not perfectly continuous or defined, but in part suggested; and each radiating stripe on either side is full of variety in size, direction, and to some extent in colour and depth of shade. Thus nature works, and so, following in her footsteps, works the Japanese artist. The same law prevailing in all nature's creation, in the plumage of birds, the painting of butterflies' wings, the marking of shells, and in all the infinite variety and beauty of the floral kingdom, the lesson is constantly renewed to the observer eye. Among flowers the orchids, with all their fantastic extravagance and mimic imitations of birds and insects, are especially prolific in examples of symmetrical effects without any repetition of similar parts or divisions into even numbers.

The orchids may be taken as offering fair types of the Japanese artist's ideal in natural art. And thus, close student of nature's processes, methods, and effects as the Japanese art workman is, he ever seeks to produce humble replicas from his only art master. Thus he proceeds in all his decorative work, avoiding studiously the exact repetition of any lines and spaces, and all diametrical divisions, or, if these be forced upon him by the shape of the object, exercising the utmost ingenuity to disguise the fact, and train away the eye from observing the weak point, as nature does in like circumstances. Thus if a lacquer box in the form of a parallelogram is the object, Japanese artists will not divide it into two equal parts by a perpendicular line, but by a diagonal, as offering a more pleasing line and division. If the box be round, they will seek to lead the eye away from the naked regularity of the circle by a pattern distracting attention, as, for example, by a zigzag breaking the circular outline, and supported by other ornaments. A similar feeling is shown by them as colourists, and, though sometimes eccentric and daring in their contrasts, they never produce discords in their chromatic scale. They have undoubtedly a fine sense of colour, and a similarly delicate and subtle feeling for harmonious blending of brilliant and sober hues. As a rule they prefer a quiet and refined style, using full but low-toned colours. They know the value of colours, however, and how best to utilize them, both supporting and contrasting them with their secondaries and complementsaries.

The development of Japanese painting may be divided into the following six periods, each signalized by a wave of progress.

(1) From the middle of the 6th to the middle of the 9th century: the naturalization of Chinese and Chino- Buddhist art. (2) From the middle of the 9th to the middle of the 13th century: the establishment of native schools under Kosho no Kanoana and his descendants and followers, the pure Chinese school gradually falling into neglect. (3) From the middle of the 13th to the latter part of the 15th century: the revival of the Chinese style. (4) From the latter part of the 15th to the latter part of the 16th century: the establishment of a popular school. (5) From the latter part of the 16th to the latter part of the 19th century: the foundation of a naturalistic school, and the first introduction of European influence into Japanese painting; the acme and decline of the popular school. (6) From about 1875 to the present time: a period of transition.

Tradition refers to the advent of a Chinese artist named Nanri, invited to Japan in the 5th century as a painter of the Imperial banners, but of the labours and influence of this man and of his descendants we have no record. The real beginnings of the study of painting and sculpture in their higher branches must be dated from the introduction of Buddhism from China in the middle of the 6th century, and for three centuries after this event there is evidence that the practice of the arts was carried on mainly by or under the instruction of Korean and Chinese immigrants.

The paintings of which we have any mention were almost limited to representations of Buddhist masters of the Tang dynasty (618–907), notably Wu Tao-tzu (9th century), of whose genius romantic stories are related. The existing work of this period is as a mural decoration in the hall of the temple of Horyo-ji, Nara, attributed to a Korean priest named Doncho, who lived in Japan in the 9th century; of this painting, in spite of the destructive effects of time and exposure, there are traces of the strong line, colour and composition that stamps the best of the later examples of Buddhist art.

The native artist who created the first great wave of Japanese painting was a coarse named Kosho no Kanoana, living under the patronage of the court (A.D. 790–870) and his successors down to about the end of the 9th century, in the midst of a period of peace and culture. Of his own work few, if any, examples have reached us; and those attributed with more or less probability to his hand are all representations of Buddhist divinities, showing a somewhat formal and conventional design, with a masterly calligraphic touch and perfect harmony of colouring. Tradition credits him with an especial genius for the delineation of animals and landscape, and commemorates his skill by a curious anecdote of a painted horse which left its frame to ravage the fields, and was reduced to pictorial stability only by the sacrifice of its eyest. He left a line of descendants extending far into the 15th century, all famous for Buddhist pictures, and some engaged in establishing a native style, the Wa-gua-ryu.

At the end of the 9th century there were two exotic styles of painting, Chinese and Buddhist, and the beginning of a native style founded upon these. All three were practised by the same artists, and it was not until a later period that each became the badge of a school.

The Chinese style (Kara-ryu), the fundamental essence of all Japanese art, has a fairly distinct history, dating back to the introduction of Buddhism into China (A. D. 62), and it is said to have been chiefly from the works of Wu Tao-tzu, the master of the 9th century, that he drew his inspiration. This early Chinese manner, which lasted in the parent country down to the end of the 15th century, was characterized by a virile grace of line, a grave dignity of composition, striking simplicity of technique, and a strong but incomplete naturalistic ideal. The colouring, harmonious but subdued in tone, held a place altogether secondary to that of the outline, and was frequently omitted altogether, even in the most famous works. Shadows and reflections were ignored, and perspective, approximately correct for landscape distances, was isometrical for near objects, while the introduction of a symbolic sun or moon lent many a distinction to the day and night scenes.

The Chinese style was one of imperfect evolution, but for thirteen centuries it was the only living pictorial art in the world, and the Chinese deserve the honour of having created landscape painting. The materials used were watercolours, brushes, generally of dog's tail, and unsized paper, translucid silk or wooden panel. The chief motives were landscapes of a peculiarly wild and romantic type, animal life, trees and flowers, and figure compositions drawn from Chinese and Buddhist legend; and these, together with the grand aims and strange shortcomings of its principles and the limited range of its methods, were adopted almost without change by Japan. It was a noble art, but unfortunately the rivalry of the Buddhist and later native styles permitted it to fall into comparative neglect, and it was left for a few of the faithful, the most famous of whom was a priest of the 14th century named Kasso, to preserve it from extinction till the great Chinese renaissance that lent its vigour to the next period. The reputed founder of Japanese caricature may also be added to the list. He was a priest named Kakuyo, but better known as the abbot of Toba, who lived in the 12th century. An unknown Chinese artist may have first suggested it to his friends by burlesque sketches, marked by a grace and humour that his imitators never equalled. Later, the motive of the Toba pictures, as such caricatures were called, tended to degenerate, and the elegant figures of Kakuyo were replaced by scrawls that often substituted indecency and ugliness for art and wit. Some of the old masters of the Yamato school were, however, admirable in their rendering of the barbarous and grotesque tales of the legends of the Hokusai school, outdid all his predecessors in the riotous originality of his weird and comic fancies. A new phase of the art now led to its present pag pha of types.

Buddhist Style. The Buddhist style was probably even more ancient than the Chinese, for the scheme of colouring distinctive of the Buddhist picture was almost certainly of Indian origin; brilliant and sumptuous, and generated by a sense of gold, it was essential to the effect of a picture destined for the dim light of the Buddhist temple. The style was applied only to the representations of sacred personages and scenes, and
The traditional forms and attributes of the Brahmanic and Buddhist divinities were mutable only within narrow limits, the subjects seldom afforded scope for originality of design or interpretation. This period was marked by a certain uniformity in art, with the 14th century being a period of rule by the Kamakura shogunate. Meicho, better known as Chō Denko, the Buddhist priest, was one of the greatest Japanese painters, an eclectic of genius, whoexcelled in every style and every branch of his art. This diversity was inestimable, and he remains to this day a model whom the most discriminative and artistic critics find it impossible to match. The descendants of Meicho served as model for the most important members of the line of the Kōrin school. Meicho, known as Nisshin (1565–1716) is by far the most accomplished of his school, and his work bears more resemblance to that of an erratic offshoot of the Kōrin School than to the normal work of the academies. He was an artist of eccentric originality, who achieved wonders in bold decorative effects in spite of a studied contempt for detail. As a lacquer painter he left a strong mark on the work of his contemporaries and successors. His brother and pupil, Kenza, adopted his style, and left a reputation as a decorater of pottery hardly less brilliant than Kōrin's in that of lacquer; and a later follower, Hōitsu (1763–1828), greatly excelled the master in delicacy and refinement, although inferior to him in vigour and invention.

Through the end of this era painting was entirely in the hands of a patronistic caste—courtiers, priests, feudal nobles and their military followers. A prince or noble, whether a member of the Kōrin circle or not, would commission the work of the old masters a dignity and poetic feeling which we vainly seek in much of the later work. Unhappy, but almost inevitably, over-culture led to a gradual falling-off from the old virility. Many of the Meicho and Tanyū’s exemplars, till the heirs to the splendid traditions of the great masters preserved little more than their conveniences and ornamental forms. It was time for a new departure, but there seemed to be no sufficient strength left within the charmed circle of the orthodox schools, and the new movement was fated to come from the provinces, whose music had hitherto been silent in the art of painting.

A new era in art began in the latter half of the 17th century with the establishment of popular schools. The most distinguished of these was the Shōgū school, under an encyclopedist’s draughtsman named Hishigawa Moronobu (c. 1646–1713). Perhaps no great change is ever entirely a novelty. The old painters of the Yamato-Tosa line had frequently shown something of the daily life around them, and one of the later scions of the school, named Iwasa Matahei, had even made a speciality of this class of motive; but so little is known of Matahei and his work that even his period is a matter of dispute, and the few pictures attributed to his pencil are open to question on grounds of authenticity. It is not improbable that he was the forerunner of the time of Moronobu, but there is no reason to believe that his labours had any material share in determining the creation and trend of the new school.

Moronobu was a consummate artist, with all the delicacy and calligraphic force of the best of the Tosa masters, whom he undoubtedly strove to emulate in style; and his pictures are not only the most beautiful, but also the most trustworthy records of the life of his time. It was not to his paintings, however, that he owed his greatest influence, but to the powerful impulse he gave to the illustration of books and broadsides by wood-engravings. It is true that this art was not invented by him, for it was used for book-borne, but they were few and unattractive, and did little to inaugurate the great stream of shōnen, or picture books, that were to take so large a share in the education of the numerous children of the rising middle class. It was partly the result of a demand, and partly the result of the popularity of artistic wood-engravings, for nothing before his series of xylographic albums approached his best work in strength and beauty, and nothing since has surpassed it. The pictures came almost entirely from pupils of the Kano and Tosa schools, but mainly from the artistic class. Most of these artists were designers for books and broadsides by calling, painters only on occasion, but a few of them did receive commissions for their finest work. The commercial period, embracing about a hundred years, there still continued to work, altogether apart from the men who were making the success of this new art, a few who found their inspiration in the Kano and Chinese schools, who multiplied pictures that had every merit except that of originality. These men, living in the past, paid little attention to the great popular movement, which seemed to be quite outside their social and artistic sphere and scarcely worthy of
cultural criticism. It was in the middle of the 18th century that the decorative, but relatively feeble, Chinese art of the later Ming period found favour in Japan and a clever exponent in a painter named Hyōtoku Kano, regarded descriptively by the followers of the old Chinese ideals, which was further hastened, from about 1765 by the popularity of the southern Chinese style. This was a weak affectation that found its chief votaries amongst literary men and more pretentious art connoisseurs. The Japanese supporter of this school was Taigadō (1722-1775), but the volume of copies of his sketches, Taigadō sannei jūsekii, published about 1870, is one of the least attractive albums ever printed in Japan.

The fifth period was introduced by a movement as momentous as that which stamped its predecessor—the foundation of a naturalistic school under a group of men outside the orthodox academical circles. The naturalistic principle was no mean new one; some of the old Chinese masters were naturalistic in a broad and noble manner, and their Japanese followers could be admirably and minutely accurate when they pleased; but too many of the latter were content to construct their pictures out of fragmentary reminiscences of ancient Chinese masterpieces, not presuming to see a rock, a tree, an ox, or a human figure, except through China. This was not the case with Okyō. It was a farmer's son named Okyō, trained in his youth to paint in the Chinese manner, who was first bold enough to adopt as a canon what his predecessors had only admitted under rare exceptions, the principle of an exact imitation of nature. Unfortunately, even he had not all the courage of his creed, and while he would paint a bird or a fish with perfect realism, he never dared to trust his eyes in larger motives than did the most devout follower of Shūbun or Motonobu. He was essentially a painter of the classical schools, with the speciality of elaborate reproduction of detail in certain sections of animal life, but fortunately this partial concession to truth, emphasized as it was by a rare sense of beauty, did large service.

Okyō rose into notice about 1775, and a number of pupils flocked to his studio in Shijō Street, Kiotō (whence Shijō school). Amongst these the most famous were Goshun (1742-1814), who is sometimes regarded as one of the founders of the school; Sosen (1757-1821), an animal painter of remarkable power, but especially celebrated for pictures of monkey life; Shūhō, the younger brother of the last, also an animal painter; Rōsetsu (1755-1799), the best landscape painter of his school; Keibun, a younger brother of Goshun, and some later followers of scarcely less fame, notably Hōyen, a pupil of Keibun; Tessan, an adopted son of Sosen; Isshō and Yōsai (1788-1879), well known for a remarkable set of volumes, the Zenkoku kōjitsu, containing plates of portraits of ancient Japanese celebrities

It remains only to allude to the European school, if school it can be called, founded by Kokan and Denkichi, two contemporaries of Okyō. These artists, at first educated in one of the native schools, obtained from a Hollander in Nagasaki some training in the methods and principles of European painting, and left a few oil paintings in which the laws of light and shade and perspective were correctly observed. They were not, however, of sufficient capacity to render the adopted manner more than a subject of curiosity, except to a few followers who have reached down to the present generation. It is possible that the essays in perspective found in the pictures of Hokusai, Hiroshige, and some of the popular artists of the 19th century, were suggested by Kokan's drawings and writings.

The sixth period began about 1875, when an Italian artist was engaged by the government as a painter of painting in the Engineering College at Tōkyō. Since that time some distinguished European artists have visited Japan, and several Japanese students have made a pilgrimage to Europe to see for themselves what lessons may be gained from Western art. These students, confronted by a strong reaction in favour of pure Japanese art, have fought manfully to win public sympathy, and though their success is not yet crowned, it is not impossible that an Occidental school may ultimately be established. Thus far the great obstacle has been that pictures painted in accordance with Western canons are not suited to Japanese interiors and do not appeal to the taste of the most renowned Japanese connoisseurs. Somewhat more successful has been an attempt—inaugurated by Hashimoto Gakusai of Kagoshima—to combine the art of the West with that of Japan by adding to the latter the chromatic art and the linear perspective of the former. If the disciples of this school could shake off the Sesshū tradition of strong outlines and adopt the Kano Motonobu revelation of modelling by mass only, their work would stand on a high place. But they, too, receive little encouragement. The tendency of the time is conservative in art matters.

A series of magnificent publications has popularized art and its best products in a manner such as could not have been anticipated. The Koko, a monthly magazine rich and beautifully illustrated and edited by Japanese students, has reached its 223rd number; the Shinbō Dansen, a colossal album containing chromosylographic facsimiles of rare and beautiful paintings, has been completed in 20 volumes; the masterpieces of Kōrin and Motonobu have been reproduced in similar albums; the masterpieces of the Ukiyo-e are in process of publication, and it seems certain that the Japanese nation will soon be educated to regard the works of its own art as will make for permanent appreciation. Meanwhile the intrepid group of painters in oil and along unlined faience, having formed themselves into a society for the promotion of Japanese art, have held periodic exhibitions, and there are, in Tōkyō and Kiotō, well-organized and flourishing art schools which receive a substantial measure of state aid, as well as a private academy founded by Okakura Kakuzō. With a base of support from the government, and especially the consumption of the Galo system. Altogether the nation seems to be growing more and more convinced that its art future should not wander far from the lines of the past.

Although a little engraving on copper has been practised in Japan for late years, it is of no artistic value; the only branch of the art which calls for recognition is the engraving, or cutting of wood-blocks for use either with colours or without. This, however, is of supreme importance, and as its technique differs in many respects from the European practice, it demands a somewhat detailed description.

The wood used is generally that of the cherry-tree, sakura, which has a grain of peculiar evenness and hardness. It is worked planwise. The surface parallel with the grain, and not across it. The design is drawn by the artist, to whom the whole credit of the production generally belongs, with a brush on thin paper, which is then pasted face downwards on the block. The engraver, who is very rarely a painter, then carves the design inscribed on the paper by and by with a large number of block etching tools. Afterwards removing the superfluous wood with gouges and chisels. Great skill is shown in this operation, which achieves perhaps the finest results registered in the field of wood engraving. The impression is obtained by the usual methods of graphic processes. A peculiar but highly artistic device is that of gradually rounding off the surfaces where necessary, in order to obtain in printing a soft and graduated mass of colour which does not terminate too abruptly. In printing with colours a separate block is made in this manner for each tint, the first containing as a rule the mere lines of the composition, and the others providing for the masses of tint to be applied. In all printing the paper is laid on the upper surface of the block, and the impression rubbed off with a circular pad, composed of twisted cord within a covering of paper cloth and bamboo-leaf, and called the barets. In the case of touch coloring, which are most extensively used in Europe, are mixed, with rice-paste as a medium, on the block for each operation, and the power of regulating the result given by this custom to an intelligent craftsman (who, again, is neither the arm of the engraver, but a creative) is perhaps the best period of very beautiful and artistic effects, such as could never have been obtained by any mechanical device. A wonderfully accurate register, or successive superposition of each block, is got mainly by the same device.

The origins of this method of colour-printing are obscure. It has been practised to some extent in China and Korea, but there is no evidence of its antiquity in these countries. It appears to be one of the few indigenous arts of Japan. But before accepting this conclusion as final, one must not lose sight of the fact that the so-called chiaroscuro engraving was at the height of its use in Italy at the same time that emblems from the Christians in Japan visited Rome, and that it is thus possible.
that the suggestion at least may have been derived from Europe. The fact that no traces of it have been discovered in Japan would be easily accounted for, when it is remembered that the examples taken home would almost certainly have been religious pictures, would have been preserved in well-known and accessible places, and would thus have been entirely destroyed in the terrible and minute extermination of Christianity by Hideyoshi at the beginning of the 17th century. Japanese tradition ascribes the invention of colour-printing to Izadumi Gonshirō, who, about the end of the 17th century, lived under the last of the Tokugawa shōguns; a red and (1792) to prints. Sir Ernest Satow states more definitely that "Sakaihara attributes its origin to the year 1695, when portraits of the actor Ichikawa Danjūrō, coloured by this process, were sold in the streets of Yedo for five cash apiece." The credit of the invention is also given to Torii Kiyonobu, who worked at about this time, and, indeed, is said to have made the prints above mentioned. But authentic examples of his work now remaining, printed in three colours, seem to show a technique too complete for an origin quite so recent. However, he is the first artist of importance to have produced the broadsheets—portraits, small pictures, and other graphic representations of contemporary events, characters and famous court-dignitaries—which are the leading and characteristic use to which the art was applied. Pupils, the chief of whom were Kiyomasa, Kiyotsune, Kiyomitsu, Kiyonaga and Kiyomine, carried on his tradition until the close of the 18th century, the three earlier using but few colours, while the works of the two last named show a technical mastery of all the capabilities of the process.

The next artist of importance is Suzuki Harunobu (worked c. 1760-1808). His great contribution to the invention of the intaglio process, probably on the grounds of an improvement in his technique, and the fact that he seems to have been one of the first of the colour-print makers to attain great popularity. Katsukawa Shunsō (d. 1832) must next be mentioned, not only for the beauty of his own work, but because he was the first master of Hosoban; then Yeisih (worked c. 1781-1800), the founder of the Hosoda school; Utaburo (1754-1806), with whom printmaking was a mass work, while he himself, alive and had in our own day a vogue greater, perhaps, than those of any other of his fellows; and Toyokuni I. (1768-1825), who especially devoted himself to broadsheet portraits of actors and dramatic scenes. He was, however, Kikutai (1760-1849). His most famous series of broadsheets is the Thirty-six Views of Mount Fuji (1823-1829), which, in spite of the constantly increasing demands for them, have always been in demand, and have been reissued, as the work, and its author, have grown in esteem, by削减. At the beginning of the 17th century the process was technically at its greatest height, and in the hands of the great masters, Hisai, Hishikawa, and as well as the contemporary Yeisih, Kiyonobu, Kuniyoshi—Kunosada and Kuniyoshi—and those of Hosoban, it first kept up an excellent level. But an undue increase in the number of blocks used, combined with the inferiority of the impressions, caused perhaps a decline which was perhaps but a sign of a rapid decline soon after 1840. This continued until the old traditions were well-nigh exhausted, but since 1880 there has been a distinct revival. The prints of the present day are cut with great skill, and the designs are excellent, though both these branches seem to lack the vigour of conception and breadth of execution of the older masters. The colours now used are more invariably of cheaper German origin, and though they have a certain prettiness, but they are the cuts were roughly coloured by hand; but the execution of this is not as good as contemporary European work. The date of the first use of colour-printing in Japanese book illustration is uncertain. In 1667 a collection of designs for "Book illustration" appeared, in which prints of several colours were made use of; but these were only employed in turn for single prints, and in no case were two of them used on the same print. It is certain, however, that the mere use of coloured inks must soon have suggested the possibility of this, and it is probable that examples of this will be discovered much earlier in date than those now at present.

About the year 1680 Hishigawara Moronobu achieved a great popularity for woodcut illustration, and laid the foundations of the splendid school which followed. The names of the engravers who cut his designs are not known, and in fact have never been ascertained. It is certain that no artist of the above list was more active than Moronobu, for he was associated with the most celebrated artists of all. The work of Tomisuke Massaburo, a little later perhaps in date, whose work is also book-illustration was the first to be known. The main influence of these thirty years numerous illustrated books appeared, including the earliest yet known which are illustrated by colour-printing. Ishisakawa Sukenobu (1671-1731) illustrated a very large number of books, many of which were printed by him. He was succeeded in 1734 by his son Ichis Shumoku (d. 1773) and Tsukitaka Tange (1717-1786), the latter of whom the making of the many of the meisho or guidebooks, a form of design and illustration which of the best of their work is to be found in the collections of pictorial designs, very often taken from Chinese sources, which were produced for the use of workers in lacquer, pottery and the other crafts. At the end of the 18th century, the art of colour-printing flourished in China, and the number of Japanese artists who turned to the making of clocks is very large. Among the artists of this school, as of all others in Japan, Hosoban (1670-1840) is undoubtedly the most important. His production was the Maungo, a collection of sketches which cover the whole ground of Japanese life and legend, art and handicraft. It consists of fifteen volumes, which appear at intervals from 1812 to 1875, twelve being published during his life and the others from material left by him. Among his many other works may be mentioned the Asam Asobi (Walks round Yedo, 1799). Of his pupils, Hokkei (1780-1856) and Kyōsai were the greatest. His other pupils, more particularly those of the later generation—Tomioka Yeisih, Toshikata and Gekko. Formerly the colour-print artist was of mean extraction and low social position, but his reputation in the eyes of the public and of the highest esteemed branches of art. This change is doubtless due in part to Occidental appreciation of the products of his art, which were formerly held in little honour by his own countrymen, the place assigned to them being scarcely higher than that accorded to magazine illustrations in Europe and America. But it is also largely due to his displays of unsurpassed skill in preparing xylographs and in the execution of the book-illustrations. The book-artist of the present day is not surpassed by the greatest of his predecessors in this line. (E. F. S.; F. Bv.)

The history of the illustrated book in Japan may be said to begin with the Isso monogatari, a romance first published in the 10th century, of which an edition adorned with woodcuts appeared in 1608. In the course of the 17th century many other works of the same nature were issued, including some in which

Sculpture and Carving. Sculpture in wood and metal is of

Fig. 10.—PEACOCKS. By Ganku (1749–1838).
ancient date in Japan. Its antiquity is not, indeed, comparable to that of ancient Egypt or Greece, but no country besides Japan can boast a living and highly developed art that has numbered upwards of twelve centuries of unbroken and brilliant productiveness. Setting aside rude prehistoric essays in stone and metal, which have special interest for the antiquary, we have examples of sculpture in wood and metal, magnificent in conception and technique, dating from the earliest periods of what we may term historical Japan—that is, from the beginning of the great Buddhist propaganda under the emperor Kimméi (540–571) and the princely hierarchy, Shōtoku Taishi (573–622). Stone has never been in favour in Japan as a material for the higher expression of the sculptor’s art.

The first historical period of ajitic art in Japan reaches from the end of the 6th to the end of the 17th century, culminating in the work of the great Nara sculptors, Unkei and his pupil Kawaike. Happily, there are still preserved in the great temples of Japan, chiefly in the ancient capital of Nara, many noble works of this period.

The place of the statue may perhaps be conferred upon sculptures in wood, representing the Indian Buddhists, Asanga and Vassabandhu, preserved in the Golden Hall of Kofuku-ji, Nara. These are attributed to a Kamakura sculptor of the 8th or 9th century, and while the subject is dignified and the work fine in position are worthy of comparison with the works of ancient Greece. With these may be named the demon lantern-holders, so perfect in the grotesque treatment of the heads and the animal forms of the sturdy body and limbs; the colossal temple guardians of the great gate of Tōdai-ji, by Unkei and Kawaike (11th century), somewhat conventionalized, but still bearing evidence of direct inspiration from the same source. In the 10th century arose the diabolical and feminine ornaments, with intense energy of action, and the smaller but more accurately modelled temple guardians in the Saikendo, Nara, which almost compare with the “fighting gladiators” in their realization of menacing strength. The “godness” of the Akashino-dera, Nara, attributed to the 8th century, is the most graceful and least conventional of female sculptures in Japan, but infinitely remote from the feminine conception of the Grecian school. The short period of Vatō’s power (1042–1045) at Kofuku-ji, has some of the qualities of the images of the two Indian Buddhists. The sculptures attributed to Jōchō, the founder of the Nara school, although powerful in pose and mastery in execution, lack the truth of observation seen in some of the earlier and later masterpieces.

The most perfect of the ancient bronzes is the great image of Bāhū-dāyaguru in the temple of Yakushiji, Nara, attributed to a Korean monk of the 9th century, named Gōgō. The bronze image of the same divinity at Hōryū-ji, said to have been cast at the beginning of the 7th century by Tori Busshi, the grandson of a Chinese Buddhist and technical expert, but much altered in design to the former. The colossal Nara Daihōsu (Vairocana) at Tōdai-ji, cast in 749 by a workman of Korean descent, is the largest of the great bronzes in Japan, but ranks far below the Yakushiji image in artistic qualities. The present head, however, is a later substitute for the original, which was destroyed by fire.

The great Nara school of sculpture in wood was founded in the early part of the 11th century by a sculptor of Indian name, Jōchō, who is said to have modelled his style upon that of the Chinese wood-carvers of the Tang dynasty; his traditions were maintained by descendants and followers down to the beginning of the 17th century. All the artists of this period were men of artistic rank and origin, and were held distinct from the carpenter-architects of the imposing temples which were to contain their works.

Sculpted images were not the only specimens of figmetric art produced in these six centuries; reliquaries, bells, vases, incense-burners, candlesticks, lanterns, decorated arms and armour, and many other objects, showing no less masterful design and execution, have been rescued. Gold and silver had been applied to the adornment of helmets and breastplates from the 7th century, but it was in the 12th century that the decoration reached the high degree of elaboration shown us in the armour of the Japanese Bayard, Yoshibunsu, which is still preserved at Kasuga, Nara.

Wooden masks employed in the ancient theatrical performances were made from the 7th century, and offer a distinct and often greater interest. A Ducal head of wood of the 12th century, which has been associated with this class of sculpture, and their designs have been carefully preserved and imitated down to the present day.

The second period in Japanese glyptic art extends from the beginning of the 13th to the early part of the 17th century. The great struggle between the Taira and Minamoto clans had ended, but the militant spirit was still strong, and brought work for the artists who made and ornamented arms and armour. The Miyōchins, a line that claimed ancestry from the 7th century, were at the head of their calling, and their work in iron breastplates and helmets, chiefly in repoussé, is still unrivalled. It was not until the latter half of the 15th century that there came into vogue the elaborate decoration of the sword, a fashion that was to last four hundred years.

The metal guard (tsuba), made of iron or precious alloys, was adorned with engraved designs, often inlaid with gold and silver. The free end of the hilt was crowned with a metallic cap or pomell (kashira), the other extremity next the tsuba was embraced by an oval ring (fuchi), and in the middle was affixed on each side a special ornament called the menuki, all adapted in material and workmanship to harmonize with the guard. The kodzuka, or handle of a little knife implanted into the sheath of the short sword or dagger, was also of metal and engraved with like care. The founder of the first great school of tsuba and Yorimono artists was Gōtō (1510–1552), friend of the painter Kano Motonobu. Many families of sword artists sprang up at a later period, furnishing treasures for the collector even down to the present day, and their labours reached a level of technical mastery and refined artistic judgment almost without parallel in the art industries of Europe. Buddhist sculpture was by no means neglected during this period, but there are few works that call for special notice. The most noteworthy effort was the casting by Ono Gorōemon in 1522 of the well-known bronze image, the Kamakura Daibutsu.

The third period includes the 17th, 18th and the greater part of the 19th centuries. It was the era of the artisan artist. The makers of Buddhist images and of sword ornaments carried on their work with undiminished industry and success, and some famous schools of the latter regarding Buddhist bronzes, however, tended to grow more conventional and the metal-workers more naturalistic as the 18th century began to wane. It was in connection with architecture that the great artisan movement began. The initiate was Hidari Jingoro (1594–1652), at first a simple carpenter, afterwards one of the most famous sculptors in the land of great artists. The gorgeous decoration of the mausoleum of Ieyasu at Nikkō, and of the gateway of the Nishi Hongwan temple at Kioto, are the most striking instances of his handwork or direction.

The pillars, architraves, ceilings, panels, and almost every available part of the temple walls is covered with arabesques and sculptured figures of dragons, lions, tigers, birds, flowers, and even pictorial compositions with landscapes and figures, deeply carved in solid or open work—the wood sometimes plain, sometimes overlaid with pigment and gilding, as in the panelled ceiling of the chapel of Ieyasu in Tokō. The designs for these decorations, like those of the sword ornaments, were adopted from the great schools of painting, but the invention of the sculptor was by no means idle. From this school the temple carvers, although still attached to the carpenters’ guild, took a place apart from the rest of their craft, and the genius of Hidari Jingoro secured for one important section of the artisans a recognition that was previously reserved for Kano Motonobu, the painter and book-illustrator, afterwards won for another.

A little later arose another art industry, also emanating from the masses. The use of tobacco, which became prevalent in the 17th century, necessitated the pouch. In order to suspend this from the girdle there was employed a kind of button or toggle—the netsuke. The metallic bowl and mouthpiece of the pipe offered a tempting surface for embellishment, as well as the clasp of the pouch; and the netsuke, being made of wood, ivory or other material susceptible of carving, also gave occasion for art and ingenuity.

The engravers of pipes, pouch clasps, and the metallic discs (kogami-buha) attached to certain netsuke, sprang from the same class of artisans who are not less original. They worked, too, with a skill little inferior to that of the Goōs, Naras, and other aristocratic sculptors of sword ornaments, and often with a refinement which their relative disadvantage in education and position did not render possible.

The netsuke and the pipe, with all that pertained to it, were for the commoners what the sword-hilt and guard were for the gentry. Neither class cared to bestow jewels upon their persons, but neither spare the least effort or expense if they should be able to own something in which they might take pride, and which met the approval of their inferiors. The final manifestation of popular glyptic art was the okimon, an ornament pure and simple, in which utility was altogether secondary in intention. This branch of work dates from the rise of the naturalistic school of painting and the great expansion of the popular school under the Katsugawa, but the okimo was formed an occasional amusement of the older glyptic artists. Some of the most exquisite and
most ingenious of these earlier productions, such as the magnificent iron eagle in the South Kensington Museum, the wonderful articulated models of crayfish, dragons, serpents, birds, that are found in many European collections, cannot compare in splendor with the Miyochin, but these were the play of giants, and were not made for articles of commerce. The new artificers of the okimono struck out a line for themselves, one influenced more by the naturalistic and popular schools than by the classical art, and the quails of Kamei, the tortoises of Seimin, the dragons of Tōun and Tōryū, and in recent years the falcons and the peacocks of Suzuki Chokichi, are the joy of the European collector. The best of these are exquisite in workmanship, graceful in design, often strikingly original in conception, and usually naturalistic in idea. They constitute a phase of art in which Japan has few rivals.

The present generation is more systematically commercial in its glyptic produce than any previous age. Millions of commercial articles in metal-work, wood and ivory flood the European markets, and may be bought in any street in Europe at a small price, but they offer a variety of design and an excellence of workmanship which places them almost beyond Western competition. Above all this, however, the Japanese sculptor is a force in art. He is nearly as thorough as his forefathers, and maintains the same love of all things beautiful; and if he cannot show any epoch-making novelty, he is at any rate doing his best to support unsurpassed the decorative traditions of the past.

History has been eminently careful to preserve the names and records of the men who chiselled sword furniture. The sword being regarded as the soul of the samurai, and the sword-furniture, as being a reflection of its manufacture, whether as forger of the blade or sculptor of the furniture, was held in high repute. The Gotō family worked steadily during 14 generations, and its 19th century representative—Gotō Ichijō—will always be remembered as one of the family's greatest experts. But there were many others whose productions fully equalled and often excelled the best efforts of the Gotō. The following list gives the names and periods of the most renowned families:

(It should be noted that the division by centuries indicates the time of a family's origin. In a great majority of cases the representatives of each generation worked on through succeeding centuries.)

15th and 16th Centuries.

Miyochin; Gotō; Umetada; Muneta; Aoki; Sōami; Nakai.

17th Century.

Kuwamura; Māzōemon; Koichi; Nagayoshi; Kuninaga; Yoshitsune; Katsugi; Tsugi; Muneyoshi; Tadahira; Shōami; Hosono; Yokoya; Nara; Okada; Okamoto; Kinsai; Ako; Yoshida; Hirata; Nasu; Moriyasuo; Inouye; Yasui; Chiyō; Kaneko; Uemura; Itawato.

18th Century.

Gorobei; Shōemon; Kikugawa; Yasuyama; Noda; Tamagawa; Fujita; Kanae; Kinemon; Hamano; Omori; Okamoto; Kashiwaya; Kusakari; Shichibei; 168.

19th Century.

Natao; Ishiguro; Yanagawa; Honjo; Tanaka; Okano; Kasarabayashi; Oda; and many masters of the Omori, Hamano and Iwamoto families, as well as the five experts, Shuraku, Tenmön, Ryūmín, Minjō and Minokunixi.

There is a radical difference between the points of view of the Japanese and the Western connoisseur in estimating the merits of sculpture in metal. The quality of the chiseling is the first feature to which the Japanese directs his attention; the decorative design is the prime object of the Occidental's attention. With very rare exceptions, the decorative motives of Japanese sword furniture were always supplied by painters. Hence it is that the Japanese connoisseur draws a clear distinction between the decorative design and its execution, crediting the former to the pictorial artist and the latter to the sculptor. He detects in the stroke of a chisel and the lines of a gravining tool subjective beauties which appear to be hidden from the great majority of Western dilettanti. He estimates the rank of a specimen by the quality of the chisel-work. The Japanese hinoki-shi (metal sculptor) uses thirty-six principal classes of chisel, each with its distinctive name, and as most of these classes comprise from five to ten sub-varieties, his cutting and gravining tools aggregate about two hundred and fifty.

Scarcely less important in Japanese eyes than the chiselling of the decorative design is the preparation of the field to which it is applied. They are not to be described with reference to this in former times. Namako and shakudo (fish-roe) grounds were essential for the mountings of swords worn on ceremonial occasions, the ishime (stone-pitting) or jimiigaki (polished) styles being considered less aristocratic.

Namako is obtained by punching the whole surface—except the portion carrying the decorative design—into a texture of microscopic dots. The finest makers of namako did not aim at regularity in the distribution of these dots, but they worked to produce the effect of millet-seed sifted haphazard over the surface. But from the 15th century the punching of the dots in rigidly straight lines is considered desirable, and this was so great that namako-making took its place among the highest technical achievements of the sculptor. When it is remembered that the punching tool was guided solely by the hand and eye, and that three or more blows of the mallet had to be struck for every dot, some conception may be formed of the patience and accuracy needed to produce these tiny protruberances in perfectly straight lines, at least absolutely uniform size. Namako disposed in straight parallel lines originally ranked at the head of this kind of work. But a new kind was introduced in the 16th century. It was obtained by punching the dots in intersecting lines, so arranged as to give the effect of a family of straight lines, the meeting of which in the centre of each was counted as one of five. This is called go-no-me-namako, because of its resemblance to the disposition of chequers in the Japanese game of go. By the 17th century later, the daismyō namako was invented, in which lines of dots were alternated with lines of breathing, and the density of which was so great that the mallet had to be struck only once on the centre of each. This is described as diapiering. There is scarcely any limit to the ingenuity and skill of the Japanese expert in diapiering a metal surface. It is possible to enumerate even the principal styles of ishime, but mention may be made of the zaragi (jagged lines) in which the surface is finely but irregularly pitted after the manner of the face of a stone; the nashi-yi (pear-ground), in which we have a surface like the rind of a pear; the takizume (needle ishime), where the indentations are so minute that they seem to have been made with the point of a needle; the gama-ishiime, which is intended to resemble the skin of a toad; the haya-ishiime, produced with a chisel sharpened so as to produce indentations having the form of a chisel or ore-kuchi (broken-tool), a peculiar kind obtained with a jagged tool; and the goamé, which resembles the plated surface of a fine straw mat.

Great importance has always been attached by Japanese experts to the patina of metal used for artistic chiselling. It was mainly for the sake of their patina that value attached to the remarkable allows shakudo (3 parts of gold to 97 of copper) and shibukiichi (1 part of silver to 3 of copper). Neither metal, when it emerges from the furnace, has any beauty, shakudo being a dark-rose, and copper and shibukiichi pale gun-metal. But after proper treatment, these forms of metal acquire various patinas with violet, grey, and brownish shades of grey with silvery lustre. These compounds afford delicate, unctuous, and effective groundings for inlay in gold and other metals, as well as for sculpture, whether inlay or in relief. Copper, too, by patina-producing treatment, is made to show not merely a rich golden sheen with pleasing limpidity, but also a variety of hues both dark and light, emerald green, the various shades of grey, and browns of numerous tones from dead-leaf to chocolate. Even greater value has always been set upon the patina of iron, and many secret recipes were preserved in artist families for producing the fine, satin-like texture so much admired by all connoisseurs.

In Japan, as in Europe, three varieties of relief carving are distinguished—kiri (laza-bori), mazoku (chakushi-bori) and bōzo (suzuribori). In the opinion of the Japanese expert, these styles hold the same respective rank as that occupied by the mezzotint, stipple, and intaglio in the palette of the engraver. Chiselling, in the Japanese sense, is a method of rendering every line of unbroken metal, and the engraver, in his treatment of the subject, is free to use every device and artifice which may contribute to its effect, and by which it may be distinguished from the ordinary engraver, unless the object be altered, is called engraving, the lines being of uniform thickness and depth. Very beautiful results are obtained by the kebō method, but incoherently the finest work in the incised class is known as katsuki-bori. In the case of sign and label painting, the effect of the chiseling is to be seen to advantage, but the details are more or less unrivalled. Evidently the idea of the great Yokoya experts, the originators of the style, was to break away from the somewhat monotonous routine of ordinary engraving, where each line performs exactly the same function, and to elevate the work to something much admired by all connoisseurs.

1 It is first boiled in a loke by lixiviating wood ashes; it is next polished with charcoal powder; then immersed in plum syrup, and last washed four or five times with a tube of water to remove all traces of alkali, the last step being to digest in a boiling solution of copper sulphate, verdigris and water.
broken blisters, which are then hammered down until each becomes a core of wave propagation. In fine work the apex of the blister is ground off before the final hammering. Iron was the metal used originally, but diversions down to five metals have been common. Various metals began thenceforward to be combined. Perhaps the choicest variety is gold grinding in a shakudo field. By repeated inlaying, the expert obtains such control of the wood-grain pattern that the individualities of the grains themselves have developed without losing any of their fantastic grace. There are other methods of producing mokume-gane.

It has been frequently asserted by Western critics that the year (1870) which witnessed the abolition of sword-wearing in Japan, witnessed also the end of her artistic metal Modern and work. That is a great mistake. The art has merely developed new phases in modern times. Not only are the artists who have emerged in the days of the Tōgō, the Nara, the Yōkoya and the Yanagawa (in fact) all of them also their productions must be called greater in many respects and more interesting than those of their renowned predecessors. They no longer devote themselves to the manufacture of sword ornaments, but work rather at vases, censers, statuettes, plaques, boxes and other objects of a serviceable or ornamental nature. All the processes described above are practised by them with full success, and they have acquired others quite as remarkable.

Of these, one of the most interesting is called hiribame (insertion). The free design, having been completely chiselled in the round, is then fixed in a field of the reverse. Several varieties of exactly similar outline have been cut out. The result is that the picture has no blank reverse. For example, on the surface of a box-lid we have the following: the box-lid was first chiselled in silver, and when the lid is opened, their breasts and the under-sides of their pinions appear. The difficulty of such work is plain. Microscopic accuracy has to be attained in cutting out the space for the junction of the design, and while the latter must be soldered firmly in its place, not the slightest trace of solder or the least sign of junction must be discernible between the metal of the inserted Another of these processes is called uchimoto-shi (hammerers) who perform preparatory work for glyptic artists in metal. The skill of these men is often wonderful. Using the hammer only, some of them can beat out an intricate shape as truly and delicately as a sculptor could carve it with his chisels. Ôhō Masatoshi, an uchimoto-shi of Airu (d. 1897), made a silver cake-box in the form of a sixteen-petalied chrysanthemum. The shapes of the body and lid corresponded so intimately that, whereas the lid could be slipped on easily and smoothly without any attempt to adjust its curves to those of the body, it always fitted so closely that the impulse of the lid to be lifted off the body was stopped.

Another feat of his was to apply a lining of silver to a shakudo box by shaping and hammering only, the fit being so perfect that the lining clung like paper to every part of the box. Suzuki Gensuke and his brother have also done marvellous work. A very fine shoji screen in Tokyo a silver game-cock with soft plumage and surface modelling of the most delicate character. It had been made by means of the hammer only. Suzuki’s kiribame process is not to be confounded with that of shibuichi- or uchimoto-shi, as it does not involve any casting. The modern artist. The gist of the latter method is that a design chiselled à jour has its outlines venced with other metal which serves to emphasize them. Thus, having pierced a spray of flowers in a thin sheet of shibuihi, the artist fits a slender rim of gold, silver or shakudo to the petals, leaves and stalks, so that an effect is produced of transparent blossoms outlined in gold, silver or purple. Another modern achievement also due to Suzuki Gensuke is the so-called maz-gane (mixed metals). It is a singular conception, and the results obtained depend largely on chance. Shibuihi and shakudo are melted separately, and when they have cooled just enough not to clatter, are too intimate to be distinct. The latter is then frequently beaten flat. The plate thus obtained shows accidental clouding, or missing of dark tones, and these patches are taken as the basis of a pictorial design to which final character is given by inlaying with gold and silver, and by kata-kiri sculpture. Such pictures partake largely of the impressionist character, but they attain much beauty in the hands of the Japanese artist with his extraordinary symbolistic and metaphorical power. In the case of maz-gane, but less fortunate, is shibuihi-dōshi (combined shibuichi), which involves beating together two kinds of shibuihi and then adding a third variety by the hammer only, which can be carried out in the case of maz-gane. The charm of these methods is that certain parts of the decorative design seem to float, not on the surface of the metal, but actually within it, an admirable effect of light and atmosphere. Thus products of the kiribame method can be made of an extraordinarily elaborate and troublesome process invented by Kajima Ippu, a great artist of the present day. It is called tegi-dashi-ågan (ground out-inlay). In this exquisite and

brush instead of using it as a common cutting tool. They succeeded admirably. In the kata-kiri-bori every line has its proper value in the pictorial design, and strength and directness become cardinal characteristics. Again, the manner for work is different in the frequency of the picture-painter. The same fundamental rule applied too, whether the field of the decoration was silk, paper or metal. Tuck and roll polychrome patterns with a formal effort. There must be no appearance of subsequent deepening, or extending, or re-cutting or finishing. Kata-kiri-bori by a great expert is a delight. One is lost in astonishment at the nervous yet powerful articulation of the delicacy and beauty of effect. Another variety of carving much affected by artists of the 17th century, and now largely used, is called shishi-åtori or the design. The form above the general plane of the field, but an effect of projection is obtained either by receding the whole space immediately surrounding the design, or by enclosing the latter in a scarped frame. Yet another method is called inlaying, & the expert can model the design on both faces of the metal as a to give as a sculpture in the round. The fashion is always accompanied by chiselling à jour (mokume-bori), so that the sculptured portions stand out in their entirety.

Inlaying with gold or silver was among the early forms of decoration in Japan. The skill developed in modern times is at least equal to anything which the past has produced.

Inlaying, the results produced are much more imposing. There are two principal kinds of inlaying: the first called hon-ågån (true inlaying), the second nonume-ågån (linen-mesh inlaying). As to the method it does not differ from that seen in the beautiful iron censers and vases inlaid with gold which the Chinese produced from the Súan-Tù era (1426-1436). In the surface of the metal the workman cuts grooves wider at the base than at the top. The Japanese polish of these grooves presents no remarkable features, except that it has been carried by the Japanese to an extraordinary degree of elaborateness. The mesh inlaying (mokume-gane or a kind of inlaying which is extensively used by artists to produce an inlaid diaper. His first business is to chisel the surface in lines forming the basic pattern of the design. Thus, for a diamond-petal diaper the chisel is carried across the face of the metal horizontally, tracing a number of parallel bands divided at fixed intervals by ribs which are obtained by merely straightening the chisel and striking it a heavy blow. The same process is then repeated, another rib being the result of the next curvature, and so on, the result being adapted to the nature of the design. Several independent chisellings may be necessary before the lines of the diaper emerge clearly, but throughout the whole operation no measurement of any kind is taken, the artist being guided entirely by his hand and eye. The metal is then heated, not to redness, but sufficiently to develop a certain degree of softness, and the workman, taking a very thin sheet of gold (or silver), hammers portions of it into the salient points of the design. In ordinary cases this is the sixth process. The seventh is to hammer gold into the outlines of the diaper; the eighth, to hammer it into the pattern filling the spaces; the ninth, to hammer the line of the design. Of course the more intricate the design the more numerous the processes. It is scarcely possible to imagine a higher effort of hand and eye than this nonume-ågån displays, for while intricacy and accuracy are alike obtained, the present one is in another sense chiefler. It is sometimes in the same design we see gold of three different hues, obtained by varying the alloy. A third kind of inlaying, peculiar to Japan, is sumi-ågån (ink-inlaying), so called because it resembles the characters produced with Indian ink beneath the transparent surface of the metal. The difference between this process and ordinary inlaying is that for sumi-ågån the design to be inlaid is fully chiselled out of an independent block of metal with sides sloping so as to be broader at the base than at the top. The object which is to receive the decoration is then channelled in dimensions corresponding to those of the design block, and the latter having been fixed in the channels, the surface is ground and polished until an intimate union is obtained between the inlaid design and the metal forming its field. Very beautiful effects are thus produced, for the design seems to have grown up to the metal, so that the metal is in a manner permeated by the design. Shibuihi inlaid with shakudo used to be the commonest combination of metals in this class of decoration, and the objects usually depicted were bamboo, cows, wild-fowl under the moon, peony sprays and so forth.

A variety of decoration much practised by early experts, and carried to a high degree of excellence in modern times, is mokume-ågån (inlay-ground). The technique consists in taking a thin plate of metal and beat it into another plate of similar metal, so that the two, though welded together, retain their separate forms. The mass, while still hot, is coated with a paste, and then, while it is yet plastic, rolled in straw bands, in which state it is roasted over a charcoal fire raised to glowing heat with the bellows. The clay having been removed, another plate of the same metal is added and the process be repeated, till in the end the number depending on the quality of grainining that the expert desires to produce. The manifold plate is then heavily punched from one side, so that the opposite face protrudes in
ingenious kind of work the design appears to be growing up from the bottom of a delightful morass. The Japanese, in the 18th century, had their castings, and today their exquisite bronzework is a byword in the world. The Occident does not yet appear to have fully realized the excellence of such talent in Japan; partly perhaps because its displays in former times were limited chiefly to sword-furnishings, partly because we have not learned to admire the use of the Japanese,因为the broad effects of richness and splendour captivate the former, whereas the latter looks for delicacy of finish, accuracy of detail and, above all, evidences of artistic competence.

In Japan, however, a craftsman is trained from the age of ten or twelve to fuse decoration of flowers and foliage: he requires that every blossom and every leaf shall be instinct with vitality, and the completeness of the tint and tone shall be in perfect harmony with the choice. But if the Japanese sculptor adopted such standards in working for foreign patrons, his market would be reduced to very narrow dimensions. He therefore adapts himself to his circumstances, and his model is to have the surface of the specimen which show tawdry handsomeness and are attractively cheap. It must be admitted, however, that even foreign appreciative faculty were sufficiently educated, the Japanese artist in metals would still labour under the disadvantage of devising shapes to take the place of those which Europe and America have learned to consider classical.

Bronze is called by the Japanese kara-kane, a term signifying "Chinese metal" and showing clearly the source from which the knowledge of the alloy was obtained. It is a copper-gold alloy, its composition fluctuating in the proportion of 70 to 82 % of copper, from 4 to 20 % of lead and from 2 to 8 % of tin. There are also present small quantities of arsenic and antimony, and zinc is found generally as a mere trace, but sometimes reaching to 6 %. Gold is supposed to have found a place in ancient bronzes, but its presence has never been detected by analysis, and of silver not more than 2 % seems to have been admitted at any time. Mr W. Gowland has shown that, whatever may have been the practice of Japanese bronze makers in ancient and medieval times, their successors in later days deliberately introduced arsenic and antimony into their alloy in order to harden it, and partly to counteract its fusibility, so that it might take a sharper impression of the mould. Japanese bronze is well suited for castings, not only because of its low melting-point, great fluidity and capacity for taking sharp impressions, but also because it has a particularly smooth surface and readily develops a fine patina. One variety deserves special mention. It is a golden yellow bronze, called sentoku—this being the Japanese pronunciation of Su-en-tō, the era of the Ming dynasty of China when this compound was invented. Copper, tin, lead and zinc, mixed in various proportions by different experts, are the ingredients, and the beautiful golden hue and glossy texture of the surface are the results of the very patina-producing processes, in which branch of metal-work the Japanese show such expert skill.

From the time when they began to cast bronze statues, Japanese experts understood how to employ a hollow, removable core round which the metal was run in a skin just thick enough for strength without weight, and they were not backward in seeking varieties of form for modelling purposes. In ordinary circumstances, a casting thus obtained took the form of a shell without any break of continuity. But when the author of the piece to be moulded thought fit to introduce the great image of Lochtana Buddha at Nara, for example, would measure 138 ft. in height were it standing erect, and its weight is about 550 tons. The colossal Amida at Kamakura has a height of 66 ft. The bronze Buddha of the Todai-ji at Nara may be seen in one piece in situ, or, if cast elsewhere, to transport them and elevate them on their pedestals. The plan pursued was to build them up gradually in their places by casting segment after segment in the field of the artist's choice.

decoration for interiors, tradition tells us scarcely anything about the masters who carved such magnificent works as those seen in the Kioto temples, the Tokugawa mausolea, and some of the old castles. There are, however, no modern developments of such work to be noted. The ability of former times exists and is exercised in the old way, though the field for its employment has been greatly narrowed.

When Japanese sculpture in wood or ivory is spoken of, the first idea that presents itself is connected with the netsuke, which, of all the art-objects found in Japan, is perhaps the most curious. First of all, Japan had given much work which, but the netsuke, we should still have no difficulty in differentiating the bright versatility of her national genius from the comparatively sombre, mechanic and unimaginative faience of China or the South Sea Islands. But in fact, when they broke to the export, they also disgusted the connoisseur and soon earned discredit for their whole class. But in fact the gylptic artists of Tokio are more as a rule to be referred to works of more importance than the netsuke, are in no sense inferior to their predecessors of feudal days, and many beautiful netsuke bearing their signatures are in existence. As for the modern work so-called, a large portion of which consists of figurines which were now carved for the foreign market, it certainly stands on a plane much higher than the netsuke, since anatomical defects which escape notice in the latter owing to its diminutive size, become obvious in the former.

One of the most remarkable developments of figure sculpture in modern Japan was due to Matsumoto Kisaburo (1830–1896). He received his first training from the followers of Koun, a wood-carver who occupied the field of sculpture much the same place as that held by Hashishima Gaho in the realm of painting. Matsumoto is principally remembered as an exponent of realistic work, and he not only displayed great power of chisel and breadth of style, but also told a story not necessarily drawn from the motives of the classical school. This departure from established canons must be traced to the influence of the school of anatomy, which was not popular in Japan when they celebrated the centenary of the great physician, and the latter has carved life-size effigies of two Imperial princes who lost their lives in the war with China (1894–95). Such work is not exclusively reserved for the noblemen, but is done art work which appeals to emotions in general rather than to individual memories. Thus Arakawa Reian, one of Koun's most brilliant pupils has displayed a figure of a swordsman in the act of driving home a furiously driven nail. The shock of the wood, which is a simple man poised on the toes of one foot, the other foot raised, the arm extended, and the body straining forward in strong yet elastic muscular effort. A more imaginative work by the same artist is a figure of a farmer who has just shot an eagle that swooped upon his grandson. The old man holds his bow still raised. Some of the eagle's feathers, blown to his side, suggest the death of the swift, at his feet lies the corpse of the little boy, and the horror, grief and anger that such a tragedy would inspire are depicted with striking realism in the farmer's face. Such work has very close affinities with Occidental conceptions. The chief distinguishing feature is that the gylptic character is preserved at the surface finish. The undisguised touches of the chisel tell a story of technical force and directness which could not be suggested by perfectly smooth surfaces. To subordinately process to a surface finish. The undisguised touches of the chisel tell a story of technical force and directness which could not be suggested by perfectly smooth surfaces. To subordinately process to a surface finish. Architecture.—From the evidence of ancient records it appears that before the 4th century the Japanese resided in houses of a very rude character. The sovereign's palace itself was merely a wooden hut. Its pillars were thrust into the ground and the whole framework—consisting of posts, beams, rafters, door-posts and window-frames—was tied together with cords made by twisting the long fibrous stems of climbing plants. The roof was thatched, and perhaps had a gable at each end with a hole to allow the smoke of the wood fire to escape. Wooden doors swung on a kind of hinges that were afterwards covered with metal. In the walls, holes to receive the ends of the rafters or rush matting were used for sitting, and the whole was surrounded with a palisade. In the middle of the 4th century two-storied houses seem to have been built, but the evidence on the subject is slender. In the 8th century, however, when the court was moved to Nara, the influence of Chinese civilization made itself felt. Architects, turners, turners, decorative artists and sculptors, coming from China and Korea, erected grand temples for the worship of Buddha, imitating the images of much beauty and adorned with paintings and carvings of considerable merit. The plan of the city itself was drawn from that of a Chinese town, and an avenue called the avenue of four parallel streets, crossed at right angles by smaller thoroughfares. During this century the first sumptuary edict ordered that the dwellings of all high officials and opulent civilians should have tiled roofs and be coloured red, the latter injunction being evidently intended to stop the use of logs carrying their bark. Tiles thenceforth became the orthodox covering for a roof, but vermicil, being regarded as a religious colour, found no favour in private dwellings. In the 9th century, after the capital had been established at Kioto, the palace of the sovereigns and the mansions of ministers and nobles were built on a scale of unprecedented grandeur. It is true that all the structures of the time had the defect of a box-like appearance. Massive, towering roofs, which impart an air of stateliness even to a wooden building and yet, by their graceful curves, avoid any suggestion of ponderosity, were still confined to Buddhist edifices. The architect of private dwellings attached more importance to satin-surfaced boards and careful joinery than to any appearance of strength or solidity.

Except for the number of buildings composing it, the palace had little to distinguish it from a nobleman's mansion. The latter was generally a massive but well-proportioned building, occupying a considerable space and having a principle floor, a second floor and a roof, but its structure was very solid and unadorned. The palace was, however, a thing of expense and the doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver doors and windows of some of the edifices were ornamented with ivory or other rare woods, and there were also gold and silver door
split bamboo, and the parent chamber was separated from the ambulatory by similar bamboo blinds with silk cords for raising or lowering them, or by curtains. The thick rectangular mats of uniform size which, fitting together so as to present a level unbroken surface, were laid on the floor, and households khác-11 in use: floors were boarded, having only a limited space matted. This form of mansion underwent little modification until the 12th century, when that of the temples of Buddhist contemplative practice called for greater privacy. Interiors were then divided into smaller rooms by means of sliding doors covered with thin rice-paper, which permitted the passage of light while offering privacy. The arched sliding doors replaced the doors which could be slid along a groove so as to be removable in the daytime, and an alcove was added in the principal chamber for a sacred picture or Buddhist image to serve as an object of contemplation, while protecting the subject from the rite of purification.

Thus the main features of the Japanese-dwelling-house were evolved, and little change took place subsequently, except that the brush of the eaves, which was hitherto used for decorating painted walls, was replaced by aristocratic mansions unlimited care exercised in the choice of rare woods.

The Buddhist temple underwent little change at Japanese hands except in the matter of decoration. Such as it was in outline when first erected in accordance with Chinese Buddhist Temple models, such it virtually remained, though in later architecture times all the resources of the sculptor and the painter were employed to beautify it externally and internally.

"The building, sometimes of huge dimensions, is invariably surrounded by a raised gallery, reached by a flight of steps in the centre of the front, and, on either side, the balustrades flanking the steps and the gallery railing. This gallery is sometimes supported upon a deep system of bracketing, corbelled out from the feet of the main pillars which supported gallery; the bracketing was generally the same for both. The Japanese roof, which, passing over the sides and the front of the building, or, in some cases, placed on the façade only, the ceilings of the halls are generally sloping, with richly carved roof-timbers showing below at intervals, and quaintly carved braces connect the outer pillars with the main posts of the building. Some temples are to be seen in which the ceiling of the hall is bored flat and decorated with large paintings of dragons in gold. The height of the hall is limited by a standard of about six or seven feet, and the general result of the treatment of columns, wall-posts, &c., is that the whole mural space, not filled in with doors or windows, is divided into oblong panels, which sometimes receive plaster, sometimes boarding and sometimes rich framework and carving or painted panels. Diagonal bracing or strutting is nowhere to be found, and in many cases mortises and other joints are as much material as to weaken the timbers at their points of connexion. It would seem that only the immense weight of the roofs and their heavy projections are the cause of some of the structures in high winds.

The principal façade of the temple is filled in one, two, or three departments with hinged doors, variously ornamented and folding outwards, sometimes in double folds. From these doorways, generally of three or four, the light is admitted to the hall; the term is generally understood, being rare. An elaborate corbelling of wooden bracketing crowns the wall, forming one of the principal ornaments of the building. The whole disposition of pillars, posts, brackets, and rafters forms an arrangement perfectly according to a preconceived plan, each laid off to a precise measurement, and of the standard of length. A very important feature of the façade is the portico or porch-way, which covers the principal steps and is generally formed by producing the central portion of the main roof over the steps and superposing such projection upon the isolated wooden pillars braced together near the top with horizontal ties, carved, moulded and otherwise fantastically decorated. Above these ties are the cornice brackets and beams, corresponding in general design to the cornice of the walls, and the intermediate space is filled with open carvings of dragons or other characteristic devices. The forms of roof are various, but mostly they commence in a steep slope, and, after a gradually flattened roof of usual size, so as to produce a slightly concave appearance, this concavity being rendered more emphatic by the eave which is given to the eaves at the four corners. The appearance of the ends of the roof is half hip, half gable. Heavy ribs of tile-cresting with large terminals are carried along the ridge and the slope of the gable. The result of the whole is very picturesque, and has the advantage of looking empty in any point of perspective. Wall columns, horizontal beams and cornice bracketing corresponds with that on the outside. The ceiling is invariably hinged, and is supported by ribs in small rectangular coffers. Sometimes painting is introduced in the coffers, and along the cornices metal clasps are added to the ribs. When the temple is of very large dimensions an interior persyle of pillars is introduced to support a roof. The main roof, and the secondary roofs of the compartments, carry a profuse bracketing corresponding to that of the cornice. The construction of the framework of the Japanese roof is such that the weights act vertically; there is no thrust on the outer walls, and every available point of the interior is used as a means of support.

The floor is partly boarded and partly matted. The shrines, altars and obliotary tables are placed at the back in the centre, and there is no arrangement for lower secondary altars in the sides. In temples of the best class the floor of the gallery and of the central portion of the main building from entrance to altar are richly lacquered; in those of a lower class they are merely polished by continued rubbing.

(J. Conder, in the Proceedings of the Royal Institute of British Architects.)

None of the magnificence of the Buddhist temple belongs to the Shintō shrine. In the case of the latter conservatism has been absolute from time immemorial. The shrines of Ise, which may be called the Mecca of Shintō devotees, are believed to present to-day precisely the appearance they presented in 1748, when they were moved thither in obedience to a revelation from the Sun-goddess. It has been the custom to rebuild them every twentieth year, alternately on each of two sites set apart for the purpose, the features of the old edifice being reproduced in the new with scrupulous accuracy.

They are enlarged replicas of the primeval wooden hut described above, having rafters with their upper ends crossed; thatched or shingled roof; boarded floors, and logs laid on the roof-ridge at right angles for the purpose of binding the ridge and the rafters firmly together. A thatched roof is imperative in the orthodox shrine, but in modern days the roofs of important Shinto edifices are sometimes abut on a supporting structure which, by means of pillars and rafters, are carried right up to the roof-ridge. At Ise, however, no such novelties are tolerated. The avenue of approach generally passes under a structure called torii. Originally designed as a perch for sacred horses, these were so placed as to indicate the position of the deity; on an ordinary daybreak, this torii subsequently came to be erroneously regarded as a gateway characteristic of the Shintō shrine. It consists of two thick trunks placed upright, their upper ends mortised into a horizontal log which projects beyond them at either side. The structure derives some grace from its extreme simplicity.

Textile Fabrics and Embroidery.—In no branch of applied art does the decorative genius of Japan show more attractive results than in that of textile fabrics, and in none has there been more conspicuous progress during recent years. Her woven and embroidered stuffs have always been beautiful; but in former times few pieces of size and splendour were produced, if we except the curtains used for draping festival cars and the hangings of temples. Tapestry, as it is employed in Europe, was not thought of, nor indeed could the small hand-loom of the period be easily adapted to such work. All that was changed, however. Areas of large dimensions, showing remarkable workmanship and grand combinations of colours, is now made. Originally designed in a firm but graceful line, it soon received the hands of a weaver and designer alike. Kawashima of Kioto has acquired high reputation for work of this kind. He inaugurated the new departure a few years ago by copying a Gobelin, but it may safely be asserted that no Gobelin will bear comparison with the pieces now produced in Japan.

The most approved fashion of weaving is called tsuzure-ori (linked-weaving); that is to say, the cross threads are laid in with the fingers and pushed into their places with a comb by hand, very little machinery being used. The threads extend only to the outlines of each figure, and it follows that every part of the pattern has a rim of minute holes like pierced lines separating postage stamps in a sheet, the effect being that the design seems to hang suspended in the ground—linked into it, as the Japanese term implies. 1 A specimen of this nature recently manufactured by Kawashima's weavers measured 20 ft. by 1.3, and represented the annual festival procession of the temple. The principal feature of the design was shown, as were also the gate and the long flight of stone steps leading up to it, several other buildings, the groves of cryptomeria that surround the mausoleum, and the festival procession. All the architectural and decorative details, all the carvings and colours, all the accessories—everything was wrought in silk, and each of the 1500 figures forming the procession wore exactly appropriate costume. Even this detail, remarkable as it was, seemed less surprising than the fact that the manufacture had been completed in a few weeks from the beginning of work to its completion, with the utmost attention to accuracy and aerial perspective. Through the graceful cryptomeria distant mountains and the still more distant sky could be seen, and between the trees and shrubs was revealed the scene of some mighty festival by daylight. The whole of the whole atmosphere appeared to be perceptible. Two years of incessant labour with relays of artisans working steadily throughout the twenty-four hours were required to finish this piece. Naturally

1 This method is some 300 years old. It is by no means a modern invention, as some writers have asserted.
CERAMICS

JAPAN

such specimens are not produced in large numbers. Next in decorative importance to tsuzure-ori stands yäsden birédo, commonly known among English-speaking people as cut velvet. Dyeing by the yäsden process is an innovation of modern times. The design is painted on a piece of white stuff which is steamed, and where the picture is ultimately fixed by methods which are kept secret. The soft silk known as habutaye is a favourite ground for such work, but silk papers are also used. A method of cutting the velvet is required to achieve such fidelity and such boldness of draughtsmanship. The difference between the results of the ordinary and the yäsden processes of dyeing is, in fact, the difference between a stencilled sketch and a true picture of cut velvet. The ordinary process of cutting the velvet is supplemented as follows: The cutter, who works at an ordinary wooden bench, has no tool except a small sharp chisel with a V-shaped point. This chisel is passed into an iron penknife, and passed through the padding of the velvet until the strands lie by the side of the chisel's point. When the velvet is brought to a point, he proceeds with the cutting in the same way as when the wires are not withdrawn. It is, in fact, velvet that has passed through all the usual stages of manufacture except the cutting of the thread along each wire and the withdrawal of the wires. The cutting artist lays the piece of unfinished velvet on his bench, and proceeds to carve into the pattern with his chisel, just as though he were shading the lines of the design with a pencil. When the pattern is lightly traced, he uses his knife delicately; when the lines are darker, he shades more heavily. When the cutting has its final stage of details, the work is said to be cut to a point piece deeply. In short, the little chisel becomes in his fingers a painter's brush, and when it is remembered that the basis upon which he is working is the same as that of silk, his hand must be trained to such delicacy of muscular effort as to be capable of arresting the edge of the knife at varying depths within the diameter of the tiny filament, the difficulty of the achievement will be understood.

Of course it is possible for him to cut the entire groundwork, and to trespass upon a line which the exigencies of the design require to be solid. The veining of a cherry petal, for example, the tessellation of a carpet's pattern, the serration of a leaf's edge—all these lines remain intact, spared by the cutter's tool, while the leaf itself, or the petal, or the scales of the fish, have the threads forming them cut so as to show the velvet nap and to appear in soft, low relief. In one variety of this fabric, a slip of gold foil is laid under each leaf, and left in position after the wire is withdrawn, the cutting tool being then used with freedom in some parts of the design, so that the gold gleams through the lowered thread, producing a rich and supple effect. It is also possible to produce such effects for which no tools can be adapted. The weaving of the lines is the basis for pictures so elaborate and microscopically accurate as those produced by the yäsden process on silk crape or habutaye.

The rich-toned, soft plumage of birds or the magnificent blending of colours in a bunch of peonies or chrysanthemums cannot be obtained with absolute fidelity on the ribbed surface of velvet.

The embroiderer's craft has been followed for centuries in Japan with eminence and success, but whereas it formerly ranked with dyeing and weaving, it has now come to be regarded as an art. Formerly the embroiderer was content to produce a pattern with his needle, now he paints a picture. So perfectly does the modern Japanese embroiderer utilize this medium that several of the most essential pictorial effects—chiaroscuro, aerial perspective and atmosphere—are present in his work. Thus a graceful and realistic school has replaced the comparatively stiff and conventional style of former times.

Further, an improvement of a technical character was recently made, which has the effect of adding greatly to the durability of these embroideries. Owing to the use of paper among the threads of the embroidery and to the preparation of the stuff forming the ground, every operation of folding used to cause perceptible injury to a piece, so that after a few years it acquired a cramped and unsightly appearance. But by the introduction of a new tool called the embroidery pen with the help of which the patterns are transferred to the embroidery, and the laying of the threads, can be done with much greater facility, the embroidery is capable of being reproduced with much greater facility, the embroidery is capable of being reproduced in a permanent form.

Ceramics.—All research proves that up to the 12th century of the Christian era the ceramic ware produced in Japan was of a very rude character. The interest attaching to it is historical rather than technical. Pottery was certainly manufactured from an early date, and examples of it have been found by the archaeologist in the Jomon period, which is the equivalent of the 10th century B.C. It differed from the coarse pottery of ancient Japan, however, in being of a far more delicate fabric, and in the softness of its glaze, the comparative sparseness of its enamelled decoration, and the relegation of blue sous couverte to an entirely secondary position. The more classic and underglaze blue of the later Japanese porcelains is a departure from the older tradition. The examples of the latter were probably the product of the kilns of Bizen, which were made in the 10th and 11th centuries, and for which the term may be used. The better examples not only of this period but of the 13th and 14th centuries are of the type of the Bizen wares, which were made for a simpler and less ornamental purpose than for the later wares. The discovery of the Hizen porcelains at the time of the 16th century is a source of particular interest to the student of Japanese ceramics. The earliest manufacture of porcelain—so distinguished from pottery—in itself is in the opening years of the 16th century, but its materials were exotic. Genuine Japanese porcelain dates from about the middle of the 16th century, a date which marks the beginning of the Hizen ware. From that time forward the Arita factories turned out large quantities of porcelain profusely decorated with blue under the glaze and coloured enamels over it. Many pieces were exported by the Dutch, and some also were specially manufactured to their order. Specimens of the latter are still preserved in European collections, where they are classed as genuine examples of Japanese ceramic art, though beyond question their style of decoration was greatly influenced by Dutch interference. The porcelains of Arita were carried to the neighbouring town of Imari for sale and shipment. Hence the ware came to be known among Japanese and foreigners alike as Imari-yaki (yaki = anything baked; hence ware).

The Nabeshima porcelain—so called because of its production at private factories under the special patronage of Nabeshima Naoshige, feudal chief of Hizen—was produced at Okawada and Hizen. It differed from Imari-yaki in the milky whiteness and Nabeshima, softness of its glaze, the comparative sparseness of its enamelled decoration, and the relegation of blue sous couverte to an entirely secondary position. This was probably the product of the famous Arita porcelain kilns in Japan; the best examples leave nothing to be desired. The factory's period of excellence began about the year 1680, and culminated at the close of the 18th century.

The Hirado porcelain—so called because it enjoyed the special patronage of Matsusita, feudal chief of Hirado—was produced at Mikawa-uchi-yama, but did not attain excellence until the middle of the 18th century, from which time on the products of the factories of the same province at Nagasaki were known as the Hirado ware. The finest of these were produced under the influence of the European style of pottery, and were decorated with blue under the glaze, but some were more white with exquisitely chiselled designs incised or in relief. The production
was always scanty, and, owing to official prohibitions, the ware did not come into general use until the 18th century. The history of Kütō ware—which, being for the most part fineware, belongs to an entirely different category from the Hizen porcelains spoken of above—is the history of individual ceramists. Although, on account of the special technique employed, four different varieties are usually distinguished. They are raku-yaki, awata-yaki, tsukubara-yaki and kiyomizu-yaki.

Kütō was uniquely the province of the shōguns; for, being entirely hand-made and fired at a very low temperature, its manufacture offers few difficulties, and has consequently been carried on by amateurs in their own homes at the present day. Through the efforts of the 16th-century master of Kütō is the parent of all the rest. It was first produced by a Korean who emigrated to Japan in the early part of the 18th century. But the term raku-yaki did not come into use until the close of the 18th century (1790-1850). The name of Kütō—raku to which he thenceforth stamped his productions. Thirteen generations of the family, that do not vary, have been handed down. The potter's art is the combination of ideograph, its calligraphy, however, differing sufficiently to be identified by connoisseurs. The fineware is thick and clumsy, having soft, brittle and very light feel. The staple type has black glaze showing little lustre, and in choice varieties this is curiously speckled and pitted with red. Salmon-coloured, red, yellow and white glazes are also found, and in late specimens glazing was added. The raku fineware owed much of its popularity to the paiting in酱 (1790-1850). Kütō pottery is the finest in Japan for the infusion of powdered tea, and its homely character suited the austere canons of the tea ceremonies.

Kiyomizu-yaki: is best known among the ceramic productions of Kütō. There is evidence to show that the art of decoration with enamels over the glaze reached Kütō from Hizen in the middle of the 17th century. Just at that time flourished the Kiyomizu pottery, factory, as it is commonly called, known as Nomura Seisuke. He immediately utilized the new method, and produced many beautiful examples of jewelled fineware, having close, hard glaze of a bluish-white; the paste was terra sigillata, with a network of fine crackle, and sparse decoration in pure full-bodied colours—red, green, gold and silver. He worked chiefly at Awata, and thus brought that factory to prominence. Nomura Seisuke is said to be the greatest Kütō potter of his time, and others of his school were the potters Mokubei (1688-1740); Ebisei, a contemporary of Kenzan; Dōbach (1751-1765), who subsequently moved to Kiyomizu-yaki, another part of Kütō, the fineware of which constitutes the Kiyomizu-yaki mentioned above; Kikō (1745-1746); Hōzan (1650-1721); Taizan (1760-1800); Bizan (180-1838); and Tanzan, who was still living in 1869. It must be noted that several of these names, as Kenzan, Dōbach, Kikō, Hōzan and Bizan, were given to more than one artist. They are family names, and though the dates we have given indicate the era of the most noted ceramists in each family, amateurs must not draw any chronological conclusion from the mere fact of survival of the name, for there are many families such as the Isadachi.

The origin of the Iwakura-yaki is somewhat obscure, and its history, at an early date, becomes confused with that of the Awata yaki, from which, indeed, it does not materially differ. In the term Kiyomizu-yaki may be included wholly such as are contained under the name of the old Kiyomizu, the exceptional of the three varieties described above.

Kiyomizu. The distinction between Kiyomizu, Awata and Iwakura is primarily local. They are parts of the same city, and if their names have been used to designate particular classes of pottery, it is not because of their technical or decorative features of each class distinguishing it from the other two, but chiefly for the purpose of identifying the place of production. On the slopes called Kiyomizu-zaka and Gojō-zaka lived a number of potteries who were virtually in the same position, although they were due to individual genius. The principal Kiyomizu artisans were: Ebisei, who moved from Awata to Gojō-zaka in 1688; Eisen and Rokubō, pupils of Ebisei; Mukö, a pupil of Eisen, but more closely associated with Ebisei; Kukō (1745-1746); Hōzan (1660-1721); and Zengoro Hozen, generally known as Eiraku (1790-1850). Eisen was the first to manufacture porcelain (as distinguished from faience) in Kütō, and in this branch of the art was carried to a high standard of excellence by Eiraku, whose speciality was a rich coral-red glaze with finely executed decoration in gold. The latter ceramist excelled also in the production of purple, green and yellow glazes, producing wares decorated with these. Eisen's whiteness was the other choice ware of the latter type was manufactured by him in Kishū, by order of the feudal chief of that province. It is known as Kusa-ki-yaki (ware of the Kuraikur park).

It is to the Kusas of the Western collectors that "Old Satsuma"; no ware is rarer in Western collections. Nine Satsuma. hundred and ninety-nine pieces out of every thousand which are purchased are inferior examples of the skill of modern forgers. In point of fact, the production of faience decorated with gold and coloured enamels have been the most esteemed wares of the 19th century in Satsuma. Some writers maintain that it did actually commence then, and that nothing of the kind had existed there previously. Setting aside, however, the strong improbability of the circumstances under which the whole work was accomplished, it is hardly likely that the form of enamelled faience could have remained unknown during a century and a half to experts working for one of the most proficient chieftains in all the land. It is hard to believe that any such record of method and written records that enamelled faience was made by the potter of Satsumon — the principal factory of Satsuma-ware in early days—as far back as the year 1767. Mitsubishi, then feudal lord of Satsumo, sent to the chieftain of Satsuma for some technique in the application of gold and coloured enamels, and it is more likely that the potters of Satsumo had already been versed in the artifice for the production of coloured enamels, with the aid of the ]) coloured enamels, with the aid of the Jap., 18th century, though it is not probable that they had the requisite knowledge, the former being a soft, subdued colour, more like a bloom than an enamé; the latter a glossy and comparatively crude pigment. In Hizaimo's time and during the twenty years following the factory had its heyday, its products were of the most exquisite kind, and it is likely that decorated Kutani porcelain were produced. The richness, profusion and microscopic accuracy of their decoration was scarcely before or since excelled, with the exception of those made under English influence. The delicacy of technique disqualifies them to rank as fine porcelains.

black, amber-brown, chocolate and yellowish grey.
were not monochromatic: they showed differences of tint, and
sometimes marked varieties of colour; as when chocolate-brown
passed into amber, or black was relieved by streaks and clouds of
grey and dead-leaf red. This ware came to be known as Toshirnyaki, a term obtained by combining the second syllable of Kato
with the two first of Shirozaemon. A genuine example of it is at
present worth many times its weight in gold to Japanese dilettanti,
Shirozaemon
though in foreign eyes it is little more than interesting.
was succeeded at the kiln by three generations of his family, each
representative retaining the name of Toshiro, and each distinguishing himself by the excellence of his work. Thenceforth Seto became
the headquarters of the manufacture of cha-no-yu utensils, and many
of the tiny pieces turned out there deserve high admiration, their
technique being perfect, and their mahogany, russet-brown, amber
and buff glazes showing wonderful lustre and richness. Seto, in
fact, acquired such a widespread reputation for its ceramic productions that the term seto-mono (Seto article) came to be used
"
"
China
is in the
generally for all pottery and porcelain, just as
West. Seto has now ceased to be a pottery-producing centre, and
has become the chief porcelain manufactory of Japan. The porcelain industry was inaugurated in 1807 by Tamikichi, a local ceramist, who had visited Hizen and spent three years there studying
the necessary processes. Owari abounds in porcelain stone; but
it does not occur in constant or particularly simple forms, and as
the potters have not yet learned to treat their materials scientifically,
For many
their work is often marred by unforeseen difficulties.
years after Tamikichi's processes had begun to be practised, the
only decoration employed was blue under the glaze. Sometimes
Chinese cobalt was used, sometimes Japanese, and sometimes a
mixture of both. To Kawamoto Hansuke, who flourished about
18301845, belongs the credit of having turned out the richest and
most attractive ware of this class. But, speaking generally, Japanese
blues do not rank on the same decorative level with those of China.
At Arita, although pieces were occasionally turned out of which
the colour could not be surpassed in purity and brilliancy, the
utensils.
tion, as had

yu

general character of the blue sous couverte was either thin or dull.
At Hirado the ceramists affected alighter and more delicatetone than
that of the Chinese, and, in order to obtain it, subjected the choice
pigment of the Middle Kingdom to refining processes of great severity.
The Hirado blue, therefore, belongs to a special aesthetic category.
But at Owari the experts were content with an inferior colour,
and their blue-and-white porcelains never enjoyed a distinguished
reputation, though occasionally we find a specimen of great merit.
Decoration with vitrifiable enamels over the glaze, though it
began to be practised at Owari about the year 1840, never became
a speciality of the place. Nowadays, indeed, numerous examples
of porcelains decorated in this manner are classed among Owari
But they receive their decoration, almost without
products.
exception, in Tokyo or Yokohama, where a large number of artists,
called e-tsuke-shi, devote themselves entirely to porcelain-painting.
These men seldom use vitrifiable enamels, pigments being much
more tractable and less costly. The dominant feature of the designs
is pictorial.
They are frankly adapted to Western taste. Indeed,
of this porcelain it may be said that, from the monster pieces of
blue-and-white manufactured at Seto vases six feet high and
garden pillar-lamps half as tall again do not dismay the Bishu
ceramist to tiny coffee-cups decorated in Tokyo, with their
delicate miniatures of birds, flowers, insects, fishes and so forth,
everything indicates the death of the old severe aestheticism. To
such a depth of debasement had the ceramic art fallen in Owari, that
before the happy renaissance of the past ten years, Nagoya discredited itself by employing porcelain as a base for cloisonnd enamelling.
Many products of this vitiated industry have found their
way into the collections of foreigners.
Pottery was produced at several hamlets in Bizen as far back as
the I4th century, but ware worthy of artistic notice did not make its
appearance until the close of the i6th century, when
Blzea.
the T a jip himself paid a visit to the factory at Imbe.
Thenceforth utensils for the use of the tea clubs began to be
manufactured. This Bizen-yaki was red stoneware, with thin

diaphanous glaze. Made of exceedingly refractory clay, it underwent stoving for more than three weeks, and was consequently
remarkable for its hardness and metallic timbre. Some fifty years
later, the character of the choicest Bizen-yaki underwent a marked

Representative specimens are truly admirable

every line,
every contour faithful. The production was very limited, and good
pieces soon ceased to be procurable except at long intervals and
heavy expense. The Bizen-yaki familiar to Western collectors is
comparatively coarse brown or reddish brown, stoneware, modelled
rudely, though sometimes redeemed by touches of the genius never
entirely absent from the work of the Japanese artisan-artist.
Easy
to be confounded with it is another ware of the same type manufactured at Shidoro in the province of Totomi.
The Japanese potters could never vie with the Chinese in the
production of glazes the wonderful monochromes and polychromes
of the Middle Kingdom had no peers anywhere.
In
Japan they were most closely approached by the faience Takatori.
of Takatori in the province of Chikuzen.
In its early days the
ceramic industry of this province owed something to the assistance
:

Korean experts who settled there after the expedition of 1592.
But its chief development took place under the direction of Igarashi
Jizaemon, an amateur ceramist, who, happening to visit Chikuzen
about 1620, was taken under the protection of the chief of the
fief and munificently treated.
Taking the renowned yao-pien-yao,
"
"
or
transmutation ware
of China as a model, the Takatori potters
endeavoured, by skilful mixing of colouring materials, to reproduce
of

the wonderful effects of oxidization seen in the Chinese ware.
They did not, indeed, achieve their ideal, but they did succeed
in producing some exquisitely lustrous glazes of the flambe type,
rich transparent brown passing into claret colour, with flecks or
"
streaks of white and clouds of
iron dust."
The pdte of this
faience was of the finest description, and the technique in every
respect faultless.
Unfortunately, the best experts confined themselves to working for the tea clubs, and consequently produced only
insignificant pieces, as tea-jars, cups and little ewers.
During the
1 8th century, a departure was made from these strict canons.
From
this period date most of the specimens best known outside Japan

A ware of which considerable quantities have found their way
westward of late years in the Awaji-yaki, so called from the island
of Awaji where it is manufactured in the village of Iga.
Awall.
It was first produced between the years 1830 and 1840
by one Kaju Mimpei, a man of considerable private means who
devoted himself to the ceramic art out of pure enthusiasm. His
story is full of interest, but it must suffice here to note the results
of his enterprise.
Directing his efforts at first to reproducing the
deep green and straw-yellow glazes of China, he had exhausted almost
his entire resources before success came, and even then the public
was slow to recognize the merits of his ware. Nevertheless he
persevered, and in 1838 we find him producing not only green and
yellow monochromes, but also greyish white and mirror-black
So thoroughly had he now mastered the
glazes of high excellence.
management of glazes that he could combine yellow, green, white
and claret colour in regular patches to imitate tortoise-shell. Many
of his pieces have designs incised or in relief, and others are skilfully
decorated with gold and silver. Awaji-yaki, or Mimpei-yaki as it
is often called, is generally porcelain, but we
occasionally find specimens which may readily be mistaken for Awata faience.
Banko faience is a universal favourite with foreign collectors.
The type generally known to them is exceedingly light ware, for the
most part made of light grey, unglazed clay, and having
Baako.
hand-modelled decoration in relief. But there are
numerous varieties. Chocolate or dove-coloured grounds with delicate diapers in gold and engobe; brown or black faience with white,
yellow and pink designs incised or in relief; pottery curiously
and deftly marbled by combinations of various coloured clays
these and many other kinds are to be found, all, however, presenting
one common feature, namely, skilful finger-moulding and a slight
roughening of the surface as though it had received the impression
of coarse linen or crape before baking.
This modern banko-yaki is
produced chiefly at Yokkaichi in the province of Ise. It is entirely
different from the original banko-ware made in Kuwana, in the same
province, by Numanami Gozaemon at the close of the i8th century.
Gpzaemon was an imitator. He took for 'his models the raku
faience of Kioto, the masterpieces of Ninsei and Kenzan, the rococo
wares of Korea, the enamelled porcelain of China, and the blue-andwhite ware of Delft. He did not found a school, simply because he
had nothing new to teach, and the fact that a modern ware goes by
the same name as his productions is simply because his seal the'
inscription on which (banko, everlasting) suggested the name of
the ware subsequently (1830) fell into the hands of one Mori
Mori Yusetsu, however,
Yusetsu, who applied it to his own ware.
had more originality than Numanami. He conceived the idea of
shaping his pieces by putting the mould inside and pressing the clay
with the hand into the matrix. Tlie consequence was that his
wares received the design on the inner as well as the outer surface,
and were moreover thumb-marked essential characteristics of the
banko-yaki now so popular.
Among a multitude of other Japanese wares, space allows us to
mention only two, those of Izumo and Yatsushiro. The

to which is applied decoration in gold and green enamel. Another variety has chocolate glaze, clouded with amber and flecked with gold dust. The former was not in its origin a true imitation of 17th century, the latter at the close of the 18th; but the Issu

yaki now procurable is a modern production.

The Yatashiro faience is a production of the province of Higo, where a number of Korean potters settled at the close of the 17th century. It is the only Japanese ware in the characteristics of a Korean original are unmistakably preserved. Its diaphanous, pearl-grey, lustrous glaze is a transmutation of the medieval crackled, overlying encaustic decoration in white slip, the fineness of its warm reddish pâte, and the general excellence of its technique, have always commanded admiration. It is produced now in considerable quantities, but the modern ware falls far short of its predecessor.

Many examples of the above varieties deserve the enthusiastic admiration they have received, yet they unquestionably belong to a lower rank of ceramic achievements than the choice productions of Chinese kilns. The potters of the Middle Kingdom, from the early eras of the Ming dynasty down to the latest years of the 18th century, stood absolutely without rivals as makers of porcelain. Their technical ability was incomparable—though in grace of decorative conception they yielded the palm to the Japanese—and the representative specimens they bequeathed to posterity remained, until quite recently, far beyond the imitative capacity of European or Asiatic experts.

As for faience and pottery, however, the Japanese despaired them in all forms, with one notable exception, the yu-ising-yao, known in the Occident as boccara. Even the yu-ising-yao, too, owed much of its popularity to special utility. It was essentially the ware of the table. In the best specimens, exquisite modelling, wonderful accuracy of finish and pâtes of interesting tints are found; such pieces are, none the less, stamped prominently with the character of utensils rather than with that of works of art. In short, the artistic output of Chinese kilns in their palmiest days, was not faience or pottery, but porcelain, whether of soft or hard paste. Japan, on the contrary, owes her ceramic distinction in the main to her faience. A great deal has been said by enthusiastic writers about the famille chrysanthemo-peonieane of Imari and the genre Kakiemon of Nabeshima, but these porcelain, beautiful as they undoubtedly are, cannot be placed on the same level with the kwan-yao and famille rose of the Chinese experts. The Imari ware, even though its thick biscuit and generally ungraceful shapes be omitted from the account, shows no enamels that can rival the exquisitely soft, broken tints of the famille rose; and the Kakiemon porcelain, for all its rich though chaste contrasts, lacks the delicate transmitted tints of the shell-like kwan-yao. So, too, the blue-and-white porcelain of Hirado, though assisted by exceptional tenderness of sous-pâte colour, by milk-white glaze, by great beauty of decorative design, and often by an authority, and general air of the modern century, the pieces are too, as indifferent. If in the best specimens exquisite modelling, wonderful accuracy of finish and pâtes of interesting tints are found, such pieces are, none the less, stamped prominently with the character of utensils rather than with that of works of art.

A recent production so degraded as the early Makuzu faience could not possibly have a lengthy vogue. Miyagawa soon began to cast about for a better inspiration, and found it in Adapta
cion of the monochromes and polychromes of the Chinese

Kang-kao and Yung-cheng kilns. The extraordinary value attaching to the incomparable red glazes of China, not only in the country of their origin but also in the United States, where collectors showed a fine instinct in this matter, seems to have suggested to Miyagawa the idea of imitation. He took for model the rich and delicate 'liquid-dawn' monochrome, and succeeded in producing specimens of a high merit. This was largely followed, and it may now be said that the tendency of many of the best Japanese ceramists is to copy Chinese chefs-d'oeuvre. To find them thus renewing
Among the seven ceramists here enumerated, Seiō of Kito probably enjoys the highest reputation. If we except the ware of Satsuma, it may be said that nearly all the fine faience of Japan was manufactured formerly in Kito. Nomura Tsuzuki, a founder of the three families of Kito kilns, carved out a long era of beautiful productions with his cream-like "fish-roe" *crucéel* glazes, carrying rich decoration of clear and brilliant vitreous glaze. Seiō is the master of these wares, probably the boldest and most original in the field of faience, having *pâte-sur-pâte* decoration in place of mirror-black or raven's-wing green, and its leveler for streaking or russet-moss dimpling, the prince of all wares in the estimation of the Japanese tea-clubs. Like Shōzan, he is still very far from being equalled, but, as a master, he has produced a number of pieces in his efforts to reach an ideal that probably will continue to elude him for ever. Of Katō there is not much to be said. He has not excelled in beauty of artistic production, but he has worked at very magnificent mono-chromes, richly deserving to be classed among prominent evidences of the new departure. Tokiō was never a centre of ceramic production. Even during the 300 years of its conspicuous prosperity as the administrative capital of the Toku-gawa shoguns, it had no noted factories, doubtless owing to the expense of any suitable potter's clay in the immediate vicinity. Its faience is a remarkable product of Japanese genius, of which the most famous is the "pin-kwo-tsing" with a cover of liquid-dawn (bean-blossom) glaze.

While Kito was the centre of Japan's ceramic production, China, especially the faience of Kiang-nan, and to a smaller degree of Kweichow, were also important in the development of Japanese ceramics. The Kishu faience of the Taizan period, for instance, was influenced by Chinese styles, and the wares produced by Awata and Chen-yao kilns are also notable. The Kato family of Nepal is another example of how Japanese potters were influenced by foreign styles, particularly the soft-paste porcelain production of the eighteenth century.

As technology and skills developed, Japanese potters were able to produce wares that were not only functional but also beautiful. The use of glazes such as *crucéel* and *pâte-sur-pâte* allowed for intricate and colorful designs, which were highly sought after in the tea-clubs of the time. The work of Seiō of Kito, for instance, is characterized by his use of *crucéel* glazes and intricate relief decoration, which are considered among the finest in Japanese ceramics.

The influence of Chinese ceramics on Japanese production is evident in the use of techniques such as *pâte-sur-pâte* and the incorporation of influences from the Kishu and Kweichow wares. However, the Japanese potters were able to develop their own unique styles, which were not only appreciated domestically but also had a significant impact on the international ceramic market.

In conclusion, the Japanese ceramic industry of the Edo period was a thriving and innovative sector of the artistic and cultural development of Japan. The work of potters such as Seiō of Kito and the Kato family, among others, contributed to the lasting legacy of Japanese ceramic art.
sorts of designs, chaste, elaborate or quaint; and these services, representing so much artistic labour and originality, are sold for prices that bear no due ratio to the skill required in their manufacture.

There is only one reservation to be made in speaking of the modern decorative industry of Japan under its better aspects. In the older days under the rules of Ashina and Kii, the so-called decorating ateliers (etsuke-dokoro), similar to those of Tokū, have been established in modern times—the artists use chiefly pigments, seldom venturing to employ vitrifiable enamels. The result is that the product, in every respect, is distinctly inferior to the most brilliant and perfect machine comparable is a fact which every connoisseur must admit. The glossy surface of a porcelain glaze is ill fitted for rendering artistic effects with ordinary cold pigments. The application of these is the privilege in which position the covering glaze serves at once to soften and to preserve the pigment. It can scarcely be doubted that the true instincts of the ceramist will ultimately counsel him to confine his decoration more strictly to those vitrifiable enamels which are used in Chinese and Japanese potters of former times obtained such brilliant results. But to employ enamels successfully is an achievement demanding special training and materials not easily to procure or prepare. The Tokū decorators are not likely, therefore, to change their present methods immediately.

An impetus was given to ceramic decoration by the efforts of a new decorating, decorated, under the direction of the German expert formerly in the service of the Japanese government, Dr Wagener. The idea of developing the art of decoration under the glaze, as applied to faience, patience thus decorated has already made many employments of which are termed in Satsuma and Kii, the colour employed being chiefly blue, though brown and black were used in very exceptional instances. The difficulty of obtaining a clear, bright tint, which was nearly the ideal that the manufactory had in mind, when, achieved, seemed to justify the effort, this class of ware never received much attention in Japan. By careful selection and preparation of pâte, glaze and pigments, Dr Wagener overcame this difficulty, not only to the manufacture was made, feasible, but also that decoration thus applied to potteries possesses unique delicacy and softness. Ware manufactured by his direction at the Tokū school of technique (shōkō gakkō), under the name of asahi-yaki, ranks among the interesting productions of modern Japan. The decorative colour chiefly employed is chocolate brown, which harmonizes excellently with the glaze. But the ware has never attained to the popularity of Japanese porcelain. It is bright, and garishness being imparted to it by the vitreous appearance of the glaze, which is manufactured according to European methods. The modern faience of Ito Tozan of Kioto, decorated with colour under the glaze, is incomparably more brilliant and nearly that of late years, decoration of a remarkably microscopic character has been successfully practised in Kioto, Osaka and Kobe, its originator, Mr. Yosuke (Ozaki), and his school are subject of modern Tokū ceramics, it may be added that Kato Tomasaburo, mentioned above in connection with the manufacture of special glazes, has also been very successful in producing porcelains decorated with blue sous couerte at his factory in the Kiishishō suburb. Hitchi of Hirado is to be classed with ceramists of the modern Japanese school, on account of one ware only, namely, porcelain having translucent (the so-called 'grains' of 'Asada' or 'Asada' in Japan). That, however, is an achievement of no small conformation, the effort had never been essayed outside China. The Hirado expert has not yet attained, technical skill equal to that of the Chinese. He cannot, like them, cover the greater part of a specimen's surface with a lacework of transparent decoration, exciting wonder that pâte deprived so greatly of continuity could have been manufactured without accident. But his artistic instincts are higher than those of the Chinese, and there is reasonable hope that in time he may excel their best works. In other respects, however, the decoration is so fine and so beautiful as those manufactured there between 1759 and 1840, when the Hirado-yaki stood at the head of all Japanese porcelain on the market. The glaze is close-grained, almost without glaze, and the soft clear blue of its carefully executed decoration.

The Owari potters were slow to follow the lead of Miyagawa Shōzan and Seifū Yōhe. At the industrial exhibition in Kioto of 1872, the first results of their efforts were attracting attention at once. In medieval times Owari was celebrated for faience glazes of various colours, much affected by the tea-clubs, but its staple manufacture from the beginning of the 19th century was porcelain decorated with blue under the glaze, the best specimens of which did not approach their Chinese prototypes. Owari potters have found their own style of pâte-de-verre, with which they have not been able to surpass some specimens showing decorative, plastic and graving skill of no mean order. Previously to that time, one of the Seta experts, who had essayed porcelain decorated with blue under the glaze, found in the greater wealth of old jades which were then but a few years old, followed in that field by Seifū of Kioto. Only lately did Owari feel the influence of the new movement towards Chinese types. Its potters took负面影响 glazes of the Chinese style, the best specimens of which were the work of Seta to the Kioto industrial exhibition of 1895. Chinese potters of the Yung-lo era (1403-1414) enriched their country with a quantity ware, of which the name of Ando-kai (bodiless utensil) was given on account of its wonderfully attenuated pâte. The finest specimens of this porcelain had incised decoration, sparingly employed but adding much to the beauty of the piece. In subsequent eras the potters of Ki-ten-chō did not fail to continue this remarkable manufacture, but its only Japanese representative was a porcelain distinctly inferior in more than one respect, namely, the egg-shell translucency, and the fact that the Hirado Chinese, have protected by pâte-de-verre to our extreme fragility. The Seta experts, however, were now making bowls, cups and vases which rank nearly as high as the celebrated Yung-lo total-ki. In purity of tone and velvety smoothness of surface, they are the nearest approach to that of Chinese ware, but in thinness of pâte it supports comparison, and in profusion and beauty of incised decoration it excels its Chinese original.

A great part of all to acknowledge the impetus of the new departure have been the potters of Kaga. For many years their ware enjoyed the credit, or discredit, of being the most lavishly decorated porcelain in Japan. It is known to Western collectors as a product blazing with red and gold, a very degenerate offspring of the Chinese Ming type, which Hozen of Kioto reproduced so beautifully at the beginning of the 19th century under the name of zelkow. That the kaga-potter has been able to carry over some of the effects of the old Japanese, (brocaded) porcelain of Kaga merit praise and admiration; but, on the whole, ware so gaudy could not long hold a high place in public esteem. The Kaga potteries ultimately appreciated that defect. They still manufacture quantities of tea and coffee sets, and dinner or dessert services of red-and-gold porcelain for foreign markets; but about 1885 some of them made zealous and patient efforts to revert to the processes that won so much fame for the old Kutani-yaki, with its grand combinations of red, lustrous, soft-toned glazes. The attempt was never entirely successful, but its results restored something of the Kaga kilns' reputation. Since 1895, again, a good deal of effort has been made in producing porcelain of a sort of a solid body, delicate and beautiful, of which a typical example is a ceramic expert, in conjunction with Shida Yasukyo, president of the Kaga products joint stock company (Kaga bussan kabushiki kaihō), and teacher in the Kaga industrial school. The line chosen by these gentlemen is very similar in purpose to that of the shōi-ten. It is the production of the exquisite Chinese monochrome known as yūko-ren-tsing (blue of the sky after rain) and yuuk-pah (daisu-de-kyo), or blue of the sky and white of the sky. The medium of the porcelain is blue, and red sous couerte. Their work shows much promise, but like all fine specimens of the Sino-Japanese school, the prices are too high to attract wide custom.

The sum of the matter is that the modern Japanese ceramist, after many efforts to cater for the taste of the Occident, evidently concludes that his best hope consists in devoting all his technical and artistic resources to reproducing the celebrated wares of China. In explanation of the fact that he did not essay this route in former times, it may be noted, first, that he had only a limited acquaintance with the wares in question; secondly, that Japanese connoisseurs never attached any value to their countrymen's imitation of Chinese porcelains so long as the originals were obtainable; thirdly, that the art of producing porcelain work as a part of a long series of degradations of the ideal, the idea of competing with it did not occur to outsiders; and fourthly, that Europe and America had not developed their present keen appreciation of Chinese masterpieces. Yet it is remarkable that China, at the close of the 19th century, should have again furnished models to Japanese eclecticism.

Laquer—Japan derived the art of lacquering from China (probably about the beginning of the 6th century), but she ultimately carried it far beyond Chinese conception. First her first experts confined themselves to plain black lacquer. From
the early part of the 8th century they began to ornament it with dust of gold or mother-of-pearl, and throughout the Hiran period (9th to 12th century) they added pictorial designs, though of a formal character, the chief motives being floral subjects, arabesques and scrolls. All this work was in the style known as hira-makie (flat decoration); that is to say, having the decorative design in the same plane as the ground. In the days of the great dilettante Yoshimasa (1449–1490), lacquer experts devised a new style, laga-makie, or decoration in relief, which immensely augmented the beauty of the ware, and constituted a feature almost unique to the period. At the close of the 16th century, the Taiko inaugurated the fashion of lavishing all the resources of applied art on the interior decoration of castles and temples, the services of the lacquerer were employed to an extent hitherto unknown, and there resulted some magnificent work on friezes, coffered ceilings, door panels, altar-pieces and cenotaphs. This new departure reached its climax in the Tokuwa gawa mausoleum of Yedo and Nikkô, which are enriched by the possession of the most splendid applications of lacquer decoration the world has ever seen, nor is it likely that anything of comparable beauty and grandeur will be again produced in the same line. Japanese connoisseurs indicate the end of the 17th century as the golden period of the art, and so deeply rooted is this belief that whenever a date has to be assigned to any specimen of exceptionally fine quality, it is hesitatingly referred to the time of Joken-in (Tsunayoshi).

Among the many skilled artists who have practised this beautiful craft since the first on record, Kiyohara Noryuji (c. 1169), may be mentioned Koyetsu (1558–1617) and his pupils, who are especially noted for their inro (medicine-cases worn as part of the costume); Kajikawa Kijirô (c. 1680), the founder of the great Kajikawa family renowned up to the 19th century; and Koyetsu (d. 1715), whose pupils and descendants maintained his traditions for a period of equal length. Of individual artists, perhaps the most notable is Ogata Korin (d. 1716), whose skill was equally great in the fields of lacquer, painting, law, and literature. The school was named Ogato Sokan, and studied the styles of the Kanô and Tosa schools successively. Among the artists who influenced him were Korin Takanobu, Nakamura Nosuke, Morishita Sôchi and Koyetsu. His lacquer-ware is distinguished for a bold and at times almost eccentric impressionism, and his use of inlay is strongly characteristic. Risutô (1663–1747), a pupil and contemporary of Korin, and like him a potter and painter also, was another lacquerer of great skill. Then followed Hanzan, the two Shioke, Yamamoto Shunshô and his pupils, Yamada Jôka and Kwanshôsai Tôyô (late 18th century). In the beginning of the 19th century worked Shôkawasaki, who frequently collaborated with his contemporaries in their external work. This lacquerer with small decorations in metal by the latter. No important new developments have taken place during modern times in Japan lacquer manufacture. His artists follow the old ways faithfully; and indeed it is not easy to see how they could do better. On the other hand, there has not been any deterioration; all the skill of former days is still active. Work is not mere handiwork, but is the work of artists, critics, but no one really familiar with modern productions can entertain such a view. Lacquer-making, however, being essentially an art and not a mere handicraft, has its eras of great masters and its seasons of inferior execution. Men of the calibre of Koyetsu Kôrin, Risutô, Kajikawa and Mitsutsuji must be rare in any age, and the epoch when they flourished is justly remembered with enthusiasm. But as the Meiji era has had its tanksu, and had in 1909 Shiyama Morishita, Fukumatsu, Kawanabe Ichô, Ogawa Shôshû, Uematsu Hômin, Shiyamada Sôchi, Morishita Morihachi and other lesser experts, all masters in designing and execution. Zeshin, shortly before he died, indicated in his koster that his work was also open to foreign influences from the west; but this is not essentially detrimental to his art. Zeshin and koster that the judgment of this really great craftsman was correct cannot be denied by any one who has seen the works of Shirayama. He excels in his representations of the family crest, and with a unique method of rendering water effects. The plates are esteemed high above gold-lacquer panels and tender and delicate pictures of nature’s softest moods—pictures that show balance, richness, harmony and a fine sense of decorum. A combination of the celebratory representations of flowers and foliage, and Morishita Morihachi and Asano Saburo (of Kaga) are admirable in all styles, but especially, perhaps, in the charming variety called togi-dashi (ground down), which is a kind of decoration that aims to make the impression of dreamy softness that pervades the decoration. The togi-dashi design, when finely executed, seems to hang suspended in the velvety lacquer. It is the kind of decoration that aims at that rich, rich quality of pure kin-makie (gold lacquer) are wanting, but in their place we have inimitable tenderness and delicacy. The only branch of the lacquerer’s art that can be said to have shown any marked development in the Meiji era is that in which parts of the decorative scheme consist of objects in gold, silver, shakudo, shibitsu, iron, or, above all, ivory or mother-of-pearl, for which purpose gold lacquer grounds carrying elaborate and profuse decoration of ivory and mother-of-pearl are objects that appeal to Japanese taste. They belong essentially to the catalogue of decorative arts imposed by their price and the market, being, in fact, an attempt to adapt the lacquerer’s art to decorative furniture for European houses. On the whole it is a successful attempt. The plaque of exquisite flowers and blossoms of flowers (especially the hydrangea), the folds of thick brocade, microscopic diapasons and arabesques, are built up with tiny fragments of iridescent shell, in combination with silver-foil, gold, 24%, of water. It is strained, deprived of its moisture, and receives an admixture of gamboage, cinnabar, acetous protoside or some other colouring matter. The object to be lacquered, which is deprived of its colouring matter, is kept from reaching the overlaid coats of lacquer. Numerous operations of luting, sizing, lacquering, polishing, drying, rubbing down, and so on, are performed by the uramono-shi, until, after many days’ treatment, the object emerges with a smooth, lustre-like dark-grey or coloured surface, and is ready to pass into the hands of the makie-shi, or decorator. The latter is an artist; those who have performed the preliminary operations are merely skilled artisans. The makie-shi may be said to paint a picture on the surface of the already lacquered object. He takes for subject a landscape, a seascape, a battle-scene, flowers, foliage, birds, fishes, insects—in short, anything that can be represented in outline. This is done by the makie-shi, who keeps his lines thin and his method is to work the image on the Ito wood, turn it, and then, having filled in the details with gold and colours, he superposes a coat of transluicid lacquer, which is finally subjected to careful polishing. If parts of the design are to be in relief, they are lacquered with a pulp of rice-paste and lacquer. In all fine lacquers gold predominates so largely that the general impression conveyed by the object is one of glow and lustre. This is not perhaps always the case, for there are those who believe that the finest and most beautiful and highly finished work, whether it be an external or an internal part. The makie-shi ranks almost as high as the pictorial artist in Japanese esteem. He frequently signs his works, and a great number of names have been thus handed down during the past two centuries.

Closiônê Enamel.—Closiônê enamel is essentially of modern development in Japan. The process was known at an early period, and was employed for the purpose of subsidiary decoration from the close of the 16th century, but not until the 19th century did the Japanese experts begin to manufacture the objects known in Europe as “enamels,” that is to say, vases, plaques, censers, bowls, and so forth, having their surface covered with vitrified pastes applied either in the cloisonné style or the choisonné style. It is necessary to insist upon this fact, because it has been stated with apparent authority that numerous specimens which began to be exported from 1865 were the outcome of industry commencing in the 16th century and reaching its point of culmination at the beginning of the 18th. There is not the slightest ground for such a theory. The work began in 1856, and Kajî Tsunayoshi (1802–1870) was the originator. During 20 years procured to the reopening of the country in 1858,
cloisonné enamelling was practised in the manner now understood by the term; when foreign merchants began to settle in Yokohama, several experts were working skillfully in Owari after the methods of Kaji Tsunekichi. Up to that time there had been little demand for enamels of large dimensions, but when the foreign market called for vessels, censers, plaques and such things, no difficulty was found in supplying them. Thus, about the year 1860 a new school was founded, and that school produced some of the finest specimens of enamelled monochrome porcelain in Japan, being destined frankly for European and American collectors. From a technical point of view these specimens had much to recommend them. The base, usually of copper, was as thin as cardboard; the cloisons, exceedingly fine and delicate, were laid on with care and accuracy; the colours were even, and the designs showed artistic judgment. Two faults, however, marred the work—first, the shapes were clumsy and unpleasing, being copied from bronzes whose solidity justified forms unsuited to thin enamelled vessels; secondly, the colours, sombre and somewhat impure, lacked the low and mellowness that give decorative superiority to the technically inferior Chinese enamels of the later Ming and early Tsing eras. Very soon, however, the artisans of Nagoya (Owari), Yokohama and Tōkyō—where the art had been taken up—found that faithful and fine workmanship did not pay. The foreign merchant desired many and cheap specimens for export, rather than few and costly. There followed then a period of gradual decline, and the enamels exported to Europe showed so much inferiority that they were supposed to be the products of a widely different era and of different makers. The industry was threatened with extinction, but by the 1880's the school had recovered, and although the dimensions had not a few earnest artists, working in the face of many difficulties and discouragements, succeeded in striking out new lines and establishing new standards for excellence.

Three clearly differentiated schools now (1875) came into existence. One, headed by Namikawa Yasuyuki of Kioto, took for its objects the utmost delicacy and perfection of technique, richness of decorations and of colour. The thin clumsily-shaped vases of the Kaji school, with their uniformly distributed decoration of diapers, scrolls and arabesques in comparatively dull colours, ceased altogether to be produced, their place being taken by graceful specimens, technically flawless, and carrying designs not only free from stiffness, but also executed in colours at once rich and soft. This school may be subdivided, Kiioto representing one branch, Nagoya, Tōkyō and Yokohama the other. In the products of the Kiioto branch the decoration generally covered the whole surface of the piece; in the products of the other branch the artist aimed rather at pictorial effect, placing the design in the field of the piece, or in some instances with a method as the latter implies great command of coloured pastes, and, indeed, no feature of the manufacture is more conspicuous than the progress made during the period 1880-1900 in the direction of throwing up diaphragms, vitrifying crosses, etc., the examples of cloisonné enamel have been produced by each branch of this school. There has been nothing like them in any other country, and they stand at an immeasurable distance above the works of the early Owari school represented by Kaji Tsunekichi and his pupils and colleagues.

The second of the modern schools is headed by Namikawa Soasuke of Tōkyō. It is an easily traced outgrowth of the second branch of the Kaji school just described, for one can readily understand that from placing the decorative design in a monochromatic field of low tone, which is essentially a pictorial method, it was a short step to the idea of concealing the mechanics of the art in order to enhance the pictorial effect. Thus arose the so-called ‘cloisonné enamels’ (murenipō). They are not always without cloisons. The design is represented in the framework of cloisons, made in any manner and in any time after the cloisons have been produced, and the cloisons are hidden—unless their presence is necessary to give emphasis to the design—and the final result is a picture in vitrified enamels.

The characteristic productions of the third among the modern schools are monochrom and transluçid enamels. All students of the art know that the monochrom enamels of China owe their beauty to the fact that the colour is in the glass, not under it. The ceramist can with no difficulty in applying a uniform coat of pigment to porcelain with great thinness and with no trouble at all. The glass is fixed and the glazed set by secondary firing at a lower temperature than that necessary for hardening the pâte. Such porcelains, however, lack the velvet-like softness and depth of tone so justly prized in the genuine monochrome, where the glass itself contains the colouring matter, pâte and glaze being fired simultaneously at the same high temperature. It is apparent that this kind of monochrome, which is known in Japan as Barry, liquid-dawn, red, aubergine purple, green (grass leaf), dove-grey and lapis lazuli blue. The pieces do not quite reach the level of Chinese monochrome porcelains, but their inferiority is not marked. The artist’s great difficulty is to hide the metal base completely. A monochrome loses much of its attractiveness when the colour merges into a metal rim, or when the interior of a vase is covered with crude unpolished paste. But to spread and fix the enamels so that neither at the rim nor in the interior shall there be any break of continuity, or any indication that the base is copper, is a problem demands quite exceptional skill.

The transluçid enamels of which the school is generally associated with decorative bases. In other words, a suitable design is chiselled in the metal base so as to be visible through the diaphanous enamel. Very beautiful effects of broken and softened lights, combined with depth and delicacy of colour, are thus obtained. But the decorative designs which lend themselves to such a purpose are not numerous. A gold base deeply chiselled in wave-diaper and overrun with a paste of aubergine purple is the most pleasing. A still higher achievement is to apply to the chiselled base designs executed in coloured enamels, finally covering the whole with translucid paste. Admireable result are thus produced, mays, which, with the help of light-uniforming enamels, are represented by the combination of golden grilles, birds or floral sprays, among the reticulations of a silver vase chiselled à jour; or filling with translucid enamels parts of a decorative scheme sculptured in iron, silver, gold or shakudo.

V.—ECONOMIC CONDITIONS

Communications.—From the conditions actually existing in the 8th century after the Christian era the first compilers of Japanese history inferred the conditions which might have existed in the 7th century before that era. One of the results of their inference was that the primitive man and his manufactures were by water only, and that not until the 5th century B.C. did the most populous region of the empire—the west coast—come into possession of public roads. Six hundred years later, the local satraps are represented as having received instructions to build regular highways, and in the 3rd century the massing of troops for an over-sea expedition invested roads with new value. Nothing is yet heard, however, about posts. These evidences of civilization did not make their appearance until the first great era of Japanese reform, the Taika period (645–690), when stations were established along the principal highways, and the employment of the estates, and a system of bells and checks was devised for distinguishing official carriers. In those days ordinary travellers were required to carry passports, nor had they any share in the benefits of the official organization, which was entirely under the control of the minister of war. Great difficulties attended the movements of private persons. Even the task of transmitting to the central government provincial taxes paid in kind had to be discharged by specially organized parties, and this journey from the north-eastern districts to the capital generally occupied three months. At the close of the 7th century the emperor Kōfuku’s age, transluçid enamels were universal, and although some persons living near the highways must supply rice to travellers, and in 745 an empress (Koken) directed that a stock of medical necessaries must be kept at the postal stations. Among the benevolent acts attributed to renowned Buddhist priests posterity specially remembers their efforts to encourage the building of roads and bridges. The great emperor Kōwamm (728–806) was constrained to devote a space of five years to the reorganization of the whole system of post-stations. Owing to the anarchy which prevailed during the 10th, 11th and 12th centuries, facilities of communication disappeared almost entirely, even for men of rank a long journey was an article, the penalty of travel became a household word among the people.

Veritomo, the founder of feudalism at the close of the 12th century, was too great a statesman to underestimate the value of roads and
posts. The highway between his stronghold, Kamakura, and the imperial city, Kioto, began in his time to develop features which ultimately entitled it to be called one of the finest roads in the world. But after Yoritomo's death the land became once more an armed camp, and the roads became the vehicle by which the feudal barons passed from place to place, as well as the transport services that each feudal chief was entitled to demand and the fees he had to pay in return. Tolerable hostilities now came into existence, but they furnished only shelter, fuel and the cheapest kind of food. By degrees, however, the progress of the feudal chiefs to and from Kioto, which at first were simple and economical, developed features of competitive magnitude, and the importance of good roads and suitable accommodation received increased attention. This found expression in practice in 1603. A system more elaborate than anything antecedent was then introduced under the name of 'flying transport.' Three kinds of couriers operated. The first class were in the direct employment of the shogunate. They carried official messages between Kioto and Osaka—a distance of 348 miles—in four days by means of a well-organized system of relays. The second class maintained communications between the chief towns of the Tokugawa family and their own family property. For the alternate years of a feudal lord's compulsory residence in that city his family had to live there. The third class were maintained by the other great families, and the elaborate entries in the endless lists of the contents and postage of the mailboxes of the three great cities of Kioto, Osaka and Kioto and intervening places. This system did not undertake to deliver a letter direct to an addressee. The method pursued was generally to place the letters in boxes at the chief stations on the road, and let the posts themselves convey them to their destination, leaving the addressees to discover for themselves that such things had arrived. Imperfect as this system was, it represented a great advance from the conditions in medieval times.

The nation does not seem to have appreciated the deficiencies of the syndicate's service, supplemented as it was by a network of waterways, and the need for new facilities for road travel. After the cessation of civil wars under the sway of the Tokugawa, the building and improvement of roads went on steadily. It is not too much to say, indeed, that when Japan opened her doors to foreigners in the middle of the 19th century, the postal system was far ahead of any one of the roads of which some of the more striking testimonies to her medieval greatness.

The most remarkable was the Tōkaidō (eastern-sea way), so called because it ran eastward along the coast from Kioto to Kioto. This great highway, 345 m. long, connected Osaka and Kioto with Kioto and Yedo. The date of its construction is not recorded, but it certainly underwent far-reaching improvements in the 12th and 13th centuries, and during the two and a half centuries of Tokugawa sway in Yedo. A wide, well-made and well-kept avenue, it was lined throughout the greater part of its length by giant pine-trees, rendering it the most picturesque highway in the world. Iyeyasu, the founder of the Tokugawa family, in 1611, sent a body of men to Kioto to protect the shrine of his patron deity, the body should be interred at Nikkō, a place of exceptional beauty, consecrated eight hundred years previously. This involved an extension of the Tōkaidō (under a different road name, the Shinjōgi) for nearly a hundred miles. The Tōkaidō shrines erected then at Nikkō and the periodical ceremonies thenceforth performed there demanded a correspondingly fine avenue of approach. The original Tōkaidō was taken for model, and Yedo and Nikkō were joined by a highway lined by rows of cryptomeria. Second only to the Tōkaidō is the Nakasendō (mid-mountain road), which also was constructed to join Kioto with Yedo, but follows an inland course through the provinces of Yamashiro, Omi, Mino, Shinshū, Közuke and Musashi. Its length is 340 m., and though not flanked by trees or possessing so good a bed as the Tōkaidō, it is nevertheless a sufficiently remarkable highway. The Oshūkaidō (now Yedo) to Aomori on the extreme north of the main island, a distance of 445 m., and several lesser highways give access to other regions.

The question of road superintendence received early attention from the government of the Restoration. At a general assembly of local prefects held at Yedo in June 1873 it was decided to classify the different roads throughout the country into several classes from which the sums necessary for their maintenance and repair should be drawn. After several days' discussion all roads were eventually ranged under one or other of the following heads:—

1. National roads, consisting of—
   Class 1. Roads leading from Yedo to the various treaty ports.
   Class 2. Roads leading from Yedo to the provincial seats.
   Class 3. Roads leading from Yedo to the prefectural offices, and those leading to the lines of connexion between cities and military stations.

2. Provincial roads, consisting of—
   Class 1. Roads connecting adjacent prefectures, or leading from military stations to their outposts.
   Class 2. Roads connecting the head offices of cities and prefectures with their branch offices.
   Class 3. Roads connecting the localities with the chief town of such neighbourhoods, or leading to seaports convenient of access.

3. Village roads, consisting of—
   Class 1. Roads leading through several localities in succession, or merely leading from one locality to another.
   Class 2. Roads specially constructed for the convenience of irrigation, pasture, mines, factories, &c., in accordance with measures determined by the people of the locality.
   Class 3. Roads constructed for the benefit of Shinto shrines, Buddhist temples, or to facilitate the cultivation of rice-fields and arable land.

Of the above three headings, it was decided that all national roads should be maintained at the national expense, the regulations for their upkeep being entrusted to the care of the prefectures along the line of route, and the cost incurred being paid from the imperial treasury. Roads leading through the states of a foreigner were paid for by a joint contribution from the government and from the particular prefecture, each paying one-half of the sum needed. Village roads, being for the convenience of local districts alone, are maintained at the expense of such districts under the general supervision of the corresponding prefecture. The width of national roads was determined at 42 ft. for class 1, 35 ft. for class 2, and 30 ft. for class 3; the prefectural roads were to be from 24 to 30 ft., and the dimensions of the village roads were optional, according to the necessity of the case.

The vehicles chiefly employed in ante-Meiji days were ox-carriages, norimono, nagas, and carts, although only the first two were used only by people of the highest rank. They were often constructed of rich lacquer; the curtains suspended in front were of the finest bamboo workmanship, with thick cords and tassels of plaited silk, and the draught animal, an ox of handsome proportions, was brilliantly caparisoned. The care and expense lavished upon these highly ornate structures would have been extravagant even in medieval Europe. They have passed entirely out of use, and are now to be seen in museums only, but the type still exists in China. The norimono resembled a miniature house slung by its roof-ridge from a massive pole which projected at either end, and was supported by the shoulders of a carrier. It, too, was frequently of very ornamental nature and served to carry aristocrats or officials of high position. The kago was the humbllest of conveyances recognized as usable by the lower classes. It was an open palled box, V-shaped in section, of a pole which rested on the shoulders of two bearers. Extraordinary skill and endurance were shown by the men who carried the norimono and the kago, but none of the less these vehicles were both profoundly uncomfortable. They have now been relegated to the warehouses of undertakers, where they serve as bearers for folks too poor to employ catalafques, their place on the roads and in the streets having been completely taken by the jinrikisha, a two-wheeled vehicle pulled by one or two men who think nothing of running 20 m. at the rate of 6 m. an hour. The jinrikisha was devised by a Japanese in 1876, and since then it has come into use throughout the whole of Asia eastward of the Suez Canal. Luggage, of course, could not be carried by norimono or kago. It was necessary to have recourse to packmen, packhorses or baggage-carts drawn by men or horses. All these still exist and are useful as ever within certain limits. In the cities and towns horses used as beasts of burden are now shod with iron, but in rural or mountainous districts straw shoes are substituted, a device which enables the animals to traverse rocky or precipitous roads with safety.
and the packhorse was even slower. Amid such conditions the idea of railways would have been slow to germinate had not a catastrophe furnished some impetus. In 1869 a rice-famine occurred on the northern island of Shikoku, and while the cereal was procurable abundantly in the northwestern provinces, the south suffered from hunger owing to lack of transport facilities. Sir Harry Parke, British representative in Tokyo, seized this occasion to urge the construction of railways. Ito and Okuma, then influential members of the government, at once recognized the wisdom of his advice. Arrangements were made for a loan of a million sterling in London on the security of the customs revenue, and English engineers were engaged to lay a line between Tokyo and Yokohama (18 m.). Vehement voices of opposition were raised in private and official circles alike, but, with all men engaged in the transport of rice, this imagined threat of ruin, and conservative patriots detected loss of national independence in a foreign loan. So fierce was the antagonism that the military authorities refused to permit operations of survey in the southern suburb of Tokyo, and the road had to be laid on an embankment constructed in the sea. Ito and Okuma, however, never flinched, and they were ably supported by Marquis M. Inouye and M. Mayeijima. The latter published, in 1870, the first Japanese work on railways, advocating the building of lines from Tokyo to Kioto and Osaka; the former, the first superintendent of the lines, held that post for 30 years, and is justly spoken of as “the father of Japanese railways.”

September 1872 saw the first official opening of a railway (the Tokyo-Yokohama line) in Japan, the ceremony being performed by the emperor himself, a measure which effectually silenced all further opposition. Eight years from the time of turning the first sod saw 71 m. of road open to traffic, the northern section being that between Tokyo and Yokohama, and the southern that between Kioto and Kobe. A period of interruption now ensued, owing to domestic troubles, and when preparations were once more made, the interest was that once again to railway problems, it found the treasury empty. Then for the first time a public works loan was floated in the home market, and about $300,000 of the total thus obtained passed into the hands of the railway bureau, which at once undertook the building of a road from Kioto to the shore of Lake Biwa, a work memorable as the first line built in Japan without foreign assistance. During all this time private enterprise had remained wholly inactive in the matter of railways, and it became a matter of importance to rouse the people from this apathetic attitude. For the ordinary process of organizing a joint-stock company in which capital and labor was combined was not very successful. But shortly after the abolition of feudalism there had come into the possession of the former feudalists state loan-bonds amounting to some 18 millions sterling, which represented the sum granted by the government to the feudalists for the substitution of the old system of feudalism, and these men from their fees. Already events had shown that the feudalists, quite devoid of business experience, were not unlikely to default and devise the bonds to unsound enterprises. Prince Takasu, one of the leaders of the Meiji Restoration, determined to persuade the feudalists to employ a part of the bonds as capital for railway construction, and thus the first private railway company was formed in Japan under the name Nippon ironfoundery by early 1876. The company was to at least 3276 m. of railway. To say that this represented an average of 91 m. per company is to convey an favourable idea, for, as a matter of fact, 15 of the companies averaged less than 24 m. Anything like efficient cooperation was impossible in such circumstances, and the expenditure was naturally high, outlays averaging less than 47% of the gross income, and that accidents and irregularities are not numerous, prove that Japanese management in this kind of enterprise is efficient.

The first Japanese railways were formed under the Nationalization of Railways. The number of private companies was no less than 36, owning and operating 3276 m. of railway. To say that this represented an average of 91 m. per company is to convey a favourable idea, for, as a matter of fact, 15 of the companies averaged less than 24 m. period of extreme commercial and financial depression set in, and the treasury had to postpone all recourse to loans for whatever purpose, so that railway progress was completely checked in the hold alike of the original and the acquired state lines. Moreover, all securities under which, in the first place, the government hesitated to hand over the bonds representing the purchase-price of the railways, lest such an addition to the volume of the public debt should cause a further devaluation and, on the other hand, the former owners of the nationalized lines found the character of their bargain greatly changed. In these circumstances the government decided to take a strong step, namely, to place the whole of the national railways under a new company, with its own management and in whose capital lines as well as those nationalized—in an account independent of the regular budget, and to devote their entire profits to works of extension and improvement, supplementing the amount with loans from the treasury when necessary.

In the sequel of the war of 1904–5 Japan, with China's consent, acquired from Russia the lease of the portion of the South-Manchuria Railway 20 miles north of Kwantung (Chang-chun) on the north and Tairen (Dulny), Port Arthur and Nitchwong on the south—a total length of 470 m. At the close of 1906 this road was handed over to a joint-stock company with a capital of 20 millions sterling, the government contributing 10 millions in the form of the road and its associated properties; the public subscribing 2 millions, and the company being entitled to issue debentures to the extent of 8 millions, the principal and interest of these debentures being officially guaranteed. Four millions' worth of debentures were issued in London in 1907 and 4 millions in 1908. This company's programme is not limited to the railway. It also works a road-laying line between Fushun and Fusan; has a line of steamers plying between Tairen and Shanghai; and engages in enterprises of electricity, warehousing, and the management of houses and lands within zones 50 li (17 m) wide, along the line. The company guarantees 6½% interest on the capital paid up by the general public.

Not until 1905 did Japan come into possession of an electric railway. It was a short line of 8½ miles from Fukuoka to the domestic exhibition held in that city. Thenceforth this class of enterprise grew steadily in favour, so that, in 1907, there were 16 companies with an aggregate capital of 20 millions sterling, having 165 m. open to traffic and 77 m. under construction. Fifteen other companies with an aggregate capital of 3 millions had also obtained charters. The principal of these is the Tokyo railway company, with a subscribed capital of 150 millions, built up, £90 millions, and 88½ m. under construction. In 1907 it carried 153 millions passengers, and its net earnings were £300,000.

The traditional story of prehistoric Japan indicates that the first recorded navigator was an over-sea invader, whose followers must therefore have possessed some knowledge of ship-building and navigation. But in what kind of craft they sailed and how they handled them, there is nothing to show clearly. Nine centuries later, but still 500 years before the era of surviving written annals, an emperor is said to have invaded Korea, embarking her forces at Kōbe (then called Takekura) in 500 vessels. In the middle of the 6th century we read of a general named Abe-no-hirata who led a flotilla up the Amur river to the invasion of Manchuria (then called Shukhshin). All these things show that the Japanese of the earliest era navigated the high sea with some skill, and at later dates down to medieval times they are found occasionally sending forces to Korea and constantly visiting China in vessels which seem to have experienced no difficulty in making the voyage. The 16th century was a period of maritime activity so marked that, had not artificial checks been applied, the Japanese, in all probability, would have obtained partial command of Far-Eastern waters. They invaded Korea; their corsairs harried the coasts of China; two hundred of their vessels, sailing under authority of the Taikō's vermillion seal, visited Siam, Cochin China and Annam, and they built ships in European style which crossed the Pacific to Acapulco. But this spirit of adventure was chilled at the close of the 16th century and early in the 17th, when events connected with the propagation of Christianity taught the Japanese to believe that national safety could not be secured without international isolation. In 1638 the ports were closed to all foreign ships except those flying the flag of Holland or of China, and a strictly enforced edict forbade the building of any vessel having a capacity of more than 500 koku (150 tons) or constructed for purposes of ocean navigation. Thenceforth, with rare exceptions, Japanese craft confined themselves to the coastwise trade. Ocean-going enterprise ceased altogether.

Things remained thus until the middle of the 19th century, when a growing knowledge of the conditions existing in the West warned the Tokugawa administration that continued isolation would be suicidal. In 1853 the law prohibiting the construction of sea-going ships was revoked and the Yedo government built at Uraga a sailing vessel of European type aptly called the "Phoenix" ("Howo Maru"). Just 243 years had elapsed since the founder of the Tokugawa dynasty constructed Japan's first foreign model, with the aid of an English pilot, William Adams. In 1853 Commodore M. C. Perry made his appearance, and thenceforth everything conspired to push Japan along the new path. The Dutch, who had been proximately responsible for the adoption of the seclusion policy in the 17th century, now took a prominent part in promoting a liberal view. They sent to the Tokugawa a present of a man-of-war and urged the vital necessity of equipping the country with a navy. Then followed the establishment of a naval college at Tsukiji in Yedo, the building of iron-works at Nagasaki, and the construction of Yotsukasa of a dockyard. Alarmed, however, to become one of the greatest enterprises of its kind in the East. This last undertaking bore witness to the patriotism of the Tokugawa rulers, for they resolutely carried it to completion during the thrones of a revolution which involved the downfall of their dynasty. Their encouragement of maritime enterprise had borne fruit, for when, in 1867, they restored the administration to the Imperial court, 44 ocean-going ships were found among their possessions and 94 were in the hands of the feudalatories, a steamer and 20 sailing vessels having been constructed in Japan and the rest purchased abroad.

If the Tokugawa had been energetic in this respect, the new government was still more so. It caused the various maritime carriers to amalgamate into one association called the Nippō-kōya yūbin kōkai kaiša (Mail SS. Company of Japan), to which were transferred, free of charge, the steamers, previously the property of the Tokugawa or the feudalatories, and a substantial subsidy was granted by the state. This, the first steamship company ever organized in Japan, remained in existence only four years. Defective management and incapacity to compete with foreign-owned vessels plying between the open ports caused its downfall (1875). Already, however, an independent company had appeared upon the scene. Organized and controlled by a man (Iwasaki Yataro) of exceptional enterprise and business faculty, this mitsubishi kaisha (three lozenge company, so called from the design on its flag), working with steamers chartered from the former feudalatory of Tosa, to which clan Iwasaki belonged, proved a success from the outset, and grew with vicissitude of the state. For when (1874) the Meiji government's first complications with a foreign country necessitated the despatch of a military expedition to Formosa, the administration had to purchase 63 foreign steamers for transport purposes, and these were subsequently transferred to the mitsubishi company together with all the vessels (17) hitherto in the possession of the Mail SS. Company, the Treasury further granting to the mitsubishi a subsidy of £50,000 annually. Shortly afterwards it was decided to purchase a service maintained by the Pacific Mail SS. Company with 4 steamers between Yokohama and Shanghai, and money for the purpose having been lent by the state to the mitsubishi, Japan's first line of steamers to a foreign country was firmly established, just 20 years after the law interfering the construction of ocean-going vessels had been rescinded.

The next memorable event in this chapter of history occurred in 1877, when the Satsuma clan, eminently the most powerful and most rebellion. For a time the fate of the government hung in the balance, and only by a flanking movement over-sea was the rebellion crushed. This strategy seems to have been urged on the government by the Commodore Perry, who subsequently handed over to the mitsubishi company, which, in 1880, found itself possessed of 32 ships aggregating 25,000 tons, whereas all the other vessels of foreign type in the country totalled only 27 with a tonnage of 6,000. It had now become
apparent that the country could not hope to meet emergencies which might at any moment arise, especially in connexion with Korean affairs, unless the development of the mercantile marine proceeded more rapidly. In 1892, in fact, the formation of the Maruhachi kaisha (Union Transport Company); its capital was about a million sterling; it received a large subsidy from the state, and its chief purpose was to provide a military service, as well as commercial, for Japan. Japan had now definitely embraced the policy of entrusting to private companies rather than to the state the duty of acquiring a mercantile marine, and of applying it to the purposes of war. But there was now seen the curious spectacle of two companies (the Mitsubishi and the Union Transport) competing in the same waters and both subsidized by the treasury. At the end of four years the government companies were amalgamated (1885) into the Nippon yuen kaisha (Japan Mail SS. Company) with a capital of £1,100,000 and an annual subsidy of £88,000, fixed on the basis of 8% of the capital. Another company had come into existence a few months later, its foundation for 100 small steamers, totalling 10,000 tons, which had hitherto been competing in the Inland Sea.

Japan now possessed a substantial mercantile marine, the rate of whose development is indicated by the following figures:

<table>

Nevertheless, only 23% of the exports and imports was transported in Japanese bottoms in 1892, whereas foreign steamers took 77%. This discrepancy was one of the subjects discussed in the first session of the Diet. The government, for example, navigation failed to obtain parliamentary consent, and in 1893 the Japan Mail SS. Company, without waiting for state assistance, offered a prize of £1000 to Bombard mainly for the purpose of carrying raw cotton from India to supply the spinning industry which had assumed great importance in Japan. Thus the rising sun flag flew for the first time outside Far-Eastern waters. Almost immediately after the establishment of this line, Japan had to engage in China, which entailed the despatch of some two hundred thousand men to the neighbouring continent and their maintenance there for more than a year. All the country's available shipping resources had been absorbed. Moreover, the government had to engage 375,588 tons, while the sailing vessels had diminished to 644 of 40,000 tons.

In 1860 there occurred an event destined to exercise a potent influence on the fortunes not only of Japan herself but also of her mercantile marine. No sooner had she exchanged with China her ratifications of a treaty of peace which seemed to preclude a long period of tranquillity, than Russia, Germany and France ordered her to restore all the continental territory ceded to her by China. Japan then recognized that her hope of peace was delusive, and that she must engage in a struggle for her existence and her national independence against the one from which she had just emerged. Determined that when the crucial moment came she should not be found without ample means of maintaining her army and government, under the leadership of Prince Itō and with the consent of the Diet, in March 1866 laws liberally encouraging ship-building and navigation. Under the navigation law 4 Japanese subjects or any company, or both, with the consent of the government, might build or charter, and thus, by the beginning of 1866, the mercantile marine of Japan had grown to 899 steamers of 372,588 tons, while the sailing vessels had diminished to 644 of 40,000 tons.

In the building of iron and steel ships the Japanese are obliged to import much of the material used, but a large steel-foundry has been established under government auspices at Wakamatsu in Kiūshū, that position having been chosen on account of comparative proximity to the sea, whereas the greater part of the iron ore used for the foundry is procured simultaneously with the growth of the mercantile marine there has been a marked development in the number of licensed mariners; that is to say, seamen registered by the government as having passed the examination prescribed by law.

In 1876 there were only 4 Japanese subjects who satisfied that definition as against 74 duly qualified foreigners holding responsible positions.

There are in Japan various institutions where the theory and practice of navigation are taught. The principal of these is the Nippon Tōgei gakkō (Japan Navigation College), established in 1879, where some 600 of the men now serving as officers and engineers have graduated. Well equipped colleges exist also in seven other places, all having been established by the government for the purpose of preparing seamen and mariners' assistants. The principal of these is the Nippon Kyōsaikai, which has succeeded about a hundred thousand seamen since its establishment in 1869.

The duty of overseeing all matters relating to the maritime carrying trade devolves on the department of state for communications, and is delegated by the latter to one of its bureaus (the Kwanzen-kyoku, or ships superintendence bureau), which, again, is divided into three sections, one for inspecting vessels, one for examining mariners, and one for the general control of all shipping in Japanese waters. The department of state has also a bureau (kujū-kyō) for the classification between Japanese and foreign ships in the carriage of the country's over-sea trade soon began to assume appreciable dimensions.

The charter figure in Japanese bottoms was only £1,100,000 of 12,100 tons carried by foreign vessels, in 1872. The corresponding figures in 1902 were £2 million against 324 million. In other words, Japanese steamers carried 14% of the total trade in 1872, but the share rose to 39% in 1902. The principal suggestion that record caused some uneasiness, which was not allayed by observing that while the tonnage of Japanese vessels in Chinese ports was only 2%
in 1896 as compared with foreign vessels, the former figure grew to 16% in 1902; while in Korean ports Japanese steamers almost monopolized the carrying trade, leaving only 18% to their foreign rivals, and even in Hong-Kong the tonnage of Japanese ships increased from 3% in 1896 to 15% in 1900. In 1898 Japan stood eleventh on the list of the thirteen principal maritime countries of the world, but in 1907 she rose to the fifth place. Her principal company, the Nippon yusen kaisha, though established as lately as 1885, now ranks ninth in point of tonnage among the 21 leading maritime companies of the world. This company was able to supply 55 out of a total fleet of 207 transports furnished by all the steam companies of Japan for military and naval purposes during the war with Russia in 1904-5. It may be noted in conclusion that the development of Japan's steam-shipping during the five decades ended 1907 was as follows—

Emigration.—Characteristic of the Japanese is a spirit of adventure: they readily emigrate to foreign countries if any inducement offers. A strong disposition to exclude them has displayed itself in the United States of America, in Australasia and in British Columbia, and it is evident that, since one nation cannot force its society on another at the point of the sword, this anti-Asiatic prejudice will have to be respected, though it has its origin in nothing more respectable than the jealousy of the labouring classes. One result is an increase in the number of Japanese emigrating to Korea, Manchuria and S. America. The following table shows the numbers residing at various places outside Japan in 1904 and 1906 respectively:

There are also small numbers of Dutch, Peruvians, Belgians, Swiss, Italians, Danes, Swedes, Austrians, Hungarians, &c. This slow growth of the foreign residents is remarkable when contrasted with the fact that the volume of the country's foreign trade, which constitutes their main business, grew in the same period from 131 millions sterling to 92 millions.

Post and Telegraphs.—The government of the Restoration did not wait for the complete abolition of feudalism before organizing a new system of posts in accordance with modern needs. At first, letters only were carried, but before the close of 1871 the service was extended so as to include newspapers, printed matter, books and commercial samples, while the area was extended so as to embrace all important towns between Hakodate in the northern island of Yezo and Nagasaki in the southern island of Kūshūshū. Two years later this field was closed to private enterprise, the state assuming sole charge of the business. A few years later saw Japan in possession of an organization comparable in every respect with the systems existing in Europe. In 1892 a foreign service was added. Whereas in 1871 the number of post-offices throughout the empire was only 179, it had grown to 6449 in 1907, while the mail matter sent during the latter year numbered 25,253 millions (including 15 millions of parcels), and 67,000 persons were engaged in handling it. Japan labours under special difficulties for postal purposes, owing to the great number of islands included in the empire, the exceptionally mountainous nature of the country, and the wide areas covered by the cities in proportion to the number of their inhabitants. It is not surprising to find, therefore, that the means of distribution are varied. The state derives a net revenue of 5 million yen approximately from its postal service. It need scarcely be added that the system of postal money-orders was developed pari passu with that of ordinary correspondence, but in this context one interesting fact may be noted, namely, that while Japan sends abroad only some £25,000 annually to foreign countries through the post, she receives over £50,000 from her over-sea emigrants.

Japan at the time of the Restoration (1868) was not entirely without experience which prepared her for the postal money-order system. Some 600 years ago the idea of the bill of exchange was born in the little town of Naragawa (Yamato province), though it did not obtain much development before the establishment of the Tokugawa shōguns in the 17th century. The feudal chiefs, having then to transmit large sums to Yedo for the purchase of compulsory residence there, availed themselves of bills of exchange, and the shōgun’s government, which received considerable amounts in Osaka, selected ten brokers to whom the duty of effecting the transfer of these funds was entrusted. Subsequently the 10 chosen brokers were permitted to extend their services to the general public, and a recent Japanese historian notes that Osaka thus became the birth-place of banking business in Japan. Postal money-orders were therefore easily appreciated at the time of their introduction in 1875. This was not true of the postal savings bank, however, an institution which came into existence in the same year. It was.

Foreign Residents.—The number of foreigners residing in Japan and their nationalities in 1889, 1899 and 1906, respectively, were as follows:

altogether a novel idea that the public at large, especially the lower sections of it, should entrust their savings to the government for safe keeping, especially as the minimum and maximum amounts at one time were fixed at such petty sums as 10 sen (2½d.) and 50 sen (1½d.) respectively. In the beginning, in the winter of 1854, £1,200 was deposited in the first year must be regarded as notable. Subsequently deposits were taken in post-office stamps, and arrangement made for the payment of interest every month. The demand for credits through the bank by merely stating the destination and the amount of the nearest post office. In 1908 the number of depositors in the post office savings bank was 82,177, and their deposits, millions of yen, was thirty per cent. of the depositors belonged to the agricultural classes, 13 to the commercial and only 6 to the industrial.

Rapid communication by means of beacons was not unknown in early primitive ages. The bamboo torch and the aid of flags was introduced until the 17th century and was probably suggested by observing the practice of foreign merchants. It was only in 1886 that the telephone service was established at Osaka, between which city and many of the principal provincial towns rudely constructed towers were placed at long distances, and from one to another of these intelligence as to the market price of rice was flashed by flag-shaking, the signals being read with telescopes. The Japanese saw a telephone for the first time in 1854, when Commodore Perry presented a set of apparatus to the shogun, and four years later the feudal chief of Satsuma (Shimazu Nariakira) caused two circuits to be set up within the enclosure of his castle. The true value of electric telegraphy was first demonstrated to the Japanese in connexion with an insurrection in 1877, under the leadership of Shimazu, whose posses of magistrates and officials was at that time, however, a line of telegraph had been put up between Tōkyō and Yokohama (18 miles) and a code of regulations had been enacted. Sudden introduction to such a mysterious product of foreign invention did not at first make its way into the minds of the lower orders, and occasional attempts were made at the outset to wreck the wires. In 1886 the postal and telegraph offices were amalgamated and both systems underwent large development. Whereas the length of wires at the end of the fourth year after the introduction of the system was only 53 m., and the number of messages 28,000, these figures had grown in 1907 to 95,651 and 25 million, respectively. Several cable lines were included in the above figures, the longest being that to Formosa (1229 m.). Wireless telegraphy began to come into general use in 1898, when several vessels belonging to the principal steamship companies were equipped with apparatus in the service of the government. A few years later the same apparatus was taken by the army and navy, especially during the war with Russia, when the latter service installed a new system, the joint invention of Captain Tomani of the navy, Professor S. Kimura of the naval college and Mr. M. Matsushiro of the department of communications. The telegraph service in Japan barely pays the cost of operating and maintenance.

The introduction of the telephone into Japan took place in 1877, but it served official purposes solely during 13 years, and even when Telephones. (1890) it was placed at the disposal of the general public its utilities found at first few appreciators. But this was fielded to a large extent by employ of local persons and the resources of the government (which monopolized the enterprise) proved inadequate to satisfy public demand. Automatic telephones were ultimately set up at many places in the principal towns and also in private houses. The longest distance covered was from Tōkyō to Osaka (348 m.). In 1907 Japan had 140,440 m. of telephone wires, 262 exchanges, 195 automatic telephones, and the approximate number of messages sent was 160 million. The telephone service pays a net revenue of about ¥100,000 annually.

Agriculture.—The gross area of land in Japan—excluding Formosa and Sakhalin—is 80,157,886 acres, of which 53,487,022 acres represent the property of the crown, the state and the communes, the rest (35,680,868 acres) being owned by private persons. Of the grand total the arable lands represent 15,301,297 acres. With respect to the immense expanse remaining unproductive, experts calculate that if all lands inclined at less than 15° be considered cultivable, an area of 10,684,517 acres remains to be reclaimed, though whether the result would repay the cost is a question hitherto unanswered. The cultivated lands are thus classified, namely, wet fields (called also paddy fields or rice lands), 6,871,437 acres; dry fields (or upland farms), 5,741,743 acres, and others, 2,688,115 acres.

Paddy fields are to be seen in every valley or dell where farming is practiced. The plots are grass-grown ridges a few inches in height and on an average a foot in breadth—the rice being planted in the soft mud thus enclosed. Narrow pathways intersect the fields and are bordered by stone walls (generally between low banks covered with clumps of bamboo) feed ditches cut for purposes of irrigation. The fields are generally kept under water to a depth of a few inches while the crops are young, but are drained immediately before harvesting. They are then dug up, and again flooded before the second crop is planted out. The rising grounds which skirt the rice-land are tiled by the hoe, and produce Indian corn, millet and edible roots. The well-drained slopes supply the peasants with timber and firewood. Thirty-six per cent. of the rice-fields yield two crops yearly. The seed is sown in small beds, and the seedlings are planted in the fields after attaining the height of about 4 in. The finest rice is produced in the fertile plains watered by the Tonegawa in the province of Shimōsa, but the grain of Kaga and of the two central provinces of Sessan and Hāritana is also very good.

Not only does rice form the chief food of the Japanese but also the national beverage, called sake, is brewed from it. In colour the best sake resembles very pale sherry; the taste is rather acid. None but the finest grain is used to make its manufacture. Of sake there are many varieties, from the best quality down to shiro-sake or "white sake," and the turbid sort, drunk on poorer diets, known as nigori-sake; there is also a sweet sort, called mirin.

The various cereal and other crops cultivated in Japan, the areas devoted to them and the annual production are shown in the following table:—

It is observed that no marked increase is taking place in the area under cultivation, and that the business of growing cotton, silk and tea, so gradually diminishing, these staples being supplied from abroad. In Germany and Italy the annual additions made to the arable area average 8% whereas in Japan the figure is only 5%. Moreover, of the latter amount the rate for paddy fields is only 37% against 70% in the case of upland farms. This means that the population is rapidly outgrowing its supply of home-produced rice, the great food-stuff of the nation, and the price of that cereal consequently shows a steady tendency to appreciate. Thus whereas the market value was 55. 9d. per bushel in 1901, it rose to 6s. 9d. in 1906. It is scarcely less important to Japan than the cereals she raises her silk and tea, divided of which find markets abroad. The production of the latter staple does not show any sign of marked decrease. Silk and development, for though tea is almost as essential an article of diet in Japan as rice, its foreign consumption is at relatively limited to the United States and their demand does not increase. The figures for the 10-year period ended 1906 are as follows:—

Sericulture, on the contrary, shows steady development year by year. Sericulture is a Japanese peculiarity. The domesticity of the latter staple does not show any sign of marked development, for though tea is almost as essential an article of diet in Japan as rice, its foreign consumption is at relatively limited to the United States and their demand does not increase. The chief silk-producing prefectures in Japan, according to the order of production, are Tochigi, Gunma, Niigata, and Fukuoka. Aichi and Shiga rank as the most backward, but still,虽然 all, the areas engaged in sericulture are 397,885. Rice, vegetables, sugar, and tobacco are also important staples of production. The figures for the ten-year period, 1897 to 1906, are as follows:—
Agricultural Improvement.

In the realm of agriculture, as in all departments of modern Japan's material development, abundant traces are found of official activity. Thus in 1896 the government, in order to correct the excessive subdivision of farmers' holdings, to utilize unproductive areas lying between cultivated fields; to straighten roads; to facilitate irrigation; to promote the use of machinery, and to make known the value of artificial fertilizers, was designed to form a system of credit. The department of agriculture of the cabinet similarly organized the cotton association and other similar societies which should develop a system of credit, assist the business of sale and purchase and concentrate small capitals. The establishment of agricultural stations was also original. Their functions were to carry on research in the formation of co-operative societies which are now to be found everywhere. This official initiative, with equally successful results, extended to the domain of sericulture and tea-growing. There are two state sericultural training institutions where not only the rearing of silk-worms and the management of sericulture are taught, but also experiments are made; and these institutions, like the state agricultural stations, have served as models for a vast number of private institutions which have sprung up in the meantime, in both the large cities and the smaller provincial towns. Experiment stations were also official. Their functions were to carry on research in the formation of co-operative societies which should develop a system of credit, assist the business of sale and purchase and concentrate small capitals. Encouragement by grants in aid was also given to the establishment of similar experimental farms by private persons in the various prefectures, and such farms are now to be found everywhere.

One of the problems of modern Japan is the supply of cattle. With a rapid increase in population, a system of cattle-breeding, not an article of diet—there is a slow but steady diminution in the stock of cattle. Thus while the number of the latter in 1897 was 1,214,163, out of which total 158,904 were slaughtered, the corresponding figures in 1906 were 1,190,373 and 167,458, respectively. The stock of sheep (3500 in 1906) increases slowly, and the stocks of goats (58,694 in 1897 and 74,750 in 1906) and swine (206,217 in 1897 and 284,708 in 1906) grow with somewhat greater rapidity, but mutton and pork do not suit Japanese taste, and goats are kept mainly for the sake of their milk. The government has done much towards the improvement of cattle and horses by importing bulls and sires, and on the whole, the mixed breed is not a success, and the war with Russia in 1904–5 has clearly disclosed a pressing need of heavier horses for artillery and cavalry purposes, large imports of Australian, American, and European breeds being necessary. It is a large and ambitious plan, and its success is attended by the formation of race-clubs which have been encouraged throughout the country.

Fisheries.—From ancient times the Japanese have been great fishermen. The seas that encircle their many-coasted islands teem with aquatic life, and aquaculture has always constituted an essential article of diet. Early in the Edo period, the government, in pursuance of a policy of isolation, interdicted the construction of ocean-going ships, and the people's enterprise in the arts of fishing and the development of the artificial-fish fisheries, and especially of the kelp fisheries, into which they had fallen since the Restoration in 1867, not only failed to be vetoed resolutely, but also the government, organizing a marine bureau and a marine products examination office, took vigorous measures to promote pêlagic fishing and to develop the kelp fisheries. To improve the fish culturing industry the government association under the presidency of an imperial prince. Fishing training schools were the next step; then periodical exhibitions of fishery machinery, fish meal production and of fishing implements; and then by rapid agricultural and forestry widening United until fishing boats of improved types came to be seen in Australasia. By 1907, in the seas of Sakhalin, the Maritime Province, Korea and China; in the waters of Kamchatka and in the Sea of Okhotsk. No less than 9000 fishermen with 2000 boats capture yearly about £300,000 worth of fish in Korean waters; at least 9000 find a plentiful livelihood off the coasts of Sakhalin and Siberia, and 200000 boats engage in the kelp fisheries of the Fraser River. In 1893, the total value of Japanese marine products and fish captured did not exceed £1 4 millions sterling, whereas in 1906 the figure had risen to £13 millions. In 1906 the total value of Japanese marine products and fish captured did not exceed £1 4 millions sterling, whereas in 1906 the figure had risen to £13 millions.

Minerals.—Crystalline schists form the axis of the Japanese islands. They run in a general direction from south-west to north-east, with chains starting east and west from Shikoku. On these schists rocks of every age are superimposed, and amid these somewhat complicated geological conditions have been found, not only are the gold and copper, but also the silver and iron mines. Precious metals, however, are not found, though crystals of quartz and antimony as well as good specimens of topaz and agate are not infrequent. Copper is also mined, and is very abundant especially in the northern part of the island of Hokkaido. There are also large deposits of coal with some valuable iron-ore. Gold.

The value of the silver mined is approximately equal to that of the gold. It is found chiefly in volcanic rocks (especially tuff), in the form of sulphide; and it is usually associated with gold, copper, lead or zinc. Silver.

Much more important in Japan's economics than either of the precious metals is copper. Veins often showing a thickness of from 70 to 80 ft., though of poor quality (2 to 8 %), are found in the marine-sedimentary rocks and in placer deposits. The former, found chiefly at Amakusa, is not greatly inferior to the high-grade copper of the American and Russian mines. The latter, though generally worked in Japan, and she obtained an important addition to its sources of supply in the sequel to the war with Russia, when the Fushun mines were seized. In 1906 there were 27,000 tons annually, and Japan is obliged to import from the neighbouring continent the greater part of the iron needed by her for ship-building and armaments. Copper.

Coal.

There have not yet been found any evidences that Japan is rich in iron ores. Her largest known deposit (magnetite) occurs at Kamaishi in Iwate prefecture, but the quantity of pig-iron from it is small. Additional iron ores are in the north, and in the south of the island of Honshu, and there are reports of iron ore in the south of Kyushu, and in the north of Shikoku, but these have not been worked. The total production in 1906 was 786,960 tons. Petroleum.

Petroleum also has of late sprung into prominence on the list of her productive products. The principal oilfields are in the north of Iwate Prefecture, and in the north of Aomori Prefecture. The chief field is in the north of Iwate Prefecture, and in the north of Aomori Prefixture. The chief field is at Sendai, and the other is at Morioka, in Iwate prefecture...
being still little exploited. The quantity of petroleum obtained in Japan in 1897 was 9 million gallons, whereas the quantity obtained in 1906 was 88 million.

Japanese industry was more than trebled during the decade 1897 to 1906, for the value of the minerals taken out in the former year was only 3.3 million sterling, whereas the corresponding figure for 1906 was 11.1 million. The earliest mention of great mining in Japan takes us back to the year A.D. 666, and by the 16th century the country had acquired the reputation of being rich in gold. During the days of her medieval intercourse with the outer world, her stores of the precious metals were largely reduced for between the years 1602 and 1766, Holland, Spain, Portugal, and China took from her 313,800 lb (troy) of gold and 11,230,000 lb of silver.

Copper occupied a scarcely less important place in Old Japan. From a period long anterior to historic times this metal was employed to manufacture mirrors and swords, and the introduction of Buddhism in the 6th century was followed by the casting of sacred images, many of which still survive. Finding in the 18th century that her foreign intercourse not only had denuded her of gold and silver, but also threatened to denude her of copper, Japan set a limit (3415 tons) to the yearly export of the latter metal. After the resumption of administrative power by the emperor in 1867, attention was quickly directed to the question of mineral resources; several Western experts were employed to conduct surveys and introduce Occidental mining methods, and ten of the most important mines were worked under the direct auspices of the state in order to serve as object lessons. Subsequently these mines were placed to private ownership, and the state retains possession of only a few iron and coal mines whose products are needed for dockyard and arsenal purposes. The following table shows the recent progress and present condition of mining industry in Japan:

The number of mine employees in 1907 was 190,000, in round numbers; the number of manufacturing companies, 189; and the aggregate paid-up capital, 10 millions sterling.

Industries.—In the beginning of the Meiji era Japan was practically without any manufacturing industries, as the term is understood in the Occident, and she had not so much as one joint-stock company. At the end of 1906, her joint-stock companies and partnerships totalled 9,329, their paid up capital exceeded 100 millions sterling, and their reserves totalled 26 millions. It is not to be inferred, however, from the absence of manufacturing organizations 50 years ago that such pursuits were deliberately eschewed or despised in Japan. On the contrary, at the very dawn of the historical epoch we find that sections of the people took their names from the work carried on by them, and that specimens of expert industry were preserved in the sovereign's palace side by side with the imperial insignia. Further, skilled artisans from the neighbouring continent always found a welcome in Japan, and when Korea was successfully invaded in early times, one of the uses which the victors made of their conquest was to import Korean weavers and dyers. Subsequently the advent of Buddhism, with its demand for images, temples, gorgeous vestments and rich paraphernalia, gave a marked impulse to the development of artistic industry, which at the outset took its models from China, India and Greece, but gradually, while assimilating many of the best features of the continental schools, subjected them to such great modifications in accordance with Japanese genius that they ceased to retain more than a trace of their originals. From the 9th century luxurious habits prevailed in Kiotó under the sway of the Fujiwara regents, and the imperial city's munificent patronage drew to its precincts a crowd of artisans. But these were not industrials, in the Western sense of the term, and, further, their organization was essentially domestic, each family selecting its own pursuit and following it from generation to generation without co-operation or partnership with any outsider. The establishment of military feudalism in the 12th century brought a reaction from the effeminate luxury of the metropolis, and during nearly 300 years no industry enjoyed large popularity except that of the armourer and the sword-smith. No sooner, however, did the prowess of Oda Nobunaga and, above all, of Hideyoshi, the taiko, bring within sight a cessation of civil war and the unification of the country, than the taste for beautiful objects and artistic utensils recovered vitality. By degrees there grew up among the feudal barons a keen rivalry in art industry, and the shogun's court in Yedo set a standard which the feuds- tors constantly strove to attain. Ultimately, in the days immediately antecedent to its fall, the shogun's administration sought to induce a more logical system by encouraging local manufacturers to supply local needs only, leaving to Kiotó and Yedo the duty of catering to general wants. But before this reform had approached maturity, the second advent of Western nations introduced to Japan the products of an industrial civilization centuries in advance of her own from the point of view of utility, and nowise superior in the application of art. Immediately the nation became alive to the necessity of manufacturing in this country, which superior- ity in this respect. But the people being entirely without models for organization, without financial machinery and without the idea of joint stock enterprise, the government had to choose between entering the field as an instructor, and leaving the nation to struggle along an arduous and expensive way to lardy development. This could be no question as to which course would conduce more to the general advantage, and thus, in days immediately subsequent to the resumption of administrative power by the emperor, the spectacle was seen of official excursions into the domains of silk-reeling, cement-making, cotton and silk spinning, brick-burning, printing and book-binding, soap-boiling, type-casting and ceramic decoration, to say nothing of their establishing colleges and schools where all branches of applied science were taught. Domestic exhibitions also were organized, and specimens of the country's products and manufactures were sent under government auspices to exhibitions abroad. On the other hand, the effect of this new departure along Western lines could not but be injurious to the old domestic industries of the country, especially to those which owed their existence to tastes and traditions now regarded as obsolete. Here again the government came to the rescue by establishing a firm whose functions were to familiarize foreign markets with the products of Japanese artisans, and to instruct the latter in adaptations likely to appeal to Occidental taste. Steps were also taken for training women as artisans, and the government printing bureau set the example of employing female labour, an innovation which soon developed large dimensions. In short, the authorities applied themselves to educate an industrial disposition throughout the country, and as soon as success seemed to be in sight, they gradually transferred from official to private direction the various model enterprises, retaining only such as were required to supply the needs of the state.

The result of all this effort was that whereas, in the beginning of the Meiji era, Japan had virtually no industries worthy of the name, she possessed in 1906—that is to say, after an interval of 25 years
of effort—no less than 4955 industrial and commercial companies, joint stock or partnership, with a paid-up capital of 40 millions sterling. Her development during the decade ending in 1906 is shown in the following table:

Number of Paid-up capital companies. (millions sterling).

What effect this development exercised upon the country's over-sea trade may be inferred from the fact that, whereas the manufactured goods exported in 1870 were nil, their value in 1901 was 8 millions sterling, and in 1906 the figure rose to over 20 millions. In the following table are given some facts relating to the principal industries in which foreign markets are interested:

### COTTON YARNS

In the field of what may be called minor manufactures—as ceramic wares, lacquers, straw-plaits, &c.—there has been corresponding growth, for the value of these productions increased from £ 1 millions sterling in 1897 to 31 millions in 1906. But as these manufactures do not enter into competition with foreign goods in either Eastern or Western markets, they are interesting only as showing the development of Japan’s producing power. They contribute nothing to the solution of the problem whether Japanese industries are destined ultimately to drive their foreign rivals from the markets of Asia, if not to compete injuriously with them even in Europe and America. Japan seems to have one great advantage over Occidental countries: she possesses an abundance of cheap and really cheap labour. It has been said, indeed, that this latter advantage is not likely to be permanent, since the wages of labour and the cost of living are fast increasing in Japan, while the average cost of labour doubled in the interval between 1895 and 1906, but, on the other hand, the number of manufacturing organizations doubled in the same time, while the amount of their paid-up capital nearly trebled. As to the necessity of life, if those specially affected by increased income be excluded, the rate of appreciation between 1900 and 1906 averaged about 30%, and it thus appears that the cost of living is not increasing with the same rapidity as the remuneration earned by the manufacturers. The manufacturers, therefore, to have a bright future, the only serious impediment being deficient capital. There is abundance of coal, and steps have been taken by large scale excellent examples of industrial development in which the country offers for developing electricity by water-power.

The fact that Japan’s exports of raw silk amount to more than 12 millions sterling, while she sends over-sea only 2½ millions’ worth of silk fabrics, suggests some marked inferiority still on the part of her weavers. But the true explanation of weaving seems to be that her distance from the Occident handicaps her in catering for the changing fashions of the West. There cannot be any doubt that the skill of Japanese weavers was at one time eminently the sun goddess herself, the predominant figure in the Japanese pantheon, is said to have practised weaving; the name of seven varieties of woven fabrics with which also the holy men themselves, careful always to keep touch with the continental developments of their faith, made frequent voyages to China, whereas they knew little of what Japan had brought to the world in technical or artistic improvements the Middle Kingdom could show. When Kōto became the permanent metropolis of the empire, at the close of the 8th century, a bureau was established for weaving brocades and rich silk stuffs to be used in the palace. This predicated an era of some three centuries of steadily developing luxury in Kōto; an era when an essential part of every aristocratic mansion’s furnishing was a collection of magnificent silk robes for use in the sumptuous ōngui. Then in the 15th century came the era of “the brocade mania,” when the brocade mountings of a picture or the wrapper of a tiny tea-jar possessed an almost incredible value, and such skill was attained by weavers that the products of the workshops command extravagant prices to-day. Kōto always remains, and still remains, the chief producing centre, and to such a degree has the science of colour been developed there that no less than 4000 varieties of tint are distinguished. The importation of the Chinese brocade to have been a special endowment of the Japanese people from the earliest times, and some of the combinations brought down from mediaeval times are treasured as incomparable examples. During the long era of peace under the Tokugawa administration the costumes of men and women showed an increasing tendency to richness and beauty. This culminated in the Genkoku epoch (1688-1700), and the aristocracy of the present day delight in viewing hand-looms and shall regard them as the costumes of that age and of its rival, the Momoyama (end of the 16th century) are reproduced.

It would be possible to draw up a formidable catalogue of the various kinds of silk fabrics that have been produced in Japan since the beginning of the Meiji era, and the signal ability of her weavers has derived a new impulse from contact with the Occident. Machinery has been largely introduced, and though the products of hand-looms still enjoy the reputation of greater durability, there is unquestionably a marked development of producing power. Japanese looms now turn out about 17 millions sterling of silk textiles, of which less than 4 millions go abroad. The increased importance of foreign commerce alone to be noted, for at the factory of Kawashima in Kōto Gobelins are produced as such have never been rivalled elsewhere.

### FOREIGN PAPER (as distinguished from Japanese)

In the field of what may be called minor manufactures—as ceramic wares, lacquers, straw-plaits, &c.—there has been corresponding growth, for the value of these productions increased from £ 1 millions sterling in 1897 to 31 millions in 1906. But as these manufactures do not enter into competition with foreign goods in either Eastern or Western markets, they are interesting only as showing the development of Japan’s producing power. They contribute nothing to the solution of the problem whether Japanese industries are destined ultimately to drive their foreign rivals from the markets of Asia, if not to compete injuriously with them even in Europe and Japan.
commodities was thus prevented so effectually that cases are recorded of one feudatory's subjects dying of starvation while those of an adjoining fief enjoyed abundance. Internationally, commerce, on the other hand, lay under the veto of the central government, which punished with death anyone attempting to hold intercourse with foreigners. Thus the fines practised a policy of mutual seclusion at home, and united to maintain a policy of general seclusion abroad. Yet it is admitted that this system was the signal development of Japanese trade took place since the imposition of those processes of that development have much historical interest they invite close attention.

As the bulk of a feudal chief's income was paid in rice, arrangements were made to be traded for sending the grain to market and transmitting its proceeds. This was effected originally by establishing in Osaka stores (kura-yashiki), under the charge of samurai, who received the rice. A system of the proceeds was given to them by official carriers. But from the middle of the 17th century these stores were placed in the charge of tradesmen to whom was given the name of kake-ya (agent). They disposed of the rice by monthly instalments to an appointed place, rendering yearly accounts and receiving commission at the rate of from 2 to 4%.

They had no special licence, but were merely enrolled in the general register of any official title or an hereditary pension. In fact a kake-ya, of such standing as the Mizutai and the Konoike families, was, in effect, a banker charged with the finances of several fishmongers. The method of paying the proceeds was the same as that of the system inaugurated for the purpose. The proceeds of the sale were paid to the kake-ya, who received them when the respective stores before mentioned had disposed of the rice.

A similar system existed in Eyo, the shogun's capital. Out of the custom of deferred delivery developed the establishment of exchanges where advances were made against sale certificates, and purely speculative transactions came into vogue. There followed an experience common enough in the West at one time: public opinion rebelled against the idea of the preservation of fish by means of the kake-ya and the shogun's capital. This business went entirely to theTokugawa administration for the purpose of limiting the price of rice.

Several of the stores were arrested and tried to trial; marginal dealings were thenceforth forbidden, and a system of licences was inaugurated in Eyo, the number of licensed dealers being restricted.

The system of organized trading companies had its origin in the 12th century, when, the number of merchants admitted within the confines of Eyo being restricted, it became necessary for those not obtaining that privilege to establish some mode of co-operation, and then resulted the formation of companies with representatives stationed in the feudal capital and share-holding members in the provinces. Instead of the shogun's written edict, the Tokugawa administration inaugurated a similar system of licences, and thus received a large increase, inasmuch as the Tokugawa regarded it chiefly as a means of obtaining worthy representatives in each branch of trade. The first licences were issued in Eyo to dealers of batteries of shops, and in the middle of the 17th century the city grew in dimensions these licences increased in value, so that pawnbrokers willingly accepted them in pledge for loans. Subsequently almanack-sellers were obliged to take out licences, and the system was afterwards extended to money-changers.

It was to the fishmongers, however, that the advantages of the commercial organization first presented themselves vividly. The greatest fish-market in Japan is at Nihon-bashi (formerly Eyo). It had its origin in the needs of the Tokugawa court. When Ieyasu (founder of the Tokugawa dynasty) entered Eyo in 1590, he found the fish-fisheries of the neighbourhood were too sparse to supply the quantities necessary for his purposes. He therefore determined on the establishment of the market. This was done in the year 1659, and the market at once became famous throughout the country. The place was chosen because it was at the head of the navigation of the Kanto, a district where the fish were taken for the carriage of their trade in the adjacent seas, on condition that they furnished a supply of their best fish for the use of the government. The remainder they sold in their own provinces. The Shogun, in order to prevent any abuse, granted to fishermen to buy boats and nets they were required to keep, and also obliged them to sell their fish at the prices fixed by the government. He then received the advane; and the latter, on his side, had to sell in the open market at prices fixed by the confederacy. A somewhat similar system applied to vegetables, though in this case the monopoly was not within the town.

It will be observed that this federation of fishmongers approximated closely to a trust, as the term is now understood; that is to say, an association of merchants engaged in the exclusive sale of a given commodity with a monopoly of the profit. As a matter of fact, the individual was excluded from the conduct of their business as well as to adhere to fixed rates. The idea was extended to nearly every trade, to monster confederations being organized in Yedo in 1695, under the name of kake-ya, which contributed a sum to the exchequer under the euphonious name of “benefit money,” amounting to nearly £20,000 annually. They attained a high state of prosperity, the whole being in the hands of the Confederacon. No member of a confederation was permitted to dispose of his licence except to a near relative, and if anyone not on the roll of a confederation engaged in the same business he became liable to punishment at the hands of the officials. In the sale of the limits thus imposed on the transfer of licences, one of these documents commanded from £80 to £5,400, and in the beginning of the 19th century the confederations, or guilds, had increased to 68 in Eyo, and engaged 1,915 merchants. The guild system extended to maritime enterprise also. In the beginning of the 17th century a merchant of Sakai (near Osaka) established a junk service between Osaka and Yedo, but this did not commence until the close of that century, when 10 gilds of Yedo and 24 of Osaka combined to organize a marine-transport company for the purpose of conveying their own merchandise. These receive goods being shipped for unaffiliated merchants. This carrying trade rapidly assumed large dimensions. The number of junks entering Yedo rose to over 1,500 yearly. They raced from Tokyo to Osaka in 8 to 10 days, as just described, and the proceeds of these commerce were, in recent times, and troubles incidental to their rivalry became so serious that it was found necessary to enact stringent rules. Each junk-mast had to subscribe a written oath that he would comply strictly with the regulations and observe the sequence of sailing as determined by lot. The junks had to call en route at Nagoya for the purpose of undergoing official examination. The order of their arrival was thus determined, and there were passed to the Confederacon, who, for most of the year, received a present in money as well as a complimentary garment, and became the shippers' favourite next season.

On the currency such treatment was extended under the control of the guilds. The business of money-changing seems to have been taken up as a profession from the beginning of the 15th century, but it was then in the hands of persons who carried strings of copper coins, and then in rare circulation, or for parcels of gold dust. From the early part of the 17th century exchanges were opened in Eyo, and in 1718 the men engaged in this business Tokugawa shogun selected 26 merchants who received licences, and no unlicensed person was permitted to purchase the avocation. Four representatives of the chief exchange met daily and fixed the rate of exchange by which their goods were sold to the shogun or the various exchanges and to the shogun's officials. As for the prices of gold or silver in terms of copper or bank-notes, 24 representatives of the exchanges met daily, and the number of silver was the figure for the following day and recorded the amount of transactions during the past 24 hours, full information on these points being at once sent to the city governors and the shogun.

The exchanges in their ultimate form approximated very closely to the Occidental idea of banks. They not only bought gold, silver and copper coins, but they also received, made loans and issued vouchers which played a very important part in commercial transactions. The voucher seems to have come into existence in Japan in the 14th century. It originated in the Yoshino market of Yamato province. In 1242, the shogun ordered the impor tence of carrying copper money so ardous that rich merchants began to substitute written receipts and engagements which quickly became current. Among these documents there was a “joint voucher” (kumiai-kakun), of which the shogun sold 54,700 to 200,000 (near 80,000) at a time. Any one of whom might be held responsible for its redemption; this had large vogue, but it did not obtain official recognition until 1636, when the third Tokugawa shogun shogun selected 26 merchants, and decreed that they should into 3 gilds, each authorized to issue vouchers, provided that a certain sum was paid by way of security. Such vouchers were obviously a form of bank-note. They silver, therefore, issued at face value, and the change came about in a similar manner. During many years the treasure of the shogun and of the feudal

---

4 They were called juda-sashi (ticket-holders), a term derived from the fact that rice-vouchers were usually held in a split bamboo which was thrust into a pile of rice-bags to indicate their buyer.

---

6 In 1625, when the population of Yedo was about three-quarters of a million, the monarchical that entered the city was 861,893 bag of rice; 795,856 casks of sake; 132,892 casks of soy (fish-sauce); 18,209,987 bundles of fire-wood; 809,790 bags of charcoal; 90,811 litres of oil; 1,570,890 bags of salt, and 3,615,600 pieces of cotton cloth.
chiefs was carried to Yedo by pack-horses and coolies of the regular postal service. But the costliness of such a method led to the selection of a number of advantageous ports in the province of Echizen. The Tokugawa government and were required to furnish money within 30 days of the date of an order drawn on them. These agents went by name, and he was to have certain amounts for cashing the cheques drawn upon it by the shogun or the daimyō in Yedo. If coin happened to be immediately available, it was employed to cash the cheques; otherwise the vouchers of the gild served instead. It was also usual in the function of a merchant to bring about a fuller development. That city has exhibited, in all eras, a remarkable aptitude for trade. Its merchants, as already shown, were not only the main agents of selling the produce of the surrounding fields, but also they became depositories of the proceeds, which they paid out on account of the owners in whatever sums the latter desired. Such an evidence of official confidence greatly strengthened the record of the business beyond the boundaries of the fief to which they belonged.

Foreign Commerce during the Meiji Era.—If Japan's industrial development in modern times has been remarkable, the same may be said even more emphatically about the development of her over-sea commerce. This was checked at first not only by the unpopularity attaching to all intercourse with outside nations, but also by embarrassments resulting from the difference between the silver price of gold in Japan and its silver price in Europe, the precious metals being connected in Japan by a ratio of 1 to 8, and in Europe by a ratio of 1 to 15. This latter fact was the cause of a sudden and violent appreciation of values; for the government, seeing the country threatened with losses by over-supply of gold, took the consequence the catastrophic by altering and reducing the weights of the silver coins without altering their denominations, and a corresponding difference exhibited itself, as a matter of course, in the silver quotations of commodities.

Another difficulty was the attitude of officialdom. During several centuries Japan's over-sea trade had been under the control of officialdom, to whose coffers it contributed a substantial revenue. But when the foreign exporter entered the field under the conditions created by the new system, he diverted to his own pocket the handsome profit previously accruing to the government; and since the latter could not easily become reconciled to this loss of revenue, or wean itself from its traditional habit of interference in affairs of foreign commerce, and since the foreigner, on his side, not only desired secrecy in order to prevent competition, but was also tormented by inveigling suspicions of Oriental espionage, not a little friction occurred from time to time. Thus the scanty records of that early epoch suggest that trade was beset with great difficulties, and that the foreigner had to contend against most adverse circumstances, though in truth his gains amounted to 40 or 50%.

The chief staples of the early trade were tea and silk. It happened that just before Japan's raw silk became available for export, the production of that article in France and Italy had been largely curtailed owing to a novel disease of the silkworm. Thus, when the first bales of Japanese silk appeared in London, and when it was found to possess qualities entitling it to the highest rank, a keen demand sprang up. Japanese green tea also, differing radically in flavour and bouquet from the black tea of China, appealed quickly to American taste, so that by the year 1870 Japan found herself selling to foreign countries tea to the extent of 12 million sterling, and raw silk to the extent of 12 million a year. This remarkable development is typical of the general history of Japan's foreign trade in modern times. Omitting the first decade and a half, the statistics for which are imperfect, the volume of the trade grew from 5 millions sterling in 1873—3 millions per head of the population—to 93 millions in 1907—or 38 millions per head. It was not a uniform growth. The period of 35 years divides itself conspicuously into two eras: the first, of 15 years (1857—1872), during which the development was from 5 millions to 9.7 millions, a ratio of 1 to 2.5; the second, of 20 years (1887—1907), during which the development was from 9.7 millions to 93 millions, a ratio of 10 to 10.
That a commerce which scarcely doubled itself in the first fifteen years should have grown nearly tenfold in the next twenty is a fact inviting attention. There are two principal causes: one general, the other special. The general cause was that several years necessarily elapsed before the nation's material condition began to respond perceptibly to the improvements effected by the Meiji government in matters of administration, taxation and transport facilities. Fiscal burdens had been reduced during the life of the old government, and a day might have been set for the building and road-making, harbour construction, the growth of posts, telegraphs, exchanges and banks, and the development of a mercantile marine did not exercise a sensible influence on the nation's prosperity until 1884 or 1885. From that time the country entered a period of steadily growing prosperity, and from that time private enterprise may be said to have finally started upon a career of independent activity. The special cause which, from 1885, contributed to a marked growth of trade was the resumption of specie payments. Up to that time the treasury's fiat notes had suffered such marked fluctuations of specie value that sound or successful commerce became very difficult. Against the importing merchant the currency trouble worked with double potency. Not only did the gold with which he purchased goods appreciate constantly in terms of the silver with which he sold them, but the silver itself appreciated sharply and rapidly in terms of the fiat notes paid by Japanese consumers. Cursory reflection may suggest that these factors should have stimulated exports as much as they depressed imports. But such was not altogether the case in practice. For the exporter's transactions were hampered by the possibility that a day or a week or even a day might intervene before the pur-chasing power of his silver in Japanese markets by bringing about a further depreciation of paper, so that he worked timidly and hesitatingly, dividing his operations as minutely as possible in order to take advantage of the downward tendency of the fiat notes. Not till this element of pernicous disturbance was removed did the trade recover a healthy tone and grow so lustily as to tread closely on the heels of the foreign commerce of China, with her 300 million inhabitants and long-established international relations.

Japan's trade with the outer world was built up chiefly by the energy and enterprise of the foreign middleman. He acted the part of an almost ideal agent. As an exporter, he commanded of cheap capital, his experience, his knowledge of foreign markets, and his connexions enabled him to secure sales as must have been beyond reach of the Japanese working independently. Moreover, he paid to native consumers ready cash for their staples, taking upon his own shoulders all the risks of finding markets abroad. As an importer, he enjoyed, in centres of supply, credit which the Japanese lacked, and he offered to native consumers foreign produce brought to their doors with a minimum of responsibility on their part. Finally, whether as exporters or importers, foreign middlemen always competed with each other so keenly that their Japanese clients obtained the best possible terms from them. Yet the ambition of the Japanese to oust them cannot be regarded as unnatural. Every nation must desire to carry on its own commerce independently of alien assistance; and moreover, the foreign middleman's residence during many years within Japanese territory, but without the pale of Japanese sovereignty, invested him with an aggressive character which the anti-Oriental exclusiveness of certain Occidental nations had appreciated.

Thus from the point of view of the average Japanese there are several reasons for wishing to dispense with alien middlemen, and it is plain that these reasons are operative; for whereas, in 1888, native merchants carried on only 12% of the country's over-sea trade without the intervention of the foreign middlemen, their share rose to 35% in 1890 and has since been slowly increasing.

Analysis of Japan's foreign trade during the Meiji era shows that during the 35-year period ending in 1907, exports exceeded imports in 21 years and exports exceeded imports in 14 years. This does not suggest a very badly balanced trade. But closer examination accentuates the difference, for when the figures are added, it is found that the excesses of exports aggregated only 11 millions sterling, whereas the excesses of imports totalled 71 millions sterling, thus a "unfavourable balance" of 60 millions over all. The movements of specie do not throw much light upon this subject, for they are complicated by large imports of gold resulting from war indemnities and foreign loans and by gold obtained by specie payments imputedly repressed by the expenditures of the foreign communities in the former settlements, of foreign tourists visiting Japan and of foreign vessels engaged in the carrying trade, as well as by the earnings of Japanese vessels and the interest on investments made by foreigners. Nevertheless, there remains an appreciable margin against Japan, and it is probably to be accounted for by the consideration that she is still engaged equipping herself for the industrial career evidently moving her by now.

The manner in which Japan's over-sea trade was divided in 1907 among the seven foreign countries principally engaged in it may be seen from the following table:

Among the 33 open ports of Japan, the first place belongs to Yokohama in the matter of foreign trade, and Kobe ranks second. This is far outstripped by the other open ports when imports are considered. As to the percentages of the whole trade standing to the credit of the five principal ports, the following figures may be consulted—Yokohama, 40%; Kobe, 35.6; Osaka, 10; Moji, 5; and Nagasaki, 2.

VI.—Government, Administration, &c. Emperor and Princes.—At the head of the Japanese State stands the emperor, generally spoken of by foreigners as the mikado (honourable gate), a term comparable with sublime porte and by his own subjects as tenshi (son of heaven) or tenno (heavenly king). The emperor Mutou Hito (p.s.) was the 121st of his line, according to Japanese history, which reckons from 660 B.C., when Jimmu ascended the throne. But as written records do not carry us back farther than A.D. 712, the reigns and periods of the very early monarchs are more or less apocryphal. Still the fact remains that Japan has been ruled by an unbroken dynasty ever since the dawn of her history, in which respect she is unique among all the nations in the world. There are four families of princes of the blood, from any one of which a successor to the throne may be taken in default of a direct heir: Princes Arisugawa, Fushimi, Kanin and Higashi Fushimi. These families are all direct descendants of emperors, and their heads have the title of shinnō (prince of the blood), whereas the other imperial princes, of whom there are ten, have only the second syllable of shinnō (pronounced wō when separated from shin). Second and younger sons of a shinnō are all wō, and eldest sons lose the title shin and become wō from the fifth generation.

The Peerage.—In former times there were no Japanese titles of nobility, as the term is understood in the Occident. Nobles there were, however, namely, kuge, or court nobles, descendants of younger sons of emperors, and daimyō (great name), some of whom could trace their lineage to mikados; but all owed their exalted position as feudal chiefs to military prowess. The Meiji restoration of 1868 led to the abolition of the daimyōs as feudal chiefs, and they, together with the kuge, were merged into one class called kabushibō (literally nobles); a term meaning to aristocracy, all inferior persons being keimin (ordinary folk). In 1884, however, the five Chinese titles of ki (prince), kō (marquis), haku (count), shi (viscount) and dan (baron) were introduced, and patents were not only granted to the ancient nobility but also conferred on men who had rendered conspicuous public service. The titles are all hereditary, but they descend to the firstborn only, younger children having no distinguishing appellation. The first list in 1884 showed 11 princes, 24 marquises, 76 counts, 324 viscounts and 74 barons. After the war with China (1894–95) the total grew to 716, and the war with...
Russia (1904–5) increased the number to 912, namely, 15 princes, 39 marquises, 100 counts, 376 viscounts and 382 barons.

Household Department.—The Imperial household department is completely differentiated from the administration of state affairs. It includes bureaus of treasury, forests, peasants and hunting, and well as boards of ceremonies and chamberlains, officials of the empress’s household and officials of the crown prince’s household. The annual allowance made to the throne is $3,000,000, and the Imperial household is said to have about 1,200,000 acres of woods, and 300,000 acres of miscellaneous lands, the whole valued at some 19 millions sterling, but probably not yielding an income of more than $200,000 yearly. Further, the household owns about 3 millions sterling (face value) of bonds and shares, from which a revenue of some $250,000 is derived, so that the whole income amounts to three-quarters of a million sterling, approximately. Out of this the households of the crown prince and all the Imperial princes are supported; allowances are granted at the time of conferring titles of nobility; a long list of charities receive liberal contributions, and considerable sums are paid to encourage art and science. This household probably one of the most frugal sovereigns that ever occupied a throne.

Departments of State.—There are nine departments of state presided over by ministers—foreign affairs, home affairs, finance, war, navy, justice, education, agriculture and commerce, communications. These ministers form the cabinet, which is presided over by the minister-president of state, so that its members number seven in all. Ministers of state are appointed by the emperor and are responsible to him alone. But between the cabinet and the crown stand a small body of men, the survivors of those by whose genius modern Japan was raised to her present high position among the nations. They are known as “elder statesmen” (sénō). Their proved ability constitutes an invaluable asset, and in the solution of serious problems their voice may be said to be final. At the end of 1909 four of these renowned statesmen remained—Prince Yamagata, Marquises Inouye and Matsukata and Count Okuma. There is also a privy council, whose functions consist of a variable number of distinguished men—in 1909 there were 29, the president being Field-Marshal Prince Yamagata. Their duty is to debate and advise upon all matters referred to them by the emperor, who sometimes attends their meetings in person.

Civil Officials.—The total number of civil officials was 137,819 in 1906. It had been only 68,876 in 1898, from which time it grew regularly year by year. The salaries and allowances paid out of the treasury every year on account of the civil service are 4 millions sterling, approximately, and the annual emoluments of the principal officials are as follows:—Prime minister, $650; minister of a department, $400; ambassador, $500, with allowances varying from $250 to $300; president of privy council, $500; resident-general in Seoul, $600; governor-general of Formosa, $600; vice-minister, $450; minister plenipotentiary, $450, with allowances from $100 to $300; public prosecutor, $600; plenipotentiary minister, $700, with allowances from $200 to $300; secretaries of state, $500; secretaries of the empire, $400; directors-general, $350. The arrangement of the civil service is that, any class of officials of a certain grade and rank, or holders of a certain number of distinguished titles, are eligible for appointment to a higher grade, and in the absence of any special law or decision, each holds the grade to which his age and experience entitle him, but not without grievances to valiant, wrongs (often fancied) to avenge, and abuses to redress. On the whole, however, there has been a remarkable absence of anything like disgraceful events. The government officials in Japan are far too busy, for instance, in xlying character the Japanese, generally saved the situation when threatened to degenerate into a “scene.” Foreigners entering the Cabinet of representatives of Japan, for the first time might easily misinterpret some of its habits. A minister in the absence of a member. It is painted in white on a golden indicator, the latter being fastened by a hinge to the face of the member’s desk. When present he sets the indicator standing upright, and lowers it when leaving the house. Permission to speak is not obtained by catching the president’s eye, but by calling out the aspirant’s name, and as ministers often emphasize their calls by hammering their desks with the indicators, there are moments of clucked din. But, for the rest, orderliness and decorum habitually prevail. Speeches have to be made from a rostrum. There arc few displays of oratory or eloquence. The Japanese formularies are said to be written by officials of distinguished gifts, views with remarkable facility. He is absolutely free from gaucherie or self-consciousness when speaking in public; he can think on his feet. But his mind does not usually busy itself with abstract ideas and subtleties of philosophical or mystic thought. Flights of fancy, impassioned bursts of sentiment, appeals to the heart rather than to the reason of an audience, are devices strange to his mental habit. He can be rhetorical, but not impassioned. Among all races habitually richer in intellect, the Japanese diet would be it difficult to find a passage describable as will to eat.

From the first the debates were recorded verbatim. Years before the date fixed for the promulgation of the constitution, a little band of devoted students at Tokyo translated the voice of the Japanese syllabary. Their labour was almost immediate without recognition or remuneration until the time of the Diet was on the eve of meeting, which was discovered that a competent staff of shorthand reporters could be organized at a price of 2,000 yen a month. But, for the rest, even alone among the countries of the world, she possesses an exact record of the proceedings of her Diet from the moment when the first word was spoken within its walls.
A special feature of the Diet's procedure helps to discourage oratorical displays. Each measure of importance has to be submitted to a committee, and not until the latter's report has been received does serious debate take place. But in ninety-nine cases out of every hundred the committee's report determines the attitude of the house, and speeches are felt to be more or less superfluous. One result of this system is that business is done with a degree of celerity scarcely known in Occidental legislatures. For example, the meetings of the house of representatives during the session 1896–1897 were 32, and the number of hours occupied by the sitting aggregated 116. Yet the result was 55 bills debated and passed, several of them measures of prime importance, such as the gold standard bill, the budget and a statutory tariff law. It must be remembered that although actual sittings of the houses are comparatively few and brief, the committees remain almost constantly at work from morning to evening throughout the twelve weeks of the session's duration.

Divisions of the Empire.—The earliest traditional divisions of Japan into provinces was made by the emperor Seimu (131-190), in whose time the sway of the throne did not extend farther north than a line curving from Sendai Bay, on the north-east coast of the main island, to the vicinity of Niigata (one of the treaty ports), on the north-west coast. The region northward of this line was then occupied by barbarous tribes, of whom the Ainu (still to be found in Yezo) are probably the remaining descendants. The whole country was then divided into thirty-two provinces. In the 3rd century the emperor Jingó, on her return from her victorious expedition against Korea, portioned out the empire into five home provinces and seven circuits, in imitation of the Korean system. By the emperor Mommu (696-707) some of the provinces were subdivided so as to increase the number to sixty-six, and the boundaries of those thus divided were re-surveyed in the reign of the emperor Shómu (723-756). The old division is as follows:

1. The Go-kinai or "five home provinces" i.e. those lying immediately around Kyushu, capital, viz.

<table>
<thead>
<tr>
<th>Yamashiro, also called Ōsaka</th>
<th>Izumi, also called Settsu</th>
<th>Washu</th>
<th>Kashū</th>

III. The two islands, viz.:

1. Tsushima or Ōshū

Upon comparing the above list with a map of Japan, it will be seen that the main island contains the Go-kinai, Tōkaidō, Tōzando, Hokurikudō, Sanin-dō, San'yōdō, and one province (Kishū) of the Nankan-dō. Omitting also the island of Awaji, the remaining islands of the group the Nankan-dō give the name Shikoku (the "four provinces") to the island in which they lie; while Saisaku coincides exactly with the large island Kūshū (the "nine provinces").

In 1688, when the rebellions of Ōsaka and Dei were over, in the Tōzando, had submitted to the emperor, those two provinces were subdivided, Dewa into Ōsaka and Ugo, and Ōshū into Iwaki, Iwashiro, Kizuken, Rikuchū and Michinoku (usually called Musu). This increased the old number of provinces from sixty-six to seventy-one. At the same time there was created a new circuit, called the Hokkaidō, or "northern-sea circuit," which comprised the eleven provinces into which the large island of Yezo was then divided (viz. Ōshima, Shuri, Shōto, Ōmura, Nakajima, Hidaka, Shōshū, Hokkaidō and South Sakhalin. Formosa and Sakhalin not having been included in Japan's territories until 1895 and 1905, respectively, are still under the military control of a governor-general, and belong, therefore, to an administration system different from that prevailing throughout the rest of the country. The prefectures and Hokkaidō are divided again into 638 sub-prefectures (gun or kōri); 60 towns (shi); 125 urban districts (cho) and 12,274 rural districts (son). The thirteen urban prefectures are Tokyo, Osaka, and Kyoto, and the urban and rural districts are distinguished according to the number of houses they contain. Each prefecture is named after its chief town; the exceptions being those of the Okinawan group of islands called Rōku (Luchu). The following table shows the names of the prefectures, their areas, populations, number of sub-prefectures, towns and urban and rural districts:

Local Administrative System.—In the system of local administration full effect is given to the principle of popular representation. Each prefecture (urban or rural), each sub-prefecture, each town and each district (urban or rural) has its local assembly, the number of members being fixed in proportion to the population. There is no superior limit to the number in the case of a prefectural assembly, but the inferior limit is 30. For a town assembly, however, the superior limit is 60 and the inferior 30; for a sub-prefectural assembly the corresponding figures are 40 and 15, and for a district assembly, 30 and 8. These bodies are all elective. The property qualification for the franchise in the case of prefectoral and sub-prefectoral assemblies is an annual payment of direct national taxes to the amount of 3 yen; and in the case of town and district assemblies, 2 yen; while to be eligible for election to a prefectural assembly a yearly payment of 10 yen of direct national taxes is necessary; to a sub-prefectural assembly, 5 yen, and to a town or district assembly, 2 yen. Under these qualifications the electors aggregate 2,009,745, and those eligible for election total 919,507. In towns and districts franchise-holders are further divided into classes with regard to their payment of local taxes. Thus for town electors there are three classes, differentiated by the following process: On the list of ratepayers the highest are checked off until their aggregate payments are equal to one-third of the total taxes. These persons form the first class. Next below them the persons whose aggregate payments represent one-third of the total amount are checked off to form the second class, and all the remainder form the third class. Each class elects one-third of the members of assembly. In the districts there are only two classes, namely, those whose payments, in order from the highest, aggregate one-half of the total, the remaining names on the list being placed in the second class. Each class elects one-half of the members. This is called the system of ō-jinushi (large landowners) and is found to work satisfactorily as a device for conferring representative rights in proportion to property. The franchise is withheld from all salaried local officials, from judicial officials, from ministers of religion, from persons who, not being bidders by profession, assist the people in affairs connected with law courts or official bureaus, and from every individual or member of a

1 This is not the population of the city proper, but that of the urban prefecture.

2 The mayor of a town (shichō) is nominated by the minister for home affairs from three men chosen by the assembly.
derived from tradition only, since the first written record goes back no further than 712. We are justified, however, in believing that at the close of the 7th century of the Christian era, when the empress Jito sat upon the throne, the social system of the Tang dynasty of China commended itself for adoption; the distinction of civil and military is said to have been then established for the first time, though it probably concerned officials only. Certain officers received definitely military commissions, as generals, brigadiers, captains and so on; a military office (hyabu-sho) was organized, and each important district throughout the empire had its military division (gundan). One-third—some say one-fourth—of the nation’s able-bodied males constituted the army. 

Tactically there was a complete organization, from the squad of 5 men to the division of 600 horse and 400 foot. Service was for a defined period, during which taxes were remitted, so that military duties always found men ready to discharge them. Thus the hereditary soldier—afterwards known as the samurai or bushi—did not yet exist, nor was there any such thing as an exclusive right to carry arms. Weapons of war, the property of the state, were served out when required for fighting or for training purposes.

At the close of the 8th century stubborn insurrections on the part of the aborigines gave new importance to the soldier. The conscription list had to be greatly increased, and it came to be a recognized principle that every stalwart man should bear arms, every weakling become a bread-winner. Thus, for the first time, the distinction between “soldier” and “man” was recognized and in consequence of the circumstances attending the distinction a measure of contempt attached to the latter. The next stage of development had its origin in the assumption of high offices of state by great families, who encroached upon the imperial prerogatives, and appropriated as hereditary perquisites posts which should have remained in the gift of the sovereign. The Fujiwara clan, taking all the civil offices, resided in the capital, whereas the military posts fell to the lot of the Taara and the Minamoto, who, settling in the provinces and being thus required to guard and police the outlying districts, found it expedient to surround themselves with men who made soldiering a profession. These latter, in their turn, transmitted their functions to their sons, so that there grew up in the shadow of the great houses a number of military families devoted to maintaining the power and promoting the interests of their masters, from whom they derived their own privileges and emoluments.

From the middle of the 10th century, therefore, the terms samurai and bushi acquired a special significance, being applied to themselves and their followers by the local magnates, whose power tended more and more to eclipse even that of the throne, and finally, in the feudal century, a further distinction was established between the whole country under the sway of military organization, the privilege of bearing arms was restricted to the samurai. Thenceforth the military class entered upon a period of administrative and social superiority which lasted, without serious interruption, until the middle of the 19th century. But it is to be observed that the distinction between soldier and civilian, samurai and commoner, was not of ancient existence, nor did it arise from any question of race or caste, victor or vanquished, as is often supposed and stated. It was an outcome wholly of ambitious usurpations, which, relying for success on force of arms, gave practical importance to the soldier, and invested his profession with factitious honour.

The bow was always the chief weapon of the fighting-man in Japan. “War” and “bow-and-arrow” were synonymous terms. 

Weapons. Tradition tells how Tametomo shot an arrow through the crest of his brother’s helmet, in order to recall the youth’s allegiance. How Natsume Kozan discharged a shaft that severed the stem of a fan swayed by the wind; how Mutsuru, ordered by an emperor to rescue a fish from the talons of an osprey without killing bird or fish, cut off the osprey’s talons, made a small incision in the belly and released the fish. 

So crescent-shaped was the lake in which the palace was built that the palace lake and the bird continued its flight; and there are many similar records of Japanese skill with the weapon. Still better were the methods by which the samurai, using the three-span halls in Kifū and Yedo, where the archer had to shoot at the man moving through the whole length of a corridor 128 yards long and only 1 ft. high. Wada Daihachi, in the 17th century, succeeded in sending a bolt 15 ft. before it was stopped by a bolt driven 75 ft. There was an average of over 5 shafts per minute; and Masatoki, in 1582, made 5333 successful shots in 20 hours, more than 4 a minute.

The lengths of the bow and arrow were determined with reference to the capacity of the archer and the tradition of his clan. The distance was the distance between the tips of the thumb and the little finger with the hand fully stretched. Fifteen of these units gave the span, and the length of the bow—say between 5 ft. and 7 ft.—was the unit for the arrow was from 12 to 15 hand-breathths, or 3.3 ft. to 4 ft. Originally the bow was of unvarnished boxwood or selkow; but subsequently bamboo alone came to be employed. Binding with cord or rattan served to strengthen the bow, and for precision, the flight the arrow had three feathers, an eagle’s wing being most esteemed for that purpose, and after it, in order, that of the copper pheasant, the crane, the adjutant and the snipe.

Next in importance to the bow came the sword, which is often spoken of as the samurai’s chief weapon, though there can be no doubt that during long ages it ranked after the bow. It was a weapon of utility with its own especial disadvantages. It has exactly similar curvatures, edge, face-line and back; its almost imperceptible tapering of blade; its admirable tempering; its consummately skilful forging; its razor-like sharpness; its cunning distribution of weight, giving a dealing sense of balance; its efficiency in hand-to-hand encounters, carried to perfection, and it has been inferred that only from that epoch did the samurai begin to esteem his sword as the greatest treasure he possessed, and to rely on it as his best instrument of offence and defence. But it is evident that the evolution of a blade must have been due to an urgent, long-existing demand, and that the katana came as the sequel of innumerable efforts on the part of swordsmiths and generous encouragement on that of the soldier. Many pages of Japanese annals and household history are associated with its use. In every age numbers of men devoted their whole lives to acquiring novel skill in swordsmanship. Many of these methods were recorded, or even written up, in book form.in some humble details unknown to any save the master himself and his favourite pupils. Not merely the method of handling the weapon had to be studied. Associated with sword-play was an art variously known as chikushin, shogyō, yosh, and jū, names which cover the exertion of muscular force in such a manner as to produce a maximum of effect with a minimum of effort, by directing an adversary’s strength so as to become auxiliary to one’s own. It was an essential element of the expert’s art not only that he should be competent to defend himself with any object that happened to be within reach, but also that without an orthodox weapon he should be capable of inflicting fatal or disabling injury on an assailant. Records of great swordsmen instances are related of men seizing a piece of firewood, a brazier-iron, or a druggist’s pestle as a weapon of offence, while, on the other side, an umbrella, an iron fan or even a pitchfork were devised for the same purpose. This was true for everyday emergencies. Were he caught weaponless by a number of assailants, his art of yawara was supposed to supply him with expedients for escape. It is true that the samurai was not a coward and the issue. The methods of gaining victory or the circumstances attending defeat were scarcely taken into consideration. The true samurai had to rise superior to all contingencies. Out of this perpetual effort, on the part of hundreds of experts to discover and perfect novel developments of swordsmanship, there grew a habit which held its vogue down to modern times, namely, that when a man had mastered one style of sword-play in the school of a teacher, he set himself to study all others, and for every purpose undertook a tour throughout the provinces, challenging every expert, and, in the event of defeat, constituting himself the victor’s pupil. The sword was not merely a weapon of war, but a part of daily life, and the distinction of wearing it, the rights that it conferred, the deeds wrought with it, the fame attaching to special skill in its use, the superstitions connected with it, the incredible value set upon a fine sword, the immense honour and power derived from it, all the traditions that had grown up around celebrated weapons, the profound study needed to be a competent judge of a sword’s qualities—all these things conspired to give the katana an importance beyond the range of this slight work, which is primarily intended as an elementary entry into the subject for the partially interested reader.
fastened to the girdle, had no play, the feat of drawing one of these very long swords demanded extraordinary aptitude.

Spear and glaive were also ancient Japanese weapons. The oldest forms of both were derived from China. Its handle measured about 6 ft. and its blade 8 ft. long and was serrated on the inner and outer surfaces, and it had a hag-backed blade tempered almost as finely as the sword itself. This, too, was a Chinese type, as was also the glaive. The glaive (naginata, long sword) was a scimitar-like blade, sometimes as wide as a sash, with a curved haft. On its long, warlike monks alone employed this weapon, but from the 12th century it found much favour among military men. Ultimately, however, it was not considered serious fighting, and it was said to have been limited to women and priests. The spear, however, was quite different. whereas the latter could not be used except by troops in very loose formation, the former served for close-order fighting.

The glaive may be described as plate armour, but the essential difference between it and the European Armour, was that whereas the latter took its shape from the body, the former neither resembled nor was intended to resemble ordinary garments. Hence the only changes that occurred in Japanese armour from generation to generation had their origin in improved methods of construction. In general appearance its did, without loss of activity, a feat impossible to any untrained man of modern days. Common soldiers were generally content with a comparatively light helmet and a corselet.

The Japanese never had a war-horse worthy to be so called. The mountainous terrain tried the strength of the animal in every way. It is known that the early Japanese saddle, but at the beginning of historic times it approximated closely to the Chinese type. Subsequently a purely Japanese shape was designed. It consisted of a wooden frame so constructed that a padded pummel could be fastened to it. Galled backs or withers were unknown with such a saddle; it fitted any horse. The stirrup, originally a simple affair resembling that of China and Europe, afterwards took the form of a shoe-sole with a cupped toe. Both stirrup and saddle were often of beautiful workmanship, the former covered with rich gold lacquer, the latter inlaid with gold or silver. In the latter part of the 14th century the Japanese introduced a metal guard for the horse, and its head was protected by a monster-faced mask of iron.

Flags were used in battle as well as on ceremonial occasions. Some were monochrome, as the red and white flags of the Taira Early and the Minamoto clans in their celebrated struggle Strategy and Tactics. some were the red and white flags of the Taira Early and the Minamoto clans in their celebrated struggle Strategy and Tactics. Some were emblazoned with figures of the sun, the moon, a dragon, a tiger and so forth, or with religious legends. Fans with iron ribs were carried by commanding officers, and signals to advance or retire were given by raising different patterns of metallic gondola-like conches. During the military epoch a campaign was opened or a contest-preluded by a human sacrifice to the god of war, the victim at this rite of blood (chi-maisuru) being generally a prisoner or a condemned criminal. Although ambuscades and surprises played a large part in all strategy, pitched battles were the general rule, and it was essential that notice of an intention to attack should be given by discharging a singing arrow. Thereafter the assaulting army, taking the word from its commander, raised a shout of Ei! Ei! to which the other side replied, and the formality of having been thus satisfied, the fight commenced. In early medieval days tactics consisted of the heads of those whom he had killed, struck a blow wherever he pleased. From time immortal a romantic value has attached in Japan to the first of anything: the first snow of winter; the first water drawn from the well on New Year’s Day; the first blossom of the spring; the first note of the nightingale. So in war the first to ride up to the foe or the wielder of the sword adjutant held in high honour, and a general gave to that distinction a special name. It necessarily resulted, too, not only from the nature of the weapons employed, but also from the immense labour devoted by the true samurai to perfecting himself in their use, that displays of individual prowess were deemed the chief object in a battle.

Some tactical formations borrowed from China were familiar in Japan, but their intelligent use and their modification to suit the circumstances of the time were inaugurated only by the great captains of the 15th and 16th centuries. Prior to that epoch a battle resembled a gigantic fencing match. Men fought as individuals, not as a result of a tactical formation, and the engagement consisted of a number of personal duels, all in simultaneous progress. It was the samurai’s habit to proclaim his name and titles in the presence of the enemy, sometimes adding from his own record or his father’s any details that might tend to dispirit his hearers. Then some one advancing to cross weapons with him would perform the same ceremony of self-introduction, and if either found anything to upbraid in the other’s antecedents or family history, he did not fail to make loud reference to it, such a device being counted efficacious as a means of disturbing an adversary’s sang-froid, though the principle underlaying it was no more than the mutual inversion of the way he could reckon on finishing his fight undisturbed, but the victor frequently had to endure the combined assault of a number of the comrades or retainers of the vanquished. Of course a skilled swordsman did not necessarily seek a single combat; he was equally ready to ride into the thick of the fight without discrimination, and a group of common soldiers never hesitated to make a united attack upon a mounted officer if they found him disengaged. But the general feature of a battle was individual contests, and when the fighting had ceased, each samurai proceeded to the tent of the commanding officer and submitted for inspection the honours he had gained.

The disadvantage of such a mode of fighting was demonstrated for the first time when the Mongols invaded Japan in 1274. The invaders moved in phalanx, guarding themselves with pavis, and covering their advance with a host of archers shooting clouds of poisoned arrows. When a Japanese samurai advanced singly and challenged one of them to combat, they opened their ranks, enclosed the challenger and cut him to pieces. Many Japanese were thus slain, and it was not until they made a concerted movement of attack that they produced any effect upon the enemy. But although the advantage of massing strength seems to have been recognized, the Japanese themselves did not adopt the formation which the Mongols had shown to be so formidable. Individual prowess continued to be the prominent factor in battles down to a comparatively recent period. The great captains Takeda Shingen and Uyesugi Kenshin are supposed to have been Japan’s pioneer tacticians. They certainly appreciated the value of a formation in which the action of the individual should be subordinated to the unity of the whole. But when it is remembered that fire-arms had already been in the hands of the Japanese for several years, and that they had means of acquainting themselves with
the tactics of Europe through their intercourse with the Dutch, it is remarkable that the changes attributed to Takeda and Uyesugi were not more drastic. Speaking broadly, what they did was to introduce into the military history of Japan the cavalry in the third line; the commanding officer in the rear, and the drums and standards in the centre. At close quarters the spear proved a highly effective weapon, and in the days of Hideyoshi (1536-1598) combined flank and front attacks by bands of spearmen became a favourite device. The importance of a strong reserve also received recognition, and in theory, at all events, a tolerably intelligent system of tactics was adopted. But not until the close of the 17th century did the doctrine of strictly disciplined action obtain practicalogue. Yoshitsune, it is said, to have been the successful inculcator of this principle, and from his time the most approved tactical formation was known as the Yamagaryū (Yamaga style), though it showed no innovation than strict subordination of each unit to the general plan.

Although, tactically speaking, the samurai was everything and the system nothing before the second half of the 17th century, and although strategy was chiefly a matter of deception, surprises and ambushes, it must not be supposed that there were no classical principles. The student of European military history searches in vain for the rules and maxims of war so often invoked by Gibb critics, but the student of Japanese history is more successful. Here, as in virtually every field of things Japanese, retrospection discovers the ubiquitous Chintamin. The treatises of Sung and 'N (called in Japan Son and Go) Chinese generals of the third century after Christ, were the classics of Far-Eastern captains through all generations. (See The Book of War, tr. E. F. Calthrop, 1908.) Yoshitsune, in the 12th century, received a loving girl to obtain a copy of Sung's work which her father had in his possession, and Yamaga, in the 17th century, when he set himself to compile a book of military tactics, wrote materials primarily from the two Chinese monographs. These treatises came into the hands of the Japanese in the 8th century, when the celebrated Kibi no Mabi went to study civilization in China, just as his successors of the 19th century went to study a new civilization in Europe and America. Thenceforth Son and Go became household words among Japanese soldiers. Their volumes were to the samurai what the Mahayana was to the Buddhist. They were believed to have collected whatever of good had preceded them, and to have forecast whatever of good the future might produce. The character of their strategic methods, somewhat analogous to those of 18th-century Europe, may be gathered from the following:—

"An army undertaking an offensive campaign must be twice as numerous as the enemy. A force investing a fortress should be numerically ten times the garrison. When the adversary holds high ground, turn his flank; do not deliver a frontal attack. When he has a mountain or a river behind him, cut his lines of communications. If he deliberately assumes a position from which victory is his only escape, hold him there, but do not molest him. If you can surround him, leave one route open for his escape, since desperate men fight fiercely. When you have to cross a river, put your advance-guard and your rear-guard at a distance from the banks. When they cross, make a river for a river, and thus you will be well laid to or in operation before you strike him at. In a march, make a deterrent your first object. Pass no copse, enter no ravine, nor approach any thicket until your scouts have explored it fully."

Such precepts are multiplied; but when these ancient authors discuss tactical formations, they do not seem to have contemplated anything like rapid, well-ordered changes of mobile, highly trained masses of men from one formation to another, or their quick transfer from point to point of a battlefield. The basis of their tactics is The Book of Changes. Here again is encountered the superstition that underlies nearly all Chinese and Japanese institutions: the superstition that took captive even the great mind of Confucius. The positive and the negative principles; the sympathetic and the antipathetic elements; cosmos growing out of chaos; chaos re-absorbing cosmos—on such fancies they founded their tactical system. The result was a phalanx of complicated organization, difficult to manoeuvre and liable to be easily thrown into confusion. Yet when Yamaga in the 17th century interpreted these ancient Chinese treatises, he detected in them suggestions for a very shrewd use of the principle of échelon, and applied it to devise formations which combined much of the frontal expansion of the line with the solidity of the column. More than that cannot be said for Japanese tactical genius. The samurai was the best fighting unit in the Orient—probably one of the best fighting units the world ever produced. It was perhaps because of that excellence that his captains remained indifferent tacticians.

In estimating the military capacity of the Japanese, it is essential to know something of the ethical code of the samurai, the Bushido (way of the warrior) as it was called. A typical example of the rules of conduct prescribed by feudal chieftains is furnished in the code of Kato Kiyomasa, a celebrated general of the 16th century:—

Regulations for Samurai of every Rank; the Highest and Lowest alike.
1. The routine of service must be strictly observed. From 6 a.m. military exercises shall be practised. Archery, gunnery, horsemanship must not be neglected. If any man shows exceptional proficiency he shall receive extra pay.
2. An hour of that desire recreation may engage in hawking, deer-hunting or wrestling.
3. With regard to dress, garments of cotton or pongee shall be worn. Any man incurring debts owing to extravagance of costume or habits will be deprived of a law officer's home, and being zealous in the practice of military arts suitable to his rank, he desires to hire instructors, an allowance may be granted to him for that purpose.
4. The staple of diet shall be unhulled rice. At social entertainments one guest for one host is the proper limit. Only when men are assembled for military exercises shall many dine together.
5. It is the duty of every samurai to make himself acquainted with the principles of his craft. Extravagant displays of adornment are forbidden in battle.
6. Dancing or organizing dances is unlawful; it is likely to betray stratagems of the enemy. Any man who is observed in the half-morning, morning, or evening with women is to be supposed to have done with his heart. Therefore for the soldier military amusements alone are suitable. The penalty for violating this provision is death by suicide.
7. Learning shall be encouraged. Military books must be read. The spirit of loyalty and filial piety must be cultivated before all things. Poem-composing pastimes are not to be engaged in by samurai. To be addicted to such amusements is to resemble a woman. A man born a samurai should live and die sword in hand. Unless he is thus trained in time of peace, he will be useless in the hour of stress. To be brave and warlike must be his invariable condition.
8. Whosoever finds these rules too severe shall be relieved from service. Should investigation show that any one is so unfortunate as to lack many qualities, he shall be singled out and dismissed forthwith. The imperative character of these instructions must not be doubted.

The plainly paramount purpose of these rules was to draw a sharp line of demarcation between the samurai and the courtiers living in Kioto. The dancing, the couplet-composing, the sumptuous living and the fine costumes of the officials frequenting the imperial capital were strictly interdicted by the feudalatories. Frugality, fealty and filial piety—these may be called the fundamental virtues of the samurai. Owing to the circumstances out of which his caste had been, he regarded all boisterousorsing pursuits with contempt, and despised money. To be swayed in the smallest degree by mercenary motives was despicable in his eyes. Essentially a stoic, he made self-control the ideal of his existence, and practised the courageous endurance of suffering so thoroughly that he could without hesitation inflict on his own body pain of the most horrible description. Nor can the courage of the samurai justly be ascribed to bluntness of moral sensibility resulting from semi-savage conditions of life. From the 8th century onwards the current of existence in Japan set with peculiar rapidity in the direction of artistic refinement and voluptuous luxury, amidst which men could scarcely fail to acquire habits and tastes inconsistent with acts of high courage and great endurance. The samurai's mood was not a product of semi-barbarism, but rather a protest against emasculating civilization. He schooled himself to regard death by his own hand as a normal eventuality. The story of other nations shows
epochs when death was welcomed as a relief and deliberately invited as a refuge from the mere weariness of life. But wherever there has been liberty to choose, and leisure to employ, a painful mode of escape to the world, men have invariably selected it. The samurai, however, adopted in karakuri (disemboweling) a mode of suicide so painful and so shocking that to school the mind to regard it with indifference and perform it without flinching was a feat not easy to conceive. Assistance was often rendered by a friend who stood ready to decapitate the victim immediately after the stomach had been gashed; but there were innumerable examples of men who consumed the tragedy without aid, especially when the sacrifice of life was by way of protest against the excesses of a feudal chief. A question of family rule, perhaps, and some motive for secrecy existed. It must be observed that the suicide of the samurai was never inspired by any doctrine like that of Hegesias. Death did not present itself to him as a legitimate means of escaping from the cares and disappointments of life. Self-destruction had only one consolatory aspect, that it was the soldier's privilege to expiate a crime with his own sword, not under the hand of the executioner. It rested with his feudal chief to determine his guilt, and his peremptory duty was never to question the justice of an order to commit suicide, but to obey it without a murmur or protest. For the rest, the general motives for suicide were escape, revenge, or the wish to check a victorious enemy, to remonstrate against some official abuse which no ordinary complaint could reach, or, by means of a dying protest, to turn a liege lord from pursuing courses injurious to his reputation and his fortune. This last was the noblest and by no means the most infrequent reason for suicide. Scores of examples are recorded of men who, with everything to make existence desirable, deliberately laid down their lives at the prompting of loyalty. Thus the samurai rose to a remarkable height of moral nobility. He had no assurance that his death might not be wholly fruitless, as indeed often proved; the sacrifice achieved its purpose, if it turned a liege lord from evil courses, the samurai could hope that his memory would be honoured. But if the lord resented such a violent and conspicuous mode of reprouving his excesses, then the faithful vassal's retribution would be an execrated memory and, perhaps, suffering for his family and relatives. Yet the deed was performed again and again. It remains to be noted that the samurai entertained a high respect for the obligations of truth; 1 "A bushi has no second word," was one of his favourite maxims. However, a man was not wholly truthful, as indeed often proved, when he sacrificed achieved its purpose, if it turned a liege lord from evil courses, the samurai could hope that his memory would be honoured. But if the lord resented such a violent and conspicuous mode of reproving his excesses, then the faithful vassal's retribution would be an execrated memory and, perhaps, suffering for his family and relatives. Yet the deed was performed again and again. It remains to be noted that the samurai entertained a high respect for the obligations of truth; 1 "A bushi has no second word," was one of his favourite maxims. However, a man was not wholly truthful, as indeed often proved, when he

1

something more, however, than a profound conception of duty was needed to nerve the samurai for sacrifices such as he seems to have been always ready to make. It is true that Japanese parents of the military class took pains to familiarize their children of both sexes from very tender years with the idea of self-destruction at any time. But superadded to the force of education and the incentive of tradition there was a transcendental influence. Buddhism supplied it. The tenets of that creed divided themselves, broadly speaking, into two doctrines, salvation by faith and salvation by works, and the chief exponent of the latter principle is the sect which prescribes meditation as the vehicle of enlightenment. Whatever be the mental processes induced by this rite, those who have practised it insist that it leads finally to a state of absorption, in which the mind is flooded by an illumination revealing the universe in a new aspect, absolutely free from all traces of passion, interest or affection, and showing, written across everything in flaming letters, the truth that for him who has found Buddha there is neither birth nor death, growth nor decay. Lifted high above his surroundings, he is prepared to meet every fate with indifference. The attainment of that state seems to have been a fact in the case both of the samurai of the military epoch and of the Japanese soldier to-day. The policy of seclusion adopted by the Tokugawa administration after the Shimabara insurrection included an order that no samurai should acquire foreign learning. Abolition of the Samurai.

Nevertheless some knowledge could not fail to filter in through the Dutch factory at Deshima, and thus, a few years before the advent of the American ships, Takashima Shūhan, governor of Nagasaki, becoming persuaded of the fate his country must invite if she remained oblivious of the world's progress, memorialized the Yedo government in the sense that, unless Japan improved her weapons of war and reformed her military system, she could not escape humiliation such as had just overtaken China. He obtained small arms and field-guns of modern type from Holland, and, repairing to Yedo with a company of men trained according to the new tactics, he offered an object lesson for the consideration of the conservative officials. They answered by throwing him into prison. But Egawa, one of his retainers, proved a still more zealous reformer, and his foresight being vindicated by the appearance of the American war-vessels in 1853, he won the government's confidence and was entrusted with the work of planning and building forts at Shinagawa and Shimoda. At Egawa's instance rifles were imported. As the first results of this were improved, a new spirit of reform permeated the army. A state of facture was commenced in Japan, a powder-mill also being established with machinery obtained from Holland. Finally, in 1862, the shōgun's government adopted the military system of the West, and organized three divisions of all arms, with a total strength of 13,600 officers and men. Disbanded at the fall of the shōgunate in 1867, this force nevertheless served as a model for a similar organization under the imperial government, and in the meanwhile the principal feats had not been idle, some—as Satsama—adopter English tactics, others following France or Germany, and one a few Dutch. This appeared upon the stage at this juncture a great figure in the person of Osoppa Masujirō, a samurai of the Chōshū clan. He established Japan's first military school at Kiōto in 1868; he attempted to substitute for the hereditary soldier conscripts taken from all classes of the people, and he conceived the plan of dividing the whole empire into six military districts. An assassin's dagger removed him on the threshold of these great reforms, but his statue now stands in Tokyō and his name is spoken with reverence by all his countrymen. In 1870 Yamagata Aritomo (afterwards field-Marshal Prince Yamagata) and Saigo Tsugumichi (afterwards Field-Marshal Saigo) returned from Europe, where they were engaged in military inspections in Europe, and in 1872 they organized a corps of Imperial guards, taken from the three classes which had been conspicuous in the work of restoring the administrative power to the sovereign, namely, the clans of Satsuma, Chōshū and Tosa. They also established garrisons in Tokyō, Sendai, Osaka and Kumamoto, thus placing the military authority in the hands of the central government. Reforms followed quickly. In 1872, the kyōshō, an office which controlled all matters relating to the war, was replaced by two departments, one of war and one of the navy, and, in 1873, an imperial decree substituted a universal conscription for the system of hereditary militarism. Many persons viewed this experiment with deep misgiving. They feared that it would not only alienate the samurai, but also entrust the duty of defending the country to men unfitted by tradition and custom for such a task, namely, the farmers, artisans and tradespeople, who, after centuries of exclusion from the military pale, might be expected to have lost all martial spirit. The government, however, was not deterred by these apprehensions. It argued that since the distinction of samurai and commoner had not originally existed, and since the former as a product simply of accidental conditions, there was no valid reason to doubt the military capacity of the people at large. The justice of this reasoning was put to a conclusive test a few years later. Originally the period of service with the colours was fixed at 3 years, that of service with the first and second reserves being 2 years each. One of the serious difficulties

Religious Influence.
encountered at the outset was that samurai conscripts were too proud to stand in the ranks with common rustics or artisans, and above all to obey the commands of plebeian officers. But patriotism soon overcame this obstacle. The whole country—except the northern island, Yezo—was parceled out into 17 military districts (Kōtō, Nagoya, Sendai, Hiroshima and Kumamoto) each furnishing a division of all arms and services. There was also from 1876 a garrison division in Tōkō. The total strength on a peace footing was 31,680 of all arms, and on a war footing, 46,350. The defence of Yezo was entrusted to a colonial militia. It may well be supposed that to find competent officers for this army greatly perplexed its organizers. The military school—now in Tōkō but originally founded by Omura in Kōtō—had to turn out graduates at high pressure, and private soldiers who showed any special aptitude were rapidly promoted to positions of command. French military instructors were engaged, and the work of translating manuals was carried out with all celerity. In 1876, this new army of conscripts had to endure a crucial test: it had to take the field against the Satsuma samurai, the very flower of their class, who in that year openly rebelled against the Tōkō government. The campaign lasted eight months; as there had not been time to form the reserves, the Imperial forces were soon seriously reduced in number by casualties in the field and by disease, the latter claiming many victims owing to defective commissariat. It thus became necessary to have recourse to the conscripts on which the war was to be won. So long as the samurai, the expectation was that their hereditary instinct of fighting was an adequate compensation for lack of training. That expectation was not fulfilled. Serving side by side in the field, the samurai volunteered and the heimin regulars found to differ by precisely the degree of their respective training. The fact was thus finally established that the fighting qualities of the farmer and artisan reached as high a standard as those of the bushi.

Therefor the story of the Japanese army is one of steady progress and development. In 1878, the military duties of the empire were divided among three offices; namely, the army department, the general staff and the inspection department. Each of the six divisions of troops were organized into three army corps.

In 1879, the total period of colour and reserve service became 10 years. In 1883 the period was extended to 12 years, the list of exemptions was abbreviated, and above all substitution was no longer allowed. Great care was devoted to the training of officers; promotion went by merit, and at least ten of the most promising officers from each division were chosen every year to receive an education. A system of education for the rank and file was organized. Great difficulty was experienced in procuring horses suitable for cavalry, and indeed the Japanese army long remained weak in this arm. In 1893 the army was divided into five districts, each with its admiralty and naval port, and the army being made responsible for coast defence, a battery construction corps was formed. Moreover, an exhaustive scheme was instituted to secure full co-operation between the army and navy. In 1888 the seven divisions of the army first found themselves prepared to take the field, and, in 1893, a revised system of mobilization was sanctioned, to be put into operation the following year, for the Chinese-Japanese War (p.100). At this period the division, mobilized for service in the field, consisted of 12 battalions of infantry, 3 troops of cavalry, 4 batteries of field and 2 of mountain artillery, 2 companies of sappers and miners, comprising 45,492 of all arms with 65,339 horses. The guards had only 8 battalions and 4 batteries (field). The field army aggregated over 120,000, with 168 field and 72 mountain guns, 40,000 rifles, 4,250 cavalry, 3,296 dismounts, of all arms, with 47,220 horses and 294 guns. Owing, however, to various modifications necessitated by circumstances, the numbers actually on duty were over 240,000, with 6495 non-combatant employees. Educated as the new soldiers were, the bulk of the infantry were armed with the Murata single-loader rifle, but the field artillery was inferior, and the only two divisions equipped with magazine rifles and smokeless powder never came into action. The nation was for a time in the habit of demanding the use of weapons instead of drawing lots, this privilege of entry enduring up to the age of 28, after which, service for the full term without drawing lots was closed. Residence in a foreign country secures exemption up to the age of 25. The total number of conscripts is over 100,000. Conscripts in the active army may be discharged before the expiration of two years if their conduct and aptitude are exceptional.

A youth is exempted if it be clearly established that his family is dependent upon his earnings. Except for permanent deformities, he may be put back to school and attend his studies on days off. Men who have been convicted of crime are disqualified, but those who have been temporarily deprived of civil rights must present themselves for conscription at the termination of their penalties. A few are exempted on military grounds. Men who have been temporarily deprived of civil rights must present themselves for conscription at the termination of their sentences. By various acts and regulations men with special marks on their hands are exempted from service with the colours. The system of volunteering is largely resorted to by persons of the better classes. Any youth who

1 The privilege at first led to great abuses. It became a common thing to employ some aged and indigent person, set him up as the head of a 'branch family,' and give him for adopted son a youth liable to conscription.
possesses certain educational qualifications is entitled to volunteer for training. If accepted after medical examination, he serves for the colours for one year, during three months of which time he must live in barracks—unless a special permit be granted by his commandant. The money so spent is deducted from his pay, and, if otherwise qualified, are assisted by the state. At the conclusion of a year’s training the volunteer is drafted into the first reserve for 61 years, and after the second year his commission and the total period (121 years) of service before passing into the territorial army is the same as that of an ordinary conscript. The main purpose of the one-year volunteer, as in Germany, is to provide officers for the cadet companies, which are cadet schools of engineering and other branches, which in Germany, are attended by the officers commissioned for this purpose, and are a part of the whole educational system of the army.

Officers are obtained in two ways. There are six local preparatory cadet schools (yen-en-gakko) in various parts of the empire, for boys of from 13 to 15. After 3 years at one of these schools a graduate spends 21 months at the central preparatory school (cho-go-chu), Tokyo, and if he graduates with sufficient credit at the latter institution, he becomes eligible for admission to the officers’ college (shikan-gakko) without further test of proficiency. The second method of obtaining officers is by transferring from the navy, and all officers of the navy have one year’s service in the officers’ college. In either case the cadet is sent to serve with the colours for 6 to 12 months as a private and non-commissioned officer, before commencing his course at the officers’ college. The period of study at the officers’ college is 2 years, and after this period the cadet serves with troops for 6 months on probation. If at the end of that time he is favourably reported on, he is commissioned as a second-lieutenant, and after three years’ service he receives a year’s further training at a special college. Officers’ ranks are the same as in the British army, but the nomenclature is more simple. The terms, with their English equivalents, are shō (second-lieutenant), tō (captain), shita (major), chōta (lieutenant-colonel), toisa (colonel), shōhā (major-general), chōhā (lieutenant-general), taishō (general), gūsui (field-marshal). All these except the last apply to the same relative ranks in the navy. Promotion is by seniority, and for grades of captain and above, but after the rank of captain all promotion is by merit, and thus many officers never rise higher than captain, in which case retirement is compulsory at the age of 45. Except in the higher ranks a certain minimum period has to be spent in each rank before promotion to the next.

There are three grades of privates: upper soldiers (jūshō-hei), first-class privates (dai-taeta), and second-class privates (nito-taeta). A private on joining is a second-class soldier. For proficiency and good conduct he is raised to the rank of first-class soldier, and ultimately to that of upper private. Non-commissioned officers are retained by the army for those who wish to make soldiering a profession, as in European armies. The grades are corporal (gōchō), sergeant (gūsai), sergeant-major (gūsai-go), major (gocho), and field-marshals (gūsui). The pay of the conscript is, as it is everywhere, a trifle (1s. to 3s. 6d. per month). The professional non-commissioned officers are better paid, the lowest grade receiving three times as much as an upper private. In addition to his pay, they are responsible for the rates prevailing in Germany, sub lieutenants receiving about £34, captains £71, colonels £238 per annum, etc. Pensions for officers and non-commissioned officers, according to scale, can be claimed after 11 years’ colour service.

The emperor is the commander-in-chief of the army, and theoretically the sole source of military authority, which he exercises through a general staff and a war department, with the assistance of a number of field-marshal-graduates (gūsui). The general staff has for chief a field-marshal, and for vice-chief a general or lieutenant-general. It includes besides the usual staff departments, various survey and engineering departments, and, in the case of war, the department of instruction. The war department is presided over by a general officer on the active list, who is a member of the cabinet without being necessarily affected by ministerial changes. These departments are further, artillerists and engineers, and a remount bureau. The headquarters of the colonial defences under general officers are Tokyo, Yokohama, Shimonski, and Yura. The whole empire is divided into three military districts, central, western, and eastern, each under the command of a general or lieutenant-general. The divisional headquarters are as follows—Lord Tōkyō, Tōkyō, N. Sendai, III. Nagoya, IV. Wakayama, V. Hiroshima, VI. Kumamoto, VII. Fukuoka, IX. Kagoshima, X. Tokio, XI. Kagoshima, XII. Takata, XIV. Utsunomiya, XV. Fushimi, XVI. Kioto, XVII. Okayama, XVIII. Kurume. Some of these divisions are permanently

on foreign service, but their recruiting areas in Japan are maintained. There are also four officers’ colleges, and, in addition to the above, 17 regiments of field and mountain artillery, as well as garrison artillery and army technical troops. The organization of the active army by regiments is 17 infantry regiments of 3 battalions; 27 cavalry regiments of 3 field and 9 mountain artillery regiments each of 3 batteries; 6 regiments and 6 battalions of siege, heavy field and fortress artillery; 20 battalions engineers; 20 regiments engineer troops.

The medical service is exceptionally well organized. It received an unbiased praise from European and American experts who observed it closely during the wars of 1900 and 1904-5. The establishment and of the medical division is correspondingly great, and arrangements complete in every detail are made for all lines of medical assistance. Much help is rendered in the case of sickness in the various societies. In addition to an income of 2,000,000 yen annually, a fine hospital in Tōkyō, a large number of auxiliary hospitals of the two specially built and equipped hospital ships. During the early part of the campaign in Pechilu, in 1900, the French column entrusted its wounded to the care of the Japanese.

The staple article of commissariat for a Japanese army in the field is koshii (dried rice), of which three days’ supply can easily be carried in a bag by the soldier. When required for use, it being placed in water, swells to its original bulk, and is eaten with a relish of salt fish, dried sea-weed or pickled plums. The task of provisioning an army on these lines is comparatively simple. The water is nearly always ready at hand, and the rice can be cooked as soon as it is obtained. The men, having no previous experience of the army, do not object to the conditions of command and discipline. The Japanese army is not a true professional soldiering army, and officers (generally subalterns), are prepared for service in the upper ranks and for staff appointments, the course of training extending over three years. The Tōkyō school, which stands next in importance. The courses pursued there are attended chiefly by subaltern officers of dismounted branches, non-commissioned officers, and junior officers also being selected to take the course. The term of training is five months. Young officers of the scientific branches are instructed at the hōkōgakki (school of artillery and engineers). There are, further, two special schools of gunnery—one for field, the other for garrison artillery, attended chiefly by captains and senior subalterns of the two branches. There is an inspection department of military education, the inspector-general being a lieutenant-general, under whom are fifteen field and general officers, who inspect the inspection and various schools and colleges of military educational matters in general.

The Japanese officer’s pay is small and his mode of life frugal. He lives in barracks, with his own bedding, and although his pay is plain and inexpensive, and he has no desire to exchange it for muti. He has no mess expenses, contribution to a band, or luxuries of any kind, and as he is nearly always without private means to pay for himself, there are, however, few who do not, in a manner, devote himself absolutely to his profession, living for nothing else, and since he is strongly imbued with an effective conception of the honour of his cloth, instances of his incurring disgrace by debt or dissipation are exceptional. The samurai may be the only class which has been revived in the officers of the modern army, who preserve and act up to all the old traditions. The system of promotion has evidently done to do with this good result, for no Japanese officer can hope to rise above the rank of captain unless, by showing himself really zealous and capable, he obtains from his commanding officer the recommendation without which all higher educational opportunities are the same. Promotion by merit is natural and in the army into promotion by favour, and corruption appears to be virtually absent. In the stormiest days of parliamentary warfare, when charges of dishonesty were freely preferred by party politicians against all departments of officialdom, no whisper ever reached the integrity of army officers.

The training of the troops is thorough and strictly progressive, the responsibility of the company, squadron and battery commanders for the training of their commands, and the latitude granted them in choice of means being, as in Germany, the keystone of the system.

Originally the government engaged French officers to assist in

Uniform does not vary according to regiments or divisions. There is only one type for the whole of the infantry, one for the cavalry, and so on. (See UNIFORMS, NAVAL AND MILITARY). Officers largely obtain their uniforms and equipment, as well as their pay and other pay, through the Kai-keisha, which is a combined officers’ club, benefit society and co-operate trading association to which nearly all belong.
organizing the army and elaborating its system of tactics and strategy, and during several years a military mission of French officers was sent to Tokyo. The idea had been valued by the Japanese. Afterwards German officers were employed, with Jakob Meckel at their head, and they left a perpetually grateful memory. But ultimately the services of foreign officers were dispensed with altogethe r and Japan decided on the plan of sending picked men to complete their studies in Europe. Up to 1904 she followed Germany in military matters almost implicitly, and it may be that the experience of that great war to guide her, she has, instead of modelling herself on any one foreign system, chosen from each whatever seemed most desirable, and also, in many points, taken the initiative herself.

With the death of the last Tokugawa shogun, Japan finally realized the dangers of the Imperial government in 1868, the latter planned to devote one-fourth of the state's ordinary revenue to the army and navy. Had the estimated revenue accrued, this would have given a dollar for a dollar a year to an army with a long record of war. But not until 1871, when the troops of the cities were finally disband ed, did the government find itself in a position to include in the annual budget. The expenditure of the fiscal year amounted to 13,812,000 dollars, of which about 11,000,000 was for the army, and 2,812,000 for the navy.

The Navy.—The traditions of Japan suggest that the art of navigation was not unfamiliar to the inhabitants of a country consisting of hundreds of islands and abound ing in inlets and bays. Some interpreters of her cosmogrophy discover a great ship in the "floating bridge of heaven," from which the divine preceptors of the islands commenced their work, and constitute in a similar sense other poetical named vehicles of that remote age. But though the seas were certainly traversed by the early invaders of Japan, and though there is plenty of proof that in medieval times the Japanese flag floated over merchants which voyaged as far as Siam and India, and over piratical craft which harassed the coasts of Korea and China, it is unquestionable that in the matter of naval architecture Japan fell behind even her next-door neighbors. The first attempt of her navy was to Kitsuhi in the 13th century. Japan had no vessels capable of contending against the invader, and when, at the close of the 16th century, a Japanese army was fighting in Korea, repeated defeats of Japan's squadrons by Korean war-junks decided the fate of the campaign on shore as well as on sea. It seems strange that an enterprising nation like the Japanese should not have taken for models the great galleons which visited the Far East in the second half of the 16th century under the flags of Spain, Portugal, Holland and England. With the exception, however, of two ships built at the Royal Dockyard in England and in the order of His Majesty, which had not the slightest effort in that direction appears to have been made, and when an edict vetoing the construction of sea-going vessels was issued in 1636 as part of the Tokugawa policy of isolation, it can scarcely be said to have checked the growth of Japan's navy, for she possessed nothing worthy of the name. It was to the object lesson furnished by the American ships which visited Yedo bay in 1853 and to the urgent counsel of the Dutch that Japan owed the inception of a naval policy. A seaman's training station was opened under Dutch instructors in 1855 at Nagasaki, a building-ship was constructed and an iron factory established at the same place, and shortly afterwards a naval school was organized at Tsukiji in Yedo, a war-ship the "Kwanbo Maru"—presented by the Dutch to the shogun's government—being used for exercising the cadets. To this vessel two others, purchased from the Dutch, were added in 1857 and 1858, and these, with one given by Queen Victoria, formed the nucleus of Japan's navy. In 1860, we find the Pacific crossed for the first time by a Japanese war-ship—the "Kwan Maru"—and subsequently some young officers were sent to Holland for instruction in naval science. In fact the Tokugawa statesmen had now thoroughly appreciated the imperative need of a navy. Thus, in spite of domestic unrest which menaced the very existence of the Yedo government, a dock-yard was established and fully equipped, the place chosen as its site being, by a strange coincidence, the village of Yokosuka where Japan's first foreign ship-builder, Will Adams, had lived and died 250 years previously. This dockyard was planned and its construction superintended by a Frenchman, M. Bertin. Although the Dutch had been the first to advise Japan's acquisition of a navy, and although French aid was sought in the case of the important and costly work at Yokosuka, the shogun's government turned to England for teachers of the art of maritime warfare. Captain Tracey, R.N., and other British officers and warrant-officers were engaged to organize and superintend the school at Tsukiji. They arrived, however, on the eve of the fall of the Tokugawa shogunate, and as the new administration was not prepared to utilize their services immediately, they returned to England. It is not to be inferred that the Imperial government had entirely abandoned naval institutions. One of the earliest Imperial rescripts ranked a navy among "the country's most urgent needs" and ordered that it should be at once placed on a firm foundation. But during the four years immediately subsequent to the restoration, a semi-interregnum existed in military affairs, the power of the word being partly transferred to the hands of the sovereign and partly retained by the feudal chieftains. Ultimately, not only the vessels which had been in the possession of the shogunate but also several obtained from Europe by the great feudatories had to be taken over by the Imperial government, which, on reviewing the situation, found itself owner of a motley squadron of 15 war ships aggregating 13,812 tons displacement, of which two were armoured, one was a composite ship, and the rest were of wood. Steps were now taken to establish and equip a suitable naval college in Tsukiji, and application having been made to the British government for instructors, a second naval mission was sent from England in 1873, consisting of 30 officers and warrant-officers under Commander (afterwards Vice-Admiral Sir) Archibald Douglas. At the very outset occasions for active service almost presented themselves. In 1868, the year after the fall of the shogunate, such ships as could be assembled had to be sent to Yezo to attack the main part of the Tokugawa squadron, which had raised the flag of revolt and retired to Hakodate under the command of the shogun's admiral, Enomoto. Then in 1874 the duty of conveying a fleet of transports to Formosa had to be undertaken; and in 1877 sea power played its part in crushing the formidable rebellion in Satsuma. Meanwhile the work of increasing and organizing the navy went on steadily. The first steam war-ship constructed in Japan had been a gunboat (138 tons) launched in 1866 from a building-yard established at Ishikawajima, an island near the mouth of the Sumida river on which Tokyo now stands. In order to replace this gunboat, two vessels of 897 tons and 1450 tons, respectively, were launched in 1875 and 1876, and Japan now found herself competent not only to execute all repairs but also to build ships of considerable size. An order was placed in England in 1875, which produced, three years later, the "Fuso," Japan's first ironclad (3717 tons) and the "Kongo" and "Hiei," steel-frame sister-cruisers of 2248 tons. Meanwhile training, practical and theoretical, in seamanship, gunnery, torpedo-practice and naval architecture went on vigorously, and in 1878 the Japanese flag was for the first time seen in European waters. 1 The term maru subsequently became applicable to merchant only, war-ships being distinguished as kan. 1

1 The term maru subsequently became applicable to merchant only, war-ships being distinguished as kan.
floating over the cruiser "Seiki" (1897 tons) built in Japan and navigated solely by Japanese. The government, constantly solicited by Japan, expressing the fleet, inaugurated, in 1883, a programme of 30 cruisers and 12 torpedo-boats, and in 1886 this was extended, funds being obtained by an issue of naval loans. But the fleet did not yet include a single battleship. When the fleet opened for the first time in 1890, a plan for the construction of two battleships encountered stubborn opposition in the lower house, where the majority attached much less importance to voting money for war-ships than to reducing the land tax. Not until 1892 was this opposition overcome in deference to an order from the throne that thirty thousand pounds sterling should be contributed yearly from the privy purse, which was the title of all official salaries being devoted during the same interval to naval needs. Had the house been more prescient, Japan's position at the outbreak of war with China in 1894 would have been very different. She entered the contest with 28 fighting craft, aggregating 57,600 tons, and 24 torpedo-boats, but among them the most powerful was a belt cruiser of 4300 tons. Not one battleship was included, whereas China had two ironclads of nearly 8000 tons each. Under these conditions the result of the naval conflict was awaited with much anxiety in Japan. But the Chinese suffered signal defeats (see Cutchi-Japanese War) off the Yalu and at Wei-hai-wei, and the victors took possession of 17 Chinese craft, including one battleship. The resulting addition to Japan's fighting force was, however, insignificant. But the naval strength of Japan did not depend on prizes. Battleships and cruisers were ordered and launched in Europe one after the other, and when the Russo-Japanese War (q.v.) came, the fleet promptly asserted its physical and moral superiority in the surprise of Port Arthur, the battle of the 10th of August, 1904, and the crowning victory of Tsushima.

As to the development of the navy from 1903 onwards, it is not possible to detail with absolute accuracy the plans laid down by the admiralty in Tōkyō, but the actual state of the fleet in the year 1908 will be apparent from the figures given below.

**Japan's naval strength at the outbreak of the war with Russia in 1904 was:**

<table>

**The highest educational institution for the navy is the naval staff college, in which there are five courses for officers alone. The gunnery and torpedo schools are attended by officers, and also by selected warrant-officers and bluejackets, who consent to extend their service. There is also a mechanical school for junior engineers, warrant-officers and ordnance artificers.**

**At the naval cadet academy—originally situated in Tōkyō but now at Akiyama near Kure—there are five courses for the Yalu apprentices, who receive a 3 years' academic course and 1 year's training at sea; and, finally, there is a naval engineering college collateral to the naval cadet academy.**

**Since 1862, foreign instruction has been wholly dispensed with in the Japanese navy; since 1886 she has manufactured her own prismatic powder; since 1891 she has been able to make quick-firing guns and Schwartzkopf torpedoes, and in 1892 one of her officers invented a particularly potent explosive, called (after its inventor) Shimose powder.**

**Finance.**—Under the feudal system of the Tokugawa (1603–1871), all land in Japan was regarded as state property, and parcelled out into 276 fiefs, great and small, which were assigned to as many fudai, the holders of which were permitted to raise revenue for the support of their households, for administrative purposes, and for the maintenance of troops. The basis of taxation varied greatly in different districts, but, at the time of the Restoration in 1867, the general principle was that four-tenths of the gross produce should go to the feudal, six-tenths to the farmer. In practice this rule was applied to the rice crop only, the assessments for other kinds of produce being levied partly in money and partly in manufactured goods. Forced labour also was exacted, and artisans and tradesmen were subjected to pecuniary levies. The yield of rice in 1867 was about 1.5 million bushels, of which the market value at prices then ruling was £24,000,000, or

1. The reader should be warned that absolute accuracy cannot be claimed for statistics compiled before the Meiji era.
JAPAN

240,000,000 yen.1 Hence the grain tax represented, at the lowest calculation, 96,000,000 yen. When the administration reverted to the emperor in 1867 the central treasury was empty, and the funds hitherto employed for governmental purposes in the fiefs continued to be devoted to the support of the feudalizers, at the payment of the samurai, and to defraying the expenses of official administration, the central treasury receiving only whatever might remain after these various outlays.

The shogun himself, whose income amounted to about £3,500,000, did not, on abdicating, hand over to the sovereign either the contents of his treasury or the lands from which he derived his revenues. He contended that funds for the government of the nation as a whole should be levied from the people at large. Not until 1871 did the feudal system cease to exist. The fiefs being then converted into prefectures, their revenues became an asset of the central treasury, less 10 % allotted for the support of the former feudalizers.2

But during the interval between 1867 and 1871, the men on whom had devolved the direction of national affairs saw no relief from crippling impecuniosity except an issue of paper money. This was not a novelty in Japan. Paper money had been known to the people since the middle of the 17th century, and in the era of which we are now writing no less than 1694 varieties of notes were in circulation. There were gold notes, silver notes, cash-notes, rice-notes, umbrella-notes, ribbon-notes, lathe-article-notes, and so on through an interminable list, the circulation of each kind being limited to the issuing fief. Many of these notes had been consigned to have any purchasing power, and nearly all were regarded by the people as evidences of official greed. The first duty of a centralized progressive administration should have been to reform the currency. The political leaders of the time appreciated that duty, but saw themselves compelled by stress of circumstances to adopt the very device which in the hands of the feudal chiefs had produced such deplorable results. The ordinary revenue amounted to only 3,000,000 yen, while the extraordinary aggregated 29,000,000, and was derived wholly from issues of paper money or other equally unsound sources.

Even on the abolition of feudalism in 1871 the situation was not immediately relieved. The land tax, which constituted nine-tenths of the feudal revenues, had been assessed by varying methods and at various rates by the different feudalizers, and re-assessment of all the land became a preliminary essential to establishing a uniform system. Such a task, on the basis of accurate surveys, would have involved years of work, whereas the financial needs of the state had to be met immediately. Under the pressure of this imperative necessity a re-assessment was roughly made in two years, and the results, although on whole the tax on land was about one-half of the real market value. Moreover, the government contemplated a gradual reduction of this already low impost until it should ultimately fall to 1 %. Circumstances prevented the consummation of that purpose. The rate underwent only one reduction of 1 %, and thereafter had to be raised on account of war expenditures. On the whole, however, no class benefited more conspicuously from the change of administration than the peasants, since not only was their burden of taxation light, but also they were converted from mere tenants into actual proprietors. In brief, they acquired the fee-simple of their farms in consideration of paying an annual rent equal to about one sixty-sixth of the market value of the land.

In 1873, when these changes were effected, the ordinary

1 The yen is a silver coin worth about 2$ : 10 yen = £1.
2 In addition to these grants, the feudalizers were allowed to retain the reserves in their treasuries; thus many of the feudal nobles found themselves possessed of substantial fortunes, a considerable part of which they generally devoted to the support of their former vassals.

Revenue of the state rose from 24,500,000 yen to 70,500,000 yen. But seven millions sterling is a small income for a country confronted by such problems as Japan had to solve. She had to build railways; to create an army and a navy; to organize posts, telegraphs, prisons, police and education; to organize ports, imperial harbours, light and buoy the coast; to create a mercantile marine; to start under official auspices numerous industrial enterprises which should serve as object lessons to the people, as well as to lend to private persons large sums in aid of similar projects. Thus, living of necessity beyond its income, the government had recourse to further issues of fiduciary notes, and in proportion as the volume of the latter exceeded actual currency requirements their specie value depreciated.

This question of paper currency inaugurate the story of banking; a story on almost every page of which are to be found inscribed the names of Prince Ito, Marquis Inouye, Banks.

Marquis Matsukata, Count Okuma and Baron Shibusawa, the fathers of their country's economic and financial progress in modern times. The only substitutes for banks in feudal days were a few private firms—"houses" would, perhaps, be a more correct expression—which received local taxes in kind, converted them into money, paid the proceeds to the central government or to the feudalizers, gave accommodation to officials, did some exchange business, and occasionally extended accommodation to private individuals. They were not banks in the Occidental sense, for they neither collected funds by receiving deposits nor distributed capital by making loans. The various fiefs were so isolated that neither social nor financial intercourse was possible, and moreover the mercantile and manufacturing classes were regarded with some disdain by the gentry. The people had never been familiarized with combinations of capital for productive purposes, and such a thing as a joint-stock company was unknown. In these circumstances, when the administration of state affairs fell into the hands of the men who had made the restoration, they not only lacked the first essential of rule, money, but were also without means of obtaining any, for they could not collect taxes in the fiefs, these being still under the control of the feudal barons; and in the absence of widely organized commerce or finance, no access to funds presented itself. Doubtless the minds of these men were sharpened by the necessities confronting them, yet it speaks eloquently for their discernment that, samurai as they were, without any business training whatever, one of their first essays was to establish organizations which should take charge of the national revenue, encourage industry and promote trade and production by lending money at comparatively low rates of interest. The tentative character of these attempts is evidenced by frequent changes. There was first a business bureau, then a trade bureau, then commercial companies, and then exchange companies, these last being established in the principal cities and at the open ports, their personnel consisting of the three great families—Mitsui, Shimada and Ono—houses of ancient repute, as well as other wealthy merchants in Kioto, Osaka and elsewhere. These exchange companies were partnerships, though not strictly of the joint-stock kind. They formed the nucleus of banks in Japan, and their functions included, for the first time, the receiving of deposits and the lending of money to merchants and manufacturers. They had power to issue notes, and, at the same time, the government issued notes on its own account. Indeed, in this latter fact is to be found one of the motives for organizing the exchange companies, the idea being that if the state's notes were lent to the companies, the people would become familiarized with the use of such currency, and the companies would find them convenient capital. But this system was essentially unsound: the notes, alike of the treasury and of the companies, though nominally convertible, were not secured by any fixed stock of specie. Four years sufficed to prove the impracticality of such an arrangement, and in 1872 the exchange companies were swept away, to be succeeded in July 1873 by the establishment of national banks on a system which combined some of the features of English banking with the general
Japan fell in 1872 and 1874. It should be noted that at this time foreign trade was still invested with a perilous character in Japanese eyes. In early days, while the Dutch had free access to her ports, they sold her so much and bought so little that it was commonly as a self-evident fact that all metals flowed out of her coffers. Again, when over-sea trade was renewed in modern times, Japan’s exceptional financial condition prevented her from taking advantage of the new system of local laws and being in a condition to take full advantage. For, during her long centuries of seclusion, gold had come to hold to silver in her coinage a ratio of 1 to 8, so that gold cost, in terms of silver, only one-half of what it cost in the European countries. This was a great power in the right to exchange their own silver coins against Japanese, weight for weight, and thus it fell out that the foreigner, going to Japan with a supply of Mexican dollars, could buy with them twice as much gold as they had cost in Mexico. Japan lost very heavily by this system, and its effects accentuated the dread with which her medieval experience had invested foreign commerce. Thus, when the bank-of-issue capital as a fund for converting such products of commerce as rice, tea, indigo, wool, cotton, silk, and others, into coined money, the bank became a credit bank. In 1872 and 1874, the fact created undue consternation, and moreover there can be no doubt that the drafters of the bank regulations had over-estimated the quantity of available gold in the country.

A new style of exports and imports came into existence in the following years. The various arrangements by which gold was exchanged for foreign paper money, or vice versa, and the removal of foreign exchange from the banks and into circulation. They were specifically returned for conversion; no deposits came to the aid of the banks, nor did the public make any use of them. Disaster became inevitable. The two great firms of Ono and Shimada, which had stood high in the nation’s estimation alike in feudal and in imperial days, closed their doors in 1874; a panic ensued, and the circulation of money ceased almost entirely.

The governmental financial arrangements were effective. The loss of bank capital was not reduced, but it was bowed to necessity. They issued a revised code of banking regulations which substituted treasury notes in the place of specie. Each bank was therewith required to invest 30 per cent of its capital in gold and silver imports, and when being lodged with the treasury, the bank became competent to issue an equal quantity of its own notes, not more than a third of its total deposits. They were for purposes of redemption. This was a complete subversion of the government’s original scheme. But no alternative offered. Besides, the situation presented a new feature. The hereditary pensions of the foudoirs had been commuted with bonds aggregating 174,000,000 yen. Were this large volume of bonds issued at once, their heavy depreciation would be likely to follow, and moreover their holders, unaccustomed to dealing with financial problems, might dispose of the bonds and invest the proceeds in hazardous enterprises. To devise some opportunity for the safe and profitable employment of these bonds seemed, therefore, a pressing necessity, and the bank-regulating problem worked out for them. For bond-holders, combining to form a bank, continued to draw from the treasury 6% on their bonds, while they acquired power to issue a corresponding amount of notes which could be lent at profitable rates. Whereas, up to 1874, only five banks were established under the original regulations, the number under the new rule was 151 in 1879, their aggregate capital having grown in the same interval from 5,000,000 yen to 40,000,000 yen.

Here, then, was a rapidly growing system resting wholly on state credit. Something like a mania for bank-organizing declared itself, and in 1876, 192 banks were formed. A bad feature was, that against the establishment of any more national banks, and to limit to 34,000,000 yen the aggregate note issues of those already in existence.

It is possible that the conditions which prevailed immediately after the establishment of the national banks might have developed some permanency had not the Satsuma rebellion broken out in 1877. Increased taxation to meet military outlay being impossible in such circumstances, nothing offered except recourse to further note issues. The result was that by 1881, fourteen years after the Restoration, notes whose face value aggregated 164,000,000 yen had been introduced into circulation; the maximum sum which they were allowed to issue was limited to 33,500,000 yen, or 8,000,000 yen, and 18 paper yen could be purchased with 10 silver ones.

The first effort that was made to strengthen the specie value of flat paper, by throwing quantities of gold and silver upon the market from time to time, and 23,000,000 yen had been devoted to the promotion of industries whose produce was thought likely to produce more gold and silver than was being produced. The deficit of 1884 was almost entirely due to a slackening of foreign exports, and thus draw specie to the country. But these devices were now finally abandoned, and the effort was applied to strengthening the value of the fiduciary currency on the one hand, and accumulating a specie reserve on the other. The steps of the programme were simple. By cutting down administrative expenditure; by transferring large sums from the foreign to the local public account; by suspending all grants in aid of provincial public works and private enterprises, and by a moderate increase of the tax on alcohol, an annual surplus of revenue, totalling 7,000,000 yen, was secured. This was applied to reducing the volume of the notes in circulation.

At the same time, it was resolved that all officially conducted industrial and agricultural works should be sold—since their purpose had been sufficiently achieved—and the proceeds, together with various securities (aggregating 26,000,000 yen in face value) held by the treasury, were applied to the purchase of specie. Had the government entered the specie business in this way, the result would have been that specie would have suffered. There were also ample reasons to doubt whether any available stores of precious metal remained in the country. In 1872 and 1873, the sales of specie were between 400,000 and 600,000 yen, and steadily driven out the dear, and although the government mint at Osaka, founded in 1871, had struck gold and silver coins worth 80,000,000 yen between that date and 1881, the customs revenue had fallen 18% in 1885, the treasury having no other deficiency to supply. It was during these years that the specie payments were then announced, and became, in the autumn of that year, an accomplished fact. From the time when this programme was declared to be a part of the public policy, the fall in the price of specie had been continued, and by 1888, the very year after the resumption of specie payments.

The above facts deserve to figure largely in a retrospect of Japanese finance. They illustrate a fact, not by itself perhaps indicating clear insight, good organizing capacity, and courageous energy, but also because volumes of adverse foreign criticism were written in the margin of the story during the course of the incidents it embodies. Now Japan had been charging its people quite heavily because she bought their goods with paper money and sold them for specie; again, she was accused of an official conspiracy to ruin the foreign local banks because she purchased exporters’ bills on Europe and America at rates that defied ordinary competition; and while some declared that she was plainly without any understanding of her own doings, others predicted that her heroic method of dealing with its industrial and economic problems would produce widespread suffering. Undoubtedly, to carry the currency of a nation from a discount of 70 or 80% to par in the course of four years, reducing its value at the same time from 160 to 119 yen, was a financial enterprise viole and unbusinesslike.

The gentler expedient of a foreign loan would have commended itself to the majority of economists. But it may be here stated, once for all, that until her final adoption of a gold standard in 1897, the foreign money market was practically closed to Japan. Had she borrowed abroad it must have been on a sterling basis. Receiving a fixed sum in silver, she would have had to disburse some specie for remitting part of it. When Japan did look to London for small sums, but when she came to cast up her accounts the cost of the accommodation stood out in deterrent proportions. A 9% loan, placed in England in 1868 and paid off in 1879, produced 3,750,000 yen in round figures; and a 7% loan, made in 1872 and paid off in 1897, produced 10,750,000 yen, and cost 36,000,000 yen. These considerations were supplemented by a strong aversion from incurring pecuniary obligations to Western states before the latter had consented...
to restore Japan's judicial and tariff autonomy. The example of Egypt showed what kind of fate might overtake a semi-independent state falling into the clutches of foreign bond-holders. Japan, therefore, did not wish to place itself in a similar position, and several times during its history it was severely tempted to follow the example of Egypt and assume the burden of foreign debt and sinking fund payments.

After the revision of the national bank regulations, semi-official banking enterprises received a much more favorable and rational treatment. It was shown that the government had found it necessary to impose limits. The government policy was intended to prevent small and private banks from engaging in unsafe and speculative practices. It was, however, only until 1881, and even at that comparatively recent date no Japanese laws had yet been enacted for the control of such operations. The commercial code, published in March 1890, did not contain any provisions for the licensing or supervision of the number of insurance companies and the volume of their transactions grew rapidly. In 1919, there were 3 enterprises, with a total capital of 7,000,000 yen and policies aggregating 1,977,000,000 yen, and in 1906 the corresponding figures were 65 companies, 22,000,000 yen paid up and policies of 4,149,000,000 yen. The premium reserves grew in the same period from 7,000,000 to 97,700,000 yen.

The origin of clearing houses preceded that of insurance companies in Japan. The first (1879), Osaka, for instance, which was quickly followed by Tokio, Yokohama, Kioto, Nagoya. In 1898 the bills handled at these institutions amounted to 1,186,000,000 yen, and were worth to 70,000,000 yen. There are clearing houses are modelled after those of London and New York.

Exchanges existed in Japan as far back as the close of the 17th century. At that time the income of the feudal chiefs consisted mainly of rice and silk, although some of them also exercised a considerable influence. In the Tokugawa era (1603-1867), the latter found it convenient to meet at fixed times and places for conducting their business. Originally their transactions were, of course, for cash, but afterwards they devised time bargains, i.e., a definite price was fixed by the representatives of the owners. The reform of abuses incidental to this system attracted the early attention of the Meiji government, and in 1863 a law was promul- gated declaring for the country. Under this law, the minimum share capital of a house constituted a joint-stock company was fixed at 100,000 yen, and the whole of its property became liable for failure on the part of its members. These companies in 1906 were 265.

Not less remarkable than this economic development was the large payment in the 1920s of the Japanese rice duty and the consequent rise in the prices of the country. The Government, in order to encourage the production of rice and to prevent the import of foreign rice, sanctioned the imposition of a special tax on rice, and this was levied at the rate of 153.

The farmers' desire to assimilate the latest technological advances, however, had the following results:

1. The Bank of Japan was established as a joint-stock company in 1882. The capital in 1909, was 30,000,000 yen. In its own line of business, the bank became a powerful instrument for its own purposes. In some years, the bank had 2211 banks, with a paid-up capital of 450,000,000 yen, reserves of 12,000,000, and deposits of 147,000,000; and whereas there was not one savings bank in 1867, there were 486 in 1906 with deposits of over 50,000,000,000 yen. The average yearly growth of the national bank thus is 1.5 and of the savings banks, 1.7.

2. The Bank of Japan was not established as a joint-stock company in 1882. The capital in 1909, was 30,000,000 yen. In its own line of business, the bank became a powerful instrument for its own purposes. In some years, the bank had 2211 banks, with a paid-up capital of 450,000,000 yen, reserves of 12,000,000, and deposits of 147,000,000; and whereas there was not one savings bank in 1867, there were 486 in 1906 with deposits of over 50,000,000,000 yen. The average yearly growth of the national bank thus is 1.5 and of the savings banks, 1.7.

3. The Bank of Japan was established as a joint-stock company in 1882. The capital in 1909, was 30,000,000 yen. In its own line of business, the bank became a powerful instrument for its own purposes. In some years, the bank had 2211 banks, with a paid-up capital of 450,000,000 yen, reserves of 12,000,000, and deposits of 147,000,000; and whereas there was not one savings bank in 1867, there were 486 in 1906 with deposits of over 50,000,000,000 yen. The average yearly growth of the national bank thus is 1.5 and of the savings banks, 1.7.

4. The Bank of Japan was established as a joint-stock company in 1882. The capital in 1909, was 30,000,000 yen. In its own line of business, the bank became a powerful instrument for its own purposes. In some years, the bank had 2211 banks, with a paid-up capital of 450,000,000 yen, reserves of 12,000,000, and deposits of 147,000,000; and whereas there was not one savings bank in 1867, there were 486 in 1906 with deposits of over 50,000,000,000 yen. The average yearly growth of the national bank thus is 1.5 and of the savings banks, 1.7.
paper-making, oil-refining, brick-making, leather-tanning, glass-making and other industries attracted eager attention, and whereas the capital subscribed for such works aggregated only 50,000,000 yen in 1886, it exceeded 1,000,000,000 yen in 1906.

When specie payments were resumed in 1885, the notes issued by the Bank of Japan were convertible in silver on demand, the silver standard being thus definitely adopted, a complete reversal of the system inaugurated at the Restoration. But, as in the case of the Bank of France, there was no return from the United States. Japan's financiers believed to the outset in gold monometallism. But, in the first place, the country's stock of gold was soon driven out by her depreciated currency; and, in the second, not only were all other Oriental nations silver-using, but also the Mexican silver dollar had long been the unit of account in Far-Eastern trade. Thus Japan ultimately drifted into silver monometallism, the silver yen becoming her unit of currency and, in the indemnity that she received from China after the war of 1894-95 she had placed in her possession of a stock of gold, she determined to revert to the gold standard. Mechanically speaking, the operation was very easy. Gold having appreciated so that its value in terms of silver had exactly doubled during the first 30 years of the Meiji era, nothing was necessary except to double the denominations of the gold coins in terms of yen, leaving the silver subsidiary coins unchanged. Thus the old 5- yen gold piece, weighing 2.222222 momme of 900 fine- ness, became a 10-yen piece in the new currency, and a new 5- yen piece of half that weight was coined. No change whatever was required in the reckonings of the people. The yen continued to be their coin of account, with a fixed sterling value of a small fraction over two shillings, and the denominations of the gold coins were doubled. Gold, however, was little seen in Japan; the whole duty of currency is done by notes.

It is not to be supposed that all this economic and financial development was unaccompanied by periods of depression and severe price fluctuations. There were in fact six such periods: in 1874, 1881, 1887, 1897, 1900 and 1907. But no year throughout the whole period failed to witness an increase in the number of Japan's industrial and commercial companies, and in the amount of capital thus invested.

To obtain a comprehensive idea of Japan's state finance, the simplest method is to set down the annual revenue at quinquennial periods, commencing with the year 1878-1879, because it was not until 1876 that the system of duly compiled and published budgets came into existence.

</tbody>
</table>

The most striking feature of the above table is the rapid growth of revenue during the last three periods. So signal was the growth that the revenue may be said to have sextupled in the 15 years ended 1909. This was the result of the two great wars in which Japan was involved, that with China in 1894-95 and that with Russia in 1904-5. The details will be presently shown.

Turning now to the expenditure and pursuing the same plan, we have the following figures:

<table>

It appears from the above that during 15 years the weight of taxation increased fourfold. But a correction has to be applied, first, on account of the tax on alcoholic liquors and, secondly, on account of customs duties, which on this side of the war probably rose to a very large figure. The former grew from 16 million yen in 1894-1895 to 72 million yen in 1898-1900, and the latter from 51 million yen to 411 million yen. If these increases be deducted, it is found that taxes, properly so called, grew from 70-5 million yen in 1894-1895 to 207-86 million yen in 1906-1908, an increase of somewhat less than three-fold. Otherwise stated, the burden per unit of population in 1894-1895 was 3-64 d., whereas in 1908-1909 it was 4-61. To understand the principle of Japanese taxation and the manner in which the above development took place, it is necessary to glance briefly at the chief taxes separately.

The land tax is the principal source of revenue. It was originally fixed at 3% of the assessed value of the land. But in 1877 this rate was reduced to 2% on which basis the tax yielded from 37 to 38 million yen annually. After the war with China (1894-1895) the government proposed to increase this impost in order to raise an extensive programme of public works and expanded armaments (known subsequently as the first post bellum programme). By this time the market value of agricultural land had largely appreciated owing to improved communications, and urban land commanded greatly enhanced prices. But the lower house of the diet, considering itself guardian of the farmers' interests, refused to endorse any increase of the tax. Not until 1899 could this resistance be overcome, and then only on condition that the change should not be operative for more than 5 years. The amended rates were 3-3% on rural lands and 5% on urban building sites. As the tax produced 65,000,000 yen, but at the end of the five-year period it had reverted to its old figure, had no war with Russia broken out. An increase was then made so that the impost varied from 3% to 17% according to the class of land, and under this new system the tax yielded 85 million yen. Thus the exigencies of two wars had augmented it from 38 millions in 1889 to 85 millions in 1907.

The business tax was introduced in 1887. It was on a graduated scale, varying from 1% on incomes of not less than 300,000 yen to 3% on incomes of 30,000,000 yen and upwards. At these rates the tax yielded an insignificant revenue of about 2,000,000 yen. In 1894-1895 paymasters were ordered to apply the purposes of the first post bellum programme. This revision increased the number of classes from five to ten, incomes of 300 yen standing at the bottom and incomes of 100,000 yen or upwards at the top, the minimum and maximum rates being 1% and 28%. The tax was now in the neighborhood of 8,000,000 yen. Finally in 1904, when war broke out with Russia, these rates were again revised, the minimum now being 2% and the maximum 8-2%. Thus revised, the tax yields a revenue of 27,000,000 yen, and the business tax.

The income tax was introduced in 1896, after the war with China, and the rates have remained unchanged. For the purposes of the tax all kinds of business are divided into nine classes, and the tax is levied on the amounts of sales (wholesale and retail), on rental value of buildings, on number of employees and on amount of capital. The yield from the tax grows steadily. It was only 1,579,000 yen in 1897, but it figured at 22,000,000 yen in the budget for 1908-1909.

The above three impostes constitute the only direct taxes in Japan. Among indirect taxes the most important is the tax on alcoholic liquors. It was inaugurated in 1871; doubled, roughly speaking, in 1878; still further increased thenceforth at intervals of about 3 years, until it is now approximately twenty times as heavy as it was originally. The liquor taxed is mainly sake; the rate is about 50 sen (one shilling) per gallon, and the annual yield is 72,000,000 yen.

52,000,000 yen, when Japan re-opened her ports to foreign commerce, the customs duties were fixed on a basis of 3% ad valorem, but the rate was almost immediately changed to a nominal 5% and a real 3%. The customs then yielded a very poor revenue—not more than three or four yen.

4 and the Japanese government had no discretionary power to alter the rates. Strenuous efforts to change this system were of length successful, and, in 1899, the tariff was divided into two second-rate tariff. It is only with the rates in the third classification that the idea of going by a treaty valid for 12 years; those in the latter being fixed at Japan's will. Things remained thus until the war with Russia having other industrial associations and other exports, the total value of the former (not counting the rates in the third classification) was determined by a treaty valid for 12 years; those in the latter being fixed at Japan's will. Things remained thus until the war with Russia.
compelled a revision of the statutory tariff. Under this system the ratio of the duties to the value of the dutiable goods was about 15 per cent. The new rates yielded a revenue of 405,000,000 yen, or a little under 10 per cent of the value of the imports.

In addition to the above there are eleven taxes, some in existence before the war of 1904-5, and some created for the purpose of raising on the war or to meet the expenses of a post bellum régime.

Taxes in existence before 1904-1905—

Also, as shown above, the land tax was increased by 35 millions; the income tax by 19 millions; the business tax by 15 millions; and the tobacco tax by 15 millions. On the whole, and of general incidence and those of special incidence be lumped together, it appears that the burden swelled from 160,000,000 yen before the war to 320,000,000 yen after the war.
6 years, of which 135,000,000 yen were added to the national debt, the remainder being defrayed with accumulations of surplus revenue, with a view to the indemnity, and with voluntary contributions from patriotic subjects. As the immediate sequel of the war, the government elaborated a large programme of armaments and public works. The expenditure for these unproductive purposes, as well as for coast fortifications, works, and dockyards, and so on came to 314,000,000 yen, and the total of the productive expenditures included in the programme was 190,000,000 yen—namely, 120 millions for telegraphs and telephones; 20 millions for riparian improvements; 20 millions in aid of industrial and agricultural banks and so forth—the whole programme thus involving an outlay of 504,000,000 yen. To meet this large figure, the Chinese indemnity and other receipts were insufficient to pay it. Hence a loan of 804,000,000 yen was raised in 1895. The latter and 100 million of the proceeds of the loan was then added to the national debt by the government, to be refunded within 50 years, interest at 4% being paid upon the principal. This loan was to be added to the national debt to the extent of 804,000,000 yen. In 1902, it was not expected that Japan would need any further immediate recourse to foreign borrowing. According to her financiers' forecast at that time, her national indebtedness would reach its maximum, namely, 575,000,000 yen, in the year 1903, and would thenceforward diminish steadily. All Japan's domestic loans were by that time placed on a uniform basis. They carried 5% for the first five years, 4% for the next 40 years, and were then to be redeemed within 50 years at latest. The treasury had power to expedite the operation of redemption according to financial convenience, but the sum expended on amortization each year must receive the previous consent of the Diet. Within the limits of that sum redemption was effected either by purchasing the stock of the loans in the open market or by drawing lots to determine the bonds to be redeemed. In the first six years after the close of 1897, the bonds of that total had been paid off at the close of 1897, and the remainder was to be redeemed by 1946, according to these programmes.

But at this point the empire became involved in war with Russia, and the protracted rupture with Russia caused a signal change in the financial situation. Before peace was restored in the autumn of 1905, Japan had been obliged to borrow 405,000,000 yen at home and 1,004,000,000 yen abroad, so that she found herself in 1908 with a total debt of 2,276,000,000 yen, of which aggregate her domestic indebtedness stood for 1,110,000,000 yen and her foreign borrowings amounted to 1,166,000,000 yen. This meant that her debt had grown from 503,000,000 yen in 1903 to 2,276,000,000 yen in 1906 and from 113 yen to 43.8 yen per head of the population. Further, out of the grand total, the sum actually spent on account of war and armaments represented 1,357,000,000 yen. The debt carried interest varying from 1% to 5%.

It will be observed that the country's indebtedness grew by 1,700,000,000 yen, in round numbers, owing to the war with Russia. This, together with the increases of the preceding years, brought the space of 30 years, for which purpose the diet was asked to approve the establishment of a national debt consolidation fund, which should be kept distinct from the general accounts of revenue and expenditure, and applied to the redemption of the existing debt and the payment of the principal. The amount of this fund was never to fall below 110,000,000 yen annually. Immediately after the war, the diet approved a cabinet proposal for the rationalization of 17 private railways, at a cost of 290,000,000 yen, and this brought the state's debts to 2,776,000,000 yen in all. The people becoming impatient of this great burden, a scheme was finally adopted in 1908 for appropriating a sum of at least 50,000,000 yen annually to the purpose of redemption.

Local Finance.—Between 1878 and 1888 a system of local autonomy in matters of finance was fully established. Under this system the local authorities possessed the power of borrowing in the same manner as the national government, and the proceeds of each periodical loan commencing from the fiscal year 1889-1890 were as follow:

<table>
<thead>
<tr>
<th>Year</th>
<th>Total Expenditure (millions of yen)</th>
</tr>
</thead>
<tbody>
<tr>

Local corporations are not competent to incur unrestricted indebtedness. The endorsement of the local assembly must be secured; redemption must commence within 3 years after the date of issue and be completed within 30 years; and, except in the case of very small loans, the sanction of the minister of home affairs must be obtained.

Wealth of Japan.—With reference to the wealth of Japan, there is no official census. So far as can be estimated from statistics for the year 1904-1905, the wealth of Japan proper, excluding Formosa, Sakhalin and some rights in Manchuria, amounts to about 19,856,000,000 yen, the items of which are as follow:

Grand total: 19,856,000,000 yen

Education.—There is no room to doubt that the literature and learning of China and Korea were transported to Japan in very early times, but there are no statistics for current statements that in the 3rd century a.E., there was a Korean immigrant who became historiographer to the Imperial court of Japan and another learned man from the same country introduced the Japanese to the treasures of Chinese literature. About the end of the 6th century the Japanese court began to send civilians and missionaries to direct to China, there to study Confucianism and Buddhism, and among these travellers there were some who passed as much as 25 or 30 years beyond the sea. The knowledge acquired by these students was crystallized into a body of laws and ordinances based on the administrative and local systems of the Sung dynasty in China, and in the middle of the 7th century the first Japanese school seems to have been established by the emperor Ten'chi, followed some 50 years later by the first university. Nara was the site of the latter, and the subjects of study were ethics, law, history and mathematics.

1Not until 1749, the date of the transfer of the capital to Ki'oto, however, is there any evidence of educational organization on a considerable scale. A university was then opened in the capital, with affiliated colleges; and local schools were built and endowed by noble families, to whose scions admission was restricted but for general education one institution is minimally known to have been provided. In this Ki'oto university the curriculum included the Chinese classics, calligraphy, history, law, etiquette, arithmetic and composition; while in the affiliated colleges special subjects were taught, as medicine, herbalism, acupuncture, shampooing, divination, the almanac and languages. Admission was limited to youths of high social grade; the students aggregated some 400, from 13 to 16 years of age; the faculty included professors and teachers, who were known by the same titles (bukase and shi) as those applied to their successors to-day; and the government supplied food and clothing as well as books. The family schools numbered five, and their patrons were the Wage, the Fujiwara, the Tachibana (one school each) and the Minamoto (two). At the one institution—opened in 828—where youths in general might receive instruction, the course

This includes 221 millions of loans raised abroad.
embraced only calligraphy and the precepts of Buddhism and Confucianism. The above respect suggests that Japan, in those early days, borrowed her educational system and its subjects of study entirely from China. But closer scrutiny shows that the national factor was carefully preserved. The ethics of administration required a combination of two elements, seichō, or the soul of Japan, and kwansei, or the ability of China; so that, while adopting from Confucianism the doctrine of filial piety, the Japanese grafted on it a spirit of unwavering loyalty and patriotism; and while accepting Buddha's teaching as to three states of existence, they supplemented it by a belief that in the life beyond the grave the duty of guarding his country would devolve on every man. Great academic importance attached to proficieney in literary composition, which demanded close study of the ideographic script, endlessly perplexing in form and infinitely delicate in sense. To be able to compose and indite graceful couplets constituted a passport to high office as well as to the favour of great ladies, for women vied with men in this accomplishment. The early years of the 11th century saw, grouped about the empress Aki, a galaxy of female authors whose writings are still accounted their country's classics—Murasaki no Shikibu, Akazome Emon, Izumi Shikibu, Ise Taiyu and several lesser lights. To the first two Japan owes the Genji monogatari and the Kesa monogatari, respectively, and from the Imperial court of those remote ages she inherited admirable models of painting, calligraphy, poetry, music, song and dance. But it is to be deplored that by this reader was limited virtually to the noble families residing in Kioto, and that the first object of education in that era was to fit men for office and for society.

Meanwhile, beyond the precincts of the capital there were rapidly growing to maturity numerous powerful military magnates who despised every form of learning that did not contribute to martial excellence. An illiterate era ensued which reached its climax with the establishment of feudalism at the close of the 12th century. It is recorded that, about that time, only one man out of a force of five thousand could decipher an Imperial mandate addressed to them. Kamakura, then the seat of feudal government, was at first distinguished for absence of all intellectual training, but subsequently the course of political events brought thither from Kioto a number of court nobles whose erudition and refinement acted as a potent leaven. Buddhism, too, had been from the outset a strong educating influence. Under its auspices the first great public library was established (1270) at the temple Shōmyo-ji in Kanazawa. It is said to have contained practically all the Chinese and Japanese books then existing, and they were open for perusal by all who so desired. The Taoist society which served the samurai was like a window to foreign learning forerunners and the sons of all samurai.

Ultimately the number of such schools rose to over 240, and being supported entirely at the expense of the feudal chiefs, they did no little honour to the spirit of the era. From 7 to 15 years of age lads attended as day scholars, being thereafter admitted as boarders, and twice a year examinations were held in the presence of high officials of the fief. The curriculum of these schools was also somewhat like that of a Western college, and was composed of three subjects: the first chiefly consisted of moral philosophy, and there were many temple schools, where ethics, calligraphy, arithmetic, etiquette and, sometimes, commercial matters were taught. A prominent feature of the system was the bond of reverential affection uniting teacher and student. Before entering school a boy was conducted by his father or elder brother to the home of his future teacher, and there the visitors, kneeling before the teacher, pledged themselves to obey him in all things and to submit unquestioningly to any discipline he might impose. Thus the teacher came to be regarded as a parent, and the veneration paid to him was embodied in a precept, "Let not a pupil treat within three feet of his teacher's shadow." In the case of the temple schools the priestly instructor had full cognisance of each student's domestic circumstances and was guided by that knolledge in shaping the course of instruction. The universally underlying principle was, "serve the country and be diligent in your respective vocations." Sons of samurai were trained in military arts, and on attaining proficiency many of them travelled about the country, inuring their bodies to every kind of hardship and challenging all experts of local fame. Unfortunately, however, the policy of national union prevailed for a long time, and as a result the sons of European knolledge. Not until the beginning of the 18th century did any authorized account of the great world of the West pass into the hands of the people. A celebrated scholar (Arai Hakuseki) then compiled works—Saiyō kibun (Record of Occidental Hearsey), and Saian igen (Renderer of Foreign Languages)—which embodied much information, obtained from Dutch sources, about Europe, its conditions and its customs. But of course the light thus furnished had very restricted influence. It was not extinguished, however. Thenceforth men's interest centred more and more on the astronomical, geographical and medical sciences of the West, though such subjects were not included in academical studies until the renewal of foreign intercourse in modern times. Then (1857), almost immediately, the nation turned to Western learning, as it had turned to Chinese thirteen centuries earlier. The Tokugawa government established in Yedo an institution called Bansho-shirabe-dokoro (place for studying foreign books), where Occidental languages were learned and Occidental works translated. Simultaneously a school for acquiring foreign medical art (Seito igaku-sho) was opened, and, a little later (1852), the Kaisei-jo (place for learning foreign languages) and the Kaisei-jo (place for studying Occidental sciences) was added to the list of new institutions. Thus the eve of the Restoration saw the
Japanese people already appreciative of the stores of learning rendered accessible to them by contact with the Occident.

Commercial education was comparatively neglected in the schools. Sons of merchants occasionally attended the *tôkagawa* or Tokugawa, as the instruction they received there had seldom anything to do with the practical processes of trade. The knowledge that had to be acquired by a system of apprenticeship. A boy of 9 or 10 was apprenticed for a period of 8 or 9 years to a merchant, who undertook to support him and teach him a trade. Generally this young apprentice could not even read or write. He passed through all the stages of shop menial, errand boy, petty clerk, salesman and senior clerk, and in the evenings he received instruction from a teacher, who used for textbooks the manual of letter-writing (shobai orai), or manual of commerce (Shôhai orai). The latter contained much useful information and was thoroughly versed in its contents was competent to discharge responsible duties. When an apprentice, having attained the position of senior clerk, had given proof of practical ability, he was often assisted by his master to start business independently, but under the same firm-name, for which purpose a sum of capital was given to him or a section of his master’s customers were assigned.

When the government of the Restoration came into power, the emperor solemnly announced that the administration should be turned over to those who were versed in the arts of the city wherever they could be found. This amounted to a declaration that in choosing officials scholastic acquirements would henceforth take precedence of the claims of birth, and thus unprecedented importance was seen to attach to education. But so long as the feudal system survived, even in part, no general scheme of education could be thoroughly enforced, and thus it was not until the conversion of the fiefs into prefectures in 1871 that the government saw itself in a position to take drastic steps. A commission of investigation was sent to Europe and America, and on its return a very elaborate and extensive plan was drawn up in accordance with French models, with which the commissioners had found conspicuously complete and symmetrical. This plan subsequently underwent great modifications. It will be sufficient to say that in consideration of the free education hitherto provided by the feudalists in their various fiefs, the government of the restoration resolved not only that the state should henceforth shoulder the main part of this burden, but also that the benefits of the system should be extended equally to all classes of the population, and that the attendance at primary schools should be compulsory. At the outset, this was conducted by the principle of cost-sharing, 20 per cent, yes, that having been approximately the expenditure incurred by the feudalists. But the financial arrangements suffered many changes from time to time, and finally, in 1877, the cost of maintaining the schools became a charge on the local taxes, the central treasury granting only sums in aid.

Every child, on attaining the age of six, must attend a common elementary school, where, during a six-years’ course, instruction is given in morals, reading, arithmetic, the rudiments of technical work, gymnastics and poetry. Year by year the attendance at these schools has increased. Thus, whereas in the year 1900, only 81-67 per cent. of the children of both sexes received the prescribed elementary instruction, the figure in 1905 was 94-93 per cent. The desire for instruction used to be keen among boys than among girls, as was natural in view of the difference of instinct; but ultimately this discrepancy disappeared almost completely. Thus, whereas the percentage of girls attending school was 75-50 in 1900, it rose to 91-46 in 1905, and the corresponding figures for boys were 90-55 and 95-10 respectively. The tuition fee paid at a common elementary school in the rural districts must not exceed 5s. yearly, and in the urban districts, 10s.; but in practice it is much smaller, for these elementary schools form part of the communal system, and such pupils are charged a smaller fee. The tuition fees from school property and miscellaneous sources, must be defrayed out of the proceeds of local taxation. In 1909 there were 18,160 common elementary schools, and also 9105 schools classified as elementary schools for boys only. The corresponding grade of the regular curriculum, a special supplementary course of study might be pursued in agriculture, commerce or industry (manual schools in the case of girls). The time devoted to these special courses is two, three or four years, according to the degree of proficiency contemplated, and the maximum fees are 15d. per month in urban districts and one-half of that amount in rural districts.

There are also 294 kindergartens, with an attendance of 26,000 infants, whose parents pay 3d. per month on the average for each child. These kindergartens are connected with elementary schools or with normal schools.

If a child, after graduation at a common elementary school, desires to extend his education, it passes into a common middle school, where training is given for practical pursuits or for admission to higher educational institutions. The ordinary curriculum at a common middle school includes moral philosophy, English language, mathematics, algebra, plane and solid geometry, nature history, moral philosophy, natural history, physics, chemistry, drawing and the Japanese language. Five years are required to graduate, and from the fourth year the student may take up a special technical course as well as the main course; or, in few exceptional cases, through the medium of the classes taught conjointly with the regular curriculum throughout the whole time. The law provides that there must be at least one common middle school in each prefecture. In November 1909 in 216.

Great inducements attract attendance at these schools. Not only does the graduation certificate carry considerable weight as a general qualification, but it also entitles a young man to volunteer for one year’s service with the colours, thus ensuring that he will be still younger men he would have to serve as an ordinary conscript.

The graduate of a common middle school can claim admittance, without examination, to a high school, where he spends three years preparing to pass to the university, or to any other subject, as law, engineering or medicine. By following the course in a high school, a youth obtains exemption from conscription until the age of 28, when he usually volunteers for public service with the colours. A high-school certificate of graduation entitles its holder to enter a university without examination, and qualifies him for all public posts. Two high schools are also provided, the object being to give a general education of higher standard. Candidates for admission must be over 12 years of age, and must have completed the second-year course of a higher elementary school. The regular course of study requires 4 years, and supplementary courses as well as special art courses may be taken.

In addition to the schools already enumerated, which may be said to contribute to the general education of the young men of special schools, generally private, and technical schools (including a few private), where instruction is given in medicine and surgery, agriculture, commerce, mechanics, applied chemistry, navigation, civil and mechanical engineering and agriculture, sericulture and various other branches of industry. There are also apprentices’ schools, classed under the heading of elementary, where a course of not less than six months, and not more than four years, may be taken in dyeing and weaving, embroidery, the making of artificial flowers, tobacco manufacture, sericulture, reeling silk, pottery, lacquer, woodwork, metal-work or brewing. There are several universities—nearly all supported by private enterprise—for the blind and the dumb.

Normal schools are maintained for the purpose of training teachers, a class of persons not plentiful in Japan, doubtless because of an inability to support them on a low scale of living. At the present time the pay on public schools, the average teachers, the latter amounting to 100 and often falling as low as 415.

There are two Imperial universities, one in Tôkyô and one in Kiôto. In 1909 they comprised 17,478 students, and 2880 students. Its colleges number 6: law, medicine, engineering, literature, science and agriculture. It has a university hall where post-graduate courses are studied, and it publishes a quarterly journal giving accounts of scientific researches, which indicate not only large erudition, but also original talent. The University of Kiôto is a comparatively new institution and has not given any signs of great vitality. In 1909 its colleges numbered four: law, medicine, literature and science: its faculty consisted of about 60 professors with 70 assistants, and its students aggregated about 1100.

In the cases especially indicated, all the figures given above are independent of private educational institutions. The system pursued by the state does not tend to encourage private education, for unless a private school brings its curriculum into exact accord with that prescribed, its students are denied the valuable privilege of partial exemption from conscription, as well as other advantages attaching to state recognition. Thus the quality of the instruction being nominally the same, the rate of fees must also be similar, and this tends to tempt private enterprise.

Public education in Japan is strictly secular: no religious teaching of any kind is permitted. The government is not even allowed to make any further inquiry into the religious opinions. Progress is marked in this branch, the rate of growth having been from 43 to 100 in the five-year period ended 1905. The largest library is the Imperial, in Tôkyô. It had about half a million volumes in 1900, and over a million in 1909.

Apart from the universities, the public educational institutions in Japan involve an annual expenditure of 31 millions sterling, out of which a little more than half a million is met by students' fees; 21 millions are paid by the communes, and the remainder is
deyards from various sources, the central government contributing only some 250,000. It is estimated that public schools, temples, in land, buildings, books, furniture, &c., aggregates 11 millions sterling.

VII.—RELIGION

The primitive religion of Japan is known by the name of Shintō, which signifies "the divine way," but the Japanese Shintō, maintain that this term is of comparatively modern application. The term Shintō being obviously of Chinese origin, cannot have been used in Japan before she became acquainted with the Chinese language. Now Buddhism did not reach Japan until the 6th century, and a knowledge of the Chinese language had preceded it by only a hundred years. It is therefore reasonable to conclude that the primitive religion of Japan had no name, and that it did not begin to be called Shintō until Buddhism had entered the field. The two creeds remained distinct, though not implacably antagonistic, until the beginning of the 9th century, when they were welded together into a system of doctrine to which the name Ryōbu-Shintō (dual Shintō) was given. In this new creed the Shintō deities were regarded as avatars of Buddhist deities, and thus it may be said that Shintō was absorbed into Buddhism. Probably that would have been the fate of the indigenous creed in any circumstances, for a religion without a theory as to a future state and without any system of moral duties could scarcely hope to survive contact with a faith more powerful than its own. Buddhism, indeed, absorbed Shintō, but shrank from losing these respects. But Shintō, though absorbed, was not obliterated. Its beliefs survived; its shrines survived; its festivals survived, and something of its rites survived also.

Shintō, indeed, may be said to be entwined about the roots of Japan’s national existence. Its scripture—as the Kojiki must be considered—resembles the Bible in that both begin with the cosmogony. But it represents the gods as peopling the newly created earth with their own offspring instead of with human beings expressly made for the purpose. The actual work of creation was done by a male deity, Izanagi, and a female deity, Izanami. From the right eye of the former was born Amaterasu, who became goddess of the sun; from his left eye, the god of the moon; and from his nose, a species of Lucifer. The grandson of the sun goddess was the first sovereign of Japan, and his descendants have ruled the land in unbroken succession ever since, the 121st being on the throne in 1909. Thus it is to Amaterasu (the heaven-illuminating goddess) that the Japanese pay reverence above all other deities, and it is to her shrine at Ise that pilgrims chiefly flock.

The story of creation, as related in the Kojiki, is obviously based on a belief that force is indestructible, and that every exercise of it is productive of some permanent result. Thus by the motions of the creative spirit there spring into existence all the elements that go to make up the universe, and these, being of divine origin, are worshipped and propitiated. Their number becomes immense when we add the deified ghosts of ancestors who were descended from the gods and whose names are associated with great deeds. These ancestors are often regarded as the tutelary deities of districts, where they receive special homage and where shrines are erected to them. The method of worship consisted in making offerings and in the recital of rituals (morio). Twenty-seven of these rituals were reduced to writing and embodied in a work called Engishiki (927). Couched in antique language, these liturgies are designed for the dedication of shrines, for propitiating evil, for entreaty blessings on the harvest, for purification, for obtaining household security, for bespeaking protection during a journey, and so forth. Nowhere is any reference found to a future state of reward or punishment, to deliverance from evil, to assistance in the path of virtue. One ceremonial only is designed to avert the consequences of sin or crime; namely, the rite of purification, which, by washing with water and by the sacrifice of valuables, removes the pollution resulting from all wrongdoing. Originally performed on behalf of individuals, this 8-barai ultimately came to be a semi-annual ceremony for sweeping away the sins of all the people.

Shintō is thus a mixture of ancestor-worship and of nature-worship without any explicit code of morals. It regards human beings as virtuous by nature; assumes that each man’s conscience is his best guide; and while believing in a continued existence beyond the grave, entertains no theory as to its pleasures and pains. Those that pass away become disembodied spirits, inhabiting the world of darkness (yomi-no-yo) and possessing power to bring sorrow or joy into the lives of their survivors, on which account they are worshipped and propitiated. Purity and simplicity being essential characteristics of the cult, its shrines are built of white wood, absolutely without decorative features of any kind, and fashioned as were the original huts of the first Japanese settlers. There are no graven images—a fact attributed by some critics to ignorance of the gylptic art on the part of the original worshippers—but there is an emblem of the But, which generally takes the form of a sraum, a miniature so-called jewel, these being the insignia handed by the sun goddess to her grandson, the first ruler of Japan. This emblem is not exposed to public view: it is enveloped in silk and brocade and enclosed in a box at the back of the shrine. The mirror sometimes prominent is a Buddhist innovation and has nothing to do with the true emblem of the creed.

From the 9th century, when Buddhism absorbed Shintō, the two grew together so intimately that their differentiation seemed hopeless. But in the middle of the 17th century a strong revival of the indigenous faith was effected by the efforts of a group of illustrious scholars and politicians, at whose head stood the Po, Motoori and Hirata. These men applied themselves with great diligence and acumen to reproduce the pure Shintō of the Kojiki and to restore it to its old place in the nation’s reverence, their political purpose being to educate a spirit of revolt against the feudal system which deprived the emperor of administrative power. The principles thus revived became the basis of the restoration of 1867; Shintō rites and Shintō rituals were re-adopted, and Buddhism fell for a season into comparative disfavour, Shintō being regarded as the national religion. But Buddhism had twisted its roots too deeply around the heart of the people to be easily torn up. It gradually recovered its old place, though not its old magnificence, for its disestablishment at the hands of the Meiji government robbed it of a large part of its revenues.

Buddhism entered China at the beginning of the Christian era, but not until the 4th century did it obtain any strong footing. Thence, two centuries later (529), it reached Japan Buddhism. The reception extended to it was not encouraging at first. Its images and its brilliant appurtenances might well deter a nation which had neither an idol nor image-worship in a decorated temple. But the ethical teachings and the positive doctrines of the foreign faith presented an attractive contrast to the colourless Shintō. After a struggle, not without bloodshed, Buddhism won its way. It owed much to the active patronage of Shōtoku taishi, prince-regent during the reign of the empress Suiko (593–621). At his command many new temples were built; the country was divided into dioceses under Buddhist prelates; priests were encouraged to teach the arts of road-making and bridge-building, and students were sent to China to investigate the mysteries of the faith at its source. From the early 8th century, the Buddhist sects spread like wildfire through Korea. The reception extended to it was imperfect and all based on the teachings of the Hinayana system. Up to this time the propagandists of the creed had been chiefly Chinese and Korean teachers. But from the 8th century onwards, when Kiōto became the permanent capital of the empire, Japanese priests of lofty intelligence and profound piety began to repair to China and bring thence modified forms of the doctrines current there. It was thus that Dengyō daishi (7. 800) became the founder of the Tendai (heavenly tranquillity) sect and Kobō daishi (774–854) the apostle of the Shingon (true word) sects. Other sects followed, until the country possessed six principal sects in all with thirty-seven sub-sects. It must be remembered that Buddhism offers an almost limitless field for eclecticism. There is not in the world any literary production

of such magnitude as the Chinese scriptures of the Mahayana.
"The canon is seven hundred times the amount of the New Testament. Hsiian Tsang's translation of the Prajna paramita
is twenty-five times as large as the whole Christian Bible."

It is natural that out of such a mass of doctrine different systems should be elaborated. The Buddhism that came to
Japan prior to the days of Dengyō daishi was that of the Vaipulya school, which seems to have been accepted in its entirety.
But the Tendai doctrines, introduced by Dengyō, Ikaku and other fellow-thinkers, though founded mainly on the Saddharama
pundarika, were subjected to the process of eclecticism which all foreign organizations undergo at Japanese hands. Dengyō
strove in the manner of the Tendai school to "old beget and
through towards the 5th century of our era on a lofty range
of mountains in the province of Chekhian by the celebrated
teacher Chikai" (Lloyd, "Developments of Japanese Budhism,
Transactions of the Asiatic Society of Japan, vol. xxii.),
and carrying it to Japan he fitted its disciplinary and meditative
methods to the foundations of the sects already existing there.
This eclecticism was even more marked in the case of the
Shingon (true word) doctrines, taught by Dengyō's illustrious
contemporary, Kōbō daishi, who was regarded as the incarnation of
several Buddhist deities, and commemorated as their mouth
organ, from the comparatively low platform of Hinayana
Buddhism, whose sole aim is individual salvation, to the Mahāyana
document, which teaches its devotee to strive after perfect
enlightenment, not for his own sake alone, but also that he may
help his fellows and intercede for them. Then followed the
Jōdo (Pure Land) sect, introduced in 1153 by a priest, Senku,
who is remembered by later generations as Hōnen shinon.
He taught salvation by faith ritualistically expressed.
The virtue that saves comes, not from imitation of and conformity to
the person and character of the saviour Amida, but from blind
trust in his efforts and ceaseless repetition of pious formulae. It
is really a religion of despair rather than of hope, and in that
respect it reflects the profound sympathy awakened in the bosom
of its teacher by the sorrows and sufferings of the troublesome
times in which he lived.

A favourite pupil of Hōnen shinon was Shinran (1173-1262).
He founded the Jōdo Shinshū (true sect of jōdo), commonly
called simply Shinshū and sometimes Monto, which subse-
quently became the most influential of Japanese sects, with its
splendid monasteries, the two Hongwana-ji in Kioto. The
differences between the doctrine of the Jōdo sect and that of its
predecessors were that the former "divested itself of all meta-
physics"; knew nothing of a philosophy of religion, dispensed
with a multiplicity of acts of devotion and the keeping of many
commandments; did not impose any vows of celibacy or any
renunciation of the world, and simply made faith in Amida the
all in all. In modern days the Shinshū sect has been the most
progressive of all Buddhist sects and has freely sent forth its
promising priests to study in Europe and America. Its devotees
make no use of charms or spells, which are common among the
followers of other sects.

Anterior by a few years to that introduction of the Shinshū
was the Zen sect, which has three main divisions, the Rinzai
(1168), the Sōtō (1223) and the Obakō (1560). This is essentially
a contemplative sect. Truth is reached by pure contemplation,
and knowledge can be transmitted from heart to heart without
the use of words. In that simple form the doctrine was accepted
by the Rinzai believers. But the founders of the Sōtō branch—
Shōyo taishi and Butuzi zenshi—added scholarship and re-
search to contemplation, and taught that the "highest wisdom
and the most perfect enlightenment are attained when all the
elements of phenomenal existence are recognized as empty, vain
and unreal." This creed played an important part in the
development of Bushidō, and its priests have always been dis-
guished for erudition and indifference to worldly possessions.

Last but not least important among Japanese sects of Buddhism is the Nichiren or Hokke, called after its founder, Nichiren
(1222-1282). It was based on the Saddharama pundarika, and it
taught that it was only one true Buddha—the moon in the
heavens—the other Buddhas being like the moon reflected
in the waters, transient, shadowy reflections of the Buddha of
truth. It is this being who is the source of all phenomenal
existence, and in whom all phenomenal existence has its being.
The imperfect Buddhism teaches a chain of cause and effect;
true Buddhism teaches that the first link in this chain of cause
and effect is the Buddha of original enlightenment. When this
point has been reached true wisdom has at length been attained.
Thus the monotheistic faith of Christianity was virtually reached
in one God in whom all creatures "live, move and have their
being." It will readily be conceived that these varied doctrines
could not have been encouraged among the sects professing them.
Sectarian controversy and schism was therefore a thing unknown
among Japanese Buddhists as they were among European
Christians, but to the credit of Buddhism it has to be recorded
that the stake and the rack never found a place among its instru-
ments of self-assertion. On the other hand, during the wars
that devastated Japan from the 12th to the end of the 16th
century, many of the monasteries became military camps, and
the monks, wearing armour and wielding glaives, fought in
secular as well as religious causes.

The story of the first Christian mission to Japan is told else-
where (see § VII. FOREIGN INTERCOURSE). Their work suffered an
early setback but for more than 150 years the Spaniards were
almost simultaneously with the conclusion of the peace
contracts, a small band of Catholic fathers entered Japan
from the Ryūkū islands, where they had settled about 1624.
They reached that, in the neighbourhood of Nagasaki, there
were some small communities where Christian worship was still carried on. It would seem that these
missionaries had not been invited to Japan, but the arrival of the fathers revived the old question, and the
native Christians, or such of them as refused to apostatize, were
removed from their homes and sent into banishment. This was
the example of religious intolerance in Japan. At the instance
of the foreign representatives in Tokio the exiles were set at liberty
in 1873, and from that time complete freedom of conscience existed. The number of Japanese Protestants is not
known although it was estimated by the American Consul to be
500 when the constitution in 1890. In 1905 there were 60,000 Roman Catholic converts in Japan forming 360 congregations, with 130 missionaries and
215 teachers, including 145 nuns. These were all European.
They were assisted by 52 Japanese priests, 52 Japanese nuns, 280
male catechists and 265 female catechists and nurses. Three
societies for native priests existed, together with 58 schools and orphan-
ages and two lepers' homes. The whole was presided over by an
archbishop and three bishops.

The Anglican Church was established in Japan in 1859 by two
American clergymen who settled in Nagasaki, and now, in con-
currence with the Baptist churches in the Far East, the Anglican
Church has missions collectively designated Nihon Sei-Kōkai. There are
6 bishops—2 American and 4 English—with about 60 foreign
and 50 Japanese priests and deacons, besides many foreign lay
workers, 100 Japanese clergymen and 50 lepers' hospitals.
The Anglican converts number 11,000. The Protestant missions include Presby-
terian (Nihon Kirisuto Kyokai), Congregational (Kumi-ai), Metho-
dist, Baptist and the Salvation Army (Kyosei-gun). The pioneer
Protestant mission was founded in 1859 by representatives of the
American Presbyterian and Dutch Reformed Churches. To this
mission belongs the credit of having published, in 1860, the first
complete Japanese version of the New Testament, followed by the
Old Testament in 1887. The Presbyterians, representing 7 religious
societies, have over a hundred missionaries; 12,400 converts;
numerous missions, have over a hundred missionaries; 12,400 converts;
a number of boarding schools for boys and girls and day schools.
The Presbyterian and American churches are associated exclusively with
the mission of the American board of commissioners for foreign missions.
They have about 11,400 converts, and the largest Christian educa-
tional institution in the world. The English Baptists and Methodists represent 6 American societies and 1 Canadian.
They have 130 missionaries and 10,000 converts; boarding schools, day
schools, and the most important Christian college in Tokio, namely,
the Aoyama Gakuin, where 1,500 students, including 100 foreign
students, are educated. The Methodists have 60 missionaries, a theological seminary, an academy
for boys, boarding schools for girls, day schools and 3,000 converts.
The Salvation Army, which did not enter Japan until 1895, has
12,500 members and 21 corps, and its general secretary is a
nightly magazine, the War Cry (To ki no Ke). Finally, the Society
of Friends, the American and London Religious Tract Societies and the German Men's Christian Association (Germ. Glaubens
verband) have their representatives in Japan. It will be seen from the above that the missionaries in Japan, in the
space of half a century (1858 to 1908), had won 110,000 converts,
in round numbers. To these must be added the Orthodox Russian
mission in Hokkaidō which has about 150 converts, the 27,000
Japanese priests and deacons, and 27,000 converts, the whole
presided over by a bishop. Thus the total number of converts
becomes 137,000. In spite of the numerous sects represented in Japan there has been virtually no sectarian strife, and it may be said of the Japanese converts that it is in the main at all about the subtleties of dogma which divide European Christianty. Their tendency is to consider only the practical aspects of the creed as a moral and ethical guide. They are disposed, also, to adapt the creed to their own requirements just as they adapted Buddhism, and this is a disposition which promises to grow.

VIII.—Foreign Intercourse

Foreign Intercourse in Early and Medieval Times.—There can be no doubt that commerce was carried on by Japan with China and Korea earlier than the 8th century of the Christian era. It would appear that from the very outset over-sea trade was regarded as a government monopoly. Foreigners were allowed to travel freely in the interior of the country provided that they submitted their baggage for official inspection and made no purchases of weapons of war, but all imported goods were bought in the first place by official appraisers who subsequently sold them to the people at arbitrarily fixed prices. Greater importance attached to the trade with China under the Ashikaga shōguns (14th, 15th and 16th centuries), who were in constant need of funds to defray the cost of interminable military operations caused by civil disturbances. In this distress they turned to the neighbouring empire as a source from which money might be obtained. This idea seems to have been suggested to the shōgun Takanui by a Buddhist priest, when he undertook the construction of the temple Tennyū-ji. Two ships laden with goods were fitted out, and it was decided that the enterprise should be repeated annually. Within a few years after this development of commercial relations between the two empires, an interruption occurred owing partly to the overthrow of the Yuen Mongols by the Chinese Ming, and partly to the activity of Japanese pirates and adventurers who raided the coasts of China. The shōgun Yoshimitsu (1368–1394), however, succeeded in restoring commercial intercourse, though in order to effect his object he consented that goods sent from Japan should bear the character of tribute and that he himself should receive investiture at the hands of the Chinese emperor's ambassador. The Nanbun government granted a certain number of commercial passports, and these were given by the shōgun to Ouchi, feudal chief of Cho-shu, which had long been the principal port for trade with the neighbouring empire. Tribute goods formed only a small fraction of a vessel's cargo: the bulk consisted of articles which were delivered into the government's stores in China, payment being received in copper cash. It was from this transaction that the shōgun derived a considerable part of his profits, for the articles did not cost him anything originally, being either presents from the great temples and provincial governors or compulsory contributions freely made by Ouchi. As for the goods provided by the Chinese government and the goods shipped in China, they were arbitrarily distributed among the noble families in Japan at prices fixed by the shōgun's assessor. Thus, so far as the shōgun was concerned, these enterprises could not fail to be lucrative. They also brought large profits to the Ouchi family, for, in the absence of competition, the products and manufactures of each country found ready sale in the markets of the other. The articles found most suitable in China were swords, fans, screens, lacquer wares, copper and agate, and the goods brought back to Japan were brocade and other silk fabrics, articles of production, jade and fragrant woods. The Chinese seemed to have had a just appreciation of the wonderful swords of Japan. At first they were willing to pay the equivalent of 12 guineas for a pair of blades, but by degrees, as the Japanese began to increase the supply, the price fell, and at the beginning of the 16th century all the diplomacy of the Japanese envoys was needed to obtain good figures for the large and constantly growing quantity of goods that they took over by way of supplement to the tribute. Buddhist priests generally enjoyed the distinction of being selected as envoys, for experience showed that their sober and invariable over emphasis on the economic aspects of the Chinese authorities and secured a fine profit for their master, the shōgun. In the middle of the 16th century these tribute-bearing missions came to an end with the ruin of the Ouchi family and the overthrow of the Ashikaga shōguns, and they were never renewed.

Japan's medieval commerce with Korea was less ceremonious than that with China. No passports had to be obtained from the Korean government. A trader was sufficiently equipped when he carried a permit from the So family, which held the island of Tsushima in fief. Fifty vessels were allowed to pass yearly from ports in Japan to the three Japanese settlements in Korea. Little is recorded about the nature of this trade, but it was rudely interrupted by the Japanese settlers, who, offended at some arbitrary procedure on the part of the local Korean authorities, took up arms (A.D. 1510) and at first signally routed the Koreans. An army from Seoul turned the tables, and the Japanese were compelled to abandon the three settlements. Subsequently the shōgun's government—which had been concerned in the struggle—approached Korea with amicable proposals, and it was agreed that the ringleaders of the raiders should be decapitated and their heads sent to Seoul, Japan's compliance with this condition affording, perhaps, a measure of the value she attached to neighbourly friendship. Thenceforth the number of vessels was limited to 25 annually and the settlements were abolished. Some years later, the Japanese again resorted to violent acts of self-assertion, and on this occasion, although the offenders were arrested by order of the shōgun Yoshiharu, and handed over to Korea for punishment, the Seoul court, in declining to resume the system of settlements or to allow the trade to be resumed on its former basis. Fifty years afterwards the ōkō's armies invaded Korea, overrunning it for seven years, and leaving, when they retired in 1598, a country so impoverished that it no longer offered any attraction to commercial enterprise from beyond the sea.

The Portuguese discovered Japan by accident in 1542 or 1543—the exact date is uncertain. On a voyage to Macao from Siam, a junk carrying three Portuguese was blown from her course and fetched Tanegashima, a small island lying south of the province of Ōtsu. The Portuguese, always hospitable and inquisitive, welcomed the newcomers and showed special curiosity about the arquebuses carried by the Portuguese, fire-arms being then a novelty in Japan and all weapons of war being in great request. Conversation was impossible, of course, but, by tracing images upon the sand, a Chinese member of the crew succeeded in explaining the cause of the junk's arrival. She was then piloted to a more commodious harbour, and the Portuguese sold two arquebuses to the local feudal lord, who immediately ordered his armament to manufacture similar weapons. Very soon the news of the discovery reached with the Portuguese traders in the East, and at least two dozen expeditions were fitted out during the next few years to exploit this new market. Their objective points were all in the island of Kitūshū—the principal stage where the drama—ultimately converted into a tragedy—of Christian propaganda and European commercial intercourse was acted in the interval between 1542 and 1637.

It does not appear that the Jesuits at Macao, Goa or other centres of Portuguese influence in the East took immediate advantage of the discovery of Japan. The pioneer propagandist was Francis Xavier, who landed near Kagoshima on the 15th of August 1540. During the interval of six (or seven) years that separated this event from the drifting of the junk to Tanegashima, the Portuguese had traded freely in the ports of Kitūshū, had visited Kōto, and had reported the Japanese capital to be a city of 96,000 houses, therefore larger than Lisbon. Xavier would certainly have gone to Japan even though he had not been specially encouraged, for the reports of his countrymen depicted the Japanese as "very desirous of being instructed," and he longed to find a field more promising than that inhabited by all these Indian nations, barbarous, vicious and irreligious. He narrowly missed being sent to Portugal as a special determinant. One was a request addressed by a feudatory, supposed to have been the chief of the
Bungo fief, to the viceroy of the Indies at Goa; the other, an appeal made in person by a Japanese named Yajirō, whom the fathers spoke of as Anjiro, and who subsequently attained celebrity under his baptismal name, Paul of the holy faith. No credible reason is historically assigned for the action of the Japanese feudal. Probably his curiosity had been excited by accounts which the Portuguese traders gave of the noble devotion of their country’s missionaries, and being entirely without the outer world as all Japanese were at that time, the old golden precio issued the invitation partly out of curiosity and partly from a sincere desire for progress. Anjiro’s case was very different. Labouring under stress of repentant zeal, and fearful that his evil acts might entail murderous consequences, he sought an asylum abroad, and was taken away in 1546 by a Portuguese vessel whose master advised him to repair to Malacca for the purpose of confessing to Xavier. This might well have seemed to the Jesuits a providential dispensation, for Anjiro, already able to speak Portuguese, soon mastered it sufficiently to interpret for Xavier and his fellow-missionaries (without which aid they must have remained long helpless in the face of the immense difficulty of the Japanese language), and to this linguistic skill he added extraordinary gifts of intelligence and memory. Xavier, with two Portuguese companions and Anjiro, were excellently received by the feudal chiefs of Satsuma and obtained permission to preach their doctrine in any part of the fief. This permit is not to be construed as an evidence of official sympathy with the foreign creed. Commercial considerations alone were in question. A Japanese feudal chief in that era had sedulously to foster every source of wealth or strength, and as the newly opened trade rendered his realm more attractive, his feudal lord was not less anxious to secure a monopoly of it in the 16th century than the Ashikaga shōguns had been in the 15th. The Satsuma daimyō was led to believe that the presence of the Jesuits in Kagoshima would certainly prelude the advent of trading vessels. But within a few months one of the expected merchantmen sailed to Hirado without touching at Kagoshima, and her example was followed by two others in the following year, so that the Satsuma chief saw himself flouted for the sake of a petty rival, Matsudaira of Hirado. This fact could not fail to provoke his resentment. But there was another influence at work. Buddhism has always been a tolerant religion, eclectic rather than exclusive. Xavier, however, had all the bigoted intolerance of his time. The Buddhist priests in Kagoshima received him with courtesy and listened respectfully to the doctrines he expounded through the mouth of Anjiro. Xavier rejoined with a display of aggressive intolerance which shocked and alienated the Buddhists. They represented to the Satsuma chief that peace and good order were inconsistent with such a display of militant propaganda, and he, already profoundly chagrined by his commercial disappointment, issued in 1550 an edict making it a capital offence for any of his vasals to embrace Christianity. Xavier, or, more correctly speaking, Anjiro, had won 150 converts, who remained without molestation, but Xavier himself took ship for Hirado. There he was received with salvoes of artillery by the Portuguese merchantmen lying in the harbour and with marks of profound respect by the Portuguese traders, a display which induced the local chief to issue orders that courteous attention should be paid to the teaching of the foreign missionaries. In ten days a hundred baptisms took place; another significant index of the mood of the Japanese in the early era of Occidental intercourse: the men in authority always showed a complaisant attitude towards Christianity where trade could be fostered by so doing, and wherever the men in authority showed such an attitude, considerable numbers of the lower orders embraced the foreign faith. Thus, in considering the commercial history of the era, the element of religion constantly thrusts itself into the foreground.

Xavier next resolved to visit Kiōto. The first town of importance he reached on the way was Yamaguchi, capital of the Chōshū fief, situated on the northern shore of the Shimonoseki Strait. There the feudal chief, Ouchi, though sufficiently courteous and inquisitive, showed no special cordiality towards humble missionaries unconnected with commerce, and the work of proselytizing made no progress, so that Xavier and his companion, Fernandez, pushed on to Kiōto. The time was mid-winter; the two fathers suffered terrible privations during their journey of two months on foot, and on reaching Kiōto they found a city which had been almost wholly reduced to ruins by internece war. Necessarily they failed to obtain audience of either emperor or shōgun, and that time the most inaccessible potentates in the direct line of the Chinese “son of heaven,” excepted, and nothing remained but street preaching, a strange resource, seeing that Xavier, constitutionally a bad linguist, had only a most rudimentary acquaintance with the profoundly difficult tongue in which he attempted to expound the mysteries of a novel creed. A fortnight sufficed to convince him that Kiōto was unfruitful soil. He therefore returned to Yamaguchi. But he had now learned a lesson. He saw that propaganda without scrip or staff and without the countenance of those sitting in the seats of power would be futile in Japan. So he obtained from Hirado and enjoyed comparative tranquillity. At the time of Xavier’s second sojourn in Yamaguchi, a Portuguese ship happened to be visiting Bungo, and at its master’s suggestion the great missionary proceeded thither, with the intention of returning temporarily to the Indies. At Bungo there was then ruling Otomo, second in power to only the Satsuma chief among the feudatories of Kiōshū. By him the Jesuit father was received with all honour. Xavier did not now neglect the lesson he had learned in Yamaguchi. He repaired to the Bungo chieftain’s court, escorted by nearly the whole of the Portuguese crew, gorgiously bedizened, carrying their arms and with banners flying. Otomo, a young and ambitious ruler, was keenly anxious to attract foreign traders with their rich cargoes and puissant weapons of war. Witnessing the reverence paid to Xavier by the Portuguese traders, he appreciated the importance of gaining the goodwill of the Jesuits, and accordingly not only granted them full freedom to teach and preach, but also enjoined upon his younger brother, who, in the sequel of a sudden rebellion, had succeeded to the lordship of Yamaguchi, the advisability of extending protection to Torres and Fernandez, then sojourning there. After some months’ stay in Bungo, Xavier set sail for Goa in February 1552. Death overtook him in the last month of the same year.

Xavier’s departure from Japan marked the conclusion of the first epoch of Christian propaganda. His sojourn in Japan extended to 27 months. In that time he and his coadjutors won about 760 converts. In Satsuma more than a year’s labour produced 150 believers. There Xavier had the assistance of Anjiro to expound his doctrines. No language lends itself with greater difficulty than Japanese to the discussion of theological questions. The terms necessary for such a purpose are not current among laymen, and only by special
study, which, it need scarcely be said, must be preluded by an accurate acquaintance with the tongue itself, can a man hope to become duly equipped for the task of exposition and dissertation. It is open to grave doubt whether any foreigner has ever attained the requisite proficiency. Leaving Anjirō in Kagoshima to care for the converts made there, Xavier pushed on to Hirado, where he baptized a hundred Japanese in a few days. Now we have it on the authority of Xavier himself that in this Hirado campaign "none of us knew Japanese." How then did they proceed? "By reciting a semi-Japanese volume" (a translation made by Anjirō of a treatise from Xavier's pen) "and by delivering sermons, we brought several over to the Christian cult." Sermons preached in Portuguese or Latin to a Japanese audience on the island of Hirado in the year 1550 can scarcely have attracted intelligent interest. On his first visit to Yamaguchi, Xavier's success of access to the understanding of his hearers was confined to the rudimentary knowledge of Japanese which Fernandez had been able to acquire in 14 months, a period of study which, in modern conditions with all the aids now procurable, would not suffice to carry a student beyond the margin of the colloquial. No converts were won. The people of Yamaguchi probably admired the splendid faith and devotion of these over-sea philosophers, but as for their doctrine, it was unintelligible. In Kōto the same experience was repeated, with an addition of much physical hardship. But when the Jesuits returned to Yamaguchi in the early autumn of 1551, they baptized 500 persons, including several members of the military class. Still Fernandez with his broken Japanese was in no more than a medium condition of Christianity. It must be concluded that the teachings of the missionaries produced much less effect than the attitude of the local chiefs.

Only two missionaries, Torres and Fernandez, remained in Japan after the departure of Xavier, but they were soon joined by three others. These newcomers landed at Kagoshima and found that, in spite of the official veto against the adoption of Christianity, the feudal chief had lost nothing of his desire to foster foreign trade.

Two years later, all the Jesuits in Japan were assembled in Bungo. Their church stood there; and they had also built two hospitals. Local disturbances had compelled them to withdraw from Yamaguchi, not, however, before their violent disputes with the Buddhist priests in that town had induced the feudatory to proscribe the foreign religion, as had previously been done in Kagoshima. From Funai, the chief town of Bungo, the Jesuits began in 1579 to send yearly reports to their Generals in Rome. These reports, known as the Annual Letters, comprise some of the most valuable information available about the conditions then existing in Japan. They describe a state of abject poverty among the lower orders; poverty so cruel that the destruction of children by their famishing parents was an everyday occurrence, and in some instances choice had to be made between cannibalism and starvation. Such suffering becomes easily intelligible when the fact is recalled that Japan had been racked by civil war during more than 200 years, each feudal chief fighting for his own hand, to save or to extend his territorial possessions. From these Annual Letters it is possible also to gather a tolerably clear idea of the course of events during the years immediately subsequent to Xavier's departure. There was no break in the continuity of the newly inaugurated foreign trade. Portuguese ships visited Hirado as well as Bungo, and in those days their masters and crews not only attended scrupulously to their religious duties, but also showed such profound respect for the missionaries that the Japanese received constant object lessons in the influence wielded over the traders by the Jesuits. Thirty years later, this orderly and reverential demeanour was exchanged for riotous excesses such as had already made the Portuguese sailor a by-word in China. But in the early days of intercourse with Japan the crews of the merchant vessels seem to have preached Christianity by their exemplary conduct. Just as Xavier had been induced to visit Bungo by the anxiety of a ship-captain for Christian ministrations, so in 1557 two of the fathers repaired to Hirado in obedience to the solicitations of Portuguese sailors. There the fathers, under the guidance of Vilela, sent brothers to parade the streets ringing bells and chanting litanies; they organized bands of boys for the same purpose; they caused the converts, and even children, to flagellate themselves at a model of Mount Calvary, and they worked miracles, healing the sick by contact with scourges or with a booklet in which Xavier had written litanies and prayers. It may well be imagined that such doings attracted surprised attention in Japan. They were supplemented by even more striking practices. For a sub-feudatory of the Hirado chief, having been converted, showed his zeal by destroying Buddhist temples and throwing down the idols, thus inaugurating a campaign of violence destined to mark the progress of Christianity throughout the greater part of its history in Japan. There followed the overthrowing of a cross in the Christian cemetery, the burning of a temple in the town of Hirado, and a street riot, the sequel being that the Jesuit fathers were compelled to leave Hirado for Bungo. It is essential to follow all these events, for not otherwise can a clear understanding be reached as to the aspects under which Christianity presented itself originally to the Japanese. The Portuguese traders, reverent as was their demeanour towards Christianity, did not allow their commerce to be interrupted by vicissitudes of propaganda. They still repaired to Hirado, and rumours of the wealth-begotting effects of their presence having reached the neighbouring fief of Omura, its chief, Sumitada, made overtures to the Jesuits in Bungo, offering a port free from all dues for ten years, a large tract of land, a residence for the missionaries and other privileges. The Jesuits hastened to take advantage of this proposal, and no sooner did the news reach Hirado than the feudatory of that island repented of having expelled the fathers and invited them to return. But while they hesitated, a Portuguese vessel arrived at Hirado, and the feudal chief declared publicly that no need existed to conciliate the missionaries, since trade went on without them. When this became known in Bungo, Torres hastened to Hirado, was received with extraordinary honours by the crew of the vessel, and at his instance she left the port, her master declaring that "he could not remain in a country where they maltreated those who professed the same religion as himself." Hirado remained a closed port for some years, but ultimately the advent of three merchantmen, which intimated their determination not to put in unless the anti-Christian ban was removed, induced the feudal chief to receive the Jesuits once more. This incident was paralleled a few years later in the island of Amakusa, where a petty feudatory, in order to attract foreign trade, as the missionaries themselves frankly explain, embraced Christianity and ordered all his vassals to follow his example; but when no Portuguese ship appeared, he apostatized, required his subjects to revert to Buddhism and made the missionaries withdraw. In fact, the competition for the patronage of Portuguese traders was so keen that the Hirado feudatory attempted to burn several of their vessels because they frequented the territorial waters of his neighbour and rival, Sumitada. The latter became a most stalwart Christian when his wish was gratified. He set himself to eradicate idolatry through his fief with the strong arm, and his fierce intolerance provoked results which ended in the destruction of the Christian town at the newly opened free port. Sumitada, however, quickly reasserted his authority, and in 1563 he took a step which had far-reaching consequences, namely, the building of a church at Nagasaki, in order that Portuguese commerce might have a centre and the Christians an assured asylum. Nagasaki was then a little fishing village. In five years it grew to be a town of thirty thousand inhabitants, and Sumitada became one of the richest of the Kūshū feudatories. When in 1573 successful conflicts with the neighbouring fiefs brought him an access of territory, he declared that he owed these victories to the influence of the Christian God, and shortly afterwards he publicly proclaimed banishment for all who would not accept the foreign faith. There were then no Jesuits by his side, but immediately two
Christian propagandism had now made substantial progress. The Annual Letter of 1582 recorded that at the close of 1581, thirty-two years after the landing of Xavier in Japan, there were about 150,000 converts, of whom some 125,000 were in Kiūshū and the remainder in Yamaguchi, Kiōto and the neighbourhood of the latter city. The Jesuits in the empire then numbered 75, but down to the year 1583 there had never been more than 9, and down to 1577, not more than 18. The harvest was certainly great in proportion to the number of sowers. But it was a harvest of artificial growth; forced by the despotic insistence of feudal chiefs who possessed the power of life and death over their vassals, and were influenced by a desire to attract foreign trade. To the Buddhist priests this movement of Christian propagandism had brought an experience hitherto unknown to them, persecution on account of creed. They had suffered for interfering in politics, but the fierce cruelty of the Christian fanaticism now became known for the first time to men themselves conspicuous for tolerance of heresy and receptivity of instruction. They had had no previous experience of humanity in the garb of an Otomo of Bungo, who, in the words of Crasset, was the real owner of the chase of the bonzes as to that of wild beasts, and made it his singular pleasure to exterminate them from his states.\(^9\)

In 1582 the first Japanese envoys sailed from Nagasaki for Europe. The embassy consisted of four youths, the oldest not more than 16, representing the fiefs of Arima, Omura and Bungo. They visited Lisbon, Madrid, Rome, and in all these cities they were received with displays of magnificence such as 16th century Europe delighted to make. That, indeed, had been the motive of Vilela in organizing the mission: he desired to let the Japanese see with their own eyes how great were the riches and might of Western states.

In the above statistics of converts at the close of 1581 mention is made of Christians in Kiōto, though we have already seen that the visit by Xavier and Fernandez to that city was wholly barren of results. A second visit, however, made by Vilela in 1559, proved more successful. He carried letters of recommendation from the Bungo chieftain, and the proximate cause of his journey was an invitation from a Buddhist priest in the celebrated monastery of Hiei-zen, who sought permission about Christianity. It was before the razing of temples and the overthrow of idols had commenced in Kiūshū. On arrival at Hiei-zen, Vilela found that the Buddhist prior who had invited him was dead and that only a portion of the old man’s authority had descended to his successor. Nevertheless the Jesuit obtained an opportunity to expound his doctrines to a party of bonzes at the monastery. Subsequently, through the good offices of a priest, described as “one of the most respected men in the city,” and with the assistance of the Bungo feuatory’s letter, Vilela enjoyed the rare honour of being received by the shōgun in Kiōto, who treated him with all consideration and assigned a house for his residence. It may be imagined that, owing such a debt of gratitude to Buddhist priests, Vilela would have behaved towards them and their creed with courtesy. But the Jesuit fathers were proof against all influences calculated to impair their stern sense of duty. Speaking through the mouth of a Japanese convert, Vilela attacked the bonzes in unmeasured terms and denounced their faith. Soon the bonzes, on their side, were seeking the destruction of these uncompromising assailants with insistence inferior only to that which the Jesuits themselves would have adopted. Against these perils Vilela was protected by the goodwill of the shōgun, who had already issued a decree threatening with death any one who injured the missionaries or obstructed their work. In spite of all difficulties and dangers these wonderful missionaries, whose courage, zeal and devotion are beyond all eulogy, toiled on resolutely and even recklessly, and such success attended their efforts that by 1564 many converts had been won and churches had been established in five walled towns within a distance of 50 miles from Kiōto. Among the converts were two Buddhist priests, noteworthy
hostile at the outset, who had been nominated as official commissioners to investigate and report upon the doctrine of Christianity. The first conversion en masse was due to pressure from above. A petty feudatory, Takayama, whose fief lay at Takatsuki in the neighbourhood of the capital, challenged Vilela to a public controversy, the result of which was that the Japanese acknowledged himself vanquished, embraced Christianity and invited his vassals as well as his family to follow his example. This man’s son—Takayama Yusho—proved one of the staunchest supporters of Christianity in all Japan, and has been immortalized by the Jesuits under the name of Don Justo Ucedono. Incidentally this event furnishes an index to the character of the Japanese samurai; he accepted the consequences of defeat as frankly as he dared it. In the same year (1564) the feudatory of Sawa, a brother of Takayama, became a Christian and imposed the faith on all his vassals, just as Sumitada and other feudal chiefs had done in Kiushu. But the Kioto sect differs from that of Kiushu in one important respect—the former is free from any intrusion of commercial motives.

Kiotō was at that time the scene of sanguinary tumults, which culminated in the murder of the shōgun (1563), and led to the issue of a decree by the emperor proscribing Christianity. In Japanese medieval custom, this was the only two instances of Imperial interference with Christian propaganda. There is evidence that the edict was obtained at the instance of one of the shōgun’s assassins and certain Buddhist priests. The Jesuits—their number had been increased to three—were obliged to take refuge in Sakai, now little more than a suburb of Osaka, but at that time a great and wealthy mart, and the only town in Japan which did not acknowledge the sway of any feudal chief. Three years later they were summoned thence to be presented to Oda Nobunaga, one of the greatest captains Japan has ever produced. In the very year of Xavier’s landing at Kagoshima, Nobunaga had succeeded to his father’s fief, a comparatively petty estate in the province of Owari. In 1568 he was seated in Kioto, a maker of shōguns and acknowledged ruler of 30 among the 66 provinces of Japan. Had Nobunaga, wielding such immense power, adopted a hostile attitude towards Christianity, the fires lit by the Jesuits in Japan must soon have been extinguished. Nobunaga, however, to great breadth and liberality of view added strong animosity towards Buddhist priests. Many of the great monasteries had become armed camps, their inmates skilled equally in field-attacks and in the art of massacre. One sect (the Nichiren), which was specially affected by the sectaries, had lent powerful aid to the murdere of the shōgun three years before Nobunaga’s victories carried him to Kioto, and the armed monasteries constituted imperia in imperio which assailed ill with his ambition of complete supremacy.

He therefore welcomed Christianity for the sake of its opposition to Buddhism, and when Takayama conducted Froez from Sakai to Nobunaga’s presence, the reception accorded to the Jesuit was of the most cordial character. Throughout the fourteen years of life that remained to him, Nobunaga continued to be the constant friend of the missionaries in particular and of the Jesuits in Japan in general. He stood between the Jesuits and the Throne when, in reply to an appeal from the Buddhist priests, the emperor, for the second time, issued an anti-Christian decree (1568); he granted a site for a church and residence at Azuchi on Lake Biwa, where his new fortress stood; he addressed to various powerful feudal lords letters signifying a desire for the spread of Christianity; he frequently made handsome presents to the fathers, and whenever they visited him he showed a degree of accessibility and graciousness very foreign to his usually haughty and imperious demeanour. The Jesuits themselves said of him: "This man seems to have been chosen by God to open and prepare the way for our faith." Nevertheless they do not appear to have entertained much hope at any time of converting Nobunaga. They must have understood that their doctrines had not made any profound impression on a man who could treat them as this potentate did in 1579, when he plainly showed that political exigencies might at any moment induce him to sacrifice them. 1 His last act, too, proved that sacrilege was of no account in his eyes, for he took steps to have himself apotheosized at Azuchi with the utmost pomp and circumstance. Still nothing can obscure the benefits he heaped upon the propagandists of Christianity.

The terrible tumult of domestic war through which Japan passed in the 15th and 16th centuries brought to her service three of the greatest men ever produced in Japan, Hideyoshi Occident or Orient. They were Oda Nobunaga, and the Toyotomi Hideyoshi and Tokugawa Ieyasu. Christianity, as Nobunaga’s lieutenant, contributed largely to the building of the latter’s fortunes, and, succeeding him in 1582, he made use of the empire under his own administrative sway. For the Jesuits now the absorbing question was, what attitude Hideyoshi would assume towards their propaganda. His power was virtually limitless. With a word he could have overturned the whole edifice created by them at the cost of so much splendid effort and noble devotion. They were very quickly reassured. In this matter Hideyoshi walked in Nobunaga’s footsteps. He not only accorded a friendly audience to Father Organzio, who waited on him as representative of the Jesuits, but also he went in person to assign to the company a site for a church and a residence in Osaka. There was presently to rise the most massive fortress ever built in the East. At that time many Christian converts were serving in high positions, and in 1584 the Jesuits placed it on record that "Hideyoshi was not only not opposed to the things of God, but he even showed that he made much account of them and preferred them to all the sects of the bonzes. . . . He is entrusting to Christians his treasures, his secrets and his furtresses of most importance, and shows himself well pleased that the sons of the great lords about him should adopt our customs and our law." Two years later, in Osaka he received with every mark of cordiality and favour a Jesuit envoy from the Portuguese, whose mission was, according to the Jesuit’s account, in that occasion his visitor recorded that he spoke of an intention of christianizing one half of Japan. Nor did Hideyoshi confine himself to words. He actually signed a patent licensing the missionaries to preach throughout all Japan, and exempting not only their houses and churches from the billeting of soldiers but also the priests themselves from local burdens. This was in 1586, on the eve of Hideyoshi’s greatest military enterprise, the invasion of Kiushu and its complete reduction. He carried that difficult campaign to completion by the middle of 1587, and throughout its course he maintained a uniformly friendly demeanour towards the Jesuits. But suddenly, when on the return journey he reached Hakata in the north of the island, his policy underwent a radical metamorphosis. Five questions were by his order propounded to the vice-provincial of the Jesuits: "Why and by what authority do you permit the discharge of public worship?" "Why did you publish a decree concerning the discharge of public worship?" "Why did you allow the Jesuits to possess themselves of any property in the name of the Emperor?" "By what authority do you permit the discharge of public worship?" "Why did you publish a decree concerning the discharge of public worship?" The Jesuits replied and, without comment, sent him word to return to Hirado, assemble all his followers there, and quit the country within six months. On the next day (July 25, 1587) the following edict was published:

---

1 The problem was to induce the co-operation of a feudatory whose castle served for frontier guard to the fact of a powerful chief, his suzerain. The feudatory was a Christian. Nobunaga proposed to the Jesuits in Kioto, and threatened to suppress their religion altogether unless they persuaded the feudatory to abandon the cause of his suzerain.
"Having learned from our faithful councillors that foreign priests have cast their eyes upon them, and that there hath been a large number of them that of Japan, and that they even had the audacity to destroy temples dedicated to our Kami and Hotōke; although the outrage merits the extreme punishment, wishing nevertheless to show them mercy, we order them under pain of death at any time to be punished within twenty days. During that space no harm or hurt will be done to them. But at the expiration of that term, we order that any of them be found in our states, they should be seized and punished as the greatest criminals. As for the Portuguese merchants, we permit them to enter our ports, there to continue their accustomed trade, and to remain in our states provided our affairs need this. But we forbid them from bringing any foreign goods into our country, under the penalty of the confiscation of their ships and goods.

How are we to account for this apparently rapid change of mood on the part of Hideyoshi? Some historians insist that from the very outset he conceived the resolve of suppressing Christianity and expelling its propagandists, but that he concealed his design pending the subjugation of Kištūsh, lest, by premature action, he might weaken his hand for that enterprise. This hypothesis rests mainly on conjecture. Its formulatons found it easier to believe in a hidden purpose than to attribute to a statesman so shrewd and far-seeing a sudden change of mind. A more reasonable theory is that, shortly before leaving Osaka for Kištūsh, Hideyoshi began to entertain doubts as to the expediency of (a) the expulsion of the Christian propagandists, and that his doubts were especially strengthened by direct observation of the state of affairs in Kištūsh. While still in Osaka, he one day remarked publicly that "he feared much that all the virtue of the European priests served only to conceal pernicious designs against the empire." There had been no demolishing of temples or overthrowing of images at Christian instance in the metropolitan provinces. In Kištūsh, however, very different conditions prevailed. There Christianity may be said to have been preached at the point of the sword. Temples and images had been destroyed wholesale; vassals in thousands had been compelled to embrace the foreign faith; and the missionaries themselves had come to be treated as demi-gods whose nod was worth conciliating at any cost of self-abasement. Brought into direct contact with these evidences of the growth of a new power, temporal as well as spiritual, Hideyoshi may well have reached the conclusion that a choice had to be finally made between his own supremacy and that of the alien creed, if not between the independence of Japan and the yoke of the great Christian states of Europe.

Hideyoshi gauged the character of the medieval Christians with sufficient accuracy to know that for the sake of their religion they would at any time defy the laws of the island. His estimate received immediate verification, for when the Jesuits, numbering 120, assembled at Hirado and received his order to embark at once they decided that only those should sail whose services were needed in China. The others remained and went about their duties as usual, under the protection of the converted feudatories. Hideyoshi, however, saw reason to wink at this disregard of his authority. At first he showed uncompromising resolution. All the churches in Kištūsh, Osaka and Sakai were desecrated, and while treachery prevailed the port of Nagasaki. These troops were manifestly dissuaded from their purpose by the Christian feudatories. But Hideyoshi did not protest, and in 1588 he allowed himself to be convinced by a Portuguese envoy that in the absence of missionaries foreign trade must cease, since without the intervention of the fathers peace and good order could not be maintained among the merchants. Rather than suffer the trade to be interrupted Hideyoshi agreed to the coming of priests, and thenceforth, during some years, Christianity not only continued to flourish and grow in Kištūsh but also found a favourable field of operations in Kōtō itself. Care was taken that Hideyoshi's attention should not be attracted by any salient evidences of what he had called a "diabolical religion," and thus for a time all went well. There is evidence that, like the feudal chiefs in Kištūsh, Hideyoshi set great store by foreign trade and would even have sacrificed to its maintenance and expansion something of the aversion he had conceived for Christianity. He did indeed make one very large concession. For on being assured that Portuguese traders could not frequent Japan unless they found Christian trade there to minister to them, he consented to the presence of a limited number of Jesuits. The statistics of 1505 show how Christianity fared under even this partial tolerance, for there were then 137 Jesuits in Japan with 300,000 converts, among whom were 17 feudal chiefs, to say nothing of many men of lesser though still considerable note, and even not a few bonzes.

For ten years after his unkloaked-for order of expulsion, Hideyoshi preserved a tolerant mien. But in 1597 his forbearance gave place to a mood of uncompromising severity. "Hideyoshi's attitude towards Christianity. Up to 1593 the Portuguese had possessed a monopoly of religious propagation and over-sea commerce in Japan. The privilege was secured to them by agreement between Spain and Portugal and by a papal bull. But the Spaniards in Manila had long looked with somewhat jealous eyes on this Jesuit reservation, and when news of the disaster of 1587 reached the Philippines, the Dominicans and Franciscans residing there were fired with zeal to enter this field of missionary enterprise, where the Portuguese had been the least reward within reach. The papal bull, however, demanded obedience, and to overcome that difficulty a ruse was necessary: the governor of Manila agreed to send a party of Franciscans as ambassadors to Hideyoshi. In that guise the friars, being neither traders nor propagandists, considered that they did not violate either the treaty or the bull. It was a technical subterfuge very unworthy of the object contemplated, and the friars supplemented it by swearing to Hideyoshi that the Portuguese would submit to his sway. Thus they obtained permission to visit Kōtō, Osaka and Fushimi, but with the explicit proviso that the clerics should not preach; for by that time they had built a church in Kōtō, consecrated it with the utmost pomp, and were preaching sermons and chanting litanies there in flagrant defiance of Hideyoshi's veto. Presently their number received an access of three friars who came bearing gifts from the governor at Manila, and now they not only established a convent in Osaka, but also seized a Jesuit church in Nagasaki and converted the circumspect worship hitherto conducted there by the fathers into services of the most public character. Officially checked in Nagasaki, they charged the Jesuits in Kōtō and elsewhere with heresy and inciting heterodoxy, and by the courageous openness of their own ministrations as compared with the clandestine timidity of the methods which wise prudence had induced the Jesuits to adopt. Retribution would have followed quickly had not Hideyoshi's attention been engrossed by an attempt to invade China through Korea. At this stage, however, a memorable incident occurred. Driven out of her course by a storm, a great and richly laden Spanish galleon, bound for Acapulco from Manila, drifted to the coast of Tosa province, and running—or being purposely run—on a sand-bank as she was being towed into port by Japanese boats, the galleon was broken and the clerk-bones of the valuable cargoes, including 30,000 crowns, and certain officials urged Hideyoshi to confiscate her as derelict, conveying to him at the same time a detailed account of the doings of the Franciscans and their open flouting of his orders. Hideyoshi, much incensed, commanded the arrest of the Franciscans and dispatched officers to Tosa to confiscate the "San Felipe." The pilot of the galleon sought to intimate these officers by showing them on a map of the world the vast extent of Spain's dominions, and being asked how one country had acquired such extended sway, replied: "Our kings begin by sending into the countries they wish to conquer missionaries who induce the people to embrace our religion, and when they have made considerable progress, troops are sent who combine with the new Christians, and then our kings have not much trouble in accomplishing the rest."
On learning of this, Hideyoshi was overcome with fury. He condemned the Franciscans to have their noses and ears cut off, to be paraded through Kioto, Osaka, and Sakai, and to be crucified at Nagasaki. "I have ordered these foreigners to be treated thus, because they have come from the Philippines to Japan, calling themselves ambassadors later that they were not; because they have remained here far too long without my permission; because, in defiance of my prohibition, they have built churches, preached their religion and caused disorders." Twenty-six suffered under this sentence—six Franciscans, three Japanese Jesuits and seventeen native Christians, chiefly domestic servants of the Franciscans. They met their fate with noble fortitude. Hideyoshi further issued a special injunction against the adoption of Christianity by a feudal chief, and took steps to give practical effect to his edict of 1587. The governor of Nagasaki received instructions to send away all the Jesuits, permitting only two or three to remain for the service of the Portuguese merchants. But the Jesuits were not the kind of men who, to escape personal peril, turn their back upon an unaccomplished work of grace. There were 125 of them in Japan at that time. In October 1597 a junk sailed out of Nagasaki harbour, her decks crowded with seeing Jesuits. In reality she carried 11 of the company, the apparent Jesuits being disguised sailors. It is not to be supposed that such a manoeuvre could be hidden from the local authorities. They winked at it, until rumour became so insistent that it was Kishū in person, and all Japanese in administrative posts knew how Hideyoshi visited disobedience and how hopeless was any attempt to deceive him. Therefore, early in 1598, really drastic steps were taken. Churches to the number of 157 were demolished in Kishū, monasteries and residences fell, and the governor of Nagasaki assembled there all the fathers of the company for deportation to Macao by the great ship in the following year. But while they waited, Hideyoshi died. It is not on record that the Jesuits openly declared his removal from the earth to have been a special dispensation in their favour. But the anti-Christian instinct in a venerable tyrant and his "soul to hell for all eternity." Yet no impartial reader of history can pretend to think that a 16th-century Jesuit general in Hideyoshi's place would have shown towards an alien creed and its propagandists even a small measure of the tolerance exercised by the Japanese statesman towards Christianity and the Jesuits.

Hideyoshi's death occurred in 1598. Two years later, his authority as administrative ruler of all Japan had passed into the hands of Ieyasu, the Tokugawa chief, and thirty years later the Tokugawa potencies had not only exterminated Christianity in Japan but had also condemned their country to a period of international isolation which continued unbroken until 1853, an interval of 214 years. It has been shown that even when they were most insistent against Christianity, Japanese administrators sought to foster and preserve foreign trade. Why then did they close the country's doors to the outside world and suspend a commerce once so much esteemed? To answer that question some retrospect is needed. Certain historians allege that from the outset Ieyasu shared Hideyoshi's misgivings about the real character of Christian preachers and Christian propaganda. But that verdict is not supported by facts. The first occasion of the Tokugawa chief's recorded contact with a Christian propagandist was less than three months after Hideyoshi's death. There was then led into his presence a Franciscan, by name Jerome de Jesus, originally a member of the fictitious embassy from Manila. This man's conduct constitutes an example of the invincible zeal and courage inspiring a Christian priest in those days. Barely escaping the doom of crucifixion which overtook his companions, he had been deported from Japan to Manila at a time when death seemed to be the certain penalty of remaining. But no sooner had he been landed at Manila than he took passage in a Chinese junk, and, returning to Nagasaki, made his way secretly from the far south of Japan to the province of Kii. There arrested, he was brought into the presence of Ieyasu and his own record of what ensued is given in a letter subsequently sent to Manila:

"When the Prince saw me he asked how I had managed to escape the previous persecution. I answered him that at that date God delivered me in order that I might go to Manila and bring back new colleagues from there—preachers of the divine law—and that I had returned from Manila to encourage the Christians, cherishing the desire to go on the cross in order to enjoy eternal glory like my former colleagues. On hearing these words the Emperor began to smile, whether in his quality of a pagan of the sect of Shinto, which teaches that there is no future life, or whether from the thought that I was frightened at having to be put to death. Then, looking at me kindly, he said, 'Be no longer afraid and no longer conceal yourself, and no longer change your habit, for I wish you well; and as for the Christians who every year pass within sight of the Kwantō where my domains are, when they go to Mexico with their ships, I have a keen desire for them to visit the harbours of this island, to refresh themselves there, and to take what they wish, to trade with my vassals and to teach them how to develop silver mines; and that my intentions may be accomplished before my death, I wish you to indicate to me the means to take to realize them.' I answered that it was necessary for a Christian to fulfill the duties of a Buddhist without disturbing the harmony of his life, so that his ships might not be lost in future as the 'San Felipe' had been, and that he should solicit this service from the governor of the Philippines. The Prince approved of my advice, and accordingly he sent a Japanese gentleman, a native of Sakai, as the bearer of this message... It is essential to oppose no obstacle to the complete liberty offered by the Emperor to the Spaniards and to our holy order, for the preaching of the holy gospel.... The same Prince (who is about to visit the Kwantō) invites me to accompany him to make choice of a house, and to visit the harbour which he promises to open to us; his desires in this respect are keener than I can express."

The above version of the Tokugawa chief's mood is confirmed by events, for not only did he allow the contemptuous Franciscan to build a church—the first—in Yedo and to celebrate Mass there, but also he sent three embassies to the Philippines, proposing reciprocal freedom of commerce, offering to open ports in the Kwantō and asking for competent naval architects. He never obtained the architects, and though the trade came, its volume was small in comparison with the abundance of friars that accompanied it. There is just a possibility that Ieyasu saw in these Spanish monks an instrument of counteracting the influence of the Jesuits, for he must have known that the Franciscans opened their mission in Yedo by "declaiming with violence against the fathers of the company of Jesus." In short, the Spanish monks assumed towards the Jesuits in Japan the same kind of toleration that the Jesuits themselves had previously assumed towards Buddhism. At that time there appeared upon the scene another factor destined greatly to complicate events. It was a Dutch merchant ship, the "Liefde." Until the Netherlands revolted from Spain, the Dutch had been the principal distributors of all goods arriving at Lisbon from the Far East; but in 1594 Philip II. closed the port of Lisbon to these rebels, and the Dutch met the situation by turning their prows to the Orient to invade the sources of Portuguese commerce. One of the first expeditions despatched for that purpose set out in 1598, and of the five vessels composing it that of the "Liefde" was the second after the "Liefde." She reached Japan during the spring of 1600, with only four-and-twenty alive out of her original crew of 110. Towed into the harbour at Funai, the "Liefde" was visited by Jesuits, who, on discovering her nationality, denounced her to the local authorities as a pirate and endeavoured to incense the Japanese against them. The "Liefde" had on board in the capacity of "pilot major" an Englishman, Will Adams of Gillingham in Kent, whom Ieyasu summoned to Osaka, where there commenced between the rough British sailor and the Tokugawa chief a cordial friendship which was to last until the death of Adams twenty years later. The Englishman became master ship-builder to the Yedo government; was employed as diplomatic agent when other traders from his own country
and from Holland arrived in Japan, received in perpetual gift a substantial estate, and from first to last possessed the implicit confidence of the shōgun. Ieyasu quickly discerned the man's hold on his patron; presently he made it plain that whatever benefit the foreign community might confer would be increased by encouraging competition among the foreigners, and realized that English and Dutch trade presented the wholesome feature of complete dissociation from religious propaganda. On the other hand, he showed no intolerance to either Spaniards or Portuguese. He issued (1601) two official patents sanctioning the residence of the fathers in Kioto, Osaka and Nagasaki; he employed Father Rodriguez as interpreter to the court at Yedo; and in 1603 he gave munificent succour to the Jesuits who were reduced to dire straits owing to the capture of the great ship from Macao by the Dutch and the consequent loss of several years' supplies for the mission in Japan.

It is thus seen that each of the great trio of Japan's 16th-century statesmen—Nobunaga, Hideyoshi and Ieyasu—adopted at the outset a most tolerant demeanour towards Christianity. The reasons of Hideyoshi's change of mood have been set forth. We have now to examine the reasons that produced a similar metamorphosis in the case of Ieyasu. Two causes present themselves immediately. The first is that, while tolerating Christianity, he did not appear to the crown, or that he himself, whether from state policy or genuine piety, strongly encouraged Buddhism. Proof of the former proposition is found in an order issued by him in 1602 to insure the safety of foreign merchants entering Japanese ports: it concluded with the reservation, "but we rigorously forbid them" (foreigners coming in such ships) "to promulgate their faith." Proof of the latter is furnished by the facts that he invariably carried with him a miniature Buddhist image which he regarded as his tutelary deity, and that he fostered the creed of Shinga as religiously as Oda Nobunaga had suppressed it. There is much difficulty in tracing the exact sequence of events which gradually educated a strong antipathy to the Christian faith in the mind of the Tokugawa chief. He must have been influenced in some degree by the views of his great predecessor, Hideyoshi. But he did not accept those views implicitly. At the end of the 16th century he sent a trusted emissary to Europe for the purpose of directly observing the conditions in the home of Christianity, and this man, the better to achieve his aim, embraced the foreign faith, and studied it from within as well as from without. The story that he had to tell was not one that failed to shock the credit of his sovereign, where freedom of conscience had existed from time immemorial. It was a story of the inquisition and of the state; of unlimited aggression in the name of the cross; of the pope's overlordship which entitled him to confiscate the realm of heretical sovereigns; of religious wars and of wellnigh incredible fanaticism. Ieyasu must have received an evil impression while he listened to his emissary's statements. Under his own eyes, too, were abundant evidences of the spirit of strife that Christian dogma engendered in those times. From the moment when the Franciscans and Dominicans arrived in Japan, a fierce quarrel began between them and the Jesuits; a quarrel which even community of suffering could not compose. Not less repellent was an attempt on the part of the Spaniards to dictate to Ieyasu the expulsion of all Hollanders from Japan, and on the part of the Jesuits to dictate the expulsion of the Spaniards. The former proposal, couched almost in the form of a demand, was twice formulated, and accompanied on the second occasion by a scarcely less insulting offer, namely, that Spanish men-of-war would be sent to Japan to burn all Dutch ships found in the ports of the empire. If in the face of proposals so contumelious as his foreign policy, authority Ieyasu preserved a calm and dignified mien, merely replying that his country was open to all comers, and that, if other nations had quarrels among themselves, they must not take Japan for battle-ground, it is nevertheless unimaginable that he did not strongly resent such interference with his own independent foreign policy, and that he did not interpret it as foreshadowing a disturbance of the realm's peace by sectarian quarrels among Christians. These experiences, predisposing Ieyasu to dislike Christianity as a creed and to distrust it as a political influence, were soon supplemented by incidents of an immediately determinative character. The first was an act of fraud and forgery committed in the interests of a Christian feudatory by a trusted official, himself a Christian. Thereupon Ieyasu, conceiving it unsafe that Christians should fill offices at his court, dismissed all those so employed, banished them from Yedo and forbade any feudal chief to harbour them. The second incident was an attempted survey of the coast of Japan by a Spanish mariner and a Franciscan friar. Permission to take this step had been obtained by an envoy from New Mexico, but no deep consideration of reasons seems to have precluded the permission on Japan's side, and when the mariner (Sebastian) and the friar (Sotelo) hastened to carry out the project, Ieyasu asked Will Adams to explain this display of industry. The Englishman replied that such a proceeding would be regarded in Europe as an act of hostility, especially on the part of the Spaniards or Portuguese, whose aggressions were notorious. He added, in reply to further questions, that the Roman priesthood had been expelled from many parts of Germany, from Sweden, Norway, Denmark, Holland and England, and that although his own country preserved the pure form of the faith in that land from which Spain and Portugal had deviated, yet neither English nor Dutch considered that that fact afforded them any reason to war with, or to annex, States which were not Christian solely for the reason that they were non-Christian." Ieyasu reposed entire confidence in Adams. Hearing the Englishman's testimony, he is said to have exclaimed, "If the sovereigns of Europe do not tolerate these priests, I do them no wrong if I refuse to tolerate them." Japanese historians add that Ieyasu discovered a conspiracy on the part of some Japanese Christians to overthrow his government by the aid of foreign troops. It was not a widely ramified plot, but it lent additional importance to the fact that the sympathy of the fathers and their converts was plainly with the only magirate in the empire who continued to dispute the Tokugawa supremacy, Hideyori, the son of Hideyoshi. Nevertheless Ieyasu shrank from proceeding to extremities in the case of any foreign priest, and this attitude he maintained until his death (1616). Possibly he might have been less tolerant towards native Christians also had not the Tokugawa authority been openly defied by a Franciscan father—the Sotelo mentioned above—in Yedo itself. Then (1613) the first execution of Japanese Christians took place. He ordered the priest to be put to death after a short incarceration. At that time, as is still the case even in these more enlightened days, insignificant differences of custom sometimes induced serious misconceptions. A Christian who had violated the secular law was crucified in Nagasaki. Many of his fellow-believers kneeled around his cross and prayed for the peace of his soul. A party of converts were afterwards burned to death in the same place for refusing to apostatize, and their Christian friends crowded to carry off portions of their bodies as holy relics. When these things were reported to Ieyasu, he said, "Without doubt that must be a diabolic fiction which persuades people not only to worship criminals condemned to death for their crimes, but also to honour those who have been burned or cut in pieces by the order of their lord" (feudal chief).

The fateful edict ordering that all foreign priests should be collected in Nagasaki preparatory to removal from Japan, that all churches should be demolished, and that the Suppression converts should be compelled to abjure Christianity, on pain of death, was issued on the 27th of January 1614. There were then in Japan 122 Jesuits, 14 Franciscans, 9 Dominicans, 4 Augustins and 7 secular priests. Had these men obeyed the orders of the Japanese authorities by leaving the country finally, not one foreigner would have suffered for his faith in Japan, except the 6 Franciscans executed at Nagasaki by order of Hidetoshi in 1597. But suffering and death counted for nothing with the missionaries as against the possibility of winning or keeping even one convert. Forty-seven of them evaded the

foreign intercourse

Japan

231

edict, some by concealing themselves at the time of its issue, the rest by leaving their ships when the latter had passed out of sight of the shore of Japan, and returning by boats to the sea-room of their former labours. Moreover, in a few months, those that had actually crossed the sea re-crossed it in various disguises, and soon the Japanese government had to consider whether it would suffer its authority to be thus flouted or resort to extreme measures.

During two years immediately following the issue of the anti-Christian decree, the attention of the Tokugawa chief and indeed of all Japan was concentrated on the closing episode of the great struggle which assured to Ieyasu final supremacy as shogun. The two empires of the outside and the battle under the walls of Osaka castle between the adherents of the Tokugawa and the supporters of Hideyori. In this struggle fresh fuel was added to the fire of anti-Christian resentment, for many Christian converts threw in their lot with Hideyori, and in one part of the field the Tokugawa troops found themselves fighting against a foe whose banners were emblazoned with the cross and with images of the Saviour and St James, the patron saint of Spain. But the Christians had protectors. Many of the feudatories showed themselves strongly averse from inflicting this injury upon their countrymen or from making the deviation of an alien religion had been partly forced by the feudatories themselves. As for the people at large, their liberal spirit is attested by the fact that five fathers who were in Osaka castle at the time of its capture made their way to distant refuges without encountering any risk of betrayal. During these events the death of Ieyasu took place (June 1, 1616), and pending the dedication of his mausoleum the anti-Christian crusade was virtually suspended.

In September 1616 a new anti-Christian edict was promulgated by Hidetada, son and successor of Ieyasu. It pronounced sentence of death on all Christians, and those of Christian stock, whose presence had been sanctioned for ministering to the Portuguese merchants: it forbade the Japanese, under the penalty of being burned alive and of having all their property confiscated, to have any connexion with the ministers of religion or to give them hospitality. It was forbidden to any prince or lord to keep Christians in his service or even on his estates, and the edict was promulgated with more than usual solemnity, though its enforcement was deferred until the next year on account of the obsessions of Ieyasu. This edict of 1616 differed from that issued by Ieyasu in 1614, since the latter had not prescribed the death penalty for converts refusing to apostatize. But both agreed in indicating expulsion as the sole manner of dealing with the foreign priests. As for the shōgun and his advisers, it is reasonable to assume that they did not anticipate much necessity for recourse to violence. They must have known that a great majority of the converts had joined the Christian church at the instance or by the command of their local rulers, and nothing can have seemed less likely than that a creed thus lightly embraced would be adhered to in defiance of torture and death. It is moreover morally certain that had the foreign propagandists obeyed the Government's edict and left the country, not one would have been put to death. They suffered because they defied the laws of the land. Some fifty missionaries happened to be in Nagasaki when Hidetada's edict was issued. A number of these were apprehended and deported, but several of them returned almost immediately. This happened under the jurisdiction of Omura, who had been specially charged with the duty of sending away the bateren (padres). He appears to have concluded that a striking example must be furnish
d, and he therefore ordered the seizure and decapitation of two fathers, De I' Assumption and Machado. The result completely falsified his calculations, and presaged the cruel struggle now destined to begin.

The bodies, placed in different coffins, were interred in the same grave. Guards were placed over it, but the concourse was immense. The sick were carried to the sepulchre to be restored to health. The Christians found new strength in this martyrdom; the pagans themselves were full of admiration for it. Numerous conversions and numerous returns of apostates took place everywhere.

In the midst of all this, Navarette, the vice-provincial of the Dominicans, and Ayala, the vice-provincial of the Augustins, came out of their retreat, and in full priestly garb started upon an open propaganda. The two fanatics—for so even Charlevoix considers them to have been—were secretly conveyed to the island Takashima and there decapitated, while their coffins were weighted with big stones and sunk in the sea. Even more directly defiant was the attitude of the next martyred priest, an old Franciscan monk, Juan de Santa Martha. He had for three years suffered all horrors of a medieval Japanese prison, when it was proposed to release him and deport him to New Spain. His answer was that, if released, he would stay in Japan and continue to propagate the faith. He was exiled in August 1618. But from that time until 1622 no other foreign missionary suffered capital punishment in Japan, though many of them arrived in the country and continued their propaganda there. During that interval, also, there occurred another incident eminently calculated to fix upon the Christians still deeper suspicion of political designs. In a Portuguese ship captured by the Dutch a letter was found instigating the Japanese converts to revolt, and promising that, when the number of these disaffected Christians was sufficient, men-of-war would be kept for them. Not the least potent of the influences operating against the Christians was that pamphlets were written by apostates attributing the zeal of the foreign propagandists solely to political motives. Yet another indictment of Spanish and Portuguese propagandists was contained in a despatch addressed to Hidetada in 1620 by the admiral in command of the British and Dutch fleet then cruising in Far-Eastern waters. In that document the friars are flatly accused of treacherous practices, and the Japanese ruler was warned against the aggressive designs of Philip of Spain. In the face of all this evidence the Japanese ceased to hesitate, and a time of terror ensued for the foreign priests. The number of converts, destined for the missionary and the officials of the Christian church, suffered a curious effect, its numbers gradually increased in severity. In 1617 the first two fathers put to death (De L' Assumption and Machado) were beheaded, "not by the common executioner, but by one of the first officers of the prince." Subsequently Navarette and Ayala were decapitated by the executioner. Then, in 1618, Juan de Santa Martha was executed like a common criminal, his body being dismembered and his head exposed. Finally, in 1622, Zuñiga and Flores were burnt alive. The same year was marked by the "great martyrdom at Nagasaki when a foreign priest went to the stake with 19 Japanese converts. The shōgun seems to have been now labouring under vivid fear of a foreign invasion. An emissary sent by him to Europe had returned on the eve of the "great martyrdom" after seven years abroad, and had made a report more than ever unfavourable to Christianity. Therefore Hidetada deemed it necessary to refuse audience to a Portuguese embassy in 1624 and to deport all Spaniards from Japan. Further, it was decreed that no Japanese Christian should thereupon be suffered to go abroad for commerce, and that though non-Christsians or men who had apostatized might travel freely, they must not visit the Philippines. Thus ended all intercourse between Japan and Spain. It had continued for 32 years and had engendered a widespread conviction that Christianity was an instrument of Spanish aggression.

Iyemitsu, son of Hidetada, now ruled in Yedo, though Hide
tada himself remained the power behind the throne. The year (1623) of the former's accession to power had been marked by the re-issue of anti-Christian decrees, and by the martyrdom of some 500 Christians within the Tokugawa domains, whither the tide of persecution now flowed for the first time. Thencefor
the campaign was continuous. The men most active and most relentless in carrying on the persecution were Mizuno and Takenaka, governors of Nagasaki, and Matsukura, feuador of Shimabara. By the latter were invented the punishment of throwing converts into the solfataras at Unzen and the torture of the fosse, which consisted in suspension by the feet, head downwards, in a pit until blood oozed from the mouth, nose and ears. Many endured this latter torture for days, until death
JAPAN

came to their relief, but a few—notably the Jesuit provincial Ferreya—apostatized. Matsuura and Takeno were so strongly obsessed by the Spanish menace that they contemplated the conquest of the Philippines in order to deprive the Spaniards of a Far-Eastern base. But timid counsels then prevailed in Yedo, where the spirit of a Nobunaga, a Hideyoshi or an Ieyasu no longer prevailed. Of course the measures of repression grew in severity as the fortitude of the Christians became more obdurate. It is not possible to state the exact number of victims. Some historians say that, down to 1635, no fewer than 280,000 were punished, but that figure is probably exaggerated, for the most authoritative reliable records indicate that the converts never amounted to more than 300,000, and many of these, if not a great majority, having accepted the foreign faith very lightly, doubtless discarded it readily under menace of destruction. Every opportunity was given for apostatizing and for escaping death. Immunity could be secured by pointing out a fellow-convert, and, when it is observed that among the seven or eight feudatories who embraced Christianity only two or three died in that faith, we must conclude that not a few cases of recanting occurred among the converts. Remorse and regret on the part of those who had apostatized only to have the former faith again restored is said to have been displayed. If the converts were intrepid their teachers showed no less courage. Again and again the latter defied the Japanese authorities by coming to the country or returning thither after having been deported. Ignoring the orders of the governors of Macao and Manila and even of the king of Spain himself, they arrived, year after year, to be certainly apprehended and sent to the stake after brief periods of propagandism. In 1626 they actually baptized over 3,000 converts. Large rewards were paid to anyone denouncing a propagandist, and as for the people, they had to trample upon a picture of Christ in order to prove that they were not Christians.

Meanwhile the feuds between the Dutch, the Spaniards and the Portuguese never ceased. In 1636, the Dutch found on a captured Portuguese vessel a report of the governor of Macao describing a two days' festival which had been held there in honour of Vieyra, the vice-provincial whose martyrdom had just taken place in Japan. This report the Dutch handed to the Japanese authorities "in order that his majesty may see more clearly what great honour the Portuguese pay to those he has forbidden his realm to trade with. It is said that they think this a stain on their honour and that they have insulted his country. Probably the accusation added little to the resentment and distrust already harboured by the Japanese against the Portuguese. At all events the Yedo government took no step distinctly hostile to Portuguese laymen until 1637, when an edict was issued forbidding any foreigners to travel in the empire, lest Portuguese with passports bearing Dutch names might enter it. This was the beginning of the end. In the last month of 1637 a rebellion broke out, commonly called the "Christian revolt of Shimabara," which sealed the fate of Japan's foreign intercourse for over 200 years.

The promontory of Shimabara and the island of Amakusa enclose the gulf of Nagasaki on the west. Among all the sites in Japan, Shimabara and Amakusa had been the two most thoroughly christianized in the early years of Jesuit propaganda. Hence in later days they were naturally the scene of the severest persecutions. Still the people would probably have suffered in silence had they not been taxed beyond all endurance to supply funds for an extravagant chief who employed savage methods of extortion. Japanese annals, however, relegate the taxation grievance to an altogether secondary place, and attribute the revolt solely to the instigation of five samurai who led a roaming life to avoid persecution for their adherence to Christianity. Whichever version be correct, it is certain that the outbreak ultimately attracted all the Christians from the surrounding regions, and was regarded by the authorities as in effect a Christian rising. The Amakusa insurgents passed over to Shimabara, and on the 27th of January 1638 the whole body—numbering, according to some authorities, 20,000 fighting men and 17,000 women and children, according to others, little more than one-half of these figures—took possession of the dilapidated castle of Haru, which stood on a plateau with three sides descending perpendicularly to the sea, a hundred feet beneath, and with a swamp on its fourth front. There the insurgents, who fought under flags with red crosses and whose battle cries were "Jesus," "Maria" and "St Iago," successfully maintained themselves against the repeated assaults of strong forces until the 12th of April, when, their ammunition and their provisions alike exhausted, they were overwhelmed and put to the sword, with the exception of 195 prisoners. During the siege the Dutch were enabled to furnish a vivid proof of eminence and to the Christianity of the Spaniards and the Portuguese. For the guns in possession of the besiegers being too light to breach anything. Kocekebacker, the factor at Hirado, was invited to send ships carrying heavy metal. He replied with the "de Ryp" of 20 guns, which threw 426 shot into the castle in 15 days. Probably the great bulk of the remaining Christians perished at the massacre of Haru. Thenceforth there were few martyrs.

It has been clearly shown that Nobunaga, Hideyoshi and Ieyasu were all in favour of foreign intercourse and trade, and that they had the most trustworthy of Jesuit emissaries. Foreign Trade in the 17th Century. Meanwhile five reformers, one-half of whom, it is said, were Jesuits, and the other half Japanese, were having a lively controversy with the former's pupil, Hidetoshi. In 1626, the latter, having been compelled to write a confession, was banished to the island of Hirado. Hidetoshi, whose influence among the Jesuits was great, made strenuous efforts to differentiate between Christianity and commerce, so that the latter might not be involved in the former's fate. In fact the three objects which Ieyasu desired most earnestly to compass were the development of foreign commerce, the acquisition of a mercantile marine and the exploitation of Japan's mines. He offered the Spaniards, Portuguese, English and Dutch a site for a settlement in Yedo, and had they accepted the offer the country might never have been closed. In his time Japan was a virtually a free trade country. Importers had not to pay any duties. It was expected, however, that they should make presents to the feudal lord into whose port they carried their goods, and these presents were very often valuable. Naturally the Tokugawa chief desired to attract such a source of wealth to his own domains. He sent more than one envoy to Manila to urge the opening of commerce direct with the regions about Yedo, and to ask the Spaniards for competent naval architects. Perhaps the truest exposition of his attitude is given in a law enacted in 1623:

"If any foreign vessel by stress of weather is obliged to touch at any place, the Tokugawa chief, even more than Japan's owner, that whoever these foreigners may be, absolutely nothing whatever that belongs to them or that they may have brought in their ship, shall be taken from them. Likewise we rigorously prohibit the use of military force to prevent the entry of any foreigner in the province of Yedo. These orders will not be obeyed by their ship, and it is not convenient for the merchants of the ship to remain in the port they have entered, they may pass to any other port that may suit them, and therein buy and sell in full freedom. Likewise we order in a general manner that foreigners may freely reside in any part of Japan they choose, but we rigorously forbid them to promulgate their faith."

It was in that mood that he granted (1605) a licence to the Dutch to trade in Japan, his expectation doubtless being that the ships which they promised to send every year would make their dépot at Uraga or in some other place near Yedo. But things were ordered differently. The first Hollanders that set foot in Japan were the survivors of the wrecked "Liede." Thrown into prison for a time, they were approached by emissaries from the feudal lord of Hirado, who engaged some of them to teach the art of casting guns and the science of gunnery to his vassals, and when two of them were allowed to leave Japan, he furnished them with the means of doing so, at the same time making promises which invested Hirado with attractions as a port of trade, though it was then and always remained an insignificant fishing village. The Dutch possessed precisely the qualifications suited to the situation then existing in Japan: they had commercial potentials without any religious associations. Fully appreciating that fact, the shrewd feudatory of Hirado set himself to make the place his and he succeeded. Shortly afterwards, an incident occurred which clearly betrayed the strength of the Tokugawa chief's desire to..."
JAPAN

In 1638, Japan truly established itself. These shallow men remained. It is given sion hindrance. Some fact remains. Captain Adams, London to previously, was disinclined to trade with Japan. Their vessels paid faithful visits to Uraga, but the Portuguese continued to monopolize the commerce.

In 1611 a Dutch merchantman (the "Brach") reached Hirado with a cargo of pepper, cloth, ivory, silk and lead. She carried two envoys, Speck and Segersohn, and in the very face of a Spanish embassy which had just arrived from Manila expressly for the purpose of "settling the matter regarding the Hollander," the Dutchmen obtained a liberal patent from Ieyasu. Twelve years previous, the merchants of London, stimulated generally by the success of the Dutch in trade with the East, and specially by the fact that these Hollander had raised the price of pepper against us from 3 shillings per pound to 6 shillings and 8 shillings, organized the East India Company which immediately began to send ships eastward. Of course the news that the Dutch were about to establish a trading station in Japan reached London speedily, and the East India Company lost no time in ordering one of their vessels, the "Clove," under Captain Saris, to proceed to the Far-Eastern Islands. She carried a quantity of pepper, and on the voyage she endeavoured to procure some spices at the Moluccas. But the Dutch would not suffer any poaching on their valuable monopoly. The "Clove" entered Hirado on the 11th of June 1613. Saris seems to have been a man self-opinionated, of shallow judgment and suspicious. Though strongly urged by Will Adams to make Uraga the seat of the new trade, though convinced of the excellence of the harbour there, and though instructed as to the great advantage of proximity to the shogun's capital, he appears to have conceived some distrust of Adams, for he chose Hirado. From Ieyasu Captain Saris received a most liberal charter, which plainly displayed the mood of the Tokugawa shogun towards foreign trade:

1. The ship that has now come for the first time from England over the sea to Japan may carry on trade of all kinds without hindrance. With regard to future visits (of English ships) permission will be given in regard to all requisite.
2. With regard to the cargoes of ships, requisition will be made by list according to the requirements of the shogunate.
3. English ships are free to visit any port in Japan. If disabled by storm or otherwise shall put into any harbor for repair.
4. Ground in Yedo in the place which may desire shall be given to the English, and they may erect houses and reside and trade there. They shall have liberty to return to their country whenever they wish to do so, and to dispose as they like of the houses they have erected.
5. If an Englishman dies in Japan of disease, or any other cause, his effects shall be handed over without fail.
6. Forced sales of cargo, and violence, shall not take place.
7. If one of the English should commit an offence, he should be sentenced by the English General according to the gravity of his offence.

(Translated by Professor Riesa.)

The terms of the 4th article show that the shogun expected the English to make Yedo their headquarters. Had Saris done so, he would have been free from all competition, would have had an immense market at his very doors, would have economized the expense of numerous overland journeys to the Tokugawa court, and would have saved the payment of many "considerations." The result of his mistaken choice and subsequent bad management was that, ten years later (1623), the English factory at Hirado had to be closed, having incurred a total loss of about £2000. In condemnation of this failure it must be noted that a few months after the death of Ieyasu, the charter he had granted to Saris underwent serious modification. The original document was opened to the English in the coast of Japan; the revised document limited them to Hirado. But this change was indirectly traced to the blunder of not accepting a settlement in Uraga and a port at Uraga. For the Tokugawa's foreign policy was largely swayed by an apprehension lest the Kūshū feudatories, over whom the authority of Yedo had never been fully established, might, by the presence of foreign traders, come into possession of such a fleet and such an armament as would ultimately enable them to wrest the administration of the empire from Tokugawa hands. Hence the precaution of confining the English to the Dutch Hirado, the seat of a dailyō too petty to become formidable, and to a Portuguese industrial city.1 But evidently an English factory in Yedo and English ships at Uraga would have strengthened the Tokugawa ruler's hand instead of supplying engines of war to his political foes. It must also be noted that the question of locality had another injurious outcome. It exposed the English—and the Dutch also—to crippling competition at the hands of a company of rich Osaka monopolists, who, as representing an Imperial city and therefore being pledged to the Tokugawa interests, enjoyed Yedo's favour and took full advantage of it. These shrewd traders not only drew a ring round Hirado, but also sent vessels on their own account to Cochin China, Siam, Tonkin, Cambodia and other places, where they obtained many of the staples in which the English and the Dutch dealt. Still the closure of the English factory at Hirado was purely voluntary. From first to last there had been no serious friction between the English and the Japanese. The company's houses and godowns were not sold. These as well as the charter were left in the hands of the dailyō of Hirado, who promised to restore them should the English re-open business in Japan. The company did think of doing so, but more on the occasion of the last peace than it was taken until the year 1653, when a merchantman, the "Return," was sent to seek permission. The Japanese, after mature reflection, made answer that as the king of England was married to a Portuguese princess, British subjects could not be permitted to visit Japan. That this reply was suggested by the Dutch is very probable; that it truly reflected the feeling of the Japanese government towards Roman Catholics is certain. The Spaniards were expelled from Japan in 1624, the Portuguese in 1638. Two years before the latter event, the Yedo government took a signal retrogressive step. They ordered that no Japanese vessel should go abroad; or that no Japanese subject should leave the country. But, if detected attempting to do so, he should be put to death, the vessel that carried him and her crew being seized "to await our pleasure;" that any Japanese resident abroad should be executed if he returned; that the children and descendants of Spaniards together with those who had adopted such children should not be allowed to remain on pain of death; and that no ship of ocean-going dimensions should be built in Japan. Thus not only were the very children of the Christian land cut off completely from the land, but the Japanese people also were sentenced to imprisonment within the limits of their islands, and the country was deprived of all hope of acquiring a mercantile marine. The descendants of the Spaniards, banished by the edict, were taken to Macao in two Portuguese galleons. They numbered 287 and the property

1 The Imperial cities were Yedo, Kibō, Osaka and Nagasaki. Under the Tokugawa the English were subsequently admitted. They were also invited to Kagoshima by the Shimazu chieftain, and, had not their experience at Hirado proved so deterrent, they might have established a factory at Kagoshima.
they carried with them aggregated 6,097,500 florins. But if the Portuguese derived any gratification from this sweeping out of their much-abused rivals, the feeling was destined to be short-lived. Already they were subjected to humiliating restrictions.

"From 1623 the galleons and their cargoes were liable to be burnt and their captains hanged, but the reign of Japan was from this moment of decisive import.

An official of the Japanese government was stationed in Macao for the purpose of inspecting all passing vessels, and of preventing any one that looked at all suspicious from proceeding to Japan. A complete list and personal description of every one on board was drawn up by this officer, a copy of it was handed to the captain and by him it had to be delivered to the authorities who met him at Nagasaki before he was allowed to anchor. If in the subsequent inspection any discrepancy between the list and the persons actually carried by the vessel appeared, it would prove very awkward for the captain. Then in the inspection of the vessel letters were copied, trunks and boxes examined, and all crucifixes or objects of religion of any kind had to be thrown overboard. In 1635 Portuguese were forbidden to employ Japanese to carry their umbrellas or their shoes, and only their chief men were allowed to bear arms, while they had to hire fresh servants every year. It was in the following year (1636) that the artificial islet of Deshima was constructed for their special reception, or rather imprisonment. It lay in front of the former Portuguese factory, with which it was connected by a bridge, and henceforth the Portu-

guese were to be allowed to cross this bridge only twice a year—at their arrival and at their departure. Furthermore, all their cargoes had to be sold at a fixed price during their fifty days' stay to a ring of licensed merchants from the imperial towns."

The imposition of such irksome conditions did not deter the Portuguese, who continued to send merchandise-laden galleons to Nagasaki. But in 1638 the bolt fell. The Shimabara rebellion was directly responsible. Probably the fact of a revolt of Christian converts, in such numbers and fighting with such resolution, would alone have sufficed to induce the weak govern-

ment in Yedo to get rid of the Portuguese altogether. But the Portuguese were suspected of having instigated the Shimabara insurrection, and the Japanese authorities believed that they had proof of the fact. Hence, in 1638, an edict was issued pro-
clamating the complete extinction of the religion. By 1640 the Portuguese had continued to bring missionaries to Japan; as they had supplied these missionaries with provisions and other necessaries, and as they had fomented the Shimabara rebellion, thenceforth any Portuguese ship coming to Japan should be burned, together with her cargo, and every one on board of her should be executed. Ample time was allowed before enforcing this edict. Not only were the Portuguese ships then at Nagasaki permitted to close up their commercial transactions and leave the port, but also in the following year when two galleons arrived from Macao, they were merely sent away with a copy of the edict and a threat. But the Daimyo, easily become reconciled to abandon a commerce from which they had derived splendid profits prior to the intrusion of the Spaniards, the Dutch and the English, and from which they might now hope further gains, since, although the Dutch continued to be formidable rivals, the Spaniards had been excluded, the English had withdrawn, and the Japanese, by the suicidal policy of their own rulers, were no longer able to send ships to China. Therefore they took a step which resulted in one of the saddest episodes of the whole story. Four aged men, the most respected citizens of Nagasaki, were selected (1640) by the Daimyo, and after they had boarded a ship carrying no cargo but only rich presents. They bore a petition declaring that for a long time no missionaries had entered Japan from Macao, that the Portuguese had not been in any way connected with the Shimabara revolt, and that interruption of trade would injure Japan as much as Portugal. These envoys arrived at Nagasaki on the 1st of July 1640, and 24 days sufficed to bring from Yedo, whether their petition had been sent, peremptory orders for their execution as well as executions to carry out the orders. There was no possibility of resistance. The Japanese had received the ship's arms, sails, guns and ammunition, and had placed the envoys, their suite and the crews under guard in Deshima. On the 2nd of August they were all summoned to the governor's hall of audience, where, after their protest had been heard that ambassadors should be under the protection of international law, the sentence written in Yedo 13 days previously was read to them. The following morning the Portuguese were offered their lives if they would apostatize. Every one rejected the offer, and being then led out to the martyrs' mount, the heads of the envoys and of 57 of their companions fell. Thirteen were saved to carry the news to Macao. These thirteen, after witnessing the burning of the galleon, were conducted to the governor's residence who gave them this message:

"Do not fail to inform the inhabitants of Macao that the Japanese wish to receive from them neither gold nor silver, nor any kind of presents or merchandise; in a word, absolutely nothing which comes from them, do not do them any wrong that they would suffer. The persons actually carried by the vessel appeared, it would prove very awkward for the captain. Then in the inspection of the vessel letters were copied, trunks and boxes examined, and all crucifixes or objects of religion of any kind had to be thrown overboard. In 1635 Portuguese were forbidden to employ Japanese to carry their umbrellas or their shoes, and only their chief men were allowed to bear arms, while they had to hire fresh servants every year. It was in the following year (1636) that the artificial islet of Deshima was constructed for their special reception, or rather imprisonment. It lay in front of the former Portuguese factory, with which it was connected by a bridge, and henceforth the Portug-

guese were to be allowed to cross this bridge only twice a year—at their arrival and at their departure. Furthermore, all their cargoes had to be sold at a fixed price during their fifty days' stay to a ring of licensed merchants from the imperial towns."

Finally the thirteen were taken to the martyrs' mount where, set up above the heads of the victims, a tablet recounted the story of the embassy and the reasons for the execution, and concluded with the words:

"So long as the sun warms the earth, let no Christian be so bold as to come to Japan, and let all know that if King Philip himself, or even the very God of the Christians, or the great Shaka contravenes this prohibition, they shall pay for it with their heads."

Had the minister of the shogun in Yedo desired to make clear to future ages that to Christianity alone was due the expulsion of Spaniards and Portuguese from Japan and her adoption of the policy of seclusion they could not have placed on record more conclusive testimony. Macao received the news with rejoicing in that its earthly ambassadors had been made ambassadors of heaven," but it did not abandon all hope of over-

coming Japan's obduracy. When Portugal recovered its independence in 1640, the people of Macao requested Lisbon to send an ambassador to Japan, and on the 16th of July 1647 Don Gonzalez de Siqueira arrived in Nagasaki with two vessels. In the name of King John IV, setting forth the severance of all connexion between Portugal and Spain, which countries were now actually at war, and urging that commercial relations should be re-established. The Portuguese, having refused to give up their rudders and arms, soon found themselves menaced by a force of fifty thousand samurai, and were glad to put out of port quietly on the 4th of September. This was the last episode in the medieval history of Portugal's intercourse with Japan.

When (1609) the Dutch contemplated forming a settlement in Japan, Ieyasu gave them a written promise that "no man shall dare to molest them and that they could and must remain and maintain and defend them as his own subjects."

Moreover, the charter granted to them contained a clause providing that, into whatever ports their ships put, they were not to be molested or hindered in any way, but, "on the contrary, must be shown all manner of help, favour and assistance." They might then have chosen any port in Japan for their headquarters, but they had the misfortune to choose Hirado. For many years they had no cause to regret the choice. Their exclusive possession of the Spice Islands and their own Essentially it consisted of the trade as a legal place and the least place in Japan's over-sea trade. Even when things had changed greatly for the worse and when the English closed their books with a large loss, it is on record that the Dutch were reaping a profit of 76% annually. Their doing at Hirado were not of a purely commercial character. The Anglo-Dutch "fleet of defence" made that port its basis of operations against the Spaniards and the Portuguese. It brought its prizes into Hirado, the profits to be equally divided between the fleet and the factories, Dutch and English, which arrangement involved a sum of a hundred thousand pounds in 1642. But after the death of Ieyasu they grew up at the Tokugawa court a party which advocated the expulsion of all foreigners on the ground that, though some professed a different form of Christianity from that of the Castilians and Portuguese, it was nevertheless one and the same creed. This policy was not definitely adopted.
but it made itself felt in a discourteous reception accorded to the commandant of Fort Zeelandia when he visited Tokyō in 1627. He attempted to retaliate upon the Japanese vessels which put into Zeelandia in the following year, but the Japanese managed to seize his person, exact reparation for loss of time and obtain five hostages whom they carried to prison in Japan. The Japanese government of that time was wholly intolerant of any injury done to its subjects by foreigners. A number of the ejected warehouses the date according to the Christian era. The factory happened to be then presided over by Caron, a man of extraordinary penetration. Without a moment's hesitation he set 400 men to pull down the warehouses, thus depriving the Japanese of all pretext for recourse to violence. He was compelled, however, to promise that there should be no observance of the Sabbath henceforth and that time should no longer be reckoned by the Christian era. In a few months, further evidence of Yedo's ill will was furnished. An edict appeared ordering the Dutch to dispose of all their imports during the year of their arrival, with the exception of a few goods. The Japanese, on the contrary, were accustomed to carry on business with Hollanders and the Dutch. A move of this kind was looked upon with the gravest alarm, and the Dutch were immediately offered to act as servants to the Dutch outside the latter's dwellings. The cooperation of the Hollanders in bombarding the castle of Hara during the Shimabara rebellion (1638) gave them some claim on the shōgun's government, but in the same year the Dutch received an imperious warning that the severest penalties would be inflicted if their ships carried priests or any religious objects or books. So profound was the dislike of everything relating to Christianity that the Dutch nearly caused the ruin of their factory and probably their own destruction by inscribing on the sole of their shoes, in red letters, the word "Arminius."

An envoy despatched from Batavia to remonstrate could not obtain audience from the shōgun, and though he presented, by way of remonstrance, the charter originally granted by Ieyasu, the reply he received was:

"His Majesty charges us to inform you that it is of but slight importance to the Empire of Japan whether foreigners come or do not come to trade. But in consideration of the charter granted to them by Ieyasu, he is pleased to allow the Hollanders to continue their operations, and to leave them their commercial and other privileges, on the condition that they evacuate Hirado and establish themselves with their vessels in the port of Nagasaki."

The Dutch did not at first regard this as a calamity. During their residence of 31 years at Hirado they had enjoyed full freedom, had been on excellent terms with the feudal lord and his samurai, and had prospered in their business. But the pettiness of the place and the inconvenience of the anchorage having always been recognized, transfer to Nagasaki promised a splendid harbour and much larger custom. Bitter, therefore, was their feeling when they found that they were to be imprisoned in Deshima, a quadrangular island whose longest face did not measure 300 yds., and, that, so far from living in the town of Nagasaki, they would not be allowed even to enter it. Siebold writes:

"A guard at the gate prevented all communications with the city of Nagasaki; no Dutchman without weighty reasons and without the permission of a warden might pass the gate; no Japanese (unless public women) might live in a Dutchman's house. As if this were not enough, even within Deshima itself our state prisoners were keenly watched. No Japanese might speak with them in their own language unless in the presence of a witness (a government spy) or visit them in their houses. The creatures of the governor had the warehouses under key and the Dutch traders ceased to be masters of their property."

There were worse indignities to be endured. No Dutchman might be buried in Japanese soil: the dead had to be committed to the deep. Every Dutch ship, her rudder, guns and ammunition removed and her sails sealed, was subjected to the strictest search. No religious service could be held. No one was suffered to pass from one Dutch ship to another without the governor's permit. Sometimes the officers and men were wantonly cudgelled by petty Japanese officiants. They led, in short, a demi-human existence. Some relief was afforded by this external severity, for at no time of their sojourn in Deshima, a period of 217 years, were the Dutch relieved from irksome and humiliating restraints. Eleven years after their removal thither, the expediency of consulting the national honour by finally abandoning an enterprise so derogatory was gravely discussed, but hopes of improvement supplementing natural reluctance to surrender a monopoly which still brought large gains, induced them to persevere. At that time this Nagasaki over-sea trade was considerable. From 7 to 10 Dutch ships used to call at Hirado yearly, and were permitted to commerce over 800 lb. of silver, the chief staples of import being silk and piece-goods, and the government levying 5% by way of customs dues. But this did not represent the whole of the charges imposed. A rent of 450 lb of silver had to be paid each year for the little island of Deshima and the houses standing on it; and, further, every spring, the Hollanders were required to send to Yedo a mission bearing for the shōgun, the heir-apparent and the court officials presents representing an aggregate value of about 530 lb of silver. They found their account, nevertheless, in buying gold and copper—especially the latter—for exportation, until the Japanese authorities, becoming alarmed at the great quantity of copper thus carried away, adopted the policy of limiting the number of vessels, as well as the inward and outward cargoes, so that, in 1790, only one ship might enter annually, nor could she carry away more than 350 tons of copper. On the other hand, the formal visits of the captain of the factory to Yedo were reduced to one every fifth year, and the value of the presents carried by him was cut down to one half.

Well-informed historians have contended that, by thus segregating herself from contact with the West, Japan's direct losses were nil. The loss to the policy of exclusion was of a subtler kind, for she learned much from European nations in the 17th century. They had little to teach her in the way of religious tolerance; in the way of international morality; in the way of social amenities and etiquette; in the way of artistic conception and execution; or in the way of that notable shibboleth of modern civilization, the open door and equal opportunities. Yet when all this is admitted, there remains the vital fact that Japan was thus shut off from the atmosphere of competition, and that for nearly two centuries and a half she never had an opportunity of warming her intelligence at the fire of international rivalry or deriving inspiration from an exchange of ideas. She stood comparatively still while the world went on, and the interval between her and the leading peoples of the Occident in matters of material civilization had become very wide before she awoke to a sense of its existence. The sequel of this page of her history has been faithfully summarized by a modern writer:

"A more complete metamorphosis of a nation's policy could scarcely be conceived. In 1641 we find the Japanese celebrated, by the emperor, throughout the whole of the Far East, by foreign and even by Chinese and the English, to trade at every port in the empire; we find, in short, all the elements requisite for a career of commercial enterprise, ocean-going adventure and industrial liberty. In 1641 everything is reversed. Trade is interdicted to all Western peoples except the Dutch, and
they are confined to a little island 200 yards in length by 80 in width; the least symptom of predilection for any alien creed exposes a Japanese subject to detention or confiscation; and the subject is liable to leave the limits of the realm involves decapitation; nor a ship large enough to pass beyond the shadow of the coast may be built. However unwelcome the admission, it is apparent that for all these changes and conditions, the alien is disarmed, and that the decision of 1641, the seclusion adopted by Japan in the early part of the 17th century and resolutely pursued until the middle of the 19th, was anti-Christian, not anti-foreign. The fact cannot be too clearly recognized. It is the seclusion, the foreign intercourse, associated with Christianity, that was to be synonymous in Japanese ears with foreign aggression, with the subversion of the mikado’s ancient dynasty, and with the loss of the integrity of the ‘sacred lands’; this is sufficiently in understanding the attitude of the nation’s mind towards this question.

Foreign Intercourse in Modern Times.—From the middle of the 17th century to the beginning of the 19th, Japan succeeded in rigorously enforcing her policy of seclusion. But in the concluding days of this epoch two influences began to disturb her self-sufficiency. One was the gradual infiltration of light from the outer world through the narrow window of the Dutch prison at Deshima; the other, frequent apparitions of Russian vessels on her northern coasts. The former was a slow process. It materialized first in the study of anatomy by a little group of youths who had acquired acciden
tial knowledge of the radical difference between Dutch and Japanese conceptions of the human frame by the books brought by the events outlined above. Throughout the whole of that period of isolation, Occidentals were not known to the Japanese by any of the terms now in common use, as gookoku-jin, seiji-tō, or tōjin, which embody the simple meaning ‘foreigner’. ‘Western’ or ‘alien’: they were popularly called batatei (patriot). Thus completely had foreign intercourse and Christian propaganda become identified in the eyes of the people. And when it is remembered that foreign intercourse, associated with Christianity, had come to be synonymous in Japanese ears with foreign aggression, with the subversion of the mikado’s ancient dynasty, and with the loss of the integrity of the ‘sacred lands’, there is fully justified in understanding the attitude of the nation’s mind towards this question.

Dutch and Russian Influence. In the concluding days of this epoch two influences began to disturb her self-sufficiency. One was the gradual infiltration of light from the outer world through the narrow window of the Dutch prison at Deshima; the other, frequent apparitions of Russian vessels on her northern coasts. The former was a slow process. It materialized first in the study of anatomy by a little group of youths who had acquired acciden
tial knowledge of the radical difference between Dutch and Japanese conceptions of the human frame by the books brought by the events outlined above. Throughout the whole of that period of isolation, Occidentals were not known to the Japanese by any of the terms now in common use, as gookoku-jin, seiji-tō, or tōjin, which embody the simple meaning ‘foreigner’. ‘Western’ or ‘alien’: they were popularly called batatei (patriot). And when it is remembered that foreign intercourse, associated with Christianity, had come to be synonymous in Japanese ears with foreign aggression, with the subversion of the mikado’s ancient dynasty, and with the loss of the integrity of the ‘sacred lands’, there is fully justified in understanding the attitude of the nation’s mind towards this question.

Great Britain reappears on this scene. Generally Japan’s northern island, Yezo, so that the aspect of foreign ships became quite familiar. From time to time American schooners were cast away on Japan’s shores. Generally the survivors were treated with tolerable consideration and ultimately sent to Deshima for shipment to Batavia. Japanese sailors, too, driven out of their route by hurricanes and caught in the stream of the “Black Current,” were occasionally carried to the Aleutian Islands, to Oregon or California, and in several instances these shipswrecked foreigners were taken back to Japan with all kindness by American vessels. On such an errand of mercy the “Morrison” entered Yedo Bay in 1837, proceeding thence to Kagoshima, only to be driven away by cannon shot; and on such an errand the “Manhattan” in 1845 lay for four days at Uraga while her master (Mercer Cooper) collected books and charts. It would seem that his experience induced the Washington government to attempt the opening of Japan. A ninety-gun ship and a sloop were sent on the errand. They anchored off Uraga (July 1846) and Commodore Biddle made due application for trade. But he received a positive refusal, and having been instructed by his government to abstain from any act calculated to excite hostility or distrust, be quietly weighed anchor and sailed away.

In this same year (1846) a French ship touched at the Rikiu (Luchu) archipelago and sought to persuade the islanders that their only security against British aggression was to place themselves under the protection of France. In fact Great Britain was now beginning to interest herself in south China, and more than one warning reached Yedo from Deshima that English war-ships might at any moment visit these Japanese shores. The Dutch had been much blamed for thus attempting to prejudice Japan against the Occident, but if the dictates of commercial rivalry, as it was then practised, did not constitute an ample explanation, it should be remembered that England and Holland had recently been enemies, and that the last British vessel, seen at Nagasaki had gone there hoping to capture the annual Dutch trading-ship from Batavia. Deshima’s warnings, however, remained unfulfilled, though they doubtless contributed to Japan’s feeling of uneasiness. Then, in 1847, the king of Holland himself intervened. He sent to Yedo various books, together with a map of the world and a despatch advising Japan to abandon her policy of isolation. Within a few months (1849) of the receipt of his Dutch majesty’s recommendation, an American brig, the “Treble,” under Commander J. Glynn, anchored in Nagasaki harbour and threatened to bombard the town unless immediate delivery were made of 18 seamen who, having been wrecked in northern waters, were held by the Japanese preparatory to shipment for Batavia. In 1849 another despatch reached Yedo from the king of Holland announcing that an American fleet might be expected in Japanese waters a year later, and that, unless Japan agreed to enter into friendly commercial relations, war must ensue. Appended to this despatch was an approximate draft of the treaty which would be presented for signature, together with a copy of a memorandum addressed by the Washington government to European nations, justifying the contemplated expedition on the ground that it would inure to the advantage of Japan as well as to that of the Occident.

In 1853, Commodore Perry, with a squadron of four ships-of-war and 500 men, entered Uraga Bay. So formidable a foreign force had not been seen in Japanese waters since the coming of the Mongol Armada. A panic ensued among the people—the ceaseless cannonading of the “Black-Hole” by Hideyoshi or Ieyasu, would have gone out to encounter these ships with assured confidence of victory. The contrast did not stop there. The shōgun, whose ancestors had administered the country’s affairs with absolutely autocratic authority, now summoned a council of the feudatories to consider the situation; and the Imperial court in Kiōto, which never appealed for heaven’s aid except in a national emergency such as had never been witnessed since the creation of the shōgunate, now directed that at the seven principal shrines and at all the great temples special “H.M.S. ‘Phaeton’” which entered that port in 1808.
prayers should be offered for the safety of the land and for the destruction of the aliens. Thus the appearance of the American squadron awoke in the cause of the country as a whole a spirit of patriotism hitherto confined to feudal interests. The shōgun does not seem to have had any thought of invoking that spirit: his part in raising it was involuntary and his ministers behaved with perplexed vacillation. The infirmity of the Yedo Administration’s purpose presented such a strong contrast to the single-minded resolution of the Imperial court that the prestige of the one was very largely impaired and that there resulted only ignominious enhancement. Perry, however, was without authority to support his proposals by any recourse to violence. The United States government had relied solely on the moral effect of his display of force, and its countrymen had supplied him with a large collection of the products of peaceful progress, from sewing machines to miniature railways. He did not unduly press for a treaty, but after lying at anchor off Urage during a period of ten days and after transmitting the president’s letter to the sovereign of Japan, he steamed away on the 17th of July, announcing his return in the ensuing spring. The conduct of the Japanese subsequently led to his departure showed had fully and rapidly that they had acquired the conviction that the appliances of their old civilization were powerless to resist the resources of the new. Orders were issued rescinding the long-enforced veto against the construction of sea-going ships; the feudal chiefs were invited to build and arm large vessels; the Dutch were commissioned to furnish a ship of war and to procure from Europe all the best works on modern military science; every one who had acquired any expert knowledge through the medium of Deshima was taken into official favour; forts were built; cannon were cast and troops were drilled. But these measures resulted only fresh evidence of the country’s inability to defy foreign insistence, and on the 2nd of December 1853, instructions were issued that if the Americans returned, they were to be dealt with peacefully. The sight of Perry’s steam-propelled ships, their powerful guns and all the specimens they carried of western wonders, had practically broken down the barriers of Japan’s isolation without need of treaties or conventions. Perry returned in the following February, and after an interchange of courtesies and formalities extending over six weeks, obtained a treaty pledging Japan to accord kind treatment to ships wrecked sailors; to put forbidding vessels to obtain stores and provisions within her territory, and to allow American ships to anchor in the ports of Shimoda and Hakodate. On this second occasion Perry had 10 ships with crews numbering two thousand, and when he landed to sign the treaty, he was escorted by a guard of honour mustering 500 strong in 27 boats. Much has been written about his judicious display of force and his sagacious tact in dealing with the Japanese, but it may be doubted whether the consequences of his exploit have not invested its methods with extravagant lustre. Standing on the threshold of modern Japan’s wonderful career, his figure shines by the reflected light of its surroundings.

Russia, Holland and England speedily secured for themselves treaties similar to that concluded by Commodore Perry in 1854.

First Treaty of Commerce was, and it was reserved for another citizen of the great republic to open them. This was Townsend Harris (1803–1873), the first U. S. consul-general in Japan. Arriving in August 1856, he concluded, in June of the following year, a treaty securing to American citizens the privilege of permanent residence at Shimoda and Hakodate, the opening of Nagasaki, the right of consular jurisdiction and certain minor concessions. Still, however, permission for commercial intercourse was withheld, and Harris, convinced that this great goal could not be reached unless he made his way to Yedo and conferred direct with the shōgun’s ministers, pressed persistently for leave to do so. Ten months elapsed before he succeeded, and such a display of reluctance on the Japanese side was very unfavourably criticized in the years immediately subsequent. Ignorance of the country’s domestic politics inspired the critics. The Yedo administration, already weakened by the growth of a strong public sentiment in favour of abolishing the dual system of government—that of the mikado in Kiōto and that of the shōgun in Yedo—had been still further discredited by its own timid policy as compared with the stalwart men of the throne towards the question of foreign intercourse. Openly to sanction commercial relations at such a time would have been little short of reckless. The Perry convention and the first Harris convention could be construed, and were purposely construed, as mere acts of benevolence towards strangers; but a commercial treaty would not have lent itself to any such construction, and naturally stimulated the militarist element to prove an unwise and suicidal step. Harris carried his point, however. He was received by the shōgun in Yedo in November 1857, and on the 20th of July 1858 a treaty was signed in Yedo, engaging that Yokohama should be opened on the 4th of July 1859 and that commerce between the United States and Japan should thereafter be freely carried on there. This treaty was actually concluded by the shōgun’s Ministers in defiance of their failure to obtain the sanction of the sovereign in Kiōto. Foreign historians have found much to say about Japanese duplicity in concealing the subordinate position occupied by the Yedo administration towards the Kiōto court. A subsequent representation is not consistent with fuller knowledge. The Yedo authorities had power to solve all problems of foreign intercourse without reference to Kiōto. Ieyasu had not seen any occasion to seek imperial assent when he granted unrestricted liberty of trade to the representatives of the East India Company, nor had Ieyamatsu asked for Kiōto’s sanction when he issued his decree for the expulsion of all foreigners. If, in the 19th century, Yedo shrank from a responsibility which it had unhesitatingly assumed in the 17th, the cause was to be found, not in the shōgun’s simulation of authority, but in his desire to associate the throne with a policy which, while recognizing it to be unavoidable, he distrusted his own ability to make the nation accept. But his ministers had promised Harris that the treaty should be signed, and they kept their word, at a risk of which the United States’ consular-general had no conception. Throughout these negotiations Harris spared no pains to create in the minds of the Japanese an intelligent conviction that the world could no longer be kept at arm’s length, and though it is extremely problematical whether he would have succeeded had not the Japanese themselves already arrived at that very conviction, his most astute exhibitions certainly produced the impression that he undoubtedly produced much impression. He was largely assisted, too, by recent events in China, where the Pei-hô forts had been captured and the Chinese forced to sign a treaty at Tientsin. Harris warned the Japanese that the British fleet might be expected at any moment in Yedo Bay, and that the best way to avert irksome demands at the hands of the English was to establish a comparatively moderate precedent by yielding to America’s proposals. This treaty could not be represented, as previous conventions had been, in the light of purely benevolent concession. It definitely provided for the trade and residence of foreign merchants, and thus finally terminated Japan’s traditional isolation. Moreover, it had been concluded in defiance of the Throne’s refusal to sanction anything of the kind. Much excitement resulted. The nation ranged itself into three parties. One comprised the advocates of free intercourse and progressive liberalization; another, while insisting that only the most limited privileges should be accorded to aliens, was of two minds as to the advisability of offering armed resistance at once or temporizing so as to gain time for preparatory; the third advocated uncompromising seclusion. Once again the shōgun convoked a meeting of the feudal barons, hoping to secure their co-operation. But with hardly an exception they pronounced against yielding. Thus the Shogunate saw itself compelled to adopt a resolutely liberal policy: it issued a decree in that sense, and thenceforth the administrative court at Yedo and the Imperial court in Kiōto stood in unequivocal opposition to each other, the Conservatives ranging themselves on the side of the latter, the Liberals on that of the former. It was a situation full of perplexity to outsiders, and the foreign

Effects of the Treaty.

Commercial intercourse had opened with Japan, and the country was rapidly modernized. The first years of the Meiji era saw the opening of new markets, the expansion of manufacturing and the establishment of a new financial system. The government took steps to improve education, and the country began to develop a sense of national identity. These changes laid the foundation for Japan’s modernization and its rise as a world power. However, the treaty also had its critics, who argued that it undermined Japan’s sovereignty and led to the introduction of foreign influences that threatened the country’s traditional values. The treaty was a turning point in Japan’s history, marking the beginning of its modern era.

JAPAN

FOREIGN INTERCOURSE
representatives misconstrued it. They imagined that the shōgun's ministers sought only to evade their treaty obligations and to render the situation intolerable for foreign residents, whereas in truth the situation threatened to become intolerable for the shōgunate itself. Nevertheless the Yedo officials cannot be entirely acquitted of duplicity. Under pressure of the necessity of self-preservation they effected with Kiyōto a compromise which the latter, true to foreign character, interpreted it to refer to foreign interests. The threatened political crisis was thus averted, but the enemies of the dual system of government gained strength daily. One of their devices was to assassinate foreigners in the hope of embroiling the shōgunate with Western powers and thus either forcing its hand or precipitating its downfall. It is not wonderful, perhaps, that foreigners were deceived, especially as they approached the solution of Japanese problems with all the Occidental's habitual suspicion of everything Oriental. Thus when the Yedo government, cognizant that serious dangers menaced the Yohokama settlement, took precautions to guard it, the foreign ministers convinced themselves that a deliberate piece of chicane was being practised at their expense; that statecraft rather than truth had dictated the representations made to them by the Japanese authorities; and that the alarm of the latter was simulated for the purpose of finding a pretext to curtail the liberty enjoyed by foreigners. Therefore a suggestion that the inmates of the legations should show themselves as little as possible in the streets of the capital, where at any moment a desperate might cut them down, was treated almost as an insult.

The Japanese had taken the opportunity to graft upon the establishment of spies, watchmen and police-officers at the several legations, a mounted escort to accompany the members whenever they moved about. Just at this time (1861) the Yedo statesmen, in order to reconcile the divergent views of the two courts, negotiated a marriage between the emperor's sister and the shōgun. But in order to bring the union about, they had to placate the Kiyōto Conservatives by a promise to expel foreigners from the country within ten years. When this became known, it strengthened the hands of the reactionaries, and furnished a new weapon to Yedo's enemies, who interpreted the marriage as the beginning of a plot to dethrone the mikado. Murderous attacks upon foreigners became more frequent. Two of these assaults had momentous consequences. The British government sent to Japan an entire fleet, with the object of proceeding by the corloge of the Satsuma feudal chief on the highway between Yokohama and Yedo. One of them was killed and the other two wounded. This outrage was not inspired by the "barbarian-expelling" sentiment: to any Japanese subject violating the rules of etiquette as these Englishmen had violated them, the same fate would have been meted out. Nevertheless, as the Satsuma daimyō refused to surrender his implicated vassals, and as the shōgun's arm was not long enough to reach the most powerful feudatories in Japan, the British government sent a squadron to bombard his capital, Kagoshima. It was not a brilliant exploit in any sense, but its results were invaluable; for the operations of the British ships finally convinced the Satsuma men of their impotence in the face of Western armaments, and converted them into advocates of liberal progress. Three months previously to this bombardment of Kagoshima another puissant feudatory had thrown down the gauntlet. The Chōshū chief, whose batteries commanded the entrance to the inland sea at Shimonoseki, opened fire upon ships flying the flags of the United States, of France and of Holland. In thus acting he obeyed an edict of the shōgun, which edict fixed the 11th of May 1861 as the date for practically inaugurating the foreigners-expulsion policy.

Again the shōgun's administrative competence proved inadequate to exact reparation, and a squadron, composed chiefly of British men-of-war, proceeding to Shimonoseki, demolished Chōshū's forts, burned his ships and scattered his samurai. In the face of the Kagoshima bombardment and the Shimonoseki expedition, no Japanese subject could retain any faith in his country's ability to oppose Occidentals by force. Thus the year 1858 began ominously in Japan's history. It saw the "barbarian-expelling" agitation deprived of the emperor's sanction; it saw the two principal clans, Satsuma and Chōshū, convinced of their country's impotence to defy the Occident; it saw the nation almost fully roused to the disintegrating and weakening effects of the feudal system; and it saw the traditional antipathy to foreigners beginning to be exchanged for a desire to study their civilization and to adopt its best features.

The treaty concluded between the shōgun's government and the United States in 1858 was of course followed by similar compacts with the principal European powers. From the outset these states agreed to co-operate for the assertion of their conventional privileges, and they naturally took Great Britain for leader, though such a relation was never openly announced. The treaties, however, continued during several years to lack imperial ratification, and, as time went by, that defect obstructed itself more and more upon the attention of their foreign signatories. The year 1865 saw British interests entrusted to the charge of Sir Harry Parkes, a man of keen insight, indomitable courage and some years' residence in Japan during a long period of service in China. It happened that a post of importance at the British legation in Yedo was then held by a remarkably gifted young Englishman, who, in a comparatively brief interval, had acquired a good working knowledge of the Japanese language, and it happened also that the British legation in Yedo was already—as it has always been ever since—the best equipped institution of its class in Japan. Aided by these facilities and by the researches of Mr. Satow (afterwards Sir Ernest Satow) Parkes arrived at the conclusions that the Yedo government was tottering to its fall; that the resumption of administrative authority by the Kiyōto court would make for the interests not only of the West but also of Japan; and that the ratification of the treaties by the mikado would elucidate the situation for foreigners while being, at the same time, essential to the validity of the documents. Two other objects also presented themselves, namely, that the import duties fixed by the conventions should be reduced from 15 to 5% ad valorem, and that the ports of Hīgō and Osaka should be opened at once, instead of at the expiration of two years as originally fixed. It was not proposed that these concessions should be made at once; the British fleet commander, with great foresight, destroyed the Shimonoseki batteries and sank the vessels lying there, a fine of three million dollars (some £750,000) had been imposed upon the daimyō of Chōshū by way of ransom for his capital, which lay at the mercy of the invaders. The daimyō of Chōshū, however, was in open rebellion against the shōgun, and as the latter could not collect the debt from the recalcitrant clansmen, while the four powers insisted on being paid by some one, the Yedo treasury was finally compelled to shoulder the obligation. Two out of the three millions were still due, and Parkes conceived the idea of remitting this debt in exchange for the ratification of the treaties, the reduction of the customs tariff from 15 to 5% ad valorem and the immediate opening of Hīgō and Osaka. He took with him to the place of negotiation (Hīgō) a fleet of British, French and Dutch war-ships, for, while announcing peaceful intentions, he had accustomed himself to think that a display of force should occupy the foreground in all negotiations with Oriental states. This coup may be said to have sealed the fate of the shōgunate. For here again was produced in a highly aggravated form the drama which had so greatly startled the nation eight years previously. What had some with those lessons learnt in the ports of Yedo, and now a foreign fleet, twice as strong as Perry's, had anchored at the vestibule of the Imperial city itself. No rational Japanese
could suppose that this parade of force was for purely peaceful purposes, or that rejection of the amicable bargain proposed by Great Britain's representative would be followed by the quiet withdrawal of the menacing fleet, whose terrible potentialities had been demonstrated at Kagoshima and Shimonsoki. The seclusionists, whose voices had been nearly silenced, raised them in renewed denunciation of the shōgun's incompetence to guarantee the sacred city of Kioto against such terrors, and the emperor, brought once more under the influence of the anti-foreign party, inflicted a heavy disgrace on the shōgun by dismissing and punishing the officials to whom the latter had entrusted the conduct of negotiations at Hīgō. Such procedure on the part of the throne amounted to withdrawing the administrative commission held by the Tokugawa family since the days of Ieyasu. The shōgun resigned. But his adversaries not being yet ready to replace him, he was induced to resume office, with, however, fatally damaged prestige. As for the three-power squadron, it steamed away successfully. Parkes had come prepared to write off the indemnity in exchange for three concessions. He obtained two of the concessions without remitting a dollar of the debt.

The shōgun did not long survive the humiliation thus inflicted on him. He died in the following year (1866), and was succeeded by Keiki, destined to be the last of the Tokugawa rulers. Nine years previously this same Keiki had been put forward by the seclusionists as candidate for the shōgunate. Yet no sooner did he attain that distinction in 1856 than he remodelled the army on French lines, engaged English officers to organize a navy, sent his brother to the Paris Exhibition, and altered many of the forms and ceremonies of his court so as to bring them into accord with Occidental fashions. The contrast between the politics he represented when a candidate for office in 1857 and the practice he adopted on succeeding to power in 1866 furnished an apt illustration of the change that had come over the spirit of the time. The most bigoted of the exclusionists were now beginning to abandon all idea of expelling foreigners and to think mainly of acquiring the best elements of their civilization. The Japanese are slow to reach a decision but very quick to act upon it when reached. From 1866 onwards the new spirit rapidly permeated the whole nation; progress became the aim of all classes, and the country entered upon a career of intellectual assimilation which, in forty years, won for Japan a universally accorded place in the ranks of the great Occidental powers.

After the abolition of the shōgunate and the resumption of administrative functions by the Throne, one of the first acts of the newly organized government was to invite foreign diplomatic representatives into the capital. The first foreign representative was a German, who had audience of the mikado. Subsequently a Law of Autonomy degree was issued, announcing the emperor's resolve to establish amicable relations with foreign countries, and "declaring that any Japanese subject thereafter guilty of violent behaviour towards a foreigner would not only act in opposition to the Imperial command, but would also be guilty of impairing the dignity and good faith of the nation in the eyes of the powers with which his majesty had pledged himself to maintain friendship." From that time the relations between Japan and foreign states grew yearly more amicable; the nation adopted the products of Western civilization with notable thoroughness, and the provisions of the treaties were carefully observed. Those treaties, however, presented one feature which very soon became exceedingly irksome to Japan. They exempted foreigners residing within her borders from the operation of her criminal laws, and secured to them the privilege of being arraigned solely before tribunals of their own nationality. That system had always been considered necessary where the subjects of Christian states visited or sojourned in non-Christian countries, and, for the purpose of giving effect to it, consular courts were established. This necessitated the confinement of foreign residents to settlements in the neighbourhood of the consular courts, since it would have been imprudent to allow foreigners to have free access to districts remote from the only tribunals competent to control them. The Japanese raised no objection to the embodiment of this system in the treaties. They recognized its necessity and even its expediency, for if, on the one hand, it infringed their country's sovereign rights, on the other, it prevented complications which must have ensued had they been entrusted with jurisdiction which they were not prepared to discharge satisfactorily. But the consular courts were not free from defects. A few of the powers organized competent tribunals presided over by judicial experts, but a majority of the treaty states, not having sufficiently large interests at stake, were content to delegate consular duties to merchants, not only deficient in legal training, but also themselves engaged in the very commercial transactions upon which they might at any moment be required to adjudicate in a magisterial capacity. In any circumstances the dual functions of consul and judge could not be discharged without anomaly by the same official, for he was obliged to act as advocate in the preliminary stages of complications about which, in his position as judge, he might ultimately have to deliver an impartial verdict. In practice, however, the system worked with tolerable smoothness, and might have remained long in force had not the patriotism of the Japanese rebelled bitterly against the implication that their country was unfit to exercise one of the fundamental attributes of every sovereign state, judicial autonomy. From the very outset they spared no effort to qualify for the recovery of this attribute. Revision of the country's laws and re-organization of its law courts would necessarily have been an essential part of the general reforms initiated by the movement with the Occident, but the question of consular jurisdiction certainly constituted a special incentive. Expert assistance was obtained from France and Germany; the best features of European jurisprudence were adapted to the conditions and usages of Japan; the law courts were remodelled, and steps were taken to educate a competent judiciary. In criminal law the example of France was chiefly followed; in commercial law that of Germany; and in civil law that of the Occident generally, with due regard to the customs of the country. The jury system was not adopted, collegiate courts being regarded as more conducive to justice, and the order of procedure went from tribunals of first instance to appeal courts and finally to the court of cassation. Schools of law were quickly opened, and a well-equipped bar soon came into existence. Twelve years after the inception of these great works, Japan made formal application for revision of the treaties on the basis of abolishing consular jurisdiction. She had asked for revision in 1871, sending to Europe and America an important embassy to raise the question. But at that time the conditions originally calling for such a juridical revolution had undergone any change such as would have justified its abolition, and the Japanese government, though very anxious to recover tariff autonomy as well as judicial, shrank from separating the two questions, lest by prematurely solving one the solution of the other might be unduly deferred. Thus the embassy failed, and though the problem attracted great academic interest from the first, it did not re-enter the field of practical politics until 1883. The negotiations were long protracted. Never previously had an Oriental state received at the hands of the Occident recognition such as that now demanded by Japan, and the West naturally felt deep reluctance to try a wholly novel experiment. The United States had set a generous example by concluding a new treaty (1878) on the lines desired by Japan. But its operation was conditional on a similar act of compliance by the other treaty powers. Ill-informed European publicists ridiculed the Washington statesmen's attitude on this occasion, claiming that what had been given with one hand was taken back with the other. The truth is that the conditional provision was inserted at the request of Japan herself, who appreciated her own unpreparedness for the concession. From 1885, however, she was freely to accept full responsibility, and she therefore asked that all foreigners within her borders should thenceforth be subject to her laws and judiciable by her law-courts, supplementing her
application by promising that its favourable reception should be followed by the complete opening of the country and the removal of all restrictions hitherto imposed on foreign trade, travel and residence in her realm. "From the first it had been the habit of Occidental peoples to upbraid Japan on account of the barriers opposed by her to full and free foreign intercourse, and she was now able to claim that these barriers were no longer maintained by her desire, but that they existed because of a system which theoretically proclaimed her unfitness for any association with Western nations, and practically made it impossible for her to throw open her territories completely for the ingress of foreigners." She had a strong case, but on the side of the European powers extreme reluctance was manifested to try the unprecedented experiment of placing their people under the jurisdiction of an Oriental country. Still greater was the reluctance of those upon whom the experiment would be tried. Foreigners residing in Japan naturally clung to consular jurisdiction as a privilege of inestimable value. They saw, in fact, that the system could not be permanently imposed on a country where the conditions justifying it had nominally disappeared. But they saw, also, that the legal and judicial reforms effected by Japan had been crowded into an extraordinarily brief period, and that, as tyros experimenting with alien systems, the Japanese might be betrayed into many errors.

The negotiations lasted for eleven years. They were begun in 1883 and a solution was not reached until 1894. Finally European Powers concurred to the justice of Japan's case, and agreed to recognition and mutual inspection of Japanese Tribunals. tribunals should assume jurisdiction over every person, of whatever nationality, within the confines of Japan, and the whole country should be thrown open to foreigners, all limitations upon trade, travel and residence being removed. Great Britain took the lead in thus releasing Japan from the fetters of the old system. The initiative came from her with special grace, for the system and all its irksome consequences had been originally imposed on Japan by a combination of powers with Great Britain in the van. As a matter of historical sequence the United States dictated the terms against which this system could not be permanently imposed on a country where the conditions justifying it had nominally disappeared. But from a very early period the Washington government showed its willingness to remove all limitations of Japan's sovereignty, whereas Europe, headed by Great Britain, whose preponderating interests entitled her to lead, resolutely refused to make any substantial concession. In Japanese eyes, therefore, British conservatism seemed to be the one serious obstacle, and since the British residents in the settlements far outnumbered all other nationalities, and since they alone had newspaper organs to ventilate their grievances—it was certainly fortunate for the popularity of her mission in the Far East that Great Britain is her way finally to set a liberal example. Nearly five years were required to bring the other Occidental powers into line with Great Britain and America. It should be stated, however, that neither reluctance to make the necessary concessions nor want of sympathy with Japan caused the delay. The explanation is, first, that each set of negotiators sought to improve other the terms or the terminology of the treaties already concluded, and, secondly, that the tariff arrangements for the different countries required elaborate discussion.

Until the last of the revised treaties was ratified, voices of protest against the continued to be vehemently raised by a large section of the foreign community in the settlements. Some were honestly apprehensive as to the issue of the experiment. Others were swayed by racial prejudice. A few had fallen into an insuperable habit of grumbling, or found their account in advocating conservatism under pretence of championing foreign interests; and all were naturally reluctant to forfeit the immunity from taxation hitherto enjoyed. It seemed as though the inauguration of the new system would find the foreign community in a mood which must greatly diminish the chances of a happy result, for without a capacious and agrigated disposition exists, opportunities to discover causes of complaint cannot be wanting. But at the eleventh hour this unfavourable demeanour underwent a marked change. So soon as it became evident that the old system was hopelessly doomed, the sound common sense of the European and American business man asserted itself. The foreign residents let it be seen that they intended to bow cheerfully to the inevitable, and that no obstacles would be willingly placed by them in the path of Japanese jurisprudence. They were soon led to take some promising steps.

An imperial rescript declared in unequivocal terms that it was the sovereign's policy and desire to abolish all distinctions between natives and foreigners, and that by fully carrying out the friendly purpose of the treaties his people would best consult his wishes, maintain the character of the nation, and promote its prestige. The premier and other ministers of state issued instructions to the effect that the responsibility now devolved on the government, and the duty on the people, of enabling foreigners to reside confidently and contentedly in every part of each country. Even the chief Buddhist prelates addressed to the priests and parishioners in their dioceses injunctions pointing out that, freedom of conscience being now guaranteed by the constitution, men professing alien creeds must be treated as courteously as the followers of Buddhism, and must enjoy the same rights and privileges.

Thus the great change was effected in circumstances of happy augury. Its results were successful on the whole. Foreigners residing in Japan now enjoy immunity of domicile, personal and religious liberty, freedom from official interference, and security of life and property as fully as though they were living in their own countries, and they have gradually learned to look with greatly increased respect upon Japanese law and its administrators.

Next to the revision of the treaties and to the result of the great wars waged by Japan since the resumption of foreign intercourse, the most memorable incident in her modern career was the conclusion, first, of an entente, and, secondly, of an offensive and defensive alliance with Great Britain in January 1902 and September 1905, respectively. The entente set out by disavowing on the part of each of the contracting parties any aggressive tendency in either China or Korea, the independence of which two countries was explicitly recognized; and went on to declare that Great Britain in China and Japan in China and Korea might take indispensable means to safeguard their interests; while, if such measures involved one of the signatories in war with a third power, the other signatory would not only remain neutral but would also endeavour to prevent other powers from joining in hostilities against its ally, and would come to the assistance of the latter in the event of its being faced by two or more powers. The entente further recognized that Japan possessed, in a peculiar degree, political, commercial and industrial interests in Korea. This agreement, equally novel for each of the contracting parties, evidently tended to the benefit of Japan more than to that of Great Britain, inasmuch as the interests in question were vital from the former power's point of view but merely local from the latter's. The inequality was corrected by an offensive and defensive alliance in 1905. For the scope of the agreement was then extended to India and eastern Asia generally, and while the signatories pledged themselves, on the one hand, to preserve the common interests of all powers in China by ensuring her integrity and independence as well as the principle of equal rights and concessions for the commerce and industry of all nations within her borders, they agreed, on the other, to maintain their own territorial rights in eastern Asia and India, and to come to each other's armed assistance in the event of those rights being assailed by any other power or powers. These agreements have, of course, a close relation to the events which accompanied or immediately preceded them, but they also present a vivid and radical contrast between a country which, less than half a century previously had cowered under the terrors of outrages from the world, and a country which now allied itself with one of the most liberal and progressive nations for the purposes of a policy.
extending over the whole of eastern Asia and India. This contrast was accentuated two years later (1902) when France and Russia concluded ententes with Japan, recognizing the independence and integrity of the Chinese Empire, as well as the principle of equal opportunity for all nations in that country, and engaging to support each other for ensuring peace and security there. Japan thus became a world power in the most unequivocal sense.

Japan's Foreign Wars and Complications.—The earliest foreign war conducted by Japan is said to have taken place at the beginning of the 3rd century, when the emperor Jing led an army to the conquest of Korea. But as the event is supposed to have happened more than 500 years before the first Japanese record was written, its traditional details cannot be seriously discussed. There is, however, no room to doubt that from time to time in early ages Japanese troops were seen in Korea, though they made no permanent impression on the country. It was reserved for Hideyoshi, the taikō, to make the Korean peninsula the scene of a great over-sea campaign. Hideyoshi, the Napoleon of Japan, having brought the whole empire under his sway as the sequel of many years of almost equal warfare with the generalship of Tosa Shigehide, reached for the project of subjugating China. By some historians his motive has been described as a desire to find employment for the immense mob of armed men whom four centuries of almost continuous fighting had called into existence in Japan: he felt that domestic peace could not be permanently restored unless these restless spirits were occupied abroad. But although that object may have reinforced his purpose, his ambition aimed at nothing less than the conquest of China, and he regarded Korea merely as a stepping-stone to that aim. Had Korea consented to be put to such a use, she need not have fought or suffered. The Koreans, however, counted China invincible. They considered that Japan would be shattered by the first contact with the great empire, and therefore although, in the 13th century, they had given the use of their harbours to the Mongol invaders of Japan, they flatly refused in the 16th to allow their territory to be used for a Japanese invasion of China. On the 24th of May 1592 the wave of invasion rolled against Korea's southern coast. Hideyoshi had chosen Nagoya in the province of Hizen as the home-base of his operations. There the sea separating Japan from the Korean peninsula narrows to a strait divided into two channels of almost equal width by the island of Tsushima. To reach this island from the Japanese side was an easy and safe task, but in the 56-mile channel that separated Tsushima from the peninsula an invading flotilla had to run the risk of attack by Korean warships. At Nagoya Hideyoshi assembled an army of over 300,000 men, of whom some 70,000 constituted the first fighting line, 87,000 the second, and the remainder formed a reserve to be subsequently drawn on as occasion demanded. The question of transport presented some difficulty, but it was solved by the simple expedient of ordering every feudal to furnish two ships for each 100,000 koku of his fief's revenue. These were not fighting vessels but mere transports. As for the plan of campaign, it was precisely in accord with modern principles of strategy, and bore witness to the daring genius of Hideyoshi. The van, consisting of three army corps and musketry in all 51,000 men, was to cross rapidly to Fusan, on the south coast of the peninsula, and immediately commence a movement northward towards the capital, Seoul, one corps moving by the eastern coast-road, one by the central route, and one by the western coast-line. Thereafter the other four corps, which formed the first fighting line, together with the corps under the direct orders of the commandant-in-chief, Uesugi Hidejyro, were to cross, for the purpose of effectually subduing the regions through which the van had passed; and, finally, the two remaining corps of the second line were to be transported by sea up the west coast of the peninsula, to form a junction with the van which, by that time, should be preparing to pass into China over the northern boundary of Korea, namely, the Yalu River. For the landing place of these reinforcements the town of Pyhong-yang was adopted, being easily accessible by the Taidong River from the coast. In later ages Japanese armies were destined to move twice over these same regions, once to the invasion of China, once to the attack of Russia, and they adopted almost the same strategical plan as that mapped out by Hideyoshi in the year 1592. The forecast was that the Koreans would offer their chief resistance, first, at the capital, Seoul; next at Pyhong-yang, and finally at the Yalu, as the approaches to all these places offered positions capable of being utilized to great advantage for defensive purposes.

On the 24th of May 1592 the first army corps, under the command of Konishi Yukinaga, crossed unmolested to the peninsula; next day the castle of Fusan was carried by storm, which some fateful befall, on the 27th, another and another stronger fortress lying 3 miles inland and garrisoned by 20,000 picked soldiers. The invaders were irresistible. From the landing-place at Fusan to the gates of Seoul the distance is 267 miles. Konishi's corps covered that interval in 19 days, storming two forts, carrying two positions and fighting one pitched battle en route. On the 12th of June the Korean capital was in Japanese hands, and by the 16th four army corps had assembled there, which for a time ran battle by the land of Tushima. To reach the northward advance was resumed, and July 15th saw Pyhong-yang in Japanese possession. The distance of 150 miles from Seoul to the Taidong had been traversed in 18 days, 10 having been occupied in forcing the passage of a river which, if held with moderate resolution and skill, should have stopped the Japanese altogether. At this point, however, the invasion suffered a check owing to a cause which in modern times has received much attention, though in Hideyoshi's days it had been little considered; the Japanese lost the command of the sea. The Japanese idea of sea-fighting in those times was to use open boats propelled chiefly by oars. They closed as quickly as possible with the enemy, and then fell on with the trenchant swords which they used so skillfully. Now during the 15th century and part of the 16th the Japanese had been so harassed by Japanese piratical raids that their inventive genius, quickened by suffering, suggested a device for coping with these formidable adversaries. Once allow the Japanese swordsman to come to close quarters and he carried all before him. To keep him at a distance, then, was the great desideratum, and the Chinese compassed this in maritime warfare by completely covering their boats with a kind of a shell, or turtle-shell, and standing the whole surface with chevets de frise, but Japanese annals indicate that in the great majority of cases solid timber alone was used. It seems strange that the Japanese should have been without any clear perception of the immense fighting superiority possessed by such protected war-boats as a covering for small boats. But certainly they were either ignorant or indifferent. The fleet which they provided to hold the command of Korean waters did not include one vessel of any magnitude: it consisted simply of some hundreds of row-boats manned by 7000 men. Hideyoshi himself was perhaps not without misgivings. Six years previously he had endeavoured to obtain two war-galleons from the Portuguese, and had he succeeded, the history of the Far East might have been radically different. Evidently, however, he committed a blunder which his countrymen in modern times have constantly avoided; he drew the sword without having fully investigated his adversary's resources. Just about the time when the van of the Japanese army was entering Seoul, the Korean admiral, Yi Sun-sin, at the head of a fleet of 80 vessels, attacked the Japanese squadron which lay at anchor near the entrance to Fusan harbour, set 26 of the vessels on fire and dispersed the rest. Four other engagements ensued in rapid succession. The last and most important took place shortly after the Japanese troops had seized Pyhong-yang. It
resulted in the sinking of over 70 Japanese vessels, transports and fighting ships combined, which formed the main part of a flotilla carrying reinforcements by sea to the van of the invading army. This despatch of troops and supplies by water had been a leading feature of Hideyoshi's plan of campaign, and the destruction of the flotilla to which the duty was entrusted may be said to have sealed the fate of the war by isolating the army in Korea from its home base. It is true that Konishi Yukinaga, who strongly opposed the first division, would have continued his northward march from Phyong-yang without delay. He argued that China was wholly unprepared, and that the best hope of ultimate victory lay in not giving her time to collect her forces. But the commander-in-chief, Ukida Hideyori, refused to endorse this plan. He took the view that since the Korean provinces were still offering desperate resistance, supplies could not be drawn from them, neither could the troops engaged in subjugating them be freed for service at the front. Therefore it was essential to await the consummation of the second phase of Hideyoshi's plan, namely, the despatch of reinforcements and material by water to Phyong-yang. The rear was secured while the two phases fared. The Japanese commander at Phyong-yang never received any accession of strength. His force suffered constant diminution from casualties, and the question of commissariat became daily more difficult. It is further plain to any reader of history—and Japanese historians themselves admit the fact—that no wise effort was made to conciliate the Korean people. They were treated so harshly that even the humble peasant took up arms, and thus the peninsula, instead of serving as a basis of supplies, had to be garrisoned perpetually by a strong army.

The Koreans, having suffered for their loyalty to China, naturally looked to her for succour. Again and again appeals were made to Peking, and at length a force of 5000 men, which had been mobilized in the Lintung peninsula, crossed the Yalu and moved south to Phyong-yang, where the Japanese van had been lying idle for over two months. This was early in October 1592. Memorable as the first encounter between Japanese and Chinese, the incident also illustrated China's supreme confidence in her own ineffable superiority. The whole of the Korean forces had been driven northward by the entire length of the peninsula by the Japanese armies, yet Peking considered that 5000 Chinese "braves" would suffice to roll back this tide of invasion. Three thousand of the Chinese were killed and the remainder fled pell-mell across the Yalu. China now began to be seriously alarmed. She collected an army variously estimated at from 51,000 to 200,000 men, and marching it across Manchuria in the dead of winter, hurled it against Phyong-yang during the first week of February 1593. The Japanese garrison did not exceed 20,000, nearly one-half of its original number having been detached to hold a line of forts which guarded the communications with Seoul. Moreover, the Chinese, though their swords were much inferior to the Japanese weapon, possessed great superiority in artillery and cavalry, as well as in the fact that their troopers wore iron mail which defied the keenest blade. Thus, after a severe fight, the Japanese had to evacuate Phyong-yang and fall back upon Seoul. But this one victory alone stanza China's credit. In all subsequent encounters of any magnitude her army suffered heavy defeats, losing on one occasion some 10,000 men, on another 4000, and on a third 39,000. But the presence of her forces and the determined resistance offered by the Koreans effectually saved the situation. Indeed, after the evacuation of Seoul, on the 9th of May 1593, Hideyoshi abandoned all idea of carrying the war into Chinese territory, and devoted his attention to obtaining honourable terms of peace, the Japanese troops meanwhile holding a line of forts along the southern coast of Korea. He died before that end had been accomplished. Had he lived a few days longer, he would have learned of a crushing defeat inflicted on the Chinese forces (at Sö-ch'irn, October 30, 1598), when the Satsuma men under Shimazu Yoshitake took 38,700 Chinese heads and sent the noses and ears to Japan, where they now lie buried under a tumulus (mimentaka, ear-mound) near the temple of Daibutsu in Kioto. Thereafter the statesmen to whom the regent on his death-bed had entrusted the duty of terminating the struggle and recalling the troops, intimates to the enemy that the evacuation of the peninsula might be obtained if a Korean prince repaired to Japan as envoy, and if some tiger-skins and ginseng were sent to Kioto in token of amity. So ended one of the greatest over-sea campaigns recorded in history. It had lasted 65 years, had seen 200,000 Japanese troops at one time on Korean soil, and had cost something like a quarter of a million lives.

From the recall of the Korea expedition in 1598 to the resumption of intercourse with the Occident in modern times, Japan enjoyed uninterrupted peace with foreign nations. Thereafter she had to engage in four wars. It is not difficult to see the striking contrast. During the first eleven centuries of her historical existence she was involved in only one contest abroad; during the next half century she fought four times beyond the sea and was confronted by many complications. Whatever material or moral advantages her association with the West conferred on her, it did not bring peace.

The first menacing foreign complication with which the Japanese government of the Meiji era had to deal was connected with the traffic in Chinese labour, an abuse not yet the "María Luz," put into port at Yokohama, carrying 200 contract labourers. One of the unfortunate men succeeded in reaching the shore and made a pitious appeal to the Japanese authorities, who at once seized the vessel and released her freight and crew, for they were better off. The Japanese had not always been so particular. In the days of early foreign intercourse, before England's attitude towards slavery had established a new code of ethics, Portuguese ships had been permitted to carry away from Hírado, as they did from Macao, cargoes of men and women, doomed to a life of enforced toil if they survived the horrors of the voyage. But modern Japan followed the tenets of modern morality in such matters. Of course the Peruvian government protested, and for a time relations were strained almost to the point of rupture; but it was finally agreed that the question should be submitted to the arbitration of the tsar, who decided in Japan's favour. Japan's attitude in this affair elicited applause, not merely from the point of view of humanity, but also because of the confidence she showed in Occidental justice.

Another complication which occupied the attention of the Tókó government from the beginning of the Meiji era was in truth a legacy from the days of feudalism. In those days the island of Yezo, as well as Sakhalin on its north-west and the Kurile group on its north, could scarcely be said to be in effective Japanese occupation. It is true that the feudal chief of Matsusae (now Fuku-yama), the remains of whose castle may still be seen on the coast at the southern extremity of the island of Yezo, exercised nominal jurisdiction; but his functions did not greatly exceed the levying of taxes on the aboriginal inhabitants of Yezo, the Kuriles and southern Sakhalin. Thus from the beginning of the 18th century Russian fishermen began to settle in the Kuriles and Russian ships menaced Sakhalin. There can be no doubt that the first explorers of Sakhalin were Japanese. As early as 1620, some vassals of the feudal chief of Matsusae visited the place and passed a winter there. It was then supposed to be a peninsula forming part of the Asiatic mainland, but in 1866 a daring Japanese traveller, by name Mamiya Rinzo, made his way to Manchuria, voyaged up and down the Amur, and, crossing to Sakhalin, discovered that a narrow strait separated it from the mainland. There still prevails in the minds of many Occidentials a belief that the discovery of Sakhalin's insular character was reserved for Captain Nevelskoy, a Russian, who visited the place in 1849, but in Japan the fact had then been known for 43 years. Muraviev, the great Russian empire-builder in East Asia, under whose orders Nevelskoy acted, quickly appreciated the necessity of acquiring Sakhalin, which commands the estuary of the Amur.
After the conclusion of the treaty of Aigun (1857) he visited Japan with a squadron, and required that the strait of La Pérouse, which separates Sakhalin from Yezo, should be regarded as the frontier between Russia and Japan. This would have given the whole of Sakhalin to Russia. Japan refused, and Muraviev immediately resigned to the policy he had already pursued with signal success in the Usuri region: he sent emigrants to settle in Sakhalin. Twice the shogunate attempted to frustrate this process of gradual absorption by proposing a division of the island along the 30th parallel of north latitude, and finally, in 1872, the Meiji government offered to purchase the Russian portion for 2,000,000 dollars (then equivalent to about £1,000,000). St Petersburg, having by that time discovered the comparative worthlessness of the island as a wealth-earning possession, showed some signs of acquiescence, and possibly an agreement might have been reached had not a leading Japanese statesman—afterwards Count Kuroda—opposed the bargain as disadvantageous to Japan. Finally St Petersburg's perseverance won the day. In 1875 Japan agreed to recognize Russia's title to the whole island on condition that Russia similarly recognized Japan's title to the Kuriles. It was a singular compact. Russia purchased a Japanese property and paid for it with Russian property. The Japanese object was to have an apanage of the Satsuma fief. The language and customs of their inhabitants showed unmistakable traces of relationship to the Japanese, and the possibility of the islands being included among the dominions of China had probably never occurred to any Japanese statesman. When therefore, in 1873, the crew of a wrecked Riūkùan junk were barbarously treated by the inhabitants of northern Formosa, the Japanese government hesitatingly assumed the responsibility of seeking redress for their outrage. Formosa being a part of the Chinese Empire, complaints were duly addressed to the Chinese government. But the Chinese authorities showed such resolute indifference to Japan's representations that the latter finally took the law into her own hands, and sent a small force to punish the Formosan murderers, who, of course, were found quite unable to offer any serious resistance. The Chinese government, now recognizing the fact that its territories had been invaded, lodged a protest which, but for the intervention of the British minister in Peking, might have involved the two empires in war. The final terms of arrangement were that, in consideration of Japan withdrawing her troops from Formosa, China should indemnify her to the extent of the expenses of the expedition. In sending this expedition to Formosa the government sought to placate the Satsuma samurai, who were beginning to show much opposition to certain features of the administrative reforms just inaugurated, and who claimed special interest in the affairs of the Riūkù islands.

Had Japan needed any confirmation of her belief that the Riūkù islands belonged to her, the incidents and settlement of the Riūkù Complication would have constituted conclusive evidence. Thus in 1876 she did not hesitate to extend her newly organized system of prefectural government to Riūkù, which thenceforth became the Okinawa prefecture, the former ruler of the islands being pensioned, according to the system followed in the case of the feudal chiefs in Japan proper. China at once entered an objection. She claimed that Riūkù had always been a tributary of her empire, and she was doubtless perfectly sincere in the contention. But China's interpretation of tribute did not seem reducible to a working theory. So long as her own advantage could be promoted, she regarded as a token of vassalage the presents periodically carried to her court from neighbouring states. So soon, however, as there arose any question of discharging a suzerain's duties, she classified these offerings as insignificant interchanges of neighbourly courtesy. It was true that Riūkù had followed the custom of dispatching gift-bearing envoys to China from time to time, just as Japan herself had done, though with less regularity. But it was also true that Riūkù had been subdued by Satsuma without China stretching out a hand to help her; that for two centuries the islands had been included in the Satsuma fief, and that in the sequel to the Formosan affair, had made a practical acknowledgment of Japan's superior title to protect the islanders. Each empire positively asserted its claims; but whereas Japan put hers into practice, China confined herself to remonstrances. Things remained in that state until 1880, when General Grant, visiting the East, suggested the advisability of a compromise. A conference met in Peking, and the plenipotentiaries agreed that the islands should be divided, Japan taking the northern group, China the southern. But on the eve of signature the Chinese plenipotentiary drew back, pleading that he had no authority to do the matter without his court's agreement. This caused certain other dignitaries, Japan, sensible that she had been flouted, retired from the discussion and retained the islands, China's share in them being reduced to a grievance.

From the 16th century, when the Korean peninsula was overrun by Japanese troops, its rulers made a habit of sending a present-bearing embassy to Japan to felicitate the accession of each shōgun. But after the fall of the Tokugawa shōgunate, the Korean court desisted from this custom, declared a determination to have no further relations with a country embracing Western civilization, and refused even to receive Japanese envoys. This conduct caused deep umbrage in Japan. Several prominent politicians cast their votes for war, and undoubtedly the sword would have been drawn had not the leading statesmen felt that a struggle with Korea, involving probably a rupture with China, must fatally check the progress of the administrative reforms then (1873) in their infancy. Two years later, however, the Koreans crowned their defiance by firing on the boats of a Japanese war-vessel engaged in the operation of coast-surveying. No choice now remained except to despatch an armed expedition against the insubordinate kingdom. But Japan did not want to fight. In this matter she showed herself an apt pupil of Occidental methods such as had been practised against herself in former years. She assembled an imposing force of war-ships and transports, but instead of proceeding to extremities, she employed the squadron—which was by no means so strong as it seemed—to intimidate Korea into signing a treaty of amity and commerce, and opening three ports to foreign trade (1876). That was the beginning of Korea's friendly relations with the outer world, and Japan naturally took credit for the fact that, thus early in her new career, she had become an instrument for extending the principle of universal intercourse opposed so strenuously by herself in the past.

From time immemorial China's policy towards the petty states on her frontiers had been to utilize them as buffers for softening the shock of foreign contact, while contiving, at the same time, that her relations with them should involve no inconvenient responsibilities for herself. The aggressive impulses of the outside world were to be checked by an unproclaimed understanding that the territories of these states partook of the inviolability of China, while the states, on their side, must never expect their suzerain to bear the consequences of their acts. This arrangement, depending largely on sentiment and prestige, retained its validity in the atmosphere of Oriental seclusion, but quickly failed to endure the test of modern Occidental practicality. Tongking, Annam, Siam and Burma were withdrawn, one by one, from the fiction of dependence on China and independence towards all other countries. But with regard to Korea, China proved more tenacious. The
possession of the peninsula by a foreign power would have threatened the maritime route to the Chinese capital and given easy access to Manchuria, the cradle of the dynasty which ruled China. Therefore Peking statesmen endeavored to preserve the old-time relations with the little kingdom. But they could never persuade themselves to modify the indirect methods sanctioned by tradition. Instead of boldly declaring Korea a dependency of China, they sought to keep up the romance of ultimate dependency and intermediate sovereignty. Thus in 1876 Korea was suffered to conclude with Japan a treaty of which both first adherents declared it to be an independent state, enjoying the same rights as Japan, and subsequently to make an alliance with the United States (1882), Great Britain (1883) and other powers, treaties in which her independence was constructively admitted. China, however, did not intend that Korea should exercise the independence thus conventionally recognized. A Chinese resident was placed in Seoul, and a system of steady though covert interference in Korea's affairs was inaugurated. The chief sufferer from these anomalous conditions was Japan. In all her dealings with Korea, in all complications that arose out of her comparatively large trade with the peninsula, in all questions of her national life, she was not permitted to assert herself negotiating with a dependency of China, and with officials who took their orders from the Chinese representative. China had long entertained a rooted apprehension of Japanese aggression in Korea—an apprehension not unwarranted by history—and that distrust tinged all the influence exerted by her agents there. On many occasions Japan was made sensible of the discrimination thus exercised against her. Little by little the consciousness roused her indignation, and although no single instance constituted a ground for strong international protest, the Japanese people gradually acquired a sense of being perpetually bailed, thwarted and humiliated by China's interference in Korean affairs. For thirty years China had treated Japan as a contemptible deserter from the Oriental standard, and had regarded her progressive efforts with openly disdainful aversion; while Japan, on her side, had chancellor more and more to furnish some striking evidence of the wisdom of her preference for Western civilization. Even more serious were the consequences of Chinese interference from the point of view of Korean administration. The rulers of the country lost all sense of national responsibility, and gave unrestrained sway to selfish and unscrupulous officialism. Our army, numbering 10,000 men and the executive alikes came to be discharged by bribery only. Family interests predominated over those of the state. Taxes were imposed in proportion to the greed of local officials. No thought whatever was taken for the welfare of the people or for the development of the country's resources. Personal responsibility was unknown among officials. To be a member of the Min family, to which the queen belonged, was to possess a passport to office and an indemnity against the consequences of abuse of power. From time to time the advocates of progress or the victims of oppression rose against the régime. They effected nothing except to recall to the world's recollection the miserable condition into which Korea had fallen. Chinese military aid was always furnished readily for the suppression of these risings, and thus the Min family learned to base its tenure of power on ability to conciliate China and on readiness to obey Chinese dictation, while the people at large fell into the apathetic condition of men who possess neither security of property nor national ambition.

As a matter of state policy the Korean problem caused much anxiety to Japan. Her own security being deeply concerned in preserving Korea from the grasp of a Western power, she could not suffer the little kingdom to drift into a condition of such administrative incompetence and national debility that a strong aggressor might find at any moment a pretext for interference. On two occasions (1882 and 1884) when China's armed intervention was employed in the interests of the Min to suppress movements of reform, the partisans of the victors, regarding Japan as the fountain of progressive tendencies, destroyed her legislation in Seoul and compelled its inmates to fly from the city. Japan behaved with forbearance at these crises, but in the consequent negotiations she acquired conventional titles that touched the core of China's alleged suzerainty. In 1885 his might not maintain troops in Seoul for the protection of her legation was admitted; in 1885 she concluded with China a convention by which each power pledged itself not to send troops to Korea without notifying the other.

In the spring of 1894 a serious insurrection broke out in Korea, and the Min family appealed for China's aid. On the 6th of July 2500 Chinese troops embarked at Tientsin and were transported to the peninsula, where they went into camp at Ya-shan (Asan), on the south-west coast. Notice of the measure being given by the Chinese government to the Japanese representative at Peking, according to treaty. During the interval immediately preceding these events, Japan had been rendered acutely sensible of China's arbitrary and unfriendly interference in Korea. Twice the efforts of the Japanese government to obtain redress for unlawful and ruinous commercial prohibitions had been thwarted by the Chinese representative in Seoul; and an ultimatum addressed from Tokyō to the Korean government had elicited from the viceroy Li in Tientsin a thinly veiled threat of Chinese armed opposition. Still was the national issue one of Korea's sovereignty; and China's procedure with regard to the murder of Kim Ok-kyun, the leader of progress in Korea, who had been for some years a refugee in Japan. Inveigled from Japan to China by a fellow-countryman sent from Seoul to assassinate him, Kim was shot in a Japanese hotel in Shanghai; and China, instead of punishing the murderer, conveyed him in a war-ship of her own to Korea to be publicly honoured. When, therefore, the Korean insurrection of 1894 induced the Min family again to solicit China's armed intervention, the Tokyō government concluded that, in the interests of Japan's security and of civilization in the Orient, steps must be taken to put an end to the misrule which offered incessant invitations to foreign aggression, and checked Korea's capacity to maintain its own independence. Japan did not claim for herself any rights or interests in the peninsula superior to those possessed there by China. But there was not the remotest probability that China, whose face had been contemptuously set against all the progressive measures adopted by Japan during the preceding twenty-five years, would join in forcing upon a neighbouring kingdom the very reforms she herself despised, were her cooperation invited through ordinary diplomatic channels only. It was necessary to contrive a situation which Japan might furnish clear proof of Japan's resolution, but also enable her to pursue her programme independently of Chinese endorsement, should the latter be finally unobtainable. She therefore met China's notice of a despatch of troops with a corresponding notice of her own, and the month of July 1894 found a Chinese force assembled at Asan and a Japanese force occupying positions in the neighbourhood of Seoul. China's motive for sending troops was nominally to quell the Tonghak insurrection, but really to re-affirm her own domination in the peninsula. Japan's motive was to secure such a position as would enable her to insist upon the radically curative treatment of Korea's malady. Up to this point the two empires were strictly within their conventional rights. Each was entitled by treaty to send troops to Korea, provided that notice was given to the other. But China, in giving notice, described Korea as her "tributary state," thus thrusting into the forefront of the discussion a contention which Japan, from conciliatory motives, would have kept out of sight. Once formally advanced, however, the claim had to be challenged. In the treaty of amity and commerce concluded in 1876 between Japan and Korea, it was explicitly declared that each side would respect the other's "tributary" relations. Japan could not agree that a power which for nearly two decades she had acknowledged and treated as her equal should be openly classed as a tributary of China. She protested, but the Chinese statesmen took no notice of her protest. They continued to apply the disputed appellation to Korea, and they further asserted their assumption of sovereignty in the peninsula by seeking to set limits to the number of troops sent by Japan, as well as to the sphere of their employment. Japan then proposed that
the two empires should unite their efforts for the suppression of disturbances in Korea, and for the subsequent improvement of that kingdom’s administration, the latter purpose to be pursued by the despatch of a joint commission of investigation. But China refused everything. Ready at all times to interfere by force of arms between the Korean people and the dominant political faction, she declined to interfere in any way for the promotion of reform. She even expressed supercilious surprise that Japan, while asserting Korea’s independence, should suggest the idea of peremptorily reforming its administration. In short, for Chinese purposes the Peking statesmen openly declared Korea a tributary state; but for Japanese purposes they insisted that it must be held independent. They believed that their joint negotiations, terminated at the close of the Japanese empire. Viewed in the light of that suspicion, China’s attitude became comprehensible, but her procedure was inconsistent, illogical and unpractical. The Tōkyō cabinet now declared its resolve not to withdraw the Japanese troops without “some understanding that would guarantee the future peace, order, and good government of Korea,” and since China still declined to come to such an understanding, Japan undertook the work of reform single-handed.

The Chinese representative in Seoul threw his whole weight into the scale against the success of these reforms. But the Outbreak of Hostilities operation, China’s troops had been sent originally for the purpose of quelling the Tonghak rebellion. But the rebellion having died of inanition before the landing of the troops, their services were not required. Nevertheless China kept them in Korea, her declared reason for doing so being the presence of a Japanese military force. Throughout the subsequent negotiations the Chinese forces lay in an entrenched camp at Asan, while the Japanese occupied Seoul. An attempt on China’s part to send reinforcements could be construed only as an unavailing effort of resolution of the Japanese by force of arms. Nevertheless China not only despatched troops by sea to strengthen the camp at Asan, but also sent an army overland across Korea’s northern frontier. At this stage an act of war occurred. Three Chinese men-of-war, convoying a transport with 1200 men encountered and fired on three Japanese cruisers. One of the Chinese ships was taken; another was so shattered that she had to be beached and abandoned; the third escaped in a dilapidated condition; and the transport, refusing to surrender, was sunk. This happened on the 25th of July 1894, and an open declaration of war was made by each empire six days later. The Japanese had a naval superiority of 7000 to 16,866, or seven to one. Nothing was achieved by these efforts.

The moment when Japan applied herself to break away from Oriental traditions, and to remove from her limbs the fetters of Eastern conservatism, it was inevitable that a widening gulf should gradually grow between herself and China. The war of 1894 was really a contest between Japanese progress and Chinese stagnation. To secure Korean immunity from foreign—especially Russian—aggression was of capital importance to both empires. Japan believed that such security could be attained by introducing into Korea the civilization which had contributed so signally to the development of her own strength and resources. China thought that she could guarantee it without any departure from old-fashioned methods, and by the same process of capricious protection which had failed so signally in the cases of Annam, Tongking, Burma and Siam. The issue really at stake was whether Japan should be suffered to act as the Eastern propagandist of Western progress, or whether her efforts in that cause should be held in check by Chinese conservatism.

The war itself was a succession of triumphs for Japan. Four days after the first naval encounter she sent from Seoul a column of troops who routed the Chinese entrenched at Asan. Many of the fugitives effected their escape to Phyong-yang, a town on the Taidong River, offering excellent facilities for defence, and historically interesting as the place where a Japanese army of invasion had its first encounter with Chinese troops in 1592. There the Chinese assembled a force of 17,000 men, and made leisurely preparations for a decisive contest. Forty days elapsed before the Japanese columns converged upon Phyong-yang, and then interval was utilized by the Chinese to throw up parapets, mount Krupp guns and otherwise strengthen their position. Moreover, they were armed with repeating rifles, whereas the Japanese had only single-loaders, and the ground offered little cover for an attacking force. In such circumstances, the advantages possessed by the defence ought to have been wellnigh insuperable; yet a day’s fighting sufficed to carry all the positions, the assailants’ casualties amounting to less than 700 and the defenders losing 6000 in killed and wounded. This brilliant victory was the prelude to the battle of Yalu, which was fought on the 26th of September, the very day after the battle at Phyong-yang, a great naval fight took place near the mouth of the Yalu River, which forms the northern boundary of Korea. Fourteen Chinese warships and six torpedo-boats were returning to home ports after conveying a fleet of transports to the Yalu, when they encountered eleven Japanese men-of-war cruising in the Yellow Sea. Hitherto the Chinese had sedulously avoided a contest at sea. Their fleet included two armoured battleships of over 7000 tons displacement, whereas the biggest vessels on the Japanese side were limited to 2500 tons. In the hands of Admiral Aizawa appreciating the value of sea power, China’s naval force would certainly have been led against Japan’s maritime communications, for a successful blow struck there must have put an end to the Korean campaign. The Chinese, however, failed to read history. They employed their war-vessels as convoys only, and, when not using them for that purpose, hid them in port. Everything goes to show that they would have avoided the battle off the Yalu had choice been possible, though when forced to fight they fought bravely. Four of their ships were sunk, and the remainder remained, as Admiral Wei-haiwei declared, the vigour of the Japanese pursuit being greatly impaired by the presence of torpedo-boats in the retreating squadron.

The Yalu victory opened the over-sea route to China. Japan could now strike at Talien, Port Arthur, and Wei-hai-wei, naval stations on the Liaotung and Shantung peninsulas, where powerful permanent fortifications, built after plans prepared by European experts and armed with the best modern weapons, were regarded as almost impregnable. They fell before the assaults of the Japanese troops as easily as the comparatively rude fortifications at Phyong-yang had fallen. The only resistance of Talien, by Wei-haiwei, the vigour of the Japanese pursuit being greatly impaired by the presence of torpedo-boats in the retreating squadron. The whole squadron of torpedo-craft had been destroyed or captured as they attempted to escape, and after three of the largest vessels had been sunk at their moorings by Japanese torpedoes, and one by gun-fire, the remaining ships surrendered, and their brave commander, Admiral Ting, committed suicide. This ended the war. It had lasted seven and a half months, during which time Japan put into the field five columns, aggregating about 125,000 of all arms. One of these columns marched northward from Seoul, won the battle of Phyong-yang, advanced to the Yalu, forced its way into Manchuria, and moved towards Mukden by Feng-hwang, fighting several minor engagements, and conducting the greater part of its operations amid deep snow in midwinter. The second column diverged westwards from the Yalu, and, marching through southern Manchuria, reached Hai-cheng, whence it advanced to the capture of Niuchwang and Ying-tse-kow. The third landed on the Liaotung peninsula, and, turning southwards, carried Talien and Port Arthur by assault. The fourth moved up the Liaotung peninsula, and, having seized Kaiping, advanced against Ying-tse-kow, and joined hands with the second column. The fifth crossed from Port Arthur to Wei-hai-wei, and captured the latter. In all these operations the total Japanese casualties were 1055 killed and 4922 wounded—figures which sufficiently indicate the inefficiency of the Chinese fighting. The deaths from disease totalled 16,866, and the total monetary expenditure was £20,000,000 sterling.

Remote

Origin of the Conflict.

Events of the War.
The Chinese government sent Li Hung-chang, viceroy of Pechili and senior grand secretary of state, and Li Ching-fong, to discuss terms of peace with Japan, the latter being represented by Marquis (afterwards Prince) Itō and Count Mutsu, prime minister and minister for foreign affairs, respectively. A preliminary agreement was signed at Shimomoseki on the 17th of April 1895, and subsequently ratified by the sovereigns of the two empires. It declared the absolute independence of Korea; ceded to Japan the part of Manchuria lying south of a line drawn from the mouth of the river Anping to the mouth of the Liao, through Feng-hwang, Hái-cheng and Ying-tse-kwó, as well as the islands of Formosa and the Pescadores; pledged China to pay an indemnity of 200,000,000 taels; provided for the occupation of Wei-hal-wei by Japan pending payment of the indemnity; secured some additional commercial privileges, such as the opening of four new places to foreign trade and the right of foreigners to engage in manufacturing enterprises in China, and provided for the conclusion of a treaty of commerce and amity between the two empires, based on the lines of China’s treaties with Occidental powers.

No sooner was this agreement ratified than Russia, Germany and France presented a joint note to the Tōkyō government, recommending that the territories ceded to Japan on the mainland of China should not be permanently occupied, as such a proceeding would be detrimental to peace. This note along its way of diplomatic courtesy, but everything indicated that its signatories were prepared to enforce their advice by an appeal to arms. Japan found herself compelled to comply. Exhausted by the Chinese campaign, which had drained her treasury, consumed her supplies of warlike material, and kept her squadrons constantly at sea for eight months, she had no residue of strength to oppose such a coalition. Her resolve was quickly taken. The day that saw the publication of the ratified treaty saw also the issue of an Imperial rescript in which the mikado, avowing his indissoluble attachment to the principles of peace, stated that the counsel offered by the European states was prompted by the same sentiment, “yielded to the dictates of magnanimity, and accepted the advice of the three Powers.” The Japanese people were shocked by this incident. They could understand the motives influencing Russia and France, for it was evidently natural that the former should desire to exclude warlike and progressive people like the Japanese from territories contiguous to her borders, and it was also natural that France should remain true to her alliance with Russia. But Germany, wholly uninterested in the ownership of Manchuria, and by profession a peace-loving nation, might be expected to rob the latter of the fruits of her victory simply for the sake of establishing some shadowy title to Russia’s goodwill. It was not known until a later period that the German emperor entertained profound apprehensions about the “yellow peril,” an irritation of Oriental hordes into the Occident, and held it a sacred duty to prevent Japan from gaining a position which might enable her to construct an immense military machine out of the countless millions of China.

Japan’s third expedition over-sea in the Meiji era had its origin in events along the history of China (q.v.). In the second half of 1900 an anti-Russian and anti-foreign rebellion, breaking out in Shantung, spread to the metropolitan province of Pechili, and resulted in a situation of extreme peril for the foreign communities of Tientsin and Peking. It was impossible for any European power, or for the United States, to organize sufficiently prompt measures of relief. Thus the eyes of the world turned to Japan, whose proximity to the scene of disturbance rendered intervention comparatively easy for her. But Japan hesitated. Knowing now with what suspicious coteries she had been associated in the development of her resources and the growth of her military strength were regarded by some European peoples, and aware that she had been admitted to the comity of Western nations on sufferance, she shrank, on the one hand, from seeming to grasp at an opportunity for armed display, and, on the other, from the solecism of obtrusive siveness in the society of strangers. Not until Europe and America made it quite plain that they needed and desired her aid did she send a division (21,000 men) to Pechili. Her troops played a fine part in the subsequent expedition for the relief of Peking, which proved to be quite a demand in midsummer under very trying conditions and operations. Fighting side by side with Russian officers and American soldiers, and under the eyes of competent military critics, the Japanese acquitted themselves in such a manner as to establish a high military reputation. Further, after the relief of Peking they withdrew a moiety of their forces, and that step, as well as their unequivocal co-operation with Western powers in the subsequent negotiations, helped to show the injustice of the suspicions with which they had been regarded.

From the time (1895) when Russia, with the co-operation of Germany and France, dictated to Japan a cardinal alteration of the Shimomoseki treaty, Japanese statesmen seem to have concluded that their country must one day cross swords with the great northern power. Not a few European and American publicists shared that view. But the vast majority, arguing that the little Eastern empire would never invite annihilation by such an encounter, believed that sufficient forbearance to avert serious trouble would always be forthcoming on Japan’s side. Yet when the geographical and historical situation was carefully considered, little hope of an ultimately peaceful settlement presented itself.

Korea, as India was to British provinces, as France’s was to the Western coast of the United States, as Russia’s was to Manchuria and China, so too it was to Japan’s. Korea, as the southern and eastern, and Russia along the eastern coast of its maritime province, are washed by the Sea of Japan. The communications between the sea and the Pacific Ocean are practically two only. One is on the north-east, namely, Tsugaru Strait; the other is on the south, namely, the channel between the extremity of the Korean peninsula and the Japanese island of the nine provinces. Tsugaru Strait is entirely under Japan’s control. It is between her main island and her island of Yezo, and in case of need she can close it with mines. The channel between the north-west coast of Japan and the Korean islands of Honshu and Shikoku would therefore be a fine open sea-way were it free from islands. But almost mid-way in this channel lie the twin islands of Tsushima, and the space of 50 m. that separates them from Japan is narrowed by another island, Iki. Tsushima and Iki belong to the Japanese empire. The former has some exceptionally good harbours, constituting a naval base from which the channel on either side could easily be sealed. Thus the avenues from the Pacific Ocean to the Sea of Japan are controlled by the Japanese empire. In other words, access to the heart of Korea’s eastern and southern coasts, and access to the Pacific from Korea’s western shore, that the Japanese are dependent upon Japan’s goodwill. So far as Korea was concerned this question mattered little, it being her fate to depend upon the goodwill of Japan in affairs of much greater importance. But with Russia the case was different. Vladivostock, which until recent times was her principal port in the Far East, lies at the southern extremity of the maritime province; that is to say, on the north-western shore of the Japan Sea. It was therefore necessary for Russia that freedom of passage by the Tsushima channel should be secured, and to secure it one of two things was essential, namely, that she should control and fortify a fortified port on the Korean side, or that Japan should be bound neither to acquire such a port nor to impose any restriction upon the navigation of the strait. To put the matter briefly, Russia must either acquire a strong foothold for herself in southern Korea, or contrive that Japan should not acquire one. There was here a strong inducement for Russian aggression in Korea.

Russia’s eastward movement through Asia has been strikingly illustrative of her strong craving for free access to southern seas and of the impediments she had experienced in gratifying that wish. An irresistible impulse, which she alone of the races of men had, driven her oceanward. Checked again and again in her attempts to reach the Mediterranean, she set out on a five-thousand-miles march of conquest right across the vast Asiatic continent towards the Pacific. Eastward of Lake Baikal she found her line of least resistance along the Amur, and when, owing to the restless perseverance
of Muravieff, she reached the mouth of that great river, the acquisition of Nikolayevsk for a naval basin was her immediate reward. But Nikolayevsk could not possibly satisfy her. Situated in an inhospitable region far away from all the main routes of the world's commerce, it offered itself only as a stepping-stone to further acquisitions. To push southward from this new port became an immediate object to Russia. There lay an obstacle in the way, however; the long strip of sea-coast from the mouth of the Amur to the Korean frontier—an area then called the Usuri region because the Usuri forms its western boundary—belonged to China, and she, having conceded much to Russia in the matter of the Amur, showed no disposition to make further concessions in the matter of the Usuri. In the presence of menaces, however, she agreed that the region should be regarded as common property pending a convenient opportunity for her delimitation. That opportunity came very soon. Seizing the moment (1860) when China had been beaten to her knees by England and France, Russia secured final cession of the Usuri region, which now became the maritime province of Sibera. Then Russia shifted her naval base on the Pacific from Nikolayevsk to Vladivostok. She gained ten degrees in a southerly direction.

From the mouth of the Amur, where Nikolayevsk is situated, to the southern shore of Korea there rests on the coast of eastern Asia an arch of islands having at its northern point Sakhalin and at its southern Yezo, the latter forming the main island of Japan. This arch embraces the Sea of Japan and is washed on its convex side by the Pacific Ocean. Immediately after the transfer of Russia's naval base from Nikolayevsk to Vladivostok, an attempt was made to obtain possession of the southern point of the arch, namely, Tsushima. A Russian man-of-war proceeded thither and quietly began to establish a settlement, which would soon have constituted a title of ownership had not Great Britain interfered. The Russians saw that Vladivostok, acquired at the cost of so much toil, could be used as a naval base only if they succeeded in the transfer of the arch, being the Japanese Sea.

Immediately after reaching the mouth of the Amur the same instinct had led them to begin the colonization of Sakhalin. The axis of this long narrow island is inclined at a very acute angle to the Usuri region, which its northern extremity almost touches, while its southern is separated from Yezo by the strait of La Pérouse. But in Sakhalin the Russians found Japanese subjects. In fact the island was a part of the Japanese empire. Resorting, however, to the Usuri fiction of justification, they were not unreasoned by the Russian law by which the arch of Sakhalin was ceded to Russia's dominion. Further encroachments upon Japanese territory could not be lightly essayed, and the Russians held their hands. They had been treibly checked: checked in trying to push southward along the coast of the mainland; checked in trying to secure an avenue from Vladivostok to the Pacific; and checked in their search for an ice-free port, which definition Vladivostok did not fulfill. Enterprise in the direction of Korea seemed to be the only hope of saving the maritime results of the great Trans-Asian march.

What range of such enterprises? Everything seemed to answer in the affirmative. Korea had all the qualifications desired by an aggressor. Her people were unprogressive, her resources undeveloped, her self-defensive capacities insignificant, her government corrupt. But she was a tributary of China, and China had begun to show some tenacity in protecting the integrity of her buffer states. Besides, Japan was understood to have pretensions with regard to Korea. On the whole, therefore, the problem of carrying to full fruition the work of Muravieff and his lieutenants demanded strength greater than Russia could exercise without some line of communications supplementing the Amur waterway and the long ocean route. Therefore she set about the construction of a railway across Asia.

The Amur being the boundary of Russia's east Asian territory, this railway had to be carried along its northern banks where many engineering and economic obstacles presented themselves. Besides, the river, from an early stage in its course, makes a huge semicircular sweep northward, and a railway following its bank to Vladivostok must make the same détour. If, on the contrary, the road could be carried over the diameter of the semicircle, it would be a straight and therefore shorter line, technically easier and economically better. The diameter, however, passed through Chinese territory, and an excuse for extorting China's permission was not in sight. Russia therefore proceeded to build each end of the road, deferring the construction of the Amur section for the moment. She had not waited long when, in 1894, war broke out between China and Japan, and the latter, completely victorious, demanded as the price of peace the southern littoral of Manchuria from the Korean boundary to the Liaotung peninsula. In the event of a repulse, the base and the promised railway to Vladivostok and to Possiet Bay on the north-eastern extremity of Korea. But it had not given to Russia free access to the Pacific, and now she was menaced with a perpetual barrier to that access, since the whole remaining coast of east Asia as far as the Gulf of Pečhili was about to pass into Japan's possession or under her domination.

Then Russia took an extraordinary step. She persuaded Germany and France to force Japan out of Manchuria. It is not to be supposed that she frankly exposed her own aggressive designs, for she never had any designs to temporary occupation at the entrance to the Gulf of Pečhili. But it is to be supposed that France and Germany were so curiously deficient in perspicacity as to overlook those designs. At all events these three great powers served on Japan a notice to quit, and Japan, exhausted by her struggle with China, had no choice but to obey.

The notice was accompanied by an exposure of reasons. Its signatories said that Japan's tenure of the Manchurian littoral would menace the security of the Chinese capital, would render the independence of Korea illusory, and would constitute an obstacle to the peace of the Orient.

The Japanese view of the situation, as in some slight degree sought from China a guarantee that no portion of Manchuria should thereafter be leased or ceded to a foreign state. But France warned Japan that to press such a demand would offend Russia, and Russia declared that, for her part, she had no intention of trespassing in Manchuria. Japan, had she been in a position to insist on the guarantee, would also have been in a position to disobey the mandate of the three powers. Unable to do either the one or the other, she quietly stepped out of Manchuria, and proceeded to double her army and treble her navy.
leaped the Korean peninsula and found access to the Pacific in Liaotung. Nothing was wanting to establish her as practical mistress of Manchuria—except a plausible long for free access to the place. Such an excuse was furnished by the Boxer rising in 1900. Its conclusion saw her in military occupation of the whole region, and she might easily have made her occupation permanent by prolonging it until peace and order should have been fully restored. But here she fell into an error of judgment. Imagining that the Chinese could be persuaded or intimidated to any concession, she proposed a convention virtually recognizing her title to Manchuria.

Japan watched all these things with profound anxiety. If there were to arise among the dangers which Russia, Germany and France had declared to be incidental to Japanese occupation of a part of Manchuria, the same dangers must be doubly incidental to Russian occupation of the whole of Manchuria—the security of the Chinese capital would be threatened, and an obstacle would be created to the permanent peace of the East. The independence of Korea was an object of supreme solicitude to Japan. Historically she held towards the little state a relation closely resembling that of suzerain, and though of her ancient conquests nothing remained except a settlement at Russian feet, it was in her interest to see the Korean coast of the Sea of Japan marked out as a prize of war. If the Boxer clauses were not to be insisted upon, and if Russia, instead of trusting time to consolidate her tenure of Manchuria, had made the mistake of pragmatically importuning China for a convention, the policy of settling the question by an interchange of innocuous conventions clauses provided for the opening of three places in Manchuria to foreign trade. It seemed a reasonable hope that, having secured commercial access to Manchuria by covenant with its sovereign, China, the powers would not allow Russia arbitrarily to restrict their privileges. It seemed also a reasonable hope that Russia, having solemnly promised to evacuate Manchuria at fixed dates, would fulfil her engagement.

The latter hope was signally disappointed. When the time came for evacuation, Russia behaved as though no promise had ever been given. She proposed wholly new conditions, which would have reduced the status of Manchuria. She invited the Great Powers to call by the title of occupying governments, and to adopt the policy of holding the peninsula in a twilight zone. With Korea, then, Russia’s east Asian expansion, though it added huge blocks of territory to her dominions, would have been commercially incomplete and strategically defective.

If it be asked why, apart from history and national sentiment, Japan should object to a Russian Korea, the answer is, first, because there would thus be planted almost within cannon-shot of her shores a power of enormous strength and insatiable ambition; secondly, because, whatever voice in Manchuria’s destiny Russia derived from her railway, the same voice in Korea’s destiny was possessed by Japan as the sole owner of railways in the peninsula; thirdly, that whereas Russia had an altogether insignificant share in the foreign commerce of Korea and scarcely ten bona-fide settlers, Japan did the greater part of the over-sea trade and had tens of thousands of settlers; fourthly, that if Russia’s dominions stretched uninterrupted from the Sea of Okhotsk to the Gulf of Pechili, her ultimate absorption of north China would be as certain as sunrise; and fifthly, that such domination and such absorption would involve the practical closure of all that immense region to Japanese commerce and industry as well as to the commercial and military power of every Western nation except Russia. This last proposition did not rest solely on the fact that to oppose artificial barriers to free competition is Russia’s sole hope of utilizing to her own benefit any commercial opportunities brought within her reach. It rested also on the fact that Russia had objected to foreign settlements at the marts recently opened by treaty with China to American and Japanese subjects. Without settlements, trade at those marts would be impossible, and thus Russia had constructively announced that there should be no trade but Russian if she could prevent it.

Against such dangers Japan would have been justified in adopting any measure of self-protection. She had foreseen them for six years, and had been strengthening herself to avert them. But she wanted peace. She wanted to develop her material resources and to accumulate some measure of wealth, without which she must remain insignificant among the nations. Two pacific devices offered, and she adopted them both. Russia, instead of trusting time to consolidate her tenure of Manchuria, had made the mistake of pragmatically importuning China for a convention, a fatal mistake which continued to haunt her, and which was to lead to a series of treaties that weakened it. To resist this demand, some arrangement of a distinctly terminable nature might be made. The United States, Great Britain and Japan, joining hands for that purpose, did succeed in so far stiffening China’s backbone that her show of resolution finally induced Russia to sign a treaty pledgeing herself to withdraw her troops from Manchuria in three instalments, each step of evacuation to be accomplished by a fixed date. That was one of the pacific devices. The other suggested itself in connexion with the new commercial treaties which China had promised to negotiate, but had not professed to have the power to make. She was, for instance, to accede to the provisions of the Boxer clauses, and it was proposed that these should be prolonged for an indefinite period. Russia was to be persuaded to accede to this demand, and in return for this she was to have a great concession in Korea, while Japan was to have a corresponding one in Manchuria.

Thus commenced a negotiation which lasted five and a half months. Japan gradually reduced her demands to a minimum. Russia never made the smallest appreciable concession. She refused to listen to Japan for one moment about Manchuria. Eight years previously Japan had gained military possession of Manchuria, and Russia with the assistance of Germany and France had expelled her for reasons which concerned Japan incomparably more than they concerned any of the three powers—the security of the Chinese capital, the independence of Korea, the peace of the East. Now, Russia had the splendid assurance to declare by implication that none of these things concerned Japan at all. The utmost she would admit was Japan’s partial right to be heard about Korea. And at the same time she herself commenced in northern Korea an aggrandisement, partly perhaps, to show her potentialities, partly by way of counter-irritant. That was not all. Whilst she studiously deferred her answers to Japan’s proposals and protracted the negotiations to an extent which was actually contumelious, she hastened to send eastward a big fleet of war-ships and a new army of soldiers. It was impossible for the dullest politician to mistake her purpose. She intended to yield nothing, but to prepare such a parade of force that her obduracy would
command submission. The only alternatives for Japan were war or total and permanent effacement in Asia. She chose war, and in fighting she sought at the same time the battle of fateful and equal opportunities for all without undue encroachment upon the sovereign rights or territorial integrity of China or Korea, against a military dictatorship, a programme of ruthless territorial aggrandizement and a policy of selfish restrictions.

The details of the great struggle that ensued are given elsewhere (see Russo-Japanese War). After the battle of Mukden the belligerents found themselves in a position which must either prelude another stupendous effort on both sides or be utilized for the purpose of peace negotiations. At this juncture the president of the United States of America intervened in the interests of humanity, and on the 9th of June, 1905, instructed the United States' representative in Tōkyō to urge that the Japanese government should open direct negotiations with Russia, an exactly corresponding note being simultaneously sent to the Russian government through the United States' representative in St. Petersburg. Japan's reply was made on the 10th of June. It intimated frank acquiescence, and Russia lost no time in taking a similar step. Nevertheless, two months elapsed before the plenipotentiaries met, and the peace treaty was signed on August 5th, at Portsmouth, New Hampshire, U.S.A. Russia sent M. (afterwards Count) de Witte and Baron Rosen; Japan, Baron (afterwards Count) Komura, who had held the portfolio of foreign affairs throughout the war, and Mr. (afterwards Baron) Takahira. In entering this conference, Japanese statesmen, as was subsequently known, saw clearly that a great part of the credit accruing to them for their successful conduct of the war would be forfeited in the sequel of the negotiations. For the people of Japan had accustomed themselves to expect that Russia would assume the responsibility of the expenses incurred by their country in the contest, whereas the cabinet in Tōkyō understood well that to look for payment of indemnity by a great state whose territory had not been invaded effectively nor its existence menaced must be futile. Nevertheless, diplomacy required that this conviction should be concealed, and thus Russia carried to the conference a belief that the financial phase of the discussion would be crucial, while, at the same time, the Japanese nation reckoned fully on an indemnity of 150 millions sterling. Baron Komura's mandate was, however, that the only radically essential terms were those formulated by Japan prior to the commencement of hostilities. She must insist on securing the ends for which she had fought, since she believed them to be indispensable to the peace of the Far East, but she would not demand anything more. The Japanese plenipotentiary, therefore, judged it wise to marshal his terms in the order of their importance, leaving his Russian colleague to imagine, as he probably would, that the converse method had been adopted, and that everything preliminary to the questions of finance and territory was of minor consequence.

The negotiations, commencing on the 10th of August, were not concluded until the 5th of September, when a treaty of peace was signed. There had been a moment when the onlooking world believed that unless Russia agreed to ransom the island of Sakhalin by paying to Japan a sum of 120 millions sterling, the conference would be broken off; nor did such an exchange seem unreasonable, for were Russia expelled from the northern part of Sakhalin, which commands the estuary of the Amur River, her position in Siberia would have been compromised. But the statesmen who directed Japan's affairs were not disposed to make any display of earth-hunger. The southern half of Sakhalin had originally belonged to Japan and had passed into Russian possession by an arrangement to which the Japanese nation strongly resented. To recover that portion of the island seemed, therefore, a legitimate ambition. Japan did not contemplate any larger demand, nor did she seriously insist on an indemnity. Therefore the negotiations were never in real danger of failure. The treaty of Portsmouth recognized Japan's "paramount political, military and economic interests" in Korea; provided for the simultaneous evacuation of Manchuria by the contracting parties; transferred to Japan the lease of the Liaotung peninsula held by Russia from China together with the Russian railways south of Kwang-Cheng-ta and all collateral mining or other privileges; ceded to Japan the southern half of Sakhalin, the 50th parallel of latitude to be the boundary between the two parts; secured fishing rights for Japanese subjects along the coasts of the seas of Japan, Okhotsk and Bering; laid down that the expenses incurred by the Japanese for the maintenance of the Russian prisoners during the war should be reimbursed by Russia, less the outlays made by the latter on account of Japanese prisoners—by which arrangement the sum of over 14 millions sterling was provided; and that the contracting parties, while withdrawing their military forces from Manchuria, might maintain guards to protect their respective railways, the number of such guards not to exceed 15 per kilometre of line. There were other important restrictions: first, the contracting parties were to abstain from taking, on the Russo-Korean frontier, any military measures which might menace the security of Russian or Korean territory; secondly, the two powers pledged themselves not to exploit the Manchurian railways for strategic purposes; and thirdly, they promised not to turn over to Japan the Okhotsk Agency or the island of Sakhalin, or any other territory, or other similar military works, or to take any military measures which might impede the free navigation of the straits of La Pérouse and the Gulf of Tartary. The above provisions concerned the two contracting parties only. But China's interests also were considered. Thus it was agreed to "restore entirely and completely to her exclusive administration all portions of Manchuria then in the occupation, or under the control, of Japanese or Russian troops, except the leased territory; that her consent must be obtained for the transfer to Japan of the leases and concessions held by the Russians in Manchuria; that the Russian government would disavow the possession of any territorial advantages or preferential or exclusive concessions in impairment of Chinese sovereignty or inconsistent with the principle of equal opportunity in Manchuria"; and that Japan and Russia "engaged reciprocally not to obstruct any general measures common to all countries which China might take for the development of the commerce and industry of Manchuria." This distinction between the special interests of the contracting parties and the interests of China herself as well as of foreign nations generally is essential to clear understanding of a situation which has subsequently attracted much attention. From the time of the opium war (1857) to the Boxer rising (1900) each of the great Western powers struggled for its own hand in China, and each sought to gain for itself exclusive concessions and privileges with comparatively little regard for the interests of others, and with no regard whatever for China's sovereign rights. The fruits of this period were: permanently ceded territories (Hong-Kong and Macao); leases temporarily establishing foreign sovereignty in various districts (Kiaochow, Wei-hai-wei and Kwang-chow); railway and mining concessions; and the establishment of settlements at open ports where foreign jurisdiction was supreme. But when, in 1900, the Boxer rising forced all the powers into a common camp, they awoke to full appreciation of a principle which had been growing current for the past two or three years, namely, that concerted action on the lines of maintaining China's integrity and securing to all alike equality of opportunity and a similarly open door, was the only feasible method of preventing the partition of the Chinese Empire and averting a clash of rival interests which might have disastrous results. This, of course, did not mean that there was to be any abandonment of special privileges already acquired or any surrender of existing concessions. The arrangement was not to be retrospective in any sense. Vested interests were to be strictly guarded until the lapse of the periods for which they had been granted, or until the maturity of China's competence to be really autonomous. A curious situation was thus created. International professions of respect for China's sovereignty, for the integrity of her empire and for the enforcement of the open door and equal opportunity,
Having waged two wars on account of Korea, Japan emerged from the second conflict with the conviction that the policy of maintaining the independence of Korea must be modified, and that since the identity of Korea and her race with Japan had been admitted, she must be allowed to enter into commercial relations with Japan on the same terms as those enjoyed by her in Manchuria. Those advantages were very substantial. They included a twenty-five years' lease—with provision for renewal—of the Liaotung peninsula, within which area of 1220 sq. m. Chinese troops might not penetrate, whereas Russia would not only exercise full administrative authority, but also take military and naval action of any kind; they included the creation of a neutral territory in the immediate north of the former and still more extensive, which should remain under Chinese administration, but where neither Chinese nor Japanese could, with or without Russian consent, cede land, open trading marts or grant concessions to any third nationality; and they included the right to build some 1000 m. of railway (which China would have the opportunity of purchasing at cost price in the year 1938 and would be entitled to receive gratis in 1982), as well as the right to hold extensive zones on either side of the railway, to administer these zones in the fullest sense, and to work all mines lying along the lines. Under the Portsmouth treaty these advantages were transferred to Japan by Russia, the railway, however, being divided, the portion to be reserved for the Kwant-Cheng-tszs fall to Japan's share, while the portion (1077 m.) to the north of that place remained in Russia's hands. China's consent to the above transfers and assignments was obtained in a treaty signed at Peking on the 22nd of December 1905. Thus Japan came to hold in Manchuria a position somewhat contradictory. On the one hand, she figured as the champion of the Chinese Empire's integrity and as an exponent of the new principle of equal opportunity and the open door. On the other, she appeared as the legatee of many privileges more or less inconsistent with that principle. But, at the same time, nearly all the great powers of Europe were similarly circumstanced. In their cases also the same incongruity was observable between the newly professed policy and the aftermath of the old practice. It was scarcely to be expected that Japan alone should make a large sacrifice on the altar of a theory to which no other state thought of yielding any retrospective obedience whatever. She did, indeed, furnish a clear proof of deference to the open-door doctrine, for instead of reserving the railway zones to her own exclusive use, as she was fully entitled to do, she sought and obtained from China a pledge to remove the restrictions which barred entry to the Chinese by Japanese citizens. For the rest, however, the inconsistency between the past and the present, though existing throughout the whole of China, was nowhere so conspicuous as in the three eastern provinces (Manchuria); not because there was any real difference of degree, but because Manchuria had been the scene of the greatest war of modern times; because that war had been fought by Japan in the cause of the new policy, and because the principles of the equally open door and of China's integrity had been the main bases of the Portsmouth treaty, of the Anglo-Japanese alliance, and of the subsequently concluded entente with France and Russia. In short, the world's eyes were fixed on Manchuria and diverted from China proper, so that every act of Japan was subjected to an exceptionally rigorous scrutiny, and the nations behaved as though they expected her to live up to a standard of almost ideal altitude. China's mood, too, greatly complicated the situation. She had the choice between two moderate and natural courses; either to wait quietly until the various concessions granted by her to foreign powers in the evil past should lapse by maturity, or to qualify herself by earnest reforms and industrious development for a position in recovery. Nominally she adopted the latter course, but in reality she fell into a mood of much impatience. Under the name of a "rights-recovery campaign" her people began to protest vehemently against the continuance of any conditions which impaired her sovereignty, and as this temper coloured her attitude towards the various questions which inevitably grew out of the situation in Manchuria, her relations with Japan became somewhat strained in the early part of 1909.
building and equipping of an industrial training school; the inauguration of sanitary works; the opening of hospitals and medical schools; the organization of an excellent educational system; the construction of waterworks in several towns; the complete remodelling of the central government; the differentiation of the courts. Meanwhile the earth is "young", as of the administration and the judiciary; the formation of an efficient body of police; the organization of law courts with a majority of Japanese jurists on the bench; the enactment of a new penal code; drastic reforms in the taxation system. In the summer of 1907 the resident-general advised the Throne to disband the standing army as an unserviceable and expensive force. The measure was doubtless desirable, but the docility of the troops had been overrated. Some of them resisted vehemently, and many became the nucleus of an insurrection which lasted in a desultory manner Japan for two years; cost the lives of 21,000 insurgents and 1,300 Japanese; and entailed upon Japan an outlay of nearly a million sterling. Altogether Japan was 15 millions sterling out of pocket on Korea's account by the end of 1909. She had also lost the veteran statesman Prince Itó, who was assassinated at Harbin by a Korean fanatic on the 26th of October 1909. Finally an end was put to an anomalous situation by the annexation of Korea to Japan on the 29th of August 1910. (See further Korea.)

IX.—DOMESTIC HISTORY

Cosmography.—Japanese annals represent the first inhabitant of earth as a direct descendant of the gods. Two books describe the events of the "Divine age." One, compiled in 712, is called the Kojiki (Records of Ancient Matters); the other, compiled in 720, is called the Nihongi (Chronicles of Japan). Both describe the processes of creation, but the author of the Chronicles drew largely upon Chinese traditions, whereas the compilers of the Records appear to have limited themselves to materials which they believed to be native. The Records, therefore, have always been regarded as the more trustworthy guide to pure Japanese conceptions. They deal with the creation of Japan only, other countries having been apparently judged unworthy of attention. At the beginning of all things a primordial trinity is represented as existing on the "plain of high heaven." Thereafter, during an indefinite time and by an indefinite process, other deities come into existence, their titles indicating a vague connexion with constructive and fertilizing forces. They are not immortal: it is explicitly stated that they ultimately pass away, and the idea of the cosmographers seems to be that each deity marks a gradual approach to human methods of procreation. Men become the dominant life and, like Boating-oil, drifts about after the manner of a jelly-fish. At last there are born two deities, the creator and the creatress, and these receive the mandate of all the heavenly beings to "make, consolidate and give birth to the drifting land." For use in that work a jewelled spear is given to them, and, standing upon the bridge that connects heaven and earth, they thrust downwards with the weapon, stir the brine below and draw up the spear, when from its point fall drops which, accumulating, form the first dry land. Upon this land the two deities descend, and, by the light of which they begat the sun, begin to lay Japan as well as numerous gods representing the forces of nature. But in giving birth to the god of fire the creatress (Izanami) perishes, and the creator (Izanaagi) makes his way to the under-world in search of her—an obvious parallel to the tales of Ishtar and Orpheus. With difficulty he returns to earth, and, as he washes himself from the pollution of Hades, there are born from the turbid water a number of evil deities succeeded by a number of good, just as in the Babylonian cosmogony the primordial ocean, Tiamat, brings forth simultaneously gods and imps. Finally, as Izanagi washes his left eye the Goddess of the Sun comes into existence; as he washes his right, the God of the Moon; and as he washes his nose, the God of Force. To these three he assigns, respectively, the dominion of the sun, the dominion of the moon, and the dominion of the ocean. But the god of force (Sosano), like Lucifer, rebels against this decree, creates a commotion in

heaven, and after having been the cause of the temporary seclusion of the sun goddess and the consequent wrapping of the world in darkness, kills the goddess of food and is permanently banished from heaven by the host of deities. He descends to Izumo on the west of the main island of Japan, and there marries a maiden from an eight-headed serpent. Sosanoo himself passes to the under-world and becomes the deity of Hades, but he invests one of his descendants with the sovereignty of Japan, and the title is established after many curious adventures. To the sun goddess also, whose feud with her fierce brother survives the latter's banishment from heaven, the idea of making her grandson ruler of Japan presents itself. She despatches three embassies to impose her will upon the descendants of Sosanoo, and finally her grandson descends, not, however, in Izumo, where the demi-gods of Sosanoo's race hold sway, but in Higa in the southern island of Kitshû. This grandson of Amaterasu (the goddess of the sun) is called Ninigi, whose great-grandson figures in Japanese history as the first human sovereign of the country, known during life as Kamu-Yamato-Iware-Biko, and given the name of Jimmu tennō (Jimmu, son of heaven) fourteen centuries after his death. Japanese annalists attribute the accession of Jimmu to the year 660 B.C. Why that date was chosen remains a matter of conjecture. The Records of Ancient Matters has no chronology, but the more pretentious writers of the Chronicles of Japan, doubtless in imitation of their Chronicles of Japan, compiled it necessarily to correspond with the years, months, and even a day for each event of importance. There is abundant reason, however, to question the accuracy of all Japanese chronology prior to the 5th century. The first date corroborated by external evidence is 461, and Aston, who has made a special study of the subject, concludes that the year 500 may be taken as the time when the chronology of the Chronicles begins to be trustworthy. Many Japanese, however, are firm believers in the Chronicles, and when assigning the year of the empire they invariably take 660 B.C. for starting-point, so that 1909 of the Gregorian calendar becomes for them 2560.

Prehistoric Period.—Thus, if the most rigid estimate be accepted, the space of 1160 years, from 660 B.C. to A.D. 500, may be called the prehistoric period. During that long interval the annals include 24 sovereigns, the first 17 of whom lived for over a hundred years on the average. It seems reasonable to conclude that the so-called assignment of the sovereignty of Japan to Sosanoo's descendants and the establishment of their kingdom in Izumo represent an invasion of Mongolian immigrants coming from the direction of the Korean peninsula—indi in one of the Nihon-gi's versions of the chronology—of the demi-gods of Sosanoo's race hold sway, but in Higa in the southern island of Kitshû. This grandson of Amaterasu (the goddess of the sun) is called Ninigi, whose great-grandson figures in Japanese history as the first human sovereign of the country, known during life as Kamu-Yamato-Iware-Biko, and given the name of Jimmu tennō (Jimmu, son of heaven) fourteen centuries after his death. Japanese annalists attribute the accession of Jimmu to the year 660 B.C. Why that date was chosen remains a matter of conjecture. The Records of Ancient Matters has no chronology, but the more pretentious writers of the Chronicles of Japan, doubtless in imitation of their Chronicles of Japan, compiled it necessarily to correspond with the years, months, and even a day for each event of importance. There is abundant reason, however, to question the accuracy of all Japanese chronology prior to the 5th century. The first date corroborated by external evidence is 461, and Aston, who has made a special study of the subject, concludes that the year 500 may be taken as the time when the chronology of the Chronicles begins to be trustworthy. Many Japanese, however, are firm believers in the Chronicles, and when assigning the year of the empire they invariably take 660 B.C. for starting-point, so that 1909 of the Gregorian calendar becomes for them 2560.

The natural element is imported into the narrative in the form of the three-legged crow of the sun, which Amaterasu sends down to act as guide and messenger for her descendants. Jimmu died at his palace of Kashiwara-barai in 585 B.C., his age being 127 according to the Chronicles, and 137 according to the Records. He was buried in a kind of tomb called misasagi, which seems to have been in use in Japan for some centuries before the Christian era—a highly specialized form of tumulus, consisting of two mounds, one having a circular, the other a triangular base, which merged into each other, the whole being surrounded by a moat, or sometimes by two concentric moats with a narrow strip of land between. In some, perhaps in most, cases the misasagi contains a large vault of great unhewn stones without mortar. The walls of this vault converge gradually towards the top, which is roofed in by enormous slabs of stone weighing
many tons each. The entrance is by means of a gallery roofed with similar stones. Several of these ancient sepulchral mounds have been examined during recent years, and their contents have furnished information of much antiquarian interest, though they are likely to occur when using the seracums. The reigns of the eight sovereigns who succeeded Jimmu were absolutely uneventful. Nothing is set down except the genealogy of each ruler, the place of his residence and his burial, his age and the date of his death. It was then the custom—and it remained so until the 8th century of the Christian era—to change the capital on the accession of each emperor; a habit which effectually prevented the growth of any great metropolis. The reign of the 10th emperor, Sujin, lasted from 28 to 30 B.C. During his era the land was troubled by pestilence and the people broke out in rebellion; calamities which were supposed to be caused by the spirit of the ancient ruler of Izumo to avenge a want of consideration shown to his descendants by their suppliants. Divination—by a Chinese process—and visions revealed the source of trouble; rites of worship were performed in honour of the ancient ruler, his descendant being entrusted with the duty, and the pestilence ceased. We now hear for the first time of vigorous measures to quell the aboriginal savages, doubtless the Ainu. Four generals are sent out against them in different directions. But the expedition is interrupted by an armed attempt on the part of the emperor's half-brother, who, utilizing the opportunity, abandoned his capital and marched from Yamashiro at the head of a powerful army to win the crown for himself. In connexion with these incidents, curious evidence is furnished of the place then assigned to woman by the writers of the Chronicles. It is a girl who warns one of the emperor's generals of the plot; it is the sovereign's aunt who interprets the warning; and it is Ata, the wife of the rebellious prince, who leads the left wing of his army. Four other noteworthy facts are recorded of this reign: the taking of a census; the imposition of a tax on animals' skins and game; the building of boats for coastwise transport, and the digging of dikes and reservoirs for agricultural purposes. All these things rest solely on the testimony of annalists writing eight centuries later than the era they discuss and compiling their narrative mostly from tradition. Careful investigations have been made to ascertain whether the histories of China and Korea corroborate or contradict those of Japan. Without entering into detailed evidence, the inference may be at once stated that the dates given in Japanese early history are just 120 years too remote; an error very likely due to the Chinese copying the Japanese, who, in the Kuma-so, is said to have invented the first method of reckoning time in Japan. But although this correction suffices to reconcile some contradictory features of Far-Eastern history, it does not constitute any explanation of the incredible longevity assigned by the Chronicles to several Japanese sovereigns, and the conclusion is that when a consecutive record of reigns came to be compiled in the 8th century, many lacunae were found which had to be filled up from the imagination of the compilers. With this parenthesis we may pass rapidly over the events of the next two centuries (29 B.C. to A.D. 200). They are remarkable for want of information; little about them is known. The islands of the southern island of Kiiush绘画 are called Kuma-so (the names of two tribes) and sometimes earth-spiders (i.e. cave-dwellers), while in the north-eastern regions of the main island they are designated Yemeshi. Expeditions are led against them in both regions by Prince Yamato-dake, a hero revered by all succeeding generations of Japanese as the type of valour and loyalty. Dying from the effects of hardship and exposure, but declaring with his last breath that loss of life was as nothing compared with the sorrow of seeing his father's face no more, his spirit ascends to heaven as a white bird, and when his soul appears to the throne, he causes cranes to be placed in the moat surrounding his palace in memory of his illustrious sire. The sovereign had partly ceased to follow the example of Jimmu, who led his armies in person. The emperors did not, however, pass a sedentary life. They frequently made progresses throughout their dominions, and on these occasions a not uncommon incident was the addition of some local beauty to the Imperial harem. This licence had a far-reaching effect, since to provide for the sovereign's numerous offspring—the hands of the Kuma-so—holding one account, every effort was made to make grants of land, and thus were laid the foundations of a territorial nobility destined profoundly to influence the course of Japanese history. Woman continues to figure conspicuously in the story. The image of the sun goddess, enshrined in Ise (5 B.C.), is entrusted to the keeping of a princess, as are the mirror, sword and jewel inherited from the sun goddess; a woman (Tachibana) accompanies Prince Yamato-dake in his campaign against the Yemeshi, and sacrifices her life to quell a tempest at sea; Saho, consort of Sujin, is the heroine of a most tragic tale in which the conflict between a filial piety and conjugal loyalty leads to her self-destruction; and a woman is found ruling over a large district in Kiiush绘画 when the Emperor Keikó is engaged in his campaign against the aborigines. The reign of Sujin saw the beginning of an art destined to assume extraordinary importance in Japan—the art of wrestling—and the first champion, Nomí no Sukune, is honoured for having suggested that clay figures should take the place of the human sacrifices hitherto offered at the sepulchre of Imperial personages. The irrigation works commenced in the time of Sujin were zealously continued under his two immediate successors, Sujin and Keikó. More than 800 ponds and channels are described as having been constructed under the former's rule. We find evidence also that the sway of the throne had been by this time widely extended, for in 125 a governor-general of 15 provinces is nominated, and two years later, governors (miyakko) are appointed in every province and mayors (inaki) in every village. The number of names of these local divisions are not given, but it is explained that mountains and rivers were taken as boundaries of provinces, the limits of towns and villages being marked by roads running respectively east and west, north and south. And since the Japanese count a landmark in their history, though foreign critics are disposed to regard it as apocryphal. It is the invasion of Korea by a Japanese army under the command of the emperor Jingo, in 200. The emperor Chú, having proceeded to Kiiush绘画 for the purpose of conducting a campaign against the Kuma-so, is there joined by the emperor, who, at the inspiration of a deity, seeks to divert the Imperial army against Korea. But the emperor refuses to believe in the existence of any such country, and heaven punishes his incredulity with death at the battle of Kuma-so, and the Kuma-so are seen fleeing out of the island of Yona; the treaty of Kang-hsi is the effect of disease, according to another. The calamity is concluded; the Kuma-so are subdued, and the emperor, having collected a fleet and raised an army, crosses to the state of Silla (in Korea), where, at the spectacle of her overwhelming strength, the Korean monarch submits without fighting, and swears that until the sun rises in the west, until rivers run towards their sources, and until pebbles ascend to the sky and become stars, he will do homage and send tribute to Japan. His example is followed by the kings of the two other states constituting the Korean peninsula, and the warlike empress returns triumphant. A Japanese circuitous route to the Orient, which is noted for its beauties, and the features, which chiefly discreet it are that it abounds in anachronisms, and that the event, despite its signal importance, is not mentioned in either Chinese or Korean history. It is certain that China then possessed in Korea territory administered by Chinese governors. She must therefore have had cognisance of such an invasion, had it occurred. Moreover, Korean history mentions twenty-five raids made by the Japanese against Silla during the first five centuries of the Christian era, but not one of them can be indentified with Jingo's alleged expedition. There can be no doubt that the early Japanese were an aggressive, enterprising people, and that their nearest over-sea neighbour suffered much from their activity. Nor can there be any reasonable doubt that the Jingo tale contains a large germ of truth, and is at least an echo of the relations that existed between Japan and Korea in the 3rd and 4th centuries. The records of the 69 years comprising
Jingo's reign are in the main an account of intercourse, sometimes peaceful, sometimes stormy, between the neighbouring countries. Only one other episode occupies a prominent place: it is an attempt on the part of Jingo's step-brothers to oppose goods exchanged to Yaman; and to prevent the accession of her son to the throne. It should be noted here that all such names as Jimmu, Sūjin, Chūai, etc., are posthumous, and were invented in the reign of Kwammu (782-806), the fashion being taken from China and the names themselves being purely Chinese translations of the qualities assigned to the respective monarchs. Thus Jimmu signifies "divine valour"; Sūjin, "deity-honouring"; and Chūai, "sacred son". The names of these rulers during life were wholly different from their posthumous appellations.
