**JORDAN, WILHELM** (1810-1904), German poet and novelist, was born at Insterburg in East Prussia on the 8th of February 1810. He studied, first theology and then philosophy and natural science, at the universities of Königsberg and Berlin. He settled in Leipzig as a journalist; but the democratic views expressed in some essays and the volumes of poems *Glocke der Weise* (1834) led to his expulsion from Saxony in 1846. He next engaged in literary and tutorial work in Bremen, and on the outbreak of the revolution, in February 1848, was sent to Paris, as a correspondent of the *Bremer Zeitung*. He almost immediately, however, returned to Germany and, throwing himself into the political fray in Berlin, was elected member for Freienwalde, in the first German parliament at Frankfort-on-Main. For a short while he sided with the Left, but soon joined the party of von Gagern. On a vote having been passed for the establishment of a German navy, he was appointed secretary of the committee to deal with the whole question, and was subsequently made ministerial councillor (Ministerialrat) in the naval department of the government. The naval project was abandoned, Jordan was pensioned and afterwards resided at Frankfort-on-Main until his death on the 25th of June 1904, devoting himself to literary work, acting as his own publisher, and producing numerous poems, novels, dramas and translations.

Among his best known works are: *Demius* (3 vols., 1822-1824), a verse history of ancient Greece (afterwards William IV.), and bore him ten children, who were ennobled under the name of Fitz Clarence, the eldest being created earl of Munster. In 1811 they separated by mutual consent, Mrs Jordan being granted a liberal allowance. In 1815 she went abroad. According to one story she was in danger of imprisonment for debt. If so, the debt must have been incurred on behalf of others—probably her relations, who appear to have been continually borrowing from her—for her own personal debts were very much more considerable. "In truth, I do not mind it at all, but I prefer it," she is said to have said. She is generally understood to have died at St. Cloud, near Paris, on the 3rd of July 1816, but the story that under an assumed name she lived for seven years after that date in England finds some credence.

**JORDAN, THOMAS** (1612-1685). English poet and pamphleteer, was born in London and started life as an actor at the Red Bull theatre in Clerkenwell. He published in 1637 his first volume of poems, entitled *Poeticall Varieties*, and in the same year appeared *A Pill to Purge Melancholy*. In 1639 he recited one of his poems before King Charles I., and from this time forward Jordan’s output in verse and prose was continuous and prolific. He freely borrowed from other authors, and frequently republished his own writings under new names. During the troubles between the king and the parliament he wrote a number of Royalist pamphlets, one of the first of which, *A Medicine for the Times*, or *An Antidote against Faction*, appeared in 1641. Deductions, occasional verses, prologues and epilogues to plays poured from his pen. Many volumes of his poems bear no date, and they were probably written during the Commonwealth. At the Restoration he elogized Monk, produced a masque at the entertainment of the general in the city of London and wrote pamphlets in his support. He then for some years devoted his chief attention to writing plays, in at least one of which, *Money is an Ass*, he himself played a part which was produced in 1668. In 1671 he was appointed to the city of London; from this date till his death in 1685 he annually composed a panegyric on the lord mayor, and arranged the pageantry of the lord mayor’s shows, which he celebrated in verse under such titles as *London Triumphant*, or *The City in Jollity and Splendour* (1672), or *London in Luster, Projecting many Bright Beams of Triumph* (1679). Many volumes of these curious productions are preserved in the British Museum.

In addition to his numerous printed works, of which perhaps *A Royal Arbour of Loyal Poetry* (1664) and *A Nursery of Novelties in Variety of Poetry* are most deserving of mention, several volumes of his poems exist in manuscript. W. C. Hazlitt and other 19th-century critics found more merit in Jordan’s writings than in those of his contemporaries for the most part scornfully referred to his voluminous productions as commonplace and dull.

See Gerard Langbaine, *Account of the English Dramatic Poets* (1651); David Erskine Baker, *Biographia Dramatica* (4 vols., 1812);
down a continuous inclined plane, broken here and there by rapids and small falls; between the Sea of Galilee and the Dead Sea its sinuosity is so great that in a direct distance of 65 m. it traverses at least 200 m. The mean fall is about 9 ft. in the mile. The Jordan has two great sources, one in Tell el-Kadi (Dan) whence springs the Nahar Leddan, a stream 12 ft. broad at the base, one north of Banias (Hamath Tiberias), and the other between Philippi, some 4 m. N., where the Nahar Banias issues from a cave, about 30 ft. broad. But two longer streams with less water contest their claim, the Nahr Barraghot from Coelesyria, which rises near the springs of the Litany, and the Nahr Hasbany from Hermon. The four streams unite below the fortress of Banias, which once held the gate of the valley, and flow into a marshy tract now called Huleh (Semechonitis, and perhaps Merom of Joshua. There the Jordan begins to fall below sea-level, rushing down 680 ft. in 9 m. to a delta, which opens into the Sea of Galilee. Thereafter it follows a valley which is usually not above 4 m. broad, but opens out twice into the small plains of Bethshan and Jericho. The river actually flows in a depression, the Zor, from a quarter to 2 m. wide, which it has hollowed out for itself in the bed of the Ghor. During the rainy season (January and February), when the Jordan overflows its banks, the Zor is flooded, but when the water falls it produces rich crops. The floor of the Ghor falls gently to the Zor, and is intersected by deep channels, which have been cut by the small streams and winter torrents that traverse it on their way to the Jordan. As far south as Kurn Surtabeh most of the valley is fertile, and even between the point of the Dead Sea (Nazareth, Ghor, between Philippi), and the Jordan, there are some all-watered oases. In summer the heat in the Ghor is intense, 110° F. in the shade, but in winter the temperature falls to 40°, and sometimes to 35° at night. During the seasons of rain and melting snow the river is very full, and liable to freshets. After twelve hours’ rain it has been known to rise from 4 to 5 ft., and to fall as rapidly. In 1257 the Jordan was dammed up for several hours by a landslip, probably due to heavy rain. On leaving the Sea of Galilee the water is quite clear, but it soon assumes a tawny colour from the soft marl which it washes away from its banks and deposits in the Dead Sea. On the whole it is an unpleasant foul stream running between poisonous banks, and as such it seems to have been regarded by the Jews and other Syrians. The Hebrew poets did not sing its praises, and others compared it unfavourably with the clear rivers of Damascus. The clay of the valley was used for brickmaking, and Solomon established brassfoundries there. From crusading times to this day it has grown sugar-cane. In Roman times it had extensive palm-groves and some small towns (e.g. Livias or Julius opposite Jericho) and villages. The Jordan is crossed by two stone bridges—the Dead Sea Bridge, and the one between Lake Huleh, the other between that lake and the Sea of Galilee—and by the modern bridges from Jerusalem to Gilead and Moab. During the Roman period, and almost to the end of the Arab supremacy, there were bridges on all the great lines of communication between eastern and western Palestine, and ferries at other places. The depth of water varies greatly with the season. When not in flood the river is often fordable, and between the Sea of Galilee and the Dead Sea there are then more than fifty fords—some of them of historic interest. The only difficulty is occasioned by the erratic zigzag current. The natural products of the Jordan valley—a hundred varieties of fruits in the cool, and the wide plains of the Alpine Hermom—are unique. Papyrus grows in Lake Huleh, and rice and cereals thrive on its shores, whilst below the Sea of Galilee the vegetation is almost tropical. The flora and fauna present a large infusion of Ethiopian types; and the fish, with which the river is abundantly stocked, have a great affinity with those of the rivers and lakes of east Africa. Ere the Jordan enters the Dead Sea, its valley has become very barren and forbidding. It reaches the lake at a minus level of 1290 ft., the depression continuing downwards to twice that depth in the bed of the Dead Sea. There the Dead Sea is a mere receptacle of the Jordan and two other rivers, with phosphatic waters, on the left, the Yarmuk (Hieromax) which flows in from the volcanic Jaulan a little south of the Sea of Galilee, and the Zerka (Jabok) which comes from the Belka district to a point more than half-way down the lower course. On the right the Jalud descends from the plain of Esdraelon to near Beisan, and the Far’a from near Nablus. Various salt springs rise in the lower valley. The rest of the tributaries are wadis, dry except after rains.

Such human life as may be found in the valley now is mainly migratory. The Bedouin and the villagers use, in winter as pasture-ground, and, with the Circassians and Maroons of the east bank, cultivate plots here and there. They retire on the approach of summer. Jericho is the only considerable settlement in the lower valley, and it lies some distance west of the stream on the lower slopes of the Judea heights.

(C. W. W.; D. G. H.)

JORDANES,1 the historian of the Gothic nation, flourished about the middle of the 6th century. All that we certainly know about his life is contained in three sentences of his history of the Goths (cap. 50), from which, among other particulars as to the history of his family, we learn that his grandfather Paria was notary to Candac, the chief of a confederation of Alans and other tribes settled during the latter half of the 5th century on the south of the Danube and the plains of Maucia, and the Bulgaria and the Dobrudjans. Jordanes himself was the nephew of his father's brother, the Gothic chief Guntihgus, until he took the vows of a monk. This, according to the manner of speaking of that day, is the meaning of his words ante conversionem meam, though it is quite possible that he may at the same time have renounced the Arian creed of his forefathers, which it is clear that he no longer held when he wrote his Gothic history. The Getica of Jordanes shows Gothic sympathies; but these are probably due to an imitation of the tone of Cassiodorus, from whom he draws practically all his material. He was not himself a Goth, belonging to a confederation of Germanic tribes, embracing Alans and Scyrians, which had come under the influence of the Ostrogoths settled on the lower Danube; and his own sympathies are those of a member of this confederation. He is accordingly friendly to the Goths, even apart from the influence of Cassiodorus; but he is also prepossessed in favour of the eastern emperors in whose territories this confederation lived and whose subject he himself was. This makes him an impartial authority on the last days of the Ostrogoths. At the same time, living in Mos sia, he is restricted in his outlook to Danubian affairs. He has little to say of the history of the world under Constantius, and Theodoric his interests lie, as Mommsen says, within a triangle of which the points are Sirmium, Larissa and Constantinople. Finally, connected as he was with the Alans, he shows himself friendly to them, whenever they enter into his narrative.

We pass from the extremely shadowy personality of Jordanes to the more interesting question of his works.

1. The Romana, or, as he himself calls it, De summa temporum seu origine actibusque gentis Romanorum, was composed in 551. It was begun before, but published after, the Getica. It is a sketch of the history of the world from the creation, based on the Old Testament, the New Testament, and the Latin and Greek authorities. The Getica, its interest lies, as Mommsen says, within a triangle of which the points are Sirmium, Larissa and Constantinople. Finally, connected as he was with the Alans, he shows himself friendly to them, whenever they enter into his narrative.

Finally, connected as he was with the Alans, he shows himself friendly to them, whenever they enter into his narrative.
Getarum, and was also written in 531. He informs us that while he was engaged upon the *Romana* a friend named Castilus invited him to compress into one small treatise the twelve books —now lost—of the senator Cassiodorus, on *The Origin and Actions of the Goths*. Jordanes professes to have had the work of Cassiodorus in his hands for but three days, and to reproduce the sense not the words; but his book, short as it is, evidently contains long verbatim extracts from the earlier author, and it may be suspected that much of his history Cassiodorus was himself indebted to the works of certain Ablabius. It was Ablabius, apparently, who had first used the Gothic sagas (*prisca corminia*); it was he who had constructed the stem of the Amals. Whether he was a Greek, a Roman or a Goth we do not know; nor can we say when he wrote, though his work may be dated conjecturally in the early part of the reign of Theodoric the Great. We can only say that he wrote on the origin and history of the Goths, using both Gothic saga and Greek sources; and that if Jordanes used Cassiodorus, Cassiodorus used, if to a lesser extent, the work of Ablabius.

Cassiodorus began his work, at the request of Theodoric, and therefore before 526: it was finished by 533. At the root of the work lies a theory, whencesoever derived, which identified the Goths with the Scythians, whose country Darius Hystaspes invaded, and with the Getae of Dacia, whom Trajan conquered. This double identification enabled Cassiodorus to bring the favoured race into line with the peoples of classical antiquity, to interweave with their history stories about Hercules and the Amazons, to make them invade Egypt, to claim for them a share in the wisdom of the semitic myth of Leucippus and the Zamoskins. He was thus able with some show of plausibility to represent the Goths as "wiser than all the other barbarians and almost like the Greeks" (Jord., *De reb. Get.*, cap. v.), and to send a son of the Gothic king Telephus to fight at the siege of Troy, with the ancestors of the Romans. All this we can now perceive to have no relation to history, but at the time it may have made the subjugation of the Roman less bitter to feel that he was not after all bowing down before a race of barbarian upstarts, but that his Aml sovereign was as firmly rooted in classical antiquity as any Julius or Claudius who ever wore the purple. In the eighteen years which elapsed between 533 and the composition of the *Getica* of Jordanes, great events, most disastrous for the Roman-Gothic monarchy of Theodoric, had taken place. It was no longer possible to write as if the whole civilization of the Western world would sit down contentedly under the shadow of East Gothic dominion and Aml sovereignty. And, moreover, the instincts of Jordanes, as a subject of the Eastern Empire, predisposed him to flatter the sacred majesty of Justinian, by whose victorious arms the overthrow of the barbarian kingdom in Italy had been effected. Hence we perceive two currents of tendency in the *Getica*. On the one hand, as a transcriber of the philo-Goth Cassiodorus, he magnifies the race of Alaric and Theodoric, and claims for them their full share, perhaps more than their full share, of glory in the past. On the other hand he speaks of the great anti-Teuton emperor Justinian, and of his reversal of the German conquests of the 5th century, in language which would certainly have grated on the ears of Totila and his heroes. When Ravenna is taken, and Vitiges carried into captivity, Jordanes almost exults in the fact that "the nobility of the Amals and the illustrious offspring of so many mighty men will be lost forever; a race of Teutonic dukes, once more an illustrious prince and a yet mightier general, whose fame shall not grow dim through all the centuries." (*Getica*, lx. § 315).

This laudation, both of the Goths and of their Byzantine conquerors, may perhaps help us to understand the motive with which the *Getica* was written. In the year 531 Germanus, nephew of Justinian, accompanied by his bride, Matasuntha, grand-daughter of Theodoric, set forth to reconquer Italy for the empire. His early death prevented any schemes for a revived Romano-Gothic kingdom which may have been based on his personalty and shadowy kingdom of Hair. His widow, however, bore a posthumous child, also named Germanus, of whom Jordanes speaks (cap. 60) as "blending the blood of the Anicii and the Amals, and furnishing a hope under the divine blessing of one day uniting their glories." This younger Germanus did nothing in after life to realize these anticipations; but the somewhat pointed way in which his name and his mother's name are mentioned by Jordanes lends some probability to the view that he hoped for the child's succession to the Eastern Empire, and the final reconciliation of the Goths and Romans in the person of a Gotho-Roman emperor.

The *De rebus Geticis* falls naturally into four parts. The first (chs. i.—xiii.) commences with a geographical description of the three quarters of the world, and the descent of the Teuton, or Got, Torrent, and Svea (Sweden), from which the Goths under their king Berig migrated to the southern coast of the Baltic. Their migration across what has since been called Lithuania to the shores of the Euxine, and their further march into Vladimir and Otergast (Latvia) in the 5th century (chs. v.—xiii.) contain an account of the intrusive Geto-Scythian element before alluded to.

The second section (chs. xiv.—xxiv.) returns to the true history of the Gothic nation, sets forth the genealogy of the Aml kings, and describes the inroads of the Goths into the Roman Empire in the 3rd century, with the foundation and the overthrow of the great Hunnish shadow kingdom of Attila.

The third section (chs. xxv.—xliv.) traces the history of the West Goths from the Hunnish invasion to the downfall of the Gotho-German kingdom in Gaul under Alaric II. (575—507). The best part of this section is indeed the book, the method of writing, and the style, which gives emphasis to a rich and varied narrative and to the style, which gives emphasis to a rich and varied narrative and to the point of interest in the characters of the principal actors. The author, who had lived in the shadow of the Hunnish invasions of Gaul and the battle of the Mauriac plains. Here we have in all probability a verbatim extract from Cassiodorus, who was only resting his history on the work of the poet in his Gallic and Italian sections. With the style of the Geto-Scythian sagas. The celebrated celebration *certaminis gaudia* assuredly came at first from the hands of the minister Cassiodorus or from the small-souled notary Jordanes, but the translation of it may have been written which first found utterance through the lips of a Gothic minstrel.

The fourth section (chs. xlvi.—lx.) traces the history of the East Goths from the same Hunnish invasion to the first overthrow of the Gothic monarchy in Italy (576—539). In this fourth section are inserted, somewhat out of their proper place, some valuable details as to the *Gothi Minores,* "an immense people dwelling in the region of Nicopolis, with their high priest and primate Voltilas, who is said also to have taught them letters." The book closes with the allusion to Germanus and the panegyric on Justinian as the conqueror of the Goths referred to above.

Jordanes refers in this respect to a number of authors besides Cassiodorus; but he owes his knowledge of them to Cassiodorus. It is perhaps only when he is using Orosius that we can hold Jordanes to have borrowed his facts. Otherwise, as Mommsen says, the *Getica* is a *mora epítome*, *laxata et perversa, historiæ Gothicae Cassidiorum.*

As to the style and literary character of Jordanes, every author who has used him speaks in terms of severe censure. Whether you are left to himself and not merely transcribing, he is sometimes scarcely grammatical. There are awkward gaps in his narrative and statements inconsistent with each other. He quotes, as if he were familiar acquainted with the writings of a number of the Gothic and Roman writers, of whom it is almost certain that he had not read more than one or two. At the same time he does not quote the chronicle of Maserlinus, nor the other documents of the history of the deposition of Augustus. All these faults make him a peculiarly unsatisfactory authority where we cannot check his statements by those of other authors. It may, however, be pleaded in extenuation that he is professedly a transcriber, and, if
JORDANUS—JORIS

his story be correct, a translator in peculiarly unfavourable circumstances. He has also himself suffered much from the in-accuracy of copyists. But nothing has really been more unfortunate for the reputation of Jordanes as a writer than the extreme preciosity-ness and artificiality which he has imposed on us. Typical Latin tritribes whose dim origins he records have in the course of centuries attained to world-wide dominion. The battle in the Mauriac plains of which he is really the sole historian, is now seen to have involved remote destinies. In 1328, the hasty pamphlet of a half-educated Gothic monk has been forced into prominence, almost into rivalry with the finished productions of the great writers of the classical world. A wretched little tract, its superficial learning is inapplicable to the history of the Germanic peoples. The best MS. is the Heidelberg MS., written in Germany, probably in the 8th century; but this perished in the fire at Mommsen's house. The next MS. in value are the Vaticans Paleatini of the 10th century, and the Valenciennes MS. of the 9th.

Editions.—The classical edition is that of Mommsen (in Mon. Germ. hist. ausst. antiqu., v., ii.), which supersedes the chief editions, such as that in the first volume of Muratori's Script. rer. Ital. The best MS. is the Heidelberg MS., written in Germany, probably in the 8th century; but this perished in the fire at Mommsen's house. The next MS. in value are the Vaticans Paleatini of the 10th century, and the Valenciennes MS. of the 9th.

Jordanus (Jordan Catalani) (fl. 1321-1330), French Dominican missionary and explorer in Asia, was perhaps born at Sévérac in Aveyron, north-east of Toulouse. In 1302 he may have accompanied the famous Thomas of Tolentino, via Negropont, to the East; but it is only in 1321 that we definitely know of him in western Asia, in the service of the Dominicans; he was to visit the Caspian Sea and certain other Franciscan missionaries on their way to China. Ill-luck detained them at Tana in Salsette island, near Bombay; and here Jordanus' companions (“the four martyrs of Tana”) fell victims to Moslem fanaticism (April 7, 1321). Jordanus, escaping, worked some time at Baruch in Gujarat, near the Nerubudda estuary, and at Surat (?) near Surat; to his fellow-Dominicans in north Persia he wrote two letters—the first from Gogo in Gujarat (October 12, 1321), the second from Tana (January 24, 1323) describing the progress of this new mission. From these letters we learn that Roman attention had already been directed, not only to the Bombay region, but also to the extreme south of the Indian peninsula, especially to “Columbus,” Quillon, or Kulaum in Travancore; Jordanus' words may imply that he had already started a mission there before October 1321. From Catholic traders he had learnt that Ethiopia (i.e. Abyssinia and Nubia) was accessible to Western Europeans; at this very time, as we know from other sources, the earliest Latin missionaries penetrated thither. Finally, the Epistles of Jordanus, like the contemporary Secreta di Marino Sanuto (1306-1321), urge the pope to establish a Christian fleet upon the Indian seas. Jordanus, between 1324 and 1328 (if not earlier), probably visited Kulaum and selected it as the best centre for his future work; it would also appear that he revisited Europe about 1328, passing through Persia, and perhaps touching at the great Crimean port of Soldaia or Sudak. He was appointed a bishop in 1328 and nominated by Pope John XXII. to the see of Columbus in 1330. Together with the new bishop of Samarkand, Thomas of Mancasola, Jordanus was commissioned to take the pall to John de Cora, Archbishop of Sultanuyah in Persia, in whose behalf Jordanus was received; he was also commended to the Christians of south India, both east and west of Cape Comorin, by Pope John. Either before going out to Malabar as bishop, or during a later visit to the west, Jordanus probably wrote his Mirabilia, which from internal evidence can only be fixed within the period 1329-1338; in this work he furnished the best account of Indian regions, products, climate, manners, customs, fauna and flora given by any European in the Middle Ages—superior even to Marco Polo's. In his triple division of the Indies, India Major comprises the shorelands from Malabar to Cochín China, while India Minor stretches from Sind (or perhaps from Baluchistan) to Malabar; and India Tertia (evidently dominated by African conceptions in his mind) includes a vast undefined coast-region west of Baluchistan, reaching into the neighbourhood of, but not including, Ethiopia and Prester John's domain. Jordanus' Mirabilia contains the earliest clear African identification of Prester John, and what is perhaps the first notice of the Black Sea under that name; it refers to the author's residence in India Major and especially at Kalam, as well as to his travels in Armenia, north-west Persia, the Lake Van region, and Chaldea: and it supplies excellent descriptions of Parsee doctrines and burial customs, of Hindu ox-worship, idol-worship, and sutees, and of Indian fruits, birds, animals and insects. After the 8th of April 1330 we have no more knowledge of Bishop Jordanus.

JORIS, DAVID, the common name of Jan Joris or Jorizoon (c. 1505-1556), Anabaptist hierarchi who called himself later Jan Joris, is mentioned as a preacher in Bruges about 1501 or 1502 probably in Flanders at Ghent or Bruges. His father, Georgius Joris de Koman, otherwise Joris van Amersfoort, probably a native of Bruges, was a shopkeeper and amateur actor at Delft; from the circumstance that he played the part of King David, his son received the name of David, but probably not in baptism. His mother was Maria, daughter of Jan de Gorter, of a good family in Delft. As a child he was clever and delicate. He seems then or later to have acquired some tincture of learning. His first known occupation was that of a glass-painter; in 1522 he painted windows for the church at Enkhuizen, North Holland (the birthplace of Paul Potter). In pursuit of his trade he probably reached England; ill-health drove him homewards in 1524, in which year he married Dirckgen Willems at Delft. In the same year the Lutherian reformation took hold of him, and he began to issue appeals in prose and verse against the Mass and against the pope as antichrist. On Ascension Day 1528 he committed an outrage on the sacrament carried in procession; he was placed in the pillory, had his tongue bored, and was banished from Delft for three years. He turned to the Anabaptists, was repubilicated in 1533, and for some years led a wandering life. He came into relations with John à Lasco, and with Menno Simons. Much influenced by Melchior Hofman, he had no sympathy with the fanatic violence of the Münster faction. At the Buckholtz conference in August 1536 he played a mediating part. His mother, in 1537, suffered martyrdom as an Anabaptist. Soon after he took up a rôle of his own, having visions and a gift of prophecy. He adapted in his own interest the theory (constantly recurrent among mystics and innovators, from the time of Abbot Joachim to the present day) of three dispensations, the old, with its revelation of the Father, the newer with its revelation of the Son, and the latest or era of the Spirit. Of this newest revelation Christus Davidus was the visible supervening on Christus Jesus. From the 1st of April 1544, bringing with him some of his followers, he took up his abode in Basel, which was to be the New Jerusalem. Here he styled himself Jan van Brugge. His identity was unknown to the authorities of Basel, who had no suspicion of his heresies. By his writings he maintained his hold on his numerous followers in Holland and Friesland. These monotonous writings, all in Dutch, flowed in a continual stream from 1524 (though none is
JORTIN—JOSEPH

513

extant before 1559) and amounted to 200 in number. His magnum opus was 'The Wonder Book (n.d. 1542, divided into two parts; 1551, handsomely reprinted, divided into four parts; both editions anonymous). Its chief claim to recognition is its use, in the latter part, of the phrase Restitutio Christi, which apparently suggested to Servetus his title Christianismi Restitutio (1553). In the 1st edition is a figure of the "new man," signed with the author's monogram, and probably drawn as a likeness of himself. It accompanies a letter, addressed to a well-known scholar, engraved in 1605, reproduced in the appendix to A. Ross's Pantheon (1653), and idealized by P. Burckhardt in 1900. Another work, Verklarung der Schoppenissen (1553) treats mystically the book of Genesis, a favourite theme with Boehme, Swedenborg and others. His remaining writings exhibit all that easy dribble of triumphant muddiness which disciples take as depth. His wife died on the 22nd of August, and his own death followed on the 25th of August 1556. He was buried, with all religious honours, in the church of St Leonard, Basel. Three years later, Nicolas Blesdijk, who had married his eldest daughter Janneke (Susanna), but had lost confidence in Jortin for the time before his death, denounced the dead man to the authorities of Basel. An investigation was begun in March 1559, and as a result of a conviction for heresy the exhumed body of Jortin was burned, together with his portrait, on the 13th of May 1559. Blesdijk's Historia (not printed till 1642) accuses Jortin of having plures uxorum. Of this there is no confirmation. Theoretically Jortin regarded polygamy as lawful; there is no proof that his theory affected his own practice.

The first attempt at a true account of Jortin was by Gottfried Arnold in his Anonymous Historia (1712), pursued with much fuller material in his Kirchen und Kaster Historie (best ed. 1740-1742). See also F. Nipphol, in Zeitschrift für die historische Theologie (1863, 1864, 1868); A. van der Linde, in Allgemeine Deutsche Biographie (1861); P. Burckhardt, Bilder Biographien (1900); Hayman, Jortin's Realencycloöpdie (1901), and the bibliography by A. van der Linde, 1867, supplemented by E. Weller, 1889. (A. Go.)

JORTIN, JOHN (1668-1770), English theologian, the son of a Protestant refugee from Brittany, was born in London on the 23rd of October 1668. He went to Charterhouse School, and in 1715 became a pensioner of Jesus College, Cambridge, where his reputation as a Greek scholar led to his being selected to translate certain passages from Eustathius in the time to Pope's Homer. In 1722 he published a small volume of Latin verse entitled Lusus poëtic. Having taken orders in 1724, he was in 1726 presented by his college to the vicarage of Swavesey in Cambridgeshire, which he resigned in 1730 to become preacher at a chapel-of-case in New Street, London. In 1731, along with some friends, he began a publication entitled Miscellaneous Observations on Authors Ancient and Modern, which appeared at intervals during two years. He was Boyle lecturer in 1749. Shortly after becoming chaplain to the bishop of London in 1762 he was appointed to a prebendal stall of St Paul's, and to the vicarage of Kensington, and in 1764 he was made archdeacon of London. He died at Kensington on the 5th of September 1770.

The principal works of Jortin are: Discussions Concerning the Truth of the Christian Religion (1746); Remarks on Ecclesiastical History (3 vols. 1751-2-4); Life of Erasmus (2 vols. 1750, 1790) founded on the Life by (Januarius Flicius); and Tracts Polemical and Miscellaneous (1790). A collection of his Various Works appeared in 1805-1810. All his writings display wide learning and acuteness. He writes on theological subjects with the detachment of a thoughtful layman, and is witty without being flippant. See John Duncan's Life of Jortin (1792).

JOSEPH, in the Old Testament, the son of the patriarch Jacob by Rachel; the name of a tribe of Israel. Two explanations of the name are given by the Biblical narrator (Gen. xxx. 23 [E], 24 [J]); a third, "He (God) increases," seems preferable. Unlike the other "sons" of Jacob, Joseph is usually reckoned as two tribes (viz. his "sons" Ephraim and Manasses), and closely associated with it is the small tribe of Benjamin (q.s.), which lay immediately to the south. These three constituted the "house" of Jacob by (Jacob's own) stock, and with the "sons" of Leah (the antelope?) are thus on a higher level than the "sons" of Jacob's concubines. The "house of Joseph" and its offshoots occupied the centre of Palestine from the plain of Esdraelon to the mountain country of Benjamin, with dependencies in Bashan and northern Gilead (see MANASEH). Practically it comprised the northern kingdom, and the name is used in this sense in 2 Sam. xix. 20; Amos v. 6; vi. 6 (note the prominence of Joseph in the blessings of Jacob and Moses, Gen. xlix., Deut. xxxiii.). Originally, however, "Joseph" was more restricted, possibly to the immediate neighbourhood of Shechem, its first establishment before the development of the name Jacob. The dramatic story of the tribal ancestor is recounted in Gen. xxxvii.–l. (see GENESIS). Joseph, the younger and envied son, is seized by his brothers at Dothan north of Shechem, and is sold to a party of Ishmaelites or Midianites, who carry him down to Egypt. After various vicissitudes he gains the favour of the king of Egypt by the interpretation of a dream, and obtains a high place in the kingdom.1 Forced by a famine his brothers come to buy food, and in the incidents that follow Joseph shows his preference for his young brother Benjamin (cf. the tribal data above). His father Jacob is invited to come to Goshen, where a settlement is provided for the family and their flocks. This is followed many years later by the exodus, the conquest of Palestine, and the burial of Joseph's body in the grave at Shechem which his father had bought.

The history of Joseph in Egypt displays some familiarity with the circumstances and usages of that country; see Driver (Hastings's D.B.) and Cheyne (Encyc. Bib., col. 2858 seq.); although Abrech (1851) and Stubbs (1873) have been otherwise connected with Joseph, his historical life has been much debated, but the differences are not incomparable with the points of resemblance, and the tale has features which are almost universal (Frazer, Golden Bough, ii. ed., vol. iii. 381 seq.). On the theory that the historical events of Joseph's history refer to an official (Yan- hamu) of the time of Amenophis III. and IV., see Cheyne, op. cit., and Hibbert Journal, October 1903. That the present form of the narrative has been influenced by current mythological lore is not improbable; on this question see (with caution) Winckler, Gesch. Israds, ii. 67-77 (1900); A. Jeremias, Alte Test., pp. 383 seq. (1906). It may be added that the Egyptian names in the story of Joseph are characteristic of the XXII. and subsequent dynasties. See, also, Meyer and Luther, Die Israeliten (1906), Index, s.v. (S. A. C.)

1Joseph's marriage with the daughter of the priest of On might show that the tribes of Ephraim and Manasses were believed to be half-Egyptian by descent, but it is notoriously difficult to determine how much is of etymological value and how much belongs to romance (viz. that of the individual Joseph).
introduced; and from John xix. 26 it is clear that he was not alive at the time of the Crucifixion.

Joseph was the father of several children (Matt. xiii. 53), but according to ecclesiastical tradition by a former marriage. The reading of Matt. i. 16, in the Sinaïtic Palimpsest (Joseph begat Jesus, who is called the Christ) also makes him the natural father of Jesus, and this was the view of certain early heretical sects, but it seems never to have been held in orthodox Christian circles. According to various apocryphal gospels (conveniently collected in B. H. Cowper’s The Apocryphal Gospels, 1884), Joseph married Mary after she was 80 years of age, and the father of four sons and two daughters; his first wife’s name was Salome and she was a connexion of the family of John the Baptist.

In the Roman Catholic Church the 19th of March has since 1642 been a feast in Joseph’s honour. Two other festivals in his honour have also been established (the Patronage of St Joseph, 3rd Sunday after Easter, and the Betrothal of Mary and Joseph, 23rd of January). In December 1870 St Joseph was proclaimed Patron of the whole Church (G. H. Bo.).

JOSEPH OF ARIMATHAEA,

in the New Testament, a wealthy Jew who had been converted by Jesus Christ. He is mentioned by the Four Evangelists, who are in substantial agreement concerning him: after the Crucifixion he went to Pilate and asked for the body of Jesus, subsequently prepared it for burial and laid it in a tomb. There are, however, minor differences in the accounts, which have given rise to controversy. Matthew (xxvii. 60) says that the tomb was Joseph’s own; Mark (xxv. 43 seq.), Luke (xxiii. 50 seq.) say nothing of this, while John (xix. 41) simply says that the body was laid in a sepulchre “nigh at hand.” Both Mark and Luke say that Joseph was a “councillor” (ἐκκλησίων βουλευτής, Mark xxv. 43), and the Gospel of Peter describes him as “a friend of Pilate and of the Lord.” This last statement is probably a late invention, and there is considerable difficulty as to “councillor.” That Joseph was a member of the Sanhedrin is improbable. Luke indeed, regarding him as such, says that he “had not consented to their counsel and deed,” but Mark (xiv. 64) says that all the Sanhedrin “condemned him to be worthy of death.” Perhaps the phrase “noble councillor” is intended to imply merely a man of wealth and position. Again Matthew says that Joseph was a disciple, while Mark implies that he was not yet among the definite adherents of Christ, and John describes him as an adherent “secretly for fear of the Jews.” Most likely he was a disciple, but belonged only to the wider circle of Christ. The account given in the Fourth Gospel suggests that the writer, faced with these various difficulties, assumed a double tradition: (1) that Joseph of Arimathaea, a wealthy disciple, buried the body of Christ; (2) that the person in question was Joseph of Arimathaea a “councillor,” and solved the problem by substituting Nicodemus as the councillor; hence he describes both Joseph and Nicodemus (xix. 30) as co-operating in the burial. Some critics (e.g. Strauss, New Life of Jesus, ch. 96) have thrown doubt upon the story, regarding some of the details as invented to suit the prophecy in Isa. lxx. 9, “they made his grave with the wicked, and with the rich in his death” (for various translations, see Hastings’s Dict. Bible, ii. 778). But in the absence of any reference to this prophecy in the Gospels, this view is unconvinced, though the correspondence is remarkable.

The striking character of this single appearance of Joseph of Arimathaea led to the rise of numerous legends. Thus William of Malmsbury says that he was sent to Britain by St Philip, and, having received a small island in Somersetshire, there constructed “with twisted twigs” the first Christian church in Britain—afterwards to become the Abbey of Glastonbury. The legend says that his staff, planted in the ground, became a thorn flowering twice a year (see Glastonbury). This tradition which is given only as such by Malmsbury himself—is not confirmed, and there is no mention of it in either Gildas or Bede.

Joseph also plays a large part in the various versions of the Legend of the Holy Grail (see Grail, The Holy).

JOSEPH I. (1678–1711), Roman emperor, was the elder son of the emperor Leopold I. and his third wife, Eleanora, countess palatine, daughter of Philip William of Neuburg. Born in Vienna on the 26th of July 1678, he was educated strictly by Prince Dietrich Otto von Salm, and became a good linguist. In 1687 he received the crown of Hungary, and he was elected king of the Romans in 1690. In 1699 he married Wilhelmina Amalia, daughter of Duke Frederick of Brunswick-Lüneburg, by whom he had two daughters. In 1702, during the War of the Spanish Succession, he saw his only military service. He joined the imperial general Louis of Baden in the siege of Landau. It is said that when he was advised not to go into a place of danger he replied that those who were afraid might retire. He succeeded his father as emperor in 1705, and it was his good fortune to govern the Austrian dominions, and to be head of the Empire during the years in which his trusted general Prince Eugene, either acting alone in Italy or with the duke of Marlborough in Germany and Flanders, was beating the armies of Louis XIV. During the whole of his reign Hungary was disturbed by the conflict with Francis Rakoczy II., who eventually took refuge in France. The emperor did not himself take the field against the rebels, but he is entitled to a large share of the credit for the restoration of his authority. He reversed many of the pedantically authoritative measures of his father, thus placating all opponents who could be pacified, and he fought stoutly for what he believed to be his rights. Joseph showed himself very independent towards the pope, and hostile to the Jesuits, by whom his father had been much influenced. He had to confront and make war on two Empires. In 1712 he began the attempts to settle the question of the Austrian inheritance by a pragmatic sanction, which were continued by his brother Charles VI.

Joseph died in Vienna on the 17th of April 1711, of small-pox.

JOSEPH II. (1741–1790), Roman emperor, eldest son of the empress Maria Theresa and her husband Francis I., was born on the 13th of March 1741, in the first stress of the War of the Austrian Succession. Maria Theresa gave orders that he was only to be taught as if he were amusing himself; the result was that he acquired a habit of crude and superficial study. His real education was given him by the writings of Voltaire and the encyclopaedists, and by the example of Frederick the Great. His useful training was conferred by government officials, who were directed to instruct him in the mechanical details of the administration of the numerous states composing the Austrian dominions and the Empire. In 1761 he was made a member of the newly constituted council of state (Staatsrath) and began to draw up minutes, to which he gave the name of “reveries,” for his mother to read. These papers contain the germs of his later policy, and of all the disasters which finally overtook him. He was a friend to religious toleration, anxious to reduce the power of the church, to relieve the peasantry of feudal burdens, and to remove restrictions on trade and on knowledge. So far he did not differ from Frederick, Catherine of Russia or his own brother and successor Leopold II., all enlightened rulers of the 18th-century stamp. Where Joseph differed from great contemporary rulers, and where he was closest akin to the Jacobins, was in the fanatical intensity of his belief in the power of the state when directed by reason, of his right to speak for the state uncontrolled by laws, and of the reasonableness of his own reasons. Also he had inherited from his mother all the belief of the house of Austria in its “august” quality, and its claim to acquire whatever it found desirable for its power or its profit. He was unable to understand that his philosophical plans for the moulding of mankind could meet with pardonable opposition. The overweening character of the man was obvious.
JOSEPH, FATHER

to Frederick, who, after their first interview in 1769, described him as ambitious, and as capable of setting the world on fire. The French minister Vergennes, who met Joseph when he was travelling incognito in 1777, judged him to be "ambitious and despotie."  

Until the death of his mother in 1780 Joseph was never quite free to follow his own instincts. After the death of his father in 1765 he became emperor and was made co-regent by his mother in the Austrian dominions. As emperor he had no real power, and his mother was resolved that neither husband nor son should ever deprive her of sovereign control in her hereditary dominions. Joseph, by threatening to resign his place as co-regent, could induce his mother to abate her dislike to religious toleration. He could, and he did, place a great strain on her patience and temper, as in the case of the first partition of Poland and the Bavarian War of 1778, but in the last resort the empress spoke the final word. During these wars Joseph travelled much. He met Frederick the Great privately at Neisse in 1769, and again at Mährisch-Neustadt in 1770. On the second occasion he was accompanied by Prince Kaunitz, whose conversation with Frederick may be said to mark the starting-point of the first partition of Poland. To this and to every other measure which promised to extend the dominions of his house Joseph gave hearty approval. Thus he was eager to enforce its claim on Bavaria upon the death of the elector Maximilian Joseph in 1777. In April of that year he paid a visit to his sister the queen of France (see Marie Antoinette), turning down an invitation of Count von Konteln, which he received, and much flattered by the encyclopaedists, but his observations led him to predict the approaching downfall of the French monarchy, and he was not impressed favourably by the army or navy. In 1778 he commanded the troops collected to oppose Frederick, who supported the rival claimant to Bavaria. Real fighting was averted by the unwillingness of Frederick to embark on a new war and by Maria Theresa's determination to maintain peace. In April 1780 he paid a visit to Catherine of Russia, against the wish of his mother.  

The death of Maria Theresa on the 27th of November 1780 left Joseph free. He immediately directed his government on a new course, full speed ahead. He proceeded to attempt to realize his ideal of a wise despotism acting on a definite system for the good of all. The measures of emancipation of the peasantry which his mother had begun were carried on by him with feverish activity. The spread of education, the secularization of church lands, the reduction of the religious orders and the clergy in general to complete submission to the lay state, the promotion of unity by the compulsory use of the German language, everything which from the point of view of 19th-century philosophy appeared "reasonable" was undertaken at once. He strove for administrative unity with characteristic haste to reach results without preparation. His anti-clerical innovations induced Pope Pius VI. to pay him a visit in July 1782. Joseph received the pope politely, and showed himself a good Catholic, but refused to be influenced. So many interferences with old customs began to produce unrest in all parts of his dominions. Meanwhile he threw himself into a succession of foreign policies all aimed at aggrandisement, and all equally calculated to extend his neighbourhood, to form new alliances, and to develop his disinterestedness. He endeavoured to get rid of the Barrier Treaty, which deburred his Flemish subjects from the navigation of the Scheldt; when he was opposed by France he turned to other schemes of alliance with Russia for the partition of Turkey and Venice. They also had to be given up in the face of the opposition of neighbours, and in particular of France. Then he resumed his attempts to obtain Bavaria—this time by exchanging it for Belgium—and only provoked the formation of the Fürstenbund organized by the king of Prussia. Finally he joined Russia in an attempt to pillage Turkey. It began on his part by an unsuccessful and incredible attempt to surprise Belgrade in time of peace, and was followed by the ill-managed campaign of 1788. He accompanied his army, but showed no capacity for war. In November he returned to Vienna with ruined health, and during 1789 was a dying man. The concentration of his troops in the east gave the malcontents of Belgium an opportunity to revolt. In doing this the nobles were all but in open rebellion, and in his other states there were peasant risings, and a revival of particularist sentiments. Joseph was left entirely alone. His minister Kaunitz refused to visit his sick-room, and did not see him for two years. His grandson, the next Joseph, gave him up on the 8th of January 1790, worn out and broken-hearted, recognized that his position could not or would not, carry out his plans. On the 30th of January 1790 he formally withdrew all his reforms, and he died on the 20th of February.

Joseph II. was twice married, first to Isabella, daughter of Philip, duke of Parma, to whom he was attached. After her death on the 27th of November 1763, a political marriage was arranged with Josepha (d. 1767), daughter of Charles Albert, elector of Bavaria (the emperor Charles VII). It proved extremely unhappy. Joseph left no children, and was succeeded by his brother Leopold II.

Many volumes of the emperor's correspondence have been published. Among them are Maria Theresia und Joseph II. Ihre Korrespondenzen samt Briefen Josepha an seinem Bruder Leopold (1867–1868); Joseph II. und Leopold von Toscani. Ihr Briefwechsel (1872); Joseph II. und Leopold I. von Friedland. Ihr Briefwechsel (1866); and Maria Antoinette, Joseph II. und Leopold II. Ihr Briefwechsel (1866); all edited by A. Ritter von Arnet. The collections are: Joseph II. Leopold II. und Kaunitz. Ihr Briefwechsel (1866); all edited by A. Beer (1871); Joseph II. und Leopold von Friedland. Ihr Briefwechsel (1866) edited by J. von Fiedler (1901); and the Geheime Korrespondenzen Josephs II. mit seinem Minister in den Oesterreichischen Niederlanden, Ferdinand Graf Trauttmansdorff, 1787–1789, edited by H. Schlitter (1902). Among the lives of Joseph may be mentioned: A. J. Gross-Hofinnung Geschichte Josephs II. (1847); C. Pagand, Histoire de Joseph II. (1843); German translation by F. Köhler, 1844); H. Meynert, Kaiser Josephs des Jüngeren Leben (1862); A. M. Frank, Kaiser Joseph II. und Leopold II. (1867); A. Fournier, Joseph II. (1885); and J. Wendrinsky, Kaiser Joseph II. (1880). There is a useful small volume on the emperor by J. Franeck Bright (1867). Other books which may be consulted are: G. Wolf, Das Unterrichtswesen in Oesterreich unter Joseph II. (1880), and Oesterreich und Preussen 1720–1770 (1880), A. Wolf and H. von Zwiedeneck-Südosten, Oesterreich unter Maria Theresia, Joseph II. und Leopold II. (1882–1884). H. Schlitter, Die Regierung Josephs II. in den Oesterreichischen Niederlanden (1900); and Pius VI. und Joseph II. 1752–1792 (1894); O. Lorenz, Joseph II. und die Belgische Revolution (1862); and L. Delplace, Joseph II. et la revolution brabancone (1890).

JOSEPH, FATHER (FRANÇOIS LECLECQ DU TREMBLAY) (1757–1638), French Capuchin monk, the confidant of Richelieu, was the eldest son of Jean Leclerc du Tremblay, president of the council of State, and was sent to the Capuchin convent of Mont Motier de Lafayette. As a boy he received a careful classical training, and in 1595 made an extended journey through Italy, returning to take up the career of arms. He served at the siege of Amiens in 1597, and then accompanied a special embassy to London. In 1599 Baron de Mafflier, by which name he was known at court, renounced the world and entered the Capuchin monastery of Orleans. He embraced the religious life with great ardour, and became a notable preacher and reformer. In 1606 he aided Antoinette d'Orléans, a nun of Fontevrault, to found a religious house for the Capuchins at Tremblay, and the convent received the official recognition of the monks. He wrote a manual of devotion for the nuns. His proselytizing zeal led him to send missionaries throughout the Huguenot centres—he had become provincial of Touraine in 1613. He entered politics at the conferences of Loundon, when, as the confidant of the queen and the papal envoy, he opposed the Gallican claims advanced by the parlement, which the princes were upholding, and succeeded in convincing them of the schismatic tendency of Gallicanism. In 1612 he began those personal relations with Richelieu which have indissolubly joined in history and legend the cardinal and the "Emir of Grace," relations which research has made clear. In 1627 the monk assisted at the siege of La Rochelle. A purely religious reason also made him Richelieu's ally against the Habsburgs. He had a dream of arousing Europe to another crusade against the Turks, and
believed that the house of Austria was the obstacle to that universal European peace which would make this possible. As Richestieu's agent, therefore, this modern Peter the Hermit manoeuvred at the diet of Regensburg (1630) to thwart the aggression of the emperor, and then advised the intervention of Gustavus Adolphus, reconciling himself to the use of Protestant armies by the theory that one poison would counteract another. Thus the monk became a war minister, and, though maintaining a personal austerity of life, gave himself up to diplomacy. It occurred in 1638, just as the cardinalate was to be conferred upon him. The story that Richestieu visited him when on his deathbed and roused the dying man by the words, "Courage, Father Joseph, we have won Breisach," is apocryphal.

See Fagiez, Le Père Joseph et Richestieu (1894), a work based largely on original and unpublished sources. Father Joseph, according to this biography, would seem not to have lectured Revenue himself but at the coronation scene Josephine described radiant with triumph over her ensnared relatives. The august marriages contracted by her children Eugène and Hortense seemed to establish her position; but her ceaseless extravagance and, above all, the impossibility that she should bear a son strained the relations between Napoleon and Josephine. She complained of his infidelities and growing callousness. The end came in sight after the campaign of 1809, when Napoleon caused the announcement to be made to her that reasons of state compelled him to divorce her. Despite all her pleadings he held to his resolve. The most was made of the slight technical irregularity at the marriage ceremony of the 1st of December 1804; and the marriage was declared null and void.

At her private retreat, La Malmaison, near Paris, which she had beautified with curios and rare plants and flowers, Josephine closed her life in dignified retirement. Napoleon more than once came to consult her upon matters in which he valued her tact and good sense. Her health declined early in 1814, and after his first abdication (April 11, 1814) it was clear that her end was not far off. The emperor Alexander of Russia and Frederick William III. of Prussia, then in Paris, requested an interview with her at her chamber, but on the 24th of May 1814, Her friend Mme de Rémusat and others, pointed out that Napoleon's good fortune deserted him after the divorce; and it is certain that the Austrian marriage clogged him in several ways. Josephine's influence was used on behalf of peace and moderation both in internal and in foreign affairs. Thus she begged Napoleon not to execute the duc d'Enghien and not to embroil himself in Spanish affairs in 1808.

JOSEPHUS, FLAVIUS (c. 37-95?), Jewish historian and military commander, was born in the first year of Caligula (37-38). His father belonged to one of the noblest priestly families, and through his mother he claimed descent from the Asmonaeans high priest Jonathan. A precocious student of the Law, he made trial of the three sects of Judaism—Pharisees, Sadducees and Essenes—before he reached the age of nineteen. Then, having spent three years in the desert with the hermit Banus, who was presumably an Essene, he became a Pharisee. In 64 he went to Rome to intercede on behalf of some priests, his friends, whom the procurator Felix had sent to render account to Caesar for some insignificant offence. Making friends with Aliturus, a Jewish actor, who was a favourite of Nero, Josephus obtained an introduction to the empress Poppaea and effected his purpose by her help. His visit to Rome enabled him to speak from personal experience of the power of the Empire, when he expostulated with the revolutionary Jews on his return to Palestine. But they refused to listen; and, with all the Jews who did not fly the country, was dragged into the great rebellion of 66. In company with two other priests, Josephus was sent to Galilee under orders (he says) to persuade the ill-affected to lay down their arms and return to the Roman allegiance, which the Jewish aristocracy had not yet renounced. Having sent his two companions back to Jerusalem, he organized the forces at his disposal, and made arrangements for the government of his province. His obvious desire to preserve law and order excited the hostility of John of Giscala, who endeavoured vainly to remove him as a traitor to the national
cause by inciting the Galileans to kill him and by persuading the Sanhedrin at Jerusalem to recall him.

In the spring of 67 the Jewish troops, whom Josephus had drilled so sedulously, fled before the Roman forces of Vespasian and Titus. He went to Jerusalem for reinforcements, and the war resumed. With the stragglers who remained, he held a strong hold against the Romans by dint of his native cunning, and finally, when the place was taken, persuaded forty men, who shared his hiding-place, to kill one another in turn rather than commit suicide. They agreed to cast lots, on the understanding that the second should kill the first and so on. Josephus providentially drew the lot and prevailed upon his destined victim to live. Their companions were all dead in accordance with the compact; but Josephus at any rate survived and surrendered. Being led before the Emperor, he was imprisoned, but propounded to him several philosophical questions, which might become emperor. In consequence of the prophecy his life was spared, but he was kept close prisoner for two years. When his prophecy was fulfilled he was liberated, assumed the name of Flavius, the family name of Vespasian, and accompanied his patron to Alexandria. There he took another wife, as the Jewess allotted him by Vespasian after the fall of Caesaerea had forsaken him, and returned to attend Titus and to act as intermediary between him and the Jews who still held Jerusalem. His efforts in this capacity failed; but when the city was stormed (70) Titus granted him leave to return to Jerusalem. So Josephus returned to the lists of some free men who had been taken and (by the gift of Titus) certain sacred books. After this he repaired to Rome and received one of the pensions, which Vespasian (according to Suetonius) was the first to bestow upon Latin and Greek writers. He was also made a Roman citizen and received an estate in Judaea. Thenceforward he devoted himself to literary work under the patronage of Vespasian, Titus, and Domitian. As he mentions the death of Agrippa II. it is probable that he lived into the 2nd century; but the date of Agrippa's death has been challenged, and, if his patronage was that of Vespasian, it is possible that Josephus may have been involved in his fall and perished under Domitian in 95.

WORKS.—1. The Jewish War (Παλαιότερον Πολεμόν, the oldest of Josephus' extant writings, was written towards the end of Vespasian's reign (69-79) —The Aramaic original has not been preserved; but the Greek version was prepared by Josephus himself in conjunction with competent Greek scholars. Its purpose in all probability was, in the first instance, to exhibit to the Babylonian Jews the overwhelming power of Rome and so to deter them from repeating the fate of the Jews of Babylonia. In its several books it gives two surveys of the history of the Jews from the capture of Jerusalem by Titus and Antiochus Epiphanes to the outbreak of war in 67, and here Josephus relies upon some such general historical texts as Niccolini and others have restored against the events of the war (67-73) which fell more or less within his own knowledge. Vespasian, Titus, and Agrippa II. testified (he tells us) to his accuracy. Reproductions of the Aramaic text would probably have protested against his pro-Roman prejudices.

2. The Jewish Antiquities (Ἰσραήλ ἰστορίαι) covers in twenty books the history of the Jews from the creation of the world to the outbreak of the war with Rome. It was finished in the thirteenth year of Domitian (93). Its purpose was to glorify the Jewish nation in the eyes of the Roman world. In the part covered by the books of the Josephus followeth them, and that mainly, if not entirely, as the Samnite Wars of the Sixth century B.C. Is the Seventy (the Septuagint version). Being a Pharsee, he sometimes introduces traditions of the Elders, which are either inferences from, or embroideries of, the Biblical narrative. Sometimes, also, he gives proof of some knowledge of Hebrew and supplements his scriptural authorities, which include 1 Esdras, from general Greek histories. For the later period he uses the Greek Esther, with its additions, 1 and 2 Maccabees, Polybius, Strabo and Nicolaus of Damasus. But towards the end he confesses that he has grown weary of his task, and his history becomes meagre. The work contains accounts of John the Baptist and Jesus, which amount far more to Josephus than to the account from oblivion by the Christians. But the description of Jesus as “a wise man, if indeed one should call him a man” can hardly be genuine, and the assertion “this was the Christ” is equally doubtless. Josephus adopted the description of Jesus as “mediator and saviour” in the sense of false-Christ or false-prophet among non-Christian Jews.

3. Josephus wrote a narrative of his own Life in order to defend himself against the calumny brought by his enemy Justus of Tiberias to the effect that he had really been the cause of the Jewish rebellion. In his defence Josephus departs from the facts as narrated in the Tetrarchic War, and is a partisan of Rome and, therefore, as a traitor to his own people from the beginning.

4. The two books Against Apion are a defence or apology directed against current misrepresentations of the Jews. Earlier titles are Concerning the Antiquity of the Jews by Nathanael of Alexandria (the leader of the Alexandrine embassy which opposed Philo and his companions when they appeared in behalf of the Alexandrine Jews in the West). It is probable that Josephus puts forward a permanent value and shows him at his best.

The Greek text of Josephus' works has been edited with full collection of different readings by B. Niese (Berlin, 1887—1893). The translation into English commissioned by W. Whiston has been (superficially) revised by A. R. Shilleto (1889-1890). Schürer (History of the Jewish People) gives a full bibliography.

J. H. A. H.
Of the mission of the spies to Jericho, two versions were current (duplicates iii. 3, 12, 18; v. 18 seq. breaks the connexion between vv. 17, 18, 20); but close parallels to the account in Jos. vii. 22def. are observed in the rite of circumcision and of the passover (iii. seq.). The complicated narrative in iii.-iv. is of composite origin (contrast iii. 17 with iv. 10, 19; cf. above, on iv. 21). Circumcision, already familiar from Exod. iv. 26, Deut. x. 16, is here regarded as a new rite (v. 2, 9, supplemented by v. 1, 4-8), but the conflicting views have been harmonized by the words "the second time..." (v. 2), and the "rolling away of the reproach of Egypt" (v. 9), but iv. 20 suggests a different origin, viz. the sacred stene-circle (cf. Judges iii. 19, R.V. marg.). An old account of the divine commission to Joshua appears in the archeaic passage v. 13-15 (cf. Moses in Exod. iii.). Fusion of sources is obvious in the story of the fall of Jericho (contrast vi. 2, 10, 16, 21 and 24, xv. 22 and 25); according to one (E) the people march seven times around the city occupying a prominent position (v. 6, 7, 9, 12 seq. 16, 20 [part], 22-24); but in the other they march every day for seven days. Both here and in the preceding chapters the Septuagint has several variants which are successfully used by the translators to simplify the present difficulties, or to use of another recession. The curse pronounced by Joshua upon the destroyed city of Jericho (vi. 25-27) is passed over in the account in Jos. x. 21; and which is acquainted with the story (1 Kings xvi. 34); the city, however, reappears in Joshua xviii. 21; 2 Sam. x. 5. Achan's sacrifice, the cause of the repulse at Ai and of the naming of the valley of Achor (Jos. vii. 1-26; cf. above, on vii. 22); and which is relative later date. It contains some probable traces of D (in vii. 5, 7, 11 seq., 15, 25) and P (in vi. 1, 16, 24 seq.). The capture of Ai has marks of the same dual origin as the preceding chapters (cf. vii. 38 with 10, 18, and viii. 2, 24; etc.), and the entire portion of the Septuagint it appears after ix. 2, while Josephus (Ant. v. 1, 10, and the Samaritan book of Joshua read it before ch. xiiii.; Dillmann, however, would place it after xi. 23. The capture of Jericho and Ai is followed by the successful stratagem of the Gibeonites to make peace with Israel (ix.); this involves them in a war with the southern Canaanites; Joshua intervenes and obtains a crowning victory (x.). The camp is still at Gilgal. A similar conquest of the northern Canaanites follows (xii.), and the battle of the book concludes with a summary of the results of the Israelitic invasion (xiii.).

No satisfactory explanation of vii. 30-35 has been found, yet ix. 1 seq. seems to show that it was the prelude to the Canaanite wars. In contrast to the absence of any reference to the occupation of central Palestine, the conquest of the south was current in several divergent traditions. Two records are blended into i.; one narrates the covenant with the Gibeonites, the other that with the Amorites (properly Hivites); and in the latter Joshua has no place (re. seq. 6b, 7, 11-14, etc.). The former has additions by D (re. seq. 10, 24 seq.); but the latter, with 15 last clause, in which event with the legislation of its day (posterior to Ezek. xlvii. 6 seq.), does not allow the Gibeonites to minister to the temple or altar, but merely to "stand on the altar," a characteristic post-exilic term (contrast rv. 21 and 23; cf. the Levitical prescriptions). The covenant is the last of the series of conflicts with the notice that Gibeon was still an independent Canaanite city in David's time (2 Sam. xiii. 10). The description of the treaty is paralleled, as the doublets show, upon two sources; the war arises from two sources (the vengeance of the Gibeonites, and the attempt to overthrow Isreal), and concludes with a twofold victory: in x. 16-24 the kings are pursued to Makkehah and Hebron; in x. 25-27, by Caleb with Zela. While the former is admitted in their flight to Azekah (cf. 1 Sam. vii. 10, 15, in the same form), Redactional links have been added, apparently by D, to whom is probably due the account (iv. 1 seq. Gilead, where Caleb receives the lot.); while iv. 1 seq., which is, so far as both were written out of the book of Jashar (v. 12 seq.), a poetical address to the race, and a prayer or spell for their aid (cf. Judges v. 20, and see Exclus. xlvii. 4). The literal interpretation of this picturesque quotation has been influenced of the prosaic comments at the end of v. 13 and beginning of v. 14. The repetition of these words, which cannot be ascribed to mere repetition, omits both. The generalizing narrative (x. 28-43), which is due to D in its present form, is partly based upon old matter (e.g. the two references to Gibeon: 28, 30), partly upon a source of the period of Joshua (v. 2 seq.) are due to D, as also are the summary (rv. 10-23, cf. style of x. 28-43), and the enumeration of the total results of the invasion (xiii.), which includes names not previously mentioned.

Division of the Land.—The result of the events narrated in the first part of the book is to ascribe the entire subjugation of Canaan to the two sons of Joseph, to the exclusion of those of Joseph (x. 15; 43). He is "now old and advanced in years," and although Joshua was instructed remained to be possessed, he is instructed to divide the conquered districts among the western tribes (xiii. 1 seq.). This is detailed at length in the second part of the book. With the completion of the division his mission is accomplished. The main body of this part (xiii. 15-xiv. 5; xvii. 1-xxii. 31) is in its present form almost entirely due to P.

In regard to details, xiii. 2-6 (now D) expresses the view that the conquest is an incompletely finished task. The land is to be possessed in the south-west and the Lebanon. Two sources deal with the inheritance of the east Jordan tribes in terms which are—(a) general (xiii. 6-12, D); and (b) precise (v. 13-32, P). The latter stands between the views of P and those of J, and everything is left open, the interest taken in these tribes, cf. for (a) i. 12-18; Deut. iii. 12-22, and the sequel in Joshua xii. 1-6; and for (b) xii. 9 seq.; Num. xxxii. P's account of the division opens with an introductory notice of the western tribes (xii. 1-5), in which Deut. (xii. 2-6) may have been at least considered as a preliminary to prepare the complete work which Moses had begun (xiv. 1-5). It opens with Judah, its borders (xiv. 1-12) and cities (rv. 20-62), and the cities, which are in the south-west and the border tribes, Ephraim (xvii. 4-9, contrast details in rv. 1-3) and Manasseh (xvii. 10-14, cf. Num. xxxv. 30-32, xxvii. 11-15; P). There is now in the narrative (xiv. 2-10, source uncertain); seven tribes have not yet received an inheritance, and and the cities of Gilead, where each branch is given to the men from each tribe to walk through the land—excluding the territory of Judah and Joseph—and to bring a description of it to him, after which they divide it among them by lot. P now resumes with an account of the borders and cities of Benjamin (xvii. 11-28), Simeon, Zebulun, Issachar, Asher, Naphtali and Dan (xix. on v. 47, see below); and, after the subscription (xix. 51), concludes with the institution of the cities of refuge (xx. 1-20, cf. Num. xxxiv.); and of the Levitical cities (xxi. 23, the earlier brief notice, xii. 33, 34). Chapter xx., belonging to the Predonation, has certain points of contact with Deut. xix., which is very important to observe, are wanting in the Septuagint; and hence loses all its force in the Latin; and in the Septuagint contains matter most of which is now given by P in xix. 29 seq. Two narratives describe the dismissal of the trans-Jordanic tribes after their co-operation in the conquest, viz. xvi. 1-6 (D, cf. xiv. 9 seq., in which the present is paralleled, and the portion of the elevation of the altar (v. 34. Gilead 7; cf. Gen. xxi. 47 seq.), is apparently a late re-writing of some now obsolete incident to emphasize the unity of Judges. P's account of the distribution of the land among the nine and a half tribes by lot (from xiv. 1-5 to xix. 51) appears to have been on the lines laid down in Num. xxxiv. (P). The scene, according to xix. 1, is Shiloh, and this verse, which does not belong to the context, should apparently precede P's narrative in xiv. 1. But of the occupation of Shiloh, the famous Ephraimitic sanctuary and the seat of the ark, we have no information. The older source, however, that Judges and the two Joseph tribes have acquired their territory; the remaining seven are blamed for their indolence (xviii. 2-10, see above), and receive their lot conjointly at the camp at Shiloh. But a distinct location in an attempt to harmonize with xvi. 1, Gilead should probably be restored. The tribe of Dan is described by P by xxi. 43 seq. (above), and may have been preceded originally by xii. 7 (where read: inheritance for the seven tribes); in its present form, which is to be restored to the west coast, another of the cities of Dan (P). Another account of the cities of Joseph and Judah can be traced here and there; e.g. in xvi. 6 seq., (where Caleb receives Hebron as its inheritance and the land he took at war); and xvi. 18-19, which receives an account of its lot (P); but perhaps the account of the ownership and possession in the latter narratives, they exist only in fragmentary form and are chiefly recognizable by their standpoint. They are characterized by the statement that the tribe of Dan (i) was only a partial one, and one which was never the work of a single man in its possession, and (ii) that the
entirely to individual or tribal achievements. This view can be traced to the introduction of Judges vii. 12 (cf. the parallel Judges i. 21 in contrast to Judges ii. 6); xvi. 10 (Judges xx. 31); xxvii. 11-13 (Judges i. 27 seq.), and in the references to tribal or family exploits: Judges xv. 13-19, xix. 47 (cf. Judges i. 34 seq.; xviii. i.). Two closing addresses are ascribed to Joshua, one an exhortation similar to the homilies in secondary portions of Deuteronomy (xxiii. 7; cf. Moses in Deut. xxviii. seq.), and Samuel's last address in 1 Kings x. 36 seq. In the absence of further control, it is possible that Joshua assembles the tribes at Shechem (Shiloh, in the Septuagint) and passes under review the history of Israel from the days of heathenism (before Abraham was brought into Canaan) down through the oppression in Egypt, the exodus, the conquest in East Jordan and the occupation of Canaan. A few otherwise unknown details are to be found (xxiv. 2, 11 seq. 14). The address (which is extremely important for its representation of the religious conditions) is made the occasion for a solemn covenant whereby the people agree to cleave to Yahweh alone. This is commemorated by the erection of a stone under the oak by the sanctuary of Yahweh (for the tree with its sacred pillar, see Gen. xxxv. 4; Judges ix. 6). The people are then dismissed, and the book closes in ordinary narrative style with the death of Joshua and his burial in his inheritance at Timnath-serah in Mt Ephraim (cf. xix. 49 seq.); the burial of Joseph in Shechem; and the death and burial of Eleazar the son of Aaron in the "hill of Phinehas."

Chapter xxiv. presupposes the complete subjection of the Canaanites and is of a late prophetic stamp. Some signs of amplification (e.g. the expansion of the war of Amalekites in Judges ii. 6) are noticeable. It is believed that it is a Deuteronomic compendium, but on the other hand, evidently distinct from the author of xxiii. But elsewhere there are traces of secondary Deuteronomic expansion and of internal incongruities in Deuteronomic narratives; contrast xiv. 6-15 with Joshua's enumeration of the "Anakim" in xii. 21 seq.; the use of this name with the "Philistines" of xii. 2 (see PHILISTINES), or the conquests in xii. 16-22 with the names in x. 36-43. All these passages are now due to D; but not only is Deuteronomic itself composite, a twofold redaction can be traced in Judges, Samuel and Kings, thus involving the deeper literary problems of Joshua with the historical books generally. Both Joshua xxii. and xxiv. are closely connected with the very contemporary age, and during the critical period of the "judges" in Judges ii. 6 seq., and ii. 6-9 actually resume Joshua xxiv. 28 seq., while the Septuagint appends to the close of Joshua the beginning of the story of Ehud (Judges iii. 12 seq.). Both Judges i.-ii.5 and chap. xvii.-xx. are based on a text-hitherto confused, and they represent conditions analogous to the older notices imbedded in the later work of P (Judges i. 21, xix. 10-12, cf. Joshua xv. 63; see JUDGES ad fin.). Moreover, P in its turn shows especial definite indications of different periods and standpoint, and the fluid state of the book at a late age is shown by the presence of Deuteronomic elements in Joshua xx., not found in the Septuagint, and by the numerous and often striking readings which the latter recursion presents.

Value of the Book.—The value of the book of Joshua is primarily religious; its fervency, its conviction of the destiny of Israel and its incitation of the unity and greatness of the God of Israel give expression to the philosophy of Israelite historians. As an historical record its value must depend upon a careful criticism of its contents in the light of biblical history and external information. Its description of the conquest of Canaan comes from an age when the event was a shadow of the past. It is an ideal view of the manner in which a divinely appointed leader guided a united people into the promised land of their ancestors. The book, now brief and summary in character, naturally died leaving the people in quiet possession of their new inheritance (xii. 23; xxiv. 44 seq.; xxiii. i.). On the other hand, the earlier inhabitants were not finally subdued until Solomon's reign (1 Kings ix. 20); Jerusalem was taken by David from the Jebusites (2 Sam. v.); and several sites in its neighbourhood, together with important fortresses like Gezer, Megiddo and Taanach, were not held by Israel at the first. There are traces of other conflicting traditions representing independent tribal efforts which were not successful, and the Israelites are even said to live in the midst of Canaanites, intermarrying with them and adopting their cult (Judges i.-iii. 6). From a careful consideration of all the evidence, both internal and external, biblical critics can be now almost unanimous that the more finished picture of the Israelite invasion and its achieved conquest is best accepted as a historical record for the age. It accords with this that the elaborate tribal lists and boundaries prove to be of greater value for the geography than for the history of Palestine, and the attempts to use them as evidence for the early history of Israel have involved numerous additional difficulties and confusion.3

The book of Joshua has ascribed to one man conquests which are not confirmed by subsequent history. The capture of Bethel, implied rather than described in Joshua viii., is elsewhere the work of theJoseph tribe (Jug. i. 22 seq.; cf. the.devastation in the conquest of Jericho, Joshua vi. 25). Joshua's victory in north Palestine has its parallel in Judges iv. at another period (see DEBORAH, and Adoni-zedek of Jerusalem (Joshua x.) can scarcely be severed from the Adoni-bezek taken by the tribes of Judah and Simeon (Judges i. 5-7). The prominence of Joshua as military and religious leader, and especially his connexion with Shechem and Shiloh, have suggested that he was a hero of the Joseph tribes of central Palestine (viz. Ephraim and Manasseh). Moreover, the traditions in Joshua viii. 30-ix. 2, and Deut. xxvii. 1-2, have placed the event of the crossing of the Jordan. This implies that Israel (like Jacob in Gen. xxxii.) crossed by the Jabbok, and in fact the Wadi Fara provides an easy road to Shechem, to the south-east of which lies Juleijil; and while this is the Gilgal of Deut. xi. 30, the battles at Jericho and Ai (Joshua ii. seq.) occur naturally after the encampment at the southern Gilgal (near Jericho). The alternative view (see especially STADE, Gesch. Isr. i. 133 seq.) connects itself partly with the ancestor of all the tribes (Jacob, i.e. Israel), and partly with the eponym of the Joseph tribes being in possession of the river when spent around Shechem, the removal of whose bones from Egypt must have had a prominent place in the traditions of the tribes concerned (Gen. i. 25; Exod. xiii. 19; Joshua xxiv. 32). According to one view (Stade, Wellhausen, Guthrie, &c.) only the Joseph tribes were in Egypt, and separate tribal movements (see JUDAH) have been incorporated in the growth of the tradition; the probability that the specific traditions of the Joseph tribes have been excised or subdivided finds support in the manner in which the Judaean P has abridged and confused the tribal lists of Ephraim and Manasseh.

The serious character of the problems of early Israelite history can be appreciated from the fact that it has not been possible to present an adequate outline of the course of events; for a criticism of the most promiment hypotheses see CHEYNE, Eucy. Bib. art. "Tribe" (col. 5202 seq.); a new theory has been more recently advanced by E. MEYER (Die Israeliten u. ihre Nachbarstämme, 1966). But Joshua as a tribal hero does not belong to the earliest phase in the surviving traditions. He has no place in the oldest surviving narratives of the exodus (Wellhausen, Steueraugel); and only later sources add him to Caleb (Num. xiv. 30; the reference in Deut. i. 38 is part of an insertion), or regard him as the author of the Deuteronomic foundation of the Amalekites (Deut. iii. 21, 28). As for the conquest, Moses at the tent of meeting he appears to have made quite secondary passages (Exod. xxxiii. 7-11; Num. xi. 28). His defeat of the Amalekites is in a narrative (Exod. xvii. 8-16) which belongs more

1 The close relation between what may be called the Deuteronomic history (Joshua—Kings) and its introduction (the legal book of Deuteronomy) shows how difficult of the traditional date assigned to the latter.

2 G. F. MOORE (Ency. Bib., col. 2608, note 2) draws attention to the instructive parallel furnished by the Greek legends of the Trojan invasion of the Peloponnesus (the "return" of the Heracles), the partition of the land by lot, &c.,
naturally to the wilderness of Shur, and it associates him with traditions of a movement direct into south Palestine which finds its counterpart when the clan Caleb (g.n.) is artificially treated as possessing its seats, with Joshua's permission. But points of resemblance between Joshua the invader and Saul the founder of the (north) Israelite monarchy gain in weight when the traditions of both recognize the inclusion or possession of Judah, and thus stand upon quite another plane as compared with those of David the founder of the Judeaean dynasty. Instead of rejecting the older stories of Saul to a framework it may be desirable to infer that there were radical divergences in the historical views of the past. Consequently, the parallels between Joshua and Jacob (see Steuernagel's Commentary, p. 150) are more significant when the occupation of central Palestine, already implied in the book of Joshua, is viewed in the light of Gen. xviii. 22, where Jacob as conqueror (cf. the very late form of the tradition in Jubilees xxxiv.) agrees with features in the patriarchal narratives which, in implying a settlement in Palestine, are entirely distinct from those which belong to the descent into Egypt (see especially, Meyer, op. cit. pp. 227 seq., 414 seq., 433; Luther, ib. 108 seq.). The elaborate account of the exodus gives the prevailing views which supersede other traditions of the origin both of the Israelites and of the worship of Yahweh (Gen. iv. 26). Several motives have influenced its growth, and the kernel—the revelation of Yahweh to Moses—has been developed until all the tribes of Israel are included and their history as a people now begins. The old traditions of conquest in central Palestine have similarly been extended, and have been adapted to the now familiar view of Israelite origins. It is this subordination of earlier tradition to other and more predominating representations which probably explains the intricacy of a book whose present text may not have been finally fixed until, as Dillmann held, as late as about 200 B.C.

BIBLIOGRAPHY.—See the comments of Dillmann, Steuernagel Holzinger (German), or the concise edition by H. W. Robinson in the Century Bible; also articles on "Joshua" by G. A. Smith, Hastings's Encyclopedia of Biblical, Theological, and Hebrews, i. 262 seq.; W. H. Bennett, in Haupt's Sacred Books of the Old Testament; Carpenter and Harford-Battersh, Comp. of Hexateuch, ch. xvii.; S. R. Driver, Lit. of the O. T. (8th ed., 1900). These give further bibliographical information, for which see also the articles on the books of the Pentateuch. (S. A. C.)

JOSUA THE STYLITE—JÓSIKA

JOSUA THE STYLITE, the reputed author of a chronicle which narrates the history of the war between the Greeks and Persians in 522–526, and which is one of the earliest and best historical documents preserved to us in Syriac. The work owes its preservation to having been incorporated in the third part of the history of pseudo-Dionysius of Tell-Mârê, and may probably have had a place in the second part of the Ecclesiastical History of John Malchus, whose work as Nau has shown pseudo-Dionysius copied all or most of the matter contained in his third part. The chronicle in question is anonymous, and Nau has shown that the note of a copyist, which was thought to assign it to the monk Joshua of Zokkān near Amīd, more probably refers to the compiler of the whole work in which it was incorporated. Anyhow the author was an eyewitness of many of the events which he describes, and must have been living at Edessa during the years when it suffered so severely from the Persian War. His view of events is everywhere characterized by his belief in the victory of Joshua, and as he penologizes Flavian II., the Chalcedonian patriarch of Antioch, in terms more than those in which he praises his great Monophysite contemporaries, Jacob of Sbrūkh and Philonous of Mahbog, he was probably an orthodox Catholic.

The chronicle was first made known by Assmann's abridged Latin version (B. O. i. 250–253) and was edited in 1876 by the abbe Martíns and (with an English translation) by W. Wright in 1882. After an elaborate apparatus to a friend—the "priest and abbot" Sernius—a brief recapitulation of events from the death of Julian in 363 and a fuller account of the reigns of the Persian kings Pērōz (437–444) and Balaš (448–484), the writer enters upon his main theme—the history of the disturbed relations between the Persian and Greek Empires from the beginning of the reign of Kavad I. (489–531), which culminated in the great war of 502–503, which led to the conclusion of peace near the end of 506. The author gives an annalistic account, with careful specification of dates, of the main events in Mesopotamia, the theatre of conflict—such as the siege and capture of Sura by Heraclius, which Perkinson (p. 502–503), their unsuccessful siege of Edessa (503, and the abortive attempt of the Greeks to recover Amid (504–505). The work was probably written a few years after the conclusion of the war. The style is graphic and straightforward, and it is evidently a manly work of instruction and of a simple, honest mind. (N. M.)

JOSIAH (Heb. yōbšiyyāḥā, perhaps "Yah [weh] supports"), in the Bible, the grandson of Manasseh, and king of Judah. He came to the throne at the age of eight, after the murder of his predecessor Amon. The circumstances of his minority are not recorded, nor is anything related of the Scyclan inroads which occurred in the latter half of the 7th century B.C., although some passages in the books of Jeremiah and Zephaniah are supposed to refer to the events. The storm which shook the external states was favourable to the peace of Judah; the Assyrian power was ruined by Chosroes, and that of the Chaldaeans had scarcely developed into an aggressive form. Samaria thus lay within the grasp of Josiah, who may have entertained hopes of forming an independent power of his own. Otherwise, it is not clear why we find him opposing himself to the Egyptian king Necho, since the assumption that he fought as an Assyrian vassal scarcely agrees with the profound reforming policy ascribed to him. At all events, at the battle of Megiddo he lost both his kingdom and his life (608 B.C.), and for a few years Judah was in the hands of Egypt (2 Kings xxii. 29 seq.). He enriched his capital with gifts of a different character, and his allusion to the dirge uttered by Jeremiah over his death (2 Chron. xxxvi. 20–25; 1 Esd. i. 32) represents the tradition which makes this prophet the author of the book of Lamentations.

The reign of Josiah is important for the biblical account of the great religious reforms which began in his eighteenth year, when he manifested interest in the repair of the Temple at Jerusalem. In the course of this work the high priest Hilkiah discovered a "law-book" which gave rise to the fullest concern. The reasons for believing that this roll was substantially identical with the book of Deuteronomy were already noted by Jeremiæus, niceby Philo, Theod., and others, and a careful examination shows that the character of the reformation which followed agrees in all its essential features with the prescriptions and exhortations of that book. (See DEUTERONOMY.) But the detailed records in 2 Kings xxii. seq. are evidently written under the influence of the reforms themselves, and are not contemporary (see KINGS, BOOK OF). They are further expanded, to agree with still later ideals, in 2 Chron. xxxiv. seq. The original roll was short enough to be read at least twice in a day (xxii. 8, 10), and hence only some portions of Deuteronomy (or of an allied preexistent) may be intended. Although the character of the reform throws remarkable light upon the condition of religion in Judah in the time of Josiah, it is to be observed that the writings of the contemporary prophets (Jeremiah, Ezekiel) make it very questionable whether the narratives are thoroughly trustworthy for the history of the king's measures. (See further JEWs, § 16.) (S. A. C.)

JÓSIKA, MIKLÓS [NICHOLAS], BARON (1794–1865), Hungarian novelist, was born on the 28th of April 1794 at Torda in Transylvania, of aristocratic and wealthy parents. After finishing the usual course of legal studies at Koloszvár (Klausenburg), he entered the army, joining a cavalry regiment, with which he subsequently took part in the Italian campaign. On the battlefield of Mincio (February 8, 1814) he was promoted to the grade of lieutenant. He served in the campaign against Napoleon, and was present at the entry of the Allied Troops into Paris (March 31, 1814). In 1818 Jósiška resigned his commission, returned to Hungary, and married his first wife 2 Or "Magdolos" (Herod. ii. 159), i.e. some "Migdal" (tower) of Judaea, not the Migdol of Exod. xiv. 2; Jer. xxiv. 1.

Elizabeth Kallai. The union proving an unhappy one, Jósića parted from his wife, settled on his estate at Szurdok in Transylvania, and devoted himself to agricultural and literary pursuits. Drawn into the sphere of politics, he took part in the memorable Transylvanian diet of 1834. About this time Jósića first began to attract attention as a writer of fiction. In 1836 his Abaš laid the foundation of his literary reputation. This novel gives a vivid picture of Transylvania in the time of Sigismund Bátori. Jósića was soon afterwards elected member of the Hungarian Academy of Sciences and of the Kiskunlady Society of the latter he became, in 1841, director, and in 1842 vice-president. In 1847 he appeared at the Transylvanian diet as second deputy for the county of Sólnok, and zealously supported the movement for the union of Transylvania with Hungary proper. In the same year he was converted to Protestantism, was formally divorced from his wife, and married Baroness Julia Podmánčízky, herself a writer of considerable merit, with whom he lived happily until his death. So great was Jósića's literary activity that by the time of the revolution (1848) he had already produced about sixty volumes of romances and novels, besides numerous contributions to periodicals. Both as magistrate of the upper house of the Hungarian diet and by his writings Jósića aided the revolutionary movement, with which he was soon personally identified, being chosen one of the members of the committee of national defence. Consequently, after the capitulation at Világos (Aug. 13, 1849) he found it necessary to flee the country, and settled first at Dresden and then, in 1850, at Brussels, where he resumed his literary pursuits anonymously. In 1864 he removed to Dresden, in which city he died on the 27th of February 1865. The romances of Jósića, written somewhat after the style of Sir Walter Scott, are chiefly of an historical and social-political character, his materials being drawn almost entirely from the annals of his own country. Among his more important works may be specially mentioned, besides Abaš—The Poet Zrini (1843); The Last of the Bátori (1837); The Bohemians in Hungary (1839); Esther (1853); Francis Rákóczi II. (1861); and A Végérdut, a tale of the time of the Transylvanian prince Belchen Gábor, 1864. Many of Jósića's novels have been translated into German.

JOSIPPON, the name usually given to a popular chronicle of Jewish history from Adam to the age of Titus, attributed to an author Josippion or Joseph ben Gorion.1 The name, though at one time identified with that of the historian Josephus, is perhaps a corruption of Hesegippus, from whom (according to Trierer) the author derived much of his material. The chronicle was probably compiled in Hebrew early in the 10th century, by a Jewish native of south Italy. The first edition was printed in Mantua in 1476. Josippion subsequently appeared in many forms, one of the most popular being in Yiddish (Judaeo-German). Though the chronicle as a whole is legendary rather than historical, it is not unlikely that some good and even ancient sources were used by the first compiler, the Josippion known to us having passed through the hands of many interpolators. The book enjoyed much vogue in England. Peter Morvyn in 1538 translated an abbreviated version into English, and edition after edition was called for. Lucien Wolf has shown that the English translations of the Bible aroused so much interest in the Jews that there was a widespread desire to know more about them. This led to the composition of many editions of Josippion. The last was formed in 1865 in the chain of events which culminated in the readmission of the Jews to England by Cromwell. (I. A.)

JOSS, in the pidgin-English of the Chinese seaports, the name given to idols and deities. It is used adjectively in regard to many things connected with religious rites, such as "joss-house," a temple; "joss-stick," a stick which when burned gives forth a fragrant odour and is used as incense; "joss-paper," paper cut to resemble money (and sometimes with prayers written upon it) burned in funeral and other ceremonies. "Joss" is not a Chinese word, and is probably a corruption of Port. deos, god, applied by Portuguese navigators in the 16th century to the idols worshipped in the East Indies. The Dutch form is joosje (diminutive of joo), whence the Javanese dejo, and the English yes, later joss. The word seems to have been carried to China by English seamen from Batavia.

JOST, ISAAC MARKUS (1793-1866), Jewish historical writer, was born on the 22nd of February 1793 at Bernburg, and studied at the universities of Göttingen and Berlin. In Berlin he began to teach, and in 1835 received the appointment of upper master in the Jewish commercial school (called the Philanthropin) at Frankfort-on-the-Main. Here he remained until his death, on the 22nd of November 1866. The work by which he is chiefly known is Geschichte der Israeliten seit der Zeit der Moscobiter, in 9 vols. (1829-1840), which was afterwards supplemented by Neuere Geschichte der Israeliten von 1815-1845 (1840-1842), and Geschichte des Judentums und seiner Sekt (1857-1859). He also published an abridgment under the title Allgemeine Geschichte des israelitischen Volkes (1831-1832), and an edition of the Mishna with a German translation and notes (6 vols., 1832-1834). The Israelische Annalen were edited by him from 1839 to 1841, and he contributed extensively to periodicals.

See Zirndorf, Isaac Markus Jost and seine Freunde (Cincinnati, 1886).

JOTUNHEIM, or JOTUN FJELDE, a mountainous region of southern Norway, lying between Gudbrandsdal on the east and Jostedalsbrea and the head of the Sogne fjord on the west. Within a area of about 930 sq. m. it contains the highest mountain in the Scandinavian Peninsula—Galdhöpiggen (8399 ft.)—and several others but little inferior. Such are Glittertind or Gilrettin (8380), and Memurutind (7960), which face Galdhöpiggen across the northward-sloping Visdal; Knutrushulstind (7182) and several other peaks exceeding 7000 ft., to the south, between lakes Gjende and Bygdin, and Skagastöldstind (7723) in the west of the region, above the Utadal, the chief summit of the magnificent Horunger. The upper parts of the main valleys are of characteristic form, not ending in lofty mountain-walls but comparatively low, and bearing lakes. The name Jotunheim (giants' home) is a modern memorial of the mountain-dwelling giants of Norse fable; the alternative name Jotun Fjelle was the first bestowed on the region, when it was explored in 1820 by the geologist Balthasar Matthias Keilhau (1797-1858). In modern times the region has attracted mountaineers and many visitors accustomed to rough lodging and difficult travelling.

JUBERT, BARTHELEMY CATHERINE (1769-1799), French general, the son of an advocate, was born at Pont de Vaux (Ain) on the 14th of April 1769. In 1784 he ran away from school to enlist in the artillery, but was brought back and sent to study law at Lyons and Dijon. In 1791 he joined the volunteers of the Ain, and was elected by his comrades successively corporal and sergeant. In January 1792 he became sub-lieutenant, and in November lieutenant, having in the meantime made his first campaign with the army of Italy. In 1793 he distinguished himself by the brilliant defence of a redoubt at the Col di Tenda, with only thirty men against a battalion of the enemy. Wounded and made prisoner in this affair, Joubert was released on parole by the Austrian commander-in-chief, Devins, soon afterwards. In 1794 he was again actively engaged, and in 1795 he rendered such conspicuous service as to be made general of brigade. In the campaign of 1796 the young general commanded a brigade under Augereau, and soon attracted the special attention of Bonaparte, who caused him to be made a general of division in December, and repeatedly selected him for the command of important detachments. Thus he was in charge of the retaining force at the battle of Rivoli, and in the campaign of 1799

1 A prefect of Jerusalem of this name is mentioned by Josephus, Bell. Jud. ii. 20. 3.
JOUBERT, J.—JOUFFROY, J.

(invasion of Austria) he commanded the detached left wing of Bonaparte's army in Tirol, and fought his way through the mountains to rejoin his chief in Styria. He subsequently held various commands in Holland, on the Rhine and in Italy, where up to January 1799 he commanded in chief. Resigning the post in consequence of a dispute with the civil authorities, Joubert returned to France and married (June) Mlle de Montholon. But he was almost immediately summoned to the field again. He took over the command in Italy from Moreau about the middle of July, but he persuaded his predecessor to remain at the front and was largely guided by his advice. The odds against the French troops in the disastrous campaign of 1799 (see FRENCH REVOLUTIONARY WARS) were too heavy. Joubert and Moreau were both in the field called to give battle by their great antagonist, Suworov. The battle of Novi was disastrous to the French army, not merely because it was a defeat, but above all because Joubert himself was amongst the first to fall (Aug. 15, 1799). Joubert died before it could be shown whether his genius was of the first rank, but he was at any rate marked out as a future great captain by the greatest captain of all ages, and his countrymen intuitively associated him with Hoche and Marceau as a great leader whose early death disappointed their highest hopes. After the battle his remains were brought to Toulon and buried in Fontaine Sainte-Beuve, where the symposium of him was made to his memory by a ceremony of public mourning (Sept. 16). A monument to Joubert at Bourg was raised by order of Louis XVIII., but another memorial was afterwards erected at Pont de Vaux.

See Guibert, Notice sur la vie de B. C. Joubert: Chevrier, Le Général Joubert d'après sa correspondance (2nd ed. 1884).

JOUBERT, JOSEPH (1754–1824), French moralist, was born at Montignac (Corrèze) on the 6th of May 1754. After completing his studies at Toulouse he spent some years there as a teacher. His delicate health proved unequal to the task, and after two years spent at home in study Joubert went to Paris at the beginning of 1778. He allied himself with the chiefs of the philosophic party, especially with Diderot, of whom he was in some sort a disciple, but his closest friendship was with the abbé de Fontanes. In 1790 he was recalled to his native place to act as juge de paix, and carried out the duties of his office with great fidelity. He had made the acquaintance of Mme de Beaumont in a Burgundian cottage where she had taken refuge from the Terror, and it was under her inspiration that Joubert's genius was at its best. The atmosphere of serenity and affection with which she surrounded him seemed necessary to the development of what Saint-Beuve calls his "esprit allé, ami du ciel et des hauteurs." Her death in 1803 was a great blow to him, and his literary activity, never great, declined from that time. In 1809, at the solicitation of Joseph de Bonald, he was made an inspector-general of education, and his professional duties practically absorbed his interests during the rest of his life. He died on the 3rd of May 1826. His manuscripts were entrusted by his widow to Chateaubriand, who published a selection of Pensées from them in 1838 for private circulation. A more complete edition was published by Joubert's nephew, Paul de Raynal, under the title Pensées, essais, maximes et correspondance (2 vols. 1842). A selection of letters addressed to Joubert was published in 1883. Joubert constantly strove after perfection, and the small quantity of his work was partly due to his desire to find adequate and luminous expression for his discriminating criticism of literature and morals.

If Joubert's readers in England are not numerous, he is well known to French students through the sympathetic essay devoted to him in Matthew Arnold's Essays in Criticism (1st series). See Sainte-Beuve, Censurex du lundi, vol. i.; Portraits littéraires, vol. ii.; and a notice by Paul de Raynal, prefixed to the edition of 1842.

JOUBERT, PETRUS JACOBUS (1834–1900), commandant-general of the South African Republic from 1880 to 1900, was born at Cango, in the district of Outshoorn, Cape Colony, on the 20th of January 1834, a descendant of a French Huguenot who fled to South Africa soon after the revocation of the Edict of Nantes by Louis XIV. Left an orphan at an early age, Joubert migrated to the Transvaal, where he settled in the Wakkerstroom district near Laing's Nek and the north-east angle of Natal. There he not only farmed with great success, but turned his attention to the study of the law. The esteem in which his shrewdness in both farming and legal affairs was held led to his election to the Volksraad as member for Wakkerstroom early in the sixties, Marthinus Pretorius being then in his second term of office as president. In 1870 Joubert was again elected, and the use to which he put his slender stock of legal knowledge secured him the appointment of attorney-general of the republic, while in 1875 he acted as president during the absence of T. F. Burgers in Europe. During the first ten years of the Transvaal, Joubert earned for himself the reputation of a consistent, unflinching Whig by refusing to hold office under the government, as Paul Kruger and other prominent Boers were doing. Instead of accepting the lucrative post offered him, he took a leading part in creating and directing the agitation which led to the war of 1880–1881, eventually becoming, as commandant-general of the Boer forces, a member of the triumvirate that administered the provisional Boer government, Joubert took a seat in the Volksraad in December 1880 at Heidelberg. He was in command of the Boer forces at Laing's Nek, Ingogo, and Majuba Hill, subsequently conducting the greater part of the campaign, and was present at the battle of Elandslaagte and later in the campaign in the Transvaal. After the surrender of the Transvaal, Joubert was appointed to the chair of his own creation—being the first man to hold the post of Professor of Political Science. He died at Pretoria on 3 April 1898, from cancer of the bladder. He was buried at Paardeberg, where he had in early life gained him the sobriquet of "Slim Piet," joined to a lack of determination and assertiveness that characterized his whole career, led him to act mainly on the defensive; and the strategically offensive movements of the Boer forces, such as Elandslaagte and Willow Grange, appear to have been neither planned nor executed by him. As the war went on, physical weakness led to Joubert's virtual retirement, and, though two days earlier he was still reported as being in supreme command, he died at Pretoria from peritonitis on the 28th of March 1900. Sir George White, the defender of Ladysmith, summed up Joubert's character when he called him "a sober and a gentleman, and a brave and honourable opponent."

JOUFFROY, JEAN (c. 1412–1473), French prelate and diplomatist, was born at Luxeuil (Haute-Saône). After entering the Benedictine order and teaching at the university of Paris from 1435 to 1438, he became almoner to Philip the Good, duke of Burgundy, who entrusted him with diplomatic missions in France, Italy, Portugal and Castile. Jouffroy was appointed Bishop of Luxeuil (1457), bishop of Arras (1453), and papal legate (1456). At this period Jouffroy took a prominent part in the diplomatic discussions brought him to the notice of the dauphin (afterwards Louis XI.). Jouffroy entered Louis's service, and obtained a cardinal's hat (1451), the bishopric of Albi (1462), and the abbacy of St Denis (1464). On several occasions he was sent to Rome to negotiate the abolition of the Pragmatic Sanction and to defend the interests of the Angevins at Naples. Attached by King Louis to the sieur de Beaupré in the expedition against John V., count
of Armagnac, Jouffroy was accused of taking the town of Lectoure by treachery, and of being a party to the murder of the count of Armagnac (1473). He died at Reuilly the same year.

JOUFFROY, THÉODORE SIMON (1706–1842), French philosopher, was born at Pontets, near Mouthe, department of Doubs. In his tenth year, his father, a tax-gatherer, sent him to an uncle at Pontarlier, under whom he commenced his classical studies. At Besançon his compositions attracted the attention of an inspector, who has described him (1814) in the normal school, Paris. He there came under the influence of Victor Cousin, and in 1817 he was appointed assistant professor of philosophy at the normal and Bourbon schools. Three years later, being thrown upon his own resources, he began a course of lectures in his own house, and formed literary connexions with Le Courier français, Le Globe, L'Encyclopédie moderne, and La Revue européenne. The variety of his pursuits at this time carried him over the whole field of ancient and modern literature. But he was chiefly attracted by the philosophical system represented by Reid and Simonton. They gave him the sense of a solution to the problem of substance supplied a more satisfactory analytic for him than the scepticism of Hume which reached him through a study of Kant. He thus threw in his lot with the Scottish philosophy, and his first dissertations are, in their leading position, adaptations from Reid's Inquiry. In 1826 he wrote a preface to a translation of the Moral Philosophy of Stewart, demonstrating the possibility of a scientific statement of the laws of consciousness; in 1828 he began a translation of the works of Reid, and in his preface estimated the influence of Scottish criticism upon philosophy, giving a biographical account of the movement from Hutcheson onwards. Next year he was returned to parliament by the arrondissement of Pontarlier; but the work of legislation was ill-suited to him. Yet he attended to his duties conscientiously, and ultimately broke his health in this discharge. In 1833 he was appointed professor of Greek and Roman philosophy at the college of France and a member of the Academy of Sciences; he then published the Mélanges philosophiques (4th ed. 1866; Eng. trans. G. Ripley, Boston, 1835 and 1838), a collection of fugitive papers in criticism and philosophy and history. In them is foreshadowed all that he afterwards worked out in metaphysics, psychology, ethics and aesthetics. He had already demonstrated in his prefaces the possibility of a philosophy apart from physiology, of the science of the phenomena of consciousness distinct from the perceptions of sense. He now classified the mental faculties, premising that they must not be confounded with capacities or properties of mind. They were, according to his analysis, personal will, primitive instincts, voluntary movement, natural and artificial signs, sensibility and the faculties of intellect; on this analytic he founded his scheme of the universe. In 1835 he published a Cours de droit naturel (4th ed. 1866), which, for precision of statement and logical coherence, is the most important of his works. From the conception of a universal order in the universe he reason to a Supreme Being, who has created it and who has conferred upon every man in harmony with it the aim of his existence, leading to his highest good. Good, he says, is the fulfilment of man's destiny, evil the thwarting of it. Every man being organized in a particular way has, of necessity, an aim, the fulfilment of which is good; and he has faculties for accomplishing it, directed by reason. The aim is good, however, only when reason guides it for the benefit of the majority. An absolute good would correspond to the conception of universal order, when actions are submitted, by the exercise of a sympathy working necessarily and intuitively to the idea of the universal order, the good has been reached, the true good, good in itself, absolute good. But he does not follow his idea into the details of human duty, though he passes in review fatalism, mysticism, pantheism, scepticism, egoism, sentimentalism and rationalism. In 1835 Jouffroy's health failed and he went to Italy, where he continued to translate the

Scottish philosophers. On his return he became librarian to the university, and took the chair of recent philosophy at the faculty of letters. He died in Paris on the 4th of February 1842. After his death were published Nouveaux mélanges philosophiques (3rd ed. 1872) and Cours d'esthétique (3rd ed. 1873). The former contributed nothing new to the system except a more emphatic statement of the distinction between psychology and physiology. The latter formulated his theory of beauty.

Jouffroy's claim to distinction rests upon his ability as an expositor of other men's ideas. He founded no system; he contributed nothing of importance to philosophical science; he initiated nothing which has survived him. But his enthusiasm for the language of pure exposition, made him a great international exponent of the transfusion of ideas. He stood between Scotland and France and Germany and France; and, though his expositions are vitiating by loose reading of the philosophers he interpreted, he did serviceable, even memorable work.

Jougs, Jogs, or Joggs (O. Fr. joug, from Lat. jugum, a yoke), an instrument of punishment formerly in use in Scotland, Holland and possibly other countries. It was an iron collar fastened by a short chain to a wall, often of the parish church, or to a tree. The collar was placed round the offender's neck and fastened by a padlock. The jougs was practically a pillory. It was used for ecclesiastical as well as civil offences. Examples may still be seen in Scotland.

JOULE, JAMES PRESCOTT (1818–1899), English physicist, was born on the 24th of December 1818, at Salford, near Manchester. Although he received some instruction from John Dalton in chemistry, most of his scientific knowledge was self-taught, and this was especially the case with regard to electricity and electro-magnetism, the subjects in which his earliest researches were carried out. From the first he appreciated the importance of accurate measurement, and all through his life the attainment of exact quantitative data was one of his chief considerations. At the age of nineteen he invented an electromagnetic engine, and in the course of examining its performance dissatisfaction with vague and arbitrary methods of specifying limits to electrical quantities caused him to adopt a convenient and scientific unit, which he set to be the amount of electricity required to decompose nine grains of water in one hour. In 1840 he was thus enabled to give a quantitative statement of the law according to which heat is produced in a conductor by the passage of an electric current, and in succeeding years he published a series of valuable researches on the agency of electricity in transformations of energy. One of these contained the first intimation of the achievement with which his name is most widely associated, for it was in a paper read before the British Association at Cork in 1845, and entitled "The Calorific Effects of Magneto-electricity and the Mechanical Value of Heat," that he expressed the conviction that whenever mechanical force is expended an exact equivalent of heat is always obtained. By rotating a small electro-magnet in water, between the poles of another magnet, and then measuring the heat developed in the water and other parts of the machine, the current induced in the coils, and the energy required to maintain rotation, he calculated that the quantity of heat capable of warming one pound of water one degree F. was equivalent to the mechanical force which could raise 838 lb. through the distance of one foot. At the same time he broke forward another determination based on the heating effects observable when water is forced through capillary tubes; the number obtained in this way was 770. A third method, depending on the observation of the heat evolved by the mechanical compression of air, was employed a year or two later, and yielded the number 798; and a fourth—the well-known frictional one of stirring water with a sort of paddle-wheel—yielded the result 890 (see Brit. Assoc. Report, 1843), though 781.5 was obtained by subsequent repetitions of the

See E. Jouffroy, Théodore Simon, Paris (1862).
experiment. In 1849 he presented to the Royal Society a memoir which, together with a history of the subject, contained details of a long series of determinations, the result of which was 772. A good many years later he was entrusted by the committee of the Royal Society on standards of electric resistance with the task of deducing the mechanical equivalent of heat from the thermal effects of electric currents. This inquiry yielded (in 1867) the result 783, and this Joule himself was inclined to regard as more accurate than his old determination by the frictional method; the latter, however, was repeated with every precaution, and again indicated 772-55 foot-pounds as the quantity of work that must be expended at sea-level in the latitude of Greenwich in order to raise the temperature of one pound of water, weighed at sea-level, from 68° to 75° Fahrenheit. The discrepancy was traced to an error which, not by Joule’s fault, vitiated the determination by the electrical method, for it was found that the standard ohm, as actually defined by the British Association committee and as used by him, was slightly smaller than was intended; when the necessary corrections were made the results of the two methods were almost precisely congruent, and thus the figure 772-55 was vindicated. In addition, numerous other researches stand to Joule’s credit—the work done in compressing gases and the thermal changes they undergo when forced under pressure through small apertures being the most celebrated. Herein lay the change of volume on solution, the change of temperature produced by the longitudinal extension and compression of solids, &c. It was during the experiments involved by the first of these inquiries that Joule was incidentally led to appreciate the value of surface condensation in increasing the efficiency of the steam engine. A new form of condenser was tested on the small engine employed, and the results it yielded formed the starting-point of a series of investigations which were aided by a special grant from the Royal Society, and were described in an elaborate memoir presented to it on the 12th of December 1860. His results, according to Kelvin, were extremely rapid and speciously to the present practical method of surface-condensation, one of the most important improvements of the steam engine, especially for marine use, since the days of James Watt. Joule died at Sale on the 11th of October 1889.

His scientific papers were collected and published by the Physical Society of London: the first volume, which appeared in 1884, contained the researches for which he was alone responsible, and the second, dated 1887, those which he carried out in association with other workers.

JOURDAN, JEAN BAPTISTE, Count (1762-1833), marshal of France, was born at Limoges on the 29th of April 1762, and in his boyhood was apprenticed to a silk merchant of Lyons. In 1776 he enlisted in a French regiment to serve in the American War of Independence, and after being invalidated in 1784 he married and set up in business at Limoges. At the outbreak of the revolutionary wars he volunteered, and as a subaltern took part in the first campaigns in the north of France. His rise was even more rapid than that of Hoche and Moreau. By 1793 he had become a general of division, and was selected by Carnot to succeed Houchard as commander-in-chief of the Army of the North; and on the 15th-16th of October 1793 he won the brilliant and important victory of Wattignies (see French Revolutionary Wars). Soon afterwards he became a “suspect,” the moderation of his political opinions and his misgivings as to the future conduct of the war being equally distasteful to the turbulent and enthusiastic Committee of Public Safety. Warned in time by his friend Carnot and by Barère, he avoided arrest and resumed his business as a silk-mercer in Limoges. He was soon recompensed, for in 1794 he was appointed commander-in-chief of the Army of Sambre-et-Meuse. After repeated attempts to force the passage of the Sambre he had failed and several severe general actions had been fought without result, Jourdan and his army were discouraged, but Carnot and the civil commissioners urged the general, even with threats, to a last effort, and this time he was successful not only in crossing the Sambre but in winning a brilliant victory at Fleurus (June 26, 1794), the consequence of which was the extension of the French sphere of influence to the Rhine, on which river he waged an indecisive campaign in 1795.

In 1796 his army formed the left wing of the advance into Bavaria. The whole of the French forces were ordered to advance on Vienna, Jourdan on the extreme left and Moreau in the centre by the Danube valley. Bonaparte on the right by Italy and Styria. The campaign began brilliantly, the Austrians under the Archduke Charles being driven back by Moreau and Jourdan almost to the Austrian frontier. But the archduke, slipping away from Moreau, threw his whole weight on Jourdan, who was defeated at Amberg and Würzburg, and forced over the Rhine after a severe rearguard action, which cost the life of Moreau. Moreau had to fall back in turn, and, apart from the victory of Stockach (March 25), and, disappeared and was a member of the court which tried Marshal Ney. He was made a count, a peer of France (1819), and governor of Grenoble (1816). In politics he was a prominent opponent of the royalist reactionaries and supported the revolution of 1830. After this event he held the portfolio of foreign affairs for a few days, and then became governor of the Invalides, where his last years were spent. Marshal Jourdan died on the 23rd of November 1833, and was buried in the Invalides.

He wrote Opérations de l'armée du Danube (1799); Mémoires pour servir à l'histoire sur la campagne de 1796 (1819); and unpublished personal memoirs.

JOURNAL (through Fr. from late Lat. diurnalis, daily), a daily record of events or business. A private journal is usually an elaborated diary. When applied to a newspaper or other periodical the word is strictly used of one published each day; but any publication issued at stated intervals, such as a magazine or the record of the transactions of a learned society, is commonly called a journal. The word “journalist” for one whose business is writing for the public press (see Newspapers) seems to be as old as the end of the 17th century.

Journals are particularly appealed to the record, day by day, of the business and proceedings of a public body. The journals of the British houses of parliament contain a public record of the business transacted day by day in either house. The record does not take note of speeches, though some of the earlier volumes contain references to them. The journals are a lengthened account written from the “votes and proceedings” (in the House of Lords called “minutes of the proceedings”), made day
by day by the assistant clerks, and printed on the responsibility of the clerk to the house, after submission to the "sub-
committee on the journals." In the Commons the journal is passed by the Speaker before publication. The journals of the House of Commons begin in the first year of the reign of Edward VI. (1547) and are complete, except for a short interval under Elizabeth. Those of the House of Lords date from the first year of Henry VIII. (1509). Before that date the proceedings in parliament were entered in the rolls of parliament, which extend from 1278 to 1503. The journals of the Lords are "records" in the judicial sense, those of the Commons are not (see Erskine May, *Parliamentary Practice*, 1906, pp. 201-202).

The term "journal" is used, in business, for a book in which an account of transactions is kept previous to a transfer to the ledger (see BOOK-KEEPING), and also as an equivalent to a ship's log, as a record of the daily run, observations, weather changes, &c. In mining, a journal is a record describing the various strata passed through in sinking a shaft. A particular use of the word is that, in machinery, for the parts of a shaft which are in contact with the bearings; the origin of this meaning, which is firmly established, has not been explained.

**JOURNEY** (through O. Fr. *jornee* or *journee*, mod. Fr. *journee*, from med. Lat. *diurnata*, Lat. *diurnus*, of or belonging to *diem*, day), properly that which occupies a day in its performance, and so a day's work, particularly a day's travel, and the distance covered by such, usually reckoned in the middle ages as twenty miles. The word is now used of travel covering a certain amount of distance or lasting a certain amount of time, frequently defined by qualifying words. "Journey" is usually applied to travel by land, as opposed to "voyage," travel by sea. The early use of "journey" for a day's work, or the amount produced by a day's work, is still found in glassmaking, and also at the British Mint, where a "journey" is taken as equivalent to the coinage of 15 lb of standard gold, 701 sovereigns, and of 60 lb of silver. The term "journeyman" also preserves the original significance of the word. It distinguishes a qualified workman or mechanic from an "apprentice" on the one hand and a "master" on the other, and is applied to one who is employed by another person to work at his trade or occupation at a day's wage.

**JOUVENET, JEAN** (1647-1717), French painter, born at Rouen, came of a family of artists, one of whom had taught Poussin. He early showed remarkable aptitude for his profession, and, on arriving in Paris, attracted the attention of Le Brun, by whom he was employed at Versailles, and under whose auspices, in 1675, he became a member of the Académie Royale, of which he was elected professor in 1681, and one of the perpetual rectors in 1707. The great mass of works that he executed, chiefly in Paris, many of which, including his celebrated Miraculous Draught of Fishes (engraved by Audran; also Landon, *Annales*, i. 42), are now in the Louvre, show his fertility in invention and execution, and also that he possessed in a high degree that general dignity of arrangement and style which distinguished the school of Le Brun. Jouvenet died on the 5th of April 1717, having been forced by paralysis during the last four years of his life to work with his left hand.

See Mém. inéd. acad. roy. de p. et de x., 1854, and D'Argenville, *Vies des peintres*.

**JOUY, VICTOR JOSEPH ETIENNE DE** (1764-1840), French dramatist, was born at Jouy, near Versailles, on the 12th of September 1764. At the age of eighteen he received a commission in the army, and sailed for South America in the company of the governor of Guiana. He returned almost immediately to France to complete his studies, and re-entered the service two years later. He was sent to India, where he met with many romantic adventures which were afterwards turned to literary account. On the outbreak of the Revolution he returned to France and served with distinction in the early campaigns, attaining the rank of adjutant-general. He drew suspicion on himself, however, by refusing to honour the toast of Marat, and had to fly for his life. At the fall of the Terror he resumed his commission but again fell under suspicion, being accused of unreasonable correspondence with the English envoy, James Harris, 1st earl of Malmsbury who had been sent to France to negotiate terms of peace. He was acquitted of this charge, but, weary of repeated attacks, resigned his position on the pretext of his numerous wounds. Jouy now turned his attention to literature, and produced in 1807 with immense success his opera *La vestale* (music by Spontini). The piece ran for a hundred nights, and was characterized by the Institute of France as the best lyric drama of the day. Other operas followed, but none obtained so great a success. He published in the *Gazette de France* a series of satirical sketches of Parisian life, collected under the title of *L'Ermité de la Chaussée d'Antin, ou observations sur les mœurs et les usages français au commencement du xixe siècle* (1812-1814, 5 vols.), which was warmly received. In 1821 his tragedy of Sylla gained a triumph due in part to the personal interest of Talma, who had studied the title rôle from Napoleon. Under the Restoration Jouy consistently fought for the cause of freedom, and if his work was overrated by his contemporaries, they were probably influenced by their respect for the author himself. He died in rooms set apart for his use in the palace of St Germain-en-Laye on the 4th of September 1846.

Out of the long list of his operas, tragedies and miscellaneous writings may be mentioned, *Fernand Cortes* (1809), opera, in collaboration with J. M. Armand and with E. G. Ophiol (1815); *Blaise* (1818); *Les Hermites en prison* (1823), written in collaboration with Antoine Jay, like himself a political prisoner; *Guillaume Tell* (1829), with Hippolyte Bie, for which Rossini composed the music; and also one of the founders of the *Biographie nouvelle des contemporains*.

**JOVELLANOS (or JOVE LLANOS), GASPAR MELCHOR DE** (1744-1811), Spanish statesman and author, was born at Gijon in Asturias, Spain, on the 5th of January 1744. Selecting law as his profession, he studied at Oviedo, Avila, and Alcalá, and in 1767 became criminal judge at Seville. His integrity and ability were rewarded in 1778 by a judgeship in Madrid, and in 1780 by appointment to the council of military orders. In the capital Jovellanos took a good place in the literary and scientific societies; for the society of friends of the country he wrote in 1787 his most valuable work, *Informe sobre un proyecto de ley agraria*. Involved in the disgrace of his friend, François Cabarrus, Jovellanos spent the years 1790 to 1797 in a sort of banishment at Gijon, engaged in literary work and in founding the Asturian institution for agricultural, industrial, social and educational reform throughout his native province. This institution continued his flourishing project up to the latest hours of his life. Summoned again to public life in 1797, Jovellanos refused the post of ambassador to Russia, but accepted that of minister of grace and justice, under the prince of the peace, whose attention had been directed to him by Godoy. Dismissed with Godoy's policy and conduct Jovellanos combined with his colleague Saavedra to procure his dismissal. Godoy returned to power in 1798; Jovellanos was again sent to Gijon, but in 1801 was thrown into prison in Majorca. The revolution of 1808, and the advance of the French into Spain, set him once more at liberty. Joseph Bonaparte, on mounting the Spanish throne, made Jovellanos the most brilliant offers; but the latter, sternly refusing them all, joined the patriotic party, became a member of the central junta, and contributed to reorganize the cortes. In 1809, when the junta was once more opposed, Jovellanos was imprisoned in its fall. To expose the conduct of the cortes, and to defend the junta and himself were the last labours of his pen. In 1811 he was enthusiastically welcomed to Gijon; but the approach of the French drove him forth again. The vessel in which he sailed was compelled by stress of weather to put in at Vega in Asturias, and there he died on the 27th of November 1811.

The poetical works of Jovellanos comprise a tragedy *El pelayo*, the comedy *El delinuente honrado*, satires, and miscellaneous pieces, including a translation of the first book of Paradise Lost. His pamphlets, especially those on political and legislative economy, constitute his real title to literary fame. In them depth of thought and clear-sighted sagacity are couched in a certain Ciceronian
JOVELLAR Y SOLER—JOVIVIUS

elegance and classical purity of style. Besides the *Ley agraria* he wrote *Elegiae*; various political and other essays; and *Memorias políticas* (1838), a work in Spanish, translated into French.

An edition of his complete works was published at Madrid (1831-1832) in 7 vols., and another at Barcelona (1839).

See *Noticias históricas de Don G. M. de Jovellanos* (1812), and Memorias, *sobre la vida del Señor ... Jovellanos*, by J. A. C. Bermudez (1814).

JOVELLAR Y SOLER, JOAQUIN (1816—1892), captain-general of Spain, was born at Palma de Mallorca, on the 28th of December 1816. At the close of his studies at the military academy he was appointed sub-lieutenant, went to Cuba as captain in 1842, returned to the War Office in 1851, was promoted major in 1853, and went to Morocco as private secretary to Marshal O'Donnell, who made him colonel in 1850 after Jovellar had been wounded at the battle of Wad el Ras. In 1863 Jovellar became a brigadier-general, in 1864 under-secretary for war; he was severely wounded in fighting the insurgents in the streets of Madrid, and rose to the rank of general of division in 1866.

Jovellar adhered to the revolution, and King Amadeus made him a lieutenant-general in 1872. He absented himself from Spain when the federal republic was proclaimed, and returned in the autumn of 1873, when Castelar sent him to Cuba as governor-general. In 1874 Jovellar came back to the Peninsula, and was in command of the Army of the Centre against the Carlists when Marshal Campos went to Sagunto to proclaim Alfonso XII. General Jovellar took command of the Carlist army in Spain, under Carles, who sent him to Cuba again as governor-general, where he remained until the 18th of June 1878, when the ten years' insurrection closed with the peace of Zaujon. Alfonso XII. made him a captain-general, president of the council, life-senator, and governor-general of the Philippines. Jovellar died in Madrid on the 17th of April 1892.

JOVIAN (Flavius jovianus) (c. 327—364), Roman emperor from June 363 to February 364, was born at Singidunum in Moesia about 328. As captain of the imperial bodyguard in 350, he gained the favour of the empress Justina and was subsequently appointed prefect of Constantinople, and on the day after that emperor's death, when the aged Sallust, prefect of the East, declined the purple, the choice of the army fell upon Jovian. His election caused considerable surprise, and it is suggested by Ammianus Marcellinus that he was wrongly identified with another Jovian, chief notary, whose name also had been put forward, or that, during the acclamations, the soldiers mistook the name Jovianus for Julianus, and imagined that the latter had recovered from his illness. Jovian at once continued the retreat begun by Julian, and, continually harassed by the Persians, succeeded in reaching the banks of the Tigris, where a humiliating treaty was concluded with the Persian king, Shapur II. (q.v.). Five provinces which had been conquered by Galerius in 289 were surrendered, together with Nisibis and other cities. The Romans also gave up all their interests in the kingdom of Armenia, and abandoned its Christian prince Arsaces to the Persians. During his return to Constantinople Jovian was found dead in his bed at Hadastana, halfway between Ancya and Nicaca. A surfeit of mushrooms or the fumes of a charcoal fire have been assigned as the cause of death. Under Jovian, Christianity was established as the state religion, and the Labarum of Constantine again became the standard of the army.

The statement that he issued an edict of toleration, to the effect that, while the exercise of magical rites would be severely punished, his subjects should enjoy full liberty of conscience, rests on insufficient evidence. Jovian entertained a great regard for Arians, whom he reinstated on the archiepiscopal throne, desiring him to draw up a statement of the Catholic faith. In *Syriac literature* Jovian became the hero of a Christian romance (G. Hoffmann, *Julianus der Abhorringer*, 1880).

For the relations of Rome and Persia see *Persia: Ancient History*.

JOVINIANUS, or Jovianus, a Roman monk of heterodox views, who flourished during the latter half of the 4th century. All our knowledge of him is derived from a passionately hostile polemic of Jerome (*Adv. Jovinianum, Libri II.*), written at Bethlehem in 393, and without any personal acquaintance with the man assailed. According to this authority Jovianus was a Roman of humble birth. His life was an ascetic, and he possessed a good acquaintance with the Bible, and was the author of several minor works, but, undergoing an heretical change of view, afterwards became a self-indulgent Epicurean and unrefined sensualist.

The views which excited this denunciation were mainly these:

1. Jovianus held that in point of merit, so far as their domestic state was concerned, virgins, widows and married persons who had been baptized into Christ were on a precisely equal footing;

2. those who with full faith have been regenerated in baptism cannot be overcome (or, according to others, not overthrown, tempted) by the devil;

3. to abstain from meats is not more praiseworthy than thankfully to enjoy them;

4. all who have preserved their baptismal grace shall receive the same reward in the kingdom of heaven.

Jovianus thus indicates a natural and vigorous reaction against the exaggerated asceticism of the 4th century, a protest shared by Helvidius and Vigilantius. He was condemned by a Roman synod under Bishop Siricius in 395, and afterwards excommunicated by another at Milan under the presidency of Ambrose.

The year of his death is unknown, but he is referred to as no longer alive in Jerome's *Contra Vigilantianum* (435).

Jovinianus (or Jovianus, as he was named by Jerome), an Italian historian and biographer, was born of an ancient and noble family at Como on the 19th of April 1483. His father died when he was a child, and Giovio owed his education to his brother Benedetto. After studying the humanities, he applied himself to medicine and philosophy at his brother's request. He was Pomponazzi's pupil at Padua; and afterwards he took a medical degree in the university of Pavia.

He exercised the medical profession in Rome, but the attraction of literature proved irresistible for Giovio, and he was bent upon becoming the historian of his age. He presented a portion of his history to Leo X., who read the MS., and pronounced it superior in elegance to anything since Livy. Thus encouraged, Giovio took up his residence in Rome, and attached himself to Cardinal Giulio de' Medici, the pope's nephew. The next pope, Adrian VI., gave him a canonry in Como, on the condition, it is said, that Giovio should mention him with honour in his history. This patronage from a pontiff who was averse from the current tone of Italian humanism proves that Giovio at this period passed for a man of sound learning and sober manners. After Adrian's death, Giulio de' Medici became pope as Clement VII. and assigned him chambers in the Vatican, with maintenance and the rank of a canon at the Lateran. In addition to other benefits, he finally, in 1528, bestowed on him the bishopric of Nocera. Giovio had now become in a special sense dependent on the Medici. He was employed by that family on several missions—as when he accompanied Ippolito to Bologna on the occasion of Charles V.'s coronation, and Caterina to Marseilles before her marriage to the duke of Orleans.

During the siege of Rome in 1527 he attended Clement in his flight from the Vatican. While crossing the bridge which connected the palace with the castle of S. Angelo, Giovio threw his mantle over the pope's shoulders in order to disguise his master.

In the sack he suffered a serious pecuniary and literary loss, if we may credit his own statement. The story runs that he deposited the MS. of his history, together with some silver, in a box at S. Maria Sopra Minerva for safety. This box was discovered by two Spaniards, one of whom secured the silver, while the other, named Herrera, knowing who Giovio was, preferred to hold the MSS. for ransom. Herrera was so careless, however, as to throw away the sheets he found in paper, reserving only that portion of the work which was transcribed on parchment. This he subsequently sold to Giovio in exchange for a bundle at Cordova, which Clement VII. conceded to the Spaniard. Six books of the history were lost in this transaction. Giovio contented himself with indicating their substance in a summary. Perhaps he was not unwilling that his work should resemble that of Livy, even in its imperfection. But

---

1 See, more fully, Harnack, *Hist. of Dogma*, v. 57.
doubt rests upon the whole of this story. Apostolos Zeno affirms that in the middle of the last century three of the missing books turned up among family papers in the possession of Count Giov. Batt. Giovio, who wrote a panegyric on his ancestor. It is therefore not certain whether, as is generally believed, he had taken an active part in the affair, but he preferred to withhold from publication those portions which might have involved him in difficulties with living persons of importance. The omissions were afterwards made good by Currut Mariniello in the fourth edition, supposed to have been compiled by himself, but Mariniello was the author of these additions is not known.

After Clemen’s death Giovio found himself out of favour with the next pope, Paul III. The failure of his career is usually ascribed to the irregularity of the life he led in the literary society of Rome. We may also remember that Paul had special causes for animosity against the Medici, whose servant Giovio had been. Despairing of a cardinal’s hat, Giovio retired to his villa on the lake of Como, where he spent the winter, and wrote the Roman Letters, donations and benefits in affording his villa with curiosities, antiquities and pictures, including a very important collection of portraits of famous soldiers and men of letters, now almost entirely dispersed. He died upon a visit to Florence in 1552.

Giovio’s principal work was the History of His Own Times, from the invasion of Charles VIII. to the year 1547. It was divided into two parts, containing altogether forty-five books. Of these, books v. vii. and viii. were never written. Giovio supplied the want of the latter six books by his lives of Leo, Adrian II., Adrian III., and Alexander III., and several other persons of importance. But he alleged that the history of that period was too painful to be written in full. His first published work, printed in 1532, is entitled Raccolta di vita e dell’ amore romanzi, in which his removal to Como he produced a valuable series of biographies, entitled Eliaq graciar illustram. They commemorate men distinguished for letters and arms, selected from all periods, and are said to have been written in illustration of portraits collected for the museum of his villa at Como. Besides these books, we may mention a biographical history of the Visconti, lords of Milan; an essay on mottoes and badges; a discourse on the statues at Como; a large collection of letters by the emperors of the East and Turkey; a treatise on the art of love; and several other miscellaneous writings. Among these, and the greater part of his other miscellaneous productions, is a long treatise on the restoration of Italian and Venetian antiquities and MSS. The name of Giovio was highly esteemed in his time, and his History was translated into English, French, and Flemish by Sir Thomas More, Robert Southwell, and others.

Giovio preferred Latin in the composition of his more important works. Though contemporary with Machiavelli, Guicciardini and Varchi, he adhered to humanistic usage, and cared more for the Latin than for the matter of his histories. His style is fluent and sonorous rather than pointed or grave. Partly owing to the rhetorical defects inherent in this choice of Latin, when Italian had gained the day, but more to his own untutored worth and cheerful: character, Giovio takes a lower rank as historian than the bulk and prestige of his writings would seem to warrant. He professed himself a flatterer and a lap-ponner, writing fulsome eulogies on the princes who paid him well, while he ignored or criticized those who proved less generous. The old story that he was kept by a golden key, and could not be moved, is an overstatement. Giovio was a man of letters, and in his capacity as a writer he had the faults of the older humanists, in combination with that literary cynicism which reached its height in Aretino; and therefore his histories and biographical essays are not to be used as authorities, without corroboration. Yet Giovio’s works, taken in their entirety and with proper reservation, have real value. To the student of Italy they yield a lively picture of the manners and the feeling of the times in which he lived, and in which he played no obscure part. They abound in vivid sketches, telling anecdotes, fugitive comments, which unite a certain charm of autobiographical romance with the worldly wisdom of an experienced courtier. A flavour of personality makes them not unpleasant reading. While we learn to despise and mistrust the man in Giovio, we appreciate the author. It would not be too far- fetched to describe him as a sort of 16th-century Horace Walpole.

BIBLIOGRAPHY.—The sources of Giovio’s biography are: his own works; Tiraboschi’s History of Italian Literature; Liuta’s Genealogy of Italian Historians; and Curtius’ History of Literature, della diocese Como, Modena (1784). Cicogna, in his Delle inscrizioni Venetian racolta (Venice, 1830), gives a list of Giovio’s works, from which the following notices are extracted: 1. Works in Latin: (1) Pauli Josii Historiarum temporis, ab anno 1494 ad an. 1497 (Florence 1540–1552), the same translated into Italian by L. Domenichi, and first published at Venice (1551), afterwards at Venice; (2) S. Hierosolimitan. ... Histoire de France et de Gali (Paris, 1548), translated by Domenichi (Florence, 1549); (3) Vita XII. vicecomitum Mediolani principum (Paris, 1549), translated by Domenichi (Venice, 1549); (4) Vita Sforiae curis. duces (Rome, 1549), translated by Domenichi (Florence, 1549), translated by Domenichi (ibid. 1551); (5) Vita magni Consalbi (ibid. 1549), translated by Domenichi (ibid. 1550); (5) Alfonsi Alessi, &c. (ibid. 1550), Italian translation by Giovanni Batt. Gelli (Florence, 1553); (5) Elogia virorum bellica virtute illustrantium (ibid. 1551), translated by Domenichi (ibid. 1554); (5) Elogia clavorum virorum, &c. (Venice, 1546) (these are biographies of men of letters), translated by Hippolita (Paris, 1548); (6) La vita e le legazioni Basili Magni principis Moscovi (Rome, 1525); (5) Descrizio Larii Lacuci (Venice, 1559); (12) Descrizio Britanniae, &c. (Venice, 1581); (12) Descrizio Gauliae, &c. (ibid. 1581). These works were published under the names of other writers, including those of Niccolò Chirico, and other stones; but the identity of the author is not questioned.

JOWETT, BENJAMIN (1817–1893), English scholar and theologian, master of Balliol College, Oxford, was born in Camb-berwell on the 15th of April 1817. His father was one of a Yorkshire family who, for three generations, had been supporters of the Evangelical movement in the Church of England. His mother was a Langhorne, in some way related to the poet and translator of Plutarch. At twelve the boy was placed on the foundation of St Paul’s School, and was not, however, at St Paul’s until in his nineteenth year he obtained an open scholarship at Balliol. In 1838 he gained a fellowship, and graduated with first-class honours in 1839. Brought up amongst pious Evangelicals, he came to Oxford at the height of the Tractarian movement, and through the friendship of W. G. Ward was drawn for a time in the direction of High Anglicanism; but a stronger and more lasting influence was that of the Arnold school, represented by A. P. Stanley. Jowett was thus led to concentrate his attention on theology, and in the summers of 1845 and 1846, spent in Germany with Stanley, he became an eager student of German language and special literature. He never lost sight of the period he was most impressed by those of F. C. Baur. But he never ceased to exercise an independent judgment, and his work on St Paul, which appeared in 1845, was the result of much original reflection and inquiry. He was appointed to the Greek professorship in the autumn of that year. He had been a tutor of Balliol and a clergyman since 1842, and had devoted himself to the work of tuition with unexampled zeal. His pupils became his friends for life. He discerned their capabilities, studied their characters, and sought to remedy their defects by friendly and searching criticism. Like another Socrates, he taught them to know themselves, repressing vanity, encouraging the despondent, and attaching all alike by his unobtrusive sympathy. This work gradually made a strong impression, and those who cared for Oxford began to speak of him as “the great tutor.” As early as 1839 Stanley had joined with Tait, the future archbishop, in advocating certain university reforms. From 1846 onwards Jowett threw himself into this movement, which in 1848 became general amongst the younger and more thoughtful fellows, until it took effect in the commission of 1850 and the act of 1854. An educational reform, the opening of the lecture rooms to competition, took place at the same time, and Jowett was one of the commission. He had two brothers who served and died in India, and he never ceased to take a deep and practical interest in Indian affairs. A great disappointment, his repulse for the mastership of Balliol, also in 1854, appears to have roused him into the completion of his book on The Epistles of St Paul. This work, described by one of his friends as “a miracle of boldness,” is full of originality and suggestions, but its publication
awakened against him a storm of theological prejudice, which followed him more or less through life. Instead of yielding to this, he joined with Henry Bristowe Wilson and Rowland Williams, who had been similarly attacked, in the production of the volume known as Essays and Reviews. This appeared in 1860 and gave rise to a strange outbreak of fanaticism. Jowett's loyalty to those who were persevering in the acceptance of his views was characteristic than his persistent silence while the augmentation of his salary as Greek professor was withheld. This petty persecution continued until 1865, when E. A. Freeman and Charles Elton discovered by historical research that a breach of the conditions of the professorship had occurred, and Christ Church raised the endowment from £40 a year to £500. Meanwhile Jowett's influence at Oxford had steadily increased. It culminated in 1864, when the country clergy, provoked by the final acquittal of the essayists, had voted in convention against the endowment of the Greek chair. Jowett's pupils, who were now drawn from the university at large, supported him with the enthusiasm which young men feel for the victim of injustice. In the midst of other labours Jowett had been quietly exerting his influence so as to conciliate all shades of liberal opinion, and bring them to bear upon the abolition of the theological test, which was still required for the M.A. and other degrees, and for university and college offices. He spoke at an important meeting upon this question in London on the 10th of June 1864, which laid the ground for the University Tests Act of 1871. In connection with the Greek professorship Jowett had undertaken a work on Plato which grew into a complete translation of the Dialogues with introductory essays. At this he laboured in vacation time for at least ten years. But his interest in theology had not abated, and his thoughts found an outlet in occasional preaching. The university pulpit, indeed, was closed to him, but several congregations in London delighted in his sermons, and from 1866 until the year of his death he preached annually in Westminster Abbey, where Stanley had become dean in 1863. Three volumes of sermons had been published before his death. The years 1865–1870 were occupied with assiduous labour. Amongst his pupils at Balliol were men destined to high positions in the state, whose parents had thus shown their confidence in the supposed heretic, and gratitude on this account was added to other motives for his unspiring efforts in tuition. In 1870, by an arrangement which he attributed to his friend Robert Lowe, afterwards Lord Sherbrooke (at that time a member of Gladstone's ministry), Scott was promoted to the deanery of Rochester and Jowett was elected to the vacant mastership by the fellows of Balliol. From the vantage-ground of this long-looked position the Plato was published in 1871. It had a great and well-deserved success. While scholars criticized particular renderings (and there were many small errors to be removed in subsequent editions), it was generally agreed that he had succeeded in making Plato an English classic.

If ever there was a beneficent despotism, it was Jowett's rule as master. Since 1866 his authority in Balliol had been really paramount, and various reforms in college had been due to his initiative. The opposing minority were now powerless, and the younger fellows who had been his pupils were more inclined to follow him than others would have been. There was no obstacle to the continued exercise of his firm and reasonable will. He still knew the undergraduates individually, and watched their progress with a vigilant eye. His influence in the university was less assured. The pulpit of St Mary's was no longer closed to him, but the success of Balliol in the schools gave rise to jealousy in other colleges, and old prejudices did not suddenly give way; while a new movement in favour of "the endowment of research" ran counter to his immediate purposes. Meanwhile, the tutorships in other colleges, and some of these fellowships also, were being filled with Balliol men, and Jowett's former pupils were prominent in both houses of parliament and at the bar. He continued the practice, which he had commenced in 1848, of taking with him a small party of undergraduates in vacation time, and working with them in one of his favourite haunts, at Askrigg in Wensleydale, or Tummel Bridge, or later at WestMalvern. The new hall (1876), the organ there, entirely his gift (1883), and the cricket ground (1880), remain as external monuments of the master's activity. Neither business nor the many claims of friendship interrupted literary work. The six or seven weeks of the long vacation, during which he had pupils with him, were in those employed in writing. The translation of Aristotle's Politics, the revision of Plato, and, above all, the translation of Thucydides many times revised, occupied several years. The edition of the Republic, undertaken in 1856, remained unfinished, but was continued with the help of Professor Lewis Campbell. Other literary schemes of larger scope and deeper interest were long in contemplation, but were not destined to take effect—an Essay on the Religions of the World, a Commentary on the Gospels, a Life of Christ, a volume on Moral Ideas. Such plans were frustrated, not only by his practical avocations, but by his determination to finish what he had begun, and the fastidious self-criticism which it took so long to satisfy. The book on Morals might, however, have been written but for the heavy burden of the vice-chancellorship, which he was induced to accept in 1882, by the hope, only partially fulfilled, of securing many improvements for the university. The vice-chancellor was ex officio a delegate of the press, where he hoped to effect much; and a plan for draining the Thames Valley, which he had now the power of initiating, was one on which his mind had dwelt for many years. The exhausting labours of the vice-chancellorship were followed by illness (1884); and after his retirement he abated the hope of producing any great original writing. His literary industry was thenceforth confined to his commentary on the Republic of Plato, and some essays on Aristotle which were to have formed a companion volume to the translation of the Politics. The essays which should have accompanied the translation of Thucydides were never written. Jowett, who never married, died on the 1st of October 1893. The funeral was one of the most impressive ever seen in Oxford. The pall-bearers were seven heads of colleges and the provost of Eton, all old pupils.

The theologian, tutor, university reformer, a great master of a college, Jowett's best claim to the remembrance of succeeding generations was his greatness as a moral teacher. Many of the most prominent Englishmen of the day were his pupils and owed much of what they were to his precept and example, his penetrative sympathy, his consistent criticism, and his unwearying friendship. Seldom have ideal aims been so steadily pursued with so clear a recognition of practical limitations. Jowett's theological work was transitional, and yet has an element of permanence. As has been said of another thinker, he was "one who delved deeply in the production of a few great ideas; these notions are being revised and called in question seek to put new life into theology by wider and more humane ideas." In earlier life he had been a zealous student of Kant and Hegel, and to the end he never ceased to cultivate the philosophic spirit; but he had little confidence in metaphysical systems, and sought rather to translate philosophy into the wisdom of life. As a classical scholar, his scorn of littlenesses sometimes led him into the neglect of minutiæ, but he had the higher merit of interpreting ideas. His place in literature rests really on the essays in his Plato. When their merits are fully recognized, it will be found that his worth, as a teacher of his countrymen, extends far beyond his own generation.

See The Life and Letters of Benjamin Jowett, by E. A. Abbott and Lewis Campbell (1897); Benjamin Jowett, by Lionel Tollemache (1898).

JOYEUSE, a small town in the department of Ardèche, France, situated on the Baume, a tributary of the Ardèche, is historically important as having been the seat of a noble French family which derived its name from it. The lordship of Joyeuse came, in the 15th century, into the possession of the house of Châteauneuf-Randon, and was made into a viscountship in 1433. Guillaume, viscount of Joyeuse, was bishop of Alet, but afterwards left the church, and became a marshal of France; he died in 1592. His eldest son Anne de Joyeuse (1561–1587), was one of the favourites of Henry III. of France, who created him duke
JOYEUSE ENTRÉE—JUANGS

and peer (1581), admiral of France (1582), and governor of Normandy (1586), and married him to Marguerite de Lorraine-Vaudémont, younger sister of the queen. He gained several successes against the Huguenots, but was recalled by court intrigues at an inopportune moment, and when he marched a second time against Henry of Navarre he was defeated and killed at Castillon. His third son, Guillaume de Joyeuse (d. 1615), cardinal and archbishop of Narbonne, Toulouse and Rouen, who brought about the reconciliation of Henry IV. with the pope; Henri, count of Bouchage, and later duke of Joyeuse, who first entered the army, then became a Capuchin under the name of Père Ange, left the church and became a marshal of France, and finally re-entered the church, dying in 1608; Antoine Scipion, grand prior of Toulouse in the order of the knights of Malta, who was one of the leaders in the League, and died in the retreat of Villelure (1592). Henriette Catherine de Joyeuse, daughter of Henri, married, on 17 Charles of Lorraine, duke of Guise, to whom she brought the duchy of Joyeuse. On the death of her great-grandson, François Joseph de Lorraine, duke of Guise, in 1675, without issue, the duchy of Joyeuse was declared extinct, but it was revived in 1714, in favour of Louis de Melun, prince of Épinoy.

JOYEUSE ENTRÉE, a famous charter of liberty granted to Brabant by Duke John III. in 1354. John summoned the representatives of the cities of the duchy to Louvain to announce to them the marriage of his daughter and heiress Jeanne of Brabant to Wenceslaus duke of Luxembourg, and he offered them liberal concessions in order to secure their assent to the change of dynasty. John III. died in 1355, and Wenceslaus and Jeanne on the occasion of their state entry into Brussels solemnly swore to observe all the provisions of the charter, which had been drawn up. From the occasion on which it was first proclaimed this charter has since been known in history as La Joyeuse Entrée. By this document the dukes of Brabant undertook to maintain the integrity of the duchy, and not to wage war, make treaties, or impose taxes without the consent of their subjects, as represented by the municipalities. All members of the duke's council were to be native-born Brabanters. This charter became the model for other provinces and the bulwark of the liberties of the Netherlands. Its provisions were modified from time to time, but remained practically unchanged from the reign of Charles V. onwards. The ill-advised attempt of the emperor Joseph II in his reforming zeal to abrogate the Joyeuse Entrée caused a revolt in Brabant, before which he had to yield.

See E. Poulet, La Joyeuse entrée, ou constitution Brabançonne (1862).

JUAN FERNANDEZ ISLANDS, a small group in the South Pacific Ocean, between 33° and 34° S., 80° W., belonging to Chile and included in the province of Valparaiso. The main island is called Mas-a-Tierra (Span. "more to land") to distinguish it from a smaller island, Mas-a-Fuera ("more to sea"). 100 m. farther west. Off the S.W. of Mas-a-Tierra lies the islet of Santa Clara. The aspect of Mas-a-Tierra is beautiful; only 13 m. in length by 4 in width, it consists of a series of precipitous rocks rudely piled into irregular blocks and pinnacles, and strongly contrasting with a rich vegetation. The highest of these, 3225 ft., is called, from its massive form, El Yunque (the avalanche); another island (called E. gelerites) on the north side is the only fair anchorage, and even there, from the great depth of water, there is some risk. A wide valley collecting streams from several of the ravines on the north side of the island streams into Cumberland Bay, and is partially enclosed and cultivated. The inhabitants number only some twenty.

The flora and fauna of Juan Fernandez are in most respects Chilean. There are few trees on the island, for most of the valuable indigenous trees have been practically exterminated, but on the sandhills, which the earlier navigators found one of the most valuable products of the island, Ferns are prominent among the flora, about one-third of which consists of endemic species. There are some 120 species of mammals, 150 species of birds, cattle, horses, asses and dogs, have been introduced, have multiplied, and in considerable numbers run wild. Sea-elephants and fur-seals were formerly plentiful. Of birds, a tyrant and a humming-bird (Enioterafantus fernandensis) are peculiar to the group, while another humming bird (E. gelerites), a thrush, and some birds of prey also occur in Chile. E. fernandensis has the peculiarity that the male is of a bright cinnamon colour, while the female is green. Both sexes agree in E. gelerites.

Juan Fernandez was discovered by a Spanish pilot of that name in 1563. Fernandez obtained from the Spanish government a grant of the islands, where he resided for some time, stocking them with goats and pigs. He soon, however, appears to have abandoned his possessions, which were afterwards for many years only visited occasionally by fishermen from the coasts of Chile and Peru. In 1566 Jacob le Maire and Willem Cornelis Schouten called at Juan Fernandez for water and fresh provisions. Pigs and goats were then abundant on the islands. In 1592, by 1700 Dampier called at Juan Fernandez and while there Captain Stradling of the "Cinque Porte" galley quarrelled with his men, forty-two of whom deserted but were afterwards taken on board by Dampier; five seamen, however, remained on shore. Other parties had previously colonized the islands but none had remained permanently. In October 1704 the "Cinque Porte" returned and found two of these men, the others having been apparently captured by the French. On this occasion Stradling quarrelled with Alexander Selkirk (q.v.), who, at his own request, became the island's most famous inhabitant for his adventures in a convalescent state, and inspired Daniel Defoe's Robinson Crusoe. Among later visits, that of Commodore Anson, in the "Centurion" (June 1741) led, on his return home, to a proposal to form an English settlement on Juan Fernandez; but the Spaniards, hearing that the matter had been mooted in England, gave orders to occupy the island, and it was garrisoned accordingly in 1750. Philip Carteret first observed this settlement in May 1767, and on account of the hostility of the Spaniards preferred to put in at Mas-a-Fuera. After the establishment of the independence of Chile at the beginning of the 19th century, Juan Fernandez was annexed into the possession of that country. On more than one occasion before 1840 Mas-a-Tierra was used as a state prison by the Chilean government.

JUANGS (Patua, literally "leaf-wearers"), a jungle tribe of Orrisa, India. They are found in only two of the tributary states, Dhenkanal and Keonjhar, most of them in the latter. They are estimated to amount in all to about 10,000. Their language belongs to the Munda family. They have no traditions which connect them with any other race, and they repudiate all connection with the Hokurs or the Santals, declaring themselves the aborigines. They speak the language, and the chief of the tribe is the Gonasika. In manners they are among the most primitive people of the world, representing the Stone age in our own day. They do not till the land, but live on the game they kill or on snakes and vermin. Their huts measure about 6 ft. by 8 ft., with very low doorways. The interior is divided into two compartments. In the first of these the father and all the females of a family huddle together; the second is used as a store-room. The boys have a separate hut at the entrance to the village, which serves as a guest-house and general assembly place where the musical instruments of the village are kept. Physically they are small and weak-looking, of a reddish-brown colour, with flat faces, broad noses with wide nostrils, large mouths and thick lips, the hair coarse and frizzy. The women until recently wore nothing but girdles of leaves, the men, a diminutive bandage of cloth. The Juangs declare that the river goddess, emerging for the first time from the Gonasika rock, surprised a party of naked Juangs dancing, and ordered them to wear leaves, with the threat that they should die if they ever gave up the custom. The Juangs' weapons are the bow and arrow and a primitive sling made entirely of cord. Their religion is a vague belief in the forest spirits. They offer fowls to the sun when in trouble and to the earth for a bountiful harvest. Polygamy is rare. They burn their dead and throw the ashes into any running stream. The most sacred oaths a Juang can take are those on an ant-hill or a tiger-skin.

See E. W. Dalton, Descriptive Ethnology of Bengal (1872).
JUAN MANUEL—JUAREZ

JUAN MANUEL, DON (1282–1349), infante of Castile, son of the infante Don Manuel and Beatriz of Savoy, and grandson of St. Ferdinand, was born at Escalonza on the 5th of May 1282. His father died in 1284, and the young prince was elided at the court of San Juan de la Peña, San Juan IV., with whom his precocious ability made him a favourite. In 1349 he was appointed adelantado of Murcia and in his fourteenth year served against the Moors at Granada. In 1349 he was entrusted by the queen-mother, Doña Maria de Molina, to conduct political negotiations with James II. of Aragon on behalf of her son, Ferdinand IV., then under age. His diplomacy was successful and his marriage to James II.'s daughter, Constantina, added to his prestige. On the death of Ferdinand IV. and of the regents who governed in the name of Alphonso XI., Don Juan took the regency of the kingdom stated of age in 1325. His ambitious design of continuing to exercise the royal power was defeated by Alphonso XI., who married the ex-regent's daughter Constanza, and removed his father-in-law from the scene by nominating him adelantado mayor de la frontera. Alphonso XI.'s repudiation of Constanza, whom he imprisoned at Toro, drove Don Juan Manuel into opposition, and a long period of civil war followed. On the death of his wife Constantina in 1327, Don Juan Manuel strengthened his position by marrying Doña Blanca de la Cerda; he secured the support of Juan Nuñez, alférez de Castile, by arranging a marriage between him and Maria, daughter of Don Juan el Tuerto; he won over Portugal by promising the hand of his daughter, the ex-queen Constanza, to the infant of that kingdom, and he entered into alliance with Mahomet III. of Granada. This formidable coalition compelled Alphonso XI. to sue for terms, which he accepted in 1338 without any serious intention of complying with them; but he was compelled to release Doña Constanza. War speedily broke out anew, and lasted till 1331 when Alphonso XI. invited Juan Manuel and Juan Nuñez to a banquet at Villahumbrales with the intention, it was believed, of assassinating them; the plot failed, and Don Juan Manuel joined forces with Peter IV. of Aragon. He was besieged by Alphonso XI. at Garci-Nuñez, whence he escaped on the 30th of July 1336, fled into exile, and kept the rebellion alive till 1338, when he made his peace with the king. He proved his loyalty by serving in further expeditions against the Moors of Granada and Africa, and died a tranquil death in the first half of 1349.

Distinguished as an astute politician, Don Juan Manuel is an author of the highest eminence, and, considering the circumstances of his stormy life, his voluminosity is remarkable. The Libro de los sabios, a treatise called Engeños de Guerra and the Libro de cantares, a collection of verses, composed between 1320 and 1327; but they have disappeared together with the Libro de la caballerta (written during the winter of 1336, and the Reglas como se debe trovar, a metrical treatise assigned to 1328–1334. Of his surviving writings, Juan Manuel's Crónica abreviada was compiled between 1319 and 1325, while the Libro de la casa must have been written between 1320 and 1329; and during this period of nine years the Crónica de España, the Crónica completa, and the Tratado sobre las armas were produced. The Libro del caballero et del escudero was finished before the end of 1326; the first book of the Libro de los estados was finished on the 22nd of May 1330, while the second was begun five days later; the first book of El Conde Lucanor was written in 1338, the second in 1336, and the fourth is dated 12th of June 1335. We are unable to assign to any precise date the devoty Tratado on the Virgin, dedicated to the priory of the monastery at Puñafael, to which Don Juan Manuel bequeathed his manuscripts; but it seems probable that the Libro de los frajes predicadores is slightly later than the Libro de los estados; that the Libro de los castigos (left unfinished, and therefore known by the alternative title of Libro inúndido) was written not later than 1333, and that the treatise De las maneras de amor was composed between 1334 and 1337.

The historical summaries, pious dissertations and miscellaneous writings are of secondary interest. The Libro del caballero et del escudero is on another plane; it is no doubt suggested by Luli's Libro del orde de cavalleria, but the points of resemblance have been exaggerated; the morbid mysticism of Luli is rejected, and the carefully finished style justifies the special regard with which the author took in this performance. The influence of Luli's Blanquerna is likewise visible in the Libro de los estados; but there are marked divergences of substance which go to prove Don Juan Manuel's acquaintance with some version (not yet identified) of the Barlaam and Josaphat legend. Nothing is more striking than the curious and varied erudition of the turbulent prince who weaves his personal experiences with historical or legendary incidents, with reminiscences of Aesop and Phaedrus, with the Disciplina clericalis, with Káthall and Dimná, with countless Oriental traditions, and with all the material of the universum, literary and otherwise, in evidence. The Lucanor, best known by the title of El Conde Lucanor (the name Lucanor being taken from the prose Tristan). This work (also entitled Libro de exemplos) was first printed by Gonzalo Argote de Molina at Seville in 1575, and it revealed Don Juan Manuel as a master in the art of prose composition, and as the predecessor of Boccaccio in the province of romantic narrative. The Cento novelle antiche are earlier in date, but these anonymous tales, derived from popular stories diffused throughout the world, lack the personal character which Don Juan lends to all his work. They are the expression of the one hundred and one items; El Conde Lucanor is essentially the production of a conscious artist, deliberative and selective in his methods. Don Juan Manuel has not Boccaccio's festive fancy nor his constructive skill; he is too persistently didactic and concerned to point a moral; but he excels in knowledge of human nature, in the faculty of ironical presentation, in tolerant wisdom and in luminous conciseness. He naturalizes the Eastern apologue in Spain, and by the laconic picturesqueness of his expression imports a new quality into Spanish prose which attains its full development in the hands of Juan de Valdés and Cervantes. Some of his themes are utilized for dramatic purposes by Lope de Vega in La Pobresma estimada, by Ruiz de Alarcón in La Prueba de las promesas, by Calderón in La Vida es sueno, and by Cañizares in Don Juan de Espina en Milán: there is an evident, though remote, relation between the tale of the mancobe que casó con una mujer muy fuerte y muy brava and The Taming of the Shrew; and a more direct connexion exists between some of Don Juan Manuel's exemplos and some of Anderson's fairy tales.

JUAREZ, BENITO PABLO (1860–1872), president of Mexico, was born near Ixtlan, in the state of Oajaca, Mexico, on the 21st of March 1866, of full Indian blood. Early left in poverty by the death of his father, he received from a charitable friar a good general education, and afterwards the means of studying law. Beginning to practise in 1834, Juarez speedily rose to professional distinction, and in the stormy political life of his time took a prominent part as an exponent of liberal views. In 1832 he sat in the state legislature; in 1846 he was one of a legislative triumvirate for his native state and a deputy to the republican congress, and from 1847 to 1852 he was governor of Oajaca. Banished in 1853 by Santa Anna, he returned in 1855 and joined Alvarez, who, after Santa Anna's defeat, made him minister of justice. Under Comonfort, who then succeeded Alvarez, Juarez was governor of Oajaca (1855–57), and in 1857 chief justice and secretary of the interior; and, when Comonfort was unconstitutionally replaced by Zuloaga in 1858, the chief justice, in virtue of his office, claimed to be legal president of the republic. It was not, however, till the beginning of 1861 that he succeeded in finally defeating the
unconstitutional party and in being duly elected president by congress. His decree of July 1861, suspending for two years all payments on public debts of every kind, led to the landing in Mexico of English, Spanish and French troops. The first two powers were soon induced to withdraw their forces; but the French remained, declared war in 1862, placed Maximilian upon the throne as emperor, and drove Juarez and his adherents to the northern limits of the republic. A grant of 200,000 acres of land on account of obstinate resistance, which resulted in final success. In 1867, Maximilian was taken at Querétaro, and shot; and in August Juarez was once more elected president. His term of office was far from tranquil; discontented generals stirred up ceaseless revolts and insurrections; and, though he was re-elected in 1871, his popularity seemed to be on the wane. He died of apoplexy in the city of Mexico on the 18th of July 1872. He was a statesman of integrity, ability and determination, whose useful qualities are too apt to be overlooked in consequence of his connexion with the unhappy fate of Maximilian.

JUBA, the name of two kings of Numidia.

Juba I. (1st century B.C.) son and successor of Hiempsal, king of Numidia. During the civil wars at Rome he sided with Pompey, partly from gratitude because he had reinstated his father on the throne (Appian, B.C., i. 80), and partly from enmity to Caesar, who had insulted him at Rome by pulling his beard (Suet., Caesar, 71). Further, C. Scribonius Curio, Caesar's general in Africa, had openly proposed, 30 B.C., when tribune of the plebs, that Numidia should be sold to colonists, and the king reduced to a tributary condition. The Senate declined the plan, and Caesarean army a crushing defeat, in which Curio was slain (Vell. Pat. ii. 54; Caesar, B.C. ii. 40). Juba's attention was distracted by a counter invasion of his territories by Bocchus the younger and Sittius; but, finding that his lieutenant Sabara was able to defend his interests, he rejoined the Pompeians with a large force, and shared the defeat at Thapsus. Fleeing from the field with the Roman general M. Petreius, he wandered about as a fugitive. At length, in despair, Juba killed Petreius, and sought the aid of a slave in despatches himself (46). Juba was a thorough savage; brave, treacherous, insolent and cruel. (See NUMIDIA.)

Juba II., son of the above. On the death of his father in 46 B.C. he was carried to Rome to grace Caesar's triumph. He seems to have received a good education under the care of Augustus who, in 29, after Mark Anthony's death, gave him the hand of Cleopatra Selene, daughter of Antony and Cleopatra, and placed him on his father's throne. In 25, however, he transferred him from Numidia to Mauretania, to which was added a part of Gaetulia (see NUMIDIA). Juba seems to have reigned in considerable prosperity, though, in A.D. 6 the metallurgical and iron works in the country were increased to such an extent that the Gaetulian and Carthaginian Caesareans and Cossus, the Roman general who helped to suppress it. The date of Juba's death is by no means certain; it has been put between A.D. 19 and 24 (Strabo, viii. 288; Dio Cassius, i. 15; ii. 26; Plutarch, Ant. 87; Caesar, 55). Juba, according to Pliny, who constantly refers to him, is mainly memorable for his writings. He has been called the African Varro.

He wrote many historical and geographical works, of which some survive in mutilated and corrupted state. A considerable value on account of the sources to which their authour had access: (1) Παλικαίον ιστορία (1) Λαογραφία; (2) Νομολογία; (3) Αθήνα; (4) De Aethiopiae sequa De expeditione africana; (5) Physiologia; (6) De Etapiaria herbis; (7) Πελοπόννησος; (8) Πελοποννήσι (Πελοποννήσιos); (9) Θεομαχία (Θεομαχίας); (10) Ορισμενίς (1) Πελοποννήσι Νείκων; (12) Μεγαλολογία. Fragments and life in Müller, Frag. Hist. Graec., vol. iii. see also Sevian, Mém. de l'Acad. des Inscriptions, vol. iv.; Hülkmann, Dreits und scripta Juba (1856). For the chronology of Juba, see the learned and research of the reference.

JUBA, or Juba river of East Africa, exceeding 1000 m. in length, rising on the S.E. border of the Abyssinian highlands and flowing S. across the Galla and Somali countries to the sea. It is formed by the junction of three streams, all having their source in the mountain range N.E. of Lake Rudolf which is the water-parting between the Nile basin and the rivers flowing to the Indian Ocean.

Of the three headstreams, the Web, the Ganale and the Daua, the Ganale (or Gana) is the central river and the true upper course of the Juba. It has two chief branches, the Black and the Great Ganale. The Black ended, the Ganale enters a large slightly undulating grass plain which extends south of the valley of the Daua and occupies all the country eastward to the junction of the two rivers. In this plain the Ganale forms a semicircular sweep northward before joining the Daua. East of the Daua, the Ganale is joined by the Web on the left or eastern bank, and about 10 m. lower down the Daua enters on the right bank.

The Web rises in the mountain basin N. of the Kandle and E. of the sources of the Ganale, and some 40 m. from its source passes, first, through a cañon 500 ft. deep, and then through a series of remarkable underground coves hollowed out of a quartz mountain and, with its arches and white columns, presenting the appearance of a pilared temple. The Daua (or Dowa) is formed by the mountain torrents which have their rise S. and W. of the Ganale and is of much smaller size and water to that river. It has few feeders and none of any size. The descent to the open country is somewhat abrupt. In its middle course the Daua has cut a deep narrow valley through the plain; lower down it bends N.E. to its junction with the Ganale. The river now widens and can place the banks are fringed with thick bush and dom-palms. At the junction of the Ganale and the Web the river is swift-flowing and 58 yards across; just below the Dauna confluence it is 200 yds. wide, the altitude here—300 m. in a distance of 50 m. on the left and 300 m. on the right sides.

Below the Daua the river, now known as the Juba, receives no tributary of importance. It first flows in a valley bounded, especially towards the west, by the escarpments of a high plateau, and containing the towns of Lugh (in 3° 50′ N., the centre of active trade), Bardena, 387 m. above the mouth, and Sarani—the last two on opposite sides of the stream, in 2° 20′ N., a crossing-place for caravans, Vioo (in 1′ 54′ N. the country becomes more level and the course of the river very tortuous. On the west a series of small lakes and backwaters receives water from the Juba during the rains. Just south of Barte the junction is close, the stream, branching Lake Debshewama or Hardingie, fed by the Lakidera river, enter from the west, and in 0° 15′ S. the Juba enters the sea across a dangerous bar, which has only one fathom of water at high tide.

From its mouth to 20 m. above Bardena, where at 2° 35′ N. rapids occur, the Juba is navigable by shallow-draught steamers, having a general depth of from 4 to 12 ft., though shallower in places. Just above its mouth it is a fine stream 250 yds. wide, with a current of 2′ knots. Below the mountainous region of the headstreams the Juba and its tributaries flow through a country generally arid away from the banks of the streams. Beyond 1′ 54′ N. the country becomes more level and the course of which in the rainy season affords herbage for the herds of cattle, sheep and camels owned by the Boran Gallas and the Somali who inhabit the district. But by the banks of the lower river the character of the country changes. In this district, known as Gosa, are considerable tracts of forest, and the level of flood water is higher than much of the surrounding land. This low-lying fertile belt stretches along the river for about 300 m., but is not more than a mile or two wide. In the river valley maize, rice, cotton and other crops are cultivated. From Gobwen, a town 50 m. below Bardena, a road runs S.W. to the seaport of Kismayu, 10 m. distant.

The lower Juba was ascended in 1863 in a steamer by Baron Karl von der Decken, who was murdered by Somali at Bardera, but the river system remained otherwise almost unknown until after 1890. In 1891 a survey of its lower course was executed by Captain F. G. Dundas of the British navy, while in 1892-1893 its headstreams were explored by the Italian officers, Captains Vittorio, Bottego and Grizoni, the former of whom disproved the supposed connexion of the Omo (see RUDOLF, LAKE) with the Juba system. It has since been further explored by Prince Eugenio Ruspoli, by Bottego's second expedition (1895), by Donaldson Smith, A. E. Butler, Captain P. Maud of the British army, and others. The river, from its mouth to the confluence of the Daua and Ganale, forms the frontier between the
JUBULPORE—JUBILEE

British East Africa protectorate and Italian Somaliland; and from that point to about 4° 20' N. the Daua is the boundary between British and Abyssinian territory.

JUBULPORE, or Jabalpur, a city, district, and division of British India in the Central Provinces. The city is 616 m. N.E. of Bombay by rail, and 220 m. S.W. of Allahabad. Pop. (1901), 90,316. The numerous gorges in the neighbouring rocks have been taken advantage of to surround the city with a series of lakes, which, shaded by fine trees and bordered by fantastic crags, add much to the safety and beauty of the town itself and is laid out in wide and regular streets. A streamlet separates the civil station and cantonment from the native quarter; but, though the climate is mild, a swampy hollow beneath renders the site unhealthy for Europeans. Formerly the capital of the Saugor and Nerbudda territories, Jubbulpore is now the headquarters of a brigade in the 5th division of the southern army. It is also one of the most important railway centres in India, being the junction of the Great Indian Peninsula and the East Indian systems. It has a steam cotton-mill. The government college educates for the science course of the Allahabad University, and also contains law and engineering classes; there are three aided high schools, a law class, an engineering class and normal schools for male and female teachers. A native association, established in 1869, supports an orphanage, with help from government. A zenana mission manages 13 schools for girls. Waterworks were constructed in 1882.

The District of Jubbulpore lies on the watershed between the Nerbudda and the Son, but mostly within the valley of the former river, which here runs through the famous gorge known as the 'black rocks,' and falls 301 ft. over the ledge (the Dhuan dhak, or "misty shoot"). Area, 3912 sq. m. It consists of a long narrow plain running north-east and south-west, and shut in on all sides by highlands. This plain, which forms an offshoot from the great valley of the Nerbudda, is covered in its western and southern portions by a rich alluvial deposit of black cotton-soil. At Jubbulpore city the soil is sandy, and water plentiful near the surface. The north and east belong to the Ganges and Jamna basins, the south and west to the Nerbudda basin. In 1901 the population was 680,538, showing a decrease of 9% since 1891, due to the results of famine. The principal crops are wheat, rice, pulse and oil-seeds. A good deal of iron-smelting with charcoal is carried on in the forests, manganese ore is found, and limestone is extensively quarried. The district is traversed by the main railway from Bombay to Calcutta; and by new branches of two other lines which meet at Katni junction.

Jubbulpore suffered severely in the famine of 1866-1879, the distress being aggravated by immigration from the adjoining native states. Fortunately the famine of 1900 was less severely felt.

The early history of Jubbulpore is unknown; but inscriptions record the existence during the 11th and 12th centuries of a local line of princes of that Haillah race which is closely connected with the history of Gondwan. In the 16th century the Gond raja of Garha Mandla extended his power over fifty-two districts, including the present Jubbulpore. During the minority of his grandson, Abkar Khan, the vicerey of Kar Manikpur, conquered the Garha principality and held it at first as an independent chief. Eventually he submitted to the emperor Akbar. The Delhi power, however, enjoyed little more than a nominal supremacy; and the prince of Garha Mandla maintained a practical independence until their subjugation by the Mahratta governors of Saugor in 1781. In 1788 the peshwa granted the Nerbudda valley to the Bhonsala princes of Nagpur, who continued to hold the district until the British occupied it in 1818.

The Division of Jubbulpore lies mainly among the Vindhyan and Satpura hill systems. It comprises the five following districts: Jubbulpore, Saugor, Damoh, Seoni and Mandla. Area, 18,950 sq. m.; pop. (1901), 2,081,499.

JUBÉ, the French architectural term (taken from the imperative of Lat. jubere, to order) for the chancel or choir screen, which in England is known as the rood-screen (see ROOD). Above the screen was a gallery or loft, from which the words "Jubé Domine benedicere" were spoken by the deacon before the reading of the Gospel, and hence probably the name. One of the finest jubés in France is that of the church of the Madeleine at Troyes, in rich flamboyant Gothic. A later example, of the Renaissance period, c. 1600, is in the church of St Étienne du Mont, Paris. In the Low Countries there are many fine examples in marble, of which one of the most perfect from Bois-le-Duc is now in the Victoria and Albert Museum.

JUBILEE (or JUBILEE), YEAR OF, in the Bible, the name applied in the Holiness section of the Priestly Code of the Hexateuch (Lev. xxv.) to the observance of every 50th year, determined by the lapse of seven seven-year periods as a year of perfect rest, when there was to be no sowing, nor even gathering of the natural products of the field and the vine. At the beginning of the jubilee-year the liberation of all Israelitish slaves and the restoration of ancestral possessions was to be proclaimed. As regards the meaning of the name "jubilee" (Heb. yâbdî) modern scholars are agreed that it signifies "ram" or "ram's horn." "Year of jubilee" would then mean the year that is inaugurated by the blowing of the ram's horn (Lev. xxv. 9).

According to Lev. xxv. 8-12, at the completion of seven sabbaths of years (i.e., 7×7=49 years) the trumpet of the jubilee is to be sounded "throughout the land" on the 10th day of the seventh month (Tisri 10), the great Day of Atonement. The 50th year thus announced is to be "hallowed," i.e., liberty 1 is to be proclaimed everywhere to everyone, and the people are to return "every man unto his possession and unto his family." As in the sabbatical year, there is to be no sowing, nor reaping that which grows of itself, nor gathering of grapes.

As regards real property (Lev. xxv. 13-34) the law is that if any Hebrew under pressure of necessity shall alienate his property he is to get for it a sum of money reckoned according to the number of harvests to be reaped between the jubilee and the first jubilee-year: should he or any relation desire to redeem the property before the jubilee this can always be done by repaying the value of the harvests between the redemption and the jubilee.

This legal enactment, though it is not found (nor anything like it) in the earlier collections of laws, is evidently based on (or modified from) an ancient custom which conferred on a near kinsmen the right of pre-emption as well as of buying back (cf. Jer. xxxii. 6 seq.). The tendency to impose checks upon the alienation of landed property was exceptionally strong in Israel. The fundamental principle is that the land is a sacred possession belonging to Yahweh. As such it is not to be alienated from Yahweh's people, to whom it was originally assigned. In Ezekiel's restoration programme "crown lands presented by the 'prince' to any of his officials revert to the crown in the year of liberty (? jubilee year)"; only to his sons may any portion of his inheritance be alienated in perpetuity (Ezek. xlvi. 16-18; cf. Code of Hammurabi, § 38 seq.).

The same rule applies to dwelling-houses of unwalled villages; the case is different as regards dwelling-houses in walled cities. These may be redeemed within a year after transfer, but if not redeemed within that period they continue permanently in possession of the purchaser, and this may well be an echo of ancient practice. An exception to this last rule is made for the houses of the Levites in the Levitical cities. As regards property in slaves (Lev. xxv. 35-55) the Hebrew whom necessity has compelled to sell himself into the service of his brother Hebrew is to be treated as a hired servant and not as a slave, and to be released absolutely at the jubilee; non-Hebrew bondmen, on the other hand, are to be bondmen forever. But the Hebrew who has sold himself into a stranger or sojourner is entitled to freedom at the year of jubilee, and further is at any time redeemable by any of his kindred—the redemption price being regulated by the number of years to run between the redemption and the jubilee, according to the ordinary wage of hired servants. Such were the enactments of the Priestly Code—which, of course, represents the latest legislation of the Pentateuch (post-exilic). These enactments, in order to be understood rightly, must be viewed in relation to the earlier understanding of 1 Heb. דַּרְדַּרְדַּר (deradër). The same word (dardâr) is used in the Code of Hammurabi in the similar enactment that wife, son or daughter sold into slavery for debt are to be restored to liberty in the fourth year (§ 117).
JUBILEES, BOOK OF

similar provisions in connexion with the sabbatical (seventh) year. The foundations of Lev. xxiv. are laid in the ancient provisions of the Book of the Covenant (Exod. xx. 2 seq.; xxiii. 10 seq.) and in Deuteronomy (xxv.). The Book of the Covenant enjoined that the land should lie fallow and Hebrew slaves be liberated in the seventh year; Deuteronomy required in addition the remission of debts (Benzing). Deuteronomy, it will be noticed, in accordance with its humanitarian tendency, not only liberates the slave but remits the debt. It is evident that these enactments proved impracticable in real life (cf. Jer. xxxiv. 8 seq.), and so it became necessary in the later legislation of P., represented in the present form of Lev. xxv., to relieve them to the 49th year, the year of jubilee. This latter, however, was a purely theoretical development of the Sabbath idea, which could never have been reduced to practice (its actual observance would have necessitated that for two consecutive years—the 49th and 50th—absolutely nothing could be reaped, while in the 51st only summer fruits could be obtained, sowing being prohibited in the 49th year). That in practice the enactments for the jubilee-year were disregarded is evidenced by the fact that, during the passage of time, the name of this remission is known to the Talmudists and Rabbins, although the jubilee-years were "reckoned" they were not observed.

The conjecture of Keenen, supported by Wellhausen, that originally Lev. xxv. 8 seq. had reference to the seventh year as a highly probable one. This may be the case also with Ezek. xlv. 16–18 (cf. Jer. xxxiv. 14). A later Rabbinical device for evading the provisions of the law was the prosbul (ascended to Hillel)—i.e. a condition made in the presence of the judge securing to the creditor the right of demanding repayment at any time, irrespective of the year of remission. Further enactments regarding the jubilee are found in Lev. xxvii. 17–25 and Num. xxxvi. 4.

JUBILEES, BOOK OF, an apocryphal work of the Old Testament. The Book of Jubilees is the most advanced pre-Christian representative of the Midrashic tendency, which had already been at work in the Old Testament Chronicles. As the chronicler had rewritten the history of Israel and Judah from the standpoint of the Priests' Code, so our author re-edited from the Pharisaic standpoint of his time the history of the world from the creation to the publication of the Law on Sinai. His work contains a commentary in the world on Genesis and part of Exodus, an enlarged Targum on these books, in which difficulties in the biblical narration are solved, gaps supplied, dogmatically offensive elements removed and the genuine spirit of later Judaism infused into the primitive history of the world.

Titles of the Book.—The book is variously entitled. First, it is known as τα Ἰσραήλ, of Ἰσραήλ, Heb. הנשים. This name is admirably adapted to our book, as it divides into jubilee periods of forty-nine years, each period of the history of the world from the creation to the legislation on Sinai. Secondly, it is frequently designated "The Little Genesis," και ἐκ Παλαιάς οὐ καὶ Μικρογέννεσ, Heb. ציון ציון. This title may have arisen from its dealing more fully with details and minutiæ than the biblical work. For the other names by which it is referred to, such as The Apocalypse of Moses, The Testament of Moses, The Book of Adam's Daughters and the Life of Adam, the reader may consult Charles's The Book of Jubilees, pp. xvii.-xx.

Object.—The object of our author was the defence and exposition of Judaism from the Pharisaic standpoint of the 2nd century B.C., against the disintegrating effects of Hellenism. In his elaborate defence of Judaism our author glorifies circumcision and the sabbath, the bulwarks of Judaism, as heavenly ordinances, the sphere of which was so far extended as to embrace Israel on earth. The law, as a whole, was to our author the realization in time of what was in a sense timeless and eternal. Though revealed in time it was superior to time. Before it had been made known in sundry portions to the fathers, it had been kept in heaven by the angels, and to its observance there was no limit in time or in eternity. Our author next defends Judaism by its glorification of Israel. Whereas the various nations of the Gentiles were subject to angels, Israel was subject to God alone.

Israel was God's son, and not only did the nation stand in this relation to God, but also its individual members. Israel received circumcision as a sign that they were the Lord's, and this privilege of circumcision they enjoyed in common with the two highest orders of angels. Hence Israel was to unite with God and these two orders in the observance of the sabbath. Finally the destinies of the world were to be worlded up with Israel. The world was renewed in the creation of the true man Jacob, and its final renewal was to be synchronized with the setting-up of God's sanctuary in Zion and the establishment of the Messianic kingdom.

In this kingdom the Gentiles had neither part nor lot.

Versions: Greek, Syriac, Ethiopian and Latin.—Numerous fragments of the Greek Version of the Book of Jubilees have come down to us. It was known to Origen, Diocletian of Antichor, Isidore of Alexandria, Epiphanius, John of Malala, Syneculus and others. This version was the parent of the Ethiopic and Latin versions. The Ethiopic is most accurate and complete, and indeed, so largely identical, that it has naturally suffered from the corruptions incident to transmission through MSS. Thus diacritics are frequent and lacunae of occasional occurrence, but the version is singularly free from the glosses and corrections of unscrupulous scribes. The Latin Version, of which about one-fourth has been preserved, is of a quality almost equal with the Ethiopic. It has, however, suffered many corruptions. Noteworthy is the fact that it contains an array of passages in which it preserves the text true over against corruptions or omissions in the Ethiopic Version. Finally, as regards the Syriac Version, evidence for and against its authenticity is inconclusive. It is based on the fact that a British Museum MS. contains a Syriac fragment entitled "Names of the wives of the Patriarchs according to the Hebrew Book of Jubilees." The Ethiopic and Latin versions of the Book of Jubilees are the most valuable extant for elucidating the Old Testament. The Ethiopic Version is translated from the Greek, for Greek words such as ἄνεμος, βλασφήμως, ἴδιος, &c., are transliterated in the Greek. Secondly, many passages must be translated into Aramaic to recover the source of the various corruptions. And, finally, proper names are transliterated as they appear in Greek and not in Hebrew. That the Latin is also a translation from the Greek is no less obvious. Thus in xiv. 12 ἤμερας = 16–18, corrupt for βακκαδας; in xxxv. 13 οικονομῆς = τοιχός, but τοιχός should here have been rendered by τριβάθμια, as the Ethiopic and the context require; in xxxii. 26, ἔλεος = λαμπρόν, corrupt for ἄρνησα (so Ethiopic).

The Book of Jubilees is a Translation of the Hebrew.—The early date of our book—the 2nd century B.C.—and its place of composition speak for a Semitic origin, and the evidence bearing on this subject is conclusive. But the question at once arises, was the original Aramaic or Hebrew? Certain proper names in the Latin Version ending in -n seem to beknap an Aramaic original, as Cettin, Filistin, &c. But since in all these cases the Ethiopic transliterations end in -n and not in -n, it is not improbable that the Aramaism in the Latin Version is due to the translator, who, it has been concluded on other grounds, was a Palestinian Jew.

The grounds, on the other hand, for a Hebrew original are numerous and nameless. The claim to be from the hand of Moses would naturally be in Hebrew, for Hebrew according to our author was the sacred and national language. The revival of the national spirit of a nation is universal, and so far as a people who were no longer a nation, the national language. The text must be translated into Hebrew in order to explain unintelligible expressions and restore the true text. One instance will sufficiently illustrate this statement. In xlvi, 11 a certain Ethiopic expression is translated, which is a mis-translation of נפוח for נפש in this context, as we know from the parallel passage in Gen. xliii. 18, which our text reproduces almost verbally, מִשְׁפָּחַת. We might observe here that our text attests the presence of diacritics already existing in the Hebrew text. (4) Hebraisms survive in the Ethiopic and Latin Versions. In the former nāgīn in iv. 4, is a corrupt transliteration of נָעַגְוֺ for נָעַג. It is a repetition of the phrase שַׁעַר שַׁעַר = in ἡμέρα in xix. 8–10... ἡμέρα. This idiom could, of course, be explained on the hypothesis of an Aramaic original. Many paronomasias discover themselves on retranslation into Hebrew.

Textual Affinities.—A minute study of the text shows that it attests an independent form of the Hebrew text of the Pentateuch. Thus it agrees at times with the Samaritan, or Septuagint, or Syriac, or Vulgate, or even with Onkelos against all the rest. To be more exact, our book represents some form of the Hebrew text of the Pentateuch midway between the forms presupposed by the Septuagint and the Syriac; for it agrees more frequently with the Septuagint, or with combinations into which the Septuagint enters, than with

1 In the Ethiopic Version in xxi. 12 it should be observed that in the Ethiopic text twelve years are assigned for the burnt offerings and the transfigured Aramean names of trees. But in a late Hebrew work (2nd century B.C.) the popular names of such objects would naturally be used. In certain cases the Hebrew may have been forgotten, or, where the tree was of late introduction, been non-existent.
any other single authority, or with any combination excluding the Septuagint. Next to the Septuagint it agrees most often with the Syriac or with combinations into which the Syriac enters. On the other hand, its independence of the Septuagint is shown in a large number of passages, where it has the support of the Samaritan and Massoretic, or of these with various combinations of the Syriac Vulgate. For these reasons I believe that we must conclude that not only may we, but that we must conclude that the text evidence points to the composition of our book at some period between 250 B.C. and A.D. 100, and at a time nearer the earlier date than the later.

Both the text written before 135 B.C. and the year of Hyrcanus's death must be considered. This conclusion is drawn from the following facts:—(1) The book was written during the pontificate of the Maccabean family, and not earlier than 135 B.C. For in xxxii. 1 Levi is called a "priest of the Most High God." Now the only high priests who bore this title were the Maccabean, who appear to have assumed it as reviving the order of Melchizedek when they displaced the Zadokite order of Aaron. Jewish tradition ascribes the assumption of this title to John Hyrcanus. It was retained by his successors down to Hyrcanus II. (2) It was written before 96 B.C. or sometime earlier in the reign of John Hyrcanus; for since our author is of the strictest sect a Pharisee and at the same time an upholder of the Maccabean pontificate, Jubilees cannot have been written after 96 when the Pharisees and Alexander Janneaus came to open strife. Nay more, it cannot have been written after the open breach between Hyrcanus and the Pharisees, when the former joined the Sadducean party.

The above conclusions are confirmed by a large mass of other evidence postulating the same date. We may, however, observe that our book points to the period already past,—of stress and persecution that preceded the recovery of national independence under the Maccabees, and presupposes as its historical background the most flourishing period of the Maccabean hegemony.

Author.—Our author was a Pharisee of the strictest sect. He maintained the everlasting validity of the law, he held the strictest views on circumcision, the sabbath, and the duty of shunning all intercourse with the Gentiles; he believed in angels and in a blessed immortality. In the next place he was an upholder of the Maccabean pontificate. He glorifies Levi's successors as high-priests and civil rulers, and applies to them the title assumed by the Maccabean princes, though he does not, like the author of the Testaments of the Twelve Patriarchs, expect the Messiah to come forth from among them. He may have been a priest.

The Views of the Author on the Messianic Kingdom and the Future Life.—According to our author the Messianic kingdom was to be brought about gradually by the progressive spiritual development of man and a corresponding transformation of nature. Its members were to reach the limit of 1000 years in happiness and immortality, with the powers of evil to be restrained, and the last judgment to take place at its close. As regards the doctrine of a future life, our author adopts a position novel for a Palestinian writer. He abandons the hope of a resurrection of the body. The souls of the righteous are to enjoy a blessed immortality after death. This is the earliest attested instance of this expectation in the last two centuries B.C.

LITERATURE.—Ethiopic Text and Translations: This text was first edited by Dillmann from two MSS. in 1859, and in 1895 by R. H. Charles from four (The Ethiopic Version of the Hebrew Book of Jubilees ... with the Hebrew, Syriac, Greek and Latin fragments). In 1885 the Greek and Latin fragments are printed together with the Ethiopic. The book was translated into German by Dillmann from one MS. in Ewald's Jahrbücher, vols. ii. and iii. (1850, 1851), and by Littmann (In Kautzsch's Apok. und Pseud. ii. 39—110) from Charles's Ethiopic text; into English by Schoedel (Bibl. Sacra. 1885) from Dillmann's text, and by Charles (Jewish Quarterly Review, vols. vi., vii. 1895—1896) from the text afterwards published in 1895. The most recent and complete edition of the Ethiopic Book of Jubilees is Critical Inquiries: Dillmann, "Das Buch der Jubiläen" (Ewald's Jahrbücher d. bibl. Wissensch. 1851, iii. 72—90); "Pseudepig. des Alten Testamentes," Herzog's Realencycl. xiii. 364—365; "Beiträge aus der Geschichte der Juden zur Kritik der Buch Jubileen," in Berichte der Kgl. Preussischen Akad., 1883; Beer, Das Buch der Jubiläen (1865); Könsch, Das Buch der Jubiläen (1874); Singer, Das Buch der Jubiläen (1868); Bohn, "Die Bedeutung des Buches der Jubiläen" (Theol. Stud. und Kritiken (1900), pp. 167—184). A full bibliography will be found in Schürer or in R. H. Charles's commentary, The Book of Jubilees or the Little Genesis (1902), which deals exhaustively with all the questions treated in this article.

(R. H. C.)

JUBILEE YEAR, an institution in the Roman Catholic Church, observed every twenty-fifth year, from Christmas to Christmas. During its continuance plenary indulgence is obtainable by all the faithful, on condition of their penitently confessing their sins and praying for the pope's intention, stated number of times, or doing an equivalent amount of meritorious work. The institution dates from the time of Boniface VIII., whose bull Antiquorum habet fidelem is dated the 22nd of February 1300. The circumstances in which it was promulgated are related by a contemporary authority, Jacobus Catoj anus, according to whose account ("Relatio de centesimo s. jubilaeo anno" in the Bibliotheca Pa trium) a rumour spread through Rome at the close of 1299 that every one visiting St Peter's on the 1st of January 1300 would receive full absolution. The result was an enormous influx of pilgrims to Rome and a contribution towards the pope's attention. Nothing was found in the archives, but an old peasant 707 years of age avowed that his father had been similarly benefited a century previously. The bull was then issued, and the pilgrims became even more numerous, to the profit of both clergy and citizens. Originally the churches of St Peter and St Paul in Rome were the only jubilee churches, but the privilege was afterwards extended to the Lateran Church and that of Sta Maria Maggiore, and it is now shared also for the year immediately following that of the Roman jubilee by a number of specified provincial churches. The greatest request of the Roman people, which was supported by St Bridget of Sweden and Pope Pius II., was fulfilled by the bull Unigenitus Dei filius, that the jubilee should recur every fifty years instead of every hundred years as had been originally contemplated in the constitution of Boniface; Urban VI., who was badly in need of money, by the bull Salvator noster in 1389 reduced the interval still further to thirty-three years (the supposed duration of the earthly life of Christ); and Paul II. by the bull Inexpugnabili (April 19, 1470) finally fixed it at twenty-five years. Paul II. also permitted foreigners to substitute for the pilgrimage to Rome a visit to some specified church in their own country and a contribution towards the expenses of the Holy Wars. According to the special ritual prescribed by Alexander VI. in 1500, the pope on the Christmas Eve with which the jubilee begins goes in solemn procession to a particular walled-up door ("Porta aurea") of St Peter's and knocks three times, using at the same time the words of Ps. cviii. 19 (Aperte mihi portas justitiae). The doors are then opened and sprinkled with holy water, and the pope passes through. A similar ceremony is conducted by cardinals at the other jubilee churches of the city. At the close of the jubilee, the special door is again built up with appropriate solemnities.

The last ordinary jubilee was observed in 1900. "Extraordinary" jubiles are sometimes appointed on special occasions, e.g., the accession of a new pope, or that proclaimed by Pope Leo XIII., for the 12th of March 1881, "in order to obtain from the mercy of Almighty God help and succour in the weighty necessaries of the Church, and courage and strength in the battle against her numerous and mighty foes." These are not so much jubiles in the ordinary sense as special grants of plenary indulgences for particular purposes (Indulgentiae plenariae in forma jubilaei).

Jücar, a river of eastern Spain. It rises in the north of the province of Cuenca, at the foot of the Cerro de San Felipe (5906 ft.), and flows south past Cuenca to the borders of Albacete; here it bends towards the east, and maintains this direction for the greater part of its remaining course. On the right it is connected with the city of Albacete by the Maria Cristina canal. After entering Valencia, it receives on the left its chief tributary the Cabriel, which also rises near the Cerro de San Felipe, in the Montes Universales. Near Alcira the Jücar turns south-eastward, and then sharply north, curving again to the south-east before it enters the Mediterranean Sea at Cullera, after a total course of 314 m. Its estuary forms the harbour of Cullera, and its lower waters are freely utilized for purposes of irrigation.

Jülicher LEOPOLD (1482—1542), known to his contemporaries as Meister Leu, Swiss reformer, was born in Alsace and educated
JUDAEA—JUDAS ISCARIOT

underlying the account of the Israelite exodus (q.e.) there are traces of a separate movement of certain clans—apart from the Israelite invasions of Palestine—which ultimately found in the south of Judah; and their traditions in Chronicles themselves show that the incorporation of these elements began under David, when Judah first occupies a prominent position in biblical history (cf. Cheyne, Genesis, vol. 2618). But such movements were not necessarily limited to one single period, and the evidence connecting (a) the non-Israelite clans of Judah with Levites, and (b) both with the south, is found in narratives referring to different ages and might point to an unseeing relationship with the south. On the other hand, clans, which in the traditions of David's time were in the south of Judah, about five hundred years after (q.e.) are found bordering to the north. These served the strenuous vicissitudes of half a millennium or all perspective of their early history has been lost. In Gen. xxviii., a curious narrative points to the separation of Judah from his tribe and from his men (v. 6), and in Gen. xxix., xxiv., it is evident that Judah, and his sons from Judah are the terms of a secession from, and all the more, the south, and the third Shulphas. From Judah and Ezr.'s widow Tamar are derived Perez and Zerah, and these and Judah's sons in post-exilic times as the two representative families of Judah (Neh. xi. 4-6; 1 Chron. ix. 4-6). This story, amid a number of other motives, appears to reflect the growth of the tribe of Judah and its fluctuations, but that the reference is to any very early period is unlikely, partly because the interest of the story is in post-exilic families, and partly because the scenes (Adulam, Chezib and Timnah) overlap with David's own fights between Hebron and Jerusalem (2 Sam. xxii. 11.; see David, ad fin.). Even David's conquests over those tribes is probably the result of his capture by Judah many years previously (Judges i. 8), and with the traditions of the Israelite heroes Joshua and Saul. Consequently few survivals are to be expected in the light of 1 Kings iv. 8-10 (perhaps the subdivisions of the Israelite kingdom, see Solomon), which might necessitate the assumption of a violent separation from the north; this, however, is quite conceivable. See Judah, Acts ii. 13-15. On the bearing of South Judah upon the historical criticism of the Old Testament, see especially N. Schmidt, Hdbb. Journal (1908), pp. 322-342, "The Jerahmeel Theory and the Importation of a Tradition, with some account of personal exploration of the country;" also Jews, § 20. (S. A. C.)

JUDAS ISCARIOT ('Iphad, 'Iskari, or 'Iskaryud, in the Bible, the son of Simon Isciari (John vi. 71, xxii., 26), and one of the twelve apostles. He is enumerated last with the special mention of the fact that he was the betrayer of Jesus. If the generally accepted explanation of his surname ("man of Kerioth"; see Josh. xv. 25) be correct, he was the only original member of the apostolic band who was not a Galilean. The circumstances which led to his admission into the apostolic circle are not stated; while the motives by which he was actuated in selling Jesus for thirty pieces of silver is a problem which has been variously analysed by scholars. According to the Gospel (as De Quincey in his famous Essay) the sole object of Judas was to place Jesus in a position in which He should be compelled to make what had seemed to His followers the too tardy display of His Messianic power: according to others (and this view seems more in harmony with the Gospel narratives) Judas was an avaricious and dishonest man, who had already abused the confidence placed in him (John xii. 6), and who was now concerned only with furthering his own ends.

As regards the effects of his subsequent remorse and the use to which his ill-gotten gains were put, the strikingly apparent discrepancies between the narratives of Matt. xxvii. 3. 10 and Acts i. 18, 19 have attracted the attention of biblical scholars, ever since Papias, in his fourth book, of which a fragment has been preserved, discussed the subject. The simplest explanation is that they represent different traditions, the Gospel narrative being composed with more special reference to prophetic fulfilments, and being probably nearer the truth than the short explanatory note inserted by the author of the Acts (see Bernard, Expositor, June 1904, p. 422 seq.). In ecclesiastical legend and

1 See especially Wellhausen, De gentibus et familias Judaeorum (Göttingen, 1869), the articles on the relative proper names in the Ency. Bib., and 1, Die Juden unter u. ihre Nachbarstämme, pp. 290-471 (much valuable matter).

2 For the principle of the Levirate illustrated in Gen. xxxviii., see C. L. B. Langford, "The Law of Levirate Marriage," in the chapter typified the suppression of Phoenician (viz. Tamar, the date-palm) and the old Canaanite elements (Zerah = indigene) by the younger Israelite invaders (Perez = branch). For other discussions, apart from those comments on Genesis, see B. Luther in Meyer, op. cit., pp. 200 seq.
in sacred art Judas Iscariot is generally treated as the very incarnation of treachery, ingratitude and impiety. The Middle Ages, after their fashion, supplied the lacunae in what they deemed his too meagre biography. According to the common form of their story, he belonged to the tribe of Reuben. Before he was born his mother Cyborea had a dream that he was destined to murder his father, commit incest with his mother, and sell his God. The attempts made by her and her husband to avert this curse simply led to its accomplishment. At his birth Judas was enclosed in a chest and flung into the sea; picked up on a foreign shore, he was educated at the court until a murder committed in a moment of passion compelled his flight. Coming to Judea, he entered the service of Pontius Pilate as page, and during this period committed the first two of the crimes which had been expressly foretold. Learning the secret of his birth, he, full of remorse, sought the prophet who, he had heard, had power on earth to forgive sins. He was accepted as a disciple and promoted to a position of trust, where avarice, the only vice in which he had hitherto been unpractised, gradually took possession of his soul, and led to the complete fulfilment of his evil destiny.

This Judas legend, as given by Jacobus de Voragine, obtained no small popularity; and it is to be found in various shapes in every important literature of Europe.

For the history of its genesis and its diffusion the reader may consult D'Ancona, La leggenda di Vergogna e la leggenda di Giuda (1869), and papers by W. Creizenach in Paul and Brunner, Beiträge zur Geschichts- und Kulturphilosophie, vii. (1875), and Victor Diederich in Rundbriefe (1880). Cholevius, in his Geschichte der deutschen Poesie nach ihren ältesten Urkunden (1854), pointed out the resemblance of the legend to that of the Sibyl. According to Daub (Judas Iscariot, oder Betrachtungen über das Böse im Verhältnisse zum Guten, 1816, 1818) Judas was "an incarnation of the devil," to whom "mercy and blessedness are alike impossible."

The popular hatred of Judas has found strange symbolic expression in various parts of Christendom. In Corfu, for instance, the people at a certain signal on Easter Eve threw away their tokens of crockery from their windows and roofs into the streets, and thus execute an imaginary stoning of Judas (see Kirkwall, Ionian Islands, ii. 47). At one time (according to Mustoxidi, Delle cose corrètes) the tradition prevailed that the traitor's house and country villa existed in the island, and that his descendants were to be found among the local Jews.

Details in regard to some Judas legends and superstitions are given in Notes and Queries, 2nd series, v. vi. and viii.; 3rd series, v. vi. and viii.; 4th series, i. 1; 5th series, vi. See also a paper by Professor Rendel Harris entitled "Did Judas really commit suicide?" in the American Journal of Theology (Phil., 1900). Matthew Arnold's poem "So Brandan" gives fine expression to the old story that, on account of an act of charity done to a leper at Joppa, Judas was allowed an hour's respite from hell once a year. (G.M.)

JUDAS-TREE, the Cercis siliquastrum of botanists, belonging to the section Coelosiphineae of the natural order Leguminosae. It is a native of France and Portugal, Spain, Italy, Greece, Asia Minor, and forms a handsome low tree with a flat spreading head. In spring it is covered with a profusion of purplish-pink flowers, which appear before the leaves. The flowers have an agreeable acid taste, and are eaten mixed with salad or made into fritters. The tree was frequently figured by the older herbalists. One woodcut by Castor Durante has the figure of Judas Iscariot suspended from one of the branches, illustrating the popular tradition regarding this tree. A second species, C. canadensis, is common in North America from Canada to Alabama and eastern Texas, and differs from the European species in its smaller size and pointed leaves. The flowers are also used in salads and for making pickles, while the branches are used to dye wool a nankin colour.

JUDD, SYLVESTER (1813-1853) American Unitarian clergyman and author, was born in Westhampton, Massachusetts, on the 23rd of July 1813. He bore the same name as his father and grandfather; the former (1750-1800) made an especial study of local history of the towns of the Connecticut valley, and wrote A History of Hadley (1863). The son lived in Northampton, Massachusetts, and Western Texas, and differed from the European species in its smaller size and pointed leaves. The flowers are also used in salads and for making pickles, while the branches are used to dye wool a nankin colour.

Templeton, Mass., where he first met Unitarians and soon found the solution of his theological difficulties in their views. He entered the Harvard divinity school, from which he graduated in 1840. In the same year he was ordained pastor of the Unitarian church of Augusta, Maine, where he died on the 26th of January 1853. His widest reputation was as the author of Margaret, a Tale of the Real and the Ideal, including Sketches of a place not before described, called Mens Christi (1835; revised 1851), written to exhibit the errors of Calvinistic and all trinitarian theology, and the evils of war, intemperance, capital punishment, the prison system of the time, and the national treatment of the Indians. This story, published anonymously, attracted much attention by its true descriptions of New England life and scenery as well as by its author's earnest purpose. Richard Edney and the Governor's Family (1850) is in much the same vein as Margaret. A poem entitled Philo, an Evangelist (1850) is a versified defence of Unitarianism. He published, besides, The Church, in a Series of Discourses (1854). As a preacher and pastor he urged the desirability of infant baptism. He lectured frequently on international peace and opposed slavery.

See Arethusa Hall, Life and Character of the Rev. Sylvester Judd (Boston, 1857) published anonymously.

JUDE, THE GENERAL EPISTLE OF, a book of the New Testament. As with the epistle of James, the problem of the writing centre upon the superscription, which addresses in Pauline phraseology (1 Thess. i. 4; 2 Thess. ii. 13; Rom. i. 7; i Cor. i. 2) the Christian world in general in the name of "Jude, the brother of James" (Matt. xiii. 55; Mark vi. 3). The historical situation depicted must then fall within the lifetime of this Judas, whose two grandsons Zoker and James (Hegesippus ap. Phil. Sidet.7) by their testimony before the authorities brought to an end the (Palestinian) persecution of Domitian (Hegesippus ap. Eus. H. E. iii. 20. 7). These two grandsons of Judas thereafter "lived until the time of Trajan," ruling in churches. Their church was evidently "a man of God" (martyrs) and were also relatives of the Lord." But in that case we must either reject the testimony of the same Hegesippus that up to their death, and that of Symeon son of Closas, successor in the Jerusalem see of James the Lord's brother, "who suffered martyrdom at the age of one hundred and twenty years while Trajan was emperor and Atticus governor," "the church (universal) had remained a pure and uncorrupted virgin" free from "the folly of heretical teachers"; or else we must reject the superscription, which presents the grandfather in a most consistent manner with the very heresies in question. For the testimony of Hegesippus is explicit that at the time of the arrest of Zoker and James they were all who survived of the kindred of the Lord. True, there is confusion in the narrative of Hegesippus, and even a probability that the martyrdom of Symeon dated under Trajan really took place in the persecution of Domitian,before the arrest of the grandsons of Jude, for apart from the alleged age of Symeon (the traditional Jewish limit of human life, Gen. vi. 3, Deut. xxxiv. 7), the cause of his apprehension "on the ground that he was a descendant of David and a Christian" (Hegesippus ap. Eus. H. E. iii. 32, 3) is inconsistent with both the previous testimony of Symeon as father and grandfather, and Asia Minor, and forms a handsome low tree with a flat spreading head. In spring it is covered with a profusion of purplish-pink flowers, which appear before the leaves. The flowers have an agreeable acid taste, and are eaten mixed with salad or made into fritters. The tree was frequently figured by the older herbalists. One woodcut by Castor Durante has the figure of Judas Iscariot suspended from one of the branches, illustrating the popular tradition regarding this tree. A second species, C. canadensis, is common in North America from Canada to Alabama and eastern Texas, and differs from the European species in its smaller size and pointed leaves. The flowers are also used in salads and for making pickles, while the branches are used to dye wool a nankin colour.

JUDD, SYLVESTER (1813-1853) American Unitarian clergyman and author, was born in Westhampton, Massachusetts, on the 23rd of July 1813. He bore the same name as his father and grandfather; the former (1750-1800) made an especial study of local history of the towns of the Connecticut valley, and wrote A History of Hadley (1863). The son lived in Northampton, Massachusetts, and Western Texas, and differed from the European species in its smaller size and pointed leaves. The flowers are also used in salads and for making pickles, while the branches are used to dye wool a nankin colour.

JUDD, SYLVESTER (1813-1853) American Unitarian clergyman and author, was born in Westhampton, Massachusetts, on the 23rd of July 1813. He bore the same name as his father and grandfather; the former (1750-1800) made an especial study of local history of the towns of the Connecticut valley, and wrote A History of Hadley (1863). The son lived in North-
corrupting heresy to "Jude the brother of James" will still be incompatible with the statements of Hegesippus, our only informant regarding his later history.

The Greek of Jude is also such as to exclude the idea of authorship in Palestine by an un schooled Galilæan, at an early date in church history. As F. H. Chase has pointed out: (1) the terms σημαίνω, συνέβη, πίστις, have attained their later technical sense; (2) "the writer is steeped in the language of the LXX.," endowing ecclesiastical language independently of other N.T. writers, and not that of the canonical books alone, but of the broader non-Palestinian canon; (3) "he has at his command a large stock of stately, sonorous, sometimes poetical words," proving him "a man of some culture, and, as it would seem, not without acquaintance with Greek writers."

If the superscription be not from the hand of the actual brother of Jesus, the question may well be asked why an apostolic name was not chosen which might convey greater authority? The answer is to be found in the direction toward which the principal defenders of orthodoxy in the last century turned for "the deposit of the faith" (Jude 3) in its purity. The Pastoral Epistles point to "the pattern of sound words, even the sayings of our Lord Jesus Christ." (1 Tim. vi. 3, &c.), as the arsenal of orthodoxy against the same foe (with 1 Tim. vi. 3–10; cf. Jude 4, 11, 16, 18 seq.). Ignatius's motto is to "be inseparable from Jesus Christ and from your bishop." (ad Taurill. vii.), Polycarp's, to "turn unto the word delivered unto us from the beginning" (cf. Jude 3; 1 John ii. 7, iii. 23, iv. 21), "the oracles of the Lord," which the false teachers "pervert to their own lusts." Papias, his ἐπαθείματα (Irenæus turns in fact from the very text to make a parallel from the statements already given) to such as were "delivered by the Lord to the faith," offering to the Christian world his Interpretation of the Lord's Oracles based upon personal inquiry from those who "came his way," who could testify as to apostolic tradition. Hegesippus, after a journey to all the principal seats of Christian tradition, testifies that all are holding to the true doctrine as transmitted at the original seat, where it was witnessed first by the apostles and afterwards by the kindred of the Lord and "witnesses" of the first generation. All these writers in one form or other revert to the historic tradition against the licence of innovators. Hegesippus indicates plainly the seal of its authority. For the period before the adoption of a written standard the resort was not so much to "apostles" as to "disciples" and "witnesses." The appeal was to "those who from the beginning had been eye-witnesses and ministers of the word" (Luke i. 2); and these were to be found primarily (until the complete destruction of that church during the revolt of Barcochebas and its suppression by Hadrian) in the mother community in Jerusalem (cf. Acts xv. 2). Its life is the measure of the period of oral tradition, whose requiem is sung by Papisc. Hegesippus and Irenæus, Polycarp and Jude (cf. the 7 sects), looks back to it as the safe guardian of the deposit "of the faith" against all the depredations of heresy which "when the sacred college of apostles had suffered death in various forms, and the generation of those that had been deemed worthy to hear the inspired wisdom with their own ears had passed away... attempted thenceforth with a bold face, to proclaim, in opposition to the preaching of the truth, the knowledge which is falsely so-called (φευδάσιος γνώσις)." For an appeal like that of our epistle to the authority of the past against the moral laxity and antinomian teaching of degenerate Pauline churches in the Greek world, the natural resort after Paul himself (Pastoral Ep.) would be the "kindred of the Lord" who were the "leaders and witnesses in every church" in Palestine. Doubtless the framers of Jude 1 would have preferred the aegis of "James the Lord's brother," if this, like that of Paul, had not been already appropriated. Failing this, the next most imposing was "Judas, the brother of James." The superscription in the case of Jude, unlike that of James, takes hold of the substance of the book. Verse 3 and the farewell (v. 24 seq.) show that Jude was composed from the start as an "epistle." If this appearance be not fulsome, the obvious relation between the two superscriptions will be best explained by the supposition that the author of Jude gave currency to the existing homily (James) before composing under the pseudonym of Jude. On the interconnexion of the two see Sieffert, s. a. "Judasbrief" In Hauck, Realencykl. vol. ix. Judea is conceived as cherishing the intention of discussing for the benefit of the Christian world (for no mere local church is addressed) the subject of "our common salvation" (the much desiderated authoritative definition of the orthdox faith), but differs from this purpose by the growth of heresy.

Few writings of this compass afford more copious evidence of date in their literary affinities. The references to Enoch (principally ver. 14 seq. = Euth. Eu. i. 9, but cf. F. H. Chase, s. v. "Jude" in Hastings's Dict. Bible) and the Assumption of Moses (v. 9) have more a geographical than a chronological bearing, the stricter canon of Palestine excluding these apocryphal books of 90 B.C. to A.D. 40; but the Pauline writings are freely employed, especially 1 Cor. x. 1–13, Rom. xvi. 25 seq., and probably Eph. and Col. Moreover, the author explicitly refers to the Christian age as already past, and to the fulfilment of the Pauline prediction (1 Tim. iv. 1 seq.) of the advent of heresy (v. 17 seq.). The Pauline doctrine of "grace" has been perverted to lasciviousness, as by the heretics whom Polycarp opposes (Ep. Polyc. vii.), and this doctrine is taught for "hire" (vv. 11, 12, 16; cf. 1 Tim. vi. 5). The unworthy "shepherds" (v. 12; cf. Ezek. xxxiv. 8; John x. 12 seq.) live at the expense of their flocks, polluting the "love-feasts," corrupting the true disciples.

According to Clement of Alexandria this was written prophetically to apply to the Carcopotamians, an antinomian Gnostic sect of c. 150; but hyper-Paulinists had given occasion to similar complaints already in Rev. xi. 14, 20 (q. s). Thus Paulinism and its perversion alike are in the past. As regards the undeniable contact of Didache ii. 7 with Jude 22 seq. (cf. Didache, iv. 1, Jude 8) priority cannot be determined; and the use of 1 John iii. 12 in Jude 11 is doubtful.

On the other hand, practically the whole of Jude is taken up into 2 Pet., the author merely avoiding, so far as he discovers them, the quotations from apocryphal writings, and prefixing and affixing sections of his own to refute the heretical eschatology. On the priority of Jude see especially against Spitta Zur Gesch. Lit. d. Urchristentums, ii. 409–411, F. H. Chase, loc. cit. p. 803. (On 2 Pet. see Peter Epistles ix.) Unfortunately, the date of 2 Pet. cannot be determined as earlier than late in the second century, so that we are thrown back upon internal evidence for the inferior limit.

The treatment of the heresy as the anti-Christ who precedes "the last hour" (v. 18), reminds us of 1 John ii. 18, but it is indicative of conditions somewhat less advanced that the heretics have not yet "gone out from" the church. The treatment of the apostolic age as past, and the deposit of the faith "bequeathed" to us from the apostles, and set before the face of Jude, "the brother of James" against it, favour rather the period of Polycarp and Papias (117–150).

The history of the reception of the epistle into church canons is similar to that of James, beginning with a quotation of it as the work of Jude by Clement of Alexandria (Paed. iii. 8), a reference by Tertullian (De cult. fem. i. 3), and a more or less hesitating endorsement by Origen ("if one might adduce the epistle of Jude," In Moll. tom. xvii. 30) and by the Muratorianum (c. 200), which excepts Jude and 2 and 3 John from its condemnation of apocryphal literature, placing it on a par with the Wisdom of Solomon "which was written by friends of his in his honour." The use of apocryphal literature in Jude itself
may account for much of the critical disposition toward it of many subsequent writers. Eusebius classed it among the "disputed" books, declaring that as with James "not many of the ancients have mentioned it" (H. E. ii. 23, 25).

The *Introduction to the New Testament* by Holtzmann, Jülicher, Weiss, Zahn, Davidson, Salmon, Bacon and the standard Commentaries of the period, the *Apostolic Age*, by Haenchen, and *McGiffert's Biblical Introduction* (2nd ed.), contain discussions of authorship and date. The articles s.s. in *Hastings's Dict. Bible* (Chase) and the *Encyc. Bib.* (Cony) are full and scholarly. In addition the *History of the Apostolic Age*, by Haenchen, containing the kindred works of Baur, Schwegler and Pfleiderer should be consulted. *Moffat's Historical New Testament*, 2nd ed., p. 589, contains a convenient summary of the evidence with copious bibliography.

One of the most recent treatments is the *Commentary on Judges and Second Peter* by J. B. Mayor (1907). (B. W. B.)

**JUDGE** (Lat. *judex*, Fr. *juge*), in the widest legal sense an officer appointed by the sovereign power in a state to administer the law; in English practice, however, justices of the peace and magistrates are not usually regarded as "judges" in the titular sense. The duties of the judge, whether in a civil or a criminal matter, are to hear the statements on both sides in open court, to arrive at a conclusion as to the truth of the facts submitted to him or, when a jury is engaged, to direct the jury to find such a conclusion, to apply to the facts so found the appropriate rules of law, and to certify by his judgment the relief to which the parties are entitled or the obligations or penalties which they have incurred. With the judgment the office of the judge is at an end, but the judgment sets in motion the executive forces of the state, whose duty it is to carry it into execution.

Such is the type of a judicial officer recognized by mature systems of law, but it is not to be accepted as the universal type, and the following qualifying circumstances should be noticed: (1) in primitive systems of law the judicial is not separated from the legislative and other governing functions; (2) although the judge is assumed to take the law from the legislative authority, yet, as the existing law never at any time contains provision for all cases, the judge may be obliged to invent or create principles applicable to the case—this is called by Bentham and the English jurists judge-made and judiciary law; (3) the separation of the function of judge and jury, and the exclusive charge of questions of law given to the judge, are more particularly characteristic of the English judicial system. During a considerable period in the history of Roman law an entirely different distribution of parts was observed. The adjudication of a case was divided between the *magistratus* and the *judex*, neither of whom corresponds to the English judge. The former was a public officer charged with the execution of the law; the latter was an arbitrator whom the magistrates commissioned to hear and report upon a particular case.

The following are points more specially characteristic of the English system and its kindred judicial systems: (1) Judges are absolutely protected from action for anything that they may do in the discharge of their judicial duties. This is true in the fullest sense of judges of the superior courts. "It is a principle of English law that no action will lie against a judge of one of the superior courts for a judicial act, though it be alleged to have been done maliciously and corruptly." Other judicial officers are also protected, though not to the same extent, against actions. (2) The highest class of judges are irremovable except by what is in effect a special act of parliament, viz. a resolution passed by both houses and assented to by the sovereign. The inferior judges and magistrates are removable for misconduct by the lord chancellor. (3) The judiciary in England is not a separate profession. The judges are chosen from the class of advocates, and almost entirely according to their eminence at the bar. (4) Judges are in England appointed for the most part by the crown. In a few cases municipal corporations may appoint their own judicial officer.

See also *Lord High Chancellor; Lord Chief Justice; Master of the Rolls, &c.*, and the accounts of judicial systems under country headings.

**JUDGE-ADVOCATE-GENERAL**, an officer appointed in England to assist the Crown with advice in matters relating to military law, and more particularly as to courts-martial. In the army the administration of justice as pertaining to discipline is carried out in accordance with the provisions of military law, and it is the function of the judge-advocate-general to ensure that these disciplinary powers are exercised in strict conformity with that law. Down to 1793 the judge-advocate-general acted as secretary and legal adviser to the board of general officers, but on the reconstitution of the office of commander-in-chief in that year he ceased to perform secretarial duties, but remained chief legal adviser. He retained his position until 1806 when he was made a member of the government and a privy councillor. The office ceased to be political in 1892, on the recommendation of the select committee of 1888 on army estimates, and was conferred on Sir F. J. Eusebius (afterwards Lord St Helier). There was no salary attached to the office when held by Lord St Helier, and the duties were for the most part performed by deputy. On his death in 1905, Thomas Milvain, K.C., was appointed, and the terms and conditions of the post were rearranged as follows: (1) A salary of £2000 a year; (2) the holder to devote the whole time to the duties of the post; (3) the retention of the post until the age of seventy, subject to continued efficiency—but with claim to gratuity or pension on retirement. The holder was to be subordinate to the secretary of state for war, without direct access to the sovereign. The appointment is conferred by letters-patent, which define the exact functions attaching to the office, which practically are the reviewing of the proceedings of all field-general, general and district courts-martial held in the United Kingdom, and advising the sovereign as to the confirmation of the finding and sentence. The judge-advocate is a salaried official in the department of the judge-advocate-general and acts under his letters-patent. A separate judge-advocate-general's department is maintained in India, where at one time deputy judge-advocates were attached to every important command. All general courts-martial held in the United Kingdom are sent to the judge-advocate-general, to be by him submitted to the sovereign for confirmation; and all district courts-martial, after having been confirmed and promulgated, are sent to his office for examination and custody. The judge-advocate-general and his deputy, being judges in the last resort of the validity of the proceedings of courts-martial, take no part in their conduct; but the deputy judge-advocates frame and revise charges and attend at courts-martial, swear the court, advise both sides on law, look after the interests of the prisoner and record the proceedings. In the English navy there is an official whose functions are somewhat similar to those of the judge-advocate-general. He is called counsel and judge-advocate of the fleet.

In the United States there is also a judge-advocate-general's department. In addition to being a bureau of military justice, it collects and arranges the records of courts-martial, courts of inquiry and military commissions. It has the custody of all papers relating to the title of lands under the control of the war department. The officers of the department, in addition to acting as prosecutors in all military trials, sometimes represent the government when cases affecting the army come up in civil courts.

**JUDGES, THE BOOK OF**, in the Bible. This book of the Old Testament, which, as we now read it, constitutes a sequel to the book of Joshua, covering the period of history between the death of this conqueror and the birth of Samuel, is so called because it contains the history of the Israelites and the establishment of the monarchy, when the government was in the hands of certain leaders who appear to have formed a continuous succession, although the office was not hereditary. The only other biblical source ascribed to this period is Ruth, whose present position as an appendix to Judges is not original (see *Bible and Ruth*).

*Structure.*—It is now generally agreed that the present arrangement of the older historical books of the Old Testament to form a continuous record of events from the creation to the Babylonian
JUDGES, BOOK OF

exile is due to an editor, or rather to successive redactors, who pieced together and reduced to a certain unity older memoirs of very different dates; and closer examination shows that the continuity of many parts of the narrative is more apparent than real. This is very clearly the case in the book of Judges. It consists of three main portions: (1) an introduction, presenting one view of the occupation of Palestine by the Israelites (i. 1–ii. 20); (2) the history of the several judges (ii. 6–xvi.); and (3) an appendix containing two narratives of the period.

1. The first section relates events which are said to have taken place after the death of Joshua, but in reality it covers the same ground with the book of Joshua, giving a brief account of the occupation of Canaan, which in some particulars repeats the statements of the previous book, while in others it is quite independent (see JOSUA). It is impossible to regard the war-like expeditions described in this section as supplementary campaigns undertaken after Joshua's death; they are plainly represented as the first efforts of the Israelites to gain a firm footing in the land (at Hebron, Debir, Bethel), in the various cities which Joshua is related to have subdued (Josh. x. 39). Here then we have an account of the settlement of Israel west of the Jordan which is parallel to the book of Joshua, but makes no mention of Joshua himself, and places the tribe of Judah in the front. The author of the chapter cannot have had Joshua or his history in his eye at all, and the words "and it came to pass after the death of Joshua" in Judg. i. 2 are from the hand of the last editor, who desired to make the whole book of Judges, including this section, an independent narrative which now precedes it in the canon of the earlier prophets.

2. The second and main section (ii. 6–xvi.) stands on quite another footing. According to Josh. xxiv. 31 the people "served Yahweh" during the lifetime of the great conqueror and his contemporaries. In Judg. ii. 7 this statement is repeated, and the writer proceeds to explain that subsequent generations fell away from the faith, and served the gods of the nations among which they dwelt (ii. 6–iii. 6). The worship of other gods is represented, not as something which went on side by side with Yahweh-worship (cf. x. 6), but as a revolt against Yahweh, periodically repeated and regularly chastised by foreign invasion. The history, falls into recurring cycles, each of which begins with religious corruption, followed by chastisement, which continues until Yahweh, in answer to the groans of his oppressed people, raises up a "judge" to deliver Israel, and recall them to the true faith. On the death of the "judge," if not sooner, the corruption spreads anew and the same vicissitudes follow. This religious explanation of the course of the history, formally expounded at the outset and repeated in more or less detail from chapter to chapter (esp. chs. 3–35, 8–9, 15–17) determines the form of the whole narrative. It is in general agreement with the spirit as also with the language of Deuteronomy, and on this account this section may be conveniently called "the Deuteronomic Book of Judges." But the main religious ideas are not so late and are rather akin to those of Josh. xxiv; in particular the worship of the high places is not condemned, nor is it excused as in 1 Kings iii. 2. The sources of the narrative are obviously older than the theological exposition of its lessons, and herein lies the value and interest of Judges. In some respects the narrative of the encounters with the Canaanites lies not so much in the events they record as in the unconscious witness they bear to the state of society in which the narrator or poet lived. From this point of view the parts of the book are by no means all of equal value; critical analysis shows that often parallel or distinct narratives have been fused together, and that, whilst the older stories gave more prominence to ordinary human motives and combinations, the later are coloured by religious reflection and show the characteristic tendency of the Old Testament to re-tell the fortunes of Israel in a form that lays ever-increasing weight on the work of Yahweh for his people. That the pre-Deuteronomic sources are to be identified with the Judaean (J, or Yahwist) and Ephramite (E, or Elohist) strands of the Hexateuch is, however, not certain.

This introduction of Deuteronomic pragmatism in the main stock of the book of Judges corresponds a unity of chronological scheme. The "judges," in spite of the fact that most of them had clearly no more than a local influence, are all represented as successive rulers in Israel, and the history is dated by the years of each judge'siphip and those of the intervening periods of oppression. But it is impossible to reconcile the numbers with the statement elsewhere that the fourth year of Solomon was the 480th from the exodus (1 Kings vi. 1). See Bible: Chronology.

The general introduction (ii. 6–iii. 6) is a blend of Deuteronomic and other sources. The intimate relationship between it and the separate narratives (Josh. xxiv. 1–27, a late Ephramite record) inserted by a second Deuteronomic hand, and xxiii., D) appears both from their contents and from the fact that Judg. ii. 6–10 is almost identical with the narrative appended to Joshua's reports (Joshua xxvii. 1–33). Judg. i. ii. 5, however, is not touched by D, and hence was probably inserted in its present position at a later date. According to the highly intricate introduction the Hebrews were oppressed: (a) by Yahweh himself in the wilderness; (b) by the Canaanites whom they married with the Canaanites and worshipped their gods (iii. 2, 6); (c) to test their loyalty to Yahweh (lii. 22; iii. 1); or (c) to punish them for the marriage with the Canaanites and their apostasy (D in li. 12; cf. Josh. xxiii., and ibid. v. 12).

To this succeeds a noteworthy example of the Deuteronomic treatment of tradition in the achievement of Othniel (g.1.) the only judge "from the tribe of Judah." The bareness of detail, not to speak of the improbability of the situation, renders its genuineness doubtful, and the passage is one of the indications of a secondary Deuteronomic redaction. The case, however, is exceptional; the stories of the other great judges were not rewritten or to any great extent re-worked by the Deuteronomic redactor, and his hand appears chiefly in the framework. Thus, in the story of Ehud and the defeat of Moab (iv. 15, 29–30) the Deuteronomic editor combines two homogeneous, vv. 19 and 20 appear to be variants, and the mention of Israel (v. 27b) is characteristic of the tendency to treat local troubles as national oppressions, whereas other records represent little national unity at this period (v. v.). See further Judges.

According to the Septuagint addition to Josh. xxiv. 33, Moab was the first of Israel's oppressors. The brief notice of Shamgar, who delivered Israel from the Philistines (iii. 31), is one of the later insertions, and in some MSS. of the LXX. it stands after xvi. 31. The story of the defeat of Sisera appears in two distinct forms, an earlier, in poetical form (v.), and a later, in prose (iv.). D's framework is to be seen in iv. 1–2; 7, 10–14 (probably found further DEBORAH). The Midianite oppression (vi.–viii.), is contained in the usual frame (vi. 1–6; vii. 27 seq.), but is not homogeneous, since vii. 4, the pursuit of the kings, cannot be the sequel of vii. 3 where XX. + XXX. 31–35 (i.e. xxiv. 30–31), are inserted. In vi.–vii. 3 is particularly intricate; vi. 25–32 does not continue vi. 11–24 (there are two accounts of Gideon's introduction and diversions in vii. 2–9 and 16–22, the former of which is that of viii. 1–10, and the latter, and vi. 36–40 (with "God") is strange after the description of the miracle in vi. 21 seq. (with "Yahweh"). Further, there are difficulties in vii. 34, viii. 6 seq., viii. 1, when compared with vii. 2–8, and vii. 16–22 two stratagems are combined. There are two sequences: vii. 23 seq. and viii. 4; with the former contrast vi. 35; with viii. 3–1 cf. xii. 6, and see below. Chapter viii. 22 seq. comes unexpectedly, and is the result of (b) Samson (vii. 7; x. 19; xii. 17). The conclusion, however, shows that Jerubbaal had only a local reputation. Finally, the condemnation of the ephod as part of the worship of Yahweh (vi. 26) agrees with the thought in vi. 25–32 as against that in vii. 11–24. (See EPHOD; GIDEON.) Chapter ix. (see ABIMELECH appears to have been wanting in the Deuteronomic book of Judges, but inserted later perhaps by means of the introduction, vii. 30–32. It has two accounts of the attack upon Shechem (lx. 26–41 and 42–49). After a brief notice of two "minor judges" (see below), follows the story of Jephthah. It concludes with the usual Deuteronomic

1. This is confirmed by the circumstance that in Judg. ii. 1 the "angel of Yahweh," who, according to Exod. xiv. 24, xxii. 20, xxxii. 34, xxxii. 2, 7 seq., must be viewed as having his local manifestation at the head quarters of the host of Israel, is still found at Gilgal and not at Shiloh.

2. The chapter was written after Israel had become strong enough to make the Canaanite cities tributary. It narrates, after the establishment of the monarchy (see 1 Kings 20–21),
formula (xii. 7), but is prefaced by a detailed introduction to the oppression of Israel (x. 6 sq.), by the inclusion of the Philistines among the oppressors (x. 7, 9), and by the prophet of God, Micah, among the oppressed. It appears to have been written in such a way not merely for the story of Samson, a hero of local interest, but also for the purposes of the Gileadites and Judah for whom Samson's sacrifice was a saving for Benjamin. How much older tradition underlies these stories is questionable. It is very doubtful whether Hosea's allusion to the depravity of Gibeon (x. 7, 11) is to be regarded either, but it is not impossible that whilst Gibeon and Jabesh-Gilead, which appear here in a bad light, are known to be associated with Saul, the sufferer is a Levite of Bethlehem, the traditional home of David. The account of the fight in x. 11 is reminiscent of Joshua's battle at Ai (Josh. vii.-viii.).

**Historical Value.**—The book of Judges consists of a number of narratives collected by Deuteronomic editors, to the same circle are due accounts of the invasions of Palestine and settlement in Joshua, and of the foundation of the monarchy in 1 Samuel. The connexion has been broken by the later insertion of matter (not necessarily of late date itself), and the whole was finally formed into a distinct book by a post-exilic hand. The dates of the older stories preserved in ii. 6-xvi. 6 are quite unknown. If they are trustworthy for the period to which they are relegated (probably 14th-12th cent. B.C.) they are probably of very great antiquity, but if they belong to the sources J and E of the Hexateuch (at least some four or five centuries later) their value is seriously weakened. On the other hand, the belief that the monarchy had been preceded by national "judges" may have led to the formation of the collection. It is evident that there was more than one period in Israelite history in which one or other of these stories of local heroes would be equally suitable. They reflect tribal rivalry and jealousy (cf. Isa. ix. 21, and the successors of Jeroboam ii), attacks by nomads and wars with Ammon and Moab; but the story of settlement, that of Canaanites and indigenous Canaanites have been suggested as explanations for the reference to the Judges, and it is not impossible that the post-Deuteronomic writer who inserted ch. ix. so understood the record. A striking exception to the lack of unity among the tribes is afforded by the account of the defeat of Sisera, and here the old poem represents a combined effort to throw off the yoke of a foreign oppressor, while the later prose version approximates the standpoint of Josh. xii. 1-15, with its defeat of the Canaanites. The general stand-point of the stories (esp. Judg. v.) is that of central Palestine; the exceptions are Othniel and Samson—the latter inter-gallicating the introduction in x. 1, and its sequel, the former now entirely due to the Deuteronomic editor. Of the narratives which precede and follow, ch. i. represents central Palestine separated by Canaanite cities from tribes to the south and north; it is the situation recognized in Judg. xix. 10-12, as well as in passages imbedded in the latest portions of the book of Joshua, though it is in contradiction to the older traditions of Joshua himself. Chapters xvii.-xxi., consisting of two narratives independent of one another and of the main stock of the book, with which they are not brought into any chronological connexion. They appear to owe their position to the latest redactor (akin to the latest stratum in the Hexateuch) who has heavily worked over xix.-xxi., and put the book into its present form by the addition of i.-ii. 5, ix. and possibly of v. The first narrative, that of Micah and the Danites, is of the highest importance for the study of the state of religion and social life in the period of Judges (c. 800-600 B.C.) and it gives of the way in which one clan passed from the condition of an invading band into settled possession of land and city. Its interest (xii. seq.) lies in the foundation of the EphRAImite sanctuary by Micah at Mt. Ephron in Judah. There are some repetitions in the account, but there is not enough evidence to restore two complete stories. The history of the Levite and the Benjamites is of quite another kind, and presupposes the presence of a large and united body of tribesmen in the north of Israel, but it gives of the break-up of the national unity among the tribes of Israel which it is not easy to reconcile with the rest of the book. In its present form this episode appears to be not very ancient; it resembles Ruth in giving a good deal of accurate archeological detail (the feast at Shiloh) in a form which suggests that the usages referred to were already obsolete when the narrative was composed. It appears to consist of an old story which has been heavily worked over, and it gives of the rise of the Judges. The older parts are preserved in xix.; the account of the Levite of Mt. Ephron (Gen. xxxviii. 1-7) is not from the Hexateuch, but it is not altogether certain whether it is a composition of the later period (c. 350 B.C.) or an ancient one. The primary event is the fall of the city of Jabesh-Gilead (xxi. 13), which is here assigned to the northern tribes, and the reconstruction of the tribe by intermarriage with the women of Shiloh (xxii. 1, 15, 17-19, 21-22). The post-exilic expansions (found chiefly in xxii., 2-14.) may be conjectured that the introduction originally formed the prelude to the rise of Saul: the intervening narratives, though not necessarily stamped with the mark of the age in which they were inserted. See S. A. Cook, Crit. Notes on T. Hist., p. 127 seq.

2 Tola and Puah (x. 1) are clans of Issachar (Gen. xvi. 13), for Jacob in x. 11, and for Eun. (xii. 11). See also Gen. xvi. 14. See Genealogy: Biblical.

3 To the same post-exilic hand may also be ascribed the introduction of the "minor judges" (so several critics), and smaller additions here and there (cf. the opening words, vii. 4, 8 seq. [contrast 21] 18; viii. 30-32; xi. 2, &c.).

4 It 16, 24 seq.) describe the punishment of Benjamin by the religious assembly and the massacre of Jabesh-Gilead for its refusal to join Israel. The Book of Judges is the only book of the Old Testament in which the phrase "gibeonites" is employed to denote the people of Gibeon, who are here described as "opposed" to Saul, and who are elsewhere represented as bringing a gift for Benjamin. How much older tradition underlies these stories is questionable. It is very doubtful whether Hosea's allusion to the depravity of Gibeon (x. 7, 11) is to be regarded either, but it is not impossible that whilst Gibeon and Jabesh-Gilead, which appear here in a bad light, are known to be associated with Saul, the sufferer is a Levite of Bethlehem, the traditional home of David. The account of the fight in x. 11 is reminiscent of Joshua's battle at Ai (Josh. vii.-viii.).
in which that adjudication is expressed; (3) the opinions of the judges expressed in a review of the facts and law applicable to the controversy leading up to the adjudication expressed in the formal document. When the judgment has been passed and entered and recorded it binds the parties; the controversy comes to an end (transit in rem judicatam), and the person in whose favour the judgment is entered is entitled to enforce it by the appropriate method of execution. There has been much controversy among lawyers as to the meaning of the expressions "final" and "interlocutory" as applied to judgments, and as to the distinction between a "judgment," a "decree," and an "order." These disputes arise upon the wording of statutes or rules of court and with reference to the appropriate times or modes of appeal or of execution.

The judgments of one country are not as a rule directly enforceable in another country. In Europe, by treaty or arrangement, foreign judgments are in certain cases and on compliance with certain formalities made executory in various states. A similar provision is made between England, Scotland and Ireland, for the registry and execution in each country of certain classes of judgments given in the others. But as regards the rest of the king's dominions and foreign states, a "foreign" judgment is in England recognized only as constituting a cause of action which may be sued upon in England. If given by a court of competent jurisdiction it is treated as creating a legal obligation to pay the sum adjudged to be due. Summary judgment may be entered in an English action based on a foreign judgment unless the defendant can show that the foreign court had no jurisdiction, or the judgment was obtained by fraud, duress or by collusion, or that there was fraud on the part of the foreign court or the successful party, or that the foreign proceedings were contrary to natural justice, e.g., concluded without due notice to the parties affected. English courts will not enforce foreign judgments as to foreign criminal or penal or revenue laws.

JUDGMENT DEBTOR, in English law, a person against whom a judgment ordering him to pay a sum of money has been obtained and remains unsatisfied. Such a person may be examined as to whether any and what debts are owing to him, and if the judgment creditor has a particular cause of action, or that there was fraud on the part of the foreign court or the successful party, or that the foreign proceedings were contrary to natural justice, e.g., concluded without due notice to the parties affected. English courts will not enforce foreign judgments as to foreign criminal or penal or revenue laws.

JUDGMENT DEBTOR, in English law, a person against whom a judgment ordering him to pay a sum of money has been obtained and remains unsatisfied. Such a person may be examined as to whether any and what debts are owing to him, and if the judgment creditor has a particular cause of action, or that there was fraud on the part of the foreign court or the successful party, or that the foreign proceedings were contrary to natural justice, e.g., concluded without due notice to the parties affected. English courts will not enforce foreign judgments as to foreign criminal or penal or revenue laws.

JUDGMENT SUMMONS, in English law, a summons issued under the Debtors Act 1869, on the application of a creditor who has obtained a judgment for the payment of a sum of money by instalments or otherwise, where the order for payment has not been complied with. The judgment summons cites the defendant to appear personally in court, and be examined on oath as to the means he has, or had, since the date of the order or judgment made against him, to pay the same, and to show cause why he should not be committed to prison for his default. An order of commitment obtained in a judgment summons remains in force for a year only, and the extreme term of imprisonment is six weeks, dating from the time of lodging in prison. When a debtor has once been imprisoned, although for a period of less than six weeks, no second order of commitment can be made against him in respect of the same debt. But if the judgment be for payment by instalments a power of committal arises on default of payment for each instalment. If an order of commitment has never been executed, or becomes inoperative through lapse of time, a fresh commitment may be made. Imprisonment does not operate as a satisfaction or extinguishment of a debt, or deprive a person of a right of execution against the land or goods of the person imprisoned in the same manner as if there had been no imprisonment.

JUDICATURE ACTS, an important series of English statutes having for their object the simplification of the system of judicature in its higher branches. They are the Supreme Court of Judicature Act 1873 (36 & 37 Vict. c. 66) and the Supreme Court of Judicature Act 1875 (38 & 39 Vict. c. 77), with various amending acts, the twelfth of these being in 1899. The act of 1873 the court of chancery, the court of queen's (king's) bench, the court of common pleas, the court of exchequer, the high court of admiralty, the court of probate and the court of divorce and matrimonial causes were consolidated into one Supreme1 Court of Judicature (sec. 3), divided into two permanent divisions, called "the high court," with (speaking broadly) original jurisdiction, and "the court of appeal" (sec. 4). The objects of the act were threefold—1st, to reduce the hitherto independent courts of common law and equity into one supreme court; secondly, to establish for all divisions of the court a uniform system of pleading and procedure; and thirdly, to provide for the enforcement of the same rule of law in those cases where chancery and common law recognized different rules. It can be seen at once how bold and revolutionary was this new enactment. By one section the august king's bench, the common pleas, in which serjeants only had formerly the right of audience, and the exchequer, which had its origin in the reign of Henry I., and all their jurisdiction, criminal, legal and equitable, were vested in the new court. It must be understood, however, that law and equity were not fused in the sense in which that phrase has generally been employed. The chancery division still remains distinct from the common law division, having a certain range of legal questions under its exclusive control, and possessing to a certain extent a peculiar machinery of its own for carrying its decrees into execution. But all actions may now be brought in the high court of justice, and, subject to such special assignments of business as that alluded to, may be tried in any division thereof.

There were originally three common law divisions of the High Court corresponding with the three former courts of common law. But after the death of Lord Chief Baron Kelly on the 17th of September 1886, and of Lord Chief Justice Cockburn on the 20th of November 1886, the common pleas and exchequer divisions were (by order in council, 10th December 1886) consolidated with the king's bench division into one division under the presidency of the lord chief justice of England, to whom, by the 25th section of the Judicature Act 1881, all the statutory jurisdiction of the chief baron and the chief justice of the common pleas was transferred. The high court, therefore, now consists of the chancery division, the common law division, under the name of the king's bench division; and the probate, divorce and admiralty division. To the king's bench division is also attached, by order of the lord chancellor (Jan. 1, 1884), the business of the London court of bankruptcy.

For a more detailed account of the composition of the various courts, see CHANCERY; KING'S BENCH; PROBATE, DIVORCE AND ADMIRALTY COURT.

The key stone of the structure created by the Judicature Acts was a strong court of appeal. The House of Lords remained the last court of appeal, as before the acts, but its judicial functions were virtually transferred to an appeal committee, consisting of the lord chancellor and other peers who have held high judicial office, and certain lords of appeal in ordinary created by the act of 1873 (see Appeal).

The practice and procedure of the Supreme Court are regulated by rules made by a committee of judges, to which have been added the rules of the law society, the bar council and the master of the rolls. The committee consists of the lord chancellor and one other person nominated by the lord chancellor. The rules now in force are those of 1883, with some subsequent amendments. With the appendices they fill a moderate-sized volume. The rules are made quite clear, and it is possible to obtain a copy of the rules without delay. The Supreme Court has jurisdiction in appeals from any court having admiralty jurisdiction, and it is possible to obtain a copy of the rules without delay. The Supreme Court has jurisdiction in appeals from any court having admiralty jurisdiction.

1 The comte de Franqueville in his interesting work, Le Système judiciaire de la Grande Bretagne, criticizes the use of the words "appeal" and "court" in English law.

2 The act of
JUDITH, BOOK OF

The most important matter dealt with by the rules is the mode of pleading. The authors of the Judicature Act had before them two systems of pleading, and the result of which they were called upon to choose was thus described by Mr. Justice Wilson, 38 Ch. D. 72, at p. 76. The effect of the rules may be thus summarized: (1) In the chancery division no trial by jury unless ordered by the judge. (2) Generally the judge may order a trial without consent of parties, or which involves prolonged investigation of documents or accounts, or which involves the examination of witnesses by local inquiries. If any party has a right to a jury in actions of slander, libel, false imprisonment, malicious prosecution, seduction or breach of promise of marriage, upon notice, for trial. (3) Or in any other action, by order. (4) Anything done by the judge at early stage would seem to demand a prescience and intelligent anticipation of future events which can hardly be expected of a master, or even a judge in chambers, except in simple cases, involving a single issue of law or fact which the parties are agreed in presenting to the court. The effect of the rules is that the plaintiff cannot deliver his statement of claim, or take any step in the action without the leave of the judge. In chancery cases the order usually made is that the plaintiff, if dissatisfied with the order, may appeal to the court of king's bench. A judgment should be delivered immediately after the appearance of the defendant, and upon such summons an order is to be made respecting pleadings, and a number of interlocutory proceedings. To make such an order at that early stage would seem to demand a prescience and intelligent anticipation of future events which can hardly be expected of a master, or even a judge in chambers, except in simple cases, involving a single issue of law or fact which the parties are agreed in presenting to the court.

Further steps have been taken with a view to simplification of procedure. By Order xxx. rule 1 (as amended in 1897), a summons, answer, traverse or demurrer must be in a separate paper, and demurrers must be answered or amended immediately after the appearance of the defendant, and upon such summons an order is to be made respecting pleadings, and a number of interlocutory proceedings. To make such an order at that early stage would seem to demand a prescience and intelligent anticipation of future events which can hardly be expected of a master, or even a judge in chambers, except in simple cases, involving a single issue of law or fact which the parties are agreed in presenting to the court.

The effect of the rules is that the plaintiff cannot deliver his statement of claim, or take any step in the action without the leave of the judge. In chancery cases the order usually made is that the plaintiff, if dissatisfied with the order, may appeal to the court of king's bench. A judgment should be delivered immediately after the appearance of the defendant, and upon such summons an order is to be made respecting pleadings, and a number of interlocutory proceedings. To make such an order at that early stage would seem to demand a prescience and intelligent anticipation of future events which can hardly be expected of a master, or even a judge in chambers, except in simple cases, involving a single issue of law or fact which the parties are agreed in presenting to the court.

The judges seem to have been dissatisfied with the effect of their former rules, for in 1883 they issued a fresh set of consolidated rules, which, with subsequent amendments, are those now in force. By these rules a further attempt was made to prono the exuberance of procedure, and forms of pleading were given in the appendix for adoption by the pleader. It is true that these forms do not display a high standard of excellence in drafting, but it was said that many of them were undoubtedly reasonable, and that important announcements were abolished, and instead thereof it was provided that any point of law raised by the pleadings should be disposed of at or after the trial, provided that by consent or order of the court the same might be set down and disposed of before the trial (Order xxx. rules 1, 2). This, in the opinion of Lord Davey in 1902 (Ency. Brit., 10th ed., xxx. 146), was a disastrous change. The right of either party to check had a prejudicial effect on the standard of legal accuracy and knowledge required in practitioners. Formerly the pleader had the fear of a demurrer before him. Nowadays he need not be as careful either in his case or in action or defence will hold water or not, and anything which is obviously frivolous or vexatious will do by way of pleading for the purpose of the trial and for getting the opposite party into the box.

Judith, a book of the Old Testament, takes its name from the heroine Judith (Judith, Ioudhē, i.e. חַוָּה, Jewess), to whom the last nine of its sixteen chapters relate. In the Septuagint and Vulgate it immediately precedes Esther, and along with Tobit comes after Nehemiah; in the English Apocrypha it is placed between Tobit and the apocryphal additions to Esther.

Argument.—In the twelfth year of his reign Nebuchadnezzar, who is described as king of Assyria, having his capital in Nineveh, makes war against Arphaxad, king of Media, and overcomes him in his seventeenth year. He then dispatches his chief general Holophernes to take vengeance on the nations of the west who had withheld their assistance. This expedition has already succeeded in its main objects when Holophernes proceeds to attack Judæa. The children of Israel, who are described as having newly returned from captivity, are apprehensive of a desecration of their sanctuary, and resolve on resistance to the uttermost. The inhabitants of Bethulia (Bethulia) and Betomes-tham in particular (neither place can be identified), directed by Joachim the high priest, guard the mountain passes near Dothaim, and place themselves under God's protection. Holophernes now inquires of the chiefs who are with him about the Israelites, and is answered by Achor the leader of the Ammonites, who enters upon a long historical narrative showing the Israelites to be invincible except when they have offended God. For this reason he is punished by being handed over to the Israelites, who lead him to the mountain passes. The next day the siege begins, and after forty days the famished inhabitants urge the governor Ozias to surrender, which he consents to do unless relieved in five days. Judith, a beautiful and pious widow of the tribe of Simeon, now appears on the scene with a plan of deliverance. Wearing her rich attire, and accompanied by her maid, who carries a bag of provisions, she goes over to the hostile camp, where she is at once conducted to the general, whose suspicions are dispersed by the tales she invents. After four days Holophernes, smitten with her charms, at the close of a
JUDSON—JUEL, J.

543

sumptuous entertainment invites her to remain within his tent over night. No sooner is he overcome with sleep than Judith, seizing his sword, strikes off his head and gives it to her maid; both now leave the camp (as they had previously been accustomed to do, ostensibly for prayer) and return to Bethulia, where the trophy is displayed amid great rejoicings and thank-givings. Achior now publicly professes Judaism, and at the instance of Judith the Israelites make a sudden victorious onslaught on the enemy. Judith now sings a song of praise, and all go up to Jerusalem to worship with sacrifice and rejoicing. The book concludes with a brief notice of the closing years of the heroine.

**Versions.**—Judith was written originally in Hebrew. This is shown not only by the numerous Hebrewisms, but also by mistranslations of the Greek translation, as in ii. 2, iii. 9, and other passages (see also the translation of Origen (Ep. ad Afric. 13) that the book was not received by the Jews among their apocryphal writings. In his preface to Judith, Jerome says that he based his Latin version on the Chaldee, which the Jews reckoned among their Hagiographa. Ball (Spelker's Apocrypha, i. 243) holds that the Chaldee text used by Jerome was a free translation or adaptation of the Hebrew. The book exists in two forms: the shorter, which is preserved only in Hebrew (see under Hebrew Midrashim below), is, according to Scholz, Lipsius, Ball and Gaster, the older; the longer form is that contained in the versions.

**Greek Version.**—This is found in three recensions: (1) in A B; (2) in C, as in Hulst's edition; (3) in codex 58, the source of the old Latin and Syriac.

**Syriac and Latin Versions.**—Two Syriac versions were made from the Greek—the first, that of the Peschito; and the second, that of Paul of Tella, the so-called Hexapleric. The Old Latin derived from the Greek, as we have remarked above, and Jerome's from the Old Latin, under the control of a Chaldee version.
adherent of the mercantile system, and laboured vigorously for the industrial development of Denmark and Norway. For an aristocrat of the old school he was liberally inclined, but only favoured petty reforms, especially in agriculture, while he regarded emancipation of the serfs as quite impracticable. Juel made no secret of his preference for absolutism, and was one of the few patriots who accepted the title of baron. He saw some military service during the Scanian War, distinguishing himself at the siege of Venedieh and by his swift decision. The critical moment materially contributing to his brother Niels's naval victory in the Bay of Kjøge. To his great honour he remained faithful to Griffenfeld after his fall, enabled his daughter to marry handsomely, and did his utmost, though in vain, to obtain the ex-chancellor's release from his dungeon.

See Carl Frederik Bicks, Dansk biografisk lex., art. "Juel" (1887, &c.); Adolf Didtev Jørgensen, P. Schumacher Griffenfeld (1893-1894). (R. N. B.)

JUEL, NIELS (1609-1674) Danish admiral, brother of the preceding, was born on the 8th of May 1630, at Christiania. He served his naval apprenticeship with Van Tromp and De Ruyter, taking part in all the chief engagements of the war of 1632-54 between England and Holland. During a long indisposition at Amsterdam in 1655-56 he acquired a thorough knowledge of ship-building, and returned to Denmark in 1656 a thoroughly equipped seaman. He served with distinction during the Swedo-Danish wars of 1658-66 and took a prominent part in the defence of Copenhagen against Charles X. During fifteen years of peace, Juel, as admiral of the fleet, laboured assiduously to develop and equip the Danish navy, and when at the outset setting over his head in 1663 of Cort Adelaar on his return from the Turkish wars. In 1666 Juel married Margrethe Ulfeldt. On the outbreak of the Scanian War he served at first under Adelaar, but on the death of the latter in November 1675 he was appointed to the supreme command. He then won a European reputation, and raised Danish sea-power to unprecedented eminence, by the system of naval tactics, afterwards perfected by Nelson, which consists in cutting off a part of the enemy's force and concentrating the whole attack on it. He first employed this manoeuvre at the battle of Jasmund off Rügen (May 25, 1676) when he broke through the enemy's line in close column and cut off five of their ships, which, however, nightfall prevented him from pursuing. Juel's operations were considerably hampered by this period by the overbearing conduct of his Dutch auxiliary, Philip Almonde, who falsely accused the Danish admiral of cowardice. A few days after the battle of Jasmund, Cornelius Van Tromp the younger, with 17 fresh Danish and Dutch ships of the line, superseded Juel in the supreme command. Juel took a leading part in Van Tromp's great victory off Öland (June 1, 1676), which enabled him to invade Sweden, though unsuccessful. On June 1667 Juel defeated the Swedish admiral Sjöblad off Möen; on the 30th of June 1677 he won his greatest victory, in the Bay of Kjøge, where, with 25 ships of the line and 1267 guns, he routed the Swedish admiral Evert Horn with 36 ships of the line and 1800 guns. For this great triumph, the just reward of superior seamanship and strategy—at an early stage of the engagement Juel's experienced eye told him that the wind in the course of the day would shift from S.W. to W. and he took extraordinary risks accordingly—he was made lieutenant admiral general and a privy councillor. This victory, besides permanently crippling the Swedish navy, gave the Danes a self-confidence which enabled them to keep their Dutch allies in their proper place. In the following year Van Tromp, whose hard-headedness had become unbearable, was discharged by Christian V., who gave the supreme command to Juel. In the spring of 1678 Juel put to sea with 84 ships carrying 2400 cannon, but as the Swedes were no longer strong enough to encounter such a formidable armament on the open sea, his operations were limited to blockading the Swedish ports and transporting troops to Rügen. After the peace of Lund Juel showed himself an administrator and reformer of the first order, and under his energetic supervision the Danish navy ultimately reached imposing dimensions, especially after Juel became chief of the admiralty in 1683. Personally Juel was the noblest and most amiable of men, equally beloved and respected by his sailors, simple, straightforward and unpretentious in all his ways. During his latter years he was popularly known in Copenhagen as "the good old knight." He died on the 8th of April 1697.

See Garde, Niels Juel (1842), and Dan. dansk. norske Sjømaats Hist. (1835-1700) (1864). (R. N. B.)

JUG, a vessel for holding liquid, usually with one handle and a lip, made of earthenware, glass or metal. The origin of the word in this sense is uncertain, but it is probably identical with a shortened form of the feminine name Joan or Joanna; cf. the similar use of Jack and Jill or Gill for a drinking-vessel or a liquor measure. It has also been used as a common expression for a homely woman, a servant-girl, a sweetheart, sometimes in a sense of disparagement. In slang, "jug" or "stone-jug" is used to denote a prison; this may possibly be an adaptation of Fr. jeug, yoke, Lat. jugum. The word "jug" is probably onomatopoëtic when used to represent a particular note of the nightingale's song, or applied locally to various small birds, as the hedge-jug, &c.

The British Museum contains a remarkable bronze jug which was found at Kumasi during the Ashanti Expedition of 1866. It dates from the reign of Richard II., and is decorated in relief with the arms of England and the badge of the king. It has a lid, spout and handle, which ends in a quatrefoil. An inscription, on three raised bands round the body of the vessel, modernized runs:

when that will not spare when he may not spend when he would. Deem the best in every doubt till the truth be tried out." The British Museum Guide to the Medieval Room contains an illustration of this vessel.

A particular form of jug is the "ewer," the precursor of the ordinary bedroom jug (an adaptation of O. Fr. eauiere, med. Lat. aquaria, water-pitcher, from aqua, water). The ewer was a jug with a wide spout, and was principally used at table for pouring water over the hands after eating, a matter of some necessity before the introduction of forks. Early ewers are sometimes mounted on three feet, and bear inscriptions such as Venes lavet. When drinking vessles were also made representing characters popular at the time, such as "Nekko jug", "Philpots jug", or "Tromp jug".

JUGE, BOIFFLE DE (d. 1502), French-Iranian adventurer and statesman, belonged to the family of del Giudice, which came from Amalfi, and followed the fortunes of the Angevin dynasty. When John of Anjou, duke of Calabria, was conquered in Italy (1461) and fled to Provence, Boiffle followed him. He was given by Duke John and his father, King René, the charge of upholding by force of arms their claims on Catalonia. Louis XI., who had joined his troops to those of the princes of Anjou, attached Boiffle to his own person, made him his chamberlain and conferred on him the vice-royalty of Roussillon and Cardelagne (1471), together with certain important lordships, among others the countship of Castres, confiscated from James of Armagnac, duke of Nemours (1476), and the temporalities of the bishopric of Castres, confiscated from John of Armagnac. He also entrusted him with diplomatic negotiations with Flanders and England. In 1480 Boiffle married Marie d'Albret, sister of Alain the Great, thus confirming the feudal position which the king had given him in the south. He was appointed as one of the judges in the trial of René of Anjou, and showed such zeal in the discharge of his functions that Louis XI. rewarded him by fresh gifts. However, the bishop of Castres recovered his diocese (1483), and the heirs of the duke of Nemours took legal proceedings for
the recovery of the countship of Castres. Boffile, with the object of escaping from his enemies, applied for the command of the armies of the republic of Venice. His application was refused, and he further lost the vicereignty of Roussillon (1491). His daughter Louise married against his will a gentleman of no rank, and this led to terrible family dissensions. In order to dissociate herself from the family, Boffile de Juge gave up the countship of Castres to his brother-in-law, Alain d'Albret (1494). He died in 1502.

See P. M. Perret, Boffile de Juge, comte de Castres, et la république de Venise (1891); F. Pasquier, Inventaire des documents concernant Boffile de Juge (1905). (M. P. *)

JUGGERNAUT, a corruption of Sans. Jānagnātha, "Lord of the World," the name under which the Hindu god Vishnu is worshipped at Puri in Orissa. The legend runs that the sacred blue-stone image of Jānagnātha was worshipped in the solitude of the jungle by an outcast, a Savara mountaineer, called Basu. The king of Malwa, Indradnyumda, had despatched Brahmans to all quarters of the peninsula, and at last discovered Basu. Thereafter the image was taken to Puri, and a temple was built around it, and in 1174, was completed fourteen years later at a cost of upwards of half a million sterling. The site had been associated for centuries before and after the Christian era with Buddhism, and the famous Car festival is probably based on the Tooth festival of the Buddhists, of which the Chinese pilgrim Fa-Hien gives an account. The present temple is a pyramidal building, 192 ft. high, crowned with the mystic wheel and flag of Vishnu. Its inner enclosure, nearly 400 ft. by 300 ft., contains a number of small temples and shrines. The main temple has four main rooms—the hall of offerings, the dais of the god, the audience chamber, and the shrine itself—the latter being each 80 ft. square. The three principal images are those of Vishnu, his brother and his sister, grotesque wooden figures roughly hewn. Elaborate services are daily celebrated all the year round, the images are dressed and redressed, and four meals a day are served to them. The attendants on the god are divided into 36 orders and 97 classes. Special servants are assigned the tasks of putting the god to bed, of dressing and bathing him. The annual rent-roll of the temple was put at $60,000 by Sir W. W. Hunter; but the pilgrims' offerings, which form the bulk of the income, are quite unknown, and has in been said to reach as much as $100,000 in one year. Ranjit Singh bequeathed the Koh-i-noor to Jagannath. There are four chief festivals, of which the famous Car festival is the most important.

The terrible stories of pilgrims crushed to death in the god's honour have made the phrase "Car of Juggernaut" synonymous with the merciless sacrifice of human lives, but these have been shown to be baseless calumnies. The worship of Vishnu is innocent of all bloodshed; he is a god of health, and a drop of blood even accidentally split in the god's presence is held to pollute the officiating priests, the people, and the consecrated food. The Car festival takes place in June or July, and the feature of its celebration is the drawing of the god from the temple to his "country-house," a distance of less than a mile. The car is 45 ft. in height and 35 ft. square, and is supported on 16 wheels of 7 ft. in diameter. Vishnu's brother and sister have separate cars, slightly smaller. To these cars ropes are attached, and thousands of eager pilgrims vie with each other to have the honour of dragging the god. Though the distance is short, the journal is long, owing to the delays in which the wheels sink. During the festival serious accidents have often happened. Sir W. W. Hunter in the Gazetteer of India writes: "In a closely packed, eager throng of a hundred thousand men and women under the blazing tropical sun, deaths must occasionally occur. There have doubtless been instances of pilgrims throwing themselves under the wheels in a frenzy of religious excitement, but such instances have always been rare, and are unknown to any that did occur, for the fatal parts of diseases and miserable objects who took this means to put themselves out of pain. The official returns now place this beyond doubt. The journal would be more opposed to the spirit of Vishnu-worship than self-immolation. Accidental death within the Car renders the whole place unclean. According to Chaitanya, the apostle of Jagannath, the destruction of the least of God's creatures is a sin of the first magnitude."

See also Sir W. W. Hunter's Orissa (1872); and District Gazetteer of Puri (1908).

JUGGLER (Lat. joculator, jester), in the modern sense a performer of sleight-of-hand tricks and dexterity feats of skill in tossing balls, plates, knives, &c. The term is practically synonymous with conjurer (see Conjuring). The joculatores were the mimics of the middle ages (see Drama); the French use of the word jongleurs (an erroneous form of jowleir) included the singers known as trouvères; and the humbler English minstrels are sometimes called jugglers, from which the exhibitions the term came to cover loose, abortive, pantomimic and sleight-of-hand performances. In ancient Rome various names were given to what we call jugglers, e.g. ventilatores (knife-throwers), and pilarii (ball-players).

JUGURTHA (Gr. Tòyòpòdas), king of Numidia, an illegitimate son of Massanabal, and grandson of Massinissa. After his father's death he was brought up by his uncle Micipsa together with his cousins Adherbal and Hiempsal. Jugurtha grew up strong, handsome and intelligent, a skilful rider, and an adept in warlike exercises. He inherited much of Massinissa's political ability. Micipsa, naturally afraid of him, sent him to Spain (134 B.C.) in command of a Numidian force, to serve under P. Cornelius Scipio Africanus Minor. He became a favourite with Scipio and the Roman nobles, some of whom put into his head the idea of making himself sole king of Numidia, with the help of Roman money.

In 118 B.C. Micipsa died. By his will, Jugurtha was associated with Adherbal and Hiempsal in the government of Numidia. Scipio had written to Micipsa a strong letter of recommendation for the favour of Jugurtha, and to the senate, a majority of which trusted the execution of his will. None the less, his testamentary arrangements utterly failed. The princes soon quarrelled, and Jugurtha claimed the entire kingdom. Hiempsal contrived to have assassinated; Adherbal he quickly drove out of Numidia. He then sent envoys to Rome to defend his usurpation on the ground that he was the injured party. The senate decided that Numidia was to be divided, and gave the western, the richer and more populous half, to Jugurtha, while the sands and deserts of the eastern half were left to Adherbal. Jugurtha's envoys appear to have found several of the Roman nobles and senators accessible to bribery. Having secured the best of the bargain, Jugurtha at once began to provoke Adherbal to a war of self-defence. He completely defeated him near the modern Philippeville, and Adherbal sought safety in the fortress of Cirta (Constantine). Here he was besieged by Jugurtha, who, notwithstanding the interposition of a Roman embassy, forced the place to capitulate, and treacherously massacred all the inhabitants, among them his cousin Adherbal and a number of Italian officers resident in the town. There was great wrath at Rome and throughout Italy; and the senate, a majority of which inclining to Jugurtha, were persuaded in the same year (117) to declare war. An army was despatched to Africa under the consul L. Calpurnius Bestia, several of the Numidian towns voluntarily surrendered, and Bocchus, the king of Mauretania, and Jugurtha's father-in-law, offered the Roman his alliance. Jugurtha was alarmed, but having at his command the accumulated treasures of Massinissa, he was successful in arranging with the Roman general a peace which left him in possession of the whole of Numidia. When the Roman army was known at Rome, the tribune Memmius insisted that Jugurtha should appear in person and be questioned as to the negotiations. Jugurtha appeared under a safe conduct, but he had partisans, such as the tribune C. Baebius, who took care that his mouth should be closed. Soon afterwards he caused his cousin Massiva, then resident at Rome and a claimant to the throne of Numidia, to be assassinated. The treaty was thereupon set aside, and Jugurtha was ordered to quit Rome. On this occasion he uttered the well-known words, "A city for sale, and doomed to perish as soon as it finds a purchaser!" (Livy, Ep. 54). The war was renewed, and the consul Spurius Afranius entrusted with the command. The Roman army in Africa was thoroughly moralized. An unsuccessful attempt was made on a fortified town, Suthul, in which the royal treasures were deposited. The army was surprised by the enemy in a night attack, and the camp was taken and
plundered. Every Roman was driven out of Numidia, and a disgraceful peace was concluded (109).

By this time the feeling at Rome and in Italy against the corruption and incapacity of the nobles had become so strong that a number of senators were prosecuted and Bestia and Albinus sentenced to exile. The war was now entrusted to Quintus Metellus, an able soldier and stern disciplinarian, and from the year 109 to its close in 106 the contest was carried on with credit to the Roman arms. Jugurtha was defeated on the river Muthal, after an obstinate and valiant resistance. Once again, however, he succeeded in surprising the Roman camp and forcing Metellus into winter quarters. There were fresh negotiations, but Metellus insisted on the surrender of the king's person, and this Jugurtha refused. Numidia on the whole seemed disposed to assert its independence, and Rome had before her the prospect of a troublesome guerrilla war. Negotiations, reflecting little credit on the Romans, were set on foot with Bocchus (q.v.) who for a time played fast and loose with both parties. In 106, Marius was called on by the vote of the people to supersede Metellus, but it was through the perfidy of Bocchus and the diplomacy of L. Cornelius Sulla, Marius's quasestor, that the war was ended. Jugurtha fell into an ambusc, and was conveyed a prisoner to Rome. Two years afterwards, in 104, he figured with his two sons in Marius's triumph, and in the subterranean prison beneath the Capitol—"the bath of ice," as he called it—he was either strangled or starved to death.

Though doubtless to a time regarded by his countrymen as their deliverer from the yoke of Rome, Jugurtha mainly owes his historical importance to the full and minute account of him which we have usually derived, namely, from the hand of Sallust, himself afterwards governor of Numidia.

See A. H. J. Greenidge, Hist. of Rome (1904); T. Mommsen, Hist. of Rome, book iv. ch. v.; the chief ancient authorities (besides Sallust) are Livy, Epit., lxi.-lxii.; Plutarch, Marius and Sulla; Velleius Paterculus, ii.; Dio, Sic., Excerpta, xxxiv.; Florus, ii. 1. See also Marius, Sulla, Numidia.

**JU-JUTSU**, a West African word held by some authorities to be a corruption of Mandingo *gru-gru*, a charm. It is more generally believed to have been adapted by the Mandingos directly from Fr. *joujou*, a toy or plaything. The word, as used by European on the Guinea coast, was originally applied to the objects which it was supposed the negroes worshipped, and was transferred from the objects themselves to the spirits or gods who dwelt in them, and finally to the whole religious beliefs of the West Africans. It is currently used in each of these senses, and more loosely to indicate all the manners and customs of the negroes of the Guinea coast, particularly the power of interdiction exercised in the name of spirits (see *Ferrism* and *Tao*).

**Ju-JU**. Under this name the fruits of at least two species of *Zizyphus* are usually described, namely, *Z. vulgaris* and *Z. jujuba*. The genus is a member of the natural order Anacardiaceae. The species are small trees or shrubs, armed with sharp, straight, or hooked spines, having alternate leaves, and fruits which are in most of the species edible, and have an agreeable acid taste; this is especially the case with those of the two species mentioned above.

*Z. vulgaris* is a tree about 20 feet high, extensively cultivated in many parts of Southern Europe, also in Western Asia, China and Japan. In India it extends from the Punjab to the north-western frontier, ascending in the Punjab Himalaya to a height of 6,500 feet, and is found both in the wild and cultivated state. The plant is grown almost exclusively for the sake of its fruit, which both in size and shape resembles a moderate-sized plum; at first the fruits are green, but as they ripen they become of a reddish-brown colour on the outside and yellow within. They ripen in September, when they are gathered and preserved by storing in a dry place; after a time the pulp becomes much softer and sweeter than when fresh. Jujube fruits when carefully dried will keep for a long time, and retain their refreshing acid flavour, on account of which they are much valued in the countries of the Mediterranean region as a winter dessert fruit; and, besides, they are nutritive and demulcent. At one time a decoction was prepared from them and recommended in pectoral complaints. A kind of thick paste, known as jujube paste, was also made of a composition of gum arabic and sugar dissolved in a decoction of jujube fruit evaporated to the proper consistency.

*Z. jujuba* is a tree averaging from 30 to 50 ft. high, found both wild and cultivated in China, the Malay Archipelago, Ceylon, India, tropical Africa and Australia. Many varieties are cultivated by the Chinese, who distinguish them by the shape and size of their fruits, which are not only much valued as dessert fruit in China, but are also occasionally exported to England.

As seen in commerce jujube fruits are about the size of a small filbert, having a reddish-brown, shining, somewhat wrinkled exterior, and a yellow or gingerbread coloured pulp enclosing a hard elongated stone.

The fruits of *Zizyphus* do not enter into the composition of the lozenges now known as jujubes which are usually made of gelatine, gelatin, &c., and variously flavoured.

**JU-JUTSU** or **JIU-JITSU** (a Chino-Japanese term, meaning muscle-scientific), the Japanese method of offence and defence without weapons in personal encounter, upon which is founded the system of physical culture universal in Japan. Some historians assert that it was founded by a Japanese physician who learned its rudiments while studying in China, but most writers maintain that ji-jiitsu was in common use in Japan centuries earlier, and that it was known in the 7th century B.C. Originally it was an art practised solely by the nobility, and was taught by the samurai who possessed the rights of nobility to commoners, of carrying swords, were thus enabled to show their superiority over common people even when without weapons. It was a secret art, jealously guarded from those not privileged to use it, until the feudal system was abandoned in Japan, and now ji-ju-jitsu is taught in the schools, as well as in public and private gymnasia. In the army, navy and police it receives particular attention. About the beginning of the 20th century, masters of the art began to attract attention in Europe and America, and schools were established in Great Britain and the United States, as well as on the continent of Europe.

Many writers translate the term ji-jiitsu "to conquer by yielding" (Jap. *ju*, plant), and this phrase well expresses a salient characteristic of the art, since the weight and strength of the opponent are employed to his own undoing. When, for example, a big man rushes at a smaller opponent, the smaller man, instead of seeking to oppose strength to strength, falls back or sidewise, pulling his heavy adversary after him and taking advantage of his loss of balance to gain some lock or hold known to the science. This element of yielding in order to conquer is thus referred to in Lafcadio Hearm's *Out of the East*: "In ji-jiitsu there is a sort of counter for every twist, wrench, pull, push or bend: only the ji-jiitsu expert does not oppose such movements. No; he yields to them. But he does much more than that. He aids them with a wicked sleight that causes the assailant to put out his own shoulder, to fracture his own arm, or, in a desperate case, even to break his own neck or back."

The knowledge of anatomy mentioned by Nitobe is acquired in order that the combatant may know the weak parts of his adversary's body and attack them. Several of these sensitive places, for instance the partially exposed nerve in the cibow or popularly known as the "funny-bone" and the complex of nerves over the stomach called the solar plexus, are familiar to the European, but the ji-jiitsu expert is acquainted with many
others which, when compressed, struck, or pinched, cause temporary paralysis of a more or less complete nature. Such places are the arm-pit, the ankle and wrist bones, the tendon running downward from the ear, the "Adam's apple," and the nerves of the upper arms. In serious fighting almost any hold or attack is resorted to, and a break of bone or joint may end the game. Chills can baffal the victim; but in the practice of the art as a means of physical culture the knowledge of the different grips is assumed on both sides, as well as the danger of resisting too long. For this reason the combatant, when he feels himself on the point of being disabled, is instructed to signal his acknowledgment of defeat by striking the floor with hand or foot. The bout then ends and both combatants rise and begin afresh. It will be seen that a victory in ju-jutsu does not mean that the opponent shall be placed in some particular position, as in wrestling, but in any position in which his judgement or knowledge tells him that, unless he yields, he will suffer a disabling injury. This difference existed between the wrestling and the pancratium of the Olympic games. In the pancratium the fight went on until one combatant acknowledged defeat, but, although many a man allowed himself to be beaten into insensibility rather than suffer this humiliation, it was nevertheless held to be a disgrace to kill an opponent.

A modern bout at ju-jutsu usually begins by the combatants taking hold with both hands upon the collars of each other's jackets or kimonos, after which, upon the word to start being given, the maneuvering for an advantageous grip begins. As the pushes, pulls, jerks, falls, grips or other movements. Once the wrist, ankle, neck, arm or leg of an assailant is firmly grasped so that added force will dislocate it, there is nothing for the seized man to do, in case he is still on his feet, but to go to the floor, often being thrown clean over his opponent's head. A fall of this kind does not necessarily mean defeat, for the struggle proceeds upon the floor, where indeed most of the combat takes place, and the ju-jutsu expert receives a long training in the art of falling without injury. Blows are delivered, not with the fist, but with the open hand, the exterior edge of which is hardened by exercises. The external and uncialized aspect of its training is the most valuable feature of ju-jutsu. The system includes a light nourishing diet, plenty of sleep, deep-breathing exercises, an abundance of fresh air and general moderation in habits, in addition to the actual gymnastic exercises for the purpose of muscle-building and the cultivation of agility of eye and mind as well as of body. It is practised by both sexes in Japan.

Many attempts have been made in England and America to match ju-jutsu experts against wrestlers, mostly of the "catch-as-catch-can" school, but these trials have, almost without exception, followed the maneuvering for an advantageous grip begins by cacious tricks of ju-jutsu, such as the strange holds and twists of wrists and ankles, are accounted foul in wrestling. Nevertheless the Japanese athletes, even when obliged to forgo these, have usually proved more than a match for European wrestlers of their own weight.

See H. Irving Hancock's Japanese Physical Training (1904); Physical Training for Women by Japanese Methods (1904); The Complete Kano Ju-jutsu (Judo) (1905); M. Ohoshi, Japanese Physical Culture (1904); K. Saito, Ju-jutsu Tricks (1905).

**JUJUY**, a northern province of the Argentine Republic, bounded N. and N.W. by Bolivia, N.E., E. and S.W. by Salta, and W. by the Los Andes territory. Pop. (1895), 49,713; (1905, estimate), 55,459, including many mestizos. Area, 18,977 sq. m., the greater part being mountainous. The province is traversed from N. to S. by three distinct ranges belonging to the great central Andean plateau: the Sierra de Santa Catalina, the Sierra de Humahuaca, and the Sierras de Zenta and Santa Victoria. In the S.E. angle of the province are the low, isolated ranges of Alumbre and Santa Barbara. Between the more eastern of these ranges are valleys of surpassing fertility, watered by the Rio Grande de Jujuy, a large tributary of the Bermejo. The western part, however, is a high plateau (parts of which is 11,500 ft. above sea-level), whose general characteristics are those of the puna regions farther west. The surface of this high plateau is broken, semi-arid and desolate, having a very scanty population and no important industry beyond the breeding of a few goats and the fur-bearing chinchilla. There are two large saline lakes; Toro, or Pozuelos, in the N., and Casabindo, or Guayayac, in the S. The climate is cool, dry and healthy, with violent tempests in the summer season. (For a descriptive account of this and on the 25th of July 1890, "A Journey to the North of the Argentine Republic," Geogr. Jour. xxiv. 1904.) The agricultural productions of Jujuy include sugar cane, wheat, Indian corn, alfalfa and grapes. The breeding of cattle and mules for the Bolivian and Chilean markets is an old industry.

Coffee has been grown in the department of Ledesma, but only to a limited extent. There are also valuable forest areas and undeveloped mineral deposits. Large borax deposits are worked in the northern part of the province, the output in 1901 having been 5000 tons. The province is traversed from S. to N. by the Central Northern railway, a national government line, which has been extended to the Bolivian frontier. It passes through the capital and up the picturesque Humahuaca valley, and promiscues, under capable management, to be an important international line, affording an outlet for southern Bolivia. The climate of the lower agricultural districts is tropical, and irrigation is employed in some places in the long dry season.

The capital, Jujuy (estimated pop. 1905, 5000), is situated on the Rio Grande at the lower end of the Humahuaca valley, 942 m. from Buenos Aires by rail. It was founded in 1553 and is 4035 ft. above sea-level. It is a picturesque city, surrounded by picturesque natural surroundings, and is situated on the old route between Bolivia and Tacuarembo, but its growth has been slow.

**Jukes, Joseph Bees** (1811-1869), English geologist, was born at Summer Hill, near Birmingham, on the 10th of October 1811. He took his degree at Cambridge in 1836. He began the study of geology under Sedgwick, and in 1839 was appointed geological surveyor of Newfoundland. He returned to England at the end of 1840, and in 1842 sailed as naturalist on board H.M.S. "Fly," despatched to survey Torres Strait, New Guinea, and the Malay archipelago. Jukes landed in England again in June 1846, and in August removed to Canada, where he undertook the geological survey of Great Britain. The district to which he was first sent was North Wales. In 1847 he commenced the survey of the South Staffordshire coal-field and continued this work during successive years after the close of field-work in Wales. The results were published in his Geology of the South Staffordshire Coal-field (1853; 2nd ed. 1859), a work remarkable for its accuracy and philosophic treatment. In 1859 he accepted the post of local director of the geological survey of Ireland. The exhausting nature of this work slowly but surely wore out even the strong constitution of a man of his brood. For many years he lectured as professor of geology, first at the Royal Dublin Society's Museum of Irish Industry, and afterwards at the Royal College of Science in Dublin. He was an admirable teacher, and his Student's Manual was the focussed textbook of British students for many years. During his residence in Ireland he wrote an article "On the Mode of Formation of some of the River-valleys in the South of Ireland" (Quarterly Journ. Geol. Soc. 1864), and in this now classic essay he first clearly sketched the origin and development of rivers. In later years he devoted much attention to the relations between the Devonian system and the Carboniferous rocks and Old Red Sandstone.

Jukes wrote many papers that were printed in the London and Dublin geological journals and other periodicals. He edited, and in great measure wrote, forty-two memoirs explanatory of the maps of the south, east and west of Ireland, and prepared a geological map of Ireland on a scale of 8 m. to an inch. He was also the author of Excursions in and about Newfoundland (2 vols., 1842); Narrative of the Surveying Voyage of H. M. S. "Fly" (2 vols., 1847); A Sketch of the Geology of South America (1855); Student's Manual of Geology (1857; 2nd ed. 1862; a later edition was revised by A. Geikie, 1872); the article "Geology" in the Ency. Brit. 9th ed. (1858) and School Manual of Geology (1865). He was also editor of his Letters, &c., of J. B., a brother, with Connecting Memorial Notes, by his Sister (C. A. Browne) (1871), to which is added a chronological list of Jukes's writings.

**Julian (Flavius Claudius Julianus) (331-363),** commonly called Julian the Apostate, Roman emperor, was born in
Constantine in 331, the son of Julius Constantius and his wife Basilia, and nephew of Constantine the Great. He was thus a member of the dynasty under whose auspices Christianity became the established religion of Rome. The name Flavius he inherited from his paternal grandfather Constantius Chlorus; Julianus came from his maternal grandfather; Claudius had been taught by Constantius's family in order to assert a connexion with Claudius Gothicus.

Julian lost his mother not many months after he was born. He was only six when his imperial uncle died; and one of his earliest memories must have been the fearful massacre of his father and kinsfolk, in the interest and more or less at the instigation of the sons of Constantine. Only Julian and his elder half-brother Gallus were spared, Gallus being too ill and Julian too young to excite the fear or justify the cruelty of the murderers. Gallus was banished, but Julian was allowed to return to Constantinople, where he was carefully educated under the supervision of the family eunuch Mardionus, and of Eusebius, bishop of Nicomedia. About 344 Gallus was recalled, and the two brothers were removed to Macellum, a remote and lonely castle in Cappadocia. Julian was trained to the profession of the Christian religion; but he became early attracted to the old faith, or rather to the idealized amalgam of paganism and philosophy which was current among his teachers, the rhetoricians. Cut off from all sympathy with the reigning belief by the terrible fate of his family, and with no prospect of a public career, he turned with all the eagerness of an enthusiastic temperament to the literary and philosophical studies of the time. The old Hellenic world had an irresistible attraction for him. Love for its culture was in Julian's mind intimately associated with loyalty to its religion.

In the meantime the course of events had left as sole autocrat of the Roman Empire his cousin Constantius, who, feeling himself unequal to the enormous task, called Julian's brother Gallus to a share of power, and in March 351 appointed him Caesar. At the same time Julian was permitted to return to Constantinople, where he happened to the greatest danger. By his rash and headstrong conduct Gallus had incurred the enmity of Constantius and the eunuchs, his confidential ministers, and was put to death. Julian fell under a like suspicion, and narrowly escaped the same fate. For some months he was confined at Milan (Mediolanum) till at the intercession of the empress Eusebia, who always felt kindly towards him, permission was given him to retire to a small property in Bithynia. While he was on his way, Constantius recalled him, but allowed—or rather ordered—him to take up his residence at Athens. The few months he spent there (July—October 355) were probably the happiest of his life.

The emperor Constantius and Julian were now the sole surviving male members of the family of Constantine; and, as the emperor again felt himself oppressed by the cares of government, there was no alternative but to call Julian to his assistance.

At the instance of the emperor he was summoned to Milan, where Constantius bestowed upon him the hand of his sister Helena, together with the title of Caesar and the government of Gaul.

The task of extreme difficulty awaited him beyond the Alps. During recent troubles the Alamanni and other German tribes had crossed the Rhine; they had burned many flourishing cities, and extended their ravages far into the interior of Gaul. The internal government of the province had also fallen into great confusion. In spite of his inexperience, Julian quickly brought affairs into order. He completely overthrew the Alamanni in the great battle of Strasbourg (August 357). The Frankish tribes which had settled on the western bank of the lower Rhine were reduced to submission. In Gaul he rebuilt the cities which had been laid waste, re-established the administration on a just and secure footing, and as far as possible lightened the taxes, which weighed so heavily on the poor provincials. Paris was the usual residence of Julian during his government of Gaul, and his name has become inseparably associated with the early history of the city.

Julian's reputation was now established. He was general of a victorious army enthusiastically attached to him and governor of a province which he had saved from ruin. He had also become an object of fear and jealousy at the imperial court. Constantius accordingly resolved to weaken his power. A threatened invasion of the Persians was made an excuse for withdrawing some of the best legions from the Gallic army. Julian recognized the covert purpose of this, yet proceeded to fulfil the commands of the emperor. A sudden movement of the legions themselves decided otherwise. At Paris, on the night of the parting banquet, they forced their way into Julian's tent, and, proclaiming him emperor, offered him the alternative either of accepting the lofty title or of an instant death. Julian accepted neither, and submitted to a défermé agreement with Constantius. The message being contemptuously disregarded, both sides prepared for a decisive struggle. After a march of unexampled rapidity through the Black Forest and down the Danube, Julian reached Sirmium, and was on the way to Constantinople, when he received news of the death of Constantius, who had set out from Syria to meet him, at Mopsucrene in Cilicia (Nov. 3, 361). Without further trouble Julian found himself everywhere acknowledged the sole ruler of the Roman Empire; it is even asserted that Constantius himself on his death-bed had saved him from ruin. Julian entered Constantinople on the 11th of December 361.

Julian had already made a public avowal of paganism, of which he had been a secret adherent from the age of twenty. It was no ordinary profession, but the expression of a strong and even enthusiastic conviction; the restoration of the pagan worship was to be the great aim and controlling principle of his government. His reign was too short to show what precise form the pagan revival might ultimately have taken, how far his feelings might have become embittered by his conflict with the Christian faith, whether persecution, violence and civil war might not have taken the place of the moral suasion which was the method he originally affected. He issued an edict of universal toleration; but in many respects he used his imperial influence unfairly to advance the work of restoration. In order to deprive the Christians of the advantages of culture, and discredit them as an ignorant sect, he forbad them to teach rhetoric. The symbols of paganism and of the imperial dignity were so artfully interwoven on the standards of the legions that they could not pay the usual homage to the emperor without seeming to offer worship to the gods; and, when the soldiers came forward to receive the trusty standards, Julian lay them on the altar. Without directly excluding Christians from the high offices of state, he held that the worshippers of the gods ought to have the preference. In short, though there was no direct persecution, he exerted much more than a morbid pressure to restore the power and prestige of the old faith.

Having spent the winter of 361—362 at Constantinople, Julian proceeded to Antioch to prepare for his great expedition against Persia. His stay there was a curious episode in his life. He is doubtful whether his pagan convictions or his ascetic life, after the fashion of an antique philosopher, gave most offence to the so-called Christians of the dissolute city. They soon grew heartily tired of each other, and Julian took up his winter quarters at Tarsus, from which in early spring he marched against
Persia. At the head of a powerful and well-appointed army he advanced through Mesopotamia and Assyria as far as Ctesiphon, near which he crossed the Tigris, in face of a Persian army which he defeated. Mislaid by the treacherous advice of a Persian nobleman, he desisted from the siege, and set out to seek the main army of the enemy under Shapur II. (i.e.). After a long, useless march he was forced to retreat, and found himself engaged with a whole Persian army; in a waterless and desert country, at the bottom of a desert, of the enemy in many an obstinate battle, but on the 26th of June 363 Julian, who was ever in the front, was mortally wounded.

The same night he died in his tent. In the most authentic history of his reign, Ammianus Marcellinus, we find a noble speech, which he is said to have addressed to his afflicted officers. Soon after his death the rumour spread that the fatal wound had been inflicted by a Christian in the Roman army. The well-known statement, first found in Theodoret (5th century), that Julian threw his blood towards heaven, exclaiming, "Thou hast conquered, O Gallienus!" is probably a development of the account of his death in the poems of Epaphras Syrus.

From Julian's unique position as the last champion of a dying polytheism, his character has always excited interest. Authors such as Gregory of Nazianzus have heaped the fiercest anathemas upon him; but a just and sympathetic criticism finds many noble qualities in his character. In childhood and youth he had learned to regard Christianity as a persecuting force. The only sympathetic friends he met were among the pagan rhetoricians and philosophers; and he found a suitable outlet for his rage against the heathenism of the studies of ancient Greece. In this way he was attracted to the old paganism; but it was a paganism idealized by the philosophy of the time.

In other respects Julian was no unworthy successor of the Antonines. Though brought up in a studious and pedantic solitude, he was no stranger to the government of Gaul than he displayed all the energy, the hardihood and the practical sagacity of an old Roman. In temperance, self-control and zeal for the public good, as he understood it, he was unsurpassed.

To these Roman qualities he added the culture, literary instincts and speculative curiosity of a Greek. One of the most remarkable features of his public life was the perfect ease and mastery with which he associated the cares of war and statesmanship with the assiduous cultivation of literature and philosophy. Yet even his devotion to culture was not free from pedantry and dilettantism. His contemporaries observed in him a want of naturalness. He had not the moral health or the composed and reticent manner of a Roman, or the spon
taneity of a Greek. He was never at rest; in the rapid torrent of his conversation he was apt to run himself out of breath; his manner was jerky and spasmodic. He showed quite a deferential regard for the sophists and the philosophers, and advanced them to offices of state; there was real cause for fear that he would introduce the government of pedants in the Roman empire.

Last of all, his love for the old philosophy was sadly disfigured by his devotion to the old superstitions. He was greatly given to divination; he was noted for the number of his sacrificial victims. Wits applied to him the joke that had been passed on Marcus Aurelius: "The white cattle to Marcus Caesar, greeting. If you conquer, there is an end of us."

Bibliography.—The works of Julian, of which there are complete editions by E. Spanheim (Leipzig, 1696) and F. C. Hertlein (Theo
ticles, 1875-1876), consist of the following: (1) Letters, of which more than eighty have been preserved under his name, although the genuineness of several has been disputed. For his views on religious toleration and his attitude towards Christians and Jews the most important are 25-27, 51, 52, and the fragment in Hertlein, i. 371. The letter of Gallus to Julian, warning him against reverting to heathenism, is probably a Christian forgery. Six new letters were discovered by P compounder of the "Recherches sur la tradition MS. des lettres de l'empereur Julian" in Mémoires couronnés . . . publiés par l'Acad. royale de Belgique, lvi. (1868) and F. C. Curnow, Sur l'autentique de quelques lettres de Julien (1880). (2) Orations, eight in number; two panegyrics on Constantius, one on the empress Eun-
bia, two theosophical declamations on King Helios and the Mother of the Gods, two essays on true and false cynicism, and a consolatory address to himself on the departure of his friend Saturnius to the East. (3) De Simplicitate (ed. William), critical comments on the eleventh book of Seneca's Apocolocyntosis, in which the deified Caesar appears in succession at a banquet given in Olympus, to be censured for their elevating praises of the Roman emperors (see authorities). Written at Antioch, a satire on the licentiousness of its inhabitants; while at the same time his own person and manner of life are treated in a whimsical spirit. It also contains a charming description of Julian's journey to Egypt in A.D. 364. It consists of two books, (4) to the Roman Senate, (5) to the Antiochans, who were in the habit of shaving. (5) Five epigrams, two of which (Anth. Pal., ix. 365, 368) are of some interest. (6) The Institutes (Julianus aureus) in three books, an attack on Christianity written during the Persian campaign. Theodotus II. ordered all copies of it to be destroyed, and its knowledge of our contents is derived almost entirely from the ed. C. J. Neumann 1886). English Translations: Select works by J. Dun
don (1874) containing all except the first seven orations (viii. and the fable from viii. are included); the theosophical addresses to King Helios and the Mother of the Gods by Thomas Taylor (1793) and C. W. King in Bohn's Classical Library (1888); the public letters, by E. J. Chinnock (1901).

 Authorities.—1. Anticeni: (a) Pagan writers. Of these the most trustworthy and impartial is the historian Ammianus Marcellinus (xv. 8-xxv.), a contemporary and in part an eye-witness of the events described. Thracian; and the unrelenting enmity of the sophist Libanius, in speaking of his imperial friend shows himself credibly free from exaggeration and servility; Eunapius (in his lives of Maximus, Orbaius, the physician and friend of Julian, and Julian, and Chrestus and Constantius, panegyrist, are less trustworthy. (b) Christian writers. Gregory of Nazianzus, the author of two violent invectives against Julian; Rufinus Rectores; See the references to Julianus Syrus. (c) Byzantine chronographers. The impression which Julian produced on the Christians of the East is reflected in two Syriac romances published by J. G. E. Hoffmann, Julianus der Abschnitts (1880); see also Th. Noldeke in Zeitschrift der deutschen morgenländischen Gesellschaft (1874), xvii., 253.)

2. Modern. For works before 1878 see R. Engemann, Scriptores Graeci (8th ed., by E. Preuss, 1880). Of later works the most important are G. H. Rendall, The Emperor Julian, Paganism and Christianity (1879); Alice Gardner, Julian, Philosopher and Emperor (1893); G. Negri, Julian the Apostle (Ed. trans., 1905); E. Müller, Kaiser Flavius Claudius Julianus (1901); P. Allard, Julian l'apostate (1900-1902); G. Man, Die Religionsphilosophie Kaiser Julians in seinen Reden auf Konig Helios und die Giitermuut (1907); J. E. Sandys, Hist. of Classical Scholarship (1906), 359; W. Christ, Geschichte der griechischen Litteratur (1898), 603; J. Geicklen, "Kaiser Julianus und die Streitschriften seiner Gegner," in Neue Jahrb. f. das klassische Altertum (1908), pp. 101-195. The sketch by Gibbon (Decline and Fall, chs. xix., xxii.-xxv.) and the articles by J. Wordsworth in Smith's Dictionary of Christian Biography and A. Harnack in Herzog-Hande's Realenzyklopdäie für protestantische Theologie ix. (1901) are valuable, the last especially for the bibliography.

JULICH (Fr. Juliers), a town of Germany, in the Prussian Rhine province, on the right bank of the Roer, 16 m. N.E. of Aix-la-Chapelle. Pop. (1890), 5459. It contains an Evangelical and two Roman Catholic churches, a gymnasium, a school for non-commissioned officers, which occupies the former ducal palace, and a museum of local antiquities. Its manufactures include sugar, leather and paper. Julich (formerly also Gulich, Guliche) the capital of the former duchy of that name, is the Julicum of the Antonini Itinerarium; some have attributed its origin to Julius Caesar. It became a fortress in the 17th century, and was captured by the archduke Leopold in 1609, by Frederick V. in 1648, by the French in 1794, and again by the French in 1813, but was in the possession of the Belgians in 1832. In 1794 it was taken by the French, who held it until the peace of Paris in 1814. Till 1866, when its works were demolished, Julich ranked as a fortress of the second class.

JULICH, or JULIERS, DUCHY OF. In the 9th century a certain Matfried was count of Julich (pagus Julacensis), and towards the end of the 11th century one Gerhard held this dignity. This Gerhard founded a family of hereditary counts, who held Julich as immediate vassals of the emperor, and in 1356 the county was raised to the rank of a duchy. The older and reigning branch of the house died in 1423, when Julich passed to Adolph, duke of Berg (det. Berg, in German), a younger branch, and who had obtained Berg by virtue of the marriage...
of one of his ancestors. Nearly a century later Mary (d. 1543) was the heiress of the two dukedoms, married John, the heir of the dukedoms of Cleves, and in 1521 the three dukedoms, Jülich, Berg and Cleves, together with the counties of Ravensberg and La Marck, were united under John’s sway. John died in 1539 and was succeeded by his son William who reigned until 1592.

At the beginning of the 17th century the dukedoms became very strong and rich, thanks to the money loaned by the imperial treasury. In 1610, John William, was childless and insane, and several princes were only waiting for his demise in order to seize his lands. The most prominent of these princes were two Protestant princes, Philip Louis, count palatine of Neuburg, who was married to the duke’s sister Anna, and John Sigismund, elector of Brandenburg, whose wife was the daughter of another sister. Two other sisters were married to princes of minor importance. Moreover, by virtue of an imperial promise made in 1463 and renewed in 1495, the elector of Saxony claimed the dukedoms of Jülich and Berg, while the proximity of the coveted lands the Netherlands made their fate a matter of great concern to the Dutch. When it is remembered that at this time there was a great deal of tension between the Roman Catholics and the Protestants, who were fairly evenly matched in the dukedoms, and that the rivalry between France and the Empire was very keen, it will be seen that the situation lacked no element of discord. In March 1609 Duke John William died. Having assured themselves of the support of Henry IV. of France and of the Evangelical Union, Brandenburg and Neuburg at once occupied the dukedoms. To counter this stroke and to support the Saxony claim, the emperor Rudolph II. ordered some imperial and Spanish troops to seize the disputed lands, and it was probably only the murder of Henry IV. in May 1610 and the death of the head of the Evangelical Union, the elector palatine, Frederick IV., in the following September, which prevented, or rather delayed, a great European war. About this time the emperor adjudged the dukedoms to Saxony, while the Dutch captured the fortress of Jülich; but for all practical purposes victory remained with the “possessing princes,” as Brandenburg and Neuburg were called, who continued to occupy and to administer the lands. These two princes had made a compact at Dordrecht in 1609 to act together in defence of their rights, but proposals for a marriage alliance between the two houses broke down and differences soon arose between them. The next important step was the timely conversion of the count palatine’s heir, Wolfgang William of Neuburg, to Roman Catholicism, and his marriage with a daughter of the powerful Roman Catholic prince, Duke Maximilian of Bavaria. The rupture between the possessing princes was now complete. Each invited foreign aid. Dutch troops marched to assist the elector of Brandenburg and Spanish ones came to aid the count palatine, but through the intervention of England and France peace was made and the treaty of Xanten was signed in November 1614. By this arrangement Brandenburg obtained Jülich and Berg, the rest of the lands falling to the count palatine. In 1666 the great elector, Frederick William of Brandenburg, made with William, count palatine of Neuburg, a treaty of mutual succession to the dukedoms, providing that in case the male line of either house became extinct the other should inherit its lands.

The succession to the dukedom of Jülich was again a matter of interest in the earlier part of the 18th century. The family of the house of Jülich of Neuburg was threatened with extinction and the emperor Charles VI. promised the succession to Jülich to the Prussian king, Frederick William I., in return for a guarantee of the pragmatic sanction. A little later, however, he promised the same dukedom to the count palatine of Sulzbach, a kinsman of the count palatine of Neuburg. Then Frederick the Great, having secured Silesia, abandoned his claim to Jülich, which thus passed to Sulzbach when, in 1742, the family of Neuburg became extinct. From Sulzbach the dukedom came to the electors palatine of the Rhine, and, when this family died out in 1790, to the elector of Bavaria, the head of the other branch of the house of Wittelsbach. In 1801 Jülich was seized by France, and by the settlement of 1815 it came into the hands of Prussia. Its area was just over 1600 sq. m. and its population about 400,000.

see Kuhl, Geschichte der Stadt Jülich; M. Ritter, Sachsen und der Jülicher Erbfolgestreit (1873), and Der Jülicher Erbfolgestreit, 1610 to 1877; A. Moller, Der Jülich-Kleinesche Erbfolgestreit im Jahre 1614 (1900) and H. H. Koch, Die Reformation im Herzogtum Jülich 1883-1888.

JULIEN, STANISLAS (1797-1873), French orientalist, was born at Orleans, probably on the 13th of April 1877. Stanislas Julien, a mechanic of Orleans, had two sons, Noël, born on the 13th of April 1797, and Stanislas, born on the 20th of September 1799. It appears that the younger son died in America, and that Noël then adopted his brother’s name. He studied classics at the collège de France, and in 1821 was appointed assistant professor of Greek. In the same year he published an edition of the Éléments d’histoire de Colombe, with versions in French, Latin, English, German, Italian and Spanish. He attended the lectures of Abel Rémusat on Chinese, and his progress was as rapid as it had been in other languages. From the first, as if by intuition, he mastered the genius of the language; and in 1824 he published a Latin translation of a part of the works of Mencius (Mang-tse), one of the nine classical books of the Chinese. Soon afterwards he translated the modern Greek odes of Kalvos under the title of La Lyre patriotique de la Grèce. But such works were not profitable in a commercial sense, and, being without any patrimony, Julien was glad to accept the assistance of Sir William Drummond and others, until in 1827 he was appointed sub-librarian to the French institute. In 1832 he succeeded Rémusat as professor of Chinese at the collège de France. In 1853 he was elected a member of the Académie des Inscriptions in the place of the orientalist, Antoine Jean Saint-Martin. For some years his studies had been directed towards the dramatic and lighter literature of the Chinese, and in rapid succession he now brought out translations of the Hoel-i-an-ki (L’Histoire du cerce de craie), a drama which occurs a scene curiously analogous to the judgment of Solomon; the Pi shay ising ki; and the Tchao-chi kou eul, upon which Voltaire had founded his Orphelin de la Chine (1755). With the versatility which belonged to his genius, he turned, apparently without difficulty, to the very different style common to Taoist writings, and translated in 1835 Le Livre des récompenses et des peines de Lao-tseu. About this time the cultivation of silkworms was beginning to attract attention in France, and by order of the minister of agriculture Julien compiled, in 1837, a Résumé des principaux traits chinois sur la culture des mûriers, et l’éducation des vers-à-soie, which was speedily translated into English, German, Italian and Russian.

Nothing was more characteristic of his method of studying Chinese than his habit of collecting every peculiarity of idiom and translation which he met with in his reading; and, in order that others might realize the benefit of his experiences, he published in 1841 Discussions grammaticales sur certaines règles de position qui, en chinois, jouent le même rôle que les inflexions dans les autres langues, which he followed in 1842 by Exercices pratiques d’analyse, de syntaxe, et de lexicographie chinoise. Meanwhile in 1839, he had been appointed joint keeper of the Bibliothèque royale, with the especial superintendence of the Chinese books, and shortly afterwards he was made administrator of the collège de France.

The facility with which he had learned Chinese, and the success which his proficiency commanded, naturally induced less gifted scholars to resent the imitation with which he regarded their mistakes, and at different times bitter controversies arose between Julien and his fellow sinologues on the one subject which they had in common. In 1842 appeared from his busy pen a translation of the Tao te king, the celebrated work in which Lao-tse sought to explain his idea of the relation existing between the universe and something which he called Tao, and on which the religion of Taoism is based. From Taoism to Buddhism was a natural transition, and about this time Julien turned his attention to the Buddhist literature of China, and more especially to the teachings of Buddha. His diligent researches, he published might better understand the references to Indian institutions,
JULIUS (POPES)

and the transcriptions in Chinese of Sanskrit words and proper names, he began the study of Sanskrit, and in 1853 brought out his *Voyages du pélerin H fouen-tang*, which is regarded by some critics as his most valuable work. Six years later he published *Les Avadanas, contes et apologues Indiens inconnus jusqu'à ce jour, suivi de poésies et de nouvelles chinoises*. For the benefit of future students he disclosed his system of deciphering Sanskrit words occurring in Chinese books in his *Méthode pour déchiffrer et transcrire les noms sanscrits qui se rencontrent dans les livres chinois* (1861). This work, which contains much of interest and importance, falls short of the value which its author was accustomed to attach to it. It had escaped his observation that, since the translations of Sanskrit works into Chinese were undertaken in different parts of the empire, the same Sanskrit words were of necessity differently represented in Chinese characters in accordance with the dialectical variations. No hard and fast rule can therefore possibly be laid down for the decipherment of Chinese transcriptions of Sanskrit words, and the effect of this im possibility was felt though not recognized by Julien, who in order to make good his rule was occasionally obliged to suppose that wrong characters had by mistake been introduced into the texts. His Indian studies led to a controversy with Joseph Toussaint Reinaud, which was certainly no free from the gall of bitterness. Among the many subjects to which he turned his attention were the native industries of China, and his work on the *Histoire et fabrication de la porcelaine chinoise* is likely to remain a standard work on the subject. In another volume he also published an account of the *Industries anciennes et modernes de l'empire chinois* (1869), translated from native authorities. In the introduction he translated the Sans tiem *King* (Le Livre des trois mots); *Thien tiem yen* (Le Livre de mille mots); *Les Deux couinies; Nouvelles chinoises; the Ping chen ling yen* (Les Deux jeunes filles lettrées); and the *Dialoghi Cinesi, Jìtch'oung k' έou-t' ew-ko*. His last work of importance was *Syndaxe nouvelle de la langue chinoise* (1869), in which he gave the result of his study of the language, and collected a vast array of facts and of idiomatic expressions. A more scientific arrangement and treatment of his subject would have added much to the value of this work, which, however, contains a mine of material which amply repays exploration. One great secret by which Julien acquired his grasp of Chinese, was, as we have said, his methodical collection of phrases and idiomatic expressions. Whenever in the course of his reading he met with a new phrase or expression, he entered it on a card which took its place in regular order in a long series of boxes. At his death, which took place on the 14th of February 1873, he left, it is said, 250,000 of such cards, about the fate of which, however, little seems to be known. In politics Julien was imperialist, and in 1863 he was made a commander of the legion of honour in recognition of the services he had rendered to literature during the second empire.

**JULIUS**, the name of three popes.

**JULIUS I.** Pope from 337 to 352, was chosen as successor of Marcus after the Roman see had been vacant four months. He is chiefly known by the part which he took in the Arian controversy. After the Eusebians had, at a synod held in Antioch, renewed their deposition of Athanasius they resolved to send delegates to Constance, emperor of the West, and also to Julius, setting forth the grounds on which they had proceeded. The latter, after expressing an opinion favourable to Athanasius, adroitly invited both parties to lay the case before a synod to be presided over by himself. This proposal, however, the Eastern bishops declined to accept. On his second banishment from Alexandria, Athanasius came to Rome, and was recognized as a regular bishop by the synod held in 349. It was through the influence of Julius that, at a later date, the council of Sardica in Illyria was held, which was attended only by seventy-six Eastern bishops, who speedily withdrew to Philippiopolis and deposed Julius, along with Athanasius and others. The Western bishops who remained confirmed the previous decisions of the Roman synod; and by its 3rd, 4th and 5th decrees relating to the rights of revision, the council of Sardica endeavoured to settle the procedure of ecclesiastical appeals. Julius on his death in April 352 was succeeded by Liberius. **(L. D.*)**

**JULIUS II.** (Giuliano della Rovere), pope from the 1st of November 1503 to the 21st of February 1513, was born at Savona in 1443. He was at first intended for a commercial career, but later was sent by his uncle, subsequently Sixtus IV., to be educated among the Franciscans, although he does not appear to have joined that order. He was loaded with favours during his uncle's pontificate, being made bishop of Carpentras, bishop of Borgora, bishop of Verceil, archbishop of Avignon, cardinal and priest of S. Pietro in Vincoli and of St Dodici Apostoli, and cardinal-bishop of Sabina, of Frascati, and finally of Ostia and Velletri. In 1480 he was made legate to France, mainly to settle the question of the Burgundian inheritance, and acquitted himself with such ability during his two years' stay that he acquired an influence in the college of cardinals which became paramount during the pontificate of Innocent VIII. A rivalry, however, growing up between him and Rodrigo Borgia, he took refuge at Ostia after the latter's election as Alexander VI., and in 1494 went to France, where he incited Charles VIII. to undertake the conquest of Naples. He accompanied the young king on his campaign, and sought to convogue a council to inquire into the conduct of the pope with a view to his deposition, but was defeated in this through Alexander's machinations. During the remainder of that pontificate Della Rovere remained in France, nominally in support of the pope, for whom he negotiated the treaty of 1498 with Louis XII., but in reality bitterly hostile to him. On the death of Alexander (1503) he returned to Italy and supported the election of Leo XI. who was then subjected to an incurable malady, of which he died shortly afterwards. Della Rovere then won the support of Cesare Borgia and was unanimously elected pope. Julius II. from the beginning repudiated the system of nepotism which had flourished under Sixtus IV., Innocent VIII. and Alexander VI., and set himself with courage and determination to restore, consolidate and extend the temporal possessions of the Church. By dexterous diplomacy he first succeeded (1504) in rendering it impossible for Cesare Borgia to remain in Italy. He then pacified Rome and the surrounding country by reconquering the powerful houses of Orsini and Colonna and by winning the other nobles to his own cause. In 1504 he arbitrated on the differences between France and Germany, and concluded an alliance with them in order to ostracize the Venetians from Fanoa, Rimini and other towns which they occupied. The alliance at first resulted only in compelling the surrender of a few unimportant fortresses in the Romagna; but Julius freed Perugia and Bologna in the brilliant campaign of 1506. In 1508 he concluded against Venice the famous league of Cambrai with the emperor Maximilian, Louis XII. of France and Ferdinand of Aragon, and this long continued to be the cause of friction between Venice and the Holy See. In 1511, shortly after this treaty, a council actually met at Pisa for this object, but its efforts were fruitless. Julius forthwith formed the Holy league with Ferdinand of Aragon and with Venice against France, in which both Henry VIII. and the emperor ultimately joined. The French were driven out of Italy in 1512 and papal authority was once more securely established in the states immediately around Rome. Julius had already issued, on the 18th of July 1511, the summons for a general council to deal with France, with the reform of the Church, and with a war against the Turks. This council, which is known as the Fifth Lateran, assembled on the 3rd of May 1512, condemned the celebrated pragmatic sanction of the French church, and was
JULLIEN—JUMALA

JULLIEN, LOUIS ANTOINE (1812–1869), musical conductor, was born at Sisteron, Basses Alpes, France, on the 23rd of April 1812, and studied at the Paris conservatoire. His fondness for the lightest forms of music cost him his position in the school, and after conducting the band of the Jardin Turc he was compelled to leave Paris to escape his creditors, and came to London, where he formed a good orchestra and established promenade concerts. Subsequently he travelled to Scotland, Ireland and America with his orchestra. For many years he was a familiar figure in the world of popular music in England, and his portly form with its gorgeous waistcoats occurs very often in the early history of the opera. "Pietro il Grande," at Covent Garden (1852) on a scale of magnificence that ruined him, for the piece was a complete failure. He was in America until 1854, when he returned to London for a short time; ultimately he went back to Paris, where, in 1859, he was arrested for debt and put into prison. He lost his reason soon afterwards, and died on the 14th of March 1860.

JULLUNDUR, or Jalundbhar, a city of British India, giving its name to a district and a division in the Punjab. The city is 260 m. by rail N.W. of Delhi. Pop. (1901), 67,735. It is the headquarters of a brigade in the 3rd division of the northern army. The Peshawar-Pakistan road crosses the city, and there is a government normal school, and high schools supported by Hindu bodies.

The District of Jullundur occupies the lower part of the tract known as the Jullundur Doab, between the rivers Satluj and Beas, except that it is separated from the Beas by the state of Kapurthala. Area, 1,431 sq. m. Pop. (1901), 917,557, showing an increase of 1% in the decade; the average density is 641 persons per square mile, being the highest in the province. Cotton-weaving and sugar manufacture are the principal industries for export trade, and silk goods and wheat are also exported. The district is crossed by the main line of the North-Western railway from Phillaur towards Amritsar.

The Jullundur Doab in early times formed the Hindu kingdom of Katoch, ruled by a family of Rajputs whose descendants still exist in the petty princes of the Kangra hills. Under Mahomedan rule the Doab was generally attached to the province of Lahore, in which it is included as a circar or governorship in the great revenue survey of Akbar. Its governors seem to have held an autonomous position, subject to the payment of a fixed tribute into the imperial treasury. The Sikh revival extended to the Doab at an early period, and a number of petty chieftains made themselves independent throughout the Doab.

In 1766 the town of Jullundur fell into the hands of the Sikh confederacy of Faiza-ulla-puria, then presided over by Khushal Singh. His son and successor built a mausoleum in the town, while several other leaders similarly fortified themselves in the suburbs. Meanwhile, Ranjit Singh was consolidating his power in the south, and in 1811 he annexed the Faiza-ulla-puria dominions. Thenceforth Jullundur became the capital of the Lahore possessions in the Doab until the British annexation at the close of the first Sikh war (1846).

The Division of Jullundur comprises the five districts of Kangra, Hoshiarpur, Jullundur, Ludhiana and Ferozepore, all lying along the river Satluj. Area, 10,410 sq. m. Pop. (1901), 4,306,662.

See Jullundur District Gazetteer (Lahore, 1908).

JULY, the seventh month in the Christian calendar, consisting of thirty-one days. It was originally the fifth month of the year, and as such was called by the Romans Quintilis. The later name of Julius was given in honour of Julius Caesar (who was born in the month); it came into use in the year of his death. The Anglo-Saxons called July Hefnmaid, or Mec)m-bnai, "mead-month," the meadows being then in bloom. Another name was after Bûna, "the latter mild month," in contradistinction to June, which was named "the former mild month." Chief dates of the month: 3rd July, Dog Days begin; 15th July, St. Winifred; 25th July, St James.

JUMALA, the supreme god of the ancient Finns and Lapps. Among some tribes he is called Num or Jiljibeeabmaerje, as protector of the flocks. Jumala indicates rather godhead than
a divine being. In the runes Ukko, the grandfather, the sender of the thunder, takes the place of Jumala.

**Jumièges**

Jumièges, a village of north-western France, in the department of Seine-Infrérieure, 17 m. W. of Rouen by road, on a peninsula formed by a bend of the Seine. Pop. (1906), 244. Jumièges is famous for the imposing ruins of its abbey, one of the great establishments of the Benedictine order. The principal remains are those of the abbey-church, built from 940 to 1067; these joined the Nogaro with two turrets, the walls of the nave a wall and sustaining arch of the great central tower and débris of the choir (restored in the 13th century). Among the minor relics, preserved in a small museum in a building of the 14th century, are the stone which once covered the grave of Agnes Sorel, and two recumbent figures of the 13th century, commonly known as the Énèròts, and representing, according to one legend, two sons of Clovis II, who, as a punishment for revolt against their father, had the tendons of their arms and legs cut, and were set adrift in a boat on the Seine. Another tradition states that the statues represent Thassilo, duke of Bavaria, and Theodo his son, relegated to Jumièges by Charlemagne. The church of St Pierre, which adjoins the south side of the abbey-church, was built in the 14th century as a continuation of a previous church of the time of Charlemagne, of which a fragment still survives. Among the other ruins, those of the chapter-house (13th century) and refectory (12th and 15th centuries) also survive.

The abbey of Jumièges was founded about the middle of the 7th century by St Philibert, whose name is still to be read on gold and silver coins obtained from the site. The abbey was destroyed by the Normans, but re-established in 928 by William Longsword, duke of Normandy, and continued to exist till 1790. Charles VII. often resided there with Agnes Sorel, who had a mansion at Mesnil-sous-Jumièges in the neighbourhood, and died in the monastery in 1450.

**Jumilla,** a town of eastern Spain, in the province of Murcia, 40 m. N. by W. of Murcia by road, on the right bank of the Arroyo del Jua, a left-bank tributary of the Segura. Pop. (1900), 16,446. Jumilla occupies part of a narrow valley, enclosed by mountains. An ancient citadel, several churches, a Franciscan convent, and a hospital are the principal buildings. The church of Santa Maria is noteworthy for its fine paintings and frescoes, some of which have been attributed, though on doubtful authority, to Peter Paul Rubens and other illustrious artists. The local trade is chiefly in coarse cloth, esparto fabrics, wine and farm produce.

**Jumna,** or Jumna, a river of northern India. Rising in the Himalayas in Tehri state, about 5 m. N. of the Jamnorti hot springs, in 32° 3' N. and 78° 30' E., the stream first flows S. for 7 m., then S.W. for 32 m., and afterwards due S. for 26 m., receiving several small tributaries in its course. It afterwards turns sharply to the W. for 14 m., when it is joined by the large river Tons from the north. The Jumna here emerges from the Himalayas into the valley of the Dun, and flows in a S.W. direction for 22 m., dividing the Kiarda Dun on the W. from the Dehra Dun on the E. It then, at the 95th mile of its course, forces its way through the Siwalik hills, and debouches upon the plains of India at Fyzabad in Saharanpur district. By this time a large river, it gives off, near Fyzabad, the eastern and western Jumna canals. From Fyzabad the river flows for 65 m. in a S.S.W. direction, receiving the Maskarua stream from the east. Near Ekdulli, in Muzaffarnagar district, it turns due S. for 80 m. to Delhi city, thence S.E. for 23 m. to near Dankaur, receiving the waters of the Hindan river on the east. From Dankaur it resumes its southerly course for 100 m. to Mahaban near Muttra, where it turns E. for nearly 200 m., passing the towns of Agra, Ferozabad and Etawah, receiving on its left bank the Karwan-nadi, and on its right the Banganga (Uタンハン). From Etawah it flows 140 m. S.E. to Hamirpur, being joined by the Sengar on its north bank, and on the south by the great river Chambal from the west, and by the Sind. From Hamirpur, the Jumna flows nearly due E., until it enters Allahabad district and passes Allahabad city, below which it falls into the Ganges in 25° 25' N. and 8° 5' E. In this last part of its course it receives the waters of the Betwa and the Ken. Where the Jumna and the Ganges unite is the prays, or place of pilgrimage, where devout Hindus resort in thousands to wash and be sanctified.

The Jumna, after issuing from the hills, has a longer course through the United Provinces than the Ganges, but is not so large nor so important a river; and above Agra in the hot season it falls into a small stream. This is no doubt partly caused by the eastern and western Jumna canals, of which the former, constructed in 1823-1830, irrigates 300,000 acres in the districts of Saharanpur, Muzaffarnagar and Meerut, in the United Provinces; while the latter, consisting of the reopened channels of two canals dating from about 1350 and 1628 respectively, extends through the districts of Umballa, Karnal, Hisar, Rohtak and Delhi, and the native states of Patiala and Jind in the Punjab, irrigating 600,000 acres. The headworks of the two canals are situated near the point where the river issues from the Siwaliks.

The traffic on the Jumna is not very considerable; in its upper portion timber, and in the lower stone, grain and cotton are the chief articles of commerce, carried in the clumsy barges which navigate its stream. Its waters are clear and blue, while those of the Ganges are yellow and muddy; the difference between the streams can be discerned for some distance below the point at which they unite. Its banks are high and rugged, often attaining the proportions of cliffs, and the ravines which run into it are deeper and larger than those of the Ganges. It traverses the extreme edge of the alluvial plain of Hindustan, and in the latter part of its course it almost touches the Bundleh- khond offshoots of the Vindhyan range of mountains. Its passage is therefore more tortuous, and the scenery along its banks more varied and pleasing, than is the case with the Ganges.

The Jumna at its source near Jamnorti is 10,849 ft. above the sea-level; at Kotnur, 16 m. lower, it is only 5036 ft.; so that, between these two places, it falls at the rate of 314 ft. in a mile. At its junction with the Tons it is 1686 ft. above the sea; at its junction with the Asan, 1470 ft.; and at the point where it issues from the Siwalik hills into the plains, 1276 ft. The catchment area of the river is 116,000 sq. m.; its flood discharge at Allahabad is estimated at 1,333,000 cub. ft. per second. The Jumna is crossed by railway bridges at Delhi, Muttra, Agra and Allahabad, while bridges of boats are stationed at many places.

**Jumping,** a branch of athletics which has been cultivated from the earliest times (see ATHLETIC SPORTS). Leaping competitions formed a part of the pentathlon, or quintuple games, of the Olympian festivals, and Greek chronicles record that the athlete Phylthus jumped a distance of 55 Olympian, or more than 50 English, feet. Such a leap could not have been made without weights carried in the hands and thrown backwards at the moment of springing. These were in fact employed by Greek jumpers and were called hâlères. They were masses of stone or metal, nearly semicircular, according to Pausanias, and the fingers grasped them like the handles of a shield. Halteres were also used for general exercise, like modern dumb-bells. The Olympian jumping took place to the music of lulites.

Jumping has always been popular with British athletes, and tradition has handed down the record of certain leapers that border on the incredible. Two forms of jumping are included in modern athletic contests, the running long jump and the running high jump; but the same jumps, made from a standing position, are also common forms of competition, as well as the hop step and jump, two hops and jump, two jumps, three jumps, five jumps and ten jumps, either with a run or from a standing position. These events are again divided into two categories by the use of weights, which are not allowed in championship contests.

---

1 The verb "to jump" only dates from the beginning of the 16th century. See The New English Dictionary takes it to be of onomatopoeic origin and does not consider a connexion with Dan. gump, Icel. goppa, &c., possible. The earlier English word is "leap" (O.E. līpahan, to jump, run, jump, cf. Ger. laufen).
In the running long jump anything over 18 ft. was once considered good, while Peter O'Connor's world's record (1901) is 24 ft. 1 1/2 in. The jump is made, after a short fast run on a cinder path, from a joist sunk into the ground flush with the path, the jumper landing in a pit filled with loose earth, its level a few inches below that of the path. The joist, called the "take-off," is painted white, and all jumps are measured from its edge to the nearest mark made by any part of the jumper's person in landing.

In the standing long jump, well spiked shoes should be worn, for it is in reality nothing but a push against the ground, and a perfect purchase is of the greatest importance. Weights held in the hands of course greatly aid the jumper. Without weights J. Darby (professional) jumped 12 ft. 13 in. and R. C. Ewry (American amateur) 11 ft. 4 3/4 in. With weights J. Darby covered 14 ft. 6 in. at Liverpool in 1890, while the amateur record is 12 ft. 9 1/2 in., made by J. Chandler and G. L. Hellwig (U.S.A.). The standing two, three, five and ten jumps are merely repetitions of the single jump, care being taken to land with the proper balance to begin the next leap. The record for two jumps without weights is 22 ft. 3 in., made by H. M. Johnson (U.S.A.); for three jumps without weights, R. C. Ewry, 35 ft. 7 1/2 in.; with weights J. Darby, 41 ft. 7 in. The hop step and jump is popular in Ireland and often included in the programmes of minor meetings, and so is the two hops and a jump. The record for the first, made by W. McManus, is 40 ft. 2 1/2 in. with a run and without weights; for the latter, also with a run and without weights, 49 ft. 1 1/2 in., made by J. B. Conolly.

In the running high jump also the standard has improved. In 1864 a jump of 5 ft. 6 in. was considered excellent. The Scotch professional Donald Dinnie, on hearing that M. J. Broeks of Oxford had jumped 6 ft. 2 1/2 in. in 1876, wrote to the newspapers to show that upon a priori grounds such an achievement was impossible. Since then many jumpers who can clear over 6 ft. have appeared. In 1895 M. F. Sweeney of New York accomplished a jump of 6 ft. 5 1/2 in. Ireland has produced many first-class high jumpers, nearly all tall men, P. Leahy winning the British amateur record in Dublin in 1898 with a jump of 6 ft. 4 1/2 in. The American A. Bird Page, however, although only 5 ft. 6 in. in height, jumped 6 ft. 4 in. High jumping 5 1/2 ft. over a light staff or lath resting upon pins fixed in two uprights upon which a scale is marked. The "take-off," or ground immediately in front of the uprights from which the spring is made, is usually grass in Great Britain and cinders in America. Some jumpers run straight at the bar and clear it with body facing forward, the knees being drawn up almost to the chin as the body clears the bar; others run and spring sideways, the feet being thrown upwards and over the bar first, to act as a kind of lever in getting the body over. There should be a shallow pit of loose earth or a mattress to break the fall.

The standing high jump is rarely seen in regular athletic meetings. The jumper stands sideways to the bar with his arms extended upwards. He then swings his arms down slowly, bending his knees at the same time, and, giving his arms a violent upward swing, springs from the ground. As the body rises the arms are brought down, one leg is thrown over the bar, and the other pulled, almost jerked, after it. The record for the standing high jump without weights is 6 ft. 6 in., by J. Darby in 1892.

By the use of a spring-board many extraordinary jumps have been made, but this kind of leaping is done only by circus gymnasts and is not recognized by athletic authorities.

For pole-leaping see POLE-VAULTING.

JUMPING-HARE, the English equivalent of springhaas, the Boer name of a large leaping south and east African rodent mammal, Pedetes caper, typifying a family by itself, the Pedetidae. Originally classed with the jerboas, to which it has no affinity, this remarkable rodent approximates in the structure of its skull to the porcupine-group, near which it is placed by some naturalists, although others consider that its true position is with the African scaly-tailed flying squirrels (Anomaluridae). The colour of the creature is bright rufous fawn; the eyes are large; and the bristles round the muzzle very long, the former having a fringe of long hairs. The front limbs are short, and the hind ones very long; and although the fore-feet have five toes, those of the hind-feet are reduced to four. The bones of the hind foot are united for a large part of their length. There are four pairs of cheek-teeth in each jaw, which do not develop roots. The jumping-hare is found in open or mountainous districts, and has habits very like a jerboa. It is nocturnal, and dwells in composite burrows excavated and tenanted by several families. When feeding it progresses on all four legs, but if frightened takes gigantic leaps on the hind-pair alone; the length of such leaps frequently reaches twenty feet, or even more. The young are generally three or four in number, and are born in the summer. A species of another sub-genus has been named. (See Rodentia.)

JUMPING-MOUSE, the name of some Amph. and mouse-like rodent, Zapus hudsonius, belonging to the family Jaculidae (Dipodidae), and the other members of the same genus. Although mouse-like in general appearance, these rodents are distinguished by their elongated hind limbs, and, typically, by the presence of four pairs of cheek-teeth in each jaw. There are five toes to all the feet, but the fore-feet are rudimentary, and furnished with a flat nail. The cheeks are provided with pouches. Jumping-mice were long supposed to be confined to North America, but a species is now known from N.W. China. It is noteworthy that whereas E. Coulomb in 1781 recognized but a single representative of this genus, ranging over a large area in North America, A. Preble distinguishes no fewer than twenty North American species and sub-species, in addition to the one from Szechuen. Among these, it may be noted that Z. insignis differs from the typical Z. hudsonius by the loss of the premolar, and has accordingly been referred to a sub-genus apart. Moreover, the Szechuen jumping-mouse differs from the typical Zapus by the closer enamel-folds of the molars, the shorter ears, and the white tail-tip, and is therefore made the type of another sub-genus. In America these rodents inhabit forest, pasture, cultivated fields or swampy banks and gravelly places. When disturbed, they start off with enormous bounds of eight or ten feet in length, which soon diminish to three or four; and in leaping the feet scarcely seem to touch the ground. The nest is placed in clefts of rocks, among timber or in hollow trees, and there are generally three litters in a season. (See Rodentia.)

JUMPING-SHREW, a popular name for any of the terrestrial insectivora of the African family Macroscelididae, of which there are a number of species ranging over the African continent, representing the tree-shrews of Astr. As they are small long-haired gerbill-like animals, mainly nocturnal, feeding on insects, and characterized by the great length of the metatarsal bones, which have been modified in accordance with their leaping mode of progression. In some (constituting the genus Rhynchoecyon) the muzzle is so much prolonged as to resemble a proboscis, whence the name elephant-shrews is sometimes applied to the members of the family.

JUNAGARH, or Junagadh, a native state of India, within the Gujarati division of Bombay, extending inland from the southern coast of the peninsula of Kathiawar. Area, 32,840 sq. m., pop. (1901), 395,428, showing a decrease of 19% in the decade, owing to famine; estimated gross revenue, £174,000; tribute to the British government and the gaekwar of Bareda, £4200; a considerable sum is also received as tribute from minor states in Kathiawar. The state is traversed by a railway from Rajkot, to the seaport of Veraval. It includes the sacred mountain of Girnar and the ruined temple of Somnath, and also the forest of Gir, the only place in India where the lion survives. Junagarh ranks as a first-class state among the many chiefships of Kathiawar, and its ruler first entered into engagements with the British.
in 1807. Nawab Sir Rasul Khanji, K.C.S.I., was born in 1858 and succeeded his brother in 1892.

The modern town of Junagarh (34°25'), 60 m. by rail S. of Rajkot, is handsomely built and laid out. In November 1807 the foundation-stones of a hospital, library and museum were laid, and an arts college has recently been opened.

Juncaceae (rush family), in botany, a natural order of flowering plants belonging to the series Liliflorae of the class Monocotyledons, containing, about two hundred species in seven genera, widely distributed in temperate and cold regions. It is well represented in Britain by the two genera which comprise nearly the whole order—Juncus, rush, and Luzula, wood-rush. They are generally perennial herbs with a creeping underground stem and erect, unbranched, aerial stems, bearing slender leaves which are grass-like or cylindrical or reduced to membranous sheaths. The small inconspicuous flowers are generally more or less crowded in terminal or lateral clusters, the form of the inflorescence varying widely according to the manner of branching and the length of the pedicels. The flowers are hermaphrodite and regular, with the same number and arrangement of parts as in the order Liliaceae, from which they differ in the inconspicuous membranous character of the perianth, the absence of honey or smell, and the brushlike stigmas with long papillae-adaptations to wind-pollination as contrasted with the methods of pollination by insect agency, which characterize the Liliaceae. Juncaceae are, in fact, a less elaborated group of the same series as Liliaceae, but adapted to a simpler and more uniform environment than that larger and much more highly developed family.

Junction City, a city and the county-seat of Geary county, Kansas, U.S.A., between Smoky Hill and Republican rivers, about 3 m. above their confluence to form the Kansas, and 72 m. by rail W. of Topeka. Pop. (1900), 4695, of whom 545 were foreign-born and 292 were negroes; (1905), 4944; (1910), 5998. Junction City is served by the Union Pacific and the Missouri, Kansas & Texas railways. It is the commercial centre of a region in whose fertile valleys great quantities of wheat, Indian corn, oats and hay are grown and live stock is raised, and whose uplands contain extensive beds of limestone, which is quarried for building purposes. Excellent water-power is available and is partly utilized by flour mills. The municipality owns and operates the waterworks. At the confluence of Smoky Hill and Republican rivers and connected with the city by an electric railway is Fort Riley, a U.S. military post, which was established in 1853 as Camp Centre but was renamed in the same year in honour of General Bennett Riley (1787–1853); in 1887 the mounted service school of the U.S. army was established here. Northward from the post is a rugged country over which extends a military reservation of about 19,000 acres. Adjoining the reservation and about 5 m. N.E. of Junction City is the site of the short-lived settlement of Pawnee, where from the 2nd to the 6th of July 1855 the first Kansas legislature met, in a building the site of which still remains; the establishment of Pawnee (in December 1854) was a speculative pro-slavery enterprise conducted by the commandant of Fort Riley, other army officers and certain territorial officials, and when a government survey showed that the site lay within the Fort Riley reservation, the settlers were ordered (August 1855) to leave, and the commandant of Fort Riley was dismissed from the army; one of the charges brought against Governor A. H. Reeder was that he had favoured the enterprise. Junction City was founded in 1857 and was chartered as a city in 1859.

June, the sixth month in the Christian calendar, consisting of thirty days. Ovid (Fasti, vi. 25) makes Juno assert that the name was expressly given in her honour. Elsewhere (Fasti, vi. 87) he gives the derivation a junioribus, as May had been derived from majores, which may be explained as in allusion either to the two months being dedicated respectively to youth and age in general, or to the seniors and juniors of the government of Rome, the senate and the comitia curiata in particular. Others connect the term with the gentile name Junius, or with the consulate of Junius Brutus. Probably, however, it originally denoted the month in which crops grow to ripeness. In the old Latin calendar of June was the fourth mouth, and in the so-called year of Romulus it is said to have had thirty days; but at the time of the Julian reform of the calendar its days were only twenty-nine. To these Caesar added the thirtieth. The Anglo-Saxons called June “the dry month,” “midsummer month,” and, in contradistinction to July, “the earlier mild month.” The summer solstice occurs in June. Principal festival days in this month: 11th June, St Barnabas; 24th June, Midsummer Day (Nativity of St John the Baptist); 29th June, St Peter.

Juneau, formerly Harrisburg, a mining and trading town picturesquely situated at the mouth of Gold Creek on the continental shore of Gastineau channel, south-east Alaska, and the capital of Alaska. Pop. (1900), 1864 (450 Indians); (1910), 1644. It has a United States custom-house and court-house. The city has fishing, manufacturing and trading interests, but its prosperity is chiefly due to the gold mines in the adjacent Silver Bow basin, the source of Gold Creek, and the site of the great Perseverance mine, and to those on the Treadwell lode on Douglas Island, 2 m. from Juneau. Placer gold was found at the mouth of the creek in 1879, and the city was settled in 1880 by two prospectors named Joseph Juneau and Richard Harris. The district was called Juneau and the camp Harrisburg by the first settlers; exploring naval officers named the camp Rockwell, in honour of Commander Charles Henry Rockwell, U.S.N. (b. 1840). A town meeting then adopted the name of Juneau. The town was incorporated in 1900. In October 1906 the seat of government of Alaska was removed from Sitka to Juneau.

Jung, Johann Heinrich (1740–1817), best known by his assumed name of Heinrich Stelling, German author, was born in the village of Grund near Hilchenbach in Westphalia on
the 12th of September 1740. His father, Wilhelm Jung, schoolmaster and tailor, was the son of Eberhard Jung, charcoal-burner, and his mother was Dorchen Moritz, daughter of a poor clergyman. Jung became, by his father's desire, schoolmaster and tailor, but found both pursuits equally wearisome. After various teaching appointments he went in 1768 with "half a French dollar" to study medicine at the university of Strassburg. There he met Goethe, who introduced him to Herder. The acquaintance with Goethe ripened into friendship; and it was by his influence that Jung's first and best work, *Heinrich Sti llings Jugend* was written. In 1772 he settled at Elberfeld and studied theology, and became a Lutheran minister. But the operations in cases of cataract, surgery, however, was much too much to his taste than tailoring or teaching; and in 1778 he was glad to accept the appointment of lecturer on "agriculture, technology, commerce and the veterinary art" in the newly established Kameralschule at Kaiserslautern, a post which he continued to hold when the school was absorbed in the university of Heidelberg. In 1787 he was appointed professor of economical, financial and statistical science in the university of Marburg. In 1803 he resigned his professorship and returned to Heidelberg, where he resided until 1806, when he received a call from the grand-duke Charles Frederick of Baden, and removed to Karlsruhe, where he remained until his death on the 2nd of April 1817. He was married three times, and left a numerous family. Of his works his autobiography *Heinrich Sti llings Leben*, from which he came to be known as Stilling, is the only one now of any interest, and is the chief authority for his life. His early novels reflect the piety of his early surroundings.

A complete edition of his numerous works, in 14 vols. 8vo, was published at Stuttgart in 1835-1838. There are English translations by Sam. Jackson of the Leben (1835) and of the Théorie de la Géométrie (London, 1834, and New York, 1851); and of Theobald, or the Fánatic, a religious romance, by the Rev. Sam. Schaeffer (1846). See biographies by F. W. Bodemann (1866), J. v. Ewald (1817), Peter son (1890).

**JUNG BAHADUR, SIR, MAHARAJA (1816-1877),** prime minister of Nepal, was a grand-nephew of Bhim sena Thapa (Bhim sen Thappa), the famous military minister of Nepal, who from 1804 to 1839 was de facto ruler of the state under the rani Tripru and her successor. Bhimsena's supremacy was threatened by the Kala Pandy, and many of his relations, including Jung Bahadur, went into exile in 1838, thus escaping the cruel fate which overtook Bhimsena in the following year. The Pandy leaders, who then reverted to power, were in turn assassinated in 1843, and Matabar Singh, uncle of Jung Bahadur, was created prime minister. He appointed his nephew general and chief judge, but shortly afterwards he was himself put to death. Fateh Jung thereon formed a ministry, of which Jung Bahadur was made military member. In the following year, 1846, a quarrel was fomented, in which Fateh Jung and thirty-two other chiefs were assassinated, and the rani appointed Jung Bahadur sole minister. The rani quickly changed her mind, and planned the death of her new minister, who at once appealed to the maharaja. But the plot failed. The raja and the rani wisely sought safety in India, and Jung Bahadur firmly established his own position by the removal of all dangerous rivals. He succeeded so well that in January 1850 he was able to leave for a visit to England, from which he did not return to Nepal until the 6th of February 1851. On his return, and frequently on subsequent dates, he frustrated conspiracies for his assassination. The reform of the penal code, and a desultory war with Tibet, occupied his attention until news of the Indian Mutiny reached Nepal. Jung Bahadur resisted all overtures from the rebels, and sent a column to Gorakpur in July 1857. In December he furnished a force of 8000 Gurkhas, which reached Lucknow on the 11th of March 1858, and took part in the siege. The moral support of the Nepalese was more valuable than the military services rendered by them. Jung Bahadur was made a G.C.B., and a tract of country annexed in 1815 was restored to Nepal. Various frontier disputes were settled, and in 1875 Sir Jung Bahadur was on his way to England when he had a fall from his horse in Bombay and returned home. He received a visit from the Prince of Wales in 1876. On the 25th of February 1877 he died, having reached the age of sixty-one. Three of his widows immolated themselves on his funeral pyre.

**JUNG-BUNZLAU (Czech, Mladd Boleslav), a town of Bohemia, 44 m. N.N.E. of Prague by rail. Pop. (1900), 13,479, mostly Czech. The town contains several old buildings of historical interest, notably the castle, built towards the end of the 10th century, and now used as barracks. There are several old churches. In that of St Maria the celebrated bishop of the Bohemian brethren, Johann August, was buried in 1595; but his tomb was destroyed in 1621. The church of St Bonaventura with the convent, originally belonging to the friars minor and later to the Bohemian brethren, is now a Frisian college. The church of St Wenceslaus, once a convent of the brotherhood, is now used for military stores. Jung-Bunzlau was built in 995, under Boleslaus II., as the seat of a gaufgraf or royal count. Early in the 13th century it was given the privileges of a town and pledged to the lords of Michalovic. In the Hussite wars Jung-Bunzlau was occupied by Taborites and became later the metropolis of the Bohemian Brethren. In 1595 Bohuslav of Lobkovic sold his rights as over-lord to the town, which was made a royal city by Rudolf II. During the Thirty Years' War it was twice burned, in 1631 by the imperialists, and in 1640 by the Swedes.

**JUNG-FRAU,** a well-known Swiss mountain (15,660 ft.), admirably seen from Interlaken. It rises on the frontier between the cantons of Bern and of the Valais, and is reckoned among the peaks of the Bernese Oberland, two of which (the Flüeliarhorn, 14,026 ft., and the Aletschhorn, 13,721 ft.) surpass it in height. It was first ascended in 1811 by the brothers Meyer, and again in 1812 by Gottlieb Meyer (son of J. R. Meyer), in both cases by the eastern or Valais side, the foot of which (the final ascent being made by the 1811-1812 route) was reached in 1828 over the Mönchjoch by six peasants from Grindelwald. In 1841 Principal J. D. Forbes, with Agassiz, Desor and Du Châtelier, made the fourth ascent by the 1812 route. It was not till 1863 that Sir George Young and the Rev. H. B. George succeeded in making the first ascent from the west or Interlaken side. This is a far more difficult route than that from the Aletsch, the latter being how frequently taken in the course of the summer.

**JUNGLE** (Sans. jangula), an Anglo-Indian term for a forest, a thicket, a tangled wilderness. The Hindustani word means strictly waste, uncultivated ground; then such ground covered with trees or long grass; and thence again the Anglo-Indian application is to forest or other wild growth, rather than to the fact that it is not cultivated.

**JUNIN,** an interior department of central Peru, bounded N. by Huancuco, E. by Loreto and Cuzco, S. by Huancavelica, and W. by Lima and Ancash. Pop. (1906 estimate), 305,700. It lies wholly within the Andes and has an area of 23,152 sq. m. It is rich in minerals, including silver, copper, mercury, bismuth, molybdenum, lead and coal. The Huallaga and Mantaro rivers have their sources in this department, the latter in Lake Junin, or Chanchaycocha, 13,250 ft. above sea-level. The capital of Junin is Cerro de Pasco, and its two principal towns are Jauja and Tarma (pop. 1906, about 12,000 and 5000 respectively).

**JUNIPER.** The junipers, of which there are twenty-five or more species, are evergreen bushy shrubs or low columnar trees, with a more or less aromatic odour, inhabiting the whole of cold and temperate northern hemisphere, but attaining their maximum development in the Mediterranean region, the North Atlantic islands, and the eastern United States. The leaves are usually articulated at the base, spreading, sharp-pointed and needle-like in form, destitute of oil-glands, and arranged in alternating whorls of threes; but in some the leaves are minute and scale-like, closely adhering to the branches, the apex only being free, and furnished with an oil-gland on the back.
Sometimes the same plant produces both kinds of leaves on different branches, or the young plants produce acicular leaves, while those of the older plants are squamiform. The male and female flowers are usually produced on separate plants. The male flowers are developed at the ends of short lateral branches, are rounded or oblong in form, and consist of several antheridiferous scales in two or three rows, each scale bearing three or six almost spherical pollen-sacs on its under side. The female flower is a small bud-like cone situated at the apex of a small branch, and consists of two or three whorls of two or three scales. The scales of the upper or middle series each bear one or two erect ovules. The mature cone is fleshy, with the succulent scales fused together and forming the fruit-like structure known to the older botanists as the galeulus, or berry of the juniper. The berries are red or purple in colour, varying in size from that of a pea to a nut. They thus differ considerably from the cones of other members of the order Coniferae, of Gymnosperms (q.v.), to which the junipers belong. The seeds are usually three in number, sometimes fewer (1), rarely more (8), and have the surface near the middle or base marked with large gland-like structures. The genus contains oil, in a fossil state, four species having been described from rocks of Tertiary age.

The genus is divided into three sections, Sabina, Oxycedrus and Caryocedrus. Juniperus Sabina is the savin, abundant on the mountains of central Europe, an irregularly spreading much-branched shrub with scale-like glandular leaves, and emitting a disagreeable odour when bruised. The plant is poisonous, acting as a powerful local and general stimulant, diaphoretic, emmenagogue and anthelmintic; it was formerly employed both internally and externally. The oil of savin is now occasionally used externally as an abortifacient. J. bermedianus, a tree about 40 or 50 ft. in height, yields a fragrant red wood, which was used for the manufacture of "cedar" pencils. The tree is now very scarce in Bermuda, and the "red cedar," J. virginiana, of North America is employed instead for pencils and cigar-boxes. The red cedar is abundant in some parts of the United States and in Virginia is a tree 50 ft. in height. It is very widely distributed from the Great Lakes to Florida and round the Gulf of Mexico, and extends as far west as the Rocky Mountains and beyond to Vancouver Island. The wood is applied to many uses in the United States. The fine red fragrant heart-wood takes a high polish, and is much used in cabinet-work and inlaying, but the small size of the planks prevents its more extended use. The galls produced at the ends of the branches have been used in medicine, and the wood yields cedar-camphor and oil of cedar-wood. J. thurifera is the incense juniper of Spain and Portugal, and J. phoenicea (L. lycia) from the Mediterranean district is stated by Loudon to be burned as incense.

J. communis, the common juniper (see fig.), and several other species, belong to the section Oxycedrus. The common juniper is a very widely distributed plant, occurring in the whole of northern Europe, central and northern Asia to Kamchatka, and east and west North America. It grows at considerable elevations in southern Europe, in the Alps, Apenines, Pyrenees and Sierra Nevada (4000 to 8000 ft.). It also grows in Asia Minor, Persia, and at great elevations on the Himalayas. In Great Britain it is usually a shrub with spreading branches, less frequently a low tree. In former times the juniper seems to have been a very well-known plant, the name occurring almost unaltered in many languages. The Lat. juniperus, probably formed from june crude form of juvenis, fresh, young, and paree, to produce, is represented by Fr. genére, Sp. enebro, Itl. ginéreo, &c. The dialectical names, chiefly in European languages, were collected by Prince L. L. Bonaparte, and published in the Academy (July 17, 1880, No. 428, p. 45). The common juniper is official in the British pharmacopoeia and in that of the United States, yielding the oil of juniper, a powerful diuretic, distilled from the unripe fruits. This oil is closely allied in composition to oil of turpentine and is given in doses of a half to three minims. The Spiritus juniperi of the British pharmacopoeia is given in doses up to one drachm. Much safer and more powerful diuretics are now in use. The wood is very aromatic and is used for ornamental purposes. In Lapland the bark is made into ropes. The fruits are used for flavouring gin (a name derived from juniper, through Fr. genére); and in some parts of France a kind of beer called genevrette was made from them by the peasants. J. Oxycedrus, from the Mediterranean district and Madeira, yields cedar-oil which is official in most of the European pharmacopoeias, but not in that of Britain. This oil is largely used by microscopists in what is known as the "oil-immersion lens."

The third section, Caryocedrus, consists of a single species, J. drupacea of Asia Minor. The fruits are large and edible; they are known in the East by the name kabbel.

Juniper (Juniperus communis) half nat. size.
1. Vertical section of fruit.

JUNIUS, the pseudonym of a writer who contributed a series of letters to the London Public Advertiser, from the 21st of January 1769 to the 21st of January 1772. The signature had been already used by him in a letter of the 21st of November 1768, which he did not include in his collection of the Letters of Junius published in 1772. The name was chosen in all probability because he had already signed "Lucius" and "Brutus," and wished to exhaust the name of Lucius Junius Brutus the Roman patriot. Whoever the writer was, he wrote under other pseudonyms before, during and after the period between January 1769 and January 1772. He acknowledged that he had written as "Philo-Junius," and there is evidence that he was identical with "Veteran," "Nemesis" and other anonymous correspondents of the Public Advertiser. There is a marked distinction between the letters of Junius and his so-called miscellaneous letters. The second deal with a variety of subjects, some of a purely personal character, as for instance the alleged injustice of Viscount Barrington the secretary at war to the officials of his department. But the "letters of Junius" had a definite object—to discredit the ministry of the duke of Grafton. This administration had been formed in October 1768, when the earl of Chatham was compelled by ill health to retire from office, and was a reconstruction of his cabinet of July 1766. Junius
fought for the return to power of Chatham, who had recovered and was not on good terms with his successors. He communica-
ted with Chatham, with George Grenville, with Wilkes, all
enemies of the duke of Grafton, and also with Henry Sampson
Woodfall, printer and part owner of the Public Advertiser. This
private correspondence has been preserved. It is written in
the disguised hand used by Junius.

The letters are of interest on three grounds—their political
significance, their style, and the mystery which long surrounded
their authorship. As political writings they possess no intrinsic
value. Junius was wholly destitute of insight, and of the power
to disentangle, define and advocate principles. The matter of
his writing was descriptive, directive, and defensive, and not a
mental attack on the ministry for their personal immorality or meanness.
An ill-judged defence of one of the body—the marquis of Granby,
commander-in-chief—volunteered by Sir William Draper, gave
him an easy victory over a vulnerable opponent. He then went
on to pour acrimonious abuse on Grafton, on the duke of Bedford,
on King George III. himself in the letter of the 19th of December
1769, and ended with a most malignant and ignorant assault
on Lord Chief Justice Mansfield. Several of his accusations
were shown to be unfounded. The practical effect of the letters
was perhaps to draw the attention of the ministry to a weakness
in its position, to provoke anger and retorts. But the letter to the king aroused
indignation, and though Grafton’s administration fell in January
1770, it was succeeded by the long-lived cabinet of Lord North.
Junius confessed himself beaten, in his private letter to Woodfall
of the 10th of January 1773. He had materially contributed
to his own defeat by his brutal violence. He sinned indeed in
a large company. The employment of personal abuse had been
habitual in English political controversy for generations, and
in the 18th century there was a strong taste for satire. Latin
literature, which was not only studied but imitated, supplied
the inspiration and the models, in the satires of Juvenal, and
the speeches of Cicero against Verres and Catiline.

If, however, Junius was doing what others did, he did it better
than anybody else—a fact which sufficiently explains his
rapid popularity. His superiority lay in his style. Here also
he was by no means original, and he was unequal. There are
passages in his writings which can be best described in the
words which Burke applied to another writer: “A mere
mixture of vinegar and water, at once vapid and sour.” But
as an author devoting himself to a high purpose and seeking
to express his ideas with vigour and vigour. He shows the influence of Bolingbroke, of Swift,
and above all of Tacitus, who appears to have been his favourite
author. The imitation is never slavish. Junius adapts, and
does not only repeat. The white heat of his malignity animates
the whole. No single sentence will show the quality of a style
which produces its effect by persistence and repetition, but such
a typical passage as follows displays at once the method and the
spirit. It is taken from Letter XLIX. to the duke of
Grafton, June 22, 1771—

"The profound respect I bear to the gracious prince who governs
this country with no less honour to himself than satisfaction to his
subjects, and who restores you to your rank under his standard, will
save you from a multitude of reproaches. The attention I should
have paid to your fallings is involuntarily attracted to the hand
which rewards them; and though I am not so partial to the royal
judgment as to affirm that the favour of a king can remove man-
tains of infamy, it serves to lessen at least, for undoubtedly it
divides, the burden. While I remember how much is due to his
sacred character, I cannot, with any decent appearance of propriety,
call you, the meanest and the basest fellow in the kingdom,
the protest, my Lord, I do not think you so. You will have a dangerous
rival in that kind of fame to which you have hitherto so happily
directly; as long as it shall please your royal father to think
you worthy of his confidence, and fit to be trusted with any
share in his government . . . With any other prince, the shameful
desertion of him in the midst of that distress, which you alone had
created, in the very crisis of danger, when he fancied he saw
the throne already surrounded by men of virtue and abilities,
would have outweighed the memory of your former services. But his
majesty’s perjury, and unworthy conduct, overrode the docu-
mentations; he remembers with gratitude how soon you had accommo-
dated your morals to the necessities of his service, how cheerfully
you had abandoned the engagements of private friendship, and renounced
the most solemn professions to the public. The sacrifice of Lord
Chatham was not lost on him. Even the cowardice and perfidy of
deserting him may have done you no discredit in his esteem. The
instance was painful, but the principle might please.

What is artificial and stilted in this style did not offend the
would-be classic taste of the 18th century, and does not now
conceal the fact that the laboriously arranged words, and arti-
fully counterbalanced clauses, convey a venomous hate and scorn.
The pre-established harmony between Junius and his readers
accounts for the rapidity of his success, and for the importance
attributed to him by Burke and Johnson, far better writers than
himself. Before 1772 there appeared at least twelve un-
authorized imitations of his style and manner, and the practice
of anonymous writers began to replace political and literary interest
in the writings. Junius himself had been early aware of the advantage
he secured by concealment. “The mystery of Junius increases
his importance” is his confession in a letter to Wilkes dated
the 18th of September 1771. The calculation was a sound one.
For two generations after the appearance of the letter of the
21st of January 1769, speculations as to the authorship of
Junius were rife, and discussion had hardly ceased in 1910.
Joseph Parke, author with Herman Merivale of the Memoirs of Sir Philip Francis (1867), gives a list of more than forty
people who had been supposed to be Junius. They are:
Edmund Burke, Lord George Sackville, Lord Chatham, Colonel
Barré, Hugh Macaulay Boyd, Dr Butler, John Wilkes, Lord
Chesterfield, Henry Flood, William Burke, Gibbon, W. E.
Hamilton, Charles Lloyd, Charles Lee (in the American
War of Independence), John Roberts, George Grenville,
James Grenville, Lord Temple, Duke of Portland, William
Greatrakes, Richard Glover, Sir William Jones, James Hollis,
Laughlin Maclean, Philip Rosenhagen, Horne Tooko, John Kent,
Hobart, West, Lord George Grenville, Lord Lambton,
Woodfall in the letter of Philip Stanhope, Alexander
Weedburn (Lord Loughborough), Dunning (Lord Ashburnham),
Liet.-General Sir R. Rich, Dr Philip Francis, a “Junto” or
committee of writers who used a common name, Dr Lolme,
Mrs Catherine Macaulay (1733–91), Sir Philip Francis, Lord Littleton,
Wolfram Cornwall and Gov. Thomas Pownall. In the great
majority of cases the attribution is based on nothing more than
a vague guess. Edmund Burke denied that he could have
written the letters of Junius if he would, or would have written
them if he could. Grattan pointed out that he was young
when they appeared. More plausible claims, such as those
made for Lord Temple and Lord George Sackville, could not
stand the test of examination. Indeed after 1816 the question
was not so much “Who wrote Junius?” as “Was Junius Sir
Philip Francis, or some undiscoverable man?” In that year
John Taylor was led by a careful study of Woodfall’s edition of
1812 to publish The identity of Junius with a distinguished living
character established, in which he claimed the letters for Sir
Philip Francis. He had at first been inclined to attribute them
to Sir Philip’s father, Dr Francis, the author of translations
of Horace and Demosthenes. Taylor applied to Sir Philip, who
did not die till 1818, for leave to publish, and received an
answer which to an unwary person might appear to constitute
denials of the authorship, but were in fact evasions.

The reasons for believing that Sir Philip Francis (q.v.) was
Junius are very strong. His evasions were only to be expected.
Several of the men he attacked lived nearly as long as himself,
the sons of others were conspicuous in society, and King George
III. survived him. Sir Philip, who had held office, who had been
decorated, and who in his later years was ambitious to obtain
the governor-generalship of India, dared not confess that he was Junius. The similarity of his handwriting to the disguised hand used by the writer of the letters is very close. If Sir Philip Francis did, as his family maintain, address a copy of verses to a Miss Giles in the handwritten volume of Junius (and the evidence that he did is weighty) there can be no further question as to the identity of the two. The similarity of Junius and Francis in regard to their opinions, their likes and dislikes, their knowledge and their known movements, amount, apart from the handwriting, almost to proof. It is certain that many felons have been condemned on circumstantial evidence less complete. The opposition to his claim is based on such assertions as that his known handwriting was inferior to the leigned hand of Junius, and that no man can make a disguised hand like Junius'. But these points are uncontrovertible, and the second is a mere expression of opinion. It is said also that Francis must have been guilty of baseness if he wrote Junius, but that if explains why he did not avow the authorship it can be shown to constitute a moral impossibility only by an examination of his life.

Authorities.—The best edition of the Letters of Junius, properly so called, with the Miscellaneous Letters, is that of J. Ward (1854). The two best contributions to the controversy as to authorship are: The Handwriting of Junius investigated by Charles Chabot, expert, with preface and collateral evidence by the Hon. E. Twistleton (1871); Memoirs of Sir Philip Francis, K.C.B., by Parkes and Sevitt (1885); Rewritten by his Servanting Counsel, the Hon. H. R. Francis (1894); The Francis Letters, edited by Beata Francis and Eliza Kear, with a note on the Junius controversy by C. F. Kear (1901); and "Francis, Sir Philip," by his Sir Leslie Stephen, in Dict. of Nat. Bel. The case for those who decline to accept the claim of Sir Philip Francis is stated by C. W. Dilke, Papers of a Critic (1875), and Abraham Hayward, More about Junius, Franciscan Theology Unsound (1886). (D. H.)

JUNIUS, FRANZ (in French, François du Jon), the name of two Huguenot scholars.

(1) FRANZ JUNIUS (1545—1602) was born at Bourges in France on 27 November 1545, son of M. and Mme. Junius. He had studied law for two years under Hugo Donellus (1527—1591) when he was given a place in the retinue of the French ambassador to Constantinople, but before he reached Lyons the ambassador had departed. Junius found ample consolation in the opportunities for study at the gymnasium at Lyons. A religious tumult warned him back to Bourges, where he was cured of certain rationalistic principles that he had imbibed at Lyons, and he determined to enter the reformed church. He went in 1562 to study at Geneva, where he was reduced to the direst poverty by the failure of remittances from home, owing to civil war and the.turbulent times. He was from a humble friend who had himself been a protégé of Junius's family at Bourges; and his health was permanently injured. The long-expected remittance from home was closely followed by the news of the brutal murder of his father by a Catholic fanatic at Issoudun; and Junius resolved to remain at Geneva, where his reputation enabled him to live by teaching. In 1565, however, he was appointed minister of the Walloon church at Antwerp. His foreign birth excluded him from the privileges of the native reformed pastors, and exposed him to persecution. Several times he had to leave the post, and finally, after spending six months in preaching at Limburg, he was forced to retire to Heidelberg in 1567. There he was welcomed by the elector Frederick II., and temporarily settled in charge of the Walloon church at Schönau; but in 1568 his patron sent him as chaplain with Prince William of Orange in his unfortunate expedition to the Netherlands. Junius escaped as soon as he could from that post, and returning to his church remained there till 1573. From 1573 till 1578 he was at Heidelberg, assisting Emmanuel Tremelius (1510—1580), whose daughter he married, in his Latin version of the New Testament (Frankfort, 1579); in 1578 he was appointed to the chair of divinity at Heidelberg. Thence he was taken to France by the duke of Bouillon, and after an interview with Henry IV. was sent again to Germany on a mission. As he was returning to France he was named professor of theology at Leiden, where he died on the 13th of October 1602.

He was a voluminous writer on theological subjects, and translated and printed many works. He helped to prepare a new edition of the Latin Old Testament, slightly altered from the former joint edition, and with a version of the New Testament added (Geneva, 1590; Hanover, 1624). The Opera Theologica, Junii Batavorum et Franzi Merivale editiones (2 vols., 1613), to which is prefixed his autobiography, written about 1592 (new ed., edited by Abraham Kuyper,1882 seq.). The autobiography had Junius's signature at Leiden, and is given in G. Adriaan Groningena, vol. I., along with a list of the author's other writings.

(2) FRANZ JUNIUS (1580—1677), son of the above, was born at Heidelberg, and brought up at Leiden. His attention was diverted from military to theological studies by the peace of 1609 between Spain and the Netherlands. In 1617 he became pastor at Hildesberg, and in 1620 went to England, where he became librarian to Thomas Howard, earl of Arundel, and tutor to his son. He remained in England thirty years, devoting himself to the study of Anglo-Saxon, and afterwards of the cognate old Teutonic languages. His work, intrinsically valuable, is important as having aroused interest in a frequently neglected subject. In 1651 he returned to Holland; and for two years lived in Friesland in order to study the old dialect. In 1675 he returned to England, and during the next year resided in Oxford; in 1677 he went to live at Windsor with his nephew, Isaac Vossius, in whose house he died on the 19th of November 1677. He was buried at Windsor in St George's Chapel.

He was pre-eminently a student. He published De pictura veterum (1637) (in English by the author, 1638; enlarged and improved edition, edited by J. G. Graevius, who prefixed a life of Junius, with selections from his works, Rotterdam, 1694); Observationes in Willerani Abbatis Franciscan paraphrasis castell canonicarum (Amsterdam, 1655); Annotaciones in harmoniam latino-francicam quattuor evangelicarum, latine a Tuiano confectam (Amsterdam, 1655); Caedmonis monachi paraphrasis poetica genetas (Amsterdam, 1653) (see criticism under CAEDMON); Quattuor D.N.I.C. evangeliorum versiones in versiones nostras duae, anglicae et d. v. (Dort, 2 vols., 1665) (the Gothic version in this book Junius transcribed from the Silver Codex of Úllslas; the Anglo-Saxon version is from an edition by Thomas Marshall, whose notes to both versions are given, and a Gothic glossary by Junius); Etymologicum anglicanum (Amsterdam, 1655); Anglo-Saxon grammar (Oxford, 1743) (its results require careful verification in the light of modern research). His rich collection of ancient MSS., edited and annotated by him, Junius bequeathed to the university of Oxford. Graevius gives a list of them; the most important are a version of the Ormulum, the version of Caedmon, and 9 volumes containing Glossarium r. linguarum septentrionalium.

JUNK. (1) (Through Port. junco, adapted from Javanese djung, or Malayan adjong, ship), the name of the native sailing craft used in connection to the far eastern seas, the Pacific, and the Chinese and Japanese. It is a flat-bottomed, high-shouldered vessel with square bows and masts carrying lug-sails, often made of matting. (2) A nautical term for small pieces of disused rope or cable, cut up to make fenders, oakum, &c., hence applied colloquially by sailors to the salt beef and pork used on board ship. The word is of doubtful origin, but may be connected with "junk" (Lat. juncus), a reed, or rush. This word is now obsolete except as applied to a form of surgical appliance, used as a support in cases of fracture where immediate setting is impossible. It is made of wood and covered with a cloth that is fastened to the fracture and is attached to the dressing stuff with straw or horsehair, formerly with rushes or reeds.

JUNKER, WILHELM (1840—1892), German explorer of Africa, was born at Moscow on the 6th of April 1840. He studied medicine at Dorpat, Göttingen, Berlin and Prague, but did not practise for long. After a series of short journeys to Iceland, Tunis and Lower Egypt, he remained almost continuously in eastern Equatorial Africa from 1875 to 1886, making first Khartum and afterwards Lado the base of his expeditions. Junker was a leisurely traveller and a careful observer; his main object was to study the peoples with whom he came into contact, and especially the Mohammedan sects and persons of European extraction. Many of his investigations in these particulars is given in his Reisen in Afrika (3 vols., Vienna, 1889—1891), a work of high merit. An English translation by A. H. Keane was published in 1890—1892. Perhaps the greatest service he rendered to geographical science
was his investigation of the Nile-Congo watershed, when he suc-
cessfully combated Georg Schweinfurth's hydrographical theories
and established the identity of the Welle and Ubangi. The Mah-
dist rising prevented his return to Europe through the Sudan, as
he had planned to do; in 1884, and an expedition, fitted out in
1885 by his brother in St Petersburg, failed to reach him. Junker
then determined to go south. Leaving Wadelai on the 2nd of
January 1886 he travelled by way of Uganda and Tabora and
reached Zanzibar in December 1886. In 1887 he received the
gold medal of the Royal Geographical Society. As an explorer
Junker is entitled to high rank, his ethnographical observations
in the Niam-Niam (Azandeh) country being especially valuable.
He died at St Petersburg on the 13th of February 1892.

See the biographical notice by E. G. Ravenstein in Proceedings of
the Royal Geographical Society (1892), pp. 185-187.

**JUNKET**, a dish of milk curdled by rennet, served with
clotted cream and flavoured with nutmeg, which is particularly
associated in England with Devonshire and Cornwall. The
word is of somewhat obscure history. It appears to come through
O. Fr. jonquette, a rush-basket, from Lat. juncus, rush. In
Norman dialect this word is used of a cream cheese. The
commonly accepted origin is that it refers to the rush-basket on
which such cream cheeses or curds were served. *Juncate*
appears in Rabelais, and is explained by Cotgrave as "spon-
meat, rose-water and sugar." Nicholas Udall (in his translation
of Erasmus's *Apophthegms*, 1542) speaks of "marchepaines or
waferes with other like junket." The word "junket" is also
used as a verb, meaning "to set to junketing.

**JUNO**, the chief Roman and Latin goddess, and the special
object of worship by women at all the critical moments of life.
The etymology of the name is not certain, but it is usually taken
as a shortened form of *Jovina*, answering to *Jovis*, from a root
diis, shining. Under Greek influence Juno was early identified
with the Greek Hera, with whose cult and characteristics she has
much in common; thus the Juno with whom we are familiar
in Latin literature is not the true Roman deity. In the *Aeneid*,
for example, her policy is antagonistic to the plans of Jupiter
for the conquest of Latium and the future greatness of Rome;
though in the fourth *Eclogue*, as Lucina, she appears in her proper
role as assisting at childbirth. It was under Greek influence
again that she became the wife of Jupiter, the mother of Mars;
the true Roman had no such personal interest in his deities as to
invent family relations for them.

That Juno was especially a deity of women, and represents in
a sense the female principle of life, is seen in the fact that as every
man had his *genius*, so every woman had her Juno; and the
goddess herself may have been a development of this conception.
The various forms of her cult all show her in close connexion
with women. As Juno Lucina she was invoked in childbirth,
and on the 1st of March, the old Roman New Year's day, the
matrons met and made offerings at her temple in a grove on the
Esquiline; hence the day was known as the *Matronalia*. As
*Caprotina* she was especially worshipped by female slaves on
the 7th of July (Nonae Caprotinae); as *Sospita* she was invoked
all over Latium as the saviour of women in their perils, and
later as the saviour of the state; and under a number of other
titles, *Cinxia*, *Uxata*, *Pronuba*, &c., we find her taking a leading
part in the state of marriage. Her chief connexion with
moon is explained by the alleged influence of the moon
on the lives of women; thus she became the deity of the Kalends,
or day of the new moon, when the *regina sacrarium* offered a lamb
to her in the *regia*, and her husband the *rex* made known to the
people the day on which the Nones would fall. Thus she is
brought into close relation with Janus, also who was worshipped
on the Kalends by the *rex sacrarium*, and it may be that in the
oldest Roman religion these two were more closely connected
than Juno and Janus. But in historical times she was asso-
ciated with Jupiter in the great temple on the Capitoline hill as
Juno Regina, the queen of all Junones or queen of heaven, as
Jupiter there was *Optimus Maximus* (see Jupiter), and under the
same title she was enticed from Veii after its capture in
392 B.C., and settled in a temple on the Aventine. Thus exalted
above all other female deities, she was prepared for that identi-
fication with Hera which was alluded to above. That she was in
some sense a deity of light seems certain; as for Lucina, e.g., she
introduced new-born infants "in luminis oras."

See Roscher's article " *Juno* " in his Lexicon of Mythology, and
his earlier treatise on Juno and Hera; Wissowa, *Religion und Kultur
der Griechen*, vol. 1, pp. 113 foll. Also a fresh discussion by Wissowa in
*Philologus* for 1905 (p. 161 foll.).

**JUNOT, ANDOCHE, DUKE OF ABBANTES (1771-1813), French
general, was born at Bussy-le-Grand (Côte d'Or), on the 23rd
of October 1771. He went to school at Chartillon, and was known
among his comrades as a clustering but lovable creature, with a
pugnacious disposition. He was studying law in Paris at the
outbreak of the Revolution and joined a volunteer battalion.
He distinguished himself by his valour in the first year of the
Revolutionary wars, and came under the special notice of
Napoleon Bonaparte during the siege of Toulon, while serving
as his secretary. It is related that as he was taking down a
despatch, a shell burst hard by and covered the paper with sand,
whereupon he exclaimed, "Bien! nous n'avions pas de sable
pour sécher l'encre! en voici!" He remained the faithful
companion of his chief during the latter's temporary disgrace,
and went with him to Italy as aide-de-camp. He distinguished
himself so much at the battle of Millesimo that he was selected
to carry back the captured colours to Paris; returning to Italy
he went through the campaign with honour, but was badly
wounded in the head at Lonato. Many rash incidents in his
career may be traced to this time. Although his early devotion
completely recovered. During the expedition to Egypt he became
a general of brigade. His devotion to Bonaparte involved him
in a duel with General Lanusse, in which he was again wounded.
He had to be left in Egypt to recover, and in crossing to France
was captured by English cruisers. On his return to France he
was made commandant of Paris, and afterwards promoted
general of division. It was at this time that he married Laure
Permon (see *Junot, Laure*). He next served at Arras in com-
mand of the grenadiers of the army destined for the invasion
of England, and made some alterations in the equipment of
the troops which received the praise of the emperor. It was,
however, a bitter mortification that he was not appointed
a marshal of France when he received the grand cross of
the legion of honour. He was made colonel-general of hussars
instead and sent as ambassador to Lisbon, his entry into
which city resembled a royal progress. But he was so restless and
dissatisfied in the Portuguese capital that he set out, without
leave, for the army of Napoleon, with which he took part in the battle
of Austerlitz, behaving with his usual courage and zeal.
But he soon became estranged from his former chief, who
never forgotten by the emperor, his uncertain temper and want of
self-control made it dangerous to employ him at court or head-
quarters, and he was sent to Parma to put down an insurrection
and to be out of the way. In 1806 he was recalled and became
governor of Paris. His extravagance and prodigality shocked
the government, and some rumours of an intrigue with a lady of
the imperial family—it is said Pauline Bonaparte—made it
desirable again to send him away. He was therefore appointed
to lead an invading force into Portugal. But the first
stage of this plan was so far so well performed that he
was expected to fall back upon for its achievement. Early in November
1807 he set out from Salamanca, crossed the mountains of
Beira, rallied his wearied forces at Abrantes, and, with 1500 men,
dashed upon Lisbon, in order, if possible, to seize the Portuguese
fleet, which had, however, just sailed away with the regent
and court to Brazil. The whole movement only took a month;
it was undoubtedly bold and well-conducted, and Junot was
made duke of Abrantes and invested with the governorship
of Portugal. But administration was his weak point. He was
not a civil governor, but a *sabreur*, brave, turbulent, and
also dissipated and rapacious; though in the last respect he was far
from being the worst offender amongst the French generals in
Spain. His hold on Portugal was never supported by a really
adequate force, and his own conduct, which resembled that of
an eastern monarch, did nothing to consolidate his conquest. After Wellesley encountered him at Vimiera (see PEnnIcular War) he was obliged to conclude the so-called convention of Cintra, and to withdraw from Portugal with all his forces. Napoleon was furious, but, as he said, was spared the necessity of sending his old friend before a court martial by the English put their own generals on their trial. Junot was sent back to Spain, where, in 1810–1811, acting under Masséna, he was once more seriously wounded. His last campaign was made in Russia, and he received more than a just share of discredit for it. Napoleon next appointed him to govern Iliyria. But Junot’s mind had become deranged under the weight of his misfortunes, and on the 29th of July 1813, at Montbard, he threw himself from a window in a fit of insanity.

JUNOT, LAURE, DUCHESS OF ABRANTES (1783–1834), wife of the preceding, was born at Montpellier. She was the daughter of Mme. Permon, to whom during her widowhood the young Bonaparte made an offer of marriage—such at least is the version presented by the daughter in her celebrated Memoirs. The Permon family, after various vicissitudes, settled at Paris, and Bonaparte certainly frequented their house a good deal after the downfall of the Jacobin party in Thermidor 1794. Mlle. Permon was married to Junot early in the consulate, and at once entered eagerly into all the gayeties of Paris, and became noted for her beauty, her caustic wit, and her extravagance. The first consul nicknamed her petite peste, but treated her and Junot with the most generous care, a fact which did not restrain her sarcasms and slanders in her portrayal of him in her Memoirs. During Junot’s diplomatic mission to Lisbon, his wife displayed her prodigality so that on his return to Paris in 1806 he was burdened with debts, which his own intrigues did not less. She joined him again at Lisbon after he had entered that city as conqueror at the close of 1807; but even the presents and spoils won at Lisbon did not satisfy her demands; she accompanied Junot through part of the Peninsular War. On her return to France she displeased the emperor by her vivacious remarks and by receiving guests whom he disliked. The ministerial jealousy of Junot thereafter threatened her with ruin; this perhaps explains why she took some part in the intrigues for bringing back the Bourbons in 1814. She did not side with Napoleon during the Hundred Days. After 1815 she spent most of her time at Rome amidst artistic society, which she enlivened with her sprightly converse. She also compiled her spirited but somewhat spiteful Memoirs, which were published at Paris in 1831–1834 in 18 volumes. Many editions have since appeared.

Of her other books the most noteworthy are Histoires contemporaines (2 vols., 1835); Scènes de la vie espagnole (2 vols., 1836); Histoire des salons de Paris (6 vols., 1837–1838); Souvenirs d’une ambassade et d’un séjour en Espagne et en Portugal, de 1808 à 1811 (2 vols., 1837). (J. H. R.)

JUNTA (from junta, to join), a Spanish word meaning (1) any meeting for a common purpose; (2) a committee; (3) an administrative council or board. The original meaning is now rather lost in the two derivative significations. The Spaniards have even begun to make use of the barbarism mélin, corrupted from the English "meeting." The word junta has always been and still is used in the other senses. Some of the board of Spanish ministers, the Junta de Relaciones, was under the Habsburg and the earlier Bourbon kings were styled juntas. The superior governing body of the Inquisition was the junta suprema. The provincial committees formed to organize resistance to Napoleon’s invasion in 1808 were so called, and so was the general committee chosen from among them to represent the nation. In the War of Independence (1808–1814), and in all subsequent civil wars or revolutionary disturbances in Spain or Spanish America, the local executive bodies, elected, or in some cases self-chosen, to appoint officers, raise money and soldiers, look after the wounded, and discharge the functions of an administration, have been known as juntas.

The form “Junto,” a corruption due to other Spanish words ending in -o, came into use in English in the 17th century, often in a disparaging sense, of a party united for a political purpose, a faction or cabal; it was particularly applied to the advisers of Charles II., to the Rump under Cromwell, and to the leading members of the great Whig houses who controlled the government in the reigns of William III. and Anne.

JUPITER, the chief deity of the Roman state. The great and continuous growth by the influence exerted from a very early period on Rome by the superior civilization of Greece not only caused a modification of the Roman god on the analogy of Zeus, the supreme deity of the Greeks, but led the Latin writers to identify the one with the other, and to attribute to Jupiter myths and family relations which were purely Greek and never belonged to the real Roman religion. The Jupiter of actual worship was a Roman god; the Jupiter of Latin literature was more than half Greek. This identification was facilitated by the community of character which really belonged to Jupiter and Zeus as the Roman and Greek developments of a common original conception of the god of the light and the heavens.

That this was the original idea of Jupiter, not only in Rome, but among all Italian peoples, admits of no doubt. The earliest form of his name was Divis pater, or Dioptier, and his special priest was the flamen dialis; all these words point to a root dio, shining, and the connexion with dies, day, is obvious (cf. Juno).

One of his most ancient epithets is Lucetus, the light-bringer; and later literature has preserved the same idea in such phrases as sub Jose, under the open sky. All days of the full moon (idus) were sacred to him; all emanations from the sky were due to him and to the sun. The forms of religious thought were probably believed to be manifestations of the god himself. As Jupiter Elicius he was propitiated, with a peculiar ritual, to send rain in time of drought; as Jupiter Fulgur he had an altar in the Campus Martius, and all places struck by lightning were made his property and guarded from the profane by a circular wall. The vintage, which needs especially the light and heat of the sun, was under his particular care, and in the festivals connected with it (Vinaria urbana) and Medesirnalia, he was the deity invoked, and his flamen the priest employed. Throughout Italy we find him worshipped on the summits of hills, where nothing but the sky and the sea could be seen. The curios of the sky could be conveniently observed. Thus on the Alban hill south of Rome was an ancient seat of his worship as Jupiter Latinaris, which was the centre of the league of thirty Latin cities of which Rome was originally an ordinary member.

At Rome itself it is on the Capitoline hill that we find his oldest temple, described by Livy (1. 10); here we have a tradition of his sacred tree, the oak, common to the worship of both Zeus and Jupiter, and here too was kept the lapis nilex, perhaps a cult, believed to have been a thunderbolt, which was used and by the form of religious thought was probably making treaties on behalf of the Roman state. Hence the curious form of oath, Jovem lapidem jurare, used both in public and private life at Rome.

In this oldest Jupiter of the Latins and Romans, the god of the light and the heavens, and the god invoked in taking the most solemn oaths, we may undoubtedly see not only the great protecting deity of the race, but one, and perhaps the only one, whose worship embodies a distinct moral conception. He is specially concerned with oaths, treaties and leagues, and it was in the presence of his priest that the most ancient and sacred form of married state (confunctorium) took place. The lesser deity Fides and Fides, were probably originally identical with him, and only gained a separate existence in course of time by a process familiar to students of ancient religion. This connexion with the conscience, with the sense of obligation and right dealing, was never quite lost throughout Roman history. In Virgil’s great poem, though Jupiter is in many ways as much Greek as Roman, he is still the great protecting deity who keeps the hero in the path of duty (pietas) towards gods, state and family.

But this aspect of Jupiter gained a new force and meaning at the close of the monarchy with the building of the famous temple on the Capitol, of which the foundations are still to be seen. It was dedicated to Jupiter Optimus Maximus, i.e. the best and greatest of all the Jupiters, and with him were associated
JUPITER

Juno and Minerva, in a fashion which clearly indicates a Graeco-Etruscan origin; for the combination of three deities in one temple was foreign to the ancient Roman religion, while it is found both in Greece and Etruria. This temple was built on a scale of magnificence quite unknown to primitive Rome, and was beyond doubt the work of Etruscan architects employed, we may presume, by the Tarquinius. Its three cellae contained the statues of the three deities, with Jupiter in the middle holding his thunderbolt. Hencetoward it was the centre of the religious life of the state, and symbolized its unity-integrated structure. The festival fell on the 17th of September, on which day the consuls originally succeeded to office; accompanied by the senate and other magistrates and priests, and in fulfillment of a vow made by their predecessors, they offered to the great god a white heifer, his favourite sacrifice, and after rendering thanks for the preservation of the state during the past year, made the same vow as that by which they themselves had been bound. Then followed the epulum jovis or feast of Jupiter, in which the three deities seem to have been visibly present in the form of their statues, Jupiter having a capital, and each goddess a cella, and stood in the temple and magistrates. In later times this day became the central point of the great Roman games (iudi Romani), originally games vowed in honour of the god if he brought a war to a successful issue. When a victorious army returned home, it was to this temple that the triumphal procession passed, and the triumph of which we hear so often in Roman history may be taken as a religious ceremony in honour of Jupiter. The general was dressed and painted to resemble the statue of Jupiter himself, and was drawn on a gilded chariot by four white horses through the Porta Triumphalis to the Capitol, where he offered a solemn sacrifice to the god, and laid on his knees the victory's laurels (see TRIUMPH).

Throughout the period of the Republic the great god of the Capitol in his temple looking down on the Forum continued to overshadow all other worship, as the one in which the whole state was concerned, in all its length and breadth, rather than any one gens or family. Under Augustus and the new monarchy it is sometimes said that the Capitoline worship suffered to some extent an eclipse (J. B. Carter, The Religion of Numa, p. 160 seq.); and it is true that as it was the policy of Augustus to identify the state with the interests of his own family, he was not disposed to direct the attention of the people to the worship in which he and his family were specially concerned; thus his temple of Apollo on the Palatine, and that of Mars Ultor in the Forum Augusti, took over a few of the prerogatives of the cult on the Capitol. But Augustus was far too shrewd to attempt to oust Jupiter Optimus Maximus from his paramount position; and he became the protecting deity of the reigning emperor as representing the state, as he had been the protecting deity of the free republic. His worship spread over the whole empire; it is probable that every city had its temple to the three deities of the Roman Capitol, and the fact that the Romans chose the name of Jupiter in almost every case, by which to indicate the chief deity of the subject peoples, proves that they continued to regard him, so long as his worship existed at all, as the god whom they themselves looked upon as greatest.

See ZEUS, ROMAN RELIGION. Excellent accounts of Jupiter may be found in Roscher's Mythological Lexicon, and in Wissowa's Religion and Cultus der Römer (p. 100 seq.).

(W. M. RO.; W. W. F. *)

JUPITER, in astronomy, the largest planet of the solar system; his size is so great that it exceeds the collective mass of all the others in the proportion of 5 to 2. He travels in his orbit at a mean distance from the sun exceeding that of the earth 5:2 times, or 483,000,000 miles. The eccentricity of this orbit is considerable, amounting to 0.048, so that his maximum and minimum distances are 504,000,000 and 462,000,000 miles respectively. When in opposition and at his mean distance, he is situated 350,000,000 miles from the earth. His orbit is inclined about 1° 18' 40'' to the ecliptic. His sidereal revolution is completed in 4332-585 days, or 11 years 314-9 days, and his synodical period, or the mean interval separating his returns to opposition, amounts to 308-87 days. His real polar and equatorial diameters measure 84,570 and 90,190 miles respectively, so that the mean is 87,380 miles. His apparent diameter (equatorial) as seen from the earth varies from about 32', when in conjunction with the sun, to 50' in opposition to that luminary. The oblateness, or compression, of his globe amounts to about 1/24; his volume exceeds that of the earth 1300 times, while his mass is about 300 times greater. These values are believed to be as accurate as the best modern determinations allow, but there are some differences amongst various observers and absolute exactness cannot be obtained.

The discovery of telescopic construction early in the 17th century and the practical use of the telescope by Galileo and others greatly enriched our knowledge of Jupiter and his system. Four of the satellites were detected in 1610, but the dark bands or belts on the globe of the planet do not appear to have been noticed until twenty years later. Though Galileo first sighted the satellites and perseveringly studied the Jovian orb, he failed to distinguish the belts, and we have to conclude either that these features were unusually faint at the period of his observations, or that his telescopes were insufficiently powerful to render them visible. The belts were first recognized by Nicolas Zucchi and Daniel Bartoli on the 17th of May 1630. They were seen also by Francesco Fontana in the same and immediately succeeding years, and by other observers of about the same period, including Zuppi, Giovanni Battista Riccioli and Francesco Maria Grimaldi. Improvements in telescopes were quickly introduced, and between 1653 and 1666 C. Huygens, R. Hooke and J. D. Cassini made more effective observations. Hooke discovered a large dark spot in the planet's southern hemisphere on the 19th of March 1664, and from this object Cassini determined the rotation period, in 1665 and later years, as 9 hours 56 minutes. The belts, spots and irregular markings on Jupiter have now been assiduously studied during nearly three centuries. These markings are extremely variable in their tones, tints and relative velocities, and there is little reason to doubt that they are atmospheric formations floating above the surface of the planet in a series of different currents. Certain of the markings appear to be fairly durable, though their rates of motion exhibit considerable anomalies and prove that they must be quite detached from the actual sphere of Jupiter. At various times determinations of the rotation period were made as follows:

<table>

A great number of Jovian features have been traced in more recent years and their rotation periods ascertained. According to the researches of Stanley Williams the rates of motion for different latitudes of the planet are approximately as under:

<table>

</table>
The above are the mean periods derived from a large number of markings. The bay or hollow in the great southern equatorial belt north of the red spot has perhaps been observed for a longer period than any other feature on Jupiter except the red spot itself. H. Schwabe saw the hollow in the belt on the 5th of September 1831 and on many subsequent dates. The rotation period of this object during the seventy years to the 5th of September 1901 was 9 h. 55 m. 36 s. from 61,813 rotations. Since 1901 the mean period has been 9 h. 55 m. 40 s., but it has fluctuated between 9 h. 55 m. 38 s. and 9 h. 55 m. 42 s. The motion of the various features is not therefore dependent upon their latitude, though at the equator the rate seems swifter as a rule than in other zones. But exceptions occur, for in 1880 some spots appeared in about 23° N. which rotated in 9 h. 48 m. though in the region immediately N. of this the spot motion is ordinarily the slowest of all and averages 9 h. 55 m. 53-8 s. (from twenty determinations). These differences of speed are of the same order as the sub-vision of their proper motions. The solar envelope, however, appears to show a pretty regular retardation towards the poles, for according to Gustav Spörer’s formula, while the equatorial period is 25 d. 2 h. 15 m. the latitudes 46° N. and S. give a period of 28 d. 15 h. 0 m.

The Jovian currents flow in a due east and west direction as though mainly influenced by the swift rotatory movement of the globe, and exhibit little sign of deviation either to N. or S. These currents do not blend and pass gradually into each other, but seem to be definitely bounded and controlled by separate phenomena well capable of preserving their individuality. Occasionally, it is true, there have been slanting belts on Jupiter (a prominent example occurred in the spring of 1861), as though the materials were evolved with some force in a polar direction, but these oblique formations have usually spread out in longitude and ultimately formed bands parallel with the equator. The longitudinal currents do not individually present us with an equitable rate of motion. In fact they display some curious irregularities, the spots carried along in them apparently oscillating to and fro without any reference to fixed periods or cyclical variations. Thus the equatorial current in 1880 moved at the rate of 6 h. 6 s. whereas in 1901 it was 6 h. 33 s. The red spot in the S. tropical zone gave 9 h. 55 m. 34 s. in 1879-1880, whereas during 1900-1908 it has varied a little on either side of 9 h. 55 m. 40-6 s. Clearly therefore no fixed period of rotation can be applied for any spot since it is subject to drifts E. or W. and these drifts sometimes come into operation suddenly, and may be either temporary or durable. Between 1878 and 1900 the red spot in the planet’s S. hemisphere showed a continuous retardation of speed.

It must be remembered that in speaking of the rotation of these markings, we are simply alluding to the irregularities in the vaporous envelope of Jupiter. The rotation of the planet itself is another matter and its value is not yet exactly known, though it is probably little different from that of the markings, and especially from those of the most durable character, which indicate a period of about 9 h. 56 m. We never discern the actual landscape of Jupiter or any of the individual forms really diversifying it.

Possibly the red spot which became so striking an object in 1878, and which still remains faintly visible on the planet, is the same feature as that discovered by R. Hooke in 1664 and 1665 by Cassini in following years. It was situated in approximately the same latitude of the planet and appears to have been hidden temporarily during several periods up to 1713. But the lack of fairly continuous observations of this particular marking makes its identity with the present spot extremely doubtful. The latter was seen by W. R. Dawes in 1857, by Sir W. Huggins in 1858, by J. Baxendell in 1859, by Lord Rosse and R. Copeland in 1873, by H. C. Russell in 1876-1877, and in later years it has formed an object of general observation. In fact it may safely be said that no planetary marking has ever aroused such widespread interest and attracted such frequent observation as the great red spot on Jupiter.

The slight inclination of the equator of this planet to the plane of its orbit suggests that he experiences few seasonal changes. From the conditions we are, in fact, led to expect a prevailing calm in his atmosphere, the more so from the circumstance that the amount of the sun’s heat poured upon each square mile of it is (on the average) less than the 27th part of what we received by each square mile of the earth’s surface. Moreover, the seasons of Jupiter have nearly twelve times the duration of ours, so that it would be naturally expected that changes in his atmosphere produced by solar action take place with extreme slowness. But this is very far from being the case. Telescopes reveal the indications of rapid changes and extensive disturbances in the aspect and material forming the belts. New spots covering large areas frequently appear and as frequently decay and vanish, implying an agitated condition of the Jovian atmosphere, and leading us to admit the operation of causes much more active than the heating influence of the sun.

When we institute a comparison between Jupiter and the earth on the basis that the atmosphere of the former planet bears the same relation to his mass as the atmosphere of the earth bears to her mass, we find that a state of things must prevail on Jupiter very dissimilar to that affecting our own globe. The density of the Jovian atmosphere we should expect to be fully six times as great as the density of our air at sea-level, while it would be comparatively shallow. But the telescopic aspect of Jupiter apparently negates the latter supposition. The belts and spots grow faint as they approach the limb, and disappear as they near the edge of the disk, thus indicating a dense and deep atmosphere. R. A. Proctor considered that the observed features suggested inherent heat, and adopted this conclusion as best explaining the surface phenomena of the planet. He regarded Jupiter as belonging, on account of his immense size, to a different class of bodies from the earth, and was led to believe that there existed greater analogy between Jupiter and the sun than between Jupiter and the earth. Thus the density of the sun, like that of Jupiter, is small compared with the earth’s; in fact, the mean density of the sun is almost identical with that of Jupiter, and the belts of the latter planet may be much more aptly compared with the spot zones of the sun than with the trade zones of the earth.

In support of the theory of inherent heat on Jupiter it has been said that his albedo (or light reflected from his surface) is much greater than the amount would be were his surface similar to that of the moon, Mercury or Mars, and the reasoning has been applied to the large outer planets, Saturn, Uranus and Neptune, as well as to Jupiter. The average reflecting capacity of the moon and five outer planets would seem to be (on the assumption that they possess no inherent light) as follows:—
These values were considered to support the view that the four larger and more distant orbs shine partly by inherent luster, and the more so as spectroscopic analysis indicates that they are each involved in a deep vapour-laden atmosphere. But certain observations furnish a contradiction to Proctor's views. The absolute extinction of the satellites, even in the most powerful telescopes, while in the shadow of Jupiter, shows that they cannot receive sufficient light from their primary to render them visible, and the darkness of the shadows of the satellites when projected on the planet’s disk proves that the latter cannot be self-luminous except in an insensible degree. It is also to be remarked that, were it only moderately self-luminous, the colour of the light which it sends to us would be red, such light being absolutely a heated vapour, when its temperature is raised. Possibly, however, the great red spot, when the colouring was intense in 1878 and several following years, may have represented an opening in the Jovian atmosphere, and the ruddy belts may be extensive rifts in the same envelope. If Jupiter's actual globe emitted a good deal of heat and light we should probably distinguish little of it, owing to the obscuring vapours floating above the surface. Venus reflects relatively more light than Jupiter, and there is little doubt that the albedo of a planet is dependent upon atmospheric characteristics, and is in no case and in every case an inherent light. It has been supposed that, when its surface is raised.

The colouring of the belts appears to be due to seasonal variations, for Stanley Williams has shown that their changes have a cycle of twelve years, and correspond as nearly as possible with a sidereal revolution of Jupiter. The variations are of such character that the two great equatorial belts are alternately affected; when the S. equatorial belt displays maximum redness the N. equatorial is at a minimum and vice versa.

The most plausible hypothesis with regard to the red spot is that it is of the nature of an island floating upon a liquid surface, though its great duration does not favour this idea. But it is an open question whether the belts of Jupiter indicate a liquid or gaseous condition of the visible surface. The difficulty in the way of this hypothesis is the great difference in the times of rotation between the equatorial portions of the planet and the spots in temperate latitudes. The latter usually rotate in periods between 9 h. 55 m. and 9 h. 56 m., while the equatorial markings make a revolution in about five minutes less, 9 h. 50 m. to 9 h. 51 m. The difference amounts to 7.5° in a terrestrial day and proves that an equatorial spot will circulate right round the enormous sphere of Jupiter (circumference 283,000 m.) in 48 days. The motion is equivalent to about 6000 m. per day and 250 m. per hour.

(W. F. D.)

Satellites of Jupiter.

Jupiter is attended by eight known satellites, resolvable as regards their visibility into two widely different classes. Four satellites were discovered by Galileo and were the only ones known until 1892. In September of that year E. E. Barnard, at the Lick Observatory, discovered a fifth extremely faint satellite, performing a revolution in somewhat less than twelve hours. In 1904 two yet fainter satellites, far outside the other five, were photographically discovered by C. D. Perrine at the Lick Observatory. The eighth satellite was discovered by P. J. Melotte of Greenwich on the 28th of February 1908. It is of the 17th magnitude and appears to be very distant from Jupiter; a re-observation on the 16th of January 1909 proved it to be retrograde, and to have a very eccentric orbit. These bodies are usually numbered in the order of their discovery, the nearest to the sun being V. In apparent brightness each of the four Galilean satellites may be roughly classed as of the sixth magnitude; they would therefore be visible to a keen eye if the brilliancy of the planet did not obscure them. Some observers profess to have seen one or more of these bodies with the naked eye notwithstanding this drawback, but the evidence can scarcely be regarded as conclusive. It does not however seem unlikely that the third, which is the brightest, might be visible when in conjunction with one of the others.

Under good conditions and sufficient telescopic power the satellites are visible as disks, and not mere points of light. Measures of the apparent diameter of objects so faint are, however, difficult and uncertain. The results for the Galilean satellites range between 0°.9 and 1°.5, corresponding to diameters of between 3000 and 5000 kilometres. The smallest is therefore about the size of our moon. Satellite I. has been found to exhibit marked variations in its brightness and aspect, but the law governing them has not been satisfactorily worked out. It seems probable that one hemisphere of this satellite is brighter than the other, or that there is a large dark region upon it. A revolution on its axis corresponding with that of the orbit (9.04 days) has also been suggested, though not yet established. Variations of light somewhat similar, but less in amount, have been noticed in the second and third satellites.

The most interesting and easily observed phenomena of these bodies are their eclipses and their transits across the disk of Jupiter. The four inner satellites pass through the shadow of Jupiter at every superior conjunction, and across his disk at every inferior conjunction. The outer Galilean satellite does the same when the conjunctions are not too near the line of nodes of the satellites' orbit. When most distant from the nodes, the satellites pass above or below the shadow and below or above the line of nodes, and the transits of the four Galilean satellites are predicated in the nautical almanacs.

When one of the four Galilean satellites is in transit across the disk of Jupiter it can generally be seen projected on the face of the planet. It is commonly brighter than Jupiter when it first enters upon the limb but sometimes darker near the centre of the disk. This is owing to the fact that the planet is much darker at the limb. During these transits the shadow of the satellites can also be seen projected on the planet as a dark point.

The theories of the motion of these bodies form one of the most interesting problems of celestial mechanics. Owing to the great elongation of the orbit of Jupiter, the influence of the stars upon the apparent motion of any of the five inner satellites is very much greater than that of the sun, or of the satellites on each other. The inclination of the orbits to the equator of Jupiter is quite small and almost constant, and the motion of each node is nearly uniform around the plane of the planet's equator.

The most marked feature of these bodies is a relation between the mean longitudes of Satellites I., II., and III. The mean longitude of I. plus twice that of III. minus three times that of II. is constantly near to 180°. It follows that the same relations subsist among the mean motions. The cause of this was pointed out by Laplace. On the same hypothesis L₄ and L₅ for the mean longitudes, and define an angle U as follows:

\[ U = L₄ - 3L₅ + 2L₆ \]

It was shown mathematically by Laplace that if the longitudes and mean motions were such that the angle U differed a little from 180°, there was a minute residual force arising from the mutual actions of the several bodies tending to bring this angle towards the value 180°. Consequently, if the mean motions were such that this angle increased only with great slowness, it would after a certain period tend back toward the value 180°, and then beyond it, exactly as a pendulum drawn out of the perpendicular oscillates towards and beyond it. Thus an oscillation would be engendered in virtue of which the angle would oscillate very slowly on each side of the central value. Computation of the influence of the satellite on the planet shows that the angle does differ from 180°, but it is not certain whether this deviation is greater than the possible result of the errors of observation. However this may be, the existence of the libration, and its period if it does exist, are still unknown.

The following are the principal elements of the orbits of the five inner satellites, arranged in the order of distance from Jupiter. The mean longitudes are for 1861, 20th of October, G.M.T., and are referred to the equinox of the epoch, 1891, 2nd of October.

The following numbers relating to the planet itself have been supplied mostly by Professor Hermann Struve.
Equatorial diameter of Jupiter (Dist. 5·2028) 38°·60 37°·50
Polar diameter of Jupiter 36°·02 35°·23
Ellipticity 1·4·15·5 1·16·5
Theoretical eclipticity from motion of 90° in the periphery of Sat. V. 1·15·3
Centrifugal force + gravity at equator 0·0000
Mass of Jupiter + Mass of Sun, now used in tables 1·1047·34
Inclination of plane of equator to ecliptic 2°·07+0·066
Long. of Node of equator on ecliptic 336°·21·47+6·262
Long. of " Node of equator on ecliptic 175°·25·91+2·299

The longitudes are referred to the mean terrestrial equinox, and
152 the time in years from 1900.
For the elements of Jupiter’s orbit, see SOLAR SYSTEM; and for
physical constants, see PLANET. (S. N.)

JUR (DIUR), the Dinka name for a tribe of negroes of the
upper Nile valley, whose real name is Luoh, or Lwo. They
appear to be immigrants, and tradition places their home in the
south; they now occupy a district of the Bahr-el-Ghazal between
the Bongo and Dinka tribes. Of a reddish black colour, fairer than the Dinka, they are well proportioned, with
the hair short. Tattooing is not common, but when found is
similar to that of the Dinka; they pierce the ears and nose, and
in addition to the ornaments found among the Dinka (gr.)
wear a series of iron rings on the forearm covering it from
wrist to elbow. They are mainly agricultural, but hunt and fish
to a considerable extent; they are also skilful smiths, smelting
their own iron, of which they supply quantities to the Dinka.
They are a prosperous tribe and in consequence sinisters are
unknown among them. Their chief currency is spears and
hoe-blades, and cowrie shells are used in the purchase of wives.
Their chief weapons are spears and bows.

See G. Schweinfurth, The Heart of Africa: Travels 1868-1871,
trans. G. E. E. Frewe (2nd ed., 1874); W. Junker, Travels in Africa
(Eng. ed., 1890-1892).

JURA, a department of France, on the eastern frontier,
formed from the southern portion of the old province of Franche-
Comté. It is bounded N. by the department of Haute-Saône,
N.E. by Doubs, E. by Switzerland, S. by Ain, and W. by Saône-
et-Loire and Côte d’Or. Pop. (1906), 527,725. Area, 1951 sq. m.
Jura comprises four distinct zones with a general direction from
cross to south. In the S.E. lie high eastern chains of the central Jura, containing the Crêt Pela (491 ft.), the highest point in the department. On the western side, in the plain there is a vast plateau bordered on the E. by the river Arbon. Westward of these runs a range of hills, the slopes of which are covered
with vineyards. The north-west region of the department is
occupied by a plain which includes the fertile Finage, the northern
portion of the Bresse, and is traversed by the Doubs and its left affluent the Loue, between which lies the fine forest of
Chaux, 76 sq. m. in area. Jura falls almost wholly within the
basin of the Rhone. Besides those mentioned, the chief rivers are the Valouze and the Bienne, which water the southern
side of the department. There are several lakes, the largest of which is that of Chalin, about 12 m. E. of Lons-le-Saunier. The climate
is, on the whole, cold; the temperature is subject to sudden and
violent changes, and among the mountains winter sometimes
lingers for eight months. The rainfall is much above the average
of France.

Jura is an agricultural department; wheat, oats, maize and
barley are the chief cereals, the culture of potatoes and rape being
also of importance. Vines are grown mainly in the cantons of
Arbois, Poligny, Salins and Voiteur. Woodlands occupy a
fifth of the area; the oak, hornbeam and beech, and, in the
mountains, the spruce and fir, are the principal varieties. Natural
pasture is abundant on the mountains. Forests, gorges and
rivers are characteristic features of the scenery. Its
minerals include iron and salt and there are stone-quarries.
Peat is also worked. Lons-le-Saunier and Salins have mineral
springs. Industries include the manufacture of Gruyère, Septem-
moncel and other cheeses (made in co-operative cheese factories
or fruitières), metal founding and forging, saw-milling, flour-
milling, the cutting of precious stones (at Septmoncel and else-
where), the manufacture of nails, tools and other iron goods,
paper, leather, brier-pipes, toys and fancy wooden-ware and
basket-work. The making of clocks, watches, spectacles and
measures, which are largely exported, employs much labour in
and around Morez. Imports consist of grain, cattle, wine, leaf-
copper, horn, ivory, fancy-wood; exports of manufactured
articles, wine, cheese, stone, timber and salt. The department
is served chiefly by the Paris-Lyon-Méditerranée railway, the
main line from Paris to Neuchâtel traversing its northern region.
The canal from the Rhone to the Rhine, which utilizes the
channel of the Rhone above the town of Lyon, is served
by this department. Lons-le-Saunier is the capital of the
department, which comprises 84 communes.

The department forms the diocese of St Claude and part of the
ecclesiastical province of Besançon; it includes within the region
of the VIIIth army corps and the educational circumscription
(académie) of Besançon, where is its court of appeal. Lons-le-
Saunier, Dôle, Arbois, Poligny, St Claude and Salins, the more
noteworthy towns, receive separate notices. At Baume-les-
Messieurs, 8 m. N.E. of Lons-le-Saunier, there is an ancient
abbey, and a fine chapel of the 12th century.

JURA ("island"), an island of the inner Hebrides, the
fourth largest of the group, on the west coast of Argyllshire,
Scotland. Pop. (1901), 560. On the N. it is separated from
the island of Scarbrough by the whirlpool of Corrieveechan, caused
by the rush of the tides, often running over 13 m. an hour,
and sometimes accelerated by gales, on the E. from the main-
land by the sound of Jura, and on the S. and W. from Islay
by the sound of Islay. At Kinsachdrach there is a ferry to
Aird in Lorne, in Argyllshire, and at Faolain there is a ferry to
Port Askaig in Islay. Its area is about 160 sq. m., the greatest
length is about 27 m., and the breadth varies from 2 to 8 m. The
surface is mountainous and the island is the most rugged of
the Hebrides. A chain of hills culminating in the Paps of
Jura—Beinn-an-Oir (2471 ft.) and Beinn Chaolais (2407 ft.)—
runs along the western length of the island, interrupted by the Tarbert
land, an arm of the sea, which forms an indentation nearly 6 m.
deep and almost cuts the island in two. Jura derived its name from the red deer which once abounded on it. Cattle and sheep
are raised; oats, barley and potatoes are cultivated along the
eastern shore, and there is some fishing. Granite is quarried
and used in glass-making. The parish of Jura comprises the islands of Balnabas, Fladla, Garvelloch, Jura, Lunga, Scarba and Skervuile.

Jura, a range which may be roughly described as the block
of mountains rising between the Rhine and the Rhone, and form-
ing the frontier between France and Switzerland. The gorges
by which these two rivers force their way to the plains cut off
the Jura from the Swabian and Franconian ranges to the north
and those of Dauphiné to the south. But in very early days,
before these gorges had been carved out, there were no openings
in the Jura at all, and even now its three chief rivers—the Doubs,
the Loue and the Ain—flow down the western slope, which
is both much longer and but half as steep as the eastern. Some
geographers extend the name Jura to the Swabian and Franco-

nian ranges between the Danube and the Neckar and the Main;
but, though these are similar in point of composition and direc-
tion to the range to the south, it is most convenient to limit the
name to the mountain ridges lying between France and Switzer-
land, and this narrower sense will be adopted here.

The Jura has been aptly described as a huge plateau about
156 m. long and 38 m. broad, hewn into an oblong shape, and
raised by internal forces to an average height of from 1500
to 2500 ft. above the surrounding plains. The shock by which it
was raised and the vibration caused by the elevation of the great
chain of the Alps, produced many transverse gorges or "cluses," while on the plateaus between those subalpine agencies have
exercised their ordinary influence.

Geologically the Jura Mountains belong to the Alpine system;
and the same forces which crumpled and tore the strata of the
one produced the folds and faults in the other. Both chains
owe their origin to the mass of crystalline and unyielding rock which forms the central plateau of France, the Vosges and the Black Forest, and which, between the Vosges and the central plateau, lies at no great depth beneath the surface. Against this mass the more yielding strata which lay to the south and west, were thrust and folded, and the Alps and the Jura were carved from the ridges which were formed. But the folding decreases in intensity towards the north; the folding in the Alps is much more violent than the folding in the Jura, and in the Jura itself the folding is most marked along its southern flanks.

The Jura is composed chiefly of Jurassic rocks—it is from this chain that the Jurassic system derives its name—but Triassic, Cretaceous and Tertiary beds take part in its formation. It may be divided into three zones which run parallel to the length of the chain and differ from one another in their structure. The innermost zone, which rises directly from the plain of Safine beneath, and is the folded Jura (Jura plissé, Kettenjura), formed of narrow parallel undulations which diminish in intensity towards the French border. This is followed by the Jura plateau (Jura tabulaire, Tafeljura), in which the beds are approximately horizontal but are broken up into blocks by fractures or faults. Finally, along its western face there is a zone of numerous dislocations, and the range descends abruptly to the plain of the Saône. This is the Région du vignoble and is well shown at Arbois.

Owing to the convergence of the faults which bound it, the plateau zone decreases in width towards the south, while towards the north, between the Jura and the Saône, and parallel to the chain, the zone is more constant. Along its inner margin the folds are often overprinted, leaning towards France, but elsewhere they are simple anticlinals and synclinals, parallel to the length of the chain, and as a rule there is a remarkable freedom from dislocations of any importance, except towards Neuchâtel and Bienne.

The countless blocks of gneiss, granite and other crystalline formations which are found in such numbers on the slopes of the Jura, and go by the name of "erratic blocks" (of which the best known instance—the Pierre à Bot—is 40 ft. in diameter, and rests on the side of a bill 800 ft. above the Lake of Neuchâtel), have been transported thither from the Alps by ancient glaciers, which have left their mark on the Jura range itself in the shape of striations and moraines.

The general direction of the chain is from north-east to south-west, but a careful study reveals the fact that there were in reality two main lines of upheaval, viz. north to south and east to west, the former best seen in the southern part of the range and the latter in the northern; and it was by the union of these two forms that the lines north-east to south-west (seen in the greatest proportion of the chain) and west-north-west to south-east (which belongs to the Vellebois range at the south-west extremity of the chain), were produced. This is best realized if we take Besançon as a centre; to the north the ridges run east and west, to the south, north and south, while to the east the direction is north-east to south-west.

Before considering the topography of the interior of the Jura, it may be convenient to take a bird's view of its outer slopes.

1. The northern face dominates on one side the famous "Trouée" (or Trench) of Belfort, one of the great geographical centres of Europe, whence routes run north down the Rhine to the North Sea, south down the basin of the Rhone into the Mediterranean basin, and so to the Saône and the Mediterrean basin. It is now so strongly fortified that it becomes a question of great strategical importance to prevent its being turned by means of the great central plateau of the Jura, which, as we shall see, is a network of roads and railways. On the other side it overhangs the "Trouée" of the Black Forest towns on the Rhine (Rheinfelden, Säckingen, Laufenburg and Waldshut), through which the central plain of Switzerland is easily gained. From a military point of view, the interior of the chain—the valley of the Doubs belonging to France, and the valley of the Birse belonging to Switzerland. Belfort is the military, Mulhausen the industrial, and Basel the commercial centre of this slope.

2. The eastern and western faces offer many striking parallels. The plains through which flow the Aar and the Saône have each been the scene of great events. Mont Blanc is divided in the lakes of Neuchâtel, Biéne and Morat. The west face runs mainly north and south like its great river, and for a similar reason the east face runs north-east to south-west. Again, both slopes are pierced by many transverse gorges or "cluses" (due to fracture and not to any other causes) which act as natural gates to the valleys of Pontarlier, though these are seen more plainly on the east face than on the west; thus the gorges at the exit from which Lons-le-Saunier, Poligny, Arbois and Saulins are built balance those of the Saône, of the Doubs, of Ain, of Montreux, of the Ain. On the east face there is but one city which commands all these important routes—Neuchâtel. This town is thus marked out by nature as a great military and industrial centre, just as is Besançon, which lies on the road which has been long known as the down the Doubs. These easy means of communicating with the Free County of Burgundy or Franche-Comté account for the fact that this western sector of Neuchâtel is more densely populated generally by Burgundian nobles, though most of the country near it was in the hands of the house of Savoy until gradually annexed by Bern. The Chasseron (5286 ft.) is the central point of the eastern face, and at this point, not far from the road climbing the great Dôle, that part of the Vosges and the Jura, which, south-west of the valley of the Doubs, which flows into the Doubs a little to the north of the Dôle, then important town of the central portion of the Saône basin. The Chasseron is wholly Swiss, as are the lower summits of the Chasseral (3279 ft.), the Mont Suchet (3250 ft.), the Aiguille de Baulmes (5128 ft.), the Dent de Vaulion (4879 ft.), the Woostenstein (4223 ft.), and the Chaumont (3845 ft.), the two last-named points being probably the best-known points in the Jura, as they are accessible by carriage road from Soleure and Neuchâtel respectively. South of the Orbe valley the east face is more abrupt, and the numerous small rocky peaks descending to the valley of the Rhone (the first and second Swiss, the rest French) of the chain—the Mont Tendre (5512 ft.), the Dôle (5055 ft.), the Reculet (5643 ft.), the last-named part of the Grand Crêté (5328 ft.), the uniformity of level being striking as on the west; the east edge of the Jura, though there the absolute height is far less. The position of the Dôle is similar to that of the Chasseron, as on the sides of it runs a great network of roads, the road from Dôle to La Faucille (4341 ft.), the latter leading through the Vallée des Dappes, which was divided in 1862 between France and Switzerland, after many negotiations. The height of these roads shows that there are no passages across the chain, rather than through natural depressions.

3. The southern face is supported by two great pillars—on the one hand the Grand Crêté (5772 ft.), the ridge of Revermont (5259 ft.) above Bourg en Bresse; between these two the basin of the Saône (the district of Bugey) stretches away to the south, forcing the Rhone to make a long détour. On the two sides of this basin the plains in which Ambérieux and Culoz stand are one another, and are the meeting points of the routes which cut through the basin by means of deep gorges. On the eastern side this great wedge is steep and rugged, ending in the Grand Colombier (5033 ft.) above Culoz, and it sinks on the western side into the valley of the Ain, the district of Besse, and the plateau of Dombes. The junction of the Ain and the Sardaone at Pont d'Ain on the west balances that of the Ais and the Rhone at Bellegarde on the east.

The Jura thus dominates on the north one of the great highways of Europe, on the east and west divides the valleys of the Saône and the Aar, and stretches out to the south so as to join hands with the most important mass of the great plains towards the north the routes from France into Germany, Switzerland and Italy, and hence its enormous historical importance.

Let us now examine the topography of the interior of the Jura.

The Jura chain is divided into three parts, each divided by a transverse range of the three great rivers of the Jura—the Doubs, the Loine and the Ain.

1. In the northern division it is the east and west line which prevails—the Lomont, the Mont Terrible, the defile of the Doubs from St Ursanne to St Hippolyte, and the "Trouée" of the Black Forest towns. It thus bars access to the central plateau from the north, and this natural wall does away with the necessity of artificial fortifications. This division falls again into two distinct portions.

(a) The first is the part east of the deep gorge of the Doubs; it turns south at St Hippolyte; it is thus quite cut off on this side, and the flat and upland mass of the Territoire and the Haut-Montagne, are the routes from France into Germany, Switzerland and Italy, and the great plateau between the Doubs and the Aar, on which, at an average height of 2600 ft., are situated a number of towns, one of the most striking features of the Jura. These include the Val de Reuil and the Val du Travers, and of the Val d'Orche, through which with watch-making, an industry which does not require bulky machinery, and is therefore well fitted for a mountain district.

(b) The part west of the cluse of the Doubs; of this, the division again falls into two parts. In the west the upper part of the range (unlike the Le Locle plateau), is called the Haut Montagne, and is given up to cheese-making, curing of hams, saw-mills, &c. The Vale of Châtillon and the Vale of Travers are the chief French centres of this industry, and being connected with Geneva by a chain of places similarly occupied, which fringe the west plateau of the Jura. The part west of the Dossourel, or the part west of the Dôle, is the most remarkable, and especially devoted to agriculture, while along its north edge metal-working and manufacture of machinery are carried on, particularly at Besançon and Audincourt.
The **central division** is remarkable for being without the deep gorges which are found so frequently in other parts of the range. It consists of a series of ridges which branch off from the central notches in the rim of which routes converge from every direction; this is the great characteristic of the middle region of the Jura. Hence its immense strategical and commercial importance. On the northern side roads run to Mortevue and Le Locle, on the north-west to Besançon, on the west to Salins, on the south-west to Dôle and Lons-le-Saunier, on the east to the Swiss plain. The Pontarier plaine is drained by the Dole, which is divided in its course by the river Drugeon. The key to this important plateau is to the east the Fort de Joux, under the walls of which meet the two lines of railway from Neuchâtel, and to the west Savièse, at the mouth of the routes from the Col de la Faucille, from Besançon, and from the French plain.

The Ain rises on the south edge of this plateau, and on a lower shelf or step, which it waters, and which may be divided into two principal divisions, the Besanclan and the Chaumont. The latter is specially important, since the road leading thence to Geneva traverses one after another, not far from their head, the chief valleys which run down into the South Jura, and thus commands the southern routes as well as those by St Cergues and the Col de la Faucille from the Geneva region, and a branch route along the Orge river from Jougne. The fort of Les Rousses, near the foot of the Dôle, serves as an advanced post to Champagnole, just as the Fort de Joux does to Pontarier.

The above sketch will serve to show the character of the central Jura. It presents a series of routes from all sides, and the importance to France of its being strongly fortified, lest an enemy approaching from the north-east should try to turn the fortresses of the "Trouée de Belfort." It is in the western part of the central Jura that the north-east route appears most clearly. The Ain, which should be in this district no less than fifteen ridges running parallel to each other, and it is these which force the Loue to the north, and thereby occasion its very eccentric course. The cultivation of woods in these regions, from which to make the tonic "abaths" has its head-quarters at Pontarier.

3. The **southern division** is by far the most complicated and entangled part of the Jura. The rivers which run down to the east forces all its drainage to the west, and the result is a number of valleys of erosion (of which that of the Ain is the chief instance), quite distinct from the natural "cluses" or fissures of those of the Doubs. Another point of interest is the number of roads which intersect it, despite its extreme irregularity. This is due to the great "cluses" of Nantua and Virieu, which traverse it from east to west. The north and south line is very clearly marked in the eastern part of this division, as the north-east and south-west is entirely wanting, but in the Villebois range south of Ambérieu we have the principal example of the north-west to south-east line. The plateau west of the Ain are cut through by the valleys of the Val d'Aoste and of the Surand, and like all the lowest terraces on the west slope do not possess any considerable towns. The Ain receives three tributaries from the east:

- The Birse, which flows from the south of the Col de Roussette to St Claude, the industrial centre of the south Jura, famous for the manufacture of wooden toys, owing to the large quantity of boxwood in the neighbourhood. Septmoncel is famous with geologists for its Jurassic and Triassic fossils. Cut off to the east by the great chain, the industrial prosperity of this valley is of recent origin.
- The Dignin, which flows from south to north. It receives the drainage of the lake of Nantua, a town noted for combs and silk weaving, and which communicates by the "cluse" of the Lac de Silan with the Valserine valley, and so with the Rhône at Bellegarde, and again with the various routes which meet under the walls of the fort of Les Rousses, while by the Val Romey and the Sérans Culoz is easily gained.
- The Albarine, connected with Coulaz by the "cluse" of Virieu, and by the Furan flowing south with Belley, the capital of the district of Bugey (the old name for the South Jura).

The "cluses" of Nantua and Virieu are now both traversed by important railways, and are the chief outlets of old the valleys of the south Jura are Lyons and Geneva. But of course the strategic importance of these gorges is less than appears at first sight, because they can be turned by following the Rhône, in its great bend to the south.

The range is mentioned by Caesar (Bell. Gall. i. 2, 3, 6, 1), Strabo (iv. 3, 4, and 6, 11), Pliny (iii. 31; iv. 105; xvi. 197) and Ptolemy (li. ix. 5), its name being a word which appears under many forms (e.g. Joux, Jorat, Jurasce, Jurians), and is a synonym for a wood or forest. The German name is Leberberg, Leber being a provincial word for a hill.

Politically the Jura is France (departments of the Doubs, Jura and Ain) and Switzerland (parts of the cantons of Geneva, Vaud, Neuchâtel, Berne, Solothurn and Basel); but at its north extremity it takes in a small bit of Alsace (Pfirt or Ferrette). In the middle ages the southern, western and northern sides were parcellled out into a number of districts, all of which were gradually absorbed by the French crown, viz., Gen, Val Romey, Bresse and Bugey (exchanged in 601 by Savoy for the marquisate of Saluzzo), Franche-Comté, or the Free County of Burgundy, an imperial fief till annexed in 1674, to the country of Montbéliard (Mâmpex) acquired in 1703, and the country of Ferrette (French 1648–1871). The northern part of the eastern side was held till 1792 (part till 1797) by the bishop of Basel as a fief of the empire, and then belonged to France till 1814, but was given to Bern in 1815 (as a recompense for its loss of Vaud), and now forms the Bernese Jura, a French-speaking district. The centre of the eastern slope formed the principality of Neuchâtel (p.v.) and the country of Valangin, which were generally held by Burgundian nobles, came by succession to the kings of Prussia in 1707, and were formed into a Swiss canton in 1815, though they did not become free from formal Prussian claims till 1872. The southern part of the eastern slope originally belonged to the house of Savoy, but was conquered bit by bit by Bern, which was forced in 1815 to accept its subject district Vaud as a colleague and equal in the Swiss Confederation. It was Charles the Bold's defeats at Grandson and Morat which led to the annexation by the confederates of these portions of Savoyard territory.

Zimmerli, Die Sprachgrenze im Jura” (vol. i. of his Die Deutsch-französische Sprachgrenze in der Schweiz) (Basel, 1891). For the French slope see Joanne’s large Itinéraire to the Jura, and the smaller volumes relating to the departments of the Ain, Doubs and Jura, contained in his Géographie départementales. For the south slope see 3 vols, in the series of the Guides Monod (Geneva): A. Monnier, La Chaux de Fonds et le Haut-Jura Neuchâtelois; J. Monod, Le Jura Bernois; and E. J. P. de la Harpe, Le Jura Vaudois.

(W. A. B. C.)

**JURASSIC.** In geology, the middle period of the Mesozoic era, that is to say, succeeding the Triassic and preceding the Cretaceous periods. The name Jurassic (French jurassique; German Juraformation or Jura) was first employed by A. Brongniart and A. von Humboldt for the rocks between the periods defined by L. von Buch, 1839; by F. A. Queustedt, 1843–1888; by A. Oppel, 1856–1888; and since then by many other workers: E. Benecke, É. Hébert, W. Waagen, and others. The study of Jurassic rocks has continued to attract the attention of geologists, partly because the bedding is so well defined and regular—the strata are little disturbed anywhere outside the Swiss Jura and the Alps—and partly because the fossils are numerous and usually well-preserved. The result has been that no other system of rocks has been so carefully examined throughout its entire extent; many “zones” have been established by means of the fossils—principally by ammonites—and these zones are not restricted to limited districts, but many of them hold good over wide areas. Oppel distinguished no fewer than thirty-three zonal horizons, and since then many more sub-zonal divisions have been noted locally.

The existence of faunal regions in Jurassic times was first pointed out by J. Marcou; later M. Neuquar greatly extended observations in this direction. According to Neuquar, three distinct geographical regions of deposit can be made out among the Jurassic rocks of Europe: (1) The Mediterranean province, embracing the Pyrenees, Alps and Carpathians, with all the tracts lying to the south. One of the biological characters of this area was the great abundance of ammonites belonging to
the groups of *Heterophylli* (Phylloceras) and *Fimbriati* (Lytoceras).

2. The central European province, comprising the tracts lying to the north of the Alpine ridge, and marked by the comparative rarity of the ammonites just mentioned, which are replaced by others of the groups *Infulti* (Aptidoceras) and *Oepelia*, and by abundant reefs and masses of coral. (3) The boreal or Russian province, comprising the middle and north of Russia, Spitzbergen and Greenland. The life in this area was much less varied than in the others, showing that in Jurassic times there was a perceptible diminution of temperature towards the north. The ammonites of the more southern tracts here disappear, together with the corals.

The cause of these faunal regions Neumayr attributed to climatic belts—such as exist to-day—and in part, at least, he was probably correct. It should be borne in mind, however, that although Neumayr was able to trace a broad, warm belt, some 60° in width, right round the earth, with a narrower mild belt to the north and an arctic boreal belt beyond, and certain indications of a repetition of the climatic zones on the southern side of the thermal equator, more recent discoveries of fossils seem to show that other influences have been at work in determining their distribution; in short, the identity of the Neumayrian climatic boundaries becomes increasingly obscured by the advance of our knowledge.

The Jurassic period was marked by a great extension of the sea, which commenced after the close of the Trias and reached its maximum during the Callovian and Oxfordian stages; consequently, the Middle Jurassic rocks are much more widely spread than the Lias. In Europe and elsewhere Triassic beds pass gradually up into the Jurassic, so that there is difficulty sometimes in agreement as to the base line for the base of the latter; similarly at the top of the system there is a passage from the Jurassic to the Cretaceous rocks (Alps).

Towards the close of the period elevation began in certain regions; thus, in America, the Sierras, Cascade Mountains, Klamath Mountains, and Humboldt Range probably began to emerge. In England the estuarine Portlandian resulted partly from elevation, but in the Alps marine conditions steadily persisted (in the Tithonian stage). There appears to have been very little crustal disturbance or volcanic activity; tufts are known in Argentina and California; volcanic rocks of this age occur also in Skye and Mull.

The rocks of the Jurassic system present great petrological diversity. In England the name "Oolites" was given to the middle and higher members of the system. Take account of the prevalence of oolitic structure in the limestones and ironstones; the same character is a common feature in the rocks of northern Europe and elsewhere, but it must not be overlooked that clays and sandstones together bulk more largely in the aggregate than the oolites. The thickness of Jurassic rocks in England is 4000 to 5000 ft., and in Germany 2000 to 3000 ft. Most of the rocks represent the deposits of shallow seas, but estuarine conditions and land deposits occur as in the Purbeck beds of Dorset and the coals of Yorkshire. Coal is a very important feature among Jurassic rocks, particularly in the Liassic division; it is found in England, Germany, France, and Russia; and to a less extent in Persia, Turkestan, Caucasus, south Siberia, China, Japan, Further India, New Zealand and in many of the Pacific Islands.

Being shallow water formations, petrological changes come in rapidly as many of the beds are traced out; sandstones pass laterally into clays, and the latter into limestones, and so on, but a reliable guide to the classification and correlation is found in the fossil contents of the rocks. In the accompanying table a list is given of some of the zonal fossils which regularly occur in the order indicated; other forms are known that are equally useful. It will be noticed that while there is general agreement as to the order in which the zonal fossil forms occur, the division between one formation and another is liable to vary according to factors in the personal equation of the authors.

The Jurassic formations stretch across England in a varying band from the mouth of the Tees to the coast of Dorsetshire. They consist of harder sandstones and limestones interstratified with softer clays and shales. Hence they give rise to a characteristic type of scenery—the more durable beds standing out as long ridges, sometimes even with low cliffs, while the clays underlie the level spaces between.

Jurassic rocks cover a vast area in Central Europe. They rise from under the Cretaceous formations in the north-east of France, whence they range southwards down the valleys of the Rhone and Rhine to the Mediterranean. They appear as a broken border round the old crystalline nucleus of Auvergne. Eastwards they range through the Jura Mountains up to the high grounds of Bohemia. They appear in the outer chains of the Alps on both sides, and on the south they rise along the centre of the Apennines, and here and there over the Spanish Peninsula. Covered by more recent formations they underlie the great plain of Northern Germany, whence they range eastwards and occupy large tracts in central and eastern Russia.

Lower Jurassic rocks are absent from much of northern Russia, the stages represented being the Callovian, Oxfordian and Volgian (of Professor S. Nikitin); the fauna differs considerably from that of western Europe, and the marine equivalents of the Purbeck beds are found in this region. In south Russia, the Crimea and Caucasus, Lias and Lower Jurassic rocks are present. In the Alps, the Lower Jurassic rocks are intimately associated with the underlying Triassic formations, and resemble them in consisting largely of reddish limestones and marbles; the ammonites in this region differ in certain respects from those of western and central Europe. The formation known as the Callovian does not appear to be present. The Upper Jurassic is mainly represented by a uniform series of limestones, with a peculiar and characteristic fauna, to which the name gave the name of *Diphyia* limestone. It is found in the horizons from Kimmeridgian to Cretaceous; it is developed on the southern flanks of the Alps, Carpathians, Apennines, as well as in south France and other parts of the Mediterranean basin. A characteristic formation on this horizon is the so-called from the fossil *Diphyia diphyi* (Peytoppe janitor) seen in the well-known escarpments (Hochgebirge Kaales). Above the *Diphyia* limestone comes the *Strangberg limestone* (Strangberg in Germany) with *Aptychus* beds and coral reefs. The rocks of the Mediterranean basin are on the whole more calcareous than those of corresponding age in north-west Europe; thus the *Lias* is represented by 1000 ft. of white crystalline limestone in Calabria and a similar rock occurs in Sicily, Bosnia, Epirus, Corfia; in Spain the *Liassic* strata are frequently dolomitic; in the Apennines they are variegated limestones and marls. The Higher Jurassic beds of Portugal, Hungary, and Russia show traces of the proximity of land in the abundant plant remains that are found in them. In Scania the *Lias* succeeds the *Rhaetic* beds in a regular manner, and Jurassic rocks have been traced northward well within the polar circle; they are known in the Lofoten Isles, Spitzbergen, east Greenland, King Charles's Island, Cape Stewart in Scoresby Sound, Grinnell Land, Prince Patrick Land, Bathurst and Euxtion Island; in many cases these rocks indicate a climate considerably milder than now obtains in these latitudes.

In the American continent Jurassic rocks are not well developed. Marine Lower and Middle Jurassic beds occur on the Pacific coast (California and Oregon); the Wyoming, Dakotas, Colorado, and Mexico and Texas. Above the marine beds in the interior are brackish and fresh-water deposits, the Morrison and Como beds (Anchisangifer and *Aptian*) in Wyoming, Dakotas, Montana, and Colorado, with the beds of *Paptanites* in Wyoming, and the beds of the *Echioflexa* in the Dakotas. They are found in northern British Columbia and perhaps in Alaska, Wyoming, Utah, Montana, Colorado, the Dakotas, &c. In California some of the
gold-bearing metamorphic slates are of this age. Marine Jurassic rocks have not been clearly identified on the Atlantic side of America. The Patuxent and Arundel formations (non-marine) are doubtfully referred to this period. Lower and Middle Jurassic formations occur in Argentina and Bolivia. Jurassic rocks have been recognized in Asia, including India, Afghanistan, Persia, Kurdistan, Asia Minor, the Caspian region, Japan and Borneo. The best marine development is in Cutch, where the following groups:

are distinguished from above downwards: the Umia series = Portlandian and Tithonian of south Europe, passing upwards into the Neocomian; the Katrol series = Oxfordian (part) and Kimeridgian; the Chari series = Callovian and part of the Oxfordian; the Patcham

which include the coal-bearing "Ipwich" and "Burrun" formations of Queensland. In New Zealand there is a thick series of marine beds with terrestrial plants, the Mataura series in the upper part of Hutton's Hokonui system. Sir J. Hector included also the Patukaka series (as Middle Jurassic) and the Flag series with the Catlin's River and Basion series below. Jurassic rocks have been recorded from New Guinea and New Caledonia.

Life in the Jurassic Period.—The expansion of the sea during this period, with the formation of broad sheets of shallow and probably warm water, appears to have been favourable to many forms of marine life. Under these conditions several groups of organisms developed rapidly along new directions, so that the Jurassic period as a whole came to have a fauna differing clearly and distinctly from the preceding Palaeozoic or succeeding Tertiary faunas. In the seas, all the main groups were represented as they are to-day.
Coral and, in later periods of the period covered later in England, and in the modern type of coral before the close of the Triassic and the middle of the Jurassic periods. Cycads, Zamites, Podococceae, &c., appeared to reach their maximum; Equisetum was still found growing to a great size and Ginkgoes occupied a prominent place; ferns were common, and the so-called "regular" type, Equisetum, Holocystis, Collyrites, Clypeus, but the "regular" forms prevailed, Cephalis, Hemicidaris, Acrocladus. Sponges were important rock-builders in those seas, and are a marked reduction in the size of the lichens such as Cnemidium, Hylorogus, Peronidella; hexactinellids, Tremadocyston, Claritaria; and horny sponges have been found in the Purbeck.

Polyzoa are found abundantly in some of the beds, Stomatopoda, Beroidea, &c. Brachiopods were represented principally by terrabrudiales (Terrabrutalis, Valdivia, Monica, Megerel), and by rhizocelluloids; these latter are known as the "broad-ribbed" Palaeozoic spiriferae and other fossils ranged so-called "irregular" type, Trigonia, more than are represented in the Jurassic, and the rimshells such as Cilium, Urechus, Pteroceras, were very abundant. Brachiopods and echinoderms, such as Echinodermata, were found in the Jurassic, but their influence was less than in the limestones of the Zechstein and other parts of the Jurassic system. The economic products of the Jurassic system are of considerable importance; the valuable coals have already been noticed; the well-known Chalk of the shores of Yorkshire and the Northampton shoals occur respectively in the Lias and Inferior Oolites. Oolites are found in England, and several of the Jurassic formations in England contain some petroleum. Building stones of great value are obtained from the Great Oolite, the Portlandian, and the Inferior Oolite; large quantities of hydraulic cement and lime have been made from the Lias. The celebrated lithographic stone of Solenhofen belongs to the upper portion of this system.

JURAT (through Fr. from med. Lat. juratus, one sworn, Lat. jurare, to swear), a name given to the sworn holders of certain offices. Under the ancien régime in France, in several towns of the south-west, such as Rochelle and Bordeaux, the jurats were members of the municipal body. The title was also borne by officials corresponding to aldermen, in the Channel Ports, but is now chiefly used as a title of office in the Channel Islands. There are two bodies, consisting each of twelve jurats, for Jersey and the bailiwick of Guernsey respectively. They are elected for life, in Jersey by the ratepayers, in Guernsey by the elective body. They form, with the bailiff as presiding judge, the royal court of justice, and are a constituent part of the legislative body. In English law, the word jurat (juratam) is applied to that part of an affidavit which contains the names of the parties swearing the affidavit and the person before whom it was sworn, and is often placed at the foot of a particular affidavit.

JURIE DE LA GRAVIERE, JEAN-BAPTISTE EDMOND (1812-1892), French admiral, son of Admiral Jurie, who served during the Revolutionary and Napoleonic wars and was a peer of France under Louis Philippe, was born on the 10th of November 1812. He entered the navy in 1828, was made a commander in 1831, and captain in 1850. During the Russian War he commanded a ship in the Black Sea. He was promoted to rear-admiral on the 1st of December 1855, and appointed to the command of a squadron in the Adriatic in 1859, where he absolutely sealed the Austrian ports with a close blockade. In October 1861 he was appointed to command the squadron in the Gulf of Mexico, and two months later the expedition against Mexico. On the 15th of January 1862 he was promoted to be vice-admiral. During the Franco-German War of 1870 he had command of the French Mediterranean fleet, and in 1871 he was appointed "director of charts." As having commanded in chief before the enemy, the age-limit was waived in his favour, and he was continued on the active list. Jurie died on the 4th of March 1892. He was a voluminous author of works on naval history and biography, most of which first appeared in the Revue des deux mondes. Among the most noteworthy of these are Guerres maritimes sous la république (4 vols., Paris, 1848) translated by Lord Dunsany under the title of Sketches of the Last Naval War (1848); Souvenirs d'un amiral (1860), that is, of his father,
Admiral Jurieu; *La Marine d'autrefois* (1865), largely autobiographical; and *La Marine d'aujourd'hui* (1872). In 1866 he was elected a member of the Academy.

**JURIEU, PIERRE** (1637-1713), French Protestant divine, was born at Mer, in Orléans, where his father was a Protestant pastor. He studied at Saumur and Sedan under his grandfather, Pierre Dumoulin, and under Leblanc de Beauville. After completing his studies in Holland and England, Jurieu received Anglican ordination; returning to France he was ordained again and succeeded his father as pastor of the church at Mer. Soon after this he published his first work, *Essai de lettres de la rédaction* (1667; Eng. trans., 1673). This *Détention* led to his appointment as professor of theology and Hebrew at Sedan, where he soon became also pastor. A year later he published his *Apologie pour la morale des Réformés*. He obtained a high reputation, but his work was impaired by his controversial temper, which frequently developed into an irritated fanaticism, though he was always entirely sincere. He was called by his adversaries "the Goliath of the Protestants." On the suppression of the academy of Sedan in 1681, Jurieu received an invitation to a church at Rouen, but, afraid to remain in France on account of the danger of detection, he went to Holland and became pastor of a church of Rotterdam till his death on the 11th of January 1713. He was also professor at the école illustre. Jurieu did much to help those who suffered by the revocation of the Edict of Nantes (1685). He himself turned for consolation to the Apocalypse, and succeeded in persuading himself (*Accomplissement des prophéties*, 1686) that the overthrow of Antichrist (i.e. the papal church) would take place in 1689. H. M. Baird says that "this persuasion, however fanciful the grounds on which it was based, exercised no small influence in forwarding the success of the design of William of Orange in the invasion of England." Jurieu defended the doctrines of Protestantism with great ability against the attacks of Antoine Arnauld, Pierre Nicole and Bossuet, but was equally ready to enter into dispute with his fellow Protestant divines (with Louis Du Moulain and Claude Payon, for instance) when their opinions differed from his own even on minor matters. The bitterness and persistence of his attacks on his colleague Pierre Bayle led to the latter being deprived of his chair in 1693.

One of Jurieu's chief works is *Lettres pastorales adressées aux fidèles de France* (3 vols. Rotterdam, 1686-1687; Eng. trans., 1689), which, notwithstanding the vigilance of the police, found its way into France and produced a deep impression on the Protestant population. His last important work was the *Histoire critique des dogmes et des ecuifs* (1704; Eng. trans., 1715). He wrote a great number of controversial works.

See the article in Herzog-Hauck, Realencyclopaedie; also H. M. Baird, *The Hugenots and the Revocation of the Edict of Nantes* (1895).

**JURIS**, a tribe of South American Indians, formerly occupying the country between the rivers Ica (lower Putumayo) and Japura, north-western Brazil. In ancient days they were the most powerful tribe of the district, but in 1820 their numbers did not exceed 200. Owing to inter-marriages the Juris are believed to have been extinct for half a century. They were closely related to the Passãs, and were like them a fair-skinned, finely built people with quite European features.

**JURISDICTION**, in general, the exercise of lawful authority, especially by a court or a judge; and so the extent or limits within which such authority is exercisable. Thus each court has its appropriate jurisdiction; in the High Court of Justice in England administration actions are brought in the chancery division, salvage actions in the admiralty, &c. The jurisdiction of a particular court is, in limited by statute, as that of a county court, which is local and is also limited in amount. In international law jurisdiction has a wider meaning, namely, the rights exercisable by a state within the bounds of a given space. This is frequently referred to as the territorial theory of jurisdiction. (See International Law; International Law, Private.)

**JURISPRUDENCE** (Lat. jurisprudentia, knowledge of law, from jus, right, and prudentia, from providere, to foresee), the general term for "the formal science of positive law" (T. E. Holland); see LAW. The essential principles involved are discussed below and in Jurisprudence, Comparative; the details of particular laws or sorts of law (Contract, &c.) and of individual national systems of law (English Law, &c.) being dealt with in separate articles.

The human race may be conceived as parcelled out into a number of distinct groups or societies, differing greatly in size and circumstances, in physical and moral characteristics of all kinds. But they all resemble each other in that they reveal on examination certain rules of conduct in accordance with which the relations of the members inter se are governed. Each society has its own system of laws, and all the systems, so far as they are known, constitute the appropriate subject matter of jurisprudence. The jurist may deal with it in the following ways. He may first of all examine the leading conceptions common to all the systems, or in other words define the leading terms common to them all. Such are the terms law itself, right, duty, property, crime, and so forth, which, or their equivalents, may, notwithstanding delicate differences of connotation, be regarded as common terms in all systems. That kind of inquiry is known in England as analytical jurisprudence. It regards the conceptions with which it deals as abstract and universal, and aims at defining them distinctly and exhibiting their logical relations with each other. What is really meant by a right and by a duty, and what is the true connexion between a right and a duty, are types of the questions proper to this inquiry. Shifting our point of view, but still regarding systems of law in the mass, we may consider them, not as stationary, but as changeable and changing, we may ask what general features are exhibited by the record of the change. This, somewhat crudely put, may serve to indicate the field of historical or comparative jurisprudence. In its ideal condition it would require an accurate record of the history of all legal systems as its material. But whether the material be abundant or scanty the method is the same. It seeks the explanation of institutions and legal principles in the facts of history. Its aim is to show how a given rule came to be what it is. The legislative source—the emanation of the rule from a sovereign authority—is of no importance here; what is important is the moral source—the connexion of the rule with the ideas prevalent during contemporary periods. This method, it is evident, involves not only a comparison of successive stages in the history of the same system, but a comparison of different systems, of the Roman with the English, of the Hindu with the Irish, and so on. The historical method as applied to jurisprudence, may be regarded as a special example of the method of comparison. The comparative method is really employed in all generalizations about law; for, although the analysis of legal terms might be conducted with exclusive reference to one system, the advantage of testing the result by reference to other systems is obvious. But, besides the use of comparison for purposes of analysis and in tracing the phenomena of the growth of laws, it is evident that for purposes of practical legislation the comparison of different systems may yield important results. Laws are contrivances for bringing about certain definite ends, the larger of which are identical in all systems. The comparison of these contrivances not only serves to bring their real object, often obscured as it is in details, into clearer view, but enables legislators to see where the contrivances are deficient, and how they may be improved.

The "science of law," as the expression is generally used, means the examination of laws in general in one or other of the ways just indicated. It means an investigation of laws which exist or have existed in some given society in fact—in other words, not the law as a scheme of regulation in idea, but the law as an actual phenomenon in itself related to the conditions of its own exposition of particular systems. Analytical jurisprudence is in England associated chiefly with the name of John Austin (q.v.), whose *Province of Jurisprudence Determined* systematized and completed the work begun in England by Hobbes, and continued at a later date and from a different point of view by Bentham. Austin's first position is to distinguish between laws properly so called and laws improperly so called. In any of the older writers on law, we find the various senses in which the word is
JURISPRUDENCE

used grouped together as variations of one common meaning. Thus Blackstone advances to his proper subject, municipal laws, through (1) the laws of inanimate matter, (2) the laws of animal nutrition, digestion, &c., (3) the laws of nature, which are rules imposed by God on men and discoverable by reason alone, and (4) the revealed or divine law which is part of the law of nature directly expounded by God. All of these are connected by this common element that they are "rules of action dictated by some superior being," and some such generalization as this is to be found at the basis of most treatises on jurisprudence which have not been composed under the influence of the analytical school. Austin disposes of it by the distinction that some of those laws are commands, while others are not commands. The so-called laws of nature are not commands; they are uniformities which resemble commands only in so far as they may be supposed to have been ordered by some intelligent being. But they are not commands in the only proper sense of that word—they are not addressed to rational beings, who may or may not will obedience to them. Laws of nature are not addressed to anybody, and there is no possible question of obedience or disobedience to them. Austin accordingly pronounces them laws improperly so called, and confines his attention to laws properly so called, which are commands addressed by a human superior to a human inferior.

This distinction seems so simple and obvious that the energy and even bitterness with which Austin insists upon it now seem superfluous. But the indiscriminate identification of everything to which common speech gives the name of a law was, and still is, a fruitful source of confusion. Blackstone's statement that, when God "put matter into motion He established certain laws of motion, to which all movable matter must conform," and that in those creatures that have neither the power to think nor to will such laws must be invariably obeyed, so long as the creature itself subsists, for its existence depends on that obedience, imputes to the law of gravitation in respect of both its origin and its execution the qualities of an act of parliament. On the other hand the qualities of the law of gravitation are imputed to certain legal principles which, under the name of the law of nature, are asserted to be binding all over the globe, so that "no human laws are of any validity if contrary to this." Austin never fails to stigmatize the use of "natural laws" in the sense of scientific facts as improper, or as metaphorical.

Having eliminated metaphorical or figurative laws, we restrict ourselves to those laws which are commands. This word is the key to the analysis of law, and accordingly a large portion of Austin's work is occupied with the determination of its meaning. A command is an order issued by a superior to an inferior. It is a manifestation of desire distinguished by this peculiarity that "the party to whom it is directed is liable to evil from its violation," and in case he comply not with the desire. "If you are able and willing to harm me in case I comply not with your wish, the expression of your wish amounts to a command." Being liable to evil in case I comply not with the wish which you signify, I am bound or obliged by it, or I lie under a duty to obey it. The evil is called a sanction, and the command or duty is said to be sanctioned by the chance of incurring the evil. The three terms command, duty and sanction are thus inseparably connected. As Austin expresses it in his logic, "each of the three terms signifies the same notion, but each denotes a different part of that notion and connects the residue." All commands, however, are not laws. That term is reserved for those commands which oblige generally to the performance of acts of a class. A command to your servant to rise at such an hour on such a morning is a particular command, but not a law or rule; a command to rise always at that hour is a law or rule. Of this distinction it is sufficient to say in the meantime that it involves when we come to deal with positive laws, the rejection of particular commands to which determinate usage in the term law would certainly be applied. On the other hand it is not, according to Austin, necessary that a true law should bind persons as a class. Obligations imposed on the grantee of an office specially created by parliament would imply a law; a general order to go into mourning addressed to the whole nation for a particular occasion would not be a law.

So far we have arrived at a definition of laws properly so called. Austin holds superiority and inferiority to be necessarily implied in command, and such statements as that "laws emanate from superiors" to be the merest tautology and trumpery. Elsewhere he sums up the characteristics of true laws as ascertained by the analysis thus: (1) laws, being commands, emanate from a determinate source; (2) every sanction is an evil annexed to a command; and (3) every duty implies a command, and chiefly means obnoxiousness to the evils annexed to commands.

Of true laws, those only are the subject of jurisprudence which are laws strictly so called, or positive laws. Austin accordingly proceeds to distinguish positive from other true laws, which are either laws set by God to men or laws set by men to men, not, however, as political superiors nor in pursuance of a legal right. The discussion of the first of these true but not positive laws leads to his celebrated discussion of the utilitarian theory. The laws set by God are either revealed or unrevealed, i.e. either expressed in direct command, or made known to men in one or other of the ways denoted by such phrases as the "light of nature," "natural reason," "dictates of nature," and so forth. Austin maintains that the principle of general utility, based ultimately on the assumed benevolence of God, is the true index to such of His commands as He has not chosen to reveal. Austin's exposition of the meaning of the principle is a most valuable contribution to moral science, though he rests its claims ultimately on a basis which many of its supporters would disown. And the simple distinction of positive and natural laws, as lying outside the proper scope of the treatise, although the reason for so condemning it is not always correctly stated. It is found in such assumptions of fact as that there is a God, that He has issued commands to men in what Austin calls the "truths of revelation," that He designs the happiness of all His creatures, that there is a predominance of good in the order of the world—which do not now command universal assent. It is impossible to place these propositions on the same scientific footing as the assumptions of fact with reference to human society on which jurisprudence rests. If the "divine laws" were facts like acts of parliament, it is conceived that the discussion of their characteristics would not be out of place in a scheme of jurisprudence.

The second set of laws properly so called, which are not positive laws, consists of three classes: (1) those which are set by men living in a state of nature; (2) those which are set by sovereigns but not as political superiors, e.g. when one sovereign commands another to act according to a principle of international law; and (3) those set by subjects but not in pursuance of legal rights. This group, to which Austin gives the name of positive morality, is that which explains this conception of positivism as lying in a state of nature, or a state of anarchy, when they are not living in a state of government or as members of a political society. "Political society" thus becomes the central fact of the theory, and some of the objections that have been urged against it arise from its being applied to conditions of life in which Austin would not have admitted the existence of a political society. Again, the third set in the group is intimately connected with positive laws on the one hand and rules of positive morality which are not even laws properly so called on the other. Laws set by human beings in a state of nature and such as do not arise out of or in pursuance of a legal right, which he is not bound to exercise, is, in Austin's phraseology, to be regarded both as a positive moral rule and as a positive law. On the other hand the rules set by a club or society, and enforced upon its members by exclusion from the society, but not in pursuance of any legal right, are laws, but not positive laws. They are imperative and proceed from

1 This appears to be an unnecessary complication. The sovereign has authorized the master to set the law, although not compelling him to do so, and enforces the law when set. There seems no good reason why the law should be called a rule of positive morality at all.
a determinate source, they have no legal or political sanction. Closely connected with this positive morality, consisting of true but not positive laws, is the positive morality whose rules are not laws properly so called, but all though they are generally denominated laws. Such are the laws of honour, the laws of fashion, and, most important of all, international law.

Nowhere does Austin's phraseology come more bluntly into conflict with common usage than in pronouncing the law of nations (which in substance is a compact body of well-defined rules resembling nothing so much as the ordinary rules of law) to be not laws at all, even in the wider sense of the term. That the rules of a private club should be law properly so called, while the whole mass of international jurisprudence is mere opinion, shocks jurisprudence, and, indeed, the whole history of jurisprudence, more than it would if it were based on the mere assertion that there is no advantage in the world's being governed by the more careful than Austin to observe these properties. He recognizes fully the futility of definitions which involve a painful struggle with the current of ordinary speech. But in the present instance the apparent paradigm is cannot be avoided if we accept the limitation of laws properly so called to commands proceeding from a determinate source. And that limitation is so generally present in our conception of law that to ignore it would be a worse anomaly than this. No one finds fault with the statement that the so-called code of honour or the dictates of fashion are not, properly speaking, laws. We regard them rather as applied to the laws of nature, because it resembles in so many of its most striking features—in the certainty of a large portion of it, in its terminology, in its substantial principles—the most universal elements of actual systems of law, and because, moreover, the assumption that brought it into existence was nothing else than this, that it consisted of those abiding portions of legal systems which prevail everywhere by their own authority. But, though "positive morality" may not be the best phrase to describe such a code of rules, the distinction insisted on by Austin is unimpeachable.

The division of those laws properly and improperly so called which are not positive laws brings us to the definition of positive law, which is the keystone of the system. Every positive law is "set by a sovereign person, or sovereign body of persons, to a member or members of the independent political society wherein that person or body is sovereign or superior." Though possibly sprung directly from another source, it is a positive law, by the institution of that present sovereign in the character of a political superior. The question is not as to the historical origin of the principle, but as to its present authority. "The legislator is he, not by whose authority the law is made, but by whose authority the law continues to be law." This definition involves the analysis of the connected expressions sovereignty, subjection and independent political society, and of determinate body—which last analysis Austin performs in connexion with that of commands. These are all excellent examples of the logical method of which he was so great a master. The broad results alone need be noticed here. In order that a given society may form a society political and independent, the generality or bulk of its members must be in a habit of obedience to a certain and common superior; whilst that certain person or body of persons must not be habitually obedient to a certain person or body. All the italicized words point to circumstances in which it might be difficult to say whether a given society is political and independent or not. Several of these Austin has discussed—e.g. the state of things in which a political society yields obedience which may or may not be called habitual to some external power, and the state of things in which a political society is divided between contending claimants for sovereign power, and it is uncertain which shall prevail, and over how much of the society. So long as that uncertainty remains we have a state ofarchy, wherein an independent society not be political must not fall below a number which can only be called determinate. Neither then in a state of anarchy, nor in insconsiderable communities, nor among men living in a state of nature, have we the proper phenomena of a political society. The last limitation goes some way to meet the most serious criticism to which Austin's system has been exposed, and it ought to be stated in his own words. He supposes a society which may be styled independent, which is considerable in numbers, and which is in no way or extremely barbarous conditions. In such society, "the bulk of its members is not in the habit of obedience to one and the same superior. For the purpose of attacking an external enemy, or for the purpose of repelling an attack, the bulk of its members are capable of bearing arms submits to one leader or one body of leaders. But as soon as that emergency passes the transient submission ceases, and the society reverts to the state which may be deemed its ordinary state. The bulk of each of the families which compose the given society renders habitual obedience to its own peculiar chief, but those domestic societies are themselves independent societies, or are not united in legal limitation, that law is by the sovereign's command. Yet there is no form of obedience to one common superior, and there is no law (simply or strictly so styled) which can be called the law of that society. The so-called laws which are common to the bulk of the community are purely and properly customary laws—that is to say, laws which are set or imposed by the general opinion of the community, but are not enforced by legal or political sanctions." Such, he says, are the savage societies of hunters and fishers in North America, and such were the Germans as described by Tacitus. He takes no account of societies in an intermediate stage between this and the condition which constitutes political society.

We need not follow the analysis in detail. Much ingenuity is displayed in grouping the various kinds of government, in detecting the sovereign authority under the disguises which it wears in the complicated state system of the United States or under the fictions of English law, in elucidating the precise meaning of abstract political terms. Incidentally the source of many celebrated fallacies in political thought is laid bare. That the question who is sovereign in a given state is a question of fact and not of law or morals or religion, that the sovereign is incapable of legal limitation, that law is by the sovereign's command, that no real or assumed compact can limit his action—are positions which Austin has been accused of enforcing with needless iteration. He cleared them, however, from the air of paradox with which they had been previously encumbered, and his influence was in no direction more widely felt than in making them the commonplaces of educated opinion in this generation.

Passing from these, we may now consider what has been said against the theory, which may be summed up in the following terms. Laws, no matter in what form they are expressed, are in the last resort reducible to commands set by the person or body of persons who are in fact sovereign in any independent political society. The sovereign is the person or persons whose commands are habitually obeyed by the great bulk of the community; and by an independent society we mean that such sovereign head is not himself habitually obedient to any other determinate body of persons. The society must be sufficiently numerous to be considerable before we can speak of it as a political society. From command, with its inseparable incident of sanction, come the duties and rights in terms of which laws are for the most part expressed. Duty means that the person of whom it is predicated is liable to the sanction in case he fails to obey the command. It involves that the law is such that persons or groups of persons may be called to account for breaches of the law. The sanction in operation in case the command be disobeyed.

We may here interpolate a doubt whether the condition of independence on the part of the head of a community is essential to the legal analysis. It seems to us that we have all the elements of a true law present when we point to a community habitually obedient to the authority of a person or determinate body of persons, no matter what the relations of that superior may be to any external or superior power. Provided that in fact the commands of the lawgiver are such that beyond which the subject cannot go, it seems immaterial to inquire whether this lawgiver in turn takes his orders from somebody else or is habitually obedient to such orders when given. One may imagine a community governed by a dependent legislator, while the supreme sovereign whose representations are of course called the lawgiver and nominee such body or person may be never directly addresses the community at all. We do not see that in such a case anything is lost. The unerring by lawgiver the lawgiver is set by the suzerain, rather than the dependent legislator. Nor is the ascertainment of the ultimate seat of power necessary to define
political societies. That we get when we suppose a community to be in the habit of obedience to a single person or to a determinate combination of persons.

The use of the word "command" is not unlike to lead to a misconception of Austin's meaning. When we say that a law is a command of the sovereign, we are apt to think of the sovereign as existing in a position of power, authority, and to some extent, of control. Many laws are not traceable to the sovereign at all in this sense. Some are based upon traditional practices, some can be traced to the influence of private citizens, and others may be the result of the acts of a few persons. In some countries a vast body of law owes its existence as such to the fact that it has been observed as law in some other society. The great bulk of modern law owes its existence and its shape ultimately to the Roman law. Although the emphasis of Austin's system has nothing to do with this, the historical origin of laws. Most books dealing with law in the abstract generalize the modes in which laws may be originated under the name of "law." Other laws may be traceable to other sources, which may vary in effect in different systems. The list given in the Institutes of Justinian of the ways in which law may be made—either by legislation, or by judicial decision, or by a list of sources. Among the sources of law other than legislation which are most commonly exemplified are the laws made by judges in the course of judicial decisions, and the general principles of the law as it is usually expressed in the law. The source of law in the one case is the judicial decision, in the other the custom. In consequence of the decisions and in consequence of the custom the rule has prevailed. English law is largely made up of principles derived from custom, as well as from the decisions of the courts, and these principles are usually expressed in the form of decrees of ancient law, as well as in the form of decrees of the sovereign. No such influence has affected English law to any appreciable extent—a result owing to the activity of the courts of the legislative. This difference has profoundly affected the form of English law as compared with that of systems which have been developed by the play of free discussion. These are the most definite of the influences to which the beginning of laws may be traced. The laws once established, no new law, it is said, can be created by the sovereign. The common law, it is said, "consists of their commands because they can repeal or alter or restate it at pleasure." "They command because, being by the assumption possessed of uncontrollable force, they could innovate without limit at any moment." On the contrary, it may be said that they command because they do as a matter of fact enforce the rules laid down in the common law. It is not because they could innovate if they pleased in the common law but because there is said to be enforced it, but because it is known that they will enforce it as it stands.

The criticism of Austin's analysis resolved itself into two different sets of objections. One relates to the theory of sovereignty which underlies it; the other to its alleged failure to include rules which in common parlance are laws, and which it is felt ought to be included in any satisfactory definition of law. As the latter is to some extent anticipated and admitted by Austin himself, we may deal with it first.

Frederic Harrison (Fortnightly Review, vols. xxx., xxxii.) was at great pains to collect a number of laws or rules of law which do not fit into the common law definitions of what a law means and creating rights and duties. Take the rule that "every will must be in writing." It is a very circuitous way of looking at things, according to Harrison, to say that such a rule creates a specific right in any determinate person of a definite description. So, again, the rule that "a legacy to the witness of a will is void." Such a rule is not "designed to give any one any rights, but simply to protect the public against wills made under undue influence." Again, the technical rule in Shelley's case that a gift to A for life, followed by a gift to the heirs of A, is a gift to A in fee simple, is pronounced to be inconsistent with the definition. It is an idle waste of ingenuity to force any of these rules into a form in which they might be said to create rights. This would be a perfectly correct description of any attempt to take any of these rules separately and analyse it into a complete command creating specific rights and duties. But there is no occasion for doing anything of the kind. It is not contended that every grammatically complete sentence in a textbook or a statute is per se a command creating rights and duties. A law, like any other command, must be expressed in words, and will require the use of such a way as the will directs. The effect of it may be expressed in a sentence which, standing by itself, is not intelligible; other sentences locally separate from the principal one may contain the exceptions and the modifications and the interpretations to which that is subject. In one of these taken by itself, but in the substance of them all taken together, is the true law, in Austin's sense, to be found. Thus the rule that every will must be in writing is a mere fragment—only the limb of a law. It belongs to the rule which fixes the rights of devises or legatees under a will. That rule in whatever form it may be expressed is, without any straining of language, a command of the law that wills be in writing. The court, "Provided the testator in his last will and testament shall be entitled to the property thereby given him," is surely a command creating rights and duties. After testament added "expressed in writing"; it is still a command. Add further, "provided he be not one of the witnesses to the will," and the command, with its product of rights and duties, is still there. Each of the additions limits the operation of the command stated imperatively in the first sentence. So with the rule in Shelley's case. It is resolvably into the rule that every person to whom an estate is given by a conveyance expressed in the form of a will, and that this rule, to say nothing of the command to write the will, is absolutely necessary to the conveyance. To take another example from later legislation. An English statute passed in 1884 enacts nothing more than this, that an act of a previous session shall be construed as "that "meant this." It would be futile indeed to force this into conformity with Austin's definition by treating it as a command addressed to the judges, and as indirectly creating rights to have such a construction respected. As it happens, the section of the previous act referred to (the Burials Act 1890) was an undeniable command addressed to the clergy, and imposed upon them a specific duty. The true command—the law—is to be found in the two sections taken together.

All this confusion arises from the fact that laws are not habitually expressed in imperative terms. Even in a mature system like that of England the great bulk of legal rules is hidden under forms which disguise their imperative quality. They appear as principles, maxims, propositions of fact, generalizations, points of pleading and procedure, and so forth. Even in the statutes the imperative form is not uniformly observed. It might be said that the more mature a legal system is the less do its individual rules take the form of commands. The greater portion of Roman law is expressed in terms which would not suit some scientific or speculative treatises. The institutional works abound in propositions which have no legal significance at all, but which are not distinguished from the true law in which they are embedded by any difference in the forms of expression. Assertions about matters of history, dubious speculations in philology, and reflections on human conduct are mixed up in the same narrative with genuine rules of law. Words of description are used, not words of command, and rules of law assimilate themselves in form to the extraneous matter with which they are mixed up.

It has been said that Austin himself admitted to some extent the force of these objections. He includes among laws which are not imperatives "declaratory laws, or laws explaining the
import of existing positive law, and laws abrogating or repealing existing positive law.” He thus associates them with rules of positive morality and with laws which are only metaphorically so called. This collocation is unfortunate and out of keeping with Austin’s method. Declaratory and repealing laws are as completely unlike positive morality and metaphorical laws as are the laws which he describes as properly so called. And if we avoid the error of treating each separate proposition enunciated by the lawgiver as a law, the cases in question need give us no trouble. Read the declaratory and the repealing statutes along with the principal laws which they affect, and the result is perfectly consistent with the proposition that all law is to be resolved into a species of command. In the one case we have in the principal taken together with the interpretative statute a law, and whether it differs or not from the law as it existed before the interpretative statute was passed makes no difference to the true character of the latter. It contributes along with the follower to the expression of a command which is a true law. In the same way repealing statutes are to be taken together with the laws which they repeal—the result being that there is no law, no command, at all. It is wholly unnecessary to class them as laws which are not truly imperative, or as exceptions to the rule that laws are a species of commands. The combination of the two sentences in which the lawgiver has expressed himself, yields the result of silence—absence of law—which is in no way incommensurable with the assertion that a law, when it exists, is a kind of command. Austin’s theory does not logically require us to treat every act of parliament as being a complete law in itself, and therefore to set aside a certain number of acts of parliament as being exceptions to the great generalization which is the basis of the whole system.

Rules of procedure again have been alleged to constitute another exception. They cannot, it is said, be regarded as commands involving punishment if they be disobeyed. Nor is anything gained by considering them as commands addressed to the judge and other ministers of the law. There may be no doubt in the law of procedure a great deal that is resolvable into law in this sense, but the general action of the legislature is not to be regarded as entering into the substantive commands which are laws. They are descriptions of the sanction and its mode of working. The bare prohibition of murder without any penalty to enforce it would not be a law. To prohibit it under penalty of death implies a reference to the whole machinery of criminal justice by which the penalty is enforced. Taken by themselves the rules of procedure are not, any more than canons of interpretation, complete laws in Austin’s sense of the term. But they form part of the complete expression of true laws. They imply a command, and they describe the society of which the command is a part. They are a complete law in itself, but not an act which exists by itself. They are not a real law, but a command which is a part of the existing laws. In all these cases the interpretation of the lawgiver is in strict accordance with the law itself, and if it cannot be said that the lawgiver has a private right to interpret the law, it is as difficult to say that he has not.

A more formidable criticism of Austin’s position is that which attacks the definition of sovereignty. There are countries, it is said, where the sovereign authority cannot by any stretch of language be said to command the laws, and yet where law manifestly exists. The ablest and the most moderate statement of this view is given by Sir Henry Maine in Early History of Institutions, p. 350:

“It is from no special love of Indian examples that I take one from India, but because it happens to be the most modern precedent in point. My instance is the Indian province called the Punjab, the country of the Five Rivers, in the state in which it was for about a quarter of a century before its annexation to the British Indian Empire. After passing through every conceivable phase of anarchy and domary anarchy, it fell under the tolerably consolidated dominion of a half-military half-religious oligarchy known as the Sikhs. The Sikhs themselves were afterwards reduced to subjection by a single chiefman belonging to their order, Runjeet Singh. At first this chiefman was considered the representative of a sovereignty conceded by Austin. He was absolutely despotic. Except occasionally on his wild frontier he kept the most perfect order; and his government will have convinced you that his domestic administration was so arranged that his commands would have been followed by death or mutilation; and this was perfectly well known to the enormous majority of his subjects. Yet I doubt whether once in all his life he took possession of the revenue; his system was to divide it into small districts—a system which has been described as the most extraordinary thing in the world, because the two chiefs would have divided the revenue a prodigious share of the produce of the soil. He harried villages which recalculated at his exactions, and he executed great numbers of men. He levied great armies; he had all material of expense. One of the most extraordinary things in his government was this:—It is, no doubt, the explanation of the greater part of the Indian laws, and may be the reason why the Indian law is not, as it is generally supposed, a gross absurdity. It is, no doubt, the explanation of the greater part of the Indian laws, and may be the reason why the Indian law is not, as it is generally supposed, a gross absurdity. It is, no doubt, the explanation of the greater part of the Indian laws, and may be the reason why the Indian law is not, as it is generally supposed, a gross absurdity. It is, no doubt, the explanation of the greater part of the Indian laws, and may be the reason why the Indian law is not, as it is generally supposed, a gross absurdity. It is, no doubt, the explanation of the greater part of the Indian laws, and may be the reason why the Indian law is not, as it is generally supposed, a gross absurdity. It is, no doubt, the explanation of the greater part of the Indian laws, and may be the reason why the Indian law is not, as it is generally supposed, a gross absurdity. It is, no doubt, the explanation of the greater part of the Indian laws, and may be the reason why the Indian law is not, as it is generally supposed, a gross absurdity. It is, no doubt, the explanation of the greater part of the Indian laws, and may be the reason why the Indian law is not, as it is generally supposed, a gross absurdity. It is, no doubt, the explanation of the greater part of the Indian laws, and may be the reason why the Indian law is not, as it is generally supposed, a gross absurdity.

So far as the mere size of the community is concerned, there is no difficulty in applying the Austinian theory. In postulating a considerably numerous community Austin was thinking evidently of small isolated groups which could not without provoking a sense of the ridiculous be termed nations. Two or three families, let us suppose, occupying a small island, totally disconnected with any great power, would not claim to be and would not be treated as an independent political community. But it is not true that Austin would have regarded the small and isolated community which is the practical unit of the old civilisation—villages in fact—of the West as having the same. So far as the mere size of the community is concerned, there is no difficulty in applying the Austinian theory. In postulating a considerably numerous community Austin was thinking evidently of small isolated groups which could not without provoking a sense of the ridiculous be termed nations. Two or three families, let us suppose, occupying a small island, totally disconnected with any great power, would not claim to be and would not be treated as an independent political community. But it is not true that Austin would have regarded the small and isolated community which is the practical unit of the old civilisation—villages in fact—of the West as having the same.

In the same category may be placed without much substantial difference all the communities in smaller islands of the earth than the face of the earth previous to the point at which legislation takes place. The united States was not in all but an occasional command. So again Maine puts his position clearly in the following sentences: “The Athenian assembly made true laws for residents on Attic territory, but the dominion of Athens over her subject cities and islands was clearly a tax-taking as distinguished from a legislating empire.” Maine, it will be observed, does not say that the sovereign assembly did not command the laws in the subject islands—only that it did not legislate.

In the same category may be placed without much substantial difference all the communities in smaller islands of the earth than the face of the earth previous to the point at which legislation takes place. The united States was not in all but an occasional command. So again Maine puts his position clearly in the following sentences: “The Athenian assembly made true laws for residents on Attic territory, but the dominion of Athens over her subject cities and islands was clearly a tax-taking as distinguished from a legislating empire.” Maine, it will be observed, does not say that the sovereign assembly did not command the laws in the subject islands—only that it did not legislate.

So far as the mere size of the community is concerned, there is no difficulty in applying the Austinian theory. In postulating a considerably numerous community Austin was thinking evidently of small isolated groups which could not without provoking a sense of the ridiculous be termed nations. Two or three families, let us suppose, occupying a small island, totally disconnected with any great power, would not claim to be and would not be treated as an independent political community. But it is not true that Austin would have regarded the small and isolated community which is the practical unit of the old civilisation—villages in fact—of the West as having the same.
jurist, who accepts Austin's postulate as true for the English system of our own day would have no difficulty in applying it to German or Roman law generated under the influence of such ideas as these.

Again, referring to the instance of Runjet Singh, Sir H. Maine says no doubt rightly that "he never did or could have dreamed of changing the civil rules under which his subjects lived. Provisions, and a belief in the sovereign body or person enforcing the rules, are all that are necessary for the enforcement of such rules as the elders themselves who applied them." That too might be said with truth of states to which the application of Austin's system would be far from difficult. The sovereign body or person enforcing the rules by all the ordinary methods of justice might conceivably believe that the rules which he enforced had an obligatory authority of their own, just as most lawyers at one time, and possibly some lawyers now, believe in the natural obligatoriness, independently of courts or parliaments, of portions of the law of England. But nevertheless, whatever ideas the sovereign or his delegates might entertain as to "the independent obligatory force" of the rules which they enforce, the fact that they do enforce them distinguishes them from all other rules. Austin seizes upon this peculiarity and fixes it as the determining characteristic of positive law. When the rule is enforced by a sovereign authority as he defines it, it is his command, even if he should never so regard it himself, or should suppose himself to be unable to alter it in a single particular.

It may be instructive to add to these examples of dubious cases one which is called exclamatory law. In so far as it has not been adopted and enforced by the state, it would, on Austin's theory, be, not positive law, but either positive morality or possibly a portion of the Divine law. No jurist would deny that there is an essence of difference between much of Austin's law as is adopted by the state and all the rest of it, and that for scientific purposes this distinction ought to be recognized. How near this kind of law approaches to the positive or political law may be seen from Austin's decision "which it determines." The chief aspect of ecclesiastical discipline was: that the church was an organized body with an outward and visible form of government; that all who were outside her bounds were outside of her domain of divine grace; that she had a command laid upon her, and authority given to her, to gather men into her fellowship by the ceremony of baptism, and, as some of those who were admitted proved unworthy of their calling, she also had the right by the power of the keys to deprive them temporarily or absolutely of the privilege of communion with her, and on their amendment to restore them once more to church membership. On this power of exclusion and restoration was founded the system of ecclesiastical discipline. It was purely spiritual jurisdiction. It obtained its hold over the minds of men from the belief, universal in the Catholic church of the early ages, that grace was conveyed to men from heaven, was conveyed to them closely in many points—indeed in all points except that of the sanction by which they were enforced. It is a spiritual not a political sanction. The force which lies behind them is not that of the sovereign or the state. When physical force is used to compel obedience to the laws of the church they become positive laws. But so long as the belief in future punishments or the fear of the purely spiritual punishments of the church is sufficient to procure obedience to them, they are to be regarded as commands, not by the state, but by the church. That difference Austin makes essential to the distinction. Civil laws as he defines them, like the religious, would be followed by jurists who would nevertheless include other laws, not ecclesiastical in purpose, but enforced by very similar methods.

Austin's theory in the end comes to this, that true laws are in all cases obeyed in consequence of the application of regulated physical force by some portion of the community. That is a fair paraphrase of the position that laws are the commands of the sovereign, and is perhaps less objectionable inasmuch as it does not imply or suggest anything about the forms in which laws are made, or rules, customs, practices, and laws; nor by whatever name these uniformities of human conduct may be called—have either this kind of force at their back or they have not. Is it worth while to make this difference the basis of a scientific system or not? Apparently it is. If it were a question of distinguishing between the law of the land courts and the laws of fashion no one would hesitate. Why should laws or rules having no support from any political authority be termed laws positive merely because there are no other rules in the society having such support?

The question may perhaps be summed up as follows. Austin's definitions are in strict accordance with the facts of government in civilized states; and, as it is put by Maine, certain assumptions or postulates having been made, the general majority of Austin's positions follow as of course or by ordinary logical process. But at the other extreme end of the scale of civilization are societies to which Austin himself refuses to apply his system, and where, it would be conceded on all sides, there is neither political community nor sovereign nor law—none of the facts which jurisprudence assumes to exist.

There is an intermediate stage of society in which, while the rules of conduct might and generally would be spoken of as laws, it is difficult to trace the connexion between them and the sovereign authority whose existence is necessary to Austin's system. Are such societies to be thrown out of account in analytical jurisprudence, or is Austin's system to be regarded as only a partial explanation of the field of true law, and his definitions good only for the laws of a portion of the world?

The true answer to this question appears to be that when the rules in any given case are habitually enforced by physical penalties, administered by a determinate person or portion of the community, they should be regarded as positive laws and the appropriate subject matter of jurisprudence. Rules which are not so enforced, but are enforced in any other way, whether by what bare outward custom, or spiritual apprehensions, or natural instinct, are rightly excluded from all that class of law which exists in all stages of society, savage or civilized, a large body of rules of conduct, habitually obeyed, are nevertheless not enforced by any state sanction of any kind. Austin's method assimilates such rules in primitive society, where they subserves the same purpose as positive laws in an advanced society, not to the positive laws which they resemble in purpose but to the moral or other rules which they resemble in operation. If we refuse to accept this position we must abandon the attempt to frame a general definition of law and its dependent terms, or we must confine ourselves with saying that law is one thing in one state of society and another thing in another. On the ground of clearness and convenience Austin's method is, we believe, substantially right, but none the less should the student of jurisprudence be on his guard against such assumptions as that legislation is a universal phenomenon, or that the relation of sovereign and subject is discernible in all states of human society. And a careful examination of Maine's criticism will show that it is devoted not so much to a rectification of Austin's position as to correction of the misconceptions into which some of his disciples may have fallen. Though there seems to be no difficulty in the apprehensions of the analysis to suppose that it involves a difference in juridical character between systems which are not yet recognized by any judicial decision and custom after such recognition. There is no such difference except in the case of what is properly called "judicial legislation"—wherein an absolutely new rule is added for the first time to the law. The recognition of a custom or law is not necessarily the beginning of the custom or law. Where a custom possesses the marks by which its legality is determined according to well understood principles, the courts pronounce it to have been law at the time of the happening of the facts as to which their jurisdiction is invoked. The fact that no previous instance of its recognition by a court of justice can be produced is not material. A lawyer before any such decision was given would nevertheless pronounce the custom to be law—with more or less hesitation according as the marks of a legal custom were obvious or not. The character of the custom is not changed when it is for the first time enforced by a court of justice, and hence the language used by Maine must be understood in a very limited sense. "Until customs are enforced by courts of justice"—so he puts the position of Austin—they are merely "positive morality," rules enforced by opinion; but as soon as courts of justice enforce them they become commands of the sovereign, conveyed through the judges who are his delegates or deputies. This proposition, on
Austin's theory, would only be true of customs as to which these marks were absent. It is of course true that when a rule enforced only by opinion becomes for the first time enforceable by a court of justice—which is the same thing as the first time of its being actually enforced—its juridical character is changed. It was positive morality; it is now law. So it is when that which was before the opinion of the judge only becomes by his decision a rule enforceable by courts of justice. It was not even positive morality but the opinion of an individual; it is now law.

The most difficult of the components of law to define is right; and, as right rather than duty is the basis of classification, it is a point of some importance. Assuming the truth of the analysis above discussed, we may go on to say that in the notion of law is involved an obligation on the part of some one, or on the part of every one, to do or forbear from doing. That obligation is duty; what is right? Dropping the negative of forbearance, and taking duty to mean an obligation to do something, with the alternative of punishment in default, we find that duties are of two kinds. The thing to be done may have exclusive reference to a determinate person or class of persons, on whose motion or complaint the sovereign power will execute the punishment or sanction on delinquents; or it may have no such reference, the thing being commanded, and the punishment following on disobedience, without reference to the wish or complaint of individuals. The last are absolute duties, and the omission to do, or forbear from doing, the thing specified in the command is in general what is meant by a crime. The others are relative duties, each of them implying and relating to a right in some one else. A person has a right who may in this way set in operation the sanction provided by the state. In common thought and speech, the German is therefore as legal has a better right to what is more positive and definite than this—as a power or faculty residing in individuals, and suggesting not so much the relative obligation as the advantage or enjoyment secured thereby to the person having the right. J. S. Mill, in a valuable criticism of Austin, suggests that the definition should be so modified as to introduce the element of "advantage to the person exercising the right." But it is exceedingly difficult to frame a positive definition of right which shall not introduce some term at least as ambiguous as the word to be defined. T. E. Holland defines right in general as a man's "capacity of influencing the acts of another by means, not of his own strength, but of the opinion or the force of society." Direct influence exercised by virtue of one's own strength, physical or otherwise, over another's acts, is "might" as distinguished from right. When the indirect influence is the opinion of society, we have a "moral right." When it is the force exercised by the sovereign, we have a legal right. It would be more easy, no doubt, to pick holes in this definition than to frame a better one.

The distinction between rights available against determinate persons and rights available against all the world, jura in personam and jura in rem, is of fundamental importance. The phrases are borrowed from the classical jurists, who used them originally to distinguish actions according as they were brought to enforce a personal obligation or to vindicate rights of property. The owner of property has a right to the exclusive enjoyment thereof, which avails against all and sundry, but not against one person more than another. The parties to a contract have rights available against each other, and against no other persons. The jura in personam is the badge of property; the jura in rem personam is a mere personal claim.

1 In English speech another ambiguity is happily wanting which in many languages besets the phrase expressing a "right." The Latin "jus," the German "Recht," the French "droit," and the Italian "diritto," the legal "right," are used without the adjective "personal or "juridical," necessary to make the distinction. In English, it is right and proper to say, "I have a right to.ms."

That distinction in rights which appears in the division of law into the law of persons and the law of things is thus stated by Austin. There are certain rights and duties, with certain capacities and incapacities, by which persons are determined to various classes. The rights, duties, &c., are the condition or status of the person; and one person may be invested with many status or conditions. The law of persons consists of the rights, duties, &c., constituting conditions or status; the rest of the law is the law of things. The separation is a mere matter of convenience, but of convenience so great that the distinction is universal. Thus any given right may be exercised by persons belonging to innumerable classes. The person who has the right may be under twenty-one years of age, may have been born in a foreign state, may have been convicted of crime, may be a native of a particular county, or a member of a particular profession or trade, &c.; and it might very well happen, with reference to any given right, that, while persons in general, under the circumstances of the case, would enjoy it in the same way, a person belonging to any one of these classes would not. If belonging to any one of those classes makes a difference not to one right merely but to many, the class may conveniently be abstracted, and the variations in rights and duties dependent thereon may be separately treated under the law of persons. The personality recognized in the law of persons is such as modifies indefinitely the legal relations into which the individual clothed with the personality may enter.

T. E. Holland disapproves of the prominence given by Austin to this distinction, instead of that between public and private law. This, according to Holland, is based on the public or private character of the persons with whom the right is connected, public persons being the state or its delegates. Austin, holding that the state can be said to have legal rights or duties, recognizes no such distinction. The term "public law" he confines strictly to that portion of the law which is concerned with political conditions, and which ought not to be opposed to the rest of the law, but "ought to be inserted in the law of persons as one of the limbs or members of that supplemental department."

Lastly, following Austin, the main division of the law of things is into (i) primary rights with primary relative duties, (2) sanctioning rights with sanctioning duties (relative or absolute). The former exist, as it has been put, for their own sake, the latter for the sake of the former. Rights and duties arise from facts and events; and facts or events which are violations of rights and duties are delicts or injuries. Rights and duties which arise from delicts are remedial or sanctioning, their object being to prevent the violation of rights which do not arise from delicts.

There is much to be said for Frederic Harrison's view (first expressed in the Fortnightly Review, vol. xxi.), that the rearrangement of English law on the basis of a scientific classification, whether Austin's or any other, would not result in advantages at all compensating for its difficulties. If anything like a real code were to be attempted, the scientific classification would be the best; but in the absence of that, and indeed in the absence of any habit on the part of English lawyers of studying the system as a whole, the arrangement of facts does not very much matter. It is essential, however, to the abstract study of the principles of law. Scientific arrangement might also be observed with advantage in treaties affecting to give a view of the whole law, especially those which are meant for educational rather than professional uses. As an example of the practical application of a scientific system of classification to a complete body of law, we may point to W. A. Hunter's elaborate Exposition of Roman Law (1876).

It is not impossible to give a more general view of English jurisprudence in anything like the same shape as those which we have been discussing. Under the heading JURISPRUDENCE, COMPARATIVE, an account will be found of the method and results of what is practically a new science. The inquiry is in that stage which is indicated in one way by describing it as a philosophy. It resembles, and is indeed only part of, the study which is described as the philosophy of history. Its chief interest has been in the light which it has thrown upon rules of law and legal institutions which had been and are generally contemplated as positive facts.
merely, without reference to their history, or have been associated historically with principles and institutions not really connected with them.

The historical treatment of law displaces some very remarkable misconceptions. Peculiarities and anomalies abound in every legal system; and, as soon as laws become the special study of a professional class, some mode of explaining or reconciling them will be resorted to. One of the prehistorical ways of philosophizing about law was to account for what wanted explanation by some theory about the origin of technical words. This implied some previous study of words and their history, and is an instance of the deep-seated and persistent tendency of the human mind to identify names with the things they represent. The Institutes of Justinian abound in explanations, founded on a supposed derivatist of the following term: *testamentum*, we are told, is *coappellatur good testatio mentis est.* A testament was no doubt, in effect, a declaration of intention on the part of the testator when this was written. But the *mentum* is a mere termination, and has nothing to do with *mens* at all. The history of testaments, which, it may be noted incidentally, has been developed with conspicuous success, gives a totally different meaning to the institution from that which was expressed by this fanciful derivation. So the perplexing subject of *possessio* was supposed in some way to be explained by the derivation from *pono* and *sedeo*—*quasi sedibus phanio.* *Pondum* was supposed to be a compound of *pondus* and *homo.* These examples belong to the class of rationalizing derivations with which students of philology are familiar. Their characteristic is that they are suggested by some prominent feature of the thing as it then appeared to observers—which feature thereupon becomes identified with the essence of the thing at all times and places.

Another prehistorical mode of explaining law may be described as metaphysical. It conceives of a rule or principle of law as existing by virtue of some more general rule or principle in the nature of things. Thus, in the English law of inheritance, until the passing of the Succession Acts, a deceased intestate would pass to his uncle or aunt, to the exclusion of his father or other lineal ancestor. This anomaly from an early time excited the curiosity of lawyers, and the explanation accepted in the time of Bracton was that it was an example of the general law of nature: "Descendit itaque jus quasi ponderosum quad cadens deorsum recta linea vel transversali, et nunquam reasenscit ea via qua descendit." It has been suggested that the "rule really results from the associations involved in the word descent." It seems more likely, however, that these associations explained rather than that they suggested the rule—that the omission of the lineal ancestor existed in custom before it was discovered to be in harmony with the law of nature. It would imply more influence than the reasoning of lawyers is likely to have exercised over the development of law at that time to believe that a purely artificial inference of this kind should have established so very remarkable a rule. However that may be, the explanation is typical of a way of looking at law which was common enough before the dawn of the historical method. Minds capable of reasoning in this way were, if possible, farther removed from the conceptions implied in the reasoning of the analytical jurists than those who were independent of the historical method itself. In this connexion it may be noticed that the great work of Blackstone marks an era in the development of legal ideas in England. It was not merely the first, as it still remains the only, adequate attempt to expound the leading principles of the whole body of law, but it was distinctly inspired by a rationalizing method. Backstone tried not merely to express but to illustrate legal rules, and he had a keen sense of the value of historical illustrations. He worked of course with the materials at his command, and his work are obnoxious alike to the modern jurist and to the modern historian. He is accused by the one of perverting history, and by the other of confusing the law. But his scheme is a great advance on anything that had been attempted before; and, if his work has been prolific in popular fallacies, at all events it enriched English literature by a prospectus of the law, in which the logical connexion of its principles *inter se*, and its relations to historical facts, were distinctly if erroneously recognized.

While the historical method has superseded the verbal and metaphysical explanation of legal principles, it had apparently, in some cases, come into conflict with the conclusions of the analytical school. The difference between the two systems comes out most conspicuously in relation to customs. There is an unavoidable break in the analytical method between societies in which rules are backed by regulated physical force and those in which no such force exists. At what point in its development a given society passes into the condition of "an independent political society" it may not be easy to determine, for the evidence is obscure and conflicting. To the historical jurist there is no such breach. The rule which in one stage of society is a law, in another merely a rule of "positive morality," is the same thing to him throughout. By the Irish Land Act 1881 the Ulster custom of tenant-right and other analogous customs were legalized. For the purposes of analytical jurisprudence there is no need to go beyond the act of parliament. The laws known as the Ulster custom are laws solely in virtue of the sovereign government. Between the law as it now is and the custom as it existed before the act there is all the difference in the world. To the historical jurist no such separation is possible. His account of the law would not only be incomplete without embracing the precursors and antecedents, but the investigation in both cases is only one of the facts, and by no means the most significant or important, in the history of its development. An exactly parallel case is the legalization in England of that customary tenant-right known as copyhold. It is to the historical jurist exactly the same thing as the legalization of the Ulster tenant right. In the one case a practice was made law by formal legislation, and in the other without formal legislation. And there can be very little doubt that in an earlier stage of society, when formal legislation had not become the rule, the custom would have been legalized relatively much sooner than it actually was. Customs then are the same thing as laws to the historical jurist, and his business is to trace the influences under which they have grown up, flourished and decayed, their dependence on the intellectual and moral conditions of society at different times, and their reaction upon them. The recognized science—and such it may now be considered to be—with which historical, or more properly comparative, jurisprudence has most analogy is the science of language. Laws and customs are to the one what words are to the other, and each separate municipal system has its analogue in a language. Legal systems are related together like languages and dialects, and the investigation in both cases brings us back at last to the meagre and obscure records of savage custom and speech. A great master of the science of language (Max Müller) has indeed distinguished it from jurisprudence, as belonging to a totally different class of sciences. "It is perfectly true," he says, "that if language be the work of man in the same sense in which a state, or a temple, or a poem, or a law are properly called the works of man, the science of language would have to be classed as an historical science. We should have a history of language as we have a history of art, of poetry and of jurisprudence; but we could not claim for it a place on the same side of the line as the history of states. Whatever be the proper position of either philology or jurisprudence in relation to the natural sciences, it would not be difficult to show that laws and customs on the whole are equally independent of the efforts of individual human will—which appears to be what is meant by language not being the work of man. The most complete acceptance of Austin's theory that law everywhere and always is the command of the sovereign does not involve any withdrawal of laws from the domain of natural science, does not in the least interfere with the scientific study of their affinities and relationships. Max Müller elsewhere illustrates his conception of the different relations of words and laws to the individual will by the story of the emperor Tiberius, who was reproved for a grammatical mistake by Marcellus, whereupon Capito, another grammarian, observed that, if what the emperor said was not good Latin, it would soon be so.
"Capito," said Marcellus, "is a liar; for, Caesar, thou canst give the Roman citizenship to men, but not to words." The mere impulse of a single mind, even that of a Roman emperor, however, probably counts for little more in law than it does in language. Even in language one powerful intellect or one influential academy may, by its own decree, give a bent to modes of speech which they would not otherwise have taken. But whether law or language be conventional or natural is really an obsolete question. Abductive, or rather, inductive, historical and natural sciences in the last result is one of names.

The application of the historical method to law has not resulted in anything like the discoveries which have made comparative philology a science. There is no Grimm's law for jurisprudence; but something has been done in that direction by the discovery of the analogous processes and principles which underlie legal systems having no external resemblance to each other. But the historical method has been applied with special success to a single system—the Roman law. The Roman law presents itself to the historical student in two different aspects. It may seem extravagant praise for a legal system, the faults of which are and always have been matter of daily complaint, but it would be endorsed by all unprejudiced students. What men complain of is the practical hardship and inconvenience of some rule or process of law. They know, for example, that the law of real property is exceedingly complicated, and that, among other things, it makes the conveyance of land expensive. But the technical law of real property, which rests to this day on ideas that have been buried for centuries, has nevertheless the qualities we have named. So too with the law of procedure as it existed under the "science" of special pleading. The greatest practitioner of modern law may be the severest critic of existing systems that has ever appeared in any age or country, Jeremy Bentham, has, admitted this: "Confused, indeterminate, inadequate, ill-adapted, and inconsistent as to a vast extent the provision or no provision would be found to be that has been made by it for the various cases that have happened to present themselves for decision, yet in the character of a repository of such cases it affords, for the manufactory of real law, a stock of materials which is beyond all price. Traverse the whole continent of Europe, ransack all the libraries belonging to all the jurisprudential systems of the several political states, add the contents together, you would not be able to compose a collection of cases equal in variety, in amplitude, in clearness of statement—in a word, all points taken together, in constructive-ness—to that which may be seen to be afforded by the collection of English reports of adjudged cases" (Bentham's Works, iv. 460).

On the other hand, the fortunes of English jurisprudence are not unworthy of comparison even with the catholic position of Roman law. In the United States of America, in India, and in the vast Colonial Empire, the common law of England constitutes most of the legal system in actual use, or is gradually being superimposed upon it. It would hardly be too much to say that English law of indigenous growth, and Roman law, between them govern the legal relations of the whole civilized world. Nor has the influence of the former on the intellectual habits and the ideas of men been much if at all inferior. Those who in the analytical jurisprudence of the school of Austin will be glad to acknowledge that it is pure outcome of English law. Sir Henry Maine associated its rise with the activity of modern legislatures, which is of course a characteristic of the societies in which English laws prevail. And if it would not be difficult to show that the germs of Austin's principles are to be found in legal writers who never dreamed of analysing a law. It is certainly remarkable, at all events, that the acceptance of Austin's system is as yet confined strictly to the domain of English law. Maine found no trace of its being even known to the jurists of the Continent, and it would appear that it has been equally without influence in Scotland, which, like the continent of Europe, is essentially Roman in the fundamental elements of its jurisprudence.

The substance of the above article is repeated from Professor E. Robertson's (Lord Loch ee's) "Law," in the 9th ed. of this work.

The object of this article is to give a general survey of the study of the evolution of law. It is not concerned with analytical jurisprudence as a theory of legal thought, or an encyclopaedic introduction to legal teaching. Jurisprudence in such a philosophic or pedagogical sense has certainly to reckon with the methods and results of a comparative study of law, but its aims are distinct from those of the latter: it deals with more general problems. On the other hand, the comparative study of law may itself be treated in two different ways: it may be directed to a comparison of existing systems of legislation and law, with a view to forming analogies and contrasts in the treatment of practical problems and taking note of expedients and of possible solutions. Or else it may aim at discovering the principles regulating the development of legal systems, with a view to explain the origin of institutions and to study the conditions of their life. In the first sense, comparative jurisprudence resolves itself into a study of home and foreign law (cf. Hofmann in the Zeitschrift für das private und öffentliche Recht der Gegenwart, 1878). In the second sense, comparative jurisprudence is one of the aspects of so-called sociology, being the study of social evolution in the special domain of law. From this point of view, the farther from the observer, the more suggestive and worthy of attention the facts were found to be. This peculiarity is easily explained if we take into account the tendency of all evolutionary investigations to obtain a view of origins in order to follow up the threads of development from their initial starting-point. Besides, it has been urged over and over again that the simpler phenomena of ancient and primitive society afford more convenient material for generalizations as to legal evolution than the extremely complex legal institutions of civilized nations. But there is no definite line of distinction between ancient and modern comparative jurisprudence in so far as both are aiming at the study of legal development. The law of Islam or, for that matter, the German civil code, may be taken up as a subject of study quite as much as the code of Hammurabi or the marriage customs of Australian tribes.

The fact that the comparative study of legal evolution is chiefly represented by investigations of early institutions is therefore a characteristic, but not a necessary feature in the treatment of the subject. But it is essential to this treatment that it should be historical and comparative. Historical, because it is only as history, i.e. a sequence of stages and conditions, that development can be thought of. Comparative, because it is not the casual notices about one or the other chain of historical facts that can supply the basis for any scientific induction. Comparisons of kindred processes have to be made in order to arrive at any conception of their general meaning and scientific regularity. As linguistic science differs from philology in so far as it treats of the general evolution of language and not of particular languages, so comparative jurisprudence differs from the history of law as a study of general evolution distinct from the development of one or the other national branch of legal enactment. Needless to say that there are intermediate shades between these groups, but it is not to these shades we have to attend, but to the main distinctions and divisions.

The idea that the legal enactments and customs of different countries should be compared for the purpose of deducing general principles from them is as old as political science itself. It was realized with especial vividness in epochs when a considerable material of observations was gathered from different sources and in various forms. The wealth of material and the recurrence of certain leading views in them led to comparison and to generalizations based on comparison. Aristotle, who lived at the close of a period marked by the growth of free Greek cities, summarized, as it were, their political experience in his Constitutions and Politics; students of these know that the Greek philosopher had to deal with not only public law and political institutions, but also to some extent private, criminal law, equity, the relations between law and morals, &c.

Another great attempt at comparative observation was made at the close of the pre-revolutionary period of modern Europe. Montesquieu took stock of the analogies and contrasts of law in the commonwealths of his time and tried to show to what extent particular enactments and rules were dependent on certain general currents in the life of societies—on forms of government, on moral conditions corresponding to these, and ultimately on the geographical facts with which various nationalities and states have to reckon in their development.

These were, however, only slight beginnings, general forecasts of a coming line of thought, and Montesquieu’s remarks on laws and legal customs remain almost as if they were meant to be temporary and partial social utopias. In the means conceived in this sense. At this distance of time we cannot help perceiving how fragmentary, incomplete and un-critical his notions of the facts of legal history were, and how strongly his thought was biased by didactic considerations, by the wish to teach his contemporaries what politics and law should be.

It was reserved for the 19th century to come forward with connected and far-reaching investigations in this field as in many others. We are not deceived by proximity and self-confidence into the belief that the nearer we come to the farther from the observer, the more suggestive and worthy of attention the facts were found to be. This peculiarity is easily explained if we take into account the tendency of all evolutionary investigations to obtain a view of origins in order to follow up the threads of development from their initial starting-point. Besides, it has been urged over and over again that the simpler phenomena of ancient and primitive society afford more convenient material for generalizations as to legal evolution than the extremely complex legal institutions of civilized nations. But there is no definite line of distinction between ancient and modern comparative jurisprudence in so far as both are aiming at the study of legal development. The law of Islam or, for that matter, the German civil code, may be taken up as a subject of study quite as much as the code of Hammurabi or the marriage customs of Australian tribes.

The fact that the comparative study of legal evolution is chiefly represented by investigations of early institutions is therefore a characteristic, but not a necessary feature in the treatment of the subject. But it is essential to this treatment that it should be historical and comparative. Historical, because it is only as history, i.e. a sequence of stages and conditions, that development can be thought of. Comparative, because it is not the casual notices about one or the other chain of historical facts that can supply the basis for any scientific induction. Comparisons of kindred processes have to be made in order to arrive at any conception of their general meaning and scientific regularity. As linguistic science differs from philology in so far as it treats of the general evolution of language and not of particular languages, so comparative jurisprudence differs from the history of law as a study of general evolution distinct from the development of one or the other national branch of legal enactment. Needless to say that there are intermediate shades between these groups, but it is not to these shades we have to attend, but to the main distinctions and divisions.

The idea that the legal enactments and customs of different
enthusiastic belief in the historical, traditional life of social groups as opposed to the intellectual conceptions of individualistic radicalism.

On the other hand, the 19th century was a scientific age and especially an age of biological science. Former periods—the 16th and 17th centuries especially—had bequeathed to it high standards of scientific investigation, an ever-increasing weight of authority in the direction of an exact study of natural phenomena and a conception of the world as ruled by laws and not by capricious interference. But these scientific views had been chiefly applied in the domain of mathematics, astronomy and physics; although great discoveries had already been made in physiology, and new branches of medicine and natural history were opened up by the investigations of 19th-century students in this respect far surpassed those of the preceding period. And the doctrine of transformation which came to occupy the central place in scientific thought was eminently fitted to co-ordinate and suggest investigations of social facts. As F. York Powell put it, Darwin is the greatest historian of modern times, and certainly an historian not in the sense of a reader of annals, but in that of a guide in the understanding of organic evolution. Though much is expressed in the one name of Darwin, it is perhaps even more momentous as a subject of study for the great and far-reaching work. To this tendency we are indebted for the rise of anthropology and of sociology, of the scientific study of man and of the scientific study of society. Of course it ought not to be disregarded that the application of scientific principles and methods to human and social facts was made possible by the growth of knowledge in regard to savage and half-civilized nations called forth by the increased activity of European and American business men, administrators and explorers. Ethnography and ethnology have brought some order into the wealth of materials accumulated by generations of workers in this direction, and it is with their help that the far-reaching generalizations of modern inquirers as to man and society have been achieved.

2. It is not difficult to see that the comparative study of legal evolution finds its definite place in a scientific scheme elaborated from such points of view. Let us see how, as a matter of fact, the study in question arose and what its progress has been. The immediate incitement for the formation of comparative jurisprudence was given by the great discoveries of comparative philology. When the labours of Franz Bopp, August Schleicher, Max Müller, W. D. Whitney and others revealed the profound connexion between the different branches of the Indo-European race in regard to their languages, and showed that the development of these languages proceeded on lines which might be studied in a strictly scientific manner, on the basis of comparative observation and with the object of tracing the uniformities of the process, it was natural that students of religion, of folk-lore and of legal institutions took up the same method and tried to win similar results (Sir H. Maine, Rede lecture in Village Communities, 3rd ed.).

It is interesting to note that one of the leading scholars of the Germanist revival in the beginning of the 19th century, Jacob Grimm, a compere of Savigny in his own line, took up with fervent zeal and remarkable results not only the scientific study of the German language, but also that of Germanic mythology and popular law. His Rechtsalterthümer are still unrivalled as a collection of data as to the legal lore of Teutonic tribes. Their basis is undoubtedly a narrow one; they treat of the varieties of legal custom among the continental Germans, the Scandinavians and the Germanic tribes of Great Britain, but the method of treatment is already a comparative one. Grimm takes up the different legal objects—property, contract, procedure, succession, crime, &c.—and examines them in the light of national, provincial and local customs, sometimes noticing expressly affinities with Roman and Greek law (e.g. the subject of imprisonment for debt, Rechtsalterthümer, 4th ed., vol. ii., p. 165).

A broader basis was taken up by a linguist who tried to trace the primitive institutions and customs of the early Aryans before their separation into divers branches. Adolphe Picte: (Les Origines indo-européennes, i. 1859; ii. 1863) had to touch constantly on questions of family law, marriage, property, public authority, in his attempt to reconstruct the common civilization of the Aryan race, and he did so on the strength of a comparative study of terms used in the different Indo-European languages. He showed, for instance, how the idea of protection was the predominant element in the position of the father in the Aryan household. The names piṭar, pater, παῖς, father, which recur in most branches of the Aryan race, go back to a root pāt-, pointing to guardianship or protection. Thus we are led to consider the patriarcha otoritas, so stringently formulated in Roman law, as an expression of a common Aryan notion, which was already in existence before the Aryan tribes parted company with the Semitic branch of the early culture have been given several times since in connexion with linguistic observations. An example is W. E. Hearne's Aryan Household (1879). Fusel de Coulanges' famous volume on the ancient city and Rudolf von Jhering's studies of primitive Indo-European institutions (Vorgeschichte der Indoeuropéer) start from similar observations, although the first of these scholars is chiefly interested in tracing the influence of religion on the material arrangements of life, while the latter draws largely on principles of public and private law, studied more especially in Roman antiquity.

3. The chief work in that direction has been achieved in one sense by a German scholar, B. W. Leist. His Graeco-Roman legal history, his Jus Gentium of Primitive Aryans, and his Jus Civile of Primitive Aryans, form the most complete and learned attempt not only to reconstitute the fundamental rules of common Aryan law before the separation of tongues and nations, but also to trace the influence of this original stock of juridical ideas in the later development of different branches of the Aryan race. These three books present three stages of comparison, marked by a successive widening of the horizon. He begins his legal history by putting together the data as to Roman and Greek legal origins; in the Alt-arisches Jus Gentium the material of Hindu law is not only drawn into the range of observation, but becomes its very centre; in the Alt-arisches Jus Civile the legal customs of the Zend branch, of Celts, Germans and Slavs, are taken into account, although the most important part of the inquiry is still directed to the combination of Hindu, Greek and Roman law. In this way Leist builds up his theories by the comparative method, but he restricts its use consciously and consistently to a definite range. He does not want to plunge into a haphazard amalgamation, but seeks to point out the possibilities in order to be able to watch for the appearance of ramifications and to explain them. According to his view comparison is of use only between "coherent" lines of facts. Common origin, not similarity of features, appears to him as the fundamental basis for fruitful comparison. It may be said that Leist's work is characterized by the attempt to draw up a continuous history of a supposed archaic common law of the Aryan race rather than to put different solutions of kindred legal problems by the side of each other. For him Aryan tribal organization with its double-sided relationship—cognatic and agnatic—through men and through women—is one, and although he does not draw its picture as Fusel de Coulanges does by the help of traits taken indiscriminately from Hindu, Roman and Greek material, although he notices divisions, degrees and variations, at bottom he writes the history of one set of principles exemplified and modulated, as it were, in the six or seven main varieties of the race. Even so the nine rules of conduct prescribed by Hindu sacral law are, according to his view, the directing rules of Roman, Greek, Germanic, Celtic, Slavonic law at the side of regard to gods, parents and fatherland, guests, personal purity, the prohibitions against homicide, adultery and theft—are variations of one and the same religious, moral and legal system, and their original unity is reflected and proved by the unity of legal terminology itself.

The same leading idea is embodied in the books of Otto Schrader—Ürgeschichte und Sprachvergleichung (1st ed., 1883; 2nd ed., 1890) and Reallexikon der indogermanischen Altertumskunde (1901). In this case we have to do not with a jurist
but with a linguist and a student of cultural history. His training made him especially fit to trace the national affinities in the data of language, and the sense of the intimate connexion between the group and the language treated by one side, of words and linguistic forms on the other, underlies all his investigations. But Schrader testifies also to another powerful influence—to that of Victor Hahn, the author of a remarkable book on early civilization, _Kulturpflanzen und Haushuerei in ihren Übergang aus Asien in Europa_ (1st ed., 1870; 2nd ed., 1902), dealing with the migrations of tribes and their modes of acquiring material civilization. Although the linguistic and archaeological sides naturally predominate in Schrader's works, he has constantly to consider legal subjects, and he strives conscientiously to obtain a clear and common-sense view of the early legal notions of the Aryans. Speaking of the "ordeals," the "wagings of God's law," for example, he traces the customs of purification by fire, water, iron, &c., to the practice of oaths (Sansk. _ahman_ ; Gr. _δυσπα_ ; O. Ital. _omn_ = first group; O. Ger. _als_ , Ir. _oth_ = second group; O. Norse _rōda_ , Arm. _ednum_ = I swear = third group). The central idea of the ordeal is thus shown to be the imprecation—"Let him be cursed whose assertion is false." The comparative study of the Aryan group assumed another aspect in the works of Sir Henry Maine. He did not rely on linguistic affinities, but made great use of another element of investigation, which plays hardly any part in the books of the writers mentioned hitherto. His personal aptitude and intelligent reading in _Ancient Law_ gets to be the interpretation of popular legal principles by modern as well as by ancient instances of their application in _Village Communities, The Early History of Institutions, Early Law and Custom_. The evolution of property in land out of archaic collectivism, ancient forms of contract and compulsion, rudimentary forms of feudality, the marriage laws, were thrown into light in consequence of systematic comparisons with the condition of the same phenomena in the code of Indian nations; but of southern Slavonic nations, medieval celts, and Teutons. This breadth of view seemed startling when the lectures appeared, and the original treatment of the subject was hailed on all sides as a most welcome new departure in the study of legal customs and institutions. And yet Maine set very definite boundaries to his comparative surveys. He renounced the chronological limitation confining such inquiries to the domain of antiquaries, but he upheld the ethnographical limitation confining them to the laws of the same race. In his case it was the Aryan race, and in his _Law and Custom_ he opposed in a determined manner the attempts of more daring students to extend to the Aryans generalizations drawn from the life of savage tribes unconnected with the Aryans by blood.

Thus, notwithstanding all diversities in the treatment of particular problems, one leading methodical principle runs through the works of all the above-mentioned exponents of comparative study. It was to proceed on the basis of common origin and on the assumption of a certain common stock of language, religion, material culture, and law to start with. What Pictet, Leist, Schrader, and Maine were doing for the Aryans, F. Hommel, Robertson Smith and others did in a lesser degree for the Semitic race.

4. The literary group which started from the discoveries of comparative philology and history was met on the way by what may be called the ethnological school of inquirers. The original impetus was given, in this case, by jurists and historians who took up the study in the field of ancient history, but treated it from the beginning in such a way as to break up the subdivisions of historic races and to direct the inquiry to a state of culture best illustrated by savage custom. The first impulse may be said to have come from J. J. Bachofen (Mutterrecht, 1861; _Antiquarische Briefe, 1880; Die Sage von Tanagra_). All the representatives of Aryan antiquities are at one in laying stress on the patriarchal and agamic system of the kindreds in the different Aryan nations; even Leist, although dwelling on the importance of cognatic ties, looks to agamic relationship for the explanation of military organization and political authority. And undoubtedly, if we argue from the predominant facts and from the linguistic evidence of parallel terms, we are led to assume that the women have been the directing element in the social and state of society. Now, Bachofen discovered in the very tradition of classical antiquity traces of a fundamentally different state of things, the central conception of which was not patriarchal power, but matrernity, relationship being traced through mothers, the wife presenting the constant and directing element of the household, while the husband (and perhaps several husbands) joined her from time to time in more or less inconstant unions. Such a state of society is definitely described by Herodotus in the case of the Lyceans, it is clearly noticeable even in later historical times in Sparta; the passage from this matriarchal institution to the oppressing patriarchy is perhaps reflected in poetical fiction in the famous Orestes myth, based on the struggle between the moral incitement which prompted the son to avenge his father and the absolute reverence for the mother required by ancient law. Although chiefly drawing his materials from classical literature, Bachofen included in his _Antiquarian Letters_ an interesting study of the marriage custom and systems of relationship of the Malabar Coast in India; they attracted his attention by the contrasts between different layers of legal tradition—the Brahmins living in patriarchal order, when the laws next to them, the Nayirs (Nairs), follow rules of matriarchy. Similar ideas were put forward in a more comprehensive form by J. F. McLennan. His early volume (Studies in Ancient History, 1876) contains several essays published some time before that date. He starts from the wide occurrence of marriage by capture in primitive societies, and groups the tribes of which we have definite knowledge into endogamous and exogamous societies according as they take their wives from among the kindred or outside it. Marriage by capture and by purchase are signs of exogamy, connected with the custom in many tribes of killing female offspring. The development of marriage by capture and purchase is a powerful agent in bringing about patriarchal rule, agamic relationship, and the formation of clans or _gentes_, but the more primitive forms of relationship appear as variations of systems based on mother-right. These views are supported by ethnological observations and used as a clue to the history of relationship and family law in ancient Greece. In further contributions published after McLennan's death these researches are supplemented and developed in many ways. The peculiarities of exogamous societies, for instance, are traced back to the even more primitive practice of Totemism, the grouping of men according to their conceptions of animal worship and to their symbols. McLennan's line of inquiry was taken up in a very effective manner not only by anthropologists like E. B. Tylor or A. Lang, but also in a more special manner by students of primitive family law. One of the most brilliant monographs in this direction is Robertson Smith's study of _Kinship and Marriage in Arabia_.

But perhaps the most decisive influence was exercised on the development of the ethnological study of law by the discovery in America of Lewis H. Morgan. In his epoch-making works on _Systems of Consanguinity_ (1869) and _on Ancient Society_ (1877) he drew attention to the remarkable fact that in the case of a number of tribes—the Red Indians of America, the Australian black tribes, some of the polar races, and several Asiatic tribes, mostly of Turanian race—degrees of relationship are reckoned and distinguished by names, not as ties between
JURISPRUDENCE, COMPARATIVE

individuals, but as ties between entire groups, classes or genera-
tions. Instead of a mother and a father a man speaks of fathers
and mothers; all the individuals of a certain group are deemed
husbands or wives of corresponding individuals of another group;
sisters and brothers have to be sought in entire generations, and
not among the descendants of a definite and common parent, and
so forth. There are variations and types in these forms of
organization, and intermediate links may be traced between
unions of consanguine people—brothers and sisters of the same
blood—on the one hand, and the monogamic marriage prevailing
nowadays, on the other; but the central and most striking fact
seems to be that in early civilizations, in conditions which we
shout, social order, and hand marriage appeared as a tie, not
between single pairs, but between classes, the men of a class being regarded as potential or actual husbands
of the women of a corresponding class. Facts of this kind
produce very peculiar and elaborate systems of relationship,
which have been copiously illustrated by Morgan in his tables.
In his Ancient Society he attempted to reduce all the known
forms and facts of marriage and kinship arrangements to
a comprehensive view of evolution leading up to the Aryan,
Semitic and Uralian family, as exhibiting the most modern
type of relationship.

These observations, in conjunction with Bachofen's
and McLennan's teaching on mother-right, brought about a complete
change of perspective in the comparative study of man and
society. The rights of ethnologists to have their say in regard
to legal, political and social development was forcibly illustrated
from both ends, as it were. On the one hand, classical antiquity
itself proved to be a rather thin layer of human civilization
hardly sufficient to conceal the long periods of barbarism and
primitive evolution which had gone to its making. On the
other hand, unexpected combinations in regard to family,
property, social order, were discovered in every corner of the
inhabited world, and our trite notions as to the character of
laws and institutions were reduced to the rank of variations on
themes which recur over and over again, but may be and have
been treated in very different ways.

There is no need to speak of the use made of ethnological
material in the wider range of anthropological and sociological
studies—the works of Tylor, Lubbock, Lippert, Spencer are in
everybody's hands—but attention must be called to the further
influence of the ethnological point of view in comparative
jurisprudence. An interesting example of the passage from one
line of investigation to another, from the historical to the anthro-
pological line, if the expression may be used for the sake of
brevity, is presented in the works of one of the founders of the
Zeitschrift für vgl. Rechtswissenschaft—Franz Bernhöff. He
appears in his earlier books as an exponent of the comparative
study of Greek and Roman antiquities, more or less in the style
of Leist. Like the latter he was gradually invited to draw India
into the range of his observations, but unlike Leist, he ended by
fully recognizing the importance of ethnological evidence, and
although he did not do much original research in that direction
himself, the influence of Bachofen and of the ethnologists made
itself felt. Bernhöff's treatment of classical antiquity itself:
in his State and Law in Rome at the Time of the Kings he starts
from the view that patricians and plebeians represent two
ethnological layers of society—a patriarchal Aryan and a
matriarchal pre-Aryan one.

But, of course, the utmost use was made of ethnological
evidence by writers who cut themselves entirely free from the
special study of classical or European antiquities. The enthusi-
asm of the explorers of new territory led them naturally to
disregard the peculiar claims of European development in the
history of higher civilization. They wanted material for a study
of the genus homo in all its varieties, and they had no time to
look after the minute questions of philological and antiquarian
research which had so long constituted the daily bread of
inquirers into the history of laws. The most characteristic
representative of the new methods of extensive comparison was
undoubtedly A. H. Post (1839-1895)—the author of many works,
in which he ranges over the whole domain of mankind—Hovas,
Zulus, Maoris, Tunguses, alternating in a kaleidoscopic fashion
with Hindus, Teutons, Jews, Egyptians. The order of his com-
positions is systematic, not chronological or even ethnographical
in the sense of grouping kindred races together. He takes up
the different subdivisions of law and traces them through all
the various tribes which present any data in regard to them.
His method is not only not bound by history, it is opposed to it.
He writes:

"The method of comparative ethnoLOGY is different from
the historical method, inasmuch as it collects the given material from
an entirely distinct point of view. Historical investigation tries
to get at the causes of the facts of rational life by observing the develop-
ment of these facts from such as preceded them within the range of
the human species, tribes and peoples. The comparative ethno-
logy inquires after the causes of facts in national life by collecting identical or similar ethnological data wherever they
may be found in the world, and by drawing inferences from these
materials to identical or similar causes. This method is therefore
quite unhistorical. It seems things that have been hitherto regarded
as closely joined and arranges these shreds into new combinations" (Grundriss, i. 14).

This is not a mere paradox, but the necessary outcome of the
situation in respect of the material used. What is being sought
is not common origin or a common stock of ideas, but relations
to similar expedients in similar situations, and it is one of the
most striking results of ethnoLOGY that it can show how peoples
entirely cut off from each other and even placed in very different
planes of development can resort to analogous solutions in
analogous emergencies. Is not the custom of the so-called
Cowade—the pretended confinement of the husband when a
child is born to his wife—a most quaint and seemingly recondite
ceremony? Yet we find it practised in the same way by Basques,
Californian Indians, and some Siberian tribes. They have surely
not borrowed from each other, nor have they kept the ceremony
as a remnant of the time when they formed one race; in each
case, evidently the passage from a matriarchal state to a patri-
archal has suggested it, and a very appropriate method it seems to
establish the fact of fatherhood in a solemn and graphic though
artificial manner. Again, an inscription from the Cretan
town of Gortyn, published in the American Journal of Archaeology
(2nd series, vol. i., 1897) by Halbherr, tells us that the weapons
of a warrior, the wool of a woman, the plough of a peasant, could
not be taken from them as pledges. We find a similar idea in
the prohibition to take from a knight his weapons, from a villein
his plough, in payment of fines, which obtained in medieval
England. The similarity extends to details, and is certainly not
derived from direct borrowing or common origin but from analogies
of situations translating themselves into analogies of legal thought.
It may be said in a sense that for the ethnological school the less
relationship there is between the compared groups the more
instructive the comparison turns out to be.

The collection of ethnological parallels for the use of sociology
and comparative jurisprudence has proceeded in a most fruitful
manner. By the side of special monographs about single tribes
or geographical groups of tribes, such as Komans of And Kurnai,
by K R. & A. W. Reade (1880), and The New Zealand, Australia, by Baldwin Spencer & F. G. Gillen (1899), the whole
range of ethnological jurisprudence was gone through by Wilken
in regard to the inhabitants of the Dutch possessions in Asia, by
M. M. Kovalevsky in regard to Caucasians, &c. As a rule the
special monographs turned out to be more successful than the
general surveys, but the interest of the special monographs
themselves depended partly on the fact that people's eyes had
been opened to the recurrence of certain widespread phenomena
and types of development.

5. Ethnologists of Post's school have not had it entirely
their own way, however. Not only did their natural opponents,
the philologists, historians and jurists, reproach them with lack
of critical discrimination, with a tendency to disregard funda-
mental distinctions, to wipe out characteristic features, to throw
the most disparate elements into the same pot. In their own
ranks a number of conscientious and scientifically trained
investigators protested against the haphazard manner in which the most intricate problems were treated, and sought to evolve more definite methodological rules. P. and F. Sarrasin in their description of the Ceylon Veddas showed a most primitive race scattered in small clusters, monogamous and patriarchal in their marriage customs and guarded careful of their property. E. A. Westermarck challenged the sweeping generalizations indulged in by many ethnologists about primitive promiscuity in sexual relations and the necessary passage of all human tribes through the stages of matrarchy and group marriage.

A very interesting departure was attempted by Dargun in his studies on the origin and development of property and his treatise on mother-right and marriage by capture. His lead was followed by R. Hildebrand in the monograph on law and custom. The principal idea of these inquirers may be stated as follows. We must conceive the juridical world as the development of a group of historical material from the very beginning to the present day. It is a world which is the result of the development of a group and not of the development of individuals. A. von Harnack and R. Hildebrand corrected the sweeping generalizations indulged in by many ethnologists about primitive promiscuity in sexual relations and the necessary passage of all human tribes through the stages of matrarchy and group marriage.

6. The necessity of employing more stringent standards of criticisms and more exact methods is now recognized, and it is characteristic that the foremost contemporary representative of comparative jurisprudence, Joseph Kohler of Berlin, principal editor of the Zeitschrift für vgl. Rechtswissenschaft, often has stressed in his works that this methodological approach to the study of private law in the provinces of Germany where the French law of the Code Napoleon was still applied, has thrown his whole energy into monographic surveys and investigations in all the departments of historical and ethnological jurisprudence. The code of Kammhuber and the Babylonian contracts, the ancient Hindu codes and juridical commentaries on them, the legal customs of the different tribes and provinces of India, the collection and sifting of the legal customs of aborigines in the German colonies in Africa, the materials supplied by the British and American tribal researches, of legal customs of the Mahomedans, and numberless other points of ethnological research, have been treated by him in articles in his Zeitschrift and in other publications. Comprehensive attempts have also been made by him at a synthetic treatment of certain sides of the law—like the law of debt in his Shakespeare vor dem Forum der Jurisprudenz (1883) or his Primitive History of Marriage. Undoubtedly we have not to deal in this case with mere accumulation of material or with remarks on casual analogies. Yet the importance of these works consists in the fact that they are the starting point of a genuine extension of methodological development in the legal history of man and the stages of development in the history of marriage is more and more comprehensively attested to, in their extensive range of observation. The critical side is expressed on many points and the same conditions are to be found as in the case of Post and some of his followers. We may sympathize cordially with Kohler's exhortation to work for a universal history of law without yet perceiving clearly what the stages of this universal history are going to be. We may acknowledge the enormous importance of Morgan's and Bachofen's discoveries without feeling bound to recognize that all tribes and nations of the earth have gone substantially through the same forms of development in respect of marriage and the stage of development and without admitting that the evidence for a universal spread of group-marriage has been proved. Altogether the research seems not entirely unfounded that investigations of this kind are carried on too much under the sway of a preconceived notion that some highly peculiar arrangement entirely different from what we are practising nowadays—say sexual promiscuity or communism in the treatment of property—must be made out as a universal clue to earlier stages of development. Kohler's occasional remarks on matters of method (e.g. Zeitschrift für vgl. Rechtswissenschaft, xii. 193 seq.) seem hardly adequate to dispel this impression. But in his own work and in that of some of his disciples and followers, J. E. Hitzig, Hellwig, Max Huber, R. Darest, and others, we find more exact forms and means of inquiry constantly brought into practice, and the results testify to a distinct heightening of the scientific standard in this group of studies on comparative jurisprudence. Especially conspicuous in this respect are three tendencies: (a) the growing disinclination to accept superficial analysis between phenomena belonging to widely different spheres of culture as necessarily produced by identical causes (e.g. Darinsky's review of Kovalevsky's assumptions to group marriage among the Caucasian tribes, Z. für vgl. Rechtswiss., xiv. 143 seq.); (b) the selection of definite historical or ethnological territo- ries which have had group-marriage; and the monographic treatment of these, which has been practised by the above-named authors, the data observed elsewhere are treated as suggestive material for supplying gaps and starting possible explanations: Kohler's own contributions have been mainly of this kind; (c) the treatment of selected subjects by an intensive legal analysis, bringing out the principles underlying one or the other rule, its possible differentiation, the means of its application in practice, &c.: Hellwig's monograph on the right of sanctuary in savage communities (Das Asyirecht der Naturvölker) may be named in illustration of this analytical tendency. Altogether, there can be no doubt that the science has reached by comparative jurisprudence when, after a hasty, one might almost say a voracious, consumption of materials, investigators begin to strive towards careful sifting of evidence and a conscious examination of methods and critical rules which have to be followed in order
to make the investigations undertaken in this line worthy of their scientific aims. Until the latter has been done many students, whose trend of thought would seem to lead them naturally into this domain, may be repelled by the uncritical indistinctness with which mere analogies are treated as elusively proofs by some of the representatives of the comparative school. F. W. Maitland, for instance, was always kept back by such considerations.

7. It is desirable, in conclusion, to review the entire domain of comparative jurisprudence, and to start, late the chief principles of method which have to be taken into consideration in the course of this study. It is evident, to begin with, that a scientific comparison of facts must be directed towards two aims—towards explaining the differences and towards enumerating the similarities. As a matter of fact the same material may be studied from both points of view, though logically these are two distinct processes.

(a) Now at this initial stage we have already to meet a difficulty and to guard against a misconception: we have namely to reckon with the plurality of causes of similarity. From assuming that wherever similar phenomena are forthcoming they are always produced by identical causes. Death may be produced by various agents—by sickness, by poison, by a blow. The habit of wearing mourning upon the death of a relation is a widespread habit, and yet it is not always to be ascribed to real or supposed grief and the wish to express it in one's outward get-up. Savage people are known to go into mourning in order to conceal themselves from the terrible spirit of the dead which would recognize them in their everyday costume (Jhering, Der Zweckim Recht, and ed., 1884-1886). This is certainly a morbid assumption at the start, but it can be greatly reduced and guarded against in actual investigation. In the example taken we are led to suppose different origin because we are informed as to the motives of the external ceremony, and thus we are taught to look not only to bare facts, but to the psychological environment in which they appear. And it is evident that the greater the complexity of observed phenomena, the more they are made up of different elements welded into one sum, the less probability there is that we have to do with consequences derived from different causes. The recurrence of group-marriages and the fact that out of the several Aryan relationship systems, only two are known, may be explained by the working of entirely different agencies. And it may be added that in most cases of an analysis of social institutions the limits of human probability and reasonable assumption do not coincide with mathematical possibility in any sense. When we register our facts and causes in algebraic forms, marking the first with \( a, b, c \), and the latter with \( x, y, z \), we are apt to demand a degree of precision which is hardly ever to be met with in dealing with social facts and causes. Let us rest content with reasonable inferences and probable explanations.

(b) The easiest way of explaining a given similarity is by attributing it to a direct loan. The process of demolition, of the borrowing of one people from the other, plays a notable part in the history of institutions and ideas. The Japanese have in our days engraffed many European institutions on their perfectly distinct civilization; the Germans have used for centuries what was termed euphemistically the Roman law of the present time (heutiges römisches Recht); the Romans absorbed an enormous amount of Greek and Oriental law in their famous jurisprudence. A check upon explanation by direct loan will, of course, lie in the fact that two societies are entirely disconnected, so that it comes to be very improbable that one drew its laws from the other. Although migrations of words, legends, beliefs, charms, have been shown by Theodor Benfey and his school to range over much wider areas than might be supposed on the face of it, still, in the case of law, so far as it has to regulate material conditions, the limits have perhaps to be drawn rather narrowly. In any case we shall not look to India in order to explain the burning of widows among the negroes of Africa; the swet may be the example of this custom which happens to be most familiar to us, but it is certainly not the only root of it on the surface of the earth.

It is much more difficult to make out the share of direct borrowing in the case of peoples who might conceivably have influenced one another. A hard and fast rule cannot be laid down in such cases, and everything depends on the weighing of evidence and sometimes on almost instinctive estimates. The use of a wager for the benefit of the tribunal in the early procedure of the Romans and Greeks, the sacramentum and the pporom, with a similar growth of the sum laid down by the parties in proportion least, seem to be indications of similar practices in analogy by the Romans from the Greeks at the time of the Twelve Tables legislation (Hofmann, Beiträge zur Geschichte des griechischen und römischen Rechts). No direct proof is available for this hypothesis, and the question in dispute might have lain for ever between this explanation and that based on the analogous development in the two closely related branches of law. The further study of the legal antiquities of other branches of the Aryan race leads one to suppose, however, that we have actually to do with the latter and not with the former model.

Although 1500 or 2000 years may have been common custom of the Vedant in Bohemia (Kapras, "Das Pfandrecht in altbühnischen Landrecht," Z. für vgl. R.-wissenschaft, xvii. 424 seq.), regulating the wager of litigation in the case of two parties submitting their dispute to the decision of a public tribunal, turn out to be so similar to the Greek and the Roman process? And the Teutonic Wedde would further countenance the view that we have to do in this case with analogous expediency or, possibly, common origin, not loans. But while dwelling on considerations which may disprove the assumption of direct loans, we must not omit to mention circumstances that may render such an assumption the best available explanation for certain particular cases of similarity. We mean especially the recurrence of special secondary traits not deducible from the nature of the relations compared. Terminological parallels are especially convincing in such cases. An example of most careful linguistic investigation attended by important results is presented by W. Thomsen's treatment of the affinities between the languages and cultures of the peoples of northern and eastern Europe. Taking the indications in regard to the influence of Germanic tribes on Finns and Lapps, we find, for instance, that the Finnish race has stood for some 3000 or 4000 years under the influence of several Germanic languages—partly of a more ancient form of Gothic than that represented by Uldas, partly of a northern (Scandinavian) tongue and even possibly of a common Gothic-northern one.

The importance of these linguistic investigations for our subject becomes apparent when we find that a series of most important legal and political terms has been imported from Teutonic into Finnish. For example, the Finnish kuningas, "king," comes from a Germanic root illustrated by O. Norse konung, O. H. Ger. kunung, A.-S. cynung, Goth. theudans. The Finnish valtta, "power," "interest," is of Germanic origin, as shown by O. N. vald, Govend. The Finnish kilda, a compact secured by solemn promise, is akin with O. N. gisil, A.-S. gisel, O. H. Ger. giséld, "hostage." The explanation for Finnish vuokra, "interest," "usury" is to be found in Gothic vohtar, O. N. ohr, Ger. Wucher, &c. (W. Thomsen, Über den Einfluss der germanischen Sprachen auf die Finnisch-lappischen, trans. E. Sievers, 1870, p. 166 seq.; cf. W. Thomsen, The Relations between Ancient Russia and Scandinavia and the Origin of the Russian State, p. 127 seq.; Miklosich, "Die Fremdwörter in den slavischen Sprachen," Denkschriften der Wiener Akademie, Ph. hist. Klasse. XV.).

The next group of analogies is formed by cases which may be reduced to common origin. In addition to what has already been said on the subject in connexion with the literature of the historical school, we must point out that in the case of kindred peoples this form of derivation has, of course, to be primarily considered. It is especially the case when we have to deal with the original stock of cultural notions of a race, and when analogies in the framing and working of institutions and legal rules are supported by linguistic affinities. The testimony of the Aryan languages in regard to terms denoting family organization and relationship can in no way be disregarded, whatever our view may be about the most primitive
JURISPRUDENCE, COMPARATIVE

stages of development in this respect. The fact that the common stock of Aryan languages and of Aryan legal customs points to a patriarchal organization of the family may be regarded as established, and it is certainly an important fact drawn from a very ancient stage of human history, although there are indications that still more primitive formations may be discovered.

Inferences in the direction of common origin become more doubtful when we argue, not that certain facts proceed from a common stock of notions embodied in the early culture of a race before it was broken up into several branches, but that they have to be accounted for as instances of a similar treatment of legal problems by different peoples of the same ethnic family. The only thing that can be said in such a case is that, methodically, the customs of kindred nations have the first claim to comparison. It is evident that in dealing with blood feud, composition for homicide, and the like, among the Germans or Slavs, the evidence of other Aryan tribes has to be primarily studied. But it is by no means useless for the investigator of these problems to inform himself about the aspect of such customs in the life of nations of other descent, and in general, the bottomless interplay of human nature. The underlying principles in this respect are to a large extent suggested by feelings and considerations which are not in any way peculiarly Aryan, and may be fully illustrated from other sources, as has been done e.g. in Steinmetz's Origins of Punishment.

(d) This leads to the consideration of what may be called disconnected analogies. They are instructive in so far as they go back, not to any continuous development, but to the fundamental, psychological and logical unity of human nature. In similar circumstances human beings are likely to solve the same problems in the same way. Take a rather late and special case. In the Anglo-Saxon laws of Ine, a king who lived in the 7th century, it is enacted that no landowner should be allowed to claim personal labour service from his tenants unless he provides them not merely with land, but with their households. Now an exactly similar rule is found in the statement of rural by-laws to be enforced on great domains in Africa, which had been taken over by the imperial fiscus—the Lex Manciana (cf. Schulten, Lex manciana). There is absolutely no reason for assuming a direct transference of the rule from one place to the other: it reflects considerations of natural equity, which as such are common from both cases, and which in both cases were directed against similar encroachments of powerful landowners on a dependent peasant population. In both instances government interfered to draw the line between the payment of rent and the performance of labour, and fastened on the same feature to fix the limit, namely, on the difference between peasants living in their own homes and those who had been settled by the landowner on his farms. Of such analogies, the study of savage life presents a great number, e.g. the widely spread practices of purification by ordeal (H. C. Lea, Superstition and Force).

(e) Organizing thought always seeks to substitute order for chaotic variety. Observations as to disconnected analogies lead to attempts to systematize them from some comprehensive point of view. These attempts may take the shape of a theory of consecutive stages of development. Similar facts appear over and over again in ethnological and antiquarian evidence, because all peoples and tribes, no matter what their race and geographical position, go through the same series of social arrangements. This is the fundamental idea which directed the researches of Maine, McLennan, Morgan, Post, Kohler, although each of these scholars formulated his sequence of stages in a peculiar way. McLennan, for instance, puts the idea referred to in the following words:

"In short, it is suggested to us, that the history of human society is that of a development following very slowly one general law, and that the variety of forms of life—of domestic and civil institution—is divisible only into the unequal development of the different sections of mankind. The first effect of this is to divide the whole and ourselves of the facts relating to the least developed races. To begin with them is to begin with history at the farthest-back point of time to which, except by argument and inference, we can reach."

Their condition, as it may to-day be observed, is truly the most ancient condition of man ("Studies in Ancient History, 2nd series, 9, 15").

On this basis we might draw up tables of consecutive stages, of which the simplest may be taken from Post:-

"Four types of organization: the tribal, the territorial, the isolated and the social. The first has as a basis marriage and relationship by blood; the second, neighbouring occupation of a district; the third, patronage relations between lord and dependants; the fourth, social intercourse and contractual relations into individual personalities" (Post, Grundrisse, i. 14).

This may be supplemented from Friedrichs in regard to initial stages of family organization. He reckons four stages of this kind: promiscuity, loose relations, patriarchal family, patriarchal family, modern, bilateral family (Z. f. vgl. R. wisenschaft). This mode of grouping similar phenomena as a sequence of stages leads to a conception of universal history of a peculiar kind. And as such it has been realized and advocated by Kohler (see e.g. his article in Helmolt's World's History, Eng. trans. i). Prompted by this conception several representatives of comparative jurisprudence have found no difficulty in seeing the general and obligatory course of legal evolution. It is to be noticed, however, that Kohler himself has entered a distinct protest against McLennan's and Post's view that the more rudimentary a people's culture is, the more archaic it is, and the earlier it has to be placed in the natural sequence of evolution. This would create difficulties in the case of tribes of exceedingly low culture, like the Ceylon Veddas, who live in monomymous and patriarchal groups. According to Kohler's view, neither the mere fact of a low standard of culture, nor the fact that a certain legal rule is the first of its kind to be put before the general course of development.

The process of development must be studied in cases where it is sufficiently clear, gaps in other cases have to be supplied accordingly, and the working together of distinct institutions, especially in cases when there is no ethnic connexion, has to be especially noticed. These are counsels of perfection, but Kohler's own example shows sufficiently that it is not easy to follow them to the letter. One thing is, however, clearly indicated by these and similar criticisms; it is, at the least, premature to sketch anything like a course of universal development in such a history. We have grave doubts whether the time will ever come for laying down any single course of that kind. The attempts made hitherto have generally led to overstating the value of certain parts of the evidence and to squeezing special traits into a supposed general course of evolution.

(j) Another group of thinkers is therefore content to systematize and explain the material from the point of view, not of universal history, but of correspondence to economic stages and types. This is, as we have seen, the leading idea in Dargun's or Hildebrandt's investigations. It is needless to go into the question of the right or wrong of particular suggestions made by these writers. The place assigned to individualism and collectivism may be adequate or not; how far can be settled only by special inquiries. But the general trend of study initiated in this direction is certainly a promising one, if only one consideration of method is well kept in view. Investigators ought to be very chary of laying down certain combinations as the necessary outcome of certain economic situations. Such combinations or consequences certainly exist; pastoral husbandry, the life of scattered hunting groups, the conditions of agriculturists under feudal rule, certainly contain elements which will recur in divers ethnical surroundings. But we must not forget a feature which is constantly before our eyes in real life: namely, that different minds and characters will draw different and perhaps opposite conclusions in exactly similar outward conditions. This may happen in identical or similar geographical environment; let us only think of ancient Greeks and Turks on the Balkan peninsula, or of ancient Greeks and modern Greeks for that matter. But even the same historical medium, as a rule, scope for treatment of legal problems on divers lines. Take systems of succession. They exercise the most potent influence on the
structure and life of society. Undivided succession, whether in the form of primogeniture or in that of junior right, sacrifices equity and natural affection to the economic efficiency of estates. Equal-partition rules, like gavelkind or parage, lead in an exactly opposite direction. And yet both sets of rules co-existed among the agriculturists of feudal England; communities placed in nearly identical historical positions followed one or the other of these rules. The same may be said of types of dwelling and forms of family life. Whether we turn to the evidence of the East from a given economic condition as if it were bound to regulate with fatalistic precision all the incidents of legal custom and social intercourse, we have to start from actual facts as complex results of many causes, and to try to reduce as much as we can of this material to the action of economic forces in a particular stage or type of development.

(g) The psychological diversities of mankind in dealing with the same or similar problems of food and property, of procreation and marriage, of common defence and relationship, of intercourse and contrast, &c., open another possibility for the grouping of facts and the explanation of law, and do so at a deeper level. It may be difficult or impossible to trace the reasons and causes of synthetic combinations in the history of society. That is, we can hardly go beyond noting that certain disconnected features of social life appear together and react on each other. But it is easier and more promising to approach the mass of our material from the analytical side, taking hold of certain principles or rules, or institutions, and tracing them to their natural consequences either through a direct systematization of recorded facts or, when these fail, through logical inferences. Some of the most important of these inferences is the historical method of comparative law. A method, in which the study of law has been effected on these lines. Mommsen's theory of Roman magistracy, Jètre's theory of the struggle for right, Kohler's view of the evolution of contract, &c., have been evolved by such a process of legal analysis; and, even when such generalizations have to be curtailed or complicated later on, they serve their turn as a powerful means of organizing evidence and suggesting reasonable explanations. The attribute of "reasonableness" has to be reckoned with largely in such cases. Analytical explanations are attractive to students because they substitute logical clearness for irrational accumulation of particular facts and the explanation of a detail by another detail that appears to the logic and to the reason common to us and to the people we are studying. This deductive element has to be closely watched and tested from the side of a concrete study of the evidence, but it seems destined to play a very prominent part in the comparative history of law, because legal analysis and construction have at all times striven to embody logic and equity in the domain of actual interests and forces. And, as we have seen in our survey of the literature of the subject, recent comparative studies tend to make the share of juridical analysis in given relative surroundings larger and larger.

What is so difficult of attainment to single workers—a harmonious appreciation of the combined influences of common origin, reception of foreign custom, recurring psychological combinations, the driving forces of economic culture and of the dialectical process of legal thought, will be achieved, it may be hoped, by the enthusiastic and brotherly exertions of all the workers in the field.

BIBLIOGRAPHY.—Of the principal works of reference may be mentioned: Zeitschrift für vergleichende Rechtswissenschaft, edited by Bernhöft, Cohn and Kohler (1878—?); Nouvelle revue historique de droit français et étranger, edited by Dastre, Emein, Appert, Fournier, Prévost, Tardiff and Proxstrom, 2nd series (1872—); Origines de la dénomination (1853); Festul des Coulangees, La Cigale et la Biche (1890); W. E. Hearn, The Aryan Household (1879); R. v. Jéroen, Vorgeschichte der Indoarbeiter (1894); B. W. Leist, Griechische Rechts geschichte (Rheinische Akademie der Wissenschaften, 1894); W. H. R. Talbert, The Origin of the Modern Historical Science (1895); S. Schach, Geschichte des westlichen und östlichen Familienrechts (1898); O. Schacht, Geschichte des weiblichen Rechts (1899); H. P. O. Lloyd, The Ancient Law and Custom (1898); M. H. d'Arbois de Jubainville, Études de droit celtique (1895).

JURJANI—JURY

1. Abu Bakr 'Abdu'l-Qahir ibn 'Abdur-Rahmān Ul-Jurjānī (d. 1078) Arabian grammarian, belonged to the Persian school and wrote a famous grammar, the Kitāb 'ulūd al-Mi'rāb or Kitāb Mīrāb 'Amil, which was edited by Erpenius (Leiden, 1617), by Bailly (Calcula, 1863), and by Spiegel (Calcula, 1893). Arabic commentaries on this work exist in MS., also in Turkish. It was first translated into Persian and then times and translated into Persian. Another of his grammatical works on which several commentaries have been written is the Kitāb Jumal fī-n-Naḥaṣ. For other works see C. Brockelmann's Gesch. der Arabischen Literatur (1898), i. 288.

2. 'Alī ibn Mahommēd ul-Jurjānī (1339-1414), Arabian encyclopaedic writer, was born near Astārābād and became professor in Shīrāz. When this city was plundered by Tīmūr (1387) he removed to Samarkand, but returned to Shīrāz in 1405, and remained there until his death. Of his thirty-one extant works, many being commentaries on other works, one of the best known is the Tafsīr (Definition), which was edited by G. Flegel (Leipzig, 1845), published also in Constantinople (1837), Graz (1866, &c.), and St Petersburg (1897).

JURY, in English law, a body of laymen summoned and sworn (jurati) to ascertainment, under the guidance of a judge, the truth as to questions of fact raised in legal proceedings whether civil or criminal. The development of the system of trial by jury has been regarded as one of the greatest achievements of English jurisprudence; it has even been said that the ultimate aim of the English constitution is "to get twelve good men into a box." In modern times the English system of trial by jury

1. I.e. the jury-box, or enclosed space in which the jurors sit in court.
has been adopted in many countries in which jury trial was not native or had been strangled or imperfectly developed under local conditions.

The origin of the system in England has been much investigated by lawyers and historians. The result of these investigations is a fairly general agreement that the germ of jury trial is to be found in the Frankish inquest (recognitio or inquisition) transplanted into England by the Norman kings. The essence of this inquest was the summoning of a body of neighbours by a public officer to give answer upon oath (recognoscere veritatem) on some question of fact or law (juz), or of mixed fact and law. At outset the object of the inquiry was usually to obtain information for the king, e.g. to ascertain facts needed for assessing taxation. Indeed Domesday Book appears to be made up by recording the answers of inquests.

The origin of juries is very fully discussed in W. Forsyth's History of Trial by Jury (1852), and the various theories advanced are more concisely stated in W. Stubbs's Constitutional History (vol. i) and in E. A. Freeman's Norman Conquest (vol. v.). Until the modern examination of historical documents proved the contrary, the jury system, like all other institutions, was popularly supposed to have come from Rome. But the work of the Anglo-legislator, and in England it has been usually assigned to Alfred the Great. This supposition is without historical foundation, nor is it correct to regard the jury as " copied from this or that kindred institution to be found in this or that German of Scandinavian land," or brought over ready made by Hengist or by William. Many writers of authority, says Stubbs, have maintained that the entire jury system is indigenous in England, some deriving it from Celtic tradition based on the principles of Roman law, and adopted by the Anglo-Saxons and Normans from the people they had conquered. Others have regarded it as a product of that legal genius of the Anglo-Saxons of which Alfred is the mythical impersonation, or as derived by that nation from the customs of primitive Germany or from their intercourse with the Danes. Nor even when it is admitted that the system of 'recognition' was introduced from Normandy have legal writers agreed as to the source from which the Normans themselves derived it. One scholar maintains that it was brought by the Norsemen from Scandinavia; another that it was derived from the processes of the canon law; another that it was developed on Gallic soil from Roman principles; another that it came from Asia through the crusades; or was borrowed by the Angles and Saxons from their Slavonic neighbours in northern Europe. The true answer is that forms of trial resembling the jury system in various particulars are to be found in the primitive institutions of all nations. That which comes nearest in time and character to trial by jury is the system of recognition by sworn inquest, introduced into England by the Normans. "That inquest," says Stubbs, "is directly derived from the Frank capitularies, into which it may have been adopted from the fiscal regulations of the Theodosian code, and thus owed some distant relationship with the Roman jurisprudence." However that may be, the system of "recognition" consisted in questions of fact, relating to fiscal or judicial business, being submitted by the officers of the crown to sworn witnesses in the local courts. Freeman points out that the Norman rulers of England were obliged, more than native rulers would have been, to rely on this system for accurate information. They needed to have a clear and truthful account of disputed points set before them, and such an account was sought for in the oaths of the recognitors. The Norman conquest, therefore, fostered the growth of those native germs common to England with other countries, out of which the institution of juries grew. Recognition, as introduced by the Normans, is, only, in this point of view, another form of the same principle which shows itself in the compurgators, in the frith-borh (frank-pledge), in every detail of the action of the popular courts before the conquest. Admitting with Stubbs that the Norman recognition was the instrument which the lawyers in England ultimately shaped into trial by jury, Freeman maintains none the less that the latter is distinctively English. Forsyth comes to substantially the same conclusion. Noting the jury germs of the Anglo-Saxon period, he shows how out of those elements, which continued in full force under the Anglo-Normans, was produced at last the institution of the jury. "As yet it was only implied in the requirement that disputed questions should be determined by the voice of sworn witnesses taken from the neighbourhood, and depositing to the truth of what they had seen or heard." The inclusions of Sir F. Pollock and F. W. Maitland, expressed in their History of English Law, and based on a closer study, are to the same effect.

This inquest then was a royal institution and not a survival from Anglo-Saxon law or popular custom, under which compurgation and the ordeal were the accepted modes of trying issues of fact. The inquest by recognition, formerly an inquest of office, i.e. to ascertain facts in the interests of the crown or the exchequer, was gradually allowed between subjects as a mode of settling disputes, and the form in fact of the original institution begun with the assize of the soil disseisin, whereby the king protected by royal writ and inquest of neighbours every seisin of a freehold. This was followed by the grand assize, applicable to questions affecting freehold or status. A defendant in such an action was enabled by an enactment of Henry II. to decline trial by combat and choose trial by assize, which was conducted as follows. The sheriff summoned four knights of the neighbourhood, who being sworn chose the twelve lawful knights most cognisant of the facts, to determine on their oaths which had the better right to the land. If they all knew the facts and agreed as to their verdict, well and good; if some or all were ignorant, the fact was certified in court, and new knights were named, until twelve were found to be agreed. The same course was followed when the twelve were not unanimous. New knights were added until the twelve were agreed. This was called afforcing the assize. At this time the knowledge on which the jurors acted was their own personal knowledge, acquired independently of the trial. "So entirely," says Forsyth, "did they proceed upon their own previously formed view of the facts in dispute that they seem to have considered themselves at liberty to pay no attention to evidence offered in court, however clearly they might dispute the case which they were prepared to support." The use of recognition is prescribed by the constitutions of Clarendon (1166) for cases of dispute as to lay or clerical tenure. See Forsyth, p. 131; Stubbs, i. 617.

This procedure by the assize was confined to real actions, and while it preceeded, it is not identical with the modern jury trial in civil cases, which was gradually introduced by consent of the parties and on pressure from the judges. Jury trial proper differs from the grand and petty assizes in that the assizes were summoned at the same time as the defendant to answer a question formulated in the writ; whereas in the ordinary jury trial no order for a jury could be made till the parties by their pleadings had come to an issue of fact and had put themselves on the country, posuerunt se super patriam (Pollock and Maitland, i. 119-128; ii. 601, 615, 621).

The Grand Jury.—In Anglo-Saxon times there was an institution analogous to the grand jury in criminal cases, viz. the twelve senior thegns, who, according to an ordinance of Æthelred II., were sworn in the county court that they would accuse no innocent man and acquit no guilty one. The twelve thegns were a jury of presentment or accusation, like the grand jury of later times, and the absolute guilt or innocence of those accused by them had to be determined by subsequent proceedings—by compurgation or ordeal. Whether this is the actual origin of the grand jury or not, the assizes of Clarendon (1166) and Northampton (1175) establish the criminal jury on a definite basis.

In the laws of Edward the Confessor and the earlier Anglo-Saxon kings are found many traces of a public duty to bring

1 Freeman, Norman Conquest, v. 451.

This fact would account for the remarkable development of the system on English ground, as contrasted with its decay and extinction in France.
offenders to justice, by hue and cry, or by action of the frith-borh, township, tithing or hundred. By the assize of Clarendon it is directed that inquiry be made in each county and in each hundred by twelve lawful men (legaliores) of the men of the hundred, and by four lawful men from each of the four vills nearest to the scene of the alleged crime, on oath to tell the truth if in the hundred or vill there is any man accused (redatus aut publicatus) as a robber or murderer or thief, or receiver of such. The assize of Northampton added outcry of coin or charters (falsonaria) and arson. The inquiry is to be held by the justices in eyre, and by the sheriffs in their county courts. On a finding on the oath aforesaid, the accused was to be taken and to go to the ordeal. By the articles of visitation of 1194, four knights are to be chosen from the county who by their oath shall choose two lawful knights of each hundred orwapentake, or, if knights be wanting, free and legal men, so that the twelve may support for all matters within the hundred, including, says Stubbs, "all the pleas of the crown, the trial of malefactors and their receivers, as well as a vast amount of civil business." The process thus described is now regarded as an employment of the Frankish inquest for the collection of fama publica. It was alternative to the rights of a private accuser by appeal, and the inquest were not exactly either accusers or witnesses, but gave voice to public repute as to the criminality of the persons whom they presented. From this form of inquest has developed the grand jury of presentment or accusation, and the coroner's inquest, which works partly as a grand jury as to homicide cases, and partly as an inquest of office as to treasure trove, &c.

The number of the grand jury is fixed by usage at not less than twelve nor more than twenty-three jurors. Unanimity is not required, but twelve must concur in the presentment or indictment.1 This jury retains so much of its ancient character that it may present of its own knowledge or information, and is not tied down by rules of evidence. After a general charge by the judge as to the bills of indictment on the file of the court, the grand jury considers the bills in private and hears upon oath in the grand jury chamber some or all the witnesses called in support of an indictment whose names are endorsed upon the bill. It does not as a rule hear counsel or solicitors for the prosecution, nor does it see or hear the accused or his witnesses, and it is not concerned with the nature of the defence, its functions being to ascertain whether there is a prima facie case against the accused justifying his trial. If it thinks that there is such a case, the indictment is returned into court as a true bill; if it thinks that there is not, the bill is ignored and returned into court torn up or marked "no bill," or "ignoramus." Inasmuch as no man can be put on trial for treason or felony, and few are tried for misdemeanor, without the intervention of the grand jury, the latter has a kind of veto with respect to criminal prosecutions. The grand jurors are described in the indictment as "the jurors for our lord the king." As such prosecutions in respect of indictable offences are now in almost all cases begun by a full preliminary inquiry before justices, and inasmuch as cases rarely come before a grand jury until after committal of the accused for trial, the present utility of the grand jury depends very much on the character of the justices' courts. As a review of the discretion of stipendiary magistrates in committing cases for trial, the inquest on grand jury cases superinduced, even when the committing justices are not lawyers, it is now a common opinion that their views as to the existence of a case to be submitted to a jury for trial should not be over-ridden by a lay tribunal sitting in private, and in this opinion many grand jurors concur. But the abolition of the grand jury would involve great changes in criminal procedure for which parliament seems to have no appetite. Forsyth thinks that the grand jury will often baffle the attempts of malevolence "by ignoring a malicious and unfounded prosecution; but it may also defeat the ends of justice by shielding a criminal with whom it has

1 Blackstone puts the principle as being that no man shall be convicted except by the unanimous voice of twenty-four of his equals or neighbours—twelve on the grand, and twelve on the petty jury.

strong political or social sympathies. The qualification of the grand jurymen is that they should be freeholders of the county—what amount appears to be uncertain—and they are summoned by the sheriff or failing him by the coroner. The coroner's jury must by statute (1887) consist of not more than twenty-three nor less than twelve jurors. It is summoned by the coroner to hold an inquest super visum corporis in cases of sudden or violent death, and of death in prisons or lunatic asylums, and to deal with treasure trove. The qualification of the coroner's jurors does not depend on the Juries Acts 1825 and 1870, and in practice they are drawn from householders in the immediate vicinity of the place where the inquest is held. Unanimity is not required of a coroner's jury; but twelve must concur in the verdict. If it charges anyone with murder or manslaughter, it is only to be convicted of the crime, and not to be tried as a grand jury, and has the same effect as an indictment by a grand jury, i.e. it is accusatory only and is not conclusive, and is traversable, and the issue of guilt or innocence is tried by a petty jury.

The Petty Jury.—The ordeal by water or fire was used as the final test of guilt or innocence until its abolition by decree of the Lateran council (1216). On its abolition it became necessary to devise a new mode of determining guilt as distinguished from ill fame as charged by the grand jury. So early as 1221 accused persons had been had to put themselves before the bar of the court, to have a verdict for 'vexum aut illum'; and the trial seemed to have been by calling for the opinions of the twelve men and the four women, who may have been regarded as a second body of witnesses who could traverse the opinion of the hundred jury. (See Pollock and Maitland, i. 616.) The reference to judicium parium in Magna Carta is usually taken to refer to the jury, but it is clear that what is now known as the petty jury was not then developed in its present form. "The history of that institution is still in manuscript," says Maitland.

It is not at all clear that at the outset the trial by the country (in pais; in patria) was before another and different jury. The earliest instances look as if the twelve men and the four women were the patria and had to agree. But by the time of Edward I. the accused seems to have been allowed to call in a second jury. A person accused by the inquest of the hundred was allowed to have the truth of the charge tried by another and different jury.2 "There is," says Forsyth, "no possibility of assigning a date to this alteration." 3 In the time of Bracton (middle of the 13th century) the usual mode of determining innocence or guilt was by combat or appeal. But in most cases the appellant had the option of either fighting with his adversary or putting himself on his country for trial —the exceptions being murder by secret poisoning, and certain circumstances presumed by the law to be conclusive of guilt.4 But the separation must have been complete by 1352, in which year it was enacted "that no indicator shall be put in inquests upon delivery of the indictes of felonies or trespass if he be challenged for that same cause by the indictee." The jurors, whatever their origin, differed from the Saxon doomsmen and the jurats of the Channel Islands in that they adjudged nothing; and from compurgators or oath-helpers in

2 The distinction between the functions of the grand jury, which presents or accuses criminals, and the petty jury, which tries them, has suggested the theory that the system of compurgation is the origin of the jury system—the first jury representing the compurgators of the accuser, the second the compurgators of the accused.

3 Forsyth, 206. The number of the jury (twelve) is responsible for some profound theories of the origin of the system. This use of twelve is not confined to England, nor in England or elsewhere to judicial institutions. "Its general prevalence," says Hallam (Middle Ages, ch. vii.), "shows that in searching for the origin of trial by jury we should not rely too far on any analogy which the mere number affords." In a Guide to English Juries (1682), by a person of quality (attributed to Lord Somers), the following passage occurs: "In analogy of late the jury is reduced to the number of twelve, like as the prophet were foreordained to the twelve apostles twelve to preach the truth; the discoverers twelve, sent into Canaan to seek and report the truth; and the stones twelve that the heavenly Hierusalem is built on." Lord Coke indulged in similar speculations.
that they were not witnesses called by a litigant to support his case (Pollock and Maitland, i. 118). Once established, the jury of trial whether of actions or indictments developed on the same lines. But at the outset this jury differed in one material respect from the modern trial jury. The ancient trial jury certify to the truth from their knowledge of the facts, however acquired. In other words, they resemble witnesses or collectors of local evidence or gossip rather than jurors. The complete withdrawal of the witness character from the jury is connected by Forsyth with the ancient rule of law that it is to produce all the witnesses of the deed, and a peculiar mode of trial per seclam. When a deed is attested by witnesses, you have a difference between the testimony of the witness, who deposes to the execution of the deed, and the verdict of the jury as to the fact of execution. It has been contended with much plausibility that in such cases the attesting witnesses formed part of the jury. Forsyth doubts that conclusion, although he admits that, as the jurors themselves were originally mere witnesses, there was no distinction in principle between them and the attesting witnesses, and that the attesting witnesses might be associated with the jury in the discharge of their duties. However that may be, in the reign of Edward III., although the witnesses are spoken of "as joined to the assize," they are distinguished from the jurors. The trial per seclam was used as an alternative to the assize or jury, and resembled in principle the system of compurgation. The claimant proved his case by vouching a certain number of witnesses (secla), who had seen the transaction in question, and the defendant rebutted the presumption thus created by vouching a larger number of witnesses on his own side. In cases in which this was allowed, the jury did not interpose at all, but in course of time the practice of the witnesses of the secla telling their story to the jury. In these two instances we have the jury as judges of the facts sharply contrasted with the witnesses who testify to the facts; and, with the increasing use of juries and the development of rules of evidence, this was gradually established as the true principle of the system. In the reign of Henry IV. we find the judges declaring that the jury after they have been sworn should not see or take with them any other evidence than that which has been offered in open court. But the personal knowledge of the jurors was not as yet regarded as outside the evidence on which they might form a verdict, and the same was laid upon the selection of jurymen from the neighbourhood of the cause of the action which shows that this element was counted on, and, in fact, deemed essential to a just consideration of the case. Other examples of the same theory of the duties of the jury may be found in the language used by legal writers. Thus it has been said that the jury may return a verdict although no evidence at all be offered, and again, that the evidence given in court is not binding on the jury, because they are assumed from their local connexion to be sufficiently informed of the facts to give a verdict, without or in opposition to the oral evidence. A recorder of London, temp. Edward VI., says that, "if the witnesses at a trial do not agree with the jurors, the verdict of the twelve shall be taken and the witnesses shall be rejected." Forsyth suggests as a reason for the continuance of this theory that it allowed the jury an escape from the altaint, by which penalties might be imposed on them for delivering a false verdict in a civil case. They could suggest that the verdict was according to the fact, though not according to the evidence.

In England the trial jury (also called petty jury or traverse jury) consists of twelve jurors, except in the county court, where the number is seven. But in small civil causes the number may by consent be by fewer than twelve jurors, and the verdict may by consent be that of the majority. The rule requiring a unanimous verdict has been variously explained. Forsyth regards the rule as intimately connected with the original character of the jury as a body of witnesses, and with the conception common in primitive society that safety is to be found in the number of witnesses, rather than the character of their testimony. The old notion seems to have been that to justify an accusation, or to find a fact, twelve sworn men must be agreed. The aforning of the jury, already described, marks an intermediate stage in the development. Where the juries were not unanimous new jurors were added until twelve were found to be of the same opinion. From the unanimous twelve selected out of a large number to the unanimous twelve constituting the whole jury was a natural step, which, however, was not taken without hesitation. In some old cases the verdict of eleven jurors out of twelve was accepted, but it was decided in the reign of Edward III. that the verdict must be the unanimous of the whole jury. Diversity of opinion was taken to imply perversity of judgment, and the law sanctioned the application of the harshest methods to produce unanimity. The jurors while considering their verdict were not allowed a fire nor any refreshment, and it is said in some of the old books that, if they failed to agree, they could be put in a cart and drawn after the justices to the border of the county, and then upset into a ditch. These rude modes of enforcing unanimity has been softened in later practice, but in criminal cases the rule of unanimity is still absolutely fixed.

In civil cases and in trials for misdeemour, the jurors are allowed to separate during adjournments and to return to their homes; in trials for treason, treason-felony and murder, the jurors, once sworn, must not separate until discharged. But by an act of 1897 jurors on trials for other felonies may be allowed by the court to separate in the same way as on trials for misdemeanor.

These rules do not apply to a jury which has retired to consider its verdict. During the period of retirement it is under the keeping of an officer of the court.

At common law aliens were entitled to be tried by a jury de medietate linguae—half Englishmen, half foreigners, not necessarily compatriots of the accused. This privilege was abolished by the Naturalization Act 1870; but by the Juries Act 1870 aliens who have been domiciled in England or Wales for ten years or upwards, if in other respects duly qualified, are liable to jury service as if they were natural-born subjects (s. 8).

A jury of matrons is occasionally summoned, viz. on a writ de ventre insipiciendo, or where a female condemned to death pleads pregnancy in stay of execution.

The jurors are selected from the inhabitants of the county, borough or other area for which the court to which they are summoned is commissioned to act. In criminal cases, owing to the rules as to venue and that crime is to be tried in the neighbourhood where it is committed, the mode of selection involves a certain amount of independent local knowledge on the part of the jurors. Where local prejudice has been aroused for or against the accused, which is likely to affect the chance of a fair trial, the proceedings may be removed to another jurisdiction, and there are a good many offences in which by legislation the accused may be tried where he is caught, irrespective of the place where he is alleged to have broken the law. As regards civil cases, a distinction was at an early date drawn between local actions which must be tried in the district in which they originated, and transitory actions which could be tried in any county. These distinctions are now of no importance, as the place of trial of a civil action is decided as a matter of procedure and convenience, and regard is not necessarily paid to the place at which a wrong was done or a contract broken.

The qualifications for, and exemptions from, service as a petty juror are in the main contained in the Juries Acts 1825 and 1870, though a number of further exemptions are added by scattered enactments. The exemptions include members of the legislature and persons in military service, clergymen, justices of the peace, barristers and solicitors, registered medical practitioners, and dentists, and officers and soldiers of the regular army. Persons over sixty are exempt but not disqualified. Lists of the jurors are prepared by the overseers in rural parishes and by the town clerks in boroughs, and are submitted to justices for revision. When jurors are required for a civil or criminal trial they are summoned by the sheriff or, if he cannot act, by the coroner. Special and Common Juries.—For the purpose of civil trials in the superior courts there are two lists of jurors, special and
common. The practice of selecting special jurors to try important civil cases appears to have sprung up, without legislative enactment, from the procedure of the courts. Fortyth says that the first statutory recognition of it is so late as 3 Geo. II. c. 25, and that in the oldest book of practice in existence (Powell's *A tourney's Academy, 1633*) there is no allusion to two classes of jurymen. The acts, however, which regulate the practice allude to it as well established. The Juries Act 1870 (33 & 34 Vict. c. 77) defines the class of persons entitled and liable to serve on special juries thus: Every man whose name shall be on the jurors' book for any county, &c., and who shall be legally entitled to be called an esquire, or shall be a person of higher degree, or a banker or merchant, or who shall occupy a house of a value of £500 (i.e. a town of 20,000 inhabitants, £500 elsewhere), or a farm of £500 or other premises at £100. A special jurymen receives a fee of a guinea for each case. Either party may obtain an order for a special jury, but must pay the additional expenses created thereby unless the judge certifies that it was a proper case to be so tried. For the common jury any man is qualified and liable to serve who has £10 by the year in land or tenements of freehold, copyhold or customary tenure; or £50 on lands or tenement held by lease for twenty-one years or longer, or who being a household is rated at £50 or more. The number of jurors is fixed at 6 in any other county. A special jury cannot be ordered in cases of treason or felony, and may be ordered in cases of misdemeanour only when the trial is in the king's bench division of the High Court, or the civil side at assizes.

Challenge.—It has always been permissible for the parties to challenge the jurors summoned to consider indictments or to try cases. Both in civil and criminal cases a charge "for cause" is allowed; in criminal cases a peremptory challenge is also allowed. Challenge "for cause" may be either to the array, i.e. to the whole number of jurors returned, or to the polls, i.e. to the jurors individually. A challenge to the array is either a principal challenge (on the ground that the sheriff is a party to the cause, or related to one of the parties), or a challenge for favour (on the ground of circumstances implying "at least a probability of bias or favour in the sheriff"). A challenge to the polls is an exception to one or more jurymen on either of the following grounds: (1) *propter honores respectum* as when a lord of parliament is summoned; (2) *propter defectum*, for want of qualification; (3) *propter affectum*, on suspicion of bias or partiality; and (4) *propter delictum*, when the juror has been convicted of a misdeainour or felony. Thus, a challenge or *affectum* is, like the charge to the array, either a principal challenge or "to the favour." In England as a general rule the juror may be interrogated to show want of qualification; but in other cases the person making the challenge must prove it without questioning the juror, and the courts do not allow the protracted examination on the *voir dire* which precedes every *causa celebre* in the United States. On indictments for treason the accused has a right peremptory to challenge thirty-five of the jurors on the panel; in cases of felony the number is limited to twenty, and in cases of misdemeanour there is no right of peremptory challenge. The Crown has not now the right of peremptory challenge and may challenge only for cause certain (Juries Act 1823, s. 29). In the case of felony, on the first call of the list of jurors objected to by the Crown are asked to stand by, and the cause of challenge need not be assigned by the Crown until the whole list has been perused or gone through, or unless there remain no longer twelve jurors left to try the case, exclusive of those challenged. This arrangement practically amounts to giving the Crown the benefit of a peremptory challenge.

Function of Jury. The jurors were originally the mouthpiece of local opinion on the questions submitted to them, or witnesses to fact as to such questions. They have now become the judges of fact upon the evidence laid before them. Their province is strictly limited to questions of fact, and within that province they are still further restricted to matters proved by evidence in the course of the trial and in theory must not act upon their own personal knowledge and observation except so far as it proceeds from what is called a "view" of the subject matter of the litigation. Indeed it is now well established that if a juror is acquainted with facts material to the case, he should inform the court so that he may be dismissed from the jury and called as a witness; and Lord Ellenborough ruled that a judge would misdirect the jury if he told them that they might reject the evidence and go by their own knowledge. The old *decantatum* assigns to judge and jury their own independent functions: *Ad quaestionem legis respondent judices: ad quaestionem facti juratores* (Plowden, 114). But the independence of the jurors as to matters of fact was from an early time not absolute. In certain civil cases a litigant dissatisfied by the verdict could adopt the procedure by attain, and if the attempt of twenty-four found that the first jury had given a false verdict, they were fined and suffered the villainous judgment. Attains fell into disuse on the introduction about 1665 of the practice of granting new trials when the jury found against the weight of the evidence, or upon a wrong direction as to the law of the case.

In criminal cases the courts attempted to control the verdicts by fixing the jurors for returning a verdict *contra plenam et manifestam evidentiam*. But this practice was declared illegal in Bushell's case (1670); and so far as criminal cases are concerned the independence of the jury as sole judge of fact is almost absolute. If they acquit, their action cannot be reviewed nor punished, except on proof of wilful and corrupt consent to "embracery" (Juries Act 1823, s. 61). If they convict no new trial can be ordered except in the rare instances of misdemeanours tried as civil cases in the High Court. In trials for various forms of libel during the 18th century, the judges restricted the powers of juries by ruling that their function was limited to finding whether the libel had in fact been published, and that it was for the court to decide whether the words published constituted an offence. By Fox's Libel Act 1732 the jurors in such cases were expressly empowered to bring in a general verdict of libel or no libel, i.e. to deal with the whole question of the meaning and extent of the incriminating publication. In other words, they were given the same independence in cases of libel as in other criminal cases. This independence has in times of public excitement operated as a kind of local option against the existing law and as an aid to procuring its amendment. Juries in Ireland in agrarian cases often acquit in the teeth of the evidence. In England the independence of the jury in criminal trials is to some extent menaced by the provisions of the Criminal Appeal Act 1907.

While the jury is in legal theory absolute as to matters of fact, it is in practice largely controlled by the judges. Not only does the judge at the trial decide as to the relevancy of the evidence tendered to the issues to be proved, and as to the admissibility of questions put to a witness, but he also advises the jury as to the logical bearing of the evidence admitted upon the matters to be found by the jury. The rules as to admissibility of evidence, largely based upon scholastic logic, sometimes difficult to apply, and almost unknown in continental jurisprudence, coupled with the right of an English juror to sum up the evidence (denied to French judges) and to express his own opinion as to its value (denied to American judges), fetter to some extent the independence or limit the chances of error of the jury.

The whole theory of the jurisdiction of the courts to interfere with the verdict of the constitutional tribunal is that the court is satisfied that the jury have not acted reasonably upon the evidence but have been misled by prejudice or passion (Watt v. Hoyt (1905), App. Cas. 118, per Lord Halsbury). In civil cases the verdict may be challenged on the ground that it is against the evidence or against the weight of the evidence, or unsupported by any evidence. It is said to be against the evidence when the jury have completely misapprehended the facts proved and have drawn an inference so wrong as to be in substance perverse. The dissatisfaction of the trial judge with the verdict is a potent but not conclusive element in determining as to the perversity of a verdict, because of his special opportunity of appreciating the
Evidence and the demeanour of the witnesses. But his opinion is less regarded now that new trials are granted by the court of appeal than under the old system when the new trial was sought in the court of which he was a member.

The appellate court will not upset a verdict when there is substantial and conflicting evidence before the jury. In such cases it is for the jury to say which side is to be believed, and the court will not interfere with the verdict. To upset a verdict on the ground that there is no evidence to go to the jury implies that the judge at the trial ought to have withdrawn the case from the jury. Under modern procedure, in order to avoid the risk of a new trial, it is not uncommon to take the verdict of a jury on the hypothesis that there was evidence for their consideration, and to leave the unsuccessful party to apply for judgment notwithstanding the verdict. The question whether there was any evidence proper to be submitted to the jury arises in some cases involving an imputation of negligence—e.g., in an action of damages against a railway company for injuries sustained in a collision. Juries are somewhat ready to infer negligence, and the courts have to say whether, on the facts proved, there was any evidence of negligence by the defendant. This is by no means the same thing as saying whether, in the opinion of the court, there was negligence. The court may be of opinion that on the facts there was none, yet the facts themselves may be of such a nature as to be evidence of negligence to go before a jury. When the facts proved are such that a reasonable man might have come to the conclusion that there was negligence, then, although the court would not have come to the same conclusion, it must admit that there is evidence to go before the jury. This statement indicates and the court sees that there is evidence to go to the jury to determine what relation the facts proved and the conclusion to be established is necessary to make the facts evidence from which a jury may infer the conclusion. The true explanation is to be found in the principle of relevancy. Any fact which is relevant to the issue constitutes evidence to go before the jury, and any fact, roughly speaking, is relevant between which and the fact to be proved there may be a connexion as cause and effect (see Evidence). As regards damages the court has always had wide powers, as damages are often a question of law. But when the amount of the damages awarded by a jury is challenged as excessive or inadequate, the appellate court, if it considers the amount unreasonable large or unnecessarily small, must order a new trial unless both parties consent to a reduction or increase of the damages to a figure fixed by the court; see Watt v. Watt (1905), App. Cas. 115.

Value of Jury System.—The value of the jury in past history as a bulwark against aggression by the Crown or executive cannot be over-rated, but the working of the institution has not escaped criticism. Its use protracts civil trials. The jurors are usually unwilling and are insufficiently remunerated; and jury trials in civil cases often drag out much longer and at greater expense than trials by a judge alone, and the proceedings are occasionally rendered ineffective by the failure of the jurors to agree.

There is much force in the arguments of Bentham and others against the need of unanimity—the application of pressure to force conviction on the minds of jurors, the indifference to veracity which the concurrence of unconvincing minds must produce in the public mind, the probability that jurors will disagree and trials be rendered abortive, and the absence of any reasonable security in the unanimous verdict that would not exist in the verdict of a majority. All this is undeniable true, but disagreements are happily not frequent, and whatever may happen in the jury room no compulsion is now used by the court to induce agreement.

But, apart from any incidental defects, it may be doubted whether, as an instrument for the investigation of truth, the jury system deserves all the encomiums which have been passed upon it. In criminal cases, especially of the graver kind, it is perhaps the best tribunal that could be devised. There the element of moral doubt enters largely into the consideration of the case, and that can best be measured by a popular tribunal. Opinion in England has hitherto been against subjecting a man to serious punishment as a result of conviction before a judge sitting without a jury, and the judges themselves would be the first to deprecate so great a responsibility, and the Criminal Appeal Act 1907, which constituted the court of criminal appeal, recognized the responsibility by requiring a quorum of three judges in order to constitute a court. The same act, by permitting an appeal to persons convicted on indictment both on questions of fact and of law, removed to a great extent any possibility of error in the jury's verdict. But, if that being so, the issue must be determined one way or the other on the balance of probabilities, a single judge would probably be a better tribunal than the present combination of judge and jury. Even if it be assumed that he would on the whole come to the same conclusion as a jury deliberating under his directions, he would come to it more quickly. Time would be saved in taking evidence, summing up would be unnecessary, and the addresses of counsel would inevitably be shortened and concentrated on the real points at issue. Modern legislation and practice in England have very much reduced the use of the jury both in civil and criminal cases.

In the county courts trial by jury is the exception and not the rule. In the court of chancery and the Admiralty court it was never used. Under the Judicature Acts many cases which in the courts of common law would have been tried with a jury are now tried before a judge alone, or (rarely) with assessors, or before an official referee. Indeed cynics say that a jury is insistent chiefly in cases when a jury, from prejudice or other causes, is likely to be more favourable than a judge alone.

In criminal cases, by reason of the enormous number of offences punishable on summary conviction, cases of the provisions made for trying certain indictment offences summarily if the offender is young or elects for summary trial, juries are less called on in proportion to the number of offences committed than was the practice in former years.

Scotland.—According to the Regiam Majestatem, which is identical with the treatise of Glanvill on the law of England (but whether the original or only a copy of that work is disputed), trial by jury existed in Scotland and for criminal cases before a date as in England, and there is reason to believe that at all events the system became established at a very early date. Its history was very different from that of the English jury system. There was no trial by small number of Scots law, but it was introduced in 1708 for the purpose of high treason (7 Ann c. 21). For the trial of criminal cases the petty jury is represented by the criminal "assize." This was always consisted of fifteen persons, some 9 chosen by ballot from the clerk of the court from the list containing the names of the special and common jurors, five from the special, ten from the common. Prosecutor and accused each have five peremptory challenges, which may only be exercised against the jurors; but there is no limit to challenges for cause. The jury is not sequestered during the trial except in capital cases or on special order of the court made proprio motu or on the application of the accused. The accused is also entitled to challenge jurors in the enclosure a necessary preliminary to a majority verdict. It is returned viva voce by the chancellor or foreman, and entered on the record by the clerk of the court, and the entry read to the jury. Besides the verdicts of "guilty" and "not guilty," a Scots jury may return a verdict of "not proven," which has legally the same effect as not guilty in releasing the accused from further proceedings on the particular charge, but inflicts on him the stigma of moral guilt.

Jury trial in civil cases was at one time in general if not prevailing use, but was gradually superseded for most purposes on the introduction of the Court of Session at Edinburgh (1 Mackay, Ct. Sess. Prac.). In many other matters, Scots law and procedure tend to follow continental rather than Insular models. The civil jury was reintroduced in 1814 (45 Geo. III. c. 45), mainly on account of the difficulties experienced by the House of Lords in dealing with questions of fact raised on Scottish appeals. At the outset a special court was instituted in the nature of a judicial commission to ascertain by means of the trial to be held, the issues in a cause and sent for such determination at the discretion of the court in which the cause was pending. The process was analogous to the sending of an issue to the jury for trial in the Court of Chancery, or in a court of assize. In 1830 the jury court ceased to exist as a separate tribunal and was merged in the Court of Session. By legislation of 1810 and 1825 certain classes of cases were indicated as appropriate to be tried by a jury in the Court of Session, and the procedure limited to actions for defamation and nuisance, or properly and in substance actions for damages, and under an act of 1866 even in these cases the jury may be dispensed with by consent of parties.
The civil jury consists as in England of twelve jurors chosen by ballot from the names on the list of those summoned. There is a right to a peremptory challenge limited to four, and also a right to challenge for cause. Unanimity was at first but is now required. The juror if unanimous may return a verdict immediately on the closing of the cause, but if not, the case is hung and may at any time not less than three hours after being enclosed return a verdict by a bare majority. If after six hours they do not agree by the requisite majority, i.e. are equally divided, then the judge must return a verdict. It was established by O'Hagan's Acts 1871 and 1872, and the Juries Acts 1878 and 1894. In criminal cases much freer use is made than in England of the rights of the accused to challenge, and of the Crown to order jurors to stand by, and what is called "jury-packing" seems to be the object of both sides when some political or agrarian issue is involved in the trial. Until the passing of the Irish Local Government Act 1880, the grand jury, besides its functions in a judicial sense, had large duties with respect to local government which are now transferred to the county councils and other elective bodies.

British Empire.—In most parts of the British Empire the jury system is in full force, and the colonial charters of justice or by local legislation. The grand jury is not in use in India; it was introduced but later abolished in the Cape Colony; and in Australia has been for most purposes superseded by the "jury of the Crown" for criminal cases. The trial by jury for criminal cases is twelve, but in India may be nine, seven, or three, according to certain provisions of the Criminal Procedure Code 1898. In colonies there has been a conflict between the provisions as to trials of the Crown and the juries for criminal trials, and in cases has been fixed at a less number than twelve and the right of the Crown to fix the number is established; see e.g. Coree, 1897, A.C. 710. In civil cases the number of the jury is reduced in some colonies, e.g. seven in Trinidad and Lucadu.

European Countries.—In France there is no civil jury. In criminal cases the place of the grand jury is taken by the chambre des mises en accusation and the petty jury tries all cases except trials after an impeachment and in all civil actions at common law in which the subject matter exceeds $20 in value (amendments vi. and vii.). The trial jury must of twelve and its verdict must be unanimous; see Cooley, Constitutional Limitations (6th ed.), 386. The respective provinces of judge and jury have been much discussed and there has been a disposition to declare the jury supreme as to law as well as to fact, but the cases are very few. The jury is not in full force in the United States, and under the Federal Constitution (Article III) there is no trial by jury in cases not affecting an American colonist before the declaration of independence; and the grand juror, coroner's jury and petty jury continue in full use. Under the United States. In the United States, under the Federal Constitution (Article III) there is no trial by jury in cases not affecting an American colonist before the declaration of independence; and the grand juror, coroner's jury and petty jury continue in full use. Under the Federal Constitution (Article III) there is no trial by jury in cases not affecting an American colonist before the declaration of independence; and the grand juror, coroner's jury and petty jury continue in full use. Under the Federal Constitution (Article III) there is no trial by jury in cases not affecting an American colonist before the declaration of independence; and the grand juror, coroner's jury and petty jury continue in full use.

The extent to which the jury system is in force in the states of the union depends on the constitution and legislation of each state. In some the use of juries in civil and even in criminal cases is reduced or made subject to the election of the judge; whereas in others unanimous verdicts are not obtained, and these peremptory challenges have been avowedly maintained. It is to be noticed that in such cases where they are permitted the unanimous verdict of the common law dozen. (W. F. C.)

**Jus Primae Noctis, or Droit du Seigneur**, a custom alleged to have existed in medieval Europe, giving the lord a right to the virginity of his vassals' daughters on their wedding-night. For the existence of the custom in a legalized form there is no trustworthy evidence. That some such abuse of power may have been occasionally exercised by brutal nobles in the lawless days of the early middle ages is most unlikely, but the jus, if it existed, is much more common in the late middle ages than the 16th or 17th century. There appears to have been an entirely religious custom established by the council of Carthage in 398, whereby the Church required from the faithful continence on the wedding-night, and this may have been, and there is evidence that it was, known as Droit du Seigneur, or "God's right." Later the clerical admonition was extended to the first three days of marriage. This religious abstention, added to the undealt fact that the feudal lord exerted fines on the marriages of his vassals and their children, doubtless gave rise to the belief that the jus was once an established custom.

The whole subject has been exhaustively treated by Louis Veullot in Le Droit du seigneur au moyen âge (1854).

**Jus Relictae**, in Scots law, the widow's right in the movable property of her deceased husband. The deceased must have been domiciled in Scotland, but the right accrones from movable property, wherever situated. The widow's provision amounts to one-third where there are children surviving, and to one-half where there are no surviving children. The widow's right vests on the husband's death, and in case of his marriage after his death, is extinguished by the new contract, it may however be renounced by contract, or be discharged by satisfaction. It is subject to alienation of the husband's movanable estate during his lifetime or by its conversion into heritage. See also Will.

**Jusserrand, Jean Adrien Antoine Jules** (1855—), French author and diplomatist, was born at Lyons on the 18th of February 1855. Entering the diplomatic service in 1876, he became in 1878 consul in London. After an interval spent in Tunis he returned to London in 1887 as a member of the French Legation. In 1890 he was appointed French minister at Copenhagen, and in 1892 was transferred to Washington. A close student of English literature, he produced some very lucid and vivacious monographs on comparatively little-known subjects: Le Théâtre en Angleterre depuis la conquête jusqu'aux prédecesseurs immédiats de Shakespeare (1878); Le Roman au temps de Shakespeare (1887; Eng. trans. by Miss E. Lee, 1900); Les Anglais au moyen âge: la vie nomade et les routes d'Angleterre au XIVe siècle (1884; Eng. trans., English Wayfarer's Life in the Middle Ages, by L. T. Smith, 1889); and L'Epopée de Langland (1893; Eng. trans., Piers Plowman, by M. C. R., 1894). His Histoire littéraire du peuple anglais, the French name of which has been published only from three volumes in 1909. In English he wrote A French Ambassador at the Court of Charles II. (1892), from the unpublished papers of the count of Cominges.

**Jussieu, De**, the name of a French family which came into prominent notice towards the close of the 16th century, and for a century and a half was distinguished for the botanists it produced. The following are its more eminent members:

1. **Antoine de Jussieu** (1666—1750), was born at Lyons on the 6th of July 1666, was the son of Christophe de Jussieu (or Jussieu), an apothecary of some repute, who published a Nouveau livre de la floriculture (1708). Antoine studied at the University of Montpellier, and travelled with his brother Bernard through Spain, Portugal and southern France. He went to Paris in 1708, J. P. de Tournefort, whom he succeeded at the Jardin des Plantes, dying in the year. His own original publications are of marked importance, but he edited an edition of Tournefort's Institutions rer herbatae (3 vols., 1719), and also a posthumous work of Jacques Barrelier, Plantae per Galliam, Hispaniam, et Italiam observatas, &c. (1714). He practised medicine, chiefly devoting himself to the very poor. He died at Paris on the 2nd of April 1750.

2. **Bernard de Jussieu** (1669—1777), a younger brother of the above, was born at Lyons on the 17th of August 1699. He took a medical degree at Montpellier and began practice in 1720, but finding the work uncongenial he gladly accepted his brother's invitation to Paris in 1722, when he succeeded Sébastien Vaillant as sub-demonstrator of plants in the Jardin du Roi. In 1725 he brought out a new edition of Tournefort's Histoire des plantes qui naissent aux environs de Paris, 2 vols., which was afterwards translated into English by John Martyn, the original work being incompleat. In the same year he was admitted into the académie des sciences, and communicated several papers to that body. Long before Abraham Trembley (1700—1784) published his Histoire des polydes d'eau douce, Jussieu maintained the doctrine that these organisms were animals, and not the flowers of marine plants, then the current notion; and to confirm his views he made
three journeys to the coast of Normandy. Singly modest and retiring, he published very little, but in 1759 he arranged the plants in the royal garden of the Trianon at Versailles, according to his own scheme of classification. This arrangement is printed in his nephew's *Genera*, pp. lxxiii.–lxx., and formed the basis of that work. He cared little for the credit of enunciating new discoveries, so long as the facts were made public. On the death of his brother Antoine, he could not be induced to succeed him in his office, but prevailed upon L. G. Lemonnier to assume the higher position. He died at Paris on the 6th of November 1777.

1. **Joseph de Jussieu** (1704–1779), brother of Antoine and Bernard, was born at Lyons on the 3rd of September 1704. Educated like the rest of the family for the medical profession, he accompanied C. M. de la Condamine to Peru, in the expedition for measuring an arc of meridian, and remained in South America for thirty-six years, returning to France in 1741. Amongst the seeds he sent to his brother Bernard were those of *Heliotropium peruvianum*, Linn., then first introduced into Europe. He died at Paris on the 11th of April 1779.

2. **Antoine Laurent Henri de Jussieu** (1748–1836), nephew of the three preceding, was born at Lyons on the 12th of April 1748. Called to Paris by his uncle Bernard, and carefully trained by him for the pursuits of medicine and botany, he largely profited by the opportunities afforded him. Gifted with a tenacious memory, and the power of quickly grasping the salient points of subjects under observation, he steadily worked at the improvement of that system of plant arrangement which had been sketched by his uncle: In 1789 was issued his *Genera plantarum secundum ordines naturae disposita, juxta methodum in horto regio Parisiensi exaratum*, anno MDCCCLXXV. This volume formed the basis of modern classification; more than this, it is certain that Cuvier derived much help in his zoological classification from its perusal. Hardly had the last sheet passed through the press, when the French Revolution broke out, and the author was installed in charge of the hospitals of Paris. The museum d'histoire naturelle was organized on its present footing mainly by him in 1793, and he selected for its library everything relating to natural history from the vast materials obtained from the convents then broken up. He continued as professor of botany there from 1797 to 1826, when his son Adrien succeeded him. Besides the *Genera*, he produced nearly sixty memoirs and several volumes on botanical topics. He died at Paris on the 17th of September 1836.

3. **Adrien Laurent Henri de Jussieu** (1797–1853), son of Antoine Laurent, was born at Paris on the 23rd of December 1797. He displayed the qualities of his family in his thesis for the degree of M.D., *De Ephalobizaeorum generibus medicisque earundem viribus tentamen*, Paris, 1824. He was also the author of valuable contributions to botanical literature on the Rutaceae, Meliaceae and Malpighiacese respectively, of *Taxonomic* in the *Dictionnaire universelle d'histoire naturelle*, and of an introductory work, styled simply *Botanique*, which reached nine editions, and was translated into the principal languages of Europe. He also edited his father's *Introductio in historiam plantarum*, issued at Paris, without imprint or date, it being a fragment of the intended second edition of the *Genera*, which Antoine Laurent did not live to complete. He died at Paris on the 29th of June 1853, leaving two daughters, but no son, so that with him closed the brilliant botanical dynasty.

4. **Laurent Pierre de Jussieu** (1792–1866), miscellaneous writer, nephew of Antoine Laurent, was born at Villeurbanne on the 7th of February 1792. His *Simon de Nantua, ou le mar- chand forain* (1818), reached fifteen editions, and was translated into seven languages. He also wrote *Simples notions de physique et d'histoire naturelle* (1857), and a few geological papers. He died at Passy on the 23rd of February 1866.

**Justice** (Lat. *justitia*), a term used both in the abstract, for the quality of being or doing what is just, i.e. right in law and equity, and in the concrete for an officer deputed by the sovereign to administer justice, and do right by way of judgment. It has long been the official title of the judges of two of the English superior courts of common law, and it is now extended to all the judges in the supreme court of judicature—a judge in the High Court of Justice being styled Mr Justice, and in the court of appeal Lord Justice. The president of the king's bench division of the High Court is styled Lord Chief Justice (q.v.). The word is also applied, and perhaps more usually, to certain subordinate magistrates who administer justice in minor matters, and who are usually called judges of the peace (q.v.).

**Justice of the Peace**, an inferior magistrate appointed in England by special commission under the great seal to keep the peace within the limits of the district for which he is appointed. The title is commonly abbreviated to J.P. and is used after the name. "The whole Christian world," said Coke, "had not the like office as justice of the peace if duly executed." Lord Cowper, on the other hand, described them as "men sometimes illiterate and frequently bigoted and prejudiced." The truth is that the justices of the peace perform without any other reward than the consequence they acquire from their office a large amount of work indispensable to the administration of the law, and (though usually not professional lawyers, and therefore apt to be ill-informed in some of their decisions) for the most part discharge their duties with little assistance. For centuries they have necessarily been chosen mainly from the landed class of country gentlemen, usually Conservative in politics; and in recent years the attempt has been made by the Liberal party to reduce the balance by appointing others than those belonging to the landed gentry, such as tradesmen, Nonconformist ministers, and working-men. But it has been recognized that the appointment of justices according to their political views is undesirable, and in 1909 a royal commission was appointed to consider and report whether any and what steps should be taken to facilitate the selection of the most suitable persons to be justices of the peace irrespective of creed and political opinion. In great centres of population, when the judicial business of justices is heavy, it has been found necessary to appoint paid justices or stipendiary magistrates to do the work, and an extension of the system to the country districts has been often advocated.

The commission of the peace assigns to justices the duty of keeping and causing to be kept all ordinances and statutes for the good of the peace and for preservation of the same, and for the quiet rule and government of the people, and further assigns to you and every other person (whereby any partiality, aforesaid A, B, C, D, &c., we will, shall be one) to inquire the truth more fully by the oath of good and lawful men of the county of all and manner of felonies, poisonings, enchantments, sorceries, arts, magic, trespasses, forestallings, regratings, encroachments, and extortions whatever. This part of the commission is the authority for the jurisdiction of the justices in sessions. Justices named specially in the parenthesis clause are said to be on the quorum. Justices for counties are appointed by the Crown on the advice of the lord chancellor, and usually with the recommendation of the lord lieutenant of the county. Justices for boroughs having municipal corporations and separate commissions of the peace are appointed by the crown, the lord chancellor either adopting the recommendation of the town council or acting independently. Justices cannot act as such until they have taken the oath of allegiance and the judicial oath. A justice for a borough while acting as such must reside in or within seven miles of the borough or occupy a house, warehouse or other property in the borough, but he need not be a burgess. The mayor of a borough is ex officio a justice during his year of office and the succeeding year. He takes precedence over all borough justices, but not over justices for the county in which the borough or any part thereof is situated, unless when acting in relation to the business of the borough.

1 Where a borough council desire the appointment of a stipendiary magistrate they may present a petition for the same to the secretary of state and it is thereafter lawful for the king to appoint to that office a barrister of seven years' standing. He is by virtue of his office entitled to receive for the same a salary, payable in four equal quarterly instalments. On a vacancy, application must again be made as for a first appointment. There may be more than one stipendiary magistrate for a borough.
JUSTICIAIR—JUSTIFICATION

The chairman of a county council is ex officio a justice of the peace for the county, and the chairman of an urban or rural district council for the county in which the district is situated. Justices cannot act beyond the limits of the jurisdiction for which they are appointed, and the warrant of a justice cannot be executed out of his jurisdiction unless it be backed, that is, endorsed by a justice of the jurisdiction in which it is to be carried into execution. A justice improperly refusing to act on his office, or acting partially and corruptly, may be proceeded against for a criminal information, and a justice refusing to act may be compelled to do so by the High Court of Justice. An action will lie against a justice for any act done by him in excess of his jurisdiction, and for any act within his jurisdiction which has been done wrongfully and with malice, and without reasonable or probable cause. But no action can be brought against a justice for a wrongful conviction until it has been quashed. By the Justices' Qualification Act 1744, every justice for a county was required to have an estate of freehold, copyhold, or customary tenure in fee, for life or a given term, of the yearly value of £100. By an act of 1875, the occupation of a justice was made a qualification. No such qualifications were ever required for a borough justice, and it was not until 1906 that county justices were put on the same footing in this respect. The Justices of the Peace Act 1906 did away with all qualification by estate. It also removed the necessity for residence within the county, permitting the same residential qualification as for borough justices, “within seven miles thereof.” The same act removed the disqualification of solicitors to be county justices and assimilated to the existing power to remove other justices from the commission of the peace the power to exclude ex officio justices.

The justices for every petty sessional division of a county or for a borough having a separate commission of the peace must appoint a fit person to be their salaried clerk. He must be either a barrister of not less than fourteen years' standing, or a solicitor of the supreme court, or have served for not less than seven years as a clerk to a police or stipendiary magistrate or to a metropolitan police court. An alderman or councillor of a borough must not be appointed as clerk, nor can a clerk of the peace for the borough or for the county in which the borough is situated be appointed. A borough clerk is not allowed to prosecute. The salary of a justice's clerk comes, in London, out of the police fund; in counties out of the county fund; in county boroughs out of the borough fund, and in other boroughs out of the county fund.

The vast and multifarious duties of the justices cover some portion of every important head of the criminal law, and extend to a considerable number of matters relating to the civil law.

In the United States these officers are sometimes appointed by the executive, sometimes elected. In some states, justices of the peace have jurisdiction in civil cases given to them by local regulations.

JUSTICIAR (med. Lat. justiciarius or justitiarius, a judge), in English history, the title of the chief minister of the Norman and earlier Angevin kings. The history of the title in this connotation is somewhat obscure. Justiciarius meant simply “judge,” and was originally applied, as Stubbs points out (Const. Hist. i. 389, note), to any officer of the king's court, to the chief justice, or in a very general way to all and sundry who possessed courts of their own or were qualified to act as judices in the shire-courts, even the style capitulis justiciarius being used of judges of the royal court other than the chief. It was not till the reign of Henry II. that the title summi or capitulis justiciarius, or justiciarum totius Angliae was exclusively applied to the king's chief minister. The office, however, existed before the style of its holder was fixed; and, whatever their contemporary title (e.g. Custos Angliae), later writers refer to them as justiciar, with or without the prefix summi or capitulis (ibid. p. 346). Thus Ranulf Flambard, the minister of William II., who was probably the first to exercise the powers of a justiciar, is called justiciar by Ordericus Vitalis.

The origin of the justiciarship is thus given by Stubbs (ibid. p. 276). The sheriff "was the king's representative in all matters judicial, military and financial in the shire. From him, or from the courts of which he was the presiding officer, appeal lay to the king alone; but the king was often absent from England and did not understand the language of his subjects. In his absence the administration was entrusted to a justiciar, a regent or lieutenant of the kingdom; and the convenience being once ascertained of having a minister who could in the whole kingdom represent the king, as the sheriff did in the shire, the justiciar became a permanent functionary."

The fact that the kings were often absent from England, and that the justiciarship was held by great nobles or churchmen, made this office of an importance which at times threatened to overshadow that of the Crown. It was this latter circumstance which ultimately led to its abolition. Hubert de Burgh (q.v.) was the last of the great justiciars; after his fall (1231) the justiciarship was not again committed to a great baron, and the chancellor soon took the position formerly occupied by the justiciar as second to the king in dignity, as well as in power and influence. Finally, under Edward I. and his successor, in place of the justiciar—who had presided over all causes vice regis—separate heads were established in the three branches into which the curia regis as a judicial body had been divided: justices of common pleas, justices of the king's bench and barons of the exchequer.

Outside England the title justiciar was given under Henry II. to the seneschal of Normandy. In Scotland the title of justiciar was borne, under the earlier kings, by two high officials, one having his jurisdiction to the north, the other to the south of the Forth. They were the king's lieutenants for judicial and administrative purposes and were established in the 12th century, either by Alexander I. or by his successor David I. In the 12th century a magister justitiarius also appears in the Norman kingdom of Sicily, title and office being probably borrowed from England; he presided over the royal court (Magna curia) and was, with his assistants, empowered to decide, inter alia, all cases reserved to the Crown (see Du Cange, s. v. Magister Justitiarius).

See W. Stubbs, Const. Hist. of England; Du Cange, Glossarium (Nort, 1885) t. r. J usticiarius.

JUSTICIARY, HIGH COURT OF, in Scotland, the supreme criminal court, consisting of five of the lords of session together with the lord justiciar-general and the lord justice-clerk as president and vice-president respectively. The constitution of the court is settled by the Act 1672 c. 16. The lords of justiciary hold circuits regularly twice a year according to the ancient practice, which, however, had been allowed to fall into disuse until revived in 1748. For circuit purposes Scotland is divided into northern, southern and western districts (see CIRCUIT). Two judges generally go on a circuit, and in Glasgow they are by special statute authorized to sit in separate courts. By the Criminal Procedure (Scotland) Act 1887 all the senators of the college of justice are lords commissioners of justiciary. The high court, sitting in Edinburgh, has, in addition to its general jurisdiction, an exclusive jurisdiction for districts not within the jurisdiction of the circuits—the three Lothians, and Orkney and Shetland. The high court also takes up points of difficulty arising before the special courts, like the court for crown cases reserved in England. The court of justiciary has authority to try all crimes, unless when its jurisdiction has been excluded by special enactment of the legislature. It is also stated to have an inherent jurisdiction to punish all criminal acts, even if they have never before been treated as crimes. Its judgments are believed to be not subject to any appeal or review, but it may be doubted whether an appeal on a point of law would not lie to the house of lords. The following crimes must be prosecuted in the court of justiciary: treason, murder, robbery, rape, fire-raising, defacement of messengers, breach of duty by magistrates, and all offences for which a statutory punishment higher than imprisonment is imposed.

JUSTIFICATION, in law, the showing by a defendant in a suit of sufficient reason why he did what he was called upon to answer,
For example, in an action for assault and battery, the defendant may prove in justification that the prosecutor assaulted or beat him first, and that he acted merely in self-defence. The word is employed particularly in actions for defamation, and has in this connexion a somewhat special meaning. When a libel consists of a specific charge a plea of justification is a plea that the words are true in substance and in fact (see LIBLE AND SLANDER).

JUSTIN I. (450-527), East Roman emperor (518-527), was born in 450 as a peasant in Asia, but enlisting under Leo I. he rose to be commander of the imperial guards of Anastasius. On the latter's death in 518 Justin used for his own election to the throne money that he had received for the support of another candidate. Being ignorant even of the rudiments of letters, Justin traced out the administration of state to his wise and faithful quaestor Proculus and to his nephew Justinianus, though his own experience dictated several improvements in military affairs. An orthodox churchman himself, he effected in 519 a reconciliation of the Eastern and Western Churches, after a schism of thirty-five years (see HORMESDAS). In 522 he entered upon a desultory war with Persia, in which he co-operated with the Arabs. In 522 also Justin ceded to Theodoric, the Gothic king of Italy, the right of naming emperors in the 1st of April 527 Justin, enfeebled by an incurable wound, yielded the closest of the regiments and assumed Justinianus at his council; on the 1st of August he died. Justin bestowed much care on the repairing of public buildings throughout his empire, and contributed large sums to repair the damage caused by a destructive earthquake at Antioch.

See E. Gibbon, Decline and Fall of the Roman Empire (ed. Bury, 1896), iv. 206-209.

JUSTIN II. (d. 578), East Roman emperor (565-578), was the nephew and successor of Justinian I. He availed himself of his influence as master of the palace, and as husband of Sophia, the niece of the late empress Theodora, to secure a peaceful election. The first few days of his reign—when he paid his uncle's debts, administered justice in person, and proclaimed universal religious toleration—gave bright promise, but in the face of the lawless aristocracy and defiant governors of provinces he effected few subsequent reforms. The most important event of his reign was the invasion of Italy by the Lombards (q.v.), who, entering in 568, under Alboin, in a few years made themselves masters of nearly the entire country. Justin's attention was distracted from Italy towards the N. and E. frontiers. After refusing to pay the Avars tribute, he fought several unsuccessful campaigns against them. In 572 his overtures to the Turks led to a war with Persia. After two disastrous campaigns, in which his enemies overran Syria, Justin bought a precarious peace by payment of a yearly tribute. The temporary fits of insanity into which he fell were due to name a colleague. Passing over his own relatives, he raised, on the advice of Sophia, the general Tiburcius (q.v.), to be Caesar in December 574 and withdrew for his remaining years into retirement.

See E. Gibbon, Decline and Fall of the Roman Empire (ed. Bury, 1896), v. 2-17; G. Finlay, History of Greece (ed. 1877), i. 291-297; J. Bury, The Later Roman Empire (1889), ii. 67-79. (M. O. B. C.)

JUSTIN (JUNIanus JUSTINUS), Roman historian, probably lived during the age of the Antonines. Of his personal history nothing is known. He is the author of Historiarum Philippicarum libri XLIIV., a work described by himself in his preface as a collection of the most important and interesting passages from the voluminous Historiae philippicae et totius mundi origines et terrae situs, written in the time of Augustus by Pompeius Trogus (q.v.). The work of Trogus is lost; but the prolegoi or arguments of the text are preserved by Pliny and other writers. Although the main theme of Trogus was the rise and history of the Macedonian monarchy, Justin yet permitted himself considerable freedom of digression, and thus produced a capricious anthology instead of a regular epitome of the work. As it stands, however, the history contains much valuable information. The style, though far from perfect, is clear and occasionally elegant. The book was much used in the middle ages, when the author was sometimes confounded with Justin Martyr.

Fischer, De electione Justinii (1868); F. Rühl, Die Verbreitung des J. im Mittelalter (1871); O. Eichert, Wörterbuch zum J. (1881); Köhler und Rühl in Neue Jahrbiicher fur Philologie, xcl., ci., cxxiii. There are translations in the chief European languages; in English by A. Goldwin (1854); R. Codrington (1862); A. E. Torday (1712); G. Turnbul (1746); J. Clarke (1790); J. S. Watson (1857).

JUSTINIAN I. (483-565). Flavius Anicius Justinianus, surpassing the Great, the most famous of all the emperors of the Eastern Roman Empire, was by birth a barbarian, native of a place called Tauresium in the district of Dardania, a region of Illyricum,1 and was born, most probably, on the 11th of May 483. His family has been variously conjectured, on the strength of the proper names which its members are stated to have borne, to have been Teutonic or Slavonic. The latter seems the more probable view. His own name was originally Uprauda.2 Justinianus was a Roman name which he took from his uncle Justin I., who adopted him, and to whom his advancement in life was due. Of his early life nothing except that he went to Constantinople while still a young man, and wrote an elementary education. Doubtless he knew Latin before Greek; it is alleged that he always spoke Greek with a barbarian accent. When Justin ascended the throne in 518, Justinian became at once a person of the first consequence, guiding, especially in church matters, the policy of his aged, childless and ignorant uncle, receiving high rank and office at his hands, and soon coming to be regarded as his destined successor. On Justin's death in 527, having been a few months earlier associated with him as co-emperor, Justinian succeeded without opposition to the throne. About 525 he had married the famous Theodora (q.v.), who, as empress regnant, was closely associated in all his actions till her death in 547.

Justinian's reign was filled with great events, both at home and abroad, both in peace and in war. They may be classed under four heads: (i) his legal reforms; (ii) his administration of the empire; (iii) his ecclesiastical policy; and (iv) his wars and foreign policy generally.

1. It is as a legislator and codifier of the law that Justinian's name is most familiar to the modern world; and it is therefore this department of his action that requires to be most fully dealt with here. He found the law of the Roman empire in a state of great confusion. It consisted of two masses, which were usually distinguished as old law (jus vetus) and new law (jus novum). The first of these comprised: (i) all such of the statutes (leges) passed under the republic and early empire as had not become obsolete; (ii) the decrees of the senate (senatus consultas) passed at the end of the republic and during the first two centuries of the empire; (iii) the writings of the jurists of the later republic and of the empire, and more particularly of those jurists to whom the right of declaring the law with authority (jus respondendi) had been committed by the emperors. As these jurists had in their commentaries upon the leges, senatus consultas and edicts of the magistrates practically incorporated all that was of importance in those documents, the books of the jurists may substantially be taken as including (i) and (ii). These writings were of course very numerous, and formed a vast mass of literature. Many of them had become exceedingly scarce—many had been altogether lost. Some were of doubtful authenticity. They were so costly that no person of moderate means could hope to possess any large number; even the public libraries had nothing approaching to a complete collection. Moreover, as they proceeded from a large number of independent authors, who wrote expressing their own opinions, they contained many discrepancies and contradictions, the dicta of one writer being controverted by another, while yet both writers might enjoy the same formal authority. A remedy had been attempted to be applied to this evil by a law of the

1 It is commonly identified with the modern Kuständil, but Uskub (the ancient Skupi) has also been suggested. See Tozer, Highlands of European Turkey, ii. 570.

2 The name Uprauda is said to be derived from the word prauda, which in Old Slavic means jasus, justitius, the prefix being simply a breathing frequently attached to Slavonic names.
The new law (jus novum), which consisted of the ordinances of the emperors promulgated during the middle and later empires (edita, rescripta, mandata, decreta), usually called by the general name of constitutiones, was in a condition not much better. These ordinances or constitutions were extremely voluminous. No complete collection of them existed, although for two collections (Codex gregorianus and Codex hermogenianus) had been made, by five jurists in the 4th century, and a large supplementary collection published by the emperor Theodosius II. in 438 (Codex theodosianus), these collections did not include all the constitutions; there were others which it was necessary to obtain separately, but many whereof it must have been impossible for a private person to procure. In this branch too of the law there existed some, though a less formidable, uncertainty; for there were constitutions which were practicable, if not formally received, by other emperors without expressly mentioning them, so that a man who relied on one constitution might find that it had been varied or abrogated by another he had never heard of or on whose sense he had not put such a construction. It was therefore clearly necessary with regard to both the older and the newer law to take some steps to collect into one or more bodies or masses so much of the law as was to be regarded as binding, reducing it within a reasonable compass, and purging away the contradictions or inconsistencies which it contained. The evil had been long felt, and reforms apparently often proposed, but nothing (except by the compilation of the Codex theodosianus) had been done till Justinian's time. Immediately after his accession, in 528, he appointed a commission to deal with the imperial constitutions (jus novum), this being the easier part of the problem. The commissioners, ten in number, were directed to go through all the constitutions of which copies existed, to select such as were of practical value, to cut these down by retrenching all unnecessary matter, and gather them, arranged in order of date, into one volume, getting rid of any contradictions by omitting one or other of the conflicting passages. These statute law commissioners, as one may call them, set to work forthwith, and completed their task in fourteen months, distributing the constitutions which they placed in the new collection into ten books, in general conformity with the order of the Perpetual Edict as settled by Salvius Julianus and enacted by Hadrian. By this means the bulk of the statute law was immensely reduced, its obscurities and internal discrepancies in great measure removed, its provisions adapted, by the abrogation of what was obsolete, to the circumstances of Justinian's own time. This Codex constitutionum was formally promulgated and enacted as one great consolidating statute in 529, and the imperial constitutions not included in it being repealed at one stroke.

The success of this first experiment encouraged the emperor to attempt the more difficult enterprise of simplifying and digesting the older law contained in the treatises of the jurists. Before entering on this, however, he wisely took the preliminary step of settling the more important of the legal questions as to which the older jurists had been divided in opinion, and which had therefore remained sources of difficulty, a difficulty aggravated by the general decline, during the last two centuries, of the level of forensic and judicial learning. This was accomplished by a series of constitutions known as the "Fifty Decisions" (Quinquaginta decisiones), along with which there were published other ordinances amending the law in a variety of points, in which old and now inconvenient rules had been suffered to subsist. Then in December 530 a new commission was appointed, consisting of sixteen eminent lawyers, on whom the president, the famous Tribonian (who had already served in the previous commission), was an exalted senator, four were professors of law, and the remaining eleven practising advocates. The instructions given to them by the emperor were as follows:—

they were to procure and peruse all the writings of all the author- ized jurists (those who had enjoyed the jus respondevit); were to extract from these writings whatever was of most permanent and substantial value, with power to change the expressions of the author wherever conciseness or clearness would be thereby promoted, or wherever such a change was needed in order to adapt his language to the condition of the law as it stood in their time; were to collect the rescripta, or formal opinions, of the emperors, giving only one statement of the law upon each point; were to insert nothing at variance with any provision contained in the Codex constitutionum; and were to distribute the results of their labours into fifty books, subdividing each book into titles, and following generally the order of the Perpetual Edict.

These directions were carried out with a speed which is surprising when we remember not only that the work was interrupted by the terrible insurrection which broke out in Constantinople in January 532, and which led to the temporary retirement from office of Tribonian, the master of the law, but also that the literature which had to be read through consisted of no less than two thousand treatises, comprising about three millions of sentences. The commissioners, who had for greater despatch divided themselves into several committees, presented their selection of extracts to the emperor in 533, and he published it as an imperial statute on December 10th of that year, with two prefatory constitutions (those known as Ommem reipublicae and Dedit nobis). It is the Latin volume which we now call the Digest (Digesta) or Pandects (Pandectae) and which is by far the most precious monument of the legal genius of the Romans, and indeed, whether one regards the intrinsic merits of its substance or the prodigious influence it has exerted and still exerts, the most remarkable law-book that the world has seen. The extracts comprised in it are 9125 in number, taken from thirty-nine authors, and are of greatly varying length, mostly only a few lines long. About one-third (in quantity) come from Ulpian, a very copious writer; Paulus stands next. To each extract there is prefixed the name of the author, and of the treatise whence it is taken. The worst thing about the Digest is its highly unscientific arrangement. The order of the Perpetual Edict, which appears to have been taken as a sort of model for the general scheme of books and titles, was doubtless convenient to the Roman lawyers from their familiarity with it, but was in itself rather accidental and historical than logical. The disposal of the extracts inside each title was still less rational; it has been shown by a modern jurist to have been the result of the way in which the committees of the commissioners worked through the books they had to peruse. In enacting the Digest as a law book, Justinian repeated all the other law contained in the treatises of the jurists (that jus vetus which has been already mentioned), and directed that those treatises should never be cited in future even by way of illustration; and he of course at the same time abrogated all the older statutes, from the Twelve Tables downwards, which had formed a part of the jus vetus. This was a necessary incident of his scheme of reform. But he went

---

1 See, for an account of the instructions given to the commission, the constitution Hacce quae, prefixed to the revised Codex in the Corpus juris civilis.

2 See the constitution Deo auctore (Cod. i. 17, 1).

3 In the middle ages people used to cite passages by the initial words; and the Germans do so still, giving, however, the number of the paragraph in the extract (if there are more paragraphs than one), at the same time abrogating all the older statutes, from the Twelve Tables downwards, which were usually cited by the numbers of the book, the title, and the paragraph, without referring to the initial words.

too far, and indeed attempted what was impossible, when he
forbad all commentaries upon the Digest. He was obliged to
allow a Greek translation to be made of it, but directed
this translation to be exactly literal.

These two great enterprises had substantially despatched
Justinian’s work; however, he, or rather Tribonian, who seems
to have acted both as his adviser and as his chief executive
officer in all legal affairs, conceived that a third book was needed,
viz. an elementary manual for beginners which should present
an outline of the law in a clear and simple form. The little work
of Gaius, most of which we now possess under the title of Com-
menteria institutionum, had served this purpose for nearly four
centuries; but much of it had, owing to changes in the law, be-
come inapplicable, so that a new manual seemed to be required.
Justinian accordingly directed Tribonian, with two and sixty
Theophilus, professor of law in the university of Constanti-
ople, and Dorotheus, professor in the great law school at Beyrouth,
to prepare an elementary textbook on the lines of Gaius. This
they did while the Digest was in progress, and produced the useful
little treatise which has ever since been the book with which
students commonly begin their studies of Roman law, the Insti-
tutes of Justinian.

It was published as a statute with full legal validity shortly before the Digest. Such merits as it possesses—
simplicity of arrangement, clearness and conciseness of expres-
sion—belong less to Tribonian than to Gaius, who was closely
followed; and there are indications that the law had not made him
obscure. However, the spirit of that great legal classic seems to
have in a measure dwelt with and inspired the inferior men who
were recasting his work; the Institutes is better both in Latinity
and in substance than we should have expected from the condi-
tion of Latin letters at that epoch, better than the other laws
which emanate from Justinian.

In the four years and a half which elapsed between the publica-
tion of the Codex and that of the Digest, many important changes
had been made in the law, notably by the publication of the new
constitutions with which settlement was made of the legal and
moral alterations in the law that had not been made by
Gaius. However, the spirit of that great legal classic seems to
have in a measure dwelt with and inspired the inferior men who
were recasting his work; the Institutes is better both in Latinity
and in substance than we should have expected from the condi-
tion of Latin letters at that epoch, better than the other laws
which emanate from Justinian.

The constitutions contained in it number 4622, the earliest
dating from Hadrian, the latest being of course Justinian’s own.
A few thus belong to the period to which the greater part of the
Digest belongs, i.e. the so-called classical period of Roman law
down to the time of Alexander Severus (244); but the great majority
is later, and belong to one or other of the four great eras of imperial
legislation, the eras of Diocletian, of Constantine, of Theodosius II.,
and of Justinian himself. Although this Codex is said to have the
same general order as that of the Digest, viz. the order of the
Perpetual Edict, there are considerable differences of arrangement
between the two. It is divided into twelve books. Its contents,
along with the Digest, form an integral part of the most im-
porant work of that time, and of much value still, historical as well as legal, are
far less interesting and scientifically admirable than the extracts
preserved in the Digest. The difference is even greater than that
between the Latin reports of cases decided since the time of
Holt and the English acts of parliament for the same two centuries.
The emperor’s scheme was now complete. All the Roman law
had been collected in two volumes of more than 20,000
excesses, a very satisfactory manual for beginners added. But Justinian and Tribo-

nian had grown so fond of legislating that they found it hard to leave
off. Moreover, the very simplifications that had been so far effective
brought into view with more clearness such anomalies or pieces of
justice as still continued to deform the law. Thus no sooner had
the work been rounded off than fresh excrescences began to be
created by the very publication of the new law. Justinian issued a
number of ordinances, dealing with all sorts of subjects and
seriously altering the law on many points—the majority
appearing before the death of Tribonian, which happened in 545.
These ordinances are three in number—Codex Variae, Novellae
constitutions post codicem (repari barakés), Novellas. Although the emperor had stated in publishing the Codex that all
further statutes (if any) would be officially collected, this promise
does not seem to have been redeemed. The three collections of the
Novellas which we possess are apparently private collections, nor do
we even know how many such constitutions were promulgated.
One of these contains 136 Novellae (Codex maior); two
contains 125 Novellae in Latin; and the third, the Liber auth-
enticarum or vulgus versio, has 134, also in Latin. This last was the collection first known and chiefly
used in the West during the middle ages; and of its 134 only 97 have been
written on by the glossators or medieval commentators; these there-
fore are not so much used as binding, those countries which recognize
and obey the Roman law,—according to the maxim
Quisquid non agnoscit glossa, nec agnoscit curia. And, whereas
Justinian’s constitutions contained in the Codex were all issued
in Latin, the rest of the books being in that tongue, these Novellas were
near all published in Greek, Latin translations being of course
made for the use of the western provinces. They are very
brief, and with the exception of a few, particularly the 116th and 118th,
which on account of the public nature of the law, and the
religion of intestate succession, are much more interesting, as supplying
materials for the history of the time, social, economical and eccle-
siastical, than in regard to their juridical importance; they may be
found printed in any edition of the Corpus juris civilis.

This Corpus juris, which bears and immortalizes Justinian’s name,
consists of the four books described above: (1) The authorized
collection of imperial ordinances (Codex constitutionum); (2) the
authorized collection of extracts from the great jurists (Digesta or
Pandectae); (3) the elementary handbook (Institutiones); (4) the
unauthorized collection of constitutions subsequent to the Codex
(Novellae). From what has been already stated, the reader will perceive that Justinian did not, according to a strict use of terms, codify
the Roman law. By a codification we understand the reduction of
the whole pre-existing body of law to a new form, the re-stating
it in a series of propositions, scientifically ordered, which may or
may not contain some new substance, but are at any rate new in
form. If he had, so to speak, thrown into one furnace all the law
contained in the treaties of the jurists and in the imperial
ordinances, fused them down, the gold of the one and the silver
of the other, and run them out into new moulds, this would have
been codification. What he did do was something quite different.
It was a codification of new laws (Codex constitutionum); (2) the
authorized collection of extracts from the great jurists (Digesta or
Pandectae); (3) the elementary handbook (Institutiones); (4) the
unauthorized collection of constitutions subsequent to the Codex
(Novellae).

From what has been already stated, the reader will perceive that Justinian did not, according to a strict use of terms, codify
the Roman law. By a codification we understand the reduction of
the whole pre-existing body of law to a new form, the re-stating
it in a series of propositions, scientifically ordered, which may or
may not contain some new substance, but are at any rate new in
form. If he had, so to speak, thrown into one furnace all the law
contained in the treaties of the jurists and in the imperial
ordinances, fused them down, the gold of the one and the silver
of the other, and run them out into new moulds, this would have
been codification. What he did do was something quite different.
It was a codification of new laws (Codex constitutionum); (2) the
authorized collection of extracts from the great jurists (Digesta or
Pandectae); (3) the elementary handbook (Institutiones); (4) the
unauthorized collection of constitutions subsequent to the Codex
(Novellae).
language, while in the extracts of which the Codex is composed we find valuable historical evidence bearing on the administration and social condition of the later Pagan and earlier Christian empire; fourthly, that Justinian's age, that is to say, the intellect of the men whose services he commanded, was quite unequal to so vast an undertaking as the fusing upon scientific principles into one new organic whole of the entire law of the empire. With sufficient time and labour the work might no doubt have been done; but what we possess of Justinian's own legislation, and still more what we know of the general condition of literary and legal capacity in his time, makes it certain that it would not have been well done, and that the result would have been not more valuable to the Romans of that age, and much less valuable to the modern world, than are the results, preserved in the Digest and the Codex, of what he and Tribonian actually did.

To the merits of the work as actually performed some reference has already been made. The chief defect of the Digest is in point of scientific arrangement, a matter about which the Roman lawyers, perhaps one may say the ancients generally, cared very little. There are some repetitions and some inconsistencies, but not more than may fairly be allowed for in a compilation of such magnitude executed so rapidly. Tribonian has been blamed for the insertions the compilers made in the sentences of the old jurists (the so-called Emblemata Tribonian); but it was a part of Justinian's plan that such insertions should be made, so as to adapt those sentences to the law as settled in the emperor's time. On Justinian's own laws, contained in the Codex and in his Novels, some what less favorable judgment must be pronounced. The text, as actually diffused, has not the salutary uniformity which is necessary to the facility of legislation, and from which alone law derives its power. From that time, the law's simplicity, its easy application, its justice, its endurance, its sanctity, its authority, its respectability, are dependent. The law, from that time, is our guide and instructor in the great business of life.

The law of Justinian is of course written in Greek, and consists of parts of the substance of the Codex and the Digest, thrown together and often altered in expression, together with some matters from the Novels, and other imperial ordinances posterior to Justinian. In the western provinces, which had been wholly severed from the empire before the publication of the Basilica, the law as settled by Justinian held its ground; but copies of the Corpus Juris were extremely rare, nor did the study of it revive until the end of the 11th century. The best edition of the Digest is that of Mommense (Berlin 1668-1870), and of the Codex that of Krüger (Berlin 1875-1877).

2. In his financial administration of the empire, Justinian is represented to us as being at once rapacious and extravagant. His unwearied activity and inordinate vanity led him to undertake a great many costly public works, many of them, such as the erection of palaces and churches, unremunerative. The money needed for these, for his wars, and for buying off the barbarians who threatened the frontiers, had to be obtained by increasing the burdens of the people. They suffered, not only from the regular taxes, which were seldom remitted even after bad seasons, but also from monopolies; and Procopius goes so far as to allege that the emperor made a practice of further recruiting his treasury by confiscating on slight or fictitious pretenses the property of persons who had displeased Theodora or himself. Fiscal severities were no doubt one cause of the insurrections which now and then broke out, and in the gravest of which, (§32) thirty thousand persons are said to have perished in the capital. It is not always easy to discover, putting together the trustworthy evidence of Justinian's own laws and the angry complaints of Procopius, what was the nature and justification of the changes made in the civil administration. But the general conclusion seems to be that these changes were always in the direction of further centralization, increasing the power of the chief ministers and their offices, bringing all more directly under the control of the Crown, and in some cases limiting the powers and appropriating the funds of local municipalities. In carrying out this new plan of imperialization, so that a certain number of offices were suppressed altogether, much to the disgust of the office-holding class, which was numerous and wealthy, and had almost come to look on the civil service as its hereditary possession. The most remarkable instance of this policy was the discontinuance of the consulship. This great office had remained a dignity centuries after it had ceased to be a power; but it was a very costly dignity, the holder being expected to spend large sums in public displays. As these sums were provided by the state, Justinian saved something considerable by stopping the payment. He named no consul after Basilios, who was the name-giving consul of 541.

In a bureaucratic despotism the greatest merit of a sovereign is to choose capable and honest ministers. Justinian's selections were usually capable, but not so often honest; probably it was hard to find thoroughly upright officials; possibly they would not have been most serviceable in carrying out the imperial will, and especially in replenishing the imperial treasury. Even the great Tribonian labours under the reproach of corruption, while the fact that Justinian maintained John of Cappadocia in power long after his disgrace is an indication of his own, and of other, noblemen's, indolence. As soon as Justinian had got rid of the last of his rivals for power, he, with Cilicia, and Syria, and Asia Minor, and Jordan, and Galatia, and Cappadocia, and the provinces between, he had, as it were, at a stroke, and with the loss of nothing valuable, got rid of all his enemies; and then he began again.

3. Justinian's ecclesiastical policy was so complex and varying that it is impossible within the limits of this article to do more than indicate its bare outlines. For many years before the close of his reign the Eastern world had been vexed by the struggles of the Monophysite party, who recognized one nature in Christ, against whom the Church had ever since maintained itself as orthodox, that the divine and human natures coexisted in Him. The latter doctrine had triumphed at the council of Chalcedon, and was held by the whole Western Church, but Egypt, great part of Syria and Asia Minor, and a considerable minority even in Constantinople clung to Monophysitism. The emperors Zeno and Anastasius had been strongly suspected of it, and the Roman bishops had refused to communicate with the patriarchs of Constantinople since 484, when they had condemned Acacius for accepting the formula of concilia issued by Zeno. One of Justinian's first public acts was to put an end to this schism by inducing Justin to make the then patriarch renounce this formula and declare his full adherence to the creed of Chalcedon. When he himself came to the throne he endeavored to persuade the Monophysites to come in by summoning some of their leaders to a conference. This failing, he ejected suspected prelates, and occasionally persecuted them, though with far less severity than that applied to the heretics of a deeper dye, such as Monantissis or even Arians. Not long after this the attention was turned to the spread of Origenist opinions in Syria, he issued an edict condemning fourteen propositions drawn from the writings of the great Alexandrian,
and caused a synod to be held under the presidency of Mennas (whom he had named patriarch of Constantinople), which welcomed the condemnation of the impugned doctrines and anathematized Origen himself. Still later, he was induced by the machinations of some of the prelates who haunted his court, and by the influence of Theodora, herself much interested in theological questions, and more than suspected of Monophysitism, to raise a needless, mischievous, and protracted controversy. The Monophysites sometimes alleged that they could not accept the decrees of the council of Chalcedon because that council had not condemned, but (as they argued) virtually approved, three writers tainted with Nestorian principles, Theodore of Mopsuestia, Theodoret, and Ibas, bishop of Edessa. It was contended that Justinian, who was still pursued by the desire to bring back the schismatics, that a great step would have been taken towards reconciliation if a condemnation of these teachers, or rather of such of their books as were complained of, could be brought about, since then the Chalcedonian party would be purged from any appearance of sympathy with the errors of Nestorius. Not stopping to reflect that in the angry and suspicious state of men's minds he was sure to lose as much in one direction as he would gain in the other, Justinian entered into the idea, and put forth an edict exposing and condemning the writings contained in the books, generally, in the treatise of Theodoret against Cyril of Alexandria, and in a letter of Bishop Ibas (a letter whose authenticity was doubted, but which passed under his name) to the Persian bishop Maris. This edict was circulated through the Christian world to be subscribed by the bishops. The four Eastern patriarchs, and the great majority of the Eastern prelates generally, subscribed, though reluctantly, for it was felt that a dangerous precedent was being set when dead authors were anathematized, and that this new movement could hardly fail to weaken the authority of the council of Chalcedon. Among the Western bishops, who were less disposed both to Monophysitism and to subservience, and especially by those of Africa, the edict was earnestly resisted. When it was found that Pope Vigilius did not forthwith comply, he was summoned to Constantinople. Even there he resisted, not so much, it would seem, from any scruples of his own, for he was not a high-minded man, as because he knew that he dared not return to Italy if he gave way. Long disputes and negotiations followed, the end of which was that Justinian summoned a general council of the church, that which we reckon the Fifth, which condemned the impugned writings, and anathematized several of the writers named by the edict. It was received, in the East but long contested in the Western Church, where a schism arose that lasted for seventy years. This is the controversy known as that of the Three Chapters (Triia capitula, Τριά καταφέλαι), apparently from the three propositions or condemnations contained in Justinian's original edict, one relating to Theodore's writings and person, the second to the incriminated treatise of Theodoret (whose person was not attacked), the third to the letter (if genuine) of Ibas (see Hefele, Concilien geschichte, ii. 777).

At the very end of his long career of theological discussion, Justinian himself lapsed into heresy, by accepting the doctrine that the earthly body of Christ was incorruptible, insensible to the weaknesses of the flesh, a doctrine which had been advanced by Julian, bishop of Haliarnassus, and gone by the name of Apthartodocetism. According to his usual practice, he issued an edict enforcing this view, and requiring all patriarchs, metropolitans, and bishops to subscribe to it. Some, who not unnaturally held that it was rank Monophysitism, refused at once, and were deprived of their sees, among them Eutychius the eminent patriarch of Constantinople. Others submitted or temporised; among these was the emperor, although the matter to be carried through, the emperor died, having tarnished if not utterly forfeited by this last error the reputation won by a life devoted to the service of Orthodoxy.

As no preceding sovereign had been so much interested in church affairs, so none seems to have shown so much activity as a persecutor both of pagans and of heretics. He renewed with additional stringency the laws against both these classes. The former embraced a large part of the rural population in certain secluded districts, such as parts of Asia Minor and Peloponnesus; and we are told that the efforts directed against them resulted in the forcible baptism of 70,000 persons in Asia Minor alone. Paganism, however, survived; we find it in Laconia in the end of the 9th century, and in northern Syria it has lasted till our own times. There were also a good many crypto-pagans among the educated population of the capital. Procopius, for instance, if he was not actually a Pagan, was certainly very little of a Christian. Inquiries made in the third year of Justinian's reign drove nearly all of these persons into an outward conformity, and their offspring seem to have become or iar Christians. At Athens, the philosophers who taught in the schools hallowed by memories of Plato still openly professed what passed for Paganism, though it was really a body of moral doctrine, strongly tinged with mysticism, in which there was far more of Christianity and of the speculative metaphysics of the East than of the old Olympian religion. Justinian, partly from religious motives, partly because he discomfited all rivals to the imperial university of Constantinople, closed these Athenian schools (536). The professors sought refuge at the court of Chosroes, king of Persia, but were soon so much disgusted by the ideas and practices of the fire-worshippers that they re- turned to the schools of the capital. Chosroes having magnanimously obtained from Justinian a promise that they should be suffered to pass the rest of their days unmolested, heresy proved more obstinate. The severities directed against the Montanists of Phrygia led to a furious war, in which most of the sectaries perished, while the doctrine was not extinguished. Harsh laws provoked the Samaritans to a revolt, from whose effects Palestine had not recovered when conquered by the Arabs in the following century. The Nestorians and the Eutychian Monophysites were not threatened with such severe civil penalties, although their worship was interdicted, and their bishops were sometimes banished; but this vexatious treatment was quite enough to keep them dis- affected, and the rapidity of the Mahomedan conquests may be partly traced to that alienation of the bulk of the Egyptian and a large part of the Syrian population which dates from Justinian's persecutions.

4. Justinian was engaged in three great foreign wars, two of them of his own seeking, the third a legacy which nearly every emperor had come into for three centuries, the secular strife of Rome and Persia. The Sassanid kings of Persia ruled a dominion which extended from the confines of Syria to those of India, and from the straits of Oman to the Caucasus. The martyr-like charac- ter of their population made them formidable enemies to the Romans, whose troops were at this epoch mainly barbarians, the settled and civilized subjects of the empire being as a rule averse from war. When Justinian came to the throne, his troops were maintaining an unequal struggle on the Euphrates against the armies of Kavadh I. (q.v.) After some campaigns, in which the skill of Belisarius obtained considerable successes, a peace was concluded in 533 with Chosroes I. (q.v.). This lasted till 539, when Chosroes declared war, alleging that Justinian had been secretly intriguing against him with the Hephthalite Huns, and doubtless moved by alarm and envy at the victories which the Romans had been gaining in Italy. The emperor was too much occupied in the West to be able adequately to defend his eastern frontier. Chosroes advanced into Syria with little resistance, and in 540 captured Antioch, then the greatest city in Asia, carrying off its inhabitants into captivity. The war continued with varying fortunes for four years more in this quarter; while in the meantime an even fiercer struggle had begun in the mountainous region inhabited by the Laz in the south- eastern corner of the Black Sea (see COLCHI). When after two-and-twenty years of fighting no substantial advantage had been gained by either party, Chosroes agreed in 562 to a peace which left Lazica to the Romans, but under the dishonourable condition of their paying 30,000 pieces of gold annually to the Persian king. Thus no result of permanent importance flowed from these Persian wars, except that they greatly weakened the Roman Empire, increased Justinian's financial embarrassments, and prevented him from prosecuting with sufficient vigour his
JUTINIAN I.

601

enterprises in the West. (See further Persia: Ancient History, “The Sassanid Dynasty.”)

These enterprises had begun in 533 with an attack on the Vandals, who were then reigning in Africa. Belisarius, despatched from Constantinople with a large fleet and army, landed without opposition, and destroyed the barbarian power in two engagements. North Africa from beyond the straits of Gibraltar to the Syrtes became again a Roman province, although the Moorish tribes of the interior maintained a species of independence; and part of southern Spain was also recovered for the empire. The occupation of Sardinia, which so important a conquest had been, was in some measure encouraged Justian to attack the Ostrogoths of Italy whose kingdom, though vast in extent, for it included part of south-eastern Gaul, Raetia, Dalmatia and part of Pannonia, as well as Italy, Sicily, Sardinia and Corsica, had been grievously weakened by the death first of the great Theodoric, and some years later of his grandson Athalaric, so that the Gothic nation was practically without a head. Justinian began the war in 535, taking as his pretext the murder of Queen Amalasuntha, daughter of Theodoric, who had placed herself under his protection of Italy, alleging this was against King, but had for a time owned a species of allegiance to the emperor at Constantinople. There was some foundation for this claim, although of course it could not have been made effective against Theodoric, who was more powerful than his supposed suzerain. Belisarius, who had been made commander of the Italian expedition, overran Sicily, reduced southern Italy, and in 536 occupied Rome. Here he was attacked in the following year by Vitiges, who had been chosen king by the Goths, with a greatly superior force. After a siege of over a year, the energy, skill, and courage of Belisarius, and the sickness which was preying on the Gothic troops obliged Vitiges to retire. Belisarius pursued his diminished army northwards, shut him up in Ravenna, and ultimately received the surrender of that impregnable city. Vitiges was sent prisoner to Constantinople, where Justinian treated him, as he had previously treated the captive Vandal king, with clemency. The imperial administration was established through Italy, but its capacity soon began to excite discontent, and the kernel of the Gothic nation had not been subdued. After two short and unfortunate reigns, the crown had been bestowed on Totila or Baduilla, a warrior of distinguished abilities, who by degrees drove the imperial generals and governors out of the country, and the so-called empire of the Goths began to assume the proportions of a state. Here Justinian, with the support of the Senate and people, assumed the character of a king. The empire had become a personal property, and Justinian began to exercise the rights of a monarch. He was not afraid of appearing too strong, and he was not afraid of appearing too weak. The emperor at last complied, and in 552 a powerful army was despatched under Narses, an Armenian eunuch now advanced in life, but reputed the most skilful general of the age, as Belisarius had been. He marched along the coast of the Gulf of Venice, and encountered the army of Totila at Taginase not far from Cesena. Totila was slain, and the Gothic cause irretrievably lost. The valiant remains of the nation made another stand under Teias on the Lactarian Hill in Campania; after that they disappear from history. Italy was recovered for the empire, but it was an italy terribly impoverished and debased. It, whose possessions carried little strength with it, Justinian’s policy both in the Vandalic and in the Gothic War stands condemned by the result. The resources of the state, which might better have been spent in defending the northern frontier against Slavs and Huns and the eastern frontier against Persians, were consumed in the conquest of two countries which had suffered too much to be of any substantial value, and which, separated by language as well as by intervening seas, could not be permanently retained. However, Justinian must have been almost preternaturally wise to have foreseen this: his conduct was in the circumstances only what might have been expected from an ambitious prince who perceived an opportunity of recovering territories that had formerly belonged to the empire, and over which its rights were conceived to be only suspended.

Besides these three great foreign wars, Justinian’s reign was troubled by a constant succession of border inroads, especially on the northern frontier, where the various Slavonic and Hunnish tribes who were established along the lower Danube and on the north of the Black Sea made freest for their depredations. These expeditions into Thrace and Macedonia, sometimes penetrating as far as the walls of Constantinople in one direction and the Isthmus of Corinth in another. Immense damage was inflicted by these marauders on the subjects of the empire, who seem to have been mostly too peaceable to defend themselves, and whom the emperor could not spare troops enough to protect. Fields were laid waste, villages burnt, large numbers of people carried into captivity; and on one occasion the capital was itself in danger. 5. It only remains to say something regarding Justinian’s personal character and capacities, with regard to which a great influence whatever he took up; he an astute and cleverly, and looking on him as a patriarch of their science, have as a rule extolled his wisdom and virtues; while ecclesiastics of the Roman Church, from Cardinal Baronius downwards, have been offended by his arbitrary conduct towards the popes, and by his last lapse into heresy, and have therefore been disposed to accept the stories which ascribe to him perfidy, cruelty, rapacity and extravagance. The difficulty of arriving at a fair conclusion is increased by the fact that Procopius, who is our chief authority for the events of his reign, speaks with a very different voice in his secret memoirs (the Anecdota) from that which he has professed in his published history, and that some of the accusations contained in the former work are so rancorous and improbable that a certain measure of discredit attaches to everything which it contains. The truth seems to be that Justinian was not a great ruler in the higher sense of the word, that is to say, a man of large views, deep insight, a capacity for forming just such plans as the circumstances needed, and carrying them out by a skilful adaptation of means to ends. But he was a man of considerable abilities, wonderful activity of mind, and admirable industry. He was interested in many things, and threw himself with ardour into whatever he took up; he had ingenuity and quickness, and pushed them on with an energy which usually made them succeed when no long time was needed, for, if a project was delayed, there was a risk of his tiring of it and dropping it. Although vain and full of self-confidence, he was easily led by those who knew how to get at him, and particularly by his wife. She exercised over him that influence which a stronger character always exercises over a weaker, whatever their respective positions; and unfortunately it was seldom a good influence, for Theodora (q.v.) seems to have been a woman who, with all her brilliant gifts of intelligence and manner, had no principles and no pity. Justinian was rather quick than strong or profound; his policy does not strike one as the result of deliberate and well-considered views, but dictated by the hopes and fancies of the moment. His activity was in so far a misfortune as it led him to attempt too many things at once, and engage in undertakings so costly that oppression became necessary to provide the funds for them. Even his devotion to work, which excite our admiration, in the centre of a luxurious court, was to a great extent unprofitable, for it was mainly given to theological controversies which neither he nor any one else could settle. Still, after making all deductions, it is plain whatever the man who, accomplished as much, and kept the whole world so occupied, as Justinian did during the first eighteen years of his reign, must have possessed no common abilities. He was affable and easy of approach to all his subjects, with a pleasant address; nor does he seem to have been, like his wife, either cruel or revengeful. We hear several times of his sparing those who had conspired against him. But he was not scrupulous in the means he employed, and he was willing to maintain in power detestable ministers if only they served him efficiently and filled his coffers. His chief passion, after that for his own fame and
glory, seems to have been for theology and religion; it was in this field that his literary powers exerted themselves (for he wrote controversial treatises and hymns), and his taste also, for among his numerous buildings the churches are those on which he spent most thought and money. Considering that his speeches are those by which his name is mainly known to posterity, it is curious that we should have hardly any information as to his legal knowledge, or the share which he took in those reforms. In person he was somewhat above the middle height, well-shaped, with plenty of fresh colour in his cheeks, and an extraordinary power of doing without food and sleep. He spent most of the night in reading or writing, and would sometimes go for a day with no food but a few green herbs. Two mosaic figures of him exist at Ravenna, one in the apse of the church of S. Vitale, the other in the church of S. Apollinare in Urbe; but of course, it cannot be sure how far in such a material the portrait fairly represents the original. He had no children by his marriage with Theodora, and did not marry after her decease. On his death, which took place on the 14th of November 655, the crown passed to his nephew Justin II.

AUTHORITIES.—For the life of Justinian the chief authorities are Procopius (Historiae, De aedificiis, Anecdota) and (from 552 A.D.) the History of Agathias; the Chronicle of Johannes Malalas is also of value. Occasional reference must be made to the writings of Jordanes and Marcellinus, and even to the later compilations of Cedrenus and Zonaras. The Vita Justiniani of Ludewig or Ludwig (1802) is the work of patient research, is frequently referred to by Gibbon in his important chapters relating to the reign of Justinian, in the Decline and Fall (see Bury’s edition, 1900). There is a Vie de Justinien by Isambert (2 vols., Paris, 1835). See also Hutton’s Christian History (1857) and Afterwards the Later Roman Emperors (1889); Hodgkin’s Italy and her Invaders (1890). (J. Bk.)

JUSTINIAN II.—RHINOMETUS (667-711), East Roman emperor, 658-695 and 704-711, succeeded his father Constantine IV, at the age of sixteen. His reign was unhappy both at home and abroad. After a successful invasion he made a truce with the Arabs, which admitted them to the joint possession of Armenia, Iberia and Cyprus, by removing 12,000 Christian Maronites from their native Lebanon, he gave the Arabs a command over Asia Minor of which they took advantage in 652 by conquering all Armenia. In 688 Justinian decisively defeated the Bulgarians. Meanwhile the bitter dissensions caused in the Church by the emperor, his bloody persecution of the Manicheans, and the rapacity with which, through his creatures Stephanus and Theodatus, he extorted the means of gratifying his sumptuous tastes and his mania for erecting costly buildings, drove his subjects into rebellion. In 695 they rose under Leontius, and, after cutting off the emperor’s nose (whence his surname), banished him to Cherson in the Crimea. Leontius, after a reign of three years, was in turn dethroned and imprisoned by Tiberius Ablimarus, who next assumed the purple. Justinian meanwhile had escaped from Cherson and married Theodore, sister of Busiris, khan of the Khazars. Compelled, however, by the intrigues of Tiberius, to quit his new home, he fled to Terbels, king of the Bulgarians. With an army of 15,000 horsemen Justinian suddenly pounced upon Constantinople, slew his rivals Leontius and Tiberius, with thousands of their partisans, and once more ascended the throne in 704. His second reign was marked by an unsuccessful war against Terbels, by Arab victories in Asia Minor, by devastating expeditions sent against his own cities of Ravenna and Cherson, where he inflicted horrible punishment upon the disaffected nobles and refugees, and by the same cruel rapacity towards his subjects. By Conspiracies again broke out: Bardas, son-in-law of Philippicus, assumed the purple, and Justinian, the last of the house of Heraclius, was assassinated in Asia Minor, December 711. See E. Gibbon, Decline and Fall of the Roman Empire (ed. Bury, 1896), v. 179-183; J. B. Bury, The Later Roman Empire (1889), ii. 320-330, 356-367.

JUSTIN MARTYR, one of the earliest and ablest Christian apologists, was born about 100 at Flavia Neapolis (anc. Sichem), now Nablus, in Palestinian Syria (Samaria). His parents, according to his own account, were Pagans (Dial. c. Tryph. 38). He describes the course of his religious development in the introduction to the dialogue with the Jew Trypho, in which he reads just a chapter in connection with a doctrine, in which he puts to him the task of the Jewish and Christian reading. Though this narrative is a mixture of truth and fiction, it may be said with certainty that a thorough study of the philosophy of Peripatetics and Pythagoreans, Stoics and Platonists, brought home to Justin the conviction that true knowledge was not to be found in them. On the other hand, he came to look upon the Old Testament prophets as approved by their antiquity; sanctity, mystery and prophecies to be interpreters of the truth. To this, as he tells us in another place (Apol. ii. 12), must be added the deep impression produced upon him by the Holy Place. He apparently took place at Ephesus; there, at any rate, he places his decisive interview with the old man, and there he had those discussions with Jews and converts to Judaism, the results of which he in later years set down in his Dialogue. After his conversion he retained his philosopher’s cloak (Eusebius, Hist. Eccl. iv. 11.8), the distinctive badge of the wandering professional teacher of philosophy, and went about from place to place discussing the truths of Christianity in the hope of bringing educated Pagans, as he himself had been brought, through philosophy to Christ. In Rome he made a fairly long stay, and gleaning, as it were, his results in a classification of his own doctrines, in which he opposed the discussion of his fellow-teachers. Among his opponents was the Cynic Crescens (Apol. ii. 13). Eusebius (Hist. Eccl. iv. 16. 7-8) concludes somewhat hastily, from the statement of Justin and his disciple Tatian (Oral. ad Grac. 19), that the accusation of Justin before the authorities, which led to his death, was due to Crescens. But we know, from the undoubtedly genuine Acta SS Justiniani et sociorum, that Justin suffered the death of a martyr under the prefect Rusticus between 163 and 167.

As an opinion of Justin as a Christian and a theologian, we must turn to his Apology and to the Dialogue with the Jew Trypho, for the authenticity of all other extant works attributed to him is disputed with good reason. The Apology—it is more correct to speak of one Apology than of two, for the second is only a continuation of the first, and dependent upon it—was written in Rome about 150. In the first part Justin defends his fellow-believers against the charge of atheism and hostility to the state. He then draws a positive demonstration of the truth of his religion from the effects of the new faith, and especially from the excellence of its moral teaching, and concludes with a exposition of Christian doctrines, of which the latter are set down with native confidence as the work of demons. As the main support of his proof the truth of Christianity appears his detailed demonstration that the prophecies of the old dispensation, which are older than the Pagan poets and philosophers, have found their fulfilment in Christianity. A third part shows, from the practices of their religious worship, that the Christians had in truth dedicated themselves to God. The whole closes with an appeal to the princes, with a reference to the edict issued by Hadrian in favour of the Christians. In the so-called Second Apology, Justin takes occasion from the trial of a Christian recently held in Rome to argue that the innocence of the Christians was proved by the very persecutions. Even as a Christian Justin always remained a philosopher. By his conscious recognition of the Greek philosophy as a preparation for the truths of the Christian religion, he appears as the first and most distinguished in the long list of those who have endeavoured to reconcile Christian with non-Christian culture. Christianity consists for him in the doctrines, guaranteed by the manifestation of the Logos in the person of Christ, giving him the righteousness and immortality, truths which have been to a certain extent foreshadowed in the monothetic religious philosophies. In this process the conviction of the condemnation of the sinner with God, of the salvation of the world and the individual through Christ, fell into the background before the vindication of supernatural truths intellectually conceived. Thus Justin may give the impression of having
rationalized Christianity, and of not having given it its full value as a religion of salvation. It must not, however, be forgotten that Justin is here speaking as the apologist of Christianity to an educated Pagan public, on whose philosophical view of life he had to base his arguments, and from whom he could not expect an immediate comprehension of the religious position of Christians. That he himself had a thorough comprehension of it is shown in the Didastea and the Josephus,” and in the Apology itself where he had to deal with the Judaism that believed in a Messiah, he was far better able to do justice to Christianity as a revelation; and so we find that the arguments of this work are much more completely in harmony with primitive Christian theology than those of the Apology. He also displays in this work a considerable knowledge of the Rabbinical writings and a skilful polemical method which was surpassed by none of the later anti-Jewish writers.

Justin is a most valuable authority for the life of the Christian Church in the middle of the 2nd century. While we have elsewhere no connected account of this, Justin’s Apology contains a few paragraphs (§ 81 seq.), which at times even an insight into the public worship of the Church and its method of celebrating the sacraments (Baptism and the Eucharist). And from this it is clear that though, as a theologian, Justin wished to go his own way, as a believing Christian he was ready to make his standpoint that of the Church and its baptismal confession of faith. His works are also of great value for the history of the New Testament writings. He knows of no canon of the New Testament, i.e. no fixed and inclusive collection of the apostolic writings. His sources for the teachings of Jesus are the "Martyrs of the Apostles," by which are probably to be understood the Synoptic Gospels (without the Gospel according to St John), which, according to his account, were read along with the prophetic writings at the public services. From his writings we derive the impression of an amiable personality, who is honestly at pains to arrive at an understanding with his opponents. As a theologian, he is of wide sympathies; as a writer, he is often diffuse and somewhat dull. There are not many traces of any particular literary influence of his writings upon the Christian Church, and this need not surprise us. The Church as a whole took but little interest in apologetic polemics, nay, these at times even an insight into the feeling that in those controversies that which she held holy might easily suffer loss. Thus Justin’s writings were not much read, and at the present time both the Apology and the Dialogue are preserved in but a single MS. (cod. Paris, 450, a.d. 1364).

**BIBLIOGRAPHY.—**The editions of Robert Etienne (Stephanus) (1502), of J. P. Strabbing (1615), of Prodenzini Marcabia (1742) are superseded by J. C. T. Otto. Justini philosophi et martyr[is] opera quae feruntur omnia (3rd ed. 5 vols., Jenae, 1876-1881). This edition contains besides the Apologies (vol. I.) and the Dialogue (vol. II.) the following writings: Speech to the Greeks (Oratio); Address to the Greeks (Cohortatio); On the Monarchy of God; Epistle to Diognetus; Fragments on the Resurrection and other Fragments; Exposition of the True Faith; Epistle to Zenos and Serenus; Refutation of certain Doctrines of Aristides; Questions and Answers to the Orthodox; Questions of Christians to Paganis; Questions of Paganis to Christians. None of these writings, not even the Cohortatio, which former critics ascribed to Justin, can be attributed to him. The authenticity of the Dialogue has occasionally been disputed, but without reason. For a handy edition of the Apology see G. Krüger, Die Apologeten Justinus des Martyrs (3rd ed. Tbingen, 1904). There is a good German translation with a comprehensive commentary by H. Veil (1894). For English translations consult the "Oxford Library of the Fathers" and the "Ante-Nicene Library." Full information about Justin’s life and views may be had from the following monographs: C. Semisch, Justin der Märtyrer (2 vols., 1840-1842); J. Donaldson, A Critical History of Christian Literature and Doctrine, vol. 2 (1865); C. E. Freppel, St Justin (3rd ed., 1866); Moritz von Englemann, H. Seligson, Das Christentum Justin des Martyers (1878); F. M. Wehoffer, Die Apologie Justin’s des Philosophen und Martyrers in literaturhistorischer Beziehung zum ersten Male untersucht (1897); Alfred Leonhard Fedor, Justinus des Martyrers Lehre von Jesus Christus (1898). On the critical questions raised by these writings consult W. Gaul. Die Abfassungsverhältnisse der pseudo-Justinischen Cohortatio ad Graecos (1902); Adolf Harnack, Didor von Tarsus. Vier pseudo-justinische Schriften als Eigentum Didors nachgewiesen (1901).

**JUTE,** a vegetable fibre now occupying a position in the manufacturing scale inferior only to cotton and flax. The term jute appears to have been first used in 1746, when the captain of the "Wake" noted in his log that he had sent on shore "60 bales of gunny with all the jute rope" (New Eng. Dict. 2.5.). In 1795 W. Roxburgh sent to the directors of the East India Company a bale of the fibre which he described as "the jute of the natives." Importations of the substance had been made at earlier times under the name of *pāt,* an East Indian native term by which the fibre continued to be spoken of in England till the early years of the 19th century, when it was supplanted by the name it now bears. This modern name appears to be derived from *jhut* or *jhot* (Sansk. *jhat,* the vernacular name by which the substance is known in the Cuttack district, where the East India Company had extensive roperies when Roxburgh first used the term.

The fibre is obtained from two species of *Corchorus* (nat. ord. *Tiliaceae,* *C. capsularis* and *C. olitorius,* the products of both being so essentially alike that neither in commerce nor agriculture is any distinction made between them. These and various other species of *Corchorus* are natives of Bengal, where they have been cultivated from very remote times for economic purposes, although there is reason to believe that the cultivation did not originate in the northern parts of India. The two species cultivated for jute fibre are in all respects very similar to each other, except in their fructification and the relatively greater size attained by *C. capsularis.* They are annual plants from 5 to 10 ft. high, with a cylindrical stalk as thick as a man’s finger, and hardly branching except near the top. The light-green leaves are from 4 to 5 in. long by 1½ in. broad above the base, and taper upward into a fine point; the edges are serrated; the two lower teeth are drawn out into bristle-like points. The small whitish-yellow flowers are produced in clusters of two or three opposite the leaves.

The capsules or seed-pods in the case of *C. capsularis* are globular, rough and wrinkled, while in *C. olitorius* they are slender, quill-like cylinders (about 1 in. long), a very marked distinction, as may be noted from fig. 1, in which a and b show the capsules of *C. capsularis* and *C. olitorius* respectively. Fig. 2 represents a flowering top of *C. olitorius.*

Both species are cultivated in India, not only on account...
of their fibre, but also for the sake of their leaves, which are there extensively used as a pot-herb. The use of C. olitorius for the latter purpose dates from very ancient times, it may be identified, as some suppose, with the mallow (mallow) mentioned in Job xxx. 4; hence the name Jew's mallow. It is certain that the Greeks used this plant as a pot-herb; and by many other nations around the shores of the Mediterranean this use of it was, and is still, common. Throughout Bengal the name by which the plants when used as edible vegetables are recognized is nāliét; when on the other hand they are spoken of as fibre-producers it is generally under the name pāti. The cultivation of C. capsularis is most prevalent in central and eastern Bengal, while in the neighbourhood of Calcutta, where, however, the area under cultivation is limited, C. olitorius is principally grown. The fibre known as China jute or Tien-tsin jute is the product of another plant, Abutilon Avicennae, a member of the Mallow family.

Cultivation and Cropping.—Attempts have been made to grow the jute plant in America, Egypt, Africa and other places, but up to the present the fibre has proved much inferior to that obtained from plants grown in India. Here the cultivation of the plant extends from the Hugli through eastern and northern Bengal. The successful cultivation of the plant demands a hot, moist climate, with a fair amount of rain. Too much rain at the beginning of the season is detrimental to the growth, while a very dry season is disastrous. The climate of eastern and northern Bengal appears to be ideal for the growth of the plant.

The quality of the fibre and the produce per acre depend in a measure on the preparation of the soil. The ground should be ploughed about four times and all weeds removed. The seed is then sown broadcast as in the case of flax. It is only within quite recent years that any attention has been paid to the selection of the seed. The following extract from Capital (Jan. 17, 1907) indicates the new interest taken in it.

"Jute seed experiments are being continued and the report for 1906 has been issued. The object of these experiments is, of course, to obtain a better class of jute seed by growing plants, especially for no other purpose than to obtain their seed. The agricultural department has about 300 muands (25,000 lb) of selected seed for distribution this year. The selling price is to be Rs. 10 per muand. The agricultural department of the government of Bengal are now fully alive to the importance of fostering the jute industry by showing conclusively that attention to scientific agriculture will make two muands of jute grow where only one muand grew before. Let them go on (as they will) till all the ryots are thoroughly indoctrinated into the new system."

The time of sowing extends from the middle of March to the middle of June, while the reaping, which depends upon the time of sowing and upon the weather, is performed from the end of June to the middle of October. The crop is said to be ready for gathering when the flowers appear; if gathered before, the fibre is weak, while if left until the seed is ripe, the fibre is stronger, but is coarser and lacks the characteristic lustre.

The fibre is separated from the stalks by a process of retting similar to that for flax and hemp. In certain districts of Bengal it is the practice to stack the crop for a few days previous to retting in order to allow the leaves to dry and to drop off the stalks. It is stated that the colour of the fibre is darkened if the leaves are allowed to remain on during the process of retting. It is also thought that the drying of the plants before retting facilitates the separation of the fibre. Any simple operation which improves the colour of the fibre or shortens the operation of retting is worthy of consideration. The benefits to be derived from the above process, however, cannot be great, for the bundles are usually taken direct to the pools and streams. The period necessary for the completion of the retting process varies according to the temperature and to the properties of the water, and may occupy from two days to a month. After the first few days of immersion the stalks are examined daily to test the progress of the retting. When the fibres are easily separated from the stalk, the operation is complete and the bundles should be withdrawn. The following description of the retting of jute is taken from Royce's 'Fibrous Plants of India':

"The proper point being attained, the native operator, standing up to his middle in water, takes as many of the sticks in his hands as he can grasp, and removing a small portion of the bark from the ends next the roots, and grasping them together, he strips off the whole with a little management from end to end, without breaking either stem or fibre. Having prepared a certain quantity into this half state, he next proceeds to wash off: this is done by taking a large handful; swinging it round his head he dashes it repeatedly against the surface of the water, drawing it through towards him, so as to wash off the impurities; then, with a dexterous throw he fans it out on the surface of the water and carefully picks off all remaining blade spots. It is now wrung out so as to remove as much water as possible, and then hung up on lines prepared on the spot, to dry in the sun."

The separated fibre is then made up into bundles ready for sending to one of the jute presses. The jute is carefully sorted into different qualities, and then each lot is subjected to an enormous hydraulic pressure from which it emerges in the shape of the well-known bales, each weighing 400 lb.

The crop naturally depends upon the quality of the soil, and upon the attention which the fibre has received in its various stages; the yield per acre varies in different districts. Three bales per acre, or 1200 lb is termed a 100% crop, but the usual quantity obtained is about 26 bales per acre. Sometimes the crop is stated in lakhs of 100,000 bales. The crop in 1906 reached nearly 9,000,000 bales, and in 1907 nearly 10,000,000 was reached. The following particulars were issued on the 19th of September 1906 by Messrs. W. F. Souter & Co., Dundee:

A number of experiments in jute cultivation were made during 1906, and the report showed that very encouraging results were obtained from land manured with cow-dung. If more scientific attention be given to the cultivation it is quite possible that what is now considered as 100% yield may be exceeded.

Characteristics: The character by which qualities of jute are judged are colour, lustre, softness, strength, length, firmness, uniformity and absence of roots. The best qualities are of a clear whitish-yellow colour, with a fine silky lustre, soft and smooth to the touch, and fine, long and uniform in fibre. When the fibre is intended for goods in the natural colour it is essential that it should be of a light shade and uniform, but if intended for yarns which are to be dyed a dark shade, the colour is not so important. The cultivated plant yields a fibre with a length of from 6 to 10 ft., but in exceptional cases it has been known to reach 14 or 15 ft. in length. The fibre is decidedly inferior to flax and hemp in strength and tenacity; and, owing to a peculiarity in its microscopic structure, by which the walls of the separate cells composing the fibre vary much in thickness at different points, the single strands of fibre are of unequal strength. Recently prepared fibre is always stronger, more lustres, softer and whiter than such as has been stored for some time—age and exposure rendering it brown in colour and harsh and brittle in quality. Jute, indeed, is much more woody in texture than either flax or hemp, a circumstance which may be easily demonstrated by its behaviour under appropriate reagents; and to that fact is due the change in colour and character it undergoes on exposure to the air. The fibre bleaches with facility, up to a certain point, sufficient to enable it to take brilliant and delicate shades of dye colour, but it is with great difficulty brought to a pure white by bleaching. A very striking and remarkable fact, which has much practical interest, is its highly hygroscopic nature. While in a dry position and atmosphere it may not possess more than 6% of moisture, under damp conditions it will absorb as much as 23%.

Sir G. Watt, in his Dictionary of the Economic Products of India, mentions the following eleven varieties of jute fibre: Serajgunje, Narinajunci, Desi, Deora, Uttariya, Deswal, Bikrampuri, Bhatial, Kamarungji, Mirganji and Jungpuri. There are several other varieties of minor importance. The first four form the four classes into which the commercial fibre is divided, and they are commonly known as Serajgunje, Narinajunci, Daisee and Dowrah. Serajgunje is a soft fibre, but it is superior in colour, which ranges from white to grey. Naringunj uncle is a strong fibre, possesses good spinning qualities, and is very suitable for good warp yarns. Its colour, which is not so high as Serajgunje, begins with a cream shade and approaches red at the roots. All the better class yarns are spun from these two kinds. Daisee is similar to Serajgunje in softness, is of good quality and of great length; its drawback is the low color factor, and hence it is not so suitable for using in natural colour. It is, however, a valuable fibre for carpet yarns, especially for dark yarns. Dowrah is a strong, harsh and low quality fibre, and is used principally for heavy wefts. Each class is subdivided according to the quality and colour of the material, and each class receives a distinctive mark called a bale's mark. Thus, the finest fibres may be divided as follows:

---

Superfine first marks.
Extra fine first marks 1st, 2nd and 3rd numbers.
Superior first marks
Standard
Good
Ordinary
Good second
Ordinary

The lower qualities are, naturally, divided into fewer varieties.

Each bale has its own marks, the fibres of which are guaranteed equal in equality to some standard mark. It would be impossible to give a list of the different marks, for there are hundreds, and new marks are constantly being added. A list of all the principal marks is issued in book form by the Calcutta Jute Baler's association.

The relative prices of the different classes depend upon the crop, upon the demand and upon the quality of the fibre; in 1905 the prices of Daisee 1st class A and First Marks were practically the same, although the former is always considered inferior to the latter. It does not follow that a large crop of jute will result in low prices, for the year 1906-1907 was not only a record one for crops, but also for prices. R. F. C. grade has been as high as £40 per ton, while its lowest recorded price is £12. Similarly the price for First Marks reached £29, 15s. in 1906 as compared with £9, 5s. per ton in 1897. The following table shows a few well-known grades with the average prices during December for the years 1903, 1904, 1905 and 1906.

Jute Manufacture: Long before jute came to occupy a prominent place amongst the textile fibres of Europe, it formed...
the raw material of a large and important industry throughout the regions of Eastern Bengal. The Hindu populace made the material up into cordage, paper and cloth, the chief use of the latter being in the manufacture of gunny bags. Indeed, up to 1830-1840 there was little or no competition with hand labour for this class of material. The process of weaving gunny bags and other coarse articles by these hand-loom weavers has been described as follows:

"The simplest is called chattee weaving-posts, called lalad paar or warp, are fixed upon the ground, occupying the length equal to the measure of the piece to be woven, and a sufficient number of twine or thread is wound on them as warp called lalad. The warp is taken up and removed to the weaving machine. Two pieces of wood are placed at two ends, which are tied to the ohari and other or roller; they are made fast to the khoti. The belot or thread is put into the warp; next to that is the sarsai; a thin piece of wood is laid upon the warp, called chappar or regulator. Here they are no longer wound but is a shuttle necessary; in the room of the latter a stick covered with thread called singa is thrown into the warp as wool, which is beaten in by a piece of plank called beyne, and as the cloth is made wound up to the roller. Next to this is a piece of wood called kheton, which is used for smoothing and regulating the woof; a stick is fastened to the warp to keep the wool straight.

Gunny was woven of numerous qualities, according to the purpose to which it is devoted. Some kinds are made close and dense in texture, for carrying such seed as poppy or rape and sugar; others less close are used for rice, pulses, and seeds of like size, and coarser and opener kinds again are woven for the outer cover of packages and for the sails of country boats. There is a thin close-woven cloth made and used as garments among the females of the aboriginal tribes near the foot of the Himalayas, and in various localities a cloth of pure jute or of jute mixed with cotton is used as a sheet to sleep on, as well as for wearing purposes. To indicate the variety of uses to which jute is applied, the following quotation may be cited from the official report of Hem Chunder Kerr as applying to Midnapur.

"The articles manufactured from jute are principally (1) gunny bags; (2) string, rope and cord; (3) kami, a net-like bag for carrying wood or goods on bullocks; (4) chat, a strip of stuff for tying bales of cotton or cloth; (5) deka, a stick with which the women work for sleep; (6) thika, a kind of hanging shelf for little earthen pots, &c.; (7) dulsam, a floor-cloth; (8) been, a small circular stand for wooden plates used particularly in pooyab, (9) painter's brush and brush for white-washing; (10) ghunsi, a waist-band worn next to the skin; (11) gochh-dari, a hair-band worn by women; (12) muhkra, a net bag used as muzzle for cattle; (13) parakha, false hair worn by players; (14) rakha-bandhan, a slender arm-band worn at the Rakhi-pooranma festival; and (15) dhup, small incense sticks burned at pooyabs."

The fibre began to receive attention in Great Britain towards the close of the 18th century, and early in the 19th century it was spun into yarn and woven into cloth in the town of Abingdon. It is claimed that this was the first British town to manufacture the material. For years small quantities of jute were imported into Great Britain and other European countries and into America, but it was not until the year 1832 that the fibre may be said to have made any great impression in Great Britain. The first really practical experiments with the fibre were made in this year in Chapelshad Works, Dundee, and these experiments proved to be the foundation of an enormous industry. It is interesting to note that the site of Chapelshad Works was in 1907 cleared for the erection of a large new technical college.

In common with practically all new industries progress was slow for a time, but once the value of the fibre and the cloth produced from it had become known the development was more rapid. The pioneers of the work were confronted with many difficulties; most people condemned the fibre and the cloth, many warps were discarded as unfit for weaving, and any attempt to mix the fibre with flax, tow or hemp was considered a form of deception. The real cause of most of these objections was the fact that suitable machinery and methods of treatment had not been developed for preparing yarns from this useful fibre. Warden in his Linen Trade says:

4 For years after its introduction the principal spinners refused to do anything with it, and cloth made of it long retained a tainted reputation. Indeed, R. Roos, a Dutch man, about 1838, to substitute jute yarns for those made from flax in the manufacture of the coffee bagging for their East Indian possessions, that the jute trade in Dundee got a proper start. That fortunate circumstance gave an impulse to the spinning of the fibre which it never lost, and since that period its progress has been truly astonishing."

The demand for this class of bagging, which is made from fine hessian yarns, is still great. These fine Rio hessian yarns form an important branch of the Dundee trade, and in some weeks during 1906 as many as 1000 bales were despatched to Brazil, besides enormous quantities to other parts of the world.

For many years Great Britain was the only European country engaged in the manufacture of jute, the great seat being Dundee. Gradually, however, the trade began to extend, and now almost every European country is partly engaged in the trade. The success of the mechanical method of spinning and weaving of jute in Dundee and district led to the introduction of textile machinery into and around Calcutta. The first mill to be run there by power was started in 1854, while by 1872 three others had been established. In the next ten years no fewer than sixteen new mills were erected and equipped with modern machinery from Great Britain, while in 1907 there were thirty-nine mills engaged in the industry. The expansion of the Indian power trade may be gathered from the following particulars of the number of looms and spindles from 1852 to 1906. In one or two cases the number of spindles is obtained approximately by reckoning twenty spindles per loom, which is about the average for the Indian mills.

The Calcutta looms are engaged for the most part with a few varieties of the commoner classes of jute fabrics, but the success in this direction has been really remarkable. Dundee, on the other hand, turns out not only the commoner classes of fabrics, but a very large variety of other fabrics. Amongst these may be mentioned the following: Hessian, bagging, tarpanil, sacking, scarfs, Brussels carpets, Wilton carpets, imitation Brussels, and several other types of carpets, rugs and matting. In addition to a large variety of fabrics of which jute forms a part. Calcutta has certainly taken a large part of the trade which Dundee held in its former days, but the continually increasing demands for jute fabrics for new purposes have enabled Dundee to enter new markets and so to take part in the prosperity of the trade.

The development of the trade with countries outside India from 1828 to 1906 may be seen by the following figures of exports:

Manufacture.—In their general features the spinning and weaving of jute fabrics do not differ essentially as to machinery and processes from those employed in the manufacture of hemp and heavy flax goods. Owing, however, to the woody and brittle nature of the fibre, it has to undergo a preliminary treatment peculiar to itself. The pioneers of the jute industry, who did not understand this necessity, or rather who did not know how the woody and brittle character of the fibre could be remedied, were perplexed by the difficulties they had to encounter, the fibre spinning badly into a hard, rough and hairy yarn owing to the splitting and breaking of the fibre. This peculiarity of jute, coupled also with the fact that the machinery on which it was first spun, although quite suitable for the stronger and more elastic fibres for which it was designed, required certain modifications to suit it to the weaker jute, was the cause of many annoyances and failures in the early days of the trade.

The first process in the manufacture of jute is termed bating. Batching is the first part of this operation; it consists of selecting the different kinds or qualities of jute for any predetermined kind of yarn. The number of bales for a batch seldom exceeds twelve, indeed it is generally three or six, and of these there may be three, four or even more varieties or marks. The "strake" or "head" of jute as they come from the bale are in a hard condition in consequence of having been subjected to a high hydraulic pressure during baling; it is therefore necessary to soften them before any further process is entered. The strakes are sometimes partly softened or crushed by means of a steam hammer during the process of opening the bale, then taken to the "strakers-up", where the different varieties are selected and hung on pins, and then taken to the jute softening machine. The more general practice, however, is to employ what is termed a "bale opener," or "jute crusher."]

The essential parts of a type of bale opener are three specially shaped rollers, the peripheries of which contain a number of small knobs. Two of these rollers are supported in the same horizontal plane of the framework, while the third or top roller is kept in close contact by means of weights and springs acting on each end of the arbor. Another type of machine termed the "breaker," or "breaker opener," is illustrated in fig. 4. The layers from the different bales are laid upon the feed cloth which carries them up to the rollers, between which the layers are crushed and partly separated. The proximity of the weighted roller or rollers to the fixed ones depends upon the width of material passing through the machine. The fibre is delivered by what is called the delivery cloth, and the batcher usually selects small streaks of about 1 lb. to 2 lb. weight each, and passes them on to the attendant or feeder of the softening machine. These small streaks are now laid as regularly as possible upon the feed-cloth of the softening machine, a general view of which is shown in fig. 4. The fibre passes between a series of fluted rollers, each pair of which is kept in contact by spiral springs as shown in the figure. The standard number of pairs is sixty-three, but different lengths obtain. There is also a difference in the structure of the flutes, some being straight, and others spiral, and each pair may or may not contain the same number of flutes. The springs allow the top rollers of each pair to rise as the material passes through the machine. Advantage is taken of this slight upward and downward movement of the top rollers to automatically regulate the flow of water and oil upon the material. The apparatus for this function is placed immediately over the 11th and 12th rollers of the softening machine and an idea of its construction may be gathered from fig. 5. In many cases the water and oil are applied by less automatic, but equally effective, means. The main object is to see that the liquids are distributed evenly while the fibre is passing through, and to stop the supply when the machine stops or when no fibre is passing. The uniform moistening of the fibre in this machine facilitates the subsequent operations, indeed the introduction of this preliminary process (originally by hand) constituted the first important step in the practical solution of the difficulties of jute spinning. The relative quantities of oil and water depend upon the quality of the batch. Sometimes both while and mineral oils are used, but in most cases the whale oil is omitted. About 1 to 1 1/2 gallons of oil is the usual amount given per bale of 400 lb. of jute, while the quantity of water per bale varies from 3 to 7 gallons. The delivery attendants remove the strakes, give them a twist to facilitate future handling, and place them on what are termed jute barrows. The strakes are now handed over to the cutters who cut off the roots, and finally the material is allowed to remain for twelve to twenty-four hours to allow the mixture of oil and water to thoroughly spread over the fibre.

When the moisture has spread sufficiently, the material is taken to the "breaker," or the first machine in the preparing department. A certain weight of jute, termed a "bollop," is laid upon the feed cloth for each revolution of the latter. The fibre, which should be arranged on the sheet as evenly as possible, is carried up by the feed cloth and passes between the feed roller and the shell on to the...
large cylinder. This cylinder, which has a high surface speed, carries part of the fibre towards the workers and strippers; the surface speed of the workers being much slower than that of the cylinder. The pins in the two rollers oppose each other, those of the workers being "back-set," and this arrangement, combined with the relative angle of the pins, and the difference in the surface speeds of the two rollers, results in part of the fibre being broken and carried round by the worker towards the stripper. This, as its name implies, strips the fibre off the worker, and carries it round to the same direction. But since the surface speed of the cylinder is much greater than the surface speed of the stripper, it follows that the fibre is combed between the two, and that part is carried forward by the cylinder to be reworked. The strippers and workers are in pairs, of which there may be two or more. After passing the last pair of workers and strippers the fibre is carried forward towards the dosing roller, the pins of which are back-set, and the fibre is removed from the cylinder by the doser, from which it passes between the dosing and pressing rollers into the conductor, and finally between the delivery and pressing rollers into the sliver can. It may be mentioned that more or less breaking takes place between each pair of rollers, the pins of which are opposed, and that combing and drawing out obtains between those rollers with pins pointing in the same direction. The ratio of the surface speeds of the drawing roller and the feed roller is termed the draft:

\[ \text{surface speed of drawing roller} : \text{surface speed of feed roller} = \text{draft}. \]

In this machine the draft is usually about thirteen.

The sliver from the can of the breaker card may be wound into bolls, or it may be taken direct to the finishing card. In the latter method from eight to fifteen cans are placed behind the feed rollers, and all the slivers from these cans are united before they emerge from the machine. The main difference between a breaker card and a finisher card is the latter is fitted with finer pins, that is, it contains two dosing rollers, and that it usually possesses a greater number of pairs of workers and strippers—a full circular finisher card having four sets.

After the fibre has been thoroughly carded by the above machines, the cans containing the sliver from the finisher card are taken to the first drawing frame. A very common method is to let four slivers run into one sliver at the first drawing, then two slivers from the first drawing are run into one sliver at the second drawing frame. There are several types of drawing frames, e.g. push-bar or slide, rotary, spiral, ring, open-link or chain, the spiral being generally used for the second drawing. All, however, perform the same function, viz., combing out the fibres and thus laying them parallel, and in addition drawing out the sliver. The designation of the machine indicates the particular method in which the gill pins are moved. These pins are much finer than those of the breaker and finisher cards, consequently the fibres are more thoroughly separated. The draft in the first drawing varies from three to five, while that in the second drawing is usually five to seven. It is easy to see that a certain amount of draft, or drawing out of the sliver, is necessary, otherwise the various doublings would cause the sliver to enegrate thicker and thicker as it goes through each machine. The doublings play a very important part in the appearance of the ultimate rove and yarn, for the chief reason for doubling threads or slivers is to minimize irregularities of thickness and of colour in the material. In an ordinary case, the total doublings in jute from the breaker card to the end of the second drawing is ninety-six: \(12 \times 4 \times 2 = 96\); and if the slivers were made thinner and more of them used the ultimate result would naturally be improved.

The final preparing process is that of roving. In this operation there is no doubling of the slivers, but each sliver passes separately through the machine, from the can to the spindle, is drawn out to a certain length, and then passed through a number of times through a set of rollers or slivers, and the process is repeated until the thread is considerable in thickness and of a constant diameter. This is the "differential motion." In the more usual kind of roving frame the sliver or bobbin is wound on a bobbin of a specified number of revolutions, and the expanding pulley, to impart an intermittently variable speed to the bobbin (each layer of the bobbin has its own particular speed which is constant for the full traverse, but each change of direction of the bobbin is speeded by a quick change of speed to the bobbin). It is essential that the bobbin should have such a motion, because the delivery of the sliver and the speed of the flyer are constant for a given roving, whereas, when there is no difference in length as the bobbin fills. In the jute roving frame the bobbin is termed the "follower," because its revolutions per minute are fewer than those of the flyer. Each layer of rove increases the diameter of the material; hence, at the end of each layer, the speed of the bobbin must be increased, and kept at this increased speed for the whole traverse from top to bottom or vice versa.

Let \(R\) = the revolutions per second of the flyer; \(r\) = the revolutions per second of the bobbin; \(d\) = the diameter of bobbin shaft plus the material; \(L\) = the length of sliver delivered per second; then \((R - r) \times d = L\).

In the above expression, \(r\) and \(L\) are constant, therefore as \(d\) increases the term \((R - r)\) must decrease; this can happen only when \(R\) is increased, which makes the machine quicker. It is easy to see from the above expression that if the bobbin were the "leader" its speed would have to decrease as it filled.

The builder, which receives its motion from the disk and scroll, from two ropes, or from both, always has an intermittently variable speed. It begins at a maximum speed when the bobbin is empty, is constant for each layer, but decreases as the bobbin fills.

The roving yarn is now ready for the spinning frame, where a further draft of about eight is given. The principles of jute spinning are similar to those of dry spinning for flax. For very heavy jute yarns the jute roving frame that was used—the desired amount of twist being given at the roving frame.

The count of jute yarn is based upon the weight in pounds of 14,400 yds., such length receiving the name of "spindle." The finest yarns weigh 24 lb to 3 lb by spindle, and the commonest kinds are 7 lb, 8 lb, 9 lb and 10 lb by spindle. The sizes rise in pounds up to about 20 lb, then by 2 lb up to about 50 lb by spindle, with much larger jumps above this weight. It is not uncommon to find 200 lb to 300 lb rove yarn, while the weight occasionally reaches 450 lb per spindle. The different sizes of yarn are extensively used in a large variety of fabrics, sometimes alone, sometimes in conjunction with other spinners, e.g. with cotton in the various kinds of carpets, with cotton in tapes and household cloths, with line and tow yarns for the same fabrics and for puddings, &c., and with wool for horse clothing. The yarns are capable of being dyed brilliant colours, but unfortunately, the colours are not very fast to light. The yarn can also be prepared to imitate human hair with remarkable closeness, and advantage of this is largely taken in making stage wigs.

For detailed information regarding jute, the cloths made from it and the machinery used, see the excellent work, "The Export Products of India;" Royce’s Fibrous Plants of India; Sharp’s Flax, Tow and Jute Spinning; Leggett’s Jute Spinning; Woodhouse and Milne’s Jute and Linen Weaving; and Woodhouse and Milne’s Textile Design: Pure and Applied. (T. Wo.)

JÜTERBOG, or GüTTERBOG, a town of Germany in the Prussian province of Brandenburg, on the Nuthe, 39 m. S.W. of Berlin, at the junction of the main lines of railway from Berlin to Dresden and Leipzig. Pop. (1900), 7407. The town is surrounded by a medieval wall, with three gateways, and contains two Protestant churches, of which that of St Nicholas (14th century) is remarkable for its three fine aisles. There are also a Roman Catholic church, an old town-hall and a modern school. Jüter-bog carries on weaving and spinning both of flax and wool, and trades in the produce of those manufactures and in cattle. The town manufactures a multi-twist and a revolted jute which belonged in the later middle ages to the archbishopric of Magdeburg, passing to electoral Saxony in 1648, and to Prussia in 1815. It was here that a treaty over the succession to the duchy of Jülich was made in March 1617 between Saxony and Brandenburg, and here in November 1644 the Swedes defeated the Imperialists. Two miles S.W. of the town is the battlefield of Dennenwitz where the Prussians defeated the French on the 6th of September 1813.
JUTES, the third of the Teutonic nations which invaded Britain in the 5th century, called by Bede Jutos or Iuti (see BRITAIN, ANGLO-SAXON). They settled in Kent and the Isle of Wight together with the adjacent parts of Hampshire. In the latter case the national name is said to have survived until Bede's own time, in the New Forest indeed apparently very much later. In Kent, however, it seems to have soon passed out of use, though there is good reason for believing that the inhabitants of that kingdom were of a different nationality from their neighbours (see KENT, KINGDOM OF). With regard to the origin of the Jutes, Bede only says that Angulus (Angel) lay between the territories of the Saxons and the Jutæ—statement which points to their identity with the Iuti or Jyder of later times, i.e., the inhabitants of Jutland. Some recent writers have preferred to identify the Jutes with a tribe called Euææi mentioned in a letter from Theodoberht to Justianin (Mon. Germ. Hist., Epist. iii., p. 132 seq.) and settled apparently in the neighbourhood of the Franks. But these people may themselves have come from Jutland.

See Bede, Hist. Ecles. i. 15, iv. 16. (H. C. M.)

JUTICPALA, or JUTICAPLA, the capital of the department of Jutland, is situated (14 km.) off the main roads from the Bay of Fosenca to the Atlantic coast, and on a small south-east hand tributary of the river Pastaæa. Pop. (1905), about 18,000.

Jutigalpa is the second city of Honduras, being surpassed only by Tegucigalpa. It is the administrative centre of a mountainous region rich in minerals, though mining is rendered difficult by the lack of communications and the unsettled condition of the country. The majority of the inhabitants are Indians or half-castes, engaged in the cultivation of coffee, bananas, tobacco, sugar or cotton.

JUTLAND (Danish Jylland), though embracing several islands as well as a peninsula, may be said to belong to the continental portion of the kingdom of Denmark. The peninsula (Chersonese or Cimbric peninsula of ancient geography) extends northward, from a line between Lübeck and the mouth of the Elbe, for 270 m. to the promontory of the Skaw (Skagen), thus preventing a natural communication directly east and west between the Baltic and North Seas. The northern portion only is Danish, and bears the name Jutland. The southern is German, belonging to Schleswig-Holstein. The peninsula is almost at its narrowest (36 m.) at the frontier, but Jutland has an extreme breadth of 110 m. and the extent from the south-western point (near Ribe) to the Skaw is 180 m. Jutland embraces nine counties, namely, Hjørring, Thisted, Aalborg, Ringkjøbing, Viborg, Randers, Aarhus, Vejle and Ribe. The main water-shed of the peninsula lies towards the east coast; therefore such elevated ground as exists is found on the east, while the western slope is gentle and consists of a low sandy plain of slight undulation. The North Sea coast (western) and Skagerack coast (north-western) consist mainly of a sweeping line of dunes with wide-lagoons behind them. In the south the northernmost of the North Frisian Islands (Fanö) is Danish. Towards the north a narrow mouth gives entry to the Limfjord, or Limfjorden, which, wide and ramifying among islands to the west, narrows to the east and pierces through to the Cattegat, thus isolating the counties of Hjørring and Thisted (known together as Vendsyssel). It is, however, bridged at Aalborg, and its depth rarely exceeds 12 ft. The seaward banks of the lagoons are frequently broken in storms, and the narrow channels through them are constantly shifting. The east coast is slightly higher than the west, and indented with true estuaries and bays. From the south-east the chain of islands forming insular Denmark extends towards Sweden, the strait between Jutland and Fünen having the name of the Little Belt. The low and dangerous coasts, off which the seas are generally very shallow, are efficiently served by a series of lifeboat stations. The western coast region is well compared with the Landes of Gascony. The interior is low. The Varde, Omme, Skjerne, Stor and Karup, sluggish and tortuous streams draining into the western lagoons, rise in and flow through marshes, while the eastern Limfjord is flanked by the swamps known as Vildmose. The only considerable river is the Guåndens, flowing from S.W. into the Randersfjord (Cattegat), and rising among the picturesque lakes of the county of Aarhus, where the principal elevated ground in the peninsula is found in the Himmlerborg and adjacent hills (exceeding 500 ft.). The German portion of the peninsula is generally similar to that of western Jutland, the main difference lying in the occurrence of islands (the North Frisian) off the west coast in place of sand-bars and lagoons. Erratic blocks are of frequent occurrence in south Jutland. (For geology, and the general consideration of Jutland in connexion with the whole kingdom, see DENMARK.)

JUTURNA, (former name Diuturna, the last), an old Latin divinity, a personification of the never-falling springs. Her original home was on the river Numicus near Lavinium, where there was a spring called after her, supposed to possess healing qualities (whence the old Roman derivation from *juare*, to help). Her worship was early transferred to Rome, localized by the Lacus Juturnae near the temple of Vesta, at which Castor and Pollux, after announcing the victory of lake Regillus, were said to have washed the sweat from their horses. At the end of the First Punic War Lutatius Catulus erected a temple in her honour on the Campus Martius, subsequently restored by Augustus. Juturna was associated with two festivals: the Juturnalia on the 11th of January, probably a dedication festival of a temple built by Augustus, and celebrated by the college of the *fontaiani*, workmen employed in the construction and maintenance of aqueducts and fountains; and the Volcanalia on the 23rd of August, at which sacrifice was offered to Volcanus, the Nymps and Juturna, as protectors against outbreaks of fire. In Virgil, Juturna appears as the sister of Turnus (probably owing to the partial similarity of the names), on whom Jupiter, to console her for the loss of her chastity, bestowed immortality and the control of all the lakes and rivers of Latium. For the statement that she was the wife of Janus and mother of Fontus (or Fons), the god of fountains, Arniobius (Adv. gentes iii. 20) is alone responsible.

JUTURNALIA, the.
"Juvenal was the son or ward of a wealthy freedman; he practised declamation till middle age, not as a professional teacher, but as an amateur, and made his first essay in satire by writing the lines on Paris, the actor and favourite of Domitian, and found in the lines of satire (lines 90) the means of gaining by their success, he devoted himself diligently to this kind of composition, but refrained for a long time from either publicly reciting or publishing his verses. When at last he did come to an educated public, his recitations were attended by great crowds and received with the utmost favour. But the lines originally written on Paris, having been inserted in one of his new satires, excited the jealous anger of an actor of the time, who was a favourite of the emperor, and procured the poet's banishment under the form of a military appointment to the extremity of Egypt. Being then eighty years of age, he died shortly afterwards of grief and vexation.

Some of these statements are so much in consonance with the indirect evidence afforded by the satires that they may be a series of conjectures based upon them. The rare passages in which the poet speaks of his own position, as in satires xi. and xii., indicate that he was in comfortable but moderate circumstances. We should infer also that he was not dependent on any professional occupation, and that he was separated in social station, and probably too by tastes and manners, from the higher class to which Tacitus and Pliny belonged, as he was by character from the new men who rose to wealth by servility under the empire. Juvenal is no organ of the pride and dignity, still less of the urbanity, of the cultivated representatives of the great families of the republic. He is the champion of the more sober virtues and ideas, and perhaps the organ of the rancours of the old aristocracy. The continued to write satires long before he gave them to the world accords well with the nature of their contents and the elaborate character of their composition, and might almost be inferred from the ephemeral but yet guarded statement of Quintilian in his short summary of Roman literature. After speaking of the merits of Lucilius, Horace and Persius as satirists, he adds, "There are, too, in our own day, distinguished writers of satire whose names will be heard of hereafter" (Inst. Or. x. 1, 94). There is no Roman writer of satire who should be mentioned along with those others by so judicious a critic, except Juvenal. The motive which a writer of satire must have had for secrecy under Domitian is sufficiently obvious; and the necessity of concealment and self-suppression thus imposed upon the writer may have permanently affected his whole manner of composition.

So far the evidence of these lives follows a not improbable tradition. But when we come to the story of the poet's exile the case is otherwise. The undoubted reference to Juvenal in Suidius Apollinaris as the victim of the rage of an actor only proves that the original story from which all the varying versions of the lives are derived was generally believed before the middle of the 5th century of our era. If Juvenal was banished at the age of eighty, the author of his banishment could not have been the "enraged actor" in reference to whom the original lines were written, as Paris was put to death in 83, and Juvenal was certainly writing satires long after 100. The satire in which the lines now appear was probably first published soon after the accession of Hadrian, when Juvenal was not an octogenarian but in the maturity of his powers. The cause of the poet's banishment at that advanced age could not therefore have been either the original composition or the first publication of the lines.

An expression in xv. 45 is quoted as a proof that Juvenal had visited Egypt. He may have done so as an exile or in a military command; but it seems hardly consistent with the importance which the emperors attached to the security of Egypt, or with the concern which they took in the interests of the army, that these conditions were combined at an age so unfit for military employment. If any conjecture is warrantable on so obscure a subject, it is more likely that this temporary disgrace should have been inflicted on the poet by Domitian. Among the many victims of Juvenal's satire it is only against interest in the worship of the vilest instruments of his court, the Egyptian Crispinus, that the poet seems to be animated by personal hatred. A sense of wrong suffered at their hands may perhaps have mingled with the detestation which he felt towards them on public grounds. But if he was banished under Domitian, it must have been either before or after 93, at which time, as we learn from an epigram of Martial, Juvenal was in Rome.

More ancient evidence is supplied by an inscription found at Aquinum, recording, so far as it has been deciphered, the dedication of an altar to Ceres by a Junius Juvenalis, tribune of the first cohort of Dalmatians, quinqueremius, and writing Divi Vestponti, a provincial magistrate whose functions corresponded to those of the censor at Rome. This Juvenalis may have been the poet, but he may equally well have been a relation. The evidence of the satires does not point to a prolonged absence from the metropolis. They are the product of immediate and intimate familiarity with the life of the great city. An epigram of Martial, written at the time when Juvenal was most vigorously employed in their composition, speaks of him as settled in Rome. He himself hints (iii. 318) that he maintained his connexion with Aquinum, and that he had some special interest in the worship of the "Helvian Ceris." Nor is the tribute to the national religion implied by the dedication of the altar to Ceres inconsistent with the beliefs and feelings expressed in the satires. While the fables of mythology are often treated contemptuously or humorously by him, other passages in the satires clearly imply a conformity to, and even a respect for, the observances of the national religion. The evidence as to the military post filled by Juvenal is curious, when taken in connexion with the confused tradition of his exile in a position of military importance. It cannot be supposed that the satires bear traces of military experience; the life described in them is rather such as would present itself to the eyes of a civilian.

The only other contemporary evidence which affords a glimpse of Juvenal's actual life is contained in three epigrams of Martial. Two of these (vii. 24 and 91) were written in the time of Domitian, the third (xii. 18) early in the reign of Trajan, after Martial had retired to his native Bilbilis. The first attests the strong regard which Martial felt for him; but the subject of the epigram seems to hint that Juvenal was not an easy person to get on with. In the second, addressed to Juvenal himself, the epithet facundus is applied to him, and to his "eloquence" as satirist or orator. In the last Martial imagines his friend wandering about discontentedly through the crowded streets of Rome, and undergoing all the discomforts incident to attendance on the levées of the great. Two lines in the poem suggest that the satirist, who inveighed with just severity against the worst corruptions of Roman morals, was not too rigid a censor of the morals of his friend. Indeed, his intimacy with Martial is a ground for not attributing to him exceptional strictness of life.

The additional information as to the poet's life and circumstances derivable from the satires themselves is not important. He had enjoyed the training which all educated men received in his day (i. 15); he speaks of his farm in the territory of Tibur.
triller rather than as a monster of lust and cruelty, is the reproduction
of a real or imaginary scene from the reign of Domitian, and is
animated by the profoundest scorn and loathing both of the
tyrant himself and of the worst instruments of his tyranny.
The fifth is a social picture of the degradation to which poor
guests were exposed at the banquets of the rich, but many of the
epigrams of Martial and the more sober evidence of one of Pliny’s
letters shows that the picture painted by Juvenal, though perhaps
exaggerated in colouring, was drawn from a state of society
prevalent during and immediately subsequent to the times of
Domitian. Book II. consists of the most elaborate of the
satires, by many critics regarded as the poet’s masterpiece, the
famous sixth satire, directed against the whole female sex,
which shares with Domitian and his creatures the most cherished
place in the poet’s antipathies. It shows certainly no diminu-
tion of vigour either in its representation or its invective.
The time at which this satire was composed cannot be fixed with
certainty, but some allusions render it highly probable that it
was given to the world in the later years of Trajan, and before
the accession of Hadrian. The date of the publication of
Book III., containing the seventh, eighth and ninth satires, seems
to be fixed by its opening line to the first years after the accession
of Hadrian. In the eighth satire another reference is made (120)
to the misgovernment of Marius in Africa as a recent event,
and at line 51 there may be an allusion to the Eastern wars
that occupied the last years of Trajan’s reign. The ninth has no
allusion to determine its date, but it is written with the same
spare freedom as the second and the sixth, and belongs to
the period when the poet’s power was most vigorous, and his
exposure of vice most uncompromising. In Book IV., comprising
the famous tenth, the eleventh and the twelfth satires, the author
appears more as a moralist than as a pure satirist. In the tenth,
the theme of the “vanity of human wishes” is illustrated by
great historic instances, rather than by pictures of the men and
manners of the age; and, though the declamatory vigour and
power of expression in it are occasionally as great as in the earlier
satires, and although touches of Juvenal’s saturnine humour,
and especially of his misogyny, appear in all the satires of this
book, yet their general tone shows that the white heat of his
indignation is abated; and the lines of the eleventh, already
referred to (201 seq.),

“Spectant juvenes quos clamor et auda
Sponsio, quois cultae decet asesseae puellae:
Nostra bibat vernum contracta cuticula solem,”
leave no doubt that he was well advanced in years when they
were written.

Two important dates are found in Book V., comprising satires
xiii-xvi. In the xiii. 16 Juvenal speaks of his friend Calvisus as
now past sixty years of age, having been born in the consulumhip
of Fonteius. Now L. Fonteius Capito was consul in 67. Again
at xv. 27 an event is said to have happened in Egypt “nuper
consulit Iunco.” There was a L. Aemilius Iuncus consul
suffectus in 127. The fifth book must therefore have been pub-
lished some time after this date. More than the fourth, this
book bears the marks of age, both in the milder tone of the senti-
ments expressed, and in the feebler power of composition exhi-
bited. The last satire is now imperfect, and the authenticity
both of this and of the fifteenth has been questioned, though on
insufficient grounds.

Thus the satires were published at different intervals, and for
the most part composed between 100 and 130, but the most
powerful in feeling and vivid in conception among them deal
with the experience and impressions of the reign of Domitian,
occasionally recall the memories or traditions of the times of
Nero and Claudius, and reproduce at least one startling page
from the annals of Tiberius. The same overpowering feeling
which constrained Tacitus (Agric. 2, 3), when the time of long
endurance and silence was over, to recall the “memory of the

1 This is especially noticeable in the seventh satire, but it applies
also to the mention of Crispinus, Latinius, the class of delatores, &c.,
in the first, to the notice of Veiento in the third, of Rubellius Blandus
in the eighth, of Callicius in the thirteenth, &c.
2 Cf. Tacitus, Annals, xiii. 25.

611
former oppression,” acted upon Juvenal. There is no evidence that these two great writers, who lived and wrote at the same time, who were animated by the same hatred of the tyrant under whom the best years of their manhood were spent, and who both felt most deeply the degradation of their times, were even known to each other. Tacitus belonged to the highest, most refined, and senatorial class, Juvenal apparently to the middle class and to that of the struggling men of letters; and this difference in position had much influence in determining the different bent of their genius, and in forming one to be a great national historian, the other to be a great social satirist. If the view of the satirist is owing to this circumstance more limited in some directions, and his taste and temper less conformable to the best ancient standards of propriety, he is also saved by it from prejudices to which the traditions of his class exposed the historian. But both writers are thoroughly national in sentiment, thoroughly masculine in tone. No ancient authors express so strong a hatred of evil. The peculiar greatness and value of both Juvenal and Tacitus is that they did not shut their eyes to the evil through which they had lived, but deeply resented it—the one with a vehement and burning passion, like the “saeva indignatio” of Swift, the other with perhaps even deeper but more restrained emotions of mingled scorn and sorrow, like the scorn and sorrow of Milton when “fallen on evil days and evil tongues.” In one respect there is a difference. For Tacitus the prospect is not wholly cheerless, the detested tyranny was at an end, and its effects might disappear with a more beneficial rule. But the gloom of Juvenal’s pessimism is unlighted by hope.

A. C. Swinburne has suggested that the secret of Juvenal’s concentrated power consisted in this, that he knew what he hated, and that what he did hate was despotism and democracy. But it would be hardly true to say that the animating motive of his satire was political. It is true that he finds the most typical examples of lust, cruelty, levity and weakness in the emperors and their wives—in Domitian, Otho, Nero, Claudius and Messalina. It is true also that he shares in the traditional idolatry of Brutus, that he strikes at Augustus in his mention of the “three disciples of Sulla,” and that he has no word of recognition for what even Tacitus acknowledges as the beneficent rule of Trajan. So too his scorn for the Roman populace of his time, who cared only for their dose of bread and the public games, is unqualified. But it is only in connexion with its indirect effects that he seems to think of despotism; and he has no thought of democracy at all. It is not a question of liberty and of the senatorial rule that he chafes, but for the loss of the old national manliness and self-respect. This feeling explains his detestation of the outward manners and superstitions, his loathing not only of inhuman crimes and cruelties but even of the lesser dejections from self-respect, his scorn of luxury and of art as ministering to luxury, his mockery of the poetry and of the stale and dilletante culture of his time, and perhaps, too, his indifference to the schools of philosophy and his readiness to identify all the professors of stoicism with the reserved and close-cropped puritans, who concealed the worst vices under an outward appearance of austerity. The great fault of his character, as it appears in his writings, is that he too exclusively indulged this mood. It is much more difficult to find what he loved and admired than what he hated. But it is characteristic of his strong nature that, where he does betray any sign of human sympathy or tenderness, it is for those who by their weakness and position are dependent on others for their protection—as for “the peasant boy with the little dog, his playfellow,” or for “the home-sick lad from the Sabine highlands, who sighs for his mother whom he has not seen for a long time, and does not know where he is or the little familiar kids.”

If Juvenal is to be ranked as a great moralist, it is not for his greatness and consistency as a thinker on moral questions. In the rhetorical exaggeration of the famous tenth satire, for instance, the highest energies of patriotism—the gallant and desperate defence of great causes, by sword or speech—are quoted as mere examples of disappointed ambition; and, in the indiscriminate condemnation of the arts by which men sought to gain a livelihood, he leaves no room for the legitimate pursuits of industry. His services to morals do not consist in any positive codifications of wholesome practical duty, but in the strength of his words about the things which he has realized and expressed the restraining influence of the old Roman and Italian ideal of character, and also of that religious conscience which was becoming a new power in the world. Though he disclaims any debt to philosophy (xii. 121), yet he really owes more to the “Stoica dogmata,” then prevalent, than he is aware of. But his highest and rarest literary quality is his power of painting characters, scenes, incidents and actions, whether from past history or from contemporary life. In this power, which is also the great power of Tacitus, he has few equals, and perhaps no superior among ancient writers. The difference between Tacitus and Juvenal in power of representation is that the prose historian is more of an imaginative poet, the satirist more of a realist and a grotesque humorist. Juvenal can paint great historical pictures in all their detail—as in the famous representation of the fall of Sejanus; he can describe a character elaborately or hit it off with a single stroke. The picture drawn may be a caricature, or a misrepresentation of the fact—as that of the father of Domesthenes, “bier-eyed with the soot of the glowing mass,” &c.—but it is, with rare exceptions, realistically conceived, and it is brought before us with the vivid touches of a Dore or of a Hogarth. He is great; he is great; he is a great pictorial satirist of the 18th century, Hogarth. Yet even in this, his most characteristic talent, his prominence to exaggeration, the attraction which coarse and repulsive images have for his mind, and the tendency to sacrifice general effect to minute-ness of detail not infrequently mar his best effects.

The difficulty is often felt of distinguishing between a powerful rhetorician and a genuine poet, and it is felt particularly in the case of Juvenal. He himself knew and has well described (vii. 53 seq.) the conditions under which a great poet could flourish, and he felt that his life was not fitted for producing one. He has little sense of beauty either in human life or nature. Whenever such sense is evoked it is only as a momentary relief to his prevailing sense of the hideousness of contemporary life, or in protest against what he regarded as the enervating influences of art. Even his references to the great poets of the past indicate rather a blast sense of indifference and weariness than a fresh enjoyment of them. Yet his power of touching the springs of tragic awe and horror is a genuine poetical gift, of the same kind as that which is displayed by some of the early English dramatists. He feels the terrible power of the words, not essentially a great rhetorician than a great poet. His training, the practical and the theoretical, of his mind, his strong but morose character, the circumstances of his time, and the materials available for his art, all fitted him to rebuke his own age and all after-times in the tones of a powerful preacher, rather than charm them with the art of an accomplished poet. The composition of his various satires shows no negligence, but rather excess of elaboration; but it produces the impression of mechanical contrivance rather than of organic growth. His movement is sustained and powerful, but there is no rise and fall in it. The verse is most carefully constructed, and is also most effective, but it is so well adjusted to the incisiveness of Lucan, not with the musical charm of Virgil. The diction is full, even to excess, of meaning, point and emphasis. Few writers have added so much to the currency of quotation. But his style altogether wants the charm of ease and simplicity. It wearsies by the constant strain after effect, its mock-heroics and allusive periphrasis, and excites distrust by its want of moderation.

On the whole no one of the ten or twelve really great writers of ancient Rome leaves the mind so mixed an impression, both as a writer and as a man, as Juvenal. He is famous for anything at all, of the highest imaginative mood—the mood of reverence and noble ambition—which made Ennius, Lucretius and Virgil the truest poetical representatives of the genius of Rome. He has nothing of the wide humanity of Cicero, of the urbanity of Horace, of the ease and grace of Catullus. Yet he
represents another mood of ancient Rome, the mood natural to her before she was humanized by the lessons of Greek art and thought. If we could imagine the elder Cato living under Domitian, cut off from all share in public life, and finding no outlet for his combative energy except in literature, we should perhaps have to give the works of Juvenal's satire and the place which is his due as a representative of the spirit of those days.

As a man he shows many of the strong qualities of the old Roman plebeian—the aggressive boldness, the intolerance of superiority and privilege, which animated the tribunes in their opposition to the senatorial rule. Even where we least like him we find nothing small or mean to alienate our respect from him.

Though he loses no opportunity of being coarse, he is not licentious; though he is often truculent, he cannot be called malignant. It is, indeed, impossible to say what motives of personal charigin, of love of detraction, of the mere literary passion for effective writing, may have contributed to the indignation which inspired his verse. But the prevailing impression we carry away after reading him is that in all his early satires he was animated by a sincere and manly detestation of the tyrannoy and cruelty, the debauchery and luxury, the levity and effeminacy, the crimes and frauds, which we know from other sources were then rife in Rome, and that a more serene wisdom and a happier frame of mind were attained by him when old age had somehow allayed the fierce rage which vexed his manhood.

AUTHORITIES.—The remarkable statements in a "life" found in a late Italian MS. (Barberini, viii. 18), "Iunius Juvenalis Aquinius Iulianus," etc., ascribed to P. Tiquinius, and a Greek MS. of Juvenal, in which Claudius Nerone et L. Antistio consulis (55) natus est, xorom habebat Septumualaean quoae Fuscino (Sat. xiv. 1) nupsit," though not necessarily false, cannot be accepted without confirmation.

The earliest evidence for the banishment of Juvenal is that of Sidonius Apollinaris (c. 480), Carm. ix. 256, "Non qui tempore Caesaris secundi | Aeterno coluit Tomos reatum | Nec qui consiliis deinde causae | Ad vulgi tenuem strepitium auram / Irati fuit hist; / In vili consilio et contra | Thebani et Juvenalis impet l'infamy | et Juvenalis impet l'infamy Theban and Juvenal imply the belief that Juvenal died in exile. The banishment is also mentioned by A. Malalas, a Greek historian subsequent to Justinian, who gives the place as Pentapolis in Africa. Chron. x. 262, Dindorf. The inscription (on a stone now lost) is as follows, the words and letters in brackets being the conjectural restorations of scholars:—[Cere] [s]i [sacrum] [D. Iu] [nus] Juvenalis [trib. coh.[Ii] Deltmatarum || Ivi quyning // flamen // divi || Vespuans || vi- vo dedicavit || qual suae pec.," Corp. inscr. lat. x. 539a, xiii. 201 sq. The best of the known manuscripts of Juvenal (P) is at Montpellier (125); but there are several others which cannot be mentioned here. Notably mentioned are MS. (Canor. Lat. 41), which contains a portion of Satire vi., the existence of which was unknown until E. O. Winstedt published it in the Rev. of Rev., vi. 29. Another fragment in the Bibliothèque Nationale was described by C. E. Stuart in the Classical Quarterly (Jan. 1909). Numerous scholia and glossaries attest the interest taken in Juvenal in post-classical times and the middle ages. This is the first time "Pithoeus" is mentioned. Two MSS. published by P. Pitchoes, and the "Cornutus scholia," of less value, specimens of which have been published by various scholars.

The earliest edition which need now be mentioned is that of P. Pitchoes, 1585, in which P was first used for the text. Amongst later ones we may mention the commentaries of Rupteri (1819) and C. F. Heinrich (1829, with the old scholia), A. Weidner (1839), L. Friedländer (1837, with a full verbal index). The most useful English commentaries are those of J. E. B. Mayor (a voluminous and learned commentary on thirteen of the Satires, ii., vi. and ix. being omitted), J. D. Lewis (1882, with a valuable list of references to all the other commentaries which may be mentioned), E. J. T. Schanz, (1890, which may be very useful), and W. T. C. Haggis (1899). The only recent critical work published in a language other than Latin is Duellman's Forschungen zu den Werken Juvenalis (1903). There are recent critical texts: conservative and chiefly based on P, by F. Buecheler (1893, with selections from the scholia) and S. Owen (in the Oxford Series of Texts and Translations). The edition of A. A. Akhmanov (1901) of the first seven books of Juvenal with fewer innovations, in the new Corpus poetarum latinorum, fasc. v. The two last-named editors alone give the newly discovered lines of Satire vi. There are other fragments of Juvenal translated into English. Dryden translated i., iii., vi., x. and xvi., the others being committed to inferior hands. Other versions are Gifford's (1802), of some merit, and C. Badham's (1814). Johnson's imitations of Satires iii. and iv. are not numerous, and contain much of the criticism and elucidation of the Satires, reference should be made to Teuffel's Geschichte der römischen Literatur (Eng. trans. by Warre, § 331, and Schanz, ditto (1901, ii. § 2, § 4200). (W.Y.S J.P.E.)

JUVENCUS, GAUS VETTIUS AQUILINUS, Christian poet, flourished during the reign of Constantine the Great. Nothing is known of him except that he was a Spanish presbyter of distinguished family. About 330 he published his Libri evangeliorum IV., each book containing about 800 hexameters. The division into books is possibly a reminiscence of the number of the Gospels. The work itself, written with the idea of outing the absurdities of Pagan mythology and replacing them by the truths of Christianity, may be called the first Christian epic.

In the Prophatio the author expresses the hope that the sacredness of his subject may procure him safety at the final conflagration of the world and admission into heaven. The whole is, in the main, a poetical version of the Gospel of Matthew, the other evangelists only being used for supplementary details. It is founded upon a pre-vulgate Latin translation, although there is evidence that Juvenal also consulted the Greek. In spite of metrical irregularities, the language and style are simple and show good taste, being free from the artificiality of other Christian poets and prose writers, and the author has made excellent use of Virgil (his chief model) and other classical writers. Juvenal set the fashion of verse translations of the Bible, and the large number of MSS. of his poem mentioned in lists and still extant are sufficient evidence of its great popularity.

According to Jerome, he was also the author of some poems on the sacraments, but no trace of these has survived. The Latin Heptateuch, a hexameter version of the first seven books of the Old Testament, has been attributed to Juvenal amongst others; but it is now generally supposed to be the work of a certain Cyprianus, a Gaul who lived in the 4th century, possibly a disciple of Jerome, an author of the Life of Caesarius, bishop of Aracile (Arles).

See M. Manitius, Geschichte der christlich-latinerischen Poesie (1891); A. Ebert, Allgemeine Geschichte der Literatur des Mittelalters, vol. i. (1889); editions of Juvenal by C. Marolfo (1886); J. Hümé, in Corpus scriptorum ecclesiasticorum latinorum, vol. xxiv. (Vienna. 1891); J. T. Hatfield, A Study of Juvenal (1890), dealing with syntax, metre and language; editions of the Heptateuch by J. E. B. Mayor (1889; reviewed by W. Sanday in Classical Review, October 1889, and E. H. Milner at Journal of Ecclesiastical Philology of the xi. vol., 1890, and R. Peper, xxiii. of the Vienna series above.)

JUVENILE OFFENDERS. In modern social science the question of the proper penal treatment of juvenile (i.e. non-adult) offenders has been increasingly discussed; and the reformatory principle, first applied in the case of children, has even been extended to reclaimable adult offenders (juveniles in crime, if not in age) in a way which brings them sufficiently within the same category to be noticed in this article. In the old days the main idea in England was to use the same penal methods for all criminals, young and old; when the child broke the law he was sent to prison along with his elders. It was only in comparatively recent times that it was realized that the two were too often the victims to circumstances beyond their own control. They were cursed with inherited taint; they were brought up among evil surroundings; they suffered from the culpable neglect of vicious parents, and still more from bad example and pernicious promptings. They were rather potential than actual criminals, calling for rescue and regeneration rather than vindictive reprisals. Under the old system a painstaking English gaol chaplain calculated that 50% of all criminals had made their first lapse at fifteen. Boys and girls both left prison at seventeen or eighteen and fourteen had been committed ten, twelve, sixteen or seventeen times. Religion and moral improvement were little regarded in prisons, industrial and technical training were impossible. The chief lesson learnt was an intimate and contemptuous acquaintance with the demoralizing interior of a gaol. There were at one time in London two "flash houses" frequented by 6000 boys trained and proficient in thieving and depredation.

The substantial movement for reform dates from the protest of Charles Dickens, who roused public opinion to such an extent that the first Reform Act was passed in 1854. Sporadic efforts to meet the evil had been made at least as far back as earlier. In 1756 the marine Society established a school for the reception and reform of younger criminals; in 1788 the City of London formed a similar institution, which grew much later into
the farm school at Redhill. In 1838 an act of parliament created an establishment at Parkhurst for the detention and correction of juvenile offenders, to whom pardon was given conditional on their entrance into some charitable institution. Parkhurst was technically a prison, and the system combined industrial training with religious and educational instruction. These earlier efforts had, however, been quite insufficient to meet the evils, for in the years immediately preceding 1854 crime was being so constantly reinforced in its beginnings, under the existing penal system, that it threatened to swamp the country. Unofficial, but more or less accurate, figures showed that between 11,000 and 12,000 juveniles passed annually through the prisons of England and Wales, a third of which was between fourteen and seventeen; 46% had been committed more than once; 18% four times and more.

The Reformatory School Act 1854, which was passed in 1856 and applied in 1854, the total reached 14,000. The ages of offenders ranged from less than twelve to seventeen; 60% of the whole were between fourteen and seventeen; 46% had been committed more than once; 18% four times and more.

The Reformatory School Act 1854, which was passed in 1856 and applied in 1854, the total reached 14,000. The ages of offenders ranged from less than twelve to seventeen; 60% of the whole were between fourteen and seventeen; 46% had been committed more than once; 18% four times and more.

Existing reformatories, or "senior home office schools," as they are officially styled, in England numbered 44 in 1907. They received whole numbers of children, and London alone had been convicted of an offence punishable with penal servitude or imprisonment. The number of these during the years between 1894 and 1906 constantly varied, but the figure of the earliest date, 6604, was never exceeded, and in some years it was considerably less, while in 1906 it was no more than 5586, though the general population had increased by several millions in the period. These figures, in comparison with those of 1854, must be deemed highly satisfactory, even when we take into account that the latter went up to the age of seventeen. Older offenders, between sixteen and twenty-one, come within the category of juvenile adults and are dealt with differently (see Borstal Scheme below).

Other schools must be classed with the reformatory, although they have no connexion with prisons and deal with youths who are only potential criminals. The first in importance are the industrial schools. When the newly devised reformatories were doing excellent service it was realized that many of the rising generation might some day lapse into evil ways but would still be only on the right side and might with proper precautions be kept there. They wanted preventive, not punitive, treatment, and for them industrial schools were instituted. The germ of these establishments existed in the Ragged Schools, "intended to educate destitute children and save them from vagrancy and crime." They had been invented by John Pounds (1766-1839), a Portsmouth shoemaker, who, early in the 19th century, was moved with sympathy for these little outcasts and devoted himself to this good work. The ragged school movement found powerful support in active philanthropists when public attention was aroused to the prevalence of juvenile delinquency. The first Industrial School Act was passed in 1856 and applied only to Scotland. Next year its provisions were extended to England, and their growth was rapid. There were 45 schools in the beginning; in 1878 the number had more than been doubled; in 1907 there were 102 in England and Wales and 31 in Scotland.

The provisions of the Education Acts 1871 and 1876 led to a large increase in the number of children committed for breaches of the law and to the establishment of two kinds of subsidiary industrial schools, short detention of truant schools and day industrial schools in which children do not reside but receive their meals, their elementary education and a certain amount of industrial training. The total admissions to truant schools in 1907 were 13,68 boys, and the numbers actually in the schools on the last day of that year were 1175 with 2568 on licence. The average length of detention was fourteen weeks and three days on first admission, seventeen weeks and five days on first re-admission, and twenty-three weeks six days on second admission. The total number of admissions into truant schools from 1878 to the end of 1907 was 44,315, of whom just half had been licensed and not returned, 11,250 had been licensed and once more re-admitted, 8000 twice, and 3100 thrice.

The day industrial schools owed their origin to another reason than the enforcement of the Education Acts. It was found that some special treatment was required for large masses of youths in large cities, who were in such a neglected or degraded condition that there was little hope of their growing into healthy men and women or becoming good citizens. They were left unclean, were ill-fed and insufficiently clothed, and were not usefully taught. The total number who attended these day schools in 1907 was 19,531 boys and 17,532 girls.

The English schools are planned on the establishment or institution system, as opposed to that of the "family" or "boarding out" systems adopted in some countries, and some controversy has been aroused as to the comparative value of the methods. The British practice has always favoured the well-governed school, with the proviso that it is kept small so that the head may know all of his charges. But a compromise has been effected in large establishments by dividing the boys into "houses," each containing a small manageable total as a family under an official father or head. Under this system the idea of the home is maintained, while the advantage of treatment and discipline is secured by grouping several houses together under one general authority. The plan of "boarding out" is not generally approved of in England; the value of the domestic training is questionable and of uncertain quality, depending entirely upon the character and fitness of the foster-parents secured. Education must be less systematic in the private home, industrial training is less easily carried out, and there can be none of that esprit de corps which stimulates effort in physical training as applied to athletics and the playing of games. No very definite decision has been arrived at as to the relative advantages of the "boarding out" and "boarding in." Among the Latin races—France, Italy, Portugal and Spain—the former is as a rule preferred; also in Belgium; in Germany, Holland and the United States placing out in private families is very much the rule; in Austria-Hungary and Russia both methods are in use.

The total admissions to English reformatory schools from their creation to the 31st of December 1907 amounted to 76,455, or 64,031 boys and 12,424 girls. The total discharges for the same period were 79,890, or 59,081 boys and 11,809 girls. The results may be tested by the figures for those discharged in 1904, 1905 and 1906.

Boys.—3573 were placed out, of whom 66 had died, leaving 3507; of these it was found that 2735 (or about 78%) were in regular employment; 158 (or about 4%) were in casual employment; 439 (or about 13%) had been convicted; and 175 (or about 5%) were unknown.

Girls.—480, of whom 11 had died, leaving 469; of these it was found that 384 (or about 82%) were in regular employment; 28 (or about 6%) were in casual employment; 17 (or about 4%) had been convicted, and 40 (or about 8%) were unknown.

For industrial schools, including truant and day schools, the total admissions, up to the 31st of December 1907, were 153,003, or 129,037 boys and 23,966 girls. Of the total number, excluding transfers, 136,961, or 108,398 boys and 28,563 girls. The results as tested by those discharged in 1904, 1905 and 1906 were as follows:

Boys.—8909 were placed out, of whom 118 had since died, leaving 8791 to be reported on; of these it was found that 7547 (or about 86%) were in regular employment; 415 (or about 4.7%) were in casual employment; 419 (or about 4.7%) were convicted or re-committed; and 410 (or about 4.6%) were unknown.

Girls.—2505 placed out, of whom 50 had died, leaving 2455 of
these 2180 (or about 89%) were in regular employment; 112 (or about 4%) were in casual employment; 20 (or about 1%) convicted or re-committed; and 142 (or about 6%) unknown.

These results are of course wholly independent of those achieved by the penal system in the military and industrial establishments; for the latter, the report of the Chief Commissioner for Prisons for October 1902. The record of the first year's work of this excellent system showed that 50 % of cases placed out had done well, thanks to the system and philanthropic labours of the Borstal Association.

The outstanding point in regard to the reclamation of these criminally inclined juveniles is the nature of the employments to which they have been recommended, and in which, as shown, they have done so well. In 1904, 1905 and 1906, the total number of boys dishonoured and placed was 12,482. By far the largest number of these, nearly a sixth, joined the army, 679 of them entering the bands; 292 joined the navy; 961 the mercantile marine; 1567 went to colonies; a very large number of these, and others as joined as labourers, a general class, the total of which was 1906. Other jobs found included miners (629), carters (352), iron or steel workers (214), mechanics (301), shoemakers (181), tailors (161), shop assistants (228), carpenters (178), bakers (131), messengers and porters, including 112 errand boys (315). The balance found employment in smaller numbers at other trades. The fate of 585 was unknown, 858 had been re-convicted, and the balance were in unrecorded or casual employment.

The outlets found by the girls from these various schools naturally follow lines appropriate to their sex and the instruction received. Of the number discharged in the three years mentioned, 1205 became general servants, 268 housemaids, 203 laundry-maidens, 52 cooks, 98 nursesmaids, 65 dressmakers, 221 were engaged in factories and mills, and the balance: was made up by marriage, domestic service or casual employment.

In Ireland the reformatory and industrial school system conforms to that of Great Britain. There were in 1905 six reformatory and 70 industrial schools in Ireland, mostly under Roman Catholic management:

A short account of the reformatory methods of dealing with juvenile offenders in certain other countries will fitly find a place here.

*Australia-Hungary.*—The law leaves children of less than ten years of age to domestic discipline, as also children above that age if not exactly criminal, although the latter may be sent to correctional schools. They are detained for varying periods, but never after twenty years of age, and they may be sent out on licence to situations or employment found for them. These schools also receive children between ten and fourteen guilty of crimes which are, however, by law deemed “contraventions” only; also the destitute between the same ages and the incorrigible whose parents cannot manage them.

In Hungary the penal code prescribes that children of less than ten years of age are not be charged with crimes; those between twelve and sixteen may be deemed to have acted without discretion, and thus escape sentence, but are sent to a correctional school where they may be detained till they are twenty years of age. An excellent system prevails in Hungary by which the supervision of those liberated is entrusted to a “protector,” a philanthropic person in the district who visits and reports upon the conduct of the boys, much like the “probation officer” in the United States.

*Belgium.*—The law of November 1891 places the whole mass of juveniles—those who are liable to any crime but who have not actually been charged with an offence—under the protection of the state. The system is very elastic, realizing the infinite variety of childish natures. The purely penal régime would be wasted upon the really vicious; a severe discipline would press too heavily on the well-disposed. Accordingly, all juveniles, male and female, are divided into six principal classes with a corresponding treatment, it being strictly ruled that there is no intermingling of the classes; the very youngest, rescued early, are never to be associated with the older, who may be already vicious and degraded and who could not fail to exercise a pernicious influence. One of the great merits of the Belgian system is that the regulations may be relaxed, and children of whose amendment good hopes are entertained may be released provisionally, either to the care of parents and guardians or to employers, artisans or agriculturists who will teach them a trade.

*Denmark.*—There were 61 establishments of all classes for juveniles in Denmark in 1906, holding some 2000 inmates. In 1874, by the will of Countess Danner, a large female refuge was founded at Castle Jagerspris, which holds some 350 girls. Another of the same class is the Royal Vodrofske Bonnehjem at Copenhagen, founded in the same year by Mille Schneider. The régime preferred in Denmark is that of the family or the very small school. The Jagerspris system is to divide the whole number of 360 into small parties of 20 each under a nurse or official mother. Employment in Danish schools is mainly agricultural, field labour and gardening, with a certain amount of industrial training; and on discharge the inmates go to farms or to apprenticeship, while a few emigrate.

*France.*—There are five methods of disposing of juvenile offenders in France:

1. The preliminary or preventative prison (maisons d'arrêt and de rééduc) for those under 14.
2. The ordinary prison for all sentenced to less than six months, whose time of detention is too short to admit of their transfer to a provincial colony. It also receives children whom parents have found unmanageable.
3. The public or private penitentiary colony for the irresponsible children, acquitted as "without discretion," as well as for the guilty sentenced to more than six months' and less than two years' detention.
4. The correctional colony, where the system is more severe, receiving all sentenced for more than two years and all who have manifested themselves as vicious and incorrigible.
5. Various penitentiary houses for young females, whatever their particular sentence.

Foremost among French penal reformers stands the name of F. A. Demetz (1796-1873), the founder of the famous colony of Mettray. M. Demetz was a judge who, aghast at the evils inflicted upon children whom he was compelled by law to imprison, left the bench and undertook to find some other outlet for them. At that time the French law, while it acquitted minors shown to have acted without discretion, still consigned them for safe keeping and inevitable contamination to the correctional colonies. M. Demetz conceived the idea of an agricultural colony, and in 1840 organized a small "société paternelle," as it was called, of which he became vice-president. Another philanthropist, the Vicomte de Bretignières de Courtelous, a landed proprietor in Touraine, associated himself in the enterprise and endowed the institution with land at Mettray near Tours. The earliest labours at Mettray were in the development of the institution, but as this approached completion they were applied to farmwork, agricultural employment being the chief feature of the place. The motto and device of Mettray was "France and labour," an idealization of the soil; a healthy life in the open air was intended to replace the overcrowding and demoralizing influences of the confined prisons; and this was effected in the usual farming operations, to which were added gardening, vine-dressing, the raising of stock and the breeding of silkworms. The labour was not light; on the contrary, the directors of the colony sought by constant employment to send their charges to bed tired, ready to sleep soundly and not romp and chatter in their dormitories. The excellence of its aims, and the manifestly good results that were growing out of the system, soon made Mettray a model for imitation in France and beyond it. Mettray establishments were planned upon it, started by the state, or private enterprise: penitentiary colonies were created for boys in connexion with some of the great central prisons. The colony of Val de Yère has a good record. It was started by a private philanthropist, Charles J. M. Lucas, (1803-1889) but after five-and-twenty years was handed over to the state. Other cognate establishments are those of Petit Quevili near Rouen, Petit Bourg near Paris, St Hiliar and Eyssees. There are several female colonies, especially that of Darnetal at Rouen.

It is for the magistrate or juge d'instruction to select the class of establishment to which the juvenile delinquents brought before him shall be committed. The very young, those of twelve years of age and under, are placed out in the country with families, unless they can be again entrusted to their parents or committed to maisons paternelles, containing very limited numbers, thirty or thirty, in charge of a large staff. After twelve, and from that age to fourteen or fifteen, the "ungrateful age" as
the French call it, boys are sent to a reformatory or "preservative school," where they will be under stronger discipline. For the third class, from fifteen to sixteen or eighteen, stricter measures are necessary, so as to dispose of them in specially selected penal colonies, as has already been done at Eysyes, where the discipline is severe, while embodying technical and industrial instruction.

Germany.—In most parts of the German Empire juvenile delinquents and neglected youths are treated in the same establishments. No child of less than twelve years of age can be proceeded against in a court of law, although in some German states destitute or abandoned children have been taken at the ages of six, five and even three years. Youths between the ages of fifteen and eighteen, and convicted, are held over if they are proved to have acted without discretion. There are many kinds of correctional institutions and a number of schools of a correctional character. These last are generally very small, the largest taking barely a hundred, but are very numerous. Many private persons have devoted themselves to the work. Count A. von der Recke-Volmerstein (1791-1878) about 1821 founded a refuge for neglected children in Düsseldorf, between Düsseldorf and Elberfeld. Pastor T. F. Flieder (1800-1864) built up a fine establishment at Kaiserwerth in 1832, which is a large infant asylum and an orphan asylum. Another famous name is that of W. von Türk (1774-1846), who studied under Pestalozzi in Switzerland. A school which has largely influenced public opinion in Great Britain, as in Germany, is the Rauhe Haus, near Hamburg, founded by Dr Wickern in 1833. This began with a single cottage but had grown in twenty years to a hamlet of twenty houses, with from twelve to sixteen inmates in each. The establishment is a Lutheran one; both boys and girls are admitted, in separate houses, and a marked feature of the place is the number of "brothers," young men of good character qualifying for work as superintendents of homes, prison officers and schoolmasters. They take part in the work and are in constant touch with the boys whom they closely supervise, being bound to "keep them in sight day and night, eat with them, sleep in their dormitories, direct their labour, accompany them to chapel, join in their recreations and sports." These "brothers" are honourably known throughout the world and have performed a large work in distant lands as missionaries, prison officers and schoolmasters. The Rauhe Haus receives three classes of juveniles: first, the boys, mostly street vagrants, girls of the same category; third, children taken as boarders from private families, who confess their inability to manage them. The instruction given is in trades, in farming operations, gardening and fruit-raising. The pupils are largely assisted on release, through the good offices of the citizens of Hamburg.

Holland.—In the Low Countries, refuges, called "Godshuizen," were founded as early as the 14th century, intended for the care and shelter of neglected youth and indigent old age. In the 17th century people came from all parts of Europe to learn from the Dutch how orphans and unfortunate children could best be cared for. The Godshuizen of Amsterdam was a vast establishment, into which as many as 4000 juveniles were sometimes crowded, with such disastrous effects that its name was changed to that of "pesthuis," and the government in the beginning of the present century ordered it to be emptied and closed. Other reformatory institutions in Holland are the Netherlands Mettray, the reform school of Zetten, near the Arnhem railway station, for Protestant girls; and that of Alkmaar for boys; the reformatory school of St Vincent de Paul at Amsterdam for both sexes; the Amsterdam reformatory for young vagabonds, male and female; the reform school of Smallleap at Amsterdam. The Netherlands Mettray, which is about five hours' journey from Amsterdam on a farm called Risselt, near Zutphen, is planned on the model of the French Mettray and was founded about 1855 by M. Suringar, a veteran Dutch philanthropist, long-president of the directors of prisons in Amsterdam.

Italy.—In Italy there is no distinction between the treatment of the offending and the neglected or deserted in youth. There are seventeen or more correctional establishments, eight of which are state institutions and the rest founded by private benevolence or by charitable associations or local communities. None of these is exclusively agricultural; ten are industrial, seven industrial and agricultural combined. In Italy the age of responsibility is nine, below which no child can be charged with an offence. The Italian schools are mostly planned on a large scale. That of Marchiound Spaghiardi accommodates 550, divided among three houses under one supreme head. The Turazza institution at Treviolo holds 380, and there are eight others with from 200 to 300 inmates. The régime is very various; the larger number of schools are on the congregated system, with daily labour in association and isolation by night. The "family" method is also practised with small groups, divisions or companies, into which the children are formed according to age or conduct.

Sweden.—All children below the age of sixteen may be sent to a correctional establishment or boarded out in respectable families:

1. If they have committed acts punishable by law which indicate moral perversity and it is deemed advisable to correct them.
2. If they are neglected, ill-used, or if their moral deterioration is feared from the vicious life and character of parents or friends.
3. If their conduct at school or at home is such that a more severe correctional treatment is necessary for their rescue.

Under this law the state is also to provide special schools to take all above ten who have shown peculiar depravity; all who have reached eighteen and who are not yet thought fit for freedom; all who have relapsed after provisional release. Sweden is rich in institutions devoted to the care of destitute and deserted children, all due to the efforts of the charitable. The largest correctional establishment is that founded at Hall, near the town of Stockholm on the shores of the Baltic. This admirable agricultural colony, modelled on that of Mettray, owes its existence to the "Oscar-Josephine society," founded by Queen Josephine, widow of Oscar I.

United States.—In the words of a report made in 1878 by F. B. Sanborn, secretary of the American Social Science Society, "America can justly plume herself upon the work accomplished by her juvenile reformatories since their inauguration down to the present time." The first in point of date and still the most considerable of the reformatories in the United States is that founded in 1835, thanks to the unwearying efforts of the great American publicist and philanthropist Edward Livingston, which now has its home on Randall's Island in New York City. In the following year a reformatory of the same class was founded in Boston, and another in the year after in Philadelphia. All were intended to receive criminal youth. There are state reformatories now in almost all the states of the Union, and those for juvenile adults in New York and Massachusetts have attracted world-wide attention, aiming so high and with such an elaboration of means that they deserve particular description.

The great state reformatory establishment of Elmira, New York, called into existence in 1880 with the avowed aim of compassing the reformation of the criminal by new processes, partakes of the system involved in the treatment of juvenile offenders. It was based upon the principle that crime ought to be attacked in its beginnings by other than ordinary punitive and prison methods. Under this view, the right of society to defend itself by punishment was denied, and it was held that a youthful offender was more sinned against than sinning. It was urged that his crime, due largely to inherited defects, mental or physical and vicious surroundings, was not his own fault, and he had a paramount claim to be treated differently by the state when in custody. The state was not justified in using powers of repression to imprison him in the usual mechanical hard and fast fashion and then return him to society, no better, possibly worse, than before; it was bound to regenerate him, to change his nature, improve his physique, and give him a new mental equipment, so that when again at large he might be fitted to take his place amongst honest citizens, to earn his living by reputable means and escape all temptation to drift back into crime. This
is the plausible explanation given for the state reformatory movement, which led to the creation on such costly and extensive lines of Elmira, and of Concord in Massachusetts, a cogitate establishment. There is very little penal about the treatment, which is that of a boarding school; the education, thorough and carried far, includes language, music, art and industrial art; diet is plentiful, even luxurious; amusements and varied recreation are permitted; well-stocked libraries are provided with entertaining books; a prison newspaper is issued (edited by an inmate). Physical development is sedulously cultivated both by gymnastics and military exercises, and the whole course is well adapted to change entirely the character of the individual subjected to it. The trouble taken in the hope of transforming erring youth into useful members of society goes still further. The original sentence has been indefinite, and release on parole will be granted to inmates who pass through the various courses with credit and are supposed to have satisfied the authorities of their desire to amend. The limit of detention need not exceed twelve months, after which parole is possible, although the average period passed before it is granted is twenty-two months. The hope of permanent amendment is further sought by the fact that a situation, generally with good wages and congenial work, provided by the authorities, awaits every inmate at the time of his discharge. The inmates, selected from a very large class, are first offenders, but guilty generally of criminal offences, which include manslaughter, burglary, forgery, fraud, robbery and receiving. The exact number of these offenders can never be exactly known, from the absence of authentic statistics and the difficulty of following up the surveillance of individuals when released on parole. Reports issued by the manager of Elmira claim that 81% of those paroled have done well, but these results are not definitely authenticated. They are based upon the ascertained good conduct during the term of surveillance, six or twelve months only, during which time these subjects have not yet spent the gratuities earned and have probably still kept the situations found for them on discharge. No doubt the moral character and great attention paid to the development of nervous energy and strengthening by every means the normal and healthful functions of the body. A leading feature in the treatment is the frequency and perfection with which bathing is carried out. A series of Turkish baths forms a part of the course of instruction; the baths being fitted elaborately with all the adjuncts of shower bath, cold douche, ending with gymnastic exercises.

A remarkable and unique institution is the state reformatory for women at Sherborne, Massachusetts, for women with severe mental defect, in a year, the opinion of several authorities are fit subjects for reformatory treatment. The majority of the inmates were convicted of drunkenness, an offence which the law of Massachusetts visits with severity—a sentence of two years being very common. This at once differentiates the class of women from that in ordinary penal establishments. At the same time we find that other women guilty of serious crime are sent by the courts to this prison with a view to their reform. Thus of 352 inmates, while no fewer than 200 were convicted of drunkenness, there were also 63 cases of offences against chastity and 30 against larceny. The average age was thirty-one and the average duration of sentence just over a year. In appearance and in character it more resembles a hospital or home for inebriates than a state convict prison. A system of grades or divisions is relied upon as a stimulus to reform. The difference in grades is denoted by small and scarcely perceptible variations of the little details of everyday life, such as are supposed in a peculiar degree to affect the appreciation of women, e.g. in the lowest division the women have their meals off old and chipped china; in the next the china is less chipped, but is not so chipped; in the next prettily set out with tumbler, cruet-stands and a pepper pot to each prisoner. The superintendent relies greatly also on the moralizing influence of animals and birds. Well-behaved convicts are allowed to tend sheep, calves, pigs, chickens, canaries and parrots. This privilege is highly esteemed and productive, it is said, of the most softening influences.

The "George Junior Republic" (q.v.) is a remarkable institution established in 1865 at Freeville, near the centre of New York State, by Mr. William Reuben George. The original features of the institution are that the inmates at "Notable about labour" is rigidly enforced, and that self-government is carried to a point that, with mere children, would appear whimsical were it not a proved success. The place is, as the name implies, a miniature "republic" with laws, legislature, courts and administration of its own, all made and carried on by the "citizens" themselves. The tone and spirit of the place appeared to be excellent and there is much evidence that in many cases strong and independent character is developed in children whose antecedents have been almost hopeless.

Borstal Scheme in England.—The American system of state reformatory schools is not directly applicable to the young of the English working classes, but the thought of the same method has been at times seriously entertained. Borstal has been an English word, but some time back the experiment of establishing a penal reformatory for offenders above the age hitherto committed to reformatory schools was resolved upon. This led to the foundation of the Borstal scheme, which was first formally started in October 1902. The arguments which had led to it may be briefly stated here. It had been conclusively shown that quite half the whole number of professional criminals had been first convicted when under twelve and that most of them then were not in the period of development, when in short the criminal habit had not yet been definitely formed. Moreover these adolescents escaped special reformatory treatment, for sixteen is in Great Britain the age of criminal majority, after which no youthful offenders can be committed to the state reformatory schools. But there was always a formidable contingent of juvenile adults between sixteen and twenty-one, sentenced to penal servitude, and their numbers although diminishing rose to an average total of 15,000. It was accordingly decided to create a penal establishment under state control, which should be a half-way house between the prison and the reformatory school. A selection was made of juvenile adults, sentenced to not less than six months and sent to Borstal in 1902 to be treated under rules approved by the home secretary. They were to be divided on arrival into three separate classes, penal, ordinary and special, with promotion by industry and good conduct from the lowest to the highest, in which they enjoyed distinctive privileges. The general system, educational and disciplinary, was intelligent and governed by common sense. Instruction, both manual and educational, was well suited to the recipients; the first embraced field work, market gardening, and the knowledge of useful handicrafts; the second was elementary but sound, aided by well-chosen libraries and brightened by the privilege of evening association to play harmless but interesting games. Physical development was also guaranteed by gymnastics and regular exercises. The results were distinctively encouraging. They arrived at Borstal "rough, untrained cubs," but rapidly improved in demeanour and inward character, gaining self-reliance and self-respect, and left the prison on the high road to regeneration. It was wisely remembered that to secure lasting amendment it is not enough to chasten the erring subject, to train his hands, to strengthen his moral sense while still in durance; it is essentially to assist him on discharge by helping him to find work, and enabling him by timely advice to keep him in the straight path. Too much praise cannot be accorded to the agencies and associations
which labour strenuously and unceasingly to this excellent end. Especial good work has been done by the Borstal association, founded under the patronage of the best known and most distinguished persons in English public life—archbishops, judges, cabinet ministers and privy councillors—which receives the juvenile adults on their release and helps them on to employment. Their labours, backed by generous voluntary contributions, have produced very gratifying results. Although the offenders originally selected to undergo the Borstal treatment were those committed for a period of six months, it was recognized that this limit was experimental, and that thoroughly satisfactory results could only be obtained with sentences of at least a year’s duration, so as to give the reforming agencies ample time to operate. In the second year’s working of the system it was formally applied to young convicts sentenced to penal servitude between the ages of sixteen and twenty-one. In the next year it was adopted for all offenders between the ages of sixteen and twenty-one committed to prison, as far as the length of sentence would permit. The commissioners of prisons, in their Report for the year 1908 (Cd. 4300) thus expressed themselves on the working of the experiment:—

"Experience soon began to point to the probable success of this general application of the principle, in spite of the fact that the prevailing shortage of sentences operated against full policy being derived from reformatory effort. The success was most marked in those localities where magistrates, or other benevolent persons, personally co-operated in making the scheme a success. Local Borstal committees were established at all prisons, and it was arranged that those members of the local committees should become ex officio honorary members of the Central Borstal Association, which it was intended should become, what it now is, the parent society directing the general aid on discharge of this category of young prisoners."

In spite of the general adoption of the Borstal system, there was a large class of young criminals who were outside its effects, those who were sentenced to terms of ten days and under for trifling offences. These juvenile adults, once having had the fear of prison taken away by actual experience, were found to come back again and again. To remedy this state of affairs, a bill was introduced in 1907 to give effect to the principle of a long period of detention for all those showing a tendency to embark on a criminal career. The bill was, however, dropped, but a somewhat similar bill was introduced the next year and became law under the title of The Prevention of Crime Act 1908. This measure introduces a new departure in the treatment of professional crime by initiating a system of detention for habitual criminals (see Recidivist). The act attempts the reformation of young offenders by giving the court power to pass sentence of detention in a Borstal institution for a term of not less than one year nor more than three on those between the ages of sixteen and twenty-one who by reason of criminal habits or tendencies or association with persons of bad character require such instruction and discipline as appear most conducive to their reformation. The power of detention applies also to reformatory school offences, while such persons as are already undergoing penal servitude or imprisonment may be transferred to a Borstal institution if detention would conduce to their advantage. The establishment of other Borstal institutions is authorized by the act, while a very useful provision is the power to release on licence if there is a reasonable probability that the offender will abstain from crime and lead a useful and industrious life. The licence is issued on condition that he is placed under the supervision or authority of some society or person willing to take charge of him. Supervision is introduced after the expiration of the term of sentence, and power is given to transfer to prison incorrigibles or those exercising a bad influence on the other inmates of a Borstal institution. The act marks a noteworthy advance in the endeavour to arrest the growing habit of crime.

(A. G.; T. A. L.)

**JUVENTAS—JUXON**

**JUVENTAS** (Latin for "youth": later Juventus), in Roman mythology, the tutelar goddess of young men. She was worshiped at Rome from very early times. In the front court of the temple of Minerva on the Capitol there was a chapel of Juventas, in which a coin had to be deposited by each youth on his birthday in the spirit of the lupa virilis, and sacrifices were offered on behalf of the rising manhood of the state. In connexion with this chapel it is related that, when the temple was in course of erection, Terminus, the god of boundaries, and Juventas refused to quit the sites they had already appropriated as sacred to themselves, which accordingly became part of the new sanctuary. This was interpreted as a sign of the immovable boundaries and eternal youth of the Roman state. It should be observed that in the oldest accounts there is no mention of Juventas, whose name (with that of Mars) was added in support of the augural prediction. After the Second Punic War Greek elements were introduced into her cult. In 218 B.C., by order of the Sibylline books, a lectisternium was prepared for Juventas and a public thanksgiving to Hercules, an association which shows the influence of the Greek Hebe, the wife of Heracles. In 207 Marcus Livius Salinator, after the defeat of Hasdrubal at the battle of Sena, vowed another temple to Juventas in the Circus Maximus, which was dedicated in 191 by C. (or M.) Licinius Lucullus; it was destroyed by fire in 16 B.C. and rebuilt by Augustus. In imperial times, Juventas personified, not the youth of the Roman state, but of the future emperor.

See Dion. Halic., iii. 69, iv. 15; Livy v. 54, xxii. 66, xxxvi. 36.

**JUXON, WILLIAM** (1582-1663), English prelate, was the son of Robert Juxon and was born probably at Chichester, being educated at Merchant Taylors’ School, London, and at St John’s College, Oxford, where he was elected to a scholarship in 1598. He studied law at Oxford, but afterwards he took holy orders, and in 1609 became vicar of St Giles, Oxford, a living which he retained until he became rector of Somerton, Oxfordshire, in 1615. In December 1621 he succeeded his friend, William Laud, as president of St John’s College, and in 1626 and 1627 he was vice-chancellor of the university. Juxon soon obtained other important positions, including that of chaplain-in-ordinary to Charles I. In 1627 he was made dean of Worcester and in 1632 he was nominated to the bishopric of Hereford, an event which led him to resign the presidency of St John’s in January 1633. However, he never took up his episcopal duties at Hereford, as in October 1633 he was consecrated bishop of London in succession to Laud. He appears to have been an excellent bishop, and in March 1636 Charles I. entrusted him with important secular duties by making him lord high treasurer of England; thus for the next five years he was dealing with the many financial and other difficulties which beset the king and his advisers. He resigned the treasurership in May 1641. During the Civil War the bishop, against whom no charges were brought in parliament, lived undisturbed at Fulham Palace, and his advice was often sought by the king, who had a very high opinion of him, and who at his execution selected him to be with him on the scaffold and to administer to him the last consolations of religion. Juxon was deprived of his bishopric in 1649 and retired to Little Compton in Gloucestershire, where he had bought an estate, and here he became famous as the owner of a pack of foxhounds. At the Restoration of Charles II. he became archbishop of Canterbury and in his official capacity he took part in the coronation of this king, but his health soon began to fail and he died at Lambeth on the 4th of June 1663. By his will the archbishop was a benefactor to St John’s College, where he was buried; he also aided the work of restoring St Paul’s Cathedral and rebuilt the great hall at Lambeth Palace.

See W. H. Marah, Memoirs of Archbishop Juxon and his Times (1860); the best authority for the archbishop’s life is the article by W. H. Hutton in the Dict. Nat. Biog. (1892).
The eleventh letter in the Phoenician alphabet and in its descendant Greek, the tenth in Latin owing to the omission of Teth (see I), and once more the eleventh in the alphabets of Western Europe owing to the insertion of J.

In its long history the shape of K has changed very little. It is on the inscription of the Moabitic Stone (early 9th cent. B.C.) in the form (written from right to left) of \( \Phi \) and \( \Upsilon \). Similar forms are also found in early Aramaic, but another form \( \Upsilon \) or \( \Upsilon \), which is found in the Phoenician of Cyprus in the 9th or 10th century B.C. has had more effect upon the later development of the Semitic forms.

The length of the two back strokes and the manner in which they join the upright are the only variations in Greek. In various places the back strokes, treated as an angle \( \angle \), become more rounded \( \ominus \), so that the letter appears as \( \kappa \), a form which in Latin probably affected the development of C (q.v.). In Crete it is elaborated into \( \eta \) and \( \theta \). In Latin K, which is found in the earliest inscriptions, was soon replaced by \( C \), and survived only in the abbreviations for Kalendae and the proper name Kaeso. The original name Kaph became in Greek Kaepa. The sound of K throughout has been that of the unvoiced guttural, varying to some extent in its pronunciation according to the nature of the vowel or its relative position in the word.

In Anglo-Saxon C replaced K through Latin influence, writing being almost entirely in the hands of ecclesiastics. As the sound changes have been discussed under C it is necessary here only to refer to the palatalization of K followed earlier by a final e as in watch (Middle English wache, Anglo-Saxon waecce) by the side of wake (M.E. waken, A.-S. wocan); batch, back, &c. Sometimes an older form of the substantive survives, as in the Elizabethan and Northern make = mate alongside match. (P. Gt.)

Kb, or Mt Godwin-Austen, the second highest mountain in the world, named after Mt Everest. It is a peak of the Karakoram extension of the Muztagh range dividing Kashmir from Chinese Turkestan. The height of Kb as at present determined by triangulation is 28,250 ft., but it is possible that an ultimate revision of the values of refraction at high altitudes may have the effect of lowering the height of Kb, while it would elevate those of Everest and Kinchinjunga. The latter mountain would then rank second, and Kb third, in the scale of altitude. Everest always maintains its ascendency. Kb was ascended for the first time by the duke of the Abruzzi in June 1909, being the highest elevation on the earth's surface ever reached by man.

Kababish, or Kababish, is a breed of the Adyghé (Circassians). The policy of Russia was always to be friendly with the Kabardian aristocracy, who were possessed of feudal rights over the Osseties, the Ingushes, the Abkasians and the mountain Tatars, and had command of the roads leading into Transcaucasia. Ivan the Terrible took Kabardia under his protection in the 16th century. Later, Russian influence was counterbalanced by that of the Crimean khans, but the Kabardian nobles nevertheless supported Peter the Great during his Caucasian campaign in 1722-23. In 1739 Kabardia was recognized as being under the double protectorate of Russia and Turkey, but thirty-five years later it was definitively annexed to Russia, and risings of the population in 1804 and 1822 were cruelly suppressed. Kabardia is considered as a school of good manners in Caucasus; the Kabardian dress sets the fashion to all the mountaineers. Kabardians constitute the best detachment of the personal Imperial Guards at St Petersburg.

A short grammar of the Kabardian language and a Russian-Kabardian dictionary, by Lopatinsky, were published in Sbornik Materialov dlia Opytuyu Kakhasku (vol. ii., Tiflis, 1891). Fragments of the poem 'Sosyruku,' some Persian tales, and the tenets of the Mussulman religion were printed in Kabardian in 1864, by Kazi Atazhukin and Shardanov. The common law of the Kabardians has been studied by Maxim Kovalyevskiy and Vsevolod Miller.

Kabba, a province of the British protectorate of Northern Nigeria, situated chiefly on the right bank of the Niger, between 7° 5' and 8° 45' N. and 5° 30' and 7° E. It has an area of 7,800 sq. m. and an estimated population of about 76,000. The province was divided into four administrative divisions. British influence was ceded to the British government in 1841 by the alight of Idah, whose dominions at that time extended to the right bank of the river. The first British settlement was a failure. In 1854 MacGregor Laird, who had taken an active part in promoting the exploration of the river, sent thither Dr W. B. Balkie, who was successful in dealing with the natives and in 1857 became the first British consul in the interior. The town of Lokoja was founded by him in 1860. In 1868 the consulate was abolished and the settlement was left wholly to commercial interests. In 1879 Sir George Goldie formed the Royal Niger Company, which bought out its foreign rivals and acquired a charter from the British government. In 1886 the company made Lokoja its military centre, and on the transfer of the company's territories to the Crown it remained for a time the capital of Northern Nigeria. In 1902 the political capital of the protectorate was shifted to Zungeru in the province of Zaria, but Lokoja remains the commercial centre. The distance of Lokoja from the sea at the Niger mouth is about 250 m.

"In the absence of any central native authority the province is entirely dependent for administration upon British initiative. It has been divided into four administrative divisions. British and native courts of justice have been established. A British station has been established at Kabba town, which is an admirable site some 50 m. W. by N. of Lokoja, about 1,500 ft. above the sea, and a good road has been made from Kabba to Lokoja. Roads have been opened through the province. (See Nigeria.)"  

KABBABISH ("goatherds"); James Bruce derives the name from Hebrew, sheep), a tribe of African nomads of Semitic origin. It is perhaps the largest "Arab" tribe in the Anglo-Egyptian Sudan, and its many clans are scattered over the country extending S.W. from the province of Dongola to the confines of Darfur. The Kabbabish speak Arabic, but their pronunciation differs much from that of the true Arabs. The Kabbabish have a tradition that they came from Tunisia and are of Mogrebin or western desert; but while the chiefs look like Arabs, the tribesmen resemble the Beja family. They themselves declare that
one of their clans, Kawahla, is not of Kabbabish blood, but was affiliated to them long ago. Kawahla is a name of Arab formation, and J. L. Burckhardt spoke of the clan as a distinct one living about Abu Haraz and on the Atbara. The Kabbabish probably received Arab rulers, as did the Abhaba. They are chiefly employed in cattle, camel and sheep breeding, and before the Scimitar they kept the only source of all transparent, from the Nile, north of Abu Gussi, to Kordofan. They also cultivate the lowlands which border the Nile, where they have permanent villages. They are of fine physique, dark with wavy hair, carefully arranged in tightly rolled curls which cling to the head, with regular features and rather thick aquiline noses. Some of the tribes wear large hats like those of the Kabyles of Algeria and Tunisia.

See James Bruce, *Travels to Discover the Source of the Nile* (1790); A. H. Keane, *Ethnology of Egyptian Sudan* (1864); Angle-Egyptian *Sudan* (edited by Count Gleichen, 1905).

**KABBALAH** (late Hebrew kabbalah, gabbalah), the technical name for the system of Jewish theosophy which played an important part in the Christian Church in the middle ages. The term primarily denotes "reception" and then "doctrines received by tradition." In the older Jewish literature the name is applied to the whole body of received religious doctrine with the exception of the Pentateuch, thus including the Prophets and Hagiographa as well as the oral traditions ultimately embodied in the Mishnah. 1 It is only since the 11th or 12th century that the Kabbalah is known as a system of doctrine for the renounced system of theosophy which claims to have been transmitted uninterruptedly by the mouths of the patriarchs and prophets ever since the creation of the first man.

The cardinal doctrines of the Kabbalah embrace the nature of the Deity, the Divine emanations or Sephiroth, the cosmosomy, the creation of angels and man, their destiny, and the import of the revealed law. According to this esoteric doctrine, God, who is boundless and above everything, is conceived, when existing and thinking, is called **En Sop** (א"א); He is the space of the universe containing **הו** and the universe is not his space. In this boundlessness He could not be comprehended by the intellect or described in words, and as such the **En Sop** was in a certain sense **ל"א** non-existent (**Zohar**, iii. 283). 2 To make his existence known and comprehensible, the **En Sop** had to become active and creative. As creation involves intention, desire, thought and work, and as these are properties which imply limit and belong to a finite being, and moreover as the imperfect and circumscribed nature of this creation precludes the idea of its being the direct work of the infinite and perfect, the **En Sop** had to become creative, through the medium of ten Sephiroth or intelligences, which emanated from him like rays proceeding from a luminary.

Now the wish to become manifest and known, and hence the idea of creation, is co-eternal with the inscrutable Deity, and the first manifestation of this primordial will is called the first **Sephirah** or emanation. This first Sephirah, this spiritual substance which existed in the **En Sop** from all eternity, contained nine other intelligences or Sephiroth. These again emanated, one from the other, the second from the first, the third from the second, and so on up to ten.

The ten Sephiroth, which form among themselves and with the **En Sop** a strict unity, and which simply represent different aspects of one and the same being, are respectively denominated (1) the Crown, (2) Wisdom, (3) Intelligence, (4) Love, (5) Justice, (6) Beauty, (7) Firmness, (8) Splendour, (9) Foundation, and (10) Kingdom. Their evolution was as follows: "When the Holy Aged, the concealed of all concealed, assumed a form, he produced everything in the manner of 188, and as the 189 could not continue in any other form. Hence Wisdom, the second Sephirah, and the beginning of development, when it proceeded from the Holy Aged (another name of the first Sephirah) emanated in male and female, for Wisdom expanded, and Intelligence, the third Sephirah, proceeded from it, and thus were obtained male and female, viz. Wisdom the father and Intelligence the mother, from whose union the other

---

2 On the **Zohar**, "The Bible of the Kabbalists," see below.

pairs of Sephiroth successively emanated" (**Zohar**, iii. 289). These nine primary or fundamental powers, Wisdom or Sephirah No. 2 and the feminine Intelligence or Sephirah No. 3 are joined together by the first potency, the Crown or Sephirah No. 1; they yield the first trial of the Sephric decade, and constitute the divine head triad, the archetypal man.

From the junction of Sephirah Nos. 2 and 3 emanated the masculine potency Love or Mercy (4) and the feminine potency Justice (5). From these, and the male principle of the feminine and the female principle of the masculine, there is formed the triad emanated again the masculine potency Firmness (6) and the feminine potency Splendour (8), which constitute the divine legs of the archetypal man and these Sephiroth form Foundation (9), which is the generative force and mediator of union between them, thus yielding the third triad in the Sephric decade. Kingdom (16), which emanated from the ninth Sephirah, encircles all the other nine, inasmuch as it is the Shechinah, the divine halo, which encompasses the whole by its all-glorious presence.

In their totality and unity the ten Sephiroth are not only denominated the World of Sephiroth, or the World of Emanations, but, owing to the above representation, are called the primordial or archetypal man (=?θροευος) and the heavenly man. It is this form which, as we are assured, the prophet Ezekiel saw in the mysterious chariot (**Ezek.** i. 2–28), and of which the earthly man is a faint copy.

As the three triads respectively represent intellectual, moral and physical qualities, the first is called the Intellectual, the second the Moral or Sensuous, and the third the Material World. According to this theory of the archetypal man the three Sephiroth on the right-hand side are masculine and represent the principle of rigour, the three on the left are feminine and represent the principle of mercy, and the four central or uniting Sephiroth represent the principle of mildness. Hence the right is called "the Pillar of Judgment," the left "the Pillar of Mercy," and the centre "the Middle Pillar." The middle Sephiroth are synecdochically used to represent the worlds or triads of which the first and second are the male and the third the female. Hence the Crown, which unites Sephiroth, which unites Wisdom and Intelligence to constitute the first triad, is by itself denominated the Intellectual World. So Beauty is by itself described as the Sensuous World, and as such is denominated the Queen or the Matron. Thus a trinity of units, viz. the Crown, Beauty and Kingdom, is obtained within the trinity of triads. But further, each Sephirah is as it were a triad in itself; (9) has therefore a special and particular position (4); (2) communicates to what is below, "Just as the Sacred Aged is represented by the number three, so are all the other lights (Sephiroth) of a threefold nature" (**Zohar**, iii. 288). In this all-important doctrine of the Sephiroth, the Kabbalah insists upon the fact that these potencies are not creations of the **En Sop**, which would be a diminution of strength; that they form among themselves and with the **En Sop** a strict unity, and simply represent different aspects of the same being, just as the different rays which proceed from the light, and which appear different things to the eye, are only different manifestations of one and the same light; that for this reason they all alike partake of the perfections of the **En Sop**; and that as emanations from the Infinite, the Sephiroth are infinite and perfect like the **En Sop**, and yet constitute the first finite things. They are infinite and perfect when the **En Sop** imparts its fullness to them, and infinite and imperfect when that fullness is withdrawn from them.

The conjunction of the Sephiroth, or, according to the language of the Kabbalah, the union of the crowned King and Queen, produced the universe in their own image. Worlds came into existence before the **En Sop** manifested himself in the human form of emanations, but they could not continue, and necessarily perished because the conditions of development which obtained with the sexual opposites of the Sephiroth did not exist. These worlds which perished are compared to sparks which fly out from a red-hot iron beaten by a hammer, and which are extinguished according to the distance

3 On the **Zohar**, "The Bible of the Kabbalists," see below.
they are removed from the burning mass. Creation is not ex nihilo; it is simply a further expansion or evolution of the Sephiroth. The world reveals and makes visible the Boundless and the concealed of the concealed. And, though it exhibits the Deity in less splendour than its Sephiric parents exhibit the En Sphah, because it is farther removed from the primordial source of light than the Sephiroth, still, as it is God in all the multifarious forms in the world point out the unity which they represent. Hence nothing in the whole universe can be annihilated. Everything, spirit as well as body, must return to the source whence it emanated (Zohar, ii. 218). The universe consists of four different worlds, each of which forms a separate Sephiric system of a decade of emanations. They were evolved in the following order: (1) The World of Emanations, also called the Image and the Heavenly or Archetypal Matri, is, out of nothing, and that the mediate beings were emanations, was much influenced by Solomon ibn Gabirol (1021-1070) the mysteries of the human face" (Zohar, ii. 76). The human form is shaped after the four letters which constitute the Jewish Tetragrammaton (q.v.; see also Jehovah). The head is in the shape of a, the arms and the shoulders are like y, the breast like y, and the two legs with the back again resemble" (Zohar, ii. 72). The soul of the whole human race pre-exist in the World of Emanations, and are all destined to inhabit human bodies. Like the Sephiroth from which it emanates, every soul has ten potencies, consisting of a triunity of triads. (1) The Spirit (neshâmah), which is the highest degree of being, corresponds to and is operated upon by the Crown, which is the highest triad in the Sephiroth, and is called the Intellectual World; (2) the Soul (rukh), which is the seat of the moral qualities, corresponds to and is operated upon by Beauty, which is the second triad in the Sephiroth, and is called the Moral World; and (3) the Cruder Soul (nephesh), which is immediately connected with the body, and is the cause of his lower instincts and the animal life, corresponds to and is operated upon by Foundation, the third triad in the Sephiroth, called the Material World. Each soul prior to its entering into this world consists of male and female united into one being. When it descends on this earth the two parts are separated and animate two different bodies. "At the time of marriage the Holy One, blessed be he, who knows all souls and spirits, unites them again as they were before; and they again constitute one body and one soul, forming as it were the right and the left of the individual. This union however is a purely corporeal. The sou," and the letters are formed into new words by reading them vertically. (2) The words of the text are ranged in squares in such a manner as to be read either vertically or boustrophedon. (3) The words are

KABBALAH 621

antiquity and influence of Kabbalah.

To obtain these heavenly mysteries, which alone make the Torah superior to profane codes, definite hermeneutical rules are employed, of which the following are the most important. (1) The words of several verses in the Hebrew Scriptures which are regarded as containing a recondite sense are placed over each other, and the letters are formed into new words by reading them vertically. (2) The words of the text are ranged in squares in such a manner as to be read either vertically or boustrophedon. (3) The words are

The view of a mediate creation, in the place of the immediate creation of the world, in which the mediate beings were created, was much influenced by Solomon ibn Gabirol (1021-1070)
and the evil effects of nervous degeneration find a more recent illustration in the mysticism of the Chasidim (Hasidim, "saints").

A Jewish sect in eastern Europe which started from a movement in the 18th century against the exaggerated casuistry of contemporary rabbis, and combined much that was spiritual and beautiful with extreme emotionalism and degradation. The appearance of the Kabbalah and of other forms of mysticism in Judaism may seem contrary to ordinary and narrow conceptions of orthodox Jewish legalism. Its interest lies, not in its doctrines, which have often been absurdly over-estimated (particularly among Christians), but in its contribution to the study of human thought. It supplied a want which has always been felt by certain types of people—vivacious effusions upon ill-balanced minds. As usual, the excessive self-introspection was not checked by a rational criticism; the individual was guided by his own reason, the limitations of which he did not realize; and in becoming a law unto himself he ignored the accumulated experiences of civilized humanity.

A feature of greater interest is the extraordinary part which this theosophy played in the Christian Church, especially at the time of the Renaissance. We have already seen that the Sephlicode or the Chet Theophane was considered to be of a magical nature, both infinite and finite, perfect and imperfect. More distinct, however, is the doctrine of the Trinity. In Deut. vi. 43, where Yahweh occurs first, then Eloheh, and then again Yahweh, we are told "The voice though one, consists of three elements, fire (i.e. warmth), air (i.e. breath), and water (i.e. humidity), yet all three are one in the mystery of the voice and can only be one. Thus also Yahweh, Eloheh, Yahweh, constitute one—three forms which are one." (Zohar, ii, 43; compare i.ii. 65). Discussing the thrice holy in Isaiah vi. 3, one coxex of the Zohar had the following remark: "The first holy denotes the Holy Father, the second the Holy Son, and the third the Holy Ghost." (cf. Galatinus, De arcans cathed. lib. ii. c. 3, p. 31; Wolf, Bibliotheca hebraica, i. 1136). Still more distinct is the doctrine of the atonement. "The Messiah invokes all the sufferings, pain, and afflictions of Israel to come upon Him. Now if He did not remove them thus and take them upon Himself, no man could endure the sufferings of Israel, due as their punishment for transgressing the law; as it is written (Isa. lii. 4), "Surely He hath borne our griefs and carried our sorrows." (Zohar, ii. 12). These and similar statements favouring the doctrine of the Messiah that made many Kabbalists of good standing the highest position in the synagogue emboldened the Catholic faith and write elaborate books to win their Jewish brethren over to Christ. As early as 1450 a company of Jewish converts in Spain, at the head of which were Paul de Heredia, Vidal de Sangosse de Aragon, and Davila, published compilations of Kabbalistic treatises to prove from them the doctrines of Christianity. They were followed by Paul Ricci, professor at Pavia, and physician to the emperor Maximilian I. Among the best-known non-Jewish exponents of the Kabbalah were the Italian count Pico di Mirandola (1463-1504), the renowned Johann Reuchlin (1455-1522), Heinrich Cornelius Agrippa of Nettesheim (1486-1535), Theophrastus Paracelsus (1493-1541), and, later, the Englishman Robert Fludd (1574-1637). Prominent among the "nine hundred theses" which Mirandola had placarded in Rome, and which he undertook to defend in the presence of all European scholars, whom he invited to the Eternal City, promising to defray their travelling expenses, was the following: "No science yields greater proof of the divinity of Christ than magic and the Kabbalah. Mirandola so convinced Pope Paul III of the paramount importance of the Kabbalah as an auxiliary to Christianity that his holiness exerted himself to have Kabbalistic writings translated into Latin for the use of divinity students. With equal zeal did Reuchlin act as the
apostle of the Kabbalah. His treatises exercised an almost magic influence upon the greatest thinkers of the time. Pope Leo X. and the early Reformers were alike captivated by the charm of his name. The Kabbalah as propounded by Reuchlin, and not only divines, but statesmen and warriors, began to study the Oriental languages in order to be able to fathom the mysteries of Jewish theosophy. The Zohar, that farrago of absurdity and spiritual devotion, was the weapon with which these Christians defended Jewish literature against hostile ecclesiastical bodies (Abrahams, 'Jew. Lit. p. 106). Thus the Kabbalah linked the old scholasticism with the new and independent inquiries in learning and philosophy after the Renaissance, and although it had evolved a remarkably bizarre conception of the creation, yet we believe in its antiquity owing to the fact that the Zohar embodies many older opinions and doctrines, and the undoubted antiquity of some of them has served as a lever in the minds of these scholars to raise the late speculations about the En Seh, the Sephiroth, &c., to the same age.

LITERATURE.—The study of the whole subject being wrapped up with Gaonicism and Oriental theosophy, the related literature is enormous. Among the more important works may be mentioned Baron von Rosenroth's 'Kabbala Denudata' (Salzburg, 1677-1678; Frankfurt, 1684); A. Fraenk, 'La Kabbale' (Paris, 2nd ed., 1889; German by Jellinek, Leipzig, 1844); C. D. Ginsburg, 'The Kabbalah, its Doctrine and History' (London, 1880); Joseph David Ginzberg, 'Kabbalah' (Philadelphia, 1888); Rubin, 'Kabbala und Agada' (Vienna, 1893), 'Heidentum und Kabbalah' (1893); Karpe, 'Et. sur les origines du Kabbalah' (Paris, 1892); A. E. Waite, 'Doctrine and Literature of the Kabbalah' (London, 1902); Flugel, 'Philosophy, Kabbala, &c.' (Haltmore, 1902); D. Neumann, 'Gesch. d. Jüd. Philosophie d. Mittelalters' (Berlin, 1907); also S. A. Binyon, in C. D. Warner's 'World's Best Literature,' 5425 seq. See further the very full articles in the Jewish Ency. by K. Kohler and L. Ginzberg ('Cabbala'), I. Brodoy ('Bahir'), 'Zohar'), with the references. (C. D. G.; S. A. C.)

KABINDA—KABIR. See KABINDA, KABIR.

KABINDA, a Portuguese possession on the west coast of Africa north of the mouth of the Congo. Westward, the borders of K, extend from N. A. to 5° 3' S., and E. to 14° 30' W. of the Congo. It has a coast-line of 93 m., extends inland, at its greatest breadth, 70 m., and has an area of about 3000 sq. m. In its physical features, flora, fauna and inhabitants, it resembles the coast region of French Congo (q.v.). The only considerable river is the Chiloango, which in part forms the boundary between Portuguese and Belgian territory, and in its lower course divides Kabinda into two fairly even portions. The mouth of the river is in 5° 12' S., 13° 5' E. The chief town, named Kabinda, is a seaport on the right bank of the small river Bile, in 5° 33' S., 12° 10' E., pop. about 2000. From the beauty of the adjacent country, it has been called the paradise of the coast. The harbour is sheltered and commodious, with anchorage in four fathoms. Kabinda was formerly a noted slave mart. Farther north are the ports of Landana and Massabi. Between Kabinda and Landana is Molembo at the head of a small bay of the same name. There is a considerable trade in palm oil, ground nuts and other jungle produce, largely in the hands of British and German firms.

The possession of the enclave of Kabinda by Portugal is a result of the efforts made by that nation during the last quarter of the 18th century to strengthen its position in the lower Congo. Whilst Portugal succeeded in obtaining the southern bank of the river to the limit of navigability from the sea, the northern bank became part of the Congo Free State (see AFRICA, § 5). Portuguese claims to the north of the river were, however, to some extent met by the recognition of her right to Kabinda. The southernmost part of Kabinda is 25 m. (following the coast-line) north of the mouth of the Congo. This district as far north as the Chiloango river (and including the adjacent territory of Belgian Congo) is sometimes spoken of as Kazongo. The name Loango (q.v.) was also applied to this region as well as to the coast-lands immediately to the north. Administratively Kabinda forms a division of the Congo district of the province of Angola (q.v.). The inhabitants are Bantu negroes who are called Kabindas. They are an intelligent, energetic and enterprising people, daring sailors and active traders.

KABIR, the most notable of the Vaishnava reformers of religion in northern India, who flourished during the first half of the 15th century. He is counted as one of the twelve disciples of Râmánuja, born in the month of Magha (about A.D. 1400) of the doctrine of the bhakti addressed to Râma, which originated with Râmânuja (12th century) in southern India. He himself also mentions among his spiritual forerunners Jaidé and Nâmôde (or Nâmâ) the earliest Marâthi poet (both about 1250). Legend relates that Kabir was the son of a Brâhman widow, by whom he was exposed, and was found on a lotus in Lahar Talâo, a pond near Bénares, by a Musulmân weaver named 'All (or

1See, e.g., G. Margoliouth, 'The Doctrine of Ether in the Kabbalah;' Philo, 'Dem. xxi. 827 seq. See also the interesting treatise on the Kabbalah on the Reformations, see Stöckl, 'Gesch. d. Philosophie des Mittelalters,' ii. 232-251.
Nur), who with his wife Nimā adopted him and brought him up in their craft as a Musalmān. He lived most of his life at Benares, and afterwards removed to Maghar (or Magahar), in the present district of Bastī, where he is said to have died in 1449. There appears to be no reason to doubt that he was originally a Musalmān and a weaver; his own name and that of his son Kamāl are Mahommedan, not Hindu. His adhesion to the doctrine of Râmānand is not a solitary instance of the religious syncretism which prevailed at this time in northern India. The religion of the earlier Sikh Gurus, which was largely based upon his teaching, also aimed at the fusion of Hinduism and Islam; and the example of Malik Muhammad,1 the author of the Padmāvat, who lived a lifetime later than Kabir, shows that religious beliefs were not uncommon. In the twelfth century, when Kabir's death is dated, the Hindus and Musalmāns each claimed him as an adherent of their faith, and that when his funeral issued forth from his house at Maghar the contention was only assuaged by the appearance of Kabir himself, who bade them look under the cloth which covered the corpse, and immediately vanished. On raising the cloth they found nothing but a heap of flowers. This was divided between the rival factions, half being buried by the Musalmāns and the other half burned by the Hindus.2

Kabir's fame as a preacher of bhakti, or enthusiastic devotion to a personal God, whom he preferred to call by the Hindu names of Rāma and Hari, is greater than that of any other of the Vaishnavya spiritual leaders. His fervent conviction of the truth and power of his doctrine, and the homely and searching expression given to it in his utterances, in the tongue of the people and not in a learned language remote from their understanding, won for him multitudes of adherents; and his sect, the Kābīrpanthī, is still one of the most numerous in northern India, its numbers exceeding a million. Its headquarters are the Kābīr Chaʿurā at Benares, where are preserved the works attributed to Kabir (called the Granth), the greater part of which, however, were written by his immediate disciples and their followers in his name.

Those works which seem to have the best claim to be considered his own compositions are the Sākhīs, or stanzas, some 9000 in number, which have a very wide currency even among those who do not formally belong to the sect, and the Shahānmāl, consisting of a thousand "words" (shabdī), or short doctrinal expositions. Perhaps some of the Rākhās, or odes (100 in number), and of the Rākhās is a mediocrity in very obscure language, but also be from his hand. Of these different forms specimen will be found translated in Professor H. H. Wilson's Sketch of the Religious Sects of the Hindus, i. 79-90. Besides the followers who call themselves by Kabir's name, there may be reason to think that the sect which bears that of some intermediate guru or master, but substantially concur with Kabir in doctrine and practice. Such, for instance, are the Nīnākhāḥī in the United Provinces, the Central Provinces, and Bombay, and the Dīdīs-panthī, numerous in Rajpūtānā (Wilson, loc. cit. pp. 103 sqq.); the Sikhs, numbering two and a half millions in the Panjāb, are also his spiritual descendants, and their Granth or Scripture is largely stocked with texts drawn from his works.

Kabir taught the life of bhakti (faith, or personal love and devotion), the object of which is a personal God, and not a philosophical abstraction or an impersonal quality-less, all-pervading spiritual substance (as in the Vēḍānta of Sankarāchārya). His utterances do not, like those of Tulsī Dās, dwell upon the incidents of the human life of Rāma, whom he takes as his type of the Supreme; nevertheless, it is the essence of his creed that God became incarnate to bring salvation to His children, mankind, and that the human mind of this incarnation still subsists in the Divine Person. He proclaims the very obscure language to guide, or help, and the divine origin of the human soul, divīnēs particula auras. All evil in the world is ascribed to Māyā, illusion or falsehood, and truth in thought, word and deed is enjoined as the chief duty of man: "No act of devotion can equal truth; no crime is so heinous as falsehood; in the heart where truth abides there is My abode." The distinctions of creeds are declared to be of no importance in the presence of God: "The city of Hara is for the east, that of 'Ali is to the west; but explore your own heart, for there are both Rāma and Karim;" 3 "Behold but One in all things: it is the second that leads you astray. Every man and woman that has ever been born is of the same nature as yourself. He, whose is the world, and whose are the children of 'Ali and Rāma, He is my Guru, He is my Pīr." He proclaims the universal brotherhood of man, and the duty of kindness to all living creatures. Life is the gift of God, and must not be violated; the shedding of blood, whether of man or animals, is a heinous crime. The followers of Kabir who observe celibacy, but adhere to the teachings of the Guru Rāmānand, and refuse to worship the Eucharist. Some of their maxims are: "The entire city of Dīvī is in your garment; whatever you do unto the least, I say unto you, do also unto Myself." (C. J. L.)

KABUL, the capital of Afghanistan, standing at an elevation of 6900 ft. above the sea in 34° 32′ N. and 69° 14′ E. Estimated pop. (1901), 140,000. Lying at the foot of the bare and rocky mountains forming the western boundary of the Kabul valley, just below the gorge made by the Kabul River, the city extends a mile and a half east to west and one mile north to south. Hemmed in by the mountains, there is no way of extending it, except in a northerly direction towards the Sherpur cantonment. As the key of northern India, Kabul has been a city of vast importance for countless ages. It commands all the passes which here debouch from the north through the Hindu Kush, and from the west through Kandahar; and through it passed successive invasions of India by Alexander the Great, Mahmud of Ghazni, Genghiz Khan, Baber, Nadir Shah and Ahmad Shah. Indeed from the time of Baber to that of Nadir Shah (1526-1738) Kabul was part of the empire of Delhi. It is now some 160 m. from the British frontier post of Jamrud near Peshawar.

Kabul was formerly walled; the old wall had seven gates, of which two alone remain, the Labori and the Sirdar. The city itself is a huddle of narrow and dirty streets, with the Bala Hisar, or fort, forming the south-east angle, and rising about 150 ft. above the plain. Its present name, as originally indicated by the name of the town about midway between it and the Sherpur cantonment which lies about a mile to the north-east. Formerly the greatest

1 This and the following passages in quotation marks are from Professor Wilson's translation of 100 Sākhīs, pp. 83-90.
2 Benares; Hara, a name of Siva.
3 I.e. Mecca.
4 "The Bountiful," one of the Koranic names of God (Allah).
ornament of the city was the arcaded and roofed bazaar called Chihár Cháhát, ascribed to Ali Mardan Khan, a noble of the 17th century, who has left behind him many monuments of his magnificent public spirit both in Kabul and in Hindustan. Its four arched gates and a darbar hall, both of a length of about 60 ft., with a breadth of 30. The display of gold was remarkable, and was not illuminated. This edifice was destroyed by Sir G. Pollock on evacuating Kabul in 1842 as a record of the treachery of the city.

The tomb of the Sultan Barber stands on a slope about a mile to the west of the city in a charming spot. The grave is marked by two erect slabs of white marble. Near him lie several of his wives and children; the garden was formerly enclosed by a marble wall; a clear stream waters the flower-beds. From the hill that rises behind the tomb there is a noble prospect of his beloved city, and of the all-fruitful plain stretching to the north of it.

After the accession of Abdur Rahman in 1880 the city underwent great changes. The Bala Hisar was destroyed and has never since been entirely rebuilt, and a fortified cantonment at Sherpur (one side of which was represented by the historic Bemaru ridge) had taken the place of the old earthworks of the British occupation of 1842 which were constructed on nearly the same site. The city streets were as narrow and evil-smelling, the surrounding gardens as picturesque and attractive, and the wealth of its public buildings, as rich as ever, but the city lay neglected. The Amir, however, effected many improvements. Kabul is now connected by well-planned and metalled roads with Afghan Turkestan on the west, with the Oxus and Bokhara on the north, and with India on the east. The road to India was first made by British and is now maintained by Afghan engineers. The road southwards to Ghazni and Kandahar was always naturally excellent and has probably needed little engineering but the general principle of road-making in support of a military advance has always been consistently maintained, and the expeditions of Khan Char Dar of Kafiristan have been supported by a very well graded and substantially constructed road up the Kunar valley from Jalalabad to Asmar, and onwards to the Bashgol valley of Kafiristan. The city ways have been improved until it has become possible for wheeled vehicles to pass, and the various roads connecting the suburbs and the city are efficiently maintained. A purely local railway has also been introduced, to assist in transporting building material. The buildings erected by Abdur Rahman were pretentious, but unmarked by any originality in design and hardly worthy representation of the beauty and dignity of Mohammedi an architecture. They included a public building and a bridge across the Kabul, when the construction of a pavilion and garden laid out around the site of Barber's tomb overlooking the Chardez valley; and many other buildings of public utility connected with stud arrangements, the manufacture of small arms and ammunition, and the requirements of what may be termed a wholesale shop under European direction, besides hospitals, dispensaries, bazaars, &c. The new palace is within an encirclement just outside the city. It is enclosed in a fine garden, well planted with trees, where the hareem or ladies' apartments occupies a considerable space. The public portion of the buildings consists of a large pavilion with entrances on each side, and a high-domed octagonal room in the centre, beautifully fitted and appointed, where public receptions take place. The darbar hall, which is a separate building, is 60 yards long by 20 broad, with a painted roof supported by two rows of pillars. But the arrangement of terraced gardens and the lighted constructed pavilion which graces the western slopes of the hills overlooking Chardez are the most attractive of these innovations. Here, on a summer's day, with the scent of roses pervading the heated air, the cool refreshment of the passing breezes and the splashing fountains may be enjoyed by the officials of the Kabul court, whilst they look across the beauty of the thickly planted plains of Chardez to the rugged outlines of Paghman and the snows of the Hindu Kush. The artistic taste of the landscape gardening is excellent, and the mountain scenery is not unworthy of Kashmir. It is pleasant to record that the graveyard of those officers who fell in the Kabul campaign of 1879-1880, which lies at the northern end of the Bemaru ridge, is not uncared for.

Kabul is believed to be the Ortopsumus or Ortopsana of the geographers of Alexander. It is on the left bank of the river of Uskhudhunah, "high place." This is the meaning of the name Bala Hisar. But the actual name is perhaps also found as that of a people in this position (Ptolemy's Kabolides), if not in the name of a city apparently identical with Ortopsumus. But at the foot of the hill in some copies read Cabira. It was invaded by the Arabs as early as the thirty-fifth year of the Hegira, but it was long before the Mahomedans effected any lasting settlement. In the early years of the history of geographies we find (according to a favourite Arabic love of jingle) Kābul and Zābuli constanty associated. Zābul appears to have been the country about Ghazni, and in 1810 the Bokhara troops under Bāghūrī became established at Kabul, and held it until 1844, and then he reigned fifteen years before his invasion of Hindostan. In modern times it became a capital again, under Timur Shah (see Afghanistan), and so has continued to both the end of the Durani dynasty, and the Barakzai, who now reign. It was occupied by Sir John Keane in 1839, General Pollock in 1842, and again by Sir Frederick, afterwards Lord Roberts, in 1879.

Kabul is also the name of the province including the city so called. It may be considered to embrace the whole of the plains called Koh Daman and Beghran, &c., to the Hindu Kush northward, with the Kohistan or hill country adjoining. Eastward it extends to the Hazara valley and the southern slopes of the Hissar and Kaffiristan, and southward it extends to the border of Ghazni; north-westward it extends to the Panjgah hills, and the valley of the upper Kabal river, and so to the Koh-i-Rabba. Roughly it embraces a territory of about 150 miles from east to west, and four from north to south. It is the staple products of the arable tracts. Artificial grasses are also much cultivated, and fruits largely, especially in the Koh Daman. Much of the fertile portion lies exposed to the summer in tents. The villages are not enclosed by fortifications, but contain small private castles or fortificies.

See C. Yates, Northern Afghanistan (1888); J. A. Gray, At the Court of the Amir (1905); Sir T. H. H. Holdich, The Indian Borderland (1901).

KABUL RIVER, a river of Afghanistan, 300 m. in length. The Kabul (ancient Kophe), which is the most important (although not the largest) river in Afghanistan, rises at about lat. 36° 12' north, and 70° 30' west, and passes leading over the Sanglakh range, an offshoot of the Hindu Kush towards Bamian and Afghan Turkestan. Its basin forms the province of Kabul, which includes all northern Afghanistan between the Hindu Kush and the Safed Koh ranges. From its source to the city of Kabul the course of the river is only 45 m., and this part of it is often exhausted in summer for purposes of irrigation. Half a mile east of Kabul it is joined by the Logar, a much larger river, which rises beyond Ghazni among the slopes of the Gul Koh (14,000 ft.), and drains the rich and picturesque valley of Logar and Bāghūrī. Below the confluence the Kabul becomes a rapid stream with a large volume of water and gradually absorbs the whole drainage of the Hindu Kush. About 40 m. below Kabul the Panjshir river joins it; 15 m. farther the Tagao; 20 m. from the Tagao junction the streams of Ailingar and Alisang (rivers of Kafiristan); and 20 m. below that, at Balaba, the Surkhab from the Safed Koh. Two or three miles below Jalalabad it is joined by the Kunar, the river of Chitrīne. From forward passes by deep gorges through the Mohmand hills, curving northward until it emerges into the Peshawar plain at Multān. Soon afterwards it receives the Swat river from the north and the Bara river from the south, and the course of 40 m. falls into the Indus at Attock. From Jalalabad downwards the river is navigable by boats or rafts of inflated skins, and is considerably used for purposes of commerce.

KABYLES, or Kabail, a confederation of tribes in Algeria, Tunisia, and a few oases of the Sahara, who form a branch of the great Berber race. Their name is the Arabic gebilat (pl.: gabsil), and was at first indiscriminately applied by the Arabs to all Berber peoples. The part of Algeria which they inhabit is usually regarded as consisting of two divisions—Great Kabylia and Lesser Kabyla, the former being also called the Kabylia of the Jurjura (also called Ardar Budfel, "Mountain of Snow"). Physically many Kabyles do not present much contrast to the Arabs of Algeria. Both Kabyle and Arab are white at birth, but rapidly grow brown through exposure to air and sunshine. Both have in general brown eyes and wavy hair
KACH GANDAVA—KADUR

of coarse quality, varying from dark brown to jet black. In
stature there is perhaps a little difference in favour of the Kabyle,
and he appears also to be of heavier build and more muscular.
Both are clearly long-headed. Some, however, of the purer
type of Kabyles in Kabylla proper have fair skins, ruddy com-
plications and blue or grey eyes. In fact there are apt to be
kinds of Kabyles: those which by much admixture have
approached to Arab and negroid types, and those which pre-
serve Libyan features. Active, energetic and enterprising, the
Kabyle is to be found far from home—as a soldier in the French
army, as a workman in the towns, as a field labourer, or as a
pedlar or trader earning the means of purchasing his bit of ground
in his native village. The Kabyles are Mohammedans of the
Sunnite branch and the Malikite rite, looking to Morocco as the
nearest centre of their religion. Some of the Kabyles retain their
vernacular speech, while others have more or less a supemly,
adopted Arabic.
The best known of the Kabyle dialects is
the Zouave1 or Iqgaouaoun, those speaking it having been
settled on the northern side of the Jurlura at least from the time
of Ibn Khaldun; it is the principal basis of Hanoteau’s Essai
de grammaire kabyle (Paris, 1874); Melchior Joseph
Eugène Daumas, Le Sahara algérien (Paris, 1843) and Maurer et
coutumes de l’Algérie (1857); Del Siane’s translation of Ibn Khaldun’s
Histoire des Berbères (Algeria, 1852); Aucapins, Les Kabyles et la
colónie de l’Algérie (Paris, 1864) and Les Beri M’zab (1868); L. J. A.
Hanoteau and A. Letourneux, La Kabylie et les coutumes kabyles
(Paris, 1882); Charpentier, in Jahrbücher der Verbreitung des Glaubens
(1874); Masqueray, Formation des cités . . . de l’Algérie (1886); Dagas,
La Kabylie et le peuple kabyle (Paris, 1878); Récoix, La Démographie de
l’Algérie (Paris, 1880); J. Liord, Races berbères: les Kabyles (Paris,
1893); Maclver and Wilkin, Libyan Notes (1901).

KACH GANDAVA, or Kacun (Kach, Kaj, Kiz), a low-lying
flat region in Baluchistan separating the Bugti hills from those
of Kalat. It is driven, like a wedge, into the frontier mountain
system and extends for 150 m. from Jacobabad to Sibi, with
nearly as great a breadth at its base on the Sind frontier. Area,
5370 sq. m.; pop. (1901), 82,600. The Mula pass, which con-
nects it with the Kalat highlands, was once the capital of Gandava) a much trodden
trade highway, and is still a practicable route though no longer a
popular one. The soil is fertile wherever it can be irrigated by
the floods brought down from the surrounding hills; but much of
the low-lying sandy waste is traversed by the North-Western railway. The climate is unhealthy in summer when pestillential hot winds are sometimes destructive to life.
The annual rainfall averages only 3 in. Kachhi, though subject
to the khan of Kalat, is administered under the tribal system.
There are no schools, dispensaries or gaols.

See Baluchistan District Gazetteer, vol. vi. (Bombay, 1907).

KACHIN HILLS, a mountainous tract in Upper Burma,
inhabited by the Kachin or Chingpaw, who are known on the
Assam frontier as Singphos. Owing to the great number of
tribes, sub-tribes and clans of the Kachins, the part of the Kachin
hills which has been taken under administration in the Myitkyina
and Bhamo districts was divided into 40 Kachin hill tracts
(recently reduced to five). Beyond these tracts there are many
Kachins in Katha, Meing Mht and the northern Shan States.
The population of the Kachin hills is roughly estimated at
19,177 sq. m., and consists of a series of ranges, for the most part
running north and south, and intersected by valleys, all leading
towards the Irrawaddy, which drains the country. There were
64,405 Kachins enumerated at the census of 1901. Philological
investigations show that it is probable that the progenitors
of the Kachins or Chingpaw were the Indo-Chinese race who,
before the beginnings of history, but after the Môn-Annam wave
had covered Indo-China, forsook their home in western China
to pour over the region where Tibet, Assam, Burma and China
met, and that they accompanied, with the mission left to the
headquarters of the Irrawaddy and the Chindwin after those
branches, destined to become the Tibetans, the Naga, the Bur-
mans and the Kuki Chins, had gone westwards and southwards.
In the middle of the 15th century the southern limit of the
Kachins was 200 m. farther north than it is now. Since then the
trace has been drifting steadily southward and eastward, a
vast aggregate of small independent clans united by no
common government, but all obeying a common impulse to
move outwards from their original seats along the line of least
resistance. Now the Kachins are on both sides of the border of
Upper Burma, and are a force to be reckoned with by frontier
administrators. According to the Kachin Hill Tribes Regulation
of 1895, administrative responsibility is accepted by the
British government on the left bank of the Irrawaddy for the
country south of the Nmalkha, and on the right bank for the
country south of a line drawn from the confluence of the
Malikha and Nmalkha through the northern limit of the Laban district
and including the jade mines. The tribes north of this line were
told that if they abstained from raiding to the south of it they
would not be interfered with. South of that line peace was to be
enforced, and a small detachment of police has been stationed
in their private affairs. On the British side of the border the
chief objects have been the disarmament of the tribes and
the construction of frontier and internal roads. A light tribute
is exacted.

The Kachins have been the object of many police operations and
two regular expeditions: (1) Expedition of 1892–93. Bhamo
was occupied by the British on the 28th of December 1885, and almost
immediately trouble began. Constant punitive measures were carried
on by the military police; but in December 1892 a police column
proceeding to establish a post at Sima was heavily attacked, and
endeavored to be established on the plain by the Myitkyina was raided by Kachins. A
force of 1200 troops was sent against it, but the enemy received their final blow at Palap, but not before three officers were
killed, three wounded, and 102 sepoys and followers killed and
wounded. (2) Expedition of 1895–96. The continued misconduct of the Sana Kachins from beyond the administrative border ren-
dered punitive measures necessary. They had remained unprotected
since the attack on Myitkyina in December 1892. Two columns were
mounted against 2500 men from Myitkyina, the other of 2000
from Mogau, marching in December 1895. The resistance was
insignificant, and the operations were completely successful. A
new police post is established on the frontiers, and a force of 300
in the Gewa hills and the country in general wholly free from
crimes of violence committed by the Kachins.

KADUR, a district of Mysore state, in southern India, with an
area of 2813 sq. m. Pop. (1901), 320,725, showing an increase of
9% in the decade. The larger portion of the district consists of
the Mainad or hill country, which contains some of the wildest
mountain scenery in southern India. The western frontier is
formed by the chain of the Ghats, of which the highest peaks are
the Kodremukh (6215 ft.) and the Merul Gudlu (5451 ft.).
The centre is occupied by the horse-shoe range of the Baba
Budans, containing the loftiest mountain in Mysore, Mulangi
Nagales. The Mainad or plain country lying beneath the
amphitheatre formed by the Baba Budan hills is a most fertile
region, well watered, and with the famous “ black cotton soil.”
The principal rivers are the Tunga and Bhadra, which rise near
each other in the Ghats, and unite to form the Tungabhadra, a
tributary of the Kistna. The eastern region is watered by the
Vedavati. At the point where this river leaves the Baba Budan
hills it is embanked to form two extensive tanks which irrigate
the lower valley. From all the rivers water is drawn off into
irrigation channels by means of anicutcs or weirs. The chief
product of wealth of Kachur is in its forests, which contain inex-
hauisable supplies of the finest timber, especially teak, and also
furnish shelter for the coffee plantations, and furnish
smelted at the foot of the hills, and corundum exists in certain
localities. Wild beasts and game are numerous, and fish are
abundant.

from the enlisting of Kabyles speaking the Zouave dialect
the Zouave regiments of the French army came to be so called.

1 From the enlisting of Kabyles speaking the Zouave dialect
The largest town is Tarike (pop. 10,164); the headquarters are at Chikmagalur (9515). The staple crop is rice, chiefly grown on the hill slopes, where the natural rainfall is sufficient, or in the river valleys, where the fields can be irrigated. Coffee cultivation is said to have been introduced by a Mahomedan saint, Baba Budan, more than two centuries ago; but it first attracted the European capital in 1840. The district is served by the Southern Mahattra railway.

KAEMPFER, ENGELBRECHT (1651-1716), German traveller and physician, was born on the 16th of November 1651 at Lemgo in Lippe-Detmold, Westphalia, where his father was a pastor. He studied at Hameln, Lüneburg, Hamburg, Lübeck and Danzig, and after graduating Ph.D. at Cracow, spent four years at Königsberg in Prussia, studying medicine and natural science. In 1681 he visited Upsala in Sweden, where he was offered inducements to settle; but his desire for foreign travel led him to become secretary to the embassy which Charles XI. sent through Russia to Persia in 1683. He reached Persia by way of Moscow, Kazan and Astrakhan, landing at Nizalbad in Daghestan after a voyage in the Caspian; from Shemakha in Shirvan he made an expedition to the Baku peninsula, being perhaps the first modern scientist to visit these fields of "eternal fire." In 1684 he arrived in Isfahan, then the Persian capital. When after a stay of more than a year the Swedish embassy prepared to return, Kaempher joined the fleet of the Dutch East India Company in the Persian Gulf as chief surgeon, and in spite of fever caught at Basra, for which he found opportunity to see something of Armenian and Persian art, and the marvels of the gardens of Isfahan, September 1689 he reached Batavia; spent the following winter in studying Javanese natural history; and in May 1690 set out for Japan as physician to the embassy sent yearly to that country by the Dutch. The ship in which he sailed touched at Siam, whose capital he visited; and in September 1690 he arrived at Nagasaki, the only Japanese port then open to foreigners. Kaempher stayed two years in Japan, during which he twice visited Tokio. His adroitness, insinuating manners and medical skill overcame the habitual jealousy and reticence of the natives, and enabled him to elicit much valuable information. In November 1692 he left Japan for Java and Europe, and in October 1693 he landed at Amsterdam. Receiving the degree of M.D. at Leiden, he settled down in his native city, becoming also physician to the court of Lippe. He died at Lemgo on the 2nd of November 1716.

The only work Kaempher lived to publish was Amseniatum exoticae resstio politico-physico-medicarum fasciculi V. (Lemgo, 1712), a selection from his papers giving results of his invaluable observations and travels. The unpublished manuscripts were purchased by Sir Hans Sloane, and conveyed to England. Among them was a History of Japan, translated from the manuscript into English by G. S. Benbow, and published at London in 2 vols., in 1727. The original German has never been published, the extant German version being taken from the English. Besides Japanese history, this book contains a description of the political, social and physical state of the country in the 17th century. For upwards of a hundred years it remained the chief source of information for the general reader, and is still not wholly obsolete. A life of the author is prefixed to the History.

KAFFA, a country of N.E. Africa, part of the Abyssinian empire. Kaffa proper (formerly known also as Comara) has an area of little more than 5000 sq. m., but the name is used in a general sense to include such parts of Gimirra, Jimma, Ennana, &c. In this larger acceptation Kaffa extends roughly from 6° to 8° N. and from 35° to 37° E. It forms the S.W. part of the great Abyssinian plateau and consists of broken table-land deeply scored by mountain torrents and densely wooded. The general elevation is about 8000 ft., while several peaks are over 10,000 ft. From the western slopes of the plateau descend headstreams of the Sobat. The principal river however is the Omo, the chief feeder of Lake Rudolf. Kaffa proper is believed to be the native home of the coffee plant (whence the name), which grows in profusion on the mountain slopes and yields a fine, strong, black coffee, the strongest known. Kaffa was 12° 36' N., 36° E., a great trading centre, but the Abyssinian headquarters are at Anderacha, about 12 m. S.S.W. of Bonga. Jiren, the capital of Jimma, 60 m. N.E. of Bonga, is a still more important town, its weekly market being attended by some 20,000 persons.

A great variety of races inhabit these countries of southern Ethiopia. The Kaffos (people of Kaffa) proper are said to be of the same stock as the northern Abyssinians and to have been separated from the rest of the country by the Mahomedan invasion of the 16th century. Thus Jimma, immediately north of the Kaffos proper, is inhabited by the other Kaffos or Kaficho, though much mixed with Gallia blood, retained their Christianity and a knowledge of Gez, the ecclesiastical tongue of Abyssinia. The ordinary language of the Kaffo has no outward resemblance to modern Abyssinian. Their speech was, however, stated by Dr C. T. Beke (c. 1830) to be cognate with the Gonga tongue, spoken in a portion of Damot, on the northern side of the Abai. Kaffa, after having been ruled by independent sovereigns, who were also suzerains of the neighbouring states, was about 1895 conquered by the Abyssinians. The first European explorer of Kaffa was Antoine de'Abbadie, who visited it in 1843. Not until the early years of the 20th century was the country accurately mapped.

KAFFIR BREAD, in botany, the popular name for a species of Encephalartos (E. cafrus), one of the cycads, a native of South Africa, so called from the farinaceous food-stuff which is found at the apex of the stem (Gr. ev, in, &phi;al&phi;γ&phi;los, head, and &omicron;&omicron;ross, bread). It is a tree reaching nearly 20 ft. in height, with very stiff, spreading pinnate leaves 3 to 4 ft. long and recurving at the tip. The species of Encephalartos, which are natives of tropical and subtropical districts, are named as greenhouses and conservatory plants; some species are effectively used in subtropical gardening in the summer months.

KAFFIRS (Arabic Kafr, an unbeliever), a name given by the Arabs to the native races of the east coast of Africa. The term was current along the east coast at the arrival of the Portuguese, and passed from them to the Dutch and English, and to the natives themselves under the form of Kafu. There are no general or collective national names for these peoples, and the various tribal divisions are mostly designated by historical or legendary chiefs, founders of dynasties or hereditary chief-taincies. The term has no real ethnological value, for the Kaffirs have no national unity. To-day it is used to describe that large family of Bantu negroes inhabiting the greater part of the Cape, the whole of Natal and Zululand, and the Portuguese dominions on the east coast south of the Zambesi. The name is also loosely applied to any negro inhabitant of South Africa. For example, the Bechuana of the Transvaal and Orange Free State are usually called Kaffirs.

The Kaffirs are divisible into two great branches: the Ama-Zulu with the Ama-Swazi and Ama-Tonga and the Kaffirs proper, probably inhabited by the Ama-Xosa, the Tembu (now the Tembu) and the Phendula (pronounced Kha-kahe). Hence the compound term Zulu-Kafr applied in a collective sense to all the Kaffir peoples. Intermediate between these two branches were several broken tribes now collectively known as Ama-Fengu, i.e. "wanderers" or "needy" people, from fenguia, to seek service (see INGO). The ramifications of the Kaffirs proper cannot be understood without reference to the national genealogies, most of the tribal names are still as accurately traced as those of the modern kings of dynasties. Thus the term Ama-Xosa means simply the "people of Xosa," a somewhat mythical chief supposed to have flourished about 1530. The influx in descent from his son Toguh was already well started. Gicaleka and Rampe (pronounced Kha-Khahe), from whom the Ama-Gicaleka, Ama-Dhlambo (Tsiamanes) and the Ama-Nqquka (Gaika or Sandila's people). The Pondo do not descend from Xosa, but probably from an elder brother, while the Tembu, though apparently representing a younger branch, are regarded by all the Kaffir tribes as the royal race. Hence the Gicaleka chief, who is the head of all

1 The Ama-Fengu are regarded both by the Zulu and Ama-Xosa as slaves or out-castes, without any right to the privileges of true-born Kaffirs. Any tribes which become broken and mixed would be called Kaffirs. The Ama-Fengu are the most degraded, suffering the most from the multiplicity of clans, such as the Ama-Bele, Aba-Sembwenti Ama-Zizi, Ama-Kuze, Aba-Sekunene, Ama-Ntokaze, Ama-Tetyeni Aha-Shiwawa, &c., all of whom are collectively grouped as Ama-Fengu.
the Ama-Xosa tribes, always takes his first or "great wife" from the Tembu royal family, and her issue alone have any claim to the succession. The subjunctive genealogical tree will place Kaffir relations in a clearer light—

Zuide (1507?), reputed founder of the nation.

It will be seen that, as representing the elder branch, the Gcaleka stand apart from the rest of Xosa's descendants, whom they group collectively as Ama-Rarabe (Ama-Kakhabe), and whose genealogies, except in the case of the Gaikas and T’slabmies, are very confused. The Ama-Xosa country lies mainly between the Keiskama and Umntata rivers.

The Zulu call themselves Abantu ba-Kwa-Zulu, i.e., "people of Zulu's land," or briefly Bakwa-Zulu, from a legendary chief Zulu, founder of the royal dynasty. They were originally an obscure tribe occupying the basin of the Umlolosi river, but rose suddenly to power under Chaka, who had been brought up among the neighboring and powerful Umntata, and who succeeded the chiefs of that tribe and of his own in the beginning of the 19th century. But the true mother tribe seems to have been the extinct Ama-Ntombela, whence the Ama-Tefulu, the U'mvande, U'mielas, U'mntetas and many others, all absorbed or claiming to be true Zulus. But they are only so by political subjection, and the gradual adoption of the Zulu dress, usages and speech. Hence in most cases the term Zulu implies political rather than blood relationship. This remark applies also to the followers of Mosiliqo (properly Umsilqozi), who, after a fierce struggle with the Bochana, founded about 1820 a second Zulu state about the head waters of the Orange river. In 1837 most of them were driven northwards by the Boers and are now known as Matabele.

The origin of the Zulu-Kaffir race has given rise to much controversy. It is obvious that they are not the aborigines of their present domain, whence in comparatively recent times—since the beginning of the 16th century—they have displaced the Hottentots and Bushmen of fundamentally distinct stock. They are themselves conscious of a foreign origin. Yet they are closely allied in speech (see Bantu Languages) and physique to the surrounding Basuto, Bechuana and other members of the great South African Negro family. Hence their appearance in the south-east corner of the continent is sufficiently explained by the gradual onward movement of the populations pressing southward on the Hottentot and Bushman domain. The specific differences in speech and appearance by which they are distinguished from the other branches of the family must in the same way be explained by the altered conditions of their new habitat. Hence it is that the farther they have penetrated southwards the farther they have become differentiated from the pure Negro type. Thus the light and clear brown complexion prevalent amongst the southern Tembu becomes gradually darker as we proceed northwards, passing at last to the blue-black and sepia of the Ama-Swazi and Tekeza. Even many of the mixed Fingo tribes are of a polished ebony colour, like that of the Joofs and other Senegambian negroes. The Kaffir hair is coarse and full of a woolly texture. The head is dolichocephalic, but it is also high or long vertically, and it is in this feature of hyposthenencephaly (height and length combined) that the Kaffir presents the most striking contrast with the pure Negro. But, the nose being generally rather broad and the lips thick, the Kaffir face, though somewhat oval, is never regular in the European sense, the deviations being normally in the direction of the Negro, with which race the peculiar odour of the skin again connects the Kaffirs. In stature they rank next to the Patagonians, Polynesians and West Africans, averaging from 5 ft. 11 in. and even 6 ft. They are slim, with well proportioned and muscular. Owing to the hard life they lead, the women are generally inferior in appearance to the men, except amongst the Zulu, and especially the Tembu. Hence in the matrimonial market, while the Ama-Xosa girl realizes no more than ten or twelve head of cattle, the Tembu belle fetches as many as forty, and if exceptionally fine even eighty.

The more warlike tribes were usually armed in leopard or ox skins, of late years generally replaced by European blankets, with feather head-dresses, coral and metal ornaments, bead armlets and necklaces. The Malagasy also, and the Maories and other islanders, generally make a show of being Kaffirs. The Ama-Xosa are fond of painting or smearing their bodies with red ochre. Their arms consist chiefly of ox-hide shields 4 to 6 ft. long, the kerrie or club, and the assegai, of which there are two kinds, one long, with the other short, much for throwing, the former with a broad blade 12 to 18 in. long, for stabbing. Their dwellings are simple conical huts grouped in kraals or villages. Although cattle form their chief wealth, and hunting and stock-breeding their main pursuits, many have turned to husbandry. The Zulu raise regular crops of "mealleys" (maize), and the Pondo cultivate a species of millet, tobacco, water melons, yams and other vegetables. Milk (never taken by the Kaffirs) millet and starch form the staples of food, and meat is seldom eaten except in time of war.

A young Kaffir attains man's estate socially, not at puberty, but upon marriage. Polygyny is the rule and each wife is regarded as adding dignity to the household. Marriage is by purchase, the price being paid in cattle. Upon the husband's death family life is continued under the headship of the eldest son of the house, the widows by virtue of levirate becoming the property of the uncle or nearest males, not sons. A son inherits and honourably liquidates, if he can, his father's debts.

Mentally the Kaffirs are superior to the Negro. In their social and moral relations, and in their capacity for invention and intelligence, they are remarkably brave, warlike and hospitable, and were honest and truthful until through contact with the whites they became suspicious and revengeful and thievish, besides acquiring most European vices. Of religion they are divided into two classes. One is that of the Zulu and Tembu, and the other is that of the Bantu and Bushmen, and have certainly never developed any mythologies or dogmatic systems. It is more than doubtful whether they had originally borrowed a portion of their foreign religion. So far as connection, however, of a future state is implied by a strongly developed worship of ancestry, and by a belief in spirits and ghosts to whom sacrifices are made. There are no idols or priests, but belief in witchcraft formerly gave the "witch-doctor" or medicine-man overwhelming power. Circumcision and polygyny are universal; the former is sometimes attributed to Mahomedan influences, but has really prevailed almost everywhere in East Africa from the remotest time.

Dearer than anything else to the Kaffirs are their cattle; and many ceremonial observances in connexion with them were once the rule. Formerly ox-racing was a common sport, the oxen running, riderless, from one side of the country to the other, the most popular hero, and these races were valued at hundreds of head of cattle. Cattle are the currency of the Kaffirs in their wild state. Ten to twenty head are the price of a wife. When a girl marries,
KAFFRARIA  629

her father (if well off) presents her with a cow from his herd. This animal is called abulangia or "doer of good" and is regarded as sacred and is not to be killed for food. It is expected that it will live as it lives. A hair of its tail is tied round the neck of each child immediately after birth. In large kraals there is the "dancing-ox," usually a big cow, kept as a horoscope to train to peculiar shapes by early mutilations. It figures in many ceremonies when it is paid a kind of knee-worship.

The Kaffirs have three, not four, seasons. "Green Heads," "Winter Heads," and "Cutting": the first is the last harvest of the crops, the second to the "warm weather." Women and children only eat after the men are satisfied. A light beer made from sorghum is their drink.

Of the few industries the chief are copper and iron smelting, practised by the Tembu, Zulu and Swazi, who manufacture weapons, spoons and agricultural implements both for their own use and for trade. They also make some of the finer grasses to prepare a peculiar water-tight vessel of grass. Characteristic of this race is their neglect of the art of navigation. Not the smallest boats are ever made for crossing the rivers, much less for venturing on the sea, except by the Makazana of Delagoa Bay and by the Zambesi people, who have canoes and flat-bottomed boats made by planks.

The Kaffir race had a distinct and apparently very old political system, which may be described as a patriarchal monarchy limited by a powerful aristocracy. Under British rule the tribal independence of the Kaffirs has disappeared. Varying degrees of autonomy have been granted, but the supreme powers of the chiefs have gone to the Swazi being in 1904 the last to be brought to order. In the Transkeian Territories tribal organization exists, but it is modified by special legislation and the natives are under the control of specially appointed Commissions of the Cape. The Cape Colony has considerable extent in Natal and throughout Zululand the Kaffirs are placed in reserves, where tribal organization is kept up under European supervision. In Basuto-land they are kept in Reserves, for which the chief headman is upheld by the imperial government, which exercises general supervision.

See Gustav Fritsch, Die Eingeborenen Suid-Afrikas, with atlas, 30 plates and 120 typical heads (Breslau, 1872); W. H. I. Bleek, Comparative Grammar of the South African Languages (London and Cape Town, pt. i., 1862; pt. ii., 1886); Theo. Hahn, Grundzüge einer Grammatik der Herero (Berlin, 1857); Dr Colenso, Grammar of the Zulu-Kafir Language (1856); Giroud de Kullio, Les Peuples de l’Afrique et de l’Amérique (Paris, 1880); G. W. Stow, The Native Races of South Africa (London, 1903); G. McC. Theal, History and Economics of South Africa, 5 vols. (London, 1907-1916), especially valuable for the political history of the Kaffirs; Caesar C. Henkel, The Native or Transkeian Territories (Hamburg, 1903); The Nations of South Africa (1901), and its sequel, The South African Natives (1908); Dudley Kidd, The Essential Kafir (1904) and Kafir Socialism. The last four books deal with the many social and economic questions raised by the contact of the Kaffir races with Europeans.

KAFFRARIA, the descriptive name given to the S.E. part of the Cape province, South Africa. Kaffrar, t.e. the land of the Kaffirs (q.v.), is no longer an official designation. It used to comprehend the whole of the Transkeian, Pondoland, and Griqualand East divisions of the Cape Colony, and the territory beyond the Kei River south of the Drakensberg Mountains as far as the Natal frontier, known as Kaffraria proper. As a geographical term it is still used to indicate the Transkeian territories of the Cape provinces comprising the four administrative divisions of Transkei, Pondoland, Tembland and Griqualand East, incorporated into Cape Colony at various periods between 1879 and 1894. They have a total area of 18,310 sq. m., and a population (1904) of 83,644, of whom 16,777 were whites. Excluding Pondoland—not considered as part of Kaffraria—this population had increased from 487,504 in 1891 to 631,887 in 1904.

Physical Features. The physical characteristics of Kaffraria bear a general resemblance to those of the Cape province proper. The country rises from sea-level in a series of terraces to the rugged range of the Drakensberg. Between that range and the coast-lands are many subsidiary ranges with fertile vales through which a large number of rivers flow. The Orange and the Tugela are the great Indian Ocean rivers have very rapid falls in comparison to their length and when less than 40 m. from the coast are still 2000 ft. above sea-level. The Kei, a portentous south-easter, separates Transkei and the native province of Zululand (2000 ft. above sea-level), Umtata, the St John’s or Umtumbu, and the Umtumvuna, which separates Kaffraria from Natal. The St John’s River rises in the Drakensberg near the Basuto-Natal frontier. The river valley has a length of 140 m., with the river’s many twists being double that length. It receives numerous tributaries, one, the Tzita, possessing a magnificent waterfall, the river leaping over an almost vertical precipice of 375 ft. The St John’s reaches the sea through a channel over 1200 ft. wide, and the coast is formed of verdure. The mouth is obstructed by a sand bar which there is 14 ft. of water. None of the rivers of Kaffraria except the St John’s are navigable.

Kaffraria is one of the most fertile regions in South Africa. The mountain ranges abound in fine trees, thick forest and bush cover the river banks, grass grows luxuriantly in the lower regions, and the hills and low vales are frequently ornamented with fields of field and garden cultivation. The coast districts are very hot in summer, the temperature from October to April on an average varying from 70° to 90° F., while in winter the day temperature is seldom below 60° F. The climate of the highlands is temperate, on altitude places climates of all grades within easy reach, from the burning coast to the often snow-clad mountain. Thunderstorms are rather frequent in summer; and after a hard rain the whole the climate is extremely healthy. At St John’s are sulphur springs.

A considerable area is devoted to the raising of wheat and other cereals, especially in the northern district (Griqualand East), where in the higher valleys are many farms owned by Europeans. Large quantities of stock are raised. Most of the land is held by the natives under tribal tenure, and the case with which their wants are supplied is detrimental to the full cultivation of the land. Kaffraria is, however, one of the chief recruiting grounds for labour throughout South Africa. Most of the white inhabitants are engaged in trade, agriculture, and mining, while the chief magistrate, head-teacher, and clergy are the chief European settlers. St John’s is the Anglican bishopric of Kaffraria. The principal buildings are the cathedral, a Gothic structure, built 1901-1906, and the town-hall, both designed by Mr. Fritsch. The chief church is dedicated to St John the Baptist in Pondoland, and the only harbour of the coast. Butterworth is the chief town in Transkei. Cala (pop. about 1000), in the N.W. part of Tembland, is the educational centre of Kaffraria. A railway, 107 m. long, the first link in the direct Cape-Natal line, runs from Indwe, 95 m. from Sterkstroom Junction on the main line from East London to the Transvaal, to Maclear, an agricultural centre in Griqualand East. Another railway parallel but south of that described above also traverses Kaffraria and connects Rorke’s Drift with Colenso.

An Annexation to the Cape.—The story of the conflicts between the Kaffir tribes and the Cape colonists is told under CAPE COLONY. As early as 1810 Kaflirland, or Kaffraria, was held not to extend west beyond the Keiskamma River. The region south of this river as far as the Kei River became in 1847 the Crown Colony of De Beer’s Kloof, annexed to Kaffraria (see GLEN GREY). The revenue is included in the ordinary budget of the Cape province. The expenditure on Kaffraria and De Beer’s Kloof is exceeded by the revenue derived from it. The franchise laws are the same as in the Cape proper. The number the whites by fifty to one, white men form the bulk of the electorate, which in 1904 numbered 4775.

The mission stations and mission churches and educational establishments in Kaffraria, but, except in Fingoland, the bulk of the Kaffirs are heathen. The Griqua profess Christianity and have their own churches and ministers. The Anglican diocese of St John’s, Kaffraria, was founded in 1873.
KAFIRISTAN

KAFIRISTAN, a province of Afghanistan. Very little of the country was known with accuracy and nothing at first hand until General Sir W. (then Colonel) Lockhart headed a mission to examine the passes of the Hindu Kush range in 1885-1886. He penetrated into the upper part of the Bashgal valley, but after a few days he found himself compelled to return to Chitral. Previously Major Tanner, R.A., had sought to enter Kafiristan from Jalalabad, but sudden severe illness cut short his enterprise. M. Nair, the famous ethnologist, who had been in the Khyber Agency department, believed that he had actually visited this little-known land during an adventurous journey which he made from India and through Chitral in disguise; but the internal evidence of his reports shows that he mistook the Kalash district of Chitral, with its deposed and idolatrous population, for the true Kafir-istan of his hopes. In 1889 Mr G. S. Robertson (afterwards Sir George Robertson, K.C.S.I.) was sent on a mission to Kafiristan. He only remained a few days, but a year later he revisited the country, staying amongst the Kafirs for nearly a year. Although his movements were hampered, his presence in the country being regarded with suspicion, he was able to study the people, and, in spite of intertribal jealousy, to meet members of many of the tribes. The facts observed and the information collected by him during his sojourn in eastern Kafiristan, and during short expeditions to the inner valleys, are the most trustworthy foundations of our knowledge of this interesting country.

Kafiristan, which literally means "the land of the infidel," is the name given to a tract of country enclosed between Chitral and Afghan territory. It was formerly peopled by pagan mountaineers, who maintained a wild independence until 1875, when they were finally subdued by Abdur Rahman, the Amphor of Kabul, who also compelled them to accept the religion of Islam. The territory thus ill named is included between 34° 30' and 36° N., and from about 70° to 71° 30' E. As the western and northern boundaries are imperfectly known, its size cannot be estimated with any certainty. Its greatest extent is from east to west at 35° 10' N.; its greatest breadth is probably about 71° E. The total area approximates to 5000 sq. m. Along the N. the boundary is the province of Badakhshan, on the N.E. the Lutkho valley of Chitral. Chitral and lower Chitral enclose it to the E., and the Kunar valley on the S.E. Afghan property supplies the S. limit. The ranges above the W. and northern valleys of Afghanistan wall it in upon the W. The northern frontier is split by the narrow Minjan valley of Badakhshan, which seems to rise in the very heart of Kafiristan.

Speaking generally, the country consists of an irregular series of main valleys, for the most part deep, narrow and tortuous, into which a vast number of smaller watercourses cut their way, the most being fed by the numerous mountain torrents and cascades the ravines and glens pour their torrent water. The mountain ranges of Metamorphic rock, which separate the main drainage valleys, are all of considerable height, and are at their bases rough and barren, like a choppy sea petrified. During the winter months, when the snow lies deep, Kafiristan becomes a number of isolated communities, with few if any means of intercommunication. In the whole land there is probably nothing in the shape of a plain. Much of the silent, gigantic country warms the heart as well as captivates the eye with its grandeur and varied beauty; much of it is the bare skeleton of the world wasted by countless centuries of storms and frost, and profoundly melancholy in its sempiternal ruin. Every variety of mountain scenery can be found: silent peaks and hard, naked ridges, snowfields and glaciers; mighty pine forests, wooded slopes and grassy uplands; or small sheep meadows and sparkling streams. At low elevations the hill-sides are covered with the wild olive and evergreen oaks. Many kinds of fruit-trees—walnuts, mulberries, apricots and apples—grow near the villages perched precariously on the wayside, as well as splendid horse-chestnuts and other shade trees. Higher in elevation, and from 4000 to 8000 ft., are the dense pine and cedar forests. Above this altitude the slopes become dreary, the juniper and wild rhubarb gradually giving place to scanty willow patches, tamarisk and stunted birches. Over 13,000 ft. there are merely mosses and rough grass. Familiar wildflowers blossom at different heights. The rivers teem with fish. Imaginary numbers of turtles, tortoises, pander-cats (a bird) as well as pigeons and doves. Gorgeously plumaged pheasants are plentiful. Of wild animals the chief are the markhor (a goat) and the shekel (a sheep). In the winter the former are recklessly slaughtered by enterprising buffalo owners, because they are reputed to be nutritious and easy to catch. In the summer the herd is depicted as herds of fat sheep, the flesh of which is used as a substitute for cheese, as well as for butter and cheese. It is a very rare animal, and is not usually seen except in the summer months. The ibex is very rare. Bears and leopards are fairly common, as well as the smaller hill creatures.

carried to the Umtata River, so that by 1885 only Pondoland, fronting on the Indian Ocean, separated the Cape from Natal. In Pondoland, Port St John, proclaimed British territory in 1881, was, along with the lower reaches of the St John's River, incorporated with Cape Colony in 1884; in 1886 the Xeshe country (Mount Ayliff) was annexed to the Cape and added to Griqua-land, being regarded as being within the boundary line. The rest of Pondoland, chiefly in virtue of a British protectorate established over all the coast region in 1885, was already more or less under British control, and in 1894 it was annexed to the Cape in its entirety. Thus the whole of Kafiristan was incorporated in Cape Colony, with the exception of some 1550 sq. m., then part of Noman's-land, annexed by Natal in 1886 and named Alfred county. To the wise administration of Major Sir Henry G. Elliot, who served in Kafiristan in various official capacities from 1877 to 1903, the country owes much of its prosperity.

Particulars concerning each of the four divisions of Kafiristan follow.

* Griqualand East (area, 7594 sq. m.), so called to distinguish it from Griqualand West, a district north of the Orange River, lies between Basutoland (N.W.), Natal (N.E.), Tembland (S.W.) and Transkeian (S.E.). It occupies the southern slopes of the Drakensberg or the fertile valleys at their feet. It includes most of the region formerly called Noman's-land, and afterwards named Adam Kok's Land from the Griqua chief who occupied it in 1862 with 200 of his followers. This country was ceded to the country till his death in 1876, establishing a tolkraad on the Dutch model. The Griquas are still ruled by an officially appointed headman, usually a chief of the indigenous Basutho (Pondomias, Ama-Baka and other tribes). The Griqua number about 6000. Since its annexation to Cape Colony Griqualand East has made fairly rapid progress. The population rose from 121,000 in 1881 to 122,688 in 1904, of whom 5001 were whites. Stock-breeding on the uplands, tillage on the lower slopes of the Drakensberg, are the chief Industries. On these slopes and uplands the climate is good and warm, and was adapted to domestic animals. The trade with Basutoland in grain and wool, and through Kokstad with Port St John and Port Shepstone, Natal. Much of the best agricultural land is owned by Europeans.

* Tembland (area, 4122 sq. m.), which lies S.W. of Griqualand East and comprises the districts of Tembland Proper, Emigrant Tembland and Bomvandalan, takes its name from the Tembu nation, called sometimes Tambookies, one of the most powerful of the Kaffer groups. In the national genealogies the Tembu hold an honourable position, being traditionally descended from Tembu, elder brother of Xosa, from whom most of the other Kafirs claim descent. The inhabitants increased from about 5000 to 231,472 in 1904, of whom 8056 were whites. The chief town is Umtata.

* Transkei (area, 2552 sq. m.) comprises the districts of Fingoland, the Transkeian and the Ciskean, and contains the Ciskea nation, who claim to be the senior branch of the Xosa family, the principal royal line of the Kaffir tribes. They still form the principal population of the district, and are estimated to number from 136,000 in 1881 to 177,730 in 1904 (1707 whites). Here are some of the Roman missionary stations, where the natives are taught agriculture, mechanical industries and a knowledge of letters. The heroic deeds of Hinza, Xozi and other chiefs famous in the wars are still remembered; but witchcraft, rain-making and other pagan practices seem to have died out. Even more advanced in all social respects are the Fingo, who give their name to the district of Fingoland, and also form the bulk of the population in the Idutywa Reserve. They wear European clothes, support their schools by voluntary contributions, edit newspapers, translate English poetry, set their national songs to music, and have a written language. The industrial institution of Blythewood, about 20 m. N.W. of Butterworth, is a branch of Lovedale (q.v.), and is largely supported by the Fingo.

* Pondolo (area, 4409 sq. m.; pop. (1904), 202,757 (including 1113 whites), an estimated increase of 36,000 since 1891) is bounded E. by the sea, N. by Natal, W. by Griqualand East, and S. by Tembland. In Pondoland the primitive organization of the natives has been little altered and the influence of the chiefs is very great. Land is held almost wholly in tribal tenure, though a number of whites possess farms acquired before the annexation of the country. The Pondolo have shown some appreciation of the benefits of education.

See G. McCall Theal's History of South Africa and other works cited in the Notes below. Also C. C. Henkel's The Native or Transkeian Territories (1903); a useful handbook by an ex-official in the Transkeian Territories.

KAFIRISTAN
All the northern passes leading into Badakhshan or into the Minjan valley of Badakhshan seem to be over 15,000 ft. in altitude. Of these, the Kani Flah and the Kamah (alone have been explored by a European traveller), the Kti, the Kulam and the Ramgal passes. Those to the east, the Chital passes, are somewhat lower, ranging from 12,000 to 14,000 ft. high. While the Kti and the Ramgals are high over the Paktun, which crosses one of the dwindled spurs near the Kunar river, is only 8000 ft. high. Between neighbouring valleys the very numerous communications are few; with the exception of the Dera Kti, and one of the Kti and Ramgal routes, the western passes are unknown. All these to some paths are so faintly indicated even when free from snow, that to adventure them without a local guide is extreme, perilous, and sometimes fatal. The cattle of the hills and mountains can be forced over many of the worst passes. Ordinarily, the herding tracks, near the crest of the ridges and high above the white torrents, are scarcely discoverable to untutored eyes. They may be at times washed away by the irruption of the snow, and the precipitous slopes with baffling eccentricity and abruptness. Nevertheless the cattle nose their way along blunderingly, but without hurt. Of no less importance in the open months, and the sole trade routes during winter, are the lower paths by the river. An unguided traveller is continually at fault upon these main lines of intercourse and traffic.

The rivers find their tumuluous way into the Kabul, either directly, as the Alinger at Laghman, or after conning with the

Kunar at Arundu and at Chigar-Serai. The Bashgal draining the eastern portion of the country, empties itself into the Pech, the westernmost of the three main sources at the head of the Bashgal valley. It glides gently through a lake close to this origin, and then through a smaller tarn. The first affluent of importance is the Istorial, which it joins at Pahul. Next comes the noisy Manangar valley, from the Shawal pass, which enters the main stream at Lutelik or Bramagatal, the chief settlement of the Bashgal branch of the Kafir tribe. The Bashgal is fed by the Yenston stream at the hamlet of Sunna, a raging, shrieking torrent in a dark narrow valley, its run obstructed by giant boulders and great tree-trunks. Racing past Bagalgur, the chief village of the Madugal Kafirs, the river changes its character round the great spur which, 1800 ft. higher up, gives space for the terraces and houses of Kamshad, the headquarters of the Kam people. The next important affluent is the river which drains the Pitugal valley, its principal water; the other is the Leh, with the joining-place of the Gourdeh valley waters. Finally it ends in the Kunar just above Arundu and Birkot. The middle part of Kafiristan, including the valleys occupied by the Presun, Kti, Ashkan and Wai tribes, is drained by a river variously called the Pech, the Kamah, and the Presun or Viron river. It has been only partially explored. Fed by the fountains and snows of the upper Presun valley, it is joined at the village of Shvetgrom by the torrent from the Kamah pass. Thence it moves quietly past meadowland, formerly set apart as holy ground, watering on its way all the Presun villages. Below the last of them, with an abrupt bend, it hurries into the unexplored country behind Tankus, where the Ashkan, which it has at hand the Kti and the Ashkan and on the left the Wai rivers, finally losing itself in the Kunar, close to Chigar-Serai. Concerning the Alinger or Kao, which carries the name of the Kamah and Ashkan, the return eastward, there are no trustworthy details. It is formed from the waters of all the valleys inhabited by the Ramgal Kafirs, and by that small branch of the Kafirs known as the Kalam tribe.

The climate varies from the Siah-Posh, or the black-robed Kafirs, and the Safed-Posh, or the white-robed, was neither scientific nor convenient, for while the Siah-Posh have much in common in dress, language, customs and appearance, the Safed-Posh divisions were not more dissimilar from the Siah-Posh than they were from one another. Perhaps the best division at present possible is into (1) Siah-Posh, (2) Waigulis, and (3) Presungalis or Viron folk.

The black-robed Kafirs consist of one very large, widely spread tribe, the Kafirs, and four much smaller communities, the Kam, the Kashtoz, the Kti, and the Rama. Although the Siah-Posh, called the Gourdeh. Numerically, it is probable that the Kafirs are the most important of all the remaining tribes put together. They inhabit several valleys, occupying a region being boundary of the Madugal country, namely, Ptsigrom, Pahul or Pshowar, Apssai, Shidgal, Bramagatal (Lutelik), Bajintra, Badamuk, Ougali, Chabu, Baprok and Purstam; (2) the Kti or Katwar Kafirs, who live in two settlements in the Kti valley; (3) the Kum people, who have four villages in the valley of the same name; (4) the Ramgals, or Gabariks, who are the most numerous, and possess the western part of the Afgan border.

The Waigulis. The upper Waigulis, which the chief of the Kafirs, the Kam or Kamtoz, who inhabit the Bashgal valley, from the Madugal boundary to the Kunar valley, and its lateral branches in seven chief settlements, namely, Urmir, Kam, Kti, Ramgal, Ashkan, Bashgal, and the Gourdeh. The next Siah-Posh tribe in importance is the Moman or Madugal Kafirs, who have three villages in the long tract between the Kafirs and the Kam in the Bashgal valley. The Bashgal tribe, or Siah-Posh tribe, differ from all the other tribes, and are believed to be descended, in great part, from the ancient people called the Aroms. Our exact knowledge of the Waigulis is scanty. They seem to be located in language and origin among the people fierce, shy and isolated, called the Ashkan, who are quite unknown. The Wai speak a tongue altogether different from that spoken by the Siah-Posh and by the Presungalis. The names of the chief villages are Bashgal, Chimon, Kegili, Akun or Akun, Mildehs, Bargant and Prianta. Of these, the Anzhi and Nishi are the best known.

The Presungalis, also called Viron, live in a high valley. In all respects they differ from other Kafirs, in none more than in their unwarlike disposition. Simple, timid, stolid-featured, and rather clumsy, they are remarkable for their industry and powers of endurance. They probably resemble the earliest immigrants. Six large well-built villages are occupied by them—Shvetgrom, Pontzgor, Diogrom, Kashtoz, Sutsumgrom and Paskigrom.

The Slaves. The origin is probably partly from the very ancient inhabitants and partly from war prisoners. Coarse in feature and dark in tint, they cannot be distinguished from the lowest class of freemen, while the household slaves, who are treated not unkindly; and artisan slaves, who are the skilled handicraftsmen—carvers, blacksmiths, bootmakers and so forth; many of the musicians are also slaves. They live in a particular portion of a village, and were considered to a certain extent uncivil, and might not approach closely to certain sacred spots. All slaves seem to wear the Siah-Posh dress, even when they own masters as free Presungalis.

Little respect is shown to women, except in particular cases to a few of advanced years. Usually they are mistresses and slaves, saleable chattels and field-workers. Degraded, immoral, and half-starved, their lot is manifestly one of disappointment and misfortune. In comparison with the men they are somewhat short. Physically they are capable of enormous labour, and are very enduring. All the field-work falls to them, as well as all kinds of inferior occupations, such as weeding, cleaning, digging against their husbands or, failing them, their male relations. They cannot inherit or possess property.

There are certainly three tongues spoken, besides many dialects, that is to say, the Siah-Posh or Presungalis, of course the most common; and although it has many dialects, the employers of one seem Language. to understand all the others. It is a Prakrit language. Of the remaining two, the Waigulis and the Kamtoz, the Siah-Posh variety is unlike the Siah-Posh. Kafirs themselves maintain that very young children from any valley can acquire the Waigulis speech, but that only those born in the Presungalis can ever converse in that language, even among elders. To Europeans, it is inscrutably difficult, and it is perhaps impossible to learn.
Religion.

KAFIRISTAN

Before their conquest by Abdur Rahman all the Kafirs were idolaters of a rather low type. There were lingering traces of the nature of the, gods were to be propitiated, and miscellaneous spirits and fairies haunted forests, rocks, vales and great stones. Imra was the Creator, and all the other gods, except to him, were inferior, and after death as a god, he symbolized hatred to the religion of Mahomet. Every village revered his shrine; some possessed two. Imra, Ghis, and Moi were honoured with separate little temples, as was usual in similar cases, but these were usually a hole, or a cavity, in the ground, and after one shrine another higher, and as the temple was adorned with stucco, and sometimes illuminated at night, the whole was a sight.

The square, Of P was the war-god, and leather gallery and war-gods, and as the scribes of the temple of P, in the times of the Kafirs, were so frequently picturesque at a distance, all are dirty and grimed with smoke; bones and horns of slaughtered animals litter the ground. The ground floor of a house is usually a stable for hogs and the latrine, as well as the manure store for the household; the middle part contains the family treasures; on the top is the living-place. In cold valleys, such as the Presungal, the houses are often clustered upon a hilltop, and penetrate into the soil to the depth of two or more apartments. Notched poles are the universal ladders and stairways.

In height Kafirs average about 5½ ft. in. They are lean; almost always barefoot; their diet consists of a limited variety of root crops and mountaineers, exceptionally they are tall and heavy. With chests fairly deep, and muscular, springy legs, there is some lightness and want of power about the shoulder girdle. Their heads are rather small; they are generally Eastern. Some tribes, notably the Wai, are fairer than others, but the average colour is that of the natives of the Punjab. Albinos, or red-haired people, number less than ¼% of the population. As a rule, the features are well-shaped, especially the eyes, which are large and expressive. The glance is wild and bold, with the wide, lidded, restless gaze of the hawk; or the exact converse—a shifty, furtive peer under lowering brows. They are a well-organized people, often divided into families and the most famous tribesmen. The shape of a man's head not uncommonly indicates his social rank. Several have the brows of thinkers and men of affairs. The degraded forms are the commonest. The hair is usually long and dark, or dark brown, and the thickened, coarse features of the darker slave class. Intellectually they are of good average power. Their moral characteristics are passion, greed, and jealousy so intense that it smotheres their wisdom. Prudence is the last, and finally they have been so largely endangered their wildly cherished independence. Revenge, especially on neighboring Kafirs, is obtained at any price. Kafirs are subtle, crafty, quick in danger and resolve, as might be expected of people who have been plunderers and assassins for centuries, whose lives were the forfeit of a fault in unlinesshing or of a moment's vacillation. Steady daring, born of wary and healthy, of the deadly hit and run; their secret weapon is a girdle. The political instinct, is the national characteristic. Glaudy shadows, they fitted in the precincts of hostile villages far distant from their own, and was a formula for success. They were the first to use a gold or silver sword; ever ready to stab in the dark, in the thick of the tumult, to stab, to slay as they slept men, women and babies. Then, with clothing for prize, and human ears as a trophy, they sped, watchful and unfeeling, as a lordly possession in their track. Kafirs, most faithful to one another, never abandoned a comrade. If he were killed, they sought to carry away his attires for burial observances. As traders, though cunning enough, they are not match for the Afghan. They were more successful as brigands and blackmailers than as skilled thieves. In night robberies and in pillaging they showed little ingenuity. Truth was considered inane and dangerous; but a Kafir is far more trustworthy than his Mohammedian neighbours. Although hospitality is generally viewed as a hopeful investment, it can be calculated on, and is esteemed. Kafirs are capable of strong friendship. They are not always kind to their own, and their fighting spirit is strong, and weak and the old. Family ties and the claim of blood even triumph over jealousy and covetousness.

The national attire of the men is a badly-cut girdle, barely defined at the waist by a leather belt studded with nails, supporting the I-hilted dagger, strong but clumsy, of slave manufacture. The headpiece, sheathed in wood covered with iron or brass, and often iron buttons, is a sort of helmet, with a circular bottom, a very dark tunic of wool, amble below the shoulders, and edged with red. This is fastened at the bottom by an iron pin, a thorn, or a fibula; it is gathered round the body by a woven band, and is kept in place by a knot tied under the left breast. A long girdle is carried a fantastically handled knife in a leather covering. The woman's tunic is sometimes worn by men. As worn by women it is a sort of skin, something like a horse jacket, and an ironfreedom cape. Its hue and the blackness of the hairy tresses keep the name of Siah-Posh, "black-robed," to the majority of the clans. The other tribes wear such articles of cotton attire as they obtain by barter, by theft, or by killing beyond the border, for

Dress, Weapons, Utensils &c.
PEACE IN THEIR TIME.

THE history of Kafiristan has always been one of the floating legendary sort. At the present day there are men living in Chitral and on other parts of the Kafiristan frontier who are prepared to testify as eye-witnesses to marvels observed, and also heard, by them, not only in the more remote valleys, but even in the Afghan borderland itself. It is not surprising that the earlier records are to a great extent fairy tales of a more or less imaginative kind and chiefly of value to those interested in folk-lore. Sir Henry Yale, a scientific soldier, a military and political plodder, and in the result of his researches thought that the present Kafiristan was part of that pagan country stretching between Kashmir and Kabul which medieval Asiatics referred to vaguely as Bilar, a name to be found in Marco Polo as Bolor.

History.—The history of Kafiristan has always been of the floating legendary sort. At the present day there are men living in Chitral and on other parts of the Kafiristan frontier who are prepared to testify as eye-witnesses to marvels observed, and also heard, by them, not only in the more remote valleys, but even in the Afghan borderland itself. It is not surprising that the earlier records are to a great extent fairy tales of a more or less imaginative kind and chiefly of value to those interested in folk-lore. Sir Henry Yale, a scientific soldier, a military and political plodder, and in the result of his researches thought that the present Kafiristan was part of that pagan country stretching between Kashmir and Kabul which medieval Asiatics referred to vaguely as Bilar, a name to be found in Marco Polo as Bolor. The first distinct mention of the Kafirs as a separate people appears in the history of Timur. On his march to the invasion of India the people at Andarab appealed to Timur for help against the Katoor and the Shah-Posh Kafirs. He responded and entered the country of those tribes through the upper part of the Panjshir valley. It was in deep winter weather and Timur had to be let down the snows by glissade in a basket guided by ropes. A detachment of 10,000 horse which he speaks of as having been sent against the Shah-Posh to his left, presumably therefore to the north, met with disaster; but he himself claims to have been victorious. Nevertheless he seems quickly to have evacuated the impracticable mountain land, quitting the country at Khawar. He caused an inscription to be carved in the defiles of Kator to commemorate his invasion and to explain its route. Inside the Kafir country on the Najil or Alishar River there is a fort still called Timur’s Castle, and in the Kalam fort there is said to be a stone engraved to record that at the farthest point of his advance. In the Memoirs of Baber there is mention of the Kafirs raiding into Panjshir and of their taste for drinking, every man having a leathern wine-bottle slung round his neck. The Amin-i-Akbari makes occasional mention of the Kafirs, probably on the authority of the famous Memoirs; it also contains a passage which may possibly have originated the widespread story that the Kafirs were descendants of the Greeks. Yule however believed that this passage did not refer to the Kafirs at all, but to the claims to descent from Alexander of the rulers in Swat before the time of the Yusufzai. Many of the princelings of the Hindu Kafirs propose to call themselves Alexander and pay tribute themselves on a similar origin, maintaining the fourth quarter of their race to be Alexander, “the two-horned,” and a princess sent down miraculously from heaven to wed him.

Benedict Goes, travelling from Peshawar to Kabul in 1603, heard of a place called Cappeslam, where no Mahomedan might enter on pain of death. Hindu traders were allowed to visit the country, but not the temples. Benedict Goes tasted the Kafir wine, and from all that he heard suspected that the Kafirs might be Christians. Nothing more is heard of the Kafirs until 1788, when Rennell’s Memoirs of a Map of

only woolen cloth is made in the country. Of late years long robes from Chitral and Badakshan have been imported by the wealthy, as for the poor these are wasted. Clothing, always hard to obtain, is precious property. Formerly little girls, the children of slaves, or else poor relations, used to be sold to the local women, who eagerly bought the children, which enabled them in one transaction to acquire a female slave and to convert an infidel. Men go bareheaded, which wrinkles them prematurely, or they wear Chitral caps, which are made of paper and cotton cloth round their brows. Siah-Posh women wear curious horned caps or a small square white head-dress upon informal occasions. The heads of other tribes bind their heads with turbans ornamented with shells and other curious articles. Women are made of goat’s hair for both sexes, and of woolen material for women. Boots, strongly sewn, of soft red leather cannot be used in women's work, as this might mar the shape, because it is made of horn or leather. For the ceremonial dances all manner of gay-coloured articles of attire, made of cheap silk, cotton velvet, and shaw cloth-of-gold are displayed, and false jewelry and tawdry ornaments; but they are not manufactured in the country, but brought from Peshawar by pedlars.

Woolen blankets and goat’s hair mats cover the beds—four-legged wooden frames laced across with string or lesser thongs. Low shelf stoles, 18 in. broad, made upon the same principle as the bedsteads, are peculiar to the Kafirs and their half-breed neighbours of the border. Iron tripod tables, singularly Greek in design, are fashioned in Wailul. A warrior’s weapons are a matchlock musket (yan), a sword (qar), a dagger which he never puts aside day or night. The axes, often carried, are light and weak, and chiefly indicate rank. Clubs, care fully ornamented by carving, are of little use in a quarrel; their purpose is to show that one is wearing a club. These walking-clubs have been often supposed to be leaping-poles. Swords are rarely seen, and shields, carried purely for ostentation, seldom used. Some carry to the large utensils, and great, grim chests of wood become in old age centres of curiosity. Prettily carved bowls with handles, or with dummy spouts, milk, butter, water or small quantities of oil. Wine, vinegar, oil, and other liquid stores are carried in bamboo flasks, which are made and fitted up with various instruments are represented by reed flageolets, small drums, primitive fiddles, and a kind of harp.

Isolated and at the outskirts of every village is a house used by women when menstruating and for lying-in. Children are named as soon as born. The infant is given to the mother to suckle, while a wise woman rapidly recites the family formula for the name selected at the instigation of the baby begins to feed is that by which it is thereafter known. Everybody has a double name, the father’s being prefixed to that given at birth. Very often the two are the same. There is a special day for the first head-shaving. No hair is allowed on a male’s scalp, except from a 4-in. circle at the back of the head, whence long locks hang down straight. Puberty is attained ceremoniously by boys. Girls simply change a fillet for a cotton cap when night prayers (salat al-woods) are carried out. The purchase of the marriage portion through intermediaries, accompanied by feasting. Divorce is often merely a sale or the sending away of a wife to slave for her parents in the same capacity. An illegitimate child is lowly in caste and position, and the low birthkill is a puny, weakling, and looks upon adultery as hospitality, provided it is not discovered by the husband. If found out, in flagrant delicto, there is a fiscal fine in cows. There is much collusion to get this penalty paid in order to save the status and cohesion of the family. Women are carried to the cemetery in a blanket, followed by a string of women lamenting. A really great man is mourned over for days with orations, dancing, wine-drinking and food distribution. Gun-firing gives notice of the procession. After two or three days the corpse is placed in the coffin at a secluded spot, and the observances are continued with a straw figure lashed upon a bed, to be danced about, lamented over and harangued as before. During regular intervals for business and refreshment old women wall genealogies. A year later, with somewhat less ceremony, the burial is performed before the mounted priest (mullah) who gives the priestly formula which is, rarely, ornamented with flags; its lid is kept from warping by heavy stones. The wooden statues or effigies are at times sinuously draped with the robe of the Shake-khan or Shah Pesh. The festivals food is set before them. Among the Presungal there are none of these images. Blood-feuds within a tribe do not exist. The slayer of his fellow, even by accident, has to pay a heavy compensation and receive an equivalent in the money. Occasionally village by village are people by families who had thus been driven forth from the community. The stigma attaches itself to children and their marriage connections. Its outward symbol is an inability to hold the head when the dead are carried to the grave. This is ceremonial, in private and after dark all may be good friends after a decorous interval. The compensation is seldom paid, although payment carries with it much enhancement of family dignity. All the laws to punish theft, assault, adultery and other injury are based on a system of compensation which is, at least, theoretically, exact. Clothing, always hard to obtain, is precious property. Formerly little girls, the children of slaves, or else poor relations, used to be sold to the local women, who eagerly bought the children, which enabled them in one transaction to acquire a female slave and to convert an infidel. Men go bareheaded, which wrinkles them prematurely, or they wear Chitral caps, which are made of paper and cotton cloth round their brows. Siah-Posh women wear curious horned caps or a small square white head-dress upon informal occasions. The heads of other tribes bind their heads with turbans ornamented with shells and other curious articles. Women are made of goat’s hair for both sexes, and of woolen material for women. Boots, strongly sewn, of soft red leather cannot be used in women’s work, as this might mar the shape, because it is made of horn or leather. For the ceremonial dances all manner of gay-coloured articles of attire, made of cheap silk, cotton velvet, and shaw cloth-of-gold are displayed, and false jewelry and tawdry ornaments; but they are not manufactured in the country, but brought from Peshawar by pedlars.
KAGERA—K’AI-FENG FU

Hindostan was published. Twenty-six years later Elphinstone’s Cawdor was published. During the British occupation of Kabul in 1839-1842 a deputation of Kafirs journeyed there to invite a visit from their country from the Christians whom they assumed to be their kindred. But the Afghans grew suspiciously jealous, and the deputation was sent coldly away.

After Sir George Robertson’s sojourn in the country and the visit of several Kafirs to India with him in 1892 an increasing intimacy continued, especially with the people of the eastern valleys, until 1895, when by the terms of an agreement entered into between the government of India and the ruler of Afghanistan the whole of the Kafir territory came nominally under the sway of Kabul. The amir Abdur Rahman at once set about enforcing his authority, and the curtain, partially lifted, fell again heavily and in darkness. Nothing but rumours reached the outside world, rumours of successful invasions, of the wholesale deportation of boys to Kabul for instruction in the religion of Islam, of rebellions, of terrible repressions. Finally even rumour ceased. A powerful Asiatic ruler has the means of ensuring a silence which is absolute, and nothing is ever known from Kabul except what the amir wishes to be known. Probably larger numbers of the growing boys and young men of Kafiristan are fanaticised Mahommedans, fanaticised with the zeal of the recent convert, while the older people and the majority of the population cherish their ancient customs in secret and their degraded religion in fear and trembling—waiting dumbly for a signal.

KAGERA, a river of east equatorial Africa, the most remote headstream of the Nile. The sources of its principal upper branch, the Nyavongo, rise in the hill country immediately east of Lake Kivu. After a course of over 400 m. the Kagera enters Victoria Nyanza on its western shore in °58’ S. It is navigable by steamers for 70 m. from its mouth, being obstructed by rapids above that point. The river was first heard of by J. H. Speke in 1858, and was first seen (by white men) by the same traveller (Jan. 16, 1862) on his journey to discover the Nile source. Speke was well aware that the Kagera was the chief river emptying into the Victoria Nyanza and in that sense the headstream of the Nile. By him the stream was called “Kitangâle,” kagera being given as equivalent to “river.” The exploration of the Kagera has been largely the work of German travellers.

See Nile; also Speke’s Discovery of the Source of the Nile (Edinburgh, 1863); R. Kandt’s Câpal Nili (Berlin, 1894); and map by P. S. Schimper and M. Moisel in Großer deutscher Kolonialatlas, No. 16 (Berlin, 1906).

KAHLUR, or BILASPUR, a native state of India, within the Punjab. It is one of the hill states that came under British protection after the first Sikh war in 1846. The Gurkhas had overthrown the country in the early part of the 19th century, and expelled the raja, who was, however, reinstated by the British in 1815. The state occupies part of the basin of the Sutlej amid the lower slopes of the Himalaya. Area, 448 sq. m. Pop. (1901), 90,873; estimated gross revenue, £100,000; tribute, £53,700; and grants, £35,500. The titular title is an ancient Rajput. The town of Bilaspur is situated on the left bank of the Sutlej, 1465 ft. above sea-level; pop. (1901), 3192.

KAHN, GUSTAVE (1859— ), French poet, was born at Metz on the 21st of December 1859. He was educated in Paris at the École des Chartes and the École des langues orientales, and began to contribute to obscure Parisian reviews. After four years spent in Africa he returned to Paris in 1885, and founded in 1886 a weekly review, La Vogue, in which many of his early poems appeared. In the autumn of the same year he founded, with Jean Moréas and Paul Adam, a short-lived periodical, Le Symboliste, in which they preached the nebulous poetic doctrine of Stéphane Mallarmé; and in 1888 he became one of the editors of the Revue indépendante. He contributed poetry and criticism to the French and Belgian reviews favouring, above the extreme symbolists, and, with Catulle Mendès, he founded at the Odéon, the Théâtre Antoine and the Théâtre Sarah Bernhardt, matinées for the production of the plays of the younger poets. He was elected to the earliest series of the writers of the verse libre, and explained his methods and the history of the movement in a preface to his Premiers poèmes (1887). Later books are Les Livres d’images (1890); Les Fleurs de la passâté (1900); some novels; and a valuable contribution to the history of modern French verse in Symbolistes et décadents (1902).

KAHNS, KARL FRIEDRICH AUGUST (1814—1888), German Lutheran theologian, was born at Greiz on the 22nd of December 1814. He studied at Halle, and in 1850 was appointed professor ordinarius at Leipzig. Ten years later he was made canon of Meissen. He retired in 1886, and died on the 20th of June 1888 at Leipzig. Kahns was at first a neo-Lutheran, blessed by E. W. Hengstenberg and his pietistic friends. He then attached himself to the Old Lutheran party, interpreting Lutheranism in a broad and liberal spirit and showing some appreciation of rationalism. His Lutherische Dogmatik, historisch-genetisch dargestellt (3 vols., 1861-1868; 2nd ed. in 2 vols., 1874-1875), by making concessions to modern criticism, by spiritualizing and adapting the old dogmas, by attacking the idea of an infallible canon of Scripture and the conventional theory of inspiration, by laying stress on the human side of Scripture and insisting on the progressive character of revelation, brought him into conflict with his former friends. A. W. Diekhoff, Franz Delitzsch (Für und wider Kähns, 1889) and Ernst Moreas (Kähns, 1897) published a pamphlet having been protected loudly against the heresy, and Kahns replied to Hengstenberg in a vigorous pamphlet, Zeugniss für die Grundwahrheiten des Protestantismus gegen Dr Hengstenberg (1862).

Other works by Kahns are Lehrte vom Abendmahl (1851), Der innere Gang des deutschen Protestantismus seit Mitte des vorigen Jahrhunderts (1854; 3rd ed. in 2 vols., 1874; Engl. trans., 1880); Christentum und Luther (1871); Geschichte der deutschen Reformation, vol. i. (1872); Der Gang der Kirche in Lebensbildern (1881, 2nd ed.); and Über das Verhältniss der alten Philosophie zum Christentum (1884).

K’AI-FENG FU, the capital of the province of Honan, China. It is situated in 34° 3′ N., 114° 33′ E., on one branch line of the Peking-Hankow railway, and forms also the district of Shang-fu. A city on the present site was first built by Duke Chwang (774-700 B.C.) to mark off (k’ai) the boundary of his fief (feng); hence its name. It has, however, passed under several aliases in Chinese history. During the Chow, Suy and T’ang dynasties (527-907) it was known as Pien-chow. During the Wu-tai, or five dynasties (907-960), it was the Tung-king, or eastern capital. Under the Sung and Kin dynasties (960-1260) it was called Pien-king. By the Yuan or Mongol dynasty (1260-1368) its name was again changed to Pien-liang, and on the return of the Chinese to power with the establishment of the Ming dynasty (1368-1644), its original name was restored. The city is situated at the point where the last spur of the Kuen-lun mountain system meets in the eastern plain, and a few miles south of the Hwango. Its position, therefore, lays it open to the destructive influences of this river. In 1642 it was totally destroyed by a flood caused by the dikes bursting, and on several prior and subsequent occasions it has suffered injury from the same cause. The city is large and imposing, with streets and handsome buildings, the most notable of which are a twelve-storeyed pagoda and a circular tower from which, at a height of 200 ft., the inhabitants are able to observe the approach of the yellow waters of the river in times of flood. The city wall forms a substantial protection and is pierced by five gates. The whole neighbourhood, which is the site of one of the earliest settlements of the Chinese in China, is full of historical associations, and it was in this city that the Jews who entered China in A.D. 1163 first established a colony. For many centuries these people have been cut off from the natives, and practised the rites of their religion in a temple built and supported by themselves. At last, however, they fell upon evil times, and in 1851, out of the seventy families which constituted the original colony, only seven remained. For fifty years no rabbi
had ministered to the wants of this remnant. In 1853 the city was attacked by the T’al-p’ing rebels, and, though at the first assault its defenders successfully resisted the enemy, it was subsequently taken. The captors looted and partially destroyed the town. It has now little commerce, but contains several schools on Western. A railway station was opened in 1902, and a military school near the railway station. A mint was established in 1905, and there is a district branch of the imperial post. The population — largely Mahomedan — was estimated (1908) at 200,000. Jews numbered about 400.

**KAILAS** was a mountain in Tibet. It is the highest peak of the range of mountains lying to the north of Lake Manasarowar, with an altitude of over 22,000 ft. It is famous in Sanskrit literature as Siva’s paradise, and is a favourite place of pilgrimage with the Hidastas, who regard it as the most sacred spot on earth. A track encircles the base of the mountain, and it takes the pilgrim three weeks to complete the round, prostrating himself all the way.

**KAIN,** the name of a sub-province and of a town of Khorasan, Persia. The sub-province extends about 300 m. N. to S., from Khaf to Seistan, and about 150 m. W. to E., from the hills of Tan to the Afghan frontier, comprising the whole of south-western Khorasan. It is very hilly, but contains many wide plains and fertile villages at a mean elevation of 4000 ft. It has a population of about 150,000, rears great numbers of camels and produces rice, wheat, and opium. The chief manufactures are felts and other woollen fabrics, principally carpets, which have a world-wide reputation. The best Kaini carpets are made at Darakheh, a village in the Zirkhan district and 50 m. N.E. of Birkend. It is divided into eleven administrative divisions: — Shâhâbâd (with the capital Birkend), Naharjân, Alghur, Tabas sunni Khaneh, Zirkh Shakhkan, Kain, Nimbulâk, Nehbandân, Khâsh, Arab Khâneh or Momenabad.

The town of Kain, the capital of the sub-province until 1740, when it was supplanted by Birkend, is situated 63 m. N. of Birkend and 112 m. S.E. of Tabas. It is surrounded by a wall, 18 ft. thick and 56 ft. high, and contains about 8000 houses. The walls are 21 ft. thick at the base and 18 ft. high. The chief inhabitants are Persians, but there are many Turks and Kurds.

The ancient city of Kairawan is the capital of the district of Kairawan in Tunisia, and it is the only town in Tunisia where the privilege of sanctuary is granted.

**KAIRAWAN** (Kerouan), the “sacred” city of Tunisia, 36 m. S. by W. by rail from Sousse, and about 80 m. due S. from the capital. Kairawan is built in an open plain a little west of a stream which flows south to the Sidi-el-Hani lake. Of the luxuriant gardens and olive groves mentioned in the early Arabic accounts of the place hardly a remnant is left. Kairawan, in shape an irregular oblong, is surrounded by a crenellated brick wall with towers and bastions and five gates. The city, however, spreads beyond the walls, chiefly to the south and east. Some of the finest treasures of Saracenic art in Tunisia are in Kairawan; but the city suffered greatly from the vulgarization which followed the Turkish conquest, and also from the blundering attempts of the French to restore buildings falling into ruin. The streets have been paved and planted with trees, but the town retains much of its Oriental aspect. The houses are built round a central courtyard, and present nothing but bare walls to the street. The chief buildings are the mosques, which are open to Christians, Kairawan being the only town in Tunisia where this privilege is granted.

In the northern quarter stands the great mosque founded by Sidi Okba ibn Nafi, and containing his shrine and the tombs of many rulers of Tunisia. To the outside it presents a heavy buttressed wall, with little of either grandeur or grace. It consists of three parts: a cloistered court, from which rises the massive and stately minaret, the mukasa or mosque proper, and the vestibule. The mukasa is a rectangular domed chamber divided by 296 marble and porphyry columns into 17 aisles, each aisle having 8 arches. The central aisle is wider than the others, the columns being arranged by threes. All the columns are Roman or Byzantine, and are the spoil of many ancient cities. Some of the finest treasurers of Saracenic art in Tunisia are in Kairawan; but the city suffered greatly from the vulgarization which followed the Turkish conquest, and also from the blundering attempts of the French to restore buildings falling into ruin. The streets have been paved and planted with trees, but the town retains much of its Oriental aspect. The houses are built round a central courtyard, and present nothing but bare walls to the street. The chief buildings are the mosques, which are open to Christians, Kairawan being the only town in Tunisia where this privilege is granted.

**KAILAS—KAIRAWAN** 635

The district of Kairawan has an area of 1595 sq. m.; pop. (1901), 16,932. Its antiquity is proved by the evidence of copperplate grants to have been known as early as the 5th century. Early in the 18th century it passed to the Babi family, with whom it remained till 1740, when it was taken by Mahomedan. It was finally handed over to the British in 1853. It was a large military station till 1830, when the cantonment was removed to Deesa.

The district of Kairawan has an area of 1595 sq. m.; pop. (1901), 716,332, showing a decrease of 18% in the decade, due to the results of famine. Except a small corner of hilly ground near its northern boundary and in the south-east and south, where the land along the Mahi is furrowed into deep ravines, the district forms an unbroken plain, sloping gently towards the south-west. The north and north-east portions are covered with patches of rich rice-land, broken by untilled tracts of low brushwood. The centre of the district is very fertile and highly cultivated; the luxuriant fields are surrounded by high hedges, and the whole country is clothed with clusters of shapely trees. To the west this belt of rich vegetation passes into a bare

though well-cultivated tract of rice-land, growing more barren and open till it reaches the maritime belt, whitened by a salt-lake crust, along the Gulf of Cambay. The chief rivers are the Mahi on the south-east and south, and the Sabarmati on the western boundary. The Mahi, owing to its deeply cut bed and many smaller streams, is navigable, though it has many rapids, but the waters of the Sabarmati are largely utilized for the latter purpose. A smaller stream, the Khar, also waters a considerable area by means of canals and sluices. The principal crops are cotton, millets, rice and pulse; the industries are calico-printing, dying, and the manufacture of soap and glass. The chief centre of trade is Nadiad, on the railway, with a cotton-mill. A special article of export is ghi, or clarified butter. The Bombay & Baroda railway runs through the district. The famine of 1899–1900 was felt more severely here than in any other part of the province, the loss of cattle being specially heavy.
was one of the companions of Mahomet. (This legend gave rise to the report that the tomb contained the remains of Mahomet’s barber.) The mosque consists of several courts and chambers, and contains some beautiful stained glass. The court which forms the entrance to the shrine of the saint is richly adorned with tiles and plaster-work, and is surrounded by an arcade of white marble columns. In one of the chambers, supporting a painted wooden roof, the minaret is faced with tiles and is surmounted by a gilded crescent.

The 19th-century mosque of Sidi Amar Abada, also outside the wall, is in the form of a cross and is crowned with seven cupolas. In the suburbs are huge cisterns, attributed to the 9th century, which still supply the city with water. The cemetery covers a large area and has thousands of Cufic and Arabic inscriptions.

Formerly famous for its carpets and its oil of roses, Kairawân is now known in northern Africa rather for copper vessels, articles in morocco leather, potash and sulphate. The town has a population of about 20,000, including a few hundred Europeans.

Arab historians relate the foundation of Kairawân by Okba with miraculous circumstances (Tabari ii, 63; Yâqût iv. 213). The date is variously given (see Weil, Gesch. d. Chalifen, i. 283 seq.); according to Tabari it must have been in 624. The legend relates that Okba determined to found a city which should be a rallying-point for the followers of Mahomet in Africa. He led his companions into the desert, and having exorted the serpents and wild beasts, he named the place Kairawân after his name, exclaiming “Here is your Kairawân” (resting-place), so naming the city.1 In the 8th century Kairawân was the capital of the province of Ifriqiya, and was defended by the caliphs. Later it became the capital of the Aghlabite princes, following the fortunes of the successive rulers of the country (see Tunisia: History). After Mecca and Medina Kairawân is the most sacred city in the eyes of the Mahomedans of Africa, and constant pilgrimages are made to its shrines. Until the time of the French occupation no Christian was allowed to pass through the gates without a special permit from the bey, whilst Jews were altogether forbidden to approach the holy city. Contrary to expectation no opposition was offered by the citizens to the occupation of the place by the French troops in 1881. On that occasion the native troops hastened to the mosques to perform their devotions; they were followed by European soldiers, and the mosques having thus been “violated” have remained open ever since to non-Mahomedans.

See Murray’s Handbook to Algeria and Tunisia, by Sir R. L. Playfair (1865); A. M. Brondley, The Last Parsee Wars: Tunis Past and Present (1882) and H. Saladin, Tunis et Kairouan (1908).

KAISERSLAUTERN, a town in the Bavarian palatinate, on the Walldauer, in the hilly district of Westrich, 41 m. by rail W. of Mannheim. Pop. (1905), 24,306. Among its educational institutions are a gymnasium, a Protestant normal school, a commercial school and an industrial museum. The house of correction occupies the site of Frederick Barbarossa’s castle, which was demolished by the French in 1713. Kaiserslautern is one of the most important industries in the palatinate. Its industries include cotton and wool spinning and weaving, iron-founding, and the manufacture of beer, tobacco, gloves, boots, furniture, &c. There is some trade in fruit and timber.

Kaiserslautern takes its name from the emperor (Kaiser) Frederick I, who built a castle here about 1152, although it appears to have been a royal residence in Carolingian times. It became an imperial city, a dignity which it retained until 1537, when it passed to the palatinate. In 1621 it was taken by the Spaniards under Alvarado, in 1635 by the Swedes, in 1635 by the French, in 1642 by the imperial forces, in 1643 and 1713 by the French troops. During 1693 and 1794 was the scene of fighting; and in the Franco-Russian War of 1870-1 it was the base of operations of the second German army, under Prince Frederick Charles. It was one of the early stations of the Reformation, and in 1849 was the centre of the revolutionary spirit in the palatinate.

See Lehmann, Urkundliche Geschichte von Kaiserslautern (Kaiserslautern, 1853); E. Jost, Geschichte der Stadt Kaiserslautern (Kaiserslautern, 1886).

KAISERSWERTH, a town in the Prussian Rhine province, on the right bank of the Rhine, 6 m. below Düsseldorf. Pop. (1905), 24,652. It possesses a Protestant and a large old Romanesque Roman Catholic church of the 12th or 13th century, with a valuable shrine, said to contain the bones of St Suitbert, and has several benevolent institutions, of which the chief is the Diakonissen Anstalt, or training-school for Protestant sisters of charity.

This institution, founded by Pastor Theodor Fleidner (1800–1864) in 1836, has more than 100 branches, some being in Asia and America; the head establishment at Kaiserswerth includes an orphanage, a lunatic asylum and a Magdalene institution. The Roman Catholic hospital occupies the former Franciscan convent.

The population is engaged in silk-weaving and other small industries.

In 1710 Pippin of Herstal presented the site of the town to Bishop Suitbert, who built the Benedictine monastery round which the town gradually formed. In 2411 the town received a charter, but in that year Count Adolph V. of Berg, who was besieging it, damned up effectually one arm of the Rhine. About the beginning of the 14th century Kaiserswerth, then an imperial city, came to the archbishopric of Cologne, and afterwards to the duchy of Juliers, whence, after some vicissitudes, it finally passed into the possession of the princes of the palatinate, whose rights, long disputed by the elector of Cologne, were legally settled in 1772.

In 1702 the fortress was captured by the Austrians and Prussians, and the Kaiserpfalz, whence the young emperor Henry IV. was abducted by Archbishop Anno of Cologne in 1602, was blown up.

KAITHAL, or KYTHAL, an ancient town of British India in Karnal district, Punjab. Pop. (1901), 14,408. It is said to have been founded by the mythical hero Yudisthira, and is connected by tradition with the monkey-god Hanuman. In 1767 it fell into the hands of the Sikh chieftain, Bhai Desu Singh, whose descendants, the bhais of Kaithal, ranked among the most powerful Cis-Sutlej chiefs. Their territories lapsed to the British in 1845. There remain the fort of the bhais, and several Mahomedan tombs of the 13th century and later. There is some trade in grain, sal-ammoniac, live stock and blankets; and cotton, salt petre, lac ornaments and toys are manufactured.

KAPOPO, the Maori name, signifying “night parrot,” and frequently adopted by English writers, of a bird, commonly called by the British in New Zealand the “ground-parrot” or “owl-parrot.” The existence of this singular form was first made known in 1843 by Ernst Dieffenbach (Travels in N. Zealand, ii, 194), from some of its tall-feathers obtained by him, and he suggested that it was one of the Cuculidae, possibly belonging to the family Centropodidae, which it resembles and that no example had been seen for many years. G. R. Gray, noticing it in June 1845 (Zool. V. “Erebus” & “Terror,” pt. ix. p. 9), was able to say little more of it, but very soon after wards a skin was received at the British Museum, of which, in the following September, he published a figure (Gen. Birds, pt. xvii.), naming it Strigops habroptilus, and rightly placing it among the parrots, but he did not describe it technically for another eighteen months (Proc. Zool. Society, 1847, p. 61). Many specimens have since been received in Europe, so that it is represented in most museums, and several examples have reached England alive.

In habits the kakapo is almost wholly nocturnal, hiding in holes (which in some instances it seems to make for itself) under the roots of trees or rocks during the day time, and only issuing forth about sunset to seek its food, which is solely vegetable in kind, and consists of the twigs, leaves, seeds and fruits of trees, grass and fern roots—some observers say mosses also. It sometimes climbs trees, but generally remains on the ground, only using its comparatively short wings to balance itself in running or to break its fall when it drops from a height. As it has been, though not always then—being apparently incapable of real flight. This is a characteristic which makes an easy prey to the marauding creatures—cats, rats and so forth—which European colonists have, by accident or design, let loose in New Zealand. Sir G. Grey says it had been, within the memory of old people, abundant in every part of that country.

1 This generic term was subsequently altered by Van der Hoeven, rather pedantically, to Stringops, a spelling now generally adopted. It has, however, been occasionally observed abroad by day; and, in captivity, one example at least is said to have been as active by day as by night.
KAKAR—KALAHARI DESERT

but (writing in 1854) was then found only in the unsalted districts.

The kakapo is about the size of a raven, of a green or brownish-green colour, thickly furred and irregularly barred with dark brown, and dashed here and there with longitudinal stripes of light yellow. Examples are subject to much variation in colour and shade, and in some the lower parts are deeply tinged with yellow. Externally the most striking feature of the bird is its head, armed with a powerful beak that it well knows how to use, and its face clothed with hairs and elongated feathers that sufficiently resemble the physiognomy of an owl to justify the generic name Strigiformes. Of its internal structure little has been described, and that not accurately. Its funkcional has been said (Proc. Zool. Society, 1874, p. 594) to be lost, whereas the claviculae, which in most birds unite to form that bone, are present, though they do not meet, while in like manner the bird has been declared (op. cit., 1897, p. 624, note) to furnish among the Carinatae the only apparent exception to the presence of a keel to the sternum. The keel, however, is undoubtedly there, as remarked by Blanchard (Ann. Nat. Sc., Zoology, 4th series, vol. xi. p. 83) and A. Milne Edwards (Ois. Foss. de la France, ii. 516), and, though much reduced in size, is nearly as much long before the advent of Dodo and the Ocydroscope. The abortive condition of this process can hardly be regarded but in connexion with the incapacity of the bird for flight, and may very likely be the result of disuse. There can be scarcely any doubt as to the propriety of considering this genus the type of a separate family of Psittaci; but whether it stands alone or some other forms (Psaeopus or Geopsittacus, for example, which in coloration and habits present some curious analogies) should be placed with it, must await future determination. In captivity the kakapo is said to show much intelligence, as well as an affectionate and playful disposition. Unfortunately it does not seem to share the amphibity characteristic of most parrots, and none that has been held in confinement appears to have long survived, while many succumb speedily.

For further details see Gould’s Birds of Australia (ii. 247), and Handbook (ii. 330); Dr Finch’s Die Papageien (i. 241), and Sir Walter Buller’s Birds of New Zealand especially.

KAKAR, a Pathan tribe on the Zhob valley frontier of Baluchistan. The Kakars inhabit the back of the Sulim mountain ranges between Quetta and the Gomal river; they are a very ancient race, and it is probable that they were in possession of these slopes long before the advent of Afghan or Arab. They are divided into many distinct tribes who have no connexion beyond the common name of Kakar. Not only is there no chief of the Kakars, or general jirga (or council) of the whole tribe, but in most cases there are no recognized heads of the different clans. In 1901 they numbered 105,444. During the second Afghan War the Kakars caused some annoyance on the British line of communications; and the Kakars inhabiting the Zhob valley were punished by the Zhob valley expedition of 1884.

KALA-AZAR, or Dum-Dum fever, a tropical disease, characterized by remittent fever, anaemia and enlargement of the spleen (spleenomegaly) and often of the liver. It is due to a protozoon parasite (see Parasitic Diseases), discovered in 1900 by Leishman in the spleen, and is of a malarial type. The treatment is similar to that for malaria. In Assam good results have been obtained by segregation.

KALABAGH, a town of British India in the Mianwali district of the Punjab. Pop. (1901), 3824. It is picturesquely situated at the foot of the Salt range, on the right bank of the Indus, opposite the railway station of Mari. The houses nestle against the foot of a precipitous hill of solid rock-salt, piled in successive tiers, the roof of each tier forming the street which passes in front of the row immediately above, and a cliff, also of pure rock-salt, towers above the town. The supply of salt, which is worked from open quarries, is practically inexhaustible. Alum also occurs in the neighbouring hills, and forms a considerable item of local trade. Iron implements are manufactured.

KALACH, also known as Donskaya, a village of S.E. Russia, in the territory of the Don Cossacks, and a river port on the Don, 51 m. N.E. of Nizhne-Chirskaya, in 44° 30' E. and 48° 43' N. Its permanent population, only about 1200, increases greatly in summer. It is the terminus of the railway (45 m.) which connects the Don with Tsarsitsyn on the Volga, and all the goods (especially fish, petroleum, cereals and timber) brought from the Caspian Sea up the Volga and destined for middle Russia, or for export through the Sea of Azov, are unloaded at Tsarsitsyn and sent over to Kalach on the Don.

KALAHANDI (formerly Karoni), a feudatory state of India, which was transferred from the Central Provinces to the Orissa division of Bengal in 1905. A range of the Eastern Ghats runs from N.E. to S.W. through the state, with open undulating country in the north, up to 24° 45' 30" N. (Proc. Ind. Ass. Calcutta, 1905, p. 156). The estimated revenue, £8000; tribute, £600. The inhabitants mostly belong to the aboriginal race of Khonds. A murderous outbreak against Hindu settlers called for armed intervention in 1882. The chief, Raghu Kishor Deo, was murdered by a servant in 1897, and during the minority of his son, Brij Mohan Deo, the state was placed in charge of a British political agent. The capital is Bhavani Patna.

KALAHARI DESERT, a region of South Africa, lying mainly between 20° and 26° S. and 19° and 24° E., and covering fully 300,000 square miles. The area is especially in the western portion of the (British) Bechuanaland protectorate, but it extends south into that part of Bechuanaland annexed to the Cape and west into German South-West Africa. The Orange river marks its southern limit; westward it reaches to the foot of the Nama and Damara hills, eastward to the cultivable parts of Bechuanaland, northward and north-westward to the valley of the Okavango and the bed of Lake Ngami. The Kalahari, part of the immense inner table-land of South Africa, has an average elevation of over 3000 ft. with a general slope from east to west and a dip northward to Ngami. Described by Robert Moffat as “the southern Sahara,” the Kalahari resembles the great desert of North Africa in being generally arid and in being scored by the beds of dried-up rivers. It presents however many points of difference from the Sahara. The surface soil is mainly red sand, but in places limestone overlies shale and conglomerates. The ground is undulating and its appearance is comparable with that of the ocean at times of heavy swell. The crests of the waves are represented by sand dunes, rising from 30 to 100 ft.; the troughs between the dunes vary greatly in breadth. On the eastern border long tongues of sand project into the sea, and dunes in places penetrate far into the desert. There are also, and especially along the river beds, extensive mud flats. After heavy rain these become pans or lakes, and water is then also found in mud-bottomed pools along the beds of the rivers. The water in the pans is often brackish, and in some cases thickly encrusted with salt. Pans also occur in crater-like depressions where rock rises above the desert sands. A tough, sun-bleached grass, growing knee-high in tufts at intervals of about 15 in., covers the dunes and gives the general colour of the landscape. Considerable parts of the Kalahari, chiefly in the west and north, are however covered with dense scrub and there are occasional patches of forest. Next to the lack of water the chief characteristics of the desert are the tuberous and herbaceous plants and the large numbers of big game found in it. Of the plants the most remarkable is the water-melon, of which both the bitter and sweet variety are found, and which supplies both man and beast with water. The game includes the lion, leopard, hippopotamus, rhinoceros, buffalo, zebra, quagga, many kinds of antelope (among them the kudu and gnu), baboon and ostrich. The elephant, giraffe and eland are also found. The hunting of these three last-named animals is prohibited, and for all game there is a close time from the beginning of September to the end of February.

The climate is hot, dry and healthy, save in the neighbourhood of the large marshes in the north, where malarial fever is prevalent. In this region the drainage is N.E. to the great Makarikari marsh and the Botletle, the river connecting the marsh with the Ngami system. In the south the drainage is towards the Orange. The Molopo and the Kuruman, which in their upper course in
eastern Bechuanaaland are perennial streams, lose their water by evaporation and percolation on their way westward through the Kalahari. The Molopo, a very imposing river on the map, is dry in its lower stretches. The annual rainfall does not exceed 10 in. It occurs in the summer months, September to March, and chiefly in thunderstorms. The country is suffering from progressive desiccation, but there is good evidence of an abundant supply of water not far beneath the surface. In the water-melon season a few white farmers living on the edge of the desert shoot melons. Such fields as have been under cultivation by artificial irrigation yield excellent returns to the farmer; but the chief commercial products of the desert are the skins of animals.

The Kalahari is the home of wandering Bushmen (q.e.), who live entirely by the chase, killing their prey with poisoned arrows, of Ba-Kalahari, and along the western border of Hottentots, who are both hunters and cattle-reapers. The Ba-Kalahari (men of the Kalahari), who constitute the majority of the inhabitants, appear to belong to the Batau tribe of the Bechuanaans, now no longer having separate tribal existence, and traditionally reported to be the eldest of the Bechuana tribes. Their features are markedly negroid, though their skin is less black than that of many negro peoples. They have thin legs and arms. The Ba-Kalahari are said to have possessed enormous herds of large horned cattle until depredations were made and driven into the desert by a fresh migration of more powerful Bechuana tribes. Unlike the Bushmen, and in spite of desert life, the Ba-Kalahari have a true passion for agriculture and they are very careful to protect their gardens. In many cases all they can grow is a scanty supply of melons and pumpkins, and they rear small herds of goats. They are also clever hunters, and from the neighbouring Bechuana chiefs obtain spears, knives, and other articles in exchange for their skins. Being in a dry country, they kill. In disposition they are peaceful to timidity, grave and almost morose. Livingstone states that he never saw Ba-Kalahari children at play. An alcoholistic method is employed to obtain water where there is no open well or running stream. To one end of a reed about 2 ft. long a bunch of grass is tied, and this end of the reed is inserted in a hole dug at a spot where water is known to exist underground. The reed is then thrown down firmly round it. An ostrich egg-shell, the usual water vessel, is placed on the ground alongside the reed. The water-drager, generally a woman, then sucks up the water through the reed, dexterously squirting it into the adjacent egg-shell. To skirt aim she places in her lips a straw, the other end of which is inserted in the shell. The shells, when filled, are buried, the object of the Ba-Kalahari being to preserve their supplies from any sudden raid by Bushmen or other foe. Early travellers stated that no amount of bullying or hunting in a Ba-Kalahari village would result in a find of water; but that on friendly relations being established the natives would bring a supply, however small, for the purpose. Transvaal across the Kalahari to Ngami and thence to the hinterland of Angola. Many of the party, men, women and children, perished of thirst during the journey. Survivors stated that in all some 250 people and 9,000 cattle died.

The Kalahari was first crossed to Lake Ngami by David Livingstone, accompanied by William C. Oweill, in 1849. In 1878-1879 a party of some three hundred British soldiers, troops of the British South Africa Company, transversed the Kalahari from Ngami and thence to the hinterland of Angola. Many of the party, men, women and children, perished of thirst during the journey. Survivors stated that in all some 250 people and 9,000 cattle died.

KALAMATA—KALAT

Vessels load and discharge by means of lighters, the outer harbour having a depth at entrance of 24 ft. and of 14 ft. The inner harbour has a depth of 15 ft. and is sheltered by a breakwater 1460 ft. in length; in the winter months the fishing craft take shelter in the haven of Armvvo. The silk industry, formerly important, still employs about 300 men and girls in four spinning establishments. Olive oil and silk are the chief exports.

KALAMAZOO, a city and the county-seat of Kalamazoo county, Michigan, U.S.A., on the W. bank of the Kalamazoo River, about 49 m. S. of Grand Rapids and 144 m. W. of Detroit. Pop. (1900) 24,404, of whom 4710 were foreign-born; (1910 census) 39,047. It is served by the Michigan Central, the Lake Shore & Michigan Southern, the Grand Rapids & Indiana, the Kalamazoo, Lake Shore & Chicago, and the Chicago, Kalamazoo & Signaw railways, and by interurban electric lines. The city has a public library, and is the seat of Kalamazoo college (Baptist), which grew out of the Kalamazoo literary institute (1853) and was chartered under its present name in 1855; the Michigan female seminary (Presbyterian), established in 1866; the Western State normal school (1904); Nazareth Academy (1897), for girls; Barbour Hall (1890), a school for boys; two private schools for the feeble-minded; and the Michigan asylum for the insane, opened in 1859. The surrounding country is famous for its cereals, and the city is an important manufacturing centre, ranking third among the cities of the state in the value of its factory products in 1909. The value of the factory product in 1904 was $3,141,767, an increase of 82-9% since 1900. The waterworks and electric-lighting plant are owned and operated by the municipality. Kalamazoo was settled in 1829, was known as Bronson (in honour of Titus Bronson, an early settler) until 1836, was incorporated as the village of Kalamazo in 1838, and in 1884 became a city under a charter granted in the preceding year.

KAPALUYA, or CALLAPOOYA, a tribe and stock of North-American Indians, whose former range was the valley of the Willamette River, Oregon. They now number little more than a hundred, on a reservation on Grande Ronde reservation, Oregon.

KALAT, the capital of Baluchistan, situated in 30° 3' N. and 66° 35' E., about 6860 ft. (above sea-level, 88 m. from Quetta. The town gives its name also to a native state with an area, including Makran and Khuran, of 71,593 sq. m. and a population (1907) of 476,336. The word Kalat is derived from kala—a fortress; and Kalat is the most picturesque fortress in the Baluch highlands. It crowns a low hill, round the base of which clusters the closely built mass of flat-roofed mud houses which form the insignificant town. A miri or citadel, having an imposing appearance, dominates the town, and contains within its walls the palace of the khan. It was in an upper room of this residence that Mehrab Khan, ruler of Baluchistan, was killed during the storming of the town and citadel by the British troops at the close of the first Afghan War in 1839. In 1901 it had a population of only 2000. The valleys immediately surrounding the fortress are well cultivated and thickly inhabited, in spite of their elevation and the extremes of temperature to which they are exposed. Recent surveys of Baluchistan have determined the position of Hozdar or Khodzdar (27° 48' N., 66° 38' E.) to be about 50 m. S. of Kalat. Khodzdar was the former capital of Baluchistan, and is as directly connected with the southern branches of the Mulla Pass as Kalat is with the northern, the Mulla being the ancient trade route to Gandava (Kandahe) and Sind. In spite of the rugged and mountainous character of the districts of the Kalat highlands, the main routes through them (concentrating on Khodzdar rather than on Kalat) are comparatively easy. The old "Pathan vall,” the trade highway between Kalat and Karachi by the Hab valley, passes through Khodzdar. From Khodzdar another route strikes a little west of south to Wad, and then passes easily into Las Bela. This is the "Kohan vall.” A third route runs to Nal, and leads to the head of the Kolwa valley (meeting with no great physical obstruction), and then strikes into the open high road to Persia. Some of the
valleys about Kalat (Mastang, for instance) are wide and fertile, full of thriving villages and strikingly picturesque; and in spite of the great preponderance of mountain wilderness (a wilderness which is, however, in many parts well adapted for the pasturage of sheep) existing in the Sarawan lowlands almost equally with the Jawaian highlands, it is not difficult to understand the importance which the province of Kalat, anciently called Taran (or Tubaran), maintained in the eyes of medieval Arab geographers (see Baluchistan). New light has been thrown on the history of Kalat by the translation of an unpublished manuscript obtained at Tatta by Mr. Tate, of the Indian Survey Department, who has added thereto notes from the Tufah and Karam, for the use of which he is indebted to Khan Sahib Raza Gakhsh, chief of Tatta. According to these authorities, the family of the khan of Kalat is of Arabic origin, and not, as is usually stated, of Brahui extraction. They belong to the Ahmadzai branch of the Mirwari clan, which originally emigrated from Oman to the Kolwa valley of Mekran. The khan of Kalat, Mir Mahmud Khan, who succeeded his father in 1803, is the leading chiefman in the Baluch Confederacy. The revenue of the khan is estimated at nearly £50,000, including subsidies from the British government; and an accrued surplus of £240,000 has been invested in Indian stocks.

See G. P. Tate, Kalat (Calcutta, 1896); Baluchistan District Gazetteer, vol. vi. (Bombay, 1907).

KALAT-I-GHLIZAI, a fort in Afghanistan. It is situated on an isolated rocky eminence 5543 ft. above sea-level and 200 ft. above the plain, on the right bank of the river Tarnak, on the road between Kabul and Kandahar, 87 m. from Kandahar and 225 m. from Kabul. It is celebrated for its gallant defence by Captain Craige and a sepoy garrison against the Afghans in the first Afghan War of 1842. In memory of this feat of arms, the 11th Pioneers still bear the name of "The Kalat-i-Ghilzai Regiment," and carry a special colour with the motto "Invicta."

KALB, JOHANN ("BARON DE KALB") (1721-1786), German soldier in the American War of Independence, was born in Hüttendorf, near Bayreuth, on the 29th of June 1721. He was of peasant parentage, and left home when he was sixteen to become a butler; in 1743 he was a lieutenant in a German regiment in the French service, calling himself at this time Jean de Kalb. He served with the French in the War of the Austrian Succession, becoming captain in 1747 and major in 1756; in the Seven Years' War he was in the corps of the de Broglie, under the great general, and carried a special colour with the motto "Invicta."

KALCREEUTH, FRIEDRICH ALOD, COUNT VON (1733-1818), Prussian soldier, entered the regiment of Gardes du Corps in 1752, and in 1758 was adjutant or aide de camp to Frederick the Great's brother, Prince Henry, with whom he served throughout the later stages of the Seven Years' War. He won special distinction at the battle of Freiberg (Sept. 29, 1760), for which Frederick promoted him major. Personal differences with Prince Henry severed their connexion in 1766, after which Kalckreuth retired from active service. But he made the campaign of the War of the Bavarian Succession as a colonel, and on the accession of Frederick William II. was restored to favour. He greatly distinguished himself as a major-general in the invasion of Holland in 1787, and by 1792 had become count and lieutenant-general. Under Brunswick he took a conspicuous part in the campaign of Valmy in 1792, the siege and capture of Mainz in 1793, and the battle of Kaiserslautern in 1794. In the campaigns against Napoleon in 1806 he played a marked part for good or evil, both at Auerstädt and in the miserable retreat of the beaten Prussians. In 1807 he defended Danzig for 78 days against the French under Marshal Lefebvre, with far greater skill and energy than he had shown in the previous year. He was promoted field marshal soon afterwards, and conducted many of the negotiations at Tilsit. He died as governor of Berlin in 1818.

The Dictées du Feldmarschall Kalckreuth were published by his son (Paris, 1844).

KALCKREUTH, LEOPOLD, COUNT VON (1855-1904), German painter, a direct descendant of the famous field-marshall (see above), was born at Düsseldorf, received his first training at Weimar from his father, the landscape painter Count Stanislaus von Kalckreuth (1828-1894), and subsequently studied at the academies of Weimar and Munich. Although he painted some portraits remarkable for their power of expression, he devoted himself chiefly to depicting the picturesque and the monotonous life of the fishing folk on the sea-coast, and of the peasants in the fields. His palette is joyous, and almost melancholy, and in his technique he is strongly influenced by the impressionists. He was one of the founders of the secessionist movement. From 1885 to 1890 Count von Kalckreuth was professor at the Weimar art school. In 1890 he resigned his professorship and retired to his estate at Hückrich in Silesia, where he occupied himself in painting subjects drawn from the life of the country-folk. In 1895 he became a professor at the art school at Karlsruhe. The Munich Pinakothek has his "Rainbow" and the Dresden Gallery his "Old Age." Among his chief works are the "Funeral at Dachau," "Homewards," "Wedding Procession in the Carpathian Mountains," "The Gleaners," "Old Age," "Before the Fish Auction," "Summer," and "Going to School."

KALEIDOSCOPE (from Gr. καλός, beautiful, ἄλος, form, and σκοτειν, to view). The article Reflection explains the symmetrical arrangement of images formed by two mirrors inclined at an angle which is a sub-multiple of four right angles. This is the principle of the kaleidoscope, an optical toy which received its present form at the hands of Sir David Brewster about the
KALERGIS—KALGOORLIE

year 1815, and which at once became exceedingly popular owing to the beauty and variety of the images and the sudden and unexpected changes from one graceful form to another. A hundred years earlier K. Bradley had employed a similar arrangement which seems to have passed into oblivion (New Improvements of Planting and Gardening, 1710). The instrument has been extensively used by designers. In its simplest form it consists of a tube about twelve inches long containing two glass plates, extending along its whole length and inclined at an angle of 60°. The eye-end of the tube is closed by a metal plate having a small hole at its centre near the intersection of the glass plates. The other end is closed by a plate of muffled glass at the distance of distinct vision, and parallel to this is fixed a plate of clear glass. In the intervening space (the object-box) are contained a number of fragments of brilliantly coloured glass, and as the tube is turned round its axis these fragments alter their positions and give rise to the various patterns. A third reflecting plate is sometimes employed, the cross-section of the three forming an equilateral triangle. Sir David Brewster modified his apparatus by moving the object-box and closing the end of the tube by a lens of short focus which forms images of distant objects at the distance of distinct vision. These images take the place of the coloured fragments of glass, and they are symmetrically multiplied by the mirrors. In the polyangular kaleidoscope the angle between the mirrors is altered at pleasure. Such instruments are occasionally found in old collections of philosophical apparatus and have been used in order to explain to students the formation of multiple images.

(C. J. J.)

KALERGIS, DIMITRI (Demetrios) (1805–1867), Greek statesman, was a Cretan by birth, studied medicine at Paris and on the outbreak of the War of Greek Independence went to the Morca and joined the insurgents. He fought under Karakasikis, was taken prisoner by the Turks before Athens and muleted of an ear; later he acted aide de camp to the French philhellenic Colonel Felhaber and to Count Cape d'Istria, president of Greece. In 1832 he was prominent lieutenant in the command of a cavalry division, he was the prime mover in the insurrection which forced King Otto to dismiss his Bavarian ministers. He was appointed military commandant of Athens and aide de camp to the king, but after the fall of the Mavrocordato ministry in 1845 was forced to go into exile, and spent several years in London, where he became an intimate of Prince Louis Napoleon. In 1848 he made an abortive descent on the Greek coast, in the hope of revolutionizing the kingdom. He was captured but released and, after a stay in the island of Zante, went to Paris (1852). At the conclusion of the War Powers he was recalled on the outbreak of the Crimean War and appointed minister of war in the reconstituted Mavrocordato cabinet (1854). He was, however, disliked by King Otto and his consort, and in October 1855 was forced to resign. In 1861 he was appointed minister plenipotentiary in Paris, in which capacity he took an important part in the negotiations which followed the fall of the Bavarian dynasty and led to the accession of Prince George of Denmark to the Greek throne.

KALEWALA, or KALEVALA, the name of the Finnish national epic. It takes its name from the three sons of Kalev (or Finland), viz. the ancient Wäinämöinen, the inventor of the sacred harp Kantele; the cunning art-smith, Ilmarinen; and the gallant Lemminkäinen, who is a sort of Arctic Don Juan. The adventures of these three heroes are wound about a plot for securing in marriage the hand of the daughter of Louhi, a hero from Pohjola, a land of the cold north. Ilmarinen is set to construct a magic mill, the Sanpo, which grinds out meal, salt and gold, and as this has fallen into the hands of the folk of Pohjola, it is needful to recover it. The poem actually opens, however, with a very poetical theory of the origin of the world. The virgin daughter of the atmosphere, Luonnotar, wanders for seven hundred years in space, until she behelds her to invoke Ukko, the northern Zeus, who sends his eagle to her; this bird makes its nest on the knees of Luonnotar and lays in it seven eggs. Out of the substance of these eggs the visible world is made. But it is empty and sterile until Wäinämöinen descends upon it and wos the exquisite Ainu. She disappears into space, and it is to recover from his loss and to find another bride that Wäinämöinen makes his series of epic adventures in the dismal country of Pohjola. Various episodes of great strangeness and wonder are introduced the lengthy recital of the quest to acquire the magical Sanpo, which gives prosperity to whatever possesses it. In the midst of a battle the Sanpo is broken and falls into the sea, but one fragment floats on the waves, and, being stranded on the shores of Finland, secures eternal felicity for that country. At the very close of the poem a virgin, Mariatta, brings forth a king who drives Wäinämöinen out of the country, and this is understood to refer to the ultimate conquest of Paganism by Christianity.

The Kalewala was probably composed at various times and by various hands, but it also brings sympathy with the latent traditions of the Finnish race, and with a mixture of symbolism and allegory exactly accordant with the instincts of that race. While in the other ancient epics of the world bloodshed takes a predominant place, the Kalewala is characteristically gentle, lyrical and even domestic, dwelling at great length on situations of moral beauty and romantic pathos. It is entirely concerned with the folk-lore and the traditions of the primeval Finnish race. The poem is written in eight-syllabled trochaic verse, and an idea of its style may be obtained from Longfellow's Hiawatha, which is a pretty true imitation of the Finnish epic.

Until the 19th century the Kalewala existed only in fragments in the memories and on the lips of the peasants. A collection of a few fragments was published anonymously in 1863, but it was not until 1835 that anything like a complete and systematically arranged collection was given to the world by Dr Elias Lönnrot. For years Dr Lönnrot wandered from place to place in the most remote districts, living with the peasants, and taking down from their lips all that they knew of their popular songs. Some of the most valuable were discovered in the governments of Archangel and Olonetz. After unwearying diligence Lönnrot was successful in collecting 12,000 lines. These he arranged as methodically as he could into thirty-two runes or cantos, which he published exactly as the heard them sung or chanted. Continuing his research, Dr Lönnrot published in 1868 a revised and enlarged edition of Kalewala, containing 12,000 lines, and a still more complete text was published by A. V. Forsman in 1867. The importance of this Indigenous epic was at once recognized in Europe, and translations were made into Swedish, German and French. Several translations into English exist, the fullest being that by J. M. Crawford in 1888. The best foreign editions are those of Castren in Swedish (1841), Louzon le Duc in French (1845 and 1860), Schiefner in German (1852). (E. G.)

KalgaN (Chang-Chia K'ow), a city of China, in the province of Chih-li, with a population estimated at from 70,000 to 100,000. It lies in the line of the Great Wall, 122 m. by rail N.W. of Peking, commanding an important pass between China and Mongolia. Its position is marked by the 50° 45' 11'' long. and 114° 54' E. latitude and height above the sea as 2810 ft. The valley between the two mountains in which it is situated is under excellent cultivation, and thickly studded with villages. Kalgan consists of a walled town or fortress and suburbs 3 m. long. The streets are wide, and excellent shops are abundant; but the ordinary houses have an unusual appearance, from the fact that they are mostly roofed with earth and become covered with green-sward. Large quantities of soda arc manufactured; and the town is the seat of an extensive trade and transit. In October 1909 it was connected by railway with Peking. In early autumn long lines of caravans come in from all quarters for the conveyance of camels from Kalgan to Kkiakhta; and each caravan usually makes three journeys in the winter. Some Russian merchants have permanent residences and warehouses just outside the gate. On the way to Peking the road passes over a beautiful bridge of seven arches, ornamented with marble figures of animals. The name Kalgan is Mongolian, and means a barrier or "gate-beam."
KALI—KALIDĀṢA

KALI (black), or Kali Ma (the Black Mother), in Hindu mythology, the goddess of destruction and death, the wife of Siva. According to one theory, Calcutta owes its name to her, being originally Kalighat, "Kali’s landing-place." Siva, who is called here his Evidence, and through whom the gods, devas, and men, "from the beginning, Bhisti, Parvatī, &c.," Her idol is black, with four arms, and red palms to the hands. Her eyes are red, and her face and breasts are besmeared with blood. Her hair is matted, and she has projecting Fang-like teeth, between which protrudes a tongue dripping with blood. She wears a necklace of skulls, her earrings are dead bodies, and she is girded with serpents. She stands on the body of Siva, to account for which attitude there is an elaborate legend. She is more worshipped in Gondwana and the forest tracts to the east and south of it than in any other part of India. Formerly human sacrifices was the essential of her ritual. The victim, always a male, was taken to her temple after sunset and imprisoned there. When morning came he was dead: the priests told the people that Kali had sucked his blood in the night. At Dantewara in Bastar there is a famous shrine of Kali under the name of Danteswari. Here many a human head has been presented on her altar. About 1830 it is said that upwards of twenty-five full-grown men were immolated at once by the raja. Cutting their flesh and burning portions of their body were among the acts of devotion of her worshippers. Kali is goddess of sin and violence, and in H. S. Müller’s History of Hinduism she is described as the victim of her ambition, and to her the sacred pickaxe, wherein with their graves were dug, was consecrated.

The "Hook-swinging Festival" (Churukk or Churulk Pujā), one of the most notable celebrations in honour of the goddess Kali, has now been prohibited in British territory. Those who had vowed themselves to self-torture submitted to be swung in the air supported only by hooks passed through the muscles over the blade-bones. These hooks were hung from a long crossbeam, which see-sawed upon a huge upright pole. Hanging to the air by men pulling down the other end of the saw-beam, the victim was then whirled round in a circle. The torture usually lasted fifteen or twenty minutes.

See A. A. Macdonell, Vedic Mythology (Strassburg, 1897).

KALĪDĀṢA, the most illustrious name among the writers of the second epoch of Sanskrit literature, which, as contrasted with the age of the Vedic hymns, may be characterized as the period of artificial poetry. Owing to the absence of the historical sense in the Hindu race, it is impossible to fix with chronological exactness the lifetime of either Kālidāsa or any other Sanskrit author. Native tradition places him in the 1st century B.C.; but such evidence is most unreliable. The Thugs murdered in the 2nd century A.D., and the works of the poet contain no allusions by which their date can be directly determined; yet the extremely corrupt form of the Pārīkṣit or popular dialects spoken by the women and the subordinate characters in his plays, as compared with the Pārīkṣit in inscriptions of ascertained age, led such authorities as Weber and Lassen to agree in fixing on the 3rd century A.D. as the approximate period to which the writings of Kālidāsa should be referred.

He was one of the "nine gems" at the court of King Vikramaditya or Vikrama, at Ujjain, and the tendency is now to regard the latter as having flourished about A.D. 375; others, however, place him as late as the 6th century. The richness of his creative fancy, his delicacy of sentiment, and his keen appreciation of the beauties of nature, combined with remarkable powers of description, place Kālidāsa in the first rank of Oriental poets. The effect, however, of his productions as a whole is greatly marred by extreme artificiality of diction, which, though to a less extent than in other Hindu poets, not unfrequently takes the form of puerile conceits and plays on words. In this respect Kālidāsa has many names that are unfavourably with the more genuine poetry of the Vedas. Though a true poet, he is wanting in that artistic sense of proportion and sense of the Greek mind, which exactly adjusts the parts to the whole, and combines form and matter into an inseparable poetic unity. Kālidāsa’s name rests chiefly on his dramas, but he is also distinguished as an epic and a lyric poet.

Kālidāsa generally, see A. A. Macdonell’s History of Sanskrit Literature (1900), and on his date G. Huth, Die Zeit des K. (Berlin, 1890).
KALIMPONG, a village of British India, in the Darjeeling district of Bengal, 4000 ft. above sea-level; pop. (1901), 1089. It is a frontier market for the purchase of wool and mules from Tibet, and an important agricultural fair is held in November. In 1900 Kalimpong was chosen by the Church of Scotland as the site of cottage homes, known as St. Andrew's Colonial Homes, for the education and training of poor European and Eurasian children.

KALINGA, or CALINGA, one of the nine kingdoms of southern India in ancient times. Its exact limits varied, but included the eastern Madras coast from Pulicat to Chickaco, running inland from the Bay of Bengal to the Eastern Ghats. The name at one time had a wider and vaguer meaning, comprehending Orissa, and probably extending to the Ganges valley. The Kalings of Pliny certainly included Orissa, but latterly it seems to have been confined to the Telugu-speaking country; and in the time of Hsien Tsang (660 A.D.) it was distinguished on the south and west from Andhra, and on the north from Odra or Orissa. Taranatha, the Tibetan historian, speaks of Kalinga as one division of the country of Telinga. Hsian Tsang speaks of Kalinga ("Kie-lung-ka") having its capital at what has been identified with the site either of Rajahmundry or Coraliga. Both Kalinga and Purnatigrigrama, Calinga and Plengatigrigrama, the former capital of Kalinga, share the honour of having been a chief city of Kalinga at different periods; but inscriptions recently deciphered seem to prove that the capital of the Gang dynasty of Kalinga was at Mukhalingam in the Ganjam district.

KALINJAR, a town and hill fort of British India in the Banda district of the United Provinces. Pop. (1901), 3015. The fort stands on an isolated rock, the termination of the Vindhyas range, at an elevation of 1203 ft., overlooking the plains of Bundelkhand. Kalinjar is the most characteristic specimen of the Hindu forresses, originally built of stone, of central India. Its antiquity is proved by its mention in the Mahabharata. It was besieged by Mahmud of Ghazni in 1023, and here the Afghan emperor Sher Shah met his death in 1545, and Kalinjar played a prominent part in history down to the time of the Mutiny in 1857, when it was held by a small British garrison. Both the fort and the town, which stands at the foot of the hill, are of interest to the antiquary on account of their remains of temples, sculptures, inscriptions and caves.

KALIR [QALIR], ELEAZER, Hebrew liturgical poet, whose hymns (hamelekh) are found in the festival prayers of the German synagogue rite. The age in which he lived is unknown. Some (hasing the view on Saadiah's Sefer ha-galuy) place him as early as the 6th century, others regard him as belonging to the 10th century. Kalir's style is powerful but involved; he may be described as a Hebrew Browning.

Some beautiful renderings of Kalir's poems may be found in the volumes of Davis & Adler's edition of the German Festival Prayers entitled Service of the Synagogue.

KALISCH, ISIDOR (1816-1886), Jewish divine, was born at Krotoschin in Prussia on the 13th of November 1816, and was educated at Berlin, Breslau and Prague. In 1848 he came to London, but passed on in 1849 to America, where he ministered as rabbi in Cleveland, Cincinnati, Milwaukee, Detroit and Newark, New Jersey. At Newark from 1875 he gave himself entirely to literary work, and exercised a strong influence as leader of the radical and reforming Jewish party.

Among his works are Wegweisen für rationale Forschungen in den biblischen Schriften (1853); and translations of Nathan der Weise (1865); Sepher Jesireh (1877); and Maimon's History of Philosophy among the Jews (1881). He also wrote a good deal of German and Hebrew verse.

KALISCH, MARCUS (or MAURICE) (1828-1885), Jewish scholar, was born in Pomerania in 1828, and died in England 1885. He was one of the pioneers of the critical study of the Old Testament in England. At one time he was secretary to the Chief Rabbi; in 1853 he became tutor in the Rothschild family and enjoyed leisure to produce his commentaries and other works. The first instalment of his commentary on the Pentateuch was Exodus (1855); this was followed by Genesis (1858) and Leviticus in two parts (1867-1872). Kalisch wrote before the publication of Wellhausen's works, and anticipated him in some important points about the exilic period. Besides these works, Kalisch published in 1877-1878 two volumes of Bible studies (on Balaam and Jonah). He was also author of a once popular Hebrew grammar in two volumes (1862-1865). In 1880 he published Path and Goal, a brilliant discussion of human destiny. His commentaries are of permanent value, not only because of the author's originality, but also because of his erudition. No other works in English contain such full citations of earlier literature. (1. A.)

KALISPEL, or PEND D'OREILLE, a tribe of North-American Indians of Salishan stock. They formerly ranged the country around Pend O'reille Lake, Washington. They number some 500 now and are settled on reserves in North Idaho.

KALISZ, a government of Russian Poland, having Prussia on the W., and the governments of Warsaw and Piotrków on the E. Its area is 4300 sq. m. Its surface is a lowland, sloping towards the west, and is drained by the Prosa and the Warta and their tributaries, and also by the Bzura. It was formerly covered with countless small lakes and thick forests; the latter are now mostly destroyed, but many lakes and marshes exist still. Pop. (1897), 844,358 of whom 427,978 were women, and 113,699 Jews; estimated pop. (1906), 853,200. They are chiefly Poles. Roman Catholicism is the state religion, and the Jewish population in each amount to 7%. Agriculture is carried to perfection on a number of estates, as livestock breeding. The crops principally raised are rye, wheat, oats, barley and potatoes. Various domestic trades, including the weaving of linen and wool, are carried on in the villages. There are some factories, producing chiefly cloth and cottons. The government is divided into eight districts, the chief towns of which, with their populations in 1897, are: Kalisz (21,680), Kolo (9400), Konin (8530), Lezczyca (8863), Slupek (7538), Sieradz (7010), Turek (8141) and Wielun (7444).

KALISZ, the chief town of the above government, situated in 51° 46' N. and 18° E., 147 m. by rail W.S.W. of Warsaw, on the banks of the Prusa, which there forms the boundary of Prussia. Pop. (1871), 18,688; (1897), 21,680, of whom 37% were Jews. It is one of the oldest and finest cities of Poland, is the seat of a Roman Catholic bishop, and possesses a castle, a teachers' institute and a large public park. The industrial establishments comprise a brewery, and factories for ribbons, cloth and sugar, and tanneries.

Kalisz is identified with the Calisia of Poltemy, and its antiquity is indicated by the abundance of coins and other objects of ancient art which have been discovered on the site, as well as by the numerous burial mounds existing in the vicinity. It was the scene of the decisive victory of Augustus the Strong of Poland over the Swedes (1676); and the site of the Convention of October 26, 1795, and of the friendly meeting of the Russian and Prussian troops in 1835, in memory of which an iron obelisk was erected in the town by Nicholas I, in 1841. The treaty of 1815 between Russia and Prussia was signed here.

KALK, a town in the Prussian Rhine province, on the right bank of the Rhine, 2 m. E. of Cologne. Pop. (1909), 25,478. Kalk is an important junction of railway lines connecting Cologne with places on the right bank of the river. It has various iron and chemical industries, brickworks and breweries, and an electric tramway joins it with Cologne.

KALKAS, or KALAKAS, a Mongolid people mainly concentrated in the northern steppes of Mongolia near their kinsmen, the Buruts. According to Sir H. Howorth they derive their name from the river Kalka, which runs into the Biur lake. Of all Mongolians they physically differ most from the true Mongol type (see Mongolia). Their colour is a brown rather than a yellow, and their eyes are open and not oblique. They have, however, the broad flat face, high cheekbones and lank black hair of their race. They number some 250,000, and their territory is divided into the four khanates of Tushetu (Tushiuyet), Tsieten (Setzen), Sai'noin'i (Sain Noyan) and Jesaktu (Jassaktu).

KALKBRENNER, FRIEDRICH WILHELM (1784-1849), German pianist and composer, son of Christian Kalkbrenner (1755-1806), a Jewish musician of Cassel, was educated at the
Paris Conservatoire, and soon began to play in public. From 1841 to 1853 he was well known as a brilliant performer and a successful teacher in London, and then settled in Paris, dying at Enghien, near there, in 1849. He became a member of the Paris piano-manufacturing firm of Pleyel & Co., and made a fortune by his business and his art combined. His numerous compositions are less remembered now than his instruction-book, with "studies," which have had considerable vogue among pianists.

KÁLLAY, BENJAMIN VON (1839-1903), Austro-Hungarian statesman, was born at Budapest on the 22nd of December 1839. His family derived their name from estates in Nágy Kallo, in Szabolcs, and claimed descent from the Balogh Semjen tribe, which colonized the country, and settled on the lower course of the Szatmárné, at the close of the 9th century, when the Magyars conquered Hungary. They played a prominent part in Hungarian history as early as the reign of Koloman (1005-1114), and from King Matthias Corvinus (1458-1490) they received their estates at Mező Tur, near Kecskemét, granted to Michael Kállay for his heroic defence of Jajce in Bosnia, and still held by his descendants. The father of Benjamin von Kállay, a superior official of the Hungarian Government, died in 1845, and with his wife he devoted himself to the education of her son. At an early age Kállay manifested a deep interest in politics, and especially in the Eastern Question. He travelled in Russia, Europe, Turkey and Asia Minor, gaining a thorough knowledge of Greek, Turkish and several Slavonic languages. He became as proficient in Servian as in his native tongue. In 1869 he entered the Hungarian Diet as Conservative deputy for Mühlbach (Sászy-Szexes); in 1869 he was appointed consul-general at Belgrade; and in 1872 he visited Bosnia for the first time. His views on Balkan questions strongly influenced Count Andrásy, the Austro-Hungarian minister for foreign affairs. Leaving Belgrade in 1875, he resumed his seat in the Diet, and shortly afterwards founded the journal Kézé Nepe, or Eastern Folk, in which he defended the vigorous policy of Andrásy. After the Russo-Turkish War of 1877 he went to Philippopolis as Austro-Hungarian envoy extraordinary on the International Eastern Rumelian Commission. In 1879 he became second, and soon afterwards first, departmental chief at the foreign office in Vienna. On the 4th of June 1882 he was appointed Imperial minister of finance and administrator of Bosnia and Herzegovina, and with the distinction with which he filled this office, for until 1895 devoted herself to the education of her son (see BOSNIA AND HERZEGOVINA). Kállay was an honorary member of the Budapest and Vienna academies of science, and attained some eminence as a writer. He translated J. S. Mill's Liberty into Hungarian, adding an introductory critique; while his version of Galatea, a play by the Greek dramatist S. N. Basiliades (1843-1874), proved successful on the Hungarian stage. His monographs on Servian history (Geschicchte der Serben) and on the Oriental ambition of Russia (Die Orientpolitik Russlands) were translated into German by J. H. Schwicker, and published at Leipzig in 1878. But, in his own opinion, his masterpiece was an academic oration on the political and geographical position of Hungary as a link between East and West. In 1873 Kállay married the countess Vilma Bethlen, who bore him two daughters and a son. His popularity in Bosnia was partly due to the tact and personal charm of his wife. He died on the 13th of July 1903.

KALMAR (Kalmar), a seaport of Sweden on the Baltic coast, chief town of the district (läns) of Kalmar, 250 m. S.S.W. of Stockholm by rail. Pop. (1900), 12,715. It lies opposite the island of Öland, mainly on two small islands, but partly on the mainland; where there is a pleasant park. The streets are regular, and most of the houses are of wood. The principal public edifices, however, are constructed of limestone from Öland, including the cathedral, built by Nicodemus Tessin and his son Nicodemus in the second half of the 17th century. Kalmar, a town of great antiquity, was formerly strongly fortified, and there remains the island-fortress of Kalmarhus, dating partly from the 12th century, but mainly from the 16th and 17th. It contains the beautiful chamber of King Eric XIV (d. 1570), an historical museum, and in the courtyard a fine ornate well-cover. This stronghold stood several sieges in the 14th, 15th and 16th centuries, and the town gives name to the treaty (Kalmar Union) by which Sweden, Norway and Denmark were united into one kingdom in 1397. Kalmar has an artificial harbour admitting vessels drawing 19 ft. There are a school of navigation, and tobacco and match factories, the produce of which, together with timber and oats, is exported. Shipbuilding is carried on.

KALMUCK, or KALMYK STEPPE, a territory or reservation belonging to the Kalmuck or Kalmik Tatars, in the Russian government of Astrakhan, bounded by the Volga on the N.E., the Don on the E., the Donets on the S., and a line on the territory of the Don Cossacks on the N.W. Its area is 36,900 sq. m., to which has to be added a second reservation of 3045 sq. m. on the left bank of the lower Volga. According to I. V. Mushketov, the Kalmuck Steppe must be divided into two parts, western and eastern. The former, occupied by the Ergeni hills, is deeply tremouched by ravines and rises 300 and occasionally 630 ft. above the sea. It is built up of Tertiary deposits, belonging to the Sarmatian division of the Miocene period and covered with loess and black earth, and its escarpments represent the natural Shahe shore of the Caspian. No fossil beds are found on or within the Ergeni hills. These hills exhibit the usual black earth flora, and they have a settled population. The eastern part of the steppe is a plain, lying for the most part 30 to 40 ft. below the level of the sea, and sloping gently towards the Volga. Post-Pliocene "Aral-Caspian deposits," containing the usual fossils (Hydroida, Neritina, eight species of Cardium, two of Dreissena, three of Adacna and Littoroglymphus cerasus), attain thicknesses varying from 105 ft. to 7 or 10 ft., and disappear in places. Lacustrine and fluvitile deposits occur intermingled with the above. Large areas of moving sands exist near Enotoyevsk, where high dunes or berdaks have been formed. A narrow tract of land along the coast of the Caspian, known as the "hillocks of Baer," is covered with hillocks elongated from west to east, perpendicularly to the coast-line, the spaces between them being filled with water or overgrown with thickets of reed, Sulis, Ulmus campestris, almond trees, &c. An archipelago of small islands is thus formed close to the shore by these mounds, which are backed on the N. and N.W. by strings of salt lakes, partly desiccated. Small streams originate in the Ergeni, but are so soon as they reach the lowlands, where water can only be obtained by wells. The scanty vegetation is a mixture of the flora of south-eastern Russia and that of the deserts of central Asia. The steppe has an estimated population of 150,000 persons, living in over 27,700 kibitkas, or felt tents. There are over 60 Buddhist monasteries. Part of the Kalmucks are settled (chiefly in the hilly parts), the remainder being nomads. They breed horses, cattle and sheep, but suffer heavy losses from murrain. Some attempts at agriculture and tree-planting are being made. The breeding of livestock, fishing, and some domestic trades, chiefly carried on by the women, are the principal sources of maintenance.

he took little or no part in the vexed internal affairs of the Dual Monarchy, and he came little before the public except at the annual statement on foreign affairs before the Delegations. His management of the affairs of his department was, however, very successful; he confirmed and maintained the alliance with Germany, which had been formed by his predecessors, and co-operated with Bismarck in the arrangements by which Italy joined the alliance. Kalnoky's special influence was seen in the improvement of Austrian relations with Russia, following on the meeting of the three emperors in September 1883 at Skiernevis, at which he was present. His Russoophile policy caused some adverse criticism in Hungary. His friendliness for Russia did not however prevent him from strengthening the position of Austria as against Russia in the Balkan Peninsula by the establishment of a closer political and commercial understanding with Servia and Rumania. In 1883 he interfered after the battle of Slivinitza to arrest the advance of the Bulgarians on Belgrade, but he lost influence in Servia after the abdication of King Milan. Though he kept aloof from the Clerical party, Kalnoky was a strong Catholic; and his sympathy for the difficulties of the Church caused adverse comment in Italy, where in 1889, in a letter to the Pope, the question of the position of the pope was still unsettled. He subsequently explained that by this he did not refer to the Roman question, which was permanently settled, but to the possibility of the pope leaving Rome. The jealousy felt in Hungary against the Ultramontanes led to his fall. In 1895 a case of clerical interference in the internal affairs of Hungary by the nuncio Agliardi aroused a strong protest in the Hungarian parliament, and consequent differences between Bánffy, the Hungarian minister, and the pope for foreign affairs led to Kalnoky's resignation. He died on the 13th of February 1898 at Prélitz in Moravia.

KALOCSA, a town of Hungary, in the county of Pest-Prága, 88 m. S. of Budapest by rail. Pop. (1900), 11,372. It is situated in a marshy but highly productive district, near the left bank of the Danube, and was once of far greater importance than at present. Kalocsa is the see of one of the four Roman Catholic archbishops in Hungary. Amongst its buildings are a fine cathedral, the archiepiscopal palace, an astronomical observatory, a seminary for priests, and colleges for training of male and female teachers. The inhabitants of Kalocsa and its surrounding country are chiefly engaged in the cultivation of the vine, fruit, flax, hemp and cereals, in the capture of water-fowl and in fishing. Kalocsa is one of the oldest towns in Hungary. The present archbishopric, founded about 1135, is a development of a bishopric said to have been founded in the year 1000 by King Stephen the Saint. It suffered much during the 16th century from the forays of Ottomans who then ravaged the country. A large part of the town was destroyed by a fire in 1875.

KALPI, or Calpere, a town of British India, in the Jaluan district of the United Provinces, on the right bank of the Jumna, 45 m. S.W. of Cawnpore. Pop. (1901), 10,130. It was founded, according to tradition, by Vasudeva, at the end of the 4th century A.D. In 1196 it fell to Kutub-ud-din, the viceroy of Mahomed Ghor, and during the subsequent Mahommedan period it played a large part in the annals of this part of India. About the middle of the 18th century it passed into the hands of the Mahrattas. It was captured by the British in 1803, and since 1806 has remained in British possession. In May 1838 Sir Hugh Rose (Lord Strathnairn) defeated here a force of about 10,000 rebels under the rani of Jhansi. Kalpi had a mint of its own, and the lowest denomination was the memoir coinage in the reign of Akbar; and the East India Company made it one of their principal stations for providing the commerce investment. The old town, which is beside the river, has ruins of a fort, and several temples of interest, while in the neighbourhood are many ancient tombs. There is a lofty modern tower ornamented with representations of the battles of Ramayana.

The town lies away from the river to the south-east. Kalpi is still a centre of local trade (principally in grain, ghee and cotton), with a station on the Indian Midland railway from Jhansi to Cawnpore, which here crosses the Jumna. There are manufactures of sugar and paper.

KALUGA, a government of middle Russia, surrounded by those of Moscow, Smolensk, Orel and Tula, with an area of 11,942 sq. m. Its surface is an undulating plain, reaching 800 to 900 ft. in its highest parts, which lie in the S.W., and deeply traversed by watercourses, especially in the N.E. The Oka, a main tributary of the Volga, and its confluent (the Zhizdra and Ugra) drain all but a strip of country in the west, which is traversed by the Bolva, an affluent of the Dnieper. The government is built up mainly of carboniferous deposits (coal-bearing), and the surface is the basis of the Delitzsch clay and quick clays which formerly covered them. Cretaceous deposits occur in the S.W., and Devonian limestones and shales crop out in the S.E. The government is covered with a thick layer of boulder clay in the north, with vast ridges and fields of boulders brought during the Glacial Period from Finland and the government of Olonets; large areas in the middle are strewed with flint boulders and patches of loess are seen farther south. The mean annual temperature is 41° F. Iron ores are the chief mineral wealth, nearly 40,000 persons being engaged in mining. Beds of coal occur in several localities, and the Oka fort, Fireclay, china-clay, chalk, grindstone, pure quartz sand, phosphates of which are also extracted. Forests cover 20% of the surface, and occur chiefly in the south. The soil is not very suitable for agriculture, and owing to a rather dense population, considerable numbers of the inhabitants find occupation in industry, or as carriers and carpenters for one-half of the year at the Black Sea ports.

The population (1,025,705 in 1863) was 1,176,353 in 1897, nearly all Great Russians. There were 116 women to 100 men, and out of the total population 94,853 lived in towns. The estimated population in 1906 was 1,287,300. Of the total area over 400 acres are tilled by the peasant communities, nearly 3,000,000 acres by private owners and some 250,000 by the Crown. The principal crops are rye, oats, barley, buckwheat, and potatoes. Hemp is grown for local use and export. Bees are kept. The chief non-agricultural industries are distilleries, iron-works, factories for cloth, cottons, paper, matches, leather, and china, flour-mills and oil works. Large quantities of wooden wares are manufactured in the villages of the south. A considerable trade is carried on in hemp, hampseed and hempseed oil, corn and hides; and iron, machinery, leather, glass, chemicals and oils, and soot of them are worked. The government is divided into 11 districts, the chief towns of which, with their area in 1807, are: Kaluga (49,728), Borovsk (8497), Koskel (5908), Likhvin (1770), Maloyaroslavets (2506), Medyn (4392), Meshchovsk (3667), Morsalk (2652), Peremys (2936), Tarsusa (1989) and Zhizdra (5906).

KALUGA, the chief town of the above government, situated on the left bank of the Oka, 117 m. S.W. of Moscow by rail, in 54° 31' N. and 36° 6' E. Pop. (1870), 36,880; (1879) 49,728. It is the see of a Greek Orthodox bishop. The public buildings include the cathedral of the Trinity (rebuilt in the 19th century in place of an older edifice dating from 1657), two monastic establishments, an ecclesiastical seminary, and a lunatic asylum. The principal articles of industrial production are leather, oil, bast mats, wax candles, starch and Kaluga cakes. The first historical mention of Kaluga occurs in 1398; its incorporation with the principality of Moscow took place in 1518. In 1607 it was held by the second false Demetrius and vainly besieged for four months by the forces of Shuisky, who had ascended the Russian throne as Basil IV. on the death of the first false Demetrius. In 1619 Kaluga fell into the hands of the hetman or chief of the Zaporozhian Cossacks. Two years later it was held by the first group of Cossacks under the leadership of Ivan Zhavoronkov, who died from fever in the town. In 1622 the whole place was laid waste by a conflagration. It recovered, however, in spite of several other confinagras (especially in 1742 and 1754). On several occasions Kaluga was the residence of political prisoners; among others Shamyl, the Chechen chief, spent his exile there (1870-1879).

KALYAN, a town of British India, in the Thana district of Bombay, situated 33 m. N.E. of Bombay city, where the two
main line of the Great Indian Peninsula railway diverge. Pop. (1901), 16,749. There is a considerable industry of rice-husking. Kalyan is known to have been the capital of a kingdom and a centre of sea-borne commerce in the early centuries of the Christian era. The oldest remains now existing are of Mahom- 

KAMA, or Kamadeva, in Hindu mythology, the god of love. He is variously stated to have been the child of Brahma or Dharma (virtue). In the Rig Veda, Kama (desire) is described as the first movement that arose in the One after it had come into life through the power of fervour or abstraction. In the Atharva-Veda Kama does not mean sexual desire, but rather the yearning after the good of all created things. Later Kama is simply the Hindu Cupid. While attempting to lure Siva to sin, he was destroyed by a fiery glance of the goddess' third eye. Thus in Hindu poetry Kama is known as Ananga, the "bodiless god." Kama's wife Rati (voluptuousness) mourned him so greatly that Siva relented, and he was reborn as the child of (Kripa and Rukmini. The babe was called Pradyumna. He is represented armed with a bow of sugar-cane; it is strung with bees, and its five arrows are tipped with flowers which overcome the five senses. A fish adorns his flag, and he rides a parrot or sparrow, emblematic of lubricity.

KAMALÅ, a red powder formerly used in medicine as an anthelmintic and employed in India as a yellow dye. It is obtained from Mallotus philippensis, Mull., a small euphor- 

The islethium which connects the peninsula with the mainland is a flat tundra, sloping gently both ways. The mountain chain, which Dittmar calls central, seems to be interrupted under 57° N. by a deep indentation corresponding to the valley of the Tighil. There too is the hydrographical network, as well as the south-east to north-east strike of the clay-slates and metamor- 

The Russians made their first settlements in Kamchatka in the end of 17th century; in 1666 Atlasov founded Verkhn-Kamchatsk, and in 1704 Robezlev founded Bolshyreetsk. In 1720 a survey of the peninsula was undertaken; in 1725-1730 it was visited by Bering's expedition; and in 1733-1745 it was the scene of the labours of the Krasheninnikov and Steller expedition.

KAME (a form of Scandinavian comb, hill), in physical geography, a short ridge or bunched mound of gravel or sand, "tumultuously stratified," occurring in connexion with glacial deposits, having been formed at the mouths of tunnels under the ice. When the ice-sheet melts, these features, formerly con- 

Another chain of volcanic mountains extends from Tikhinevsk (which burst into activity several times in the 18th and 19th centuries) to Shiveluch, seemingly parallel to the above but farther north. The two chains contain twelve active and twenty- 

The floating ice which accumulates in the northern parts of the Sea of Okhotsk and the cold current which flows along the east coast of the peninsula render its summers chilly, but the winter is relatively warm, and temperatures below -40° F. are experienced only in the highlands of the interior and on the Okhotsk littoral. The average temperatures at Petropavlovsk (53° N.) are: year 37° F., January 17°, July 58°; while in the valley of the Kamchatka the average temperature of the winter is 16°, and of the summer as high as 58° and 64°. Rain and snow are copious, and dense fogs shroud the coast in summer; consequently the mountains are well clothed with timber and the meadows with grass, except in the tundra of the north. The highlands are clothed with a luxuriant shrubbery, and the moss on the cliffs is composed of Polycladus, which is the plant that covers the cobble stones in the gorges of the Kamchatka.
The Kamenets—Kampen

KAMENETS, a town of S.-W. Poland, and the seat of the government of Podolia. It stands in 48° 56' N. and 26° 30' E., on a high, rocky bluff of the river Smotrich, a left-hand tributary of the Dniester, and near the Austrian frontier. Pop. (1863), 20,690; (1900) 39,113, of whom 50% were Jews and 30% Poles. Round the town lies a cluster of suburban villages, Polish Folwark, Russian Folwark, Zinkovtsi, Karvasarui, &c.; and on the opposite side of the river, accessible by a wooden bridge, stands the castle which long frowned defiance across the Dniester to Khotin in Bessarabia. Kamenets is the seat of a Roman Catholic and a Greek Orthodox bishop. The Roman Catholic cathedral of St Peter and St Paul, built in 1361, is distinguished by a minaret, recalling the time when it was used as a mosque by the Turks (1672–1699). The Greek cathedral of St John the Baptist dates from the 16th century, but up to 1798 belonged to the Basilian monastery. Other buildings are the Orthodox Greek monastery of the Trinity, and the Catholic Armenian church (founded in 1398), possessing a 14th-century missal and an image of the Virgin Mary that saw the Mongol invasion of 1230–1242. The town contains Orthodox Greek and Roman Catholic seminaries, founded in 1825, and a Greek theological school. Kamenets were laid waste by the Mongol leader Batu in 1240. In 1433 it was made the chief town of the province of Podolia. In the 15th and 16th centuries it suffered frequently from the invasions of Tatars, Moldavians and Turks; and in 1672 the hetman of the Cossacks, Doroshenko, assisted by Sultan Mahomed IV. of Turkey, made himself master of the place. Restored to Poland by the peace of Karlowitz (1699), it passed with Podolia to Russia in 1795. Here the Turks were defeated by the Poles in 1633, and here twenty years later peace was concluded between the same antagonists. The fortifications were demolished in 1813.

KAMENZ, a town in the kingdom of Saxony, on the Black Elster, 21 m. N.E. of Dresden, on a branch line of railway from Bischöfswerda. Pop. (1900), 9726. It has four Evangelical churches, among them a Wendish one, and a handsome new town-hall with a library. The hospital is dedicated to the memory of Lessing, who was born here. A colossal bust of the poet was placed opposite the Wendish church in 1863, and a monument was raised to him on a neighbouring hill in 1864. The industries of Kamenz include wool-spinning, and the manufacture of cloth, glass, crockery, and clay. The town was burnt in 1200. Kamenz, was known by the name Drielkretscham until the 16th century. In 1318 it passed to the mark of Brandenburg; in 1319 to Bohemia; and in 1635, after suffering much in the Hussite and Thirty Years' wars, it came into the possession of Saxony. In 1706 and 1842 it was almost entirely consumed by fire.

KAMENZ is also the name of a village in Prussia, not far from Breslau; pop. 900. This is famous on account of its Cistercian monastery, founded in 1094. Of the house, which was closed in 1816, only a few buildings remain.

KAMES, HENRY HOME, Lord (1696–1782), Scottish lawyer and philosopher, son of George Home of Kames, in Berwickshire, where he was born in 1696. After receiving a somewhat imperfect education from a private tutor, he was in 1712 inden- tured to a writer to the signet in Edinburgh, but an accidental introduction to Sir Hew Dalrymple, then president of the court of session, determined him to aspire to the position of advocate. He accordingly set himself to studying various branches of literature, especially metaphysics and moral philosophy. He was called to the bar in January 1724, and, as he lacked those brilliant qualities which sometimes command immediate success, he employed his leisure in the compilation of Remarkable Deci- sions in the Court of Session from 1716 to 1728 (1728). This work having attracted attention, his power of ingenious reasoning and mastery of law gradually gained him a leading position at the bar. In 1732 he was appointed a judge in the court of session under the title of Lord Kames, and in 1762 he was made one of the lords of justiciary. In 1741 he married Agatha Drummond, through whom in 1761 he succeeded to the estate of Blair Drummond, Perthshire. He continued to discharge his judicial duties till within a few days of his death at Edinburgh on the 27th of December 1782.

Lord Kames took a special interest in agricultural and commercial affairs. In 1735 he was appointed a member of the board of trade for encouragement of the fisheries, arts and manufactures of Scotland, and about the same time he was named one of the commissioners for the management of the forfeited estates annexed to the Crown. The first project of agriculture he wrote The Gentleman Farmer (1760). In 1765 he published a small pamphlet On the Flax Husbandry of Scotland; and, besides availing himself of his extensive acquaintance to procure the postponement of the import duty on flax, he recommended the introduction of manufactures, he took a prominent part in furthering the project of the Forth and Clyde Canal. He was also one of the founders of the Physical and Literary Society, afterwards the Royal Society of Edinburgh. It is, however, as a writer on philosophy that Lord Kames is best known. In 1751 he published his Essays on the Principles of Morality and Natural Religion (Ger. trans., Leipzig, 1772), in which he endeavoured to maintain the doctrine of innate ideas, but conceded to man an apparent but only apparent freedom of the will. His statement of the latter doctrine so aroused the alarm of certain clergymen of the Church of Scotland that he found it necessary to withdraw it; and though he endeavoured to expatiate here to attribute man's delusive sense of freedom, not to an innate conviction implanted by God, but to the influence of the passions. His other philosophical works are An Introduction to the Art of Thinking (1761), Elements of Criticism (1765), Sketches of the History of Man (1774). See Life of Lord Kames, by A. F. Tytler, Lord Woodhouselee (2 vols., 1807).

KAMMIN, or CAMMEN, a town in the Prussian province of Posen, 23 m. N. of the Baltic, on the Kammschinske Bodden, a lake connected with the sea by the Devenow. Pop. (1901), 5923. Among its four Evangelical churches, the cathedral and the church of St Mary are noteworthy. Iron-founding and brewing are carried on in the town, which has also some fishing and shipping. There is steamer communication with Stettin, about 40 m. S.S.W. Kammin is of Wendish origin, and obtained municipal privileges in 1274. From about 1200 till 1628 it was the seat of a bishopric, which at the latter date became a secular principality, being in 1648 incorporated with Brandenburg.

See Küchen, Geschichte der Stadt Kammin (Kammin, 1885).

KAMPE, a town in the province of Overysel, Holland, on the left bank of the Yssel, 33 m. above its mouth, and a terminal railway station 8 m. N.W. of Zwolle. It has regular steamboat communication with Zwolle, Deventer, Amsterdam, and Enk- hoven. Pop. (1901), 19,544. Kampen is surrounded by beautiful gardens and promenades, the place of many fairs, and has a fine river front. The four terraced gateways furnish excellent examples of 16th and 17th century architecture. Of the churches the Bovenkerk ("upper church"), or church of St Nicholas, ranks with the cathedral of Utrecht and the Janskerk at 's Hertogenbosch as one of the three great medieval churches in Holland. It was begun in 1369, and has double aisles, ambula- tory and radiating chapels, and contains some finely carved woodwork. The Roman Catholic Buitenkerk ("outer church") is also a fine building of the 14th century, with good modern panelling. There are many portraits, the walls are covered with the ancient churches and monasteries of Kampen; but the most remarkable building is the old town-hall, which is unsurpassed in Holland. It dates from the 14th century, but was partly restored after a fire in 1543. The exterior is adorned with niched statues and beautiful iron trellis work round the windows. The old council-chamber is wainscoted in black oak, and contains a remarkable sculptured chimney-piece (1545) and fine wood carving. The town-hall contains the municipal library, collections of tapestry, portraits and antiquities, and valuable archives relating to the town and province. Kampen is the seat of a Christian Reformed theological school, a gymnasium, a higher burgher school, a municipal school of design, and a large orphanage. There are few or no local taxes, the municipal chest being filled by the revenues derived from the fertile delta-land, the Kampenlandia, which is always being built up at the mouth of
KAMPTEE—KANARIS

454,409, showing an increase of 2% in the decade. The trade of the interior, which used to pass down to the seaports, has been largely diverted by the opening of the Southern Mahratta railway. Along the coast rice is the chief crop, and coco-nut palms are also important. In the upland there are valuable gardens of areca palms, cardamoms and pepper. Rice and timber are exported, and sandalwood-carving and salt manufacture are carried on. The main feature in the physical geography of the district is the range of the Western Ghats, which, running from north to south, divides it into two parts, a lowland or coast strip (Payanghat), and an upland plateau (Balaghat). The coast-line is only broken by the Karwar headland in the north, and by the estuaries of four rivers and the mouths of many smaller streams, through which the salt water finds an entrance into numerous lagoons winding several miles inland. The breadth of the lowlands varies from 5 to 15 miles. From this narrow belt rise a few smooth, flat-topped hills, from 200 to 300 ft. high; and at places it is crested by lofty, rugged, densely wooded spurs, which, starting from the main range, maintain almost to the coast a height of not less than 1000 ft. Among these hills lie well-tiled valleys of garden and rice land. The plateau of the Balaghat is irregular, varying from 1500 to 2000 ft. in height. In some parts the country rises into well-wooded knolls, in others it is studded by small, isolated, steep hills. Except on the banks of streams and in the more open glades, the whole is one broad waste of woodland and forest. The open spaces are dotted with hamlets or parcelled out into rice clearings. Of the rivers flowing eastward into the sea, the best known is the Sahyadri, the chief of these is the Wardha or Varada, a tributary of the Tungabhadra. Of those that flow westwards, the four principal ones, proceeding from north to south, are the Kali, Gungavali, Tadri and Sharanati. The last of these forms the famous Gersoppa Falls. Extensive forests clothe the hills, and are conserved under the rules of the forest department.

SOUTH KANARA DISTRICT has its headquarters at Mangalore. Area, 4021 sq. m.; Pop. (1901), 1,134,713, showing an increase of 7% in the decade. The district is intersected by rivers, none of which exceeds 100 ft. in length. They all take their rise in the Western Ghats, and many are navigable during the fair weather for from 15 to 25 miles from the coast. The chief of these streams are the Netravati, Gurpur and Chendragiri. Numerous groves of coco-nut palms extend along the coast, and green rice-fields are seen in every valley. The Western Ghats, rising to a height of 3000 to 6000 ft., fringe the eastern boundary. Forest land of great extent and value exists, but most of it is private property. Jungle products (besides timber) consist of bamboo, cardamoms, wild arrowroot, gali-nuts, gamboge, catechu, fibrous bark, cinnamon, gums, resin, dyes, honey and beeswax. The forests formerly abounded in game, which, however, is rapidly decreasing under incessant shooting. The staple crop is rice. The chief articles of import are piece goods, cotton yarn, oils and salt. Tiles are manufactured in several places out of a fine potter's clay. The Azhikal-Mangalore line of the Madras railway serves the district.

KANARESE, a language of the Dravidian family, spoken by about ten millions of people in southern India, chiefly in Mysore, Hyderabad, and the adjoining districts of Madras and Bombay. It has an ancient literature, written in an alphabet closely resembling that employed for Telugu. Since the 12th century the Kanarese-speaking people have largely adopted the Lingiyat form of faith, which may be described as an anti-Brahmanical sect of Siva worshippers (see HINDUISM). Most of them are agriculturists, but they also engage actively in trade.

KANARIS (or CANARIS), CONSTANTINE (1790-1877), Greek patriot, belonged to the class of coasting sailors who produced if not the most honest, at least the bravest, and the most successful of the combatants in the cause of Greek independence. He was born at the island of Chios, but as a youth went to Byzantium, where he engaged in the Turkish service, and was employed as a frigate commander. He retired in 1825, and afterwards lived at Constantinople. For seven years he was employed as a teacher in a Greek school, and was then elected president of the provincial council of Chios. In 1836 he was sent to Paris on a mission, and on his return became minister at Athens, where he remained until 1839. He then lived in private life, but was soon made ambassador to France, where he was active in the cause of the Ionian Greeks. In 1844 he was sent to the seaports of the Albanian coast, and was received with enthusiasm. He was employed in this capacity until 1850, and then returned to Athens. On the fall of the government in 1854 he was placed in charge of the navy, and was at once the active leader of the Greek navy. He had long been in the habit of sending war cruisers to the Dardanelles in order to harass the Turkish fleet. In 1844 he sent out to sea the warship Kallimachos, with a reinforcement of seamen and marines. On the formation of the United States of Greek and Albanian States, Constantine was appointed minister at Vienna, where, in 1848, he entered into a treaty on the Ngreez commerce.
KANAUJ—KANDAHAR

Chio in April 1822 by the Turkish Capitan Pasha. The command of the force of fifty small vessels and eight fire ships sent to assail the Turkish fleet was the navarch Miaoulis, but it was Kanaris who executed the attack with the fire ships on the 6th flagship the Capitan Pasha on the night of the 18th of June 1822. The Turks were celebrating the feast of Bahram at the end of the Ramadan fast. Kanaris had two small brigs fitted as fire ships, and thirty-six men. He was allowed to come close to the Turkish flagship, and succeeded in attacking his fire ships to her, setting them on fire, and escaping with his party. The fire reached the powder and the flagship blew up, sending the Capitan Pasha and 2000 Turks into the air. Kanaris was undoubtedly aided by the almost incredible sloth and folly of his opponents, but he chose his time well, and he has the right to be regarded as perhaps the most dangerous. That Kanaris could carry out the venture with a volunteer party not belonging to a regularly disciplined service, not only proved him to be a clever partisan fighter, but showed that he was a leader of men. He repeated the feat at Tenedos in November of 1822, and was then considered to have disposed of nearly 4000 Turks in the two ventures. When his native island, Psara, was occupied by the Turks he continued to serve under the command of Miaoulis. He was no less distinguished in other attacks with fire ships at Samos and Mytilene in 1823, which firmly established an utter panic in the Turkish navy. His efforts to destroy the ships of Mehemet Ali at Alexandria in 1824 were defeated by contrary winds. When the Greeks tried to organize a regular navy he was appointed captain of the frigate “Hellas” in 1826. In politics he was a follower of Capo d’Istria. He helped to upset the government of King Otho and to establish his successor, was prime minister in 1824–1865, came back from retirement to preside over the ministry formed during the crisis of the Russo-Turkish war, and died in office on the 15th of September 1877. Kanaris is described as of small stature, simple in appearance, somewhat shy and melancholy. He is justly remembered as the most blameless of the popular heroes of the War of Independence. He was almost the only one among them whom Dundonald, with whom he served in a successful attack on an Egyptian war-ship near Alexandria, excepts from the sweeping charges of cowardice he brings against the Greeks.

KANAUJ, an ancient city of British India, in Farukhabad district, United Provinces, near the left bank of the Ganges. Pop. (1901), 18,552. Kanauj in early times formed the capital of a great Indian kingdom. Its prosperity dates from a prehistoric period, and seems to have culminated about 2000 B.C. under Harsha. In 1319 it fell before Mahmuud of Ghazni, and again in 1194 before Mahommed Ghori. The existing ruins extend over the lands of five villages, occupying a semicircle fully 4 m. in diameter. No Hindu buildings remain intact; but the great mosque, constructed by Ibrahim Shah of Jaunpur in 1406 out of Hindu temples, is still called by Hindus “Sita’s Kitchen.” Kanauj, which is traditionally said to be derived from Kanya-kahja (=the crooked maiden), has given its name to an important division of Brahmins in northern India. Hinduism in Lower Bengal also dates its origin from a Brahman migration southwards from this city, about 800 or 900. Kanauj is now noted for the distilling of scents.

KANDAHAR, the largest city in Afghanistan, situated in 31° 37’ N. lat. and 65° 43’ E. long., 3400 ft. above the sea. It is 370 m. distant from Herat on the N.W., by Girishk and Farah—Girishk being 75 m., and Farah 225 m. from Kandahar. From Kabul, on the N.E., it is distant 315 m., by Kalat-i-Ghilzai and Ghazni—Kalat-i-Ghilzai being 83 m., and Ghazni 232 whaten. To the west it is about 110 m., and from Peshin to India the three principal routes measure approximately as follows: by the Zhob valley to Dera Ismail Khan, 300 m.; by the Bori valley to Dera Ghazi Khan, 275 m.; by Quetta and the Bolan to Dadar, 125 m.; and by Chappar and Nari to Sibi, 120 m. The Indian railway system extends to New Chaman, within some 80 m. of Kandahar. Immediately round the city is a plain, highly cultivated and well populated to the south and west; but on the north-west barren, and bounded by a double line of hills, rising to about 1000 ft. above its general level, and breaking its dull monotony with irregular lines of scarped precipices, crowned with fantastic pinnacles and peaks. To the north-west these hills form the watershed between the valleys of the Arghandab and the Tarnak, until they are lost in the mountain masses of the Hazarajat—a wild region inhabited by tribes of Tatar origin, which effectually shuts off Kandahar from communication with the north. On the south-west they lose themselves in the sandy desert of Registan, which wraps itself round the plain of Kandahar, and forms another impassable barrier. But there is a break in these hills—a gate, as it were, to the great high road between Herat and India; and it is this gate which the fortresses of Kandahar so effectually avoid its danger, and show its strategic importance. Other routes there are, open to trade, between Herat and northern India, either following the banks of the Hari Rud, or, more circuitously, through the valley of the Helmund to Kabul; or the line of hills between the Arghandab and the Tarnak may be crossed close to Kalat-i-Ghilzai; but of the two former it may be said that they are not ways open to the passage of Afghan armies owing to the hereditary hostility existing between the Aeinaks and Hazara tribes and the Afghans generally, while the latter is not beyond striking distance from Kandahar. The one great high road which goes to nowhere in India, but it involves the passage of some rough country, across the great watershed between the basins of the Helmund and the Indus. But the best known road from Kandahar to India is that which stretches across the series of open stony plains interspersed with rocky hills of irregular formation leading to the foot of the Kwaia Amran (Khojak) range, on the far side of which from Kandahar lies the valley of Peshin. The passage of the Kwaia Amran involves a rise and fall of some 3200 ft., but the range has been tunnelled and a railway now connects the frontier post of New Chaman with India; but the line from the former to the latter passes over the well-known, known as the Harpan loop, the other as the Bolan or Mashkaf line. They meet at Sibi (see BALUCHISTAN). Several roads to India have been developed through Baluchistan, but they are all dominated from Kandahar. Thus Kandahar becomes a sort of focus of all the direct routes converging from the wide-stretching western frontier of India towards Herat and Persia, and the fortress of Kandahar gives protection on the one hand to trade between Hindustan and Herat, and on the other it lends to Kabul security from invasion by way of Herat.

Kandahar is approximately a square-built city, surrounded by a wall of about 32 m. circuit, and from 25 to 30 ft. high, with an average breadth of 15 ft. Outside the wall is a ditch 10 ft. deep. The city and its defences are entirely mud-built. There are four main streets crossing each other nearly at right angles, the central "chouk" being covered with a dome. These streets are wide and bordered with trees, and are flanked by shops with open front verandas. There are no buildings of any great pretension in Kandahar, a few of the more wealthy Hindus occupying the best houses. The tomb of Ahmad Shah is the great high road monument, and the minaret is very high. Among other handsome cupola, and the twelve minor tombs of Ahmad Shah's children grouped around, contains a few good specimens of fresco-work and of inlaid inscriptions. The four streets of the city divide it into convenient quarters for the accommodation of its mixed population of Durani, Ghilzais, Parsiwans and Kakars, numbering in all some 30,000 souls. Of these the greater proportion are the Parsiwans (chiefly Kizilbash).
It is reckoned that there are 1600 shops and 182 mosques in the city. The mullahs of these mosques are generally men of considerable power. The walls of the city are pierced by the famous "Bab-i-Karkarpur," "Herat" and the "Idgah," opposite the four main gates, with additional gates, the Top Khana and the Bardurani respectively, in the western half of the city. The Idgah gate passes through the citadel, which is a square-built enclosure with sides of about 260 yds. in length. The flank defences of the main wall are insufficient; indeed there is no pretence at scientific structure about any part of the defences; but the site of the city is well chosen for defence, and the water supply (drawn by canals from the Arghandab or derived from wells) is good.  

The river Arghandab is a narrow stream, stretched along the slope of a rocky ridge, and extending into the plain below its foot, are the ruins of the old city of Kandahar sacked and plundered by Nadir Shah in 1738. From the top of the ridge a small citadel overlooks the half-buried ruins. On the north-east face of the hill forty steps, cut out of solid limestone, lead upward to a small, dome-roofed recess, which contains some interesting Persian inscriptions cut in relief on the rock, recording particulars of the history of Kandahar, and defining the vast extent of the kingdom of the emperor Baber. Popular belief ascribes the foundation of the old city to Alexander the Great.  

Although Kandahar has long ceased to be the seat of government, it is nevertheless by far the most important trade centre in Afghanistan, and the revenues of the Kandahar province assist largely in supporting the chief power at Kabul. There are no great numbers of the peculiarly Afghan hawkers of bazaars in the city; but the long lines of bazaars display goods from England, Russia, Hindustan, Persia and Turkestan, embracing a trade area as large probably as that of the whole of Hindustan. The customs and town dues taken together amount to a sum equal to the annual revenue of the Kandahar province, which is of considerable extent, stretching to Pul-i-Sangin, 10 m. south of Kalkat-i-Ghilzai on the Kabul side, to the Helmund on the west, and to the Hazara country on the north-west. 

When Farah has been governed from Kandahar since 1863, its revenues are not reckoned as a part of those of the province. The land revenue is partly assessed in grain, the salaries of government officers, parts of the produce of the "harakats" or the country farms, or for grain at rates fixed by government, usually about 20% above the city market prices. The greater part of the English goods sold at Herat are imported by Karachi and Kandahar—acts of which testifies to the great insecurity of trade between Meshed and Herat. 

Some of the items included as town dues are curious. For instance, the tariff on animals exposed for sale includes a charge of 5% of velorem on slave girls, besides a charge of 1 rupee per head. The kidney fat of all sheep and the skins of all goats slaughtered in the public yard are purquisites of government, the former being used for the tanning, which, we are told, is a government monopoly. The imports consist chiefly of English goods, such as cloths, boots, leather, sugar, salt, iron and copper, from Hindustan, and of shawls, carpets, barak (native woollen cloth), postins (coats made of sheep skins or shot, tunic or coat made of sheep skins), and Turkestan. The exports are wool, cotton, madder, cummin seed, asafoetida, fruit, silk and spices. The system of coinage is also curious: 105 English rupees are melted down, and the alloy extracted, and the 295 mohurs are then vulcanised and the rupees are then melted, and the molten metal mixed with the 100 rupees silver; and out of this 808 Kandahari rupees are coined. As the Kandahari rupee is worth about 8 annas (if an English rupee), the government thus realises a profit of 1%. Government accounts are kept in "Kham" rupees, the "Kham" being worth about five-sixths of a Kandahari rupee; in other words, it about equals the franc, or the Persian "kh."  

Immediately to the south and west of Kandahar is a stretch of well-irrigated and highly cultivated country, but the valley of the Arghandab is the most fertile of the districts, and from the luxuriant abundance of its orchards and vineyards, and the verdant Lindsey scenes of landscape beauty. The pomegranate fields form a striking feature in the valley—the pomegranates of Kandahar, with its "airard melons" and grapes, being unequalled in quality by any in the East. The vines are grown on artificial banks, probably for want of the necessary wood to trellis them—the grapes being largely exported in a semi-dried state. Fruit, indeed, besides being largely exported, is a staple article of the produce of the whole of Afghanistan. The art of irrigation is so well understood that the water supply is at times exhausted, no river water being available. By the irrigation system of Kandahar the plains are chiefly watered by canals drawn from the Arghandab near Babaran and conducted through the same gap in the hills which admits the Herat road. The amount of irrigation and the number of water channels for the purpose is very great, and is an indication of the wealth and fertility of the people only immediately about Kandahar, but in all districts where the main rivers and streams are bordered by green bands of cultivation. Irrigation by "karaz" is also largely resorted to. The karaz is a system of underground channeling which usually taps a sub-surface watercourse at the bottom of the hill and conducts it through a series of waterless hills which cover the face of the country. The water is not brought to the surface, but is carried over long distances by an underground channel or drain, which is constructed by sinking shafts at intervals along the required course and connecting them by the shafts by tunnelling. The general agricultural products of the country are wheat, barley, pulse, fruit, madder, asafoetida, lucerne, and hemp or tobacco.  

Of the mineral resources of the Kandahar district not much is known, but an abandoned gold mine exists about 2 m. north of the town. Some general idea of the resources of the Kandahar district has been derived from the fact that it supplies the emperor with everything except luxuries during the entire period of occupation in 1879-81; and that, in spite of the great strain thrown on the resources by the presence of the two armies of Ayub Khan and of General Roberts, there was no partial failure of the autumn crops and only a partial harvest the previous spring, the army was fed without great difficulty until the final evacuation, at one-third of the prices paid in Quetta for supplies drawn for India.  

History.—Kandahar has a stormy history. Sultan Mahmud of Ghazni took it in the 11th century from the Afghans who then held it. In the beginning of the 13th century it was taken by Jenghiz Khan, and in the 14th by Timur. In 1507 it was captured by the emperor Baber, but shortly afterwards it fell again into Afghan hands, to be retaken by Babur in 1521. Babur's son, Humayun, afterwards retailed it to the Kandahar to Babur, but failed to keep his word, and the Persians besieged the place unsuccessfully. Escaping from the possession of the Moguls till 1625, when it was taken by Shah Abbas. Aurangzeb tried to take it in 1649 with 5000 men, but failed to carry the gate. The city was afterwards ceded to the Persians, who remained in possession till 1709, when it was taken by the Afghans, and was retaken after two years' siege by Nadir Shah. Nadir Shah was assassinated in 1749, and immediately on hearing of his death his eldest son, Shuja Shah, went to Kandahar, which he acquired as a reward of his courage in the occupation of the treasure at Kandahar, and proclaimed himself king, with the consent, not only of the Afghans, but, strange to say, of the Hazaras and Baluchis as well. Kandahar was thus, for a time, the seat of the city to its present position, and thus founded the Afghan kingdom, with modern Kandahar as its capital. Ahmad Shah died in 1773, and was succeeded by his son Timur, who died in 1793, and left the throne to his son Shuja Shah. The son of Shuja Shah became his half-brother Mahmud, who was in his turn deposed by Shah Shuja, the full brother of Zaman Shah. After a short reign Shuja Shah fled to India to avoid the death penalty for his inability to repress the rising power of Fatah Khan. Fatah Khan was a cousin of the chief, and he took refuge first with Ranjit Singh, who then ruled the Punjab, and finally secured the protection of British power. Afghanistan was now practically dismembered. Mahmud was reinstated by Fateh Khan, whom he appointed his vizier, and whose nephews, Dost Mohammed and Khan Kohn dil Khan, he placed respectively in the governments of Kabul and Kandahar. Fateh Khan was barbarously murdered by Khan Kohn dil Khan near Chitral. The chief, Dost Mohammed himself was driven from power, and the Barakzai clan secured the sovereignty of Afghanistan. While Dost Mohammed and Kandahar became temporarily a sort of independent chiefship under two or three of his descendants, and Shah Shuja was actively supported by the British. Kandahar was occupied, and Shah Shuja reinstated on the throne of his ancestors, and his government was supported by the British. The British were occupied with the war on Persia, and after surrender to the British force, was deported into Hindostan. The fall of Kandahar, the occupation of southern Afghanistan continued to occupy Kandahar till the autumn of 1842, when General Nott marched on Kabul to meet Pollock's advance from Jalalabad. The cantonments near the city, built by Nott's division, were repaired and again occupied by the British army in 1879, when Shere Ali was driven to take refuge by the invasion of Afghanistan, nor were they finally evacuated till the spring of 1881. Trade statistics of late years show a gradual increase of exports to India from Kandahar and the countries adjacent thereto, but a curious falling-off in imports. The only large item of imports is cotton goods, the encouraging imports doubtless affected the balance, but did not disfigure the country, nor did its effect show in the fall in the railway between New Chaman and Killa Abdulla (on the Peshin side of the Khijak) conduct to the improvement of trade.  

(ercd, 1881)  

**KANDI, a town of British India, in Murshidabad district, Bengal, Pop. (1901), 12,637. It is the residence of the rajah of Kandi. It is a healthy and devout Hindu family. The founder of this family was Shri Samrat Singh, the banyan or agent of Warren Hastings, who was born at Kandi. He died a priest in his old age with an immense fortune. His name has become a celebrity for the most magnificent sadhaka, or funeral obsequies, ever performed in Bengal, celebrated in honour of his mother, at a cost, it is said, of £20,000.**  

**KANDY, a town near the centre of Ceylon, 75 m. from Colombo by rail, formerly the capital of a kingdom of the same name,**
situated towards the heart of the island, 178 ft. above the sea. It lies round the margin of an artificial lake constructed by the last king of Kandy in 1866, and is beautifully surrounded by hills. The most striking objects are the temples (of which twelve are Buddhist and four Brahman), the tombs of the Kandian kings, and the various buildings of the royal residence, partly allowed to fall into disrepair, partly utilized by the government. Of the temples the Dalada Malagawa is worthy of particular mention; it claims, as the name indicates, to be in possession of a Buddha tooth.

The island was occupied by the Portuguese in the 16th century and by the Dutch in 1653; but in both instances the native kings succeeded in shaking off the foreign yoke. The British got possession of the place in 1803, but the garrison afterwards capitulated and were massacred, and it was not till 1814–15 that the king was defeated and dethroned. The British authority was formally established by the convention of March 2, 1815. In 1848, owing to an attempt at rebellion, the town was for a time under martial law. It has been greatly improved of recent years. Sir William Gregory when governor did much to restore the ancient Kandy decorations, while the Victoria Jubilee Commemoration Building, including the "Ferguson Memorial Hall," and two fine hotels, add to the improvements. The Royal Botanic Gardens are situated at Peradeniya, 3 m. distant. Kandy is a uniquely beautiful, highland, tropical town, full of interesting historical and Buddhist associations. A water supply and electric lighting have been introduced. Roman Catholic missions are active in the work of education, for which a large block of buildings has been erected. Church of England, Wesleyan and Baptist missions are also at work. The population of the town in 1900 was 26,386; of the district, 377,591. Average annual rainfall, 81½ in.; average temperature, 75°C. There is a branch railway from Kandy, north to Matale, 17 m.

**KANE, ELISHA KENT** (1820–1857), American scientist and explorer, was born in Philadelphia on the 20th of February 1820, the son of the jurist John Kintzing Kane (1795–1838), a friend and supporter of Andrew Jackson, attorney-general of Pennsylvania in 1835–1845, U.S. judge of the Eastern District of Pennsylvania after 1846, and president of the American Philosophical Society in 1856–1858. Young Kane entered the university of Virginia and obtained the degree of M.D. in 1842, and in the following year entered the U.S. navy as surgeon. He had already acquired a considerable reputation in physiological research. The ship to which he was appointed was ordered to China, and he found opportunities during the voyage for indulging his passion for exploration, making a journey from Rio de Janeiro to the base of the Andes, and another from Bombay through India to Ceylon. On the arrival of the ship at its destination he provided a substitute for his post and crossed over to the island of Luzon, which he explored. In 1844 he left China, and, returning by India, Persia, Syria, Egypt, Greece, Austria, Germany and Switzerland, reached America in 1846. In that year he was ordered to the west coast of Africa, where he visited Dahomey, and contracted fever, which told severely on his constitution. On his return in 1847, he exchanged the naval for the military service, and was sent to join the U.S. army in Mexico, where he had some extraordinary adventures, and where he was again stricken with fever.

On the fitting out of the first Grinnell expedition, in 1850, to search for Sir John Franklin, Kane was appointed surgeon and naturalist under Lieut. de Haven, who commanded the ships "Advance" and "Rescue." The expedition, after an absence of sixteen months, during nine of which the ships were ice-bound, returned without having found any trace of the missing vessels. Kane was in feeble health, but worked on at his narrative of the expedition, which was published in 1854, under the title of The U.S. Grinnell Expedition in Search of Sir John Franklin. He was determined not to give up the search for Franklin, and in spite of ill-health travelled through the States lecturing to obtain funds, and gave up his pay for twenty months. At length Henry Grinnell fitted out an expedition, in the little brig "Advance," of which Kane was given the command. She sailed in June 1853, and passing up Smith Sound at the head of Baffin Bay advanced into the enclosed sea which now bears the name of Kane Basin, thus establishing the Polar route of many future Arctic expeditions. Here, off the coast of Greenland, the expedition passed two winters, accomplishing much useful geographical, as well as scientific, work, including the attainment of what was to remain for sixteen years the highest northern latitude, 80° 35' N. (June 1854). From this point a large area of open water was seen which was believed to be "an Ocean Polar Sea," a chimera which played an important and delusive rôle in subsequent explorations. After enduring the greatest hardships it was resolved to abandon the ship, Upernivik being reached on the 5th of August 1855, whence a relief expedition brought the explorers home. Medals were authorized by Congress, and in the following year Dr Kane received the founder's medal of the Royal Geographical Society, and, two years later, a gold medal from the Paris Geographical Society. He published The Second Grinnell Expedition in 1856. Dr Kane died at Havana on the 16th of February 1857, at the age of thirty-seven. Between his first and second Arctic voyages he married a second time, and received the name of Mary Louisa Kane, the widow of the late John Kane, father of Elisha Kent Kane, the Arctic explorer.

**KANGAROO,** the universally accepted, though not apparently the native, designation of the more typical representatives of the marsupial family Macropodidae (see Marsupials). Although intimately connected with the cuscus and phalangers by means of the musk-kangaroo, the kangaroos and wallabies, together with the rat-kangaroos, are easily distinguishable from other dipoiodont marsupials by their general conformation, and by peculiarities in the structure of their limbs, teeth and other organs. They vary in size from that of a sheep to a small rabbit. The head, especially in the larger species, is small, compared with the rest of the body, and tapers forward to the muzzle. The shoulders and fore-limbs are feebly developed, and the hind-limbs of disproportionate strength and magnitude, which give the animals a peculiarly awkward appearance when moving about on all-fours, as they occasionally do when feeding. Rapid progress is, however, performed only by the powerful hind-limbs, the animals covering the ground by a series of immense bounds, during which the fore part of the body is inclined forwards, and balanced by the long, strong and turgid tail, which is carried horizontally backwards. When not moving, they often assume a perfectly upright position, the tail aiding the two hind-legs to form a tripod, and the front-limbs dangling by the side of the chest. This position gives full scope for the senses of sight, hearing and smell to warn of the approach of enemies. The fore-paws have five digits, each armed with a strong, curved claw. The hind-foot is extremely long, narrow and (except in the musk-kangaroo) without the first toe. It consists mainly of the very large and strong toe, corresponding to the fourth of the human foot, ending in a strong curved and pointed claw.
(fig. 2). Close to the outer side of this lies a smaller fifth digit, and to the inner side two excessively slender toes (the second and third), bound together almost to the extremity in a common integument. The two little claws of these toes, projecting together from the skin, may be of use in scratching and cleaning the fur of the animal, but the toes must have quite lost all connexion with the functions of support or progression. This type of foot-structure is termed syndactylous.

The dental formula, when completely developed, is \( i_1, c_1, p_3, m_3 \) on each side, giving a total of 34 teeth. The three incisors of the upper jaw are arranged in a continuous arched series, and have crowns with broad cutting edges; the first or middle incisor is often larger than the others. Corresponding to these in the lower jaw is but one tooth on each side, which is of great size, directed horizontally forwards, narrow, lanceolate and pointed with sharp edges. Owing to the slight union of the two halves of the lower jaw in front in many species the two lower incisors work together like the blades of a pair of scissors. The canines are absent or rudimentary in the lower, and often deciduous at an early age in the upper jaw. The first two premolars are compressed, with cutting longitudinal edges, the anterior one is deciduous, being lost about the time the second one replaces the milk-molar, so that three premolars are never found in place and use in the same individual. The last premolar and the molars have quadrato crowns, provided with two strong transverse ridges, or with four obtuse cusps. In \( M. giganteus \) and its immediate allies, the premolars and sometimes the first molar are shed, so that in old examples only the two posterior molars and the incisors are found in place. The milk-dentition, as in other marsupials, is confined to a single tooth on each side of each jaw, the other molars and incisors being never changed. The dentition of the kangaroos, functionally considered, thus consists of sharp-edged incisors, most developed near the median line of the mouth, for the purpose of cropping herbage, and ridged or tuberculated molars for crushing.

The number of vertebrae is—in the cervical region 7, dorsal 13, lumbar 6, sacral 2, caudal varying according to the length of the tail, but generally from 21 to 25. In the fore-limb the clavicle and the radius and ulna are well developed, allowing of considerable freedom of motion of the fore-paw. The pelvis has large epipubic or "marsupial" bones. The femur is short, and the tibia and fibula of great length, as is the foot, the whole of which is applied to the ground when the animal is at rest in the upright position.

The stomach is large and very complex, its walls being puckered by longitudinal muscular bands into a number of folds. The alimentary canal is long, and the caecum well developed. The young (which, as in other marsupials, leave the uterus in an extremely small and imperfect condition) are placed in the pouch as soon as they are born; and to this they resort temporarily for shelter for some time after they are able to run, jump and feed upon the herbage which forms the nourishment of the parent. During the early period of their sojourn in the pouch, the blind, naked, helpless young creatures (which in the great kangaroo scarcely exceed an inch in length) are attached by their mouths to the nipple of the mother, and are fed by milk injected into their stomach by the contraction of the muscle covering the mammary gland. In this stage of existence the elongated upper part of the larynx projects into the posterior nares, and so maintains a free communication between the lungs and the external surface, independently of the mouth and gullet, thus averting danger of suffocation while the milk is passing down the gullet.

Kangaroos are vegetable-feeders, browsing on grass and various kinds of herbage, but the smaller species also eat roots. They are naturally timid and inoffensive, but the larger kinds when hard pressed will turn and defend themselves, sometimes killing a dog by grasping it in their fore-paws, and inflicting terrible wounds with the sharp claws of their powerful hind-legs, supporting themselves meanwhile upon the tail. The majority are inhabitants of Australia and Tasmania, forming one of the most prominent and characteristic features of the fauna of these lands, and performing the part of the deer and antelopes of other parts of the world. They were important sources of food-supply to the natives, and are hunted by the colonists, both for sport and on account of the damage they do in consuming grass required for cattle and sheep. A few species are found in New Guinea, and the adjacent islands, which belong, in the zoological sense, to the Australian province, beyond the bounds of which none occurs.

The more typical representatives of the group constitute the sub-family \( Macropodinae \), in which the cutting-edges of the upper incisors are nearly level, or the first pair but slightly longer than the others (fig. 3). The canines are rudimentary and often wanting. The molars are usually not longer (from before backwards) than the anterior premolars, and less compressed than in the next section. The crowns of the molars have two prominent transverse ridges. The fore-limbs are small with subequal toes, armed with strong, moderately long, curved claws. Hind-limbs very long and strongly made. Head small, with more or less elongated muzzle. Ears generally rather long and ovate.
KANGAROO-RAT—KANGRA

The typical genus *Macropus*, in which the muzzle is generally naked, the ears large, the fur on the nape of the neck usually directed backwards, the claws of the fourth hind-toe very large, and the tail stout and tapering, includes a large number of species. Among these, the great grey kangaroo (*M. giganteus*, fig. 1) deserves special mention on account of having been discovered during Captain Cook's voyage of 1770. It is about the same size, while other large species are *M. anitlinus* and *M. robustus*. The larger wallabies, or brush-kangaroos, such as the red-necked wallaby (*M. ruficolis*) constitute a group of smaller-sized species; while the smaller wallabies, such as the filler (g.v.) (*M. muelleri*) and *M. thetidis*, constitute yet another section. The genus ranges from the eastern Austro-Malay islands to New Guinea.

Native to the plains of Australia and Tasmania, constituting the genus *Petrogale*, chiefly distinguished by the thinner tail being more densely haired and terminating in a tuft. Well-known species are *P. penicillata*, *P. santheus* and *P. lateralis*. The few species of tail-tallassy wallabies, *Onychogale*, which are confined to the Australian mainland, take their name from the presence of a horny spur at the end of the tail, and are further distinguished by the hairy muzzle, *O. angasii, O. faenustus* and *O. luteus* represent the group. The hare-wallabies, such as *Lagorchestes* and *Porometa*, *L. hirsutus* and *L. conspicillatus*, constitute a genus with the same distribution as the last, and likewise with a hairy muzzle, but with a rather short, evenly furred tail, devoid of a spur. They are great leapers and swift runners, mostly frequenting open stony plains.

More distinct is the Papuan genus *Dorcopsis*, as typified by *D. muelleri*, although it is to some extent connected with *Macropus* by *D. floridanus*. It is a group of small wallabies the nape of which is directed more or less disproportionately elongated. Perhaps, however, the most distinctive feature of the genus is the great fore-and-aft length of the penultimate premolar in both jaws. Other species are *D. rufolateralis* and *D. beneniurus*. The rock-kangaroos include the Papuan *Dendrolagus musculus*, *D. rufus*, *D. dorianus*, *D. beneniurus* and *D. maximus*, and the North Queensland *D. lumholtzi*, the reduction in the length of the hind-limbs is carried to a still further degree, so that the proportions of the fore and hind-limbs are almost normal. The genus agrees with *Dorcopsis* in the direction of the hair on the neck, but the muzzle is only partially hairy, and the elongation of the penultimate premolar is less. These kangaroos are largely arboreal in their habits, but they descend to the ground to feed. Lastly, we have the banded wallaby, *Lagostrophus fasciatus*, of Western Australia, a small species characterized by its naked muzzle, the presence of long bristles on the tail, and the absence of furred tail, which conceal the claws, and also of dark transverse bands on the lower part of the back. The skull has a remarkably narrow and pointed muzzle and much inflated auditory bullae; while the two spines of the lower jaw are firmly welded together at the joint, thus effectively preventing the scissor-like action of the lower incisors distinctive of *Macropus* and its immediate allies. As regards the teeth, canines are wanting, and the penultimate upper premolar is short, from before backwards, with a distinct ledge on the inner side.

In the rat-kangaroos, or kangaroo-rats, as they are called in Australia, and the sub-family *Potoroidea*, the first upper incisor is narrow, curved, and much exceeds the others in length; the upper canines are persistent, flattened, blunt and slightly curved, and the first two premolars of both jaws have large, simple, compressed crowns, with a nearly straight or slightly convex cutting-edge, and both outer and inner surfaces usually marked by a series of parallel, vertical grooves and ridges. Molars with quadrato crowned and a blunt conical cusp at each corner, the last notably smaller than the rest, sometimes rudimentary or absent. Front teeth narrow; the three middle toes considerably exceeding the first and second in length and their claws long, compressed and but slightly curved. Hind feet as in *Macropus*. Tail long, and sometimes partially prehensile when it is used for carrying bundles of grass with which these animals build their nests. The group is confined to Australia and Tasmania, and all the species are related to *P. rufescens*.

In the members of the typical genus *Potorous* (formerly known as *Hypsiprymnus*) the head is long and slender, with the auditory bullae somewhat swollen; while the ridges on the first two premolars are more pronounced, and there are large vacuities on the palate. The tarsus is short and the muzzle naked. The genus includes *P. tridactylus*, *P. giberti* and *P. platypus*. In *Betongia*, on the other hand, the head is shorter and wider, with smaller and more arcsly the first two premolars are also more prominent and somewhat oblique (fig. 4); the tarsus is long and the tail is prehensile. The species are *B. lesueurii*, *B. gaimardi* and *B. cuniculus*. The South Australian *Caloprymnus capensis* represents a genus new to the last, but with the edge of the hairy border of the bare muzzle less emarginate in the middle line, still more swollen auditory bullae, and the ridges on the first two premolars are also more numerous and somewhat oblique (fig. 4); the tarsus is long and the tail is prehensile. The species are *C. rufescens*, which differs from all the others by the hairy muzzle, and the absence of inflation in the auditory bullae and of vacuities on the palate.

Perhaps, however, the most interesting member of the whole group is the tiny musk-kangaroo (*Hypsiprymnodon moschatus*) of north-west Australia, which alone represents the sub-family *Hypsiprymnodontinae*, a group characterized by the presence of an opposable first toe on the hind-foot and the outward inclination of the develop- ments on the palate. The list is completed by *Aepyprymnus rufescens*, which differs from all the others by the hairy muzzle, and the absence of inflation in the auditory bullae and of vacuities on the palate.

KANGAROO-RAT, a name applied in different parts of the world to two widely different groups of mammals. In Australia it is used to denote the small kangaroo-like marsupials technically known as *Potoroidea*, which zoologists prefer to call rats (see *KANGRA and KANGAROO*). In North America it is employed for certain small pocket-gophers, and is nearly allied to the pocket-gophers and belonging to the family *Geomyidae*. Kangaroo-rats in this latter series are represented by three North American genera, of which *Dipodomys phillipsi*, *Cricetodipus agilis* and *Microdipodops megacephalus* may respectively be taken as examples. Resembling pocket-gophers in the possession of cheek-pouches, kangaroo-rats, together with pocket-mice, are distinguished by their elongated hind-limbs and tails, large eyes, well-developed ears and general jerboa-like appearance and habits. The upper incisor teeth are also relatively narrower, and there are marked differences in the skull. The cheek-teeth are rootless in kangaroo-rats, but they develop roots in the pocket-mice. The former inhabit open, sandy districts, where they burrow beneath rocks or stones, and hop about like jerboas; their food consisting of grasses and other plants.

KANGVAR, a small district of Persia, situated between Hamadan and Kermanshah, and, being held in fief by the family of a deceased court official, forming a separate government. The district is very fertile and contains 30 villages. Its revenues amount to about 5,500 per annum, and its chief place is the large village of Kangvar, which has a population of about 2,000 and is 47 m. from Hamadan on the high road to Kermanshah.

KANGRA, a town and district of British India, in the Jullundur division of the Punjab. The town, sometimes called Nagarkot, is situated 2,409 ft. above the sea. Pop. (1901), 4,786. The Kotachi rajahs had a stronghold here, with a fort and rich temples. Mahmud of Ghazni took the fort in 1009 and from one of the temples carried off a vast treasure. In 1360 Kangra was again plundered, by Feroz Shah. The temple of Devi Baijeshari was said to be the oldest and wealthiest in northern India. It was destroyed, together with the fort and the great temple, in the earthquake of the 4th of April 1905, when 1,335 lives were lost in this place alone, and about 20,000 elsewhere. In 1853 the headquarters of the district were removed to the sanitarium of Dharmasala.

The district of Kangra extends from the Jullundur Dohn far into the southern ranges of the Himalaya. Besides some Rajput states, annexed after the Sikh wars, it includes Lahul, Spiti and Kulu, which are essentially Tibetan. The Beas is the only important river. Area, 9,078 sq. m., of which Kangra proper has only 2725. Pop. (1901), 7,688; average density 77 persons per sq. m., but with only one person per sq. m. in Spiti. Tea
cultivation was introduced into Kanga about 1850. The Palampur fair, established by government with a view to fostering trade with Central Asia, attracts a small concourse of Turkoman merchants. Lahaulis carry on an enterprising trade with Ladakh and countries beyond the frontier, by means of pack sheep and goats. Rice, tea, potatoes, opium, spices, wool and honey are the chief exports.

See Kangra District Gazetteer (Lahore, 1906).

KANISHKA, king of Kabul, Kashmir, and north-western India in the 2nd century A.D., was a Tatar of the Kushan tribe, one of the five into which the Yue-chi Tatars were divided. His dominions extended as far down into India as Madurad, and probably as far to the north-west as Bokhara. Private inscriptions found in the Punjab and Sind, in the Yusufzai district and at Madurad, and referred by European scholars to his reign, are dated in the years five to twenty-eight of an unknown era. It is the references by Chinese historians to the Yue-chi tribes before their incursion into India, together with conclusions drawn from the history of art and literature in his reign, that render the date given the most probable. Kanishka's predecessors on the throne were Pagans; but shortly after his accession he professed himself, probably from political reasons, a Buddhist. He spent vast sums in the construction of Buddhist monuments; and under his auspices the fourth Buddhist council, the council of Jalandhara (Jallunder) was convened under the presidency of Vasumitra. At this council three treatises were composed-the Canon of the Great Sky, and the Canon of the Earth. This change of the language used as a medium of literary intercourse was partly the cause, partly the effect, of a complete revulsion in the intellectual life of India. The reign of Kanishka was certainly the turning-point in this remarkable change. It has been suggested with great plausibility, that the wide extent of his domains facilitated the incursion into India of Western modes of thought; and thus led in the first place to the corruption and gradual decline of Buddhism, and secondly to the gradual rise of Hinduism. Only the publication of the books written at the time will enable us to say whether this hypothesis is at present supported. It is nothing more—perhaps it is really a sufficient explanation of the very important results of his reign. In any case it was a migration of nomad hordes in Central Asia that led, in Europe, to the downfall of the Roman civilization; and then, through the conversion of the invaders, to medieval conditions of life and thought. It was the very same migration of nomad hordes that led, in India, to the downfall of the Buddhist civilization; and subsequently, after the conversion of the Sakas and Tatar invaders, to medieval Hinduism. As India was nearer to the starting-point of the migration, its results were felt there somewhat sooner.

KANKAKEE, a city and the county-seat of Kankakee county, Illinois, U.S.A., in the N.E. part of the state, on the Kankakee river, 56 m. S. of Chicago. Pop. (1900), 13,595, of whom 3346 were foreign-born; (1910 census), 13,986. Kankakee is served by the Cleveland, Cincinnati, Chicago & St. Louis, the Illinois Central, and the Chicago, Indiana & Southern (controlled by the New York Central) railways. It is the seat of the Eastern Hospital for the Insane (1879) a state institution; St Joseph's Seminary (Roman Catholic) and a Conservatory of Music. At Bourbonnais Grove, 3 m. N. of Kankakee is St. Victor's College (founded 1868), a well-known Roman Catholic divinity school, and Notre Dame Academy, another Catholic institution. The city has a public library and four large parks; in Court House Square there is a monument erected by popular subscription in honour of the soldiers from Kankakee county who died in the Civil War. There are rock quarries here, and the city manufactures sewing machines, musical instruments, especially pianos, foundry and machine shop products, agriculture implements and furniture. The total value of the factory product in 1905 was $2,089,143, an increase of 222.4% since 1900. Kankakee is also a shipping point for agricultural products. It was first settled in 1832; was platted as the town of Bourbonnais in 1833, when Kankakee county was first organized; was chartered as the city of Kankakee in 1855, and was re-chartered in 1892.

KANKER, a feudatory state of India, within the Central Provinces; area, 1429 sq. m.; pop. (1901), 103,536; estimated revenue, £10,000. It is a hilly tract, the headwaters of the Mahanadi. The extensive forests have recently been made profitable by the opening of a branch railway. The residence of the raja, who is of an old Rajput family though ruling over Gonds, is at Kanker (pop. 3900).

KANO, one of the most important provinces of the British protectorate of Northern Nigeria. It includes the ancient emirates of Kano, Katsina, Daura and Kazaure, and covers an area of about 31,000 sq. m. The sub-province of Katagum was incorporated with Kano in 1905, and is included within this area. The population of the double province is estimated at about 2,500,000.

Kano was one of the original seven Hausa states. Written annals carry the record of its kings back to about A.D. 900. Legendary history goes back much further. It was conquered by the Songbhi (Songhay) in the early part of the 16th century, and more than once appears to have made at least partial subjection to Bornu. Mahommedanism was introduced at a period which, according to the system adopted for the dating of the annals, must have been either in the 12th or the 14th century. The Hausa system of government and taxation was adopted by the Fula when in the early part of the 16th century the Mahommedan people overran the Hausa states. It has been erroneously stated that the Fula imposed Mahommedanism on the Hausa states. The fact that they adopted the existing system of government and taxation, which are based upon Koranic law, would in itself be sufficient proof that this was not the case. But the annals of Kano distinctly record the introduction and describe the development of Mahommedanism at an early period of local history.

The capital is the city of Kano, situated in 2° N. and 80° 32'E., 220 m. S.S.E. of Sokoto and 300 N.E. of Lagos. It is built on an open plain, and is encompassed by a wall 11 m. in perimeter and pierced by thirteen gates. The wall is from 30 to 50 ft. high and about 40 ft. thick at the base. Round the wall is a deep double ditch, a dwarf wall running along its centre. The gates are simply cow-hides, but are set in massive entrance towers. Only about a third of the area (7½ sq. m.) enclosed by the walls is inhabited nor was the whole space ever occupied by buildings, the intention of the founders of the city being to wall in ground sufficient to grow food for the inhabitants during a siege. The arable land within the city is mainly on the west and north; only to the south-east do the houses come right to the walls. Within 500 yds. are two small hills, one, Dala, about 120 ft. high being the most ancient quarter of the town. Dala lies north-west. To its east is a great pond, the Jakarta, 1½ m. long, and by its north-east shore is the market of the Arab merchants. Here also was the slave market. The palace of the emir, in front of which is a large open space, is in the Fula quarter in the south-east of the city. The palace consists of a number of buildings covering 33 acres and surrounded by a wall 20 to 30 ft. high. The architecture of the city is not without merit. The houses are built of clay with (generally) flat roofs impervious to fire. Traces of Moorish influence are evident and the horseshoe arch is common. The
audience hall of the emir’s palace—25 ft. sq. and 18 ft. high—is decorated with designs in black, white, green and yellow, the yellow designs (formed of micaceous sand) glistening like gold. The dome-shaped roof is supported by twenty arches.

The city is divided into fourteen quarters, each presided over by a headman, and inhabited by separate sections of the community. It is probably the greatest commercial city in the central Sudan. Other towns, like Zaria, may do as much trade, but Kano is pre-eminent as a manufacturing centre. The chief industry is the weaving of cloth from native grown cotton. Leather goods of all kinds are also manufactured, and from Kano come most of the “morocco leather” goods on the European markets. Dyeing is another large trade, as is the preparation of indigo. Of traders there are four distinct classes. They are: (1) Arabs from Tripoli, who export ostrich feathers, skins and ivory, and bring in burnouses, scents, sweets, tea, sugar, &c.; (2) Salaga merchants who import kola nuts from the hinterland of the Guinea Coast, taking in exchange cloth and live stock and leather and other goods; (3) the Ashebana traders, who come from the oases of Asben or Air with camels laden with salt and “potash” (i.e. sodium carbonates), and with herds of cattle and sheep, receiving in return cotton and hardware and kolas; (4) the Hausa merchants. This last class trades with the other three and dispatches caravans to Illorin and other places, where the Kano goods, the “potash” and other merchandise are exchanged for kolas and European goods. The “potash” finds a ready sale among the Yorubas, being largely used for cooking purposes. In Kano itself it is a great market for livestock: camels, horses, oxen, asses and goats being on sale.

Besides Hausa, who represent the indigenous population, there are three colonies at Kano. The first (from Bornu) and Nupians in Kano. The Fula form the aristocratic class. The population is said to amount to 100,000. About a mile and a half east of Kano is Nassarawa, formerly the emir’s suburban residence, but since 1902 the British Residency and barracks.

The city of Kano appears on the map of the Arab geographer, Idries, A.D. 1145, and the hill of Dala is mentioned in the earliest records as the original site of Kano. Barth, however, concluded that the present town does not date earlier than the second half of the 16th century, and that before the rise of the Fula power (c. 1800) scarcely any great Arab merchant ever visited Kano. The present town may be the successor of an older town occupying a position of similar pre-eminence. Kano submitted to the Fula without much resistance, and under them in the first half of the 19th century flourished. The first resident visited by the British official, in 1824, and in 1825 Barth lived some time in 1851 and again in 1854. Barth’s descriptions of the wealth and importance of the city attracted great attention in Europe, and Kano was subsequently visited by many Arab traders, missionaries, students and savants, but none was permitted to live permanently in the city. In the closing years of the century, Kano became the centre of resistance to the British, and was, in 1917, the emirate of Kano or Fula’s release. In February 1905 the city was captured by a British force under Colonel T. L. N. Morland, and a new emir, Abbas, a brother of Aliu, installed.

After the occupation by the British in 1903 the province was organized for administration on the same system as that adopted throughout northern Nigeria. The emir on his installation takes an oath of allegiance to the British Crown, and accepts the position of head of the first class under British rule. A resident is placed at his court, and assistant residents have their headquarters in the administrative districts of the province. British courts of justice are established both with the courts of the emir, and are the supreme courts of the province. Taxation is assessed under British supervision and paid into the native treasury. A fixed portion is paid by the emir to the British government. The emir is not allowed to maintain a standing army, and the city of Kano is the headquarters of the British garrison. The conditions of appointment of the emirs are fully laid down in the terms accepted at Sokoto on the close of the Sokoto-Kano cantonment. Under the concession of British rule there has been no serious trouble in the province. The emir Abbas, who is loyal to the British and proved himself a ruler of remarkable ability and intelligence. He was indefatigable in dispensing justice, and, with the zeal of a native administrator, he discharged from fifty to a hundred cases a month. He also took an active interest in the reform and reorganization of the system of taxation, and in the opening of the country to trade. He further showed himself to be an able and tactful statesman, which at times arose in connexion with the lesser chiefs of his province.

The province of Kano is generally fertile. For a radius of 30 m. the capital the country is closely cultivated and densely populated, with some 40 walled towns and with villages and hamlets hardly a mile apart. Kano district proper contains 170 walled towns and about 450 villages. There are many streams, but water is scarce. The soils are poor and light, and often to a depth of 5 ft. The crops are African grains, wheat, onions, cotton, tobacco, indigo, with sugar-cane, cassava, &c. The population is chiefly agricultural, but also commercial and industrial. The chief industries are weaving, leather-making, dyeing and working in iron and pottery. Cattle are abundant. (See Nigeria: History; and Sokoto.)

**KANSAS** (known as the “Sunflower State”) is the central commonwealth of the United States of America, lying between 37° and 40° N. lat. and between 94° 38' and 105° 1' 34" W. long. (i.e. 25° W. long. from Washington.) It is bounded on the N. by Nebraska, on the E. by Missouri, on the S. by Oklahoma, and on the W. by Colorado. The state is nearly rectangular in shape, with a breadth of about 210 m. from N. to S. and a length of about 410 m. from E. to W. It contains an area of 82,158 sq. m. (212,824 sq. m., or 82,844 sq. m. cut by our stream low escarpments. The bluffs on the Missouri are in places 200 ft. high, and the valley of the Cimarron, in the south-west, has deep cuts, almost gorges. The west central portion has considerable irregularities of contour, and the north-west is distinctively hilly. In the south-west, below the Arkansas river, is an area of sandhills, and the Ozark Plateau region, as above stated, extends into the south-east corner, though not there much elevated. The great central valley is traversed by the Kansas (or Kaw) river, which, inclusive of the Smoky Hill Branch, extends the entire length of the state, with lateral valleys on the north. Another broad valley is formed in the south half of the state by the Arkansas river, with lateral valleys on the north and south. The south-east portion contains the important Neosho and smaller valleys. In the extreme south-west is the valley of the Cimarron, and along the south boundary is a network of the south tributaries of the Arkansas. Numerous small affluent of the Missouri enrich and diversify the north-east quarter. The streams of Kansas are usually fed by perennial springs, and, as a rule, the east and middle portions of the state are well watered. Most of the streams maintain a good flow of water in the driest seasons, and in case of heavy rains many of them “underflow” the adjacent bottoms, impounding the permeable substratum of the country with the surplus water, which in time drains out and feeds the subsiding streams. This feature is particularly true of the Saline, Solomon and Smoky Hill rivers. The west part is more elevated and water is less abundant.

**Climate.**—The climate of Kansas is exceptionally salubrious. Extremes of heat and cold occur, but as a rule the winters are dry and mild while the summers are cool and refreshing. The average annual temperature of the state for seventeen years preceding 1903 was 54° 5', the warmest mean being 56° 0', the

For the thirty years 1878-1906 the mean rainfall for ten-year periods was 22.20, 22.57, and 23.21 in., for the first, second and third periods respectively.

The geographic features of Kansas have a profound effect upon its climate. The extensive plains and open valleys are characterized by great extremes of temperature, the cold winter and the hot summer. The temperature over the state is much more uniform than is the precipitation, which diminishes somewhat regularly westward. In the above periods the mean annual temperatures varied from 19.9° to 22.3° in. (av. 21.3 in.), in the middle from 18.58' to 34.30 (av. 26.68), in the east from 26.00 to 45.71 (av. 34.76); the mean for the state remained almost constant at $29.7°$绝对不会.
region salt is produced in immense quantities, within a great north to south belt about Hutchinson. The beds, which are exploited by the brine method at Hutchinson, at Ellsworth (Ellsworth county), at Anthony (Harper county) and at Sterling (Rice county), lie from 400 to 1,200 feet below the surface; some are thick and 99% pure. At Kanopolis in Ellsworth county, at Lyons in Rice county and at Kingman, Kingman county, the salt is mined and sold as rock-salt. In the south-west salt is found in beds and dikes of limestone that are from 20 to 150 feet thick. The total product from 1880 to 1899 was valued at $5,538,856; the product of 1906 has been valued at $5,982,244.

The value of the Kansas natural gas increased from a small amount in 1870 to nearly $3,000,000 in 1906, when it was valued at $2,952,252. This gain was due largely to the discovery of the three large gas fields, the Colorado, the Pittsburg and the Coffeyville. There has been an increase in the production of lignite (Harper county) from 1890 to 1906 of 808,043 tons, valued at $57,896.

The natural rock salt, which was valued at $4,228,813 in 1900, was valued at $6,220,124 in 1906, an increase of 51% over the value of 1900. At present Kansas is far more important as a salt producer than any other state, and the salt mined in Kansas is sold throughout the United States.

Communications.—Kansas is excellently provided with railways, with an aggregate length in January 1909 of 8,914.77 m. (in 1870, 8,860 respectively, 1,501, 3,244 and 8,710 m.), and the total mileage of interurban lines is 1,346.50 m.

The most important systems are the Atchison, Topeka & Santa Fe, the Kansas City Rock Island & Pacific, the Missouri, the Kansas & Texas, the Chicago, Burlington & Quincy, and the St. Louis & San Francisco systems. The first train entered Kansas on the Union Pacific in 1860. During the following decade the lines of the Missouri Pacific, the Kansas & Texas and the Santa Fe were well under construction. These roads give excellent connexions with Chicago, the Gulf and the Pacific.

A number of ester river front of 150 m. on the Missouri, which is navigable for steamboats of good size. The internal rivers of the state are not utilized for commercial purposes.

Population.—In population Kansas ranked in 1900 and 1910 (1,609,049) twenty-second in the Union. The decennial increases of population from 1860 to 1900 were 235,98, 173,4, 43,3 and 30,5% the population in 1900 being 1,470,405, or 18% to the sq. m. Of this number 22% of lives in cities of 2500 or more inhabitants. Nine cities numbered more than 10,000 inhabitants: Kansas City (51,418), Topeka—the state capital (33,508), Wichita (24,671), Leavenworth (20,731), Atchison (15,721), Lawrence—the seat of the state university (10,826), Scott (10,322), Galena (10,155) and Pittsburg (10,112). The life of all these save the last two go back to Territorial days; but the importance of Fort Scott, like that of Galena and Pittsburg, is due to the development of the mineral counties in the southeast.

Other cities of above 5000 inhabitants were Hutchinson (6370), Emporia (5223), Parsons (7682), Ottawa (6034), Newton (6208), Arkansas City (6146), Salina (6974), Argonia (5975) and Iola (7501). The number of negroes (5%) is somewhat greater in the southern counties of the state, largely owing to an exodus of coloured people from the South in 1868-1878, and at that time when their condition was an unusually hard one: an exodus turned mainly toward Kansas. The population is very largely American-born (97% in 1900; 47% being natives of Kansas).

Germans, British, Scandinavians and Russians constitute the bulk of the foreign-born. The west third of the state is comparatively scantily populated, owing to its aridity. In the 'eighties, after a succession of wet seasons, and again in the 'eighties, settlement was pushed far westward, beyond the limits of safe travel, but hundreds of settlers—and indeed many entire communities—were literally starved out by the recurrence of droughts. Irrigation has made a surer future for limited areas, however, and the introduction of drought-resisting crops and the substitution of dairy and livestock interests in the place of agriculture have brightened the outlook in the western counties, whose population increased rapidly after 1900. The early 'eighties were made notable by a tremendous "boom" in real estate, rural and urban, throughout the commonwealth. As regards the distribution of religious sects, in 1906 there were 458,190 communicants of all denominations, and of this number 121,208 were Methodists (108,907 being Methodist Episcopalians of the Northern Church), 93,195 were Roman Catholics, 46,260 were Baptists (34,975 being members of the Northern Baptist Convention and 10,011 of the National (Colored) Baptist Convention), 40,765 were Presbyterians (33,465 being members of the Northern Church) and 40,560 were Disciples of Christ.

The German-Russian Mennonites, whose immigration became notable about 1874, furnished at first many examples of communal economy, but these were later abandoned. In 1906 the total number of Mennonites was 7445, of whom 3581 were members of the Missouri, the Conference of Mennonites of North America, 1825 belonged to the Schellenberger Brüdergemeinde, and the others were distributed among seven other sects.

1 According to the state census Kansas had in 1905 a total population of 1,544,968; nearly 28% lived in cities of 2500 or more inhabitants; 13 cities had more than 10,000 inhabitants: Kansas City (757,871), Topeka (377,628), Wichita (311,110), Leavenworth (209,343), Atchison (18,159), Pittsburg (14,697), Coffeyville (13,196), Fort Scott (12,248), Parsons (11,720), Lawrence (11,708), Hutchinson (11,215), Independence (11,206) and Iola (10,287). Other cities of the inhabited counties were: Chanute (9728), Emporia (8974), Winfield (7854), Salina (7820), Ottawa (7797), Arkansas City (7634), Newton (6601), Galena (6449), Argonia (6053), Junction City (5624) and Cherryvale (5068).
Government.—The constitution is that adopted at Wyandotte on the 29th of July 1859 and ratified by the people on the 4th of October 1859; it came into operation on the 29th of January 1861, and was amended in 1861, 1864, 1867, 1873, 1875, 1876, 1880, 1888, 1900, 1902, 1904 and 1908. An amendment may be proposed by either branch of the legislature, and, if approved by two-thirds of the members elected to each house as well as by a majority of the electors voting on it at a general election, it is adopted. A constitutional convention to revise or amend the constitution may be called in the same manner.

Universal manhood suffrage is the rule, but women may vote in school and municipal elections, Kansas being the first state in the Union to grant women municipal suffrage as well as the right to hold municipal offices (1857). General elections to state, county, and township offices are held, in the absence of a legal tender, at the first Tuesday after the first Monday in November.

The state executive officers are a governor, lieutenant-governor, secretary of state, auditor, treasurer, attorney-general and superintendent of public instruction, all elected for a term of two years. The governor appoints, with the approval of the Senate, a board of public works and some other administrative boards, and he may veto any bill from the legislature, which cannot thereafter become a law unless again approved by two-thirds of the members elected to each house.

The Senate of Kansas and a House of Representatives, meets in regular session at Topeka, the capital, on the second Tuesday of January in odd-numbered years. The membership of the senate is limited to 40, and that of the house of representatives to 125. Senators are elected for four years and representatives for two years. In regular sessions not exceeding fifty days and in special sessions not exceeding thirty days the members of both houses are paid three dollars a day besides an allowance for travelling expenses, but they receive no compensation for the extra time of longer sessions.

In 1908 a direct primary law was passed applicable to all nominations except with the exception of state and national officers. The constitutions of the states provide for a public election of candidates in cities of less than 5000 inhabitants; like public elections the primaries are made a public charge; nomination is by petition signed by a certain percentage (for state office, at least 1%; for district office, at least 2%; for sub-district or county office, at least 3%) of the party vote; the direct nominating system applies to the candidates for the United States Senate, the nominee chosen by the direct primaries of each party being the nominee of the party.

The judicial power is vested in one supreme court, thirty-eight district courts, one probate court for each county, and two or more justices of the peace for each township. All justices are elected; those of the superior court, seven in number, for a term of years. The superior court is divided into districts, each district having three every two years; those of the district courts for four years; and those of the probate courts and of the justices of the peace for two years.

The state officers, a governor, lieutenant-governor, a secretary of state, auditor, treasurer, and attorney-general are elected by the people, the governor having a power of appointment for a term of two years. The state treasurer has charge of the state funds. The governor and the judges of the supreme court have power to issue writs of habeas corpus and other processes, and to adjudge the freedom of persons held to answer an indictment of the state. In the case of the death of a judge of the supreme court, the governor appoints the successor for the remainder of the term. The government provides for the appointment of city officials in the cities of 5000 and over.

The constitution provides for school improvement in the counties which were a permanent school fund. Taxation is on the general property system. The entire system has been—as in other states where it prevails—extremely irregular and arbitrary as regards local taxation, but a good deal of redistribution of wealth has taken place. In 1880 $160,570,761, in 1890 $347,217,818, in 1906 $208,329,749, and in 1908, when it was supposed to be the actual valuation of all taxable property, $2,453,601,850), though significant of taxation methods, are not significant of the general condition or progress of the state.

Education.—Higher educational institutions, the state supports the university of Kansas at Lawrence (1866), an agricultural college at Manhattan (1853; aided by the United States government); a normal school at Emporia (1865), a western branch of the same at Hays (1902); a manual training normal school (1902) at Pittsburg, the state normal school, the second in number of years, two years every three years, four years every six years; an agricultural and mechanical institute (1862, reorganized on the plan of Tuskegee institute in 1900) also for negroes. The university of Kansas was organized in 1855 and was reincorporated in 1866. Its engineering department was established in 1879, its normal department (abolished 1883), its department of music in 1877, its department of law in 1878, and the department of pharmacy in 1883; in 1893 the preparatory department was abolished and the university was reorganized with "schools" in place of the former "departments." In 1899 a school of medicine was established, in connection with which the Eleanor Taylor Bell memorial hospital was erected in 1899. The total enrolment in 1906 was 2065 (1351 men and 702 women); the university library contained 60,000 volumes and 37,000 pamphlets. An efficient communication system is established by law in 1907. There are in Kansas 70 newspapers, 24 of them weekly. The building and maintenance of libraries and the establishment of free public schools and endowed denominational institutions are maintained. The largest
of these are the Kansas Wesleyan University (Methodist Episcopal, 1853), Salina and Baker University (Methodist Episcopal, 1858) at Baldwin. Among the many smaller colleges are Washburn College (Congregational, 1856) at Topeka, the Southwest Kansas College (Methodist Episcopal, 1880) at Emporia, Bethany College (Lutheran, 1881) at Lindsborg, Fairmount College (non-sectarian, 1885) at Wichita, St Mary's College (Roman Catholic, 1869) at St Mary's, and Ottawa University (Methodist, 1857), also at Topeka is the College of the Sisters of Bethany (Protestant Episcopal, 1861) for women. There are also various small professional schools and private normal schools. An industrial school for the United States at Beloit, for girls, and Ottawa University at Topeka, and for criminals under twenty-five at Hutchinson; a penitentiary at Lansing; a soldiers' orphans' home at Atchison and a soldiers' home at Dodge City; and schools for feeble-minded youth at Winfield, for the deaf at Olathe, and for the blind at Kansas City. These institutions are under the supervision of a state board of control. The state contributes also to many institutions on a private basis. Most of these institutions receive state aid, administer outdoor relief, and some care for insane patients at the cost of the state.

History.—The territory now included in Kansas was first visited by Europeans in 1541, when Francisco de Coronado led his Spaniards from New Mexico across the buffalo plains in search of the wealth of "Quivira," a region located by Bandelier and other authorities in Kansas north-east of the Great Bend of the Arkansas. Thereafter, save for a brief French occupation, 1719–1725, and possibly slight explorations equally inconsequential, Kansas remained in undisturbed possession of the Indians until in 1823 it passed to the United States (all save the part west of the Missouri river), and with the establishment of prairie commerce to Santa Fé (New Mexico), the waves of emigration to the Mormon land and to California, the growth of traffic to Salt Lake, and the explorations for a transcontinental railroad, Kansas became well known, and was taken out of that mythical "Great American Desert," in which, thanks especially to Pike and to Washington Irving, it had been supposed to lie. The trade with Santa Fé began about 1804, although regular caravans were begun only about 1833. This trade was one of the main interests in the life of the early settlers, and perhaps, in retrospect, too, is the army of emigrants crossing the continent in "prairie schooners" to California or Utah, of whom almost all went through Kansas.

But this movement of hunters, trappers, traders, Mormons, miners and homesteaders left no show of settlement in Kansas, for which, therefore, the succession of Territorial governments organized for the northern portion of the Louisiana Purchase had no real significance. Before 1854 Kansas was an Indian land, although on its Indian reservations (created in its east part for eastern tribes removed thither after 1836) some few whites resided: missionaries, blacks smiths, agents, farmers supposed to teach the Indians agriculture, and land "squatters," —possibly 800 in all. Fort Leavenworth was established in 1827, Fort Scott in 1842, Fort Riley in 1853. There were Methodist (1829), Baptist, Quaker, Catholic and Presbyterian missions active by 1837. Importunities to Congress to institute a Territorial government began in 1832. This was realized by the Kansas-Nebraska Bill of 1854.

By that Act Kansas (which from 1854 to 1861 included a large part of Colorado) became, for almost a decade, the storm center of national political passion, and her history of prime significance in the unfolding prologue of the Civil War. Despite the Missouri Compromise, which had prohibited slavery in the Louisiana Purchase N. of 36° 30' N. lat. (except in Missouri), slaves were living at the missions and elsewhere, among Indians and whites, in 1854. The "popular sovereignty" principle of the Kansas-Nebraska Bill involved a sectional struggle for the new Territory. Time showed that the winning of Kansas was a question of the lightest-footed immigrant. Slaveholders were not footloose, they had all to lose if they should carry their blacks into Kansas and should nevertheless fail to make it a slave-state. Thus the South had to establish slavery by other than actual slaveholders, unless Missouri should act for her to establish it. But Missouri did not move her slaves; while her vicinity encouraged border partisans to seek such establishment even without residence —by intimidation, election frauds and outrage. This determined at once the nature of the Kansas struggle and its outcome; and after the South had played and lost in Kansas, "the war for the Union caught up and nationalized the verdict of the Topeka "bouquet.""

In the summer of 1854 Missouri "squatters" began to post claims to border lands and warn away intending anti-slavery settlers. The immigration of these from the North was fostered in every way, notably through the New England Emigrant Aid Company (see Lawrence, A. A.), whose example was widely imitated. Little organized effort was made in the South to settle the Territory; Lawrence (Wakarusa) and Topeka, free-state centres, and Leavenworth, Lecompton and Atchison, pro-slavery towns, were among those settled in 1854.

At the first election (Nov. 21, 1854), held for a delegate to Congress, 3700 armed Missourians invaded Kansas and stuffed the ballot boxes; and this intimidation and fraud was practised on a much larger scale in the election of a Territorial legislature in March 1855. The resultant legislature (at Pawnee, later at Shawnee Mission) adopted the laws of Missouri almost en bloc, made it a felony to utter a word against slavery, made extreme pro-slavery views a qualification for office, declared death the penalty for aiding a slave to escape, and in general repudiated liberty for its opponents. The radical free-state men thereupon began the importation of rifles. All criticism of this was sharply denounced by the Missouri editorials as "bogus" legislation at Shawnee being "repudiated." Perfecting their organization in a series of popular conventions, they adopted (Dec. 1855) the Topeka Constitution —which declared the exclusion of negroes from Kansas—elected state officials, and sent a contestant delegate to Congress. The Topeka "government" was simply a craftily impressive organization, a standing nullification of the Union. It met now and then, and its "aristocratic" "bloc" government was twice dispersed by United States troops; but it passed no laws, and did nothing that conflicted with the Territorial government countenanced by Congress. On the other hand, the laws of the "bogus" legislature were generally ignored by the free-state partisans, except in cases (e.g. the service of a writ) where that was impossible without apparent actual rebellion against the authority of the legislature, and therefore of Congress.

Meanwhile the "border war" began. During the (almost bloodless) "Wakarusa War" Lawrence was threatened by an armed force from Missouri, but was saved by the intervention of Governor Shannon. Up to this time the initiative and the bulk of outrages lay assuredly heavily on the pro-slavery side; hereafter they became increasingly common and more evenly divided. In May 1856 another Missouri force entered Lawrence without resistance, destroyed its printing offices, wrecked buildings and pillaged generally. This was the day before the assault on Charles Sumner (q.v.) in the Senate of the United States. These two outrages fired Northern passion and determination. In Kansas they were a stimulus to the most radical elements. Immediately after the attack on Lawrence, John Brown killed a six-year-old boy and murdered and mutilated five pro-slavery men, on Pottawatomie Creek; a horrible deed, showing a new spirit on the free-state side, and of ghastly consequence—for it contributed powerfully to widen further the licence of highway robbery, pillage and arson, the ruin of homes, the driving off of settlers, marauding expeditions, attacks on towns, outrages in short of every kind, that made the following months a weter of lawlessness and crime, until Governor Geary—by putting himself above all partisanship, repudiating Missouri, and using Federal troops—
put an end to them late in 1856. (In the isolated south-eastern counties they continued through 1856–1858, mainly to the advantage of the “jay-hawkers” of free-state Kansas and to the terror of Missouri.)

The struggle now passed into another phase, in which questions of state predominated. But something may be remarked in passing of the leaders in the period of turbulence. John Brown wished to deal a blow against slavery, but did nothing to aid any conservative political organization to that end. James H. Lane was another radical, and always favoured force. He was a political adventurer, an enthusiastic, energetic, ill-balanced man, shrewd and magnetic. He assuredly did much for the free-state cause; meek politics were not alone sufficient in those days, in Kansas. The organization of the free-state leaders was Charles Robinson (1818–1894). He was born in Massachusetts, studied medicine at the Berkshire Medical School, and had had political experience in California, whither he had gone in 1849, and where in 1850–1852 he was a member of the legislature and a successful anti-slavery leader. In 1854 he had come to Kansas as an agent of the Emigrant Aid Company. He was the author of the Topeka government idea, or at least it was its moving spirit, serving throughout as the “governor” under it; though averse to force, he would use it if necessary, and we may fairly say that he introduced in Kansas the “Kearney War.” His partisans say that he saved Kansas, and regard Lane as a fomentor of trouble who accomplished nothing. Andrew H. Reeder (1807–1864), who showed himself a pro-slavery sympathizer as first Territorial governor, was removed from office for favouring the free-state party; he became a leader in the free-state cause. Every governor who followed him was forced by the logic of events and truth tacitly to acknowledge that right lay with the free-state party. Reeder and Shannon fled the Territory in fear of assassination by the pro-slavery party, with which at first they had had most sympathy. Among the pro-slavery leaders David Rice Atchison (1807–1886), United States Senator in 1843–1855, accompanied both expeditions against Lawrence; but he urged moderation, as always, at the end of what was a legitimate result of his radical agitation.

In June 1857 delegates were elected to a constitutional convention. The election Act did not provide for any popular vote upon the constitution they should form, and was passed over Governor John W. Geary’s veto. A census, miserably deficient (largely owing to free-state abstention and obstruction), was the basis of the Constitution as finally adopted. The free-state party demanded a popular vote on the constitution. On the justice of this Governor Robert J. Walker and President Buchanan were at first unequivocally agreed, and the governor promised fairplay. Nevertheless only pro-slavery men voted, and the convention was thus pro-slavery. The document it framed is known as the Lecompton Constitution. Before the convention met, the free-state party, abandoning its policy of political inaction, captured the Territorial legislature. On the constitutional convention rested, then, all hope of saving Kansas for slavery; and that would be impossible if they should submit their handbook to the people. The convention declared slave property to be “before and higher than any constitutional sanction” and forbade amendments affecting it; but it provided for a popular vote on the alternatives, the “constitution with slavery” or the “constitution with no slavery.” If the latter should be adopted, slavery should cease “except that the right to property in slaves in the Territory should not be interfered with.

The free-state men regarded this as including the right to property in offspring of slaves, and therefore as pure fraud. Governor Walker stood firmly against this. The Constitution, as it contained the grant of lands demanded by the Lecompton Ordinance from 23,500,000 acres to 3,500,000 acres, and offered only the normal cession to new states. But this grant of 3,500,000 acres was conditioned on the acceptance of the Lecompton Constitution, and Congress made no promise of any grant if that Constitution were not adopted. The bill was introduced by William Hayden English (1822–1856), a Democratic Representative, among others, in Congress in 1853. It passed both houses of Congress.1 This Act was termed “The Kansas Homestead Act.” It was intended “to induce the people of Kansas to take up the lands, and to promote the permanent improvement of that country.”

1 The English Bill was not a mere bill to the degree that it has usually been considered as such; it reduced the grant of land demanded by the Lecompton Ordinance from 23,500,000 acres to 3,500,000 acres, and offered only the normal cession to new states. But this grant of 3,500,000 acres was conditioned on the acceptance of the Lecompton Constitution, and Congress made no promise of any grant if that Constitution were not adopted. The bill was introduced by William Hayden English (1822–1856), a Democratic Representative, among others, in Congress in 1853. It passed both houses of Congress.1 This Act was termed “The Kansas Homestead Act.” It was intended “to induce the people of Kansas to take up the lands, and to promote the permanent improvement of that country.”

The free-state men ignored the alteration attempted by the Lecompton Constitution; but they participated nevertheless in the provisional election for officers under the Lecompton government, capturing all offices, and then, the same day, voted overwhelmingly against the constitution (Jan. 4, 1858).

Nevertheless, Buchanan, against the urgent counsel of Governor Denver, urged on Congress (Feb. 2) the admission of Kansas under the Lecompton Constitution. He was opposed by Senator Stephen A. Douglas, the leader of the Northern Democracy. The Senate upheld the President; the House of Representatives voted down his policy; and finally both houses accepted the English Bill, Democrats, Republicans, Radicals and Conservatives all offering some millions of acres of public lands if she should accept the Lecompton Constitution.1 On the 21st of August 1858, by a vote of 1,350 to 1,788, Kansas resisted this temptation. The plan of the Administration thus effectually miscarried, and its final result was a profound split in the Democratic party.

The free-state men framed an excellent anti-slavery constitution at Leavenworth in March–April 1858, but the origins of the convention were illegal and their work was still-born. On the 29th of July 1859 still another constitution was therefore framed at Wyandotte, and on the 4th of October it was ratified by the people. Meanwhile the Topeka “government” disappeared, and also, with its single purpose equally served, the free-state party, most of it (once largely Democratic) passing into the Republican party, now first organized in the Territory. On the 29th of January 1861 Kansas was admitted to the Union under the Wyandotte Constitution. The United States Census of 1860 gave her a population of 175,004 inhabitants.

The struggle in Kansas, the first physical national struggle over slavery, was of paramount importance in the breaking up of the Whig party, the firm establishment of an uncompromising anti-slavery party, the sectionalization of the Democracy, and the general preparation of the country for the Civil War.

Drought and famine came in 1860, and then upon the impoverished state came the strain of the Civil War. Nevertheless Kansas furnished proportionally a very large quota of men to the Union armies. Military operations within her own borders were largely confined to a guerrilla warfare, carrying on the bitter neighbourhood strife between Kansas and Missouri. The Confederate officers began by repressing predatory plundering from Missouri; but after James H. Lane, with an 8,000 man raiding force, had crossed the border, sacking, burning and killing in his progress, Missouri “bushrangers” retaliated in kind. Freebooters trained in Territorial licence had a free hand on both sides. Kansas bands were long the more successful. But William C. Quantrill, after sacking various small Kansas towns along the Missouri river (1862–63), in August 1863 took Lawrence (q.v.) and put it mercilessly to fire and sword—the most ghastly episode in border history. In the autumn of 1864 the Confederate general, Sterling Price, aiming to enter Kansas from Missouri but defeated by General Pleasanton’s cavalry, retreated southward, zigzagging party on both sides of the Missouri–Kansas line. This ended for Kansas the border raids and the war. Lane was probably the first United States officer to enlist negroes as soldiers. Many of them (and Indians too) fought bravely for the state. Indian raids and wars troubled the state from 1864 to 1878. The tribes domiciled in Kansas were rapidly moved to Indian Territory after 1868.
After the Civil War the Republicans held uninterrupted supremacy in national elections, and almost as complete control in the state government, until 1892. From about 1870 onward, however, elements of reform and of discontent were embodied in a succession of radical parties of protest. Prohibition arose thus, was accepted by the Republicans, and passed into the constitution. Woman suffrage became an organized political issue. Much legislation has been passed to control the railways. General control of the media of commerce, economic co-operation, tax reform, banking reforms, legislation against monopolies, disposal of state lands, legislation in aid of the farmer and labourer, have been issues of one party or another. The movement of the Patrons of Industry (1874), growing into the Grange, Farmers' Alliance, and finally into the People's (Populist) party (see Farmers' Movement), was perhaps of greatest importance. In conjunction with the Democrats the Populists controlled the state government in 1882-1894, and 1896-1898. These two parties decidedly outnumbered the Republicans at the polls from 1890-1898, but they could win only by fusion. In 1892-1893, when the Populists elected the governor and the Senate, and the Republicans (as the courts eventually determined) the House of Representatives, political passion was so high as to threaten armed conflicts in the capital. The Australian ballot was introduced in 1893. In the decade following 1880, struggles in the western counties for the location of county seats (the bitterest local political fights known in western states) repeatedly led to bloodshed and the interference of the state militia.

**Kansas City,** a city and the county-seat of Wyandotte county, Kansas, U.S.A., on the W. bank of the Missouri River, at the mouth of the Kansas, altitude about 800 ft. It is separated from its greater neighbour, Kansas City, Missouri, only by the state line, and is the largest city in the state. Pop. (1890), 38,315; (1900), 51,418, of whom 6,377 were foreign-born and 5906 Negroes; (1910) 74,116, of whom 10,363 were foreign-born and 8,601 Negroes; (1920) 92,863. It is served by the Union Pacific, the Missouri Pacific, the Chicago, Rock Island & Pacific, and the Chicago Great Western railways, and by electric lines connecting with Leavenworth and with Kansas City, Missouri. There are several bridges across the Kansas river. The city covers the low, level bottom-land at the junction of the two rivers, and spreads over the surrounding highlands to the W., the principal residential district. Its plan is regular. The first effective steps toward a city park and boulevard system were taken in 1897, when a board of park commissioners, appointed by the mayor. The city has been divided into the South Park District and the North Park District, and at the close of 1908 there were 10 m. of boulevards and parks aggregating 160 acres. A massive steel and concrete toll viaduct, about 12 ft. in length, extends from the bluffs of Kansas City, Kan., across the Kansas valley to the bluffs of Kansas City, Mo., and is used by pedestrians, vehicles and street cars. There is a fine public library building given by Andrew Carnegie. The charities of the city are co-ordinated through the associated charities. Among charitable state-aided institutions are the St. Margaret's hospital (Roman Catholic), Bethany hospital (Methodist), a children's home (1893), and, for negroes, the Douglass hospital training school for nurses (1898)—the last the largest private charity of the state. The medical department of the Kansas state university, the other departments of which are in Lawrence, is in Kansas City; and among the other educational institutions of the city are the Western university and industrial school (a co-educational school for negroes), the Kansas City Baptist theological seminary (1902), and the Kansas City university (Methodist Protestant, 1891). Kansas has had but one hospital medical college (for liberal arts), Wilson high school (preparatory), a school of elocution and oratory (in Kansas City, Mo.), a Normal School, Kansas City Hahnemann Medical College (in Kansas City, Mo.), and a school of theology. The city is the seat of the Kansas (State) school for the blind. Kansas City is one of the largest cities in the country without a drinking saloon. Industrially the city is important for its stockyards and its meat-packing interests. With the exception of Chicago, it is the largest live-stock market in the United States. The product-value of the city's factories in 1903 was $66,473,630; 92.5% consisting of the product of the wholesale slaughtering and meat-packing houses. Especially in the South-west markets Kansas City has an advantage over Chicago, St Louis, and other large packing centres (except St Joseph), not only in freights, but in its situation among the "corn and beef" states; it shares also the
extraordinary railway facilities of Kansas City, Missouri. There are various important manufactures, such as soap and candles, subsidiary to the packing industry; and the city has large flour mills, railway and machine shops, and foundries. A large cotton-merchant, producing coarse fabrics, was opened in 1907. Natural gas derived from the Kansas fields became available for lighting and heating, and crude oil for fuel, in 1906.

Kansas City was founded in 1856 by the consolidation of "old" Kansas City, Armourdale and Wyandotte (in which Armstrong and Riverview were then included). Of these municipalities Wyandotte, the oldest, was originally settled by the Wyandotte Indians in 1843; it was platted and settled by whites in 1857; and was incorporated as a town in 1858, and as a city in 1859. At Wyandotte were made the first moves for the Territorial organization of Kansas and Nebraska. During the Kansas struggle Wyandotte was a pro-slavery town, while Quindaro (1858), a few miles up the Missouri, was a free-state settlement and Wyandotte's commercial rival until after the Civil War. The convention that framed the constitution, the Wyandotte Constitution, under which Kansas was admitted to the Union, met here in July 1859. "Old" Kansas City was surveyed in 1859 and was incorporated as a city in 1872. Armourdale was laid out in 1880 and incorporated in 1882. The packing interest was first established in 1867; the first large packing plant was that of Armour & Co., which was removed to what is now Kansas City in 1871. Kansas City adopted government by commission in 1906.

**KANSAS CITY**, a city and port of entry of Jackson county, Missouri, U.S.A., the second in size and importance in the state, situated at the confluence of the Missouri and Kansas rivers, adjoining Kansas City, Kansas, and 235 m. W. by N. of St. Louis. Pop. (1890), 132,716; (1900), 163,752, of whom 18,410 were foreign born (German, 4,816; Irish, 3,507; Swedish, 1,805; English, 1,863; English-Canadian, 1,369; Italian, 1,034), and 17,567 were negroes; (1910 census) 248,381. Kansas City, the gateway to the South-west, is one of the leading railway centres of the United States. It is served by the Union Pacific, the Missouri Pacific, the Frisco System, the Chicago, Burlington & Quincy, the Atchison, Topeka & Santa Fé, the Chicago Great Western, the Chicago, Milwaukee & St. Paul, the Chicago & Alton, the Wabash, the Kansas City Southern, the Chicago, Rock Island & Pacific, the Missouri, Kansas & Texas, the Leveworth, Kansas & Western, the Kansas City, Mexico & Orient, the St. Louis, Kansas City & Colorado, the Quincy, Omaha & Kansas City, and the St Joseph & Grand Island railways, and by steamboat lines to numerous river ports.

The present retail, office, and wholesale sections were once high bluffs and deep ravines, but through and across these well graded streets were constructed. South and west of this highland, along the Kansas river, is a low, level tract occupied chiefly by railway yards, stock yards, wholesale houses and manufacturing establishments; north and east of the highland is a flat section, the Missouri River bottoms, occupied largely by manufactories, railway yards, grain elevators and homes of employees. Much high and dry "made" land has been reclaimed from the river flood-plain. Two great railway bridges across the Missouri, many smaller ones, cross the river at various points; and the state toll viaduct extending from bluff to bluff across the valley of the latter river, lie within the metropolitan area of the two cities. The streets of the Missouri city are generally wide and excellently paved. The city-hall (1890–1893), the courthouse (1888–1892), and the Federal Building (1892–1900) are the most imposing of the public buildings. A convention hall, 314 ft. long and 198 ft. wide, with a seating capacity of about 15,000, is covered by a steel-frame roof without a column for its support; the exterior of the walls is cut stone and brick. The building was erected within three months, to replace one destroyed by fire, for the National Democratic Convention which met here on the 4th of July 1900. The Public Library with walls of white limestone and Texas granite, contained (1908) 95,000 volumes. The Congregational, the Calvary Baptist, the Second Presbyterian, the Independence Avenue Christian, the Independence Avenue Methodist, and the Second Christian Science churches are the finest church buildings. The board of trade building, the building of the Star newspaper, and several large office buildings (including the Scarritt, Long, and New York Life Insurance buildings) are worthy of mention.

Kansas City has over 2000 acres in public parks; but Swope Park, containing 1324 acres and lying south of the city limits, board the others are distributed with a design to give each section a recreation ground within easy walking distance, and all (including Swope) are connected by parkways, boulevards and street-car lines. The Paseo Parkway, 256 ft. wide, extends from N. to S. through the centre of the city for a distance of 2 1/2 m., and adjoining it near its middle is the Parade, or principal playground. The city has eight cemeteries, the largest of which are Union, Elmwood, Mt Washington, St Mary's and Forest Hill. The charitable institutions and professional schools included in 1908 about thirty hospitals, several children's homes and homes for the aged, an industrial home, the Kansas City school of law, the University medical college, and the Scarritt training school. The city has an excellent public school system. A Methodist Episcopal institutional church, admirably equipped, was opened in 1906. The city has a juvenile court, and maintains a free employment bureau.

Kansas City is primarily a commercial centre, and its trade in livestock, grain and agricultural implements is especially large. The annual pure-bred livestock show is of national importance. The annual commercial centre. The annual commercial fair includes more than $33,385,633 in 1906, to $35,573,049 in 1908, or 50-8%. Natural gas and crude petroleum from Kansas fields became of industrial importance about 1906. Natural gas is used to light the residence streets and to heat many of the residences.

Kansas City is one of the few cities in the United States empowered to frame its own charter. The first was adopted in 1875 and the second in 1889. In 1905 a new charter, drawn on the lines of the model "municipal program" advocated by the National Municipal League, was submitted to popular vote, but was defeated by the influence of the saloons and other special interests. The charter of 1908 is a revision of this proposed charter of 1905 with the objectionable features eliminated; it was adopted by a large majority vote. Under the provisions of the charter of 1908 the people elect a mayor, city treasurer, city comptroller, and judges of the municipal court, each for a term of two years. The legislative body is the common council composed of two houses, each having as many members as there are wards in the city—14 in 1908. The members of the lower house are elected, one by each ward, in the spring of each even year. The upper house members are elected by the city at large and serve four years. The board of park commissioners, board of fire and water commissioners, a board of civil service, a city councilor, a city auditor, a city assessor, a purchasing agent, and subordinate officers, are appointed by the mayor, without confirmation by the common council. A non-partisan board composed of citizens who must not be physicians has general control of the city's hospitals and health department. A new hospital at a cost of half a million dollars was completed in 1908. The charter provides for a board of police commissioners elected from the city's districts, and a majority of the police board are appointed by the governor of the state; and the police control the grant of liquor licences. The city is supplied with water drawn from the Missouri river above the mouth of the Kansas or Kaw (which is used as a sewer by Kansas City, Kan.); the main pumping station and settling basins being at
KANSK—KANT

Quindaro, several miles up the river in Kansas; whence the water is carried beneath the Kansas, through a tunnel, to a high-pressure distributing station in the west bottoms. The waterworks (direct pressure system) were acquired by the city in 1895. All other public services are in private hands. The street-railway service is based on a universal 5-cent transfer throughout the metropolitan area. Some of the street and overhead electric trolley cars in the United States were used here in 1883.

The first permanent settlement within the present limits of Kansas City, which took its name from Kansas river,1 was established by French fur traders about 1821. Westport, a little inland town—platted 1833, a city 1837, merged in Kansas City in 1839—now a fashionable residential district of Kansas City—was a rival of Independence in the Santa Fé trade which she gained almost in toto in 1844 when the great Missouri flood (the greatest the river has known) destroyed the river landing utilized by Independence. Meanwhile, what is now Kansas City, and was then Westport Landing, being on the river where a swift current wore a rocky stead, steadily increased in importance and overshadowed Westport. But in 1838 lots were surveyed and the name changed to the Town of Kansas. It was officially organized in part in 1847, formally incorporated as a town in 1850, chartered under its present name in 1853, rechartered in 1875, in 1889 and in 1908. Before 1850 it was practically the exclusive eastern terminus on the present line for the Santa Fé trade,2 and a great outfitting point for California immigrants. The history of this border trade is full of picturesque and legendary stories. During the Civil War both Independence and Westport were the scene of battles; Kansas City escaped, but her trade went to Leavenworth, where it had the protection of an army post and a quiet frontier. After the war the railways came, taking away the traffic to Santa Fé, and other cities farther up the Missouri river took over the trade to its upper valley. In 1866 Kansas City was entered by the first railway from St Louis; 1867 saw the beginning of the packing industry; in 1869 a railway bridge across the Missouri assured it predominance over Leavenworth and St Joseph; and since that time—save for a depression shortly after 1890, following a real-estate boom—the material progress of the city has been remarkable; the population increased from 4,411 in 1860 to 32,260 in 1870, 55,285 in 1880, and 132,916 in 1890.

See T.S. Case (ed.), History of Kansas City, Missouri (Syracuse, 1888); William Griffith, History of Kansas City (Kansas City, 1900); for industrial history, the Greater Kansas City Yearbook (1907 seq.); for an official history of the Kansas City Board of Education (Kansas City, 1907 seq.); prepared for the Business Men's League.

KANSK, a town of eastern Siberia, in the government of Yeniseisk, 153 m. by rail E. of Krasnoyarsk, on the Kan River, a tributary of the Yenisei, and on the Siberian highway. Pop. (1897), 7594. It is the chief town of a district in which gold is found, but lies on low ground subject to inundation by the river.

KAN-SUH, a north-western province of China, bounded N. by Mongolia, E. by Shen-si, S. by Szech'uen, W. by Tibet and N.W. by Turkestan. The boundary on the N. remains undefined, but the province may be said to occupy the territory lying between 32° 50' and 40° N., and 106° and 98° 20' E., and to contain about 260,000 sq. m. The population is estimated at 6,800,000. Western Kan-suh is mountainous, and largely a wilderness of sand and snow, but east of the Hwang-ho the country is cultivated. The principal river is the Hwang-ho, and in the mountains to the south of Lan-chow Fu rises the Wei-ho, which traverses Shen-si and flows into the Hwang-ho at Tung-kwan. The chief products of Kan-suh are cloth, horse hides, a kind of curd like butter which is known by the Mongols under the name of wuta, musk, plums, onions, dates, sweet melons and medicines. (See CHINA.)

KANT, Immanuel (1724-1804), German philosopher, was born at Königsberg on the 22nd of April 1724. His grandfather was an emigrant from Scotland, and the name Kant is not unconnected with the north of Scotland, whence the family is said not to have come. His father was a saddler in Königsberg, then a stronghold of Pietism, to the strong influence of which Kant was subjected in his early years. In his tenth year he was entered at the Collegium Fredericianum with the definite view of studying theology. His inclination at this time was towards classics, and he was recognized, with his school-fellow, David Ruhnken, as among the most promising classical scholars of the college. His taste for the greater Latin authors, particularly Lucretius, was never lost, and he acquired at school an unusual facility in Latin composition. With Greek authorities he does not appear to have been equally familiar. During his university course, which began in 1740, Kant was principally attracted towards mathematics and physics. The lectures on classics do not seem to have satisfied him, and, though he attended courses on theology, and even preached on one or two occasions, he appears finally to have given up the intention of entering the Church. The last years of his university studies were much disturbed by poverty. His father died in 1746, and for nine years he was compelled to earn his own living as a private tutor. Although he disliked the work, and was not specially qualified for it, he did not regard the excellent precepts of his Pädagogik, he was never able to apply them—yet he added to his other accomplishments a grace and polish which he displayed ever afterwards to a degree somewhat unusual in a philosopher by profession. In 1755 Kant became tutor in the family of Count Kayserling. By the kindness of a friend named Richter, he was enabled to resume his university career, and in the autumn of that year he graduated as doctor and qualified as privatdocent. For fifteen years he continued to labour in this position, his fame as writer and lecturer steadily increasing. Though twice he failed to obtain a professorship at Königsberg, he shortly received appointments elsewhere. The only academic preference received by him during the lengthy probation was the post of under-librarian (1760). His lectures, at first mainly upon physics, gradually expanded until nearly all descriptions of philosophy were included under them.

In 1770 he obtained the chair of logic and metaphysics at Königsberg, and delivered as his inaugural address the dissertation De mundi sensibilis et intelligibilis forma et principiis. Eleven years later appeared the Kritik of Pure Reason, the work towards which he had been working in the previous ten years, and his later writings are developments. In 1783 he published the Prolegomena, intended as an introduction to the Kritik, which had been found to stand in need of some explanatory comment. A second edition of the Kritik, with some modifications, appeared in 1787, after which it remained unaltered. In spite of its frequent obscurity, its novel terminology, and its declared opposition to prevailing systems, the Kantian philosophy made rapid progress in Germany. In the course of ten or twelve years from the publication of the Kritik of Pure Reason, the books which he had written had become the standard text-books in all the leading universities, and it even penetrated into the school of the Church of Rome. Such men as J. Schulz in Königsberg, J. G. Kiesewetter in Berlin, Jakob in Halle, Born and A. L. Heydenreich in Leipzig, K. L. Reinhold and E. Schmid in Jena, Buhr in Göttingen, Tennemann in Marburg, and Snell in Giessen, with many others, made it the basis of their philosophical teaching, while theologians like Tiettrunk, Stüdtlin, and Ammon eagerly applied it to Christian doctrine and morality. Young men flocked to Königsberg as to a shrine of philosophy. The Prussian Government even undertook the expense of their support. Kant was hailed by some as a second Messiah. He was consulted as an oracle on all questions of casuistry—as, for example, on the lawfulness of inoculation for the small-pox. This universal homage for a long time led Kant unaffected; it was only in his later years that he
KANT

spoke of his system as the limit of philosophy, and resented all further progress. He still pursued his quiet round of lecturing and authorship, and contributed from time to time papers to the literary journals. Of these, among the most remarkable was his review of Herder's Philosophy of History, which greatly exasperated that author, and led to a violent act of retaliation some years after in his Metakritik of Pure Reason. Schiller at this period in vain sought to engage Kant upon his Horen. He remained true to the Berlin Journal, in which most of his criticisms appeared.

In 1792 Kant, in the full height of his reputation, was involved in a collision with the Government on the question of his religious doctrines. Naturally his philosophy had excited the declared opposition of the adherents of the Christian Church, and it could not be reconciled to the literal doctrines of the Lutheran Church. It would have been much better to permit his exposition of the philosophy of religion to enjoy the same literary rights as his earlier works, since Kant could not be interdicted without first silencing a multitude of theologians who were at least equally separated from positive Christianity. The Government, however, judged otherwise; and after the first part of his book, On Religion within the Limits of Reason alone, had appeared in the Berlin Journal, a decree was issued, forbidding its publication. This act, which treats in a more rationalizing style of the peculiarities of Christianity, was forbidden. Kant, thus shut out from Berlin, availed himself of his local privilege, and, with the sanction of the theological faculty of his own university, published the full work in Königsberg.

The Government, probably influenced as much by hatred and fear of the French Revolution, of which Kant was supposed to be a partisan, as by love of orthodoxy, resented the act; and a secret cabinet order was received by him intimating the displeasure of the king, Frederick William II., and exacting a pledge not to lecture or write at all on religious subjects in future. With this arbitrary order, after a struggle, complicated, and kept his engagement till 1797, when the death of the king, according to his construction of his promise, set him free. This incident, however, produced a very unfavourable effect on his spirits. He withdrew in 1794 from society; next year he gave up all his classes but one public lecture on logic or metaphysics; and in 1797, before the removal of the interdict on his theological teaching, he ceased altogether his public labours, after an academic course of forty-two years. He previously, in the same year, finished his treatises on the Metaphysics of Ethics, which, with his Anthropology, comprised that part of his works that he revised with his own hand. His Lectures on Logic, on Physical Geography, on Paedagogics, were edited during his lifetime by his friends and pupils. By way of asserting his right to resume theological disquisition, he also issued in 1798 his Strife of the Faculties, in which all the strongest points of his work on religion were urged afresh, and the correspondence that had passed between himself and his censor was given to the world.

From the date of his retirement from the chair Kant declined in strength, and gave tokens of intellectual decay. His memory began to fail, and a large work at which he wrought night and day, on the connexion between physics and metaphysics, was found to be only a repetition of his already published doctrines. After 1802, finding himself attacked with a weakness in the limbs attended with frequent fits of falling, he mitigated the Spartan severity of his life, and consented to receive medical advice. A constant restlessness oppressed him; his sight gave way; his conversation became an extraordinary mixture of metaphors; and it was only at intervals that gleams of his former power broke out, especially when some old chord of association was struck in natural science or physical geography. A few days before his decease, with a great effort he thanked his medical attendant for his visits in the words, "I have not yet lost my feeling for humanity." On the 12th of February 1804 he died, having almost completed his eightieth year. His stature was small, and his appearance feeble. He was little more than five feet high; his breast was almost concave, and, like Schleiermacher, he was deformed in the right shoulder. His senses were quick and delicate; and, though of weak constitution, he escaped by strict regimen all serious illness.

His life was arranged with mechanical regularity; and, as he never married, he kept the habits of his studious youth to old age. His man-servant, who awoke him summer and winter at five o'clock, testified that he had not once failed in thirty years to respond to the call. After rising he studied for two hours, then lectured other two, and spent the rest of the forenoon, till one, at his desk. He then dined at a restaurant, which he frequently changed, to avoid the influx of strangers, who crowded to see and hear him. This was his only regular meal; and he often prolonged the conversation till late in the afternoon. He then walked out for at least an hour in all weathers, and spent the evening in lighter reading, or preparation, and to the preparation of his next day's lectures, after which he retired between nine and ten to rest. In his earlier years he often spent his evenings in general society, where his knowledge and conversational talents made him the life of every party. He was especially intimate with the families of two English merchants of the name of Green and Motherby, where he found many opportunities of meeting ship-captains, and other travelled persons, and thus gratifying his passion for physical geography. This social circle included also the celebrated J. G. Hamann, the friend of Herder and Jacobi, who was thus a mediator between Kant and the philosophical wanderers.

Kant's reading was of the most extensive and miscellaneous kind. He cared comparatively little for the history of speculation, but his acquaintance with books of science, general history, travels and belles lettres was boundless. He was well versed in English literature, chiefly of the age of Queen Anne, and had read English philosophy from Locke to Hume, and the Scottish school. He was at home in Voltaire and Rousseau, but had little or no acquaintance with the French sensational philosophy. He was familiar with all German literature up to the date of his Kritik, but ceased to follow it in its great development by Goethe and Schiller. It was his habit to obtain books in sheets from his publishers Kanter and Nicolovius; and he read over for many years all the new works in their catalogue, in order to keep abreast of universal knowledge. He was fond of newspapers and works on politics; and this was the only kind of reading that could interrupt his studies in philosophy.

As a lecturer, Kant avoided altogether that rigid style in which his books were written. He sat behind a low desk, with a few jottings on slips of paper, or textbooks marked on the margin, before him, and delivered an extemporean address, opening up to the subject by partial glimpses, and with many anecdotes or familiar illustrations, till a complete idea of it was presented. His voice was extremely weak, but sometimes rose into eloquence, and always commanded perfect silence. Though kind to his students, he refused to remit their fees, as this, he thought, would discourage independence. It was another principle that his chief exertions should be bestowed on the intermediate class of talent, as the geniuses would help themselves, and the dunces were beyond remedy.

Simple, honourable, truthful, kind-hearted and high-minded as Kant was in all moral respects, he was somewhat deficient in the region of sentiment. He had little enthusiasm for the beauties of nature, and indeed never sailed out into the Baltic, or travelled more than 40 miles from Königsberg. Music he disregarded, and all poetry that was more than sententious prose. His ethics have been reproached with some justice as setting up too low an ideal for the female sex. Though faithful in a high degree to the duties of friendship, he could not bear to visit his friends in sickness, and after their death he repressed all allusion to their memory. His engaging intellectual labours no doubt tended somewhat to harden his character; and in his zeal for rectitude of purpose he forgot the part which affection and sentiment must ever play in the human constitution.

On the 17th of February 1804, the hundredth anniversary of Kant's death, a Kantian society (Kantgesellschaft) was formed at Halle under the leadership of Professor H. Vaihinger to promote Kantian studies. In 1904 it had an annual membership
KANT
Urtheilskraft, and Max (1756); agreement to continues Earthquakes diffused, an anonymously Allgemeine learned to have been shown by the earth's light.

1. Gedanken von der wahren Schätzung der lebendigen Kräfte (1747); an essay dealing with the famous dispute between the Cartesians and Leibnitzians regarding the expression for a force. According to the Cartesians, this quantity was directly proportional to velocity; according to their opponents, it varied with the square of the velocity. Their dispute has now lost its interest, for physicists have learned to distinguish accurately the two quantities which are vaguely included under the expression amount of force, and consequently have been able to show in what each party was correct and in what it was wrong. We try in almost entire sections and divisions, criticizes acutely the arguments of the Leibnitzians, and concludes with an attempt to show that both modes of expression are correct when correctly limited and interpreted.

2. Kant's later works experienced a Change since the Earliest Times (1754; ed. and trans., W. Hastie, 1900. Kant's Cosmogony; cf. Lord Kelvin in The Age of the Earth, 1897, p. 159). Kant's later writings have been carried out, in ignorance of Kant's priority, by Delaunay (1865) and Adams. He points out that the action of the moon in raising the waters of the earth must have a secondary effect in the slight retardation of the earth's motion, and refers to a similar cause to the fact that the moon turns always the same face to the earth.

3. Allgemeine Naturgeschichte und Theorie des Himmels, published anonymously in 1755 (4th ed. 1808; republished H. Ebert, 1890). In this remarkable work Kant, proceeding from the Newtonian conception of the solar system, extends his consideration to the entire sidereal system, points out how the whole may be mechanically regarded, and throws into prominence the importance of the nebular hypothesis which has since received the title of the nebular hypothesis. In some details, such e.g. as the regarding of the motion of the entire solar system as portion of the general cosmical mechanism, he had predecessors, among others Thomas Wright of Durham, but the work as a whole contains a wonderfully acute anticipation of much that was afterwards carried out by Herschel and Laplace. The hypothesis of the origin of the earth in which he combines this hypothesis of the formation of the satellites and rings, is unquestionably to be assigned to Kant. (On this question see discussion in W. Hastie's Kantstudien (1896).)

4. Meditationum quarundam de ipse succincta delineatio (1755), an inaugural dissertation, containing little beyond the notion that both earth and the ether are of a similar nature, is diffused, elastic and subtle matter (ether) which is the underlying substance of heat and light. Both heat and light are regarded as vibrations of this diffused ether.

5. On the Causes of Earthquakes (1755); Description of some Recently Experienced Earthquakes (1756).

6. Explanatory Remarks on the Theory of the Winds (1756). In this brief tract, Kant, apparently in entire ignorance of the explanation given in 1735 by Hadley, points out how the varying velocity of rotation of the successive zones of the earth's surface furnishes a key to the explanation of the wind's action. His conclusions are in agreement with that now received. See the parallel statements from Kant's tract and Dove's essay on the influence of the rotation of the earth on the flow of its atmosphere (1835), given in Zöllner's work, Über die Natur der Cometen, pp. 477-482.

7. On the Different Races of Men (1775); Determination of the Notion of a Human Race (1785); Conjectural Beginning of Human History (1807). All three tracts containing some points of interest in regard to the empirical grounds for Kant's doctrine of teleology. Reference will be made to them in the notice of the Krift of Judgement.

8. On the Volcanoes in the Moon (1758); On the Influence of the Moon on the Weather (1794). The second of these contains a remarkable discussion of the relation between the centre of the moon's figure and its state of gravity. From the difference between these Kant is led to conjecture that the gravitational force of the earth is not turned from us must be altogether unlike those of the face presented to us. His views have been restated by Hansen.

9. Lectures on Physical Geography (1822); published from notes of Kant's lectures, with the approval of the author.

Consideration of these works is sufficient to show that Kant's major contribution to the science of natural philosophy was profound, and that his philosophy is to be dealt with as having throughout a reference to general scientific conceptions. For more detailed treatment of his importance in science, reference may be made to "Kant's Essay," "Kant and his Mentis on Natural Science--a study on the Nature of Creatures," (pp. 426-484); to Dietrich, Kant and Newton; Schultz, Kant and Darwin; Reusch's careful analysis of the science of natural philosophy; (1868); W. Hastie's introduction to Kant's Cosmogony (1900), which summarizes criticism to that date; and articles in Kant-Studien (1896 fol).

One of the philosophical writings of Kant need not be more than bibliographical, as in the account of his philosophy it will be necessary to consider at some length the successive stages in the development of his thought. Arranged chronologically these works are:

1755. Principia rerum cognitioe or metaphysisca noue dilucidato.
1758. De metaphysicae cum geometrica juxta usus in philosophia naturali, cuius specimen I, continuit monologismum physicum.
1763. Versuch den Begriff der negativen Grösse in die Westertart einzuftühren, "Attempt to introduce the Notion of Negative Quantity into Philosophy." (1763).
1764. Beobachtungen über das Gefühl des Schönen und Erhabenen (Riga, 1771; Königsberg, 1776).
1766. Untersuchung über die Deutschen der Grundsätze der Natürlichkeit der Philosophie als Wissenschaft; "An Essay on the Evidence (Clearness) of the Fundamental Propositions of Natural Theology and Ethics." (1766).
1768. Trüme eines Geistersehers, ertlärt durch Trüme der Metaphysik, "Dreams of a Ghost-see (or Clairvoyant), explained by the Dreams of Metaphysics." (Eng. trans. E. F. Goewitz, with intro. by F. Sewall, 1900).
1790. Ueber eine Entdeckung, nach der alle neue Kritik der reinen Vernunft durch eine andere einleblich gemacht werden soll, "On a Discovery by which all the recent Critique of Pure Reason is superseeded by a more ancient" (i.e. by Leibnitz's philosophy).
1791. Ueber die wirklichen Fortschritte der Metaphysik seit Leibnits und Wolff's, "On the Real Advances of Metaphysics since Leibnitz and Wolff"; and Ueber das Misslingen aller philosophischen Versuche in der Theodicee.
1799. Der Streit der Fakultäten, "Contest of the Faculties."
The Kantian Philosophy.

Historians are accustomed to divide the general current of speculation into epochs or periods marked by the dominance of some single philosophical conception with its systematic evolution. Perhaps in this connection should be added an era of intellectual enlightenment in that of the critical philosophy. The great work of Kant absolutely closed the lines of speculation along which the philosophical literature of the 18th century had proceeded, and has been regarded for a hundred years as the system of modern thought, in which it was thought that all the essential problems of thought, a method which has prescribed the course of philosophical speculation in the present age. The critical system has thus a twofold aspect: as an old system, its character is defined by its content; and, as a new system, in which the previous efforts of modern thought, shows the imperfect nature of the fundamental notions therein employed, and offers a new solution of the problems to which those notions had been applied. It opens up two whole aspects of thought, and, in the process of the development, was on the point to which it should be judged. A work of this kind is essentially epoch-making.

In any complete account of the Kantian system it is therefore necessary that there should be constant reference, on the one hand, to the peculiar character of the preceding 18th-century philosophy, and, on the other hand, to the problems left for renewed treatment to more modern thought. Fortunately the development of the Kantian system itself furnishes such treatment as is necessary of the former reference. For the critical philosophy was a work of slow growth. Its writers had been able to trace with great definitiveness the successive stages through which it passed from the notions of the preceding philosophy to the new and comprehensive method which it was to exalt. The whole of it, of any great mind, it has been said with justice, ever matured so slowly. In the early essays we find the principles of the current philosophies, those of Leibnitz and English empiricism, amalgamated. It was probable that such a method may, were the truth of their works ever so great, be judged. We note the appearance of the difficulties or contradictions which manifest the one-sidedness or imperfection of the principle applied; and we then trace back to the problem, if any, and hence in the completed system, to take the place of the earlier method. To understand the Kantian work it is indispensable to trace the history of its growth in the mind of its author.

The two preceding stages of modern philosophy, only the second, that of Locke and Leibnitz, seems to have influenced practically the course of Kant's speculation. With the Cartesian movement as a whole he shows little acquaintance and no sympathy, and his own philosophical conception is never brought into relation with the systematic treatment of metaphysical problems characteristic of the Cartesian method. The fundamental question for philosophical reflection presented itself to him in the form which it had assumed in the hands of Locke and his successors in England, of Leibnitz and the Leibnitzian school in Germany. The transition from the Cartesian movement to that of Leibnitz and Locke, had been natural and indeed necessary. Nevertheless the full bearings of the philosophical question were somewhat obscured by the comparatively limited fashion in which it was presented in the works of these men. The influence of the so-called subjectivism, a tendency which differentiates the modern from the ancient method of speculation, is expressed in Locke and Leibnitz in a definite and peculiar fashion. How necessary to modern speculation is the dissolution of all futility of cognition, which is the inevitable result of the individualist method, but also the clearest consciousness of the very root of the difficulty. The systematic application of the doctrine that knowledge is a product of an individual person, and to this end, leads Hume to distinguish between truths reached by analysis and truths which involve real conceptions. The conception of an object as one without further inquiry, though it is an error to suppose, as Kant has seem to have supposed, that he regarded mathematical propositions as coming under this head (see Hume), with respect to the conception of an object which is not, so hopelessly at fault. No real connexion between isolated objects of experience are perceived by us. No single matter of fact necessarily implies the existence of any other. In short, if the difficulty be in its ultimate form, no existence thought as a distinct individual can transcend itself, or imply relation to any other existence. If the parts of conscious experience are regarded as so many distinct things, there is a very reality of the thing contingently, if at all. If the individual mind be really thought as individual, it is impossible to explain how it should have knowledge or consciousness at all. In short, says Hume, there are two principles which entirely renounce it. The first is the power to renounce either of them, viz. that all our distinct perceptions are distinct existences, and that the mind never perceives any real connexion among distinct existences.

Thus, on the one hand, the individualist conception, when carried out to its full extent, leads to the total negation of all real cognition. If the real system of things, to which conscious experience has reference, be regarded as standing in causal relation to this experience there is no conceivable foundation for the assertion of the existence of such a non-existent. If, on the other hand, we take the difficulty to be in the human mind, which is somewhat involved in thought. The same result is apparent, on the other hand, when we consider the theory of knowledge implied in the Leibnitzian individualism. The metaphysical conception of the individual, that the mind is in itself, presents insuperable difficulties when the connection or interdependence of the monads is in question, and these difficulties obtrude themselves when the attempt is made to work out a philosophy of knowledge, as is shown by the work of the monads. The fact, the mundus intelligibilis, is contained impliciter in each monad, and the several modes of apprehension can only be regarded as so many stages in the development of the monads. Thus, knowledge, if it is not the understanding, real connexion of facts and analysis of notions, are not, therefore, distinct in kind, but differ only in degree. The same fundamental axioms, the logical principles of identity and contradiction, are to be found in both systems of thought. It is true that Leibnitz himself did not work out any complete doctrine of knowledge, but in the hands of his successors the theory took definite shape in the principle that all knowledge is possible, in essence and in idea.

The process of analysis might be complete or incomplete. For finite intelligences there was an inevitable incompleteness so far as knowledge of matters of fact was not
KANT was certainly. These this He not occurs the still not whole. The 1770; cannot or and said, between Kant's clearness between the subordinate doctrines of the System. The successful essays which have been utilized as comments to Kant's core principles are not to be regarded as so many imperfect sketches of the doctrines of the *Kritik* nor are we to look in them for anticipations of the critical view. They are essentially tentative, and exhibit with unfailing conscientiousness in every instance an effort force on a wider and more comprehensive view. There can be no doubt that some of the special features of the *Kritik* are to be found in these precritical essays, e.g. the doctrine of the Achérmatism is certainly foreshadowed in the *Dissertation* of 1770; the *Kritik*, however, is no patchwork, and what appears in the *Dissertation* takes an altogether new form when it is wrought into the more comprehensive conception of the later treatises.

The particular problem which gave the occasion to the first of the precritical writings is, in an imperfect or particular fashion, the fundamental question to which the *Kritik* is an answer. What is the relation between the concepts of causality and the notion of necessity? Kant seems never to have been satisfied with the Wolffian identification of logical axioms and principles of the will with the concepts of identity and contradiction and those for which no logical ground can be shown. Such immediate or indemonstrable judgments, it is said, abound in our experience. They are, in fact, as Kant presently perceived, the foundations for all judgments regarding real existence. It becomes impossible that the question regarding their nature, legitimacy and their distinction from analytic judgments should not present itself to him. The three tracts belonging to the years 1753-1754 are not a mere explanation of the essential opposition between the two classes of judgments. In the *Essay on Negative Quantities*, the fundamental thought is the total distinction in kind between logical opposition (the contradictoriness of notions, which Kant always viewed as formed, definite products of thought) and real opposition. For the one adequate explanation is found in the logical axioms of analytical thinking; for the other no such explanation is to be had. Logical ground and real ground are totally distinct.

"I can understand perfectly well," says Kant, "how a consequence follows from its reason according to the law of identity, since it is discoverable by mere analysis of the notion contained in it... But how and why can a judgment arise from an antecedent which is contrary to the law of identity, this I should gladly have made clear to me...

How shall I comprehend that, since something is, something else shall happen? Do I, in short, see distinct existences, and, as distinct, not necessary? The notion of an external ground, in fact, is the one thought he proceeds, "reflected on the nature of our knowledge in relation to our judgment of reason and consequent, and I intend to expound fully in the following sections, which are separated from the relation of a real ground to that which is thereby posited or denied cannot be expressed by a judgment but only by means of a notion, which by analysis may certainly be reduced to yet simpler notions of real grounds, but yet in such a way that the final result of all of our cognition in this regard must be found in simple and irreducible notions of real grounds, the relation of which to their consequences cannot be made clear."

The striking similarity between Kant's expressions in this Essay and the remarks with which Hume introduces his analysis of the notion of causation has led to the supposition that at this period of his life Kant was influenced by the ideas of the earlier empiricist. Consideration of the whole passage is quite sufficient to show the groundlessness of this supposition. The thesis that will be Kant is presented was one arising inevitably from reflection upon the nature of our knowledge, and the solution does not in any way go beyond that theory. It is a solution, in fact, which must have been impossible had the purport of Hume's doctrine been contained in the only way in which Kant was here at the point at which he remained for many years, accepting without any criticism certain fundamental notions as required for real judgment. His ideal of metaphysics is still that of complete analysis of given concepts, the control of the faculty of reason. How come these notions and with what right do we apply them in cognition? is yet apparent. Any direct influence from Hume must therefore be placed in a period earlier than 1753.

The prize essay *On the Principles of Natural Theology and Morals* brings forward the same fundamental opposition—though in a special form. Here, for the first time, appears definitely the distinction between synthesis and analysis, and in the distinction is found the reason for the superior certainty and clearness of mathematics as opposed to philosophy. Mathematics, Kant thinks, proceeds a priori synthetically; with mathematical physics, on the other hand, is analytic in method; in it the notions are given, and by analysis they are cleared up. It is to be observed that the description of mathematics as synthetic is not an anticipation of the *Kritik*. Kant is not concerned with the critique of speculative knowledge in this place, raise the question as to the reason for assuming that the abstract syntheses of mathematical construction have any reference to reality. The deeper significance of synthesis has not been developed in the *Kritik*.

In the *Only Possible Ground of Proof for the Existence of God*, the argument, though largely Leibnizian, advances one step farther toward complete structure, and exhibits the elements of the critic of speculative knowledge. In the *Dissertation* Kant was, in the critique of speculative theology his fundamental doctrine that real existence is not a predicate to be added in thought to the conception of a possible subject. So far as subjective thought is concerned, the possibility of a knowable subject is already established. One year 1765 was marked by the publication of Leibniz's posthumous *Newesexx Essay*, in which his theory of knowledge is more fully stated than in any of his previous tracts. In all probability Kant gave some attention to this work, though no special reference to it occurs in his writings, and it may have assisted to give additional precision to his doctrine. In the curious essay, *Dreams of a *T*ERGE*.

The whole development of Kant's thought up to this point is intelligible when regarded from the Leibnizian point of view, with which he started. There appears no reason to conclude that Hume at this period exercised any influence upon Kant, and no Humean doctrine is, at this stage, further, and add that even in the *Dissertation* of 1770, generally regarded as more than foreshadowing the *Kritik*, the really critical question is not involved. A brief notice of the contents of this tract will serve the purpose. It contains Kant's methods and principles of the critical or transcendental philosophy. Sense and understanding, according to the *Dissertation*, are the two components of knowledge. The objects of the one are things of sense or phenomena; the objects of the other are noumena. These are absolutely distinct, and are not to be regarded as differing only in degree. In phenomena we distinguish matter, which is given by sense, and form, which is the law of the order of the intellect; they are *leges intellectus*.

Apart, then, from the expanded treatment of space and time as subjective forms, we find in the *Dissertation* little more than the very precise and definite formulation of the slowly growing opposition to the Leibnizian doctrines. That the pure intellectual notions should be defended as springing from the nature of intellect is not out of harmony with the statement of the *Tractatus* given earlier. For this doctrine had not been held to have validity for actual things except on grounds of experience. Here they are supposed to exist, dissevered from experience, and are allowed validity as determinations of things in themselves.

The stage which Kant had now reached in his philosophical development was one of great significance. The doctrine of knowledge as presented in the *Dissertation* required the putting aside of the Wolffian rationalism could assume for him, and, though many of the elements of the *Kritik* are contained therein, it was not ready in advance of the Wolffian theory. The doctrine of space and time
as forms of sense-perception, the reference of both space and time and the pure mind's reference to itself, the distinction between sense and understanding as one of kind, not of degree, with the correlative distinction between pheno-
momenal and noumena—all of these reappear, though changed and modified in the new inquiry. It is not accidental, therefore, that, so far as the Dissertation is concerned, the way had only been prepared for the true critical inquiry, and that the real import of Husserl's ideas, what, according to him, was to be the standard of the manner, however, in which the doctrine of knowledge had been stated in the Dissertation, the further inquiry had been rendered inevitable. It had become quite impossible for Kant to remain long without reference to the fundamental element of his doctrine of knowledge, the so-called pure intellectual notions. Those notions, according to the Dissertation, were the only notions that are to be regarded as objects which are not directly or immediately brought into relation to our faculty of cognition. They did not serve as the connecting links of formed experience; on the contrary, they were supposed to be the main reference of the entire scheme of knowledge. Hence, for the first time, the task for intelligence like ours. In his previous essays, Kant, while like-
wise maintaining that such pure, irreducible notions existed, had asserted in general terms that they applied to experience, and that their applicability or justifiability rested on experience itself, but had not raised the question as to the ground of such justifiability. Now, from another side, the supreme difficulty was presented—how could those notions define objects, or, in fact, define experience itself? For some time the correlative difficulty, how objects of sense-
perception were possible, does not seem to have suggested itself to Kant. In the Dissertation sense-perception had been taken as reality, or as an indispensable condition of experience. It was the product of the treatment of such representations by the logical or analy-
tical processes of understanding. Some traces of these confused facts are left even in the Kritik, specially perhaps in the Aesthetik, and the rise of the ambiguity which unfortunately attaches to the more developed theory of cognition. So soon, however, as the critical question was put, Kant applied himself to its solution in the Dissertation. It is the statement of this general problem that we find the new and characteristic feature of Kant's work.

The question of the substantial accuracy of Kant's reference to the particular occasion or cause of the critical inquiry. Up to the stage indicated by the Dissertation he had been attempting, in various ways, to unite two radically divergent modes of explaining cognition—that which would account for the content of experience by reference to affection from things without us, and that which viewed the intellect itself as somehow furnished with the means of pure, rational cognition. He now discovered that Hume's sceptical analysis of the concept of cause was in itself a typical or crucial instance of the much more general problem. If experience, says Kant, consists solely of states of mind somehow given, how do we distinguish the first from the second? What is the distincion from others, with what right do we make the common assumptions that parts of experience are necessarily connected? The only possible answer, drawn from the premises laid down, must be that these assumptions of causality or connection are inherent in the experience itself, and are not part of the object of experience. Thus, as Kant had been willing to admit and as Hume also held, involves or implies something more than is given in experience—for that which is given is contingent—and rests upon an a priori or pure notion. But a priori notions, did they exist, could have no claim to regulate experience. Hume, therefore, for his part, rejected entirely the notion of cause as being fictitious and delusive, and professed to account for the habit of regarding experience as actually connected by reference to arbitrarily formed custom of thinking. Experience, as given, contingent material, had a certain uniformity, and recurring uniformities generated in us the habit of regarding them as causally connected. A more general experience for explanation could lead to no valid conclusion has been already noted as evident to Hume himself.

The schematic or individualistic conception of experience had thus

The absolutely new conception of experience was necessary, if the fact of experience is to be explained at all, in order to give to what Kant expresses the business of his critical philosophy were merely different fashions of stating the one ultimate problem, differing according to the particular aspect of knowledge, which he happened to have in mind, or, worse, when he supposed, with only the judgments possible, or how far cognition extends, or what word attaches to metaphysical propositions, is simply to ask, in a general way, what seems necessary to the total concept of the object of the subject is conscious. How is it possible for the individual thinking subject to connect together the parts of his experience in the mode we call cognition. The whole scope of his critical philosophy is, therefore, the complete analysis of experience from the point of view of the conditions under which such experience is possible for the conscious subject. The whole problem of metaphysical problems, of the possibility of the experience, which is the net result of the Kritik, is indefinably prod-
founder and richer than that which had ruled the 18th century philosophies, and for another reason. The critical experience still appears as how-

Kant's concepts of the conditions in which the critical system, of the which the above are merely the more prominent, may all be traced to the one source, the false or at least inadequate idea of the individual. The more thorough explanation of the relation between the experience and the individual subject was the problem left by Kant for his successors.

In any detailed exposition of the critical system it would be necessary to state and to reject the one or other of the two extreme and precise natures of the problems immediately before Kant, and in the subsequent place to follow with some closeness the successive stages of the system as presented in the three main works, the Kritik of Pure Reason, the Kritik of Practical Reason, and the Metaphysic of Nature and the Metaphysic of Ethics. It would be necessary, also, in an expanded treatment, to bring out clearly the Kantian classification of the philosophical sciences, and to indicate the relation between the critical or transcendental investigation of the several faculties and the more developed sciences to which that investigation serves as introduction. As any detailed statements of the critical system, however compressed, would be beyond the limits of the present article, it is proposed here to select only the more salient doctrines, and to point out in connexion with what subjects and in what sense they were applicable. The second part of the Kritik of Pure Reason is here treated with the more important of the minor works, the Metaphysic of Nature and the Metaphysic of Ethics. The work, however, as a sketch of so elaborate and complex a system, and for all points of special interpretation reference must be made to the many detailed dissertations on or about the Kantian philosophy.

The doctrine from which Kant starts in his critical or transcen-
dental investigation of knowledge is that to which the slow develop-
ment of his thought had led him. The essence of cognition or knowledge was a synthetic act, an act of combining in thought the detached elements of experience. Now synthesis was explicable only in so far as reference could be given to the subject, anddivision reference to the effects of external real things upon our faculties is admitted. For, on the other hand, all the logical treatment applied only to objects of knowledge as already given in some synthetic forms, and, on the other hand, real things could yield only isolated effects and not the combination of these effects in the forms of synthetic apprehension. To the matter of knowledge for the conscious subject, it must be regarded as the conjunction of
of given material and synthetic combination. Form and matter may indeed be regarded separably and dealt with in isolation; in a paradoxical sense they are necessarily and inseparably united. The problem of the *Kritik* thus becomes for Kant the complete statement of the elements necessarily involved in the subjective analysis by which any given data of sense are realized in our individual consciousness. He is not asking, with Locke, whence the details of experience arise; he is not attempting a natural history of the growth of experience in the individual mind; but he is asking, whatever the source of what we take as necessarily involved in any fact of knowledge, *i.e.* in any synthetic combination of parts by the conscious subject, what precisely are the conscious elements that are involved in the experience? These conscious elements, as necessary to an experience, are, these may be enumerated briefly thus:—given data of sense, inner or outer; the forms of perception, *i.e.* space and time; the forms of thought, *i.e.* the categories; the ultimate condition of knowledge, *i.e.* the unity of the knowing subject. The central unity in reference to which alone is any part of experience cognizable. But the consciousness of self is the foundation of knowledge only when related to given material. The ego in itself the element of difference, and the essence of knowledge is the consciousness of unity in difference. For knowledge, therefore, it is necessary that difference should be given to the ego. The modes under which it is possible for such given difference to become portion of the conscious experience of the ego, the modes under which the isolated data can be synthetically combined so as to form a cognizable whole, make up the form of cognizance, and upon this form rests the prior realization of the knowledge-word.*

The notion of the ego as a purely logical unity, containing in itself no element of difference, and having only analytical identity, is fundamental to all logical systems. Other difficulties and perplexities. To say that the ego as an individual *does not produce* the world of experience is by no means the same as to say that the ego is pure unity without element of difference. In the first the ego is creating the ego as a condition of experience and denying of its productive efficacy; in the second case we are dealing with the unity of the ego as a condition of knowledge, of any experience whatsoever. In the second sense, it is therefore necessary to assert that the ego is pure unity, pure unity. The unity and identity of the ego, so regarded, are taken in abstraction, *i.e.* as disavowed from the more complex whole of which they are necessary elements. When the ego is taken as a condition of knowledge, unity is not more important than the difference necessarily correlated with it. That the ego as a thing should not produce difference is quite beside the mark. The consequences of the abstract separation which goes into the ego and the objects of experience are apparent throughout his whole system. Assuming at the outset an opposition between the two, self and matter of knowledge, he is driven by the exigencies of the problem of reconciliation to insert term after term as means of bringing them together, but never succeeds in attaining a junction which is more than mechanical. To the end, the ego remains, partly the pure logical ego, partly the concrete ego, and not immediately related to each other. It is for this reason that the system of forms of perception and categories appears so contingent and haphazardly made to suit Kant's ends, for why should any supplied for the pure logical ego should present itself necessarily under these forms. They are regarded rather as portions of the subjective mechanism of the individual consciousness. The mind or ego of the Kantian system was it were-removed from which by which it alone could act upon the material supplied to it. Such a crude conception is far, indeed, from doing justice to Kant's view but it undoubtedly represents the prevailing assumption of many of his cardinal doctrines. The philosophy of Fichte is historically interesting as that in which the deficiencies of Kant's fundamental position were first discerned and the attempt made to remedy them. Kant did not attempt to work out systematically the elements involved in knowledge before considering the subjective processes by which knowledge is realized in consciousness. He mixes up the two instead of first considering general details of each and upon the results of previous psychology than upon the lines prescribed by his own new conception of experience. He treats the elements of knowledge as nearer at hand than the subjective processes involved in knowledge, viz. sense and understanding. Great ambiguity is the natural result of this procedure. For it was not possible for Kant to avoid the misleading connotation of the terms employed by him. In strictness, sense, understanding imagination and reason ought to have had their functions defined in close relation to the elements of knowledge with which they are associated and not as the subjective processes as separate facts, but only as factors in the complex organic whole.
synthesis and in the constitution of objects of sense-experience. The formation of the general unity of mathematics, therefore, being included under this the pure science of movement, is thus laid in the critical doctrine of space and time.

The Aesthetik isolates sense-perception, and considers its forms as those of the understanding. Kant proceeds, consequently, to an analysis of the confusion, arising from this, is noticeable in the Analytik when the necessity for justifying the position of the categories is under discussion. The doctrine in which Kant was involved by his doctrine of space and time has, in so far, a deeper and more erroneous isolation of sensibility. He has not in any way "deduced" space and time, but, proceeding from the ordinary current view of the phenomena, has found and proved, that space and time are possible after analysis. The relation in which they stand to the categories or pure notions is ambiguous; and, when Kant has to consider the function in which categories and data of sense are to be brought together, the question of their identity by those categories, the connective notions and the pure forms of perception, and finds it, apparently, only a matter of contingent convenience that they should or should not become the objects of possible experience. To this point also Fichte was the first to call attention.

Affection of sense, even when received into the pure forms of perception, is not matter of knowledge. For cognition there is requisite synthetic combination, and the intellectual function through which such combination takes place. The forms of intelleluctal function Kant proceeds to enumerate with the aid of the concept of the synthetic combination. In this reference to logic he has been severely blamed, but the precise nature of the contribution to the commonly accepted logical classification is very generally misconceived. Synthetic combination, Kant points out, is formally expressed in pure intuition, and which is of the highest importance for practical life. At the foundation of the judgments which express the types of synthetic combination, through which knowledge is possible, lie the pure general notions, the abstract aspect of the categories under which it would be possible in experience, that is, in datums of representation, to deal with the union of representations, though its unity is analytic merely, not synthetic. But the same intellectual function which serves to give intuition of synthetic combination, is to be found in experience, to give unity to the synthetic combinations of real perception. It appeared evident, then, to Kant that in the forms of judgment, as they are stated in the common logic, there must be found the analogies of the types of judgment which are involved in transcendentally logical, or in the theory of real cognition. His view of the ordinary logic was wide and comprehensive, though in his restriction of the science to pure form one can trace the influence of his earlier treatment of the problem in the Disquisition. Part of the argument of the logic is that it has revived the study of logic and prepared the way for a more thorough consideration of logical doctrines. The position assigned to logic by Kant is not, in all probability, one which can be defended; indeed, it is hard to see how Kant himself, in consistency with the critical doctrine of knowledge, could have retained many of the older logical theorems, but the precision with which the logical analysis of the forming of intuition and judgment has been marked off from cognate philosophic disciplines, prepared the way for the more thoughtful treatment of the whole question.

Formal logic thus yields to Kant the list of the general notions, pure intuition of which alone experience is possible for a conscious subject. It has already been noted how serious was the error involved in the description of those notions by Kant, and other results of which have been of very great significance. Kant, indeed, was mainly influenced by his strong opposition to the Leibnizian rationalism, and therefore assigns the categories to understanding, the logical faculty, without consideration of the question,—which might have been suggested by the previous statements of the Disquisition,—what relation these categories held to the empirical notions formed by comparison, abstraction and generalization when directed upon representations of objects. But when the categories are described as notions, i.e. forms of products of thought, there rises necessity the problem which had presented itself to Kant at every stage of his pre-critical thinking; to what extent can we consider those notions not only in respect to objects of experience? The answer which he proceeds to give, altogether explains the definition of the categories as formed products of thought, and enables us to see more clearly the nature of the synthetic combination of intuition, which is the reason for the whole critical work.

The unity of the ego, which has been already noted as an element entering into the synthesis of cognition, is a unity of a quite distinct and peculiar kind. That the ego to which different parts of experience are presented must be the same ego, if there is to be cognition at all, is analytically evident; but the peculiarity is that the ego must be a one-sided, or unipolar, unity. Self-consciousness is only possible in relation to difference not contained in the ego but given to it. The unity of appearance, then, as Kant calls it, is a unity of the object, of the subject of experience, which in all the critical work.

The organic combination of the particular of sense with the unity of the general of the categories. Reference of representations to the unity of the object, synthetic unity of apperception, and subsuposition of data of sense under the categories, are thus three sides or aspects of the one fundamental fact. A

In this deduction of the categories, as Kant calls it, there appears for the first time an endeavour to connect together into one organic whole the several elements entered into by Kant himself. However much before this essential task could be regarded as complete. Kant has certainly brought together self-consciousness, the system of the categories and data of sense. He has shown what the conditions of self-consciousness are necessary of possible experience. But he has not shown, nor did he attempt to show, how it was that the conditions of self-consciousness are the very categories arrived at by consideration of the system of logical doctrines. It is the result of the synthetic combination of the several elements which has shown, the data of sense brought about, for according to his scheme this stood, to a certain extent at any rate, to be the several objects of possible experience. The function to effect an organic combination of the several elements was the natural consequence of the false start which had been made.

The mode in which Kant endeavours to show how the several portions of cognition are subjectively realised brings in the clearest light the inconsistencies and imperfections of his doctrine. Sense had been asserted as furnishing the particular of knowledge, understanding as furnishing the universal. Kant here shows that the particular was cognizable only in and through the universal. Still, each was conceived as somehow in itself complete and finished. Sense and understanding had distinct functions, and the object manipulating synthetic combination is a thing with a distinct mode only one of possible experience. But data of sense had at least one universal aspect, and the aspect of the sense-data had nothing to do with the sense-data. Categories were in themselves abstract and valueless, serviceable only when restricted to possible objects of experience. This was true of a conception on which Kant had been brought, that the objects of experience were united in one, and an intermediate process whereby the universal of the category might be so far individualized as to comprehend the particular, and was, therefore, the process which was prescribed, and the object was only one of possible experience. Kant's conception, however, was so comprehensive as to impose a result that has much that has proved of extreme value for subsequent thought.

Productive imagination is thus the concrete element of knowledge, and its general modes are the abstract expression of the a priori laws of all possible experience. The categories are restricted in their applicability to the schema, i.e., to the pure forms of conjunction of the manifold in time, and in the modes of combination of schemata and principles, and the categories are only restricted in their history in mathematics and physics. Perception or real cognition is thus conceived as a complex fact, involving data of sense and pure productive forms, determined by the category and realized through productive imagination, and which may be deduced from the consideration of the mode in which understanding and sense are united by productive imagination is therefore the object of the diagram and contains the feature, and its features are enough for us to observe attention. According to his usual plan, Kant arranges these principles in conformity with the tabular of the categories, dividing the four classes, however, into two main groups, the mathematical and the dynamical. The mathematical principles are the abstract expression of the necessary mode in which data of sense are determined by the category in the form of intuitions or representations of objects; the dynamical is the abstract expression of the modes in which the existence of objects of intuition is determined. The mathematical principles are constitutive, i.e. express determinations of the objects themselves; the dynamical are representatives, i.e. express the condition in which the objects can form parts of real experience. Under the mathematical principles come the general rules which furnish the ground for the application of quantities of representing to real facts of experience. For as data of sense are by no means restricted to objects only the objects of space and time, and as space and time are only known when determined in definite manner by the understanding through the scheme of number (quantity) or degree (quality), all intuitions are extensive quantities and contain a real element, that of sense, which has degree. Under the dynamical principles, the general modes in which the existence of objects are determined, fall the analogies of space, time, and general, and since the unity of the objects in relation to one another can be determined, and the postulates of experience, the general rules according to which the existence of objects is such as to exist as a self-conscious existence can be determined. The analogies of experience can be regarded as the analogies of the modes in which the perception of time, i.e., their permanence, succession or coexistence, and the principles are respectively those of substance, causality and rectitude. It is to be observed that Kant in the expression of these analogies reaches the final solution of the difficulty which had
so long pressed upon him, the difficulty as the relation of the pure common experience. These notions are not directly applicable to experience, nor do we find in experience anything corresponding to the pure intellectual notions of substance, cause and reciprocity. But experience is for us the combination of all our relations of perception, formed by the pure intellectual notions, and accordingly experience is possible for us only as in modes corresponding to the notions. The permanent in time, it is to be understood that the experience eternal, it is possible save through the determination of all changes as in relation to a permanent in time. Determined sequence is the causal relation in any possible experience, and no experience is possible but only to a determined in relation to a determined order in time. So with coexistence and reciprocity.

The postulates of experience are general expressions of the significant existence in the experience of a conscious subject. The element of reality in such experience must always be given by intuition, and, so far as determination of existence is assumed, extent of experience as far as it can be viewed as absolutely necessary. The real meaning of these peculiarities is hardly ever expressed by intuition, though it is clear that the solution of the matter is to be found in these peculiarities of the experience. The conclusion which he was led to the greatest importance for the after development of his system. Cognition is necessarily limited, the categories are restricted in their application to elements of possible experience to that which is presented in intuition, and all intuition is for the ego contingent. To assert that cognition is limited and its matter contingent is to form the idea of an intelligence for theorems of knowledge, not the existence of a sphere of intuitions, and for whom the data of intuition would not be given, contingent facts, but necessarily produced along with the pure categories. This idea of an intellect is the first conception for the determination of reason demands, and it involves the conception of a realm of objects for such an understanding, a realm of objects which, in opposition to the phenomena of our relative and limited experience, may be called noumena or things-in-themselves. The noumenon, therefore, is in one way the object of a non-sensuous intuition, but more correctly is the expression of the limited and partial character of our knowledge. The idea of a noumenon is thus a belonging nothingness.

Assuredly, the difficult section of the Kritik, on the ground of the distinction between phenomena and noumena, would not have led to the solution of any of the difficulties which Kant has outlined and developed, as it has already been seen, have validity only in reference to objects of possible experience. We may expect, then, to find the transcendent employment of the categories leading into various difficulties and inconsistencies. The criticism of reason in its specific aspect throws fresh light on the limits to human knowledge and the significance of experience.

The specific function of reason is the effort after completed explanation of the experience presented in cognition. But in such effort there are no notions to be employed other than the categories and these, as has already been seen, have validity only in reference to objects of possible experience. We may expect, then, to find the transcendent employment of the categories leading into various difficulties and inconsistencies. The criticism of reason in its specific aspect throws fresh light on the limits to human knowledge and the significance of experience.

Reason has set itself as the complex result of relations between the ego or subject and the world of phenomena. Reason may therefore attempt a completed explanation either of the ego or of the world of phenomena or of the total relation between them. The grounds of the attempts, to determine the categories, the metaphysical sciences, rational psychology, rational cosmology, rational theology. It is readily seen, in regard to the first of them, that the attempt to determine them as pure concepts and, in the second, to determine them as pure categories, presupposes a confusion between the ego as pure logical unity and the ego as object of intuition, and involve a transcendental use of the categories of experience. It profits not to apply such categories to the soul, for no intuition corresponding to them is or can be given. The idea of the soul must be regarded as transcendent. So too when we endeavour, by the intuitions of the understanding, to determine the nature and relation of parts of the world, we find that reason is landed in a peculiar difficulty. Any solution that can be given is too narrow for the demands of reason and too wide for the demands of the understanding, the employment of the categories leads to antimony, or equally balanced systems of apparently contradictory results. Due attention to the relation between the determinations of reason and the other sciences and to discover their precise origin and significance

Finally, the endeavour to find in the conception of God, as the supreme reality, the explanation of experience, is seen to lead to no conclusive results. But any doctrine of our knowledge that might show the reality of our idea of a Supreme Being, so far as knowledge is concerned, God remains a transcendental ideal.

The criticism of the transcendental ideas, which is also the examination of the conceptions of the realm of pure reason, yields a definite and intelligible result. These ideas, the expression of the various modes in which unity of reason may be sought, have no objects corresponding to them in the sphere of cognition. They have not, therefore, like the categories, any constitutive value, and all attempts at metaphysical construction with the notions or categories of science must be regarded as of necessity hopeless. But the ideas are not found to be valueless, for it is shown that they are significant, as indicating the very essence of the function of reason.

The limits of scientific cognition become intelligible, only when the sphere of understanding is regarded as a transcendent, or fundamentally dependent, on the sphere of reason, that is, the sphere of rationally complete cognition. The ideas, therefore, in relation to knowledge strictly so called, have regulative value, for they furnish a prescription of the precise nature of the sphere of reason, and, at the same time, since they spring from reason itself, they have a real value in relation to reason as the very inmost nature of intelligence. Self-consciousness cannot be regarded as merely a mechanically determined result. Free reflection upon the whole system of knowledge is sufficient to indicate that the sphere of intuition, with its rational principles, does not exhaust conscious experience. There is still, therefore, something to cognize, above and beyond the realm of free, self-conscious spirit; and, within this sphere, it may be anticipated that the ideas will acquire a significance richer and deeper than the merely regulative import which they possess among the categories.
in conscious experience. Judgment is here merely reflective; that is, it is regarded solely as the act of determining the most possible material of knowledge, while the universal, not necessary for cognition, is supplied by reason itself. The empirical details of nature, which are not determined by the categories of understanding, are not determined by the categories of intuition. This is the nature of other fashion could nature, in its particular, contingent aspect, be thought as forming a complete, consistent, intelligible whole.

The conditioned and conditioned nature to intelligence is conceivable and possible makes up the subject of the third great Kritik, the *Kritik of Judgment*, a work presenting unusual difficulties to the interpreter of the Kantian system. The *Kritik of Judgment* is the last book by Kant of the faculties of cognition has two specific applications, with the second of which it is more closely connected than with the first. In the first book, its being *purely subjective*, when the empirical condition for the exercise of judgment is furnished by the feeling of pleasure or pain; such adaptation is aesthetic. In the second place, the adaptation may be objective or logical, when understanding alone is the condition and then the possibility can be conceived only through the notion of the end realized in such adaptation is teleological, and the empirical facts in question are organismic.

Aesthetics, or the scientific consideration of the judgments resting on the feelings of pleasure and pain arising from the harmony or want of harmony between the particular of experience and the laws of experience. The term is taken from the ancient Greek, but the doctrine of teleology there unfolded is the more important for the complete view of the critical system. For the analysis of the teleological judgment and of the consequences flowing from it leads to an understanding of the teleological philosophy as presented by Kant. The phenomena of organic production furnish data for a special kind of judgment, which, however, involves or rests upon a quite general principle, that of the contingency of the particular occurrence, or the dependence of the subjective on the objective, of the end on the means.

The notion of contingency arises, according to Kant, from the fact that understanding and sense are distinct, that understanding does not determine the particular possibility, and, consequently, that the principle of the adaptation of the particular to our understanding is merely supplied by reason on account of the peculiarity or limited character of understanding. End in nature, therefore, is a subjective or problematic conception, implying the limits of understanding, and consequently resting upon the idea of an understanding constituted unlike ours — of an intuitive understanding, and understanding which has the grounds not be "the" grounds. The idea of such an understanding is, for cognition, transcendent for no corresponding fact of intuition is furnished, but it is realized with practical certainty in relation to reason as practical. For we are, from practical grounds, compelled to at least practice necessity to ascribe a certain aim or end to this supreme understanding. The moral law, or reason as practical, prescribes the realization of the highest good, and such realization implies a higher order the mere contingency of phenomena. If the end must be preceded by and cause as a moral cause, and nature as so ordered that realization of the moral end is in it possible. The final conception of the Kantian philosophy is that of a *teleology of nature* by other means, is that in it a remarkable passage of the Kritik. "The systematic unity of ends in this world of intelligences, which, although as mere nature it is to be called only the world of sense, can yet as a system of free ends be ordered, can be, and must be". This leads inevitably to the teleological unity of all things which constitute this great whole according to universal natural laws, just as the unity of sensation and free ends of things is required by necessary natural laws, and unites the practical with the speculative reason.

The world must be represented as having originated from an idea, if it is to harmonize with that use of reason without which we should hold ourselves unworthy of reason — viz, the moral order, which rests entirely on the idea of the supreme good. Hence all natural research tends towards the form of a system of ends, and in its highest development would be a physico-theology. But this, since it is a system of ends, must rest on an explanation of the essence of freedom and not accidentally instituted by external commands, establishes the teleology of nature on grounds which a prior must be inseparably connected with the inner possibility of things. The teleology of nature is thus made to rest on a transcendental theology, which takes the ideal of supreme ontological per- fection as a principle of systematic unity, a principle which connects all things according to universal and necessary natural laws, since they all have their origin in the absolute necessity of a single primal being." (p. 538)

**Bibliography** — Edits and works of reference are exceedingly numerous. Since 1896 an indispensable guide is the periodical review *Kantstudien* (Hamburg and Berlin, thrice yearly), edited by Hans Vaihinger and Bruno Bauch, which contains admirable annotated reviews of all books touching on Kantianism. It has reproduced a number of striking portraits of Kant. For books up to 1887 see Erich Ardickes in *Philosophical Review* (Boston, 1892 fol.); for 1890—1894 R. Reckew's *Kant Bibliothek* (3 vols.); for 1895—1906 F. W. Schubert (Leipzig, 1838—1840, 12 vols., containing a history of the Kantian school; (3) G. Harenstein, "in chronological order") (Leipzig, 1897—1899, 6 vols.;) (4) Kirchmann, *Handbuch der Philosophie der Völker*; Barry, *Bibliography of Kant's Works* (1896); (5) under the auspices of the Königliche Preussische Akademie der Wissenschaften a new collected edition was begun in 1899, a volume having been published in 1903. A plan has been made: in four sections: Works, Letters, MSS. Remains and Verlesungen. There are also useful editions of the three Kritics by Kehrbauch, and critical editions of the *Prolegomena* and *Kritik der reinen Vernunft* in the *Philosophical Review*, 1900; in the *Philosophy of Kant* (Gower, ed., 1908). There are also three *Kritik* of. See also in general the latest edition of Ueberweg's *Grundriss der Geschichte der Philosophie*.

**Editions** — Complete editions of Kant's works are as follows: (1) The *Kritik der reinen Vernunft* (1781), with the critical edition of Kant's *Kritik der reinen Vernunft* by A. J. Buchler (Leipzig, 1895); (2) G. H. Hartmann, "in chronological order") (Leipzig, 1897—1899, 6 vols.;) (4) Kirchmann, *Handbuch der Philosophie der Völker*; Barry, *Bibliography of Kant's Works* (1896); (5) under the auspices of the Königliche Preussische Akademie der Wissenschaften a new collected edition was begun in 1899, a volume having been published in 1903. A plan has been made: in four sections: Works, Letters, MSS. Remains and Verlesungen. There are also useful editions of the three Kritics by Kehrbauch, and critical editions of the *Prolegomena* and *Kritik der reinen Vernunft* in the *Philosophical Review*, 1900; in the *Philosophy of Kant* (Gower, ed., 1908). There are also three *Kritik* of. See also in general the latest edition of Ueberweg's *Grundriss der Geschichte der Philosophie.*

On Cant's theory of education, see E. F. Blicher, The Educational Theory of Immanuel Kant (trans., ed., Intro., 1904); trans. of Uebcr Pädagogik by Annette Clurton (1899); J. Geluk, Kant (1883).

(R. A. D.; X.)

KANURI, or Beriberi, an African tribe of mixed origin, the dominant race of Bornu. They are large-boned and coarse-faced, but contain nevertheless a distinct strain of Fula blood. Beriberi (or Berberi) is the name given them by the Hausa, or included the Phagwara Bornu.

KOALIN, a pure white clay, known also as china-clay, since it is an essential ingredient in the manufacture of china, or porcelain. The word koalin, formerly written by some authors caulain, is said to be a corruption of the Chinese Kaau-ting, meaning "High Ridge," the name of a hill east of King-te-chen, whence the earliest samples of the clay sent to Europe were obtained by the Père d'Entrecrois, a French Jesuit missionary in China in the early part of the 18th century. His specimens, examined in Paris by R. A. Réaumur, showed that true porcelain, the composition of which had not previously been known in Europe, could be made from the same name of clay—though it now appears incorrectly—as koalin and petunse, corresponding respectively to our china-clay and china-stone. The koalin confers plasticity on the paste and secures retention of form for the ware when exposed to the heat of the kiln, whilst the petunse gives the translucency so characteristic of porcelain. Some of the earliest discoveries of koalin in Europe were at Aue, near Schneeberg in Saxony, and at St Yrieix, near Limoges in France. In England it was discovered in Cornwall about the year 1750 by William Cookworthy, of Plymouth; and in 1766 he took out his patent for making porcelain from moonstone or grown (china-stone) and grown clay (koalin), the latter imparting "whiteness and infusibility" to the china. These raw materials were found first at Tregonning Hill, near Breage, and afterwards at St Stephen's in Brannel, near St Austell; and their discovery led to the manufacture of hard paste, or true porcelain, at Plymouth and subsequently at Bristol.

Koalin is a hydrous aluminium silicate, having the formula H₃Al₂Si₂O₇ or Al₂SiO₅·H₂O, but in common clay this silicate is largely mixed with impurities. Certain clays contain partly white hexagonal scales, usually microscopic, referable to the monoclinic system, and having the chemical composition of koalin. This crystalline substance was termed koalinite by S. W. Johnson and J. M. Blake in 1867, and it is now regarded as the basis of pure clay. The koalinite of Anglesey has been studied by Allan Dick. The origin of koalin may be traced to the alteration of certain aluminous silicates like feldspar, scapolite, beryl and topaz; but all large deposits of china-clay are due to the decomposition of feldspar, generally in granite, but sometimes in gneiss, pitchstone, &c. The turbidity of many feldspones is the result of partial "kaolinization," or alteration to koalin. The china-clay rocks of Cornwall and Devon are granites in which the orthoclase has become kaolinized. These rocks are sometimes known as carcelzite, a name proposed by J. H. Collins from a typical locality, the Carclee mine, near St Austell. It has often been supposed that the alteration of the granite has been effected mainly by meteoric agencies, the carbonic acid having decomposed the alkaline silicate of the feldspar, whilst the aluminous silicate assumes a hydrated condition and forms koalin. In many cases, however, it seems likely that the change has been effected by subterranean agencies, probably by heated vapours carrying fluorine, boron, and other minerals containing these elements, like tourmaline, often occur in association with the china-clay. According to F. H. Butler the kaolinization of the west of England granite may have been effected by a solution of carbonic acid at a high temperature, acting from below.

The china-stone, or petunse, is a granitic rock which still retains much of the unaltered feldspar, on which its fusibility depends. In order to prepare koalin for the market, the china-clay rock is broken up, and the clay washed out by means of water. The liquid containing the clay in mechanical suspension is run into channels called "drags" where the coarser impurities settle out, and whence it passes to another set of channels known as "micas," where the finer materials settle down. Thus purified, the clay-water is led into a series of pots or tanks, in which the finely divided clay is slowly deposited; and, after acquiring sufficient consistence, it is transferred to the drying-house, or "dry," heated by flues, where the moisture is expelled, and the koalin obtained as a soft white earthy substance. The clay has extensive application in the arts, being used not only for the manufacture of china, but in paper-making, bleaching and various chemical industries.

Under the species "kaolinite" may be included several minerals which have received distinctive names, such as the Saxon mineral called from its pearly lustre nacre, a name originally given by A. Brongniart to a nacreous mica; pholerite found chiefly in cracks of ironstone and named by J. Guillemin from the Greek φόλις, a scale; and lithomarge, the old German Steinmarmor, a compact clay-like body of white, yellow or red colour. Dr C. Hinta has pointed out that the word pholerite should properly be written phylolite (φυλόλιτος). Closely related to kaolinite is the mineral called also "clay," a name given to it by P. Berthier after his uncle Omalius d'Halloy, the Belgian geologist.

(F. W. R.)

KAPUNDA, a municipal town of Light county, Southern Australia, 48 m. by rail N.N.E. of Adelaide. Pop. (1901), 1805. It is the centre of a large wheat-growing district. The celebrated copper mines discovered in 1843 were closed in 1879. There are quarries near the town, in which is found fine marble of every colour from dark blue to white. This marble was largely used in the Houses of Parliament at Adelaide.

KAPURTHALA, a town, district, and province, within the Punjab. Area, 652 sq. m.; pop. (1901), 314,341, showing an increase of 5% in the decade; estimated gross revenue, £78,000; tribute, £8700. The Kapurthala family is descended from Jassa Singh, a contemporary of Nadir Shah and Ahmad Shah, who by his intelligence and bravery made himself the leading Sikh of his day. At one time it held possessions on both sides of the Sutlej, and also in the Bara Doab. The cis-Sutlej estates and scattered tracts in the Bara Doab were forfeited owing to the hostility of the chief in the first Sikh war; but the latter were afterwards restored in recognition of the loyalty of Raja Randhir Singh during the turmoil of 1843. Before 1875 no town appears to have existed here; but about that time some little trade began to centre upon the convenient harbour, and the settling up of Shahbandar, the ancient port of Sint, shortly afterwards drove much of its former trade and population to the rising village. Under the Kallora princes, the khan of Kalat obtained a grant of the town, but in 1795 it was captured by the Talpur Mirs, who built the fort at Manora, at the entrance to the harbour. They also made considerable efforts to increase the trade of the port.

KARACHI, or Kurrachee, a seaport and district of British India, in the Sind province of Bombay. The city is situated at the extreme western end of the Indus delta, 500 m. by sea from Bombay and 820 m. by rail from Lahore, being the maritime terminus of the North-Western railway, and the main gateway for the trade of the Punjab and part of central Asia. It is also the capital of the province of Sind. Pop. (1881), 73,500; (1891), 125,190; (1901), 115,497. Before 1775 no town appears to have existed here; but about that time some little trade began to centre upon the convenient harbour, and the settling up of Shahbandar, the ancient port of Sind, shortly afterwards drove much of its former trade and population to the rising village. Under the Kallora princes, the khan of Kalat obtained a grant of the town, but in 1795 it was captured by the Talpur Mirs, who built the fort at Manora, at the entrance to the harbour. They also made considerable efforts to increase the trade of the port.
and at the time of the British acquisition of the province the town and suburbs contained a population of 14,000. This was in 1843, from which time the importance of the place practically dates.

The harbour of Karachi has an extreme length and breadth of about 5 m. It is protected by the promontory of Manora Head; and the entrance is partially closed by rocks and by the peninsula (formerly an island) of Kiamari. On Manora Head, which is fortified, are the buildings of the port establishment, a cantonment, &c. Kiamari is the landing-place for passengers and goods, and has three piers and railway connexions. The harbour improvements were begun in 1854 with the building of the Napier Mole or caseway connecting Kiamari with the mainland. The entrance has a minimum depth of 25 ft.; and a large number of improvements and extensions have been carried out by the harbour board, which was created in 1880, and transformed in 1886 into the port trust.

The great extension of the canal colonies in the Punjab, entirely devoted to the cultivation of wheat, has immensely increased the export trade of Karachi. It now ranks as the third port of India, being surpassed only by Calcutta and Bombay. The principal articles of export, besides wheat, are oilseeds, cotton, wool, hides and bones. The annual value of exports, including specie, amounts to about nine millions sterling. There are iron works and manufactures of cotton cloth, silk scarves and carpets. The fisheries and oyster beds are important.

Among the principal public buildings are government house, the Frere municipal hall, and the Napier barracks. The military cantonments, stretching north-east of the city, form the headquarters of a brigade in the 4th division of the southern army. An excellent water supply is provided by an underground aqueduct 18 m. in length. The chief educational institutions are the Dayaram Jethmal Arts College, with a law class; five high schools, of which two are for Europeans and one for Mahomedans; a convent school for girls; and an engineering class. The average rainfall for the year is about 5 in. The rainy months are July and August, but one or two heavy showers usually fall about Christmas. The end of May, beginning of June, and first fortnight in October are hot. November, December, January, February and March are delightfully cool and dry; the remaining months are damp with a constant cool sea breeze.

The District of Karachi has an area of 11,970 sq. m. Pop. (1901), 607,439, showing an increase of 6% in the decade. It consists of an immense tract of land stretching from the mouth of the Indus to the Baluch border. It differs in general appearance from the rest of Sind, having a rugged, mountainous region along its western border. The country gradually slopes away to the south-east, till in the extreme south the Indus delta presents a broad expanse of low, flat and unpicturesque alluvium. Besides the Indus and its mouths, the only river in the district is the Hab, forming the boundary between Sind and Baluchistan. The Manchhar lake in Sehwan sub-division forms the only considerable sheet of water in Sind. The hot springs at Pir Mangho are 6 m. N. of Karachi town. The principal crops are rice, millets, oil-seeds and wheat. In addition to Karachi, there are seaports at Sirgonda and Keti Bandar, which conduct a considerable coasting trade. Tatta was the old capital of Sind. Kotri is an important railway station on the Indus. The main line of the North-Western railway runs through the district. From Kotri downwards the line has been doubled to Karachi, and at Kotri a bridge has been constructed across the Indus opposite Hyderabad, to connect with the Rajputana railway system.

KARAGEORGE (in Servian, Karadayorde) (c. 1766-1817), the leader of the Servians during their first revolution against the Turks (1804-13), and founder of the Servian dynasty Kara-georgевич. His Christian name was George (Dyordye), but being not only of dark complexion but of gloomy, taciturn and easily, excitable temper, he was nicknamed by the Servians "Tsni Dyordye" and by the Turks "Karageorge," both meaning "Black George," the Turkish name becoming soon the generally adopted one. He was born in 1766 (according to some in 1768), the son of an extremely poor Servian peasant, Petronye Petrovich. When quite a young man, he entered the service of a renowned Turkish brigand, Fazli-Bey by name, and accompanied his master on his adventurous expeditions. When twenty he married and started a small farm. But having killed a Turk, he left Servia for Syria, in Croatia-Slavonia, where the monks of the monastery Krushedol engaged him as one of their forest guards. He remained in the service of the monks nearly two years, then enlisted into an Austrian regiment, and after that took part in the Austrian war against Russia (1788-91). He deserted his regiment, returned to Servia, and settled in the village of Topola, living sometimes as a peaceful farmer and sometimes again as the leader of a small band of "hayduks"—men who attacked, robbed and in most cases killed the travelling Turks in revenge for the oppression of their country.

The circumstances in which the Servians rose against the janissaries of the pashalik of Belgrade are related in the article on Servia. The leaders of the insurgents' bands and other arms of influence were divided at the time into two parties: one at the village of Orashatz, and there elected Karageorge as the supreme leader (Vrhovni Vozd) of the nation. Under his command the Servians speedily cleared their country not only of the janissaries disloyal to the Sultan, but of all other Turks, who withdrew from the open country to the fortified places. Karageorge and his armed Servians demanded from the Sultan the privileges of self-government. The Porte, confronted by the chances of a war with Russia, decided in the autumn of 1806 to grant to the Servians a fairly large measure of autonomy. Unfortunately Karageorge was comparatively poor in political gifts and diplomatic tact. While the hattisherej granting the rights demanded by the Servians was on the way to Servia, Karageorge attacked the Turks in Belgrade and Shabats, captured the towns first and then also the citadels, and allowed the Turkish population of Belgrade to be massacred. At the same time the Russian headquarters in Bucharest informed Karageorge that Russia was at war with Turkey and that the Tsar counted on the co-operation of the Servians. Karageorge and his Servians then definitely rejected all the concessions which the Porte had granted them, and joined Russia, hoping thereby to secure the conditional independence of Servia. The co-operation of the Servians with the Russians was of no great importance, and probably disappointing to both parties. But as the principal theatre of war was far away from Servia on the lower Danube, Karageorge was able to give more attention to the internal organization of Servia. The national assembly proclaimed Karageorge the hereditary chief and gospodar of the Servians (Dec. 26, 1808), he on his part promising under oath to govern the country "through and by the national council" (Senate). Karageorge's hasty and uncompromising temper and imperious habits, as well as his want of political tact, soon made him many enemies amongst the more prominent Servians (voivodes and senators). His difficulties were considerably increased by the intrigues of the Russian political agent to Servia, Rodopninik. A crisis came during the summer months of the year 1813. The treaty of peace, concluded by the Russians somewhat hurriedly in Bucharest in 1812, did not secure efficiently the safety of the Servians. The Turks demanded from Karageorge, as a preliminary condition for peace, that the Servians should lay down their arms and Karageorge refused to comply. Thenceforward the entire Turkish army which fought against the Russians on the Danube, being disengaged, invaded Servia. After a few inefficient attempts to stem the invasion, Karageorge gave up the struggle, and with most of the voivodes and chiefs of the nation left the country, and crossed to Hungary as a refugee (Sept. 20, 1813). From Hungary he went to Russia and settled in Khotin (Bessarabia), enjoying a pension from the Tsar's government. But in the summer of 1817 he suddenly and
secretly left Russia and reappeared quite alone in Servia in the neighbourhood of Semendria (Smederevo) on the Danube. The motives and the object of his return are not clear. Some believe that he was sent by the Hetaeists to raise up Servia to a new war with Turkey and thereby facilitate the rising of the Greek people. It is generally assumed, however, that, having heard that Servia, under the guidance of Milosh Obrenovich, had obtained a certain measure of self-government, he desired to put himself again at the head of the nation. This impression seems to have been that of Milosh himself, who at once reported to the Pasha of Belgrade the arrival of Karageorge. The pasha demanded that Karageorge, alive or dead, should be delivered to him immediately, and made Milosh personally responsible for the execution of that order. Karageorge’s removal could not unfortunately be separated from the personal interest of Milosh; already acknowledged as chief of the nation, Milosh did not like to be displaced by his old chief, who in a critical moment had left the country. Karageorge was killed (July 27, O.S., 1817) while he was asleep, and his head was sent to the pasha for transmission to Constantinople. It is impossible to exonerate Milosh Obrenovich from responsibility for the murder, which became the starting-point for a series of tragedies in the modern history of Servia.

Karageorge was one of the most remarkable Servians of the 19th century. No other man could have led the bands of undisciplined and badly-armed Servian peasants to such decisive victories against the Turks. Although he never assumed the title of prince, he practically was the first chief and master (gospodar) of the people of Servia. He succeeded, however, not because he was liked but because he was feared. His gloomy silence, his easily aroused anger, his habit of punishing without hesitation the slightest transgressions by death, spread terror among the people. He is believed to have killed his own father in a fit of anger when the old man refused to follow him in his flight to Hungary at the beginning of his career. In another fit of rage at the report that his brother Marinko had assaulted a girl, he ordered his men to seize his brother and to hang him there and then in his presence, and he forbade his mother to go into mourning for him. Even by his admirers he is admitted to have killed by his own hand no fewer than 125 men who provoked his anger. But in battles he is acknowledged to have been always admirable, displaying marvellous energy and valour, and giving proofs of a real military genius. The Servians consider him one of their greatest men. In grateful remembrance of his national cause they elected his younger son, Alexander, in 1842, to be the reigning prince of Servia, and again in 1903 they chose his grandson, Peter Karageorgevich (son of Alexander) to be the king of Servia.

(C. M.)

KARA-HISSAR ("Black Castle"). (1) AFTUM KARA-HISSAR (q.v.). (2) ICHE, or ISCHA KARA-HISSAR (anc. Docium), a small village about 14 m. N.E. of No. 1. Docium was a Macedonian colony established on an older site. It was a self-governing municipality, striking its own coins, and stood on the Apamea-Synnada-Pessinus road, by which the celebrated marble called Synnadic, Dociumian and Phrygian was conveyed to the coast. The quarries are 2½ m. from the village, and the marble was carried thence direct to Synnada (Chifut Kassaba). Some of the marble has the rich purple veins in which poets saw the blood of Atys.

See W. M. Ramsay, Hist. Geog. of Asia Minor (London, 1890); Murray, Hbk. to Asia Minor (1893).

KARA-HISSAR SHARKI [i.e. "eastern Kara-Hissar"], also called Shabin Kara-Hissar from the alum mines in its vicinity, the chief town of a sanjak of the same name in the Sivas vilayet of Asia Minor. Pop. about 12,000, two-thirds Mussulman. It is the Roman Colonia, which gradually superseded Pompey's foundation, Nicolopolis, whose ruins lie at Purkh, about 12 m. W. (hence Kara-Hissar is called Nikopolis by the Armenians). In later Byzantine times it was an important frontier station, and did not pass into Ottoman hands until twelve years after the capture of Constantinople. The town, altitude 4860 ft., is built round the foot of a lofty rock, upon which stand the ruins of the Byzantine castle, Meurocastron, the Kara Hissar Daula of early Moslem chroniclers. It is connected with its port, Kerasund, and with Sivas, Erzingan and Erzerum, by carriage roads.

KARAISSAKIS, GEORGES (1782-1827), leader in the War of Greek Independence, was born at Agraphe in 1782. During the earlier stages of the war he served in the Morea, and had a somewhat discredit able share in the intrigues which divided the Greek leaders. But he showed a sense of the necessity for co-operation on the part of the government, and was a steady supporter of Capo d’Astra. His most honourable services were performed in the middle and later stages of the war. He helped to raise the first siege of Missolonghi in 1823, and did his best to save the town in the second siege in 1826. In that year he commanded the patriot forces in Rumelia, and though he failed to co-operate effectually with other chiefs, or with the foreign sympathizers fighting for the Greeks, he gained some successes against the Turks which were very welcome amid the disasters of the time. He took a share in the unsuccessful attempts to raise the siege of Athens in 1827, and made an effort to prevent the disastrous massacre of the Thessalians. On 5th May 1827, Finlay speaks of him as a capable partisan leader who had great influence over his men, and describes him as of "middle size, thin, dark-complexioned, with a bright expressive animal eye which indicated fiery blood."

KARAJICH, VUK STEFANOVICH (1787-1864), the father of modern Servian literature, was born on the 6th of November 1787 in the Servian village of Trishch, on the border between Bosnia and Servia. He first learnt to read and write in the old monastery of Tronoshë near his native village, was trained as writer and reader of letters to the commander of the insurgents of his district at the beginning of the first Servian rising against the Turks in 1804. Mostly in the position of a scribe to different voyvozdes, sometimes as school-teacher, he served his country during the first revolution (1804-1813), at the collapse of which he left Servia, but instead of following Karageorge and other voyvozdes to Russia he went to Vienna. There he was introduced to the great Servian scholar Yernej Kopitar, who, having heard him recite some Servian national ballads, encouraged him to collect the poems and popular songs, wrote a grammar of the Servian language, and, if possible, a dictionary. The practice of literary work was adhered to by Karajich, who all his life acknowledged gratefully what he owed to his learned teacher.

In the second half of the 18th and in the beginning of the 19th century all Servian literary efforts were written in a language which was not the Servian vernacular, but an artificial language, of which the foundation was the Old Slavonic in use in the churches, but somewhat Russianized, and mixed with Servian words forced into Russian forms. That language, called by its writers the "Servian-Slavonic," was neither Servian nor Slavonic. It was written in Old Cyrillic alphabet, which had no meaning in the Servian language, while there were several sounds in that language which had no corresponding signs or letters in the Old Slavonic alphabet. The Servian philosopher Dositej Obradovich (who at the end of the 18th century spent some time in London teaching Greek) was the first Servian author to proclaim the principle that the books for the Servian people ought to be written in the language of the people. But the great majority of his contemporaries were of opinion that a language of Servian literature ought to be evolved out of the dead Old Slavonic of the church books. The church naturally decidedly supported this view. Karajich was the great reformer who changed all this. Encouraged by Kopitar, he published in 1814 (2nd ed., 1815) in Vienna his first book, Mala Prostonarodna Slaveno-Serbska Pjesmarica ("A small collection of Slavonic-Servic songs of the common people "), containing a
hundred lyric songs, sung by the peasant women of Servia, and six poems about heroes, or as the Servians call them Yvanochke pesme, which are generally recited by the blind bards or by peasants. From that time Karajich's literary activity moved on two parallel lines: to give scientific justification and foundation to the adoption of the vernacular Servian as the literary language; and, by collecting and publishing national songs, folk-lore, proverbs, &c., to show the richness of the Servian people's poetical and intellectual gifts, and the wealth and beauty of the Servian language. By his reform of the Servian alphabet and orthography, his Servian grammar and his Servian dictionary, he established the fact that the Servian language contains thirty distinct sounds, for six of which the Old Slavonic alphabet had no special letters. He introduced new letters, which made it possible to write out of the Old Slavonic alphabet eighteen letters for which the Servian language had no use. This reform was strenuously opposed by the church and many conservative authors, who went so far as to induce the Servian government to prohibit the printing of books in new letters, a prohibition removed in 1859. Karajich's alphabet facilitated his reform of orthography, his principle being: write as you speak, and read as it is written. Hardly any other language in the civilized world has such a simple, logical, scientific spelling system and orthography as the Servian has in Karajich's system. His first grammatical essay was published in Vienna in 1834, Pismenida Serbskogo yeizka po gonoru prososprostara naroda ("The grammar of the Servian language as spoken by the common people"). An improved edition appeared in Vienna in 1818, together with his great work Srpski Rječnik (Lexicon Serbico-Germanico-Latinum). This dictionary—containing 26,279 words—was full of important contributions to folk-lore, as Karajich never missed an opportunity to add to the meaning of the word the description of the national customs or popular beliefs connected with it. A new edition of his dictionary, containing 46,270 words, was published at Vienna in 1852. Meanwhile he gave himself earnestly to the work of collecting the "creations of the mind of the Servian common people." He travelled through Servian countries (Servia, Bosnia, Herzegovina, Montenegro, Dalmatia, Syrmia, Croatia), and the result was shown in a largely augmented edition of his Srpske Narodne Pesme, of which the first three volumes appeared at Leipzig in 1823 and 1824, the fourth volume appearing at Vienna in 1833. Popular Stories and Enigmas was published in 1821, and Servian National Proverbs in 1836. From 1836 to 1834 he was the editor of an annual, called Davatca (The Morning Star), which he filled with important contributions concerning the ethnography and history of the Servian people. In 1838 he published a historical monograph, Milost Obrenovich, Prince of Servia; in 1837, in German, Montenegro and Montenevrigis; in 1867, The Servian Governing Council of State. He supplied Leopold Ranke with the materials for his History of the Servian Revolution. He also translated the New Testament into Servian, for the British and Foreign Bible Society (Vienna, 1847). Karajich died in Vienna on the 6th of February 1864, and his remains were transferred to Belgrade in 1867 with great solemnity and at the expense of the government of Servia.

**KARA-KALPAKS**—**KARA-KUM**

KARA-KORUM (Turkish, "black stone débris"), the name of two cities in Mongolia. One of these, according to G. Potanin, was the capital of the Uighur kingdom in the 8th century, and the other was in the 15th century a capital of the steppe monarchy of Mongolia. The same name was used by historians to have (or applied to) the Khangai range at the headwaters of the Orkhon. (1) The Uighur KARAKORUM, also named Muhablik ("bad town"), was situated on the left bank of the Orkhon, in the Talal-khan-dal-step, to the south-east of Ugei-nor. It was deserted after the fall of the Uighur kingdom, and in the 10th century Abaki, the founder of the Khitan kingdom, planted on its ruins a stone bearing a description of his victories. (2) The Mongolian KARAKORUM was founded at the birth of the Mongolian monarchy established by Jenghiz Khan. A palace for the Khan was built in 1204 by these ancestors. A temple was also constructed in 1215. Plano Carpini visited it in 1246, Rubruquis in 1253, and Marco Polo in 1275. Later, the fourth Mongolian king, Kublai, left Karakorum, in order to reside at Kai-pin-fu, near Peking. When the khan Arik-bog declared himself and Karakorum independent of Kublai-Khan, the latter besieged Karakorum, took it by famine, and probably laid it waste so thoroughly that the town was afterwards forgotten.

The exact sites of the two Mongolian capitals were only established in 1889-1891. Sir H. Yule (The Book of Marco Polo, 1871) was the first to distinguish two cities of this name. The Russian traveller Paderin (in Journ. Russ. Travelers in Central Asia, 1890) named one by the Mongols Kar Balghasun ("black city") or Khara-kherem ("black wall"), of which only the wall and a tower are in existence, while the streets and ruins outside the wall are seen at a distance of 12 m. Paderin's belief that this was the old Mongol capital has been shown to be incorrect. As to the Mongolian Karakorum, it is identified by several authorities with a site on which towards the close of the 16th century the Buddhist monastery of Erdeni Tsu was built. This monastery lies about 25 m. south by east of the Uighur capital. North and north-east of the monastery are ruins of ancient buildings. Professor D. Pozdnjév, who visited Erdeni Tsu for a second time in 1892, stated that the earthen wall surrounding the monastery might well be part of the wall of the old city. The proper position of the two Karakorums was determined by the expedition of N. Yadrintsev in 1889, and the two expeditions of the Helsingfors Ugro-Finnish society (1890) and the Russian academy of science, under Dr W. Radlov (1891), which were sent out to study Yadrintsev's discovery.

See Works (Truly) of the Orkhan Expedition (St Petersburg, 1892); Yule, The Book of Marco Polo, 1871. The first visited the Uighur capital (see Turks), named now by the Mongols Kar Balghasun ("black city") or Khara-kherem ("black wall"), of which only the wall and a tower are in existence, while the streets and ruins outside the wall are seen at a distance of 12 m. Paderin's belief that this was the old Mongol capital has been shown to be incorrect. As to the Mongolian Karakorum, it is identified by several authorities with a site on which towards the close of the 16th century the Buddhist monastery of Erdeni Tsu was built. This monastery lies about 25 m. south by east of the Uighur capital. North and north-east of the monastery are ruins of ancient buildings. Professor D. Pozdnjév, who visited Erdeni Tsu for a second time in 1892, stated that the earthen wall surrounding the monastery might well be part of the wall of the old city. The proper position of the two Karakorums was determined by the expedition of N. Yadrintsev in 1889, and the two expeditions of the Helsingfors Ugro-Finnish society (1890) and the Russian academy of science, under Dr W. Radlov (1891), which were sent out to study Yadrintsev's discovery.

**KARA-KUL, the name of two lakes** ("Great," and "Little") of Russian Turkestan, in the province of Ferghana, and on the Pamir plateau. Great Kara-kul, 12 m. long and 10 m. wide (formerly much larger), is under 36° N., to the south of the Trans-Alai range, and lies at an altitude of 13,200 ft.; it is surrounded by high mountains, and is reached from the north over the Kyzyl-art pass (14,015 ft.). A peninsula projecting from the east shore and an island near the north shore divide into two basins, a smaller eastern one which is shallow, 42 to 63 ft., and a larger western one, which has depths of 75 to 750 ft. It has no drainage outlet. Little Kara-kul lies in the north-east Pamir, or Sarikol, north-west of the Mustag-at peak (25,850 ft.), at an altitude of 12,700 ft. It varies in depth from 70 ft. in the south to 50 to 70 ft. in the middle, and 1000 ft. or more in the north. It is a moraine lake; and a stream of the same name flows through it, but is named Ghez in its farther course towards Kashgar in East Turkestan.

**KARA-KUM** ("Black Sands"), a flat desert in Russian Central Asia. It extends to nearly 110,000 sq. m., and is bounded on the N.W. by the Ust-urt plateau, between the Sea of Aral and the Caspian Sea, on the N.E. by the Amu-darya, on the S. by the Turkoman oases, and on the W. it nearly reaches the Caspian
Sea. Only part of this surface is covered with sand. There are broad expanses (takyr) of clay soil upon which water accumulates in the spring in the summer these are muddy, but later quite dry, and merely a few Solanaceae and bushes grow on them. There is also shor, similar to the above but encrustcd with salt and gypsum, and relieved only by Solanum and Salix species. (b) Beldersher is a common name of salt sand, which, according to V. Mainov, assumes five different forms. (1) Barkhans, chiefly in the east, which are mounds of loose sand, 15 to 35 ft. high, hoof-shaped, having their gently sloping convex sides turned towards the prevailing winds, and a concave side, 30° to 40° steep, on the opposite slope. They are disposed in groups or chains, and the winds drive them at an average rate of 20 ft. annually towards the south and south-east. Some grass (Stipa pennata) and bushes of skusaud (Haloxylon ammodendron) and other steppe-grasses (e.g. Calligonum, Halimodendron and Atriplex) grow on them. (2) Mounds of sand, of about the same size, but irregular in shape and of a slightly firmer consistence, mostly bearing the same bushes, and also Artemisia and Tamarix; they are chiefly met with in the east and south. (3) A sandy desert, slightly undulating, and covered in spring with grass and flowers (e.g. tulips, Rheum, various Umbelliferae), which are soon burned by the sun; they cover very large spaces in the south-east. (4) Sands disposed in waves from 50 to 70 ft., and occasionally up to 100 ft. high, at a distance of from 200 to 400 ft. from each other; they cover the central portion, and their vegetation is characteristic of the preceding division. (5) Dunes on the shores of the Caspian, composed of moving sands, 35 to 80 ft. high and devoid of vegetation.

A typical feature of the Kara-kum is the number of "old river beds," which may have been either channels of tributaries of the Amu and other rivers or depressions which contained elongated salt lakes. Water is only found in wells, 10 to 20 m. apart—sometimes as much as 100 m.—which are dug in the takyrs and give saline water, occasionally unfit to drink, and in place of rain-water retained in the long-tailed takyrs. The population of the Kara-kum, consisting of nomads Kirghiz and Turkmans, is very small. The region in the north of the province of Syr-darya, between Lake Aral and Lake Chalkarteniz, is also called Kara-kum.

KARAMAN (anc. Laranda, a name still used by the Christian inhabitants), a town in the Konia vilayet of Asia Minor, situated in the plain north of Mount Taurus. Pop. 8000. It has few industries and little trade, but the medieval walls, well preserved castle and mosques are interesting, and the old Seljuk medresse, or college, is a beautiful building. Karaman is connected with Konia by railway, having a station on the first section of the Bagdad railway. Little is known of its ancient history except that it was destroyed by Perdiccas about 322 B.C., and afterwards became a seat of Isaurian pirates. It was occupied by Frederick Barbarossa in 1190; in 1466 it was captured by Mahomed II., and in 1486 by Bayezid II.

KARAMANIA, formerly an independent inland province in the south of Asia Minor, named after Karaman, the son of an Armenian convert to Islam, who married a daughter of Ala ed-Din Kaikobad, the Seljuk sultan of Rum, and was granted Laranda in 669, and made governor of Selevke, 1223-1245. The name Karaman is, however, Turkman and that of a powerful tribe, settled apparently near Laranda. The Armenian convert must have been adopted into this. On the collapse of the Seljuk empire, Karaman's grandson, Mahmud, 1279-1319, founded a state, which included Pamphylia, Lycaonia and large parts of Cilicia, Cappadocia and Phrygia. Its capital, Laranda, superseded Konia. This state was frequently at war with the kings of Lesser Armenia, the Lusignan princes of Cyprus and the knights of Rhodes. It was also engaged in a long struggle for supremacy with the Osmanli Turks, which only ended about 1472, when it was definitely annexed by Mahomed II. The Osmanlis divided Karamania into Kharij north, and Ichili south, of the Taurus, and restored Konia to its metropolitan position. The name Karamania is now often given by geographers to Ichili only; but so far as it has had any exact significance in modern times, it has stood for the whole province of Konia. Before the present provincial division was made (1864), Karamania was the eyalet of which Konia was the capital, and it did not extend to the sea, the whole littoral from Adalia eastward being under the pasha of Adana. Nevertheless the local name "Karamania" signifies the country stretching from Adalia to Messina.

(D. G. H.)

KARAMNASA, a river of northern India, tributary to the Ganges on its right bank, forming the boundary between Bengal and the United Provinces. The name means "destroyer of religious merit," which is explained by more than one legend. To this day all high-caste Hindus have to be carried without over being defiled by the touch of its waters.

KARA MUSTAPA (d. 1683), Turkish vizier, surnamed "Meczetan," was a son of Uryt Ibrit (not Uryt, Sinan or Mechetan Mesrezan), and brother-in-law to Ahmed Kuprili, whom he succeeded as grand vizier in 1676, after having for some years held the office of Kaimakam or locum tenens. His greed and ostentation were equalled by his incapacity, and he behaved with characteristic insolence to the foreign ambassadors, from whom he extorted large bribes. After conducting a campaign in Poland which terminated unfortunately, he gave a ready response to the appeal for aid made by the Hungarians under Imre Thékoly (q.v.) when they rose against Austria, his hope being to form out of the Habsburg dominions a Musulman empire (Meczetan). He found the Turks in the West, however, to be anything but a warlike people, and the campaign was foiled in part by his own lack of military skill, but chiefly through the heroic resistance of Vienna and its timely relief by John Sobieski, king of Poland. Kara Mustapa paid for his defeat with his life; he was beheaded at Belgrade in 1683 and his head was brought to the sultan on a silver dish.

Another Kara Mustapa PASHA (d. 1643), who figures in Turkish history, was by birth a Hungarian, who was enrolled in the Janissaries, rose to be Kapudan Pasha under Murad IV., and after the capture of Bagdad was made grand vizier. He is generally considered the greatest vizier of the Ottoman Empire and represented the best type of the class. After much war, he was dismissed, restored to power, and again dismissed and put to death. The last years of his life he spent in a monastery.

KARAMZIN, NIKOLAI MIKHAILOVICH (1765-1826), Russian historian, critic, novelist and poet, was born at the village of Mikhailovka, in the government of Orenburg, and not at Simbirsk as many of his English and German biographers incorrectly state, on the 1st of December (old style) 1765. His father was an officer in the Russian army, of Tartar extraction. He was sent to Moscow with the Prince of Schuysk, his brother-in-law. He was sent to St Petersburg, where he made the acquaintance of Dmitryev, a Russian poet of some merit, and occupied himself with translating essays by foreign writers into his native language. After residing some time at St Petersburg, he went to Simbirsk, where he lived in retirement till induced to revisit Moscow. There, finding himself in the midst of the society of learned men, he again took his literary work. In 1789 he resolved to travel, and visited Germany, France, Switzerland and England. On his return he published his Letters of a Russian Traveller, which met with great success. These letters were first printed in the Moscow Journal, which he conducted, and were afterwards collected and issued in six volumes (1797-1801). In the same periodical Karamzin also published translations of some of the tales of Marmontel, and some original stories, among which may be mentioned Poor Lisa and Natalia the Boyar's Daughter. In 1794 and 1795 Karamzin abandoned his literary journal, and published a miscellany in two volumes, entitled A gla, in which appeared, among other things, "The Island of Bornholm" and "Ila Mourotmez," a story based upon the adventures of the well-known hero of many a Russian legend. In 1797-1799 he issued another miscellany or poetical almanac, The Annals, in conjunction with Derzhavin and Dmitriev. In 1798 he compiled The Pantheon, a collection of pieces from the works of the most celebrated authors ancient and modern, translated into Russian. Many of his lighter productions were subsequently printed by him in a volume entitled My Troyes. In 1802 and 1803 Karamzin
edited the journal the European Messenger. It was not until after the publication of this work that he realized where his strength lay, and commenced his History of the Russian Empire. In order to accomplish the task, he secluded himself for two years; and, on the cause of his retirement becoming known to the emperor Alexander, Karamzin was invited to Tver, where he read to the emperor the first eight volumes of his history. In 1816 he removed to St Petersburg, where he spent the happiest days of his life, enjoying the favour of Alexander, and submitting to him the sheets of his great work, which the emperor read over with him in the gardens of the palace. He died on the 22nd of May, 1826, in the Taurida palace. A monument was erected to his memory at Simbirsk in 1845.

As an historian Karamzin has deservedly a very high reputation. Till the appearance of his work little had been done in this direction in Russia. The preceding attempts of Tatishchev was merely a rough sketch, inelegant in style, and without the true spirit of criticism. Karamzin was most industrious in accumulating materials, and the notes of his conversations with the old men of the place. Much of his history is elegant and flowing, modelled rather upon the easy sentences of the French prose writers than the long periodical paragraphs of the old Slavonic school. Perhaps Karamzin may justly be censured for the false gloss and romantic air thrown over the early Russian annals, concealing the coarseness and cruelty of the native manners; in this respect he reminds us of Sir Walter Scott. It is at this that his work is best seen, it being a genuine history of Russia throughout Europe, and probably had their influence upon him. Karamzin appears openly as the panegyrist of the autocracy; indeed, his work has been styled the "Épic of Despotism." He does not hesitate to avow his admiration of Ivan the Terrible, and considers him and his grandfather Ivan III. as the builders up of Russian greatness, a glory which in his earlier writings, perhaps at that time more under the influence of Western ideas, he had assigned to Peter the Great. In the battle-pieces (e.g. the description of the field of Koulikovo, the taking of Kazan, &c.) we find considerable powers of description; and the characters of many of the chief personages in the Russian annals are drawn in firm and bold lines. Karamzin was of great service to his country; in fact he may be regarded as the founder of the review and essay (in the Western style) among the Russians.

KARA SEA, a portion of the Arctic Ocean demarcated, and except on the north-west completely enclosed, by Novaya Zemlya, Vaygach Island and the Siberian coast. It is approached from the west by the strait of Mackenzie in between the two islands of Novaya Zemlya, and Kara and Yugor to the north and south of Vaygach Island respectively. On the southeast Kara Bay penetrates deeply into the mainland, and to the west of this the short Kara river enters the sea. The sea is all shallow, the deepest parts lying off Vaygach Island and the northern part of Novaya Zemlya. It had long the reputation of being almost constantly ice-bound, but after the Norwegian captain Johannesen had demonstrated its accessibility in 1869, and Nordenskiöld had crossed it to the mouth of the Yenisei in 1875, it was considered by many to offer a possible trade route between European Russia and the north of Siberia. But the open season is in any case very short, and the western straits are sometimes icebound during the entire year.

KARASU-BAZAR, a town of Russia, in the Crimea and government of Taurida, in 45° 3' N. and 34° 26' E., 25 m. E.N.E. of Simferopol. Pop. (1897), 12,691, consisting of Tatars, Armenians, Greeks, Qaraite Jews, and about 200 so-called Krymchaki, i.e. Jews who have adopted the Tatar language and dress, and who live chiefly by making morocco leather goods, knives, embroidery and so forth. The site is low, but the town is surrounded by hills, which afford protection from the wind. With the fall of many traders, the gloomy bazaar with its multitude of tiny shops, the market squares, the blind alleys, the little gates in the dead courtyard walls, all give the place the stamp of a Tatar or Turkish town. Placed on the high road between Simferopol and Kerch, and in the midst of a country rich in corn land, vineyards and gardens, Karasu-Bazar used to be a chief seat of commercial activity in the Crimea; but it is gradually declining in importance, though still a considerable centre for the export of fruit.

The caves of Akkaya close by give evidence of early occupation of the spot. When in 1736 Khan Feta Ghirai was driven by the Russians from Bakchi-sarai he settled at Karasu-Bazar, but next year the town was captured, plundered and burned by the Russians.

KARATEGHIN, a country of Central Asia, subject to Bokhara, and consisting of a highland district bounded on the N. by Samarkand and Ferghana (Khokand), on the E. by Ferghana, on the S. by Darvaz, and on the W. by Issar and other Bokharan provinces. The plateau is traversed by the Surkhabor Vakhsh, a right-bank tributary of the Amu-clary (Oxus). On the N. border is the Issar and Zarafshan mountains, and on the S. border the Peter I. (Periokhtan) range (24,000 ft.). The area is 8000 sq. m. and the population about 60,000-five-sixths Tajiks, the rest Kara-irghiz. With the neighbouring lands Karateghin has no communication except during summer, that is, from May to September. The winter climate is extremely severe; snow begins to fall in October and it is May before it disappears. During the warmer months, however, the mountain sides are richly clothed with the foliage of maple, mountain ash, apple, pear and walnut trees; the orchards furnish, not only apples and pears, but plums, apricots, melons, figs, apricots, and peaches, and the farmers enjoy the sufficient corn to export. Both cattle and horses are of a small and hardy breed. Rough woollen cloth and mohair are woven by the natives, who also make excellent fire-arms and other weapons. Gold is found in various places and there are salt-pits in the mountains. The chief town, Harm or Garm, is a place of some 2000 inhabitants, situated on a hill on the right bank of the Surkhab.

The native princes, who claimed to be descended from Alexander the Great, were till 1868 practically independent, though their allegiance was claimed in an ineffectual way by Khokand, but eventually Bokhara took advantage of their intestine feuds to secure their real submission in 1877.

KARAUFI, or Kerowlee, a native state of India, in the Burputana agency. Area, 1242 sq. m.; pop. (1901), 156,786; estimated revenue about £3,300,000. Almost the entire territory is composed of hills and broken ground, but there are no lofty peaks, the highest having an elevation of less than 1400 ft. above sea-level. The Chambal river flows along the south-east boundary of the state. Iron ore and building stone comprise the mineral resources. The prevailing agricultural products are millets, which form the staple food of the people. The only manufactures consists of a little weaving, dyeing, wood-turning and stone-cutting. The principal imports are piece goods, salt, sugar, cotton, buffaloes and bullocks; the exports rice and goats. The feudal aristocracy of the state consists of Jadu Rajputas connected with the ruling house. They pay a tribute in lieu of constant military service, but in case of emergency or on occasions of state display they are bound to attend on the chief with their retainers. The mahara is the head of the clan, which claims descent from Krishna. Mahara Bhanwar Pal Deo, who was born in 1862 and succeeded in 1866, was appointed C.C.I.E. in 1897, on the occasion of Queen Victoria's diamond jubilee.

The town of Karauli had a population in 1901 of 23,482. It dates from 1348, and is well situated in a position naturally defended by ravines on the north and east, while it is further protected by a great wall. The palace of the maharaja is a handsome block of buildings dating from the middle of the 18th century.

KAREN, one of the chief hill races of Burma. The Karens inhabit the central Pegu Yoma range, forming the watershed between the Sittang and Irrawaddy rivers, the Paunguanga range between the Sittang and the Salween, and the eastern slopes of the Arakan Yoma mountains to the west of the Irrawaddy delta. They are supposed to be the descendants of Chinese tribes driven southwards by the pressure of the Shan races, before they were again made to retire into the hills by the expansion of the Môn power. Their own traditions ascribe their original home to the west of the sandy desert of Gobi stretching between China and Tibet. According to the census of 1901 they numbered in all 777,233 persons within British India, divided into the Sgaw, 86,434, the Pwo, 174,070, and the Bghai, 4936.
KAREN-NI—KARLI

while 457,355 are returned as “unspecified.” The Sgaw and Pwo are collectively known as the “White Karens,” and chiefly inhabit British territory. They take their name from the colour of their clothes. The Bghai, or “Red Karens,” who are supposed by some to be an entirely distinct race, chiefly inhabit the independent hill state of Karen-ni (q.v.). The Karen is of a squarer build than the Burman, his skin is fairer, and he has more of the Mongolian obliquity of the eyes. In character also the people differ from the Burmese. They are singularly devoid of honesty, and as a rule are just as bold and cautious, and lack altogether the light gaiety and fascination of the Burmese. They are noted for truthfulness and chastity, but are dirty and addicted to drink. The White Karens furnish perhaps the most notable instance of conversion to Christianity of any native race in the British empire. Prepared by prophecies current among them, and by curious traditions of a biblical flavour, in addition to their antagonism to the dominant Burmese, they embraced with fervour the new creed brought to them by the missionaries, so that out of the 147,525 Christians in Burma according to the census of 1901, upward of a hundred thousand were Karens. The Red Karens differ considerably from the White Karens. They are the wildest and most lawless of the so-called Karen tribes. Every male belonging to the clan used to have the rising sun tattooed in bright vermilion on his back. The men are small and wizened, but athletic, and have broad reddish-brown faces. Their dress consists of a short pair of breeches, usually of a reddish colour, with black and white stripes interwoven perpendicularly or like a tartan, and a handkerchief is tied round the head. The Karen language is tonal, and belongs to the Siamese-Chinese branch of the Indo-Chinese family.

See D. M. Smeaton, The Local Kares of Burma (1887); J. Nibet, Burma under British Rule (1901); M. and B. Ferrars, Burma (1900); and O’Connor Scott, The Silken East (1904). (J. G. Sc.)

KAREN-NI, the country of the Red Karens, a collection of small states, formerly independent, but now feudatory to Burma. It is situated approximately between 18° 50’ and 19° 55’ N. and between 97° 10’ and 97° 50’ E. The tract is bounded on the N. by the Shan states of Móng Pài, Hsautung and Mawkmai; on the E. by Siam; on the S. by the Papun district of Lower Burma; and on the W. a stretch of mountainous country, inhabited by the Bre, and various other small tribes, formerly Karens. The country is divided into two parts, the northern, belonging to the British, and the southern, belonging to the French.

KARLI, a French settlement in India, situated on the south-east coast, within the limits of Tanjore district, with an area of 53 sq. m., and a population (1901) of 56,955. The site was promised to the French by the Tanjore raja in 1738, in return for services rendered, but was only obtained by them by treaty signed at Madras in 1793. It became a British possession in 1765, again taken in 1768, and finally restored in 1817. The town is neatly built on one of the mouths of the Cauvery, and carries on a brisk trade with Ceylon, exporting rice and importing chiefly European articles and timber. A chef de l’administration, subordinate to the government at Pondicherry, is in charge of the settlement, and there is a tribunal of first instance.

KARLI, a village of British India, in the Poona district of the Bombay presidency, famous for its rock caves. Pop. (1901), 903. The great cave of Karli is said by Ferguson to be without exception the largest and finest chaitiya cave in India; it was...
excavated at a time when the style was in its greatest purity, and is splendidly preserved. The great chai ly hall is 126 ft. long, 45 ft. 7 in. wide, and about 46 ft. high. A row of ornamental columns rises on either side to the ribbed teak roof, and at the far end of the nave is a massive dagoba. Dating from the beginning of the Christian era or earlier, this cave has a wooden roof, which repeats the pattern of the walls, and which Fergusson considers to be part of the original design. Since wood rapidly deteriorates in India owing to the climate and the ravages of white ants, the refinement of this roof is preserved by brick. 

Karlsruhe, or Karlsruhe (Hungarian, Karloécsa; Croatian, Karlovci), a city of Croatia-Slavonia, in the county of Syrmia; on the right bank of the Danube, and on the railway from Peterwardein, 6 m. N.W. to Belgrade. Pop. (1900), 5043. Karlsruhe is the seat of an Orthodox metropolitan, and has several churches and schools, and a hospital. The fruit-farms and vineyards of the Fruška Gora, a range of hills to the south, yield excellent plum brandy and red wine. An obelisk at Slankamen, 13 m. E. by S., commemorates the defeat of the Turks by Louis of Baden, in 1691. The treaty of Karlsruhe, between Austria, Turkey, Poland and Venice, was concluded in 1699; while 1848-1849 the city was the headquarters of Servian opposition to Hungary. It was included, until 1881, in the Military Frontier.

Karlskrona [Karlskrona], a seaport of Sweden, on the Baltic coast, chief town of the district (län) of Blekinge, and headquarters of the Swedish navy. Pop. (1900), 23,925. It is pleasantly situated upon islands and the mainland, 200 m. S.S.W. of Stockholm by rail. The harbour is capacious and secure, with a sufficient depth of water for the largest vessels. It has three entrances; the principal, and the only one practicable for large vessels, is to the south of the town, and is defended by two strong forts, at Drottningärden on the island of Aspö, and on the islet of Kungsholm. The dry docks, of great extent, are cut out of the solid granite. There is slip-accommodation for large vessels. Karlskrona is the seat of the Royal Naval Society, and has a navy-arsenal and hospital, and naval and other schools. Charles XI, the founder of the town as naval headquarters (1680), is commemorated by a bronze statue (1807). There are factories for naval equipments, galvanized metal goods, felt hats, canvas, leather and rice, and breweries and granite quarries. Exports are granite and timber; imports, coal, flour, provisions, hides, and iron sheets.

Karlsruhe, or Karlsruhe, a city of Germany, capital of the grand-duchy of Baden; 33 m. S.W. of Heidelberg, on the railway Frankfurt-on-Main-Basel, and 39 m. N.W. of Stuttgart. Pop. (1895), 84,030; (1905), 111,200. It stands on an elevated plain, 5 m. E. of the Rhine and on the fringe of the Hardwald forest. Karlsruhe takes its name from Karl Wilhelm, margrave of Baden, who, owing to disputes with the citizens of Durlach, erected here in 1715 a hunting seat, around which the town has been built. The city is surrounded by beautiful parks and gardens. The palace (Schloss), built in 1731-1776 on the site of the previous erection of 1715, is a plain building in the old French style, composed of a centre and two wings, presenting nothing remarkable except the octagon tower (Bielturn), from the summit of which a splendid view of the city and surrounding country is obtained, and the marble saloon, in which the meridian of Cassini was fixed or drawn. In front of the palace is the Great Circle, a semicircular line of buildings, containing the government offices. From the palace the principal streets, fourteen in number, radiate in the form of an expanded fan, in a S.E., S. and S.W. direction, and are again intersected by parallel streets. This fan-like plan of the older city has, however, been abandoned in the more modern extensions. Karlsruhe has several fine public squares, the principal of which are the Schloßplatz, with Schwanthaler's statue of the grand duke Karl Friedrich in the centre, and market square (Markt-platz), with a fountain and a statue of Louis, grand duke of Baden. In the centre of the Rondelplaz is an obelisk in honour of the grand duke Karl Wilhelm. The finest street is the Kaiserstrasse, running from east to west and having a length of a mile and a half, and a uniform breadth of 72 ft. In it are several of the chief public buildings, notably the technical high school, the arsenal and the post office. Among other notable buildings are the town hall; the theatre; the hall of representatives; the mint; the joint museum of the grand-ducal and national collections (natural history, archaeology, ethnology, art and a library of over 150,000 volumes); the palace of the heir-apparent, a late Renaissance building of 1891-1896; the imperial bank (1893); the national industrial hall, with an exhibition of machinery; the new law courts; and the hall of fine arts, which shelter a good picture gallery. The city has six Evangelical and four Roman Catholic Churches. The most noteworthy of these are the Evangelical town church, the burial-place of the margraves of Baden; the Christuskirche, and the Bernharduskirche. Karlsruhe possesses further the Zähringen museum of curiosities, which is in the left wing of the Schloss; an architectural school (1891); industrial art school and museum; cadet school (1892); botanical and electro-technical institutes; and horticultural and agricultural schools. Of its recent public monuments may be mentioned one to Joseph Victor von Scheffel (1826-1886); a bronze equestrian statue of the emperor William I. (1890); and a memorial of the 1870-71 war. Karlsruhe is the headquarters of the XIV. German army corps. Since 1870 the industry of the city has grown rapidly, as well as the city itself. There are large railway workshops; and the principal branches of industry are the making of locomotives, carriages, tools and machinery, jewelry, furniture, gloves, cement, carpets, perfumery, tobacco and beer. There is an important arms factory. Maxau, on the Rhine, serves as the river port of Karlsruhe and is connected with it by a canal finished in 1901.

See Fecht, Geschichte der Haupt- und Residenzstadt Karlsruhe (Karlsruhe, 1887); E. von Woyth, Karlsruhe, Geschichte der Stadt und ihrer Verwaltung (Karlsruhe, 1893-1902); Naether, Die Umgebung der Residenz Karlsruhe (Karlsruhe, 1888); and the annual Chronik der Haupt- und Residenzstadt Karlsruhe.

Karlskrona [Karlskrona], a town of Sweden, the capital of the district (län) of Blekinge, on the island of Tingvalla under the northern shore of Lake Vener, 205 m. W. of Stockholm by the Christina railway. Pop. (1900), 11,869. The fine Klar River here enters the lake, descending from the mountains of the frontier. To the north-west lies the Fryksdalen or valley of the Nors River, containing three beautiful lakes and fancifully named the Svea-Switzerland. In Finland and other parts of the district there are numerous iron-works. Karlskrona was founded in 1584. It is the seat of a bishop and has a cathedral. Trade is carried on by way of the lake and the Gota canal. There are mechanical works, match factories and stockinet factories, and a mineral spring rich in iron, the water of which is bottled for export. Under the constitution of united Sweden and Norway, in the event of the necessity of electing a Regent and the disagreement of the parliaments of the two countries, Karlskrona was indicated as the meeting-place of a delegation for the purpose.

Here, on the 31st of August 1905 the conference met to decide upon the severance of the union between Sweden and Norway, the delegates concluding their work on the 23rd of September.

Karlskrona or Karlshagen (Hungarian, Karlovszor; Croatian, Karlovci), a royal free city, municipality and garrison town in the county of Agram, Croatia-Slavonia; standing on hilly ground beside the river Kulpa, which here receives the Korana and the Dobra. Pop. (1900), 7306. Karlshagen is on the railway from Agram to Fiume. It consists of the fortress, now obsolete, the inner town and the suburbs. Besides the Roman Catholic and Orthodox churches, its chief buildings are the Franciscan monastery, law courts and several large schools, including one for military cadets. Karlshagen has a considerable transit trade in grain, wine, spirits and bony, and manufactures the liqueur called rosoglio.

Karma, sometimes written Karmen, a Sanskrit noun (from the root kṛ, to do), meaning deed or action. In addition to this simple meaning it has also, both in the philosophical and the colloquial speech of India a technical meaning, denoting "a person's deeds as determining his future lot." This is not merely in the vague sense that on the whole good will be rewarded
and evil punished, but that every single act must work out to the uttermost its inevitable consequences, and receive its retribution, however many ages the process may require. Every part of the material universe—man, woman, insect, tree, stone, or whatever it be—is the dwelling of an eternal spirit that is working out its destiny, and while receiving reward and punishment for the past is laying up reward and punishment for the future. This he had to prove. The soul, an enduement and an inseparable reaping is accepted by learned and unlearned alike as accounting for those inequalities in human life which might otherwise lead men to doubt the justice of God. Every act of every person has not only a moral value producing merit or demerit, but also an inherent power which works out its fitting reward or punishment. To the Hindu this does not make heaven and hell unnecessary. These two exist in many forms more or less grotesque, and after death the soul passes to one of them and there receives its due; but that existence too is marked by desire and action, and is therefore productive of merit or demerit, and as the soul is thus still entangled in the meshes of karma it must again assume an earthly garb and continue the strife. Salvation is to the Hindu simply deliverance from the power of karma, and each of the philosophic systems has its own method of obtaining it. The last book of the Laws of Manu deals with karmaphalam, “the fruit of karma,” and gives many curious details of the way in which sin is punished and merit rewarded. The origin of the doctrine cannot be traced with certainty, but there is little doubt that it is post-vedic, and that it was readily accepted by Buddha in the 6th century B.C. As he did not mean to justify the existence of soul or to modify the doctrine (see Buddhism).

KARMAK, JÓZSEF (1769-1795), Hungarian author, was born at Losoncz on the 14th of March 1769, the son of a Calvinist pastor. He was educated at Losoncz and Pest, whence he migrated to Vienna. There he made the acquaintance of the beautiful and eccentric Countess Markovics, who was for a time his mistress, but she was not, as has often been supposed, the heroine of his famous novel Fanny Hagymosnai (Fanny’s testament). Subsequently he settled in Pest as a lawyer. His sensibility, social charm, liberal ideas (he was one of the earliest of the Magyar freemasons) and personal beauty, opened the doors of the best houses to him. He was generally known as the Pest Alcibiades, and was especially at home in the salons of the Protestant magnates. In 1792, together with Count Ráday, he founded the first theatrical society at Buda. He maintained that Pest, not Pressburg, should be the literary centre of Hungary, and in 1794 founded the first Hungarian quarterly, Urania, but it met with little support and ceased to exist in 1795, after three volumes had appeared. Karmán, who had long been suffering from an incurable disease, died in the same year. The best known of his works is the sentimental novel, Fanny Hagymosnai, much in the style of La nouvelle Héloïse and Wtther, the most exquisite product of Hungarian prose in the 18th century and one of the finest psychological romances in the literature. Karmán also wrote two satires and fragments of an historical novel, while his literary programme is set forth in his dissertation Amnemit csinosodása. Karmán’s collected works were published in Ábrahám Nemzeti Könyvki (Pest, 1878), &c., preceded by a life of Karmán. See F. Barath, Joseph Karmán (Hung. Vá. Ojs, 1874). Zsaodi’s biography on Karmán in Közop Irodalomtörténeti (Budapest, 1894).

KARNAK, a village in Upper Egypt (pop. 1907, 12,585), which has given its name to the northern half of the ruins of Thebes on the east bank of the Nile, the southern being known as Luxor (q.v.). The Karnak ruins comprise three great enclosures built of crude brick. The northermost and smallest of these contained a temple of the god Mont, built by Amenophis III., and restored by Rameses II. and the Ptolemies. Except a well-preserved gateway dating from the reign of Ptolemy Euergetes I., little more than the plan of the foundations is traceable. Its axis, the line of which is continued behind the enclosure wall by an avenue of sphinxes, pointed down-stream (N.E.). The southern enclosure contained a temple of the goddess Mut, also built by Amenophis III., and almost as ruinous as the last, but on a much larger scale. At the back is the sacred lake in the shape of a horse-shoe. The axis of the temple runs approximately northward, and is continued by a great avenue of palks to the southern pylons of the central enclosure. This last is of vast dimensions, forming approximately a square of 1500 ft., and it contains the greatest of all known temples, the Karnak temple of Amenophis III. (see below). Inside and outside each of these enclosures there were a number of subsidiary temples and shrines, mostly erected by individual kings to special deities. The triad of Thebes was formed by Ammon, his wife Mut and their son Khons. The large temple of Khons is in the enclosure of the Ammon temple, and the temple of Mut, as already stated, is connected with the latter by the avenue of palks. The Mont temple, on the other hand, is isolated from the others and turned away from them; it is smaller than that of Khons. Mont, however, may perhaps be considered as a special god of Thebes; he certainly was a great god from very ancient times in the immediate neighbourhood, his seat being about 4 m. N.E. at Medamot, the ancient Madu, and about 10 m. S.W. on the west bank at Hermomis. It is probable that a temple of Ammon existed at Karnak under the Old Kingdom, if not in the prehistoric age; but it was unimportant, and no trace of it has been discovered. Slight remains of a considerable temple of the Middle Kingdom survive behind the shrine of the great temple, and numbers of fine statues of the twelfth and later dynasties have been found; two of the obelisks placed in the later seventh pylon, while a large number were buried in a great pit, in the area behind that pylon, which has yielded an enormous number of valuable and interesting monuments reaching to the age of the Ptolemies. The axis of the early temple lay from E. to W., and was followed by the main line of the later growth; but at the beginning of the eighteenth dynasty, Amenophis I. built a temple south of the west front of the old one, and at right angles to it, and thus started a new axis which was later developed in the series of pylons VII.-X., and the avenue to the temple of Mut. The VIIIth pylon in particular was built by Hatshepsut, probably as an approach to her temple of Amenophis, but eventually Tethmosis III. cleared the latter away entirely. Thebes was then the royal residence, and Ammon of Karnak was the great god of the state. Tethmosis I. built a court round the temple of the Middle Kingdom, entered through a pylon (No. V.), and later added the pylon No. IV., with obelisks in front of it. Hatshepsut placed two splendid obelisks between the Pylons IV. and V., and built a shrine in the court of Tethmosis I., in front of the old temple. Tethmosis III., greatest of the Pharaohs, remodelled the buildings about the obelisks of his united sister with the deliberate purpose of hiding the pylon with them, and largely reconstructed the surroundings of the court. At a later date, after his wars were over, he altered Hatshepsut’s sanctuary, engraving on the walls about it a record of his campaigns; to this time also is to be attributed the erection of a great festival hall at the back of the temple. The small innermost pylon (No. VI.) is likewise the work of Tethmosis III. Amenophis III., though so great a builder at Thebes, seems to have contented himself with erecting a great pylon (No. III.) at the west end. The closely crowded succession of broad pylons here suggests a want of space for westward expansion, and this is perhaps explained by a trace of a quarry found by Lefrain in 1905 near the southern line of pylons; a branch of the Nile or a large canal may have limited the growth. As has been stated, Tethmosis III. continued on the southern axis; he destroyed the temple of Amenophis I. and erected a larger pylon (No. VII.) to the north of Hatshepsut’s No. VIII. To these Haremheb added two great pylons and the long avenue of ram-figures, changing the axis slightly so as to lead direct to the temple of Mut built by Amenophis III. All of these southern pylons are well spaced. In the angle between these pylons and the main temple was the great rectangular sacred lake. By this time the temple of Karnak had attained to little more than half of its ultimate length from east to west.
With the XIXth Dynasty there is a notable change perhaps due to the filling of the hypothetical canal. No more was added on the southern line of building, but westward Rameses I erected pylon No. II. at an ample distance from that of Amenophis III., and Seti I. and Rameses II. utilized the space between for their immense Hall of Columns, one of the most celebrated achievements of Egyptian architecture. The materials of which the pylon is composed bear witness to a temple having stood near by of the later and unacknowledged kings of the XVIIth Dynasty. Haremheb's pylon No. IX. was likewise constructed out of the ruins of a temple dedicated by Amenemhat III. to Amenophis III. and Harmakis. Rameses III. built a fine temple, still well preserved, to Ammon at right angles to the axis westward of pylon No. II.; Sheshonk I. (Dynasty XXII.) commenced a great colonnaded court in front of the pylon, enclosing part of this temple and a smaller triple shrine built by Seti II. In the centre of the court Tirhaka (Tirhathu, Dynasty XXV.) set up huge columns 64 ft. high, rivaling those of the central aisle in the Hall of Columns, for some building now destroyed. A vast unfinished pylon at the west end (No. I.), 370 ft. wide and 142 ft. high, is of later date than that of the court, and is usually attributed to the Persian period. It will be observed that the successive pylons diminish in size from the outside inwards. Portions of the solid crude-brick scaffolding are still seen banked against this pylon. About 100 metres west of it is a stone quay, on the platform of which stood a pair of obelisks of Seti II.; numerous graffiti recording the height of the Nile from the XXIst to the XXVIth Dynasties are engraved on the quay.

Besides the kings named above, numbers of others contributed in greater or less measure to the building or decoration of the colossal temple. Alexander the Great restored a chamber in the festival hall of Tethmosis III., and Ptoleny; Soter built the central shrine of granite in the name of Philipp Arribadeus. The walls throughout, as usually in Egyptian temples, are covered with scenes and inscriptions, many of these, such as those which record the annals of Tethmosis III., the campaign of Seti I. in Syria, the exploit of Rameses II. at the battle of Kadesh and his treaty with the Hittites, and the dedication of Sheshonk's victories to Ammon, are of great historical importance. Several large steiae with interesting inscriptions have been found in the ruins, and statues of many ages of workmanship. In December 1903 M. Legrain, who had seen the court on several visits to the temple area systematically, first tapped an immense deposit of colossal statues, steiae and other objects large and small in the space between pylon No. VII. and the great hypostyle hall. After three seasons' work, much of it in deep water, 750 large monuments have been extracted, while the small figures, &c., in bronze and other materials amount to nearly 20,000. The value of the find, both from the artistic and historical standpoint, is immense. The purpose of the deposit is still in doubt; many of the objects are of the finest materials and finest workmanship, and in perfect preservation; even precious metals are not absent. Multitudes of objects in wood, ivory, &c., have decayed beyond recovery. That all were waste pieces seems incredible. They are found lying in the uttermost confusion; in date they range from the XIXth Dynasty to the Ptolemaic period.

The inundation annually reaches the floor of the temple, and the saltpetre produced from the organic matter of the ruins, annually melting and crystallizing, has disintegrated the soft sandstone in the lower courses of the walls and the lower drums and bases of the columns. There is moreover no solid foundation in any part of the temple. Slight falls of masonry have taken place from time to time, and the accumulation of rubbish was the only thing that prevented a great disaster. Repairs, often on a large scale, have therefore gone on side by side with the clearance, especially since the fall of many columns in the great hall in 1899. All the columns which fell in that year were re-erected by 1908.

The temple of Khons, in the S.W. corner of the great enclosure, is approached by an avenue of rams, and entered through a fine pylon erected by Euegeses I. It was built by Rameses III., and his successors in the XXth Dynasty with Hrhib of Dynasty XXI. Excavations in the remains of the S.E. corner, however, have revealed flint weapons and other sepulchral remains of the earliest periods, proving that the history of Thebes goes back to a remote antiquity.

KAROLYI, K., a town and district of British India, in the Delhi division of the Punjab. The town is 7 m. from the right bank of the Jumna, with a railway station 76 m. N. of Delhi. Pop. (1901), 23,559. There are manufactures of cotton cloth and boots, besides considerable local trade and an annual horse fair.

The District of KAROLYI stretches along the right bank of the Jumna, north of Delhi. It is entirely an alluvial plain, but is crossed by the low uplift of the watershed between the towns of Panipat and Delhi, which is 1553 sq. m.; pop. (1901), 853,225, showing an increase of nearly 3½% in the decade. The principal crops are millets, wheat, pulse, rice, cotton and sugar-cane. There are several factories for ginning and pressing cotton. The district is traversed by the Delhi-Umballa-Kalka railway, and also by the Western Jumna canal. It suffered from famine in 1896-97, and again to some extent in 1899-1900.

No district of India can boast of a more ancient history than Karolyi, as almost every town or stream is connected with the legends of the Mahabharata. The town of Karnal itself is said to have been founded by Raja Karn, the mythical champion of the Kauravas in the great war which forms the theme of the national epic. Panipat, in the south of the district, is said to have been one of the pledges demanded from Duryodhana by Yudishtira as the price of peace in that famous conflict. In historical times the plains of Panipat have three times proved the theatre of battles which decided the fate of Upper India. It was here that Ibrahim Lodí and his vast host were defeated in 1526 by the veteran army of Baber; in 1556 Akbar reasserted the claims of his family on the same battlefield against the Hindu general of the house of Adil Shah, which had driven the heirs on the oncoming and the throne of Bengal; and at Panipat too, on the 7th of January 1761, the Mahabharata war was renewed by Ahmad Shah Durani. During the troubles period which then ensued the Sikhs managed to introduce themselves, and in 1707 one of their chieftains, Desu Singh, appropriated the fort of Kaithal, which had been built during the reign of Akbar. His descendants, the bhais of Kaithal, were reckoned amongst the most important Gis-Sutlej princes. Different portions of this district have lapsed from time to time into the hands of the British.

KÁROLYI, Álós, Count (1825-1889), Austro-Hungarian diplomatist, was born in Vienna on the 8th of August 1825, the great-grandson of the Hungarian family of Károlyi dates from the time of Alexander Károlyi (1668-1743), one of the generals of Francis Rákóczi II., who in 1711 negotiated the peace of Szatmár between the insurgent Hungarians and the new king, the emperor Charles VI., was made a count of the Empire in 1712, and subsequently became a field marshal in the imperial army. Álós Károlyi entered the Austrian diplomatic service, and was attached successively to embassies at various European capitals. In 1850 he was sent to St. Petersburg on a special mission concerning the support of Russia against Napoleon III. He was ambassador at Berlin in 1866 at the time of the rupture between Prussia and Austria, and after the Seven Weeks' War was charged with the negotiation of the preliminaries of peace at Nikolsburg. He was again sent to Berlin in 1871, acted as second plenipotentiary at the Berlin congress of 1878, and was sent in the same year to London, where he represented Austria for ten years. He died on the 2nd of December 1889 at Tòttymegyék.
KAROSS, a cloak made of sheepskin, or the hide of other animals, with the hair left on. It is properly confined to the coat of skin without sleeves worn by the Hottentots and Bushmen of South Africa. These karosses are now often replaced by a blanket. Their chiefs wore karosses of the skin of the wild cat, leopard or caracal. The word is also loosely applied to the cloaks of leopard-skin worn by the chiefs and principal men of the Kaffir tribes. Kaross is probably either a genuine Hottentot word, or else an adaptation of the Dutch kuras (Portuguese cura), a cuirass. In a vocabulary dated 1673 karos is described as belonging to the Dutch.

KARRER, FELIX (1825-1903), Austrian geologist, was born in Vienna on the 11th of March 1825. He was educated in Vienna, and served for a time in the war department, but he retired from the public service at the age of thirty-two, and devoted himself to science. He made especial studies of the Tertiary formations and fossils of the Vienna Basin, and investigated the geological relations of the thermal and other springs in that region. He became an authority on the foraminifera, on which subject he published numerous papers. He wrote also a little book entitled Der Boden der Hauptstädte Europas (1881). He died in Vienna on the 19th of April 1903.

KARROO, two extensive plateaus in the Cape province, South Africa, known respectively as the Great and Little Karroo. Karroo is a corruption of Karava, a Hottentot word meaning dry, barren, and its use as a place-name indicates the character of the plateau so designated. They form the two intermediate "steps" between the coast-lands and the inner plateau which constitutes the largest part of South Africa. The Little (also called Southern) Karroo is the table-land nearest the southern coast-line of the Cape, and is bounded north by the Zwaarteburg, which separates it from the Great Karroo. From west to east the Little Karroo has a length of some 200 m., whilst its average width is 30 m. West of the Zwaarteburg the Little Karroo merges into the Great Karroo. Eastward it is limited by the hills which almost reach the sea in the direction of St Francis and Algoa Bays. The Great Karroo is of much larger extent. Bounded south, as stated, by the Zwaarteburg, further east by the Eerzuurb (of the coast chain), its northern limit is the mountain range which, under various names, such as Nieuwveld and Sneeuwberg, forms the wall of the inner plateau. To the south-west and west it is bounded by the Hex River Moun-

KARS, a province of Russian Transcaucasia, having the governments of Kutaia and Tiflis on the N., those of Tiflis and Erivan on the E., and Asiatic Turkey on the S. and W. Its area amounts to 7410 sq. m. It is a mountainous, or rather a highland, country, being in reality a plateau, with ranges of mountains running across it. The northern border is formed by the Arzyn range, a branch of the Jafari Mts., which attains altitudes of over 9000 ft. In the south the Kura-dagh reaches 10,400 ft. in Mount Agha-khur, and the Aragvi-dagh 10,510 ft. in Mount Ashkh; and in the middle Allah-akhbar rises to 10,215 ft. In October it is very difficult to cross the province from north to south, the Kyasr-dagh and flows across it westwards, then eastwards and north-eastwards, quitting it in the north-east. The winters are very severe. The towns of Kaghyschman (4620 ft.) and Sarykamish (7500 ft.) have a winter temperature like that of Finland, and at the latter place, with an annual mean (35°F) equal to that of Hammerfest in the extreme north of Norway, the thermometer goes down in winter to 40° below zero and rises in summer to 90°. The annual mean temperature at Kars is 40°-5° and at Aradhan, farther north, 37°. The Alpine meadows (yulnas) reach up to 1000 ft. and afford excellent pasturage in spring and summer. The province is almost everywhere covered with fir, and above 5000 ft. forms the inner plate land of the continent. (See CAPE COLONY.)

KARS, a province of Russian Transcaucasia, having the governments of Kutaia and Tiflis on the N., those of Tiflis and Erivan on the E., and Asiatic Turkey on the S. and W. Its area amounts to 7410 sq. m. It is a mountainous, or rather a highland, country, being in reality a plateau, with ranges of mountains running across it. The province is almost everywhere covered with fir, and above 5000 ft. forms the inner plate land of the continent. (See CAPE COLONY.)
KURDS invaded the Alpine pasturages above the valley of the Aras; and after them Khabardinians, Circassians, Osettes and Kara-papaks successively found a refuge in this highland region. After the Russo-Turkish War of 1877-78, when this region was transferred to Russia by the treaty of Berlin, some 8,750 Turks emigrated to Asia Minor, their places being taken by nearly 22,000 Armenians, Greeks and Russians. At the census of 1897 the population consisted principally of Armenians (73,400), Kurds (43,000), Greeks (32,600), Kara-papaks (30,000), Russians, Turks and Persians. The capital is Kars. The province is divided into four districts, the chief towns of which are Kars (q.v.), Ardashan (pop. 800 in 1897), Kaghyshtaman (3435) and Olyt. (J. T. BR.)

KARS, a fortified town of Russian Transcaucasia, in the province of Kars, formerly at the head of a sanjak in the Turkish vilayet of Erzerum. It is situated in 40° 37' N. and 43° 6' E., 185 m. by rail S.W. of Tiilis, on a dark basil spur of the Soghanlidak, above the deep ravine of the Kars-chai, a sub-tributary of the Aras. Pop. (1897), 8672; (1897), 20,891. There are three considerable suburbs—Orta-kapi the S., Batram Pasha to the E. and Timuran to the W. At the N.W. corner of the town, overhanging the river, is the ancient citadel, in earlier times a strong military post, but completely commanded by the surrounding eminences. The place is, however, still defended by a fort and batteries. There is a 10th century cathedral, Kars being the see of a bishop of the Orthodox Greek Church. Coarse woollens, carpets and felt are manufactured.

During the 9th and 10th centuries the seat of an independent Armenian principality, Kars was captured and destroyed by the Seljuk Turks in the 12th century, by the Mongols in the 13th, and by Timur (Tamerlane) in 1387. The citadel, it would appear, was built by Sultan Murad III. during the war with Persia, at the close of the 16th century. It was strong enough to withstand a siege by Nadir Shah of Persia, in 1732, and in 1807 it successfully resisted the Russians. After a brave defence it surrendered on the 23rd of June 1828 to the Russian general Count I. F. Paskevich, 11,000 men becoming prisoners of war. During the Crimean War the Turkish garrison, guided by General Williams (Sir W. Fenwick Williams of Kars) and other foreign officers, kept the Russians at bay during a protracted siege; but after the battle of Inkerman, by which time the food had utterly failed, nothing was left but to capitulate (Nov. 1855). The fortress was again stormed by the Russians in the war of 1877-78, and on its conclusion was transferred to Russia.

Lake, "Kars and Our Captivity in Russia" (London, 1890); and "Memoire de la Conférence de Kars" (London, 1857); Dr. Sandwith, Narrative of the Siege of Kars (London, 1856); C. B. Norman, Armenia and the Campaign of 1877 (London, 1878); Greene, Russian Army and its Campaigns in Turkey (1879).

KARSHI, a town of Bokhara, in Central Asia, situated 96 m. S.E. of the city of Bokhara, in a plain at the junction of two main confinutes of the Kasiske-darya. It is a large and straggling place, with a citadel, and the population amounts to 25,000. There are three colleges, and the Biki mosque is a fine building inlaid with blue and white tiles. Along the river stretches a fine promenade sheltered by poplars. Poppies and tobacco are largely grown, the tobacco being deemed the best in Central Asia. There is a considerable trade in grain; but the commercial prosperity of Karshi is mainly due to its being a meeting-point for the roads from Samarkand, Bokhara, Hissar, Balkh and Maimana, and as the market where the Turkomans and Uzbegs dispose of their carpets, knives and fire- arms. Its copper-smiths are famous for their fine work. Karshi was a favourite residence of Timur (Tamerlane).

KARST, in physical geography, the region east of the northern part of the Adriatic. It is composed of high and dry limestone ridges. The country is excessively faulted by a long series of parallel fractures that border the N.E. Adriatic and continue inland that series of steps which descend beneath the sea and produce the series of long parallel islands off the coast of Triest and along the Dalmatian shore. It has been shown by E. Suess (Antlitz der Erde, vol. i. pt. 2, ch. iii.) that the N. Adriatic is a sunken dish that has descended along these fractures and folds, which are not uncommonly the scene of earthquakes, showing that these movements are still in progress. The crust is very much broken in consequence and the water sinks readily through the broken limestone rocks, which owing to their nature are also very absorbent. The result is that the scenery is barren and desolate, and as this structure always, wherever found, gives rise to similar features, a large part of this character is a general cause and effect. The water running in underground channels dissolves and denudes away the underlying rock, producing great caves as at Adelsberg, and breaking the surface with sinks, potholes and unroofed chasms. The barren nature of a purely limestone country is seen in the treeless regions of some parts of Derbyshire, while the underground streams and sinks of parts of Yorkshire, and the unroofed gorge formed by the Cheddar cliffs, give some indication of the action that in the high fractured mountains of the Karst produces a depressing landscape which has some of the features of the “bad lands” of the United States.

KARSTEN, KARL JOHANN BERNHARD (1782-1853), German mineralogist, was born at Bützow in Mecklenburg, on the 26th of November 1782. He was author of several comprehensive works, including Handbuch der Eisenhüttenkunde (2 vols., 1816; 3rd ed., 1841); System der Metallurgie geschichtlich, statistisch, theoretisch und technisch (5 vols. with atlas, 1831-1843); Lehrbuch der Salinenkunde (2 vols., 1840-1847). He was well known as editor of the Archiv für Bergbau und Hüttenwesen (20 vols., 1818-1834); and (with H. von Dechen) of the Archiv für Mineralogie, Geognosie, Bergbau und Hüttenwesen (16 vols., 1820-1854). He died at Berlin on the 22nd of August 1853. His son, Dr. Hermann Karsten (1809-1877), was professor of mathematics and physics in the university of Rostock.

KARTIKEYA, in Hindu mythology, the god of war. Of his birth there are various legends. One relates that he had no mother but was produced by Siva alone, and was suckled by six nymphs of the Ganges, being miraculously endowed with six faces that he might simultaneously obtain nourishment from each. Another story is that six babes, miraculously conceived, were born of the six nymphs, and that Tarvati, the wife of Siva, became the mother of the gods. It is generally supposed that they became one, but preserved six faces, twelve arms, feet, eyes, &c. Kartikeya became the victor of giants and the leader of the armies of the gods. He is represented as riding a peacock. In southern India he is known as Subramanya.

KARUN, an important river of Persia. Its head-waters are in the mountain cluster known since at least the 14th century as Zardah Kuh (13,000 ft.) and situated in the Bakhtiar country about 15 m. W. of Isfahan. In its upper course it reaches Shushter it is called Ab i Kurang (also Kurand and Kuran), and in the Bunderkhan, an old cosmographical work in Pahlavi, it is named Khârâf. From the junction of the two principal sources in the Zardah Kuh at an altitude of about 8000 ft., the Ab i Kurang is a powerful stream, full, deep and flowing with great velocity for most of its upper course between precipices varying in height from 1000 to 3000 ft. The steepness and height of its banks make it in general useless for irrigation purposes. From its principal sources to Shushter the distance as the crow flies is only about 75 m., but the course of the river is so tortuous that it travels 250 m. before it reaches that city. Besides being fed on its journey through the Bakhtiar country by many mountain-side streams, torrents and salt, it receives various tributaries, the most important being the Ab i Bazaut from the right and the Ab i Baraz from the left. At Shushter it divides into two branches, one the “Gergar,” an artificial channel cut in old times and flowing east of the

1The real principal source of the river has been correctly located at ten miles above the reputed principal source, but the name Kurang has been erroneously explained as standing for Kurang i rang and has been given to the mountain with the real principal source. Kurang i rang has been wrongly explained as meaning the “variegated mountain.”
KARWAR—KASAI

city, the other the "Shutait" flowing west. These two branches, which are navigable to within a few miles below Shushter, unite after a run of about 50 m. at Band i Kir, 24 m. S. of Shushter, and there also take up the Ab i Diz (river of Dizful). From Band i Kir to a point two miles above Muhammad the river is called Karun (Rio Carom of the Portuguese writers of the 16th and 17th centuries) and is navigable all the way with the exception of about two miles at Ahvaz, where a series of cliffs and rocky shelves cross the river and cause rapids. Between Ahvaz and Band i Kir (46 m. by river, 24 m. by road) the river has an average depth of about 20 ft., but below Ahvaz down to a few miles above Muhammad it is in places very shallow, and vessels with a draught exceeding 3 ft. are liable to ground. About 12 m. above Muhammad and branching off to the left is a choked-up river bed called the "blind Karun," by which the Karun found its way to the sea in former days. Ten miles farther a part of the river branches off to the left and due S. by a channel called Bahmashir (from Bahm-Arash, the name of the district in the early middle ages) which is navigable to the head of vessels of little draught. The Karun up to Ahvaz was opened to international navigation on the 30th of October 1888, and Messrs Lynch of London established a fortnightly steamer service on it immediately after.

To increase the water supply of Isfahan Shah Tahmasp I. (1524–1576) and some of his successors, notably Shah Abbas I. (1587–1629), undertook some works for diverting the Kurang into a valley which drains into the Zayendeh-rud, the river of Isfahan, by tunnelling, or cutting through a narrow rocky ridge separating the two river systems. The result of many years' work, a cleft 200 yds. long, 15 broad, and 18 deep, cut into the rock, probably amounting to no more than one-tenth of the necessary work, can be seen at the junction of the two principal sources of the Kurang.

KARWAR, or Carwar, a seaport of British India, administrative headquarters of North Kanara district in the Bombay presidency; 205 m. S. of Bombay city. Pop. (1901), 16,847. As early as 1660 the East India Company had a factory here, with a trade in muslin and pepper; but it suffered frequently from Dutch, Portuguese and native attacks, and in 1752 the English agent was withdrawn. Old Karwar fell into ruins, but a new town grew up after the transfer of North Kanara to the Bombay presidency. It is the only safe harbour all the year round between Bombay and Cochin. In the bay is a cluster of islets called the Oyster Rocks, on the largest of which is a lighthouse. Two smaller islands in the bay afford good shelter to native craft during the strong northeast winds that prevail from February to April. The commercial importance of Karwar has declined since the opening of the railway to Marmagao in Portuguese territory.

KARWI, a town of British India, in the Banda district of the United Provinces, on a branch of the Indian Midland railway; pop. (1901), 7,743. Before the Mutiny it was the residence of a Maharatta noble, who lived in great state, and whose accumulations constituted the treasure afterwards famous as "the Kiywae and Banda Prize Money."

KARYOGAMY (Gr. καρυώγις, nut or kernel, thus "nucleus," and γάμος, marriage), in biology: (1) the fusion of nuclei to form a single nucleus in syngamic processes (see Reproduction); (2) the process of pairing in Infusoria (q.v.), in which two migratory nuclei are interchanged and fuse with two stationary nuclei, while the cytoplasmic bodies of the two mates are in intimate temporary union.

KASAI, or Cassai, a river of Africa, the chief southern affluent of the Congo. It enters the main stream in 3° 10' S., 16° 10' E. after a course of over 800 m. from its source in the highlands which form the south-western edge of the Congo basin—separating the Congo and Zambezi systems. The Kasai and its many tributaries cover a very large part of the Congo basin. The Kasai rises in about 12° S., 10° E. and flows first in a north-easterly direction. About 10° 35' S., 22° 15' E. it makes a rectangular bend northward and then takes a north-westerly direction. Five rivers—the Luembo, Chiumbo, Lujiamo or Luashisho, Chikapa and Lovua or Lowe—rise west of the Kasai and run in parallel courses for a considerable distance, falling successively into the parent stream (between 7° and 8° S.) as it bends westward in its northern course. The Luembo and the Chiumbo are the chief affluents and enter the Kasai as one river. A number of rapids occur in these streams. A few miles below the confluence of the Lovuo, the last of the five rivers named to join the Kasai, the main stream is interrupted by the Wissmann Falls which, though not very high, bar further navigation from the north. Below this point the river receives several right-hand (eastern) tributaries. These also have their source in the Zambezi-Congo watershed, rising just north of 12° S., flowing north in parallel lines, and in their lower course bending west to join the Kasai. The chief of these affluents are the Luula and the Sankuru, the latter of which is almost a parallel of the Sankuru makes a bold curve westward on reaching 4° S., following that parallel of latitude a considerable distance. Its waters are of a bright yellow colour. After the junction of the two rivers (in 4° 17' S., 20° 15' E.), the united stream of the Kasai flows N.W. to the Congo. From the south it is joined by the Loange and the Kwango. The Kwango is a large river rising a little north of 20° S., and west of the source of the Kasai. Without any marked bends it flows north—joined from the east by the Juma, Wamba and other streams—and has a course of 600 m. before joining the Kasai in 5° S., 18° E. The lower course of the Kwango is navigable, the upper course being interrupted by rapids. On the north (in 3° 8' S., 15° E.) the lower Kasai is joined by the Lukeny or Ikatta. This river, the most northerly affluent of the Kasai, rises between 24° and 25° E., and about 3° S. in swampy land through which the Lomami (another Congo affluent) flows northward. The Lukeny has an east to west direction flowing across a level country once occupied by a lake, of which Lake Leopold II. (q.v.), connected with the lower course of the Lukeny, is the scanty remnant. Below the lake the Lukeny is known as the Mimi. Near its mouth the Kasai, in its lower course generally a broad stream steered with islands, is narrowed to about half a mile on passing through a gap in the inner line of the West African highlands, by the cutting of which the old lake of the Kasai basin must have been drained. The Kasai enters the Congo with a minimum depth of 25 feet and a breadth of about 700 yards, at a height of 942 ft. above the sea. The confluence is known as the Kwa mouth, Kwa being an alternative name for the lower Kasai. The volume of water entering the Congo averages 321,000 cub. ft. per second: the largest amount discharged by any of the Congo affluents. In floodtime the current flows at the rate of 5 or 6 m. an hour. The Kasai and its tributaries are navigable for over 1,000 m. by steamer.

The Kwango affluent of the Kasai was the first of the large affluents of the Congo known to Europeans. It was reached by the Portuguese from their settlements on the west coast in the 16th century. As its lower course they were ignorant. Portuguese travellers in the 16th century are believed to have reached the upper Kasai, but the first accurate knowledge of the river basin was obtained by David Livingstone, who reached the upper Kasai from the east and explored in part the upper Kwango (1854–1855). V. L. Cameron and Paul Pogge crossed the upper Kasai in the early seventies. The Kwa mouth was seen by H. M. Stanley in his journey down the Congo in 1877, and he rightly regarded it as the
Kasbek—Kashgar

outlet of the Kwan-go, though not surmising it was also the outlet of the Kasai. In 1882 Stanley ascended the river to the Kwan-go Kasai, and made the important discovery of Lake Loepold II. In 1884 George Grenfell journeyed up the river beyond the Kwan-go confluence. The systematic exploration of the main stream and its chief tributaries was, however, mainly the work of Captain C. Lemaître, who named the caspian and that of other Germans during 1880–1887. (See Wissmann’s books, especially Im Inneren Afrikas, Leipzig, 1888.) On his third journey, 1886–1888, Wissmann was joined by Major von Mechoch, an Austrian, explored the middle course of the Kasai in 1886, and its north branch was subsequently surveyed by Grenfell and Holman Bentlely, a Baptist missionary. In 1890–1891 a Belgian expedition under Captain C. Lemaître traced the Congo-Zambesi waterfalls, obtaining valuable information concerning the upper courses of the southern Kasai tributaries. The upper Kasai basin and its peoples were further investigated by a Hungarian traveller, E. Torday, in 1906–1909. (See Torday’s paper in Geogr. J., 1910; also Conan and the authorities there cited.)

Kasbek (Georgian, Mkinvari; Ossetian, Urs-khokh), one of the chief summits of the Caucasus, situated in 42° 44’ N. and 44° 30’ E., 7 m. as the crow flies from a station of the same name on the high road to Tiflis. Its altitude is 16,545 ft. It rises on the range which runs north of the main range (main water-parting), and which is pierced by the gorges of the Ardon and the Terek. Kasbek represents an extinct volcano, built up of trachyte and sheathed with lava. The summit, like the other Kasai peaks, is composed of trachyte, whose base lies at an altitude of 5,000 ft. Owing to the steepness of its slopes, its eight glaciers cover an aggregate surface of not more than 8 sq. m., though one of them, Maliev, is 36 m. long. The best-known glacier is the Dvordarok, or Devdarok, which creeps down the north-eastern slope into a gorge of the same name, reaching a level of 7,530 ft. At its eastern foot runs the Georgian military road through the pass of Darial (7,095 ft.). The summit was first climbed in 1868 by D. W. Freshfield, A. W. Moore, and C. Tucker, with a Swiss guide. Several successful ascents have been made since, the most valuable in scientific results being that of Pastukhov (1886) and that of G. Merzbacher and L. Purtsheller in 1890. Kasbek has a great literature, and has left a deep mark in Russian poetry.

Kashan, a small province of Persia, situated between Isfahan and Kerman. It is divided into the two districts gernissir, the “warm,” and sardsisir, the “cold,” the former with the city of Kashan in the plains, the latter in the hills. It has a population of 75,000 to 80,000, and pays a yearly revenue of about 15,000,000 rials. Kashan (Cashan) is the provincial capital, in 34° 0’ N. and 51° 27’ E., at an elevation of 3,190 ft., 150 m. from Teheran; pop. 35,000, including a few hundred Jews occupied as silk-winders, and a few Zoroastrians engaged in trade. Great quantities of silk stuffs, from raw material imported from Gilan, and copper utensils are manufactured at Kashan and sent to all parts of Persia. Kashan also exports rose-water made in villages in the hilly districts about 20 m. from the city, and is the only place in Persia where cobalt can be obtained, from the mine at Kamsar, 19 m. to the south. At the foot of the hills 4 m. W. of the city are the beautiful gardens of Fin, the scene of the official murder, on the 9th of January 1852, of Mirza Taki Khan, Amir Nizam, the grand vizier, one of the ablest ministers that Persia has had in modern times.

Kashgar, an important city of Chihli Turkestan, in 39° 24’ 26’’ N. lat. 76° 0’ 45’’ E. long. 4043 ft. above sea-level. It consists of two towns, Kuhna Shahr or “old city,” and Yangi Shahr or “new city,” about five miles apart, and separated from one another by the Kyzyl Su, a tributary of the Tarim river. It is called Su-leh by the Chinese, which perhaps represents an original Sok or Sorak. This name seems to be older than Kashgar, which is said to mean “variegated houses.” Situated at the junction of routes from the valley of the Oux, from Khokhand and Samarkand, Amalt, Aksu, and Khotan, the last two leading from China and India, Kashgar has been noted from very early times as a political and commercial centre. Like all other cities of Central Asia, it has changed hands repeatedly, and was from 1864–1887 the seat of government of the Amir Yakub Beg, surnamed the Atalik Ghazi, who established and for a brief period ruled with remarkable success a Mahomedan state comprising the chief cities of the Tarim basin from Turfan round along the skirt of the mountains to Khotan. But the kingdom collapsed with his death and the Chinese retook the country in 1877 and have held it since.

Kashgar was a small fortifited city on high ground overlooking the river Turfan. Its walls are lofty and supported by buttress bastions with loopholed turrets at intervals; the fortifications, however, are but of hard clay and are much out of repair. The city contains about 2,000 houses. Beyond the bridge, a little way off, are the ruins of ancient Kashgar, which once covered a large extent of country on both sides of the Turfan, and the walls of which even now are 12 feet wide at the top and twice that in height. This city—Aski Shahr (Old Town) as it is now called—was destroyed in 1514 by Mirza Ababaker (Abubekr) on the approach of Sultan Said Khan’s army. About two miles to the north beyond the river is the shrine of Hazrat Afak, the saint king of the country, who died and was buried here in 1693. It is a handsome mausoleum faced with blue and white glazed tiles, standing under the shade of some magnificent silver poplar.

About it Yakub Beg erected a commodious college, mosque and monastery, the whole being surrounded by rich orchards, fruit gardens and vineyards. The Yangi Shahr of Kashgar is, as its name implies, modern, having been built in 1838. It is of oblong shape running north and south, and is entered by a single gateway. The walls are lofty and massive and strengthened by turrets, while a ducal flight is a projecting bastion.

The whole is surrounded by a deep and wide ditch, which is filled from the river, at the risk, however, of bringing down the whole structure, for the walls are of mud, and stand upon a porous sandy soil. In the time of the Chinese, before Yakub Beg’s sway, Yangi Shahr held a garrison of six thousand men, and was the residence of the aman or governor. Yakub erected his orda or palace on the site of the aman’s residence, and two hundred ladies of his harem occupied a commodious enclosed hard by. The population of Kashgar has been recently estimated at 60,000 in the Kuhna Shahr and only 2000 in the Yangi Shahr.

With the overthrow of the Chinese rule in 1865 the manufacturing industries of Kashgar declined. Silk culture and carpet manufacture have flourished for ages at Khotan, and the products always find a ready sale at Kashgar. Other manufactures consist of a strong coarse cotton cloth called kham (which forms the dress of the common people, and for winter wear is padded with cotton and quilted), boots and shoes, saddery, felts, furs and sheepskins made up into cloaks, and various articles of domestic use. A curious street sight in Kashgar is presented by the hawkers of meat pies, pastry and sweetmeats, which they trundle about on hand-barrows just as their counterparts do in Europe; while the knife-grinder’s cart, and the vegetable seller with his tray or basket on his head, recall exactly similar itinerant traders further west.

The earliest authentic mention of Kashgar is during the second period of ascendency of the Han dynasty, when the Chinese conquerors called it Kiang (Hsing), or Kiang (Hsung), and formed a group of states in the Tarim basin almost up to the foot of the Tian Shan mountains. This happened in 76 B.C. Kashgar does not appear to have been known in the West at this time but Ptolemy speaks of a town beyond the Imaus, which is in a Kastis region, possibly exhibiting the name whence Kashgar and Kashiaria (often applied to the district) are formed. Next ensues a long epoch of obscurity. The country was converted to Buddhism and probably ruled by the Kushans, who occupied Kasa-kh (which they calls Ka-sha) on his return journey from India to China. The Buddhist religion, then beginning to decay in India, was working its way to a now growth west, and subsequently, especially the Nestorian Christians were establishing bishoprics at Herat, Merv and Samarkand, whence they subsequently proceeded to Kashgar, and finally to China itself. In the 8th century came the retreat from the empire to China of the Chinese Lung-Tsang passed through Tashkent, looking by assistance to the reigning queen of Bokhara, to enable her to repel the enemy. But although the Mahomedan religion from the very commencement sustained cheeks, it nevertheless made its
KASHI—KASHMIR

weight felt upon the independent states of Turkestan to the north and east, and thus acquired a steadily growing influence. It was not, however, till the 10th century that Islam was established at Khotan, or Kucha, an important city on the hoof-kingdoms (Kachkas). It appears to havé been the descendants of the people called Tolas and to have been one of the many Turkish tribes who migrated westwards from China. Boghra Khan, the most celebrated prince of this line, was driven out of Khotan in the 9th century. He reigned for some time at Buzurg Beg, and in 1219 by Jenghiz Khan. He gave an invasion a decided check to the progress of the Mahommedan creed, but on his death, and during the rule of the Jagatai Khans, who became converts to that faith, it became reestablished and hitherto visited the city, which he calls Casuar, about 1275 and left some notes on it.

In 1389-1390 Timur ravaged Kashgar, Andijan and the intervening country. Kashgar passed through a troubous period, and in 1514, on the invasion of the Khan Sultan Said, was destroyed by Mirza Ababakar, who with the aid of ten thousand men built the new fort with massive defences higher up on the banks of the Turfan. The dynasty of the Jagatai Khans collapsed in 1572 by the dismemberment of the country between rival representatives; and soon after two powerful Khofoa factions, the White and Black Mountainers (Ak and Khoja) rose in disunion. The last of the White Mountainers, of the convention of the Kalmucks of Dzungaria, fill up the history till 1759, when a Chinese army from IlI (Kulja) invaded the country, and, after perpetrating widespread massacres, finally consolidated their advantage through the Chidek Khans, together with the Manchu garrison. The Chinese had thoughts of pushing their conquests towards western Turkestan and Samarkand, the clients of which sent to seek assistance of the Afghan king Ahmad Shah. This movement rekindled an embassy to Peking to demand the restitution of the Mahommedan states of Central Asia, but the embassy was not well received, and Ahmed Shah was too much engaged with the Turks and the Chinese to attempt to enforce his demands by arms. Timur and his successors, in 1637, held Kashgar, with sundry interruptions from Mahommedan revolts—one of the most serious occurring in 1827, when the territory was invaded and the city taken by Jahangir Khoja; Chang-ling, however, having been converted to Islam of IlI by government, the other revolted cities in 1828. A revolt in 1829 under Mahommed Ali Khan and Yusuf, brother of Jahangir, was more successful, resulting in the cession of several important trade privileges to the Mahomedans of the district of Altay Shah (the *six cities *), as it was then named. Until 1846 the country enjoyed peace under the just and liberal rule of Zahir-ud-din, the Chinese governor, but in that year a fresh Khofoa revolt under Khati Tora led to his making himself master of the city, with circumstances of unbridled licence and oppression. His reign was, however, brief, for he was deposed by his sixty-five, on the approach of the Chinese, he fled into Khotan, which he left behind him. But the rebellion of the Khofoa revolts (1857) was of about equal duration with the previous one, and took place under Wali Khan, a degraded dabeiraloo, and the Mahomedan peninsula was again seceded to the Chidek Shahs. The great Tungani (Dungan) revolt, or insurrection of the Chinese Mahommedans, which broke out in 1862 in Kansuh, spread rapidly to Dzungaria and through the line of towns in the Tarim basin. The Tungani troops in Yarkand rose, and (10th of July) the Tungani, as they were named, massacred some seven thousand Chinese, while the inhabitants of Kashgar, rising in their turn against their masters, invoked the aid of Sadik Beg, a Kirghiz chief, who was reinforced by Buzurg Khan, the heir of Jahangir, and Yakub Beg, his general, these being despatched at Sadik's request by the ruler of Khokand to raise what troops they could to aid his Mahommedan friends in Kashgar. Sadik Beg soon received the aid of having asked for a Khoja, and eventually raised an army against Kashgar, which by this time had succumbed to Buzurg Khan and Yakub Beg, but was defeated and driven back to Khokand. Buzurg Khan delivered himself up to indolence and debauchery, but Yakub Beg, with his troops, marched to Kashgar, made himself master of Yangi Shah, Yangi-Hissar, Yarkand and other towns, and eventually became sole master of the country, Buzurg Khan proving himself totally unfit for the post of ruler. Kashgar and the seven cities of the Tarin basin remained under Yakub Beg's rule until 1877, when the Chinese regained possession of their ancient dominion. (C. E. D. B.; C. E.L.)

KASHI, or Kasi, formerly the Persian word for all glazed and enamelled pottery irrespectively; now the accepted term for certain kinds of enamelled tile-work, including brick-work and tile-mosaic work, manufactured in Persia and parts of Mahommedan India, chiefly during the 16th and 17th centuries. It is quite possible that the name kashi is immediately derived from Kashan, a town in Persia noted for its jameh mosque. This ancient pottery site, in turn, probably receives its name from the structure of its past time industry; as a "city of the plain" it would obviously have no claim to the farther-eastern suffix shan, meaning a mountain. Sir George Birdwood wisely considers that "the art of glazing enameh ware has, in Persia, descended in an almost unbroken tradition from the period of the greatness of Chaldea and Assyria...

KASHMIR, or Cashmere, a native state of India, including much of the Himalayan mountain system to the north of the Punjab. It has been fabled in song for its beauty (e.g. in Moore's Lalla Rookh), and is the chief health resort for Europeans in India, while politically it is important as guarding one of the approaches to India on the northwest frontier. The proper
The name of the state is Jammu and Kashmir, and it comprises in all an estimated area of 80,900 sq. m., with a population (1901) of 2,605,578, showing an increase of 14.21% in the decade. It is bounded on the north by some petty hills and chieftains and by the Karakoram mountains; on the east by Tibet; and on the south by the hills, which are about 12,000 ft. to the north and west. Frontier provinces. The state is in direct political and administrative connection with the Government of India, which is represented by representatives of the British authority. Territories comprise the provinces of Jammu (including the jagir of Punch), Kashmir, Ladakh, Baltistan and Gilgit; the Shin states of Yaghan, of which the most important are Chilas, Darel and Tangir, are nominally subordinate to it, and the two former pay a tribute of gold dust. The following are the statistics for the main divisions of the state:

<table>

The remainder of the state consists of uninhabited mountains, and its only really important possession is the districts of Jammu and Kashmir.

Physical Conformation. — The greater part of the state is mountainous, and with the exception of a strip of plain on the south-west, which is continuous with the great plain of the Punjab, the remainder may be divided into the following regions:

1. The outer hills and the central mountains of Jammu district.
2. The valley of Kashmir.
3. The far side of the great central range, including Ladakh, Baltistan and Gilgit.

The hills in the outer region of Jammu, adjoining the Punjab plains, begin with a height of 200 to 200 ft. followed by a tract of rugged country, including various ridges running nearly parallel, with long narrow valleys between. The average height of these ridges is from 3000 to 4000 ft. The central mountains are commonly 8000 to 10,000 ft., covered with pastures or else with forest. Then follow the lofty mountain ranges, including the region of perpetual snow. A great chain of snowy mountains branching off south-east and north-west divides the drainage of the Chenab and the Jhelum rivers from that of the higher branches of the Indus. It is within spurs from this chain that the valley of Kashmir is enclosed amid hills which rise from 14,000 to 15,000 ft., while the valley itself forms a cup-like basin at an elevation of 5000 to 6000 ft. All beyond that great range is a wide tract of mountainous country, bordering the north-western part of Tibet and embracing Ladakh, Baltistan and Gilgit.

The length of the Kashmir valley, including the inner slopes of its mountains, is about 120 miles, with a width of 42 miles in the eastern face. The great ridge which is thrown off to the south-west by Nanga Parbat rises, at a distance of 12 m., to another summit 20,740 ft. in height, from which runs south-west, and south-east the ridges which are the northern watersheds of Kashmir. The former range, after running 70 m. south-west, between the valleys of the Kishanganga and the Kunhar or Nain-sukh, turns southward, closely pressing the river Jhelum, after it has received the Kishanganga, with a break a few miles farther south which admits the Kunhar. This line presents several prominent summits, the highest of which is 16,487 and 15,544 ft. above the sea. The range which runs south-east from the junction peak have mentioned divides the valley of the Kishanganga from that of the Astor and other tributaries of the Indus. The highest point on this range, where it skirts Kashmir, is 17,202 ft. above the sea. For more than 50 m. from Nanga Parbat, the range runs south-west, by a succession of ridges which become more and more lofty until it reaches the Warwana, a distance of 12 miles from the Chenab. The highest point of this eastern boundary is 14,700 ft. There are no glaciers. The highest point on the Panjal range, which forms the south and south-west boundaries, is 15,523 ft. above the sea.

The river Jhelum (g.s.) or Behat (Sanskrit Vilasa)—the Hydaspes of Greek historians and geographers—flows north-westward through the middle of the valley. After a slow and winding course it expands and is then known as the Jhelum proper. From below Srinagar, over a slight depression in the plain, and forms the Wular lake and Jhelum, which is about 121 m. by 5 m. in extent, and surrounded by the lofty mountains which tower over the north and north-east of the valley. Leaving the lake on the north side, the river follows the slope of the range, winds south-east, and rapidly decreases in size until on reaching a width of 40 m. above Srinagar, the river is 5400 ft. above sea-level, and at Srinagar 5235 ft. It has thus a fall of about 4 ft. per mile in this part of its course. For the next 15 miles on the Wular, and thence to Baramulla, its fall is only about 25 ft. per mile. On the course of the river in the flat valley between Islamabad and Baramulla, there is much boat traffic; but none below Baramulla, till the river comes out into the plains.

On the north-east side of this low narrow plain of the Jhelum is a broad hilly tract between which and the higher boundary range runs the Kishenganga River. Near the east end of this interior hilly tract, and connected with the higher range, is one summit 17,839 ft. Around this peak and between the ridges which run from it are many small glaciers. These heights look down on one side into the beautiful valley of the Sind River, and on the other the valley of the Lidar, which join the Jhelum. Among the hills north of Srinagar rises one conspicuous mountain mass, 16,903 ft. in height, from which the north side descends tributaries of the Kishenganga, and on the south the Jelant River, which forms an ar. The peasants who cultivate these and their numerous affluents the whole valley of Kashmir is watered abundantly.

The foot of many spurs of the hills which run down on the Kashmir plain are pieces of low table-land, called kardas. These terraces vary in height in different parts of the valley from 100 to 300 ft. above the alluvial plain. Those which are near each other are linked by roads and a number of footpaths. The level plain in the middle of the Kashmir valley consists of fine clay and sand, with water-worn pebbles. The karewas consist of horizontal beds of clay and sand, the lacustrine nature of which is shown by the shells which they contain.

Two passes lead northward from the Kashmir valley, the Bzuril (13,500 ft.) and the Kamiri (14,050). The Burzil is the main pass through Srinagar and is called Astor. It is usually practicable only between the middle of July and the middle of October. The road from Srinagar to Leh in Ladakh follows the Sind valley to the Zoij-la pass (11,300 ft.). Only a short piece of the road, where snow accumulates, prevents this pass being used all the year. About the south-east end of the valley are two passes, the Margam (11,500 ft.), the Hoksar (13,315) and the Marbal (11,500), leading to the valleys of the Chenab and the Ravi. South of Islamabad, on the direct route to Jammu and Sialkot, is the Balahal pass (9236 ft.). Further west on the Panjal range is the Pir Panjal or Panchal pass (11,400 ft.), with a second pass, the Rattan Pir (8200 ft.), across a second ridge down south-west, and the two passes are the beautiful and stilted fort of Baramgali. This plateau is the raja of Punch, and may be mentioned among the maharaja of Kashmir.

Geology. — The general strike of the beds, and of the folds which have affected them, is from N.W. to S.E., parallel to the mountain ranges. Along the south-western border lies the zone of Tertiary beds which form the Sub-Himalayas. Next to this is a great belt of Palaeozoic rocks, through which rise the granite, gneiss and schist of the Zanskar and Dhauladhars ranges of the Pir Panjal. In the midst of the Sub-Himalayan zone are Mesozoic and Cretaceous beds, which divide the valley of the Jhelum, which is the easy route from the valley westward, having two ways down to the plains, one by Muzafarabad and the other valley to Hasan Abdal, the other by the British station of Murree to Rawalpindi.

Climate. — The valley of Kashmir, situated as it is, south-west of the Panjal range, has not the periodical rains of India. Its rainfall is irregular, greatest in the spring months. Occasional
storms in the monsoon pass over the crests of the Panjali and give heavy rain on the elevated plateaus on the Kashmir side. And again clouds pass over the valley and are arrested by the higher hills on the Himalayan side, where snow falls, occurring at intervals from October to March. In the valley the first snow generally falls about the end of December, but never to any great amount.

The hottest months are July, August, and the greater part of September. The heat is moderated by the mountain scenery, and the humidity is comparatively low. The maximum temperature is about 105° below freezing. A health resort the province, excluding Srinagar, which is insanitary and relaxing, has no rival anywhere in the neighbourhood of its climate. Its climate is admirably adapted to the European coldblooded races, and the change of climate and the facility of moving about the visitor is enabled with ease to select places at elevations most congenial to him. Formerly only 2,000 pilgrims who went to Srinagar, it is estimated by the police that there are fifty thousand. The influx is placed on visitors, and their number increases annually. European sportsmen and travellers, in addition to residents of India, resort there freely. The railway to Rawalpindi, and a driving road thence to Srinagar make the valley easy of access. When the temperature in Srinagar rises at the beginning of June, there is a general exodus to Gulmarg, which has become a fashionable hill-station. This great influx of visitors has resulted in a corresponding diminution of game. Special game preservation rules have been introduced, and nullabs are let out for stated periods with a restriction on the number of head to be shot. The wild animals of the country include wild buffalo, the hog, the hog-headed sheep, and the domesticated hog. Many sportmen now cross into Ladakh and the Pamirs. 

People.—The great majority of the inhabitants of Kashmir are professively Mahomedans, but their conversion to the faith of Islam is comparatively recent and they are still strongly influenced by their ancient superstitions. At the census of 1901 out of a total population in the whole state of 2,905,578, there were 2,154,665 Mahomedans, 689,073 Hindus, 35,047 Buddhists and 25,828 Sikhs. The Hindus are mostly found in Jammu, and the Buddhists are confined to Ladakh. In Kashmir proper the few Hindus (56,682) are almost all Brahmanas, called as Pandits. Superstition has made the Kashmiri timid; tyranny has made him a liar; while physical disasters have made him selfish and pessimistic. Up to recent times the cultivator lived under a system of begar, which entitled an official to take either labour or commodities free of payment from the villages. Having no security of property, the people had no incentive to effort, and with no security for life they lost the independence of free men. But the land settlement of 1889 swept all these abuses away. Restrictive monopolies, under which bricks, lime and timber were sold, a water monopoly, and other private enterprise, were abolished. The results of the settlement are thus enumerated by Sir Walter Lawrence: "Little by little, confidence has sprung up. Land which had no value in 1889 is now eagerly sought after by all classes. Cultivation has extended and improved. Houses have been rebuilt and repaired, fields fenced in, orchards planted, vegetable gardens well stocked and new mills constructed. Women no longer are seen toiling in the fields, for their husbands are now at home to do the work, and the long journeys to Gilgit are a thing of the past. When the harvest is ripe the peasant reaps it at his own good time, and not a soldier ever enters the villages." In consequence of this improvement in their conditions of life and of the influx of wealth into the country brought by visitors, the Kashmiri grows every year in material prosperity and independence of character. The Kashmir women have a reputation for beauty which is not altogether deserved, but the children are always pretty.

The language spoken in Kashmir is akin to that of the Punjuck, though marked by many peculiarities. It possesses an ancient literature, which is written in a special character (see KASHMIRI).

The climate of Kashmir is very healthy and at the altitude to the climate of Kashmir, upon the character of its inhabitants has been referred to. The list includes fires, floods, earthquakes, famines and cholera. The ravages of fire are chiefly felt in Srinagar. In 1856 thirty-one houses and 2225 houses were wrecked; another flood occurred in July 1903, when the bend between the Dal Lake and the canal gave way, and the lake rose 10 ft. in half an hour. Between two and three thousand houses and around Srinagar collapsed, while over 40 miles of the tonga road was washed away. In 1588, when about 1000 great earthquakes have occurred, all of long duration and accompanied by great loss of life. During the 19th century there was not a single large earthquake. During the 19th century there were no great earthquakes. During the 19th century there was not a single large earthquake.

Industries.—The chief industry of Srinagar is formerly the weaving of the celebrated Kashmir shawl, which dates back to the days of the emperor Baber. These shawls first became fashionable in Europe in the reign of Napoleon, when they fetched from £100; but the industry received a blow at the time of the Franco-German War, and the famine of 1877 scattered the weavers. The place of the Kashmiri shawl has to some extent been taken by the Kashmiri carpet, but the most thriving industry now is that of silk-weaving. Srinagar is also celebrated for its silver-work, papier mache and wood-carving. The minerals and metals of the Jammu Himalayas have always been of importance, and coal of fair quality has been found, but the difficulties of transport interfere with its working.

History.—The metrical chronicle of the kings of Kashmir, called Rajatarangini, was pronounced by Professor H. H. Wilson to be the only Sanskrit composition yet discovered to which the title of history can with any propriety be applied. Commencing with traditional history of very early times, it comes down to the reign of Sangrama Deva, 1006; the second work, by Jonaraja, takes up the history in continuation of Kalka. and, entering the Mahmoodian period, gives an account of the reigns down to that of Zain-ul-ab-ad-din, 1412. P. Srivara carried on the record to the accession of Fath Shah, 1486. And the fourth work, called Rajawalputationa, by Pranjuna Bhatta, completes the history to the time of the incorporation of Kashmir in the dominions of the Mogul emperor Akbar, 1588. In the Rajatarangini it is stated that the valley of Kashmir was formerly a lake, and that it was drained by the great Vini or sage, Kasaya, son of Marichi, son of Brahma, by cutting the gap in the hills at Baraulamula (Varaha-mula). When Kasaya had drained the lake, he left a number of Brahmanas to occupy it. This is still the local tradition, and it is the accepted local condition of the country we may see some ground for the story which has taken this form. The name of Kasaya is by history and tradition connected with the draining of the lake, and the chief town or collection of dwellings in the valley was called Kasaya-pur—a name which has been plausibly identified with the Kasarvadavos of Biceataus (Steph. Hitz., s.n.) and Kasarvados of Herolitis (lil. 102, iv. 44). Kashmir is the country meant also by Ptolemy's Kasarvada. The ancient
name Kasyapa-pur was applied to the kingdom of Kashmir when it comprehended great part of the Punjab and extended beyond the Indus. In the 7th century Kashmir is said by the Chinese traveller Hsuan Tsang to have included Kabul and the Punjab, and the hill region of Gandhara, the country of the Gandarae of classical geography.

At an early date the Sanskrit name of the country became Kāśmīr. The earliest inhabitants, according to the Rajatarangini, were the people called Nagā, a word which signifies "snake." The history shows the prevalence in early times of tree and serpent worship, of which some sculptured stones found in Kashmir still retain the memorials. The town of Islamabad is called also by its ancient name Anant-nāg ("eternal snake"). The source of the Jhelum is at Vir-nāg (the powerful snake), &c. The other races mentioned as inhabiting this country and the neighbouring hills are Gandhari, Khasa and Daradāe. The Khasa people are supposed to have given the name Kasmir. In the Mahābhārata the Kasmira and Daradāe are named together among the Kshattriya races of northern India. The question whether, in the immigration of the Aryans into India, Kashmir was taken on the way, or entered afterwards by that people after they had reached the Punjab from the north-west, appears to require an answer in favour of the latter view (see vol. ii. of Dr. J. Muir's Sanskrit Texts).

The Aryan races of Kashmir and surrounding hills, which have at the present time separate geographical distribution, are given by Mr Drew as Kashmirī (mostly Mahomedan), in the Kashmir basin and a few scattered places outside the main Kasmir (mostly Mahomedan) in Gilgit and hills north of Kashmir; Dōrga (Hindu) in Jamma; Dōrga (Mahomedan, called Chibdāl) in Punch and hill country west of Kasmir; Paṅḍārī or mountaineers (Hindu) in Kashmir, east of Kashmir, and hills about the valley of the Chenab.

In the time of Asoka, about 245 B.C., one of the Indian Buddhist missions was sent to Kashmir and Gandhara. After his death Brahmanism revived. Then in the time of the three Kushan princes, Huvishka, Jushka and Kanishka, who ruled over Kashmir about the beginning of the Christian era, Buddhism was to a great extent restored, though for several centuries the two religions existed together in Kashmir, Hinduism predominating. Yet Kashmir, when Buddhism was gradually losing its hold, continued to send Buddhist teachers to other lands. In this Hindu-Buddhist period, and chiefly between the 6th and 10th centuries of the Christian era, were erected the Hindu temples in Kashmir. In the 6th and 7th centuries Kashmir was visited by some of the Chinese Buddhist pilgrims to India. The country is called Shie-mi in the narrative of To Yeng and Sung Yün (578). One of the Chinese travellers of the next century was for a time an elephant-tamer to the king of Kasmir. The name of the king was Lāyvgur (Kia-ch'ot-mi-lo). He entered by Baramula and left by the Pir Panjal pass. He describes the hill-girt valley, and the abundance of flowers and fruits, and he mentions the tradition about the lake. He found in Kashmir many Buddhists as well as Hindus. In the following century the kings of Kashmir appear to have paid homage and tribute to China, though this is not alluded to in the Kashmir chronicle. Hindu kings continued to reign till about 1194, when Udiana Deva was put to death by his Mahomedan vizier, Amir Shah, who ascended the throne under the name of Shams-ud-din.

Of the Mahomedan rulers mentioned in the Sanskrit chronicles, one, who reigned about the close of the 14th century, has made his name prominent by his active opposition to the Hindu religion, and his destruction of temples. This was Sikandar, known as Buri-shikan, or the "idol-breaker." It was in his time that India was invaded by Timur, to whom Sikandar made submission and paid tribute. The country fell into the hands of the Moguls in 1588. In the time of Ahmad Shah Durani, on his third invasion of India (1756); and from that time it remained in the hands of Afghans till it was wrested from them by Ranjit Singh, the Sikh monarch who died in 1819. Eight Hindu and Sikh governors under Ranjit Singh and his successors were followed by two Mahomedans similarly appointed, the second of whom, Sheikh Imam-ud-din, was in charge when the battles of the first Sikh war 1846 brought about new relations between the British Government and the Sikhs.

Gulab Singh, a Dogra Rajput, had from a humble position been raised to high office by Ranjit Singh, who conferred on him the small principality of Jammu. On the final defeat of the Sikhs by Bahadur Shah (1856) Gulab Singh was invited to take a leading part in arranging conditions of peace. The treaty of Lahore (March 9, 1846) sets forth that, the British Government having demanded, in addition to a certain assignment of territory, a payment of a crore and a half of rupees (1½ millions sterling), and the Sikh government being unable to pay the whole, the maharaja (Dhulip Singh) cedes, as equivalent for one crore, the hill country belonging to the Punjab and the Indus, including Kashmir and Hazara. The governor-general, Sir Henry Hardinge, considered it expedient to make over Kashmir to the Jammu chief, since 1866 his friendship while the British government was administering the Punjab on behalf of the young maharaja. Gulab Singh was well prepared to make up the payment in default of which Kashmir was ceded to the British; and so, in consideration of his services in restoring peace, his independent sovereignty of the country made over to him was recognized, and he was admitted to a separate treaty. Gulab Singh had already, after several extensions of territory east and west of Jammu, conquered Ladakh (a Buddhist country, and till then subject to Lhasa), and had then annexed Skardo, which was under independent Mahomedan rulers. He had thus, the name of Kasmir, and the possession of his territories, the his positions attained nearly their present form and extent. Gulab Singh died in 1857, and was succeeded by his son, Ranbir Singh, who died in 1893. The next ruler, Maharaja Partab Singh, G.C.S.I. (b. 1859), immediately on his accession inaugurated the settlement reforms already described. His rule was remarkable for the reassertion of the Kashmir sovereignty over Gilgit (q.v.). Kashmir imperial service troops participated in the Black Mountain expedition of 1891, the Hunza Nagar operations of 1891, and the Tirah campaign of 1897–98. The Kashmir revenue of the state is about 666,000 rupees.

Kashmiri (properly Kāśmīrī), the name of the vernacular language spoken in the valley of Kashmir (properly Kāśmīr) and in the hills adjoining. In the Indian census of 1901 the number of speakers was returned at 1,007,957. By origin it is the southern member of the Dard group of the Pīśāca languages (see Indo-Aryan languages). The other Pīśāca languages speak further east, in the valleys of the Shān, spoken to its north in the country round Gilgit, and Kōhistān, spoken in the hill country on both sides of the river Indus before it debouches on to the plains of India. The Pīśāca languages also include Khōwār, the vernacular of Chitral, and the Kāfir group of speeches, of which the most important is the Bashgāl of Kāfīrstan. All of these forms of speech Kashmiri is the only one which possesses a literature, or indeed an alphabet. It is also the only one which has been dealt with in the census of India, and it is therefore impossible to give even approximate figures for the numbers of speakers of the others. The whole family occupies the three-sided tract of country between the Hindu-Kush and the north-western frontier of British India. As explained in Indo-Aryan Languages, the Pīśāca languages are Aryan, but are neither Iranian nor Indo-Aryan. They represent the speech of an independent Aryan migration over the Hindu-Kush directly into their present inhospitable seats, where they have developed a phonetic system of their own, while they have retained unchanged forms of extreme antiquity which have long passed out of current use both in Persia and in India. Their speakers appear to have left the main Aryan body after the Indo-Aryan type, before the end of the Indo-Aryan migration, but before all the typical peculiarities of Iranian speech had fully developed. They are thus representatives of a stage of
linguistic progress later than that of Sanskrit, and earlier than that which we find recorded in the Iranian Avesta.

The immigrants into Kashmir must have been Shins, speaking a language closely related to the tongue of the modern Shind. They appear to have dispossessed and absorbed an older non-Aryan people, whom local tradition now classes as Nágás, or Snake-gods, and, at an early period, to have come themselves under the influence of Indo-Aryan immigrants from the south, who entered the valley along the course of the river Jhelum. The language has therefore lost most of its original Písça character, and is now a mixed one. Sanskrit has been actively studied for many centuries, and the Kashmiri vocabulary, and even its grammar, are now largely Indian. So much is this the case that, for convenience’ sake, it is more convenient to employ a Kashmiri word when it is known to be a loan-word from Sanskrit, than to employ the corresponding Sanskrit word. Thus, it is therefore customary to employ the word ‘Kashmiri’ as belonging to the north-western group of Indo-Aryan languages, instead of as belonging to the Písça family as its origin demands. It cannot be said that either classification is wrong.

Kashmir has few dialects. In the valley there are slight changes of idiom from place to place, but the only important variety is Kishtvári, spoken in the hills south-west of Kashmir. Smaller dialects, such as Pogul and Rambánt of the hills south of the Baniál pass, may also be mentioned. The language itself is an old one. Pálací was written by Kalīha in the 12th century A. D., and, judging from these specimens, the language does not appear to have changed materially since his time.

General Character of the Language.—Kashmiri is a language of great philological interest. The two principal features which at once strike the student are the numerous euphonic changes of vowels and consonants and the employment of pronominal suffixes. In both cases the phenomena are perfectly plain, cause and effect being alike presented to the eye in the somewhat complicated systems of declension and conjugation. As these changes have long ago passed through this stage, and many of the phenomena now present by them are due to its influence, although all record of it has disappeared. In this way a study of Kashmiri explains a number of difficulties found by the student of Indo-Aryan vernaculars.\(^1\)

In the following account the reader is presumed to be in possession of the facts recorded in the articles INDO-ARYAN LANGUAGES and PRÁKRIT, and the following contractions will be employed: Ksh. = Kashmiri ; Skr. = Sanskrit ; P. = Písça ; Sh. = Shíná.

A. Vocabulary. The vocabulary of Kashmiri, as has been explained, mixed. At its basis it has a large number of words which are now proper to the language of the neighbouring Shins, and these have been enriched by words taken over from the Shins. Note the most familiar ideas and such as are in most frequent use. Thus, the personal pronouns, the earlier numerals, the words for “father,” “son,” “fire,” “love,” etc. These changes are all closely connected with corresponding Shíná words. There is also a large Indian element, consisting partly of words derived from Sanskrit vocabularies introduced in ancient times, and partly of words borrowed in later days from the vernaculars of the Punjab. Finally, there is a considerable Persian (including Arabic) element due to the long Musulman domination of the Happy Valley. Many of these have been considerably altered in accordance with Kashmiri phonetic rules, so that sometimes appear in strange forms. Thus the Persian lagdm, a bride, has become lákam, and the Arabic bábat, concerning, appears as bábat. The population speaking Kashmiri is mainly Muslim, there being, roughly speaking, nine Mahommedan Kashmiris to less than one Hindu. This difference of religion has strongly influenced the vocabulary. The Musulmans use Persian and Arabic words with great freedom, while the Hindus, or Ò‘‘Pándits as they are called, confine their borrowings almost entirely to words derived from Sanskrit. As the literary class is mostly Hindu, it follows that Kashmiri literature, taken as a whole, while affording most interesting and profitable study, hardly represents the actual language spoken by the mass of the people. There are, however, a few good Kashmiri works written by Musulmans in their own dialect.

B. Written Characters. Musulmans and Christian missionaries employ the Persian alphabet for their writing. This alphabet is quite unsuited for representing the very complex Kashmiri vowel system. Hindus employ the Sáràdá alphabet, of Indian origin and akin to the well-known Nagari. Kashmiri sounds can be recorded very successfully in this character, but there is no adequate index of its pronunciation.

The letters n and ŋ, even when not u-mátr or i-mátr, often change a preceding long d to ñ, which is usually written ñ, and ñ respectively. Thus rúwákh, they have lost, is pronounced rúwákh, and in the

---

The declension is confined to certain nouns in th, d, n, h, and l, in which the final consonant is liable to change owing to a following *-ātār.

Other cases are formed (as in true Indo-Aryan languages) by the above methods, postposing, in some, of which is added to the accusative, while others are added to the ablative case. To the former are added 

<table>
<thead>
<tr>
<th>First Person</th>
<th>Second Person</th>
<th>Third Person</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sing.</td>
<td>Nom.</td>
<td>m</td>
</tr>
<tr>
<td>Acc.</td>
<td>m</td>
<td>th</td>
</tr>
<tr>
<td>Abl</td>
<td>m</td>
<td>th</td>
</tr>
<tr>
<td>Plur.</td>
<td>none</td>
<td>none</td>
</tr>
</tbody>
</table>

Before these the verbal terminations are often slightly changed for the sake of euphony, and, when necessary for the pronunciation, the vowel a is inserted as a junction vowel.

The connection of another set of suffixes also commonly added to verbs, with an adversative force. Of these na negatives the verb, as in chah, he is; chuna, he is not; a asks a...
question, as in chu(h), is he? If adds emphasis, as in chu(h), he is indeed; and ty adds a question with emphasis, as in chu(h)ty, is he indeed?

Two or three suffixes may be employed together, as in kar*, was made, karu-m, was made by me, kar*+m-akh*, was thou made by me? The two kk suffixes become h with v when they are followed by a pronominal suffix commencing with a vowel, as in kar*+h-as (for kar*-kh-as), I was made by them.

E. Conjugation. As in the case of the modern Indo-Aryan vernaculars, the present and future tenses of the verb are mainly participle. Three only of the old tenses, the present, the future and the imperative have survived, the first having become a future, and the second a past conditional. The latter two may be called radical tenses. The verb substantive, which is also used as an auxiliary verb, has a present and a past. The former is made by adding the pronominal suffixes of the nominative to a base chu(h), and the latter by adding the same to a base *a. Thus:

<table>
<thead>
<tr>
<th>Singular</th>
<th>Feminine</th>
<th>Masculine</th>
<th>Feminine</th>
</tr>
</thead>
<tbody>
<tr>
<td>chu-s, I am</td>
<td>chh-s, I am</td>
<td>chh, we are</td>
<td>chh, we are</td>
</tr>
<tr>
<td>chu-ku, thou art</td>
<td>chu-kh, thou art</td>
<td>chu-aa, you are</td>
<td>chu-aa, you are</td>
</tr>
<tr>
<td>chu, he is</td>
<td>chu, she is</td>
<td>chu, they are</td>
<td>chu, they are</td>
</tr>
</tbody>
</table>

As for the finite verb, the modern future (old present), and the past participial (old future) do not change for gender, and do not employ suffixes, but retain relics of the old personal terminations of the tenses from which they are derived. They are thus conjugated, taking the verbal root kar, as the typical verb.

<table>
<thead>
<tr>
<th>Future, I shall make, &amp;c.</th>
<th>Past Conditional, (if I had made, &amp;c.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Singular</td>
<td>Plural</td>
</tr>
<tr>
<td>kara</td>
<td>karapy</td>
</tr>
<tr>
<td>karis</td>
<td>karabs</td>
</tr>
<tr>
<td>kar</td>
<td>karan</td>
</tr>
</tbody>
</table>

For the imperative we have 2nd person singular, kar, plur. karis; third person singular and plural karin. Many of the above forms will be intelligible from a consideration of the closely allied Sanskrit, although they are not derived from that language; but some (e.g. those of the second person singular) can only be explained by the analogy of the Iranian and of the Pitschen languages.

The present participle is formed by adding *a to the root; thus, kar*an, making. It does not change for gender. From this we get a present and an imperative, formed by adding respectively the present and past tenses of the auxiliary verb. Thus, kar*an chus, I (masculine) am making; I make; karan ches, I (feminine) am making, I make; karan *aais, I (masculine) was making; and so on.

There are several past participles, all of which are liable to change for gender, and are utilized in conjugation. We have:

For the imperative we have 2nd person singular, kar, plur. karis; third person singular and plural karin.

Many of the above forms will be intelligible from a consideration of the closely allied Sanskrit, although they are not derived from that language; but some (e.g. those of the second person singular) can only be explained by the analogy of the Iranian and of the Pitschen languages.

The present participle is formed by adding *a to the root; thus, kar*an, making. It does not change for gender. <tr>
<td>kar*mas</td>
<td>kar*mas</td>
<td>kar*mas</td>
<td>kar*mas</td>
</tr>
</tbody>
</table>

The passive is formed by conjugating the auxiliary verb, adding the appropriate suffixes, with the compound past participle. Thus kar*mas* chu-anas, made am-by-him, I has made; tasaj*ma* chu-kh, escaped art thou, thou hast escaped; wuphyoma* chu-us, flown am-I, I have flown. Similarly for the perfect participle, kar*mas* mas-an, was made by-him, I had made me, and so on.

Many verbs have irregular past participles. Thus mar, die, has min*; di, give, has di*; kiki, eat, has hhvay for its weak, and kheyv for its strong participle, which takes the same form, and, respectively. Others must be learnt from the regular grammars.

The infinitive is formed by adding -un to the root; thus kar-un, to make. It is declined like a somewhat irregular noun of the first declension, its accusative being karana. There are three forms of the noun of agency, of which typical examples are kar-awun, kar-an-ad, and kar-an-eruk, a maker.

The present is formed by conjugating the verb yi, come, with the ablative of the infinitive. Thus, karana yiwais chu(h), he is coming, or into coming, i.e. it is being made. A root may be active or causative by adding -aw-un, -aw, or -rav. Thus, kar-anaw*, was made (itself); kenu, cut, has kruvav for its weak, and kruvy for its strong participle, which takes the same form, and, respectively. Others must be learnt from the regular grammars.

F. Indeclinables. Indeclinables (adverbs, prepositions, conjunctions and interjections) must be learnt from the dictionary. The number of interjections is very large, and they are distinguished by minute rules depending on the number of the person addressed and the exact amount of respect due to him.

Literature.—Kashmiri possesses a somewhat extensive literature, which has been very little studied. The missionary William Carey published an edition of the New Testament in the Sardar character, which was the first book published in the language. In 1885 the Rev. J. Hinton Knowles published at Bombay a collection of Kashmiri proverbs and sayings, and K. F. Burkhard in 1895 published an edition of Mahamad Gami’s poem on Yausuf and Zulaihah. This, with the exception of later translations of the Scriptures in the Persian character and a few minor works, is all the literature that has been printed or about which anything has been written. Mahamad Gami’s poem is valuable as an example of the Kashmiri used by Musulmans. For Hindustani we may refer to the translation of the Jarnaini Dinar by the very popular Lallav-taky, a poem on Sauda published by a woman named Lalladevi, is said to be the oldest work in the language which has survived. Another esteemed work is the Sheva Parinya of Krsna Rujamaka, a living author. These and other works which have been studied by the present writer have little independent value, being imitations of Sanskrit literature. Nothing is known about the dates of most of the authors.
AUTHORITIES.—The scientific study of Kashmiri is of very recent date. The only printed lexicographical work is a short vocabulary by W. J. Elmslie (London, 1872). K. F. Burkhard brought out a grammar of the Musalmun dialect in the Proceedings of the Royal Bavarian academy of Sciences for 1887–1888, of which a translation by G. A. Grierson appeared in the Indian Antiquary of 1895 and the following years (reprinted as a separate publication, Bombay, 1897). T. R. Wade (London, 1897) is the latest sketch, and the only attempt at a complete work of the kind in English is G. A. Grierson's Essays on Kâshmiri Grammar (London and Calcutea, 1890). A valuable native grammar in Sanskrit, the Kasminiababomta of Isvar Kania, has been edited by the same writer (Calcutta, 1888). For an examination of the origin of Kashmiri grammatical forms and the Pśiqa question generally, see G. A. Grierson's "On Certain Suffixes in the Modern Indo-Aryan Vernaculars" in the Zeitschrift für Vergleichende Sprachenforschung auf dem Gebiete der indischen Sprachen für 1903 and The Pśiqa Languages of North-Western India (London, 1906).

The only imp. ext. text which has been published is Burkhard's edition, with a partial translation, of Mahmūd Gā'īn's "Yūsuf and Zulaikha" in the Zeitschrift der Deutschen Morgenländischen Gesellschaft for 1895 and 1899. The text of the Sīra Fariyaya, edited by G. A. Grierson, is in course of publication by the Asiatic Society of Bengal.

KASHUBES—KASSALA

(K. G.)

KASHUBES (sing. Kaszub, plur. Kaszeba), a Slavonic people numbering about 200,000, and living on the borders of West Prussia and Pomerania, along the Baltic coast between Danzig and Lake Garden, and inland as far as Konitz. They have no literature and no history, as they consist of peasants and fishermen, the educated classes being mostly Germans or Poles. Their language has been held to be but a dialect of Polish, but it seems better to separate it, as in some points it is quite independent, in some it offers a resemblance to the language of the Polabs (q.v.). This is most seen in the western dialect of the so-called Slovinci (of whom there are about 250 left) and Kabâtki, whereas the eastern Kashube is more like Polish, which is encroaching upon and assimilating it. Lorentz calls the western dialect a language, and distinguishes 38 vowels. The chief points of Kashube as against Polish are that all its vowels can be nasal instead of o and e only, that it has preserved quantity and a free accent, has developed several special vowels, e. g. a, e, i, and has preserved the original order, e. g. garden as gread. The consonants are very Polish. (See also SLAVS.)

AUTHORITIES.—F. Lorentz, Slawinska Gramatik (St Petersburg, 1903) and "Die gegenseitigen Verhältnisse der sogen. Lechtischen Sprachen," in Arch. f. Slav. Phil. xiv. (1900); J. Ramult, Słownik języka pomorskiego czyli kaszubskiego, i.e. of the Necropoleon of the Sea Coast (Pomeranian) or Kashubian (Cracow, 1893).

KASIMOV, a town of Russia, in the government of Ryazan, on the Oka River, in 54° 56' N. and 41° 3' E., 75 m. E.N.E. of Ryazan. Pop. 28,545, of whom about 1000 were Tatars. It is famed for its tanneries and leather goods, sheepskins and post-horse bells. Founded in 1152, it was formerly known as Meshcherski Gorodets. In the 14th century it became the capital of a Tatar khaneate, subject to Moscow, and so remained until 1667. The town possesses a cathedral, and a mosque supposed to have been built by Kasim, founder of the Tatar principality. Near the mosque stands a mausoleum built by Shah-All in 1535. Lying on the direct road from Astrakhan to Moscow and Nizhniy-Novgorod, Kasimov is a point of some trade, and has a large annual fair in July. The waiters in the best hotels of St. Petersburg are mostly Kasimov Tatars.

See Veliaminov-Terov, The Kasimov Tatars (St. Petersburg, 1853–1866).

KASSA (Ger. Kaschau; Lat. Casonia), the capital of the county of Abauj-Torna, in Hungary, 170 m. N.E. of Budapest by rail. Pop. (1900), 35,856. Kassa is one of the oldest and hand- somest towns of Hungary, and is pleasantly situated on the right bank of the Hernád. It is surrounded on three sides by hills covered with forests and vineyards, and opens to the S. E. towards a pretty valley watered by the Hernád and the Tarcza. Kassa consists of the inner town, which was the former old town surrounded with walls, and of three suburbs separated from it by a broad glacial. The most remarkable building, considered the grandest masterpiece of architecture in Hungary, is the Gothic cathedral of St. Elizabeth. Begun about 1270 by Stephen V., it was continued (1342–1382) by Queen Elizabeth, wife of Charles I., and her son Louis I., and finished about 1468, in the reign of Matthias I. (Corvinus). The interior was transformed in the 18th century to the Renaissance style, and the whole church thoroughly restored in 1877–1886. The church of St Michael and the Franciscan or garrison church date from the 13th century. The royal law academy, founded in 1659, and sanctioned by golden bull of King Leopold I. in 1660, has an extensive library; there are also a museum, a Roman Catholic upper gymnasium, and secondary for priests, and other schools and benevolent institutions. Kassa is the see of a Roman Catholic bishopric. It is the chief political and commercial town of Upper Hungary, and the principal entrepôt for the commerce between Hungary and Galicia. Its most important manufactures are tobacco, machinery, iron, furniture, textiles and millings. About 3 m. N.W. of the town are the baths of Bankó, with alkaline and ferruginous springs, and about 12 m. N.E. lies Rákó–Herlein, with an intermittent chalybeate spring. About 20 m. W. of Kassa lies the famous Pietroburgo, the seed of the city of Ryazan, of the 13th century. The abbey contains a rich library and valuable archives. In the neighbourhood is a fine stalactite groto, which often served as a place of refuge to the inhabitants in war time.

Kassa was created a town and granted special privileges by Béla IV. in 1235, and was raised to the rank of a royal free town by Stephen V. in 1270. In 1290 it was surrounded with walls. The subsequent history presents a long record of revolts, sieges and disastrous conflagrations. In 1430 the plague carried off a great number of the inhabitants. In 1458 the right of minting money according to the pattern and value of the Buda coinage was granted to the municipality by King Matthias I. The bishopric was established in 1804. In the revolutionary war of 1848–49 the Hungarians were twice defeated before the walls of Kassa by the Austrians under General Schlick, and the town was held successively by the Austrians, Hungarians and Russians.

KASSALA, a town and mudiria of the Anglo-Egyptian Sudan. The town, a military station of some importance, lies on the river Gash (Mareb) in 15° 28' N., 36° 24' E., 260 m. E.S.E. of Khartum and 240 m. W. of Massawa, the nearest seaport. Pop. about 25,000. It is built on a plain, 1700 ft. above the sea, at the meeting of the Abyssinian highlands 15 m. W. of the frontier of the Italian colony of Eritrea. Two dome-shaped mountains about 2600 ft. high, jebeds Mokram and Kassala, rise abruptly from the plain some 3 m. to the east and south-east. These mountains and the numerous gardens Kassala contains give to the place a picturesque appearance. The chief buildings are of brick, but most of the natives dwell in grass tubuls. A short distance from the town is Khatmia, containing a tomb mosque with a high tower, the headquarters of the Morgan family. The sheikhs El Morgan are the chiefs of a religious brotherhood, widely spread and of considerable influence in the eastern Sudan. The Morgan family are of Afghan descent. Long settled in Jidda, the head of the family removed to the Sudan about 1800 and founded the Morgan sect. Kassala was founded by the Egyptians in 1840 as a fortified post from which to control their newly conquered territory near the Abyssinian frontier. In a few years it grew into a place of some importance. In November 1883 it was besieged by the dervishes. The garrison held out till the 30th of July 1885 when owing to lack of food they capitulated. Kassala was captured from the dervishes by an Italian force under Colonel Baratieri on the 17th of July 1894 and by the Italians was handed over on Christmas day 1897 to Egypt. The bulk of the inhabitants are Hallega "Arabs." Kassala mudiria contains some of the most fertile land in the Anglo-Egyptian Sudan. It corresponds roughly with the district formerly known as Taka. It is a region of light rainfall, and cultivation depends chiefly on the Gash flood. The river is however absolutely dry from October to June. White dura of excellent quality is raised.
KASSASSIN, a village of Lower Egypt, 22 m. by rail W. of Ismailia on the Suez Canal. At this place, on the 28th of August and again on the 9th of September 1882 the British force operating against Arabi Pasha was attacked by the Egyptians—both attacks being repulsed (see Egypt: Military Operations).

KASSITES, an Elamite tribe who played an important part in the history of Babylonia. They still inhabited the north-western mountains of Elam, immediately south of Halwan, when Sennacherib attacked them in 702 B.C. They are the Kassaeans of Ptolemy, who divides Susiana between them and the Elamians; according to Strabo (xi. 13, 3, 6) they were the neighbours of the Amirs (Bitolia). Later, when Meheke (679-624, p. 173) has shown that they are the Kassians of the older Greek authors who are identified with the Susians by Aeschylus (Choephor. 424, Pers. 17, 120) and Herodotus (v. 49, 52). We already hear of them as attacking Babylonia in the 9th year of Samsu-iluna the son of Khammurabi, and about 1780 B.C. they overran Babylonia and founded a dynasty there which lasted for 576 years and nine months. In the course of centuries, however, they were absorbed into the Babylonian population; the kings adopted Semitic names and married into the royal family of Assyria. Like the other languages of the non-Semitic tribes of Elam that of the Kassites was written in cuneiform, a vocabulary of it has been handed down in a cuneiform tablet, as well as a list of Kassite names with their Semitic equivalents. It has no connexion with Indo-European, as has erroneously been supposed. Some of the Kassite deities were introduced into the Babylonian pantheon, and the Kassite tribe of Khubirs seems to have settled in the Babylonian plain.

See Fr. Delitzsch, Die Sprache der Kassiten (1884). (A. H. S.)

KASTAMBUL. (Kastambol.) (1) A vilayet of Asia Minor which includes Paphlagonia and parts of Pontus and Galatia. It is divided into four sanjaks—Kastambul, Bolu, Changra and Sinope—is rich in mineral wealth, and has many mineral springs and extensive forests, the timber being used for charcoal and building and the bark for tanning. The products are chiefly cereals, fruits, opium, cotton, tobacco, wool, ordinary goat-hair and mohair, in which there is a large trade. There are coal-mines at and near Ereğli (anc. Heracleia) which yield steam coal nearly as good in quality as the English, but they are badly worked. Its population comprises about 953,000 Moslems and 27,000 Christians. (2) The capital of the vilayet, the ancient Castamum, is situated in the valley of the Gediz, and connected by a carriage road, 54 m. with its port Ineboli on the Black Sea. The town is noted for its copper utensils, but the famous copper mines about 36 m. N., worked from ancient times to the 10th century, are now abandoned. There are over 30 mosques in the town, a dervish monastery, and numerous theological colleges (medreses), and the Moslem inhabitants have a reputation for bigotry. The climate though subject to extremes of heat and cold is healthy; in winter the roads are often closed by snow. The population of 16,000 includes about 2,500 Christians. Castamon became an important city in later Byzantine times. It lay on the northern trunk-road to the Euphrates and was built round a strong fortress whose ruins crown the rocky hill west of the town. It was taken by the Danishmend Amirs of Sivas early in the 12th century, and passed to the Turks in 1303. (J. G. C. A.)

KASTORIA (Turkish Kesrie), a city of Macedonia, European Turkey, in the vilayet of Monastir, 45 m. S. by W. of Monastir (Bitolia). Pop. (1905), about 10,000, one-third of whom are Greeks, one-third Slavs, and the remainder Albanians or Turks. Kastoria occupies part of a peninsula on the western shore of Lake Kastoria, which here receives from the north its affluent the Zelova. The lake is formed in a deep hollow surrounded by limestone mountains, and is drained on the south by the Bistritza, a large river which flows S.E. nearly to the Greek frontier, then sharply turns N.E., and finally enters the Gulf of Salonica. The lake has a area of 20 sq. m., and is 2850 ft. above sea-level. Kastoria is the seat of an Orthodox bishop. It is usually identified with the ancient Celetrum, captured by the Romans under Sulpiadius, during the first Macedonian campaign, 200 B.C., and better known for the defence maintained by Bryennius against Alexis L. in 1084. A Byzantine wall with round towers runs across the peninsula.

KASUR, a town of British India, in the Lahore district of the Punjab, situated on the north bank of the old bed of the river Beas, 34 m. S.E. of Lahore. Pop. (1901), 22,022. A Rajput colony seems to have occupied the present site before the earliest Mahommedan invasion; but Kasur does not appear in history until late in the Mussulman period, when it was settled by a Pathan colony from beyond the Indus. It has an export trade in grain and cotton, and manufactures of cotton and leather goods.

KATANGA, the sub-province of the double province of Kano in the British protectorate of Northern Nigeria. It lies approximately between 11° and 13° N. and 8° 20' and 10° 40' E. It is bounded N. by the French Sudan, E. by Bornu, S. by Bauchi, and W. by Kano. Katagum consists of several small but ancient Mahommedan emirates—Katagum, Messau, Gummel, Hadejia, Machena, with a fringe of Bedde pagans on its eastern frontier towards Bornu, and other pagans on the south towards Bauchi. The Waube flows from Kano through the province via Hadejia and Gummel; the Kattagum falls into it, that of the transport of goods brought by the Zungeru-Zaria-Kano railway to the headquarters of Katagum and western Bornu. Katagum is a fertile province inhabited by an industrious people whose manufactures rival those of Kano.

In ancient times the province of Katagum formed the debarable country between Bornu and the Hausa states. Though Mahommedan it resisted the Fula invasion. Its northern emirates were for a long time subject to Bornu, and its customs are nearly assimilated to those of Bornu. The province was taken under administrative control by the British in October 1903. In 1904 the capitals of Gummel, Hadejia, Messau and Jemaari were brought into touch with the administration and native and provincial courts established. At the beginning of 1905 Katagum was incorporated as a sub-province with the province of Kano, and the administrative organization of a double province was extended over the whole. Hadejia, which is a very wealthy town and holds an important position both as a source of supplies and a centre of trade, received a garrison of mounted infantry and became the capital of the sub-province.

Hadejia was an old Habe town and its name, an evident corruption of Haideja, the name of the celebrated wife and first convert of Mahommed, is a strong presumption of the incorrectness of the Fula claim to have introduced Islam to its inhabitants. The ruling dynasty of Hadejia was, however, overthrown by Fula usurpation towards the end of the 18th century, and the Fula ruler received a flag and a blessing from Dan Fodio at the beginning of his sacred war in the opening years of the 19th century. Nevertheless the habit of independence being strong in the town of Hadejia the little emirate held its own against Sokoto, Bornu and all comers. Though included nominally within the province at Katagum it was the boast of Hadejia that it had never been conquered. It had made formal submission to the British in 1903 on the successful conclusion of the Kano-Sokoto campaign, and in 1905, as has been stated, was chosen as the capital of the sub-province. The emir's attitude became, however, in the spring of 1906 openly antagonistic to the British and a military expedition was sent against him. The emir with his disaffected chiefs made a plucky stand but after five hours' street fighting the town was reduced. The emir and three of his sons were killed, and a new emir, the rightful heir to the throne, who had shown himself in favour of a peaceful policy, was appointed. The offices of the war chiefs in Hadejia were abolished and 150 yards of the town wall were broken down.

Slave dealing is at an end in Katagum. The military station at Hadejia forms a link in the chain of British forts which extends along the northern frontier of the protectorate. (See Nigeria.) (F. L. L.)

KATANGA, a district of Belgian Congo, forming the southwestern part of the colony. Area, approximately, 180,000 sq. m.; estimated population 1,000,000. The natives are members of
the Luba-Lunda group of Bantus. It is a highly mineralized region, being specially rich in copper ore. Gold, iron and tin are also mined. Katanga is bounded S. and S.E. by Northern Rhodesia, and British capital is largely interested in the development of its resources, the administration of the territory being entrusted to a committee on which British members have seats. Direct railway communication with Cape Town and Beira was established in 1900. There is also a rail and river service via the Congo to the west coast. (See CONGO FREE STATE.)

KATER, HENRY (1777-1835), English physicist of German descent, was born at Bristol on the 16th of April 1777. At first he proposed to study law; but this he abandoned the year of his death in 1794, and entered the army, obtaining a commission in the 12th regiment of foot, then stationed in India, where he rendered valuable assistance in the great trigonometrical survey. Failing health obliged him to return to England; and in 1808, being then a lieutenant, he entered on a distinguished student career in the senior department of the Royal Military College at Sandhurst. Shortly after he was promoted to the rank of captain. In 1814 he retired on half-pay, and devoted the remainder of his life to scientific research. He died at London on the 26th of May 1835.

His first important contribution to scientific knowledge was the comparison of the merits of the Cassgrainian and Gregorian telescopes, from which (Phil. Trans., 1813 and 1814) he deduced that the illuminating power of the former exceeded that of the latter in the proportion of 5:2. This inferiority of the Gregorian he explained as being probably due to the mutual interference of the rays as they crossed at the principal focus before reflection at the second mirror. His most valuable work was the determination of the length of the second's pendulum, first at London and subsequently at various stations throughout the country (Phil. Trans., 1818, 1819). In these researches he skillfully took advantage of the well-known property of reciprocity between the centres of suspension and oscillation of an oscillating body, so as to determine experimentally the precise position of the centre of oscillation; the distance between these centres was then the length of the ideal simple pendulum having the same time of oscillation. As the inventor of the floating collimator, Kater rendered a great service to practical astronomy (Phil. Trans., 1825, 1828). He also published memoirs (Phil. Trans., 1821, 1831) on British standards of length and mass; and in 1832, he published an account of his labours in verifying the Russian statement that for the determination of the standard yard his body, in the respect he received in 1814 the decoration of the St. Anne; and the same year he was elected a fellow of the Royal Society.

His attention was also turned to the subject of compass needles, his Bakerian lecture " On the Best Kind of Steel and Form for a Compass Needle" (Phil. Trans., 1821) containing the results of many experiments. The treatise on "Mechanics" in Lardner's Cyclopedia was partly written by him; and his interest in more purely astronomical questions was evidenced by two communications to the Astronomical Society's Memoirs for 1831-1833—the one on an observation of Saturn's outer ring, the other on a method of determining longitude by means of lunar eclipses.

KATHA, a district in the northern division of Upper Burma, with an area of 6094 sq. m., 1730 of which consists of the former separate state of Wuntho. It is bounded N. by the Upper Chindwin, Bhamo and Myitkyina districts, E. by the Kaukwe River as far as the Irrawaddy, thence east of the Irrawaddy by the Shan State of Mong Mit (Momeik), and by the Shweli River, S. by the Ruby Mines district and Shwebo, and W. by the Upper Chindwin district. Three ranges of hills run through the district, known as the Kebula, the Minwun, Gangaw and Mangin ranges. They separate the three½ valleys—the Irrawaddy, the Méa and the Mu. The Minwun range runs from north to south, and forms for a considerable part of its length the dividing line between the Katha district proper and what formerly was the Wuntho state. Its average altitude is between 1500 and 2000 ft. The Gangaw range runs from the north of the district for a considerable portion of its length close to and down the right bank of the Irrawaddy as far as Tigyaining, where the Myathetindan pagoda gives its name to the last point. Its highest point is 4400 ft., but the average is between 1500 and 2000 ft. The Katha branch of the railway crosses it at Petsut, a village 12 miles west of Katha town. The Mangin range runs through Wuntho (highest peak, Maingthon, 5450 ft.).

Gold, copper, iron and lead are found in considerable quantities in the district. The Kyaupkzat gold-mines, worked by an English company, gave good returns, but the quartz reef proved to be a mere pocket and is now worked out. The iron, copper and lead are not now worked. Jade and soapstone also exist, and salt is produced from brine wells. There are three forest reserves in Katha, with a total area of 1219 sq. m. The population in 1890 was 15,212. An increase of 3% is recorded in the census of 1901. The number of Shans is about half that of Burmese, and of Kadus half that of Shans. The Shans are mostly in the Wuntho subdivision. Rice is the chief crop in the plains, tea, cotton, sesamum and hill rice in the hills. The valley of the Méa, which is very malarious, was used as a convict settlement under Burmese rule. The district was first occupied by British troops in 1886, but it was not finally quieted till 1890, when the Wuntho sawbwa was deposed and his state incorporated in Katha district. Katha is the headquarters of the district. The principal means of communication are the Irrawaddy River, a branch of the Irrawaddy, which runs between Mandalay and Bhamo, and the railway which communicates with Sagaing to the south and Myitkyina to the north. A ferry-steamers plies between Katha and Bhamo.

KATHIAWAR, or KATYWAR, a peninsula of India, within the Gujarat division of Bombay, giving its name to a political agency. Total area, about 23,400 sq. m.; pop. (1901), 2,645,805. These figures include a portion of the British district of Ahmedabad, a portion of the state of Baroda, and the small Portuguese settlement of Diu. The peninsula is bounded N. by the Rann of Cutch, E. by Ahmedabad district and the Gulf of Cambay, and S. by the Gulf of Khambat, where the extreme length is 270 m., the greatest breadth about 165 m. Generally speaking, the surface is undulating, with low ranges running in various directions. With the exception of the Tangha and Mandav hills, in the west of Jhalawar, and some unimportant hills in Hallar, the northern portion of the country is flat; but in the south, from near Gogo, the Gir range runs nearly parallel with the coast, and at a distance of about 20 m. from it, along the north of Babriawar and Sorath, to the neighbourhood of Girnar. Opposite this latter mountain is the solitary Osam hill, and then still farther west a range of hills, between Hallar and Barada, running about 20 m. north and south from the hill to Ramwadi. The Girnar group of mountains is an important granitic mass, the highest peak of which rises to 3500 ft. The principal river is the Bhadar, which rises in the Mandav hills, and flowing S.W. falls into the sea at Navi-Bandar; it is everywhere marked by highly cultivated lands adjoining its course of about 115 m. Other rivers are the Aji, Machhu and Satrunji—the last remarkable for romantic scenery. Four of the old races, the Jaitwas, Churassamas, Solunkis and Walas still exist as proprietors of the soil who exercised sovereignty in the country prior to the immigration of the Jhals, Jadejas, Purans, Kathis, Gohels, Jats, Mahomedans and Maharrats, between whom the country is now chiefly partitioned out. Kathiwar has many notable antiquities, comprising a rock inscription of Asoka, Budhish caves, and fine Jain temples on the sacred hill of Girnar and at Patiana.

The political agency of Kathiawar has an area of 20,882 sq. m. In 1901 the population was 2,320,166, showing a decrease of 15% in the decade due to the results of famine. The estimated gross revenue of the several states is £1,278,000; total tribute (payable to the British, the gaekwar of Baroda and the nawab of Junagarh), £70,000. There are altogether 193 states of varying size and importance, of which 14 exercise independent jurisdiction, while the rest are more or less under British administration.

The eight states of the first class are Junagaw, Nawanganar, Bhaunagar, Porbandar, Dhrangadra, Morvi, Gondal and Jafarabad. The headquarters of the political agent are at Rajkot, in the centre of the peninsula, where also is the Rajkum college, for the education of the sons of the chiefs. There is a similar school for giriras, or chiefs of lower rank, at Gondal. An
excellent system of metre-gauge railways has been provided at the cost of the leading states. Maritime trade is also very active, the chief ports being Porbandar, Mangrol and Veraval. In 1909 the trade was valued at 24,000,000 rupees, and the imports at £1,120,000. The progressive prosperity of Kathiawar received a shock from the famine of 1890-1900, which was felt everywhere with extreme severity.

KATKOV, Michael Nikiforovich (1818-1887), Russian journalist, was born in Moscow in 1818. On finishing his course at the university he devoted himself to literature and philosophy, and showed so little individuality that during the reign of Nicholas I he never once came into disagreeable contact with the authorities. With the Liberal reaction and strong reform movements, Katkov entered the field of journalism and even rose to the position of Press-censor and Editor-in-Chief of the Government, by representing with great ability the moderately Conservative spirit of Moscow in opposition to the occasionally ultra-Liberal and always cosmopolitan spirit of St Petersburg. With the Slavophils he agreed in advocating the extension of Russian influence in south-eastern Europe, but he carefully kept aloof from them and condemned their archaeological and ecclesiastical sentimentiality. Though generally temperate in his views, he was extremely incisive and often violent in his modes of expressing them, so that he made many enemies and sometimes incurred the displeasure of the press-censor and the ministries, against which he was more than once protected by Alexander III. in consideration of his able advocacy of national interests. He is remembered chiefly as an energetic opponent of Polish national aspirations, of extreme Liberalism, of the system of public instruction based on natural science, and of German political influence. In this last capacity he helped to prepare the way for the Franco-Russian alliance.

KATMANDU (less correctly Khaltmandu), the capital of the state of Nepal, India, situated on the bank of the Vishnumati river, is the seat of the Rajah of the Bhagmati raj. The town, which is said to have been founded about 723, contains a population estimated at 70,000, occupying 5000 houses made of brick, and usually from two to four stores high. Many of the houses have large projecting wooden windows or balconies, richly carved. The maharaja's palace, a huge, rambling, ungainly building, stands in the centre of the town, which also contains numerous temples. One of these, a wooden building in the centre of the town, gives it its name (kat = wood). The streets are extremely narrow, and the whole town very dirty. A British resident is stationed about a mile north of the town.

KATO, Taka-Akira (1859- ), Japanese statesman, was born at Nagoya, and commenced life as an employee in the great firm of Mitsui Bishi. In 1887 he became private secretary to Count Okuma, minister of state for foreign affairs. Subsequently he served as director of a bureau in the finance department, and from 1894 to 1899 he represented his country at the court of St James. He received the portfolio of foreign affairs in the fourth tō阁 cabinet (1900-1901), which remained in office only a few months. Appointed again to the same position in the Sajō cabinet (1906), he resigned after a brief interval, being opposed to the nationalization of the private railways, which measure the cabinet approved. He then remained without office until 1908, when he again accepted the post of ambassador in London. He was decorated with the grand cross of St Michael and St George, and earned the reputation of being one of the strongest men among the junior statesmen.

KATRINE, Loch, a freshwater lake of Scotland, lying almost entirely in Perthshire. The boundary between the counties of Perth and Stirling runs from Glengyle, at the head of the lake, down the centre to a point opposite Stronachlachar from which it strikes to the south-western shore towards Loch Arleik. The loch, which has a south-easterly trend, is about 8 m. long, and its greatest breadth is 1 m. It lies 364 ft. above the sea-level, It occupies an area of 44 square miles and has a drainage basin of 372 square miles. The average depth is 142 ft., the greatest depth being 495 ft. The average annual rainfall is 76 inches. The mean temperature at the surface is 56° F., and at the bottom 42° F.. The scenery has been immortalized in Sir Walter Scott's Lady of the Lake. The last years of Alexander II's reign, in the highlands of the west, and the important heights of the Ben A'an (1750 ft.) and the grassy cliffs and broken contour of Ben Venue (2303 ft.) It is fed by the Clyde and numerous burns, and drained by the Achray to Loch Achray and thence by the Black Avon to Loch Venacher. Since 1859 it has formed the chief source of the water-supply of Glasgow, the aqueduct leaving the lake about 15 m. S.E. of Stronachlachar. By powers obtained in 1885 the level of the lake was increased by 5 ft. by a system of sluices regulating the outflow of the Achray. One result of this damming up has been to submerge the villages of Achray and Stronachlachar. The principal points on the shores are Glengyle, formerly a fastness of the Macgregors, the Trossachs, the Goblins' Cave on Ben Venue, and Stronachlachar (Gaelic, "the mason's nose"), from which there is a ferry to Collachra on the opposite side. A road has been constructed from the Trossachs for nearly 6 miles along the northern shore. During summer steamers ply between the Trossachs and Stronachlachar and there is a daily service of coaches from the Trossachs to Callander (about 10 m.) and to Aberfoyle (9 m.), and between Stronachlachar, to Inver- snaid on Loch Lomond (about 44 m.). The road to Inversnaid passes through the Macgregors' country referred to in Scott's Rob Roy.

KATSENA, an ancient state of the western Sudan, now included in the province of Kano in the British protectorate of Northern Nigeria. Katsena was amongst the oldest of the Hausa states. There exist manuscripts which carry back its history for about 1000 years and tradition ascribes the origin of the Hausa population, which is known also by the name of Habe or Habeche, to the union of Bajibida of Bagdad with a prehistoric queen of Daura. The conquest of the Habe of Katsena by the Fulani about the beginning of the 19th century made little difference to the country. The more cultivated Habe were already Mahommaded and the new rulers adopted the existing customs and system of government. These were in many respects highly developed and included elaborate systems of taxation and justice.

The capital of the administrative district is a town of the same name, in 13° N., 7° 41' E., being 160 m. E. by S. of the city of Sokoto, and 84 m. N.W. of Kano. The walls of Katsena have a circuit of between 13 and 14 miles, but only a small part of the enclosed space is inhabited. In the 17th and 18th centuries it appears to have been the largest town in the Hausa countries, and its inhabitants at that time numbered some 100,000. The date of the foundation of the present town must be comparatively modern, for it is believed to have been moved from its ancient site and at the time of Leo Africanus (c. 1523) there was no place of any considerable size in the province of Katsena. Before that period Katsena boasted of being the chief seat of learning throughout the Hausa states and this reputation was maintained to the time of the Fulah conquest. In the beginning of the 19th century the town fell into the hands of the Fulah, but only after a protracted and heroic defence. In March 1903 Sir F. Lugard visited Katsena on his way from Sokoto and the emir and chiefs accepted British suzerainty without fighting. The Katsena district has since formed an administrative district in the double province of Kano and Katagum. The emir was unfaithful to his oath of allegiance to the British crown, and was deposed in 1904. His successor was installed and took the oath of allegiance
in December of the same year. Katsena is a rich and populous district.

See the Travels of Heinrich Barth (new ed., London, 1890, chs. xxiii. and xxiv.). Consult also the Annual Reports on Northern Nigeria issued by the Colonial Office, London, particularly the Report for 1902.

Katsena is also the name of a town in the district of Katsena-Allah, in the province of Muri, Northern Nigeria. This district is watered by a river of the same name which takes its rise in the mountains of the German colony of Cameroon, and flows into the Benue at a point above Abinai.

Katsena, Taro, Marquess (1847- ), Japanese soldier and statesman, was born in 1847 in Choshu. He commanded his career by fighting under the Imperial banner in the civil war of the Restoration, and he displayed such talent that he was twice sent at public expense to Germany (in 1870 and 1884) to study strategy and tactics. In 1886 he was appointed vice-minister of war, and in 1891 the command of division devolved on him. He led the left wing of the Japanese army in the campaign of 1894-95 against China, and made a memorable march in the depth of winter from the north-east shore of the Yellow Sea to Haicheng, finally occupying Niuchwang, and effecting a junction with the second army corps which enabled him to attack the Liaotung peninsula. For these services he received the title of viscount. He held the portfolio of war from 1898 to 1901, when he became premier and retained office for four and a half years, a record in Japan. In 1902 his cabinet concluded the first entente with England, which event procured for Katsena the rank of count. He also directed state affairs throughout the war with Russia, and concluded the offensive and defensive treaty of 1905 with Great Britain, receiving from King Edward the grand cross of the order of St Michael and St George, and being raised by the mikado to the rank of marquess. He resigned the premiership in 1905 to Marquess Saionji, but was again invited to form a cabinet in 1908. Marquess Katsura might be considered the chief exponent of conservative views in Japan. Adhering strictly to the doctrine that ministries were responsible to the emperor alone and not at all to the diet, he stood wholly aloof from political parties, only his remarkable gift of tact and conciliation enabling him to govern on such principles.

Katwerfelo (or Katterfelo), Gustavus (d. 1709), quack doctor and conjurer, was born in Prussia. About 1782 he came to London, where his advertisements in the newspapers, headed: "Wonders! Wonders! Wonders! which enabled him in the trade most profitably upon the credulity of the public during the widespread influenza epidemic of that year. His public entertainment, which, besides conjuring, included electrical and chemical experiments and demonstrations with the microscope, extracted a flattering testimonial from the royal family, who witnessed it in 1784. The poet William Cowper refers to Katwerfelo in The Task; he became notorious for a long tour he undertook, exciting marvel by his conjuring performances.

Kattowitz, a town in the Prussian province of Silesia, on the Rawa, near the Russian frontier, 5 m. S.E. from Beuthen by rail. Pop. (1875), 11,252; (1905), 35,772. There are large iron-works, foundries and machine shops in the town, and near it zinc and anthracite mines. The growth of Kattowitz, like that of other places in the same district, has been very rapid, owing to the development of the mineral resources of the neighbourhood. In 1825 it was a mere village, and became a town in 1857. It has monuments to the emperors William I. and Frederick III.

See G. Hoffmann, Geschichte der Stadt Kattowitz (Kattowitz, 1895).

Kata, or Cutwa, a town of British India, in Burdwan district, Bengal, situated at the confluence of the Bhagirathi and Ajai rivers. Pop. (1901), 7220. It was the residence of many wealthy merchants, but its commercial importance has declined as it is without railway communication and the difficulties of the river navigation have increased. It was formerly regarded as the key to Murshidabad. The old fort, of which scarcely a vestige remains, is noted as the scene of the defeat of the Maharattas by Ali Vardi Khan.

Katzdid, the name given to certain North American insects, belonging to the family Locustidae, and related to the green or tree grasshoppers of England. As in other members of the family, the chirrup, alleged to resemble the words "Katzidid," is produced by the friction of a file on the underside of the left forewing over a ridge on the upper side of the right. Several species, belonging mostly to the genera Microcentonus and Cyrtophillus, are known.

Kaufbeuren, a town in the kingdom of Bavaria, on the Wertach, 55 m. S.W. of Munich by rail. Pop. (1903), 8955. Kaufbeuren is still surrounded by its medieval walls and presents a handsome town hall with fine paintings, an old tower (the Hexenturm, or witches' tower), a museum and various educational institutions. The most interesting of the ecclesiastical buildings is the chapel of St Blasius, which was restored in 1896. The chief industries are cotton spinning, weaving, bleaching, dyeing, printing, machine building and lithography, and there is an active trade in wine, beer and cheese. Kaufbeuren is said to have been founded in 842, and is first mentioned in chronicles of the year 1126. It appears to have become a free imperial city about 1288, retaining its autonomy until 1805, when it passed to Bavaria. It was formerly a resort of pilgrims, and Roman coins have been found in the vicinity.

See F. Steine, Die Reichskonig Kaufbeuren und die bayrische Restaurationspolitik (Munchen, 1879); and Schroeder, Geschichte der Stadt und Katholischen Pfarrei Kaufbeuren (Augsburg, 1903).

Kaufmann, Maria Anna Angelica (1741-1827), the once popular artist and Royal Academician, was born at Coire in the village of Gravedonne, near the 30th of October 1741. Her father, John Josef Kaufmann, was a poor man and mediocre painter, but apparently very successful in teaching his precocious daughter. She rapidly acquired several languages, read incessantly, and showed marked talents as a musician. Her greatest progress, however, was in painting; and in her twelfth year she had become a notability, with bishops and nobles for her sitters. In 1754 her father took her to Milan. Later visits to Italy of long duration appear to have succeeded this excursion; in 1763 she visited Rome, returning to it again in 1764. From Rome she passed to Bologna and Venice, being everywhere feted and caressed, as much for her talents as for her personal charms. Writing from Rome in August 1764 to her friend Francis, Winckelmann refers to her exceptional popularity. She was then painting his picture, a half-length, of which she also made an etching. She spoke Italian as well as German, he says; and she also expressed herself with facility in French and English—one result of the last-named accomplishment being that she painted all the English visitors to the Eternal City. "She may be styled beautiful," he adds, "and in singing may vie with our best virtuosi." While at Venice, she was induced by Lady Wentworth, the wife of the English ambassador to accompany her to London, where she appeared in 1766. One of her first works was a portrait of Garrick, exhibited in the year of her arrival at "Mr Moreing's great room in Maiden Lane." The rank of Lady Wentworth opened society to her, and she was everywhere well received, the royal family especially showing her great favour.

Her firmest friend, however, was Sir Joshua Reynolds. In his pocket-book she name as "Miss Angelica" or "Miss Angel," appears frequently, and in 1766 he painted her, a compliment which she returned by her "Portrait of Sir Joshua Reynolds," atet. 46. Another instance of her intimacy with Reynolds is to be found in the variant of Guercino's "El in Arcadia ego" produced by her at this date, a subject which Reynolds repeated a few years later in his portrait of Mrs Bouvier and Mrs Crewe. When, about November 1767, she was entrapped into a clandestine marriage with an adventurer who passed for a Swedish count (the Count de Horn) Reynolds befriended her, and it was doubtless owing to his good offices that her name is found among the signatories to the famous petition to the king for the establishment of the Royal Academy. In its first catalogue of 1769 she appears with "R.A." after her name (an honour which she shared
KAUFMANN, C. P.—KAULBACH

KAUKAUNA, a city of Outagamie county, Wisconsin, U.S.A., on the Fox river 7 m. N.E. of Appleton and about 100 m. N. of Milwaukee. Pop. (1900), 3135, of whom 1044 were foreign-born (1895) 4907; (85-5) 10. The same Kauckaun belonged to the illus-

try urban electric railway lines connecting with other cities in the Fox river, valley, and by river steamboats. It has a Carnegie library, a hospital and manufactories of pulp, paper, lumber and woodenware. Dam on the Fox River furnish a good water-power. The city owns its water-works.

A small settlement of Indian traders was made here as early as 1821; in 1830 a Presbyterian mission was established, but the growth of the place was slow, and the city was not chartered until 1885.

KAULBACH, WILHELM, an artist, was born in Westphalia on the 13th of October 1825. His father, who was poor, combined painting with the goldsmith’s trade, but means were found to place Wilhelm, a youth of seventeen, in the art academy of Düsseldorf, then becoming renowned under the directorship of Peter von Cornelius. Young Kaulbach contended against hardships, even hunger. But his courage never failed; and, uniting genius with industry, he was ere long foremost among the young national party which sought to revive the arts of Germany. The ambitious work by which Louis I. sought to transform Munich into a German Athens afforded the opportunity of a rapid rise to artistic fame. An ambitious mission was de-

missioned to execute the enormous frescoes in the Glyptothek, and his custom was in the winters, with the aid of Kaulbach and others, to complete the cartoons at Düsseldorf, and in the summers, accompanied by his best scholars, to carry out the designs in colour on the museum walls in Munich. But in 1824 Cornelius became director of the Bavarian academy. Kaulbach, not yet twenty, followed, took up his permanent residence in Munich, laboured hard on the public works, executed independent commissions, and in 1849, when Cornelius left for Berlin, succeeded to the directorship of the academy, and which he held till his death on the 7th of April 1874. His son Hermann (1846–1900) also became a distinguished painter.

Kaulbach matured, after the example of the masters of the Middle Ages, the practice of mural or monumental decoration; he once more conjoined painting with architecture, and displayed a creative fertility and readiness of resource scarcely found since the era of Raphael and Michelangelo. Early in the series of his multidiscending works came the famous Narrenhaus, the appalling memories of a certain madhouse near Düsseldorf; the composition all the more deserves mention for points of contact with Hogarth. Somewhat later came his illustrations to Reineke Fuchs. These, together with occasional figures or passages in complex pictorial dramas, show how dominant and irresistible were the artist’s sense of satire and enjoyment of fun; character in its breadth and sharpness is depicted with keenest relish, and at times the sardonic smile bursts into the loudest laugh. Thus occasionally the grotesque degenerates into the vulgar, the grand into the ridiculous, as in the satire on “the Pigtail Age” in a fresco outside the New Pinakothek. Yet these exceptional extravagances came not of weakness but from excess of power. Kaulbach tried hard to become Grecian and Italian; but he never reached Phidias or Raphael; in short the blood of Dürer, Holbein and Martin Schongauer ran strong in his veins. The art products in Munich during the middle of the 19th century were of a quantity to preclude first-rate quality, and Kaulbach contracted a fatal facility in covering wall and canvas by the ace. He painted in the Hofgarten, the Odeon, the Palace and on the external walls of the New Pinakothek. His perspicuous and showy manner also gained him abundant occupation as a book illustrator; in the pages of the poets his fancy revelled; he was glad to take inspiration from Wieland, Goethe, even Klopstock; among his engraved designs are the Shakespeare gallery, the Goethe gallery and a folio edition of the Gospels. With regard to these examples of “the Munich school,” it was asserted that Kaulbach had been unfortunate alike in having found Cornelius for a master and King Louis for a patron, that he attempted “subjects far beyond him, believing
that his admiration for them was the same as inspiration"; and supplied the lack of real imagination by "a compound of intellect and fancy."

Nevertheless in such compositions as the Destruction of Jerusalem by the Battle of the Huns Kaulbach shows, the stately lucid, simplification of his work, and the effects of action and situation, and thus as it were takes the spectator by storm. The manner may be occasionally noisy and raucy, but the effect after its kind is tremendous. The cartoon, which, as usual in modern German art, is superior to the ultimate picture, was executed in the artist's prime at the age of thirty. At this period, as here seen, the knowledge was little short of absolute; subtle is the sense of beauty; playful, delicate, firm the touch; the whole treatment artistic.

Ten or more years were devoted by the Germans to a "cycle"—a series of pictures depicting the Tower of Babel, the Age of Homer, the Destruction of Jerusalem, the Battle of the Huns, the Crusades and the Reformation. These major tableaux, several 30 ft. long, and each comprising over one hundred figures above life-size, are surrounded by minor compositions making more than twenty in all. The idea is to congregate around the world's historic dramas the prime agents of civilization; thus here are assembled allegoric figures of Architecture and other arts, of Science and other kingdoms of knowledge, together with lawyers from the time of Moses, not forgetting Frederick the Great. The chosen situation for this immense didactic and theatrical display is the Treppenhaus or grand staircase in the new museum, Berlin; the surface is a granulated, absorbent wall, specially prepared; the technical method is that known as "water-glass," or "liquid flint," the infusion of silica securing permanence. The same medium was adopted in the later wall-pictures in the Houses of Parliament, Westminster.

The painter's last period brings no new departure; his ultimate works stand conspicuous by exaggerations of early characteristics. The series of designs illustrative of Goethe, which had an immense success, were melodramatic and pandering to popular taste. The vast canvas, more than 30 ft. long, the Sea Fight at Salamis, painted for the Maximilianum, Munich, evinces wanted imagination and facility in composition; the handling also retains its largeness and vigour; but in this astounding scenic uproar moderation and the simplicity of nature are thrown to the winds, and the whole atmosphere is hot and feverish.

Kaulbach's was a beauty-loving art. He is not supreme as a colourist; he belongs in fact to a school that holds colour in subordination but labours hard for a grand manner. This foundation of his art in form and composition. Indeed, the science of composition has seldom if ever been so clearly understood or worked out with equal exactitude and completeness; the constituent lines, the rhythm of the work, the effect of the whole, the blend into absolute and calculated equilibrium; in modern Germany painting and music have trodden parallel paths, and Kaulbach is musical in the melody and harmony of his compositions. His narrative too is lucid, and moves as a stately march or royal triumph; the sequence of the figures is unbroken; the arrangement of the groups accord with every literary form; the picture falls into incident, episode, dialogue, action, plot, as a drama. The style is eclectic; in the Age of Homer the types and the treatment are derived from Greek marbles and vases; then in the Tower of Babel the severity of the antique gives place to the suavity of the Italian renaissance; while in the Crusades the composition is let loose into incident and the action as in modern German painting, and the great master in later years withered in favour, and had to witness, not without iniquity, the rise of an opposing party of naturalism and realism. (J. B. A.)

KAUNITZ-RIETBURG, WENZEL ANTON, PRINCE (1711-1704), Austrian chancellor and diplomatist, was born at Vienna on the 2nd of February 1711. His father, Max Ulrich, was the third count of Kaunitz, and married an heiress, Maria Ernestine Franziska von Rietburg. The family was ancient, and was believed to have been of Slavonic origin. Wenzel Anton was educated for the church, but on the death of his elder brother he was trained for the law and for diplomacy, at Vienna, Leipzig and Leiden, and by travel. His family had served the Habsburgs with some distinction, and Kaunitz had no difficulty in obtaining employment. In 1735 he was a Reichshofrat. When the Emperor Charles VI. died in 1740, he is said to have hesitated before deciding to support Maria Theresa. If so, his hesitation did not last long, and left no trace on his loyalty. From 1742 to 1744 he was minister at Turin, and in the latter year was sent as minister with the Archduke Charles of Lorraine, the governor of Belgium. He was therefore an eye-witness of the campaigns in which Marshal Saxe overran Belgium. At this time he was extremely discouraged, and sought for his recall. But he had earned the approval of Maria Theresa, who sent him as representative of Austria to the peace congress of Aix-la-Chapelle in 1748. His tenacity and dexterity established his reputation as a diplomatist. He confirmed his hold on the regard and confidence of the empress by the line he took after the conclusion of peace. In 1749 Maria Theresa appealed to all her counsellors for advice as to the policy Austria ought to pursue in view of the changed conditions produced by the rise of Prussia. The great majority of them, including her husband Francis I., were of opinion that the old alliance with the sea Powers, England and Holland, should be maintained. Kaunitz, either because he was really persuaded that the old policy must be given up, or because he saw that the dominating idea in the mind of Maria Theresa was the recovery of Silesia, gave it as his opinion that Frederick was now the "most wicked and dangerous enemy of Austria," that it was hopeless to expect the support of Protestant nations against him, and that the only way of recovering Silesia was by an alliance with Russia and France. The empress eagerly accepted views which were already her own, and entrusted the adviser with the execution of his own plans. An ambassador to France from 1750 to 1752, and after 1753 as "house, court and state chancellor," Kaunitz laboured successfully to bring about the alliance which led to the Seven Years' War. It was considered a great feat of diplomacy, and established Kaunitz as the recognized master of the art. His triumph was won in spite of personal defects and absurdities which would have ruined most men. Kaunitz had manias rarely found in company with absolute sanity. He would not hear of death, nor approach a sick man. He refused to visit his dying master Joseph II. for two whole years. He would not breathe fresh air. On the warmest summer day he kept a handkerchief over his mouth when out of doors, and his only exercise was riding under glass, which he did every morning for exactly the same number of minutes. He relaxed from his work in the company of a small dependent society of sycophants and buffoons. He was considered a solemn and dangerous enemy of Austria. When in 1770 he met Frederick the Great at Mährisch-Neudrück, he came with a summary of political principles, which he called a catechism, in his pocket, and assured the king that he must be allowed to speak without interruption. When Frederick, whose interest it was to humour him, promised to listen quietly, Kaunitz rolled his mind out for two hours, and went away with the firm conviction that he had at last enlightened the inferior intellect of the king of Prussia as to what politics really were. Within a very short time Frederick had completely deceived and outmanoeuvred him. With all his pomposity and conceit, Kaunitz was simple and orderly; when his advice was not taken he would carry out the wishes of his masters, while no defeat ever damped his pertinacity.

To tell his history from 1750 till his retirement in 1792 would be to tell part of the internal history of Austria, and all the international politics of eastern and central Europe. His governing principle was to forward the interests of "the august house of Austria," a phrase sometimes repeated at every few lines of his despiscates. In internal affairs he in 1758 recommended, and helped to promote, a simplification of the confused and subdivided Austrian administration. But his main concern was always with diplomacy and foreign policy. Here he strove with untiring energy, and no small measure of success, to extend the Austrian dominions. After the Seven Years' War he endeavoured to avoid great risks, and sought to secure his ends by
alliances, and claims professing to have a legal basis, and justified at enormous length by arguments both pedantic and hypocritical. The French Revolution had begun to alter all the relations of the Powers before his retirement. He never understood its full meaning. Yet the circular despatch which he addressed to the lower house of the National Assembly on July 1794 contains the first outlines of Metternich's policy of "legitimacy," and the first proposal for the combined action of the powers, based on the full recognition of one another's rights, to defend themselves against subversive principles. Kaunitz died at his house, the Garten Palast, near Vienna, on the 27th of June 1794. He married on the 6th of May 1756, Maria Ernestine von Starhemberg, who died on the 6th of September 1754. Four sons were born of the marriage.

See Hornay, Oesterreichischer Plutarch (Vienna, 1823), for a biographical sketch based on personal knowledge. Also see Brunner, Joseph II., Correspondance avec Colonial et Kaunitz (Mayence, 1871); A. Beer, Joseph II., Leopold II. und Kaunitz (Vienna, 1873).

KAUP, JOHANN JAKOB (1803-1873), German naturalist, was born at Darmstadt on the 10th of April 1803. After studying at Göttingen and Heidelberg he spent two years at Leiden, where his attention was specially devoted to the amphibians and fishes. He then returned to Darmstadt as an assistant in the grand ducal museum, of which in 1840 he became inspector. In 1829 he published Skizze zur Entwickelungsgeschichte der europäischen Thierwelt, in which he regarded the animal world as a more or less continuous progression from lower to higher forms, from the amphibia through the birds to the beasts of prey; but subsequently he repudiated this work as a youthful indiscretion, and on the publication of Darwin's Origin of Species he declared himself against its doctrines. The extensive fossil deposits in the neighbourhoud of Darmstadt gave him ample opportunities for palaeontological inquiries, and he gained considerable reputation by his Beiträge zur näheren Kenntniss der urweltlichen Säugthiere (1855-1862). He also wrote Classification der Säugthiere und Vogel (1844), and, with H. G. Brown (1800-1862) of Heidelberg, Die Geraul-ärtigen Reste aus dem Lias (1842-1844). He died at Darmstadt on the 4th of July 1873.

KAURI PINE, in botany, Agathis australis, a conifer native of New Zealand where it is abundant in forests in the North Island between the North Cape and 38° south latitude. The forests are rapidly disappearing owing to use as timber and to destruction by fires. It is a tall resiniferous tree, usually ranging from 80 to 100 ft. in height, with a trunk 4 to 10 ft. in diameter, but reaching 150 ft., with a diameter of 13 to 22 ft.; it has a straight columnar trunk and a rounded bushy head. The thick resiniferous bark falls off in large flat flakes. The leaves, which persist for several years, are very thick and leathery; on young trees they are lance-shaped 2 to 4 in. long and ½ to 1 in. broad, becoming on mature trees linear-oblong or obovate-oblong and ½ to 1½ in. long. The ripe cones are almost spherical, erect, and 2 to 3 in. in diameter; the broad, flat, rather thin cone-scales fall from the axis when ripe. Each scale bears a single compressed seed with a membranous wing. The timber is remarkable for its strength, durability and the ease with which it is worked. The resin, kauri-gum, is an amber-like deposit dug in large quantities from the roots of the stumps forming large stumps generally varying in size from that of a hen's egg to that of a man's head. The colour is of a rich brown or amber yellow, or it may be almost colourless and translucent. It is of value for varnish-making.

KAVA (Cava or Ava), an intoxicating, but non-alcoholic beverage, produced principally in the islands of the South Pacific, from the roots or leaves of a variety of the pepper plant (Piper methysticum). The method of preparation is somewhat peculiar. The roots or leaves are first chewed by young girls or boys, care being taken that only those possessing sound teeth and excellent general health shall partake in this operation. The chewed material is then placed in a bowl, and water or coco-nut milk is poured over it, the whole is well stirred, and subsequently the woody matter is removed by an ingenius but simple mechanical manipulation. The resulting liquid, which has a mousy or cafe-au-lait appearance, or is of a greenish hue if made from leaves, is now ready for consumption. The taste of the liquid is at first sweet, and then pungent and acrid. The usual dose corresponds to about two mouthfuls of the root. Intoxication (but this apparently only applies to those not acquainted with the use of the liquid) follows in about twenty minutes. The drunkenness produced by kava is of a melancholy, silent and drowsy character. Excessive drinking is said to lead to skin and other diseases, but per contra many medicinal virtues are ascribed to the preparation. There appears to be little doubt that the active principle in this beverage is a poison of an alkaloidal nature. It seems likely that this substance is not present as such (i.e. as a free alkaloid) in the plant, but that it exists in the form of a glucoside, and that by the process of chewing this glucoside is split up by one of the fermentations in the salivary into the free alkaloid and sugar.

KAVALI (ka-vad'-a), a Persian name which occurs first in the mythical history of the old Iranian kingdom as Kai Kohad (Kaikobaq). It was borne by two kings of the Sassanid dynasty.

(1) KAVADI, son of Peroz, crowned by the nobles in 488 in place of his uncle Balash, who was deposed and blinded. At Mazdak's request the latter was restored to the throne. The Ephthalites or White Huns from the east. After one of their victories against Peroz, Kavadi had been a hostage among them during two years, pending the payment of a heavy ransom. In 484 Peroz had been defeated and slain with his whole army. Balash was not able to restore the royal authority. The hopes of the magnates and high priests that Kavadi would suit their purpose were soon disappointed. Kavadi gave his support to the communistic sect founded by Mazdak, son of Bamdad, who demanded that the rich should divide their wives and their wealth with the poor. His intention evidently was by adopting the doctrine of the Mazdakites, to break the influence of the magnates. But in 496 he was deposed and incarcerated in the "Castle of Oblivion" in Susiana, and his brother Jamasp (Zamaspes) was raised to the throne. Kavadi, however, escaped and found refuge with the Ephthalites, whose king gave him his daughter in marriage and aided him to return to Persia. In 499 he became king again and punished his opponents. He had to pay a tribute to the Ephthalites and applied for subsidies to Rome, which had before supported the Persians. But now the emperor Anastasius refused subsidies, expecting that a war between Persia and the Byzantine Empire would exhaust one another in war. At the same time he intervened in the affairs of the Persian part of Armenia. So Kavadi joined the Ephthalites and began war against the Romans. In 502 he took Theodosiopolis in Armenia, in 503 Amida (Diarbekr) on the Tigris. In 505 an invasion of Armenia by the western Huns from the Caucasus led to an armistice, during which the Romans paid subsidies to the Persians for the maintenance of the fortifications on the Caucasus. When Justin I. (518-527) came to the throne the conflict began anew. The Persian vassal, Mondhir of Hira, was defeated at Issopotamias and slaughtered the monks and nuns. In 531 Belisarius was beaten at Callinicum. Shortly afterwards Kavadi died, at the age of eighty-two, in September 531. During his last years his favourite son Chosroes had great influence over him and had been proclaimed successor. He also induced Kavadi to break with the Mazdakites, whose doctrine had spread widely and caused great social confusion throughout Persia. In 529 they were refuted in a theological discussion held before the throne of the king by the orthodox Magians, and were slaughtered and persecuted everywhere; this time himself was hanged. Kavadi evidently was, as Procopius (Pers. i. 6) calls him, an unusually clear-sighted and energetic ruler. Although he could not free himself from the yoke of the Ephthalites, he succeeded in restoring order in the interior and fought with success against the Romans. He built some
KAVALA—KAVIROND

towns which were named after him, and began to regulate the taxation.

(3) KAVADI II. SHEROF (Siroes), son of Chosroes II., was raised to the throne in opposition to his father in February 628, after the great victories of the emperor Heraclius. He put his father and eighteen brothers to death, began negotiations with Heraclius, but died after a reign of a few months.

KAVALA, or CAVALLA, a walled town and seaport of European Turkey in the vilayet of Salonica, on the Bay of Kavala, an inlet of the Aegean Sea. Pop. (1905), about 5000. Kavala is built on a promontory stretching south into the bay, and opposite the island of Thasos. There is a harbour on each side of the promontory. The resident population is increased in summer by an influx of fishermen, who travel from 2000 to 3000 are employed in curing tobacco and preparing it for export. The finest Turkish tobacco is grown in the district, and shipped to all parts of Europe and America, to the annual value of about £1,250,000. Mehemet Ali was born here in 1769, and founded a Turkish school which still exists. His birthplace, an unpretentious little house in one of the tortuous older streets, can be distinguished by the tablet which the municipal authorities have affixed to its front wall. Numerous Roman remains have been found in the neighbourhood, of which the chief is the large aqueduct on two tiers of arches which still serve to supply the town and dilapidated citadel with water from Mount Pangeus.

Kavala has been identified with Neapolis, at which St Paul landed on his way from Samothrace to Philippi (Acts xvi. 11). Neapolis was the port of Philippi, as Kavala now is of Seres; in the bay on which it stands the fleet of Brutus and Cassius was stationed during the battle of Philippi. Some authorities identify Neapolis with Durrës (Durres), mentioned by Herodotus as famous for its gold mines.

KAVANAGH, ARTHUR MACMOROUGH (1831-1889), Irish politician, son of Thomas Kavanagh, M.P., who traced his descent to the ancient kings of Leinster, was born in Co. Carlow, Ireland, on the 25th of March 1831. He had only the rudiments of arms and legs, but in spite of these physical defects had a remarkable career. He learnt to ride in the most fearless way, strapped to a special saddle, and managing the horse with the stumps of his arms; and also fished, shot, drew and wrote, various mechanical contrivances being devised to supplement his limited physical capacities. He travelled extensively in Egypt, Asia Minor, Persia and India between 1846 and 1853, and after succeeding to the family estates in the latter year, he married in 1855 his cousin, Miss Frances Mary Leetley. Assisted by his wife, he was a most philanthropic landlord, and was an active county magistrate and chairman of the board of guardians. A Conservative and a Protestant, he sat in Parliament for Co. Wexford from 1866 to 1868, and for Co. Carlow from 1868 to 1880. He was opposed to the disestablishment of the Irish Church, but supported the Land Act of 1870, and sat on the Bessborough Commission. In 1886 he was made a member of the Privy Council in Ireland. He died of pneumonia on the 25th of December 1889, in London. It is supposed that his extraordinary career suggested the idea of "Lucas Malef's" in the novel, The History of Sir Richard Calmady.

KAVANAGH, JULIA (1824–1887), British novelist, was born at Thurles in Tipperary, Ireland, in 1824. She was the daughter of Morgan Peter Kavanagh (d. 1874), author of various worthless philological works and some poems. Julia spent several years of her early life with her parents in Normandy, laying there the foundation of a mastery of the French language and insight into French modes of thought, which was perfected by her later frequent and long residences in France. Miss Kavanagh's literary career began with her arrival in London about 1844, and her uneventful life affords few incidents to the biographer. Her first book was Three Paths (1847), a story for the young; but her first work to attract notice was Madeleine, a Tale of Normandy (1848). Other books followed: A Summer and Winter in the Two Sicilies (1858); French Women of Letters (1862); English Women of Letters (1862); Woman in France during the 18th Century (1850); and Women of Christianity (1852). The scenes of her stories are always almost laid in France, and she handles her French themes with fidelity and skill. Her style is simple and pleasing rather than striking; and her characters are interesting without being strongly individualized. Her most popular novels were perhaps Adèle (1857), Queen Mab (1863), and John Dorrien (1875). On the outbreak of the Franco-German War Julia Kavanagh removed with her mother from Paris to Rouen. She died at Nice on the 28th of October 1877.

KAVASS, or CAVASS (adapted from the Turkish kavawas, a bow-maker; Arabic qaws, a bow), a Turkish name for an armed police-officer; also for a courier such as it is usual to engage when travelling in Turkey.

KAVIRONDO, a people of British East Africa, who dwell in the valley of the Nzoia River, on the western slopes of Mount Elgon, and along the north-east coast of Victoria Nyanza. Kavirondo is the general name of two distinct groups of tribes, one Bantu and the other Nilotic. Both groups are immigrants, the Bantu from the south, the Nilotic from the north. The Bantu appear to have been the first comers. The Nilotic tribes, probably an offshoot of the Acholi (q.v.), appear to have crossed the lake to reach their present home, the country around Kavirondo Gulf. Of the two groups the Bantu now occupy a more northerly position than their neighbours, and are probably the most representative of that race" (Hobley). Their further progress north was stopped by the southward movement of the Nilotic tribes, while the Nilotic Kavirondo in their turn had their wanderings arrested by an irruption of Elgumi people from the east. The Elgumi are themselves probably of Nilotic origin. Both groups of Kavirondo are physically fine, the Nilotic stock appearing more virile than the Bantu. The Bantu Kavirondo are divided into three principal types—the Awa-Rimri, the Awa-Ware and the Awa-Kisi. By the Nilotic Kavirondo their Bantu neighbours are known as Ja-Mwa. The generic name for the Nilotic tribes is Ja-Luo. The Bantu Kavirondo call them Awa-Nyoro. The two groups have many characteristics in common. A characteristic feature of the people is their nakedness. Among the Nilotic Kavirondo married men who are fathers wear a small piece of goat-skin, which though practically useless as a covering must be worn according to tribal etiquette. Even among men who have adopted European clothing this goat-skin must still be worn underneath. Contact with whites has led to the adoption of European clothing by numbers of the men, but the women, more conservative, prefer nudity or the scanty covering which they wore before the advent of Europeans. Among the Bantu Kavirondo married women wear a short fringe of black string in front and a tassel of banana fibre suspended from a girdle behind, this tassel having at a distance the appearance of a tail. Hence the report of early travellers as to a tailed race in Africa. The Nilotic Kavirondo women wear the tail, but dispense with the fringe in front. For "dandy" they wear a goat-skin slung over the shoulders. Some of the Bantu tribes practise circumcision, the Nilotic tribes do not. Patterns are tattooed on chest and stomach for ornament. Men, even husbands, are forbidden to touch the women's tails, which must be preserved even should any women be without roupies round their body. The Kavirondo are noted for their independent and pugnacious nature, their honesty and their sexual morality, traits particularly marked among the Bantu tribes. There are more women than men, and thus the Kavirondo are naturally inclined towards polygamy. Among the Bantu tribes a man has the refusal of all the younger sisters of his wife as they attain puberty. Practically no woman lives unmarried all her life, for if no suitor seeks her, she singles out a man and offers herself to him at a "reduced price," an offer usually accepted, as the women are excellent agricultural labourers. The Nilotic Kavirondo incline to exogamy, endeavouring always to marry outside their clan. Girls are betrothed at six or seven, and the husband-elect continually makes small presents to his father-in-law-elect till the bride reaches womanhood. It is regarded as shameful if the girl be not found a virgin on her wedding day. She is sent back to her parents, who have to return the marriage
price, and pay a fine. The wife's adultery was formerly punished with death, and the capital penalty was also inflicted on young men and girls guilty of unchastity. Among the Beantu Kavirondo the usual minimum price for a wife is forty head of cattle or twenty goats and one cow; the payment is in kind and not in money. The Nilotic Kavirondo pay two to ten sheep and two to six cows; the husband-elect can claim his bride when he has made half payment. If a woman dies without bearing children, the amount of her purchase is returnable by her father, unless the widower consents to replace her by another sister. The women are prolific and the birth of twins is common. This is considered a lucky event, and is celebrated by feasting and dances. Among the Beantu Kavirondo the mother of twins must remain in her hut for seven days. Among the Nilotic Kavirondo the parents and the infants must stay in the hut for the first month, and when the baby has grown a little, the children in succession the next child born is taken out at dawn and placed on the road, where it is left till a neighbour, usually a woman friend who has gone that way on purpose, picks it up. She takes it to its mother who gives a goat in return. A somewhat similar custom prevails among the Nilotic tribes. Names are not male and female, and a daughter often bears her father's name.

The Kavirondo bury their dead. Among one of the Beantu tribes, the Awa-Wanga, it is buried in a sitting position, but at such a depth that the head protrudes. Over the head an earthenware pot is placed, and his principal wives have to remain in the hut till the flesh is eaten by ants or decomposes, when the huts are burnt and buried. The body is carried to the grave, and the skeleton is unearthed, and reburied with much ceremony in the sacred burial place of the tribe. Married women of the Beantu tribes are buried in their hut lying on their right side with the head up; the hut being then deserted. Among the Nilotic tribes the grave is dug beneath the verandah of the hut. Men of the Beantu tribes are buried in an open space in the midst of their huts; in the Nilotic tribes, the wife of a deceased man is buried in her hut, if not, beneath the verandah of the hut in which he died.

A child is buried near the door of its mother's hut. A sign of mourning is a cord of banana fibre wound round the neck and waist. A chief who has been in conflict before his death is not allowed in the hut, if not, beneath the verandah of the hut in which he died.

The Kavirondo are essentially an agricultural people: both men and women work in the fields with large iron hoes. In addition to sorghum, Ekeuzine and maize, tobacco and hemp are both cultivated and smoked. Both sexes smoke, but the use of hemp is restricted to men and unmarried women, as it is thought to injure child-bearing women. Hemp is smoked in a bubble-bubble. The Kavirondo cultivate sesame and make an oil from its seeds which they burn in little clay lamps. These lamps are of the ancient saucer type, the basin being the oil bowl's open lip, introduced on the continent by the coast people. While some tribes live in isolated huts, those in the north have strongly walled villages. The walls are of mud and formerly the wells the Nilotic tribesmen used to build a pyramid of mud blocks, which the British the security of the country has induced the Kavirondo to let the walls fall into disrepair. Their huts are circular with conical thatched roof, and fairly broad verandah all round. A portion of the hut is partitioned off as a sleeping-place for goats, and the fowls sleep indoors in a large basket. Skins form the only bedstead. In each hut are two fires, about which a rigid etiquette prevails. Strangers or distant relatives are not allowed to pass beyond the first, which is near the door, and is used for cooking. At the second, which is nearly in the middle of the hut, sit the hut owner, his wives, children, brothers and sisters. Around this fireplace the family sleep. Cooking pots, water pots and earthenware gourds are the only other furniture. The food is served in small baskets. Every grown man has a hut to himself, and one for each wife. The huts of the Masaba Kavirondo of west Elgon have the apex of the roof surrounded by a carved pole which Sir H. H. Johnston says is obviously a phallicus. Among the Beantu Kavirondo a father does not eat with his sons, nor do brothers eat together. Among the Nilotic tribes fathers and sons eat together, unless they separate at special occasions. Women eat apart and only after the men have finished. The Kavirondo keep cattle, sheep, goats, fowls and a few dogs. Women do not eat sheep, fowls or eggs, and are not allowed to handle milk except when they milk it with open hands. The flesh of the wild cat and leopard is esteemed by most of the tribes. From Ekeuzine a beer is made. The Kavirondo are lucky hunters, capturing the hippopotamus with ropes and traps, and attacking with spears and arrows the elephants, rhinoceros and antelopes. They are caught by line and rod or in traps. Bee-keeping is common, and where trees are scarce the hives are placed on the roof of the hut. Among the Beantu Kavirondo, Kollmann says, the young are sound being held until the animal dies. Though a peaceful people the Kavirondo fight well. Their weapons are spears with rather long flat blades without blood-courses, and broad-bladed swords. Some use slings, and most carry shields. Bows and arrows are also used; firearms are however displacing other weapons. Kavirondo warfare was mainly defensive and intertribal, this last a form of vendetta. Kavirondo warfare is a mystery that baffles both before his return and he was rubbed with "medicine" (generally goat's dung), to defend him from the spirit of the dead man. This custom the Awa-Wanga abandoned when they obtained firearms. The young warriors were made to stab the bodies of their slain enemies. Kavirondo industries are salt-making, effected by burning reeds and water-plants and passing water through the ashes; the smelting of iron ore (confined to the priestly tribes); and the weaving of mats.

The Kavirondo are many tribes, divided, Sir H. H. Johnston suspects, totemically. Their religion appears to be a vague ancestor-worship, but the northern tribes have two gods, Awafa and Ishisho, "the generatrices of the earth and sea." The gods are sacrificed. The Kavirondo have great faith in divination from the entrails of a sheep. Nearly everybody and everything is to the Kavirondo ominous of good or evil. They have few myths or traditions; the ant-bear is the chief figure in their beast-lore. They believe in witchcraft and practise trial by ordeal. As a race the Kavirondo are on the increase. This is due to their fecundity and small mortality. Those who live in the low-lying lands suffer from a mild malaria, while abroad they are subject to dysentery and pneumonia. Epidemics of small-pox have occurred. Native medicine is of the simplest. They dress wounds with butter and leaves, and for the treatment of the lung-fever they make a hole in the chest, and a goad is thrust into it. There are no medicine-men—the women are the doctors. Certain of the incisor teeth are pulled out. If a man retains these he will, it is thought, be killed in warfare. Among certain tribes the incisor teeth are kept as a trinket. A combination of these misfortunes would befall their husbands. For the same reason the wife scars the skin of her forehead or stomach. A Kavirondo husband, before starting on a journey, makes a purchase, and in return usually buys a piece of cloth, fish or goats.

There is a law which directs that not more than one husband may be married to one wife. The Kavirondo have four—the birth dance, the death dance, that at initiation and one of a propitiatory kind in seasons of drought. Their music is plaintive and sometimes pretty, produced by a large lyre-shaped instrument. They use also various drums.

The Ja-Luo women use for ear ornaments small beads attached to pieces of brass. Like the aggy beads of West Africa these beads are not of local manufacture nor of recent introduction. They are ancient, in colour generally blue, occasionally yellow or green, and are picked up in certain districts after heavy rain. By the natives they are termed "souvenirs," and are sometimes worn, but are more commonly used by the women to decorate charms in shape and colour with an ancient Egyptian beads and other beads obtained from ancient cities in Baluchistan.

T. A. J.)

KAW, or KANSA, a tribe of North American Indians of Siouan stock. They were originally an offshoot of the Osages. Their early home was in Missouri, whence they were driven to Kansas by the Dakotas. They were moved from one reservation to another, till in 1873 they were settled in Indian Territory; they have since kept their home there. KAWRDAH, a feudatory state of India, within the Central Provinces; area, 709 sq. m.; pop. (1907), 57,474, showing a decrease of 37% in the decade, due to famine; estimated revenue, £7000. Half the state consists of hill and forest. The residence of the chief, who is a Raj Gond, is at Kawrda (pop. 4772), which is also the headquarters of the Kabirpanthi sect (see KABIR).

KAY, JOHN (1742-1826), Scottish caricaturist, was born near Dalketh, where his father was a mason. At thirteen he was apprenticed to a barber, whom he served for six years. He then went to Edinburgh, where in 1771 he obtained the freedom of the city by joining the corporation of barber-surgeons. In 1785, induced by the favour which greeted certain attempts of his to etch in aquafortis, he took down his barber's pole and opened a small print shop in Parliament Square. There he continued to flourish, painting miniatures, and publishing at short intervals his sketches and caricatures of local celebrities and oddities, who abounded at that period in Edinburgh society. He died on the 21st of February 1826.

Kay's portraits were collected by Hugh Paton and published under the title A series of original portraits and caricature etchings (Edin., 1807, 2 vols.) and also subsequently in various anecdotes (Edin., 2 vols. 1803, 1838; 8vo ed., 4 vols. 1842; new 4to ed., with additional plates, 2 vols., 1877), forming a unique record
of the social life and popular habits of Edinburgh at its most interesting epoch.

KAY, JOSEPH (1821–1878), English economist, was born at Salford, Lancashire, on the 27th of February 1821. Educated privately and at Trinity College, Cambridge, he was called to the bar at the Inner Temple in 1848. He was appointed judge of the Salford Hundred court of record in 1862 and in 1869 was made a queen's counsel. He is best known for a series of works on the social condition of the poor in France, Switzerland, Holland, Germany and Austria, the materials for which he gathered on a four years' tour as travelling bachelor of his university. They were The Education of the Poor in England and Europe (London, 1846); The Social Condition of the People in England and Europe (London, 1850, 2 vols.); The Coming and Education of Poor Children in English and in German Towns (Manchester, 1853). He was also the author of The Law relating to Shipmasters and Seamen (London, 1875) and Free Trade in Land (1879, with a memoir). He died at Dorking, Surrey, on the 9th of October 1878.

KAYAK, or CAYAK, an Eskimo word for a fishing boat, in common use from Greenland to Alaska. It has been erroneously derived from the Arabic caque, supposed to have been applied to the native boats by early explorers. The boat is made by covering a light wooden framework with sealskin. A hole is pierced in the centre of the top of the boat, and the kayakor (also dressed in sealskin) laces himself up securely when seated to prevent the entrance of water. The kayak is propelled like a canoe by a double-bladed paddle. The name kayak is properly only applied to the boat used by an Eskimo man—that used by a woman is called an umiak.

KAYASTH, the writer caste of Northern India, especially numerous and influential in Bengal. In 1901 their total number in all India was more than two millions. Their claim to be Khattatriyas who have taken to clerical work is not admitted by the Brahmins. Under Mahomedan rule they learnt Persian, and filled many important offices. They are now eager students of English, and have supplied not only several judges to the high court but also the first Hindu to be a member of the governor-general's council. In Bombay their place is taken by the Prabhus, and in Assam by the Kalitas (Kolitas); in Southern India there is no distinct clerical caste.

KAYE, SIR JOHN WILLIAM (1814–1876), English military historian, was the son of Charles Kaye, a solicitor, and was educated at Eton and the Royal Military College, Addiscombe. From 1832 to 1841 he was an officer in the Bengal Artillery, afterwards spending some years in literary pursuits both in India and in England. In 1836 he entered the civil service of the East India Company, and when the government of India was transferred to the British crown succeeded John Stuart Mill as secretary of the political and secret department of the India office. In 1871 he was made a K.C.S.I. He died in London on the 24th of July 1876. Kaye's numerous writings include History of the Sepoy War in India (London, 1864–1876), which was revised and continued by Colonel G. B. Malleson and published in six volumes in 1888–1889; History of the War in Afghanistan (1st ed., London, 1856; 2nd ed., London, 1873); Administration of the East India Company (London, 1853); The Life and Correspondence of Charles, Lord Melville (London, 1854); The Life and Correspondence of Henry St George Tucker (London, 1854); Life and Correspondence of Sir John Malcolm (London, 1856); Christianity in India (London, 1859); Lives of Indian Officers (London, 1867); and two novels, Peregrine Pulney and Long engagements. He also edited several works dealing with Indian affairs; wrote Essays of an Optimist (London, 1870); and was a frequent contributor to periodicals.

KAYSER, FRIEDRICH HEINRICH EMANUEL (1845– ), German geologist and palaeontologist, was born at Königsberg, on the 26th of March 1845. He was educated at Berlin where he took his degree of Ph.D. in 1870. In 1882 he became professor of geology in the university at Marburg. He investigated fossils of various ages and from all parts of the world, but more especially from the Palaeozoic formations, including those of South Africa, the Polar regions, and notably the Devonian fossils of Germany, Bohemia and other parts of Europe.

Among his separate works are Lehrbuch der Geologie (2 vols., il.), Geologische Formationskunde (1891 (2nd ed., 1902), and i. Allgemeine Geologie (3 vols., 1881–1882; 2nd ed., 1892), written and edited by F. Lake, 1893, under the title Textbook of Comparative Geology. Another work in Beiträge zur Kenntniss der Fauna der Siegenschne Graswuche (1892).

KAY-SHUTTLEWORTH, SIR JAMES PHILLIPS, Bart. (1804–1877), English politician and educationalist, was born at Rochdale, Lancashire, on the 20th of July 1804, the son of Robert Kay. At first engaged in a Rochdale bank, in 1824 he became a medical student at Edinburgh University. Settling in Liverpool about 1827, he worked for the Ancients and Ardwick Dispensary, and the experience which he thus gained of the conditions of the poor in the Lancashire factory districts, together with his interest in economic science, led to his appointment in 1835 as poor law commissioner in Norfolk and Suffolk and later in the London districts. In 1839 he was appointed first secretary of the committee formed by the Privy Council to administer the Government grant for the public education in Great Britain. He is remembered as having founded Battersea, London, in conjunction with E. Carleton Tufnell, the first national college (1839–1840); and the system of national school education of the present day, with its public inspection, trained teachers and its support by state as well as local funds, is largely due to his initiative. In 1842 he married Lady Janet Shuttleworth, assuming by royal licence his bride's name and arms. A breakdown in his health led him to resign his post on the committee in 1849, but subsequent recovery enabled him to take an active part in the working of the central relief committee instituted under Lord Derby, during the Lancashire cotton famine of 1861–1865. He was created a baronet in 1845. Until the end of his life he interested himself in the movements of the Liberal party in Lancashire, and the progress of education. He died in London on the 9th of May 1877. His Physiology, Pathology and Treatment of Asphyxia became a standard textbook, and he also wrote numerous papers on public education.

His son, Sir Ughtred James Kay-Shuttleworth (b. 1844), became a well-known Liberal politician, sitting in parliament for Hastings from 1869 to 1880 and for the Clitheroe division of Lancashire from 1885 till 1902, when he was created Baron Shuttleworth. He was chancellor of the duchy of Lancaster in 1892 and secretary to the Admiralty in 1892–1895.

KAZALA, or KAZAN, a fort and town in the Russian province of Syr-darya in West Turkestan, at the point where the Kazala River falls into the Syr-darya, about 50 m. from its mouth in Lake Aral, in 45° 45' N. and 62° 7' E., "at the junction," to quote Schuyler, "of all the trade routes in Central Asia, as the road from Orenburg meets here with the Khiva, Bokhara and Tashkent roads." Besides carrying on an active trade with the Kirghiz of the surrounding country, it is of growing importance in the general current of commerce. Pop. (1897), 7600. The floods in the river make it an island in spring; in summer it is parched by the sun and hot winds, and hardly a tree can be got to grow. The streets are narrow but the houses, as well as the fairly strong fort, are built of mud bricks.

KAZAN, a government of middle Russia, surrounded by the governments of Vyatka, Ufa, Samara, Simbirsk, Nizhny-Novgorod and Kostroma. Area 24,601 sq. m. It belongs to the basins of the Volga and its tributary the Kama, and by these streams the government is divided into three regions; the first, to the right of the main river, is traversed by deep ravines sloping to the north-east, towards the Volga, and by two ranges of hills, one of which (300 to 500 ft.) skirts the river; the second region, between the left bank of the Volga and the left bank of the Kama, is an open steppe; and the third, between the left bank of the Volga and the right bank of the Kama, resembles in its eastern part the first region, and in its western part is covered with forest. Marl's, limestones and sandstones, of Permian or Triassic age, are the principal rocks; the Jurassic formation
KAZAN—KAZINCZY

appears in a small part of the Tetyush district in the south; and Tertiary rocks stretch along the left bank of the Volga. Mineral springs (iron, sulphur and petroleum) exist in several places. The Volga is navigable throughout its course of 2,000 m. through Kazan, as well as the Kama (1,100 m.); and the Vyatka, Kazanka, Rutka, Tsivyly, Greater Kokshaga, Ilet, Vetluga and Mesha, are not without value as waterways. About four hundred small lakes are enumerated within the government; the upper and lower Kaban supply the city of Kazan with water.

The climate is severe, the annual mean temperature being 37-8° F. The rainfall amounts to 16 in. Agriculture is the chief occupation, and 82% of the population are peasants. But the Volga, Kama, Vyatka and their tributaries. Kazan is divided into twelve districts. The chief town is Kazan (q.v.). The district capitals, with their populations in 1807 are: Cheboksary (4,658), Chistopol (20,161), Kozmodemyansky (5,212), Izhevsk (5,439), Mamadysh (4,213), Spassk (2,770), Syzran (2,653), Tetyushin (4,754), Tsarevokhaskoisk (1,654), Tyulyuk (2,373) and Yadrin (2,467). Population (1859), 1,872,437; (1867), 2,190,185, of whom 1,113,555 were women, and 176,396 lived in towns. The estimated population in 1906 was 3,504,400. It consists principally of Russians and Tatars, with a variety of Finno-Turkish tribes: Chuvashas, Cheremisses, Mordvinians, Votyaks, Meshcheryaks, and some Jews and Poles. The Russians belong to the Orthodox Greek Church or are Nonconformists; the Tatars are Mussulmans, and the Finno-Turkish tribes are either pagans or belong officially to the Orthodox Greek Church, the respective proportions being (in 1897): Orthodox Greek, 69-4% of the whole; Nonconformists, 17% Mussulmans, 28-5%.

(K. A.; J. T. B.)

KAZAN (called by the Cheremisses Ossoo), a town of eastern Russia, capital of the government of the same name, situated in 72° 54' N., on a m. from the Volga, which however reaches the city when it overflows its banks every spring. Kazan lies 650 m. E. from Moscow by rail and 253 E. of Nizhny-Novgorod by the Volga. Pop. (1883), 140,726; (1900), 143,797, all Russians except for some 20,000 Tatars. The most striking feature of the city is the kreml or citadel, founded in 1437, which crowns a low hill on the N.W. Within its wall, capped with five towers, it contains several churches, amongst them the cathedral of the Annunciation, founded in 1562 by Gury, the first archbishop of Kazan, Kazan being an archiepiscopal see of the Orthodox Greek Church. Other buildings in the kreml are a magnificent monastery, built in 1556; an arsenal; the modern castle in which the governor resides; and the red brick Suyumbeka tower, 246 ft. high, which is an object of great veneration to the Tatars as the reputed burial-place of one of their saints. A little E. of the kreml is the Bogoroditski convent, built in 1579 for the reception of the Black Virgin of Kazan, a miracle-working image transferred to Moscow in 1612, and in St Petersburg since 1710. Kazan is the intellectual capital of eastern Russia, and an important seat of Oriental scholarship. Its university, founded in 1604, is attended by nearly 1100 students. Attached to it is an excellent library of 220,000 vols., an astronomical observatory, a botanical garden and various museums. The ecclesiastical academy, founded in 1846, contains the old library of the Solovetski (Solovki) monastery, which is of importance for the history of Russian religious sects. The city is adorned with bronze statues of Tsar Alexander II., set up facing the kreml in 1895, and of the poet G. R. Derzhavin (1743-1810); also with a monument commemorating the capture of Kazan by Ivan the Terrible. The central parts of the city consist principally of small one-storeyed houses, surrounded by gardens, and are inhabited chiefly by Russians, while some 20,000 Tatars dwell in the suburbs. Kazan is, further, the intellectual centre of the Russian Mahomedans, who have here their more important schools and their printing-premises. Between the city and the Volga is the Admiralty suburb, where Peter the Great had his Caspian fleet built for his campaigns against Persia. The more important manufactures are leather goods, soap, wax candles, sacred images, cloth, cottons, spirits and bells. A considerable trade is carried on with eastern Russia, and with Turkestan and Persia. Previous to 1552 the Volga was the upper limit of sail. In 1552 of whose ancient capital, Bolgari or Bolgari, lie 60 m. S. of Kazan. The city of Kazan itself stood, down to the 13th century, 30 m. to the N.E., where traces of it can still be seen. In 1438 Ulugh Mahmmed (or Ula Makhmet), khan of the Golden Horde of the Mongols, founded, on the ruins of the Bulgarian state, the kingdom of Kazan, which in its turn was destroyed by Ivan the Terrible of Russia in 1552 and its territory annexed to Russia. In 1774 the city was laid waste by the rebel Fugachev. It has suffered repeatedly from fires, especially in 1815 and 1825. The Kazan Tatars, from having lived so long amongst Russians and Finnish tribes, have lost a good many of the characteristic features of their Tatar (Mongol) ancestry, and bear now the stamp of a distinct ethnographic type. They are found also in the neighbouring governments of Vyatka, Ufa, Orenburg, Samara, Saratov, Simbirsk, Tambov and Nizhny-Novgorod. They are intelligent and enterprising, and are engaged principally in trade.

See Pingehin's Kazaan Old and New (in Russian); Velyaminov-Zernov's Kazanetsправляться (3 vols., St Petersburg, 1885-1886); Zarinsky's Sketches of Old Kazan (Kazan, 1897); Tomkin's Sketches of Kazan in 1852 (Kazan, 1890); Firsov's books on the history of the native population (Kazan, 1864 and 1869); and Shpilevski, on the antiquities of the town and government, in Izvestia i Zapiski of the Kazan University (1877). A bibliography of the Oriental books printed in the city is printed in Bulletin of the St Petersburg Academy (1867). Compare also L. Leger's "Kazan et les tartares," in Bibl. Univ. de Genève (1874).

(K. A.; J. T. B.)

KAZERUN, a district and town of the province of Fars in Persia. The district is situated between Shiraz and Bushire. In its centre is the Kazerun Valley with a direction N.W. to S.E., a fertile plain 30 m. long and 7 to 8 m. broad, bounded S.E. by the Parishian Lake (8 m. long, 3 m. broad) N.W. by the Boshavar River, with the ruins of the old city of Beh-Shahpur (Beshäver, Boshävir, also, short, Shahpur) and Sassanian bas-reliefs on its banks. There also, in a cave, is a statue of Shapur. The remainder of the district is mostly hilly country intersected by numerous streams, plains and hills being covered with zizyphus, wild almond and oak. The district is divided into two divisions; town and villages, the latter being called Kuh i Marsh (and again subdivided into (1) Push i Kuh; (2) Yarrak; (3) Shakan). It has forty-six villages and a population of about 15,000; it produces rice of excellent quality, cotton, tobacco and opium, but very little corn, and bread made of the flour of acorns is a staple of food in many villages. Wild almonds are exported. Kazërûn, the chief place of the district, is an unwalled town situated in the midst of the central plain, in 29° 37' N., 51° 43' E, at an elevation of 2800 ft., 70 m. from Shiraz, and 96 m. from Bushire. It has a population of about 8000, and is divided into four quarters separated by open spaces. Adjoining it on the W. is the famous Nazar garden, with noble avenues of orange trees, planted by order of the Shah in 1627, and a magnificent castle, built in 1767. A couple of miles N. of the city behind a low range of hills are the imposing ruins of a marble building said to stand over the grave of Sheik Amin ed din Mohammed b. Zia ed din Mas'ud, who died A.D. 740 (A.D. 1339). S.E. of the city on a high mound are ruins of buildings with underground chambers, popularly known as Kal'eh i Gabr, "castle of the fire-worshippers."

KAZINCZY, PERENCZ (1735-1831), Hungarian author, the most indefatigable agent in the regeneration of the Magyar
KAZVIN—KEAN, EDMUND

795

language and literature at the end of the 18th and beginning of the 19th century, was born on the 27th of October 1759, at Ér-Semlyén, in the county of Bihar, Hungary. He studied law at Kassa and Eperies, and in Pest, where he also obtained a thorough knowledge of French and German literature, and made the acquaintance of Gideon Ráday, who allowed him the use of his library. In 1784 Kazinczy became subnotary for the county of Abaúj; and in 1786 he was nominated inspector of schools at Kassa. There he began to devote himself to the restoration of the Magyar language and literature by translations from classical foreign works, and by the augmentation of the native vocabulary from ancient Magyar sources. In 1788, with the assistance of Baróti Szabó and John Bacskányi, he started at Kassa the first Magyar literary magazine, called the Magyar Mese- és Vitézviselő; the Orphée, which succeeded it in 1790, was his own creation. Upon the accession of Leopold II., Kazinczy, as a non-Catholic, was obliged to resign his post at Kassa, his literary activity in no way decreased. He not only assisted Gideon Ráday in the establishment and direction of the first Magyar dramatic society, but enriched the repertoire with several translations from foreign authors. His Hamlet, which first appeared at Kassa in 1790, is a rendering from the German version of Schröder. Implicated in the democratic conspiracy of the abbot Martinovich, Kazinczy was arrested on the 14th of December 1794, and condemned to death; but on account of his uncle’s influence his sentence was released in 1801, and shortly afterwards married Sophia Törtk, daughter of his former patron, and retired to his small estate at Széphalom or “Fairhill,” near Sátor–Ujhely, in the county of Zemplén. In 1828 he took an active part in the conferences held for the establishment of the Hungarian academy in the historical section of which he became the first corresponding member. He died of Asiatic cholera, at Széphalom, on the 22nd of August 1831.

Kazinczy, although possessing great beauty of style, cannot be regarded as a powerful and original thinker; his fame is chiefly due to the felicity of his translations from the masterpieces of Goethe, Wieland, Klopstock, Ossian, La Rochebeaucouf, Marmonló, Molière, Metastasio, Shakespeare, Sterne, Cicer, Sallust, Anacreon, and many others. He also edited the works of Baróczy (Fest, 1812–8, 8 vol.) and of the poet Zrínyi (1817, 2 vol.), and the poems of Dayka (1813, 3 vol.) and of John Kis, (1815, 3 vol.). A collective edition of his works (Szép Literatúra), consisting for the most part of translations, was published at Pest, 1814–1816, in 9 vols. His original productions (Éredei Munkák), largely made up of letters, were edited by Joseph Bajza and Francis Tody at Pest, 1836–1845, in 5 vols. Editions of his poems appeared in 1858 and in 1863.

KAZVIN, a province and town of Persia. The province is situated N.W. of Teheran and S. of Gilan. On the W. it is bounded by Khamseh. It pays a yearly revenue of about £2,200,000, and contains many rich villages which produce much grain and fruit, great quantities of the latter being dried and exported.

Kazvin, the capital of the province, is situated at an elevation of 4185 ft., in 36° 15' N. and 50° E., and 92 m. by road from Teheran. The city is said to have been founded in the 4th century by the Sassanian king Shapur II (309–379). It has been repeatedly damaged by earthquakes. Many of its streets and most of the magnificent buildings seen there by Chardin in 1674 and other travellers during the 17th century are in ruins. The most remarkable remains are the palace of the Safavid shahs and the mosque with its large blue-dome. In the 16th century Shah Tahmasp I. (1524–1576) made Kazvin his capital, and it remained so till Shah Abbas I. (1587–1629) transferred the seat of government to Isfahán. The town still bears the title Dar es Salteneh, "the seat of government." Kazvin has many baths and is the centre of an important system of irrigation formerly carried on by these canals rendered the plain of Kazvin one of the most fertile regions in Persia; now most of the canals are choked up. The city has a population of about 50,000 and a thriving transit trade, particularly since 1809 when the carriage road between Rešht and Teheran with Kazvin as a half-way stage was opened under the auspices of the Russian "Enzel-Teheran Road Company." Great quantities of rice, fish and silk are brought to it from Gilan for distribution in Persia and export to Turkey.

KEAN, EDMUND (1775–1833), was born in London on the 17th of March 1775. His father was probably Edmund Kean, an architect’s clerk; and his mother was an actress, Ann Carey, grand-daughter of Henry Carey. When in his fourth year Kean made his first appearance on the stage as Cupid in Norvërre’s ballet of Cymon. As a child his vivacity and cleverness, and his ready affection for those who treated him with kindness, made him a universal favourite, but the harsh circumstances of his lot, and the want of proper restraint, while they developed strong self-reliance, fostered wayward tendencies. About 1794 a few benevolent persons provided the means of sending him to Lisbon, where he remained for two years. When he returned to England, he was a tall, strong, fair-haired boy with a most remarkable ease and rapidity; but finding the restraint intolerable, he was shipped as a cabin boy at Portsmouth. Discovering that he had only escaped to a more rigorous bondage, he counterfeited both deafness and lameness with a histrionic mastery which deceived even the physicians at Madeira. On his return to England he sought the protection of his uncle Moses Kean, mimic, ventriloquist and general entertainer, who, besides continuing his pantomimic studies, introduced him to the study of Shakespeare. At the same time Miss Tidswell, an actress who had been specially kind to him from infancy, taught him the principles of acting. On the death of his uncle he was taken charge of by Miss Tidswell and under her direction he began the systematic study of the principal Shakespearean characters, displaying the peculiar originality of his genius by interpretations entirely different from those of Kemble. His talents and interesting countenance induced a Mrs Clarke to adopt him, but the slight of a visitor so wounded his pride that he suddenly left her house and went back to his old surroundings. In his fourteenth year he obtained an engagement to play leading characters for twenty nights in York Theatre, appearing as Hamlet, Hastings and Cato. Shortly he moved to London, while he played with the strolling company belonging to Richardson’s show, the humour of his performances being derisive—"the Moor—III., who commanded him to recite at Windsor. He subsequently joined Saunders’s circus, where in the performance of an equestrian feat he fell and broke his legs—the accident leaving traces of swelling in his insteps throughout his life. About this time he picked up music from Charles Incledon, dancing from D’Egville, and fencing from Angelo. In 1807 he played leading parts in the Belfast theatre with Mrs Siddons, who began by calling him “a horrid little man” and on further experience of his capability said that he “played very, very well,” but that “there was too little of him to make a great actor.” An engagement in 1808 to play leading characters in Beverley’s provincial troupe was brought to an abrupt close by his marriage (July 17) with Miss Mary Chambers of Waterford, the leading actress. For several years his prospects were very gloomy, but in 1814 the committee of Drury Lane theatre, the fortunes of which were then so low that bankruptcy seemed inevitable, resolved to give him a chance among the “experiments” they were making to win a return of popularity. When the expectation of his first appearance in London was close upon him he was so feverish that he exclaimed, “If I succeed I shall go mad.” His opening at Drury Lane on the 26th of November, 1814, sold out and Lord Melbourne roused the audience to almost uncontrollable enthusiasm. Successive appearances in Richard III., Hamlet, Othello, Macbeth and Lear served to demonstrate his complete mastery of the whole range of tragic emotion. His triumph was so great that he himself said on one occasion, “I could not feel the stage under me.” On the 25th of November 1820 Kean appeared for the first time in New York as Richard III. The success of his visit to America was unequivocal, although he fell into a vortex of difficulties with the press. On the 4th of June 1821 he returned to England. 1 This date is apparently settled by a letter from Kean in 1829, to Dr Gibson (see Rathenary Express for the 28th of June 1823, where the letter is printed and vouched for), inviting him to dinner on the 17th of March to celebrate Kean’s birthday. Several other dates have been given in books of reference, the 4th of November having been formerly accepted by this Encyclopaedia.
Probably his irregular habits were prejudicial to the refinement of his taste, and latterly they tended to exaggerate his special defects and mannerisms. The adverse decision in the divorce case of Cox v. Keane on the 17th of January 1825 caused his wife to leave him, and aroused against him such bitter feeling, shown by the almost riotous conduct of the audiences before which he appeared about this time, as nearly to compel him to retire permanently into private life. A second visit to America in 1825 was largely a repetition of the persecution which, in the name of morality, he had suffered in England. Some cities showed him a spirit of opposition, and hurled him to the ground. It marred and endangered his life by the violence of their disapproval.

In Quebec he was much impressed with the kindness of some Huron Indians who attended his performances, and he was made chief of the tribe, receiving the name Alainenouéid. Keane's last appearance in New York was on the 5th of December 1826 in Richard III., the rôle in which he was first seen in America. He returned to England and was ultimately received with all the old favour, but the contest had made him so dependent on the use of stimulants that the gradual deterioration of his gifts was inevitable. Still, even in their decay his great powers triumphed during the latter period of his career. His voice was never equalled in brilliancy, and his physical faculties, and compelled admiration after his gait had degenerated into a weak hobble, and the lightning brilliancy of his eyes had become dull and bloodshot, and the tones of his matchless voice marvelled by rough and grating hoarseness. His appearance in Paris was a failure owing to a fit of drunkenness. His last appearance on the stage was at Covent Garden, on the 25th of March 1833 when he played Othello to the Iago of his son Charles. At the words "Villain, be sure," in scene 3 of act iii., he suddenly broke down, and crying in a faltering voice "O God, I am dying. Speak to them, Charles," fell senseless into his son's arms. He died at Richmond on the 15th of May 1833.

It was in the impersonation of the great creations of Shakespeare's genius that the varied beauty and grandeur of the acting of Keane were displayed in their highest form, although probably his most powerful character was Sir Giles Overreach in Massinger's A New Way to Pay Old Debts, the effect of his first impersonation of which was such that the pit rose en masse, and even the actors and actresses themselves were overcame by the terrific dramatic illusion. His only personal disadvantage as an actor was his smallness of his stature, was the absolutely insensible in his unusually mobile; he had a matchless command of facial expression; his fine eyes scintillated with the slightest shades of emotion and thought; his voice, though weak and harsh in the upper register, possessed in its lower range tones of penetrating and resistless power, and a thrilling sweetness like the witchery of the finest music; above all, in the grander moments of his passion, his intellect and soul seemed to rise beyond material barriers and to glorify physical defects with their own greatness. Keane specially excelled as the exponent of passion. In Othello, Iago, Shylock and Richard III., characters utterly different from each other, but in which the predominant element is some form of passion, his identification with the personality, as he had conceived it, was as nearly as possible perfect, and each isolated phase and aspect of the plot was elaborated with the minutest attention to details, and yet with an absolute subordination of these to the distinct individuality he was endeavouring to portray. Coleridge said, "Seeing him act was like reading Shakespeare by flashes of lightning." If the range of character in which Keane attained supreme excellence was narrow, no one except Garrick has been so successful in so many great impersonations. Unlike Garrick, he had no true talent for comedy, but in the expression of biting and satirum wit, of grim and ghostly gaity, he was unsurpassed. His eccentricities at the height of his fame were numerous. Sometimes he would ride recklessly on his horse Shylock throughout the night. He was presented with a tame lion with which he might be found playing in his drawing-room. The prizefighters Mendoza and Richard the Black were among his visitors. Grattan was his devoted friend. In his earlier days Talma said of him, "He is a magnificent uncut gem; polish and round him off and he will be a perfect tragedian." Macready, who was much impressed by Kean's Richard III. and met the actor at supper, speaks of his "unassuming manner...partaking in some degree of shyness" and of the "touching grace" of his singing. Kean's delivery of the three words "I answer—NO!" in the part of Sir Edward Mortimer in The Iron Chest, cast Macready into an abyss of despair at rivalling him in this rôle. So full of dramatic interest is the life of Edmund Keane that it formed the subject for a play by the elder Dumas, entitled Kean on désordre et génie, in which Frederick-Lemaitre achieved one of his greatest triumphs.
made him enemies at Rome, whence there came in 1866 a request for his resignation of the rectorate, and where he spent the years 1897–1900 as canon of St John Lateran, assistant bishop at the pontifical throne, and counsellor to the Propaganda. In 1900 he was consecrated archbishop of Dubuque, Iowa. He took a prominent part in the Catholic Young Men's National Union and in the Total Abstinence Union of North America; and was in general charge of the Catholic delegation to the World's Parliament of Religions at the Columbian Exposition in 1893. He lectured widely on temperance, education and American institutions, and in 1890 was Dudleian Lecturer at Harvard University.

A selection from his writings and addresses was edited by Maurice Francis Egan under the title Outward and Upward: A Year Book (Baltimore, 1902).

KERNEY, a city and the county-seat of Buffalo county, Nebraska, U.S.A., about 130 m. W. of Lincoln. Pop. (1892), 8074; (1900), 8094 (650 foreign-born); (1910), 6202. It is on the main overland line of the Union Pacific, and is a junction of the Burlington & Missouri River railroad. The city is situated in the broad, flat bottom-lands a short distance N. of the Platte River. Lake Kearney, in the city, has an area of 40 acres. The surrounding region is rich farming land, devoted especially to the growing of alfalfa and Indian corn. At Kearney are a State Industrial School for boys, a State Normal School, the Kearney Military Academy, and a Carnegie library. Good water-power is provided by a canal from the Platte River about 17 m. above Kearney, and the city's manufactures include foundry and machine-shop products, flour and bakery products. Kearney was founded in 1872, and settled a year before the two railways actually formed their junction here or the city was platted. Kearney became a town in 1873, a city of the second class and the county seat in 1874, and a city of the first class in 1901. It is to be distinguished from an older and once famous prairie city, popularly known as "Dobey Town" (i.e. Adobe), founded in the early 'fifties on the edge of the reservation of old Fort Kearney (removed in 1848 from Nebraska City), in Kearney county, on the S. shore of the Platte about 6 m. S.E. of the present Kearney; here in 1861 the post office of Kearney City was established. In the days of the prairie breathing caravans Dobey Town was one of the most important towns between Independence, Missouri, and the Pacific coast, and it had a rough, wild, picturesque history; but it lost its immense frightening interests after the Union Pacific had been extended through it in 1866. The site of Dobey Town, together with the Fort, was abandoned in 1874. Fort Kearney and the city too were named in honour of General Stephen W. Kearny, and the name was at first correctly spelled without a second "e."

KERNEY, PHILIP (1815–1862), American soldier, was born in Fort Leavenworth, 2nd of June 1815, and was originally intended for the legal profession. He graduated at Columbia University (1833), but his bent was decidedly towards soldiering, and in 1837 he obtained a commission in the cavalry regiment of which his uncle, (General) Stephen Watts Kearny (1794–1848), was colonel and Lieutenant Jefferson Davis adjutant. Two years later he was sent to France to study the methods of cavalry training in vogue there. Before his return to the United States in 1840 he had served, on leave, in Algeria. He had inherited a large fortune, but he remained in the service, and his wide experience of cavalry work caused him to be employed on the headquarters of the army. After six more years' service Kearny left the army, but almost immediately afterwards he rejoined, bringing with him a company of cavalry, which he had raised and equipped chiefly at his own expense, to take part in the Mexican war. In December 1846 he was promoted captain. In leading a brilliant cavalry charge at Churubusco he lost his left arm, but he remained at the front, and won the brevet of major for his gallantry at Contreras and Churubusco. In 1851 he again resigned, to travel round the world. He saw further active service with his old comrades of the French cavalry in the Italian war of 1859, and received the cross of the Legion of Honour for his conduct at Solferino. Up to the outbreak of the American Civil War he lived in Paris, but early in 1861 he hastened home to join the Federal army. At first as a brigade commander and later as a divisional commander in the Army of the Potomac, he infusest into his men his own cavalry spirit of dash and bravery. At Williamsburg, Seven Pines, and Second Bull Run, he displayed his usual romantic courage, but at Chantilly (Sept. 1, 1862), after repulsing an attack of the enemy, he rode out in the dark too far to the front, and mistaking the Confederates for his own men was shot dead. His body was sent to the Federal lines with a message from General Lee, and was buried in Trinity Churchyard, New York. His commission as major-general of volunteers was dated July 4, 1862, but he never received it.

See J. W. de Peyster, Personal and Military History of Philip Kearny (New York, 1869).

KERNEY, a town of Hudson county, New Jersey, U.S.A., between the Passaic and Hackensack rivers, adjoining Harrison, and connected with Newark by bridges over the Passaic. Pop. (1900), 10,896, of whom 3597 were foreign-born; (1910 census), 8,659. The New York & Greenwood Lake division of the Erie railroad has a station at Arlington, the principal village (in the N.W. part), which contains attractive residences of Newark, Jersey City and New York City business men. The town covers an area of about 7 sq. m., including a large tract of marsh-land. In Kearney are railway repair shops of the Pennsylvania system, and a large abattoir; and there are numerous manufactures. The value of this town's factory products increased from $1,607,002 in 1900 to $4,447,904 in 1910, or 175½ per cent. Among its institutions are the State Soldiers' Home, removed here from Newark in 1880, a Carnegie library, two Italian homes for orphans, and a Catholic Industrial School for boys.

The neck of land between the Passaic and the Hackensack rivers, for 7 m. N. from where they unite, was purchased from the proprietors of East Jersey and from the Indians by Captain William Sandford in 1668 and through Nathaniel Kingsland, sergeant-major of Barbadoes, received the name "New Barbadoes." After the town under this name had been extended considerably to the northward, the town of Lodi was formed out of the S. portion in 1829, the town of Harrison was founded out of the S. portion of Lodi in 1840, and in 1867 a portion of Harrison was set apart as a township and named in honour of General Philip Kearny, a former resident. Kearny was incorporated as a town in 1895.

KERNEY, ANNIE (1825–1879), English novelist, was born near Wetherby, Yorkshire, on the 3rd of March 1825, the daughter of an Irish clergyman. She was the author of several children's books and novels, of which the best known is Castle Dale, an Irish story. She also wrote an Early Egyptian History (1861) and The Nation Around (1870). She died at Eastbourne on the 3rd of March 1879.

KEATE, JOHN (1773–1852), English schoolmaster, was born at Wells, Somersetshire, in 1773, the son of Prebendary William Keate. He was educated at Eton and King's College, Cambridge, where he had a brilliant career as a scholar; taking holy orders, he became, about 1797, an assistant master at Eton College. In 1809 he was elected headmaster. The discipline of the school was then in a most unsatisfactory condition, and Dr Keate (who took the degree of D.D. in 1810) took stern measures to improve it. His partiality for the birch became a by-word, but he succeeded in restoring order and strengthening the weakened authority of the masters. Beneath an outwardly rough manner the little man concealed a really kind heart, and when he retired in 1834, the boys, who admired his courage, presented him with a handsome testimonial. A couple of years before he had publicly flogged eighty boys on one day. Keate was made a canon of Windsor in 1820. He died on the 5th of March 1852 at Hartley Westpall, Hampshire, of which parish he had been rector since 1824.

See Maxwell Lyte, History of Eton College (3rd ed., 1899); Collins, Etoniana; Harwood, Alumni Etonenses; Annual Register (1852); Gentleman's Magazine (1852).
KEATS, JOHN (1795–1821), English poet, was born on the 29th or 31st of October 1795 at the sign of the Swan and Hoop, 24 The Pavement, Moordens, London. He published his first volume of verse in 1817, his second in the following year, his third in 1820, and died of consumption at Rome on the 23rd of February 1821 in the fourth month of his twenty-sixth year. (For the biographical facts see the later section of this article.)

In Keats's first book there was little foretaste of anything greatly or even genuinely good; but between the marshy and sandy flats of sterile or futile verse there were undoubtedly some few purple patches of floral promise. The style was frequently detestable—a mixture of sham Spenserian and mock Wordsworthian, alternately florid and arid. His second book, *Endymion*, rises in its best passages to the highest level of Barnfield and of Lodge, the two previous poets with whom, had he published nothing more, he might most properly have been classed; and this, among minor minstrels, is no unenviable place. His third book raised him at once to a foremost rank in the highest class of English poets. Shelley, up to twenty, had written little or nothing that would have done credit to a boy of ten; and of Keats also it may be said that the merit of his work at twenty-five was hardly by comparison more wonderful than its demerit at twenty-two. His first book fell as flat as it deserved to fall; the reception of his second, though less considerate than on the whole it deserved, was not more contemptuous than that of immeasurably better books published about the same time by Coleridge, Landor and Shelley. A critic of exceptional carelessness and candour might have noted in the first book so singular a stock of the most unadulterated poetic genius, and a notable sonnet on Chapman's Homer; a just judge would have indicated, a partial advocate might have exaggerated, the value of such golden gain amid a garish harvest of tares as the hymn to Pan and the translation into verse of Tithian's Bacchanaal which glorify the weedy wilderness of *Endymion*. But the hardest thing said of that poem by the Quarterly reviewer was unconsciously echoed by the future author of *Adonais*—that it was all but absolutely impossible to read through; and the obscener insolence of the "Blackguard's Magazine," as Landor afterwards very justly labelled it, is explicable though certainly not excusable if we glance back at such a passage as that where *Endymion* exchanges fulsome and liquorish entreatments with the "known unknown from whom his being signifies such darling (i) essence." Such nauseous and pitiful phrases as these, and certain passages in his correspondence, make us understand the source of the most offensive imputations or insinuations levelled against the writer's manhood; and, while admitting that neither his love-letters, nor the last piteous outcries of his wailing and shrieking agony, would ever have been made public by merciful editors, we must also admit that, if they could never have been published, it is no less certain that they ought never to have been written; that a manly kind of man or even a manly sort of boy, in his love-making or in his suffering, will not howl and snivel after such a lamentable fashion. One thing hitherto inexplicable a very slight and rapid glance at his amatory correspondence will amply suffice to explain: how it came to pass that the woman so passionately beloved by so great a poet should have thought it the hopeless attempt of a mistaken kindness to revive the memory of a man for whom the best that could be wished was complete and compassionate oblivion. For the side of the man's nature presented to his inspection, this probably was all that charity or reason could have desired. But that there was a finer side to the man, even if considered apart from the poet, his correspondence with his friends and their general evidence to his character give more sufficient proof than perhaps we might have derived from the general impression left on us by his works; though indeed the preface to *Endymion* itself, however illogical in its obviously implied suggestion that the poem published was unworthy of publication, gave proof or hint at least that after all its author was something of a man. And the eighteenth of his letters to Miss Brawne stands out in bright and brave contrast with such as seem incompatible with the traditions of his character on his manlier side. But if it must be said that he lived long enough only to give promise of being a man, it must also be said that he lived long enough to give assurance of being a poet who was not born to come short of the first rank. Not even a hint of such a probability could have been gathered from his first or even from his second appearance; after the publication of his third volume it was no longer a matter of possible debate among judges of the failure of *Endymion*; yet Keats never gave even secret certainty. Two or three phrases cancelled, two or three lines erased, would have left us in *Lamia* one of the most faultless as surely as one of the most glorious jewels in the crown of English poetry. *Isabella*, feeble and awkward in narrative to a degree almost incredible in a student of Dryden and a pupil of Leigh Hunt, is overcharged with episodical effects of splendid and pathetic expression beyond the reach of either. *The Eve of St Agnes*, aiming at no doubtful success, succeeds in evading all casual difficulty in the line of narrative; with no shadow of reference to such interest as may be derived from statistical inci- dent or depth of sentiment, it stands out among all other famous poems as a perfect and unsurpassable study in pure colour and clear melody—a study in which the figure of Madeline brings back upon the mind's eye, if only as moonlight recalls a sense of sunshine, the nuptial picture of Marlowe's Hero and the sleeping presence of Shakespeare's Imogen. Beside this poem should always be placed the less famous but not less precious *Eve of St Mark*, a fragment unexcelled for the simple perfection of its perfect simplicity, exquisite alike in suggestion and in accomplishment. The triumph of *Hyperion* is as nearly complete as that of *Endymion*; yet Keats is only the manly devotion and rational sense of duty to his art as in his resolution to leave this great poem unfinished; not, as we may gather from his correspondence on the subject, for the pitiful reason assigned by his publishers, that of discouragement at the reception given to his former work, but on the solid and reasonable ground that a Miltonic study had something in its very scheme and nature too artificial, too studios of a foreign influence, to be carried on and carried out at such length as was implied by his original design. Fortified and purified as it had been on a second revision, when much introductory allegory and much tentative effusion of sonorous and superfluous verse had been rigorously clipped down or pruned away, it could not long have retained spirit enough to support or inform the shadowy body of a subject so little charged with tangible significance. The faculty of assimilation as distinguished from imitation, than which there can be no surer or stronger sign of strong and sure original genius, is not more evident in the most Miltonic passages of the revised *Hyperion* than in the more Shakespearean passages of the unrevised tragedy which no radical correction could have left other than a sense of artificiality. Yet Keats was not unreasonably exasperated; he did not wish to say that in this chaotic and puerile play of *Otho the Great* there are such verses as Shakespeare might not without pride have signed at the age when he wrote and even at the age when he rewrote the tragedy of *Romeo and Juliet*. The dramatic fragment of *King Stephen* shows far more power of hand and gives far more promise of success than does that of Shelley's *Charles the First*. Yet we cannot say with any confidence that even this far from extravagant promise would certainly or probably have been kept; it is certain only that Keats in these attempts did at least succeed in showing a possibility of future excellence far too tragic or at least a romantic dramatist. In every other line of high and serious poetry his triumph was actual and consummated; here only was it no more than potential or incomplete. As a ballad of the more lyrical order, *La Belle dame sans merci* is not less absolutely excellent, less triumphantly perfect in force and clearness of impression, that as a narrative poem is *Lamia*. In his lines on Robin Hood, and in one or two other less noticeable studies of the kind, he has shown thorough and easy mastery of the beautiful metre inherited by Fletcher from Barnfield and by Miltons from Fletch and that simple force of spirit and style which distinguishes the genuine ballad manner from all spurious attempts at an artificial simplicity was once more at least
KEATS

achieved in his verses on the crowning creation of Scott's humaner and manlier genius—Meg Merrilies. No little injustice has been done to Keats by such devotees as fix their mind's eye only on the more salient and distinctive notes of a genius which in fact was very much more various and tentative, less limited and peculiar, than would be inferred from an exclusive study of his more specially characteristic work. But within the limits of that work must we look of course for the genuine credentials of his fame; and highest among them we must rate his unequalled and unrivalled odes. Of these perhaps the two nearest to absolute perfection, to the triumphant achievement and accomplishment of the very utmost beauty possible to human words, may be that to Autumn and that on a Grecian Urn; the most radiant, fervent and musical is that to a Nightingale; the most pictorial and perhaps the tenderest in its armour of passionate fancy is that to Psyche; the sublimest in sweetness of thought and feeling is that on Melancholy. Greater lyrical poetry the world may have seen than any that is in these; lovelier it surely has never seen, nor ever can it possibly see. From the divine fragment of an unfinished ode to Maen we can but guess that if completed it would have been worthy of a place beside the highest. His remaining lyrics have many beauties about them, but none perhaps can be called thoroughly beautiful. He has certainly left us one perfect sonnet of the first rank and as certainly he has left us but one.

Keats has been promoted by modern criticism to a place beside Shakespeare. The faultless formalism and profound subtlety of his art and entire instinct for the absolute of the poet, the limits of absolute natural beauty can hardly be questioned or overlookd; and this is doubtless the one main distinctive gift or power which denotes him as a poet among all his equals, and gives him a right to rank for ever beside Coleridge and Shelley. As a man, the two admirers who did best service to his memory were Lord Houghton and Matthew Arnold. These alone, among all of their day who have written of him without the disadvantage or advantage of a personal acquaintance, have clearly seen and shown us the manhood of the man. That ridiculous and degrading legend was imposed on so genuine a man of nature as Shelley, while evoking the very natural and allowable laughter of Byron, fell to dust at once forever on the appearance of Lord Houghton's biography, which gave perfect proof to all time that "men have died and worms have eaten them" but not for fear of critics or through suffering inflicted by reviews. Somewhat too sensually sensitive Keats may have been in either capacity, but the nature of the man was as far as was the quality of the poet above the pitiful level of a creature whose soul could "let itself be snuffed out by an article"; and, in fact, owing doubtless to the accident of a death which followed so fast on his early career, his funereal and post-mortemuteness of spirit, the incalculable and injustice of his reviewers in general have been comparatively and even considerably exaggerated. Except from the chief fountain-head of professional ribaldry then open in the world of literary journalism, no reek of personal insult arose to offend his nostrils; and the tactics of such unwashed malignants were inevitably suicidal; the references to his brief experience of apprenticeship to a surgeon which are quoted from Blackwood, in the shorter as well as in the longer memoir by Lord Houghton, could leave no bad odour behind them save what might hang about men's yet briefier recollection of his antique unmentionable existence. The false Keats, therefore, whom Shelley pitied and Byron despised would have been, had he ever existed, a thing beneath compassion or contempt. That such a man could have had such a genius is almost evidently impossible; and yet more evident is the proof which remains on everlasting record that none was ever further from the chance of inducing to such degradation than the real and actual man who made that name immortal. (A. C. S.)

Subjoined are the chief particulars of Keats's life.

He was the eldest son of Thomas Keats and his wife Frances Jennings, and was baptized at Bishoptoke, in Islington, on the 18th of December 1795. The entry of his baptism is supplemented by a marginal note stating that he was born on the 31st of October. Thomas Keats was employed in the Swan and Hoop livery stables, Finsbury Pavement, London. He had married his master's daughter, and managed the business on the retirement of his father-in-law. In April 1804 Thomas Keats was killed by a fall from his horse, and within a year of this event Mrs Keats married William Rawlings, a warehouseman. The marriage proved an unhappy one, and in 1806 Mrs Rawlings, with her children John, George, Thomas and Frances Mary (afterwards Mrs Llanos, d. 1850), went to live at Edmonton with her mother, who had inherited a considerable competence from her husband. There is evidence that Keats's parents were by no means of the commonplace type that might be hastily inferred from these associations. They had desired to send their sons to Harrow, but John Keats and his two brothers were eventually sent to a school kept by John Clarke at Enfield, where he became intimate with his master's son, Charles Cowden Clarke. His vivacity of temperament showed itself at school in a love of fighting, but in the last year of his school life he developed a great appetite for reading of all sorts. In 1816 he left school to be apprenticed to Mr Thomas Hammond, a surgeon in Edmonton. He was still within easy reach of his old school, where he frequently borrowed books, especially the works of Spenser and the Elizabethans. With Hammar he quarrelled before the termination of his apprenticeship, and in 1814 the connexion was broken by mutual consent. His mother had died in 1810, and in 1814 Mrs Jennings. The children were left in the care of two guardians, one of whom, Richard and Abbey, seems to have used and wasted the endowment of the boy. John Keats went to London to study at Guy's and St Thomas's hospitals, living at first alone at 8 Dean Street, Borough, and later with two fellow students in St Thomas's Street. It does not appear that he neglected his medical studies, but his chief interest was turned to poetry. In March 1816 he became a dresser at Guy's, but about the same time his poetic gifts were stimulated by an acquaintance formed with Leigh Hunt. His friendship with Benjamin Haydon, the painter, dates from later in the same year. Hunt introduced him to Shelley, who showed the younger poet a copy of the posthumous volume of Endymion. In 1816 Keats moved to the Piazza, at the corner of Charlotte Street, with his brothers George and Tom, the former of whom was then employed in his guardian's counting-house, but much of the poet's time was spent at Leigh Hunt's cottage at Hampstead. In the winter of 1816-1817 he definitely abandoned medicine, and in the spring appeared Poems by John Keats dedicated to Leigh Hunt, and published by Charles and James Ollier. On the 14th of April he left London to find quiet for work. He spent some time at Shanklin, Isle of Wight, then at Margate and Canterbury, where he was joined by his brother Tom. In the summer the three brothers took lodgings in Well Walk, Hampstead, where Keats showed at last he went to live with his friend Thomas Charles Armitage Brown. In September of the same year (1817) he paid a visit to his friend, Benjamin Bailey, at Oxford, and in November he finished Endymion at Burford Bridge, near Dorking. His youngest brother had developed consumption, and in March John went to Teignmouth to nurse him in place of his brother George, who had decided to sail for America with his newly married wife, Georgiana Wyle. In May (1818) Keats returned to London, and soon after appeared Endymion: A Poetic Romance (1818), bearing on the title-page as motto "The stretched metre of kindness. In 1816 Keats moved to one Kent and his friend Armitage Brown started on a walking tour in Scotland, vividly described in the poet's letters. The fatigue and hardship involved proved too great a strain for Keats, who was forbidden by an Inverness doctor to continue his tour. He returned to London by boat, arriving on the 18th of August. The autumn was spent in constant attendance on his brother Tom, who died at the beginning of December. There is no doubt that he resented the attacks on him in Blackwood's Magazine (August 1818), and the Quarterly Review (April 1818, published only in September), but his chief preoccupations were elsewhere. After Keats's death he went to live with his friend Thomas Charles Armitage Brown who had already made the acquaintance of Fanny Brawne, a girl of seventeen, who lived with her mother close by. For her Keats
quickly developed a consuming passion. He was in indifferent health, and, owing partly to Mr Abbey's mismanagement, in difficulties for money. Nevertheless his best work belongs to this period. In July 1819 he went to Shanklin, living with James Rice. They were soon joined by Brown. The next two months Keats spent with Brown at Winchester, enjoying an interval of calmness due to his absence from Fanny Brawne. At Winchester he completed Lamia and Otho the Great, which he had begun in conjunction with Brown, and began his historical tragedy of King Stephen. Before Christmas he had returned to London and his bondage to Fanny. In January 1820 his brother George paid a short visit to London, but received no confidence from him. The fatal nature of Keats's illness showed itself on the 3rd of February, but in March he recovered sufficiently to be present at the private view of Hazlitt's pictures of "Christ's Entry into Jerusalem." In May he removed to a lodging in Weslayan Place, Kentish Town, to be near Leigh Hunt who eventually took him into his house. In July appeared his third and last book, Lamia, Isabella, The Eve of St Agnes and other Poems (1820). Keats left the Hunts abruptly in August in consequence of a delay in receiving one of Fanny Brawne's letters which had been broken open by a servant. He went to Wentworth Place, where he was taken in by the Brawnes. The suggestion that he should spend the winter in Italy was followed up by an invitation from Shelley to Pisa. This, however, he refused. But on the 16th of July he was sent back to England by Joseph Severn, the artist, who had long been his friend. The travellers settled in the Piazza de Spagna, Rome. Keats was devotedly tended by Dr (afterwards Sir) James Clarke and Severn, and died on the 23rd of February 1821. He was buried on the 27th in the old Protestant cemetery, near the pyramid of Cestius.

BIBLIOGRAPHY.—Keats's friends provided the material for the authoritative biography of the poet by Richard Monckton Milnes (April 23, 1792 at Oxford, to March 31, 1874 at Oxford), entitled Life, Letters and Remains of John Keats (1848; revised ed., 1867). The Poetical Works of John Keats were issued with a memoir by R. M. Milnes in 1854, 1856, 1861, 1866, 1867, and in the Aldine edition, 1876. The standard edition of Keats is The Poetical Works and Other Writings of John Keats first brought together, including Poems and numerous Letters not before published, edited with notes and appendices by Harry Buxton Forman (4 vols., 1883): re-issue with corrections and additions, 1889. Of the many other editions of Keats's poems may be mentioned that in the Muses' Library, The Poems of John Keats (1890), edited by G. Thorn Drury with an introduction by Robert Bridges. Other works by C. de Selincourt, The Letters of John Keats to Fanny Brawne (1898) were edited with introduction and notes by H. Buxton Forman, and the Letters of John Keats to his Family and Friends (1891) by Sidney Colvin, who is also the author of Shakespeare's Country Men and Other Essays (1887). In this latter the papers of the young Keats are included. See also The Papers of a Critic. Selected from the Writings of the late Charles Wentworth Dilke (1873), and for further bibliographical information an index to the Early Letters of MS. "E." (Edgbaston, 1878). A facsimile of Keats's autograph MS. of "Hyperion," purchased by the British Museum in 1904, was published by E. de Selincourt (Oxford, 1905).

KEBLE, JOHN (1792–1866), English poet and divine, the author of the Christmas Year, was born on St Mark's Day (April 25), 1792 at Fairfax, Gloucestershire. He was the second child of the Rev. John Keble and his wife Sarah Maule. Descended from a family which had attained some legal eminence in the time of the Commonwealth, John Keble, the father of the poet, was vicar of Coln St Aldwyn, but lived at Fairfax, about 3 m. distant from his cure. He was a clergyman of the Old Church school, whose adherents, untouched by the influence of the Wesleys, had moulded their piety on the doctrines on the non-jurors and the old Anglican divines. Himself a good scholar, he did not send his son to any school, but educated him and his brother at home so well that both obtained scholarships at Corpus Christi College, Oxford. John was elected scholar of Corpus in his fifteenth, and fellow of Oriel in his nineteenth year, April 1811. In Easter term 1810 he had obtained double first class honours, a distinction which had been obtained only twice before, by Sir Robert Peel. After his election to the Oriel fellowship Keble gained the University prizes, both for the English essay and also for the Latin essay. But he was more remarkable for the rare beauty of his character than even for academic distinctions. Sir John Taylor Coleridge, his fellow scholar at Corpus and his life-long friend, says of him, after their friendship of five and fifty years had closed, "It was the singular happiness of his nature, remarkable even in his undergraduate days, that love for him was always sanctified by reverence—reverence that did not make the love less tender, and love that did but add intensity to the reverence." Oriel College was, at the time when Keble became a fellow, the centre of all the finest ability in Oxford. Copleston, Davison, Whately, were among the fellows who elected Keble; Arnold, Pusey, Newman, were soon after added to the society. In 1815 Keble was ordained deacon, and priest in 1816. His real bent and choice were towards a pastoral cure in a country parish; but he remained in Oxford, acting first as a public examiner in the schools, then as a tutor in Oriel, till 1823. In summer he sometimes took clerical work, sometimes made tours on foot through various English counties, during which he was composing poems, which afterwards took their place in the Christian Year. He had a rare power of attracting to himself the finest spirits, a power which lay not so much in his ability or his genius as in his character, so simple, so humble, so pure, so unworlly, yet wanting not that severity which can stand by principle and maintain what he holds to be worth preserving. In 1823 he returned to Fairford, there to assist his father, and with his brother to serve as curate to the parish. The brothers, which make up that book had been the silent gathering of years. Keble had purposed in his own mind to keep them beside him, correcting and improving them, as long as he lived, and to leave them to be published only "when he was fairly out of the way." This resolution was at length overcome by the importunities of his friends, and above all by the strong desire of his father to see his son's poems in print before he died. Accordingly they were printed in two small volumes in Oxford, and given to the world in June 1827, but with no name on the title-page. The book was to be published anonymously, but the name of the author soon transpired.

Between 1827 and 1872 one hundred and fifty-eight editions had issued from the press, and it has been largely reprinted since. The author, so far from taking pride in his widespread reputation, seemed all his life long to wish to disconnect his name with the book, and "as if he would rather it had been the work of some one else than himself." This feeling arose from no false modesty. It was because he knew that in these poems he had painted his own heart, the best part of it; and he doubted whether it was right thus to exhibit himself, and by the revelation of only his better self, to win the good opinion of the world.

Towards the close of 1831 Keble was elected to fill the chair of the poetry professorship in Oxford, as successor to his friend and admirer, Dean Milman. This chair he occupied for ten eventful years. He delivered a series of lectures, clothed in excellent idiomatic Latin (as was the rule), in which he expounded a theory of poetry which was original and suggestive. He looked on poetry as a vent for overcharged feeling, or a full imagination, or some imaginative regret, which had not found their natural outlet in life and action. This suggested to him a distinction between what he called primary or the secondary and poetry—the first employing poetry to relieve their own hearts, the second, poetic artists, composing poetry from some other and less impulsive motive. Of the former kind were Homer, Lucrètius, Burns, Scott; of the latter were Euripides, Dryden, Milton.

This view was set forth in an article contributed to the British
In the late autumn of the latter year, Keble left Hursley for the sake of his wife's health, and sought the milder climate of Bournemouth. There he had an attack of paralysis, from which he died on the 29th of March 1866. He was buried in his own churchyard at Hursley; and in little more than a month his wife was laid by her husband's side.

Keble also published *A Metrical Version of the Psalter* (1839), *Lyra Innocentium* (1840), and a volume of poems was published posthumously, *Keble's Poems* (1863). But it is his poetry that gives him a place in the religious world. It was a happy thought that dictated the plan of the book, to furnish a meditative religious lyric for each Sunday of the Church's year and for each of the Psalms of the Church.

The subject of each poem is generally suggested by some part of the lessons or the gospel or the epistle for the day. One thing which gives these poems their strangely unique power is the sentiment to which Keble clings, the claim that the poet who makes the appeal, illumining more or less every poem.

The intimacy with the Bible which is manifest in the pages of the *Christian Year*; and the unobtrusive felicity with which Biblical sentiments and language are introduced have done much to endear these poems to all Bible readers. "The exactness of the descriptions of Palestine, which Keble had never visited, have been noted, and verified on the spot," by Dean Stanley, who points to the lake of Gennesaret, which were first touched in the *Christian Year*; and he observes that throughout the book "the Biblical scenery is treated graphically as real scenery, and the Biblical history and Biblical country." As to its style, the *Christian Year* is calm and grave in tone, and subdued in colour, as becometh its subjects and sentiments. The contemporary poets whom Keble most admired were Scott, Wordsworth, Southey, and Coleridge. The echoes and influence traces are visible in his work. Yet he has a style of language and a cadence of his own, which steal into the heart with strangely soothing power. Some of the poems are faultless, after their kind, flowing from the first stroke to the last, lucid in thought, vivid in diction, harmonious in their pensive melody. In others there are imperfections in rhythm, conventionalities of language, obscurities or over-subtleties of thought, which mar the reader's enjoyment. Yet even the most defective poems commonly have, at least, a single verse, expressing some profound thought or tender shade of feeling, for which the sympathetic reader willingly pardons artistic imperfections in the whole.

Keble's life was written by his life-long friend Mr Justice J. T. Coleridge. The following is a complete list of his writings:

1. Works published in Keble's lifetime: *Christian Year* (1837); *Psalter* (1839); *Prælectiones Academicae* (1844); *Lyra Innocentium* (1846); *Sermons Academical* (1848); *Argument against Repeal of Marriage Law, and Sequel* (1857); *Eucharistic Adoration* (1857); *Life of Bishop Wilson* (1865); *Sermons Occasional and Parochial* (1867). 2. Posthumous publications: *Village Sermons on the Baptismal Service* (1868); *Miscellaneous Poems* (1866); *Letters of Spirit*; *Life of Pusey* (1869); *Prayer Year, or, Christian Year, 11* (1875—1880); *Occasional Papers and Reviews* (1877); *Sibyl's Sacraments* (1877); *Outlines of Instruction or Meditation* (1880).
KEEL, the bottom timber or combination of plates of a ship or boat, extending longitudinally from bow to stern, and supporting the framework (see SHIP-BUILDING). The origin of the word has been obscured by confusion of two words, the Old Norwegian kjøle (cf. Swedish köl) and a Dutch and German kiel. The first had the meaning of the English "keel," the other of ship, boat. The modern usage in Dutch and German has approximated to the English. The word kiel is represented in old English by cet, a word applied to the long war galleys of the Vikings, in which sense "keel" or "kecile" is still used by archaeologists. On the Tyne "keel" is the name given to a flat-bottomed vessel used to carry coals to the colliers. There is another word "keel," meaning to cool, familiar in Shakespeare (Love's Labour Lost, v. ii. 930), "while greasy Joan doth keel the pot," i.e., prevents a pot from boiling over by pouring in cold water, &c., stirring or skimming. This is from the Old English cílan, to cool, a common Teutonic word, cf. German kühlen.

KEELEY, MARY ANNE (1806–1899). English actress, was born at Ipswich on the 22nd of November 1805 or 1806. Her maiden name was Goward, her father being arazier and timberman. After some experience in the provinces, she first appeared on the stage in London on the 2nd of July 1825, in the opera Rosina. It was not long before she gave up "singing parts" in favour of the drama proper, where her powers of character-acting could have scope. In June 1829 she married Robert Keeley (1793–1869), an admirable comedian, with whom she had often appeared. Between 1832 and 1842 they acted at Covent Garden, at the Adelphi with Buckstone, at the Olympic with Charles Mathews, and at Drury Lane with Macready. In 1836 they visited America. In 1838 she made her first great success as Nydia, the blind girl, in a dramatized version of Bulwer Lytton's The Last Days of Pompeii, and followed this with an equally striking impersonation of Smike in Nicholas Nickleby. In 1839 came her decisive triumph with her picturesque and spirited acting as the hero of a play founded upon Harrison Ainsworth's Jack Sheppard. So dangerous was considered the popularity of the play, with its glorification of the prison-breaking felon, that the lord chamberlain ultimately forbade the performance of any piece upon the subject. It is perhaps mainly as Jack Sheppard that Mrs. Keeley lived in the memory of playgoers, despite her long subsequent career in plays more worthy of her remarkable gifts. Under Macready's management she played Nerissa in The Merchant of Venice, and Audrey in As You Like It. She managed the Lyceum with her husband from 1844 to 1847; acted with Webster and Kean at the Haymarket; returned for five years to the Adelphi; and made her last regular public appearance at the Lyceum in 1859. A public reception was given her at this theatre on her 90th birthday. She died on the 12th of March 1899.

KEELING ISLANDS (often called Cocos and Cocos-Keeling Islands), a group of coral islands in the Indian Ocean, between 12° 4' and 12° 13' S., and 96° 40'-57' E., but including a smaller island in 11° 50' N. and 96° 50' E. The group furnished Charles Darwin with the typical example of an atoll or lagoon island. There are altogether twenty-three small islands, 9½ m. being the greatest width of the whole atoll. The lagoon is very shallow and the passages between many of the islands are fordable on foot. An opening on the northern side of the reef permits the entrance of vessels into the northern part of the lagoon, which forms a good harbour known as Port Refuge or Port Albion. The coco-nut (as the name Cocos Islands indicates) is the characteristic product and is cultivated on all the islands. The flora is scanty in species. One of the commonest living creatures is a monstrous crab which lives on the coco-nuts; and in some places there also are great colonies of the pigeon-crane crab. The group was visited by Dr H. O. Forbes in 1878, and later, at the expense of Sir John Murray, by Dr Guppy, Mr Ridley and Dr Andrews. The object of their visits was the investigation of the fauna and flora of the atoll, more especially of the formation of the coral reefs. Dr Guppy was fortunate in reaching North Keeling Island, where a landing is only possible during the calmest weather. The island he found to be about a mile long, with a shallow enclosed lagoon, less than 3 ft. deep at ordinary low water, with a single opening on its east or weather side. A dense vegetation of iron-wood (Cordia) and other trees and shrubs, together with a forest of coco-nut palms, covers its surface. It is tenanted by myriads of sea-fowl, frigate-birds, boobies, and terns (Gygis carnifex), which find here an excellent nesting-place. The island is unhabited, and is visited only once or twice a year. The excrement from this large colony has changed the carbonate of lime in the soil and the coral nodules on the surface into phosphates, to the extent in some cases of 60–70%, thus forming a valuable deposit, beneficial to the vegetation of the island itself and promising commercial value. The lagoon is slowly filling up and becoming cultivable land, but the rate of recovery from the sea has been specially marked since the eruption of Krakatoa, the pumice from which was washed on to it in 1883. J. Ross, who had commanded a brig during the English occupation of Java, settled with his family (who continued in the ownership) on Direction Island, and his little colony was soon strengthened by Hare's runaway slaves. The Dutch Government had in an informal way claimed the possession of the islands since 1829; but they refused to allow Ross to hoist the Dutch flag, and accordingly the group was taken under British protection in 1856. In 1876 it was attached to the government of Ceylon, and in 1882 placed under the authority of the governor of the Straits Settlements. The ownership and superintendence continued in the Ross family, of whom George Clunies Ross died in 1910, and was succeeded by his son Sydney.

KEEL-MOULDING, in architecture, a round on which there is a small fillet, somewhat like the keel of a ship. It is common in the Early English and Decorated styles.

KEENE, CHARLES SAMUEL (1823–1891), English black-and-white artist, the son of Samuel Browne Keene, a solicitor, was born at Horsey on the 10th of August 1823. Educated at the Ipswich Grammar School until his sixteenth year, he early showed artistic leanings. Two years after the death of his father he was articled to a London solicitor, but, the occupation proving ungenial, he was removed to the office of an architect, Mr Pilkington. His spare time was now spent in drawing historical and nautical subjects in water-colour. For these trifles his mother, to whose energy and common sense he was greatly indebted, soon found a purchaser, through whom he was brought to the notice of the Wythmers, the wood-engravers. This led to his being bound to them as apprentice for five years. His earliest known
KEENE, L.—KEEP

KEENE, LAURA (c. 1820—1873), Anglo-American actress and manager, whose real name was Mary Moss, was born in England. In 1851, in London, she was playing Pauline in The Lady of Lyons. She made her first appearance in New York in the 26th of September 1852, on her way to Australia. She returned in 1855 and till 1863 managed Laura Keene's theatre, in which was produced, in 1858, Our American Cousin. It was her company that was playing at Ford's theatre, Washington, on the night of Lincoln's assassination. Miss Keene was a successful melodramatic actress, and an admirable manager. She died at Montclair, New Jersey, on the 4th of November 1873.

See John Greehan's Life of Laura Keene (1897).

KEENE, a city and the county-seat of Cheshire county, New Hampshire, U.S.A., on the Ashuelot river, about 45 m. S.W. of Concord, N.H., and about 92 m. W.N.W. of Boston. Pop. (1910) 8,115, of whom 1255 were foreign-born; (1910 census), 10,668. Area, 36-5 sq. m. It is served by the Boston & Maine railroad and by the Fitchburg railroad (leased by the Boston & Maine). The site is level, but is surrounded by ranges of lofty hills—Monadnock Mountain is about 10 m. S.E. Most of the streets are pleasantly shaded. There are three parks, with a total area of about 219 acres; and in Central Square stands a soldiers' and sailors' monument designed by Martin Milmore and erected in 1871. The principal buildings are the city hall, the custom buildings and the city hospital. The Public Library had in 1905 about 16,300 volumes. There are repair shops of the Boston & Maine railroad here, and manufacturers of boots and shoes, woollen goods, furniture (especially chairs), pottery, &c. The value of the factory product in 1905 was $2,690,697. The site of Keene was one of the Massachusetts grants made in 1733, but Canadian Indians made it untenable and it was abandoned from 1746 until 1750. In 1753 it was incorporated and was named Keene, in honour of Sir Benjamin Keene (1697-1757), the English diplomatist, who as agent for the South Sea Company and Minister in Madrid, and as responsible for the commercial treaty between England and Spain, was in high reputation at the time; it was chartered as a city in 1784.

KEEP, ROBERT PORTER (1844-1904), American scholar, was born in Farmington, Connecticut, on the 26th of April 1844. He graduated at Yale in 1865, was instructor there for two years, was United States consul at the Piraeus in Greece in 1869-1871, taught Greek in Williston Seminary, Easthampton, Massachusetts, in 1876-1885, and was principal of Norwich Free Academy, Norwich, Conn., from 1885 to 1900, the school owing its prosperity to him hardly less than to the commensurate endowment in 1903 he took charge of Miss Porter's school for girls at Farmington, Conn., founded in 1844 and long controlled by his aunt, Sarah Porter. He died in Farmington on the 3rd of June 1904.

KEEP (corresponding to the French donjon), in architecture the inmost and strongest part of a medieval castle, answering to the citadel of modern times. The arrangement is said to have originated with Gundulf, bishop of Rochester (d. 1108), architect of the White Tower. The Norman keep is generally a very massive square tower. There is generally a cellar below, ingeniously concealed in the thickness of a wall or in a pillar. The most notable Norman towers in England are the White Tower in London, those at Rochester...
Arundel and Newcastle, Castle Hedingham, &c. When the keep was circular, as at Conisborough and Windsor, it was called a “shell-keep” (see Castle). The verb “to keep,” from which the noun with its particular meaning here treated was formed, appears in O.E. as cœpon, of which the derivation is unknown; no words related to it are found in cognate languages. The earliest meaning (c. 1000) appears to have been “to lay hold of, to seize;” from which its secondary uses of “to guard, observe, retain possession of, have developed.”

KEEWATIN, a district of Canada, bounded E. by Committee Bay, Fox Channel, and Hudson and James bays, S. and S.W. by the Albany and English rivers, Manitoba, Lake Winnipeg, and Nelson river, W. by the 100th meridian, and N. by Simpson and Rae straits and gulf and peninsula of Boothia; thus including an area of 445,000 sq. m. Its surface is in general barren and rocky, studded with innumerable lakes with intervening elevations, forest-clad below 60° N., but usually bare or covered with moss or lichens; and Bel and Coats Islands, in Hudson Bay; and Akimiski, in James Bay.

A few small communities at the posts of the Hudson Bay Company constitute practically the whole of the white population. In 1897 there were 832 Indians in the Churchill and Nelson rivers district, but no figures are available for the district as a whole. The principal posts in Keeatin are Norway House, near the outlet of Lake Winnipeg; Oxford House, on the lake of the same name; York Factory, at the mouth of Hayes river; and Fort Severn and Churchill, at the mouths of the Severn and Churchill rivers respectively. In 1897 the district of Keeatin included the North-West Territories and the whole place under an administrator or acting governor. The derivation of the name is from the Cree—the “north wind.”

KEF, more correctly El-Kef (the Rock), a town of Tunisia, 125 m. by rail S.S.W. of the capital, and 75 m. S.E. of Bona in Algeria. It occupies the site of the Roman colony of Sicca Veneria, and is built on the steep slope of a rock in a mountainous region through which flows the Mellegue, an affluent of the Mejerdah. Situated at the intersection of main routes from the west and south, Kef occupies a position of strategic importance. Through distances 22 m. from the African frontier it was practically a border post, and its walls and citadel were kept in a state of defence by the Tunisians. The town with its half-dozen mosques and tortuous, dirty streets, is still partly walled. The southern part of the wall has however been destroyed by the French, and the remainder is being left to decay. Beyond the part of the wall destroyed is the French quarter. The kasbah, or citadel, occupies a rocky eminence on the west side of the town. It was built, or rebuilt, by the Turks, the material being Roman. It has been restored by the French, who maintain a garrison here.

The Roman remains include fragments of a large temple, dedicated to Hercules, and of the baths. The ancient cisterns remain, but are empty, being used as part of the barracks. The town is however supplied by water from the same spring which filled the cisterns. The Christian cemetery is on the site of a basilica. There are ruins of another Christian basilica, excavated by the French, the apse being intact and the nartex serving as a church. Many stones with Roman inscriptions are built into the walls of Arab houses. The modern town is much smaller than the Roman colonia in top, about 6000, including about 100 Europeans (chiefly Maltese).

The Roman colony of Sicca Veneria appears from the character of its worship of Venus (Val. Max. ii. 6, 15) to have been a Phoenician settlement. It was afterwards a Numidian stronghold, and under the Caesars became a fashionable residential city and one of the chief centres of Christianity in North Africa. The Christian apologist Arnobius the Elder lived here.

KEHL, a town in the grand-duchy of Baden, on the right bank of the Rhine, opposite Strassburg, with which it is connected by a railway bridge and a bridge of boats. Pop. 4000. It has a considerable trade river in timber, tobacco and coal, which has been developed by the formation of a harbour with two basins. The chief importance of Kehl is its connexion with the military defence of Strassburg, to the strategic area of which it belongs. It is incircled by the strong forts Bose, Blumenthal and Kirchbach of that system. In 1768 Kehl was taken from the imperialists by the French, and in 1863 a new fortress, built by Vauban, was begun. In 1697 it was restored to the Empire and was given to Baden, but in 1703 and again in 1713 it was taken by the French, who did not however retain it for very long. In 1793 the French again took the town, which was retaken by the Austrians and was restored to Baden in 1803. In 1806 the French, again in possession, restored the fortifications, but these were dismantled in 1815, when Kehl was again restored to Baden. In August 1870, during the Franco-German War, the French shelled the defended town.

KEIGHLEY (locally Keethley), a municipal borough in the Keighley parliamentary division of the West Riding of Yorkshire, England, 17 m. W.N.W. of Leeds, on branches of the Great Northern and Midland railways. Pop. (1901), 41,564. It is beautifully situated in a deep valley near the junction of the Worth with the Aire. A canal between Liverpool and Hull affords it water communication with both west and east coasts. The principal buildings are the parish church of St Andrew (dating from the time of Henry I.), modernized in 1710, rebuilt with the exception of the tower in 1805, and again rebuilt in 1858), and the handsome Gothic mechanics’ institute and west school, both the works of A. P. Pugin. In 1713 the operations of which have been extended so as to embrace a trade school (1871) for boys, and a grammar school for girls. The principal industries are manufactures of woolen goods, spinning, sewing and washing machines, and tools. The town was incorporated in 1882, and the corporation consists of a mayor, 6 aldermen and 18 councillors.

KEI ISLANDS [Ke, Key, Kii, &c.; native, Ewe], a group in the Dutch East Indies, in the residency of Ambonoya, between 5° and 6° S. and 134° 50’ and 133° 15’ E., and consisting of four parts: Nuu-lut or Great Kei, Roa or Little Kei, the Tayanda, and the Kur group. Great Kei differs physically in every respect from the other groups. It is of Tertiary formation (Miocene), and has a chain of volcanic elevations along the axis, reaching a height of 2600 ft. Its area is 290 sq. m., all the other land area of the group being 572 sq. m. All the other islands are of post-Tertiary formation and of level surface. The group has submarine connexion, under relatively shallow sea, with the Timorlaut group to the south-west and the chain of islands extending north-west towards Ceram; deep water separates it on the east from the Aru Islands and on the west from the inner islands of the Banda Sea. Among the products are coco-nuts, sago, fish, trepang, timber, copra, maize, yams.
and tobacco. The population is about 23,000, of whom 14,000 are pagans, and 8,500 Mahomedans.

The inhabitants are of three types. There is the true Kei Islander, a Polynesian by his height and black or brown wavy hair, with a complexion between the Papuan black and the Malay yellow. There is the pure Papuan, who has been largely merged in the Kei type. Thirdly, there are the immigrant Makasae, who came to him in a special language (and by the profession of Mohammedanism) are descendants of natives of the Banda islands who fled eastward before the encroachments of the Dutch. The pagans have rude statues of deities and places of sacrifice indicated by flat-topped cairns. The Kei Islanders are skillful in carving and celebrated boat-builders.

KEIM, KARL THEODOR (1825-1878), German Protestant theologian, was born at Stuttgart on the 17th of December 1825. His father, Johann Christian Keim, was headmaster of a gymnasium. Here Karl Theodor received his early education, and then proceeded to the Stuttgart Oberschule. In 1843 he went to the university of Tübingen, where he attracted the notice of the learned head of the Biblical faculty, Friedrich Bleek, Richard Rothe, C. M. Arndt and Issak Dornen. He taught at Tübingen from June 1851 until 1856, when, having become a pastor, he was made deacon at Esslingen, Württemberg. In 1859 he was appointed archdeacon; but a few months later he was called to the university of Zürich as professor of theology (1859-1873), where he produced his important works. Before this he had written on church history (e.g. Schwäbische Reformationsgeschichte bis zum Augsburger Reichstag, 1853). His inaugural address at Zürich on the human development of Jesus, Die menschliche Entwicklung Jesu Christi (1861), and his Geschichte der Worte Jesu (1862) were preparatory to his chief work:

In 1873 Keim was appointed professor of theology at Giessen. This post he resigned, through ill-health, shortly before his death on the 17th of November 1878. He belonged to the "meditation" school of theology.

Chief works, besides the above: Reformationsblätter der Reichsstadt Ulm (1846); Ambrosius Blarer, der Schwäbische Reformator (1860); Der Überwitit Konstantins d. Gr. zum Christenthum (1862); his sermons, Freundesworte zur Gemeinde (2 vols., 1861-1862); and Celsius wahres Wert (1873). In 1881 H. Ziegler published one of Keim's last works, Christenheit und Christenheit mit einem biographisch-chronologischen Anhang.

KEITH, the name of an old Scottish family which derived its name from the barony of Keith in East Lothian, said to have been granted by Malcolm II., king of Scotland, to a member of the house for services against the Danes. The office of great marshall of Scotland, afterwards hereditary in the Keith family, may have been conferred at the same time; for it was confirmed, together with possession of the lands of Keith, to Sir Robert Keith by a charter of King Robert Bruce, and appears to have been held as annexed to the land by the line of grand serjeanty. Sir Robert Keith commanded the Scottish horse at Bannockburn, and was killed at the battle of Neville's Cross in 1346. At the close of the 14th century Sir William Keith, by exchange of lands with Lord Lindsay, obtained the crag of Dunnottar in Kincardineshire, where he built the castle of Dunnottar, which became the stronghold of his descendants. He died about 1407. In 1430 a later Sir William Keith was created Lord Keith, and a few years afterwards earl marshall, and these titles remained in the family until 1716. William, 10th earl marshall (d. 1581), was one of the guardians of Mary queen of Scots during her minority, and was a member of her privy council on her return to Scotland. While refraining from extreme partisanship, he was an adherent of the Reformation; he retired into private life at Dunnottar Castle about 1567, thereby gaining the sobriquet "William of the Tower." He was reputed to be the wealthiest man in Scotland. His eldest daughter Anne married the regent Murray. His grandson George, 5th earl marshall (c. 1553-1623), was one of the most cultured men of his time. He was educated at King's College, Aberdeen, where he became a proficient classical scholar, afterwards studying divinity under Theodore Beza at Geneva. He was a firm Protestant, and took an active part in the affairs of the Kirk. His high character and abilities procured him the appointment of special ambassador to Denmark to arrange the marriage of James VI. with the Princess Anne. He was subsequently employed on a number of important commissions; but he preferred literature to public affairs, and about 1620 he retired to Dunnottar, where he died in 1623. He is chiefly remembered as the founder in 1593 of the Marischal College in the university of Aberdeen, which he richly endowed. From his uncle he inherited the title of Lord Altarie about 1590. William, 7th earl marshall (c. 1617-1661), took a prominent part in the Civil War, being at first a leader of the covenanting party in north-east Scotland, and the most powerful opponent of the marquess of Huntly. He co-operated with Montrose in Aberdeenshire and neighbouring counties against the Gordons. With Montrose he signed the Bond of Cumbernauld in August 1640, but took no active steps against the popular party till 1648, when he joined the duke of Hamilton in his invasion of England, escaping from the rout at Reback. At Duns he was entertained by the marshall at Dunnottar, and in 1651 the Scottish regalia were left for safe keeping in his castle. Taken prisoner in the same year, he was committed to the Tower and was excluded from Cromwell's Act of Grace. He was made a privy councillor at the Restoration and died in 1661.

Sir John Keith (d. 1714), brother of the 7th earl marshall, was, at the Restoration, given the hereditary office of knight marshall of Scotland, and in 1677 was created earl of Kintore, and Lord Keith of Inverurie and Keith-Hall, a reward for his share in preserving the regalia of Scotland, which were secretly conveyed from Dunnottar Castle to Forres, and then to Inverurie, at the instance of the earl marshall, who was besieged by Cromwell's troops, and which Sir John, perilously to himself, swore he had carried abroad and delivered to Charles II., thus preventing further search. From him are descended the earls of Kintore.

George, 10th earl marshall (c. 1693-1778), served under Marlborough, and like his brother Francis, Marshal Keith (q.v.), was a zealous Jacobite, taking part in the rising of 1715, after which he es-cap ed to the continent. In the following year he was attainted, his estates and titles being forfeited to the Crown. He lived for many years in Spain, where he concerned himself with Jacobite intrigues, but he took no part in the rebellion of 1745, procuring about that year to Prussia, where he became, like his brother, intimate with Frederick the Great. Frederick employed him in several diplomatic posts, and he is said to have conveyed valuable information to the earl of Chatham, as a reward for which he received a pardon from George II., and returned to Scotland in 1750. His heir male, on whom, but for the attainder of 1716, his titles would have devolved, was apparently his cousin Alexander Keith of Ravelston, to whom the attainted earl had sold the castle and lands of Dunnottar in 1760. From Alexander Keith was descended, through the female line, Sirerrick Keith, M.P., of Ochtertyre, who sold the estates of Dunnottar and Ravelston. After this line,
of 1716 the right of the Keiths of Ravelston to be recognized as the representatives of the earls marshal was disputed by Robert Keith (1681–1757), bishop of Fife, a member of another collateral branch of the family. The bishop was a writer of some repute, his chief work, The History of the Affairs of the Church and State of Scotland (Edinburgh, 1734), being of considerable value for the reigns of James V., James VI., and Mary Queen of Scots. He also published a Catalogue of the Bishops of Scotland (Edinburgh, 1759), and other less important historical and theological works.

Robert Keith (d. 1774), descended from a younger son of the 2nd earl marshal, was British minister in Vienna in 1748, and subsequently held other important diplomatic appointments, being known to his numerous friends, among whom were the leading men of letters of his time, as "Ambassador Keith." His son, Sir Robert Murray Keith (1730–1795), was on Lord George Sackville's staff at the battle of Minden. He became colonel of a regiment (the 8th foot) known as Keith's Highlanders, who won distinction in the continental wars, but were disbanded in 1766. He was poisoned in 1789 by his society friends, in which he achieved considerable success by his honesty, courage, and knowledge of languages. In 1781 he became lieutenant-general; in 1789 he was made a privy councillor.

From the Keith family through the female line was descended George Keith Elphinsto, Baron Keith of Stonehaven, Marshal and afterwards Viscount Keith (q.v.), whose titles became extinct at the death of his daughter Margaret, Baroness Keith, in 1869.

KEITH, FRANCIS EDWARD JAMES (1666–1758), Scottish soldier and Prussian field marshal, was the second son of William, 9th earl marshal of Scotland, and was born on the 11th of June 1666 at the castle of Inverurie near Peterhead. Through his careful education under Robert Keith, bishop of Edinburgh, subsequently at Edinburgh University in preparation for the legal profession, he acquired that taste for literature which afterwards secured him the esteem of the most distinguished savants of Europe; but at an early period his preference for a soldier's career was decided. The rebellion of 1715, in which he displayed qualities that gave some augury of his future eminence, compelled him to seek safety on the Continent. After spending two years in Paris, chiefly at the university, he in 1719 took part in the ill-starred expedition of the Pretender to the Highlands of Scotland. He then passed some time at Paris and Madrid in obscurity and poverty, but eventually obtained a colonelcy in the Spanish army, and, it is said, took part in the siege of Gibraltar (1726–27). Finding his Protestantism a barrier to promotion, he obtained from the king of Spain a recommendation to Peter II. of Russia, from whom he received (1728) the command of a regiment of the guards. He displayed in numerous campaigns the calm, intelligent and watchful valour which was his chief characteristic, obtaining the rank of general of infantry and the reputation of being one of the ablest officers in the Russian service as well as a capable and liberal civil administrator. Judging, however, that his rewards were not commensurate with his merits, he in 1747 offered his services to Frederick II. of Prussia, who at once gave him the rank of field marshal, in 1749 made him governor of Berlin, and soon came to cherish towards him, as towards his brother, the 10th earl marshal, a strong personal regard. In 1756 the Seven Years' War broke out. Keith was employed in high command from the first, and added to his Russian reputation on every occasion by resolution and promptitude of action, not less than by care and skill. In 1756 he commanded the troops covering the investment of Pirmas, and distinguished himself at Lobositz. In 1757 he commanded at the siege of Prague; later in this same campaign he defended Leipzig against a greatly superior force, was present at Rossbach, and, while the king was fighting the campaign of Leuthen, conducted a foray into Bohemia. In 1758 he took a prominent part in the unsuccessful Moravian campaign, after which he withdrew from the army to recruit his broken health. He returned in time for the autumn campaign in the Lusatia, and was killed on the 14th of October 1758. His body was honourably buried on the field by Marshal Daun and General Lacy, the son of his old commander in Russia, and was shortly afterwards transferred by Frederick to the garrison church of Berlin. Many memorials were erected to him by the king, Prince Henry, and others. Keith died unmarried, but had several children by his mistress, Eva Mertens, a Swedish prisoner captured by him in the war of 1741–43. In 1889 the 1st Silesian Infantry Regiment No. 22 of the German army received his name.

See K. A. Varnhagen von Ense, Biographische Denkmale, part 7 (1844): Memoir of Field Marshal James Keith, written by himself (1714–1734; edited by Thomas Constable for the Spalding Club, 1843); T. Carlyle, Frederick the Great, passim; V. Pacyzniski-Tenczynski, Leben des G. F. M. Jakob Keith (Berlin, 1880); Peter Buchanan, Account of the Family of Keith (Edinburgh, 1878); Anon., Memoir of Marshal Keith (Peterhead, 1895); Pauli, Leben grosser Helden, part iv.

KEITH, GEORGE (c. 1639–1710), British divine, was born at Aberdeen about 1639 and was educated for the Presbyterian ministry at Marischal College in his native city. In 1662 he became a Quaker and worked with Robert Barclay (q.v.). After being imprisoned for preaching in 1676 he went to Holland and Germany on an evangelistic tour with George Fox and William Penn. Two further terms of imprisonment in England induced him (1684) to emigrate to America, where he was surveyor-general in East New Jersey and then a schoolmaster at Philadelphia. He travelled in New England defending Quakerism against the attacks of Increase and Cotton Mather, but after a time fell out with his own folk on the subject of the atonement, accused them of deistic views, and started a community of his own called "Christian Quakers" or "Keithians." He endeavoured to advance his views in London, but the Yearly Meeting of 1694 disowned him, and he established a society at Turner's Hall in a Philpot Lane, where he so far departed from Quaker usage as to administer the two sacraments. In 1700 he conformed to the Anglican Church, and from 1702 to 1704 was an agent of the Society for the Propagation of the Gospel in America. He died on the 27th of March 1716 at Edburton in Sussex, of which parish he was rector. Among his writings were The Deism of William Penn and his Brethren (1699); The Standard of the Quakers examined; or, An Answer to the Apology of Robert Barclay (1702); A Journal of Travels (1706). Gilbert Burnet, bishop of Salisbury, a fellow-Abderdorian, speaks of him as "the most learned man that ever was in that sect, and well versed in the Oriental tongues, philosophy and mathematics."

KEITH, GEORGE GEORGE ELPHINSTONE, Viscount (1726–1823), British admiral, fifth son of the 10th Lord Elphinstone, was born in Elphinstone Tower, near Stirling, on the 7th of January 1746. Two of his brothers went to sea, and he followed their example by entering the navy in 1761, in the "Gosporn," then commanded by Captain Jervis, afterwards Earl St Vincent. In 1767 he made a voyage to the East Indies in the Company's service, and put £2000 lent him by an uncle to such good purpose in a private trading venture that he laid the foundation of a large fortune. He was a lieutenant in the 1770, commander in 1777, and post captain in 1775. During the war in America he was employed against the privateers, and with a naval brigade at the occupation of Charleston, S.C. In January 1781, when in command of the "Warwick" (50), he captured a Dutch 50-gun ship which had beaten off an English vessel of equal strength a few days before. After peace was signed he remained on shore for ten years, serving in Parliament as member first for Dumbartonshire, and then for Strtingshire. When war broke out again in 1793 he was appointed to the "Robust" (74), in which he took part in the occupation of Toulon by Lord Hood. He
particularly distinguished himself by beating a body of the French ashore at the head of a naval brigade of English and Spaniards. He was entrusted with the duty of embarking the fugitives when the town was evacuated. In 1794 he was promoted rear-admiral, and in 1795 he was sent to occupy the Dutch colonies at the Cape of Good Hope and in India. He had a large share in the capture of the Cape in 1795, and in August 1796 captured a whole Dutch squadron in Saldanha Bay. In the interval he had gone on to India, where his health suffered, and the capture at Saldanha was effected on his way home. When the Mutiny at the Nore broke out in 1797 he was appointed to the command of the fleet then so agitated. He was equally successful at Plymouth, where the squadron was in a state of effervescence. At the close of 1798 he was sent as second in command to St Vincent. It was for a long time a thankless post, for St Vincent was at once half incapacitated by ill-health and very arbitrary, while Nelson, who considered that Keith's appointment was a personal slight to himself, was peevish and insubordinate. The escape of a French squadron which entered the Mediterranean from Brest in May 1799 was mainly due to rivalries among the British naval commanders. Keith was sent with full powers to Brest on their retreat, but was unable to bring them to action. He arrived in Brest in November as commander-in-chief. He co-operated with the Austrians in the siege of Genoa, which surrendered on the 4th of June 1800. It was however immediately afterwards lost in consequence of the battle of Marengo, and the French made their re-entry so rapidly that the admiral had considerable difficulty in getting his ships out of the harbour. The close of 1801 and the beginning of the following year were spent in transporting the army sent to recover Egypt from the French. As the naval force of the enemy was completely driven into port, the British admiral had no opportunity of an action at sea, but his management of the convoy carrying the troops, and of the landing at Aboukir, was greatly admired. He was made a baron of the United Kingdom—a French barony having been conferred on him in 1797. On the renewal of the war in 1803 he was appointed commander-in-chief in the North Sea, which post he held till 1807. In February 1812 he was appointed commander-in-chief in the Channel, and in 1814 he was raised to a viscountcy. During his last two commands he was engaged first in overlooking the measures taken to meet a threatened invasion, and then in directing the movements of the numerous small squadrons and private ships employed on the coasts of Spain and Portugal, and in protecting trade. He was at Plymouth when Napoleon surrendered and was brought to England in the "Bellerophon" by Captain Maitland (1777–1839). The decisions of the British government were expressed through him to the fallen Emperor. Lord Keith refused to be led into disputes, and confined himself to declaring steadily that he had his orders to obey. He was not much impressed by the appearance of his illustrious charge, and thought that the airs of Napoleon and his suite were ridiculous. Lord Keith died on the 10th of March 1823 at Tullyallan, his property in Scotland, and was buried in the parish church. A portrait of him by Owen is in the Painted Hall in Greenwich. He was twice married: in 1787 to Jane Mercer, daughter of Colonel William Mercer of Aldie; and in 1808 to Hester Maria Thrale, who is spoken of as "Queenie" in Boswell's "Life of Johnson" and Mr. D'Aubray's "Diary." He had a daughter by each marriage, but no son. Thus the viscountcy became extinct on his death, but the English and Irish baronies descended to his eldest daughter Margaret (1788–1867), who married the Comte de Flahaut de la Billarderie, only to become extinct on her death.

There is a panegyrical "Life of Lord Keith" by Alex. Allardyce (Edinburgh, 1882); and biographical notices will be found in John Marshall's "Royal Naval Biography," i. 43 (1823–1835), and the Naval Chronicle, x. 1. (D. H.)

**KEITH,** a police burgh of Banffshire, Scotland, on the Isla, 533 m. N.W. of Aberdeen by the Great North of Scotland railway. Pop. (1901), 4753. A branch of the Highland railway also gives access to Elgin, and there is a line to Buckie and Portessie on the Moray Firth. The burgh includes Old Keith and New Keith on the east bank of the Isla, and Fife-Keith on the west bank. Though Old Keith has a charter dating from William the Lion it fell into gradual decay; New Keith, founded in the 18th century by the second earl of Seafield, being better situated for the growth of a town. Fife-Keith has sprung up since 1816. The principal public buildings include the Turner memorial hospital, the Longmore hall, and the Institute. In the Roman Catholic church there is a painting of the "Incredulity of St Thomas," presented by Charles X. of France. The industries include manufactures of tweeds, blankets, agricultural implements, and boots and shoes; there are also distilleries, breweries, flour mills, and lime and manure works. But the most important source of the earnings of the town is the agricultural trade of the shire. The "Summer Eve Fair" held in September is the largest cattle and horse fair in the north of Scotland; the town is also the headquarters of the dressed-meat trade in the north.

**KEI, or KECH,** the chief place in a district of the province of Makran in Baluchistan, which has given its name to Kej-Makran, as distinguished from Persian Makran. There is no town, but a number of small villages dominated by a fort built upon a rock, on the eastern bank of the Kej River. This fort, like many others similarly placed throughout the country, is supposed to be inhabited only by a few IOS. Its inhabitants are supporters of the surrounding tribes. Kej (or Kiz) was an important trade centre in the days of Arab supremacy in Sind, and the rulers of Kalat at various times marched armies into the province with a view to maintaining their authority. At the beginning of the 19th century it had the reputation of a commercial centre, trading through Panjgur with Kandahar, with Karachi via Bela, and with Muscat and the Persian Gulf by the seaport of Gwadar, distant about 80 m. The present Khan of Makran exercises but a feeble sway over this portion of his dominion, although he appoints a governor to the province. The principal tribe residing around Kej is that of the Gichki, who claim to be of Rajput origin, and have settled in Makran during the 17th century, having been driven out of Rajputana. The climate during summer is too hot for Europeans. During winter, however, it is temperate. The principal exports consist of dates, which are considered of the finest quality. A local revolt against Kalat rendered an expedition against Kej necessary in 1858. Colonel Mayne reduced the fortress and restored order in the surrounding districts.

**KEKULÉ, FRIEDRICH AUGUST** (1829–1890), German chemist, was born at Darmstadt on the 7th of September 1829. While studying architecture at Gipsen he came under the influence of Liebig and was induced to take up chemistry. From Giessen he went to Paris, and then, after a short sojourn in Switzerland, he visited England. Both in Paris and in England he enjoyed personal intercourse with the leading chemists of the period. On his return to Germany he started a small chemical laboratory at Heidelberg, where, with a very slender equipment, he carried out several important researches. In 1838 he was appointed professor of chemistry at Ghent, and in 1856 was called to Bonn to fill a similar position, which he held till his death in that town on the 13th of June 1886. Kekulé's main importance lies in the far-reaching contributions which he made to chemical theory, especially in regard to the constitution of the carbon compounds. The doctrine of atomicity had already been enunciated by E. Frankland, when in 1858 Kekulé published a paper in which, after giving reasons for regarding carbon as a tetraelement, he set forth the essential features of his famous doctrine of the linking of atoms. He explained that in substances containing several carbon atoms it must be assumed that some of the affinities of each carbon atom are bound by the affinities of the atoms of other elements contained in the substance, and some by an equal number of the affinities of the other carbon atoms. The simplest case is when two carbon atoms are combined so that one affinity of the one is tied to one affinity of the other; two, therefore, of the affinities of the two atoms are occupied in keeping the two atoms together, and only the remaining six are available for atoms of other elements. The next simplest case consists in the mutual interchange of two affinity units, and so on. This conception led Kekulé to his "closed-chain" or "ring" theory of the constitution
of benzene which has been called the "most brilliant piece of prediction to be found in the whole range of organic chemistry," and this in turn led in particular to the elucidation of the constitution of the "aromatic compounds," and in general to new methods of chemical synthesis and decomposition, and to a deeper insight into the composition of numberless organic bodies and their mutual relations. Professor F. R. Japp, in the Kekulé memorial lecture he delivered before the London Chemical Society on the 15th of December 1897, declared that three-fourths of modern organic chemistry is directly or indirectly the work of Kekulé's benzene theory, and that without its guidance and inspiration the industries of the coal-tar colours and artificial therapeutic agents in their present form and extension would have been inconceivable.

Many of Kekulé's papers appeared in the Annalen der Chemie, of which he was editor, and he also published an important work, Lehrbuch der organischen Chemie, of which the first three volumes are dated 1861, 1860 and 1882, while of the fourth only one small section was issued in 1887.

"KELLER, ALBERT (1845— ), German painter, was born at Gais, in Switzerland; he studied at the Munich Academy under Lenbach and Ramberg, and must be counted among the leading colourists of the modern German school. Travels in Italy, France, England and Holland, and a prolonged sojourn in Paris, helped to develop his style, which is marked by a sense of elegance and refinement all too rare in German art. His scenes of society life, such as the famous "Dinner" (1890), are painted with thoroughly Parisian esprit, and his portraits are marked by the same elegant distinction. He is particularly successful in the rendering of travelling silk, hospital drapes and draperies. His historical and imaginative works are as modern in spirit and as unacademic as his portraits. At the Munich Pinakothek, he has his "Jairi Töchterlein" (1886), whilst the Königshof Museum contains his "Romant Bath," and the Liebieg collection in Reichenberg the "Audience with Louis XV.", the first picture that drew attention to his talent. Among other important works he painted "Faustina in the Temple of Juno at Praeneste," "The Witches' Sleep" (1888) "The Judgment of Paris," "The Happy Sister," "Temptation" (1902), "Autumn" (1893), "An Adventure" (1896), and "The Crucifixion."

KELLER, GOTTFRIED (1819—1890), German poet and novelist, was born at Zürich on the 19th of July 1819. His father, a master joiner, dying while Gottfried was young, his early education was neglected; he, however, was in 1835 apprenticed to a landscape painter, and subsequently spent two years (1840–1842) in Munich learning to paint. Interest in politics drew him into literature, and his talents were first disclosed in a volume of short poems, Gedichte (1846). This obtained him recognition from the government of his native canton, and he was in 1848 enabled to take a comparatively liberal course in his studies at the University of Heidelberg. From 1850 to 1855 he lived in Berlin, where he wrote his most important novel, Der grüne Heinrich (1851–1853; revised edition 1879–1880), remarkable for its delicate autobiographic portrayal and the beautiful episodes interwoven with the action. This was followed by Die Leute von Seldsgaia (1850), studies of Swiss provincial life, including in Romeo und Julia auf dem Dorfe one of the most powerful short stories in the German language, and in Die drei gerechten Kommacher, almost as great a master-piece of humorous writing. Returning to his native city with a considerable reputation, he received in 1864 the appointment of secretary to the canton. For a time his creative faculty seemed paralysed by his public duties, but in 1872 appeared Sieben Legenden, and in 1874 a second series of Die Leute von Seldsgaia, in both of which books he displayed no abatement of power and originality. He retired from the public service in 1876 and employed his leisure in the production of Zürcher Novellen (1878), Das Sinngedicht, a collection of short stories (1881), and a novel, Martin Salander (Berlin, 1886). He died on the 15th of July 1890 at Hottingen. Keller's place among German novelists is very high. Few have united such fancy and imagination to such uncompromising realism, such tragic earnestness to such abounding humour. As a lyric poet, his genius is no less original; he takes rank with the best German poets of this class in the second half of the 19th century.

Keller's Gesammelte Werke were published in 10 vols. (1889–1890), to which was added another volume, Nachgelassene Schriften und Dichtungen, containing the fragment of a tragedy (1893). In English appeared, G. Keller: A Selection of his Tales translated with a Memoir and Notes by Mrs. H. Murray (Boston, 1881). A further estimate of Keller's life and works cf. O. Brahms (1883); E. Brendering, G. Keller nach seinem Leben und Dichten (1892); F. Baldensperger, G. Keller; sein Leben und Wirken (Mann, 1895). K. A. Kaes, Kekulé, Leben, Seine Briefe und Tagebücher (Berlin, 1894–1897); A. Köster, G. Keller (1900; 2nd ed., 1907); and for his work as a painter, H. E. von Berlepsch, Gottfried Keller als Maler (1895).

KELLER, HELEN ADAMS (1880— ), American blind deaf-mute, was born at Tuscumina, Alabama, in 1880. When barely two years old she was deprived of sight, smell and hearing, by an attack of scarlet fever. At the request of her parents, who were acquainted with the success attained in the case of Laura Bridgman (q.v.), one of the graduates of the Perkins Institution at Boston, Miss Anne M. Sullivan, who was familiar with the teachings of Dr S. G. Howe (q.v.), was sent to instruct her at home. Unfortunately an exact record of the steps in her education was not kept; but from 1888 onwards, at the Perkins Institution, Boston, and under Miss Sarah Fuller at the Horace Mann school in New York, and at the Wright Humason school, she not only learnt to read, write, and talk, but became proficient, to an exceptional degree, in the ordinary educational curriculum. In 1900 she entered Radcliffe College, and successfully passed the examinations in mathematics, &c, for her degree of A.B. In 1904 the Miss Sullivan, whose ability as a teacher must be considered almost as marvellous as the talent of her pupil, was throughout her devoted companion. The case of Helen Keller is the most extraordinary ever known in the education of blind deaf-mutes (see Deaf and Dumb ad fin.), her acquirements including several languages and her general culture being exceptionally wide. She wrote The Story of My Life (1902), and volumes on Optimism (1903), and The World I Live in (1908), both which in literary style and in outlook on life are a striking revelation of the results of modern methods of educating those who have been so handicapped by natural disability.

KELLERMANN, FRANÇOIS CHRISTOPHE DE (1735–1820), duke of Valmy and marshal of France, came of a Saxon family, long settled in Strassburg and ennobled, and was born there on the 28th of May 1735. He entered the French army as a volunteer, and served in the Seven Years' War and in Louis XV.'s Polish expedition of 1771, on returning from which he was made a lieutenant-colonel. He became brigadier in 1784, and in the following year maréchal-de-camp. In 1789 Kellermann enthusiastically embraced the cause of the Revolution, and in 1791 became general of the army. After the War of the Villas there was made a lieutenant-general, and in August of the same year came to him the opportunity of his lifetime. He rose to the occasion, and his victory of Valmy (see French Revolutionary Wars) over the Prussians, in Goethe's words, "opened a new era in the history of the world." Transferred to the army on the Moselle, Kellermann was accused by General Custine of neglecting to support his operations on the Rhine; but he was acquitted at the bar of the Convention in Paris, and placed at the head of the army of the Alps and of Italy, in which position he showed himself a careful commander and excellent administrator. Shortly afterwards he received instructions to reduce Lyons, then in revolt against the Convention, but shortly after the surrender he was imprisoned in Paris for thirteen months. Once more honourably acquitted, he was reinstated in his command, and did good service in maintaining the south-eastern border against the Austrians until his army was merged into that of General Bonaparte in Italy. He was then sixty-two years of age, still physically equal to his work, but the young generals who had come to the front in these two years represented the new spirit and the new art of war, and Kellermann's active career came to an end. But the hero of Valmy was never forgotten. When Napoleon came to power Kellermann was named
successively senator (1800), honorary marshal of France (1803), and duke of Valmy (1808). He was frequently employed in the administration of the army, the control of the line of communications, and the command of reserve troops, and his long and wide experience made him one of Napoleon’s most valuable assistants. In 1814 he voted for the deposition of the emperor and became a partisan under the new government. After the “Hundred Days” he sat in the Chamber of Peers and voted with the Liberals. He died at Paris on the 23rd of September 1820.

See J. G. P. de Salve, Fragments historiques sur M. le maréchal de Kellermann (Paris, 1807), and De Bodtoux, Esquisse de la carrière militaire de F. C. Kellermann, due de Valmy (Paris, 1817).

His son, François Étienne de Kellermann, duke of Valmy (1770–1833), French cavalry general, was born at Metz and served for a short time in his father’s regiment of Hussionars previous to entering the diplomatic service in 1791. In 1793 he again joined the army, serving chiefly under his father’s command in the Alps, and rising in 1796 to the rank of chef de bataille. In the latter part of Bonaparte’s celebrated Italian campaign of 1796–97 the younger Kellermann attracted the future emperor’s notice by his brilliant conduct at the forcing of the Tagliamento. He was made general of brigade at once, and continued in Italy after the peace of Campo Formio, being employed successively in the armies of Rome and Naples under Macdonald and Championnet. In the campaign of 1800 he commanded a cavalry brigade under the First Consul, and at Marengo (June 14) he initiated and carried on one of the most brilliant cavalry actions of history, which, with Desaix’s infantry attack, regained the lost battle and decided the issue of the war. He was promoted general of division at once, but as early as the evening of the battle he presented what he thought to be an attempt to belittle his exploit. A heated controversy followed as to the influence of Kellermann’s charge on the course of the battle, and in this controversy he displayed neither tact nor forbearance. However, his merits were too great for his career to be ruined either by his conduct in the dispute or by the frequent scandals, and even by the frauds, of his private life. Unlike his father, whose title to fame did not rest on one fruitful opportunity. Though not the most famous, he was perhaps the ablest of all Napoleon’s cavalry leaders, and distinguished himself at Austerlitz (Dec. 2), in Portugal under Junot (on this occasion as a skillful diplomatist), at the brilliant cavalry combat of Tornes (Nov. 28, 1809), and on many other occasions in the Peninsular War. His rapacity was more than ever notorious in Spain, yet Napoleon met his unconvinced excuses with the words, “General, whenever your name is brought before me, I think of nothing but Marengo.” He was on sick leave during the Russian expedition of 1812, but in 1813 and 1814 his skilful handling of his cavalry marked his father’s rank under the first Restoration, but joined Napoleon during the Hundred Days, and commanded a cavalry corps in the Waterloo campaign. At Quatre Bras he personally led his squadrons in the famous cavalry charge, and almost lost his life in the mêlée, and at Waterloo he was again wounded. He was disgraced at the second Restoration, and, on succeeding to his father’s title and seat in the Chamber of Peers in 1820, at once took up and maintained till the fall of Charles X. in 1830 an attitude of determined opposition to the Bourbons. He died on the 2nd of June 1835.

His son François Christophe Edmond de Kellermann, duke of Valmy (1802–1868), was a distinguished statesman, political historian, and diplomatist under the July Monarchy.

KELLGREN, JOHAN HENRIK (1751–1795), Swedish poet and critic, was born at Floby in West Gothland, on the 1st of December 1751. He studied at the university of Åbo, and had already some reputation as a poet when in 1774 he there became a “docent” in aesthetics. Three years later he removed to Stockholm, where in conjunction with Assessor Carl Lenngren he began in 1778 the publication of the journal Stockholmsposten, of which he was sole editor from 1788 onwards. Kellgren was librarian to Gustavus III from 1780, and from 1785 his private secretary. On the institution of the Swedish Academy in 1786 he was appointed one of its first members. He died at Stockholm on the 20th of April 1795. His strong satiric tendency led him into numerous controversies, the chief that with the critic Thomas Thorild, against whom he directed his satire Nyf försk alltid inomand vers, where he sneers at the “raving of Shakespeare” and “the convulsions of Goethe.” His lack of humour detracts from the greater part of his polemical writings. His political and satirical pieces are partly lyrical, partly dramatic; of the plays the versification belongs to him, the plots being due to Gustavus III. The songs interspersed in the four operas which they produced in common, viz., Gustaf Vasa, Gustaf Adolf och Ebba Brahe, Aeneas i Kartago, and Drottningen Kristina, are wholly the work of Kellgren. From about the year 1788 a higher and graver feeling pervades Kellgren’s verses, partly owing to the influence of the works of Lessing and Goethe, but probably more directly due to his controversy with Thorild. Of his minor poems written before that date the most important are the charming spring-song Vinterens vilda lyktar, and the satirical Minna lätten och Mene erej sviffor det man är gale. The best productions of what is called his later period are the satire Ljuset sfender, the comic poem Dumhorns teverne, the warmly patriotic Kantat 1. jan. 1789, the ode Till Kristina, the fragment Sigvart och Hilmå, and the beautiful song Nya skapelser, both in thought and form the finest of his works. Among his lyrics are the choicest fruits of the Gustavian age of Swedish letters. His earlier efforts, indeed, express the superficial doubt and pert frivolousness characteristic of his time; but in the works of his riper years he is no mere “poet of pleasure,” as Tagliamento and Mannhardt styled him, but a worthy exponent of the earnest moral feeling and the human sympathies in a felicitous and melodic verse.

His Samlade skrifter (3 vols., 1796; a later edition, 1884–1888) were revised by himself. His correspondence with Rosenstein and with Clevelberg was edited by H. Schlück (1886–1887 and 1894). See Wieselgren, Skoaras sköna litteratur (1833–1840); Afterbom, Svenska stora och skälder (1841–1855); C. W. Böttiger in Transactions of the Swedish Academy, xiv. 107 seq. (1870); and Gustaf Ljunggren’s Kellgren, Leopold, och Thorild, and his Svenska skivrets händelser (1873–1877).

KELLOGG, CLARA LOUISE (1842– ), American singer, was born at Sumterville, South Carolina, in July 1842, and was educated in New York for the musical profession, singing first in opera there in 1861. Her fine soprano voice and artistic gifts soon made her famous. She appeared as prima donna in Italian opera in London, and at concerts, in 1867 and 1868; and from that time till 1887 was one of the leading public singers. She appeared at intervals in London, but was principally engaged in America. In 1874 she organized an opera company which was widely known in the United States, and her enterprise and energy in directing it were remarkable. In 1887 she married Carl Strakosch, and retired from the profession.

Kells was a name of the Anglo-Norman family in Ireland, on the Blackwater, 94 m. N.W. of Navan on a branch of the Great Northern railway. Pop. of urban district (1901), 2,428. The prosperity of the town depends chiefly upon its antiquarian remains. The most notable is St Columbus’s house, originally an oratory, but afterwards converted into a church, the chancel of which was in existence in 1732. The present church is modern, with the exception of the bell-tower, rebuilt in 1758. Near the church there is a fine though imperfect specimen of the ancient round tower, 95 ft. in height; and there are several ancient crosses, the bases of which are now that of the town-place. Kells was originally a royal residence, whence its ancient name Connenseas, meaning the dun or circular northern fort, in which the king resided, and the intermediate name Kenlis, meaning head fort. Here Conn of the Hundred Fights resided in the 2nd century; and here was a palace of Dermot, king of Ireland, in 544–556. The other places in Ireland named Kells are probably derived from Cealla, signifying church. In the 6th century Kells, it is said, was granted to St Columbile. Of the monastery which he built to have founded there are no remains, and the town owes its chief ecclesiastical importance to the bishopric founded about 807, and united to Meath in the 10th century. The ecclesiastical establishment was noted as a seat of learning, and a monument of this remains in the Book of Kells an illuminated
KELLY, E.—KELP

copy of the Gospels in Latin, containing also local records, dating from the 8th century, and preserved in the library of Trinity College, Dublin. The illumination is executed with extraordinary delicacy, and the work is asserted to be the finest extant example of early Christian art of this kind. Neighbouring antiquaries are the church of Dulane, with a fine doorway, and the dun or fortification of Dimor, the principal erection of a series of defences on the hills about 6 m. W. of Kells. Among several seats in the vicinity is that of the Marquess of Headfort. *Kells returned two members to the Irish parliament before the Union.

KELLY, EDWARD (1834–1880), Australian bushranger, was born at Wallan-Wallan, Victoria. His father was a transported Belfast convict, and his mother's family included several thieves. As boys he and his brothers were constantly in trouble for horse-stealing, and "Ned" served three years' imprisonment for this offence. In April 1837, an attempt was made to arrest his brother Daniel on a similar charge. The whole Kelly family resisted this and Ned wounded one of the constables. Mrs Kelly and some of the others were captured, but Ned and Daniel escaped to the hills, where they were joined by two other desperadoes, Byrne and Hart. For two years, despite a reward of £8000 offered jointly by the governments of Victoria and New South Wales for their arrest, the gang under the leadership of Kelly terrorized the country on the borderland of Victoria and New South Wales,"holding up" towns and plundering banks. Their intimate knowledge of the district, full of narrow lanes and their elaborate system of well-paid spies, ensured the direct pecuniary interest of many persons and contributed to their long immunity from capture. They never ill-treated a woman, nor preyed upon the poor, thus surrounding themselves with an attractive atmosphere of romance. In June 1880, however, they were at last tracked to a wooden shanty at Glenrowan, near Benalla, which the police surrounded, riddled with bullets, and finally set on fire. Kelly himself, who was outside, could, he claimed, easily have escaped had he not refused to desert his companions, all of whom were killed. He was severely wounded, captured, and in April 1881, an attempt was made to arrest his brother, convicted and hanged in October 1886. The total cost of the capture of the Kelly gang was reckoned at £15,000.

See F. A. Hare, The Last of the Bushrangers (London, 1892).

KELLY, SIR FITZROY (1796–1880), English judge, was born in London in October 1796, the son of a captain in the Royal Navy. In 1824 he was called to the bar, where he gained a reputation as a skilled pleader. In 1834 he was made a king's counsel. A strong Tory, he was returned as member of parliament for Ipswich in 1835, but was unseated on petition. In 1837 however he again became member for that town. In 1843 he sat for Cambridge, and in 1852 was elected member for Harwich, but, a vacancy suddenly occurring in East Suffolk, he preferred to contest that seat and was elected. He was solicitor-general in 1845 (when he was knighted), and again in 1852. In 1858–1859 he was attorney-general in Lord Derby's second administration. In 1866 he was raised to the bench as chief baron of the exchequer and made a member of the Privy Council. He died at Brighton on the 18th of September 1880.

See E. Foss, Lives of the Judges (1870).

KELLY, HUGH (1739–1777), Irish dramatist and poet, son of a Dublin publican, was born in 1739 at Killarney. He was apprenticed to a staymaker, and in 1760 went to London. Here he worked at his trade for some time, and then became an attorney's clerk. He contributed to various newspapers, and wrote pamphlets for the booksellers. In 1767 he published Memoirs of a Magdalen, or the History of Louisa Midday (2 vols.), a novel which obtained considerable success. In 1766 he published anonymously Thespi; or, A Critical Examination into the Merits of All the Principal Performers belonging to Drury Lane Theatre, a poem in the heroic couplet containing violent attacks on the principal contemporary actors and actresses. The poem opens with a panegyric on David Garrick, however, and bestows foolish praise on friends of the writer. This satire was partly inspired by Churchill's Rosciad, but its criticism is obviously dictated chiefly by personal prejudice. In 1767 he produced a second part, less scurrilous in tone, dealing with the Covent Garden actors. His first comedy, False Delicacy, written in prose, was produced by Garrick at Drury Lane on the 23rd of January 1768, with the intention of rivaling Oliver Goldsmith's Good-Natured Man. It is a moral and sentimental comedy, described by Garrick in the prologue as a sermon preached in acts. Although Samuel Johnson described it as "totally void of character," it was very popular and had a great sale. In French and Portuguese versions it drew crowded houses in Paris and Lisbon. Kelly was a journalist in the pay of Lord North, and therefore hated by the party of John Wilkes, especially as being the editor of the Public Ledger. His Thespias had also made him many enemies; and Mrs Clive refused to act in his pieces. The production of his Wodwold (Drury Lane, 3rd of March 1770), occasioned a riot in the theatre, repeated at the second performance, and the piece had to be abandoned. His other plays are: Clementina (Covent Garden, 23rd of February 1771), a blank verse tragedy, given out to be the work of a "young American Clergyman" in order to escape the opposition of the Wilkites; The School for Wives (Drury Lane, 11th of December 1773), a prose comedy given out as the work of Major (afterwards Sir William) Addington; a two-act piece, The Romance of an Hour (Covent Garden, 2nd of December 1774), borrowed from Montesquieu's tale L'Amant de l'Aprece; and an unsuccessful comedy, The Moon (1785), by Louis Stamma; and "The Rescue or Thespian Scourge ..." (1767), by John Brown-Smith.

KELLY, MICHAEL (1762–1826), British actor, singer and composer, was the son of a Dublin wine-merchant and dancing-master. He had a musical education at home and in Italy, and for four years from 1783 was engaged to sing at the Court Theatre at Vienna, where he became a friend of Mozart. In 1786 he sang in the first performance of the Nozze di Figaro. Appearing in London, at Drury Lane in 1787, he had a great success, and thenceforth was the principal English tenor at that theatre. In 1793 he became acting-manager of the King's Theatre, and he was in great request at concerts. He wrote a number of songs (including "The Woodpecker"), and the music for many dramatic pieces, now fallen into oblivion. In 1826 he published his entertaining Reminiscences, in writing which he was helped by Theodore Hook. He combined his professional work with conducting a music-shop and a wine-shop, but with disastrous financial results. He died at Margate on the 9th of October 1826.

KELP (in M.E. culp or culpe, of unknown origin; the Fr. equivalent is varech), the ash produced by the incineration of various kinds of sea-weed (Algae) obtained in great abundance on the west coasts of Ireland and Scotland, and the coast of Brittany. It is prepared from the deep-sea tangle (Laminaria digitata), sugar wrack (L. saccharina), knobbled wrack (Fucus nodosus), black wrack (F. serratus), and bladder wrack (F. vesiculosus). The Laminaria is the most easily obtained only when cast up on the coasts by storms or other causes. The species of Fucus growing within the tidal range are cut from the rocks at low water, and are therefore known as "cut-weeds." The weeds are first dried in the sun and are then collected into shallow pits and burned till they form a fused mass, which while still hot is sprinkled with water to break it up into convenient pieces. A ton of kelp is obtained from 20 to 22 tons of wet sea-weed. The average composition may vary as follows: potassium sulphate, 10 to 12%; potassium chloride, 20 to 25%; sodium carbonate, 5%; other sodium and magnesium salts, 15 to 20%; and insoluble ash from 40 to 50%. The relative richness in iodine of different samples varies largely, good drift kelp yielding as much as 10 to 15 lb per ton of 22½ cwts., whilst cut-weed kelp will not give more than 3 to
4 lb. The use of kelp in soap and glass manufacture has been rendered obsolete by the modern process of obtaining carbonate of soda cheaply from common salt (see IODINE).

KELSO, a burgh and market town of Roxburghshire, Scotland, on the left bank of the Tweed, 52 m. (43 m. by road) S.E. of Edinburgh and 104 m. N.E. of Jedburgh by the North British railway. Pop. (1901), 4008. The name has been derived from the Old Welsh caeloch, or Anglo-Saxon cælæc, "chalk", and the Scots knew, "hollow," a derivation more evident in the earlier forms Calkon and Calchon, and illustrated in Chalken, the former name of the Tweed town. The abbey church of the Virgin and St John the Evangelist, was founded in 1128 by David I. for monks from Tiron in Picardy, whom he transferred hither from Selkirk, where they had been installed fifteen years before. The abbey, the building of which was completed towards the middle of the 13th century, became one of the richest and most powerful establishments in Scotland, claiming precedence over other monasteries and disputing for a time the supremacy with St Andrews. It suffered damage in numerous English forays, was pillaged by the 4th earl of Shrewsbury in 1346, and, with the Northumberland castle of Northumber, stood before the hands of the English, from whom it was delivered in 1314 by Sir James Douglas. Ceded to Edward III. in 1333, it was regained in 1342 by Sir Alexander Ramsay of Dalhousie, only to be lost again four years later. The estate of Kellon, or Kälne, was held by the king.

The town stood the formidable castle and flourishing town of Roxburgh, from which the shire took its name. No trace exists of the town, and of the castle all that is left are a few ruins shaded by ancient ash trees. The castle was built by the Northumbrians, who called it cales, and was afterwards renamed by the Marchmen as Edinale, the old name of a tower on the Castle Hill. An old name, Athlone, is recorded by James II. was married and Alexander III. was born in the castle. During the long period of Border warfare, the town was repeatedly burned and the castle captured. After the defeat of Wallace at Falkirk the enterprise of the English, from whom it was delivered in 1314 by Sir James Douglas. Ceded to Edward III. in 1333, it was regained in 1342 by Sir Alexander Ramsay of Dalhousie, only to be lost again four years later. The castle was held by the king in the War of the Marches, and as such was honored by the queen. It was at the siege that the king, James II., was killed by the explosion of a huge gun called "the Lion." On the fall of the castle the town languished and was finally abandoned in favour of the rising burgh of Kelso. The town, whose patron-saint was St James, is still commemorated by St James's Fair, which is held on the 5th of every August on the vacant site, and is the most popular of Border festivals.

KELSO, William Thomson, Baron (1824-1907), British physicist, the second son of James Thomson, I.L., professor of mathematics in the university of Glasgow, was born at Belfast, Ireland, on the 26th of June 1824, his father being then teacher of mathematics in the Royal Academical Institution. He was born in the Roxburghshire town of Kelso in the parish of Selkirk (Edenham, "The Village on the Eden"), the birthplace of the poet James Thomson, to whose memory an obelisk, 52 ft. high, was erected on Feny Road in 1820.

KELVIN, William Thomson, Baron (1824-1907), British physicist, the second son of James Thomson, I.L., professor of mathematics in the university of Glasgow, was born at Belfast, Ireland, on the 26th of June 1824, his father being then teacher of mathematics in the Royal Academical Institution. He was born in the Roxburghshire town of Kelso in the parish of Selkirk (Edenham, "The Village on the Eden"), the birthplace of the poet James Thomson, to whose memory an obelisk, 52 ft. high, was erected on Feny Road in 1820.

KELVIN, William Thomson, Baron (1824-1907), British physicist, the second son of James Thomson, I.L., professor of mathematics in the university of Glasgow, was born at Belfast, Ireland, on the 26th of June 1824, his father being then teacher of mathematics in the Royal Academical Institution. He was born in the Roxburghshire town of Kelso in the parish of Selkirk (Edenham, "The Village on the Eden"), the birthplace of the poet James Thomson, to whose memory an obelisk, 52 ft. high, was erected on Feny Road in 1820.
Thomson proposed his absolute scale of temperature, which is independent of the properties of any particular thermometric substance, and in 1851 he presented to the Royal Society of Edinburgh a paper on the dynamical theory of heat, which reconciled the work of N. L. Sadi Carnot with the conclusions of Count Rumford, Sir H. Davy, J. R. Mayer and Joule, and placed the dynamical theory of heat and the fundamental principle of the conservation of energy in a position to command universal acceptance. It was in this paper that the principle of the dissipation of energy, briefly summarized in the second law of thermodynamics, was first stated.

Although his contributions to thermodynamics may properly be regarded as his most important scientific work, it is in the field of electricity, especially in its application to submarine telegraphy, that Lord Kelvin is best known to the world at large. From 1854 he is most prominent among telegraphists. The stranded form of conductor was due to his suggestion; but it was in the letters which he addressed in November and December of that year to Sir G. G. Stokes, and which were published in the Proceedings of the Royal Society for 1855, that he discussed the mathematical problem of the measurement of every electric quantity, laid down the principle that in long cables the retardation due to capacity must render the speed of signalling inversely proportional to the square of the cable's length. Some held that if this were true ocean telegraphy would be impossible, and sought in consequence to disprove Thomson's conclusion. Thomson, on the other hand, set to work to overcome the difficulty by improvement in the manufacture of cables, and first of all in the production of copper of high conductivity and the construction of apparatus which would readily respond to the slightest variation of the current in the cable. The mirror galvanometer and the siphon recorder, which was patented in 1867, were the outcome of these researches; but the scientific value of the mirror galvanometer is independent of its use in telegraphy, and the siphon recorder is the direct precursor of one form of galvanometer (d'Arsonval's) now commonly used in electrical laboratories.

A mind like that of Thomson could not be content to deal with any physical quantity, however successfully from a practical point of view, without subjecting it to measurement. Thomson's work in connexion with telegraphy led to the production in rapid succession of instruments adapted to the requirements of the time. For the measurement of every electric quantity, local and electric lighting came to the front a new set of instruments was produced to meet the needs of the electrical engineer. Some account of Thomson's electrometer is given in the article on that subject, while every modern work of importance on electric lighting describes the instruments which he has specially designed for central station work; and it may be said that there is no quantity which the electrical engineer is ordinarily called upon to measure for which Lord Kelvin did not construct the suitable instrument.

Currents from the ten-thousandth of an ampere to ten thousand amperes, electrical pressures from a minute fraction of a volt to 100,000 volts, come within the range of his instruments, while the private consumer of electric energy is provided with a meter recording Board of Trade units.

When W. Weber in 1851 proposed the extension of C. F. Gauss's system of absolute units to electromagnetism, Thomson took up the question, and, applying the principles of energy, calculated the absolute electromotive force of a Daniell cell, and determined the absolute measure of the resistance of a wire from the heat produced in it by a known current. In 1861 it was Thomson who induced the British Association to appoint its first famous committee for the determination of electrical standards, and it was he who suggested much of the work carried out by J. Clerk Maxwell, Balfour Stewart and Fleeming Jenkin as members of that committee. The oscillatory character of the discharge of the Leyden jar, the foundation of the work of H. R. Hertz and of wireless telegraphy were investigated by him in 1853.

It was in 1853 that he undertook to write a series of articles for Good Words on the mariner's compass. He wrote the first, but so many questions arose in his mind that it was five years before the second appeared. In the meanwhile the compass went through a process of complete reconstruction in his hands, a process which enabled both the permanent and the temporary magnetism of the ship to be readily compensated, while the weight of the 10-in. card was reduced to one-seventeenth of that of the standard card previously in use, although the time of swing was increased. Second only to the compass in its value to the sailor is Thomson's sounding apparatus, whereby soundings can be taken in 100 fathoms by a ship steaming at 16 knots; and by the employment of piano-wire, a breaking strength of 140 tons per square inch and an iron sinker weighing only 34 lb, with a self-registering pressure gauge, soundings can be rapidly taken in deep ocean. Thomson's tide gauge, tidal harmonic analyser and tide predictor are famous, and among his work in the interest of navigation must be mentioned his tables for the simplification of Sumner's method for determining the position of a ship at sea.

It is impossible within brief limits to convey more than a general idea of the work of a philosopher who published more than three hundred original papers bearing upon nearly every branch of physical science, in the lecture days that Lord Kelvin the mathematician of a vortex theory of matter on hydrodynamical principles or discovering the limitations of the capabilities of the vortex atom, on another was applying the theory of elasticity to tides in the solid earth, or was calculating the size of water molecules, and later was designing an electricity meter, a dynamo or a domestic water-tap. It is only by reference to his published papers that any approximate conception can be formed of his life's work; but the student who had read all these knew comparatively little of Lord Kelvin if he had not talked with him face to face. Extreme modesty, almost amounting to diffidence, was combined with the utmost kindliness in Lord Kelvin's bearing to the most elementary student, and nothing seemed to give him so much pleasure as an opportunity to acknowledge the efforts of the humblest scientific worker. The progress of physical discovery during the last half of the 19th century was perhaps as much due to the kindly encouragement which he gave to his students and to others who came in contact with him as to his own researches and inventions; and it would be difficult to speak of his influence as a teacher in stronger terms than this.

One of his former pupils, Professor J. D. Cock, wrote of him: "It is perhaps at the lecture days that Lord Kelvin the mathematician, was most of his characteristics. . . . His master mind, soating high, sees one vast connected whole, and, alive with enthusiasm, with smiling face and sparkling eye, he shows the panorama to his pupils, pointing out the similarities and differences of its parts, the boundaries of our knowledge, and the regions of doubt and speculation. To follow him in his flights is real mental exhilaration."

In 1832 Thomson married Margaret, daughter of Walter Crum of Thornlebank, who died in 1870; and in 1874 married Frances Anna, daughter of Charles R. Blandy of Madeira. In 1866, perhaps chiefly in acknowledgment of his services to trans-Atlantic telegraphy, Thomson received the honour of knighthood, and in 1892 he was raised to the peerage with the title of Baron Kelvin of Largs. The Grand Cross of the Royal Victorian Order was conferred on him in 1896, the year of the jubilee of his professorship. In 1890 he became president of the Royal Society, and he received the Order of Merit on its institution in 1902. A list of the degrees and other honours which he received during the fifty-three years he held his Glasgow chair would occupy as much space as this article; but any biographical sketch would be completely incomplete if it failed to notice the celebration in 1896 of the jubilee of his professorship. Never before had such a gathering of rank and science assembled as that which filled the halls in the university of Glasgow on the 15th, 16th and 17th of June in that year. The city authorities joined with the university in honouring their most distinguished citizen. About 2500 guests were received in the university buildings, the library of which was devoted to an exhibition of the instruments invented by Lord Kelvin, together with his certificates, diplomas and medals. The Eastern, the Anglo-American and the Commercial
KEMBLE

723

Cable companies united to celebrate the event, and from the university library a message was sent through Newfoundland, New York, Chicago, San Francisco, Los Angeles, New Orleans, Florida and Washington, and was received by Lord Kelvin seven and a half minutes after it had been despatched, having travelled about 20,000 miles and twice crossed the Atlantic during the interval. It was at the banquet in connexion with the jubilee celebration that the Lord Provost of Glasgow thus summarized Lord Kelvin's character: "His industry is unwearied; and he seems to take rest by turning from one difficulty to another—difficulties that would appal most men and be taken as enjoyable by no one else... This life of useful industry, his universal honour, has left Lord Kelvin with a lovable nature that charms all with whom he comes in contact."

Three years after this celebration Lord Kelvin resigned his chair at Glasgow, though by formally matriculating as a student he maintained his connexion with the university, of which in 1904 he was elected chancellor. But his retirement did not mean cessation of active work or any slackening of interest in the scientific thought of the day. Much of his time was given to writing and revising the lectures on the wave theory of light which he delivered at Tait's Glasgow lectures in 1884, but which were not finally published until 1904. He continued to take part in the proceedings of various learned societies; and only a few months before his death, at the Leicester meeting of the British Association, he attested the keenness with which he followed the current developments of scientific speculation by delivering a long and searching address on the electronic theory of matter. He died on the 17th of December 1907 at his residence, Netherhall, near Largs, Scotland; there was no heir to his title, which became extinct.

In addition to the Baltimore lectures, he published with Professor P. G. Tait a standard but unfinished Treatise on Natural Philosophy (1857). A number of his scientific papers were collected in his Reprint of Papers on Electricity and Magnetism (1872), and in his Mathematical and Physical Papers (1882, 1883 and 1890), and three volumes of his Popular Lectures and Addresses appeared (1889-90). He was also the author of the articles on "Heat," and "Electricity," in the 5th edition of the Encyclopaedia Britannica.

See Andrew Gray, Lord Kelvin (1908); S. P. Thompson, Life of Lord Kelvin (1910), which contains a full bibliography of his writings.

(W. G.; H. M. R.)

KEMBLE, the name of a family of English actors, of whom the most famous were Mrs Siddons (q.v.) and her brother John. Philip Kemble, the eldest of the twelve children of ROGER KEMBLE (1721-1802), a strolling player and manager, who in 1753 married an actress, Sarah Wood.

JOHN PHILIP KEMBLE (1757-1823), the second child, was born at Prescot, Lancashire, on the 1st of February 1757. His father was a Roman Catholic, and he was educated at Sedgeley Park Catholic seminary, near Wolverhampton, and the English college at Douai, with the view of becoming a priest. But at the conclusion of the four years' course he discovered that he had no vocation for the priesthood, and returning to England he joined the theatrical company of Crump & Chamberlain, his first appearance being as Theodosius in Lee's tragedy of that name at Wolverhampton on the 8th of January 1776. In 1778 he joined the York company of Tate Wilkinson, appearing at Wakefield as Captain Plume in Farquhar's The Recruiting Officer; in Hull for the first time as Macbeth on the 30th of October, and in York as Orestes in Ambrose Philip's Distressed Mother. In 1781 he obtained a "star" engagement at Dublin, making his first appearance there on the 2nd of November as Hamlet. He also achieved great success as Raymond in The Count of Narbonne, a play taken from Horace Walpole's Castle of Otranto. Gradually he worked for himself a high reputation as a careful and finished actor, and this, combined with the greater fame of his sister, led to an engagement at Drury Lane, where he made his first appearance on the 30th of September 1783 as Hamlet. In this rôle he awakened interest and discussion among the critics rather than the enthusiastic approval of the public. But as Macbeth on the 31st of March 1785 he shared in the enthusiasm aroused by Mrs Siddons, and established a reputation among living actors second only to hers. Brother and sister had first appeared together at Drury Lane on the 22nd of November 1783, as Beverley and Mrs Beverley in Moore's The Gamester, and as King John and Constance in Shakespeare's tragedy. In the following year they played Montgomery and Matilda in Cumberland's The Carmelites, and in 1785 Adorni and Camiola in Kemble's adaptation of Massinger's A Maid of Honour, and Othello and Desdemona. Between 1785 and 1787 Kemble appeared in a variety of rôles, his Mentevoile in Jephson's Julius producing an overwhelming impression. On the 8th of December 1789 he married Priscilla Hopkins, Breereton (1762-1824), the ward of his father's actor and manager, who was Kemble's appointment as manager of Drury Lane in 1788 gave him full opportunity to dress the characters less according to tradition than in harmony with his own conception of what was suitable. He was also able to experiment with whatever parts might strike his fancy, and of this privilege he took advantage with greater courage than discretion. His activity was prodigous, the list of his parts including a large number of Shakespearean characters and also a great many in plays now forgotten. In his own version of Coriolanus, which was revived during his first seasons the character of the "noble Roman" was invested with his powers that he not only played it with a perfection that has never been approached, but, it is said, unconsciously allowed its influence to colour his private manner and modes of speech. His tall and imposing person, noble countenance, and solemn and grave demeanour were uniquely adapted for the Roman characters in Shakespeare's plays; and, when in addition he had to depict the gradual growth and development of an absorbing passion, his representation gathered a momentum and majestic force that were irresistible. His defect was in flexibility, variety, rapidity; the characteristic of his style was method, regularity, precision, elaboration even of the minutest details, founded on a thorough psychological study of the special personality he had to represent. His elocutionary art, his fine sense of rhythm and emphasis, enabled him to excel in declamation, but physically he was incapable of giving expression to impetuous vehemence and searching pathos. In Coriolanus and Cato he was beyond praise, and possibly he may have been superior to both Garrick and Kean in Macbeth, although it must be remembered that in it part of his inspiration must have been caught from Mrs Siddons. In all the other great Shakespearean characters he was, according to the best critics, inferior to them, so least in Lear, Hamlet and Welser, and most so in Shylock and Richard III. On account of the eccentricities of Sheridan, the proprietor of Drury Lane, Kemble withdrew from the management, and, although he resumed his duties at the beginning of the season 1800-1801, he at the close of 1802 finally resigned connexion with it. In 1803 he became manager of Covent Garden, in which he had acquired a sixth share for £23,000. The theatre was burned down on the 20th of September 1808, and the raising of the prices after the opening of the new theatre, in 1809, led to riots, which practically suspended the performances for three months. Kemble had been early ruined by the fire, and was only saved by a generous loan, after which his name became a byword, and he decided to retire from the stage. In 1813 he was elected a director of the company, and in 1814 he was one of the subscribers for the fans that were presented to the performers on the occasion of the jubilee celebration of the theatre. In 1817 he was a member of the management of Drury Lane. He died at his house in the Strand, on the 26th of February 1823.

See BAODEN, Life of John Philip Kemble (1825); Fitzgerald, The Kembles (1871).

STEPHEN KEMBLE (1758-1832), the second son of Roger, was rather an indifferent actor, ever eclipsed by his wife and fellow player, Elizabeth Satchell Kemble (c. 1763-1841), and a man of such portly proportions that he played Falstaff without padding. He managed theatres in Edinburgh and elsewhere.

CHARLES KEMBLE (1775-1854), a younger brother of John Philip and Stephen, was born at Brecon, South Wales, on the 25th of November 1775. He, too, was educated at Douai.
KEMBLE, J. M.—KEMÉNY

After returning to England in 1792, he obtained a situation in the post-office, but this he soon resigned for the stage, making his first recorded appearance at Sheffield as Orlando in As You Like It in that year. During the early period of his career as an actor he made his way slowly to public favour. For a considerable time he played with his brother and sister, chiefly in secondary parts, and this with a grace and finish which received scant justice from the critics. His first London appearance was on the 21st of April 1794, as Malcolm to his brother's Macbeth. Ultimately he won independent fame, especially in such characters as Archer in George Farquhar's Beaux Stratagem, Dorincourt in Mrs Cowley's Belle's Stratagem, Charles Surface and Robert in Congreve's Haymow's Suspicions. His Laertes and Macduff were hardly less interesting than his brother's Hamlet and Macbeth. In comedy he was ably supported by his wife, Marie Thérèse de Camp (1774-1838), whom he married on the 2nd of July 1806. His visit, with his daughter Fanny, to America during 1832 and 1834, aroused much enthusiasm. The later period of his career was clouded by money embarrassments in connexion with his joint proprietorship in Covent Garden Theatre. He formally retired from the stage in December 1836, but his final appearance was on the 10th of April 1840. For some time he held the office of examiner of plays. In 1844-5, 1851-3, he acted from Shakespear to Willis's Rooms. He died on the 21st of November 1854. Macready regarded his Cassio as incomparable, and summed him up as "a first-rate actor of second-rate parts."

See Gentleman's Magazine, January 1855; Records of a Girlhood, by Frances Anne Kemble.

ELIZABETH WHITLOCK (1761-1836), who was a daughter of Roger Kemble, made her first appearance on the stage in 1783 at Drury Lane as Portia. In 1785 she married Charles E. Whitlock, went with him to America and played with much success there. She had the honour of being bestowing on President Washington. She seems to have retired about 1807, and she died on the 27th of February 1836. Her reputation as a tragic actress might have been greater had she not been Mrs Siddons's sister.

FRANCES ANNE KEMBLE (Fanny Kemble) (1809-1893), the actress and author, was Charles Kemble's elder daughter; she was born in London on the 27th of November 1809, and educated chiefly in France. She first appeared on the stage on the 29th of October 1829 as Juliet at Covent Garden. Her attractive personality made her a great favourite, and he enabled her to recoup his losses as a manager. She played all the principal women's parts, notably Portia, Beatrice and Lady Teazle, but Julia in Sheridan Knowles' The Hunchback, especially written for her, was perhaps her greatest success. In 1832 she went with her father to America, and in 1834 she married there a Southern planter, Pierce Butler. They were divorced in 1849. In 1847 she returned to the stage, from which she had retired on her marriage, and later, following her father's example, appeared with much success as a Shakespearian reader. In 1877 she returned to England, where she lived—using her maiden name—till her death in London on the 15th of January 1893. During this period Fanny Kemble was a prominent and popular figure in the social life of London. Besides her plays, Francis the First, unsuccessfully produced in 1832, The Star of Seville (1837), a volume of Poems (1844), and a book of Italian travel, A Year of Consolation (1847), she published a volume of her Journal in 1835, and in 1863 another (dealing with life on the Georgia plantation), and also a volume of Plays, including translations from Dumas and Schiller. These were followed by Records of a Girlhood (1856), Records of Late Life (1883), Notes on some of Shakespeare's Plays (1883), Far Away and Long Ago (1889), and Further Records (1891). Her various volumes of reminiscences contain much valuable material for the social and dramatic history of the period.

ADELAIDE KEMBLE (1814-1879), Charles Kemble's second daughter, was an opera singer of great promise, whose first London appearance was made in Norma on the 2nd of November 1841. In 1843 she married Edward John Sartoris, a rich Italian, and retired after a brief but brilliant career. She wrote A Week in a French Country House (1867), a bright and humorous story, and of a literary quality not shared by other tales that followed. Her son, Algernon Charles Sartoris, married General U. S. Grant's daughter.

Among more recent members of the Kemble family, mention may also be made of Charles Kemble's grandson, HENRY KEMBLE (1848-1907), a sterling and popular London actor.

KEMBLE, JOHN MITCHELL (1807-1857), English scholar and historian, eldest son of Charles Kemble the actor, was born in 1807. He received his education partly from Dr Richardson, author of the Dictionary of the English Language, and partly at the New College, Oxford. He helped to establish in 1826 an exhibition to Trinity College, Cambridge. At the university his historical essays gained him high reputation. The bent of his studies was turned more especially towards the Anglo-Saxon period through the influence of the brothers Grimm, under whom he studied at Göttingen (1831). His thorough knowledge of the Teutonic languages and his critical faculty were shown in his Beowulf (1835-1837), Über die Stammittel der Westsachsen (1836), Codex Diplomaticus Aevi Saxonic (1839-1848), and in many contributions to reviews; while his History of the Saxons in England (1847), new edition (1880), was written after the manner of a native historian. He also devoted the original works of the early period of English history. He was editor of the British and Foreign Review from 1835 to 1844; and from 1840 to his death was examiner of plays. In 1857 he published State Papers and Correspondence Illustrative of the Social and Political State of Europe from the Revolution to the Accession of the House of Hanover. He died at Dublin on the 20th of March 1857. His Horae Ferales, or Studies in the Archaeology of Northern Nations, was completed by Dr R. G. Latham, and published in 1864. He married the daughter of Professor Amadeus Wendt of Göttingen in 1826 and had two daughters and a son; the elder daughter was the wife of Sir Charles Santley, the singer.

KEMÉNY, ZSIGMOND, BARON (1816-1875), Hungarian author, came of a noble but reduced family. In 1837 he studied jurisprudence at Marosvásárhely, but soon devoted himself entirely to journalism and literature. His first unfinished work, On the Causes of the Disaster of Mohacs (1840), attracted much attention. In the same year he studied natural history and anatomy at Vienna University. In 1841, along with Lajos Kovács, he edited the Transylvania, a newspaper. In 1842 he became a member of the National Assembly, and in 1843 he was elected to the National Council. He was then appointed as an active part in provincial politics and warmly supported the principles of Count Stephen Széchényi. In 1846 he moved to Pest, where his pamphlet, Köröskedel és ellenszeres (Partisanship and its Antidote), had already made him famous. Here he also confessed with the most eminent of the moderate reformers, and for a time he was on the staff of the Pesti Hir lá, the same year he brought out his first great novel, Pál Gyulay. He was elected a member of the revolutionary diet of 1848 and accompanied it through all its vicissitudes. After a brief exile he accepted the amnesty and returned to Hungary. Careless of his unpopularity, he took up his pen to defend the cause of justice and moderation, and in his two pamphlets, Forradalom után (After the Revolution) and Még egy o o a forradalom után (One word more after the Revolution), he defended the point of view which was realized by Déak in 1867. He subsequently edited the Pesti Napló, which became virtually Déak's political organ. Kemény also published several political essays (e.g. The Two Wessexenlisy, and Stephen Szechenyi) which are among the best of their kind in any literature. His novels published during these years, such as Pécs és nő (Husband and Wife), Sziroványi (The Heart's Secrets), &c., also won him a foremost rank among contemporary novelists. During the 'sixties Kemény took an active part in the political labour of Déak, whose right hand he continued to be, and popularized the Composition of 1867 which he had done so much to bring about. He was elected to the diet of 1867 for one of the divisions of Pest, but took no part in the debates. The last years of his life were passed in complete seclusion in Transylvania. To the works of Kemény already
KEMP—KEMP

mentioned should be added the fine historical novel Rajongok (The Fanatics) (Pest, 1858–1859), and Collected Speeches (Hung.) (Pest, 1889).

See L. Nogradi, Baron Sigismund Kemény's Life and Writings (Hung.) (Budapest, 1902); G. Bekesi, Sigismund Kemény, the Revolution and the Composition (Hung.) (Budapest, 1888). (R. N. B.)

KEMP, WILLIAM (fl. 1600), English actor and dancer. He probably began his career as a member of the earl of Leicester's company, but his name first appears after the death of Leicester in a list of players authorized by an order of the privy council in 1533 to play 7 m. out of London. Ferdinand Stanley, Lord Strange, was the patron of the company of which Kemp was the treasurer. He died in London in 1554; until 1562 he was connected with Burbage and Shakespeare to act before the queen at Greenwich. He was the successor, both in parts and reputation, of Richard Tarlton. But it was as a dancer of jiggs that he won his greatest popularity, one or two actors dancing and singing with him, and the words doubtless often being improvised. Examples of the music may be seen in the MS. collection of John Dowlard now in the Cambridge University Library. At the same time Kemp was given parts like Dogberry, and Peter in Romeo and Juliet; indeed his name appears by accident in place of those of the characters in early copies. Kemp was also an actor in the company of Cardinal Wolsey, dancing on the Continent, and in 1602 he was a member of the earl of Worcester's players, and Philip Henslowe's diary shows several payments made to him in that year.

KEMPE, JOHN (c. 1380–1454), English cardinal, archbishop of Canterbury, and chancellor, was son of Thomas Kempe, a gentleman of Ollantigh, in the parish of Wye near Ashford, Kent. He was born about 1380 and educated at Merton College, Oxford. He practised as an ecclesiastical lawyer, was an assessor at the trial of Oldcastle, and in 1413 was made dean of the Court of Arches. Then he passed into the royal service, and being employed in the administration of Norandy was eventually made chancellor of the duchy. Early in 1419 he was elected bishop of Rochester, and was consecrated at Rouen on the 3rd of December. In February 1421 he was translated to Chichester, and in November following to London. During the minority of Henry VI. Kempe had a prominent position in the English council as a supporter of Henry Beaufort, whom he succeeded as chancellor in March 1426. In this same year he was promoted to the archbishopric of York. Kempe held office as chancellor for six years; his main task in government was to keep Humphrey of Gloucester in check. His resignation on the 19th of February 1426 was a concession to Gloucester. He still enjoyed Beaufort's favour, and retaining his place in the council was employed on important missions, especially at the congress of Arras in 1435, and the conference at Calais in 1438. In December 1439 he was created cardinal, and during the next few years took less share in politics. He supported Suffolk over the king's marriage with Margaret of Anjou; but afterwards there arose some difference between them, due in part to a dispute about the nomination of the cardinal's nephew, Thomas Kempe, to the bishopric of London. At the time of Suffolk's fall in January 1450 Kempe once more became chancellor. His appointment may have been due to the fact that he was not committed entirely to either party. In spite of his age and infirmity he showed some vigour in dealing with Cade's rebellion, and by his official experience and skill did what he could for four years to sustain the king's authority. He was rewarded by his translation to Canterbury in July 1452, when Pope Nicholas added as a special honour the title of cardinal—bishop of Santa Rufina. As Richard of York gained influence, Kempe became unpopular; men called him "the cursed cardinal," and his fall seemed imminent when he died suddenly on the 22nd of March 1455. He was buried at Canterbury, in the choir. Kempe was a politician first, and hardly at all a bishop; and he was accused with some justice of neglecting his dioceses, especially at York. Still he was a capable official, and a faithful servant to Henry VI., who called him "one of the wisest lords of the land" (Paston Letters, i. 313). He founded a college at his native place at Wye, which was suppressed at the Reformation.

KEMPEN, a town in the Prussian Rhine Province, 40 m. N. of Cologne by the railway to Zevenaar. Pop. (1900), 6319. It has a monument to Thomas à Kempis, who was born there. The industries are considerable, and include silk-weaving, glassmaking and the manufacture of electrical plant. Kempen belonged in the middle ages to the archbishopric of Cologne and received civic rights in 1394. It is memorable as the scene of a victory gained, on the 17th of January 1641, by the French and Hanseatics over the Imperialists.

See Terwelp, Die Stadt Kempen (Kempen, 1894), and Niessen, Heimatbundes des Kreises Kempen (Crefeld, 1895).

KEMPENFELT, RICHARD (1718–1782), British rear-admiral, was born at Westminster in 1718. His father, a Swede, is said to have been in the service of James II., and subsequently to have entered the British army. Richard Kempenfelt went into the navy, and saw his first service in the West Indies, taking part in the capture of Portobello. In 1746 he returned to England, and from that date to 1780, when he was made rear-admiral, saw active service with the British fleet in the various quarters of the world. In 1781 he gained, with a vastly inferior force, a brilliant victory, fifty leagues south-west of Ushant, over the French fleet under De Guichen, capturing twenty prizes. In 1782 he hoisted his flag on the "Royal George," which formed part of the fleet under Lord Howe. In August this fleet was ordered to refit at top speed at Portsmouth, and proceed to the relief of Gibraltar. A leak having been located below the waterline of the "Royal George," the vessel was careened to allow of the defect being repaired. According to the version of the disaster favoured by the Admiralty, she was overturned by a breeze. But the general opinion of the navy was that the shifting of her weights was more than the old and rotten timbers of the "Royal George" could stand. A large piece of her bottom fell out, and she went down at once. It is estimated that not fewer than 800 persons went down with her, for besides the crew there were a large number of tradesmen, women and children on board. Kempenfelt, who was in his cabin, perished with the rest. Cowper's poem, the "Loss of the Royal George," commemorates this disaster. Kempenfelt effected radical alterations and improvements in the signalling system then existing in the British navy. A painting of the loss of the "Royal George" is in the Royal United Service Institution, London.

KEMP, SIR JAMES (1764–1844), British soldier, was gazetted to the 101st Foot in India in 1783, but on its disbandment two years later was placed on half-pay. It is said that he took a clerkship in Greenwood's, the armymagets (afterwards Cox & Co.). He attracted the notice of the Duke of York, through whom he obtained a captaincy (very soon followed by a majority) in the newly raised 113th Foot. But it was not long before his regiment experienced the fate of the old 101st; this time however Kemt was retained on full pay in the recruiting service. In 1799 he accompanied Sir Ralph Abercromby to Holland, and later to Egypt as an aide-de-camp. After Abercromby's death Kemt remained on his successor's staff until the end of the campaign in Egypt. In April 1803 he joined the staff of Sir David Dundas, but next month returned to regimental duty, and a little later received a lieutenant-colonelcy in the 81st Foot. With his new regiment he went, under Craig, to the Mediterranean theatre of operations, and at Maida the light brigade led by him bore the heaviest share of the battle. Employed from 1807 to 1811 on the staff in North America, Brevet-Colonel Kemt at the end of 1811 joined Wellington's army in Spain with the local rank of major-general, which was, on the 1st of January 1812, made substantive. As one of Picton's brigadiers, Kemt took part in the great assault on Badajoz and was severely wounded. On rejoining for duty, he was posted to the command of a brigade of the Light Division (43rd, 42nd and 95th Rifles),
which he led at Vera, the Nivelle (where he was again wounded), Bayonne, Orthez and Toulouse. Early in 1815 he was made K.C.B., and in July for his services at Waterloo, G.C.B. At that battle he commanded the 28th, 32nd and 70th as a brigadier under his old chief, Picton, and on Picton's death succeeded to the command of his division. From 1825 to 1830 he was Governor-General of Canada, and at a critical time displayed firmness and moderation. He was afterwards Master-General of the Ordnance. At the time of his death in 1854 he had been for some years a full General.

KEMPTEN, a town in the kingdom of Bavaria on the Iller, 81 miles W. of Munich, by rail 106 (1905), 20,663. The town is well built, has many spacious squares and attractive public grounds, and contains a castle, a handsome town-hall, a gymnasion, &c. The old palace of the abbots of Kempten, dating from the end of the 17th century, is now partly used as barracks, and near to it is the fine abbey church. The industries include wool-spinning and weaving and the manufacture of paper, beer, machines, bosiery and matches. As the commercial centre of the Aalgau, Kempten carries on active trade in timber and dairy produce. Numerous remains have been discovered on the hills and in the vicinity.

Kempten, identified with the Roman Cambodunum, consisted in early times of two towns, the old and the new. The continual hostility that existed between these was intensified by the welcome given by the old town, a free imperial city since 1289, to the Reformed doctrines, the new town keeping to the older faith. The Benedictine abbey of Kempten, said to have been founded in 773 by Hildegarde, the wife of Charlemagne, was an important house. In 1360 its abbot was promoted to the dignity of a prince of the Empire by the emperor Charles IV.; the town and abbey passed to Bavaria in 1503. Here the Austrians defeated the French on the 17th of September 1796.

See Förderer, Die Stadt Kempten und ihre Umgebung (Kempten, 1891); Hagnmüller, Geschichte der Stadt und der gefürsten Grafschaft Kempten, vol. i. (Kempten, 1840); and Meierhofer, Geschichtliche Darstellung der dunkuwichtigsten Schicksale der Stadt Kempten (Kempten, 1856).

KEN, THOMAS (1637-1711), the most eminent of the English non-juring bishops, and one of the fathers of modern English hymnology, was born at Little Berkhamstead, Herts, in 1637. He was the son of Thomas Ken of Furnival's Inn, who belonged to an ancient stock,—that of the Knes of Ken Place, in Somersetshre; his mother was a daughter of the now forgotten poet, John Chalkhill, who is called by Walton an "acquaintant and friend of Edmund Spenser." Ken's step-sister, Anne, was married to Izaak Walton in 1646, a connexion which brought Ken from his boyhood under the refining influence of this gentle and devout man. In 1652 Ken entered Winchester College, and in 1656 became a student of Hart Hall, Oxford. He gained a fellowship at New College in 1657, and proceeded B.A. in 1660 and M.A. in 1664. He was for some time tutor of his college; but the most characteristic reminiscence of his university life is the mention made by Anthony Wood that in the musical gatherings of the time "Thomas Ken of New College, a junior, would be sometimes among them, and sing his part." Ordained in 1662, he successively held the livings of Little Easton in Essex, Brightstone (sometimes called Brixton) in the Isle of Wight, and East Woodhay in Hampshire; in 1672 he resigned the last of these, and returned to Winchester, being by this time a prebendary of the cathedral, and chaplain to the bishop, as well as a fellow of Winchester College. He remained there for several years, acting as curate in one of the lowest districts, preparing his Manual of Prayers for the use of the Scholars of Winchester College (first published in 1674), and composing hymns. It was at this time that he wrote, primarily for the same body as his prayers, his morning, evening and midnight hymns, the first two of which, beginning "Awake, my soul, and with the sun" and "Glory to Thee, my God, this night," are now household words wherever the English tongue is spoken. The latter is often made to begin with the line "All praise to Thee, my God, this night," but in the earlier editions over which Ken had control, the line is as first given. In 1674 Ken paid a visit to Rome in company with young Izaak Walton, and this journey seems mainly to have resulted in confirming his regard for the Anglican communion. In 1679 he was appointed by Charles II. chaplain to the Princess Mary, wife of William of Orange. While with the court at the Hague, he incurred the displeasure of William by insisting that a promise of marriage, made to an English lady of high birth by a relative of the prince, should be kept; and he therefore gladly returned to England in 1685, when he was immediately appointed one of the king's chaplains. He was once more residing at Winchester, when he was knighted in 1685; and he retained his dignities, taken back from his disloyal conduct, as he had composed, court, and his residence was chosen as the home of Nell Gwynne; but Ken stoutly objected to this arrangement, and succeeded in making the favourite find quarters elsewhere.

In August of this same year he accompanied Lord Dartmouth to Tangier as chaplain to the fleet, and Pepys, who was one of the company, has left on record some quaint and kindly reminiscences of him and of his services on board. The fleet returned in April 1684, and a few months after, upon a vacancy occurring in the see of Bath and Wells, Ken, now Dr Ken, was appointed bishop. This was followed by the acceptance of the vacant See of Winchester, and the consecration took place at Lambeth on the 25th of January 1685; and one of Ken's first duties was to attend the death-bed of Charles, where his wise and faithful ministrations won the admiration of everybody except Bishop Burnet. In this year he published his Exposition on the Church Catechism, perhaps better known by its sub-title, The Practice of Divine Love. In 1688, when James reissued his "Declaration of Indulgence," Ken was one of the "seven bishops" who refused to publish it. He was probably influenced by two considerations: first, by his profound aversion from Roman Catholicism, to which he felt he would be giving some episcopal recognition by compliance; and, second and more especially, by the feeling that James was compromising the spiritual freedom of the church. Along with his six brethren, Ken was committed to the Tower on the 8th of June 1688, on a charge of high misdemeanour; the trial, which took place on the 29th and 30th of the month, and which resulted in a verdict of acquittal, is matter of history. With the revolution, which is said to have followed this impolitic trial, new troubles encountered Ken; for, having sworn allegiance to James, he thought himself thereby precluded from taking the oath to William of Orange. Accordingly, he took his place among the non-jurors, and, as he stood firm to his refusal, he was, in August 1691, superseded in his bishopric by Dr Kidder, dean of Peterborough. From this time he lived mostly in retirement, finding a congenial home with Lord Weymouth, his friend from college days, at Longleat in Wiltshire; and though pressed to resume his diocese in 1703, upon the death of Bishop Kidder, he declined, partly on the ground of growing weakness, but partly no doubt from his love for the quiet life of devotion which he was able to lead at Longleat. His death took place there on the 9th of March 1711.

Although Ken wrote much poetry, besides his hymns, he cannot be called a great poet; but he had that fine combination of spiritual insight and feeling with poetic taste which marks all great hymn-writers. As a hymn-writer he has had few equals in England; it can scarcely be said that even Keble, though possessed of much rarer poetic gifts, surpassed him in his own sphere (see HYMNS). In his own day he took high rank as a pulpit orator, and even royalty had to beg for a seat amongst his audiences; but his sermons are now forgotten. He lives in history, apart from his three hymns, mainly as a man of unstained purity and invincible fidelity to conscience, work only in a certain narrowness of view which is a frequent attribute of later centuries who possessed. As an ecclesiastic he was a High Churchman of the old school.

Ken's poetical works were published in collected form in four volumes by W. Hawkins, his relative and executor, in 1721; his prose works in eight volumes by B. Thorold in 1785. Ken's hymns are included in the three volumes of the Congregational Psalter of 1874. A more comprehensive edition was published by F. L. Herford in 1904. The fact, however, that in 1712—only a year after Ken's death—his friend, Bronson, prefixed to the last and largest edition of the HYMNS the "All praise," has been deemed by such a high authority as the 1st Earl of Selborne sufficient evidence that the alteration had Ken's authority.
works were issued in 1838 in one volume, under the editorship of J. T. Round. A brief memoir was prefixed by Hawkins to a selection from Ken's works which he published in 1713; and a life, in two volumes, by the Rev. W. L. Bowles, appeared in 1830. But the story of the Duke being the subject of the J. Ireland and Anderson's *The Life of Thomas Ken, Bishop of Bath and Wells*, by a Layman, 1851; 2nd ed., 1854) and of Dean Humphreys (2 vols., 1888; revised, 1890). See also the Rev. W. Hunt's article in the *Dict. Nat. Biog.*

KEN, a river of Northern India, tributary to the Jumna on its right bank, flowing through Bundelkund. An important reservoir in its upper basin, which impounds about 180 million cubic feet of water, irrigates about 374,000 acres in a region specially liable to drought.

KEN, KENDAL OF. Name sometimes written *Kin*, a town of Upper Egypt on a canal about a mile E. of the Nile and 380 m. S.S.E. of Cairo by rail. Pop. (1907), 20,069. Kena, the capital of a province of the same name, was called by the Greeks Caene or Caenopolis (probably the *Nēa Pόla* of Herodotus; see אַנִिּנְמִי in distinction from Copitos (*q.v.*), 15 m. S., to whose trade it eventually succeeded. It is a remarkable fact that its modern name should be derived from a purely Greek word, like Iskendria from Alexandria, and Nekrash from Naucratis; in the absence of any known Egyptian name it seems to point to Kena having originated in a feast settlement in connection with the Red Sea trade. It is a flourishing town, specially noted for the clay in the making of which it is obtained from a valley north of Kena. The pottery is sent down the Nile in specially constructed boats. Kena is also known for the excellence of the dates sold in its bazaars and for the large colony of dancing girls who live there. It carries on a trade in grain and dates with Arabia, via Kosseir on the Red Sea, 100 m. E. in a direct line. This insignificant traffic is all that is left of the extensive commerce formerly maintained—chiefly via Benice and Copitos—between Upper Egypt and India and Arabia. The road to Kosseir is one of great antiquity. It leads through the valley of Hammâmât, celebrated for its ancient breccia quarries and deserted gold mines. During the British operations in Egypt in 1801 Sir David Baird and his force marched along this road to Kena, taking sixteen days on the journey from Kosseir.

KENDEL, DUKEDOM OF. The English title of duke of Kendal was first bestowed in May 1667 upon Charles (d. 1667), the infant son of the duke of York, afterwards James II. Several persons have been created earl of Kendal, among them being John, 3rd. of Bedford, son of Henry IV.; John Beaufort, duke of Bedford; Sir George Sothern (c.1444); and Queen Anne's husband, George, prince of Denmark.

In 1719 Ehengarde Melusina (1667–1743), mistress of the English king George I., was created duchess of Kendal. This lady was the daughter of Gustavus Adolphus, count of Schullenburg (d. 1691), and was born at Emden on the 25th of December 1667. Her father held important positions under the elector of Brandenburg; her brother Matthias John (1661–1747) won great fame as a soldier in Germany and was afterwards commander-in-chief of the army of the republic of Venice. Having entered the household of Sophia, electress of Hanover, Melusina attracted the notice of her son, the future king, whose mistress she became about 1690. When George crossed over to England in 1714, the "Schullenburg," as Sophia called her, followed him and soon supplanted her principal rival, Charlotte Sophia, Baroness von Klannisegg (c. 1703–1725), afterwards countess of Darlington, as his first favourite. In 1716 she was created duchess of Munster; then duchess of Kendal; and in 1723 the emperor Charles VI. made her a princess of the Empire. The duchess was very avaricious and obtained large sums of money by selling public offices and titles; she also sold patent rights, one of these being the privilege of supplying Ireland with a new copper coinage. This she sold to a Wolverhampton iron merchant named William Wood (1671–1730), who flooded the country with coins known as "Wood's halfpence," thus giving occasion for the publication of Swift's famous *Draper's Letters*. In political matters she had much influence with the king, and she received £10,000 for procuring the recall of Bolingbroke from exile. After George's death in 1727 she lived at Kendal House, Tedworth, Middlesex, until her death on the 26th of May 1743. The duchess was by way of a beautiful woman, and her figure caused the populace to refer to her as the "maypole."

By the king she had two daughters: Petronilla Melusina (c. 1693–1778), who was created countess of Walsingham in 1722, and who married the great earl of Chesterfield; and Margaret Gertrude, countess of Lippe (1703–1773).

**KENDALL, WILLIAM HUNTER** (1843— ). English actor, whose family name was Grimston, was born in London on the 16th of December 1843, the son of a painter. He made his first stage appearance at Glasgow in 1862 as Louis XIV., in *A Life's Reward* acted as Lord Hastings. In 1865 he went to Birmingham and elsewhere, he joined the Haymarket company in London in 1866, acting everything from burlesque to Romeo. In 1869 he married Margaret (Madge) Shafto Robertson (b. 1849), sister of the dramatist, T. W. Robertson. As "Mr and Mrs Kendall" their professional careers then became inseparable. Mrs Kendall's first stage appearance was as Marie, "a child," in *The Orphan of the Frozen Sea* in 1854 in London. She soon showed such talent both as actress and singer that she secured numerous engagements, and by 1866 was playing Ophelia and Don Carlos. She joined W. H. potato in Scotland. With Sothern, and Pauline to his Claud Melnotte. But her real triumphs were at the Haymarket in Shakespearian revivals and the old English comedies. While Mr Kendall played Orlando, Charles Surface, Jack Absolute and Young Marlowe, his wife made the combination perfect with her Rosalind, Lady Teazle, Lydia Languish and Kate Hardcastle; and she created Galatea in Gilbert's *Pygmalion and Galatea* (1871). Short seasons followed at the Court theatre and at the Prince of Wales's, at the latter of which they joined the Bancrofts in *Diplomacy* and other plays. Then in 1879 began a long association with Mr (afterwards Sir John) Hare as joint-managers of the St James's theatre, some of their notable successes being in *The Square*, *Impulse*, *The Ironmaster* and *A Scrap of Paper*. In 1888, however, the Hare and Kendall régime came to an end. From that time Mr and Mrs Kendall chiefly toured in the provinces and in America, with an occasional season at rare intervals in London.

KENDEL, a market town and municipal borough in the Kendal parliamentary division of Westmorland, England, 251 m. N.W. from London on the Windermere branch of the London and North-Western railway. It is a market-town with a large town, with 41,600 inhabitants in 1801, and with the greatest in the county. It is picturesquely placed on the river Kent, and is irregularly built. The white-walled houses with their blue-slated roofs, and the numerous trees, give it an attractive appearance. To the S.W. rises an abrupt limestone eminence, Scout Scar, which commands an extensive view towards Windermere and the southern mountains of the Lake District. The church of the Holy Trinity, the oldest part of which dates from about 1200, is a Gothic building with five aisles and a square tower. In it is the helmet of Major Robert Philipson, who rode into the church during service in search of one of Cromwell's officers, Colonel Briggs, to do vengeance on him. This major was notorious as "Robin the Devil," and his story is told in Scott's *Rokeby*. Among the public buildings are the town hall, classic in style; the market house, and literary and scientific institution, with a museum containing a fossil collection from the limestone of the locality. Educational establishments include a free grammar school, in modern buildings, founded in 1525 and well endowed; a blue-coat school, science and art school, and green-coat Sunday school (1813). On an eminence east of the town are the ruins of Kendal castle, attributed to the first barons of Kendal. It was the birthplace of Catherine Parr, Henry VIII.'s last queen. On the Castlebury Hill, an artificial mound probably of pre-Norman origin, an obelisk was raised in 1788 in memory of the revolution of 1688. The woollen manufactures of Kendal have been noted since 1313, when Edward III. is said to have granted letters of protection to John Kemp, a Flemish weaver who settled in the town; and, although the coarse cloth
KENDALL—KENG TUNG

known to Shakespeare as “Kendal green” is no longer made, its place is more supplied by active manufactures of tweeds, railway rugs, horse clothing, knitted woollen caps and jackets, worsted and woollen yarns, and similar goods. Other manufactures of Kendal are machine-made boots and shoes, cards for wool and cotton, agricultural and other machinery, paper, and, in the neighbourhood, gunpowder. There is a large weekly market for grain, and annual horse and cattle fairs. The town is governed by a mayor, 6 aldermen and 18 councillors. Area, 2622 acres.

The outline of a Roman fort is traceable at Watercrock near Kendal. The barony and castle of Kendal or Kirkby-in-Kendal, held by Turold before the Conquest, were granted by William I. to Ivo de Taillebois, but the barony was divided into three parts in the reign of Richard II., one part with the castle passing to Sir William Parr, knight, ancestor of Catherine Parr. After the death of her brother William Parr, marquis of Northampton, his share of the barony called Marquis Fee reverted to Queen Elizabeth. The castle, being evidently deserted, was in ruins in 1586. Kendall was plundered by the Scots in 1210, and was visited by the rebels in 1715 and again in 1745 when the Freemen were given a local charter in Kendall in 1345, and the borough with “court houses” and the fee-farm of free tenants is included in a confirmation charter to Sir William Parr in 1472. Richard III. in 1484 granted the inhabitants of the barony freedom from toll, passage and portage, and the town was incorporated in 1576 by Queen Elizabeth under the title of an alderman and 12 burgesses, but Charles I. in 1635 appointed a mayor, 12 aldermen and 20 capital burgesses. Under the Municipal Reform Act of 1835 the corporation was again altered. From 1832 to 1885 Kendall sent one member to parliament, but since the last date its representation has been merged in that of the southern division of the county. A weekly market on Saturday granted by Richard I. to Roger Fitz Reinfred was purchased by the corporation from the earl of Lonsdale and Captain Bagot, lords of the manor, in 1885 and 1886. Of the five fairs which are now held three are ancient, that now held on the 29th of April being granted to Marmaduke de Tweng and William de Ros in 1307, and those on the 8th and 9th of November to Christiana, widow of Ingelram de Gynes, in 1333. See Victoria County History, Westmorland; Cornelius Nicholson, The Annals of Kendall (1861).

KENDALL, HENRY CLARENCE (1847-1882), Australian poet, son of a missionary, was born in New South Wales on the 8th of April 1847. He received only a slight education, and in 1860 he entered a lawyer’s office in Sydney. He had always had literary tastes, and sent some of his verses in 1862 to London to be published in the Athenæum. Next year he obtained a clerkship in the Lands Department in Sydney, being afterwards transferred to the Colonial Secretary’s office; and he combined this work with the writing of poetry and with journalism. His principal volumes of verse were Leaves from an Australian Forest (1866) and Songs from the Mountains (1868), his feeling for nature, as embodied in Australian landscape and bush-life, being very true and full of charm. In 1869 he resigned his post in the public service, and for some little while was in business with his brothers. Sir Henry Parkes took an interest in him, and eventually appointed him to an inspectorship of forests. He died on the 1st of August 1882. In 1886 a memorial edition of his poems was published at Melbourne.

KENEALY, EDWARD VAUGHAN HYDE (1819-1880), Irish barrister and author, was born at Cork on the 2nd of July 1819, younger son of a local merchant. He was educated at Trinity College, Dublin; was called to the Irish bar in 1840 and to the English bar in 1847; and obtained a fair practice in criminal cases. In 1868 he became a Q.C. and a bencher of Gray’s Inn. It was not, however, till 1873, when he became leading counsel for the Tichborne claimant, that he came into any great prominence. His violent conduct of the case became a public scandal, and after the verdict against his client he started a paper to plead his cause and to attack the judges. His behaviour was so extreme that in 1874 he was disbarred and disowned by his Inn.

He then started an agitation throughout the country to ventilate his grievances, and in 1875 was elected to parliament for Stoke; but no member would introduce him when he took his seat. Dr Kenealy, as he was always called, gradually ceased to attract attention, and on the 16th of April 1880 he died in London. He published a great quantity of verse, and also of somewhat mystical theology. His second daughter, Dr Arabella Kenealy, besides practising as a physician, wrote some clever novels.

KENG TUNG, the most extensive of the Shan States in the province of Burma. It is in the southern Shan States’ charge of the British government and contains the most extensive forest in the Shan area. The area of the state is rather over 12,000 sq. m. It is bounded N. by the states of Mang Lôn, Mông Lêm and Kêng Hûng (Hai Hsaw Pann), the two latter under Chinese control; E. by the Mekong river, on the farther side of which is French Lào territory; S. by the Siamese Shan States, and W. by a general way by the Salween river, though it overlaps it in some places. The state is known to the Chinese as Mêng Kêng, and was frequently called by the Burmese the 32 cities of the Gôn (Hkhôn). Kêng Tùng has expanded very considerably since the establishment of British control. The two largest forests in Kêng Tùng are that of Kêng Cheng, which in Burmese times were separate charges. The “classical” name of the state is Khemarat or Khemarata Tungkapi. About 63% of the area lies in the basin of the Mekong river and 37% in the Salween drainage area. The watershed is a high and generally continuous range. Some of its peaks rise to over 7000 ft., and the elevation is nowhere much below 5000 ft. Parallel to this successive hill ranges run north and south. Mountainous country so greatly predominates that the forested area are but as islands in a sea of rugged hills. The chief rivers, tributaries of the Salween, are the Nam Hka, the Hwe Lông, Nam Pu, and the Nam Hsîm. The first and last are very considerable rivers. The Nam Hîka rises in the Wa or Vû states, the Nam Hsîm on the watershed range in the centre of the state. Rocks and rapids make both unnavigable, but much timber goes down the Nam Hsîm. The lower part of both rivers forms the boundary of Kêng Tùng state. The chief tributaries of the Mekong are the Nam Ngâ, the Nam Lwe, the Nam Yawg, Nam Lîn, Nam Hôk and Nam Kôk. Of these the chief is the Nam Lwe, which is navigable in the interior of the state, but elsewhere is a fast-running river. The Nam Hîka and Nam Hsîm are also considerable streams. The lower course of the latter passes by Chieng Rai in Siamese territory. The lower Nam Hôk or Mê Huak forms the boundary with Siam.

The existence of minerals was reported by the sawbwa, or chief, to Francis Garnier in 1867, but none is worked or located. Gold is believed to exist in most of the forests. There are extensive teak forests on the slopes of the Nam Ngâ, and Mông Hâst, and the sawbwa works them as government contracts. One-third of the price realized from the sale of the logs at Moulemîn is retained as the government royalty. There are teak forests also in the Mekong drainage area in the south of the state, but there is only a local market for the timber. Rice, as elsewhere in the Shan States, is the chief crop. Next to it is sugar-cane, grown both as a field crop and in gardens. Earth-outs and tobacco are the only other field crops in the valleys. On the hills, besides rice, cotton, poppy and tea are the chief crops. The tea is carelessly grown, badly prepared, and only consumed locally. A great deal of garden produce is raised in the valleys, especially near the capital. The state is rich in cattle, and exports them to the country west of the Salween. Cotton and opium are exported in large quantities, the former entirely to China, a good deal of the latter to northern Siam, which also takes shoes and sandals. Tea is carried through outlets to Kêng Hûng, and silk from the Siamese Shan States. Cotton and silk weaving are dying out as industries. Large quantities of shoes and slippers are made of buffalo and bullock hide, with Chinese felt uppers and soft iron hobnails. There is a good deal of pottery work. The chief work in iron is the manufacture of guns, which has been carried on for many years in certain villages of the Sam Tao district. There are small textiles and thread-woven rugs, but the work is durable. The revenue of the state is collected as the Burmese that has the value of about 1,500,000 kyats (C. 200,000). In turn, these revenues were converted into tribute. For the quinquennial period 1903-1908 the state paid Rs. 30,000 (2600) annually.
The population of the state was enumerated for the first time in 1901, giving a total of 190,658. According to an estimate made by Mr G. C. Stirling, the political officer in charge of the state, in 1897–1898, of the various tribes of Shans, the Hlun and Li contribute about 21,000, the Lems and Shans about 7000, and the Chinese Shans about 5000. Of the hill tribes, the Kaw or Aka are the most homogeneous with 22,000, but probably the Wa (or Wi), disguised under various tribal names, are at least equally numerous and build huts make up a total of 36,000, and the remainder are classed as animists. Spirit-worship is, however, very conspicuously prevalent among all classes even of the Shan, and is common to all his pacts and customs. The British government on the 9th of February 1897. The early history of Keng Tong is very obscure, but Burmese influence seems to have been maintained since the latter half, at any rate, of the 16th century. The lowland area of lands in ruins is between the 2nd and 3rd centuries, and it is the opinion of the Chinese that they have taken the capital in 1765–66, but were driven out by the united Shan and Burmese troops. The same fate seems to have attended the first Siam invasion in 1804. The second and third Siamese invasions in 1852 and 1854, resulted in great disaster to the invaders, though the capital was invested for a time. Keng Tong, the capital, is situated towards the southern end of a valley about 12 m. long and with an average breadth of 7 m. The town is surrounded by a brick wall and moat about 5 m. round. Only the central and northern portions are much built over. Pop. (1901), 1905. It is the most considerable town in the British Shan States. In the town crowds of market people crowd towards to Shan custom every five days, and numerous caravans come from China. The military post formerly was 7 m. west of the town, at the foot of the old wall. The headquarters of a regiment of regulars was stationed there; this was reduced to a garrison and recently to military police. The site was badly chosen and proved very unhealthy, and the headquarters both military and civil have been moved to Long Loi, 5 m. north and 12 m. south of the capital. The rainfall probably averages between 50 and 60 in. for the year. The temperature seems to rise to nearly 100° F. during the hot weather, falling 30° or more during the night. In the cold weather a temperature of 40° or a few degrees more or less appears to be the lowest experienced. The plain in which the capital stands has an altitude of 3000 ft. (J. G. Sc.)

KENILWORTH, a market town in the Rugby parliamentary division of Warwickshire, England; pleasantly situated on a tributary of the Avon, on a branch of the London & North-Western railway, 50 m. N.W. from London. Pop. of urban district (1901), 4544. The town is only of importance from its antiquarian interest and the magnificent ruins of its old castle. The walls originally enclosed an area of 7 acres. The principal portions of the building remaining are the gatehouse, now used as a dwelling-house; Caesar's tower, the only portion built by Geoffrey de Clinton now extant, with massive walls 16 ft. thick; the base of the tower of St. John's Chapel; the gateway of the de Gaunt family by John of Gaunt with windows of very beautiful design; and the Leicesters buildings, which are in a very ruinous condition. Not far from the castle are the remains of an Augustinian monastery founded in 1172, and afterwards made an abbey. Adjoining the abbey is the parish church of St Nicholas, restored in 1865, a structure of mixed architecture, containing a fine Norman doorway, which is supposed to have been the entrance of the former abbey church.

Kenilworth (Chinewer, Kenilwarda, Kinshoppinga, Kenil-  lord, Kiltingworth) is said to have been a member of Stoneleigh before the Norman Conquest and a possession of the Saxon kings, whose royal residence there was destroyed in the wars between Edward and Canute. The town was granted by Henry I. to Geoffrey de Clinton, a Norman who built the castle round which the whole history of Kenilworth centres. He also founded a monastery here about 1122, and afterwards made an abbey. Adjoining the abbey is the parish church of St Nicholas, restored in 1865, a structure of mixed architecture, containing a fine Norman doorway, which is supposed to have been the entrance of the Kenilworth abbey church.

The famous "Dictum of Kenilworth" was proclaimed here in 1266. After the battle of Evesham the rebel forces rallied at the castle, which, after a siege of seven months, was surrendered, and the rebel leaders were imprisoned there. The king then granted it to his son Edmund. Through John of Gaunt it came to Henry IV, and was granted by Elizabeth in 1562 to Robert Dudley, afterwards Earl of Leicester, but on his death in 1588 again merged in the possessions of the crown. The earl spent large sums on restoring the castle and grounds, and here in July 1575 he entertained Queen Elizabeth at "an excessive cost," as described in Scott's Kenilworth. On the queen's first entry "a small floating island illuminated by a great variety of torches... made its appearance upon the lake," upon which, clad in silks, were the Lady of the Lake and two nymphae waiting on her, and for the several days of her stay "very rare shews and sports were there exercised.

During the civil wars the castle was dismantled by the soldiers of Cromwell and was from that time abandoned to decay. The only mention of Kenilworth as a borough occurs in a charter of Henry I. to Geoffrey de Clinton and in the charters of Henry I. and Henry II. to the church of St Mary of Kenilworth confirming the gift of the land. Titled persons are mentioned as holding the castle that he kept the land in which his castle was situated and also land for making his borough, park and fishpond. The town possesses large tanneries.

Kenites, in the Bible a tribe or clan of the south of Palestine, closely associated with the Amalekites, whose hostility towards Israel, however, it did not share. On this account Saul spared them when bidden by Yahweh to destroy Amalek; David, too, whilst living in Judah, appears to have been on friendly terms with them (1 Sam. xvi. 23, xxx. 20). Moses himself refers to the Kenites as "people of A Beth-

Kaw or Aka, the most homogeneous with 22,000, but probably the Wa (or Wi), disguised under various tribal names, are at least equally numerous and build huts make up a total of 36,000, and the remainder are classed as animists. Kenilworth (Chinewerd, Kenilwarda, Kinelingwortha, Kenil- lord, Killingworth) is said to have been a member of Stone-
created Viscount Kenmure in 1633. The family had generally adhered to the Presbyterian cause, but Robert, the 4th viscount, had been excepted from the annually given to the Scottish rolavists in 1644, and the 5th viscount, who had succeeded his kinsman Robert in 1663, after some vacillation, had joined the court of the exiled Stuarts. The 6th viscount's adherence to the Pretender in 1715 is said to have been due to his wife Mary Dalzell (d. 1776), sister of Robert, 6th earl of Carnwath. He raised the royal standard of Scotland at Lochmaben on the 12th of October 1715, and was joined by about two hundred gentle- men, with Carnwath, William Maxwell, 5th earl of Nithsdale, and George Seton, 5th earl of Winton. This small force received some reinforcements before Kenmure reached Hawick, where he learnt the news of the English rising. He effected a junction with Thomas Forster and James Radclyffe, 3rd earl of Derwentwater, at Rothbury. Their united forces of some fourteen hundred men, after a series of rather aimless marches, halted at Kelso, where they were reinforced by a brigade under William Mackintosh. Threatened by an English army under General George Carpenter, they eventually crossed the English border to join the Lancashire Jacobites, and the command was taken over by Forster. Kenmure was taken prisoner at Preston on the 13th of November, and was sent to the Tower. In the following January he was tried with other Jacobite noblemen before the House of Lords, when he pleaded guilty, and appealed to the king's mercy. Immediately before his execution on Tower Hill on the 24th of February he reiterated his belief in the claims of the Pretender. His estates and titles were forfeited, but in 1824 an act of parliament repealed the forfeiture, and his direct descendant, John Gordon (1750-1849), became Viscount Kenmure. On the death of the succeeding peer, Adam, 8th viscount, without issue in 1847, the title became dormant.

KENNEDY, the name of a famous and powerful Scottish family long settled in Ayrshire, derived probably from the name Kenneth. Its chief seat is at Culzean, or Colzean, near Maybole in Ayrshire.

A certain Duncan who became earl of Carrick early in the 13th century is possibly an ancestor of the Kennedys, but a more certain ancestor is John Kennedy of Dunure, who obtained Cassillis and other lands in Ayrshire about 1350. John's descendant, Sir James Kennedy, married Mary, a daughter of King Robert III. and his son, Sir Gilbert Kennedy, was created Lord Kennedy before 1458. Another son was James Kennedy (c. 1400-1465), bishop of Stirling, whose grandson was created earl of Cassillis. John died in 1465. The bishop founded and endowed St. Salvator's college at St Andrews and built a large and famous ship called the "St Salvator." Andrew Lang (History of Scotland, vol. i.) says of him, "The chapel which he built for his college is still throned by the scarlet gowns of his students; his arms endure on the oaken doors; the beautiful silver mace of his gift, wrought in Paris, and representing all orders of spirits in the universe, is one of the few remaining relics of ancient Scottish plate." Before the bishop had begun to assist in ruling Scotland, a kinsman, Sir Hugh Kennedy, had helped Joan of Arc to drive the English from France.

One of Gilbert Kennedy's sons was the poet, Walter Kennedy (q.v.), and his grandson David, third Lord Kennedy (killed at Flodden, 1513), was created earl of Cassillis before 1510; David's sister Janet 'Kennedy' was one of the mistresses of James IV. The earl was succeeded by his son Gilbert, a prominent figure in the history of Scotland from 1513 until he was killed at Preston in the 22nd of December 1527. His son Gilbert, the 3rd earl (c. 1517-1558), was educated by George Buchanan, and was a prize pupil; and after the rout of Solway Mains in 1542. He was soon released and was lord high treasurer of Scotland from 1554 to 1558, although he had been intriguing with the English and had offered to kill Cardinal Beaton in the interests of Henry VIII. He died somewhat mysteriously at Dieppe late in 1558 when returning from Paris, where he had attended the marriage of Mary Queen of Scots, and the dauphin of France. He was the father of the "king of Carrick" and the brother of Quintin Kennedy (1520-1564), abbot of Crossraguel. The

rabbit wrote several works defending the doctrines of the Roman Catholic Church, and in 1562 had a public discussion on these questions with John Knox, which took place at Maybole and lasted for three days. He died on the 22nd of August 1564. Gilbert Kennedy, 4th earl of Cassillis (c. 1541-1576), called the "king of Carrick," became a protestant, but fought for Queen Mary at Langside in 1568. He is better known through his cruel treatment of Allan Stewart, the declarator abbot of Crossraguel, Stewart being badly burned by the earl's orders at Dunure in 1570 in order to compel him to renounce his title to the abbey lands which had been seized by Cassillis. This "ane weary greedy man" died at Edinburgh in December 1576. His son John (c. 1567-1615), who became the 5th earl, was lord high treasurer of Scotland in 1599 and his lifetime wit- nessed the culmination of a great feud between the senior and a younger branch of the Kennedy family. He was succeeded as 6th earl by his nephew John (c. 1595-1668), called "the grave and solemn earl." A strong presbyterian, John was one of the leaders of the Scots in their resistance to Charles I. In 1643 he went to the Westminster Assembly of Divines and several times he was sent on missions to Charles I. and to Charles II.; for a time he was lord justice general and he was a member of Cromwell's council of state. His son, John, became the 7th earl, and one of his daughters, Mary, married Donato Lagostina, later archbishop of Salerno. This lady was the mother of Sir John Kennedy, 8th earl, who became bishop of Salisbury. His first wife, Jean (1607-1642), daughter of Thomas Hamilton, 1st earl of Haddington, has been regarded as the heroine of the ballad "The Gypsy Laddie," but this identity is now completely disproved. John, the 7th earl, "the heir," says Burnet, "to his father's stiess, but not to his other virtues," supported the revolution of 1688 and died on the 23rd of July 1701; his grandson the 8th earl, died without sons in August 1759.

The titles and estates of the Kennedys were now claimed by William Douglas, afterwards duke of Queensberry, a great-grandson in the female line of the 7th earl and also by Sir Thomas Kennedy, Bart., of Culzean, a descendant of the 3rd earl, i.e. by the heir general and the heir male. In January 1762 the House of Lords decided in favour of the heir male, and Sir Thomas became the 9th earl of Cassillis. He died unmarried on the 30th of November 1775, and his brother David, the 10th earl, also died unmarried on the 18th of December 1792, when the baronetcy became extinct. The earldom of Cassillis now passed to a cousin, Archibald Kennedy, a captain in the royal navy, whose father, Sir John Kennedy, 4th earl (1770-1846), had migrated to America in 1722 and had become erectoer of customs when he was appointed the 11th earl, had estates in New Jersey and married an American heiress; in 1765 he was said to own more houses in New York than any one else. He died in London on the 30th of December 1794, and was succeeded by his son Archibald (1770-1846), who was created Baron Ailsa in 1806 and marquess of Ailsa in 1831. His great-grandson Archibald (b. 1847) became 3rd marquess.

See the article in vol. ii. of Sir R. Douglas's Peerage of Scotland, edited by Sir J. B. Paul (1906). This is written by Lord Ailsa's son and heir, Archibald Kennedy, earl of Cassillis (b. 1872).

KENNEDY, BENJAMIN HALL (1804-1889), English scholar, was born at Summer Hill, near Birmingham, on the 6th of November 1804, the eldest son of Rann Kennedy (1772-1851), who came of a branch of the Ayrshire family which had settled in Staffordshire. Rann Kennedy was a scholar and man of letters, several of whose sons rose to distinction. B. H. Kennedy was educated at Birimingham and Shrewsbury schools, and St John's College, Cambridge. After a brilliant university career he was elected fellow and classical lecturer of St John's College in 1828. Two years later he became an assis- tant master at Harrow under Mr. Forster, and head master in 1836. He retained this post until 1866, the thirty years of his rule being marked by a long series of successes won by his pupils, chiefly in classics. When he retired from Shrews- bury a large sum was collected as a testimonial to him, and was devoted partly to the new school buildings and partly to the founding of a Latin professorship at Cambridge. The first two occupants of the chair were both Kennedy's old pupils, H. A. J.
Munro and J. E. B. Mayor. In 1867 he was elected regius professor of Greek at Cambridge and canon of Ely. From 1870 to 1882 he was a member of the committee for the revision of the New Testament. He was an enthusiastic advocate for the admission of women to a university education, and took a prominent part in the establishment of Newnham and Girton colleges. He was also a keen politician of liberal sympathies. He died near Torquay on the 6th of April 1880. Among a number of classical school-books published by him are two, a Public School Latin Primer and Public School Latin Grammar, which were for long in use in nearly all English schools.

His other chief works are: Sophocles, Oedipus Tyrannus (2nd ed. 1868); Aristophanes, Birds (1873); Aeschylus. Agamemnon (2nd ed., 1882), with introduction, metrical translation and notes; a commentary on Virgil (3rd ed., 1881); and a translation of Plato, Theaetetus (1881). He contributed largely to the collection known as Sabiniena Corolla, and published a collection of verse in Greek, Latin and English under the title of Between Whiles (2nd ed., 1882), with many autobiographical details.

His brother, Charles Rann Kennedy (1808-1867), was educated at Shrewsbury school and Trinity College, Cambridge, where he graduated as senior classic (1831). He then became a barrister of the Inner Temple, 1831-1835, and was called to the bar at Queen's College, Birmingham. As adviser to Mrs Swinem, the plaintiff in the celebrated will case Swinen v. Swinen (1856), he brought an action for remuneration for professional services, but the verdict given in his favour at Warwick assizes was set aside by the court of Common Pleas, on the ground that a barrister could not sue for the recovery of his fees.

The excellence of Kennedy's scholarship is abundantly proved by his translation of the orations of Demosthenes (1852-1863, in Both's Classical Library), and his blank verse translation of the works of Virgil (1861). He was also the author of New Rules for Pleading (2nd ed., 1841) and A Treatise on Annuities (1840).

He died in Birmingham on the 17th of December 1867.

Another brother, Rev. William James Kennedy (1814-1891), was a prominent educationalist, and the father of Lord Justice Sir William Rann Kennedy (b. 1846), himself a distinguished Cambodge scholar.

KENNEDY, THOMAS FRANCIS (1786-1879), Scottish politician, was born near Ayr in 1788. He studied for the bar and became advocate in 1811. Having been elected M.P. for the Ayr burghs in 1818, he devoted the greater part of his life to the promotion of a liberal reform of the British constitution. He was a founder of the Free Church in Scotland, and a member of the Free Church Kirk in 1843. He was a prominent supporter of the Repeal of the corn laws, and in 1848 he transported the relics of St Columba to a church which he had constructed at Scone. He is said also to have carried out six invasions of Northumbria, in the course of which he burnt Dunbar and took Melrose. According to the Scalacronica of Sir Thomas Gray he drove the Angles and Britons over the Tweed, reduced the land as far as that river, and first called his kingdom Scotland.

In his reign there appears to have been a serious invasion by Danish pirates, in which Cluny and Dunkeld were burnt. He died in 860 or 862, after a reign of twenty-eight years, at Forteviot and was buried at Iona. The double claims are due to a contest of authorities. Twenty-eight years is the accepted length of his reign, and according to the chronicle of Henry of Huntingdon it began in 832. The Pictish Chronicle, however, gives Tuesday, the 13th of February as the day, and this suits 862 only, in which case his reign would begin in 834.

KENNETH II. (d. 993), son of Malcolm I, king of Alban, succeeded Cusleán, son of Indulf, who had been slain by the Britons of Strathclyde in 971 in Lothian. Kenneth began his reign by levelling the Pictish state of the Picts of Strathclyde, but he lost a large part of his force on the river Conon. Soon afterwards he attacked Eadulf, earl of the northern half of Northumbria, and ravaged the whole of his territory. He fortified the fords of the Forth as a defence against the Britons and again invaded Northumbria, carrying off the earl's son. About this time he gave the city of Brechin to the church. In 977 he is said to have slain Amlaith or Olaf, son of Indulf, king of Alban, perhaps a rival claimant.
to the throne. According to the English chroniclers, Kenneth paid homage to King Edgar for the cession of Lothian, but these statements are probably due to the controversy as to the position of Scotland. The *mormaers*, or chiefs, of Kenneth were engaged throughout his reign in a contest with Sigurd the Norwegian, earl of Orkney, for the possession of Caithness and the northern district of Scotland as far south as the Spey. In this struggle the Scots attained no permanent success. In 995 Kenneth, whose strength like that of the other kings of his branch of the race, the Suenoer Kings, was chiefly north of the Tay, was slain treacherously by his own subjects, according to the later chroniclers at Fettercarn in the Mearns through an intrigue of Einvela, daughter of the earl of Angus. He was buried at Iona.

See *Chronicles of the Picts and Scots*, ed. W. F. Skene (Edinburgh, 1867); and W. F. Skene, *Celtic Scotland* (Edinburgh, 1876).

KENNED, WHITE (1660-1728), English bishop and antiquary, was born at Dover in August 1660. He was educated at Westminster school and at St Edmund's Hall, Oxford, where, while an undergraduate, he published several translations of Latin authors, including *In Praise of Folly*. In 1685 he became vicar of Ambrosden, Oxfordshire. A few years after he returned to London to become tutor and vice-principal of St Edmund's Hall, where he gave considerable impetus to the study of antiquities. George Hickes gave him lessons in Old English. In 1693 he published *Parochial Antiquities*. In 1700 he became rector of St Botolph's, Aldgate, London, and in 1701 archdeacon of Huntingdon. For a eulogistic sermon on the first duke of Devonshire he was in 1707 recommended to the deanship of Peterborough. He afterwards joined the Low Church party, strongly supported Bishop Burnet's and Masaniello's Bangorian controversy supported with great zeal and considerable bitterness the side of Bishop Hoadly. His intimacy with Charles Trimmell, bishop of Norwich, who was high in favour with the king, secured for him in 1718 the bishopric of Peterborough. He died at Westminster in December 1728.

Kennett published in 1698 an edition of Sir Henry Spelman's *History of Sacrilege*, and he was the author of fifty-seven printed works, chiefly tracts and sermons. He wrote the third volume (Charles I.-Anne) of the composite *Complete History of England* (1706), and a more detailed and valuable Register and Chronicle of the Restoration. He was much interested in the Society for the Propagation of the Gospel.

In 1732 he published *The Life of Bishop White Kennett*, by the Rev. William Newton (anonymous), appeared in 1730. See also Nicholls's *Literary Anecdotes*, and I. Dismall's *Calamities of Authors*.

KENNEDY, JAMES (1780–1840), English dramatist, was the son of James Kennedy, one of the founders of Boodle's Club in London. His first play, a farce called *Raising the Wind* (1803), was a success owing to the popularity of the character of "Jeremy Diddler." Kennedy produced more than forty dramas and operas between 1803 and 1849, and many of his pieces, in which Mrs Siddons, Madame Vestris, Foote, Lewis, Liston and other leading players appeared from time to time, enjoyed a considerable vogue. His most popular play was *Sweethearts and Wives*, produced at the Haymarket theatre in 1823, and several times afterwards revived; and among the most successful of his other works were: *False Alarms* (1807), a comic opera with music by Brahman; *Love, Law and Physic* (1812); *Spring and Autumn* (1827); *The Illustrious Stranger, or Married and Buried* (1827); *Masaniello* (1828); *The Sicilian Vespers*, a tragedy (1840). Kenney, who numbered Charles Lamb and Samuel Rogers among his friends, died in London on the 29th of July 1840. He married the widow of the dramatist Thomas Holcroft, by whom he had two sons and two daughters.

His second son, CHARLES LAMB KENNE (1823–1881), made a name as a journalist, dramatist and miscellaneous writer. Commencing life as a clerks in the General Post Office in London, he joined the staff of *The Times*, to which paper he contributed dramatic criticism. In 1856, having been called to the bar, he became secretary to Ferdinand de Lesseps, and in 1857 he published *The Gates of the East* in support of the projected construction of the Suez Canal. Kenney wrote the words for a number of light operas, and was the author of several popular songs, the best known of which were "Soft and Low" (1865) and "The Vagabond" (1871). He also published a *Memoir of M. W. Balfe* (1875), and translated the *Correspondence of Balzac*. He included Thackeray and Dickens among his friends in a literary coterie in which he enjoyed the reputation of a wit and an accomplished writer of *vers de société*. He died in London on the 23rd of August 1881.

KENNIGOTT, GUSTAV ADOLPH (1818–1897), German mineralogist, was born at Breslau on the 6th of January 1818. After being employed in the Hofmineralien Cabinet at Vienna, he became professor of mineralogy in the university of Zürich. He was distinguished for his researches on mineralogy, crystallography and petrology. He died at Lugano, on the 7th of March 1897.

KENNIGOTT, BENJAMIN (1718–1783), English divine and Hebrew scholar, was born at Totnes, Devonshire, on the 4th of April 1718. He succeeded his father as master of a charity school, but by the liberality of friends he was enabled to go to Wadham College, Oxford, in 1744, where he distinguished himself in Hebrew and divinity. While an undergraduate he published two dissertations, *On the Tree of Life in Paradise; Offices and Observations on the Bahir Man*, and *On the Observations of Gais and Abd* (2nd ed., 1747), which procured him the honour of a bachelor's degree before the statutory time. In 1747 he was elected fellow of Exeter College, and in 1750 he took his degree of M.A. In 1764 he was made a fellow of the Royal Society, and in 1767 keeper of the Radcliffe Library. He was also canon of Christ Church (1770) and rector of Culham (1753), in Oxfordshire, and was subsequently presented to the living of Menheniot, Cornwall, which he was unable to visit and resigned two years before his death. He died at Oxford, on the 18th of September 1783.

His chief work is the *Vetus Testamentum hebraicum cum varii locutionibus* (2 vols. fol., Oxford, 1776–1780). Before this appeared he had written two dissertations entitled *The State of the Printed Hebrew Text of the Old Testament considered*, published respectively in 1753 and 1759, with an appendix, in which he identified "the absolute integrity" of the received Hebrew text. The first contains a "comparison of 1 Chron. xi. with 2 Sam. v. and xxii. and observations on seventy MSS., with an extract of mistakes in each of the leading and chief MSS., and a large table of readings..." The second, *A critical examination of the printed copies of the Chaldee paraphrase*, gives an account of Hebrew MSS. of the Bible known to be extant, and catalogues one hundred MSS. preserved in the British Museum and in the libraries of Oxford and Cambridge. In 1760 he issued his proposals for collating all Hebrew MSS. of date prior to the invention of printing. Subscriptions to the amount of nearly £10,000 were obtained, and many learned men addressed themselves to the work of collation, Bruns of Helmstading himself specially useful as regarded MSS. in Germany, Switzerland and Italy. Between 1760 and 1769 ten "annual accounts" of the progress of the work were given, and in its final state 52 printed editions of the Bible were either wholly or partially collated, and use was made also (but often very perfunctorily) of the quotations in the Talmud. The materials thus collected, when properly arranged and made ready for the press, extended to 300 fol. The text finally followed in printing was that of Van der Hoocht—unpointed however, the points having been disregarded in the collation—and the various readings were given at the foot of the page. The Samaritan Pentateuch stands alongside the Hebrew in parallel columns. The *Dissertatio generalis*, appended to the second volume, contains an account of the MSS. and other authorities on the Pentateuch, divided into periods, and beginning with the formation of the Hebrew canon after the return of the Jews from the exile. Kennicott's great work was in one sense a failure. It yielded no materials of value to the study of the Hebrew text, and the volume points overlooked the one thing in which some result (grammatical if not critical) might have been derived from collation of Massoretic MSS. But the negative result of the publication and of the *Variae
Kenisco's work was perpetuated by his widow, who founded two university scholarships at Oxford for the study of Hebrew. The fund yields an income of £200 per annum.

KENNINGTON, a district in the south of London, England, within the municipal borough of Lambeth. There was a royal palace here until the reign of Henry VII. Kennington Common, now represented by Kennington Park, was the site of a gallows until the end of the 18th century, and was the meeting-place appointed for the great Chartist demonstration of the 10th of April 1848. Kennington Oval is the ground of the Surrey County Cricket Club. (See LAMBETH.)

KENORA (formerly RAT PORTAGE), a town and port of entry in Ontario, Canada, and the chief town of Rainy River district, situated at an altitude of 1887 ft. above the sea. Pop. (1891), 1860; (1901) 5222. It is 133 m. by rail east of Winnipeg, on the Canadian Pacific railway, and at the outlet of the Lake of the Woods. The Winnipeg river has at this point a fall of 65 ft., which, with the lake as a reservoir, furnishes an abundant and unfailing water-power. The industrial establishments comprise reduction works, saw-mills and flour-mills, one of the latter being the largest in Canada. It is the distributing point for the gold mines of the district, and during the summer months steamboat communication is maintained on the lake. There is important sturgeon fishing.

KENOSHA, a city and the county-seat of Kenosha county, Wisconsin, U.S.A., on the S.W. shore of Lake Michigan, 35 m. S. of Milwaukee, and 15 m. N.E. of Chicago. Pop. (1870) 1129, of whom 3333 were foreign-born; (1910), 21,371. It is served by the Chicago & North-Western railway, by inter-urban electric lines connecting with Chicago and Milwaukee, and by freight and passenger steamship lines on Lake Michigan. It has a good harbour and a considerable lake commerce. The city is situated on high bluffs above the lake, and is widely known for its healthiness. At Kenosha is the Gilbert M. Simmons library, with 19,300 volumes in 1908. Just south of the city is Kemper Hall, a Protestant Episcopal school for girls, under the charge of the Sisters of St Mary, opened in 1870 as a memorial to Jackson Kemper (1789-1852), missionary bishop (1835-1859), and the first bishop of Wisconsin (1854-1870) of the Protestant Episcopal Church. Among Kenosha’s manufactures are brass and iron beds (the Simmons Manufacturing Co.), mattresses, typewriters, leather and brass goods, wagons, and automobiles—the “Rambler” automobile being made at Kenosha by Thomas B. Jeffery and Co. There is an extensive sole-leather tannery. The total value of the factory product in 1905 was $42,562,600, the city ranking third in product value among the cities of the state. Kenosha, originally known as Southport, was settled about 1834, organized as the village of Southport in 1842, and chartered in 1850 as a city under its present name.

KENSETT, JOHN FREDERICK (1818-1872), American artist, was born in Cheshire, Connecticut, on the 22nd of March 1818. After studying engraving he went abroad, took up painting, and exhibited at the Royal Academy, London, in 1845. In 1849 he was elected to the National Academy of Design, New York, and in 1859 he was appointed a member of the committee to superintend the decoration of the United States Capitol at Washington, D.C. After his death the contents of his studio realized at public auction over $550,000. He painted landscapes more or less in the manner of the Hudson River School.

KENINGTON, a western metropolitan borough of London, England, bounded N.E. by Paddington, and the city of Westminster, S.E. by Chelsea, S.W. by Fulham, N.W. by Hammersmith, and extending N. to the boundary of the county of London. Pop. (1901), 176,628. It includes the districts of Kensal Green (partly) in the north, Notting Hill in the north-central portion, Earl’s Court in the south-west, and Brompton in the south-east. A considerable but indefinite area adjoining Brompton is commonly called South Kensington; but the area known as West Kensington is within the borough of Fulham.

The name appears in early forms as Chenesitun and Kenesilune. Its origin is obscure, and has been variously connected with a Saxon royal residence (King’s town), a family of the name of Chesni, and the word caen, meaning wood, from the forest which originally covered the district and was still traceable in Tudor times. The most probable derivation, however, founds the name a connection with the Saxon tribe or family of Kensigs. The history of the manor is traceable from the time of Edward the Confessor, and after the Conquest it was held of the Bishop of Coutances by Aubrey de Vere. Soon after this it became the absolute property of the de Veres, who were subsequently created Earls of Oxford. The place of the manorial courts is preserved in the name of the modern district of Earl’s Court. With a few short intervals the manor continued in the direct line until Tudor times. There were also three sub-manors, one given by the first Aubrey de Vere early in the 13th century to the Abbey of Abingdon, whence the present parish church is called St Mary Abbots; while in another, Knotting Barnes, the origin of the name Notting Hill is found.

The brilliant period of history for which Kensington is famous may be dated from the settlement of the Court here by William III. The village, as it was then, had a reputation for healthiness through its gravel soil and pure atmosphere. A mansion standing on the western flank of the present Kensington Gardens had been the seat of Heneage Finch, Lord Chancellor and afterwards Earl of Nottingham. It was known as Nottingham House, but the name is derived from the small yard from which it is separated by a high wall. Ironically, the name of avoiding residence in London as he suffered from asthma, it became known as Kensington Palace. The extensive additions and alterations made by Wren according to the taste of the King resulted in a severely plain edifice of brick; the orangerie, added in Queen Anne’s time, is a better example of the same architect’s work. In the palace died Mary, William’s consort, William himself, Anne and George II., whose wife Caroline did much to beautify Kensington Gardens, and formed the beautiful lake called the Serpentine (1735). But a higher interest attaches to the palace as the birthplace of Queen Victoria in 1819; and the last state coach to which the Queen was conveyed is preserved in the palace. The young Victoria was dressed in an apron by her order, towards the close of her life, the palace became open to the public.

Modern influences, one of the most marked of which is the widespread erection of vast blocks of residential flats, have swept away much that was reminiscent of the historical connexions of the “old court suburb.” Kensington Square, however, lying south of High Street in the vicinity of St Mary Abbots church, still preserves some of its picturesque houses, nearly all of which were formerly inhabited by those attached to the court; it numbered among its residents Addison, Talleyrand, John Stuart Mill, and Green the historian. In Young Street, opening from the Square, Thackeray lived for many years. His house here, still standing, is most commonly associated with his work, though he subsequently moved to Onslow Square and to Palace Green. Another link with the past is found in Holland House, hidden in its beautiful park north of Kensington Road. It was built by Sir Walter Cope, lord of the manor, in 1607, and obtained its present name on coming into the possession of Henry Rich, earl of Holland, through his marriage with Cope’s daughter. He extended and beautified the mansion. General Fairfax and General Lambert are mentioned as occupants after his death, and later the property was let, William Penn of Pennsylvania being among those who leased it. Addison, marrying the widow of the 6th earl, lived here until his death in 1719. During the tenancy of Henry Fox, third Lord Holland (1773-1840), the house gained a European reputation as a meeting-place of statesmen and men of letters. The formal gardens of Holland House are finely laid out, and the rooms of the house are both beautiful in themselves and enriched with collections of pictures, china and tapestries. Famous houses no longer standing were Campbell House, in the district north-west of the parish church, formerly known as the Gravel Pits; and Gore House, on the site
of the present Albert Hall, the residence of William Wilberforce, and later of the countess of Blessington.

The parish church of St Mary Abbots, High Street, occupies an ancient site, but was built from the designs of Sir Gilbert Scott in 1869. It is in Decorated style, and has one of the loftiest spires in England. In the north the borough includes the cemetery of Kensal Green (with the exception of the Roman Catholic portion, which is in the borough of Hammersmith); it was opened in 1838, and great numbers of eminent persons are buried here. The Roman Catholic Church of Our Lady of Victories lies close to Kensington Road, and in Brompton Road is the Oratory of St Philip Neri, a fine building with richly decorated interior, noted for the beauty of its musical services, as is the Carmelite Church in Church Street. St Charles's Roman Catholic College (for boys), near the north end of Ladbroke Grove, was founded by Cardinal Manning in 1863; the buildings are now used as a training centre for Catholic school mistresses. Of secular institutions the principal are the museums in South Kensington. The Victoria and Albert, commonly called the South Kensington Museum, contains various sections divided into sections, and includes the buildings of the Royal College of Science. Close by is the Natural History Museum, in a great building by Alfred Waterhouse, opened as a branch of the British Museum in 1880. Near this stood Cromwell House, erroneously considered to have been the residence of Oliver Cromwell, the name of which survives in the adjacent Cromwell Road. In Kensington Gardens, near the upper end of Exhibition Road, which separates the two museums, was held the Great Exhibition of 1851, the hall of which is preserved as the Crystal Palace at Sydenham. The greater part of the gardens, however, with the Albert Memorial, erected by Queen Victoria in memory of Albert, prince consort, the Albert Hall, opposite to it, one of the principal concert-halls in London, and the Imperial Institute to the south, are actually within the city of Westminster, though commonly connected with Kensington. The gardens (275 acres) were laid out in the time of Queen Anne, and have always been a popular and fashionable place of recreation. Extensive grounds at Earl's Court are open from time to time for various exhibitions. Further notable buildings in Kensington are the town-hall and free library in High Street, which is also much frequented for its excellent shops, and the Brompton Divi-

cision Hospital, Fulham Road. In Holland Park Road is the house of Lord Leighton (d. 1896), given to the nation, and open, with its art collection, to the public.

Kensington is a suffragan bishopric in the diocese of London. The parliamentary borough of Kensington has north and south divisions, each returning one member. The borough council consists of a mayor, 10 aldermen and 60 councillors. Area, 2291.1 acres.

KENT, EARLS OF. The first holder of the English earldom of Kent was probably Odo, bishop of Bayeux, and the second a certain William de Ypres (d. 1162), both of whom were deprived of the dignity. The regent Hubert de Burgh obtained this honour in 1227, and in 1321 it was granted to Edmund Plantagenet, the youngest brother of Edward II. Edmund (1301-1330), who was born at Woodstock on the 5th of August 1301, received many marks of favour from his brother the king, whom he steadfastly supported until the last act in Edward's life opened in 1326. He fought in Scotland and then in France, and was a member of the council when Edward III. became king in 1327. Soon at variance with Queen Isabella and her lover, Roger Mortimer, Edmund was involved in a conspiracy to restore Edward II., who he was led to believe was still alive; he was arrested, and beheaded on the 19th of March 1330. Although he had been condemned as a traitor his elder son Edmund (c. 1327-1333) was recognized as earl of Kent, the title passing on his death to his brother John (c. 1330-1352).

After John's childless death the earldom appears to have been held by his sister Joan, "the fair maid of Kent," and in 1360 Joan's husband, Sir Thomas de Holand, or Holland, was summoned to parliament as earl of Kent. Holand, who was a soldier of some repute, died in Normandy on the 28th of December 1360, and his widow married Edward the Black Prince, by whom she was the mother of Richard II. The next earl was Holand's eldest son Thomas (1350-1357), who was marshal of England from 1358 to 1385, and was in high favour with his half-brother, Richard II. The 3rd earl of Kent of the Holand family was his son Thomas (1374-1400). In September 1397, a few months after becoming earl of Kent, Thomas was made duke of Surrey as a reward for assisting Richard II. against the lords appellant; and on the 11th of February 1398, he was created Duke of Kent and Holand, a dukedom in which he beheaded in January of the following year for conspiring against Henry IV. However, his brother Edmund (1384-1408) was allowed to succeed to the earldom, which became extinct on his death in Brittany in September 1408.

In the same century the title was revived in favour of William, a younger son of Ralph Neville, 1st earl of Westmorland, and through his mother Joan Beaufort a grandson of John of Gaunt, duke of Lancaster. William (c. 1405-1463), who held the barony of Fauconberg in right of his wife, Joan, gained fame during the wars in France and fought for the Yorkists during the Wars of the Roses. His prowess is said to have been chiefl}' responsible for the victory of Edward IV. at Towton in March 1461, and soon after this event he was created earl of Kent and admiral of England. He died in January 1463, and, as his only legitimate issue were three daughters, the title of earl of Kent again became extinct. Neville's natural son Thomas, "the bastard of Faucon-
berq" (d. 1471), was a follower of Warwick, the "Kingmaker." The long connexion of the family of Grey with this title began in 1465, when Edmund, Lord Grey of Ruthin, was created earl of Kent. Edmund (c. 1420-1456) was the eldest son of Sir John Grey whom Henry VI. had created Duke of Kent, and was a younger son of his brother, John, who had been created Duke of Exeter. During the earlier part of the Wars of the Roses Grey fought for Henry VI.; but by deserting the Lancastrians during the battle of Northampton in 1460 he gave the victory to the Yorkists. He was treasurer of England and held other high offices under Edward IV. and Richard III. His son and successor, George, 2nd earl of Kent (c. 1455-1503), also a soldier, married Anne Woodville, a sister of Edward IV.'s queen, Elizabeth, and was succeeded by his son Richard (1481-
1524). After Richard's death without issue, his half-brother and heir, Henry, (c. 1495-1526), did not assume the title of earl of Kent on account of his poverty; but in 1572 Henry's grandson Reginald (d. 1573), who had been member of parliament for Weymouth, was recognized as earl; he was followed by his brother Henry (1541-1605), and then by another brother, Charles (c. 1545-1623). Charles's son, Henry, the 6th earl (c. 1583-
1639), married Elizabeth (1581-1611), daughter of Gilbert Talbot, 7th earl of Shrewsbury. This lady, who was an authoress, took for her second husband the jurist John Selden. Henry died without children in November 1639, when the earldom of Kent, separated from the barony of Ruthin, passed to his cousin Anthony (1557-1643), a clergyman, who was succeeded by his son Henry (1594-1651), Lord Grey of Ruthin. Henry had been a member of parliament from 1640 to 1643, and as a supporter of the popular party was speaker of the House of Lords until its abolition. The 11th earl was his son Anthony (1654-1702), whose son Henry became 12th earl in August 1702, lord chamberlain of the royal household from 1704 to 1710, and in 1706 was created earl of Harold and marquess of Kent, becoming duke of Kent four years later. All his sons predeceased their father, and when the duke died in June 1740, his titles of earl, marquess and duke of Kent became extinct.

The 12th Edward Augustus, fourth son of George III., was created duke of Kent and Strathearn by his father. Born on the 2nd of November 1767, Edward served in the British army in North America and elsewhere, becoming a field marshal in 1805. To quote Sir Spencer Walpole, Kent, a stern disciplinarian, "was unpopular among his troops; and the storm which was created by his well-intentioned effort at Gibraltar to check the licentiousness and drunkenness of the garrison compelled him finally to retire from the government of this colony." Owing to pecuniary difficulties his later years were mainly passed on the continent of Europe. He died at Sidmouth on the 23rd
of January 1820. In 1818 the Duke married Maria Louisa Victoria (1786-1861), widow of Emich Charles, prince of Lie-ningen (d. 1814), and sister of Leopold I, king of the Belgians; and his only child was Queen Victoria (q.v.).

KENT, JAMES (1763-1847), American jurist, was born at Philippi in New York State on the 31st of July 1763. He graduated at Yale College in 1781, and began to practise law at Poughkeepsie, in 1785 as an attorney, and in 1787 at the bar. In 1815 he was elected judge of the county, and served in that capacity until 1821, when he moved to Poughkeepsie, and was sworn in as judge of the county in the state Assembly. In 1793 he removed to New York, where Governor Jay, to whom the young lawyer's Federalist sympathies were a strong recommendation, appointed him a master in chancery for the city. He was professor of law in Columbia College in 1793-98 and again served in the Assembly in 1796-97. In 1797 he became Recorder of New York, in 1798 judge of the supreme court of the state, in 1802 chief justice, and in 1814 chancellor of New York. In 1821 he became a member of the convention to revise the state constitution. Next year, Chancellor Kent resigned his office and was re-elected to his former chair. Out of the lectures he now delivered grew the Commentaries on American Law (4 vols., 1826-1830), which by their learning, range and lucidity of style won for him a high and permanent place in the estimation of both English and American jurists. Kent rendered most essential service to American jurisprudence while serving as chancellor. Chancery law had been very unpopular during the colonial period, and had received little development, and no decisions had been published. His judgments of this class (see Johnson's Chancery Reports, 7 vols., 1816-1824) cover a wide range of topics, and are so thoroughly considered and developed as unquestionably to rank as the best of American equity jurisprudence. Kent was a man of great purity of character and of singular simplicity and guilelessness. He died in New York on the 12th of December 1847.

To Kent we owe several other works (including a Commentary on International Law) of less importance than the Commentaries. See J. Duer's Discourse on the Life, Character and Public Service of James Kent (1829); The National Portrait Gallery of Distinguished Americans, vol. ii. (1852); W. Kent, Memoirs and Letters of Chancellor Kent (Boston, 1868).

KENT, WILLIAM (1685-1748), English “painter, architect, and the father of modern gardening,” as described by Walpole in his Anecdotes of Painting describes him, was born in Yorkshire in 1685. Apprenticed to a coach-painter, his ambition soon led him to London, where he began life as a portrait and historical painter. He found patrons, who sent him in 1710 to study in Italy; and at Rome he made other friends, among them Lord Burlington, with whom he returned to England in 1719. Under that nobleman's roof Kent chiefly resided till his death on the 12th of April 1748—obtaining abundant commissions in all departments of his art, as well as various court appointments which brought him an income of £600 a year. Walpole says that Kent was below mediocrity in painting. He had some little taste and skill in architecture, of which Holkham Hall is perhaps the most favourable example. The mediocre statue of Shakespeare in Westminster Abbey sufficiently stamps his powers as a sculptor. His merit in landscape gardening is greater. In Walpole's language, Kent "was painter enough to taste the charms of landscape, bold and opinionative enough to dare and to dictate, and born with a genius to strike out a great system from the twilight of imperfect essays." In short, he was the first in English gardening to vindicate the natural against the artificial. Banishing all the clipped monstrousities of the topiary art in your box-hedges, he broke the streams from the conventional canal and marble basin, and rejecting the mathematical symmetry of ground plan then in vogue, Kent endeavoured to imitate the variety of nature, with due regard to the principles of light and shade and perspective. Sometimes he carried his imitation too far, as when he planted dead trees in Kensington gardens to give a greater air of truth to the scene, though himself was one of the first to detect the folly of such an extreme. Kent's plans were designed rather with a view to immediate effect over a comparatively small area than with regard to any broader or subsequent results.

KENT, one of the kingdoms of Anglo-Saxon Britain, the dimensions of which seem to have corresponded with those of the present county (see below). According to tradition it was the first part of the country occupied by the invaders, its founders, Hengest and Horsa, having been employed by the British king Vortigern against the Picts and Scots. Their landing, according to English tradition, took place between 410-455, though in the Welsh accounts the Saxons are said to have arrived in 428 (cf. Hist. Brit., 1155; Bede, Eccl. Hist., ii. 35). It is probably the name of Kent given by the Belgians; it was known to give the name of Kent to the island. In 455 Hengest and Aesc (Oisc), who reigned till 512, but little value can be attached to these dates. Documentary history begins with Aethelberht, the great-grandson of Aesc, who reigned probably 560-616. He married Bertha, daughter of the Frankish king Haribert, or Charibert, an event which no doubt was partly responsible for the success of the mission of Augustine, who landed in 597. Aethelberht was at this time supreme over all the English kings south of the Humber. On his death in 616 he was succeeded by his son Ecgberht, who made the kingdom famous for its monasteries and learning, and gave the name of Kent to the island. He was succeeded by Eadberht, who, however, reigned under two years. The death of Eadberht was followed by a disturbed period, in which Kent was under kings whom Bede calls "dubii vel externi." An unsuccessful attempt at conquest seems to have been made by the West Saxons, one of whose princes, Mul, brother of Ceadwalla, is said to have been killed in 687. There is some evidence for a successful invasion by the East Saxon king Sigehere during the same year. A king named Oswine, who apparently belonged to the native dynasty, seems to have obtained part of the kingdom in 688. The other part came in 689 into the hands of Wulfhere, probably a son of the East Saxon king Sebbe. Wulfhere, a son of Ecgbert, succeeded Oswine about 690, and obtained possession of the whole kingdom before 694. From him also we have a code of laws. At Wulfhere's death in 725 the kingdom was divided between his sons Aethelberht, Eadberht and Alric, the last of whom appears to have died soon afterwards. Aethelberht reigned till 762; Eadberht, according to the Chronicle, died in 748, but some doubtful charters speak of him as alive in 761-762. Eadbryht was succeeded by his son Eardwulf, and he again by Eanmund, while Aethelberht was succeeded by a king named Sigered. From 764-770 we find a king named Ecgbert, who in the early part of his reign had a colleague named Heaberth. At this period Kentish history is very obscure. Another king named Aethelberht appears in 781, and a king Ealhmund in 784, but there is some reason for suspecting that Offa annexed Kent about this time. On his death (796) Eadbryht Fræan made himself king, but in 798 he was defeated and captured by Coenwulf, who made his own brother Cuthred king in his place. On Cuthred's death in 807 Coenwulf seems to have kept Kent in his own possession. His successors Coenwulf and Beornwulf likewise appear to have held Kent, but in 825 we hear of a king named Baldred who was expelled by Ecgbert king of Wessex. Under the West Saxon dynasty Kent, together with Essex, Sussex and Surrey, was sometimes given as a dependent kingdom to one of the royal family. During Ecgbert's reign it was entrusted to his son Aethelwulf, on whose accession to the throne of Wessex, in 839, it was given to Aethelstan, probably his son, who lived at least till 851. From 855 to 860 it was governed by Aethelberht son of Aethelwulf. During the last years of Alfred's reign it seems to have been entrusted by him to his son Edward. Throughout the 9th century we hear also of two earls, whose spheres of authority may have corresponded to those of the two
kings whom we find in the 8th century. The last earls of whom we have any record were the two brothers Sigehelm and Sigewulf, who fell at the Holm in 905 when the Kentish army was cut off by the Danes, on Edward the Elder’s return from his expedition into East Anglia. At a later period Kent appears to have been held, together with Sussex, by a single earl.

The internal organization of the Kingdom of Kent seems to have been influenced by Mercia. Besides the division into Wessex and East Kent, which probably corresponds with the kingdoms of the 8th century, we find a number of lathes, apparently administrative districts under reeves, attached to royal villages. In East Kent there were four of these, namely, Canterbury, Eastry, Wye and Lymne, which can be traced back to the 9th century or earlier.

In the 11th century we hear of two lathes in West Kent, those of Sevenoaks and Aylesford.

The social organization of the Kentish nation was wholly different from that of Mercia and Wessex. Instead of two "noble" classes we find only one, called first eorcl, later as in Wessex, geseath. Again below the ordinary freeman we find three varieties of persons called laics, probably freedmen, to whom we have nothing analogous in the other kingdoms. Moreover the wergeld of the eorcl, or ordinary freeman, was two or three times as great as that of the same class in Wessex and Mercia, and the same difference of treatment is found in all the compensations and fines relating to them. It is not unlikely that the peculiarities of Kentish custom observed by historian, especially in the relationship of the land, are connected with these characteristics. An explanation is probably to be obtained from a statement of Bede—that the settlers in Kent belonged to a different nationality from those who formed the other kingdoms, namely, the Jutes (p. 49).

KENT, a south-eastern county of England, bounded N. by the Thames estuary, E. and S.E. by the English Channel, S.W. by Sussex, and W. by Surrey. In the north-west the administrative county of London encroaches upon the ancient county of Kent, the area of which is 1554 square miles. The county is roughly triangular in form, London lying at the apex of the western angle, the North Foreland at that of the eastern and Dunegate at that of the southern. The county is divided centrally, from west to east, by the well-marked range of hills known as the North Downs, entering Kent from Surrey. In the west above Westerham these hills exceed 800 ft.; to the east the height is much less, but even in Kent (or in Surrey they are higher) the North Downs form a more striking physical feature than their height would indicate. They are intersected, especially on the north, by many deep valleys, well wooded. At three points such valleys penetrate almost completely through the main mass of the hills. In the west, the Darent, flowing north to the Thames below Dartford, pierces the hills north of Sevenoaks, but its waters are collected chiefly from a subsidiary ridge of the Downs running parallel to the main line and south of it, and known as the Ragstone Ridge, from 600 to 800 ft. in height. The Medway, however, cuts through the entire hill system, rising in the Forest Ridges of Sussex, flowing N.E. and past Tunbridge, collecting feeders from south and east (the Teine, Beult and others) near Yalding, and then flowing N.E. and N. through the hills, past Maidstone, joining the Medway at the point on the north-eastern extremity of the South Downs, between the Downs and the Forest Ridges to the south (which themselves extend into Kent), watered by the upper Medway and its feeders, are called the Vale of Kent, and fall within the district well known under the name of the Weald. The easternmost penetration of the Downs is that effected by the Stour (Great Stour) which rises on their southern face, flows S.E. to Ashford, where it receives the East Stour, then turns N.E. past Wye and Canterbury, to meander through the lowlands representing the former channel which isolated the Isle of Thanet from the mainland. The channel was called the Wantsume, and its extent may be gathered from the position of the village of Fordwich near Canterbury, which had formerly a tidal harbour, and is a member of the Cinque Port of Sandwich. The Little Stour joins the Great Stour in these lowlands from a deep vale among the Downs.

About two-thirds of the boundary line of Kent is formed by tidal water. The estuary of the Thames may be said to stretch from London Bridge to Sheerness in the Isle of Sheppey, which is divided from the mainland by the narrow land (bridged at Queensbridge) of the Swale. Sheerness lies at the point of the Medway, a narrow branch of which cuts off a tongue of land termed the Isle of Grain lying opposite Sheerness. Along the banks of the Thames the coast is generally low and marshy, embankments being in several places necessary to prevent inundation. At a few points, however, as at Gravesend, spurs of the North Downs descend directly upon the shore. In the estuary of the Medway there are a number of low marshy islands, but Sheppey presents to the sea a range of slight cliffs from 80 ft. to 100 ft. in height. The marshes extend along the Swale to Whitstable, where they join the tidal cliffs, constituting the cliffs towards the Isle of Thanet, when they become lofty and grand, extending round the Foreland southward to Pegwell Bay. The coast from Sheppey round to the South Foreland is skirted by numerous flats and sands, the most extensive of which are the Goodwin Sands off Deal. From Pegwell Bay south to a point near Deal the coast is flat, and the drained marshes or levels of the lower Stour extend to the west; but thence the coast rises again into chalk cliffs, the eastward termination of the North Downs, the famous white cliffs which form the nearest point of the Medway to the open sea. The Medway was, overlooking the Strait of Dover. These cliffs continue round the South Foreland to Folkestone, where they fall away, and are succeeded west of Sandgate by a flat shingly shore. To the south of Hythe this shore borders the wide expanse of Romney Marsh, which, immediately west of Hythe, is overlooked by a line of abrupt hills, but for the rest is divided on the north from the drainage system of the Stour only by a slight uplift. The marsh, drained by many channels, seldom rises over a dozen feet above sea-level. At its southern extremity, and at the extreme south of the county, is the shingly promontory of Dungeness. Within historic times Saxon Hythe was the chief port of this region; but now it is a small fishing village east of the river Rother, which forms part of the boundary of Kent with Sussex, entering the sea at Rye harbour, was represented by a tidal estuary for a considerable distance inland.

Geology.—The northern part of the county lies on the southern rim of the London basin; here the beds are dipping northwards. The southern part of the county is occupied by a portion of the Wealden anticline. The London Clay occupies the tongue of land between the estuaries of the Thames and the Medway, and a district about 8 m. wide stretching southwards from Whitstable to Canterbury, and extending eastwards to the Isle of Thanet. The cliffs at Pegwell Bay are formed of Thanet sands, and the neighbourhod of London it rises above the plastic clay into the deeply-dug Chalk of Sheerness, with a height of about 450 ft. and a number of smaller eminences. The thickness of the formation near London is about 400 ft., and at Sheppey it reaches 480 ft. At Sheppey it rich in innumerable beds of fossil fish and shells. The plastic clay, which rests chiefly on chalk, occupies the remainder of the estuary of the Thames, but at several places it is broken through by outcrops of chalk, which in some instances run northwards to the banks of the river. The Lower Tertiaries are represented by three different formations known as the Thanet beds, the Woolwich and Reading beds, and the Oldhaven and Blackheath beds. The Thanet beds resting on chalk form a narrow outcrop rising into cliffs at Pegwell Bay and Reculver, and consist of (1) of a constant base bed of clayey greenish sand, seldom more than 5 ft. in thickness; (2) of a thin and local bed composed of alternations of brown clay and loam; (3) of a bed of light yellow sand, which in west Kent attains a thickness of more than 60 ft.; (4) of bluish grey sandy marl containing fossils, and almost entirely confined to east Kent, the thickness of the formation being more than 60 ft.; and (5) of fine light grey sand of an equal thickness, also fossiliferous. The middle series of the Lower Tertiaries, known as the Woolwich and Reading beds, rests either on the Thanet beds or on chalk. They consist chiefly of beds of very fine grey sand, with very various colours, the common fossil containing estuarine and oyster shells and the latter flint pebbles. The thickness of the formation varies from 15 to 80 ft., but most commonly it is from 25 to 40 ft. The woolwich beds rest on chalk, and the reading beds rest on the woolwich beds, and the latter are, in some places, at least 20 ft. thick. The Oldhaven and Blackheath beds lying between the London Clay and the Woolwich beds. They consist chiefly of flint pebbles or of light-coloured quartzite sand, the thickness being from 20 to 30 ft, and are best seen at Oldhaven and Blackheath.
basin is succeeded by the North Downs, an elevated ridge of country consisting of an outcrop of chalk which extends from Westerham to Folkestone with an irregular breadth generally of 3 to 6 miles, but exacting an extension between the eastern extremity of the north of Folkestone. After dipping below the London Clay at Canterbury, it sends out an outcrop which forms the greater part of the eastern slopes of the Medway and of the Greensand between Otford and Westerham. To the south of the Darent Valley is a narrow valley formed by the Gault, a fossiliferous blue clay. This is succeeded by an outcrop of the Lower Greensand—including the Hythe Beds—which are a continuation of the Thanet Beds at the base—which extends across the country from west to east with a breadth of from 2 to 7 m., and rises into the picturesque elevations of the Ragstone hills. The remains of Ipswichian occur in Thanet Beds, which extend from the eastern Sussexborders to the Kent basin, and are occasionally found in the Gault. The highest elevation is nearly 400 ft. and the south-west corner of the county is occupied by Romney Marsh, which within a comparatively recent period has been recovered from the sea. The Thames separates the plateaux of London Clay and Greensand, and Pleistocene mammalia have been found in fissures in the Hythe beds at Ightham, where ancient stone implements are common. Remains of clog deposits lie in pipes in the chalk near Lenham. Coal-measures, as will be seen, have been found near Dover.

The London Clay is much used for bricks, coarse pottery and road-making and is extensively worked at Chatham, Bexley, Herne Bay, Gravesend and Sittingbourne near Faversham, and Port Shepway (Richborough). The Kentish blue clay are used in the manufacture of bricks in the Thanet region and Grimwade near the River Thames. The Greensand of the Medway is extensively worked for its variety of coal and chalk for road-making, carried on on the basins of the Darent, Medway, Cray and neighbouring streams; engineering, chemical and other works along the Thames; manufacture of bricks, tiles and chestnut veneers in the Medway and the Swale. A variety of industries is connected with the Government establishments at Chatham and Sheerness. Ship-building is prosecuted here and at Gravesend, Dover and other ports. Shrimping is carried out near Erith and Faversham and elsewhere.

Deep-sea fishing is largely prosecuted all round the coast. Shrimps, soles and Boudoir are taken off Hythe and Dover. The county is one of the chief counties of England. The principal towns are near Whitstable, Faversham, Milton, Queenborough and Rochester, some being worked by ancient companies or gilds of fishermen.

After theession in 1882 of works in connexion with the Channel tunnel, to connect England and France, coal-boring was attempted in the disused shaft, west of the Shakespeare Cliff railway tunnel near Dover. In 1890 coal was struck at a depth of 1190 ft., and further boring in 1891 was carried out by the company. The mining was unsuccessful, and boring ceased in 1901, but the work was resumed by the Consolidated Kent Collieries Corporation, and an extension of bories revealed in 1905 the probability of a successful development of the industry until 1908.

Communications.-Railway communications are practically monopolized by the South Eastern & Chatham Company, which may have no infringement of the property of the Kentish coalfields during the period of the company's operation. The principal channels of communication with the continent, through the ports of Dover, Folkestone and Queenborough. The county contains four of the Cinque Ports, namely, Dover, Hythe, New Romney and Sandwich. Seaside resorts are numerous and populous—on the north coast are Minster (Sheppey), Whitstable and Herne Bay; there is a ring of watering-places round the Essex of the Isle of Thanet—Shoreham, Broadstairs, Minster, Margate (23,118), Ramsgate (27,733), Rochester, a city (30,590), Sandwich (3170), Tenterden (3243), Tunbridge Wells (33,373). The urban districts are Ashford (12,808), Beckenham (26,332), Bexley (12,018), Broadstairs and St Peter's (6466), Chertsey (7001), Chislehurst (7429), Dartford (15,644), Erith (25,216), Farningham (2515), Herne Bay (7626), Milton (7986), Northfleet (12,906), Penge (22,465), Sandgate (2294), Sevenoaks (8106), Sheerness (18,179), Sittingbourne (359,428), Southend (13,000), Swanley (3626), Westerham (1764), Wrotham (2971). Small villages are Rainham (5693) near Chatham, Aylesford (2678), East Malling (2391) and West Malling (2312) in the Maidstone district; Edenbridge (2546) and Westerham (2005) on the western border of the county; Cranbrook (3949), Goudhurst (2725) and Hawkhurst (3136) in the south-west. Among villages which have grown into residential towns through their
proximity to London, beyond those included among the boroughs and urban districts, there should be mentioned Orpington (1259). The county is in the south-eastern circuit, and assizes are held at Maidstone. It has two courts of quarter sessions, and is divided into 17 petty sessional divisions. The boroughs having separate commissions of the peace and courts of quarter sessions are Canterbury, Deal, Dover, Faversham, Folkestone, Gravesend, Hythe, Maidstone, Margate, Rochester, Sandwich and Tenterden; while those of Lydd, New Romney, Ramegate and Tunbridge Wells have separate commissions of the peace. The liberty of Romney Marsh has petty and general sessions. The justices of the Cinque Ports exercise certain jurisdiction, the non-corporate members of the Cinque Ports of Dover and Sandwich having separate commissions of the peace and courts of quarter sessions. The central criminal court has jurisdiction over certain parishes adjacent to London. All those civil parishes within the county of Kent of which any part is within twelve miles of, or of which no part is more than fifteen miles from, Charing Cross are within the metropolitan police district. The total number of civil parishes is 427. Kent is mainly in the diocese of Canterbury, but has parts of the archdeaconry of Romney and Tunbridge. It contains 476 ecclesiastical parishes or districts, wholly or in part. The county (extra-metropolitan) is divided into 8 parliamentary divisions, namely, North-western or Dartford, Western or Sevenoaks, South-western or Tunbridge, Mid or Medway, North-eastern or Faversham, Southern or Ashford, Eastern or St Augustine's and the Isle of Thanet, each returning one member; while the boroughs of Canterbury, Chatham, Dover, Gravesend, Hythe, Maidstone and Rochester each return one member.

History.—For the ancient kingdom of Kent see the preceding article. The shire organization of Kent dates from the time of Aethelred, the name as well as the boundary being that of the ancient kingdom, though at first probably with the addition of the suffix "shire," the form "Kent" occurring in a record of the folk-moot at this date. The inland shire-boundary has varied with the altered course of the Rother. In 1888 the county was diminished by the formation of the county of London.

At the time of the Domesday Survey Kent comprised sixty hundreds, and there was a further division into six lests, probably representing the shires of the ancient kingdom, of which two, Suttons and Aylesford, of Rochester, have present-day lacies. The remaining four, Borowest Lest, Estre Lest, Limowest Lest and Wiwart Lest, existed at least as early as the 9th century, and were apparently named from their administrative centres, Burgwara (the burg being Canterbury), Eastre, Lynne and Wye, all of which were meeting places of the Kentish Council. The five modern lades (Aylesford, St Augustine, Scray, Sheppey and Sutton-at-Hone) all existed in the time of Edward I, with the additional lathe of Hedelinge, which was absorbed before the next reign in that of St Augustine. The Nomina Villarum of the reign of Edward II mentions all the sixty-six modern hundreds, modern lacies and two-thirds of which were at that date in the hands of the church.

Shires of Kent are mentioned in the time of Æthelred II., and in Saxon times the shiremeet met three times a year on Penenden Heath near Maidstone. After the Conquest the great ecclesiastical landholders claimed exemption from the jurisdiction of the shire, and in 1279 the abbot of Battle claimed to have his own coroner in the hundred of Wye. In the 13th century twelve liberties in Kent claimed to have separate bailiffs. The assizes for the county were held in the reign of Henry III. at Canterbury, Tunbridge and Rochester, and also at the Lowye of Tonbridge under a mandate from the Crown as a distinct liberty; afterwards at different intervals at East Greenwich, Dartford, Maidstone, Milton-next-Gravesend and Sevenoaks; from the Restoration to the present day they have been held at Maidstone. The liberty of Romney Marsh has petty and quarter sessions under its charters.

Kent is remarkable as the only English county which comprises two entire bishoprics, Canterbury, the see for East Kent, having been founded in 597, and Rochester, the see for West Kent, in 600. In 1291 the archdeaconry of Canterbury was co-extensive with that diocese and included the deaneries of Westbere, Bridge, Sandwich, Dover, Elham, Lynnpe, Charing, Sutton, Sittingbourne, Ospringe and Canterbury; the archdeaconry of Rochester, also co-extensive with its diocese, included the deaneries of Rochester, Dartford, Malling and Shoreham. In 1843 the deansery of Canterbury, and the archdeaconry of Rochester. In 1853 the deaneries of Malling and Charing were subdivided into North and South Malling and East and West Charing. Lynnpe was subdivided into North and South Lynnpe in 1857 and Dartford into East and West Dartford in 1864. Gravesend and Cobham deaneries were created in 1862 and Greenwich and Woolwich in 1868, all in the archdeaconry of Rochester. In 1873 East and West Bridge deaneries were created in the archdeaconry of Canterbury, and Croydon in the archdeaconry of Maidstone. In 1889 Tunbridge deanery was created in the archdeaconry of Maidstone. In 1906 the deaneries of East and West Dartford, at the hands of the judges, existing in the 18th century, were abolished, and Shoreham and Tunbridge were transferred from Maidstone to Rochester archdeaconry.

Between the Conquest and the 14th century the earldom of Kent was held successively by Odo, bishop of Bayeux, William of Ypres and Hubert de Burgh (sheriff of the county in the reign of Henry III.), none of whom, however, transmitted the honour, which was bestowed by Edward I. on his youngest son Edmund of Woodstock, and subsequently passed to the families of Holland and Neville (see KENT, EARS AND DUKES OF). In the Domestical Survey only five lay tenants-in-chief are mentioned, all the chief estates being held by the church, and the fact that the Kentish gentry are less ancient than in some remoter shires is further explained by the constant implantation of new stocks from London. Greenwich is illustrous as the birthplace of Henry VIII., Mary and Elizabeth. Sir Philip Sidney was born at Penshurst, being descended from William de Sidney, chamberlain to Henry II. Botton Malherbe was the seat of the Wottons, from whom descended Nicholas Wotton, privy councillor to Henry VIII., Edward VI., Mary and Elizabeth. The family of Leiborne of Leiborne Castle, of whom Sir Roger Leiborne took the Capture of Rochester by William Rufus during the rebellion of Odo of Bayeux; the capture of Dover and Leeds castles by Stephen; the murder of Thomas à Becket at Canterbury in 1170; the submission of John to the pope's legate at Dover in 1213, and the capture of Rochester Castle by the king in the same year. Rochester Castle was in 1216 captured by the dauphin of France, to whom nearly all Kent submitted, and during the Wars of Henry III. with his barons was captured by Gilbert de Clare. In the peasants' rising of 1381 the rebels plundered the archbishop's palace at Canterbury, and 100,000 Kentishmen gathered at Wat Tyler's Barn. In 1450 Kent took a leading part in Jack Cade's rebellion; and in 1554 the insurrection of Sir Thomas Wyatt began at Maidstone. On the outbreak of the Great Rebellion feeling was much divided, but after capturing Dover Castle the parliament soon subdued the whole county. In 1648, however, a widespread insurrection was organized on behalf of Charles, and was suppressed by Fairfax. The county was among the first to welcome back Charles II. In 1667 the Dutch fleet under De Ruyter advanced up the Medway, levelling the fort at Sheerness and burning the ships at Chatham. In
the Kentish petition of 1701 drawn up at Maidstone the county protested against the peace policy of the Tory party.

Among the earliest industries of Kent were the iron-mining in the Weald, traceable at least to Roman times, and the salt industry, which flourished along the coast in the 10th century. The Domesday Survey, besides testifying to the agricultural activity of the country, mentions over one hundred salt-works and numerous valuable fisheries, vines at Chart Sutton and Leeds, and cheese at Milton. The Hundred Rolls of the reign of Edward I. frequently refer to wool, and Flemish weavers settled in the Weald, and on the south coast near Hastings. Tiles were manufactured at Wyre in the 14th century. Valuable timber was afforded by the vast forest of the Weald, but the restrictions imposed on the felling of wood for fuel did serious detriment to the iron-trade, and after the statute of 1558 forbidding the felling of timber for iron-smelting within fourteen miles of the coast the industry steadily declined.

The discovery of coal in the northern counties dealt the final blow to its prosperity. Cherries are said to have been imported from Flanders and first planted in Kent by Henry VIII., and from this period the culture of fruits (especially apples and cherries) and of hops spread rapidly over the county. Thread-making at Maidstone and silk-weaving at Canterbury existed in the 16th century, and before 1500 one of the first paper-mills in England was set up at Dartford. The statute of 1630 forbidding the exportation of wool, followed by the Plague of 1665, led to a serious trade depression, while the former enactment resulted in the vast smuggling trade which spread along the coast, 40,000 packs of wool being smuggled to Calais from Kent and Sussex in two years.

In 1290 Kent returned two members to parliament for the county, and in 1295 Canterbury, Rochester and Tunbridge were also represented; Tunbridge however made no returns after this date. In 1352 Maidstone acquired representation, and in 1415 Queenborough. Under the act of 1832 the county returned four members in two divisions, Chatham was represented by one member and Greenwich by two, while Queenborough was disfranchised. Under the act of 1868 the county returned six members in three divisions and Gravesend returned one member. By the act of 1885 the county returned eight members in eight divisions, and the representation of Canterbury, Maidstone and Rochester was reduced to one member each. By the London Government Act of 1892 the borough of Greenwich was taken out of Kent and united with the twenty-eight metropolitan boroughs of the county of London.

Antiquities.—As was to be expected from its connexion with the early history of England, and from its beauty and fertility, Kent possessed a larger than average number of monastic foundations. The earliest were the priory of Christ's Church and the abbey of St Augustine's, each called the cathedral of Kent: the first, founded by Augustine and the monks who accompanied him to England. Other Saxon foundations were the nunneries at Folkestone (630), Lyminge (633; minnery and monastery), Reculver (660), Minster-in-Thanet (870), Minster-in-Sheppey (675), and the priory of St Martin at Dover (966), all belonging to the Benedictine order. Some of these were re-founded, and the principal monastic remains now existing are those of the Benedicite priories at Rochester (1089), Folkestone (1095), Dover (1140); the Benedictine nunneries at Malling (time of William Rufus), Minster-in-Sheppey (1130), Higham (founded by King Stephen), and Davington (1153); the Cistercian convent of St Augustines at Maidstone (1147) and priory at Monks Horton (time of Henry II.); the preceptory of Knights Templars at Swingfield (time of Henry II.); the Premonstratensian abbey of St Radigund's, near Dover (1191); the first house of Dominicans in England at Canterbury (1223); the first Carmelitine house in England, at Aylesford (1240); and the priory of Augustinian nuns at Dartford (1355). Other houses of which only fragments now exist are the priory of St Edmund, near Erith, and Bilsington priory near Ashford, established in 1178 and 1253 respectively, and both belonging to the Augustinian canons; and the house of Francisca at Canterbury (1225). But no remains exist of the priory of St Mary's at Minster-in-Thanet, of St Gregory's at Staverton, near Leeds, near Maidstone (1119), Tunbridge (middle of 12th century), Combwell, near Cranbrook (time of Henry II.); the nunnery of St Sepulchre near Langdon abbey; the priory of St John at Headcorn, near the first house of Crutched Friars in England (1224), where miracle plays were presented in the church by the friars on Trinity Sunday; the Carmelitine priories at Sandwich (1272) and Losenham near Tenterden (1241); and the preceptory of Knights of St John of Jerusalem at West Peckham, near Tunbridge (1408).

Rising from the cathedral churches of Canterbury and Rochester, the county is unsurpassed in the number of churches it possesses of the highest interest. For remains of a date before the Conquest the church of Lyminge is of first importance. Here, as at Maidstone, there seems to have been a church founded by Æthelburga, wife of Edwin, king of Northumb-land, and rebuilt, with considerable use of Roman material, in 655 by St Dunstan. There is similar early work in the church of Padworth, not far distant from Sulgrave. Among the earliest, the first in interest is the small church at Barfreston, one of the most perfect specimens of its kind in England, with a profusion of orna-mental work graphically rounding the chancel and east window. The churches of St Margaret-at-Cliff, Patricroft and Douzain are hardly less noteworthy, while the tower of New Romney church should also be mentioned. Among several remarkable Early English specimens north of the busy Hythe church, the church of SS. Mary and Eanswith, Folkestone, Minster-in-Thanet, Chalk, with its curious porch, Faversham and Westwell, with fine contemporary glass, are also worthy of notice. Stone church, near Dartford, a late example of this style, transitional to Decorated, is very fine; and among Decorated buildings Chatham church exhibits in some of its windows the peculiar tracery known as Kentish Decorated. The church of Childers, near Hythe, is remarkable, for the fine glass of this period in Nettlestead church mustered there. The church of Cobham contains one of the richest collections of ancient brasses in England.

Besides its also rich in examples of ancient architecture other than ecclesiastical. The castles of Rochester and Dover are famous; those of Canterbury and Chilham are notable among others. Ancient mansions are very numerous; among these are the castellated Leeds Castle in the Medway valley, Penshurst Place near Edenbridge, Saltwood and Westenhanger near Hythe, the Motte House at Ightham near Wrotham, Knole House near Sevenoaks, and Cobham Hall. Examples of early domestic architecture abound throughout the county.

Authorities.—A full bibliography of the many earlier works on the county and its towns is given in J. R. Smith's Bibliotheca Cantiana (Canterbury, 1857). There may be mentioned here W. L. Sandys, Perambulation of Kent (London, 1576, 1826); R. Kilburne, Topographical or Survey of the County of Kent (London, 1659); J. and T. C. H. and Villar Cantium (London, 1659, 1776); J. Harris, History of Kent (London, 1761, 1777); E. Hasted, State of the County and Archæological Survey of Kent (4 vols. folio, Canterbury, 1778-1799; 2nd ed., 12 vols. 8vo, Canterbury, 1797-1801); W. H. Ireland, History of the County of Kent (London, 1829-1830); C. Sandys, Consuetudines Cantiana (London, 1851); A. Hussey, Notes on the Churches of Kent (London, 1852); L. B. Larking, The Domesday Book of Kent (1866); R. Furley, History of the Weald of Kent (Ashford, 1871-1874); W. A. Port,修理 the Kentish Church (London, 1884); J. St. S. Tyte, Our Country, Kent's History, Kent. See also Archaeologia Cantiana (translations of the Kent Archaeological Society, London, from 1858).

KENTIGERN, ST. or MUNGO ('colon friend," a name given to him, according to Jocelyn, by St Seranus), a Briton of Strathclyde, called by the Goidels In Glaschu, "the Grey Hound," was, according to the legends preserved in the lives which remain, of royal descent. His mother with his child was thrown down from a hill called Dunpelder (Trarpan Law, Haddingtonshire), but survived the fall and escaped by sea to Culross on the farther side of the Firth of Forth, where Kentigern was born. It is possible that she may have been a nun, as a convent had been founded in earlier times on Trarpan Law. The life then describes the training of the boy by Servanus, but the date of the latter renders this impossible. Returning to Strathclyde Kentigern lived for some time at Glasgow, near a cemetery ascribed to St Ninian, and was eventually made bishop of that region by the king and clergy. This story is partially attested by Welsh documents, in which Kentigern appears as the bishop of Carmarth, apparently the title of that region. Subsequently he was opposed by a pagan king called Morken, whose relatives after his death succeeded in forcing the saint to retire from Strathclyde. He thereupon took refuge with St David at Menevia (St David's), and eventually founded a monas-tery at Llandewy (St Asaph's), for which purpose he received grants from Madawn, prince of Gwynedd. After the battle of Arderyd in 573 in which King Rhydderch, leader of the Chris- tian party in Strathclyde, was victorious, Kentigern was recalled. He fixed his see first at Huddam in Dumfriesshire, but afterwards
KENTON—KENTUCKY

740

returned to Glasgow. He is credited with missionary work in Galloway and north of the Firth of Forth, but most of the dedications in his which survive are north of the Mounth in the upper valley of the Dee. The meeting of Kington and Columbia probably took place soon after 584, when the latter began to preach in the neighbourhood of the Tay.

KENTON, a city and the county seat of Hardin county, Ohio, U.S.A., on the Scioto river, 60 m. N.W. of Columbus. Pop. (1900), 6852, including 403 foreign-born and 271 negroes; (1910), 7185. It is served by the Erie, the Cleveland, Cincinnati, Chicago & St Louis, and the Ohio Central railways. It is built on the water-parting between Lake Erie and the Mississippi River, here about 100 ft. above sea-level. There are shops of the Ohio Central railway here, and manufactories of hardware. The municipality owns and operates its waterworks.

Kenton was named in honour of Simon Kenton (1755-1836) a famous scout and Indian fighter, who took part in the border warfare, particularly in Kentucky and Ohio, during the War of American Independence and afterwards. It was platted and became the county seat in 1833, and was chartered as a city in 1885.

KENT'S CAVERN, or Kent's Hole, the largest of English bone caves, famous as affording evidence of the existence of Man in Devon (English) contemporaneously with animals now extinct or no longer indigenous. It is about a mile east of Torquay harbour and is of a sinuous nature, running deeply into a hill of Devonian limestone. Although long known locally, it was not until 1825 that it was scientifically examined by Rev. J. McEnery, who found worked flints in intimate association with the bones of extinct mammals. He recognized the fact that they proved the existence of man in Devonshire while those animals were alive, but the idea was too novel to be accepted by his contemporaries. His discoveries were afterwards verified by Godwin Austen, and ultimately by the Committee of the British Association, whose explorations were carried on under the guidance of Wm. Pengelly from 1865 to 1880. There are four distinct strata in the cave. (1) The surface is composed of dark earth and contains medieval remains, Roman pottery and articles which prove that it was in use during the Iron, Bronze and Neolithic Ages. (2) Below this is a stalagmite floor, varying in thickness from 1 to 3 ft., and covering (3) the red earth which contained bones of the hyaena, lion, mammoth, rhinoceros and other animals, in association with flint implements and an engraved antler, which proved man to have been an inhabitant of the cavern during its deposition. Above this and below the stalagmite there is in one part of the cave a black band from 2 to 6 in. thick, formed of soil like No. 2, containing charcoal, numerous flint implements, and the bones and teeth of animals, the latter occasionally perforated as if used for ornament. (4) Filling the bottom of the cave was a hard breccia, with the remains of bears and flint implements, the latter in the main ruder than those found above; in some places it was no less than 1½ ft. thick. The most remarkable animal remains found in Kent's Cavern are those of the Sabre-toothed tiger, Machaerodus latidens of Sir Richard Owen. While the value of McEnery's discoveries was in dispute the exploration of the cave of Brixham near Torquay in 1858 proved that man was coeval with the extinct mammals, and in the following year additional proof was offered by the implements that were found in Wookey Hole, Somerset. Similar remains have been met with in the caves of Wales, and in England as far north as Derbyshire (Cresswell), proving that over the whole of southern and middle England men, in precisely the same stage of rude civilization, hunted the rhinoceros, the mammoth and other extinct animals.

See Sir John Evans, "Ancient Stone Implements of Great Britain" (London, 1897); Lord Avebury's "Prehistoric Times" (1900); W. Pengelly, "Address to the British Association" (1883) and Life of him by C. D. G. F. Holford, "History of the Geological Society", vol. iv. 286; Pengelly, "Literature of Kent's Cavern" in Trans. Devonshire Association (1868); William Boyd Dawkins, "Cave-hunting and Early Man in Britain."
KENTUCKY
skunks, and the streams were inhabited by trout, perch, buffalo-fish,
sun-fish, mullet, eels, and suckers. Of the larger game there remain
only a few deer, bears and lynx in the mountain districts, and the
numbers of small game and fish have been greatly reduced. In its
primeval state Kentucky was generally well timbered, but most of
the middle section has been cleared and here the blue grass is now
the dominant feature of the flora. Extensive forest areas still remain
both in the east and the west, In the east oak, maple, beech,
"
chestnut, elm, tulip-tree (locally
yellow poplar "), walnut, pine
and cedar trees are the most numerous; in the west the forests are
composed largely of cypress, ash, oak, hickory, chestnut, walnut,
beech, tulip-tree, gum and sycamore trees.
Locust, pawpaw,
cucumber, buck-eye, black mulberry and wild cherry trees also
and
the
abound,
grape, raspberry and strawberry are native fruits.
Climate.
The climate is somewhat more mild and even than that of
the neighbouring states. Themean annual temperature, about 50 F.
on the mountains in the S. E., and 60 W. of the Tennessee, is about
55 F. for the entire state ; the thermometer seldom registers as high
as 100 or as low as 10. Themean annual precipitation ranges
from about 38 in. in the north-east to 50 in. in the south, and is about
46 in. for the entire state; it is usually distributed evenly throughout
the year and very little is in the form of snow. The prevailing winds
blow from the west or south-west rain-bearing winds blow mostly
from the south and the cold waves come from thejnorth or north-west.
The best soils are the alluvium in the bottom-lands along
Soil.
some of the larger rivers and that of the Blue Grass Region, which
is derived from a limestone rich in organic matter
(containing phosThe soil within a radius of
phorus) and rapidly decomposing.
some 20 m. around Lexington is especially rich outside of this area
the Blue Grass soil is less rich in phosphorus and contains a larger
mixture of sand. The soils of the Highland Rim Plateau as well
as of the lowland west of the Tennessee river vary greatly, but the
most common are a clay, containing more or less carbonate of lime,
and a sandy loam. On the escarpment around the Blue Grass
Region the soils are for the most part either cherty or stiff with
clay and of inferior quality. On the mountains and on the Alleghany
Plateau, also, much of the soil is very light and thin.
Agriculture.
Kentucky is chiefly an agricultural state. Of the
75 2 i53 I of its inhabitants who, in 1900, were engaged in some gainful
occupation, 408,185 or 54'2 %, were agriculturists, and of its total
land surface 21,979,422 acres, or 85-9%, were included in farms.
The percentage of improved farm land increased from 35^2 in 1850
to 49'9 in 1880 and to 62*5 in 1900. The number of farms increased
from 74,777 in 1850 to 166,453 in 1880 and to 234,667 in 1900; and
their average size decreased from 2267 acres in 1850 to 129'! acres
in 1880 and to 937 acres in 1900, these changes being largely due
to the breaking up of slave estates, the introduction of a considerable
number of negro farmers, and the increased cultivation of tobacco
and market-garden produce. In the best stock-raising country,
e.g. in Fayette county, the
opposite tendency prevailed during the
latter part of this period and old farms of a few hundred acres were
combined to form some vast estates of from 2000 to 4000 acres.
Of the 234,667 farms in 1900, 155,189 contained less than 100 acres,
76,450 contained between 100 and 500 acres, and 558 contained more
than looo acres; 152,216 or 64*86%, were operated by owners or
part owners, of whom 5320 were negroes; 16,776 by cash tenants,
of whom 789 were negroes; and 60,289 D V share tenants, of whom
4984 were negroes. In 1900 the value of farm land and improvements was $291,117,430; of buildings on farms, $90,887,460; of livestock, $73,739,106. In the year 1899 the value of all farm products
was $123,266,785 (of which $21,128,530 was the value of products
fed to livestock), including the following items: crops, $74,783,365;
animal products,
44,303,940; and forest products, $4,179,840.
The total acreage of all crops in 1899 was 6,582,696. Indian corn
is the largest and most valuable crop.
As late as 1849, when it
produced 58,672,591 bu., Kentucky was the second largest Indiancorn producing state in the Union. In 1899 the crop had increased
to 73.974. 220 bu. and the acreage was 3,319,257 (more than half the
acreage of all crops in the state), but the rank had fallen to ninth in
product and eleventh in acreage; in 1909 (according to the Yearbook
of the United States Department of Agriculture) the crop was
103,472,000 bu. (ninth among the states of the United States), and
the acreage was 3,568,000 (twelfth among the states). Among the
cereals wheat is the next largest crop; it increased from 2,142,822 bu.
in
1849 to 11,356,113 bu. in 1879, and to 14,264,500 bu. in 1899; in
1909 it was only 7,906,000 bu. The crop of each of the other cereals
is small and in each case was less in 1899 than in 1849. The culture
of tobacco, which is the second most valuable crop in the state, was
begun in the north part about 1780 and in the west and south early
in the 1 9th century, but it was late in that century before it was introduced to any considerable extent in the Blue Grass Region, where
it was then in a measure substituted for the culture of hemp.
By
1849 Kentucky ranked second only to Virginia in the production of
tobacco, and in 1899 it was far ahead of any other state in both
acreage and yield, there being in that year 384,805 acres, which was
of the total acreage in the continental United States, yielding
34'9
314,288,050 Ib. As compared with the state's Indian corn crop of
that year, the acreage was only a little more than one-ninth, but the
value ($18,541,982) was about 63%. In 1909 the tobacco acreage
in Kentucky was 420,000, the crop was 350,700,000 Ib, valued at

ville, and the hill country south and east, whose product, the red
and white Burley, is a fine-fibred light leaf, peculiarly absorbent of
licorice and other adulterants used in the manufacture of sweet
chewing tobacco, and hencea peculiarly valuable crop, which formerly
1
averaged 22 cents a pound for all grades. The high price received by

the hill growers of the Burley induced farmers in the Blue Grass
to plant Burley tobacco there, where the crop proved a great success,
more than twice as much (sometimes 2000 ID) being grown to the
acre in the Blue Grass as in the hills and twice as large patches being
easily managed. In the hill country the share tenant could usually
plant and cultivate only four acres of tobacco, had to spend 120 days
working the crop, and could use the same land for tobacco only once
in six years.
So, although a price of 6*5 cents a pound covered
expenses of the planter of Burley in the Blue Grass, who could use
the same land for tobacco once in four years, this price did not repay

efficacy of pooling methods in securing better prices for the tobacco
crop. Following their example, the planters of the Burley formed
the Burley Tobacco Society, a Burley pool, with headquarters at
Winchester and associated with the American Society of Equity,
which promoted in general the pooling of different crops throughout
the country. The tobacco planters secured legislation favourable to
the formation of crop pools. The Burley Tobacco Society attempted
to pool the entire crop and thus force the buyers of the American
Tobacco Company of New Jersey (which usually bought more than
three-fourths of the crop of Burley) to pay a much higher price for

the lawlessness subsided in the Burley
after the agreement of the American Tobacco Company to purchase
the remainder of the 1906 crop at a " round " price of 2Oj cents
and a part of the 1907 crop at an average price of 17 cents, thus
making it profitable to raise a full crop in 1909.
Kentucky is the principal hemp-growing state of the Union the
crop of 1899, which was grown on 14,107 acres and amounted to
10,303,560 ft, valued at $468,454, was 877% of the hemp crop
of the whole country. But the competition of cheaper labour in
other countries reduced the profits on this plant and the product of
1899 was a decrease from 78,818,000 ft in 1859. Hay and forage,
the fourth in value of the state's crops in 1899, were grown on
683,139 acres and amounted to 776,534 tons, valued at $6,100,647;
in 1909 the acreage of hay was 480,000 and the crop of
653,000 tons
was valued at $7,771,000. In 1899 the total value of fruit grown
in Kentucky was $2,491,457 (making the state rank thirteenth
among
the states of the Union in the value of this product), of which
$1,943,645 was the value of orchard fruits and $435,462 that of small
fruits.
Among fruits, apples are produced in greatest abundance,
6,053,717 bu. in 1899, an amount exceeded in only nine states; in
1889 the crop had been 10,679,389 bu. and was exceeded only by the
crop of Ohio and by that of Michigan. Kentucky also grows considerable quantities of cherries, pears, plums and peaches, and, for its
size, ranks high in its crops of strawberries, blackberries and
raspberries. Indian corn is grown in all parts of the state but most
largely
in the western portion.
Wheat is grown both in the Blue Grass
Region and farther west and the best country for fruit is along the
Ohio river between Cincinnati and Louisville and in the hilly land surrounding the Blue Grass Region. In the eastern part of the state
district.

KENTUCKY

where crops are generally light, Indian corn, oats and potatoes are the staple food of the white population. Tobacco, hemp, and cotton are grown. The thoroughbred Kentucky horse has long had a world-wide reputation for speed; and the Blue Grass Region, especially Fayette, Bourbon and Woodford counties, is probably the finest horse-breeding region in the world. In 1900, the average value of colts between the ages of one and two years was $377.78. In the Blue Grass Region many thoroughbred short-horned beef cattle are raised. The principal short-horned cattle, mules, cattle and sheep increased quite steadily from 1850 to 1900, in both numbers and value in 1880 and in 1900 was nearly one-third less than in 1850. In 1900 the state had 497,245 horses, 191,100 mules, 36,025 mule-ears, 703,175 cows, 755,061 steer cattle, 2,006,550 sheep, and 2,008,699 swine; in 1910 there were in Kentucky 407,000 horses, 207,000 mules, 394,000 milk cows, 665,000 other neat cattle, 1,660,000 sheep and 989,000 swine. The principal sections of the state in which this characteristic industry is carried on are those of Garrard, Jackson and the principal hog-raising counties were Graves, Hardin, Ohio, Union and Hickman.

Forests and Timber. — More than one-half of the state (about 22,200 sq. m.) was in 1900 still wooded. In 1900 of the total cut of 777,218 M. ft., B.M., 392,804 were white oak and 279,740 M. ft. were tulip-tree. Logging is the principal industry of several localities, especially in the east, and the lumber product of the state increased in value from $1,502,434 in 1850 to $4,061,361 in 1880, and to $13,774,910 in 1900. The factory product in 1900 was valued at $13,338,533, and in 1905 at $14,539,000. Out of this standing crop, at $58.00 per load, the hardwood lumber, 265,776 M. ft. were oak and 133,057 M. ft. were “poplar.” The planing mill industry is increasing rapidly, as it is found cheaper to do the planing in the State than to send the lumber to the principal capitals of planing mills in the State increased 117.2% and the value of products increased 142.8%.

Manufactures. — Kentucky’s manufactures are principally those from the products of her farms and forests furnish the raw material. The most distinctive of these is probably the distillery, the state’s whisky being famous. A colony of Roman Catholic immigrants from Luxembourg settled along the Salt and the Ohio in 1775, and, later, at Bardstown, Bullitt, Hardin, Shelby, Meade, and Meade counties, in 1798. The first flour mill was erected in 1819, and the first distillery in 1820. In 1890, 796 distilleries were in operation, and in 1904, 68,400 tons (of which 52,492 tons were from Morgan county); according to the Minerals Resources of the United States (1907) published by the United States Geological Survey. In 1897, 2,745,000 barrels of whisky and in 1907 of cannon coal (including 4560 tons of semi-cannel coal) was 77,733 tons, and exclusive of semi-cannel coal the output of Kentucky was much larger than that of any other state. Some of the coal mined is used in the foundry department, and the state’s share of the profit from the sale of the coal, which is valued at $235,505 in 1898, $86,169 in 1906; the maximum output up to 1906; and in 1907, 67,668 tons ($157,288). Coal was first mined in Kentucky in 1807; in Pulaski county, in 1827; between 1827 and 1835 the annual output was from 2000 to 6000 tons; in 1840 it was 23,572 tons and in 1860 it was 285,760 tons.

The creek which was discovered on Little Rennick’s Creek, near Burkesville, in Cumberland county, in 1829, when a flowing oil well (the “American well,” whose product was sold as “American oil” to heal rheumatic affections, bums, etc.) was struck, is one of the oldest taken off after a sand discovery in the “sixties at the mouth of Crocus Creek a small but steady amount of oil was got each year. Great pipe lines from Parkersburg, West Virginia, to Somerset, Pulaski county, and from Somerset to Lexington and Prestoburg and Prestoburg, had in 1902 a mileage of 275 m. The principal fields are in the “southern tier,” from Wayne to Allen county, including Barren county; farther east, Knox county, and Floyd and Knott counties; to the north-east the Radford field in Bath and Rowan counties on the Licking river. In 1902 the petroleum products in the state amounted to 246,930 barrels, valued at $172,837, a gain in quantity of 81.4% over 1901. Kentucky is the S.W. extreme of the natural gas region of the west flank of the Appalachian system; the greatest amount is found in Martin county in the east, and Breckinridge county in the north-west. The value of the state’s natural gas (published by the Department of Interior) in 1896, $286,243 in 1900, $365,611 in 1902, and $350,176 in 1907.

Iron ore has been found in several counties, and an iron furnace was built in Bath county, in the N.E. part of the state, as early as 1802. In 1809 it was in operation, and in 1902 it was mined only in Bath, Lyon and Trigg counties, of which the total output was 71,066 long tons, valued at $481,682; in 1907 only 25,000 tons were mined and valued at the mines at $35,000.

In 1808 there began an increased activity in the mining of fluor spar, and Crittenden, Fayette and Livingston counties produced in 1902, 29,070 tons (valued at $143,410) of this mineral. In 1902, 1903, 1904, 1905 and 1906, 179,000, 175,000, 180,000, 181,000 and 182,000 pieces of glass were made. The output in 1900, at $238,204,125, 52.1% of the product of the entire state, and showing an increase of 25.9% over the value of the city’s factory products in 1900. Ashland is the principal centre of the industry.

Minerals.— The mineral resources of Kentucky are considerable, though very little developed. The value of all manufactured products in 1900 was $154,166,385, and the value of manufactures based on the output of raw materials in 1900 was $10,294,788; the total value of mineral products was $19,294,341 in 1907. Bituminous coal is the principal mineral, and in 1907 Kentucky ranked second among the bituminous fields of the United States; in output in 1907 amounted to 10,753,124 short tons, and in 1902, to 6,766,684 short tons as compared with 2,396,755 tons produced in 1889. In 1902 the amount was about equally divided between the eastern and western coalfields. In 1907, the output of Kentucky coal ($5,004,572 in 1900) was $4,059,438, or, in 1907, $4,248,029, in 1900; $5,373,017 in 1905; packed meats ($5,177,167 in 1900; $6,063,731 in 1905); lard and machine shop products ($4,454,610 in 1898; $4,654,579 in 1900; $256,017 in 1907, $4,368,411 in 1900; $4,593,251 in 1905—an increase already remarked); carriages and wagons ($5,177,167 in 1900; $6,063,731 in 1905); lard and machine shop products ($4,454,610 in 1898; $4,654,579 in 1900; $3,386,277 in 1905; $3,673,678 in 1907). Other important manufactures (each with a product in 1905 of more than one million dollars) were cotton-seed oil and cake (in 1900 Kentucky was fifth among the cotton-producing states); jute, jute yarn, and jute cordage; cotton seed, cotton bleaching and cotton oil (in 1900 Kentucky was fifth among the cotton-growing states); cooperage, agricultural implements, boots and shoes, cigars 1

1 In the census of 1905 statistics for other than factory-made products, such as those of the hand trades, were not included.
were native born. The rugged east section of the state, a part of Appalachian America, is inhabited by a people of marked characteristics, portrayed in the fiction of Miss Murfuree ("Charles Egbert Craddock") and John Fox, Jr. They are nearly all of British—English and Scotch-Irish—descent, with a trace of Huguenot. They have good native ability, but through lack of communication with the world their progress has been retarded. Before the Civil War they were owned by land for the most part not owners of slaves, so that a social and political barrier, as well as the barriers of nature, separated them from the other inhabitants of the state. In their speech several hundred words persist which elsewhere have been obsolete for three centuries or occur only in dialects in England. Their life is still in many respects very primitive; their houses are generally built of logs, their clothes are often homespun, Indian corn and ham form a large part of their diet, and their means of transportation are the saddle-horse and sleds and wheelbarrows drawn by oxen or mules. In instincts and in character, also, the typical "mountaineers" are to a marked degree primitive; they are, for the most part, very ignorant; they are primitively hospitable and are warm-hearted to friends and strangers, but are implacable in their enmities and are prone to vendettas and family feuds, which often result in the killing in open fight or from ambush of members of one faction by members of another; and their relative seclusion and isolation has brought them, especially in some districts, to a disregard for law, do to a belief that they must execute justice with their own hands. This spirit of vendetta to the attitude of the law and revenue officers sent to discover and close illicit stills for the distilling from Indian corn of so-called "moon-shine" whisky (consisting largely of pure alcohol). The taking of life and "moon-shining," however, have become less and less frequent among them, and Berea College, at Berea, the Lincoln Memorial University, and other schools in Kentucky and adjoining states have done much to educate them and bring them more in harmony with the outside community.

The population of Kentucky is largely rural. However, in the decade between 1890 and 1900 the percentage of urban population (i.e., population of places of 4000 inhabitants or more) to the total population increased from 17.5 to 19.7 and the percentage of semi-urban (i.e., population of incorporated places with a population of less than 4000) to the total increased from 8.86 to 9.86%; but 48.3% of the urban population of 1900 was in the city of Louisville. In 1910 the following cities each had a population of more than 2,500: Covington (25,277), Louisville (32,735), Newport (30,309), Paducah (22,760), Owensboro (16,011), Henderson (11,452), Frankfort, the capital (10,456), Hopkinsville (9139), Bowling Green (9173), Ashland (8688), Middlesboro (7209), Winchester (7090), Euston (5873), Maysville (5157), Mayfield (5615), Paris (5859), Danville (5420), Richmond (5340). Of historical interest are Harrodsburg (260), the first permanent settlement in the state, and the county-seat of...
KENTUCKY.

idots and insane persons, all male citizens of the United States, who are at least 21 years of age, and have lived in the state one year, in the county six months, and in the voting precinct two months, are entitled to vote. The legislature provides for the registration in cities of the first, second, third and fourth classes—the minimum population for a city of the fourth class being 3000. Corporations are forbidden to contribute money for campaign purposes on penalty of forfeiting their charters, or, if not chartered in the state, their right to carry on business in the state. The executive is composed of a governor, a lieutenant-governor, a treasurer, an auditor of public accounts, a register of the land office, a commissioner of agriculture, labour, and statistics, a secretary of state, and a superintendent of public instruction. All are chosen by popular vote for four years and are ineligible for immediate re-election, and each must be at least 30 years of age and must have been a resident citizen of the state for two years next preceding his election.

If a vacancy occurs in the office of governor during the first two years a new election is held; if it occurs during the last two years the lieutenant-governor serves out the term. Lieutenant-governor Beckham, elected in 1900 to fill out the unexpired term of Governor Goebel (assassinated in 1900), was re-elected in 1903, the second term of his late predecessor. At the last regular election the constitutional prohibition on successive terms did not apply in such a case.

The governor is commander-in-chief of the militia when it is not called into the service of the United States; he may remit fines and forfeitures, commute sentences, and grant reprieves and pardons, except in cases of impeachment; and he calls extraordinary sessions of the legislature. His control of patronage, however, is not extensive, and his veto power is very weak. He may veto any measure including items in appropriation bills, but the legislature can repass such a measure by a simple majority of the total membership in each house. Among the various state administrative units, the board of the registration of nine members, the board of health of five members, a board of control of state institutions with four members, the board of police, the board of examination and the state election commission, the state election commission and the sinking fund commission of three members each. Legislative power is vested in a General Assembly, which consists of a Senate and a House of Representatives. Senators are elected for four years, one-half retiring every two years; representatives are elected for two years. The minimum age for a representative is 24 years, for a senator 30 years. There are thirty-eight senators and one hundred representatives. The Senate sits as a court for the trial of impeachment cases. A majority of either house constitutes a quorum, but as regards ordinary bills, on the third reading, not only must they receive a quorum, but the quorum is increased to not less than two-fifths of the total membership of the house. For the enactment of appropriation bills and bills creating a debt a majority of the total membership in each house is required. All revenue must originate in the House. The Senate may introduce amendments. There are many detailed restrictions on local and special legislation. The constitution provides for the elections of local officers and the registration of voters, but provision is not made for the election of all the judges. The one circuit court of each county has jurisdiction in civil cases involving not more than $500, and in criminal cases in which the fine does not exceed $500, or in which the felony is a misdemeanor. The court consists of two judges, elected for eight years.
KENTUCKY

there should have been established in each county of the state at least one County High School to which all common school graduates of the state are admitted without charge. Separate insti-
tutes for white and coloured teachers were created and attached to state high schools. The State Board of Examiners is good for life. A state certificate issued by the State Board of Examiners is good for eight years with one renewal. County certificates issued by the County Board of Examiners are of three years' duration, two as a renewal.

According to a school census there was in 1908-1909 a school population of 739,352, of which 587,051 were reported from the rural districts and 152,291 from the urban areas. The state population was 734,617, the average of public schools was 441,372, the average attendance was 260,843; there were approximately 3352 male and 3247 female white teachers and 1274 negro teachers; and the state expenditures for the purposes of education amounted to $809,997, of which sum $2,437,942.56 came from the state treasury.

What was formerly the State Agricultural and Mechanical College at Lexington became the State University by legislative enactment (1908); there is no tuition fee except in the School of Law. The State University has a Department of Education. The state main-
tains for the whites two State Normal Schools, which were established in 1896—1897, for the eastern district, at Richmond, and for the western district, at Bowling Green. Under the law estab-
lishing State Normal Schools, each county is entitled to one or more appointments of scholarships, one annually for every 300 white school children of the last school census. A Kentucky Normal and Industrial School (1886) for negroes is maintained at Frankfort. Among the private and denominational colleges in Kentucky are the University of Kentucky (State University), at Danville, Trans-
vylvania University, at Lexington; Georgetown College (Iroquois), at Georgetown; Kentucky Wesleyan College (M.E. South), at Win-
chester; and Berea College (non-sectarian) at Berea.

The five largest cities in the state are in this part of the country, suffered from over-speculation in land and railways during 1830-1850. The funded debt of the state amounted to four and one-half millions of dollars in 1850, when the new constitution limited the power of the legislature to contract further obliga-
tions or to decrease or disapprove the sinking funds. From 1850 to 1880 there was a gradual reduction except during the years of the Civil War, which has frequently produced annual deficits, which are, as a rule only nominal, since the total receipts exceed the total expenditures. In 1902 the net bonded debt, exclusive of about two millions of dollars held for educational purposes, was $1,171,394, but this debt was paid in full in the years immediately following. The sinking fund commission is composed of the governor, attorney-general, secretary of state, auditor and treasurer. The first banking currency in Kentucky was issued in 1802 by a co-operative insurance company established by Mississippi Valley traders. The Bank of Kentucky, established at Frankfort in 1806, had a monopoly for several years. In 1818-1820 the legislature chartered 46 banks, nearly all of which went into liquidation during the panic of 1819. The Bank of the Commonwealth was chartered in 1820 as a state institution and the charter of the Bank of Kentucky was revoked in 1822. A court decision in favor of the lender notes the fact that the Bank of the Commonwealth gave rise to a bitter controversy which had considerable influence upon the political history of the state. This bank failed in 1829. In 1834 the legislature chartered the Bank of Louisville, successor to the Bank of Kentucky, the Bank of Lexington and the Bank of Frankfort. These institutions survived the panic of 1837, and soon came to be recognized as among the most prosperous and the most conservative banks west of the Alleghenies. The state banking laws are stringent and most of the business is still controlled by banks operating under state charters.

History.—The settlement and the development of that part of the United States west of the Alleghany Mountains has probably been the most notable feature of American history since the close of the Seven Years' War (1763). Kentucky was the first settle-
ment in this movement, the first state west of the Alleghany Mountains admitted into the Union. In 1763 the latter part of the country was claimed by the Cherokee as a part of their hunting grounds, by the Six Nations (Iroquois) as a part of their western conquests, and by Virginia as a part of the territory granted to her by her charter of 1609, although it was actually inhabited only by a few Chickasaws near the Mississippi river and by a small tribe of Shawnees in the north, opposite what is now Ports-
mouth, Ohio. The early settlers were often attacked by Indian raiders from what is now Tennessee or from the country north of the Ohio, but the work of colonization would have been far more difficult if those Indians had lived in the Kentucky region itself.

Dr Thomas Walker (1715-1794), as an agent and surveyor of the Loyal Land Company, made an exploration in 1750 into the present state from the Cumberland Gap, in search of a suitable place for settlement but did not get beyond the mountain region. In the next year Christopher Gist, while on a similar mission for the Ohio Company, explored the country westward from the mouth of the Scioto river. In 1756 John Finley, an Indian trader, descended the Ohio river in a canoe to the site of Louis-
ville. It was Finley's descriptions that attracted Daniel Boone, and soon after Boone's first visit, in 1767, travellers through the Kentucky region were heard of bringing back glowing tales of the概况 of the land. The English settlement was established at Harrodsburg in 1774 by James Harrod, and in October of the same year the Ohio Indians, having been defeated by Virginia troops in the battle of Point Pleasant (in what is now West Virginia), signed a treaty by which they surrendered their claims south of the Ohio river. In March 1775 Richard Henderson and some North Carolina land speculators met about 1200 Cherokee Indians in council on the Watauga river and concluded a treaty with them for the purchase of all the territory south of the Ohio river and between the Kentucky and the Watauga rivers in 1775. The purchase was named Transyl-
vania, and within less than a month after the treaty was signed, Boone, under its auspices, founded a settlement at Boones-
borough which became the headquarters of the colony. The title was declared void by the Virginia government in 1778, but Henderson and his associates received 200,000 acres in com-
ensation, and all sales made to actual settlers were confirmed.

During the War of Independence the colonists were almost entirely neglected by Virginia and were compelled to defend them-
selves against the Indians who were often under British leader-
ship. In 1778 Boonesborough was attacked in April and in July 1777 and in August 1777. In 1778, Henderson, who had founded the settlement of Boonesbor-

The title was declared void by the Virginia government in 1778, but Henderson and his associates received 200,000 acres in com-
ensation, and all sales made to actual settlers were confirmed. During the War of Independence the colonists were almost entirely neglected by Virginia and were compelled to defend them-
selves against the Indians who were often under British leader-
ship. In 1778 Boonesborough was attacked in April and in July 1777 and in August 1777. In 1778, Henderson, who had founded the settlement of Boonesbороgh, was besieged in August 1783 by about 600 Indians under the notorious Simon Girty, who after raising the siege drew the defenders, numbering fewer than 200, into an ambush and in the battle of Blue Licks which ensued the Kentuckians lost about 67 killed and 7 prisoners. Kentucky county, practically cot-

minous with the present state of Kentucky and embracing all the territory claimed by Virginia south of the Ohio river and west of Big Sand Creek and the ridge of the Cumberland Mountains, was one of three counties which was formed out of the land of the Indians in 1775. Four years later, this in turn was divided into three counties, Jefferson, Lincoln and Fayett, but the name Kentucky was revived in 1782 and was given to the judicial district which was then organized for these three counties. The War of Independence was followed by an extensive immigration from Virginia, Maryland and North Carolina\(^2\) of a popu-
l
d 0\% of which fully 95%, excluding negro slaves, were of pure English, Scotch or Scotch-Irish descent. The manners, customs and institutions of Virginia were transplanted beyond the mountains. There was the same political rivalry between the old settlers and the small farmers of the Blue Grass Region and the "poor whites" of the mountain districts that there was in Virginia between the tide-water planters and the mountainiers. Between these extremes were the small farmers of the "Barrens"\(^3\) in Kentucky and of the Piedmont Region in Virginia. The aristocratic influences in both states have always been on the Southern and Democratic side, but while they were strong enough in Virginia to lead the state into secession they were unable to do so in Kentucky.

\(^{1}\) Most of the early settlers of Kentucky made their way thither either by the Ohio river (from Fort Pitt) or—the far larger number—by the route of the Cumberland Gap and the Southern Overland Trail. Their latter route began at Ingles's Ferry, on the New river, in what is now West Virginia, and proceeded west by south to the Cumberland Gap. The "Wilderness Road," as marked by Daniel Boone in 1775, was a mere trail, running from the Watauga settlement in east Tennessee to the Cumberland Gap, and thence by way of what are now Crab Orchard, Danville and Bardstown, to the Falls of the Ohio, and was passable only for men and horses until 1799, when the state made it a wagon road. Consult Thomas Speed, The Wilderness Road (Louisville, Ky., 1886), and Archer B. Hulbert, Boone's Wilderness Road (Cleveland, O., 1903).

\(^{2}\) The "Barrens" are a part of the state west of the Blue Grass Region, and were so called merely because the Indians had burned most of the forests here in order to provide better pastureage for buffaloes and other game.
At the close of the War of Independence the Kentuckians complained because the mother state did not protect them against their enemies and did not give them an adequate system of local government. Nine conventions were held at Danville from 1784 to 1790 to demand separation from Virginia. The Virginia authorities expressed a willingness to grant the demand provided Congress would admit the new district into the Union as a state. The delay, together with the proposal of John Jay, the Secretary for Foreign Affairs and commissioner to negotiate a compact with Virginia, led the Spanish envoy, to surrender navigation rights on the lower Mississippi for twenty-five years in order to remove the one obstacle to the negotiations, aroused so much feeling that General James Wilkinson and a few other leaders began to intrigue not only for a separation from Virginia, but also from the United States, and for the formation of a close alliance with the Spanish at New Orleans. Although most of the settlers were too loyal to be led into such a plot they generally agreed that it might have a good effect by bringing pressure to bear upon the Federal government. Congress passed a preliminary act in February 1791, and the state was formally admitted into the Union on the 1st of June 1792. In the Act of 1792 for dividing Fincastle county, Virginia, the ridge of the Cumberland Mountains was named as a part of the east boundary of Kentucky; and now that this ridge had become a part of the boundary between the states of Virginia and Kentucky they, in 1799, appointed a joint commission to run the boundary line on this ridge. A dispute with Tennessee over the southern boundary was settled in a similar manner in 1820.1 The constitution of 1792 provided for manhood suffrage and for the election of the governor and of senators by an elected board of trustees. Shelby was the first governor of the new state. The people still continued to have troubles with the Indians and with the Spanish at New Orleans. The Federal government was slow to act, but its action when taken was effective. The power of the Indians was overthrown by General Anthony Wayne’s victory in the battle of Fallen Timbers, fought the 20th of August 1794 near the rapids of the Maumee river a few miles above the site of Toledo, Ohio; and the Mississippi question was settled temporarily by the treaty of 1795 and permanently by the purchase of Louisiana in 1803. In 1798–1799 the legislature passed the famous Kentucky Resolutions in protest against the alien and sedition acts.

For several years the Anti-Federalists or Republicans had contended that the administration at Washington had been exercising powers not warranted by the constitution, and when Congress had passed the alien and sedition laws the leaders of that party seized upon the event as a proper occasion for a spirited public protest which took shape principally in resolutions passed by the legislatures of Kentucky and Virginia. The original draft of the Kentucky Resolutions of 1798 was prepared by Vice-President Thomas Jefferson, although the fact that he was the author of them was kept from the public until he acknowledged it in 1821. They were introduced in the House of Representatives by John Breckinridge on the 8th of November, were passed by that body with some amendments but with only one dissenting vote on the 10th, were unanimously concurred in by the Senate on the 13th, and were approved by Governor James Garrard on the 16th. The first resolution was a statement of the ultra states’-rights view of the relation of the states to the Federal government2 and subsequent resolutions declare the alien and sedition laws unconstitutional and therefore “void and of no force,” principally on the ground that they provided for an exercise of powers which were reserved to the state. The resolutions further declare that “this Commonwealth is determined, as it doubts not its co-states are, namely to submit to undelegated and therefore unlimited powers in no man or body of men on earth,” and that these and successive acts of the same character, unless arrested on the threshold, may tend to destroy the Constitution, the source, and end, and the rights of the people. Copies of these resolutions were sent to the governors of the various states, to be laid before the different state legislatures, and replies were received from Connecticut, Delaware, Massachusetts, New Hampshire, New York, Rhode Island, Vermont and Virginia, but all except that from Virginia were unfavourable. Nevertheless the Kentucky legislature on the 22nd of November 1799 reaffirmed in a new resolution the principles it had laid down in the first series, asserting in this new resolution that the state “does now unequivocally declare its attachment to the Union, and to the Constitution, and faithfully to obey its obvious and real intention, and will be among the last to seek its dissolution,” but that “the principle and construction contended for by sundry of the state legislatures, that the General Government is the exclusive judge of the extent of the powers delegated to it, stop nothing [short of] despotism—since the discretion of those who administer the government, and not the Constitution, would be the measure of their powers,” “that the several states which formed that instrument, being sovereign and independent, have the unquestionable right to judge of the infraction,” and “that a multiplication of those sovereignties which acts done under color of delegation do not perform is the rightful remedy.” These measures show that the state was Democratic-Republican in its politics and pro-French in its sympathies, and that it was inclined to follow the leadership of that state from which most of its people had come.

The constitution of 1799 adopted the system of choosing the governor and senators by popular vote and deprived the supreme court of its original jurisdiction in land cases. The Burr conspiracy (1804–1806) aroused some excitement in the state. Many would have followed Burr in a filibustering attack upon the Spanish in the South-West, but scarcely any would have approved of a separation of Kentucky from the Federal Union. No battles were fought in Kentucky during the War of 1812, but her troops constituted the greater part of the forces under General William Henry Harrison. They took part in the operations at Fort Wayne, Fort Meigs, the river Raisin and the Thames.

The Democratic-Republicans controlled the politics of the state without any serious opposition until the conflict in 1820–1826, arising from the demands for a more adequate system of currency and other measures for the relief of the debtors. They declared the state into what were known as the relief and anti-relief parties. After nearly all the forty-six banks chartered by the legislature in 1818 had been wrecked in the financial panic of 1819, the legislature in 1820 passed a series of laws designed for the benefit of the debtor class, among them one making state bank notes a legal tender for all debts. A decision of the Clark county district court declaring this measure unconstitutional was affirmed by the court of appeals. The legislature in 1824 repealed all of the laws creating the existing court of appeals and then established a new one. This precipitated a bitter campaign.
between the anti-relief or "old court," party and the relief or "new court," party, in which the former was successful. The old court party followed the lead of Henry Clay and John Quincy Adams in national politics, and became National Republicans and later Whigs. The new court party followed Andrew Jackson and Martin Van Buren and became Democrats. The electoral vote of the state was cast for Jackson in 1828 and for Clay in 1832. During the next thirty years Clay's conservative influence dominated the politics of the state. Kentucky voted the Whig ticket in every presidential election from 1852 until the party made its last campaign in 1854. When the Whigs were destroyed by the slavery issue some of them immediately became Democrats, but the majority became Americans, or Know-Nothings. They elected the governor in 1855 and almost succeeded in carrying the state for their presidential ticket in 1856. In 1860 the people of Kentucky were drawn toward the South by their interest in slavery and by their social relations, and toward the North by business ties and by a national sentiment which was fostered by the Clay traditions. They naturally assumed the leadership in the Constitutional Union movement of 1860, casting the vote of the state for Bell and Lamborn.

After the election of President Lincoln they also led in the movement to secure the adoption of the Crittenden Compromise or some other peaceable solution of the difficulties between the North and the South.

A large majority of the state legislature, however, were Democrats, and in his message to this body, in January 1861, Governor Magoffin, also a Democrat, proposed that a convention be called to determine "the future of Federal and inter-state relations of Kentucky," later too, in reply to the president's call for volunteers, he declared, "Kentucky will furnish no troops for the wicked purpose of subduing her sister Southern States." Under these conditions the Unionists asked only for the maintenance of neutrality, and a resolution to this effect was carried by a bare majority—48 to 47. Some of the secessionists took this as a defeat and left the state immediately to join the Confederate ranks. In the next month there was an election of congressmen, and an anti-secession candidate was chosen in nine out of ten districts. An election in August of one-half the Senate and all of the House of Representatives resulted in a Unionist majority in the new legislature of 103 to 35, and in September, at the call of the state troops, had begun to invade the state, Kentucky formally declared its allegiance to the Union. From September 1861 to the fall of Fort Donelson in February 1862 that part of Kentucky which is south and west of the Green River was occupied by the Confederate army under General A. S. Johnston, and at Russellville in that district a so-called "sovereignty convention" assembled on the 18th of November. This body, composed mostly of Kentucky men who had joined the Confederate army, passed an ordinance of secession, elected state officers, and sent commissioners to the Confederate Congress, whose bond, voted on the 9th of December to admit Kentucky into the Confederacy. Throughout the war Kentucky was represented in the Confederate Congress—representatives and senators being elected by Confederate soldiers from the state. The officers of this "provisional government," headed by G. W. Johnson, who had been elected "governor," left the state when General A. S. Johnston withdrew; Johnson himself was killed at Shiloh, but an attempt was subsequently made by General Bragg to install this government at Frankfort. General Felix K. Zollicoffer (1812–1863) had entered the south-east part of the state through Cumberland Gap in September, and later with a Confederate Mountain regiment attempted the invasion of central Kentucky, but in October 1861 he met with a slight repulse at Wild Cat Mountain, near London, Laurel county, and on the 19th of January 1862, in an engagement near Mill Springs, Wayne county, with about an equal force under General George H. Thomas, he was killed and his force was utterly routed. In 1862 General Braxton Bragg in command of the Confederates in eastern Tennessee, eluded General Don Carlos Buell, in command of the Federal Army of the Ohio stationed there, and entering Kentucky in August 1862 proceeded slowly toward Louisville, hoping to win the state to the Confederate cause and gain recruits for the Confederacy in the state. His main army was preceded by a division of about 15,000 men under General Edmund Kirby Smith, who on the 30th of August defeated a Federal force under General Wm. Nelson near Richmond and threatened Cincinnati. Bragg met with little opposition on his march, but Buell, also marching from Minnesota under General Buell, turned on Bragg, and forced him to withdraw. On his retreat, Bragg attempted to set up a Confederate government at Frankfort, and Richard J. Hawes, who had been chosen as G. W. Johnson's successor, was actually "inaugurated," but naturally this state "government" immediately collapsed. On the 8th of October Buell and Bragg fought an engagement at Perryville which, though tactically indecisive, was a strategic victory for Buell; and thereafter Bragg withdrew entirely from the state into Tennessee. This was the last serious attempt on a large scale by the Confederates to win Kentucky; but in February 1863 one of General John H. Morgan's bands made a raid on Mount Sterling and captured it; in March General Pegram made a raid into Pulaski county; in March 1864 General N. B. Forrest assaulted Fort Anderson at Paducah but failed to capture it; and in June General Morgan made an unsuccessful attempt to take Lexington.

Although the majority of the people sympathized with the Union, the emancipation of the slaves without compensation even to loyal owners, the arming of negro troops, the arbitrary imprisonment of citizens and the interference of Federal military officials in purely civil affairs aroused so much feeling that the state became strongly Democratic, and has remained so almost uniformly since the war. Owing to the panic of 1863, distrust of the free silver movement and the expenditure of large campaign funds, the Republicans were successful in the gubernatorial election of 1895 and the presidential election of 1896. The election of 1899 was disputed. William S. Taylor, Republican, was inaugurated governor on the 12th of December, but the legislative committee on contests decided in favour of the Democrats. Governor-elect Goebel was shot by an assassin on the 30th of January 1900, was sworn into office on his deathbed, and died on the 3rd of February. Taylor fled the state to escape trial on the charge of murder. Lieutenant-Governor Beckham filled out the unexpired term and was re-elected in 1900. In 1907 the Republicans again elected their candidate for governor.

KENYA—KENYON

Governors of Kentucky—continued

William O. Bradley
Republican
1895-1899
1899-1900
William S. Taylor

William Goebel*

J. C. W. Beckham

Augustus E. Wilcox

* Died in office.
† Governor Crittenden resigned on the 31st of July to become Attorney-General of the United States and John L. Helm sold out the unexpired term.

President Lincoln resigned on the 13th of February 1871 to become U.S. Senator from Kentucky. P. H. Leslie filled out the remainder of the term and was elected in 1871 for a full term.

Taylor's election was contested by Goebel, who received the certificate of election.

BIBLIOGRAPHY. For descriptions of physical features and accounts of natural resources see Reports of the Kentucky Geological Survey, the Biennial Reports of the Bureau of Agriculture, Labor and Statistics; the Reports of the United States Census and various publications of the U.S. Geological Survey, and other publications listed in Bulletin 301 (Bibliography and Index of North American Geology (or 1901-1905) and other bibliographies of the Survey. For an early description, see Gilbert Imlay, A Topographical Description of the Western Territory of North America (London, 3rd ed., 1797), in which John Filson's "Discovery, Settlement and Present State of Kentu

The most important ridges centre in the peak Lenana (16,900 ft.) at the eastern end of the central group, and through it runs the chief water-parting of the mountain, in a generally north to south direction. Three main valleys, known respectively as Hinde, Gorges and Hobley valleys, run down from this to the east, and four—Mackinder, Hausberg, Teleki and Höhnel—to the west. From the central peaks fifteen glaciers, all lying west of the main ridge, descend to the north and south of the lower two, which are in the plains, and Gregory and Lewis glaciers, each about 1 m. long, which, with the smaller Kolb glacier, lie immediately west of the main divide. Most of the glaciers terminate at an altitude of 14,800–14,900 ft., but the small César glacier, drained to the Hausberg valley, reaches to 14,500 ft. Glaciation was formerly much more extensive, old moraines being observed down to 12,000 ft. In the upper parts of the valleys a number of lakes occur, occupying hollows and rock basins in the agglomerates and ashes, fed by springs, and feeding many of the streams that drain the mountain slopes.

The largest of these are Lake Höhnel, lying at an altitude of both the shaft and butt of the higher lift is present close and with those of Mount Elgon, of other mountains of East Africa and of Cameroon Mountain. The true native names of the mountain are said to be Kilinyaga, Doenyo Ebor (white mountain) and Doeny Egeri (spotted mountain). It was first seen, from a distance, by the missionary Ludwig Krapf in 1849; approached from the west by Joseph Thomson in 1883; partially ascended by Count S. Teleki (1859), J. W. Gregory (1893) and Georg Kolb (1896); and its summit reached by H. J. Mackinder in 1899.

KENYON, LLOYD KENYON, 1ST BARON (1732-1822), lord chief-justice of England, was descended by his father's side from an old Lancashire family; his mother was the daughter of a small proprietor in Wales. He was born at Gredington, Flintshire, on the 5th of October 1732. Educated at Rushin grammar school, he was in his fifteenth year articled to an attorney at Nantwich, Cheshire. In 1750 he entered at Lincoln's Inn, London, and in 1756 was called to the bar. As for several years he was almost unemployed, he utilized his leisure in taking notes of the cases argued in the Court of King's Bench, which were afterwards published. Through answering the cases of his friend John Dunning, afterwards Lord Ashburnham, he gradually became known to the attorneys, after which his success was so rapid that in 1780 he was made king's counsel. He showed conspicuous ability in the cross-examination of the witnesses at the trial of Lord George Gordon, but his speech was so tactless that the verdict of acquittal was really due to the brilliant effort of Erskine, the junior counsel. This want of tact, indeed, often betrayed Kenyon into striking blunders; as an advocate he was,
moreover, deficient in ability of statement; and his position was achieved chiefly by hard work, a good knowledge of law and several lucky friendships. Through the influence of Lord Thurlow, Kenyon in 1780 entered the House of Commons as member for Hindon, and in 1782 he was, through the same friendship, appointed attorney-general in Lord Buckingham's administration, an office which he continued to hold under Pitt. In 1784 he received the mastership of the rolls, and was created a baronet. In 1788 he was appointed lord chief justice as successor to Lord Mansfield, and the same year was raised to the peerage as Baron Kenyon of Gredington. As he had made many enemies, his elevation was by no means popular with the bar; but on the bench, in spite of his capricious and choleric temper, he proved himself not only an able lawyer, but a judge of rare and inflexible impartiality. He died at Bath, on the 4th of April 1802. Kenyon was succeeded as 2nd baron by his son George (1776-1855), whose great-grandson, Lloyd (b. 1864), became the 4th baron in 1899. See Life by Hon. G. T. Kenyon, 1873.

KEOKUK, a city of Lee county, Iowa, U.S.A., on the Mississippi river, at the mouth of the Des Moines, in the S.E. corner of the state, about 200 m. above St. Louis. Pop. (1900), 14,641; (1900), 14,008. It is served by the Chicago, Burlington & Quincy, the Chicago, Rock Island & Pacific, the Wabash, and the Toledo, Peoria & Western railways. There is a bridge (about 2200 ft. long) across the Mississippi, and another (about 1200 ft. long) across the Des Moines. The city has a public library and St. Joseph and Graham hospitals, and is the seat of the Keokuk Medical College (1849). There is a national cemetery here. Much of the city is built on bluffs along the Mississippi. Keokuk is at the foot of the Des Moines Rapids, round which the Federal Government has constructed a navigable canal (opened 1837) about 90 m. long. It descends at extreme low water of 5 ft.; at the foot a great dam, 1 ½ m. long and 38 ft. high, has been constructed. Keokuk has various manufactures; its factory product in 1905 was valued at $4,225,915, 38.6% more than in 1900. The city was named after Keokuk, a chief of the Sauk and Foxes (1780-1848), whose name meant "the watchful" or "he who moves alertly." In spite of Black Hawk's war policy in 1832 Keokuk was passive and neutral, and with a portion of his nation remained peaceful while Black Hawk and his warriors fought. His grave, surrounded by a monument, is in Rand Park. The first of the city was in 1820, but further settlement did not begin until 1836. Keokuk was laid out as a town in 1837, was chartered as a city in 1848, and in 1907 was one of five cities of the state governed by a special charter.

KEONJHAR, a tributary state of India, within the Orissa division of Bengal; area, 3006 sq. m.; pop. (1901), 285,738; estimated revenue, $50,000. The state is an offshoot from Mayurbhanj. Part of it consists of rugged hills, rising to more than 3000 ft. above sea-level. The residence of the raja is at Keonjhar (pop. 4532).

KEONTHAL, a petty hill state in the Punjab, India, with an area of 116 sq. m.; pop. (1901), 29,499; estimated revenue, $4400. The chief, a Rajput, received the title of raja in 1857. After the Gurkha War in 1814, a portion of Keonthal, which had been occupied by the Gurkhas, was sold to the maharaja of Patiala, the remaining being restored to its hereditary chief. In 1834 the district of Panur was added to the Keonthal state. The raja exercises rights of lordship over the petty states of Kotli, Theog, Madhan and Ratesh.

KEPLER, JOHANN (1571-1630), German astronomer, was born on the 27th of December 1571, at Wel, in the duchy of Württemberg, of which town his grandfather was burgomaster. He was the eldest child of an ill-assorted union. His father, Henry Kepler, was a reckless soldier of fortune; his mother, Catherine Guddenmann, the daughter of the burgomaster of Eltingen, was undisciplined and ill-educated. Her husband found campaigning in Flanders under Alva a welcome relief from domestic life; and, after having lost all he possessed by a forfeited security and tried without success the trade of tavern-keeping in the village of Elmendingen, he finally, in 1589, deserted his family. The misfortune and misconduct of his parents were not the only troubles of Kepler's childhood. He recovered from small-pox in his fourth year with crippled hands and eyesight permanently impaired; and a constitution enfeebled by premature birth had to withstand successive shocks of severe illness. His schooling began at Leonberg in 1577,—the year, as he himself tells us, of a great comet; but domestic bankruptcy occasioned his transference to field-work, in which he was exclusively employed for several years. Bodily infirmity, combined with mental aptitude, were eventually considered to indicate a theological vocation; he was, in 1594, placed at the university in Strasbourg. Two years later, in 1596, he took the degree of Maulbronn. A brilliant examination for the degree of bachelor procured him in 1598, admittance on the foundation to the university of Tübingen, where he laid up a copious store of classical erudition, and imbibed Copernican principles from the private instructions of his teacher and life-long friend, Michael Maestlin. As yet, however, he had little knowledge of, and less inclination for, astronomy; and it was with extreme reluctance that he turned aside from the more promising career of the ministry to accept, early in 1594, the vacant chair of that science at Gratz, placed at the disposal of his benefactor the Lord-bishop of the Lusatian states.

The best recognized function of German astronomers in that day was the construction of prophesying almanacs, greedily bought by a credulous public. Kepler thus found that the first duties required of him were of an astrophological nature, and set himself with characteristic alacrity to master the rules of the art as laid down by Ptolemy and Cardan. He, moreover, sought in the events of his own life a verification of the theory of planetary influences; and it is to this practice that we owe the summary record of each year's occurrences which, continued almost to his death, affords for his biography a slight but sure foundation. But his thoughts were already working in a higher sphere. He early attained to the settled conviction that for the actual disposition of the solar system some abstract intelligible reason must exist, and this, after much meditation, he believed himself to have found in an imaginary relation between the "five regular solids" and the number and distances of the planets. He notes with exultation the 9th of July 1595, as the date of the pseudo-discovery, the publication of which in Promotissimorum Cosmographicarum seu Mysterium Cosmographicum (Tübingen, 1596) procured him much fame, and a friendly correspondence with the two most eminent astronomers of the time, Tycho Brahe and Galileo.

Soon after his arrival at Gratz, Kepler contracted an engagement with Barbara von Mühlbeck, a wealthy Styrain heiress, who, at the age of twenty-three, had already survived one husband and been divorced from another. Before her relatives could be brought to countenance his pretensions, Kepler was obliged to undertake a journey to Würtemberg to obtain documentary evidence of the somewhat obscure nobility of his family, and it was thus not until the 27th of April 1597 that the marriage was celebrated. In the following year the archduke Ferdinand, on assuming the government of his hereditary dominions, issued an edict of banishment against Protestant preachers and professors. Kepler immediately fled to the Hungarian frontier, but, by the favour of the Jesuits, was recalled and reinstated in his post. The gymnasium, however, was deserted; the nobles of Styria began to murmur at subsidizing a teacher without pupils; and he found it prudent to look elsewhere for employment. His refusal to subscribe unconditionally to the rigid formula of belief adopted by the theologians of Tübingen permanently closed against him the gates of his alma mater. His embarrassment was relieved however by an offer from Tycho Brahe of the position of assistant in his observatory near Prague, which, after a preliminary visit of four months, he accepted. The arrangement was made just in time; for in August 1600 he received definite notice to leave Gratz, and, having leased his wife's property, he departed with his family for Prague.

By Tycho's unexpected death (Oct. 24, 1601) a brilliant career seemed to be thrown open to Kepler. The emperor Rudolph II.
immediately appointed him to succeed his patron as imperial mathematician, although at a reduced salary of 500 florins; the invaluable treasure of Tycho's observations was placed at his disposal; and the laborious but congenial task was entrusted to him of completing the tables to which the grateful Dane had already affixed the title of Rudolphine. The first works executed by him at Prague were, nevertheless, a homage to the astronomical prophecies of the emperor. In De fundamentis astronomiae solaris (Prague, 1602) he declared his purpose of preserving and to a large extent, of truth. In adopted the theory he drew his observations on a brilliant star which appeared suddenly (Sept. 30, 1604), and remained visible for seventeen months, in De stella nova in pede Serpentarii (Prague, 1606). While sharing the opinion of Tycho as to the origin of such bodies by condensation of nebulous matter from the Milky Way, he attached a mystical significancy to the coincidence in time and place of the sidereal apparition with a triple conjunction of Mars, Jupiter and Saturn. The main task of his life was not meanwhile neglected. This was nothing less than the foundation of a new astronomy, in which physical cause should replace arbitrary hypothesis. A preliminary study of optics led to the publication, in 1604, of his Astronomiae pars optica, containing important discoveries in the theory of vision, and a notable approximation towards the true law of refraction. But it was not until 1609 that, the "great Martian labour" being at length completed, he was able, in his own figurative language, to lead the captive planet to the foot of the imperial throne. From the time of his first introduction to Tycho he had devoted himself to the investigation of the orbit of Mars, which, on account of its large eccentricity, had always been especially recalcitrant to theory, and the results appeared in Astronomia nova aevi novae, seu Physica coelestis nova traditionis commentarius de motibus stellae Martis (Prague, 1609). In this, the most memorable of Kepler's multifarious writings, two of the cardinal principles of modern astronomy—the laws of elliptical orbits and of equal areas—were established (see Astronomy: History); important truths relating to gravity were enunciated, and the tides ascribed to the influence of lunar attraction; while an attempt to explain the planetary revolutions in the then backward condition of mechanical knowledge produced a theory of vortices closely resembling that afterwards adopted by Descartes. Having been provided, in August 1610, by Ernest, archbishop of Cologne, with one of the new Galilean instruments, Kepler began, with unpeakable delight, to observe the wonders revealed by it. He had welcomed with a little essay called Dissertatio cum Nuncio Sidereo Galilei's first announcement of celestial novelties; he now, in his Dieoptrice (Augsburg, 1611), explained the theory of refraction by lenses, and suggested the principle of the "astronomical" or inverting telescope. Indeed the work may be said to have founded the branch of science to which it gave its name.

The year 1611 was marked by Kepler as the most disastrous of his life. The death by small-pox of his favourite child was followed by that of his wife, who, long a prey to melancholy, was on the 3rd of July carried off by typhus. Public calamity was added to private bereavement. On the 23rd of May 1611 Matthias, brother of the emperor, assumed the Bohemian crown in Prague, compelling Rudolph to take refuge in the citadel, where he died on the 20th of January following. Kepler's fidelity in remaining with him to the last did not deprive him of the favour of his successor. Payments of arrears, now amounting to upwards of 4000 florins, was not, however, in the desperate condition of the imperial finances, to be hoped for; and he was glad, while retaining his place as court astronomer, to accept in 1613 the office of mathematician to the states of Upper Austria. His residence at Linz was troubled by the harsh conduct of the pastor Hitzeler, in excluding him from the rites of his church on the ground of supposed Calvinistic leanings—a decision confirmed, with the addition of an insulting reprimand, on his appeal to Würtemberg. In 1613 he appeared with the emperor Matthias before the diet of Ratisbon as the advocate of the introduction into Germany of the Gregorian calendar; but the attempt was for the time frustrated by anti-papal prejudice. The attention devoted by him to chronological subjects is evidenced by the publication about this period of a treatise in which he sought to prove that the birth of Christ took place five years earlier than the commonly accepted date.

Kepler's second courtship forms the subject of a highly characteristic letter addressed by him to Baron Stralendorf, in which he reviews the qualifications of eleven candidates for his hand, and explains the reasons which decided his choice in favour of a portionless orphan girl named Susanna Reutlinger. The marriage was celebrated at Linz, on the 30th of October 1613, and seems to have proved a happy and suitable one. The abundant vintage of that year drew his attention to the defective methods in use for estimating the cubical contents of vessels, and his essay on the subject (Nova Stereometria Dolorum, Linz, 1615) entitles him to rank among those who prepared the discovery of the infinitesimal calculus. His observations on the three comets of 1618 were published in De Comitis, contemporaneously with De Harmonica Mundi (Augsburg, 1619), of which the first lineaments had been traced twenty years previously at Grazt. This extraordinary production is memorable as having announced the discovery of the "third law"—that of the sesquiplicate ratio between the planetary periods and distances. But the main purport of the treatise was the exposition of an elaborate system of celestial harmonies depending on the various and varying velocities of the several planets, of which the sentient soul animating the sun was the solitary auditor. The work exhibiting this fantastic emulation of extravagance with genius was dedicated to James I. of England, and the compliment was acknowledged with an invitation to that island, conveyed through Sir Henry Wotton. Notwithstanding the distracted state of his own country, he refused to abandon it, as he had previously, in 1617, declined the post of successor to G. A. Magini in the mathematical chair of Bologna.

The insurmountable difficulties presented by the lunar theory forced Kepler, after an enormous amount of fruitless labour, to abandon his design of comprehending the whole scheme of the heavens in one great work to be called Hipparcos, and he then threw a portion of his materials into the form of a dialogue intended for the instruction of general readers. The Epitome Astronomiae Copernicae (Linz and Frankfurt, 1618-1621), a lucid and attractive textbook of Copernican science, was remarkable for the prominence given to "physical astronomy," as well as for the extension to the Jovian system of the laws recently discovered to regulate the motions of the planets. The first of a series of ephemerides, calculated on these principles, was published by him at Linz in 1617; and in that for 1620, dedicated to Baron Napier, he for the first time employed logarithms. This important invention was eagerly welcomed by him, and its theory formed the subject of a treatise entitled Chilias Logarithmorum, printed in 1624, but circulated in manuscript three years earlier, which largely contributed to bring the new method into general use in Germany.

His studies were interrupted by family trouble. The restless
disposition and unbridled tongue of Catherine Kepler, his mother, created for her numerous enemies in the little town of Leonberg; while her unguarded conduct exposed her to a species of calumny at that time readily circulated and believed. As early as 1615 suspicions of sorcery began to be spread against her, which she, with more spirit than prudence, met with an action for libel. The suit was purposefully protracted, and at length, in 1620, the un-hanged woman, then in her seventy-fourth year, was tried for a formal charge of witchcraft. Kepler immediately hastened to Württemberg, and owing to his indefatigable exertions she was acquitted after having suffered thirteen month's imprisonment, and endured with undaunted courage the formidable ordeal of "territorium," or examination under the imminent threat of torture. She survived her release only a few months, dying on the 13th of April 1622.

Kepler's whole attention was now devoted to the production of the new tables. "Germany," he wrote, "does not long for peace more anxiously than I do for their publication." But financial difficulties, combined with civil and religious convulsions, long delayed the accomplishment of his desires. From the 24th of June to the 29th of August 1620, Linz was besieged, and its inhabitants reduced to the utmost straits by bands of insurgent peasants. The pursuit of science needed a more tranquil shelter; and on the raising of the blockade, Kepler obtained permission to transfer his types to Ulm, where, in September 1627, the Rudolphine Tables were at length given to the world. Although by no means free from errors, their value appears from the fact that they ranked for a century as the best aid to astronomy. As a result of a trip to Augsburg, containing a journey to Langenburg (1625); i.e., to Tycho's catalogue of 777 stars, enlarged by Kepler to 1005. Kepler's claims upon the insomniac exchequer amounted by this time to 12,000 florins. The emperor Ferdinand II., too happy to transfer the burden, countenanced an arrangement by which Kepler entered the service of the duke of Friedland (Wallenstein), who assumed the full responsibility of the debt. In July 1628 Kepler accordingly arrived with his family at Sagan in Silesia, where he applied himself to the printing of his ephemerides up to the year 1636, and whence he issued, in 1639, a Notice to the Curious in Things Celestial, warning astronomers of approaching transits. That of Mercury was actually seen by Gassendi in Paris on the 7th of November 1631 (being the first passage of a planet across the sun ever observed); that of Venus, predicted for the 6th of December following, was invisible in western Europe. Wallenstein's promises to Kepler were but imperfectly fulfilled. In lieu of the sums due, he offered him a professorship at Rostock, which Kepler declined. An expedition to Ratisbon, undertaken for the purpose of representing his case to the diet, terminated his life. Shaken by the journey, which he had performed entirely on horseback, he was attacked by the fever, and died at Ratisbon on the 15th of November (N.S.), 1630, in the fifty-ninth year of his age. An inventory of his effects showed him to have been possessed of no inconsiderable property at the time of his death. By his first wife he had five, and by his second seven children, of whom only two, a son and a daughter, reached maturity.

The character of Kepler's genius is especially difficult to estimate. His tendency towards mystical speculation formed a not less formidable barrier than its own development of truth. Without assigning to each element its due value, no sound comprehension of his modes of thought can be attained. His idea of the universe was essentially Pythagorean and Platonic. He started with the conviction that the arrangement of its parts must correspond with certain abstract conceptions of the beautiful and harmonious. His imagination, thus kindled, animated him to those severe labours of which his great discoveries were the fruits. His demonstration that the planes of all the planetary orbits pass through the centre of the sun, coupled with his clear recognition of the sun as the moving power of the system, entitled him to rank as the founder of physical astronomy. Thus, in his last, and the most important, phases of planetary movements and distances to musical intervals and geometrical constructions seemed to himself discoveries no less admirable than the achievements which have secured his lasting fame. Outside the boundaries of the solar system, the metaphysical side of his genius, no longer held in check by experience, fully asserted itself. The Keplerian like the Pythagorean cosmos was threefold, consisting of the centre, or sun, the surface, represented by the sphere of the fixed stars, and the intermediate space, filled with ethereal matter. It is a mistake to suppose that he regarded the stars as some mysterious and inscrutable order, not given to mankind by Bruno that to effect, but with dissent. Among his happy conjectures may be mentioned that of the sun's axial rotation, postulated by him as the physical cause of the revolutions of the planets; the suggestion of a periodical variation in the obliquity of the ecliptic; and the explanation as a solar atmospheric effect of the radiance observed to surround the moon during an eclipse of the sun.

It is impossible to consider without surprise the colossal amount of work accomplished by Kepler under numerous disadvantages. But his iron industry counted no obstacles, and secured for him the triumph of genius, that of having given to mankind the best that was in him. In private character he was amiable and affectionate; his generosity in recognizing the merits of others secured him against the worst shafts of envy; and a life so happily and inaccessibly deposited in the observatory of Pulkowa, were fully brought to light, under the able editorship of Dr. Ch. Frisch, in the first complete edition of his works. This important publication (Joannis Kepleri opera omnia, Frankfort, 1888-1891, 8 vols., 8vo) contains, besides the works already enumerated and several minor treatises, a posthumous scientific satire entitled Joh. Kepleri Sphingo, or brief print of the Würtemberger. The introduction is of-
£35,000 of prize money which he received freed him from the unpleasant position of younger son of a family ruined by the extravagance of his father. He became rear-admiral in October 1762, was one of the Admiralty Board from July 1765 to November 1766, and was promoted vice-admiral on the 24th of October 1770. When the Falkland Island dispute occurred in 1770 he was to have commanded the fleet to be sent against Spain, but a settlement was reached, and he had no occasion to hoist his flag over that time. Though most of the most devoted period of his life belongs to the opening years of the war of American Independence, Keppel was by family connexion and personal preference a strong supporter of the Whig connexion, led by the Marquess of Rockingham and the Duke of Richmond. He shared in all the passions of his party, then excluded from power by the resolute will of George III. As a member of Parliament, in which he had a seat for Windsor from 1761 till 1780, and then for Surrey, he was a steady partisan, and was in constant hostility with the "King's Friends." In common with them he was prepared to believe that the king's ministers, and in particular those of whom then First Lord of the Admiralty, were capable of any villany. When therefore he was appointed to command the Western Squadron, the main fleet prepared against France in 1778, he went to sea predisposed to think that the First Lord would be glad to cause him to be defeated. It was a further misfortune that when Keppel hoisted his flag one of his subordinate admirals should have been Sir Hugh Palliser (1723–1790), who was a member of the Admiralty Board, a member of parliament, and in Keppel's opinion, which was generally shared, jointly responsible with his colleagues for the ruin of the navy. The most important and the last of which Keppel fought with the French on the 27th of July 1779 ended in a highly unsatisfactory manner, owing mainly to his own unintelligent management, but partly through the failure of Sir Hugh Palliser to obey orders, he became convinced that he had been deliberately betrayed. Though he praised Sir Hugh in his public despatch he attacked him in private, and the Whig press, with the unquestionable aid of Keppel's friends, began a campaign of calumny to which the ministerial papers answered in the same style, each side accusing the other of deliberate treason. The result was a scandalous series of scenes in parliament and of court martial. Keppel was first tried and acquitted in 1779, and then Palliser was also tried and acquitted. Keppel was ordered to strike his flag in March 1779. Until the fall of Lord North's ministry he acted as an opposition member of parliament. When it fell in 1782 he became First Lord, and was created Viscount Keppel and Baron Elden. His career in office was not distinguished, and he broke with his old political associates by resigning as a protest against the Peace of Paris. He finally discredited himself by joining the Coalition ministry formed by North and Fox, and with its fall disappeared from public life. He died unmarried on the 2nd of October 1786. Burke, who regarded him with great affection, said that he had "something high" in his nature, and that it was "a wild stock of pride on which the tenderest of all hearts had grafted the milder virtues." His popularity disappeared entirely in his later years. His portrait was six times painted by Sir Joshua Reynolds. The copy which belonged originally to Burke is now in the National Gallery.

There is a full Life of Keppel (1842), by his grand-nephew, the Rev. Thomas Keppel.

KEPEL, SIR HENRY (1800–1904), British admiral, son of the 4th Earl of Albemarle and of his wife Elizabeth, daughter of Lord de Clifford, was born on the 14th of June 1800, and entered the navy from the old naval academy of Portsmouth in 1822. His family connexions secured him rapid promotion, at a time when the rise of less fortunate officers was very slow. He became lieutenant in 1829 and commander in 1833. His first command in the "Children" brig (16) was largely passed on the coast of Spain, which was then in the midst of the convulsions of the Carlist war. Captain Keppel had already made himself known as a good seaman. He was engaged with the squadron stationed on the west coast of Africa to suppress the slave trade. In 1837 he was promoted post captain, and appointed in 1841 to the "Dido" for service in China and against the Malay pirates, a service which he repeated in 1847, when in command of H.M.S. "Maeander." The story of his two commands was told by himself in two publications, The Expedition to Borneo of H.M.S. "Dido" for the Suppression of Piracy (1840), and in A Visit to the Indian Archipelago in H.M.S. "Maeander" (1853). The substance of these books was afterwards incorporated into his autobiography, which was published in 1899 under the title A Sailor's Life under four Sovereigns. In 1853 he was appointed to the command of the "St Jean d'Acre" of 101 guns for service in the Crimean War. But he had no opportunity to distinguish himself at sea in that struggle. As commander of the naval brigade landed to co-operate in the siege of Sevastopol, he was more fortunate, and he had an honourable share in the latter days of the siege and reduction of the fortress. After the Crimean War he was again sent out to China, this time in command of the "Raleigh," as commodore to serve under Sir M. Seymour. The "Raleigh" was lost on an uncharted reef near Hong-Kong, but three small vessels were named to act as her tenders, and Commodore Keppel commanded in them, and with the crew of the "Raleigh," in the action with the Chinese at Fatshan Creek (June 1, 1857). He was honourably acquitted for the loss of the "Raleigh," and was named to the command of the "Alligator," which he held till his promotion to rear-admiral. For his share in the action at Fatshan Creek he was made K.C.B. The prevalence of peace gave Sir Henry Keppel no further chance of active service, but he held successive commands till 1879, when he was appointed to the Admiralty, and from 1879, two years after he attained the rank of Admiral of the Fleet. He died at the age of 95 on the 17th of January 1904.

KER, JOHN (1752–1766), Scottish spy, was born in Ayrshire on the 8th of August 1753. His true name was Crawford, his father being Alexander Crawford of Crawfordland; but having married Anna, younger daughter of Robert Ker, of Kersland, Ayrshire, whose only son Daniel Ker was killed at the battle of Stenikirk in 1694, he assumed the name and arms of Ker in 1697, after buying the family estates from his wife's elder sister. Having become a leader among the extreme Covenanters, he made use of his influence to relieve his pecuniary embarrassments, selling his support at one time to the Jacobites, at another to the government, and whenever possible to both parties at the same time. He held a licence from the government in 1707 permitting him to associate with those whose disloyalty was known or suspected, proving that he was at that date the government's paid spy; and in his Memoirs Ker asserts that he had a number of other spies and agents working under his orders in different parts of the country. He entered into correspondence with Catholic priests and Jacobite conspirators, whose schemes, so far as he could make himself cognisant of them, he betrayed to the government. But he was known to be a man of the worst character, and it is improbable that he succeeded in gaining the confidence of people of any importance. The duchess of Gordon was for a time, it is true, one of his correspondents, but in 1707 she had discovered him to be "a knave." He went to London in 1709, where he seems to have extracted considerable sums of money from politicians of both parties by promising or threatening, as the case might be, to expose Godolphin's relations with the Jacobites. In 1713, if his own story is to be believed, business of a semi-diplomatic nature took Ker to Vienna; where, although he failed in the principal object of his errand, the emperor made him a present of his portrait set in jewels. Ker also occupied his time in Vienna, he says, by gathering information which he forwarded to the electress Sophia; and in the following year on his way home he stopped at Hanover to give some advice to the future king of England as to the best way to govern the English. Although in his own opinion Ker materially assisted in placing George J. on the English throne, his services were unrewarded, owing, he would have us believe, to the incorrigibility of his character. Similar ingratitude was the recompense for his revelations of the Jacobite intentions in 1715.
and as he was no more successful in making money out of the East India Company, nor in certain commercial schemes which engaged his ingenuity during the next few years, he died in a debtors' prison, on the 8th of July 1726. While in the King's Bench he sold to Edmund Curll the bookseller, a fellow-prisoner, who was serving a sentence of five months for publishing obscene books, the manuscript of (or possibly only the materials on which were based) the Memoirs of John Ker of Kersland, which Curll published in 1726 in three parts, the last of which appeared after Ker's death. For issuing the first part of the Memoirs, which was discovered (and discreditable to the government, but which Curll in self-justification described as containing the memory of Queen Anne,) the publisher was sentenced to the pillory at Charing Cross; and he added to the third part of the Memoirs the indictment on which he had been convicted.

See the above-mentioned Memoirs (London, 1726-1727), and in particular the Preface to part 1; George Lockhart, The Lockhart Papers (2 vols., London, 1817); Nathaniel Hooke, Correspondence, edited by W. D. Macray (Roxburgh Club, 2 vols., London, 1870), in which Ker is referred to under several pseudonyms, such as 'Wicks,' 'Tristaze,' "The Cameronian Mealmonger, &c.,

KERAK, a town in eastern Palestine, 10 m. E. of the southern angle of the Lisan. Its fortifying remains, with a portion of a thick black rocky hill about 3000 ft. above sea-level, stand on a platform forming an irregular triangle with sides about 3000 ft. in length, and separated by deep ravines from the ranges around on all sides but one. The population is estimated at 6000 Moslems and 1800 Orthodox Greek Christians. Kerak is identified with the Moabite town of Kir-Hareseth (destroyed by the Hebrews, Edomite coalition, 2 Kings iii. 25), and denounced by Isaiah under the name of Kir or Moab (xvi. 1), Kir-Hareseth (xvi. 7) or Kir-Heres (xvi. 11): Jeremiah also refers to it by the last name (xxix. 31, 36). The modern name Xârê, appears in 2 Macc. xii. 17. Later, Kerak was the seat of the archbishop of Petra. The Latin kings of Jerusalem, recognizing its importance as the key of the E. Jordan region, fortified it in 1142: from 1183 it was attacked desperately by Saladin, to whom at last it yielded in 1188. The Arabian Ayyubite princes fortified the town, as did the Egyptian Mameluke sultans. The fortifications were repaired by Bihars in the 13th century. For a long time after the Turkish occupation of Palestine and Egypt it enjoyed a semi-independence, but in 1853 a Turkish governor with a strong garrison was established there, which has greatly contributed to secure the safety of travellers and the general quiet of the district. The town is an irregular congeries of flat mud-roofed houses. In the Christian quarter is the church of St George; the mosque also is a building of Christian origin. The town is surrounded by a wall with five towers; entrance now is obtained through breaches in the wall, but formerly it was accessible only by means of tunnels cut in the rocky substratum. The castle, now used as the headquarters of the garrison and closed to visitors, is a remarkably fine example of a crusaders' fortress.

KERALA, or CHEERA, the name of one of the three ancient Dravidian kingdoms of the Tamil country of southern India, the other two being the Chola and the Pandya. Its original territory comprised the country now contained in the Malabar district, with Travancore and Cochin, and later the country included in the Comoratore district and a part of Salem. The boundaries, however, naturally varied much from time to time. The earliest references to this kingdom appear in the edicts of Asoka, where it is called Keralapatra (i.e. son of Kerala), a name which in a slightly corrupt form is known to Ptolemy and the author of the Periplous. There is evidence of a lively trade carried on by sea with the Roman empire in the early centuries of the Christian era, but of the political history of the Kerala kingdom nothing is known beyond a list of rajjas compiled from inscriptions, until in the 14th century the struggle began with the Cholas, by whom it was conquered and held till their overthrow by the Mahomedans in 1310. In these their turn were driven out by a Hindu confederation headed by the chieftains of Vijayanagar, and Kerela was absorbed in the Vijayanagar empire until its destruction by the Mahomedans in 1565. For about 80 years it seems to have preserved a precarious independence under the naiks of Madura, but in 1640 was conquered by the Adil Shah dynasty of Bijapur and in 1652 seized by the king of Mysore.

KERASUND (anc. Choerodas, Pharmacis, Cerasus), a town on the N. coast of Asia Minor, in the Trebizond vilayet, and the port—an exposed roadstead—of Kara-Hissar Shardi, with which it is connected by a carriage road. Pop. just under 10,000.

Kerasun was also a city in ancient Asia Minor, being in a slight minority. The town is situated on a rocky promontory, crowned by a Byzantine fortress, and has a growing trade. It exports filberts (for which product it is the centre), walnuts, hives and timber. Cerasus was the place from which the wild cherry was introduced into Italy by Lucullus and so to Europe (hence Fr. cerise, "cherry").

KÉRATRY, AUGUSTE HILARION, COMTE DE (1769-1859), French writer and politician, was born at Rennes on the 28th of December 1769. Coming to Paris in 1790, he associated himself with Bernardin de St Pierre. After being twice imprisoned during the Revolution, he retired to Brittany, where he devoted himself to literature till 1814. In 1818 he returned to Paris as deputy for Finistère, and sat in the Chamber till 1824, becoming one of the recognized liberal leaders. He was re-elected in 1827, took an active part in the establishment of the July monarchy, was appointed a councillor of state (1830), and in 1837 was made a peer of France. After the coup d'état of 1851 he retired from public life. Among his publications were Contes et Idylles (1791); Lysus et Clytipe, a poem (1801); Inductions morales et physiologiques (1817); Documents pour servir à l'histoire de France (1820); Du Bon dans les arts d'imitation (1823); Le Dernier des Beau-manoir (1824). His last work, Clarisse (1844), a novel, was written when he was eighty-five. He died at Port-Marly on the 7th of November 1859. His son, comte Emile de Kératry (1832- ), became deputy for Finistère in 1869, and strongly supported the war with Germany in 1870. He was in Paris during part of the siege, but escaped in a balloon, and joined Gambetta. In 1871 Thiers appointed him to the prefecture, first of the Haute-Garonne, and subsequently of the Bouches-du-Rhône, but he resigned on the 5th of December 1872. He was a member of the National Assembly in the Second Empire and was on the Right, on the 28th of October A.D. 488 (see CALAPHITE, sec. B, § 2). The most important feature of the town is the great shrine of Hosain, containing the tomb of the martyr, with its golden dome and triple minarets, two of which are gilded. Kerela is a place of pilgrimage of the Shi'ite Moslems, and is only less sacred to them than Meshed 'Ali and Mecca. Some 200,000 pilgrims from the Shi'ite portions of Islam are said to journey annually to Kerela, many of them carrying the bones of their relatives to be buried in its sacred soil, or bringing their sick and aged to die there in the odour of sanctity. The mullahs, who fix the burial fees, derive an enormous revenue from the faithful. Formerly Kerela was a self-governing hierarchy and constituted an inviolable sanctuary for criminals; but in 1843 the Turkish
government undertook to deprive the city of some of these liberties and to enforce conscription. The Kerbelese resisted, and Kerbelā was bombarded (hence the ruined condition of the old walls) and reduced—with great slaughter. Since then it has formed an integral part of the Turkish administration of Irak. The enormous influx of pilgrims naturally creates a brisk trade in Kerbela and the towns along the route from Persia to that place and beyond to Nejef. The population of Kerbelā, necessarily fluctuating, is estimated at something over 30,000, of whom the principal part are Shi'ites, chiefly Persians, with a goodly mixture of British Indians. No Jews or Christians are allowed to reside there.

See Chodzko, Théâtre persan (Paris, 1878); J. P. Peters, Nippur (J. P. Pl. 1897).

KERCH, or KERKES, a seaport of S. Russia, in the government of Taurida, on the Strait of Kerch or Yenikale, 60 m. E.N.E. of Theodosia, in 45° 21' N. and 36° 30' E. Pop. (1897), 31,702. It stands on the site of the ancient Panticapaeum, and, like most towns built by the ancient Greek colonists in this part of the world, occupies a beautiful site. About 6 m. inside the town are the ruins of the ancient city of Yenikale, administrative centre of the town. Two and a half miles to the south are strongly fortified works defending the entrance to the Sea of Azov.

The Greek colony of Panticapaeum was founded about the middle of the 6th century B.C., by the town of Mileto. From about 435 B.C. till the conquest of this region by Mithradates the Great, king of Pontus, about 180 B.C., the town and territory formed the kingdom of the Bosporus, ruled over by an independent dynasty. Phanaces, the son of Mithradates, became the founder of a new line under the protection of the Romans, which continued to exist till the middle of the 4th century A.D., and extended its power over the maritime parts of Tauris. After that the town—which had already begun to be known as Bospor—a passed successively into the hands of the Eastern empire, of the Khazars, and of various barbarian tribes. In 1318, the Tatars, who had come into possession in the previous century, ceded the town to the Genoese, who soon raised it into a new importance as a commercial centre. They usually called the place Cerchio, a corruption of the Russian name Krtchew (hence Kerch), which appears in the 14th century inscription of Tmutarakan (a Russian principality at the north foot of the Caucasus). Under the Turks, whose rule dates from the 15th century, Kerch was a military port; and as such it plays a part in the Russo-Turkish wars. Captured by the Russians under Dolgorukov in 1771, it was ceded to them along with Yenikale by the peace of Kuchuk-Kainarji, and it became a centre of Russian naval activity. Its importance was greatly impaired by the rise of Odessa and Taganrog; and in 1820 the fortress was dismantled. Kerch suffered severely during the Crimean War.

Archaeologically Kerch is of particular interest, the kurgans or sepulchral mounds of the town and vicinity having yielded a rich harvest of works of art. The most important of these mounds, one of which had a number of tombs been opened, is the Aitun or Zoloto-oba (Golden Mound) which stood on a hill overlooking the city. In the Kul-oba, or Mound of Cinders opened in 1830–1831, was a similar tomb, in which were found what appear to be the remains of a golden dress, a large golden crown formed with griffins and beautiful arabesques. In the Aitun or Golden Mound, the relics of a tomb belonging to a woman of the 3rd century B.C. were found. The tomb was made by a woman of the 3rd century B.C. Her name is inscribed, Miltiades, and her grave is now in the Museum of Kerch.

KERCKHOVEN, JAN POLYANDER VAN DEN (1656–1694), Dutch Protestant divine, was born at Metz, in 1656. He became French preacher at Dort in 1659, and afterwards succeeded Franz Comarus as professor of theology at Leiden. He was invited by the States General of Holland to revise the Dutch translation of the Bible, and it was he who edited the canons of the synod of Dort (1618–1619).

His many published works include Responsio ad sophismata A. Casoriai doctoris sivoniamas (1661); Dissertatio contra ladorum des religios des Sancti Treboli (1662); Explicatio somae (1625).

KERGUELEN ISLAND, KERGUELLEN'S LAND, or DESOLATION ISLAND, an island in the Southern Ocean, to the S.E. of the Cape of Good Hope, and S.W. of Australia, and nearly half-way between them. Kerguelen lies between 48° 30' and 49° 44' S. and 68° 49' and 70° 35' E. Its extreme length is about 85 m., but the island is not less than about 1400 sq. m. The island is throughout a small mountainous, presenting the appearance of the area of a series of jagged peaks. The various ridges and mountain masses are separated by steep-sided valleys, which run down to the sea, forming deep fjords, so that no part of the island is more than 10 m. from the sea. The chief summits are Mounts Ross (6120 ft.), Richards (4000), Crozier (3751), Wyllye Thomson (3160), Hooker (2600), Moseley (2400). The coast-line is extremely irregular, and the fjords, at least on the north, east and south, form a series of well-sheltered harbours. As the prevailing winds are westerly, the safest anchorage is on the north-east. Christmas Harbour on the north and Royal Sound on the south are noble harbours, the latter with a labyrinth of islets interspersed over upwards of 20 m. of landlocked waters. The scenery is generally magnificent. A district of considerable extent in the centre of the island is occupied
by snowfields, whence glaciers descend east and west to the sea. The whole island, exclusive of the snowfields, abounds in fresh-water lakes and pools in the hills and lower ground. Hidden deep mudholes are frequent.

Kerguelen Island is of undoubted volcanic origin, the prevailing rock being basaltic lavas, intersected occasionally by dikes, and an active volcano and hot springs are said to exist in the south-west of the island. As the surface of the mainland is high, the island must have been thickly clothed with woods and other vegetation of which it has no doubt been denuded by volcanic action and submergence, and possibly by changes of climate. It presents evidences of having been subjected to glaciaiion, with subsequent immersion and immense denudation. The soundings made by the "Challenger" and "Gazelle" and the affinities which in certain respects exist between the islands, seem to point to the existence of a great landmass extending from the island on which Kerguelen, Prince Edward's Islands, the Crozetts, St Paul and Amsterdam are the remains. The Kerguelen plateau rises in many parts to within 1500 fathoms of the surface of the sea. Beds of coal and of red earth are found in some places. The summits of the flat-topped hills about Betsy Cove, in the south-east of the island, are formed of caps of basalt.

According to Sir J. Hooker the vegetation of Kerguelen Island is of great antiquity; and may have originally reached it from the American continent; it has no affinities with Africa. The present climate is not favourable to permanent vegetation; the island lies within the arid region, and has no drying winds; its temperature is kept down by the surrounding vast expanse of sea, and it lies within the line of the cold Antarctic drift; there is, however, a warm season during which certain plants, the temperature is about 39° F., while the summer temperature has been observed to approach 70°. Tempests and squalls are frequent, and the weather is rarely calm. On the lower slopes of the mountains a belt of vegetation, from three to fifteen feet in height, exists, and is constantly saturated with moisture. A rank grass, Festuca Cookei, grows thickly in places up to 300 ft., with Asorella, Cotula plumea, &c.; Sir J. D. Hooker enumerated twenty-one species of flowering plants and seven of ferns, lycops, and characeae; at least seventy-four species of mosses, twenty-five of Hepaticae, and sixty-one of lichens are known, and there are probably many more. Several of the flowering plants of French Guiana are present on the island.

The characteristic feature of the vegetation, the Kerguelen's Land cabbage, was formerly abundant, but has been greatly reduced by rabbits introduced on to the island. Fur-seals are still found in Kerguelen Island, although their numbers have been reduced by reckless slaughter. The sea-éléphant and sea-leopard are characteristic. Penguins of various kinds are abundant; a teal (Querquedula Eatonii) peculiar to Kerguelen and the Crozets is also found in considerable numbers, and penguins, especially the giant petrel (Oisfraga gigantica), skuaas, gulls, shear-hills (Chionis minor), albatross, terns, cormorants, and Cape pigeons frequent the island. There is a con-

KERMADEC, a small group of hilly islands in the Pacific, about 30° S., 178° W., named from D'Entrecasteaux's captain Huon Kermadec, in 1791. They are British possessions. The largest of the group is Raoul or Sunday Island, 20 m. in circumference, 1600 ft. high, and thickly wooded. The flora and fauna belong for the most part to those of New Zealand, on which colony the islands are also politically dependent, having been annexed in 1887.

KERMAN (the ancient Karmania), a province of Persia, bounded E. by Seistan and Baluchistan, S. by Baluchistan and Fars, W. by Fars, and N. by Yezd and Khorasan. It is of very irregular shape, exposing a considerable part of the year, feeding the springs and canals by means of which large tracts in this almost rainless region in summer are kept under cultivation. Still farther west the Kuh Dina range is continued from Fars, also in a south-easterly direction to Bashkird beyond Bander Abbasi. Between the south-western highlands and the Jamal Bariz there is some arid and unproductive land, but the true desert of Kerman lies mainly in the north and north-east, where it merges northwards in the great desert "Lut," which stretches into a pale yellow highly pungent essential oil, which gives the plant a peculiar flavour but renders it extremely wholesome. It was discovered by Captain Cook during his first voyage, but the first account of it was published by (Sir) Joseph Hooker in The Botany of the Antarctic Voyage of the "Erebus" and "Terror" in 1839-1843. During the stay of the latter expedition on the island, daily use was made of this vegetable either cooked by itself or boiled with the ship's beef, pork or pea-soup. Hooker observes of it, "This is perhaps the most interesting plant produced during the whole of the voyage performed in the Antarctic Sea, growing as it does upon an island the remotest of any from a continent, and yet, besides this esculent, only seventeen other flowering plants."

Kerkuk, or Qerqo, the chief town of a sanjak in the Mosul vilayet of Asiatic Turkey, situated among the foot hills of the Kurdistan Mountains at an elevation of about 1100 ft. on both banks of the Khassa Chai, a tributary of the Tigris, known in its lower course as Adhem. Pop. estimated at 12,000 to 15,000, chiefly Mahomedan Kurds. Owing to its position at the junction of several routes, Kerku has a brisk transit trade in hides, Persian silks and cloths, colouring materials, fruit and timber; but it does not appear to be much of a manufacturing or commercial centre.
Kerman—Kermes

Khorasan. These southern deserts differ from the kavir of central Persia mainly in three respects: they are far less saline, are more sandy and drier, and present in some places tracts of 80 to 100 miles almost absolutely destitute of vegetation. Yet they are crossed by well-known tracks running from Kerman eastwards and north-eastwards to Seistan and Khorasan and frequently traversed by caravans. It appears that these sandy wastes are continually encroaching on the fertile districts, and this is why Kerman is situated about 1,700 miles north-east of the sands of the desolate plains extending thence north-westwards to Bam. There are also some khejeh or salt swamps answering to the kavir in the north, but occurring only in isolated depressions and nowhere of any great extent. The desert of Kerman lies about 1,000 ft., or less, above the sea, apparently on nearly the same level as the Lut, from which it cannot be geographically separated. The climate, which varies much with the relief of the land, has the reputation of being unhealthy, because the cool air from the hills is usually attended by chills and agues. Still many of the upland valleys enjoy a genial and healthy climate. The chief productive area is through the gams, dates of unrivalled flavour from the southern parts, and wool, noted for its extreme softness, and the soft underhair of goats (kurk), which latter are used in the manufacture of the Kerman shawls, which in delicacy of texture yield only to those of Kashmir, while often surpassing them in design, colour and finish. Besides woolen goods (shawls, carpets, &c.) Kerman exports mainly cotton, grain and dates, receiving in return from India cotton goods, tea, indigo, China, glass, sugar, &c. Wheat and barley are scarce. Bandar Abbas is the natural outlet; but, since shipping has so far been precluded for Bushire farther west, the trade of Kerman has greatly fallen off.

For administrative purposes the province is divided into nineteen districts, one being the capital of the same name with its immediate neighbourhood (numeh); the others are Akta and Uruz; Anar; Bam and Narmashir; Bardsir; Jiruf; Khabis; Khinaman; Kubenan (Kubhahan); Kuhpayeh; Fariz; Rafsian; Rabbur; Raver; Rayin; Rudbar and Bashakird; Sirjan; Zerend. The inhabitants number about 700,000, nearly one-third being nomads.

Kerman, capital of the above province, situated in 30° 17' N., 56° 31' E., at an elevation of 6,000 ft. Its population is estimated at 60,000, including about 2,000 Zoroastrians, 100 Jews, and a few Shikarpuri Indians. Kerman has post and telegraph offices (Indo-European Telegraph Department), British and Russian consulates, and an agency of the Imperial bank of Persia. The neighbouring districts produce little grain and have to get their supplies for four or five months of the year from districts far away. A traveller has stated that it was easier to get a man (61 lb.) of saffron at Kerman than a man of barley for his horse, and in 1879 Sir A. Houtum-Schindler was ordered by the authorities to curtail his excursions in the province "because his horses and males ate up all the stock." Kerman manufactures great quantities of carpets and felts, and its carpets are almost unsurpassed for richness of texture and durability. The old name of the city was Guvashir. Adjoining the city on hills rising 400 to 500 ft. above the plain in the east are the ruins of two ancient forts with walls built of sun-dried bricks on stone foundations. Some of the walls are in perfect condition. Among the mosques in the town there are several ancient mosques, one the Masjid-i Juma, a foundation of the Muzaffarid ruler Mubarak edin Mohamed dating from A.H. 1349, the other the Masjid-i Malik built by Malik Kaverd Seljuk (1041-1072).

Kermanshah, or Kermanshah, is an important province of Persia, situated W. of Hamadan, N. of Luristan, and S. of Kurdistan, and extending in the west to the Turkish frontier. Its population is about 400,000, and it pays a yearly revenue of over £20,000. Many of its inhabitants are nomadic Kurds and Lurs who pay little taxes. The plains are well watered and very fertile, while the hills are covered with rich pastures which support large flocks of sheep and goats. The sheep provide a great part of the meat supply of Teheran. The province also produces much wheat and barley, and could supply great quantities for export if the means of transport were better.

Kermanshah (Kermisin of Arab geographers), the capital of the province, is situated at an elevation of 5,100 ft., in 34° 10' N., and 46° 59' E., about 220 m. from Bagdad, and 250 m. from Teheran. Although surrounded by fortifications with five gates and 11 miles in circuit, it is now practically an open town, for the walls are in ruins and the moat is choked with weeds. It has a population of about 40,000. The town is situated on the high road between Teheran and Bagdad, and carries on a transit trade estimated in value at £150,000 per annum.

Kermes (Arab. girmis; see Crimson), a crimson dye-stuff, now superseded by cochineal, obtained from Kermes ilicis (= Coccus ilicis, Lat.= C. vermilio, G. Planchon). The genus Kermes belongs to the Coccidæ or Scale-insects, and its species are common on oaks wherever they grow. The species from which kermes is obtained is common in Spain, Italy and the South of France and the Mediterranean basin generally, where it feeds on Quercus coccifera, a small shrub. As in the case of other scale-insects, the males are relatively small and are capable of flight, while the females are wingless. The females of the genus Kermes are remarkable for their gall-like form, and it was not until 1714 that their animal nature was discovered.

In the month of May, when full grown, the females are globose, 6 to 7 millim. in diameter, of a reddish-brown colour, and covered with light yellow discoloured protuberances of the same kind as those of the females of other scale-insects. These protuberances are formed by small burs or buds by a circular lower surface 2 millim. in diameter, and surrounded by a narrow zone of white cottony down. At this time there are concealed under a cavity, formed by the approach of the abdominal wall of the insect to the dorsal one, thousands of eggs of a red colour, and smaller than poppy seed, which are protruded and ranged regularly beneath the insect. At the end of May or the beginning of June the red secretion now by the inhabitants of the district of attachment of the parent. They are then of a fine red colour, elliptic and convex in shape, but rounded at the two extremities, and bear two threads half as long as their body at their posterior end. At this period of the year, they are enclosed in a membrane with extraordinary rapidity all over the food plant, and in two or three days attach themselves to fissures in the bark or buds, but rarely to the leaves. In warm and dry summers the insects breed again in the months of August and September, according to Emeré, and then they are more frequently found attached to the leaves. Usually they remain immovable and apparently unaltered until the end of the succeeding March, when their bodies become gradually indented and lose all trace of abdominal rings. They then appear full of a reddish juice resembling discoloured blood. In this state, or when the eggs are ready to be extruded, the insects are collected. This juice, which is the liquid which the insects are ready to escape are dried in the sun on linen cloths—care being taken to prevent the escape of the young from the cloths until they are dead. The young insects are then sifted from the shells, made into a paste with vinegar, and this paste, once dried, exposing skins, excreta packed into it is then ready for exportation to the East under the name of "pâte d'écarlate." In the pharmacopoeia of the ancient kermes triturated with vinegar was used as an outward application, especially in wounds of the nerves. From the 9th to the 16th century this insect formed an ingredient in the "confectio alkermes," a well known medicine, at one time official in the London pharmacopoeia, as an astringent in doses of 20 to 60 grains or more. Syrup of kermes was also prepared. Both these preparations have fallen into disuse.

Mineral kermes is trisulphide of antimony, containing a variable portion of trioxide of antimony both free and combined with alkali. It was known as poivre des Chartreux because in 1714 it is said to have saved the life of a Carthusian monk who had been given up by the Paris faculty; but the monk Simon who brought the powder to the Chartreux monastery is said to have been put to death for his discovery. The reputation became so great that in 1720 the French government bought the recipe for its preparation. It still appears in the pharmacopoeias of many European countries and in that of the United States. The product varies somewhat according to the mode of preparation adopted. According to the French directions the official substance is obtained by adding 60 grammes of powdered antimony trisulphide to a boiling solution of 1280 grammes of crystallized sodium carbonate in 12,800 grammes of distilled water and boiling for one hour. The liquid is then filtered hot, and on being allowed to cool slowly deposits the
KERMESSE—KERRY

Kermesse, which is washed and dried at 100 °C.; prepared in this way it is a brown-red velvet powder, insoluble in water.

See G., "le chène", Le Kermes du chêne (Montpellier, 1864); Lewis, Manual de la industria del tinto de pison or color of pison de España (Madrid, 1788); Adams, Paulus Aegineta, ill. 180; Beckmann, History of Inventions.

KERMESSE (also KERMIS and KERMES), originally the mass said on the anniversary of the foundation of a church and in honour of the patron, the word being equivalent to "Kirmass." Such celebrations were regularly held in the Low Countries and also in northern France, and were accompanied by feasting, dancing and sports of all kinds. They still survive, but are now predominantly religious in character, and the old allegorical representations are uncommon. The Brussels Kermesse is, however, still marked by a procession in which the effigies of the Mannikin and medieval heroes are carried. At Mons the Kermesse occurs annually on Trinity Sunday and is called the procession of Lumeçon (Walloon for limaçon, a snail); the hero is Gilles de Chin, who slays a terrible monster, capot of a princess, in the Grand Place. This is the story of George and the Dragon. At Hasselt the Kermesse (now only septennial) not only commemorates the Christian story of the foundation of the town, but every preserves traces of a pagan festival. The word Kermesse (generally in the form "Kirmess") is applied in the United States to any entertainment, especially one organized in the interest of charity.

See Demetrius C. Bouger, Belgian Life in Town and Country (1904).

KERN, JAN HENDRIK (1833— ), Dutch Orientalist, was born in Java of Dutch parents on the 6th of April 1833. He studied at Utrecht, Leiden and Berlin, where he was a pupil of the Sanskrit scholar, Albrecht Weber. After some years spent as professor of Greek at Maastricht, he became professor of Sanskrit at Bonn and in 1863, and in 1865 at Leiden. His studies included the Malay languages as well as Sanskrit. His chief work is Geschiedenis van het Buddhismus in Indië (Haarlem, 2 vols., 1881—1883); in English he wrote a translation (Oxford, 1884) of the Saddharma Pundarika and a Manual of Indian Buddhism (Strassburg, 1896) for Bühler Kilhorn's Grundriss der indischen Philologie.

KERNEL (O.E. cornel, a diminutive of "corn," seed, grain), the soft and frequently edible part contained within the hard outer husk of a nut or the stone of a fruit; also used in botany of the nucleus of a seed, the body within its several integuments or coats, the chief source of the nucleus of any structure; hence, figuratively, the pith or gist of any matter.

KERNER, JUSTINUS ANDREAS CHRISTIAN (1786—1862), German poet and medical writer, was born on the 15th of September 1786 at Ludwigsburg in Württemberg. After attending the classical schools of Ludwigsburg and Maulbronn, he was apprenticed in a cloth factory, but, in 1804, owing to the good services of Professor Karl Philipp Conz (1762—1827) of Tübingen, was enabled to enter the university there; he studied medicine but had also time for literary pursuits in the company of Uhlans, Gustav Schwab and in 1807 at Leiden. His studies included the Malay languages as well as Sanskrit. His chief work is Geschiedenis van het Buddhismus in Indië (Haarlem, 2 vols., 1881—1883); in English he wrote a translation (Oxford, 1884) of the Saddharma Pundarika and a Manual of Indian Buddhism (Strassburg, 1896) for Bühler Kilhorn's Grundriss der indischen Philologie.

KERRY, a county of Ireland in the province of Munster, bounded W. by the Atlantic Ocean, N. by the boundary of the Shannon, which separates it from Clare, Limerick and Cork, and S.E. by Cork. The area is 1,149,336 acres, or 181 sq. m., the county being the fifth of the Irish counties in extent. Kerry, with its combination of mountain, sea and plain, possesses some of the finest scenery of the British Islands. The portion of the county south of Dingle Bay consists of mountain masses intersected by narrow valleys. Formerly the mountains were covered by a great forest of fir, birch and yew, which was nearly all cut down to be used in smoking iron, and the constant pasturage of cattle prevents the growth of young trees. In the north-east towards Killarney the hills rise abruptly into the rugged range of Macgillycuddy's Reeks, the highest summit of which, Carroun (Carrantuohill), has a height of 3,414 ft. The next highest summit is Caper (3200 ft.), and several others are over 2,000 ft. Lying between the precipitous sides of the Tomies, the Purple Mountains and the Reeks is the famous Gap of Dunloe. In the Dingle promontory Brandon Mountain attains a height of 3,127 ft. The sea-coast, for the most part wild and mountainous, is much indented by inlets, the largest of which, Tralee Bay, Dingle Bay and Kenmare River, lie in sianical troughs, the structural fields of the rocks forming extensive promontories. Between Kenmare River and Dingle Bay the land is separated by mountain ridges into three valleys. The extremity of the peninsula between Dingle Bay and Tralee Bay is very precipitous, and Mount Brandon, rising abruptly from the ocean, is skirted at its base (in part) by a road from which magnificent views are obtained. From near the village of Ballyunion to Kilconey Point near the Shannon there is a remarkable succession of constant guests, and thither came also in 1836 Friederike Hauffe (1815—1859), the daughter of a forester in Prevoirt, a somnambulist and clairvoyante, who forms the subject of Kerner's famous work Die Schirin von Prevoirt, Eröffnungen über das innere Leben des Menschen und über das Heineinragen einer Geisterwelt in die unsere (1839; 6th ed., 1892). In 1838 he published a collection of Gedichte which were later supplemented by Der letzte Blüttenstraus (1832) and Winterblätten (1859). Among others of his well-known poems are the charming ballad Der reichste Prits; a drinking song, Wohlauf, noch getrunken, and the pleasant Wanderer in der Stägemühle.

In addition to his literary productions, Kerner wrote some popular books, besides giving great merit, dealing with animal organisms, Das Fettgift oder die Fetsäure und ihre Wirkungen auf die tierischen Organismen (1822); a description of Wildbad and its healing waters, Das Wildbad im Königreich Württemberg (1813); while he gave a pretty and vivid account of his youthful years in Büdcrbuch aus meiner Knabenzeit (1859); and in Die Bestürmung der würtembergischen Stadt Weinsberg im Jahre 1725 (1820), showedconsiderable skill in historical narrative. In 1851 he was compelled, owing to increasing blindness, to retire from the medical profession and, in 1855, he lived in Kenmare, with his daughters, at Weinsberg until his death on the 21st of February 1862. He was buried beside his wife, who had predeceased him in 1854, in the churchyard of Weinsberg, and the grave is marked by a stone slab with an inscription he himself had chosen: Friederike Kerner und ihr Justinus. Kerner was one of the most inspired poets of the Swabian school. His poems, which largely deal with natural phenomena, are characterized by a deep melancholy and a leaning towards the supernatural, which, however, is balanced by a quaint humour, reminiscent of the Volklied.
KERRY

of caves, excavated by the sea. One of these caves inspired Tennyson with some lines in "Merlin and Vivien," which he wrote on the spot. The principal islands are the picturesque Skelligs, Valencia Island and the Blasket Islands.

The principal rivers are the Blackwater, which, rising in the Dunkerran Mountains, forms for a few miles the boundary line between Kerry and Cork, and then passes into the latter county; the Ruaughter, which with a course resembling the arc of a circle falls into the head of the Kenmare River; the Inny and Ferta, which flows north-westward, the one into Ballinskellig Bay and the other into Valencia harbour; the Flesk, which flows northward through the lower Lake of Killarney, after which it takes the name of Laune, and flows north-westward to Dingle Bay; the Caragh, which rises in the mountains of Dunkerran, after forming several lakes falls into Castlemaine harbour; the Maine, which flows from Castle Island and south-westward to the sea at Castlemaine harbour, receiving the northern Flesk, which rises in the mountains that divide Cork from Kerry; and the Feale, Gale and Brick, the junction of which forms the Cashin, a short tidal river which flows into the estuary of the Shannon. The lakes of Kerry are not numerous, and none is of great size, but those of Killarney (g.r.) form one of the most important features in the striking and picturesque mountain scenery amidst which they are situated.

The other principal lakes are Lough Curran (Waterville Lake), near Ballinskellig, and Lough Caragh near Castlemaine harbour. Salmon and trout fishing with the rod is extensively prosecuted in all these waters. Near the summit of Mangerton Mountain an accumulation of water in a deep hollow forms what is known as the Devil's Punchbowl, the surplus water, after making a succession of cataracts, flowing into Muckross Lake at the foot of the mountain. There are chalybeate mineral springs near Killarney, near Valencia Island, and near the mouth of the Inny; sulphurous chalybeate springs near Dingle, Castlemaine and Tralee; and a saline spring at Magherybeg in Corkaguiney, which bursts out of clear white sand a little below high-water mark.

Killarney is an inland centre widely celebrated and much visited on account of its scenic attractions; there are several well-known coast resorts, among them Derrynane, at the mouth of Kenmare Bay, the residence of Daniel O'Connell the "liberator"; Glenbeigh on Dingle Bay, Parknasilla on Kenmare Bay, Waterville (an Atlantic telegraph station); the lakes of Ballinskellig Bay and Lough Curran, and Tarbert, a small coast town on the Shannon estuary. Others of the smaller villages have grown into watering-places, such as Ballybunion, Castlegregory and Portmagee.

Geology. — Kerry includes on the north and east a considerable area of Carboniferous shales and sandstones, reaching the coal-margins at Glenbeigh; on the west are the unproductive coal measures of the Glanmore Mountains. The Carboniferous Limestone forms a fringe to these beds, and is cut off by the sea at Knockaneen Bay, Tralee and Castlemaine. In all the great promontories, Old Red Sandstone, including Jukes's "Glengarriff grit," forms the mountains while synclinal hollows of Carboniferous Limestone have become submerged to form marine inlets between them. The Upper Lake of Killarney lies in a hollow of the Old Red Sandstone, which here rises to its greatest height in Macgillycuddy's Reeks; Lough Leane however, with its low shores, rests on Carboniferous Limestone. In the Dingle promontory the Old Red Sandstone is strikingly unconformable on the Dingle beds and the Upper Silurian. The latter include volcanic rocks of Wenlock age. The evidences of local glaciation in this county, especially on the wild slopes of the mountains, are as striking as in North Wales. A copper-mine was formerly worked at Muckross, near Killarney, in which cobalt ores also occurred. Slate is quarried in Valencia Island.

Fauna. — Foxes are numerous, and otters and badgers are not uncommon, but are very rare. The red deer inhabits the mountains round Killarney. The golden eagle, once frequently seen in the higher mountain regions, is now rarely met. The sea eagle haunts the lofty marine cliffs, the mountains and the rocky islands of the coast. The osprey, or sea-hawk, is a frequent visitor. The merganser frequents both the sea-cliffs, and the turtle-dove is an occasional visitant. The great grey seal is found in Brandon and Dingle bays.

Climate and Agriculture. — Owing to the vicinity of the sea and the height of the mountains, the climate is very moister and unsuitable for the growth of cereals, but it is so mild even in winter that suburban and other trees indigenous to warm climates grow in the open air, and several flowering plants are found which are unknown in England. In the northern parts the land is generally coarse and poor, except in the bogs which here and there are formed by the streams. In the Old Red Sandstone valleys there are many very fertile regions, and several extensive districts now covered by bog, admit of easy conversion into good land so as to render the whole country fit for agricultural purposes. The turf is of a black or dark brown hue, and is the best of Clonger, for the purpose of fuel. The principal grain grown is oats, and the sheaves are reaped with scythes and hand-threshed. Barley, wheat, and occasionally rye, are grown for home consumption, but are not extensively cultivated. The dairy breeds of cattle—small finely-shaped animals, black or red in colour, with small upturned horns—are famed for the quality both of their flesh and milk, and are in considerable demand for the parks surrounding the residences of several noble persons in the county. The deer of Kerry are of a very fine size, and are frequently seen in the woods between crossed by the Killarney and an unknown breed, is larger but without its fine qualities. Little regard is paid to the breed of sheep, but those in most common use resemble the native breed from Spain. Goats share with sheep the sweet pasturage of the higher mountain ridges, while cattle occupy the lower slopes.

Other Industries. — In former times there was a considerable linen trade in Kerry, but this is now nearly extinct, the chief manufacturing being that of coarse woolens and linens for home use. At Killarney a variety of articles are made from the wood of the arbutus. A considerable trade in agricultural produce is carried on at Tralee, Dingle and Kenmare, and in slate and stone at Valencia. The deep-sea and coast fisheries are prosperous, and there are many small fishing settlements along the coast, but the centres of the two fisheries are at Castlemaine and Dingle. The Kerry fisheries are a public industry, for which the district centres are Kenmare and Killarney.

Communications. — The Great Southern & Western railway almost monopolizes the lines in the county. The principal line is the Killorglin to Kenmare line, terminated by lines to Tralee, Cahersiveen and Dingle, and passing ultimately to Limerick. Branches are from Headford to Kenmare; Farranfore to Killorglin, Cahersiveen and Dingle; Killorglin to Fenit and to Castlecloyre; and the Listowel and Ballybunion railway. All these lines are to the coast, and the Tralee and Dingle railway connects these two towns. The only inland branch is from Tralee to Castleisland.

Population and Administration. — The population (179,136 in 1891; 165,726 in 1901) decreases to an extent about equal to the average of the Irish counties, but the emigration returns are among the heaviest. The chief towns are Tralee (the county town, pop. 8,570), Dingle (3,100), Cahersiveen (980), Killorglin (917), Killarney (818), Cahirciveen (1,303), while Dingle, Kenmare, Killorglin and Castleisland are smaller towns. The county comprises 9 baronies, and contains 85 civil parishes. Assessments are held at Tralee, and quarter sessions at Cahersiveen, Dingle, Kenmare, Killarney, Listowel and Tralee. The headquarters of the constabulary force is at Tralee. Previous to the Union the county returned eight members to the Irish Parliament, two for Tralee, and two for each of the boroughs of Tralee, Dingle and Ardfeet. At the Union the number was reduced to three, two for the county and one for the borough of Tralee; but the divisions now number four: north, south, east and west, each returning two county and one member. The county is in the Protestant diocese of Limerick and the Roman Catholic dioceses of Kerry and Limerick.

History. — The county is said to have derived its name from Clare, with his tribe, the Ciareaidhe, is stated to have inhabited about the beginning of the Christian era the territory lying between Tralee and the Shannon. The island of Yveta was at a later period included in the kingdom of Desmond (p. 96). Kerry suffered frequently from invasions of the Danes in the 9th and 10th centuries, until they were finally overthrown at the battle of Clontarf in 1014. In 1172 Dermot MacCarthy, king of Cork and Desmond, made submission to Henry II. on certain conditions, but was nevertheless gradually compelled to retire within the limits of Kerry, which is one of the areas generally considered to have been shire ground by King John. An English adventurer, Raymond le Gros, received from his MacCarthy, a large portion of the county, and named it Lousa. In 1577-1580 attempts were made by the Spaniards to invade Ireland, landing at Limerick harbour, near Dingle, and a fortress was erected here, but was destroyed by the English in 1580. The Irish took advantage of the disturbed state of England at the time of the Puritan revolution to attempt the overthrow of the English rule in Kerry, and ultimately obtained possession of Tralee, but in 1652 the rebellion was completely subdued, and a large number of estates were afterwards confiscated.

There remains of a round tower at Aghadoe, near Killarney, and another, one of the finest and most perfect specimens in Ireland, 92 ft. high, at Rattoo, not far from Ballybunion.
the summit of a hill to the north of Kenmare River is the remark-

able stone fortress known as Staigue Fort. There are several

stone cells in the principal Skellig island, where penance, invol-

ving the scaling of dangerous rocks, was done by pilgrims, and

where there were formerly monastic remains which have been

swept away by the sea. The principal groups of sepulchral

stones are those on the summits of the Tomie Mountains, a

remarkable stone fort at Cahersiveen, a circle of stones with

enormous capstone, the Tuosist, and others with inscriptions

near Dingle. The remote peninsula of a line from Dingle to

Smerwick harbour is full of remains of various dates. There

are notable monastic ruins are those of Innisfallen, founded

by St Finian, a disciple of St Columba, and the fine remains of

Muckross Abbey, founded by the Franciscans, but there are also

monastic remains at Ardfort, Castlemaine, Derrynane, Kilcoleman

and O'Donney. Among ruined churches of interest are those of

Aghadoe, Kilcrohane, Lough Currane, Derrynane and Muckross.

The cathedral of Ardfort, founded probably in 1253, was partly

destroyed during the Cromwellian wars, but was restored in 1831.

Some interesting portions remain (see Tralee). There is a

large number of feudal castles.

KERSAINT, ARMAND GUY SIMON DE COENENPREN, COMTE DE (1742-1793), French sailor and politician, was born at

Paris on the 20th of July 1742. He came of an old family,
his father, Guy François de Coenmepren, comte de Kersaint,
being a distinguished naval officer. He entered the navy in
1755, and in 1757, while serving on his father's ship, was
promoted to the rank of ensign for his bravery in action.
By 1782 he was a captain, and in this year took part in an expedition to

Greece. At that time the office of admiral was divided into two parties—the reds or nobles, and the blue or roturiers.

At the outbreak of the Revolution, Kersaint, in spite of
his high birth, took the side of the latter. He adopted the new
ideas, and in a pamphlet entitled Le Bon Sens attacked feudal
privileges; he also submitted to the Constituent Assembly a
scheme for the reorganization of the navy, but it was not
accepted. On the 4th of January 1790 Kersaint was appointed
administrator of the department of the Seine by the electoral
assembly of Paris. He was also elected as a député suppléant
to the Legislative Assembly, and was called upon to sit in it in
place of a deputy who had resigned. From this time onward his
chief aim was the realization of the navy scheme which he had
vainly submitted to the Constituent Assembly. He soon saw
that this would be impossible unless there were a general reform
of all institutions, and therefore gave his support to the policy
of the advanced party in the Assembly, denouncing the conduct of
Louis XVI., and on the 10th of August 1792 voting in favour
of his deposition. Shortly after, he was sent on a mission to
the armée du Centre, visiting in this way Soissons, Reims, Sedan
and the Ardennes. While thus occupied he was arrested by the
municipality of Sedan; he was set free after a few days' detention.
He took an active part in one of the last debates of the Legisla-
tive Assembly, in which it was decided to publish a Bulletin officiel,
a report continued by the next Assembly, and known by the
name of the Bulletin de la Convention Nationale. Kersaint
was sent as a deputy to the Convention by the department of
Seine-et-Oise in September 1792, and on the 1st of January 1793
was appointed vice-admiral. He continued to devote himself
to questions concerning the navy and national defence, prepared
a report on the English political system and the navy, and caused
a decree to be passed for the formation of a committee of general
defence which after many modifications was to become the
famous Committee of Public Safety. He had also had a decree
passed concerning the navy on the 11th of January 1793.
He had, however, entered the ranks of the Girondins, and had voted
in the trial of the king against the death penalty and in favour
of the appeal to the people. He resigned his seat in the Conven-
tion on the 20th of January. After the death of the king his
opposition became more marked; he denounced the September
massacres, but when called upon to justify his attitude confined
himself to attacking Marat, who was at the time all-powerful.
His friends tried in vain to obtain his appointment as minister
of the marine; and he failed to obtain even a post as officer.
He was arrested on the 23rd of September at Ville d'Auvray, near
Paris, and taken before the Revolutionary Tribunal, where he
was accused of having conspired for the restoration of the
monarchy, and of having insulted national representation by
resigning his position in the legislature. He was executed on
the 4th of December 1793.

His brother, GUY PERE (1747-1822), also served in the navy,
and took part in the American war of independence. He did not
accept the principles of the Revolution, but emigrated.
He was restored to his rank in the navy in 1813, and died in
1822, after having been préfet maritime of Antwerp, and prefect
of the department of Meurthe.

Considérations sur la force publique et l'institution des gardes nationales
(1783); Lette à Miroir (1791); Moyens présentés à l'Assemblée
nationale pour rétablir la paix et l'ordre dans les colonies; also E.
Chevalier, Histoire de la Marine française sous la première République;
E. Charavay, L'Assemblée électorale de Paris en 1790 et 1791 (Paris,
1890); and Agonor Bardoux, La Duchesse de Duras (Paris, 1896),
the beginning of which deals with Kersaint, whose daughter married
Amédée de Duras. (R. A.)*

KERVYN DE LETTENHOVE, CONSTANTINE BRUNO,
BARON, (1817-1891), Belgian statistician, was born at Saint-
Michel-les-Bruges in 1817. He was a member of the Catholic
Constitutional party and sat in the Chamber as member for
Eeclo. In 1870 he was appointed a member of the cabinet of
Anethan as minister of the interior. But his official career
was short. The cabinet appointed as governor of Lille one
Decker, who had been entangled in the financial speculations
of the Van-Houdoncourt by which the whole clerical party had
been discredited, and which provoked riots. The cabinet was
forced to resign, and Kervyn de Lettenhove devoted himself
to literature and history. He had already become known as
the author of a book on Froissart (Brussels, 1835), which
was crowned by the French Academy. He edited a series of chronicles—Chroniques relatives à l'histoire de la Belgique sous la
domination des ducs de Bourgogne (Brussels, 1870-1873), and
Rédactions politiques des Pays Bas et de l'Angleterre sous le regne de
Philippe II. (Brussels, 1882-1882). He wrote a history of
Les Huguenots et les Gueux (Bruges, 1883-1883) in the spirit of
a violent Roman Catholic partisan, but with much industry
and learning. He died at Saint-Michel-les-Bruges in 1891.

See Notices biographiques et bibliographiques de l'Académie de
Belgique for 1887.

KESHUB CHUNDER SEN (KESHAVA CHANDRA SENA) (1838-
1884), Indian religious reformer, was born of a high-caste family
at Calcutta in 1838. He was educated at one of the Calcutta
colleges, where he became proficient in English literature and
history. For a short time he was a clerk in the Bank of Bengal,
but resigned his post to devote himself exclusively to literature
and philosophy. At that time Sir William Hamilton, Hugh
Blair, Victor Cousin, J. H. Newman and R. W. Emerson were
among his favourite authors. Their works made the deepest
impression on him, for, as he expressed it, "Philosophy first
taught me insight and reflection, and turned my eyes inward
from the things of the external world, so that I began to reflect
on my position, character and destiny." Like many other
educated Hindus, Keshub Chunder Sen had gradually dissociated
himself from the popular forms of the native religion, without
abandoning what he believed to be its spirit. As early as 1857
he joined the Brahma Samaj, a religious association aiming at
the reformation of Hinduism. Keshub Chunder Sen threw him-
self with enthusiasm into the work of this society and in 1862
himself undertook the ministry of one of its branches. In
the same year he helped to found the Albert College and started
the Indian Mirror, a weekly journal in which social and moral
subjects were discussed. In 1863 he wrote The Brahma Samaj
Vindicated. He also travelled about the country lecturing and
preaching. The steady development of his reformatory zeal led
to a split in the society, which broke into two sections, Chunder
Sen putting himself at the head of the reform movement, which
took the name "Brahma Samaj of India," and tried to propagate
KESTMÁRK—KESTREL

its doctrines by missionary enterprise. Its tenets at this time were the following: (1) The wide universe is the temple of God. (2) Wisdom is the pure land of pilgrimage. (3) Truth is the everlasting scripture. (4) Faith is the root of all religions. (5) His last illness he wrote The Nature (6) or The Sacred Laws of selfishness is the true asceticism. In 1866 he delivered an address on "Jesus Christ, Europe and Asia," which led to the false impression that he was about to embrace Christianity. This helped to call attention to him in Europe, and in 1870 he paid a visit to England. The Hindu preacher was warmly welcomed by almost all denominations, particularly by the Unitarians, with whose creed the new Brahma Samaj had most in common, and it was the committee of the British and Foreign Unitarian Association that organized the welcome soirée at Hanover Square Rooms on the 12th of April. Ministers of ten different denominations were on the platform, and among those who officially bade him welcome were Lord Lawrence and Dean Stanley. He remained for six months in England, visiting most of the chief towns. His eloquence, delivery and command of the language won universal admiration. His own impression of England was somewhat disappointing. Christianity in England appeared to him too sectarian and narrow, too "muscular and hard," and Christian life in England more materialistic and outward than spiritual and inward. "I came here an Indian, I go back a confirmed Indian; I came here a Theist, I go back a Hindu. The king of this country is not the king of the whole country more and more." These words spoken at the farewell soirée may furnish the key to the change in him which so greatly puzzled many of his English friends. He developed a tendency towards mysticism and a greater leaning to the spiritual teaching of the Indian philosophies, as well as a somewhat despotistic attitude towards the Samaj. He gave his child daughter in marriage to the raja of Kuch Behar; he revived the performance of mystical plays, and himself took part in one. These changes alienated many followers, who deserted his standard; he himself is the Sadhak General Chunder Sen (1878). Chunder Sen did what he could to reinvigorate his own section by a new infusion of Christian ideas and phrases, e.g. "the New Dispensation," "the Holy Spirit." He also instituted a sacramental meal of rice and water. Two lectures delivered between 1881 and 1883 throw a good deal of light on his latest doctrines. They were "The Marvellous Mystery, the Trinity," and "Asia's Message to Europe." This latter is an eloquent plea against the Europeanizing of Asia, as well as a protest against Western sectarianism. During the intervals of these lectures he wrote The New Samaj, or The Natural Laws of the Aryans of the New Dispensation. He died in January 1884, leaving many bitter enemies and many warm friends.

See the article BRAHMA SAMAJ; also P. Mozoomdar, Life and Teachings of Keshub Chunder Sen (1888).

KEŠMÁRK (Ger. Kásmárk), a town in Hungary, in the county of Szepes, 240 m. N.E. of Budapest by rail. Pop. (1900), 5560. It is situated on the Poprad, at an altitude of 1920 ft., and is surrounded on all sides by mountains. Among its buildings are the Roman Catholic parish church, a Gothic edifice of the 15th century with fine carved altars; a wooden Protestant church of the 17th century; and an old town-hall. About 12 m. W. of Kásmárk lies the famous watering-place Tatrafürdő (Ger. Kásmárk), at the foot of the Schlagendorf peak in the Tatra Mountains. Kásmárk is one of the oldest and most important Saxon settlements in the north of Hungary, and became a royal free town at the end of the 13th century, in 1440 it became the seat of the counts of Szepes (Ger., Zips), and in 1464 it was granted new privileges by King Matthias Corvinus. During the 16th century, together with the other Saxon towns in the Szepes county, it began to lose both its political and commercial importance. It remanied a royal free town until 1576.

KESTREL (Fr. Cressorelle or Crechère, O. Fr. Quercerelle and Quercelle, in Burgundy Cristel), the English name1 for one of the smaller falcons. This bird, though in the form of its bill and hindquarters it may own length of its wings one of the true falcons, and by many ornithologists placed among them under its Linnaean name of Falco tinnunculus, is by others referred to a distinct genus Tinnunculus as T. alaudarius—the last being an epithet wholly inappropriately. 2 These species were in a case in which the nearly the whole of Europe requires the establishment of a genus on structural characters may seem open to question. The differences of structure which separate Tinnunculus from Falco are of the slightest, and, if insisted upon, must lead to including in the former birds which obviously differ from kestrels in all but a few characters arbitrarily chosen; and yet, if structural characters be set aside, the kestrels form an assemblage readily distinguishable by several peculiarities from all other Falconidae, and an assemblage separable from the true Falcons of the genus Falco, with its Indian group of Tinnunculus and Falco (see gr.). Scarcely any one outside the walls of an ornithological museum or library would doubt for a moment whether any bird shown to him was a kestrel or not; and Gurney has stated his belief (Ibis, 1881, p. 277) that the aggregation of species placed by Bowdler Sharpe (Cat. Birds Brit. Mus. i. 423-448) under the generic designation of Cerchneis (which should properly be Tinnunculus) includes "three natural groups sufficiently distinct to be treated as at least separate subgenera, bearing the name of Dissodectes, Tinnunculus and Erithopis." Of these the first and last are the kestrels, but are perhaps rather related to the hobbies (Hypopatria). The ordinary kestrel of Europe, Falco tinnunculus or Tinnunculus alaudarius, is by far the commonest bird of prey in the British Islands. It is almost entirely a summer migrant, coming from the south in early spring and departing in autumn, though examples (which are nearly always found to be birds of the year) occasionally occur in winter, some arriving on the eastern coast in autumn. It is most often observed while hanging in the air for a minute or two in the same spot, by means of short and rapid beats of its wings, as, with head pointing to windward and tail well out, it is sporting for prey—which consists chiefly of mice, but it will at times take a small bird, and the remains of frogs, insects and even earthworms have been found in its crop. It generally breeds in the deserted nest of a crow or pie, but frequently in rocks, ruins, or even in hollow trees—laying four or five eggs, mottled all over with dark brownish-red, sometimes tinged with orange and at other times with purple. Though it may occasionally snatch up a young partridge or pheasant, the kestrel is the most harmless bird of prey, if it be not, from its destruction of mice and cockchafers, a benevolent bird of the country. It is a very wide-ranging bird (see T. alaudarius), but its range from 68° N. lat., and the greater part of Asia—though the form which inhabits Japan and is abundant in north-eastern China has been by some writers deemed distinct and called T. japonicus—it also found over a great part of Africa, being, however, unknown beyond Guinea on the west and Mombasa on the east coast (Ibis, 1881, p. 457). The southern countries of Europe have also another and smaller species of kestrel, T. tinnunculus (the T. cenchris and T. maurus of some writers), which is widely spread in Africa and Asia, though specimens from India and China are distinguished as T. philinoides. These other species are found in Africa—T. rupicolus, T. rupicoloides and T. alopecus—the first a common bird in the Cape, while the others occur in the interior. Some of the islands of the Ethiopian region have peculiar species of kestrel, as the T. newtoni of Madagascar, T. punctatus of Mauritius and T. gracilis of the Seychelles; while, on the opposite side, the kestrel of the Cape Verde Islands has been separated as T. neglectus. The T. sparverius, commonly known in Canada and the United States as the "sparrow-hawk," is a beautiful little bird. Various attempts have been made to recognize several species, more or less in accordance with locality, but the majority of ornithologists seem unable to accept the distinctions which have been elaborated chiefly by Bowdler Sharpe in his Catalogue and R. Ridgway (North American Birds, iii. 159-175), the former of whom recognizes six species, while the latter admits but three—

1 Other English names are windhover and stagelake (the last often corrupted into stonegale and stannell).
T. sparverius, T. leucophrys and T. sparverioides—five geographical races of the first, viz. the typical T. sparverius from the continent of North America except the coast of the Gulf of Mexico; T. australis from the continent of South America except the North Atlantic and Caribbean coasts; T. isolinus, inhabiting continental America from Florida to Fr.Guiana; T. dominicensis from the Lesser Antilles as far northwards as St Thomas; and lastly T. cinnamominus from Chile and western Brazil. T. leucophrys is said to be from Haiti and Cuba; and T. sparverioides peculiar to Cuba only. This last has been generally allowed to be a good species, though Dr Gundlach, the best authority on the birds of that island, in his Contribution à la Ornithologie Cubana (1876), will not allow its validity. More recently it was found (Ibts, 1881, pp. 547–564) that T. australis and T. cinnamominus cannot be separated, that Ridgway's T. leucophrys should properly be called T. dominicensis, and his T. dominicensis T. antillarum; while Ridgway has recorded the supposed occurrence of T. sparverioides in Florida. Of other kestrels T. moluccensis is widely spread throughout the islands of the Malay Archipelago, while T. cenchroides seems to inhabit the whole of Australia, and has occurred in Tasmania (Proc. Roy. Soc. Tasmania, 1875, pp. 7, 8). No kestrel is found in New Zealand, but an approach to the form is made by the very pretty little bird (T. meridionalis), which is often found on the coast race or species has been described, H. brunnea or H. ferox), the "sparrow-hawk," "quail-hawk" and "bush-hawk" of the colonists—a bird of much higher courage than any kestrel, and perhaps exhibiting the more generalized and ancestral type from which both kestrels and falcons may have descended. (A. N.)

KESWICK, a market town in the Penrith parliamentary division of Cumberland, England, served by the joint line of the Cockermouth Keswick & Penrith, and London & North-Western railways. Pop. of urban district (1901), 4451. It lies in the northern part of the Lake District, in an open valley on the banks of the river Derwent. In the north and the lovely lake of Derwentwater to the south. It is much frequented by visitors as a centre for this famous district, for boating on Derwentwater and for the easy ascent of Skiddaw. Many residences are seen in the neighbourhood, and the town as a whole is modern. Fitz Park, opened in 1887, is a pleasant recreation ground. The town-hall contains a museum of local geology, natural history, &c. In the parish church of Crosthwaite, 1 m. distant, there is a monument to the poet Southey. His residence, Greta Hall, stands at the end of the main street. The river Derwent is noted for its excellent salmon fishing, and the plowman (locally wad) used to be supplied from mines in Borrowdale. Char, caught in the neighbouring lakes, are potted at Keswick in large quantities and exported.

KESWICK CONVENTION, an annual summer reunion held at the above town for the main purpose of "promoting practical holiness" by meetings for prayer, discussion and personal intercourse. It has no denominational limits, and is largely supported by the "Evangelical" section of the Church of England. The convention, started in a private manner by Canon Harford-Battersby, then vicar of Keswick, and Mr Robert Wilson in 1874, met first in 1875, and rapidly grew after the first few years, both in numbers and influence, in spite of attacks on the alleged "perfectionism" of some of its leaders and on the novelty of its methods. Its members take a deep interest in foreign missions.

In the History of the C.M.S., vol. iii. (by Eugene Stock), the missionary influence of the "Keswick men" in Cambridge and elsewhere may be readily traced. See also Keswick Convention. See Conventions, its Message, its Method and its Men, edited by C.F. Harford (1906).}

KET (or KETT), ROBERT (d. 1549), English rebel, is usually called a banner, but he certainly held the manor of Wyomondham in Norfolk. With his brother William he led the men of Wyomondham in their quarrel with a certain Flowerden, and having thus come into prominence, he headed the men of Norfolk when they rose in rebellion in 1549 owing to the hardships inflicted by the extensive enclosures of common lands and by the general policy of the protector Somerset. A feast held at Wyomondham in July 1549 developed into a riot and gave the signal for the outbreak. Leading his followers to Norwich, Ket formed a camp on Mouchould Heath, where he is said to have commanded 7000 men, introduced a regular system of discipline, administered justice and blockaded the city. He refused the royal offer of an amnesty on the ground that innocent and just men had no need of pardon, and on the 1st of August 1549 attacked and took possession of Norwich. John Dudley, earl of Warwick, marched against the rebels, and after his offer of pardon had been rejected he forced his way into the city, driving its defenders before him. Then, strengthened by the arrival of some foreign mercenaries, he attacked the main body of the rebels at Dustin- dale on the 23rd of August. Ket's men were easily routed by the trained soldiery, and Robert and William Ket were seized and taken to London, where they were condemned to death for treason. On the 7th of December 1549 Robert was executed at Norwich, and his body was hanged on the top of the castle, while that of William was hanged on the church tower at Wyomondham.

KETCH, JOHN (d. 1686), English executioner, who as "Jack Ket," gave the nickname of "ketch" to two centuries to his successors, is believed to have been appointed public hangman in the year 1663. The first recorded mention of him is in The Pleeters Ballad, being Jack Ketch's incompareable Receipt for the Cure of Trautory Recusants and Wholsome Physick for a Popish Contagion, a broadside published in December 1672. The execution of William, Lord Russell, on the 21st of July 1683 was carried out by him in a clumsy way, and a pamphlet is extant which contains his "Apologie," in which he alleges that the prisoner did not "dispose himself as was most suitable" and that he was interrupted while taking aim. On the scaffold, on the 23rd of July, the nation of all the countries of the world, according to Ketch, referred to his treatment of Lord Russell, the result being that Ketch was quite unmanned and had to deal at least five strokes with his axe, and finally use a knife, to sever Monmouth's head from his shoulders. In 1686 Ketch was deposed and imprisoned at Bridewell, but when his successor, Pascha Rose, a butcher, was, after four months in the office, hanged at Tyburn, Ketch was reappointed. He died towards the close of 1686.

KETCHUP, also written catsup and ketchup (said to be from the Chinese koe-chiep or ke-tsip, brine or pickled fish), a sauce or relish prepared principally from the juice of mushrooms and of many other species of edible fungi, salted for preservation and variously spiced. The juices of various fruits, such as cucumbers, tomatoes, and especially green walnuts, are used as a basis of ketchup, and shell-fish ketchup, from oysters, mussels and cockles, is also made; but in general the term is restricted to sauces having the juice of edible fungi as their basis.

KETENES, in chemistry, a group of organic compounds which may be considered as internal anhydrides of acetic acid and its substitution derivatives. Two classes may be distinguished: the aldo-ketenes, including ketene itself, together with its mono-alkyl derivatives and carbon suboxide, and the keto-ketenes which comprise the dialkyl ketenes. The aldo-ketenes are colourless compounds which are not capable of autoxidation, are polymerized by pyridine or quinoline, and are inert towards compounds containing the groupings C:N and C:O. The keto-ketenes are coloured compounds, which undergo autoxidation readily, form ketene bases on the addition of pyridine and quinoline, and yield addition compounds with substances containing the successors C:N and C:O groupings. The ketenes are usually obtained by the action of zinc on ethereal or ethyl acetate solutions of halogen substituted acid chlorides or bromides. They are characterized by their additive reactions: combining with water to form acids, with alcohols to form esters, and with primary amines to form amides.

Ketene, CH₂:CO, was discovered by N. T. M. Wilsome (Jour. Chem. Soc., 1907, vol. 91, p. 1938) among the gaseous products formed
KETI

bromide
(H. Staudinger, Ber. 1908, 41, p. 594). At
bromacetyl
ordinary temperatures, it is a gas, but it may be condensed to a
C. It is
liquid and finally solidified, the solid melting at -151

acetic anhydride.

It

by its penetrating smell. On standing for some
time a brown-coloured liquid is obtained, from which a colourless
liquid boiling at 126-127 C., has been isolated (Wilsmore, ibid.,
characterized

1908, 93, p. 946).
Although originally described as acetylketen, it
has proved to be a cyclic compound (Ber., 1909, 42, p. 4908). It
is soluble in water, the solution showing an acid reaction, owing
to the formation of aceto-acetic acid, and with alkalis it yields
acetates.
It differs from the simple ketenes in that it is apparently
unacted upon by phenols and alcohols. Dimethyl ketene, (CHs^C :CO,
obtained by the action of zinc on o-brom-isobutyryl bromide, is a
yellowish coloured liquid. At ordinary temperatures it rapidly
polymerizes (probably to a tetramethylcylobutanedione). It boils

hydride (Staudinger,

ibid.).

Diphenyl

ketene,

(CtHi^tC :CO, obtained

of zinc on diphenyl-chloracetyl chloride, is an orangered liquid which boils at 146 C. (12 mm.).
It does not polymerize.
Magnesium phenyl bromide gives triphenyl vinyl alcohol.

The ketones

are of neutral reaction, the lower

members

being colourless, volatile, pleasant-smelling liquids. They
do not reduce silver solutions, and are not so readily oxidized
as the aldehydes.
On oxidation, the molecule is split at the
carbonyl group and a mixture of acids is obtained. Sodium
amalgam reduces them to secondary alcohols; phosphorus
pentachloride replaces the carbonyl oxygen by chlorine, forming
the ketone chlorides.
Only those ketones which contain a
methyl group are capable of forming crystalline addition compounds with the alkaline bisulphites (F. Grimm, Ann., 1871,
157, p. 262).
They combine with hydrocyanic acid to form

which on hydrolysis furnish hydroxyacids,
(CH,) 2 CO H> (CH,) 2 C-OH-CN -> (CH 3 ) 2 -C-OH-CO 2 H;
with phenylhydrazine they yield hydrazones; with hydrazine
they yield in addition ketazines RR'-C:N-N:C-RR' (T. Curtius),
and with hydroxylamine ketoximes. The latter readily under"
Beckmann " transformation on treatment with acid
go the
chlorides, yielding substituted acid amides,

RC(NR')-OH -> R-CO-NHR'

OXIMES, also A. Hantzsch, .Ber., 189 1,24, p. 13). The ketones
react with mercaptan to form mercaptols (E. Baumann, Ber.,
1885, 18, p. 883), and with concentrated nitric acid they yield
