his Algerian allies, before deciding on their final plans. Meanwhile, against Mustapha’s better judgment, Piaili induced the council of war to attack St Elmo, in order to open the way for his fleet to an anchorage, safe in all weathers, in Marsamuscetto harbour. This strategic blunder was turned to the best advantage by La Valette, who so prolonged the most heroic defence of St Elmo that the Turks lost 7000 killed and as many wounded before exterminating the 1200 defenders, who fell at their post. In the interval Dragut was mortally wounded, the attack on Notabile was neglected, valuable time lost, and the main objective (the Borgo) and St Angelo left intact. The subsequent siege of St Angelo, and its supporting fortifications, was marked by the greatest bravery on both sides. The knights and their Maltese troops fought for death or victory, without asking or giving quarter. The Grand Master proved as wise a leader as he was brave. By September food and ammunition were getting scarce, a large relieving force was expected from Sicily, and Piaili became restive, on the approach of the equinox, for the safety of his galleys. At last the viceroy of Sicily, who had the Spanish and allied fleets at his disposal, was spurred to action by his council. He timidly landed about 6000 or 8000 troops at the north-west of Malta and withdrew. The Turks began a hurried embarkation and allowed the Christians to join forces at Notabile; then, hearing less alarming particulars of the relieving force, Mustapha relented his reluctant troops, faced his enemies in the open, and was driven in confusion to his ships on the 8th of October, 1565. The Order thus reached the highest pinnacle of its fame, and new knights flocked to be enrolled therein from the flower of the nobility of Europe; La Valette refused a cardinal’s hat, determined not to impair his independence. He made his name immortal by founding on Mt Scaberras “a city built by gentle men for gentlemen” and making Valletta a magnificent example of fortification, unrivalled in the world. The pope and other sovereigns donated vast sums for this new bulwark of Christianity, but, as its ramparts grew in strength, the knights were slow to seek the enemy in his own waters, and became false to their traditional strategy as a naval power. Nevertheless, they harassed Turkish commerce and made booty in minor engagements throughout the 16th and 18th centuries, and they took part as an allied Christian power in the great victory of Lepanto. With the growth of wealth and security the martial spirit of the Order began to wane, and so also did its friendly relations with the Maltese. The field for recruiting its members, as well as its landed estates, became restricted by the Reformation in England and Germany, and the French knights gradually gained a preponderance which upset the international equilibrium of the Order. The election of elderly Grand Masters became prevalent, the turmoil and chances of frequent elections being acceptable to younger members. The civil government became neglected and disorganized, licentiousness increased, and riots began to be threatening. Expenditure on costly buildings was almost ceaseless, and kept the people alive. In 1614 the Vignacourt aqueduct was constructed. The Jesuits established a university, but they were expelled and their property confiscated in 1768. British ships of war visited Malta in 1675, and in 1688 a fleet under the Earl of Grafton came to Valletta. The fortifications of the “Three Cities” were greatly strengthened under the Grand Master Cotoner. In 1722 the Turkish prisoners and slaves, then very numerous, formed a conspiracy to rise and seize the island. Premature discovery was followed by prompt suppression. Castle St Angelo and the fort of St James were, in 1775, surprised by rebels, clamouring against bad government; this rising is known as the Rebellion of the Priests, from its leader, Mannarino. The last but one of the Grand Masters who reigned in Malta, de Rohan, restored good government, abated abuses and promulgated a code of laws; but the ascendancy acquired by the Inquisition over the Order, the confiscation of the property of the knights in France on the outbreak of the Revolution, and the intrigues of the French made the task of regenerating the Order evidently hopeless in the changed conditions of Christendom. On the death of Rohan the French knights disagreed as to the selection of his successor, and a minority were able to elect, in 1797, a German of weak character, Ferdinand Hompesch, as the last Grand Master to rule in Malta. Bonaparte had arranged to obtain Malta by treachery, and he took possession without resistance in June 1798; after a stay of six days he proceeded with the bulk of his forces to Egypt, leaving General Vaubois with 6000 troops to hold Valetta. The exiled knights made an attempt to reconstruct themselves under the emperor Paul of Russia, but finally the Catholic parent stem of the Order settled in Rome and continues there under papal auspices. It still comprises members who take vows of celibacy and prove the requisite number of quarterings.

Towards the close of the rule of the knights in Malta feudal institutions had been shaken to their foundations, but the transition to republican rule was too sudden and extreme for the people to accept it. The French plundered the churches, abolished monks, nuns and nobles, and set up forthwith the ways and doings of the French Revolution. Among other laws Bonaparte enacted that French should at once be the official language, that 30 young men should every year be sent to France for their education; that all foreign monks be expelled, that no new priests be ordained before employment could be found for those existing; that ecclesiastical jurisdiction should cease; that neither the bishop nor the priests could charge fees for sacramental ministrations, &c. Stoppage of pensions and confiscation of property of the clergy and nobility, more than half had been living on foreign revenues, of the knights, and famine, followed the defeat of Bonaparte at the Nile, and the failure of his plans to make Malta a centre of French trade. An attempt to seize church valuables at Notabile was forcibly resisted by the Maltese, and general discontent broke out into open rebellion on the 2nd of September 1798. The French soon discovered to their dismay that, from behind the rubble walls of every field, the agile Maltese were unsatisfactory. The prospect of an English blockade of Malta encouraged the revolt, of which Canon Caruana became the leader. Nelson was appealed to, and with the aid of Portuguese allies he established a blockade and deputed Captain Ball, R.N. (afterwards the first governor) to assume, on the 9th of February 1799, the provisional administration of Malta and to superintend operations on land. Nelson recognized the movement in Malta as a successful revolution against the French, and upheld the contention that the king of Sicily (as successor to Charles V. in that part of the former kingdom of Aragon) was the legitimate sovereign of Malta. British troops were landed to assist in the siege; few lives were lost in open action, but a great deal of damage was done to property and structures of the island, and finally forced the French to surrender to the allies. Canon Caruana and other leaders of the Maltese aspired to obtain for Malta the freedom of the Roman Catholic religion guaranteed by England in Canada and other dependencies, and promoted a petition in order that Malta should come under the strong power of England rather than revert to the kingdom of the two Sicilies.

The Treaty of Amiens (1802) provided for the restoration of the island to the Order of St John; against this the Maltese strongly urged, and the commercial treaty which was made between France and the United Kingdom guaranteed the maintenance of French influence. The English flag was flown side by side with the Neapolitan, and England actually renewed war with France sooner than give up Malta. The Treaty of Paris (1814), with the acclamations of the Maltese, confirmed Great Britain in the aggregation of Malta to the empire. A period elapsed before the government of Malta again became self-supporting, during which over 500,000 was contributed by the British exchequer in aid of revenue, and for the importation of food-stuffs. The restoration of Church property, the establishment of law and administration on lines to which the people were accustomed before the French invasion, and the claiming for the Crown of the vast landed property of the knights, were the first cares of British civil rule. As successor to the Order, the Crown claimed and eventually established (by the negotiations in Rome of Sir Frederick Hankey, Sir Gerald Strickland and
Sir Lintorn Simmons (with regard to the presentation of the bishopric (worth about £4000 a year) the right to veto the appointment of distasteful candidates. This right was exercised to secure the nomination of Canon Caruana and later of Monsignor Pace. When the pledge, given by the Treaty of Amiens, to restore the Order of St John with a national Maltese 'language,' could not be fulfilled, political leaders began demanding instead the re-establishment of the "Consiglio Popolare" of Norman times (without reflecting that it never had legislative power); but by degrees popular aspirations developed in favour of a free constitution on English lines. The British authorities steadily maintained that, at least until the mass of the people became educated, representative institutions would merely screen irresponsible oligarchies. After the Treaty of Paris stability of government developed, and many important reforms were introduced under the strong government of the masterful Sir Thomas Maitland; he acted promptly, without seeking popularity or fearing the reverse, and he ultimately gained more real respect than any other governor, not excepting the marquess of Hastings, who was a brilliant and sympathetic administrator. Trial by jury for criminal cases was established in 1829. A council of government, of which the members were nominated, was constituted by letters patent in 1835, but this measure only increased the agitation for a representative legislature. Freedom of the press and many salutary innovations were brought about on a report of John Austin and G. C. Lewis, royal commissioners, appointed in 1836. The basis of taxation was widened, sinescues abolished, schools opened in the country districts, legal procedure simplified, and the Police established on an English footing. Queen Adelaide visited Malta in 1838 and founded the Anglican college church of St Paul. Sir F. Hankey as chief secretary was for many years the principal official of the civil administration. In 1847 Mr R. Moore O'Ferrall was appointed civil governor. In June 1849 the constitution of the council was altered to comprise ten nominated and eight elected members.

The revolutions in Italy caused about this time many, including Crispi and some of the most intellectual Italians, to take refuge in Malta. These foreigners introduced new life into politics and the press, and made it fashionable for educated Maltese to delude themselves with the idea that the Maltese 'were' Italians, because a few of them could speak the language of the peninsula. A clerical reaction followed against new progressive ideas and English methods of development. After much unreasoning vituperation the Irish Catholic civil governor, who had arrived amidst the acclamations of all, left his post in disgust. His successor as civil governor was Sir W. Reid, who had formerly held the Italian command. His determined attempts to promote education met with intense opposition and little success. At this period the Crimean War brought great wealth and commercial prosperity to Malta. Under Sir G. Le Marchant, in 1858, the nominal rule of military governors was re-established, but the civil administration was largely confided to Sir Victor Houlton as chief secretary, whilst the real power began to be concentrated in the hands of Sir A. Dingli, the Crown advocate, who was the interpreter of the law, and largely its maker, as well as the principal depository of local knowledge, able to prevent the pressure of higher officials to barrier which difference of language created between governors and government. The civil service gravitated into the hands of a clique. At this period much money was spent on the Marsa extension of the Grand Harbour, but the rapid increase in the size of steamships made the scheme inadequate, and limited its value prematurely. The military defences were entirely remodelled under Sir G. Le Marchant, and considerable municipal improvements and embellishments were completed. But this governor was obstructed and intimidated by local politicians as vehemently as his predecessors and his successors. Ministers at home have often appeared to be inclined to the policy of pleasing by avoiding the reforming of what might be left as it was found. Sir A. Dingli adapted a considerable portion of the Napoleonic Code in a series of Malta Ordinances, but stopped short at points likely to cause agitation. Sir P. Julyan was appointed royal commis-
enforced. A naval officer was placed over the police to diminish difficulties with the naval authorities and sailors. A marine force was raised to stop smuggling; and the subtractions of coal during coaling operations was stopped by drastic legislation. The civil service was reorganized so as to reward merit and work by promotion. Tenders were strictly enforced in letting government property and contracts; a largely increased revenue was applied on water supply, drainage and other works. Lepers were segregated by law.

The Malta marriage question evoked widespread agitation; Sir A. Dingli had refrained from making any provision in his code as to marrying. The Maltese relied on the Roman Canon Law, the English on the common law of England, Scots or Irish had nothing but the English law to fall back upon. Maltese authorities were ignorant of the disabilities of British Nonconformists at common law, and they had not perceived that persons with a British domicile could not evade their own laws by marrying in Malta, e.g. that an English girl up to the age of 21 required the father’s or guardian’s consent from which a Maltese was legally exempt at 18. Sir G. Strickland preferred legislation to the covering up of difficulties by governors’ licences and appeals to incongruous precedents. Sir Lintorn Simmons was appointed envoy to the Holy See, to ascertain how far legislation might be pushed by the right of civil marriage without justifying clerical agitation and obstruction in the council. He succeeded in coming to an agreement with Rome. Nevertheless Sir A. Dingli and ecclesiastics of all denominations, for conflicting reasons, swelled the opposition against the liberal concessions obtained from Leo XIII. The legal necessity for legislation in accordance with the agreement was, nevertheless, on a special reference, submitted to the privy council, whose decision affirmed the advisability of legislation and the need for validating retrospectively marriages not supported by either Maltese or English common law. Agitation in the imperial parliament stopped government action, but the publicity of the finding of the privy council warned all concerned against the risk of neglecting the common law of the empire whenever they were not prepared to follow the lex loci contractus.

Since the British occupation it was disputed whether the military authorities had the right to alienate for the benefit of the imperial exchequer fortress sites no longer required for defence. The reversion of such property was claimed for the local civil government, and the principles governing these rights were ultimately laid down by an order in council, which also determined military rights to restrict buildings within the range of forts. The co-operation of naval and military authorities was obtained for the construction, at imperial expense, of the breakwater designed to save Malta from being abandoned by long and deep draft modern vessels. British-born subjects were given the right to be tried in English. The new system of education (already described) was set up, and many new schools were built with funds provided by order in council against the wishes of the elected majority.

An order in council (1890) making English the language of the courts after fifteen years (by which the Maltese would have obtained the right to be tried in English) was promulgated at a time when the system of taxation was also being revised; henceforth agitation in favour of Italian and against taxation attained proportions unpleasant for those who preferred popularity to reform and progress. The elected members demanded the recall of Sir G. Strickland on his refusing to change his policy. The military governor gave way, as regards making English the language of the courts on a fixed date, but educational reforms and the imposition of new taxes (those in Malta being 2½d. per head, against 9½d. in England) were enacted by an order in council notwithstanding the agitation. Mr Mereweather was appointed chief secretary and civil lieutenant-governor in 1902, and Sir Gerald Strickland became governor and commander-in-chief of the Leeward Islands. Governor Sir F. Grenfell was created a peer. Strenuous efforts were made to placate the Italian party in the administration of the educational reforms; but, as these were not repealed, elected members refused supply, and kept away from the council. Persistence in this course led to the repeal by letters-patent of 1903 of the Strickland-Mizzi Constitution of 1887.

In place of occasional orders in council for important measures, a more permanent and efficient instrument of government was adopted, a small majority was again, with its drawbacks, fully re-established for all local affairs great and small. The representatives were repeatedly re-elected, to resign again and again as a protest against a restricted constitution.

MALTA (or MEDITERRANEAN) FEVER, a disease long prevalent of Malta and formerly at Gibraltar, as well as other Mediterranean centres, characterized by prolonged high temperature, with anaemia, pain and swelling in the joints, and neuritis, lasting on an average four months but extending even to two or three years. Its cause has not been determined, but it was considered closely related to the cholera on the part of Colonel (afterwards Sir) David Bruce, to which contributions were made by various officers of the R.A.M.C. and others, this problem had now been solved. A specific micro-organism, the Micrococcus melitensis, was discovered in 1887, and it was traced to the milk of the Maltese goats. A commission was sent out to Malta in 1904 to investigate the question, and after three years’ work its conclusions were embodied in a report by Colonel Bruce in 1907. It was shown that the disappearance of the disease from Gibraltar had synchronized with the
MALTÉ-BRUN—MALTHUS

The non-importation of goats from Malta; and preventive measures adopted in Malta in 1906, by banishing goats' milk from the military and naval dietary, put a stop to the occurrence of cases. In the event of Malta fever a vaccine has been used with considerable success.

MALTÉ-BRUN, CONRAD (1755–1826), French geographer, was born on the 21st of August 1755 at Thisted in Denmark, and died at Paris on the 14th of December 1826. His original name was Malte Conrad Brun. While a student at Copenhagen he made himself famous partly by his verses, but more by the violence of his political pamphleteering; and at length, in 1780, the legal actions which the government authorities had from time to time instituted against him culminated in a sentence of banishment. The principles which he had advocated were those of the French Revolution, and after first seeking asylum in Sweden he found his way to Paris. There he looked forward to a political career; but, when Napoleon's personal ambition began to unfold itself, Malte-Brun was bold enough to protest, and to turn elsewhere for employment and advancement. He was associated with Edme Mentelle (1730–1815) in the compilation of the Geographie mathématique... de toutes les parties du monde (Paris, 1803–1807, 16 vols.), and he became recognized as one of the best geographers of France. He is remembered, not only as the author of six volumes of the learned Précis de la géographie universelle (Paris, 1810–1820), continued by other hands after his death, but also as the originator of the Annales des voyages (1808), and one of the founders of the Geographical Society of Paris. His second son, Victor Adolphe Malte-Brun (1816–1889), followed his father's career of geographer, and was a voluminous author.

MALTHUS, THOMAS ROBERT (1766–1834), English economist, was born in 1766 at the Rookery, near Guildford, Surrey, a small estate owned by his father, Daniel Malthus, a gentleman of good family and independent fortune, of considerable culture, the friend and correspondent of Rousseau and one of his executors. Young Malthus was never sent to a public school, but received his education from private tutors. In 1784 he was sent to Cambridge, where he was ninth wrangler, and became fellow of his college (Jesus) in 1797. The same year he received orders, and undertook the charge of a small parish in Surrey. In the following year he published the first edition of his great work, An Essay on the Principle of Population as it affects the Future Improvement of Society, with Remarks on the Speculations of Mr Godwin, M. Condorcet, and other Writers. This methodical and in every respect a good deal of surprise as well as attention; and with characteristic thoroughness and love of truth the author went abroad to collect materials for the verification and more exhaustive treatment of his views. As Britain was then at war with France, only the northern countries of Europe were quite open to his research at that time; but during the brief Peace of Amiens Malthus continued his investigations in France and Switzerland. The result of these labours appeared in the greatly enlarged and more mature edition of his work published in 1803.

In 1803 Malthus married happily, and not long after was appointed professor of modern history and political economy in the East India Company's College at Haileybury. This post he retained till his death suddenly from heart disease on the 23rd of December 1834. Malthus was one of the most amiable, candid and cultured of men. In all his private relations he was not only without reproach, but distinguished for the beauty of his character. He bore popular abuse and misrepresentation without the slightest murmur or sourness of temper. The aim of his inquiries was to promote the happiness of mankind, which could be better accomplished by pointing out the real possibilities of progress than by indulging in vague dreams of perfectibility apart from the actual facts which condition human life.

Malthus's Essay on Population grew out of some discussions which he had with his father respecting the perfectibility of society. His father shared the theories on that subject of Condorcet and Godwin; and his son combated them on the ground that the realization of a happy society will always be hindered by the miseries consequent on the tendency of population to increase faster than the means of subsistence. His father was struck by the weight and originality of his views, asked him to put them in writing, and then recommended the publication of the manuscript. It was in this way that Tennyson saw the light. Thus it will be seen that both historically and philosophically the doctrine of Malthus was a corrective reaction against the superficial optimism diffused by the school of Rousseau. It was the same optimism, with its easy methods of regenerating society and its fatal blindness to the real conditions that circumscribe human life, that was responsible for the wild theories of the French Revolution and many of its consequent excesses.

The project of a formal and detailed treatise on population was an afterthought of Malthus. The essay in which he had studied a hypothetic future led him to examine the effects of the principle he had put forward on the past and present state of society; and he undertook an historical examination of these effects, and sought to draw such inferences in relation to the actual state of things as experience seemed to warrant. In its original form he had spoken of no checks to population but those which came under the head either of vice or of misery. In the 1803 edition he introduced the new element of the preventive check supplied by what he called "moral restraint," and is thus enabled to "soften some of the harshest conclusions" at which the treatise arrived. The treatise passed through six editions in his lifetime, and in all of them he introduced various corrections and additions. That of 1816 is the last he revised, and supplies the final text from which it has since been reprinted.

Notwithstanding the great development which he gave to his work and the almost unprecedented amount of discussion to which it gave rise, it remains a matter of some difficulty to discover what solid contribution he has made to our knowledge, nor is it easy to ascertain precisely what practical precepts, not already familiar, he founded on his theoretic principles. This twofold vagueness is well brought out in his celebrated correspondence with Nassau Senior, in the course of which it seems to be made apparent that his doctrine is new not so much in its essence as in the phraseology in which it is couched. He himself tells us that when, after the publication of the original essay, the main argument of which he had deduced from David Hume, Robert Wallace, Adam Smith and Richard Price, he began to inquire more closely into the subject, he found that "much more had been done" upon it "than he had been aware of." It had "been treated in such a manner by some of the economists, occasionally by Montesquieu, and, among English writers, by Sir Arthur Young and Rev. J. Townsend, as to create a natural surprise that it had not excited more of the public attention." "Much, however," he thought, "remained yet to be done. The comparison between the increase of population and food had not, perhaps, been stated with sufficient force and precision," and "few inquiries had been made into the various modes by which the level of population and the means of subsistence are affected." The first desideratum here mentioned—the want, namely, of an accurate statement of the relation between the increase of population and food—Malthus doubtless supposed to have been supplied by the celebrated proposition that "population increases in a geometrical, food in an arithmetical ratio." This proposition, however, has been conclusively shown to be erroneous, there being no such difference of law between the increase of man and that of the organic beings which form his food. When the formula cited is not used, other somewhat nebulous expressions are sometimes employed, as, for example, that "population has a tendency to increase faster than food," which has been treated as if it were spontaneous growths, and which, on account of the ambiguity of the word "tendency," is admittedly consistent with the fact asserted by Senior, that food tends to increase faster than population. It must always have been perfectly well known that population will probably (though not necessarily) increase with every augmentation of the supply of subsistence, and may, in some instances, inconveniently press upon, or even for a certain time exceed, the number properly corresponding to that supply. Nor could it ever have been doubted that war, disease, poverty—
the last two often the consequences of vice—are causes which keep population down. In fact, the way in which abundance, increase of numbers, want, increase of deaths, succeed each other in the natural economy, when reason does not intervene, had been fully explained by Joseph Townsend in his Dissertation on the Poor Laws (1786) which was known to Malthus. Again, it is surely plain enough that the apprehension of individuals of the evils of poverty, or a sense of duty to their possible offspring, may retard the increase of population, and has in all civilized communities operated to a certain extent in that way. It is only when such obvious truths are cloaked in the technical terminology of "positive" and "preventive checks" that they appear novel and profound; and yet they appear to contain the whole message of Malthus to mankind. The lapidary apparatus of historical and statistical facts respecting the several countries of the globe, adduced in the altered form of the essay, though it contains a good deal that is curious and interesting, establishes no general result which was not previously well known.

It would seem, then, that what has been ambitiously called Malthus's theory of population, instead of being a great discovery as some have represented it, or a poisonous novelty, as others have considered it, is no more than a formal enunciation of obvious, though sometimes neglected, facts. The pretentious language often applied to it by economists is objectionable, as being apt to make us forget that the whole subject with which it deals is as yet very imperfectly understood—the causes which modify the force of the sexual instinct, and those which lead to variations in fecundity, still awaiting a complete investigation.

It is the law of diminishing returns from land, involving as it does—though only hypothetically—the prospect of a continuously increasing difficulty in obtaining the necessary sustenance for all the members of a society, that gives the principal importance to population as an economic factor. It is, in fact, the confluence of the Malthusian ideas with the theories of Ricardo, especially with the corollaries which the latter deduced from the doctrine of rent (though these were not accepted by Malthus), that has led to the introduction of population as an element in the discussion of so many economic questions in modern times.

Malthus had undoubtedly the great merit of having called public attention in a striking and impressive way to a subject which had neither theoretically nor practically been sufficiently considered. But he and his followers appear to have greatly exaggerated both the magnitude and the urgency of the dangers to which they pointed. In their conception of social imperfection assumed such portentous dimensions that it seemed to overshadow the whole heaven and threaten the world with ruin. This doubtless arose from his having at first omitted altogether from his view of the question the great counteracting agency of moral restraint. Because a force exists, capable, if unchecked, of producing certain results, it does not follow that those results are imminent or even possible in the sphere of experience. A body thrown from the hand would, under the simple impulse of projection, move for ever in a straight line; but it would not be reasonable to take special action for the prevention of this result, ignoring the fact that it will be sufficiently counteracted by the other forces which will come into play. And such other forces exist in the case we are considering. If the inherent energy of the principle of population (supposed everywhere the same) is measured by the rate at which numbers increase under the most favourable circumstances, surely the force of less favourable circumstances, acting through prudential or altruistic motives, is measured by the great difference between this rate and that of those populations in the present day in the most European countries. Under a rational system of institutions, the adaptation of numbers to the means available for their support is effected by the felt or anticipated pressure of circumstances and the fear of social degradation, within a tolerable degree of approximation to what is desirable. To bring the result nearer to the just standard, a higher measure of popular enlightenment and more serious habits of moral reflection ought indeed to be encouraged. It is the duty of the individual to his possible offspring, and not any vague notions as to the pressure of the national population on subsistence, that will be adequate to influence conduct for social improvement.

It can scarcely be doubted that the favour which was at once accorded to the views of Malthus in certain circles was due in part to an impression, very welcome to the higher ranks of society, that they tended to relieve the rich and powerful of responsibility for the condition of the working classes, by showing that the latter had chiefly themselves to blame, and not either the negligence of their superiors or the institutions of the country. The application of his doctrines, too, made by some of his successors had the effect of discouraging all active effort for social improvement.

Thus Chalmers "reviews socialism and gravely sets aside all the schemes usually proposed for the amelioration of the economic condition of the people" on the ground that an increase of comfort will lead to an increase of numbers, and so the last state of things will be worse than the first.

Malthus has in more modern times derived a certain degree of reflected lustre from the rise and wide acceptance of the Darwinian hypothesis. Its author himself, in tracing its filiation, points to the phrase "struggle for existence" used by Malthus in relation to the social competition. Darwin believed that man advanced to his present high condition through such a struggle, consequent on his rapid multiplication. He regarded, it is true, the agency of this cause for the improvement of the race as largely superseded by moral influences in the more advanced social stages. Yet he considered it, even in these stages, of so much importance towards that end that, notwithstanding the individual suffering arising from the struggle for life, he deprecated any great reduction in the natural, by which he seems to mean the ordinary, rate of increase.

Besides his great work, Malthus wrote Observations on the Effect of the Corn Laws; An Inquiry into the Nature and Progress of Rent; Principles of Political Economy; and Definitions in Political Economy. His views on rent were of real importance.

For his life see Memoir by his friend Dr Otter, bishop of Chichester (prefixed to 2nd ed., 1836, of the Principles of Political Economy), and Malthus and his Work, by J. Bonar (London, 1885). Practically every treatise on economics deals with Malthus and his essay, but the following special works may be referred to: Soetbeer, Die Stellung der Socialisten zur Malthus'schen Bevölkerungstheorie (Berlin, 1886); G. de Molinari, Malthus, essais sur le principe de population (Paris, 1887); Cossa, Bevölkerungslehre (Milan, 1893); and Ricardo, Letters to Malthus, ed. J. Bonar (1887).

MALTON, a market town in the Thirsk and Malton parliamentary division of Yorkshire, England, 21 m. N.E. of York by a branch of the North Eastern railway. The town comprises Old Malton and New Malton in the North Riding, and Norton on the opposite side of the river Derwent, in the East Riding. Pop. of urban district of Malton (1901), 4758; of urban district of Norton 3842. The situation, on the wooded hills rising from the narrow valley, is very picturesque. The church of St Michael is a fine late Norman building with perpendicular tower; the church of St Leonard, of mixed architecture, with square tower and spire, has three Norman arches and a Norman font. The church of St Mary at Old Malton was attached to a Gilbertine priory founded in 1150; it is transitional Norman and Early English, with later insertions. Remains of the priory are scanty, but include a crypt under a modern house. In the neighbourhood of Malton are the slight but beautiful fragments of Kirkham Abbey, an Early English Augustinian foundation of Walter l'Espec (1131); and the fine mansion of Castle Howard, a massive brick building of the 18th century. Each of these memorials has a noteworthy collection of pictures. Malton possesses a townhall, a corn exchange, a museum, and a grammar-school founded in 1547. There are iron and brass foundries, agricultural implement works, corn mills, tanneries and breweries. In the neighbourhood are lime and whinstone quarries.

Traces of a Romano-British village exist on the east side of the town, but there appears to be no history of Malton before the Norman Conquest. The greater part of Malton belonged to the crown in 1865 and was evidentially retained until Henry I.
gave the castle and its appurtenances to Eustace son of John, whose descendants took the name of Vescy. Eustace mediated the deliverance of Malton Castle to King David of Scotland in 1158, but his plans were altered owing to the battle of the Standard. The "burgh" of Malton is mentioned in 1187, and in 1295 the town returned two members to parliament. It was not represented again, however, until 1640, when an act was passed to restore its ancient privileges. In 1867 the number of members was reduced to one, and in 1885 the town was disfranchised. Until the 17th century the burgesses had all the privileges of a borough by prescriptive right, and were governed by two bailiffs and two under-bailiffs, but these liberties were taken from them in 1864 and have never been revived. From that time a bailiff and two constables were appointed at the court leet of the lord of the manor until a local board was formed in 1854. In the 15th century Agnes de Vescy, then lady of the manor, held a market in Malton by prescription, and Camden writing about 1586 says that the lord of the manor then held two weekly markets, on Tuesday and Saturday, the last being the best cattle market in the county. The markets are now held on Saturdays and alternate Tuesdays, and still belong to the lord of the manor.

MALTZAN, HEINRICH VON, BARON ZU WARTENBURG UND PETERSFELD (1826-1874), German traveller, was born on the 6th of September 1826 near Dresden. He studied law at Heidelberg, but on account of ill health spent much of his time from 1850 in travel. Succeeding to his father's property in 1852, he extended the range of his journeys to Morocco and other parts of Barbary, and before his return home in 1854 had also visited Egypt, Palestine and other countries of the Levant. In 1856-1857 he was again in Algeria; in 1858 he reached the city of Morocco; and in 1866 he succeeded in performing the pilgrimage to Mecca, which he afterwards described in Meine Wallfahrt nach Mecca (Leipzig, 1866), but had to flee for his life to Jidda without visiting Medina. He then visited Aden and Bombay, and after some two years of study in Europe again began to wander through the coasts and islands of the Mediterranean, repeatedly visiting Algeria. His first book of travel, Drei Jahre im Nordwesten von Afrika (Leipzig), appeared in 1863, and was followed by a variety of works and essays, popular and scientific. Maltzan's last book, Reise nach Südabraisien (Brunswick, 1873), is chiefly valuable as a digest of much information about little-known parts of south Arabia collected from natives during a residence at Aden in 1870-1871. From 1872 onwards his other services to science must be noticed his collection of Punic inscriptions (Reise in Tunis und Tripolis, Leipzig, 1870), and the editing of Adolph von Wrede's remarkable journey in Hadramut (Reise in Hadramaut, &c., Brunswick, 1870). After long suffering from neuralgia, Maltzan died by his own hand at Pisa on the 23rd of February 1874.

MALUS, ÉTIENNE LOUIS (1775-1812), French physicist, was born at Paris on the 23rd of June 1775. He entered the military engineering school at Mezières; but, being regarded as a suspected person, he was dismissed without receiving a commission, and obliged to enter the army as a private soldier. Being employed upon the fortifications of Dunkirk, he attracted the notice of the director of the works, and was selected as a member of the École polytechnique then to be established under G. Monge. After three years at the École he was admitted into the corps of engineers, and served in the army of the Sambre and Meuse; he was present at the passage of the Rhine in 1797, and at the affairs of Ulm and Altenkirch. In 1798 he joined the Egyptian expedition commanded by Bonaparte in the East till 1801. On his return he held official posts successively at Antwerp, Strasbourg and Paris, and devoted himself to optical research. A paper published in 1800 ("Sur une propriété de la lumière réfléchie par les corps diaphanes") contained the discovery of the polarization of light by reflection, which is specially associated with his name, and in the following year he won a prize from the Institute with his memoir, "Théorie de la double réfraction de la lumière dans les substances cristallines." He died of phthisis in Paris on the 23rd of February 1812.

MALVACEAE, in botany, an order of Dicotyledons belonging to the series Columniferae, to which belong also the orders Tilliacae (containing Tilia, the lime-tree), Bombacaceae (containing Adansonia, the baobab), Sterculiaceae (containing Theobroma cocoa, and Cela, cola-nut). It contains 39 genera with about 300 species, and occurs in all regions except the coldest, the number of species increasing as we approach the tropics. It is represented in Britain by three genera: Malva, mallow; Althaea, marsh-mallow; and Lavatera, tree-mallow. The plants are herbs, as in the British mallows, or, in the warmer parts of the earth, shrubs or trees. The leaves are alternate and often palmarately lobed or divided; the stipules generally fall early. The leaves and young shoots often bear stellate hairs and the tissues contain mucilage-sacs. The regular, hermaphrodite, often showy flowers are borne in the leaf-axils, solitary or in fascicles, or form more or less complicated cymose arrangements. An epicalyx (see Mallow, figs. 3, 4), formed by a whorl of three or more bracteoles, is generally present just beneath the calyx; sometimes, as in Abutilon, it is absent. The petals, which are usually fives (fig. 1); the five sepals, g, which have a valvate or campanulate arrangement, are succeeded by five often large showy petals which are twisted in the bud; they are free to the base, where they are attached to the staminal tube and fall with it when the flower withers. The very numerous stamens are regarded as arising from the branching of a whorl of five opposite the petals; they are united into a tube at the base, and bear kidney-shaped one-celled anthers which open by a slit across the top (fig. 2). The large spheroidal pollen-grains are covered with spines. The carpels are one to numerous; when five in number, as in Abutilon, they are opposite the petals, or, as in Hibiscus, opposite the sepals. In the British genera and many others they are numerous, forming a whorl round the top of the axis in the centre of the flower, the united styles rising from the centre and bearing a corresponding number of stigmatic branches. In Malope the numerous carpels are arranged one above the other in vertical rows. One or more anatropous ovules are attached to the inner angle of each carpel; they are generally ascending but sometimes pendulous or horizontal; the position may vary, as in Abutilon, in one and the same carpel. The flowers are protandrous; when the flower opens the unripe stigmas are hidden in the staminal tube and the anthers occupy the centre of the flower; as the anthers dehice the filaments bend backwards and finally the ripe stigmas spread in the centre. Pollination is effected by insects which visit the flower for the honey, which is secreted in pits one between the base of each petal and is protected from rain by hairs on the lower margin of the petals. In small pale-flowered forms, like Malva rotundifolia, which attract few insects, self-pollination has been observed, the style-arms twisting to bring the stigmatic surfaces into contact with the anthers. Except in Malva, which has a berry, the fruits are dry. In Malus (see Mallow) and allied genera they form one-seeded schizocarps separating from the persistent central column and from each other. In Hibiscus and Gossypium (cotton-plant, g.,) the fruit is a capsule splitting loculicidally. Distribution of the seeds is sometimes aided by hooked outgrowths on the wall of the schizocarp, or by a hairy covering on the seed; an extreme case of which is the cotton-plant where the seed is buried.
in a mass of long tangled hairs—the cotton. The embryo is generally large with much-folded cotyledons and a small amount of endosperm.

The largest genus, *Hibiscus*, contains 300 species, which are widely distributed in the tropics. *H. rosmarinifolia* is a well-known greenhouse plant. *Abutilon* (g.v.) contains 80 species, mainly tropical; *Lavatera*, with 20 species, is chiefly Mediterranean; *Althea* has about 15 species in the temperate and warm temperate regions, being the hollyhock (g.v.); *Malva* has about 30 species in the north temperate zone. Several genera are largely or exclusively American.

**MALVASIA** (Gr. *Monemassia*, i.e. the "city of the single approach or entrance"); Ital. *Napoli di Malvasia*; Turk. *Mengeshe or Beneshe*), one of the principal fortresses and commercial centres of the Levantine coast, a midland region represented by a considerable mass of ruins and a town of about 550 inhabitants. It stood on the east coast of the Morea, contiguous to the site of the ancient Epidaurus Lymner, of which it took the place. So extensive was its trade in wine that the name of the place became familiar throughout Europe as the distinctive appellation of a special kind—Ital. *Malvasia*; Span. *Malvagia*; Fr. *Malvoisie*; Eng. *Malvaise* or *Malmsay*. The wine was not of local growth, but came for the most part from Tenos and others of the Cyclades.

As a fortress Malvasia played an important part in the struggles between Byzantium, Venice and Turkey. The Byzantine emperors considered it one of their most valuable posts in the Morea, and rewarded its inhabitants for their fidelity by unusual privileges. Piranesi (Lib. IV. cap. xvi.) tells how the emperor Constantine XI. gave to Malvasia the privilege of having its own bishops and ecclesiastical matters on Constantin; a metropolitan or archbishop’s see, and how Alexius Comnenus, and especially Andronicus II. (Palaeologus) gave the Monemassian nobles freedom from all sorts of exactions throughout the empire. It was captured after a three years' siege by Guillaume de Villehardouin in 1248, but the citizens retained their liberties and privileges, and the town was restored to the Byzantine emperors in 1262. After many changes, it placed itself under Venice from 1463 to 1540, when it was ceded to the Turks. In 1689 it was the only town of the Morea which held out against Morosini, and Cornaro his successor only succeeded in reducing it by fire. In 1715 it capitulated to the Turks, and on the failure of the insurrection of 1770 the leading families were scattered abroad. As the first fortress which fell into the hands of the Greeks in 1821, it became in the following year the seat of the first national assembly.

See Curtius, *Peloponnesos*, ii, 293 and 328; Castellani, *Lettres sur la Mort* (1808), for a plan; Valiero, *Storia della guerra di Candia* (Venice, 1679), for details as to the fortress; W. Miller in *Journal of Hellenic Studies*, i, 1892.

**MALVERN**, an inland watering-place in the Bewdley parliamentary division of Worcestershire, England, 128 m. W.N.W. from London by the Great Western railway, served also by a branch of the Midland railway from Ashchurch on the Bristol-Birmingham line. Pop. of urban district (1901), 16,449. It is beautifully situated on the eastern slopes of the Malvern Hills, which rise abruptly from the flat valley of the Severn to a height of 1305 ft. in the Worcestershire Beacon. The district still bears the name of Malvern Chase, originally a Crown-land and forest, though it was granted to the earldom of Gloucester by Edward I. A ditches along the summit of the hills determined the ancient boundary. Becoming a notorious haunt of criminals, the tract was disafforested by Charles I., with the exception of a portion known as the King's Chase, part of which is included in the present common-land formed under the Malvern Hills Act of 1884.

Malvern was in early times an important ecclesiastical settlement, but its modern fame rests on its fine situation, pure air, and chalybeate and bituminous springs. The open-air cure for consumptive patients is here extensively practised.

The town is a collection of small towns and villages, extending along the foot of the hills for 5 m. The principal is Great Malvern, lying beneath the Worcestershire Beacon. It has a joint station of the Great Western and Midland railways. Here was the Benedictine priory which arose in 1083 out of a hermitage endowed by Edward the Confessor. The priory church of SS. Mary and Michael is a fine cruciform Perpendicular building, with an ornate central tower, embodying the original Norman nave, and containing much early glass and carved choir-stalls. The abbey gate and the refectory also remain. There are here several hydrographic establishments, and beautiful pleasure gardens. Malvern College, founded in 1862, is an important English public school. A museum is attached to it. Mineral waters are manufactured. At Malvern Wells, 2½ m. S., are the principal medicinal springs, also the celebrated Holy Well, the water of which is of perfect purity. There are extensive fishponds and hatcheries; and golf-links. The Great Western railway has a station, and the Midland at Hanley Road. Little Malvern lies at the foot of the Herefordshire Beacon, which is crowned by a British camp, 1½ m. S. of Malvern Wells. There was a Benedictine priory here, of which traces remain in the church. Malvern Line, 1 m. N.E. of Great Malvern, of which it forms a suburb, has a station on the Great Western railway. West Malvern and North Malvern, named from their position relative to Great Malvern, are pleasant residential quarters on the higher slopes of the hills.

**MALWA**, an historic province of India, which has given its name to one of the political agencies into which Central India is divided. Strictly, the name is confined to the hilly table-land, bounded S. by the Vindhyan range, which drains N. into the river Chambal; but it has been extended to include the Nerbudda valley farther south. Its derivation is from the ancient tribe of Malvas of whom very little is known, except that they founded the Vikrama Samvat, an era dating from 57 B.C., which is popularly associated with a mythical king Vikramaditya. The earliest name of the tract seems to have been Avanti, from its capital the modern Ujjain. The position of the Malwa or Moholo mentioned by Hsuan Tsang (7th century) is plausibly assigned to Gujrat. The first records of a local dynasty are those of the Paramaras, a famous Rajput clan, who ruled for about four centuries (800-1200), with their capital at Ujjain and afterwards at Dhar. The Mahomedans invaded Malwa in 1235; Daulat Khan Ghori founded an independent kingdom, which lasted till 1531. The greatest ruler of this dynasty was Hoshang Shah (1405-1435), who made Mandu (g.v.) his capital and embellished it with magnificent buildings. In 1562 Malwa was annexed to the Mogul empire by Akbar. On the break-up of that empire, Malwa was one of the first provinces to be conquered by the Maharratas. About 1743 the Maharatta peshwa obtained from Delhi the title of governor, and decreed his authority to three of his generals—Sindia of Gwalior, Holkar of Indore, and the Powar of Dhar who claims descent from the ancient Paramara. At the end of the 18th century Malwa became a cockpit for fighting between the rival Maharatta powers, and the headquarters of the Firdausi or irregular plunderers. The Findars were extirpated by the campaign of Lord Hastings in 1817, and the country was reduced to order by the energetic rule of Sir John Malcolm. Malwa is traditionally the land of plenty, in which sufferers from famine in the neighbouring tracts always take refuge. But in 1809-1800 it was itself visited by a severe drought, which seriously diminished the population, and has since been followed by plague. The most valuable product is opium.

The Malwa agency has an area of 8919 sq. m. with a population (1901) of 1,045,753. It comprises the states of Dewas (senior and junior branch), Jaora, Ratlam, Sitamau and Saliara, together with a large portion of Gwalior, parts of Indore and Tonk, and about 35 petty estates and holdings. The headquarters of the political agent are at Nimach.

Malwa is also the name of a large tract in the Punjab, south of the river Sutlej, which is one of the two chief homes of the Sikhs, the other being known as the Malwa SinJV, which includes the British districts of Ferozepore and Ludhiana, together with the native states of Patiala, Jind, Nabha and Malmer Kotla.

See J. Malcolm, *Central India* (1824); C. E. Luard, *Bibliography of Central India* (1908), and *The Paramars of Dhar and Malwa* (1908).

**MAMARONECK**, a township of Westchester county, New York, U.S.A., on Long Island Sound, about 20 m. N.E. of New York City and a short distance N.E. of New Rochelle. Pop. (1890), 2385; (1900) 3849; (1905) 5655; (1910)
MAMERI—MAMIANI DELLA ROVERE

5602. Mamaroneck is served by the New York, New Haven & Hartford railroad. The township includes the village of Larchmont (pop. in 1910, 1958), incorporated in 1851, and part of the village of Mamaroneck (pop. in 1910, including the part in Larchmont, 5609), incorporated in 1895. Larchmont is the headquarters of the Larchmont Yacht Club. The site of Mamaroneck township was bought in 1660 from the Indians by John Richbell, an Englishman, who obtained an English patent to the tract in 1668. The first settlement was made by relatives of his on the site of Mamaroneck village in 1676, and the township was erected in 1788. On the 28th of August 1776, near Mamaroneck, a force of American militiamen under Capt. John Flood attacked a body of Loyalist recruits under William Lounsby, killing the latter and taking several prisoners. Soon afterwards Mamaroneck was occupied by the Queen's Rangers under Colonel Robert Rogers. On the night of the 21st of October an attempt of a force of Americans under Colonel John Haslet to surprise the Rangers failed, and the Americans, after a hand-to-hand fight, withdrew with 36 prisoners. Mamaroneck was the home of John Peter DeLancy (1753-1828), a Loyalist soldier in the War of Independence, and was the birthplace of his son William Heathcote DeLancy (1797-1865), a well-known Protestant Episcopal clergyman, provost of the University of Pennsylvania in 1827-1832 and bishop of western New York from 1830 until his death. James Fenimore Cooper, the novelist, married (1811) a daughter of John Peter DeLancy; lived in Mamaroneck for several years, and here wrote his first novel, Precaution, and planned The Spy.

MAMELI, GOFFREDO (1827-1849), Italian poet and patriot, was born at Genoa of a noble Sardinian family. He received a sound classical education at the Scuolapi College, and later studied law and philosophy at the university of Genoa. When nineteen years old he corresponded with Mazzini, to whom he became whole-heartedly devoted; among other patriotic poems he wrote a hymn to the Bandiera brothers, and in the autumn of 1847 a song called "Fratelli d'Italia," which as Carducci wrote, "resounded through every district and on every battlefield of the peninsula in 1848 and 1849." Mameli served in the National Guard at Genoa, and then joined the volunteers in the Lombard campaign of 1848, but after the collapse of the movement in Lombardy he went to Rome, where the republic was proclaimed and whence he sent the famous despatch to Mazzini: "Roma! Repubblica! Venite!" At first he wrote political articles in the newspapers, but when the French army approached the city with hostile intentions he joined the fighting ranks and soon won Garibaldi's esteem by his bravery. Although wounded in the engagement of the 30th of April, he at once resumed his place in the ranks, but on the 3rd of June he was again wounded much more severely, and died in the Pellegrini hospital on the 6th of July 1849. Besides the poems mentioned above, he wrote hymns to Dante, to the Apostles, "Dio e popolo," &c. The chief merit of his work lies in the spontaneity and enthusiasm for the Italian cause which rendered it famous, in spite of certain technical imperfections, and he well deserved the epithet of "The Tyrtaeus of the Italian revolution.

See A. G. Barrili, "G. Mameli nella vita e nell'arte," in Nuova Antologia (June 1, 1902); the same writer's edition of the Scritti ed opere (Genoa, 1891; trans. Cesaresco, Italian Characters (London, 1901); A. Luzio, Profili Biografici (Milan, 1906); G. Trevedyan, Garibaldi's Defence of the Roman Republic (London, 1907).

MAMELUKE (anglicized through the French, from the Arabic mamalik, a slave), the name given to a series of Egyptian sultans, originating (1250) in the usurpation of power by the bodyguard of Turkish slaves first formed in Egypt under the successors of Saladin. See EGYPT: History (Moslem period).

MAMERNITI, or "children of Mars," the name taken by a band of Campanian (or Samnite) freebooters who about 289 B.C. seized the Greek colony of Messana at the north-east corner of Sicily, after having been hired by Agathocles to defend it (Polyb. i. 7. 2). The adventure is explained by tradition (e.g. Festus 158, Müller) as the outcome of a ter sacrum; the members of the expedition are said to have been the male children born in a particular spring of which the produce had been vowed to Apollo (cf. SAMNITES), and to have settled first in Sicily near Tauromenium. An inscription survives (R. S. Conway, Italic Dialects, 1) which shows that they took with them the Osca language as it was spoken in Capua or Nola at that date, and the constitution usual in Italic towns of a free community (tuttae) governed by two annual magistrates (meddices). The inscription dedicated some large building (possibly a fortification) to Apollo, which so far confirms the tradition just noticed. Though in the Osca language, the inscription is written in the Greek alphabet common to south Italy from the 4th century B.C. onwards, viz. the Tarentine Ionic, and so are the legends of two coins of much the same date as the inscription (Conway, ib. 4). From onwards (B. V. Head, Historia numorum, 136) the legend itself is Graecized (MAMEPTININ, instead of MAAEMEPTINOTM) which shows how quickly here, as everywhere, "Graecia capta victoriam cepit." On the Roman conquest of Sicily the town secured an independence under treaty (Cicer. Verr. 3. 6. 13). The inhabitants were still called Mamertines in the time of Strabo (vi. 2. 3).

See further Mommsen, C.I.L. x. sub loc., and the references already cited (R. S. Conway).

MAMERTINIUS, CLAUDIUS (4th century A.D.), one of the Latin panegyrist. After the death of Julian, by whom he was evidently regarded with special favour, he was prefect of Italy (356) under Valens and Valentinian, but was subsequently (368) deprived of his office for embezlement. He was the author of an extant speech of thanks to Julian for raising him to the consulship, delivered on the 1st of January 362 at Constantinople. Two panegyrical addresses (also extant) to Maximian (emperor A.D. 286-305) are attributed to an older magister Mamertinus, but it is probable that the corrupt MS. super- scription contains the word memoriae, and that they are by an unknown magister memoriae (an official whose duty consisted in communicating imperial rescripts and decisions to the public). The first of these was delivered on the birthday of Rome (April 21, 289), probably at Maximian's palace at Augusta Trevirorum (Trèves), the second in 290 or 291, on the birthday of the emperor. By some they are attributed to Eumenius (q.e.) who was a magister memoriae and the author of at least one (if not more) panegyrics.

The three speeches will be found in E. Bährans, Panegyrici latini (1896), also Teuffel-Schwabe, Hist. of Roman Literature (Eng trans.), § 417. 7.

MAMIANI DELLA ROVERE, TERENZIO, COUNT (1802-1883), Italian writer and statesman, was born at Pesaro in 1799. Taking part in the outbreaks at Bologna arising out of the accession of Pope Gregory XVI, he was elected deputy for Pesaro to the assembly, and subsequently appointed minister of the interior; but on the collapse of the revolutionary movement he was exiled. He returned to Italy after the amnesty of 1846, and in 1848 he was entrusted with the task of forming a ministry. He remained prime minister, however, only for a few months, his political views being anything but in harmony with those of the pope. He subsequently retired to Genoa where he worked for Italian unity, was elected deputy in 1856, and in 1860 became minister of education under Cavour. In 1863 he was made minister to Greece, and in 1865 to Switzerland, and later senator and councillor of state. Meanwhile, he had founded at Genoa in 1849 the Academy of Philosophy, and in 1853 had been appointed professor of the history of philosophy at Turin; and he published several volumes, not only on philosophical and social subjects, but of poetry, among them Rimovimento della filosofia antica italiana (1836), Teoria della Religione e dello stato (1886), Kant e l'ontologia (1879), Religione dell' avvenir (1880), Di un nuovo diritto europeo (1843, 1857). He died at Rome on the 21st of May, 1885.

See Indice delle opere di Terenzio Mamiani (Pesaro, 1887); Gaspare, Vita di Terenzio Mamiani (Ancona, 1887); Barzelotti, Studi e ricerche (Bologna, 1893).
MAMMALIA (from Lat. mamma, a teat or breast), the name proposed by the Swedish naturalist Linnaeus for one of the classes, or primary divisions, of vertebrated animals, the members of which are collectively characterized by the presence in the females of special glands secreting milk for the nourishment of the young. With the exception of the lowest group, such glands always communicate with the exterior by means of the teats, nipples or mammas, from which the class derives its name. The class-name (modified by the French into Mammifères, and replaced in German by the practically equivalent term Säugthiere) has been anglicized into "Mammals" (mam- mal, in the singular). Of recent years, and more especially in America, it has become a custom to designate the study of mammals by the term "mammalogy." Etymologically, however, that designation is not justified; for it is of hybrid (Latin and Greek) origin, and is equivalent to "masto1ogy," the science which deals with the mammary gland (Gr. μαστός, woman's breast), a totally different signification. As regards existing forms of life, the limitations of the class are perfectly well defined and easy of recognition; for although certain groups (not, by the way, whales, which, although excluded in popular estimation from the class, are in all essential respects typical mammals) are exceedingly aberrant, and present structural features connecting them with the lower vertebrate classes, yet they are distinctly low as far as the nourishment of the young is certainly most nearly affiliated by their preponderating characteristics. There is thus at present a day a great interval, unbridged by any connecting links, between mammals and the other classes of vertebrates.

Not so, however, when the extinct forms of vertebrate life are taken into consideration, for there is a group of reptiles from the early part of the Secondary, or Mesozoic period, some of whose members must have been so intimately related to mammals that, were the whole group fully known, it would clearly be impossible to draw a distinction between Mammalia on the one hand, and Reptilia on the other. Indeed, as it is, we are already partially acquainted with one of these early intermediate creatures (Triadodon), which forms a kind of zoological shuttlecock, being, so to speak, hit from one group to another, and back again, by the various zoologists by whom its scanty remains have been studied. Considered collectively, mammals, which did not make their appearance on the earth for some time after reptiles had existed, are certainly the highest group of the whole vertebrate sub-kingsdom. This expression must not, however, be considered in too restricted a sense. In mammals, as in other classes, low as well as high forms, a large number of tests that can be applied, especially those based on the state of development of the central nervous system, it will be seen that the average exceeds that of any other class, that many species of this class far excel those of any other in perfection of structure, and that it contains one form which is unuestionably the culminating point amongst organized beings.

Mammals, then, are vertebrated animals, possessing the normal characteristics of the members of that primary division of the animal kingdom. They are separated from fishes and amphibians (Pisces and Batracians) on the one hand, and agree with reptiles, and birds (Reptilia and Aves) on the other, in the possession during intra-uterine life of the membranous vascular structures respectively known as the amnion and the allantois, and likewise in the absence at this or any other period of external gills. A four-chambered heart, with a complete double circulation, and warm blood (less markedly so in the lowest group than in the rest of the class), distinguish mammals from existing reptiles, although not from birds. From both birds and reptiles the class is distinguished, so far at any rate as existing forms are concerned, by the following features: the absence of a nucleus in the red corpuscles of the blood, which are nearly always circular in outline; the free suspension of the lungs in a thoracic cavity, separated from the abdominal cavity by a muscular partition, or diaphragm, which is the chief agent in inflating the lungs in respiration; the aorta, or main artery, forming but a single arch after leaving the heart, which curves over the left terminal division of the windpipe, or bronchus; the presence of more or fewer hairs on the skin and the absence of feathers; the greater development of the bridge, or commissure, connecting the two halves of the brain, which usually forms a complete cerebral wall, or a tloph by the bulky large size of its anterior portion; the presence of a fully developed larynx at the upper end of the trachea or windpipe, accompanied by the absence of a syrinx, or expansion, near the lower end of the same; the circumstance that each half of the lower jaw (except perhaps at a very early stage of development) consists of a single piece articulating posteriorly with the squamosal element of the skull without the intervention of a separate quadrate bone; the absence of prefrontal bones in the skull; the presence of a pair of lateral knobs, or condyles (in place of a single median one) of the skull for articulation with the first vertebra; and, lastly, the very obvious character of the female being provided with milk-glands, by the secretion of which the young (produced, except in the very lowest group, alive and not by means of externally hatched eggs) are nourished for some time after birth.

In the majority of mammals both pairs of limbs are well developed and adapted for walking or running. The fore-limbs may, however, be modified, as in moles, for burrowing, or, as in bats, for flight, or finally, as in whales and dolphins, for swimming, with the assumption in this latter instance of a fin-like, or paddle-like, form. The complete disappearance of the hind-limbs. Special adaptations for climbing are exhibited by both pairs of limbs in oppossums, and for hanging to boughs in sloths. In no instance are the fore-limbs wanting.

In the great majority of mammals the hind extremity of the axis of the body is prolonged into a tail. Very generally the tail has distinctly the appearance of an appendage, but in some of the lower mammals, such as the thylacinum among marsupials, and the aard-vark or ant-horn among the edentates, it is much thickened at the root, and passes insensibly into the body, after the fashion common amongst reptiles. As regards function, the tail may be a mere pendent appendage, or may be adapted to grasp boughs in climbing, or even to collect food or materials for a nest or sleeping place, as in the spider-monkeys, opossums and rat-kangaroos. Among jumping animals it may serve as a balance, as in the case of jerboas and kangaroos, while in the latter it is also used as a support when resting; among many hoofed mammals it is used as a fly-whisk; and in whales and dolphins, as well as in the African Potamoget and the North American musquash, it plays an important part in swimming. Its development is correlated with the fashion of the wearer is, however, not supported by the actual facts of the case.

As already indicated, the limbs of different mammals are specially modified for various modes of life; and in many cases analogous modifications occur, in greater or less degree, throughout the entire body. Those modifications most noticeable in the case of cursorial types may be briefly mentioned as examples. In this case, as might be expected, the greatest modifications occur in the limbs, but correlated with this is also an elongation of the head and neck in long-legged types. Adaptation for speed is further exhibited in the moulding of the shape of the body so as to present the minimum amount of resistance to the air, as well as in increase in heart and lung capacity to meet the extra expenditure of energy. Finally, in the jumping forms we meet with an increase in the length and weight of the tail, which has to act as a counterpoise. As regards the feet, a reduction in the number of digits from the typical five is a frequent feature, more especially among the hoofed mammals, where the culmination in this respect is attained by the existing members of the horse tribe and certain representatives of the extinct South American Proterotheriids, both of which are monodactyl. Brief reference may also be made to the morphological importance of extraordinary length or shortness in the skulls of mammals—dolichocephalism and brachycephalism; both these features being apparently characteristic of specialized types, the former condition being (as in the horse) often, although not invariably, connected with length of limb and neck, and
adaptation to speed, while brachycephalism may be correlated with short limbs and an abbreviated neck. Exceptions to this rule, as exemplified by the cats, are due to special adaptive causes. In point of bodily size mammals present a greater range of variation than is exhibited by any other living terrestrial animals, the extremes in this respect being displayed by the African elephant on the one hand and certain species of shrew-mice (whose head and body scarcely exceed an inch and a half in length) on the other. When the aquatic members of the class are taken into consideration, the maximum dimensions are vastly greater, Sibbald's orca attaining a length of fully 88 ft., and being probably the bulkiest and heaviest that ever existed. Within the limits of individual groups, it may be accepted as a general rule that increase in bulk or stature implies increased specialization; and, further, that the largest representatives of any particular group are also approximately the latest. The latter dictum must not, however, be pushed to an extreme, since the African elephant, which is the largest living land mammal, attaining in exceptional cases a height approaching 12 ft., was largely exceeded in this respect by an extinct Indian species, whose height has been estimated at 15 as.

In regard to sense-organs, ophthalmoscopic observations on the eyes of living mammals (other than man) have revealed the existence of great variation in the arrangement of the blood-vessels, as well as in the colour of the retina; blue and violet seem to be unknown, while red, yellow and green form the predominating shades. In the main, the various types of minute ocular structure correspond very closely to the different groups into which mammals are divided, this correspondence affording important testimony in the favour of the general correctness of the classification. Among the exceptions are the South American squirrel-monkeys, whose eyes approximate in structure to those of the lemurs. Man and monkeys alone possess parallel and convergent vision of the two eyes, while a divergent, and consequently a very widely extended, vision is a prerogative of the lower mammals; squirrels, for instance, and probably also hares and rabbits, being able to see an object approaching them directly from behind without turning their heads.

An osteological question which has been much discussed is that of the reptilian quadrate bone in the mammalian skull. In the opinion of F. W. Tyberg, who has carefully reviewed all the other theories, the balance of evidence tends to show that the quadrate has been taken up into the inner ear, where it is represented among the auditory ossicles by the incus. Although the present article does not discuss mammalian osteology in general (for which see Vertebrae), it is interesting to notice in this connexion that the primitive condition of the mammalian tympanum apparently consisted merely of a small and incomplete bony ring, with, at most, an imperfect ventral wall to the tympanic cavity, and that a close approximation to this original condition still persists in the monotremes, especially Ornithorhynchus. The tympano-hyal is the characteristic mammalian element in this region; but the entotympanic likewise appears to be peculiar to the class, and to be unrepresented among the lower vertebrates. The tympanum itself has been regarded as representing one of the elements—probably the supra-angular—of the compound reptilian lower jaw. The presence of only seven vertebrae in the neck is a very constant feature among mammals; the exceptions being very few.

Two other points in connection with mammalian osteology may be noticed. A large number of mammals possess a perforation, or foramen, on the inner side of the lower end of the humerus, and also a projection on the shaft of the femur known as the third trochanter. From its occurrence in so many of the lower vertebrates, the entepicondylar foramen of the humerus as it is called, is regarded by Dr E. Stomer as a primitive structure, of which the original object was to protect certain nerves and blood-vessels. It is remarkable that it should persist in the spectacled bear of the Andes, although it has disappeared in all other living members of the group. The third trochanter of the femur, on the other hand, can scarcely be regarded as primitive, seeing that it is absent in several of the lower groups of mammals. Neither can its presence be attributed, as Professor A. Gaudry suggests, to the reduction in the number of the toes, as otherwise it should not be found in the rhinoceros. Its general absence in man forbids the idea of its having any connexion with the upright posture.

**Hair.**—In the greater number of mammals the skin is more or less densely clothed with a peculiarly modified form of epidermis known as hair. This consists of hard, elongated, slender, cylindrical or tapering, thread-like masses of epidermic tissue, each of which is provided with a short branch or "haft" at the bottom of a pit, or follicle, in the true skin, or dermis. Such hairs, either upon different parts of the skin of the same species, or among different species, of the same form, are of different sizes and degrees of rigidity—as seen in the fur of the mole, the bristles of the pig, and the spines of the hedgehog and porcupine, which are all modifications of the same structures. These differences are mainly from the development of the constituent elements into which the epidermal cells are modified. Each hair is composed usually of a cellular pithy internal portion, containing much air, and a denser or more horny external or cortical part. In some mammals, instead of an external cellular cortex, there is composed of the central medullary or cellular substance, and is consequently very easily broken; in others the horny part exceeds, being the outermost layer of a hair a solid mass of a hard, tough, scaly toed sloth (Brodyus) the hairs have a central horny axis and a pithy exterior. Though generally nearly smooth, or but slightly scalied, the surface of some hairs is imbricated; that is to say, shows a hard, scaly structure like shingles in some trees. Some, like the two toed sloth (Choloepus) they are longitudinally grooved or fluted. Though usually more or less cylindrical or circular in section, hairs are often elliptical or flattened, as in the curly-haired races of men, the tropical portion of the hair of men and women, and conspicuously in the spines of the spiny squirrels of the genus Xerus and those of the mouse-like Platacanthomys. Hair having a property of mutual cohesion or "feeling," which depends upon a roughened, scalied surface and a tendency to curl, as in domestic sheep, is called "wool."

It has been shown by J. C. H. de Meijere that the insertion of the individual hairs in the skin displays a definite arrangement, constant for each species, but varying in different groups. In jerboas, for example, a bunch of twelve or thirteen hairs springs from the same point, while in the polar bear, single touching, and several slender ones arise together, and in the marmosets three equal-sized hairs form regular groups. These tufts or groups likewise display an orderly and definite grouping in different mammals, which suggests the origin of such groups from the existence in primitive mammals of a scaly coat comparable to that of reptiles, and indeed directly inherited therewith.

In a large proportion of mammals there exist hairs of two distinct types, one long, one short, the former appearing on the surface, and the other shorter, finer and softer, constituting the under-fur, which may be compared to the down of birds. A well-known example furnished by the fur of elephants, in which the hair is removed in the manufacture of commercial "seal-skin," leaving only the soft and fine under-fur.

Remarkable differences in the direction of slope of the hair are noticeable on different parts of the body and limbs of many mammals, especially in certain apes, where the hair of the fore-limbs is inclined towards the elbow from above and from below. More remarkable still is the fact that the direction of the slope often differs in closely allied groups, as, for instance, in African and Asiatic buffaloes, in which the hair of the middle line of the back has opposite directions. Whorls of hair, as on the face of the horse and the South American tapir, are also met with elsewhere. In connexion with hair, there is another feature of interest. In this connexion reference may be made to patches or lines of long and generally white hairs situated on the back of certain ruminants, which are capable of erection when vertical or horizontal, and apparently, among the birds, "to guide the members of a herd in flight. Such are the white chrysantheme-like patches on the rump of the Japanese deer and of the American prong-buck (Ailuropo- copus), and the line of hairs situated in a groove on the loins of the African spring-buck. The white under-side of the tail of the rabbit and the yellow rump-patch of many deer are analogous. The eye-lashes, or cilia, are familiar examples of a special local development of hair; they are generally foliaceous, or termed "sibriases," and connected with nerves, and in certain cases with glands, occur in various regions. They are most common on the head, as with the "flags" of sea-kittens (Lynx), the "ear hairs" of cats and many rodents. In other instances, notably in the lemur, but also in certain carnivora, rodents and marsupials, they occupy a position on the fore-arm near the wrist, in connexion with glands, and may be considered as accessory organs, the "gland hairs." The hairy covering is partial and limited to particular regions; in others, as the hippopotamus and the sea-cows, or Sirenis, though scattered over the whole surface of the animal, it is extremely short and scanty.
MAMMALIA

but in none is it reduced to so great an extent as in the Cetacea, in which it is limited to a few small bristles confined to the neighbourhood of the lips and nostrils, and often present only in the young, or even the foetal condition. 

Similarly, the abundance of those of the mane and tail of the horse, persist throughout life, but more generally, as in the case of the body-hair of the same animal, they are shed and renewed periodically. Generally the hair of the mane and tail of the horse is shed and replaced growth in winter, which is shed as summer comes on; and some few, which inhabit countries covered in winter with snow, as the Arctic fox, variable hare and ermine, undergo a complete change of colour in the autumn, when their white pelage disappears and is replaced by a rich golden brown.

There has been much discussion as to whether this winter whitening is due to a change in the colour of the individual hairs or to a change of coat. It has, however, been demonstrated that the hair of practically all species of mammals is composed of phagocytes, which devour the pigment-bodies; and from microscopic observations recently made by the French naturalist Dr E. Trouessart, it appears that the phagocytes are developed in the epidermis, where the hairs grow. The external hair is thus in reality a secretion of much more complex than the teeth of which they are usually, the lower portions of the limbs are plainly favourable to a recognition-taint being left in the tracks of terrestrial animals; and antelopes particularly in the terrene prairies, are capable of showing tracks from their face-trunks on tree-trunks. And when glands are confined to theJava, their function is no doubt sexual; the secretion forming part of the attraction, or stimulus, to the other sex.

Dentition.—In the great majority of mammals the teeth form a definite series, of which the hinder elements are of a more or less complex type, while those in front are simpler. With the exception of the marsupials, a set of deciduous, or milk, teeth is developed in most mammals with a complicated type of dentition; these milk-teeth, growing after the permanent set, are shed and are replaced by the permanent dentition. While the teeth of mammals are set in the jaw-sockets, or alveoli, it is the deciduous (or milk-) teeth which are the first to appear (in utero), when they are succeeded by the larger permanent series, which is the only other ever developed. This double series of teeth thus forms a very characteristic feature of mammals generally. Both the milk and the permanent dentition display the aforesaid complexity of the hinder teeth as compared with those in front, and since the number of milk-teeth is always considerably less than that of the permanent set, it follows that the hinder milk-teeth in describing the development of successive series of teeth, which are of similar structure, but without any internal bony support, and situated in the middle line. Calluses, or bare patches covered with hardened and thickened epidermis, are found on the buttocks of young horses, and of camels and other ungulates (Equidae), the grasping under-surface of the tail of prehensile-tailed monkeys, opossums, &c. The greater part of the skin of the one-horned Indian rhinoceros is yellow and stifferened by an increase of the tissue of both the skin and epidermis, constituting the well-known jointed "armour-plated" hide of those animals.

Nails, Claws and Hoofs.—With few exceptions, the terminal extremities of the digits of both limbs of mammals are more or less protected or armed by epidermic plates or sheaths, constituting the various forms of nails, claws or hoofs. These are absent in the Cetacea alone. A perforated spur, with a special secreting gland in connection, is found attached to each hind-leg of the males of the existing species of Monotremata.

Scent-glands, &c.—Besides the universally distributed sweat-glands, there is, in mammals, a glandular system of scent-glands in modified portions of the skin, often involuted to form a shallow recess or a deep sac with a narrow opening, situated in various parts of the surface of the body, and secreting odorous substances, by the aid of which individuals recognize one another. These probably afford the principal means by which wild animals are able to become aware of the presence of other members of the species. 

To this group of structures belong the suborbital face-gland, "larmier," or "crumen," of antelopes and deer, the frontal gland of the muntjak and of bats of the genus Phyllostoma, the chin-gland in men, and the so-called " gland of Tschermak," the glandular patch behind the ear of the chamois and the red-buck, the glands on the lower parts of the legs of most deer and a few other cases, the temporal gland of which is indicated by tufts of long and often specially-coloured hair, the interdigital foot-glands of goats, sheep, and many other ruminants, the temporal gland of elephants, the lateral glands of the musk-shrew, the gland on the back of the hyrax and the pecora (from the presence of which the latter animal takes the name Dicotyles), the gland on the tails of the members of the dog-tribe, the preputial glands of the musk-deer and beaver (both well known for the use made of their powerfully odorous secretion), the gland of the great white shark, the anal glands of Carnivora, the perineal gland of the civet (also of commercial value), the caudal glands of the fox and goat, the gland on the wing-membrane of bats of the genus Saccopteryx, the post-digital gland of the rhinoceros, &c. Very generally these glands are common to both sexes, and it is in such cases that their function as a means of mutual recognition is most evident. It has been found that the sweat from the feet of horses is valuable in the treatment of ulcers, and that the sweat from the hoofs of rhinos of Asia is used in all countries as a purifier of wounds; the sweat from the hoofs of the Asian and African Pachymetopos, Sirenia and rhinos of Africa has been used in medicine for their medicinal properties. The sweat from the hoofs of the Perissodactyla, including man, has been used as a medicine in the cold regions of Asia, and also by the Chinese, for purifying wounds. The sweat from the hoofs of the Asioidea is sometimes used as a medicine in Africa; the sweat from the hoofs of the Rhinoceri has been used as a medicine in Europe; and the sweat from the hoofs of the Equinae has been used as a medicine in the Orient.
In a very large number of mammals the teeth of different parts of the series are more or less differentiated in character; and, accordingly, have different functions to perform. The front teeth are simple and one-rooted, and are adapted for cutting and seizing. They are called "incisors." The back, lateral or cheek teeth, on the other hand, have broader and more complex crowns, tuberculated or ridged, and supported on two or more roots. They crush or grind the food, and are hence called "molars." Many mammals have, between these two sets, a tooth at each corner of the mouth, longer and more pointed than the others, adapted for tearing or stabbing, or for fixing struggling prey. From the conspicuous development of such teeth in the Carnivora, especially the dogs, they have received the name of "canines." A dentition with its component parts so differently formed that these distinctive terms are applicable to them is called heterodont (Gr. τρεπον, different). In most cases, though by no means invariably, mammals with a heterodont dentition are also diphyodont (Gr. διπυδον, of double root).

This general arrangement is obvious in a considerable number of mammals; and examination shows that, under great modifications in detail, there is a remarkable uniformity of essential characters in the dentition of a large number of members of the class belonging to different orders and not otherwise closely allied, so much that it is possible to formulate a common plan of dentition from which the others have been derived by the alteration of some and the suppression of other members of the series, and occasionally, but very rarely, by addition. In this generalized form of mammalian dentition the total number of teeth present is 44, or 11 above and 11 below on each side. Those of each jaw are placed in continuous series without intervals between them; and, although the anterior teeth are simple and single-rooted, and the posterior teeth complex and with several roots, the transition between the two kinds is gradual.

In dividing and grouping such teeth for the purpose of description and comparison, more definite characters are required than those derived merely from form or function. The first step towards a classification rests on the fact that the upper jaw is composed of two bones, the premaxilla and the maxilla, and that the division or suture between these bones separates the three front teeth from the rest. These three teeth, which are implanted in the premaxilla, form a distinct group, to which the name of "incisor" is applied. This distinction is, however, not so important as it appears at first sight, for their connection with the bone is only of a secondary nature, and, although it happens conveniently that in the great majority of cases the division between the bones coincides with the inter-space between the third and fourth tooth of the series, still, when it does not, as in the mole, too much weight must not be given to this fact, if it contravenes other reasons for determining the homologies of the teeth. The eight remaining teeth of the upper jaw offer a natural division, as much as the three hind, one canine, one molar-predecessors; and, although some of the anterior teeth may be in the same case, the particular one preceding these three always has such a predecessor. These three, then, are grouped as the "molars." Of the five teeth between the incisors and molars the most anterior, or the one usually situated close behind the premaxillary suture, very generally assumes a lengthened and pointed form, and is designated in the human as the canine tooth. It is customary, therefore, to call this tooth, whatever its size or form, the "canine." The remaining four are the "premolars." This system has been objected to as artificial, and the argument has been produced that the teeth of the Carnivora are in that order of the "canine." The premolars and canines are indeed sometimes not obvious; but the terms are now in such general use, and also so convenient, that it is not likely they will be superseded. It is frequently convenient to refer to the teeth behind the canine as the "cheek teeth."

With regard to the lower teeth the difficulties are greater, owing to the absence of any suture corresponding to that which defines the incisors above; but since the number of the teeth is the same, since the corresponding teeth are preceded by deciduous teeth, and since in the large majority of cases it is the fourth tooth of the series which is modified in the same way as the canine (or fourth tooth) of the upper jaw, in the lower jaw it is convenient to adopt the same designations as with the upper series, and to call the first three, which are implanted in the part of the mandible opposite to the premaxilla, the incisors, the next the canine, the next four the premolars, and the last three the molars.

It may be observed that when the mouth is closed, especially when the opposed surfaces of the teeth present an irregular outline, the corresponding upper and lower teeth are not exactly opposite, otherwise the fit of the two series could not be maintained. There is a rule the points of the lower teeth shut into the interspaces in front of the corresponding teeth of the upper jaw. This is very distinct in the canine teeth of the Carnivora, and is a useful guide in determining the homologies of the teeth of the two jaws.

For the sake of brevity the complete dentition is described by the following formula, the numbers above the line representing the teeth of the upper series, and below the line those of the lower series:

- Canines: 4, 3, 2, 1
- Premolars: 4, 3, 2, 1
- Molars: 3, 2, 1

This can be further simplified by the following formula, by which the teeth on one side of the mouth are indicated:

- Incisors: i 
- Canines: c 
- Premolars: p 
- Molars: m

The individual teeth of each group are enumerated from before backwards, and by such a formula as the following:

- Lower jaw: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14
- Upper jaw: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14

A special numerical designation is given by which each one can be identified. In mentioning any single tooth, such a sign as m1 will mean the first upper molar, m2 the second upper molar, and so on.

When, as is the case among nearly all existing mammals with the exception of the members of the genera Sus (pigs), Gymnura (rat-shrew), Talpæ (moles) and Mygale (desmans) the number of teeth is reduced below the typical forty-four, it appears to be an almost universal rule that if one of the incisors is missing it is the second, or middle one, while the premolars commence to disappear from the front of the series, or the molars from the hind part of the series.

The milk-dentition is expressed by a similar formula, d for deciduous, being added before the letter expressive of the nature of the tooth. As the three molars and (almost invariably) the first premolar of the permanent series have no milk substitute, the typical milk-dentition would be expressed as: di, c1, d1, m1 = 28. The teeth which precede the premolars of the permanent series are called either milk or milk-premolars, the teeth following between the molars and molars of the permanent dentition, the first milk-molar resembles a premolar, while the last has the characters of the posterior molar. It is sometimes convenient to refer to all the seven cheek-teeth as members of a single continuous series (which they undoubtedly are), and for this purpose the following nomenclature has been proposed:

- Upper Jaw: 1, 2, 3, 4
- Lower Jaw: 5, 6, 7

With the exception of the Cetacea, most of the Edentata, and the Sirenia, in which the dental formula is in many cases not descriptive, the distinction between premolars and molars in the placental mammals as a whole have a dentition conforming more or less closely to the foregoing type.

As marsupials the case is, however, somewhat different: the whole number not being limited to 44, owing largely to the fact that the number of upper incisors may exceed three pairs, reaching indeed in some instances to six or even eight. Many are those which the number of pairs of incisors in the upper always exceeds those in the lower. When fully developed, the number of cheek-teeth is, however, seven; and it is probable that, as in placentals, the first four of these are premolars and the remaining three molars, although it was long held that these numbers should...
be transposed. The most remarkable feature about the marsupial dentition is that, at most, only a single pair of teeth is replaced in each jaw; this pair, on the assumption that there are four premolars, representing the third of that series. With the exception of this replacing pair of teeth in each jaw, it is considered by many authorities that the marsupial dentition corresponds to the deciduous, or milk, dentition in other mammals. In support of this view the specimens of an earlier set of teeth which have been detected in the jaws of some members of the order, represent, not the milk-series, but a preadult dentition. On the assumption that these functional teeth are equated with the milk-teeth, the dentition of marsupials, like those of other mammals, in this respect agrees exactly with modern elephants, in which the same peculiarity exists.

In carnivorous mammals are teeth entirely absent. Even in the whalebone whales their germs are formed in the same manner and at the same period of life as in other mammals, and even become partially calcified, although they never rise above the gums, and consequently never appear at the surface of the mouth. Prolaghals among the Edentata no traces of teeth have been found at any age. Adult monotrems are in like case, although the duck-billed platypus has teeth when young on the sides of the jaws. The northern sea-cow (Rhytina), now extinct, appears to have been toothless throughout life.

In different groups of mammals the dentition is variously specialized in accordance with the nature of the food on which the members of these groups subsist. From this point of view the various adaptive modifications of mammalian dentition may be roughly grouped under the headings of piscivorous, carnivorous, insectivorous, omnivorous, and herbivorous.

The fish-eating, or piscivorous, type of dentition is exemplified under two phases in the dolphins and in the seals (being in the latter instance essentially modifications of the predator, or the prey, form). In the dolphins, and in a somewhat less marked degree among the seals, this type of dentition consists of an extensive series of conical, nearly equal-sized, sharp-pointed teeth, implanted in an elongated and flattened, often immovable, and almost functionless bone of the upper jaw, without either tearing or masticating. In the dolphins the teeth are simple conical, but in the seals they are often trident-like; while in the otter the dentition differs but little from the ordinary carnivorous type.

This carnivorous adaptation, in which the function is to hold and kill struggling animals, often of large size, attains its highest development in the Felidae. The narrow mouth opening is lessened by a cutting and piercing type, and from their wide separation in the mouth give a firm hold; the jaws being as short as is consistent with the free action of the canines, or tusks, so that no part of the mouth is lost. The incisors are small, so as not to interfere with the penetrating action of the tusks; and the crowns of some of the teeth of the cheek-series are modified into scissor-like blades, in order to rasp off the flesh from the bones, or to crack the bones themselves, while the later teeth of this series tend to disappear.

In the insectivorous type, as exemplified in moles and shrew-mice, the middle pair of incisors in each jaw are long and pointed so as to cause a tearing action for the capture and holding of insects, the canines being broken up by the numerous sharp cusps surmounting the cheek-teeth.

The omnivorous type, as exemplified in man and monkeys, and to a less specialized degree in swine, the incisors are of moderate and nearly equal size; the canines, if enlarged, serve for other purposes than holding prey, and such enlargement is usually confined to the upper jaw. The teeth of the lower jaw are broad flattened crowns surmounted by rounded bosses, or tubercles.

In the herbivorous modification, as seen in three distinct phases in the horse, the kangaroo, and in ruminants, the incisors are generally well developed in one or both jaws, and have a nipping action, either against one another or against a toothless hard pad in the upper jaw; while the canines are usually small or absent, at least in the lower jaw, but in the lower jaw may be approximated and assimilated to the incisors. The cheek-teeth are large, with broad flattened crowns surmounted either by simple transverse ridges, or complicated by elevations and infoldings. The number of these teeth is greater than in the mammal most completely like the molar, and, contrary to what obtains among the Carnivora, the whole series of cheek-teeth (with the occasional exception of the first) is very strongly developed.

Opinions differ as to the mode in which the more complicated cheek-teeth of mammals have been evolved from a simpler type of tooth. According to one theory, this has been brought about by the union of more or less complicated single teeth into a compound tooth. A more generally accepted view—especially among palaeontologists—is that the tritubercular theory, according to which the canines, premolars, and molars are all arranged in a triangle, with the apex pointing inwards in the teeth of the upper jaw. Additions of extra cusps form teeth of a more complicated type. Each cusp of the primitive triangle has received a second one. The single teeth, and not the several tooth-rows, while names have also been assigned to super-added cusps. Molar teeth of the simple tritubercular type persist in the golden moles (Chrysochloris) among the Insectivora and also in the marsupial mole (Notoryctes) among the marsupial. The type is, moreover, common among the mammals of the early Eocene, and still more so in those of the Jurassic epoch; this forming one of the strongest arguments in favour of the tritubercular theory. (See Professor Huxley's "Further Evidence for the Original Tri- tubercular Theory," in vol. xviii. (new series) of the American Journal of Science, 1903.)

Digestive System.—As already mentioned, mammals are specially characterized by the division of the body-cavity into two main chambers, by means of the horizontal muscular partition known as the diaphragm, which is perforated by the great blood-vessels, and the two larger nerves leading to and from the brain. The great majority of mammals is peculiar for being guarded by thick fleshly lips, which are, however, absent in the Cetacea; their principal function being to seize the prey for which purpose they are endowed, as a rule, with more or less strongly marked prehensile power. The roof of the mouth is formed by the palate, terminating behind by a muscular, contractile arch, having in man and a few other species a median projection (the uvula) which communicates with the pharynx. The anterior part of the palate is composed of nictuous membrane tightly stretched over the flat or slightly concave bony layer which separates the mouth from the nasal passages, and is generally raised into a series of transverse ridges, which sometimes, as in ruminants, attain a considerable development. In the floor of the mouth, between the two branches of the lower jaw, and supported behind by the hyoid apparatus, lies the tongue, an organ the free surface of which, especially in its posterior part, is devoted to the sense of taste, but which by reason of its great mobility (being composed almost entirely of muscular fibres) performs important functions in swallowing, masticating and procuring food. Its modifications in form in different mammals are numerous. Between the long, extensile, worm-like tongue of the anteaters, the echidnas, and the sloths, and the short, immovable and almost functionless tongue of the porpoise, every intermediate condition is found. Whatever the form, the upper surface is, however, covered with numerous fine papillae, and modified to the various modes of action (Fig. 1). In some mammals, notably lemurs, occurs a hard structure known as the sublingual, which may terminate in a free horny tip. If, as has been conjectured, this is an expression, the tongue of reptiles, the mammalian tongue will obviously be a superadded organ distinctive of the class.

Salivary glands, of which the most constant are the parotid and the sublingual, are generally distributed in various mammals. Next in constancy are the sublingual, closely associated with the last-named, at all events in the locality in which the secretion is poured out; and the submaxillary, found only in some mammals in the cheek, just under cover of the anterior part of the zygomatarch, the duct entering the mouth-cavity near that of the parotid.

The alimentary, or intestinal, canal varies greatly in relative length in relation to the size of the mammal. In some mammals, the alimentary canal is short, while in terrestrial mammals the gut is markedly prolonged; in some becoming immensely lengthened. The alimentary canal of the lower and wider portion, called respectively the small and the large intestine; the former being arbitrarily divided into duodenum, jejunum and ileum, and the latter into colon and rectum. One of the most striking peculiarities of this part of the canal is the frequent presence of a blind pouch, or caecum, situated at the junction of the large and the small intestine. This caecum presents the special character of a vestigial development, from the smallest bulging of a portion of the side-wall of the tube to a large and complex sac, greatly exceeding in capacity the rudimentary mouths of feeding-glands in the oral canal. It is only in herbivorous mammals that the caecum is developed to this great extent, and among these there is a constant increase in the size and complexity of the organ and that of the stomach. Where the latter is simple, the caecum is generally short and is entirely without any func-

FIG. 3.—Diagrammatic Plan of the general arrangement of the Alimentary Canal in a typical Mammal.

1, oesophagus; 2, stomach; 3, pylorus; 4, intestine; 5, small intestine (ab.
6, large intestine or breviated); 7, caecum; 8, ileum; 9, intestine; 10
10, rectum; 11, long intestine or colon, ending in the rectum; 12, large intestine or colon, ending in the rectum; 13, large intestine or colon, ending in the rectum; 14, large intestine or colon, ending in the rectum.
the horse and the dog may be cited as instances where the single caecum is of large size, this being especially the case of the former, where it is of enormous dimensions; the horse is galloping, and its alimentary organs, especially that devoted to the digestion of grass, are developed on a large scale. It is a larger caecum than the narrow, long, blind pouches, which, while he has also recorded their occurrence in the hyrax and the manati. With the aid of these instances of paired caeca, coupled with the frequent existence of a rudiment of its missing fellow, it has been endeavoured to demonstrate conclusively that these double organs in birds correspond in relations with their normally single representative in mammals. In mammals and birds the caeca are often calcified, a disposition caused by the arrangement of the longitudinal bands of muscular tissue in their walls; but the small intestine is always smooth and simple-walled externally, though its lining membrane often exhibits longitudinal folds, called villi, by which it is everywhere beset, and the more obvious transverse, longitudinal, or reticulated folds projecting into the interior, met with in man and most mammals, of which the "valvulae conniventes" of man form well-known examples. Besides the crypts of Lieberkühn found throughout the intestinal canal, and the glands of Brunner confined to the duodenum, there are other structures in the mucous membrane, about the nature of which there is still much uncertainty, called "sulci" and "glandulae, the latter more commonly known by the name of Glandulae pyloricane, probably the peculiar feature in the caeca of all living mammals it has been divided into a number of distinct lobes, which have received separate names. It has, indeed, been suggested that in mammals the caeca are underdeveloped. This, however, is denied by G. Ruge (vol. xxxix. of Gegenbaur's Morphologisches Jahrbuch).

Origin of Mammals.—That mammals have become differentiated from a lower type of vertebrates at least as early as the commencement of the Jurassic period is abundantly testified by the occurrence of the remains of small species in strata of that epoch, some of which are mentioned in the articles MARSUPIALIA and MONOTREMATA (q.v.). Possibly mammalian remains also occur in the antecedent Triassic epoch, some palaeontologists regarding the South African Triasodon as a mammal, while others consider that it was probably a reptile. Whatever may be the true state of the case with regard to that animal probably also holds good in the case of the approximately contemporaneous European Microlestes. Of the European Jurassic (or Oolitic) mammals our knowledge is unfortunately very imperfect; and from the scarcity of their remains it is quite probable that they are merely stragglers from the region (possibly Africa) where the class was first differentiated. It is not till the early Eocene that mammals become a dominant type in the northern hemisphere.

It is now practically certain that mammals are descended from reptiles, as M. Gadow, in a paper on the origin of mammals contributed to the Zeitschrift für Morphologie, sums up as follows: "Mammals are descendants of reptiles as surely as they [the latter] have been evolved from Amphibia. This does not mean that any of the living groups of reptiles can claim their honour of ancestry, but it means that the mammals have branched where the principal reptilian groups meet, and that is a long way back. The Theromorpha, especially small Thieriodonta, almost show us what these creatures were like." It may be explained that the Theromorpha, or Anomodontia, are those critics who divide the Mammalia into two main orders: the Theriodonta and the Thieriodonta. The former includes the lower reptilian forms, the latter is confined to the deposits of South Africa, some of which present a remarkable resemblance in their dentition and skeleton to mammals, while others come equally near amphibians. A difficulty naturally arises with regard to the fact that in reptiles the occipital condyle by which the skull articulates with the vertebral column is single, although composed of three elements, whereas in amphibians and mammals the articulation is formed by a pair of condyles. Nevertheless, according to Professor H. F. Osborn, the triarticular reptilian condyle, by the loss of its median element, has given rise to the paired in these higher classes so that this difficulty disappears. The fate of the reptilian quadrato bone (which is reduced to very small dimensions in the Anomodontia) has been referred to in an earlier section of the present article, where some mention has also been made of the disappearance in mammals of the hinder elements of the reptilian lower jaw, so as to leave the single bone (dentaly) of each half of this part of the skeleton in mammals.

Most of the earliest known mammals appear to be related to the Marsupialia and Insectivora. Others however (inclusive of Triasodon and Microlestes, if they be really mammals), seem nearer to the Monotremata; and the quadrupedous marsupials on the one hand, and monotremes on the other are not independently derived from reptilian ancestors.

With regard to the evolution of marsupials and placentals, it has been pointed out that the majority of modern marsupials exhibit in the structure of their feet traces of the former opposability of the thumb and great toe to the other digits; and it has accordingly been argued that all marsupials are descended from arboreal ancestors. This doctrine is now receiving widespread acceptance among anatomical naturalists; and in the American Naturalist for 1904, Dr. W. D. Matthew, an American palaeontologist, considers himself provisionally justified in extending it as to include all mammals. That is to say, he believes that, with the exception of the duckbill and the echidna, the mammalian class as a whole can lay claim to descent from small arboreal forms. This view, of course, almost entirely based upon palaeontological considerations; and these, in the author’s opinion, admit of the conclusion that all modern placental and marsupial mammals are descended from a common ancestral stock, of which the members were small in bodily size. These ancestral placental and marsupial mammals may have been characterized by the presence of five toes to each foot, of which the first was more or less completely opposable to the other four. The evidence in favour of this primitive opposability is considerable. In all the groups which are at present arboreal, the palaeontological evidence goes to show that their ancestors were likewise so; while since, in the case of modern terrestrial forms, the structure of the wrist and ankle joints tends to approximate to the arboreal type, as we recede in time, the available evidence, so far as it goes, is in favour of Dr. Matthew’s contention.

The author also discusses the proposition from another standpoint, namely, the condition of the earth’s surface in Cretaceous times. His theory is that in the early Cretaceous epoch the animals of the world were mostly aerial, amphibious, aquatic or arboreal; the flora of the land being undeveloped as compared with its present state. On the other hand, towards the close of the Cretaceous epoch (when the Chalk was in course of deposition), the spread of a great upland flora vastly extended the territory available for mammalian life. Accordingly, it was at that epoch that the small ancestral insectivorous mammals forded their terrestrial habitat to try a life on the open plains, where their descendants developed on the one hand into the carnivorous and other groups, in which the toes are armed with nails or claws, and on the other into the hoofed group, inclusive of such monsters as the elephant and the giraffe. The hypothesis is not free from certain difficulties, one of which will be noticed later.

Classification.—Existing mammals may be primarily divided into three main groups, or subclasses, of which the second and third are much more closely related to one another than is either of them to the first. These three classes are the Monotremata (or Prototheria), the Marsupialia (Didelphid, or Metatheria), and the Placentalia (Monodelph, or Eutheria); the distinctive characters of each being given in separate articles (see MONOTREMATA, MARSUPIALIA and MONODELPHIA.)

The existing monotremes and marsupials are each represented only by a single order, the placentals are divided into the following ordinal and subordinal groups, those which are extinct being marked with an asterisk (*)—

1. Insectivora (Moles, Hedgehogs, &c.).
2. Chiroptera (Bats).
3. Dermoptera (Colugo, or Flying Lemur).
4. Ependontata:
   a. Xenarthra (Anteaters, Sloths and Armadillos).
   b. Pholidota (Pangolins).
   c. Tubulidentata (Ant-bears, or Aard-varks).
Mammalia

5. Rodentia (Gnawing Mammals)—
   a. Duplicidentata (Hares and Picas).
   b. Arvicolidae (Lemmings).  
   c. Simuliidae (Winged Flies).
   d. Cryptodonta (Mammals with Horses).  
   e. Proboscidea (Elephants and Miscellaneous Pinnipedia).

7. Carnivora;—
   a. Fissipedia (Cats, Dogs, Bears, &c.).
   b. Chiroptera (Bats).
   c. Mystacoceti (Whalebone Whales).  
   d. Stenodonta (Elephants and Horses).  
   e. *Barypoda* (Elephants, &c.).
   f. *Xenarthra* (Mammals with Hinges).
   g. *Lipotra* (Macrauchenia, &c.).
   h. *Aepydrac recording* (Sirenia, &c.).
   i. *Perissodactyla* (Turtles, Horses, &c.).
   j. Artiodactyla (Ruminants, Swine, &c.).

8. Primates;—
   a. Prosimiae (Lemurs and Galagos).  
   b. Anthropoidea (Monkeys, Apes, and Man).

Separate articles are devoted to each of these orders, where references will be found to the various derivates of some of the minor groups and a number of the more representative species.

**Relationships of the Groups.**—As we proceed in time we find the earlier genera of these Orders, which were the ancestors of the higher order Cetacea, of the Hesperodonta, and of the Carnivora. The former group are much nearer to the ancestry of the mammalian class than the latter two, and their early representatives have not been modified to anything like the same extent. The Eocene carnivorans, of which the Hyracoida, the Barypoda, and the Tribrachia formed part, were more closely related to the ancestry of the Carnivora and to the ancestry of the Borypoda, than to the ancestry of the Carnivora and the Anthropoidea.

**Distribution.**—For an account of the "realms" and "regions" of the globe, see Zoological Distribution. For the purposes of such zoogeographical studies, mammals are more useful adaptive to environment, owing to their many limited powers of dispersal; most of them (exclusive of the purely aquatic forms, such as seals, whales, dolphins, and sea-cows) being unable to cross anywhere more than a very narrow arm of the sea. Consequently, the presence of nearly all groups of mammals in areas now separated by considerable stretches of sea proves that at no very distant date such tracts must have had a land-connection. In the case of the southern continents the difficulty is, however, to determine whether allied groups of mammals (and other animals) have reached their present isolated habitats by dispersal from the north along widely sun-dered longitudinal lines, or whether such a distribution implies the former existence of equatorial land-connections. It may be added that even bats are unable to cross large tracts of sea; and the fact that fruit-bats of the genus *Hypotis* are found in Madagascar and the Seychelles, as well as in India, while they are absent from Africa, is held to be an important link in the chain of evidence demonstrating a former land-connection between Madagascar and India.

There is another point of view from which mammals are of special importance in regard to geographical distribution, namely, their comparatively late rise and dispersal, or "radiation," as compared with reptiles. As regards terrestrial mammals (with which alone we are at present concerned), one of the most striking features in their distribution is the practical absence from oceanic islands; the
MAMMALIA

only species found in such localities being either small forms which might have been carried on floating timber, or such as have been introduced by human agency. This absence of mammalian life in oceanic islands extends even to New Zealand, where the indigenous mammals comprise only two peculiar species of bats, the so-called Moa or rat having been introduced by man.

On the list of leading features in mammalian distribution is the fact that the Monotremata, or egg-laying mammals, are exclusively confined to Australia and Papua, with the adjacent islands. The monotremes are the only mammals that have penetrated into the maximum depth in the form of the“Notogaenae” of the distributionists), extending, however, as far west as Celebes and the Moluccas, although in these islands they form an insignificant minority among an extensive placental fauna, being probably of Oriental affinity. The distribution of these species is common to either Papua or Australia. Very different, on the other hand, is the condition of things in Australia and Papua, where marsupials (and monotremes) have become dominant at the expense of the placental beings represented (apart from bats, which are mainly of an Asiatic type) only by a number of more or less aberrant rodents belonging to the mouse-tribe, and in Australia by the dingo, or native dog, and in New Guinea by a wild pig. The dingo was, however, almost certainly brought from Asia by the ancestors of the modern natives; while the Papanig pig is also in all probability a human introduction, very likely of much later date.

A complete line of references of the text can be found, allowing the reader to understand the context and the specific features of the distribution of these mammals. The text describes the distribution patterns of various mammal groups, highlighting their unique geographical ranges and the impact of human activity on their dispersal. It also touches on the evolutionary history of these species, explaining how they have adapted to their respective environments across different continents and islands.
MAMMARY GLAND

Giraffes flourished during the Pliocene in Asia (where they have originated), but survive only in Africa. An African origin has also been proposed for the follow-up radiation of the bovids (Bovidae), but this was substantiated it would explain the abundance of that family in Africa and the absence from the heart of that continent of the deer group (Cervidae), the exclusion of which is affixed to the hypothesis that whereas we can recognize ancestral deer in the Tertiaries of Europe we cannot point with certainty to the forerunners of the Bovidae. Whether its birthplace was in Africa or to the north, it is probable that the holocene epoch, so many species of the Bovidae (Tragulidae), now surviving only in West and Central Africa and tropical Asia, are conversely a purely Old World group.

The camels (Tylode) certainly originated in the northern hemisphere, but although their birthplace has been confidently claimed for North America, an equal, if not stronger, claim may be made on the part of Central Asia. From the latter area, where wild camels still exist, the group may be assumed to have made its way at an early period into North America; whence, at a much later date, it finally penetrated into South America. In the Old World it seems to have reached the fringe of the African continent, where its outposts were.

The pigs (Susidae) and the hippos (Hippopotamidae) are essentially Old World groups, the former of which has alone succeeded in establishing itself in the New World, the only representative of this group (Geoshyus) is in the New World. The Suinae are at present spread all over the Old World, although the African forms (other than the one from the South-eastern coast) are distinctly marked from those inhabiting Europe, Asia, and South America. These two families are typically terrestrial, and are the only remaining representatives of the order Susidae; the third sub-order, the Glossochoerusidae, having been long extinct.

It is, however, noteworthy that extinct lemmurs occur in the Tertiary deposits of both halves of the northern hemisphere—a fact which has induced Dr J. L. Wortman to suggest a polar origin for the entire group. In the Tertiary period, the distribution of the various families and genera is more regular than is now the case, the distribution of the Primates must suffice, as their past history is too imperfectly known to admit of generalizations being drawn.

The main facts at the present day are, firstly, the restriction of the Prosimiae, or lemurs, to the warmer parts of the globe, the only exceptions being the Coendou (Cebus), and the range of the soft-witted lemurs in Madagascar (where other Primates are wanting); and, secondly, the widespread distribution of the monkeys of the New World (Platyrrhini), and the Old World monkeys and apes, or Catarrhini.

The term "mammals" is now so commonly used that it is unnecessary to give a definition of it. All the main groups of mammals—the Insectivora, Edentata, Marsupialia, and Monotremata—have already been described in this volume. The remaining order, the Chiroptera, or bats, is here considered.

It is, however, noteworthy that extinct lemmurs occur in the Tertiary deposits of both halves of the northern hemisphere—a fact which has induced Dr J. L. MAMMARY GLAND

Supernumerary nipples and glands are not uncommon, and, when they occur, are usually situated in the mammary line which extends from the anterior axillary fold to the line of the pubes; hence, when an extra nipple appears above the normal one, it is external to it, but, when below, it is nearer the middle line. The condition of extra breasts is more frequent in male infants than in females. O. Ammon (quoted by Wiedersheim) was an animal in which both sexes helped in the process of lactation.

Locule of gland

(From A. F. Dixon, Cunningham's Text Book of Anatomy.)

FIG. 1.—Dissection of the Mammary Gland.

records the case of a German soldier who had four nipples on each side. These nipples in the human subject are seldom found below the 11th or 12th ribs, but in the female of Marsupials (e.g., Monotremes, Marsupials) the mammary glands are developed, and in the pouched Monotremes (Monotremes, Marsupials) the mammary glands are found, and so they are in most Ungulates as well as in the Cetacea. In the elephants, Sirenia, Chiroptera, most of the Primates, on the other hand, they are confined to the pectoral region, and this is also the case in some Rodents, e.g., the jumping hare (Pedetes caper). In the monotremes the mammary pit remains throughout life, and the milk is conducted along the hairs to the young, but in other Mammals nipples are formed in one of two ways. One is that already described in Man, which is common to the Marsupals and Primates, while in the other the margin or wall of the mammary pit grows up, and so forms a nipple. With a very deep pit, into the bottom of which the alveoli are placed, the alveoli will rapidly increase in size, and the whole of the breast may become infected and destroyed. Supposing that, in making the incision, no pus is discovered, the relief to the vascular tension thus produced will be practically of no further benefit. If the pus had better be done under a general anaesthetic, so that the surgeon can introduce a probe, or his finger, into the wound, breaking down the partitions which are likely to exist between separate abscesses, or even through the wall of the inflammation. As the discharge begins to cease, the tenderness subsides, and gentle massage, or firm strapping of the breast, will prove useful. The general treatment will consist in the administration of an aperient, and, the tongue being clean, in prescribing such drugs as quinine, strychnia and iron. The diet should be liberal, but not carried to such excess that the power of digestion and absorption is overtaxed. During the early acute stage of the disease small doses of morphia may be necessary. When the tongue has cleaned, a little wine may be given with advantage.

Eczema around the nipple of a woman late in life, with, perhaps, localized ulceration, is known as Paget's Disease. The importance of it is that cancerous infiltration is apt to pass from it along the milk-ducts and to involve the breast in malignant disease. Hence, when eczema about the nipple refuses to clear up under the influence of soothing treatment, it is well to insist on the removal of the entire breast. Sometimes this eczema is malignant from the beginning, being associated with the active proliferation of the alveoli in the surrounding tissues. The nipple is retracted in most of these cases, which, however, are not often met with.

Talactocele. In some cases the occurrence in women who are past middle age. The part of the breast involved is enlarged, hard, and more or less tender and painful. It is sometimes impossible clinically to distinguish this disease from cancer. True, the tumour is not so large as the one produced by cancer, and the swelling is not to the muscles of the chest wall, and if there are any glands secondarily enlarged in the arm-pit they are not so hard as they may be in cancer. If the patient is suffering much from discomfort, and, highly advisable to leave it to time to clear up the diagnosis, for a chronic mastitis, innocent at first, may eventually become cancerous. If in any case the difficulty of distinguishing a chronic mastitis from a malignant tumour of the breast is insuperable, the safest course is to remove the breast and have it examined by the microscope. The suggestion, sometimes made, as to the preliminary removal of a small piece of the tumour for examination is not to be recommended.

Cysts of the Breast.—A galactoceles is a tumour due to the locking up of milk in a greatly dilated duct. Other forms of cystic disease may be due to serous or hyaloid fluid, or to thin pus, being absorbed by the fibrous tissue. The cysts may be removed by incision, and by passing a gauze dressing into their depths. If the fluid is occupied by many cysts, the whole breast had best be removed.

Cancer of the Breast may be met with in men as well as in women; in men, however, it is very rare. It is commonest in women between
MAMMEE APPLE—MAMMOTH

The fruit of Mammea americana (natural order Clusiaceae), a large tree with opposite leathery gland-dotted leaves, white, sweet-scented, short-stalked, solitary or clustered axillary flowers and yellow fruit 3 to 6 in. in diameter. The bitter rind encloses a sweet aromatic flesh, which is eaten raw or steeped in wine or with sugar, and is also used for preserves. There are one to four large rough seeds, which are bitter and resinous, and used as anthelmintics. An aromatic liqueur distilled from the flowers is known as eau de crédo in the West Indies, and the acidic resinous gum is used to destroy the chigoes which attack the naked feet of the negroes. The wood is durable and well adapted for building purposes; it is beautifully grained and used for fancy work.

MAMMON, a word of Aramaic origin meaning "riches." The etymology is doubtful; connections with a word meaning "entrusted," or with the Hebrew maimon, treasure, have been suggested. "Mammon," Gr. μαμών (see Professor Eb. Nettle in Encyc. Bibl.), occurs in the Sermon on the Mount (Matt. vi. 24) and the parable of the Unjust Steward (Luke xvi. 9–13). The Authorized Version keeps the Syriac word. Wycliffe uses "richess." The New English Dictionary quotes Peters Planum as containing the earliest personification of the name. Nicholaus de Lyra (commenting on the passage in Luke) says that Mammon est nomen daemonis. There is no trace, however, of any Syriac god of such a name, and the common identification of the name with a god of covetousness or avarice is chiefly due to Milton (Paradise Lost, i. 678).

MAMMOTH (Gr. mammut, mod. mammut, the Tatar word mamna, earth, from which it is supposed to be derived, is not known to exist), a name given to an extinct elephant, Elephas primigenius of Blumenbach. Probably no extinct animal has left such abundant evidence of its former existence; immense numbers of bones, teeth, and more or less entire cases, or "mummies," as they may be called, having been discovered, with the flesh, skin and hair in situ, in the frozen soil of the tundra of northern Siberia.

The general characteristics of the order Proboscidea, to which the mammoth belongs, are given under that heading. The mammoth pertains to the most highly specialized section of the tribe of elephants, which also contains the modern Asian species. Of the whole group it is in many respects, as in the size and form of the tusks and the characters of the molar teeth, the farthest removed from the mastodon type, while its nearest surviving relative, the Asiatic elephant (Elephas maximus), has retained the slightly more generalized characters of the mammoth's contemporaries of more southern climes, E. columbi of America and E. armeniacus of the Old World. The tusks, or "tusks," which were probably smaller in the female, in the adult males attained the length of from 9 to 10 ft. measured along the outer curve. Upon leaving the head they were directed at first downwards, and outwards, then upwards and finally inwards at the tips, and generally with a tendency to a spiral form not seen in other elephants.

It is chiefly by the characters of the molar teeth that the various extinct modifications of the elephant type are distinguished. Those of the mastodon are very different from those of the mammoth. The lower molar teeth (Fig. 2) differ from the corresponding organs of the allied species in great breadth of the crown as compared with the length, the narrowness and crowding or close approximation of the roots, the thinness of the enamel, and its straightsness, parallelism and absence of "cirming," as seen on the worn surface or in a horizontal section of the tooth. The molars, as in other elephants, are six in number on each side above and below, succeeding each other from before backwards as No. 1, 2, 3, 4, 5, 6. The upper molars also have a number of ridges or plates of which each tooth is composed, the thickness of the enamel varies so much as to have given rise to a distinction between a "thick-plated" and a "thin-plated" variety at the latter being most prevalent among specimens from the Arctic regions. From the specimens with
thick enamel plates the transition to the other species mentioned above, including *E. maximus*, is almost imperceptible.

The bones of the skeleton generally more resemble those of the Indian elephant than of any other species, but the skull differs in the narrower summit, narrower temporal fossae, and more prolonged incisive sheaths, supporting the roots of the enormous tusks. Among the external characters by which the mammoth was distinguished from either of the existing species of elephant was the dense clothing, not only of long, coarse outer hair, but also of close under woolly hair of a reddish-brown colour, evidently in adaptation to the cold climate it inhabited. This character is represented in rude but graphic drawings of prehistoric age found in caverns in the south of France. It should be added that young Asiatic elephants often show considerable traces of the woolly coat of the mammoth. The average height does not appear to have exceeded that of either of the existing species of elephant.

The geographical range of the mammoth was very extensive. There is scarcely a county in England in which its remains have not been found in alluvial gravel or in caverns, and numbers of its teeth are dredged in the North Sea. In Scotland and Ireland its remains are less abundant, and in Scandinavia and Finland they appear to be unknown; but they have been found in vast numbers at various localities throughout the greater part of central Europe (as far south as Santander and Rome), northern Asia, and the northern part of the American continent.

The mammoth belongs to the post-Tertiary or Pleistocene epoch and was contemporaneous with man. There is evidence to show that it existed in Britain before, during and after the glacial period. It is in northern Siberia that its remains have been found in the greatest abundance and in exceptional preservation. For a long period there has been from that region an export of mammoth-ivory, fit for commercial purposes, to China and to Europe. In the middle of the 19th century trade was carried on at Khiva in fossil ivory. Middendorff estimated the number of tusks which have yearly come into the market during the last two centuries at at least a hundred pairs, but Norden- skjöld considers this estimate too low. Tusks are found along the whole shore-line between the mouth of the Obi and Bering Strait, and the farther north the more numerous they become, the islands of New Siberia being one of the favourite collecting localities. The remains are found not only round the mouths of the great rivers, but embedded in the frozen soil in such circumstances as to indicate that the animals lived not far from the localities in which they are found; and they are exposed either by the melting of the ice in warm summers or the washing away of the sea-cliffs or river-banks. In this way the bodies of more or less nearly perfect animals, often standing in the erect position, with the soft parts and hairy covering entire, have been brought to light.

**MAMMOTH CAVE**, a cave in Edmonson county, Kentucky, U.S.A., 37° 14’ N. lat. and 86° 17’ W. long., by rail 85 m. S.S.W. of Louisville. Steamboats run from the mouth of the Green river, near Evansville, Indiana, to the Mammoth Cave landing. The cave is usually said to have been discovered, in 1809, by a hunter named Hutchins; but the county records, as early as 1797, fixed its entrance as the landmark for a piece of real estate. Its mouth is in a forest ravine, 194 ft. above Green River and 600 ft. above the sea. This aperture is not the original mouth, the latter being a chasm a quarter of a mile north of it, and leading into what is known as Dixon’s cave. The two portions are not now connected, though persons in one can make themselves heard by those in the other.

The cavernous limestone of Kentucky covers an area of 8,000 sq. m., is massive and homogeneous, and belongs to the Subcarboniferous period. It shows few traces of dynamic disturbance, but has been carved, mainly by erosion since the Miocene epoch, into many caverns, of which the Mammoth Cave is the largest.

The natural arch that admits one to Mammoth Cave has a span of 70 ft., and from a ledge above it a cascade leaps 59 ft. to the rocks below, where it disappears. A flight of stone steps leads the way down to a narrow passage, through which the air rushes with violence, outward in summer and inward in winter. The temperature of the cave is uniformly 54° F. throughout the year, and the atmosphere is both chemically and optically of singular purity. While the lower levels are moist from the large pools and rivers that have secret connexion with Green river, the upper galleries are extremely dry. These conditions led at one time to the erection of thirteen cottages at a point about 1 m. underground, for the use of invalids, especially consumptives. The experiment failed, and only two cottages now remain as curiosities.

The Main Cave, from 40 to 300 ft. wide and from 35 to 125 ft. high, has several vast rooms, e.g. the Rotunda, where are the ruins of the old saltpetre works; the Star Chamber, where the protrusion of white crystals through a coating of the black oxide of manganese creates an optical illusion of great beauty; the Chief City, where an area of 2 acres is covered by a vault 125 ft. high, and the floor is strewed with rocky fragments, among which are found numerous half-burnt torches made of canes, and other signs of prehistoric occupancy. Two skeletons were exhumed near the
Rotunda; but few other bones of any description have been found. The so-called Mammoth Cave "mummies" (i.e. bodies kept by being inhumed in nitrous earth, with accompanying utensils, ornaments, braided sandals and other relics, were found in Short and Salt Caves near by, and removed to Mammoth Cave for exhibition. The Main Cave, which abruptly ends 4 m. from the entrance, is joined by winding passages, with spacious galleries on different levels; and, although the diameter of the area of the whole cavern is less than 10 m., the combined length of all accessible avenues is supposed to be about 150 m.

The chief points of interest are arranged along two lines of exploration, besides which there are certain side excursions.

The "short route" requires about four hours, and the "long route" nine. Audubon's Avenue, the one nearest the entrance, is occupied in winter by myriads of bats, that hang from the walls in clusters like swarms of bees. The Gothic Avenue contains numerous large stalactites and stalagmites, and an interesting place called the Chapel, and ends in a double dome and cascade. Among the most surprising features of cave scenery are the vertical shafts that pierce through all levels, from the uppermost galleries, or even from the sink-holes, down to the lowest floor. These are styled pits or domes, according to the position occupied by the observer. A crevice behind a block of stone, 40 ft. long by 20 ft. wide, called the Giant's Coffin, admits the explorer to a place where six pits, varying in depth from 65 ft. to 200 ft., exist in an area of 600 yds. This includes Gorin's Dome, which is viewed from a point midway in its side, and also from its top, and was formerly regarded as the finest room in the cavern. Others admire more the Mammoth Dome, at the termination of Spark's Avenue, where a cataract falls from a height of 50 ft. amid walls wonderfully draped with stalactitic tapestry. The Egyptian Temple, which is a continuation of the Mammoth Dome, contains six massive columns, two of them quite perfect and 50 ft. high and 25 ft. in diameter. The combined length of these contiguous chambers is 400 ft. By a crevice above they are connected with an arm of Audubon's Avenue. Lucy's Dome, one of the group of Jessup Domes, is supposed to be the loftiest of all these vertical shafts. A pit called the "Maelstrom," in Crogan's Hall, is the spot most remote from the mouth of
as the ouholophites resemble roses. Again, there are chambers with drifts of snowy crystals of the sulphate of magnesia, the ceilings so thickly covered with their efflorescence that a loud concussion will cause them to fall like flakes of snow.

Many small rooms and tortuous paths, where nothing of special interest can be found, are avoided as much as possible on the regular routes; but certain disagreeable experiences are inevitable. There is peril also in the vicinity of the deep pits. The one known as the Bottomless Pit was for many years a barrier to all further exploration, but it is now crossed by a wooden bridge. Long before the shaft had been cut as deep as now the water flowed away by a channel gradually contracting to a serpentine way, so extremely narrow as to be called the Fat-Man’s Misery. The walls, only 18 in. apart, change direction eight times in 105 yds., while the distance from the sandy path to the ledge overhead is but 5 ft. The rocky sides are finely marked with waves and sipples, as if running water had suddenly been petrified. This winding way conducts one to River Hall, beyond which lie the crystalline gardens that have been described. It used to be said that, if this narrow passage were blocked up, escape would be impossible; but an intricate web of fissures, called the Corkscrew, has been discovered, by means of which a good climber, ascending only a few hundred feet, lands 1000 yds. from the mouth of the cave, and cuts off one or two miles.

The waters, entering through numerous domes and pits, and falling, during the rainy season, in cascades of great volume, are finally collected in River Hall, where they form several extensive lakes, or rivers, whose connection with Green River is known to be in deep springs appearing under arches on its margin. Whenever there is a freshet in Green River the streams in the cave are joined in a continuous body of water, the rise sometimes being 60 ft. above the low-water mark. The subidence within is less rapid than the rise; and the streams are impassable for about seven months in each year. They are navigable from May to October, and furnish interesting features of cave scenery. The first approach is called the Dead Sea, embraced by cliffs 60 ft. high and 100 ft. long, above which a path has been made, whence a stairway leads down to the banks of the river Styx, a body of water 40 ft. long, crossed by a natural bridge. Lake Lethra comes next—a broad basin enclosed by walls 90 ft. high, below which a narrow path leads to a pontoon at the neck of the lake. A beach of the finest yellow sand extends for 200 yds. to Echo River, the largest of all being from 20 to 200 ft. wide, 10 to 40 ft. deep and about three-quarters of a mile long. It is crossed by boats. The arched passage-way is very symmetrical, varying in height from 19 to 35 ft., and famous for its musical reverberations—not a distinct echo, but an harmonious prolongation of sound far from 10 to 30 seconds. The original Cathedral has a certain keynote of its own, which, when firmly struck, excites harmonics, including tones of incredible depth and sweetness.

There are several other streams here besides those in River Hall. On one of them F. J. Stevenson of London is said to have floated for seven hours without finding its end. A glance at the accompanying map will show that there is a labyrinth of avenues and chasms seldom visited and never fully explored. New discoveries are frequently made. An exploring party in 1904 found a rare form of Amblyopsis, and Amblyopsis speciosa ascending from the easternmost part of the cave; beyond which another party, in 1905, discovered several large domes previously unknown. H. C. Hovey, in 1907, was led by expert guides into still wilder recesses, where a series of five domes were found, that opened into each other by tall gateways; each dome being 60 ft. in diameter and 175 ft. high. This magnificent group has since been named “Hovey’s Cathedral Domes.” No instrumental survey of the Mammoth Cave has ever been allowed by the management. The best map possible is the one only the result of estimates and partial measurements. The depths of the most noted pits have easily been ascertained by line and plummet and the height of several large domes has been found by the use of small baloons. While making a survey exclusively for the cave-owners in 1908, Max Kaemper of Berlin, Germany, forced an opening from the main cave into a remarkable region to which the general name of “Violet City” was given, in honour of Mrs Violet Blair Janin, who owned a third of the Mammoth Cave estate. Special features are Kaemper Hall, Blair Castle, the Marble Temple and Walhalla. There are eleven enormous pits, many large fine stalactites and stalagmites and surprisingly beautiful mural decorations. Dr Hovey made and published (1909) a new handbook embodying all known discoveries of importance, with four sketch-maps of the routes of usual exhibition.

The fauna of Mammoth Cave has been classified by F.W. Putnam, A. S. Packard and E. D. Cope, who have catalogued twenty-eight species truly subterraneous, besides those that may be regarded as stragglers from the surface. They are distributed thus: Vertolobata, 8 species; Insecta, 17; Archachiada, 12; Myriapoda, 2; 2; Crustacea, 5; Vernes, 3; Molusos, 1. Ehrenberg adds a list of 8 Polycastigian Infusoria, 1 fossil Infusoriam, 5 Phyllolitharia and several microscopic fungi. A bed of Agaricus was found by the writer near the river Styx; and upon this hint an attempt has been made to propagate edible fungi in this locality. All the known forms of plant-life are either fungi or allied to them, and many are only microscopic. The most interesting inhabitants of Mammoth Cave are the blind, wingless grasshoppers, with extremely long antennae; blind, colourless crayfish (Cambaris pelliculus, Telt.); and the blind fish, Amblyopsis speleus, colourless and viviparous, from 1 to 6 in. long. The Cambaris and Amblyopsis have wide distribution, being found in many other caves, and also in deep wells, in Kentucky and Indiana. Fish not blind are occasionally caught, which are apparently identical with species existing in streams outside. The true subterranean fauna may be regarded as chiefly of Pleistocene origin; yet certain forms are possibly remnants of Tertiary life.

Proctor (1852); Rambles in the Mammoth Cave in 1844, by Alexander Bullitt, with map by Stephen Bishop; guide-books by Wright (1858), Binkerd (1869), Forwood (1875), Proctor (1876), Hovey (1882), and, and Hovey and Call (1891). Hovey’s Celebrated Agaricus (1884).

**MAMORE—MAMUN**

A river of Bolivia which unites with the Beni in 10° 20' S. to form the Madeira, one of the largest tributaries of the Amazon. It rises on the northern slope of the Sierra de Cochabamba east of the city of Cochabamba, and is known as the Chimoré down to its junction with the Chapare, or Chaparí. Its larger tributaries are the Chapare, Séure, Apero and Yacuma from the west, and the Ichala, Guapay or Grande, Ivari and Guaporé from the east. Taking into account its length only, the Guapay should be considered the upper part of the Mamoré; but it is shallow and obstructed, and carries a much smaller volume of water. The Guaporé, or Itenez, also rivals the Mamoré in length and volume, having its source in the Serra dos Parecis, Matto Grosso, Brazil, a few miles from streams flowing northward to the Tapajos and Amazon, and southward to the Paraguay and Paraná. The Mamoré is interrupted by rapids a few miles above its junction with the Beni, but a railway 180 m. long has been undertaken from below the rapids of the Madeira. Above the rapids the river is navigable to Chimoré, at the foot of the Sierra, and most of its tributaries are navigable for long distances. Franz Keller (in *The Amazon and Madeira Rivers*; New York, 1874) gives the outflow of the Mamoré at mean water level, and not including the Guaporé, as 2530 cubs. in. per second, and the area of its drainage basin, also not including the Guaporé, as 9382 sq. m.

**MAMUN** (c. 786–833), originally ABDULLAH, surnamed AL-MAMUN (“in whom men trust”), the seventh of the Abbasid caliphs of Bagdad, was born about A.D. 786, and was the second son of Harun al-Rashid. By Harun’s will he was successor.
designate to his brother Amin, during whose reign he was to be governor of the eastern part of the empire. On Harun's death (809) Amin succeeded and Mamun acquired. Irritated, however, by the treatment he received from Amin, and supported by a portion of the army, Mamun speedily rebelled. A five years' struggle between the two brothers ended in the death of Amin and the proclamation of Mamun as caliph at Bagdad (Sept. 813). Various factions and revolts, which disturbed the first years of his reign, were readily quelled by his prudent and energetic measures. But a much more serious rebellion, stirred up by his countenancing the heretical sect of Ali and adopting their colours, soon after threatened his throne. His crown was actually on the head of his uncle Ibrahim b. Mahdi (surnamed Mobarek) for a short time (Barbier de Meynard, in Journal Asiatic, March—April 1869). This inaugurated a period of tranquillity, which Mamun employed in fostering literature and science. He had already, while governor of Khorasan, founded a college there, and attracted to it the most eminent men of the day, and Bagdad became the seat of academical instruction. At his own expense he caused to be translated into Arabic many valuable books from the Greek, Persian, Chaldæan and Coptic languages; and he was himself an ardent student of mathematics and astronomy. The first Arabic translation of Euclid was dedicated to him in 813. Mamun founded observatories at Bagdad and Kassiu (near Damascus), and succeeded in determining the inclination of the ecliptic. He also caused a degree of the meridian to be measured on the plain of Shinar; and he constructed astronomical tables, which are said to be wonderfully accurate. In 837 he was converted to the heterodox faith of the Mo'azzimites, who asserted the free-will of man and denied the eternity of the Koran. The later years (829–839) of his reign were disturbed by hostilities with the Greek emperor Theophilus, while a series of revolts in different parts of the Arabian empire betokened the decline of the military glory of the caliphs. Spain and part of Africa had already asserted their independence, and Egypt and Syria were now inclined to follow. In 833, after quelling Egypt, at least nominally, Mamun marched into Cilicia to prosecute the war with the Greeks, but died near Tarsus, leaving his crown to a younger brother, Motasim. The death of Mamun ended an important epoch in the history of science and letters and the period of Arabian prosperity which his father's reign had begun.

See further under CALIPHATE, sect. C., §§ 5, 6, 7.

MAMUND, a Pathan tribe and valley on the Peshawar border of the North-West Frontier Province of India. The Mamunds live partly in Bajour and partly in Afghan territory, due north of the Mohmands, a much larger tribe, with whom they must not be confounded. They are one of the clans of the Tarkanis (q.v.), and number about a thousand men; they gave much trouble during the Chitral Campaign in 1895, and again during the Mohmand Expedition in 1897; they inflicted severe losses upon General Jeffrey's brigade. (See MOHMUND.)

MAN, the word common to Teutonic languages for a single person of the human race, of either sex, the Lat. homo, and Gr. ἄνθρωπος; also for the race collectively, and for a full-grown adult male human being. Teutonic languages, other than English, have usually adopted a derivative in the first sense, e.g. German Mensch. Philologists are not in agreement as to whether the Sanskrit mān is the direct source, or whether both are to be traced to a common root. Doubt also is thrown on the theory that the word is to be referred to the Indo-Germanic root, men, meaning "to think," seen in "mind," man being essentially the thinking or intelligent animal. (See ANTHROPOLOGY.)

MAN, ISLE OF (anc. Mona), a dominion of the crown of England, in the Irish Sea. (For map, see ENGLAND, section 1.) It is about 33 m. long by about 12 broad in the broadest part. Its general form resembles that of an heraldic lozenge, though its outline is very irregular, being indented at numerous spots and broken by narrow creeks. Its chief physical characteristic is the close juxtaposition of mountain, glen and sea, which has produced a variety and beauty of scenery unsurpassed in any area of equal size elsewhere.

The greater part of its surface is hilly. The hills, which reach their culminating point in Snaefell (2034 ft.), have a definite tendency to trend in the direction of the longer axis, but throw out many radiating spurs, which frequently extend to the coast-line. They are, for the most part, smooth and rounded in outline, the rocks being such as do not favour the formation of crags, though, owing to the rapidity of their descent, streams have frequently rent steep-walled craggy gullies in their sides. The strength of the prevalent southwest wind has caused them to be treeless, except in some of the lower slopes, but they are clad with verdure to their summits. Rising almost directly from the sea, they appear higher than they really are, and therefore present a much more imposing appearance than many hills of greater altitude. On the south-west, where they descend precipitously into the sea, they unite with the cliffs to the north and south of them to produce the most striking part of the coast scenery for which the Isle is remarkable. But, indeed, the whole coast from Peel round by the Calf, past Castletown and Douglas to Maughold Head, near Ramsey, is distinguished by rugged grandeur. From Ramsey round by the Point of Ayre to within a few miles of Peel extend low sandy cliffs, bordered by flat sandy shores, which surround the northern plain. This plain is relieved only by a low range of hills, the highest of which attains an elevation of 270 ft. The drainage of the island radiates from the neighbourhood of Snaefell, from which mountain and its spurs streams have on all sides found their way to the sea. The most important of these are the Sull, falling into the sea at Ramsey; the Awe or Glaz (bright lake), and the $doo$ (dark river), which unite their waters near Douglas; the Ne, at the mouth of which Peel is situated; and the Awe-arigid (silver river, now called the Silverburn), which joins the sea at Castletown. There are no lakes. The narrow, winding glesns thus formed, which are studded with clumps of fir, sycamore and mountain ash, interspersed with patches of gorse, heather and fern, afford a striking and beautiful contrast to the bare mountain tops. Traces of an older system of drainage than that which now exists are noticeable in many places, the most remarkable being the central depression between Douglas and Peel. The chief bays are, on the east coast, Ramsey, with an excellent anchorage, Laxey, Douglas, Derbyhaven, Castletown and Port St Mary; and, on the west coast, Port Erin and Peel.

Geology.—The predominant feature in the stratigraphy of the Isle of Man is, in the words of G. W. Lamplough, the central ridge of flysch and breccia with an extensive outwash plain in the north and south of the island. The characteristic N.W.-S.E. lines, which control the distribution of the cliffs and basins, have cut down the central mass of the island to a N.E.—S.W. tract as early as a date as the beginning of the Carboniferous period. This prototype of the present island appears after-wards to have been upheaved, with the help of other older elements, to its present position, at least 100 million years later; but with the progress of denudation the old ridge has once more emerged from beneath this mantle." This mass of ancient rocks, the Manx Slate Series, has been divided locally into the Barre Slates, the Agnesshe and other grit beds; and the Loman and Annyll Beds. The whole series strikes N.E.—S.W., while structurally the strata form part of a synclinorium, the higher beds being on the N.W. and the lower on the E. sides of the islands, the lower beds in the west; although the subordinate dips appear to indicate an anticlinal structure. These rocks have been greatly crumpled; and in places, notably in Sully Glen, thrusting has developed a well-defined thrust-brecia. So much has this folding and compression toughened the soft argillaceous rocks that the Barrule Slate, for example, is almost everywhere found occupying the highest points while the hard but more jointed slates and flagstones occur on the lower ground on the mountain flanks. The Manx Series is penetrated and altered by large masses of granite at Dhoon, Foxdale and one or two other spots; and dykes, more or less directly associated with these, both ordinary dikes and the sills, are numerous throughout. Many of these have been obtained from these rocks, but they are regarded, provisionally, as of Upper Cambrian age. Carboniferous rocks, including a basal conglomerate, white limestone with abundant fossils, and the black marble (attached as a black marble) occur about Castletown, Poolbush Bay and Langness; and the basement beds appear again on the west coast at Peel. The cliffs and ridges of Great Scarf and the Léith Hills have scattered fragments of grits, tuffs, agglomerates and basalts, as well as later dolerite dykes, in a most striking manner. Here too may be seen some curious effects

of thrusting in the limestones. At the northern end of the island the Manx Slate is found abruptly in an ancient sea-cliff which crosses between Ramsey and Ballaugh. The low-lying country beyond is fertile, but not generally level, and includes gravel and sandstone deposits. In the Bride Hills are seen glacial mounds rising 150 ft. above the level of the plain. The depressions known as the Curraghs, now drained, are still marked by the remnants of the stagnant glacial lakes. Glacial deposits are found also in all parts of the island. Beneath the thick drift of the plain, Carboniferous, Permian and Triassic rocks have been proved to lie at some depth below the present level, and they are seen arising near the Point of Ayre and Ramsey beach. Silver-bearing lead ore, zinc and copper are the principal minerals found in the Isle of Man; the most important mining centres being built on land above 30 ft. high.

### Climate
- The Isle is liable to heavy gales from the south-west. Of this the trend of the branches of the trees to the north-east is a striking testimony. But it is equally subject to the influence of the warm westerly air from the Atlantic, so that in winter mild, and in summer cool. The mean annual temperature is 54°F., the warmest (August) 71°F., giving an extreme annual range of temperature of 17°F. only, while the average temperature in spring is 46°F., in summer 57°F., and in winter 32°F. Further evidence of the mildness of the climate is afforded by the fact that fuchsias, hydrangeas, and escallions grow luxuriantly in the open air. Its rainfall, placed as it is between mountain districts in England, Ireland, Scotland and Wales, is naturally rather wet than dry. Statistics, however, reveal remarkable variations of rainfall in different parts of the island, varying from 61 in. at Snaffle to 25 in. at the Calf of Man. In the more populous districts it varies from 46 in. at Ramsey, and 45 in. at Peel. Peeil, being 34 in. at Castletown, is the driest. Sunshine the Isle of Man has a larger share in any portion of the United Kingdom except the south and south-east coasts and the Channel Islands. Briefly, then, the climate of the island may be pronounced as equable and sunny, and, though humid, decidedly invigorating; its rainfall, though it varies greatly, is excessive in the populous districts; and its winds are strong and frequent, and usually from north and east.

### Flora
- Like Ireland, the Isle of Man is exempt from beetles and toads, a circumstance traditionally attributed to the agency of St Patrick, the patron saint of both islands. Frogs, however, have been observed in recent years, and basil and wood-sorrel, wild shamrock and linden are found. Badgers, moles, squirrels and voles are absent and foxes are extinct. Fossil bones of the Irish elk are frequently found, and a complete skeleton of this animal is to be seen at Castletown. The red deer, which is referred to in the ancient laws and pictured on the runic crosses, became extinct by the beginning of the 18th century. Hares are less plentiful than formerly, and rabbits are not very numerous. Snipe are fairly common, and there are a few partridges and grouse. The latter, which had become extinct, were reintroduced in 1880. Woodcock, wild geese, wild ducks, plover, widgeon, teal, heron, bittern, kingfishers and the Manx snipe are characteristic of the north and west coasts, but do not abound there. The puffin (Fratercula arctica) is still numerous on the Calf island in the summer time. The peregrine falcon, which breeds on the cliffs of the east and north coasts, is very scarce. The protection of sea-birds (local act of 1867) has resulted in a not uncontrollable increase in the number of gulls. A variety of the domestic cat, remarkable for the absence or scanty condition of the tail, is peculiar to the island.

### Fauna
- Like the fauna, the flora is chiefly remarkable for its meagerness. It contains at most 450 species as compared with 600 in Jersey. Alpine forms are absent. But what it lacks in variety it makes up in beauty and quantity. For the profusion of the gorse, the heather and of spring flowers, especially of primroses, and of ferns, the Isle of Man is probably unrivalled.

### People
- The Manx people of the present day are mainly of Scandian-Celtic origin, with some slight traces of earlier races. They have broad and broad heads, usually broader than those of their brother Irish, and are found in Ireland and Scotland, with very broad, but not specially prominent cheek-bones. The Manx are usually either scuitiform, like those of the Northmen, or oval, which is the usual Celtic type, and whose noses are almost always of good length, and straighter than is general among Celtic races. Light eyes and fair complexion, with rather dark hair, are the usual combinations. They are usually rather tall and heavily built, their average height (males) being 5 ft. 7 in., and average weight (naked) 155 lb. The tendency of the population to increase has been very great. It reached its maximum in 1891. Since then it has slightly declined. A noticeable feature is its greater proportionate growth in the towns, especially Douglas, than in the country. The population reached its maximum in 1891. Since then it has been shrinking rapidly, especially in the northern district.

### Chief Political Divisions and Towns
- The island is divided into six shadings (so named from the Scouby, the old Slovak or ship district), called Glenfaba, Middle, Rushen, Garff, Ayre and Michael, each of which has its officer, the coroner, whose functions are similar to those of a sheriff, and whose jurisdiction extends over the whole of the island. For the towns see CASTLETOWN, DOUGLAS, PEEL and RAMSEY. The principal villages are Ballasalla, Ballaugh, Foxdale, Laxey, Michael, Onchan, Port Erin and Port St Mary.

### Industries
- The island is supplied with water by steamers with Liverpool, Glasgow, Greenock, Belfast, Silloth, Whitehaven, Belfast and Dublin throughout the year and, during the summer season, there are also steamers plying to Holyhead, Liverpool, Fleetwood and Blackpool. A daily mail was established in 1779. The internal communications are excellent. The roads are under the management of a board appointed by the Tynwald Council, a surveyor-general, and a road-warden, who are maintained by a system of licences on public-houses, carriages, carts and dogs, and a rate on real property. There are railways between Douglas, Ramsey, Peel, Port Erin, Port St Mary, the line between Douglas and Ramsey being via St John's and Michael. Electric tramways run from Douglas to Ramsey via Laxey, from Douglas to Port Soderick, and from Laxey to the summit of Snaefell.

### Agriculture
- The position of the Manx farmers, though they generally pay higher rents than their compatriots in those countries, is, except in the remote parts of the island, more favourable than that of the English or Scottish farmers. The best soil is the level country, and the less fertile country, and the less fertile are the clay soils. The island is still able to afford larger lease and small holdings have almost entirely disappeared. The cultivated area is about 93,000 acres, or 65% of the whole. The Maize and corn crops, barley about six-tenth. The amount of wheat and other corn crops is very trifling. Neither Maize wheat nor barley is as good as that of England; but where as good as that of England is grown, it is grown to what is grown on the mainland. Turnips, which are an excellent crop, are largely exported, and the dry and sandy soil of the north of the island is very favourable for the cultivation of root crops. The white, red and clover and the common grasses grow luxuriantly, and the pasturage is, generally speaking, good. Some of the low-lying land, especially in the north, is much in need of systematic drainage. The livestock, largely in consequence of the premiums given by the insular government and the local agricultural society to bulls, heavy and light stallions and cart mares, now approximates very closely in quality to the stock in the south and west. Dairy cows, which are the large number of small and medium-sized, are maintained by the insular dairy and agricultural department of agricultural industry. Apples, pears and wall fruit do not succeed very well, but the soil is favourable for the cultivation of strawberries, raspberries, currants and vegetables. Both agricultural and market-garden produce are quite insufficient to supply the demand in the summer.

### Fishing
- The important place which the fishing industry acquire in the social and national life of the Isle of Man is fully reflected in the wording of the oath formerly taken by the deemsters, who promised to execute the laws between the sovereign and his subjects "with fidelity and justice, without indirectly or otherwise neglecting the herring backbone do the lie in the midst of the fish." The number of herring fisheries has been increasing; the land and records abound in evidence of the great extent to which both the people and their rulers were dependent on the produce of the sea. The amount of fish caught, except herrings, is not sufficient to supply
local demand in the summer, though some of the fish named are exported during the rest of the year. About 250 vessels, aggregating 4260 tons, with crews numbering 4250, are employed in this industry. A fish hatchery has been established at Port Erin by the island. 

(c) Mining. —There is no doubt that, in proportion to its area, the metalliferous wealth of the Isle of Man has been very considerable. It is computed that the island has had, in various periods, a series of years in the first rank in the British Islands for productiveness of zinc and silver lead respectively. These metals have constituted its principal riches, but copper pyrites and hematite iron have also been worked in marketable quantities, while only very small amounts of the ores of nickel and antimony have been found. The mines are rented from the Crown as lord of the manor. The value of the output from the mines has been very small, but throughout the years 1906 the tonnage of vessels (other than fishing or wind-bound vessels) cleared for traffic was 726,790. The number of vessels (other than fishing vessels) registered as belonging to the island in 1906 was 79.

Commerce. —The chief exports are lead, zinc, turnips, rope, cotton nets and salt. The imports consist chiefly of timber, provisions, fuel (coal), and grass. In 1906 the tonnage of vessels was 130,000 tons, and the vessels trading to the island. The values of the imports and exports were £2,000,000 and £1,500,000 respectively. The chief trading ports are Douglas, Ramsey, Peel, Castletown, and Onchan.

Government. —The government of the island is vested in a lieutenant-governor, appointed by the Crown; in a Council, which is the upper branch of the legislature; in the House of Keys, which is the lower branch; and in the Tynwald. The Council is the executive body of the Island, and it appoints boards to manage the harbours, highways, education, local government, and lunatic and poor asylums. The legislative power is vested in the Legislative Assembly, which consists of the Council and the House of Keys. The sessions of the Assembly are held at Peel and Castletown alternately.

Law. —The High Court of Justice, of which the lieutenant-governor is president, contains three divisions: viz., the Chancery Division, in which the clerk of the rolls sits as judge, the Common Law Division, of which the deemsters are the judges, and the Court of Admiralty, of which the attorneys-general, auditor, and treasurer of the Island sit. It has been held that the jurisdiction of the Chancery and Common Law Division is in the main similar to that of the corresponding divisions in the courts at London. The Court of Admiralty has no arrest jurisdiction, similar to that of the Appeal Courts in England. The Common Law Courts for the southern division of the island are held at Douglas and Castletown alternately and those for the northern division at Ramsey and Peel. The Chancery Court sits once a fortnight at Douglas. These courts also have summary jurisdiction in matters of debt, actions for liquidated damages under £50, suits for possession of real or personal property, petitions for probate, &c. These courts, called Deemsters' Courts, are held weekly, alternately at Douglas and Castletown, by the lieutenant-governor and deemsters. The Chancery Court was established in 1867, the Deemsters' Court in 1847, and the Court of General Gaol Delivery is the Supreme Criminal Court and is presided over by the lieutenant-governor, who is assisted by the clerk of the rolls and the two deemsters. These courts are held in the four towns; they hear all cases under £100, as well as for ejectment and for the trial of cases usually brought before a stipendiary magistrate in England. The magistrates (J. P.'s) also hold regular courts in the towns for the trial of breaches of the peace and minor offenses. There is a coroner in each of the six shewings. These officers are appointed annually by the lieutenant-governor and perform duties similar to those of a sheriff's officer in England. Inquests are held on the person of a high-bailiff or a stipendiary magistrate. There are also sessions of assize in which the Court of General Gaol Delivery is the Supreme Criminal Court and is presided over by the lieutenant-governor, who is assisted by the clerk of the rolls and the two deemsters. The bailiff and bailiff of the island are the only persons authorized to conduct any suit in the island. The Court of General Gaol Delivery is the Supreme Criminal Court and is presided over by the lieutenant-governor, who is assisted by the clerk of the rolls and the two deemsters. The bailiff and bailiff of the island are the only persons authorized to conduct any suit in the island.

As regards real property the general tenure is a customary freehold devolving from each possessor to his next heir-at-law. The descent of land follows the same rules as the descent of the crown of England. The right of primogeniture extends to females in default of males in the line of descent. Thus a widower or widow, being the first wife or husband of a person deceased, is entitled to the half of the lands which have descended hereditarily, and is forfeited by a second marriage; a second husband or second wife is only entitled to the half interest in one descent and one married estate. Of the land purchased by the husband the wife surviving him is entitled to a life interest in one moiety. A statute of the year 1777 provided that all land should be granted to lease for any term not exceeding twenty-one years in possession without the consent of the wife.

Church. —It is not known by whom Christianity was introduced into Man, but from the large proportion of names of Irish ecclesiastics surviving in the apocriftables of the old Manx keelils, or cells, which are of similar type to the Irish oratories of the 6th and 7th centuries, and in the dedications of the parish churches, which are usually on the sites of burial, it may be reasonably concluded that Manxmen were, for the most part, Christianized by Irish missionaries. During the invasions of the pagan Vikings Christianity was almost certainly extinguished, and it was not till the end of the reign of King Canute, the King of Denmark, in the 11th century. The two most important events in the history of the medieval Manx Church were the formation of the diocese of Sedir (q.v.) and the foundation of the abbey of Rushen, a branch of the Cistercian abbey of Furness, in the latter part of the 12th century. The following event was important because the Cistercians were exempted from all episcopal visitation and control, by charter granted by the pope, and therefore, having no priest of their own order. From this time till the Reformation we find that there was an almost continuous struggle between the laity and the spiritual barons and monks, who had obtained great power and property. All property held in Manx law was held by the Crown and evidence as is available it would seem that the Reformation was a very slow process. When Isaac Barrow (uncle of his well-known namesake) became bishop in 1663 the condition of the Church was deplorable, but under him and his able and saintly successors, Thomas
Wilson (1668–1758) and Mark Hildesley (1755–1773), it attained to a very much higher level than the English Church during the same period. After Hildesley's time it was again neglected, and successful missionary work for the rest of the century only averted the establishment of a rapid increase of Nonconformity. It was not till the second decade of the 19th century that the condition of the Church began to improve again, and this improvement has steadily continued. In 1879 a Church of Man and Man theological school was established for the training of candidates for holy orders. This school has been affiliated to Durham University. In 1880 four rural deaneries were established, and the following year a bishop was consecrated. Acts were passed at Westminster for the establishment of Church courts. In 1895 a cathedral chapter, with four canons, was constituted under the name of the "Dean and Chapter of Man," the bishop being the dean of the cathedral church. A Church Synod, under the Bishop of Man, was constituted by an act of parliament in 1877. View to supplementing the incomes of the clergy, which had been greatly reduced on account of the low price of corn. There have been several acts giving Nonconformists equal rights with Churchmen in administering oaths, and this bill of ten years standing these are the Burials Acts of 1881 and 1895, which permit burials to take place in churchyards without the rites of the Church of England, and allow any burial service, provided it be Christian, in mortuary chapels. At the present day Nonconformists, chiefly Wesleyan Methodists, probably outnumber Churchmen, and there is a small number of Roman Catholics and Presbyterian. The bishop, who has a seat, but not a vote, in the House of Lords, is appointed either by a right of election or at the pleasure of the Crown and for life as a religious dignitary. The bishop is also the bishop of the Dean of Man, and is the living of the dean and his wife, a rector and a vicar of the archdeaconry and a rector of the deanery. The jurisdiction of the only remaining ecclesiastical court, which is presided over by the archbishop, as representing the bishop and the dean, is to determine the question of the election of officers, and swaying-in of churchwardens and the granting of faculties. The power of the Manx Convocation to make canons, though not exercised since 1740, has never been abrogated, and so far affords a token that the Church is in a different condition from that of the Church of England, and it is not prohibited by the laws of the land, though, if approved by the insular Legislature, Education. —It was not till 1872, when the insular Legislature passed the Public Elementary Education Act, that the Manx State undertook any direct responsibility for education. This act differed from the English Act of 1870 in three important particulars: (1) it gave the power of appointment to every town and parish school under a school board; (2) the attendance of children was made compulsory; and (3) every elementary school, those in connection with the Church of Rome excepted, was obliged to provide for non-sectarian instruction in reading during the period of attendance. By an act of the Legislature, passed by suitable explanation. Since the date of this act education has made extraordinary strides. It became free in 1892, and a higher-grade school was established in Douglas in 1894. The public elementary schools, which is nearly all managed by School Boards, are subject to the control of a local Council of Education appointed by the Manx Court; but, as the Manx Act of 1872 requires that, in order to obtain a government grant, the schools should be under the management of a board of a certain number of members elected by the people of the district, from which the profession department at Whitehall, they are examined by English inspectors, and compelled to attain the same standard of efficiency as the English schools. In 1854 an act was passed allowing for the establishment of a secondary education passed by the Legislature. The total number of public elementary schools in 1906 was 47, 42 being board and 5 denominational. Besides King William's College, opened in 1833, which is established by the state and available at a very reasonable fee, there are grammar schools in Douglas, Ramsey and Castletown. The Manx language (see Celt: Language) still lingers, the censuses of 1901 showing that there were about 4,400 people who understood something of it. There is now no one who does not speak English. Economics. —Municipal government was established in 1860, and in 1876 vaccination was made compulsory, as also was the registration of births, marriages and deaths in 1878. It was not till 1884 that the sanitation of the towns was seriously taken in hand; but ten years later the sanitary condition of the island was dealt with by an act of parliament constituting an Island Board of Health, and village councils, with commissioners elected by the people, who had in conjunction with a board elected by the Tynwald Court and an inspector appointed by it, to attend to all questions relating to sanitation and infectious diseases. As a result of these measures the death-rate has been greatly reduced. In 1888 a permissive poor law was established; it has been adopted by all the towns except Peel and by seven of the seventeen country parishes. Registration of births, marriages and deaths in 1891, and the debt reached its maximum amount, £219,531, in 1913. History.—The history of the Isle of Man falls naturally into three periods. In the first of these the island was inhabited by a Celtic people. The next is marked by the Viking invasions and the establishment of Scandinavian rule. The third period is that of the English dominion. The secular history of the Isle of Man during the Celtic period is an absolute blank, there being no trustworthy record of any event whatever before the incursions of the Northmen, since the exploits attributed to Baetan MacCairill, king of Ulster, at the end of the 6th century, which were formally supposed to have been performed in the Isle of Man, really occurred in the vicinity between the Firths of Clyde and Forth. And it is clear that, even if the supposed conquest of the Menavian islands—Man and Anglesey—by Edwin of Northumbria, in 616, did take place, it could not have led to any permanent results; for, when the English were driven from the coasts of Cumberland and Lancashire soon afterwards, they could not well have retained their hold on the island to the west of these coasts. It is, however, possible that in 685, when Ecgfrid laid Ireland waste from Dublin to Drogheda, he temporarily occupied Man. During the period of Scandi- navian supremacy there were two main epochs—one before the conquest of Man by Godred Crovan in 1079, and the other after it. The earlier epoch is characterized by warfare and unsettled rule, the later is comparatively peaceful. Between about A.D. 800 and 815 the Vikings came to Man chiefly for plunder; between about 850 and 990, when they settled in it, the island fell under the rule of the Scandinavian kings of Dublin; and between 990 and 1079, it was subject to the powerful earls of Orkney. The conqueror Godred Crovan was evidently a remarkable man, though little information about him is attainable. According to the Chronicle of Mann we have "'subdued Dublin, and a great part of Leinster, and held the Scota in such subjection that no one who built a vessel dared to insert more than three bolts." The memory of such a ruler would be likely to survive in tradition, and it seems probable therefore that he is the person commemorated in Manx legend under the name of King Gore or Orry. The islands which were under his rule were called the Sulur-eajar (Sudreys or the south isles, in contradistinction to the norr-eajar, or the north isles, i.e. the Orkneys and Shetlands, and they consisted of the Hebrides, and of all the smaller western islands of Scotland, with Man. At a later date his successors took the title of Rex Manniae et Insularum. Olaf, Godred's son, was a powerful monarch, who, according to the Chronicle, maintained "such close alliance with the kings of Ireland and Scotland that no one ventured to disturb the Isles during his time" (1113–1152). His son, Godred, who for a short period ruled over Dublin also, as a result of a quarrel with Somerled, the ruler of Argyll, in 1156, lost the smaller islands off the coast of Argyll. An independent sovereignty was thus interposed between the two divisions of his kingdom. Early in the 13th century, when Reginald of Man did homage to King John, we hear for the first time of English intervention in the affairs of Man. But it was into the hands of Scotland that the islands were ultimately to fall. During the whole of the Scandinavian period the isles were nominally under the suzerainty of the kings of Norway, but they only occasionally asserted it with any vigour. The first to do so was Harold Haafager about 855, then came Magnus Barford about 1100, both of whom conquered the isles. From the middle of the 12th century till 1217 the suzerainty, owing to the fact that Norway was a prey to civil dissensions, had been of a very shadowy character. But after that date it became a reality and Norway consequently came into collision with the growing power of Scotland. Finally, in 1261, Alexander III. of Scotland sent envoys to Norway to negotiate for the cession of the isles, but their efforts led to no result. He therefore initiated hostilities which terminated in the complete defeat of the Norwegian fleet at Largs in 1263. Magnus, king of Man and the Isles, who had fought on the Norwegian side, was compelled to surrender all the isles over which he had ruled, except Man, for which he did homage. Two years later his son was deposed, settled in Ireland, and the agrarian system of the sum of 4000 marks, ceded the islands, including Man, to Scotland. But Scotland's rule over Man was not firmly
established till 1275, when the Manx were defeated in a decisive battle at Ronaldsway, near Castletown. In 1290 we find Edward I., of England in possession of Man, and it remained in English hands till 1313, when it was taken by Robert Bruce after besieging Castle Rushen for five weeks. Then, till 1346, when the battle of Neville's Cross decided the long struggle between England and Scotland in England's favour, there followed a confused period when Man was sometimes under English and sometimes under Scottish rule. About 1335 it had been granted by King Edward III. to William de Montacute, 1st earl of Salisbury, as his absolute possession, without any servitude to be rendered to him. In 1392 his son sold the island "with the crowne" to Sir William Le Scoore. In 1399 Henry IV. caused Le Scoore, who had taken Richard's side, to be beheaded. The island then came into the possession of the crown and was granted to Henry de Percy, earl of Northumberland, but, he having been attainted, Henry IV., in 1406, made a grant of it, with the patronage of the bishopric, to Sir John Stanley, his heirs and assigns, on the service of rendering two falcons on paying homage and two falcons on his return after the period of his tenure. With the accession of the Stanleys to the throne there begins a better epoch in Manx history. Though the island's new rulers rarely visited its shores, they placed it under responsible governors, who, in the main, seem to have treated it with justice. Of the thirteen members of the family who ruled in Man, the second Sir John Stanley (1414-1432), James, the 7th earl (1627-1652), and the 10th earl of the same name (1702-1736) had the most important influence on it. The first curbed the power of the spiritual barons, introduced trial by jury, instead of trial by battle, and ordered the laws to be written. The second, known as the Great Stanley, and his wife, Charlotte de la Tremouille (or Tremouille), are probably the most striking figures in Manx history. In 1643 Charles I. ordered him to go to Man, where the people, who were no doubt influenced by what was taking place in England, threatened to revolt. But his arrival, with English soldiers, soon put a stop to anything of this kind. He conciliated the people by his affability, brought in Englishmen to teach various handicrafts and tried to help the farmers by improving the breed of Manx horses, and, at the same time, he restrained the exactions of the Church. But the Manx people never had less liberty than under his rule. They were heavily taxed; troops were quartered upon them; and they also had the more lasting grievance of being compelled to accept leases for three lives instead of holding their land by the "straw tenure" which they considered to be equivalent to a customary inheritance. Six months after the death of the king Stanley received a summons from General Ireton to surrender the island, which he haughtily declined. In August 1651 he went to England with some of his troops, among whom were 300 Manxmen, to join King Charles II., and he and they shared in the decisive defeat of the Royalists at Worcester. He was captured and confined in Chester Castle, and, after being tried by court martial, was executed at Wigan. Soon after his death the Manx Militia, under the command of William Christian, rose against the Countess and captured all the insular forts except Rushen and Peel. They were then joined by a parliamentary force under Colonel Duckenfield, to whom the Countess surrendered after a brief resistance. Fairfax had been appointed "Lord of Man and the Isles" in September, so that Man continued under a monarchical government and remained in the same relation to England as before. The restoration of Stanley government in 1660 therefore caused as little friction and alteration as its temporary cessation had. One of the first acts of the new lord, Charles (the 8th earl), was to order Christian to be tried. He was found guilty and executed. Of the other persons implicated in the rebellion only three were excepted from the general amnesty. But by order in Council they were pardoned, and the judges responsible for the sentence on Christian were punished. His next act was to dispute the permanency of the tenants' holdings, which they had not at first regarded as being affected by the acceptance of leases, a proceeding which led to an almost open rebellion against his authority and to the neglect of agriculture. In lieu of it the people devoted themselves to the fisheries and to contraband trade. The agrarian question was not settled till 1704, when James, Charles's brother and successor, largely through the influence of Bishop Wilson, entered into a compact with his tenants, which was embodied in an act, called the "Act of Settlement." Their compact secured the tenants in the possession of their estates in perpetuity on condition of a fixed rent, and a small fine on succession or alienation. From the great importance of this act to the Manx people it has been called the "Manx Charter." At the same time as the rent increased, the rent payable to the lord became so small in proportion as to be almost nominal. James died in 1736 and the sovereignty of the isle passed to James Murray, 2nd duke of Atholl. In 1764 he was succeeded by his only surviving child Charlotte, Baroness Strange, and her husband, John Murray, who, in right of his wife, became Lord of Man. About 1720 the contraband trade greatly increased. In 1726 it was, for a time, somewhat checked by the interposition of parliament, but during the latter years of the Atholl régime (1756-1765) it assumed such proportions that, in the interests of the national revenue, it became necessary to suppress it. With a view to so doing an Act of Parliament, called the "Revesting Act," was passed in 1765, under which the sovereign rights of the Atholls and the customs revenues of the island were purchased for the sum of £70,000, and an annuity of £2,000 was granted to the duke and duchess. The Atholls still retained their manorial rights, the patronage of the See, and certain other perquisites, which were finally purchased for the excessive sum of £47,144 in 1828. Up to the time of the Revestment the Tynwald Court passed laws concerning the government of the island in all respects and had control over its finances, subject to the approval of the lord. After the Revestment, or rather after the passage of the "Miscchiefs Act" in the same year, Imperial Parliament legislated with respect to customs, harbours and merchant shipping, and, in measures of a general character, it occasionally inserted clauses by which penalties in contravention of the acts of which they formed part might be enforced in the island. It also assumed the control of the insular customs duties. Such were the changes which, rather than the transference of the sovereignty from the lord to the king of Great Britain and Ireland, modified the Constitution of the Isle of Man. Its ancient laws and tenures were not interfered with, but in many ways the Revestment adversely affected it. The hereditary lords were far from being model rulers, but most of them had taken some personal share in its government, and had interested themselves in the well-being of its inhabitants. But now the whole direction of its affairs was handed over to officials, who regarded the island as a pestilent nest of smugglers, from which it was their duty to extract as much revenue as possible. Some alleviation of this state of things was experienced between 1793 and 1826 when the 4th duke of Atholl was appointed governor, since, though he quarrelled with the Keys and was unduly solicitous for his pecuniary interests, he did occasionally exert himself to promote the welfare of the island. After his departure the English officials resumed their sway. But they were more considerate than before. Moreover, since smuggling, which had only been checked, not suppressed, by the Revesting Act, had by that time almost disappeared, and the Manx revenue was producing a large and increasing surplus, the Isle of Man came to be regarded more favourably, and, thanks to this fact and to the representations of the Manx people to English ministers in 1837, 1844 and 1853, it obtained a somewhat less stringent customs tariff and an occasional dole towards erecting its much neglected public works. Since 1866, when the Isle of Man obtained a measure of at least nominal "Home Rule," the Manx people have made remarkable progress, and at the present day form a prosperous community.

Monuments.—The prehistoric monuments in Man are numerous. There are earth entrenchments, seemingly of the earliest period; fragments of stone circles and alignments; burial cairns
MANAAR, GULF OF—MANAOAG

with stone cists of several successive periods; urn mounds and crannoges or lake dwellings. The monuments belonging to the historic period begin with the round tower on Peel islet, the humble Celtic keels and the sculptured crosses in which the island is especially rich. Of these crosses about one-fourth have inscriptions in the old Norse language. The origin and history of the early buildings remaining on the island are obscure. The castles of Rushen and Peel are the only important buildings of a military character which survive, but the remains of ecclesiastical buildings are numerous and interesting, though, with the exception of St. German's Cathedral on Peel islet, nothing of great antiquity. There are also the remains of the Monastery of Kirk Michael, the ruins of a fishing village named Ballaugh, and the remains of a castle called Arms. There has been much controversy about the origin of the arms of the island—the "three-legs" found on a beautiful pillar cross near Maughold churchyard belonging to the latter part of the 14th century. It was probably originally a sun symbol and was brought from Sicily by the Vikings. The motto quocunque jeceris stabit is of comparatively recent origin.

Hall Caine's novels, The Deeaster, The Manxman, &c., have no doubt greatly helped the island in its present position. The most truthful representation of the social life of the people is to be found in a novel entitled The Captain of the Parish, by John Quine. Bibliotheca Manensi (Manx Society, vol. xxiv.) contains a good list of MSS. and books relating to the island up to 1876, and A. W. Moore's History of the Isle of Man has a list of the most important MSS. and books up to 1900. (A. W. M.)

MANAAR, GULF OF, a portion of the Indian Ocean lying between the coast of Madras and Ceylon. Its northern limit is the line of rocks and islands called Adam's Bridge. Its extreme width from Cape Comorin to Point de Gouin is about 200 miles.

MANACOR, a town of Spain in the island of Majorca, 40 m. by rail E. of Palma. Pop. (1900), 12,458. Manacor has a small market and grain, fruit, oil, and live stock. The neighbourhood is well supplied with the caves of Drach, containing several underground lakes, and the caves of Artá, one of the largest and finest groups of stalactite caverns in western Europe.

MANAGE, to control, direct, or be in a position or have the capacity to do anything (from Ital. maneggiare, to train horses, literally; to handle; Lat. manus, hand). The word was first used of the "management" of a horse. Its meanings have been much influenced by the French ménager, to direct a household or ménage (from late Lat. mansio, house); hence to economize, to husband resources, &c. The French menage, act of guiding or leading, from mener, to lead, seems also to have influenced the meaning.

MANAGUA, the capital of Nicaragua, and of the department of Managua; on the southern shore of Lake Managua, and on the railway from Diríamba to El Viejo, 65 m. by rail S.E. of the Pacific port of Corinto. Pop. (1903), about 30,000. Managua is a modern city, with many flourishing industries and a rapidly growing population. Its chief buildings are those erected after 1855, when it was chosen as the capital to put an end to the rivalry between the then more important cities of Leon and Granada. They include the Palace Nacional or government buildings, Cathedral and more recently a national library and museum, an ornate Renaissance structure, the barracks and the general post office. Owing to its position on the lake, and its excellent communications by rail and steamer, Managua obtained after 1855 an important export trade in coffee, sugar, cocoa and cotton, although in 1876 it was temporarily ruined by a great inundation.

MANAKIN, from the Dutch word Mannetje, applied to certain small birds, a name apparently introduced into English by G. Edwards (Nat. Hist. Birds, l. 21) in or about 1743, since which time it has been accepted generally and is now applied to those for which the family Pipridae is peculiar to the Neotropical Region and have many of the habits of the titmouse family (Paridae), living in deep forests, associated in small bands, and keeping continually in motion, but feeding almost wholly on the large soft berries of the different kinds of Melastoma. The Pipridae, however, have no close affinity with the Paridae,1 but belong to another great division of the order Passeres, the Clamatoridae group or the Anisomyzidae. The manakins are nearly all birds of gay appearance, generally exhibiting rich tints of blue, crimson, scarlet, orange or yellow in combination with chestnut, deep black and white, or olive green; and among their most obvious characteristics are their short bill and feeble feet, of which the outer toe is united to the middle toe for a good part of its length. The tail, in most species very short, has in others the middle feathers much elongated, and in one of the outer rectrices are attenuated and produced into threads. They have been divided (Brit. Mus. Cat. Birds, vol. iv.) into nineteen genera with about seventy species of which eighteen are included under P. leucotis, and the best known, has a wide distribution from the isthmus of Panama to Guiana and the valley of the Amazon; but it is one of the most plainly coloured of the family, being black with a white head. The genus Machaeropeterus, consisting of four species, is very remarkable for the extraordinary form of some of the secondary wing-feathers in the males, in which the shaft is thickened and the webs changed in shape, as described and illustrated by P. L. Sclater (Proc. Zool. Society, 1860, p. 90; Ibid., 1862, p. 175) in the case of the beautiful M. delicatus, and it has been observed that the wing-bones of these birds are also much thickened, no doubt in correlation with this abnormal shape. A like deviation from the ordinary character is found in the allied genus Chironomachoris, comprehending seven species, and Sclater is of the opinion that it enables them to make the singular noise for which they have long been noted, described by O. Salvin (Ibis, 1860, p. 37) in the case of one of them, M. candae, as beginning "with a sharp note not unlike the crack of a whip," which is "followed by a rattling sound not unlike the call of a landrail"2 and it is a similar habit that has been obtained for another species, M. edwardsi, the name in Cayenne, according to Buffon (Hist. Nat. Oiseaux, iv. 413) of Cassisoiette.

(A. N.)

1 Though Edwards called the species he figured (ut supra) a titmouse, he properly remarked that there was no genus of European birds to which he could liken it.

2 The figures are repeated by Darwin (Descent of Man, &c., ii. 66).
inhabitants devote themselves especially to rice-culture, though tobacco, Indian corn, sugar-cane, fruit and vegetables are also raised. A statue of the Virgin Mary here is visited annually (especially during May) by thousands from Pangasinan and adjoining provinces. The inhabitants are mostly Ilocanos. Manaog includes the town proper and eighteen barrios.

**MANAOS**, a city and port of Brazil and capital of the state of Amazonas, on the left bank of the Rio Negro 12 m. above its junction with the Solimões, or Amazon, and 908 m. (Wappáus) above the mouth of the latter, in lat. 3° 8' 4" S., long. 66° W. Pop. (1908), about 40,000, including a large percentage of Indians, negroes and mixed-bloods; the city is growing rapidly. Manaos stands on a slight eminence overlooking the river, 106 ft. above sea-level, traversed by several "igapós" (canoe paths) or side channels, and beautified by the luxuriant vegetation of the Amazon valley. The climate is agreeable and healthful, the average temperature for the year (1902) being 84°, the number of rainy days 130, and the total rainfall 66-4 in. Up to the beginning of the 20th century the only noteworthy public edifices were the church of N.S. de Conceição, the St Sebastian asylum and, possibly, a Misericordia hospital; but a government building, a custom-house, a municipal hall, courts of justice, a market-place and a handsome theatre were subsequently erected, and a modern water-supply system, electric light and electric trams and bridges were provided. The "igapós" are spanned by a number of bridges. Higher education is provided by a lyceum or high school, besides which there is a noteworthy school (bearing the name of Benjamin Constant) for poor orphan girls. Manaos has a famous botanical garden, an interesting museum, a public library, and a meteorological observatory. The port of Manaos, which is the commercial centre of the whole upper Amazon region, was nothing but a river anchorage before 1902. In that year a foreign corporation began improvements, which include a stone river-wall or quay, storehouses for merchandise, and floating wharves or landing stages connected with the quay by floating bridges or roadways. The floating wharves and bridges are made necessary by the rise and fall of the river, the difference between the maximum and minimum levels being about 33 ft.

The principal exports are rubber, nuts, cacao, dried fish, hides and piassava fibre. The markets of Manaos receive their supplies of beef from the national stock ranges on the Rio Branco, and it is from this region that hides and horns are received for export. The shipping movement of the port has become large and important, the total arrivals in 1907, including small trading boats, being 1580, of which 133 were ocean-going steamers from Europe and the United States, 75 from south Brazilian ports, and 227 river steamers from Pará. This rapid growth in its direct trade is due to a provincial law of 1878 which authorized an abatement of 3% in the export duties on direct shipments, and a state law of 1900 which made it compulsory to land and ship all products of the state from the Manaos custom-house.

The first European settlement on the site of Manaos was made in 1600, when a small fort was built here by Francisco da Motta Falcão, and was named São José de Rio Negro. The mission and village which followed was called Villa de Barra, or Barra do Rio Negro (the name "Barra" being derived from the "bar" in the current of the river, occasioned by the backwash caused by its encounter with the Amazon). It succeeded Barcellos as the capital of the old capitania of Rio Negro in 1809, and became the capital of Amazonas when that province was created in 1850, its name being then changed to Manaos, the name of one of the principal tribe of Indians living on the Rio Negro at the time of its discovery. In 1805-1806 Manaos became the see of the new bishopric of Amazonas.

**MANASSAS**, a district of Prince William county, Virginia, and a town of the district, about 30 m. W.S.W. of Washington, D.C. Pop.(1910) of the district, 3381; of the town, 1217. The village of Manassas (in the town), known also as Manassas Junction, is served by the Chesapeake & Ohio and the Southern railways. North of the junction is Bull Run, a small stream which empties into the Occoquan, an arm of the Potomac. In this neighbourhood two important battles of the American Civil War, the first and second battles of Bull Run, were fought on the 21st of July 1861 and on the 29th-30th of August 1862 respectively; by Southern historians these battles are called the battles of Manassas. At Manassas is the Manassas Industrial School for Coloured Youth (non-sectarian; privately supported), which was founded in 1892 and opened in 1894; in 1908-1909 it had nine teachers (all negroes) and 121 pupils, all in elementary grades.

**MANASSEH** (7th cent. b.c.), son of Hezekiah, and king of Judah (2 Kings xxii. 1-18). His reign of fifty-five years was marked by a reaction against the reforming policy of his father, and his persistent idolatry and bloodshed were subsequently regarded as the cause of the destruction of Jerusalem and the dispersion of the people (2 Kings xxiii. 26 seq.; Jer. xv. 4). As a vassal of Assyria he was contemporary with Sennacherib, Esar-haddon (681-668 B.C.) and Assur-hani-pal (668-662 B.C.), and his name (Me-na-si-e) appears among the tributaries of the two latter. Little is known of his history. The chronicler, however, relates that the Assyrian army took him in chains to Babylon, and that after his repentance he returned, and distinguished himself by his piety, by building operations in Jerusalem and by military organization (2 Chron. xxxiii. 10 seq.). The story, however, referred to in xxiii. 29, is untrustworthy, but the historical foundation may have been some share in the revolt of the Babylonian Samas-sum-ukin (648 B.C.), on which occasion he may have been summoned before Assur-bani-pal with other rebels and subsequently reinstated. See further Driver, in Hogarth, *Authority and Archaeology*, pp. 114 seq. Manasseh was succeeded by his son Amon, who after a brief reign of two years perished in a conspiracy, his place being taken by Amon’s son (or brother) Josiah (q.v.). A lament formerly ascribed to Manasseh (cf. 2 Chron. xxxiii. 18) is preserved in the Apocrypha (see MANASSEH, PRAYER OF; and APOCRYPHAL LITERATURE). On Judg. xviii. 36 (marg.), see Jonathan.

**MANASSEH** (apparently Hebrew for "he who causes to forget," but see H. W. Hogg, *Euc. Bib.*); in the Bible, a tribe of Israel, the elder but less important of the "sons" of Joseph. Its seat lay to the north of Ephraim, but its boundaries can scarcely be defined. It merged itself with its "brother" in the south and with Issachar, Zebulun and other tribes in the north (Josh. xvii. 7 sqq.). From the latter it was separated for a time by a line of Canaanite cities extending from Dor to Bethnan, which apparently were not all subdued till the days of David or Solomon (Judg. i. 27; 1 Sam. xxxi. 10; 1 Kings ix. 15). Besides its western settlement in the fertile glades of northern Samaria, running out into the great plain, there were territories east of the Jordan reckoned to Manasseh. Gilead and Bashan were said to have been taken by Machir, and a number of places of uncertain identification were occupied by Nobah and Jair (Num. xxxii. 41; Judg. x. 3-2). It seems most natural to suppose that these districts were held before the Israelites crossed over to the west (cf. the tradition Num. xxii. Deut. iii.). On the other hand, in Judg. v. 14, Machir may conceivably belong to the west, and it is possible that, according to another tradition, these movements were the result of the complaint of the Joseph tribes that their original territory was too restricted. In the genealogical lists, Machir, perhaps originally an independent branch, is the eldest son of Manasseh (Josh. xvii. 1 b, 2); but according to later schemes he is Manasseh’s only son (Num. xxvii. 28-34). Intermixture with Amaranæans is indicated in the view that he was the son of Manasseh and an Aramean concubine (1 Sam. xxvii. 12 seq.; Gen. xxxix. 16). The Amaranæans of Geshur and Maacah (cf. 2 Sam. v. 6; Gen. xxii. 24) dwelt among the Israelites of eastern Jordan (Josh. xiii. 13). Subsequently, at an unknown period of history, sixty cities were lost (1 Chron. ii. 23). The story of the daughter of the Manassite Zelophehad is of interest for the Hebrew law of inheritance (Num. xxvii. 1-11, xxviiv.).

1 So Budde (Richter u. Samuel), who recovers certain old fragments and arranges Josh. xvii. 14-18 (f. 18 read "hill-country of Gilead"); Num. xxxii. 39, 41 seq.; Josh. xiii. 15.
MANASSES—MANATI

541

Some details of the history of this twofold branch of the Israelites are contained in the stories of Gideon (W. Manasseh) and Jephthah (E. Manasseh). The it has been held that the close bond uniting the two districts, but the details have been variously interpreted: Winckler, for example, suggesting that Saul himself was originally from E. Manasseh and that he followed in the footsteps of his predecessor. Hastings's "The History of A. Kluge," (pp. 222-224), by clearing up the matter, was at a considerable height. Generally speaking, its position in the east made it share the fortune of Ephraim, whilst on the east the proximity of Ammonites and Moabites controlled its history; see also the articles by southern neighbours, GAD and REUBEN, and the articles GEOGRAPHY (Biblical); and JEWS: History. (S. C. A.)

MANASSES, CONSTANTINE, Byzantine chronicler, flourished in the 12th century during the reign of Manuel I. (Commnenus) (1143-1180). He was the author of a Chronicle or historical synopsis of events from the creation of the world to the end of the reign of Nicephorus Botaniates (1081), written by direction of Irene, the emperor's sister-in-law. It consists of about 900 lines,—in the so-called "political" metre. There is little of it, except that it is rather more poetical than the iambic chronicle of Ephraim (about 150 years later). It obtained great popularity and appeared in a free prose translation; it was also translated into Slavonic. The poetical romance of the Lives of Aristander and Callithia, also in "political" verse, is only known from the fragments preserved in the Poësies (rose-garden) of Macarius Chryssocephalus (14th century). Manasses also wrote a short biography of Oppian, and some descriptive pieces (all except one unpublished) on artistic and other subjects.

MANASSES, PRAYER OF, an apocryphal book of the Old Testament. This writing, which since the Council of Trent has been placed in the Canon of Rome to the position of an appendix to the Vulgate, was placed by Luther and the translators of the English Bible among the apocryphal books. In some MSS. of the Septuagint it is the eighth among the canticles appended to the Psalter, though in many Greek psalters, which include the canticles, it is not found at all. In Swete's Old Testament in Greek, iii. 802 sqq., A is printed with the variants of T (Psalterium turicense). From the statements in 2 Chron. xxxiii. 12, 13, 18, 19, it follows that the Old Testament chronicler found a prayer attributed to Manasses in his Hebrew sources. The Kings of Israel and Judah of the Stars. Naturally the question arises, had the existing Prayer of Manasses any direct connexion with the prayer referred to by the chronicler? Ewald was of opinion that the Greek was an actual translation of the lost Hebrew; but Ball more wisely takes it as a free rendering of a lost Haggadic narrative found on the older document from which the chronicler drew his information. This view he supports by showing that there was once a considerable literature in circulation regarding Manasses's later history. On the other hand most scholars take the Prayer to have been written in Greek, e.g. Fritzsche, Schürer and Ryschkewitsch (Kautzsch, 4th ed. ii. 131; Neumann, 6th ed. ii. 245). Cf. Gibbon's Decline and Fall (ed. Bury, 1898), vi. 108; Du Cange, Gloss. med. et infin. lat. (v. 395), who has an interesting quotation from the Annals of Ædianus. Let us explain "political" verse as implying that the verses are "scorta et meretrices, quod omnibus sunt obsequiisque et peculiare, et servitutem publicam servient." A notable (Septuaginta Studien III) contends that the text of A and B is derived from the Apoc. Conii. ii. 22, or from its original, and not from a MS. of the Septuagint.

This fine penitential prayer seems to have been modelled after the penitential psalms. It exhibits considerable unity of thought, and the style is, in the main, dignified and simple.

As regards the date, Fritzsche, Ball and Ryssel agree in assigning this psalm to the Maccabean period. Its eschatological and doctrine of "divine forgiveness" may point to an earlier date.

The best short account of the book is given by Ball (Speaker's Apocrypha, ii. 361-371); see also Porter in Hastings's Dict. Bible, iii. 232-233. (R. H. C.)

MANATI (often anglicized as "manatee"), the name, adapted from the Carib manatabou, given by the Spanish colonists of the West Indies to the American representative of a small group of herbivorous aquatic mammals, constituting, with their allies the dugong and the new extinct Rhinoco, the order Sirenia. The name, though possibly of Mandingo origin (see MANDINGO), was latinized as manatus, furnished with hands, thus referring the etymology to the somewhat hand-like form, or hand-like use, of the fore-flippers, which alone serve these creatures for limbs. Manatis, as shown in the illustration in the article SIRENA, are somewhat whale-like in shape, having a similar horizontally expanded tail-fin, but here the resemblance to the Cetacea ceases, the whole organization of these animals being constructed on entirely different lines. The American manati, MANATI (or, as some would have it, Trichechus latirostris), inhabits the rivers of Florida, Mexico, Central America and the West Indies, and measures from 9 to 13 feet in length. The body is somewhat fish-like, but depressed and ending posteriorly in a broad, flat, shovellike horizontal tail, with rounded edges. The head is of moderate size, oblong, with a blunt, truncated muzzle, and divided from the body by a slight constriction or neck. The fore limbs are flattened oval paddles, placed rather low on the sides of the body, and showing externally no signs of division into fingers, but with three diminutive flat nails near their extremities. No trace of hind limbs are discernible either externally or internally; and there is no dorsal fin. The mouth is peculiar, the tumbid upper lip being cleft in the middle line into two lobes, each of which is separately movable. The nostrils are two semilunar valve-like slits at the apex of the muzzle. The eyes are very minute, placed at the sides of the head, and with a nearly circular aperture with wrinkled margins; and external ears are wanting. The skin generally is of a dark greyish colour, not smooth or glistening like that of whale or dolphin, but finely wrinkled. At a little distance it appears naked, but close inspection, at all events in young animals, shows a scanty covering of delicate hairs, and both upper and under lips are supplied with short, stiff bristles.

Manatis have a number—as many as 20 pairs in each jaw—of two-ridged teeth, of which, however, but comparatively few are in use at once. They lack the large tusks of the male dugong, and the fore part of the skull is not so much bent down as in that animal. In life the palate has a horny plate, with a similar one in the lower jaw. The skeleton is described under SIRENA.

Manatis pass their life in the water, inhabiting bays, lagoons, estuaries and large rivers, but the open sea is unsuited to their peculiar mode of life. As a rule they prefer shallow water, in which, when not feeding, they lie near the bottom. In deeper water they often float, with the body much arched, the rounded
back close to the surface, and the head, limbs and tail hanging downwards. The air in the lungs assists them to maintain this position. Their food consists exclusively of aquatic plants, on which they feed beneath the water. They are slow in their movements, and perfectly harmless, but are subject to persecution for the sake of their oil, skin and flesh. Frequent attempts have been made to keep specimens alive in captivity, and sometimes with considerable success, one having lived in the Brighton Aquarium for upwards of sixteen months. From such captive specimens certain observations on the mode of life of these animals have been made. We learn, for instance, that from the shoulder joint the flippers can be moved in all directions, with the elbow and wrist permit of free extension and flexion. In feeding, manatees push the food towards their mouths by means of one of the hands, or both used simultaneously, and any one who has seen these members thus employed can believe the stories of their carrying their young under their arms. Still more interesting is the action of the peculiar lateral pads formed by the divided upper lip, thus described by Professor A. Garrod: "These pads have the power of transversely approaching towards and receding from the mouth simultaneously with the lips. When the animal is on the point of seizing (say) a leaf of lettuce, the pads are diverged transversely in such a way as to make a median gap of considerable breadth. Directly the leaf is within grasp the lip-pads are approximated, the leaf is firmly seized between their contiguous bristy surfaces, and then drawn inwards by a backward movement of the lower margin of the lip as a whole." The animal is thus enabled by the unaided means of the upper lip to introduce food placed before it without the assistance of the comparatively insignificant lower lip, the action recalling that of the mouth of the silkworm and other caterpillars in which the mandibles diverge and converge laterally during mastication. All trustworthy observations indicate that the manatee has not the power of voluntarily leaving the water. None of the specimens in confinement has been observed to emit any sound.

The Amazonian manatee (M. imnugis) is a much smaller species, not exceeding 7 or 8 ft. in length, and without nails to the flippers. It ascends most of the tributaries of the Amazon until stopped by rapids. From a specimen which lived a short time in London it appears that the lip-pads are less developed than in the northern species. The third species is the West African M. senegalensis, which extends a distance of about ten degrees south and sixteen north of the equator, and ranges into the heart of the continent as far as Lake Chad. From 8 to 10 ft. appears to be the normal length; the weight of a specimen was 500 lb. The colour is bluish black, with a tinge of olive-green above and yellow below. (R. L.*)

**MANBHUM—MANCHE**

**MANBHUM**, a district of British India, in the Chota Nagpur division of Bengal. The administrative headquarters are at Purulia. Area, 4174 sq. m.; pop. (1921), 1,301,364, showing an increase of 9.1% since 1891. Manbhumi district forms the first step of a gradual descent from the table-land of Chota Nagpur to the delta of lower Bengal. In the northern and eastern portions the country is open, and consists of a series of rolling downs dotted here and there with isolated conical hills. In the western and southern tracts the country is more broken and the scenery much more picturesque. The principal hills are Dalma (3407 ft.), the crowning peak of a range of the same name; Gangabari or Gajboro (2220 ft.), the highest peak of the Baghmundi range; about 20 m. south-west of Purulia; and Panchkot or Panchet (1600 ft.), on which stands the old fort of the rajas of Panchet. The hills are covered with dense jungle. The chief river is the Kasai, which flows through the district from north-west to south-east into Midnapore, and on which a considerable floating trade in sal timber is carried on. The most numerous aboriginal tribe are the Sontals; but the Bhumiats Kols are the characteristic race. In Manbhumi they inhabit the country lying on both sides of the Subanraka. They are pure Mundas, but their compatriots to the east have dropped the title of Munda with the use of their distinctive language, have adopted Hindu customs, and are fast becoming Hindus in religion. The Bhumiats Kols of the Jungle Mahals were once the terror of the surrounding districts; they are now more peaceful.

Three principal crops of rice are grown, one sown broadcast early in May on table-lands and the tops of ridges, an autumn crop, and a winter crop, the last forming the chief harvest of the district. Other crops are wheat, barley, Indian corn, pulses, oilseeds, linseeds, sugar-cane, indigo, tobacco, tussur silk (manufactured near Raghunathpur), timber, resin, coconuts in good seasons). The chief imports are salt, piece goods, brass utensils and unwrought iron. Cotton hand-loom weaving is carried on all over the district. Population of Manbhumi district, to the Damodar valley, where a large number of mines have been opened since 1894. The United Free Church of Scotland has a mission in the district, with a station priest, and issues a monthly journal in Sonthali; and a German Lutheran mission has been established since 1864. The district is traversed by the Bengal–Nagpur railway, while two branches of the East Indian railway serve the coalfield.

**MANCHA, LA** (Arabic, Al Ma'msha, "the dry land" or "wilder- ness"), a name which when employed in its widest sense denotes the bare and monotonous elevated plateau of central Spain that lies between the mountains of Toledo and the western spurs of the Sierra Nevada, being bounded on the S. by the Sierra Morena and on the N. by the Alcarria region. It thus comprises portions of the modern provinces of Toledo, Albacete and Cuenca, and the greater part of Ciudad Real. Down to the 16th century the eastern portion was known as La Mancha de Montearagon or de Aragon, and the western simply as La Mancha; afterwards the north-eastern and south-western sections respectively were distinguished by the epithets Alta and Baja (upper and lower). La Mancha is famous as the scene of Cervantes' novel Don Quixote; in appearance, with its multitude of windmills and vast tracts of arid land, it remains almost exactly as Cervantes described it. Many villages, such as El Toboso and Argamasilla de Alba, both near Alcázar de San Juan, are connected by tradition with episodes in Don Quixote.

**MANCHE**, a department of north-western France, made up chiefly of the Cotentin and the Avranchin districts of Normandy, and bounded W., N. and E. by the English Channel (Fr. La Manche), from which it derives its name, E. by the department of Calvados, S.E. by Orne, S. by Mayenne and Ille-et-Vilaine. Pop. (1906), 485,443. Area, 2475 sq. m. The department is traversed from south to north by a range of hills, in many parts picturesque, and connected in the south with those of Maine and Brittany. In the country round Mortain, which has been called the Switzerland of Normandy, they rise to a height of 1200 ft. The coast-line, running northward along the bay of the Seine from the rocks of Grand Camp to Cape Barfleur, thence westward to Cape la Hague, and finally southward to the Bay of Mont St Michel, has a length of 200 miles. The Vire and the Taute (which near the small port of Carentan receives the Ouze as a tributary on the left) fall into the sea at the Calvados border, and are united by a canal some miles above their mouths. From the mouth of the Taute a low beach runs to the port of St Vaast-la-Hougue, where the coast becomes rocky, with sandbanks. Off St Vaast lies the fortified island of Tatihou, with the laboratory of marine zoology of the Natural History Museum of Paris. Between Cape Barfleur and Cape la Hague lie the roads of Cherbourg, protected by the famous breakwater. The whole western coast is inhospitable; its small havens, lying behind formidable barriers and reefs, are almost dry at low tide. Great cliffs, such as the points of Jobourg (420 ft. high) and Flamanville, alternate with long strands, such as that which extends for 30 m. from Cape Carteret to Granville. Between this coast and the Channel Islands the tide, pent up between numerous sandbanks, flows with a terrific force that has given these passages such ill-omened names as Passage de la Déroute and the like. The only important harbours are Granville and the haven of refuge of Dielette between Granville and Cherbourg. Carteret carries on a passenger traffic with the Channel Islands. The Seine river, flowing parallel with the coast, is bounded on its flowing by Cotances. South of Granville the sands of St Pair are the commencement of the great bay of Mont Saint Michel,
whose area of 60,000 acres was covered with forest till the terrible tide of the year 709. The equinocial tides reach a vertical height of nearly 50 ft. In the bay the picturesque walls of the abbey rise from the summit of a rock 400 ft. high. The Sée, which waters Avranches, and the Couesnon (separating Manche from Ille-et-Vilaine) disembogue in the bay.

The climate of Manche is mild and humid, from its propinquity to the sea. Rain is never severe; myrtles and fuchsias flourish in the open air. Excessive heat is also unusual; the predominant winds are south-west.

The characteristic industry of the department is the rearing of horses and cattle, carried on especially in the rich meadow of the eastern Cotentin; sheep are raised in the western arrondissement of Coutances. Wheat, buckwheat, barley and oats are the chief cereals cultivated. Manche is one of the foremost departments for the production of cider-apples and pears; plums and figs are also largely grown. Butter is an important source of profit, as also are poultry and eggs. Flourishing market-gardens are found in the west. The department contains valuable granite quarries in the Cherbourg arrondissement and the Chausey islands; building and other stone is quarried.

Villedieu manufactures copper-ware and Sourdeval iron and other metal-ware; and there are wool-spinning mills, paper-works and leather-works, but the department as a whole is industrially unimportant. There are oyster-beds on the coast (St Vaast, &c.), and the maritime population, besides fishing for herrings, mackerel, lobsters or sole, collect seaweed for agricultural use. Coutances is the seat of a bishopric of the province of Rouen. The department is one of the chief seats of the X. army corps and of the circumscriptions of the académie (educational division and appeal-court of Caen, Cherbourg (q.v.), with its important port, arsenal and shipbuilding yards, is the chief centre of population. St Lô (q.v.) is the capital; there are six arrondissements (St Lô, Avranches, Cherbourg, Coutances, Mortain, Valognes), with 48 cantons and 647 communes. Avranches, Mortain, Coutances, Granville and Mont Saint Michel receive separate treatment. At Lessay and St Sauveur-le-Vicomte there are the remains of ancient Benedictine abbeys, and Torigni-sur-Vire and Touteville (close to Cherbourg) have interesting châteaux of the 16th century. Valognes, which in the 17th and 18th centuries posed as a provincial centre of culture, has a church (15th, 16th and 17th centuries) remarkable for its dome, the only one of Gothic architecture in France.

MANCHESTER, EARLS AND DUKES OF. The Manchester title, in the English peerage, belongs to a branch of the family of Montagu (q.v.). The first earl was Sir Henry Montagu (c. 1562-1642), grandson of Sir Edward Montagu, chief justice of the king's bench 1599-1654, who was named by King Henry VIII. one of the executors of his will, and governor to his eldest son, Edward VI. Sir Henry Montagu, who was born at Boughton, Northamptonshire, about 1563, was educated at Christ's College, Cambridge, and, having been called to the bar, was elected recorder of London in 1603, and in 1616 was made chief justice of the king's bench, in which office he fell to him to pass sentence on Sir Walter Raleigh in October 1618. In 1620 he was appointed lord high treasurer, being raised to the peerage as Baron Montagu of Kimbolton, Huntingdonshire, and Viscount Mandeville. He became president of the council in 1621, in which office he was continued by Charles I, who created him earl of Manchester in 1626. In 1628 he became lord privy seal, and in 1635 a commissioner of the treasury. Although from the beginning of his public life in 1601, when he first entered parliament, Manchester had inclined to the popular side in politics, he managed to retain to the end the favour of the king. He was a judge of the Star Chamber, and one of the most trusted councillors of Charles I. His loyalty, ability and honesty were warmly praised by Clarendon. In conjunction with Coventry, the lord keeper, he pronounced his opinion in favour of the legality of ship-money in 1634. He died on the 7th of November 1642. Manchester was

married three times. One of his sons by his third wife was father of Charles Montagu, created earl of Halifax in 1699.

Edward Montagu, 2nd earl of Manchester (1602-1671), eldest son of the 1st earl by his first wife, Catherine Spencer, granddaughter of Sir John Spencer of Althorp, was born in 1602, and was educated at Sidney Sussex College, Cambridge. He was member of parliament for Huntingdonshire 1625-1626, and in the latter year was raised to the peerage of Baron Montagu of Kimbolton, but was known generally by his courtesy title of Viscount Mandeville. His first wife, who was related to the duke of Buckingham, having died in 1625 after two years of marriage, Mandeville married in 1626 Anne, daughter of the 2nd earl of Warwick. The influence of his father-in-law, who was afterwards admiral on the side of the parliament, drew Mandeville to the popular side in the questions in dispute with the crown, and at the beginning of the Long Parliament he was one of the recognized leaders of the popular party in the upper House, his name being joined with those of the five members of the House of Commons impeached by the king in 1642. At the outbreak of the Civil War, having succeeded his father in the earldom in November 1642, Manchester commanded a regiment in the army of the earl of Essex, and in August 1643 he was appointed major-general of the parliamentary forces in the eastern counties, with Cromwell as his second in command. Having become a member of the "committee of both kingdoms" in 1644, he was in supreme command at Marston Moor (July 1, 1644); but in the subsequent operations his lack of energy brought him into disagreement with Cromwell, and in November 1644 he strenuously expressed his disapproval of continuing the war (see Cromwell, Oliver). Cromwell brought the shortcomings of Manchester before parliament in the autumn of 1644; and early in the following year, anticipating the self-denying ordinance, Manchester resigned his command. He took a leading part in the frequent negotiations for an arrangement with Charles, was consultant with Lenthall of the great seal 1646-1648, and frequently presided in the House of Lords. He opposed the trial of the king, and retired from public life during the Commonwealth; but after the Restoration, which he actively assisted, he was loaded with honours by Charles II. In 1660 he was made a general, and he died on the 4th of May 1671. Manchester was made a K.G. in 1661, and became F.R.S. in 1667. Men of such divergent sympathies as Baxter, Burnet and Clarendon agreed in describing Manchester as a lovable and virtuous man, who loved peace and moderation both in politics and religion. He was five times married, leaving children by two of his wives, and was succeeded in the title by his eldest son, Robert, 3rd earl of Manchester (1634-1683).

Charles Montagu, 1st duke of Manchester (c. 1656-1722), son of Robert, 3rd earl of Manchester, was educated at Trinity College, Cambridge, and succeeded to his father's earldom in 1683. Warmly sympathizing with the Whig revolution of 1688, he attended William and Mary at their coronation, fought under William at the Boyne, became a privy councillor in 1695, and held various important diplomatic posts between that date and 1714, when he received an appointment in the household of George I, by whom on the 28th of April 1719 he was created duke of Manchester. He died on the 20th of January 1722, and was succeeded successively in the dukedom by his two sons, William 2nd duke of Manchester (1700-1739), and Robert 3rd duke (c. 1710-1765), who was vice-chamberlain to Queen Caroline, wife of George II.

George Montagu, 4th duke of Manchester (1737-1788), was the son of Robert, the 3rd duke. He was a supporter of Lord Rockingham, and an active opponent in the House of Lords of Lord North's American policy. In the Rockingham ministry of 1782 Manchester became lord chamberlain. He died in September 1788.
MANCHESTER

William Montagu, 5th duke of Manchester (1768-1842), second son of the preceding, was educated at Harrow, and having become a colonel in the army in 1794, was appointed governor of Jamaica in 1808. Here he remained, except for a visit to England (1811-1813) till 1827, administering the colony with ability in a period of considerable difficulty, and doing much to prepare the way for emancipation of the slaves. From 1827 to 1830 he was postmaster-general in the cabinet of the duke of Wellington, and died in Rome on the 18th of March 1843. His wife was Susan, daughter of the 4th duke of Gordon. He was succeeded by his son George, 6th duke (1799-1853), a captain in the navy; whose son William Drogo, 7th duke (1823-1890), married Louise, daughter of the Comte d'Alten of Hanover, who after his death married Spencer Cavendish, 8th duke of Devonshire. William was succeeded by his son George Victor Drogo, 8th duke of Manchester (1853-1892), on whose death the title devolved on his son, William Angus Drogo, 9th duke of Manchester (b.1877).

MANCHESTER, a township of Hartford county, Connecticut, U.S.A., about 9 m. E. of Hartford. Pop.(1890), 6222; (1900), 10,605, of whom 3771 were foreign-born; (1890 census, 13,641. Manchester is served by the New York, New Haven & Hartford railway and by electric line connecting with Hartford, Rockville and Stafford Springs. The township covers an area of about 28 sq. m., and includes the villages of Manchester, South Manchester, Buckland, Manchester Green and Highland Park. The Hockanum River provides a good water power, and Manchester has various manufactures. At South Manchester, an attractive industrial village, a silk mill was built in 1838; the silk mills of one firm (Cheney Brothers) here cover about 13 acres; the company has done much for its employees, whose homes are almost all detached cottages in attractive grounds. Manchester was originally a part of the township of Hartford, and later a part of the township of East Hartford. The first settlement within its present limits was made about 1672; the land was bought from the Indians in 1676; and the township was separated from East Hartford and incorporated in 1823.

See also Meskin's Model Factories and Villages (1905).

MANCHESTER, a city and county of a city, municipal, county and parliamentary borough of Lancashire, England, 189 m. N.W. by N. of London, and 31 m. E. by N. of Liverpool. It stands for most part on a level plain, the rising ground being chiefly on the north side. The rivers are the Irwell, the Medlock, the Irk, and the Tib, the last entirely overarched and covered by streets and warehouses. The Irwell, which separates Manchester from Salford, is crossed by a series of bridges and discharges itself into the Mersey, which is about 10 m. distant. The chief part of the district, before it was covered with the superficial drift of sand, gravel and clay, consisted of upper New Red Sandstone with slight portions of lower New Red Sandstone, magnesian marls and upper red marls, hard sandstone and limestone rock, and cold clays and shales of contiguous coal-fields. The city, as its thousands of brick-built houses show, has been for the most part dug out of its own clay-fields. The parliamentary and municipal boroughs of Manchester are not conterminous. The city boundaries, which in 1841 enclosed 4703 acres, have been successively enlarged and now enclose 19,914 acres. There are four large stations for the Lancashire & Yorkshire, London & North-Western, the Midland, Cheshire lines, Great Northern, and Great Central railways, and many subsidiary stations for local traffic. Tramways, as well as railways, run from Manchester to Oldham, Ashton, Eccles, Stockport, &c., with which places the city is connected by continuous lines of street. The length of the streets in the city of Manchester is 758 m. (exclusive of those in the district of Withington, which joined the city in 1905). The tramway lines within the city boundaries extend to 111 m., and in addition there are 58 m. leased to the corporation by adjacent local authorities. As a matter of fact, the whole of south-east Lancashire and some portions of Cheshire are linked to Manchester by railways and tramways so as to form one great urban area, and the traveller passes from one town to another by lines of street which, for the most part, are continuous. Facility of communication is essential to the commercial prosperity of Manchester, and its need was recognized by the duke of Bridge-water, whose canal, constructed in 1761, has now been absorbed by the Manchester Ship Canal (q.v.). The making of this early waterway was an event only less important than the opening of the Manchester & Liverpool railway in 1830. The total township of Manchester, which forms the nucleus of the city, is comparatively small, and outlying hamlets having been added, its size has increased without regularity of plan. Roughly speaking, the city forms a square, with Market Street as its central thoroughfare. The tendency of recent development is to reduce the irregularities so that the other main streets may either run parallel to or intersect Market Street. Deansgate, which formerly ended in a narrow tangle of buildings, is now a broad road with many handsome buildings, and the same process of widening, enlarging and rebuilding is going on, more or less, all over Manchester. Market Street, Tram Street, the Neck and the Merry Hill are being improved, and with some reason, "the most congested street in Europe"; but relief is anticipated from some of the other street improvements. The centre of the city is occupied by business premises; the factories and workshops are mainly on the eastern side. The most important of the public buildings are in the centre and the south. The latter is also the most favoured residential district, and at its extremity is semi-rural in character. Large masses of the population live beyond the city boundary and come to their daily avocations by train and tram. Such a population is rarely homogeneous and Manchester attracts citizens from every part of the globe; there are considerable numbers of German, Armenian and Jewish residents. The houses are for the most part of brick, the public buildings of stone, which is speedily blackened by the smoky atmosphere. Many of the warehouses are of considerable architectural merit, and in recent years the use of terra-cotta has become more common. It is only in the suburbs that gardens are possible; the air is laden with black dust, and the rivers, in spite of all efforts, are in the central part of the city mere dirty ditches. It is impossible to describe Manchester in general terms, for within the city boundaries the conditions vary from the most squalid of slums to suburban and almost rural beauty.

Churches.—Manchester is the seat of an Anglican bishopric, and the chief ecclesiastical building is the cathedral, which, however, was built simply as a parish church, and, although a fine specimen of the Perpendicular period, is by no means what might be expected as the cathedral of an important and wealthy diocese. In the course of restoration a piece of Saxon sculpture came to light. This "Angel stone" represents a winged figure with a scroll inscribed "In manus iuvs Domine" in characters of the 8th century. The bulk of the building belongs to the early part of the 15th century. The first warden was John Huntingdon, rector of Ashton, who built the choir. The building, which was noticed for its hard stone by Leland when he visited the town, did not stand time and weather well, and by 1345 some portions of it were rapidly decaying. This led to its restoration by James P. Holden. By 1868 the tower was almost completely renovated in a more durable stone. Further restoration was carried out by J. J. Crowther, and the addition of a porch and vestries was executed by Basil Champneys. The total length is 720 ft. and the breadth 112 ft. There are several stained-glass windows, including one to the memory of "Chinese Gordon." The recumbent statues of Bishop James Fraser and of Hugh Birley, M.P., should also be named. In the Ely chapel is the altar tomb of Bishop James Stanley. In the stalls there are some curious misericord carvings. The tower is 139 ft. high, and contains a peel of ten bells, chiefly from the foundry of the Rudhalls. There are two organs, one by Fairey, and a modern one in oak case designed by Sir G. Scott. The parish church was made collegiate in 1422, and when in 1847 the bishopric of
Manchester was created the warden and fellows became dean and canons and the parish church became the cathedral. The first bishop was James Prince Lee, who died in 1869; the second was James Fraser, who died in 1885; the third was James Moorhouse, who resigned in 1903 and was succeeded by Edmund Arbuthnott Knox. The church endowments are considerable and have been the subject of a special act of parliament, known as the Manchester Rectory Division Act of 1845, which provides £3500 per annum for the dean and £600 to each of the four canons, and divides the residue among the incumbents of the new churches formed out of the old parish.

Of the Roman Catholic churches that of the Holy Name, which belongs to the Jesuits, is remarkable for its costly decoration. The Greek Church and most of the Nonconformist bodies have places of worship. There are twelve Jewish synagogues. The meeting-house of the Society of Friends is said to be the largest of the kind in the kingdom and will seat 1200 persons.

Public Buildings.—The Royal Infirmary, founded in 1752, having become inadequate for its purposes, a new building has been erected on the south side of the city near the university, from designs by Edwin T. Hall and John Brooke; it was opened in 1909 by king Edward VII. The central site in Piccadilly thus became available for other purposes, and the corporation gave instructions for plans to be made for a new library and art gallery. The art gallery already existing in 1909 was founded as the Royal Institution, but in 1882 passed under the control of the city council. The building was designed by Sir Charles Barry. The collection contains some fine paintings by Etty, Milkins, Leighton and other artists. The sculpture includes casts of the Elgin marbles and a statue of Dr John Dalton by Chantrey. The most striking of the public buildings is the town hall, probably the largest municipal building in the country, but no longer entirely adequate to the increasing business of the city council. It was completed in 1877 from designs by Alfred Waterhouse, who selected as the style of architecture a form of Gothic, but treated it very freely as purposes of utility required. The edifice covers 8000 sq. yds., and includes more than two hundred and fifty rooms. The building consists of continuous lines of corridors surrounding a central courtyard and connected by bridges. The principal tower is 386 ft. high to the top of the ball, and affords a view which extends over a large part of south Lancashire and Cheshire and is bounded only by the hills of Derbyshire. The tower contains a remarkable peal of bells by Taylor of Loughborough, forming an almost perfect chromatic scale of twenty-one bells; each bell has on it a line from canto 105 of Tennyson's In Memoriam. The great hall is 100 ft. long and 50 ft. wide, and contains a magnificent organ built by Cavallé-Coll of Paris. The twelve panels of this room are filled with paintings.
by Ford Madox Brown, illustrating the history and progress of the city. The royal exchange is a fine specimen of Italian architecture and was erected in 1869; the great meeting-hall is one of the largest rooms in England, the ceiling having a clear area, without supports, of 120 ft. in width. The exchange is seen at its best on market days (Tuesday and Friday). The assize court, now built in 1864, fronts the reconstituted building. The style is a mixture of Early English and Decorative, and a large amount of decorative art has been expended on the building. The branch Bank of England is a Doric building designed by C. R. Cockerell. There are separate town-halls for the townships of Ardwick, Chorlton, Hulme, Cheetham, Broughton and Pendleton. The Free Trade hall is a fine structure in the Lombardo-Venetian style, and its great hall will accommodate about five thousand people. It is used for public meetings, concerts, &c., and was built by Edward Walters. The Athenaeum, designed by Barry, was founded by Richard Cobden and others associated with him for "the advancement and diffusion of knowledge." The institution has, perhaps, not developed exactly on the lines contemplated by its promoters, but it has been very useful. The advantages enjoyed by members of social clubs, with the addition of facilities for educational classes and the use of an excellent news-room and a well-selected library, are offered in return for a payment which does not amount to a penny a day. The mechanics' institution has developed into the school of Technology, which now forms a part of the university. The Portico is a good specimen of the older proprietary libraries and news-rooms. It dates from 1826, and has a library. The Memorial Hall was built to commemorate the memory of the ejected ministers of 1662; it is used for meetings, scientific, educational, musical and religious. The Whitworth Institute is governed by a corporate body originating from the liberal bequests of Sir Joseph Whitworth. The Institute contains a valuable collection of works of art and stands in the centre of a wood-land park. In the park, which has been transmitted to the corporation, is a sculpture group of "Christ and the Children," executed by George Tinworth from the designs of R. D. Darbishire, by whom it was presented. The assize courts, built from designs by Waterhouse (1864), the post office (1887), and the police courts (1871) should also be named. Many fine structures suffer from being hemmed in by streets which prevent the proportions from being seen to advantage.

Monuments.—In Piccadilly are bronze statues of Wellington, Watt, Dalton, Peel and Queen Victoria. Another statue of the Queen, by the Princess Louise, is placed on the new porch of the cathedral. A bronze statue of Cobden occupies a prominent position in St Ann's Square. There also is the South African War Memorial of the Manchester Regiment. The marble statue of the Prince Consort, covered by a Gothic canopy of stone, is in front of the town hall, which dwarfs what would otherwise be a striking monument. In Albert Square there are also statues of Bishop Fraser, John Bright, Oliver Heywood and W. E. Gladstone. A statue of J. P. Joule is in the town hall, which also contains memorials of other worthies. The Queen's Park has a statue of Benjamin Brierley, a well-known writer in the Lancashire dialect. The most picturesque is Matthew Noble's bronze statue of Cromwell, placed on a huge block of rough granite as pedestal. It stands at the junction of Deansgate and Victoria Street, near the cathedral, and was presented to the town by Mrs E. S. Heywood.

Education.—There are many educational facilities. The oldest institution is the grammar school, which was founded in 1579 by Hugh Oldham, bishop of Exeter, a native of the town. The master and usher appointed by the bishop were to teach freely every child and scholar coming to the school, "without any money or reward taken"; and the bishop forbade the appointment of any member of the religious orders as head master. Some corn mills were devised for the maintenance of the school, which was further endowed at both the universities by Sarah, duchess of Somerset, in 1692. The school has now two hundred and fifty free scholars, whilst other pupils are received on payment of fees. Among those educated at the grammar school were Thomas De Quincey, Harrison Ainsworth and Samuel Bamford the Radical. After the grammar school the oldest educational foundation is that of Humphrey Chetham, whose bluecoat school, founded in 1655, is housed in the building formerly occupied by the college of theology. This also contains the public library founded by Chetham, and is the most interesting relic of antiquity in the city. The educational charity of William Hulme (1631-1691) is administered under a scheme drawn up in 1881. Its income is nearly £10,000 a year, and it supports a grammar school and aids education in other ways. There are three high schools for girls. The Nicholls hospital was founded in 1881 for the education of orphan boys. Manchester was one of the first places to adopt the powers given by Forster's Act of 1870, and on the abolition of school boards the educational supervision was transferred to a committee of the corporation strengthened by co-opted members. In addition to the elementary schools, the municipality provides a large and well-equipped school of technology, and a school of art to which is attached an arts and crafts museum. There are a pupil teachers' college, a school of domestic economy, special schools for feeble-minded children, and a Royal College of Music. The schools for the deaf and dumb are situated at Old Trafford, in a contiguous building of the same Gothic design as the blind asylum, to which they were attached in 1872. The Whitworth Institution was erected on the south side of the town from designs by Waterhouse. In 1880 a university charter was granted, excluding the faculties of theology and medicine, and providing for the incorporation of University College, Liverpool, and the College of Science, Leeds. The federal institution thus created lasted until 1903, when the desire of Liverpool for a separate university of its own led to a reconstruction. Manchester University consists of one college—Owens College—in its greatly enlarged form. The buildings include the Whitworth Hall (the gift of the legates of Sir Joseph Whitworth), the Manchester Museum and the Christie Library, which is a building for the university library given by R. C. Christie, who also bequeathed his own collection. Dr Lee, the first bishop of Manchester, left his library to Owens College, and the legates of Sir Joseph Whitworth bought and presented E. A. Freeman's books. The library has received other important special collections. The benefactions to the university of Thomas Ashton are estimated at £50,000. There are in Manchester a number of denominational colleges, Wesleyan, Unitarian, Baptists, &c., and many of the students preparing for the ministry receive their arts training at the university, the theological degrees of which are open to students irrespective of creed.

Libraries, Museums and Societies.—Manchester is well provided with libraries. The Chetham library, already named, contains some rare manuscripts, the gem of the collection being a copy of the historical compilation of Matthew Paris, with corrections in the author's handwriting. There is a large collection of matter relating to the history and archaeology of Lancashire, and containing the transcripts of Lancashire MSS. bequeathed by Canon F. R. Raines. The collections of broadsides formed by Mr J. O. Halliwell-Phillipps, and the library of John Byrom, rich in myths and short-hand writers, should also be named. The Manchester Free Libraries were founded by Sir John Potter in 1852. There is now a reference library containing about 170,000 volumes, including an extensive series of English historical works, a remarkable collection of works of political economy and trade, and special collections relating to local history, Dr Thomas Fuller, shorthand and the gipsies. The
HENRY WATSON MUSIC LIBRARY, and the Thomas Greenwood Library for librarians were presented to the reference library, and the Foreign Library was purchased. Affiliated to the reference library there are nineteen libraries, each of which includes a lending department and reference department. The total library includes the members of the Manchester libraries, including the Manchester Town library, the textual library, the Free library, and the Manchester library, was founded by Mrs. Enriqueta Rylands, and named the John Rylands Library in memory of her husband. The beautiful building was designed by Basil Champneys; the library includes the famous Alt Library, which was bought from Earl Spencer by Rylands died in 1908, and by her will increased the endowment of the library so that it has an income of £13,000 yearly. She also bequeathed her own library.

Manchester possesses numerous literary and scientific associations. The oldest of these, the Literary and Philosophical Society, founded in 1781, has a high reputation, and has numbered among its working members Musley Dalton, founder of the Fairharn, J. P. Joule, H. E. Roscoe and many other famous men of science. It has published a series of memoirs and proceedings. The Manchester Statistical Society was the first society of the kind established in the kingdom, and has issued Transactions containing many important papers. The Field Naturalists' and Archaeologists' Society, the Microscopical Society, the Botanists' Association, and the Geological Society, have been prominent. Manchester, the headquarters of the Lancashire and Cheshire Antiquarian Society and of several prominent clubs, the Chatham, the Record, the Lancashire Parish Registers Society. Seven daily papers are published, and various weekly and monthly publications are issued. Of newspaper clubs, the Manchester Guardian (Liberal) being one of the best newspapers in the city, while the Manchester Courier (Unionist) has an important local influence. The Manchester Quarterly is issued by the Local Historical Club, which newspaper clubs, the Manchester Chamber of Commerce was established in 1857 was repeated in the Jubilee Exhibition of 1887. The Manchester Academy of Fine Arts is a society of artists, and holds an annual exhibition in the city art gallery.

Parks and Open Spaces.—There are fifty-three parks and open spaces. The Queen's Park, at Harpurhey, is pleasantly situated, though surrounded by cottages and manufactories. Philips Park is also attractive, in spite of its close proximity to some of the densely populated portions of the town. The Alexandra Park has various shrubbery walks and is connected with the remnant collection presented by Charles Darrah. Some of the open spaces are small; Boggart Hole Clough, where great efforts have been made to preserve the natural features, is 76 acres in extent, and was the largest until 1902, when Heaton Park, containing 662 acres, was purchased. It was formerly the seat of the earls of Wilton, and includes Heaton House, one of Wyatt's structures. In the Queen's Park there is a museum, and periodical exhibitions of works of art are held. The meadows of the Town Park, under the care of the Corporation, are also responsible for four cemeteries, having a total area of 228 acres.

Religious Houses.—There are nine churches, mostly large, and eight small. The Theatre Royal was established as a patent theatre. When the bill for it was before the House of Lords in 1775 it was advocated as an antidote to Methodism. The Bellevue Zoological Gardens at Ashton, for playing parties and other musical performances, the Anncoats Recreation Committee have since 1882 had Sunday lectures, and occasional exhibitions of pictures, window gardening, &c. The Arndale Hotel is a fine building, and is connected with the educational influences of art and culture generally. In addition to works of art, there are concerts, lectures, reading circles, &c. The museum is worked in connexions with a university settlement. The German element in the population has largely influenced the taste for music by which Manchester is distinguished, and the orchestral concerts (notably under Charles Halé) are famous.

Population.—From a census taken in 1773 it appears that there were then in the township of Manchester and its out-townships 12,926 persons. The first decennial census, 1801, showed the population to be 75,275; in 1851 it was 303,382; in 1901, 666,824. It is not easy to make an exact comparison between different periods, because there have been successive enlargements of the boundaries. The population has overflowed into the surrounding districts, and if all that belongs to the urban area, of which it is the centre, were included, greater would probably rival London in the number of its inhabitants.

Manufactures and Commerce.—Manchester is the centre of the English cotton industry (for details see Cotton and Cotton Manufacture), but owing to the enhanced value of many mills and workshops have been removed to the outskirts and to neighbouring villages and towns, so that the centre of Manchester and an ever-widening circle around are now chiefly devoted not so much to production as to the various offices of distribution. It would be a mistake, however, to regard Manchester as solely dependent upon the industries connected with cotton. There are other important manufactures which in another community would be described as gigantic. Wool and silk are manufactured on a considerable scale, though the latter industry has for some years been on the decline. The miscellaneous articles grouped under the designation of small-ware occupy many hands. Machinery and tools are made in vast quantities; the chemical industries of the city are also on a large scale. In short, there are but few important manufactures that are wholly unrepresented.

The city of Manchester to the rich coal-fields of Lancashire has had a most beneficial and prosperous influence; but for this, the rapid expansion of the industries would have been impossible.

The Manchester Bankers' Clearing House returns show an almost unbroken yearly increase. The amount in 1872 was £72,805,510; in 1907 it was £320,206,332; by the severe depression of 1908 it was reduced to £288,555,307. Another test of prosperity is the increase in rateable value. In 1839 it was £6,609,994; in 1871, £7,193,627; in 1881, £5,301,225; in 1891, £7,798,005; in 1901, £8,394,879; in 1907, £14,191,039; in 1906, £11,119,190.

The commercial institutions of Manchester are too numerous for detailed description; its chamber of commerce has for more than sixty years exercised much influence on the trade of the district and of the nation. Manchester is the headquarters of the Co-operative Wholesale Society, and of the cooperative movement generally.

The most important event in the modern history of the district is the creation of the Manchester Ship Canal (q.v.), by which Manchester and Salford have a direct communication with the sea at Eddystone, near Liverpool. The canal was opened for traffic in January 1894. The official opening ceremony was on the 21st of May 1894, when Queen Victoria visited Manchester. The total expenditure on capital account has been £16,567,881. The original share capital of £8,000,000 and £1,812,000, raised by debentures, having been exhausted, the corporation of Manchester advanced on loan a further sum of £5,000,000.

Municipality.—Manchester received a municipal charter in 1383, received the title of city in 1385, and became a county borough in 1838. The city corporation consists of 31 aldermen and 93 councillors. The mayor received the title of lord mayor in 1830. The present corporation of Manchester makes no pecuniary allowance to its lord mayor, and the office is a costly one.

The water supply is controlled by the corporation. The works at Longendale, begun in 1848, were completed, with extensions in 1884, at a cost of £3,147,893. The area supplied by Manchester waterworks was about 85 square miles, inhabited by a million people. The increase of trade and population led to the obtaining of a further supply from Lake Thirlmere, at the foot of Helvellyn and 96 miles from Manchester. The watershed is about 11,000 acres. The daily consumption is over 38 million gallons. Manchester supplies in bulk to many local authorities in the district between Thirlmere and the city. The corporation have also established works for the supply of hydraulic and electric power.

The gas lighting of Manchester has been in the hands of the corporation for many years, as also the supply of electricity both for lighting and energy. When the works are complete the electricity company will supply an area of 45 sq. m. to a certain number of industries.

Condition.—Dr. John Tatham constructed a Manchester life-table based on the vital statistics of the decennium 1881-1890, from which it appeared that, while in England and Wales of 1000 men aged 25 nearly 800 survived to be 45 and of 1000 aged 45, 560 survived to be 65, in Manchester the survivors were only 732 and 414 respectively. The expectation of life, at 25, was, for England and Wales 36-12 years, and for Manchester 36-69 years. But the death-rate has since rapidly decreased; in 1861 it was 260 per thousand living; in 1901 it was 21-6; in 1910 it was 19-0; in 1917 it was 17-9. The deaths of infants under one year old amounted to 169 per 1000.
MANCHESTER

The reports of the medical officer show that whilst the density of the population, the impurity of the atmosphere, and the pollution of the streams are difficult elements in the sanitary problem, great efforts have been made towards improving the health of the people. The birth-rate in 1878 was 28.8; the death-rate, 11.1. The population of Manchester is now estimated at 315,000, and is likely to be increased by immigration as well as by natural increase. The number of persons to the acre is 33.

In the Antonine Itinerary the name Manccuniun (p.r.) or Manu-}

cium is given. This is the origin of the modern name, and has supplied the adjective "Manchurian" (cf. "Old Mancunians" applied to old boys of Manchester Grammar School).

Joan Gresley, who was summoned to parliament as Baron de la Warre. The West family, in 1579, sold the manorial rights for £3000 to John Lacy, who, in 1596, resold them to Sir Nicholas Gresley, whose descendants enjoyed the emoluments derived from them till 1845, when they were purchased by the municipality of Manchester for £200,000. The lord of the manor had the right to tax and toll, and the buildings were brought for sale into the market of the town. But, though the inhabitants were thus to a large extent taxed for the benefit of one individual, they had a far greater amount of local self-government than might have been supposed, and the courtleet, which was then the governing body of the town, had, though in a rudimentary form, nearly all the powers now possessed by municipal corporations. This court did not only control over the watching and warding of the town, the regulation of the water supply, and the cleaning of the streets, but also had power, which at times was used freely, of interfering with the private liberty of their fellow-citizens. Thus, no single woman was allowed to be a householder; no person might employ other than the town musicians; and the amount to be spent at wedding feasts and other festivities was carefully settled. Under the protection of the barons the town appears to have steadily increased in prosperity, and it early became an important seat of the textile manufactures. Fulling mills were at work in the district in the 13th century; and documentary evidence exists to show that the woollen manufactures were carried on in Ancoats at that period. In 1358 Leland described it as "the fairest, best-built, quickest, and most populous town in Lancashire." The right of sanctuary granted to the town in 1540 was found so detrimental to its industrial pursuits that after very brief experience the privilege was taken away. The college of Manchester was dissolved in 1547, but was refounded in Mary's reign. Under her successor the town became the headquarters of the commission for establishing the Reformed religion. In 1641 we hear of the Manchester people purchasing linen yarn from the Irish, weaving it, and returning it for sale in a finished state. They also brought cotton wool from Smyrna to work into fustians and dimities. An act passed in the reign of Edward VI. regulates the length of cottons called Manchester, Lancashire and Cheshire cottons. These, notwithstanding their name, were probably all woolen textures. It is thought that some of the Flemish weavers who were introduced into England by Queen Philippa of Hainault were settled in Manchester; and Fuller has given an exceedingly quaint and picturesque description of the district in which these artisans were welcomed by the inhabitants of the country they were about to enrich with a new industry. The Flemish weavers were in all probability reinforced by religious refugees from the Low Countries.

In the civil wars, the town was besieged by the Royalists under Lord Strange (better known as Earl of Derby—"the great Stanley"); but was successfully defended by the inhabitants under the command of a German soldier of fortune, Colonel Rosworm, who complained with some bitterness of their ingratitude to him. An earlier affair between the Puritans and some of Lord Strange's followers is said to have occasioned the shedding of the first blood in the struggle between the king and parliament. The year 1604 witnessed the trial of those concerned in the so-called Lancashire plot, which ended in the triumphant acquittal of the supposed Jacobites. That the district really contained many ardent sympathizers with the Stuarts was, however, shown in the rising of 1715, when the clergy ranged themselves to a large extent on the side of the Pretender; and it was still more evident in the rising of 1745, when the town was occupied by Prince Charles Edward Stuart, and a regiment, known afterwards as the Manchester regiment, was formed and placed under the command of Colonel Francis Townley. In the fatal retreat of the Stuart troops the Manchester contingent was left to garrison Carlisle, and surrendered to the duke of Cumberland. The officers were taken to London, where they were tried for high treason and beheaded on Kennington Common.
The variations of political action in Manchester had been exceedingly marked. In the 16th century, although it produced both Roman Catholic and Protestant martyrs, it was earnestly in favour of the Reformed faith, and in the succeeding century it became indeed a stronghold of Puritanism. Yet the successors of the Roundheads who defeated the army of Charles I. were Jacobite in their sympathies, and by the latter half of the 18th century had become imbued with the aggressive form of patriotic sentiment known as anti-Jacobinism, which showed itself chiefly in dislike of reform and reformers of every description. A change, however, was imminent. The distress caused by war and taxation, towards the end of the 18th and the beginning of the 19th century, led to bitter discontent, and the anomalies existing in the parliamentary system of representation afforded only too fair an object of attack. While single individuals in some portions of the country had the power to return members of parliament for their pocket boroughs, great towns like Manchester were entirely without representation. The popular discontent was met by a policy of repression, culminating in the affair of Peterloo, which may be regarded as the starting-point of the modern reform agitation. This was in 1819, when an immense crowd assembled on St Peter's Fields (now covered by the Free Trade Hall and warehouses) to petition parliament for a redress of its grievances. The Riot Act was read by a clerical magistrate; but in such a manner as to be quite unheard by the mass of the people; and drunken yeomanry cavalry were then turned loose upon the terrified mass of spectators. The yeomanry appear to have used their sabres freely; several people killed and many more injured; and, although the magistrates received the thanks of the prince regent and the ministry, their conduct excited the deepest indignation throughout the entire country. Those who had organized the meeting, including "Orator" Hunt with Samuel Bamford and other working men, were imprisoned.

Naturally enough, the Manchester politicians took an important part in the Reform agitation; when the Act of 1832 was passed, the town sent as its representatives the Right Hon. C. P. Thomson, vice-president of the board of trade, and Mark Philips. With one notable exception, this was the first time that Manchester had been represented in parliament since its barons had seats in the House of Peers in the earlier centuries. In 1834 Charles Worsley and R. Radcliffe were nominated to represent it in Cromwell's parliament. Worsley was a man of great ability, and has a place in history as the man who carried out the injunction of the Protector to "remove that bauble," the mace of the House of Commons. The agitation for the repeal of the corn laws had its headquarter in Manchester, and the success which attended it, not less than the active interest taken by its inhabitants in public questions, has made the city the home of other projects of reform. The "United Kingdom Alliance for the Suppression of the Liquor Traffic" was founded there in 1833, and during the continuance of the American War the adherents both of the North and of the South deemed it desirable to have organizations in Manchester to influence public opinion in favour of their respective causes. A charter of incorporation was granted in 1838; a liberal policy was pursued; and the town was included in the borough of Manchester in 1833.

The Lancashire cotton famine, caused by the Civil War in America, produced much distress in the Manchester district, and led to a national movement to help the starving operatives. The more recent annals of Manchester are a record of industrial and commercial developments, and of increase in educational opportunities of all kinds. Politically Manchester was Liberal, of one or other shade, under the first Reform Act; a Conservative member was first elected in 1868, and in 1874 two. Under household suffrage in 1885 that party secured five out of six members; in 1886 and 1892, three out of six. In 1895 and 1900 five Unionists were elected, but in 1906 six Liberals were returned, one of whom (Mr Winston Churchill) was defeated at a by-election in 1908. In 1910 three Liberals, two Labour members and one Conservative were elected.

AUTHORITIES.—Although several excellent books have been written on subjects connected with the town, there is no adequate modern work. One is History of Manchester, by the Rev. John W. Baines, appeared in 1771; it is a mere fragment, and, though containing much important matter, requires to be very discreetly used. The following were recommended and John Reily, History of Manchester, (1861); R. W. Procter, Manchester in Holiday Dress (1866), Memorials of Manchester Streets (1874), Memorials of Bygone Manchester (1886); Richard Buxton, Botanical Guide to Manchester, &c. (2nd ed. 1859); J. G. Grindrod, Manchester Flora (1859); James Tait, Medieval Manchester (1903); Charles Boeder, Roman Manchester (1900); Sir Bosdin Lech, History of the Manchester Ship Canal (1897), 2 vols. (W. E. A. A.)

MANCHESTER (popularly Manchester-by-the-Sea), a township of Essex county, Massachusetts, U.S.A., about 25 m. N.E. of Boston, on Massachusetts Bay. Pop. (1900), 2522; (1905, state census), 2618; (1910), 2673. Area, 7-048 sq. m. It is served by the Boston & Maine railroad, and is connected with neighbouring towns and cities by electric lines. The township, which is bounded in part by the Merrimack river, with picturesque shores alternating between rocky headlands and sandy beaches, is drained for several miles along the coast between Beverly on the west and Gloucester on the east. It is one of the most beautiful watering-places in America, and is the favourite summer residence of many of the foreign diplomats at Washington. The "singing beach" is a stretch of white sand, which, when trodden upon, emits a curious musical sound. Manchester, originally a part of Salem, was settled about 1630 and was at first known as Jeffrey's Creek. It was incorporated separately under its present name in 1845.

Among the other public buildings and institutions are the United States Government building, the city-hall, the county-court-house, the city library (1854; the outgrowth of the Manchester Athenaeum, established in 1844), St Anselm's College (R.C.), a Roman Catholic cathedral, four Roman Catholic convents, the Elliot hospital, the Sacred Heart hospital and the hospital of Notre Dame de Lourdes, the State industrial school, the State house of correction, the Gale home for aged women, an old ladies' home (R.C.), St Martha's home for working girls, the Manchester children's home and four orphan asylums. In the largest of five public squares is a soldiers' monument, consisting of a granite column 50 ft. high,
surmounted by a statue of Victory. The city has two parks, and in one of them, overlooking the Merrimac, is a monument to the memory of General John Stark, who was born and was buried there. The water-supply is obtained from Lake Massa-
besic. Amoskeag Falls in the Merrimac are 55 ft. in height, and by means of hydraulic canals Manchester is provided with a fine water-power. Steam power is also used, and the city is by far the first important manufacturing centre in the state. It is extensively engaged in the manufacture of cotton goods, boots and shoes, worsted goods, hosiery and other knit goods, and locomotives; among the other manufactures are linen goods, steam fire-engines, paper, edge tools, soap, leather, carriages and beer. The value of the city’s factory products increased from $24,685,345 in 1900 to $30,666,926 in 1905, or 26-5%. In 1905 Manchester produced 24-8% of the total factory product of the state. Manchester ranks fifth among the cities of the United States in cotton manufacturing, and ninth among the cities of the country in the manufacture of boots and shoes.

On account of the abundance of fish in the river here, Amoskeag Falls and vicinity were a favourite resort of the Penacook Indians, and it is said that John Eliot, the ‘‘ Apostle to the Indians,’’ preached to them here in the summer of 1631. The first white settlement within the present limits of Manchester was made in 1722 by Scottish-Irish immigrants at Goffe’s Falls, 5 m. below Amoskeag Falls. In 1723 a cabin was built by some of these immigrants at the greater falls, and gradually a small settlement grew up there. By 1730 the Massachusetts charter had been granted to land adjacent to Manchester, and the town was known as ‘‘Tyng’s Snow-Show Shoes’’ and their descendants a tract of land 3 m. wide along the east bank of the Merrimac, designated as ‘‘Tyng’s Township.’’ The Scottish-Irish claimed this tract as part of their grant from New Hampshire, and there arose between the rival claimants a bitter controversy which lasted until May 1741, when the courts decided against the Massachusetts claimants. In 1731 the territory formerly known as ‘‘Tyng’s Township,’’ and sometimes called ‘‘Harrytown,’’ with portions of Chester and Londonderry, was incorporated as a township under the name Derryfield; in 1810 the name was changed to Manchester, the change having been suggested by the town’s manufacturing possibilities; and in 1846 Manchester was chartered as a city. The first sawmill was erected as early as 1736, and during the years from 1794 to 1807 a canal was constructed around the Amoskeag Falls through which to carry lumber. As late as 1830 the town had a population of only 877, but in 1831 the Amoskeag Manufacturing Company was incorporated, the construction of hydraulic canals and the erection of cotton mills followed, the villages of Pacthagouqu and Amoskeag were annexed in 1834, and the population increased to 3235 in 1840, to 8841 in 1860, and to 33,952 in 1880.

Consult M. D. Clarke, Manchester, A Brief Record of its Past and a Picture of its Present (Manchester, 1875).

**MANCHESTER, a former city of Chesterfield county, Virginia, U.S.A., (on the S. side of the James river), since 1910 a part of Richmond. Pop. (1900), 9715, of whom 3358 were negroes; (1906 estimate), 9997. It is served by the Atlantic Coast Line, the Seaboard Air Line, and the Southern railways, by electric lines to Richmond and Petersburg, and by numerous river boats. It is nearly situated in a bend of the river, with about 2 m. of water front; on the heights above is Forest Hill park, a pleasure resort, and adjacent to it Woodland Heights, a beautiful residential district. From the surrounding country come much agricultural produce, coal, lumber, bricks and granite. There is a good harbour and excellent water power. Among the manufactures are paper, flour, cotton goods, leather, brick, railway supplies, &c. The value of the city’s factory products increased from $4,021,358 in 1900 to $3,226,688 in 1905, or 99%.

**MANCHESTER SHIP CANAL.** The advantage of a waterway for the conveyance of goods between eastern Lancashire and the sea is so obvious that so far back as the year 1721 Thomas Steers designed a plan for continuing to Manchester the large navigation which then existed between Liverpool and Warrington. Parliamentary powers were then obtained to improve the rivers Mersey and Irwell from Warrington to Manchester by means of locks and weirs. This work was successfully carried out, and proved of great benefit to the trade of the district. The duke of Bridgewater, who had made a canal from his collieries at Worsley to Manchester, afterwards continued the canal to the Mersey at Runcorn; this extension was opened in 1762 and competed with the Mersey and Irwell navigation, both routes being used by barges carrying about fifty tons of cargo. The Liverpool & Manchester Canal was extended as far as the Manchester races for conveyance of goods, but the high rates of carriage, added to heavy charges at the Liverpool docks, prejudiced trade, and the question was mooted of a ship canal to bring cotton, timber, grain and other goods direct to Manchester without transshipment. The first plan was made by William Chapman in 1825, and was followed by one designed by Henry Palmer in 1842, but it was not until the year 1882 that the movement was originated that culminated in the opening of the Manchester Ship Canal by Queen Victoria on the 21st of May 1894.

In determining the plan of the canal the main point which arose was whether it should be made with locks or whether it should be on the sea-level throughout, and therefore tidal. The advantage of a still waterway in navigating large steamers, and the facilities which the sea-level canal would offer, were important considerations. To prevent the quick discharge of goods at the terminal docks at Manchester, secured the adoption of the plans for a canal with locks as designed by Sir Ellen Bridges and Sir Robert William, which had been envisaged between Manchester and Runcorn, while from the latter place to Liverpool it was proposed to improve the upper Mersey estuary by constructing training walls and dredging to form a deep central channel. The question of the lock method was referred to the House of Commons, and the 5th of May 1883, when the bill passed the committee of the House of Lords but was rejected by the committee of the House of Commons. Forward again the next year, it was passed by the Lords but thrown out by the Commons. The opposition from Liverpool and the railway companies was very strong; to meet to some extent that of the former, a continuation of the canal was proposed from Runcorn to Warrington; and the opposition of the latter, instead of a raised channel in the estuary, and in this form the bill was again introduced in the session of 1885, and, notwithstanding strong opposition, was passed by both houses of parliament. The cost of this contest to the shipping companies was £900,000, and the opposition on the bill having sat over 175 days. Owing to difficulties in raising the capital the works were not begun until November 1887.

The total length of the canal is 35½ m. and it may be regarded as divided into three sections. From Eastham to Runcorn it is near or through the Mersey estuary for 12¾ m., and thence to Latchford near Warrington, 84 m., it is inland; both these sections to the water’s edge were placed, with a view to allow of the channels being dredged to 28 ft. when necessary. At the lower end of the canal at Eastham the valley of the river is well sheltered and adjoins a good low-water channel communicating with the Swayne deep at Liverpool. Three entrance locks have been constructed alongside the canal, and the minimum width of the water-level in the canal near Southport is 75 ft., with a water-front of 120 ft. At the various sites this width is increased by 20 ft. for parts. The slopes are generally about 1 in 11, but are flatter through some portions; in rock-cutting the sides are nearly vertical. From Eastham to Runcorn the canal is alternately inland and on the foreshore of the estuary, on which embankments were constructed to act as dams and keep out the tide during the excavation of the canal, and afterwards to maintain the water-level at low water in the estuary; both sides are faced with concrete, and are principally clay ventured from the cuttings. In some places, where the foundation was of a porous nature, sheeting piles of timber had to be used. At Ellesmere Port, where the canal embankment rises 35 ft. above the level of the estuary, sheeting piles 35 ft. long were driven, to secure the base of the embankment on each side; water jets under pressure through 18 in. wrought-iron pipes were used at the foot of each pile to drive them into the earth. At the river Weaver ten Stoney roller sluices are built, each 30 ft. span, with heavy stone and concrete piers and foundations; at Runcorn,
The canal from Latchford to Manchester is in heavy cutting through the valleys of the rivers Mersey and Irwell. As these rivers are not wide enough to allow of the passage of some of the larger vessels, cast-iron siphon pipes were laid to carry off any land drainage which was at a lower level than the canal; the largest of these siphons was constructed to allow the tidal and fresh water of the rivers to pass through without obstruction. Some of the locks in the siphon are about 20 ft. long, and 5 ft. deep. The height of the canal bed is nearly steady, the depth of cutting varying from 35 to 70 ft., partly in rock, but generally in alluvial deposit. The whole length of the canal passes through the Wirral peninsula, which was formerly a large expanse of sand, clay, and silt, which gave much trouble during the progress of the work; retaining walls of stone and brickwork had to be built in these places to maintain the sides of the canal from slips and injury to the accommodation.

The canal, when opened, was being virtually one long lock, wharves at various points having been erected to enable chemical or manufacturing works to be carried on, widenings being provided where necessary. At Ellesmere Port coal tips and sheds have been erected, and the canal was so arranged that there were poling placings in the course of the Manchester), (point) and Runcorn, where a large trade is carried on with the Staffordshire Potteries and the Cheshire salt districts. At Partington branch from the railways connect the canal with the Yorkshire route from Manchester to the Lancashire and Staffordshire route, and the new channel is divided into half sections of about 3 ft. wide by the hydraulic coal tips. At Mode Wheel there are extensive abattoirs and lairages, erected by the Manchester Corporation; large steel oil tanks, graveling docks and pontoons, cold air meat stores and other accommodation for traffic. At Manchester the area of the docks is 104 acres, with 152 acres of quay space, having over 5 m. of frontage to the docks, which are provided with numerous three-storey transit sheds, thirty seven stores and seven four-storey warehouses, and a large grain silo. The London & North Western and Lancashire & Yorkshire railway companies and the Manchester and Salford Bridge Lines Committee have made branch lines to the docks and sidings at which are over 30 miles in length. Much traffic is also carried, or dealt with by inland canals in direct communication with the docks. The subsidence of a wide and deep canal, nearly straight, for comparatively shallow and narrow winding rivers, and the use of large sluices in place of fixed weirs to carry off the river water, have been of great advantage to the district in greatly reducing the height of locks.

The navigation in the canal, docks and subsidiary work amounted to over 54 million cub. yds., nearly one-fourth of which was sandstone rock; the excavated material was used in the construction of the canals and in the making of the basins of the rivers and raising low lands near the canal. As many men were employed on the works as could be obtained, but the number never exceeded 17,000, and the greater part of the excavation was done by 600 navvies and others, with a large number of steam locomotives, and more than 100 locomotives working the canals and cutting back the side of the river. The engines, with the local residents, and the navigation in the & North Western, and other companies, were at one time 6300 in length, and 173 locomotives, 6300 wagons and trucks, and 316 fixed and portable steam-engines and cranes were employed, the total cost of the plant being nearly £1,000,000. The expenditure on the works, including plant and equipment, to the 1st of January 1900, was £10,377,660. The purchase of the Mersey & Irwell Navigation and Bridge Lines Committee, (1,786,651), land and compensation (1£,223,809), interest on capital during construction ($1,170,733), and parliamentary, superintendence and general expenses brought up the total amount to £15,248,437.

Manchester Ship Canal

Western railway near Warrington, with its important route to Scotland. The single swing bridges, used in some cases to cross navigations, are dangerous and inconvenient, and high-level division lines were adopted for each railway crossing the canal. No such alteration of a railway had been previously sanctioned by parliaments, but the importance of the canal usage, and the fact that secured the requisite powers against the strong opposition of the railway companies. Embankments were made close to and the old lines of railway, and the works were done from the canal on each side, the canal itself being crossed by viaducts which give a clear headway of 75 ft. at ordinary water-level. Vessels with high masts trading on the canal are provided with a 35 ft. course, and it is claimed that the canal will double the traffic of the Mersey navigation, and will be the largest in the world. The width of each viaduct is 135 ft., and the span of the viaducts is so arranged as to maintain the full width of the canal for navigation, and as far as possible to have the embankments above the level of the water. The splendid work of the railway viaducts would be of no use if the navigation were not maintained, and the importance of the road is illustrated by the fact that some 500,000 people are employed in the navigation and work, and the accommodation of the workpeople required to meet the enlarged trade of the river.

For further details see Sir Bosdin Leech, History of the Manchester Ship Canal (Manchester, 1907). (E. L. W.)
MANCHURIA, the name by which the territory in the east of Asia occupied by the Manchus is known in Europe. By the Chinese it is called the country of the Manchus, an epithet meaning "pure," chosen by the founder of the dynasty which now rules over Manchuria and China as an appropriate designation for his family. Manchuria lies in a north-westerly and southeast direction between 39° and 53° N. and between 116° and 134° E., and is wedged in between China and Mongolia on the west and north-west, and Korea and the Russian territory on the Amur on the east and north. More definitely, it is bounded N. by the Amur, E. by the Usuri, S. by the Gulf of Liao-tung, the Yellow Sea and Korea, and W. by Chih-li and Mongolia. The territory thus defined is about 800 m. in length and 200 m. in width, and contains about 390,000 sq. m. It is divided into three provinces, viz. Hei-lung-kiang or Northern Manchuria, Kirin or Central Manchuria, and Sheng-king or Southern Manchuria. Physically the country is divided into two regions, the one a series of mountain ranges occupying the northern and eastern portions of the kingdom, and the other a plain which stretches southwards from Mukden, the capital, to the Gulf of Liao-tung.

A system of parallel ranges of mountains, culminating in the Chinese Ch'ang pai Shan, "the long white mountains," on the Korean frontier, runs in a north-easterly direction from the shores of the Gulf of Liao-tung. In its course through Eastern Manchuria it forms the watershed of the Sungari, Usuri and other rivers, and in the south that of the Ya-lu and of the Sungari river system. It also forms the eastern boundary of the great plain of Liao-tung. The mountains of this system reach their greatest height on the south-east of Kirin, where their snow-capped peaks rise to the elevation of 8000 ft. The scenery among them is justly celebrated, more especially in the neighbourhood of Haich'eng, Shu-yen and the Korean Gate.

The three principal rivers of Manchuria are the Sungari, Mutan-kiang and Usuri already mentioned. Of these the Sungari, which in the larger part rises on the northern slopes of the Ch'ang pai Shan range, and runs in a north-westerly direction to its junction with the Nonni, from which point it turns north-east until it empties itself into the Amur. It is navigable by native junks above Kirin, which city may also be reached by steamer. In its long course it varies greatly both in depth and width, in some parts being only a few feet deep and spreading out to a width of more than a mile, while in other and mountainous portions of its course its channel is narrowed to 300 or 400 ft., and its depth is increased in inverse ratio. The Usuri rises in about 44° N. and 134° E., and after running in an easterly direction for about 400 m. enters Manchuria in about 43° N., and turning southward empties itself into the Gulf of Liao-tung. The Ya-lu rises in Korea, and is the frontier river of that country.

Provinces and Towns.—Mukden, or as it is called by the Chinese Sheng-king, the capital city of Manchuria, is situated in the province of Sheng-king, occupies a fine position on the river Hun-ho, an affluent of the Liou, and is a city of considerable pretensions, which was the capital of the Manchu dynasty and is also in the province of Sheng-king. The other cities in the province are Kin-chow-fu on the west of the Gulf of Liao-tung; Kin-chow, on the western extremity of the Liao-tung peninsula; Kai-ping, on the north-western shore of the same peninsula; Hai-cheng, on the road from Niui-chwang to Mukden; Ki-yuen, a populous and prosperous city in the north of the province; and Sing-k'ing, east of Mukden, the original seat of the founders of the present dynasty. The most important commercial place, however, is the treaty port of Niui-chwang, at the head of the Gulf of Liao-tung. According to the custom-house returns the value of the foreign imports and exports in the year 1880 was $691,954 and $1,117,790 respectively, besides a large native trade carried on in junks. In 1904 the value of foreign imports had increased to $2,737,490, but the exports amounted to $1,742,859 only, the comparative low figure being accounted for by the Russo-Japanese war.

The province of Kirin, or Central Manchuria, is bounded on the N. and N.W. by the Sungari, on the S. by Sheng-king and Korea, on the W. by Mongolia, and on the E. by the Usuri and the maritime Russian province. It contains an area of about 90,000 sq. m., and is entirely mountainous with the exception of a stretch of plain country in its north-western corner. This plain produces large quantities of indigo and opium, and is physically remarkable for the number of isolated conical hills which dot its surface. These sometimes occur in a direct line at intervals of 15 or 20 m., and elsewhere are scattered about "like dish-covers on a table." Kirin, the capital of the province, occupies a magnificent position, being surrounded on the north, west and south by a semicircular range of mountains with the broad stream of the Sungari flowing across the front. The local trade is considerable. A-shhe-ho, on the Ash, with a population of 60,000; Petuna (Chinese, Sung-chung), on the Sungari, population 30,000; San-sing, near the junction of the Sungari and Mutan-kiang; Lin-lin, 120 m. to the north of the city, and Tsitsihar (Chinese, Kirin), on the Amur, and Shing-king on the Nonni and Ninguta are the other principal cities in the province.

Hei-lung-kiang, or Northern Manchuria, which contains about 195,000 sq. m., is bounded on the N. and E. by the Amur, on the S. by the Sungari, and on the W. by the Nonni and Mongolia. It is traversed by the Great and Lesser Khingan mountains and their offshoots. This province is thinly populated, and is cultivated only along the lines of its rivers. The only towns of any importance are Tsitsihar and Mergen, both situated on the Nonni and Khailar in the west.

Climate, Flora, Fauna.—The climate over the greater part of the country thaws between extremes of heat and cold, the temperature ranging between 90° F. in the summer and 10° below zero in the winter. As in the north of China, the rivers are frozen up during the four winter months. After a short spring the heat of summer again succeeds, and this continues for about six weeks' duration. The great plain in Sheng-king is in many parts swampy, and in the neighbourhood of the sea, where the soil emits a saline exudation such as is also common in the north of China, it is studded with groups of millet and various kinds of grain are grown, and on it trees flourish abundantly. The trees and plants are much the same as those found in Eastern Mongolia, and in winter the lower the elevated mountains are covered to their summits with trees. The wild animals also are those known in Europe, with the addition of tigers and panthers. Bears, wild boars, hare, wolves, foxes and wild cats are very common, and in the desert north tables are found in great numbers. One of the most noticeable of the birds is the Mongolian lark (Melanocorypha mongolica), which is found in a wild state both in Manchuria and in the desert of Mongolia. This bird is exported in large numbers to northern China, where it is much prized on account of its extraordinary power of imitation. The Manchurian crane is common, as also are eagles, curours, harriers, stoats, &c., and insects are innumerable, much to the wariness of much of the country. The rivers are well stocked with fish, especially with salmon, which forms a common article of food. In such immense shoals do these fish appear in some of the smaller streams that numbers are squeezed out on to the banks and there perish.

Products and Industries.—In minerals Manchuria is very rich: coal, gold, iron (as well as magnetic iron ore), and precious stones are found in large quantities. Gold mines are worked at several places in the northern part of Manchuria, of which the principal are Liou-chuang and Lo-ho. Several lead mines are worked near the river, and many small lead mines are also in the province of Sheng-king. The other cities in the province are Kin-chow-fu on the west of the Gulf of Liao-tung; Chin-chou, on the western extremity of the Liaotung peninsula; Kai-ping, on the north-western shore of the same peninsula; Hai-cheng, on the road from Niui-chwang to Mukden; Ki-yuen, a populous and prosperous city in the north of the province; and Sing-k'ing, east of Mukden, the original seat of the founders of the present dynasty. The most important commercial place, however, is the treaty port of Niui-chwang, at the head of the Gulf of Liao-tung. According to the custom-house returns the value of the foreign imports and exports in the year 1880 was $691,954 and $1,117,790 respectively, besides a large native trade carried on in junks. In 1904 the value of foreign imports had increased to $2,737,490, but the exports amounted to $1,742,859 only, the comparative low figure being accounted for by the Russo-Japanese war.
Population.—The population is estimated as follows for each of the three divisions:

- Province of Shêng-king (Fêng T'ien) = 4,000,000
- Kirin = 6,500,000
- Hei-lung-kiang = 2,000,000

Total = 12,500,000

Communications.—Four principal highways traverse Manchuria. The first runs from Peking to Kirin via Mukden, where it sends off a branch to Korea. At Kirin it bifurcates; one branch going to Sinking, the extreme north-eastern town of the province of Kirin, and the other to Possiet Bay on the coast via Ninguta. The second road runs from the treaty port of Niu-chwang through Mukden to Petusa in the north-western corner of the Kirin province, and thence to Tsitsihar, Mergen and the Amur. The third also starts from the main line continues in the same general direction to the eastern frontier of Manchuria, and so to Vladivostok. In 1898 Russia obtained a lease of the Liao-tung peninsula, and a clause of this contract empowered her to connect Port Arthur and Dalny (now Tairen) with the main Manchuria railway by a branch southward from Harbin. In spite of interruption caused by the Boxer outbreak, through communication was established in 1901. Under the Russo-Japanese treaty of August 1905, after the war, supplemented by a convention between Japan and Korea concluded in December of the same year, Japan took over the line from Port Arthur as far as Kwang-chêng-tsze, now known as the Southern Manchurian railway (598 m.). Branches were promoted (a) from Mukden to Antung on the Yalu, to connect with the Korean system, and (b) from Kwang-chêng-tsze to Kirin. The rest of the original Manchurian system (1088 miles) remains under Russian control. In the south-west of Manchuria a line of the Imperial Russian railways gives connexion from Peking, and branches at Kou-pang-tsze to Sinching and Niu-chwang, and the link between Sin-ming-ting and Mukden is also under Chinese control. The lines now under Russian control were laid down, and remain, on the 5 ft. gauge which is the Russian standard; but after the Russian control of the southern lines was lost the gauge was altered from that standard.

History.—Manchu, as has been said, is not the name of the country but of the people who inhabit it. The name was adopted by a ruler who rose to power in the beginning of the 13th century. Before that time the Manchus were more or less a shifting population, and, being broken up into a number of tribes, they went mainly under the distinctive name of those clans which exercised lordship over them. Thus under the Chow dynasty (1122–225 B.C.) they were known as Sewshin, and at subsequent periods as Yih-low, Wuh-keih, Moh-hoh, Pohai, Nûchih and according to the Chinese historians also as Khitan. Throughout their history they appear as a rude people, the title thrice sent to the Chinese court consisting of stone arrow-heads, hawks, gold, and latterly ginseng. Assuming that, as the Chinese say, the Khitans were Manchus, the first appearance of the Manchus, as a people, in China dates from the beginning of the 10th century, when the Khitans, having first conquered the kingdom of Pohai, crossed the frontier into China and established the Liao or Iron dynasty in the northern portion of the empire. These invaders were in their turn overthrown two centuries later by another invasion from Manchuria. These new conquerors were Nûchihis, and therefore direct ancestors of the Manchus. On assuming the imperial yellow in China their chief adopted the title of 'Gothu.' For 'Iron' (Liao), he said, "rusts, but gold always keeps its purity and colour, therefore my dynasty shall be called Kin." In a little more than a century, however, the Kins were driven out of China by the Mongols under Jenghiz Khan. But before the close of their rule a miraculous event occurred on the Chang-pai-Shan mountains which is popularly believed to have laid the seeds of the greatness of the present rulers of the empire. Three heaven-born maidens, so runs the

Niu-chwang, and strikes southward to Kin-chow at the extremity of the Liao-tung peninsula. The fourth connects Niu-chwang with the Gate of Korea. The original Manchurian railway was constructed under an agreement made in 1895 between the Chinese government and the Russo-Chinese bank, an institution founded in 1895 to develop Manchuria’s Russian interests in the East. The Chinese Eastern Railway Company was formed by the bank under this agreement, to construct and work the line, and surveys were made in 1897, the town of Harbin being founded as headquarters for the work. The line, which affords through communication from Europe by way of the Trans-Siberian system, enters Manchuria near a station of that name in the north-west corner of the country, passes Khailar, and runs south-east, near Tsitsihar, to Harbin. Thence
legend, were bathing one day in a lake under the Chang-pai-Shan mountains when a passing magpie dropped a ripe red fruit into the lap of one of them. The maiden ate the fruit, and in due course a child was born to her, whom she named Atin Gioro, or the Golden. When quite a lad Atin Gioro was elected chief over three contending clans, and established his capital at Otoli near the Chang-pai-Shan mountains. His reign, however, was brief, for his subjects rose and murdered him, with all his sons except the youngest, Fancha, who, like the infant Haitiu in Mongolian history, was miraculously saved. Nothing is recorded of the facts of Atin Gioro's reign except that he named the people over whom he reigned Manchu, or "Pure." His descendants, through the escaped Fancha, fell into complete obscurity until about the middle of the 16th century, when one of them, Nurhachu by name, a chieftain of a small tribe, rose to power. Nurhachu played with skill and daring the rôle which had been played by Jenghiz Khan more than three centuries before in Mongolia. With even greater success than his Mongolian counterpart, Nurhachu drew tribe after tribe under his sway, and after numerous wars with Korea and Mongolia he established his rule over the whole of Manchuria. Being thus the sovereign of an empire, he, again like Jenghiz Khan, adopted for himself the title of Ying-ming, "Brave and Illustrious," and took a wife from his own tribe. The title of Manchu was assumed by his son, in 1617, after numerous border fights with the Chinese; Nurhachu drew up a list of "seven hates," or indictments, against his southern neighbours, and, not getting the satisfaction he demanded, declared war against them. The progress of this war, the peace hastily patched up, the equally hasty alliance and its consequences, being matters of Chinese history, are treated in the article CHINA.

Manchuria was claimed by Russia as her particular sphere of interest towards the close of the 19th century, and in the course of the disturbances of 1900 Russian troops occupied various parts of the country. Eventually a Manchurian convention was arranged between China and Russia, by which Russia was to evacuate the province; but no actual ratification of this convention was made by Russia. The Anglo-German agreement of October 1900, to which Japan also became a party, and by which it was agreed to "maintain undiminished the territorial condition of the Chinese empire," was considered by Great Britain and Japan not to exclude Manchuria; but Germany, on the other hand, declared that Manchuria was of no interest to her. The Anglo-Japanese treaty of 1902, however, was ostensibly directed towards the preservation of Manchuria in Chinese hands. British capital has been invested in the extension of the Chinese Northern railway to Niu-chwang, and the fact was officially recognized by an agreement between Great Britain and Russia in 1899. One result of the Russo-Japanese War was the evacuation of Manchuria by the Russians, which, after the conclusion of peace in 1905, was handed over by Japan to China.

MARCHAND, PASQUALE STANISLAS (1817-1888), Italian jurist and statesman, was born at Castel Baronia, in the province of Avellino, on the 17th of March 1817. At Naples, where he studied law and displayed great literary activity, he rapidly acquired a prominent position, and in 1848 was instrumental in persuading Ferdinand II. to participate in the war against Austria. Twice he declined the offer of a portfolio in the Neapolitan cabinet, and upon the triumph of the reactionist party undertook the defence of the liberties of the Neapolitans. Taken up with imprisonment in his turn, he fled to Piedmont, where he obtained a university professorship and became preceptor of the crown prince Humbert. In 1860 he prepared the legisla-

Mancini, also known as Sabians, Nasaraeans, or St John's Christians, an Oriental sect of great antiquity, interesting to the theologian as almost the only surviving example of a very ancient and distinctive religious system.

The first of these names (not Mandeans or Mandaites) is that given by themselves, and means ναουραίοι, followers of Gnosis (from νοεω, i.e. to perceive). The Gnosis of which they profess themselves adherents is a personal revelation, the surrender of the mind to the "knowledge of life" (see below). The title Nasaraeans (Νασαραῖοι), according to Petermann, they give only to those among their adherents who are distinguished for knowledge and character. Like the Arabic Naṣara, it is originally identical with the name of the half heathen half Jewish-Christian Naṣara, and indicates an early connection with that sect. The inappropriateness of the designation of St John's Christians arises from the early and imperfect acquaintance of Christian missionaries, who had regard merely to the reverence in which the name of the Baptist is held among them, and their frequent ignorance of the historical facts with which the designation they take is Sabians, in Arabic Sībīʿi, from سبأ, to baptize, thus claiming the toleration extended by the Koran (Sur. 5.73; 22; 17; 2, 59) to those of that name.

Mancini—Mandaeans
Mandaean

Religion compounded of Christian, heathen, and Jewish elements on a type which is essentially that of ancient Gnosticism.

The Mandaeans are found in the marshy lands of South Babylonia (al-baṭašīh), particularly in the neighbourhood of Basra (or Bussorah), and in Khūrīstān (Disful, Shuster). They speak the languages of the localities in which they are settled (Arabic or Persian), but the language of their sacred books is an Aramaic dialect, which has its closest affinities with that of the Babylonian Talmud, written in a peculiar character suggestive of the old Palmyrene. The knowledge of the Mandaeans has been known since a period of the 17th century, when the first Christian missionaries, Ignatius a Jesu 4 and Angelus a Sancto, began to labour among them at Basra; further information was gathered at a somewhat later date by Pietro della Valle 5 and Jean de Thévenot 6 (1633-1657), and in the following century by Engelbrecht Kaempfer (1651-1716), Jean Chardin (1643-1713) and Carsten Niebuhr. In recent times they have been visited by A. H. Petermann 7 and Albrecht Socin, and Siouffi 8 published in 1880 a full and accurate account of their manners and customs, taken from the lips of a converted Mandaean. For our knowledge of the Mandaean system, however, we still depend chiefly upon the sacred books already mentioned, consisting of fragments of very various antiquity derived from an older literature.

Of these the largest and most important is the Sidrā rabbā ("Great Book"), known also as Gime 2 ("Treasure"), consisting of two unequal parts, of which the larger is called yámīnā (to the right hand) and the smaller sīmāla (to the left hand), because of the manner in which they are bound together. The former is intended for the living; the latter consists chiefly of prayers to be read at the burial of priests. As regards doctrine, the work is exhaustive; but it is diffuse, obscure, and occasionally self-contradictory, as might be expected in a work which consists of a number of unconnected paragraphs of various authorship and date. The last section of the "right-hand" part (the "Book of Kings") is one of the older portions, and from its allusion to "the Persian and Arabian kings" may be dated somewhere between a.d. 700 and 900. Many of the doctrinal portions may in substance well be still older, and date from the time of the Sassanids. None of the MSS., however, is older than the 10th century.

The following sketch represents, as far as can be gathered from these heterogeneous sources, the principal features of the Mandaean system. The ground and origin of all things is Pērā, or more correctly Pērā rabbā ("the great abyss," or from τὰς, "to split," cf. the Gnostic šibōs, or more probably cf. Heb. pērā, "the great fruit"), associated with whom, and forming a triad with him, are the primal aeons Ayār šīnā rabbā ("the great shining aether," and Māndā rabbā d'ēbārā, "the great spirit of glory," usually called simply Māndā rabbā). The last-named, the most prominent of the three, is the king of light properly so called, from whom the development of all things begins. From him emanates Yārdūnā rabbā, "the great Jordan," which, as the highest-world soul, permeates the whole aether, the domain of Ayār. Alongside of Māndā rabbā frequent mention is made of D'māthē, his "image," as a female power; the name "image of the father" arises out of the same conception as that which gives rise to the name of īwōna among the Greek Gnostics. Māndā rabbā called into being the highest of the aeons properly so called, Hāyyē Kāḏāmṣēy, "Primal Life," and then withdrew into deepest secrecy, visible indeed to the highest but not to the lowest aeons (cf. Zoābā and Iṣpefērēfē), yet manifesting himself also to the souls of the more pious of the Mandaeans after their separation from the body. Primal Life, who is properly speaking the Mandaean god, has the same predicates as the primal spirit, and every prayer, as well as every section of the sacred books, begins by invoking him. The extremely fantastic delineation of the world of light by which Hāyyē Kāḏāmṣēy is surrounded (see for example the beginning of Sidrā rabbā) corresponds very closely with the Manichaean description of the abode of the "king of the paradise of light." The king of light "sits in the far north in might and glory." The Primal Light unfolds himself by five great branches, viz. the highest purest light, the gentle wind, the harmony of souls (or υμπαράσκευαν), the three forms, "all these being treated as abstractions and personified. Out of the further development and combination of these primary manifestations arise numerous aeons (Uḥṭār, "splendours," from ṣāḥ, "is rich"), of which the number is often stated to be three hundred and sixty. They are divided into a number of classes (kings, hypostases, forms, &c.); the proper names by which they are invoked are many, and for the most part obscure, borrowed, to some extent, from the Parsee angelology. From the First Life proceeds a principal emanation the "Second Life," Hāyyē Tishāyē, generally called Yāṣhām. This last name is evidently meant to be Hebrew, "Yahweh of the heavens," the God of the Jews being of a secondary rank in the usual Gnostic style. The next emanation after Yāṣhām is "the messenger of life" (Maḏa d'hayey, literally γάους τής ζωής), the most important figure in the entire system, the mediator and redeemer, the Adonai and the Christ of the Mandaeans, from whom, as already stated, they take their name. He belongs to the heathen Gnosis, and is in his essence the same as the Babylonian Manduk. Yāṣhām desired to raise himself above the Primal Light, but failed in the attempt, and was punished by removal out of the pure aetherial world into that of inferior light. Mandā, on the other hand, continues with the First Life and Māndā rabbā, and is called his "beloved son," the "first born," "high priest" and "sword of life." The "Life" calls into existence in the visible world a series of three great Helpers, Hībīl, Shīthīl and Anūsh (late Judeo-Babylonian transformations of the well-known names of the book of Genesis), the guardians of souls. The last son of the Second Life is Hāyyē Mālah, the "Third Life," usually called father of the Ulthār (Abā d' Uḥṭār, Abābār). His usual epithet is "the Ancient" (ʾāṯāq), and he is also called "the deeply hidden and guarded." He stands on the borderland between the here and the hereafter, translation of about a quarter of this work has been published in W. Brandt's Mandäische Schriften, with notes (Göttingen, 1893). A critical edition still remains a desideratum. Next in importance to the Sidrā rabbā is the Sidrā d'yekyā, or "Book of John," otherwise known as the "Discourses of the Kings," which has not as yet been printed as a whole, although portions have been published by Lorschbach and Tychsen (see Museum, ii. u. orient. Lit., (1897), and Staudlin's Beitr. z. Phil. u. Gesch. d. Rel., Stuttgart, 1886-1896). The Kolostāt (Ar. Khulāṣa, "Quintessence"), or according to its fuller title "Enyānā 'urāšā dajbābā ummāṣeṣētāh (Songs and Discourses of Baptism and the Ascent," viz. of the soul after death, according to the rite described by the Mandaeans). It is also known as Sidrā d'nesmēhā, "Book of Souls," and besides hymns and doctrinal discourses contains prayers to be offered by the priests at sacrifice and at meals, as well as other liturgical matter. The Persian name is given to the book as a whole in contrast to the Greek name, it is also known as the independent MS. The Dvōhe, hitherto unpublished, contains the ritual for atonement. The Aṣfur malatadāšē, or "Book of the Zodiac," contains astrological matters. Of smaller pieces many are magic and used as amulets.

The use of the word "life" in a personal sense is usual in Gnosti-icism: compare the Zew of Valentia and el-bayyāl el-mualama, "the dark life," of Mani in the Fibris.
like the mysterious ἔφεστός τοῖς σέλενεσ τετηρίου or sēnes tertius of Mani, whose becoming visible will betoken the end of the world. Abāthūr sits on the farthest verge of the world of light that lies towards the lower regions, and weighs in his balance the deeds of the departed spirits who ascend to him. Beneath him was originally nothing but a huge void with muddy black water at the bottom, in which his image was reflected, becoming ultimately solidified into P'tāhil, his son, who now partakes of the nature of matter. The demigurfs of the Mandaeans, and corresponding to the Ialdaboth of the Ophites, he at the instance of his father frames the earth and men—according to some passages in conjunction with the seven bad planetary spirits. He created Adam and Eve, but was unable to make them stand upright, whereupon Hibil, Shithil and Anōsh were sent by the First Life to infuse into their forms spirit from Mānā rabbā himself. Hibil, at the instance of the supreme God, also taught men about the world of light and the aeons, and especially gave them to know that not P'tāhil but another was their creator and supreme God, who as the “great king of light, without number, without limit,” stands far above him. At the same time he enjoined the poor to marry and people the world. P'tāhil had now lost his power over men, and was driven by his father out of the world of light into a place beneath it, whence he shall at the day of judgment be raised, and after receiving baptism be made king of the 'Uthrē with divine honours.

The underworld is made up of four vestibules and three hells properly so called. The vestibules have each two rulers, Zartay and Zartanay, Hag and Mag, Gaf and Gafan, Anatam and Kin. In the highest hell rules alone the grisly king Sh'ālm, the ‘warrior’; in the storey immediately beneath is Giv, the “great”; and in the lowest is Krūn or Karkūm, the oldest and most powerful of all, commonly called “the great mountain of flesh” (Ṭā'ā rabbā d'besrā), but also “the first-born of darkness.” In the vestibules dirty water is still to be met with, but the hells are full of scorching consuming fire, except Krūn’s domain, where is nought but dust, ashes and vacancy. Into these regions descended Hibil the brilliant, in the power of Mānā rabbā, just as in the Manichaean mythology the “primal man,” armed with the elements of the king of light, descends to a contest with the primal devil. Hibil lingers, gradually unfolding his power, in each of the vestibules, and finally passing from hell to hell reaches Karkūm. Hibil allows himself to be half swallowed by the monster, but is unhurt, and compels his antagonist to recognize the superiority of Mānā rabbā, the God of light, and to divulge his profoundest secret, the hidden name of darkness. Armed with this he returns through the successive hells, compelling the disclosure of every secret, depriving the rulers of their power, and barring the doors of the several regions. From the fourth vestibule he brought the female devil Rūhā, daughter of Kin, and set her over the whole four. This Rūhā, the mother of falsehood and lies, of poisoning and fornication is an anti-Christian parody of the Rūhā d’Qudshā (Holy Spirit) of the Syriac Church. She is the mother of Ur, the personified fire of hell, who in anger and pride made a violent onset on the world of light (compare the similar occurrence in the Manichaean mythology), but was mastered by Hibil and thrown in chains down to the “black water,” and imprisoned within seven iron and seven golden walls. By Ur, Rūhā, while P'tāhil was engaged in his work of creation, became mother of three sets of seven, twelve and five sons respectively; all were translated by P'tāhil to the heavenly firmament (like the Archons of Mani), the first group forming the planets and the next the signs of the zodiac, while the third is as yet undetermined. Of the names of the planets Estera (Ishtar Venus), also called Rūhā d’Qudshā, “holiest spirit”), Enha (Nebo, Mercury), Sin (moon), Kēwān (Saturn), Bil (Jupiter), and Nirīg (Nirgil, Mars) reveal their Babylonian origin; II or II, the sun, is also known as Kādūṣ and Adānay (the Adonai of the Old Testament); as lord of the planetary spirits his place is in the midst of them, as source of all temptation and evil amongst men. The houses of the first as well as the earth and a second world immediately to the north of it, rest upon anvils laid by Hibil on the belly of Ur.

In the Mandæan representation the sky is an ocean of water, pure and clear, but of more than adamantine solidity, upon which the stars and planets sail. Its transparency allows us to see even to the pole star, who is the central sun around whom all the heavenly bodies move. Wearing a jewelled crown, he stands before Abāthūr’s door at the gate of the world of light; the Mandæans accordingly invariably pray with their faces turned northward. The earth is conceived of as a round disk, slightly sloping towards the south, surrounded on three sides by the sea, but on the north by a high mountain of turquoises; behind this is the abode of the Mandæans, paradise, inhabited by the Egyptians who were saved from drowning with Pharaoh in the Red Sea, and whom the Mandæans look upon as their ancestors, Pharaoh himself having been their first high priest and king. The total duration of the earth they fix at four hundred and eighty thousand years, divided into seven epochs, in each of which one of the planets rules. The Sīdār Rabbā knows of three total destructions of the human race by fire and water, pestilence and sword, a single pair alone surviving in each case. In the Mandæan view the Old Testament saints are false prophets; such as Abraham, who arose six thousand years after Nā (Noah) during the reign of the sun, Mishā (Moses), in whose time the true religion was professed by the Egyptians, and Shīmūn (Solomon) bar Davith, the lord of the demons. Another false prophet and magician was Yishu M’Sīhhā, who was in fact a manifestation of the planet Mercury. Forty-two years before his day, under King Pontius Pilate, there had appeared the true prophet Yahyyā or John son of Zechariah, an incarnation of Hibil, of whose birth and childhood fantastic stories are told. Yahyyā by a mistake gave baptism to the false Messiah, who had enfeigned humility; on the completion of his mission, after undergoing a seeming execution, he returned clothed with light into the kingdom of light. As a contemporary of Yahyyā and the false Messiah Hibil’s younger brother Anōsh ‘Uthrē came down from heaven, caused himself to be baptized by Yahyyā, wrought miracles of healing and of raising the dead, and brought about the crucifixion of the false Messiah. He preached the true religion, destroyed Jerusalem (“Urashilam,” i.e. “the devil finished it”), which had been built by Adānay, dispersed over the world the Jews who had put Yahyyā to death, and previous to his return into the worlds of light sent forth three hundred and sixty prophets for the diffusion of the true religion. All this speaks of intense hatred alike of Jews and Christians; the fasts, celibacy and monastic and anchorite life of the latter are peculiarly objectionable to the Mandæans. Two hundred and forty years after the appearing of the false Messiah there came to the world sixty thousand saints out of Pharaoh’s world to take the place of the Mandæans, who had been completely extirpated; their high priest had his residence in Damascus. The last false priest was M'hánnad and Ahtmaz the father of Mahomet (Mahomet), but Anōsh, who remained close beside him and his immediate successors, prevented hostilities against the true believers, who claim to have had in Babylonia, under the Abbasids, four hundred places of worship. Subsequent persecutions compelled their withdrawal to ‘Ammārā in the neighbourhood of Wāsit, and ultimately to Khūzistān. At the end of the world the devil Ur will swallow up the earth and the other intermediate higher worlds, and thereupon will burst and fall into the abyss of darkness which, along with all the worlds and powers of darkness, he will ultimately cease to be, so that thenceforward the universe will consist of but one everlasting world of light.

The chief depositaries of these Mandæan mysteries are the priests, who enjoy a high degree of power and social regard. The priesthood has three grades: (1) the Sh’āndū or deacon is generally a widow’s son, a very poor family spirit, or young man driven by poverty to an employer; (2) the Ītārī (i.e. P’tāhil) to be invested is baptized by a bishop and two priests or by four priests after a long and extremely painful period of preparation. (3) The Genēstār (“treasurer”) or bishop, the highest dignitary of the whole body or the Tumrīdū after a variety of tests, and
possesses unlimited authority over the clergy. A supreme priestly
cert, that of Rish 'amman, or "head of the people," is recog-
nized, but only in theory; since the time of Pharaoh this sovereign
pontificate has only once been filled. When are and
privileges are held in the interests of the Sect. The sheikh, or
dress which is all white, consists of a tunic, an upper garment, and a girdle with the so-called
iyya ("crown"); in all ceremonies the celebrants must be barefoot.
By the Mandaean ceremony of bath, the less important part of the liturgy is
is that of baptism (masbahā), which is called for in a great variety of
cases, not only for children but also for adults, where consecration or
purification is required, as for example on all Sundays and feast
days. A considerable number of ceremonies are conducted after neglect of any formality on the part of a priest in the discharge of
his functions. In all these cases baptism is performed by total immersion,
and is often accompanied by sprinkling with water. For the climax of the festival the rite is observed wholesale by mere sprinkling of large
masses of the faithful at once. The Mandaean observe also with
the elements of bread (pehād) and wine (masbahā, lit. "fountain")
a successful outcome of which is a special application of holy water
usually dispensed at festivals, but only to baptized persons of good
repute who have never willingly denied the Mandaean faith. In
receiving it the communicant must not touch the host with his
finger; otherwise it loses its virtue. The hosts are made by the
priests from unleavened fine flour. The Mandaean places of worship,
being designed only for the priests and their assistants (the
members of the congregation, Mesoreci, and even some of the
lay faithful of the sect, are not allowed to enter the sacred buildings,
neighbourhood of running water (for baptisms) is essential. At the
collection of a church the sacrifice of a dove (the bird of Ishtar)
has been reserved for the priest, and the chief and the Mandaean
great feasts: (1) that of the New Year (Naurūz rabba), on the last day of
the first month of winter; (2) Dehūd b'i-nnā, the anniversary of
the happy return of Hībīl Zīvā from the kingdom of darkness into
that of light, lasting five days, beginning with the 18th of the first
month of spring; (3) the Marāwān, in commemoration of the drowned
Egyptians, on the first day of the second month of spring; (4) the
great five days' baptismal festival (pandhē), the chief feast, kept on
the first day of the new moon. In the course of the ceremony—during its
continuance every Mandaean, male and female,
must dress in white and bathe thrice daily; (5) Dehūd d'amūnān,
in remembrance of the departure of the Mandaean from the
second day of the second month of autumn; (6) Khaneke Zākha, the prepara-
tion feast, held on the last day of the year. There are also fast days
called m'battāl (Arab.), on which it is forbidden to kill any living thing
or eat flesh. These, however, are really "rest-days," as fasting is forbidden in Mandaism. The year is solar, and has
three months of thirty days each, with intercalary days between
the eighth and the ninth month. Of the seven days of the week, next to Sunday (hahshaba) Thursday has a special sacredness as the
day of Hībīl Zīvā. As regards secular occupation, the present
Mandaeans are goldsmiths, ironworkers, and house and ship carpen-
ters. Shams is the chief of the Mandaeans and the duty of
him is marriage. In the 17th century, according to the older
travellers, they numbered about 20,000 families, but the present
data nearly number more than 300,000. In contrast to the
Mandaeans distinguished from the Moslem only by a brown coat and a parti-coloured headcloth with a cord twisted round it.
They have some peculiar deathbed rites: a dove with some atten-
dance of the priest approaches a bath first of warm and afterwards of cold water; a holy dress,
consisting of seven pieces (nastā), is then put on; the feet are directed
towards the north and the head turned to the south, so that the body faces
the sun. After the burial a funeral feast is held in the
house of mourning. The Mandaean are strictly reticent about their theological dogmas in
the presence of strangers; and knowledge of the
possess of these is extremely small. The foundation of the system
is obviously to be sought in Gnosticism, and more particularly
in the older type of that doctrine (known from the serpent-symbal as
Ophites, with which obtain the Ophites of the
Asia generally. But it is equally plain that the Ophite nucleus has from
time to time received very numerous and often curiously per-
cipient interpretations, which have given rise to the various
Oriental races, both the Chaldaean and the Syrian, and ultimately to
the Syrian, and ultimately to
the use by the Mandaeans of the Babylonian and
the Ophite genus itself it is not difficult to recognize the general
features of the religions of ancient Babylonia, and thus we are
brought back to an earlier period. The sect is a remnant of the
origin of Gnosticism in general. It is certain that Babylonia, the seat of the present
Mandaeans, must be regarded also as the cradle in which their
system was created. It is impossible to think of them as coming from Palestine, or to attribute to their dogma a Jewish
origin. They do not spring historically from the disciples of John the
Baptist (Acts xvii. 25; xix. 3 sqq.; Recov. Chum. i. 54), the tradi-
tion that the Mandaean doctrine was spread by John the
Baptist is interesting in itself, and is therefore worthless; at the same time it is true that their
baptismal practice and its interpretation place them in the
same class with the Hermeneutics of Euzebius (H. E. iv. 22
and Epiphanius (Hær. xvii.), or with the sect of disciples of John
who remained apart from Christianity. Their reverence for John is
not of a piece with their whole syncretizing attitude towards the New
Testament, and indeed, as has been seen, they appropriate the entire
domestic of the Bible. Their history, however, is probably so short
as to Jesus and John, a phenomenon which bears witness to the close
relations of the Mandaean doctrine both with Judaism and Christian-
ity. A great number of sects, which are less important, or of
religion, is entirely the subject of the study of the
mandaeans, the older gnostic from the old and elaborate Babylonian
Chaldaean religion is clearly seen also in the fact that the names of the
old pantheon (as for example those of the planetary deities)
are retained, but their hold has degraded to the position of demons—a
conclusion confirmed by the fact that the Mandaean, like the
allied Ophites, Peratae and Manichaee, certainly have their
original belief in Babylonian and Mesopotamian forms. But
the trinity of Anu, Bel, and Ea in the old Babylonian religion has its
counterpart in the Mandaean Šērā, Širā, and Mānī ra. The
Dūnēs of Mānā is the Damkin, the wife of Ea, mentioned by
them. The Mandaean, as shown by Shams, is a sect of
Hībīl Zīvā with his incarnations clearly correspond to the
old Babylonian Marduk, Merodach, the "first-born" son of Ea, with his
title of god of the sea, the chief god of the Babylonians, in
the water, the god of marriage and childbearing, and the mediator and temperer in the old religion. Hībīl's contest with darkness has its
attribution in Marduk's battle with chaos, the dragon Tiamat,
which (another striking parallel) partially swallows Marduk, just
as it is related of Hībīl and the Manichean primordial man.
Other features are borrowed by the Mandaeans of the mythology
under this head from the well-known epos of Istar's descensus ad inferos. The
sanctity with which water is invested by the Mandaeans is to be explained by
the fact that Ea has his seat in the depths of the world

Abhandl. der Orientalen-kongressen zu Berlin (Berlin, 1882); also W. Brandt's
Mandäische Religion (Leipzig, 1886), and M. N. Bittman's Études sur le
religion des Soudav (Paris, 1880).
(K. K.; G. W. T.)

MANDALAY, formerly the capital of independent Burma, now the
headquarters of the Mandalay division and district, as well as the
chief town in Upper Burma, stands on the left bank of the Irrawaddy, in 21° 59' N. and 96° 8' E. Its height above mean
elevated above sea level was 110 feet. By the British, it is called
King Mindon. It is now divided into the municipal area and the
cantonment. The town covers an area of 6 m. from north
to south and 3 from east to west, and has well-metalled
roads lined with avenues of trees and regularly lighted and
covered. The cantonment consists of the area inside the
old city walls, and is now called Fort Dufferin. In the centre stands
the palace, a group of wooden buildings, many of them
carved and gilt, resting on a brick platform 900 ft. by 500 ft., and
6 ft. high. The greater part of it is now utilized for military
and other offices. The garrison consists of a brigade belonging
to the Burma command of the Indian army. There are many
pagodas and monastic buildings in the town. The population
in 1901 was 183,816, showing a decrease of 3% in the decade.
The population is very mixed. Besides Burmese there are
Zerbabis (the offspring of a Mahomedan with a Burman
wife), Mahomedans, Hindus, Jews, Chinese, Shans and Manipurs
(called Kathse), Kachins and Palaungns. Trains run from Mandalay
to Rangoon, Myitkyina, and up the Mandalay—Kunlong run
to the steamers of the Irrawaddy Flotilla Company also ply in
Lower Burma. The town of Mandalay also stands on
the banks of the Zeygong, was burnt in 1897, and again in 1906, but rebuilt.

The Mandalay District has an area of 2117 sq. m. and a popula-
tion (1901) of 346,457, giving a density of 177 inhabitants to the
square mile. About 600 sq. m. along the Irrawaddy river are
flat land, nearly all cultivated. In the north and east there are
some 1500 sq. m. of high hills and table-lands, forming geogra-
phically a portion of the Shan table-land. Here the fall to the
plains averages 3000 to 4000 ft. in a distance of 10 m. This
part of the district is well wooded and watered. The Maymyo

Mandalay
subdivision has very fine plateaus of 3000 to 3600 ft. in height. The highest peaks are between 4000 and 5000 ft. above sea-level. The Irrawaddy, the Myitn-nge and the Madaya are the chief rivers. The last two come from the Shan States, and are navigable for between 20 and 30 m. There are many canals, most of which have fallen greatly into disrepair, and the Aungbinl, Nanda and Shwepli lakes also supply water for cultivation. A systematic irrigation scheme has been undertaken by the government. The Sagain hills near Madaya are noted for their alabaster; rubies are also found in small quantities. There are 335 sq. m. of forest reserves in the district, but this is little utilized. The climate is dry and healthy. During May and June and till August strong winds prevail. The thermometer rises to about 107° in the shade in the hot weather, and the minimum in the month of December is about 56°. The rainfall is light, the average being under 30 in.

The Division includes the districts of Mandalay, Bhamo, Myitkina, Katha and Ruby Mines, with a total area of 39,373 sq. m., and a population (1901) of 777,338, giving an average density of 30 inhabitants to the square mile. (J. G. Sc.)

Mandamus, a writ issuing from the High Court of Justice (named from the first word in the Latin form of the writ) containing a command in the name of the king, directed to inferior courts, corporations, or individuals, ordering them to do a specific act within the duty of their office, or which they are bound by statute to do, and performance whereof the applicant for the writ has a specific legal right to enforce. Direct orders from the sovereign to subjects commanding the performance of particular acts were common in early times, and to this class of orders mandamus originally belongs. It became customary during the reign of King's Bench, in cases where a legal duty was established but no sufficient means existed for enforcing it, to order performance by this writ. Under the Judicature Acts and the Crown Office Rules, 1906 (r. 49), the powers of the court of King's bench as to the grant of the prerogative writ of mandamus are exercisable only in the King's bench division of the High Court.

The writ when of right is not of course: i.e. the applicant cannot have it merely for the asking, but must satisfy the High Court that circumstances exist calling for it. The procedure regulating the grant and enforcement of the writ is determined by the Crown Office Rules, 1906 (rr. 49-68, 125).

Mandamus has always been regarded as an exceptional remedy, to supplement the deficiencies of the common law, or defects of justice. Where another legal or equitable remedy exists, equally appropriate, convenient, speedy, beneficial and effectual, the writ will not be granted. It is only when no such remedy by indictment is available: is but is not unless the existence of the duty and refusal to perform it are clearly established, nor would the performance in fact have become impossible. The writ is used to compel inferior courts to hear and determine according to law cases within their jurisdiction, e.g. where a county court of justices in petty or quarter sessions refuse to assume a jurisdiction which they possess to deal with a matter brought before them. It has in recent years been employed to compel municipal bodies to discharge their duties as to providing proper sewerage for their districts and to compel anti-vaccinationist guardians of the poor to appoint officers for the execution of the Vaccination Act. It is also employed to compel the promoters of railway and similar undertakings to discharge duties imposed upon them towards the public, e.g., the payment of interest due on railway stocks, &c. affected by their railways or other undertakings. The courts do not prescribe the specific manner in which the duty is to be discharged, but do not stay their hands until substantial compliance is established. Besides the prerogative common-law writ there are a number of orders, made by the High Court under statutory authority, and described by the modern lawyers as Mandamus. Thus, under the Companies Act, 1867, proceeding to the election of a corporate officer of a municipal corporation (Municipal Corporations Act 1882, s. 235); orders in the nature of mandamus to justices to hear and determine a matter within their jurisdiction, on which a case has previously been instituted to special cases.

At common law mandamus lies only for the performance of acts of the public officer. The enforcement of merely private obligations, such as those arising out of contracts, is not within its scope. By s. 68 of the Common Law Procedure Act 1854, the plaintiff in any action other than replevin and ejectment was empowered to claim a writ of mandamus to compel the defendant to fulfill any duty in the fulfilment of which the plaintiff was personally interested. By s. 25 (8) of the Judicature Act 1873 a mandamus may be granted by an interlocutory order of the High Court in all cases in which it shows that the omission on the part of the public officer in question should be made. This enactment does not deal with the prerogative mandamus but empowers the king's bench and the chancery divisions to grant an interlocutory mandamus in any pending cause or matter by way of order in the other than the final judgment and even by an order made after the judgment. S. 68 of the act of 1854 has been repealed and replaced by Order LII. of the Rules of the Supreme Court. The remedy thus created is an attempt to engraft upon the old common law remedy the damages to the plaintiff which are the indirect result of the duty in question. It is not limited to cases in which the prerogative writ would be granted; but mandamus is not granted when the remedy which can be obtained by some remedy equally convenient, beneficial and effectual, or a particular and different remedy is provided by statute. An action for mandamus does not lie against judicial officers as justices. The mandamus issued in the action is no longer a writ of mandamus, but a judgment or order having effect equivalent to the writ formerly used.

Mandate Injunction.—The High Court has a jurisdiction derived from the court of chancery to grant injunctions at the suit of the attorney-general or of private persons. Ordinarily such injunctions are in the form of prohibition or restraint and not of command. But occasionally mandatory injunctions are granted in the form of a mandamus.

Specific Performance.—The jurisdiction of the High Court, derived from the court of chancery, to decree specific performance of contracts has some resemblance to mandamus in the domains of public or quasi-public law.

Ireland.—The law of Ireland as to mandamus is derived from that of England, and differs therefrom only in minor details.

In British possessions, the prerogative power to issue the prerogative writ is usually vested in the Supreme Court by its charter or by local legislation.

United States.—The writ has passed into the law of the United States. There is, in the federal judiciary an employment of the mandamus not as the old prerogative writ in the king's bench practice, but as a mode of exercising appellate jurisdiction, also as a proceeding ancillary to a judgment previously rendered, in exercise of original jurisdiction, as when a circuit court having rendered a judgment against a county issues a mandamus requiring its officers to levy a tax to provide for the payment of the judgment. In the United States, states mandamus is used under varying regulations, mandate being in some cases substituted as the name of the proceeding.

MANDAN, a tribe of North American Indians of Siouan stock. When first met they were living on the Missouri at the mouth of the Heart river. At the beginning of the 19th century they were driven up the Missouri by the Sioux. In 1843 they joined the Ojibway and the Arapahos, and settled in their present position at Fort Berthold reservation, North Dakota. The Mandans have always been agricultural; they are noted for their ceremonies, and from the tattooing on face and breast were described in the sign language as "the tattooed people."

Mandarin, the common name for all public officials in China, the Chinese name for whom is kwan or kwain. The word comes through the Portuguese from Malay mantri, a counselor or minister of state. The ultimate origin of this word is the Sanskrit root man or man, "mind," &c. The term "mandarin" is not, in its western usage, applied indiscriminately to all civil and military officials, but only to those who are entitled to wear a "button," which is a spherical knob, about an inch in diameter, affixed to the top of the official cap or hat. These officials, civil and military alike, are divided into nine grades or classes, each grade being distinguished by a button of a particular colour. The grade to which an official belongs is not necessarily related to the office he holds. The button which distinguishes the first grade is a transparent red stone; the second grade, a red coral button; the third, a sapphire; the fourth, a blue opaque stone; the fifth, a crystal button; the sixth, an opaque white shell button; the seventh, a plain gold button; the eighth, a worked gold button; and the ninth, a worked silver button. The mandarins also wear certain insignia embroidered on their official robes, and have girdle clasps of different material. The first grade have, for civilians an embroidered Manchurian crane on the breast and back, for the military an embroidered unicorn with a girdle clasp of jade set in rubies. The second grade, for civilians an embroidered golden pheasant, for the military a lion with a girdle.
clasp of gold set in rubies. The third grade, for civilians a peacock, for the military a leopard with a clasp of worked gold. The fourth grade, for civilians a wild goose, for the military a tiger, and a clasp of worked gold with a silver button. The fifth grade, for civilians a silver pheasant, for the military a bear and a clasp of plain gold with a silver button. The sixth grade, for civilians an egret, for the military a tiger-cat with a mother-of-pearl clasp. The seventh grade, for civilians a mandarin clasp, for the military a mottled bear with a silver clasp. The eighth grade, for civilians a quail, for the military a seal with a clear horn clasp. The ninth grade, for civilians a long-tailed jay, for the military a rhinoceros with a buffalo-horn clasp.

The "mandarin language" is the Chinese, which is spoken in official and legal circles; it is also spoken over a considerable portion of the country, particularly the northern and central parts, though not perhaps with the same purity. Mandarin duck (anas galerulata) and Mandarin orange (citrus nobilis) possibly derive their names, by analogy, from the sense of superioriity implied in the title "mandarin." See Society in China, by Sir R. K. Douglas; L'Empire du milieu, by E. and O. Reclus.

MANDASOR, or MANDAUV, a town of Central India, in the native state of Gwalior, on the Rajputana railway, 31 m. S. of Neemuch. Pop. (1901), 20,936. It gave its name to the treaty with Holkar, which concluded the Mahtratta-Findari War in 1818. It is a centre of the tin and opium trade, and its neighbourhood is full of archaeological interest. An inscription discovered near the town indicated the erection of a temple of the sun in 437, and at Sondari are two great monolith pillars recording a victory of Yasodharma, king of Malwa, in 528. The fort dates from the 14th and 15th centuries. Hindu and Jain remains are numerous, though the town is now entirely Mahomedan.

Mandate (Mandatum), a contract in Roman law constituted by one person (the mandatarius) promising to do something gratuitously at the request of another (the mandator), who undertakes to indemnify him against loss. The jurist distinguished the different cases of mandate according as the object of the contract was the benefit of the mandator or a third person singly, or the mandator and a third person, the mandator and the mandatarius, or the mandatarius and a third person together. When the benefit was that of the mandatarius alone, the obligations of the contract were held not to arise, although the form of the contract might exist, the commission being held to be merely advice tendered to the mandatarius, and acted on by his own risk. Mandatum was classified as one of the contracts established by consent of the parties alone, but, as there was really no obligation of any kind until the mandatarius had acted on the mandate, it has with more propriety been referred to the contracts created by the supply of some fact (re). The obligations of the mandates under the contract were, briefly, to do what he had promised according to his instructions, observing ordinary diligence in taking care of any property entrusted to him, and handing over to his principal the results of his action, including the right to sue in his name. On the other hand, the mandator was bound to recoup his expenses and indemnify him against loss through obligations he might have incurred.

The essentials and the terminology of the contract are preserved in most modern systems of law. But in English law mandate, unlike a bailment, can hardly be said to exist as a separate form of contract. To some extent the law of mandate corresponds partly to the law of principal and agent, partly to that of principal and surety. "Mandate" is retained to signify the contract more generally, and "mandatarius" is restricted to persons of property, and it implies the delivery of something to the bailee, both of which conditions are unknown in the mandate of the civil law (see BAILMENT).

MANDUE, a town of the province of Cebu, island of Cebu, Philippine Islands, on the E. coast and E. coast road, about 4 m. N.E. of the town of Cebu, the capital. Pop. (1903), 11,078; in the same year the town of Consolacion (pop. 5511) was merged with Mandue. Its climate is very hot, but healthy. The principal industries are the raising of Indian corn and sugar-cane and the manufacture of salt from sea-water. Cebú-Visayan is the language.

Mandelic acid (Phenylglycollic acid), C₇H₇O₃, or C₇H₇(OH)-COOH, an isomer of the cresotic and the oxyoxymethylbenzoic acids. Since the molecule contains an asymmetric carbon atom, the acid exists in three forms, one inactive "racemic" mixture, and the other two being optically active forms. The inactive variety is known as paramandelic acid. It may be prepared by the action of hydrochloric acid on the addition compound of benzaldehyde and hydrocyanic acid:

CH₃CHO+HCl+HCl+2H₂O = C₇H₇-OH-COOH+NH₄Cl (F. L. Winckler, Ann., 1836, 18, 310), by boiling phenylchloroacetic acid with alkalis (A. Spiegel, Ber., 1881, 14, 239), by heating benzyolformaldehyde with alkalis (H. v. Peichmann, Ber., 1887, 20, 2005), and by the action of dilute alkalis on α-dibromacetophenone (C. Engler, Ber., 1887, 20, 2202):

C₇H₇CHO+HBr+H₂O = C₇H₇-CHOH-CO-K

It crystallizes from water in large rhombic crystals, which melt at 118° C. Oxidizing agents convert it into benzaldehyde. When heated with hydrolytic acid and phosphorus it forms phenylactic acid; whilst concentrated hydrobromic acid and hydrochloric acid at moderate temperatures convert it into phenylbrom- and phenylchloro-acetic acids. The inactive mixture may be resolved into its active components by fractional crystallization of the dibromo salt, when the salt of the former modification separates first; or the ammonium salt may be fermented by Penicillium glaucum, when the "laevor" form is destroyed and the dextro form remains untouched; on the other hand, Saccharomyces ellipsoideus destroys the dextro form, but does not touch the "laevor" form. A mixture of the two forms in equivalent quantities produces the inactive variety, which is also obtained when either form is heated for some hours to 106° C.

MANER, CAROL VAN (1548-1606), Dutch painter, poet and biographer, was born of a noble family at Meulebeke. He studied under Lucas de Heere at Ghent, and in 1568-1596 under Pieter Vlerick at Kortrijk. The next five years he devoted to the writing of religious plays for which he also painted the scenery. Then followed three years in Rome (1574-1577), where he is said to have been the first to discover the catacombs. On his return journey he passed through Vienna, where, together with the sculptor Hans Mont, he made the triumphal arch for the entry of the emperor Rudolph. After many vicissitudes caused by war, loss of fortune and plague, he settled at Haarlem where, in connection with the old archbishopric of Utrecht, he became a most active and useful academy of painting. His fame is, however, principally based upon a voluminous biographical work on the paintings of various epochs—a book that has become for the northern countries what Vasari's Lives of the Painters became for Italy. It was completed in 1603 and published in 1604, in which year Van Mander removed to Amsterdam, where he died in 1606.

MANDEVILLE, BERNARD DE (1670-1733), English philosopher and satirist, was born at Dordrecht, where his father practised as a physician. On leaving the Emmen School at Rotterdam he gave proof of his ability by an Oraatio scholastica de medicina (1685), and at Leiden University in 1689 he maintained a thesis De brutorum operationibus, in which he advocated the Cartesian theory of automatism among animals. In 1691 he took his medical degree, pronouncing an "inaugural disputation," De chylosi vitia. Afterwards he came to England "to learn the language," and succeeded so remarkably that many refused to believe he was a foreigner. As a physician he seems to have done little, and lived poorly on a pension given him by some Dutch merchants and money which he earned from distillers for advocating the use of spirits. His conversational abilities won him the friendship of Lord Macclesfield (chief justice 1710-1718) who introduced him to Addison, described by Mandeville as "a parson in a tye-wig." He died in January (19th or 21st) 1733/4 at Hackney.
MANDEVILLE, GEOFFREY DE—MANDEVILLE, SIR JOHN

The work by which he is known is The Fable of the Bees, published first in 1705 under the title of The Grumbling Hive, or Knaves Turn’d Honest (two hundred doggerel couples). In 1714 it was republished anonymously with Remarks and An Enquiry into the Origin of Moral Virtue. In 1723 a later edition appeared, including An Essay on Charity and Charity Schools, and a Search into the Nature of Society. This was a work primarily written as a political commentary on the state of England in 1715, when the Tories were accusing Marlborough and the ministry of advocating the French War for personal reasons. The edition of 1723 was presented as a nuisance by the Grand Jury of Middlesex, was denounced in the London Journal by "Theophilus Philo-Britannus," and attacked by many writers, notably by Archibald Campbell (1691-1756) in his Areteologia (published as his own by Alexander Innes in 1728; afterwards by Campbell, under his own name, in 1733, as Enquiry into the Original of Moral Virtue). The Fable was reprinted in 1729, a ninth edition appeared in 1755, and it has often been reprinted in more recent times. Berkeley attacked it in the second dialogue of the Alciphron (1732) and John Brown criticized him in his Essay upon Shaftesbury's Characteristics (1751).

Mandeville's philosophy gave great offence at the time, and has always been stigmatized as false, cynical and degrading. His main thesis is that the actions of men cannot be divided into lower and higher. The higher life of man is merely a fiction introduced by philosophers and rulers to simplify government and the relations of society. In Mandeville's "every reasonable man, contrary to the impulse of nature, should endeavour the benefit of others, or the conquest of his own passions, out of a rational ambition of being good”) is actually detrimental to the state in its commercial and intellectual progress, for it is the vices (i.e. the self-regarding actions of men) which alone, by means of inventions and the circulation of capital in connexion with luxurious living, stimulate society into action and progress. In the Fable he shows a society possessed of all the virtues "bliss with content and honesty," falling into apathy and utterly paralyzed. The absence of self-love (cf. Hobbes) is the death of progress. The so-called higher virtues are mere hypocrisy, and arise from the selfish desire to be superior to the brutes. "The moral virtues are the political offspring which flattery begot upon pride." Similarly he arrives at the great paradox that "private vices are public benefits." But his best work and that in which he approximates most nearly to modern views is his account of the origin of society. His a priori theories should be compared with Maine's historical inquiries (Ancient Law, c. V.). He endeavours to show that all social law is self-regulated and protective alliances among the weak. Denying any form of moral sense or conscience, he regards all the social virtues as evolved from the instinct for self-preservation, the give-and-take arrangements between the partners in a defensive and offensive alliance, and the feelings of pride and vanity artificially fed by politicians, as an antidote to dissension and chaos. Mandeville's ironical paradoxes are interesting mainly as a criticism of the "amiable "idealism of Shaftesbury, and in comparison with the serious egoistic systems of Hobbes and Helvetius. It is more proper to describe that Mandeville had considerable philosophic insight; at the same time he was mainly negative or critical, and, as he himself said, he was writing for "the entertainment of people of knowledge and education." He may be said to have cleared the ground for the coming utilitarianism.

Works.—Typhon: a Burlesque Poem (1704); Aesop Dress'd; or, a Collection of Fables wri't in Familiar Verse (1704); The Planter's Charity (1704); The Virgin Unmasked (1709, 1723, 1731, 1745). A work in which he denounces the moral corruption of his own age; Hypochondriack and Hysterick Passions (1711, 1715, 1730) admired by Johnson (Mandeville here protests against merely speculative therapeutics, and advances fanciful theories of his own creation in connexion with psychotic ferment "he shows a knowledge of Locke's methods, and an admiration for Sydenham); Free Thoughts on Religion (1720); A Conference about Wishing (1721); "The Complete Serjeant," or the Customs of England, for the Use of Young Gentlemen (1725); The Origin of Honour and the Usefulness of Christianity in War (1732). Other works attributed, wrongly, to him are A Modest Defence of Public Stews (1724); The World Unmask'd (1736) and Zoologia medicinalis hibernica (1741).
against the king of Manzi; had been among rocks of adamant in the Indian Ocean; had been through a haunted valley, which he places near "Milstork" (i.e. Malasigrid in Armenia); had been driven home against his will in 1357 by arthritic gout; and had written his book as a consolation for his "wretched rest." The paragraph which states that he had had his book confirmed at Rome by the pope is an interpolation of the English version.

Part at least of the personal history of Maneville is mere invention. Nor is any contemporary corroboration of the existence of such a Jehan de Maneville known. Some French MSS., not contemporary, give a Latin letter of presentation from him to Edward III., but so vague that it might have been penned by any writer on any subject. It is in fact beyond reasonable doubt that the travels were in large part compiled by a Liègue physician, known as Jobains à Je Barbe or Jehan à la Barbe, otherwise Jehan de Bourgogne.

The evidence of this is in a modernized extract quoted by the Liègue herald, Louis Abry 1 (1643-1720), from the lost fourth book of the Myrure des Hystors of Johans des Freis, styled d'Oltreouse. In this "Jean de Bourgogne, dit à la Barbe," is said to have revealed himself on his deathbed to d'Oulotremouse, whom he made his executor, and to have described himself in his will as "messire Jean de Maneville, chevalier, comte de Montfort in Angleterre et seigneur de l'isle de Campdi et du château Pérouse. It is added that, having had the misfortune to kill himself; he had been driven from England by the king; and had traveled through the three parts of the world, arrived at Liègue in 1343, was a great naturalist, profound philosopher and astrologer, and had a remarkable knowledge of physic. And the identification is confirmed by the fact that in the now destroyed church of the Guillemins was a tombstone of Maneville, with a Latin inscription stating that he was otherwise named "ad Barbam," was a professor of medicine, and died at Liègue on the 17th of November 1372: this inscription is quoted as far back as 1467.

Even before his death the Liègue physician seems to have confessed to a share in the composition of the work. In the common Latin abridged version of it, at the end of c. vii., the author says that when stopping in the sultan's court at Cairo he met a venerable and expert physician of "our" parts, that they rarely came into conversation because their duties were of a different kind, but that long afterwards at Liègue he composed this treatise at the exhortation and with the help (hortatu et adiutorio) of the same venerable man, as he will narrate at the end of it. And in the last chapter he says that in 1355, in returning home, he came to Liègue, and being laid up with old age and arthritis of the gout in the street called Bassesauvery, i.e. Basse Sauvain, consulted the physicians. That one came in who was more venerable than the others by reason of his age and white hairs, was evidently expert in his art, and was commonly called Magister Johannes ad Barbam. That a chance remark of the latter caused the renewal of their old Cairo acquaintance, and that Ad Barbam, after showing his medical skill on Maneville, urgently begged him to write his travels; "and so at length, by his advice and help, monitu et adiutorio, was composed this treatise, of which I had certainly been in nothing but nothing as nothing of my own parts in England." He goes on to speak of himself as being now lodged in Liègue, "which is only two days distant from the sea of England"; and it is stated in the colophon (and in the MSS.) that the book was first published in French by Maneville, its author, in 1355, at Liègue, and soon after in the same city translated into the said Latin form. Moreover, a MS. of the French text extant at Liègue about 1864 contained a similar statement, and added that the author lodged at a hostel called "l'hoste Henkin Levo": this MS. gave the physician's name as "Johans de Bourgogne dit alle barbe," which doubtless conveys its local form.

There is no contemporary English mention of any English knight named Jehan de Maneville, nor are the arms said to have been on the Liègue tomb like any known Maneville arms. But Dr G. F. Warner has ingeniously suggested that de Bourgogne may be a certain Jehan de Bourgogne, who was pardoned by parliament on the 20th of August 1321 for having taken part in the attack on the Despensers, but whose pardon was revoked in May 1322, the year in which "Maneville" professes to have left England. And it should now be added that among the persons similarly pardoned on the recommendation of the same nobleman was a John Manevilain, whose name appears closely related to that of de Maneville 1—which is merely a later form of "de Magneville."

Mangeuilain occurs in Yorkshire as early as 16 Hen. I. (Pipe Roll Soc., xv. 40), but is very rare, and (falling evidence of any place named Mangeville) seems to be merely a variant spelling of Magneville. The meaning may be simply "of Magneville," de Magneville; but the family of a 14th century bishop of Nevers were called both "Mangevilain" and "de Mangevilain"—where Manevilain seems a derivative place-name, meaning the Magneville or Maneville district. In any case it is clear that the name Maneville was probably not once suggested to de Bourgogne by that of his fellow-culprit Mangevilian, and it is even possible that the two fled to England together, were in Egypt together, met again at Liègue, and shared in the compilation of the Travels.

Whether after the appearance of the Travels either de Bourgogne or "Mangevilain" visited England is very doubtful. St Albans Abbey had a sapphire ring, and Canterbury a crystal orb, said to have been given by Maneville; but these might have been sent from Liègue, and it will appear later that the Liègue physician possessed and wrote about precious stones. St Albans also had a legend that a ruined marble tomb of Maneville (represented cross-legged and in armour, with sword and shield) once stood in the abbey; this may be true of "Mangevilain" or it may be a mere myth.

It is a little curious that the name preceding Mangevilain in the list of persons pardoned is "Johan le Barber." Did this suggest to de Bourgogne the alias "à la Barbe," or was that only a Liègue nickname? Note also that the arms on Maneville's tomb were borne by the Tyrells of Hertfordshire (the county in which St Albans lies); for of course the crescent on the lion's breast is only the "difference" indicating a second son.

Leaving this question, there remains the equally complex one whether the book contains any facts and knowledge acquired by actual travels and residence in the East. Possibly it may, but only as a small portion of the section which treats of the Holy Land and the ways of getting thither, of Egypt, and in general of the Levant. The prologue, indeed, points almost exclusively to the Holy Land as the subject of the work. The mention of more distant regions comes in only towards the end of the Language, and as an afterthought, as it were.

By far the greater part of these more distant travels, extending in fact from Trebizond to Hormuz, India, the Malay Archipelago, and China, and back again to western Asia, has been appropriated from the narrative of Friar Odoric (written in 1330). These passages, as served up by Maneville, are almost always, indeed, swollen with interpolated particulars, usually of an extravagant kind, whilst in no few cases the writer has failed to understand the passages which he adopts from Odoric and professes to give as his own experiences. Thus (p. 200), where Odoric has given a most French MS. of Maneville at present. It was probably lent out and then returned. 1

1 The de Manevilles, earls of Essex, were originally styled de Magneville, and Leland, in his Comm. de Script. Brit. (CDV), calls our St Albans the "Mangeville of Maneville." 2

2 Page indications like this refer to passages in the 1866 reissue of Halliwell's edition, as being probably the most ready of access.

---

1 Quoted again from him by the contemporary Liègue herald, Lefort, and from Lefort in 1866 by Dr S. Bormans. Dr J. Vogels communicated it in 1884 to Mr E. W. B. Nicholson, who wrote on it in the Academy of April 12, 1884.

2 See Dr G. F. Warner's edition (Roxburghe Club), p. 38. In the Bull. de l'Institut archéologique Liégeois, iv. (1860), p. 171, M. Ferdinand Heron quotes the passage from "MSS. de la Bibliothèque publique de Liègue, à l'Université, no. 360, fol. 118," but the MS. is not in the 1875 printed catalogue of the University Library, which has no Old
curious and veracious account of the Chinese custom of employing tame cormorants to catch fish, the cormorants are converted by Mandeville into "little beasts called loyres (loyre, B), which are taught to go into the water" (the word loyre being apparently used here for "otter," lutra, for which the Provençal is luria or loiria).

At a very early date the coincidence of Mandeville's stories with those of Odoric was recognized, insomuch that a MS. of Odoric which is or was in the chapter library at Mainz begins with the words: Incipit Itinerarius fideliis fratris Odorici socii Militis Mandevil per Indian; licet hic [read ill] prius et alter posterius peregrinationem swam descripti. At a later day Sir T. Herbert calls Odoric "travelling companions of our Sir John"; and Purchas, with most perverse injustice, whilst calling Mandeville, next to Polo, "if next...the greatest Asian traveller that ever the world had," insinuates that Odoric's story was stolen from Mandeville's. Mandeville himself is crafty enough, at least in one passage, to anticipate criticism by suggesting the probability of his having travelled with Odoric (see p. 282 and below).

Much, again, of Mandeville's matter, particularly in Asiatic geography and history, is taken bodily from the Historiae Orientis of Hetoum, an Armenian of princely family, who became a monk of the Praemonstrant order, and in 1307 dictated this work on the East, in the French tongue at Poitiers, out of his own extraordinary acquaintance with Asia and its history in his own time.

It has been objected that no passage in Mandeville can be plausibly traced to Marco Polo, with one exception. This is (p. 163) where he states that at Hormuz the people during the great heat lie in water—a circumstance mentioned by Polo, though not by Odoric. We should suppose it most likely that this fact had been interpolated in the copy of Odoric used by Mandeville, for if he had borrowed it direct from Polo he would have borrowed more.

A good deal about the manners and customs of the Tartars is demonstrably derived from the famous work of the Franciscan Ioannes de Plano Carpini, who went as the pope's ambassador to the Tartars in 1245-1247; but Dr Warner considers that the immediate source for Mandeville was the Speculum historiale of Vincent de Beauvais. Though the passages in question are all to be found in Plano Carpini more or less exactly, the expression is condensed and the order changed. For examples compare Mandeville, p. 250, on the tasks done by Tartar women, with Plano Carpini, p. 643; Mandeville, p. 250, on Tart habitat of eating, with Plano Carpini, pp. 639-640; Mandeville, p. 231, on the titles borne on the seals of the Great Khan, with Plano Carpini, p. 715, &c.

The account of Prester John is taken from the famous Epistle of that imaginary potentate, which was so widely diffused in the 13th century, and created that renown which made it incumbent on every traveller in Asia to find some new tale to tell of him. Many fabulous stories, again, of monsters, such as cyclopes, sciapodes, hippopodes, monoscelides, anthropophagi, and men whose heads did grow beneath their shoulders, of the phoenix and the weeping crocodile, such as Pliny has collected, are introduced here and there, derived no doubt from him, Solinus, the bestaries, of the Speculum naturale of Vincent de Beauvais. And interspersed, especially in the chapters about the Levant, are the stories and legends that were retailed to every pilgrim, such as the legend of Seth and the grains of paradise from which grew the wood of the cross, that of the shooting of old Cain by Lamech, that of the castle of the sparrow-hawk (which appears in the tale of Melusina), those of the origin of the balsam plants at Matarya, of the dragon of Cos, of the river Sabbath, &c.

But all these passages have also been verified as substantially occurring in Barrois's French MS. Nouv. Acq. Franc. 4515 in the Bibliothèque Nationale, Paris, mentioned below (of A.D. 1321), cited B, and in that numbered xxxix. of the Grenville collection (British Museum), which dates probably from the early part of the 15th century, cited G.

1Viz. in D'Avezac's ed. in tom. iv. of Rec. de voyages et de mémoires pub. by the Soc. de Géog., 1839.

Even in that part of the book which might be supposed to represent some genuine experience there are the plainest traces that another work has been made use of, more or less—we might almost say as a framework to fill up. This is the itinerary of the German knight Wilhelm von Boldensele, written in 1336 at the desire of Cardinal Talleyrand de Perigord.2 A cursory comparison of this with Mandeville leaves no doubt that the latter has followed its thread, though digressing on every side, and too often eliminating the singular good sense of the German traveller.

We may indicate as examples Boldensele's account of Cyprus (Mandeville, p. 28 and p. 10), of Tyre and the coast of Palestine (Mandeville, 29, 30, 33, 34), of the journey from Gaza to Egypt (34), passages about Babylon of Egypt (40), about Mecca (42), the general account of Egypt (45), the pyramids (52), some of the wonders of Cairo, such as the slave-market, the chicken-hatching stoves, and the apples of paradise, i.e. plantains (49), the Red Sea (57), the convent on Sinai (58, 60), the account of the church of the Holy Sepulchre (74-76), &c. There is, indeed, only a small residuum of the book to which genuine character, as containing the experiences of the author, can possibly be attributed. Yet, as has been intimated, the borrowed stories are frequently claimed as such experiences. In addition to those already mentioned, he alleges that he had witnessed the curious exhibition of the garden of transmigrated souls (described by Odoric) at Cansay, i.e. Hangchow-fu (211). He and his fellows with their valets had remained fifteen months in service with the emperor of Cathay in his wars against the king of Manzi—Manzi, or Southern China, having ceased to be a separate kingdom some seventy years before the time referred to. But the most notable of these false statements occurs in his adoption from Odoric of the story of the Valley Perilous (282). This is, in its original form, apparently founded on real experiences of Odoric viewed through a haze of excitement and superstition. Mandeville, whilst swelling the wonders of the tale with a variety of extravagant touches, appears to safeguard himself from the reader's possible discovery that it was stolen by the interpolation: "And some of our fellows accorded to enter, and some not. So there were with us two worthy men, Friars Minor, that were of Lombardy, who said that if any man would enter they would go in with us. And when they had said so, upon the gracious trust of God and of them, we caused mass to be sung, and made every man to be shriven and housed; and then we entered, fourteen persons; but at our going out we were but nine," &c.

In referring to this passage it is only fair to recognize that the description (though the suggestion of the greatest part exists in Odoric) displays a good deal of imaginative power; and there is much in the account of Christian's passage through the Valley of the Shadow of Death, in Boccaccio's famous allegory, which indicates a possibility that the John Baptist may have seen and remembered this episode either in Mandeville or in Hakluyt's Odoric.

Nor does it follow that the whole work is borrowed or fictitious. Even the great Moorish traveller Ibn Batuta, accurate and veracious in the main, seems—in one part at least of his narrative—to invent experiences; and in such works as those of Jan van Hees and Arnold von Harff we have examples of pilgrims to the Holy Land whose narratives begin apparently in sober truth, and gradually pass into fancies and fiction and extravagance. So in Mandeville also we find particulars not yet traced to other writers, and which may therefore be provisionally assigned either to the writer's own experience or to knowledge acquired by colloquial intercourse in the East.

It is difficult to decide on the character of his statements as to recent Egyptian history. In his account of that country (pp. 37, 38) though the series of the Comanian (i.e. of the Bahri Ma'mufter) sultans is borrowed from Hefoum down to the accession of Mellechnasser, i.e. Malik al-Nâšir (Nâšir ud-dîn Mahommed), who reigned first to the death of 1293. Mandeville appears to speak from his own knowledge when he adds that this "Mellechnasser reigned long and governed wisely." In fact, though twice

2It is found in the Thesaurus of Canisius (1604), v. pt. ii. p. 95, and in the ed. of the same by Basnage (1752), iv. 337.
displaced in the early part of his life, Malik Nāṣir reigned till 1341, a duration unparalleled in Mahommedan Egypt, whilst we are told that during the last thirty years of his reign Egypt rose to a high pitch of wealth and prosperity. Mandeville, however, then goes on to say that his eldest son, Melechemader, was chosen to succeed; but this prince was caused privately to be slain by his brother, who took the kingdom under the name of Melechmadron. 1 And he was sold when I departed from those countries, and became a monk. 2

1357 were quoted Writing a comment in the later fourteenth century. 3 Melechmadron. 1

In the defective French MS. a page of blank is left, when it says the melechmadron, which may appear to have some connection with the description of Mount Sinai, "et c'est celle vallée mult fleirode" (ibid. p. 32). Consequently the corresponding English version has a blank page. Moreover, in the English text, there are many amendments and corrections to the Latin original. All English printed texts before 1725, and Ashtons's 1887 edition, follow these defective copies, and in only two known MSS. has the lacuna been detected and filled up.

1357

The English text of the Egerton MS. Egerton 1892 (Northern dialect, about 1410–1420 ?), in which, according to Dr Vogels, the corresponding portion has been borrowed from that English version which had been already based on the Latin. The other is in the British Museum MS. Cotton Titus C. viii. (a later English dialect, about 1410–1420 ?), representing a text completed, and revised throughout, from the French, though not by a competent hand. The Egerton text is certainly more reliable than Dr G. F. Warner's revised, while portions of Melechmadron himself, and this assertion was till lately taken on trust by almost all modern historians of English literature. The words of the original "je eusees cest livret mis en latin" and "... je l'ay mis en românt" were mistranslated as if "je eusse" meant "I had" instead of "I should have," and then (whether of traslation or copying of a copy of the original accidental omission) the words were added "and translated it aten out of Frenche into Englysshe." Mätzner (Alltichtige Sprachproben, I., ii., p.145) seems to have been the first to show that the current English text cannot possibly have been based by Mandeville himself. Of the original French there is no satisfactory edition, but Dr Vogels has undertaken a critical text, and Dr Warner has prepared a critical text of the French of a British Museum MS. with variants from three others.

It remains to mention certain other works bearing the name of Mandeville. 4

Dr. Add. C. 280 in the Bodleian library appends to the "Travels" a short French Life of St Alban of Germany, the author of which calls himself John Mandiville, knight, formerly of the town of St Alban, and relates how he himself had been printed by the Royal Society. The Travels of a French MS. have been discovered by a Saracen friend with some fine jewels which had passed into d'Oultremont's own possession: of this Lapidaire, a French version, which seems to have been completed after 1479, has been printed several times. A MS. of it, offered for sale in 1864, is said to have been divided into five books: (1) the travels, (2) de la forme de la terre et comment et par quelle main elle fut faite, (3) des faits des héros, (4) des herbes selon les syndos et les philosophes par de là, and (5) le lapidaristre—while the cataloguer supposed Mandeville to have been the author of a concluding piece entitled La Veniance de nostre Signeur Ihesu Crist. For the description of the gold and silver of daramathye ju delivres de la prison. From the treatise on herbs a passage is quoted asserting it to have been composed in 1357, in honour of the author's natural lord, Edward, king of England. This date is corroborated by the title of king of Scotland given to Edward, who had received from Balil the surrender of the crown and kingly dignity on the 20th of January 1356, and on the 3rd of October 1357 released King David and made peace with Scotland; unfortunately we are not told whether the treatise contains the author's name, and, if so, what name. Tanner (Bibliotheque) alleges that Mandeville wrote several books on medicine, and among the Ashmolean MSS. in the Bodleian Library there is one John de Magalvilla (No. 1479), an alchemical receipt by him (No. 1407), and another alchemical receipt by Johannes de Villa Magna (No. 1441).

In the defective English MSS. he has only offered a laboured and problematical explanation.

1 Die Quellen für die Reisebeschreibung des Johann von Mandiville, Inaugural-Dissertation. Leipzig (Berlin, 1888). This was revised and enlarged as "Untersuchungen über Johann von Mandeville und die Quellen seiner Reisebeschreibung," in the Zeitschrift der Gesellschaft für Erkundung zu Berlin, Bd. 23, Helt 3 u. 4 (No. 135, 136).

2 Dr. Vogels controverts these positions, arguing that the earliest English version from the French was the complete Cotton text, and that the present version was derived by Dr Warner. The English copyists have been accused of being deficient. English MS. His supposed evidences of the priority of the Cotton text equally consist with its being a later revision, and for Rays Ilk (Kalif), the author says (Rosseburgh Club ed., p. 18) that it is ant a dire come roi (3). Il y s'oit avoir v v. soudans, 3 "as much as to say king. There used to be 5 sultans." In the defective French MS. a page of blank is left, when it says the melechmadron, which may appear to have some connection with the description of Mount Sinai, 4

3 Die ungedruckten lateinischen Versionen Mandevilles (Crefeld, 1866).

4 Handschriftliche Untersuchungen über die englische Version Mandevilles's (Crefeld, 1891), p. 46.

5 Stanislas Borman, Introduction to d'Oultremont's Chronicle, pp. lxxxix., xc; see also Warner's edition of the Travels, p. xxxv. The ascription is on ff. 5 and 6 of Le Tresorier de philosophie naturelles des Flandres et Frieses, a MS. which was first used by the inventory of the Fonds francais 12326 of the Bibliotheque Nationale, Paris. The passage about Alexandria is on f. 81.

6 Jacques Pannier, Le Livre des Secrets, pp. 189–204; noting not d'Oultremont's evidence, he has discounted the localization to Mandeville and doubted the existence of a Latin original. Description... d'une collection... d'anciens manuscrits... réunis par les soins de M. J. Tchener, i. (Paris, 1852.), p. 159 (referred to by Pannier, pp. 194–194).
Mandinga—Mandingo

Finally, de Bourgogne wrote under his own name a treatise on the
plague, 1 extant in Latin, French and English texts, and in Latin and
English abridgments. Herein he describes himself as Johannes
de Burgundia, otherwise called cam Barbe, citizen of Liége and
professor of the art of medicine; says that he had practised forty
years and had been in Liége in the plague of 1356; and adds that he
had previously written a treatise on the cause of the plague, according
to the indications of astrology (beginning Deus deorum), and another
on distinguishing pestilential diseases (beginning Cam nimium
propier instans temporis epidemide). "Burgundia" is sometimes
corrupted into "Burgalega," 2 and into other translations of the
abridgment almost always appears as "Burdews" (Bordeaux) or the
like. MS. Rawlinson D. 257 (15th century) in the Bodleian also
contains a large number of English medical receipts, headed "Practica
phlsica Magistri Johannis de Burgundia."

See further Dr G. F. Warner's article in the Dictionary of National
Biography for a comprehensive account, and for bibliographical
references; Ulysse Chevalier's Répertoire des sources et documents
 moyen âge for references generally; and the Zentralbl. f. celt. Philologie
II., i. 126, for an edition and translation, by Dr Whitley Stokes, of
Fingin O'Mahony's Irish version of the Travals.

Mandhata, a village with temples in India, in Nimar district
of the Central Provinces, on the south bank of the Narbada.
Pop. (1901), 832. It is a famous place of Hindu pilgrimage, as
containing one of the twelve great lingos of Siva; and as late as
the beginning of the 19th century it was the scene of the self-
imolation of devotees who threw themselves from the cliffs into
the river.

Mandi, a native state of India, within the Punjab. It ranks as
the most important of the hill states to which British influence
extended in 1846 after the first Indian War. The territory lies
amongst the higher ranges of the Himalaya, between Kangra and
Kulu. The country is mountainous, being intersected by two
great parallel ranges, reaching to an average height of 5000 to
7000 ft. above sea-level. The valleys between the hill ranges are
fertile, and produce all the ordinary grains, besides more valuable
crops of rice, maize, sugar-cane, poppy and tobacco. Iron is
found in places, and also gold in small quantities. Area, 1300
sq. m.; pop. (1901), 174,045; estimated revenue, £28,000; tribute,
£6,666. The chief, whose title is raja, is a Rajput of old family.
Considerable sums have been expended on roads and bridges. An
important product of the state is salt, which is mined in two
places.

The town of Mandi is on the Beas, which is here a mountain
torrent, crossed by a fine iron bridge; 2901 ft. above sea-level;
88 m. from Simla. Pop. (1901), 8144. It was founded in 1527,
and contains a palace of the 17th century and other buildings of
interest. It is a mart for transfrontier trade with Tibet and
Yarkand.

Mandingo, the name currently given to a very important
division of negro peoples in West Africa. It is seemingly a corrup-
tion of a term applied to an important section of this group, the
Mande-nka or Mande nga. The present writer has usually heard
this word pronounced by the Mandingo themselves "Mandifa,"
or even "Madifa." It seems to be derived from the racial name
Mande, coupled with the suffix nka or ne, meaning "people,
the people of Mande. Then again this word Mande seems to take
the varying forms of Male, Mali, Mame, Mande, and Mando, and
as being "Mandian" or "Mandian." Perhaps it is connected with a
word Mali, which means "hippopotamus," or else "manati"—probably the latter. According to
Desplagnes, the word is further divisible into ma, which would have
meant "fish," and nde, a syllable to which he ascribes the mean-
ing of "father." In no Mandingo dialect known to the present
writer (or in any other known African language) does the vocable
ma apply to "fish," and in only one very doubtful far eastern
Mandingo dialect is the root nde or any other similar root applied to "father." This etymology
may be abandoned, probably in favour of Marni, Mali, Madi, Mande, meaning "hippopotamus," and in some cases the other big water mammal,
the manati. 2

1 Respecting this, see David Murray, The Black Book of Paisley, &c. (1885), and John de Burdegal, &c. (1891).
2 Indeed it is possible that the European name for this Sirenaian—manati—derived from the West Indies, is the corruption of a West

The West African tribes speaking Mandingo languages vary
very much in outward appearance. Some of them may be West
African negroes of the forest type with little or no intertwixing
with the Caucasian; others, such as the typical Mandingos or the
Susus, obviously contain a non-nego element in their physique.
This last type resembles very strongly the Swahilis of the Zanzi-
bar littoral or other crosses between the Arab and the negro;
and though nearly always black-skinned, often has a well-shaped
nose and a fairly full beard. The tribes dwelling in the
African forest, but speaking languages of Mandingo type, do not
perhaps exhibit the very proathonous, short-limbed, "ugly" de-
velopment of West African negro, but are of rather a refined type,
and some of them are lighter in skin colour than the more Arab-
looking Mandingos of the north. But in these forest Mandingos
the beard is scanty. Occasionally the Mandingo physical type
appears in eastern Liberia and on the Ivory Coast amongst
people speaking Kru languages. In other cases it is associated
with the Senfo speech-family.

Delafosse divides the Mandingo group linguistically into three
main sections: (1) the Mande-tamu, (2) the Mande-fu, and (3) the
Mande-ta, according as they use for the numeral 10 the root
tamu, f6 or fu. Of the first group are the important tribes of the
Sonini-ké (called Sarakulle by the Fula, and Sarakó by the
French); the Swànni people of Azèr, and the oases of Tíshít,
Wádan and Wáláta in the south-west Sahara; and the Bozo,
who are the fishermen along the banks of the Upper Niger and
the Baní from Jënné to Tímbuktu. The Sonini-ké are also known
as Marka, and they include (according to lènger) the Sanogho
and the Kúrtei along the banks of the Niger east of Tímbuktu as far as Say.

The group of Mande-ta would include the Bämâna (incorrectly
called Bambara) of the upper Senegal and of Segú on the Upper
Niger, the Tòronke, the Mandènega, the Numu of the district west
of the Black Volta, the Yalo of south-western Liberia, and the
Dúyila or Gúyla of the region at the back of the Ivory Coast.

The group of the Mande-fu includes a great many different
languages and dialects, chiefly in the forest region of Sierra Leone
and Liberia, and also the dialects of the celebrated Susu and Soso
tribe, and the Mandingo tribes of Futa Jallon, of the Grand
Scarcies River and of the interior of the Ivory Coast, and of the
regions between the eastern affluents of the Upper Niger and the
Black Volta. To this group Delafosse joins the Boko dialect
spoken by people dwelling to the west of the Lower Niger at
Bussa—between Bussa and Borgu. If this hypothesis be correct
it gives a curious eastern extension to the range of the Mandingo
family at the present day; or it may be a vestige left by the Man-
ingo invasion which, according to legend, came in prehistoric
times from the Hausa countries across the Niger to Senegambia.
It is remarkable that this Boko dialect as recorded by the
missionary Koelle most resembles certain dialects in central
Liberia and in the Ivory Coast hinterland.

The Mandingos, coming from the East and riding on horses
(according to tradition), seem to have invaded western Nigeria
about a.D. 1000 (if not earlier), and to have gradually displaced
and absorbed the Songhai or Fula (in other words, Negroid,
"White") rulers of the countries in the basin of the Upper Niger
or along its navigable course as far as the Gold Coast region. On the ruins of these Songhai, Berber, or Fula
kingdoms rose the empire of Mali (Melle). Considerable sections
of the Mandingo invaders had adopted Mahomedanism, and
extended a great Mahomedan empire of western Nigeria far
northwards into the Sahara Desert. In the 16th century the
Songhai regained supernal power. See infra, § The Melle Empire.

Although the Mandingos, and especially the Susa section, may
have come as conquerors, they devoted themselves through the
succeeding centuries more and more to commerce. They became
the extreme west of Africa what the Hausa are in the west-
central regions. Some of the Madingo invasions, especially in

African word manati, applied very naturally to the animal by the West
African slaves, who at once recognised it as similar to the creature
found on the West African coast in their own rivers, and also on the
Upper Niger.
The forest region, left little more than the imposition of their language; but where there was any element of Caucasian blood (for the original Mandingo invaders were evidently dashed with the Caucasian by intermingling with some of the negroid races of north-central Africa), they imposed a degree of civilization which excluded cannibalism (still rampant in much of the forest region of West Africa), introduced working in leather and in metals, and was everywhere signalized by a passionate love of music, a characteristic of all true Mandingo tribes at the day. It is noteworthy that many of the instruments affected by the Mandingos are found again in the more civilized regions of Bantu Africa, as well as in the central Sudan. Many of these types of musical instruments can also be traced originally to ancient Egypt. The Mandingos also seem to have brought with them in their westward march the Egyptian type of ox, with the long, erect horns. It would almost seem as if this breed had been preceded by the zebu or humped ox; though these two types are evidently of common origin so far as derivation from one wild species is concerned. The Mandingos maintain the system of totems or clans, and each section or tribe identifies itself with a symbol, which is usually an animal or a plant. The Mandenga are supposed to have either the manati or the hippopotamus as tanna (totem). (Binger states that the manati was the totem of the Mande group, to which perhaps belonged originally the Susu and the Dyula.) The Banama are the people of the crocodile; the Samanke are the people of the elephant; the Samokho of the snake. Other totems or symbols of special families or castes are the dog, the calabash or gourd, the lion, the green monkey, the leopard, the monkey lizard, a certain spice called bandugu, certain rats, the python, the crocodile. 

Authorities.—The bibliography dealing with the Mandingo peoples is very extensive, but only the following works need be cited: Captain L. G. Binger, Du Niger au Golfe de Guinée, &c. (1892); Maurice Delafosse, Vocabulaire comparatif de 60 langues des pays barbares (1904); Lieut. Desplagnes, Le Plateau central nigerien (1907); Lady Lugard, A Tropical Dependency (1905); Sir Harry Johnston, Liberia (1906). Most of these works contain extensive bibliographies.

The Melle Empire.—The tradition which ascribes the arrival of the Mandingo in the western Sudan to the 10th or 11th century is referred to in the previous section. It is not known by whom the Melle (Mali) state was founded. Neither is there certainty as to the site of the capital, also called Melle. Idrisi in the 12th century describes the Wangara (a Hausa name for the Mandingo) as a powerful people, and El Bakri writes in similar terms. But the first king whose name is preserved was Baramidanna, believed to have reigned from 1213 to 1235. His territory lay south of that of Jenné, partly within the bend of the Niger and partly west of that river. The people were already Moslem, and the capital was a rendezvous for merchants from all parts of the western Sudan and the Barbary States. Mari Jatah (or Didea), Baramidanna’s successor, about the middle of the 13th century conquered the Susu, then masters of Ghanata (Ghana). Early in the 14th century Mansa, i.e. Sultan, Kunkur Musa, extended the empire, known as the Mellestine, to its greatest limits, making himself master of Timbuktu, Gao and all the Songhoi dominions. His authority extended northward over the Sahara to the Tuat oases. Mansu Suleiman was on the throne when in 1352-1353 Melle was visited by Ibn Batuta. By this monarch the empire was divided into three great provinces, ruled by viceroys. For a century afterwards Melle appears to have been the dominant Sudan state west of the Lower Niger, but it had to meet the hostility of the growing power of the pagan Mossi, of the Tuareg in the north and of the Songhoi, who under Sunni Ali (c. 1353) had already regained a measure of independence. Camadamo nevertheless describes Melle in 1454 as being still the most powerful of the negro-land kingdoms and the most important for its traffic in gold and slaves. The Songhoi sovereign Askia is said to have completed the conquest of Melle at the beginning of the 16th century. It nevertheless retained some sort of national life with the advent of the Europeans in the Niger countries (end of the 16th century) native civilization suffered a blow from which it never recovered. Civil war is said to have finally wrought the ruin of Melle about the middle of the 17th century. The Portuguese, from their first appearance on the Senegal and Gambia, entered into friendly relations with the rulers of Melle. Barros relates (Da Asia, Decade I) that John II. of Portugal sent embassies to the court of Melle by way of the Gambia (end of the 15th century). At that time the authority of Melle was said to extend westward to the coast. The king, pressed by the Mossi, the Songhoi and the Fula, succeeded in gaining the help of the Portuguese—what with what result does not appear; but in 1534 Barros himself despatched an ambassador to the king of Melle concerning the trade of the Gambia. By way of that river the Portuguese themselves penetrated as far as Bambuk, a country occupied by the Mandingo in the 12th century. By Barros the name of the Melle ruler is given as Mandi Mansa, which may be the native form for “Sultan of the Mandi” (Mandingo).

MANDLA, a town and district of British India, in the Jubbulpore division of the Central Provinces. The town is on the river Nerbbuda, 1787 ft. above the sea. It has a manufacture of bell-metal vessels. Pop. (1901), 5054. The district of Mandla, among the Satpura hills, has an area of 5054 sq. m. It consists of a wild highland region, broken up by the valleys of numerous rivers and streams. The Nerbbuda flows through the centre of the district, receiving several tributaries which take their rise in the Maikal hills, a range densely clothed with sal forest, and forming part of the great watershed between eastern and western India. The loftiest mountain is Chauradarad, about 3400 ft. high. Tigers abound, and the proportion of deaths caused by wild animals is greater than in any other district of the Central Provinces. The magnificent sal forests which clothed the highlands have suffered greatly from the nomadic system of cultivation practised by the hill tribes, who burned the wood and sowed their crops in the ashes; but measures have been taken to prevent further damage. The population in 1901 was 318,400, showing a decrease of 6-5% in the decade, due to famine. The aboriginal hill tribes are more numerous in Mandla than in any other district of the Central Provinces, particularly the Gonds. The principal crops are rice, wheat, other food grains, pulse and oil-seeds. There is a little manufacture of country cloth. ‘A branch of the Bengal-Nagpur railway touches the south-western border of the district. Mandla suffered most severely from the famine of 1866-1877, partly owing to its inaccessibility, and partly from the shy habits of the aboriginal tribes. The registered death-rate in 1907 was as high as 96 per thousand.

MANDOLINE (Fr. mandoline; Ger. Mandoline; It. mandolina), the female member of the lute family, and therefore a stringed instrument of great antiquity. The mandoline is classified amongst the stringed instruments having a vaulted back, which is more accentuated than even that of the lute. The mandoline is strung with steel and brass wire strings. There are two varieties of mandolines, both Italian: (1) the Neapolitan, 2 ft. long, which is the best known, and has four courses of pairs of unisons tuned like the violin in fifths; (2) the Milanese, which is slightly larger and has five or six courses of pairs of unisons. The neck is covered by a finger-board, on which are distributed the twelve or more frets which form nuts at the correct points under the strings on which the fingers must press to obtain the chromatic semitones of the scale. The strings are twanged by means of a plectrum or pick, held between the thumb and first finger of the right hand. In order to strike the string the pick is given a gliding motion over the string combined with a down or an up movement, respectively indicated by signs over the notes. In order to sustain notes on the mandoline the effect known as tremolo is employed; it is produced by means of a double movement of the pick up and down over a pair of strings.

1 On the ruins of the old Melle dominions arose five smaller kingdoms, representing different sections of the Mandingo peoples.
The mandrake is a derivative of the mandola or mandore, which was smaller than the lute but larger than either of the mandolines described above. It had from four to eight courses of strings, tied to a quill by strong strings and the other in pairs of unisons. The mandore is mentioned in Robert de Caleson's (12th cent.), and elsewhere; it may be identified with the pardura.

The Neapolitan mandoline was scored for by Mozart as an accompaniment to the celebrated serenade in Don Juan. Beethoven wrote for it a Sonatina per il mandolino, dedicated to his friend Krumpholz. Gretz and Paisiello also introduced it into their operas, an accompaniment to serenades.

The earliest method for the mandoline was published by Feuchette in Paris in 1770. The earliest mention of the instrument in England, in 1738, is quoted in Ashton's Social Life in the Reign of Queen Anne: "Signior Conti will play...on the mandoline, an instrument not known yet." (K. S.)

MANDRAKE (Mandragora officinarum), a plant of the potato family, order Solanaceae, a native of the Mediterranean region. It has a short stem bearing a tuft of ovate leaves, with a thick fleshy and often forked root. The flowers are solitary, with a purplish bell-shaped corolla; the fruit is a fleshy orange-coloured berry. The mandrake has been long known for its poisonous properties and supposed virtues. It acts as an emetic, purgative and narcotic, and was much esteemed in old times; but, except in Africa and the East, where it is used as a narcotic and anti-spasmodic, it has fallen into well-earned disrepute. In ancient times, according to Isidorus and Serapion, it was used as a narcotic to diminish sensibility under surgical operations, and the same use is mentioned by Kazwijn. I. 397, s.c. "Luifâh." Shakespeare more than once alludes to this plant, as in Antony and Cleopatra; "Give me to drink mandragora." The notion that the plant shrieked when touched is alluded to in Romeo and Juliet: "And shrieks like mandrakes torn out of the earth, that living mortals, hearing them, run mad." The mandrake, often growing like the lower limbs of a man, was supposed to have other virtues, and was much used for love philters, while the fruit was supposed, and in the East is still supposed, to facilitate pregnancy (Aug., C. Paust. xxi. 56; cf. Gen. xxx. 14, where the Hebrew סְדִּיק is undoubtedly the mandrake). Like the mallow, the mandrake was potent in all kinds of enchantment (see Maimonides in Chwolson, Stabier, ii. 450). Dioscorides identifies it with the ἡπάκα, the root named after the enchantress Circe. To it appears to apply the fable of the magical herb Baars, which cured demonsiacs, and was procured at great risk or by the death of a dog employed to drag it up, in Josephus (B. J. vii. 6, § 3). The German name of the plant (Atrausa; O. H. G. Alfrūna) indicates the prophetic power supposed to be in little images (homunculi, Goldmännchen, Galgenmännchen) made of this root which were cherished as oracles. The possession of such a root was the last resort to ensure prosperity (Sachs, Du Canne, s.v. Mandragora and Littfr.).

Gerard in 1597 (Herball, p. 280) described male and female mandrakes, and Dioscorides also recognizes two such plants corresponding to the spring and autumn species (M. vernalis and M. officinarum respectively), differing in the colour of the foliage and shape of fruit.

MANDRILL (a name formed by the prefix "man" to the word "drill," which was used in ancient literature to denote an ape, and is probably of West African origin), the common title of the most hideous and most malignantly coloured of all the African monkeys collectively denominated baboons and constituting the genus Papio. Together with the drill (g.v.), the mandrill, Papio maion, constitutes the subgenus Maion, which is exclusively West African in distribution, and characterized, among other peculiarities, by the extreme shortness of the tail, and the great development of the longitudinal bony swellings, covered during life with naked skin, on the sides of the muzzle. As a whole, the mandrill is characterized by heavity of body, stoutness and strength of limb, and exceeding shortness of tail, which is a mere stump, not 5 in. long, and usually carried erect. It is, moreover, remarkable for the prominence of its brow-ridges, beneath which the small and closely approximated eyes are deeply sunk; the immense size of the canine teeth; and more especially for the extraordinarily vivid colouring of some parts of the skin. The body generally is covered with soft hair—light olive-brown above and silvery grey beneath—and the chin is furnished underneath with a small pointed yellow beard. The hair of the forehead and temples is directed upwards so as to meet in a point on the crown, which gives the head a triangular appearance. The ears are naked, and bluish black. The hands and feet are naked, and black. A large space around the greatly developed callouses on the buttocks, as well as the upper part of the insides of the thighs, is naked and supplied with a crimson colour, shedding off on the one side the same shade of lilac or blue, which, depending upon injection of the superficial blood-vessels, varies in intensity according to the condition of the animal—increasing under excitement, fading during sickness, and disappearing after death. It is, however, in the face that the most remarkable disposition of vivid hues occurs, more resembling those of a brilliantly coloured flower than what might be expected in a mammal. The cheek-prominences are of an intense blue, the effect of which is heightened by deeply sunk longitudinal furrows of a darker tint, while the central line and termination of the nose are bright scarlet. It is only to fully adult males that this description applies. The female is of much smaller size, and more slender; and, though the general tone of the hairy parts of the body is the same, the prominences, furrows, and colouring of the face are much less marked. The young males have black faces.

Old males are remarkable for the ferocity of their disposition, as well as for other disagreeable qualities; but when young they can easily be tamed. Like baboons, mandrills appear to be omnivorous eaters, feeding on fruit, roots, reptiles, scorpions, &c., and inhabit open rocky ground rather than forests. Not much is known of the mandrill's habits in the wild state, nor of the exact limits of its geographical distribution; the specimens brought to Europe coming from the west coast of tropical Africa, from Guinea to the Gaboon. (See also Primates.)

(M. H. F.; R. L.*)

MANDU, or Mandogah, a ruined city in the Dhar state of Central India, the ancient capital of the Mahomedian kingdom of Malwa. The city is situated at an elevation of 2079 ft. and extends for 8 m. along the crest of the Vindhyan mountains. It reached its greatest splendour in the 15th century under Hoshang Shah (1405-1434). The circuit of the battlemented wall is nearly 23 m., enclosing a large number of palaces, mosques and other buildings. The oldest mosque dates from 1405; the finest is the Jama Masjid or great mosque, a notable example of Pathan architecture, founded by Hoshang Shah. The marble-clad tomb of this ruler is also magnificent.

For a description and history of Mandu, see Sir James Campbell's Geography of Bombay, i. part ii. (1860), and Journal of the Bombay Asiatic Society (vol. xxi.).

MANDURIA, a city of Apulia, Italy, in the province of Lecce, from which it is 27 m. W. by road (22 m. E. of Taranto), 270 ft. above sea-level, and 8 m. N. of the coast. Pop. (1901), 12,199 (town); 13,100 (commune). It is close to the site of the ancient Manduria, considerable remains of the defences of which can still be seen; they consisted of a double line of wall built of rectangular blocks of stone, without mortar, and with a broad ditch in front. Some tombs with gold ornaments were found in 1886 (L. Violante in Notizie degli Scavi, iii. i. p. 100). It was an important stronghold of the Messapii against Tarentum, and Archidamus III., king of Sparta, fell beneath its walls in 338 B.C., while leading the army of the latter (Plut., Agis, 3, calls the place Mandonion: see s.v. ARCHIDAMUS). It revolted to Hannibal, but was stormed by the Romans in 209 B.C. Pliny mentions a spring here which never changed its level, and may still be seen. The town was destroyed by the Saracens in the 10th century; the inhabitants settled themselves on the site of the present town, at first called Casalnuovo, which resumed the old name, now Manduro.

(T. As.)

MANDVI, a seaport of India, in the native state of Cutch, within the Gujarat province of Bombay, 36 m. from Bhuj, and 182 m. by sea from Karachi. Pop. (1901), 24,683. It is a weekly port of call for steamers of the British India line, vessels
MANES, in Roman mythology, the disembodied and immortal spirits of the dead. The word is an old adjective—manis, manus, meaning "good," the opposite of which is immanis; hence the Manes, clearly a euphemistic term, are the "good people." They were looked upon as gods; hence the dedication, of great antiquity and frequent occurrence, Deis vel Divis Manibus in sepulchral inscriptions, used even in Christian times. When a body was consumed on the funeral pyre, relations and friends invoked the deceased as a divinity, and the last of the Twelve Tables prescribed that the body of such a divinity be Manes should be respected, and that each man should regard the dead members of his family as gods. Their home was in the bowels of the earth, from which they only emerged at certain times. It was an old Italian custom—especially at the foundation of cities—to dig a pit in the form of an inverted sky (hence called mundus), the lower part of which was supposed to be sacred to the gods of the underworld, including the Manes. Such a pit existed on the Palatine at Rome. It was covered by a stone called lapis manalis, representing the entrance to the lower world, which was marked by trees in the Roman calendar. The Manes were then believed to issue forth, and these days were regarded as religious—it is, that all important business in public and private life was suspended. Offerings were made to propitiate the dead: libations of water, wine, warm milk, honey, oil, and the blood of sacrificial victims—black sheep, pigs and oxen (suovetaurilia)—was poured upon the graves; ointment and incense were offered, lamps were lighted, and the grave was adorned with garlands of flowers, especially roses and violets. Beans, eggs, lentils, salt, bread and wine, placed on the grave, formed the chief part of a meal partaken of by the mourners. There was also a public state festival in honour of the dead, called Pentalia, held from the 13th to the 21st of February, the last month of the old Roman year, the last day of the festival being called Feralia. During its continuance all the temples were shut, marriages were forbidden, and the magistrates had to appear without the insignia of their office.

There was considerable analogy between the Manes and the received idea of "souls"—and there was a corresponding idea that they could be conjured up and appear as ghosts. They were the proper inhabitants of the place of sending dreams. It is to be noticed that, unlike the Lares, the Manes are never spoken of singly.

For authorities, see Lares and Penates.

MANET, ÉDOUARD (1832–1883), French painter, regarded as the most important master of Impressionism (p.r.), was born in Paris on the 23rd of January 1832. After spending some time under the tuition of the Abbé Poiloup, he entered the Collège Rollin, where his passion for drawing led him to neglect all his other lessons. His studies finished in 1848, he was placed on board the ship Guadeloupe, voyaging to Rio de Janeiro. On his return he first studied in Couture's studio (1851), where his independence often infuriated his master. For six years he was an intermittent visitor to the studio, constantly taking leave to travel, and going first to Cassel, Dresden, Vienna and Munich, and afterwards to Florence, Rome and Venice, where he made some stay. Some important drawings date from this period, and one picture, "A Nymph Surprised." Then, after imitating Couture, more or less, in "The Absinthe-Drinker" (1866), and Courbet in "The Old Musician," he devoted himself almost exclusively to the study of the Spanish masters in the Louvre. A group was already gathering round him—Whistler, Legros, and Fantin-Latour haunted his studio in the Rue Guyot. His "Spaniard playing the Guitar," in the Salon of 1861, excited much admiration. Delacroix alone defended but, this notwithstanding, his "Filer of the Guard" and "Breakfast on the Grass" were refused by the jury. Then the "Exhibition of the Rejected" was opened, and round Manet a group was formed, including Bracquemond, Legros, Jongkind, Whistler, Harpignies and Fantin-Latour, the writers Zola, Duranty and Duret, and Astruc the sculptor. In 1863, when an amateur, M. Martinet, lent an exhibition-room to Manet, the painter exhibited fourteen pictures; and then, in 1864, contributed again to the Salon "The Angels at the Tomb" and "A Bull-fight." Of this picture he afterwards kept nothing but the toreador in the foreground, and it is now known as "The Dead Man." In 1865 he sent to the Salon "Christ reviled by the Soldiers" and the famous "Olympia," which was hailed with mockery and laughter. It represents a nude woman reclining on a couch, behind which is seen the head of a negro who has been attacked by a black cat at her feet emphasizes the whiteness of the sheet on which he lay. This work (now in the Louvre) was presented to the Luxembourg by a subscription started by Claude Monet (1860). It was hung in 1870 among the Caillebotte collection, which included the "Balcony," and a study of a female head called "Angelina." This production, of a highly independent individuality, secured Manet's exclusion from the Salon of 1866, so that he determined to exhibit his pictures in a place apart during the Great Exhibition of 1867. In a large gallery in the Avenue de l'Alma, half of which was occupied by Courbet, he hung no fewer than fifty paintings. Only one important picture was accepted. The Execution of the Emperor Maximilian; its exhibition was prohibited by the authorities. From that time, in spite of the fierce hostility of some adversaries, Manet's energy and that of his supporters began to gain the day. His "Young Girl" (Salon of 1868) was justly appreciated, as well as the portrait of Lola; but the "Balcony" and the "Breakfast" (1869) were as severely handled as the "Olympia" had been. In 1870 he exhibited "The Music Lesson" and a portrait of Mlle E. Gonzales. Not long before the Franco-Prussian War, Manet, finding himself in the country with a friend, for the first time discovered the true value of open air to the effects of painting in his picture "The Garden," which gave rise to the "open air" or plein air school. After fighting as a gunner, he returned to his family in the Pyrenees, where he painted "The Battle of the Kearsarge and the Alabama." His "Bon Bock" (1873) created a furore. But in 1875, as in 1869, there was a fresh outbreak of abuse, this time of the "Railroad," "Polichinelle," and "Argenteuil," and the jury excluded the artist, who for the second time arranged an exhibition in his studio. In 1876 his "Luncheon" was submitted to the Salon, but was rejected. The following works were exhibited at the Salon of 1881: "In the Conservatory," "In a Boat," and the portraits of Rochefort and Proust; and the Cross of the Legion of Honour was conferred on the painter on the 31st of December in that year. Manet died in Paris on the 20th of April 1883. He left, besides his pictures, a number of pastels and engravings. He illustrated Les Chats by Champfleury, and Edgar Allan Poe's The Raven.

See Zola, Manet (Paris, 1867); E. Bazire, Manet (Paris, 1884); G. Geoffroy, La Vie artistique (1893). (H. F.)

MANETENERIS, a tribe of South American Indians of the upper Purus river, and between it and the Jurua, north-western Brazil. They manufacture cotton cloth, and have iron axes and fish hooks. The men wear long ponchos, the women sacks open at the bottom. The Maneteneris are essentially a waterside people. Their cedarwood canoes are very long and beautifully made.

MANETHO (Манэта in an inscription of Carthage; Μανέθω in a papyrus), Egyptian priest and annalist, was a native of Sebennytos in the Delta. The name which he bears has a good Egyptian appearance, and has been found on a contemporary papyrus probably referring to the man himself. The evidence of Plutarch and other indications connect him with the reigns of Ptolemy I. and II. His most important work was an Egyptian history in Greek, for which he translated the native records. It is now only known by some fragments of narrative in Josephus's treatise Against Apion, and by tables of dynasties and kings with lengths of reigns, divided into three books, in the works of Christian chroniclers. The earliest and best of the latter is Julius Africanus, besides whom Eusebius and
some falsifying apologists offer the same materials; the chief text is that preserved in the Chronographia of Georgius Syncellus. It is difficult to judge the value of the original from these extracts; it is clear from the different versions of the lists that they have been corrupted. Manetho's work was probably based on native lists like that of the Turin Papyrus of Kings: even his division into dynasties may have been derived from such. The fragments of narrative give a very confused idea of Egyptian history in the time of the Hyksos and the XVIIIth Dynasty. The royal lists, too, are crowded with errors of detail, both in the names and order of the kings, and in the lengths attributed to the reigns. The brief notes attached to some of the names may be derived from Manetho's narrative, but they are chiefly references to kings mentioned by Herodotus or to marvels that were supposed to have occurred: they certainly possess little historical value. A puzzling annotation to the name of Bocchoris, "in whose time a lamb spake 900 years," has been well explained by Krael's reading of a demotic story written in the twenty-third year of Augustus. According to this a lamb prophesied that after Bocchoris's reign Egypt should be in the hands of the oppressor 900 years; in Africanus's day it was necessary to lengthen the period in order to keep up the spirits of the patriots after the stated term had expired. This is evidently not from the pure text of Manetho. Notwithstanding all their defects, the fragments of Manetho have provided the accepted scheme of Egyptian dynasties and have been of great service to scholars ever since the first months of Champollion's decipherment.

Krael in Festgaben für Bodinger (Innsbruck, 1898); Grenfell and Hunt, El Hibeh Papyri, i. 223; also the section on chronology in Egypt, and generally books on Egyptian history and chronology.

F. L. G.

MANFRED (c. 1225-1266), king of Sicily, was a natural son of the emperor Frederick II. by Bianca Lanegra, or Lanzea, who is reported on somewhat slender evidence to have been married to the emperor just before his death. Frederick himself appears to have regarded Manfred as legitimate, and by his will named him as prince of Tarentum and appointed him as the representative in Italy of his half-brother, the German king, Conrad IV. Although only about eighteen years of age Manfred acted loyally and with vigour in the execution of his trust, and when Conrad appeared in southern Italy in 1253 his authority was quickly and generally acknowledged. When in May 1254 the German king died Manfred became the accepted head of the antipapal party. Innocent IV., accepted the regency on behalf of Conradin, the infant son of Conrad. But the strength of the papal party in the Sicilian kingdom rendered the position of the regent so precarious that he decided to open negotiations with Innocent. By a treaty made in September 1254, Apulia passed under the authority of the pope, who was personally conducted by Manfred into his new possession. But Manfred's suspicions being aroused by the demeanour of the papal retinue, he fled to the Saracens at Lucera. Aided by Saracen allies, he defeated the papal troops at Francavilla on the 3rd of December 1254, and soon established his authority over Sicily and the Sicilian possessions on the mainland.

Taking advantage in 1258 of a rumour that Conradin was dead, Manfred was crowned king of Sicily at Palermo on the 10th of August in that year. The falsehood of this report was soon manifest; but the new king, supported by the popular voice, declined to abdicate, and pointed out to Conradin's envoys the necessity for a strong native ruler. But the pope, to whom the Saracen alliance was a serious offence, declared Manfred's coronation void and pronounced sentences of excommunication. Undeterred by this sentence Manfred sought to obtain power in central and northern Italy, and in conjunction with the Gibellines his forces defeated the Guelphs at Monte Aperto on the 4th of September 1260. He was then recognized as protector of Tuscany by the citizens of Florence, who did homage to his representative, and he was chosen senhor of the Romans by a faction in the city. Terrified by these proceedings, Pope Urban IV. implored aid from France, and persuaded Charles count of Anjou, a brother of King Louis IX., to accept the investiture of the kingdom of Sicily at his hands. Hearing of the approach of Charles, Manfred issued a manifesto to the Romans, in which he not only defended his rule over Italy but even claimed the imperial crown. The rival armies met near Benevento on the 26th of February 1266, where, although the Germans fought with undaunted courage, the cowardice of the Italians quickly brought destruction on Manfred's army. The king himself, refusing to fly, rushed into the midst of his enemies and was killed. Over his body, which was buried on the battlefield, a huge heap of stones was placed, but afterwards with the consent of the pope the remains were unearthed, cast out of the papal territory, and interred on the banks of the Liris. Manfred was twice married. His first wife was Beatrice, daughter of Amadeus IV. count of Savoy, by whom he had a daughter, Constance, who became the wife of Peter III. king of Aragon; and his second wife, who died in prison in 1271, was Helena, daughter of Michael II. despot of Epirus. Contemporaries praise the noble and magnanimous character of Manfred, who was renowned for his physical beauty and intellectual attainments.

Manfred forms the subject of dramas by E. B. S. Raupach, O. Marbach and F. W. Rogge. Three letters written by Manfred are published in J. B. R. Palmaro, Papyri, vol. III (Palermo, 1732). See Cesare, Storia di Manfredi (Naples, 1837); Münch, König Manfred (Stuttgart, 1840); Riccio, Alcuni studi storici intorno a Manfredi e Condrom (Naples, 1850); F. W. Schirrmacher, Die letzten Hohenstaufen (Gottingen, 1871); Capasso, Historia diplomatica regni Siciliae (Naples, 1874); A. Karst, Geschichte Manfreds vom Tode Friedrichs II. bis zu seiner Krönung (Berlin, 1897), and K. Hampe, Urban IV. und Manfred (Heidelberg, 1905).

MANFREDONIA, a town and archiepiscopal see (with Viesti) of Apulia, Italy, in the province of Foggia, from which it is 225 m. N.E. by rail, situated on the coast, facing E., 13 ft. deep, on the south of the Strait of Manfredonia, and giving its name to the gulf to the east of it. Pop. (1901), 11,540. It was founded by Manfred in 1263, and destroyed by the Turks in 1620; but the medieval castle of the Angevins and parts of the town walls are well preserved. In the church of S. Domenico, the chapel of the Maddalena contains old paintings of the 14th century. Two miles to the south-west is the fine cathedral of S. Maria Maggiore di Siponto, built in 1117 in the Romanesque style, with a dome and crypt. S. Leonardo, nearer Foggia, belonging to the Teutoonic order, is of the same date. This marks the southern limit of the ancient Apulian coast, the harbour, Apri, which became a Roman colony in 194 B.C., and was not destroyed until in favour of Manfredonia until the 13th century, having become unhealthy owing to the stagnation of the water in the lagoons. See A. Beltramelli, Il Garagone (Bergamo, 1907).

MANGABEY, a name (probably of French origin) applied to the West African monkeys of the genus Cercocebus, the more typical representatives of which are characterized by their bare, flesh-coloured upper eye-lids, and the uniformly coloured hairs of the fur. (See Primates.)

MANGALIA, a town in the department of Constantza Rumania, situated on the Black Sea, and at the mouth of a small stream, the Mangalia, 10 m. N. of the Bulgarian frontier. Pop. (1900), 1450. The inhabitants, among whom are many Turks and Bulgarians, are mostly fisherfolk. Mangalia is to be identified with the Thracian Kallatis or Acervetus, a colony of Miletus which continued to be a flourishing place to the close of the Roman period. In the 14th century it had 30,000 inhabitants, and a large trade with Genoa.

MANGALORE, a seaport of British India, administrative headquarters of the South Kanara district of Mahrara, and terminus of the west coast line of the Madras railway. Pop. (1901), 44,108. The harbour is formed by the backwater of two small rivers. Vessels ride in 24 to 30 ft. of water, and load from and unload into lighters. The chief exports are coffee, cocoa-nut products, timber, rice and spices. Mangalore clears and exports all the coffee of Coorg, and trades directly with Arabia and the
Mangan — Manganese

Persian Gulf. There is a small shipbuilding industry. The town has a large Roman Catholic population, with a European bishop, several churches, a convent and a college. It is the headquarters of the Basle Lutheran mission, which possesses one of the most active printing presses in southern India, and has also successfully introduced the industries of weaving and the manufacture of tiles. Two colleges (Government and St. Aloysius) are situated here. Mangalore was gallantly defended by Colonel John Campbell of the 5th regiment from May 1783, to January 30, 1784, with a garrison of 1850 men, of whom 412 were English, against Tippoo Sultan’s whole army.

MANGAN, JAMES CLARENCE (1803-1849). Irish poet, was born in Dublin on the 1st of May 1803. His baptismal name was James, the “Clarence” being his own addition. His father, a grocer, who boasted of the terror with which he inspired his children, had ruined himself by imprudent speculation and extravagant hospitality. The burden of supporting the family fell on James, who entered a scrivener’s office, at the age of fifteen, and drudged as a clerk. Various occupations he has been employed for some time in the library of Trinity College, and in 1833 he found a place in the Irish Ordnance Survey. He suffered a disappointment in love, and continued ill health drove him to the use of opium. He was habitually the victim of hallucinations which at times threatened his reason. For Charles Maturin, the eccentric author of Melmoth, he cherished a deep admiration, the results of which are evident in his prose stories. He belonged to the Comet Club, a group of youthful enthusiasts who carried on war in their paper, the Comet, against the levying of tithes on behalf of the Established Church, and the Papists. Contributions to the Dublin Penny Journal followed; and to the Dublin University Magazine he sent translations from the German poets. The mystical tendency of German poetry had a special appeal for him. He chose poems that were attuned to his own melancholy temperament, and did much that was excellent in this field. He also wrote versions of old Irish poems, though his knowledge of the language, at any rate at the beginning of his career, was but slight. Some of his best-known Irish poems, however, O’Hussey’s Ode to the Magpie, for instance, follow the originals very closely. Besides these were “translations” of Arabic, Turkish and Persian. How much of these languages he knew is uncertain, but he had read widely in Oriental subjects, and some of the poems are exquisite though the original authors whom he cites are frequently mythical. He took a mischievous pleasure in mystifying his readers, and in practising extraordinary metres. For the Nation he wrote from the beginning (1842) of its career, and much of his best work appeared in it. He afterwards contributed to the United Irishman. On the 20th of June 1849 he died at Meath Hospital, Dublin, of cholera. It was alleged at the time, that starvation was the real cause. This statement was untrue, but there is no doubt that his wretched poverty made him ill able to withstand disease.

Mangan holds a high place among Irish poets, but his fame was deferred by the inequality and mass of his work, much of which was lay buried in inaccessible newspaper files under his many pseudonyms, “Vacus,” “Tetra Filius,” “Clarence,” &c. Of his genius, morbid though it sometimes is, as in his tragic autobiographical ballad of The Nameless One, there can be no question. He expressed with rare sincerity the tragedy of Irish hopes and aspirations, and he furnished abundant proof of his versatility in his excellent nonsense verses, which are in strange contrast with the general trend of his work.

An autobiography which appeared in the Irish Monthly (1822) does not reproduce the real facts of his career with any fidelity. For some time after his death there was no adequate edition of his works, but the Dublin Anthology (1845), and The Poets and Poetry of Munster (1849) had included thirty of his ballads in his Romances and Ballads of Ireland. Other selections appeared subsequently, notably one (1857), by Miss L. V. B. Cryer. The Poems of James Clarence Mangan (1831) and the Prose Writings (1904), were both edited by D. J. O’Donoghue, who wrote in 1897 a complete account of the Life and Writings of the poet.

MANGANESE [symbol Mn; atomic weight, 54.93 (O = 16)], a metallic chemical element. Its dioxide (pyrolusite) has been known from very early times, and was at first mistaken for a magnetic oxide of iron. In 1740 J. H. Pott showed that it did not contain iron and that it yielded a definite series of salts, whilst in 1774 C. Scheele proved that it was the oxide of a distinct metal. Manganese is found widely distributed in nature, being generally found to a greater or less extent associated with the carbonates and silicates of iron, calcium and magnesium, and also as the minerals braunite, hausmanite, psilomelane, and hauserite. It has also been recognized in the atmosphere of the sun (A. Cornu, Comptes rendus, 1878, 86, pp. 315, 530), in sea water, and in many mineral waters.

The metal was isolated by J. G. Gahn in 1774, and in 1807 J. F. John (Gehlen’s Jour. chem. phys., 1807, 3, p. 452) obtained an impure metal by reducing the carbonate at a high temperature with charcoal, mixed with a small quantity of oil. R. Bunsen prepared the metal by electrolyzing manganese chloride in a porous cell surrounded by a carbon crucible containing hydrochloric acid, when the method has been employed for the isolation of the metal. C. Brunner (Pogg. Ann., 1857, 101, p. 264) reduced the fluoride by metallic sodium, and E. Glatzel (Ber., 1889, 22, p. 2857) the chloride by magnesium, H. Moissan (Ann. Chim. Phys., 1896 (7) 9, p. 280) reduced the oxide with carbon in the electric furnace; and H. Goldschmidt has prepared the metal from the oxide by means of his “thermite” process (see Chromitum). W. H. Green and W. H. Wahl (German patent 70773 (1893)) prepare a 97% manganese from pyrolusite by heating it with 30% sulphuric acid, the product being then converted into manganese oxide by heating in a current of reducing gas at a red hot heap. Vreded in a reducing atmosphere, and finally reduced by heating with granulated aluminium in a magnesia crucible with lime and fluor spar as a flux. A purer metal is obtained by reducing manganese amalgam by hydrogen (O. Prelinger, Monats., 1894, 14, p. 353).

Prelinger’s manganese has a specific gravity of 7.42, and the variety obtained by distilling pure manganese amalgam in vacuo is pyrophoric (A. Guntz, Bull. Soc. [3], 7, 275), and burns when heated in a current of sulphur dioxide. The pure metal readily evolves hydrochloric when acted upon by sulphuric and hydrochloric acids, and is readily attacked by dilute nitric acid. It precipitates many metals from solutions of their salts. It is employed commercially in the manufacture of special steels. (See Iron and Steel.)

Compounds

Manganese forms several oxides, the most important of which are manganese oxide, MnO, trimanganese tetroxide, Mn3O4, manganese sesquioxide, Mn2O3, manganese dioxides, MnO2, manganese trioxide, Mn2O3, and manganese sesquioxide. Manganese dioxide, MnO2, is obtained by heating a mixture of anhydrous manganese chloride and sodium carbonate with a small quantity of ammonium chloride (J. v. Liebig and F. Wöhler, Pogg. Ann., 1839, 21, p. 583); or by reducing the higher oxides with hydrogen or carbon monoxide. It is a dark coloured powder of specific gravity 5.09. Manganese hydroxide, Mn(OH)2, is obtained as a white precipitate on adding a solution of a caustic alkali to a manganese salt; the preparation of the crystalline variety identical with the mineral pyrochlore (see A. de Schulten, Comptes rendus, 1887, 105, p. 1265). It rapidly oxidizes on exposure to air and turns brown, going ultimately to the sesquioxide. Manganese sesquioxide, Mn2O3, is reduced more or less pure when the other oxides are heated. It may be obtained crystalline by heating manganese sulphate and potassium nitrate at a bright red heat (H. Delaray, Comptes rendus 1861, 52, p. 985). It is a reddish-brown powder, which when heated with hydrochloric acid yields chlorine. Manganese sesquioxide, Mn2O3, found native as the mineral braunite, may be obtained in considerable quantity in the other oxides by heating a mixture containing not more than 26% of the latter gas (W. Dittmar, Jour. Chem. Soc., 1864, 17, p. 294). The hydrated form, found native as the mineral magnesium, is obtained by the spontaneous oxidation of manganese hydroxide. In the hydrated condition it is a dark brown powder which readily loses water at above 100° C., it dissolves in hot nitric acid, giving manganese nitrate and manganese dioxide; Mn2O3 + 2HNO3 = Mn(NO3)2 + MnO2 + 2H2O. Manganese dioxide, or pyrolusite (g.), MnO2, the most important oxide, may be prepared by heating crystallized manganese nitrate until red fumes are given off, decanting the clear liquid, and heating to 150° to 200° C. for 40 to 60 hours (A. Gorgen, Bull. Soc., 1890 [3], 4, p. 16).
or by heating manganese carbonate to 265 °C in the presence of air and washing the residue with very dilute cold hydrochloric acid. Manganese Dioxide, MnO₂, readily loses a portion of its weight strongly heated, leaving a residue of Mn₃O₄. When heated with concentrated hydrochloric acid it yields chlorine, and with concentrated sulphuric acid it yields oxygen. It is reduced to the monoxide which is converted into the dioxide by oxygen. Manganese dioxide, Mn₃O₄, dissolves in cold concentrated hydrochloric acid, forming a dark brown solution which probably contains manganic chloride (see R. J. Meyer, Zeit. anorg. Chem., 1899, 22, p. 169; G. Neumann, M. Schott, and R. Franke, Jour. prak. Chem., 1896, 11, p. 1). It is a yellow-brown, glassy, highly crystalline hydrated manganese dioxide owing to the readiness with which it loses oxygen, leaving residues of the type xMnO·yMnO₂. Such mixtures, or hydrates, as it is frequently called, are used in the manufacture of manganic salts, or by suspending manganese carbonate in water and passing chlorine through the mixture. The solid matter is filtered off washed with water, and warmed with 10% nitric acid (A. Gorten). It is then filtered off and washed. Manganese carbonate, MnCO₃, is prepared by gradually heating at 138 °C a mixture of concentrated sulphuric and manganese dioxide until the whole becomes of a dark green colour. The excess of acid is removed by spreading the mass on a porous plate and adding residue to the original quantity of acid, again spread on a porous plate, and finally dried quickly at about 130 °C. It is a dark green deliquescent powder which decomposes on heating or just beginning to fuse to a greenish brown. It is readily decomposed by dilute acids.

With potassium sulphate in the presence of sulphuric acid it forms potassium manganese alum, K₂SO₄·Mn(SO₄)₂·2H₂O. A. Piccini (Zeit. anorg. Chem., 1898, 17, p. 355) has also obtained a compound, Mn₂Al₂O₄·3H₂O, which, when heated, is decomposed by the action of fluorine on manganous chloride, is decomposed by heat into manganous fluoride and fluorine. By suspending the dioxide in carbon tetrachloride and passing carbon tetrachloride gas, W. B. Holmes (Abst. J.C.S., 1907, ii, p. 873) obtained a black trichloride and a reddish-brown tetrachloride.

Manganese Carbide, Mn₃C, is prepared by heating manganous oxide with sugar charcoal in an electric furnace, or by fusing manganous chloride and calcium carbonate. Water decomposes it, giving methane and hydrogen (H. Moissan; Mn₃C·6H₂O = 3MnO+3H₂). It is used as a reducing agent.

Manganese—Those salts are derived from manganic acid H₂MnO₄. Those of the alkali metals are prepared by fusing manganese dioxide with sodium or potassium hydroxide in the presence of H₂O to form a dark pasty mass. On cooling and evaporation, manganous carbonate is precipitated. This is dissolved in dilute acid and poured on ammonia lustrous, pure, or light-colour white precipitate. It is used in the manufacture of manganous salts.

Manganous Chloride, MnCl₂·4H₂O, is prepared by dissolving manganese dioxide in hydrochloric acid, allowing the solution to cool, and then evaporating to dryness. This gives a white crystalline product, which is used in the manufacture of manganous salts.

Manganous Sulphate, MnSO₄·4H₂O, is prepared by slowly heating a mixture of manganese dioxide and sulphuric acid in the presence of air and then evaporating the resulting solution to dryness. The resulting product is used in the manufacture of manganous salts.

Manganous Nitrate, Mn(NO₃)₂·6H₂O, is prepared by dissolving manganese dioxide in nitric acid and concentrating the solution, crystallizing from nitric acid solutions in long colourless needles, which melt at 23-8 °C and boil at 245-6 °C. It is used in the manufacture of manganous salts.

Manganous Chloride, MnCl₂·4H₂O, is prepared by slowly heating a mixture of manganese dioxide and sulphuric acid in the presence of air and then evaporating the resulting solution to dryness. The resulting product is used in the manufacture of manganous salts.

MANGANITE—MANG LÖN

If the plant be allowed to remain in the ground till the following year strong leafy angular aerial stems are developed, 3 ft. or more in height, which branch and bear the inflorescences. The flowers are arranged in dense sessile clusters subtended by a small bract, and resemble those of the true beet. The so-called seeds are clusters of spurious fruits. After fertilization the fleshy receptacle and the base of the perianth of each flower enlarge and the flowers in a cluster become united; the fleshy parts with the ovaries, each of which contains one seed, become hard and woody. Hence several seeds are present in one "seed" of commerce, which necessitates the careful thinning of a young crop, as several seedlings may spring from one "seed."

This plant is very susceptible of injury from frost, and hence in the short summer of Scotland it can neither be sown so early nor left in the ground so late as would be requisite for its mature growth. But it is peculiarly adapted for those southern parts of England where the climate is too hot and dry for the successful cultivation of the turnip. In feeding quality it rivals the swede; it is much relished by livestock—pigs especially doing remarkably well upon it; and it keeps in good condition till midsummer if required. The valuable constituent of mangel is dry matter which averages about 12% as against 11% in swedes. Of this two-thirds may be sugar, which only develops fully during storage. Indeed, it is only after it has been some months in the store heap that mangel becomes a palatable and safe food for cattle. It is, moreover, exempt from the attacks of the turnip beetle. On all these accounts, therefore, it is peculiarly valuable in those parts of Great Britain where the summer is usually hot and dry.

Up to the act of depositing the seed, the processes of preparation for mangel are similar to those described for the turnip; winter dunging being even more appropriate for the former than for the latter. The common drilling machines are easily fitted for sowing its large rough seeds, which should be sown from the beginning of April to the middle of May and may be deposited either on ridges or on the flat. The after culture is like that of the turnip. The plants are thinned out at distances of not less than 15 in. apart. Transplanting can be used for filling up of gaps with more certainty of success than in the case of swedes, but it is much more economical to avoid such gaps by sowing a little swede seed along with the mangel. Several varieties of the plant are cultivated—those in best repute being the long red, the yellow globe and the tankard, intermediate in shape. This crop requires a heavier dressing of manure than the turnip to grow it in perfection, and is much benefited by having salt mixed with the manure at the rate of 2 or 3 cwt. per acre. Nitrogenous manures are of more marked value than phosphatic manures. The crop requires to be secured in store heaps as early in the summer as possible, as it is easily injured by from melting rain. MANGLE. (1) A machine for pressing and smoothing clothes after washing (see LAUNDRY). The word was adopted from the Dutch; mangel-stok means a rolling pin, and ijmen mangelen, to press linen by rolling; similarly in O. Ital. mangano meant, according to Florio, "a press to press buckorn," &c.

The origin of the word is to be found in the medieval Latin name, manganum, mangerum or mangana, for an engine of war, the "mangonel," for hurling stones and other missiles (see CASTAULT). The Latin word was adapted from the Greek μαγγανός, a trick or device, cognate with μαγγανός, a machine. (2) To cut in pieces, to damage or disfigure; to mutilate. This word is of obscure origin. According to the New English Dictionary it presents an Anglo-French machanger, a form of mahoisner from which the English "main" is derived, cf. the old form "mayhem," surviving in legal phraseology. Skeat connects the word with the Latin manus, maimed, with which "main" is not cognate.

MANG LÖN, a state in the northern Shan states of Burma. It is the chief state of the Wa or Vö tribes, some of whom are head-hunters, and Mang Lön is the only one where annual war-relations exist. Estimated area, 3,000 sq. m.; estimated population, 40,000. The state extends from about 21° 30' to 25° N., or for 100 m. along the river
Salween. Its width varies greatly, from a mile or even less on either side of the river to perhaps 40 m. at its broadest part near Taklit, the capital. It is divided into East and West Mang Lôn, the boundary being the Salween. There are no Wa in West Mang Lôn. Shans form the chief population, but there are Palaungs, Chinese and Ylangam, besides Lahu. The bulk of the population in East Mang Lôn is Wa, but there are many Shans and Lahu. Both portions are very hilly; the only flat land is along the banks of streams in the valleys, and here the Shans are settled. There are prosperous settlements and bazaars at Nawng Hkam and Mông Kao in West Mang Lôn. The Wa of Mang Lôn have given up head-hunting, and many profess Buddhism. The capital, Taklit, is perched on a hill-top 6000 ft. above sea-level. The sawbwa is a Wa, and has control over two sub-states, Môt Hai to the north and Maw Hpa to the south.

MANGNALL, RICHMAL (1769-1820), English schoolmistress, was born, probably at Manchester, on the 7th of March 1769. She was a pupil and finally mistress of a school at Croxtone Hall, near Wakefield, Yorkshire, where she conducted most successfully until her death there on the 1st of May 1820. She was the author of Historical and Miscellaneous Questions for the Use of Young People (1800), generally known as “Mangnall’s Questions,” which was prominent in the education of English girls in the first half of the 19th century.

MANGO. The mango-tree (Mangifera indica, natural order Anacardiacese) is a native of tropical Asia, but is now extensively cultivated in the tropical and subtropical regions of the New as well as the Old World. It is indigenous in India at the base of the Himalayas, and in Further India and the Andaman Islands (see A. de Candolle, Origin of Cultivated Plants). The cultivation of the fruit must have spread at an early age over the Indian Peninsula, and it now grows everywhere in the plains. It grows rapidly to a height of 30 to 40 ft., and its dense, spreading and glossy foliage would secure its cultivation for the sake of its shade and beauty alone. Its fruit, a drupe, though in the wild variety (not to be confused with that of Spondias mangifera, belonging to the same order, also called wild mango in India) stringy and sour, from its containing much gallic acid, and with a disagreeable flavour of turpentine, has become sweet and luscious through culture and selection, to which we owe many varieties, differing not only in flavour but also in size, from that of a plum to that of an apple. When unripe, they are used to make pickles, tarts and preserves; ripe, they form a wholesome and very agreeable dessert. In times of scarcity the kernels also are eaten. The timber, although soft and liable to decay, serves for common purposes, and, mixed with sandal-wood, is employed in cremation by the Hindus. It is usually propagated by grafts, or by layering or inarching, rather than by seed.

MANGOSTEEN (Garcinia Mangostana), a tree belonging to the order Guttiferae. It is a native of the Malay Peninsula, and is extensively cultivated in southern Tenasserim, and in some places in the Madras presidency. Poor results have followed the attempt to introduce it to other countries; and A. de Candolle refers to it as one of the most local among cultivated plants both in its origin, habitation and cultivation. It belongs to a family in which the mean area of the species is very restricted. It is an evergreen about 20 ft. high, and is somewhat fir-like in general form, but the leaves are large, oval, entire, leathery and glistening. Its fruit, the much-valued mangosteen, is about the size and shape of an orange, and is somewhat similarly partitioned, but is of a reddish-brown to chestnut colour. Its thick rind yields a very aromatic juice, rich in tannin, and containing a gamboge-like resin. The soft and juicy pulp is snow-white or rose-coloured, and of delicious flavour and perfume. It is wholesome, and may be administered in fever. The genus Garcinia is a genus of trees containing about fifty species in the tropics of the Old World, and usually yielding a yellow gum-resin (gamboge). G. Morella, a native of India, yields the true gamboge.

MANGROVE. The remarkable “mangrove forests” which fringe tidal estuaries, overrun salt marshes, and line muddy coasts in the tropics of both Old and New Worlds, are composed of trees and shrubs belonging mainly to the Rhizophoraceae, but including, especially in the eastern mangrove formations of Further India and the Malay Archipelago, members of other orders of Diocleyledons, such as Lyrataceae (Sonnerata), Verbenaceae (Aristaea), and the acaulescent Nipa-palm. Their trunks and branches constantly emit adventitious roots, which, descending in arched fashion, strike at some distance from the parent stem, and send up new trunks, the forest thus spreading like a banyan grove. An advantage in dispersal, very characteristic of the order, is afforded by the seeds, which have a striking peculiarity of germination. While the fruit is still attached to the parent branch the long radicle emerges from the seed and descends rapidly towards the mud, where it may even establish itself before falling off. Owing to its clubbed shape, this is always in the right position; the plume then makes its appearance. An interesting feature of the mangrove is the air-roots, erect or knotted branches of the roots, which project above the mud, and are provided with minute openings (stomata or lenticels), into which the air passes and is then carried by means of passages in the soft spongy tissue to the roots which spread beneath the mud. The wood of some species is hard and durable, and the astringent bark is used in tanning. The fruit of the common mangrove, Rhizophora Mangle, is sweet and wholesome, and yields a light wine.

MANICHAEISM. Towards the close of the 3rd century two great religions stood opposed to one another in western Europe, one wholly Iranian, namely Mithraism, the other of Jewish origin, but not without Iranian elements, part and parcel probably of the Judaism which gave it birth, namely Christianity. Professor Franz Cumont has traced the progress of Mithraism all over the Balkan Peninsula, Italy, the Rhine-lands, Britain, Spain and Latin Africa. It was peculiarly the religion of the Roman garrisons, and was carried by the legionaries wherever they went. It was an austere religion, inculcating self-restraint, courage and honesty; it secured peace of conscience through forgiveness of sins, and abated for those who were initiated in its mysteries the superstitious terrors of death and the world to come. In these respects it resembled Christianity. Soldiers may have espoused it rather than the rival faith, because in the primitive age Christian discipline denied them the sacraments, on the ground that they were professional shedders of blood. The cumbersome mythology and cosmogony of Mithraism at last weakened its hold upon men’s minds, and it disappeared during the 4th century before a victorious Catholicism, yet not until another faith, equally Iranian in its mythology and cosmological beliefs, took its place. This new faith was that of Mani, which spread with a rapidity only to be explained by supposing that Mithraism had prepared men’s minds for its reception. Mani professed to blend the teachings of Christ with the old Persian Magism. Kessler, the latest historian of Manicheaism, opines that Mani’s own declaration on this point is not to be relied upon, and has tried to prove that it was rather of Semitic or Chaldaic origin. He certainly shows that the old Assyrian mythology influenced Mani, but not that this element did not reach him through Persian channels. In genuine Manichaean documents we only find the name Mani, but Manes, Manes, Manœst, Manichaens, meet us in 4th-century Greek and Latin documents. In the Acta Archelai his first name is said to have been Cubricus, in which Kessler explains as a corruption of Shuravik, a name common among the Arabs of the Syrian desert.

Life of Mani.—According to the Mahometan tradition, which is more trustworthy than the account contained in these Acta, Mani was a high-born Persian of Esbatana. The year of his birth is uncertain, but Kessler accepts as reliable the statement made by Biruni, that Mani was born in the year 557 of the astronomers of Babylon (A.D. 215–216). He received a careful education at Ctesiphon from his father Fatak, Babak or Patak (Ilarikos). As the father connected himself at a later period with the confession of the Moghulshik, or “Baptists,” in
southern Babylonia, the son also was brought up in the religious doctrines and exercises of this sect. These Baptists (see the *Fnhrist*) were apparently connected with the Elkesiates and the Hemerobaptists, and certainly with the Manicheans. It is probable that this Babylonian sect had absorbed Christian elements. That the chief objects of the sect were the suppression of, or reconciliation with, various forms of religion. If even a small part of the stories about his father is founded on fact, it was he who first introduced Mani to that medley of religions out of which his system arose. Mani- 
chaean tradition relates that Mani received revelations while yet a boy, and assumed a critical attitude towards the religious instruction that was being imparted to him. This is the more incredible since the same tradition informs us that the boy was as yet prohibited from making public use of his new religious views. It was only when Mani had reached the age of twenty-five or thirty that he commenced his public career as a Christian preacher. The later did at the court of the Persian king, Shāpūr I, and, according to the story, on the coronation day of that monarch (241 2). A Persian tradition says that he had previously been a Christian presbyter, but this is certainly incorrect. Mani did not remain long in Persia, but undertook long journeys for the purpose of spreading his religion, and also sent forth disciples. According to the Acta Archelai, his missionary activity extended westwards into the territory of the Christian church; but from Oriental sources it is certain that Mani rather went into Trans-

oxiana, western China, and south Asia, as far as India. His labours there as well as in Persia were not without result. Like Mahomet after him and the founder of the Elkesiates before him, he gave himself out for the last and highest prophet, who was to surpass all previous divine revelation, which only possessed a relative value, and to set up the perfect religion. In the closing years of the reign of Shāpūr I. (c. 270) Mani returned to the Persian capital, and gained adherents even at court. But the dominant priestly caste of the Magians, on whose support the king was dependent, were naturally hostile to him, and after some opposition Mani was driven out. The successor of Shāpūr, Hārmizd (272 273), appears to have been favourably disposed towards him, but Bahram I. abandoned him to the fanaticism of the Magians, and caused him to be crucified in the capital in the year 276 7. The corpse was flayed, and Mani's adherents were cruelly persecuted by the king.

**Mani's Writings.**—Mani himself composed a large number of works and epistles, which were in great part still known to the Manicheans long after his death, but are now lost. Heads of the Manichean churches also wrote religious treatises, so that the ancient Manichean literature must have been very ex-
tensive. According to the *Fnhrist*, Mani made use of the Persian and Syriac languages. Like the Oriental Magians, his head, he invented an alphabet of his own, which the *Fnhrist* has handed down to us. In this alphabet the sacred books of the Manichees were written, and the *Archelai* reckons seven principal works of Mani, six being in the Syriac and one in the Persian language; regarding some of these we also have information in Epiphanius, Augustine, Titus of Bostra, and Photius, as well as in the formula of abjuration (Cotelerius, *PP. Apost. Op. i. 543*) and in the Acta Archelai. They are (1) The Book of Secrets (see Acta Archelai), containing discussions bearing on the Christian sects spread throughout the East, especially the Marcionites and Bardesanites, and dealing also with their conception of the Old and New Testaments; (2) The Book of the Giants (Demons?); (3) The Book of Precepts for Hearers (probably identical with the Episto

l Fundament of Augustine and with the 1st Chapters of Ephipan

eus and the Acta Archelai; this was the most widely spread and most popular Manichean work, having been translated into Greek and Latin, and contains (in a short summary of all the doctrines of fundamental authority) : (4) The Book Shabdāpurāt (Filag was unable to explain this name; according to Kessler it signifies "epistle to King Shāpūr"; the treatise was of an eschatological character; (5) The Book Bērūk *) (Kessler explains him with the "Thesaurus [vita]" of the Acta Archelai, Epiphanius, Photius, and Augustine, and if this be correct it also must have been in use among the Latin Manicheans); (6) The Book sūpaurēs (of un-

known meaning), a later work in the Manichean system which is not given in our present text of the *Fnhrist*, but which is in all probability identical with the "holy gospel" of the Manichees (Marcionites, Archelai and other authorities). It was this work which the Manicheans set up in opposition to the Gospels. Besides these principal works, Mani also wrote a large number of smaller treatises and epistles. The practice of writing epistles was continued by his successors. These Manichean dis-

sertations also became known in the Graeco-Roman Empire, and existed in collections.1 There also existed a Manichean book of memorabilia, and of prayers, in Greek, as well as many others,2 of which were destroyed by the Christian bishops acting in con-

junction with the authorities. A Manichean epistle, addressed to one Marcellus, has, however, been preserved for us in the Acta Archelai.3

**Manichean System.**—Though the leading features of Mani-
chaeism can be exhibited clearly even at the present day, and though it is undoubted that Mani himself drew up a complete system, many details are nevertheless uncertain, since they are differently described in different sources, and it often remains doubtful which of the accounts that have been transmitted to us represents the original teaching of the founder.

The Manichean system is one of consistent, uncompromising dualism, in the form of a fantastic philosophy of nature. The physical and the ethical are not distinguished, and in this respect the character of the system is thoroughly material-

istic; for when Mani co-ordinates good with light, and evil with darkness, this is no mere figure of speech, but light is actually good and darkness evil. From this it follows that religious knowledge involves the knowledge of nature and the, and the latter knowledge is important, and the latter process of freeing the element of light from the darkness. Under such circumstances ethics becomes a doctrine of abstinence in regard to all elements which have their source within the sphere of darkness.

The self-contradictory character of the present world forms the point of departure for Mani's speculations. This contra-
diction presents itself to his mind primarily as elemental, and only in the second instance as ethical, inasmuch as he considers the sensual nature of man to be the outflow of the evil elements in the world. From the history of creation it appears that he concludes the existence of two beings, originally quite separate from each other—light and darkness. Each is to be thought of according to the analogy of a kingdom. Light presents itself to us as the good prinal spirit (God, radiant with the ten [twelve] virtues of love, faith, fidelity, high-mindedness, wisdom, meekness, knowledge, understanding, mystery and insight), and then further as the heavens of light and the earth of light, with their guardians the glorious aeons. Darkness is likewise a spiritual kingdom (more correctly, it also is con-

ceived as a spiritus mundi in Mani's system). The father of all things in the world, according to Mani, has no "God" at its head. It embraces an "earth of darkness." As the earth of light has five tokens (the mild zephyr, cooling wind, bright light, quickening fire, and clear water), so has the earth of darkness also five (mist, heat, the sirocco, darkness and vapour). Satan with his demons was born from the kingdom of darkness. These two kingdoms stood opposed to each other from all eternity, touching each other on one side, but remaining unmingled. Then Satan began to rage, and made an incursion into the kingdom of light, into the earth of light. The God of light, with his spirit, "the spirit of his right hand," now begot the primal man, and sent him, equipped with the five pure elements, to fight against Satan. But the latter proved himself the stronger, and the primal man was for a moment vanquished. As in the life of light himself now took to the field, and with the help of new aeons (the spirit of life, etc.) inflicted total defeat upon Satan, and set the

1 A βιβλίον προφητικὸν is spoken of in the formula of abjuration, and an *Epistola ad virginem Menoch* by Augustine. Fabrius has collected the "Greek Fragments of Manichean Epistles" in his

2 The Canticum ammoni is cited by Augustine.

3 Zittwitz assumes that this epistle was in its original form of much larger extent, and that the author of the *Acts* took out of it the matter for the speeches which he makes Mani deliver during his dispute with Bishop Archelaus. The same scholar traces back the account by Turbo in the *Acts*, and the historical data given in the fourth section, to the writings of Turbo, a Mesopotamian, who is assumed to have been a Manichean renegade and a Christian. But as to this difference of opinion is at least allowable.
MANICHAEISM

promal man free; the latter had already been robbed of part of his light by the darkness, and the five dark elements had already mingled themselves with the generations of light. It only remained now for the primal man to descend into the abyss and prevent the further increase of the darkness by cutting off its roots; but it could not immediately separate against the elements that had once mingled. These mixed elements are the elements of the present visible world, which was formed from them at the command of the God of light. The forming of the world is in itself the beginning of the deliverance of the imprisoned elements of light. The world is represented as an orderly structure of various heavens and various worlds, which is borne and supported by the aevos, the angels of light. It possesses in the sun and moon, which are in their nature almost quite pure, large reservoirs, in which the portions of light that have been rescued are stored up. In the sun dwells the primal man himself, as well as the glorious spirits which carry on the work of redemption; in the moon the mother of life is enthroned. The twelve constellations of the zodiac form an ingenious machine, a great wheel with buckets, which pour into the sun and moon, those shining ships that sail continually through space, the portions of light set free from the world. Here they are purified anew, and attain finally to the kingdom of pure light and to God Himself. The later Western Manichaeans termed those portions of light which are occupied throughout the course of the world and its elements and organisms—waiting their deliverance, the Jesus putibilis.

It is significant of the materialistic and pessimistic character of the system that, while the formation of the world is considered as a work of the good spirits, the creation of man is referred to the princes of darkness. The first man, Adam, was engendered by Satan in conjunction with "sin," "cupidity," "desire." But the spirit of darkness drove into him all the portions of light that he had stolen, in order to be able to dominate through the darkness. The being created in the image of Adam by the darkness, Eve, the offspring of Adam by Eve, thus did mankind come into existence, its various members possessing very different shares of light, but the men having uniformly a larger measure of it than the women. In the course of history the demons sought to bind men to themselves by means of sensuality, error and false religions (among which is to be reckoned above all the religion of Moses and the prophets), while the spirits of light cared on their process of distillation with the view of gaining the pure light which exists in the world. But these good spirits can only save men by imparting to them the true gnosia concerning nature and her forces, and by calling them away from the service of darkness and sensuality. To this end prophets, preachers of true knowledge, have been sent into the world. Mani, following the example of the gnostic Jewish Christians, appears to have held Adam, Noah, Abraham (perhaps Zoroaster and Buddha) to be such prophets. Probably Jesus was also accounted a prophet who had descended from the world of light; however, the historical Jesus, the devilish Messiah of the Jews, but a contemporaneous phantom Jesus, who neither suffered nor died (Jesus putibilis). According to the teaching of some Manichaeans, it was the primal man who disseminated the true gnosia in the character of Christ. But at all events Mani himself, on his own claim, is to be reckoned the last and greatest prophet, who took up the work of Jesus putibilis and of Paul (for he too finds recognition), and first brought full knowledge. He is the "leader," the "ambassador of the light," the "Paraclete." It is only through his agency and that of his imitators, "the elect," that the separation of the light from the darkness can be completed. The system contains very fantastic descriptions of the processes by which the light and darkness are separated. But the decisive act is to be found in the person of the God of light. He who during his lifetime did not become one of the elect, who did not completely redeem himself, has to go through a severe process of purification on the other side of the grave, till he too is gathered to the blessedness of the light. It is erroneous, however, to ascribe, as has been done, a doctrine of transmigration to the Manichaeans. Of course men's bodies as well as the souls of the unsaved, who according to the oldest conception have in them no light whatever, fall under the sway of the powers of darkness. A later view, adopted by the Christian Church, was that the souls in the unsaved as actually becoming lost. When the elements of light have at last been completely, or as far as possible, delivered from the world, the end of all things comes. All glorious spirits assemble, the God of light himself appears, accompanied by the aevos and the perfected just ones. The angels supporting the world withdraw themselves from their burden, and everything falls in ruins. A tremendous conflagration consumes the world; the perfect separation of the two powers takes place once more; high above is the kingdom of God, and the world is no more. God is all in all, and deep below is the (? now powerless) darkness. Ethic, Social Polity and Worship of the Manichaeans.—On the basis of such a cosmical philosophy, ethics can only have a dualistic ascetic character. Manichaeus ethics is not merely negative, however, since it is necessary to cherish, strengthen and purify the elements of light, as well as free oneself from the elements of darkness. The aim is not self-destruction, but self-preservation; and the ethics of Manichaeism appears in point of fact as thoroughly ascetic. The Manichaeans had, above all, to refrain from sensual enjoyment, shutting himself up against it by three seals—the signaculum oris, manus and stinutius. The signaculum oris forbids all kind of sensuality, strictly prohibited were drinking, eating, kissing, &c.—vegetable diet being allowed because plants contained more light, though the killing of plants, or even plucking their fruit and breaking their twigs, was not permitted), as well as all impure speech. The signaculum manus prohibits all traffic with things generally, in so far as they carry in them elements of darkness. Finally, by the signaculum stinutius every gratification of sexual desire, and hence marriage, are forbidden. Besides all this, life was further regulated by an exceedingly rigorous system of fasts. Certain astronomical conjunctions determined the selection of the fast-days, which in their total number amounted to nearly a quarter of the year. On these days Manichaeans kept a strictly early Saturday, and the practice was also generally observed on Monday. Hours of prayer were determined with equal exactness. The Manichaeans had to pray at least three times a day. The worshipper turned towards the sun, or the moon, or the north, as the seat of light; but it is erroneous to conclude from this, as has been done, that in Manichaeism the sun and moon were themselves objects of worship. Forms of prayer used by the Manichaeans have been preserved to us in the Fihrist. The prayers are addressed to the God of light, to the whole kingdom of light, to the glorious angels, and to Mani himself, who is apostrophized in them as "the great tree, which is all salvation." According to Kessler, these prayers are closely related to the Mandaic and the ancient Babylonian hymns. An asceticism so strict and painful as that demanded by Manichaeism could only be practised by few; hence the religion must have abandoned all attempts at an extensive propaganda, and had it not conceded the principle of a twofold morality. A doctrine of separation, made in the first instance for the community of the perfect Manichaeans, and the catechumeni (auditors), the secular Manichaeans. Only the former submitted themselves to all the demands made by their religion; for the latter the stringency of the precepts was relaxed. They had to avoid idolatry, sorcery, avarice, falsehood, fornication, &c.; above all, they were not allowed to kill any living being (the ten commandments of Mani). They had also to abstain from the possession of goods, and to profess in truth they lived very much as their non-Manichaeum fellow-citizens. We have here essentially the same condition of things as in the Catholic Church, where a twofold morality was also in force, that of the ecclesiastic and of the ordinarie. The position of the electi in Manichaeism was a more distinguished one than that of the monks in Catholicism. For, after all, the Christian monks never quite forgot that the church was by God the Church Christ, and that the Manichaean elect were actually themselves redeemers. Hence it was the duty of the auditors to pay the greatest respect and most assiduous attention to the
MANICHAEISM

575
electi. These “perfect ones,” wasting away under their asceticism, were objects of admiration and of the most elaborate solicitude. For the regular electi, as well as for those of the second rank who were called the electi set free, the portions of light from the vegetables. They prayed for the auditores, they blessed them and interceded for them, thereby shortening the process of purification the latter had to pass through. The auditores had a full knowledge of religious truths, a point of distinction from Catholicism.

The distinction between electi and auditores, however, does not exist in the conception of the Manichean Church; on the contrary, the latter possessed a hierarchy of three ranks, so that there were altogether five gradations in the community. These were regarded as a copy of all the ranks of light from the vegetables. At the head stood the teachers ("the sons of meekness," Mani himself and his successors); then follow the administratores ("the sons of knowledge," the bishops); then the elders ("the sons of understanding," the presbyters); lastly, the auditores ("the sons of insight"). The number of the electi must always have been small. According to Augustine the teachers were twelve and the bishops seventy-two in number. One of the teachers appears to have occupied the position of superiority at the head of the whole Manichean Church. At least Augustin speaks of such a personage, and the Fhrist also has knowledge of a chief of all Manicheans. The constitution, therefore, had a monarchical head.

The worship of the Manicheans must have been very simple, and must have consisted either in the hyms, and prayers of adoration. This simple service promoted the secret dissemination of their doctrine. The Manicheans too, at least, in the West, appear to have adapted themselves to the Church's system of the Church festival. The chief festival with all classes was the Bema (Bhuma), the feast of the "teacher's chair," held in commemoration of the death of Mani in the month of March. The faithful prostrated themselves before an adorned but empty chair, which was raised upon a podium of five steps. Long fasts accompanied the feasts. The Christian and Mahomedan historians could learn little of the Manichean mysteries and "sacraments," and hence the former charged them with obscene rites and abominable usages. It may be held as undoubted that the later Manicheans celebrated mysteries analogous to Christian baptism and the Lord's Supper, which may have been borrowed from the ancient Persian rite and ceremonies instituted by Mani himself and having their origin in nature-worship.

Recent Discoveries.—F. Cumont (Revue d'histoire et de littérature religieuse, t. xii, 1907, No. 2) showed that one at least of the fundamental myths of Mani was borrowed from the Avesta, namely, that which recounts how through the manifestation of the virgin of light and of the messenger of salvation to the luminous princes of darkness the vital substance of light held captive in their limbs was liberated and recovered for the realm of light. The legend of the Omophorus and Suni-Mani, in which earth and lustrous heavens on their respective shoulders, even if it elsewhere occurs in the cuneiform texts of Assyria, is yet to be traced in Manichean has-reliefs. It also may therefore have come to Mani through Magian channels.

When, however, we turn to the numerous fragments of authentic Manichean liturgies and hymns lately discovered in Turfan in East Turkestan, Mani's direct indebtedness to the cycle of Magian legends rather than to Chaldœa sources (as Kessler argued) is clearly exhibited.

In fr. 472, taken from the Sháhrínán, as part of a description of the sun-god in his ship or reservoir the sun, we have a mention of Az and Ahriman and the devas (demons), the Pairaks. Az in the Avestan mythology was the demon serpent who murders God, and is an ally of Ahriman, as also are the Pairaks. It is in fact the same as the ruin of Ažidahāko Māsāinyaya, which name Darmesteter interprets in the Persian sources as the demon serpent, the sorcerer (Ormazd et Ahriman, Paris, 1879, p. 157). In fr. 469, descriptive of the configuration of the world, we read of how, after Až and the demons have been struck down, the pious man is purified and led up to sun and moon and to the being of Ahura Mazda, the Divine.

In fr. 368, descriptive of a scene of judgment, the sun is described as the "first stranger" (cf. Matt. xxv. 43), the son of the god Zavran, the Ruler-Child. In the orthodox literature of fire-worship Zavran was the founder of the manichaean Church and was elevated to the position of supreme power, creator of Ormazd and Ahriman, and, long before Mani, Zarván accompanied Mithras in all his westward migrations.

In an enumeration of angels, we hear of Narsus, who may be the Nêryôsûs (Armenian Nerses or Nasais) of the Avesta. The other angels are Jacob, the mighty angel and leader of angels, the Lord Bar Simûs, Qaftinus the mighty, Raphael, Gabriel, Michael, Sarâd and Nastinkus—a truly Catholic list.

In 4 fr. 14 rubric enjoins the recital of the hymn of the Frêôgârt. Here we recognize a technical term of the Avesta,—namely, the "first angel." The last line reads: "the first (manichæan) direction of the dead (Darmest., op. cit., p. 239). In this hymn we read how the gods shall release us from this sinful time, from the oppression of this world. In fr. 4, under the rubric Bar Simûs, we read: "And let the Lord (Ormazd) free us from the sinfulness, the anger of Frêôdôn, the good; and later on we read as follows: "(with his mighty glance may the god of pure name, Frêôdôn, the king and Jacob Narseas, protect religion and us the sons of Mîhr and Frêôdôn, the liberator, the compassionate") the slave of Aîis (or Ak)." Dahâka, also Nârimân, spelled Nairiman, are familiar figures in the old Persian pantheon. In the same prayer the votary begs that "new blessing may come," new victory from the Lord Zarvân over the glories and angels, the spirits of this world, to the end that he accept our holy religion, become a watcher within and without, helper and protector," and the prayer ends thus: "I invoke the angels, the strong ones, the mighty, Raphael, Michael, Gabriel, Sarâd, who shall protect us from all adversity, and free us from the wicked Ahriman.

In the above Vahman is Vohu Mano, the good thought or inspiration of the Zarostanian religion. Mîhr is Mithras. The god Narseas is also invoked in other fragments.

In fr. 74 is invoked, together with Jesus and Mani, the "strong mighty Zôsch, the redeemer of souls." In the Avesta Srasraô the angel that guards the world at night from demons, and is styled "the righteous" or "the strong."

Fr. 38 is as follows: "Mithras (Mîs. Mîtrâ) great ... messenger of the gods, mediator (or interpreter) of religion, of the elect one Jesus—Yezû, of light, of truth, the redeemer of souls, Mani. Do thou in me make peace, O light-bearer, mayest thou redeem my soul from this born-dead (existence)."
Fr. 543 runs thus: "and ladder of the Magian faith. Thou, new teacher of Christ of the East, and promoter of those that have the good faith. For thou wast born under a glittering star in the family of the rulers. Elect are these—Jesus and Vahman."

The above examples bear out Mani's own declaration, as reported by the Fhrist, that his faith was a blend of the old Magian cult with Christianity. Whether the Hebrew names of angels came to him direct from the Jews or not we cannot tell, but they were, as the Greek magical papyri prove, widely diffused among the Gentiles long before his age. The Armenian writer Bemir (c. 380) relates that Mani's teaching was merely that of the Magi, plus an ascetic morality, for which they hated and slew him. Just as the background of Christianity was formed by the Hebrew scriptures, and just as the Hebrew legends of the creation became the basis of its scheme of human redemption from evil, so the Avesta, with its quaint cosmogony and myths, formed the background of Mani's new faith. He seems to have quarrelled with the later Magism because it was not dualistic enough, for in fr. 28 we have such a passage as the following: "If they think that all life is sun and sun, then shall they recognize that their end shall be in fire. And they say that Ormazd and Ahriman are brothers, and in consequence of this saying they shall come to annihilation." In the same fragment the Christians are condemned as worshippers of idols, unless indeed the writer has genuine pagans in view. There is a mention of Marcion in the same context, but it is unintelligible. There can be no doubt that in the form in which Mani became acquainted with it Christianity had been disengaged, and liberated from the womb of Judaism which gave it birth. This presentation of it as an ethical system of universal import was the joint work of Paul and Marcion. It remains to add that in these newly found fragments Mani styles himself "the apostle (lit. the sent forth) of Jesus the friend in the love of the Father, of God." He uses the formula:
MANICHAEISM

Manichaeism and Buddhism.—It remains to be asked whether Buddhistic elements can also be detected in Manichaeism. Most modern scholars since F. C. Baur have answered this question in the affirmative. According to Kessler, Mani made use of the teaching of Buddha, at least as far as ethics was concerned. It cannot be doubted that Mani, who undertook long journeys as far as India, knew of Buddhism. The name Mani (Buddha) and the injunctions of the Buddha (Buddhist teaching), which Mani, and perhaps in the latter's own writings, indicates further that he had occupied his attention with Buddhism when engaged in the work of founding his new religion. But his borrowings from this source must have been quite insignificant. A detailed comparison shows the difference between Buddhism and Manichaeism in all their principal doctrines to be very great, while it becomes evident that the points of resemblance are almost everywhere accidental. This is also true of the ethics and the asceticism of the two systems. There is not a single point in Manichaeism which demands for its explanation an appeal to Buddhism. Such being the case, the relationship between the two religions remains a mere possibility, a possibility which the inquiry of Geyer (Das System des Manichaeismus und sein Verhältniss zum Buddhismus, Jena, 1875) has not been able to elevate into a probability.

The Secret of Manichaeism.—How are we to explain the rapid spread of Manichaeism, and the fact that it really became one of the great religions? What gave it strength was that it united an ancient mythology and a thorough-going materialistic dualism, with an exceedingly simple spiritual worship and a strict morality. On comparing it with the Semitic religions of nature we perceive that it was free from their sensuous cultus, substituting instead a spiritual worship as well as a strict morality. Manichaeism was thus able to satisfy the new wants of an old world. It offered revelation, redemption, moral virtue and immortality, spiritual benefits on the basis of the religion of nature. A further source of strength lay in the simple yet firm social organization which was given by Mani himself to his new institution. Manichaeism was open, and the ignorant, the enthusiast and the man of the world, could all find acceptance here, and there was laid on no one more than he was able and willing to bear. Each one, however, was attached and led onward by the prospect of a higher rank to be attained, while the intellectually gifted had an additional inducement in the assurance that they did not require to submit themselves to any authority, but would be led to God by pure reason. Thus adapted from the first to individual requirements, this religion also showed itself able to appropriate from time to time foreign elements. Originally furnished from fragments of various religions, it could increase or diminish this possession without rupturing its own elastic framework. And, after all, great adaptability is just as necessary for a universal religion as a divine founder in whom the highest revelation of God may be seen and revered. Manichaeism indeed, though it applies the title "redeemer" to Mani, has really no knowledge of a redeemer, but only of a physical and gnostic process of redemption; on the other hand, it possesses in Mani the supreme prophet of God. If we consider in contrast Manichaeism as a simple, apparently profound, and yet convenient solution of the problem of good and evil, a problem that had become peculiarly oppressive to the human race in the 2nd and 3rd centuries, we shall have named the most important factors which account for the rapid spread of the system.

Sketch of the History of Manichaeism.—Manichaeism first gained a firm footing in the East, i.e. in Persia, Mesopotamia and Transoxiana. The persecutions it had to endure did not prevent its extension. In the 3rd century the sect of the Manichaeans, which was fought for centuries in Babylon, at a later period in Samarkand. Even after the conquests of Islam the Manichaean Church continued to maintain itself, indeed it seems to have become still more widely diffused by the victorious campaigns of the Mahomedans, and it frequently gained secret adherents among the latter themselves. Its doctrine and discipline underwent little change.
But Christianity, as the system. various difficulties. Manichaeism. It was the adherents, initiated. and Langlois, the West. The teachings of the Manichaeans in the 1st century to the 5th century. It was only subsequent to about 330 that Manichaeism spread rapidly in the Roman Empire. Its adherents were recruited on the one hand from the old gnostic sects (especially from the Marcionites—Manichaeism exerted besides this a strong influence on the development of the Marcionite churches of the 4th century), on the other hand from the large number of the "cultured," who were striving after a "rational." It was also in some manner Christian religion. Its polemics and its criticism of the Catholic Church now became the strong side of Manichaeism, especially in the West. It admitted the stumbling-blocks which the Old Testament offers to every intelligent reader, and it gave itself out as a Christianity without the Old Testament. Instead of the subtle Catholic theories concerning divine predestination and human freedom, and instead of a difficult theology, it offered an exceedingly simple conception of sin and goodness. The doctrine of the incarnation of God, which was especially objectionable to those who were going over to the new universal religion from the old cults, was not proclaimed by Manichaeism. In its rejection of this doctrine Manichaeism agreed with Neoplatonism; but, while the latter, notwithstanding all its attempts to conform itself to Christianity, could find no formula by which to inaugurate within its own limits the special veneration of Christ, the Western Manichaeans succeeded in giving their teaching a Christian tinge. The only part of the Manichaean mythology that became popular was the crude, physical dualism. The barbaric elements were judiciously screened from view as a "mystery"; they were, indeed, here and there explicitly disavowed even by the initiated. The farther Manichaeism advanced into the West the more Christian and philosophic did it become. In Syria it maintained itself in comparative purity. In North Africa it found its most vigorous adherents, gaining secret support even among the clergy. Augustine was an auditor for nine years, while Faustus was at that time the most esteemed Manichaean teacher in the West. Augustine in his later writings against the Manichaeans deals chiefly with the following problems: (1) the relation between knowledge and faith, and between reason and authority; (2) the nature of good and evil, and the origin of the latter; (3) the existence of free will, and its relation to the divine omnipotence; (4) the relation of the evil in the world to the divine government.

The Christian Byzantine and Roman emperors, from Valens onwards, enacted strict laws against the Manichaeans. But at first these bore little fruit. The auditors were difficult to trace out, and besides they really gave little occasion for persecution. In Rome itself between 370 and 440 Manichaeism gained a large amount of support, especially among the scholars and public teachers. It also made its way into the life of the people by means of a popular literature in which the apostles were made to play a prominent part (Apocryphal Acts of the Apostles). Manichaeism in the West had also some experience of attempts at reformation from the ascetic side, but of these we know little. In Rome Leo the Great was the first who took energetic measures, along with the state authorities, against the system. Valentinian III. decreed banishment against its adherents, Justinian the punishment of death. In North Africa Manichaeism appears to have been extinguished by the persecution of the Vandals. But it still continued to exist elsewhere, both in the Byzantine Empire and in the West, and in the earlier part of the middle ages it gave an impulse to the development of sects, which remained related to it. And if it has not been quite proved that in the 4th century the Priscillanists of Spain were influenced by Manichaeism, it is at least undoubtedly that the Paulicians and Bogomiles, as well as the Catharists and the Albigenses, are to be traced back to Manichaeism (and Manichism). Thus the system, not indeed of Man the Persian, but of Manichaeism as modified by Christian influences, accompanied the Catholic Church until the 13th century.

Sources.—(a) Oriental. Among the sources for a history of Manichaeism the most important are the Oriental. Of these the earliest is the Chronicle of Eusebius (ed. by J. M. Schmidt, Munich, 1900), see also Zeitsch. f. hist. Theol., 1840, i.; Langlois, Collection, ii. 375 seq.), who wrote in the 5th century against Marcion and Mani; and the Alexandrian patriarch Euthychius d. 916., Anonym., ed. Poecocie (16th cent.), also Arabic and Persian historians. The Turfan fragments described in the body of this article. See also W. Brandt, Schriften aus der Grenz- oder Sidorabba (Gottingen, 1893), on the Christian Orientals that mentioned the Manichaeans as followers of Man. The earliest mention of the Manichaeans in the Byzantine Empire is found in the works of the German translation by J. M. Schmidt, Munich, 1900, see also Zeitsch. f. hist. Theol., 1840, i.; Langlois, Collection, ii. 375 seq.), who wrote in the 5th century against Marcion and Mani; and the Alexandrian patriarch Euthychius d. 916., Anonym., ed. Poecocie (16th cent.), also Arabic and Persian historians. The Turfan fragments described in the body of this article. See also W. Brandt, Schriften aus der Grenz- oder Sidorabba (Gottingen, 1893), on the Christian Orientals that mentioned the Manichaeans as followers of Man. The earliest mention of the Manichaeans in the Byzantine Empire is found in the works of the
MANIFEST—MANILA

are John of Damascus (De haeres. et Dialog.) and Photius (cod. 179 Biblioth.). The struggle with the Paulicians and the Bogomiles, who were often simply identified with the Manichaeans, again directed attention to the latter. In the West the works of Augustine are also cited (for information on the subject of Mani-

theeism (Contra epistolam Manichaeei, quam vocat fundamentum; Contra Faustum Manichaeeum; Contra Adimen-

tum; Contra Secondumum; De aechs cum Felsea Manichaee; De genesis c. Manichaei; De natura boni; De duabus animabas; De substantia credendi; De moribus ecc. cot, et de moribus Manicheorum; De haeres). The more complete picture, however, which may be here obtained, is that of the Manichaeism, in making generalizations from it, for it is beyond doubt that Western Manicheanism adopted Christian elements which are want-
ing the original and in the Oriental Manicheism. The “Dispate

the Persians with a Manichean “Per. P. I. p. 509-578 (first ed. by A. Mai) is shown by G. Mercati, Studi e testi (Rome, 1901) to be the procès verbal of an actual discussion held under Justinian at Constantinople in 427.

LITERATURE.—The most important works on Manicheism are:

Beausobre: Hist. critique de Manichée et du Manichéisme (2 vols., 1734 seq.; the Christian elements in Manicheanism are here strongly, indeed too strongly, emphasized); Bar, Das manich. Religions-

(1832; in this work Manichean speculation is exhibited from a speculative standpoint); Fliget, Mani (1862; a very careful investigation on the basis of the Fihrist); Kessler, Untersuchung sur Genese, genese der monotheistischen Lehren. and the article on Manichéer, by the same writer in Herzog-Hauck’s R.E., xii. 193-228; Kessler, Mani (2 vols., Berlin, 1889, 1903); Ernest Kochat, Estatíi sur Manicheismus (Brussels, 1875); Mercati, Fragments syriques d’ouvrages manichéens, et fragments d’ouvrages de F. H. Monon, (1875); O. Hülser, L. La cosmogonie manichéenne d’après Théodore Bar Khéouli, by Franz

Cumont (Brussels, 1908); II. Fragments syriques d’ouvrages manichéens, by Kugener and F. Cumont. III. Les Formules grecques d’anima et d’esprit dans les écrits manichéens, by F. Cumont. IV. Les monuments de Mosheim, Lardwel, Walch and Schröck, as well as the monograph by Trechsel, Uber Kanon, Kritik und Exegese der Manichãer (1832), may also be mentioned as still useful. The various researches which have been made regarding Parseism, the ancient Semitic religions, Gnosticism, &c., are of the greatest importance for the investigation of Manicheanism.

MANIFEST (Lat. manifex, clear, open to view), in commercial law, a document delivered to the officer of customs by the captain of a ship before leaving port, giving a description of the shipped goods of every kind, and setting forth the marks, numbers and descriptions of the packages and the names of the consignors thereof. In England, by the Revenue Act 1854, s. 3, where goods are exported for which no bond is re-

quired, a manifest must be delivered to the officer of customs by the master or owner of the ship within six days after the final discharge of the cargo. The act declares that, in the default of being a sum not exceeding five pounds.

MANIHNIKI (MANIHNIKI, MONIHNIKI), a scattered archi-

pelago in the central Pacific Ocean, between 4° and 11° S., and 156° and 162° W., seldom visited, and producing only a little copra and guano. It may be taken to include the Caroline or Thornton Islands, Vostok and Flint to the east; Suvarov, Manihiki or Humphrey, and Tongareva or Penryn to the west, and Starbuck and Malden to the north, the whole thus roughly forming the three corners of a triangle. There are pearl and pearl-shell fisheries at Tongareva and Suvarov. The natives (about 1000) are Polynesians and nominally Christian. There are ancient stone buildings of former inhabitants on Malden Island. The islands were mostly discovered early in the 19th century, and were annexed by Great Britain mainly in 1885-1889.

MANIKALA, a village of India, in Rawalpindi district of the Punjab. Pop. (1901), 734. It contains one of the largest stupas or Buddhist memorial shrines in N. India, and the one first known to Europeans, who early detected traces of Greek influence in the sculpture. The site was excavated by General Court in 1834, and has been identified by Sir A. Cunningham with the scene of Buddha’s “body-offering.”

MANILA, the capital city and principal port of the Philip-

pine Islands, situated on the W. coast of the island of Luzon, on the E. shore of Manila Bay, at the mouth of the Pasig river, in lat. 14° 35' 32" N., and in long. 126° 58' 8" E. It is about 4890 m. W.S.W. of Honolulu, 6990 m. W.S.W. of San Francisco, 628 m. S.E. of Hong-Kong, and 1630 m. S. by W. of Yokohama. Pop. (1879), 93,595; (1887), 176,777; (1903), 219,928. Of the total population in 1903, 183,537 were of the brown race, 21,838 were of the yellow race, 7943 were of the white race, and 234 were of the black race (290 of those of this race were foreign-born), and 4564 were of mixed races; of the same total 131,659, or nearly 60% were males. The foreign-born in 1903 numbered 29,491, comprising 21,683 natives of China, 4300 natives of the United States of America, 2065 natives of Spain, and 721 natives of Japan. Nearly all of the brown race were native-born, and 86% of them were Tagalogs.

The city covers an area of about 20 sq. m. of low ground, through which flow the Pasig river and several esteros, or tide-water creeks. To the west is the broad expanse of Manila Bay, beyond which the rugged mountains rise; to the eastward the city extends about half-way to Laguna Bay; a lake nearly as large as Manila Bay and surrounded on three sides by mountains. On the south bank of the Pasig and fronting the bay for nearly a mile is the “Ancient City,” or Intramuros, enclosed by walls 24 m. long, with a maximum height of 24 ft., built about 1590. Formerly a moat flanked the city on the land sides, and a drawbridge at each of six gates was raised every night. But this practice was discontinued in 1852 and the moat was filled with earth in 1905. In the north-west angle of the bay, near Escolta, is the most beautiful thoroughfare of the city, and the Rosario, noted for its Chinese shops. Between Binondo and the bay is San Nicholas, with the United States customs-house and large shipping interests. North of San Nicholas is Tondo, the most densely populated district; in the suburbs, outside the fire limits, the greater part of the inhabitants live in native houses of bamboo frames roofed and sided with nipa palm, and the thoroughfares consist of narrow streets and navi-
gable streams. Paco, south-west of Intramuros, has some large cigar factories, and a large cemetery where the dead are buried in coffins with strong wooden boxes, the custom being carried on long the bay in the south part of the city, San Miguel on the north bank of the river above Intramuros, and Sampaloc farther north, are the more attractive residential districts.

Most of the white inhabitants live in Ermita and Malate, or in San Miguel, where there are several handsome villas along the river front, among them that of the governor-general of the Philippines. The better sort of houses in Manila have two storeys, the lower one built of brick or stone and the upper one of wood, roofed with red Spanish tile or with corrugated iron; the upper storey contains the living-rooms, and the lower has servants’ rooms, store-houses, stables, carriage-houses and poultry yards. On account of the warm climate the cornices are wide, the upper storey projects over the lower, and the outer walls are fitted with sliding frames. Translucent outer shells are a common substitute for glass; and the walls are white-washed, but on account of the frequency of earth-Quakes are not plastered. More than one half of the dwellings in the city are mere thatched huts huddled together on the public buildings and the remains are, however, some churches with graceful towers and beautiful façades and a few attractive monuments; among the latter are one standing on the Magellan Plaza (Plaza or Paseo de Magallanes) beside the Pasig, to the memory of Ferdinand Magellan, the discoverer of the islands; and another by A. Querol on the shore of the bay, to the memory of Don Miguel de Legaspi (d. 1572), the founder of the Spanish city, and of Andres de Urdaneta (1494), in the Christians who accompanied Legaspi to Cuba (but not to what is now Manila).

Many improvements have been made in and about the city since the American occupation in 1898. The small tram-
cars drawn by native ponies have been replaced by a modern American electric street-railway service, and the railway service to and from other towns on the island of Luzon has been ex-
etended; in 1908, 267 m. were open to traffic and 400 m. were under construction. Connected with Manila by electric railway
is Fort William McKinley, a U.S. army post in the hills five miles away, quartering about 3,000 men. The scheme for dredging some of the channels in order to make them navigable and for filling in others has been in part executed. But the greatest improvement affecting transportation is the construction of a safe and deep harbour. Although Manila Bay is nearly landlocked, it is so large that in times of strong winds it becomes nearly as turbulent as the open sea, and it was formerly so shallow that vessels drawing more than 16 ft. could approach no nearer than two miles to the shore, where typhoons of the southwest monsoon not infrequently obliged them to lie several days before they could be unloaded. Two long jetties or breakwaters for the construction of a harbour, and the area have been dredged to a depth of 30 ft., and two harbours of steel and concrete, one 600 ft. long and 70 ft. wide, and the other 650 ft. long and 110 ft. wide, were in process of construction in 1909. The Pasig river has been dredged up to the Bridge of Spain to a depth of 18 ft. and from the Bridge of Spain to Laguna de Bay to a depth of 6 ft. The construction of the harbour was begun about 1880 by the Spanish government, but the work was less than one-third completed when the Americans took possession. Among other American improvements in the harbour is the construction of a system whereby the sewage by means of pumps is discharged into the bay more than a mile from the shore; a system of gravity waterworks (1908) whereby the city's water supply is taken from the Marquina river about 23 m. from the city into a storage reservoir which has a capacity of 2,000,000,000 gallons and is 212 ft. above the sea; the extension of the Luneta, the principal pleasure-ground; a boulevard for several miles along the bay; a botanical garden; and new market buildings.

Climate.—Manila has a spring and summer hot season, an autumn and winter cooler season, a summer and autumn rainy season, and a winter and spring dry season. For the twenty years 1883-1902 the annual average of mean monthly temperatures was 26°-8° C., the maximum was 37°-4° and the minimum 17°-0° in 1884. From May until October the prevailing wind is south-east, from November to January it is north, and from February to April it is east. July and August are the cloudiest months of the year; the average number of rainy days in each of those months being 21, and in February or March only 3. The annual average of rainy days is 136:9 in the wet season (average precipitation for the six months, 1556-2 mm.) and 44 in the dry season (average precipitation for the six months, 6 mm.). Thunderstorms are frequent and occasionally very severe, between May and September; the annual average of thunderstorms for the decadennium 1888-1897 was 229.2. Daily maximum temperatures were lowest in June (average 90-7); the severity of these storms may be imagined from the fact that in a half-hour between 5 and 6 p.m. on the 21st of May 1892 the fall (probably the maximum) was 60 mm. The air is very humid in the period annual mean relative humidity was 79-4%, the lowest average for any one month was 66-5% in April 1896 (the average for the twenty Aprils was 70-7), and the highest average for any one month was 80-9-9% for September 1897 (the average for the twenty Septembers was 85-3). The city is situated as to be affected by shocks from all the various seismological centres of Luzon, especially those from the active volcano Isabela, 35 m. south of the city. At the Manila observatory, about 1 m. south-east of the walled city, the number of perceptible earthquakes registered by seismograph between 1886 and 1897 inclusive was 221; the greater numbers for any one year were 26 in 1885 and 1892, and the least, 5 in 1896 and 6 in 1889 and in 1894; the average number in each May was 1-44, in each July, 1-33, and in January and in February 0-72; the frequency is much greater in each of the three months of autumn than in the three months of autumn and winter.

Public Institutions.—The public school system of Manila includes, besides the common schools and Manila high school, the American school, the Philippine normal school (1901), the Philippine school of arts and trades (1901), the Philippine medical school (1907) and the Philippine school of commerce (1908). The Philippine government inaugurated a system of monthly Philippine Journal of Science, and co-operates with the Jesuits in maintaining, in Ermita, the Manila observatory (meteorological, ethnological, and astronomical), which is one of the best equipped institutions in the Orient. The University of Far Eastern Studies was founded by order of the King of Spain in 1909, and grew out of a seminary, for the foundation of which Philip II. of Spain gave a grant in 1585, and which opened in 1601; and of the Dominican college of St Thomas, dating from 1611. Other educational institutions are the (Dominican) San José medical and pharmaceutical college, San Juan de Letrán (Dominican), which is a primary and secondary school, the ateneo municipal, a corresponding secondary and primary school under the charge of the Jesuits, and the college of St Isidro, a girls' school. In 1908 there were twenty-four newspapers and periodicals published in the city, of which thirteen were Spanish, fourteen were English, two were Chinese, and two were Tagalog; the principal dailies were the Manila Times, Caballo American, El Libre, El Liberal. Mexico, El Renacimiento and La Democracia. There are some Spanish hospitals in Manila, in two of which the city's indigent sick are cared for at its expense; in connection with another a reform school is maintained; and there are a general hospital, built by the government, a government hospital for contagious diseases, a government hospital for government employees, a government hospital for lepers, and (for American philanthropists, St Paul's hospital (Roman Catholic), University hospital (Protestant Episcopal), and the Mary Johnson hospital (Methodist Episcopal), and several American and Protestant churches in the city, notably a Protestant Episcopal cathedral and training schools for native teachers. In Bilibid prison, in the Santa Cruz district, nearly 80% of the prisoners of the archipelago are confined; it is under the control of the department of public instruction and its inmates are given an opportunity to learn one or more useful trades.

Industry.—Industry is important chiefly for its commerce, and to make it the chief distributing point for American goods consigned to Eastern markets the American government undertook the harbour improvements, and abolished the tonnage dues levied under for its expense; in connection with another a reform school was maintained; and there are a general hospital, built by the government, a government hospital for contagious diseases, a government hospital for government employees, a government hospital for lepers, and (for American philanthropists, St Paul's hospital (Roman Catholic), University hospital (Protestant Episcopal), and the Mary Johnson hospital (Methodist Episcopal), and several American Protestant churches in the city, notably a Protestant Episcopal cathedral and training schools for native teachers. In Bilibid prison, in the Santa Cruz district, nearly 80% of the prisoners of the archipelago are confined; it is under the control of the department of public instruction and its inmates are given an opportunity to learn one or more useful trades.

Administration.—Manila is governed under a charter enacted in 1901 by the Philippine commission, and amended in 1903. This vests the legislative and administrative authority mainly in a municipal board of five members, of whom three are appointed by the governor of the Philippines by the advice and consent of the Senate; the other two are appointed by and are the president of the advisory board and the city engineer. The administration is divided into eight departments: engineering and public works; sewer and waterworks construction; sanitation and transportation; assessments and collections; police, fire, law and schools. There are no elective offices, but there is an advisory board, appointed by the governor and consisting of one member from each of eleven districts; its recommendations the municipal board must seek on all important matters. The administration of justice is vested in a municipal court and in one court under justices of the peace and auxiliary justices; the administration of school affairs is vested in a special board of six members; and matters pertaining to health are administered by the insular bureau of health.

History.—The Spanish city of Manila (named from " nilad," a weed or bush which grew in the locality) was founded by Legaspi in 1571. The site had been previously occupied by a town under a Mahommædian chieftain, but this town had been burned before Legaspi gained possession, although a native settlement still remained, within the present district of Tondo. In 1572, while the Spaniards were constructing the city, the small town was burned and was nearly captured by a force of Chinese pirates who greatly outnumbered the Spaniards. About 1590 the construction of the present walls and other defences began. At the beginning of the 17th century Manila had become the commercial metropolis of the Far East. To it came fleets from China, Japan, India, Malacca and other places in the Far East for an exchange of wares, and from it rich cargoes were sent by way of Mexico to the mother country in exchange for much cheaper
goods. Before the close of the century, however, a decline began, from which there was but little recovery under Spanish rule. Several causes contributed to this, among them the waning of the power of Spain, an exclusive commercial policy, disputation and administration hostilities with the Chinese, ravages of the Malay pirates, and the growth of Dutch commerce. On several occasions the city has been visited with destructive earthquakes; those of 1645 and 1803 were especially disastrous. In 1762, during war between England and Spain, an English force under Vice-Admiral Sir Samuel Cornish (d. 1770) and Lient.-General Sir William Draper (1721-1787) breached the walls and captured the city, but by the Treaty of Paris (1763) it was returned to Spain. In 1837 the port of Manila was opened to foreign trade, and there was a steady but slow increase in prosperity up to about 1890. During this period, however, progress was hampered by vested interests, and the spirit of rebellion among the natives became increasingly threatening. About 1892 a large number of Filipinos in and near Manila formed a secret association whose object was independence and separation from Spain. In August 1896 members of this association began an attack; and late in December the movement was reinforced as a result of the execution in Manila of Dr. José Rizal y Mercado (1861-1896), a Filipino patriot. It spread to the provinces, and was only in part suppressed when, in April 1898, Spain declared war against Spain. On the 1st of May an American fleet under Commodore George Dewey destroyed the Spanish fleet stationed in Manila Bay (see Spanish-American War). The smouldering Filipino revolt then broke out afresh and an American army under General Wesley Merritt (1836- ) was sent from San Francisco to assist in capturing the city. The Spaniards, after making a rather weak defence, surrendered it on the 13th of August 1898. Trouble now arose between the Americans and the Filipinos under the leadership of Emilio Aguinaldo, for the latter wished to establish a government of their own. On the night of the 4th of February 1899 the Filipinos attacked the American army which was defending the city, but were repulsed after suffering a heavy loss. A military government, however, was maintained in the city until August 1901.

**MANILA HEMP,** the most valuable of all fibres for cordage, the produce of the leaf-stalks of *Musa textilis,* a native of the Philippine Islands. The plant, called *abacá* by the islanders, throws up a spurious stem from its underground rootstocks, consisting of a cluster of sheathing leaf-stalks, which rise to a height of from 15 to 25 ft., and spread out into a crown of brown undivided leaves characteristic of the various species of *Musa* (plantain, bananas, &c.). From 12 to 20 clusters are developed on each rhizome. In its native regions the plant is rudely cultivated solely as a source of fibre; it requires little attention, and when about three years old develops flowers on a central stem, at which stage it is in the most favourable condition for yielding fibre. The stalk is then cut down, and the sheathing stalks are torn asunder and reduced to small strips. These strips in their fresh succulent condition are drawn between a knife-edged instrument and a hard wooden block to which it is fixed. The knife is kept in contact with the block except when lifted to introduce the ribbons. Sufficient weight is suspended to the end of the knife to keep back all pith when the operator is drawing forward the ribbon between the block and knife. By repeated scraping in this way the soft cellular matter which surrounds the fibre is removed, and the fibre so cleaned has only to be hung up to dry in the open air, when, without further treatment, it is ready for use. Each stock yields, on an average, a little under 1 lb. of fibre. Fibres from cutting down plants and separating fibre will prepare not more than 25 lb. per day. The fibre yielded by the outer layer of leaf-stalks is hard, fully developed and strong, and used for cordage, but the produce of the inner stalks is increasingly thin, fine and weak. The finer fibre is used by the natives, without spinning or twisting (the ends of the single fibres being knotted or gummied together), for making exceedingly fine, light and transparent yet comparatively strong textures, which they use as articles of dress and ornament. According to Warden, "muslin and grass-cloth are made from the finest fibres of Manila hemp, and some of them are so fine that a garment made of them may, it is said, be enclosed in the hollow of the hand." In Europe, especially in France, articles of clothing, such as shirts, veils, neckerchiefs and women's hats, are made from *abacá.* It is also used for matting and twines. It is of a light colour, very lustrous, and possesses great strength, being thus exceptionally suitable for the best class of ropes. It is extensively used for marine and other cordage. The hemp exported for cordage purposes is a somewhat woody fibre, of a bright brownish-white colour, and possessing great durability and strain-resisting power. The strength of Manila hemp compared with English hemp is indicated by the fact that a Manila rope 31 in. in circumference and 2 fathoms long stood a strain of 1660 lb. before giving way, while a similar rope of English hemp broke with 385 lb. The fibre contains a very considerable amount of adherent pectinous matter, and in its so-called dry condition an unusually large proportion, as much as 12% of water. In a damp atmosphere the fibre absorbs moisture so freely that it has been found to contain not less than 40% of water, a circumstance which dealers in the raw fibre should bear in mind. From the old and disintegrated ropes is made the well-known Manila paper. The plant has been introduced into tropical lands—the West Indies, India, Borneo, &c.—but only in the Philippines has the hemp been successfully produced as an article of commerce. It is distributed throughout the greater part of the Philippine Archipelago. The area of successful cultivation lies approximately between 6° and 15° N. and 121° and 126° E.; it may be successfully cultivated up to about 4000 ft. above sea-level. The provinces, or islands, where cultivation is most successful are those with a heavy and evenly distributed rainfall, H. T. Edwards, fibre expert to the Philippine bureau of agriculture, wrote in 1904:—

"The opportunities for increasing the production of *abacá* in the Philippines are almost unlimited. Enormous areas of good *abacá* land are as yet untouched, while the greater part of land already under cultivation might yield a greatly increased product if more careful attention were given to the various details of cultivation. The introduction of irrigation will make possible the planting of *abacá* in many districts where it is now unknown. The perfection of a machine for the extraction of the fibre will increase the entire output by nearly one-third, as this amount is now lost by the wasteful hand-stripping process."
saggs that hardly any Roman except Caesar, Cicero and Fronto had treated the subject, it is probable that he did not know the work of Manlius. The latest event referred to in the poem (i. 898) is the great defeat of Varus by Arminius in the Teuto-burgiensis Saltus (A.D. 9). The fifth book was not written till after the reign of Tiberius; the work appears to be incomplete, and was probably never published.

See editions by J. Scaliger (1579); R. Bentley (1739); F. Jacob (1846); A. G. Fringsé (1876); and T. Breiter (Leipzig, 1907; and commentary 1909); of book I. by A. E. Husmann (1903). On the subject generally, see M. Bechert, De emendandis Manilii Raetiae (1878) and De M. M. Astronomorum Poeta (1891); B. Freier, De M. Astronom. Aetate (1880); A. Cramer, De Manilii Elocutione (very full; 1882); G. Larson, De Manilio Poeta, with select bibliog. (1897); J. H. Keulemeaux, Les Africains (a study of the Latin idiom of Africa; 1894); R. Ellis, Notices Manilianae (1891); J. P. Postgate, Silve Maniliana (1897), chiefly on textual questions; F. Thomas, Lactationes Manilianae (1888), a collation of the Gelamencis (Gelomlu) MS.; F. Plessis, La Poesia latina (1909), pp. 477-493.

MANILIUS, GAIUS, Roman tribune of the people in 66 B.C.

At the beginning of his year of office (Dec. 67) he succeeded in getting a law passed (de libertinis sufragatis), which gave freedom of speech to the tribune's voters on the day on which he could manumitted them, that is, in the same tribe as their patron; this law, however, was almost immediately declared null and void by the senate. Both parties in the state were offend by the law, and Manlius endeavoured to secure the support of Pompey by proposing to confer upon him the command of the war against Mithradates with unlimited power (see Pompey).

The proposal was supported by Cicero in his speech, Pro lege Manilia, and carried almost unanimously. Manlius was later accused by the aristocratic party on some unknown charge and defended by Cicero. He was probably convicted, but nothing further is heard of him.

See Cicero's speech: Dio Cassius xxxvi. 25-27; Plutarch, Pompey, 30; Vell. Pat. ii. 33; art. Rome: History, § II.

MANIN, DANIELE (1804—1857), Venetian patriot and statesman, was born in Venice, on the 15th of May 1804. He was the son of a converted Jew, who took the name of Manin because that patrician family stood sponsors to him, as the custom then was. He studied law at Padua, and then practised at the bar of his native city. A man of great learning and a profound jurist, he was inspired from an early age with a deep hatred for Austria. The heroic but foolhardy attempt of the brothers Bandiera, Venetians who had served in the Austrian navy against the Neapolitan Bourbons in 1844, was the first event to cause an awakening of Venetian patriotism, and in 1847 Manin presented a petition to the Venetian congregation, a shadowy consultative assembly tolerated by Austria but without any power, informing the emperor of the wants of the nation. He was arrested on a charge of high treason (Jan. 18, 1848), but this only served to increase the agitation of the Venetians, who were beginning to know and love Manin. Two months later, when all Italy and half the rest of Europe were in the throes of revolution, the people forced Count Pallfy, the Austrian governor, to release him (March 17). The Austrians soon lost all control of the city, the arsenal was seized by the revolutionists, and under the direction of Manin a civic guard and a provisional government were instituted. The Austrians evacuated Venice on the 26th of March, and Manin became president of the Venetian republic.

He was already in favour of Italian unity, and though not anxious for annexation to Piedmont (he would have preferred to invoke French aid), he gave way to the will of the majority, and resigned his powers to the Piedmontese commissioners on the 7th of August. But after the Piedmontese defeats in Lombardy, and the armistice by which King Charles Albert abandoned Lombardy and Venetia to Austria, the Venetians attempted to lynch the royal commissioners, whose lives Manin saved with difficulty; an assembly was summoned, and a triumvirate formed with Manin at its head. Towards the end of 1848 the Austrians, having been heavily reinforced, reoccupied all the Venetian mainland; but the citizens, hard-pressed and threatened with a siege, showed the greatest devotion to the cause of freedom, all sharing in the dangers and hardships and all giving what they could afford to the state treasury. Early in 1849, Manin was again chosen president of the republic, and conducted the defence of the city with great ability. After the defeat of Charles Albert's forlorn hope at Novara in March the Venetian assembly voted "Resistance at all costs!" and granted Manin unlimited powers. Meanwhile the Austrian forces closed round the city; but Manin showed an astonishing power of organization, in which he was ably seconded by the Neapolitan general, Guglielmo Pepe. But on the 26th of May the Venetians were forced to withdraw to Malgraha, half-way between the city and the mainland; food was becoming scarce, on the 13th of June the powder magazine blew up, and in July cholera broke out. Then the Austrian batteries began to bombard Venice itself, and when the Sardinian fleet withdrew from the Adriatic the city was also attacked by sea, while certain demagouges caused internal trouble. At last, on the 24th of August 1849, when all provisions and ammunition were exhausted, Manin, who had courted death in vain, succeeded in negotiating an honourable capitulation, on terms of amnesty to all save Manin himself, Pepe and some others, who were to go into exile. On the 27th Manin left Venice, and the Austrians gathered up his papers and burnt them in Marseilles, and he himself reached Paris broken in health and almost destitute, having spent all his fortune for Venice.

In Paris he maintained himself by teaching and became a leader among the Italian exiles. There he became a convert from republicanism to monarchism, being convinced that only under the auspices of King Victor Emmanuel could Italy be freed, and together with Giorgio Pallavicini and Giuseppe La Farina he founded the Società Nazionale Italiana with the object of propagating the idea of unity under the Piedmontese monarchy. His last years were embittered by the terrible sufferings of his daughter, who died in 1854, and he himself died on the 22nd of September 1857, and was buried in Aby Scheffer's family tomb. In 1868, two years after the Austrians finally departed from Venice, his remains were brought to his native city and honoured with a public funeral. Manin was a man of the greatest honesty, and possessed genuinely statesmanlike qualities. He believed in Italian unity when most men, even Cavour, regarded it as a vain thing, and his work of propaganda by means of the National Society greatly contributed to the success of the cause.

See A. E. Kerrera, Vita di D. Manin (Venice, 1872); P. de la Forge, Dereglement, etc., de D. Manin (Paris, 1860); Henri Martin, D. Manin (Paris, 1859); V. Marchesi, Storiannali dellistoria di Venezia (Turin) and an excellent monograph in Countess Martinengo Cesaresco's Italian Characters (London, 1901).

MANING, FREDERICK EDWARD (1812—1883), New Zealand judge and author, son of Frederick Maning, of Johnville, county Dublin, was born on the 5th of July 1812. His father emigrated to Tasmania in the ship "Ardent" in 1824 and took up a grant of land there. Young Maning served in the fatuous expedition which attempted to drive in the Tasmanian blacks by sweeping with an unbroken line of armed men across the island. Soon afterwards he decided to try the life of a trader among the wild tribes of New Zealand, and, landing in the beautiful inlet of Hokianga in 1833, took up his abode among the Ngapuhi. With them the tall Irish lad—he stood 6 ft. 3 in.—full of daring and good-humour and as fond of fun as of fighting, quickly became a prime favourite, was adopted into the tribe, married a chief's daughter, and became a "Pakeha-Maori" (foreigner turned Maori). With the profits of his trading he bought a farm of 200 acres on the Hokianga, for which, unlike most white adventurers of the time, he paid full value. When New Zealand was peacefully annexed in 1840, Maning's advice to the Maori was against the arrangement, but from the moment of annexation he became a loyal friend to the government, and in the wars of 1845—46 his influence was exerted with effect in the settlers' favour. Again, in 1860, he persuaded the Ngapuhi to volunteer to put down the insurrection in Taranaki. Finally, at the end of 1865, he entered the public service as a judge of the native lands court, where his unequalled knowledge of the Maori language, customs, traditions and prejudices was of solid value.
MANILE—MANIPUR

In this office he served until 1881, when ill-health drove him to resign, and two years later to seek surgical aid in London, where, however, he died of cancer on the 25th of July 1883. At his wish, his body was taken back to New Zealand and buried there. A bust of him is placed in the public library at Auckland. Maning is chiefly remembered as the author of two short books, Old New Zealand and History of the War in the North of New Zealand against the Chief Tuhoe. Both books were reprinted in London in 1876 and 1884, with an introduction by the earl of Pembroke.

MANILE (Lat. manipulus, from manus, hand, and pere, to fill), a liturgical vestment of the Catholic Church, proper to all orders from the subdeacon upwards. It is a narrow strip of material, silk or half-silk, about a yard long, worn on the left fore-arm in such a way that the ends hang down to an equal length on either side. In order to secure it, it is sometimes tied on with strings attached underneath, sometimes provided with a hole in the lining through which the arm is passed. It is ornamented with three crosses, one in the centre and one at each end, that in the centre being obligatory, and is often elaborately embroidered. It is the special ensign of the office of subdeacon, and at the ordination is placed on the arm of the new subdeacon by the bishop with the words: “Take the maniple, the symbol of the fruit of good works.”1

1 According to Father Braun this custom cannot be traced earlier than the 14th century. It forms no essential part of the ordination ceremony (Liturg. Gewandung, p. 548).

It is strictly a “mass vestment,” being worn, with certain exceptions (e.g. by a subdeacon singing the Gospel at the service of blessing the palms), only at Mass, by the celebrant and the ministers assisting.

The most common name for the maniple up to the beginning of the 11th century in the Latin Church was mappula (dim. of mappa, cloth), the Roman name for the vestment until the time of Innocent III. The designation manipulus did not come into general use until the 15th century. Father Braun (Liturg. Gewandung, p. 517) gives other early medieval names: sudunum, fano, mantle, all of them meaning “cloth” or “handkerchief.” He traces the vestment ultimately to a white linen cloth of ceremony (pallium ilinostium) worn in the 4th century by the Roman clergy over the left arm, and peculiar at that time to them. Its ultimate origin is obscure, but is probably traceable to some ceremonial handkerchiefs commonly carried by Roman dignitaries, e.g. those with which the magistrates were wont to signal the opening of the games of the circus. As late as the 9th century, indeed, the maniple was still a handkerchief, held folded in the left hand. By what process it became changed into a narrow strip is not known; the earliest extant specimen of the hand-like maniple is that found in the grave of St Cuthbert (9th century); by the 11th century (except in the case of subdeacons, whose maniple would seem to have continued for a while to be cloth of practical use) the maniple had universally assumed its present general form and purely ceremonial character.

The maniple was originally carried in the left hand. In pictures of the 9th, 10th and 11th centuries it is represented as either so carried or as hung over the left fore-arm. By the 12th century the rule according to which it is worn over the left arm had been universally accepted. According to present usage the maniple is put on by priests after the alb and girdle, by deacons and subdeacons after the dalmatic or tunic; by bishops at the altar after the alb. In Catholic practice at masses for the dead, when it is assumed before the stole.2

2 For the evolution of these rules see Braun, op. cit. pp. 546 seq.

In the East the maniple in its Western form is known only to the Armenians, where it is peculiar to subdeacons. This vestment is not derived from the Roman rite, but is properly a stole, which the subdeacons used to carry in the left hand. It is now laid over the subdeacon’s left arm at ordination. The true equivalent of the maniple (in the Greek and Armenian rites only) is not, as has been assumed, the epimanikion, a sort of loose, embroidered cuff (see Vestments), but the epiposition. This is a square of silk, stiffened with cardboard, surrounded by an embroidered border, and usually decorated in the middle with a cross or a sword (the “sword of the Spirit,” which it is supposed to symbolize); sometimes, however, the space within the border is embroidered with pictures. It is worn only by bishops and the higher clergy, and derives its name from the fact that it hangs down over the kase (γωρα). It is worn on the right side, under the phelonion, but when the sakkos is worn instead of the phelonion, by metropolitans, &c., it is attached to the British Epiphany, like the maniple, was originally a cloth held in the hands in fact sufficiently proved by the ancient name χυζαλαον (χελαν, hand), which it retained until the 12th century. For convenience sake this cloth came to be suspended from the girdle on the right side, and is thus represented in the earliest extant paintings (see Braun, p. 552). The name epiposition, which appears in the latter half of the 12th century, probably marks the date of the complete conventionalization of the original cloth into the present still embroidered square; but the earliest representations of the vestment in its actual form date from the 14th century, e.g. the mosaic of St Athanasius in the chapel of St Zeno in St Mark’s at Venice.

MANIPUR, a native state on the north-east frontier of India, in political subdivision to the lieutenant-governor of Eastern Bengal and Assam. Area, 8,456 sq. m. Pop. (1901), 284,465. It is bounded on the N. by the Naga country and the hills overlooking the Assam valley, on the W. by Cachar district, on the E. by Upper Burma, and on the S. by the Lushai hills. The state consists of a wide valley, estimated at about 65 sq. m., surrounded by a large surrounding tract of mountainous country. The hill ranges generally run north and south, with occasional connecting spurs and ridges of lower elevation between. Their greatest altitude is in the north, where they reach to upwards of 8000 ft. above sea-level. The principal geographical feature in the valley is the Logtak lake, an irregular sheet of water of considerable size, but said to be yearly growing smaller. The valley is watered by numerous rivers, the Barak being the most important. The hills are densely clothed with tree jungle and large forest timber. Some silk is produced and there are a few primitive manufacturing industries, e.g. of pottery. Rice and forest produce, however, are the principal exports. The road from Manipur to the Assam-Bengal railway at Dimapur is the principal trade route.

The kingdom of Manipur, or, as the Burmans call it, Kasse or Kathe, first emerges from obscurity as a neighbour and ally of the Shan kingdom of Pong, which had its capital at Mogau. The valley appears to have been originally occupied by several tribes which came from different directions. Although their general facial characteristics are Mongolian, there is a great diversity of feature among the Manipuris, some of them showing a regularity approaching the Aryan type. In the valley the people are chiefly Hindus, that religion being of recent introduction. Their own name for themselves is Meithai, and their language is a branch of the Kuki-Chin family, spoken by 273,000 persons in all India in 1901. One of their peculiarities is the high position enjoyed by women, who conduct most of the trade of the valley. They have a caste system of their own, different from that of India, and chiefly founded on the system of lahuf, or prohibited marriages. The Warneris, who are the largest community, are divided into clans or tribes, the annual male between the ages of seventeen and sixty was formerly obliged to place his services at the disposal of the state for a certain number of days each year, and to different classes of the people different employments were assigned. About four hundred Mahommadan families, descendants of settlers from Bengal, reside to the east of the capital. The aboriginal hill-men belong to one of the two great divisions of Nagas and Kukis, and are subdivided into innumerable clans and sections with slight differences in language, customs or dress. The state is noted for the excellence of its breed of ponies. The English game of polo was introduced from Manipur, where it forms a great national pastime.

The first relations of the British with Manipur date from 1762, when the raja solicited British aid to repel a Burmese invasion.
and a treaty was entered into. The force was recalled, and little communication between the two countries took place until 1824, on the outbreak of the first Burmese War. British assistance was again invoked by the raja, and the Burmese were finally expelled from both the Assam and the Manipur valleys. Disputed successes have always been a cause of trouble. The raja, Chandra Kirtti Singh, died in 1886, and was succeeded by his eldest son, Sur Chandra Singh, who appointed his next brother, Kula Chandra Dhuya Singh, Jibraj or heir-apparent. In 1890 another brother, the senapati, or commander-in-chief, Tikendrajit Singh, dethroned the raja, and installed the Jibraj as regent, the eldest surviving son of the late Chandra. The mission of Assam (Quinton) marched to Manipur with 400 Gurkhas, in order to settle the question of succession. His purpose was to recognize the new ruler, but to remove the senapati. For some futile negotiations, Quinton sent an ultimatum, requiring the surrender of the senapati, by the hands of the political resident, F. Grimwood, but no result followed. An attempt was then made to arrest the senapati, but after some sharp fighting, in which Lieut. Brackenbury was killed, he escaped; and the Manipuris then attacked the British residency with an overwhelming force. Quinton, Newyn, and some other officers, with the help of the local Manipuri chief, Grimwood, Cossins and Lieut. Simpson, unarmcd, went to the fort to negotiate. They were all there treacherously murdered, and when the news arrived the Gurkhas retreated to Cachar, Mrs Grimwood and the wounded being with them. This led to a military expedition, which did not encounter much resistance. The various columns, converging on Manipur, found it deserted; and the regent, senapati, and others were captured during May. After a formal trial the senapati and one of the generals of the rebellion were hanged and the regent was transported to the Andaman Islands. But it was decided to preserve the existence of the state, and a child of the ruling family, named Chura Chand, of the age of five, was nominated raja. He was sent to be educated in the Mayo College at Ajmere, and he afterwards served for two years in the imperial cadet corps. Meanwhile the administration was conducted under British supervision. The opportunity was seized for abolishing slavery and unpaid forced labour, a land revenue of Rs. 2 per acre being substituted in the valley and a house-tax in the hills. The boundaries of the state were demarcated, disarmament was carried out, and the construction of roads was pushed forward. In 1901 Manipur was visited by Lord Curzon, on his way from Cachar to Burma. In May 1907 the government of the state was handed over to Chura Chand, who was to be assisted by a council of six Manipuris, with a member of the Indian civil service as vice-president. At the same time it was announced that the government of India would support the raja with all its powers and suppress summarily all attempts to displace him. The revenue is £56,000. The capital is Imphal, which is really an overgrown village; pop. (1901), 67,093.

See Mrs Ethel St Clair Grimwood, My Three Years in Manipur (1891); Manipur State Gazetteer (Calcutta, 1905); T. C. Hodson, The Meities (1908).

MANISA (anc. Magnesia ad Sipyllum), the chief town of the Sarsu-khan sanjak of the Aidin ( Smyrna) vilayet of Asia Minor, situated in the valley of the Gediz Chai (Hermus), at the foot of Mt Sipylos, and connected by railway with Smyrna and Afsum Kara-Hissar. Pop. about 35,000, half being Mussulman. Manisa is an important commercial centre, and contains interesting buildings dating from the times of the Seljuk and early Ottoman sultans, including mosques built by Murat II. and III. and a Mevlevi Tekke second only to that at Konia. It is the seat of a flourishing American mission. In 1304 Manisa was occupied by John Ducas, who when he became emperor made it the Byzantine seat of government. In 1305, after the inhabitants had massacred the catholicus, Roger de Flor beseiged it unsuccessfully. In 1313 the town was taken by Saru Khan and became the capital of the Turcoman emirate of that name. In 1398 it submitted to the Osmanli sultan Bayezid I., and in 1402 was made a treasure city by Timur. In 1419 it was the scene of the insurrection of the liberal reformer, Bedr ed-Din, which was crushed by Prince Murad, whose residence in the town as Murad II., after twice abdicating the throne, is one of the most romantic stories in Turkish history. In the 17th century Manisa became the residence of the greatest of the Darsi Bey families, Kara Osman Oglu, Turcoman by origin, and possibly connected with the former emirs of Sarukhan, which seems to have risen to power by farming the taxes of a province which princes of the house of Othman had often governed and regarded with especial affection. The Ilev of Sarukhan was one of the twenty-two in the Ottoman Empire leased on a life tenure up to the time of Mahmut II. In the 18th century the family of Kara Osman was prominent as members of the grand council. In 1765 a son of the last grand senapati, being lord of Bergama and another of Aidin, while the head of the house held Manisa with all the Hermes valley and had greater power in Smyrna than the representative of the capitan pasha in whose province that city nominally lay. Outside their own fiefs the family had so much property that it was commonly said they could sleep in a house of their own at any stage from Smyrna to Baghdad. The last of its great beys was Haji Hussein Zade, who was frequently called in to Smyrna on the petition of his friends, the European merchants, to assure tranquillity. But in the notorious times consequent on the Sclavonic invasion of Egypt, and the British and Russian attacks on the Porte early in the 19th century. He always acquitted himself well, but having refused to bring his contingent to the grand vizier when on the march to Egypt in 1798, and awakened the jealousy of the capitan pasha, he was in continual danger. Exiled in 1812, he was subsequently restored to Manisa, and died there in 1821. His son succeeded after sanguinary tumults; but Mahmut II., who had long marked the family for destruction, was so hostile towards it, after he had got rid of the Janissaries, that it had lost all but the shadow of power by 1830. Descendants survived in Manisa who retained a special right of granting title-deeds within the district, independent of the local administration.

(M. G. H.)

MANISTEE, a city and the county-seat of Manistee county, Michigan, U.S.A., on the Manistee river (which here broadens into a small lake) near its entrance into Lake Michigan, about 114 m. W.N.W. of Grand Rapids. Pop. (1890), 12,812; (1900), 14,260 (4666 foreign-born); (1904, state census), 12,768; (1910), 12,871. It is served by the Pere Marquette, the Manistee & Grand Rapids, the Manistee & North-Eastern, and the Manistee & Luther railways, and by steamboat lines to Chicago, Milwaukee and other lake ports. The channel between Lake Manistee and Lake Michigan has been considerably improved since 1867 by the Federal government. There is a United States life-saving station at the harbour entrance. The city has a county normal school, a school for the deaf and dumb, a domestic science and manual training school, a business college, and a Carnegie library. Manistee is a summer resort, with good trout streams and well-known brine-baths. One mile from the city limits, on Lake Michigan, is Orchard Beach, a bathing resort, connected by the city by electric railway; and about 9 m. north of Manistee is Portage Lake (about 2 m. long and 1 m. wide), a fishing resort and harbour of refuge (with a good channel from Lake Michigan), connected with the city by steamboat and railway. Manistee has large lumber interests, is the centre of an extensive fruit-growing region, and has various manufactures, including lumber and salt. The total value of the factory product in 1904 was $3,236,601. The municipality owns and operates its waterworks. Manistee (the name being taken from a former Ottawa Indian village, probably on Little Traverse Bay, Mich.) was settled about 1849, and was chartered as a city in 1869, the charter of that year being revised in 1890.

MANITObA, a lake of Manitoba province, Canada, situated between 50° 11' and 51° 48' N. and 97° 56' and 99° 35' W. It has an area of 1711 sq. m., a length of shore line of 535 m., and is at an altitude of 810 ft. above the sea. It has a total length of 119 m., a maximum width of 29 m., discharge of 14,533 cusec. ft.

1 There is a very large salt block at Eastlake, 1 m. east of Manistee, and Filer City, a few miles south-east, is another source of supply.
per second, and has an average depth of 12 ft. Its shores are low, and for the most part swampy. The Waterhen river, which carries the discharge of Lake Winnipegosis, is the only considerable stream entering the lake. It is drained by the Little Saskatchewan river into Lake Winnipeg. It was discovered by De la Verendrye in 1739.

MANITOBA, one of the western provinces of the Dominion of Canada, situated midway between the Atlantic and the Pacific coasts of the Dominion, about 1,090 m. due west of Quebec. It is bounded S. by the parallel 52° N., which divides it from the United States; W. by 101° 20' W.; N. by 52° 50' N.; and E. by the western boundary of Ontario. Manitoba formerly belonged to the Hudson's Bay Company, and after the transfer of its territory to Canada was admitted in 1870 as the fifth province of the Dominion. At that time the infant province had an area of 13,500 sq. m., and some 12,000 people, chiefly Indian half-breeds. In 1881 the limits were increased as above, and the province now contains upwards of 73,956 sq. m., extending 294 m. from north to south and upwards of 700 from east to west. The old district of Assiniboia, the result of the efforts in colonization by the earl of Selkirk in 1811 and succeeding years, was the nucleus of the province.

The name Manitoba sprang from the union of two Indian words, Manito (the Great Spirit), and Waba (the "narrow") of the lake, which may readily be seen on the map. This well-known strait was a sacred place to the Cree and Saulteaux, who, impressed by the weird sound made by the wind as it rushed through the narrow, as simple children of the prairies called them Manito-Waba, or the "Great Spirit's narrow." The sound arising from this unusual sound, has been by numerous tongues translated into "God's Voice." The word was afterwards contracted into its present form. As there is no accent in Indian words, the natural pronunciation of this name would be Mān-i-tō-bā. On this account, the custom of both the French and English people of the country was for years before and for several years after 1870 to pronounce it Mān-i-tō-bā, and even in some cases to spell it "Manitoba." After the formation of the province and the familiar use of the provincial name in the Dominion parliament, where it has occupied much attention for a generation, the pronunciation has changed, so that the province is universally known from ocean to ocean as Mān-i-tō-bā.

### Physical Features

The drainage of Manitoba is entirely north-eastward to Hudson Bay. The three lakes—whose greatest lengths are 300, 120, and 110 m., respectively—are Winnipegos, Winnipeg, and Lake Winnipeg. They are all of irregular shape, but average respectively 30, 18, and 10 m. in width. They are fresh, shallow and tideless. Winnipegosis and Manitoba at high water, in spring-time, discharge their waters through small streams into Winnipeg. The chief rivers emptying into Lake Winnipeg are the Winnipeg, the Red, and the Saskatchewan. The Assiniboine river enters the Red river 45 m. from Lake Winnipeg, and at the confluence of the rivers ("The Forks") is situated the city of Winnipeg. The Winnipeg, which flows from the territory lying south-east of Lake Winnipeg, is a noble river some 200 m. long, which after leaving Lake of the Woods dashes with its clear water over many cascades, and traverses very beautiful scenery. At its falls from Lake of the Woods is one of the greatest and most easily utilized water-power in the world, and from falls lower down the river electric power for the city of Winnipeg is obtained. The Red river is at intervals subject to freshets. In the 19th century's experience of the Selkirk colonists there have been four "floods." The highest level of the site of the city of Winnipeg is said to have been under 5 ft. of water for several weeks in May and June in 1826, and 2.5 ft. in 1832, not covered in 1861; only the lowest levels were under water in 1882. The extent of overflow has thus on each occasion been less. The loose soil on the banks of the river is easily carried away in great masses, and the low banks widened as to render the recurrence of an overflow unlikely. The Saskatchewan, though not in the province, empties into Lake Winnipeg less than half a degree from the northern boundary. It is a swift river, flowing in the Rocky Mountains, in the course of 180 degrees of longitude. Near its mouth are the Grand Rapids. Above these steamers ply to Fort Edmonton, a point upwards of 800 m. north of the city of Winnipeg. The Grand Rapids, through Lake Winnipeg, up Red river to the city of Winnipeg, important locks having been constructed on the river at St. Andrews.

The surface of Manitoba is somewhat level and monotonous. It is chiefly a prairie region, with treeless plains of from 5 to 40 m.

Winter, with cold but clear and bracing weather, usually sets in about the middle of November, and ends with March. In April and May the rivers have opened, the snow has disappeared, and the opportunity has been afforded the farmer of sowing his grain. June is often wet, but most favourable for the springing crops. July and August are warm, but, excepting two or three days at a time, not uncomfortably so; while the autumn weeks of late August and September are very pleasant. Harvest generally extends from the middle of August to near the end of September. The chief crops of the farmer are wheat (which from its flinty hardness and full kernel is the speciality of the Canadian north-west), oats, barley and peas. Hay is made of the native prairie grasses, which grow luxuriantly. From the richness and mellowness of the soil potatoes and all tatt roots reach a great size. Heavy dews in summer give the needed moisture after the rains of June have ceased. The traveller and farmer are at times annoyed by the mosquito.

### Area and Population

The area is 73,956 sq. m., of which 64,066 are land and 9890 water. Pop. (1871), 18,995; (1881), 62,260; (1891), 152,506; (1901), 254,047 (129,332 males, 116,615 females); (1906), 365,688 (205,183 males and 160,505 females). The principal cities and towns are: Winnipeg (90,153), Brandon (10,468), Portage la Prairie (5106), St Boniface (5119), West Selkirk (7921), and Morden (1457). In 1901, 49,102 families inhabited 45,415 houses, and the proportion of the urban population to the rural was 27.5 to 72.5. Classified according to place of birth, the principal nationalities were as follows in 1901: Canada, 180,853; England, 20,392; Scotland, 8099; Ireland, 4537; other British possessions, 499; Germany, 2291; Iceland, 5403; Austria, 11,570; Russia and Poland, 8854; Scandinavia, 1772; United States, 6922; other countries, 4028. In 1901 the Indians numbered 5827; half-breeds, 16,372. Of the Indian half-breeds, one half are of English-speaking parentage, and chiefly of Orkney origin; the remainder are known as Metis or Bois-brulés, and are descended from French-Canadian voyageurs. In 1875 a number of Russian Mennonites (descendants of the Anabaptists of the Reformation) came to the
country. They originally emigrated from Germany to the plains of southern Russia, but came over to Manitoba to escape the conscription. They number upwards of 15,000. About 4000 French Canadians, who had emigrated from Quebec to the United States, have also made the province their home, as well as Icelanders now numbering 20,000. During the decade ending 1907 large reserves were settled with Rutenians often known as Galicians, Poles and other peoples from central and northern Europe. Some 30,000 of these are found in the province. The remainder of the population is chiefly made up of English-speaking people from the other provinces of the Dominion, from the United States, from England and Scotland and the north of Ireland.

Religion.—Classified according to religion, the various denominations were, in 1901, as follows: Presbyterians, 65,310; Episcopalian, 44,874; Methodists, 49,909; Roman Catholics, 35,622; Baptists, 9098; Lutherans, 16,743; Mennonites, 15,222; Greek Catholics, 7808; other denominations, 9903; not specified, 638.

Government.—The province is under a lieutenant-governor, appointed for a term of five years, with an executive council of six members, responsible to the local legislature, which consists of forty-two members. It has four members in the Canadian Senate and ten in the House of Commons.

Education.—The dual system of education, established in 1871, was abolished in 1890, and the administrative machinery consolidated under a minister of the Crown and an advisory board. This act was amended in 1897 to meet the wishes of the Roman Catholic minority, but separate schools were not re-established; nor was the council divided into denominational committees. There are collegiate institutes for more advanced education at Winnipeg, Brandon and Portage la Prairie, with a total of 1904 pupils enrolled. There is also a normal school at Winnipeg for the training of teachers. Higher education is represented by the provincial university, which teaches science and mathematics, holds examinations, distributes scholarships, and grants degrees in all subjects. It has affiliated to it colleges of the Roman Catholic, Episcopalian, Presbyterian and Methodist denominations, with medical and pharmaceutical colleges. The arts colleges of the churches carry on the several courses required by the university, and send their students to the examinations of the university. A well-equipped agricultural college near Winnipeg is provided for sons and daughters of farmers.

Agriculture is the prevailing industry of Manitoba. Dairy-farming is rapidly increasing in importance, and creameries for the manufacture of butter and cheese are established in almost all parts of the province. Large numbers of horses, cattle, swine and poultry are reared. The growth of cereals is the largest department of agriculture followed.

These figures do not include the wheat ground into flour and sent by way of British Columbia to Asia and Australia, nor the wheat retained by the farmers for seed. The Dominion government maintains an experimental farm of 670 acres at Brandon. The fisheries are all fresh-water, principally white-fish, pickerel and pike. Large quantities of fresh fish caught in lakes Winnipeg and Manitoba are shipped to all parts of the United States.

Communications.—The region of the Red River and Assiniboine valleys was opened up by the fur traders, who came by the waterways from Lake Superior, and afterwards by the water communication of the Hudson Bay Company, and the York boat,1 yet the steam-boat played an important part in the early history of the region from 1868 till 1885, when access from the United States was by steams down the Great Lakes. The completion of the St Andrew’s Rapids canal on Red River, and the Grand Rapids canal on the Saskatchewan river will again give an impetus to inland navigation on the tributaries of Lake Winnipeg. Lake Manitoba also affords opportunity for inland shipping.

The broad expanse of prairie-land in the western provinces of Canada is well suited for the cheap and expeditious building of railways. The first connection with the United States was by the railways coming down the Red River valley. But the desire for Canadian unity led the Dominion to assist a transcontinental line connecting Manitoba with eastern Canada. The building of the Canadian Pacific railway through almost continuous rocks for 800 miles was one of the greatest engineering feats of modern times. Immediately on the formation of the Canadian Pacific railway companies the transcontinental line was begun at Winnipeg and there are radial lines running from this centre to all parts of the country. Winnipeg is thus connected with Montreal on the east, and Vancouver on the west, and is the central point of the Canadian Pacific system, having railway yards and spool and engine facilities for the whole of America. In opposition to the Canadian Pacific railway a southern line was built from Winnipeg to the American boundary. This fell into the hands of the Canadian Northern railway, which was promoted by the promoters of the Canadian Northern railway. This railway has six radiating lines leaving the city of Winnipeg, and its main line connects Port Arthur on Lake Superior with Edmonton in the west. The Canadian Northern railway has a remarkable network of railways connecting Winnipeg with every corner of Manitoba. The Great Northern railway has also three branch lines in Manitoba and one of these has Winnipeg as its terminus. The grand Trunk Pacific railway, the great transcontinental line promoted by the Laurier government, passes through Manitoba north of the Canadian Pacific, coming from the east and southward to pass Winnipeg, then’ southward and westward to Portland, its gradients being designed to find its way through the Rocky Mountains to its terminus of Prince Rupert on the north coast of British Columbia.

History.—The first white settlement in Manitoba was made by Pierre Gaultier de Varennes, Sieur de la Verendrye (d. 1749), who, gradually pushing westward from Lake Superior, reached Lake Winnipeg in 1733, and in the following year built a fort on the plains at the mouth of the Assiniboine river. Another fort was built another at Fort Rouge, at the junction of the Red and Assiniboine rivers, where is now the city of Winnipeg. After the British conquest of 1763 the west became the scene of a rapidly increasing fur trade, and for many years there was keen rivalry between the Hudson’s Bay Company, with its headquarters in England, and the North-West Company of Montreal. French and Scottish farmers and fur-traders gradually settled along the Red River, and by their frequent marriages with the Indians produced a race of metis or half-breeds. From 1811 to 1818 Lord Selkirk’s attempted colonization greatly increased the population; from the time of his failure till 1869 the settlers lived quietly under the mild rule of the Hudson’s Bay Company. In that year the newly formed Dominion of Canada bought from the company its territorial and political rights. A hasty occupation by Canadian officials and settlers led to the rebellion of the Metis under Louis Riel, a native leader. The rebellion was quelled and Sir Garnet Wolseley (now Lord Wolseley) was sent from Canada by the lake route, with several regiments of troops—regulars and volunteers. The Manitoba Act providing the province was passed by the Canadian parliament in 1870. (See Red River Settlement; and RIEL, LOUIS.)

The admixture of races and religions, and its position as the key to the great West, have ever since made Manitoba the

1 A round-bottomed, strongly built boat, 30 to 36 ft. long, propelled by 8 men. It was devised by the Hudson’s Bay Company for carrying freight, as it saved time and was safer for the men.
storm centre of Canadian politics. In the charter granted by the Canadian parliament to the Canadian Pacific railway a clause giving it for twenty years control over the railway construction of the province led to a fierce agitation, till the clause was repealed in 1888. Till 1884 an equally fierce agitation was carried on against Ontario with regard to the eastern boundary of Manitoba. (See Ontario.) In both these disputes the provincial leader was the Hon. John Norquay, in whose veins ran a large admixture of Indian blood. In 1890 changes in the school system unfavourable to Roman Catholic Church led to a constitutional struggle, to which was due the defeat of the Federal ministry in 1896. Since 1896 its rapid material progress has produced numerous economic problems and disputes, many of which are still unsolved.

(G. Br.; W. L. G.)

MANITOU or MANTO (Algonquian Indian, "mystery," "supernatural"), among certain American Indian tribes, a spirit or genius of good or evil. The Manitou is almost always an animal, each individual having one assigned him, generally by dream-inspiration, at the greatest religious act of his life—his first fast. This animal then becomes his fetish; its skin is carried as a charm, and representations of it are tattooed and painted on the body or engraved on the weapons.

MANITOWOC (Indian, "Spirit-land"), a city and the county-seat of Manitowoc county, Wisconsin, on the W. shore of Lake Michigan, 73 m. N. of Milwaukee. Pop. (1890), 7710; (1900), 11,786, of whom 2998 were foreign-born; (1910 census), 13,027. It is served by the Chicago & North-Western, and the Wisconsin Central railways; by ferry across the lake to Frankfort, Mich., and Ludington, Mich.; by the Ann Arbor and the Pere Marquette railways; and by the Goodrich line of lake steamers. The city is finely situated on high ground above the lake at the mouth of the Manitowoc river. At Manitowoc are the county insane asylum and a Polish orphan asylum. The city has a training school for county teachers, a business college, two hospitals and a Carnegie library. There are ship-yards for the construction of both steel and wooden vessels, and several grain elevators. The value of the factory products increased from $1,935,442 in 1900 to $4,427,816 in 1905, or 129.8 per cent.—a greater increase than that of any other city in the state during this period. There is a good harbour, and the city has a considerable lake commerce in grain, flour, and dairy products. Jacques Vieve established here a post for the North-west Company of fur traders in 1795. The first permanent settlement was made about 1836, and Mani- towoc was chartered as a city in 1876. In Manitowoc county, 18 m. south-west of the city of Manitowoc, is St Nazianz, an unorganized village near which in 1834 a colony or community of German Roman Catholics was established under the leadership of Father Ambrose Oswald, the primary object being to enable poor people by combination and co-operation to supply themselves with the comforts of life at minimum expense and have as much time as possible left for religious thought and worship. The title of the colony's land was vested in Father Oswald after the panic of 1857 until his death in 1874, when he devised the lands to "the colony founded by me." The colony had no legal existence at the time, but was then incorporated as the "Roman Catholic Religious Society of St Nazianz," and as such sued successfully for the bequest. Financially the colony was successful, but as there were some desertions and no new recruits after Father Oswald's death, there were few members by 1900. There are no longer any traces of communism, and the colony's property is actually held by an organization of the local Roman Catholic church.

MANIZALES, a city of Colombia and capital of the department of Cundin (as up 1905 the northern part of Antioquia, 75 m. S. of Medellin, on the old trade route across the Cordillera between Bogota, the Magdalena, and the Cauca Valley. Pop. (1905, estimate), 29,000. The city is situated on a plateau overlooking the western slope of the Cordillera, 6988 ft. above the sea. It is surrounded by rich mineral and agricultural districts.

MANKATO, a city and the county-seat of Blue Earth county, Minnesota, U.S.A., at the southern bend of the Minnesota river, which is joined by the Blue Earth about 86 m. S.W. of Minneapolis. Pop. (1890), 8838; (1900), 10,590, of whom 2758 were foreign-born; (1910 census), 10,365. Mankato is served by the Chicago, St. Paul, Minneapolis & Omaha, the Chicago & North-Western (both " North-Western Lines"), the Chicago, Milwaukee & St. Paul, and the Chicago Great-Western railways. The city has two fine parks, a Carnegie library, a Federal building, the Immanuel and St. Joseph hospitals, two commercial colleges, and a state normal school (1868). The numerous lakes in the neighbourhood, particularly Lake Madison and Lake Washington, are widely known as summer resorts. Four miles west of the city is Minnesota state park (area, 60 acres), in which are Minnesota Falls (60 ft.) and a fine gorge; the park was established by the state in 1905-1906. Mankato has an extensive trade in dairy and agricultural products (especially grain), stone (a pinkish buff limestone is quarried in the vicinity), and forest products. The value of its factory products increased from $1,587,315 in 1900 to $3,422,117 in 1905, or 81.5%.

Mankato was settled about 1853, and was first chartered as a city in 1868. On or near the site of the city stood a village of the Mankato ("blue earth") band of the Mdewakanton Sioux, who derived their name from one of their chiefs, "Old Mankato." In this region occurred the Sioux uprising of 1862, and from this point operations were carried on which eventually resulted in the subjugation of the Indians and the hanging, at Mankato, in December 1862, of 38 leaders of the revolt. In the uprising the Mankato band was led by another chief named Mankato, who took part in the attack on Ft Ridgeley, Minn., in August, in the engagement on the 3rd of September at Birch Coolie, Minn., and in that on the 23rd of September at Wood Lake, where he was killed.

MANLEY, MARY DE LA RIVIERE (c. 1663-1724), English writer, daughter of Sir Roger Manley, governor of the Channel Islands, was born on the 7th of April 1663 in Jersey. She wrote her own biography under the title of The Adventures of Ricele, or the History of the Author of the Atalantis by "Sir Charles Lovemore." (1714). According to her own account she was left an orphan at the age of sixteen, and beguiled into a mock marriage with a kinsman who deserted her basely three years afterwards. She was patronized for a short time by the duchess of Cleveland, and wrote an unsuccessful comedy, The Lost Lover (1660); in freedom of speech she equaled the most licentious writers of comedy in that generation. Her tragedy, The Royal Mischief (1666) was more successful. From 1666 Mrs Manley was a favourite member of witty and fashionable society. In 1705 appeared The Secret History of Queen Zorah and the Zaronitas, a satire on Sarah, duchess of Marlborough, under the guise of romance. This was probably by Mrs Manley, who, four years later, achieved her principal triumph as a writer by her Secret Memoirs... of Several Persons of Quality (1706), a scandalous chronicle "from the New Atlantis, an island in the Mediterranean." She was arrested in the autumn of 1709 as the author of a libellous publication, but was discharged by the court of queen's bench on the 13th of February 1710. Mrs Manley sought in this scandalous narrative to expose the private vices of the ministers whom Swift, Bolingbroke and Harley combined to drive from office. During the keen political campaign in 1711 she wrote several pamphlets, and many numbers of the Examiner, criticizing persons and policy with equal vivacity. Later were published her tragedy Lucius (1717); The Power of Love, in Seven Novels (1720), and A Stage Coach Journey to Exeter (1725).

MANLIUS, the name of a Roman gens, chiefly patrician, but containing plebeian families also.

1. Marcus Manlius Capitolinus, a patrician, consul 392 B.C. According to tradition, when in 390 B.C. the besieging Gauls were preparing to storm the Capitol, he was roused by the cackling of the sacred geese, rushed to the spot and threw down the foremost assailants (Livy v. 47; Plutarch, Camillus, 27).
Several years after, seeing a centurion led to prison for debt, he freed him with his own money, and even sold his estate to relieve other poor debtors, while he accused the senate of embezzling public money. He was charged with aspiring to kingly power, and condemned by the comitia, but not until the assembly had adjourned to a place without the walls, where they could no longer see the Capitol which he had saved. His house on the Capitol (the origin of his surname) was razed, and the Manlii resolved that henceforth no patrician Manlius should bear the name of Marcus. According to Mommsen, the story of the saving of the Capitol was a later invention to explain his surname, and his attempt to relieve the debtors a fiction of the times of Cinna.

Livy vi. 14-20; Plutarch, Camillus, 36; Cicero, De domo, 38.

2. Titus Manlius Imperius Torquatus, twice dictator (353, 349 B.C.) and three times consul (347, 344, 340). When his father, L. Manlius Imperius (dictator 363), was brought to trial by the tribune M. Pomponius for abusing his office of dictator, he forced Pomponius to drop the accusation by threatening his life (Livy vii. 3-5). In 360, during a war with the Gauls, he slew one of the enemy, a man of gigantic stature, in single combat, and took from him a torques (neck-ornament), whence his surname. When the Latins demanded an equal share in the government of the confederacy, Manlius vowed to kill with his own hand the first Latin he saw in the senate-house. The Latins and Campanians revolted, and Manlius, consul for the third time, marched into Campania and gained two great victories, near Vesuvius, where P. Decius Mus (q.v.), his colleague, "devoted" himself in order to gain the day, and at Trifanium. In this campaign Manlius executed his own son, who had killed an enemy in single combat, and thus disobeyed the express command of the consuls.

Livy vii. 4, 10, 27, viii. 3; Cicero, De off. iii. 31.

5. Titus Manlius Torquatus, consul 255 B.C. and 224, censor 231, dictator 208. In his first consulship he subjugated Sardinia, recently acquired from the Carthaginians, when the temple of Janus was shut for the second time in Roman history (Livy i. 19). In 216 he opposed the ransoming of the Romans taken prisoners at Cannae; and in 217 he was sent to Sardinia and defeated a Carthaginian attempt to regain possession of the island.

Livy xxiii. 34; Polybius ii. 31.

4. Gnaeus Manlius Vulso, praetor 195, consul 189. He was sent to Asia to conclude peace with Antioco III., king of Syria. He marched into Pamphylia, defeated the Cela of Gorgias at Apam and Cato and then they turned back towards the Halys. In the winter, assisted by ten regiments sent from Rome, he settled the terms of peace with Antioco, and in 187 received the honour of a triumph.

Polybius xxii. 16-25; Livy xxxvii. 12-28, 37-50; xxxix. 6.

MANN-HORACE (1796-1859), American educationist, was born in Franklin, Massachusetts, on the 4th of May 1856. His childhood and youth were passed in poverty, and his health was early impaired by hard manual labour. His only means for gratifying his eager desire for books was the small library founded in his native town by Benjamin Franklin and consisting principally of histories and treatises on theology. At the age of twenty he was fitted, in six months, for college, and in 1839, graduated with highest honours, from the Brown University at Providence, Rhode Island, having devoted himself so unremittingly to his studies as to weaken further his naturally feeble constitution. He then studied law for a short time at Wrentham, Massachusetts; was tutor in Latin and Greek (1820-1822) and librarian (1821-1823) at Brown University; studied during 1821-1823 in the famous law school conducted by Judge James Gould at Litchfield, Connecticut; and in 1823 was admitted to the Norfolk (Mass.) bar. For fourteen years, first at Dedham, Massachusetts, and after 1833 at Boston, he devoted himself, with great success, to his profession. Meanwhile he served, with conspicuous ability, in the Massachusetts House of Representatives from 1827 to 1833 and in the Massachusetts Senate from 1833 to 1837, for the last two years as president. It was not until he became secretary (1837) of the newly created board of education of Massachusetts, that he began the work which was soon to place him in the foremost rank of American educationists. He held this position till 1848, and worked with a remarkable intensity—holding teachers' conventions, delivering numerous lectures and addresses, carrying on an extensive correspondence, introducing numerous reforms, planning and inaugurating the Massachusetts normal school system, founding and editing The Common School Journal (1838), and preparing a series of "Common School Annuals" (1839), which are still considered as being "among the best expositions. If, indeed, they are not the very best ones, of the practical benefits of a common school education both to the individual and to the state" (Hinsdale). The practical result of his work was the virtual revolutionizing of the common school system of Massachusetts, and indirectly of the common school systems of other states. In carrying out his work he met with bitter opposition, being attacked particularly by certain school-masters of Boston who strongly disapproved of his political theories and actions, and by various religious sectaries, who contended against the giving up of all sectarian instruction from the schools. He answered these attacks in kind, sometimes perhaps with unnecessary vehemence and rancour, but he never faltered in his work, and, an optimist by nature, a disciple of his friend George Combe (q.v.), and a believer in the indefinite improbability of mankind, he was sustained throughout by his conviction that nothing could so much benefit the race, morally, intellectually and materially, as education. Resigning the secretaryship in 1848, he was elected to the national House of Representatives, as an anti-slavery Whig to succeed John Quincy Adams, and was re-elected in 1849, and, as an independent candidate, in 1850, serving until March 1853. In 1852 he was the candidate of the Free-soilers for the governorship of Massachusetts, but was defeated. In Congress he was one of the ablest opponents of slavery, contending particularly against the Compromise Measures of 1850, but he was never technically an Abolitionist and he disapproved of the Radicalism of Garrison and his followers. From 1853 until his death, on the second of August 1859, he was president of the newly established Antioch College at Yellow Springs, Ohio, where he taught political economy, intellectual and moral philosophy, and natural theology. The college received insufficient financial support and suffered from the attacks of religious sectaries—he himself was charged with insincerity because, previously a Unitarian, he joined the Christian Connexion, by which the college was founded—but he earned the love of his students, and by his many addresses exerted a beneficial influence upon education in the Middle West.

A collected edition of Mann's writings, together with a memoir (1 vol.) by his second wife, Mary Peabody Mann, a sister of Miss E. P. Peabody, was published (in 5 vols. at Boston in 1867-1891) as the Life and Works of Horace Mann. Of subsequent biographies the best is probably Burke A. Hinsdale's Horace Mann and the Common School Revival in the United States (New York, 1898), in "The Great Educators" series. Among other biographies O. H. Lang's Horace Mann, his Life and Work (New York, 1893), Albert E. Winslow's Horace Mann, the Educator (1893), and Hinsdale's Life of Horace Mann, Educator, Patriot and Reformer (Philadelphia, 1910), may be mentioned. In vol. I. of the Report for 1895-1896 of the U.S. Stat e superintendent of education there is a detailed "Bibliography of Horace Mann," containing more than 700 titles.

MANN, a concrete saccharine exudation obtained by making incisions on the trunk of the flowering or manna ash tree, Fraxi- nus Orus. The manna ash is a small tree found in Italy, and extending to Switzerland, South Tirol, Hungary, Greece, Turkey and Asia Minor. It also grows in the islands of Sicily, Corsica and Sardinia. It blossoms early in summer, producing numerous clusters of whitish flowers. At the present day the manna of commerce is collected exclusively in Sicily from cultivated trees, chiefly in the districts around Capaci, Carini, Cisini and Favara, small towns 20 to 25 m. W. of Palermo, and in the townships of Geraci, Castelbuono, and other places in the district of Cefalu, 50 to 70 m. E. of Palermo. In the fraxinelli or plantations the
trees are placed about 7 ft. apart, and after they are eight years old, and the trunk at least 3 in. in diameter, the collection of manna is begun. This operation is performed in July or August during the dry weather, by making transverse incisions 1½ to 2 in. long, and about 1 in. apart, through the bark, one cut being made each day, the first at the bottom of the tree, another directly above the first, and so on. In succeeding years the process is repeated on the untouched sides of the trunk, until the tree has been cut all round and exhausted. It is then cut down, and a year or two later, when the sap has degenerated, the sapling is cut down, and the finest or flaky manna appears to have been allowed to harden on the stem. A very superior kind, obtained by allowing the juice to encrust pieces of wood or strands inserted in the cuts, is called manna a cannoLO. The fragments adhering to the stem, after the finest flakes have been removed are scraped off, and form the small or Tolfa manna of commerce. That which flows from the lower incisions is often collected on tiles or on a concave piece of the prickly pear (Opuntia), but is less crystalline and more glutinous, and is less esteemed.

Manna of good quality dissolves at ordinary temperatures in about 6 parts of water, forming a clear liquid. Its chief constituent is mannite or manna sugar, a hexatomic alcohol, C₆H₁₂(OH)₁₂, which likewise occurs, in much smaller quantity, in certain species of the brown seaweed, Fucus, and in plants of several widely separated natural orders. Manna is obtained by extracting manna with alcohol and crystallizing the solution. The best manna contains 70 to 80%. It crystallizes in shining rhombic prisms from its aqueous solution and as delicate needles from alcohol. Manna possesses mildly laxative properties, and on account of its sweet taste is employed as a mild aperient for children. It is less used in England now than formerly, but is still largely consumed in South America. In Italy manna is prepared for sale in the shape of small cones resembling loaf sugar in shape, and is frequently prescribed in medicine instead of manna.

The manna of the present day appears to have been unknown before the 15th century, although a mountain in Sicily with the Arabic name Giblinga, i.e. "manna mountain," appears to point to its collection there during the period that the island was held by the Saracens, 827-1070. In the 16th century it was collected in Calabria, and until recently was produced in the Tuscan Maremma, but none is now brought into commerce from Italy, although the name of Tolfa, a town near Civita Vecchia, is still applied to an inferior variety of the drug.

Various other kinds of manna are known, but none of these has been found to contain mannite. Alhagi manna (Persian and Arabic tar-angubin, also known as terendschabin) is the produce of Alhagi moseorum, a small, spiny, leguminous plant, growing in Arabia, Asia Minor, the Valley of Afghanistan, Baluchistan, and northern India. This manna occurs in the form of small, roundish, hard, dry, earthy, grains, varying from the size of a mustard seed to that of a coriander, of a light brown colour, sweet taste, and sema-like odour. The spines and pods of the plant are often mixed with it. It is collected near Kandahar and Herat, and imported into India from Cabul and Kandahar. Tamarak manna (Persian gaz-angubin, tamarisk honey) exudes in June and July from the slender branches of Tamarica gallica, var. manserghi, in the form of honey-like drops, which, in the cold temperature of the early morning, are found in the solid state. This secretion is caused by the puncture of an insect, Coccus infuscatus. When placed in the Valley of Afghanistan, Baluchistan, and northern India, to which country it is chiefly exported, especially in the Wady el Sheik, this manna (Arabic man) is collected by the Arabs and sold to the monks of St Catherine, who supply it to the pilgrims visiting the convent. It is found also in Persia and the Punjab, but does not appear to be collected in any quantity. This kind of manna seems to be alluded to by Herodotus (vii. 31). Under the same name of gaz-angubin there are sold commonly in the Persian bazaars, but it is not the chief ingredient of the other manna. Also, a manna is obtained by writing verses in Arabic on the leaves of the common Larch (p.p.), and bide-knecht on those of the willow, Salix fragilis; and a kind of manna was at one time obtained from the cedar.

The manna of the Biblical narrative, notwithstanding the miraculous circumstances with which it was associated, answers in its description very closely to the tamarak manna. See Bentley and Trimen, Medicinal Plants (1880); Watt, Dictionary of Economic Products of India, under "Manna" (1891). For analyses see Ebert, Abr. J.C.S., 1899, p. 176.

MANNERS, CHARLES (1857- ), English musician, whose real name was Southcote Mansergh, was born in London, son of Capt. Mansergh, an Irishman. He was a fine bass voice, and was educated for the musical profession in Dublin and at the Royal Academy of Music in London. He began singing in opera in 1881, and in 1882 had great success as the squire in Iolanthe at the Savoy, following this with numerous engagements in opera both in England and America. He married the singer Fanny Moody, already a leading soprano on the operatic stage, in 1890; and in 1897 they formed the Moody-Manners opera company, which had a great success in the provinces and under-take seasons in London in 1902. Manners and his wife were assisted by some of her excellent artists, and their enterprise had considerable influence on contemporary English music.

MANNERS-SUTTON, CHARLES (1755-1828), archbishop of Canterbury, was educated at Charterhouse and Cambridge. In 1785 he was appointed to the family living at Averham-with-Kelham, in Nottinghamshire, and in 1791 became dean of Peterborough. He was consecrated bishop of Norwich in 1792, and two years later received the appointment of dean of Windsor in commendam. In 1805 he was chosen to succeed Archbishop Moore in the see of Canterbury. During his primacy the old archiepiscopal palace at Croydon was sold and the country palace of Addington bought with the proceeds. He presided over the first meeting which issued in the foundation of the National Society, and subsequently lent the scheme his strong support. He also exerted himself to promote the establishment of the Indian episcopate. His only published works are two sermons, one preached before the Lords (London, 1794), the other before the Society for the Propagation of the Gospel (London, 1797). His brother, THOMAS MANNERS-SUTTON, 1st baron MANNERS (1750-1842), was lord chancellor of Ireland. For his son Charles see CANTERBURY, 1st VISOUNT.

MANNHEIM, a town of Germany, in the grand-duchy of Baden, lying on the right bank of the Rhine, at its confluence with the Neckar, 30 m. by rail N. of Karlsruhe, 10 m. W. of Heidelberg and 55 m. S. of Frankfort-on-Main. Pop. (1900), 141,131; (1905), 162,607 (of whom about 70,000 are Roman Catholics and 6,000 Jews). It is perhaps the most regularly built town in Germany, consisting of twelve parallel streets intersected at right angles by others, which cut it up into 136 square sections of equal size. These blocks are distinguished, after the American fashion, by letters and numerals. Except on the south side all the streets bend over on the promenade, which forms a circle round the town on the site of the old ramparts. Outside this ring are the suburbs Schwetzingen-Vorstadt to the south and Neckar-Vorstadt to the north, others being Lindenhof, Mühlau, Neckarau and Käfertal. Mannheim is connected by a handsome bridge with Ludwigshafen, a rapidly growing commercial and manufacturing town on the left bank of the Rhine, in Bavarian territory. Mannheim is south of the main road bridges.

The whole of the south-west side of the town is occupied by the palace (1720-1759), formerly the residence of the elector palatine of the Rhine. It is one of the largest buildings of the
kind in Germany, covering an area of 15 acres, and having a frontage of about 600 yards. It has 1500 windows. The left wing was totally destroyed by the bombardment of 1795, but has since been restored. The palace contains a picture gallery and collections of natural history and antiquities, and in front of it are two monumental fountains and a monument to the emperor William I. The large and beautiful gardens at the back form the public park of the town. Among the other prominent buildings in the city, the theatre, the arsenal, the synagoge, the "Kaufhaus," the town-hall (Rathaus, 1771) and the observatory. A newer building is the fine municipal Festhalle with magnificent cupola. The only noteworthy churches are the Jesuit church (1737-1760), the interior of which is lavishly decorated with marble and painting; the Konzordienkirche and the Schlosskirche. In front of the theatre are statues of Schiller, August Wilhelm I of Baden, and Wolfgang Heribert von Dalberg (1750-1806), intendant of the theatre in the time of Schiller. Mannheim is the chief commercial town on the upper Rhine, and yields in importance to Cologne alone among the lower Rhenish towns. It stands at the head of the effective navigation on the Rhine, and is not only the largest port on the upper course of that stream, but is the principal emporium for south Germany for such commodities as cereals, coal, petroleum, timber, sugar and tobacco, with a large trade in hops, wine and other south German produce. Owing to the rapid increase in the traffic, a new harbour at the mouth of the Neckar was opened in 1868. The industries are equal in importance to the transit trade, and embrace metalworking, iron founding and machine building, the manufacture of electric plant, celluloid, automobiles, furniture, cables and chemicals, sugar refining, cigar and tobacco making, and brewing.

Mannheim is the seat of the central board for the navigation of the Rhine, of a high court of justice, and of the grand ducal commissioner for north Baden.

History.—The name of Mannheim was connected with its present site in the 8th century, when a small village belonging to the abbey of Lorsch lay in the marshy district between the Neckar and the Rhine. To the south of this village, on the Rhine, was the castle of Eicholzheim, which acquired some celebrity as the place of confinement assigned to Pope John XXIII. by the council of Constance. The history of modern Mannheim begins, however, with the opening of the 17th century, when the elector palatine Frederick IV. founded a town here, which was peopled chiefly with Protestant refugees from Holland. The strongly fortified castle which he erected at the same time had the unfortunate result of making the infant town an object of contention in the Thirty Years' War, during which it was five times taken and retaken. In 1688 Mannheim, which had in the meantime recovered from its former disasters, was captured by the French, and in 1688 it was burned down. Ten years later it was rebuilt on an extended scale, and provided with fortifications by the elector John William. For its subsequent importance it was indebted to the elector Charles Philip, who, owing to ecclesiastical disputes, transferred his residence from Heidelberg to Mannheim in 1720. It remained the capital of the Palatinate for nearly sixty years, being especially flourishing under the elector William III. During the revolution of 1794 Mannheim fell into the hands of the French, and in the following year it was released by the Austrians after a severe bombardment, which left scarcely a single building uninjured. In 1803 it was assigned to the grand duke of Baden, who caused the fortifications to be razed. Towards the end of the 18th century Mannheim attained great celebrity in the literary world as the place where Schiller's early plays were performed for the first time. It was at Mannheim that Kotlebae was assassinated in 1819. During the revolution in Baden in 1849 the town was for a time in the hands of the insurgents, and was afterwards occupied by the Prussians.

See Feder, Geschichte der Stadt Mannheim (1875-1877, 2 vols., new ed. 1903); Pichler, Chronik des Hof- und National Theaters in Mannheim (Mannheim, 1879); Landgraf, Mannheim und Ludwigs- hof. Geschichte der wissenschaftlichen Bedeutung Mannheims, published by the Mannheim Chamber of Commerce (Mannheim, 1905); the Forschungen zur Geschichte Mannheims und der Pfalz, published by the Mannheimer Altertumsverein (Leipzig, 1898); and the annual Chronik der Hauptstadt Mannheim (1901 seq.).

MANNING, HENRY EDWARD (1808-1892), English Roman Catholic cardinal, was born at Totteridge, Hertfordshire, on the 15th of July 1808, 1 being the third and youngest son of William Manning, a West India merchant, who was a director of the Bank of England and governor, 1812-1813, and who sat in Parliament for thirty years, representing in the Tory interest Plympton Earl, Lyngington, Evesham, and Penryn successively. His mother, Mary, daughter of Henry Leroy Hunter, of Beech Hill, Reading, was of a family said to be of French extraction. Manning's boyhood was mainly spent at Coomb Bank, Sundridge, Kent, where he had for companions Charles and Christopher Wordsworth, afterwards bishops of St Andrews and of Lincoln. He was educated at Harrow, 1822-1827, Dr G. Butler being then the head master, but obtained no distinction beyond being in the cricket eleven in 1825. He matriculated at Balliol College, Oxford, in 1827, and soon made his mark as a debater at the Union, where Gladstone succeeded him as president in 1830. At this date he was ambitious of a political career, but his father had sustained severe losses in business, and in these circumstances Manning, having graduated with first-class honours in 1830, obtained the year following, through Viscount Goderich, a post as supernumerary clerk in the colonial office. This, however, he resigned in 1832, his thoughts having been turned towards a clerical career under Evangelical influences, which affected him deeply throughout life. Returning to Oxford, he was elected a fellow of St Mary's College, and was ordained; and in 1833 he was presented to the rectory of Lavington-with-Graffham in Suffolk, by Mrs Sargent, whose granddaughter Caroline he married on the 7th of November 1833, the ceremony being performed by the bride's brother-in-law, Samuel Wilberforce, afterwards bishop of Oxford and of Winchester. Manning's married life was of brief duration. His young and beautiful wife was of a consumptive family, and died childless (July 24, 1837). The lastling sadness that thus early overshadowed him tended to facilitate his acceptance of the austere teaching of the Oxford Tracts; and though he was never an acknowledged disciple of Newman, it was due to the latter's influence that from this date his theology assumed an increasingly High Church character, and his printed sermon on the "Rule of Faith" was taken as a public profession of his alliance with the Tractarians. In 1838 he took a leading part in the Church education movement, by which diocesan boards were established throughout the country; and he wrote an open letter to his bishop in criticism of the recent appointment of the ecclesiastical commission. In December of that year he paid his first visit to Rome, and called on Dr Wiseman, then bishop of Southwark. In January 1842 Shuttleworth, bishop of Chichester, and Newman, in company with W. E. Gladstone. In January 1842 Shuttleworth, bishop of Chichester, and Newman, in company with W. E. Gladstone. In January 1842 Shuttleworth, bishop of Chichester, and Newman, in company with W. E. and the following winter he spent abroad, chiefly in Rome, where he saw Newman "wearing the Oratorian habit and dead to the world." He had public and private audiences with the pope on the 9th of April and the 11th of May 1848, but recorded next to nothing in his diary concerning them, though numerous other entries show that among others, everything connected with the Roman Church, and private papers also indicate that he recognized at this time grave defects in the Church of England and a mysterious attractiveness in Roman Catholicism, going so far as to question whether he might not one day be a Roman Catholic himself. Returning to England, he protested, but with moderation, against the appointment of Hampden as bishop of Hereford, and continued to take an active part in the religious education controversy. Through the influence of Samuel Willerforce, he was offered the post of sub-almoner to Queen Victoria, always recognized as a stepping-stone to the episcopal bench, and his refusal of it was honourably consonant with all else in his career as an Anglican dignitary, in which he united pastoral diligence with an asceticism that was then quite exceptional. In 1850 the decision of the privy council, that the bishop of Exeter was bound to institute the Rev. G. C. Gorham to the benefice of Brampton Speke in spite of the latter's acknowledged disbelief in the doctrine of baptismal regeneration, brought to a crisis the position within the Church of England of those who believed in that Church as a legitimate part of the infallible Ecclesia docens. Manning made it clear that he regarded the matter as vital, though he did not act on this conviction until that hope remained of the decision being set aside or practically anulled by joint action of the bishops. In July he addressed to his bishop an open letter on "The Appellate Jurisdiction of the Crown in Matters Spiritual," and he also took part in a meeting in London which protested against the decision. In the autumn of this year (1850) was the great popular outcry against the "Papal aggression" (see Wiseman), and Manning, feeling himself unable to take part in this protest, resigned, early in December his benefice and his archdeaconry; and writing to Hope-Scott, who a little later became a Roman Catholic with him, stated his conviction that the alternative was "either Rome or licence of thought and will." He was received into the Roman Catholic Church by Father Brownbill, S.J., at the church in Farm Street, on Passion Sunday, the 6th of April 1851. On the following Sunday he was confirmed and received to communion by Cardinal Wiseman, who also, within ten weeks of his reception, ordained him priest. Manning thereupon proceeded to Rome to pursue his theological studies, residing at the college known as the "Academy for Noble Ecclesiastics," and attended lectures by Perron and Passaglia among others. In the spring he received him in private audience, and in 1854 conferred on him the degree of D.D. During his visits to England he was at the disposal of Cardinal Wiseman, who through him, at the time of the Crimean War, was enabled to obtain from the government the concession that for the future Roman Catholic army chaplains should not be regarded as part of the staff of the Protestant chaplain-general. In 1857 the pope, proprio motu, appointed him provost (or head of the chapter) of Westminster, and the same year he took up his residence in Bayswater as superior of the "College of the Oratory," and president of the "Confraternity of secular priests on the same lines as the institute of the Oratory, but with this difference, that they are by their constitution at the beck and call of the bishop in whose diocese they live. The community was thus of the greatest service to Cardinal Wiseman, whose right-hand man Manning thenceforward became. During the eight years of his life at Bayswater he was most active in all the duties of the priesthood, preaching, hearing confessions, and receiving conversions; and he was notably zealous to promote in England all that was specially Roman and papal, thus giving offence to old-fashioned Catholics, both clerical and lay, many of whom were largely influenced by Gallican ideas, and had with difficulty accepted the restoration of the hierarchy in 1850. In 1860 he delivered a course of lectures on the pope's temporal power, at that date seriously threatened, and shortly afterwards he was appointed a papal domestic prelate, thus becoming a "Monsignor," to be addressed as "Right Reverend." He was now generally recognized as the able and effective leader of the Ultramontane party among English Roman Catholics, acting always, however, in subordination to Cardinal Wiseman; and on the latter's death (Feb. 15, 1865) it was felt that, if his footsteps should succeed to the vacant archbishopric, the triumph of Ultramontanism would be secured. Such a consummation not being desired by the Westminster chapter, they submitted to the pope three names, and Manning's was not one of them. Great efforts were made to secure the succession for the titular archbishop Errington, who at one time had been Wiseman's coadjutor with that right reserved to him, but who had been ousted from that position by the pope acting under Manning's influence. In such circumstances Pius IX. could hardly do otherwise than ignore Errington's nomination, as he also ignored the nomination of Clifford, bishop of Clifton, and of Grant, bishop of Southwark; and, by what he humorously described as "the Lord's own coup d'état," he appointed Manning to the archepiscopal see. consecrated at the pro-cathedral at Moorfields (since destroyed) by Dr Ullathorne, bishop of Birmingham (June 8, 1865), and enthroned there (Nov. 6), after receiving the pallium in Rome, Manning began his work as archbishop by devoting himself especially to the religious education of the poor and to the establishment of Catholic industrial and reformatory schools. He steadily opposed whatever might encourage the admission of Catholics to the national universities, and so put his foot down on the project to open a church house in the Oratory at Oxford with himself as superior. He made an unsuccessful and costly effort to establish a Catholic university at Kensington, and he also made provision for a diocesan seminary of strictly ecclesiastical type. Jealous of the exclusive claims of the Roman Church, he procured a further condemnation at Rome of the "Association for the Promotion of the Unity of Christendom," which advocated prayers for the accomplishment of a kind of federal union between the Roman, Greek and Anglican Churches, and in a pastoral letter he insisted on the heretical assumption implied in such an undertaking. He also worked for the due recognition of the dignity of the secular or pastoral clergy, whose position seemed to be threatened by the growing ascendancy of the seculars, and especially of the Jesuits, whom, as a practically distinct organization within the Church, he steadily opposed. In addition to his diocesan synods, he presided in 1875 over the fourth provincial synod of Westminster, which legislated on "acatholic" universities, church music, mixed marriages, and the order of a priest's household, having previously taken part, as theologian, in the provincial synods of 1853 and 1855, with a hand in the preparation of their decrees. But it was chiefly through his strenuous advocacy of the policy of defining papal infallibility at the Vatican council (1869-1870) that Manning's name obtained world-wide renown. In this he was instant in season and out of season. He brought to Rome a petition in its favour from his chapter at Westminster, and during the progress of the council he laboured incessantly to overcome the opposition of the "inopportunists." And he never ceased to regard it as one of the chief privileges of his life that he had been able to take an active part in securing the definition, and in furthering the establishment of the "Chair of St. Peter," as the seat of divine revelation. In 1875 he published a reply to Gladstone's attack on the Vatican decrees; and on the 15th of March in that year he was created cardinal, with the title of SS. Andrew and Gregory on the Coelian. He was present at the death of Pius IX. (Feb. 7, 1878); and in the subsequent conclave, while some Italian cardinals were prepared to vote for his election to fill the vacant chair, he himself supported Cardinal Pecci, afterwards known as Leo XIII. With him, however, Manning found less sympathy than with his predecessor, though Manning's advocacy of the claims of labour attracted Leo's attention, and influenced the encyclical which he issued on the subject. After the Vatican council, and more especially after the death of Pius IX., Manning devoted his attention mainly to social questions, and with these his name was popularly associated during the last fifteen years of his life. From 1872 onwards he
was a strict teetotaller, not touching alcohol even as a medicine, and there was some murmuring among his clergy that his teaching on this subject verged on heresy. But his example and his zeal profoundly influenced for good the Irish poor forming the majority of his flock; and the "League of the Cross" which he founded, and which held annual demonstrations at the Crystal Palace, numbered nearly 30,000 members in London alone in 1874. He sat on two royal commissions, the one on the housing of the working classes (1884), and the other on primary education (1886); and in each case the report showed evident marks of his influence, which his fellow-commissioners recognized as that of a wise and competent social reformer. In the cause of labour he was active for many years, and in 1872 he set an example to the clergy of all the churches by taking a prominent part in a meeting held in Exeter Hall on behalf of the newly established Agricultural Labourers' Union, Joseph Arch and Charles Bradlaugh being among those who sat with him on the platform. In later years his strenuous advocacy of the claims of the working classes, and his declaration that "every man has a right to work or to bread" led to his being denounced as a Socialist. That he was such he denied more than once (Lemire, Le Cardinal Manning et son action sociale, Paris, 1893, p. 210), nor was he ever a Socialist in principle; but he favoured some of the methods of Socialism, because they alone seemed to him practically to meet the case of that pressing poverty which appealed to his heart. He took a leading part in the settlement of the dockers' strike in the autumn of 1889, and his patient and effectual action on this and on similar occasions secured for him the esteem and affection of great numbers of working men. So that his death on the 14th of January 1892, and his funeral a week later, were the occasion for a remarkable demonstration of popular veneration. The Roman Catholic Cathedral at Westminster is his joint memorial with his predecessor, Cardinal Wiseman.

Whatever may have been the value of Manning's services to the Roman Catholic Church in England in bringing it, as he did, up to a high level of what in earlier years was commonly denounced as Ultramontanism, it is certain that by his social action, as well as by the earnestness and holiness of his life, he greatly advanced, in the minds of his countrymen generally, their estimate of the character and value of Catholicism. Pre-eminently he was a devout ecclesiastic, a "great priest"; and his sermons, both Anglican and Catholic, are marked by fervour and dignity, by a conviction of his own authoritative mission as preacher, and by an eloquent insistence on considerations such as warm the heart and bend the will rather than on such as force the intellect to assent. But many of his instincts were those of a statesman, a diplomatist, a man of the world, even of a business man; and herein lay, at least in part, the secret of his influence and success. Intellectually he did not stand in the front rank. He was neither a philosopher nor a literary genius. Among his many publications, written, it is only fair to admit, amidst the urgent pressure of practical work, there is barely a page or even a sentence that bears the stamp of immortality. But within a somewhat narrower field he worked with patience, industry, and self-denying zeal; his ambition, which seemed to many personal, was rather the outcome of his devotion to the cause of the Church; and in the later years of his life especially he showed that he loved righteousness and hated iniquity, and that he realized as clearly as any one that the service of God was incomplete without the service of man.

The publication in 1896 of Manning's Life, by Purcell, was the occasion for some controversy on the ethics of biography. Edward Purcell was an obscure Catholic journalist, to whom Manning, late in life, had entrusted, rather by way of charitable bequest, his private diaries and letters and papers. It came as a shock in Purcell's voluminous biography much that was obviously never intended for the public eye, was perhaps inadvertently, printed together with a good deal of ungenerous comment. The facts disclosed and the strictly censored passage were: (1) that Manning, while yet formally an Anglican, and while publicly and privately dissuading others from joining the Roman Catholic Church, was yet within his diocese canonically and in other ways acting as if he were its Bishop; (2) that he was continually intriguing at the back-stairs of the Vatican for the furtherance of his own views as to what was desirable in matters ecclesiastical; (3) that his relations with Newman were very unfriendly; and (4) that, while for many years he endeavoured in his clergy and by his own example to set a Roman Catholic hierarchy, he held privately very cordial relations with men of diverse religions or of no theological beliefs at all. And certain passages showing Manning deeply interested in a geographical fragment of an unhonourable likeness to the verdict of posterity on his career. But independent critics (among whom may specially be named François de Fressinier) held that Manning came well through the charge, and that Purcell had great value as an observed and frank revelation of character.

**MANNY, SIR WALTER DE MANNY, BARON DE (d. 1372), soldier of fortune and founder of the Charterhouse, younger son of Jean de Mauny, known as Le Borgne de Mauny, by his wife Jeanne de Jenlain, was a native of Hainaut, from whose counts he claimed descent. Manny—the name is thus spelt by most English writers—was a patron and friend of Fosrart, in whose chronicles his exploits have a conspicuous and probably an exaggerated place. He appears to have first come to England as an esquire of Queen Philippa in 1327, and he took a distinguished part in the Scottish wars of Edward III. In 1337 he was placed in command of an English fleet, and in the following year accompanied Edward to the continent, where in the campaigns of the next few years he proved himself one of the boldest and ablest of the English king's military commanders. He was summoned to parliament as a baron by writ from the 12th of November 1347 to the 8th of January 1371. In 1359 he was made a knight of the Garter; and at various times he received extensive grants of land both in England and in France. He was frequently employed by King Edward in the conduct of diplomatic negotiations as well as in military commands. He was one of those charged with the safe custody of the French king John when a prisoner at Calais in 1350; in 1350 he was second in command under John of Gaunt in his invasion of France.

But Manny is chiefly remembered for his share in the foundation of the Charterhouse in London. In 1349 he bought some acres of land near Smithfield, which were consecrated as a burying-place where large numbers of the victims of the Black Death were interred; and here he built a chapel, from which the place obtained the name of "Newchurchaw." The chapel and ground were bought from Manny by the bishop of London, Michael de Northburgh, who died in 1361 and by his will bequeathed a large sum of money to found there a Carthusian convent. It is not clear whether this direction was ever carried out; for in 1371 Manny obtained letters patent from King Edward III. permitting him to found, apparently on the same site, a Carthusian monastery called "La Salutation Mort de Dieu," where the monks were to pray for the soul of Northburgh as well as for that of Manny himself. The bishop's bequest may have contributed to the building and endowment of the house; or possibly, as seems to be implied by a bull granted by Urban VI, in 1358, there were originally two kindred establishments owing their foundation to Northburgh and Manny respectively. At all events Manny, who died early in 1372, left instructions that he was to be buried in the church of the Carthusian monastery founded by himself. About 1335 he married Margaret, daughter and heiress of Thomas Plantagenet, Earl of Norfolk, son of King Edward I., whose first husband had been John, Lord Segrave. This lady, who outlived Manny by many years, was co-heiress of Norfolk in her own right, and she was created duchess of Norfolk in 1357. Manny left no surviving son. His daughter Anne, Baroness de Manny in her own right, married John Hastings, 2nd earl of Pembroke; and on the death of her only son unmarried in 1389, the barony of Manny became extinct.

Lincolnshire. About 6 m. from Bourne was the Gilbertine monastery of Sempingham, founded by Sir Gilbert de Semping- 
ham in 1139. The foundation provided for seven to thirteen 
canons, with a number of lay brothers and a community of nuns. 
No books were allowed to the lay brothers and nothing could be 
written in the monastery without the prior's consent. Mannyng 
entered this house in 1288, when, according to the rules, he 
must have been at least 24 years of age, if, as is supposed, he was a 
lay brother. He says he was at Cambridge with Robert de 
Bruce and his two brothers, Thomas and Alexander, but this 
does not necessarily imply that he was a fellow-student. There 
was a Gilbertine monastery at Cambridge, and Mannyng may 
have been there on business connected with his order. When 
he wrote Handlyng Synne he had been (11. 63-70) fifteen years 
in the priory, beginning to write in "englysh rime in 1303." 
Thirty-five years later he began his Story of Ingloide, and had 
removed (11. 139, &c.) to the monastery of Sixille (now Sixhills), 
near Market Rasen, in north Lincolnshire.

Handlyng Synne, a poem of nearly 13,000 lines, is a free trans-
lation, with many additions and amplifications, from William 
of Waddington's Manuel des Pecheus. It is a series of metrical 
homilies on the Ten Commandments, the Seven Deadly Sins 
and the Seven Sacraments, illustrated by a number of amusing 
stories from various sources. The Cursor Mundi had turned 
religious history into something not very different from a romance 
of chivalry, and in the stories of Handlyng Synne, the in-
fluence of the fabliaux is not far to seek. Mannyng wrote in 
the English tongue not for learned but for "lewd" men, "that 
taly and ryym wyl blethly here," to occupy the leisure hours 
during which they might otherwise fall into "vlyane, deadly 
synne or other folly." Each of his twenty-four topics has its 
complement of stories. He tells of the English observance of 
Saturday afternoon as holy to the Virgin, and has much to say 
of popular amusements, which become sins when they keep 
people away from church. Tournaments in particular are 
ferile. Mannyng gives the seven deadly pleasures, except 
those of the birth and resurrection of Christ performed in 
the churches, also lead men into transgression. He inveighs 
against the oppression of the poor by the rich, reproves those 
who, weary of matins or mass, spend their time in church "jang-
ling," telling tales, and wondering where they will get the best 
ale, and revives the legend of the dancers at the church door 
during mass who were cursed by the priest and went on dancing 
for a twelvemonth without cessation. He loved music himself, 
and justified this profane pleasure by the example of Bishop 
Grosseteste, who kept his harper in the chamber next his own, 
but he holds up as a warning to gleemen the fate of the minstrel 
who sang loud while the bishop said grace, and was miserably 
killed by a falling stone in consequence. The old monk's keen 
observation makes the book a far more valuable contribution 
to history than his professed chronicle. It is a storehouse of 
quaint stories and out-of-the-way information on manners and 
customs.

His chronicle, The Story of Ingloide, was also written for the 
solec and amusement of the unlearned when they sit together in 
fellowship (11. 6-10). The earlier half is written in octosyllabic 
verse, and begins with the story of the Dragon. The genealogy 
of Locrine, king of Britain, is traced back to Noah, through 
Aeneas, and the chronicler relates the incidents of the Trojan 
war as told by Dares the Phrygian. From this point he follows 
closely the Brui of Wace. He loved stories for their own sake, 
and found fault with Wace for questioning the miraculous 
elements in the legend of Arthur. In the second half of 
this chronicle, which is less simple in style, he translates from 
the French of Pierre de Lantgot. He writes in rhyming alexan-
drines, and in the latter part of the work uses middle rhymes. 
Mannyng's Chronicle marks a change in national sentiment. 
Though he regards the Norman domination as a "bondage," he 
is loud in his praises of Edward L, "Edward of Ingland."

The linguistic importance of Mannyng's work is very great. 
He used very few of those Teutonic words which, though still in use, 
were eventually to drop out of the language, and he introduced 
a great number of French words destined to be permanently 
adopted in English. Moreover, he employed comparatively 
few obsolete inflexions, and his work no doubt furthered the 
adoption of the Middle dialect as the acknowledged literary 
instrument. T. L. Kington-Oliphant (Old and Middle English, 
1878) regards his work as the definite starting point of the New 
English, which was to be the means to form the language of the 
Book of Common Prayer.

A third work, usually ascribed to Mannyng, chiefly on 
the ground of its existing side by side with the Handlyng Synne 
in the Harleian and Bodleian MSS., is the Mediacyuns of 
the Soper of oure lordes Jhesu, And also of hyss pasyon And eke 
of the peyeus of hyss sweete modyr, Mayden marye, a free translation 
of St Bonaventura's De coena et passione Domini...
and it was not till 1853 that, by the advice of the Prince Consort, a body of troops were gathered together for a camp of exercise on Chobham Common, and that eventually a standing camp of exercise was evolved out of the temporary camp formed during the Crimean War at Aldershot.

Most continental armies have, since the great successes of the Germans in 1870, copied more or less their system of military training; hence it is appropriate to consider their methods first. The whole training of the army is based on a yearly programme of gradual progression, and the conduct of the regiment is regularly conducted by squads, companies, battalions and regiments, the latter finishing their field training about the middle of August, when the manoeuvre period begins. The troops are employed throughout four or five days of drills on flat ground, to get them under the hand of their commanders and prepare them for manoeuvres. Then follow ten working days of manoeuvres in new and varied ground, of which four are in Belgium, four training as government bodies on areas given in each case the unit named being divided into two portions of all arms, which manoeuvre against one another. Each year two or more army corps carry out manoeuvres before the emperor, working against one another. The chief feature of the German manoeuvres is the free hand allowed to leaders of sides. Of course, for reasons of supply and transport, it is necessary to keep the troops within a certain radius of their stations, and so far as possible the safety of the troops, while retaining their own initiative, the leaders of sides have to give such orders as will suit the arrangements made by the director of manoeuvres for supply. The faculty of quartering troops on private individuals is not merely be regarded as a service to this end, for with portable tent equipment, give, great latitude to the German leaders in their choice of quarters for troops, and so increase the simplicity and economy of the war. It is a fact that manoeuvres are a close copy of the German, but those of the French present the peculiarity of a certain amount of prearrangement, especially at grand manoeuvres, when it is frequently laid down beforehand which side will be victorious. Thus a series of pictures of war is presented, but the manoeuvres are hardly a test of the skill of the rival leaders. But, as just as in recent years in France this manoeuvre plan has been modified, so also the entire liberty given to commanders to carry out what is given in the plan, the result is that in the following years owing to the strain of forced marches which it entailed on the troops.

In England, the climate and social conditions, and the distribution of the army, necessitate a quite peculiar system. The troops leave their barracks and move into standing camps, generally in May, and in these for about three months their training up to that in battalions in carried out on the drill ground. Camps of mixed units are then formed for a month, and from them, but always over the same ground, the manoeuvres of regiments, brigades and divisions are performed. Then follow the so-called mobile manoeuvres, which last for ten days or a fortnight. Of all European manoeuvres these are perhaps the nearest approach to war, for the sides start a great distance apart, and ample time is allowed for cavalry reconnaissance. Besides this, the supplies are sufficient for all purposes, including food for supply; hence the director is not so tied down by consideration of this matter as in other armies. A political colour is sometimes given to these manoeuvres, especially in the phases of the off season, which are the means of autumn training, and, especially when the manoeuvres take place in frontier districts.

In England the military authorities have long been hampered in the organization of manoeuvres by the necessity of carrying them out on public parks, or on areas designated as a favour by, or hired from, private individuals. There has been no want of recognition by the military authorities of the necessity for, and value of, manoeuvres, and the training at the camps of instruction has been supplemented as far as possible by small manoeuvres on such portions of country as could be made available. But, with the exception of spasmodic efforts in 1871 and 1872, it was not until 1897 that an Act was passed providing for the convening of military advisers, and passed a Military Manoeuvres Act, by which certain districts could be "proclaimed" for purposes of manoeuvres, and troops in consequence could traverse all ground. In 1898 the first time the camp was held at Aldershot, which was held in Wils and Dorset, and were intended to be repeated at fixed intervals in future years. In addition, every effort was made to add to the existing permanent training camp at Aldershot a new permanent camp at Aldershot Plain with the intention of developing it into a second Aldershot. But the training on those well-known grounds, excellent as it is in itself as a preparation, is not "manoeuvres," and never can do away with the disadvantages of training on, with a more or less free hand given to the leaders over fresh country.

Much misconception prevails as to the nature and limitation of the "general idea" and the "special idea" of each side comprises the instructions upon which it is acting.

1 The "general idea" is a document, communicated to both sides, containing such general information of the war—the supposed frontiers, previous battles, &c.—as would be matters of common knowledge. The "special idea" of each side comprises the instructions upon which it is acting.

2 The "special idea" of each side comprises the instructions upon which it is acting.
different heights. The difference being directly proportional to the
difference of pressures and inversely as the specific gravity of
the liquid used.

Two forms are in use: (1) the "open-tube," in which the pressure
in one limb is equal to the atmospheric pressure, and (2) the "closed-
tube," in which the experimental pressure is balanced against the
liquid column and the air compressed into the upper part of a closed
limb of the tube. In the "open tube" form (fig. 1) the pressure on
the surface \(a\) is equal to the pressure on the surface at \(b\) (one atmo-
sphere) plus the hydrostatic pressure exerted by the liquid column
of height \(a\ b\). The liquid commonly used is mercury. If a scale
be placed behind the limbs of the tube, so that the difference \(a\ b\)
can be directly determined, then the pressure in \(a\) is at once expressible
as \(P + a\ b\) in millimetres or inches of mercury, where \(P\) is the atmo-
spheric pressure, known from an ordinary barometric observation.
In the "closed tube" form (fig. 2) the calculation is not so simple,
for the variation of pressure on the mercury surface in the closed
limb has to be taken into account. Suppose the length of the air
column in the closed limb be \(h\) when the mercury is at the same
height in both glasses. Applying the experimental pressure to the
open end, if this be greater than atmospheric pressure the mercury
column will rise and the air column diminish in the closed
limb. Let the length of the air column be \(h'\), then its pressure is \(h' k\)

\[
\text{atmospheres.}
\]

The difference in height of the mercury columns in the two limbs is \(2(h' - h)\), and the pressure in the open limb is obviously
equal to that of a column of mercury of length \(2(h' - h)\), plus \(h' k\)
atmospheres. These instruments are equally serviceable for deter-
ing less than one atmosphere. In laboratory practice, e.g. when it is required to determine the degree of exhaust of a water
pump, a common form consists of a vertical glass tube having its
lower end immersed in a basin of mercury, and its upper end con-
ected by means of an intermediate vessel to the exhaust. The
mercury rises in the tube, and the difference between the barometric
height and the length of the mercury column gives the pressure
attained.

MANOR. Any definition of a manor, in land tenure, must

take note of two elements—economic and political. The

manor has an estate for its basis, although it need not coincide
with an estate, but may be wider. It is also a political unit, a
district formed for purposes of government, although the political
functions made over to it may greatly vary. As a lordship
based on land tenure, the manor necessarily comprises a ruler
and a population dependent on him, and the characteristic trait
of such dependence consists not in ownership extending over
persons, as in slave-holding communities, nor in contractual
arrangements, as in a modern economic organization, but in
various forms and degrees of subjection, chiefly regulated by
custom. In the sense mentioned the manor is by no means a
peculiarly English institution; it occurs in every country where
feudalism got a hold. Under other names we find it not only
in France, Germany, Italy, Spain, but also, to a certain extent,
in the Byzantine Empire, Russia, Japan, &c. It is especially
representative of an aristocratic stage in the development of
European nations. When tribal notions and arrangements
ceased to be sufficient for upholding their commonwealths,
when social and political life had to be built up on the basis of
land-tenure, the type of manorial organization came forward in
natural course. It was closely connected with natural economy,
and was suited to a narrow horizon of economic wants and politi-
cal requirements. At the same time it provided links for a kind
of national federation of military estates. We shall only speak
of the course of manorial evolution in France and Germany,
because this presents the clearest expression of the fundamental
principles of manorial life and the best material for comparison
with English facts.

One problem common to the entire European world has to be
considered from the very beginning. Does the manor date
from the Roman Empire, or not? Can its chief features be
traced in Roman institutions? There can be no doubt that at
the end of the Roman period certain traits are noticeable which
might, under favourable conditions, develop into a manorial
combination. Great estates with political functions, populations
subjected to the political lordship of landowners, appear in the
closing centuries of the empire, and have to be reckoned with as
precursors of medieval manorial life. The original organization
of the ancient world was built up on the self-government of cities
and on the sharp distinction between citizens and slaves. Both
features were gradually modified by the Roman Empire. Self-
government was atrophied by bureaucratic interference; the
eco nomy based on the exploitation of slaves began to give way
before relations in which the elements of freedom and servitude
were oddly mixed. During the last centuries of its existence
the Western Empire became more and more a conglomerate of
barbaric and half-civilized populations, and it is not strange
that the characteristic germs of feudalism began to show them-
selves within its territory as well as outside it. As far as
political institutions are concerned, we notice that the central
power, after claiming an absolute sway over its subjects, is
obliged more and more to lean on private forces in order to
maintain itself. One of its favourite resources in the 4th and
5th centuries consists in making great landowners responsible
for the good behaviour of their tenants and even of their less
important neighbours. The salus, the great domain, is occasion-
ally recognized as a separate district exempt from the ordinary
national subjection, and, subordinated to its owner in respect of
taxes and police. Even so, there is a tendency to make the landowner responsible for military con-
scription, for the presentation of criminals to justice. On
the other hand the incumbents of ecclesiastical offices are nominated
in accordance with the wishes of patrons among the landowners;
and in the administration of justice the influence of this class makes
itself felt more and more. Nor are signs of a convergent
evolution wanting on the economic side. Slaves are used more
and more as small householders provided with rural tenements
and burdened with rents and services. Free peasant farmers
holding by free agreement get more and more reduced to a status
of half-free settlers occupying their tenancies on the strength
of custom and traditional ascription to the glebe. Eventually
this status is recognized as a distinct class by imperial legislation.
Ominous symptoms of growing political disruption and of an
aristocratic transformation of society were visible everywhere at
the close of the empire. Yet there could be no talk of a manorial
system as long as the empire and the commercial intercourse
protected by it continued to exist.

The fall of the empire hastened the course of evolution. It
brought economic depression to the tribes who were unable to
uphold either the political power or the economic system of the
Romans. The Germans had from old certain manorial features
in the constitution of their government and household. The
owner of a house had always been possessed of a certain political
power within its precincts, as well as within the fenced area sur-
rounding it: the peace of the dwelling and the peace of the hedged-
in yard were recognized by the legal customs of all the German
tribes. The aristocratic superiority of warriors over all classes
engaged in base peaceful work was also deeply engraved in the
minds of the fighting and conquering tribes. At the same time
the downfall of complicated forms of civilization and civil inter-
course rendered necessary a kind of subjection in which tributary
labourers were left to a certain extent to manage their own affairs.
The German conqueror was unable to move slaves about like
draughts: he had no scope for a complicated administration
of capital and work. The natural outcome was to have recourse
to serfdom with its convenient system of tribute and services.

But, as in the case of the Roman Empire, the formation of
regular manors was held back for a time in the early Germanic
monarchies by the lingering influence of tribal organization.
In the second period of medieval development in continental
Europe, in the Carolingian epoch, the features of the estate as
a political unit are more sharply marked, Notwithstanding
the immense efforts of Charles Martel, Pippin and Charlemagne
to strengthen the tottering edifice of the Frankish Empire, public authority had to compromise with aristocratic forces as a matter of fact this was done. As regards military organization this is expressed in the recognition of the power of seniores, called upon to lead their vassals in the host; as regards jurisdiction, in the increase of the numbers of commended freemen who seek to interpose the powerful patrimonial of lay and secular magnates between themselves and the Crown. Great estates arose not only on the lands belonging to the king, but on that of churches and of lay potenates, and the constitution of these estates, as described for instance in the Polytique of St Germain des Prés or in the "Breviary of the kings of the Franks," reminds us forcibly of that of later feudal estates. They contain a home-farm, with a court and a casa indominicata, or manor-house, some holdings (mansi) of free men (suciantes), of serfs (serviles), and perhaps of half-free people (lildies). The rents and services of this dependent population are stated in detail, as in later customs, and there is information about the agricultural implements, the stores and stock on the home-farm. Thus the economic basis of the manor exists in more or less complete order, but it cannot be said as yet that there was a complete separation of the two types of production. The holdings of independent free men and village organizations of ancient type still surround the great estates, and in the case of ecclesiastical possessions we are often in a position to watch their gradual extension at the expense of the neighbouring free settlers, by way of direct encroachment, and by that of surrender and commendation on the part of the weaker citizens. Another factor which plays a great part in the gradual process of feudalism is the rise of private jurisdictions, which falls chiefly into the 10th and 11th centuries. The struggle against Northmen, Magyars and Slavs gave a crowning touch to the process of localization of political life and of the aristocratic constitution of society.

In order to describe the full-grown continental manor of the 11th century it is better to take French examples than German, Italian or Spanish. Feudalism in France attained the greatest extension and utmost regularity, while in other European countries it was hampered and intermixed with other institutional features. The expression best corresponding to the English "manor," in the sense of an organized district, was seigneurie. But "seigneur" is in use, in a sense corresponding to maestério, but it meant strictly "manor" or chief homestead in France. Baronie is another term which might be employed in some instances as an equivalent of the English manor, but, in a sense, it designates only one species of a larger genus, the estate of a full-baron in contrast to a mere knight's fee, as well as to a principality. Some of the attributes of a baron are, however, typical, as the purest expression of manorial rights, and may be used in a general characterization of the latter.

The seigneurie may be considered from three points of view—as a unit of administration, as an economic unit, and as a union of social classes.

In principle the disruption of political life brought about by feudalism ought to have resulted in the complete administrative independence of the manor. Chaque baron est souverain dans son baronie is a proverb meant to express this radical view of manorial separation. But other sources may be noticed also. It was assumed, and even at the time of the greatest prevalence of feudalism the little sovereigns of France were combined into a loose federation of independent seigneuries. Still, the proverb was not a mere play of words, and it took a long time for the kind of France to break in potenates, like the little Sire de Coucy in the immediate vicinity of Paris, who sported in his crest the self-complacent motto: Je ne sais pas mais je vais le savoir. The general expression of this aspect of feudalism in the life of the seigneurie was the juridiction combined with the latter. The principal origin of this jurisdiction was the dismemberment of royal justice, the acquisition by certain owners of the right of holding royal pleas. The assumption of authority over public tribunals of any kind was naturally considered as equivalent to such a transmission of royal right. But other sources may be noticed also. French feudal law that in all cases when land was granted by a seigneur in subfeudation the recipients would be bound to appear as members of a court of tenants for the settlement of conflicts in regard to land. A third source may be traced in the extension of the patrimonial justice of a person over his serfs and personal dependents to the classes of free and half-free population connected with the seigneurie in one way or another. There was a very close question of these attempts to confer a bewildering fusion of tribunals and judicial rights. It happened sometimes that the question as to who should be the judge in some particular contest was decided by matter-of-course expedients such as the one wherein the first on the spot to proclaim himself judge in a case was deemed entitled to jurisdiction. In other cases one seigneur held the pleas in a certain place for six days in the week, while some competitor of his, or his principal lord, had jurisdiction in the seven days of the week. In this manner feudal chaos by the classification of judicature functions according to the four categories of high, middle, low and tenurial justice was formed. The seigneurie, as a result, was tended to be surrounded by their jurisdiction, and the four concerned cases arising from subfeudation. As a rule the baron or seigneur sat in justice with a court of assessors or peers, but the constitution of such courts varied a great deal. They represented partly the succession of the old popular courts with their scabini, partly courts of vassals and tenants. In strict feudal law an appeal was allowed from a lower to a higher court only in a case of denial of justice (denis de justice), not in error or revision of sentence. This rule was, however, very often infringed, and gave way ultimately before the restoration of royal justice.

The economic fabric of the French seigneurie varied greatly, according to localities. In the north of France it was not unlike that of the English manor. The capital message, or castle, and the home-farm of the lord, were surrounded by dependent holdings, "mansi" or demesnes held by vassals. Between these tenures there were various ties of neighbourhood and economic solidarity recalling the open-field cultivation in England and Germany. When the harvest was removed from the open fields, the peasants returned for undivided gardens to the houses of the householders of the village exercised rights of common with their cattle. Wild pasture and woods were used more or less in the same fashion in England (clubs and commons). In the south, individual property was more prevalent and the villages were not so closely united by ties of neighbourhood. Yet even then the dependent households were arranged into mansi or coloniace, subjected to approximately equal impositions in respect of land and services. In the case of feudal manorial life, the combined working of a central home-farm, of its economic satellites providing necessary help in the way of services, and contributing towards the formation of manorial stores, is quite as much a feature of French as of English medieval husbandry. The social relations between the manorial lord and his subjects are marked by various forms of the exploitation of the latter by the former. Apart from jurisdictional profits, rents and agricultural services of all kinds were exacted from the "half-free and half-serf" rural population. Some of these dues have to be traced to servile origins, although they were evidently gradually extended to groups of people who were not descended from them and who had no earlier considerable subjection. The main mordi of rustic tenants meant that they had no goods of their own, but held movable property on sufferance without the right of passing it on to their successors. As a rule, of fact, sons of a rustic tenant were not allowed to become tenants of their fathers, and sometimes succession was extended to other relatives, but the person taking inheritance paid a heavy fine for entering into possession, or gave up a horse, an ox, or some other especially valuable piece of property. The formage corresponded to the English mercetum, and was exacted from rusticus on the marriage of their daughters. Although this payment assumed very different shapes, and sometimes only appeared in case consorts belonged to different lords, it was considered a badge of servidom. Cheveu (capitation) might be exacted as a poll-tax from all the free inhabitants of a seigneurie, or, more especially, from those who left the manor. The power of the manorial lord was more particularly expressed in his right of pre-emption (retrait seigneurial), and in taxes on alienation (lods et ventes). As a rule the real property of a tenant did not escape the feudal rite of the lord enjoyed divers rights which are commonly attributed to the state—the right of coinage money, of levying direct taxes and toll (lalgumium, tolota) and of instituting monopolies. These latter were of common occurrence, and might take the shape, for instance, of forcing the inhabitants to make use of the lord's mill (moutin banal), or of his oven (four banal), or of his bull (taureau banal).

In Germany the history of the manorial system is bound up with the evolution of the Grundherrschaft (landlordship), as opposed to Gutsherrschaft (estate-ownership). The latter need not include any elements of public authority and aristocratic supremacy: the former is necessarily connected with public functions and aristocratic standing. The centre of the Grundherrschaft was the Hof, the court or hall of the lord, from which the political and economic rights of the lord radiated.
The struggle of the military aristocracy and of ecclesiastical institutions with common freedom was more protracted than in France or England; the lordships very often took the shape of disparate rights over holdings and groups of population scattered over wide tracts of country. Here feudal the manor and the lord is bound with the realm to entirely different authority. Therefore the aspect of German manorialism is more confused and heterogeneous than that of the French or English systems. One remarkable feature of it is the consistent separation of criminal justice from other kinds of jurisdiction on Church property; Episcopal sees and abbeys delegated their share of criminal justice to lay magnates in the neighbourhood (Vogeti), and this division of power became a source of various conflicts and of many entangled relations. The main lines of German manorialism are not radically different from those of France and England.

The communal element, the Dorfverband, is usually more strongly developed than in France, and assumes a form more akin to the English township. But there were regions, e.g. Westphalia, where the population had settled in separate farms (Hofsystem), and where the communal solidarity was reduced to a union for administrative purposes and for the use of pasture.

It need hardly be added that every step in the direction of more active economic intercourse and more efficient public authority tended to lessen the influence of the manorial system in so far as the latter was based on the localization of government, natural husbandry and aristocratic authority.

The Manor in England.—It will be most convenient to describe a typical English manor in its best known period, the 13th century, and to indicate briefly the modifications of the type which varying conditions may produce. Topographically such a manor consisted of the lands of the lord and of those of the tenants, less closely clustered together, and surrounded by arable land divided into large fields, two or three in number. Each of these fields was divided again into shots or furlongs, and each of these shots was broken up into cultivated strips a pole wide, each containing an acre, separated by narrow balks of turf. There were also certain meadows for supplying hay; and beyond the cultivated land lay the wood and waste of the manor. Portions of arable or meadow land might be found apart from the organization of the remainder; the lord of the manor might have a park, and each household a garden, but the land of the manor and the open fields, the meadows and the wastes or common. The condition of the inhabitants of such a manor is as complex as its geography. At the head of the society came the lord of the manor, with his hall, court, or manor-house, and the land immediately about it, and his demesne both in the fields and in the meadow land. The arable demesne consisted of certain of the acre strips lying scattered over the various furlongs; his meadow was a portion assigned to him each year by the custom of the manor. He had also certain rights over the surrounding waste, paramount to those enjoyed by the other inhabitants. Part of his demesne land would be granted out to free tenants to hold at a rent or by military or other service; part would be in the lord's own hands, and cultivated by him. Each part so granted out would carry with it a share in the meadow land and in the profits of the waste. These rights of the free tenants over the waste limited the lord's power over it. He could not by enclosure diminish their interest in it. The statute of Merton in 1326 and the second statute of Westminster in 1285 marked the utmost limit of enclosure allowed in the 13th century. Below the lord and the free tenants came the villeins, natives, bondmen, or holders of virgates or yard-lands, each holding a house, a fixed number of acre strips, and a share of the meadow and of the profits of the waste. The number of strips so held was usually about thirty; but virgates of fifteen acres or even eighty are not unknown. In any one manor, however, the holdings of all the villeins were equal. Normally the holder of a virgate was unfree; he had no rights in the eye of the law against his lord, who was protected from all suits by the exceptus villenagii; he could notwithout leave quit the manor, and could be claimed by process of law if he did; the strict contention of law deprived him of all right to hold property; and in many cases he was subject to certain degrading incidents, such as the manerisation (mercerisation), a payment due to the lord upon the marriage of a daughter, which was regarded as a special mark of unfree condition. But there are certain limitations to be made. Firstly, all these incidents of tenure, even merchet, might not affect the personal status of the tenant; he might still be free, though holding by an unfree tenure; secondly, even if unfree, he was not exposed to the arbitrary will of his lord but was protected by the custom of the manor as interpreted by the manor court. Moreover, he was not a slave, he was not bought and sold apart from his holding. The hardship of his condition lay in the services due from him. As a rule a villein paid for his holding in money, in labour and in kind. In money he paid, firstly, a small fixed rent called rent of assize; and, secondly, dues under various names, partly in lieu of services commuted into money payments, and partly for the privileges and profits enjoyed by him on the waste of the manor. In labour he paid more heavily. Week by week he had to come with his own plough and oxen to plough the lord's demesne; when ploughing was done he had to harrow, to reap the crops, to thresh and carry them, or do whatever might be required of him, until his allotted number of days' labour in the year was done. Beyond this his lord might request of him extra days in harvest or other seasons of emergency, and these requests could not be denied. Further, all the carriage of the manor was provided by the villeins, even to places as much as a hundred miles away from the manor. The mending of the ploughs, hedging, ditching, sheep-shearing and other miscellaneous work also fell upon him, and it is sometimes hard to see what time remained to him to work upon his own holding. In kind he usually rendered honey, eggs, chickens and perhaps a plow-share, but these payments were almost always in the value. Another class of inhabitants remains to be mentioned—the cotters. These are the poor of the manor, who hold a cottage and garden, or perhaps one acre or half an acre in the fields. They were unfree in condition, and in most manors their services were modelled upon those of the villeins. From their ranks were usually drawn the shepherd of the manor, the bee-keeper and other minor officials of the manor.

A complicated organization necessarily involves administrators. Just as the services of the tenants and even their names vary from manor to manor, so does the nature of the staff. Highest in rank came the steward; he was attached to no manor in particular, but controlled a group, travelling from one to another to take accounts, to hold the courts, and generally represent the lord. Under him are the officers of the several manors. First came the bailiff or beadle, the representative of the lord in the manor; his duty was to collect the rents and services, to gather in the lord's crops and account for the receipts and expenditure of the manor. Closely connected with him was the "messor" or reaper; in many cases, indeed, "reaper" seems to have been only another name for the bailiff. But the villeins were not without their own officer, the provost or reeve. His duty was to arrange the distribution of the services due from the tenants, and, as their representative, to assist the bailiff in the management of the manor. Sometimes the same man appears to have united both offices, and we find the reeve accounting to the lord for the issues of the manor.
MANOR-HOUSE

To these important officials may be added a number of smaller ones, the shepherd, the swineherd, the beekeeper, the cowherd, the ploughman and so on, mostly selected from the cotters, and occupying their small holdings by the services expressed in their titles. The number varies with the constitution and needs of each estate, and they are often replaced by hired labour.

The most complicated structure in the system is the manor court. The complication is, indeed, partly the work of lawyers interpreting institutions they did not understand by formulae not adapted to describe them. But behind the form of the court lies the fact that in the 13th century the meeting-point of the lord and the tenant boy both free and unfree, that any question touching on the power and constitution of the court was bound to affect the interests of the lord and the tenants, and that there was no external power capable of settling such questions as did arise. Amid this maze a few clear lines can be laid down. In the first place, so far as the 13th century goes, all the discussion that has collected about the terms court leet, court baron and court customary may be put aside; it relates to questions which in the 13th century were only just emerging. The manor court at that date exercised its criminal, civil, and manorial jurisdiction. In addition to this power of exercising the highest criminal franchises, even if he otherwise protected them; he could, for instance, no longer hang a murderer on his own gallows. Perhaps it may be said that to the exercise of the feudal manorial jurisdiction the royal courts added; if so, the manorial court was necessary. But it is clear that no such condition was necessary to the existence of the manor. Apart from the change in the court of the manor, the most important change in its history is that which connected the copyholder with the copyholder's manor. In the 13th century, the lord's steward was the only person that could judge the tenant. In the 16th century, the lord's steward was the only person that could judge the tenant, and the manor was the courts customs. The question of the existence of the manor court has been discussed in recent times, and it is the courts of the manor that are the subject of this report.

The powers of the manor court are not only to try cases but also to decide of them. The manor court has jurisdiction both civil and criminal. The manor court has the power to try cases of trespass, theft, assault, and the like; but under special conditions, the justice of great offences remained in the king. But offences against the custom of the manor, such as bad ploughing, improper taking of wood from the lord's woods, and the like, were of course the staple criminal business of the court. The under head of manorial business the court dealt with the choice of the manorial officers, and had some power of making regulations for the management of the manor; but its most important function was the recording of the surrender and of the manorial services. Into the history and meaning of this form of land transfer it is not necessary to enter here. But it must be noted that the conveyance of a villein's holding was effected by the vendor surrendering his land to the lord, who thereupon married the purchaser to the holding. The same procedure was employed in all cases of transfer of land, and the transaction was regularly recorded upon the rolls of the court among the records of all the other business transacted there. Finally, the court dealt with all suits to land within the manor, questions of alienation and inheritance, and with civil suits not connected with land. But it need hardly be said that in an ordinary rural manor very few of these would occur.

It will be clear on consideration that the manor court as here described consisted of conflicting elements of very different origin and history. Founded partly on express grants of franchises, partly on the inherent right of a feudal lord to hold a court for his free tenants, partly on the obscure community traceable among the unfree inhabitants of the manor, it is incapable of strict legal definition. All these elements, moreover, contain in themselves reasons for the decay which gradually came over the system. The history of the decay of the manorial jurisdictions in England has not yet been written. On the one hand were the king's courts, with new and improved processes of law; on the other hand the gradual disintegration which marks the history of the manor during the 14th and 15th centuries. The criminal jurisdiction was the first to disappear, and was closely followed by the civil jurisdiction over the free tenants; and in modern times all that is left is the jurisdiction over the customary tenants and their holdings, and that in an attenuated form. A few words must be given to the legal theories of the 15th century on this subject. It is true that the manorial court was conducted partly on modern lines, and that the existence of the manor two courts were necessary—a court customary for customary tenants, and a court baron for free tenants. The customary the lord's steward is the judge; in the court baron the freeholders are the judges. If the number of the court diminished, so that it could not be held, and the manor perishes. Nor can it be revived by the grant of new freemen, as only a few new freemen would hold not of the lord of the manor, but of his lord. The customary tenants and the court customary may survive, but the manor is only a reputed manor. Of the 13th century all this is untrue, but even at that date the existence of free tenants was in a measure essential to the existence of the manor court. If there were none the jurisdiction of the court over free tenants of course disappeared.

Apart from the change in the court of the manor, the most important change in its history is that which connected the copyholder with the copyholder's manor. In the 13th century, the lord's steward was the only person that could judge the tenant. In the 16th century, the lord's steward was the only person that could judge the tenant, and the manor was the courts customs. The question of the existence of the manor court has been discussed in recent times, and it is the courts of the manor that are the subject of this report.

MANOR-HOUSE (Lat. manerium; Fr. manoir), in architecture, the name given to the dwelling-house of the lord of the manor. The manor-house was generally arranged for defence against robbers and thieves and was often surrounded by a moat with drawbridge, but was not provided with a keep or with towers or lofty curtain walls so as to stand a siege. The early buildings were comparatively small, square in plan, comprising a hall with one or two adjacent chambers; at a later period wings were added, thus forming three sides of a quadrangle, like the house designed by John Thorpe as his residence, the plan of which is among his drawings in the Soane Museum. One of
MANRESA—MANSE

The most ancient examples is the manor-house built by Richard Cœur de Lion at Southampton as a rendezvous when he was about to cross into France. This consisted of a hall and chapel on the first floor, with cellars on the ground floor; the walls of this structure, with the chimney-piece, are still in existence. The distinction between the "manor-house" and "castle" is not always very clearly defined; in France such buildings as the castles of Aydon (Northumberland) and of Stokessy (Shropshire) are described as manors, while others, like those built as country houses and not as castles, are called manor-houses. In England the protecting towers and machicolated parapets still formed part of the design, they were considered to be purely decorative features.

In England the principal examples of which remain are the manor-houses of Appleton, Berkshire, with a moat; King John's house at Bradshope, Shropshire; and Raggall, Herefordshire, with traces of moat; Godmersham, Kent; Little Wenham Hall, Suffolk, built partly in brick and flint, and one of the earliest in which the bricks, probably imported from Flanders, are found; Charnley Hall, Berkshire, the T-shaped plan in two storeys; Longthorpe House, near Peterborough; Stokessy, Shropshire, already referred to; Cottesford, Oxfordshire; Woodcroft, Northamptonshire; Acton Hall, Shropshire; Old Soar, Plaxtol, Kent, in 17th storeys, the ground storey vaulted and used as cellar and storehouse, and the upper floor with hall, solar and chapel.

The foundation of all these date from the 14th century. In the 15th century, Igham Mote, Kent, which is of which, with the moat, date from the 14th century, is one of the best preserved manor-houses; then follow Norborough Hall, Northamptonshire; Creslow manor-house, Bucks, with moat; Sutton Courtmerry, Berkshire; the Court Lodge, Great Chart, Kent; Stanton St Quintin, Great Chalfield, and South Wraxhall, all in Wilts; Meare manor-house, Somerset; Ockwell, Berks; Ringfield manor-house, Derbyshire; Kirby Muxloe, Leicester; Stoke Albrighton, Northamptonshire; and, in the 16th century, Large Marney Hall, Essex (1520); Sutton Place, Surrey (1530); the Vyne, Hampshire, already influenced by the first Renaissance. In the 17th and 18th centuries the manor-house is generally of rectangular plan, though well and solidly built, would seem to have been erected more with a view to interior comfort than to exterior embellishment. There is one other type of manor-house, which partakes of the characteristics of the castle, and this is the manor in which the house is generally rectangular or square, with angle turrets and in several storeys; in France it is represented by the manor-houses of St Medard near Bordeaux and Camarac (Dordogne), and in England by Tattershall Castle, Lincolnshire and Midleton Tower, Norfolk, both being in brick. (R. P. S.)

MANRESA, a town of north-eastern Spain, in the province of Barcelona, on the river Cardoner and the Barcelona-Lérida railway. Pop. (1900), 23,252. Manresa is the chief town of the highlands watered by the Cardoner and upper Llobregat, which meet below the town, and are also connected by a canal 18 m. long. Two bridges, one built of stone and dating from the Roman period, the other constructed of iron in 1804, unite the wider and larger part of Manresa with the modern suburbs on the right bank of the river. The principal buildings are the collegiate church of Santa María de la Sócor, the Dominican monastery, and the church of San Ignazio, built over the cavern (cueva santa) where Ignatius de Loyola spent most of the year 1522 in penitentary exercises and the composition of his Exercitia spiritualia. Santa Maria is a fine example of Spanish Gothic, and consists, like many Catalan churches, of nave and chancel, aisles and ambulatory, without transepts. One of its chief treasures is the magnificent altar of St Ignatius, the altarpiece of which is attributed to Duccio di Buoninsegna (1260-1319). The altar was shipped to Lima, South America, in 1556, and was restored to Manresa in 1875. The richly carved statue of the Blessed Virgin is of the 16th century. The old monastery, adjoining the cueva santa, commands a magnificent view of the Montserrat (q.v.), and is used for the accommodation of the pilgrims who yearly visit the cavern in thousands. Manresa has important iron-foundries and manufactures of woolen, cotton and linen goods, ribbons, hats, paper, soap, chemicals, spirits and flour. Building-stone is quarried near the town.

Manresa is probably the Muniosa of the Romans, which was the capital of the Jaccetani or Jaccetani, an important tribe of the south-eastern Pyrenees. A large portion of the town was burned by the French in 1812.

MANRIQUE, GóMEZ (1417–1467), Spanish poet, soldier and politician and dramatist, was born at Amusco. The fifth son of Pedro Manrique, adelantado mayor of León, and nephew of Santillana (q.v.), Gómez Manrique was introduced into public life at an early age, took a prominent part against the constable Álvaro de Luna during the reign of John II., went into opposition against Miguel Lucas de Iranzo in the reign of Henry IV., and declared in favour of the infanta Isabel, whose marriage with Ferdinand he promoted. Besides being a distinguished soldier, he acted as a moderating political influence and, when appointed corregidor of Toledo, was active in protecting the converted Jews from popular resentment. His will was signed on the 31st of May 1490, and he is known to have died before the 16th of February 1491. He inherited the literary taste of his uncle Santillana, and was greatly esteemed in his own age; but his reputation was afterwards eclipsed by that of his nephew Jorge Manrique (q.v.), whose Coplas were continually reproduced. Gómez Manrique's poems were not printed till 1885, when they were edited by Antonio Faz y Melia. They at once revealed him to be a poet of eminent merit, and it seems certain that his Coplas, addressed to Diego Arias de Avila, inspired the more famous Coplas of his nephew. His didactic verses are modelled upon those of Santillana, and his satires are somewhat coarse in thought and expression; but his place in the history of Spanish literature is secure as the earliest Spanish dramatist whose name has reached posterity. He wrote the Representación del nacimiento de Nuestro Señor, a play on the Passion, and two monos, or interludes, played at court.

MANRIQUE, JORGE (1440–1478), Spanish poet and soldier, was born probably at Paredes de Nava. The fourth son of Rodrigo Manrique, count de Paredes, he became like the rest of his family a fervent partisan of Queen Isabel, served with great distinction in many engagements, and was made comendador of Montizón in the order of Santiago. He was killed in a skirmish near the fortress of Garcí-Muñoz in 1478, and was buried in the church attached to the convent of Ucles. His love-songs, satires, and acrostic verses are merely ingenious compositions in the taste of his age; he owes his imperishable renown to a single poem, the Coplas por la muerte de su padre, an elegy of forty stanzas on the death of his father, which was first printed in 1553. It is entitled to a place in his Elegias, or Canselor de Mendoza about the year 1482. There is no foundation for the theory that Manrique drew his inspiration from an Arabic poem by Abu 'l-Baká Salih ar-Rundi; the form of the Coplas is influenced by the Cancionero del Rey, and the matter derives from the Bible, from Boethius and from other sources readily accessible. The great sonorous common-places on death are vitalized by the intensely personal grief of the poet, who lent a new solemnity and significance to thoughts which had been for centuries the common property of mankind. It was given to Jorge Manrique to have one single moment of sublime expression, and this isolated achievement has won him a fame undimmed by any change of taste during four centuries.

The best edition of the Coplas is that issued by R. Fouché-Delbos in the Bibliotheca hispanica; the poem has been admirably translated by Longfellows. Manrique's other verses were mostly printed in Hernando del Castillo's Cancionero general (1511).

MANSE (Med. Lat. mansa, mansus or mansum, from manere, to dwell, remain), originally a dwelling-house together with a portion of land sufficient for the support of the family. It is defined by Du Cange (Glossarium, s. v. Mansus) as ... cedum agri portionem quae coloretur et in qua coloni aedes esset. The term was particularly applied, in ecclesiastical law, to the house and glebe to which every church was entitled by common right,
MANSSEL—MANSFELD, E.

the rule of canon law being sanctum est ut unicunque ecclesiae manus integer absque abilo servito tributatur (Philimore, Eccles. Law, 1869, ii. 1129). The word is now chiefly used for the residence of a minister of the Established Church of Scotland; to this every minister of a rural parish is entitled, and the landed proprietors must build and keep it up. "Manse" is also loosely used for the residence of a minister of various Free Church denominations (see GELEB).

MANSEL, HENRY LONGUEVILLE (1820–1871), English philosopher, was born at Cosgrove, Northamptonshire (where his father, also Henry Longueville Mansel, fourth son of General John Mansel, was rector), on the 6th of October 1820. He was educated at Harrow and at St John's College, Oxford. He took a double first in 1843, and became tutor of his college. He was appointed reader in moral and metaphysical philosophy at Magdalen College in 1853, and Waynflete professor in 1859. He was a great opponent of university reform and of the Hegelianism which was then beginning to take root in Oxford. In 1867 he succeeded A. P. Stanley as professor of ecclesiastical history, and in 1868 he was appointed dean of St Paul's. He died on the 31st of July 1871.

The philosophy of Mansel, like that of Sir William Hamilton, was mainly due to Aristotle, Kant and Reid. Like Hamilton, Mansel rejected the laws of thought as a general foundation of metaphysics, and the duality of consciousness as testifying to both self and the external world, and the limitation of knowledge to the finite and "conditioned." His doctrines were developed in his edition of Aldrich's Aris logicee radimenta (1839)—his chief contribution to the reviving study of Aristotle—and in his Prolegomena logic: an Inquiry into the Psychological Character of Logical Processes (1851, 2nd ed. enlarged 1860), in which the limits of logic as the "science of formal thinking" are rigorously determined. In his Bampton lectures on The Limits of Religious Thought (1858, 1st. ed. 1857; Danish trans. 1859) he applied the Christian theology the metaphysical agnosticism which seemed to result from Kant's criticism, and which had been developed in Hamilton's Philosophy of the Unconditioned. While denying all knowledge of the supersensuous, Mansel deviated from Kant in contending that cognition of the ego as it really is itself a fact of experience. Consciousness, he held—agreeing thus with the doctrine of "natural realism" which Hamilton developed from Reid—implies knowledge both of self and of the external world. The latter Mansel's psychology reduces to cognate abstractions, and assigns them as extended; with the former he held consciousness of free will and moral obligation. A summary of his philosophy is contained in his article "Metaphysics" in the 8th edition of the Encyclopaedia Britannica (separately published, 1866). Mansel wrote also The Philosophy of the Conditioned (1866) in reply to Mill's criticism of Hamilton; Letters, Lectures, and Reviews (ed. Chandler, 1873), and The Gnostic Heresies (ed. J. B. Lightfoot, 1875, with a biographical sketch by Lord Carnarvon). He wrote a commentary on the first two gospels in the Speaker's Commentary.

MANSFELD, the name of an old and illustrious German family which took its name from Mansfeld in Saxony, where it was seated from the 11th to the 18th century. One of its earliest members was Hoyer von Mansfeld (d. 1115), a partisan of the emperor Henry V. during his struggles with the Saxons; he fought at Mansfeld (1137) and was killed in his service at Wellesholz. Still more famous for the part he played was Jorg (1480–1560), an intimate friend of Luther and one of the earliest and staunchest supporters of the Reformation. He helped to crush the rising of the peasants under Thomas Munzer in Thuringia in 1525; he was a member of the league of Schmalkalden, and took part in all the movements of the Protestants against Charles V. With Albert was associated his brother Gebhard, and another member of the family was Johann Gebhard, elector of Bologna from 1558 to 1562. A son of another branch of the Mansfelds was Peter Ernst, Fürst von Mansfeld (1517–1604), governor of Luxembourg, who unlike his kinsman was loyal to Charles V. He went with the emperor to Tunis and fought for him in France. He was equally loyal to his son, Philip II. of Spain, whom he served at St Quentin and in the Netherlands. He distinguished himself in the field and found time to lead a body of troops to aid the king of France against the Huguenots. In this capacity he was present in 1569 at the battle of Moncontour, where another member of his family, Count Wolrad of Mansfeld (d. 1578) was among the Huguenot leaders. The Mansfeld family became extinct in 1780 on the death of Friedrich Count of Mansfeld, whose lands were divided between Saxony and Prussia.

MANSFELD, ERNST, GRAF von (c. 1580–1626), German soldier, was an illegitimate son of Peter Ernst, Fürst von Mansfeld, and passed his early years in his father's palace at Luxemburg. He gained his earliest military experiences in Hungary, where his half-brother Charles (1543–1595) also a soldier of renown, held a high command in the imperial army. Later he served under the Archduke Leopold, until that prince's ingratitude, and in the service of the Spanish, led him to break with his brother. He then essayed in being a soldier and his army in Bohemia, and in 1621 he took up his position in the Upper Palatinate, successfully resisting the efforts made by Tilly to dislodge him. From the Upper he passed into the Rhenish Palatinate. Here he relieved Frankenthal and took Hagenau; then, joined by his master, the elector Frederick, he defeated Tilly at Wiesloh in April 1622 and plundered Alsace and Hesse. But Mansfeld's ravages were not confined to the lands of his enemies; they were ruinous to the districts he was ordered to defend. At length Frederick was obliged to dismiss Mansfeld's troops from his service. Then joining Christian of Brunswick the count led his army through Lorraine, devastating the country as he went, and in August 1622 defeating the Spaniards at Fleurs. He next entered the service of the United Provinces and took up his quarters in East Friesland, capturing fortresses and inflicting great hardships upon the inhabitants. A mercenary and a leader of mercenaries, Mansfeld often interrupted his campaigns by journeys made for the purpose of raising money, or in other words of selling his services to the highest bidder, and in these diplomatic matters he showed considerable skill. About 1624 he paid three visits to London, where he was hailed as a hero by the populace, and at least one to Paris. James I. was anxious to furnish him with men and money for the recovery of the Palatinate, but it was not until January 1625 that Mansfeld and his army of "raw and poor rascals" sailed from Dover to the Netherlands. Later in the year, the Thirty Years' War having been renewed under the leadership of Christian IV., king of Denmark, he re-entered Germany to take part therein. But on the 25th of April 1626 Wallenstein inflicted a severe defeat upon him at the bridge of Gotha or tannen, known in the annals of the war as the battle of Hohenfriedberg, at which he intended to attack the hereditary lands of the house of Austria, and pursued by Wallenstein he pressed forward towards Hungary, where he hoped to accomplish his purpose by the aid of Bethem Gabor, prince of Transylvania. But when Gabor changed his policy and made peace with the emperor, Mansfeld was compelled to disband his troops. He set out for Venice, but when he reached Rakowitz he was taken ill, and

MANSFIELD, RICHARD (1587–1907), American actor, was
born on the 24th of May 1857, in London, his mother being
Madame [Ermina] Rudersdorff (1822–1889), the singer, and his
father, Maurice Mansfield (d. 1861), a London wine merchant.
He first appeared on the stage at St George's Hall, London,
and then drifted into light opera, playing the Major-General
in The Pirates of Penzance, and the Lord High Executioner
in The Mikado, both in the English provinces and in America.
In 1883 he joined A.M. Palmer's Union Square theatre company
in New York, and made a great hit as MacNamara, Chieftain
in A Parisian Romance. He appeared successfully in several plays
adapted from well-known stories, and his rendering (1887) of
the double titled parts in R. L. Stevenson's Strange Case of
Dr Jekyll and Mr Hyde created a profound impression. It was
with this play that he made his London reputation during a
season (1888) at the Lyceum theatre, by invitation of Henry
Irving. He produced Richard III. the next year at the Globe.
Among his other chief successes were Prince Karl, Cyrano de
Bérgéric and Monseur Beauchâtre. He was one of the earliest
stars of the American stage, and in 1894 was Bluntschli in Arms
and the Man, and as Dick Dudgeon in The Devil's Disciple in 1897.
As a manager and producer of plays Mansfield was remarkable for his lavish staging.
He died in New London, Connecticut, on the 30th of August 1907.

See the lives by Paul Willsch (1908) and William Winter (1910).

MANSFIELD, WILLIAM MURRAY, 1ST EARL OF (1705–1793), English judge, was born at Scone in Perthshire, on the 2nd of March 1705. He was a younger son of David Murray, 5th Viscount Stormont (c. 1665–1731), the dignity having been granted in 1621 by James I, to his friend and helper, Sir David Murray (c. 1581), a celebrated judge. Sir David Murray's father was Lord Stormont's family was Jacobite in its politics, and his second son James (c. 1670–1728), being apparently mixed up in some of the plots of the time, joined the court of the exiled Stuarts and in 1721 was created earl of Dunbar by James Edward, the Old Pretender.

William Murray was educated at Perth grammar school and Westminster School, of which he was a king's scholar. Entering Christ Church, Oxford, he graduated in 1727. A friend of the family, Lord Foley, provided the funds for his legal training, and he became a member of Lincoln's Inn on his departure from Oxford, being called to the bar in 1730. He was a good scholar and mixed with the best literary society, being an intimate friend of Alexander Pope. His appearance in some important Scottish appeal cases brought him into notice, and in Scotland at least he acquired an immense reputation by his appearance for the city of Edinburgh when it was threatened with disfranchisement for the affair of the Porteous mob. His English practice had as yet been scanty, but in 1737 a single speech in a jury trial of note placed him at the head of the bar, and from this time he had all he could attend to. In 1748 he married Lady Elizabeth Finch, daughter of the earl of Winchelsea. His political career began in 1742 with his appointment as solicitor-general. During the next fourteen years he was one of the most conspicuous figures in the parliamentary history of the time. By birth a Jacobite, by association a Tory, he was nevertheless a Moderate, and his politics were really dominated by his legal interests. Although holding an office of subordinate rank, he was the chief defender of the government in the House of Commons, and during the time that Pitt was in office, Lord Murray, as the writer has elsewhere stated, he became attorney-general, and for the next two years acted as leader of the House of Commons under the administration of the duke of Newcastle. But in 1756, when the government was evidently approaching its fall, an unexpected vacancy occurred in the chief justiceship of the king's bench, and he claimed the office, being at the same time raised to the peerage as Baron Mansfield.

From this time the chief interest of his career lies in his judicial work, but he did not wholly disavow himself from politics. He became by a singular arrangement, only repeated in the case of Lord Ellenborough, a member of the cabinet, and was repeatedly in this position through various changes of administration for nearly fifteen years, and, although he persistently refused the chancellorship, he acted as Speaker of the House of Lords while the Great Seal was in commission. During the time of Pitt's ascendency he took but little part in politics, but while Lord Bute was in power his influence was very considerable, and seems mostly to have been exerted in favour of a more moderate line of policy. He was on the whole a supporter of the prerogative, but within definite limits. Macaulay terms him, justly enough, "the father of modern Toryism, of Toryism modified to suit an order of things in which the House of Commons is the most powerful, if not the only body in the state." During the stormy session of 1770 he came into violent collision with Chatham and Camden in the questions that arose out of the Middlesex election and the trials for political libel; and in the subsequent years he was the subject of the bitter attacks of Junius, in which his early Jacobite connexions, and his apparent leanings to arbitrary power, were used against him with extraordinary ability and virulence. In 1776 he was created earl of Mansfield. In 1783, although he declined to re-enter the cabinet, he acted as Speaker of the House of Lords during the coalition ministry, and with this his political career may be said to have closed. He continued to act as chief justice until his resignation in June 1788, and after five years spent in retirement died on the 20th of March 1793. He left no family, but his title had been re-granted in 1792 with a direct remainder to his nephew David Murray, 7th Viscount Stormont (1727–1796). The 2nd earl was ambassador to Vienna and then to Paris; he was secretary of state for the southern department from 1779 to 1782, and lord president of the council in 1783, and again from 1794 until his death. In 1806 his descendant Alan David Murray (b. 1864) became 6th earl of Mansfield.

Lord Mansfield's great reputation rests chiefly on his judicial career. The political trials over which he presided, although they gave rise to numerous accusations against him, were conducted with singular fairness and propriety. He was accused with especial bitterness of favouring arbitrary power by the law which he laid down in the trials for libel which arose out of the publications of Junius and Horne Tooke, and which at a later time he reaffirmed in the case of the dean of St Asaph (see Libel). But we must remember that his view of the law was curtailed in by the great majority of the judges and lawyers of that time, and was supported by undoubted precedents. In other instances, when the government was equally concerned, he was wholly free from suspicion. He supported Lord Camden's decision against general warrants, and reversed the outlawry of Wilkes. He was always ready to protect the rights of conscience, whether they were claimed by Dissenters or Catholics, and the popular fury which led to the destruction of his house during the Gordon riots was mainly due to the fact that a Catholic priest, who was accused of saying Mass, had escaped the penal laws by his charge to the jury. His chief celebrity, however, is founded upon the consummate ability with which he discharged the civil duties of his office. He has always been recognized as the founder of English mercantile law. The common law as it existed before his time was wholly inadequate to cope with the new cases and customs which arose with the increasing development of commerce. The facts were left to the jury to decide as best they might, and no principle was in existence which could be applied to them. In cases which involved in subsequent cases, Mansfield found the law in this chaotic state, and left it in a form that was almost equivalent to a
code. He defined almost every principle that governed commercial transactions in such a manner that his successors had only to apply the rules he had laid down. His knowledge of Roman and foreign law, and the general width of his education, freed him from the danger of relying too exclusively upon narrow precedents, and afforded him a storehouse of principles and illustrations, while the grasp and acuteness of his intellect enabled him to put his judgments in a few striking sentences. A similar influence was exerted by him in other branches of the common law; and although, after his retirement, a reaction took place, and he was regarded for a while as one who had corrupted the ancient principles of English law, these prejudices passed rapidly away, and the value of his work in bringing the older law into harmony with the needs of modern society has long been fully recognized.

See Holliday's *Life* (1797); Campbell's *Chief Justices; foss's Judges; Greville's Memoirs, passim; Horace Walpole's Letters; and other memoirs and works on the period.

MANSFIELD, a market town and municipal borough in the Mansfield parliamentary division of Nottinghamshire, England, on the small river Mann or Maun; the junction of several branches of the Midland railway, by which it is 142 m. N.N.W. from London. Pop. (1891), 33,094; (1901), 35,250. Area, 7,268 acres. The church of St Peter is partly Early Norman, and partly Perpendicular. There is a grammar school founded by Queen Elizabeth in 1561, occupying modern buildings. Twelve almshouses were founded by Elizabeth Heath in 1693, and to these six were afterwards added. There are a number of ancient mansions. The industries are the manufacture of lace, thread, boots and machinery, iron-founding and brewing. In the neighbourhood, as at Mansfield Woodhouse to the north, there are quarries of limestone, sandstone and freestone. The town is governed by a mayor, 6 aldermen and 18 councillors. During the hereditary Mansfield was occasionally the residence of the Mercian kings, and it was afterwards a favourite resort of Norman sovereigns, lying as it does on the western outskirts of Sherwood Forest. By Henry VIII. the manor was granted to the earl of Surrey. Afterwards it went by exchange to the duke of Newcastle, and thence to the Portland family. The town obtained a fair from Richard II. in 1377. It became a municipal borough in 1382.

MANSFIELD, a city and the county-seat of Richland county, Ohio, U.S.A., about 65 m. S.W. of Cleveland. Pop. (1890), 13,473; (1900), 17,640, of whom 781 were foreign-born; (1910 census), 20,768. It is served by the Pennsylvania (Pittsburg, Ft. Wayne & Chicago division), the Erie, and the Baltimore & Ohio railways. It is built on an eminence (115 ft.), and has two public parks, a substantial courthouse, a soldiers' and sailors' memorial building, a public library, a hospital and many fine residences. It is the seat of the Ohio state reformatory. Mansfield has an extensive trade with the surrounding agricultural country, but its largest interests are in manufactures. The total factory product in 1905 was valued at $7,333,578. There are natural gas wells in the vicinity. The waterworks and the sewage disposal plant are owned and operated by the municipality. Mansfield was laid out in 1808, and was named in honour of Lieut.-Colonel Jared Mansfield, (1759-1830), United States officer, who first crossed the Mississippi in 1812, and professor of natural and experimental philosophy at West Point from 1812 to 1828. Mansfield was incorporated as a village in 1828 and was first chartered as a city in 1857. It was the home of John Sherman from 1840 until his death.

MANSION (through O. Fr. mansion, mod. maison, from Lat. mansio, dwelling-place, stage on a journey; manere, to remain), a term applied in early English use to the principal house of the lord of a manor. By the *Settled Land Act* 1850, § 10, subsec. 1, repealing § 15 of the act of 1852, "the principal mansion house ... on any settled land shall not be sold or exchanged or leased to the tenant for life without the consent of the trustees of the settlement or an order of the court." The principles guiding an English court of law for making or refusing such an order are laid down in *In re the Marquess of Ailesbury's Settled Estate* (1892), 1 Ch. 506, 546; A.C. 356. In general usage, the term "mansion" is given to any large and important house in town or country; and "mansion house" to the official residence, when provided, of the mayor of a borough, particularly to that of the lord mayors of London and Dublin. From the general meaning of a conspicuously large dwelling-place comes the modern employment of the term "mansion," in London and elsewhere, for large buildings composed of "flats."
noblly. His strict justice and enlightened administration were not less notable than the military prowess by which he is best known. His arms were the terror of the Christians, and raised the Moslem power in Spain to a pitch it had never before attained. In Africa his armies were for a time hard pressed by the revolt of 200,000 viscounts of Mauretania, but before his death this enemy had also fallen. Mansur died at Medinaecil on the 10th of August 1002, and was succeeded by his son Mozaffar.

MANSURA, the capital of the province of Dakahlia, Lower Egypt, near the west side of Lake Menzala, and on the Cairo-Damietta railway. Pop. (1907), 40,279. It dates from 1221, and is famous as the scene of the battle of Mansura, fought on the 8th of February 1250, between the crusaders commanded by the king of France, St Louis, and the Egyptians. The battle was drawn, but it led to the retreat of the crusaders on Damietta, and to the surrender of St Louis. Mansura has several cotton-ginning, cotton, linen and sail-cloth factories.

MANT, RICHARD (1776-1848), English divine, was born at Southampton on the 12th of February 1776, and was educated at Winchester and Trinity College, Oxford. He was elected fellow of Oriel in 1798, and after taking orders held a curacy at Southampton (1802), and then the vicarage of Coggleshall, Essex (1810). In 1811 he was Hampton lecturer, in 1816 was made rector of St Botolph's, and in 1820 bishop of Killaloe and Killfenoragh (Ireland). In 1823 he was translated to Down and Connor, to which Diocese he remained, but died before he could perfect his connexion with the Rev. George D'Oyly he wrote a commentary on the whole Bible. Other works by him were the Psalms in an English Metrical Version (1842) and a History of the Church of Ireland (1839-1841; 2 vols.).

MANTEGAZZA, PAOLO (1831-1910), Italian physiologist and anthropologist, was born at Monza on the 31st of October 1831. After spending his student-days at the universities of Pisa and Milan, he gained his M.D. degree at Pavia in 1854. After traveling in Europe, India and America, he practised as a doctor in the Besancon and Grenoble districts. Returning to Italy in 1858 he was appointed surgeon at Milan Hospital and professor of general pathology at Pavia. In 1870 he was nominated professor of anthropology at the Instituto di Studi Superiori, Florence. Here he founded the first Museum of Anthropology and Ethnology in Italy, and later the Italian Anthropological Society. From 1865 to 1876 he was deputy for Monza in the Italian parliament, subsequently being elected to the senate. He became the object of bitter attacks on the ground of the coloured complexion of himself and his race, and carried the practice of vivisection. His published works include Pitiologia del dolore (1880); Pitiologia dell' amore (1886); Elementi d'igiene (1875); Fisiomonia e mimica (1888); Le Estasi umane (1887).

MANTEGNA, ANDREA (1431-1506), one of the chief heroes in the advance of painting in Italy, was born in Vicenza, of very humble parentage. It is said that in his earliest boyhood Andrea was, like Giotto, put to shepherding or cattle-herding; this is not likely, and can at any rate have lasted only a very short while, as his natural genius for art developed with singular precocity, and excited the attention of Francesco Squarcione, who entered him into the guild of painters before he had completed his eleventh year.

Squarcione, whose original vocation was tailoring, appears to have had a remarkable enthusiasm for ancient art, and a proportionate faculty for acting, with profit to himself and others, as a sort of artistic middleman; his own performances as a painter were merely mediocre. He travelled in Italy, and perhaps in Greece also, collecting antique statues, reliefs, vases, &c., forming the largest collection then extant of such works, making drawings from them himself, and throwing away his stores for others to study from, and then undertaking works on commission for which his pupils no less than himself were made available. As many as one hundred and thirty-seven painters and pictorial students passed through his school, established towards 1440, which became famous all over Italy. Mantegna was, as he deserved to be, Squarcione's favourite pupil. Squarcione adopted him as his son, and purposed making him the heir of his fortune. Andrea was only seventeen when he painted, in the church of S. Sofia in Padua, a Madonna picture of exceptional and recognized excellence. He was no doubt fully aware of having achieved no common feat, as he marked the work with his name and the date, and the years of his age. This painting was destroyed in the course of the church by a fall of the roof, and was succeeded by his son Paolo in the same church, of whom we shall speak presently.

As the youth progressed in his studies, he came under the influence of Jacopo Bellini, a painter considerably superior to Squarcione, father of the celebrated painters Giovanni and Gentile, and of a daughter Nicolosia; and in 1454 Jacopo gave Nicolosia to Andrea in marriage. This connexion of Andrea with the pictorial rival of Squarcione is generally assigned as the reason why the latter became alienated from the son of his adoption, and always afterwards hostile to him. Another suggestion, which rests, however, merely on its own internal probability, is that Squarcione had at the outset used his pupil Andrea as the unsavory executant of certain commissions, but that after a while Andrea began painting on his own account, thus injuring the professional interests of his chief. The remarkably definite and original style formed by Mantegna may be traced out as founded on the study of the antique in Squarcione's atelier, followed by a diligent application of principles of work exemplified by Paolo Uccello and Donatello, with the practical guidance and example of Jacopo Bellini in the sequel.

Among the other early works of Mantegna are the frescoes of two saloons in the entrance of the church of S. Antonio in Padua, 1452, and an altar-piece of St Luke and other saints for the church of S. Giustina, now in the Brera Gallery in Milan, 1453. It is probable, however, that before this time some of the pupils of Squarcione, including Mantegna, had already begun that series of frescoes in the chapel of S. Cristoforo, in the church of S. Agostino degli Eremitani, by which the great painter's reputation was fully confirmed, and which remain to this day conspicuous among his finest achievements. The now censorious Squarcione found much to carp at in the earlier works of his son, and it is probable that Jacopo, to whom Andrea adhered like men of stone, and had better have been coloured stone-colour at once. Andrea, conscious as he was of his own great faculty and mastery, seems nevertheless to have felt that there was something in his old preceptor's strictures; and the later subjects, from the legend of St Christopher, combine with his other excellences more of natural character and vivacity. Trained as he had been to the study of marbles and the severity of the antique, and openly avowing that he considered the antique superior to nature as being more eclectic in form, he now and always preserved precision of outline, dignity of idea and of figure, and he thus tended towards rigidity, and to an austere wholeness rather than gracious sensitiveness of expression. His draperies are tight and closely folded, being studied (as it is said) from models draped in paper and woven fabrics gummed. Figures slim, muscular and bony, action impetuous but of arrested energy, tawny landscape, gritty with littering pebbles, mark the athletic hauteur of his style. He never changed, though he developed and perfected, the manner which he had adopted in Padua, his colouring, at first rather neutral and undecided, strengthened and matured. There is throughout his works more balancing of colour than fineness of tone. One of his great aims was optical illusion, carried out by a mastery of perspective which, though not always impeccably correct, nor absolutely superior in principle to the highest contemporary point of attainment, was worked out by himself with strenuous labour, and an effect of actuality astonishing in those times.

Successful and admired though he was in Padua, Mantegna left his native city at an early age, and never afterwards resided...
Mantegna was no less eminent as an engraver, though his history in that respect is somewhat obscure, partly because he never signed many of his prints, partly because the number of engravings made by him is not accurately known. The account which has come down to us is that Mantegna began engraving in Rome, prompted by the engravings produced by Baccio Baldi of Siena and Filippo Dal Pozzo, and continued it in Mantua, 1472. The account in Mantua, on the other hand, is that Mantegna treated several compositions as the Hampton Court pictures, a Bacchanal Festival, "Hereles and Antaeus," and "Gods," and that he executed the "Deposition from the Cross," the "Entombment," the "Resurrection," the "Man of Sorrows," and the "Virgin in a Grotto." Mantegna himself has been credited with the important invention of the process of engraving with the burin on copper. This claim cannot be sustained on a comparison of dates, but at any rate he introduced the art into upper Italy. Several of his engravings are supposed to be executed on silver, but much less hard than copper. The technique of himself and his followers is characterized by the strongly marked forms of the design, and by the oblique formal hatchings of the shadows. The prints are frequently to be found in two states, or editions. In the first state the line is hard and the white spaces are weakly pressing, and they are weak in tint; in the second state the printing press has been used, and the ink is stronger.

The influence of Mantegna on the style and tendency of his age was very marked, and extended not only to his own flourishing Mantuan school, but over Italian art generally. His vigorous perspectives and trenchant foreshortenings pioneered the way to other artists; in solid antique taste, and the power of reviving the aspect of a remote age with some approach to system and consistency, he distanced all contemporary competition. He did not, however, leave behind him the habit of superior faculty. His two legiti-
mates were painters of only ordinary ability. His favourite pupil was known as Carlo del Mantegna; Caroto of Verona was another pupil, Bonsignori an imitator. Giovanni Bellini, in his turn, was inspired by Mantegna's works, obviously followed the lead of his brother-in-law Andrea.

The works painted by Mantegna, apart from his frescoes, are not numerous; some thirty-five are attributed to him by modern authors. A number of works, including a noted copy of Andrea della Robbia's "Madonna and Child with Chanting Angels" (1461), in the Tribunale of the Uffizi, Florence, three pictures remarkable for scrupulous finish; in the Berlin Museum, the "Dead Christ with two Angels"; in the Louvre, the two celebrated pictures of mythic allegory—"Parnassus" and "Minerva Triumphant over the Vices"—in the National Gallery, London, "The Agony in the Garden," "The Virgin and Child Enthroned, with the Baptist and the Magdalen," a late example; the monochrome of "Vestals," brought from Hamilton Palace, "The Triumph of Scipio" (or "Phrygian Morning"), the Gods received by the Roman Commonwealth, a tempera in chiarooscuro, painted only a few months before the master's death; in the Brera, Milan, the "Dead Christ, with the two Maries weeping," a remarkable "larme de force" in the way of foreshortening, which, though it has a stunted appearance, is in correct technical perspective as seen from all points of view. With all its exceptional merit, this is an eminently ugly picture. It remains an example of Mantegna's studio unsold at his death, and assigned to the dealer de Pinto.

Not to speak of earlier periods, a great deal has been written concerning Mantegna of late years. See the works by Maud Crutwell of his native town; The Life of Mantegna by James Fellowes (1892), Julia Cartwright, Mantegna and Francia (1881).
at Chatham, near London. He found time to prosecute researches on the palaeontology of the Secondary rocks, particularly in Sussex—a region which he made classical in the history of discovery. While occupying still a consultatory appointment at Brussels his eminence as a geological investigator was fully recognized on the publication of his work on *The Fossils of the South Downs* (1822). His most remarkable discoveries were made in the Wealden formations. He demonstrated the fresh-water origin of the strata, and from them he brought to light and described the remarkable Dinosaurian reptiles known as *Iguanodon, Hylaeosaurus, Pelorosaurus and Regnosaurus*. For these researches he was awarded the Wollaston medal by the Geological Society and a Royal medal by the Royal Society.

He was elected F.R.S. in 1825. Among his other contributions to the literature of palaeontology was his description of the Triassic reptile *Telerpeton eliginensis*. Towards the end of his life Dr Mantell retired to London, where he died on the 10th of November 1852. His eldest son, Walter Baldock Durrant Mantell (1820–1899), settled in New Zealand, and there attained high public positions, eventually being secretary for Crown-lands. He obtained remains of the *Notornis*, a recently extinct bird, and also brought forward evidence to show that the moas were contemporaries of man.

In addition to the works above mentioned Dr Mantell was author of *Illustrations of the Geology of Sussex* (4to, 1827); *Geology of the South-downs* (1833); *The Wonders of Geology* (2 vols. 1838; ed. 7, 1852); *Geological Excursions round the Isle of Wight*, and along the *Adjacent Coast of Dorsetshire* (1847; ed. 3, 1854); *Petrifactions and their Teachings* (1851); *The Metals of Creation* (2 vols., 1854).

**MANTES-SUR-SEINE**, a town of northern France, capital of an arrondissement in the department of Seine-et-Oise on the left bank of the Seine, 34 m. W.N.W. of Paris by rail. Pop. (1906), 8113. The chief building in Mantes is the celebrated church of Notre-Dame which dates in the main from the end of the 12th century. A previous edifice was built down by William the Conqueror together with the rest of the town, at the capture of which he lost his life in 1087; he is said to have bequeathed a large sum for the rebuilding of the church. The plan, which bears a marked resemblance to that of Notre-Dame at Paris, includes a nave, aisles and choir, but no transepts. Three portals open into the church on the west, the two northernmost, which date from the 12th century, being decorated with fine carving; that to the south is of the 14th century and still more ornate. A fine rose-window and an open gallery, above which rise the summits of the western towers, form the upper part of the façade. In the interior, chapels dating from the 13th and 14th centuries are of interest. The tower of St Maclou (14th century), relic of an old church and the hôtel de ville (15th to 17th centuries), are among the older buildings of the town, and there is a fountain of the Renaissance period. Modern bridges and a medieval bridge unite Mantes with the opposite bank of the Seine on which the town of Limay is built. The town has a sub-prefecture and a tribunal of first instance. Mantes was occupied by the English from 1346 to 1356, and from 1416 to 1440.

**MANTEUFFEL, EDWIN, FREIHERR VON** (1809–1888), Prussian field marshal, son of the president of the superior court of Magdeburg, was born at Dresden on the 24th of February 1809. He was brought up with his cousin, Otto von Manteuffel (1805–1882), the Prussian statesman, entered the guard cavalry at Berlin in 1827, and became an officer in 1838. After attending the War Academy for two years, and serving successively as aide-de-camp to General von Mülling and to Prince Albert of Prussia, he was promoted captain in 1843 and major in 1848, when he was aide-de-camp to Prince Wurzburg, with whom he had gained the confidence he had gained during the revolutionary movement in Berlin. Promoted lieutenant-colonel in 1852, and colonel to command the 3th Uhlans in 1853, he was sent on important diplomatic missions to Vienna and St Petersburg. In 1857 he became major-general and chief of the military cabinet. He gave hearty support to the prince regent’s plans for the reorganization of the army. In 1861 he was violently attacked in a pamphlet by Karl Twisten (1820–1870), a Liberal leader, whom he wounded in a duel. He served as lieutenant-general (to which rank he was promoted on the coronation of William I., Oct. 18, 1861) in the Danish war of 1864, and at its conclusion was appointed civil and military governor of Schleswig. In the Austrian War of 1866 he first occupied Holstein and afterwards commanded a division under Vogel von Falkenstein in the Hanoverian campaign, and succeeded him, in July, in command of the Army of the Main (see Seven Weeks’ War). His successful operations ended with the occupation of Würzburg, and he received the order for le mérite. He was, however, on account of his monarchist political views and almost bigoted Roman Catholicism, regarded by the parliament as a reactionary, and, unlike the other army commanders, he was not granted a money reward for his services. He then went on a diplomatic mission to St Petersburg, where he was persona grata, and succeeded in gaining Russia’s assent to the new position in north Germany. On returning he was gazetted to the colonelcy of the 5th Dragoons. He was appointed to the command of the IX. (Schleswig-Holstein) army corps in 1866. But having formerly exercised both civil and military control in the Elbe duchies he was unwilling to be a purely military commander under one of his late civil subordinates, and retired from the army for a year. In 1868, however, he returned to active service.

In the Franco-German War of 1870–71 he commanded the II. corps under Steinmetz, distinguishing himself in the battle of Colomby-Neuilly, and in the repulse of Bazine at Noiselle (see *Franco-German War*; and *Metz*). He succeeded Steinmetz in October in the command of the I. army, won the battle of Amiens against General Farre, and occupied Rouen, but was less fortunate against Faidherbe at Pont Noyelles and Bapaume. In January 1871 he commanded the newly formed Army of the South, which he led, in spite of hard frost, through the Côte d’Or and over the plateau of Langres, cut off Bourbaki’s army of the east (80,000 men), and, after the action of Pontarlier, compelled it to cross the Swiss frontier, where it was disarmed. His immediate reward was the Grand Cross of the order of the Iron Cross, and at the conclusion of peace he received the Black Eagle. When the Southern Army was disbandment Manteuffel commanded first the II. army, and, from June 1871 until 1873, the army of occupation left in France, showing great tact in a difficult position. On leaving France at the close of the occupation, the emperor promoted Manteuffel to the rank of general field marshal and awarded him a large grant in money, and about the same rank. Commander II. of Russia gave him the order of St Andrew. After this he was employed on several diplomatic missions, was for a time governor of Berlin, and in 1879, perhaps, as was commonly reported, because he was considered by Bismarck as a formidable rival, he was appointed governor-general of Alsace-Lorraine; and this office he exercised—more in the spirit, some said, of a Prussian than of a German official—until his death at Carlshad, Bohemia, on the 17th of June 1885.

See lives by v. Collas (Berlin, 1874), and K. H. Keck (Bielefeld and Leipzig, 1890).

**MANTINEIA**, or Mantinea, an ancient city of Arcadia, Greece, situated in the long narrow plain running north and south, which is now called after the chief town Tripolis. Tegea was in the same valley, about 10 m. S. of Mantinea, and the two cities continually disputed the supremacy of the district. In every great war we find them ranged on opposite sides, except when superior force constrained both. The worship and mysteries of Cera at Mantinea were famous. The valley in which the city lies has no opening to the coast, and the water finds its way, often only with much care and artificial aid, through underground passages (*katavothra*) to the sea. It is bounded on the west by Mount Maenalus, on the east by Mount Artemision.

Mantineia is mentioned in the Homeric catalogue of ships, but in early Greek times existed only as a cluster of villages inhabited by a purely agricultural community. In the 6th century it was still insignificant as compared with the neighbouring city of Tegea, and submitted more readily to Spartan
overlordship. The political history of Mantineia begins soon after the Persian wars, when its five constituent villages, at the suggestion of Argos, were merged into one city, whose military strength with secured it a leading position in the Peloponnese. Its policy was henceforth guided by three main considerations. Its democratic constitution, which seems to have been entirely congenial to the population of small freeholders, and its ambition to gain control over the Alpheus watershed and both the Arcadian high roads to the isthmus, frequently estranged Mantineia from Sparta and threw it into the arms of Argos. But the chronic frontier disputes with Tegea, which turned the two cities into bitter enemies, contributed most of all to determine their several policies. About 469 B.C. Mantineia alone of Arcadian townships refused to join the league of Tegea and Argos against Sparta. Though formally enrolled on the same side during the Peloponnesian War the two cities used the truce of 423 to wage a fierce but indecisive war with each other. In the time following the peace of Nicias the Mantinians, whose attempts at expansion beyond Mount Maenalus were being foiled by Sparta, formed a powerful alliance with Argos, Elis and Athens (420), which the Spartans, assisted by Tegea, broke up after a pitched battle in the city's territory (418). In the subsequent years Mantineia still found opportunity to give the Athenians covert help, and during the Corinthian War (394-387) sparingly disguised its sympathy with the anti-Spartan league. In 385 the Spartans seized a pretext to besiege and dismantle Mantineia and to scatter its inhabitants among four villages. The city was reconstituted after the battle of Leuctra and under its statesman Lycomedes played a prominent part in organizing the Arcadian League (370). But the long-standing jealousy against Tegea, and a recent one against the new foundation of Megalopolis, created dissensions which resulted in Mantineia passing over to the Spartan side. In the following campaign of 362 Mantineia, after narrowly escaping capture by the Theban general Epaminondas, became the scene of a decisive conflict in which the latter achieved a notable victory but lost his own life. After the withdrawal of the Thebans from Arcadia Mantineia failed to recover its pre-eminence from Megalopolis, with which city it had frequent disputes. In contrast with the Macedonian sympathies of Megalopolis Mantineia joined the leagues against Antipater (322) and Antigonus Gonatas (266). A change of constitution, imposed perhaps by the Macedonians, was nullified (about 250) by a revolution through which democracy was restored. About 225 B.C. Mantineia entered the Achaean League, from which it had obtained protection against Spartan encroachments, but soon passed in turn to the Aetolians and to Cleomenes III. of Sparta. A renewed defection, inspired apparently by aversion to the aristocratic government of the Achaeans and jealousy of Megalopolis, was punished in 222 by a thorough devastation of the city, which was now reconstituted as a dependency of Argos and renamed Antigoneia in honour of the Achaean's ally Antigonus Doson. Mantineia regained its autonomous position in the Achaean League in 192, and its original name during a visit of the emperor Hadrian in A.D. 133. Under the later Roman Empire the city dwindled into a mere village, which since the 6th century bore the Slavonic name of Goritza. It finally became a prey to the malaria which arose when the plain fell out of cultivation, and under Turkish rule disappeared altogether.

The site was excavated by M. Fougrès, of the French School at Athens, in 1888. The plan of the agora and adjacent buildings has been recovered, and the walls have been completely investigated. The town was situated in an unusual position for a Greek city, on a flat marshy plain, and its walls form a regular ellipse about 2½ m. in circumference. When the town was first formed in 470 B.C. by the "synoecism" of the neighbouring villages, the river Ophis flowed through the midst of it, and the Spartan king Agesipolis dammed it up below the town and so flooded out the Mantinians and sapped their walls, which were of unbaked brick. Accordingly, when the city was rebuilt in 370 B.C., the river Ophis was divided into
two branches, which between them encircled the walls; and the walls themselves were constructed to a height of almost 3 to 6 feet of stone, the green being of unbaked bricks. These are the walls on which the remains are still extant. There are tegulae about every 80 ft.; and the gates are so arranged that the passage inwards usually runs from right to left, and so an attacking force would have to expose its right or shieldless side. Within the walls the most conspicuous landmark is the theatre, which, unlike the majority of Greek theatres, consists entirely of an artificial mound standing up from the level plain. Only about a quarter of its original height remains. Its scene is of rather irregular shape, and borders one of the narrow ends of the agora. One of the gates of several temples, one of them sacred to the hero Podaros. The agora is of unsymmetrical form; its sides are bordered by porticoes, interrupted by streets, like the primitive agora of Elis as described by Pausanias, and unlike the regular agoras of Ionic type. Most of these porticoes were of Roman period — the finest of them were erected, as we learn from inscriptions, by a lady named Epigone: one, which faced south, had a double colonnade, and was called the Baury: close to it was a large exedra. The foundations of a square market-hall of earlier date were found beneath this. On the opposite side of the agora was a building of the Bouleuton or senate-house. Traces remain of paved roads both within the agora and leading out of it; but the whole site is now a deserted and feverish swamp. The site is interesting for comparison with Megalopolis; the nature of its plan seems to imply that its main features must survive from the earlier “synoeccism” a century before the time of Epaminondas.

Five battles are recorded to have been fought near Mantinea; 418, 362 (see above), 295 (Demetrius Polorceres defeats Archidamus of Sparta), 242 (Arius beats Agis of Sparta), 207 (Philopoemen beats Machanidas of Sparta). The battles of 362 and 207 are discussed at length by J. Kromayer, Antike Schlachtfelder in Griechenland (Berlin, 1903), 27-123, 281-314; Wiener Studien (1905), pp. 1-10.

MANTIS, an insect belonging to the order Orthoptera. Probably no other insect has been the subject of so many and widespread legends and superstitions. One of the most common mantiis is Mantis religiosa, L. The ancient Greeks endowed it with supernatural powers (µαρρίς, a diviner); the Turks and Arabs hold that it prays constantly with its face turned towards Mecca; the Provençals call it Prego-Diou (Prie-Dieu); and numerous more or less similar names—preacher, saint, nun, mendicant, soothsayer, &c.—are widely distributed throughout southern Europe. In Nubia it is held in great esteem, and the Hottentots, if not indeed worshipping the local species (M. fusa), as one traveller has alleged, at least appear to regard its alighting upon any person both as a token of saintliness and an omen of good fortune.

Yet these are “not the saints but the tigers of the insect world.” The front pair of limbs are very peculiarly modified—the coxa being greatly elongated, while the strong third joint or femur bears on its curved underside a channel armed on each edge by strong movable spines. Into this groove the stout tibia is capable of closing like the blade of a penknife, its sharp, serrated edge being adapted to cut and hold. Thus armed, with head raised upon the much-elongated and semi-transparent prothorax, and with the half-opened fore-limbs held outwards in the characteristic devotional attitude, it rests motionless upon the four posterior limbs waiting for prey, or occasionally stalks it with slow and silent movements, finally seizing it with its knife-blades and devouring it. Although apparently not daring to attack ants, these insects destroy great numbers of flies, grasshoppers and caterpillars, and the larger South-American species even attack small frogs, lizards and birds. They are very pugnacious, fencing with their sword-like limbs “like hussars with sabres,” the larger frequently devouring the smaller, and the females the males. The Chinese keep them in bamboo cages, and match them like fighting-cocks.

The common species fixes its somewhat nut-like egg capsules on the stems of plants in September. The young are hatched in early summer, and resemble the adults, but are without wings.

The green coloration and shape of the typical mantis are procryptic, serving to conceal the insect alike from its enemies and prey. The passage from leaf to flower simulation is but a step which, without interfering with the protective value of the coloration so far as insectivorous foes are concerned, carries with it the additional advantage of attracting flowering-feeding insects within reach of the raptorial limbs. This method of allurement has been perfected in certain tropical species of Mantidae by the development on the prothorax and raptorial limbs of laminate expansions so coloured on the under side as to resemble papilionaceous or other blossoms, to which the likeness is enhanced by a gentle swaying kept up by the insect in imitation of the effect of a lightly blowing breeze. As instances of this may be cited Idalum diabolicum, an African insect, and Gongylus gongylodes, which comes from India. Examples of another species (Empusa eugena) when standing upon the ground deceptively imitate in shape and hue a greenish white anemone tinted at the edges with rose; and Bates records what appears to be a true case of aggressive mimicry practised by a Brazilian species which exactly resembles the white ants it preys upon.

MANTIS-PLOGY, a small long-winged mantis belonging to the family Mantispidae, related to the ant-lions, lace-wing flies, &c., and named from their superficial resemblance to a mantis owing to the length of the prothorax and the shape and prehensile character of the anterior legs. The larva, at a first candle-form stage, makes its way into the egg-case of a spider or the nest of a wasp to feed upon the eggs or young. Subsequently it changes into a fat grub with short legs. When full grown it spins a silken cocoon in which the transformation into the pupa is effected. The latter escapes from its double case before moulting into the mature insect.

MANTLE, a long flowing cloak without sleeves, worn by either sex. Particularly applied to the long robe worn over the armour by the men-at-arms of the middle ages, the name is still given to the robes of state of kings, peers, and the members of an order of knights. Thus the “electoral mantle” was a robe of office worn by the imperial electors, and the Teutonic knights were known as the orde alborn mantellorum from their white mantles. As an article of women’s dress a mantle now means a loose cloak or cape, of any length, and made of silk, velvet, or other rich material. The word is derived from the Latin mantellum or mantelum, a cloak, and is probably the same as, or another form of, mantellium or mantelle, a table-napkin or table-cloth, from manus, hand, and tela, a cloth. A late Latin mantum, from which several Romance languages have taken words (cf. Ital. mantello, and Fr. mante), must, as the New English Dictionary points out, be a “back-formation,” and this will explain the diminutive form of the Spanish mantilla. From the old French mantel came the English

Praying Mantis (Mantis religiosa).
compounds "mantel-piece," "mantel-shelf," for the stone or wood beam which serves as a support for the structure above a fire-place, together with the whole framework, whether of wood, stone, &c., that acts as an ornament of the same (see CHIMNEYPIECE). The modern French form manteau is used in English chiefly as a dressmaker's term for a woman's mantle. Manteus," much used in the 18th century for a similar garment, is probably a home-creation of manteau, due to silk or other materials coming from the Italian town of that name, and known by the trade name of "mantus." The Spanish mantilla is a covering for the head and shoulders of white or black lace or other material, the characteristic head-dress of women in southern and central Spain. It is occasionally seen in the other parts of Spain and Spanish countries, and also in Portugal. "Mante" is used in many transferred senses, all with the meaning of "covering," as in zoology, for an enclosing sac or integument; thus it is applied to the "tunic" or layer of connective-tissue forming the body-wall of ascidians encroaching muscle-fibres, blood-sinuses and nerves (see TUNICA). The term is also used for a meshed cap of refractory oxides employed in systems of incandescent lighting (see LIGHTING). The verb is used for the creaming or frothing of liquids and of the suffusing of the skin with blood. In heraldry "mantling," also known as "panache," "lambrequin" or "contoise," is an ornamental appendage to an escutcheon, of flowing drapery, forming a background (see HERALDRY). MANTON, THOMAS (1620-1677), English Nonconformist divine, was born at Langham, near Essex, in 1620, and was educated at Hart Hall, Oxford. Joseph Hall, bishop of Norwich, ordained him deacon: he never took priest's orders, holding that "he was properly ordained to the ministerial office." He was one of the clerks at the Westminster Assembly, one of Cromwell's chaplains and a "trier," and held livings at Stoke Newington (1645) and St Paul's, Covent Garden (1656). He Disapproved of the execution of Charles I. In 1658 he assisted Baxter to draw up the "Fundamentals of Religion." He helped to restore Charles II. and became one of his chaplains, refusing the deanery of Rochester. In 1662 he lost his living under the Act of Uniformity and preached in his own rooms and in other parts of London. For this he was arrested in 1670. His works are best known in the collected edition by J. C. Ryle (22 vols. 1870-1875). MAN-TRAPS, mechanical devices for catching poachers and trespassers. They have taken many forms, the most usual being like a large rat-trap, the steel springs being armed with teeth which met in the victim's leg. Since 1827 they have been illegal in England, except in houses between sunset and sunrise, and man'sSaturday evening and Sunday. MANTUA (Ital. Mantova), a fortified city of Lombardy, Italy, the capital of the province of Mantua, the see of a bishop, and the centre of a military district, 25 m. S.S.W. of Verona and 100 m. E.S.E. of Milan by rail. Pop. (1866), 31,783. It is situated 88 ft. above the level of the Adriatic on an almost insular site in the midst of the swampy lagoons of the Mincio. As the belt of marshy ground along the south side can be laid under water at pleasure, the site of the city proper, exclusive of the considerable suburbs of Borgo di Fortezza to the north and Borgo di San Giorgio to the east, may still be said to consist, as it formerly did more distinctly, of two islands separated by a narrow channel and united by a number of bridges. On the west side lies Lago Superiore, on the east side Lago Inferiore—the boundary between the two being marked by the Argine del Mulino, a long mole stretching northward from the northwest angle of the city to the citadel. On the highest ground in the city rises the cathedral, the interior of which was built after his death according to the plans of Giulio Romano; it has double aisles, a fine fretted ceiling, a domed-covered transept, a bad baroque façade, and a large unfinished Romanesque tower. Much more important architecturally is the church of St Andrea, built towards the close of the 15th century, after plans by Leon Battista Alberti, and consisting of a single, barrel-vaulted nave 350 ft. long by 62 ft. wide. It has a noble façade with a deeply recessed portico, and a brick campanile of 1414. The interior is decorated with 18th-century frescoes, to which period the dome also belongs. Mantegna is buried in one of the side chapels. S. Sebastiano is another work of Alberti's. The old ducal Palace—one of the largest buildings of its kind in Europe—was begun in 1392 for Guido Bonaccosi, and probably completed in 1428 for Ludovico Gonzaga; but many of the accessory apartments are of much later date, and the internal decorations are for the most part the work of Giulio Romano and his pupils. There are also some fine rooms of the early 19th century. Close by are the Piazza dell' Erbe and the Piazza Sordello, with Gothic palaces. The Castello di Corte here, the old castle of the Gonzagas (1395-1406), erected by Bartolino da Novara, the architect of the castle of Ferrara, now contains the archives, and has some fine frescoes by Mantegna with scenes from the life of Ludovico Gonzaga. Outside of the city, to the south of Porta Pusterla, stands the Palazzo del Te, Giulio's architectural masterpiece, erected for Frederick Gonzaga in 1523-1535; of the numerous fresco-covered chambers which it contains, perhaps the most celebrated is the Sala dei Giganti, where, by a combination of mechanical with artistic devices, the rout of the Titans still contending with artillery of upturn rocks against the pursuit and thunderbolts of Jove appears to rush downwards on the spectator. The architecture of Giulio's own house in the town is also good. Perhaps the most notable of Mantua's arts and sciences (Accademia Vergilian), occupying a fine building erected by Piermarini, a public library founded in 1780 by Maria Theresa, a museum of antiquities dating from 1779, many of which have been brought from Sabbioneta, a small residence town of the Gonzagas in the late 16th century, a mineralogical museum, a good botanical garden, and an observatory. There are ironworks, tanneries, breweries, oil-mills and flour-mills in the town, which also has printing, furniery, doll-making and playing-card industries. As a fortress Mantua was long one of the most formidable in Europe, a force of thirty to forty thousand men could be drawn from within its walls; but it had two serious defects—the marshy climate told heavily on the health of the garrison, and effective sorties were almost impossible. It lies on the main line of railway between Verona and Modena; and is also connected by rail with Cremona and with Monolice, on the line from Padua to Bologna, and by steam tramway with Brescia and other places. S. Maria delle Grazie, standing some 5 m. outside the town, was consecrated in 1390 as an act of thanksgiving for the cessation of the plague, and has a curious collection of ex-voto pictures (wax figures), and also the tombs of the Gonzaga family. Mantua had still a strong Etruscan element in its population during the Roman period. It became a Roman municipium, with the rest of Gallia Transpadana; but Martial calls it little Mantua, and had it not been for Virgil's interest in his native place, and in the expulsion of a number of the Mantuans (and among them the poet himself) from their lands in favour of Octavian's soldiers, we should probably have heard almost nothing of its existence. In 568 the Lombards found Mantua a walled town of some strength; recovered from their grasp in 698 by the exarch of Ravenna, it was again captured by Agilulf in 601. The 9th century was the period of episcopal supremacy, and in the 11th the city formed part of the vast possessions of Bonifacio, marquis of Canossa. From him it passed to Geoffrey, duke of Lorraine, and afterwards to the countess Matilda, whose support of the pope led to the conquest of Mantua by the emperor Henry IV in 1090. Reduced to obedience by Matilda in 1113, the city obtained its liberty on her death, and instituted a communal government of its own, salvo imperialis justitia. It afterwards joined the Lombard League; and the unaggressive attitude made by Frederick II. in 1236 brought it a recognition of its privileges. But after a period of internal discord Ludovico Gonzaga attained to power (1238), and was recognized as imperial vicar (1259);
and from that time till the death of Ferdinando Carbo in 1708 the Gonzagas were masters of Mantua (see Gonzaga). Under Gian Francesco II., the first marquis, Ludovico III., Gian Francesco III. (whose wife was Isabella d’Este), and Federico II., the last Duke of Mantua, the city rose rapidly into importance as a seat of industry and culture. It was stormed and sacked by the Austrians in 1830, and never quite recovered. Claimed in 1708 as a fief of the empire by Joseph I., it was governed for the greater part of the century by the Austrians. In June 1769 it was besieged by Napoleon; but in spite of terrific bombardments it held out till February 1777. A three days’ bombardment in 1799 again placed Mantua in the hands of the Austrians; and, though restored to the French by the Peace of Lunéville (1801), it became Austrian once more, and held out till 1866. Between 1849 and 1859, when the whole of Lombardy except Mantua was, by the peace of Villafranca, ceded to Italy, the city was the scene of violent political persecution.

See Gaet. Susani, Nuovo prospetto delle pitture, &c., di Mantova (Mantua, 1830); Carlo d’Arco, Delia arti e degli artefici di Mantova (Mantua, 1857); and Storia di Mantova (Mantua, 1874).

MANU (Sanskrit, "man"), in Hindu mythology, the first man, ancestor of the world. In the Satapatha-Brahmana he is an immortal, holy man, in a boojum-tree. Warned by a fish of the impending disaster he built a ship, and when the waters rose was dragged by the fish, which harnessed to his craft, beyond the northern mountains. When the deluge ceased, a daughter was miraculously born to him and this pair became the ancestors of the human race. In the later scriptures the fish is declared an incarnation of Brahma. See Sanskrit Literature; Indian Law (Hindu).

MANUAL, i.e. belonging to the hand (Lat. manus), a word chiefly used to describe an occupation which employs the hands, as opposed to that which chiefly or entirely employs the mind. Particular uses of the word are: "sign-manual," a signature or autograph, especially one affixed to a state document; "manual-exercise," in military usage, drill in the handling of the rifle; "manual alphabet," the formation of the letters of the alphabet by the fingers of one or both hands for communication with the deaf and dumb; and "manual acts," the breaking of the bread, and the taking of the cup in the hands by the officiating priest in consecrating the elements during the celebration of the Eucharist. The use of the word for tools and implements to be used by the hands has been transferred to the "manual fire-engine." From the Late Latin use of manuale as a substantive, meaning "handbook," comes the use of the word for a book treating a subject in a concise way, but more particularly of a book of offices, containing the forms to be used in the administration of the sacraments other than the Mass, but including communion out of the Mass, also the forms for churchnng, burials, &c. In the Roman Church such a book is usually called a rituale, "manual" being the name given to it in the English Church before the Reformation. The keyboard of an organ, as played by the hands, is called the "manual" in distinction from the "pedal" keys played by the feet.

MANUCODE, from the French, an abbreviation of Manuscodiata, and the Latinized form of the Malay Manukadewa, meaning, says Crawford (Malay and Eng. Dictionary, p. 97), the "bird of the gods," and a name applied for more than two hundred years apparently to birds-of-paradise in general. In the original sense of its inventor, Montbeillard (Hist. nat. oiseaux, iii. 163), Manucode was restricted to the king bird-of-paradise and three allied species; but in English it has been transferred to a small group of species whose

1 Manucodiata was used by M. J. Brissot (Ornithologie, ii. 130) as a generic term equivalent to the Linnaean Paradisaea. In 1783 Boddaert, when assigning scientific names to the birds figured by Daudenton, called the subject of one of them (P. paradisaea) Manucodi,chalybea, the first word being apparently an accidental curtailment of the name of Brissot’s genus to which he referred it. Nevertheless some writers have taken it as evidence of an intention to separate this new genus of birds, but in reality, the use of Manucodi in scientific nomenclature, and the English form to correspond.

relationship to the Paradisaeidae has been frequently doubted, and must be considered uncertain. These manucodes have a glossy cuticular plumage of much beauty, but are distinguished from other birds of similar coloration by the outer tail-feathers being united for some distance, and by the extraordinary convolution of the trachea, in the males at least, with which is correlated the loud and clear voice of the birds. The convoluted portion of the trachea lies on the breast, between the skin and the muscles, much as is found in the females of the painted snipes (Rostratula), in the males of the curassows (Cracidae), and in a few other birds, but wholly unknown elsewhere among the Passeres. The manucodes are peculiar to the Papuan sub-region (including therein the peninsula of New Guinea, the Celebes, and New York), and are found in Australia, New Guinea, and New York. (Cat. B. Brit. Museum, iii. 164), two genera, for the first of which, distinguished by the elongated tufts on the head, he adopts R. P. Lesson’s name Phonygama, and for the second, having no tufts, but the feathers of the head crisped, that of Manucodia; and W. A. Forbes (Proc. Zool. Soc. 1882, p. 349) observed that the validity of the separation was confirmed by their tracheal formation. Of Phonygama Sharpe recognizes three species, P. keraudreni (the type) and P. junies, both from New Guinea, and P. goedl, the Australian representative. The species: P. keraudreni Elliot (Ibis. 1878, p. 56) and Count Salvadordi (Ornith. dello Papuasia, i. 510) to be inseparable. There is a greater unanimity in regard to the species of the so-called genus Manucodia proper, of which four are admitted—M. chalybeata or chalybea from north-western New Guinea, M. comrici from the south-eastern part of the same country, M. atrata of wide distribution within the Papuan area, and M. jobiensis peculiar to the island which gives it a name. Little is known of the habits of these birds, except that they are, as already mentioned, remarkable for their vocal powers, which, in P. keraudreni, Lesson describes (Voy. de la Coquille, "Zoologie," i. 638) as enabling them to pass through every note of the gamut. (A. N.)

MANUEL I., COMENENUS (c. 1120–1180), Byzantine emperor (1143–1180), the fourth son of John II., was born about 1120. Having distinguished himself in his father’s Turkish war, he was nominated emperor in preference to his elder surviving brother. Endowed with a fine physique and great personal courage, he devoted himself whole-heartedly to a military career. He endeavoured to restore by force of arms the predominance of the Empire in the Balkan peninsula, and was successful for a time in this policy, and so was involved in conflict with his neighbours on all sides. In 1144 he brought back Raymond of Antioch to his allegiance, and in the following year drove the Turks out of Isauria. In 1147 he granted a passage through his dominions to two armies of crusaders under Conrad III. of Germany and Louis VII. of France; but the numerous out-breaks of overt or secret hostility between the Franks and the Greeks on their line of march, for which both sides were to blame, nearly precipitated a conflict between Manuel and his guests. In the same year the emperor made war upon Roger of Sicily, whose fleet captured Corfu and plundered the Greek towns, but in 1148 was defeated with the help of the Venetians. In 1149 Manuel recovered Corfu and prepared to take the offensive against the Normans. With an army mainly composed of mercenary Italians he invaded Sicily and Apulia, and although the progress of both these expeditions was arrested by defeats on land and sea, Manuel maintained a foothold in southern Italy, which was secured to him by a peace in 1155, and continued to interfere in Italian politics.

1 Notes on the trade of his empire he made treaties with Pisa and Genoa; to check the aspirations of Federic I. of Germany he supported the free Italian cities with his gold and negotiated with pope Alexander III. In spite of his friendliness towards the Roman church Manuel was refused the title of "Augustus" by Alexander, and he nowhere succeeded in attaching the Italians permanently to his interests. None the less in a war with the Venetians (1172–74), he not only held his ground in Italy but
drew his enemies out of the Aegean Sea. On his northern frontier Manuel reduced the rebellious Serbs to vassalage (1350-52) and made repeated attacks upon the Hungarians with a view to annexing their territory along the Save. In the years of 1351-53 and 1366-67 he led his troops to Hungary but failed to maintain himself there; in 1368, however, a decisive victory near Semlin enabled him to conclude a peace by which Dalmatia and other frontier strips were ceded to him. In 1369 he sent a joint expedition with King Amalric of Jerusalem to Egypt, which retired after an ineffectual attempt to capture Damietta. In 1358-59 he fought with success against Raymond of Antioch and the Turcs of Iconium, but in later wars against the latter he made no headway. In 1376 he was decisively beaten by them in the pass of Myriokephalon, where he allowed himself to be surprised in line of march. This disaster, though partly retrieved in the campaign of the following year, had a serious effect upon his vitality; henceforth he declined in health and in 1380 succumbed to a slow fever.

In spite of his military prowess Manuel achieved but in a slight degree his object of restoring the East Roman empire. His victories were counterbalanced by numerous defeats, sustained by his subordinates, and his lack of statesmanlike talent prevented his securing the loyalty of his subjects. The expense of keeping up his mercenary establishment and the sumptuous magnificence of his court put a severe strain upon the financial resources of the state and the subsequent collapse of the Byzantine empire was largely due to his brilliant but unproductive reign. Manuel married, firstly, a sister-in-law of Conrad III. of Germany; and secondly, a daughter of Raymond of Antioch. His successor, Alexis II., was a son of the latter.

MANUEL II. PALAELOGUS (1350-1425), Byzantine emperor from 1391 to 1425, was born in 1350. At the time of his father's death he was a hostage at the court of Bayezid at Brusa, but succeeded in making his escape; he was forthwith besieged in Constantinople by the sultan, whose victory over the Christians at Nicopolis, however (Sept. 28, 1396), did not secure for him the capital. Manuel subsequently set out in person to seek help from the West, and for this purpose visited Italy, France, Germany and England, but without material success; the Francs were not invited to come, and the death of Bayezid in the following year were the first events to give him a genuine reprieve from Ottoman oppression. He stood on friendly terms with Mahommed I., but was again besieged in his capital by Murad II. in 1422.

Shortly before his death he was forced to sign an agreement whereby the Byzantine empire undertook to pay tribute to the sultan.

Manuel was the author of numerous works of varied character—historical, rhetorical, poetical, and legal. Many of these are printed in Migne, Patrologia Graeca, clv., 1., the letters being edited by E. Legrand (1893). There is a special monograph, by B. de Xivry (in Mémoires de l'Institut de France, xix. (1853), highly recommended by O. Krumkatchev, whose Geschichte der byzantinischen Literatur (1897) should also be consulted.

MANUEL I. (d. 1263), emperor of Trebizond, surnamed the Great Captain (ο στρατηγοκάρατος), was the second son of Alexius I., first emperor of Trebizond, and ruled from 1228 to 1263. He was unable to withstand the invasion of the Seljuks, first to the Seljuks and afterwards to the Mongols. He vainly negotiated for a dynastic alliance with the Franks, by which he hoped to secure the help of Crusaders.

MANUEL II., the descendant of Manuel I., reigned only a few months in 1332-1333. Manuel III. reigned from 1390 to 1417, but the only interest attaching to his name arises from his connexion with Timur, whom he vassalised before resistance.

MANUEL, EUGENE (1823-1901), French poet and man of letters, was born in Paris, the son of a Jewish doctor, on the 13th of July 1823. He was educated at the École Normale, and taught rhetoric for some years in provincial schools and then in Paris. In 1870 he entered the department of public instruction, and in 1878 became inspector-general. His works include: Pages intimes (1866), which received a prize from the Academy; Poèmes populaires (1874); Pendant la guerre (1871), patriotic poems, which were forbidden in Alsace-Lorraine by the German authorities; En voyage (1881), poems; La France (4 vols., 1854-1858); a school-book written in collaboration with his brother-in-law, Lévi Alavars; Les Ouvriers (1870), a drama dealing with social questions, which was crowned by the Academy; L'Absent (1873), a comedy; Poesies du foyer et de l'école (1880), and editions of the works of J. B. Rousseau (1852) and André Chénier (1884).

He died in Paris in 1901.

His Poesies complètes (2 vols., 1899) contained some fresh poems; to his Mélanges en prose (Paris, 1905) is prefixed an introductory note by A. Cahan.

MANUEL, JACQUES ANTOINE (1775-1827), French politician and orator, was born on the 10th of December 1775. When seventeen years old he entered the army, which he left in 1797 to become a lawyer. In 1814 he was chosen a member of the chamber of representatives, and in 1815 he urged the claim of Napoleon's son to the French throne and protested against the restoration of the Bourbon. After this event he actively opposed the government, his eloquence making him the foremost orator among the members of the Left. In February 1823 his opposition to the proposed expedition into Spain to help Ferdinand VII. against his rebellious subjects produced a tumult in the Assembly. Manuel was expelled, but he refused to accept this sentence, and force was employed to remove him. He died on the 20th of August 1827.

MANUEL, LOUIS PIERRE (1751-1793), French writer and Revolutionist, was born at Montargis (Loiret). He entered the Congregation of the Christian Doctrine, and became tutor to the son of a Paris banker. In 1783 he published a pamphlet, called Essais historiques, critiques, littéraires, et philosophiques, for which he was imprisoned in the Bastille. He embraced the revolutionary ideas, and after the taking of the Bastille became a member of the provisional municipality of Paris. He was one of the leaders of the émeutes of the 10th of June and the 10th of July 1792, played an important part in the formation of the revolutionary communes which assured the success of the latter coup; and was made procureur of the commune. He was present at the September massacres and saved several prisoners, and on the 7th of September 1792 was elected one of the deputies from Paris to the convention, where he was one of the promoters of the proclamation of the republic. He suppressed the decoration of the Cross of St Louis, which he called a stain on a man's coat, and demanded the sale of the palace of Versailles. His missions to the king, however, changed his sentiments; he became reconciled to Louis, courageously refused to vote for the death of the sovereign, and had to tender his resignation as deputy. He retired to Montargis, where he was arrested, and was guillotined in Paris on the 17th of November 1793.

Besides the work cited above and his political pamphlets, he was the author of Coup d'œil philosophique sur le régime de St Louis (1786); L'Année française (1788); La Bastille dévêtue (1789); La Police de Paris dévêtée (1791); and Lettres sur la Révolution (1792). In 1792 he was prosecuted for publishing an edition of the Lettres de Mirabeau à Sophie, but was acquitted.

Augustine DE MELLO [DOM FRANCISCO] (d. 1616-1666). Portuguese writer, a connexion on his father's side of the royal house of Braganza, was a native of Lisbon. He studied the Humanities at the Jesuit College of S. Antão, where he showed a precocious talent, and tradition says that at the age of fourteen he composed a poem in ottava rima to celebrate the recovery of Bahia from the Dutch, while at seventeen he wrote a scientific work, Concordancias mathematicas. The death of his father, XVII. 20
Dom Luis de Mello, drove early to soldierly, and having joined a contingent for the Flanders war, he found himself in the historic storm of January 1627, when the pick of the Portuguese fleet suffered shipwreck in the Bay of Biscay. He spent much of the next ten years of his life in military routine work in the Peninsula, varied by visits to the court of Madrid, where he contracted a friendship with the Spanish poet Quevedo and earned the favour of the powerful minister Olivares. In 1637 the latter despatched him in company with the conde de Linhares on a mission to pacify the revolted city of Evora, and on the same occasion the duke of Braganza, afterwards King John IV, (for whom he acted as confidential agent at Madrid), employed him to satisfy King Philip IV of the loyalty of the Spanish crown. In the following year he suffered a short imprisonment in Lisbon. In 1639 he was appointed colonel of one of the regiments raised for service in Flanders, and in June that year he took a leading part in defending Corunna against a French fleet commanded by the archbishop of Bordeaux, while in the following August he directed the embarkation of an expeditionary force of 10,000 men when Admiral Oquendo sailed with seventy ships to meet the French and Dutch. He came safely through the naval defeat, which the channel suffered by the Spaniards at the hands of Van Tromp, and on the death of the Catalonian rebellion became chief of the staff to the commander-in-chief of the royal forces, and was selected to write an account of the campaign, the Historia de la guerra de Catalua, which became a Spanish classic. On the proclamation of Portuguese independence in 1640 he was imprisoned by order of Olivares, and when released hastened to offer his sword to John IV. He travelled to England, where he spent some time at the court of Charles I., and thence passing over to Holland assisted the Portuguese ambassador to equip a fleet in aid of Portugal, and himself brought it safely to Lisbon in October 1641. For the next three years he was employed in various important military commissions and further busied himself in defending by his pen the king's title to his newly acquired throne. An intrigue with the beautiful countess of Villa Nova, and her husband's jealousy, led to his arrest on the 19th of November 1644 on a false charge of assassination, and he lay in prison about nine years. Though his innocence was clear, the court of his Order, that of Christ, influenced by his enemies, deprived him of his commenda and sentenced him to perpetual banishment in India with a heavy money fine, and the king would not have forgiven him. Owing perhaps to the intercession of the queen regent of France and other powerful friends, his sentence was finally commuted into one of exile to Brazil. During his long imprisonment he finished and printed his history of the Catalonian War, and also wrote and published a volume of Spanish verses and some religious treatises, and composed in Portuguese a volume of homely philosophy, the Carta de Guia de Casados and a Memorial in his own defence to the king, which Herculeano considered "perhaps the most eloquent piece of reasoning in the language." During his exile in Brazil, whether he sailed on the 17th of April 1655, he lived at Bahia, where he wrote one of his Epanaphoras de varia historia and two parts of his masterpiece, the Apologos dialogaes. He returned home in 1659, and from then until 1663 we find him on and off in Lisbon, frequently the celebrated Academia dos Genericos, of which he was five times elected president. In the last year he proceeded to Parma and Rome, by way of England, and France, and Alphonso VI. charged him to negotiate with the Curia about the provision of bishops for Portuguese sees and to report on suitable marriages for the king and his brother. During his stay in Rome he published his Dialogues, dedicated to Queen Catherine, wife of Charles II. of England, and his Cartas familiares. On his way back to Portugal he printed his Obras metricas at Lyons in May 1665, and he died in Lisbon the following year.

Manuel de Mello's early Spanish verses are tainted with Gongorism, but his Portuguese sonnets and cartas on moral subjects are notable for their power, sincerity and perfection of form. He strove successfully to emancipate himself from foreign faults of style, and by virtue of his native genius, and his knowledge of the traditional poetry of the people, and the best Quinhentista models, he became Portugal's leading lyric poet and prose writer of the 17th century. As with Camoens, imitations and encomiastic contributions to make Manuel de Mello a great writer. His contributions to the leading nobles, ecclesiastics, diplomats and literati of the time, are written in a conversational style, lighted up by flashes of wit and enriched with apposite illustrations and quotations. His commerce with the best authors appears in the Hospital das letrass, a brilliant chapter of criticism forming part of the Apologos dialogues. His comedy in redendillas, the Auto do Fidalgo Aprendiz, is one of the last and quite the worthiest production of the school of Gil Vicente, and may be considered an anticipation of Molière's Le Bourgeois gentilhomme.

There is no uniform edition of his works, but a list of them will be found in his Obras da Silva's Dicionario bibliographico portugues. In Dom Francisco Manuel de Mello, his Life and Writings, by Edgar Prestage (Manchester, 1905), "D. Francisco Manuel de Mello, documentos bibliographicos," and "D. Francisco Manuel de Mello, obras autographas e ineditas," by the same writer, in the Archivo historico portugues for 1899. Manuel de Mello's prose style is considered at length by G. Criot in Mariana Historien (Eng. Pam.) 1905. pp. 378 seq.

MANUL (Felis manul), a long-haired small wild cat from the deserts of Central Asia, ranging from Tibet to Siberia. The coat is long and soft, pale silvery grey or light buff in hue, marked with black on the chest and upper parts of the limbs, with transverse stripes on the loins and rings on the tail of the same hue. The Manul preys upon small mammals and birds. A separate generic name, Trachidurus, has been proposed for this species by Dr. K. Satsuin.

MANURES AND MANURING. The term "manure" originally meant that which was "worked by hand" (Fr. manuener), but gradually came to apply to any process by which the soil could be improved. Prominent among such processes was that of directly applying "manure" to the land, manure in this sense being what we now call "farmyard manure" or "dung," the excreta of farm animals mixed with straw or other litter. Gradually, however, the use of the term spread to other materials, some of home origin, some imported, some manufactured by artificial processes, but all useful as a means of improving the fertility of the soil. Hence we have two main classes of manures: (a) what may be termed "natural manures," and (b) "artificial manures." Manures, again, may be divided according to the materials from which they are made—e.g. "bone manure," "fish manure," "wool manure," &c., or according to the constituents which they mainly supply—e.g. "phosphatic manures," "potash manures," "nitrogenous manures," or there may be combinations of these to form mixed or "compound manures." Whatever it be, the word "manure" is now generally applied to anything which is used for fertilizing the soil. In America the term "fertilizers" is more generally adopted, and in Great Britain the introduction of the "Fertilizers and Feeding Stuffs Act" has effected a certain amount of change in the same direction. The modern tendency to turn attention less to the consideration of manurial applications given to land and more to the physical and mechanical changes introduced thereby in the soil itself, would seem to be carrying the word "manure" back more to its original meaning.

The subject of manures and their application involves a prior consideration of plant life and its requirements. The plant, growing in the soil, and surrounded by the atmosphere, gains from these two sources its nourishment and means of growth through the various stages of its development.

Chemical analysis has shown that plants are composed of water, organic or combustible matters, and inorganic or mineral matters. Water constitutes by far the greater part of a living plant; a grass crop may contain about 80% of water. The organic or combustible matters are those which are lost, along with the water, when the plant is burnt; the inorganic or mineral matters those which are left behind as an "ash" after the burning. The combustible matter is composed of six elements: carbon, hydrogen, oxygen, nitrogen, sulphur and a little phosphorus. About one-half of the combustible matter of plants is carbon. Along with
MANURES

hydrogen and oxygen the carbon forms the cellulose, starch, sugar, and, which plants contain, and with these same elements and sulphur the carbon forms the albuminoids of plants. The inorganic or mineral matters comprise a comparatively small part of the plant, but they contain, as essential constituents of plant life, the following elements: potassium, calcium, magnesium, iron, phosphorus and sulphur. In addition, other, but not essential, elements are found in the ash e.g. sodium, silicon and chlorine, together with small quantities of manganese and other rarer elements.

The above constituents that have been classed as "essential," are necessary for the growth of the plant, and absence of any one will involve failure. This has been shown by growing plants in water dissolved in which are salts of the elements present in plants. By omitting in turn one or other of the elements aforesaid it is found that the plants will not grow after they have used up the materials contained in the seed itself. These elements are accordingly termed "essential," and it therefore becomes necessary to inquire how they are to be supplied.

The atmosphere is the great storehouse of organic plant food. The leaves take up, through their stomata, the carbonic acid and other gases of the atmosphere. The carbonic acid, under the influence of light, is decomposed in the chlorophyll cells, oxygen is given off and carbon is assimilated, being subsequently built up into the various organic bodies forming the plant's structure. It would seem, too, that plants can take up a small quantity of ammonia by their leaves, and also water to some extent, but the free or uncombined nitrogen of the air cannot be directly assimilated by the leaves of plants.

From the soil, on the other hand, the plant obtains, by means of its root system, the required requirements, also sulphur and phosphorus, and nearly all its nitrogen and water. Carbon, too, in the case of fungi, is obtained from the decayed vegetable matter in the soil. The roots are able not only to take up soluble salts that are presented to them, but they can attack and render soluble the solid constituents of the soil, thus transforming them into available plant food. In this way important substances, such as phosphoric acid and potash, are supplied to the plant, as also lime. Roots can further supply themselves with nitrogen in the form of nitrates, the ammonia and other nitrogenous bodies undergoing ready conversion into nitrates in the soil. These various mineral constituents, being transferred to the plant, go to form new tissue, and ultimately seed, or else accumulate in the sap and are deposited on the older tissue.

Whether the nitrogen of the air can be utilized by plants or not has been long and strenuously discussed, Boussingault first, and then Lawson, Gilbert and Pugh, maintaining that there was no evidence of this utilization. But it was always recognized that certain plants, clover for example, enriched the land with nitrogen to an extent greater than could be accounted for by the mere supply to them of nitrates in the soil. Ultimately Hellriegel supplied the explanation by showing that, at all events, certain of the Leguminosae, by the medium of swellings or "nodules" on their roots, were able to fix the atmospheric nitrogen in the soil, and to convert it into nitrates for the use of the plant. This was found to be the result of the action of certain micro-organisms within the leguminous roots, which in turn fed upon the carbohydrates of the plant and were thus living in a state of "symbiosis" with it. So far, however, this has not been shown to be the case with any other plants than the Leguminosae, and, though it is asserted by some that many other plants can take up the nitrogen of the air directly through their leaves, there is no clear evidence as yet of this.

We must now consider how the different requirements of the plant in regard to the elements necessary to maintain its life and to build up its structure affect the question of manuring. Under conditions of natural growth and decay, when no crops are gathered in, or consumed on the land by live stock, the herbage, on dying down and decaying, returns to the atmosphere and the soil the elements taken from them during life; but, under cultivation, a succession of crops deprives the land of the constituents which are essential to healthy and luxuriant growth. Without an adequate return to the land of the matters removed in the produce, its fertility cannot be maintained for many years. In newly opened countries, where old forests have been cleared and the land brought under cultivation, the virgin soil often possesses a first a high degree of fertility, but gradually its productive power decreases from year to year. Where land is plentiful and easy to be obtained it is more convenient to clear fresh forest land than to improve more or less exhausted land by the application of manure, labour and skill. But in all densely populated countries, and where the former mode of cultivation cannot be followed, it is necessary to resort to artificial means to restore the natural fertility of the land and to maintain and increase its productiveness. That continuous cropping without return of manure ends in deterioration of the soil is well seen in the case of the wheat-growing areas in America. Crops of wheat were taken one after another, the straw was burned and nothing was returned to the land; the produce began to fall off and the cultivators moved on to fresh lands, there to meet, in time, with the same experience; and now that the available land has been more or less intensely occupied, or that new land is too far removed for ready transport of the produce, it has been found necessary to introduce the system of manuring, and America now manufactures and uses for herself large quantities of artificial and other manures.

That the same exhaustion of soil would go on in Great Britain, if uncropped by manuring, is known to every practical farmer, and, if evidence were needed, it is supplied by the renowned Rothamsted experiments of Laws and Gilbert, on a heavy land, and also by the more recent Woburn experiments of the Royal Agricultural Society of England, conducted on a light sandy soil. The following table will illustrate this point, and show also how under a system of manuring the fertility is maintained:—

Whereas on the heavier and richer land of Rothamsted the produce of unmanured wheat has fallen in 58 years from 17.2 bushels to 12.3 bushels, on the lighter and poorer soil of Woburn it has fallen in 30 years from 17.4 bushels to 10.8 bushels; barley has in 50 years at Rothamsted gone from 22.4 bushels to 10 bushels, whilst at Woburn (which is better suited for barley) it has fallen in 30 years from 23 bushels to 13.3 bushels. At both Rothamsted and Woburn the application of farm-yard manure has kept the produce of wheat and barley practically up to what it was before the importance or even increased it. Even these conclusions can be drawn from the use of artificial manures at each of the experimental stations named, exemplifying the fact that with suitable manuring crops of wheat or barley can be grown years after year without the land undergoing deterioration, whereas if left unmanured it gradually declines in fertility.

Practical proof has further been given of this in the well-known "continuous corn-growing" system pursued, in his regular farming, by Mr John Prout of Sawbridgeworth, Herts, and subsequently by his son, Mr W. A. Prout, since the year 1862. By supplying, in the form of artificial manures, the necessary constituents required for life, Mr Prout was enabled to grow year after year, with only an occasional interval for a clover crop and to allow of cleaning the land, excellent crops of wheat, barley and oats, and without, it may be added, the use of farm-yard manure at all.

In considering the economical use of manures on the land regard must be had to the following points: (1) the requirements of the crops intended to be cultivated; (2) the physical condition of the soil; (3) the chemical composition of the soil; and (4) the composition of the manure. Briefly stated, the guiding principle of manuring economically and profitably is to meet the requirements of the crops intended to be cultivated, by incorporating with the soil, in the most efficacious states of combination, the materials in which it is deficient, or which the various crops usually grown on the farm do not find in the land in a sufficiently available condition to ensure an abundant harvest. Soils vary greatly in composition, and hence it will be readily understood that in one locality or on one particular field a certain manure may be used with great benefit, while in another field the same manure has little or no effect upon the produce.

For plant life to thrive certain elements are necessary, viz., carbon, hydrogen, oxygen, nitrogen, sulphur, phosphorus, among the organic or combustible matters, and among the inorganic or mineral matters, potassium, calcium, magnesium, iron, phosphorus and sulphur. We must now examine the extent to which these necessary elements occur in either of the two great storehouses, the atmosphere and the soil, and how their removal in the form of crops may be made up for by the use of manures, so that the soil may be maintained in a state of fertility. Further, we must consider what functions these elements perform in regard to plant life, and, lastly, the forms in which they can best be applied for the use of crops.

Of carbon, hydrogen and oxygen there is no lack, the atmosphere providing carbonic acid in abundance, and rain giving the elements hydrogen and oxygen, so that these are supplied from natural sources. Iron, magnesium and sulphur also are seldom or never deficient in soils, and do not require to be supplemented by manuring. Accordingly, the elements for which there is the greatest demand by plants, and which the soil does not provide in sufficiency, are nitrogen, phosphorus, potassium, and, possibly, calcium. Manuring, apart from the physical and mechanical advantages which it confers upon soils, practically resolves itself, therefore, into the supply of nitrogen, phosphorus and potassium, and it is with the supply of these that we shall accordingly deal in particular.

1. Nitrogen.—Though we are still far from knowing what are the exact functions which nitrogen fulfils in plant life, there is no doubt as to the fact that it plays a most important part in the growth of the plant and in the formation of stem and leaf. Without a sufficiency of nitrogen the plant would be stunted in growth. Its growth, indeed, may be said to be measured by the supply of nitrogen, for while mineral constituents like phosphoric acid and potash are only taken up to the extent that the plant can use them i.e. according to its rate of growth, this actual growth itself would seem to be determined by the extent of the nitrogen supply. This is what causes the ready response given to a crop by the application of a quick-acting nitrogenous fertiliser, whether as nitric or as ammonia, and which is marked by the dark-green colour produced and the pushing-on of the growth. Similarly, this use of nitrogen, by promoting growth, defies any attempts of the substitution of the use of other elements of the nitrogen to produce the same effect in leaves and stems is the result of over-nitrogen manuring.

The composition of the grain is likewise affected, becoming more nitrogenous. With crops, however, while rapid growth is required, and nitrogen is the chief element, i.e. nitrous, in particular, too, over-manuring with nitrogen will tend to produce rankness and coarseness of growth. Experiments at Rothamsted and elsewhere, as well as the everyday experience of farmers, bear testimony to the paramount importance of nitrogen-supply, and to the crops it is capable of raising. This applies not only to corn crops of all kinds, but to root crops, grass, potatoes, &c. Leguminous crops alone seem to have no need of it. In view of this practical experience, Liebig’s "mineral theory"—according to which he laid down that plants only needed to have mineral constituents, such as phosphoric acid, must be cultivated in association with nitrogenous fertilisers, without which none of these other elements can be obtained, has been widely essayed in ordinary cultivated soils is much more marked than is that of mineral constituents, and consequently even with the application of nitrogen alone (as by the use of nitrate of soda or sulphon of ammonium, good crops of grass, and cereals, etc.,) can be obtained. This has been shown both at Rothamsted and at Woburn. On the other hand, experiments at these stations have demonstrated that better and more lasting results are obtained by the judicious use of nitrogenous materials in conjunction with phosphates and potash.

The form in which nitrogen is taken up by plants is mainly, if not wholly, that of nitrates, which are readily-soluble salts. Ammonia is also used by nitrogenous bodies undergo in the soil, through the agency of nitrifying organisms present in it (Bacterium nitritans, &c.), rapid conversion into nitrates, and as such are easily assimilable by the plants. Ammonia, however, is mostly removed in drainage, and hence the adequate supply of nitrogen for the plant’s use is a constant problem in agriculture. Experiments on the rate of removal of nitrates from the soil by drainage showed that every inch of rain passing through the drains caused a loss of 2½ lb of nitrogen per acre (Voelcker and Frankland). At the same time, soils, as Way showed, have the power of absorbing, in different degrees, ammonia from its solution in water, and when salts of ammonia are passed through soils the ammonia alone is absorbed, the acids passing, generally in combination with lime, into the drainage.

On experiments at Rothamsted on drainage showed that, though large quantities of ammonia salts were applied to the land, the drainage water contained merely traces of ammonia, but, on the other hand, nitrates in quantity, thus proving that it is as nitrate, not as nitrogen itself, that plants mainly, if not entirely, take up their nitrogenous food.

From these investigations it follows that much more nitrogenous matter has to be added to the land to maintain the same increase in the crop. Nitrogen, then, being so all-important, the question, where is it to come from? We have seen that the leaves take up only minute quantities of ammonia, comparatively small amounts are supplied in the rain, dew, snow, &c., and in the case of Leguminosae alone have we any evidence of plants being able to provide themselves with nitrogen from atmospheric sources. Some few organisms present in fertile soils, e.g., Azotobacter chroococcum, have also the power, under certain conditions, of fixing the free nitrogen of the atmosphere without the intervention of a "host," but all these sources would be very inadequate to meet the demands of an agricultural crop. The addition of nitrogenous fertilisers, whether applied in a soluble or fixed form, must be considered, in analysis, much more than 15% of nitrogen, and it is evident that the great source of supply of the needed nitrogen must be the direct manuring of the soil with materials containing nitrogen. These materials will be considered in detail later.

2. Phosphorus.—This is the most important mineral element which has to be supplied to the soil by the agency of manuring. Grass, to be kept up in prime condition, requires the ordinary manures, and is reckoned as phosphoric acid, and though its absence in sufficiency is not so marked or so soon shown under prolonged cultivation as is that of nitrogen, yet the fact that it is needed by all classes of plants, and the application of materials which combine with great benefits, makes its supply one of great Importance. From the time that Liebig, in 1840, suggested the treatment of bones with sulphuric acid in order to make them more readily available for the use of crops, and that

---

1 The amount of nitrogen thus deposited annually was found at Rothamsted to be 7-21 lb per acre.
MANURES

The influence of potash on particular crops is very marked. On clovers and other leguminous crops it is highly beneficial, while on grass land it is of particular importance as inducing the spread of clovers, and other leguminous plants, in the Rothamsted grass experiments, where with a mineral manure containing potash one-half of the herbage is leguminous in nature, whereas with the same manure, but without potash, none of the leguminous plants. Similarly, where nitrogen is used by itself and no potash given there are no leguminous plants at all to be found. Potash occurs in an ordinary fertile soil to the extent of about 20‰; a soil containing 40‰ will have a good supply of the element. Potash, however, is mostly bound up in the soil in the form of insoluble silicates, and these are often in a far from available form, being only slowly utilized, and more or less hidden, so that getting them acted on by the air and moisture, and so liberating the potash. According to B. Dyer's method of ascertaining the availability of potash in soils, the amount of potash soluble in a 1% citric acid solution should be about 0.05% otherwise the action of potash manures will be a requisite. In the case of soils containing much lime a larger quantity would, no doubt, be needed.

Potash, like phosphoric acid, is readily retained by soils, and so is not subject to any considerable losses by drainage. This retention is exercised by the ferric-oxide and alumina in soils, but still more so by the double silicates, and to some extent also by the humus of the soil. The soil containing 0.1% of lime, the solution of lime in the soil, the lime taking the place of the potash. Lime, therefore, of much importance in setting free fresh stores of potash. Soda salts also, when in considerable excess, are able to liberate potash, and phosphoric acids. In many cases, the beneficial action attending the use of common salt.

4. Calcium.—Though calcium, or lime, is found in sufficient quantity in unrestored soils, yet it is not so essential a condition as lime is clearly deficient and where that deficiency has shown itself in practice. Moreover, so comparatively easy is the removal of lime from the soil by drainage, and so important is the part which lime plays in liberating potash from its compounds, and in helping the retain bases in the soil so that they are not lost in drainage, that the significance of lime cannot be ignored. Further, the availability of both potash and phosphoric acid in the soil has been shown to be much increased by the presence of lime. Lime carbonate of calcium is, also necessary for the process of nitrification to go on in the soil. Some sandy soils, and even some clays, contain insufficient lime to render the soil itself that which can be referred to the soil. When this is the case nothing can adequately take the place of lime, and in this sense lime may be called a "manure." In the majority of cases, however, the practice of liming or chalking, which was a common one in former times, was resorted to mainly because of the ameliorating effects it produced on the land, both in a mechanical and in a physical direction. Thus, on clay soil it fluidizes the particles, rendering the soil less tenacious of moisture, improving the drainage and making the soil warmer. Nor must the directly chemical results be overlooked, for in addition to those already mentioned, of liberating plant food (chiefly potash and phosphoric acid) the beneficial action of lime may be pointed out. Lime acts in a special way as regards the sourness or "acidity" which is sometimes produced in land when lime is deficient. In soils that are acid through the accumulation of humic acid nitrification is prohibited, and if the soil life is to be maintained the use of lime has the effect of "sweetening" the land, and of restoring its bacterial activity. This acidity is also seen in the occurrence of "chalking" as a "chalking" plant. Lime is thus a plant food, producing this being one that thrives in an acid soil. It is only found in soils poor in lime, and the only remedy for it is liming. The growth of weeds like spurry, marigold, sorrel, &c., is also a sign of land being wanting in lime. The most striking instance of this "soil acidity" is that afforded by the Woburn experiments, where, on a soil originally poor in lime, the soil has, through the continuous use of ammonia salts, been impoverished of the lime to such an extent that it has become quite sterile and is distinctly acid in character. The application of lime, however, to such a soil has had the effect of quite restoring its fertility.

5. Magnesium.—This is not known to be deficient in soils, although an essential element in them, and it is seldom directly applied to crops. Cereals contain much magnesium, and the manures, kainite, contain magnesium salts in considerable quantity; but their influence is not known to be of beneficial nature, though, like common salt, magnesia salts will, doubtless, render some of the plants more perfect. The same is true of lime carbonate. It is not without their influence on crops, and experiments have been undertaken at the Woburn experimental farm and elsewhere to determine the nature of this influence. Carbonate of magnesia has been tried in connexion with the lime salts with good results.

6. Iron.—Iron is another essential ingredient of soil that is found in abundance and does not call for special application in manurial
MANURES

form. Iron is essential for the formation of chlorophyll in the leaves, and its presence is believed also to be beneficial for the development of the flowering parts, for the formation of fruits, and in vines especially. Ferrous sulphate has, partly with this view, and partly for its fungus-resisting properties, been suggested as a desirable constituent of manures. The function performed by the silicates and the phosphoric acid, potash and ammonia has been already alluded to.

7. Sulphur.—This, the last of the "essential" elements, is seldom supplied in manures. For it, the producer would find it a large task for the plant's supply, and it is little required except for the building-up, with carbon, hydrogen, oxygen and nitrogen, of the albuminoids. There are few artificial manures which do not contain a small amount of sulphur, notably superphosphate. Sulphate of lime (gypsum) is sometimes applied to the land direct as a way of giving lime; this is employed in the case of clover and hops principally.

Having thus dealt with the essential ingredients which plants must have, the materials which may reasonably be supplied to them in the form of additional manures, we may briefly pass over the other constituents found in plants, which may, or may not, be given as manures.

8. Sodium.—This is a widely distributed element. The influence of common salt (chloride of sodium) in liberating, when used in large excess, potash from the silicates in which it is combined in the plant, has been already referred to. In this way, and also nitrate of soda (the two forms in which soda salts are used as manures) may have some benefit. The principal purpose for which sodium is considered, however, is the supply of certain elements which are required in the land. It is specially useful in a dry season, or for succulent crops such as cabbage, kale, &c., or again for plants of maritime origin (such as mangels), which thrive near the sea shore.

9. Silica.—Silica is an abundant element. Though silica forms such a large part of the ash of plants and is especially abundant in the straw of cereals, there is no evidence that it is required in any great amount. It is, however, believed to "stiffen" the stems of cereals and grasses, but plants grown without it will do perfectly well. It would, however, appear that soluble silica does play some part in enabling phosphoric acid to be better assimilated by the plant. Silicates, however, have not justified their use as direct fertilizers.

10. Chlorine.—A certain amount of chlorine is brought down in the rain, and chlorides are also used in the form of common salt, with the effect, as all fanciers of liberating from silicates, when given in excess, but there is no evidence as to any particular part which the chlorine itself plays.

11. Manganese, &c.—Manganese occurs in minute quantities in most plants, and it, along with lithium (found largely in the tobacco-plant), caesium, titanium, uranium and other rare elements, may be found in soils. Experiments at the Woburn post-culture station and others point to stimulating effects on vegetation produced by the action of minute doses of salts of these elements, but, so far, their use as manorial ingredients need not be considered in practice. As an example of the use of such an element when it existed in the soil, which may be described as decayed vegetable matter, is not without importance in plant life. Of it, farm-yard manure is to a large extent composed, and many organic manures, as they are called, contain quantities of it. Decomposed bones, decayed vegetation, the stubble of cereal crops and many waste materials add humus to the land, and this humus, by exposure to the air, is always undergoing aerobic changes in the soil, opening it out, distributing the carbonic acid through it, and supplying it, in its further decomposition, with nitrogen. The principal effects of humus on the soil are of a physical character, and it exercises particular benefit through its power of retaining moisture. Humus, however, has a distinct chemical action, in that it forms combinations with iron, calcium and ammonia. It thus becomes one of the principal sources of supply of the nitrogenous food of plants, and a soil rich in humus is one that has been carefully managed. The nitrogenous organic matter of the humus is not available as a food for plants, but many kinds of fungi and bacteria are capable of converting it into ammonia, from which, by the agency of nitrifying organisms, it is converted into nitrous and nitrated amides, available for the use of plants. Humus is able to retain phosphoric acid, potash, ammonia and other bases. So important were the functions of humus considered at one time that on this Tauber built his "humus theory," which was, in effect, that, if humus was supplied to the soil, plants required nothing more. This was based, however, on the erroneous belief that the carbon, of which the bulk of the organic matter of the humus is derived, is converted into nitrous and nitrated amides, not as we now know it to be, from the carbonic acid of the atmosphere. This theory was in turn replaced by the "mineral theory" of Liebig, and then both of them by the "nitrogen theory" of Inger

We pass next to review, in the light of the foregoing, the manures in common use at the present day.

Manures, as already stated, may be variously classified according to the materials they are made from, the constituents which they chiefly supply, or the uses to which they are put. But, except with certain few manures, such as nitrate of soda, sulphate of ammonia and potash salts, which are used purely for one particular purpose, it is impossible to make any definite classification of manures, owing to the fact that the majority of them serve more than one purpose, and contain more than one fertilizing constituent of value. It is only on broad lines, therefore, that any division can be framed. Between so-called "natural" manures, like farm-yard manure, seaweed, wool waste, shoddy, bones, &c., which undergo no particular artificial preparation, and manufactured manures like superphosphate, dissolved bones, and other artificially prepared materials, there may, however, be a distinction drawn, as also between these and such materials as are imported and used without further preparation, e.g. nitrate of soda, kainit, &c., on the whole, the best classification to attempt is that according to the fertilizing constituents which each principally supplies, and this will be adopted here, with the necessary qualifications.

I.—NITROGENOUS (WHOLLY OR MAINLY) MANURES

These divided themselves into: (a) Natural nitrogenous manures; (b) imported or manufactured manures.

1. NATURAL NITROGENOUS MANURES

Under this heading come—farm-yard manure; seaweed; refuse cakes and meals; wool dust and shoddy; hoofs and horns; blood; soot; sewage sludge.

2. FARM-YARD MANURE.—This is the most important, as well as the most generally used, of all natural manures. It consists of the solid and liquid excreta of animals that are fed at the homestead, together with the material used as litter. The composition of farm-yard manure will vary greatly according to the conditions under which it is produced. The principal determining factors are (1) the nature and age of the animals producing it, (2) the food they are given, and (3) the kind and quantity of litter used, (4) whether it be made in feeding-boxes, covered yards or open yards, (5) the length of time and the way in which it has been stored.

The following analysis represents the general composition of well-made farm-yard manure, in which the litter used is straw.

*Containing nitrogen = 59 %, which is equal to ammonia.*

It is to be regarded as a very rich manure. Put broadly, farm-yard manure will contain from 65 to 80% of water, from .45 to .65% of nitrogen, from .4 to .8% of potash, and from .2 to .5% of phosphoric acid.

The analysis shows that farm-yard manure contains all the constituents, without exception, which are required by cultivated crops in order to bring them to perfection, and hence it may be called a "perfect" manure. Dung, it may be observed, contains a great amount of carbonic acid and ammonia, and is required by cultivated crops in order to bring them to perfection.

The compounds of different kinds of animals vary in composition, and those of the same animal will vary according to the nature and quantity of the food given, the age of the animal, and the way it is generally treated. Thus, a young animal which is growing, needs food to produce bone and muscle, and voids poorer dung than one which is fully grown and only has to keep up its condition. Similarly, a milking-cow will produce poorer dung than a dairy-cow which is being fatted, producing more phosphorus than feeding without cake. Straw is the most general litter used, but peat-moss litter, sawdust, &c., may be used, and they will affect the quality of the manure to some extent. Peat-moss is the best absorbent and has a higher manurial value than straw. Box-feeding manure, and that made in covered yards will suffer much less loss than that made in an open yard. Lastly, manure kept in a dry covered with earth will be much richer than that left in an uncovered heap. The solid and liquid excreta differ much in composition,
MANURES

for, while the forms are principally phosphoric acid, lime, manure, and ash; the latter, on account of its nitrogen, the urine is almost destitute of phosphoric acid, and abound in alkaline salts (including salts of potash) and in nitrogeneous organic matters, ammonia, which when richly drained are set free, and yield ammonia. Unless, therefore, the two kinds of excrements are mixed, a perfect manure supplying all the needs of the plant is not obtained; care must accordingly be taken to absorb all the urine by plants as quickly as possible. Difficulty is sometimes experienced in collecting the urine, as it is limited, by the length of time and the way in which it has been kept. Fresh dung is soluble in water only to a limited extent, and, in consequence, it is not possible to do anything of the kind. When the manure has been used as a ferments. It is, however, as a rule, the best dung which has been kept some time; fresh dung is therefore generally used in autumn or winter, and thoroughly rotten dung in spring, when an immediate forcing effect is required.

The progress of manuring, in which farmers are so constantly engaged, and for which precautions on keeping, have been the subject of much inquiry. In Germany, Maerrer and Schneidewind; in France, Muntz and Girard; and in England, Voelcker, Wood, Russell and others, have investigated these losses, as far as they are not covered by the time the animal is reared. The best dung is that made complete set of experiments is one conducted at the Woburn experimental station and extending over three years (1899-1901). The dung was cake-fed manure made in feeding-boxes from which no drainage issued, and, after removal, it was kept in a heap, covered with earth. Hence it was made under as good conditions as possible; but, even then, the losses—a deduction for live- weight—never amounted to more than 15% of the nitrogen of the food, and the making, and 34% (or a further 19%) during storing and by the time the manure came to be put on the land, had been sampled at intervals. The results seem to show that only about 50% of the nitrogen of the food is given back, and of the dung that goes on the land. This is the figure which Lawes and Gilbert suggested in the practical application of their Table of Organic Soluble Fertilizers.

During the fermentation of dung a large proportion of the non-nitrogenous organic matter disappears in the forms of carbonic acid and water, while another portion is converted into humic acid which fix the ammonia produced from the non-nitrogenous constituents of the solid and liquid excreta. The mineral remains remain behind entirely in the rotten dung, if care be taken to prevent loss by drainage. For proper decomposition of the delicate organic material and moisture are requisite, while extreme dryness or too much water will arrest the due fermentation of the mass.

Well-fermented dung is more concentrated and consequently more valuable than fresh dung, and in some cases, the rotten dung contains any appreciable quantity of volatile ammonia, and there is no advantage from applying gypsum, dilute acid, superphosphate, kainite, or other substances recommended as fixers of ammonia. If dung is carted into the field and spread out at once in thin layers it will suffer comparatively little loss. But if dung be kept for a length of time in shallow heaps, or in open straw yards and exposed to rain, it loses by drainage a considerable proportion of its most valuable soluble fertilizing constituents. Experiments with farm-yard manure kept in an open yard showed that this was not only owing to the weather, nearly all the soluble nitrogen and 78-2% of the soluble phosphorus being lost by drainage (A. Voelcker). To prevent this loss, farm-yard manure, as has been pointed out, should, whenever possible, be carted into a heap and put on land, but land will not absorb nitrogen, some of these materials, e.g., rape cake, cotton cake and mustard cake, contain appreciable amounts of phosphoric acid and potash. Rape cake, or "cake land," as it is called in Norfolk, is used extensively for manures, and it is believed to be a preventive of wireworm, and so is often employed for potatoes and root-crops.

Green-manuring.—Though properly belonging to cultivation rather than to manuring, and acting chiefly as a means of improving the condition of the soil, the practice of green-manuring carries with it manural benefits also, in that it supplies humus and nitrogen to the soil, and provides a substitute for farm-yard manure. The ploughing-in of a leguminous green-crop which has collected nitrogen from the air, will absorb results in a greater accumulation of nitrogen for a succeeding corn-crop, and thus supply the cheapest form of manuring. Green-manuring is most beneficial on light land, poor in vegetable manure.

Many waste materials of this kind are used because of their supplying, in the form of nitrogenous organic matter, nitrogen for crop uses. The nitrogen in the form of legumes, though low in content, is available and useable for nitrogen, some of these materials, e.g., rape cake, cotton cake and mustard cake, contain appreciable amounts of phosphoric acid and potash. Rape cake, or "cake land," as it is called in Norfolk, is used extensively for manures, and it is believed to be a preventive of wireworm, and so is often employed for potatoes and root-crops. Rape-seed from which the oil has been extracted by chemical means, and which is called "rape refuse," is made use of in hop-gardens as a slowly acting supplier of nitrogen. It will contain 4 to 5% of nitrogen with 3 to 4% of phosphates. Damaged cotton and other feeding-cakes, no longer fit for feeding, are ground into meal and put on land as manures, and are useful for manurial purposes, and will have up to 5% of nitrogen with 4 to 5% of phosphates. Spent hops, malt dust and other waste materials are similar used. The principal use of these materials is as rough manure, and to give bulk to the soil when supplying nitrogen in suitable form.

Wool-dust, Shoddy, &c.—The clippings from wool from the refuse from cloth factories, silk, fur and hair waste, carpet clippings and similar waste materials are comprised in this category. They are valuable purely for their nitrogen, and should be purchased according to their nitrogen-contents. They are favourite materials with hops-growers, and with fruit-larders, as they are perhaps a manure which supplies its nitrogen in organic form, and which acts continuously, if not too quickly. It is the custom in hoplands to add clippings to the soil and keep the crops covered with manure till it has much fertility stored up in it for succeeding crops. According to its nature, wool-dust or shoddy may contain anything from 3% of nitrogen up to 14%.

Leather is another waste material of the same class, but the process of tanning it has undergone makes its nitrogen but very slowly available and it is avoided, in consequence, as a manure.
MANURES

There have been several processes started with the object of rendering leather more useful as a manure.

Hoofs and Horns.—The clippings and shavings from horn factories are largely used by some hop-growers, and, though very slow in their results, are of some value. They are sometimes finely ground and sold as "keronikon," chiefly for use in compound artificial manures.

Dried Blood is another purely nitrogenous material, which, however, is largely used only by the artificial manure maker. It will contain from 12 to 14% of nitrogen. It is obtained by simply evaporating down the blood of animals, and is claimed to contain the most valuable of the organic nitrogenous materials enumerated, and, when obtainable, is a favourite manure with fruit-growers, being also used for root and vegetable growing. Soils are very variable. It owes its manurial value mainly to the ammonia salts it contains, and a good sample will have about 4% of ammonia. It is frequently adulterated, being mixed with ashes, earth, &c. The manures purchased for a thousand dollars may not contain anything of the nitrogenous matter, but the hundred dollars of the so-called "sludge," as it is generally termed, is often useful because of the lime it contains. It is peculiarly valuable for crops such as beans and peas, which, by some, are still greatly exaggerated. Where land is in need of organic matter, or where it is desirable to consolidate light land by the addition of material of this class, sludge may, however, have decided value on mechanical and physical grounds, but land such as cannot be treated at all.

b. Imported or Manufactured Nitrogenous Manures

These are nitrate of soda; sulphate of ammonia; calcium cyanamide; calcium nitrate.

Nitrate of Soda.—This is the best known and most generally used of the imported nitrogenous manures. It is exported from the rains of Chile and Peru, from which it was first shipped about the year 1830. By 1890 the export had reached 1,341,550 tons. It is uncertain what its origin is, but it is generally believed to be the deposit of a river which ran through an ancient sea which was raised by volcanic eruption and its waters evaporated. Another theory puts it as the deposit from the saline residues of fresh-water streams. The crude deposit is termed calcite, and from this (which contains common salt and sulphates of soda, potash and lime) the nitrate is crystallized out and obtained as a salt containing 95 to 96% pure nitrate of soda. It is sold on a basis of 95% pure, and is but little subject to alteration. As a quickly acting nitrogenous manure nitrate of soda has no equal, and it is in great demand as a top-dressing for corn crops, also for roots. On grass-land, if used alone, it tends to produce grass that is hard and unpalatable. Manure made with increased crops to produce, if used in quantity, inferiority of quality in grain. It can be employed in conjunction with superphosphate and other artificial manures, though it should not be mixed with them long before the mixture is to be put on. It is a very soluble salt, and the nitrogen being in the form of nitrates, it can be readily taken up by plants. On the other hand, it is readily removed from the soil by drainage, and its effects last only for a single season. Owing to its solubility, it requires to be used in much larger amount than the crop actually will take up. On a heavy soil it has a bad influence in reducing and in quantity, causing the land to "run," and making the tilth bad. Though, doubtless, exhaustive to the soil, when used alone, there is no evidence yet of nitrate of soda causing land to "run," as has been shown to be the case with sulphate of ammonia. Manure made with increased crops, but for mangels it has been used to advantage up to 4 cwt. per acre. As a top-dressing for corn crops it differs little in its crop-results from natural manure of equal value. In roots, it was reported they answered better, owing to its more ready solubility and quicker action, whereas in a wet season sulphate of ammonia does better.

Sulphate of Ammonia.—This is the great competitor with nitrate of soda for the title of the best manure of the year, and it is a gas and as a by-product in the distillation of shale, &c., as also from coke ovens. By adding sulphuric acid to the ammonial, it is distilled over from 28% to 30% of ammonia. It is sold in the manufacture of gas and debates of the commercial manure. The latter is used on the land, leaving also a slight amount of residue for a second crop. It is nearly as efficacious as a top-dressing for corn crops as is nitrate of soda, and for some crops, e.g., potatoes, it is considered superior.

It may also be used like nitrate of soda for root crops. On grass-land its effect in increasing graminaceous but reducing nitrogenous life is similar to that of nitrate of soda, but with corn it has not the same deteriorating influence on the quality of grain. It can be used to superphosphate or other artificial manures, and is therefore a common form in which nitrogen is given in compound manures. It does not produce the bad effect on the tith of certain soils that nitrate of soda does, but it is open to the objection that when used in the form of lime, it will exhaust the soil and leave it in an acid condition, so that the soil is unable to bear crops again until fertility is restored by the addition of lime. As a nitrogenous manure it is 1 cwt. per acre.

Calcium Cyanamide.—This is a new material which promises the earliest result of the utilization, in a commercial form, of atmospheric nitrogen as a manurial substance. It is obtained by passing acetylene gas over the surface of a carbonaceous fuel, and, whilst some nitrogen is lost, some, perchance, is transferred to the carbon, and, whilst some benefit to certain soils by reason of the lime value contained. Like cyanamide, it is still in the experimental stage as regards its agricultural use, and can only be produced where electric power is constantly available.

Neither material is altogether free from objection, the cyanamide heating with mixed with other manures and even with soil, and being liable to give off acetylene gas owing to the presence of calcium carbide, whereas the calcium nitride is a salt which on exposure to a moist atmosphere readily deliquesces.

II. PHOSPHATIC MANURES

Under the heading of manures that are used purely for their phosphatic benefit to the soil are superphosphate and basic slag.

Superphosphate.—This is the typical phosphatic manure, and is the base of the numerous artificial manures used on the farm. Superphosphate is made by dissolving raw phosphatic minerals in sulphuric acid (oil of vitriol), the tribasic phosphate of lime which these contain being converted into the so-called "soluble phosphates." Sulphate of lime being formed at the same time. The first impetus to the manufacture of superphosphate was given by Liebig, who, as he suggested, in 1810, the treatment of bones with oil of vitriol in order to make them act more quickly in the soil. The laws, subsequently, in 1843, applied this to mineral phosphates, using them in their order, but it was not until after the discovery of superphosphate that then began. Coprolites, as found in Cambridgeshire, Suffolk, Bedfordshire and elsewhere were the raw materials at first employed in the United Kingdom. But gradually the demand increased, and it became convenient to carry on the process on a large scale. These raw materials were searched to bring in the raw material for conversion into superphosphate. Many new sources of supply have been worked, and many worked out or abandoned in favour of better and cheaper materials. Among these were the crystallineapatites of India and Norway, French, Spanish and German (Lahn) phosphates, and, at a later period, Carolina (land and river), Florida, Tennessee, Somme, Belgian, Algerian and Tunisian phosphates. In addition to these came other materials which, in their origin, were really of the nature of guano, being bird deposits the phosphatic matters of which were gradually washed out. The mineral matter remains and altered the composition of the original rock on which the guano was deposited, thus forming rich deposits of phosphate of lime. Such were the phosphates obtained from many of the islands of the Indian Ocean, especially the islands of Redonda, Curacao, and also St. Helena, Ascension, Sombrero, Caruaçu, Aruba, Malden Island, Megillons, Baker Island, Fanning Islands, Laccadives Islands, &c., guano. Few of these have been worked out, and their place has been largely taken by the rich deposits of Ocean Island and Christmas Island, which are of similar origin. The principal supplies of phosphatic materials at the present time come from Florida, Algeria, Tunis, Ocean Island and Christmas Island, the production of the last named being very considerable. The main phosphates are those of Alta Vela, but these consist mainly of phosphate of alumina, and are not used for superphosphate manufacture but for phosphorus production.

Oxides, as already used, contained from 50 to 60% of phosphoric acid, but they are not used now, the richer sources, which are also better adapted for superphosphate manufacture, having been discovered. The richer phosphatic materials of which a number of phosphates is of great importance, as phosphates containing these bodies are liable to cause superphosphate to go back, or form what is called "reverted" phosphates, the percentage of soluble
phosphate" being reduced thereby. For this reason many of the older suppliers have been replaced by newer and better ones. Florida rock phosphate of high grade contains 75 to 78% of phosphate of lime, and Florida land pebble phosphate about 70%. Algerian and Egyptian phosphate rock are exceptionally pure and are very free from iron and alumina, alumin, thus fitting them especially for superphosphate making. Tennessee phosphate has about 70% of phosphate, South Carolina phosphate rock and Idaho and Christmas Island phosphates are of very high grade and yield over 80 and up to 86% of phosphate of lime. Superphosphate is made by finely grinding the raw phosphate and mixing it with a solution of sulfuric acid adjusted to contain 10% of sulfuric acid. In order to precipitate the phosphate there is a matter of some uncertainty, but it is a phosphate soluble in water, and believed to be mono-calcic phosphate. This is the true "soluble phosphate," but in commercial transactions it is universal to express the composition as if the original phosphate rock had been rendered soluble. Ordinary grades of mineral superphosphate give from 25 to 27% of soluble phosphate, and higher grades 30 to 35%. On reaching the soil, the soluble phosphate becomes precipitated by the calcium and iron compounds in the soil. But it is precipitated in a very fine form of division in which it is readily attacked by the plant roots. Superphosphate is used practically for all crops, including cereals, clover and other leguminous crops. Its use tends to early maturity in a crop. Its value for giving a start to root crops is particularly recognized, and root crops generally are grown on as the best manures, as they readily utilize the phosphoric acid in the soil itself. On land poor in lime superphosphate must be used with caution owing to its acid nature, and in such cases an undissolved phosphate is preferable. The quantity in which it is necessary to use depends upon the crop, the soil, the climate and the previous cropping of the land. The principal uses of superphosphate are: (1) as a fertilizer, and (2) as a quickacting material for increasing the yield of a crop or the size of its fruits. It is used for all crops, but particularly for rapidly maturing crops. The principal use of basic slag is on grass-land, especially where the soil is heavy or clayey. It has proved to be a valuable material for increasing the yield of a crop or the size of its fruits. It is used for all crops, but particularly for rapidly maturing crops. The principal uses of superphosphate are: (1) as a fertilizer, and (2) as a quickacting material for increasing the yield of a crop or the size of its fruits. It is used for all crops, but particularly for rapidly maturing crops. The principal uses of superphosphate are: (1) as a fertilizer, and (2) as a quickacting material for increasing the yield of a crop or the size of its fruits. It is used for all crops, but particularly for rapidly maturing crops.
MANUSCRIPT

There are, in addition to the foregoing, certain materials which in a limited sense only can be called ‘manures’, but the influences of which are mostly seen in the mechanical and physical improvements which they effect in soil. Such are salt, and also lime in its different forms.

Salt.—The action of salt in liberating potash from the soil has been explained. As a manure it is sometimes used along with nitrate of soda as a top-dressing for clover. The belief that it predisposed the straw, and crops also, and mangles in particular, it is employed; also for cabbage and other vegetables. Lime.—The use of this is almost solely to be considered as a soil improvement; it has that attribute (gypsum) is, however, occasionally used as a dressing for clover, and also for hops. The fact that superphosphate itself contains a considerable amount of sulphate of lime renders the special application of limestone unnecessary, as a rule.

As compared with ‘natural’ manures, like farm-yard manure, artificial manures have the disadvantage that they, unlike it, do not improve the physical condition of the soil. Artificial manures have, however, the advantage over farm-yard manure that they can supply in a small compass, and even if used in small quantity, the needed nitrogen, phosphoric acid and potash, &c., which crops require, are added to the farm-yard manure but in small proportion. In Egypt, further, present the expensive fertilizing matters in a concentrated form, and by their application save expense in labour. (A. V.)

MANUSCRIPT.—A term applied to any document written by the human hand (Lat. manu scriptum) with the aid of pen, pencil or other instrument which can be used with cursive facility, as distinguished from an inscription engraved with chisel or graver worked laboriously. By usage the word has come to be employed in a special sense to indicate a written work of the ancient world or of the middle ages; collections of such ancient manuscripts being highly prized and being stored for preservation in public libraries. Down to the time of the invention of printing, and until the printed book had driven it out of the field, the manuscript was the vehicle for the conservation and dissemination of literature, and discharged all the functions of the modern book.

In the present article a description is given of the development of the ancient manuscript, particularly among the Greeks and Romans, leading on to the medieval manuscripts of Europe and bringing down the history of the latter to the invention of printing; the history of the printed volume is dealt with in the article Book (q.v.).

Materials.—The handbooks on palaeography describe in full the different materials which have been employed from remote times to the present day, and may be referred to for further details. To dispose, in the first place, of the harder materials that have been put under requisition, we find metals both referred to by writers and actually represented by surviving examples. Thin leaves of gold or silver were recommended for the inscription of charms in particular. Leaden plates were in common use for incantations; the material was cheap and was supposed to be durable. On such plates were scratched the names of deities, prophecies, or other magical formulas, or inscribed with tax receipts and ephebemal drafts and memoranda, children’s dictation lessons, &c. Analogous to the clay documents of western Asia are the tablets coated with wax in vogue among the Greeks and Romans, offering a surface not to be inscribed with the pen but to be scratched with the sharp pointed stylus. These will be described more fully below. With them we class the wooden boards, generally whitened with a coating of paint or composition and designed for the storage of the documents, and also the scrolls specially used for educational purposes. Such boards were also employed for official notices in Athens in the 4th century B.C. A similar use was made of the bullae, which were made of vegetable substances with the addition of clay, and there was another use of dried cork with the same end. In a few exceptional circumstances, substances there were many, such as animal skins and vegetable growths. Practically we might confine our attention to three of them: papyrus, parchment or vellum, and paper, the employment of which in turn is almost universal. But there are also others which must be mentioned.

In a primitive state of society leaves of plants and trees strong enough for the purpose were the principal means of writing. Palm leaves, for example, were employed to receive writing. Palm leaves are used for this purpose to the present day in parts of India; and the references in classical authors to leaves as early writing material among the Greeks and Romans cannot be doubted.

The bark of trees, and particularly the inner bark of the lime-tree, φυλόκα, tīla, was employed. The fact that the Latin word liber, bark, eventually meant also a book, would be sufficient proof that that material was once in common literary use, even if it were not referred to by writers.

Linum, too, was a writing material among the early Romans, as it was among the Egyptians, and as it had to some extent among the Egyptians.

Skins of animals, tanned, have doubtless served as a writing material from the very earliest period of the use of letters. The Egyptians, for example, occasionally used for this purpose the backs of ostriches, which had designated their writing material of leather. The Jews, also, to the present day hold to the ancient Eastern custom and inscribe the law upon skins.

But generally these materials were superseded in the old world by the famous Egyptian writing material manufactured from the papyrus plant, which gradually passed beyond the boundaries of its native land and was adopted at a remote period into other countries. Into Greece and into Rome it was introduced at so early a time that practically it was the vehicle for classical literature throughout its course. A description of the manufacture and use of this material will be given presently. Here it may be mentioned that papyrus is associated in Greek and Roman literature with the roll form of the ancient manuscript, as will be more fully explained below, and that it was the supersession of this material by parchment or vellum which led to the change of shape to the book form.

The introduction of the new material, parchment or vellum, was not a revival of the use of animal skins as followed by the old world. The skins were now not tanned into leather, but were prepared by a new process to provide a material, thin, strong, flexible, and smooth of surface on both faces. This improved process was the secret of the success of the new material in ousted the time-honoured papyrus as a writing material. This secret was discovered by Pliny, that Eumenes II. of Pergamum (197-158 B.C.), seeking to extend the library of his capital, was opposed by the jealousy of the Ptolemies, who forbade him to bring in and used it, and that the growth of a rival library, and that he was thus compelled to have recourse to skins as a writing material, at all events points to Pergamum as the chief centre of trade in the material, παραγωγή, charta pergamina. The old term βεβολα, membrane, originally to the older leather, were transferred to the newly improved substance. In describing MSS. written on this material, by common consent the term parchment has in modern times given place to that of vellum, properly applicable only to calf skin, but now generally used in reference to a medieval skin-book of any kind. Parchment is a title now usually reserved for the hard sheepskin or other skin material on which law deeds are engrossed. (See Parchment.)

Vellum had a long career as a writing material for the literature of the early centuries of our era and of the middle ages. In its later application it was employed more for the decoration than for the content of the book. By the 15th century paper, an Asiatic invention, was making its way into Europe and was adopted in the Eastern Empire as a material for Greek literature. In its present form it was not produced in Egypt. It soon afterwards began to appear in the countries of southern Europe. In the course of the 14th century the use of it became fairly established, and in the middle of the century a number of paper manuscripts were produced in Italy. First of all the 15th century paper became the common material for the manuscript book.

The new paper, however, made no further change in the name of the manuscript book, as vellum was still employed as a writing material, as vellum; it could be inscribed on both sides; it could be made up into quires and bound in the codex form; and it had the further advantage of being easily manufactured in large quantities, and therefore of being comparatively cheap.

The Forms of the Manuscript Book.—In describing the development of the manuscript book in the ancient world, and
The text was written in columns, *σελίδες*, *paginae*, the width of which seems not to have been prescribed, but which for calligraphic effect were by preference made narrow, sufficient margins being left at head and foot. The average width of the columns in the best extant papyri ranges from two to three-and-a-half inches. The written line usually ran or lay between the length of the roll, so that the columns stood, so to say, with the height of the rolled-up roll, and were disclosed consecutively as the roll was unwound. Ruling with lead to guide the writing is mentioned by writers, but it does not appear that the practice was generally followed. The number of lines in the several columns of extant papyri is not constant, nor is the marginal boundary of the beginnings of the lines, for the accuracy of which a ruled vertical line would have proved useful, ordinarily kept even. No doubt in practice the horizontal fibres of the material were found to afford a sufficient guide for the lines of writing.

If the title of the work was to be given, the scribe appears to have written it ordinarily at the end of the text. But something more was needed. To be obliged to unroll a text to the end, in order to ascertain the name of the author, would be the height of inconvenience. Its title was therefore sometimes written at the head of the text. It appears also that at an early period it was inscribed on the outside of the roll, so as to be visible as the roll lay in a chest or on the shelf. But a more general practice was to attach to the top edge of the roll a label or ticket, *εἴλος*, or *ovrissos, titulos, index*, which hung down if the roll lay on the table. In one instance a label was of a size, and with a light material, by which more than one specimen of the material, and perhaps different kinds, may be distinguished, the only such label made of papyrus has survived and is in the British Museum.

The scribe would not commence his text at the very beginning, nor would he carry it quite down to the end, of the roll. He would leave blank a sufficient length of material at either extremity, where the roll would naturally be most exposed to wear and tear by handling in unrolling and re-rolling; and, further, the extreme vertical edges might each be strengthened by the addition of a strip of papyrus so as to form a double thickness of material.

According to the particulars given by classical authors, the roll would be finished off somewhat elaborately; but the details described by them must be taken to apply to the more expensive productions of the book trade, corresponding with the full-bound volumes of our days. In practice, a large proportion of working copies and ordinary editions must have been dealt with more simply. Firstly, the roll should be rolled up round a central stick, of wood or bone, called the *φύλακα*, *umbilicus*, to which in the last stage of manufacture it was firmly attached. But as a matter of fact no rolling-sticks have been found in company with extant papyri, and it has therefore been suggested that they were not attached to the material but were rolled in loose, and were therefore liable to drop out. In some instances, as in the rolls found at Herculaneum, a central core of papyrus instead of a stick was thought sufficient. The edges, *frontes*, of the roll, after it had been rolled up, were shorn and were rubbed smooth with pumice, and they were sometimes coloured. A valuable roll might be protected with a vellum wrapper, *περίφλεγμα*, *peripluma*, so that all that remained of the roll was the central portion, which is written on the back of a farmer's accounts, of the end of the 1st century—but only for private use. It being the rule, then, to confine the writing to one side of the material, that is, to the inner surface of the made-up roll, that surface was more carefully prepared and smoothed than the other; and, further, the joints of the several sheets were so well made that they offered no obstacle to the action of the pen. Still further, care was taken that this, the *recto* surface of the material, should be that in which the shreds of papyrus of which it was composed lay horizontally, so that the pen might move freely along the fibres; the shreds of the *verso* side, on the other hand, being in vertical position. This point is of some importance, as, in cases where two different handwritings are found on the two sides of a papyrus, it may be usually assumed that the one on the *recto* surface is the earlier.

The text was written in columns, *σελίδες*, *paginae*, the width of which seems not to have been prescribed, but which for calligraphic effect were by preference made narrow, sufficient margins being left at head and foot. The average width of the columns in the best extant papyri ranges from two to three-and-a-half inches. The written line usually ran or lay between the length of the roll, so that the columns stood, so to say, with the height of the rolled-up roll, and were disclosed consecutively as the roll was unwound. Ruling with lead to guide the writing is mentioned by writers, but it does not appear that the practice was generally followed. The number of lines in the several columns of extant papyri is not constant, nor is the marginal boundary of the beginnings of the lines, for the accuracy of which a ruled vertical line would have proved useful, ordinarily kept even. No doubt in practice the horizontal fibres of the material were found to afford a sufficient guide for the lines of writing.

If the title of the work was to be given, the scribe appears to have written it ordinarily at the end of the text. But something more was needed. To be obliged to unroll a text to the end, in order to ascertain the name of the author, would be the height of inconvenience. Its title was therefore sometimes written at the head of the text. It appears also that at an early period it was inscribed on the outside of the roll, so as to be visible as the roll lay in a chest or on the shelf. But a more general practice was to attach to the top edge of the roll a label or ticket, *εἴλος*, or *ovrissos, titulos, index*, which hung down if the roll lay on the table. In one instance a label was of a size, and with a light material, by which more than one specimen of the material, and perhaps different kinds, may be distinguished, the only such label made of papyrus has survived and is in the British Museum.

The scribe would not commence his text at the very beginning, nor would he carry it quite down to the end, of the roll. He would leave blank a sufficient length of material at either extremity, where the roll would naturally be most exposed to wear and tear by handling in unrolling and re-rolling; and, further, the extreme vertical edges might each be strengthened by the addition of a strip of papyrus so as to form a double thickness of material.

According to the particulars given by classical authors, the roll would be finished off somewhat elaborately; but the details described by them must be taken to apply to the more expensive productions of the book trade, corresponding with the full-bound volumes of our days. In practice, a large proportion of working copies and ordinary editions must have been dealt with more simply. Firstly, the roll should be rolled up round a central stick, of wood or bone, called the *φύλακα*, *umbilicus*, to which in the last stage of manufacture it was firmly attached. But as a matter of fact no rolling-sticks have been found in company with extant papyri, and it has therefore been suggested that they were not attached to the material but were rolled in loose, and were therefore liable to drop out. In some instances, as in the rolls found at Herculaneum, a central core of papyrus instead of a stick was thought sufficient. The edges, *frontes*, of the roll, after it had been rolled up, were shorn and were rubbed smooth with pumice, and they were sometimes coloured. A valuable roll might be protected with a vellum wrapper, *περίφλεγμα*, *peripluma*, so that all that remained of the roll was the central portion, which is written on the back of a farmer's accounts, of the end of the 1st century—but only for private use. It being the rule, then, to confine the writing to one side of the material, that is, to the inner surface of the made-up roll, that surface was more carefully prepared and smoothed than the other; and, further, the joints of the several sheets were so well made that they offered no obstacle to the action of the pen. Still further, care was taken that this, the *recto* surface of the material, should be that in which the shreds of papyrus of which it was composed lay horizontally, so that the pen might move freely along the fibres; the shreds of the *verso* side, on the other hand, being in vertical position. This point is of some importance, as, in cases where two different handwritings are found on the two sides of a papyrus, it may be usually assumed that the one on the *recto* surface is the earlier.
accomplished by making the revolutions with his two hands while he held the revolving material steady under his chin. Although the codex or manuscript in book-form began to make its way in Greek and Roman literature as early as the 1st century of our era, the roll maintained its position as the recognised type of literary document down to the 3rd, and even into the 4th century, when it was altogether superseded. We shall proceed to describe the codex after giving some account of the waxen, or, to speak more correctly, the waxed, tablet, its precursor in the book-form.

The ordinary waxen tablet in use among the Greeks and Romans was a small oblong slab of wood, beech, fir, and especially box, the surface of which on one or both sides, with the exception of the surrounding margins which were left intact in order to form a frame, was sunk to a slight depth and was therein coated with a thin layer of wax, usually black. The tablet thus presented the appearance of a child’s school-slate of the present day. Such tablets were single, double, triple, or of several pieces or leaves. In Greek they were called πίνακες, πίνακας, δεκτος, δεκτίον.: In Latin cera, tabula, tabella, &c. Two or more put together and held together by rings or thongs as hinges formed a cadox or codex, literally a stock of wood, which a set of tablets might resemble, and from which they might actually be made by cleaving the wood of the first two leaves was called δίθυρος, διτρυτος; of three, τριτυτος, triptychs: and so on. The triptych appears to have been most generally used. A general term was also libellus.

Tablets served for the ordinary minor affairs of life: for memorandum, literary and other notes and drafts, school exercises, accounts, &c. The writing incised with the stilius could be easily obliterated by smoothing the wax, and the tabula rosa was thus rendered available for a fresh inscription. But tablets were also employed for official purposes, when documents had to be protected from the action of drafts or other legal transactions; and in such cases they were closed against inspection by being bound round with threads which were covered by the witnesses’ seals.

Small tablets, codicilli, pugillares, often of more valuable material, such as ivory, served for correspondence among other purposes; very small specimens are mentioned as vitellini, for the exchange of love-letters.

A certain number of Greek waxen tablets have been recovered, chiefly from Egypt, but none of them is very early. They are generally of the 3rd century, and are mostly inscribed with school exercises. The largest and most perfect extant codex is one in the British Museum (Add. MS. 33,270), perhaps of the 3rd century, being made up of nine leaves, measuring nearly 9 by 7 in., and inscribed with documents in shorthand.

Of Latin tablets we are fortunate in having a fairly large number of examples. Exclusive of a few isolated specimens, they are the result of two important finds. Twenty-four tablets containing the records of a burial club, A.D. 131-167, were recovered between 1786 and 1855 from some ancient mining works in Dacia. In 1875 as many as 127 tablets, containing deeds connected with sales by auction and payment of taxes, A.D. 15-62, were found in the ruins of Pompeii. These specimens have afforded the means of ascertaining the mechanical arrangement of waxen tablets when adopted for legal instruments among the Romans. Most of them are triptychs, severely clenched from single blocks of wood. Subject to some variations, the triptych was usually arranged as follows. Of the six sides or pages of the codex, pages 1 and 5 were of plain wood, and the outside leaves 2, 3, 5 were waxed; and page 4, which had a groove cut across the middle was sometimes of plain wood, sometimes waxed. The authentic deed was inscribed with the stilius on the waxed pages 2 and 3; and the first two leaves were then bound round with three twisted threads which passed down the groove so as to close the deed from inspection. On page 4 the witnesses’ names were then inscribed (in ink if the page was plain; with the stilius if waxed), and their seals were impressed in the groove, thus securing the threads. In addition to the protection afforded to the seals from casual injury by their position in the groove, the third leaf acted as a cover to them. On page 5 an abstract or duplicate of the deed, as required by law, was inscribed. The arrangement of the Daedalian tablets differed in this respect, that page 4 was waxed, and that the duplicate copy was begun on that page in the space on the left of the groove, that on the right being reserved for the names of the witnesses. In the case of one of the Pompeian tablets the threads and seals still remain.

The survival of the use of tablets to a late time should be noted. St Augustine refers to his tables, and St Hilary of Arles also mentions their employment for the purpose of correspondence; there is a record of a letter written in tabellis as late as A.D. 1148. They were very commonly used throughout the middle ages in all the west of Europe. Specimens inscribed with money accounts of the 13th and 14th centuries have survived in France, and similar documents of the 14th and 15th centuries are to be found in several of the municipal archives of Germany. Reference to their use in England occurs in literature, and specimens of the 14th or 15th century are said to have been dug up in Ireland. In Italy their employment is both recorded and proved by actual examples of the 13th and 14th centuries. With the beginning of the 16th century they seem to have practically come to an end, although a few survivals of the custom of writing on wax have been preserved to modern times.

As already stated, the codex, or MS. in book-form, owed its existence to the substitution of vellum for papyrus as the common writing material for Greek and Roman literature. The fact that vellum was a tough material capable of being inscribed on both sides, that writing, particularly if freshly written, could be easily washed off or erased from it, and that the material could thus be made available for second use, no doubt contributed largely to its ready adoption. In Rome in the 1st century B.C. it was used, like the waxen tablets for the writing of official documents, and that vellum tablets began to take the place of the cerae. References are not wanting in the classical writers to its employment for such temporary purposes. To what extent it was at first pressed into the service of literature and used in the preparation of books for the market must remain uncertain. But in the first centuries of our era it may be assumed that vellum codices were not numerous. The papyrus roll still held its position as the liber or book of literature. Yet we learn from the poems of Martial that in his day the works of some of the best classical authors were to be had on vellum. From the way in which, in his Agapæatae, he has contrasted as exchangeable gifts certain works written respectively on papyrus and on vellum, it has been argued that vellum at that time was a cheap material, inferior to papyrus, and only used for roughly written copies. Up to a certain point this may be true, but the fact that the earliest great vellum Greek codices of the Bible and of Latin classical authors, dating back to the 4th century, are composed of very finely prepared material would indicate a perfection of manufacture of long standing.

But, apart from the references of writers, we have the results of recent excavations in Egypt to enable us to form a more correct judgment on the early history of the vellum codex. There have been found a certain number of inscribed leaves and fragments of vellum of early date which without doubt originally formed part of codices or MSS. in book-form. It is true that they are not numerous, but from the character of the writing certain of them can be individually assigned to the 3rd, to the 2nd, and even to the 1st century. We may then take it for an established fact that the codex form of MS. was gradually thrusting its way into use in the first centuries of our era.

The convenience of the codex form for easy reference was also a special recommendation in its favour. There can be little doubt that such compilations as public registers must at once have been drawn up in the new form. The jurists also were quick to adopt it, and the very title “codex” has been attached to great legal compilations, such as those of Theodosius and Justinian. Again, the book-form was favoured by the early Christians. The Bible, the book which before all others became
the great work of reference in their hands, could only be consulted with convenience and despatch in the new form. A single codex could hold the contents of a work which formerly must have been distributed through many volumes in roll-form. The term σαμάτιον, which was one of the names given to a codex, was expressive of its capacity. Turning again to discoveries in Egypt, it appears that in the early centuries the codex-form had become so usual among the Christians in that land that even the native material, papyrus, the recognized material for the roll, was now also made up by them into leaved books. The greater number of papyri in the 3rd century containing Christian fragments of the Scriptures, the "Sayings of Our Lord," and the like, are in book-form. On the other hand, the large majority of the non-Christian papyri of the same period keep to the old roll-form. Thus the codex becomes at once identified with the new religion, while the papyrus roll to the last is the chosen vehicle of pagan literature.

In the 4th century the struggle between the roll and the codex for supremacy in the literary field was finished, and the victory of the codex was achieved. Henceforward the roll-form remained in use of the flesh-side, and in the manuscripts in which the liturgies; and for such purposes it survives to the present day. But so completely was it superseded in literature by the codex that even when papyrus, the material once identified with the roll-form, was used as it sometimes was down to the 6th and 7th centuries and later, it was made up into the leaved codex, not only in Egypt but also in western Europe.

The shape which the codex usually assumed in the early centuries of the middle ages was the broad quarto. The quires or gatherings of which the book was formed generally consisted, in the earliest examples, of four sheets folded to make eight leaves (τετράδιον or τετράδιον, quaternio), although occasionally quintsers, or quires of five sheets (ten leaves), were adopted. Sexterns, or quires of six sheets (twelve leaves), came into use at a later period. In making up the quires, care was generally taken to lay the sheets of vellum in such a way that hair-side faced hair-side, and flesh-side faced flesh-side; so that, when the book was opened, the two pages before the reader had the same appearance, either the yellow tinge of the hair-side, or the fresh whiteness of the flesh-side. In Greek MSS. the arrangement of the sheets was afterwards reduced to a system; the first sheet was laid with the flesh-side downwards, so that that side began the quire; yet in so early an example as the Codex Alexandrinus the first page of a quire is the hair-side. In Latin MSS. also the hair-side appears generally to have formed the first page. When paper came into general use for codices in the 13th century, it was not an uncommon practice to give the paper quires additional strength by an admixture of vellum, a sheet of the latter material forming the outer leaves, and sometimes the middle leaves also, of the quire. The quire mark, or "signature," was usually written at the foot of the last page, but in some early instances (e.g. the Codex Alexandrinus) it appears at the head of the first page of each quire. The numbering of the separate leaves in a quire, in the fashion followed by early printers, came in in the 14th century. Catch-words to connect the quires appear first in the 13th century and are not uncommon in the 14th century.

No exact system was followed in ruling the guiding lines on the pages of the codex. In the case of papyri it was enough to mark with the penel the vertical marginal lines to bound the text, if indeed even this was considered needless (see above); the fibres of the papyrus were a sufficient guide for the lines of writing. On vellum it became necessary to rule lines to keep the writing even. These lines were at first drawn with a blunt point, almost invariably on the hair (or outer) side of the skin, and strongly enough to be in relief on the flesh (or inner) side. Marginal lines were drawn to bound the text laterally; but the ruled lines which guided the writing were not infrequently drawn right across the sheet. Each sheet should be ruled separately; but two or more sheets were often laid and ruled together, the lines being drawn with so much force that the lower sheets also received the impressions. In rare instances lines are found ruled on both sides of the leaf, as in some parts of the Codex Alexandrinus. In this same MS. and in other early codices the ruling was not always drawn for every line of writing, but was occasionally spaced so that the writing ran between the ruled lines as well as on them. The lines were evenly spaced by means of guiding pricks made at measured intervals with a compass or rotary instrument down the margins; in some early MSS. these pricks run down the middle of the page. Ruling with the plummet or lead-point is found in the 11th century and came into ordinary use in the 13th century; coloured inks, e.g. red and blue, were used for ornamental ruling in the 11th century.

Mechanical Arrangement of Writing in MSS.—It has already been stated above that in the papyrus rolls the text was written in columns. They stood with convenient intervals between them and with fair margins at top and bottom. The length of the lines was to some extent governed by the nature of the text. If it was a poetical work, the metrical line was naturally the line of the column, unless, as sometimes was the case, the verse was written continuously as prose. For prose works a narrow column was preferred. It is noticeable that the columns gradually took a tendency to lean to the right instead of being perpendicular—an indication that it was not the practice to rule marginal lines. In codices the columnar arrangement was also largely followed, and the number of columns in a page was commonly two. There are instances, however, of a larger number. The Codex Sinaiticus of the Bible has four columns to the page; and the Codex Vaticanus, three columns. And the tricolumnar arrangement occurs every now and then in later MSS.

In both Greek and Latin literary MSS. of early date the writing runs on continuously without separation of words. This practice, however, may be regarded as rather artificial, as in Text-out with papyri written in non-literary hands and in Latin out separa-deeds also, contemporary with these early literary textual MSS., there is a tendency to separation. In a text thus continuously written occasional ambiguities necessarily occurred, and then a dot or apostrophe might be inserted between words to aid the reader. Following the system of separation of words which appears in ancient inscriptions, wherein the several words are marked off by single, double, or triple dots or points, the words of the fragmentary poem on the battle of Actium found at Herculaneum are separated by single points, probably to facilitate reading aloud; monosyllables or short prepositions and conjunctions, however, being left unseparately from the words immediately following them—a system which is found in practice at a later time. But such marks of separation are not to be confounded with similar marks of punctuation whereby sentences are marked off and the sense of the text is made clear. Throughout the career of the uncial codices down to the 6th century, continuity of text was maintained. In the 7th century there is some evidence of separation of words, but without system. In early Latin minuscule codices partial separation in an uncertain and hesitating manner went on to the time of the Carolingian reform. In early Irish and English MSS., however, separation is more consistently practised. In the 9th and 10th centuries long words tend to separation, but short words, prepositions and conjunctions, still cling to the following word. It was not till the 11th century that the smaller words at length stood apart, and systematic separation of words was established. In Greek minuscule codices of the 9th century a certain degree of separation takes place; yet a large proportion of words remain linked together, and they are even incorrectly divided. Indeed a correct system of distinct separation of words in Greek texts was never thoroughly established even as late as the 14th century.

But while distinction of words was disregarded in early literary texts, distinction of important pauses in the sense was recognized from the first. The papyrus of the Persic Paragraphs of Timotheus of Miletus, the oldest MS. of a Greek text in existence, of the end of the 4th century B.C., is written in independent paragraphs. This is a natural system, the simplicity of which has caused it to be the system of modern
times. But, in addition, the Greek scribe also separated paragraphs by inserting a short horizontal stroke, παράγραφος, between them at the commencement of the lines of writing. It should be noted that this stroke indicated the close of a passage, and therefore belonged to the paragraph just concluded, and did not stand for an initial sign for the new paragraph which followed. The dividing stroke was also used to mark off the different speeches of a play. Besides the stroke, a wedge-shaped sign or όρος was used. But to make every paragraph and distinctly by itself would have entailed a certain loss of space. If the concluding line were short, there would remain a long space unfilled. Therefore, when this occurred, it became customary to leave only a short space blank to mark the termination of the paragraph, and then to proceed with the new paragraph in the same line, the παράγραφος at the same time preventing possible ambiguity. The next step was to project the first letter of the first full line of the new paragraph slightly into the margin, as a still further distinction; and lastly to enlarge it. The commencement of the letter gave it so much prominence that the dividing stroke could then be dispensed with, and in this form the new paragraph was henceforward indicated in Greek MSS. it being immaterial whether the enlarged letter was the initial or a medial letter of a word. As early as the 5th century there is evidence that the παράγραφος was losing its meaning with the scribes, for in the Codex Alexandrinus of the Bible it is not infrequently found in anomalous positions, particularly above the initial letters of different books, as if it were a mere ornament. In Latin MSS. there was no such fixed system of marking off paragraphs as the Greeks had. A new paragraph began with a new line, or a brief space in a line separated the conclusion of a paragraph from the beginning of the next one. It was only by the ultimate introduction of large letters, as the initial letters of the several sentences and paragraphs, and by the establishment of a system of punctuation, in the modern sense of the word, that a complete arrangement of the text was possible into sentences and paragraphs in accordance with its sense.

From the earliest times an elementary system of punctuation by points is found in papyri. Thus the papyrus of the Curse of Artemis, at Vienna, which is at least as early as the 3rd century B.C., and in one or two other ancient examples, a double point, resembling the modern colon, separates sentences. But more commonly a single point, placed high in the line of writing, is employed. This single punctuation was reduced to a system by the Alexandrian grammarians, its invention being ascribed to Aristophanes of Byzantium, 260 B.C. The point placed high on a level with the top of the letters had the value of a full-stop; in the middle of the line of writing, of a comma; and placed down on the line of a semicolon. But these distinctions were not observed in the MSS. In the early vellum codices both the high and the middle point are found. In medieval MSS, other signs, coming nearer to our modern system, make their appearance. In Latin MSS. by the 7th century the high point has the value of the modern comma, the semicolon appears with its present value, and a point emphasized with additional signs, such as a second point or point and dash, marks a full-stop. In the Carolingian period the comma appears, as well as the inverted semicolon holding a position between our comma and semicolon.

Another detail which required the scribe's attention in writing his text was the division of the last word in a line, when for want of room a portion of it had to be carried over into the next line. It was preferable, indeed, to avoid such division, and in the papyri as well as in the codices letters might be reduced in size and huddled together at the end of the line with this view. In the early codices too it was a common practice to link letters together in monogrammatic form, such as the common verbal termination ον, su, and sabe; when the line was also broken by the division of a word was necessary, it was subject to certain rules. According to the Greek practice the division was ordinarily made after a vowel, as etυκεσφερ (even monosyllables might be so treated, as οντες). But in the case of double consonants the division fell after the first of them, as τερον: and, when the first of two or more consonants was a liquid or nasal the division followed it, as οθθελωμυν, μανθων. When a word was compounded with a preposition, the division usually followed the preposition, as προσεηνον, but not infrequently the normal practice of dividing after a vowel prevailed, as προσεηνον. In Latin the true sylabic division was followed, but occasionally the scribes adopted the Greek system and divided after a vowel or within a word.

A modification of the practice of writing the text continuously was allowed in the case of certain works. Rhetorical texts, such as the orations of Demosthenes and Cicero, Colometry, and the text of the Bible, might be broken up into short clauses or sense-lines, apparently with the view of assisting reading aloud. Instances of MSS. so written are still extant. This system, to which the name of "colometry" has been given, is the arrangement by cola and commata referred to by St Jerome in his preface to Isaiah. It will be found more fully explained under the heading of STICHEOMETRY; where also is described the mechanical computation of the length of a text by measured lines, for the purpose or calculating the pay of the scribe.

The title of a MS., both in roll-form and in codex-form, was frequently written at the end of the text, but even at an early date it stood in some instances at the beginning: and the latter practice in course of time prevailed, although even in the 15th century the title was sometimes reserved for the close of the MS. In this latter position it might have been accompanied by other particulars concerning the MS., such as the length of the work, the date of writing, the name of the scribe, &c., all combined in a final paragraph called the colophon. For distinction, title and colophon might be written in red, as might also the first few lines of the text. This method of rubrication was a very early practice, appearing even in ancient Egyptian papyri. Such rubrics and titles and colophons were at first written in the same character as the text; afterwards, when the admixture of different kinds of writing was allowed, capitals and uncials were used at discretion. Running titles or head-lines are found in some of the earliest Latin MSS. In the same characters as the text, but of a small size. Quotations were usually indicated by ticks or arrow-heads in the margin, serving the purpose of the modern inverted commas. Sometimes the quoted words were arranged as a sub-paragraph or indented passage. In commentaries of later date, the quotations from the work commented upon were often written in a different style from the text of the commentary itself.

Accentuation, &c.—Accentuation was not systematically applied to Greek MSS. before the 7th century, but even in the literary papyri it appears occasionally. In the latter instances accents were applied specially to assist the reader, and they seem to have been used more frequently in texts which may have presented greater difficulties than usual. For example, they are found fairly plentifully in the papyri of Bacchylides of the 1st century B.C. In the less well-written papyri they are fewer in number; and papyri written in non-literary hands are practically devoid of them. Accents have been frequently added to the texts of Homer, as in the Harris and Bayeux papyri, but apparently long after the date of the writing. They were not used in the early uncial MSS. Breathings also appear occasionally in the papyri. The rough and the smooth breathings are found in the form of the two halves of the Η (Η) in the Bacchylidpapyri; in other papyri they are in rectangular form, never rounded like an apostrophe; in fact rounded breathings do not come into general use until the 12th century. Other signs for indicating accents are occasionally found in Greek MSS. For example, a short accent or horizontal stroke was employed to indicate a single-letter word, and an apostrophe was sometimes used to separate words in order to prevent ambiguity of the sense. In MSS. written in x, χ, ψ, and after proper names not having a Greek termination.

Accents were seldom employed by Latin scribes. In early Irish and English MSS., in particular, an acute accent is occasionally found over a monogram or over the lower letter of a single letter. In the 9th and 10th centuries a curious occasional practice obtained among the correctors of the texts of expressing the aspirate by the Greek half-cêta symbol, instead of writing the letter θ in the ordinary way—perhaps only an affection.
Corrections.—For obliteration or removing pen strokes from the surface of the material the sponge was used in ancient times. While the brush was often left on a prepositional adposition, the writer was influenced by this means; and for a fragile material, such as papyrus, he could well use no other. On vellum he might use sponge or knife. But after a MS. had left its hands it would undergo various changes of a different nature. He could no longer conveniently apply the sponge. On hard material he might still use the knife to erase letters or words or sentences. But he could not “cut out” the whole page, as in the early MSS. The early system of indicating erasure was the placing of dots or minute strokes above the letters to be thus “expunged.” The same marks were also (and generally at later periods) placed under the letters, in case the page might be inside a book, in which case the letters were also struck out with strokes of the pen or altered into others, and that letters and words were interlined. A long sentence, however, was not divided between two pages. The cartouche, the margin, and its place in the text indicated by corresponding reference marks, such as $\text{dh}$, $\text{ls}=\text{hic deest}$, $\text{hoc supra}$ or $\text{hic scribit}$, &c.

Abbreviations and Contractions.—The practice of shortening words in writing has played an important part in the history of the ancient and the medieval manuscript. Two reasons have been disposed men to follow this practice: firstly, the desire to avoid the labour of writing over and over again the same words, which can be readily understood in a shortened form as when written in full; and, secondly, the necessity of saving space at a time when it was an object to make the most of the writing material to hand. To write the name of a limited number of persons was needed; to satisfy the second, a more elaborate system was necessary. The most natural method of reducing the length of a word is by suppressing such non-essential terminations as may end in a single letter, that is, by simple abbreviation. If space of any appreciable value is to be saved in a page of writing, a system is necessary for eliminating letters from the body of the word as well as from the terminations. As both system of abbreviation, as well as abbreviation; and, in addition, the employment of arbitrary signs, analogous to shorthand, will serve still further to condense the text. An elaborate system of contraction of this nature was naturally only fully developed after very long practice; so that it is generally recognized in MSS. from the 5th to the 17th century a such a system was in full force.

Different kinds of literature were, according to their nature, more or less abbreviated and contracted. From early times such curtailment was more freely employed in works written in technical language, such as works on law or grammar or mathematics, wherein particular words are more liable to repetition, than in MSS. of general literature. The oldest system of abbreviation is that in which a single letter (nearly always the initial letter) or at most two or three letters represent the whole word. This system we know was in common use among both Greek and Latin writers, and in Latin MSS. from the 9th to the 17th century such a system was in full force.

Abbreviations in Greek MSS.—The early well-written literary papyri written in non-literary script they naturally occur just as they would in contemporary common documents. As early as the 3rd and 2nd centuries B.C. the ordinary method of abbreviation was to omit the termination or latter portion of the word and to mark the omission by a short horizontal stroke or dash: or the letter which immediately preceded the omission was written above the line as a key to the contraction, as $\text{r}$ for $\text{for}$. Such a system obviously might be extended indefinitely at the discretion of the writer. But in addition, at quite an early period, symbols and monogrammatic forms were invented and adopted. Hence abbreviations in Greek, which have been found in common use in cursive papyri. A notable instance of their employment in a full degree occurs in the papyrus of Aristotle's Constitution of Athens, of the 1st century.

The well-written literary papyri, the early vellum uncial codices of the Bible, being inscribed with calligraphic formality, avoided in principle the use of abbreviations. But by the 4th to the 6th centuries A.D. when papyri were more frequently written, a contraction or abbreviation of certain words and terminations had, it seems, become so fixed by usage that the contracted forms were adopted in the texts. They are $\text{e}=\text{theis}$, $\text{ε}={\text{theis}}$, $\text{χ}=\text{hro}$. $\text{κ}=\text{cro}$, $\text{σ}=\text{gro}$, $\text{τ}=\text{tr}$, $\text{τ}=\text{tr}$. Final $\text{n}$, especially at the end of a line, was dropped, and its place occupied by the horizontal stroke, as $\text{τ}$. But whilst this limited system was used in biblical, and also in liturgical MSS., in profane literature a greater licence was recognized. For example, in a fragment of a mathematical work at Milan, of the 7th century, we find instances of abbreviation by dropping terminations, just as in the earlier papyri, and, in addition, contracted forms of abbreviations. By the 8th century the Pauline system had acquired a still further development, whereby a whole system or in the literary form and became the literary unconscious of abbreviations. From the 9th century onwards a fully developed system of abbreviation and contraction was practised in Greek MSS. In the 12th, 13th and 14th centuries texts were fully contracted; and as the writing became more cursive contraction-marks were more carelessly applied, until, in the 15th century, they degenerated into mere flourishes.

As far back as material is available for comparison, it appears that abbreviations and contractions in Latin MSS. followed the same lines as those in Greek MSS. We have no very early papyri. We must look to Graeco-Latin as to the practice of Roman writers was in the 3rd and 2nd centuries B.C., and early 1st centuries B.C.; but there can be little doubt that remote time there was followed in Latin writing a system of abbreviation which was later developed, either by curtailment of terminations, and that in ephemeral documents written in cursive characters such abbreviation was allowed more freely than in more regular literature. Latin abbreviations are derived from the words by their initial letters has already been referred to. It was in common use, as we know, in the inscriptions on coins and monuments, and to some extent in the texts of Roman writers. But the ambiguity which must have always accompanied such a system of single-letter abbreviations, or sigla, naturally induced an improvement by expressing a word by two or more of its letters. Hence was developed the more regular syllabic system of the Romans, where the leading letters of the several syllables were written, as $\text{EG}=$ ierge, $\text{HR}=$ heres, $\text{ST}=$ satis. At a later time Christian writers secured greater exactness by expressing the final letter of a contraction thus: $\text{deus}=$ deus, etc. In this way the system was developed, and the initial letters, or sigla, many derived from shorthand symbols, came into use to indicate inflections and terminations; or the terminating letter or a leading letter to indicate the termination might be written above the line, as $\text{Q}=\text{que}$, $\text{V}=\text{serum}$, $\text{N}=\text{noster}$, $\text{S}=\text{sint}$. This practice became capable of greater development later on. Among the special signs are $\text{c}=\text{est}$, $\text{t}=\text{est}$, $\text{r}={\text{n}}$, $\text{p}=\text{pro}$, $\text{d}=\text{per}$, $\text{g}=\text{pro}$, $\text{termination} \simeq$. The letter $\text{g}$ with distinctive strokes applied in different letters represented the often recurring relative and other short words, as $\text{quo}$, $\text{qua}$.

In Latin Biblical uncial MSS. the same restrictions on abbreviations were exercised as in the Greek. The sacred names and titles used in the MSS. DSS., DPN, SC, SCS, SCS, Exempla, Exempla, and others appear in the oldest codices. The contracted terminations $\text{a}=\text{que}$, $\text{B}=\text{bus}$, and the omission of final $\text{n}$, or (more rarely) final $\text{n}$, are common to all Latin MSS, of the earliest period. There is a gradual development of the form of our vocative name that is always written by the Latin scribes in letters indicating the Greek $\text{H}$, $\text{X}$, $\text{V}$, $\text{XP}$, and $\text{K}$, $\text{X}$. In the full development of the medieval system of abbreviation and contraction was effected at the time when the Carolingian schools were severely compelling the reform of the handwriting of western Europe. Then came a free practice of abbreviation by suppression of terminations and the latter portions of words, the omission of which was indicated by the ordinary signs, the horizontal or oblique stroke of the apostrophe; then came a freer practice of contraction by omitting letters and syllables from the middle as well as the end of words, as $\text{dio}$, $\text{omino}$, $\text{prb}$, $\text{presbyter}$; and then from the practice of writing above the line a leading letter of an omitted syllable, as $\text{in}={\text{infra}}$, $\text{t}={\text{tur}}$, concur, special signs, with significant implications, were also gradually developed. Such growths are well illustrated in the change undergone by the semicolon, which was attached to the end of a word or the omission of the termination, as $\text{b}={\text{bus}}$, $\text{q}=\text{que}$, $\text{deb}=\text{debet}$, and which in course of time became converted into $\text{s}$, a form which survives in our ordinary abbreviation, viz. (i.e. $\text{si}$).

The full development of this method of abbreviating and shortening words is the result of practices carried over to all the nations of western Europe. The Spanish scribes, however, attached different values to certain of them. For example, in Visigothic MSS. $\text{qm}$, which elsewhere represented quum, may be partially contracted to $\text{q}m$, or even to $\text{qm}$, or to $\text{q}m$. Thus the use of arbitrary symbols for special words be understood. These are generally adaptations of the shorthand signs known as Tironian signs, such as $\text{se}=$ $\text{sit}$, $\text{sc}=$ $\text{sibi}$, $\text{st}=$ $\text{sunt}$, which were employed particularly in early MSS. of English and Irish origin.
MANUTIUS

By the 11th century the system of Latin contractions had been reduced to exact rules, and words from the Greek were written phonetically. In 1455, rendered its culminating point in the 13th century, the period of increasing demand for MSS., when it became more than ever necessary to economize space. After this date the exact formation of words was more sparingly used than in MSS., and a knowledge of the flexions and terminations of this language could not be readily adapted to other languages so different in grammatical structure.

As the MSS. of a palimpsest MSS., that is, MSS. written upon material from which older writing has been previously removed by washing or scraping, are described in a separate article (PAULIMEPEST). The ornamentation of MSS. is vastly different with the headings

**Writing Implements.**—In conclusion, a few words may be added respecting the writing implements employed in the production of MSS. The reed, calamus, was adapted for tracing characters either on papyrus or vellum. By the ancient Egyptians, and probably also by the eal Greek scribes in Egypt, it was used with a soft brush-like point, rather as a paint-brush than as a pen. The Greek and Roman scribes used the reed cut to a point and slit like the quill; and it survived as a writing implement into the middle ages. For scratching letters on the waxen tablet the sharp pointed bodkin, erudos, sphyphos, stidi, graphium, was necessary; made of iron, bronze, or ivory, it had to be straightened by a body of knobby sharpening, and the butt-end therewith corrections could be made by smoothening the wax surface (hence serrata stilum, to correct). Although there is no very clear record of the use of quills, it is observable that the quill is adapted as they are for the purpose and to be had everywhere, must have been in request even in ancient times as they afterwards were in the middle ages. Bronze pens, fashioned exactly on the model of those of the Romans, is in fact known in the cardboard and vellum-book (sometimes even with a nib at each end), of late Roman manufacture, are still in existence. A score of them are to be found scattered amongst public and private museums. The ruler for guiding ruled lines was the kairos, canon, regula; the pencil was the uhdranum plumium, the plummet; the pricker for marking the spacing out of the ruled lines was the dug arm, circinus, puncatorium; the pen-knife, kalamion, culex, scalprum; the erasing-knife, rastorum, rasellum. Inks.—Inks of various colours were employed from early times. The ink of the early papyrus is a deep glossy black; in the Byzantine period it deteriorates. In the middle ages black ink is generally of excellent quality; it tends to deteriorate from the 14th century. But its quality varies in different countries at different periods. Red ink, besides being used for titles and colophons, also served for contrast, as, for example, in glasses. In the Carolingian period entire MSS. were occasionally written in red ink. Other coloured inks—green, violet and yellow—are also found, at an early date. Gold and silver writing fluids were used in the texts of the ancient papyrus, gold MSS. and writing in gold was reintroduced under Charlemagne for codices of ordinary white vellum. It was introduced into English MS. in the 10th century.

**TEXTUAL CRITICISM.**—F. van Hee, Essai sur les livres dans l'antiquité (1840); E. Egger, Histoire du livre depuis ses origines jusqu'à nos jours (1880); T. Birt, Das antike Buchweisen (1882) and Die Buchrolle in der Kunst (1907); W. Wattenbach, Das Schrifftum im Mittelalter (1882); R. Deininger, Der Buchdruck (1882); D. M. D. Gorer, Les anciens Buchweisen (1900); J. W. Clark, The Care of Books (1901) W. Schubart, Das Buch bei den Griechen und Römer (1907); and generally the authorities quoted in the article PALEOGRAVIA, also TEXTUAL CRITICISM. (E. M. T.)

**MANUTIUS,** the Latin name of an Italian family (Mannucchi, Manuzio), famous in the history of printing as organizers of the Aldine press.

**MANUTIUS** (1450-1515). Teobaldo Mannucchi, better known as Aldo Manuzio, the founder of the Aldine press, was born in 1450 at Sermoneta in the Papal States. He received a scholar's training, studying Latin at Rome under Gasparino da Verona, and Greek at Ferrara under Guarino da Verona. In 1482 he went to reside at Mirandola with his old friend and fellow-student, the illustrious Giovanni Pico. There he stayed two years, prosecuting his studies in Greek literature. Before Pico removed to Florence, he procured for Aldo the post of tutor to his nephews Alberto and Lionello Pico, princes of Carpi. Although rapidly rewarded on his return to the press, and gave him lands at Carpi. It was Aldo's ambition to secure the literature of Greece from further accident by committing its chief masterpieces to type. Before his time four Italian towns had won the honours of Greek publications: Milan, with the grammar of Lascaris, Aesop, Theocritus, a Greek Psalter, and Isocrates, between 1476 and 1493; Venice, with the Erotemaia of Chrysoloras in 1484; Vicenza, with reprints of Lascaris's grammar and the Erotemaia, in 1488 and 1490; Florence, with Alopae's Homer, in 1488. Of these works, only three, the Milanese Theocritus and Isocrates and the Florentine Home, were classical, took up, bestowing on Aldo the most appropriate station for his labours. He settled there in 1490, and soon afterwards gave to the world editions of the Hero and Leander of Musaeus, the Galegymyomachia, and the Greek Psalter. These have no date; but they are the earliest tracts issued from his press, and are called by him "Precursors of the Greek Library." At Venice Aldo gathered an army of Greek scholars and compositors around him. His trade was carried on by Greeks, and Greek was the language of his household. Instructions to typesetters and binders were given in Greek. The prefaces to his editions were written in Greek. Greeks from Crete collected MSS., read proofs, and gave models of calligraphy for casts of Greek type. Not counting the craftsmen employed in merely manual labour, Aldo entertained as many as thirty of these Greek assistants in his family. His own industry and energy were unremitting. In 1495 he issued the first volume of his Aristotle. Four more volumes completed the work in 1497-1498. Nine comedies of Aristophanes appeared in 1498. Thucydides, Sophocles and Herodotus followed in 1501; Xenophon's Helenika and Euripides in 1503; Demosthenes in 1504. The troubles of Italy, which pressed hard on Venice at this epoch, suspended Aldo's labours for a while. But in 1508 he resumed his series with an edition of the minor Greek orators; and in 1509 appeared the lesser works of Plutarch. Then came another stoppage. The league of Cambay had driven Venice back to her lagoons, and all the forces of the republic were concentrated on a struggle to the death with the allied powers of Europe. In 1513 Aldo reappeared with Plato, which he dedicated to Leo X. In a preface eloquently and earnestly comparing the miseries of warfare and the woes of Italy with the sublime and tranquil objects of the student's life. Findar, Hesychius, and Athenaeus followed in 1514.

These complete the list of Aldo's prime services to Greek literature. But it may be well in this place to observe that his successors continued his work by giving Pausanias, Strabo, Aeschylus, Galen, Hippocrates and Longinus to the world in first editions. Omission has been made of Aldo's reprints, in order that the attention of the reader might be concentrated on his labours in editing Greek classics from MSS. Other pressings were at work in Italy; and, as the classics issued from Florence, Venice, and Milan, Aldo's leading the Florentine must have contributed to fresh industry under the collateral of codices and the correction of texts. Nor was the Aldine press idle in regard to Latin and Italian classics. The Asolani of Beemo, the collected writings of Poliziano, the Hypnerotomachia Poliphili, Dante's Divine Comedy, Petrarch's poems, a collection of early Latin poets of the Christian era, the letters of the younger Pliny, the poems of Pontanus, Sannazzaro's Arcadia, Quintilian, Valerius Maximus, and the Adagia of Erasmus were printed, either in first editions, or with a beauty of type and paper never reached before, between the years 1505 and 1514. For these Italian and Latin editions Aldo had the elegant type struck which bears his name. It is said to have been copied from Petrarch's handwriting, and was cast under the direction of Francesco da Bologna, who has been identified by Panizzi with Francia the painter.

Aldo's enthusiasm for Greek literature was not confined to the printing-room. Whatever the students of this century may think of his scholarship, they must allow that only a few scholars in modern times, from the very best of the Roman orators, could have enabled him to accomplish what he did. In his own days Aldo's learning was won the hearty acknowledgment of ripe scholars. To his fellow workers he was uniformly generous, free from jealousy, and prodigal of praise. While aiming at that excellence of typography which renders his editions the treasures of the book-collector, he strove at the same time to make them cheap. We may perhaps roughly estimate the
current price of his pocket series of Greek, Latin and Italian classics, begun in 1501, at 2s. per volume of our present money. The five volumes of the Aristotle cost about £8. His great undertaking was carried on under continual difficulties, arising from strikes among his workmen, the piracies of rivals, and the interruptions of war. When he died, bequeathing Greek literature as an inalienable possession to the world, he was a poor man. In order to promote Greek studies, Aldo founded the Academy of Melissa in 1500 under the title of the New Academy. Its rules were written in Greek. Its members were obliged to speak Greek. Their names were Hellenized, and their official titles were Greek. The biographies of all the famous men who were enrolled in this academy must be sought in the pages of Didot's Alde Manuce. It is enough here to mention that they included Erasmus and the English Lincoln.

In 1499 Aldo married Maria, daughter of Andrea Torresino of Asola. Andrea had already bought the press established by Nicholas Jenson at Venice. Therefore Aldo's marriage combined two important publishing firms. Henceforth the names Aldus and Asolani were associated on the title pages of the Aldine publications; and after Aldo's death in 1515, Andrea and his two sons carried on the business during the minority of Aldo's children. The device of the dolphin and the anchor, and the motto festina lente, which indicated quickness combined with firmness in the execution of a great scheme, were never wholly abandoned by the Aldines until the expiration of their firm in the third generation.

2. PAULUS MANUTIUS (1512-1574). By his marriage with Maria Torresino, Aldo had three sons, the youngest of whom Paolo, was born in 1512. He had the misfortune to lose his father at the age of two. After this event his grandfather and two uncles, the three Asolani, carried on the Aldine press, while Paolo prosecuted his early studies at Venice. Excessive application hurt his health, which remained weak during the rest of his life. At the age of twenty-one he had acquired a solid reputation for scholarship and learning. In 1533 Paolo undertook the conduct of his father's business, which had latterly been much neglected by his uncles. In the interregnum between Aldo's death and Paolo's succession (1514-1533) the Asolani continued to issue books, the best of which were Latin classics. But, though their publications count a large number of first editions, and some are works of considerable magnitude, they were not brought out with the scholarly perfection at which Aldo aimed. The Asolani attempted to perform the whole duties of editing, and to reserve all its honours for themselves, dispensing with the service of competent collaborators. The result was that some of their editions, especially their Aesop's of 1518, are singularly bad. Paolo determined to restore the glory of the Aldine press and treated from his uncles. The field of Greek literature having been well-nigh exhausted, he devoted himself principally to the Latin classics. He was a passionate Ciceronian, and perhaps his chief contributions to scholarship are the corrected editions of Cicero's letters and orations, his own epistles in a Ciceronian style, and his Latin version of Demosthenes. Throughout his life he combined the occupations of a student and a printer, winning an even higher celebrity in the former field than his father had done. Four treatises from his pen on Roman antiquities deserve to be commemorated for their erudition no less than for the elegance of their Latinity. Several Italian cities esteemed him for the possession of so rare a man; and he received tempting offers from the Spanish court. Yet his life was a long struggle with pecuniary difficulties. To prepare correct editions of the classics, and to print them in a splendid style, has always been a costly undertaking. And, though Paolo's publications were highly esteemed, their sale was slow. In 1550 he received for a time external support from the Venetian Academy, founded by Federigo Badoaro. But Badoaro failed disgracefully in 1550, and the academy was extinct in 1562. Meanwhile Paolo had established his brother, Antonio, a man of good parts but indifferent conduct, in a printing office and book shop at Bologna. Antonio died in 1559, having been a source of trouble and expense to Paolo during the last four years of his life. Other pecuniary embarrassments arose from a contract for supplying fish to Venice, into which Paolo had somewhat strangely entered with the government. In 1561 pope Pius IV. invited him to Rome, offering him a yearly stipend of 500 ducats, and undertaking to establish and maintain his press there. The profits on publications were to be divided between Paolo Manuzio and the Apostolic camera. Paolo accepted the invitation, and spent the larger portion of his life, under three papacies, with varying fortunes, in the city of Rome. Ill-health, the commercial interests he had left behind at Venice, and the coldness shown him by pope Pius V., induced him at various times and for several reasons to leave Rome. As was natural, his editions after his removal to Rome were mostly Latin works of theology and Biblical or patristic literature.

Paolo married Caterina Odoni in 1546. She brought him three sons and one daughter. His eldest son, the younger Aldus, succeeded him in the management of the Venetian printing house when his father settled at Rome in 1561. Paolo had never been a strong man, and his health was overtaxed with studies and commercial worries. Yet he lived into his sixty-second year, and died at Rome in 1574.

3. ALDUS MANUTIUS, JUNIOR (1547-1597). The younger Aldo born in the year after his father Paolo's marriage, proved what is called an infant prodigy. When he was nine years old his name was placed upon the title page of the famous Eleganze della lingua Toscana e Latina. The Eleganze was probably a book made for his instruction and in his company. In 1562, when Paolo was in Bologna, he produced a work upon Latin spelling, called Orthographiae rusticae. During a visit to his father at Rome in the next year he was able to improve this treatise by the study of inscriptions, and in 1575 he completed his labours in the same field by the publication of an Epitome orthographiae. Whether Aldo was the sole composer of the work on spelling, in its first edition, may be doubted; but he appropriated the subject and made it his own. Probably his greatest service to scholarship is this analysis of the principles of orthography in Latin.

Aldo remained at Venice, studying literature and superintending the Aldine press. In 1572 he married Francesca Lucrezia daughter of Bartolommeo Giunta, and great-grandchild of the first Giunta, who founded the famous printing house in Venice. This was an alliance which augured well of the Giunta for the future of the Aldines, especially as Aldo had recently found time to publish a new revised edition of Vellius Paterculus. Two years later the death of his father at Rome placed Aldo at the head of the firm. In concert with the Giunta, he now edited an extensive collection of Italian letters, and in 1576 he published his commentary upon the Ars poetica of Horace. About the same time, that is to say, about the year 1576, he was appointed professor of literature to the Cancelleria at Venice. The Aldine press continued through this period to issue books, but none of signal merit; and in 1585 Aldo determined to quit his native city for Bologna, where he occupied the chair of eloquence for a few months. In 1587 he left Bologna for Pisa, and there, in his quality of professor, he made the curious mistake of printing Alberti's comedy Philodoxius as a work of the classic Lepidus. Sixtus V. drew him in 1588 from Tuscany to Rome; and at Rome he hoped to make a permanent settlement as lecturer. But his political reasons were ill attended, and he soon fell back upon his old vocation of publisher under the patronage of a new pope, Clement VIII. In 1597 he died, leaving children, but none who cared or had capacity to carry on the Aldine press. Aldo himself, though a precocious student, a scholar of no mean ability, and a publisher of some distinction, was the least remarkable of the three men who gave books to the public under the old Aldine ensign. This does not of necessity mean that we should adopt Scaliger's critique of the younger Aldo without reservation. Scaliger called him a poverty-stricken talent, slow in operation: his work is very commonplace; he aped his father. What is true in this remark lies partly in the fact that scholarship in Aldo's days had flown beyond
the Alps, where a new growth of erudition, on a basis different from that of the Italian Renaissance, had begun.

See Renouard's Annales de l'imprimerie des Aldes (Paris, 1834); Didot's Aldes Monume (Paris, 1875); Omont's Catalogue of Aldine publications (Paris, 1892).

MANWARING, ROBERT, English 18th-century furniture designer and cabinet maker. The dates of his birth and death are unknown. He was a contemporary and imitator of Chippendale, and not the least considerable of his rivals. He prided himself upon work which he described as "gentle," and his specialty was chairs. He manifests the same surprising variations of quality that are noticed in the work of nearly all the English cabinet-makers of the second half of the 18th century, and while his best had an undeniable elegance his worst was exceedingly bad—squat, ill-proportioned and confused. Some of his chairbacks are so nearly identical with Chippendale's that it is difficult to suppose that the one did not copy from the other, and most of the designs of the greater man enjoyed priority of date. During a portion of his career Manwaring was a devotee of the Chinese taste; he likewise practised in the Gothic manner. He appears to have introduced the small bracket between the front rail of the seat and the top of the chair leg, or at all events to have made such constant use of it that it has come to be regarded as characteristic of his work. Manwaring described certain of his own work as "elegant and superb," and as possessing "grandeur and magnificence." He did not confine himself to furniture but produced many designs for rustic gates and railings, often very extravagant. One of his most absurd rural chairs has rock-work with a waterfall in the back.

Among Manwaring's writings were The Cabinet and Chair Makers' Real Friend and Companion, or the Whole System of Chairmaking Made Plain and Easy (1765); The Carpenters' Complete Guide to Gothic Railing (1754); and The Chair-makers' Guide (1766).

MANYCH, a river and depression in S. Russia, stretching between the lower river Don and the Caspian Sea, through the Don Cossacks territory and between the government of Astrakhan on the N. and that of Staroprov on the S. During the greater part of the year it is either dry or occupied in part by a string of saline lakes (limans or limens); but in spring when the streams swell which empty into it, the water flows in two opposite directions from the highest point (near Shara-Khulusun). The western stream flows westwards, with an inclination northwards, until it reaches the Don, though when the latter river is running high, its water penetrates some 60 miles up the Manych. The eastern stream dies away in the sandy steppe about 25 miles from the Caspian, though it is said sometimes to reach the Kuma through the Huiduk, a tributary of the Kuma. Total length of the depression, 330 m. As for its significance as a former (geological) connexion between the Sea of Azov and the Caspian Sea, see CASPIAN SEA. By some authorities the Manych depression is taken as part of the boundary between Europe and Asia.

MANYEMA (Una-Ma-Nyema, eaters of flesh), a powerful and warlike Bantu-Negroid people in the south-east of the Congo basin. Physically they are of a light colour, with well formed features, full bodies, wavy hair, and dark brown or black eyes, described as singularly pretty and graceful. Manyemaland was for the greater part of the 19th century an Eldorado of the Arab slave raiders.

MANZANARES, a town in Spain, of the province of Ciudad Real, on the river Azuer, a large sub-tributary of the Zancara, and on the railways from Madrid to Ciudad Real and Linares. Pop. (1900), 11,229. Manzanares is one of the chief towns of La Mancha, and thus in the centre of the district described by Cervantes in Don Quixote. Its citadel was founded as a Christian fortress after the defeat of the Moors at Las Navas de Tolosa (1221). Bull-fights were formerly held in the main plaza, where galleries to accommodate spectators were built between the buttresses of an ancient parish church. Manzanares has manufactures of soap, bricks and pottery, and an active trade in wheat, wine, spirits, aniseed and saffron.

MANZANILLO, a town and port on the Pacific coast of Mexico, in the state of Colima, 52 m. by rail W.S.W. of the city of that name. It is situated on a large harbour partly formed and sheltered by a long island extending southwards parallel with the coast. Southward also, and in the vicinity of the town, is the large stagnant, shallow lagoon of Cayutlan which renders the town unhealthy. Manzanillo is a commercial town of comparatively recent creation. Its new harbour works, the construction of which was begun in 1890, and its railway connexion with central Mexico, promise to make it one of the chief Pacific ports of the republic. These works include a breakwater 1350 ft. long, with a depth of 12 to 70 ft. and a maximum breadth of 320 ft. at the base and 25 ft. on top, and all the necessary berthing and mechanical facilities for the handling of cargoes. A narrow-gauge railway was built between Colima and Manzanillo toward the end of the nineteenth century, but the traffic was only sufficient for a tri-weekly service up to 1908, when the gauge was widened and the railway became part of the Mexican Central branch, completed in that year from Irapuato through Guadalajara to Colima. The exports include hides and skins, palm leaf hats, Indian corn, coffee, palm oil, fruit, lumber and minerals.

MANZANILLO, an important commercial city of Cuba, in Santiago province, on the gulf of Guacanabo, about 17 m. S. of the mouth of the Rio Cauto, on the shore of Manzanillo Bay. Pop. (1907), 15,819. It is shut off to the east and south by the Sierra de la Caba. Between the Cauto and the rivers Yara and Bucay are near the city. Manzanillo is the only coast town of importance between Trinidad and Santiago. It exports large quantities of sugar, hides, tobacco, and bees-wax; also some cedar and mahogany. The history of the settlement begins in 1784, but the port was already important at that time for a trade in woods and fruits; French and English corsairs resorted thither for ship-building woods. The settlement was sacked by the French in 1792, and in the following year a fort was built for its protection. In 1853 it received an ayuntamiento (council) and in 1879, for its "loyalty" in not following the lead of Santiago in proclaiming the Spanish Constitution, received from the crown the title of Fiel. In 1877 the port was opened to commerce, national and foreign.

MANZONI, PIER ANGELO. Italian author, was born about the end of the fifteenth century at La Stellata, near Ferrara. He wrote a poem entitled Zodiacus vitae, published at Basel in 1543, and dedicated to Hercules II. of Ferrara. The poem is full of didactic writing on the subject of human happiness in connexion with scientific knowledge, and combines metaphysical speculation with practical attacks on ecclesiastical hypocrisy, and especially on the Pope and on Liberalism. It was translated into several languages, but fell under the ban of the Inquisition on the ground of its rationalizing tendencies.

MANZONI, ALESSANDRO FRANCESCO TOMMASO ANTONIO (1785-1837), Italian poet and novelist, was born at Milan on the 7th of March 1785. Don Pietro, his father, then about fifty, represented an old family settled near Lecco, but originally feudal lords of Barzio, in the Valsassina, where the memory of their violence is still perpetuated in a local proverb: "Varial, Mordolo, Manzoni." Beyond the Cauto, violent attacks on ecclesiastical hypocrisy, and especially on the Pope and on Liberalism. He married a woman of literary merit. The poet's maternal grandfather, Cesare Beccaria, was a well-known author, and his mother Giulia a woman of some literary ability. Manzoni's intellect was slow in maturing, and at the various colleges where his school days were passed he ranked among the dunces. At fifteen, however, he developed a passion for poetry, and wrote two sonnets of considerable merit. On the death of his father in 1805, he joined his mother at Aujeul, and spent two years there, mixing in the literary set of the so-called "ideologues," philosophers of the 18th century school, among whom he made many friends, notably Claude Fauriel. There too he imbibed the negative creed of Voltaireanism, and only after his marriage, and under the influence of his wife, did he exchange it for that fervent Catholicism which colored his later life. In 1806-1807, while at Aujeul, he first appeared before the public as a poet, with two pieces, one entitled Urania,
in the classical style, of which he became later the most conspicuous adversary, the other an elegy in blank verse, on the death of Count Carlo Imbonati, from whom, through his mother, he inherited considerable property, including the villa of Brusuglio, the ancient principal residence.

Manzoni’s marriage in 1808 to Henriette Blondel, daughter of a Genevese banker, proved a most happy one, and he led for many years a retired domestic life, divided between literature and the picturesque husbandry of Lombardy. His intellectual energy at this period was devoted to the composition of the *Inni sacri*, a series of sacred lyrics, and a treatise on Catholic morality, forming a task undertaken under religious guidance, in preparation for his early lapse from faith. In 1818 he had to sell his paternal inheritance, as his affairs had gone to ruin in the hands of a dishonest agent. His characteristic generosity was shown on this occasion in his dealings with his peasants, who were heavily indebted to him. He not only cancelled on the spot the record of all sums owing to him, but bade them keep for themselves the whole of the coming maize harvest.

In 1819 Manzoni published his first tragedy, *Il Conte di Carmagnola*, which, boldly violating all classical conventionalisms, excited a lively controversy. It was severely criticized in the *Quarterly Review*, in an article to which Goethe replied in its defence, “one genius,” as Count de Gubernatis remarks, “having divined the other.” The death of Napoleon in 1821 inspired Manzoni’s powerful stanzas *Il Cinque maggio*, the most popular lyric in the Italian language. The political events of that year, and the imprisonment of many of his friends, weighed much on Manzoni’s mind, and the historical studies in which he sought distraction during his subsequent retirement at Brusuglio suggested his great work. Round the episode of the *Innominato*, historically identified with Bernardino Visconti, the novel *I Promessi sposi* began to grow into shape, and was completed in September 1822. The work when published, after revision by friends in 1825–1827, at the rate of a volume a year, at once raised its author to the first rank of literary fame. In 1822, Manzoni published his second tragedy *Adelchi*, turning on the overthrow by Charlemagne of the Lombard domination in Italy, and containing many veiled allusions to the existing Austrian rule. With these works Manzoni’s literary career was practically closed. But he laboriously revised *I Promessi sposi* in the Tuscan idiom, and in 1830 republished it in that form, with a sort of sequel, *La Storia della Colonna infame*, of very inferior interest. He also wrote a small treatise on the Italian language.

The end of the poet’s long life was saddened by domestic sorrows. The loss of his wife in 1833 was followed by that of several of his children, and of his mother. In 1837 he married his second wife, Teresa Borri, widow of Count Stampa, whom he also survived, while of nine children born to him in his two marriages all but two preceded him to the grave. The death of his eldest son, Pier Luigi, on the 28th of April 1873, was the final blow which hastened his end; he fell ill immediately, and died of cerebral meningitis on the 22nd of May. His country mourned him with almost royal pomp, and his remains, after lying in state for some days, were followed to the cemetery of Milan by a vast cortège, including the royal princes and all the great officers of state. But his noblest monument was Verdi’s *Requiem*, specially written to honour his memory.

Biographical sketches of Manzoni have been published by Cesare Chenevié (1885), Angiol de Gubernatis (1879), Arturo Graf (1888). Some of his letters have been published by Giovanni Sforza (1882).

**MAORI** (pronounced “Mowri”); a Polynesian word meaning “native,” “indigenous”; the word occurs in distinction from *pakeha*, “stranger,” in other parts of Polynesia in the forms *Maoi* and *Mooli*, the name of the race inhabiting New Zealand when first visited by Tasman in 1642.

That they were not indigenous, but had displaced an earlier Melanesian or Papuan race, the true aborigines, is certain. The Maoris are Polynesians, and, in common with the majority of their kinsfolk throughout the Pacific, they have traditions which point to Savi, originally Savaiki, the largest island of the Samoan group, as their cradleland. They say they came to New Zealand from “Hawai,” and they appear to distinguish between a large and small, or a nearer and farther, “Hawai.” “The seed of our coming is from Hawai; the seed of our nourishing, the seed of mankind.” Their great chief, Te Kupe, first landed, they say, on Aoteraroa, as they called the north island, and, pleased with his discovery, returned to Hawai to tell his fellow-countrymen. Thereafter he returned with seven war canoes, each holding a hundred warriors, priests, stone idols and sacred weapons, as well as native plants and animals. Hawai, the name of Te Kupe’s traditional home, is identical with several other Polynesian place-names, e.g. Hawai, Apai in the Tonga Islands, Evava in the Marquesas, all of which are held to be derived from Savi or Savaiki. Dr Thomson, in his *Story of New Zealand*, quotes a Maori tradition, published by Sir George Grey, that certain islands, among which it names Raratonga, Parima and Manono, are islands near Hawai. The Raratongas call themselves Maori, and state that their ancestors came from Hawai, and Pirima and Manono are the native names of two islands in the Samoan group. The almost identical languages of the Raratongas and the Maoris strengthen the theory that the two peoples are descended from Polynesians migrating, possibly at widely different dates, from Samoa. The distance from Raratonga to New Zealand is about 2000 m, and, with the aid of the trade wind, large canoes could traverse the distance within a month. Moreover the fauna and flora of New Zealand in many ways resemble those of Samoa. Thus it would seem certain that the Maoris, starting from “further Hawai,” or Samoa, first touched at Raratonga, “nearer Hawai,” whence, after forming a settlement, they journeyed on to New Zealand. Maori tradition is explicit as to the cause of the exodus from Samoa, gives the names of the canoes in which the journey was made and the time of year at which the coast of New Zealand was sighted. On the question of the date a comparison of genealogies of Maori chiefs shows that, up to the beginning of the 20th century, about eighteen generations or probably not much more than five centuries had passed since the first Maori arrivals. There is some evidence that the “tradition of the six canoes” does not represent the first contact of the Polynesian race with New Zealand. If earlier immigrants from Samoa or other eastern Pacific islands arrived they must have become absorbed into the native Papuan population—arguing from the absence of any distinct tradition earlier than that of “the six canoes.” Some have sought to find in the Morioris of Chatham Island the remnants of this Papuan-Polynesian population, expelled by Te Kupe and his followers. The extraordinary ruined fortifications found, and the knowledge of the higher art of war displayed by the Maoris, suggest (what is no doubt the fact) that there was a hard fight for them when they first arrived, but the greatest resistance must have been from the purer Papuan inhabitants, and not from the half-castes who were probably easily overthrown. The shell heaps found on the coasts and elsewhere dispose of the theory that New Zealand was uninhabited or practically so six centuries back.

Any description of the Maoris, who in recent years have come more and more under the influence of white civilization, must necessarily refer rather to what they have been than what they are. Physically the Maoris are true Polynesians, tall, well-built, with straight or slightly curved noses, high foreheads and oval faces. Their colour is usually a darker brown than that of their kindred in the South Seas, but likewise of almost European in features, are met with. Their hair is black and straight or wavy, scarcely ever curly. They have long been celebrated for their tattooing, the designs being most elaborate. Among the most industrious of Polynesian races, they have always been famed for wood-carving; and in building, weaving and dyeing they had made great advances before the whites arrived. They are also good farmers and bold seamen. In the Maori wars they showed much strategic skill, and their knowledge of fortification was very remarkable. Politically the
Maoris have always been democratic. No approach to a monarchy ever existed. Each tribe under its chief was autonomous. Tribal lands were held in common and each man was entitled to a share in the products. They had slaves, but so few as not to alter the social conditions. Every Maori was a soldier, and war was the chief business and joy of his life. Tribal wars were incessant. The weapons were wooden spears, clubs and stone tomahawks. Cannibalism, which earned them in earlier years a terrible name, was generally restricted to the bloodthirsty banquets which always followed a victory. The Maoris ate their enemies’ hearts to gain their courage, but to whatever degree animistic beliefs may have contributed to their cannibalism, it is certain that long before Captain Cook’s visit religious sanction for the custom had long given place to mere glutinous enjoyment.

The Maoris had no regular marriage ceremony. Polygamy was universal, and even to-day they are not strictly monogamous. The power of the husband over the wife was absolute, but women took their meals with the men, were allowed a voice in the tribe’s affairs, and sometimes accompanied the men into battle. Some tribes were endogamic, and there matrarchy was the rule, descent being traced through the female line. Ferocious as they were in war, the Maoris were generally hospitable and preferential in their home-life, and a pleasant characteristic, noticed by Captain Cook, is their respect and care of the old. The Maoris buried their dead, the cemeteries being ornamented with carved posts. Their religion was a nature-worship intimately connected with the veneration of ancestors. There was a belief in the soul, which was supposed to dwell in the left eye. They had no doubt as to a future state, but no definite idea of a supreme being. They had no places of worship, nor, though they had sacred wooden figures, is there any reason to consider that they were idolators in the strict sense of the word. The custom of taboo was very fully developed. Nowadays they are all nominally Christians. While they had no written language, a considerable oral literature of songs, legends and traditions existed. Their priesthood was a highly trained profession, and they had schools which taught a knowledge of the stars and constellations, for many of which they had names. All Maoris are natural orators and poets, and a chief was expected to add these accomplishments to his prowess as a warrior or his skill as a seaman. The Maoris of to-day are law-abiding, peaceable and indolent. They have been called the Britons of the south, and their courage in defending their country and their intelligence amply justify the compliment. By the New Zealanders they are cordially liked. At the census of 1906 they numbered 47,731, as against 45,470 in 1874; and there were 6,516 half-castes. See also POLYNESIA and SAMOA.

MAP (or MAPES), WALTER (d. c. 1208/9), medieval ecclesiastic, author and wit, to whose authority the main body of prose Arthurian literature has, at one time or another, been assigned, flourished in the latter part of the 12th and early years of the 13th centuries. Concerning the date of his birth and his parentage nothing definite is known, but it is ascribing him to a position at court to the merits of his parents they were probably people of some importance. He studied at Paris under Girard la Pucelle, who began to teach in or about 1160, but as he states in his book De nugis curialibus that he was at the court of Henry II. before 1162, his residence at Paris must have been practically comprised in the decade 1150–1160.

Map’s career was an active and varied one; he was clerk of the royal household and justice itinerant; in 1170 he was present at the Lateran council on Rome, by his way thither being enter-

ained by the count of Champagne; at this time he apparently held a plurality of ecclesiastical benefices, being a prebend of St Paul’s, canon and precentor of Lincoln and parson of Woburn, Gloucestershire. There seems to be no record of his ordination, but as he was a candidate for the see of Hereford in 1195 it is most probable that he was in priest’s orders. The last reference to him, as living, is in 1208, when an order for payment to him is on record, but Giraldeus Cambrensis, in the second edition of his Hibernica, redacted in 1210, utters a prayer for his soul, “cujus animae propitieatur Deus,” a proof that he was no longer alive.

The special interest of Map lies in the perplexing question of his relation to the Arthurian legend and literature. He is invariably cited as the author of the Lancelot proper (consisting of two parts), the Queste and the Mort Artus, all three of which are now generally found in one manuscript under the title of Lancelot. The Mort Artus, however, we know to be the prose working over of an earlier and independent poem. Sundry manuscripts of the yet more extensive compilation which begins with the Grand Saint Graal also refer to Map as having composed the cycle in conjunction with Robert de Boron, to whom, as a rule, the Grand Saint Graal and Merlin are exclusively assigned. The manuscript MS. 337 (fonds François), refers throughout to Map as authority, and the anonymous Lancelot codex, B. N. 112, a combination of the Lancelot and the Tristan, also couples his name with that of Robert de Boron. In fact it may safely be said that, with the exception of the prose Tristan, always attributed either to Luces de Gast, or Hélie de Boron, the authority of Map has been invoked for the entire vast mass of Arthurian prose romantic literature. Now it is practically impossible that one man, and that one an occupier of court and public offices, constantly employed in royal and public business, very frequently travelling abroad (e.g. we know he was at Limoges in 1173; at Rome in 1179; in Burgundy in 1183; and at Angers in 1199), could have found the necessary leisure. On this point we have the testimony of his one undoubted work, De nugis curialibus, which tells us he composed “by snatches” during his residence at court. De nugis is a comparatively small book; if it were difficult to find leisure for that, much more would it have been difficult to find the time requisite for the composition of one only of the many long-winded romances which have been fathered on Map. Giraldeus Cambrensis, with whom he had been friendly terms, and who frequently refers to and quotes him, speaks in which Map contrasted Giraldeus’ labours with his own, apparently to the disadvantage of the latter, “vos scripta deditis, et nos verba” —a phrase which has been interpreted as meaning that Map himself had produced no literary work. But inasmuch as the De nugis is undoubtedly, and certain satirical poems directed against the loose life of the clergy of the day most probably, his work, the speech must not be taken too literally. It seems difficult also to believe that Map’s name should be so constantly connected with our Arthurian tradition without any ground whatever; though it must be admitted that he himself never makes any such claim—the references in the romances are all couched in the third person, and bear no sign of being other than the record by the copyist of a traditional attribution.

A different and very interesting piece of evidence is afforded by the Ipomedon of Huc de Rotelande; in relating how his hero appeared at a tournament three days running, in three different suits of armour, red, black and white, the author remarks, "Sul ne sois pas de mentir l'art, Walter Maps est un homme si vrai." This apparently indicated that Map, also, had made himself responsible for a similar story. Now this incident of the "Three Days’ Tournament" is found alike in the prose Lancelot and in the German Lantelot, this latter translated from a French poem which, in 1104, was in the possession of Hugo de Morville. The Ipomedon was written somewhere in the decade 1180–1190, and there is no evidence of the prose romance having then been in existence. We have no manuscript of any prose Arthurian romance earlier than the 13th century, to which period Gaston
Topographical maps and plans are drawn on a scale sufficiently large to enable the draughtsman to show most objects on a scale true to nature. Its information should not only be accurate, but geographically intelligible and with taste. Exaggeration, however, is not always to be avoided, for even on the British 1 in. ordnance map the roads appear as if they were 150 ft. in width.

Chorographical (Gr. χώρα, country or region) and general maps are either reduced from topographical maps or compiled from such miscellaneous sources as are available. In the former case the cartographer is merely called upon to reduce and generalize the information given by his originals, to make a judicious selection of place names, and to take care that the map is not overcrowded with names and details. Far more difficult is his task where no surveys are in progress and the map has to be compiled from a variety of sources. These materials generally include reconnaissance survey of small districts, route surveys and astronomical observations supplied by travellers, and information obtained from native sources. The compiler, in combining these materials, is called upon to examine the various sources of information, and to form an estimate of their value, which he can only do if he has himself some knowledge of surveying and of the methods of determining positions by astronomical observation. A knowledge of the languages in which the accounts of travellers are written, and of native languages, is almost indispensable. He ought not to be satisfied with compiling his map from existing maps, but should subject each explorer's account to an independent examination, when he will frequently find that either the explorer himself, or the draughtsman employed by him, has failed to introduce into his map the whole of the information available. Latitudes from the observations of travellers may generally be trusted, but longitudes should be accepted with caution; for so competent an observer as Captain Speke placed the capital of Uganda in longitude 32° 44' E., when its true longitude as determined by trustworthy observatories is 32° 26' E., and an error of 18'.

Again, on the map illustrating Livingston's "Last Journeys," the Luapula is shown as issuing from the Bangweulu in the north-west, when an examination of the account of the natives who carried the great explorer's remains to the coast would have shown that it leaves that lake on the south.

The second group includes all maps compiled for special purposes. Their variety is considerable, for they are designed to illustrate physical and political geography, travel and navigation, trade and commerce, and, in fact, every subject connected with geographical distribution. They are of themselves illusory, are represented on the same scale, and are so ingeniously prepared and so variously styled, that no description of them is capable of being illustrated by means of a map. We thus have (1) physical maps, (2) political maps, (3) ethnological maps, illustrating the distribution of the varieties of man, the density of population, &c.; (4) travel maps, showing roads or railways and ocean-routes (as is done by Phillips' "Marine Atlas"), or designed for the special use of cyclists or agriculturists; (5) statistical maps, illustrating commerce and industries; (6) historical maps; (7) maps specially designed for educational purposes.

Scale of Maps.—Formerly map makers contented themselves with placing upon their maps a linear scale of miles, deduced from the central meridian or the equator. They now add the proportion which these units of length have to nature, or state how many of these units are contained within some local measure of length. The former method, usually called the "natural scale," may be described as "international," for it is quite independent of local measures of length, and depends exclusively upon the size and figure of the earth. Thus a scale of 1 : 1,000,000 signifies that each unit of length on the map

1 The ancient Greeks called a map Πίναξ. The Romans Tabula geographica (Gr. χώρας) was the medieval Latin for a map of the world which the ancients called Tabula taurus orbis descriptionem continens.
In cases where the draughtsman has omitted to indicate the scale we can ascertain it by dividing the actual length of a meridian degree by the length of a degree measure upon the map. Thus a degree between 50° and 60° measures 11,226,000 mm.; on the map it is represented by 111 mm. Hence the scale is $1:1,000,000$ approximately.

The linear scale of maps can obviously be used only in the case of maps covering a small area, for in the case of maps of greater extension measurements would be vitiated owing to the distortion or exaggeration inherent in all projections, not to mention the expansion or shrinking of the paper in the process of printing. As an extreme instance of the misleading character of the scale given on maps embracing a wide area we may refer to a map of the world. The scale of that map, as determined by the equator or centre meridian, we will suppose to be $1:125,000,000$, while the encircling meridian indicates a scale of $1:80,000,000$; and a "mean" scale, equal to the square root of the proportion which the area of the map bears to the actual area of a hemisphere, is $1:112,000,000$. In adopting a scale for their maps, cartographers will do well to choose a multiple of 1000 if possible, for such a scale can claim to be international, while in planning an atlas they ought to avoid a needless multiplicity of scales.

Maps, Projections, are dealt with separately below. It will suffice therefore to point out that the ordinary needs of the cartographer can be met by conical projections, and, in the case of maps covering a wide area, by Lambert's equal area projection. The indiscriminate use of Mercator's projection, for maps of the world, is to be deprecated owing to the inordinate exaggeration of areas in high latitudes. In the case of topographical maps, sheets bounded by meridians and parallels are to be commended.

The meridian of Greenwich has been universally accepted as the initial meridian, but in the case of most topographical maps of foreign countries local meridians are still adhered to—perhaps the more important among these are—

- Paris (Obs. nationale) $2^\circ$ 20' 14" E. of Greenwich.
- Pulkova (St Petersburgh) $30^\circ$ 19' 39" E.
- Stockholm $13^\circ$ 56' 59" E.
- Rome (Collegio Romano) $12^\circ$ 47' 7" E.
- Brussels (Old town) $4^\circ$ 22' 11" E.
- Madrid $3^\circ$ 41' 16" W.
- Ferro (assumed) $20^\circ$ 0' W. of Paris.

The outline includes coast-line, rivers, roads, towns, and in fact all objects capable of being shown on a map, with the exception of the hills and of woods, swamps, deserts and the like, which the draughtsman generally describes as "ornament." Conventional signs and symbols are universally employed in depicting these objects.

Delineation of the Ground.—The mole-hills and serrated ridges of medieval maps were still in almost general use at the close of the 18th century, and are occasionally met with at the present day, being cheaply produced, readily understood by the unlearned, and in reality preferable to the uncouth and misleading hatchings still to be seen on many maps. Far superior are those scenographic representations which enable a person consulting the map to identify prominent landmarks, such as the Pic du Midi, which rises like a pillar to the south of Pau, but is not readily discovered upon an ordinary map. This advantage is not fully recognized, for such views of distant hills are still commonly given on the margin of marine charts for the assistance of navigators; military surveyors are encouraged to introduce sketches of prominent landmarks upon their reconnaissance plans, and the general public is enabled to consult "Pictuesque Relief Maps"—such as F. W. Delenkamp's Switzerland (1839) or his Panorama of the Rhine. Delineations such as these do not, however, satisfy scientific requirements. All objects on a map are required to be shown as projected horizontally upon a plane. This principle must naturally be adhered to when delineating the features of the ground. This was recognized by J. Picard and other members of the Academy of Science whom Colbert, in 1668, directed to prepare a new map of France, for on David Vivier's map of the environs of Paris (1674, scale 1 : 86,400) very crude hachures bounding the rivers have been substituted for the scenographic hills of older maps. Little progress in the delineation of the ground, however, was made until towards the close of the 18th century, when horizontal contours and hachures regulated according to the angle of inclination of all slopes, were adopted. These contours intersect the ground at a given distance above or below the level of the sea, and thus bound a series of horizontal planes (see fig. 1).

Contours of this kind were first utilized by M. S. Cruquius in his chart of the Merwede (1728); Philip Buache (1737) introduced such contours or isobaths (Gr. iso, equal; bathis, deep) upon his chart of the Channel, and intended to introduce similar contours or isobypses (iso-phi, height) for a representation of the land. Dupain-Triel, acting upon a suggestion of his friend M. Ducaric, published his La France considérée dans les différentes hauteurs de ses plaines (1791), upon which equidistant contours at intervals of 16 toises found a place. The scientific value of the carefully surveyed maps is fully recognized. They not only indicate the height of the land, but also enable us to compute the declivity of the mountain slopes; and if minor features of ground lying between two contours—such as ravines, as also rocky precipices and glaciers—are indicated, as is done on the Siegfried atlas of Switzerland, they fully meet the requirements of the scientific man, the engineer and the mountain-climber. At the same time it cannot be denied that these maps, unless the contours are inserted at short intervals, lack graphic expression. Two methods are employed to attain this: the first distinguishes the strata or layers by colours; the second indicates the varying slopes by shades or hachures. The first of these methods yields a hypsographical, or—if the sea-bottom be included, in which case all contours are referred to a common datum line—a bathy hypsographical map. Carl Ritter, in 1806, employed graduated tints, increasing in lightness on proceeding from the lowlands to the highlands; while General F. von Hauslaw, director of the Austrian Surveys, in 1842, advised that the darkest tints should be allotted to the highlands, so that they might not obscure details in the densely peopled plains. The desired effect may be produced by a graduation of the same colour, or by a polychromatic scale—such as white, pale red, pale brown, various shades of green, violet and purple, in ascending order. C. von Sonklar, in his map of the Hohe Taurn (1 : 144,000; 1854) coloured plains and valleys green; mountain slopes in five shades of brown; glaciers blue or white. E. G. Ravenstein's map of Ben Nevis (1887) first employed the colours of the spectrum, viz. green to brown, in ascending order for the land; blue, indigo and violet for the sea, increasing in intensity with the height, or the depth. At first cartographers chose their colours rather arbitrarily. Thus Horsell, who was the first to introduce tints...
on his map of Sweden and Norway (1:600,000; 1835), coloured the lowlands up to 300 ft. in green, succeeded by red, yellow and white for the higher ground; while A. Papen, on his hypo graphical map of Central Europe (1857) introduced a perplexing range of colours. At the present time compilers of strata maps generally limit themselves to two or three colours, in various shades, with green for the lowlands, brown for the hills and blue for the sea. On the international map of the world, planned by Professor A. Penck on a scale of 1 : 1,000,000, which has been undertaken by the leading governments of the world, the ground is shown by contours at intervals of 100 metres (to be increased to 200 and 500 metres in mountainous districts); the strata are in graded tints, viz. blue for the sea, green for lowlands up to 300 metres, yellow between 300 and 500 metres, brown up to 2000 metres, and reddish tints beyond that height.

The declivities of the ground are still indicated in most topographical maps by a system of strokes or hachures, first devised by L. Chr. Müller (Plan und Kartenzeichen, 1788) and J. G. Lehmann, who directed a survey of Saxony, 1780-1806, and published his Theorie der Bergezeichnung in 1799. By this method the slopes are indicated by strokes or hachures crossing the contour lines at right angles, in the direction of flowing water, and varying in thickness according to the degree of declivity they represent (cf. for example, the map of Switzerland in this work). The light is supposed to descend vertically upon the country represented, and in a true scale of shade the intensity increases with the inclination from 0° to 90°; but as such a scale does not sufficiently differentiate the lesser inclinations which are the most important, the author adopted a conventional scale, representing a slope of 45° or more, supposed to be inaccessible, as absolutely black, the level surfaces, which reflect all the light which falls upon them, as perfectly white, and the intervening slopes by a proportion between black and white, as in fig. 2. The main principles of this system have been maintained, to the slope of the ground to be represented, may be employed. This method affords a ready and expeditious means of sketching the ground, if the draughtsman limits himself to characteristically indicating its features by what have been called "form lines." This method can be recommended in the case of plotting the results of an explorer's route, or in the case of countries of which we have no regular survey (cf. the map of Afghanistan in this work).

Instead of supposing the light to fall vertically upon the surface as is still supposed to fall obliquely, generally at an angle of 45° from the upper left-hand corner. It is claimed for this method that it affords a means of giving a graphic representation of Alpine districts where other methods of shading fail. The Dufour map of Switzerland (1:100,000) is one of the finest examples of this style of hill-shading. For use in the field, however, and for scientific work, a contoured map like Siegfried's atlas of Switzerland, or, in the case of hilly country, a map shaded on the assumption of a vertical light, will prove more useful than one of these, notwithstanding that truth to nature and artistic beauty are claimed on their behalf.

Instead of shading by lines, a like effect may be produced by mezzotint shading (cf. the map of Italy, or other maps, in this work, on a similar method), and if this be combined with contour lines very satisfactory results can be achieved. If this tint be printed in grey or brown, isohypses, in black or red, show distinctly above it. The same combination is possible if hills engraved in the ordinary manner are printed in colours, as is done in an edition of the 1-inch ordnance map, with contours in red and hills hachured in brown.

Efforts have been made of late years to improve the available methods of representing ground, especially in Switzerland, but the so-called stereoscopic or relief maps produced by F. Becker, X. Imfeld, Kümmerly, F. Leuzinger and other able cartographers, however admirable as works of art, do not, from the point of utility, supersede the combination of horizontal contours with shaded slopes, such as have been long in use. There seems to be even less chance for the combination of coloured strata and hachures proposed by K. Peucker, whose theoretical disquisitions on aerial perspective are of interest, but have not hitherto led to satisfactory practical results.¹

The above remarks apply more particularly to topographical maps. In the case of general maps on a smaller scale, the orographical features must be generalized by a skilful draughtsman and artist. One of the best modern examples of this kind is Vogel's map of Germany, on a scale of 1:500,000.

Selection of Names and Orthography.—The nomenclature or "lettering" of maps is a subject deserving special attention. Not only should the names be carefully selected with special reference to the objects which the map is intended to serve, and to prevent overcrowding by the introduction of names which can serve no useful object, but they should also be arranged in such a manner as to be read easily by a person consulting the map. It is an accepted rule now that the spelling of names in countries using the Roman alphabet should be retained, with such exceptions as have been familiarized by long usage. In such cases, however, the correct native form should be added within brackets, as Florence (Firenze), Leghorn (Livorno), Cologne (Coln) and so on. At the same time these corrupted forms should be eliminated as far as possible. Names in languages not using the Roman alphabet, or having no written alphabet should be spelt phonetically, as pronounced on the spot. An elaborate universal alphabet, abounding in diacritical marks, has been devised for the purpose by Professor Lepsius, and various other systems have been adopted for Oriental languages, and by certain missionary societies, adapted to the languages in which they teach. The following simple rules, laid down by a Committee of the Royal Geographical Society, will be found sufficient as a rule; according to this system the vowels are to be sounded as in Italian, the consonants as in English, and no redundant letters are to be introduced. The diphthong ai is

¹ K. Peucker, Schattenplastik und Farbenplastik (Vienna, 1898); Geograph. Zeitschrift (1902 and 1908).
to be pronounced as in aisle; ou as ow in how; aw as in law. Ch is always to be sounded as in church, g is always hard; y always represents a consonant; whilst kh and gh stand for gutturals. One accent only is to be used, the acute, to denote the syllable on which stress is laid. This system has in great measure been followed throughout the present work, but it is obvious that in numerous instances these rules must prove inadequate. The international diaeresis, as a mark of distinction, such as æ and Æ - used to express quantity, and the diaeresis, as in aè, to express consecutive vowels, which are to be pronounced separately, may prove of service, as also such letters as ë, ǽ and Ù, to be pronounced as in German, and in lieu of the French ai, eu or ui.

The United States Geographic Board acts upon rules practically identical with those indicated, and compiles official lists of place-names, the use of which is binding upon government departments, but which it would hardly be wise to follow universally in the case of names of places outside America.

**Measurement on Maps**

**Measurement of Distance.** — The shortest distance between two places on the surface of a globe is represented by the arc of a great circle. If the two places are upon the same meridian or upon the equator the exact distance separating them is to be found by reference to a table giving the lengths of arcs of a meridian and of the equator. In all other cases recourse must be had to a map, a globe or mathematical formula. Measurements made on a topographical map yield the most satisfactory results. Even a generalised map may be trusted, provided we keep within ten degrees of its centre. In the case of more considerable distances, however, a globe of suitable size should be consulted, or—and this seems preferable—they should be calculated by the rules of spherical trigonometry. The problem then resolves itself in the solution of a spherical triangle.

In the formulae which follow we suppose \( I \) and \( I' \) to represent the latitudes, \( a \) and \( b \) the co-latitudes (90° - \( I \) or 90° - \( I' \)), and \( t \) the difference in longitude between them or the meridian distance, whilst \( D \) is the distance required.

If both places have the same latitude we have to deal with an isocoses triangle, of which two sides and the included angle are given. This triangle, for the convenience of calculation, we divide into two right-angled triangles. Thus we have:

\[
\sin \frac{1}{2} D = \sin a \sin \frac{1}{2} t,
\]

and since \( \sin a = \sin (90° - I) = \cos I \), it follows that

\[
\sin \frac{1}{2} D = \sin \frac{1}{2} t.
\]

If the latitudes differ, we have to solve an oblique-angled spherical triangle, of which two sides and the included angle are given. Thus,

\[
\cos D = \cos a \cos b + \sin a \sin b \cos t = \sin l \sin l' + \cos l \cos l' \cos t.
\]

In order to adapt this formula to logarithms, we introduce a subsidiary angle \( p \), such that \( \cos p = \cos l \cot t \); we then have

\[
\cos D = \sin l \cos(l' - p) / \sin p.
\]

In the above formulae our earth is assumed to be a sphere, but when calculating and reducing to the sea-level, a base-line, or the side of a primary triangulation, account must be taken of the spheroidal shape of the earth and of the elevation above the sea-level. The error due to the neglect of the former would at most amount to 1%, while a reduction to the mean level of the sea necessitates reducing the elevation by about 1%. Hence, in drawing a base-line 100,000 metres in length, measured on a plateau of 3700 metres (12,000 ft.) in height, to 57 metres only.

These orographic distances are of course shorter than those measured along a loxodromic line, which intersects all parallels at the same angle. Thus the distance between New York and Oporto, following the former (great circle sailing), amounts to 3000 nautical miles, while, following the rhumb, as in Mercator sailing, it would amount to 3120 m.

These direct distances may of course differ widely with the distance which it is necessary to travel between two places along a road, down a river or over a coast-line. Thus, the direct distance, as the crow flies, between Bríg and the hospice of the Simplon amounts to 4.42 geogr. m. (slope nearly 9°), while the distance by road measured by the geom. m. (as nearly 3°). Distances such as these can be measured only on a topographical map of a fairly large scale, for on general maps many of the details needed for that purpose can no longer be represented. Space runners for facilitating these measurements, variously known as chartometers, curvimeters, opisometers, &c., have been devised in great variety. Nearly all these instruments register the revolution of a small wheel of known circumference, which is run along the line to be measured.

The Measurement of Areas is easily effected if the map at our disposal is drawn on an equal area projection. In that case we need simply cover the map with a network of squares—the area of each of which has been determined with reference to the unit of the map—count the squares, and estimate the contents of those only partially enclosed within the boundary, and the result will give the approximation. Instead of drawing these squares upon the map itself, they may be engraved or etched upon glass, or drawn upon transparent celluloid or tracing-paper. Still more expeditiously is the use of a planimeter, such as Captain Prytz's "Hatchet Planimeter," which yields fairly accurate results, or G. Coupé's "Polar Planimeter," one of the most trustworthy instruments of the kind.

When dealing with maps not drawn on an equal area projection we substitute quadrilaterals bounded by meridians and parallels, the areas for which are given in the "Smithsonian Geographical Tables" (1894), by Professor H. Wagner's tables in the geographical Jahrbuch, or similar works.

It is obvious that the area of a group of mountains projected on a horizontal plane, such as is presented by a map, must differ widely from the area of the superficies or physical surface of those mountains exposed to the air. Thus, a slope of 45° having a surface of 100,000 m. projected upon a horizontal plane only measures 59 sq. m., whilst 100 sq. m. of the snowclad Sénis in Appenzell are reduced to 106 sq. m. A better method is to use the mapometric data, that is the horizontal and vertical scale ratios. Given the area-A of the plane between the two horizontal contours, the height h of the upper above the lower contour, the length of the upper contour l, and the area of the face presented by the edge (upper side) h l, we have:

\[
h = A / (A - l).
\]

The result is an approximation, for inequalities of the ground bounded by the two contours are neglected.

The hypographical map facilitates likewise the determination of the mean height of a country, and this height, combined with the area, the determination of volume, or cubic contents, is a simple matter.

**Relief Maps** are intended to present a representation of the ground which shall be absolutely true to nature. The object, however, can be fully attained only if the scale of the map is sufficiently large, if it be drawn to a scale of at least 1: 25,000, or even 1: 12,500, so that there shall be no exaggeration of the heights, and if regard be had, eventually, to the curvature of the earth's surface. Relief maps on a small scale necessitate a generalization of the features of the ground, as in the case of ordinary maps, as likewise an exaggeration of the heights. Thus on a relief map on a scale of 1: 1,000,000 a mountain like Ben Nevis would only rise to a height of 1-3 mm.

The methods of producing reliefs vary according to the scale and the materials available. A simple plan is as follows—draw an outline of the country of which a relief is to be produced on a board; mark all points the altitude of which is known or can be estimated by pins or wires clipped off so as to denote the heights; mark river-courses and suitable profiles by strips of vellum and finally finish your model with the aid of a good map, in clay or wax. If contoured maps are available it is easy to build up a strata-relief, which facilitates the completion of the relief so that it shall be a fair representation of nature, which the strata-relief cannot claim to be. A pantograph armed with cutting-files which carve the relief out of a block of gypsum, was employed in 1893-1900 by C. Pericot of Geneva, in producing his relief map of Switzerland on a scale of 1 : 100,000. After copies of such reliefs have been taken in gypsum, cement, stationary pasteboard, fossil dust mixed with vegetable oil, or some other suitable material, they are painted. If a number of copies is required it may be advisable to print a map of the country represented in colours, and either to emboss this map, backed with papier-mâché, or paste it upon a copy of the relief—a task of some difficulty. Relief maps are frequently objected to on

1. Professor Henrici, Report on Planimeters (64th meeting of the British Association, Oxford, 1894); J. Tennant, "The Planimeter" (Engineering, xlv. 1903).

2. H. Wagner, a study of the Planimeter, Jahrbuch (Hanover, 1908, pp. 241-252) refers to numerous authorities who deal fully with the whole question of measurement.

3. Kienel of Leoben in 1891 had invented a similar apparatus which he called a Relief Pantograph (Zeitschrift, Vienna Geog. Soc. 1891).
account of their cost, bulk and weight, but their great use in teaching geography is undeniable.

Globes. 1 It is impossible to represent on a plane the whole of the earth's surface, or even a large extent of it, without a considerable amount of distortion. On the other hand a map drawn on the surface of a sphere representing a terrestrial globe will prove true to nature, for it possesses, in combination, the qualities which the ingenuity of no mathematician has hitherto succeeded in imparting to a projection intended for a map of some extent, namely, equivalence of areas of distances and angles. Nevertheless, it should be observed that our globes take no account of the oblateness of our sphere; but as the difference in length between the circumference of the equator and the perimeter of a meridian ellipse only amounts to 0.16%, it could be shown only on a globe of unusual size.

The method of manufacturing a globe is much the same as it was at the beginning of the 16th century. A matrix of wood or iron is covered with successive layers of papers, pasted together so as to form pasteboard. The shell thus formed is then cut along the line of the intended equator into two hemispheres, they are then moulded together and made to revolve round an axis the ends of which passed through the poles and entered a metal meridian circle. The sphere is then coated with plaster or whitewash, and when it has been smoothed on a lathe and dried, the lines representing meridians and parallels are drawn upon it. Finally the globe is covered with the paper gores upon which the map is drawn. The adaptation of these gores to the curvature of the sphere calls for great care. Generally from 12 to 24 gores and two small segments for the polar regions printed on vellum paper are used for each globe. The method of preparing these gores was originally found empirically, but in the year 1728 of Albert Dürr it has also engaged the minds of many mathematicians, foremost among whom was Professor A. G. Kästner of Göttingen. One of the best instructions for the manufacture of globes we owe to Altmüller of Vienna. 2

Larger globes are usually on a stand the top of which supports an artificial horizon. The globe itself rotates within a metallic meridian to which its axis is attached. Other accessories are a hour-circle, around the north pole, a compass placed beneath the globe, and a flexible quadrant used for finding the distances between places. These accessories are indispensable if it be proposed to solve the problems usually propounded in books on the "use of the globes," but can be dispensed with if the globe is to serve only as a map of the world. The size of a globe is usually given in terms of its diameter. To find its scale divide the mean diameter of the earth (1,273,500 m.) by the diameter of the globe; to find its circumference multiply the diameter by \( \pi \). 3

**Map Printing.**—Maps were first printed in the second half of the 16th century. Those in the *Rudimentum novitarum* published at Liébceck in 1475 are from woodcuts, while the maps in the first two editions of Ptolomy published in Italy in 1472 are from copper plates. Wood engraving kept its ground for a considerable period, especially in Germany, but copper in the end supplanted it, and owing to the beauty and clearness of the maps produced by a combination of engraving and etching it still maintains its ground. The objection that a copper plate shows signs of wear after a thousand impressions has been taken has been removed, since duplicate plates are readily produced by electrotyping, while transfers of copper engravings, on stone, zinc or aluminium, make it possible to turn out large editions in a print process, which thus supersedes the slow-working hand-press. 4 These impressions from transfers, however, are liable to be inferior to impressions taken from an original plate or an electrolyte. The art of lithography greatly affected the production of maps. The work is either engraved upon the stone (which yields the most satisfactory result at half the cost of copper-engraving), or it is drawn upon the stone by pen, brush or chalk (after the stone has been "grained"), or it is transferred from a drawing upon transfer paper in lithographic ink. In chromolithography a stone is required for each colour. Owing to the great weight of stones, their cost and their liability of being fractured in the press, zinc plates, and more recently aluminium plates, have largely taken the place of stone. The processes of zincoigraphy and of algraphy (aluminium printing) are essentially the same as the lithography. Zincographs are generally used for producing surface blocks or plates which may be printed in the same way as a wood-cut. Another process of producing such blocks is known as the "molybdenum" process. A copper plate having been coated with wax, outline and ornament are cut into the wax, the lettering is impressed with type, and the intaglio thus produced is electrotyped. 4 Movable types are utilized in several other ways in the production of maps. Thus the lettering of the map, having been set up in type, is inked in and transferred to a stone or a zinc-plate, or it is impressed upon transfer-paper and transferred to the stone. Photographic processes have been utilized not only in reducing maps to a smaller scale, but also for producing stones and plates for lithography. The making of such stones is intended to be produced by photographic processes upon stone, zinc or aluminium. The original drawings for this map had to be done with exceptional neatness, the draughtsman spending twelve months on that which he would have completed in four months had it been intended to engrave the map on copper; yet an average chart, measuring 530 by 630 mm., which would have taken two years and nine months for drawing and engraving, was completed in less than fifteen months—fifty days of which were spent in "retouching" the copper plate. It only cost £169 as compared with £260 which had the old method been pursued.

**History of Cartography.**

A capacity to understand the nature of maps is possessed even by peoples whom we are in the habit of describing as "savages." Wandering tribes naturally enjoy a great advantage in this respect over sedentary ones. Our arctic voyagers—Sir E. W. Parry, Sir J. Ross, Sir F. L. MacClintock and others—have profited from rough maps drawn for them by Eskimos. Specimens of such maps are given in C. F. Hall's *Life with the Esquimaux* (London, 1864). Henry Youle Hind, in his work on the Labrador Peninsula (London, 1863) praises the map which the Montagnais and Nasquaaue Indians drew upon bark. Similar essays at map-making are reported in connexion with Australians, Maoris and Polynesians. Tupaia, a Tahitian, who accompanied Captain Cook in the "Endeavour" to Europe, supplied his patron with maps; Naraka drew a map in chalk of the Pauomot archipelago on the deck of Captain Wilkes's vessel; the Marshall islanders, according to Captain Winkler (Marine Rundschau, Oct. 1893) possess maps upon which the bearings of the islands are indicated by small strokes. Far superior were the maps found among the semi-civilized Mexicans when the Spanish first discovered and invaded their country. Among them were cadastral plans of villages, maps of the provinces of the empire of the Aztecs, of towns and of the coast. Montezuma presented Cortes with a map, painted on Nequen cloth, of the Gulf coast. Another map did the Conquistador good service on his campaign against Honduras (Lorenzana, *Historia de nuevo España*, Mexico, 1770; W. H. Prescott, *History of the Conquest of Mexico*, New

4 The great majority of the maps in this work are made by this process.
York, 1843). Peru, the empire of the Incas, had not only ordinary maps, but also maps in relief, for Pedro Sarmiento da Gamboa (History of the Incas, translated by A. R. Markham, 1907) tells us that the 9th Inca (who died in 1191) ordered such reliefs to be produced of certain localities in a district which he had recently conquered and intended to colonize. These were the first relief maps on record. It is possible that these primitive efforts of American Indians might have been further developed, but the Spanish conquest put a stop to all progress, and for a consecutive history of the map and map-making we must turn to the Old World, and trace this history from Egypt and Babylon, through Greece, to our own age.

The ancient Egyptians were famed as "geometers," and as early as the days of Rameses II. (Sesostris of the Greeks, 1333–1300 B.C.) there had been made a cadastral survey of the country showing the rows of pillars which separated the nomes as well as the boundaries of landed estates. It was upon a map based upon such a source that Eratosthenes (276–196 B.C.) measured the distance between Syene and Alexandria which he required for his determination of the length of a degree. Ptolemy, who had access to the treasures of the famous library of Alexandria was able to supplement, to utilize these cadastral plans when compiling his geography. It should be noted that he places Syene only two degrees to the east of Alexandria instead of three degrees, the actual meridian distance between the two places; a difference which would result from an error of only 7° is the orientation of the map used by Ptolemy. Scarcely any specimens of ancient Egyptian cartography have survived. In the Turin Museum are preserved two papyri with rough drawings of gold mines established by Sesostris in the Nubian Desert. These drawings have been commented upon by S. Birch, F. Chabas, R. J. Lauth and other Egyptologists, and have been referred to as the two most ancient maps in existence. They can, however, hardly be described as maps, while in age they are surpassed by several cartographical clay tablets discovered in Babylonia. On another papyrus in the same museum is depicted the victorious return of Seti I. (1366–1333) from Syria, showing the road from Pelusium to Heropolis, the canal from the Nile with crocodiles, and a lake (mod. Lake Timsah) with fish in it. Apollonius of Rhodes who succeeded Eratosthenes as chief librarian at Alexandria (196 B.C.) reports in his Argonautica (iv. 270) that the inhabitants of Colchis whom Herodotus (iv. 124) he looks upon as the descendants of Egyptian colonists, preserved, as he informs, certain graven tablets (kopiæs) on which land and sea, roads and towns were accurately indicated. Eustathius (since 1160 archbishop of Thessalonica) in his commentary on Dionysius Periegetes, mentions route maps which Sesostris caused to be prepared, while Strabo (i. 5) dwells at length upon the wealth of geographical documents to be found in the library of Alexandria.

A cadastral survey for purposes of taxation was already at work in Babylonia in the age of Sargon of Akkad, 3500 B.C. In the British Museum may be seen a series of clay tablets, circular in shape and dating back to 2500 or 2100 B.C., which contain surveys of lands. One of these depicts in a rough way lower Babylonia encircled by a "salt water river," Oceanus.

Development of Map-making among the Greeks—Ionian mercenaries and traders first arrived in Egypt, on the invitation of Psammeticus I. about the middle of the 7th century B.C. Among the visitors to Egypt, there were, no doubt, some who took an interest in the science of the Egyptians. One of the most distinguished among them was Thales of Miletus (640–543 B.C.), the founder of the Ionian school of philosophy, whose pupil, Anaximander (611–546 B.C.) is credited by Eratothenes with having designed the first map of the world. Anaximander looked upon the earth as a section of a cylinder, of considerable thickness, suspended in the centre of the circular vault of the heavens, an idea perhaps borrowed from the Babylonians, for Job (xxvi. 7) already speaks of the earth as "hanging upon nothing." Like Homer he looked upon the habitable world (oïlovym) as being circular in outline and bounded by a circumfluent river. The geographical knowledge of Anaximander was naturally more ample than that of Homer, for it extended from the Cassiterides or Tin Islands in the west to the Caspian in the east, which he conceived to open out into Oceanus. The Aegean Sea occupied the centre of the map, while the line where ocean and firmament seemed to meet represented an ocean of air.

Anaximenes, a pupil of Anaximander, was the first to reject the view that the earth was a circular plane, but held it to be an oblong rectangle, buoyed up in the midst of the heavens by the compressed air upon which it rested. Circular maps, however, remained in the popular favour long after their erroneousness had been recognized by the learned. Even Hecataeus of Miletus (549–472 B.C.), the author of a Periodus or description of the earth, of whom Herodotus borrowed the terse saying that Egypt was the gift of the Nile, retained this circular shape and circumfluent ocean when producing his map of the world, although he had at his disposal the results of the voyage of Scylax of Caryanda from the Indus to the Red Sea, of Darius' campaign in Scythia (513), the information to be gathered among the merchants from all parts of the world who frequented an emporium like Miletus, and what he had learned in the course of his own extensive travels. Hecataeus was probably the author of the "bronze tablets upon which was engraved the whole circuit of the earth, the sea and rivers " (Herod. v. 49), which Aristogoras, the tyrant of Miletus, showed to Cleomenes, the king of Sparta, in 504, whose gift he sought in vain in a proposed revolt against Darius, which resulted disastrously in 494 in the destruction of Miletus. The map of the world brought upon the stage in Aristophanes' comedy of The Clouds (423 B.C.), where a disciple of the Sophists points out upon it the position of Athens and of other places known to the audience, was probably of the popular circular type, which Herodotus (iv. 36) not many years before had derided and which was discarded by Greek cartographers ever after. Thus Democritus of Abdera (5. c. 450, d. after 360), the great philosopher and founder, with Leucippus, of the atomic theory, was also the author of a map of the inhabited world which he supposed to be half as long again from west to east, as it was broad.

Dicaearchus of Messana in Sicily, a pupil of Aristotle (326–360 B.C.), is the author of a topographical account of Hellas, with maps, of which only fragments are preserved; he is credited with having estimated the size of the earth, and, as far as known he was the first to draw a parallel across a map. This parallel, or dividing line, called diaiphragm (partition) by a commentator, extended due east from the Pillars of Hercules, through the Mediterranean, and along the Taurus and Imaus (Himalaya) to the eastern ocean. It divided the inhabited world, as then known, into a northern and a southern half. In compiling his map he was able to avail himself of the information obtained by the bematis (surveyors who determined distances by pacing) who accompanied Alexander the Great on his campaigns; of the results of the voyage of Nearchus from the Indus to the Euphrates, and of the Periplus of Scylax of Caryanda, which described the coast from between India and the head of the Arabian Gulf. On the other hand he wisely rejected the results of the observations for latitude made by Pytheas in 336 B.C. at his native town, Massilia, and during a subsequent voyage to northern Europe. In the end the map of Dicaearchus resembled that of Democritus.

Scientific geography profited largely from the labours of Eratosthenes of Cyrene, whom Ptolemy Euergetes appointed
MAP

635

keeper of the famous library of Alexandria in 247 B.C., and died in that city in 195 B.C. He won fame as having been the first to determine the size of the earth by a scientific method. Having determined the difference of latitude between Alexandria and Syene which he erroneously believed to lie on the same meridian, and obtained the distance of those places from each other from the surveys made by Egyptian geographers, he concluded that a degree of the meridian measured 700 stadia. 1 Eratosthenes is the author of a treatise which deals systematically with the geographical knowledge of his time, but of which only fragments have been preserved by Strabo and others. This treatise was intended to illustrate and explain his map of the world. In this task he was much helped by the materials collected in his library. Among the travellers of whose information he was thus able to avail himself were Pytheas of Massilia, Patroclus, who had visited the Caspian (285–282 B.C.), Megasthenes, who visited Palibothra on the Ganges, as ambassador of Seleucus Nicator (305–291 B.C.), Timoxenes of Rhodes, the commander of the fleet of Ptolemy Philadephus (284–246 B.C.) who wrote a treatise "On harbours," and Philo, who visited Meroe on the upper Nile. His map formed a parallelogram measuring 75,800 stadia from Usisima (Ushant island) or Saccum Promontorium in the west to the mouth of the Ganges and the land of the Coniaci (Comorin) in the east, and 46,000 stadia from Thule in the north to the supposed southern limit of Libya. Across it were drawn seven parallels, running through Meroe, Syene, Alexandria, Rhodes, Lysimachia on the Hellespont, and Thule in the north; the few latitudes had indeed been observed, but were crossed at right angles by seven meridians, drawn at irregular intervals, and passing through the Pillars of Hercules, Carthage, Alexandria, Thapsacus on the Euphrates, the Caspian gates, the mouth of the Indus and that of the Ganges. The position of all the places mentioned was supposed to have been determined by trustworthy authorities. The inhabited world thus delineated formed an island of irregular shape, surrounded on all sides by the ocean, the Erythraean Sea freely communicating with the western ocean. In his text Eratosthenes ignored the popular division of the world into Europe, Asia and Libya, and substituted for it a northern and southern division, divided by the parallel of Rhodes, each of which he subdivided into sphragides or plinthia—seals or plinths. The principles on which these divisions were made remain an enigma to the present day. This map of Eratosthenes, notwithstanding its many errors, such as the assumed connexion of the Caspian with a northern ocean and the supposition that Carthage, Sicily and Rome lay on the same meridian, enjoyed a high reputation in his day. Even Strabo (30 B.C.) adopted Eratosthenes' features, but while he improved the European frontier, he rejected the valuable information secured by Pythes and retained the connexion between the Caspian and the outer ocean. In the extreme east his information extended no further than that of Eratosthenes, viz. to India and Taprobane (Ceylon) and the Sacae (Kirghiz).

Hipparchus, the famous astronomer, on the other hand, (c. 130 B.C.) proved a somewhat captious critic. He justly objected to the arbitrary nature of the map of Eratosthenes. The parallels, or climata 2 drawn through places, were not equal; the longest day is of equal length and the declination (distance) from the equator is the same, he maintained, ought to have been inserted at equal intervals, say of half an hour, and the meridians inserted on a like principle. In fact, he demanded that maps should be based upon a regular projection, several

1 If, with W. Dörpfeld, we assume an Attic stadium of 200 steps (500 ft.) to be equal to 104 metres, a degree of 700 stadia would be equal to 118,800 metres; its actual length according to modern measurement being 110,808 metres.

2 Climata based on the length of the longest day were introduced by Hippocrates (c. 400 B.C.). Zones similar to those already drawn out for the celestial sphere were first introduced by the Pythagorean Parmenides of Elea (544–430 B.C.) distinguishes five of these zones, viz. a torrid zone, between the tropics of summer and winter, which was uninhabitable on account of heat; two frigid zones, uninhabitable on account of cold, and two intermediate temperate zones.

into four quarters, each inhabited, thus anticipating the discovery of North and South America and Australia. 3

The period between Eratosthenes and Marinus of Tyre was one of great political importance. Carthage had been destroyed (146 B.C.), Julius Caesar had carried on his campaign in Gaul (59–51 B.C.), Egypt had been occupied (30 B.C.), Britannia conquered (A.D. 41–79), and the Roman empire had attained its greatest extent and power under the emperor Trajan (A.D. 98–117). But although military operations added to our knowledge of the world, scientific cartography was utterly neglected.

Among Greek works written during this period there are several which either give us an idea of the maps available at that time, or furnish information of direct service to the compiler of a map. Among the latter a Periplos or coastal guide of the Erythraean Sea, which clearly reveals the peninsular shape of India (A.D. 90) and Arrian's Periplus Ponti Euxeni (A.D. 131) which Festus Avvenus translated into Latin. Among travellers Eudoxus of Cyzicus occupies a foremost rank, since, between 115–87 B.C. he visited India and the east coast of Africa, which subsequently he attempted in vain to circumnavigate by

3 Celestial globes were made much earlier than terrestrial ones. In the museum of Naples there is a celestial globe, 2 metres in diameter, supported on the shoulders of the Atlas (284–221 B.C.) by himself refers to globes in his Almagest, as also in the Geography. Leontius, who wrote a book on the manufacture of globes (first published at Basil in 1539), is identified by Fiorini with a bishop of Neapolis (Cyprus) of the time of Constantine XI (642–668).
following the route of Hanno, along the west coast. Among geographers should be mentioned Posidonius (13-55 B.C.), the head of the Stoic school of Rhodes, who is stated to be responsible for having reduced the length of a degree to 500 stadia; Artemidorus of Ephesus, whose "Geographumena" (c. 100 B.C.) are based upon his own travels and a study of itineraries, and above all, Strabo, who has already been referred to. Among historians who looked upon geography as an important aid in their work are numbered Polybius (c. 210-120 B.C.), Diodorus Siculus (c. 30 B.C.) and Agathachidus of Cnidus (c. 120 B.C.) to whom we are indebted for a valuable account of the Erythrean Sea and the adjoining parts of Arabia and Ethiopia. The Periegesis of Dionysius of Alexandria is a popular description of the world in hexameters, of no particular scientific value (c. A.D. 130). He as well as Artemidorus and others accepted a circular or ellipsoidal shape of the world and a circumfluent ocean; Strabo alone adhered to the scientific theories of Eratosthenes. Thus led to assume that the distance from the first meridian drawn through the Fortunate islands to Sera (mod. Si-ngan-fu), the capital of China, was equal to 225°, which Ptolemy reduced to 177°, but which in reality only amount to 126°. A like overestimate of the distances covering the march of Julius Maurer to Agisymba, which Marinus places 24° south of the equator, a latitude which Ptolemy reduces to 18°, but which is probably no farther south than lat. 15° N. The map of Marinus was accompanied by a list of places arranged according to latitude and longitude. It must have been much in demand, for three editions of it were prepared. Masudi (10th century) saw a copy of it and declared it to be superior to Ptolemy’s map. Ptolemy (q.v.) was the author of a Geography (c. A.D. 150) in eight books. "Geography," in the sense in which he uses the term, signifies the delineation of the known world, in the shape of a map, while chorography carries out the same objects in fuller detail, with regard to a particular country. In Book I, he deals with the principles of mathematical geography, map projections, and sources of information with special reference to his predecessor Marinus. Books II. to VII. form an index to the maps. They contain about 8000 names, with their

Fig. 3.—Ptolemy’s Map.

The credit of having returned to the scientific principles innovated by Eratosthenes and Hipparchus is due to Marinus of Tyre (c. A.D. 120) which, though no longer occupying the preeminent position of former times, was yet an emporium of no inconsiderable importance, having extensive connections by sea and land. The map of Marinus and the descriptive accounts which accompanied it have perished, but we learn sufficient concerning them from Ptolemy to be able to appreciate their merits and demerits. Marinus was the first who laid down the position of places on a projection according to their latitude and longitude, but the projection used by him was of the rudest. Parallels and meridians were represented by straight lines intersecting each other at right angles, the relative proportions between degrees of longitude and latitude being retained only along the parallel of Rhodes. The distortion of the countries represented would thus increase with the distance, north and south, from this central parallel. The number of places whose position had been determined by astronomical observation was as yet very small, and the map had thus to be compiled mainly from itineraries furnished by travellers or the dead reckoning of seamen. The errors due to an exaggeration of distances were still further increased on account of his assuming a degree to be equal to 500 stadia, as determined by Posidonius, instead of accepting the 700 stadia of Eratosthenes. He was

Fig. 4.
latitudes and longitudes, and with their aid it is possible to reconstruct the maps. These maps existed, as a matter of course, before such an index could be compiled, but it is doubtful whether the maps in our available manuscript, which are attributed to Agathodaimon, are copies of Ptolemy’s originals or have been compiled, after their loss, from this index. Book VIII. gives further details with reference to the principal towns of each map, as to geographical position, length of day, climate, &c.

Ptolemy’s great merit consists in having accepted the views of Hipparchus with respect to a projection suited for a map of the world. Of the two projections proposed by him one is a modified conical projection with curved parallels and straight meridians; in the second projection (see fig. 3) both parallels and meridians are curved. The correct relations in the length of degrees of latitude and longitude are maintained in the first case along the latitude of Thule and the equator, in the second along the parallel of Agisymba, the equator and the parallels of Meroe, Syene and Thule. Following Hipparchus he divided the equator into 360° drawing his prime meridian through the Fortunate Islands (Canaries). The 26 special maps are drawn on a rectangular projection. As a map compiler Ptolemy does not take a high rank. In the main he copied Marinus whose work he revised and supplemented in some points, but he failed to realize the peninsular shape of India, erroneously exaggerated the size of Taprobane (Ceylon), and suggested that the Indian Ocean had no connexion with the western ocean, but formed a separate mass of water. Ptolemy knew but of a few latitudes which had been determined by actual observation, while of three longitudes resulting from simultaneous observation of eclipses he unfortunately accepted the least satisfactory, namely, that which placed Arbela 45° to the east of Carthage, while the actual meridian distance only amounts to 34°. An even graver source of error was Ptolemy’s acceptance of a degree of 500 instead of 700 stadia. The extent to which the more correct proportion would have affected the delineation of the Mediterranean is illustrated by fig. 4. But in spite of his errors the scientific method pursued by Ptolemy was correct, and though he was neglected by the Romans and during the middle ages, once he had become known, in the 15th century, he became the teacher of the modern world.

Map-Making among the Romans.—We learn from Cicero, Vitruvius, Seneca, Suetonius, Pliny and others, that the Romans had both general and topographical maps. Thus, Varro (De rustici) mentions a map of Italy engraved on marble, in the temple of Tellus, Pliny, a map of the seat of war in Armenia, of the time of the emperor Nero, and the famous map of the Roman Empire which was ordered to be prepared for Julius Caesar (44 B.C.), but only completed in the reign of Augustus, who placed a copy of it, engraved in marble, in the Porticus of his sister Octavia (7 B.C.). M. Vipsanius Agrippa, the son-in-law of Augustus (d. 12 B.C.), who superintended the completion of this famous map, also wrote a commentary illustrating it, quotations from which of Ammianus Marcellinus of Antioch (d. 330), Pliny and others, afford the only means of judging of its character. The map is supposed to be based upon actual surveys and other reconnaissances, and it be borne in mind that the Roman Empire at that time was traversed in all directions by roads furnished with mile-stones, that the Agrimensores employed upon such a duty were skilled surveyors, and that the official reports of the commanders of military expeditions and of provincial governors were available, this map, as well as the provincial maps upon which it was based, must be considered a work of superior excellence, the loss of which is much to be regretted. A copy of it may possibly have been utilized by Marinus and Ptolemy in their compilations. The Romans have been reproached for having neglected the scientific methods of map-making advocated by Hipparchus. Their maps, however, seem to have met the practical requirements of political administration and of military undertakings.

Only two specimens of Roman cartography have come down to us, viz. parts of a plan of Rome, of the time of the emperor Septimius Severus (A.D. 193–211), now in the Museo Capitolino, and an itinerary scriptum, or road map of the world, compressed within a strip 745 mm. in length and 34 mm. broad. Of its character the reduced copy of one of its 12 sections (fig. 5) conveys an idea. The map, apparently of the 3rd century, was copied by a monk at Colmar, in 1265, who fortunately contented himself with adding a few scriptural names, and having been acquired by the learned Conrad Peutinger of Augsburg it became known as Tabula peutingeriana. The original is now in the imperial library of Vienna.

Map-Making in the Middle Ages.—In scientific matters the early middle ages were marked by stagnation and retrogression. The fathers of the church did not encourage scientific pursuits, which Lucianus (4th century) declared to be unprofitable. The doctrine of the sphericity of the earth was still held by the more learned, but the heads of the church held it to be unscriptural. Pope Zachary, when in 741 he condemned the views of Virgilius, the learned bishop of Salzburg, an Irishman who had been denounced as a heretic by St Boniface, declares it to be perversa et unqua doctrina. Even after Gerbert of Aurillac, better known as Pope Sylvester II. (990–1063), Adam of Bremen (1075), Albertus Magnus (d. 1286), Roger Bacon (d. 1294), and indeed all men of learning had accepted as a fact and not a mere hypothesis the geocentric system of the universe and sphericity of the globe, the authors of maps of the world, nearly all of whom were monks, still looked in the main to the Holy Scriptures for guidance in outlining the inhabited world. We have to deal thus with three types of these early maps, viz. an oblong rectangular, a circular and an oval type, the latter being either a compromise between the two former, or an artistic development of the circular type. In every instance the inhabited world is surrounded by the ocean. The authors of rectangular maps look upon the Tabernacle as an image of the world at large, and believe that such expressions as the “four corners of the earth” (Isa. x. 12), could be reconciled only with a rectangular world. On the other hand there was the expression “circuit of the earth” (Isa. xl. 12), and the statement (Ezek. v. 5) that “God had set Jerusalem in the midst of the nations and countries.” In

1 Facsimiles of it have been published by Desjardins (1869–1871), by K. Miller (1886), who ascribes it to Castorius, a.d. 366, and by others.
neither parallels nor meridians are indicated, nor is there a scale. Other features frequently met with are the Paradise in the Far East, miniature towns, plants, animals, human beings and monsters, and an indication of the twelve winds around the margin.

The oldest rectangular map of the world is contained in a most valuable work written by Cosmas, an Alexandrian monk, surnamed Indicopleustes, after returning from a voyage to India (535 A.D.), and entitled Christian Topography. According to Cosmas (fig. 6) the inhabited earth has the shape of an oblong rectangle surrounded by an ocean which breaks in in four great gulfs—the Roman or Mediterranean, the Arabian, Persian and Caspian Sea. Beyond this ocean lies another world, which was occupied by man before the Deluge, and within which Cosmas placed the Terrestrial Paradise. Above this rise the walls of the heavens like unto the tent of the Tabernacle. Far more simple is a small map of the world of the 8th century found in a codex in the library of Albi, an archiepiscopal seat in the department of Tarn. Its scanty nomenclature is almost wholly derived from the "Historiae adversum paganos" of Paulus Orosius (418). Far greater interest attaches to the so-called Anglo-Saxon Map of the World in the British Museum (Cotton MSS.), where it is bound up in a codex which also contains a copy of the Periegesis of Priscianus. Map and Periegesis are for their presence upon this map. The broad features of the map were derived no doubt from an older document which may likewise have served as the basis for the map of the world engraved on silver for Charlemagne, and was also consulted by the compilers of the Hereford and Ebstorf maps (see fig. 11).

Aethicus a work widely read at the time, but this does not prove that the author was able to avail himself of a map based upon that survey. A map essentially identical with that of Hereford, but larger—its diameter is 156 cm. (6 in.), and consequently fuller of information—was discovered in 1830 in the old monastery of Ebstorf in Hanover. Its date is 1484. Both maps abound in miniature pictures of towns, animals, fabulous beings and other subjects. The Hereford map is surmounted by a picture of the Day of Judgment. Similar in design, though much smaller of scale and oval in form, are the maps which illustrate the popular Polychronicon of Ranulf Higden, a monk of St Werburgh’s Abbey of Chester (d. 1363).

Our little map (fig. 12) is taken from a copy of Beatus’ work made in 1203, and preserved at Burgo de Oasma in Castile. Similar maps illustrating the Commentaries exist at St Sever (1590), Paris (1203), and Tunis; others are rectangular, the oldest being in Lord Ashburnham’s library (1970). Beatus, too, describes the southern land as inhabilabilis. The habitable world is divided among the twelve apostles, whose portraits are given. On the maps illustrating the encyclopaedic Liber floridus by Lambert, a canon of St Omer (1120), this south land “unknown to the sons of Adam” is stated to be inhabited “according to the philosophers” by Antipodes. Lambert, indeed, seems to have believed in the sphericity of the earth. Fig. 13 shows his map of the world reduced from a MS. at Wolfenbüttel, to which is added a diagram of the zones from a MS. at Ghent, which illustrates Macrobius’ commentary on Cicero’s Somnium Scipionis. Diagrams illustrating the division of the world into climata, are to be found in the epus majus of Roger Bacon (d. 1294) and in Cardinal Pierre d’Ailly’s De imagine Mundi (1410).

Among countries represented on a larger scale on maps, Palestine not unnaturally occupies a prominent place in this age of pilgrimages and crusades (1095-1291). The maps which accompany St Jerome’s translation of the Onomasticon of St Eusebius (388). The same subject is illustrated by a picture-map in mosaic, portions of which were discovered in 1896 on the floor of the church of Madaba to the east of the Dead Sea. This is the oldest original of a map in existence, for it dates back to the 6th century. Among more recent maps of Palestine, that by Petrus Vesconte (1320) is greatly superior to the earlier maps. It illustrates Marino Sanuto’s Serrata sferale crucis, in which its author vainly appeals to Christendom to undertake another crusade. One of the earliest plans of Jerusalem is contained in Gesta Francorum, a history of the Crusades up to 1106, based upon information furnished by Fulcherius of Chartres (c. 1100).

There existed, no doubt, special maps of European countries, but the only documents of that description are two maps of Great Britain, the one of the 14th century, the other by Matthew of Paris, the famous historiographer of the monastery of St Albans (1256-1259). Celestial globes were known in the time of Bede; they formed part of the educational apparatus of the monastic schools. Gerbert of Aurillac is known to have made such globes (929). Their manufacture is described by Alphonso the Wise (1252), as also in De sphaera solidae of G. Campanus of Novara (1303). Terrestrial globes, however, are not referred to.

Map-making among the Arabians and other Nations of the East—Bagdad early became a famous seat of learning. Indian astronomers found apt pupils there among the Arabs; the works of 1 R. Gough, British Topography (London 1768). His "Histories" are published in Rerum brit. scriptores XL and LVII. 1866-1869.
Ptolemy were translated into Arabic, and in 827, in the reign of the caliph Abdullah al Mamun, an arc of the meridian was measured in the plain of Mesopotamia. Most famous among these Arabian astronomers were Al Batani (d. 998), Ibn Yunis of Cairo (d. 1008), Zakala (Azarchel), who determined the meridian distance between his observatory in Toledo and Bagdad to amount to $51^\circ 30'$, an error of $3'$ only, as compared with Ptolemy's error of $18'$, and Abul Hassan (1230) who reduced the great axis of the Mediterranean to $44^\circ$.

Further materials serviceable to the compilers of maps were supplied by numerous Arabian travellers and geographers, among whom Masudi (915-940), Istakhr (950), Ibn Haukal (942-970), Al Biruni (d. 1038), Ibn Batuta (1325-1356) and Abul Feda (1331-1370), occupy a foremost place, yet the few maps which have reached us are crude in the extreme. Masudi, who saw the maps in the Horimos or Rasm el Ard, a description of which was engraved for King Roger of Sicily upon a silver plate, or the rectangular map in 70 sheets which accompanies his geography (Nushat-ul Mushtat) take rank with Ptolemy's work. These maps are based upon information collected during many years at the instance of King Roger. The seven climates adopted by Idrisi are erroneously supposed to be equal in latitudinal extent. The Mediterranean occupies nearly half the inhabited world in longitude, and the east coast of Africa is shown as if it extended due east.

The Arabians are not known to have produced a terrestrial globe, but several of their celestial globes are to be found in our collections. The oldest of these globes was made at Valenca, and is now in the museum of Florence. Another globe (of 1225) is at Velletri; a third by Ibn Hula of Mosul (1273) is the property of the Royal Asiatic Society of London; a fourth (1289) from the observatory of Maragha, in the Dresden Museum, two globes of uncertain age at Paris (see fig. 17) and another in London. All these globes are of metal (bronze), or they might not have survived so many years.

The charts in use of the medieval navigators of the Indian Ocean—Arabs, Persians or Dravidas—were equal in value if not superior to the charts of the Mediterranean. Marco Polo mentions such charts; Vasco da Gama (1498) found them in the hands of his Indian pilot, and their nature is fully explained in the Mohit or encyclopaedia of the sea compiled from ancient sources by the Turkish admiral Sidi Ali Ben Hosein in 1551. These charts are covered with a close network of lines intersecting each other at right angles. The horizontal lines are parallels, depending upon the altitude of the pole star, the Calves of the Little Bear and the Barrow of the Great Bear above the horizon. This altitude was expressed in isbas or inches each equivalent to $15^\circ 45'$ or $50^\circ$. Each isba was divided into zoms or eights. The interval between two parallels thus only amounted to $12^\circ 51'$. These intervals were mistaken by the Portuguese occasionally for degrees, which account for Malacca, which is in lat. $2^\circ 15'$ N., being placed on Cantino's Chart (1502) in lat. $14^\circ$ S. It may have been a map of this kind which accounts for Ptolemy's moderate exaggerations of the size of Taprobana (Ceylon). A first meridian, separating a leeward from a windward region, passed through Kas Kumhri (Comorin) and was thus nearly identical with the first meridian of the Indian astronomers which passed through the sacred city of Ujjain (Ozere of Ptolemy) or the meridian of Azin of the Arabs. Additional meridians were drawn at intervals of zoms, supposed to be equal to three hours' sail.

In China, maps in the olden time were engraved on bronze.

1 M. Bittner, Die topogr. Capital des ind. See spitzen (Vienna, 1897).
or stone, but after the 10th century they were printed from wood-blocks. Among the more important productions of more recent times, may be mentioned a map of the empire, said to be based upon actual surveys by Y-hang (721), who also manufactured a celestial globe (an older globe by Ho-shing-tien, 4 metres in circumference was produced in 450), and an atlas of the empire on a large scale by Thu-sie-pun (1311–1312) of which new enlarged editions with many maps were published in the 16th century and in 1799. None of these maps was graduated, which is all the more surprising as the Chinese astronomers are credited with having made use of the gnomon as early as 1000 B.C. for determining latitudes.

In the case of Japan, the earliest reference to a map is of 646, in which year the emperor ordered surveys of certain provinces to be made.

Portolano Maps.—During the long period of stagnation in cartography, which we have already dealt with, there survived among the seamen of the Mediterranean charts of remarkable accuracy, illustrating the Portolani or sailing directories in use among them. Charts of this description are first mentioned in connexion with the Crusade of Louis XI. in 1270, but they originated long before that time, and in the eastern part of the Mediterranean they embody materials available even in the days before Ptolemy, while the correct delineation of the west seems to be of a later date, and may have been due to Catalan seamen. These charts are based upon estimated bearings and distances between the principal ports or capes, the intervening coast-line being filled in from more detailed surveys. The bearings were dependent upon the seaman’s observation of the heavens, for these charts were in use long before the compass had been introduced on board ship (as early as 1205, according to Guiot de Provins) although it became fully serviceable only after the needle had been attached to the compass card, an improvement probably introduced by Flavio Gioja of Amalfi in the beginning of the 14th century. The compass may of course have been used for improving these charts, but they originated without its aid, and it is therefore misleading to describe them as Compass or Loxodromic charts, and they are now known as Portolano charts.

![Fig. 20.—The Mediterranean.](image4)
None of these charts is graduated, and the horizontal and vertical lines which cross many of them represent neither parallels nor meridians. Their most characteristic feature, and one by which they can most readily be recognized, is presented by groups or systems of rhumb-lines, each group of these lines radiating from a common centre, the central group being generally encircled by eight or sixteen satellite groups. In the course of time the centres of radiation of all these groups had imposed upon them ornate *rose dei venti*, or windroses, such as may still be seen upon our compass-cards. Each chart was furnished with a scale of miles. These miles, however, were not the ordinary Roman miles of 3000 paces or 5000 ft., but smaller miles of Greek or Oriental origin, of which six were equal to five Roman miles, and as the latter were equal to 1480 metres, the Portolano miles had a length of only 1333 metres, and 75.2 of the former, and 90.3 of the latter were equal to a degree. The difference between these miles was known, however, only to the more learned among the map-makers, and when the charts were extended to the Atlantic seaboard the two were assumed to be identical.

On these old charts the Mediterranean is delineated with surprising fidelity. The meridian distance between the Straits of Gibraltar and Beirut in Syria amounts upon them to about 3000 Portolano miles, equal in lat. 36° N. to 40° 5', as compared with an actual difference of 41° 2', and a difference of 61° assumed by Ptolemy. There exists, however, a serious error of orientation, due, according to Professor H. Wagner, to the inexperience of the cartographers who first combined the charts of the separate basins of the Mediterranean so as to produce a chart of the whole. This accounts for Gibraltar and Alexandria being shown as lying due east and west of each other, although there is a difference of 5° of latitude between them, a fact known long before Ptolemy.

The production of these charts employed numerous licensed draughtsmen in the principal seaports of Italy and Catalonia, and among seamen these MS. charts remained popular long after the productions of the printing-press had become available. The oldest of these maps which have been preserved, the so-called "Pisan chart," which belongs probably to the middle of the 13th century, and a set of eight charts, known by the name of its former owner, the Cavaliere Tamar Luxoro, of somewhat later date, are both the work of Genoese artists. Among more eminent Genoese cartographers are Joannes da Carignano (d. 1344), Petrus Vesconte, who worked in 1317 and 1327, and is the draughtsman of the maps illustrating Marino Sanuto's *Liber secretorum fidelium crucis*, which was to have roused Cristendom to engage in another crusade (figs. 19 and 21) Battista Beccario (1426, 1435) and Bartolomeo Pareto (1455). Venice ranks next to Genoa as a centre of cartographic activity. Associated with it are Francesco Pizigano (1367-1373), Francesco de Cesanis (1421), Giacomo Girdoli (1422-1446), Andrea Bianco (1425-1428) Giovanni Leardo (1442-1452), Alvise Cadiamanto, who was associated with the Portuguese explorers on the west coast of Africa (1454-1456) and whose *Portolano* was printed at Venice in 1450, and Fra Mauro (1457).

Associated with Ancona are Grazioso Benincasa and his son Andreas, whose numerous charts were produced between 1467 and 1508, and Count Ortomano Freducci (1497-1538).

The earliest among Majorcan and Catalan cartographers is Angelino Dulcert (1325-1339) whom A. Managhi claims as a Genoese, whose true name according to him was Angelino Dalorto.
Other Catalans are Jahuda Cresques, a Jew of Barcelona, the supposed author of the famous Catalan map of the world (1375), Guglielmo Solerio (1384), Mecla de Viladestes (1413-1433) Gabriel de Vallescbe (1439-1447) and Pietro Rosselli, a pupil of Beccario of Genoa (1465). These maps were originally intended for the use of seamen navigating the Mediterranean and the coasts of the Atlantic, but in the course of time they were extended to the mainland and ultimately developed into maps of the whole world as then known. Thus Pizigano's map of 1367 extends as far east as the Gulf of Persia, whilst the Medecan map of 1356 (at Florence) is remarkable on account of a fairly correct delineation of the Caspian, the Shatt el Arab in Africa, and the correct direction given to the west coast of India, which had already been pointed out in a letter of the friar Giovanni da Montecorvino of 1292. Most of the expansions of Portolano maps into maps of the world are circular in shape, and resemble the wheel maps of an earlier period. This is the character of the map of Petrus Vesconte of 1320 (fig. 21), of Giovanni Linardo (1448) and of a Catalan map of 1450. Jerusalem occupies the centre of these maps, Arab sources of information are largely drawn upon, while Ptolemy is neglected and contemporary travellers are ignored. Far superior to these maps is Fra Mauro's map (1457), for the author had availed himself not only of the information collected by Marco Polo and earlier travellers, but was able, by personal intercourse, to gather additional information from Nicolò de' Conti, who had returned from the east in 1440, and more especially from Abyssinians who lived in Italy at that time. His delineation of Abyssinia, though unduly spread over a wide area, is indeed wonderfully correct. Very different in character is the Catalan map of 1375, for its author, discarding Ptolemy, shows India as a peninsula. On the other hand, an anonymous Genoese would-be reformer of maps (1457; fig. 24), still adheres to the erroneous Ptolemaic delineation of southern Asia, and the same error is perpetuated by Henricus Marvellus Germanus on a rough map showing the Portuguese discoveries up to 1489. None of these maps is graduated, but if we give the Mediterranean a length of 3000 Portolano miles, equivalent in 36° N. to 41°, then the longitudinal extent of the old world as measured on the Genoese map of 1457 would be 136° instead of 177° or more as given by Ptolemy.

**FIG. 23.—Catalan Map of the World (1375).**

**FIG. 24.—Genoese Map (1457).**

Portolano miles, equivalent in 36° N. to 41°, then the longitudinal extent of the old world as measured on the Genoese map of 1457 would be 136° instead of 177° or more as given by Ptolemy.

The Revival of Ptolemy.—Ptolemy's great work became known in western Europe after Jacobus Angelus de Scarparia had translated it into Latin in 1410. This version was first printed in 1475 at Vicenza, but its contents had become known through MS. copies before this, and their study influenced the construction of maps in two respects. They led firstly to the addition of degree lines to maps, and secondly to the compilation of new maps of those countries which had been inadequately represented by Ptolemy. Thus Claudius Clavus Swartica (Niger), who was at Rome in 1424, compiled a map of the world, extending westward as far as Greenland. The learned Cardinal Nicolaus Krebe, of Cusa (Cues) on the Moselle, who died 1464, drew a map of Germany which was first published in 1491; D. Nicolaus Germanus, a monk of Reichenbach, in 1466 prepared a set of Ptolemy's maps on a new projection with converging meridians; and Paolo del Pozzo Toscanelli in 1474 compiled a new chart on a rectangular projection, which was to guide the explorer across the western ocean to Cathay and India. Of the seven editions of Ptolemy which were published up to the close of the 15th century, all except that of Vicenza (1475) contained Ptolemy's 27 maps, while Francesco Berlinghieri's version (Florence 1478), and two editions published at Ulm (1482 and 1486), contained four or five modern maps in addition, those of Ulm being by Nicolaus Germanus.

The geographical ideas which prevailed at the time Columbus started in search of Cathay may be most readily gathered from two contemporary globes, the one known as the Laon globe because it was picked up in 1860 at a curiosity shop in that town, the other produced at Nuremberg in 1492 by Martin Behaim. The Laon globe is of copper gilt, and has a diameter of 170 mm. The information which it furnishes, in spite of a legend-intended to lead us to believe that it presents us with the results of Portuguese explorations up to the year 1493, is of more ancient date. The Nuremberg globe is a work of a more ambitious order. It was undertaken at the suggestion of George Holzscher, a travelling member of the town council. The work was entrusted to Martin Behaim, who had resided for six years in Portugal and the Azores, and was believed to be a thoroughly qualified cosmographer.

1 E. G. Ravenstein, Martin Behaim, His Life and his Globe (London, 1908). On the original only equator, ecliptics, tropics, polar circles and one meridian 80° to the west of Lisbon are laid down.
The globe is of pasteboard covered with whiting and parchment, and has a diameter of 507 mm. The author followed Ptolemy not only in Asia, but also in the Mediterranean. He did not avail himself of the materials available in his day. Not even the coasts of western Africa are laid down correctly, although the author claimed to have taken part in one of the Portuguese expeditions. The ocean separating Europe from Asia is assumed as being only 126° wide, in accordance with Toscanelli’s ideas of 1474. Very inadequate use has been made of the travels of Marco Polo, Nicolò de’ Conti, and of others in the east. On the other hand, the globe is made gay with flags and other decorations, the work of George Glockendon, a well-known illuminator of the time.

The maritime discoveries and surveys of that age of great discoveries were laid down upon so-called “plane-charts,” that is, charts having merely equidistant parallels indicated upon them, together with the equator, the tropics and polar circles, or, in a more advanced stage, meridians also. The astrolabe quadrant or cross-staff enabled the mariner to determine his latitude with a certain amount of accuracy, but for his longitude he was dependent upon dead reckoning, for although various methods for determining a longitude were known, the available astronomical ephemerides were not trustworthy, and errors of 30° in longitude were by no means rare. It was only after the publication of Kepler’s Rudolphine Table (1626) that more exact results could be obtained. A further difficulty arose in connexion with the variation of the compass, which induced Pedro Reinel to introduce two scales of latitude on his map of the northern Atlantic (1504; fig. 27).

The chart of the world by Juan de la Cosa, the companion of Columbus, is the earliest extant which depicts the discoveries in the new world (1500), Nicolau de Canserio, a Genoese, and the map which Alberto Cantino caused to be drawn at Lisbon for Hercules d’Este of Ferrara (1502), illustrating in addition the recent discoveries of the Portuguese in the East. Other cosmo-graphers of distinction were Pedro Reinel (1504–1542), Nuno Garcia de Toreno (1520), to whom we are indebted for 21 charts, illustrating Magellan’s voyage, Diogo Ribeiro (maps of the world 1517, 1529), Alonso de Santa Cruz, of Seville, whose Isolaria general includes charts of all parts of the world (1541), John Rotz or Rut (1542), Sebastian Cabot (1544), as also Nicolas Desleis, Pierre Deschiers, G. Breton and V. Vallard, all of Arques, near Dieppe, whose charts were compiled between 1541 and 1554.

Of the many general maps of the world or of particular countries, a large number illustrate such works as G. Reisch’s Margarita philosophica (1163), the cosmographies of Peter Apianus or Bienewitz (1520, 1522, 1530), Seb. Münster (1544), J. Hunter (1546) and Guillelmus Postel (1561) or the Geographia of Lívio Sanuto (1588); others, and these the more numerous and important, supplement the original maps of several editions of Ptolemy. Thus the Roman edition of 1507, edited by Marcus Benaventura and Joa Cota, contains 6 modern maps, and to these was added in 1508 Joh. Ryusch’s famous map of the world on a modified conical projection. The next edition published at Venice in 1511 contained a heart-shaped world by Bernhard Sylvanus. The Strassburg Ptolemy of 1513 has a supplement of as many as 20 modern maps by Martin Waldseemüller or Illacomilus, several among which are copied from Portuguese originals. Waldseemüller was one of the most distinguished cartographers of his day. He was born at Radoszul in Baden in 1470, was associated with Ringmann at the gymnasium of J. G. Kohl published facsimiles of the American section of the maps (Weimar, 1860).
St Dié, and died in 1521. He published in 1507 a huge map of the world, in 12 sheets, together with a small globe of a diameter of 110 mm., the segments for which were printed from wood-blocks. On these documents the new world is called America, after Amerigo Vespucci, its supposed discoverer. In 1511 Waldseemüller published a large map of Europe, in 1513 he prepared his maps for the Strassburg edition of Ptolemy, and in 1516 he engraved a copy of Canerio's map of the world. The Strassburg edition of 1522 contains Waldseemüller's maps,1 edited on a reduced scale by Laurentius Fraisius, together with three additional ones. The same set of maps is reprinted in the Strassburg edition of 1524, newly translated by W. Pirckheimer with notes by Joh. Müller Regiomontanus, and in the Lyon edition of 1535, edited by Michael Servetus. The new maps of the Basel edition of 1540, twenty-one in number, are by Sebastian Münster; Jacob Gastaldo supplied the Venice edition of 1548 with 34 modern maps, and these with a few additions are repeated in Girolamo Ruscelli's Italian translation of Ptolemy published at Venice in 1561.

Equally interesting with these Ptolemaic supplements are collections like that of Anton Lafreri, which contains reprints of 142 maps of all parts of the world originally published between 1556 and 1572 (Geographia tavołe moderne, Rome, n.d.), or that of J. F. Camocio, published at Venice in 1576, which contains 88 reprints.

The number of cartographers throughout Europe was considerable, and we confine ourselves to mentioning a few leading men. Among them Germany is then represented by G. Pollhofer, the author of an interesting road-map of central Europe (1501), Sebastian Münster (1489-1552), Elias Camerarius, whose map of the mark of Brandenburg won the praise of Mercator; Wolfgang Latz von Lazius, to whom we are indebted for maps of Austria and Hungary (1561), and Philip Apianus, who made a survey of Bavaria (1553-1563), which was published in 1568 on the reduced scale of 1:144,000, and is fairly described as the topographical masterpiece of the 16th century. For maps of Switzerland we are indebted to Konrad Türl (1495-1497), Johann Stumpf (1548) and Aegidius Tschudi (1538). A map of the Netherlands from actual survey was produced by Jacob of Deventer (1536-1539). Leonardo da Vinci, the famous artist, while in the service of Cesare Borgia as military engineer, made surveys of several districts in central Italy. Other Italian cartographers of merit were Giovanni Battiata Agnese of Venice, whose atlases (1517-1526) enjoyed a wide popularity; Benedetto Bordone (1528); Giacomo Gastaldo, cosmographer of the Venetian Republic (1534-1568); and his successor, Paolo Forlani. New maps of Spain and Portugal appeared in 1560, the former being done to Pedro de Medina, the latter to Fernando Alvarez Sánchez and Hernando Alvaro. Among the French map-makers of this period may be mentioned Oronce Finéé (Finaeus), who in 1525 published a map of France, and Jean Jolivet (c. 1560). Gregorio Lilly (1546) and Humphrey Llywd of Denbigh (d. 1510) furnished maps of the British Isles, Olaus Magnus (1539) of Scandinavia, Anton Wied (1542), Sigismund von Herberstein (1549) and Anthony Jenkinson (1562) of Muscovy.

The cylindrical and modified conical projections of Marinus and Ptolemy were still widely used, the stereographical projection of Hipparchus, was for the first time employed for terrestrial maps in the 16th century, but new projections were introduced in addition to these. The earliest of these, a trapeziform projection with equidistant parallels, by D. Nicolaus Geranmus (1466), naturally led to what is generally known as Flamsteed's projection. Joh. Stabius (1502) and his pupil J. Werner (1514) devised three heart-shaped projections, one of which was equivalent. Petrus Apianus (1524) gave his map an elliptical shape. H. Glareanus (1510) was the first to employ an equidistant zenithal polar projection.

No reasonable fault can be found with the marine surveyors of this period, but the scientific cartographers allowed themselves too frequently to be influenced by Ptolemaic traditions. Thus

1 Facsimiles of the maps of 1507 and 1517 were published by J. Fischer and F. M. von Wieser (Innsbruck, 1903).

Columbus, trusting to Toscanelli's misleading chart, looked upon the countries discovered by him as belonging to eastern Asia, a view still shared about 1507 by his brother Bartolomeo. Waldseemüller (1507) was the first to separate America and Asia by an ocean of considerable width, but J. Ruyssch (1508) returns to the old idea, and even joins Greenland (Grenland) to eastern Asia. Bologninus Zaltarius on a map of 1562, and Mercator on his famous chart of 1569, separates the two continents by a narrow strait which they call Stretto de Anian, thus anticipating the discovery of Bering Strait by more than a hundred and fifty years. Anian, however, which they place upon the American coast, is no other than Marco Polo's Anica or Anin, our modern Annam. Such an error could never have arisen had the old compilers of maps taken the trouble to plan Marco Polo's routes.

Globes, both celestial and terrestrial, became popular after the discovery of America. They were included among the scientific apparatus of ships and of educational establishments. Columbus and Magellan had such globes, those of the latter produced by P. Reinel (1510), and Conrad Celtes tells us that he illustrated his lectures at the university of Vienna with the help of globes (1501). Globes were still engraved on copper, or painted by hand, but since 1507, in which year Waldseemüller published a small globe of a diameter of 110 mm., covered with printed segments or gores, this cheap and expedient method has come into general use. Waldseemüller constructed his gores graphically, A. Dürer (1525) and Hen. Loriti Glareanus (1527) were the first who dealt scientifically with the principles underlying their construction. Globes
covered with printed gores were produced by L. Boulenger (1574), Joh. Schöner (1555), P. Apianus, Gemma Frisius (1530) and G. Mercator (1541). Leonardo da Vinci’s rough map of the world in 8 segments (c. 1513) seems likewise to have been intended for a globe. Of J. Schöner we know that he produced four globes, three printed from segments (1515, 1523, 1533), and the earliest works are a map of Palestine (1537), a map of the world on a double heart-shaped projection (1525), and a topographical map of Flanders based upon his own surveys (1540), a pair of globes (1541, diam. 120 mm.), and a large map of Europe which has been praised deservedly for its accuracy (1554). He is best known by his marine chart (1566) and his atlas. The projection of the former may have been suggested by a note by W. Pirckheimer in his edition of Ptolemy (1525). Mercator constructed it graphically, the mathematical principles underlying it being first explained by E. Wright (1594). The “Atlas” was only published after Mercator’s death, in 1595. It contained nine maps, but after the plates had been sold to Jodocus (Jesse) Hondius the number of maps was rapidly increased, although Mercator’s name was retained. Mercator’s maps are carefully engraved on copper. Latin letters are used throughout; the miniatures of older maps are superseded by symbols, and in the better-known countries the maps are fairly correct, but they fail lamentably when we follow their author into regions—the successful delineation of which depends upon a critical combination of imperfect information.

Even before Mercator’s death, Antwerp and Amsterdam had become great centres of cartographic activity, and they maintained their pre-eminence until the beginning of the 18th century. Abraham Ortelius (1527–1592), of Antwerp, a man of culture and enterprise, but not a scientific cartographer, published the first edition of his Theatrum orbis terrarum in 1570. It then contained 53 maps, by various authors. By 1595 the number of maps had increased to 119, including a Parergon or supplement of 12 maps illustrating ancient history. In 1578 was published the Speculum orbis terrarum of Gerard de Jode or de Jodeis. Lucas Janszon Waghenaer (Aurigarius) of Enkhuizen published the first edition of his Spiegel der Zeevaart (Mariners’ Mirror) at Leiden in 1585. It was the first collection of maps, maps lived through many editions, was issued in several languages and became known as Charetter and Waggener. In the same year Adrian Gerritz published a valuable Paskaarte of the European Sea. Ten years afterwards, in 1595, W. Barentssoons published a marine atlas of the Mediterranean, the major axis of which he reduced to 42 degrees. Jodocus

and formerly served the purpose of a pyx. Its diameter is 160 mm., its date about 1530. About the same date is assigned to a globe by Robert de Bailly, engraved on copper and gilt (diam. 440 mm.). Celestial globes were manufactured by Regiomontanus (d. 1476) at Nuremberg, by Joh. Stößler (1499), and by G. Hartmann (1533).

**Mercator and his Successors.**—Of Gerhard Kremer (1512–1594) and formerly served the purpose of a pyx. Its diameter is 160 mm.; its date about 1530. About the same date is assigned to a globe by Robert de Bailly, engraved on copper and gilt (diam. 440 mm.). Celestial globes were manufactured by Regiomontanus (d. 1476) at Nuremberg, by Joh. Stößler (1499), and by G. Hartmann (1533).

Mercator and his Successors.—Of Gerhard Kremer (1512–1594) and formerly served the purpose of a pyx. Its diameter is 160 mm.; its date about 1530. About the same date is assigned to a globe by Robert de Bailly, engraved on copper and gilt (diam. 440 mm.). Celestial globes were manufactured by Regiomontanus (d. 1476) at Nuremberg, by Joh. Stößler (1499), and by G. Hartmann (1533).
Another cartographic publishing firm was established at Amsterdam in 1612 by Willem Janszon Blaeu (1571-1638), a friend of Tycho Brahe, from 1633 "mapmaker" of the states-general, and a man of scientific culture. He was succeeded by his son Jan (d. 1673) and grandson Cornelius, and before the end of the century turned out a Zee-Spiegel of 108 charts (1623), an Atlas novus (Nieuwe Atlas), 1643, enlarged in the course of time until it consisted of 12 folio volumes containing hundreds of maps. J. A. Comel in 1633 published a collection of maps under the quaint title of Vurig Colom de Zeevaer (Fiery Column of Navigation). Among more recent Dutch map publishers are Nicolaus Visscher (Piscator), R. Goos, H. Doncker, F. de Wit, and J. and G. van Keulen, whose atlases were published between 1681 and 1722. These Dutch maps and charts are generally accompanied by descriptive notes or sailing directions printed on the back of them. A similar work is the Arcano del mare of Sir Robert Dudley, duke of Northumberland, the numerous sheets of which are on Mercator's projection (1631).

In France, in the meantime, an arc of the meridian had been measured (1660-1670) by Jean Picard, numerous longitudes had been observed between 1672 and 1680 by the same, and by Phil. de Lahire (d. 1719), and these were utilized in a Corte de France "as corrected from the observations of the members of the Academy of Sciences" (1666-1669), in a map of the world (1694) by D. Cassini, as also in Le Neptune Francois (1693) with contributions by Pene, D. Cassini and others. These corrected longitudes were not yet available for the maps produced by Nicolas Sanson of Abbeville, since 1627. The cartographical establishment founded by him in that year was carried on after his death in 1667 by his sons, his son-in-law, P. Duval (d. 1685) and his grandson Robert de Vaugondy (1766). Among the cartographers whom he employed were M. Tavernier and Mariette, and in many instances he mentioned the authors whose maps he copied. By 1710 the maps published by the firm numbered 466. Nicolas de Fer, the great rival of Sanson, and his heirs, are stated to have published as many as 600 maps after 1700.

In no other country of Europe was there at the close of the 16th century a geographical establishment capable of competing with the Dutch towns or with Sanson, but the number of those who produced maps, in many instances based upon original surveys, was large. Germany is thus represented, among others, by C. Henneberger (map of Prussia, 1576), by M. Oeder, (survey of Saxony, 1586-1607), A. Raub (fine hill features on a map of the environs of Wangen and Lindau, 1617), W. Schickhardt (survey of Württemberg, 1624-1635), and G. M. Visscher (map of Austria and Styrai, 1669-1720); Switzerland by H. C. Giger (Canton of Zürich, a masterpiece, 1667); Italy by G. A. Magini (1558-1616), and V. Coronelli, appointed cosmographer of the Venetian Republic, 1685, and founder of the Ac. Cosmogr. del Argonauti, the earliest geographical society, and Diogo Homem, a Portuguese settled at Venice (1556-1754); Denmark by J. Mejer of Husum (1650); Sweden by A. Bureus, the "father of Swedish cartographers" (1590-1668); the British Islands by Ch. Saxton (County Atlas of England and Wales 1579), J. Speed (Theatrum of Great Britain, 1610), Timothy Pont and Robert Gordon of Strathloch (map of Scotland, 1608), and A. Moll. A Novus atlas sinensis, based upon Chinese surveys, was published in 1653 by Martin Martini, S.J., a missionary recently returned from China. Isaac Voss, in his work De Nifi (1659), published a map of central Africa, in which he anticipated D'Anville by rejecting all the fanciful details which found a place upon Filippo Pigaffetta's map of that continent.

The first maps illustrating the variation of the compass were published by Chris. Burrus (d. 1632) and Athanasius Kircher (Magnes, Rome, 1643), and maps of the ocean and tidal currents by the latter in his Mundus subterraneus (1665). Edmund Halley, the astronomer, compiled the first variation chart of scientific value (1683), as also a chart of the winds (1686).

Fig. 31.—Mercator's Chart of the World (1569).
Globes manufactured for commercial purposes by Blaue and others have already been mentioned, but several large globes, for show rather than for use, were produced in addition to these. Thus A. Busch, of Limburg (1656–1664), manufactured a globe for Duke Frederick of Holstein, formerly at Gottorp, but since 1713 at Tsarskoye Selo. It has a diameter of 11 ft. (3.57 metres) and is hollow, the inner surface of the shell being covered with a star map, and the outer surface with a map of the world. Professor Erh. Weigel (1696) produced a hollow celestial globe in copper, having a small terrestrial globe in its centre. Its diameter is 3.25 metres. Lastly there is a pair of giant globes of artistic design, turned out by V. Coronelli (1623), and intended as presents to Louis XIV. Their diameter is nearly 5 metres. A pair of globes of 1592 by Emeric Molineux (diam. 0.10 mm.) is now in the Temple Library, and is referred to in Blundeville's Exercises (1594).

The Eighteenth Century.—It was no mere accident which enabled France to enjoy a pre-eminence in cartographic work during the greater part of the 18th century. Not only had French men of science and scientific travellers done excellent work as explorers in different parts of the world, but France could also boast of two men, Guillaume Delisle and J. B. Bourguignon d'Anville, able to utilize in the compilation of their maps the information they acquired.

Delisle (1675–1726) published 98 maps, and although as works of art they were inferior to the maps of certain contemporaries, they were far superior to them in scientific value. On one of his earliest maps compiled under advice of his father Claude (1700), he gave the Mediterranean its true longitudinal extension of 41°. It was Delisle who assumed the meridian of Ferro, which had been imposed upon French navigators by royal order (1634), to lie exactly 20° to the west of Paris. The work of reform was carried further by B. d'Anville (1697–1782). Altogether he published 211 maps, of which 66 are included in J. Cook and of others; and Tho. Jefferys' West Indian and American Atlases (1775, 1778). James Rennell (1742–1830), who was surveyor-general of India, published the Bengal Atlas (1781), and sagaciously arranged the vast mass of information collected by British travellers and others in India and Africa, but it is chiefly with the name of Aaron Arrowsmith, who came to London in 1778, and his successors, with which the glory of the older school of cartographers is most intimately connected. His nephew John died in 1873. Among local cartographers may be mentioned H. Moll (d. 1732), J. Senex, whose atlas was published in 1725, and Dowet, whose atlas was brought out at the expense of the duke of Argyll.

In Germany J. B. Homann (d. 1724) founded a geographical establishment in 1702, which depended at first upon copies of British and French maps, but in course of time published also original maps such as J. M. Hase's Africa (1727) and Tobias Meyer's Mappe critica of Germany (1780), J. T. Güssfeld's map of Brandenburg (1773), John Mayer's Württemberg (1750), and J. C. Müller's Bavaria, both based on trigonometrical surveys. Colonel Schmettau's excellent survey of the country to the west of the Weser (1767–1787) was never published, as Frederick the Great feared it might prove of use to his military enemies. Switzerland is represented by J. J. Scheuchzer (1712), J. Gessner (d. 1750), G. Walser (Atlas novus Helvetica, 1765), and W. R. Meyer, Atlas der Schweiz (1786–1802). Of the Austrian Netherlands, Count Joseph de Ferrari published a chorographic map on the same scale as Cassini's Carte de la France (1777). Of Denmark a fine map was published under the auspices of the Academy of Science of Copenhagen (1766–1825) of Spain and Portugal an atlas in 102 sheets by Thomas Lopez (1765–1802); of Russia a map by J. N. Delisle in 19 sheets (1730–1745); charts illustrating the variation of the compass and of magnetic "dip" by E. Dunn (1776), J. C. Wiffe (1768); a chart of the world by W. Dampier (1785). Map projections were dealt with by two eminent mathematicians, J. H. Lambert (1772) and Leonh. Euler (1777).

On the maps of Delisle and d'Anville the ground is still represented by "molehills." Hachures of a rude nature first made their appearance on David Vivier's map of the environs of Paris (1674), and on Cassini's Carte de la France. Contour lines (isobaths) were introduced for the first time on a chart of the Merwede by M. S. Cruquius (1728), and on a chart of the English Channel by Phil. Buache (1737). Dupain-Trièf, acting on a suggestion of Du Carla, compiled a contoured map of France (1701), and it only needed the introduction of graduated tints between these contours to secure a graphic picture of the features of the ground. It was J. G. Lehmans (1759) who based his "Harteck'sche" maps on these horizontal contours. More than 80 methods of showing the hills have found advocates since that time, but all methods must be based upon contours to be scientifically satisfactory.

Two relief maps of Central Switzerland deserve to be mentioned, the one by R. L. Lüffy in wax, now in Lucerne, the other by J. R. Meyer of Aarau and Müller of Engelberg in paper mâché, now in Zurich. Globes of the usual commercial type were manufactured in France by Delisle (1700), Forbin (1710–1731), and De la Ronceray (1735). By J. J. La Hire (1750), published by E. and G. Adams (1710–1863); Germany by Homann and Seutter (1756). A hollow celestial globe 18 ft. in diameter was set up by Dr Roger Long at Cambridge; the terrestrial globe which Count Ch. Gravie of Vergeennes presented to Louis XVI. in 1787 had a diameter of 26 metres, or 85 ft.

Modern Cartography.—The compiler of maps of the present day enjoys many advantages not enjoyed by men similarly occupied a hundred years ago. Topographical surveys are gradually extending, and explorers of recent years are trained for their work as they were a generation ago, whilst technical processes of recent invention—such as lithography, photography and heliogravure—facilitate or expedite the completion of his task. This task, however, has grown more difficult and exacting. Mere outline maps, such as formerly satisfied the public, suffice no longer. He is called upon more
especially to give a satisfactory delineation of the ground, he must meet the requirements of various classes of the public, and be prepared to record cartographically all the facts of physical or political geography which are capable of being recorded on his maps. The ingenuity of the compiler is frequently taxed when called upon to illustrate graphically the results of statistical information of every description.

Germany since the middle of the 19th century has become the headquarters of scientific cartography. This is due as much to the inspiriting teachings of Ritter and Humboldt as to the general culture and scientific training combined with technical skill commanded by the men who more especially devote themselves to this branch of geography, which elsewhere is too frequently reduced into the hands of mere mechanists like H. Berghaus (1797–1854), H. Kiepert (1818–1899), and A. Petermann (1822–1878) who must always occupy a foremost place in the history of cartography. Among the geographical establishments of Germany, that founded by Justus Perthes (1785), at Gotha, occupies the highest rank. Among its publications are A. Steiler’s Hand-Atlas (1817–1832), K. von Spruner’s Historical Atlas (1438–1485), H. Berghaus’ Physical Atlas (1836–1842), E. von Sydow’s Wall Maps for Schools (1838–1849) and School Atlas (1847). The bulk of these atlases survive, though the author of the original edition of the Geographical Atlas (1807) is said to have been repeatedly superseded by others bringing information up to the date of publication. To the same firm we are indebted for Petermann’s Mitteilungen, started in 1855 by A. Petermann, after whose death in 1902 they were successively edited by E. Behm, A. Sapan and P. Langhans, as also the Geographisches Jahrbuch (since 1866), at first edited by E. Behm, afterwards by Professor H. Wagner. Among other geographical institutes in Germany which deserve mention are the Weimar Institut, founded in 1831 by F. Schrader, and directed in 1845–1846 by H. Kiepert; Paul Fleming at Glogau (K. Sohr’s Handatlas, 1845), A. Ravenstein at Frankfurt, D. Reimer at Berlin (H. Kiepert, Handatlas, 1860); R. Andree (Hand-Atlas, 1880), and E. Debes (Hand-Atlas, 1894) in Leipzig, and H. Holzer in Vienna (Vincenz von Haardt’s maps). France is represented by the publishing firms of Ch. Delagrange (Lavusevar’s maps), Hachette (Vivien de St. Martin’s Atlas universel, in progress since 1875), F. Schrader’s Atlas de géographie moderne, (1880), and Armand Colin (Vidal de la Blache’s Atlas général, 1894). In Great Britain A. Arrowsmith established himself in London in 1792 (General Atlas, 1817), but the cartographical business ceased on the death of John Arrowsmith in 1823. John Walker, to whose initiative the charts published by the admiralty are indebted for the perspicuous, firm and yet artistic execution, which facilitate their use by the mariner, was also the author of the maps published by the Society for the Diffusion of Useful Knowledge (1829–1840). Among more recent firms are W. and A. K. Johnston (founded 1825; Royal Atlas, 1853); J. Bartholomew & Co., now carried on by J. G. Bartholomew (Reduced Survey maps, Atlas of the World’s Commerce, 1900); Philip & Sons (Imperial Atlas, 1850; Systematic Atlas by E. G. Ravenstein, 1854; Mercantile Marine Atlas, 1904, globes), and E. Stanford (London Atlas).

In 1800 Professor A. Penck proposed to prepare a map of the world, including the oceans, on a scale of 1:1,000,000, and his scheme was promised the support of a committee which met in London in 1809, and upon which were represented the leading powers of the world. Maps on that scale of a great part of Africa, Asia and America have been published by British, French, German and United States authorities. A horizontal metrical chart of the oceans, by Professor J. Thoulet was published in 1904 at the expense of Prince Albert of Monaco.

Reliefs from printed maps were first produced by Baurkeller of Darmstadt and Donndorf at Frankfort, from originals furnished by A. Ravenstein (1838–1844). The exaggeration in altitude, on these maps and on those of a later date and on a larger scale, was very considerable. No such exaggeration exists in the case of reliefs of parts of the Alps, on a large scale, by P. Kell and Pelikan (1850), X. Infeld (1891), P. Oberlertner (1891–1893), C. Perron (1863–1900), F. Becker (1900), A. Heim (1904) and others. A relief globe was first suggested in a letter of M. Maestlin to J. Kepler (1596). The first globe of this description for the use of the field, was made by Z. Drasche (1598). H. Erben is the author of a rough relief on a convex surface (1842), but the finest example of this description is a relief of Italy, by César Pomba and H. Fritsche, on a scale of 1:1,000,000 and without exaggeration of heights (1880–1884). A map of Italy in the baptism of St Peter at Rome has occasionally been described as a relief, though it is merely a rude outline map of Italy, by Carlo Fontana (1698), carved into a convex surface.

Several globes of unusual dimensions were produced in the cartography of last century. That which Colonel Langlois erected in the Champs Elysées (1840) was described as a globe of Wyld’s hollow globe, or “Georamma,” diam. 18 metres, occupied Leicester Square until swept away as a nuisance. The giant globe proposed by Elisé Reclus in 1893 has never been erected; he has, however, produced maps on a concave surface, as suggested by J. D. Hauber in 1742.

Authorities.—The history of maps is dealt with ably in Vivien de St. Martin’s Histoire de la géographie (Paris, 1875), and in Peschel’s Geschichte der Erdkunde (2nd ed. by Sophus Ruge, Berlin, 1877), as also by W. Wollkenhauer (Leitfaden zur Geschichte der Kartographie, Breslau, 1865), and H. Zondervan (Allgemeine Kartenkunde, 1890). Men like H. Berghaus (1797–1854), H. Kiepert (1818–1899), and A. Petermann (1822–1878) who must always occupy a foremost place in the history of cartography. Among the geographical establishments of Germany, that founded by Justus Perthes (1785), at Gotha, occupies the highest rank. Among its publications are A. Steiler’s Hand-Atlas (1817–1832), K. von Spruner’s Historical Atlas (1438–1485), H. Berghaus’ Physical Atlas (1836–1842), E. von Sydow’s Wall Maps for Schools (1838–1849) and School Atlas (1847). The bulk of these atlases survive, though the author of the original edition of the Geographical Atlas (1807) is said to have been repeatedly superseded by others bringing information up to the date of publication. To the same firm we are indebted for Petermann’s Mitteilungen, started in 1855 by A. Petermann, after whose death in 1902 they were successively edited by E. Behm, A. Sapan and P. Langhans, as also the Geographisches Jahrbuch (since 1866), at first edited by E. Behm, afterwards by Professor H. Wagner. Among other geographical institutes in Germany which deserve mention are the Weimar Institut, founded in 1831 by F. Schrader, and directed in 1845–1846 by H. Kiepert; Paul Fleming at Glogau (K. Sohr’s Handatlas, 1845), A. Ravenstein at Frankfurt, D. Reimer at Berlin (H. Kiepert, Handatlas, 1860); R. Andree (Hand-Atlas, 1880), and E. Debes (Hand-Atlas, 1894) in Leipzig, and H. Holzer in Vienna (Vincenz von Haardt’s maps). France is represented by the publishing firms of Ch. Delagrange (Lavusevar’s maps), Hachette (Vivien de St. Martin’s Atlas universel, in progress since 1875), F. Schrader’s Atlas de géographie moderne, (1880), and Armand Colin (Vidal de la Blache’s Atlas général, 1894). In Great Britain A. Arrowsmith established himself in London in 1792 (General Atlas, 1817), but the cartographical business ceased on the death of John Arrowsmith in 1823. John Walker, to whose initiative the charts published by the admiralty are indebted for the perspicuous, firm and yet artistic execution, which facilitate their use by the mariner, was also the author of the maps published by the Society for the Diffusion of Useful Knowledge (1829–1840). Among more recent firms are W. and A. K. Johnston (founded 1825; Royal Atlas, 1853); J. Bartholomew & Co., now carried on by J. G. Bartholomew (Reduced Survey maps, Atlas of the World’s Commerce, 1900); Philip & Sons (Imperial Atlas, 1850; Systematic Atlas by E. G. Ravenstein, 1854; Mercantile Marine Atlas, 1904, globes), and E. Stanford (London Atlas).
The one-inch map for the whole of the United Kingdom was completed in 1890. It covers 697 sheets (or 488 of a "new series" in large sheets), and is published in three editions, viz. (a) in outline, with contours in black, (b) with hills hachured in brown or black, and (c) printed in five colours. Carefully revised editions of these and of the other maps are brought out at intervals of 15 years at most. Since 1898 the department has also published maps on a smaller scale, viz. a map of England and Wales, on a scale of 2 m. to 1 in., in two editions, both printed in colour, the one with hills stippled in brown, the other coloured on the "layer system" as a strata-relief map; a map of the United Kingdom on a scale of 4 m. to 1 in., also in two editions, the one in outline, showing five classes of roads and parish boundaries, the other in colours, with stippled hills; a map on a scale of 10 m. to 1 in., also in two editions, and finally a map of the United Kingdom on a scale of 1:1,000,000.

The geological surveys of Great Britain and Ireland were connected from 1832 to 1853 with the ordnance survey, but are now carried on independently. The ordnance survey, too, no longer depends on the war office but upon the board of agriculture and fisheries. A Bathymetical Survey of the Freshwater Loughs of Scotland, under the direction of Sir John Murray and L. Pullar, was completed in 1908, and the results published by the Royal Geographical Society.

Proposals for a new map of France, to replace the famous Cassini map of 1744-1793 were made in 1802 and again by Frédéric-Auguste Berthaut, in 1832. The Carte de France de l'état major was in preparation in 1892. It was engraved on copper. The hachured hills are based upon contours, and are of admirable clearness. It has served as a basis for a Carte de la France, published by the Service Vilcinac on a scale of 1:100,000, in 1905 sheets, and of a general map prepared by the ministère des travaux publics on a scale of 1:200,000 in 80 sheets. On both these maps the hills are printed in grey chalk. A third topographical map of France is being published in accordance with the recommendation of a committee presided over by General de la Noix in 1897. The surveys for this map were begun in 1905. The maps are based upon the cadastral plans (1:1000), thoroughly revised and connected with the triangulation of France and furnished with contours at intervals of 5 m. by precise measurement. These minutes are published on a scale of 1:5000 for municipal districts, while on the sheets of the general map the interval is 1:50,000. Each sheet is bounded by parallels and meridians. The hills are shown in brown contours at intervals of 10 m. and grey shading in chalk (Berthaut, *La Carte de France, 1750-1898*; Paris, 1899). A geological map of France on a scale of 1:80,000 is nearly completed, there are also a map (1:500,000) by Carez and Vasseur, and an official Carte géologique (1:1,000,000; 1906).

By the middle of the 19th century topographical maps of the various German states had been completed, and in several instances surveys of a more exact nature had been completed or begun, when in 1878 the governments of Prussia, Saxony, Bavaria and Württemberg agreed to supersede local maps by publishing a map of the empire (*Reichskarte*) in 674 sheets on a scale of 1:100,000. The earlier sheets of this excellent map were lithographed, but these are gradually being superseded by maps engraved on copper. Colour-printing is employed since 1903. The hills are hachured and in some instances contours at intervals of 50 metres are introduced. The map was completed in 1909, but is continually undergoing renewal. The *Messinschläther* or *Positionsblätter* in Bavaria, are on a scale of 1:25,000. The older among them are much to be desired, but those of a later date are satisfactory. This applies more especially to the maps of Saxony (since 1875) and Württemberg (since 1893). The features of the ground on most of these maps are shown by contours at intervals of 10 metres. The map produced on this large scale numbers over 6000 sheets, and is used as a basis for the geological surveys carried on in several of the states of Germany. A general map of the German Empire (*Uebersichtskarte*) on a scale of 1:200,000, in 196 sheets, is in progress since 1893. It is printed in three colours, and gives contours at intervals of 10 metres. In addition to these maps there are D. G. Reynmann's well-known *Spezialkarte von Mittel Europa* (1:200,000), acquired by the Prussian government in 1874 (it will ultimately consist of 706 sheets), a government and Liebenow's map of central Europe (1:300,000) and C. Vogel's beautiful map of Germany (1:500,000).

The *Spezialkarte* of Austria-Hungary on a scale of 1:75,000 (765 sheets), based upon a triangulation and cadastral surveys (1816-1867), was completed in 1889, and published in heliogravure. This map was repeatedly revised, but as it no longer met modern requirements as to accuracy and the direct output of contoured maps, it was decided to publish a new map. The first sheets, on a scale of 1:25,000, are being published in photo-lithography. A general map of central Europe in 230 sheets published by the Austrian government (1:200,000) includes nearly the whole of the Balkan Peninsula.

The famous map of Switzerland, with which is associated the name of General H. Dufour (d. 1875), is based upon a triangulation (1809-1833) and surveys on a scale of 1:25,000 for the lowlands, 1:50,000 for the alpine districts, and was published (1842-1865) on a scale of 1:100,000. The hills are hachured, the light in the case of the loftier regions, being supposed to fall obliquely. The original surveys, carefully revised, have been published since 1870 as a Topographical Atlas of Switzerland—the so-called Siegfried Atlas, in 532 sheets. They are printed in three colours, contours at intervals of 10 and 20 metres being in brown, incidental features (ravines, cliffs, glaciers) in black or blue. To mountain-climbers these contour maps are invaluable, but for the military purpese "strata maps" such as J. M. Ziegler's hypsometric maps (1856) or so-called "relief maps," which attempt to delineate the ground so as to give the impression of a relief, are generally preferred.

The new survey of Belgium was completed in 1872 and there have been published 572 plane-table sections or *planchettes* on a scale of 1:20,000 (1866-1888), a "Carte topographique de la Belgique," in 72 sheets, on a scale of 1:125,000 (1861-1888), and a more recent map in 26 sheets on a scale of 1:100,000 (1903-1912). The last is printed in three colours, the ground is shown in contours of 10 metres interval and grey stippling.

The new survey of the Netherlands, based upon General Krayerhoff's primary triangulation (1802-1811) was completed in 1855. The results have been published on a scale of 1:25,000 (776 sheets, since 1860), 1:50,000 (Topographic and Military Map, 62 sheets, 1850-1854, and a Waterstaatskaart, 1864-1892), and 1:200,000 (Topographical Atlas, 21 sheets, 1866-1871).

In Denmark, on the proposal of the Academy of Science, a survey was carried out in 1766-1825, but the maps issued by the Danish general staff depend upon more recent surveys. These include plane-table sections (Maaelersblad), 1200 sheets on a scale of 1:200,000, with contours at intervals of 5 to 10 ft., published since 1830; "Atlas blandt..."
of Jutland and of De Danske Ør, on a scale of 1:40,000, the former 131 sheets, since 1870, the latter, on the same scale, in 94 sheets, since 1890, and still in progress, and a general staff map on a scale of 1:100,000, in 65 sheets, since 1890. Maps of the Faroe and of Iceland have likewise been issued.

Modern surveys in Sweden date from the organization of a corps of "Landemittare," known since 1874 as a topographical department of the general staff. The maps issued by this authority include one of southern Sweden, 1:100,000, another of northern Sweden, 1:200,000, and a general map on a scale of 1:1,000,000. In Norway a geographical survey (Oppussing) has been in progress since 1783, and the topographical map of the kingdom on a scale of 1:100,000 in 340 sheets, has not yet been completed.

Of Russia in Europe only the more densely peopled governments have been surveyed, since 1816, in the manner of other Russian European countries, while for most regions there are only so-called "military surveys." The most readily available map of the whole country is the io-verst map (1:420,000), known as General J. A. Strelitzi's, and published 1865-1885. A topographic map (1:126,000) embracing the western part of the country of the Don Cossacks, is designed to be extended over the whole empire. Certain governments—Moscow, Kief, Volhyina, Bessarabia, the Crimea, &c.—have been published on a scale of 1:24,000, while Finland, as far as 61° N., was re-surveyed in 1870-1895, and a map on a scale of 1:42,000 is approaching completion.

Surveys in Asiatic Russia are conducted by the topographical departments organized at Oranburg, Tashkent, Omsk, Irkutsk, and Tiflis. To the latter we are indebted for a valuable map of Caucasus, 1:126,000, which since the first publication (1859-1883) has undergone careful revision. The Siberian departments have published a number of maps on a scale of 1:420,000. In addition to these the survey for the Trans-Siberian railway has been published on a scale of 1:630,000, as also maps of the Russo-Chinese frontier districts, 1:210,000 and 1:168,000. A map of Asiatic Russia, 1:420,000, by Bolshef, in 102 sheets, is in course of publication.

Passing to southern Europe we find that Portugal has completed a Charte chorographica (1:100,000) since 1886. In Spain a topographical survey on a scale of 1:210,000 has been in progress since 1870, but of the map of Spain in 1907 sheets on a scale of 1:50,000 only 150 had been issued by the deposito de la guerra up to 1910. Meanwhile reference may be made to B. F. Coello's Atlas de la España (1848-1890), the maps of which are on a scale of 1:200,000.

In Italy Tavolata rilevata on a scale of 1:25,000 or 1:50,000, with contours, based on surveys made 1862-1890, are being published, and a Carta del regno d'Italia, 1:100,000, is practically complete. There are a Carta idelogica and a Carta geologica on the same scale, and a Carta orografica on a scale of 1:50,000. Greece is still dependent upon foreigners for its maps, among which the Carte de Grèce (1:200,000) from rapid surveys made by General Palet in 1828, was published in a new edition in 1880. A similar map, mainly based upon surveys made by Austrian officers and revised by H. Kiepert (1:300,000), was published by the Military Geographical Institute of Vienna in 1885. Far superior to these maps is the Karte von Italien, 1:100,000 and 1:50,000 based upon careful surveys made by Russian officers and published by E. Curtius and J. H. Kaupert on behalf of the German Archaeological Institute in Athens (1878), or A. Philippson's map of the Peloponnese (1:300,000; 1901).

For maps of the Balkan Peninsula we are still largely indebted to the rapid surveys carried on by Austrian and Russian officers. The Austrian map of central Europe embraces the whole of the Balkan Peninsula on a scale of 1:200,000; the Russian surveys (1877-1879) are embodied in a map of the eastern part of the Balkan on a scale of 1:126,000, and a map of Bulgaria and southern Rumelia, on a scale of 1:200,000, both published in 1883. A map of Turkey in Europe, scale 1:210,000, was published by the Turkish general staff (1899), and another map, scale 1:250,000, by the intelligence division of the British war office is in progress since 1906. Bosnia and Herzegovina are now included with the surveys of the Austrian Empire, the kingdom of Servia has been surveyed (1886-1913) and the results published on a scale of 1:75,000; in eastern Rumania surveys have been in progress since 1874 and the results have been published on a scale of 1:50,000; a general map of the entire kingdom, scale 1:250,000, was published in 1906-1907; a map of Monte negro (1:75,000), based on surveys by Austrian and Russian officers, was published at Vienna in 1894.

In Asiatic Turkey several districts of historical interest have been surveyed, and surveys have likewise been made in the interest of railways, or by boundary commissions, but there is no such thing as a general survey carried on under the direction of government. We are thus, to a large extent, still dependent upon compilations, such as R. Kiepert's Asia Minor (1:400,000; 1904-1908), a map of Iran (1:126,000; 1904-1908), a map of Asia Minor published at Potsdam (1909), and another map (1:420,000), published by the Royal Geographical Society, or a Russian general map (1:630,000, published 1880-1895). Among maps based upon actual surveys those of Palestine, by Lieutenant G. R. Conder and H. H. (afterwards Lord) Kitchener (1:63,360, 1886), of the Sinai Peninsula by Sir C. W. Wilson and H. S. Palmer (1:126,730, 1870), of Arabia Petraea by Dr. A. Musil (1:300,000, 1907) or of the Aden territory (1903) are among the more interesting. Of Cyprus an excellent map from surveys by Major (Lord) H. H. Kitchener was published in 1884 (1:51,360).

In the case of Persia and Afghanistan we are still dependent upon compilations such as a Russian staff map (1:80,000, published in 1886), Colonel Sir T. H. Holdich's map of Persia (1:1,014,000, Simla, 1897-1899), or a smaller map (1:126,000 and 1:456,000), published by the geographical division of the general staff. The settlement of boundaries in northern Afghanistan (1883) and in Seistan (1879) has necessitated surveys of some interest.

A trigonometrical survey of British India was begun in 1800 and was proceeded with in most parts of the country, which is equal to those of most European states. The surveys are made on scales varying according to the necessities of the case or the nature of the country, and they have been extended since 1862 beyond the boundaries of India proper. Revenue surveys for land settlement are published on a scale of 1:4000, but the usual scale for topographical maps is 1:63,360. An Indian Atlas, on a scale of 1:255,000, includes also Ceylon and the Malay Peninsula, but although begun so long ago as 1827 many of its sheets are unpublished. There are in addition an official map of India (1:1,000,000), the first edition of which was published in 1903, as also maps of the great provinces of India, including Burma, all on a scale of 1:2,827,500, and a variety of physical and statistical maps. Ceylon and the Straits Settlements, with the Federal Malay States, have their own surveyors-general. The British North Borneo Company published a Map of British North Borneo, on a scale of 1:633,600 (1906).

In Siam a regular survey was organized by Mr. J. McCarthy (1881-1883), a former official of the Indian survey, which did good work in connexion with the determination of the Franco-Siamese frontier (1906). The surveys are made on the scales of 1:4000, 1:15,500, and 1:63,360.

In French Indo-China surveys have been in progress since 1881. The Bureau of the Indo-Chinese general staff, has published a map of Indo-China, including Cambodia, in 45 sheets (1:200,000, 1865), while to the service géographique de l'Indo-Chine, organized in 1899, we owe a Carte de l'Indo-Chine (1:500,000).

For China we are still largely dependent upon careful compilations like Baron F. von Richthofen's Atlas von China (1:750,000, 1893).
Berlin, 1885-1890) or Bretschneider's *Map of China* (1,400,000,000) a new edition of which appeared at St Petersburg in 1900. There are good survey maps of the British colony of Hong-Kong, of Wei-hai-Wei and of the country around Kiao-chou, and the establishment of topographical offices at Peking and Ngan-king holds out some promise of native surveys. In the meantime large scale maps prepared by European authorities are to be welcomed, such as maps of Chih-li and Shan-tung (1,700,000), from surveys by Russian officers, 1900-1905, maps on East China (1,170,000) and of Yun-nan by British, German and Indian officers, of the Indo-Chinese frontier (1,200,000, Paris 1908), and of the upper Yangtsze-kiang by S. Chevalier (Shanghai, 1900).

Japan has a regular survey department originated by Europeans and successfully carried on by natives. The primary triangulation was completed in 1856, a topographical map coloured geologically (1:200,000) was published 1889-1897, and in addition to this there are being published an agronomical map on a scale of 1:100,000 (since 1887) and others. The Japanese government has likewise published a map of Korea (1,100,000; 1898).

The Philippine Islands are represented in a carefully compiled map by C. W. Hodgson (111,155,000, New York, 1908). Of Java we possess an excellent topographical map based upon surveys made 1850-1887 (1,100,000). A similar map has been in progress for Sumatra since 1893, while the maps for the remaining Dutch Indies are still based, almost exclusively, upon flying surveys. For general purposes the *Atlas der Niederländischen Besitzungen in Ost-Indien* by J. N. Stemfropf and J. J. Tei Siethoff, of which a new edition has been published since 1900, may be consulted with confidence.

In Africa nearly all the international boundaries have been carefully surveyed and marked on the ground, since 1850, and yield a good basis as a guide for the map compiler.

**Africa.**

A general map of Africa, by Colonel Lannoy de Bissy, on a scale of 1:2,000,000 was first published in 1882-1888, but is carefully revised from time to time. The geographical section of the British general staff is publishing maps of all Africa on scales of 1:250,000 and 1:1,000,000. In Egypt excellent work has been done by a survey department organized and directed by Captain H. G. Lyons up to 1900. It has published a topographical map of the Nile valley (1,500,000), an irrigation map (1,100,000), a general map (1:250,000), numerous cadastral plans, &c. Work on similar lines is carried on in the Anglo-Egyptian Sudan. Algeria has been in course of survey since 1868, Tunis since 1876, and the results have been published on scales of 1:50,000 and 1:250,000. Of Morocco there are many maps, among which several compiled by the French Geographical Society of l' ORIGINAL are of the first importance, including a *Carte du Maroc* (1,200,000), in progress since 1900. In the British colonies of tropical and of South Africa1 surveys for the most part are carried on actively. Of the Gambia Colony there is a map by Major E. L. Cowie (1,250,000, 1904-1905); the survey of the Gold Coast Colony is being published by Major F. G. Guggensberg since 1907 (1,250,000 and 1,200,000); southern and northern Nigeria are adequately represented on the maps of the general staff (1,250,000). The states of British South Africa have each their surveyor-general, and a reconnaissance survey has been in progress since 1903. It is based upon a careful triangulation, superintended by Sir D. Gill, and carried in 1907 within 70 m of Lake Tanganyika. This survey is rapidly superseding other maps, such as the surveyor-general's map of Cape Colony (1,217,000); A. Duncan's map of the Orange River State (1,148,705; 1902-1904) and Jeppe's map of the Transvaal (1,470,000; 1899). The results of a survey of southern Rhodesia are given on the map of the British general staff (1,500,000; 1909), while of north-eastern Rhodesia we have an excellent map compiled by C. L. Beringer in 1907 (1,000,000). Surveys in British Central Africa were taken up in 1894; a survey of Lake Nyasa, by Lieut. E. L. Rhodes and W. B. Phillips, was published in 1902. As regards British East Africa and Uganda, the surveys in the latter (on scales of 1,100,000 and 1,250,000) have made considerable progress. The Victoria Nyanza was surveyed by Captain B. Whitehouse (1898-1900), and the results have been published on a scale of 1:20,000. These British possessions, together with the whole of Somaliland and southern Abyssinia, are satisfactorily represented on the maps of the British general staff, and others.

Maps of the French Africa Colonies have been published by the *Surveys* de l'Afrique occidentale et the service géographique des colonies. A map of Senegal (1,100,000) is in progress since 1905. The official maps of the other colonies have been compiled by A. Meunier between 1902 and 1909. They include French West Africa, (1,200,000; 2nd ed., 1908), French Guinea (1,500,000; 1902) and the Ivory Coast and Dahomey (1,500,000; 1907-1908). A map of the French Congo by J. Hansen (1,500,000), was published in 1907. In Madagascar a topographical bureau was established by General J. S. Gallieni in 1896, and the surveys are being published since 1900 on a scale of 1:100,000.

As regards the German colonies we are dependent upon compilations by R. Kiepert, P. Sprigade and M. Moisel. Good maps of the Portuguese colonies are to be found in an *Atlas colonial Portugais*, a second edition of which was published by the Comissão de Cartographia in 1900. Of the Congo State we have an official map on a scale of 1,200,000, published in 1907. Of Italian Eritrea we have excellent maps on various scales of 1,500,000, 1,250,000 and 1,500,000, based upon surveys made between 1888 and 1900.

In the states of Australia cadastral surveys conducted by surveyors-general have been in progress for many years, as also trigonometrical surveys (Western Australia excepted), and the publication of parish and township or county maps keeps pace with the settlement of the country; but with the exception of Victoria none of these states is in possession of a topographical map equal in accuracy to similar maps published in Europe. In Victoria the so-called geodetic survey was begun in 1858; the maps are published on a scale of 1:12,750. There exists also a general map, on a scale of 1:506,450. Maps on the same scale are available of New South Wales, South Australia and Tasmania, on a scale of 1,500,000 for Western Australia, on a scale of 1,253,460 for Queensland. There are likewise maps on smaller scales, which undergo frequent revision. The map of British New Guinea is on a scale of 1,330,300 (1898). New Zealand has a good general map on a scale of 1:633,700. A trigonometrical survey was given up and only details of immediate practical use are required. The "Lands Department" of the Fiji Islands has published a map on a scale of 1:138,000 (1909).

The cadastral surveys in Canada are carried on by a commission of Crown-lands in the old provinces and by a Dominion land office, which lays out townships as in the United States, but with greater accuracy. A surveyor-general is attached to the department of the interior, at Ottawa. He publishes the topographical maps (1,653,366) since 1906. They are based upon theodolite traverses 15 m. apart, and give the United States lake and coast surveys, the details being filled in by plane-table surveys on a scale of 1:311,680. The contours, 25 ft. apart, depend upon spirit-levelling. In the Rocky Mountains surveys photographic apparatus is successfully employed. The surveyor-general issues also "sectional maps" (1,100,000 and 1,400,000) and so-called "Standard" topographical maps for the thinly peopled west, on scales of 1,250,000 and 1,500,000. He is responsible likewise for maps of Yukon and of Labrador, supplied by the geological survey, the latter upon the plan of the Canadian department of military defence is publishing since 1904 topographical maps on scales of 1,653,366 and 1,261,732, with contours. A geodetic survey department, under Dr. W. F. King, chief astronomer of the Dominion, was established in 1900.

---

1 See "The Survey in British Africa": the *Annual Report of the Colonial Survey Commission*. 
MAP PROJECTIONS

Maps of Newfoundland, orographical as well as geological, scale 1:1,834,200, have been published.

In the United States a "geological survey" was organized in 1879, under Clarence King as director, whose successor, Major J. W. Powell, rightly conceived that it was necessary to produce good topographical maps before a geological survey could be pursued with advantage. It is under his wise guidance that the survey has attained its present efficiency. It is based upon a triangulation system made by the U.S. Coast and Geodetic Survey. The maps of the more densely peopled parts of the Union are published on a scale of 1:62,500, and those of the remainder of the country on half or a quarter of that scale. The hills are shown by contours at intervals of 10 or 100 ft. The details given are considered sufficient to admit of the selection of general routes for railways or other public works. The survey progresses at the rate of about 40,000 sq. m. annually, and in course of time it will supersede the map of the separate states, based on older surveys. A "reconnaissance" map of Alaska (on a scale of 1 : 250,000) was published in 1908.

In Mexico the surveys are in charge of a comision geografica-exploradora attached to the secretaria de Fomento, but only about 140 sheets of a Carta general on a scale of 1:100,000 have been published. There are also a map of the state of S. Luis Potosi (1 : 250,000), of the environs of Puebla (1 : 50,000) and a Carta general de la republica mexicana (1 : 250,000).

A useful map of Central America has been published by the topographical section of the British general staff on a scale of 1 : 170,300. Of great value for cartographical work is a careful survey, carried out by the American engineer, J. B. (1897-1898), for a continental railway running along the west coast from Mexico to Chile. In South America, in proportion to the area of the country, only few surveys of a thoroughly scientific nature have been made, and it is therefore satisfactory that the service geografique of the French army should be publishing, since 1900, a map of the entire continent on a scale of 1 : 1,000,000.

Colombia is but inadequately represented by rough maps. For Colombia we have F. L. Vergara y Velasco's Atlas de geografia colombiana (1906-1908); Ecuador is fairly well represented by Th. Wolf (1892) and Hans Meier (1907); in the case of Peru we still largely depend upon Paz Soldan's Atlas de geografia (1865-1867) and A. Raimondi's Mapa del Peru (1 : 500,000) based upon surveys made before 1869. Sir Martin Conway's 'Map of the Andes of La Paz' (1 : 600,000; 1900) as well as Major P. H. Fawcett's survey of the Brazilian boundary (1906-1907) are welcome additions to our knowledge of Bolivia.

In Chile a comision topografica was appointed as long ago as 1848, but the map produced under its auspices by Professor F. Pissis (1 : 250,000, 1870-1877), leaves much to be desired. Since that time, however, valuable maps have been published by an Oficina de mensura de tierras, by a seccion de geografia y minas connected with the department of public works, by the Oficina hidrografica, and more especially in connexion with surveys necessitated by the boundary disputes with Argentina, which were settled by arbitration in 1899 and 1902. The surveys which led to the latter were conducted by Sir Thomas Holdich.

In Venezuela a commission for producing a plano militar or military map of the country was appointed by General Castro in 1904, but little progress seems to have been made, and meantime we are dependent upon a revised edition of A. Codol's map of the country, published in 1881. In Brazil little or nothing is done by the central government, but the progressive states of Sao Paulo and Mines Geraias have comissões geograficas e geologicos engaged in the production of topographical maps. Valuable materials have likewise been acquired by several river surveys including those of the Amazonas by Azevedo and Pinto (1862-1864) and W. Chandlees (1865-1866) and of the Rio Madeira by Colonel G. Earl Church and Keller-Leuzinger (1869-1873). The proposal of a committee presided over by the Marshal H. de Beunepaire-Rehan (1876) to prepare a map of Brazil on a scale of 1 : 200,000 has never been acted upon, and in the meantime we are dependent upon works like the Atlas do imperio do Brasil by Mendes de Almeida (1868) or the maps in our general atlases.

In Argentina an official geographical institute was established in 1879, but neither A. Seelstrang's Atlas (1886-1892) nor H. Kosskold's Mapa toponografico (1 : 2,000,000; London, 1895), which were published by it, nor any of the numerous provincial maps are based upon scientific surveys.

It need hardly be said that hydrographic surveys have been of great service to compilers of maps. There are few coast-lines, frequented by shipping, which have not yet been surveyed in a manner sufficient for marine use. In this work the British hydrographic office may justly claim the credit of having contributed the chief share. Great Britain has likewise taken the lead in those deep-sea explorations which reveal to us the configuration of the sea-bottom, and enable us to construct maps of the ocean bed corresponding to the contoured maps of dry land yielded by topographical surveys.

(E. G. R.)

MAP PROJECTIONS

In the construction of maps, one has to consider how a portion of a spherical surface, or a configuration traced on a sphere, can be represented on a plane. If the area to be represented bear a very small ratio to the whole surface of the sphere, the matter is easy: thus, for instance, there is no difficulty in making a map of a parish, for in such cases the curvature of the surface does not make itself evident. If the district is larger and reaches the size of a county, as Yorkshire for instance, then the curvature begins to be sensible, and one requires to consider how it is to be dealt with. The sphere cannot be opened out into a plane like the cone or cylinder; consequently in a plane representation of configurations on a sphere it is impossible to retain the desired proportions of lines of areas or equality of angles. But thought the solution of the requirements of the case, we may fulfil some by sacrificing others; we may, for instance, have in the representation exact similarity to all very small portions of the original, but at the expense of the areas, which will be quite misrepresented. Or we may retain equality of areas if we give up the idea of similarity. It is therefore usual, excepting in special cases, to steer a middle course, and, by making compromises, endeavour to obtain a representation which shall not involve large errors of scale.

A globe gives a perfect representation of the surface of the earth, but, practically, the necessary limits to its size make it impossible to represent in this manner the details of countries. A globe of the ordinary dimensions serves scarcely any other purpose than to convey a clear conception of the earth's surface as a whole, exhibiting the figure, extent, position and general features of the continents and islands, with the intervening oceans and seas; and for this purpose it is indeed absolutely essential and cannot be replaced by any kind of map.

The construction of a map virtually resolves itself into the drawing of two sets of lines, one set to represent meridians, the other to represent parallels. These being drawn, the filling in of the outlines of countries presents no difficulty. The first and most natural idea that occurs to one as to the manner of drawing the circles of latitude and longitude is to draw them according to the laws of perspective. Perhaps the next idea which would occur would be to derive the meridians and parallels in some other simple geometrical way.

Cylindrical Equal Area Projection.—Let us suppose a model of the earth to be enveloped by a cylinder in such a way that the cylinder touches the equator, and let the plane of each parallel such as PR be prolonged to intersect the cylinder in the circle pr. Now unroll the cylinder and the projection will appear as in fig. 2. The whole world is now represented as a rectangle, each parallel is a straight line, and its total length is the same as that of the equator, the distance of each parallel from the equator is sin l (where l is the latitude and the radius of the model of the earth is taken as unity). The meridians are parallel straight lines spaced at equal distances.
This projection possesses an important property. From the elementary geometry of sphere and cylinder it is clear that each
strip of the projection is equal in area to the zone on the model which it represents, and that each portion of a strip is equal in area to the corresponding portion of a zone. Thus, each small four-sided figure (on the model) bounded by meridians and parallels is represented on the projection by a rectangle which is of exactly the same area, and this applies to any such figure however small. It therefore follows that any figure, of any shape on the model, is correctly represented as regards area by its corresponding figure on the projection. Projections having this property are said to be equal-area projections or equivalent projections; the name of the projection just described is the cylindrical equal-area projection. This projection will serve to exemplify the remark made in the first paragraph that it is possible to select certain qualities of the model which shall be represented truthfully, but only at the expense of other qualities. For instance, it is clear that in this case all meridian lengths are too small and all lengths along the parallels, except the equator, are too large. Thus although the areas are preserved the shapes are, especially away from the equator, much distorted.

The property of preserving areas is, however, a valuable one when the purpose of the map is to exhibit areas. If, for example, it is desired to give an idea of the area and distribution of the various states comprising the British Empire, this is a fairly good projection. Mercator's, which is commonly used in atlases, preserves local shape at the expense of area, and is valueless for the purpose of showing areas.

Many other projections can be and have been devised, which depend for their construction on a purely geometrical relationship between the imaginary model and the plane. Thus projections may be drawn which are derived from cones which touch or cut the sphere, the parallels being formed by the intersection with the cones of planes parallel to the equator, or by lines drawn radially from the centre. It is convenient to describe all projections which are derived from the model by a simple and direct geometrical construction as "geometrical projections." Other projections may be known as "non-geometrical projections." Geometrical projections, which include perspective projections, are generally speaking of small practical value. They have been used much more largely on the map-maker's horizon than their importance warrants. It is not going too far to say that the expression "map projection" conveys to most well-informed persons the notion of a geometrical projection; and yet by far the greater number of useful projections are non-geometrical. The notion referred to is no doubt due to the very term "projection," which unfortunately appears to indicate an arrangement of the terrestrial parallels and meridians which can be arrived at by direct geometrical construction. Especially has harm been caused by this idea when dealing with the group of conical projections. The most useful conical projections have nothing to do with the secant cones, but are simply projections in which the meridians are straight lines which converge to a point which is the centre of the circular parallels. The number of really useful geometrical projections may be said to be four: the equal-area cylindrical just described, and the following perspective projections—the central, the strophoergic and Clarke's external.

**Perspective Projections.**

In perspective drawings of the sphere, the plane on which the representation is actually made may generally be any plane perpendicular to the line joining the centre of the sphere and the point of vision. If \( V \) be the point of vision, \( P \) any point on the spherical surface, then \( P \), the point in which the straight line \( VP \) intersects the plane of the representation, is the projection of \( P \).

**Orthographic Projection.**—In this projection the point of vision is at an infinite distance and the rays consequently parallel; in this case the plane of the drawing may be supposed to pass through the centre of the sphere. Let the circle (fig. 3) represent the plane of the equator on which we propose to make an orthographic representation of meridians and parallels. The centre of this circle is clearly the projection of the pole, and the parallels are projected into circles having the pole for a common centre. The diameters \( aa' \), \( bb' \) being at right angles, let the semicircle \( bab' \) be divided into the required number of equal parts; the diameters drawn through these points are the projections of meridians. The distances of \( c \), of \( d \) and of \( e \) from the diameter \( aa' \) are the radii of the successive circles representing the parallels.

It is clear that, when the points of division are very close, the parallels will be very much crowded towards the outside of the map; so much so, that this projection is not much used.

For an orthographic projection of the globe on a meridian plane let \( qmz \) (fig. 4) be the meridian, \( nz \) the axis of rotation, then \( qr \) is the projection of the equator. The parallels will be represented by straight lines passing through the points of equal division; these lines are, like the equator, perpendicular to \( nz \). The meridians will in this case be ellipses described on \( nz \) as a common major axis, the distances of \( c \), of \( d \) and of \( e \) from \( nz \) being the minor semilaxes.

**Orthographic Projection.**

Let us next construct an orthographic projection of the sphere on the horizon of any place. Set off the angle \( aop \) (fig. 5) from the radius \( ao \), equal to the latitude. Drop the perpendicular \( pt \) on \( ao \), then \( P \) is the projection of the pole. On \( ao \) produced take \( ob = PP \), then \( ob \) is the minor semiaxis of the ellipse representing the equator, its major axis being \( qr \) at right angles to \( ao \). The points in which the meridians meet this elliptic equator are determined by lines drawn parallel to \( aob \) through the points of equal subdivision \( edefg \). Take two points, as \( d \) and \( g \), which are \( po' \) apart, and let \( sk \) be their projections on the equator; then \( f \) is the pole of the meridian which passes through \( k \). This meridian is of course an ellipse, and is described with reference to \( f \) exactly as the equator was described with reference to \( P \). Produce \( io \) to \( i ' \), and make \( io \) equal to half the shortest chord that can be drawn through \( f \); then \( io \) is the semi-axis of the elliptic meridian, and the major axis is the diameter perpendicular to \( io \).

For the parallels: let it be required to describe the parallel whose co-latitude is \( u' \); take \( pm = pm' = u \), and let \( mm' \) be the projections of \( mm' \) and \( u \) on \( aP' \); then \( mm' \) is the minor axis of the ellipse representing the parallel. Its centre is of course midway between \( mm' \) and \( u' \), and the greater axis is equal to \( pm \). Thus the construction is obvious. When \( pm \) is less than \( po \) the whole of
the ellipse to be drawn. When \( pm \) is greater than \( ph \) the ellipse touches the circle in two points; these points divide the ellipse into two parts, one of which, being on the other side of the meridian plane \( pm \), is invisible. Fig. 6 shows the complete orthographic projection.

**Stereographic Projection.**—In this case the point of vision is on the surface, and the projection is made on the plane of the great circle whose pole is \( V \). Let \( kpl \) (fig. 7) be a great circle through the point of vision, and \( ors \) the trace of the plane of projection.

Let \( c \) be the centre of a small circle whose radius is \( cp=c; \) the straight line \( pl \) represents this small circle in orthographic projection.

We have first to show that the stereographic projection of the small circle \( pl \) is itself a circle; that is to say, a straight line through \( V \) moving along the circumference of \( pl \), traces a circle on the plane of projection \( ors \). This line generates an oblique cone standing on a circular base, its axis being \( eV \) (since the angle \( Vc-\angle eV0 \)); this cone is divided symmetrically by the plane of the great circle \( kpl \), and also by the plane which passes through the axis \( Vc \), perpendicular to the plane \( kpl \). Now \( Vr-Vp \), being \( \varphi \) sec \( kVp-Vc \cos kVp=Vc-Vk \), is equal to \( Vr-Vi \); therefore the triangles \( VrK \), \( VpK \) are similar, and it follows that the section of the cone by the plane \( r \) is similar to the section by the plane \( pl \).

But the latter is a circle, hence also the projection is a circle; and since the representation of every infinitely small projection is itself a circle, it follows that the projection of the representation of small parts is strictly similar. Another inference is that the angle in which two lines on the sphere intersect is represented by the same angle in the projection, which may otherwise be proved by means of fig. 8, where \( kpl \) is the diameter of the sphere passing through the point of vision, \( fcl \) the plane of projection, \( kpl \) a great circle, passing of course through \( V \), and \( s\) the line of intersection of these two planes. A tangent plane to the surface at \( t \) cuts the plane of projection in the line \( rs \) perpendicular to \( to; \) it is a tangent to the circle \( at \) and \( ir \) are any two tangents to the surface at \( t \). Now the angle \( vsl \) (being the projection of \( l \)) is therefore \( vsl=\theta, \) for \( vsl=\theta, \) \( vsl=\tan \theta \), therefore \( vsl=\theta, \) and since \( tes \) and \( wes \) are right angles, it follows that the angles \( rs \) and \( ws \) are equal. Hence the angle \( rs \) is also equal to its projection \( rs \); that is, any angle formed by two intersecting lines on the surface is truly represented in the stereographic projection.

In this projection, therefore, angles are correctly represented and every small triangle is represented by a similar triangle. Projections having this property of similar representation of small parts are called orthomorphic, conform or conformable.

The word orthomorphic, which was introduced by Germain 1 and adopted by Craig 2 is perhaps the best to use.

Since in orthomorphic projections very small figures are correctly represented, it follows that the scale is the same in all directions round a point in its immediate neighbourhood, and orthomorphic projections may be defined as possessing this property. There are many other orthomorphic projections, of which the best known is Mercator's. These are described below.

We have seen that the stereographic projection of any circle of the sphere is itself a circle. But in the case in which the circle to be projected passes through \( V \), the projection becomes, for a great circle, a line through the centre of the sphere; otherwise, a line anywhere. It follows that meridians and parallels are represented in a projection on the horizon of any place by two systems of orthogonally cutting circles, one system passing through two fixed points, namely, the poles; and the projected meridians as they pass through the poles show the proper differences of longitude.

To construct a stereographic projection of the sphere on the horizon of a given place. Draw the circle \( kpl \) (fig. 9) with the diameters

1 A. Germain, Tracté des Projections (Paris, 1865).

\[ \theta, \phi \text{ at right angles; the latter is to represent the central meridian. Take } kpl \text{ equal to the co-latitude of the place to be projected; then, if } \theta \text{ is the angle } kpl \text{ makes with the angle } \phi \text{; then } \phi \text{ is the centre of the required circle, whose direction as it passes through } \theta \text{ will make an angle } \phi \text{ with } \phi. \]

The lengths of the several lines are

\[ \phi=\tan \theta; \phi'=\cot \phi; \phi=\cot \theta; \phi'=\cot \phi. \]

Again, for the parallels, take \( Pb=Pc \) equal to the co-latitude, say \( c \), of the parallel to be projected; join \( sc \) cutting \( ir \) in \( d \). Then \( ed \) is the diameter of the circle which is the required projection; its centre is of course the middle point of \( ed \), and the lengths of the lines are

\[ od=\tan \theta (u-c); \quad oe=\tan \theta (u+c). \]

The line \( sm \) itself is the projection of a parallel, namely, that of which the co-latitude \( c=180^\circ-u \), a parallel which passes through the point of vision.

Notwithstanding the facility of construction, the stereographic projection is not much used in map-making. It is sometimes used for maps of the hemispheres in atlases, and for star charts.

**External Perspective Projection.**—We now come to the general case in which the point of vision has any position outside the sphere.

The great circle section of the sphere by a plane passing through \( V \), the central point of the portion of surface to be represented, and \( V \) the point of vision. Let \( p \) perpendicular to \( Vc \) be the plane of representation, join \( mV \) passing \( p \) in \( f \), then \( f \) is the projection of any point \( m \) in the circle \( abc \), and \( fe \) is the representation of \( cm \).

Let the angle \( com=\theta, \quad Ve=k, \quad Vs=\theta, \quad Vs=P \); then, since \( fV=mg; \quad gV, \quad we \) have \( p=\tan \theta (u-k \cos u) \), which gives the law connecting the spherical distance \( u \) with its rectilinear representation \( p \). The relative scale at any point in this system of projection is given by

\[ s=\sin \theta \tan (\theta +\tan \theta) \]

the former applying to measurements made in a direction which passes through the centre of the map, the latter to the transverse direction. The product \( s \) gives the exaggeration of scale. With the aid of any alteration in \( \theta \) we have \( s=\tan \theta (u+k \cos u) \), and the greatest alteration of angle is

\[ \sin \theta \tan (\theta +\tan \theta) \]

This vanishes when \( h=1 \), that is if the projection be stereographic; or for \( h=0 \), that is at the centre of the map. At a distance of \( h \) from the centre, the greatest alteration is \( 90^\circ -2 \cot 2\theta \). (See Phil. Mag. 1862.)

**Clark's Projection.**—The constants \( h \) and \( k \) can be determined, so that the total misrepresentation of meridians and parallels is a minimum. In any particular case this maximum can only be ascertained by trial, that is to say, log \( H \)-log \( H' \) must be calculated for certain equidistant values of \( h \), and then the
particular value of $h$ which corresponds to the required maximum can be obtained by interpolation. Thus we find that if it be required to make the best possible perspective representation of a hemisphere, the values of $h$ and $k$ are $h = 1.47$ and $k = 2.034$; so that in this case

$$\rho = 2.034 \sin \mu$$

For a map of Africa or South America, the limiting radius $\beta$ we may take as $40^\circ$; then in this case

$$\rho = 2.543 \sin \mu.$$  

For Asia, $\beta = 54$, and the distance $h$ of the point of sight in this case is $1.61$. Fig. 11 is a map of Asia having the meridians and parallels laid down on this system.

---

**MAP**

Fig. 12 is a perspective representation of more than a hemisphere, the radius $\beta$ being $108^\circ$, and the distance $h$ of the point of vision, $1.49$.

The co-ordinates $xy$ of any point in this perspective may be expressed in terms of latitude and longitude of the corresponding point on the sphere in the following manner. The co-ordinates originating at the centre take the central meridian for the axis of $y$ and a line perpendicular to it for the axis of $x$. Let the latitude of the point $G$, which is to occupy the centre of the map, be $\gamma$; if $\phi, \omega$

be the latitude and longitude of any point $P$ (the longitude being reckoned from the meridian of $G$), $r$ the distance $PG$, and $\mu$ the azimuth of $P$ at $G$, then the spherical triangle whose sides are $90^\circ - \gamma$, $90^\circ - \phi$, and $\omega$ gives these relations—

$$\sin \mu = \cos \phi \sin \omega,$$

$$\sin \mu = \cos \gamma \sin \phi - \sin \gamma \cos \phi \cos \omega,$$

$$\cos \mu = \sin \gamma \sin \phi + \cos \gamma \cos \phi \cos \omega.$$ 

Now $x = r \sin \mu$, $y = r \cos \mu$, that is,

$$\frac{x}{\rho} = \cos \phi \sin \omega,$$

$$\frac{y}{\rho} = \cos \gamma \sin \phi - \sin \gamma \cos \phi \cos \omega.$$ 

by which $x$ and $y$ can be computed for any point of the sphere. If from these equations we eliminate $\omega$, we get the equation to the parallel whose latitude is $\phi$: it is an ellipse whose centre is in the central meridian, and its greater axis perpendicular to the same. The radius of curvature of this ellipse at its intersection with the centre meridian is $h \cos \phi (h \sin \gamma + \sin \phi)$.

The elimination of $\phi$ between $x$ and $y$ gives the equation of the meridian whose longitude is $\omega$, which also is an ellipse whose central and axes may be determined.

The following table contains the computed co-ordinates for a map of Africa, which is included between latitudes $40^\circ$ north and $40^\circ$ south and $40^\circ$ of longitude east and west of a central meridian.

**Central or Gnomic (Perspective) Projection.**—In this projection the eye is imagined to be at the centre of the sphere. It is evident that, since the planes of all great circles of the sphere pass through the centre, the representations of all great circles on this projection will be straight lines, and this is the special property of the central projection, that any great circle (i.e., shortest line on the spherical surface) is represented by a straight line. The plane of projection may be either parallel to the plane of the equator, in which case the parallels are represented by concentric circles and the meridians by straight lines radiating from the common centre; or the plane of projection may be parallel to the plane of some meridian, in which case the meridians are parallel straight lines and the parallels are hyperbolas; or the plane of projection may be inclined to the axis of the sphere at any angle $\lambda$.

In the latter case, which is the most general, if $\theta$ is the angle any meridian makes (on paper) with the central meridian, $\delta$ the longitude of any point $P$ with reference to the central meridian, $l$ the latitude of $P$, then it is clear that the central meridian is a straight line at right angles to the equator, which is also a straight line, also $\tan \theta = \sin \gamma \tan \omega$, and the distance of $P$, the projection of $P$, from the equator along its meridian is (on paper) $m \sec \gamma \sin \delta / \sin (\delta + \lambda)$, where $\tan \gamma = \cot \lambda \cos \delta$, and $m$ is a constant which defines the scale.

The three varieties of the central projection are, as is the case with other perspective projections, known as polar, meridian or horizontal, according to the inclination of the plane of projection.

Fig. 14 is an example of a meridian central projection of part of the Atlantic Ocean. The term "gnomic" was applied.
MAP PROJECTIONS

MAP

to this projection because the projection of the meridians is a
similar problem to that of the graduation of a sun-dial. It is,
however, better to use the term "central", which explains itself.
The central projection is used for the study of direct routes by sea and
land. The United States Hydrographic Department has
published some charts on this projection. False
notions of the direction of shortest lines, which are
generated by a study of the parallels of a central
projection, may be cor-
rected by an inspection of maps drawn on the
central projection.

There is no projection which accurately possesses
the property of showing shortest paths by straight
lines when applied to the
spheroid; one which very
nearly does so is that which results from the intersection of
terrestrial normals with a plane.

We have briefly reviewed the most important projections
which are derived from the sphere by direct geometrical con-
struction, and we pass to that more important branch of the subject
which deals with projections which are not subject to this
limitation.

Conical Projections.

Conical projections are those in which the parallels are repre-
sented by concentric circles and the meridians by equally spaced
radii. There is no necessary connexion between a conical pro-
jection and any touching or secant cone. Projections for instance
which are derived by geometrical construction from secant cones
are very poor projections, exhibiting large errors, and they will
not be discussed. The name conical is given to the group
embraced by the above definition, because, as is obvious, a
projection so drawn can be bent round to form a cone. The
simplest and, at the same time, one of the most useful forms of
conical projection is the following:

Conical Projection with Rectified Meridians and Two Standard
Parallels.—In some books this has been, most unfortu-
ately, termed the "secant conical," on account of the fact that there
are two parallels of the correct length.

The use of this term in the
caused much confusion. Two selected
parallel arcs are represented by concentric cir-
cular arcs of their true lengths; the
meridians are their radii. The
degrees along the meridians are represented by
their true lengths; and the other parallels
are circular arcs through points so deter-
mined and are concentric with the chosen
parallels.

Thus in fig. 15 two parallels Gm and G'm' are represented by their
true lengths on the sphere: all the distances along the
meridian PGG', PP'm' the true spherical lengths rectified.

Let \( y \) be the co-latitude of Gm; \( \gamma \) that of G'm'; \( u \) be the angle at G1 and OD = \( r \), where PP is the representation of the pole. Then the true length of
the parallel Gm on the sphere is \( \omega \sin \gamma = hu(\gamma + \pi) \); similarly \( \omega \sin \gamma' = hu(\gamma' + \pi) \).

The radius of the sphere is assumed to be unity, and \( z \) and \( y \) are expressed in circular measure. Hence \( h = \sin \gamma (\pi + \gamma) = \sin \gamma' (\pi + \gamma') \); from this \( h \) and \( z \) are easily found.

In the above description it has been assumed that the two
errorless parallels have been selected. But it is usually desirable
to impose some condition which itself will fix the errorless
parallels. There are many conditions, any one of which may be
imposed. In fig. 15 let \( Cm \) and \( C'm' \) represent the extreme
parallels of the map, and the co-latitudes of these parallels be \( c \) and \( c' \), then any one of the following conditions may be
fulfilled:

(a) The errors of scale of the extreme parallels may be made
equal and may be equated to the error of scale of the parallel
of maximum error (which is near the mean parallel).

(b) Or the errors of scale of the extreme parallels may be
equated to that of the mean parallel. This is not so good a
projection as (a).

(c) Or the absolute errors of the extreme and mean parallels
may be equated.

(d) Or in the last the parallel of maximum error may be
considered instead of the mean parallel.

(e) Or the mean length of all the parallels may be made correct. This
is equivalent to making the total area between the extreme
parallels correct, and must be combined with another
condition, for example, that the errors of scale on the extreme
parallels shall be equal.

We will now discuss (a) above, viz. a conical projection with recti-
ced meridians and two standard parallels, the scale errors of
the extreme parallels and parallel of maximum error being equated.

Since the scale errors of the extreme parallels are to be equal,
\[
\frac{h(c + c')}{\sin c - 1} = \frac{h(c + c')}{\sin c' - 1}, \text{ whence } c' = c - \frac{\sin c}{\sin c' - \sin c}.
\]

The error of scale along any parallel (near the centre), of which
the co-latitude is \( b \), is
\[
1 = \frac{1}{\sin b}.
\]

This is a maximum when
\[
\tan b = \frac{\pi}{n}, \text{ whence } b \text{ is found.}
\]

Also
\[
1 = \frac{h(c + c')}{\sin c} - 1, \text{ whence } h \text{ is found.}
\]

For the errorless parallels of co-latitudes \( \gamma \) and \( \gamma' \) we have
\[
h = (\gamma + \pi)\sin (\gamma + \gamma')\sin \gamma'.
\]

If this is applied to the case of a map of South Africa between the
limits 15° S. and 33° S. (see fig. 16) it will be found that the parallel
of maximum error is 29° 10'; the errorless parallels, to the nearest
degree, are those of 18° and 32°. The greatest scale error in this
case is about 0-7%.

In the above account the earth has been treated as a sphere.
Of course its real shape is approximately a spheroid of revolution,
and the values of the axes most commonly employed are those of
Clarke or of Bessel. For the spheroid, formulae arrived at by
the same principles but more cumbersome in shape must be used.
But it will still be sufficiently accurate for the selection of the errorless parallels
to use the simple spherical formulae given above; then, having
made the selection of these parallels, the true spheroidal lengths along the
meridians between them can be taken out of the ordinary tables
(such as those published by the Ordnance Survey or by the U.S.
Coast and Geodetic Survey). Thus, if \( a, a' \) are the lengths of \( i \)
the errorless parallels (taken from the tables), of the true rectified
length of the meridian arc between them (taken from the tables),
\[
h = (a(\pi - a)/d)180/\pi,
\]
and the radius on paper of parallel, \( a \), is \( a(\pi - a)/d \), and the radius
of any other parallel is radius of \( a \) plus \( a(\pi - a)/d \) the true meridian distance
between the parallels.

This class of projection was used for the 1/1,000,000 Ordnance
map of the British Isles. The three maximum scale errors in this
case work out to 0-23%, the range of the projection being from
50° S. to 61° N., and the errorless parallels are 49° 31' and 51° 14'.

Where no great refinement is required it will be sufficient to take
the errorless parallels as those distant from the extreme parallels
about one-sixth of the total range in latitude. Thus suppose it is
required to plot a projection for India between latitudes 8° S. and 40° N.
By this rough rule the errorless parallels should be distant from the
extreme parallels about 32° 76', i.e. 5° 20'; they should therefore,
to the nearest degree, be 13° and 35° N. The maximum scale errors
will be about 0-3%.

The scale errors vary approximately as the square of the range of
latitude; a rough rule, is, largest scale error = \( L/50,000 \), where \( L \)
the range in the latitude in degrees. Thus a country with a range of
2° in latitude (nearly 500 m.) can be plotted on this projection with
a maximum linear scale error (along a parallel) of about 0-1%;
there is no error along any meridian. It is immaterial with this

1 This error is much less than that which may be expected from contraction and expansion of the paper upon which the projection is drawn or printed.
projection (or with any conical projection) what the extent in longitude is. It is clear that this class of projection is accurate, simple and useful.

(From Text Book of Topographical Surveying, by permission of the Controller of H. M. Stationery Office.)

Figure 16.—South Africa on a conical projection with rectified meridians and two standard parallels. Scale 800 m. to 1 in.

In the projections designated by (c) and (d) above, absolute errors of length are considered in the place of errors of scale, i.e., between any two meridians (c) the absolute errors of length of the extreme parallel are equated to the absolute error of length of the middle parallel. Using the same notation

\[ h = \sin \phi = \sin \left(\frac{c + c'}{2}\right) \]

L. Euler, in the Acta Acad. Imp. Petrop. (1778), first discussed this.

If a map of Asia between parallels 10° N. and 70° N. is constructed on this system, we have \( c = 20° \), \( c' = 80° \), whence from the above equations \( s = 66.7° \) and \( h = 61.38° \). The absolute errors of length along parallels 10°, 40°, and 70° between any two meridians are equal but the scale errors are respectively 5, 6, and 15%.

The modification (d) of this projection was selected for the 11,000,000 map of India and Adjacent Countries under publication by the Survey of India, in accord with this is given in a pamphlet produced by that department in 1903. The limiting parallels are 8° and 40° N., and the parallel of greatest error is 25° 40' 51".

The errors of scale are 1.1, 2.3, and 1.9%.

It is not as a rule desirable to select this form of the projection. If the surface of the map is everywhere equally valuable it is clear that an arrangement by which errors of scale are larger towards the pole than towards the equator is unsound, and it is to be noted that in the case quoted the great bulk of the land is in the north of the map. Projection (a) would for the same region have three equal maximum scale errors of 2.5%.

It may be admitted that the practical difference between the two constructions in this paper is insignificant, but linear scale errors should be reduced as much as possible in maps intended for general use.

f. In the fifth form of the projection, the total area of the projection between the extreme parallels and any two meridians is equated to the area of the portion of the sphere which it represents, and the errors of scale of the extreme parallels are equated. Then it is easy to show that

\[ s = \left(\frac{c + c'}{2}\sin c\sin c'\right) \left(\sin c' - \sin c\right) \]

\[ h = \left(\cos c - \cos c'\right) \left(\cos c' - \cos c\right) \left(\cos c + \cos c'\right) \]

It can also be shown that any other zone of the same range in latitude will have the same scale errors along its limiting parallels. For instance, a series of projections may be constructed for zones each having a range of 10° of latitude, from the equator to the pole. Treating the earth as a sphere and using the above formulae, the series will possess the following properties: the meridians will all be true to scale, the area of each zone will be correct, the scale errors of the limiting parallels will all be the same, that the length of the upper parallel of any zone will be equal to that of the lower parallel of the zone above it. But the curvatures of these parallels will be different, and two adjacent zones will not fit but will be capable of exact rolling contact. Thus a very instructive flat model of the globe may be constructed which will show by suitably arranging the points of contact of the zones the paths of great circles on the sphere. The flat model was devised by Professor J. D. Everett, F.R.S., who also pointed out that the projection had the property of the equality of scale errors of the limiting parallels for zones of the same width. The projection may be termed Everett's Projection.

Simple Conical Projection.—If in the last group of projections the two selected parallels which are to be errorless approach each other indefinitely closely, we get a projection in which all the meridians are, as before, of the true rectified lengths, in which one parallel is errorless, the curvature of that parallel being clearly that which would result from the unrolling of a cone touching the sphere along the parallel represented. And it was in fact originally by a consideration of the tangent cone that the whole group of conical projections came into being. The quasi-geometrical way of regarding conical projections is legitimate in this instance.

The simple conical projection is therefore arrived at in this way: imagine a cone to touch the sphere along any selected parallel, the radius of this parallel on paper (Pp, fig. 17) will be \( r \cot \phi \), where \( r \) is the radius of the sphere and \( \phi \) is the latitude; or if the spheroidal shape is taken into account, the radius of the parallel on paper will be \( v \cot \phi \) where \( v \) is the normal terminated by the minor axis (the value \( v \) can be found from ordinary geodetic tables). The meridians are generators of the cone and every parallel such as HII is a circle, concentric with the selected parallel PP and distant from it the true rectified length of the meridian are between them.

This projection has no merits as compared with the group just described. The errors of scale along the parallels increase rapidly as the selected parallel is departed from, the parallels on paper being always too large. As an example we may take the case of a map of South Africa of the same range as that of the example given in (a) above, viz. from 15° S. to 35° S. Let the selected parallel be 25° S.; the radius of this parallel on paper (taking the radius of the sphere as unity) is \( c = 25° \); the radius of parallel 35° S., radius of 25° S.—meridian at 35° N. = in. 0.0131. Also \( h = \sin \phi = \sin 25° \), and length on paper along parallel 35° of \( \omega = \sin \phi \times 1 \times 970 = \sin 25° \times 1 \times 970 \times \sin 25° \), but length on sphere of \( \omega = \cos 35° \), hence scale error = \( \frac{1}{10} \times 970 \sin 25° \cos 35° = 1 - 1\frac{1}{6} \), an error which is more than twice as great as that obtained by method (a).

Bonne's Projection.—This projection, which is also called the "modified conical projection," is derived from the simple conical, just described, in the following way: a central meridian is chosen and drawn as a straight line; degrees of latitude spaced at the true rectified distances are marked along this line; the parallels are concentric circular arcs drawn through the proper points on the central meridian, the arcs being fixed by describing one chosen parallel with a radius of \( v \cot \phi \) as before; the meridians on each side of the central meridian are drawn as follows: along each parallel distances are marked equal to the true lengths along the parallels on sphere or spheroid, and the curve through corresponding points of fixed are the meridians (fig. 18).

This system is that which was adopted in 1803 by the "Départ de la Guerre" for the map of France, and is there known by the title of Projection de Bonne. It is that on which the ordnance street map of Scotland on the scale of 1 in. to a mile is constructed, and it is frequently met with in ordinary atlases. It is ill-adapted for countries having great extent in longitude, as the intersections of the meridians and parallels become very oblique—as will be seen on examining the map of Asia in most atlases.

If \( \phi_0 \) be taken as the latitude of the centre parallel, and co-ordinates be measured from the intersection of this parallel with the central meridian, then, if \( r \) be the radius of the parallel of latitude, we have \( r = \cos \phi_0 \), \( r_0 = \phi_0 \). Also, if \( S \) be a point on this parallel whose co-ordinates are \( x, y \), so that \( VS = r_0 \), and \( \theta \) be the angle VS makes with the central meridian, then \( \theta = \omega \times \cos \phi_0 \), and \( x = \sin \theta \), \( y = \phi_0 - \rho \cos \theta \).

The projection has the property of equal areas, since each small element bounded by two infinitely close parallels is equal in length and width to the corresponding element on the sphere or spheroid. Also all the meridians cross the chosen parallel (but no other) at right angles, since in the immediate neighbourhood of that parallel the projection is identical with the simple conical projection. Where an equal-area projection is required for a country having no great extent in longitude, such as France, Scotland or Madagascar, this projection is a good one to select.

Sinusoidal Equal-area Projection.—This projection, which is
sometimes known as Sanson's, and is also sometimes incorrectly called Flamsteed's, is a particular case of Bonne's in which the selected parallel is the equator. The equator is a straight line at right angles to the central meridian which is also a straight line. Along the central meridian the latitudes are marked off at the true rectified distances, and from points so found the parallels are drawn as straight lines parallel to the equator, and therefore at right angles to the central meridian. True rectified lengths are marked along the parallels and through corresponding points the meridians are drawn. If the earth is treated as a sphere the meridians are clearly sine curves, and for this reason d'Avezac has given the projection the name sinusoidal. But it is equally easy to plot the spheroidal lengths. It is a very suitable projection for an equal-area map of Africa.

Werner's Projection.—This is another limiting case of Bonne's equal-area projection in which the selected parallel is the pole. The parallels on paper then become concentric circular arcs of which the pole is the centre. The central meridian is still a straight line which is cut by the parallels at true distances. The projection (after Johann Werner, 1468-1528), though interesting, is practically useless.

**Polyconic Projections.**

These pseudo-conical projections are valuable not so much for their intrinsic merits as for the fact that they lend themselves to tabulation. There are two forms, the simple or equidistant polyconic, and the rectangular polyconic.

**The Simple Polyconic.** If a cone touches the sphere or spheroid along a parallel of latitude \( \phi \) and is then unrolled, the parallel will on paper have a radius of \( \nu \cot \phi \), where \( \nu \) is the normal terminated by the minor axis. If we imagine a series of cones, each of which touches one of a selected series of parallels, the apex of each cone will lie on the prolonged axis of the spheroid; the generators of each cone lie in meridian planes, and if each cone is unrolled and the generators in any one plane are superposed to form a straight central meridian, we obtain a projection in which the central meridian is a straight line and the parallels are circular arcs each of which has a different centre which lies on the prolongation of the central meridian, the radius of any parallel being \( \nu \cot \phi \).

So far the construction is the same for both forms of polyconic. In the simple polyconic the meridians are obtained by measuring outwards from the central meridian along each parallel the true lengths of the degrees of longitude. Through corresponding points so found the meridian curves are drawn. The resulting projection is accurate near the central meridian, but as this is departed from the parallels increasingly separate from each other, and the parallels and meridians (except along the equator) intersect at angles which increasingly differ from a right angle. The real merit of the projection is that each particular parallel has for every map the same absolute radius, and it is thus easy to construct tables which shall be of universal use. This is especially valuable for the projection of single sheets on comparatively large scales. A sheet of a degree square on a scale of 1:250,000 projected in this manner differs inappreciably from the same sheet projected on a better system, e.g. an orthomorphic conical projection or the conical with rectified meridians and two standard parallels; there is thus the advantage that the simple polyconic when used for single sheets and large scales is a sufficiently close approximation to the better forms of conical projection. The simple polyconic is used by the topographical section of the general staff, by the United States coast and geodetic survey and by the topographical division of the U.S. geological survey. Useful tables, based on Clarke's spheroid of 1866, have been published by the war office and by the U.S. coast and geodetic survey.

**Rectangular Polyconic.**—In this the central meridian and the parallels are drawn as in the simple polyconic, but the meridians are curves which cut the parallels at right angles.

In this case, let \( P \) (fig. 20) be the north pole, \( CPU \) the central meridian, \( U, U' \) points in that meridian whose co-latitudes are \( z \) and \( z+\delta \), so that \( UU' = \epsilon \), \( UC = \tan z \), \( UC' = \tan (z+\delta) \); and with \( CC' \) as centres describe the arcs \( UQ, U'Q' \), which represent the parallels of co-latitude \( z \) and \( z+\delta \). Let \( POQ' \) be a part of a meridian curve cutting the parallels at right angles. Join \( QQ' \), \( C'Q' \); these being perpendicular to the circles will be tangents to the curve. Let \( UCQ = 2a \), \( UCQ' = 2(a+da) \), then the small angle \( COC' \), or the angle between the tangents at \( QQ' \), will be \( 2\delta a \). Now \( UC = UU' - UU' \tan (z+\delta) - UC \tan z = \tan z \cdot \tan 2\delta a \).

The tangents \( CQ, C'Q' \) will intersect at \( q \), and in the triangle \( CQ'C' \), the perpendicular from \( C \) on \( C'Q' \) is (omitting small quantities of the second order) equal to either side of the equation

\[
\frac{\tan 2\delta a}{\sin 2\delta a} = \frac{\tan \delta a}{1 + \tan^2 \delta a} = \frac{2a \sin z}{1 + \cos^2 a}
\]

At the equator this becomes simply \( 2a \). Let any equatorial point whose actual longitude is \( 2\delta a \) be represented by a point on the developed equator at the distance \( 2\delta a \) from the central meridian, then we have the following very simple construction (due to O'Farrell of the ordnance survey). Let \( P \) (fig. 21) be the pole, \( U \) any point in the central meridian, \( QUQ' \) the represented parallel whose radius \( CU = \tan z \). Draw \( SU \perp \) to the central meridian through \( U \); then to determine the point \( Q \), whose longitude is, say, \( 3^\circ \), lay off \( 3^\circ \) equal to the true length of the arc of parallel on the sphere, i.e. \( 1^\circ \times 30' \) to \( 2a \sin z \), and with this centre and radius \( SU \) describe a circular arc, which will intersect the parallel in the required point \( Q \). For if we suppose \( 2\delta a \) to be the longitude of the required point \( Q \), \( U \) is by construction \( \cos z \), and the angle subtended by \( SU \) at \( C \) is

\[
\tan^2 \left( \frac{\omega \sin z}{\tan z} \right) = \tan^2 \left( \frac{\omega \cos z}{\tan z} \right) = \omega
\]

and therefore \( UCQ = 2a \) as it should be. The advantages of this method are that with a remarkably simple and convenient mode of construction we have a map in which the parallels and meridians intersect at right angles.

Fig. 22 is a representation of this system of the continents of Europe and Africa, for which it is well suited. For Asia this system would not do, as in the northern latitudes, say along the parallel of \( 50^\circ \), the representation is much cramped.

With regard to the distortion in the map of Africa as thus constructed, consider a small square in latitude \( 40^\circ \) and in \( 40^\circ \) longitude east or west of the central meridian, the square being so placed as to be transformed into a rectangle. The sides of this rectangle, unity, became \( 0.95 \) and \( 1.13 \), and the area \( 1.08 \), the diagonals intersecting at \( 90^\circ \pm 0^\circ 56' \). In Clarke's perspective projection a
square of unit side occupying the same position, when transformed to a rectangle, has its sides 1·02 and 1·15, its area 1·17, and its diagonals intersect at 90°= θ. The latter projection is therefore the best in point of "similarity," but the former represents areas. This apparent misrepresentation is due to the nature of the meridian. The areas are smaller in particular part of the map; along the equator towards 30° or 40° longitude, the polyconic is certainly inferior, while along the meridian it is better than the perspective—except, of course, near the centre. Upon the whole the more even distribution of distortion gives the advantage to the perspective system. For single sheets on large scales there is nothing to choose between this projection and the simple polyconic. Both are sensibly perfect representations. The rectangular polyconic is occasionally used by the topographical section of the general staff.

**Zenithal Projections.**

Some point on the earth is selected as the central point of the map; great circles radiating from this point are represented by straight lines which are inclined at their true angles at the point of intersection. Distances along the radiating lines vary according to any law outwards from the centre. It follows (on the spherical assumption), that circles of which the selected point is the centre are also circles on the projection. It is obvious that all perspective projections are zenithal.

**Equidistant Zenithal Projection.**—In this projection, which is commonly called the "equidistant projection," any point on the sphere being taken as the centre of the map, great circles through this point are represented by straight lines of the true rectified lengths, and intersect each other at the true angles.

In the general case—

If $z_1$ is the co-latitude of the centre of the map, $z$ the co-latitude of any other point, $a$ the difference of longitude of the two points, $A$ the azimuth of the linejoining them, and $c$, $e$, $f$, $k$, $l$, $m$, $n$, the spherical lengths of the line joining them, then the position of the intersection of any meridian with any parallel is given (on the spherical assumption) by the solution of a simple spherical triangle.

$$
\text{let } \tan \theta = \tan z \cos a, \cos c = \cos z \sec \theta \cos (z-\theta), \sin A = \sin z \sin a \cos c.
$$

The most useful case is that in which the central point is the pole; the meridians are straight lines inclined to each other at the true angular differences of longitude, and the parallels are equidistant circles with the pole as centre. This is the best projection to use for maps exhibiting the progress of polar discovery, and is called the polar equidistant projection. The errors are smaller than might be supposed. There are no scale errors along the meridians, and along the parallels the scale error is $(\sin z) - 1$, where $z$ is the co-latitude of the parallel. On a parallel 10° distant from the pole the error of scale is only $0·5\%$.

**General Theory of Zenithal Projections.**—For the sake of simplicity it will be at first assumed that the pole is the centre of the map, and that the earth is a sphere. According to what has been said above, the meridians are now straight lines diverging from the pole, dividing the $360^\circ$ into equal angles; and the parallels are represented by circles having the pole as centre, the radius of the parallel whose co-latitude is $z$ being $p$, a certain function of $z$. The particular function selected determines the nature of the projection.

Let $Pp'$, $Pr'$ (fig. 23) be two contiguous meridians crossed by parallels $p$, $q$, and $Op'$, $Oo'$ the straight lines representing these meridians. If the angle at $P$ is $dp$, this also is the value of the angle at $O$. Let the co-latitude

$$
Pp = z, \quad Pq = z + dz; \quad Op'p, \quad Op'q = dp, \quad Pq = dp; \quad Pr = \sin zd.
$$

the circular arcs $p'r'$, $q's'$ representing the parallels $p$, $q$, $r$, $s$. If the radius of the sphere be unity,

$$
\theta' = \theta; \quad p'r' = p'dp; \quad Pq = dp; \quad Pr = \sin zd.
$$

**Put**

$$
s = \theta dp; \quad \sin z, \quad \text{then } p'o'p = dp \text{ and } p'o' = e\sin z.
$$

That is to say, $a$, $\sigma'$ may be regarded as the relative scales, at co-latitude $z$, of the representation, applying to meridional measurements, $\sigma'$ to measurements perpendicular to the meridian. A small square situated in co-latitude $z$ having one side in the direction of the meridian—the length of its side being $e$—is represented by a rectangle whose sides are $te$ and $te'$; its area consequently is $te'e'$.

If it were possible to make a perfect representation, then we should have $\sigma = 1$, $\sigma' = 1$ throughout. This, however, is impossible. We may make $\sigma = 1$ throughout by taking $\rho = z$. This is the Equidistant Projection just described, a very simple and elegant method of representation, as follows:

Or we may make $\sigma' = 1$ throughout. This gives $\rho = \sin z$, a perspective projection, namely, the Orthographic.

Or we may require that areas be strictly represented in the development. This will be effected by making $\sigma' = 1$, or $\rho dp = \sin zd$, the integral of which is $\rho = 2 \sin z$, which is the Zenithal Equal-area Projection of Lambert, sometimes, though wrongly referred to as Lorgna's Projection after Antonio Lorgna (b. 1736). In this system there is misrepresentation of form, but no misrepresentation of areas.

Or we may require a projection in which all small parts are to be represented in their true forms, i.e., an orthomorphic projection. For instance, a small square on the spherical surface is to be represented as a small square in the development. This condition will be attained by making $\sigma' = e'$, or $dp' = \sin zd$, the integral of which is $e'$, being an arbitrary constant, $p = c \tan z$. This, again, is a perspective projection, namely, the Stereographic.

In this, though all small parts of the surface are represented in their correct shapes, yet, the scale varying from one part of the map to another, the whole is not a similar representation of the original. The scale of $\rho = \sec z$, at any point, applies to all distances round the point.

These two last projections are, as it were, at the extremes of the scale; each, perfect in its own way, is in other respects objectionable. We may avoid both extremes by the following considerations. As long as we cannot lay down $\sigma = 1$ and $\sigma' = 1$, so as to have a perfect picture of the spherical surface, yet considering $\phi - 1$ and $\phi - 1$ as the local errors of the representation, we may make $(\phi - 1)^\frac{3}{2} + (\phi - 1)^\frac{1}{2}$ a minimum over the whole surface to be represented. To effect this we must multiply this expression by the element of surface to which it applies, viz., $\sin zd, zd$, and then integrate from the centre to the (circular) limits of the map. Let $b$ be the spherical radius of the segment of the sphere to be represented, then the total misrepresentation is to be taken

$$
\int \frac{b^3}{(2a^2 - 1)^3} \left( \frac{p}{\sin z} \right)^2 \sin zd,\quad \text{which is to be made a minimum.}
$$

Putting $p = z + y, \text{ and giving to } y$ only a variation subject to the condition $dy = 0$ when $z = 0$, the equations of solution—using the ordinary notation of the calculus of variations—are

$$
N \frac{dp}{dz} = 0; \quad Pd = 0.
$$

$Pb$ being the value of $2p \sin z$ when $z = b$. This gives $\sin^2 z = 2(\sin z + 1 - \tan z) = 0$.

This method of development is due to Sir George Airy, whose original paper — the investigation is different in form from the above, which is due to Colonel Clarke—will be found in the Philosophical Magazine for 1861. The solution of the differential equation leads to this result

$$
\rho = 2 \cot z \log, \quad sec z + 2 \tan z, \quad C = 2 \cot z \frac{3}{2} \log, \quad sec \frac{3}{2}.
$$

The limiting radius of the map is $R = 2C \tan \frac{3}{2}$. In this system, called by Sir George Airy Projection by balance of errors, the total misrepresentation is an absolute minimum. For short it may be called Airy's Projection.

Returning to the general case where $\rho$ is any function of $z$, let us consider the local misrepresentation of direction. Take any indefinitely small line, length $s$, making an angle $a$ with the meridian in co-latitude $z$. Its projections on a meridian and parallel are $z \cos a$, $z \sin a$, which in the map are represented by $e' \cos a$, $e' \sin a$. Then $a'$ be the angle in the map corresponding to $a$, $\tan a' = (1/\rho') \tan a$.

Put $e' = \rho'dz, \sin zd, = \Sigma$, and the error $a' - a$ of representation $e$, then

$$
\tan a' = 1 + \Sigma \tan a.
$$

Put $Z = \cot z$, then $e$ is a maximum when $a' = \frac{\pi}{2}$, and the corresponding value of $e$ is $e = \frac{\pi}{2} - 2\Sigma$.

For simplicity of explanation we have supposed this method of development so applied as to have the pole in the centre. There is, however, no necessity for this, and any point on the
surface of the sphere may be taken as the centre. All that is necessary is to calculate by spherical trigonometry the azimuth and distance, with reference to the assumed centre, of all the points of intersection of meridians and parallels within the space which is to be represented in a plane. Then the azimuth is represented unaltered, and any spherical distance \( s \) is represented by \( p \). Thus we get all the points of intersection transferred to the representation, and it remains merely to draw continuous lines through these points, which lines will be the meridians and parallels in the new small area.

Thus treating the earth as a sphere and applying the Zenithal Equal-area Projection to the case of Africa, the central point selected being on the equator, we have, if \( \theta \) be the spherical distance of any point from the centre, \( \phi, \alpha \) the latitude and longitude (with reference to the centre), of this point, \( \cos \theta = \cos \phi \cos \alpha \). If \( A \) is the azimuth of this point at the centre, \( \tan \phi = \tan a \cot \phi \). On paper a line from the centre is drawn at an azimuth \( A \), and the distance \( \theta \) is represented by \( 2 \sin \theta \). This makes a very good projection for a single-sheet equal-area map of Africa. The exaggeration in such systems, it is important to remember, whether the linear scale, area, or \( \cos \theta \) be given for a given distance from the centre, whatever be the azimuth; that is, the exaggeration is a function of the distance from the centre only.

**General Theory of Conical Projections.**

Meridians are represented by straight lines drawn through a point, and a difference of longitude \( \omega \) is represented by an angle \( \omega \). The parallels of latitude are circular arcs, all having as centre the point of divergence of the meridian lines. It is clear that perspective and zenithal projections are particular groups of conical projections.

Let \( z \) be the co-latitude of a parallel, and \( p \), a function of \( z \), the radius of the circle representing this parallel. Consider the infinitely small space on the sphere contained by two consecutive meridians, and the difference of whose longitude is \( \omega \), and two consecutive parallels whose co-latitude are \( z \) and \( z + \Delta z \). The sides of this rectangle are \( p = \Delta z \), \( \cos z \Delta \phi \) in the projection; \( p' \) \( q' \) these become \( p' = \cos \phi \Delta \alpha \), \( p' = \phi \Delta \phi \).

The scale of this projection as compared with the sphere is the ratio of the parallel \( p' / p = \sin z / \sin z \) to the scale of measurements. The definition is, \( \cos z / \cos z \). This gives the group of orthomorphic projections.

In this case \( \Delta \phi / \Delta z = \sin z \), or \( \Delta \phi = \frac{\pi}{2} \Delta z \).

Integrating, we get (i) a meridian.

Now \( k \) is at our disposal and we may give it such a value that two selected parallels are of the correct distance. Let \( a, b \) be the co-latitudes of these parallels, then it is easy to show that

\[
h = \log \sin a - \log \sin b = \frac{\pi}{2} \log \tan \frac{a}{2} - \log \tan \frac{b}{2}.
\]

This projection, given by equations (i) and (ii), is Lambert's orthomorphic projection—commonly called Gauss's projection; its descriptive name is the orthomorphic conical projection with two standard parallels.

The constant \( k \) in (i) defines the scale and may be used to render the scale errors along the selected parallels not nil but the same; and some other parallel, e.g. the central parallel may then be made errorless.

The value \( k = \frac{1}{2} \), as suggested by Sir John Herschel, is admirably suited for a map of the world. The representation is fan-shaped, with remarkably little distortion (fig. 31).

If any parallel of co-latitude \( s \) is true to scale \( h(k \tan \frac{a}{2} = \sin s \), if this parallel is the equator, then \( \tan \phi = \sin \phi / \cos \phi \), and equation (i) becomes \( h \tan (\sin s / k) = h \), and the radius of the equator \( = h / k \). The distance \( r \) of any parallel from the equator is \( r = h \tan (\sin s / k) - \frac{1}{2} (1 + k^2) \).

If, instead of taking the radius of the earth as unity we call it \( a \), \( r = (a/b) \tan (\sin s / k) \). When \( h \) is very small, the angles between the meridians in the representation are very small; and proceeding to the limit, when \( h \) is zero the meridians are parallel—that is, the vertex of the cone has removed to infinity. And at the limit when \( k \) is zero we have \( r = \log \sin s, \cos \phi / \phi \), which is the characteristic equation of Mercator's projection.

**Mercator's Projection.**—From the manner in which we have arrived at this projection it is clear that it retains the characteristic property of orthomorphic projections—namely, similarity of representation of small parts of the surface. In Mercator's chart the equator is represented by a straight line, which is crossed at right angles by a system of parallel and equidistant straight lines representing the meridians. The parallels are straight lines parallel to the equator, and the distance of the parallel of latitude \( \phi \) from the equator is, as we have seen above, \( \phi = \log (\sin (\phi + \frac{1}{2}) / \sin (\phi + 1)) \).

In the vicinity of the equator, or indeed within 30° of latitude of the equator, the representation is very accurate, but as we proceed northwards or southwards the exaggeration of area becomes larger, and eventually excessive—the poles being at infinity. This distance of the parallels may be expressed in the form \( r = a \cos \phi + \log (\sin (\phi + \frac{1}{2}) / \sin (\phi + 1)) \).

Thus we see that near the equator \( r \) is nearly proportional to the latitude. As a consequence of the similar representation of small parts, a curve drawn on the sphere cutting all meridians at the same angle—the loxodromic curve—is projected into a straight line, and it is this property which renders Mercator's chart so valuable to seamen. For instance: join by a straight line on the chart Land's End and Bermuda, and measure the angle of intersection of this line with the meridian. We get thus the bearing which a ship has to retain during its course between these ports. This is not great-circle sailing, and the ship so navigated does not take the shortest path. The projection of a great circle (being neither a meridian nor the equator) is a curve which cannot be represented by a simple algebraic equation.

If the true spheroidal shape of the earth is considered, the semixes being \( a \) and \( b \), putting \( c = \sqrt{(a^2 - b^2) / a} \), and using common logarithms, the distance of any parallel from the equator can be shown to be

\[
(\frac{\pi}{2} \log \tan (\alpha + \beta) - \frac{\pi}{2} \log \sin \phi - \frac{1}{2} \log \sin \phi - \ldots)
\]

where \( M \), the modulus of common logarithms, is 0.434294.

Of course Mercator's projection was not originally arrived at in the manner above described; the description has been given to show that Mercator's projection is a particular case of the conical orthomorphic group. The introduction of the projection is due to the fact that for desiring to possess charts which shall give correct local outlines (i.e. in modern phraseology shall be orthomorphic) and shall at the same time show as a straight line any line which cuts the meridians at a constant angle. The latter condition clearly necessitates parallel meridians, and the former a continuous increase of scale as the equator is departed from, i.e. the scale at any point must be equal to the scale at the equator \( x \) sec latitude. In early days the calculations were made by assuming that for a small increase of latitude, say \( \psi \), the scale was constant, and then summing up the small lengths so obtained. Nowadays (for simplicity the earth will be taken as a sphere) we should say that a small length of meridian \( d \phi \) is represented in this projection by a sec \( d \phi \), and the length of the meridian in the projection between the equator and latitude \( 1 \) is

\[
\sqrt{1^2 + a^2} \sec d\phi = a \log \tan (\alpha + \beta),
\]

which is the direct way of arriving at the law of the construction of this very important projection.
Mercator's projection, although indispensable at sea, is of little value for land maps. For topographical sheets it is obviously useless; and in cases in which it is required to show large areas on small scales on an orthomorphic projection, that form should be chosen which gives two standard parallels (Lambert's conical orthomorphic). Mercator's projection is often used in atlases for maps of the world. It is not a good projection to select for this purpose on account of the great exaggeration of scale near the poles. The misconceptions arising from this exaggeration of scale may, however, be corrected by the juxtaposition of a map of the world on an equal-area projection.

It is now necessary to revert to the general consideration of conical projections.

It has been shown that the scales of the projection (fig. 23) as compared with the sphere are$p'q'/pq = dp/dz = e$ along a meridian, and$|p'q'| = gh = e' = 2\sin\zeta$ at right angles to a meridian.

Now if $\phi = \pi/2$ the areas are correctly represented, then $h = \sin\zeta$ and integrating $\frac{1}{2}h^2 = -C \cos\zeta$; (I.) This gives the whole group of equal-area conical projections.

As a special case let the pole be the centre of the projected parallels, then when $\zeta = p = \pi/2$, and const. = 1, we have $p = 2\sin\zeta/2hk$ (II.)

Let $s$ be the co-latitude of some parallel which is to be correctly represented, then $2k \sin \frac{1}{2}\zeta/hk = \sin s$, and $h = \cos\zeta \frac{1}{2};$ putting this value of $h$ in equation (ii), the radius of any parallel $= p = 2\sin\zeta/2$ sec $\zeta$; (III.)

This is Lambert's conical equal-area projection with one standard parallel, the pole being the centre of the parallels.

If we put $s = 0$, then $k = 1,$ and the meridians are inclined at their true angles, also the scale at the pole becomes correct, and equation (iii.) becomes $p = 2\sin\zeta/2$; (IV.)

this is the sentinal equal-area projection.

Reverting to the general expression for equal-area conical projections $p = \sqrt{\frac{2(C - \cos s)}{h}}$ (I.)

we can dispose of $C$ and $h$ so that any two selected parallels shall be their true lengths; let their co-latitudes be $s_{1}$ and $s_{2}$ then

$2\sqrt{(C - \cos s_{1})/2} = \sin s_{2}$ (v.)

$2\sqrt{(C - \cos s_{2})/2} = \sin s_{2}$ (vi.)

from which $C$ and $h$ are easily found, and the radii are obtained from (I.) above. This is H. k. Albers' conical equal-area projection with two standard parallels. The pole is not the centre of the parallels.

Projection by Rectangular Spheroïdal Co-ordinates.

If in the simple conical projection the selected parallel is the equator, this and the other parallels become parallel straight lines and the meridians are straight lines spaced at equatorial distances, cutting the parallels at right angles; the parallels are their true distances apart. This projection is the simple cylindrical. If now we imagine the touching cylinder turned through a right-angle in such a way as to touch the sphere along any meridian, a projection is obtained exactly similar to the last, except that in this case we represent, not parallels and meridians, but small circles parallel to the given meridian and great circles at right angles to it. It is clear that the projection is a special case of conical projection. The position of any point on the earth's surface is thus referred, on this projection, to a selected meridian as one axis, and any great circle at right angles to it as the other. Or, in other words, any point is fixed by the length of the perpendicular from it on to the fixed meridian and the distance of the foot of the perpendicular from some fixed point on the meridian, these spherical or spheroidal co-ordinates being plotted as plane rectangular co-ordinates.

The perpendicular is really a plane section of the surface through the given point at right angles to the chosen meridian, and may be briefly called a great circle. Such a great circle clearly diverges from the parallel; the exact difference in latitude and longitude between the point and the foot of the perpendicular can be at once obtained by ordinary geodetic formulae, putting the azimuth = 90°. Approximately the difference of latitude in seconds is $x^2 \tan \phi \cos \epsilon 1/2\phi$ where $x$ is the length of the perpendicular, $\phi$ that of the radius of curvature to the meridian, $\epsilon$ that of the normal terminated by the minor axis, $\phi$ the latitude of the foot of the perpendicular. The difference of longitude in seconds is approximately $\phi \sec \rho \cos \epsilon 1/2\phi$. The resulting error consists principally of an exaggeration of scale near the north and south poles and is represented equal to $\frac{1}{2}x$ or $\frac{1}{2}$ (expressing $x$ in arc); it is practically independent of the extent in latitude.

It is on this projection that the 1/2,500 Ordnance maps and the 6-in. Ordnance maps of the United Kingdom are plotted, a meridian being chosen for a group of counties. It is also used for the 1-in., $\frac{1}{2}$ in. and 6 in. Ordnance maps of England, the central meridian being that which passes through a point in Delamere Forest in Cheshire. This projection should not as a rule be used for topographical maps, but is suitable for cadastral plans on account of the convenience of plotting the rectangular co-ordinates of the very numerous trigonometrical or traverse points required in the construction of such plans. As regards the errors involved, a range of about 150 miles each side of the central meridian will give a maximum error in scale in a north and south direction of about $\pm 1\%$.

Elliptical Equal-area Projection.

In this projection, which is also called Mollweide's projection the parallels are parallel straight lines and the meridians are ellipses, the central meridian being a straight line at right angles to the equator, which is equally divided. If the whole world is represented on the spherical assumption, the equator is twice the length of the central meridian. Each elliptical meridian has, for one axis the central meridian, and for the other the intercepted portion of the equally divided equator. It follows that the meridians go east and west of the central meridian form a circle.

It is easy to show that to preserve the property of equal areas the distance of any parallel from the equator must be $\frac{1}{2} \sin \delta$ where $\pi \sin \phi = 2b + \sin \phi$, $\phi$ being the latitude of the parallel. The length of the central meridian from pole to pole = $2 \sqrt{2}$, where the radius of the sphere is unity. The length of the equator = $4 \sqrt{2}$.

The following equal-area projections may be used to exhibit the entire surface of the globe: Cylindrical equal area, Sinusoidal equal area and Elliptical equal area.

Conventional or Arbitrary Projections.

These projections are devised for simplicity of drawing and not for any special properties. The most useful projection of this class is the globular projection. This is a conventional representation of a hemisphere in which the equator and central meridian are two equal straight lines at right angles, their intersection being the centre of the circular boundary. The meridians divide the equator into equal parts and are arcs of circles passing through points so determined and the poles. The parallels are arcs of circles which divide the central and extreme meridians into equal parts. Thus in fig. 26 NS = EW and each is divided into equal parts (in this case each division is 10°); the circumference NESW is also divided into 10° spaces and circular arcs are drawn through the corresponding points. This is a simple and effective projection and one well suited for conveying ideas of the
general shape and position of the chief land masses; it is better for this purpose than the stereographic, which is commonly employed in atlases.

Thus in the above list 8 are equal-area, 3 are orthomorphic, 1 balances errors, 1 represents all great circles by straight lines, and in one system of great circles is represented correctly.

The general shape and position of the chief land masses; it is better for this purpose than the stereographic, which is commonly employed in atlases.

The following are the projections adopted for some of the principal official maps of the British Empire:

Conical, with Rectified Meridians and Two Standard Parallels.—The 1:1,000,000 Ordnance map of the United Kingdom, special maps of the topographical section, General Staff, e.g. the 64-mile map of Afghanistan and Persia. The 1:1,000,000 Survey of India maps of India and adjoining countries.

Modified Conical, Equal-area (Bonne’s).—The 1 in., 1 in., 1 in., and 1/4 in. Ordnance maps of Scotland and Ireland. The 1:800,000 Cape Colony Survey by the General Staff, including all maps on these scales of British Africa. A rectilinear approximation to the simple polycyclic is also used for the topographical sheets of the Survey of India. The simple polycyclic is used for the 1 in. maps of the Militia Department of Canada.

Zenithal Projection by Balance of Errors (Airy’s).—The 10-mile to 1 in. Ordnance map of England.

Conical projection by Rectangular Spheroidal Co-ordinates.—The 1:250,000 and 6 in. Ordnance sheets of the United Kingdom, and the 1 in., 1/4 in. and 1/2 in. Ordnance maps of England. The cadastral plans of the Survey of India, and cadastral plans throughout the empire.

AUTHORITIES.—See: Traité des projections des cartes géographiques, by A. Germain (Paris, 1856) and A Treatise on Projections, by T. Craig, United States Coast and Geodetic Survey (Washington, 1882). Both Germain and Craig (following Germain) make use of the expression 'projections of the tercums' which is apt to give the impression that the spherical surface is developable. As this is not the case, and since such projections are conical, it is best to avoid the use of the term, the history of the subject is clear. 'Coup d’œil historique sur la projection des cartes géographiques,' Société de géographie de Paris (1863).

J. H. Lambert (Beiträge zum Gebrauch der Mathematik, u.s.w. Berlin, 1772) devised the following projections of the terrestrial: 15, 15, 17, and 21; his transverse cylindrical orthomorphic and the transverse cylindrical equal-area have not been described, as they are seldom used. Among other contributors we mention Mercator, Euler, Gauss, C. B. Mollweide (1772-1828), Lacrange, Cassini, R. Bonne (1727-1795). Airy and Colonel A. R. Clarke. (C. F. Cl.: A. R. C.)

MAPLE, SIR JOHN BLUNDELL, BART. (1845-1905), English business magnate, was born on the 1st of March 1845. His father, John Maple (d. 1900), had a small furniture shop in Tottenham Court Road, London, and his business began to develop about the time that his son entered it. The practical management soon devolved on the younger Maple, under whom it attained colossal dimensions. The firm became a limited liability company, with a capital of two millions, in 1890, with Mr Maple as chairman. He entered parliament as Conservative member for Dulwich in 1857, was knighted in 1892, and was made a baronet in 1897. He was the owner of a large stables of race-horses, and from 1885 onwards won many important races, appearing at first under the name of "Mr Childwick." His public benefactions included a hospital and a recreation ground to the city of St Albans, near which his residence, Childwickbury, was situated, and the rebuilding, at a cost of more than £50,000, of University College Hospital, London. He died on the 24th of November 1903. His only surviving daughter married in 1896 Baron von Eckhardt of the German Embassy.

Fig. 27.—Plane Table Rectangular, dimensions in inches, for a scale of 4 in. to 1 m.

Projections for Field Sheets.

Field sheets for topographical surveys should be on conical projections with rectified meridians; these projections for small areas and ordinary topographical scales—not less than 1/500,000—are sensibly errors. But to save labour it is customary to employ for this purpose either form of polyconic projection, in which the errors for such scales are also negligible. In some surveys, to avoid the difficulty of plotting the flat arcs required for the parallels, the arcs are replaced by polygons, each side being the length of the portion of the arc it replaces. This method is especially suitable for scales of 1:125,000 and larger, but it is also sometimes used for smaller scales.

Fig. 27 shows the method of plotting the projection for a field sheet. Such a projection is usually called a gnomonic. In this case ABC is the central meridian; the true meridian lengths of 90° spaces are marked on this meridian, and to each of these, such as AB, the figure in this case representing a square half degree), such as ABED, is applied. Thus the line DE is the intersection of the circle of radius AD with a circle of radius BD, these lengths being taken from geodetic tables. The method has no merit except that of convenience.

Summary.

The following projections have been briefly described:

1. Cylindrical equal-area.
2. Orthographic.
3. Stereographic (which is orthomorphic).
4. General external perspective.
5. Minimum error (Clarke’s).
6. Conical.
7. Conical, with rectified meridians and two standard parallels (Bonne’s).
8. Simple conical.
9. Simple cylindrical (a special case of 8).
10. Modified conical equal-area (Bonne’s).
11. Sinusoidal.
12. Werner’s conical.
15. Conical orthomorphic with 2 standard parallels (Lambert’s, commonly called Gauss’s).
16. Cylindrical orthomorphic (Mercator’s).
17. Conical equal-area with one standard parallel.
18. Equidistant conical.
21. Elliptical equal-area (Mollweide’s).
22. Globular (conventional).
23. Field sheet gnomonic.

Of the above 25 projections, 23 are conical or quasi-conical, if zenithal and perspective projections be included. The projections may, if it is preferred, be grouped according to their properties.
MAPLE—MAQQARI

MAPLE, in botany. The maple (O. E. mapel-tréow, mapelder) and sycamore trees are species of Acer, of the order Aceriaceae. The genus includes about sixty species, natives of Europe, North America and Asia, especially the Himalayas, China and Japan. Maples are for the most part trees with opposite, long-stalked, palmately lobed leaves. When they are in flower, they are in fact far more like the leaves of the Norway maple, or in racemes of flowers appearing with, or later than, the leaves as in sycamore. Some of the flowers are often imperfect, the stamens or pistil being more or less aborted. The fruit is a two-winged "samar." The genus was represented in the Tertiary flora of Europe, when it extended into the polar regions; nineteen species have been recorded from the Miocene strata of Oenningen in Switzerland. The common maple, A. campestre, is the only species indigenous to Great Britain. This and the sycamore were described by Gerard in 1597 (Herball, p. 1950), the latter being "a stranger to England." Many species have been introduced, especially from Japan, for ornamental purposes.

Acer campestre, the common maple, is common in hedgeshows, but not a timber tree, being 20 ft. high, though in sheltered situations 30 ft. or more is attained. The leaves are generally less than 2 in. across, and the five main lobes are blunter than in the sycamore. The clusters of green flowers terminate the branches, and the fruit is composed of two wings, the fruit spread almost horizontally, and are smaller than in the sycamore. It occurs in northern Europe, the Caucasus, and northern Asia. The wood isexcelled in fuel and woodworkers have made use of it for centuries. It contains a fine grain, sometimes beautifully veined, and takes a high polish. Hence it has been celebrated from antiquity for tables, &c. The wood of the roots is frequently knotted, and valuable for small objects of carving. The young shoots, being flexible and tough, are employed in France as whips.

A. platanoides, the Norway maple, is a handsome tree of quick growth, with a smooth bark. The leaves are of a deep green, and afford abundant shade. The flowers are borne in long pendulous racemes, and the two wings of the fruit are ascending. It lives from 140 to 200 years. It is frequently found in wooded moorland situations in central Europe. The wood when young is white, but old heartwood is yellow or brownish. Like the common maple it is hard and takes a high polish. It is much prized by wheelwrights, cabinet-makers, sculptors, &c., on the Continent; while knotted roots are employed for inlaying. Sugar has been obtained from the sap of this as from other species, the most being one ounce from a quart of sap. The latter has also been made into wine in the Highlands of Scotland.

A. pseudoplatanus, the sycamore or great maple, is a handsome tree of quick growth, with a smooth bark. The leaves are of a dark green, and afford abundant shade. The flowers are borne in long pendulous racemes, and the two wings of the fruit are ascending. It lives from 140 to 200 years. It is frequently found in wooded moorland situations in central Europe. The wood when young is white, but old heartwood is yellow or brownish. Like the common maple it is hard and takes a high polish. It is much prized by wheelwrights, cabinet-makers, sculptors, &c., on the Continent; while knotted roots are employed for inlaying. Sugar has been obtained from the sap of this as from other species, the most being one ounce from a quart of sap. The latter has also been made into wine in the Highlands of Scotland.

A. platanoides, the Norway maple, is met with from Norway to Italy, Greece, and central and south Russia. It was introduced into Britain in 1683. It is a lofty tree (from 40 to 70 ft.), resembling the sycamore, but with yellow flowers, appearing before the leaves, and more spreading wings to the fruit. There are several varieties.

A. pseudoplatanus, the sycamore is the common maple, and is known generally as polygonum phum, which has been confused with a native species of the genus Acer. It is further confused with several species of the genus Aesculus. It is a large tree, bearing leaves without lobes; A. discolor, with large plane-like leaves; and A. caricifolium, with foliage resembling that of the hornbeam.

The North American species, the sugar, rock, or bird's-eye maple, was introduced in 1735. It sometimes attains to 70 or even over 100 ft., more commonly 50 to 60 ft. It is remarkable for the breadth of the bark, which is 12 in. across, and a rosy tinge after exposure to light. The grain is fine and close, and when polished has a silky lustre. The timber is used instead of oak where the latter is scarce, and is employed for axi-tree, buckets, and other articles as well as for sleighs, carriages, &c. It is remarkable for accidental forms in the arrangement of the fibres, an undulated one like those of the curled maple (A. rubrum), and one of spots, which gives the name bird's-eye to the wood of this species. Like the sugar maple, it is frequently used for bedsteads, writing-desks, shoe- lasts, &c. The wood forms excellent fuel and charcoal, while the ashes are rich in alkaline principles. It is extensively grown in New York State, and is exported from Boston and New York. Sugar is principally extracted from this species, the sap being boiled and the syrup when reduced to a proper consistence runs into moulds to form cakes. Trees growing in low and moist situations afford the most sap but least sugar.

A. rubrum, the red-flowering or scarlet maple, is a middle-sized tree, and was introduced in 1656. The bright scarlet or dull red flowers appear before the leaves in March and April. The wood, like that of other species, is applicable to many purposes—as for fencing or to be visited Jerusalem and Damascus, and during the next six years made the pilgrimage five times. In 1628 he was again in Damascus, where he gave a course of lectures on Bukhari's collection of Traditions, spoke much of the glories of Moslem Spain, and received the impulse to write his work on this subject later. In the same year he returned to Cairo, where he spent a year in writing his history. He was just making preparations to settle definitely in Damascus when he died in 1637.

His great work. The Breath of Perfume from the Branch of Great Andalusia and Memorials of its Visier Lisan ud-Din ibn ul-Kham, consists of two parts. The first is a compilation from many authors on the description and history of Moslem Spain; it was published by Wright, Krehl, Dozy and Dugat as Analectes sur l'histoire et la littérature des Arabes d'Espagne (Leiden, 1855-1857). The second, in English, ran through five editions (London, 1840-1843). The whole work has been published at Bulaik (1863) and Cairo (1885).
MAQ'RIZI—MAR, EARLDOM OF

For other works of Maqrizi see C. Brockelmann's Gesch. der arabischen Literatur (Berlin, 1902), ii. 297.

(G. W. T.)

MAQ'RIZI, or MAKRIZI [Taqī ud-Dīn Ahmad ibn 'Ali] (1364-1442), Arabian historian, known as al-Maqrizi because of his ancestral connexion with Maqrizi, a suburb of Baalbek, was born at Cairo and spent most of his life in Egypt, where he was trained in the Hanifi school of law, though later he became a Shafiite with an inclination to Zahirite views. In 1358 he made the pilgrimage. For some time he was secretary in a government office, and in 1399 became inspector of markets for Cairo and northern Egypt. This post he soon gave up to become preacher at the mosque of 'Amr, president of the mosque of Hākim, and lecturer on tradition. In 1408 he went to Damascus to become inspector of the Qalānīsīyya and lecturer. Later he retired into private life at Cairo. In 1430 he made the pilgrimage with his family and travelled for some five years. His learning was great, his observation accurate and his judgment good, but his books are largely compilations, and he does not even always acknowledge the sources to which he is indebted. Most of his works are concerned with Egypt. The most important is the Mawsil wa-l-Thbr fi dhikr ul-Ḫiṣā al-Thbr (2 vols., Bulaq, 1843), which he brought from Cairo in 1854, and which was translated into French by E. Tourant and published and annotated by A. R. Guest, "A List of Writers, Books and other Authorities mentioned by El Maqrizi in his Khīṭāt," in Journal of the Royal Asiatic Society, 1902, pp. 103-125. Of his History of the Fatimides an extract was published by J. G. L. Kosegarten in his Chestnomathia (Leipzig, 1828), pp. 115-123; The History of the Ayyābī and Manṣūrī Rulers has been translated into French by E. Quatremère (2 vols., Paris, 1837-1843). Maqrizi began a large work called the Magaṣfah, a cyclopaedia of Egyptian biography in alphabetical order. It was intended to have 12 volumes, but only 16 were written. Three autograph volumes exist in MS. in Leiden, and one in Paris.

Among smaller works published are the Mahommedan Coinage (ed. O. G. Tychsen, Rostock, 1799; French translation by S. de Sacy, Paris, 1797); Arab Weights and Measures (ed. Tychsen, Rostock, 1800); the Arabian Tribes that migrated to Egypt (ed. P. Wüstenfeld, Göttingen, 1847); the Account of Hadramawt (ed. P. B. Moskowj, Bonn, 1866); the Strife between the Bani Umayya and the Bani Ḥāshim (ed. G. Vos, Leiden, 1888), and the Moslems in Abyssinia (ed. F. T. Rink, Leiden, 1790). For Maqrizi's life see the quotations from contemporary biographies in S. de Sacy's Chestnomathia arab (2nd ed., Paris, 1826), ii. 112 seq., and for other works still in MS. C. Brockelmann, Gesch. der arabischen Literatur (Berlin, 1899), ii. 38-41.

MAR, EARLDOM OF. Mar, one of the ancient divisions or provinces of Scotland, comprised the larger portion of Aberdeen-shire, extending from north of the Don southward to the Mounth. Like other such districts, it was in Celtic times under the rule of a mormaer. In the 12th century his place was taken by an earl, but no definite succession of ears appears till the 13th century, nor is any connexion established between them and the mormaers. From the middle of the 13th century the titles were recognised as among the "seven eares of Scotland" and held a great position. Earl Graetney (fl. c. 1300) married a sister of (King) Robert Bruce, who brought him the lordship of Garioch and castle of Kildrummy, which she held against the earl of Athole, an ally of the English (1335). Their son Donald was made regent in July 1332, but was disastrously defeated and slain at Dupplin next month. His daughter and eventual heir, Margaret, brought the earldom to her husband, William, earl of Douglas, and on the accession of her daughter Isabel a troublesome time followed.

While she was living as a widow at her castle of Kildrummy, it was stormed by Alexander Stewart, a bastard, who forced her to execute a charter (August 12, 1404) settling the reversion to the earldom on himself and his heirs. This act she revoked by a charter of the 19th of September 1404, which cannot now be found; but on marrying him, on the 9th of December 1404, she granted him the earldom for life, the king confirming this on the 21st of June 1405. After her death in 1408 the earl played a great part, commanding the royal forces at the battle of Harlaw, when the Lord of the Isles was defeated in 1411, and afterwards acting as warden of the Marches. In 1426 he resigned the earldom to the Crown, the king granting it by a fresh creation to him and certain heirs, with reversion to the Crown. On the earl's death in 1435 the earldom was claimed by Robert, Lord Erskine, as heir of Graetney, earl of Mar, through a daughter; but the Crown claimed as reversionary under the creation of 1426. A long struggle followed, till in 1457 James II. obtained from a justiciary court at Aberdeen a recognition of the Crown's right to the earldom and its lands, and shortly after bestowed them on his son John as earl of Mar and Garioch. John married a younger sister of Alexander, earl of Galloway, in 1479, and in 1485 his elder brother Alexander duke of Albany contested the title, but was soon frightened. James III. created his son John earl of Mar and Garioch in 1486, and after his death unmarried in 1503, James IV. alienated to Lord Elphinstone (1507-1510) many of the Mar lands, including Kildrummy. The title was not revived till 1562, when James Stewart, earl of Murray, held it for a few months.

In 1569 John, Lord Erskine, succeeded in getting returned heir to the earldom, and shortly after (June 23, 1569) Queen Margaret restored the charter to him and his heirs "all and hale the said earldom of Mar." As earl he took part against the queen in 1567, but in 1572 was made regent of Scotland, which post he retained till his death (1572). His son, earl John (c. 1558-1634), played a great part in the history of the family. His great achievement was the recovery of the Mar estates, alienated by the Crown during the long period that his family had been out of possession, including Kildrummy, the "head" of the earldom. It was in his time that the precedence of the earldom (see below) was settled. John, the next earl (c. 1565-1654) was a Royalist, as was his son John (d. 1668), much to the injury of the family fortune, which was further impaired by the attachment of the family, after the Revolution, to the Stuarts. His son Charles (1650-1689) was arrested by the government just before his death (1689), and the next earl, John (1675-1732), a prominent Jacobite (see below), was attainted, the earldom remaining under forfeiture for 168 years; by the Old Pretender he was created duke of Mar.

Alloa and other Erskine estates of the attainted earl were re-purchased for the family, and descended to John Francis Erskine (1741-1825), his heir-male, who was also his heir of line through his daughter. To him, in his eighty-third year, as grandson and heir of the regent and there as "earl and regent, and one holding the earldom" and Queen Mary, his estates were restored by act of parliament in 1824. His grandson, who succeeded him in 1828, inherited the earldom of Kellie (1619) and other Erskine dignities by decision of 1835. At his death in 1866, his earldom of Mar was the subject of rival claims, and the right to the succession was not determined till 1875. His estates passed to his cousin and heir-male, who succeeded to his earldom of Kellie and claimed "the honour and dignity of earl of Mar." But the latter was also claimed by a Mr Goode, whose father had married the late earl's eldest sister, and who assumed the title. It was not suggested that the late earl had more than one earldom of Mar, but Lord Kellie claimed it as descendible to heirs-male under a creation by Queen Mary, and Mr Goode as descendible to heirs of line under an earlier creation. The House of Lords decided (Feb. 25, 1875) that Lord Kellie was entitled to the earldom as having been created by Queen Mary in 1565, with a limitation which must be presumed to be to heirs-male of the body. This decision gave great dissatisfaction, but was described as "final, right or wrong, and not to be questioned" by Lord Selborne and the lord chancellor in 1877, and Lord Kellie was thenceforth recognized as holding the earldom on the Union Roll, the only one known, though Mr Goode continued to assume the title. The Lords' decision could not be reversed, but in 1885, after much agitation, a means was found of evading it in practice by the "Earldom of Mar Restitution Act." By "an equivocation on the facts of the case," it was recited that "doubts may exist whether the said ancient honour, dignity, and title of peerage of earl of Mar . . . was or was not . . . by any lawful means surrendered or merged in the Crown" before 1565, and that the House of Lords had decided that Queen Mary's known charter of 1565 applied only to lands and "did not operate
or extend to restore" the peerage dignity, and enacted that
"John Francis Erskine Goodeve Erskine" (which last name the
claimant had added) should be "restored to" the ancient earldom.
His previous assumption of the title was thus rejected as invalid,
but from the passing of the act two earldoms of Mar were in
existence, that of Lord Kellice being confirmed and allowed the
precedence of 1565, while the restored earldom was allowed that
of the dignity of the Union ROYALTY. Only one known to them.
This precedence had been assigned to it by the Decretal of
Ranking (1606), and assigns to it an origin in 1494 (or, as some
say, 1395). It is frequently, but absurdly, stated to have been
"created before 1014," and wrongly spoken of as the Premier
Scottish Earldom (see Earl). A barony of Garioch is also
wrongly said to be annexed to it, but the title is used by the
earl's eldest son in default of any other.

MAR, JOHN ERSKINE, 1ST OR 6TH EARL OF (d. 1572),
regent of Scotland, was a son of John, 5th Lord Erskine (d. 1552),
who was guardian of King James V., and afterwards of Mary Queen
of Scots. The younger John, who succeeded his father as 6th
Lord Erskine in 1558, joined the religious reformers, but he was
never very ardent in the cause, although he subscribed the letter
asking Knox to return to Scotland in 1557. The custody of
Edinburgh Castle was in his hands, and during the struggle
between the regent, Mary of Lorraine, and the lords of the
Congregation he appears to have acted consistently in the
interests of peace. When Mary Stuart returned to Scotland in
1561 Lord Erskine was a member of her council, he favoured
her marriage with Lord Darnley, and his wife, Annabella Murray,
called by Knox a "verrey Jesabell," was a frequent companion
of the queen. In 1565 Erskine was granted the earldom of Mar
(see above). As guardian of James, afterwards King James VI.,
he prevented the young prince from falling into the hands of
Bothwell, and when the Scottish nobles rose against Mary and
Bothwell, Mar was one of their leaders; he took part in the
government of Scotland during Mary's imprisonment at Lochleven,
and also after her subsequent abdication. In September 1571 he
was chosen regent of Scotland, but he was overshadowed and perhaps
slighted by the earl of Morton, and he died at Stirling on the 29th
of October 1572.

JOHN ERSKINE, 2ND OR 7TH EARL OF (c. 1558-1634),
Scottish politician, was the only son of the preceding. Together
with King James VI. he was educated by George Buchanan.
After attaining his majority he was nominally the guardian of
the young king, who was about seven years his junior, and who
lived with him at Stirling; but he was in reality a puppet in the
hands of the regent, the earl of Morton; and he lost power and
position when Morton was imprisoned. He was concerned in the
seizure of James VI. in 1562 (a plot known as the raid of Ruth-
ven); but when James escaped from his new custodians the earl
fled into the west of Scotland. Then leaving his hiding-place Mar
seized Stirling Castle, whereupon James marched against him,
and he took refuge in England. Queen Elizabeth interceded for
him, but in vain, and after some futile communications between
the governments of England and Scotland Mar and his friends
gathered an army, entered the presence of the king at Stirling,
and were soon in supreme authority (1585). Mar was restored to
his lands and titles. Henceforward he stood high in the royal
favour; he became governor of Edinburgh Castle and was made
tutor to James's son, Prince Henry, and for his second wife he
married Mary, daughter of Sir Esme Sempill, earl of Lennox.
In 1601 the earl was sent as envoy to London; here Elizabeth
assured him that James should be her successor, and his mission
was conducted with tact and prudence. Having joined the
English privy council Mar was created Lord Cardross in 1610;
he was a member of the Court of High Commission and was lord
high treasurer of Scotland from 1611 to 1630. He died at Stirling
on the 14th of December 1634. John (c. 1585-1654), his only
son by his first wife, succeeded to his earldom; by his second wife
he had five sons, among them being James (d. 1640), earl of
Buchan; Henry (d. 1628), whose son David (d. 1671) succeeded
him, by his marriage to Mary of Cardross; and Charles, the ancestor of the earls of Rosslyn.

MAR, JOHN ERSKINE, 6TH OR 11TH EARL OF (1675-1733)
Scottish Jacobite, was the eldest son of Charles, the 5th earl
(1650-1689), from whom he inherited estates which were heavily
loaded with debt. He was associated with the party favourable
to the English government; he was one of the commissioners for
the Union, and was made a Scottish secretary of state, becoming
after the Union of 1707 a representative peer for Scotland,
keeper of the signet and a privy councillor. In 1713 Mar was
made an English secretary of state by the Tories, but he seems
to have been equally ready to side with the Whigs, and in 1714
he assured the king, George I., of his loyalty. However, like
the other Tories, he was deprived of his office, and in August 1715
he went in disguise to Scotland and placed himself at the head
of the adherents of James Edward, the Old Pretender. Meeting
many Highland chieftains at Aboyne he avowed an earnest
desire for the independence of Scotland, and at Braemar on the
6th of September 1715 he proclaimed James VIII. king of Scot-
land, England, France and Ireland. Gradually the forces under
his command were augmented, but as a general he was a complete
failure. Precious time was wasted at Perth, a feigned attack on
Stirling was resultless, and he could give little assistance to the
English Jacobites. At Sherifmuir, where a battle was fought in
November 1715, Mar's forces largely outnumbered those of his
opponent, Archibald Campbell, afterwards 3rd duke of Argyll;
but no bravery could atone for the signal incompetence displayed
by the earl, and the fight was virtually a decisive defeat for the
Jacobites. Mar then met James Edward at Fetteresso; the
cause however was lost, and the prince and the earl fled to France.
Mar sought to interest foreign powers in the cause of the Stuarts;
but in the course of time he became thoroughly distrusted by
the Jacobites. In 1721 he accepted a pension of £3,500 a year
from George I., and in the following year his name was freely
mentioned in connexion with the trial of Bishop Atterbury,
whom it was asserted that Mar had betrayed. This charge may
perhaps be summarized as not proven. At the best his conduct
was highly imprudent, and in 1724 he left the Pretender's
service. His later years were spent in Paris and at Aix-la-
Chapelle, where he died in May 1732.

Mar, who was known as "bawbee John," married for his second wife, Mary Sutherland, d. 1706, daughter of the 1st duke
of Kingston, and was thus a brother-in-law of Lady Mary Wortley
Montagu. He had been attainted in 1716, and his only son,
Thomas, Lord Erskine, died childless in March 1766.

Mar's brother, James ERSKINE (1679-1754), was educated as
a lawyer and became lord justice clerk of the Court of Session
and Lord Grange in 1710. He took no part in the rising of 1715,
although there is little doubt that at times he was in communi-
cation with the Jacobites; but was rather known for his piety and
for his sympathy with the Presbyterians. He is more famous
however, owing to the story of his wife's disappearance. This
lady, Rachel Chichey, was a woman of disordered intellect;
probably with reason she suspected her husband of infidelity,
and after some years of unhappiness Grange arranged a plan for
her seizure. In January 1732 she was conveyed with great secrecy from Edinburgh to the island of Heisker, thence to
St Kilda, where she remained for about ten years, thence
she was taken to Assynt in Sutherland, and finally to Skye.
To complete the idea that she was dead her funeral was publicly
celebrated, but she survived until May 1745. Meanwhile
in 1734 Grange had resigned his judgeship and had become
an English member of parliament; here he was a bitter opponent
of Sir Robert Walpole. He died in London on the 26th of
January 1754.
MARA—MARAGHA

See the Journal of the Earl of Mar (1716); R. Patten, History of the late Rebellion (1717); and A. Lang, History of Scotland, vol. iv. (1897).

MARA, GERTRUD ELISABETH (1749–1833), German singer, was born at Cassel, the daughter of a poor musician named Schmeling. From him she learnt the violin, and while still a child playing at the fair at Frankfort was so remarkable that money was collected to provide for her. She was helped by influential friends, and studied under Hiller at Leipzig for five years, proving both wonderful to her wonderland and a wonderful soprano voice. She began to sing in public in 1771, and was soon recognized as the greatest singer that Germany had produced. She was permanently engaged for the Prussian Court, but her marriage to a deauched violinist named Mara created difficulties, and in 1780 she was released. After singing at Vienna, Munich and elsewhere, she appeared in Paris in 1785, where her rivalry with the singer Todl developed into a regular faction. In 1784 she went to London, and continued to appear there with great success, with visits at intervals to Italy and France. When, for some years she returned to her native country, she visited England again in 1816, and then abandoned the stage. She went to Livadia, and died on the 20th of January 1833 at Revel.

MARABOUT (the French form of the Arab. marubbi, "one who picks his horse on a hostile frontier"; cf. Portug. marabute; Span. marabito), in Mahomedan religion a hermit or devotee. The word is derived from ribâd, a fortified frontier station. To such stations pious men betook them to win religious merit in war against the infidel; their leisure was spent in devotion, and the habits of the convent superseded those of the camp (see M. G. De Slane in Jour. As., 1843, i. 165, Dozy, Suppl. i. 502). Thus ribâd came to mean a religious house or hospice (zâriya). The great sphere of the marabouts is North Africa. There it was that the community formed by Yahya b. Ibrahim and the doctor Abdallah developed into the conquering empire of the Murabitbs, or, as Christian writers call them, the Almoravides (q.v.), and there still, among the Berbers, the marabouts enjoy extraordinary influence, being esteemed as living saints and mediators. They are liberally supported by alms, direct all popular assemblies, and have a decisive voice in intertribal quarrels and all matters of consequence. On their death their sanctity is transferred to their tombs (also called marabouts), where chapels are erected and gifts and prayers offered. The marabouts took a prominent part in the resistance offered to the French by the Algerian Molesmes; and they have been similarly active in politico-religious movements in Tunisia and Tripoli.

See L. Rinn, Marabouts et Khouan (Algiers, 1884); and the article DERVISH.

MARACAIBO, a large lake of western Venezuela, extending southward from the Gulf of Venezuela, into which it opens through a long neck, or strait, obstructed at its mouth by islands and bars, and having a large drainage basin bounded on the W. by the Eastern Cordillera, on the S.E. by the Cordillera de Merida, and on the E. by a low range of mountains extending N. by W. from Trujillo to the coast. The lake is roughly quadrangular in shape, and measures from the 9th to the 11th parallel of S. lat. and from the 71st to the 72nd meridian. It opens into the Gulf through 13 channels, the depth on the bar in the main channel ranging from 7 ft. at low water to 12 ft. at high water. Inside the bar the depth is about 30 ft., and the lake is navigable for vessels of large size. It receives the waters of many rivers, principally on its west and south sides, the largest of which are the Catatumbo and Zulia, Escalante, Chano, Ceniza, Sant'Ana, Negro, Apan and Palmar. The first three have navigable channels for river steamers. There are a number of small and western margins, the largest of which is the Laguna de Zulia. The heavy rainfall on the eastern slopes of the Eastern Cordillera, which is said to exceed 86 in. per annum, is responsible for the great volume of water discharged into the lake. The average annual precipitation over the whole basin is said to be 70 in. In the upper half of the lake the water is sweet, but below that, where the tidal influence is stronger, it becomes brackish. The only port of consequence on the lake is Maracaibo, but there are small ports at its upper end which are in direct communication with the inland cities of Trujillo, Merida and San Cristobal. The Catatumbo River, which enters from the west near the north end of the lake, and its principal tributary, the Zulia, are navigable as far as Villa-zizar, in Colombia, and afford an excellent transportation route for the coffee and other products of Santander.

MARACAIBO (sometimes MARACAYBO), a city and seaport of Venezuela and capital of the state of Zulia (formerly Maracaibo), on the west shore of the broad channel or neck which connects Lake Maracaibo with the Gulf of Venezuela, or Maracaibo, almost 400 ft. from the mouth of the channel. Pop. (1889), 34,284; (1905), 49,817; there is a considerable German element in the vicinity. The best residential suburb, Hatios, extends along the lake shore toward the south. The city is provided with tramways, telephone service and electric lighting, but the water supply and drainage are inferior. The most important buildings are the executive's residence, the legislative chambers, the municipal hall, the Baralt theatre, the prison, the market, a hospital and six churches. The city also has a school of arts, a public library, and a public garden. In 1912 it was estimated that Maracaibo had 400 hotels, 100 public houses, a number of gambling houses and brothels, and was one of the educational centres of Spanish America; the city now has a national college and a naval school. The industries include shipbuilding, and the manufacture of saddlery and other leather products, bricks and tile, rum, beer, chocolate and cacao-nut oil. Maracaibo is chiefly known, however, as one of the principal commercial centres and shipping ports on the northern coast of South America. The bar at the entrance to Maracaibo channel does not admit vessels drawing more than 12 ft., but there is a depth of 30 ft. Inside and near the city, steam navigation is maintained on the Catatumbo-Zulia rivers to Villamizar, and on the Escalante to Santa Cruz. The principal exports from Maracaibo are coffee, hides and skins, cabinet and dye-woods, cocoa, and mangrove bark, to which may be added dividi, sugar, copaiba, ganma and hemp straw for paper-making, and fruits. In 1906, 20% of the coffee exports was of Colombian origin.

Maracaibo was founded in 1571 by Alonso Paccheco, who gave it the name Nueva Zamora. Up to 1668 the entrepot for the inland settlements was a station named Gibraltar at the head of the lake, but the destruction of this valuable trade centre by the pirates of that time rendered Maracaibo the most important port on the lake. The city did not figure actively in the War of Independence until 1821 (Jan. 28), when the province declared its independence and sought an alliance with Colombia. This brought to an end the armistice between Bolivar and Morillo, and thenceforward the city experienced all the changing fortunes of war until its final capture by the revolutionists in 1822.

MARAGHA, a town of Persia in the province of Azerbaijan, on the Safi River, in 37° 25' N., 46° 16' E., 86 m. from Tabriz. Pop. about 16,000. It is pleasantly situated in a narrow valley running nearly north and south at the eastern extremity of a well-cultivated plain opening towards Lake Urmiya, which lies 18 m. to the west. The town is encompassed by a high wall ruined in many places, and has four gates. Two stone bridges in good condition, said to have been constructed during the reign of Hulaku Khan (1256–1265), and since then several times repaired, lead over the Safi River on the western side of the town. The place is surrounded by extensive vineyards and orchards, all well watered by canals led from the river, and producing great quantities of fruit for exportation to Russia. On a hill west of the town is a famous observatory (rasad) dedicated under the direction of the great astronomer Nasr-ud-din of Tus. The hills west of the town consist of horizontal strata of sandstone covered with irregular pieces of basalt and the top of the hill on which the observatory stood was made level by taking away the basalt. The building, which no doubt served as a citadel as well, enclosed a space of 380 yds. by 150, and the foundations of the walls were 45 to 5 ft. in thickness. The marble, which is known throughout Persia as Maraga marble, is a travertine obtained at the village of Dashkeen (Turkish for
“stone-breakers” (about 30 m. north-west from Maragha. It is deposited from water, which bubbles up from a number of springs in the form of horizontal layers, which at first are thin crusts and can easily be broken, but gradually solidify and harden into blocks with a thickness of 7 to 8 in. It is a singularly beautiful substance, being of pink, greenish, or milk-white colour, streaked with reddish, copper-coloured veins. An analysis made gave the following result: calcium carbonate, 90.93; magnesium, 75.7; iron, 1.37; manganese, 1.34; calcium sulphate, 2.30; calcium phosphate, 24 (R. T. Günther, Geog. Journ. xiv. 517).

MARANHÃO, or MARANHAM (Span. Maranhon, the name given to the upper Amazon), a northern state of Brazil, bounded N. by the Atlantic, E. and S.E. by Piauí, S.W. and W. by Goyaz and Pará. Area, 177,569 sq. m.; pop. (1890), 430,854; (1900), 499,308. The coastal zone and the north-west corner of the state belong to the Amazon valley region, being a heavily forested plain traversed by numerous rivers. The eastern and southern parts, however, belong to the lower terraces of the great Brazilian plateau, broken by eroded river-courses between which are high open plains. There is no true mountain ranges in Maranhão, those indicated on the maps being only plateau escarpments marking either its northern margin or the outlines of river valleys. The climate is hot, and the year is divided into a wet and dry season, extreme humidity being characteristic of the former. The heat, however, is greatly modified on the coast by the south-east trade winds, and the climate is generally considered healthy, though brief fevers and eruptive diseases are common on the coast. The coast itself is broken and dangerous, there being many small indentations, which are usually masked by islands or shoals. The largest of these are the Bay of Turuassú, facing which is the island of São João, and several others of small size, and the contiguous bays of São Marcos and São José, between which is the large island of Maranhão. The rivers of the state all flow northward to the Atlantic and a majority of them have navigable channels. The Parnahyba forms the eastern boundary of Maranhão, but it has one large tributary, the Baías, entirely within the state. A part of the western boundary is formed by the Tocantins and another part by the Gurupy, which separates the state from Pará. The principal rivers of the state are the Maracassum and Turuassú, the Mearim and its larger tributaries (the Pindaré, Grajá-th, Flôres and Corda) which discharge into the Bay of São Marcos, and the Itapicuru and Monim which discharge into the Bay of São José. Like the Amazon, the Mearim has a pororoca or bore in its lower channel, which greatly interferes with navigation. There are a number of small lakes in the state, some of which are, apparently, merely reservoirs for the annual floods of the rainy season. The depressions of the plains of S. Maranhão are agricultural, the river valleys and coastal zone being highly fertile and being devoted to the cultivation of sugar-cane, cotton, rice, coffee, tobacco, mandioca and a great variety of fruits. The southern highlands, however, are devoted to stock-raising, which was once an important industry. Troublesome insects, vampire bats, and the failure to introduce new blood into the degenerated herds, are responsible for its decline. Agriculture has also greatly declined, the state producing for export only a comparatively small quantity of cotton, rice, sugar, mahogany, rubber, and rum. Besides São Luiz, the capital of the state, the principal towns, with the population of their municipal districts in 1890, are: Caxias (19,443), Alcântara (4730), Caicó (7266), Grajá-th (11,704), Turuassú (8983) and Viana (9965).

The coast of Maranhão was first discovered by Pinzon in 1500, but it was included in the Portuguese grant of captaincies in 1534. The first European settlement, however, was made by a French trading expedition under Jacques Riffault, of Dieppe, in 1594, who lost two of his three vessels in the vicinity of the island of Maranhão, and left a part of his men on that island when he returned home. Subsequently Daniel de la Rivardière was sent to report on the place, and was then commissioned by the French crown to found a colony on the island; this was done in 1612. The French were expelled by the Portuguese in 1615, and the Dutch held the island from 1641 to 1644. In 1621 Ceará, Maranhão and Pará were united and called the “Estado do Maranhão,” which was made independent of the southern captaincies. Ceará was subsequently detached, but the “state” of Maranhão remained independent until 1774, when it again became subject to the colonial administration of Brazil. Maranhão did not join in the declaration of independence of 1822, but in the following year the Portuguese were driven out by Admiral Lord Cochrane and the province became a part of the new empire of Brazil.

MARANO (accursed or banned), a term applied to Jewish Christians in Spain. Converted to Roman Catholicism under compulsion, these “New Christians” often continued to observe Jewish rites in their homes, as the Inquisition records attest. It was in fact largely due to the Maranos that the Spanish Inquisition was founded. The Maranos made rapid strides in prosperity, and “accumulated honours, wealth and popular hatred” (Lea, History of the Spanish Inquisition, i. 122). This was one of the causes that led to the expulsion of the Jews from Spain in 1492. Maranos emigrated to various countries, but many remained in the Peninsula. Subsequently distinguished individuals left home for more tolerant lands. The Jewish community in London was refounded by Maranos in the first half of the 17th century. Hamburg commerce, too, owed much to the enterprise of Portuguese Maranos. In Amsterdam many Maranos found asylum; Spinoza was descended from such a family. There are still remnants of Marano families in Portugal and Spain.

See Lea, loc. cit. and elsewhere, sec. ii., “New Christian”.

Graetz, History of the Jews, Eng. trans., see index s. v. “Marano”.

M. Kayserling, In Jewish Encyclopedia, viii. 318 sqq.; and for the present day Jewish Quarterly Review, xv. 251 sqq. (I. A.)

MARASH (anc. Germánica-Marasis), the chief town of a sanjak of the same name in the Aleppo vilayet, altitude 2600 ft. situated E. of the Jihán river, at the foot of Mt Taurus. The sanjak lies almost wholly in Mt Taurus, and includes the Armenian town of Zeitun. Marash is prosperous, and has a large trade in Kurd carpets and embroideries. The climate is good, except in summer. Of the population (50,000) about half are Turkish-speaking Armenians. There are a college, church and schools belonging to the American mission, a native Protestant church and a Jesuit establishment. The site, which lies near the mouths of the three main passes over the eastern Taurus—viz.: those descending from Geukus (Coxysus), Allbastian-Yarpuz (Arabissus), and Malatía (Meltene),—is shown to have had early importance, not only by the occurrence of Maras in Assyrian inscriptions, but by the discovery of several “Hitite” monuments on the spot. These, said to have been unearthed, for the most part in the vicinity of the Khorsabad, but not in the town, are now in Constantinople and America, and include an inscribed lion, once built into the wall of the citadel known in the middle ages as al-Marwani, and several steles. No more is known of the place until it appears as Germánica-Caesarea, striking imperial coin with the head of L. Verus (middle of 2nd cent. a.D.). The identification of Marash with Germánica has been disputed, but successfully defended by Sir W. M. Ramsay; and it is borne out by the Armenian name Kermánik, which has been given to the town at least since the 12th century. Before the Roman period Marash doubtless shared the fortunes of the Seleucid kingdom of Commagene. Germánica-Marasina played a great part in Byzantine frontier warfare: Heraclius was there in a.D. 649; but before 700 it had passed into Saracen hands and been rebuilt by the caliph Moawiyah. During the 8th and 9th centuries, when the direct pass from Cucusus came into military use, Marasina (the older name had returned into general use) was often the Byzantine objective and was more than once attacked; but after 770, when Mansur incorporated it in Palestine, it remained definitely in Moslem power and was refortified by Haruz-al-Rashid. It was seized by the crusaders after their march across Mt Taurus, a.D. 1097, became an important town of Lesser Armenia and was taken by the Seljuks in 1147. In the 16th century it was added to the Osmanli Empire by Selim I. Marash
passed with the rest of Syria into Egyptian hands in 1532, and in 1839 received fugitives from the defeat of Nizib, among whom was Moltke. Ibrahim Buha was encamped near it when directed on by his father, at the bidding of the powers, to stay his further advance. Since its reversion to Ottoman power (1820) the history of Marash has been varied only by Armenian troubles, largely connected with the fortunes of Zeitun, for the reduction of which place it has more than once been used as a base. There was less disturbance there in 1805-1806 than in other northerly Syrian towns.

(D. G. H.)

**MARAT,** JEAN PAUL (1743-1793), French revolutionary leader, eldest child of Jean Paul Marat, a native of Cagliari in Sardinia, and Louise Cabrh of Geneva, was born at Boudry, in the principality of Neuchâtel, on the 24th of May 1743. His father was a designer, who had abandoned his country and his religion, and married a Swiss Protestant. On his mother's death in 1759 Marat set out on his travels, and spent two years at Bordeaux in the study of medicine, whence he moved to Paris, where he made use of his knowledge of his two favourite sciences, optics and electricity, to subdue an obstinate disease of the eyes. After some years in Paris he went to Holland, and then on to London, where he practised his profession. In 1773 he made his first appearance as an author with a *Philosophical Essay on a New Planet,* which was a valedictory letter to France, English, French, German, Italian and Spanish philosophers, and directly attacked Helvetius, who had in his *De l'esprit* declared a knowledge of science unnecessary for a philosopher. Marat declares that physiology alone can solve the problems of the connexion between soul and body, and proposes the existence of a nervous fluid as the true solution. In 1774 he published *The Chains of Slavery,* which was intended to influence constituencies to return popular members, and reject the king's friends. Its author declared later that it procured him an honorary membership of the patriotic societies of Carlisle, Berwick and Newcastle. He remained devoted to his profession, and in 1775 published in London a little *Essay on Gleeats,* and in Amsterdam a French translation of the first two volumes of his *Essay on Man.* In this year he visited Edinburgh, and on the recommendation of certain Edinburgh physicians was made an M.D. of St Andrews. On his return to London he published an *Enquiry into the Nature, Cause, and Cure of a Singular Disease of the Eyes,* with a dedication to the Royal Society. In the same year there appeared the third volume of the French edition of the *Essay on Man,* which reached Ferney, and exasperated Voltaire, by its vaunted likeness of those of Helvetius, into a sharp attack which only made the young author more conspicuous. His fame as a clever doctor was now great, and on the 24th of June 1777, the comte d'Artois, afterwards Charles X. of France, made him by brevet physician to his guards with 2000 livres a year and allowances.

Marat was soon in great request as a court doctor among the aristocracy; and even Brissot, in his *Mémoires,* admits his influence in the scientific world of Paris. The next years were much occupied with scientific work, especially the study of heat, light and electricity, on which he presented memoirs to the Académie des Sciences, but the academicians were horrified at his temerity in differing from Newton, and, though acknowledging his industry, would not receive him among them. His experiments greatly interested Benjamin Franklin, who used to visit him and Goethe always regarded his rejection by the academy as a glaring instance of scientific despotism. In 1780 he had published at Neuchâtel a *Plan de législation criminelle,* founded on the principles of Beccaria. In April 1786 he resigned his court appointment and purchased the *Mémoires académiques,* or *nouvelles découvertes sur la lumière.*

His scientific life was now over, his political life was to begin; in the notoriety of that political life his great scientific and philosophical knowledge was to be forgotten, the high position he had given up denied, and he himself scoffed at as an ignorant charlatan, who had sold quack medicines about the streets of Paris, and been glad to earn a few sous in the stables of the comte d'Artois. In 1788 the notables had met, and advised the assembling of the states-general. The elections were the cause of a flood of pamphlets, of which one, *Ofrande à la patrie,* was by Marat, and, though now forgotten, dwelt on much the same points as the famous brochure of the Abbé Sieyes: 'Qu' est-ce que le tiers état? When the states-general met, Marat's interest was as great as ever, and in June 1789 he published a supplement to his *Ofrande,* followed in July by *La constitution,* in which he embodies his idea of a constitution for France, and in September by his *Tableau des vices de la constitution d'Angleterre,* which he presented to the Assembly. The latter alone deserves remark. The Assembly was at this time full of anglophobes, who desired to establish in France a constitution similar to that of England. Marat had seen that England was at this time being ruled by an oligarchy using the forms of liberty, which, while pretending to represent the country, was really being gradually mastered by the royal power. His heart was now all in politics; and he decided to start a paper. At first appeared a single number of the *Moniteur patriote,* followed on the 12th of September by the first number of the *Publiciste parisien,* which on the 16th of September took the title of *L'Ami du peuple* and which he edited, with some interruptions, until the 21st of September 1792.

The life of Marat now becomes part of the history of the French Revolution. From the beginning to the end he stood alone. He was never attached to any party; the tone of his mind was to suspect whoever was in power. About his paper, the incarnation of himself, the first thing to be said is that the man always meant what he said; no poverty, no misery or persecution, could keep him quiet; he was perpetually crying, "Nous sommes trahi." Whatever suspected any one had only to denounce him to the *Ami du peuple,* and the denounced was never let alone till he was proved innocent or guilty. Marat began by attacking the most powerful bodies in Paris—the Constituent Assembly, the ministers, the corps municipal, and the court of the Châtelet. Denounced and arrested, he was imprisoned from the 8th of October to the 5th of November 1789. A second time, owing to his violent campaign against Lafayette, he narrowly escaped arrest and had to flee to London (Jan. 1790). There he wrote his *Dénonciation contre Necker,* and in May dared to return to Paris and continue the *Ami du peuple.* He was embittered by persecution, and continued his vehement attacks against all in power, and at last, after the day of the Champs de Mars (July 17, 1793), against the king himself. All this time he was hiding in cellars and sewers, where he was attacked by a horrible skin disease, tended only by the woman Simone Evrard, who remained true to him. The end of the Constituent Assembly he heard of with joy and with bright hopes for the future, soon dashed by the behaviour of the Legislative Assembly. When almost despairing, in December 1791, he fled once more to London, where he wrote his *École du citoyen.* In April 1792, summoned again by the Cordeliers' Club, he returned to Paris, and published No. 657 of the *Ami.* The war was now the question, and Marat saw clearly that it was to serve the purposes of the Royalists and the Girondins, who thought of themselves alone. Again denounced, Marat had to remain in hiding until the 10th of August. The early days of the war being unsuccessful, the proclamation of the duke of Brunswick excited all hearts; who could go to save France on the frontiers and leave Paris in the hands of his enemies? Marat, like Danton, foresaw the massacres of September. After the events of the 10th of August he took his seat at the commune, and demanded a tribunal to try the Royalists in prison. No tribunal was formed, and his suggestion was thought the result. In the elections to the Convention, Marat was elected second out of the twenty-four deputies for Paris, and for the first time took his seat in an assembly of the nation. At the declaration of the republic, he closed his *Ami du peuple,* and commenced, on the 25th, a new paper, the *Journal de la république française,* which was to contain his sentiments as its predecessor had done, and to be always on the watch. In the Assembly Marat had no party; he would always suspect and oppose the powerful, refuse power for himself. After the battle of Valmy, Dumoulin was the
France; the M. the M. In 1894; vols., B. that. 1901 the number of speakers was 18,237,809, or about the same as the population of Spain. Marathi occupies an irregular triangular area of approximately 100,000 sq.m., having its apex about 25 miles west of Bombay in the north and Karwar on the open Arabian Sea in the south. It covers parts of two provinces of British India—Bombay and the Central Provinces (including Berar)—with numerous settlers in Central India and Madras, and is also the principal language of Portuguese India and of the north-western portion of His Highness the Nizam’s dominions. The standard form of speech is that of Poona in Bombay, and, in its various dialects it covers the larger part of that province, in which it is the vernacular of more than eight and a half millions of people.

As explained in the article Indo-Aryan Languages, there were in ancient times two main groups of these forms of speech—one, the language of the Midland, spoken in the country near the Gangetic Doab, and the other, the languages of the so-called “Outer Band,” containing the Midland on three sides, west, east and south. The country to the south of the Midland, in which members of this Outer group of languages were formerly spoken, included the modern Rajputana and Gujarat, and extended to the basin of the river Nerbudda, being bounded on the south by the Vindhyas. In the course of time the population of the Midland expanded, and gradually occupied this tract, reaching the sea in the province of the Nerbudda. The language of the Outer Band was thus forced to yield, and its speakers were driven from Caen, where the escaped Girondins were trying to raise France against Paris. Sitting thus on the 13th of July he heard in the evening a young woman, begging to be admitted to see him, saying that she brought news, said, "They shall be soon guillotined," when the young girl, whose name was Charlotte Corday (q.v.), stabbed him to the heart.

His death caused a great commotion at Paris. The Convention attended his funeral, and placed his bust in the hall where it held its sessions. Louis David painted “Marat Assassinated,” and a veritable cult was rendered to the Friend of the People, whose ashes were transferred to the Panthéon with great pomp on the 21st of September 1794—to be cast out again in virtue of the decree of the 8th of February 1795. Marat’s name was long an object of execration on account of his insistence on the death penalty. He stands in history as a bloodthirsty monster, yet in judging him one must remember the situations he endured and the terrible disease from which he suffered.

Besides the works mentioned above, Marat wrote: Recherches physiques sur l’électricité, etc. (1782); Recherches sur l’électricité médicale (1783); Notions élémentaires d’optique (1783); Lettres de l’observateur Bon Sæt à M. de M. sur la future catastrophe des infortunés Pilatre de Rozier et Romain, les aéronautes et l’aérostation (1785); Observations de M. l’amateur Avec à M. l’abbé Sans... &c., (1785); Éloge de Montesquieu (1785), published 1883 by M. de Brezez; Lettres CHalotis modernes, ou lettres sur le chalotis académique (1791); Les Aventures du comte Poniowski (published in 1837 by Paul Lacroix, the "bibliothèque Jacques"); Lettres poniassiers (unpublished). Most of these publications were gathered together by A. Vermeers, in Études du Je. M. Marat, l’ami du peuple, recueillies et annotées (1869). Two of his tracts, (1) On Gleet, (2) A Disease of the Eyes, were reprinted, ed. J. B. Bailey, in 1891.

See A. Vermier, Jean Paul Marat (1880); François Chévereon, Marat; esprit politique, accompli de sa vie (2 vols., 1880); Auguste Cabanès, Marat incompté (1891); A. Bougeart, Marat, l’ami du peuple (2 vols., 1865); M. Tourneux, Bibliographie de l’histoire de France, from 1229 to 1884; vol. iv., 1896, and E. B. Bax, J. P. Marat (1900). The Correspondance de Marat has been edited with notes by C. Villay (1898). ([R. A.])

MARATHI (properly Marathi), the name of an important Indo-Aryan language spoken in central and western India. In 1

The name is sometimes spelt Maharathi, with an h before the r, but, according to a phonetic law of the Aryan languages of western India, this is incorrect. The original h in “Mahārāṣṭrī” from which the word is derived, is liable to elision on coming between two vowels.

MARATHI (properly Marathi), the name of an important Indo-Aryan language spoken in central and western India. In 1

The name is sometimes spelt Maharathi, with an h before the r, but, according to a phonetic law of the Aryan languages of western India, this is incorrect. The original h in “Mahārāṣṭrī” from which the word is derived, is liable to elision on coming between two vowels.
While is the Sauraseni. and Maharatri alien was are do the Ma.ha.-raslr
Godavari, of the district of Vindhya, It has been noted that the Nebraska, and is
obtained in the 17th century by BalaJi Avaj, the secretary of the celebrated
Sivaji. Its chief merit is that each word can be written as a whole, without being
pen from the paper, a feat which is impossible in the case of Marathi.1

Origin of the Language.—The word “Marathi” signifies the language of the Maratha country. It is the modern form of the Sanskrit Mährästrä, just as “Marâtha” represents the old Mährästrä, or Great Kingdom. Mährästrä was the name given by Sanskrit writers to the particular form of Prakrit spoken in Mährästrä, the great Aryan kingdom extending southwards from the Vindhyâ range to the Kistna, broadly corresponding to the southern part of the Bombay Presidency and to the state of Hyderabad. As pointed out in the article PRAKRIT this Mährästrä early obtained literary pre-eminence in India, and became the form of Prakrit employed as the language not only of lyric poetry but also of the formal epic (kâtyâ). Dramatic works were composed in it, and it was the vehicle of the non-canonical scriptures of the Jain religion. The oldest work in the language of which we have any knowledge is the Suttasâ, or Seven Centuries of verses, compiled at Prâtisthâna, on the Godâvari, the capital of King Hala, at some time between the 3rd and 7th centuries A.D. Prâtisthâna is the modern Pathan in the Aurangabad district of Hyderabad, and that city was for long famous as a centre of literary composition. In later times the political centre of gravity was transferred to Poona, the language of which district is now accepted as the standard of the best Marathi.

General Character of the Language.—In the following account of the main features of Marathi, the reader is presumed to be familiar with the leading facts stated in the articles INDO-ARYAN LANGUAGES and PRAKRIT. In the Prakrit stage of the Indo-Aryan languages we can divide the Prakritis into two well-defined groups, an Inner, Sauraseni and its connected dialects on the one hand, and an Outer, Mährästrä, Ardhamâgadhî, and Mâgadhî with their connected dialects on the other. These two groups differed in their phonetic laws, in their systems of declension and conjugation, in vocabulary, and in general character.2 In regard to the last point reference may be made to the frequent use of meaningless suffixes, such as -alla, -illa, -ulla, &c., which can be added, almost ad libitum to any noun, adjective or particle in Mährästrä and Ardhamâgadhî, but which are hardly ever met in Sauraseni. These give rise to numerous secondary forms of words, used, it might be said, in a spirit of playfulness, which give a distinct flavour to the whole language. Similarly the late Mr Beames (Comparative Grammar, l. 103) well describes Marathi as possessing “a very decided individuality, a type quite its own, arising from its comparative isolation for so many centuries.” Elsewhere (p. 38) he uses language which would easily well apply to Mährästrä Prakrit when he says, “Marathi is one of those languages which we may call playfult—it delights in all sorts of jingling formations, and has struck out a larger quantity of secondary and tertiary words, diminutives, and the like, than of any of the cognate tongues,” and again (p. 52):—

“In Marathi we see the results of the Pandit’s file applied to a form of speech originally possessed of much natural wilderness and licence. The hedgedrows have been pruned and the wild bears and roses trained into order. It is a copious and beautiful language, second only to Hindi. It has three genders, and the same elaborate preparation of the base as Sindhi, and, owing to the great corruption which has taken place of its phonetic formations, the difficulty of determining the gender of nouns is as great in Marathi as in German. In fact, if we were to institute a parallel in this respect, we might appropriately describe Hindi as the English, Marathi as the German, and the Maharatri as the Latin of the Indian group—Hindi having cast aside whatever could possibly be dispensed with, Marathi having retained whatever has been spared by the action of time. To an Englishman Hindi commends itself by its absence of form, and the positional structure of its sentences resulting therefrom; to our High-German cousins the Marathi, with its fuller array of genders, terminations, and inflections, would probably seem the completer and finer language.3

In the article PRAKRIT it is explained that the literary Prakritis were not the direct parents of the modern Indo-Aryan vernaculars. Each Prakrit had first to pass through an intermediate stage of the Apabhramasas, before it could become a vernacular. The Apabhramasas is therefore the only one concerning which we have definite information. Although it would be quite possible to reason from analogy, and thus to obtain what would be the corresponding forms of Mährästrä Apabhramas, we should often be travelling upon insecure ground, and it is therefore advisable to compare Marathi, not with the Apabhramas from which it is immediately derived, but with its grandmother, Mährästrä Prakrit. We shall adopt this course, so far as possible, in the following pages.

Vocabulary.—In the article INDO-ARYAN LANGUAGES it is explained that, allowing for phonetic development, the vocabulary of Sauraseni Prakrit was the same as that of Sanskrit, but that the farther we go from the Midland, the more examples we meet of a new vocabulary, the so-called Marathi, as distinct from the Prakritis spoken outside the Midland, and strange to Sanskrit. Mährästrä Prakrit, the most independent of the Outer languages, was distinguished by the large proportion of these dêlya words found in it, and the Marathi, and these were transferred to Marathi.

The Brahmins of the Maratha country have always had a great reputation for learning, and their efforts to create a literary language out of their vernacular took, as in other parts of India, the direction of tattamâ, or the style of tattamâ, to lend that they considered to be dignity to their sentences. But the richness of the language in dêlya words has often rendered such borrowing unnecessary, and has saved Marathi, although the proportion of tattamâ to tâdâhânu4 in the language is more than sufficiently high, from the fate of the Pandit-ridden literary Bengali, in which 80 to 90% of the vocabulary is pure Sanskrit. There is indeed a tradition of stylistic chastity in the Maratha country from the earliest times, and even Sanskrit writers contrasted the simple elegance of the Deccan (or Vaidarbhi) style with the flowery complexity of eastern India.

The borrowed, through the medium of Arabic words in the Marathi vocabulary is comparatively low, when compared with, say, Hindostani. The reason is, firstly, the predominance in the literary world of these learned Brahmins, and, secondly, the fact that the Maratha country was not conquered by the Musulmans till a fairly late period, nor was it so thoroughly occupied by them as were Sind, the Punjab, and the Gangetic valley.

Phonetics.—In the standard dialect the sounds of the tongue are the same as in Sanskrit, but r and l sounds have been borrowed directly from that language (tattamâs). Final short vowels (a, i and u) have all disappeared in prose pronunciation, except in a few local dialects, but in the speech of old and young u are found for a. In the Nagari character, the non- pronunciation of a final e is not indicated. After an accented syllable a medial e is pronounced very lightly, even when the accent is not the main accent of the word. Thus, if we indicate the main accent by a’1, and an accented syllable by a”, we have the pronounceable forms of the word (Sanskrit: prakrit: Marathi:)

Several of the old synthetic cases have survived in Marathi, especially in the antique form of the language preserved in poetry. Most of them have fallen into disuse in the modern prose language. We may note the following, some of which have preserved the Māhārāṣṭrī forms, while others are directly derived from the Apabhraṃśa stage of the language. We content ourselves with giving some of the synthetic cases of one noun, a weak neutral a-base, ghar, a house.

The accusative is usually the same as the nominative, but when definiteness is required the dative is employed instead. The termination n̄, with its plural n̄, is, as explained in the article GUJRĀT, really the oblique form, by origin a locative, of the nā or n̄, employed in Gujarati to form the genitive. The suffix n̄ of the dative plural is derived from the same word. Here it is probably a corruption of the Apabhraṃśa nā or n̄āka. The postposition fā is probably a corruption of the Sanskrit lābhā, Apabhraṃśa lāhī, for the benefit of. As regards the a-base, we have in old Marathi poetry a form corresponding to gharah-in-west, which explains the derivation. Gharahā kāsa is by-form of the Prakrit synthetic ablative gharahā, to which nāya, another oblique form of nā, is added to define the meaning. The locative termination -ā is a contraction of the Pr. -ānt, Skr. -ant, within.

The genitive gharātī is really an adjectival meaning "belonging to the house," and agrees in gender, number and case with the noun which is possessed. Thus māḷāyātā ghaḍā, the gardener's horse, māḷāyātē ghaḍā, the gardener's horses.

As already stated, in Prakrit the genitive is employed instead of the dative, and thus forms the basis of the Marathi dative singular. The genitive plural is not used as a dative plural in Marathi, but it is the basis of the plural general oblique case. The Marathi singular general oblique case is really the same as the Marathi dative singular, but in the standard form of speech when so used the final s is dropped, gharās, as a general oblique case, being only found in dialects. This general oblique case is the result of the confusion of the various oblique cases originally distinguished in Sanskrit and in literary Prakrit. In Apabhraṃśa the genitive began to usurp the function of all the other cases. It is obvious that if it were regularly employed in so indeterminate a sense, it would give rise to great confusion. Hence when it was intended to show clearly what particular case was meant, it became usual to add, to this indeterminate genitive, defining particles corresponding to the English "of," "to," "from," "by," &c., which, as in all Indo-Aryan languages they follow the main word, are called "postpositions." Before dealing with these, it will be convenient to give the modern Marathi synthetic declension of the commoner forms of nouns. The only synthetic case which is not employed in prose is the dative, and this can always be formed from the general oblique case by adding an s to the end of the word. It is therefore not given in the following table.

The suffix sā, cā, ē, is derived from the Sanskrit suffix tyakas, Pr. ca, which is used in much the same sense. In Sanskrit it may be added either to the locative or to the unmodified base of the word to which it is attached, thus, ghaḍātyaka or ghaḍātyaka-tyakas. Similarly in Marathi, while it is usually added to the general oblique base, it may also be added to the unmodified noun, in which case it has a more distinctly adjectival force. The use of sā has been influenced by the fact that the Sanskrit word bṛyār, Pr. bīcā, also takes the same form in Marathi. As explained in the article HINDOSTANI, synonyms of this word are used in other Indo-Aryan languages to form suffixes of the genitive.1

Strong adjectives, including genitives, can be declined like substantives, and agree with the qualified noun in gender, number and case. When the substantive is in an oblique case, the adjective is put into the general oblique form without any defining postposition, which is added to the substantive alone. Weak adjectives are not inflected in modern prose, but are inflected in poetry. As in other Indo-Aryan languages, comparison is effected by putting the noun with which comparison is made in the ablative case.

The pronouns closely follow the Prakrit originals. The origin of these is discussed in the article HINDOSTANI, and the account need not be repeated here. As usual in these languages, there is no pronoun of the third person, its place being supplied by the demonstratives. The following are the principal pronominal forms—

1 Fuller information regarding all the above postpositions will be found in G. A. Grierson's article "On Certain Suffixes in the Modern Indo-Aryan Vernaculars," on pp. 473 seq. of the Zeitschrift für vergleichende Sprachforschung for 1903.
MARATHI

674

ml, 1, instr. ml, myd, dat. madd; āmāh, we, instr. āmāh, obl. āmāh; mādāhā, my, of me; āmās, our, of us.

tū, thou, instr. tū, tuā, dat. tūa, obl. tūa, tumbh, you, instr. tumbh, obl. tumbh, your.
dār, by, of; dārām, your.

dārāga, selī, obl. dārāga, gen. dārāgī.

This is also employed as an honorific pronoun of the second person, and, in addition, to mean we including you.

hā, this, fem. kā, neut. kūt; āi, he, that, fem. āi, neut. āt; dā, who, fem. ji, neut. jī.

kōp, who? kāt, what? obl. kātā; kē, any one; kēhī, anything.

In all these the plural is employed honorifically instead of the singular.

Conjugation.—In Prakrit (q.v.) the complicated system of Sanskrit conjugation had already disappeared, and all verbs fell into two classes, the first, or a-, and the second, or e-, conjugation, in which the e represents the aya of the Sanskrit tenth conjugation and of causal and denominative verbs. Marathi follows Prakrit in this respect and has two conjugations. The first, corresponding to the Prakrit a-class, as a rule consists of intransitive verbs, and the second, corresponding to the e- or causal class, of transitive verbs, but there are numerous exceptions. Verbs whose roots end in vowels or in h belong partly to one and partly to the other conjugation.

These conjugations differ only in the present and past participles and in the tenses formed from them. Here, in the first conjugation an a, and in the second conjugation an i, is inserted between the base and the termination.

The only original Prakrit tenses which have survived in Marathi are the present and the imperative. The present has lost its original meaning and is now a habitual past. It is also the base of the Marathi future. These three tenses, the habitual past, the imperative and the future, are conjugated as follows. They should be compared with the corresponding forms in the article Prakrit.

The verb selected is the root u(h, rise, of the first conjugation.

As in Rajasthani, Bihari and the Indo-Aryan language of Nepal (see PAHARI), the future is formed by adding ā, or in the first person singular n, to the old present. In the second person singular the 1 has been added to a form derived from the Pr. u(hāt, which is also the origin of the old present u(hāt. Some scholars, however, see in u(hāt a derivation of the Prakrit future u(hātā, thou shalt arise, and a confusion of the Prakrit present and future is quite possible.

The remaining tenses are modern forms derived from the participles. The verbal nouns, participles and infinitives are as follows:

<table>
<thead>
<tr>
<th>Person</th>
<th>Habitual past (old present)</th>
<th>Imperative</th>
<th>Future</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sing.</td>
<td>u(hā</td>
<td>u(hā</td>
<td>u(hā</td>
</tr>
<tr>
<td>Plural</td>
<td>u(hā</td>
<td>u(hā</td>
<td>u(hā</td>
</tr>
</tbody>
</table>

The only form that requires notice is that of the conjunctive participle. It is derived from the Apehrānšā form u(hā, to which the ending -nā (old Marathi nā, nya) has been added.

Various tenses are formed by adding personal suffixes to the present, past or future passive participle. When the subject of the verb is in the nominative the tense so formed agrees with it in gender, number and case. We may note four such tenses: a present u(hāt, I rise; a past, u(hāt, I rose; past conditional, u(hāt, had I risen; and a subjunctive, u(hātā, I should rise. In the present, the terminations are relics of the verb substantive, and in the other tenses of the personal pronouns. In these latter, as there is no pronoun of the third person, the third persons have no terminations, but are simply the unmodified participle. We thus get the present and the past conjugated as follows, with a masculine subject:

<table>
<thead>
<tr>
<th>Present, I rise.</th>
<th>Past, I rose.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Singular.</strong></td>
<td><strong>Plural.</strong></td>
</tr>
<tr>
<td>1</td>
<td>u(hā</td>
</tr>
<tr>
<td>2</td>
<td>u(hā</td>
</tr>
<tr>
<td>3</td>
<td>u(hā</td>
</tr>
</tbody>
</table>

The feminine and neuter forms differ from the above: thus, u(hāt, thou (fem.) rose; u(hāt, thou (fem.) didst rise; and so on for the other persons and numbers.

It will be observed that, in the case of transitive verbs, while the present participle is active, the past and future passive participles are passive in meaning. The same is the case with the future passive participle of the intransitive verb. In tenses, therefore, that result from these participles the sentence must be construed passively. The subject must be put into the instrumental case, and the participle inflected to agree with the object. If the object is not expressed, or, as is sometimes the case, is expressed in the guise of a kind of ethicative, the participle is construed impersonally, and is employed in the neuter form. Thus (present tense) mudrāt (nom. masc.) pāhī (gen. nā, instr.) mangātā (instrumental pāhī (nom. fem.) vācī (fem.) the boy read a book, literally, by-the-boy a-book was-read; or mudrāgan vācī (neuter), he read the book, literally, by-the-boy, with-reference-to-the-book. Similarly in the subjunctive formed from the future passive participle, mudrāgan pāhū (neuter), the boy should read a book (by-the-boy a-book is-to-be-read) or mudrāgan pāhū (neuter), the boy should read the book (by-the-boy with-reference-to-the-book, it (impermissible) a-book is-to-be-read). As an example of the subjunctive of an intransitive verb, we have māht, by-thee it-is-to-be-risen, thou shouldst rise. As in intransitive verbs the passive sense is not so strong, in the case of the tense may also be used actively, as in māhtā, thou shouldst rise, āi, thou (art) to-be-risen. It will be noted that when a participle is used passively it takes no personal suffix.

We have seen that the present futurative is formed by conjugating the present participle with the verb substantive. Further tenses are similarly made by suffixing, without compounding, various tenses of the verb substantive to the various participles. Thus mi u(hāt āhē, I am rising; mū u(hāt hāhē, I was rising; māyā u(hāt hāhē (imper-sonal construction), I should have risen. In the case of tenses formed from the past participle, the auxiliary is appended, not to the participle, but to the past tense, as in mū u(hāt āhē, I have risen; māyā mārīl āhē (personal passive construction) or māyā mārīl āhē (impersonal passive construction), I have killed. Similarly mū u(hāt hāhē (active construction), I had risen. The usual forms of the present and past of the verb substantive are:

<table>
<thead>
<tr>
<th>Present, I am.</th>
<th>Past, I was (masc.)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Singular.</strong></td>
<td><strong>Plural.</strong></td>
</tr>
<tr>
<td>1</td>
<td>āhē</td>
</tr>
<tr>
<td>2</td>
<td>āhē</td>
</tr>
<tr>
<td>3</td>
<td>āhē</td>
</tr>
</tbody>
</table>

The past changes for gender, but the present is immutable in this respect. Āhē is usually considered to be a descendant of the Sanskrit āsmi, I am, while hāhē is derived from the Pr. hāntu, the present participle of what corresponds to the Skr. root bhū, become.

A potential passive and a causal are formed by adding ā to the root of a simple verb. The former is used with the first, or intransitive, and the latter the second or transitive conjugation. The potential passive of a neuter verb is necessarily construed impersonally. The causal verb denotes indirect agency; thus, karāntē, to do, karāntē, to cause a person to do; hūyā-koṣṇām māyā āē karāntē, I caused him to do that, literally, by-means-of-him by-me that was-caused-to-be-done. The potential, being passive, has the subject in the dative (cf. Latin māhē est ludensum) or in the instrumental of the genitive, as in āē āhē (dative), or mārīl āhē (instr. of mārīl, of me), u(hātā, I can rise, literally, for-me, or by-me (action), rising-can-be-done. So, Rāmā, or Rāmāē, pāhī vācī, Rām could read a book (by R, a book could be read). Several verbs are irregular. These must be learnt from the grammars. Here we may mention hēnē, to become, past participle dēhā; yēnē, to come, past participle dī; and dēkē, to go, past participle dēkā. These are compound verbs. One of these, making a passive, is formed by conjugating the verb dēkē, to go, with the past participle of the principal verb. Thus, mārīl dēkē, he is being killed, literally, he goes killed.

1 See, however, Hoernle, Comparative Grammar, p. 364.
Marathon—Marazion

675

Literature.—As elsewhere in India, the modern vernacular literature of the Marathi country arose under the influence of the religious reformation by Ramanuja early in the 12th century. He and his followers taught devotion to a personal deity instead of the past. Under their influence the writer of the most important record is Namdev (12th century), whose hymns in honour of Vishnu, a personal form of Vishnu, have travelled far beyond the home of his writer, and are even found in the Sikh Adi Granth. In the 15th and 16th centuries a paraphrastic version of the Satyakriti Bhagavat Gita, which is still much admired. Passed over several intermediate writers we come to the period of the warrior Sivaji. He was a disciple of Ramdass (1617-1680), and under him, will the Dasaad, a work on religious duty, be a classic. Contemporary with Ramdass and Sivaji was Tukaram (1608-1669), a Soudra by caste, and yet the greatest writer in the language. He began life as a petty坐着 in the Marathi of the day, but later wrote several prose and verse poems, greatly beloved by family relations, he abandoned the world and became a wandering ascetic. His Abhang or "unbroken" hymns, probably so called from the Indian Sanskrit world, are written in the language of his country of birth. They are fervent, but than abounding in excellent morality, do not rise to any great height as poetry. Other Marathi poets who may be mentioned are Sridhara (1675-1726), the most copious of all, who translated the Bhagavata Purana, and the learned Mayuran or Moropant (1729-1794), whose works swell too much of the lamp to satisfy European standards of criticism. Marathi literature was an inspiration to the Marathi, but its importance rests on the fact that it collected the popular traditions about national saints, and was thus the author of the Acta Sanctorum of the Marathas. Litanies, or erotic lyrics, by various writers, are supposed to have been taken by contemporaries for decent. Another branch of Marathi literature is composed of Pavadgas or war-ballads, mostly by nameless poets, which are sung everywhere throughout the country. There is a small prose literature, consisting of nar- rative and ethical novels, and popular tales. In the 19th century the facilities of the printing press are responsible for a great mass of published matter. Most of the best works have been written in English by learned natives, upon whom the methods of European scholarship have exercised more influence than elsewhere in India, and have given rise to a happy combination of native and European. Many of the authors of outstanding merit have appeared during the last century.

Konkani once had a literature of its own, which is said to have been destroyed by the Invasion at Goa. Temples and manuscripts of Konkani were burnt wholesale. Under Roman Catholic auspices a new literature arose, the earliest writer being an Englishman, Thomas Stephens (Thomaz Estevado), who came to Goa in 1579, wrote the first Konkani grammar, and died there in 1619. Amongst other works, he was the author of a Konkani paraphrase of the New Testament in metrical form, which has been several times reprinted and is still a favourite work with the native Christians. Since his time many Konkani writers have written in Konkani literature from the pens of Portuguese missionaries and native converts.

Authorities.—Marathi is fortunate in possessing the best dictionary to be found in India, viz. "A Dictionary of the Marathi Language", 2nd ed., Bombay, 1857. Navalkar's 3rd ed., Bombay, 1894 is the best grammar. The earliest student of Marathi was the Portuguese, who were familiar only with the language as spoken on the Portuguese Settlement of the northern coast of Malabar and with Konkani. They have since devoted themselves to these two forms of speech. For the former, reference may be made to the "Onto-Aryan Linguistic Dictionary", or to the "Dictionnaire de la langue du dialecte de no dialeto do norte", by Cunha Rivara (Goa, 1838). For Konkani proper, see A. F. X. Maffei's "Gramma" (Mangalore, 1882) and "Dictionnaire" (ibid., 1883). These are in English. Monseigneur S. R. Dalgozo is the author of a "Konkani-Portuguese Dictionary" (Bombay, 1918).

Marathon, a plain on the N.E. coast of Attica, divided from the plain of Athens by the range of Pentelicus; it contained four villages—Marathon, Probalinthus, Tricorythos and Oenoee—which originally formed an independent tetrapolis and in historical times still upheld peculiar rites and legendary associations, chiefly connected with Heracles and Theseus. In the 6th century B.C. it served as a base for Pelopissus (q.v.), who owned much property in that district, for securing the rest of Attica. The plain derives its fame mainly from the battle in which the Athenians and Plateans defeated the Persians (490 B.C.). The Persian force had been sent by King Darius to punish the Athenians for previous interferences in Asia and to restore their tyrant Hipias. It was probably by advice of the latter that the generals Datis and Artaphernes landed their troops, numbering perhaps 50,000, at Marathon. The Athenians, on the recommendation of their strategus Miltiades, resolved to meet this force in the open field, and sent out their full levy of 9000 heavy infantry under the polemarch Callimachus. They were joined on the way by 1000 Plateans, but were disappointed of the assistance which they expected from Sparta. From their station at the head of the Vrana valley, which slopes down to Marathon plain, the Athenians for some days observed the Persian army, which gave no sign of proceeding to attack. After some waiting, Miltiades, who seems throughout to have played a more prominent part than his superior Callimachus, drew up the Athenian army for battle and charged down upon the enemy, whose line was formed on the level about a mile distant. The Athenian wings, whose formation had been made specially deep, broke the opposing divisions by their impact; the centre was at first overborne by the superior weight of the native Persians, but ultimately with the assistance of the victorious wings, which closed around the Persian centre. The Persian army, which had been thrown back into the sea all along the line, and, although the majority regained their ships, no less than 6400 were left dead, as against 192 Athenians. The Persian fleet, of which perhaps a detachment had been sent on before the battle, now sailed round Cape Sunium in order to effect a landing at Phalerum, close by Athens, and with the help of traitors within the walls to take the city by surprise. But Miltiades, who had suspected some plot all along, and had lately been warned by a signal on Mt Pentelicus which he interpreted as a message to the Persians, marched back the victorious army in time to defend Athens. The enemy, upon noticing his presence, did not venture a second disembarkation and retired straightforward out of Greek waters. The details of the battle, and the Persian plan of campaign, are not made clear by our ancient sources, but reconstructions have been attempted by numerous modern authorities. (M. O. B. C.)

The tumult or "Soros" was excavated by M. Stais in 1891 and 1892. A slight previous excavation had brought to light some prehistoric implements, and it was supposed that the mound contained no connexion with the Persian war, but in 1889 it was discovered that the presence of those prehistoric objects was accidental. Underlying the mound was found a stratum about 85 ft. long by 20 broad, consisting of a layer of sand, above which lay the ashes and bones of many corpses; together with these were the remains of many lyclethi and other vases, some of them contemporary with the Persian wars, some of them of much earlier style, and probably taken in the emergency from neighbouring cemeteries. It is conjectured with some probability that a large vase containing ashes may have been used as the burial urn of one of the Athenian generals who fell. There was also, in the middle of the stratum, a trench for funeral offerings about 30 ft. by 3; it contained bones of beasts, with ashes and fragments of vases. There can therefore be no doubt that the tumult was piled up to commemorate the Athenians who fell in the battle, and that it marks the place where the carnage was thickest. A selection from the contents of the tumult has been placed in the National Museum at Athens. (E. Gr.)

Marazion, a small seaport in the St Ives parliamentary division of Cornwall, England, on the shore of Mount's Bay, 2 m. E. of Penzance, served by the Great Western railway. Pop. (1901), 1251. A causeway of boulders and pebbles, thrown up by the sea and passable at low tide, unites Marazion with the insular St Michael's Mount (q.v.). The church of St Hilary, destroyed by fire in 1853, had a very fine spire, which has been
MARBLE

faithfully reproduced in the restored building. Unusual archaeological interest attaches to the churchyard. Its inscribed stones date from the 4th century, one being in honour of Constantine the Great. Another has Cornish lettering, which can no longer be deciphered; and there are British and Roman crosses. Market gardening and fishing are the main industries.

The charter attributed to Robert count of Mortain, granting lands and liberties to St Michael's Mount, opposite Marazion, included a market on Thursdays. This appears to have been held from the first on the mainland. From it is probably derived the Margashbigan (Parum Forum) of the earlier and Margashbige or Marketjew (Forum Jovis) of the later charters. It may be added that a Jewish origin has been ascribed to the place from the name Marketjew. It is certain that Richard king of the Romans provided that the three fairs, on the two feasts of St Michael and at Mid-Lent, and the three markets which had hitherto been held by the priors of St Michael's Mount on land not their own at Margashbigan, should in future be held on their own land at Marchadyou. He transferred in fact the fairs and markets from the demesne lands of the Bloyou in Marazion to the priory (1462). To regulate the loss of an ancient measure Ralph Bloyou in 1331 procured for himself and his heirs a market on Mondays and a fair on the vigil, feast and mourning of St Andrew at Marchasyon. In Leland's time the market was held at Marhsedethyow (Forum Jovis), and both Norden (1682) and Carew (1602) tell us that Marcajewe signifies the Thursday's market, which, whether etymologically sound or not, shows that the prior's market had prevailed over its rival. In 1595 Queen Elizabeth granted to Marazion a charter of incorporation. This ratified the grant of St Andrew's fair, provided for another on the Feast of St Barnabas and established a market on Saturdays. The corporation was to consist of a mayor, 8 aldermen and 12 capital burgesses. This corporation continued to administer the affairs of the borough until it was dissolved under the Municipal Corporations Act in 1835, when the property belonging to it was vested in charity commissioners. The chairman of the commissioners retains possession of the regalia. Of the fairs only the Michaelmas fair has survived and all the markets have gone. It is frequently stated that Marazion had formerly the right of returning two members to parliament, but that owing to its inability to pay the members' expenses the right was lost. Under the Common-wealth an attempt was made to secure or recover the right, and two members are said to have been returned, but they were not allowed to take their seats. Remains of an ancient bronze furnace, discovered near the town, tend to prove that tin-smelting was practised here at an early period. Marazion was once a flourishing town, and owed its prosperity to the throne of pilgrims who came to visit St Michael's Mount. During the first half of the 16th century it was twice plundered; first by the French, and later by the Cornish rebels. The rise and progress of the neighbouring borough of Penzance in the 17th century was the undoing of Marazion.

MARBLE (from Lat. marmor, Gr. ἱαμψως, shining stone), a term applied to any limestone or dolomite which is sufficiently close in texture to admit of being polished. Many other ornamental stones—such as serpentine, alabaster and even granite—are sometimes loosely designated marble, but by accurate writers the term is invariably restricted to those crystalline and compact varieties of carbonate of lime (occasionally with carbonate of the magnesia) which, when polished, are applicable to purposes of decoration. The crystalline structure is typically shown in statuary marble. A fractured surface of this stone displays a multitude of sparkling facets, which are the rhomboidal cleavage-planes of the component grains. The beautiful lustre of polished statuary marble is due to the light penetrating for a short distance into the rock and then suffering refraction at the surfaces of the deeper lying crystals. The durability of marble in a dry atmosphere or when protected from rain renders it a valuable building-stone (p. 47); on the other hand, when exposed to the weather or the acid atmosphere of large cities, its surface readily crumbles.

4 Statuary and Economic Marbles. Among statuary marbles the first place may be assigned to the famous Pentelic marble, the material in which Pheidias, Praxiteles, and other Greek sculptors executed their principal works. The characteristics of this stone are well seen in the Elgin marbles, which were removed from the Parthenon at Athens, and are now at the British Museum. The marble was derived from the quarries of Mount Pentelicus in Attica. Several large buildings have recently been constructed with this marble in London. The neighbouring mountain of Hymenus likewise yielded marbles, but these except for so pure in colour nor so fine in texture as those of Pentelicus. Parian marble, another stone much used by Greek sculptors and architects, was quarried in the isle of Paros, chiefly at Mount Marpessa. It is called by ancient writers lychnites (from the Gr. λυχνος, a lamp) in allusion to the fact that the quarries were worked by the light of lamps. The Venus de' Medici is a notable example of work in this material. Carrara marble is better known than any of the Greek marbles; inasmuch as it constitutes the stone invariably employed by the best sculptors of the present day. This marble occurs abundantly in the Apuan Alps, near the town of Massa Marittima, and is largely worked in the neighbourhood of Carrara, Massa and Serravezza. Stone from this district was employed in Rome for architectural purposes in the time of Augustus, but the finer varieties, adapted to the needs of the sculptor, were not discovered until some time later. It is in Carrara marble that the finest works of Michelangelo and of Canova are executed. The purest varieties of this stone are of snow-white colour and of fine saccharoidal texture. Silica is disseminated through some of the marble, becoming a source of annoyance to the workman; while occasionally it separates as beautifully pellucid crystals of quartz, known as "Carrara diamonds." The geological age of the marbles of the Apuan Alps has been a subject of much dispute, some geologists regarding them as metamorphosed Triassic, Liassic or Rhætic rocks. Much of the common marble is of a bluish colour, and therefore unfit for statuary purposes; while streaked with blue and grey veins the stone is known as bardiglio. Curiously enough, the common white marble of Tuscany comes to England as Sicilian marble—a name probably due to its having been formerly re-shipped from some port in Sicily.

Although crystalline marbles fit for statuary work are not found to any extent in Great Britain, the limestones of the Palaeozoic formations yield a great variety of marbles well suited for architectural purposes. The Devonian rocks of south Devon are rich in handsome marbles, presenting great diversity of tint and pattern. Plymouth, Torquay, Ilplepen, Babacombe and Chudleigh may be named as the principal localities. Many of these limestones owe their beauty to the fossil corals which they contain, and are hence known as "madrrepore marbles." Of far greater importance than the marbles of the Devonian system are those of Carboniferous age. It is from the Carboniferous or Mountain Limestone that British marbles are mainly derived. Marbles of this age are worked in Derbyshire and Yorkshire, in the neighbourhood of Bristol, in North Wales, in the Isle of Man, and in various parts of Ireland. One of the most beautiful of these stones is the "encrinit marble," a material which owes its peculiarities to the presence of numerous encrinites, or stone-lilies. These fossils, when cut in various directions, give a characteristic pattern to the stone. The joints of the stems and arms are known from their shape as "wheel-stones," and the rock itself has been called "entochal marble." The most beautiful varieties are those in which the calcareous fossils appear as white markings on a ground of grey limestone. In Belgium a black marble with small sections of crinoid stems is known as petit granit, while in Derbyshire a similar rock, crowded with fragments of minute encrinites, is termed "bird's-eye marble." Perhaps the most generally useful marbles yielded by the Carboniferous system are the black varieties, which are largely benzoined for chimney-pieces, vases, and other ornamental objects. The colour of most black limestone is due to the presence of bituminous matter. Such limestone commonly
Marble

emits a feebler light, but the colour, being of organic origin, is discharged on calcination. Black marbles, more or less dense in colour, are quarried in various parts of Ireland, especially at Kilkenny and near Galway, but the finest kind is obtained from near Ashford in Derbyshire. From Ashford is also derived a very beautiful stone known as "rosewood marble." This is a dense brown laminated limestone, displaying when polished a handsome pattern somewhat resembling the grain of rosewood; it occurs in very limited quantity, and is used chiefly for inlaid work. The black marble of Frosterley, Yorkshire, is another Carboniferous example which owes its "figure" or pattern to the presence of large quantities of anthracite. Various marbles may be compared to the well-known "landscape marble" or Cotham stone, an argillaceous limestone with peculiar dendritic markings, due probably to the infiltration of water containing oxide of manganese. This limestone occurs in irregular masses near the base of the White Lias, or uppermost division of the Rhaetic series. It is found principally in the neighbourhood of Bristol. The arborescent forms depicted in bluish-grey upon this landscape marble form a marked contrast to the angular markings of warm brown colour which are seen on slabs of "rainbow" or the "rainbow" marble of Italy. A white marbe in which the occasional black bands resemble as landscape stone, or pietera poesina. British limestones of Secondary and Tertiary age are not generally compact enough to be used as marbles, but some of the shelly beds are employed to a limited extent for decorative purposes. "Ammonite marble" is a dark brown limestone from the Lower Lias of Somersetshire, crowded with ammonites, principally A. planicostata. Under the name of Forest marble, geologists recognize a local division of the Lower Oolite series, so named by W. Smith from Wychwood Forest in Oxfordshire, where shelly limestones occur; and though, of little economic value, are capable of being used as rough marbles. But the most important marbles of the Secondary series are the shelly limestones of the Purbeck formation. Purbeck marble was a favourite material with medieval architects, who used it freely for slender clustered columns and for sepulchral monuments. It consists of a mass of the shells of a fresh-water snail, *Paludina cornifera*, embedded in a blue, grey or greenish limestone, and is found in the Upper Purbeck beds of Swanage in Dorsetshire. Excellent examples of its use may be seen in Westminster Abbey and in the Temple Church near York. As in the cathedrals of Salisbury, Winchester, Worcester and Lincoln. Sussex marble is a very similar stone, occurring in thin beds in the Weald clay, and consisting largely of the shells of *Paludina*, principally *P. sussexiensis* and *P. flavirum*. The altar stones and the episcopal chair in Canterbury Cathedral are of this material. Certain calcareous metamorphic rocks frequently form stones which are sufficiently beautiful to be used for ornamental purposes, and are generally classed as marbles. Such serpentinitic limestones are included by petrologists under the term "opalcalcite." The famous *verde antico* is a rock of this character. Mona marble is an opalcalcite from the metamorphic series of the Isle of Anglesey, while the "Irish green" of architects is a similar rock from Connemara in western Galway. It is notable that some of the "white marble" of Connemara has been found by W. King and T. H. Rowney to consist almost wholly of malacolite, a silicate of calcium and magnesium. A beautiful marble has been worked to a limited extent in the island of Tresco, one of the Hebrides, but the quarry appears to be now exhausted. This Tresco marble is a limestone having a delicate carnelian colour diffused through it in irregular patches, and containing rounded crystals of sapphire, a green augitic mineral resembling malacolite in composition.

Many marbles which are prized for the varied patterns they display owe these patterns to their formation in concentric zones—such marbles being in fact stelagmitic deposits of carbonate of lime, sometimes consisting of aragonite. One of the most beautiful stalagmitic rocks is the so-called onyx marble of Algeria. This stone was largely used in the buildings of Carthage and Rome, but the quarries which yielded it were not known to modern sculptors until 1849, when it was rediscovered near Oued-Abdallah. The stone is a beautifully translucent material, delicately clouded with yellow and brown, and is greatly prized by French workmen. Large deposits of a very fine onyx-like marble, similar to the Algerian stone, have been worked at Tekali, about 35 miles from the city of Mexico. Among other stalagmitic marbles, mention may be made of the well-known Gibraltar stone, which is often worked into models of cannon and other ornamental objects. This stalagmite is much deeper in colour and less translucent than the onyx marbles of Algeria and Mexico. A richly tinted stalagmitic stone worked in California is known as Californian marble. It is worth noting that the "alabaster" of the ancient writers is stelagmitic carbonate of lime, and that this stone is therefore called by mineralogists "Oriental alabaster" in order to distinguish it from our modern "alabaster," which is a sulphate, and not a carbonate, of lime. Gypsum capable of taking a polish is found at Fauld in Staffordshire and in Italy and Spain.

The brown and yellow colours which stalagmitic marbles usually present are due to the presence of oxide of iron. This colouring matter gives special characters to certain stones, such as the *giolo antico*, or antique yellow marble of the Italian antiquaries. A reddish marble is a reddish mottled stone obtained from the neighbourhood of Siena in Tuscany; and a somewhat similar stone is found in King's County, Ireland. True red marble is by no means common, but it does occur, of bright and uniform colour, though in very small quantity, in the Carboniferous limestone of Derbyshire and north-east Staffordshire. The red marble called *rosso antico* is often confounded with the *porfiro rossso antico*, which is really a micahornblende porphyrite owing its red colour to the mineral willemite. Fire marble is the name given to a brown shelly limestone containing ammonites and other fossil shells, which present a brilliant display of iridescent colours, like those of precious opal. It occurs in rocks of Liassic age at the lead-mines of Bieleberg in Carinthia, and is worked into snuff-boxes and other small objects. By mineralogists it is often termed *lumachella*, an Italian name which may, however, be appropriately applied to any marble which contains small shells.

The quarries of France, Belgium, Italy and Spain, not to mention less important localities, yield a great diversity of marbles, and almost each stone bears a distinctive name, often antiquarian or folk-lore in origin. And it may be impossible to enumerate the local names used by marble-workers in different countries to distinguish the various stones which pass under their hands.

America possesses some valuable deposits of marble, which in the eastern States have been extensively worked. The crystalline limestones of western New England furnish an abundance of white and grey marble, while a beautiful material fit for statuary work has been quarried near Rutland in Vermont. A grey bird's-eye marble is obtained from central New York, and the greyish clouded limestones of Thomaston in Maine have been extensively quarried. Of the variegated and coloured marbles, perhaps the most beautiful are those from the northern part of Vermont, in the neighbourhood of Lake Champlain. A fine breciated marble is found on the Maryland side of the Potomac, below Point of Rocks. Among the principal localities for black marble may be mentioned Shoreham in Vermont and Glen Falls in New York. In 1908 the American States producing marble were, in order of value, Vermont, Georgia, Tennessee, New York, Massachusetts, Alabama, Pennsylvania, Maryland, California, Colorado, Alaska, N. Carolina, Kentucky, New Mexico, Utah, Missouri and Idaho. In Canada the crystalline limestones of the pre-Cambrian series yield beautiful marbles.

In India we find important quarries at Makrana in Rajputana,—a locality which is said to have yielded the marble for the famous Taj Mahal at Agra. In the valley of the Nerbudda, near Jabalpur, there is a large development of marble. The white marble which is used for the delicately pierced screens called *jalis* work is obtained from near Raiah, in Ujwar. (F. W. R.*)

Petrography.—Marbles are uniformly crystalline, and hence have no bedding or schistosity which would tend to make them fissile.
but are entirely massive and free from grain. The microstructure of pure marble is comparatively simple. In thin sections they are seen to be built up of somewhat rounded grains of calcite, fitting closely together, showing no graininess, and lacking the evidence of crystalline form. They are colourless and transparent, and are usually traversed by a lattice-work of sharply defined cleavage cracks, which correspond to the cleavage planes of calcite, a fine-grained rock. This variety of calcite is usually called "various Marblehead, as a name given to the various kinds of colourless or white-marble rock presented to the microscope. These may have been produced by pressure acting either during the crystallization of the rock or at a later period.

The purest marbles generally contain some accessory minerals, and it is these rocks that they form a considerable proportion of the whole mass. The most common are quartz in small rounded grains, scales of colourless or pale yellow mica (muscovite and phlogopite), dark green talc, and small flakes of iron oxide. Even fine Carrara marble leaves a residue of this sort when dissolved in acid. Many marbles contain other minerals which are usually silicates of lime or magnesia. The list of these accessories is a very large one. An蛆e is very frequent. It may be white (malacolite) or pale green (coccokite, sahite, diopside); hornblende occurs as white bladed tremolite or pale green actinolite; and present also, such as orthoclase, or more frequently some plagioclase such as albite, labradorite or anorthite; scapolite (or wernermite); various kinds of garnet; vesuvianite, spinel, forsterite, periclase, brucite, talc, zoisite and epidote, chondrodite, biotite, and chlorite. Such minerals may be regarded as accessory minerals. The presence of metalliferous minerals such as galena, grey or red silver ores, zinc blende, antimonite, chalcopyrite, molybdite, cassiterite, or wolframite is an unusual occurrence. Such substances, especially if these substances occur in workable quantities. The rubies of Burma are found in crystalline limestone and are constantly accompanied by precious spinel or baliash.

These minerals represent impurities in the original limestone which crystallized at the time that the marble became crystalline. The silicates derive their silica mainly from sand or infiltrated siliceous deposits; the alumina represents an admixture of clay mineral from limonite or haematite in the original state of the rock. Where the silicates bulk largely because the original limestone was highly impure, the acid may have been expelled out of the rock as silica during the process of recrystallization. The rock is then a calc-silicate rock, hard, tough, flinty and no longer readily soluble in acids. They are sometimes fine-grained hornstones known as calc-silicate hornfelses. Where white minerals predominate (wollastonite, tremolite, feldspar) these rocks may have a close resemblance to marbles, but often they are green from the abundance of green augites and amphiboles, or brown (when garnet and vesuvianite are present in quantity) or yellow (with epidote, chondrodite or sphene). Decomposition induces further changes in colour owing to the formation of green or yellow serpentine, pale green talc, red haematite, and the appearance of a red coloration. Such silicate marbles have originated in this manner. Often bands of calc-silicate rock alternate with bands of marble, and they may be folded or bent; in other cases, nodules of silicate rock may be contained in pure marble. Earth movements may shatter the rocks, producing fissures afterwards filled with veins of calcite; in this way the beautiful breciated or veined marbles are produced. Sometimes the fragments are rolled and cemented by mere marble under pressure and pseudo-conglomerates or "crush conglomerates" result. In other cases the bedding of the marble indicates the original bedding of the calcareous sediments. Crystalline limestones which contain much mica may be called micaschists, in them quartz, garnet and hornblende often also occur. The phylmites are marbles containing much serpentine, which has been formed by the decomposition of forsterite, olivine augite. The much-discussed Eosom, at one time supposed to be the earliest known fossil and found in Archaean limestones in Canada, is now known to be inorganic and to belong to the ophiolites. There are probably all kinds of slightly metamorphosed limestones. The passage of limestones rich in fossils into true marbles as they approach great crystalline intrusions of granite is a phenomenon which scientists do not fully understand. Crystallization of the rock has not completely obliterated the organic structures (e.g. at Carrara and at bergen in Norway). The agencies which have induced the metamorphism are heat and pressure, the latter exerted by the weight of the overlying rocks and from the movement of the earth's crust. For these changes took place before the granite cooled and while it was still deeply buried beneath the surface. In 1869 S. E. R. S. Muller advocated, a set of experiments of which he was the principal. He enclosed schist in a gun-barrel securedly plugged and heated it to a high temperature in a furnace. Carbonic acid was given off by the schist and produced a great pressure in the interior of the tube, which finally burst and the schist was converted into granular crystalline marble. As rocks which have undergone changes of this kind are commonest in the oldest and deepest layers of the earth's crust, most marbles are Palaeozoic or pre-Cambrian. They occur very often with mica schists, phyl-

Marblehead, a township of Essex county, Massachusetts, U.S.A., occupying a rocky promontory on Massachusetts Bay, 1 mi. W. N. of Boston. Pop. (1890), 8203; (1900), 7823; (1930), 7297. Many of the fine marble masses in the rock have undergone decomposition by the heating action of igneous intrusions may have played no part, but the rise of temperature and increase of pressure due to the folding movement of the earth's crust and subsequent changes have probably been the operating cause. This type of metamorphism has been distinguished by the name "marmarosis" (Sir A. Geikie, Text Book of Geology, 1882).

For descriptions of ancient marbles see F. Corsi, Delie pierre antiche (Rome, 1845); M. W. Porter, What Rome was built with (Oxford, 1907), and for marbles in general consult E. Hull, Building and Ornamental Stones (1872); G. F. Merrill, Stones for Building and Decoration (3rd ed., 1905, New York).

Washington in conveying his troops across the East River after the battle of Long Island, and later in ferrying them across the Delaware before the battle of Trenton. Marblehead furnished more than 1000 men to the Continental army. During the war of 1812 (Ancient Stone Implements, 2nd ed., p. 430) admits that the game was formerly prohibited among undergraduates on the steps of the Bodleian or the Senate House. There is a similar tradition at Westminster School that the boys were forbidden to play marbles in Westminster Hall on account of the complaints made by members of parliament and lawyers. An anonymous poem of the 17th century speaks of a boy about to leave Eton as "A dance at syntax, but a dab at taw."

Rogers, in The Pleasures of Memory, recalls how "On you grey stone that fronts the chancel-door, Worn smooth by busy feet, now seen no more, Each eve we shot the marble through the ring."

Defoe (1720) writes of the seer Duncan Campbell: "Marbles, which he used to call children's playing at bowls, yielded him mighty diversion; and he was so dexterous an artist at shooting that little alabaster globe from between the end of his forefinger and the knuckle of his thumb, that he seldom missed hitting plumb, as the boys call it, the marble he aimed at, though at the distance of two or three yards." The locus classicus on marbles in the 19th century is in the trial in Pickwick, where Sergeant Buzfuz pathetically says of Master Bardell that "his 'alley tors' and his 'commones' are alike neglected; he forgets the long familiar cry of 'knuckle down,' and at tip-cheese, or odd and even, his hand is out." Many similar passages might be adduced to prove the former popularity of marbles with the young of all classes. In some rural parts of Sussex Good Friday was known as "marble-day" till late in the 19th century, since on that day both boys and girls in England this game was often played. There was some traditional reason for regarding marbles as a Lenten sport—perhaps, as the Rev. W. D. Parish suggests, "to keep people from more boisterous and mischievous enjoyments."

The origin of the game is concealed in the mists of antiquity. Marbles used by Egyptian and Roman children before the Christian era are to be seen in the British Museum. Probably some of the small stone spheres found among neolithic remains, such as Evans (Ancient Stone Implements, 2nd ed., p. 430) admits to be too small for projectiles, are prehistoric marbles. It is commonly assumed that the game which the youthful Augustus, like other Roman children, played with nuts was a form of marbles, and that the Latin phrase of relicinquire nucis, in the sense of putting away childish things, referred to this game. Strutt believed that nuts of the roundest sort were the original "marbles." The earliest unmistakable reference to marbles in literature seems to be in a French poem of the 12th century, quoted by Littré as in Billet.

The marbles that with which various games are nowdays played are small spheres of stone, glass or baked clay. In the 18th century they were mostly made from chips of marble (whence the name) or other stone, which were ground into a roughly spherical shape by attrition in a special iron mill. Nuremberg was then the center of the trade in marbles, and indeed wherever there was a stonemason's yard to afford raw material. The "alley taw," as its name indicates, was made of alabaster. In the first decade of the 20th century English marbles were all imported from central Germany, and the alleys, or most valuable marbles, used for shooting, were mostly made of coloured glass, sold retail from ten a penny to a penny each. Coloured stone marbles are still made, but are very small, and only of limited variety.

The cost of marbles is stated at prices varying from forty to a hundred a penny, though even the cheapest of these were painted by hand with concentric rings. The well-made and highly valued alleys of earlier times were no longer procurable, owing to the decline in popularity of the sport. In the United States, however, much more expensive and accurately rounded marbles were still manufactured, the latest being of hollow steel.

There has never been any recognized authority on the game of marbles, and it is probable that, in the past as in the present, every child who could afford a string of marbles must have had his own rules. There were, however, three or four distinct games which are traditional, and may be found, with trifling variations, wherever the game is played. Sturt, writing at the end of the 19th century, describes these as follows: (1) "Taw, wherein a number of boys put each of them one or two marbles in a ring and shoot at them alternately with other marbles, and he who obtains the most of them by beating off his opponent's ring is the victor in the ring—whence the game is often known as "ring-taw"—are usually of the cheaper kind known as "commonies," "stoneyes," or "potties," and the marble with which the player shoots is a marble of one stone, one-knuckle, or "alley," or "tor," or "honeycomb," as spelt "tor," as by Dickens. Usually it is necessary that the alley should emerge from the ring as well as drive out another marble; unless this rule holds the ring is a "game" or "small game," and the player must be skillful enough to leave his alley inside it, whilst driving the object marble outside. (2) "Nine holes: which consists in bowling of marbles at a wooden bridge with nine arches. Each arch bears a number, and the owner of the bridge pays that number of marbles to the player who shoots through it, making his profit from the missing marbles, which he confiscates; or the game may be played in which the nine holes are "big," i.e., the player needs to hit nine marbles into all the holes to complete the "bowl," and in the fewest bowls obtains the victory." This primitive form of golf is played by Zulu adults with great enthusiasm, and is still popular among the car-drivers of Belfast. (3) "Boss out, or boss and span, also called hit and span, wherein one puts a marble to any distance that he pleases, which serves as a mark for his antagonist to bowl at, whose business it is to hit the marble first bowled, or lay his own near enough to it for him to span the space between them and touch both marbles; in either case he wins, if not, his marble remains where it lay and becomes a mark for the first player, and so alternately until the game be won." In rural districts, particularly in the Coal Country, it is still a going-to-school game, because it helped the pupils along the road.

Mr F. W. Hackwood states that, in the middle of the 19th century, taverns in the Black Country had the custom of setting a game of bowls 20 ft. long by 12 ft. wide and 18 in. from the ground, with a raised wooden rim to prevent the marbles from running off. Players knelt down to shoot, and had to "knuckle down" fairly—rather not to the knuckle of the shooting hand than on the ground, that the flip of the thumb was not aided by a jerk of the wrist. The game was usually ring-taw. But marbles is now obsolete in England as a game for adults (Old English Sports, London, 1907). A writer in Notes and Queries (IX. ii. 314) thus describes the marbles used by English boys in the middle of the 19th century: "In ring-taw the player put only commonies in the ring, and shot into the rakes, which included stoneyes, alleys and blood-alleys. Commonies were unglazed; potties glazed in the kiln. Stoneyes were made from common pebbles such as were used for road-mending; alleys and blood-alleys out of marble. The blood-alleys were very highly priced, so called for their "blood," the spots or streaks of red in them. In Derbyshire, where large numbers were made, they had relative values. The stone was either three commonies or two potties. The blood-alleys were worth six commonies or four potties. Blood-alleys were worth more, according to the depth and arrangement of colour—from twelve to fifty commonies and stoneyes in proportion. "A taw with a history" was a game where five to seven or more rubles were in correspondence."

"All the best-made marbles were taws, and no commonies or potties were used for shooting with, either in ring-taw or the various hole-games." In Belfast the season, as observed from March to June, when the ground was usually dry and hard. The marbles were stoneyes, of composition painted; crockeries, of slightly glazed stone-ware, dark brown and yellow, claysies, of red clay, hard baked; in marbles, in white, black, or red with flowing white -flow; in glass marbles, with white glaze and painted rings; and glass marbles. The two chief games were ring-taw and hole and taw; in the latter three holes were made in a line, 6 ft. to 12 ft. apart, and the player
had to go three times up and down according to somewhat elaborate rules (Notes and Queries, IX. iii. 65). The stonework and cobbles were sold at twenty a penny; the clayeys were cheaper and were not used as stakes; the marbles were cut from china, and at times the shoemaker's cost a halfpenny and a farthing respectively.

In other parts of the country the phraseology of marbles affords some interesting problems for the philologist. We hear of "alleyes, bards, guineas!"; "marbles!"; "Dutch alleyes;" and "Dutch alleyes;" and also "perch marbles of rolled and baked clay; in Scotland of "bools, whinnies, glasses, jairies;" of "Dutch alleyes," and so forth. "Dubs, trebs and fobs, stand for two, three and four;" and "charms" are marbles. When the tow stayed in the ring it was a "chuck." "Phobbo slips" was a phrase used to forbid the correction of an error.

We know of the various games of marbles played by English children is to be found in Mrs Gomme's Traditional Games of England, Scotland and Ireland (London, 1898), under the headings Boss-out, Bridgeboard, Bun-hole, Cob, Ho-go, Holy Bang, Hundreds, Long, Long-Taw, Master and three marbles; and Passididdles. Other games are known as Plum-pudding, or Pickin the Plums, in which one shoots at marbles in a row; Pyramids, in which the marbles are arranged in a pyramid; Bounce About, Bounce Eye Conqueror, Die Shot, Fortifications, Handiers, Increase Pound, Knock Out, Rising Taw, Spanners, Tip-shears; Strutt's Sports and Pastimes, ed. J. C. Cox (London, 1902). Much information will be found in Notes and Queries, and in the second series. For marbles in France see Larousse, s.v. Billes. See also Solitaire. (W. E. G. F.)

MARBOT, JEAN BAPTISTE ANTOINE MARCELIN, BARON DE (1782-1854), French soldier, son of General Jean Antoine de Marbot (1754-1800), who died in the defence of Genoa under Masséna, was born at La Riviére (Corrèze), on the 18th of August 1782. He joined the republican army as a volunteer in 1799, rose rapidly to commissioned rank, and was aide-de-camp to Marshal Augereau, commanding the VII. corps, in the war against Prussia and Russia in 1806-7. After this he served with great distinction in the Peninsular War under Lannes and Masséna, and showed himself to be a dashingly light cavalry in the Russian War of 1812 and the German campaign of the following year. After a slow recovery from the wounds he had received at Leipzig and Hanau, he was promoted general of brigade by Napoleon during the Hundred Days, and took part in, and was wounded at, the battle of Waterloo. He was exiled at the second restoration and only returned to France in 1819, after which, however, his intimacy with the Duke of Orleans secured him important military positions. After the July restoration he was made maréchal-de-camp, and in this rank he was present at the siege of Antwerp in 1832. He was promoted lieutenant-general in 1836. From 1835 to 1840 he served in various Algerian expeditions, and in 1845 he was made a member of the Chamber of Peers. Three years later, at the fall of Louis Philippe, he retired into private life. He died at Paris on the 16th of November 1854. Marbot wrote two pamphlets, Remarques critiques sur l'œuvre de M. le général Soult, Initial Considerations sur l'Art de la guerre (1820), and La Nécessité d'augmenter les forces militaires de la France (1829), but his fame rests chiefly, if not indeed wholly, on the fascinating Memoirs of his Life and Campaigns which were published in Paris in 1891 (Eng. trans., 1902). To ordinary readers and to students of history alike these give a picture of the Napoleonic age of warfare which for vividness and romantic interest has never been surpassed.

His elder brother, ANTOINE ADOLPHE MARCELIN DE MARBOT (1781-1844), was born at La Riviére, on the 22nd of March 1781, entered the army at the age of eighteen, and commanded a battalion in the revolutionary wars and became aide-de-camp to Bernadotte. In 1802 he was arrested on the ground of being concerned in a plot of the Republicans against the Consulate, but he was released, though Napoleon continued to regard him as an opponent of the established régime. After a term of duty with the army in Santo Domingo he participated in the campaigns of 1806-7, and from 1808 to 1811 he was employed in the Peninsular War. In the Russian War of 1812 he was wounded and made prisoner. At the end of two years of captivity he returned to France and was again employed as aide-de-camp to Marshal Davout during the Hundred Days, and thereafter passed into retirement, from which he did not emerge till 1830. He attained the rank of maréchal-de-camp under Louis Philippe, and died at Bra, near Tulle, on the 2nd of June 1844.

MARBURG, a town of Austria, in Styria, 41 m. S. of Graz by rail. Pop. (1900), 24,501. It is very Picturesquely situated on the left bank of the river Drave, on a plain called the Pettauer-Feld, at the base of the well-wooded Bachergebirge. To the north of the town the train passes through the Leitersberg tunnel (725 yds. long), opened in 1846, while the Drave, which has here a width of 200 yds., is spanned by a magnificent iron bridge, built in 1845. The principal buildings are the cathedral, raised in the 12th century, the Mirow, erected in 1623, is 136 ft. high, and the old castle. Its situation in the midst of a fertile vine and fruit-growing district, connected by the navigable Drave with Hungary, and by railway with Vienna, Trieste, Tirol and Carinthia, makes it the centre of a considerable traffic in wine and grain. Its industrial products are leather, boots and shoes, iron and tin wares, liqueurs and sparkling wine, and it also contains the extensive workshops of the South Austrian railway. Marburg is the seat of the bishop of Lavant, and is the native town of the famous Austrian admiral, Baron Wilhelm von Toepffer (1827-1871). Near Marburg is the village of Mariarast, the church of which is a popular place of pilgrimage.

MARBURG, an ancient university town of Germany, in the Prussian province of Hesse-Nassau, situated on the slope of a hill on the right bank of the Lahn, 60 m. by rail N. of Frankfort-on-Main, on the main line to Cassel. Pop. (1905), 26,137. On the opposite bank of the river, here spanned by two bridges, lies the suburb of Weidenhausen and the railway station of the Prussian state railway. On the hill on which the town is built, crowned by the extensive old Schloss, a fine Gothic building, the most noteworthy parts of which are the Rittersaal, dating from 1277-1312, and the beautiful little chapel. This Schloss was formerly the residence of the landgraves of Hesse, served afterwards as a prison, and is now the repository of the historically interesting and valuable archives of Hesse. The chief architectural ornament of Marburg is, however, the Elisabethen-kirche, a veritable gem of the purest Early Gothic style, erected by the grand master of the Teutonic Order in 1255-1283, to contain the tomb of St Elizabeth of Hungary. The remains of the saint were deposited in a rich silver-gilt sarcophagus, which may still be seen, and were afterwards visited by myriads of pilgrims, until the Protestant zeal of Landgrave Philip the Generous caused him to remove the body to some unknown spot in the church. The church also contains the tombs of numerous Hessian landgraves and knights of the Teutonic Order. The Lutheran church is another good Gothic edifice, dating mainly from the 15th century. The town-hall, built in 1532, and several fine houses in the Renaissance style, also deserve mention. The university of Marburg, founded by Philip the Magnanimous in 1527, was the first university established without papal privileges, and speedily acquired a great reputation throughout Protestant Europe. It has a library of 140,000 volumes, is admirably equipped with medical and other institutes, which form some of the finest modern buildings in the town, and was attended, in 1905, by 1576 students. Marburg also possesses a gymnasium, a "Realschule," an agricultural school, a society of naturalists, a hospital, and an extensive lunatic asylum. It is the seat of a district court, and of superintendents of the Lutheran and Reformed Churches. Marburg pottery is renowned; and leather, iron wares and surgical instruments are also manufactured there. The environs are very picturesque.

Marburg is first historically mentioned in a document of the beginning of the 13th century, and received its municipal charter from the landgrave Louis of Thuringia in 1227. On his death it became the residence of his wife, Elizabeth of Hungary, who built a hospital there, and died in 1231, at the age of twenty-four, worn out with works of religion and charity. She was canonized in 1255 at the instance of the Teutonic Knights, who had settled in Marburg in 1244, and were engaged in protecting her cult. By 1247 Marburg had already become the second town of Hesse, and in the 15th and 16th centuries it alternated with Cassel as...
the seat of the landgravies. In 1529 the famous conference between Luther and Zwingli on the subject of Transubstantiation took place there in the Rittersaal of the Schloss (see Marburg, Colloquy 09). During the Thirty Years' and Seven Years' Wars Marburg suffered considerably from sieges and famine. In 1606, and again in 1610, it was the centre of an abortive rising against the French, in consequence of which the fortifications were destroyed.

See Kolbe, Marburg im Mittelalter (Marb., 1879); Bücking, Mittheilungen aus Marburs Vorzeit (Marb., 1886); Schoel, Marburg die Perle des Hessenlandes (2nd ed., 1903).

MARBURG, COLLOQUY OF (Marburger Religionsgespräch), the name given to a conference of divines held in 1529 in the interests of the unity of Protestant Germany. The circumstances in which the influence of the men who conducted its deliberations, and the result of its proceedings, combine to render it of no small importance for the history of the Reformation in Germany. After the Imperial Diet of Spires in 1526 had decreed that all states of the empire should observe the Edict of Worms (1521), banning Luther and his adherents, in such a manner that they should not be afraid to answer it before God and the emperor, the reform movement had received such an access of strength that the Catholic party felt itself menaced in earnest, and in 1529 again passed a resolution at Spire, designed not merely to preclude any further expansion of the Reformation, but even to prevent it from maintaining the ground already won. This duty was at once challenged, on the 16th of April, by the protest of the Evangelical states (whence the name Protestants); and the effect of this disclaimer was not small. Still, it was devoid of political significance, unless backed by the united force of all the princes and states subscribing to the Evangelical teaching; and this unity was wanting. The feud which raged round the doctrine of the Lord's Supper had already broken out before the first diet of Spire, and had aroused great and immediate excitement. At a very early period, however, efforts were made to ally the dissension. Strassburg pronounced for conciliation; but the most powerful and zealous champion of peace was to be found in the landgrave Philip of Hesse, who recognized the absolute necessity—from a political standpoint—of the union of all German Protestants. It is probable that he had invited Luther to a religious conference as early as the year 1527; but on that occasion he met with a refusal. True, the impression conveyed by the attitude of the Catholic party at the second Diet of Spires had served to awaken the feeling for solidarity among the Evangelicals there assembled; and on the 22nd of April they had even secured the basis for a provisional alliance in the shape of a formula drawn up by Bucer and dealing with the Lord's Supper. But it was obvious that a permanent coalition could not be expected unless some definite understanding on the debated point could be attained; and on the very same day the landgrave despatched to Zwingli an invitation to a colloquy, and received his prompt acquiescence. Melanchthon, who in the tension which prevailed at the synod had shown himself inclined to negotiation, became suspicious on his return, and endeavoured to influence the elector of Saxony and the duke of Wurttemberg to prevent the colloquy; but, however, was so far successful that the beginning of October (1529) saw the colloquy opened in the castle at Marburg. With Zwingli, who had arrived on the 27th of September, he had several interviews of considerable political importance before the Wittenberg divines made their appearance. These interviews settled the preliminaries of an alliance; but they rested on the assumption that the theological feud between Wittenberg and Zürich could be removed, or its violence at least abated. These proceedings opened on the 31st of October with conferences between Luther and Oecolampadius, and Melanchthon and Zwingli; then on the two following days the discussion proper—confined almost entirely to Luther and Zwingli—was held before the landgrave and his guest Duke Ulrich of Württemberg, in the presence of more than fifty persons. As regards the main point of contention, i.e., the doctrine of the Lord's Supper, no agreement was found practicable; and the private conversations on the 4th of October, which formed the sequel of the debate, carried matters no farther. "You have another spirit," said Luther. Since the landgrave, however, was reluctant to see the colloquy brought to an absolutely fruitless close, he requested Luther to draw up a list of the most important points of doctrine on which it might yet be possible to arrive at some degree of unanimity. This was done on the 4th of October; and a few alterations were introduced to meet the wishes of the Swiss deputies. The Articles of Marburg, which thus came into being, contain the doctrine of the Trinity, of the personality of Christ, of faith and justification, of the Scriptures, of baptism, of good works, of confession, of government, of tradition, and of infant baptism. The fifteenth article, treating of the Lord's Supper, defines the ground common to both parties even in this debateable region, recognizing the necessity of participation in both kinds, and rejecting the sacrifice of the Mass. It then proceeds to fix the point of difference in the fact that no agreement had been reached on the question "whether the true body and blood of Christ are corporeally present in the bread and wine" ("Nit vergleich habent wir uns, ob der war leib und pluto Christi leiblich im brot und wein say"). Nevertheless, the adherents of each doctrine are recommended to display Christian charity to those of the other. These articles were signed by the ten official members of the colloquy: Luther, Jonas, Melanchthon, Osiander, Agricola, Brenz, Oecolampadius, Bucer, Hedio and Zwingli. The personal contact between Luther and Zwingli led to no mental rapprochement between the two; but in the following year the Articles of Marburg did good service as one of the preliminaries to the Augsburg Confession, and remain a valuable document for the fundamental principles common to the Lutheran and Reformed Churches.

MARCA, PIERRE DE (1594—1662), French prelate and historian, was born at Gan, near Pau, on the 24th of January 1594. His family was known among judicial circles in the 16th century, and maintained the Roman Catholic faith after the official introduction of the Reformed religion into Navarre. After having studied law at the university of Toulouse he practised successfully at Pau. But he was ambitious, and turned to a larger sphere. He ardently called for the armed intervention of King Louis XIII. in Béarn, and on this occasion published his first writing, Discours d'un Béarnais, très fidèle sujet du roi, sur l'édi du rétablissement de l'exercice de la religion catholique dans tout le Béarn (1618). After the easy campaign of 1620 in which he had been taken by the Protestants, he was given back to the Roman Catholic church; this task was performed, under his supervision, with judgment and moderation. During the siege of La Rochelle he performed a mission which brought him in touch with Richelieu, who shortly afterwards nominated him intendant de justice in Béarn (1631), and in 1639 summoned him to Paris with the title of councillor of state. The following year, the question of the intervention of kings in the election of bishops having been raised in a pamphlet by Charles Hersent (Optatus Gallus de cassoachis, sive de controversia ecclesiastica qua adhuc talis sit, Paris, 1631), the business was referred to the council of the Gallican Church, in his celebrated treatise De concordia sacerdotii et imperii, seu de libertatis ecclesiae gallicanae (1641). He was soon rewarded for this service. Although he had not yet taken even the minor holy orders, he was nominated bishop of Couserans by the king on the 28th of December 1641, but the pope refused to give his sanction. It was only after Marca had formally denied those propositions contained in De concordia which were displeasing to Rome that he was proclaimed in the consistory (Jan. 13, 1648). During this time, and until 1651, he was governor of the province of Catalonia, then occupied by the French. After the Treaty of the Pyrenees, he was sent to direct the conference which had been formed to fix the limits of Roussillon, which had just been ceded to France (1660). Marca now interested himself in the fortunes of Mazarin, and remained faithful to him even during the
Marcantonio. As a recompense, he was nominated archbishop of Toulouse (May 28, 1652), but had to wait for the bulls of investiture till the 23rd of March 1654. It was difficult for him to please both pope and king. In the struggle against the Jansenists he used all the influence he had with the clergy to secure the passage of the apostolic constitution of the 31st of March 1653 (*Relation de ce qui s’est fait depuis 1653 dans les assemblées des évêques au sujet des cinq propositions, 1657*); but in the rebellion raised by Retz, archbishop of Paris, against the king, he took the part of the king against the pope. Michel Le Tellier having ordered him to refute a thesis of the college of Sorbierium, he treated it with circumspection and allusion, as most Gallican in its ideas, but refused to publish it for fear of drawing down "the indigation of Rome." These tactics were successful, and when Retz, weary of a struggle without definite results, resigned the archbishopric, Marca became his successor (Feb. 26, 1662). He did not derive much profit from this new favour, as he died on the 20th of June following, without his nomination having been sanctioned by the pope.

Marca, charger and covetous, was also an historian of note. When very young he showed his interest in the past history of his native land, and in 1617, at the age of twenty-three, he had set to work looking through archives, copying charters, and corresponding with the principal men of learning of his time, the brothers Dupuy, André Duchesne and Jean Belsy, whom he visited in Poitou. *Histoire de Blarn* was published at Paris in 1640. It was not so well received as his *De concordia*, but is more appreciated by posterity. If Marca's criticism is too often undecided, both in the ancient epochs, where he supports the text by a certain amount of guesswork and in certain points where he touches on religion, yet he always gives the text correctly. A number of chapters end with an interesting collection of charters. It is to be regretted that this incomplete work does not go beyond 1500. During his long stay in Catalonia he made preparations for a geographical and historical description of this province, which was bound to France by so many political and literary associations. Baluze, who became his secretary in 1666, helped him with the work and finished it, adding clever appendices and publishing the whole in 1688 under the title *Marca historica*.

Marca's biography was written in Latin by two of his intimate friends, Etienne Baluze, his secretary (*Epistola ad Samuelum Sorbierum, de vita, gestis et scriptis Petri de Marca, Paris, 1663*), and his brother Paul de Faget (*Histoire et vita del Marca, theological pamphlets, first published by Paul de Faget in 1668*). This contained four treatises on the Eucharist, the sacrifice of the Mass, the erection of the patriarchate of Constantinople (in Latin), and the sacrament of the Eucharist (in French). It was supposed to contain heretical propositions and caused a good deal of scandal, inciting Baluze against Faget, both of whom abused the other, to defend the memory of the prolate.

See Bayle's article in the *Dictionnaire historique et critique* (i.v. "Marca"), and the Vie de Marca in the *Histoire de Blarn* (vol. i., 1894) of V. Dubarre.

**Marcantonio** [Marcantonio Raimondi], the chief Italian master of the art of engraving in the age of the Renais-
sance, and the first who practised it in order to reproduce, not designs of his own invention, as earlier craftsmen had commonly done, but those of other artists almost exclusively. The date of his birth is uncertain, nor is there any good authority for assigning it, as is commonly done, approximately to the year 1488. He was probably born some years at least earlier than this, inasmuch as he is mentioned by a contemporary writer, Achillini, as being an artist of repute in 1504. His earliest dated plate, illustrating the story of Pyramus and Thisbe, belongs to the following year, 1505. Marcantonio received his early education in the famous discipline of his master, painter of Bologna, Francesco Ribaldi, usually called Fra
di, "Having more aptitude in design," says Vasari, "than his master, and managing the graver with facility and grace, he made wainscots and many other things in niello, such being then highly valued. It is said that the Venetian and Lombard engravers had not hitherto been directed, like that of Schongauer or Düer north of the Alps, towards securing such freedom and precision in the use of the burin as should impart to the impressions taken from their engraved plates both a striking decorative effect and a power of suggesting to the eye a complex variety of natural objects and surfaces in light and shade. The Italian masters had been satisfied with much more rudimentary effects. The Florentine primitives had been content either with very soft and hazy effects of drapery, or with the fordycean patterns of the flat plate, or with broad open shadings in the manner of the English. Mantegna and Pollaiuolo, the two chief original masters who practised the art, had used the latter method with great power but at the same time great simplicity.

By the beginning of the 16th century a desire for a more complicated kind of effects was already arising among the followers of the art in Italy. Both backgrounds and passages of foreground detail were often imitated, inartificially enough, from the works of the northern masters. Marcantonio himself was among the foremost in this movement. About eighty engravings can be referred to the first five or six years of his career (1505-1511). Their subjects are very various, including many of pagan mythology, and some of obscure allegory, along with those of Christian devotion. The types of figures and drapery, and the general character of the compositions, bespeak for the most part the inspiration, and sometimes the direct authorship, of Fra
cia. But the influence of German example is very perceptible also, particularly in the landscape backgrounds, and in the endeavour to express form by means of light and shadow with greater freedom than had been hitherto to the practice of the southern schools. In a few subjects also the figures themselves correspond to a coarse Teutonic, instead of to the refined Italian, ideal. But so far we find Marc-
tonio only indirectly leaning on the north for the sake of self-
improvement. It must have been for the sake of commercial profit that he by-and-by produced a series of direct counterfeit
copper from Albert Düer's woodcuts. These facsimiles are sixty-nine in number, including seventeen of Düer's "Life of the Virgin," thirty-seven of his "Little Passion," on wood, and a number of single pieces. According to Vasari, Düer's indignation over those counterfeit was the cause of his journey to Venice, where he is said to have lodged a complaint against Marcantonio, and induced the Senate to prohibit the counterfe
ting of his monogram, at any rate, upon any future imitations of the kind. Vasari's account must certainly be mistaken, inasmuch as Düer's journey to Venice took place in 1506, and neither of the two series of woodcuts imitated by Marcantonio was published until 1511. The greater part of the designs for the "Life of the Virgin" had, it is true, been made and engraved seven years earlier than the date of their publication; and it is to be remarked that, whereas Marcantonio's copies of the "Little Passion" leave out the monogram of Düer, it is inserted in his copies of the "Life of the Virgin"; whence it would, after all, seem possible that he had seen and counterfeited a set of impressions of this series at the time when they were originally executed, and before their publication. But the real nature of the transaction, if transaction there was, which took place between Düer and Marcantonio we cannot now hope to recover. Enough that the Bolognese engraver evidently profited, both in money and in education of the hand, by his
work in imitating in a finer material the energetic characters of these northern woods. He was soon to come under a totally different influence, and to turn the experience he had gained to account in interpreting the work of a master of a quite other stamp. Up till the year 1510 Marcantonio had lived entirely at Bologna, with the exception, it would appear, of a visit or visits to Venice. (A few of his early engravings are from drawings of the school of Giorgione.) Very soon afterwards he was attracted, for good and all, into the circle which surrounded Raphael at Rome. Where or when he had first made Raphael’s acquaintance is uncertain. His passage to Rome by way of Florence has been supposed to be marked by an engraving, dated 1510, and known as “The Climbers,” Les Grimpeurs (Bartsch, 487), in which he has reproduced a portion of the design of Michelangelo’s cartoon of the Soldiers surprised bathing, and has added behind the figures a landscape imitated from the then young Dutch engraver Lucas of Leyden. Contemporary or somewhat earlier than this is a large engraving done by him from a design by Baldassare Peruzzi, a Sienese artist drawn about the same time into the Raphael circle. The piece in which he is recorded to have first tried his hand after Raphael himself is the Lucretia (Bartsch 192). From that time until he disappears in the catastrophe of 1527, Marcantonio was almost exclusively engaged in reproducing by means of engraving the designs of Raphael or of his immediate pupils. Raphael, the story goes, was so delighted with the print of the Lucretia that he personally trained and helped Marcantonio afterwards. A printing establishment was set up under the charge of Raphael’s colour-grinder, Il Baviera, and the profits, in the early stage of the business, were shared between the engraver and the printer. The sale soon became very great; pupils gathered round about Marcantonio, of whom the two most distinguished were Marco Dente, known as Marco da Ravenna, and Agostino de’ Musi, known as Agostino Veneziano; and he and they, during the last ten years of Raphael’s life, and for several years following his death, gave forth a great profusion of engravings after the master’s work—not copying, in most instances, his finished paintings, but working up, with the addition of simple backgrounds and accessories, his first sketches and trials, which often give the composition in a different form from the finished work, and are all the more interesting on that account. The best of these engravings produced in the workshop of Marcantonio—those, namely, done by his own hand, and especially those done during the first few years after he had attached himself to Raphael—count among the most prized and coveted examples of medieval art. They are marked by the genius of his master, and lose little of the chastened science and rhythmical purity of Raphael’s contours, or of the inspired and winning sentiment of his faces; while in the parts where he is left to himself—the rounding and shading, the background and landscape—he manages his burin with all the skill and freedom which he had gained by the imitation of northern models, but puts away the northern emphasis and redundancy of detail. His work, however, does not long remain at the height marked by pieces like the Lucretia, the Didot, the Judgment of Paris, the Poetry, the Philosophy, or the first Massacre of the Innocents. Marcantonio’s engravings after the works of Raphael’s later years are cold, ostentatious, and soulless by comparison. Still more so, as is natural, were those which he and his pupils produced after the designs of the degenerate scholars of Raphael and Michelangelo, of a Giulio Romano, a Polidoro, or a Bandinelli. Marcantonio’s association with Giulio Romano was the cause of his first great disaster in life. He engraved a series of obscene designs by that painter in illustration of the Sette Foti illustrazioni di Pietro Aretino, and thereby incurred the anger of pope Clement VII., at whose order he was thrown into prison. Marcantonio’s ruin was completed by the calamities attendant on the sack of Rome in 1527. He had to pay a heavy ransom in order to escape from the hands of the Spaniards, and fled from Rome, in the words of Vasari, “all but a beggar.” It is said that he took refuge in his native city, Bologna; but he never again emerges from obscurity, and we all know with certainty that in 1534 he was dead. (S. C.)

MARCASTE, a mineral with the same chemical composition as pyrites, being iron disulphide FeS₂, but crystallizing in the orthorhombic instead of in the cubic system. The name is of Arabic origin and was long applied to crystallized pyrites (q.v.); it was restricted to the present species by W. Haidinger in 1845. The mineral was known to G. Aggricola in 1546 under the names Wasserkie and Weisserkie and Leherkie, and it has been variously known as white pyrites, hepatic pyrites, lamellar pyrites, radiated pyrites (German Strahlkies) and prismatic pyrites. The orthorhombic form of the crystals, as distinct from the cubic form of pyrites, was recognized by Romé de l’Isle in 1772, though later R. J. Haly considered the crystals to be only distorted cubic forms. The crystals are isomorphous with mispickel (q.v.), but only rarely are they distinctly developed and simple (fig.). Usually, they are twinned on a prism plane, M, producing pentagonal stellate groups of five crystals; twinning on the plain g, in which the crystals intercross at angles of nearly 60°, is less common. This frequent twinning gives rise to characteristic forms, with many re-entrant angles, to which the names “spear pyrites” and “cokcomb pyrites” are applied. The commonest point of aggregation is that of radially arranged fibres, the external surface of the mass being globular, nodular or stalactitic in form.

Apart from crystalline form, the external characters of marcasite are very similar to those of pyrites, and when distinct crystals are not available the two species cannot always be easily distinguished. The colour is usually pale bronze-yellow, often rather lighter than that of pyrites; on freshly fractured surfaces of pure marcasite the colour is tin-white, but this rapidly tarnishes on exposure to air. The lustre is metallic and submetallic. The cleavage is cristobalite; the fracture is fibrous or powdery. The hardness (6-6½) is the same as that of pyrites, and the specific gravity (4.8-4.9) as a rule rather less. Arsenical varieties of marcasite, containing up to 5% of arsenic, are known as lorchidite and kyrosite.

Marcasite readily oxidizes on exposure to moist air, with the production of sulphuric acid and a white fibrous efflorescence of native sulphur, and Cristobalite in similar circumstances often became completely disintegrated. In nature it is frequently altered to limonite with the separation of native sulphur. Marcasite is thus the less stable of the two modifications of iron disulphide. It does not possess the characteristic property of pyrites, but has been made with a view to determining the difference in chemical constitution of marcasite and pyrites, but with no very definite results. It is a noteworthy fact that whilst pyrites has been prepared artificially, marcasite has not. Marcasite occurs under the same conditions as pyrites, but is much less common. Whilst pyrites is found abundantly in the older crystalline rocks and slates, marcasite is more abundant in clays, and has often been formed as a concretion around organic remains. It is abundant, for example, in the plastic clay of the Brown Coal formation at Lititzing, near Carlshad, in Bohemia, at which place it has been extensively mined for the manufacture of sulphur and ferrous sulphate. In the Chalk of the south-east of England nodules of marcasite with a fibrous radiated structure are abundant, and in the Chalk Marl between Dover and Folkestone fine twinned groups of “spear pyrites” are common. The mineral is found more in metaliferous districts than in much less frequently than pyrites; for example the “cokcomb pyrites” of the lead mines of Derbyshire and Cumberland. (L. J. S.)

MARCEAU-DESGRAVIERs, FRANCOIS SÉVERIN (1760-1796), French general, was born at Chartres on the 1st of March 1760. His father was a law officer, and he was educated for a legal career, but at the age of nineteen he joined the army at Rennes. Whilst on furlough in Paris Marcseau joined in the attack on the Bastille (July 14, 1789); after that event he took his discharge from the regular army and returned to Chartres, but the embarrassments of his family soon compelled him to seek fresh military employment. He became drill instructor, and afterwards captain in the departmental (Eure-et-Loir) regiment of the National Guard. Early
in March 1792 he was elected lieutenant-colonel of one of the battalions of the Eure-et-Loire; he took part in the defence of Verdun in 1792, and it fell to his lot to bear the proposals of capitulation to the Prussian camp. The spiritless conduct of the defenders excited the wrath of the revolutionary authorities, and Marceau was fortunate in escaping arrest and finding re-employment as a captain in the regular service. Early in 1793 he became with other officers "suspect," and was for some time imprisoned. On his release he hurried to take part in the defence of Saumur against the Vendéan royalists, and distinguished himself at the combat of Saumur (June 10, 1793) by gallantly rescuing the representative Bourbotte from the hands of the insurgents. The Convention voted him the thanks of the country, and thenceforward his rise was rapid. His conduct at Chantonnay (Sept. 5) won him the provisional rank of general of brigade. On the 17th of October he bore a great part in the victory of Cholet, and on the field of this battle began his friendship with Kléber. For the victory of Cholet Kléber was made general of division and Marceau confirmed as general of brigade. Their advice was of the greatest value to the generals in command, and the military talents of each were the complement of the other's. Marceau, who became general of division (Nov. 10), succeeded to the chief command ad interim, and with his friend won important victories near Le Mans (Dec. 12-13) and Savenay (Dec. 23). After the battle of Le Mans, Marceau rescued and protected a young Royalist lady, Angélique des Meslies. It is often supposed that he was in love with his prisoner; but the help given by the commanding-in-chief does not warrant such a conclusion (Jan. 27, 1794). Marceau had already retired from the war, exhausted by the fatigue of the campaign, and he and Kléber were saved from arrest and execution only by the intervention of Bourbotte. Marceau became affianced about this time to Agathe Lépretre de Châteaugiron, but his constant military employment, his broken health, and the opposition of the comte de Châteaugiron on the one hand and of Marceau's devoted half-sister "Émira," wife of the Republican politician Sergeant, on the other, prevented the realization of his hopes. After spending the winter of 1793-1794 in Paris he took a command in the army under Jourdan, in which Kléber also served. He took part in the various battles about Charleroi, and at the final victory of Fleurs (June 26, 1794) he had a horse shot under him. He distinguished himself again at Jülich and at Aldenhoven, and stormed the lines of Coblenz on the 23rd of October. With the Army of the Sambre and Meuse he took his share in the campaign of 1795 on the Rhine and the Lahn, distinguishing himself particularly with Kléber in the fighting about Neuwied and the peninsula. On Oct. 10, 1795, he was given the wheelchair of a lieutenant-colonel, and at Sulzbach in the 13th of December. In the campaign of 1796 the famous invasion of Germany by the armies of Jourdan and Moreau ended in disaster, and Marceau's men covered Jourdan's retreat over the Rhine. He fought the desperate actions on the Lahn (Sept. 16 and 18), and at Altenkirchen on the 19th received a mortal wound, of which he died on the 21st, at the early age of twenty-seven. The Austrians vied with his own countrymen in doing honour to the dead general. His body was burned, and his ashes, which at the time were placed under a pyramid designed by Kléber, were transferred in 1809 to the Pantheon at Paris.

See Maze, Le Général Marceau (1889); Parfait, Le Général Marceau (1892); and T. C. Johnson, Marceau (London, 1896).

MARCEL, ÉTIENNE (d. 1358), provost of the merchants of Paris under King John II., belonged by birth to the wealthy Parisian bourgeoisie, being the son of a clothier named Simon Marcel and of Isabelle Barbou. He is mentioned as provost of the Grande-Confrérie of Notre Dame in 1350, and in 1354 he succeeded Jean de Pacy as provost of the Parisian merchants. His political career extended to 1356, when John was deposed and after the battle of Poitiers. In conjunction with Robert le Coq, bishop of Laon, he played a leading part in the states-general called together by the dauphin Charles on the 17th of October. A committee of eighty members, constituted on their initiative, pressed their demands with such insistence that the dauphin prorogued the states-general; but financial straits obliged him to summon them once more on the 3rd of February 1357, and the promulgation of a great edict of reform was the consequence. John the Good forbade its being put into effect, whereupon a conflict began between Marcel and the dauphin, Marcel endeavouring to set up Charles the Bad, king of Navarre, in opposition to him. The states-general assembled again on the 13th of January 1358, and on the 22nd of February the populace of Paris, led by Marcel, invaded the palace and murdered the marshals of Champagne and Normandy before the prince's eyes. Thenceforward Marcel was in open hostility to the throne. After vainly hoping that the insurrection of the Jacquerie might turn to his advantage, he next supported the king of Navarre, whose armed bands infested the neighbourhood of Paris. On the night of the 31st of July Marcel was about to open the gates of the capital to them, but Jean Maillart prevented the execution of this design, and killed him before the Porte Saint-Antoine. During the following days his adherents were likewise put to death, and the dauphin was enabled to re-enter Paris. Étiéne Marcel married first Jeanne de Dammartin, and secondly Marguerite des Essars, who survived him.

See F. T. Perrens, Étiéne Marcel et le gouvernement de la bourgeoisie au xixè siècle (Paris, 1860); P. Frémiaux, La Famille d'Étiéne Marcel, in the Mémoires of the Société de l'histoire de Paris et de son administration (1903), xxx.; and Hon. R. D. Denning, Étiéne Marcel (1898).

MARCELLINUS, ST., according to the Liberian catalogue, became bishop of Rome on the 30th of June, 296; his predecessor was Caius or Gaius. He is not mentioned in the Martyrologium Hieronymianum, or in the Depositio episcoporum, or in the Depositio martyrum. The Liber pontificalis, basing itself on the Acts of St Marcellinus, the text of which is lost, relates that during Diocletian's persecution Marcellinus was called upon to sacrifice, and offered incense to idols, but that, repenting shortly afterwards, he confessed the faith of Christ and suffered martyrdom with several companions. Other documents speak of his defection, and it is probably this lapse that explains the silence of the ancient liturgical calendars. In the beginning of the 5th century Petilianus, the Donatist bishop of Constantine, affirmed that Marcellinus and his priests had given up the holy books to the pagans during the persecution and offered incense to false gods. St Augustine contents himself with denying the affair (Contra ill. Petilianii, ii. 205; De unico baptismo, 27). The records of the pseudo-council of Sinuessa, which were fabricated at the beginning of the 6th century, state that Marcellinus, after his flight from Milan, found himself before a council, which refused to try him on the ground that priamo sedes a nemine iudicatur. According to the Liber pontificalis, Marcellinus was buried, on the 26th of April 304, in the cemetery of Priscilla, on the Via Salaria, 25 days after his martyrdom; the Liberian catalogue gives as the date the 25th of October. The fact of the martyrdom, too, is not established with certainty. After a considerable interregnum he was succeeded by Marcellus, with whom he has sometimes been confounded.

See L. Duchesne, Liber pontificalis, i. lxxiii.-lxxiv. 162-165, and ii. 563. (H. DE.)

MARCELLO, BENEDETTO (1656-1739), Italian musical composer, was born in 1656, either on the 31st of July or on the 1st of August. He was of noble family (in his compositions he is frequently described as "Patrizio Veneto"), and although a pupil of Lotti and Gasparini, was intended by his father to devote himself to the law. In 1711 he was a member of the Council of Forty, and in 1730 went to Pola as Provveditore. His health having been impaired by the climate of Istria, he retired after eight years to Brescia in the capacity of Camerlengo, and died there on the 24th of July 1739.

Marcello is best remembered by his Estro poetico-armonico (Venice, 1724-1727), a musical setting for voices and strings
of the first fifty Psalms, as paraphrased in Italian by G. Giustiniani. They were much admired by Charles Avison, who with John Garth brought out an edition with English words (London, 1777). Some extracts are to be found in Hawkins's History of Music. His other works are chiefly cantatas, either for one voice or several; the library of the Brussels conservatoire possesses some interesting volumes of chamber-cantatas composed for his mistress. Although he produced an opera, La Pavana di Musica, at Venice in 1702, he had little sympathy with this form of composition, and vented his opinions on the state of musical drama at the time in the satirical pamphlet Il Teatro alla moda, published anonymously in Venice in 1720. This little work, which was frequently reprinted, is not only extremely amusing, but is also most valuable as a contribution to the history of opera.

A catalogue of his works is given in Monatshefte für Musikwissenschaft, vol. xxiii. (1891).

**MARCELLUS**, the name of two popes.

**MARCELLUS I.** succeeded Marcellinus, after a considerable interval, most probably in May 508, under Maxentius. He was banished from Rome in 509 on account of the tumult caused by the severity of the penalties he had imposed on Christians who had lapsed under the recent persecution. He died the same year, being succeeded by Eusebius. He is commemorated on the 16th of January.

**MARCELLUS II.** (Marcello Cervini), the successor of Julius III., was born on the 6th of May 1501, and was elected pope on the 9th of April 1555. He had long been identified with the rigorist party in the church, and as president of the Council of Trent had incurred the anger of the emperor by his jealous defence of papal prerogative. His motives were lofty, his life blameless, his plans for reform nobly conceived. But death removed him (April 30, 1555) before he could do more than give an earnest of his intentions. He was followed by Paul IV.

Contemporary lives are to be found in Panvinio, continuator of Platina, De vita pontificii rom.; and Ciacconio, Vitae et res gestae summorum pontificum rom. (Rome, 1601–1602). F. Polidoro, De gestis vitae et moribus Marcelli II. (Rome, 1744), makes use of an unpublished biography of the pope by his brother, Alessandro Cervini. See also Brill, Intorno alla vita et alle azioni di Marcellio II. (Montepulciano, 1846); Ranke, Popes (Eng. trans., Austin), i. 284 seq.; A. von Reumann, Gesch. der Staats Rom., iii. 2, 512, seq. (T. F. C.)

**MARCELLUS, I.** Roman plebeian family belonging to the Claudian gens. Its most distinguished members were the following:

1. Marcus Claudius Marcellus (c. 268–208 B.C.), one of the Roman generals during the Second Punic War and conqueror of Syracuse. He first served against Hamilcar in Sicily. In his first consulship (222) he was engaged, with Cn. Cornelius Scipio as colleague, in war against the Insubrian Gauls, and won the spolia opima for the third and last time in Roman history by slaying their chief Viridomarus or Virdumarus (Polybius ii. 34; Propertius v. 10, 39). In 216, after the defeat at Cannae, he took command of the remnant of the army at Canusium, and although he was unable to prevent Capua going over to Hannibal, he saved Nola and southern Campania. In 214 he was in Sicily as consul at the time of the revolt of Syracuse; he stormed Leontini and besieged Syracuse, but the skill of Archimedes repelled his attacks. After a two years' siege he gradually forced his way into the city and took it in the face of strong Punic reinforcements. He spared the lives of the inhabitants, but carried off their art treasures to Rome, the first instance of a practice afterwards common. Consul again in 210, he took Salapia in Apulia, which had revolted to Hannibal, by breaking the Roman party there, and put to death the Numidian garrison. Proconsul in 209, he attacked Hannibal near Venusia, and after a desperate battle retired to that town; he was accused of bad generalship, and had to leave the army to defend himself in Rome. In his last consulship (208), he and his colleague, while reconnoitring near Venusia, were unexpectedly attacked, and Marcellus was killed. His successes have been exaggerated by Livy, but the name often given to him, the “sword of Rome,” was well deserved.

Livy xxiii. 14–17, 41–46; xxiv. 27–32, 35–39; xxv. 5–7, 23–31; xxvi. 26, 29–32; xxvii. 1–5, 21–28; Polybius viii. 5–9, x. 32; Appian, Hannib. 50; Florus ii. 6.

2. M. Claudius Marcellus, an invertebrate opponent of Julius Caesar. During his consulship (51 B.C.) he proposed to remove Caesar from his army in March 49, but this decision was delayed by Pompey's irresolution and the skilful opposition of the tribune C. Curio (see CAESAR, JULIUS). In January 49 he tried to put off declaring war against Caesar till an army could be got ready, but his advice was not taken. When Pompey left Italy, Marcus and his brother Gaius followed, while his cousin withdrew to Liternum. After Pharsalus M. Marcellus retired to Mytilene, where he practised rhetoric and studied philosophy. In 46 his cousin and the senate successfully appealed to Caesar to pardon him, and Marcellus reluctantly consented to return. On this occasion Cicero's1 speech Pro Marcello was delivered. Marcellus left for Italy, but was murdered in May by one of his own attendants, P. Magius Chilo, in the Peiraicus. Marcellus was a thorough aristocrat. He was an eloquent speaker (Cicero, Brutus, 21), and a man of firm character, although not free from avarice.

See Cicero, Ad fam. iv. 4, 7, 10, and Ad Att. v. 11 (ed. Tyrrell and Purser); Caesar, B. C. i. 1; Suetonius, Caesar, 29; G. Boissier, Cicero and his Friends (Eng. trans., 1897).

3. M. Claudius Marcellus (c. 43–25 B.C.), son of C. Marcellus and Octavia, sister of Augustus. In 25 he was adopted by the emperor and married to his daughter Julia. This seemed to mark him out as the heir to the throne, but Augustus, when attacked by a serious illness, gave his signet to M. Vipsanius Agrippa. In 23 Marcellus, then curule aedile, died at Baiae. Livia was suspected of having poisoned him to get the empire for her son Tiberius. The elder Marcellus had died in the youth and he was celebrated by many writers, especially by Virgil in a famous passage (Aenid, vi. 866). He was buried in the Campus Martius, and Augustus himself pronounced the funeral oration. The Theatrum Marcelli (remains of which can still be seen) was afterwards dedicated in his honour.

Horace, Oder, ii. 12; Propertius iii. 18; Dio Cassius liii. 28, 30; Tacitus, Annals, ii. 41; Suetonius, Augustus, 63; Vell. Pat. ii. 93.

**MARGESCENT** (Lat. marcescenti, withering), a botanical term for withering without falling off.

**MARCH, EARLS OF,** a title derived from the "marches" or boundaries (1) between England and Wales, and (2) England and Scotland, and held severally by great feudal families possessed of lands in those border districts. The earls of March on the Welsh borders were descended from Roger de Mortimer (so called from his castle of Mortimer in Normandy), who was connected by marriage with the dukes of Normandy. His son Ralph (d. c. 1104) figures in Domesday as the holder of vast estates in Shropshire, Herefordshire and other parts of England, especially in the west; and his grandson Hugh de Mortimer, founder of the priory of Wigmore in Herefordshire, was one of the most powerful of the barons reduced to submission by Henry II., who compelled him to surrender his castles of Cleobury and Wigmore. The Mortimers, however, continued to exercise almost undisputed sway, as lords of Wigmore, over the western counties and the Welsh marches.

1. **Welsh Marches.—Roger de Mortimer** (c. 1286–1330), 8th baron of Wigmore and 1st earl of March, being an infant at the death of his father, Edmund, was placed by Edward I. under the guardianship of Piers Gaveston, and was knighted by Edward in 1306; Mortimer's mother being a relative of Edward's consort, Eleanor of Castile. Through his marriage with Joan de Joinville, or Genevill, Roger not only acquired increased possessions on the Welsh marches, including the important castle of Ludlow, which became the chief stronghold of the Mortimers, but also extensive estates and influence in Ireland, whither he went in 1308 to enforce his authority. This brought him into conflict with the De Lacy's, who turned for support to Edward Bruce, brother of Robert Bruce, king of Scotland. Mortimer was appointed lord-lieutenant of Ireland by Edward II. in 1316,1

The authorship of this speech has been disputed.
and at the head of a large army drove Bruce to Carrickfergus, and the De Lacy into Connaught, wreaking vengeance on their adherents whenever they were to be found. He was then occupied for some years with baronial disputes on the Welsh border until about 1316, when he began to interest himself in his growing popularity. In 1318, III., and Despenser, and he supported Humphrey de Bohun, earl of Hereford, in refusing to obey the king’s summons to appear before him in 1321. Forced to surrender to the king at Shrewsbury in January 1322, Mortimer was consigned to the Tower of London, whence he escaped to France in August 1324. In the following year Isabella, wife of Edward II., anxious to escape from her husband, obtained his consent to her going to France to use her influence with her brother, Charles IV., in favour of peace. At the French court the queen found Roger Mortimer; she became his mistress soon afterwards, and at his instigation refused to return to England so long as the Despensers retained power as the king’s favourites. The scandal of Isabella’s relations with Mortimer compelled them both to withdraw from the French court to Flanders, where they obtained assistance for an invasion of England. Landing in England in September 1326, they were joined by Henry, earl of Lancaster; London rose in support of the queen; and Edward took flight to the west, whither he was pursued by Mortimer and Isabella. After wandering helplessly for some weeks in Wales, the king was taken on the 16th of November, and was compelled to abdicate in favour of his son. But though the latter was crowned as Edward III. in January 1327, the country was ruled by Mortimer and Isabella, who procured the murder of Edward II. in the following September. Rich estates and offices of profit and power were now heaped on Mortimer, and in September 1328 he was created earl of March. Greedy and grasping, he was no more competent than the Despensers to conduct the government of the country. The jealousy and anger of Lancaster having been excited by March’s arrogance, Lancaster prevailed upon the young king, Edward III., to throw off the yoke of his mother’s paramour. At a parliament held at Nottingham in October 1330 a plot was successfully carried out by which March was arrested in the castle, and, in spite of Isabella’s entreaty to her son to “have pity on the gentle Mortimer,” was conveyed to the Tower. Accused of assuming royal power and of various other high misdemeanours, he was condemned without trial and hanged at Tyburn on the 29th of November 1330, his vast estates being forfeited to the crown. March’s wife, by whom he had four sons and eleven daughters, survived till 1356. The daughters all married into powerful families, chiefly of Marcher houses. His eldest son, Edmund, was father of Roger Mortimer (c. 1328–1360), who was knighted by Edward III. in 1346, and restored to his grandfather’s title as 2nd earl of March.

EDMUND DE MORTIMER (1351–1381), 3rd earl of March, was son of Roger, 2nd earl of March, by his wife Philippa, daughter of William Montacute, 1st earl of Salisbury. Being an infant at the death of his father, Edmund, as a ward of the crown, was placed by Edward III. under the care of William of Wykeham and Richard Fitzalan, earl of Arundel. The position of the young earl, powerful on account of his possessions and hereditary influence in the Welsh marches, was rendered still more important by his marriage in 1368 to Philippa, only daughter of Lionel, duke of Clarence, third son of Edward III. Lionel’s wife was Elizabeth, daughter and heiress of William de Burgh, 6th Lord of Connaught and 3rd earl of Ulster, and Lionel had himself been created earl of Ulster before his marriage. The earl of March, therefore, not only became the representative of the chief Anglo-Norman lords in Ireland in right of his wife Philippa, but the latter, on the death of her father shortly after her marriage, stood next in succession to the crown after the Black Prince and his sickly son Richard, afterwards king Richard II. This marriage had, therefore, far-reaching consequences in the history of England, giving rise to the claim of the house of York to the crown of England, contested in the War of the Roses; Edward IV. being descended from the third son of Edward III. as great-grandson of Philippa, countess of March, and in the male line from Edmund, duke of York, fifth son of Edward III.

Mortimer, now styled earl of March and Ulster, became marshal of England in 1369, and was employed in various diplomatic missions during the next following years. He was a member of the council of the Commons, and introduced the Commons in 1372—the first instance of such a joint conference since the institution of representative parliaments—on the question of granting supplies for John of Gaunt’s war in France; and in the opposition to Edward III. and the court party, which grew in strength towards the end of the reign, March took the popular side, being prominent in the Good Parliament of 1376 among the lords who, encouraged by the Prince of Wales, concerted an attack upon the court party led by John of Gaunt. The Speaker of the Commons in this parliament was March’s steward, Peter de la Mare; he firmly withheld John of Gaunt in stating the grievances of the Commons, in supporting the impeachment of several high court officials, and in procuring the banishment of the king’s mistress, Alice Perrers. March was a member of the administrative council appointed by the same parliament after the death of the Black Prince to attend the king and advise him in all public affairs. On the accession of Richard II., a minor, in 1377, the earl became a member of the standing council of government; though as father of the heir-presumptive to the crown he wisely abstained from claiming any actual administrative office. The most powerful person in the realm was, however, John of Gaunt, duke of Lancaster, whose jealousy of March led to the acceptance by the latter of the lieutenancy of Ireland in 1379. March succeeded in asserting his authority in eastern Ulster, but failed to subdue the O’Neills farther west. Proceeding to Munster to put down the turbulence of the chieftains of the south, March died at Cork on the 27th of December 1381. He was buried in Wignome Abbey, of which he had been a benefactor, and where his wife Philippa died about the same time was also interred. The earl had two sons and two daughters, the elder of whom, Elizabeth, married Henry Percy (Hotspur), son of the earl of Northumberland. His eldest son Roger succeeded him as 4th earl of March and Ulster. His second son Edmund (1367–1409) played an important part in conjunction with his brother-in-law Hotspur against Owen Glendower; but afterwards joined the latter, whose daughter he married about 1402.

ROGER DE MORTIMER, 4th earl of March and Ulster (1374–1398), son of the 3rd earl, succeeded to the titles and estates of his family when a child of seven, and a month afterwards he was appointed lord-lieutenant of Ireland, his ‘uncle Sir Thomas Mortimer acting as his deputy. Being a ward of the Crown, his guardian was the earl of Kent, half-brother to Richard II.; and in 1388 he married Kent’s daughter, Eleanor. The importance which he owed to his hereditary influence and possessions, and especially to his descent from Edward III., was immensely increased when Richard II. publicly acknowledged him as heir-presumptive to the crown in 1385. In 1394 he accompanied Richard to Ireland, but notwithstanding a commission from the king as lieutenant of the districts over which he exercised nominal authority by hereditary right, he made little headway against the native Irish chieftains. March enjoyed great popularity in England though he took no active part in opposing the despotic measures of the king; in Ireland he illegally assumed the native Irish costume. In August 1398 he was killed in fight with an Irish clan, and was buried in Wignome Abbey. March’s daughter Anne married Richard earl of Cambridge, son of Edmund duke of York, fifth son of Edward III.; their son, Richard, duke of York, was father of King Edward IV., who thus derived his title to the crown and acquired the estates of the house of Mortimer.

EDMUND DE MORTIMER (1391–1425), 5th earl of March and Ulster, son of the 4th earl, succeeded to his father’s claim to the crown as well as to his title and estates on the death of the latter in Ireland in 1398. In the following year Richard II. was deposed and the crown seized by Henry of Lancaster. The young earl of March and his brother Roger were then kept in custody
by Henry IV., who, however, treated them honourably, until March 1405, when they were carried off from Windsor Castle by the opponents of the Lancastrian dynasty, of whom their uncle Sir Edmund Mortimer (see above) and his brother-in-law Henry Percy (Hotspur) were leaders in league with Owen Glendower. The boys were recapitulated, and in 1409 were committed to the care of the prince of Wales. On the accession of the latter as Henry V., in 1413, the earl of March was set at liberty and restored to his estates, his brother Roger having died some years previously; and he continued to enjoy the favour of the king in spite of a conspiracy in 1415 to place him on the throne. His brother John, 3rd earl of Cambridge, played the leading part. March accompanied Henry V. throughout his wars in France, and on the king's death in 1422 became a member of the council of regency. He died in Ireland in 1425, and as he left no issue the earldom of March in the house of Mortimer became extinct, the estates passing to the last earl's nephew Richard, who in 1435 was officially styled duke of York, earl of March and Ulster, and baron of Wigmore. Richard's son Edward having ascended the throne in 1461 as Edward IV., the earldom of March became merged in the crown.

II. Scottish Marches.—The Scottish earls of March were descended from Crinan, whose son Maldred married Algitha, daughter of Ughtred, earl of Northumberland, by Eligiva, daughter of the Saxon king Æthelred. Maldred's son Cospatrick, or Cospattick, was made earl of Northumberland by William the Conqueror; but being soon afterwards deprived of this position he fled to Scotland, where Malcolm Canmore, king of Scotland, welcomed him and granted him Dunbar and the adjoining lands. Two generations of Cospatricks followed in lineal succession, bearing the title of earl, but without territorial designation. Cospattick II. witnessed the charter of Alexander I. founding the abbey of Scone in 1115. The 3rd earl, also named Cospattick, a liberal benefactor of Melrose Abbey, died in 1165, leaving two sons, the younger of whom was the ancestor of the earls of Homo. The elder son, Waltheof, was the first of the family to be styled "Comes de Dunbar," about the year 1174. His importance is proved by the fact that he was one of the hostages for the performance of the Treaty of Falaise for the liberation of William the Lion in 1175. Waltheof's son Patrick Dunbar (the name Dunbar, derived from the family estates, now becoming an hereditary surname), styled 5th earl of Dunbar, although his father had been the first to adopt the territorial designation, was keeper of Berwick Castle, and married Ada, natural daughter of William the Lion. His grandson Patrick, 7th earl, headed the party that liberated King Alexander III. in 1255 from the Comyns, and in the same year was nominated guardian of the king and queen by the Treaty of Roxburgh. He signed the Treaty of Perth (July 6, 1266) by which Magnus VI., of Norway ceded the Isle of Man and the Hebrides to Scotland. His wife was Christian, daughter of Robert Bruce, the competitor for the crown of Scotland.

Patrick Dunbar, 8th earl of Dunbar and 1st earl of March, claimed the crown of Scotland in 1291 as descendant of Ada, daughter of William the Lion. He was one of the "seven earls of Scotland," a distinct body separate from the other estates of the realm, who claimed the right to elect a king in cases of disputed succession, and whose authority was, perhaps, to be traced to the seven provinces of the Pictish kingdom. He was the first of the earls of Dunbar to appear in the records as "comes de Marchia," or earl of March. Like most of his family in later times, he was favourable to the English interest in Scottish affairs, and he did homage to Edward I. of England. His wife Margaret, daughter of Alexander Comyn, earl of Buchan, took the other side and held the castle of Dunbar, the Balliol, but was forced to surrender it to Edward in 1296. In 1298 he was appointed the English king's lieutenant in Scotland.

Patrick Dunbar (1285-1366), 9th earl of Dunbar and 2nd earl of March, son of the preceding, gave refuge to Edward II. of England after Bannockburn, and contrived his escape by sea to England. Later, he made peace with Robert Bruce, and by him was appointed governor of Berwick Castle, which he held against Edward III., until the defeat of the Scots at Halidon Hill (July 19, 1333) made it no longer tenable. His courtiers, known in Scottish history and romance as "Black Agnes," daughter of Thomas Randolph, earl of Moray (Murray), and granddaughter of Robert Bruce, is famous for her defence of Dunbar, and is declared to have driven the English under the earl of Salisbury in 1358, Salisbury being forced to abandon the attempt after a fierce siege lasting nineteen weeks. This lady succeeded to the estates and titles of her brother, John Randolph, 3rd earl of Moray. The earldom of Moray passed after her death to her second son, John Dunbar, who married Marjory, daughter of King Robert II. Black Agnes also bore to the earl of March two daughters, the elder of whom, Agnes, after being the mistress of King David II., married Sir James Douglas, lord of Dalkeith, from whom were descended the first three earls of Morton; the younger, Elizabeth, married John Maitland of Lethington, ancestor of the earls of Lauderdale, whose second title was marquess of March.

George Dunbar (d. 1420), 10th earl of Dunbar and 3rd earl of March, great-nephew of the 8th earl and warden of the marches, accompanied Douglas in his foray into England in 1388, and commanded the Scots after Otterburn. He afterwards quarrelled with the Douglases, because his daughter was passed over in favour of a daughter of Archibald, "the Grim Earl of Douglas," as wife for David, duke of Rothesay, son of Robert III. When Douglas seized March's lands the latter fled to England, where he was welcomed by Henry IV., to whom he was related. He fought on the English side at Homildon Hill; and, having revealed to Henry the defection of the Perces, who were in league with Douglas and Owen Glendower, he fought against those allies at the battle of Shrewsbury (July 23, 1403). Becoming reconciled with Douglas, he returned to Scotland in 1405, and was restored to his earldom by the regent Albany. He died in 1420.

George Dunbar, 11th earl of Dunbar and 4th earl of March, was one of the negotiators for the release of James I. of Scotland in 1423 from his captivity in England, and was knighted at that king's coronation. In 1434, however, on the ground that the regent had had no power to reverse his father's forfeiture for treason, March was imprisoned and his castle of Dunbar seized by the king; and the parliament at Perth declared his lands and titles forfeited to the crown. The earl, being released, retired to England with his son Patrick, whose daughter and heiress Margaret was ancestress of Patrick, 3rd earl of Dumfries, now represented by the marquess of Bute.

The earldom of March in the house of Dunbar having thus been forfeited to the crown, James II. in 1455 conferred the title, together with that of warden of the marches, on his second son Alexander, duke of Albany; but this prince entered into treasonable correspondence with Edward IV. of England, and in 1487 the earldom of March and the barony and castle of Dunbar were again declared forfeited and annexed to the crown of Scotland.

The title of earl of March was next held by the house of Lennox. In 1576 the earldom of Lennox became extinct on the death without male issue of Charles (father of Lady Arabella Stuart), 5th earl of Lennox; and it was then revived in favour of Robert Stuart, a grand-uncle of King James VI., second son of John, 3rd earl of Lennox. But in 1579 Esmé Stuart, a member of a collateral branch which in 1508 had inherited the lordship of Aubigny in France, came to Scotland and obtained much favour with James VI. The earldom of Lennox (soon afterwards raised to a dukedom) was taken from Robert and conferred upon Esmé; and Robert was compensated by being created earl of March and baron of Dunbar (1585). Robert died without legitimate issue in 1586, and his earldom of March again reverted to the crown. In 1619 Esmé, 3rd duke of Lennox, was created
MARCH, A.—MARCH

earl of March; and his son James was created duke of Richmond in 1641. On the death without issue of Charles, 6th duke of Lennox and 3rd duke of Richmond, in 1672, his titles devolved upon King Charles II. as nearest collateral heir-male. In 1675 Charles conferred the titles of duke of Richmond and Lennox and earl of March on his three cousins, the dukes of Lennox and Kerouale, from whom the earldom of March has descended to its present holder the duke of Richmond and Gordon. (See RICHMOND, EARLS AND DUKES OF; and LENNOX.)

The title of earl of March in the peerage of Scotland, by another creation, was conferred in 1697 on William Douglas, second son of William, 1st duke of Queensberry. His grandson William, 3rd earl of March, became 4th duke of Queensberry on the death without surviving male issue of his cousin Charles, 3rd duke of Queensberry, in 1778. Dying unmarried in 1790, the several titles of the duke passed to different branches of the house of Douglas. The earldom of March is stated by Sir Bernard Burke and other authorities to have devolved upon Francis, 8th earl of Wemyss, great-great-grandson of David, 3rd earl of Wemyss, whose wife was Anne, daughter of the 1st duke of Queensberry and sister of the 1st earl of March; and the title is now assumed by the earl of Wemyss. On the other hand, Francis, 8th earl of Wemyss, not having been an heir of the body of the 1st earl of March, Sir Robert Douglas says in The Peerage of Scotland (2 vols., Edinburgh 1813; Lady Elizabeth Cunyngham, Some Account of the Stuart of Angus in Fife and Kinross, 1891). (R. M. J.)

MARCH, AUZIAS (c. 1385-1458), Catalan poet, was born at Valencia towards the end of the 14th century. Little is known of his career except that he was twice married—first to Na Ysabel Martorell, and second to Na Johanna Scorns—that he died on the 4th of November 1458, and that he left several natural children. Inheriting a easy fortune from his father, the treasurer to the duke of Gandia, and enjoying the powerful patronage of Prince Carlos de Viana of Aragon, March was enabled to devote himself to poetical composition. He is an undisguised follower of Petrarch, carrying the imitation to such a point that he addresses his Conts d’amor to a lady whom he professes to have first in church on Good Friday; so far as the difference of language allows, he reproduces the rhythmical cadences of his model, and in the Conts de mort touches a note of brooding sentiment peculiar to himself. Though his poems are disfigured by obscurity and a monotonous morbidity, he was fully entitled to the supremacy which he enjoyed among his contemporaries, and the success of his innovation no doubt encouraged Boscán to introduce the Italian metres into Castilian.

His verses were first printed in Catalan in 1543, but they had already become known through the Castilian translation published by Baltasar de Romani in 1539.

MARCH, FRANCIS ANDREW (1825— ), American philologist and educationalist, was born on the 25th of October 1825 in Millbury, Massachusetts. He graduated in 1843 at Amherst, where his attention was turned to the study of Anglo-Saxon by Noah Webster. He was a teacher at Swanzey, New Hampshire, and at the Leicester Academy, Massachusetts, in 1845-1847, and attempted the philological method of teaching English "like Latin and Greek," later described in his Method of Philological Study of the English Language (1865); at Amherst in 1847-1849; at Fredericksburg, Virginia, in 1852-1855; and in 1854 became a tutor at Lafayette College, where he became adjunct professor of belles-lettres and English literature in 1856, and professor of English language and comparative philology—the first chair of the kind established—in 1857. He lectured on constitutional and public law and Roman law in 1875-1877, and also taught subjects as diverse as botany and political economy. In 1879 he became professor emeritus. At Lafayette he introduced the first carefully scientific study of English in any American college, and in 1870 published A Comparative Grammar of the Anglo-Saxon Language, in which its Forms are Illustrated by Those of Old Frisian, Old Norse and Old High German, and An Anglo-Saxon Reader; he was editor of the "Douglas Series of Christian Greek and Latin Classics," to which he contributed Latin Hymns (1874); he was chairman of the Commission of the State of Pennsylvania on Amended Orthography; and was consulting editor of the Standard Dictionary, and in 1870-1882 was director of the American readers for the Philological Society's (New Oxford) Dictionary. He was president of the American Philological Association in 1873-1874 and in 1895-1896, of the Spelling Reform Association after 1876; and of the Modern Language Association in 1895-1893. Among American linguistic scholars March ranks with Whitney, Child and Gildersleeve; and his studies in English, though practically pioneer work in America, are of undoubted value. His article "On Recent Discussions of Grimm's Law" in the Transactions and Proceedings of the American Philological Association for 1873 in large part anticipated Verner's law. With his son, Francis Andrew March, Jun. (b. 1863), adjunct-professor of modern languages in 1884-1891 and subsequently professor of English literature at Lafayette, he edited A Thesaurus Dictionary of the English Language (1903).

See Addresses in Honor of Professor Francis A. March, LL.D., L.H.D., delivered at Easton, Pennsylvania, on the 24th of October 1895.

MARCH, a market town in the Wisbech parliamentary division of Cambridgeshire, England, 30 m. N. by W. of Cambridge. Pop. of urban district (1901), 7,565. It lies in the midst of the flat fen country, on the old course of the river Nene. It is an important junction on the Great Eastern railway and the starting-point of a line worked by that company jointly with the Great Northern to Lincoln and Doncaster. The church of St Wendreda, in Early English and later styles, is remarkable for a magnificent Perpendicular timber roof, beautifully carved. There are agricultural implement and engineering works, and corn mills.

MARCH; the third month of the modern calendar, containing thirty-one days. It was the Romans' first month until the adoption of the Julian calendar, 46 B.C., and it continued to be the beginning of the legal year in England until the 18th century. In France it was reckoned the first month of the year until 1564, when, by an edict of Charles IX., January was decreed to be thenceforth the first month. Scotland followed the example of France in 1599; but in England the change did not take place before 1752. The Romans called the month Martius, a name supposed to have been conferred on it by Romulus in honour of his putative father, Mars, the god of war; but Ovid declares the month to have existed before the time of Romulus, though in a different position in the calendar. The Anglo-Saxons called March Hidý-monath, "loud or stormy month," or Lenten-monath, "lengthening month," in allusion to the fact that the days then rapidly become longer. There is an old saying, common to both England and Scotland—which has its equivalent among the Basques and many European peoples—representing March as borrowing three days from April; the last three days of March being called the "borrowing" or the "borrowed days." As late as the end of the 18th century the first three days of March were known in Devonshire as "Blind Days," and were deemed so unlucky that no farmer would sow seed then.

The chief festival days of March are the 1st, St David; the 14th, St. Gudule, or the 9th, St. Wulfric; and the 21st, Lady Day, one of the quarter days in England.

MARCH (1) (from Fr. marcher, to walk; the earliest sense in French appears to be "to trample," and the origin has usually been found in the Lat. marchus, hammer; Low Lat. marcere, to hammer; hence to beat the road with the regular tread of a soldier; cf. "beat," of a policeman's round), the movement of military troops with regular rhythmic steps, often with the
time marked by the beat of drum, the sound of pipes or bugles or the music of a military band; hence the advance or movement of a body of troops from one point to another, and the distance covered in so doing. The word is also naturally applied to the music composed for marching to, and to the steady regular advance or progress of non-military bodies or persons, or of events, &c. In the military sense, "marching" is walking in formed bodies of troops, either during drill evolutions on parade or on the "line of march" from one place to another. In both senses the word is used with mounted troops as well as with dismounted men. Formerly all evolutions were carried out at the so-called "parade-march" pace of about 75-80 paces to the minute, and in one or two armies of the 18th century the parade step cadence was as slow as 60. These cadences are, however, reserved in all armies for ceremonial occasions, and the usual manoeuvre and marching pace ("quick march") is about 120, the "double" march pace (pas gymnostique) about 180. The "quick" march, translated into miles and hours, is about 3½ or 3¾ miles an hour in all armies, though a few special bodies of light troops such as the Italian Bersaglieri are trained to move at a much faster rate for hours together, either by alternate "quick" and "double" marching or by an unvarying "jog-trot." The paces recognized for cavalry are the walk, the trot, the canter and the gallop; the usual practice on the line of march being to alternate the walk and the trot, which combination gives a speed of about 5 miles an hour for many hours together. A "day's march," or more simply a "march," is usually reckoned to be 15-16 miles for a large body of troops, a "forced" march being one of 30 miles or over, or one in which, from whatever cause, the troops are on foot for more than about seven hours. For large bodies of troops the rate of movement on the line of march rarely exceeds 3 miles an hour. The immense assistance afforded by music to marching troops has been recognized from the earliest times of organized armies, and a great deal of special march-music has been written for military bands, formerly often in 4 or ¾ time (one bar representing one pace with the foot), but now almost invariably in common or ¾ time, which is more suitable for the "quick march." The music itself is usually a combination of simple, lively melody and well-marked accents for the drums, with little attempt at contrapuntal writing. The fife or piccolo, the natural bugle (in Italy and elsewhere the chromatic key-bugle is used), and the drum are the principal instruments, the "hand," as distinct from the "drums" and "bugles," having in addition to drum and fifes clarinets (saxophones in France and Belgium) and saxhorns of all types. In Scottish regiments, and in a few isolated cases elsewhere, bagpipes provide the marching music. The importance of music on the march is attested further by the almost universal practice of singing or whistling marching songs, and even playing them on concertinas, &c., in the absence of the band and drums.

2. From MARCHE, the French form of a common Teutonic word represented in English by "mark" (q.v.), a boundary or frontier region between two countries or districts. The word appears to have been first used in this sense in the 8th century, and the earliest "mark" or "march" districts were tracts of land on the borders of the Carolingian Empire. Whatever Charlemagne pushed forward the frontiers of the Frankish realm he provided for the security of his lands, new and old alike, by establishing mark districts on the borders. The defence and oversight of these were entrusted to special officers, afterwards called margraves or counts of the mark, who usually enjoyed more extensive powers than fell to the lot of an ordinary count. It is at this time that we hear first of the Spanish mark (marca hispanica) and the Bavarian mark (marca bajuriae). These mark districts were practically obliterated during the reigns of the feeble sovereigns who succeeded Charlemagne, but the system was revived with the accession of Henry the Fowler, the DB, and his successors, and at the expense of heritages in Saxony, a "march" district of Saxony being called the mark of Saxony, the mark of Thuringia, the mark of Bohemia, the mark of Bavaria, and in eastern Germany generally. Under Henry and his son, Otto I., though the Great, marks were again set upon the borders of Germany, and this time the organization was more lasting. The mark districts increased in size and strength, especially those which fell under the dominion of an able and energetic ruler, and some of them became powerful states, retaining the name mark long after the original significance of the word had been forgotten. It is interesting to note that the two most important of the modern German states, Austria and Prussia, both had their origin in mark districts, the mark of Brandenburg, the nucleus of the kingdom of Prussia, being at first a border district to the east and south of Saxony, and the mark of Austria, being a border district of the duchy of Bavaria. In Italy march districts made their appearance about the same time as in other parts of the Frankish Empire. The best known of these is the mark of Ancona, which with other marches and adjoining districts, was known later as the Marches, a province lying about the centre of Italy between the Apennines and the Adriatic Sea. After forming part of the states of the Church the Marches were united with the kingdom of Italy in 1560 (see MARCHE, Thi.).

In England the same connexion the plural word "marches" was the form commonly adopted, and soon after the Norman Conquest the disturbed districts on the borders of Wales began to be known as the Welsh marches. Lands therein were granted to powerful nobles on condition that they undertook the defence of the neighbouring counties of England. These lords of the marches, or lords marcher, as they were often called, had special privileges, but they were generally so fully occupied in fighting against each other and in seeking to increase their own wealth and power that the original object of their appointment was entirely forgotten. The condition of the marches grew worse and worse, and during disturbed reigns, like those of Henry III., and Edward II., lawlessness was rampant and rebellion was centred therein. A more satisfactory condition of affairs, however, prevailed after the conclusion of the Wars of the Roses; and the establishment by Henry VIII. in 1542 of a council of Wales and the marches was followed by a notable diminution of disorder in this region. About the time of Elizabeth the Welsh marches ceased to have any but an historical importance. In 1528 Roger Mortimer, a member of one of the most powerful of the marcher families, was created earl of March (comes de marchia Wales), and in the reign of Edward III. (1354) the marches were declared to be no part of the principality, but directly subject to the English crown. It is difficult to define the boundaries of the Welsh marches, as their extent varied considerably from time to time, but under Edward I. and again under the Lancastrian kings the marcher lordships included more than half of the area of Wales; they embraced practically the whole of the principality except the counties of Anglesea, Carnarvon and Merioneth in the north and Carmarthen and Cardigan in the south, together with parts of the English border counties, Monmouth, Hereford and Shropshire.

The debateable ground between England and Scotland was also known as the marches, although its condition began to attract the attention of the southern kingdom somewhat later than was the case with Wales. Arrangements were made for garrisoning them and at one time they were divided into three sections: the east, the west, and the middle marches, the oversight of each being entrusted to a warden. Roughly speaking, they embraced the modern counties of Northumberland and Cumberland, together with a tract on the Scotch side of the border. The need for protecting them ceased soon after the accession of James VI. of Scotland to the English throne, and they have now only an historical and legendary significance. About 1290 Patrick de Dunbar, earl of Dunbar, called himself earl of March, taking the name from the merse, or march, a tract of land in Berwickshire.

In France under the ancien régime there was a county of La Marche, and in north-east Germany there was the county of La Marche, now part of the kingdom of Prussia.
FRANCE. Sometimes it was called the Marche Limousine, and originally it was a small district cut partly from Limousin and partly from Poitou. Its area was increased during the 13th century, after which, however, it remained unaltered until the time of the Revolution. It was bounded on the E. by Bourbonnais and Auvergne; on the S. by Limousin; and on the W. by Poitou. It embraced the greater part of the modern department of Creuse, a considerable part of Haute Vienne, and a fragment of Indre. Its area was about 1900 sq. m.; its capital was Charroux and later Guéret, and among its other principal towns were Dorat, Bellac and Confolens.

Marche first appears as a separate fief about the middle of the 10th century when William III., duke of Aquitaine, gave it to one of his vassals named Boss, who took the title of count. In the 12th century it passed to the counts of Limousin, and this house retained it until the death of the childless Count Hugh in 1033, when it was seized by the French king, Philip IV. In 1316 it was made a duchy for Prince Charles, afterwards King Charles IV., and a few years later (1327) it passed into the hands of the family of Bourbon. The family of Armagnac held it from 1435 to 1477, when it reverted to the Bourbons, and in 1527 it was seized by Francis I. and became part of the domains of the French crown. It was divided into Haute Marche and Basse Marche, the estates of the former being in existence until the 17th century. From 1470 until the Revolution the province was under the jurisdiction of the parlement of Paris.

See A. Thomas, Les États provinciaux de la France centrale (1879).

MARCHE, a town of Belgium in the province of Luxemburg, 33 m. S.W. of Liége and about 28 m. S.E. of Namur. Pop. (1904), 33,940. It dates from the 7th century, when it was the chief town of the pagus falmiensis, as it still is of the same district now called Flémalle. Formerly it was fortified, and a treaty was signed there in 1577 between Philip II. and the United Provinces. In 1792 Lafayette was taken prisoner by the Austrians in a skirmish near it.

MARCHENA, a town of southern Spain, in the province of Seville, on the Cordova-Utrera and Marchena-La Roda railways. Pop. (1900), 12,468. Marchena occupies a sandy valley near the river Corbones, a left-hand territory of the Guadalquivir. Formerly it was surrounded with walls and towers, a large portion of which still remains. Among the principal buildings is the palace of the dukes of Arcos, within the entrenchment, and in the church of Santa Maria de la Mota. At the eastern end of the town is a sulphur spring. There is some trade in wheat, barley, olives, oil and wine. Marchena (perhaps the Castra Gemina of Pliny) was taken from the Moors by St. Ferdinand in 1240.

MARCHENA RUIZ DE CASTRO, JOSÉ (1768–1821), Spanish author, was born at Utrera on the 18th of November 1768 and studied with distinction at the university of Seville. He took minor orders and was for some time professor at the seminary of Veragua, but he became a convert to the doctrines of the French philosophes, scandalizing his acquaintances by his professions of materialism and his denunciations of celibacy. His writings being brought before the Inquisition in 1792, Marchena escaped to Paris, where he is said to have collaborated with Marat in L'ami du peuple; at a later date he organized a revolutionary movement at Bayonne, returned to Paris, avowed his sympathies with the Girondists, and refused the advances of Robespierre. He acted as editor of L'ami des lois and other French journals till 1799, when he was expelled from France; he succeeded, however, in obtaining employment under Moreau, upon whose fall in 1804 he declared himself a Bonapartist. In 1808 he accompanied Murat to Spain as private secretary; in this same year he was imprisoned by the Inquisition, but was released by Joseph Bonaparte, who appointed him editor of the official Gazeta. In 1813 Marchena retired to Valencia, and thence to France, where he supported himself by translating into Spanish the works of Montesquieu, Rousseau, Voltaire, and Volney. The liberal triumph of 1820 opened Spain to him once more, but he was coldly received by the revolutionary party. He died at Madrid shortly before the 26th of February 1821. The interest of his voluminous writings is almost wholly ephemeral, but they are excellent specimens of trenchant journalism. His Fragments Petronii (Basel, 1802), which purports to reconstruct the original of Petronius, is a testimony to Marchena's fine scholarship; but, by the irony of fate, Marchena is best known by his ode to Christ Crucified, which breathes a spirit of profound and tender piety.

MARCHES, THE (It. Le Marche), a territorial division of Italy, embracing the provinces of Pesaro and Urbino, Ancona, Macerata, and Ascoli Piceno, with an area of 3763 sq. m., and a population of 1,088,763 in 1901. It is bounded by the Emilia on the N., the Adriatic on the E., the Abruzzi on the S., and Umbria on the W. The four provinces follow one another in the order given from north to south and have a certain amount of coast-line. The chief rivers, all of which run into the Adriatic eastwards and north-eastwards, are the Metauro (anc. Mætærus, q.v.) and the Tronto (anc. Truentus), the latter forming the southern boundary of the compartimento for some distance. Except for the river valleys and the often very narrow coast strip, the general level is more than 500 ft. above the sea. The lower hills are very largely composed of loose, clayey, unstable earth, while the Apennines are of limestone. The province of Pesaro and Urbino falls within the boundaries of the ancient Umbria (q.v.), while the territory of the other three belonged to Picenum (q.v.). The railway from Bologna to Brindisi runs along the coast-line of the entire territory. At Ancona it is joined by the main line from Foligno and Rome; at Porto Cívitanova is a branch to Macerata, San Severino and Fabriano (a station on the line from Ancona to Rome and the junction for Urbino); at Porto S. Gárgolo is a branch to Fermo and, at Porto d'Ascoli, a branch to Ascoli Piceno. But, with the exception of the railway along the coast, there is no communication north and south, owing to the mountainous nature of the country, except by somewhat devious roads.

Owing largely to the messadria or métayer system, under which products are equally divided between the owners and the cultivators of the land, the soil is fairly highly cultivated, though naturally poor in quality. The silk industries, making of straw-plait and straw hats, rearing of silkworms and cocoons, with some sugar-refining, tobacco, terra-cotta manufacture, brickworks and ironworks, furnish the chief occupations of the people for agriculture and pastoral pursuits. Another important branch of activity is the making of paper in the town of Senigallia and Chiavreppaleo.

It is the largest tobacco factories of the Italian régime. Limestone quarries and sulphur mines supply building stone and sulphur to the regions of central Italy; chalk and petroleum are also found. As regards maritime trade the province possesses facilities in the port of Ancona (the only really good harbour, where are also important shipbuilding works), the canal ports of Senegallia (Sinegallia), Pesaro, Fano and other smaller harbours chiefly used by fishing boats. Fishing is carried on by the entire coast population, which furnishes a large contingent of sailors to the Italian navy.

For the early history of the territory of the Marches see PICENUM. From the Carolingian period onwards the name Marca begins to appear—first the Marca Ferrmana for the mountainous part of Picenum, the Marca Camerinense for the district farther north, including a part of Umbria, and the Marca Anconitana for the former Pentapolis. In 1080 the Marca Anconitana was given in investiture to Robert Guiscard by Gregory VII., to whom the countess Matilda ceded the Marches of Camerino and of Fermo. In 1105 we find the emperor Henry IV., investing Werner with the whole territory of the three marches under the name of March of Ancona. It was afterwards once more recovered by the Church and governed by papal legates. It became part of the kingdom of Italy in 1860.

The pictorial art of the Marches from the 13th century onwards has become the object of considerable interest since the important exhibition held at Macerata in 1905, when many interesting works, scattered all over the district in small towns and villages, were brought together. The result was something of a revelation,
MARCHMONT, EARLS OF MARCHION

MARCHMONT, EARLS OF. The 1st earl of Marchmont was Sir Patrick Hume or Home (1641-1724), son of Sir Patrick Hume, bart. (d. 1648), of Polwarth, Berwickshire, and a descendant of another Sir Patrick Hume, a supporter of the Reformation in Scotland. A member of the same family was Alexander Hume (c. 1560-1600), the Scottish poet, whose Hymns and Sacred Songs were published in 1599 (new ed. 1632). Polwarth, as Patrick Hume was usually called, became a member of the parliament in 1679 and was afterward retaining the honor of the earldom of Lauderdale towards the Covenanters, and for his contumacy he was imprisoned. After his release he went to London, where he associated himself with the duke of Monmouth. Suspected of complicity in the Rye House plot, he remained for a time in hiding and then crossed over to the Netherlands, where he took part in the deliberations of Monmouth, the earl of Argyll and other exiles about the projected invasion of Great Britain. Although he appeared to distrust Argyll, Polwarth sailed to Scotland with him in 1685, and after the failure of the undertaking he escaped to Utrecht, where he lived. In great poverty until 1688. He accompanied William of Orange to England, and in 1689 he was again a member of the Scottish parliament. In 1690 he was made a peer as Lord Polwarth; in 1696 he became lord high chancellor of Scotland, and in 1697 was created earl of Marchmont. When Anne became queen in 1702 he was deprived of the chancellorship. He died on the 2nd of August 1724. His son Alexander, the 2nd earl (1676-1740), took the name of Campbell instead of Hume after his marriage in 1697 with Margaret, daughter and heiress of Sir George Campbell of Cessnock, Ayrshire. He was a lord of session from 1704 to 1714; ambassador to Denmark from 1715 to 1721, and lord clerk register from 1716 to 1723. His son Hugh Hume, 3rd earl (1708-1794), who entered parliament in 1734 at the same time as his twin brother Alexander (d. 1756), afterwards lord clerk register of Scotland, was keeper of the great seal of Scotland, one of Bolingbroke’s most intimate friends and one of Pope’s executors. His two sons having predeceased their father, the cadet became dormant, Marchmont House, Berwickshire, and the estates passing to Sir Hugh Purves, bart., a descendant of the 2nd earl, who took the name of the merged cadet line had, however, three daughters, one of whom, Diana (d. 1827), married Walter Scott of Harden, Berwickshire; and in 1835 his son Hugh Hepburn-Scott (1758-1841) successfully claimed the Scottish barony of Polwarth. In 1867 his grandson, Walter Hepburn (b. 1838), became 6th Lord Polwarth.

MARCHPANE, or MARZIPAN, a sweetmeat made of sweet almonds and sugar pounded and worked into a paste, and moulded into various shapes, or used in the icing of cakes, &c. The best marchpane comes from Germany, that from Künzelsberg being celebrated. The origin of the word has been much discussed. It is common in various forms in most European languages, Romanic or Teutonic; Italian has marmosco, French mazepain, and German marzipan, which has in English to some extent superseded the true English form "marchpane." Italian seems to have been the source from which the word passed into other languages. In Johann Burchard’s Diarium curialim romanum (1483-1492) the Latin form appears as marmopanis (Du Cange, Glossarium s. v.), and Minshue explains the word as Marmisian panis, bread of Mars, from the "towers, castles and such like," that appeared on elaborate works of the confectioner’s art made of this sweetmeat. Another derivation is that from Gr. μαρχη, harley cake, and Lat. panis. A connexion has been sought with the name of a Venetian coin, natapimus (Du Cange, s. v.), on which was a figure of Christ enthroned, struck by Enrico Dandolo, doge of Venice (1102-1205). From the coin the word was applied to a small box, and hence apparently to the sweetmeat contained in it.

MARCIAN (c. 300-457), emperor of the East (450-457), was born in Thrace or Illyria, and spent his early life as an obscure soldier. He subsequently served for nineteen years under Ardashirius and Aspar, and took part in the wars against the Persians and Vandals. Through the influence of these generals he became a captain of the guards, and was later raised to the rank of tribune and senator. On the death of Theodosius II. he was chosen as consort by the latter’s sister and successor, Pulcheria, and called upon to govern an empire greatly humbled and impoverished by the ravages of the Huns. Marcian repudiated the payment of tribute to Attila; he reformed the finances, checked extravagance, and repeopled the devastated districts. He repelled attacks on Syria and Egypt (455), and quelled disturbances on the Armenian frontier (456). The other important event of his reign is the Council of Chalcedon (451), in which Marcian endeavoured to mediate between the rival schools of theology.

MARCIANUS, c. 400. Greek geographer, was born at Heraclea in Pontus. Two of his works have been preserved in a more or less mutilated condition. In the first, the Periplus of the Outer Sea, in two books, in which he proposed to give a complete description of the coasts of the eastern and western oceans, his chief authority is Ptolemy; the distances from one point to another are given in stades, with the object of rendering the work easier for the ordinary student. In this he follows Protagoras, who, according to Photius (cod. 188), wrote a sketch of geography in six books. The work contains nothing that cannot be learned from Ptolemy, whom he follows in calling the promontory of the Novantae (Mull of Galloway) the most northern point of Britain. Improving on Ptolemy, he makes the island of Taprobane (Ceylon) twenty times as large as it is in reality. The second, the Periplus of the Inner Sea (the Mediterranean), is a meagre epitome of a similar work by Menippus of Pergamum, who lived during the times of Augustus and Tiberius. It contains a description of the southern coast of the Euxine from the Thracian Bosphorus to the river Iris in Pontus. A few fragments remain of an epitome by Marcianus of the eleven books of the Geographumena of Artemidorus of Ephesus.

MARCION and THE MARCIONITE CHURCHES. In the period between 130 and 180 a.d. the varied and complicated Christian fellowship in the Roman Empire crystallized into close and mutually exclusive societies—churches with fixed constitutions and creeds, schools with distinctive esoteric doctrines, associations for worship with peculiar mysteries, and ascetic sects with special rules of conduct. Of ecclesiastical organizations the most important, next to Catholicism, was the Marcionite community. Like the Catholic Church, this body professed to comprehend everything belonging to Christianity. It admitted all believers without distinction of age, sex, rank or culture. It was no mere school for the learned, disclosed no mysteries for the privileged, but sought to lay the foundation of the Christian community on the pure gospel, the authentic institutes of Christ. The pure gospel, however, Marcion found to be everywhere more or less corrupted and mutilated in the Christian circles of his time. His undertaking thus resolved itself into a reformation of Christendom. This reformation was to deliver Christendom from false Jewish doctrines by restoring the Pauline conception of the gospel,—Paul being, according to Marcion, the only apostle who had rightly understood the new message of salvation as delivered by Christ. In Marcion’s own view, therefore, the founding of his church—to which he was first driven by opposition—amounted to a reformation of Christendom through a return to the gospel of Christ and to Paul; nothing was to be accepted beyond that. This of itself shows that it is a mistake to reckon Marcion among the Gnostics. A dualist he certainly was, but he was not a Gnostic. For he ascribed salvation, not to “knowledge,” but to...
“faith”; he appealed openly to the whole Christian world; and he nowhere consciously added foreign elements to the revelation given through Christ. It is true that in many features his Christian system—if we may use the expression—resembles the so-called gnostic systems; but the duty of the historian is to point out what Marcion plainly aimed at; only in the second place have we to inquire how far the result corresponded with those purposes.

The doctrines of Marcion and the history of his churches from the first to the 7th century are known to us from the controversial works of the Catholic fathers. From Justin onwards, almost every eminent Church teacher takes some notice of Marcion, while very many wrote satires against him. The most important of those which have come down to us are the controversial pieces of Irenaeus (in his great work against heretics), Tertullian (Adv. Marc. I. v.), Hippolytus, Pseudo-Origen Adamantius, Epiphanius, and the Armenian Esnik. From these works the contents of the Marcionite Gospel, and also the text of Paul’s epistles in Marcion’s recension, can be settled with tolerable accuracy. His opponents, moreover, have preserved some expressions of his, with extracts from his principal work: so that our knowledge of Marcion’s views is in part derived from the best sources.

Marcion was a wealthy shipowner, belonging to Sinope in Pontus. He appears to have been a convert from Paganism to Christianity, although it was asserted in later times that his father had been a bishop. That report is probably as untrustworthy as another, that he was excommunicated from the Church for seducing a virgin. What we know for certain is that after the death of Hyginus, bishop of Rome (or c. 130 A.D.), he arrived, in the course of his travels, at Rome, and made a handsome donation of money to the local church. Even then, however, the leading features of his peculiar system must have been already thought out. At Rome he tried to gain acceptance for them in the college of presbyters and in the church; he failed. He had previously made similar attempts in Asia Minor. But he now encountered such determined opposition from the majority of the congregation that he found it necessary to withdraw from the great church and establish in Rome a community of his own. This was about the year 144. The new society increased in the two following decades; and very soon numerous sister-churches were flourishing in the east and west of the empire. Marcion took up his residence permanently in Rome, but still undertook journeys for the propagation of his opinions. In Rome he was associated with the Syrian Gnostic Cerdo, whose speculations influenced the development of the Marcionite theology. Still Marcion seems never to have abandoned his design of gaining over the whole Church to his gospel. The proof of this is found, partly in the fact that he tried to establish relations with Polycarp of Smyrna, from whom he got a sharp rebuff, partly in a legend to the effect that towards the end of his life he sought readmission to the Church. Such, presumably, was the construction put in after times on his earnest endeavour to unite Christians on the footing of the “pure gospel.” When he died is not known, but his death can scarcely have been much later than the year 165.

The distinctive teaching of Marcion originated in a comparison of the Old Testament with the gospel of Christ and the theology of the apostle Paul. Its motive was not cosmological or metaphysical, but religious and historical. In the gospel he found a God revealed who is goodness and love, and who desires faith and love from men. This God he could not discover in the Old Testament; on the contrary, he saw there the revelation of just, stern, jealous, wrathful and variable God, who requires from his servants blind obedience, fear and outward righteousness. Overpowered by the majesty and novelty of the Christian message of salvation, too conscientious to rest satisfied with the ordinary attempts at the solution of difficulties, while prevented by the limitations of his time from reaching an historical insight into the relation of Christianity to the Old Testament and to Judaism, he believed that he expressed Paul’s view by the

hypnosis of two Gods: the just God of the law (the God of the Jews, who is also the Creator of the world), and the good God, the Father of Jesus Christ. Paradoxes in the history of religion the chief stimulus which Paul drew out, and which Marcion’s contemporaries passed by as utterly incomprehensible, and where he made the foundation of an ethico-dualistic conception of history and of religion. It may be said that in the 2nd century only one Christian—Marcion—took the trouble to understand Paul; but it must be added that he misunderstood him. The profound reflections of the apostle on the radical antithesis of law and gospel, works and faith, were not appreciated in the 2nd century. Marcion alone perceived their decisive religious importance, and with them confronted the legalizing, and in this sense Judaizing, spirit of his age. In his opinion, those who with the ideas lost their truth under his treatment; for, when it is denied that the God of redemption is at the same time the almighty Lord of heaven and earth, the gospel is turned upside down.

The assumption of two Gods necessarily led to cosmological speculations. Under the influence of Cerdo, Marcion carried out his ethical dualism in the sphere of cosmology; but the fact that his system is not free from contradictions is the best proof that all along religious knowledge, and not philosophical, had been his aim. The main outlines of his teaching are as follows. Man is, in spirit, soul and body, a creature of the just and wrathful god. This god created man from οὐρά (matter), and imposed on him a strict law. Since no one could keep this law, the whole human race fell under the curse, temporal and eternal, of the Demiurge. Then a higher, hitherto unknown, and concealed even from the Demiurge, took pity on the wretched, condemned race of men. He sent his Son (whom Marcion probably regarded as a manifestation of the supreme God Himself) down to this earth in order to redeem men. Clothed in a visionary body, in the likeness of a man of thirty years old, the Son made his appearance in the fifteenth year of Tiberius, and preached in the synagogue at Capernaum. But none of the Jewish people understood him. Even the disciples whom he chose did not recognize his true nature, but mistook him for the Messiah promised by the Demiurge through the prophets, who as warrior and king was to come and set up the Jewish empire. The Demiurge himself did not suspect who the stranger was; nevertheless he became angry with him, and, although Jesus had punished his misdeeds, the Demiurge caused him to be nailed to the cross. By that act, however, he pronounced his own doom. For the risen Christ appeared before him in his glory, and charged him with having acted contrary to his own law. To make amends for this crime, the Demiurge had now to deliver up to the good God the souls of those who were to be redeemed; they are, as it were, purchased from him by the death of Christ. Christ then proceeded to the underworld to deliver the spirits of the departed. It was not the Old Testament saints, however, but only sinners and malefactors like Cain, Esau and Saul, who obeyed his summons. The prophets and patriarchs, having been often deceived by the Demiurge, suspected a trick and would not avail themselves of the promised salvation, remaining content with the bliss of being in Abraham’s bosom. Then, to gain the living, Christ raised up Paul as his apostle. He alone understood the gospel, and recognized the difference between the just God and the good. Accordingly, he opposed the original apostles with their Judaistic doctrines, and founded small congregations of true Christians. But the preaching of the false Jewish Christians gained the upper hand; nay, they even falsified the evangelical oracles and the letters of Paul. Marcion himself was the next raised up by the good God, to proclaim once more the true gospel. This he did by setting aside the spurious gospels, purging the real gospel (the Gospel of Luke) from supposed judaizing interpolations, and restoring the true text of

1 Esnik’s presentation of the Marcionite system is a late production, and contains many speculations that cannot be charged upon Marcion himself.

2 Marcion’s teaching at this point forestalls the patristic christology of Noetus and Praxeas (see Neander, Church Hist. ii. 143).—[Ed.]
the Pauline epistles. Likewise composed a book, called the Antitheses, in which he proved the disparity of the two Gods, from a comparison of the Old Testament with the evangelical writings.

On the basis of these writings Marcion proclaimed the true Christianity, and founded churches. He taught that all who put their trust in the good God, and his crucified Son, renounce their allegiance to the Demiurge, and approve themselves by good works of love, shall be saved. But he taught further—and here we trace the influence of the current gnosticism on Marcion—that only the spirit of man is saved by the good God; the body, because material, perishes. Accordingly his ethics also were thoroughly dualistic. In the Demiurge, with the Christian, was the delusion; he meant the whole "service of the perishable." The Christian must shun everything sensual, and especially marriage, and free himself from the body by strict asceticism. The original ethical contrast of "good" and "just" is thus transformed into the cosmological contrast of "spirit" and "matter." The good God appears as the god of spirit, the Old Testament God as the god of matter. That is Gnosticism; but it is at the same time illogical. For, since, according to Marcion, the spirit of man is derived, not from the good, but from the just God, it is possible to see why the spirit should yet be more closely related to the good God than the material. There is yet another direction in which the system ends with a contradiction. According to Marcion, the good God never judges, but everywhere manifests His goodness—is, therefore, not to be feared, but simply to be loved, as a father. But here the question occurs, What becomes of the men who do not believe the gospel? Marcion answers, The good God does not judge them, but merely removes them from His presence. Then they fall under the power of the Demiurge, who—rewards them for their fidelity, says Mary, and on the contrary, punishes them in his hell! The contradiction here is palpable; and at the same time the antithesis of "just" and "good" ultimately vanishes. For the Demiurge now appears as an inferior being, who in reality executes the purposes of the good God. It is plain that dualism here terminates in the idea of the sole supremacy of the good God.

It is not surprising, therefore, that even in the 2nd century the disciples of Marcion diverged in several directions. Rigorous asceticism, the rejection of the Old Testament, and the recognition of the Pastoral Epistles as Pauline, and hence the canon of the New Testament of Marciotic churches falls between the years 150 and 250. During that time they were really dangerous to the great Church; for in fact they maintained certain genuine Christian ideas, which the Catholic Church had forgotten. The earliest inscription (A.D. 318) on a Christian place of worship is Marcionite, and was found on a stone which had stood over the doorway of a house in a Syrian village. From the beginning of the 4th century they began to die out in the West, or rather they fell prey to Manichaeism. In the East also many Marcionites went over to the Manichaeans; but there they survived much longer. They can be traced in India to the 3rd and 4th centuries, and in China to the 5th and 6th. But it was unquestionably from Marcionite impulses that the new sects of the Paulicians and Bogomils arose; and in so far as the western Cathari, and the antinomian and antiercical sects

1 Marcion was the earliest critical student of the New Testament canon and text. It is noteworthy that he refused to admit the genuineness of the Pauline Epistles and said that the letter to the Ephesians was really addressed to the Laodiceans (Tertullian, Adv. Marc. v. 11, 21).—(ED.)

Some have seen a reference to this work in 1 Tim. vi. 20.—(ED.)

of the 13th century are connected with these, they also may be included in the history of Marcionism.

(A. HA.)

MARCOMANNI (i.e. men of the mark, or border), the name of a Suevic tribe. With kindred peoples they were often in conflict with the Roman Empire, and gave their name to the Marcomannic War, a struggle waged by the emperor Marcus Aurelius against them and the Quadri. The Marcomanni disappeared from history during the 4th century, being probably merged in the Bavarians, the later Bavariae.

See Suuri; also F. M. Wittmann, Die älteste Geschichte der Marcomannen (Münich, 1855), and E. Devrient, "Hermunduren and Markomannen" in Neues Jahrh. f. das klassische Altertum (1901), 51.

MARCOS DE NIZA (c. 1495-1558), a Franciscan friar born in Nice about 1495. He went to America in 1531, and after serving his order zealously in Peru, Guatemala and Mexico, was chosen to explore the country north of Sonora, whose wealth was pictured in the hearsay stories of Alvar Nuñez Cabeza de Vaca. Preceded by Estevanico, the negro companion of Cabeza de Vaca in his wanderings and the "Black Mexican" of Zuñi traditions, Fray Marcos left Culiaca in March 1539, crossed south-eastern Arizona, penetrated to Zuñi or the "Seven Cities of Cibola," and in September returned to Culiaca. He saw Zuñi only from a distance, and his description of it as equal in size to the city of Mexico was probably exact; but he embodied much mere hearsay in his report, the Descubrimiento de las siete ciudades, which led F. V. de Coronado to make his famous expedition next year to Zuñi, of which Fray Marcos was the guide; and the realities proved a great disappointment. Fray Marcos was made Provincial of his order for Mexico before the second trip to Zuñi, returned in 1541 to the capital, where he died on the 25th of March, 1558.

The Descubrimiento is one of the world's famous narratives of travel. It may be found in J. F. Pacheco's Documentos (vol. iii.) and Hakluyt's Voyages (vol. iii.); also in G. Ramusio, Navigazioni (vol. iii.) and H. Ternaux-Compans, Voyages (vol. iii.). See A. P. A. Bandelier, The Gilded Man (El Dorado). (New York, 1893); H. H. Bancroft, Arizona and New Mexico (San Francisco, 1888), and, for critical opinions, G. F. Winship, "The Coronado Expedition," in U.S. Government, Fourteenth Annual Report (for 1892-1893), Washington, (1896).-Marcos de Niza, 1558.

MARCOUS JULES (1824-1898), Swiss-American geologist, was born at Salins, in the department of Jura, in France, on the 20th of April 1824. He was educated at Besançon and at the college of St Louis, Paris. He worked in early years with J. Thurnham (1804-1852) on the geology of the Jura mountains. In 1847 he went to North America as travelling geologist for the Jardin des Plantes, and in the following year in Boston he joined Agassiz, whom he had met in Switzerland, and accompanied him to the Lake Superior region. Marcou spent two years in studying the geology of various parts of the United States and Canada, and returned to Europe for a short time in 1850. In 1853 he published a Geological Map of the United States, and the British Provinces of North America. In 1855 he became professor of geology and paleontology at the polytechnic school of Zurich, but relinquished this office in 1859, and in 1861 again returned to the United States, when he assisted Agassiz in founding the Museum of Comparative Zoology. In 1861 he published his Geological Map of the World (2nd ed. 1875). Of his published papers those which are noteworthy are those on the Jurassic and Cretaceous formations of the Jura, on the "Dyas" (Perman) of Nebraska, and on the Taconic rocks of Vermont and Canada. His other works include L'ettres sur les roches du Jura et leur distribution géographique dans les deux hémisphères (1857-1860) and Geology of North America (1838). Marcou died at Cambridge, Mass., on the 17th of April 1898.

MARCUS AURELIUS ANTONINUS (121-180), Roman emperor and Stoic philosopher, was born in Rome A.D. 121, the date of his birth being variously stated as the 6th, 21st and 26th of April.
The early part of the reign of Aurelius was clouded by national misfortunes. An inundation of the Tiber swept away a large part of Rome, destroying fields, drowning cattle, and causing a famine (162); then came earthquakes, fires and plagues of insects; the soldiers in Britain tried to induce their general Statius Priscus to proclaim himself emperor; finally, the Parthians crossed the Euphrates, and the Roman forces under Severianus at Elegia in Cappadocia, and devastated Syria. Verus, originally a man of considerable courage and ability, was sent to oppose the Parthians, but gave himself up to sensual excesses, and the Roman cause in Armenia would have been lost, and the empire itself, perhaps, imperilled, had not Verus had under him able generals, the chief of whom was Avidius Cassius (see Cassius, AVNVR). By them the Parthian War was brought to a conclusion in 165, but Verus and his army brought back with them a terrible pestilence, which spread through the whole empire. The people seem to have thought that the last days of the empire had come. The Parthians had at last been beaten, not subdued; the Britons threatened revolt; there were signs that various tribes beyond the Alps intended to break into Italy. Indeed, the bulk of the reign of Aurelius was spent in efforts to ward off the attacks of the barbarians. He went himself to the wars with Verus in 167, first to Aquileia and then on to Pannonia and Noricum, wintering at Sirmium in Pannonia. Ultimately the Marcomanni, the fiercest of the tribes that inhabited the country between Illyria and the sources of the Danube, sued for peace in 168. In January or February 169 Verus died at Altinum, apparently of apoplexy, though some ventured to say that he was poisoned by Aurelius.

Aurelius was thenceforth indisputably master of the empire, during one of the most troubled periods of its history. His reign is well described by F. W. Farrar (Seekers after God): "He regarded himself as being, in fact, the servant of all. The registry of the citizens, the suppression of litigation, the elevation of public morals, the care of minors, the retribution of public expenses, the limitation of gladiatorial games and shows, the care of roads, the restoration of senatorial privileges, the appointment of none but worthy magistrates, even the regulation of street traffic, these and numberless other duties so completely absorbed his attention that, in spite of indifferent health, they often kept him at severe labour from early morning till long after midnight. His position, indeed, often necessitated his presence at games and shows, but on these occasions he occupied himself either in reading, in being read to, or in writing notes. He was one of those who held that nothing should be done hastily, and that few crimes were worse than the waste of time. The comprehensiveness of his legal and judicial reforms is very striking. Slaves, heirs, women and children, were benefited, and he made serious attempts to deal with the steady fall in the birth-rate of legitimate children.

In the autumn of 169 two of the German tribes, the Quadi and the Marcomanni, with their allies the Vandals, Iazyges and Sarmatians, renewed hostilities and, for three years, Aurelius rested almost constantly at Carnuntum. In the end the Marcomanni were driven out of Pannonia, and were almost destroyed in their retreat across the Danube. In 174 Aurelius gained over the Quadi a decisive victory, which is commemorated by one of the sculptures on the column of Antonine. The story is that the Romans, entangled in a defile, were suffering from thirst. A sudden storm gave abundance of rain, while hail and thunder confounded their enemies, and enabled the Romans to gain an easy and complete victory. This triumph was universally considered at the time, and for long afterwards, to have been a miracle, and bore the title of "The Miracle of the Thundering Legion." The pagan writers (e.g. Dio Cassius, lxx. 8–10) ascribed the victory to the magic arts of an Egyptian named Arunphis who prevailed on Mercury and other gods to

1 Capitolinus states that he was originally called Caecilius Severus after his mother's grandfather; if so the name was early discarded.
Marcus Aurelius Antoninus

give relief, while the Christians attributed it to the prayers of their brethren in a legion to which, they affirmed, the emperor then gave the name of "The Thundering." Dacler, however, and others who adhere to the Christian view of the miracle, admit that the appellation of "Lightning" or "Lightning (🖉🖉🖉🖉🖉🖉🖉� хоз)" was given to the legion because there was a figure of lightning on their shields. It has also been virtually proved that it had the title even in the reign of Augustus.

Aurelius next marched to Germany. There news reached him that Avilius Cassius, the commander of the Roman forces in the north, had abjured his allegiance and assumed himself emperor (175). But after three months Cassius was assassinated, and his head was brought to Aurelius, who, with characteristic magnanimity, persuaded the senate to pardon all the family of Cassius. It is a proof of the wisdom of Aurelius's clemency that he had little or no trouble in pacifying the provinces which had been the scene of rebellion. He treated them all with forbearance, and it is said that when the correspondence of Cassius was brought him he burnt it without reading it. During his journey of pacification, Faustina, who had borne him eleven children, died. Dio Cassius and Constans place Faustina with the three shameless infidelity to her husband, who is even blamed for not paying heed to her crimes. But none of these stories rests on trustworthy evidence; on the other hand, there can be no doubt that Aurelius trusted her while she lived, and mourned her loss.

After the death of Faustina and the pacification of Syria, Aurelius proceeded, on his return to Italy, through Athens, and was initiated in the Eleusinian mysteries, the reason assigned for his doing so being that it was his custom to conform to the established rites of the countries he visited. He gave large sums of money for the endowment of chairs in philosophy and rhetoric, with a view to making the schools the resort of students from all parts of the empire. Along with his son Commodus he entered Rome in 176, and obtained a triumph for victories in Germany. In 177 occurred that persecution of Christians, the share of Aurelius in which has been the subject of so much controversy. Meanwhile the German War continued, and the two Quintilli, who had been left in command, begged Aurelius once more to take the field. In this campaign Aurelius, after a series of successes, was attacked, according to some historians, by an infectious disease, of which he died after a seven days' illness, either in his camp at Sirmium (Mitrovitz), on the Save, in Lower Pannonia, or at Vindobona (Vienna), on the 19th of March 180, in the fifty-ninth year of his age. Other accounts are: (1) that he was poisoned in the interests of Commodus (Dio. Cass. Lxi. 33, 4), (2) that he died of a chronic stomachic disease; the latter is perhaps the most likely. His ashes (according to some authorities, his body) were taken to Rome. By common consent he was deified and all those who could afford the cost obtained his statue or bust; for a long time his statues held a place among the penates of the Romans. Commodus, who was with his father when he died, erected to his memory the Antonine column (now in the Piazza Colonna at Rome), round the shaft of which are sculptures in relief commemorating the miracle of the Thundering Legion and the various victories of Aurelius over the Quadi and the Marcomanni. A bronze equestrian statue was set up in the Forum, now on the Capitol.

Aurelius throughout his reign was hostile to Christianity. The Christians suffered from systematic persecution, and many historians, with a strange lack of historical insight, have poured denunciation upon him for an attitude which was the natural outcome of his convictions. During his reign the atmosphere of Roman society was heavily charged with the popular Greek philosophy to which, ethics apart, Christianity was diametrically opposed. Under Antoninus the "pursuit" of Christians was unknown; under Trajan and Hadrian it was forbidden (cf. Keim, Aus dem Urchrist, p. 99). But Aurelius was an eager patriot and a man of logical mind. From his earliest youth he had learned to identify the ritual of the Roman religion with the very essence of the imperial idea. He became a Sullan priest at the age of eight, and soon knew by heart all the forms and liturgical order of the official worship, and even the sacred music. In the earliest statue we have he is a youth offering incense; he is a priest at the sacrificial altar in the latest triumphal reliefs. Naturally he felt that the prevalence of Christianity was incompatible with his ideal of Roman prosperity, and therefore that the policy of the Flavian emperors was the only logical solution of an important problem. Neumann argued that the recrudescence of active persecution was initiated by a deliberate ad hoc rescript issued probably in A.D. 176. Sir W. M. Ramsay, however, doubts this (The Church in the Time of Emperor Lucius, 1903). He refers it to a long series of inscriptions to provincial governors (mandata, not decreta) which interpreted their duty largely in conformity with the attitude of the reigning emperor. In other words the governors were ordered merely to punish sacrilege, and, under Aurelius, Christianity was regarded as such. In the second place, though it is true that the persecutions indicated by Celsius (Origen, Celsus, v. 69), Justin, Melito (in Eusebius, H. E., iv. 26), Athenagoras (Libellus pro Christianis) and the Acts of Martyrs, were greatly in excess of those recorded in previous reigns, it must not be forgotten that only in the Antonine period the Christians began to keep records. Thirdly, there can be no doubt that the Christians had recently assumed a much bolder attitude, and thus segregated themselves from the mass of those unorthodox sects which the Roman could afford to despise. Like the Druids in Gaul (cf. T. Mommsen, Prov. Rom. Emp., Eng. trans. i. 105, and V. Duruy, Rev. archéol., Apr. 1880), the Christians were particularly dangerous, inasmuch as they taught a unity which transcended that of the Roman Empire, and must, therefore, have been regarded as antagonistic to the existing political and social order.

When, therefore, we remember that Aurelius knew little of the Christians, that the only mention of them in the Meditations is a contemptuous reference to certain fanatics of their number whom even Clement of Alexandria compares for their thirst for martyrdom to the Indian gymnosophists, and finally that the least worthy of them were doubtless the most prominent, we cannot doubt that Aurelius was acting unquestionably in the best interests of a perfectly intelligible ideal. He was "Roman in resolution and repression, Roman in civic nobility and pride, Roman in the tenacity of imperium, Roman in the unification of the Roman Church, Roman in self-effacement, for the service of the State" (G. H. Rolland).

Philosophy.—The book which contains the philosophy of Aurelius is known by the title of his Reflections, or Meditations, although that is not the name which he gave to it himself (Tâ et kavôv). Of the genuineness of the work no doubts are now entertained. Believing that he wrote also an autobiography, which has perished, the Meditations were written, it is evident, as occasion offered—in the midst of public business, and on the eve of battles on which the fate of the empire depended—hence their fragmentary appearance, but hence also much of their practical value and even of their charm. It is believed by many critics that they were intended for the guidance of Aurelius's son, Commodus (q.v.); at all events they are generally considered as one of the most precious of the legacies of antiquity. Renan even called them "the most human of all books," and they are described by J. S. Mill in his Utility of Religion as almost equal in ethical elevation to the Sermon on the Mount.

Aurelius throughout his life adhered to the Stoical philosophy. But, as Tennensays, he imparted to it "a character of gentleness and benevolence, by making it subordinate to a love of mankind, allied to religion." His thoughts represent a transitional movement, and it is difficult to discover in them anything like a systematic philosophy. From the manner, however, in which he seeks to reconcile the distance between the cause of the good and the goodness of the cause with which he advises men to examine all the impressions on their minds, it may be inferred that he held the view of Anaxagoras—that God and matter exist independently, but that God cannot be said to be in or anything in the world, although Schultz is probably right in maintaining that all his theology amounts to this—the soul of man is most intimately united to his body. In them they have nothing in common. In the idea of the deity, although they say that the deity is most intimately united to the world or the material universe, and together they form one whole. We find in the Meditations no speculations on the absolute nature of the deity, and no clear expressions of opinion as to a future state.
We may also observe here that, like Epicurus, he is by no means so decided on the subject of suicide as the old stoics were. "Life," he says, "is, in all probability, the most unjust of theii; the goal in life to be aimed at, according to him, is not happiness, but tranquility, or equanimity. This condition of mind can be obtained only by "living lawfully," and he sums it up under the single word, "resignation," and as a means to that end is certain to make the four chief virtues—each of which has its distinct sphere—into the knowledge of good and evil; justice, or the giving to every man his due; forbearance, or suffering, when the law order of things requires it; and the persuasions of the body, when they are not conformable to the rational principle which must govern. This "living lawfully," this "resigning to fate," this "right thinking," this "satisfied acquiescence," becomes a mystery of nature, a composition out of the same elements, and a decomposition into the same, and altogether not a thing of which any man should be ashamed, for it is not contrary to the nature of a sensible animal, and not contrary to the reason of our constitution." The morality of Marcus Aurelius cannot be said to have been new, since it is the way to the world's happiness, in an accent and its innate tenderness. But above all, what gives the sentences of Marcus Aurelius an enduring value and fascination and renders them superior to the utterances of Epicurus and Seneca, is the reasonableness of his principles, the propriety of his prophecies, the records of his practice. To the saintliness of the cloister he added the wisdom of the man of the world; he was constant in misfortune, not elated by prosperity, never "carrying things to the sweating-point," but preserving, in a time of universal corruption, unreality and self-indulgence, a nature sweet, pure, self-deifying, unaffected.

MARCY, WILLIAM LEARNED (1786-1837), American statesman, was born in Southbridge (then part of Sturbridge), Massachusetts, on the 12th of December 1786. He graduated at Brown University in 1808, studied law, was admitted to the bar in Troy, New York, and began practice there in 1810. During the War of 1812 he served first as a lieutenant and afterwards as a captain of volunteers, and on the 22nd of October 1812 took part in the storming of the British post at St Regis, Canada. In 1816 he became recorder of Troy, but as he sided with the Anti-Clinton faction of the Democratic-Republican Party, known as the "Bucktails," he was removed from office in 1818 by his political opponents. As editor of the Troy Budget (daily) he was a vigorous supporter of Martin Van Buren, and when Van Buren's followers acquired control of the legislature in 1829 Marcy was named the Lieutenant-general of the New York militia. From 1825 to 1829 Marcy served as a member of the House of Representatives, an office then especially important on account of the large expenditures for internal improvements, and during this period he became the leading member of the famous "Allany Regency," a group of able Democratic politicians who exerted a powerful influence throughout the state by their control of the public patronage and machinery. He was one of the associate justices of the New York Supreme Court from 1829 to 1851, presiding over the trial of the alleged murderers of William Morgan and in other cases not at all connected with the United States Senate from December 1831 to July 1832, when he resigned to become governor of New York. In a speech in the Senate defending Van Buren against an attack by Henry Clay, Marcy made the unfortunate remark that "to the victors belong the spoils of the enemy," and thereby became widely known as a champion of the proscription of political opponents. He served as governor of New York for six years (Jan. 1, 1833 to Dec. 31, 1838), but was defeated in 1838 by the Whig candidate, William H. Seward. As governor he checked the issue of bank charters by the legislature and the enforcement, in 1838, of a general "paper money" law, which abolished the monopoly of the Bank of New York and opened the way to the old banking system. In 1830-1842 Marcy was a member of a commission appointed by President Van Buren, in accordance with the treaty of 1830 between the United States and Mexico "to examine and decide upon" certain claims of citizens of the United States against Mexico. In 1843 he presided over the Democratic state convention at Syracuse, and in 1844-1845 he was recognized as one of the leaders of the "Hunkers," or regular Democrats in New York, and an active opponent of the "Barnburners." He was secretary of war under President Polk from 1845 to 1849, and in such discharge with ability the various duties incident to the conduct of the Mexican War; he became involved, however, in controversies with Generals Scott and Taylor, who accused him, it seems very unjustly, of seeking to embarrass their operations in the field because they were political opponents of the administration. In the Democratic convention at Baltimore, in 1852, Marcy was a prominent candidate for the presidential nomination, and from 1853 to 1857 he was secretary of state in the cabinet of President Pierce. Few cabinet officers in time of peace have had more engrossing duties than he; his circumspection, sagacity, and diplomatic agents abroad, recommending that, whenever practicable, they should "appear in the simple dress of an American citizen," created much discussion in Europe; in 1867 his recommendation was enacted into a law of Congress. One of the most important matters with which he was called upon to deal was the "Kosfa Affair." 1 His "Hülsemann letter" (1853), is an important 1 The "Kosfa Affair" involved an interesting question of international law—i.e., the right of a alien domiciled in any country to the protection of that country—and has served as a precedent for the American government in somewhat similar cases that have arisen. Martin Kosfa, a Hungarian revolutionary of 1848, had emigrated to the United States in 1849, and was kept at the step for naturalization by formally declaring his intention to become a citizen of the United States. In 1853 he went on personal business to Smyrna, where he secured a passport from the American consul; the American consul, however, caused him to be seized and detained on an Austrian brig-of-war. Soon afterward Captain Duncan N. Ingraham (1802-1891), in command of a United States sloop-of-war, arrived at Smyrna and demanded Kosfa's release, but no notice being given that Kosfa were released; and as a compromise Kosfa was placed in the custody of the French consul. To Chevalier Hülsemann, the representative of France at Washington, who was acting from the United States the disavowal of the acts of its agents, the complete surrender of Kosfa, and "satisfaction proportionate to the magnitude of the outrage," Marcy wrote on the 26th of September, 1853, that "Kosfa had been arrested with the nationality of the United States" and had a right to the protection of the United States government, and added: Whenever by the law of nations an individual becomes clothed with our national
state paper, and the principles it enunciates have been approved by leading authorities on international law. In the same year he secured the negotiation of the Gadsden Treaty (see GADSDEN, JAMES), by which the boundary dispute between Mexico and the United States was adjusted and a large area was added to the Federal domain; and in June 1854 he concluded with Lord Elgin, governor-general of Canada, acting for the British Government, a treaty designed to settle the fisheries question and providing for tariff reciprocity (as regards certain enumerated commodities) between Canada and the United States. In 1854 Marcy had to deal with the complications growing out of the bombardment of San Juan, Puerto Rico, and Porto Rico (Greytown), Nicaragua, by the United States sloop-of-war "Cyane," for insults offered the American minister by its inhabitants and for their refusal to make restitution for damages to American property. The expedition of William Walker (q.v.) to Nicaragua in 1855 further complicated the Central American question. The Crimean War, on account of the extensive recruiting therefor by British consuls in several American cities, in violation of American neutrality, led to a diplomatic controversy with Great Britain, and in May 1856 the British minister, John F. T. Crampton (1805-1886), resorted to public threats. At the end of the year new American ministers were appointed to New York, Philadelphia and Cincinnati were revoked. The incident created great excitement in England, but in 1857 the British government sent Sir Francis Napier to Washington to take Crampton's place. To the Declaration of Paris of 1856, prescribing certain rules of naval warfare, Marcy on behalf of his government refused to subscribe, because Great Britain had rejected his proposed amendment exempting from seizure in time of war all private property not contraband. The diplomatic relations of the United States and Spain furnished, perhaps, the most perplexing of Marcy's problems. Upon the seizure (on Feb. 28, 1854) of the American vessel "Black Warrior," the confiscation of her cargo, and the fining of her captain by the Cuban authorities, on the ground that this vessel had violated the customs regulations of the port of Havana, slavery propagandists sought to force the administration into an attitude that would lead to war with Spain and make possible the seizure of Cuba; and it was largely due to Marcy's influence that war was averted, Spain restoring the confiscated cargo and remitting the captain's fine.1 The secretary, however, was not averse to increasing his popularity and his chances for the presidency by obtaining Cuba in an honourable manner, and it was at his suggestion that James Buchanan, J. Y. Mason and Pierre Soulé, the ministers respectively to Great Britain, France and Spain, met at Ostend and Aix-la-Chapelle in October 1854 to discuss the Cuban question. But the remarkable "Ostend Manifesto" (see BUCHANAN, JAMES), the outcome of their conference, was quite unexpected, and Marcy promptly disavowed the document. Marcy died at Ballston Spa, New York, on the 4th of July 1857, a short time after the close of Pierce's administration. In domestic affairs Marcy was a shrewd, but honest partisan; in diplomacy he exhibited the qualities of a broad-minded, patriotic statesman, endowed, however, with vigour, with brilliancy, than intellect.

For his early career, consult J. S. Jenkins, Lives of the Governors of New York (Auburn, New York, 1851), and for his work as secretary of state, see James Ford Rhodes, A History of the United States (vols. i. and ii., New York, 1892), and an article by Sidney Webster, "Mr. Marcy, the Cuban Question, and the Ostend Manifesto," in vol. viii. of the Political Science Quarterly (New York, 1893).

MARDIN, the chief town of a sanjak of the Diarbekr vilayet of Asiatic Turkey. It is a military station on the Diarbeckr-Mardin road. It occupies a remarkable site on the southeastern talus of a conical hill of sedimentary rock, and thus presents a picturesque landscape. He can claim the protection of this government, and it may respond to that claim without being obliged to explain its conduct to any foreign power; for it is its duty to make its nationality respected to a certain degree at every foreign court on the globe." Eventually Koseta was released and returned to the United States. The Hülsemann letter was published and greatly increased Marcy's popularity.

1 See Henry L. James, "The Black Warrior Affair" in the American Historical Review, vol. xii. (1907).

The streets are narrow and paved in steps, while often the roadway runs along the roof of the house in the tier below. The hill is almost surrounded by old walls, while on the summit are the remains of the famous castle of the Kaleh Shubha (Lat. Marede oder Marde), which from Roman times has played an important part in history. The Arab geographers considered it impregnable, and from its steep approaches and well-arranged defences it was able to offer a protracted resistance to the Mongolian conqueror Hulagu and to the armies of Timur. It was also for several centuries the residence of more or less independent princes of the Ortokid Turkoman dynasty. The climate is healthy and dry, and in winter the snowy season lasts sometimes scantly. Mardin is the centre of a good corn-growing district, and is important chiefly as a border town for the Kurds on the north and the Arab tribes to the south. It is the chief centre of the Jacobite Christians, who have many villages in the Tor Abdin hills to the north-east, and whose patriarch lives at Deir Zafaran, a Syrian monastery of the 9th century not far off in the same direction. The population is estimated at 27,000, of whom about one-half are Christians of the Armenian, Chaldean, Jacobite, Protestant and Roman Catholic confessions. Besides many mosques and churches there are three monasteries (Syrian, Franciscan and Capuchin), and an important American Mission station, with church, schools and a medical officer.

MARDUK (Bibl. Merodach), the name of the patron deity of the city of Babylon, who, when Babylon permanently became the political centre of the united states of the Euphrates valley under Khhammurni (c. 2250 B.C.), rose to the position of the head of the Babylonian pantheon. His original character was that of a solar deity, and he personifies more specifically the sun of the spring-time who conquers the storms of the winter season. He was thus fitted to become the god who triumphs over chaos that reigned in the beginning of time. This earlier Marduk, however, was effaced by the reflex of the political development through which the Euphrates valley passed and which led to imbuing him with traits belonging to gods who at an earlier period were recognized as the heads of the pantheon. There are more particularly two gods—Ea and Bel—whose powers and attributes pass over to Marduk. In the case of Ea the transfer proceeds pacifically and without involving the effacement of the older god. Marduk is very different from the father. The father voluntarily recognizes the superiority of the son and hands over to him the control of humanity. This association of Marduk and Ea, while indicating primarily the passing of the supremacy once enjoyed by Eridu to Babylon as a religious and political centre, may also reflect an early dependence of Babylon upon Eridu, not necessarily of a political character but, in view of the spread of culture in the Euphrates valley from the south to the north, the recognition of Eridu as the older centre on the part of the younger one. At all events, traces of a cult of Marduk at Eridu are to be noted in the religious literature, and the most reasonable explanation for the existence of a god Marduk in Eridu is to assume that Babylon in this way paid its homage to the old settlement at the head of the Persian Gulf.

While the relationship between Ea (q.v.) and Marduk is thus marked by harmony and an amicable abdication on the part of the father in favour of his son, Marduk's absorption of the power and prerogatives of Bel of Nippur was at the expense of the latter's prestige. After the days of Khhammurni, the cult of Marduk eclipses that of Bel (q.v.), and although during the five centuries of Cassite control in Babylonia (c. 1750-1200 B.C.), Nippur and the cult of the older Bel enjoy a period of renaissance, when the reaction ensued it marked the definite and permanent triumph of Marduk over Bel until the end of the Babylonian empire. The only serious 'rival to Marduk after 1200 B.C. is Assur (q.v.) in Assyria. In the south Marduk reigns supreme, and his supremacy is indicated most significantly by making him the Bel, "the lord," par excellence.

The old myths in which Bel of Nippur was celebrated as the hero were transformed by the priests of Babylon in the interest of the local economy, and the name of the deity was changed to Marduk. The name Marduk means "belonging to Marduk."
of the Marduk cult with the chief rôle assigned to their favourite. The hymns once sung in the temple of Bel were re-edited and adapted to the cult of Babylon. In this process the older Bel was deliberately set aside, and the climax was reached when the conquest of the monster Tiamat, symbolizing the chaos prevailing in the earlier days, was ascribed to Marduk instead of, as in the older form of the epic, to Bel. With this stroke Marduk became the creator of the world, including mankind—again setting aside the far older claims of Bel to this distinction.

Besides absorbing the prerogatives of Ea and Bel, Marduk was also imbued with the attributes of other of the great gods, such as Adad, Shamash, Nergal and Ninib, so that, more particularly as we approach the days of the Neo-Babylonian Empire, the impression is created that Marduk was the only real deity recognized, and that the other gods were merely the various forms under which he manifested himself. So far as one can speak of a monotheistic tendency in Babylonia it connects itself with this conception that was gradually crystallized in regard to the old solar deity of Babylon.

The history of the city of Babylon can now be traced back to the days of Sargon of Agade (before 3000 B.C.) who appears to have given the city its name. There is every reason to assume, therefore, that the cult of Marduk existed already at this early period, though it must always be borne in mind that, until the days of Khammu-rabi, his jurisdiction was limited to the city of Babylon, itself the seat of the god, and that he was regarded solely as a solar deity.

On monuments and cylinders he is represented as armed with the weapon with which he despatched the monster Tiamat. At times this monster is also depicted lying vanquished at his feet, and occasionally the monster with the lance or the lance alone is reproduced instead of the god himself.

In the astral-theological system, Marduk is identified with the planet Jupiter. As the creator of the world, the New Year's festival, known as Zagruk and celebrated at the time of the vernal equinox (or, as is traced to his festival, which lasted for eleven days, symbolized the new birth of nature—a reproduction therefore of the creation of the world. The arbiter of all fates, Marduk, was pictured as holding an assembly of the gods during the New Year's festival for the purpose of deciding the lot of each individual for the year to come. The epic reciting his wonderful deed in despatching the monster Tiamat and in establishing law and order in the world in the place of chaos was recited in his temple at Babylon known as E-Saggila, "the lofty house," and there are some reasons for believing that the recital was accompanied by a dramatic representation of the epic.

The meaning of the name Marduk is unknown. By a species of word-play the name was interpreted as "the son of the chamber," with reference perhaps to the sacred chamber of fate in which he sat in judgment on the New Year's festival. Ideographically it is represented by two signs signifying "child of the day" (or "of the sun") which is a distinct allusion to his original solar character. Other ideographic signs describe him as the "strong and universal ruler." The name of his consort was Sarpanit, i.e., the shining or brilliant one—again an allusion to Marduk's solar traits—and this name was playfully twisted by the Babylonian priests to mean "the seed-producing" (as though compounded of šēr, seed, and bāali, producing, which was regarded as an appropriate appellation for the female counterpart of the creator of mankind and of life in general. The punning etymology betrays the evident desire of the priests to see in Marduk's consort a form or manifestation of the great mother-goddess Ishtar (g.v.), just as in Assyría Ishtar frequently appears as the consort of the chief god of Assyro, known as Assur (q.v.).

MARE, the English term for the female of any animal of the family Equidae, of the ass, or zebra, but particularly of the horse. It is also used of the camel. To find a "mare's nest" is an old proverbial saying for a purely imaginary discovery. In "night-mare," an oppressive or terrifying dream, the termination is a word appearing as mar, mæir and marea in various Teutonic languages for a goblin, supposed to sit on a sleeper's chest and cause these dreams: cf. elf. This Teutonic word also appears in the French coucharse, the first part being from coucher, to tread or trample upon, Lat. calcar.

MARE CLAUSUM and MARE LIBERUM (Lat. for "closed sea" and "free sea"). In international law, terms associated with the historic controversy which arose out of demands on the part of different states to assert exclusive dominion over areas of the open or high sea. Thus Spain laid claim to exclusive dominion over whole oceans, Great Britain to all her environs narrow seas and so on. These claims gave rise to vigorous opposition by other powers and led to the publication of Grotius's work (1605) called Mare liberum. In Mare clausum (1659) John Selden endeavoured to prove that the sea was practically as capable of appropriation as territory. Owing to the conflict of claims which grew out of the controversy, maritime states had to moderate their demands and base their pretensions to maritime dominion on the principle that it extended seawards from land.

A formula was found by Bynkershoek in his De dominio maris (1702) for the restriction of dominion over the sea to the actual distance to which cannon range could protect it. This became universally adopted and developed into the three-mile belt (see TERRITORIAL WATERS). In recent times controversies have arisen in connexion with the Baltic, the Black Sea and more particularly the Bering Sea. In the latter case the United States, after the purchase of Alaska, vainly attempted to assert dominion beyond the three-mile limit. Still more recently the hardship of treating the greater part of Mony Firth as open sea to the exclusion of British and to the advantage of foreign fishermen has been raised (see NORTH SEA FISHERIES CONVENTION; TERRITORIAL WATERS).

Conventions for the suppression of the slave trade, including the Brussels General Act of 1853, and the North Sea Fisheries Convention, have placed restrictions on the freedom of the high seas. As a result, certain areas of the sea have been brought under control, on the principle that what is the property of all nations must be used without detriment to its use by others (see HIGH SEAS).

MAREE, LOCH, a fresh-water lake in the county of Ross and Cromarty, Scotland. Its name—of which Maroy and Mournie are older variants—does not, as is often supposed, commemorate the Virgin, but St Maerubha, who came from Bangor in Ireland in 671 and founded a monastery at Applecross and a chapel (now in ruins) on Isle Maree. Trending in a south-easterly direction, the lake has a length of 3 miles from Kircho-ewe to the head of the dam erected in the 16th century (or earlier) by the iron-smelters of the Cheardach Ruaird, or Red Smiddy, on the short but impetuous river Ewe by which it drains to the sea. It lies at a height of 32 ft. above sea-level; the greatest breadth is just over 2 m. at Slattadale, the mean breadth being 35 ft. and the greatest depth, 36 ft., occurs in the upper basin, the mean depth being 125 ft. Its waters cover an area of fully 11 sq. m., and its islands nearly 1 sq. m., while the drainage area is 172 sq. m. A remarkable feature is the large number (more than 30) and considerable area of the islands. Excepting Loch Crôach, a small lake in the Assynt district of Sutherlandshire, its insularity (i.e., the ratio of the total area of the islands to that of the water surface) is higher than that of any other lake in Great Britain, Loch Lomond coming next. Nearly all the islands lie north and east of Slattadale, the largest being Eilean Subhainn, or St Swithin's Isle, which contains a small lake 750 ft. long, 300 ft. broad and 64 ft. deep. For two-thirds of its length the loch is flanked by magnificent mountains. On the north-east the principal heights are Ben Sioch (2517 ft.), whose sugar-loaf form dominates the landscape, Ben Luir (2817) and Ben Airidh-a-Char (2593), and, on the south-west, the peaks of Ben Eay, four of which exceed 3000 ft.

MAREMMA (a corruption of Marittima, "situated on the sea"), a marshy region of Tuscany, Italy, extending from the mouth of the Cecina to Orbetello and varying in breadth from 15 to 20 m. In Etruscan and Roman times the Maremma was a
populous and fertile coast plain, with considerable towns situated on the hills—Populonia, Russelae, Cosa, &c., and was drained by a complete system of subterranean canals which were brought to light by the excavations made in connexion with the railways passing through the district. But the decline of agriculture at the end of the Republic led to a conversion of the land to pasture, and later the unsettled state of affairs consequent on the fall of the Roman Empire resulted in neglect of the watercourses. Leopold II. of Tuscany (1822-1844) made the first successful efforts to counteract the malaria which has affected the district, by drainage, the filling up of swamps, and the establishment of new farms, and since his time continuous efforts have been made with considerable success.

MARENGO, a village of north Italy, on the road between Alessandria and Tortona, and 41 m. E.S.E. of the gates of the former. It is situated on the Fontanone brook, a small affluent of the Tanaro which marks the western edge of the plain of Marengo, the scene of the great victory won by Napoleon over the Austrians under Baron Melas (1729-1806) on the 14th of June 1800. The antecedents of the battle are described under French Revolutionary Wars.

The French army, in ignorance of its opponent's position, had advanced westward from the Scrivia towards Alessandria on the 12th, and its outposts had reached the Bormida on the evening of the 13th. But contact with the main Austrian army was not obtained, and on the assumption that it was moving towards either Valenza or Genoa Napoleon weakened his army by considerable detachments sent out right and left to find the enemy and to delay his progress. Unknown, however, to Napoleon Melas's army was still at Alessandria, and on the morning of the 14th of June it filed out of the fortress and began its advance into the great plain of Marengo, one of the few favourable cavalry battlegrounds in north Italy.

The dispersion of the French army allowed only a fragmentary, though most energetic, resistance to be offered to the Austrian onset. The latter, considerably delayed at first by the crossing of the river Bormida, broke up into two columns,1 which advanced, the right by the main road on Marengo, the left on Castel Ceriolo. The former, personally commanded by Melas, was 20,000 strong, and General Victor, its immediate opponent, about 10,000, or including some 3000 of Lannes' corps who fought on his right, about 15,000 strong; the Austrians were, moreover, greatly superior in guns and cavalry. The French disputed every yard of ground, holding their first line until they had by fire and counter-attack forced practically the whole of the Austrian right to deploy, and two hours passed before the Austrians managed to reach the Fontanone brook. But Victor's troops, being disorganized and short of ammunition, had then to retire more rapidly across the plain. The retreat was orderly, according to Victor's report, and made in échelon from the centre, and it is certain that at any rate the regiments held together, for the 6000 Austrian sabres found no opportunity to charge home. Many guns and wagons were, however, abandoned.

On the French right, opposed to the column of Lieut.-Field-Marshall Ott, was Lannes, with some 4000 men (excluding Watrin's division which was with Victor) against 7500. He too was after a time forced to retire, with heavy losses. Thus, about 9 a.m. the First Consul, who was at some distance from the field, was at last convinced that he had to deal with Melas's army. At once he sent out his staff officers to bring back his detachments, and pushed forward his only reserve, Monnier's division, to support Lannes and Victor. But before this help arrived Lannes had been driven out of Castel Ceriolo, and Victor and Watrin forced back almost to San Giuliano. A little after 2 p.m. Monnier's division (3500) came into action, and its impetuous advance drove the Austrians out of Castel Ceriolo. But after an hour it was forced back in its turn, and by 3 p.m. therefore, the 20,000 French troops, disordered and exhausted, and in one line without reserves,2 held a ragged line of battle to the right and left of San Giuliano. The best that could be expected was a prolongation of the struggle till nightfall and a fairly orderly retreat. The Austrian general, believing that the battle was won, returned to Alessandria, leaving a younger man, his chief of staff Zach, to organize the pursuit.

Then followed one of the most dramatic events in military history. Of the two detachments sent away by Napoleon in search of the enemy, one only received its orders of recall. This was Boudet's division of Desaix's corps, advanced as far as Rivalta and at noon heading for Pozzolo-Formigaro on the Alessandria-Genoa road. At 1 p.m. a brief message, "Revenez, au nom de Dieu!" altered the direction of the column, and between 4 and 5, after a forced march, the division, headed by Desaix, came on to the battle-field. It was deployed as a unit and moved forward at the word of command along the main road Alessandria-Torta, the sight of their closed line giving fresh courage to the men of Lannes and Victor. Then, while on the right side Zach was arraying a deep column of troops to pursue along the main road, Napoleon and Desaix, themselves under fire, hastily framed a plan of attack. All arms were combined. First, Marmont with eight of Boudet's guns and ten others (the rest had been abandoned in the retirement) came into action on the right of the road, replying to the fire of the Austrian guns and checking their advanced infantry; close in rear of the artillery was Desaix's infantry with the remnants of Lannes' and Victor's troops rallying on its right and left; on Lannes' right, still facing Ott's column, was Monnier, supported by the light cavalry of Ney, and by his 12th regiment of horse and foot; lastly 400 sabres of Kellermann's cavalry brigade, which had been driven back several times and had lost heavily, formed up on the right of Desaix. About 5 p.m. Desaix advanced against the head of the Austrian main column formed by Zach. He himself fell in the attack, but the onset of his intact troops drove back the leading Austrians upon their supports, and at the critical moment when the attack of Boudet's single weak division had almost spent its force, Kellermann with his 400 sabres saluted out of the French line. Marmont had brought up two guns to assist the infantry, and also ordered his last reserve, the 83rd regiment of foot, to place him to the front, wheeled inwards against the flank of the great column, and rode through and through it. Zach was taken prisoner with more than 2000 men, and Kellermann, rallying some of his troopers, flung himself upon the astonished Austrian cavalry and with the assistance of the Consular Guard cavalry defeated it. The "will to conquer" spread along the whole French line, while the surprise of the Austrians suddenly and strangely became mere panic. Lannes, Victor and Monnier advanced fresh, pushing the Austrians back on Marengo. A few Austrian battalions made a gallant stand at that place, while Melas himself, as night came on, rallied the fugitives beyond. Next day the completely exhausted, but victorious,

1 A third column was sent out to the extreme right (3000 under O'Reilly). This destroyed a small French detachment on the extreme left, but took little or no part in the main battle.

2 The Austrians, too, fighting in "linear" formation had few reserves. About one-third only of the imperial forces in Italy was actually engaged in the battle.
French army extorted from the dazed Austrians a convention by which all Italy up to the Mincio was evacuated by them. The respective losses were: French about 4000, Austrians 9000.

See the French official Campagne de l'armée de réserve, vol. ii., by C. de Cugnac.

MAREOTIS (Arabic Mariut), the most westerly of the lakes in the Delta of Egypt. On the narrow strip of land separating, the lake from the Mediterranean, the city of Alexandria is built. (See Egypt; and Alexandria.)

MARET’S-TAIL, in botany, the popular name for an aquatic herb known botanically as Hippiris vulgaris (natural order Haloragaceae). It grows on margins of lakes, ponds and similar localities. After flowering, it has a submerged stem, from which spring many-jointed cylindrical stems bearing numerous narrow leaves closed in whorls. The minute greenish flowers are borne in the leaf-axils. Like many freshwater plants it has a wide distribution, occurring in arctic and temperate regions in the northern hemisphere and reappearing in antarctic South America.

MARET, HUGUIN-BERNARD, Duc de Bassano (1763–1839), French statesman and publicist, was born at Dijon. After receiving a sound education, he entered the legal profession, and became advocate at the King’s Council at Paris. The ideas of the French Revolution profoundly influenced him, and wholly altered his career. The interest aroused by the debates of the first National Assembly suggested to him the idea of publishing them, jointly with Méjean, in the Bulletin de l'Assemblée. The publicist Charles Joseph Panckoucke (1736–1798), owner of the Mercure de France and publisher of the famous Encyclopédie (1751), persuaded him to merge this in a larger paper, the Moniteur universel, which gained a wide repute for correctness and impartiality. He was a member of the moderate club, the Feuillants; but after the overthrow of the monarchy on the 10th of August 1792 he accepted an office in the ministry of foreign affairs, where he sometimes exercised a steady influence. On the withdrawal of the Britishlegation from Paris Maret went on a mission to London, where he had a favourable interview with Pitt on the 2nd of December 1792. All hope of an accommodation was, however, in vain. After the execution of Louis XVI. (Jan. 21, 1793), the chief French diplomatic agent, Chauvelin, was ordered to leave England, while the French Convention declared war (Feb. 1, 1793). These events precluded the possibility of success attending a second mission of Maret to London in January. After a space, in which he held no diplomatic post, he became ambassador of the French Republic at Naples; but, while repairing thither with De Séméville he was captured by the Austrians and was kept in dungeon by them for some thirty months, until, at the close of 1795, the two were set free in return for the liberation of the daughter of Louis XVI. For a time Maret betook himself to journalism; but he played a useful part in the negotiations for a peace with Great Britain which went on at Lille during the summer of 1797, until the victory of the Jacobins at Paris in the coup d’état of Brumaire (Sept. 1799) frustrated the hopes of Pitt for peace and inflamed on Maret another reverse of fortune. On the return of Bonaparte from Egypt in 1799 Maret joined the general’s party which came to power with the coup d’état of Brumaire (Nov. 9–10, 1799). Maret now became one of the First Consul’s secretaries and shortly afterwards secretary of state. In this position his moderation, industry, good sense, knowledge of men and affairs, made his services of great value. The Moniteur, which became the official journal of the state in 1800, was placed under his control. He sometimes succeeded in toning down the hard, abrupt language of Napoleon’s communications, and in every way proved a useful intermediary. It is known that he had a share in the drawing up of the new constitutions for the Batavian and Italian Republics. In 1804 he became Minister; in 1807 he was named count, and in 1809 he received the title of Duc de Bassano, an honour which marked the sense entertained by Napoleon of his strenuous toil, especially in connection with the diplomatic negotiations and treaties of this period. His personal devotion to the emperor was of that absolute unwavering kind which Napoleon highly valued; it is said in the attempt to save the unhappy general by the great man in April–May 1808 in order to make himself master of the destinies of Spain. Maret also assisted in drawing up the constitution destined for Spain, which the Spaniards at once rejected. Maret accompanied Napoleon through most of his campaigns, including that of 1809; and at its close he expressed himself in favour of the marriage alliance with the archduchess Marie Louise of Austria, which took place in 1810. In the spring of 1811, the duchess Bassano replaced Champagny, duc de Cadore, as minister of foreign affairs. In this capacity he showed his personal integrity and devotion, concluding the treaties between France and Austria and France and Prussia, which preceded the French invasion of Russia in 1812. He was with Napoleon through the greater part of that campaign; and after its disastrous conclusion helped to prepare the new forces with which Napoleon waged the equally disastrous campaign of 1813. But in November 1813 Napoleon replaced him by Caulaincourt, duc de Vicence, who was thought to be more devoted to the cause of peace and personally grateful to the emperor Alexander I. of Russia, Maret, however, was never to see his influence with his master through the campaign of 1814, as also during that of 1815. After the second restoration of the Bourbons he was exiled, and retired to Grötz where he occupied himself with literary work. In 1820 he was allowed to return to France, and after the Revolution of 1830, Louis Philippe, king of the French, made him a peer of France; he also held two high offices for a few days. He died at Paris in 1839. He shares with Daru the honour of being the hardest worker and most devoted supporter in Napoleon’s service; but it has generally been considered that he carried devotion to the length of servility, and thus often compromised the real interests of France. This view has been contested by Baron Ernouf in his work Maret, duc de Bassano, which is the best biography.

For Maret’s mission to England in 1792 and his work at Lille in 1793, see Augustus W. Miles, Letters on the French Revolution; J. H. Rose, The Life and Times of William Pitt, and for other incidents of Maret’s career, the memoirs of Bourrienne, Pasquier, Ménalv and Savary (duc de Rogivo), may be consulted. Thiers’s account of Maret is in general hostile to him.

MARGARET (Fr. Marguerite, It. Margherita, Ger. Margareta, and Margarete, with dim. Grete, Gretchen, Meta, fr. Lat. margarita, margo/spar, a pearl), a female proper name, which became very popular in all Christian countries as that of the saint noticed below. Biographies of some who have borne it are arranged below in the following order: saints, queens of Scotland, queens of other countries, princesses and duchesses.

MARGARET, ST (SANCTA MARGARITA), virgin and martyr, is celebrated by the Church of Rome on the 18th of July. According to the legend, she was a native of Antioch, daughter of a pagan priest named Aedesius. She was scourged by her father for her Christian faith, and lived in the country with a foster mother keeping sheep. Olybrius, the “praesces orientis,” offered her marriage as the price of her renunciation of Christianity. Her refusal led to her being cruelly tortured, and after various miraculous incidents, she was put to death. Among the Greeks she is known as Marina, and her festival is on the 17th of July. She has been identified with St Pelagia (q.v.)—Marina being the Latin equivalent of Marina. According to a legend, was also called Margarita. We possess no historical documents on St Margaret as distinct from St Pelagia. An attempt has been made, but without success, to prove that the group of legends with which that of St Margaret is connected is derived from a transformation of the pagan divinity Aphrodite into a Christian saint. The problem of her identity is a purely literary question. The cult of St Margaret was very widespread in England, where more than 250 churches are dedicated to her.

See Acta sanctorum, July, v. 24–45; Bibliotheca hagiographica, Latina (Brussels, 1899), n. 5303–5313; Frances Arnold-Forster, Studies in Church Dedication (London, 1899), i. 131–133 and iii. 19. (H. DE.)
MARGARET, ST—MARGARET OF NORWAY

MARGARET, ST (c. 1045–1063), the queen of Malcolm III. Canmore king of Scotland, was the daughter of the English prince Edward, son of Edmund Ironside, and sister of Edgar Ætheling, and was probably born in Hungary. In 1067 the widow and children of Edward fled from Northumberland with a large number of followers and sought the protection of the Scottish king. The marriage of Malcolm and Margaret soon took place and was followed by several invasions by Northumbria led by the Scottish king, probably in support of the claims of his brother-in-law Edgar. These, however, had little result beyond the devastation of the province. For more important were the effects of this alliance upon the history of Scotland. A considerable portion of the old Northumbrian kingdom had been reduced by the Scottish kings in the previous century, but up to this time the English population had little influence upon the ruling element of the kingdom. Malcolm's marriage undoubtedly improved the condition of the English to a great extent, and under Margaret's sons, Edgar, Alexander I, and David I, the Scottish court practically became anglicized.

Margaret died on the 17th of November 1063, four days after her husband and her eldest son Edward, who were slain in an invasion of Northumberland. She rebuilt the monastery of Tona, and was canonized in 1251 on account of her great benefactions to the Church.

See Chronicles of the Picts and Scots (Edinburgh, 1867), edited 1876, by W. F. Skene; and W. F. Skene, Celtic Scotland (Edinburgh).

MARGARET (1489–1547), queen of Scotland, eldest daughter of Henry VII., king of England, by his wife Elizabeth, daughter of Edward IV., was born at Westminster on the 20th of November 1489. Before she was six years old negotiations were opened, which dragged on for several years, for marrying the princess to James IV. of Scotland, whose support of the pretender Perkin Warbeck it was hoped to avert by such an alliance. Eventually the marriage was celebrated in Edinburgh on the 8th of August 1503. The avaricious Henry VII. gave his daughter a scanty dowry and quarrels on this head embittered the relations between the two kingdoms, which the marriage, although accompanied by a treaty of perpetual peace, did nothing to heal. The whole of Margaret's life after her marriage with James IV. was an unending series of intrigues, first with one political faction then with another; at one time in favour of her native country, at another in hostility to it, her conduct being mainly influenced at all times by considerations affecting her pocket.

Margaret was crowned at Edinburgh in March 1504. Until 1507 she had no children; between that date and 1510 two sons and a daughter were born, all of whom died in infancy; in 1512 she gave birth to a son who succeeded his father as James V.; in 1514 she bore a posthumous son, Alexander, created duke of Ross, who died in the following year. A dispute with her brother Henry VIII. over a legacy claimed by Margaret was a contributory cause of the war which ended at Flodden, where James IV. was killed on the 9th of September 1513, having by his will appointed Margaret sole guardian of his infant son, now King James V. Scotland was divided mainly into two parties, one in favour of alliance with England, and the other with France. The leader of the latter was John Stewart, duke of Albany, next heir to the crown of Scotland after Margaret's sons; Margaret herself for the most part inclined to the English faction; and when Albany returned to Scotland from France on the invitation of the Scottish parliament in the spring of 1514, the conflict grew almost to civil war. Various projects for Margaret's remarriage had already been started, Louis XII. of France and the emperor Maximilian being proposed as suitable husbands for the young widow, when the queen privately married Archibald Douglas, earl of Angus, on the 6th of August 1514. The consequences of this marriage were to alienate many of the most powerful of the nobility, especially the earls of Arran and Home, and to make Margaret entirely dependent on the house of Douglas; while it furnished the council with a pretext for removing her from the regency and guardianship of the king in favour of Albany in July 1515. Albany had to blockade Margaret in Stirling Castle before she would surrender her sons. After being obliged to capitulate, Margaret returned to Edinburgh, and being no longer responsible for the custody of the king she fled to England in September, where a month later she bore to Angus a daughter, Margaret, who afterwards became countess of Lennox, mother of Lord Darnley and grandmother of James VI. of England.

In the summer of 1516 Margaret went to her brother's court in London, while Angus, much to his wife's displeasure, returned to Scotland, where he made his peace with Albany and was restored to his estates. The rivalry between the French and English factions in Scotland was complicated by private feuds of the Hamilions and Douglases, the respective heads of which houses, Arran and Angus, were contending for the supreme power in the absence of Albany in France, where at the instance of Henry VIII. he was detained by Francis I. Margaret, quarrelling with her husband over money matters, sided at first with Arran and began to agitate for a divorce from Angus. In this she was probably aided by Albany, who had been in Rome, and who found an unexpected ally in the queen-mother, Margaret being temporarily alienated from the English party by her brother Henry's opposition to her divorce. When Albany returned to Scotland in 1521 his association with Margaret gave rise to the accusation that it was with the intention of marrying herself that he favoured her divorce from Angus, and it was even suggested that she was Albany's mistress. As Albany was strongly supported by the Scottish parliament, Angus found it necessary to withdraw to France till 1522. During these years there was constant warfare between the English and the Scots on the border, and in May 1524 Albany was obliged to retire to France. Henry VIII. continually aimed at securing the person of his nephew, the king of Scots; while Margaret veered from faction to faction without any settled policy, unless it was the "erection" of her son, i.e. her proclamation as a reigning sovereign, which she successfully brought about in July 1524. The queen-mother had at this time fallen in love with Henry Stewart, second son of Lord Avondale, whom she married immediately after obtaining her divorce from Angus in 1527. Margaret and her new husband, who was created Lord Methven, now became for a time the ruling influence in the counsels of James V. But when her desire to arrange a meeting between James and Henry VIII. in 1534 was frustrated by the opposition of the clergy and the council, Margaret in her disappointment revealed certain secrets to Henry which led to her being accused by her son of betraying him for money and of acting as an English spy. In 1537 she was anxious to obtain a divorce from Methven, and it was proposed that she should be created queen of Scotland; but this was defeated by the intervention of James. Two years later she was reconciled to her husband, by whom she had no children; and, continuing to the end to intrigue both in Scotland and England, she died at Methven Castle on the 18th of October 1541.

(R. J. M.)

MARGARET (1253–1290), titular queen of Scotland, and generally known as the "maid of Norway," was the daughter of Eric II. king of Norway, and Margaret, daughter of Alexander III. king of Scotland. Her mother died soon after Margaret's birth, and in 1284 the estates of Scotland decided that if Alexander died childless the crown should pass to his granddaughter. In March 1286 Alexander was killed and Margaret became queen. The English king Edward I. was closely watching affairs in Scotland, and in 1289 a marriage was arranged between the infant queen and Edward's son, afterwards Edward II. Margaret sailed from Norway and reached the Orkneys, where she died about the end of September 1290. The news of this occurrence...
was first made known in a letter dated the 7th of October 1290. Some mystery, however, surrounded her death, and about 1350 a woman from Leipzig declared she was Queen Margaret. The impostor, if she were such, was burned at a witch at Bergen.

See A. Lang, History of Scotland, vol. i. (Edinburgh, 1904).

**MARGARET (1353–1412),** queen of Denmark, Norway, and Sweden, the daughter of Valdemar IV, of Denmark, was born in 1353 and married ten years later to King Haakon VI. of Norway. Her first act, after her father's death (1375), was to procure the election of her infant son Olaf as king of Denmark. Olaf died in 1387, having in 1380 also succeeded his father; and in the following year Margaret, who had ruled both kingdoms in his name, was chosen regent of Norway and Denmark. She had already given proofs of her superior statesmanship by recovering possession of Schleswig from the Holstein counts, who had held it absolutely for a generation, and who now received it back instead as a fief (by the compact of Nyborg 1386), but under such stringent conditions that the Danish crown got all the advantage of the arrangement. By this compact, moreover, the chronically rebellious Jutish nobility lost the support they had hitherto always found in Schleswig-Holstein, and Margaret, free from all fear of domestic sedition, could now give her undivided attention to Sweden, where the numerous nobles were already in arms against their unpopular king, Albert of Mecklenburg. At a conference held at Dalaborg Castle, in March 1388, the Swedes were compelled to accept all Margaret's conditions, elected her "Sovereign Lady and Ruler," and engaged to accept from her any king she chose to appoint. On the 24th of February 1389, Albert, who had returned from Mecklenburg with an army of mercenaries, was routed and taken prisoner at Aase near Falköping, and Margaret was now the omnipotent mistress of three kingdoms. Stockholm then almost entirely a trader's town was held out; fear of Margaret induced both the Mecklenburg princes and the Wendish towns to hasten to its assistance; and the Baltic and the North Sea speedily swarmed with the privateers of the Vittualien brödre or Vitaliøner, so called because their professed object was to revitalize Stockholm. Finally the Hansa intervened, and by the compact of Lindholm (1395) Albert was released by Margaret on promising to pay 60,000 marks within three years, the Hansa in the meantime to hold Stockholm in pawn. Albert failing to pay his ransom within the stipulated time, the Hansa surrendered Stockholm to Margaret in September 1398, in exchange for very considerable commercial privileges.

It had been understood that Margaret should, at the first convenient opportunity, provide the three kingdoms with a king who was to be her nearest kinsman, and in 1389 she proclaimed her infant cousin, Eric of Pomerania, king of Norway. In 1396 homage was rendered to him in Denmark and Sweden likewise, Margaret reserving to herself the office of regent during his minority. To weld the united kingdoms still more closely together, Margaret summoned a congress of the three councils of state to Kalmar in June 1397; and on Trinity Sunday, the 17th of June, Eric was solemnly crowned king of Denmark, Norway and Sweden. The proposed act of union divided the three Rigsraads, but the actual deed embodying the terms of the union never got beyond the stage of an unratified draft. Margaret revolted at the clauses which insisted that each country should retain exclusive possession of its own laws and customs, and be administered by its own dignitaries, as tending in her opinion to prevent the complete amalgamation of Scandinavia. But smarting national pride and a distrust of potential robbery of too great a fortune, she avoided every appearance of an open rupture. A few years after the union of Kalmar, Eric, now in his eighteenth year, was declared of age and homage was rendered to him in all his three kingdoms, but during her lifetime Margaret was the real ruler of Scandinavia. So long as the union was insecure, Margaret had tolerated the presence near the throne of “good men” from all three realms (the Rigsråd, or council of state, as these councillors now began to be called); but their influence was always insignificant. In every direction the royal authority remained supreme. The offices of high constable and earl marshal were left vacant; the Daneker or national assembly fell into disuse; a great queen, an ideal despot, ruled through her court officials acting as superior clerks. But law and order were well maintained; the licence of the nobility was sternly repressed; the kingdoms of Sweden and Norway were treated as integral parts of the Danish state, and national aspirations were frowned upon or checked, though Norway, as being more loyal, was treated more indulgently than Sweden. Margaret also recovered for the Crown all the landed property which had been alienated during the troublous days of Valdemar IV. This so-called "reduction," or land-recovery, was carried out with the utmost rigour, and hundreds of estates fell into the Crown. Margaret also reformed the Danish currency, substituting good silver coins for the old and worthless copper tokens, to the great advantage both of herself and the state. She had always large sums of money to dispose of, and a considerable proportion of this treasure was dispensed in works of charity. Margaret's foreign policy was sagaciously circumspect, in sharp contrast with the venturesomeness of her father's. The most tempting offer of alliance, the most favourable conjunctures, could never move her from her system of neutrality. On the other hand, she was ready to help and she speedily forgot her father's. Gotland she purchased from its actual occupant, Albert of Mecklenburg and the Livonian Order, and the greater part of Schleswig was regained in the same way.

Margaret died suddenly on board her ship in Flensborg harbour on the 28th of October 1412. We know very little of her private character. Contemporary records are both scanty and hostile to a sovereign who squeezed the utmost out of the people. Craft and williness are the qualities most generally attributed to her, coupled with the cynical praise that "in temporal matters she was very lucky."

See Danmarks riges historie, den senere Middelalder, pp. 358–412 (Copenhagen, 1869–77); Danmarks historier: Her dømmende Margrethe (Copenhagen, 1882–1901); Hill, Margaret of Denmark (London, 1868).

**MARGARET OF ANJOU (1430–1482),** queen of England, daughter of René of Anjou, titular king of Naples and Jerusalem, was born on the 23rd of March 1430. When just fourteen she was betrothed to Henry VI. king of England, and in the following year was brought to England and married at Titchfield Abbey, near Southampton, on the 23rd of April 1445. On the 8th of May she was crowned at Westminster, and two days later crowned at Westminster. Margaret's marriage was negotiated by William de la Pole, duke of Suffolk, and when she came to England, Suffolk and his wife were her only friends. Naturally she fell under Suffolk's influence, and supported his policy. This, added to her French origin and sympathies, made her from the start unpopular. Though clever and good-looking, she was self-willed and imperious, and without the conciliatory manners which her difficult position required. In almost everything she was the opposite of her gentle husband, but entered into his educational schemes, and gave her patronage to the foundation of Queen's College, Cambridge. Margaret's really active share in politics began after Suffolk's fall in 1450. She not only supported Edmond Beaufort, duke of Somerset, in his opposition to Richard of York, but concerned herself also in the details of government, seeking not over-wisely pecuniary benefits for herself and her friends. But as a childless queen her influence was limited; and when at last her only son, Edward, was born on the 13th of October 1453, her husband was stricken with a disease from this time she was the ardent champion of her husband's and son's rights; to her energy the cause of Lancaster owed its endurance, but her implacable spirit contributed to its failure. When York's protectorate was ended by Henry's recovery in January 1455, Margaret, not content with the restoration of Somerset and her other friends to liberty and office, pushed her politics to extremes. The result was the defeat of the Lancastrians at St Albans, and for a year Margaret had to
acquiesce in York's power. Yet at this time one wrote of her: "The queen is a great and strong labourous woman, for she spareth no pain to see her things to an intent and conclusion to her power" (Paston Letters, i. 378). All the while she was organizing her party; and ultimately, in October 1456 at Coventry, procured some change in the government. Though formally reconciled to York in March 1458, she continued to intrigue with her partisans in England, and even with friends in France, like Pierre de Brezé, the seneschal of Normandy. After the Yorkist failure at Ludlow in 1455, it was Margaret's vindictiveness that embittered the struggle by a wholesale proscription of her opponents in the parliament at Coventry. She was not present with her husband at Northampton on the 10th of July 1460. After romantic adventures, in which she owed her safety to the loyalty of a boy of fourteen, her only companion, she escaped with her little son to Harlec. Thence after a while she made her way to Scotland. From Mary of Gelderland, the queen regent, she purchased the promise of help at the price of surrendering Berwick. Margaret was still in Scotland at the date of Wakefield, so was not, as alleged by hostile writers, responsible for the barbarous treatment of York's body. But she at once joined her friends, and was with the northern army which defeated Warwick at St Albans on the 17th of February 1461; for the executions which followed she must bear the blame. After Towton Margaret with her husband and son once more took refuge in Scotland.

A year later she went to France, and with help from her father and Louis XI. equipped an expedition under Pierre de Brezé. She landed in Northumberland in October, and achieved some slight success; but when on the way to seek further help from Scotland the fleet was overwhelmed in a storm, and Margaret herself barely escaped in an open boat to Berwick. In the spring she was again trying to raid Northumberland, meeting with many hardships and adventures. Once she owed her escape from capture to the generosity of a Yorkist squire, who carried her oil on his own horse; finally she and her son were brought to Bamburg through the compassionate help of a robber, whom they had encountered in the forest. Thence in August 1463 she crossed to Sluys in Flanders. She was almost destitute, but was courteously treated by Charles the Bold, then count of Charolais, and so made her way to her father in France. For seven years she lived at Saint-Michel-en-Barrois, educating her son with the help of Sir John Fortescue, who wrote at this time: "We be all in great poverty, but yet the queen susteines us in meat and drink. Her highness may do more than she doth" (Works, ii. 72, ed. Clermont). Margaret never lost her hopes of her son's restoration. But when at last the quarrel between Warwick and Edward IV. brought her the opportunity, it was with difficulty that she could consent to be reconciled to so old and bitter an enemy.

After Warwick's success and Henry's restoration Margaret still remained in France. When at last she was ready to sail she was delayed by contrary winds. So it was only on the very day of Warwick's defeat at Barnet (14th of April) that Margaret and Edward landed at Weymouth. Three weeks later the Lancastrians were defeated at Tewkesbury, and Edward was killed. Margaret was not at the battle; she was captured a few days after, and brought to London on the 21st of May. For five years she remained a prisoner, but was treated honourably and for part at least of the time was in charge of her old friend the duchess of Suffolk. Finally Louis XI. ransomed her under the Treaty of Pescquiny, and she returned to France on the 29th of January 1476. Margaret lived for six years at different places in Bar and Anjou, in poverty and dependent for a pension on Louis, who made her surrender in return her claims to her father's inheritance. She died on the 25th of April 1482 and was buried at Angers Cathedral. René, whom she probably never saw after 1470, had died in the previous year. During her last years Chastellain wrote for her consolation his Temple de Bocace dealing with the misfortunes of contemporary princes.

As the courageous champion of the rights of her son and her husband, Margaret must command a certain sympathy. But she was politically unwise, and injured their cause by her readiness to purchase foreign help at the price of English interests. Comines wrote well of her that she would have done more prudently if she had endeavoured to adjust the disputes of the rival factions instead of saying "I am of this party, and will maintain it" (Memoires vi. ch. 19). Her fierce partisanship embittered her enemies, and the Yorkists did not hesitate to allege that her son was a bastard. This, like the scandal concerning Margaret and Suffolk, is proved false; but Margaret, however, continued and found expression in the Mirror for Magistrates and in Drayton's Heroic Epistles, as well as in Shakespeare's Henry VI.

BIBLIOGRAPHY.—For contemporary English authorities see under Henry VI. French authorities and especially the Chroniques of George de Chastellain, and the Memoires of Philippe de Comines contain much that is of value. The Letters of Margaret of Anjou (Cameron Soc., 1863) have small historical importance. There have been numerous biographies, the chief is Mrs Hookham's Life of Margaret of Anjou (1872). But the best modern accounts are to be found in G. du Fresne de Beaucourt's Histoire de Charles VII., Dr Gaedtner's Introduction to the Paston Letters, Sir James James's Lancashire and York (1892), and The Political History of England (1897), by Professor C. Oman. Last, Margaret von Anjou, vor und bei Shakespeare (Palaestra, lvi., Berlin, 1906) is a useful digest of authorities.

Margaret of Austria (1480-1530), duchess of Savoy and regent of the Netherlands from 1507 to 1530, daughter of the archduke Maximilian of Austria, afterwards the emperor, was born at Bruges on the 10th of January 1480. At two years of age she was betrothed to the dauphin Charles, son of Louis XI. of France, and was brought up at the French court. In 1489, however, Charles, now king as Charles VIII., to prevent Maximilian taking as his second wife the duchess Anne of Brittany, threw over Margaret and married the Breton heiress herself. Her ambitious father now sought for Margaret another throne, and in April 1497 she was married at Burgos to the infant John, heir to the throne of Castile and Aragon. She was left a widow, however, a few months later. In 1501 Margaret became the wife of Phillibert II., duke of Savoy, who only survived until 1504. The sudden death of her brother the archduke, Philip the Handsome (Sept 25, 1506), opened out to her a new career. In 1507 she was appointed by her father regent of the Netherlands and guardian of her nephew Charles, afterwards the emperor. Charles V. Charles came of age in 1515, but he entrusted Margaret with the regency, as the vast extent of his dominions permitted him but seldom to visit the Netherlands, and she continued to hold the post until her death in 1530. She was a wise and prudent ruler, of masculine temper and intrepidity, and very capable in affairs.

Le Glay, Maximilien I. et Marguerite d'Autriche (with correspondence, Paris, 1836); De Quinsouas, Mémoires pour servir à l'histoire de Marguerite d'Autriche (Paris, 1855), and E. E. Tremayne, The First Governors of the Netherlands: Margaret of Austria (1908).

Margaret of Austria (1522-1580), duchess of Parma and regent of the Netherlands from 1559 to 1567, was a natural daughter of Charles V. Her mother, Margaret van Ghent, was a Fleming. She was brought up by her aunts Margaret of Austria and Maria of Hungary, who were successively regents of the Netherlands. Margaret was born in Brussels in 1522. In 1533 she was married to Alexander de Medici, duke of Florence, who was assassinated in 1537, after which she became the wife of Ottavio Farnese, duke of Parma, in 1542. The union proved an unhappy one. Like her aunts, who had trained her, she was a woman of masculine abilities, and Philip II., when he left the Netherlands in 1559 for Spain, acted wisely in appointing her regent. In ordinary times she would have proved as successful a ruler as her two predecessors in that post, but her task was very different from theirs. She had to face the growing storm of anti-French and anti-Catholic sentiment in Spain, and Philip left her but nominal authority. He was determined to pursue his own arbitrary course, and the
issue was the revolt of the Netherlands. In 1567 Margaret resigned her post into the hands of the duke of Alva and retired to Italy. She had the satisfaction of seeing her son Alexander Farnese appointed to the office she had held down, and to watch his successful career as governor-general of the Netherlands. She died at Rome on 23 January 1586.

Rach-fahl, Margaretha van Parma, Staatshijerin der Nederlanden, 1550-1567 (M. Niemeyer and Co., 1894); ibid., Margareta av Parma’s bibliography in Cambridge Modern History, iii, 795-809 (1904).

MARGARET OF PROVENCE—MARGATE

MARGARET OF PROVENCE (1221-1295), queen of France, was the daughter of Raymond Berenger V, count of Provence. She was married to Saint Louis at Sens on the 27th of May 1234, and was crowned the next day. Blanche of Castile, the queen-mother, arranged the marriage to win over to the cause of France the powerful count of Provence, but treated her daughter-in-law most unkindly, and her jealousy of the energetic young queen was naturally shared by Louis, whose coldness towards and suspicion of his wife are well known. Margaret did not lack courage; she followed the king on his campaigns, and herself heroically at Damietta. But her ambition and strong personal prejudices often led her to actions injurious to the realm. This is most noticeable in her hostility to her brother-in-law Charles of Anjou, who had married her sister Beatrice, and her devotion to Henry III. of England, who had married her other sister Eleanor. Aspiring during the reign of her son to the same rôle which she had seen Blanche of Castile play, she induced, in 1263, the young Philip, heir to the throne, to promise to obey her in everything up to the age of thirty. But and Saint Louis was obliged to ask for a bull from Urban IV., which would release the prince from his oath. After Saint Louis’ death, Margaret continued obstinately to claim her rights on the province of Provence against Charles of Anjou. She sought to employ force of arms, calling upon her son, her nephew Edward II. of England, and the German king Rudolph of Hamburg. She did not give up her claim until after the death of Charles of Anjou (1285), when Philip the Bold succeeded in getting her to accept an income from the county of Anjou in exchange for her rights in Provence. She died on the 31st of December 1295.

See E. Bouteir, Marguerite de Provence, in Revue des questions historiques, 1877-1879.

MARGARET MAULTASC (1318-1369), countess of Tirol, who received the name of Maultasch (pocket-mouth) on account of the shape of her mouth, was the daughter and heiress of Henry, duke of Carinthia and count of Tirol. When Henry died in 1335 Carinthia passed to Albert II., duke of Austria; but Tirol was inherited by Margaret and her young husband, John Henry, son of John, king of Bohemia, whom she had married in 1330. This union was not a happy one, and the Tirolese disliked the government of Charles, afterwards the emperor Charles IV., who ruled the county for his brother. The result was that John Henry was driven from Tirol, and Margaret’s cause was espoused by the emperor Louis IV., who was anxious to add the county to his possessions. Declaring her marriage dissolved on the ground that it had not been consummated, Louis married Margaret in 1342 to his own son Louis, margrave of Brandenburg. But as this action on the emperor’s part entrenched on the privileges of the Church, Pope Clement VI. placed father and son under the ban, from which they were not released until 1350. In 1356 Margaret’s husband died, followed two years later by her only son, Meinhard, when she handed over Tirol to Rudolph IV., duke of Austria, and retired to Vienna, where she died on the 3rd of October 1369. She lived long in the memory of the people of Carinthia, who regarded her as an amazon, and called her the Wickend Grrel.

See A. Huber, Geschichte der Vereinigung Tirols mit Oesterreich (Innsbruck, 1864).

MARGARINE, the name, first given by Chevreul, to an artificial substitute for butter, made of beef and other animal fats, and sometimes mixed with real butter. The name of “buttermine” has also been used. Artificial butter, or “margarine-mouries,” was for some years manufactured in Paris according to a method made public by the eminent chemist Mège-Mouriès. Having supposed that the formation of butter contained in milk was due to the absorption of fat contained in the animal tissues, he was led to experiment on the splitting up of animal fat. The process he ultimately adopted consisted in heating finely minced beef meat with water, carbonate of potash, and fresh sheep’s stomach cut up into small fragments. The mixture he raised to a temperature of 45° C. (113° F.). The influence of the pepsine of the sheep’s stomach with the heat separated the fat from the cellular tissue; he removed the fatty matter, and submitted it when cool to powerful hydraulic pressure, separating it into stearin and oleomargarine, which last alone he used for butter-making. Of this fat about the proportions of 10 lb with 4 pints of milk, and 3 pints of water were placed in a churn, to which a small quantity of anatto was added for colouring, and the whole churned together. The compound so obtained when well washed was in general appearance, taste and consistency like ordinary butter, and when well freed from water it was found to keep a longer time. Margarine is a perfectly wholesome butter-substitute, and is now largely used, but the ease with which it can be passed as real has led to much discussion and legislative action. (See ADULTERATION.)

MARGARITA, an island in the Caribbean Sea belonging to Venezuela, about 12 m. N. of the peninsula of Araya, and constituting, under the constitution of 1904,—with Tortuga, Cubagua and Coche,—a political division called the Eastern Federal District. The island is about 40 m. long from east to west, has an area of 400 sq. m., and consists of two mountainous extremities, nearly separated by the Laguna Grande on the south, but connected by a low, narrow isthmus. The highest point is the peak of Macano, 4,846 ft., in the western part, the highest point in the eastern part being the peak of Copei, 4,710 ft. The higher valleys of the interior are highly fertile and are well adapted to grazing and stock-raising. The principal industries are fishing and the making of salt. The pearl fisheries, which were so productive in the 16th and 17th centuries, are no longer important. A domestic industry of the women is that of making coarse straw hats, which are sold on the mainland. The products of Margarita, however, are insufficient to support its population, and large numbers periodically emigrate to the mainland, preventing the increase in population which its healthful climate favours. The population was estimated in 1905 at 40,000, composed in great part of half-caste Guayquerí Indians. The capital is Asunción (pop. about 3000), on the east side of the island, and its principal port is Pompata on the south coast. The two small ports of Puebla de la Mar (Porlamar) and Puebla del Norte are merely open roadsteads.

The Island of Margarita (from Span. Margarita, pearl) was discovered by Columbus in 1498, and was bestowed in 1524 upon Marceclo Villalobos by Charles V. In 1561 the freebooter Lope de Aguirre ravaged the island, and in 1662 the town of Pompata was destroyed by the Dutch. For a long time Margarita was attached to Cumana, but in the eighteenth century it was made administratively independent. Its traders and sailors rendered invaluable assistance to the revolutionists in the war of independence, and the Spanish general, Morillo, was driven from its shores in 1817; in recognition of this it was made a separate state and was renamed Nueva Esparta (New Sparta). In 1904-1905 it was formed with Asunción as its capital. The first Spanish settlement in South America was Nueva Cadiz, founded in 1515 on the barren island of Cubagua; but the place was abandoned when pearl-fishing and slave-trading ceased to be profitable.

MARGATE, a municipal borough and seaside resort in the Isle of Thanet parliamentary division of Kent, England, 74 m. E. by S. of London by the South Eastern & Chatham railway. Pop. (1891), 18,662; (1901), 23,118. It lies on the north coast
MARGGRAF—MARGUERITE DE VALOIS

of Thanet, and is practically contiguous with Westgate on the west and with Broadstairs on the south-east, owing to the modern extension of these popular watering-places. An electric tramway connects Margate with Broadstairs and Ramsgate, and during the season it is served by numerous pleasure steamers from London. An esplanade faces the sea along nearly the entire front of the town, and is lined with hotels, shops and dwelling-houses. A jetty exceeding a quarter of a mile in length permits the approach of vessels at all tides. It was built in 1852 and subsequently enlarged, but a pier was constructed by John Rennie in 1815, and is now chiefly used by fishermen and colliers. The church of St John the Baptist, founded in 1050, contains some portions of Norman architecture, the remainder being Decorated and Perpendicular. It is rich in ancient brasses and monuments, including a brass to Sir John Daundykton (1443), whose family occupied a manor in the neighbourhood as early as the 13th century. The manor house of Daundykton, or Dent de Lion, with its gateway of the early part of the 15th century, remains between Margate and Westgate. Charitable institutions include a deaf and dumb asylum (1875-1880), the Metropolitan infirmary for children (1841), and the royal sea-bathing infirmary, established in 1791 and enlarged through the munificence of Sir Erasmus Wilson in 1882. Dane Park (35 acres) was opened in 1868.

Margate (Meregate, Mergate), formerly a small fishing village, was an ancient and senior non-corporate member of Dover. In 1347 it contributed 15 ships of armed tonnage at the siege of Calais. Throughout the 15th century references are made to Margate in crown regulations regarding fisheries and shipping. A pier existed before 1500, but by the reign of Henry VIII. it was in a decayed condition. The amount of corn shipped was evidently small, the drouts being insufficient to keep the pier in repair. Under Elizabeth Margate was still an obscure fishing village employing about 20 small vessels ("boys") in the coasting and river trades, chiefly in the conveyance of grain, on which in 1791 it chiefly subsisted. The drouts increased, but were not properly collected until 1754. In 1777 the pier was rebuilt. It was about this time that Margate first began to be known as a bathing-place owing to its fine stretch of firm sand. In 1835 Margate was still a liberty of Dover and no right of citizenship could be acquired. In 1857 it was incorporated. In 1777 a weekly market was granted on Wednesday and Saturday. It is now held daily, but principally on those two days.

MARGGRAF, ANDREAS SIGISMUND (1709-1782), German chemist, was born at Berlin on the 3rd of March 1709. After studying chemistry at Berlin and Strassburg, medicine at Halle, he went to Paris where he became seneschal to his native city in 1735 as assistant to his father, Henning Christian Marggraf, chief apothecary at the court. Three years later he was elected to the Berlin Academy of Sciences, which in 1754 put him in charge of its chemical laboratory and in 1760 appointed him director of its physics class. He died in Berlin on the 7th of August 1782. His name is especially associated with the discovery of sugar in beetroot. In 1747 he published an account of experiments undertaken with the view of determining true sugar from indigenous plants, and found that for this purpose the first place is taken by beetroot and carrot, that in those plants sugar like that of cane exists ready formed, and that it may be extracted by boiling the dried roots in alcohol, from which it is deposited on cooling. This investigation is also memorable because he detected the minute sugar-crystals in the roots by the help of the microscope, which was thus introduced as an adjunct to chemical inquiry. In another research dealing with the nature of alum he showed that one of the constituents of that substance, alumina, is contained in common clay, and further that the salt cannot be prepared by the action of sulphuric acid on alumina alone, the addition of an alkali being necessary. He explained and simplified the process of obtaining phosphorus from urine, and made some admirable observations on phosphoric acid; but though he noted the increase in weight that attends the conversion of phosphorus into phosphoric acid he was content to remain an adherent of the phlogistic doctrine. For his time he was a skilful chemical analyst; he knew how to distinguish potash and soda by the different colorations they produce in flame, and how to test for iron with prussiate of potash: he was aware that sulphate of potash, gypsum and heavy spar, in spite of their different appearances, all contain sulphuric acid; and he recognized that there are different varieties of urinary calculi. In metallurgy he devised improved methods for the manufacture of zinc and the purification of silver, tin and other metals.

His papers, mostly written in French, were presented to the Berlin Academy, and with the exception of a few of the latest were collected in two volumes of Chemische Schriften in 1761-1767.

MARGHELAN, or MARGHILAN, a town of Asiatic Russia, situated in 46° 28' N. and 71° 45' E., the administrative centre of the province of Ferghana. Pop. (1860), 42,855, mostly Sarts, with Tajiks and Jews. It is a very old town, with high earthen walls and twelve gates, commanded by a fort. It lies in a beautiful, extraordinary fertile and well irrigated district. The heat in summer is excessive. The principal industry is the manufacture of silk; camels' hair and woollen fabrics are also made. The new Russian town, founded in 1857, is 10 m. distant to the south-east, and has a population (1897) of 8,877.

MARGRAVE (Ger. Markgraf), a German title meaning literally "duke of the March" (Lat. marchio, corn. marchae, marchius). The margraves had their origin in the counties established by Charlemagne and his successors to guard the frontier districts of the empire, and for centuries the title was always associated with this function. The margraves had within their own jurisdiction the authority of dukes, but at the outset they were subordinate to the dukes in the feudal army of the empire. In the 12th century, however, the margraves of Brandenburg and Austria (the north and east marks) asserted their position as tenants-in-chief of the empire; with the break-up of the great duchies the others did the same; and the margraves henceforward took rank with the great German princes. The title of margrave very early lost its original significance, and was borne by princes whose territories were in no sense frontier districts, e.g. by Hermann, a son of Hermann, margrave of Verona, who assumed in 1112 the title of margrave of Baden. Thus, too, when the elector Albert Achilles of Brandenburg in 1473 gave Bayreuth and Ansbach as apanages to his sons and their descendants these styled themselves margraves. The title, however, retained in Germany its sovereign significance, and has not, like "marquis" in France and a "duke" in Italy, assumed not a mere title of nobility; it is not, therefore, in its present sense the equivalent of the English title "marquess." The German margravates have now all been absorbed into other sovereignties, and the title margrave is borne only as a subsidiary title in the full style of their sovereigns.

MARGUERITE, the popular name for the plant known botanically as Pyrethrum (or Chrysanthemum) frutescens (natural order Compositae), a shrubby perennial with smooth leaves cut pinnately into narrow segments and flower-heads two to three inches across, yellow, brownish, or brown, in a cluster on slender erect stalks. The white ray-florets surround a yellow disk. It is a native of the Canary Isles, and a favourite for decoration and for greenhouse cultivation, window-boxes and open ground in the summer. The yellow marguerite (étolie d'or) has somewhat larger pale yellow flowers and glaucous leaves. The plant is propagated from cuttings taken in autumn from old plants and placed in sandy loamy soil in cold frames. By pruning the shoots in autumn the plants may be grown into very large specimens in the course of a few years.

MARGUERITE DE VALOIS. The name Marguerite was common in the Valois dynasty, and during the 16th century there were three princesses, all of whom figure in the political as well as in the literary history of the time, and who have
been not unfrequently confounded. The first and last are the most important, but all deserve some account.

1. MARGUERITE D'ANGOULÊME (1492–1549). This, the most celebrated of the Marguerites, bore no less than four surnames. By family she was entitled to the name of Marguerite de Valois; as the daughter of Charles d’Orléans, count d’Angoulême, she is more properly, and by careful writers almost invariably, called Marguerite d’Angoulême. From her first husband she took, during no small part of her life, the appellation Marguerite d’Alençon, and from her second, Henri d’Albret, king of Navarre, that of Marguerite de Navarre. She was born at Angoulême on the 11th of April 1492, and was two years older than her brother, Charles d’Alençon; she was betrothed early to Charles, duke d’Alençon, and married him in 1509. She was not very fortunate in this first marriage, but her brother’s accession to the throne made her, next to their mother Louise of Savoy, the most powerful woman of the kingdom. She became a widow in 1525, and was sought in marriage by many persons of distinction, including, it is said, Charles V. and Henry VIII. In 1527 she married Henri d’Albret, titular king of Navarre, who was considerably younger than herself, and whose character was not faultless, but who seemed the more noble, becoming his wife and valuing his wife. Navarre was not reconquered for the couple as Francis had promised, but ample apanages were assigned to Marguerite, and at Nérac and Pau miniature courts were kept up, which yielded to none in Europe in the intellectual brilliancy of their frequenters. Marguerite was at once one of the chief patronesses of letters that France possessed, and the chief refuge and defender of advocates of the Reformed doctrines. Round her gathered C. Marot, Bonaventure Des Périers, N. Denisot, J. Peletier, V. Brodeau, and many other men of letters, while she protected Rabelais, E. Dolet, &c. For a time her influence with her brother, to whom she was entirely devoted, and whom she visited when he was imprisoned in Spain, was effectual, but latterly her political rather than religious considerations made him discourage Lutheranism, and a fierce persecution was begun against both Protestants and freethinkers, a persecution which drove Des Périers to suicide and brought Dolet to the stake. Marguerite herself, however, was protected by her brother, and her personal inclinations seem to have been rather towards a mystical Pietism than towards dogmatic Protestantism. She died in 1549. Nevertheless she nobly and bravely to the very end endeavored to maintain the reputation of women of letters who have led to the bringing of odious accusations against her character, for which there is not the smallest foundation. Marguerite died at Odet-en-Bigorre on the 21st of September 1549. By her first husband she had no children, by her second a son who died in infancy, and a daughter, Jeanne d’Albret, who became the mother of Henry IV. Although the poets of the time are unwearied in celebrating her charms, she does not, from the portraits which exist, appear to have been regularly beautiful, but as to her sweetness of disposition and strength of mind there is universal consent.

Her literary work consists of the Héptameron, of poems entitled Les Marguerites de la marguerite des princesses, and of Letters. The Héptameron, constructed, as its name indicates, on the lines of the Decameron of Boccaccio, consists of seventy-two short stories told to each other by a company of ladies and gentlemen who were passing the summer in the country. It was not printed till 1558, ten years after the author’s death, and then under the title of Les Amants fortunés. Internal evidence, and strong feelings of its having been a joint work, in which more than one of the men of letters who composed Marguerite’s household took part. It is a delightful book, and strongly characteristic of the age in which it was written. The semi-historical character which characterizes the period appears in it, but in a less coarse form than in the great work of Rabelais; and there is a poetical spirit which, except in rare instances, is absent from Pantomime. The letters are delicate, and very good. The Marguerites consist of a very miscellaneous collection of poems, mysteries, farces, devotional poems of considerable length, spiritual and miscellaneous songs, &c. The Pantomimes (1546, &c. by M. de Scelles (d’Alençon), are the most characteristic, consisting of verse-epistles, comédies (pieces in dramatic form on the death of Francis I, &c.), Les Prisoners, a long allegorical poem of amorous-religious-historical tenor; some miscellaneous verse chiefly in dizains, and a later and remarkable piece, Le Navire, expressing her despair at her brother’s death. Of the other works, never yet completely edited, the best editions are, for the Héptameron, Leroux de Lincé (1853); for the Lettres, Mme d’Urfé (1841–1842); and for the Marguerites, &c., Frank (1873). English translations of the Héptameron was issued in 1887 by A. Machen, with an introduction by Miss A. M. F. Robinson (Mme Darmesteter) and another (anonymous) by G. Saintsbury. The Héptameron is a masterpiece of the Renaissance; Marguerite’s Le Miroir de l’amé pêcheresse was translated by Queen Elizabeth. Books on Marguerite and her court are also many. There may be noted Durand’s Marguerite de Valois et la cour de François Ier (1864); Le sorcier d’Angoulême (1891); and Rothstein’s Konigin Margareta von Navarre (1885); Miss Edith Sichel’s Women and Men of the French Renaissance (1901), and P. Courtault’s Marguerite de Navarre (1904).

II. The second MARGUERITE (1542–1574), daughter of France, was born on the 5th of June, 1523, at St Germain-en-Laye, and, at an age the lateness of which caused lampoons, married Emmanuel Philibert, duke of Savoy, in 1550. Like her aunt and her niece she was a good scholar and strongly interested in men of letters. She is noteworthy as having given the chief impulse at the court of her brother Henry II. to the first efforts of the Pléade (see RONSARD), and as having continued her patronage of literature at Turin. The poet Marc Antonio Flaminio, for instance, congratulates himself in pretty Latin verses on her singing his poems.

Her literary work has been enlarged by A. G. Spinelli.

III. The third MARGUERITE (1555–1615), called more particularly Marguerite de Valois, was great-niece of the first and niece of the second, being daughter of Henry II. by Catherine de’ Medici. She was born on the 14th of May 1553. When very young she became famous for her beauty, her learning, and the looseness of her conduct. She was married, after a liaison with the duke of Guise, to Henry of Navarre, afterwards Henry IV., on the eve of St Bartholomew’s Day. Both husband and wife were extreme examples of the licentious manners of the time, but they not unfrequently lived together for considerable periods, and nearly always on good terms. Later, however, Marguerite was established in the castle of Usson in Auvergne, and after the accession of Henry the marriage was dissolved by the pope. But Henry and Marguerite still continued friends; she still bore the title of queen; she visited Marie de’ Medici on equal terms; and the king frequently consulted her on important affairs, though his somewhat parasimonious spirit was grieved by her extravagance. Marguerite exhibited during the rest of her life, which was not a short one, the strange Valois mixture of licentiousness, pious exercises, and the cultivation of art and letters, and died in Paris on the 27th of August 1615. She was the model on which was admirably written, and rank among the best of the 17th century. She was the idol of Pierre de Bourdeline Brantôme, and is the “Reine Margot” of anecdote and history.

The Mémoires are contained in the collection of Michaud and Poujoulat, and have been published separately by Guesard (the best, 1849). Lalanne, Caboc, &c. An English translation with introduction by Violet Fane appeared in 1892. Her character, and still more her circumstances, made the pen very unambitiously busy with her in her lifetime, the chief of many lampoons being the famous Divorce sauvage, variously attributed to Agrippa d’Aubigné, Palma Cayet, and others. The chief recent book on her is Saint-Poucy’s Histoire de Marguerite de Valois (1887).

(G.S.A.)

MARGUERITE, PAUL (1860– ) and VICTOR (1866– ).

French novelists, both born in Algeria, were the sons of General Jean Auguste Margueritte (1823–1870), who after an honourable career in Algeria was mortally wounded in the great cavalry charge at Sedan, and died in Belgium, on the 6th of September 1870. An account of his life was published by Paul Margueritte as Mon père (1884; enlarged ed., 1897). The names of the two brothers are generally associated, on account of their collaboration. Paul Margueritte, who has given a picture of his home in Algers in Le Jardin du passé (1893), was sent to the military school of La Flèche for the sons of officers, and became in 1880 clerk to the minister of public instruction. He designed two pantomimes, Pierrot assassin de sa femme (Théâtre Libre, 1882), and Colombine parricide (Cercle funambulesque, 1888).
in which the traditional Pierrot, played by Margueritte himself, became a nervous, tragic creature." He resigned his clerkship in 1859 to devote himself entirely to literature, producing in rapid succession a series of novels, among which were *Tous quatre* (1883), *La Confession posthume* (1886), *Maison ouverte* (1887), *Pascal Géofos* (1887), *Jours d'épreuve* (1889), *Amandis* (1890), *La Force des choses* (1891), *Sur le retour* (1892), *La Tourmente* (1893), *Ma grande* (1892), *Ame d'enfant* (1894) and *L'Eau qui dort* (1896). Paul Margueritte had begun as a realistic novelist, but he was one of the five writers who signed a manifesto against Zola's *La Terre*, and he made his reputation by delicate, scholarly studies of the by-ways of sentiment. His brother Victor entered his father's regiment, the 1st chasseurs d'Afrique, in 1888, and served in the army until 1896, when he resigned his commission. He had already been known by some volumes of poetry, and by a translation from Calderon (La Double méprise, played at the Odéon, 1898) when he began to collaborate with his brother. From the time of this collaboration Paul Margueritte's work gained in style and force.

Among the books written in common by the brothers, the most famous is the series known under the collective title, *Une Époque, deux âges*. During the events of 1870-1871, and including the novels *Le Désir* (1893), *Les Tranchons du glaise* (1900), *Les Braves gens* (1901), *La Commune* (1904). They also collaborated in an *Histoire de la guerre de 1870-1871* (1903). These books were founded on a mass of documentary and verbal information, amassed with great care and arranged with admirable art; the authors are historians rather than novelists. The disasters and humiliations of the campaigns are faithfully described, but are traced to defects of organization and leadership; while the courage and patriotism of the army itself is made the basis of an assured confidence in the destinies of France. *La Commune* is a bold indictment of the methods adopted by the victorious party. The novelists also attacked the laws governing marriage and divorce and the abuses entailed by the dowry demanded from the bride, in pamphlets and in the novels, *Femmes nouvelles* (1899), *Les Deux vies* (1902), and *Le Prisme* (1905). Their literary partnership was dissolved in 1907. Paul Margueritte was one of the original members of the Académie de Goncourt.

**MARHEINEKE—MARIANAS**

**MARHEINEKE, PHILIP KONRAD** (1782-1846), German Protestant divine, was born at Hildesheim, Hanover, on the 1st of May 1780. He studied at Göttingen, and in 1805 was appointed professor extraordinarius of philosophy at Erlangen; in 1807 he moved to Heidelberg. In 1811 he became professor ordinarius at Berlin, where from 1820 he was also preacher at Trinity Church and worked with Schleiermacher. When he died, on the 31st of May 1846, he was a member of the supreme consistorial council. At first influenced by Schelling, Marheineke found a new master in Hegel, and came to be regarded as the leader of the Hegelian Right. He sought to defend and explain all the orthodox doctrines of the Church in an orthodox way in the terms of Hegel's philosophy. The dogmatic system that resulted from this procedure was inevitably more Hegelian than Christian; it was in fact an essentially new form of Christianity. Marheineke's developed views on dogmatics are given in the third edition (1847) of his *Die Grundlehren der christlichen Dogmatik als Wissenschaft*. When he published the first edition (1819) he was still under the influence of Schelling; the second edition (1827) marked his change of view. His works on symbols show profound scholarship, keen critical insight, and rare impartiality. The *Christliche Symbolik* (1810-1814) has been pronounced his masterpiece.

**MARIANA, JUAN DE** (1596-1624), Spanish historian, was born at Talavera. He studied at the university of Alcalá, and was admitted at the age of seventeen into the Society of Jesus. In 1561 he went to teach theology in Rome, reckoning among his pupils Robert Bellarmine, afterwards cardinal; then passed into Sicily; and in 1600 he was sent to Paris, where his expositions of the writings of Thomas Aquinas attracted large audiences. In 1574, owing to ill health, he obtained permission to return to Spain; the rest of his life being passed at the Jesuits' house in Toledo in vigorous literary activity. He died at Madrid, on the 17th of February 1624. Among his chief works, *Historia de rebus Hispaniae* (first appeared in twenty books at Toledo in 1592; ten books were subsequently added (1605), bringing the work down to the accession of Charles V. in 1516). In a still later period of events the author completed it to the accession of Philip IV. (1621). It was so well received that Mariana was induced to translate it into Spanish (the first part in 1601: completed, 1609; Eng. trans., by J. Stevens, 1690). Mariana's *Historiae*, though in many parts uncritical, is justly esteemed for its research, accuracy, sagacity and style. Of his other works the most interesting is the *treatise De rege et regis regno* (Toledo, 1598). In its sixth chapter the question whether it is lawful and necessary to overthrow a tyrant is freely discussed and answered in the affirmative, a circumstance which brought much odium upon the Jesuits, especially after the assassination of Hexius of France. The Jesuits, and the volume of *De regalium et politicarum institutionum et institutionis regalium historiarum* (published by Mariana at Cologne, in 1609, containing in particular a tract. "De morte et immortalitate," and another, "De mutatione monetar") was put upon the index excommunicatus, and led to the severest form of censure and excommunication. During his confinement there was found among his papers a critique upon the Jesuits, which was printed after his death. *Locum sequens de usuris et in usurae forma generationis societatis Jesu occurrat* (Bordeaux, 1629), and was ordered by order of Charles III. when he banished the Jesuits from Spain.

**MARIAÑO, MARIANES, or LADRONES (Ger. Marienen), an archipelago in the north-western Pacific Ocean, in about 15° to 21° N. and 145° E. With the exception of the island of Guam (United States) it administratively forms part of the New Guinea protectorate. It consists of two groups—a northern of ten volcanic main islands, of which only four (Agrigan, Anatahan, Almagan and Pagan) are inhabited; and a southern of five coraline limestone islands (Rota, Guam, Aguijan, Tinian and Saipan), all inhabited save Aguijan. In the volcanic group an extreme elevation of about 2700 ft. is reached, and there are craters showing signs of activity. Earthquakes are not uncommon. Coral reefs fringe the coasts of the southern isles, which are of slight elevation. The total area, excluding Guam, is about 245 sq. m. and the population 3000, mostly descendants of the Tagal immigrants from the Philippines. All the islands except Farallon de Medinilla and Urracas or Mangs (in the northern group) are more or less densely wooded, and the vegetation is luxuriant, much resembling that of the Carolines, and also of the Philippines, whence many species of plants have been introduced. Owing to the humidity of the soil cryptogams are numerous, as also most kinds of grasses. Cocoa-nut and areca palms, yams, sweet potatoes, manioc, coffee, cocoa, sugar, cotton, tobacco and mother-of-pearl are the chief products, and copra is the principal export. Agriculture is neglected, in spite of the exceptional advantages offered by the climate and soil. On most of the islands there is a plentiful supply of water. The native population known to the early Spanish colonists as Chamorros has died out as a distinct people, though their descendants have intermarried with the immigrant Tagals and natives of the Carolines. At the Spanish occupation in 1868 the Chamorros were estimated at 49,000 to 60,000, but
MARIANAS—MARIA THERESA

less than a century later only 1,800 remained. They were typical Micronesians, with a considerable civilization. In the island of Tinian are some remarkable remains attributed to them, consisting of two rows of massive square stone columns, about 5 ft. 4 in. broad and 14 ft. high, with heavy round capitals. According to early Spanish accounts cinerary urns were found imbedded in the capitals.

The fauna of the Marianas, though inferior in number and variety, is similar in character to that of the Carolines, and contains numerous to both colonies. Swine and other wild animals are wild, and are hunted when required: the former were known to the earlier inhabitants; the latter with most other domestic animals were introduced by the Spaniards. The climate though damp is healthy, while the heat, being tempered by the trade winds, is milder than that of the Philippines; the variations of temperature are not great.

The discovery of this archipelago is due to Magellan, who, on the 6th of March 1521 observed the two southernmost islands, and sailed between them (O. Peschel, Geschichte des Zeitalters der Entdeckungen, Stuttgart, 1877). The name Islas de los Ladrones (or "islands of the Thieves") was given them by the ship's crew of Magellan on account of the, pilfering propensity of the inhabitants; and the islands are still commonly called the Ladrones. Magellan himself styled them Islas de las Velas Latinas ("Islands of the Lateen Sails"). San Lásparo in the archipelago, Jardines and Frazeros are among the names applied to them; the last, navigated by the famous Sir George, Lord Anson, Voyage round the World, bk. iii., 1748.

The Ladrones were visited by Byron in 1763, Wallis in 1767 and Crozet in 1772. The entire archipelago (except Guam) together with the Caroline and Newel Islands was sold by Spain to Germany for 830,570 in 1899.

See Anson, op. cit.; L. de Freycinet, Voyage autour du monde (Paris, 1823). The islands are described in Nautical Magazine, xxxiv., xxxv. (London, 1865-1866); O. Finsch, Karolinen und Mariänen (Hamburg, 1900); Costenoble, "Die Mariänen", in Globus, lxxii-viii. (1905).

MARIANAS, or MARINAS, a tribe of South American Indians on the river Jutahy, north-western Brazil. They wear small pieces of wood in their ears and lips, but are not tattooed. Marianas are also found on the upper reaches of the Putumayo across to the Yapará.

MARIANUS SCOTUS (1028-1082 or 1083), chronicler (who must be distinguished from his namesake Marianus Scotus, d. 1085, abbot of St Peter's, Regensburg), was an Irishman by birth, and called Modbrigt, or servant of Bridget. He was educated by a certain Tigernach, and having become a monk he crossed over to the continent of Europe in 1036, and his subsequent life was passed in the abbeys of St Martin at Cologne and of St Gall. He died at Mainz, on the 22nd of December 1082 or 1083.

Marianus wrote a Chronicon, which purports to be a universal history from the creation of the world to 1082. The Chronicon was very popular during the middle ages, and in England was extensively used by Florence of Worcester and other writers. It was first printed at Basel in 1559, and has been edited with an introduction by G. Waitz for the Monumenta Germaniae historica, Scriptores (Bd. iv.). See also W. Wattenbach, Deutschlands Geschichtsquellen (Bd. ii., 1894).

MARIA STELLA, the self-styled legitimate daughter of Philip, duke of Orleans. According to her, Louis Philippe was not the son of Philip duke of Orleans, but a supposed child, his father being another Philip, and that child was given to a, certain village of Modigliana in Tuscany. The story is that the duke and duchess of Orleans, travelling under the incognito of Comte and Comtesse de Joinville, were at this village in April 1773, when the duchess gave birth to a daughter; and that the duke, desiring a son in order to prevent the rich Penthievre inheritance from reverting to his wife's relations in the event of her death, bribed the Chiappinis to substitute their newly-born male child for his own.

Maria Stella, the supposed daughter of Chiappini, went on the stage at Florence, where her putative parents had settled, and there at the age of thirteen became the wife of the first Lord Newborough, after whose death she married the Russian Count Ungern-Sternberg. On the death of her putative father in 1821 she received a letter, written by him shortly before his death, in which he confessed that she was not his daughter, adding "Heaven has repaired my fault, since you are in a better position than your real father, though he was of almost similar rank" (i.e. a French nobleman). Maria Stella henceforward devoted her time and fortune to establishing her identity. Her first success was the judgment of the episcopal court at Faenza, which in 1824 declared that the Comte Louis de Joinville exchanged his daughter for the son of Lorenzo Chiappini, and that the Domenoisse de Joinville had been baptized as Maria Stella "with the false statement that she was the daughter of L. Chiappini and his wife." The discovery that Joinville was a countship of the Orleans family, and a real or fancied resemblance of Louis Philippe to Chiappini, convinced her that the duke of Orleans was the person for whose sake she had been cheated of her birthright, a conviction strengthened by the striking resemblance which many people discovered in her to the princesses of the Orleans family. In 1830 she published her proofs under the title Maria Stella ou un échange d'une demoiselle du plus haut rang contre un plus vile comble (reprinted 1839 and 1840). This coincided with the advent of Louis Philippe, who, she claimed, her claim became a weapon for those who wished to throw discredit and ridicule on the "bourgeois monarch." He for his part treated the whole thing with amused contempt, and Baroness Newborough-Sternberg de Joinville, or Marie Étoile d'Oéland, as she called herself, was suffered to live in Paris until on the 23rd of December 1843 she died in poverty and obscurity.

In spite of much discussion and investigation, the case of Maria Stella remains one of the most painful problems of the 19th century. Payne Gallwey's Mystery of Maria Stella, Lady Newborough (London, 1907), is founded on her own accounts and argues in favour of her point of view. More convincing, however, is Maurice Vitrac's Philippe-Egalitt et M. Chiappini (Paris, 1907), which is based on unpublished material in the Archives nationales. M. Vitrac seeks to overthrow Maria Stella's case by an aibi. The duke and duchess of Orleans could not have been at Modigliana in April 1773; his simple reason that they can be proved at that time to have been in Paris. On the 8th of April the duke, according to the official Gazette de France, took part in the Maundy Thursday ceremonies at Versailles; from the 7th to the 14th he was in constant attendance at the lodge of Freemasons of which he had just been elected grand master. Moreover, it was impossible for the first prince of the blood royal to leave France without the royal permission, and his absence would have certainly been remarked. Lastly, the duchess's accouterment, a semi-public function in the case of royal princesses, did not take place till the 6th of October. M. Vitrac identifies the real father of Maria Stella with the Count de Joinville, and Bancroft-Davenport, in 1796 without issue: the case being not one of substitution, but of ordinary "farming out" to avoid a scandal.

MARIA THERESA (1717-1780), archduchess of Austria, queen of Hungary and Bohemia, and wife of the Holy Roman emperor Francis I., was born at Vienna on the 13th of May 1717. She was the eldest daughter of the Emperor Charles VI. (r.o.) and his wife Elizabeth of Brunswick-Wolfenbüttel. On the 12th of February 1736 she was married to her cousin Francis of Lorraine (r.o.), then grand duke of Tuscany, and afterwards emperor. Five sons and eleven daughters were born of this marriage. From the date of her father's death on the 20th of October 1740, till her own death in 1780, Maria Theresa was one of the central figures in the wars and politics of Europe. But unlike some sovereigns, whose reigns have been agitated, but whose personal character has left little trace, Maria Theresa had a strong and in the main a noble individuality. Her great qualities were relieved by human traits which make her more sympathetic. It must be allowed that she was fairly open to the criticism implied in a husbandly jest attributed to Francis I. While they were returning from the opera house at Vienna she said to him that the singer they had just heard was the greatest actress who had ever lived, and he answered "Next to you, Madam." Maria Theresa had undoubtedly an instinctive histrionic sense of the perspective of the theatre, and could adopt the appropriate attitude and gesture, passionate, dignified or pathetic, required to impress those she wished to influence. But there was no affectation in her assemb-
Joseph II., in her arms, and so worked on their feelings that they shouted \textit{Moriamur pro rege nostro Maria Theresia}, is only mythically true. But during the delicate negotiations which were required to secure the support of the Hungarians on the side of the Empire, she undoubtedly did appeal to them with passionate eloquence, and, we may believe, with a very pardonable sense of the advantage she obtained from her youth, her beauty and her sex. Her beauty, inherited from her mother, was of an open and noble German type. The official portrait by Muytens, engraved by Petit, gives a less convincing impression than an excellent chalk drawing of the head by Gabriel Mattel. In the conflict between her sense of what was morally just and her sense of duty to the state she laid herself open to the scoffing taunt of Frederick of Prussia, who said that in the first partition of Poland \textit{elle pleureit et prenait longeurs}. But the king of Prussia's taunt is deprived of its sting by the almost incredible candour of her own words to Kaunitz, that if she was to lose her reputation before God and man for respecting the rights of others it must not be for a small advantage—if, in fact, Austria was to share in the plunder of Poland, she was to be consoled for the distress caused to her feelings by the magnitude of her share of the booty. There was no hypocrisy in the tears of the empress. Her intellectual honesty was as perfect as Frederick's own, and she was as incapable as he was of endeavouring to blind herself to the quality of her duty. No ruler was ever more loyal to his vassals, and no woman to her husband. Maria Theresa considered herself first and foremost, as the heir of the rights of the house of Austria. Therefore, when her inheritance was assailed at the beginning of her reign, she fought for it with every weapon an honest woman could employ, and for years she cherished the hope of recovering the lost province of Silesia, conquered by Frederick. Her practical sense showed her the necessity of submitting to spoliation when she was overpowered. She accepted the peace of Berlin in 1742 in order to have a free hand against her Bavarian enemy, the emperor Charles VI. of Austria. When Frederick renewed the war she accepted the struggle cheerfully, because she hoped to recover her own. Down to the peace of Aix-la-Chapelle in 1748 she went on fighting for Silesia or its equivalent. In the years following the peace she applied herself to finding allies in France and Russia who would help her to recover Silesia. Here, as later in the case of Poland, she subordinated her feelings to her duty to the state. Though she denied that she had ever written directly to Madame de Pompadour, it is certain that she allowed her ministers to make use of the favourite's influence over the French king. When fate decided against her in the Seven Years' War she bowed to the inevitable, and was thenceforward a resolute advocate of peace.

In her internal government she showed herself anxious to promote the prosperity of her people, and to give more unity to an administration made up by the juxtaposition of many states and races with different characters and constitutions. Her instincts, like those of her enemy Frederick and her son Joseph II., were emphatically absolutist. She suspended the meetings of the estates in most parts of her dominions. She was able to do so because the mass of her subjects found her hand much lighter than that of the privileged classes who composed these bodies. Education, trade, religious toleration, the emancipation of the agricultural population from feudal burdens—all had her approval up to a certain point. She would favour them, but on the distinct condition that nothing was to be done to weaken the bonds of authority. She took part in the suppression of the Jesuits, and she resisted the pope in the interest of the state. Her methods were those of her cautious younger son, Leopold II., and those of her eldest son and immediate successor, Joseph II. She did not give her consent even to the suppression of torture in legal procedure without hesitation, lest the authority of the law should be weakened. Her caution had its reward, for whatever she did was permanently gained, whereas her successor in his boundless zeal for reform brought his empire to the verge of a general rebellion.

In her private life Maria Theresa was equally the servant of the state and the sovereign of all about her. She was an affectionate wife to her husband Francis I.; but she was always the queen of Hungary and Bohemia and archduchess of Austria, like her ancestress, Isabella the Catholic, who never forgot, not allowed her husband to forget, that she was "the proprietress queen" of Castle and Leon. She married her daughters in the interest of Austria, and taught them not to forget their people and their father's house. In the case of Marie Antoinette (q.v.), who married the dauphin, afterwards Louis XVI., she gave an extraordinary proof of her readiness to subordinate everything to the reason of state. She instructed her daughter to show a proper respect to her husband's grandfather, Louis XV., by behaving with politeness to his mistresses, in order that the alliance between the two courts might run no risk. The signing of the peace of Teschen, which averted a great war with Prussia, on the 13th of May 1779, was the last great act of her reign, and so Maria Theresa judged it to be in a letter to Prince Kaunitz; she said that she had now finished her life's journey and could sing a \textit{Te Deum}, for she had secured the repose of her people at whatever cost to herself. The rest, she said, would not last long. Her fatal illness developed in the autumn of the following year, and she died on the 28th of November 1780. When she lay painless on her deathbed her son Joseph said to her, "You are not at ease," and her last words were the answer, "I am sufficiently at my ease to die."

See M. M. Rabenlehrer, \textit{Mariazell, Österreichs Lorele}(Vienna, 1891); and O. Eigner, \textit{Geschichte des aufgehobenen Benediktinerstifts Mariazell} (Vienna, 1900).

\textbf{MARIE AMÉLIE THÉRÈSE} (1782–1866), queen of Louis Philippe, king of the French, was the daughter of Ferdinand IV., King of Naples, and the archduchess Maria Carolina, daughter of the emperor Maria Theresa, and belonged to the house of Bourbon. She was born at Caserta, on the 26th of April 1782, and received a careful education which developed the naturally pious and honourable disposition that earned for her in the family circle the nickname of \textit{La Santa}. Driven from Naples in 1798, the Neapolitan royal family fled to Palermo, and the years from 1800 to 1802 were spent by Marie Amélie with her mother at the Austrian court. In 1806 they were again in flight before the armies of Masséna, and it was during the second residence of her father's court at Palermo that she met the exiled Louis Philippe, then duke of Orleans, whom she married in November 1809. Returning to France in 1814, the duke and duchess of Orleans had barely established themselves in the Palais Royal in Paris when the Hundred Days drove them into exile. Marie Amélie took refuge with her four children in England, where she spent two years at Orleans House, Twickenham. Again in France in 1817, her life at Neuilly until 1828 was the happiest period of her existence. Neither then nor at any other time did she take any active share in politics; but she was not without indirect influence on affairs, because her strong royalist and legitimist traditions prevented the court from including her in the suspension with which her husband's liberal views were regarded. Her attention was absorbed by the care and education of her numerous family, even after the revolution of 1830 had made her queen of the French, a position accepted by her with forebodings of disaster justified by her early experience of
revolutions. During her second exile, from 1848 to the end of her life, she lived at Claremont, where her charity and piety endeared her to the many English friends of the Orleans family. Marie Amélie died at Claremont, on the 24th of March 1866.

See A. Trognon, Vie de Marie Amélie (1872); A. L. Baron Imbert de St Amand, La Jeunesse de Marie Amélie (1891), Marie Amélie au Palais Royal (1892), Marie Amélie et la cour de Palerne (1891), Marie Amélie et la cour de Trévoux (1892), Marie Amélie et l’estépie de France, La Baronne de Choiseul (1898), Marie Amélie et la société française en 1847 (1894), and Marie Amélie et la duchesse d’Orléans (1893).

MARIE ANTOINETTE (1755-1793), queen of France, ninth child of Maria Theresa and the emperor Francis I, was born at Vienna, on the 2nd of November 1755. She was brought up under a simple and austere régime and educated with a view to the French marriage arranged by Maria Theresa, the abbé Verdun being appointed as her tutor in 1769. Her marriage with the dauphin, which took place at Versailles on the 16th of May 1770, was intended to crown the policy of Choiseul and confirm the alliance between Austria and France. This fact, combined with her youth and the extreme corruption of the French court, made her position very difficult. Madame du Barry, whose influence over Louis XV. was at that time supreme, formed the centre of a powerful anti-Choiseul cabal, which succeeded in less than a year after the dauphin’s marriage in bringing about the fall of Choiseul and seriously threatening the stability of the Austrian alliance. Thus the young princess was surrounded by enemies both at court and in the dauphin’s household, and came to rely almost entirely upon the Austrian ambassador, the comte de Mercy-Argenteau, whom Maria Theresa had instructed to act as her mentor. At the same time arranging that she herself should be kept informed of all that concerned her daughter, so that she might at once advise her and safeguard the alliance. Hence arose the famous secret correspondence of Mercy-Argenteau, an invaluable record of all the details of Marie Antoinette’s life from her marriage in 1770 till the death of Maria Theresa in 1780.

Marie Antoinette soon won the affection and confidence of the dauphin and endeared herself to the king, but her position was precarious, and both Mercy and Maria Theresa had continually to urge her to conquer her violent dislike for the favourite and try to conciliate him.

The accession of the young king and queen on the death of Louis XV. (May 10, 1774), was hailed with great popular enthusiasm. But her first steps brought Marie Antoinette into open hostility with the anti-Austrian party. She was urgent in obtaining the dismissal of d’Aiguillon, and did all in her power to secure the recall of Choiseul, though without success. Thus from the very first she appeared in the light of a partisan, having against her all the enemies of Choiseul and of the Austrian alliance, and was already given the nickname of “l’autrichienne” by mesdames the king’s aunts. At the same time her undisguised impatience of the cumbrous court etiquette shocked many people, and her taste for pleasure led her to seek the society of the comte d’Artois and his young and dissolute circle. But the greatest weakness in her position lay in her unsatisfactory relations with her husband. The king, though affectionate, was cold and aghastic, and it was not till seven years after her marriage that there was any possibility of her bearing him an heir. This fact naturally decreased her popularity, and as early as September 1774, was made the subject of offensive pamphlets and the like, as in the case of the affaire Beaumarchais. (See Beaumarchais.)

The end of the period of mourning for the late king was the signal for a succession of gaieties, during which the queen displayed a passion for amusement and excitement which led to unfortunate results. Being childless, and with a husband who could not command her respect, her longing for affection led her to form various intimate friendships, above all with the princess de Lamballe and the comtesse Jules de Polignac, who soon obtained such an empire over her affections that no favour was too great or too improper for Madame de Lamballe. And with the benefit of Madame de Lamballe the queen revived the superfluous and expensive office of superintendent of her household, which led to constant disagreements and jealousies among her ladies and offended many important families. In frequenting the salons of her friends the queen not only came in contact with a number of the younger and more dissipated courtiers, whose high play and unseemly amusements she countenanced, but she fell under the influence of various ambitious intriguers, such as the baron de Béversal, the comte de Vaudreuil, the duc de Lauzun and the comte d’Adhemar, whose interested manoeuvres she was induced to further by her affection for her favourites. Thus she was often led to interfere for frivolous reasons in public affairs, and sometimes with serious results, as in the case of the trial of the comte de Guînes (1776), where her interference was responsible for the fall of Turpot. At the same time her extravagance in dress, jewelry and amusements (including the gardens and theatricals at Trianon, of the cost of which such exaggerated reports were spread about) and her presence at horse-races and masked balls in Paris without the king, gave rise to great scandal, which was seized upon by her enemies, among whom were Mesdames, the count of Provence, and the duke of Orleans and the Palais Royal clique.

At this critical period her brother, the emperor Joseph II., decided to visit France. As the result of his visit he left with the queen a memorandum in which he pointed out to her in plain terms the dangers of her conduct. 1 He also took advantage of his visit to advise the king, with such success that at last, in 1778, the queen had the hope of becoming a mother. For a time the emperor’s remonstrances had some effect, and after the birth of her daughter, Marie Thérèse Charlotte (afterwards duchesse d’Angoulême) in December 1778, the queen lived a more quiet life. The death of Maria Theresa (Nov. 29, 1780) deprived her of a wise and devoted friend, and by removing all restraint on the rashness of Joseph II. was bound to increase the disliké of the Austrian alliance and cause embarrassment to Marie Antoinette. Her position was very much strengthened by the birth (Oct. 22, 1781) of a dauphin, Louis Joseph Xavier François, and on the death of Maurepas, which left the king without a chief minister, she might have exerted a considerable influence in public affairs had she taken a consistent interest in them; but her repugnance to serious matters triumphed, and she preferred to occupy herself with the education of her children, to whom she was a wise and devoted mother, 2 and with her friends and amusements at Trianon. Personal motives alone would lead her to interfere in public affairs, especially when it was a question of obtaining places or favours for her favourites and their friends. The influence of the Polignacs was now at its height, and they obtained large sums of money, a dukedom, and many nominations to places. It was Madame de Polignac who obtained the appointment of Calonne as controller-general of the finances, 3 and who succeeded Madame de Guéménée as “governess of the children of France” after the bankruptcy of the prince de Guéménée in 1782. 4 Again, in response to Mercy and Joseph II.’s urgent representations, Marie Antoinette exerted herself on behalf of Austria in the affairs of the opening of the Scheldt (1783-1784) and the exchange of Bavaria (1785), in which, though she failed to provoke active interference on the part of France, she succeeded in obtaining the payment of considerable indemnities to Austria, a fact which led to the popular legend of her having sent millions to Austria, and aroused much indignation against her. Later, on the recommendation of Mercy and Vermond, she supported the nomination of Louis de Brienne in 1787, an appointment which, though widely approved at the time, was laid to the queen’s blame when it ended in failure.

Two more children were born to her; Louis Charles, duke of Normandy, afterwards dauphin, on the 27th of March 1785, and Sophie Hélène Beatrix (d. June 19, 1787), on the 9th of July 1786. In 1785-1786 the affair of the Diamond Necklace (q.v.)

1 See Arnest, Marie Antoinette, Joseph II. and Leopold II., pp. 1-18.

2 v. the Instructions données à la marquisse de Tourzel, governor of the bank of France, dated the 21st of July, 1789, in la Rocheiette and Beaucourt, Lettres de Marie Antoinette, ii. 131.

3 But see Arnest and Flammermont, i. 228, foot-note.

4 This had reflected discredit on the queen, Madame de Guéménée, having been one of her intimate friends.
revealed the depth of the hatred which her own follies and the calumnies of her enemies had aroused against her. The public held her responsible for the bankrupt state of the country; and thought, in 1788, following the popular outcry, she was warned upon the king to recall Necker, it was impossible for him to avert the Revolution. The year 1789 was one of disaster for Marie Antoinette; on the 10th of March her brother Joseph II. died, and on the 4th of June her eldest son. The same year saw the assembly of the States-General, which she had dreaded; the taking of the Bastille, and the events leading to the terrible days of the 5th and 6th of October at Versailles and the removal of the royal family to the Tuileries. Then began the negotiations with Mirabeau, whose high estimate of the queen is well-known (e.g. his famous remark, "The king has only one man on his side, and that is his wife."). But the queen was violently prejudiced against him, believing him among other things to be responsible for the events of the 5th and 6th of October, and he never gained her full confidence. She was naturally incapable of seeing the full import of the Revolution, and merely temporised with Mirabeau. She dreaded the thought of civil war; and even when she had realized the necessity for decisive action the king's apathy and indecision made it impossible for her to persuade him to carry into effect Mirabeau's plan of leaving Paris and appealing to the people. His difficulties were increased by the departure of Mirabeau in September, and the Montmorin whom now took his place in the negotiations had not her confidence to the same extent. Feeling herself helpless and almost isolated in Paris, she now relied chiefly on her friends outside France—Mercy, Count Axel Fersen, and the baron de Breteuil; and it was by their help and that of Bouillé that after the death of Mirabeau, on the 8th of April 1791, the plan was arranged of escaping to Montmédy, which ended in the flight to Varennes (June 21, 1791).

After the escape from Varennes the royal family were closely guarded, but in spite of this they still found channels of communication with the outside world. The king being sunk in apathy, the task of negotiation devolved upon the queen; but in her inexperience and ignorance of affairs, and the uncertainty of information from abroad, it was hard for her to follow any clear policy. Her courageous bearing during the return from Varennes had greatly impressed Barnave, and he now approached her on behalf of the Feuillants and the constitutional party. For about a year she continued to negotiate with them, forwarding to Mercy the emperor Leopold II. letters and memoranda dictated by them, and secretly burning letters from friends not to accept these letters as her own opinions, but to realize that she was dependent on the Constitutionalists. She agreed with their plan of an armed congress, and on this idea both she and Fersen insisted with all their might, Fersen leaving Brussels and going on a mission to the emperor to try and gain support and checkmate the émigrés, whose desertion the queen bitterly resented, and whose rashness threatened to frustrate her plans and endanger the lives of her family.

As to the acceptance of the constitution (Sept. 1791), "issue of absurdities" though the queen thought it, and much as she would have preferred a bolder course, she considered that in the circumstances the king was bound to accept it in order to inspire confidence. Mercy was also in correspondence with the Constitutionalists, and in letter after letter to him and the emperor, the queen, strongly supported by Fersen, insisted that the congress should be formed as soon as possible, her appeals increasing in urgency as she saw that Barnave's party would soon be powerless against the extremists. But owing to the lengthy negotiations of the powers the congress was continually postponed. On the 1st of March 1792 Leopold II. died, and was succeeded by the young Francis II. Marie Antoinette's actions were now directed entirely by Fersen, for she suspected Mercy and the emperor of sacrificing her to the interests of Austria (Fersen, i. 231; Arneil, pp. 254, 276, &c.).

The declaration of war which the king was forced to make (April 20) threw her definitely into opposition to the Revolution, and she betrayed to Mercy and Fersen the plans of the French generals (Arneil, p. 250; Fersen, ii. 239, 289, 209, 325, 337). She was now certain that the fate of the king was threatened, and the events of the 20th of June added to her terrors. She considered their only hope to lie in the intervention of the powers and in the appeal to force, and endorsed the suggestion of a threatening manifesto which should hold the National Assembly and Paris responsible for the safety of the king and royal family. Immediately after Brunswick's manifesto followed the storming of the Tuileries and the removal of the royal family to the Temple (Aug. 10). During all these events and the captivity in the Temple Marie Antoinette showed remarkable courage and dignity. In spite of her falling health and the ill-treatment she was subjected to, the most offensive espionage, attempts were made to rescue her, among others Michonis 'Conspiration de l'oeillett.' On the 14th of October began her trial, her defence being entrusted to Chauveau-Lagarde and Tronson-Ducoudray. Her noble attitude, even in the face of the atrocious accusations of Fouquier-Tinville, commanded the admiration even of her enemies, and her answers during her long examination were clear and skilful. The following were the questions finally put to the jurisdiction.

1. Is it established that manoeuvres and communications have existed with foreign powers and other external enemies of the republic, the said manoeuvres, &c., tending to furnish them with assistance in money, give them an entry into French territory, and facilitate the progress of their armies?

2. Is Marie Antoinette of Austria, the widow Capet, convicted of having co-operated in these manoeuvres and maintained these communications?

3. Is it established that a plot and conspiracy has existed tending to kindle civil war within the republic, by arming the citizens against one another?

4. Is Marie Antoinette, the widow Capet, convicted of having participated in this plot and conspiracy?

The jury decided unanimously in the affirmative, and on the 6th of October 1793 Marie Antoinette was led to the guillotine, leaving behind her a touching letter to Madame Elizabeth, known as her "Testament." As to the justice of these charges, we have seen how the queen was actually guilty of betraying her country, though it was only natural for her to identify the cause of the monarchy with that of France. To civil war she was consistently opposed, and never ceased to dissociate herself from the plans of the émigrés, but here again her very position made her an enemy of the republic. In any case, all her actions had as their aim—firstly, the safeguarding of the monarchy and the king's position, and later, when she saw this to be impossible, that of securing the safety of her husband and her son.

1. H. Belloc, Marie-Antoinette, pp. 311-312, states that clause VIII. of Brunswick's manifesto was 'drafted' by Marie Antoinette, i.e. that the idea of holding Paris responsible for the safety of the royal family was first suggested by her. He bases this statement entirely upon the queen's letters of July 3rd to Fersen, of July 4th to Mercy, the reception of which is admitted by the authors quoted (Arneil, p. 221). But these letters were obviously the answer to Fersen's letter of June 30th to the queen (Fersen ii. 315), in which he tells her the terms of the manifesto. Moreover, the suggestion of holding the Assembly responsible is to be found as early as in the memo. of the Constitutionalists of September the 8th, 1791, and is included in the Instructions of Mallet du Pan (Mems. ed. Sayoux, i. 281; and appendix 445). Fersen (Fersen ii. 239, 237, 18th July and 28th July to the queen, and p. 329, 29th July to (Ansb) states that it was he who drew up the manifesto by means of the marquis de Limon.
For a bibliographical study see: M. Tourneux, Marie Antoinette devant l'histoire. Essai bibliographique (2nd ed., Paris, 1901); id., Bibliogr. de la ville de Paris . . . (vol. iv. 1906), nos. 20980-21338; also Bibliothèque Thiers (Paris, 1892, 1893, 1894), which lists in detail the books by and about Marie Antoinette published during her lifetime and the appearance of Arneth's publications 1865-1869, are based partly on these forgeries. For a detailed examination of the question of the authenticity of the letters see the introduction to Yvonne Villemarque, Lettres authentiques de Marie-Antoinette (Leipzig, 1901); the authenticity of the letters was also questioned by the newspapers of Vienna published by Alfred von Arneth and others: A. von Arneth, Marie Theresia und Marie Antoinette, ihr Briefwechsel 1770-1750 (Paris and Vienna, 1865); id., Marie Antoinette, Joseph II. und Leopold II., ihr Briefwechsel (Leipzig, Paris and Vienna, 1866); and A. Geffroy, Correspondance secrète de Marie-Thérèse et du comte de Mercy-Argenteau (3 vols., Paris, 1874); and J. Flammermont, Louis XV. et le prince de Conti (3 vols., Paris, 1875-1877). See also Correspondance entre le comte de Mirabeau et le comte de la Marche, 1759-1761, recueillie . . . par F. de Bacour (3 vols., Paris, 1878); A. M. de Koenigswald, Le comte de Mirabeau et la cour de France (2 vols., Paris, 1877-1878). Memoires: See most contemporary memoirs, e.g. those of the prince of Ligne, Choiseul, Ségur, Bouillé, Dumouriez, &c. Some, such as those of Madame Campan, Weiper, Chiry, Mme de Torel, are prejudiced in her favor, others, such as those of Besenval, Lauzon, Soulavie, are equally prejudiced against her. M. Tourneux (op. cit.) discusses the authenticity of the memoirs: Mme Campan, Mémoires sur la vie privée de Marie Antoinette (4th ed., 2 vols., Paris, 1823, Eng. trans. 1887), the inaccuracy of which is clearly demonstrated by J. Flammermont in Etudes et préjugés sur les ouvrages de Mme Campan; Mém. de la Rochefoucauld, Les Mémoires de Mme Campan, in the Bulletin of the Faculté des lettres de Poitiers (1865), pp. 56, 109; J. Weber, Mémoires concernant Marie Antoinette (3 vols., London, 1805-1806; Eng. trans., 1805-1806); Mémoires de M. le baron de Besenval (3 vols., Paris, 1805); Mémoires de M. le duc de Lauzun (2nd ed., 2 vols., Paris, 1822); E. Davoux, Mém. secrets de J. M. Augereau, secrétaire des commandements de la reine M. Antoinette (Paris, 1829); Mme Vigée-LeBrun, Mes souvenirs (2 vols., Paris, 1867); Mémoires de Mme la duchesse de Tourzel, ed. by the duc de Cars (2 vols., Paris, 1853); Mémoires de la baronne d'Oberkirk (2 vols., Paris, 1853). Campan was the first to publish the general life and letters of Marie-Antoinette on the basis of Louis XVI, and bibliographies to articles Louis XVI. and French Revolution. A. Sordet, L'Europe et le Rév. fr. (ii. passim) contains a good list of books on Marie Antoinette. B. de la Rochefoucauld, Histoire de Marie Antoinette (Paris, 1859); P. de Nolhac, Marie Antoinette, dauphine (Paris, 1897); id., La Reine Marie Antoinette (4th ed., 1898), which gives good descriptions of Versailles, Trianon, and the Bois de Boulogne; Trésor de la Rochefoucauld, Histoire de Marie Antoinette (2nd ed., 1890), Paris, 1890; A. L. Bicknell, The Story of Marie Antoinette; R. Froiss, Königin Marie Antoinette, Bilder aus ihrem Leben (Leipzig, 1904); G. Denjardin, Le Petit-Trianon (Versailles, 1885). For her trial and death, see E. Campardon, Marie Antoinette à la Conciéterie (1863). H. Bello's Marie Antoinette (London, 1909) is very biased and sometimes misleading. (C. B. F.)

MARIE DE FRANCE (fl. c. 1175-1190), French poet and fabulist. In the introduction (c. 1240) to his Vie Seint Edmond le dauphin le Lyonn d'Engreine (2 vols., BnF, 1898), he says that he composed stories for the fair ladies of England. The nature of his poems was identified by his authors with counts, barons and knights, but especially with ladies. She is also mentioned by the anonymous author of the Couronnement Renart. Her lays were translated into Norwegian 2 by order of Haakon IV.; and Thomas Chresté, who is generally supposed to have lived in the reign of Henry VI., gave a version of Lanzal. 3 Very little is known about her history, and until comparatively recently the very century in which she lived remained a matter of dispute. In spite of her own statement in the epilogue to her fables: "Marie al num, sf sui de füst 4 Cotton MS. Domit. Tri. (British Museum), edited for the Rolls Series by Thomas Arnold in 1892. 5 Edited by R. Keyser and C. R. Unger as Strenglekår & Låtshåk (Christiania, 1890). 6 Christiane's Lausale was printed by J. Risdon in Ancient English Metrical Romances (1802); and by L. Erling (Kempten, 1883). 7 Marie, generally interpreted to mean that Marie was a native of the Île de France, she seems to have been of Norman origin, and certainly spent most of her life in England. Her language, however, shows little trace of Anglo-Norman provincialism. Like Wace, she used a literary dialect which probably differed very widely from common Norman speech. The manuscripts in which Marie's poems are preserved date from the late 13th or even the 14th century, but the language fixes the date of the poems in the second half of the 12th century. The Lais are dedicated to an unknown king, who is identified as Henry II. of England, and the fairies, her Kope, were written according to the Epilogus for a Count William, generally recognized to be William Longsword, earl of Salisbury. The author of Couronnement Renart, says that Marie had dedicated her poem to the count William to whom the unknown poet addresses himself. This is William of Dampierre (d. 1251), the husband of the countess Margaret of Flanders, and his identification with Marie's count William is almost certainly an error. Marie lived and wrote at the court of Henry II., which was very literary and purely French. Queen Eleanor was a Provençal, and belonged to a family that had assimilated the Celtic legends. In any case the Breton lays of abundant evidence of traditions from Scandinavian and Oriental sources. The Guignar of Marie de France presents marked analogies with the ordinary Oriental romance of escape from a harem, for instance, with details superadded from classical mythology. Marie seems to have contented herself with giving new literary form to the stories she heard by turning them into Norman octosyllabic verse, and apparently made few radical changes from her originals. Joseph Bédier thinks that the lays of the Breton minstrels were prose recitals interspersed with short lyrics something after the manner of the cante-fable of Aucassin et Nicolette. Marie's task was to give these cante-fables a narrative form destined to be read rather than sung or recited.

The Lais which may be definitely attributed to Marie are: Guignar, Equitan, Le Frène, Le Bisclaref (the werewolf), Les Deux amants, Lausale, Chastell, Lanzal, Le Chéteufereaux, Milon, Yonce and Lanzal. The first two are Breton, and the Lai de l'Insuan de Renart and the Lai du cor de Robert Bicket, two authors otherwise unknown. They vary in length from some twelve thousand lines to about a hundred. Le Chéteufereaux, a short episode of the Tristan story, telling how Tristan makes known his presence in the wood to Isoult, is the best known of them all. Laustic 4 (Le Rossignol) is almost as short and simple. In Yonce a mysterious bird visits the lady kept in durance by an old husband, and is turned into a valiant knight. The lover is killed by the husband, but in due time is avenged by his son. The scene of the story is partly laid in Chester, but the fable in slighter different forms occurs in the folklore of many countries. 5 Lausale 4 is a fairy story, and the heroine vanishes eventually with her fairy prince to the island of Avalon or Avillion. Elduc is more elaborately planned than any of the fables, and the action is divided between Exeter and Brittany. Here again the story of the man with two brides is not new, but the three characters of the story are so dealt with that each wins the reader's sympathy. The resignation of the wife of Elduc and her recognition of the new wife, and a parallel in another of the lays, Chresté's. For the relations between Lanzal and the Lai de Graele, wrongly ascribed to Marie by Roquefort, see W. H. Schofield, "The Lays of Lanzal and Lanzal, and the story of Wayland," in the Publications of the Med. Lang. Assoc. of America, vol. xv. (Baltimore, 1900).
Le Frère. The story is in both cases more human and less repugnant than the, in some respects, similar story of Griselda.

Marie's Yaşep is translated from an English original which she erroneously attributed to Alfred the Great, who, had she, translated it from the Latin. The collection includes many fables that have come down from Phædrus, some Oriental stories derived from Jewish sources, with many popular apologies that belong to the hagiographic genre. From the literary standpoint, they are intended to amuse rather than to instruct. Marie describes the misery of the poor under the feudal régime, but she preaches resignation rather than revolt. The propriety of this collection is attested by the twenty-three MSS. of it that have been preserved.

Another poem attributed to Marie de France is L'Espurgatoire Saint Patris, a translation from the Tractatus de purgatorio S. Patris (1160) of Henry of Sahery, which brings her activity down almost to the close of the century.

See Die Päpste der Marie de France (1886), edited by Karl Warnke with the help of materials left by Eduard Moll; and Die Laist der Marie de France (2nd ed., 1900), edited by Karl Warnke, with comparative notes by Reinhold Köhler; the two works being vols. vi. and iii. of the Bibliotheca Normannica of Hermann Suchtich; also an extremely interesting article by Joseph Bédier in the Revue des deux mondes (Oct., 1891); another by Alice Kemp-Welch in the Nineteenth Century (Dec., 1897). For an analysis of the Laist see Reine de philosophie française, vii. 161 seq.; Karl Warnke, Die Quellen des Esop de Marie de France. The Laist was published in 1819 by B. de Roquefort. L'Espurgatoire Saint Patris was edited by T. A. Jenkins (Philadelphia, 1894). Some of the Laists were paraphrased by Arthur O'Shaughnessy in his Leys de France (1872).

MARIE DE' MEDICI (1572-1642), queen consort and queen regent of France, daughter of Francis de' Medici, grand duke of Tuscany, and Joanna, an Austrian archduchess, was born in Florence on April 25, 1573. After Joanna's death in 1578 duke Francis married the notorious Bianca Capello, and the grand-ducal children were brought up away from their father at the Piti Palace in Florence, where after the death of her brother and sister and the marriage of her elder sister Eleonora, Duchess of Mantua, a companion was chosen for Marie, this being Leonora Dori, afterwards known as Leonora Galigai. She received a good education in company with her half-brother Antonio. After many projects of marriage for Marie had failed Henry IV. of France, who was under great monetary obligations to the house of Medici, offered himself as a suitor although his marriage with Marguerite de Valois was not yet dissolved; but the marriage was not celebrated until October 1600. Her eldest son, the future Louis XIII., was born at Fontainebleau in September of the next year; the other children who survived were Gaston duke of Orleans; Elizabeth queen of Spain; Christine duchess of Savoy; and Henrietta Maria queen of England. During her husband's lifetime Marie de' Medici showed little sign of political taste or ability; but after her murder in 1610 when she became regent, she devoted herself to affairs with unflagging energy and for her more than for the glory of the Medici gave her confidence chiefly to Concini, the husband of Leonora Galigai, who squandered the public money and secured a series of important charges with the title of Maréchal d'Ancre. Under the regent's lax and capricious rule the princes of the blood and the great nobles of the kingdom revolted; and the queen, too weak to assert her authority, consented at Sainte Mehemoh (May 15, 1614) to buy off the discontented princes. In 1616 her policy was strengthened by the accession to her councils of Richelieu, who had just returned from the 4th meeting of the states general in 1614; but Louis XIII., who was now sixteen years old, was determined to throw off the tutelage of his mother and Concini. By his orders Concini was murdered, Leonora Galigai was tried for sorcery and beheaded, Richelieu was banished to his bishopric, and the queen was exiled to Blois. After two years of virtual imprisonment she escaped in 1619 and became the centre of a new revolt. Louis XIII., easily dispersed the rebels, but through the mediation of Richelieu was reconciled with his mother, who was allowed to hold a small court at Angers, and resumed her place in the royal council in 1620. But differences between her and the cardinal rapidly arose, and the queen was finally driven to intrigue against Richelieu again from court. For a single day the journée des dix, the 12th of November 1630, she seemed to have succeeded; but the triumph of Richelieu was followed by her exile to Compiegne, whence she escaped in 1631 to Brussels. From that time till her death at Cologne on the 3rd of July 1642 she intrigued in vain against the cardinal.

Among contemporary authorities for the history of Marie de' Medici, see Mathieau de Morgues, Deux faces de la vie et de la mort de Marie de Médicis (Antwerp, 1643); J. B. Matthieu, Éloges historial de Marie de Médicis (Paris, 1620); Florentin du Lomega, Le Tableau de la vie et de la mort de Marie de Médicis (Amsterdam, 1630); and A. P. Lord, The Regency of Marie de Médicis (London, 1904). For the political history see the bibliographies to Henry IV. and Louis XIII. There are lives by Thiroux d'Areconville (3 vols., Paris, 1774) by Miss J. S. H. Pardoe (London, 1832, and again 1890); and by Balzac, Histoire de Marie de Médicis (Paris, 1877). There is a technical discussion of the causes of her death in A. Masson's La Sorcellerie et la science des poisons au xviie siècle (Paris, 1904), and the memoirs of Paul L. Batifol's La Vie intime, d'une reine de France (Paris, 1906; Eng. trans. 1898).

MARIE GALANTE, an island in the French West Indies. It lies in 15° 55' N. and 61° 17' W., 16 m. S.E. of Guadeloupe, of which it is a dependency. It is nearly circular in shape and 55 sq. m. in area. A rocky limestone plateau, rising in the east to a height of 675 ft., occupies the centre of the island, and from it the land descends in a series of well-wooded terraces to the sea. The shores are rocky, there are no harbours, and the roadstead off Grand Bourg is difficult of access, owing to the surrounding reefs. The climate is healthy and the soil rich; sugar, coffee and cotton being the chief products. The largest town is Grand Baie (1,5001). The island is reached by a steamer the relief, taking 3 days from Martinique. La Martinique. The island was discovered by Columbus in 1493, and received its name from the vessel on which he was sailing. The French who settled here in 1648 suffered numerous attacks both from the Dutch and the British, but since 1766, except for a short period of British rule in the early part of the 19th century, they have held undisturbed possession.

MARIE LESZCZYNSKA (1703-1768), queen consort of France, was born at Breslaw on the 23rd of July 1703, being the daughter of Stanislas Leszcynski (who in 1704 became king of Poland) and of Catherine (sister to the Elector Palatine). After a temporary flight from Warsaw the child was lost, and eventually discovered in a stable; on another occasion she was for safety's sake hidden in an oven. In his exile Stanislas found his chief consolation in superintending the education of his daughter. Madame de Prie first suggested the Polish princess as a bride for Louis duke of Bourbon, but she was soon betrothed not to him but to Louis XV., a step which was the outcome of the jealousies of the houses of Condé and Orléans, and was everywhere regarded as a mésalliance for the Bourbon. The idea was at first received with some alarm on account of the Protestant sympathies of Madame de Prie, but when she was ennobled by Louis XIV. as Madame de Leszczyński, the princess, who maintained with him the chief consolation of her harassed life. After a momentary reconciliation with Louis during his illness at Metz in 1744, Marie shut herself up more closely with her own circle of friends until her death at Versailles on the 24th of June 1768.
MARIE LOUISE (1791–1847), second wife of Napoleon I., was the daughter of Francis I., emperor of Austria, and of the princess Theressa of Naples, and was born on the 12th of December 1791. Her disposition, fresh and natural but lacking the qualities that make for distinction, gave no promise of eminence until reasons of state brought Napoleon shortly after his divorce of Josephine to sue for her hand (see NAPOLÉON and JOSEPHINE). It is probably, though not quite certain, that the first suggestions as to this marriage of convenience emanated secretly from the Austrian chancellor, Metternich. The prince de Ligne claimed to have been instrumental in arranging it. In any case the proposal was well received at Paris both by Napoleon and by his ministers; and though there were difficulties respecting the divorce of Josephine, yet these were surmounted in a way satisfactory to the emperor and the prelates of Austria. The marriage took place by proxy in the church of St. Augustine, Vienna, on the 11th of March 1810. The new empress was escorted into France by Queen Caroline Murat, for whom she soon conceived a feeling of distrust. The civil and religious contracts took place at Paris early in April, and during the honeymoon, spent at the palace of Compiègne, the emperor showed the greatest regard for his wife. "He is so evidently in love with her," wrote Metternich "that he cannot conceal his feelings, and all his customary ways of life are subordinate to her wishes." His joy was complete when on the 20th of March 1811 she bore him a son who was destined to bear the empty titles of "king of Rome" and "Napoleon II." The regard of Napoleon for his consort was evidenced shortly before the birth of this prince, when he bade the physicians, if the lives of the mother and of the child could not both be saved, to spare her life. Under Marie Louise, the etiquette of the court of France became more stately and the ritual of religious ceremonies more elaborate. Before the campaign of 1812 she accompanied the emperor to Dresden; but after that scene of splendour of fortunes crowded upon Napoleon. In January 1814 he appointed her to act as regent of France (with Joseph Bonaparte as lieutenant-general) during his absence in the field.

At the time of Napoleon's first abdication (April 11, 1814), Joseph and Jerome Bonaparte tried to keep the empress under some measure of restraint at Blois; but she succeeded in reaching her father the emperor Francis while Napoleon was on his way to Elba. She, along with her son, was escorted into Austria by Count von Neipperg, and refused to comply with the entreaties and commands of Napoleon to proceed to Elba; and her alienation from him was completed when he ventured to threaten her with a forcible abduction if she did not obey. During the Hundred Days she remained in Austria and manifested no desire for the success of Napoleon in France. At the Congress of Vienna the Powers awarded to her and her son the duchies of Parma, Piacenza and Guastalla, in conformity with the terms of the treaty of Fontainebleau (March, 1814); in spite of the determined opposition of Louis XVIII. she gained this right for herself owing largely to the support of the emperor Alexander, but she failed to make good the claims of her son to the inheritance (see NAPOLÉON II.). She proceeded alone to Parma, where she fell more and more under the influence of the count von Neipperg, and had to acquiesce in the title of "empress" of the Reichstadt of Austria obtained by him. The tidings of the death of Napoleon at St. Helena reached her she was living in intimate relations with Neipperg at Parma, and bore a son to him not long after that event. Napoleon on the other hand spoke of her in his will with marked tenderness, and both excused and forgave her infidelity to him. Thereafter Neipperg became her managistic husband; and they had other children. In 1832, at the time of the last illness of the duke of Reichstadt, she visited him at Vienna and was there at the time of his death; but in other respects she shook off all association with Napoleon. Her residence in Parma, jointly with Neipperg, was characterized by a clemency and moderation which were lacking in the other Italian states in that time of reaction. She preserved some of the Napoleonic laws and institutions; in 1817 she established the equality of women in heritage, and ordered the compilation of a civil code which was promulgated in January 1820. The penal code of November 1821 abolished many odious customs and punishments of the old code, and allowed publicity in criminal trials. On the death of Neipperg in 1829 his place was taken by Baron Werklein, whose influence was hostile to popular liberty. During the popular movements of 1831 Marie Louise had to take refuge with the Austrian garrison at Piacenza; on the resumption of her rule by her brother she deteriorated, Parma becoming an outlaw of the Austrian empire. She died at Vienna on the 18th of December 1847.

(Vienna, 1890); A. de Brecqueville, The Duke of Reichstadt (Eng. ed., London, 1905). See also the Memoirs of Bausset, Mme Durand Méneval and Metternich; and Max Billard, The Marriage Ventures of Marie Louise, English version by Evelyn duchess of Wellington (1910).

MARIENBAD, a town of Bohemia, Austria, 115 m. W. of Prague by rail. Pop. (1900), 4588. It is one of the most frequented watering-places of Europe, lying on the outskirts of the Kaiserwald at an altitude of 2095 ft., and is 40 m. S.W. of Carlsbad by rail. Marienbad is enclosed on all sides except the south by gently sloping hills clad with fragrant pine forests, which are intersected by lovely walks. The principal buildings are: the Roman Catholic church, which was completed in 1851; the English church, the theatre, the Kurhaus, built in 1901, and several bathing establishments and hospitals. The mineral springs, which belong to the adjoining abbey of Tepli, are eight in number, and are used both for bathing and drinking, except the Marienquelle, which is usually barred by the authorities. In the springs of the Kreuzbrunnen and the Ferdinandsbrunnen, contain alkaline-saline waters which resemble those of Carlsbad, except that they are cold and contain nearly twice the quantity of purgative salts. Others, like the Ambrosiusbrunnen and the Karolinenbrunnen, are among the strongest iron waters in the world, while the Rudolfbrunnen is an earthly-alkaline spring. The waters are used in cases of liver affections, gout, diabetes and obesity; and the patients must conform during the cure to a strictly regulated diet. Besides the mineral water baths there are also moor or mud-baths, and the peat used for these baths is the richest in iron in the world. About 1,000,000 bottles of mineral water are exported annually.

Amongst the places of interest round Marienbad is the bassaltic rock of Podhron (2776 ft.), situated about 3 m. to the east, from which an extensive view of the Böhmischer Wald, Fichtelgebirge and Erzgebirge is obtained. About 7 m. in the same direction lies the old and wealthy abbey of Tepl, founded in 1193. The actual building dates from the end of the 17th and the beginning of the 18th century, and contains a fine library with a collection of autographs, a collection of the small and old town of Tepl (pop. 2789). To the north-east of Marienbad lies the small watering-place of Königswart; near it is a castle belonging since 1618 to the princes of Metternich, which contains an interesting museum, created by the famous Austrian statesman in the first part of the 19th century. It contains, besides a fine library, a collection of the presents he received during his long career; numerous autographs, and other historical relics, a collection of rare coins, armour, portraits and various minerals. Marienbad is situated, about the youngest of the Bohemian watering-places, although its springs were known from of old. They appear in a document dating from 1341, where they are called the "Auschwitzer springs belonging to the abbey of Tepl," but it was only through the efforts of Dr. Josef Nehr, the doctor of the abbey, who from 1770 until his death in 1820 worked hard to demonstrate the curative properties of the springs, that the waters began to be used for medicinal purposes. The place obtained its actual name of Marienbad in 1808; became a watering-place in 1818, and received its charter as a town in 1828.

See Lang, Päker durch Marienbad und Umgebung (Marienbad, 1902); and Kisch, Marienbad, seine Umgebung und Heilmittel (Marienbad, 1895).

MARIENBERG, a town of Germany, in the kingdom of Saxony 16 m. S.E. of Chemnitz on the Flöha-Reitzenhain railway.
Pop. (1905), 7603. It has an Evangelical church, a Roman Catholic church, a non-commissioned officers' school and a preparatory school; and the industries comprise wool-spinning, flax-dressing, the making of lace, toys and cigars, and silver-mining.

MARIENBURG (Polish, Malbork), a town of Germany, in the Prussian province of West Prussia, 30 m. by rail to the S.E. of Danzig in a fertile plain on the right bank of the Nogat, a channel of the Vistula, here spanned by a handsome railway bridge and by a bridge of boats. Pop. (1905), 13,093. Marienburg contains large chemical wool-cleaning works and several other factories, carries on a considerable trade in wood, linen, feathers and brushes, and is the seat of important cattle, horse and wool markets. Its educational institutions include a gymnasium and a Protestant normal school. In the old market-place, many of the houses in which are built with arcades, stands a Gothic town-hall, dating from the end of the 14th century. The town is also embellished with a fine statue of Frederick the Great, who added this district to Prussia, and a monument commemorating the war of 1870-71. Marienburg is chiefly interesting from its having been for a century and a half the residence of the grand masters of the Teutonic order. The large castle of the order here was originally founded in 1274 as the seat of a simple commandery against the pagan Prussians, but in 1309 the headquarters of the grand master were transferred hither from Venice, and the "Marienburger Schloss" soon became one of the largest and most strongly fortified buildings in Germany. On the decline of the order in the middle of the 15th century, the castle passed into the hands of the Poles, by whom it was allowed to fall into neglect and decay. It came into the possession of Prussia in 1772, and was carefully restored at the beginning of the 19th century. This interesting and curious building consists of three parts, the Alt- or Hochschloss, the Mittelschloss, and the Vorburg. It is built of brick, in a style of architecture peculiar to the Baltic provinces, and is undoubtedly one of the most important secular buildings of the middle ages in Germany.

Of the numerous monographs published in Germany on the castle of Marienburg, it will suffice to mention here Büsching's Schloss der deutschen Ritter zu Marienburg (Berlin, 1828); Voigt's Geschichte von Marienburg (Königsberg, 1824); Bergau's Ordenshaupthaus Marienburg (Berlin, 1871); and Steinbrecht, Schloss Marienburg in Preussen (6th ed., Berlin, 1903).

MARIENWERDER, a town of Germany, in the Prussian province of West Prussia, 3 m. E. of the Vistula, 23 m. S. of Marienburg by rail. Pop. (1905), 10,258. The town was founded in the year 1233 by the Teutonic order. It has a cathedral of the same period, a triple Gothic church, containing the tombs of several grand masters of the Teutonic order; a (Gothic) town-hall (1880); a Roman Catholic basilica (1858); a non-commissioned officers' school; a monument of the war of 1870-71 (1897); an archaeological collection; and a seminary for female teachers. The industries include iron-foundries, saw-mills, sugar-refineries, breweries and printing-works.

MARIE THÉRÈSE (1638-1683), queen consort of France, was born on 25th September 1638 at the Escorial, being the daughter of Philip IV, of Spain and Elizabeth of France. By pretending to seek a bride for his master in Margaret of Savoy, Mazarin had induced the king of Spain to make proposals for the marriage of his daughter with Louis XIV., and the treaty of the Pyrenees in 1659 stipulated for her marriage with the French king, Marie renouncing any claim to the Spanish succession. As the treaty, however, hinged on the payment of her dowry, which was practically impossible for Spain, Mazarin could evade the other terms of the contract. Marie Thérèse was married in June 1660, when Philip IV. with his whole court accompanied the bride to the Isle of Peasants in the Bidassoa, where she was met by Louis. The new queen's amiability and her un- doubted virtues failed to secure her husband's regard and affection. She saw herself neglected in turn for Louise de la Vallière, Mme. de Montespan and others; but Marie Thérèse was too pious and too humble openly to resist the position in which she was placed by the king's avowed infidelities. With the growing influence of Madame de Maintenon over his mind and affections he bestowed more attention on her, which she repaid by lavishing kindness on the mistress. She had no part in political affairs except in 1672, when she acted as regent during Louis XIV.'s campaign in Holland. She died on the 30th of July 1663 at Versailles, not without suspicion of foul play on the part of her husband. Of her six children only one survived her, the dauphin Louis, who died in 1699.

See the funeral oration of Bossuet (Paris, 1684). E. Ducrétet, Le Mariage de Louis XIV., d'après les contemporains et des documents inédits (Bayonne, 1895); Dr Cabanne, Les Morts mystérieuses de l'histoire (1900), and the literature dealing with her rivals Louise de la Vallière, Madame de Montespan and Madame de Maintenon.

MARIETTA, a city and the county-seat of Cobb county, Georgia, U.S.A., in the N.W. of the state, about 17 m. N.W. of Atlanta. Pop. (1890), 3384; (1900), 4446, of whom 1928 were negroes; (1910), 5969. The city is served by the Louisville & Nashville, the Nashville, Chattanooga & St. Louis, and the Western & Atlantic railways, and is connected with Atlanta by an electric line. Marietta is situated about 1118 ft. above the sea, has a good climate, and is both a summer and a winter resort. The principal industries are the manufacture of chairs and paper, and the preparation of marble for the markets; there are also locomotive works, planing mills, a canning factory, a knitting mill, &c. At Marietta there is a national cemetery, in which more than 10,000 Federal soldiers are buried, and at Kennesaw Mountain, 1 mile W.S.W. of the city, the fiercest battles of the Civil War was fought. After the Confederate retreat from Dalton in May 1864, General William T. Sherman, the Federal commander, made Marietta his next intermediate point in his Atlanta campaign, and the Confederate commander, General Joseph E. Johnston, established a line of defence west of the town. After several preliminary engagements Sherman on the 26th and 27th of June made repeated unsuccessful attempts to drive the Confederates from their defences at Kennesaw Mountain; he then resorted to a flanking movement which forced the Confederate general to retire (July 2) toward Atlanta. Marietta was settled about 1840, and was chartered as a city in 1852.

MARIETTA, a city and the county-seat of Washington county, Ohio, U.S.A., on the Ohio River, at the mouth of the Muskingum, about 115 m. S.E. of Columbus. Pop. (1890), 8273; (1900), 13,348, including 670 foreign-born and 361 negroes; (1910), 12,923. It is served by the Pennsylvania (Marietta Division), the Baltimore & Ohio (Marietta & Parkersburg, Marietta & Zanesville, and Ohio River divisions) and the Marietta, Columbus & Cleveland railway, and by steamboat lines to several river ports; a bridge across the Ohio connects it with Williamstown, West Virginia. The city is in a hilly country of much natural beauty, and is of considerable historic interest. On the banks of the Muskingum is a public park, facing which stood the oldest church in the state; this was burned in 1905, but was subsequently rebuilt in the old style. Near by are some 18th century buildings, some interesting earthworks of the " mound-builders," and a cemetery in which are buried many soldiers who fought in the War of Independence. Marietta is the seat of Marietta College, dating from 1831, which in 1906 had more than 500 students. It possesses a library of 60,000 volumes, including some rare collections, especially the Stimson collection of books bearing on the history of the North-West Territory. Petroleum, coal, and iron-ore abound in the neighbouring region, and the city has a considerable trade in these and in its manufactures of chairs, leather, florists' goods, carriages, wagons, boats, boilers, bricks and glass. In 1905 the factory products were valued at $2,599,821.

Marietta, named in honour of Marie Antoinette, is the oldest settlement in the state and in the North-west Territory. It was founded in 1788 by a company of Revolutionary officers from New England under the leadership of General Rufus Putnam, and in the same year the North-West Territory was formally organized here. The pseudo-classicism of the period of Marietta's foundation is indicated by the names—Capitolium for one of
the public squares, Sacra Via for one of the principal streets, and Campus Martius for the fortification. The settlement was incorporated as a town in 1800 and chartered as a city in 1852. In 1890 the village of Harmar, including the site on which Fort Harmar was built in 1785, was annexed.

See Henry Howe, *Historical Collections of Ohio* (Columbus, 1891).

**MARIEETTE, AUGUSTE FERDINAND FRANÇOIS** (1821–1881), French Egyptologist, was born on the 11th of February 1821 at Boulogne, where his father was town clerk. Educated at the Boulogne municipal college, where he distinguished himself and showed much artistic talent, he went to England in 1839 when eighteen as professor of French and drawing at a school at Stratford-on-Avon. In 1840 he became pattern-designer to a ribbon manufacturer at Coventry; but weary of ill-paid exile he returned the same year to Boulogne, and in 1841 he took his degree at Douai. He now became a professor at his old college, and for some years supplemented his salary by giving private lessons and writing on historical and archaeological subjects for local periodicals. Meanwhile his cousin Nestor L'Hôte, the friend and fellow-traveller of Champollion, died, and upon Mariette devolved the task of sorting the papers of the deceased savant. He thenceforth became passionately interested in Egyptology, threw himself to the study of hieroglyphs and Coptic, and in 1847 published a *Catalogue analytique* of the Egyptian Gallery of the Boulogne Museum; in 1849, being appointed to a subordinate position in the Louvre, he left Boulogne for Paris. Entrusted with a government mission for the purpose of seeking and purchasing Coptic, Syriac, Arabic and Ethiopic MSS. for the national collection, he started for Egypt in 1850; and soon after his arrival he made his celebrated discovery of the ruins of the Serapeum and the subterraneous catacombs of the Apisbulls. His original mission being abandoned, funds were now advanced for the prosecution of his researches, and he remained in Egypt for four years, excavating, discovering and despatching archaeological treasures to the Louvre, of which museum he was on his return appointed an assistant conservator. In 1858 he accepted the position of conservator of Egyptian monuments to the ex-khедive, Isma'il Pasha, and removed with his family to Cairo. His history thenceforth becomes a chroniclce of unwearied exploration and brilliant success. The museum at Bula was founded immediately. The pyramid-fields of Memphis and Sakkara, and the necropoleis of Meydum, and those of Abydos and Thebes were examined; the great temples of Dendera and Edfu were desinterred; important excavations were carried out at Karnak, Medinet-Habu and Deir el-Bahiri; Tanis (the Zoa of the Bible) was partially explored in the Delta; and even Gebel Barkal in the Sudan. The Sphinx was bared to the rock-level, and the famous granite and alabaster monument miscalled the "Temple of the Sphinx" was discovered. Mariette was raised successively to the rank of bey and pasha in his own service. Honours and orders were showered on him: the Legion of Honour and the Medjilde in 1854; the Red Eagle (first class) of Prussia in 1855; the Italian order of SS. Maurice and Lazarus in 1857; and the Austrian order of Francis-Joseph in 1858. In 1873 the Academy of Inscriptions decreed to him the biennial prize of 20,000 francs, and in 1878 he was elected a member of the Institute. He was also an honorary member of most of the learned societies of Europe. In 1877 his health broke down through overwork. He lingered for a few years, working to the last, and died at Cairo on the 19th of January 1881.

His chief published works are: *Le Sphinx et Memphis* (1857; and following years); *Denderah*, five folios and one 4to (1873–1875); *Abydos*, two folios and one 4to (1870–1880); *Karnak*, five folio and 4to (1875); *Deir el-Bahiri*, folio and 4to (1877); *Littes géographiques* des pyramides de Karnak, folio (1879); *Catalogue du Musée de Baudiag* (six editions 1864–1876); *Aperçu de l’histoire d’Égypte* (four editions, 1864–1874, etc.); *Les Mastabas de l’ancien empire* (edited by Maspero) (1883). See "Notice biographique," by Maspero in *Auguste Mariette* 1875: *Guerres diverses à Rome* 1877; *Paris, 1900*; *Égypte: Exploration and Research.*

**MARIGNAC, JEAN CHARLES GALISSARD DE** (1817–1894), Swiss chemist, was born at Geneva on the 24th of April 1817. When sixteen years old he began to attend the École Polytechnique in Paris, and from 1837 to 1839 studied at the École des Mines. Then, after a short time in Liebig's laboratory at Giessen, and in the Sèvres porcelain factory, he became in 1841 professor of chemistry in the academy of Geneva. In 1845 he was particularly interested in mineralogy also, and held both chairs till 1878, when ill-health obliged him to resign. He died at Geneva on the 15th of April 1894. Marignac's name is well known for the careful and exact determinations of atomic weights which he carried out for twenty-eight of the elements. In undertaking this work he had, like J. S. Stas, the purpose of testing Prout's hypothesis, but he remained more disposed than the Belgian chemist to consider the possibility that it may have some degree of validity. Throughout his life he paid great attention to the "rare earths" and the problem of separating and distinguishing them; in 1878 he extracted ytterbia from what was supposed to be pure erbia, and two years later found gadolinia and samaria in the samarskite earths. In 1858 he pointed out the isomorphism of the fluorantes and the fluosilicates, thus settling the then vexed question of the composition of silicic acid; and subsequently he studied the fluosalts of zirconium, boron, tungsten, &c., and prepared silicoticungastic acid, one of the first examples of the complex inorganic acids. In physical chemistry he carried out many researches on the nature and processes of solutions, investigating the variation of the specific heat of saline solutions with temperature and concentration, and the phenomena of liquid diffusion.

A memorial lecture by P. T. Cleve, printed in the *Journal of the London Chemical Society* for 1895, contains a list of Marignac's papers.

**MARIGNAN, BATTLE OF**, fought on the 13th and 14th of September 1355 between the French army under Francis I. and the Swiss. The scene of the battle—which was also that of a hard fought engagement in 1515 (see *Mastabas*)—was at Meldegno, a small village of Melegnano, on the river Lambro, 10 m. S.E. of Milan. The circumstances out of which the battle of Marignan arose, almost inconceivable to the modern mind, were not abnormal in the conditions of Italian warfare and politics then prevailing. The young king of France had gathered an army about Lyons, with which to overrun the Milanese; his allies were the republics of Venice and Genoa. The duke of Milan, Maximilian Sforza, had secured the support of the emperor, the king of Spain, and the pope, and also of the Swiss cantons which then supplied the best and most practicalable passes of the Alps and the Apennines were held by Swiss and papal troops. Francis however boldly crossed the Col de l'Argentière (Aug. 1515) by paths that no army had hitherto used, and Marshal de La Palisse surprised and captured a papal corps at Villafranca near Pinerolo, whereupon the whole of the enemy's troops fell back on Milan. The king then marching by Verceil, Novara and Pavia, joined hands with Alviano, the Venetian commander, and secured a foothold in the Milanese. But in order to avoid the necessity of besieging Milan itself, he offered the Swiss a large sum to retire into their own country. They were about to accept his offer, not having received their subsidies from the pope and the king of Spain, when a fresh corps of mercenaries descended into Italy, desirous both of gaining booty and of showing their prowess against their new rivals the French and Lower Rhine "Ilanquesens" (Landsknechts) and against the French gendarmerie, whom (alluding to the "Battle of the Spurs" at Guinegate in 1535) they called "hares in armour." The French took position north of the river Ticino, and the Swiss, the Venetians at La Palisse and the Venetian, in check the Spanish army at Placenza. Alviano, who was visiting the king when the Swiss appeared before Melegnano, hurried off to bring thither his own army. Meantime the French and the Swiss engaged in an incredibly fierce struggle.

The king's army was grouped in front of the village, facing in the direction of Milan, with a small stream separating it from the oncoming Swiss. On either side of the Milan road was a
large body of landsknechts, a third being in reserve. The French and Gascon infantry (largely armed with arquebuses) was on the extreme right, the various bodies of gendarmerie in the centre. In front of all was the French artillery. The battle opened in the afternoon of the 13th of September. As the Swiss advanced in three huge columns, the French guns fired into them with terrible effect, but the assailants reached the intersected ground, bordering the stream, and thus protected from the rush of the French gendarmerie, they debouched on the other side, and fell upon the landsknechts. The crowd of combatants, the gathering darkness, and the dust, prevented any general direction being given to the battle by the leaders of either side. Francis himself at the head of two hundred gendarmes charged and drove back two large bodies of Swiss which were pressing the landsknechts hard. The battle went on by moonlight till close on midnight, when the Swiss retired a short distance. Both sides spent the rest of the night on the battlefield, reorganising their broken corps. Francis and his gendarmes were the outmost line of the French army, and remained all night mounted, lance in hand and helmet on head. Next morning at sunrise, the battle was renewed. The Swiss now left their centre inactive opposite the king and with two strong corps attempted to work round his flanks. That on the left made for the French baggage, but found it strongly guarded by landsknechts, who drove them back. The nearest French gendarmerie joined in the pursuit, but a detachment from the Swiss centre fell upon these and destroyed them. This detachment in turn followed up its advantage until Francis himself expressed it, "the whole came turned out" to aid the landsknechts and "hunted out" the Swiss. Meantime the Swiss left attack had closed with the French infantry bands and the "aventuriers" (afterwards the famous corps of Piccardie and Piedmont), who were commanded on this day be the famous engineer Pedro Navarro. It was in the main struggle of arquebus against pike, but it was not the arquebus alone, or even principally, that gave the victory to the French. When the Swiss ranks had been disordered, the short pike and the sword came into play, and aided by the constable de Bourbon with a handful of the gendarmerie, the French right more than held its own until Alviano with the cavalry from Lodi rode on to the field and completed the rout of the Swiss. In the centre meanwhile the two infantry stood fast for eight hours, separated by the brook, while the artillery on both sides fired into it at short range. But the landsknechts, animated by the king, endured it as well as the Swiss; and at the last, Francis leading a final advance of his exhausted troops, the Swiss gave way and fled. Only 3000 Swiss escaped out of some 45,000 who fought. On the French side probably 8000 were killed or died of wounds, and it is supposed the Swiss lost at least 7000. The lesson was the efficacy of combining two arms against one. The French gendarmerie, burning to avenge the insult of "hares in armour," made more than thirty charges by squadrons, and they were admirably supported by their light artillery. The landsknechts retrieved their first day's defeat by their conduct on the second day. Nevertheless Marignan was in the main the work of the gendarmerie, the last and greatest triumph of the armoured lancer; and as a fitting close to the battle the young king was knighted by Bayard on the field.

Marignoli stayed at Peking or Cambaltec three or four years, after which he travelled through eastern China to Zayton or Amoy Harbour, quitting China apparently in December 1347, and reaching Columbium (Kaulam or Quillon in Malabar) in 1348. In 1350 he left his community, and his plan of a Latin mission, probably founded by Jordanus of Séverac, who had been appointed bishop of Columbium by Pope John XXII. in 1330. Here Marignoli remained sixteen months, after which he proceeded on what seems a most devious voyage. First he visited the shrine of St Thomas near the modern Madras, and then proceeded to what he calls the kingdom of Saba, and identifies with the Sheba of Scripture, but which seems from various particulars to have been Java. Taking ship again for Malabar on his way to Europe, he encountered great storms. They found shelter in the little port of Perioli or Perios (Beruwala or Berbery) in the south-west of Ceylon; but here the legate fell into the hands of "a certain tyrant Coya Jaan (Khoja Jaha), a eunuch and an accursed Saracen," who proceeded to treat him with all deference, but detained him four months, and plundered all the gifts and Eastern rarities that he was carrying home. This detention in Sceylan enables Marignoli to give a variety of curious particulars regarding Adam's Peak, Buddhist monasticism, the aboriginal races of Ceylon, and other matters. After this we have only fragmentary notices, dealing with Babel, Bagdad, Musul, Aleppo and thence to Damascus and Jerusalem. In 1353 he arrived at Avignon, and delivered a letter from the great khan to Pope Innocent VI. In the following year the emperor Charles IV., on a visit to Italy, made Marignoli one of his chaplains. Soon after, the pope made him bishop of Bisignano; but he seems to have been in no hurry to reside there. He appears to have accompanied the emperor to Prague in 1354-1355; in 1356 he is found acting as envoy to the Pope from Florence; and in 1357 he is at Bologna. We know not when he died. The last trace of Marignoli is a letter addressed to him, which was found in the 18th century among the records in the Chapter Library at Prague. The writer is an unnamed bishop of Armagh, easily identified with Richard Fitz Ralph, a strenuous foe of the Franciscans, who had broken lances in controversy with Ockham and Burley. The letter implies that some intention had been entertained from Avignon of sending Marignoli to Ireland in connexion with matters then in debate—a project which stirs Fitz Ralph's wrath.

The fragmentary notes of Marignoli's Eastern travels often contain vivid remembrance and graphic description, but combined with an incontinent vanity, and an incoherent lapse from one thing to another. They have no claim to be called a narrative, and it is with no small pains that anything like a narrative can be pieced out of them. Indeed the mode in which they were elicited curiously illustrates how little medieval travellers thought of publication
The emperor Charles, instead of urging his chaplain to write a history of his past journeys, set him to the repugnant task of recasting the annals of Bohemia; and he consigned himself by salting the insipid stuff by interpolations, à propos de bottes, of his recollections of his travels.

Nobody seems to have noticed the work till 1768, when the chronicle was published in vol. ii. of the Monumenta hist. Bohemiacae nusquam anticea edita by Father Gelasius Dobner. But, though Marigny had been deposited in the archives of the Hieronymite monastery in Prague, Dobner seems to have associated him till 1820, when an interesting paper on his travels was published by J. G. Meier. Professor Friedrich Kunzmann of Munich also devoted the second one of his historical series of papers on the ecclesiastical travellers of the middle ages.

MARIGNY-ENGUERRAND DE (1200-1235), French writer, scholar, and minister of Philip IV. The Fair, was born at Lyons-la-Forêt in Normandy, of an old Norman family of the smaller baronage called Le Portier, which took the name of Marigny about 1200. Enguerrand entered the service of Hugues de Bonville, chamberlain and secretary of Philip IV., as a squire, and then was attached to the household of Queen Jeanne, who made him one of the executors of her will. He married her goddaughter, Jeanne de St Martin. In 1298 he received the custody of the castle of Issoudun. After the death of Pierre Flotte and Hugues de Boisrbéat, at the battle of Mons-en-Pévèle in 1304, he became Philip’s grand chamberlain and chief minister. In 1306 he was sent to preside over the exchequer of Normandy. He received numerous gifts of land and money from Philip as well as a pension from Edward II. of England. Possessed of an ingratiating manner, polite, learned and astute, he acted as an able instrument in carrying out Philip’s plans, and received corresponding confidence. He shared the popular odium which Philip incurred by debarasing the coinage. He acted as the agent of Philip in his contest with Louis de Nevers, the son of Robert count of Flanders, imprisoning Louis and forcing Robert to surrender Lille, Douay and Béthune. He obtained for his half-brother Philip de Marigny in 1325 the bishopric of Cambrai, and in 1329 the archiepiscopate of Sens, and for his brother Jean in 1312 the bishopric of Beauvais. Still another relative, Nicolas de Fréauville, became the king’s confessor and a cardinal. He addressed the estates general in 1314 and succeeded in getting further taxes for the Flemish war, incurring at the same time much ill will. This soon came to a head when the princes of the blood, eager to fight the Flemings, were disappointed by his negotiating a peace in September. He was accused of receiving bribes, and Charles of Valois denounced him to the king himself; but Philip stood by him and the attack was of no avail. The death of Philip IV. on the 29th of November 1314 was a signal for a reaction against his policy. The feudal party, whose power the king had tried to limit, turned on his ministers and chiefy on his chamberlain. Enguerrand was arrested by Louis X. at the instigation of Charles of Valois, and twenty-eight articles of accusation including charges of receiving bribes were brought against him. He was refused a hearing; but his accusations were correct, and Louis was inclined to spare him anything more than banishment to the island of Cyprus. Charles then brought forward a charge of sorcery which was more effectual. He was condemned at once and hanged on the public gallows at Montfaucon, protesting that in all his acts he had only been carrying out Philip’s commands (April 30, 1315). Louis X. seems to have repented of his treatment of Marigny, and left legacies to his children. When his chief enemy, Charles of Valois, lay dying in 1325, he was stricken with remorse and ordered his last inscriptions to be distributed among the poor of Paris with a request to “pray for the souls of Enguerrand and Charles.”

Marigny founded the collegiate church of Notre Dame d’Escaès near Rouen in 1313. He was twice married, first to Jeanne de St Martin, by whom he had three children, Louis, Marie and Isabelle (who married Robert, son of Robert de Tancarville), and the second time to Alips de Mons.

See contemporary chronicles in vols. xx. to xxiii. of D. Bouquet, Historiens de la France; P. Clément, Trois drames historiques (Paris, 1857); Ch. Dufayard, La Réaction féodale sous les fils de Philippe le Bel, in the Revue historique (1894, liv. 241-272) and iv. 241-290.

MARIGNY, JEAN DE (d. 1350), French bishop, was a younger brother of the preceding. Entering the church at an early age, he was rapidly advanced until in 1313 he was made bishop of Beauvais. During the next twenty years he was one of the most notable of the members of the French episcopate, and was particularly in favour with King Philip VI. He devoted himself in 1335 to the completion of the choir of Beauvais Cathedral, the enormous windows of which were filled with the richest glass. But this building activity, which has left one of the most notable Gothic monuments in Europe, was broken into by the Hundred Years’ War. Jean de Marigny, a successful administrator and man of affairs rather than a saintly churchman, was made one of the king’s lieutenants in southern France in 1341 against the English invasion. His most important military operation, however, was when in 1346 he successfully held out in Beauvais against a siege by the English, who had overrun the country up to the walls of the city. Created archbishop of Rouen in 1347 as a reward for this defence, he enjoyed his new honours only three years; he died on the 26th of December 1350.

MARIGOLD. This name has been given to several plants, of which the following are the best known: Calendula officinalis, the pot-marigold; Tagetes erecta, the African marigold; T. patula, the French marigold; and Chrysanthemum segetum, the corn marigold. All these belong to the order Compositae; but Caltha palustris, the marsh marigold, belongs to the order Ranunculaceae.

The first-mentioned is the familiar garden plant with large orange-coloured blossoms, and is probably not known in a wild state. There are now many fine garden varieties of it. The florets are unisexual, the “ray” florets being female, the “disk” florets male. This and the double variety have been in cultivation for at least three hundred years, as well as a proliferous form, C. prolifera, or the “fruitful marigold,” of Gerard (Herball, p. 602), in which small flower-heads proceed from beneath the circumference of the flower. The figure of “the greatest double marigold,” C. multiflora maxima, given by Gerard (loc. cit. p. 600) is larger than most specimens now seen, being 3 in. in diameter. He remarks of “the marigold” that it is called Calendula “as it is to be seen to flower in the calends of almost every month.” It was supposed to have several specific virtues, but they are non-existent. “The marigold, that goes to bed wi’ the sun,” is mentioned by Shakespeare, Winter’s Tale, iv. 3.

Tagetes patula, and T. patula, the French and African marigolds, are natives of Mexico, and are equally familiar garden plants, having been long in cultivation. Gerard figures five varieties of Flos africanus, of the single and double kind (loc. cit. p. 600). Besides the above species the following have been introduced later, T. lucida, T. signata, also from Mexico, and T. ternifolium from Peru. Chrysanthemum segetum, the yellow corn marigold, is indigenous to Great Britain, and is frequent in corn-fields in most parts of England. When dry it has been employed as hay. It is also used in Germany for dyeing yellow. Gerard observes that in his day “the stalk and leaves of Corn Marigold, as Dioscorides saith, are eaten as other potherbes are.”

Colitha palustris, the marsh marigold, or king-cups, the “winking Mary-buds,” of Shakespeare (Cymb., ii. 3), is a common British plant in marshy meadows and beside water. It bears smooth heart-shaped leaves, and flowers with a golden yellow calyx but no corolla, blossoming in March and April. The flower-buds preserved in salted vinegar are a good substitute for capers. A double-flowered variety is often cultivated, and is occasionally found wild.
MARIINSK—MARINES

MARIINSK, a town of Russia, in West Siberia and the government of Tomsk, on the bank of the Ob river and on the Siberian railway, 147 m. E.S.E. of Tomsk. Pop. (1897), 8,300. It is built of timber, but has a stately cathedral. There are tanneries and soapworks; and Mariinsk is an entrepot for the goldmines.

MARILLAC, CHARLES DE (c. 1510-1560), French prelate and diplomatist, came of a good family of Auvergne, and at the age of twenty-two was advocate at the parlement of Paris. Suspected, however, of sympathizing with the reformers, he deemed it prudent to leave Paris, and in 1535 went to the East with his cousin Jean de la Forêt, the first landlord and ambitious, he soon made his mark, and his cousin having died during his embassy, Marillac was appointed his successor. He did not return from the East until 1538, when he was sent almost immediately to England, where he remained ambassador until 1543. He retained his influence during the reign of Henry II., fulfilling important missions in Switzerland and at the imperial court (1547-1551), and at the courts of the German princes (1553-1554). In 1555 he was one of the French deputies at the conferences held at Mark near Arden, to discuss the fate of the last bishop of Rome (1557) and at the Diet of Augsburg (1559). In 1550 he was given the bishopric of Vannes, and in 1557 the archbishopric of Vienne; he also became a member of the privy council. He distinguished himself as a statesman at the Assembly of Notables at Fontainebleau in 1560, when he delivered an exceedingly brilliant discourse, in which he opposed the policy of violence and demanded a national council and the assembly of the states general. Irritated by his opposition, the Guises compelled him to leave the court, and he died on the 2nd of December of the same year.

MARINES (from Lat. mare, sea), the technical term for seamen, i.e. troops appropriated and specially adapted to the requirements of maritime war. This force—formerly (1664) styled "mariners"—is in origin, use and application peculiarly British. Only a few nations possessing a special force discharging exactly similar functions is the United States (see below). In the armed forces of the great European Powers marines and marine artillery are mentioned, but these troops have little in common with British and American marines. In France their duties are to garrison military ports and colonies and take part in marine and other wars. In Germany they are used for coast defence. In Holland, Austria and Italy they have a military organization, but not as complements of sea-going ships.

The origin of the British marine force was an order in council 1664, directing "1,200 Land souldiers to be forthwith rayzed to be in readiness to be distributed in His Majesty's fleete prepared for sea service." This body was named the "Admiral's regiment." At this period land warfare had developed a system and was waged by men organized, disciplined and trained. Sea warfare was left "to every man's own conceit." War-ships were built to be manned in a hurry, by "the press," when needed. Men were thus obtained by force and grouped without organization or previous training in ships. When no longer required they were turned adrift. The administration of England's fleet was "a prodigy of wastefulness, corruption and indolence; no estimate could be trusted, no contract was performed, no check was enforced." Such officers as had been "bred to the sea seemed a strange and savage race." They robbed the king and cheated the seamen. As regards land force, it was a violation of the law to keep at home in the king's pay "any other body of armed men, save as a guard for the royal person." On the other hand it was "illegal to land press men" in a foreign country, but soldiers "only required a little persuasion to land." Thus by thrusting into naval chaos and confusion a nucleus of disciplined, trained and organized land troops, an expedient was found which offered a solution of the many political and administrative difficulties of the time. This "Admiral's regiment," was the germ which by a constant process of evolution during a period of over 235 years has produced not merely the marine forces, but the royal navy, organized, disciplined and trained as it is to-day. In 1668 the experiment of the Admiral's regiment was extended. At a council held "to discourse about the fitness for entering men presently for manning the fleete," King Charles II. "cried very civilly, 'If ever you intend to man the fleet without being cheated by the capering of times, I pray you take this man in charge.'" This seems to throw some light on the council's order a few days later "to draw out and furnish such numbers of His Majesty's Foot Guards for His Majesty's service at sea this summer, as H.R.H. the duke of York, lord high admiral of England, shall from time to time desire." The men were to be paid and accounted for by their own officers. This maritime force subsequently disappeared, but two new regiments of "marines" were raised in 1694, the House of Commons directing they "were to be employed in the service of the navy only. One regiment to be composed of seamen, and the other of soldiers employed in the dockyards with extra pay. None of the officers were to be sea commanders, save two colonels. The intention was to make these regiments feeders for the navy, captains being ordered to report periodically "the names of such soldiers as shall in any measure be made seamen, and how far each of them is qualified toward being an able seaman." In 1697 these regiments were disbanded, but early in the reign of Queen Anne a number of regiments of marines were raised, and independent companies of marines were also enlisted in the West Indies. At the peace of Utrecht (1713) the marines were disbanded, but reappeared in 1730 as part of the army; and in 1740 three regiments of marines were raised in America, the colonels being appointed by the crown, the captains by the provinces. In 1747 the marine regiments were transferred from the control of the secretary at war to that of the admiralty, and the next year once more wholly disappeared on the treaty of Aix-la-Chapelle (1748).

During the preceding period of fifty-four years the marine force appeared and disappeared with war. It was a military body, applied to naval purposes. Its main functions were three-fold: (1) for fighting in ships; (2) for seizing and holding land positions necessary or advantageous to the naval operations of war; (3) for maintaining discipline of the ships, and by "expertness in handling arms to incite our seamen to the imitation of them." Incidentally the force came to be regarded as so good a feeder for the navy that Admiral Vernon (1739) urged "the necessity of converting most of our marching regiments into marines, and if, as they became seamen they were admitted to be discharged as such, that would make a good nursery for the breeding of them."

The organization of the force was purely military. Regiments were embarked in fleets, and distributed in the ships. The officers were interchangeable with those of the guards and line. John Churchill (afterwards duke of Marlborough) and George Rooke (afterwards Admiral Sir George Rooke) were together at one time ensigns of marines. During this period the marines were never regarded as a reserve for the fleet. The navy in peace did without them. The necessities of maritime war demanded a mobile military force adapted to naval conditions and at naval disposal, and so in all naval operations during these eighty-four years the marines played a conspicuous part. The navy had been slowly groping towards a system. For example, sea officers had been granted a uniform, and a naval academy (1720) had been established for the education of young gentlemen for the sea service. But in its main features the navy remained in 1748 as it was in 1664. The sailor was kidnapped and forced into ships, to become an outcast when no longer wanted. The marine when not in a ship was comfortably housed and looked after by his officers in barracks on shore.

In 1755 the marine force once more reappeared under the Admiralty, and from that date its history has been continuous.
But the regimental system was abandoned, and an entirely new principle of organization was applied. Companies were raised, and these companies were grouped into great depots, called divisions, at Portsmouth, Plymouth and Chatham. At these divisions this force could be increased and reduced at pleasure, without disturbing the basis of organization, and from them could be supplied as many or as few seamen as the navy might desire. The officers of these divisions were responsible for the training of their men, while the care, equipment, and working of the larger ordnance afloat and field-guns ashore, and was employed also as a body of gunnery instructors to the fleet. In 1831, a certain number of naval officers being thought to be sufficiently trained in gunnery, this corps, of which Napier wrote, 'Never in my life have I seen soldiers like the Royal Marine Artillery,' was, without warning, abolished. Then the marine force ceased to be composed of two corps, artillery and infantry, and it reverted to a single one of infantry. Very soon afterwards, however, the Admiralty began to build up what they had so suddenly and ruthlessly destroyed, by ordering the conversion of one company of each infantry marine division into artillery. The number of these artillery companies gradually increased, and were grouped in a separate depot. Just as the wars from Charles II. to George III. had demobilized marines, so the Crimean War led to their increase. Thus in 1859 the artillery companies of marines were formed into a separate division, and in 1862 the old name of Royal Marine Artillery was restored.

The marines thus became once more and still remain two corps, the official designation of the whole being Royal Marine Forces. In 1855 the marine infantry corps became light infantry, and in 1869 the Woolwich division (added in 1853) was abolished; and more recently a marine depot, as a feeder of the other divisions, was established at Walmer. The headquarters of the R.M.A. are at Eastney, Southsea. The divisions R.M.L.I. are at Gosport, and H.M.L. at Sheerness. The uniform of the corps is blue with red facings, that of R.M.L.I. red with blue facings. The badge of both corps is the globe surrounded with the laurel wreath, with the motto 'Per mare per terram.' The Royal Marine Forces share with the 3rd Battalion Grenadier Guards, the East Kent Regiment (formerly the Buffs), and the Royal London Militia the privilege of marching through the city of London with colours flying, bands playing and bayonets fixed. This is due to a common original association with the London train bands.

War Services.—To describe these would be to review the wars waged by England by sea and by land for over 200 years. In every sea fight, great or small, marines have taken part, and on every continent they have served in big and little wars, sometimes as part of the army, sometimes with naval contingents, sometimes alone. Throughout the Napoleonic war the marines took part in every sort of operation afloat and ashore. During the Crimean War, mortar-boat flotillas in the Baltic and Black Sea were commanded and manned by R.M.A. while companies in the same corps served with the Royal Artillery in the trenches before Sebastopol—a marine infantry brigade occupying the heights of Balaklava. During the Indian Mutiny, marines (artillery and infantry) served with the Native Brigade under Peel. In the China wars batteries and brigades of the marine force played a prominent part, and likewise were represented in all the Egyptian and Sudan campaigns, 1881 to 1898. In the final campaign the R.M.A. gunners came to the relief of the Royal Horse Artillery when exhausted, and fought their guns; in another the R.M.A., out of the débris of the enemy's Krupp guns captured, built up one complete gun and fought it with effect; in the final campaign gunboats were brought up in pieces, put together and fought by a detachment of the R.M.A.

In 1889 in the Boer War the marine artillery and infantry took part with the Naval Brigade, maintaining their historic reputation, and the battle of Eckernförde was fought with exceptionally severe fire. Characteristics of Marine System.—The recruit first goes to the depot at Walmer, and is trained as a soldier before joining his division to complete instruction as a marine. His division is his permanent military home, from which he goes on service and to which he returns at its conclusion. Restrictions on marriage, necessary under the army system, are not necessary in the marine forces. The permanent home of the wife and family is not broken up by the marine going abroad; the wife thus can continue any local goodwill in any business her industry may secure. This fixed home enables a marine to learn a trade at the workshops of the division, whether bricklaying, carpentering, building anything, etc., to the corps. Marines are enlisted for 12 years, and if of good character they can re-engage to complete 21 years, entitling to pension. The periods of service abroad for marines are shorter (generally 3 years) than for the army, with exceptions in the case of the Royal Marine Artillery. The administrative, as distinct from the instructional, staff necessary for a marine division is more simple and less expensive than that of a numerical army equivalent in size, and the less complicated nature of pay accounts is also less complex. The following table shows the relative proportions of marine forces to the whole navy at different periods up to the South African War of 1899:

<table>

The above table indicates a gradual change in naval policy and practice. In regard to the navy as a whole, the proportion of warships with the gradual disappearance of masts, sails and yards, the proportion of marines has steadily declined. Down to very recent times the marine spent more time ashore than afloat. Now the reverse is the case. By the introduction of the Continuous Service Act 1853, the blue-jacket was placed on exactly the same footing as the marine in respect

1 Including 22,689 of the engineer branch providing the locomotion of modern ships—just as seamen from 1805-1858 provided it for ships of the past.
of conditions of service and pension, and now the blue-jacket when not atoll is quartered in barracks. The main difference between the blue-jacket and the dress uniform of the dragoon is that the dress uniform is better paid than the marine. As regards opportunity of discipline, there is now no difference; and in short, all the reasons for the existence of a marine force have disappeared except as regards on the coast or in a district such as the holding of ports and the seizing of minor positions necessary to prosecution of maritime war. The facts that modern ships cannot now as for defence upon a single seaport when the enemy forces sufficient for that purpose, and are more dependent on fixed bases of supply and repair than in old days, point to a different method of using and applying the marine force to the sole purpose for which they are now necessary as a distinct branch of the naval service. If employed at the headquarters of a naval station, their efficiency as marines could be preserved by occasional embarkation of the officers and men in rotation. The substitution of marines for seamen at stations would also relieve the army of a class of duties incident to naval warfare which the marine force formerly performed, and which prejudicially affects the organization and arrangement of the army as a mobile field force.

Marine Corps, United States — This dates from the establishment of the American navy. It is a wholly separate military body, though under the control of the Navy Department. It was formed in 1775, and it has a history of brilliant services rendered by land and sea in all the wars of America since that date. The headquarters of the corps are at Washington, and the strength of the corps was fixed by Act of Congress (March 3, 1809) at 211 officers and 3,920 non-commissioned officers and men. Its organization and system are based on the British model, and the dress corresponds to that of the United States army. The corps is organized into battalions of three companies and these are assigned to the several stations. A relation similar to that of a chief of bureau. Although the organization closely follows the army system, regimental or even permanent battalion organizations are impracticable, owing to their numerous and widely-separated stations. Practically all shore stations have barracks where marines are enlisted and drilled. At these places they also do sentry, police and orderly duties. From such stations they are sent to ships for sea duty. Nearly all ships carry a body of marines known as the guard, varying in size from a few men commanded by a sergeant, on small ships, to eighty or more, with one or more commissioned officers, on large vessels. It is customary to cause all marines to serve at sea three of the four years of each enlistment. On board ship they perform sentry and orderly duty, and assist in police duties. They are also instructed in many exercises pertaining to the navy, as rowing, naval signalling, gun drill, &c. In action they act as riflemen, and on many ships serve a portion of the guns. When circumstances require a force to be landed from ships present to guard American interests, ships of war, flags, &c., the marine guard is usually sent, though, if possible, a more efficient, or better armed, force is landed also. Marines also garrison places beyond the territorial limits of the United States which are under naval control. Candidates for first enlistment must be between the ages of 21 and 35 and unmarried, must be citizens of the United States, be able to read, write and speak English, and pass a physical examination. Second lieutenants are appointed from civil life after examination or from the graduates of the Naval Academy. Promotion is by seniority as in the navy.

Admiral Farragut’s opinion that “the marine guard is one of the great essentials of a man-of-war,” is corroborated by that of Admiral Wilkes, who considered that “the marines constitute the great difference between a man-of-war and a privateer.” In the famous battles between the “Bonhomme Richard” and the “Serapis” in 1777, and in that between the “Chesapeake” and “Shannon,” the American marines displayed brilliant gallantry; and while on the one hand they were involved in the bloodiest fighting of the Old World (1793), in which they were most effective, on the other, their story is one of victory. Their use, their strategies, their colours, they on the other shared in the hard fighting of the Mexican War as well as all the important coast actions of the Civil War of 1850–65. A proposal to incorporate them with the army after the struggle met with universal condemnation from the authorities best qualified to judge of their value. A brigade of three battalions served in the Philippines in 1899. Their device is a globe resting on an anchor and surmounted with a gable, with a corner inscription, “Ever faithful to the faith that once set them apart.”

MARINETTE—MARINUS (POPEs) 721

MARINETTE, a city and the county-seat of Marinette county, Wisconsin, U.S.A., 162 m. N. of Milwaukee, on the W. shore of Green Bay, at the mouth of the Menominee River. Pop. (1890), 11,573; (1900), 16,195, of whom 5,552 were foreign-born; (1905), 15,354; (1910), 14,616. It is served directly by the Wisconsin & Michigan, the Chicago, Milwaukee & St Paul, and the Chicago & North-Western railways, and by several steamboat lines connecting with lake ports; and is connected by ferry with Frankfort, Michigan (served by the Ann Arbor railroad). The city has a fine harbour and a considerable commerce in iron and lumber products. Five bridges connect Marinette with Menominee, Michigan, on the other side of the river. Marinette has a Federal building; the Stephenson public library, founded by Senator Isaac Stephenson (b. 1829), a local “lumber king”; a county agricultural school and training school for rural teachers, and three public parks. The Northern Chautauqua Assembly holds annual summer sessions in Chautauqua Park, on the shore of Green Bay. The growth of Marinette began with the development of the neighboring pine forests; and the manufacture of lumber and lumber products has always been its principal industry. The water-power of the Menominee River is largely utilized for the manufacture of paper and flour. Other manufactures are boxes, furniture and woodware, boats, boilers and agricultural machinery. In 1905 the factory products were valued at $3,633,390. The first white settlement was made here on the site of a Menominee Indian village in 1830, and the city was named in honour of the daughter of an Indian chief, Marinette (1811–1887), a niece of Madame de Marie and Antoinette. A city charter was granted in 1887.

MARINI (or MARINO), GIAMBATTISTA (1569–1625), Italian poet, was born at Naples on the 18th of October 1569. After a somewhat disreputable youth, during which he became known for his Canzone de’ baci, he secured the powerful patronage of Cardinal Aldobrandini, whom he accompanied from Rome to Ravenna and Turin. An edition of his poems, La Lira, was published at Venice in 1602–1614. His ungoverned pen and disorderly life compelled him to leave Turin and take refuge from 1615 to 1622 in Paris, where he was favourably recognized by Marie de’ Medici. There his long poem Adone was published in 1623. He died at Naples on the 25th of March 1625. The licence, evocazione and conceits of Mari, the chief of the school of “Scentistii” (see Italy: Literature), were characteristic of a period of literary decadence.

See M. Menghini, G. B. Marini (Rome, 1888).

MARINO, a town of Italy, in the province of Rome, 15 m. S.E. of Rome by rail, and also accessible by electric tramway. Pop. (1901), 7307. It is picturesquely situated on a spur of the Alban Hills, 1165 ft. above sea level, and occupies the site of the ancient Castrimoenium, a municipium of no great importance, though the surrounding district, which now produces much wine, is full of remains of ancient villas. The origin of the name is uncertain; perhaps it is derived from the medieval Morena (itself derived from the Latin Muarena, from one of the Roman owners of the district), a name originally given to the lower ground between the 9th and 11th mile of the Via Latina. In the early 13th century it belonged to the Frangipani family, but passed into the hands of the Orsini in 1266. In 1378 a battle took place here between the partisans of Urban VI. and those of the anti-pope Clement VII. of Geneva (the Orsini having taken the side of the latter), who were, however, defeated; and in 1399 Marino was apparently under the Papacy. In 1406 it passed to the Colonna family, to whom it still belongs. There are remains of the medieval fortifications.

MARINUS, the name of two popes. MARINUS I., sometimes called Martin II., pope from 882 to 884, was the son of a Tuscan priest, and entered the church at an early age, becoming a deacon about 862. Three successive popes sent him as legate to Constantinople, his mission in each case having reference to
the controversy excited by Photius (q.v.); and having become an archdeacon and a bishop, he also negotiated on behalf of pope John VIII. with the emperor Charles the Fat. About the end of December 882 he succeeded John VIII. as pope, but his election did not pass unchallenged either in eastern or in western Europe. However, having secured his position, Marinus restored Formosus, cardinal-bishop of Porto, and anathematized Photius. This pope was on friendly terms with the English king, Alfred the Great. He died in May 884, and was succeeded by Adrian III.

Marinus II., sometimes called Martin III., pope from 942 to 946, was merely the puppet of Alberic (d. 954), prince and seneschal of the Romans. He died in May 946, and was succeeded by Agapetus II.

Marinus, neo-Platonist philosopher, was born in Palestine and was early converted to the old Greek religion. He came to Athens at a time when, with the exception of Proclus, there was a great dearth of eminent men in the neo-Platonic school. It was for this reason rather than for any striking ability of his own that he succeeded to the headship of the school on the death of Proclus. During this period the professors of the old Greek religion suffered severe persecution at the hands of the Christian Romans. Marinus was consequently invited to Epidaurus. His chief work was a biography of Proclus, which is extant. It was first published with the works of Marcus Antoninus in 1559; it was republished separately by Fabricius at Hamburg in 1700, and re-edited in 1814 by Boissoneau with emendations and notes. Other philosophical works are attributed to him, including commentaries on Aristotle and on the Philolaus. It is said that he destroyed the latter because its doctrine, his successor, expressed disapproval of it.

Marinus of Tyre, geographer and mathematician, the founder of mathematical geography, flourished in the 2nd century A.D. He lived before Ptolemy, who acknowledges his great obligations to him. His chief merit was that he assigned to each place its proper latitude and longitude, and introduced improvements in the construction of his maps. He also carefully studied the works of his predecessors and the diaries of travellers. His geographical treatise is lost.

See A. Forbiger, Handbuch der alten Geographie, vol. i. (1842); E. H. Bunbury, Hist. of ancient Geography (1875), ii. p. 519; and especially E. H. Berger, Geschichte der wissenschaftlichen Erdkunde der Griechen (1903).

MARIO, GIUSEPPE, COUNT OF CANDIA (1810-1833), Italian singer, the most famous tenor of the 19th century, son of General di Candia, was born at Cagliari in 1810. His career as a singer was the result of accidental circumstances. While serving as an officer in the Sardinian army he was imprisoned at Cagliari for some trifling offence. When his period of confinement was over, he resigned his commission. His resignation was refused, and he fled to Paris. There his success as an amateur vocalist produced an offer of an engagement at the Opera. He studied singing for two years under M. Ponchard and Signor Bordogni, and made his début in 1835 as the hero of Meyerbeer's Robert le Diable. His success was immediate and complete, but he did not stay long at the Opera. In 1839 he joined the company of the Théâtre Italien, which then included Malibran, Sontag, Persiani and Grisi, Rubini, Tamburini and Lablache. His first appearance here was made in the character of Nemorino in Donizetti's Elise d'Amore. He sang in London for the first time in the same year. His success in Italian opera far surpassed that which he had won in French, and in a short time he acquired a European reputation. He had a handsome face and a graceful figure, and his voice, though less powerful than that of Rubini or that of Tamberlik, had a velvety softness and richness which have never been equalled. Experience gave him ease as an actor, but he never excelled in tragic parts. He was an ideal stage lover, and he retained the grace and charm of youth long after his voice had begun to show signs of decay. He created very few new parts, that of Ernesto in Don Pasquale (1843) being perhaps the only one deserving of mention. Among the most successful of his other parts were Otello in Rossini's opera of that name, Gennaro in Lucrèzia Borgia, Almaviva in Il Barbiere di Siviglia, Fernando in La Favorita, and Manrico in Il Trovatore. Mario made occasional appearances in oratorio singing. He took part in the Birmingham Festival of 1839 and at the Hereford Festival of 1855, and undertook various concert tours in the United Kingdom, but his name is principally associated with triumphs in the theatre. In 1856 he married Giulia Grisi, the famous soprano, by whom he had five daughters. Mario bade farewell to the stage in 1871. He died at Rome in reduced circumstances on the 11th of December 1883.

Marion, Francis (1732-1793), American soldier, was born in 1732, probably at Winyah, near Georgetown, South Carolina, of Huguenot ancestry. In 1750 he entered the British army, and Bluff plantation near Eutaw Springs, in St John's parish, Berkeley county. In 1761 he served as a lieutenant under William Moultrie in a campaign against the Cherokee. In 1775 he was a member of the South Carolina Provincial Congress; and on the 21st of June was commissioned captain in the 2nd South Carolina regiment under W. Moultrie, with whom he served in June 1776 in the defence of Fort Sullivan (Fort Moultrie), in Charleston Harbor. In September 1776 the Continental Congress commissioned him a lieutenant-colonel. In the autumn of 1776 he was appointed major-general, and was appointed governor of Carolina. During the British occupation of Charleston (May 12, 1780) and the defeats of General Isaac Huger at Monk's Corner (Berkeley county, South Carolina) and Lieut.-Colonel Abraham Buford at the Waxhaws (near the North Carolina line, in what is now Lancaster county), Marion organized a small troop—which usually consisted of between 20 and 70 men—the only force then opposing the British in the state. Governor John Rutledge made him a brigadier-general of state troops, and in August 1780 Marion took command of the scanty militia, ill equipped and ill fed. With this force he was identified for almost all the remainder of the war in a partisan warfare in which he showed himself a singularly able leader of irregular troops. On the 20th of August he captured 150 Maryland prisoners, and about a score of their British guard; and in September and October repeatedly surprised larger bodies of Loyalists or British regulars. Colonel Banastre Tarleton, sent out to capture him, despaired of finding the "old swap fox," who eluded him by following swap paths. When General Nathanael Greene took command in the south, Marion and Colonel Henry Lee were ordered in January 1781 to attack Georgetown, but they were unsuccessful. In April, however, they took Fort Waton and in May Fort Motte, and they succeeded in breaking communications between the British posts in the Carolinas. On the 31st of August Marion rescued a small American force hemmed in by Major C. Fraser with 500 British; and for this he received the thanks of Congress. He commanded the right wing under General Greene at Eutaw Springs. In 1782, during his absence as state senator at Jacksonsborough, his brigade deteriorated and there was a conspiracy to turn him over to the British. In June of the same year he put down a Loyalist uprising on the banks of the Pedee river; and in August he left his brigade and returned to his plantation. He served several terms in the state Senate, and in 1784, in recognition of his services, was made commander of Fort Johnson, practically a courtesy title with a salary of £500 per annum. He died on his estate on the 27th of February 1795. Marion was small, slight and sickly-looking. As a soldier he was quick, watchful, resourceful and calm, the greatest of partisan leaders in the bitter struggle in the Carolinas.

See the Life (New York, 1844) by W. G. Simms; Edward McCandys, South Carolina in the Revolution (New York, 1901-1902); and a careful study of Marion’s ancestry and early life by “R. Y.” in vols. i. and ii. of the Southern and Western Monthly Magazine and Review (Charleston, 1845).

Marion, Henri François (1846-1896), French philosopher and educationalist, was born at Saint-Parize-en-Viry (Nièvre) on the 9th of September 1846. He studied at Nevers, and at the École Normale, where he graduated in 1868. After occupying several minor positions, he returned to Paris in 1875 as professor
of the Lycée Henri IV, and in 1886 he became docteur-en-lettres.

In the same year he was elected a member of the Council of Public Instruction, and devoted himself to improving the scheme of French education, especially in girls' schools. He was largely instrumental in the foundation of écoles normales in provincial towns, and himself gave courses of lectures on psychology and practical ethics in their early days. He died in Paris on the 5th of April 1896.

His chief philosophical works were an edition of the Théodicée of Leibnitz (1874), a monograph on Locke (1879), De nomé et droits de l'homme (1880), Glissounus urum Leibniz de natura substantiae cogitanti quidquid iriuberi (1880); De La solidarité morale (4th ed., 1893). His lectures at Fontenay have been published in two volumes entitled Légons de psychologie appliquée à l'Education, and Légons de morale; those delivered at the Sorbonne are collected in L'Éducation dans l'université (1892).

**MARION**, a city and the county-seat of Grant county, Indiana, U.S.A., about 60 m. N.E. of Indianapolis, on the Mississinewa River. Pop. (1910), 19,359. It is served by the Chicago, Cincinnati & Louisville, the Cleveland, Cincinnati, Indianapolis, St. Louis, the Pittsburgh, Cincinnati, Chicago & St. Louis, and the Toledo, St. Louis & Western railways, and by interurban electric lines connecting with Indianapolis, Muncie, Fort Wayne, Kokomo and many other towns and cities. The city is the seat of the Marion Normal College and Business University, and has a Carnegie library. Marion lies in a good farming country and in the centre of the state's natural gas region. Among the manufactures are glass, stoves, iron bedsteads, foundry and machine-shop products, steel, planing-mill products, paper, pulp and leather. The total value of the factory products in 1910 was $4,290,166, or the value of the glass product alone being $1,042,057, or 24.3% of the total. Marion was settled in 1823 and was named in honour of General Francis Marion.

**MARION**, a city and the county-seat of Marion county, Ohio, U.S.A., 44 m. N. by W. of Columbus. Pop. (1900), 11,862, including 782 foreign-born and 112 negroes; (1910), 18,232. Marion is served by the Pennsylvania, the Erie, the Cleveland, Cincinnati, Chicago & St. Louis, and the Hocking Valley railways, and by interurban electric railway to Columbus. It is the trade centre of a rich farming district. Limestone is abundant, and the city has various manufacturing concerns, foundries, machine-shop products, agricultural implements, planing-mill products, engines, steam shovels, dredges, pianos and silks. In 1905 the value of factory products was $3,227,712, being 33.1% greater than in 1900. Marion was laid out in 1821, and was chartered as a city in 1890.

**MARIONETTES** (probably from Ital. maria, a fool or buffoon, but also said to be derived from the marieleeti, or little figures of the Virgin Mary), FANZOCCHI (from fantino, a child) or PUPPETS (It. puppa), are a baby or doll-like figure representing the figures, generally below life-size, suspended by threads or wires and imitating with their limbs and heads the movements of living persons.

The high antiquity of puppets appears from the fact that figures with movable limbs have been discovered in the tombs of Egypt and among the remains of Etruria; they were also common among the Greeks, from whom they were imported to Rome. Plays in which the characters are represented by puppets or by the shadows of moving figures, worked by concealed performers who deliver the dialogue, are not only popular in India and China, but during several centuries past maintained an important position among the amusements of the people in most European countries. Goethe and Lessing deemed them worthy of attention; and in 1721 Le Sage wrote plays for puppets to perform.

The earliest performances in English were drawn or founded upon Bible narratives and the lives of the saints, in the same vein as the "morals" plays which they succeeded. Popular subjects in the 16th century were The Prodigal Son and Ninian, with Jonah and the Whale. And in a pamphlet of 1611, describing Bartholomew Fair, we read, "Here a knave in a fool's coat, with a trumpet sounding or a drum beating, invites you to see his puppets. Here a rogue like a wild woodman, or in an antick shape like an incubus, desires your company to view his motion." In 1679 Pepys recorded how at Bartholomew Fair he found "my Lady Castlemaine at a puppet play, Patient Grizzil." Besides The Sorrows of Griselda, other puppet plays of the period were Dick Whittington, The Vagaries of Merry Andrew, and The Humours of Bartholomew Fair. Powell's noted marionette show was the subject of an article in The Tatler, 1709, and again in The Spectator, 1711. The latter refers to the pathetico-tragicomically fantastic nature of the divinities of Olympus and descended to the strains of music. An idea of the class of representation may be gathered from an advertisement of Crawley, a rival of Pinkethman, which sets forth—"The Old Creation of the World, with the addition of Noah's Flood," also several fountains playing water during the time of the play. The best scene represented "Noah and his family coming out of the ark, with all the animals two by two, and all the fowls of the air seen in a prospect sitting upon trees; likewise over the ark is the sun rising in a gaudy manner; scene of the figures, painted upon a flat surface, the angels ringing bells. "Likewise machines descending from above, double, with Dives rising out of hell and Lazarus seen in Abraham's bosom; besides several figures dancing jigs, sara-bands, and country dances, with the merry conceits of Squire Punch and Sir John Spendall." Yates showed a moving picture of a city, with an artificial cascade, and a temple—with mechanical birds in which attention was called to the exact imitation of living birds, the quick motion of the bills, just swelling of the throat, and fluttering of the wings. The puppets were on stages 5 ft. in state on either side. In the 18th century, Flockton's show presented five hundred figures at work at various trades. Brown's Theatre of Arts showed at country fairs, from 1830 to 1840, the battle of Trafalgar, Napoleon's army crossing the Alps, and the marble palace of St Petersburg; and at still a later date Clapton's similar exhibition Grace Darling rescuing the crew of the "Forfarshire" steam-wrecked on the Fern Islands, with many ingenious moving figures of quadrupeds, and, in particular, a swan which dipped its head into imitation water, opened its wings, and with flexible neck preened and trimmed its plumage. In these mechanical mechanical arrangements for accomplishing the tricks of pantomime harlequinade. Among the puppet personages presented in the small street shows are generally included a sailor who dances a hornpipe, a hoop-dancer, a dancer of the Highland fling, a country pensioner, a vaunter on a pole also balancing two chairs, a clown playing with a butterfly, a dancing figure without head until the head rises out of the body, gradually displaying an enormous long goatee, a skeleton in a skeleton, and a Frenchman in a skeleton stage, but piece successively flying to piece, the body first sitting up, then standing, and finally capped by the skull, when the complete figure begins to dance. Ombres Chinoises are performances by means of the shadows of figures projected upon a stretched sheet of thin calico or a gauze scene painted as a transparency. The cardboard flat figures are held behind this screen, illuminated from behind—the performer supporting each figure by a long wire held in one hand while wires
MARIOTTE, there only stay the communication. The first volume of the *Histoire et mémoires de l'Académie* (1733) contains many original papers by him, upon a great variety of subjects, such as the air and its movements, the nature of colour, the notes of the trumpet, the barometer, the fall of bodies, the recoil of guns, the freezing of water, &c.

His *Essai de physique*, four in number, of which the first three were published at Paris between 1676 and 1679, are his most important works, and form, together with *Traité de la percussion des corps*, the first volume of the *Oeuvres de Mariotte* (2 vols., Leiden, 1717). The second of these essays (*De La nature de l'air*) contains the statement of the law that the volume of a gas varies inversely as the pressure, which, though very generally called by the name of Mariotte, had been discovered in 1660 by Robert Boyle. The fourth essay is a systematic treatment of the nature of colour, with a description of many curious experiments and a discussion of the rainbow, halos, parhelia, diffraction, and the more purely physiological phenomena of colour. The discovery of the blind spot is noted in a short paper in the second volume of his collected works.

MARITOSAN, or YOKUTS, a linguistic stock of North American Indians, including some 40 small tribes. Its former territory was in southern California, around Tulare lake. The Maritonsans were fishermen and hunters. Their villages consisted of a single row of wedge-shaped huts, with a ring of brush along the front. In 1850 they numbered some 3000; in 1905 there were 154 on the Tule river reservation.

MARIUS, JACOB (1837–1890), Dutch painter, first studied at the Antwerp Academy, and subsequently in Hébert's studio during a stay in Paris from 1865 till 1871. He returned to Holland when the Franco-Prussian War broke out, and died there in August 1890. Though he painted, especially in early life, domestic scenes and interiors invested with deeply sympathetic feeling, it is as a landscape painter that Marius will be famous. He was the painter of bridges and windmills, of old quays, massive towers, and level banks; even more was he the painter of water, and misty skies, and chancing clouds. In all his works, whether in water or oil colour, and in his etchings, the subject is always subordinate to the effect. His art is suggestive rather than decorative, and his force does not seem to depend on any preconceived method, such as a synthetic treatment of form or gradations of tone. And yet, though his means appear so simple, the artist's mind seems to communicate with the spectator's by directness of pictorial instinct, and we have only to observe the admirable sense of composition and truthful perspective to understand the sure knowledge of his business that underlies such purely impressionist handling. Marius has shown all that is gravest or brightest in the landscape of Holland, all that is heaviest or clearest in its atmosphere—for instance, in the "Grey Tower, Old Amsterdam," in the "Landscape near Dordrecht," in the "Sea-weed Carts, Scheveningen," in "A Village Scene," and in the numerous other pictures which have been exhibited in the Royal Academy, London (1885, 1886, 1887, 1888); Brussels and Holland, and in various private collections. "No painter," says M. Philippe Zilcken, "has so well expressed the ethereal effects, bathed in air and light through floating silvery mist, in which painters delight, and the characteristic remote horizons blurred by haze; or again, the grey yet luminous weather of Holland, unlike the dead grey rain of England or the heavy sky of Paris."

See Max Rooses, *Dutch Painters of the Nineteenth Century* (London, 1893); and Jacobus van Marum, "Ph. Zilcken, Peintres Hollandais modernes" (Amsterdam, 1893); Jan Veth, "Een Studie over Jacob Maris," *Onze Kunst* (Antwerp, 1902).

**MARITIME PROVINCE** (Russ., Primorskaya Oblas'), a province of Russia, in East Siberia. It consists of a strip of territory along the coast of the Pacific from Korea to the Arctic Ocean, including also the peninsula of Kamchatka, part of the island of Sakhalin, and several small islands along the coast. Its western boundary stretches northwards from a point S.W. of Peter the Great Bay (43° 40' N.) by Lake Hanka or Khanka and along the Usuri, then goes due north from the mouth of the Usuri as far as 52° N., runs along the Stanovoi watershed, crosses the spurs of this plateau through barren tundra, and finally reaches the Arctic Ocean at Chann Bay (75° N.). Area, 715,735 sq. m.

The northern part lies between the Arctic Ocean and the Seas of Okhotsk and Amur. The country is half forest, half tundra, the latter consisting of a chain of mountains, several summits of which reach 8000 ft. (Malakchinga peak), while the promontories by which the Asian coast is terminated. Harris Bering Strait runs up to 1000 to 2000 ft. Only lichens and mosses, with a few dwarf species of Siberian trees, grow in this district. The fauna, however, is far richer than might be expected. A few American birds and mammals cross the strait when it is frozen. This country, and the seas which surround it, have for the last two centuries supplied Siberian trade with its best furs. The blue fox and black sable have been nearly exterminated, and the whale has become very rare. The sea-otter is rapidly becoming rare, though it has the same altitude as Maritelles, the average yearly temperature of the sea-cow (Rhytina stelleri) was completely extinguished in the course of forty years. The sea-bear (Olaria ursina), which, at one time was the only bear in Asia, has largely been exterminated, and multiplies rapidly. The middle part of the province is a low strip (40 to 60 m. wide) along the Sea of Okhotsk, including the basin of the Udja in the south. This area is occupied by rugged mountains, from 2000 to 3000 ft. high, and is intersected by the rivers of East Siberia. Thick forests of larch cloth the mountains half way up, as well as the deep valleys. The undulating hills of the basin of the Udja, which is a great river, runs to the south-west, between the Stanovoi and Bureya mountains, of the deep indentation of the Sea of Okhotsk, are covered with forests and marshes.

The southern part of the province includes two distinct regions. From the north-east the coast is the Bureya, or Little Khingan range, of which the group of the Shanter Islands is a continuation, a wide, deep depression runs south-west to the confluence of the Amur and the Usuri, and thence to the lowlands of the lower Sungari. This is the region on the right banks of the Amur and the Usuri, between these rivers and the coast, is occupied by several systems of mountains, usually represented as a single range, the Sikhota-alin. The summits reach 3150 ft. (Golaya Gora), and the average elevation of the few passes is about 2500 ft. There is, however, one depression occupied by Lake Kidzi, which may have been at one time an outflow of the Amur to the sea. The Sikhota-alin ranges are covered with imperceptible forests. The flora and fauna of this region (especially in the Usuri district) exhibit a striking combination of species of the Japanese and Siberian regions, with the addition of plants which clings to the larch and the cedar-pine, and the tiger meets the sable and the sable. The quantity of fish in the rivers is immense, and in August the Amur and the Usuri swarm with salmon.

The basin of the Amur, on the southern extremity of the valley of the Sufleng river, which enters the Pacific in the Gulf of Peter the Great, and on the shores of the bays of the southern extremity, is even there the climate is very harsh. The warm current of the Kero-Siwo does not reach the coasts of Siberia, while a cold current originating in the Sea of Okhotsk brings its icy water and chilling fogs to the coasts of Sakhalin, and flows along the Pacific shore to the eastern coast of Korea. The high mountains of the sea-coast and the monsoons of the Chinese Sea produce in the southern parts of the Maritime Province cold winters and wet summers. Accordingly, at Vladivostok (on the Gulf of Peter the Great), although it has the same latitude as Hokkaido, the January temperature is only 39° F., and the harbour is frozen for nearly three months in the year; the Amur and the Usuri are frozen in November. Toward the end of March, the ice, formed by the Amur, which destroys the harvests and give rise to serious inundations of the Amur. The sea-coast farther north has a continental and arctic climate. At Nikolayevsk, temperatures as low as −41° F. are observed in winter, and as high as 84° F. in summer, the average yearly temperature being below zero (−9°). At Ayan (56° 27' N.), the average temperature of the year is 25° (−4° in winter and 52° in summer), and at Otkhotko (59° 21' N.), it is 25° (−6° in winter and 52° in summer). Russian settlements occur throughout the whole of the province, but, with the exception of those on the banks of the Amur and the Usuri, and on the southern parts of the sea-coast, they are mere centres of administration.

Okhotsk is one of the oldest towns of East Siberia, having been founded by Peter the Great (1690). Khabarovsk, formerly the capital of the Maritime Province; but the difficulties of navigation and of communication with the interior, and the complete failure of the governmental colonization of the Amur,
caused the seat of government to be transferred to Khabarovsk. Since the loss (1905) of Port Arthur to the Japanese, Vladivostok on Peter the Great Bay has again become the chief naval station of Russia on the Pacific. Over the waves of the Sea of Okhota are sent the bands of the Chinese, who export stags' horns, seaweed and mushrooms, and of the Germans, who import groceries and spirits.

The total population was 209,516 in 1897, of whom 57.7% were Russians, 18.7% by Tungus, 11.6% by Orochaks, 9.2% by Chuvantses, 2.5% by Koryaks, 1.7% by Ghilyaks and Kamchadaleas. Their chief occupations are hunting and fishing; the Russians carry on agriculture and trade in furs. Active measures were taken in 1883–1897 for increasing the Russian population in the South Usuri district, the result being that over 29,000 immigrants, chiefly Little Russian peasants, settled there; while Cossacks from the Don and Cherkassy have been brought to the Transbaikalian, the Amur and the province of Manchuria, gradually developing in the South Usuri region. Gold-mining has been started on the Angum, a tributary of the Amur. Coal is found near Vladivostock, as well as in Kamchatka. Roads exist only in the South Usuri district. A railway runs from Vladivostock to Nikol'sk (69 m.), and thence to Khabarovsk along the right bank of the Usuri (412 m.). At Nikol'sk the Manchurian railway begins.

(M. A. K.; J. T. B.)

MARITIME TERRITORY, a term used in international law to denote coastal waters which are not Territorial Waters though in immediate contact with the sea. In the case of Territorial Waters (q.v.) the dominion of the adjacent state is subject to a limit of three miles; all territory is not subject to any limitation. Thus any strait through which the right of passage of foreign vessels can be forbidden (as the Solent or the Inland Sea of Japan), or bays so land-locked that they cannot be held to form part of any ocean-highway, are maritime territory.

MARIUPOL, a seaport of Russia, on the north shore of the Sea of Azov, at the mouth of the Kalmius, in the government of Ekaterinoslav, 67 m. W. of Taganrog. Pop. (1900), 52,770, including the inhabitants of two suburbs, Mariinsk and Kara-su. The place is said to have been inhabited in remote times under the name of Makhata; but the history of the town is not included in 1779, by Greek emigrants from the Crimea. Its inhabitants are engaged in agriculture, cattle-breeding, fishing, and the manufacture of leather, agricultural implements, iron goods and bricks. In export trade Mariupol ranks next to Taganrog among the ports of the Sea of Azov; but its harbour is open to the south-east and shallow, though it is being gradually deepened by systematic dredging. The principal articles of export are cereals, with some olivecake, phosphate and coal; but the total value is only about £2,000,000 annually. The imports do not reach a million sterling.

MARIUS OF AVENCHES (or AVENCIUM) (d. 593 or 594), chronicler and ecclesiastic, was born in the neighbourhood of Autun probably in 530, and became bishop of Avanches about 573. In addition to being a good bishop, Marius was a clever goldsmith; he was present at the council of Mâcon in 585, and transferred the seat of his bishopric from Avanches to Lausanne. He died on the 31st of December 593 or 594. As a continuation of the Chronicon of Prosper of Aquitaine, Marius wrote a short Chronicon dealing with the period from 455 to 581; and although he borrowed from various sources his work has some importance for the history of Burgundy. Regarding himself and his land as still under the authority of the Roman empire, he dates his Chronicon according to the years of the Roman consuls and of the East Roman emperors.

The only extant manuscript of the Chronicon is in the British Museum. Among several editions may be mentioned the one in the Monumenta Germaniae historica, chronica minora, Band II. (1893), with introduction by T. Mommsen; the work has some importance for the history of Burgundy. Regarding himself and his land as still under the authority of the Roman empire, he dates his Chronicon according to the years of the Roman consuls and of the East Roman emperors.

MARIUS, GAUS (155–86 B.C.), Roman general, of plebeian descent, the son of a small farmer of Cesarca (mod. Casamare, "home of Marius") near Arpinum. He served first in Spain under the great Scipio Africanus, and rose from the ranks to be an officer. In 189 B.C. he was one of a number who brought his province to the Senate of the Senate of the North. He obtained from them a commission to the Aedileship. When about forty years of age he married a lady of patrician rank, Julia, the aunt of Julius Caesar. This gave him a new social status, and being at the same time a popular favourite and a brave, energetic soldier, he was in 115 elected praetor, in which capacity he effected the subjugation of the troublesome province of Further Spain. In the war with Jugurtha (109–106) he came to the front as lieutenant of the consul Quintus Cæcilius Metellus Numidicus. When he had already achieved some successes over Jugurtha (q.v.), in 107 he was elected consul for the first time (an almost unheard-of honour for a "new man"), his popularity with the army and people being sufficient to prevent his election to a new post. In the following year, in conjunction with Sulla, he brought the war to a triumphant issue, and passed two years in his province of Numidia, which he thoroughly subdued and annexed. The surrender of the person of Jugurtha to Sulla gave rise to the view that he, not Marius, had really ended the war, and so laid the foundation of the subsequent enmity between the two leaders.

By this time Marius was generally recognized as the ablest general of the day, and was appointed to the chief command against the Cimbri and Teutones. Two Roman armies had been lost near the valley of the Aven, and it seemed as if a repetition of the disaster of the Allia and the capture of Rome itself might not be impossible. Marius, out of unpromising materials and a demoralized soldiery, organized a well-disciplined army, with which he inflicted on the invaders two decisive defeats, the first in 102 at Aquae Sextiae (Aix), 18 m. north of Marseilles, and the second in the following year on the Raudian plain near Verceiliae (Vercelli), about midway between Turin and Milan. For some centuries afterwards Rome remained un molested by northern barbarians. In 101 Marius was elected consul a fifth time (previously in 107, 104, 103, 102), hailed as the "saviour of his country," and honoured with a triumph of unprecedented splendour.

The glorious part of his career was now over. Though a very able soldier, he was without the intellectual culture which the Gracchi, his political ancestors, possessed. As a politician he on the whole failed, though he retained the confidence of the popular party almost to the last. But he unfortunately associated himself with the demagogues Saturninus (q.v.) and Glauca, in order to secure the consuls'ship for the sixth time (100). The manner in which he turned against his former associates (although he probably had no choice in the matter) alienated the sympathies of the plebs; and Marius, feeling that his only chance of rehabilitation lay in war, left Rome for Asia, where he endeavoured to provoke Mithradates to hostilities. On his return he served as legate in the Social War (90), and defeated the Marsi on two occasions. In 88 war broke out with Mithradates, and Sulla was appointed by the senate to the chief command, which was eagerly desired by Marius. This led to a rupture. With the assistance of the tribune Sulpius Rufus, Marius succeeded in getting the command transferred to himself. Sulla marched upon Rome and defeated Marius, who fled to the marshes of Minturnae in Latium. He was discovered and taken prisoner; and the local magistrates, in accordance with Sulla's proclamation, resolved to put him to death. The Gallic trooper sent to strike off the old man's head quailed, it is said, before the fire of his eyes, and fled exclaiming, "I cannot kill Gaius Marius." The inhabitants out of compassion then allowed Marius to depart, and put him on board a ship which conveyed him to Carthage. When forbidden to land, he told the messenger to inform the governor that he had seen Marius sitting as a fugitive among the ruins of Carthage. Having been joined by his son, he took refuge in the island of Cercina. Meantime, Sulla having left Italy for the Mithradatic war, Cinna's sudden and violent revolution put the senate at the mercy of the popular leaders, and Marius greedily caught at the opportunity of a bloody vengeance, which became in fact a reign of terror in which senators and nobles were slaughtered wholesale. He had himself elected consul for the fifth time, in fulfilment of a prophecy given to him in early manhood. Less than three weeks afterwards he died of fever, on the 13th of January 86.
Marivaux was not only a great general, but also a great military reformer. From his time a citizen militia was replaced by a professional soldiery, which had hitherto been little liked by the Roman people. He further made the cohort the military unit instead of the maniple, and his cavalry and light-armed troops were drawn from foreign countries, so that it may be said that Marivaux was the originator of the mercenary army. The Roman soldier was henceforth a man who had no trade but war. A great general could hardly fail to become the foremost man in the state. Marivaux, however, unlike Caesar, did not attempt to overturn the oligarchy by means of the army; he used rather such expedients as the constitution seemed to allow, though they had to be backed up by riot and violence. He failed as a political reformer because the merchants and the moneyed classes, whom the Gracchi had tried to conciliate, feared that they would themselves be swept away by a revolution of which the mob and its leaders would be the ultimate controllers. Marivaux had a decided tinge of fanaticism and superstition. In canvassing for the consulship he was guided by the counsels of an Etruscan soothsayer, and was accompanied in his campaigns by a Syrian prophetess. The fashionable accomplishments of the day, and the new Greek culture, were wholly alien to his taste.

For the life of Marius the original sources are numerous passages in Cicero's works, Sallust's Jugurtha, the epitomes of the lost books of Livy, the three histories of Sallustius, Vellius Paterculus, Florus and Appian's Bellum civil. See F. D. Gerich, Marius et Sulla (Basil, 1886); I. Gilles, Campagne de Marius dans la Gaule (1870); W. Votsch, Marius als Reformator des römischen Heerwesens (with notes and references to ancient authorities, 1886); A. H. J. Greenidge, History of Rome, vol. i. (1904); also Rome: History, II. "The Republic."

MARIVAUX, PIERRE CARLET DE CHAMBLAIN DE (1688-1753), French novelist and dramatist, was born at Paris on the 4th of February 1688. His father was a financier of Norman extraction whose real name was Carlet, but who assumed the surname of Chamblain, and then superseded that of Marivaux. M. Carlet de Chamblain was a man of good reputation, and received the appointment of director of the mint at Riom in Auvergne, where and at Limoges the young Pierre was brought up. It is said that he developed literary tastes early, and wrote his first play, the Père prudent et équitable, when he was only eighteen; it was not, however, published till 1712, when he was twenty-four. His chief attention in those early days was paid to novel writing, not the drama. In the three years from 1713 to 1715 he produced three novels—Effets surprenants de la sympathie, La Voituré embarrassée, and a book which, Plutarch's Lives—Pharsamone, Les Polies romans, and Le Don Quichotte moderne. All these books were in a coarse strain, not in the least resembling the pieces which long afterwards were to make his reputation, but following partly the Spanish romances and partly the heroic novels of the preceding century, with a certain intermixture of the marvellous. Then Marivaux's literary ardour took a new phase. He fell under the influence of Antoine Honard[d] de La Motte, and thought to serve the cause of that ingenious paradoxer by travestying Homer, an ignoble task, which he followed up (perhaps, for it is not certain) by performing the same office in regard to Fénelon. His friendship for La Motte, however, introduced him to the Mercure, the chief newspaper of France, where in 1717 he produced various articles of the "Spectator" kind, which were distinguished by much keenness of observation and not a little literary skill. It was at this time that the peculiar style called Marivaudage first made its appearance in him. The year 1720 and those immediately following were very important ones for Marivaux; not only did he produce a comedy, now lost except in small part, entitled L'Amour et la vérité, and another and far better one entitled Arlequin folli et l'amour, but he wrote a tragedy, Annibal (printed 1727), which was and deserved to be unsuccessful. Meanwhile his literary affairs underwent a sudden revolution. His father had left him a comfortable subsistence, but he was persuaded by friends to risk it in the Mississippi scheme, and after vastly increasing it for a time lost all that he had. His prosperity had enabled him to marry (perhaps in 1721) a certain Mlle Martin, of whom much good is said, and to whom he was deeply attached, but who died very shortly. His pen now became almost his sole resource. He had a connection with both the fashionable theatres, for his Annibal had been played at the Comédie Française and his Arlequin folli at the Comédie Italienne, where at the time a company who were extremely popular were called the comedians de la Noblesse et de la Cour. His plays, however, were established. He endeavoured too to turn his newspaper practice in the Mercure more to account by starting a weekly Spectateur Français (1722-1723), to which he was the sole contributor. But his habits were the reverse of methodical; the paper appeared at the most irregular intervals; and, though it contained some excellent work, its irregularity killed it. For nearly twenty years the theatre, and especially the Italian theatre, was Marivaux's chief support, for his pieces, though they were not ill received by the actors at the Français, were rarely successful there. The best of a very large number of plays (Marivaux's theatre numbers between thirty and forty items) were the Surprise de l'amour (1722), the Triomphe de Piutres (1728), the Jeu de l'amour et du hasard (1730), Les Fauxes confidences (1737), all produced at the Italian theatre, and Le Legs (1736), produced at the French. Meanwhile he had at intervals returned to both his other lines of composition. A periodical publication called L'Indigent philosophe appeared in 1727, and another called Le Cabinet du philosophe in 1734, but these reviews which were so much fatal to the Spectateur prevented these later efforts from success. Marivaux published the first two parts of his best and greatest work, Marianne, a novel of a new and remarkable kind. The eleven parts appeared in batches at intervals during a period of exactly the same number of years, and after all it was left unfinished. In 1735 another novel, Le Paysan parvenu, was begun, but this also was left unfinished. He was elected a member of the Academy in 1742. He survived for more than twenty years, and was not idle, again contributing occasionally to the Mercure, writing plays, and essays (which were seldom of much worth), and so forth. He died on the 12th February 1753, aged seventy-five years.

The personal character of Marivaux was curious and somewhat contradictory, though not without anomalies, one of the closest of which is to be found in Goldsmith. He was, however, unlike Goldsmith, at least as brilliant in conversation as with the pen. He was extremely good-natured, but fond of saying very severe things, unhesitating in his acceptance of favours (he drew a regular annuity [from Marivaux]), but never too much to be forced away. He was very touchy, yet at the same time, it was said, considerably, of the source of which he was ignorant. His extreme sensitiveness is shown by many stories. He had one daughter, who took the veil, the duke of Orleans, the regent's successor, furnishing her with her dowry.

The so-called Marivaudage is the main point of importation about Marivaux's literary work, though the best of the comedies have great merit. Marivaux's is the first of the many imitations of the great development of the French novel—legitimatize, that is, in opposition to the brilliant but episodic productions of Le Sage. Its connection, and that of Le Paysan parvenu, with the satires of Richardson but of Fielding is also an interesting though a difficult subject. The subject matter of Marivaux's peculiar style has been generally and, with tolerable exactness described as the metaphysic of love-making. His characters, in a happy phrase of Claude Prosper Jolyot de Crébillon's, not only tell each other and the reader everything they have thought, but everything that they would not choose to persuade the other of. The style chosen for this is justly regarded as derived mainly from Fontenelle, and from them to the Préceuses, though there are traces of it even in La Bruyère. It abuses metaphor somewhat, and delights to turn off a metaphor itself in some unexpected and bizarre fashion. Now it is a familiar phrase which is used where dignified language would be expected; now the reverse. In the criticism of Crébillon and others already advanced, Marivaux's is the style of Marivaux's being an introduction to each other of words which have never made acquaintance, and which think that they
MARJORAM—MARK, ST.

727

Once more Mark's name occurs in the New Testament, this time with yet another leader, Peter, the friend of his earliest Christian years in Jerusalem, to whom he attached himself after the deaths of Barnabas and Paul. Peter's words, "Mark, my son," show how close was the spiritual tie between the two. Peter thought well of young Mark (1 Pet. v. 13); and as he is writing from Rome ("Babylon") he has in mind the change of policy it implied, this forms a link between the New Testament and early tradition, which speaks of Mark as an Evangelist writing his Gospel under the influence of Peter's preaching (in Rome). This is the essence of the tradition preserved from "the elders of former days" by Clement of Alexandria (in Eus. ii. 15, vi. 14), a tradition probably based on Papias's record (cf. Eus. iii. 30) of the explanation given by "the Elder" (John) as to the contrast in form between Mark's memoirs (his Letters and the Gospel of Matthew (see Gospels; Papias), but defining the place where these memoirs were written as Rome. That he acted to some degree as Peter's interpreter or dragoon (imagewpez), owing to the apostle's imperfect mastery of Greek, is held by some but denied by others (e.g. by Zahn). His rôle throughout his career was "servus servorum dei; and the fact that he was this successively to Barnabas, Paul and Peter, helps to show the essential harmony of their message.

The identification of the author of the second Gospel with Mark, who were to tradition, enables us to fill in our picture of his life. The little that is certain is that he travelled in Greece, to the youth of (the year 40), to whom his Gospel refers. He was in Rome (iv. 51 seq.; cf. his detailed knowledge as to the place of the last supper, 13 seq.). It is probably as evangelist, and not in his own person, that he became known as "he of the stunted extremities" (katafotboktion, "curt-fingered"), a title first found in Hippolytus (Haer. vii. 30), in a context which makes its metaphorical reference to his Gospel pretty evident. It was too as evangelist that he became personally a subject of later interest, and of speculative legends due to this, e.g. he was one of the Seventy (fifty found in Adamantius, Dial. de recta fide, 4th century), he was the founder of the Alexandrine Church (recorded as a tradition by Eusebius, ii. 16) and his first bishop (id. ii. 2), and was author of the local type of liturgy (cf. the Acts of Mark, ch. vii., not earlier than the end of the 4th century).

As to his last days and death nothing is really known. It is possible—event probably, if we accept the theory that he had already been there with Barnabas—that Alexandria was his final sphere of work, as the earliest tradition on the Gospel of Mark implies (the Syriac reference, the Acts of the 6th century, probably after Julius Africanus in the early 3rd century), and as was widely assumed in the 4th century. That he died and was buried there is first stated by Jerome (De vir. ill. 8), to which his Acts adds the glory of martyrdom (cf. Ps.-Hippolytus, De LXX Apostolis).

LITERATURE.—H. B. Swete, The Gospel acc. to St Mark (1898), Introduction, § 1, where the authorities are fully cited; also the art. in Hastings's Dict. Bible. The Patristic and other legends are discussed at length by R. A. Lapaus, Die apokr. Apostelgesch. u.v.m. (1884), ii. 2, and T. Schermann, Propheten- und Apostelllegenden (1907), 265 seq. (with sepulchral reference to Ps.-Hippolytus and Ps.-Dorothesus).

Medieval Legends.

The majority of medieval writers on the subject state that Mark was a Levite; but this is probably no more than an inference from his supposed relationship to Barnabas. The Alexandrian tradition is that he was of Cyrenean origin and Soterius, a writer of the 10th century, adds to this the statement that his father's name was Aristobulus, who, with his wife Mary, was driven from the Pentapolis to Jerusalem by an invasion of barbarians.
in turn; Augustine and Bede think that Mark is designated by the "man"; Theophylact and others think that he is designated by the eagle; Anastasius Sinaita makes his symbol the ox; but medieval art acquiesced in the opinion of Jerome that he was indicated by the lion. Most of the martyrs and calumniators have fixed April 25 as the day on which he should be commemorated; but the Martyr. Hieron. gives the 23rd of September, and some Greek martyrologists give the 11th of January. This unusual variation probably arises from the diversity of opinions as to whether there was one Mark or more than one.

See Canon Molini of Venice, De vita et ipsipanis S. Marci Evangeliar, edited, after the author's death, by S. Pieri, the librarian of the Bibliotheca Lessiana (1866); K. A. Lipsius, Die apokryphen Apostelgesch. und Apostellegenden (1883 fol.), vol. ii. part 2, pp. 321-353.

MARK, a word of which the principal meanings are in their probable order of development, boundary, an object set up to indicate a boundary or position; hence a signification, impression or trace. The word in O. Eng. is meor, and appears in all Teutonic languages, cf. Du. merk, Ger. Mark, boundary, marken, sign, impression; Romanic languages have borrowed the word, cf. Fr. marque, It. marca. Cognate forms outside Teutonic have been found in Lat. margo, "margin," and Pers. marz, boundary. Others would refer to the Lith. margas, striped, parti-coloured, and Sanskrit marga, trace, especially of hunted game. In the sense of boundary, or a tract of country or near a boundary or frontier, "mark" in English usage has been supplanted by the Teutonic "mark." Its most ancient meaning is "the place to which aΛωος has been assigned" (see Mark System), and also historically the name of certain principalities, such as the Mark of Brandenburg. The Italian marca is also sometimes rendered by "mark," as in the mark of Ancona.

Mark is also the name of a modern silver coin of the German empire. This is apparently a distinct word and not of Teutonic origin; it is found in all Teutonic and Romanic languages, Latinized as marca or marcius. The mark was originally a name given to a weighing weight, and was common throughout western Europe and was equivalent to 8 oz. The variations, however, throughout the middle ages were considerable (see Du Cange, Gloss. med. et incompl. Lat., s.v. Marca for a full list). In England the "mark" was never a coin, but a money of account only, and apparently came into use in the 10th century through the Danes. It first was taken as equal to 100 pennies, but after the Norman Conquest was equal to 100 pennies (30 pennies to the oz.) = $ of the pound sterling, or 136.40, and therefore in Scotland 134d. English; and in French was marque, and in Teutonic languages mark (marki, märk) and was a silver coin. This value is established first in 1570 and afterwards in 1663. The modern German mark was adopted in 1873 as the standard of value and the money of account. It is of the value of 61.46 grains of gold, 900 fine, and is equal to English standard gold of the value of 11.747 pence. The modern silver coin, nearly equal in value to the English shilling, was first issued in 1875. (See Numismatics, § iv.)

MARK, GOSPEL OF, the second of the four canonical Gospels of the Christian Church. Till quite recent times this Gospel, though nominally equal to the others in authority, has unquestionably not aroused the same interest or feelings of attachment as they have, partly from its not bearing the name of an apostle for its author, as the first and fourth do, partly, also, owing to the fact that the first and third, while they include most of what is found in it, contain much additional matter, which is of the highest value. Of late, however, it has acquired new importance through the critical inquiries which have led to the conclusion that the two other synoptic Gospels are not, and that upon a document which is upon the whole most truly represented in it (see Gospel), so that it possesses the advantage of being an earlier source of information, or at least of bringing us more fully into contact with such a source. The significance of all that we can learn as to the history of the composition of Mark's Gospel is clearly enhanced by this consideration.

(1) Early Account of a Writing by Mark.—According to a fragment of Papias (ap. Eus. Hist. Eccl. III. 39) taken from...
a work probably written c. A.D. 140, Mark, who was the follower
and interpreter of Peter, recorded after the latter's decease
the words of Christ and the narratives of His deeds which he
had heard the Apostle deliver, but he could not arrange the
matter "in order," because he had not himself been a personal
follower of Jesus. This account Papias had derived, he tells
us, from an informant who had heard it repeatedly given by
"the elder," a Christian of the first generation and upon whom
bear he little doubt that the work to which Papias
himself supposed this story to apply was the Gospel of Mark
virtually as we know it. The tradition in regard to this work
must have been continuous between his time and that of Irenaeus,
who (c. A.D. 180) gives a similar account of its composition.
It may be noted also that the same view of the origin of the
Gospel of Mark appears to have been held by a contemporary of
Papias, Justin Martyr. In his Dialogue with Trypho (c. 106)
he cites a fact about the name of Peter from "his Memoirs," and
adds also another similar fact about the name given to
the sons of Zebedee, just as they are stated in Mark iii. 16, 17,
and nowhere else so far as we know. He may well have been
ready to call the work "Peter's," though he believed that
Mark actually composed it, on the ground that the latter
recorded what the Apostle said (cf. ibid. c. 103).

But is our Gospel of Mark also to be identified with.
the writing by Mark spoken of by "the elder" whose account had
been reported to Papias? Some confusion is here more con-
ceivable; while, if it is supposed that such a writing was worked
up by Mark, this may seem insufficient to explain
the connexion of Mark's name with the latter.

In support of this view it is urged, though it is so much less
often now than it used to be, that the description "not in order"
does not fit our Gospel of Mark, the order in which is from an
historical point of view as good as, if not better than, in
the other Gospels. But from whomsoever the expression proceeds
—whether from Papias, or his informant, or "the elder"—
we may feel sure that considerations such as appeal to us from
our training in historical criticism are not those which suggested it,
but rather the want of agreement between this Gospel and
some standard which on altogether different grounds was
applied to it. This argument, then, for supposing that the
original writing by Mark differed widely in form and contents
from the Gospel which now bears his name appears to be without
force. The question whether the two differed to any, and if
so to what, extent can be decided only from an examination of
the Gospel itself.

(2) The Question of the Integrity of the Gospel of Mark.—There
are in a good many parts of this Gospel indications that the
narrative has been derived from Simon Peter or some
else who was a personal follower of Jesus in the days of His
earthly ministry. It has been widely felt that the account of
the call of the first four disciples and of the events which
immediately followed (i. 15-30) at the opening of the Galilean
ministry, bears strong marks of proceeding from Simon Peter.
Other passages might be pointed out in which it is suitable
to suppose that this disciple in particular was the informant.
But we will content ourselves with noticing signs that the
reminiscences of some eyewitness are recorded. (a) Traits apparently
without importance without upon which no stress is laid in the context, but which it was natural for
a narrator who was actually present, and only for such a one
to introduce, because he remembered them as associated with
the principal events. The following are instances and others
might be cited: the mention of "other boats," iv. 36; the
half-foolish remark made by Peter when in a dazed condition at
the Transfiguration, ix. 5, 6; the young man who, when
Jesus was arrested, followed, "having a linen cloth cast
about him," xiv. 51, 52; the fact that Simon of Cyrene was
coming "from the country," xx. 21. (b) There is great truth of local
coloring. The references to places and the descriptions of
natural features (the lake-shore, i. 16; ii. 13; iii. 7; the hills
near at hand, iii. 13; v. 3, 13; vi. 46; the desert places among
the hills or by the shore, i. 35, 45; vi. 31, 32) appear to be
accurate; the routes indicated in the journeys that are taken
are probable (vii. 24, 31; viii. 27; x. 17, 32, 46; xi. 1). Again,
the term "village-towns" (i. 38) is a remarkably appropriate
one (cf. Josephus, B. i. III. iii. 2). There would, indeed,
be an exception to the general correctness of the topography
if we were compelled to suppose that "country of the Gera-
sees" (which is the best reading according to existing MS.
evidence at Mark v. 1) must mean the territory of the city
of Gerasa. But it is easy to imagine that some confusion may
have arisen in the transliteration of the name into Greek, and
that the place really indicated is Khersa, near the middle of
the eastern shore of the lake. The pair of references (vi. 45, 53)
which might also be adduced as an exception, will be noticed
below. Further, the conditions of life and thought in Palestine
at the time in question are faithfully represented, Aramaic
words spoken on some important occasions are preserved
(iii. 17; v. 41; xv. 34). And, to mention a point of a different
kind, the parts played by different sections among the Jewish
people are such as might be expected. The point of view of
speakers and actors is throughout that belonging to the time
of the ministry of Jesus, not to that when the Christian Church
had come into existence. (c) The good order in this Gospel,
I.e. the natural development of the narrative, will be indicated
below. It has without good reason, as we have seen, been
supposed to show that it cannot be the record by Mark referred
to by Papias. And in reality it would be difficult to account
for this feature except on the supposition that one who had
lived through the events and had heard the accounts would
be required to give a comprehensive sketch of the story of the ministry
and sufferings of Jesus, to relate the facts in the main as they
happened; and that a hearer of his has to a considerable extent
reproduced them in the same order.

The last consideration seems to show that the general form
and structure of the Gospel, and not merely certain portions
of it, are original. In point of style, also, there is a large amount
of uniformity. The chief exceptions are that, whereas some
incidents are related in a very concise manner (e.g. i. 23-28,
and 40-45), there is in other cases considerable amplitude
of description (see esp. v. 1-20, 35-43 and ix. 14-27). But
Mark's own writing might exhibit this variety, according to
what he had been told or could remember. Moreover, a ten-
dency to amplitude of language may be noticed here and there
in some of the more concise narratives. Further, it would
be unreasonable to suppose that Mark, even if he relied chiefly
on what he had heard Peter teach, would refrain from using
any other sources of information which he possessed. Some
have supposed that the same Logian document in Greek which
was used by the first and third evangelists was also required
for Mark. This is highly improbable, but he may have derived
particular sayings from the Aramaic source itself of that docu-
ment by independent translation; and may also have learned
both sayings and narratives in other ways. It would seem
also that the Discourse on the Last Things in ch. xii., differing
as it does both in its greater length and in its systematic struc-
ture from other discourses recorded by him, must have come
to his hands in a written form. In it some genuine sayings of
Christ appear to have been worked up along with matter
from Jewish and Apocalyptic and in accordance with an
Apocalyptic model.

There does not, then, seem to be good reason for thinking
that the work which proceeded from the hands of Mark differed
widely in character and contents from the Gospel which now
bears his name. But there are indications that some passages
have been interpolated in it: e.g. in Mark iv. 10 there is some
want of fitness in the inquiry of the disciples as to the meaning
of "the parables" after only one has been given, and again a
want of agreement between that inquiry and the words of
Jesus at v. 13. "Know ye not also parable, and how shall ye
know all the parables?" We notice further that the two
parables in vv. 26-32 are somewhat loosely appended. It
looks as if they were insertions in the passage as it originally
stood, and that the references to parables in the plural, together
with the statement at vv. 33, 34, had been introduced in order to adapt the context to these additions. This view is confirmed by the fact that in Luke viii. 4 seq. only oneparable, that of the sower, is given or referred to. This evangelist has probably here borrowed the original form of Mark. Simultaneously the collection of sayings after Mark ix. 40 (vv. 41-50) has probably been interpolated. They are thrown together in a way unusual with Mark, who is accustomed to place important saying in a setting of its own. Here again we note that they do not appear at the corresponding point in Luke, though some of them are given by him in other contexts. The account of the crossing of the lake (vi. 45-53) after the feeding of the five thousand furnishes an instance of a different kind. The difficulty as to the position of Bethsaida, or (if εἰς τὸ πέρα, "unto the other side," at v. 45 is taken to refer only to the crossing of a bay at the north-eastern corner of the lake) the discrepancy between "crossing" in this sense and in that of v. 53 would be explained if the narrative (which is not in Luke) may be held to be an interpolation by one not familiar with the localities. Once more, the account of the feeding of the four thousand (viii. 1-9) resembles that of the feeding of the five thousand (vi. 35-44) closely in all respects except that of the numbers given, about which differences might easily arise in tradition, and it looks therefore as if it might be a "doublet," i.e. another form of the same narrative derived through a different channel. And it is not so likely that Mark should have mistaken it for a distinct incident as that an editor of his Gospel should have done so. Some other instances, of greater or less probability, might be mentioned.

In addition to such larger insertions, the text of the original document seems to have undergone a certain amount of revision. Some of the cases in which the first and third evangelist agree against Mark in a word or clause may be best accounted for by their both having reproduced the common source (an example may be seen under 4. below).

As we have found it necessary to distinguish between the original composition by Mark, to whom in the main the work appears to be due, and some enlargement and alteration which it subsequently underwent whereby it reached its present form, these stages must be borne in mind in considering dates that may be assigned in connexion with this Gospel. According to Papias, Mark wrote after the death of Peter, i.e. after A.D. 64, if we suppose it is usual to do, that Peter was martyred in the time of Nero after the burning of Rome. It would be natural for Mark to set himself to make his record soon after the Apostle's death; and in confirmation of the view that he did so it may be pointed out that in the form of the prophecy in ch. xiii. of the calamities that were to come upon Jerusalem, no details occur of a kind to suggest that it had actually taken place. Further, Mark's work may very probably have been used by Luke in its original form. On the other hand, it was known to our first evangelist very nearly in the form in which we have it. The chief revision of Mark would seem, then, to have taken place between the times of the composition of the first and third Gospels, which cannot be far removed from one another (see Matthew, Gospel or St. The last twelve verses were added later still, probably early in the 2nd century, probably to take the place of the ending which had been lost, or which was regarded as defective. (On the evidence that the last 12 verses are not by the same hand as the rest of the Gospels see Westcott and Hort's New Testament in Greek, append., p. 29 seq. and Swete's St Mark in loc. and p. xcvii seq. of his introduction.)

(3) The Gospel History as represented in Mark.—After a (1) preparatory passage, i. 1-13, the Gospel deals with (ii) Christ's ministry in Galilee and other parts of northern Palestine, i. 14-ix. 50. This portion of the history may suitably be divided into three periods: (a) Early period. From the appearance of the Word of Jesus to the first plot to destroy Him (i. 14-iii. 6). (b) Middle period. From the gathering of crowds from all parts and appointment of the Twelve that the Twelve to execute an alarm of Herod (iii. 7-vi. 29). (c) Closing period. From Christ's withdrawal with His disciples after their return from their mission to His final departure from Galilee (vi. 30-ix. 50). Throughout

we can trace a development as to (a) the stir created and the attitude of men towards Jesus: i. 32-34, 37 (excitement at Capernaum); i. 40 (Jesus spreads the Gospel to distant parts appear in the crowds); iv. 2 seq. (the word of the Kingdom is received in very various ways); viii. 28 (great diversity of localities); (b) the nature and extent of Christ's work: ii. 1-ii. 6 (Scribes come from Jerusalem and a more heretical charge is preferred); (c) the formation of a band of disciples and the position accorded to them: i. 16-20 (four are called to follow Him. This group is increased vii. 14 (yet another); iii. 14 (He takes twelve from those before called); vii. 1 seq. (He sends them out to preach and work cures); (d) the methods which he adopts: i. 21, 39-ii. 1 (preaches to the multitudes); (e) the message which he gives: i. 38 (in the neighbourhood of Capernaum); v. 1 (crosses to eastern shore of the lake); vi. 6 (a tour which includes Nazareth); vi. 45 (Bethsaida); vii. 31 (Journey to Tyre and Sidon and back through Decapolis); vii. 22, 27 (is at Bethsaida and visits neighbourhood of Caesarea Philippi); (f) His self-revelation: viii. 27 seq. (first unambiguous declaration of Messiahship).

(iii) The Journey from Galilee to Jerusalem, the Last Days, Passion and Resurrection, x. 1 to end. He goes first to "the borders of Judaea and beyond Jordan" (Perea), and exercises His ministry there. In Jerusalem, a further journey towards Jerusalem there, Jerusalem, and Jerusalem, with violent opposition to Jesus in the synagogues, and in the Temple; vii. 51 to viii. 39. The account of the time in Jerusalem includes a series of conflicts with the Jews; ix. 18-ix. 38. The details of the Parable of the Ten Virgins, x. 1-11. The only notes of time in the Gospel occur in connexion with the conspiracy to kill Jesus (xiv. 1) and the Last Supper (verse 12).

(4) The Leading Ideas of St Mark.—Ch. i. 1, which stands as a title, was probably, even according to the short form of it which is supported by MS. evidence, due to a reviser of the original. Both Matthew and Luke show signs of having had somewhat different beginning before them. Nevertheless, that title fitly describes the work. It is emphatically the "Gospel," because it sets forth the person and work of the Christ. The evangelist is conscious of this aim. It appears not at great moments of the history such as the Baptism (i. 11), the confession of Peter (viii. 20), the Transfiguration (ix. 7); nor again merely in the prominence given to the miracles of Jesus and in particular to the casting out of devils, but also in many of the sayings recorded in it, as in the great series contained in the narratives in ch. ii. 5, 10, 17, 19; and again in the reply of Jesus to those who charged Him with being in collusion with Satan (iii. 27). The character of the genuine disciples of the Christ and the demands that are made of them form, as it were, the complement to the representation of what He Himself is, and are set forth in other striking sayings, related along with the memorable occasions on which they were spoken: (iii. 34, 35; viii. 34-35; ix. 23, 29, 35-37; x. 14, 15, 42-43).

Schetz, Jesus in den Evangelien, zugleich ein Beitrag zum Verständniss des Markus evangeliums (1901); E. J. Weiss, Das älteste Evangelium (1903). Also bibliography to the article Gospel. (V. H. S.)

MARKBY, Sir William (1829— ) , English jurist, the fourth son of the Rev. William Henry Markby, rector of Duxford St Peter's, was born at Duxford, Cambridge, in 1829. He was educated at Bury St Edmunds and Merton College, Oxford, where he took his degree in 1850. In 1856 he was called to the bar, and in 1865 he became recorder of Buckingham. In 1866 he went to India as judge of the High Court of Calcutta. This post he held for twelve years, and on his retirement was appointed Reader in Indian Law at Oxford. In 1852 he was a member of the Commission to inquire into the administration of justice at Trinidad and Tobago. Besides Principles of Law considered with reference to the General Principles of Jurisprudence. The latter, being intended in the first place for Indian students, calls attention to many difficulties in the definition and application of legal conceptions which are usually passed over in textbooks, and it ranks as one of the few books on the philosophy of law which are both useful to beginners and profitable to teachers and thinkers. In 1897 appeared The Indian Evidence Act, with Notes. Sir William Markby
MARKET

also contributed to the law magazines, articles on Law and Fact, German Jurists and Roman Law, Legal Fictions, &c., several of which are embodied in the later editions of the Elements. He was made D.C.L. of Oxford in 1879, and K.C.E. in 1889.

MARKET (Lat. mercatus, trade or place of trade). This term is used in two well-defined senses. (1) It means a definite place where (a) traders who are retail sellers of a specific class of commodity or commodities are in the habit of awaiting buyers every day in shops or stalls; or whither (b) they are in the habit of proceeding on specified days at more or less frequent regular intervals. Covent Garden market for fruit and flowers, and Leadenhall market for meat and poultry, are good examples in London of the kind of institution included in class (a). They are a very ancient and economic phenomenon, dating from the earliest period of the development of organized communities of human beings, and in general characteristics have changed little since they began to exist. Markets of the type of class (b) are also of very ancient origin (see FAIRS), but inasmuch as they are constituted essentially by the presence of persons, many of whom assemble from various places outside the place of meeting, they were capable of a little more development than those belonging to class (a), owing to increased facilities for locomotion. The nature of an ancient market of class (c) is well illustrated by one of Athens, in which the citizens, say of Athens, or his chief slave, proceeded daily to make household purchases, differs little from the group of shops visited by the wives of the less wealthy citizens of modern states. In many places abroad, and not a few in England, actual markets still exist. It may be said that the huge collections of shops, such as the various cooperative stores, are only a revival of the old "market-place," with its shops or booths gathered round a central area, adapted to the needs of modern big cities. (2) The term "market" has come to be used in another and more general sense in modern times. To-day a market is "any body of persons who are in intimate business relations, and carry on extensive transactions in any commodity." He adds that "these markets may or may not be localized," and he instances the money market as a case in which the term "market" denotes no special locality. As a rule, however, most of the business of a market is transacted at some particular place, such as the London Stock Exchange, the Baltic, the Bourse of Paris, the Chicago "Wheat-pit." Even in the case of the London money market, merchants still meet twice a week at the Royal Exchange to deal in foreign bills, and other American cities separate from it widely in space. In a minor degree the dealers in all places where a cotton market exists affect the bigger markets to some extent. What is true of the cotton market is also true to some extent of all markets, though few markets are so highly organized or show such large transactions as that for cotton. Among other markets of the first class may be mentioned those for pig-iron, wheat, copper, coffee, and sugar. There are many articles the markets for which are of considerable dimensions at times, but which lack the market character, such as the London Wool Sales, which take place now in five "series" a week. Formerly the number of "series" was four. (For "market overt" see SALE OF GOODS and STOLEN GOODS.)

Characteristics of Markets.—The conditions required in order that the operations of a trading body may display the fully-developed features of a modern market, whether for commodities or securities, are—

(1) A large number of parties dealing.

(2) A large amount of the commodities or securities to be dealt with.

(3) An organization by which all persons interested in the commodity or security can rapidly communicate with one another.

(4) Existence and frequent publication of statistical and other information as to the present and probable future supply of the commodity or security.

The movements which take place in prices in any market, whether fully organized or not, depend largely on changes of opinion among buyers and sellers. The changes of opinion may be caused by erroneous as well as by correct information. They may also be the result of wrong inferences drawn from correct information. In markets for commodities of the first importance, such as wheat, cotton, iron, and other articles which are dealt in daily, the state of opinion may vary much during a few hours. The broad characteristics of markets of this class are similar. There is a tendency in all of them to show phenomena of annual periodicity, due partly to the seasons, the activity of certain months being in normal years greater in the case of any given market than that of other months. This tendency was always liable to be interfered with by the special forces at work in particular years; and the great increase in the facilities of communication between dealers by telegraph, and of transportation of commodities between widely distant points, which was one of the marked features of the development of the economic organism in all actively commercial countries during the last thirty years of the 19th century, has still further interfered with it. Nevertheless, a tendency to annual periodicity is still perceptible, especially in markets for produce of the soil, the supply of which largely depends on the meteorological conditions of the areas where they are grown on a scale sufficient to furnish an appreciable proportion of the total produce. Periodicity of another kind known as "cyclic," and due to a different set of causes, is believed to exist by many persons competent to form a judgment; but although the evidence for this view is very strong, the theory expounding it is not yet in a sufficiently advanced state to admit of its being regarded as established.

Phenomena of Markets.—Bagehot said of the money market that it is "often very dull and sometimes extremely excited." This classical description of the market for "money" applies to a large extent to all markets.

(5) Tendency to Equilibrium. If any market is not at a moment tending to an equilibrium between the quantity of commodities offered and that of commodities desired; supposing equilibrium to have been attained in a given market, and that for some appreciable period it is not disturbed, the price for the commodity dealt in, in the market, will remain practically unchanged during that period. Not that there will be no transactions going on, but that the amounts offered daily will be approximately equal to the amounts demanded daily.

We have briefly described the statical condition of a market; we must now briefly examine its dynamics. Disturbance may take place through a change in—

(1) Supply, or opinion as to future probable supply.

(2) Demand, or opinion as to future probable demand.

(3) In both simultaneously, but such a change that demand is increased or decreased more than the supply, or vice versa. A moderate disturbance caused by one of the above changes, or a combination of them, will produce an immediate effect on the price of the commodity, which again will tend to react on both the supply and the demand to alter the opinions of sellers and buyers. If no further change tending to disturb the market takes place, the market will gradually settle down again to a state of equilibrium. But if the disturbance has been considerable, a relatively long time may elapse before the market becomes quiet; and very likely the level of price at which the new equilibrium is established will be very different from that ruling before the disturbance set in. Further scientific
investigation of the dynamics of a market is in any case very difficult, and is impossible without a complete analysis of the statistical condition, such as is found at length in the textbooks of mathematical economics; but it is possible to describe briefly certain dynamical phenomena of markets which are of a comparatively simple character, and are also of practical interest.

Every great market is organized with a view not merely to the purchase and sale of a commodity at once, or "on the spot," but also with a view to the future require-
ments of buyers and sellers. This organization arise naturally from the necessities of business, since modern industry and commerce are carried on continuously, and manufacturing has been made for the requirements, say, of a spinning-mill, by arranging for the delivery of successive quan-
tities of cotton, wool or silk over a period of months "ahead." In the case of cotton, "forward deliveries" can be purchased six or seven months in advance, and the person who undertakes to deliver the cotton at the times stated is said in the language of the market to "sell forward." If the quantity of cotton produced each year were always the same, no very remarkable results would follow from this mode of doing business, except the economy resulting to the spinner from not being compelled to lock up part of his capital in raw material before he could use it. But as the cotton and other crops vary considerably from year to year, some curious consequences follow from the practice of "selling forward." The seller, of course, makes his bargain in the belief that he will be able to "cover" the sale he has made at a profit—that is, he hopes to be able to buy the cotton he has to deliver at a lower price than he undertook to deliver it at. If so, all is well for both parties, for the buyer has had the advantage of having insured a supply of cotton. But supposing something has happened to raise the price consid-
erably, such as a great "shortage" of the crop, the seller may lose. If a great many other persons have taken the same mistaken view of the probabilities of the market, a condition of things may arise in which they may be "cornered." (See COTTON.)

A "corner" in an exchangeable article is an abnormal condition of the market for it, in which, owing to a serious miscalculation of probable supply, many traders who have made contracts to deliver at a certain date are unable to fulfil them. In most cases the fact that the market is "oversold" becomes known to some time before the date for the completion of the contracts, and other traders take advantage of the position to raise the price against those who are "short" of the article. A corner is therefore usually a result of the failure of a speculation for the fall. Theoretically a trader who has undertaken to deliver 100 tons of an article, but cannot, after every endeavour, obtain more than 90 tons, could be made to pay his whole capital in order to be relieved from the bargain. In practice he gets off more easily than this. Frequently when many traders have sold largely "forward," other traders deliberately try to use that position as a basis for creating a "corner." Generally, however, they only succeed in causing great inconvenience to all parties, themselves included, for as a rule they are only able to make the "corner" effective by buying up so much of the article that when they have compelled their opponents to pay largely to be relieved of contracts to deliver, they are left with so big a stock of the article that they cannot sell it except at a loss, which is sometimes big enough to absorb the gain previously secured. In the case of very small markets "corners" may be complete, but in big markets they are never of great consequence. Preventing or making time losses happen to prevent the full realization of the operators' plans. The idea of a "corner" is, however, so fascinating to the commercial mind, especially in the United States, that probably no year passes without an attempt at some operation of the kind, though the conditions may in most cases prevent any serious result.

"Corners" have what is called a "moral" aspect. It is curious to note that the indignation of the "market" at the disturbance to prices which results from operations of this kind is generally directed against the speculators for the fall, while that of the public, including trade consumers, is directed against the operator for the rise. The operator for the fall, or "bear," is denounced for "selling what he has not got," a very inaccurate description of his action, while the "bull" or operator for the rise is spoken of by a much wider circle as a heartless person who endeavours to make a profit out of the necessities of others. From a strict ethical standpoint there is really nothing to choose between the two.

The Money Market.—There is one market which presents features of so peculiar a character that it is necessary to describe it more particularly than other phenomena of the kind, and that is the money market. The term "money," as distinguished from "money-market money" or "bankers' money," a form of wealth which has existed from early times, but not in great abundance until within the last two or three hundred years. Immense wealth has existed in certain countries at various epochs, owing to the fertility of the soil, success in trade, or the plunder of other communities, and all states which have been great have at the time of their greatness possessed wealth; but the wealth which the countries, or a few fortunate individuals belonging to them, have had has been considerable only of what is still called real property—that is, land and buildings—and the produce of the soil or of mines. The balance consisted partly of merchandise of various kinds and shipping, and to a large extent of the precious metals in the form of coin or bullion, or of precious stones and jewelry. Where no settled government was established no one could become or remain very wealthy who was not in a position to defend himself by the strong hand or allied with those who were; and as a rule the only people who could so defend themselves were possessors of large areas of rich land, who were able to retain the services of those who dwelt on it either through their personal military qualities or in virtue of habit and custom. The inhabitants of wealthy cities were able to protect themselves to some extent, but they nearly always found it necessary to ally themselves with the neighbouring land-owners, whom they aided with money in return for military support.

A money market in the modern sense of the word could only exist in a rudimentary form under these conditions. There was a sort of money market, for there was a changing rate of interest and a whole code of law relating to it (Macleod, Banking, 3rd ed., p. 174) in republican Rome; but although large lending transactions were part of the daily life of the Roman business world, as well as of those of the Greek cities and of Carthage and its dependencies, none of these communities presented the phenomena of a highly organized market. Money-lending was also a regular practice in Egypt, Chaldea and other ancient seats of civilization, as recent discoveries show. It was only in comparatively recent times, however, when Europe had formed itself into more or less organized states, with conditions fairly favourable to the steady growth of trade and industry, that organized money markets came into existence in places such as Venice, Genoa, Augsburg, Basel, the Hanse towns, and various cities in the Low Countries, Spain and Portugal, as well as in London. The financial strength of these rudimentary money markets was not very great, and as it depended a good deal on the possession by individuals of actual cash, the existence of these markets was precarious. "Hoarded ducats" were too often an attraction to needy princes, whose unwelcome attentions a rich merchant, even when an influential burgler of a powerful city, was less able to resist than the violence of a housebreaker, against whom strong vaults and well-secured chests situated in sombre towers were a great protection. The necessary potentate could often urge his desire for a "loan" by very persuasive methods. Occasionally, if his predecessors had ac-
quired the confidence of the banking class sufficiently to induce them to place their cash reserves in one of his strong places "for safety" an unscrupulous ruler could help himself, as Charles II. helped himself to the stores of the London goldsmiths which were left in the Mint. The power of the banking class continued to grow, however, and a real market for money had come into
existence in many cities of Europe by the middle of the 17th century. (See Banks and Banking.)

In the 18th century the "money market" consisted of the Bank of England and various banks and merchants, and distinction between the two being still not complete. Towards the end of that century arose an important class of dealers in credit, the bill brokers, and with their appearance the modern money market of London may be said to have assumed its present form, for though the process of development has not ceased, the changes have been of the nature of growth and not of the acquisition of new organs.

The formation of joint-stock banks and discount companies, however, and the reconstitution of the Bank of England by the Act of 1844, exercised an important influence on the way in which the money market of London has developed. It must be explained that in the every-day talk of the City "the market" has a special meaning, by which only the banks and discount houses, or even only the latter in some cases, are denoted, as in the phrases constantly seen in the daily reports published in the newspapers towards the end of a quarter, "the market has to-day borrowed largely from the Bank of England," or, "the market was obliged to renew part of the loans which fell due to the Bank to-day." But this use of the term in a special sense, thoroughly understood by those to whom it is habitual, and resulting in no ambiguity in practice, is not in accord with the requirements of economic analysis.

The working organs of the money market of London at the beginning of the 20th century were:

The institutions included in group A are the most constantly active organs of the money market; those included in group B are intermittently active, but in the case of section (4), though their activity is greater at some times than others, they are never wholly outside the market. Even in the case of (3) a certain amount of qualification is needed, which is indicated by the fact that most of the great merchant houses are "registered" as bankers, though they do not perform the functions usually associated with that term in the United Kingdom. Several of the great houses were originally and still are nominally merchants, but are largely concerned with finance—business—that is, with the making of loans to foreign governments and the issue of capital on behalf of companies. These powerful capitalists often have large amounts of money temporarily in their hands, and lend it in the money market or on the Stock Exchange; one or two of them are large buyers of bills from time to time, and generally the members of this group may be said to be in sufficiently close touch with the active organs of the money market to form part of it.

The actual working of the money market has been described by Walter Bagehot in his Lombard Street, a work which has attained the rank of a classic. Most of what he said in 1873 is true now, and although certain minor respects, developments have taken place, the most important being the greater extent to which money is "used up" every day, or rather every night. In Bagehot's time the discount houses only quoted "allowance" rates for "loans at call and short notice," based on the rate "allowed" by the banks for loans at seven days' notice; but since then the bill-brokers have been obliged—to occasionally fix their terms independently of the banks, and (2) to "allow" a rate for "money for the night." This latter practice became usual about 1885 or 1889. The change it introduced was not a vital one, but has some importance from the point of view of the historian. A good deal of the "money" thus dealt with is derived from the group of traders included in class (5). It is (c) money which is temporarily in the hands of houses or institutions which have just received subscriptions to loans or other capital offered to the public; (b) balances left temporarily with finance houses or banks on behalf of foreign governments or other parties who have payments to make in London. In the former case the "money" is almost invariably only available for a short time, probably only for a few days; in the latter case it probably will be only available for a few days, but may be available for months. Money derived from either of these sources is usually to be had cheap, but is not, in the slang of the City, "good," because uncertain how long loans at call obtained from either of them will remain undisturbed. Nevertheless, there has been at times so much "money" of this fugitive character, and derived from such varied sources since about 1888, that its cheapness has been an attraction to the less wealthy bill-brokers, who have occasionally been able to go on using it profitably for many continuous weeks, or even months, in their business. The risk run by employing it is, of course, the certainty that it will be "called" from the borrower sooner or later, and probably at a time when it is very inconvenient to repay it. The more wealthy houses take money of this kind when it suits them, but never rely on it as a basis for business.

Since Bagehot wrote the growth of the big joint-stock banks has been enormous, not so much through the increased business done by banks generally, though the expansion in banking has been considerable, as by the absorption of a great number of small banks by three or four large institutions (see Banks and Banking). The growth of these institutions has been to facilitate combination for purposes of common concern among banks generally—e.g., to support the Bank of England in maintaining its reserve, which is the sole reserve of all the banks, at a proper level, and thus render the money market more stable. Two or three of the banks have for a long time, owing to their large holding of bills, had much more influence than the Bank of England over the foreign exchanges, on which the foreign bullion movements chiefly depend; and since 1890 persons of weight in the joint-stock banking body have implicitly, though not explicitly, admitted a certain degree of responsibility in the matter on behalf of their institutions. It is, however, characteristic of British business arrangements that the question of the responsibility for the reserve of the Bank of England, the ultimate reserve of the whole country, is still in as nebulous a condition, so far as explicit acceptance of responsibility by any institution is concerned, as it was in 1870. There has been no improvement in theory, though in practice there has been real improvement, since Bagehot's time. The tendency is, indeed, decidedly in the direction of closer combination between the Bank and the banks. On one occasion the Bank has not, generally speaking, "in the market," but by more or less private negotiations with the big banks, obtained temporary control of large sums belonging to the banks in order to take cash off the market. This proceeding, and its concomitants, did not meet with universal approval; but the results were satisfactory on the whole, and on the later occasions when the measure was carried out there was little or no friction.

The enormous war loans raised by Japan in 1904, 1905, 1906 exemplified aptly the modern methods of dealing with the huge and indescribable quantum of capital which new conditions produce. The loans were issued by three banks, one of which was a Japanese institution and represented the Japanese government in the operations connected with the various loans. Of the other two, one was a leading London bank and the other the principal British bank doing business in China. These large loans were issued with the minimum of disturbance to the London money market. The very large amounts of cash which were suddenly withdrawn from other banks, and deposited with the institutions issuing the loan as "application money," were lent out again by the short-term loan market as soon as possible, usually on the afternoon of the day of issue. The work involved was very heavy, as a great number of cheques had to be cleared in a brief space of time, but by skilful organization this was done. Similar promptitude was displayed when the successive instalments on the loans
became due and were paid, most of the cash being available for borrowers a few hours after it was paid in by the holders of the scrip which represented the loans until the definitive bonds were ready. The task of dealing with cash forming instalments of the loans was not, however, the only problem before the banks which issued them. As the scrip of each loan gradually became "fully paid" the proceeds of the loan in the hands of the banks became a very large sum. The Japanese government held the whole of it at its disposal, and might have seriously embarrassed the London money market if it had not dealt with its huge balances considerably. The Japanese government had agreed not to withdraw any of them before they were held in London in gold, but it was under no restrictions as to how it should employ the money lying to its account. It might have kept it locked up until it had a bill for ships or clothing to pay. As might be expected, the government from the outset transferred a portion of what was deposited with the banks to the Bank of England, finding it advantageous on various grounds to do so. The remainder was lent for short periods by the banks, but for some time no means were available for lending for any considerable length of time, though the Japanese government had no immediate use for the whole of it. It was suggested to the government by its advisers that it would be a convenience to the money market, and no inconvenience to Japanese policy, if any balances which were not likely to be wanted for some months were invested in British treasury bills, and the government, after fully acquainting itself with the nature of the operation, agreed to it. The plan was found to work well; it released for definite periods money that would otherwise have been of little use to the money market, and it was of pecuniary benefit to the Japanese exchequer to the extent of the interest earned by the portion of the balances so employed. Incidentally it suited the British treasury; the Japanese demand, which became a constant feature in connexion with treasury bill issues, lowered the discount rates at which "sixes" were placed. The Japanese not only applied for treasury bills and bought them in the market, but they also took up some of the exchequer bonds issued in connexion with the South African war towards the end of their currency, thus relieving the money market of a further part of the weight of British government paper which it would otherwise have had to take on itself. A further important development of Japanese management of its London balances took place in 1906, when a portion of these balances was placed under the control of agents of the Bank of England, to be lent, or not lent, in the market as suited the Bank's policy, which was at that time directed to raising the value of money in order to protect and increase its reserve. The plan worked very well on the whole. It was merely an adaptation of a practice initiated some years before, whereby the Bank sometimes obtained temporary control of moneys belonging to the India Council. The same idea, that of "intercepting" market funds, which were beating down the discount rate, depressing the foreign exchanges and depleting the Bank's reserve, has been employed in regard to the clearing banks themselves, the banks having on more than one occasion agreed to lend the Bank of England a certain portion of their balances. The discount houses, though an important body of institutions, are not of so much importance as they were before 1866, when they suffered a serious blow through the failure of "Overend's," from which as a body they have never fully recovered. The five large concerns which still exist are, however, very powerful and exercise considerable influence on the market. They hold considerable quantities of bills at all times; occasionally their holdings are very large, but they turn out the contents of their bill cases readily if they think fit. Their business is different in practice from that of the smaller "bill-brokers," who usually are what their name suggests, namely, persons who do not hold many bills, but find them for banks who need them, charging a small commission. The small bill-brokers borrow from the Bank of England much more freely than the big discount houses. The latter only "go to the bank" in ordinary times perhaps once or twice a year. During the South African War, which disturbed the money market very much, they obtained accommodation from the Bank more frequently than usual. The small brokers almost always have to borrow from the Bank at the end of every quarter, when money is scarce owing to the regular quarterly requirements of business, and also, to some extent, because certain of the banks make it a practice to call in loans at the end of each month in order to show a satisfactory cash reserve in their monthly balance-sheet. This practice is not approved by the best authorities, for although it does no great harm in quiet times, the banks which follow it might find it difficult otherwise to borrow even if the loans in times of severe stringency.

MARKET BOSWORTH—MARKHAM, SIR C. R.

The Discount Houses.

MARKHAM, SIR CLEMENS ROBERT (1830- ), English traveller, geographer and author, son of the Rev. David F. Markham, canon of Windsor, and of Catherine, daughter of Sir W. Milner, Bart., of Nunappleton, Yorkshire, was born on the 20th of July 1830 at Stillingfleet, near York, and educated at Westminster School. He entered the navy in 1844, became midshipman in 1846, and passed for a lieutenant in 1851. In 1850-1851 he served on the Franklin search expedition in the Arctic regions, under Captain Austin. He retired from the navy in 1872, and in

MARKHAM, G. MARKIRCH

1832–1834 travelled in Peru and the forests of the eastern Andes. He visited South America again in 1860–1861, in order to arrange for the introduction of the cinchona plant into India, a service of the highest value to humanity. In 1865–1866 he visited Ceylon and India, to inspect and report upon the Tinnevelly pearl-fishery and the cinchona plantations. On the Abyssinian expedition of 1867–68 he served as geographer, and was present at the storming of Magdala. In 1874 he accompanied the Arctic expedition under Sir George Nares, and in 1875 on the voyage of Sir Charles Lyell's H.M.S. Challenger. In later years Sir Clements Markham travelled extensively in western Asia and the United States. In 1835 he became in charge of the geographical department of the Indian Office. He was secretary to the Hakluyt Society from 1838–1887, and became its president in 1890. From 1863–1888 he acted as secretary to the Royal Geographical Society, and on his retirement received the society's gold medal for his distinguished services to geography. He was elected president of the same society in 1893, and retained office for the unprecedented period of twelve years, taking an active share in the work of the society and in increasing its usefulness in various directions. It was almost entirely due to his exertions that funds were obtained for the National Antarctic Expedition under Captain Robert Scott, which left England in the summer of 1901. Sir Clements Markham was elected F.R.S. in 1873; was created C.B. in 1871, and K.C.B. in 1890; became an honorary member of the principal geographical societies; and was president of the International Geographical Congress which met in London in 1895.

Sir Clements Markham conducted the Geographical Magazine from 1872–1878, when it became merged in the Proceedings of the Royal Geographical Society. Among his other publications may be mentioned the following: Franklin's Footsteps (1852); Casso and Landwehr's Models of the World (1853); a Quicks Grammar and Dictionary (1853); Spanish Irrigation (1856); A History of the Abyssinian Expedition (1869); A Life of the Great Lord Fairfax (1870); Walter, a Quichua Drama (1871); Memoir on the Indian Survey (1871; 2nd ed., 1878); General Sketch of the History of Persia (1873); The Threshold of the Unknown Region (1874, 4 editions); A Memoir of the Countess of Chinchon, (1875); Missions to Tibet, (1877; 2nd ed., 1879); Memoir of the Indian Surveys; Persian War (1880); Peru (1880); The War between Chili and Peru (1875–81; 3rd ed., 1883); The Sea Fathers (1885); The Fighting Veres (1888); Paladins of King Edwin (1866); Life of John Davis the Adventurer (1883); The Horned Devil, in which the narrator, a dened that the king was not guilty of the murder of the two princes in the Tower; also lives of Admiral Fairfax, Admiral John Markham, Columbus and Major Renelle; A History of Peru; editions with introductions to many British Society (1891); Alcuin, a Triarchy, of which the Hakluyt Society published four volumes were translations; about seventy papers in the Royal Geographical Society's Journal; the Reports on the Moral and Material Progress of India for 1871–1872 and 1872–1873; Memoir of Sir George Nares, the Royal Geographical Society, chapters for J. W. W. H. of America, and the chapters on discovery and surveying for Clowes's History of the Navy.

MARKHAM, GERVASE (or Jervis) (1662–1697), English poet and miscellaneous writer, third son of Sir Robert Markham of Coatham, Nottinghamshire, was born probably in 1668. He was a soldier of fortune in the Low Countries, and later was a captain under the earl of Essex's command in Ireland. He was acquainted with Latin and several modern languages, and had an exhaustive practical acquaintance with the arts of forestry and agriculture. He was a noted horse-breeder, and is said to have imported the first Arab. Very little is known of the events of his life. The story of the murderous quarrel between Gervase Markham and Sir John Holles related in the Biographia Britannica (s.v. Holles) has been generally connected with him, but in the Dictionary of National Biography, Sir Clements R. Markham, a descendant from the same family, refers it to another contemporary of the same name, whose monument is still to be seen in Laneham church. Gervase Markham was buried at St. Giles's, Cripplegate, London, on the 3rd of February 1657. He is said to have died in London, but this cannot be substantiated himself considerably in his works, sometimes reprinting the same books under other titles. His booksellers procured a declaration from him in 1617 that he would produce no more on certain topics.

Markham's writings include: The Teares of the Beleved (1600) and Marie Magdelane's Teares (1601) long and rather commonplace poems on the Passion and Resurrection of Christ, both reprinted (1628) by W. B. Grosart in his Early English Poets; The Ruin (1871); The Most Honorable Tragedy of Sir Richard Grinville (1595), reprinted (1781) by Professor E. Arber, a prolix and euristic poem which remains a classic of the English stage; Venetia (1605), a stanzas in an address to Tennyson's mind when he wrote his stirring ballad: The Poem of Persephone (1639); a Discourse of Horsemanship (1653) was followed by other popular treatises on horsemanship and horsemanship, Honour in his Perfection (1623), a best seller of his time; and The Friends of Friendship (1694), and the Soudier's Accedence (1685) turns his military experiences to account. He edited Juliana Berners's Boke of Saint Albans (1900) for the Early English Text Society, and reprinted numerous books on highwaymen, many of which are reprinted in Lowndes's Bibliographer's Manual (Bohn's ed., 1837–1846).

MARKHAM, MRS., the pseudonym of Elizabeth Penrose (1780–1837), English writer, daughter of Edmund Cartwright, the inventor of the power-loom. She was born at her father's residence at Barwood, Leicestershire, on the 3rd of August 1806. In 1804 she married Robert Kirtley, a clergyman in Lincolnshire, a voluminous theological writer. During her childhood Mrs Penrose had frequently stayed with relatives at Markham, a village in Nottinghamshire, and from this place she took the nom de plume of "Mrs Markham," under which she gained celebrity as a writer of history and other books for the young. The best known of her books was A History of England from the First Invasion by the Romans to the End of the Reign of George III. (1823), which went through numerous editions. In 1828 she published a History of France. Both these works enjoyed a wide popularity in America as well as in England. The distinctive characteristic of "Mrs Markham's" histories was the elimination of all the "horrors" of history, and of the complications of modern party politics, as being unsuitable for the youthful mind; and the addition to each chapter of "Conversations" between a fictitious group consisting of teacher and pupils bearing upon the subject matter. Her less well-known works were Amusements of Westernheart, or Moral Stories for Children (2 vols., 1824); A Visit to the Zoological Gardens (1829); two volumes of stories entitled The New Children's Friend (1832); Historical Conversations for Young People (1836). Sermons for Children (1837). Mrs Markham died on the 24th of January 1837. See Samuel Smiles, A Publisher and his Friends (2 vols., London, 1891); G. C. Boase and W. P. Courtney, Bibliotheca Cornubiensis (3 vols., London, 1874–1882).

MARKHAM, WILLIAM (1719–1807), archbishop of York, was educated at Westminster and at Christ Church, Oxford. He was made a fellow of the college, and for a time was attached to the headship of his old school and college in 1753 and 1757 respectively. He held from time to time a number of livings, and in 1771 was made bishop of Chester and tutor to George prince of Wales. In 1777 he became archbishop of York, and also lord high almoner and privy councilor. He was for some time a close friend of Edmund Burke, but his strong companionship of Warren Hastings caused a breach. He was accused by Lord Chatham of preaching pernicious doctrines, and was a victim of the Gordon riots in 1786. He died in 1807.

MARKHOR (French, Ste-Marie-aux-Mines), a town of Germany, in Upper Alsace, pretty situated in the valley of the Leber, an affluent of the Rhine, near the French frontier. Pop. (1900), 12,372. The once productive silver, copper and lead
mines of the neighbourhood were practically unworked during the whole of the 19th century, but have recently been reopened. The main industries of the place are, however, weaving and dyeing, and it is estimated that there are about 40,000 workpeople engaged in the industry of which Markirch is the centre. The small river Leber, which intersects the town, was at one time the boundary between the German and French languages, and traces of this separation still exist. The German-speaking inhabitants on the right bank were Protestants, and subject to the courts of Rappolstein, while the French inhabitants were Roman Catholics, and under the rule of the dukes of Lorraine.

See Mühlenbeck, Documents historiques concernant Ste-Marie aux Dames (1756-1777); Hauser, Das Bergbaugebiet von Markirch (Strass., 1900).

MARKLAND, JEREMIAH (1603-1756), English classical scholar, was born at Childwall in Lancashire on the 29th (or 18th) of October 1633. He was educated at Christ's Hospital and Peterhouse, Cambridge. He died at Milton, near Dorking, on the 7th of July 1776.

His most important works are Epistola critica (1723), the Syraxe of Statius (1728), notes to the editions of Lydias by Taylor, of Maximus of Tyre by Davies, of Euripides' Hippolytos by Musgrave, editions of Euripides' Supplices, Iphigenia in Tauride and in Aulide (ed. T. Gasford, 1811); and Remarks on the Epistles of Cicero to Brutus (1745). See J. Nicholls's Literary Anecdotes (1812), iv. 272; also biography by F. A. Wolf, Literarische Analekten, ii. 370 (1818).

MARKO KRALYEVICH, Servian hero, was a son of the Servian king or prince, Vukashin (d. 1371). Chagrined at not himself becoming king after his father's death, he headed a revolt against the new ruler of the Servians. Later he passed into the service of the sultan of Turkey, and was killed in battle about 1394. Marko, however, is more celebrated in legend than in history. He is regarded as the personification of the Servian race, and stories of strength and wonder have gathered round his name. He is supposed to have lived for 300 years, to have ridden a horse 150 years old, and to have used his enormous physical strength against oppressors, especially against the Turks. He is a great figure in Servian poetry, and his deeds are also told in the epic poems of the Rumanians and the Bulgarians. One tradition relates how he retired from the world owing to the advent of firearms, which, he held, made strength and valour of no account in battle. Goethe regards Marko as the counterpart of Heracles and of the Persian Rustem.

The Servian poems about him were published in 1878; a German translation by Gröber (Marko, der Königsohn) appeared at Vienna in 1883.

MARK SYSTEM, the name given to a social organization which rests on the common tenure and common cultivation of the land by small groups of freemen. Both politically and economically the mark was an independent community, and its earliest members were doubtless blood relatives. In its origin the word is the same as mark or march (q.v.), a boundary. First used in this sense, it was then applied to the land cleared by the settlers in the forest areas of Germany, and later it was used for the system which prevailed—to what extent or for how long is uncertain—in that country. It is generally assumed that the lands of the mark were divided into three portions, forest, meadow and arable, and as in the manorial system which was later in vogue elsewhere, a system of rotation of crops in two, three or even six fields was adopted, each member of the community having rights of pasture in the forest and the meadow, and a certain share of the arable. The mark was a self-governing community. Its affairs were ordered by the marksmen or chief among whom was the markmoot. Soon, however, their freedom was encroached upon, and in the course of a very short time it disappeared altogether.

The extent and nature of the mark system has been, and still is, a subject of controversy among historians. One school holds that it was almost universal in Germany; that it was, in fact, the typical Teutonic method of holding and cultivating the land. From Germany, it is argued, it was introduced by the Angle and Saxon invaders into England, where it was extensively adopted, being the foundation upon which the prevailing land system in early England was built. An opposing school denies entirely the existence of the mark system, and a French writer, Pustel de Coulanges, refers to it contemptuously as the "mark system of the Rhine". This view is based largely upon the supposition that common ownership of the land was practically unknown among the early Germans, and was by no means general among the early English. The truth will doubtless be found to lie somewhere between the two extremes.

The complete mark system was certainly not prevalent in Anglo-Saxon England, nor did it exist very widely, or for any very long period in Germany, but the system which did prevail in these two countries contained elements which are also found in the mark system.

The chief authority on the mark system is G. L. von Maurer, who has written Einleitung zur Geschichte der Mark-Hof- und Stadtverfassung und der öffentlichen Gewalt (Munich, 1854; new ed., Vienna, 1896), and Geschichte der Markenverfassung in Deutschland (Erlangen, 1896). See also N. D. Pustel de Coulanges, Recherches sur quelques problèmes de l'histoire (1885); and a translation from the same writer's works called The Origin of Property in Land, by M. Ashley. This contains an introductory chapter by Professor W. J. Ashley. Other authorities are K. Lamprecht, Deutsches Wirtschaftsleben im Mittelalter (Leipzig, 1886); R. Schröder, Lehrbuch der deutschen Rechtsgeschichte (Leipzig, 1902); and W. Stubs, Constitutional History of England, vol. i. (1891).

MARL (from O. Fr. marle, Late Lat. margilla, dim. of margia; cf. Du. and Ger. Marge), a calcareous clay, or a mixture of carbonate of lime with argillaceous matter. It is impossible to give a strict definition of a marl, for the term is applied to a great variety of rocks with a considerable range of composition. On the one hand, the marls gradually into clays by diminution in the amount of lime that they contain, and on the other hand they pass into argillaceous limestones (see LIMESTONE). From 25-75% of carbonate of lime may be regarded as characteristic of the marls. But in popular usage many substances are called marls which would not be included under the definition given here. The practice formerly much in vogue of top-dressing land with marls, and the use of many different kinds of earth and clay for that purpose, has led to a very general misapplication of the term; for all sorts of rotten rock, some being of igneous origin while others are rain-wash, loams, and various superficial deposits, have been called "marls" in different parts of Britain, if only it was believed that an application of them to the surface of the fields would result in increased fertility.

The typical marls are soft, earthy, and of a white, grey or brownish colour. Many of them disintegrate in water; and they are readily attacked by dilute hydrochloric acid, which dissolves the carbonate of lime rapidly, giving off bubbles of carbon dioxide. The lime in marls is in various forms: in coarse yellowish whole or broken; in others it is a fine impalpable powder mixed with the clay. In many marls there is organic matter (plant fragments or humus). Sand is usually not abundant but is rarely absent. Gypsum occurs in some marls, occasionally in large simple crystals with the form of lozenge-shaped plates or in twinned groups resembling an arrow-head; fine examples of these are obtained in the marls of Montmartre near Paris, where celestine (strontium sulphate) occurs also in nodular or concretionary masses. Large crystals of calcite or dolomite, lumps of iron pyrites or radiate nodules of marcasite, and small crystals of quartz are found in certain marl deposits; and in Westphalia the marls of the Senonian (part of the Cretaceous system) at Hamm yield masses of stromatolite up to two feet in length. A very large variety of accessory minerals may be proved to exist in marls by microscopic examination.

The rocks known as shell marls are found in many parts of Britain and other northern countries, and are much valued by farmers as a carbonate of lime. The carbonate of lime in the marl is normally turned to produce quicklime. They are generally obtained by digging pits in marshy spots or meadows, and often occur below considerable thicknesses of peat. The large number of shells of fresh-water molusca are scattered through a matrix of clay; usually retaining their shapes though they are in a friable and semi-decomposed state. The species represented are very few, and from their unbroken state it is obvious that they
have not been transported but lived in the place where their remains are found. As mollusca of this kind thrive best in open strechtes of clear water, the sites of the marl deposits must have been shallow lakes and open pools.

At the bottom of the strata it is uncommon to find beds which have the same composition and in many cases the same origin as shell marl. While some of them are fresh-water deposits, others are marine in origin; the Pliocene and Pleistocene marls in Norfolk, Suffolk and Essex are essentially sand and gravel, which are often rich in shells; with them occur clays such as the Chilseford clay; and many of these beds have actually been used as marls for droning. But the surface of agricultural land. Better examples occur among the Oligocene beds of the Hampshire basin and the Isle of Wight, where the Steadon, Bembridge and Hempstead marls are clays, on the other hand. These belong to the Chalk and represent the soft and argillaceous limestones of marine origin, which may be described as marls, occur on several horizons. At its base the white chalk is often mixed with clay, and the chalk marl of this type is as a rule only a few feet thick, being of a rusty brown colour, and is always more or less argillaceous.

In the Triassic rocks of Britain there is a very important series of red, green and mottled clays, over a thousand feet thick in some places, which have been called the New red marls. These underlie the Keuper or uppermost division of the system, and in Cheshire contain valuable deposits of rock salt, the principal sources of that mineral in Great Britain. In the strata these rocks have not many of the features rather than calcareous rocks. Most of them appear to have been laid down in saline lakes in desert areas. As a rule they contain very few fossils, and often they have little or no carbonate of lime, but beds and veins of fibrous gypsum occur in them in considerable profusion. These rocks cover a wide area in the midland counties extending to the south coast near Exmouth, and reappear in the north in the Vale of Eden and in a few places in southern Scotland. The most extensive deposits are in Yorkshire and Lancashire. They are used for making bricks and tiles and for glass. In the Rhaetic beds which immediately overlie the Triassic rocks are found the grey marls, consisting of thin beds of clay, from a few feet thick, which have been called the "grey marls" and the "teal-green marls." To rocks older than this same marl has not often been given, probably because the argillaceous limestones are of the same age. In the Carboniferous and Silurian rocks, they are usually firm and compact, while marl usually comprise rocks which are more or less soft and friable. In other countries, and especially in Germany, many different kinds of marl and of marl-slate are described. Two of these are of especial importance—the dark copper-bearing marl slate of the Permian rocks near Mansfeld in Germany, which has been long and extensively worked as sources of copper, and the white or creamy Solefuhlen limestone, much quarried in Bavaria, and used as a lithographic stone.

MARLBOROUGH, EARLS AND DUKES OF.

The earldom of Marlborough was held by the family of Ley from 1620 to 1679. James Ley, the 1st earl (c. 1550-1639), was lord chief justice of the King's Bench in Ireland and then in England; he was an English member of parliament and was lord high treasurer from 1632 to 1640. His son, also named James Ley, was the 2nd earl of Marlborough. The 3rd earl was his grandson James (1618-1665), a naval officer who was killed in action with the Dutch. James was succeeded by his uncle William, a younger son of the 1st earl, on whose death in 1679 the earldom became extinct.

In 1689 John Churchill was created earl and in 1702 duke of Marlborough (see below). After the death of his only son Charles in 1703 an act of parliament was passed in 1706 settling the duke's title upon his daughters and their issue. Consequently when he died in June 1722 his eldest daughter Henrietta (1681-1733), wife of Francis Godolphin, and earl of Godolphin, became duchess of Marlborough. She died without sons and was succeeded by her nephew Charles Spencer, 5th earl of Sunderland (1706-1758), a son of the great duke's second daughter Anne (d. 1716). Although at this time Charles handed over the Sunderland estates to his younger brother John, the ancestor of the earls, he did not obtain Blenheim until Sarah, the dowager duchess, died in 1744. His eldest son George Spencer, the 4th duke (1739-1817), left three sons. The eldest, George Spencer, the 5th duke (1766-1840), was summoned to the House of Lords as Baron Spencer of Wormleighton in 1806, and in 1817, after succeeding to his father's seat, he took this title. Spencer Churchill, the 2nd duke's second son, Lord Henry John Spencer (1770-1795), emigrated to Sweden and to Prussia; and his third son was Lord Francis Almeric Spencer (1770-1835), who was created a peer as Baron Churchill of Whichwood in 1815. His grandson Victor Albert Francis Charles Spencer (b. 1864) succeeded his father as 3rd Baron Churchill in 1886, and was raised to the rank of a viscount in 1902.

The 7th duke of Marlborough, John Winston Spencer-Churchill (1822-1883), a prominent Conservative politician, was lord-lieutenant of Dorset and of the Isle of Wight, and served as Member of Parliament for the York constituencies and for North Yorks during various periods of his life. The Duke of Marlborough is a descendant of the younger son of the Blandford (the courtesy title borne by the duke's eldest son in his father's lifetime) was responsible for the act of 1856 called the "Blandford Act," enabling populous parishes to be divided for purposes of Church work. In 1892 his grandson Charles Richard John Spencer-Churchill (b. 1871) became 9th duke of Marlborough.

MARLBOROUGH, JOHN CHURCHILL, 1ST DUKE OF (1650-1722), English soldier, was born in the small manor house of Ash, in Mulsbury, Devonshire, near Axminster, in May or June 1650. Arabella Churchill, his eldest sister, and the mother of the duke of Berwick, was born in the same house on the 28th of February 1648. They were the children of Winston Churchill of Glenamottton Wooton in Dorset and Elizabeth the fourth daughter of Sir John Drake, who died in 1636; his widow, after the close of the civil war, received her son-in-law into her own house. From 1663 to 1665 John Churchill went to St Paul's school, and there is a tradition that during this period he showed the bent of his taste by reading and re-reading Vegetus De re militari. When fifteen years old he became page of honour to the Duke of York, and about the same time his sister Arabella became maid of honour to the Duchess of York. This was the first promotion of Blandford (the courtesy title borne by the duke's eldest son in his father's lifetime) was responsible for the act of 1856 called the "Blandford Act," enabling populous parishes to be divided for purposes of Church work. In 1892 his grandson Charles Richard John Spencer-Churchill (b. 1871) became 9th duke of Marlborough.

In 1672, when England to her shame sent six thousand troops to aid Louis XIV. in his attempt to subdue the Dutch, Churchill was made a captain in the company of which the duke of York was colonel, and soon attracted the attention of Turenne, by whose profound military genius the whole army was directed. At the siege of Nimeguen Churchill acquitted himself with such success that the French commander predicted his ultimate rise to distinction. When Maelstricht was besieged in June 1673 he saved the life of the duke of Monmouth, and received the thanks of Louis XIV. for his services. In 1678 he was married to Sarah Jennings (b. June 5, 1660), the favourite attendant on Princess Anne, younger daughter of the Duke of York. Her father, Richard Jennings of Sandridge, near St Albans, had twenty-two brothers and sisters; one of the latter married a London tradesman named Francis Hill, and their daughter Abigail Hill afterwards succeeded her cousin the duchess of Marlborough as favourite to Queen Anne.

On the accession of James II. the Churchills received a great increase in fortune. Colonel Churchill had been created a Scotch peer as Lord Churchill of Eymouth on the 21st of December 1663; and as a reward for his services in going on a special mission from the new monarch to Louis XIV. he was
advanced on the 14th of May 1685 to the English peerage under the title of Baron Churchill of Sandridge in Hertfordshire. When the duke of Monmouth attempted his ill-fated enterprise in the western counties, the second position in command of the king's army was bestowed on Lord Churchill, and on the 3rd of July 1685 he was raised to the hereditary dignity of a peer-general of England, with the style and title of Duke of Marlborough. His vigilance and energy at the battle of Sedgemoor (July 6) victory declared itself on the king's side. After the death of Monmouth he withdrew as far as possible from the administration of public business, but both he and his wife remained the favourite attendants of the princess Anne. Whilst on his embassy to the French court he had declared with emphasis that if the king of England should change the religion of the state he should at once leave his service, and it was not long before the design of James became apparent to the world. Churchill was one of the first to send overtures of obedience to the prince of Orange, to whom he had gone on a commission in 1678. Although he continued in a high position under James and drew the emoluments of his places, he promised William of Orange to use every exertion to bring over the troops to his side. James had been warned against putting any trust in the loyalty of the man on whom he had showered so many favours, but the warnings were in vain, and on the landing of the Dutch prince at Brixham Churchill was promoted to be lieutenant-general (Nov. 7, 1688) and was sent against him with five thousand men. When the royal army had advanced to the downs of Wiltshire and a battle seemed imminent, James was dismayed at finding that in the dead of night his general had stolen away like a thief into the opposite camp.

Churchill was sworn as a privy councillor on the 14th of February 1688/9 and on the 9th of April became earl of Marlborough. William felt, however, that he could not place implicit reliance in his friend's integrity; and, with a clear sense of the manner in which Marlborough's talents might be employed without any detriment to the stability of his throne, he sent him in the following year to command the army into the Netherlands, and in the autumn of 1690 into Ireland, where owing to his generalship Cork and Kinsale fell into his hands after short sieges. For some time there was no open avowal of any distrust in Marlborough's loyalty, but in May 1692 he was thrown into the Tower on an accusation of treason. Though the evidence which could be brought against him was slight, and he was soon set at liberty, there is no doubt that Marlborough was in close relations with the exiled king at St Germain, and that he even went so far as to disclose, in May 1694, to his late master the intention of the English to attack the town of Brest. The talents of the statesmen of this reign were chiefly displayed in their attempts to convince both the exiled and the reigning king of England of their attachment to his fortunes. The sin of Marlborough lay in the fact that he had been favoured above his fellows by each in turn, and that he betrayed both alike apparently without scruple or without shame. Once again during the Fenwick plot of 1696 he was charged with treason, but William, knowing that if he pushed Marlborough and his friends to extremities there would be no other statesmen on whom he could rely, contented himself with ignoring the accusation of Sir John Fenwick, and with executing that conspirator himself. In 1698 the forgiven traitor was made governor to the young duke of Gloucester, the only son of Anne's numerous children who gave promise of attaining to manhood. During the last years of William's reign Marlborough once more was placed in positions of responsibility. His daughters were married into the most prominent families of the land; Henrietta, the eldest, became the wife of Francis, the eldest son of Lord Godolphin; the second, the loveliest woman at the court, with her father's face and temper and her mother's beauty, married Charles, Lord Spencer, the only surviving son of the earl of Sunderland. Higher honours came on the accession of Queen Anne in March 1702. He was at once appointed a Knight of the Garter, captain-general of the English troops both at home and abroad, and master-general of the ordnance. The new queen did not forget the lifelong service of his wife; three positions at the court by which she was enabled to continue by the side of the sovereign were united in her person. The queen showed her devotion to her friend by another signal mark of favour. The ransperation of Windsor Park was granted her for life, with the especial object of enabling Lady Marlborough to live in the Great Lodge. These were but the pre-eminence of fame and power. A week or two after the death of William it was announced by the three great powers, England, Holland and Austria, which formed the grand alliance, that war should be declared against France on the same day, and on the 4th of May 1702 the War of the Spanish Succession was declared by the three countries. Marlborough was made commander-in-chief of the united armies of England and Holland, but throughout the war his plans were impeded by the jealousy of the commanders who were nominally his inferiors, and by the opposite aims of the various countries that were striving to break the power of France. He and his wife wished to penetrate into the French lines; the anxiety of the Dutch was for the maintenance of their frontier and for an augmentation of their territory; the desire of the Austrian emperor was to secure that his son the Archduke Charles should rule Spain. To secure concerted action by these different powers taxed all the diplomacy of Marlborough, but he succeeded for the most part in his desires. In the first year of the campaign it was shown that the armies of the French were not invincible. Several fortresses which Louis XIV. had seized upon surrendered to the allies. Kaseinworth on the Rhine surrendered on the 15th of June, and Venlo on the Meuse on the 23rd of September. The prosperous commercial town of Liége with its commanding citadel capitulated on the 29th of October. The successes of Marlborough caused much rejoicing in his own country, and for these brilliant exploits he was raised (Dec. 14, 1702) to be duke of Marlborough, and received a grant of £3,000 per annum for the queen's life. In the spring of the following year a crushing blow fell upon the duke and duchess. Their eldest and only surviving son, the marquess of Blandford, was seized whilst on a visit to Nijmegen, having been offered him the dowry of Princess Françoise (afterwards bishop of Chichester), with the small-pox, and died on the 20th of February 1703, in his seventeenth year. His talents had already justified the prediction that he would rise to the highest position in the state.

The result of the campaign of 1703 inspired the French king with fresh hopes of ultimate victory. The dashing plans of Marlborough were frustrated by the opposition of his Dutch colleagues. When he wished to invade the French territory they urged him to besiege Bonn, and he was compelled to accede to their wishes. It surrendered on the 15th of May, whereupon he returned to his original plan of attacking Antwerp; but, in consequence of the incapacity of the Dutch leaders, the generals (Villeroy and Boufflers) of the French army surprised the Dutch division on the 30th of June and inflicted on it a loss of many thousands of men. Marlborough was forced to abandon his enterprise, and all the compensation which he received was the capture of the insignificant forts of Huy and Limburg. After a year of comparative failure for the allies, Louis XIV. was emboldened to enter upon an offensive movement against Austria; and Marlborough, smarting under the misadventures of 1703, was eager to meet him. A magnificent army was sent by the French king, under the command of Marshal Tallard, to join the forces of the elector of Bavaria and to march by the Danube so as to seize Vienna itself. Marlborough divined the intention of the expedition, and while making a feint of marching into Alsace led his troops into Bavaria. The two armies (that under Marlborough and Prince Eugène numbering more than fifty thousand men, whilst Tallard's forces were nearly four thousand strong) met in battle near the village of Blenheim, on the bank of the Danube. The French commander made the mistake of supposing that the enemy's attack would be directed against his position in the village, and he concentrated an excessive number of his troops at that point. The early part of the fight was in favour of the French. Three times were the troops led by Prince Eugène, which were attacking the Bavarians, the enemy's left wing, driven back in confusion; Marlborough's cavalry
failed on their first attack in breaking the line of the enemy’s centre. But in the end the victory of the allies was conclusive. Nearly thirty thousand of the French and Bavarians were killed and wounded, and eleven thousand of the French who had been driven down to the Danube were forced to surrender. Bavaria fell into the hands of the allies. Never was a victory more eagerly welcomed than this, and never was a conquering leader more rewarded than Marlborough. Poets and prose writers were employed to do him honour, and the lines of Addison comparing the English triumph at Blenheim with the Greek “palladium” in the storm of 1703 have been famous for over two centuries. The manor of Woodstock, which was transferred by act of parliament from the crown to the duke, was a reward more after his own heart. The gift even in that form was noble, but the queen heightened it by instructing Sir John Vanbrugh to build a palace in the park at the royal expense, and £240,000 of public money was spent on the buildings. He was also created a prince of the empire and the principality of Mindelheim was formed in his honour.

The following year was not marked by any stirring incident. Marlborough was harassed by tedious formalities at the Hague and by jealousies at the German courts. The armies of the French were again brought up to their full standard, but the generals of Louis were instructed to entrench themselves behind earthworks and to act on the defensive. In the darkness of a July night these lines were broken through near Tilremont, and the French were forced to take shelter under the walls of Louvain. Marlborough in vain urged an attack upon them in their new position, and when 1705 had passed away the forces of the French king had suffered no diminution. This immunity from disaster tempted Villeroi in the next spring into meeting the allied forces in an open fight, but his assurance proved his ruin. Through the superior tactics of Marlborough the battle of Ramillies (May 23, 1706) ended in the total rout of the French, and caused the transference of nearly the whole of Brabant and Flanders to the allies. Five days afterwards the victor entered Brussels in state, and the inhabitants acknowledged the rule of the archduke. Antwerp and Ostend surrendered themselves with slight loss. Menin held out until three thousand of the soldiers of the allies were laid low around its walls, but Dendermonde, which Louis had forty years previously besieged in vain, quickly gave itself up to the resistless Marlborough.

Again a year of activity and triumph was succeeded by a period of languor and depression. During the whole of 1707 fortune inclined to the other side, with the result that in July 1708 Ghent and Bruges returned to the allegiance of the French, and Marlborough, fearing that their example might be followed by the other cities, advanced with his whole army towards Oudenarde. Had the counsels of Vendôme, one of the ablest of the French generals, prevailed, the fight might have had a different issue, but his suggestions were disregarded by the duke of Burgundy, the grandson of Louis, and the battle, which raged on the high ground above Oudenarde, ended in their defeat (July 11, 1708). After this victory Marlborough, ever anxious for decisive measures, wished to advance on Paris, but he was overruled. The allied army invested the town of Lille, on the fortifications of which Vauban had expended an immense amount of thought; and after a struggle of nearly four months, and the loss to the combatants of thirty thousand men, the citadel was surrendered by Marshal Boufflers on the 9th of December. By the end of the year Brabant was again subject to the rule of the allies. The suffering in France at this time weighed so heavily upon the people that its proud king humbled himself to sue for peace. Each of the allies in turn did he supplicate, and Tory his minister endeavoured by promises of large sums of money to obtain the support of Marlborough to his proposals. These attempts were in vain, and when the winter passed away a French army of one hundred and ten thousand, under the command of Villars, took the field. On the 3rd of September 1709 Tournay capitulated, and the two leaders, Marlborough and Eugène, led their forces to Mons in spite of the attempt of Villars to prevent them. For the last time during the protracted war the two armies met in fair fight at Malplaquet, on the south of Mons (Sept. 11, 1709), where the French leader had strengthened his position by extensive earthworks. The fight was long and doubtful, and although the French ultimately retreated under the direction of Boufflers, for Villars had been wounded on the knee, it was in good order, and their losses were less than those of their opponents. The campaign lasted for a year or two after this indecisive contest, but it was not signalized by any such “glorious victory” as Blenheim. All that the English could plume themselves on was the preservation of their existence; when Marlborough and his friends had to fear was the gradual tightening of the enemy’s chain until it reached the walls of Paris. The energies of the French were concentrated in the construction of fresh lines of defence, until their commander boasted that his position was impregnable. In this way the war dragged on until the conclusion of the Peace of Utrecht in June 1712.

These victorious campaigns had not prevented the position of Marlborough from being undermined by party intrigues at home. In the early part of Queen Anne’s reign his political friends were found among the Tories, and the ministry under Sidney Godolphin was chiefly composed of members of that party. After a year or two, however, the more ardent Tories withdrew, and two younger adherents of the same cause, Harley and St John, were introduced in May 1704 into the ministry. The duchess, partly through the influence of her son-in-law, the earl of Sunderland, who came into office against the queen’s wish on the 3rd of December 1706, and partly through the opposition of the Tories to the French war, had gone over to the Whig cause, and she pressed her views on the sovereign with more vehemence than discretion. She had obtained for her indigent cousin, Abigail Hill, a small position at court, and the poor relation very soon began to injure the benefactor who had befriended her. With Hill’s assistance Harley and St John widened the breach with the queen which was commenced by the imperious manner of the duchess. The love of the two friends changed into hate, and no opportunity for humiliating the family of Marlborough was allowed to pass neglected. Sunderland and Godolphin were the first to fall (July-Aug. 1710); a few months later the duchess was dismissed from her offices; and, although Marlborough himself was permitted to continue in his position a short time longer, his fall was only delayed until the last day of 1712. Life in England had become so unpleasant that he went to the Continent in November 1712 and remained abroad until the death of Anne (Aug. 1, 1714).

Then he once more returned to England and resumed his old military posts, but he took little part in public affairs. Even if he had wished to regain his commanding position in the country, ill health would have prevented him from obtaining his desires. Johnson indeed says, in the Vanity of Human Wishes, that “the streams of dotage” flowed from his eyes; but this is a poetical exaggeration. It is certain that at the time of his death he was able to understand the remarks of others and to express his own wishes. At four o’clock on the morning of the 16th of June 1722 he died at Cranbourn Lodge, near Windsor. His remains were at first deposited in Westminster Abbey, in the vault at the east end of King Henry VII.’s chapel, but they now rest in a mausoleum in the chapel at Blenheim.

His widow, to whom must be assigned a considerable share both in his rise and in his fall, survived till the 18th of October 1744. Those years were spent in bitter animosity with many within and without her own family. Left by her husband with the command of boundless wealth, she used it for the vindication of his memory and for the justification of her own resentment. Two of the leading opponents of the Whig ministry, Chesterfield and Pitt, were especially honoured by her attentions. To Pitt she left ten thousand pounds, to the other statesmen twice that sum and a reversionary interest in her landed property at Wimbledon. Whilst a widow she received numerous offers of marriage from titled suitors. She refused them all: from her marriage to her death her heart had no other inmate than the man as whose wife she had become almost a rival to royalty.
The rapid rise of Marlborough to the highest position in the State was due to his singular tact and his diplomatic skill in the management of men. In an age remarkable for grace of manner and for adroitness of compliment, his courteous demeanour and the art with which he refused or granted a favour extorted the admiration of every one with whom he came in contact. Through his consideration for the welfare of his soldiers he held together for a time an army drawn from all parts of Christendom. His talents may not have been profound (he possessed "an excellent plain understanding and sound judgment" is the opinion of Lord Chesterfield), but they were such as Englishmen love. Alike in planning and in executing, he took infinite pains in all points of detail. Nothing escaped his observation, and in the hottest moment of the fight the coolness of his intellect shone conspicuous. His enemies indeed affected to attribute his uniform success in the field to fortune, and they magnified his love of money by drawing up balance sheets which included every penny which he had received, but omitted the pounds which he had spent in the cause he had sincerely at heart.

All that can be alleged in excuse of his attempts to serve two masters, the king whom he had deserted and the king who had received him into favour, is that not one of his associates was without sin in this respect.

The books on Marlborough are very numerous. Under his name in the catalogue of the British Museum there are 165 entries, and 447 under that of his wife. The chief works are Ledard's, Archdeacon William Coke's (1818-1819), Sir Archibald Alison's (1855), and Viscount Wolseley's (1894) Lives, but Wolseley stops with the accession of George IV. An admirer of a French memoir of Marlborough's Letters and Despatches, edited by Sir George Murray (5 vols., 1845); and the interesting summaries of Mrs Creighton (1879) and George Saintsbury (1885), the description in John Hill Burton's Encyclopaedia of Queen Anne, and the numerous battle scenes of Marlborough, are from personal observation. A good account of his birthplace and country will be found in G. P. R. Pulman's Book of the Ancient District (4th ed., 1875); and for the home of the duchess the reader can refer to the History of Herfordshire, by E. C. Cussans. A memoir of her, by one of her descendants, Mrs Arthur Colville, appeared in 1904. The pamphlets written on her conduct at court relate to matters of little interest at the present time.

MARLBOROUGH, a market town and municipal borough in the Devizes parliamentary division of Wiltshire, England, 735 m. W. of London, on the Great Western and the Midland and South Western Junction railways. Pop. (1901), 3,887. It is an old-fashioned place on the skirts of Savernake Forest, lying in a valley of the chalk uplands known as Marlborough Downs, and traversed by the river Kennet. It consists mainly of one broad street, in which a majority of the houses are Jacobean; those on the north side, which have projecting upper storeys, forming the colonnade commended in the Diary of Samuel Pepys for 1668. St Peter's Church, a red-brick structure, is said to have been built by the scene of the ordination of Cardinal Wolsey in 1498. The church of Freshute, largely rebuilt, but preserving its Norman pillars, has a curious piscina, and a black basalt font of great size dating from 1100-1150, in which according to a very old tradition King John was baptized. Other noteworthy buildings are the town-hall, 16th century grammar school and Marlborough College. This important public school was opened in 1843, originally for the sons of clergymen, by whom alone certain scholarships are tenable. The number of boys is about 600. Marlborough possesses little trade other than agricultural; but there are breweries, tanneries and rope-makers. The town is governed by a mayor, 4 aldermen and 12 councillors. Area, 308 acres.

The antiquity of Marlborough is shown by the Castle Mound, a British earthwork, which local legend makes the grave of Merlin; and the name of Marlborough has been regarded as a corrupt form of Merlin's Berg or Rock.

Near the site of the modern Marlborough (Merelege, Merelege) was originally a Roman castrum called Cunetio, and later there was a Norman fortress in which William I. established a mint. In Domesday it was royal demesne and during the following centuries figures in numerous grants generally as the dowry of queens. The castle, built under Henry I., by Roger, bishop of Salisbury, was held for Matilda against Stephen, and became a favourite residence of Henry II., Savernake being a royal deer-park. In 1267 Henry III. held his last parliament here, at which the Statute of Marlborough was passed. The castle ceased to be an important stronghold after the Wars of the Roses, but was garrisoned for Charles I. by its owners, the Seymour family. Marlborough itself, however, is mentioned by Clarendon as "the most notoriously disaffected towne in Wiltshire," and was captured by the royal forces in 1643, and partly burnt. At the Restoration Charles II. was received and magnificently entertained by Lord Seymour, whose mansion forms the oldest part of Marlborough College. The town was constituted a suffragan see by Henry II. Sacheverell, the politician and divine, was born here in 1674, and educated at the grammar school. In 1653 the town was nearly destroyed by fire, and it again suffered in 1679 and 1690; after which an act was passed forbidding the use of thatch. Marlborough, from its position on the Great Bath Road, was a famous coaching centre.

The first charter was granted by John in 1204, and conferred a gild merchant, together with freedom from all pleas except pleas of the Crown and from all secular exactions by sea and land. This was confirmed by subsequent sovereigns from Henry III. to Henry VIII. Later charters were obtained from Henry IV. in 1407 and from Elizabeth in 1570. The former granted some additional exemptions whilst the latter incorporated the town under the title of mayor and burgesses of Marlborough. The corporation was finally reconstructed in 1835 under the title of a mayor, 4 aldermen and 12 councillors. Marlborough returned two members to parliament until 1885, when the number was reduced to one, and in 1885 the representation was merged in that of the county. A yearly fair was granted by John in 1204, for eight days from August 14, and two more by Henry III. for three days from November 11 and June 29 respectively. In 1204 John also granted a weekly market on Wednesday and Saturday. In Tudor times the corn trade prospered here.

See "Victoria County History": Wilt; James Waglen, History of Marlborough (London, 1854).

MARLBOROUGH, a city of Middlesex county, Massachusetts, U.S.A., about 28 m. W. of Boston. Pop. (1910), 33,609 (33,121 foreign-born); (1010), 14,579; it is served by the Boston & Maine and the New York New Haven & Hartford railways, and by inter-urban electric lines. The city, with a total area of 21-08 sq. m., lies in a fertile hilly country, and contains several ponds, including the beautiful Williams Pond, which covers 1 sq. m. A public library was established here in 1792; it was housed in a new building in 1904. Other public buildings are the city hall, the Federal building and a state armoury. There is a boarding school for girls, St Ann's Academy (1887), under the direction of the Sisters of St. Ann. The city's importance is industrial; in 1908 its factory product was valued at $7,468,849 (an increase of 66% since 1900), of which 86.9% was the value of boots and shoes. Whether the city is named from Marlborough in Wiltshire, or, as seems more probable, because of early spellings "Marberg" and "Marbridge," from the presence of marl in the neighbourhood, is uncertain. Settlers from Sudbury in 1665 took possession of a hill called by the Indians Whipsuifenkke and gradually hemmed in the Christian Indian village of Ockooogansett (or Ongokinguamescit), on an adjoining hill. This hill was named by the Indians Joy Hill, but was afterwards called Marlborough. The town was incorporated in 1660. It was destroyed by Indians in March 1676, during King Philip's war, and was abandoned for a year. Westborough was separated from it in 1717, Southborough in 1727, and a part of Berlin in 1784; parts of it were annexed to Northborough in 1807, to Bolton in 1820 and to Hudson in 1866; and it annexed parts of Framingham in 1791, and of Southborough in 1843. In 1890 it was incorporated as a city.

See S. A. Drake, History of Middlesex County, ii. 137 sqq., "Northborough" by Rev. R. S. Griffin and E. L. Bigelow (Boston, 1880).

MARLITT, E., the pseudonym of Eugenie John (1825-1887), German novelist, who was born at Arnstadt in Thuringia, the daughter of a merchant, on the 5th of December 1825. By her musical talent she attracted the notice of the reigning princess
of Schwarzbarg-Sondershausen, who provided for her training as a singer at the Vienna Conservatoire. After three years' study she made a successful stage début, but was compelled in consequence of deafness to abandon this career. She then became reader and travelling companion to her patrons, and her life at the court on her many travels furnished her with material for her novels. In 1863 she resigned her post, and then lived with her brother at Arnstadt until her death on the 22nd of June 1887.

Her first novel, Die zwölf Apostel, was published in the Gartenlaube in 1865 and this was followed in 1866 by Goldelse (23rd ed., 1889), with which her polished and unhemmed prose reputation was established. The same editor who published Mamsell Blasbar (1866); Das Geheimniss der alten Mamsell (1867; 13th ed., 1888); Reichsrägen Gisela (1869; 9th ed., 1900); Das Heidelprinzesschen (1871; 8th ed., 1888) and Im Hause des Kommerzienrats (1877; 5th ed., 1891). All these works are directed against social prejudices, but, although attractively written, are deficient in higher literary qualities and appeal mostly to juvenile readers.

E. Marliett's Csmaltenke Romane und Novellen were published in 10 volumes (1888-1890; 2nd ed., 1891-1894), to which is appended a biographical memoir.

MARLOW (Great Marlow), a market town in the Wycombe parliamentary division of Buckinghamshire, England, 313 m. W. of London on a branch of the Great Western railway. Pop. of urban district 16,379. Marlow church, perhaps one of the oldest ecclesiastical foundations in England, was destroyed in 1542 and rebuilt in 1544. It is beautifully situated on the north (left) bank of the Thames, which is here confined closely between low wooded hills. A weir and lock, near which rise the high tower and spire of the modern church of all Saints, separate two fine reaches of the river, and the town is a favourite resort for boating and fishing. The village of Little Marlow, where the foundations of a Benedictine nunnery of the time of Henry III. have been revealed by excavation, lies near the river two miles below. The town is, as a whole, modern in appearance, but a few old houses remain, such as the grammar school, founded as a bluecoat school in 1624, adjoining which is a house occupied by the poet Shelley in 1817. The town has manufactures of chintz, lace and embroidery, paper mills and breweries.

Great Marlow (Marlewe, Merlewe, Marlowe, Marlow) appears as a manor in Domesday Book, but its "borough and liberties" are not mentioned before 1261. It was then held by the earls of Gloucester, and its importance was probably due to the bridge across the Thames, first built, according to tradition, by the Templars at Bisham. No charter of incorporation was ever granted to the town, but there are faint traces of its constitution in the 14th century. In 1342 the mayor and burgesses presented to a chantry and continued to be the patrons till 1394. Later writs addressed to the town only mention two bailiffs as officers of the borough, nor were the pontage rights and dues held by it until the 15th century. Two burgesses sat in parliament from 1300 to 1309, but the representation of the borough lapsed until 1621, when the right to return members was re-established. After the Reform Bill of 1832 the boundaries of the parliamentary borough were enlarged, but in 1867 its representation was reduced to one member, and in 1885 was merged in that of the county. No grant of a market in the borough has been found, but a market was held by the Dispensers who had succeeded the De Clares as lords of the manor in the 14th century. In the 16th century the market seems to have been given up, but it was revived and held in the 18th century, only to disappear again before 1862. Fairs were mentioned in 1306 on the death of Gilbert de Clare, when they were held on St Luke's Day and on the Wednesday in Whits-week by the earl of Gloucester, and Hugh le Dispenser was granted a fair in his manor of Marlow in 1324. In 1344 two of the fairs, one of which, for horses and cattle, is still held on the 29th of October. Lace and satin-stitch work used to be made to a considerable extent.

MARLOWE, CHRISTOPHER (1564-1593), English dramatist, the father of English tragedy, and instigator of dramatic blank verse, the eldest son of a shoemaker at Canterbury, was born in that city on the 6th of February 1564. He was christened at St George's Church, Canterbury, on the 26th of February, 1563/4, some two months before Shakespeare's baptism at Stratford-on-Avon. His father, John Marlowe, is said to have been the grandson of John Morley or Marlowe, a substantial tenant of Canterbury. The father, who survived by a dozen years or so his illustrious son, married on the 22nd of May 1561 Catherine, daughter of Christopher Arthur, at one time a servitor of St Peter's, Canterbury, who had been ejected by Queen Mary as a married minister. The dramatist received the rudiments of his education at the King's School, Canterbury, which he entered at Michaelmas 1578, and where he had as his fellow-pupils Richard Boyle, afterwards known as the great earl of Cork, and Will Lyly, the brother of the dramatist. Stephen Gosson entered the same school a little before, and William Harvey, the famous physician, a little after Marlowe. He went to Cambridge as one of Archbishop Parker's scholars from the King's School, and matriculated at Benet (Corpus Christi) College, on the 17th of March 1571, taking his B.A. degree in 1584, and that of M.A. three or four years later.

Francis Kett, the mystic, burnt in 1589 for heresy, was a fellow and tutor of his college, and may have had some share in developing Marlowe's opinions in religious matters. Marlowe's classical acquirements were of a kind which was then extremely common, being based for the most part upon a minute acquaintance with Roman mythology, as revealed in Ovid's Metamorphoses. His spirited translation of Ovid's Amores (printed 1590), which was at any rate commended at Cambridge, does not seem to point to any very intimate acquaintance with the grammar and syntax of the Latin tongue. Before 1587 he seems to have quitted Cambridge for London, where he attached himself to the Lord Admiral's Company of Players, under the leadership of the famed actor Edward Alleyn, and almost at once began writing for the stage. Of Marlowe's career in London, apart from his four great theatrical successes, we know hardly anything; but he evidently knew Thomas Kyd, who shared his unorthodox opinions. Nash criticized his verse, Greene attacked his shudder at his atheism; Gabriel Harvey maligned his memory. On the other hand Marlowe was intimate with the Walsingham of Scadbury, Chiselhurst, kinsmen of Sir Francis Walsingham: he was also the personal friend of Sir Walter Raleigh, and perhaps of the poetical earl of Oxford, with both of whom, and with such men as Walter Warner and Robert Hughes the mathematicians, Thomas Harriot the notable astronomer, and Matthew Royden, the dramatist is said to have met in free converse. Either this free converse or the licentious character of some of the young dramatist's tirades seems to have sown a suspicion among the strait-laced that his morals left everything to be desired. It is probable enough that this attitude of reprobation drove a man of so exalted a disposition as Marlowe into a more insurgent attitude than he would have otherwise adopted. He seems at any rate to have been associated with what was denounced as Sir Walter Raleigh's school of atheism, and to have dallied with opinions which were then regarded as putting a man outside the pale of civilized humanity. As the result of some depositions made by Thomas Kyd under the influence of torture, the Privy Council were upon the eve of investigating some serious charges against Marlowe when his career was abruptly and somewhat scandalously terminated. The order had already been issued for his arrest, when he was slain in a quarrel by a man variously named (Archer and Ingram) at Deptford, at the end of May 1593, and he was buried on the 1st of June in the churchyard of St Nicholas at Deptford. The following September Gabriel Harvey referred to him as "dead of the plague." The disgraceful particulars attached to the tragedy of Marlowe in the popular mind would not seem to have appeared until four years later (1597) when Thomas Beard, the Puritan author of The Theatre of God's Providence, published a pamphlet in which he used the dramatist as one of his warning examples of the vengeance of God. Upon the embellishments of this story, such as that of Francis Meres the critic, in 1598, that Marlowe came to be "stabb'd to death by a bawdy servingman, a rivel of his in his lewde love," or that of William Vaughan in the Golden Grove of 1600, in which the unfortunate poet's dagger is thrust into his own eye in prevention of his felonious assault upon an innocent man, his guest, it is impossible now to pronounce. We really do not know the
circumstances of Marlowe’s death. The probability is he was killed in a brawl, and his atheism must be interpreted not according to the ex parte accusation of one Richard Baines, a professional informer (among the Privy Council records), but as a species of rationalistic antinomianism, dialectic in character, and closely related to the defection from conventional orthodoxy for which Ketteridge, on one side, and Marston, on the other, were held to have laid the foundations before the end of his life there is reason to believe that he transferred his services from the Lord Admiral’s to Lord Strange’s Company, and may have thus been brought into communication with Shakespeare, who in such plays as Richard II. and Richard III. owed not a little to the influence of his romantic predecessor.

Marlowe’s career as a dramatist lies between the years 1587 and 1593, and the four great plays to which reference has been made were Tamburlaine the Great, an heroic epic in, dramatic form divided into acts. With many and heavy faults, there is something of genuine greatness in Tamburlaine the Great; and for two grave reasons it must always be remembered with distinction and mentioned with honour. It is the first poem ever written in English blank verse, as distinguished from mere rhymeless decasyllables; and it contains one of the noblest passages, perhaps indeed the noblest, in the literature of the world, ever written by one of the greatest masters of poetry in loving praise of the glorious delights and sublime submission to the everlasting limits of his art. In its highest and most distinctive qualities, in unfolding and infallible command of the rapturous language of music, and the proper tone of colour for the finest touches of poetic execution, no poet of the most elaborate modern school, working at ease upon every consummate resource of luxurious learning and leisurely refinement, has ever excelled the best and most representative work of a man who had literally no models before him and probably or evidently was often if not always compelled to write against time for his living.

The just and generous judgment passed by Goethe on the Faustus of his English predecessor in tragic drama of the same subject is somewhat more than sufficient to counterbalance the slighting or the sneering references to that magnificent poem which might have been expected from the ignorance of Byron or the incompetence of Hallam. And the particular note of merit observed, the special point of the praise conferred, by the great German poet should be no less sufficient to dispose of the vulgar misconception yet lingering among scholars and pretenders to criticism, which regards a writer by whom no man was ever born with a finer or a stronger instinct for perfection of excellence in execution as a mere noble savage of letters, a rough self-taught scribbler or scribbler of crude and rude genius, whose unheaven blocks of verse had in them some veins of rare enough metal to be quarried and polished by Shakespeare. What most impressed the author of Faust in the work of Marlowe was the quality the want of which in the author of Manfred is proof enough to consign his best work to the second or third class at most. “How greatly it is all planned!” the first requisite of all great work, and one of which the highest genius possible to a greatly gifted barbarian could by no possibility understand the nature or conceive the existence. That Goethe “had thought of translating it” is perhaps hardly less precious a tribute to its greatness than the fact that it has been actually and admirably translated by the master himself, in the last months before the end of his life. Tamburlaine is monotonous in the general roll and flow of its stately and sonorous speech; but the unity of tone and purpose in Doctor Faustus is not relieved by change of manner and variety of incident. The comic scenes, written evidently with as little labour as of relish, are for the most part scarcely more than transcripts, thrown into the form of dialogue, from a popular prose History of Dr Faustus, and therefore should be set down as little to the discredit as to the credit of the poet. Few masterpieces of any age in any language can stand beside this tragic poem—it has hardly the structure of a play—for the qualities of terror and splendour, for intensity of purpose and sublimity of note. In the vision of Helen, for example, the intense perception of loveliness gives actual sublimity to the sweetness and radiance of mere beauty in the passionate and spontaneous selection of words the most choice and perfect; and in like manner the sublimity of simplicity in Marlowe’s conception and expression of the agonies endured by Faustus under the immediate imminence of his doom gives the highest note of beauty, the quality of absolute fitness and propriety, to the sheer straightforwardness of speech in which his agonizing horror finds vent ever more and more terrible from the first to the last equally beautiful and fearful verse of that tremendous monologue which has no parallel in all the range of tragedy.

It is now a commonplace of criticism to observe and regret the decline of power and interest after the opening acts of The Jew of Malta. This decline is undeniable, though even the latter part of the play (the text of which is very corrupt) is not wanting in rough energy; but the first two acts would be sufficient foundation for the durable fame of a dramatic poet. In the blank verse of Milton alone—who perhaps was hardly less indebted than Shakespeare was for inspiration to Marlowe as the first English master of blank verse in its grander forms—has the glory or the melody of passages in the opening soliloquy of Barnabas been possibly surpassed. The figure of the hero before it degenerates into caricature is as finely touched as the poetic execution is excellent; and the rude and rapid sketches of the minor characters show at least some vigour and vivacity of touch.

In Edward the Second the interest rises and the execution improves as visibly and as greatly with the course of the advancing story as they decline in The Jew of Malta. The scene of the king’s deposition at Kenilworth is almost as much finer in tragic effect and poetic quality as it is shorter and less elaborate than the corresponding scene in Shakespeare’s King Richard II. The terror of the death-scene undoubtedly rises into horror; but this horror is with skilful simplicity of treatment preserved from passing into disgust. In pure poetry, in sublime and splendid imagination, this tragedy is excelled by Doctor Faustus; in dramatic power and positive impression of natural effect it is certainly the masterpiece of Marlowe. It was almost inevitable, in the hands of any poet but Shakespeare, that the characters represented should be capable of securing or even exciting any finer sympathy or more serious interest than attends on the mere evolution of successive events or the mere display of emotions (except always in the great scene of the deposition) rather animal than spiritual in their expression of rage or tenderness or suffering. The exact balance of mutual effect, the final note of scenic harmony, between ideal
conception and realistic execution is not yet struck with perfect accuracy of touch and security of hand; but on this point also Marlowe has here come nearer by many degrees to Shakespeare than any of his other predecessors have ever come near to Marlowe.

Of The Massacre at Paris (acted in 1593, printed 1600?) it is impossible to judge fairly from the garbled fragment of its genuine text which is all that has come down to us. To Mr Collier, among numberless other obligations, we owe the discovery of a noble passage excised in the piratical edition which gives us the only version extant of this unhappy play, and which, as it must be allowed, contains nothing of quite equal value. This is obviously an occasional and polemical work, and being as it is overcharged with the anti-Catholic passion of the time has a typical quality which gives it some empirical significance and interest. That antipapal ardour is indeed the only note of unity in a rough and ragged chronicle which shambles and stumbles onward from the death of Queen Jeanne of Navarre to the murder of the last Valois. It is possible to conjecture, what it would be fruitless to affirm, that it gave a hint in the next century to Nathaniel Lee for his far superior and really admirable tragedy on the same subject, issued ninety-seven years after the death of Marlowe.

In the tragedy of Dido Queen of Carthage (completed by Thomas Nash, produced and printed 1594), a servile fidelity to the text of Virgil's narrative has naturally resulted in the failure which might have been expected from an attempt at once to transcribe what is essentially inimitable and to reproduce it under the hopeless alien conditions of dramatic adaptation. The one really noble passage in a generally feeble and incomplete work is, however, uninspired by the unattainable model to which the dramatists have been only too obsequious in their subservience. It is as nearly certain as anything can be which depends chiefly upon cumulative and collateral evidence that the better part of what is best in the serious scenes of King Henry VI. is mainly the work of Marlowe. That he is at any rate the principal author of the second and third plays passing under that name among the works of Shakespeare, but first and imperfectly printed as The Contention between the two Famous Houses of York and Lancaster, can hardly be now a matter of debate among competent judges. The crucial difficulty of criticism in this matter is to determine, if indeed it should not rather say to conjecture, the authorship of the numerous scenes in prose showing as they generally do a power of comparatively high and pure comic realism to which nothing in the acknowledged works of any pre-Shakespearian dramatist is even remotely comparable. Yet, especially in the original text of these scenes as they stand unpurified by the ultimate revision of Shakespeare or his editors, there are tones and touches which recall rather the clownish horseplay and homely ribaldry of his predecessors than anything in the lighter interludes of his very earliest plays. We find the same sort of thing which we find in their writings, only better done than they usually do it, rather than such work as Shakespeare's a little worse done than usual. And even in the final text of the tragic or metrical scenes the highest note struck is always, with one magnificent and unquestionable exception, rather in the key of Marlowe at his best than of Shakespeare while yet in great measure his disciple.

A Taming of a Shrew, the play on which Shakespeare's comedy was founded, has been attributed, without good reason, to Marlowe. The passages in the play borrowed from Marlowe's works provide an argument against, rather than for his authorship; while the humorous character of the play is not in keeping with his other work. He may have had a share in The Trouble some Roaigne of King John (1594), and Fleay conjectured that the plays Edward III. and Richard III. usually included in editions of Shakespeare are at least based on plays by Marlowe. Lust's Dominion, printed in 1657, was incorrectly ascribed to him, and a play no longer extant, The True History of George Scanderbage, was assumed by Fleay on the authority of an obscure passage of Gabriel Harvey to be his work. The Maiden's Holiday, assigned to Day and Marlowe, was destroyed by Warburton's cook. Day was considerably Marlowe's junior, and collaboration between the two is not probable.

Had every copy of Marlowe's boyish version or perversion of Ovid's Elegies (P. Ovidii Nasonis Amorum compressed into three books) deservedly perished in the flames to which it was judicially condemned by the sentence of a brace of prelates, it is possible that an occasional bookworm, it is certain that no poetical student, would have deplored its destruction, if its demerits could in that case have been imagined. His translation of the first book of Lucre's alternately rises above the original and falls short of it,—often inferior to the Latin in point and vigour, but in some passages, as in the opening lines of the fourth canto, a more conscious and more heartily writtenLatin version which, with its thin classicism and its feeble and rigid conditions of dramatic adaptation, has a more exalted piece of work.

One of the most faultless lyrics and one of the loveliest fragments in the whole range of descriptive and fanciful poetry would have secured a place for Marlowe among the memorable men of his epoch, even if his plays had perished with himself. His Passionate Shepherd remains ever since unrivalled in its way—a way of pure fancy and radiant melody without break or lapse. The untitled fragment, on the other hand, has been very closely rivalled, perhaps very happily imitated, but only by the greatest lyric poet of England—by Shelley alone. Marlowe's poem of the Drummer Boy (1593; reprinted in the quarto edition of 1595; completed and brought out by George Chapman, who divided Marlowe's work into two sets, and added four of his own, 1598), closing with the sunrise which closes the night of the lovers' union, stands alone in its age, and far ahead of the work of any possible competitor between the death of Spenser and the dawn of Milton. In clear mastery of narrative and presentation, in melodious ease and simplicity of strength, it is not less pre-eminently than in the admirable beauty and impeccable perfection of separate lines or passages. It is doubtful whether the heroic couplet has ever been more finely handled.

The place and the value of Christopher Marlowe as a leader among English poets it would be almost impossible for historical criticism to over-estimate. To none of them all, perhaps, have so many of the greatest among them been so deeply and so directly indebted. Nor was ever any great writer's influence upon his fellows more utterly and unmixedly an influence for good. He first, and he alone, guided Shakespeare into the right way of work; his music, in which there is no echo of any man's before him, found its own echo in the more prolonged but hardly more exalted harmony of Milton's. He is the greatest discoverer, the most daring and inspired pioneer, in all our poetic literature. Before him there was neither genuine blank verse nor a genuine tragedy in our language. After his arrival the way was prepared, the paths were made straight, for Shakespeare. (A. C. S.)

Marlowe's fame, so finely appreciated by Shakespeare and Drayton, was in obscurity from the fall of the theatres until the generation of Lamb and Hazlitt. A collected edition was brought out by Pickering in 1826. This was greatly improved upon by the Rev. G. H. Purdy and J. G. Lydgate, in 1858; and, in 1860, by Colonel Francis Cunningham in 1871. The standard edition of Mr A. H. Bullen in 3 vols. appeared in 1884-1885 and is now under revision. The 'Best Plays' were edited for the Mermaid series by Havelock Ellis with an Introduction by J. A. Symonds (1887-1886). The best modern text is that edited by C. F. Tucker Brooke (Oxf. Univ. Press, 1910). A sketch in outline of Marlowe's life and work was essayed by J. G. Lydgate (Cameronian, 1813), but not very concisely. See also W. G. Wright's Essay on Marlowe's Influence (1866); Modern Lang. Rev. iv. 167 (M. at Cambridge); Swinburne,
Study of Shakespeare (1880); Elze, Notes, and Hazlitt Drapery Lit.; 
the Life of Hogarth, fac., and Appendix, Sept. Oct., 1905; Jusserand, Hist. of English Lit.; the Cambridge Hist. of English Lit.; Seccome and Allen, Age of Shakespeare (vol. ii. 3rd ed., 1909), and the separate editions of Dr Faustus, Edward II., &c.

The Town of Pontarlier, It was the town of the quinces, (Lucuma), which Fabyan is pleasant pavilion at the east of it, and the latter part of it, bears sumptuous pulp. (Lucuma)

Close MARMANDE, a town which bears the name Marmalade, its Pavillon, and bears the name of Fabyan in the Chronicles of the Faust-buch or Historia von D. Johann Fausten (Frankfort, 1887), and for Edward II., the Chronicles of Fabyan (1516), Holinshed (1577) and Stow (1580).

MARLOWE, JULIA [SARAH FRANCES FROST] (1870— ), American actress, was born near Keswick, England, on the 17th of August 1870, and went with her family to America in 1875. Her first formal appearance on the stage was in New York in 1887, although she had before that travelled with a juvenile opera company in H.M.S. Pinafore, and afterwards was given such parts as Maria in Twelfth Night in Miss Josephine Riley's travelling company. Her first great success was as Parthenia in Ingomar, and her subsequent presentations of Rosalind, Viola, and Julia in The Hunchback confirmed her position as a "star." In 1894 she married Robert Taber, an actor, with whom she played until their divorce in 1900. Subsequently she had great success as Barbara Frietchie in Clyde Fitch's play of that name, and other dramas; and from 1904 to 1907 she acted with E. H. Sothern in a notable series of Shakespeare plays, as well as in modern drama.

MARLY-LE-ROI, a village of northern France in the department of Seine-et-Oise, 5 m. N. by W. of Versailles by road. Pop. (1906), 1409. Notwithstanding some fine country houses, Marly is dull and unattractive, and owes all its celebrity to the sumptuous château built towards the end of the 17th century by Louis XIV., and now destroyed. It was originally designed as a simple hermitage to which the king could occasionally retire with a few of his more intimate friends from the pomp of Versailles. He died in it, and it grew into great magnitude as the ruinous extravaganzas of the Grand Monarque. The central pavilion (inhabited by the king himself) and its twelve subsidiary pavilions were intended to suggest the sun surrounded by the signs of the zodiac. Seldom visited by Louis XV., and wholly abandoned by Louis XVI., it was demolished after the Revolution, its art treasures having previously been dispersed, and the remains now consist of a large basin, the Abreuvoir, a few mouldering ivy-grown walls, some traces of parterres with magnificient trees, the park, and the forest of 83 sq. m., one of the most pleasant promenades of the neighbourhood of Paris, containing the shooting preserves of the President of the Republic.

Close to the Seine, half-way between Marly-le-Roi and St Germain, is the village of Port-Marly, and one mile farther up is the hamlet of Marly-la-Machine. Here, in 1684, an immense hydraulic engine, driven by the current of the river, was erected; it raised the water to a high tower, where the aqueduct of Marly began (700 yds. in length, 75 in height, with 36 arches, still well-preserved), carrying the waters of the Seine to Versailles.

MARMALADE (adopted from Fr. marmelade, from marmelo, a quince, derived through the Lat. melinum, from Gr. μῆλον, honey, and μαρμαρός, an apple, an apple grafted on a quince), a preserve originally made of quinces, but now commonly of Seville oranges. The "marmalade-tree" (Lucumomarmo) bears a fruit whose thick pulp resembles marmalade and is called natural marmalade. "Marmalade box" is the name of the fruit of the Genipa Americana, which opens in the same manner as a walnut, the nut being replaced by a soft pulp.

MARMANDE, a town of south-western France, capital of an arrondissement in the department of Lot-et-Garonne, 35 m. N.W. of Agen, on the Southern railway from Bordeaux to Cette. Pop. (1906), town 6373; commune, 9748. Marmande is situated at the confluence of the Toc and the Garonne on the right bank of the latter river, which is here crossed by a suspension bridge. Public institutions include the sub-prefecture, the tribunals of first instance and commerce, the communal college and schools of commerce and industry and of agriculture. Apart from the administrative offices, the only building of importance is the church of Notre-Dame, which dates from the 13th, 14th and 15th centuries. The graceful windows of the nave, the altar-piece of the 18th century, and in particular, the Renaissance cloister adjoining the south side, are its most interesting features.

Among the industries are iron-founding, steam sawing and manufacturing of woolens, carriage-making, cooperage and branding-distilling. There is a large trade in wine, plums, cattle, grain and other agricultural produce.

Marmande was a bastide founded about 1195 on the site of a more ancient town by Richard Cœur de Lion, who granted it a liberal measure of self-government. Its position on the banks of the Garonne made it an important place of toll. It soon passed into the hands of the counts of Toulouse, and was three times besieged and taken during the Albigensian crusade; it was once captured by Amaury de Montfort in 1219 being followed by a massacre of the inhabitants. It was united to the French crown under Louis IX. 'A short occupation by the English in 1447, an unsuccessful siege by Henry IV. in 1577 and its resistance of a month to a division of Wellington's army in 1814, are the chief events in its subsequent history.

MARMIER, XAVIER (1809-1892), French author, was born at Pontarlier, in Doubs, on the 24th of June 1809. He had a passion for travelling, and this he combined throughout his life with the production of literature. After journeys in Switzerland, Belgium, and Holland, he was attached in 1835 to the Arctic expedition of the "Recherche"; and after a couple of years at Rennes as professor of foreign literature, he visited (1842) Russia, (1845) Syria, (1846) Algeria, (1848-1849) North and South America, and numerous volumes from his pen were the result. In 1870 he was elected to the Academy, and he was for many years prominently identified with the Sainte-Geneviève library. He did much to encourage the study of Scandinavian literature in France, publishing translations of Holberg, Oehlenschlager and other Danish authors. He was a great admirer of Shakespeare.

MARMONT, AUGUSTE FRÉDÉRIC LOUIS VIESSÉ DE, DUKE OF RAGUSA (1774-1852), marshal of France, was born at Châtillons-sur-Seine, on the 20th of July 1774. He was the son of an ex-officer in the army who belonged to the petite noblesse and adopted the principles of the Revolution. His love of soldiering soon showing itself, his father took him to Dijon to learn mathematics prior to entering the artillery, and there he made the acquaintance of Bonaparte, who renewed after obtaining his commission when he served in Toulon. The acquaintance ripened into intimacy, Marmont became General Bonaparte's aide-de-camp, remained with him during his disgrace and accompanied him to Italy and Egypt, winning distinction and promotion to general of brigade. In 1799 he returned to Europe with his chief; he was present at the coup d'état of the 18th Brumaire, and organized the artillery for the expedition to Italy, which he commanded with great effect at Marengo. For this he was at once made general of division. In 1801 he became inspector-general of artillery, and in 1804 grand officer of the Legion of Honour, but was greatly disappointed at being omitted from the list of officers who were made marshals. In 1805 he received the command of a corps, with which he did good service at Ulm. He was then directed to take possession of Dalmatia with his army, and occupied Ragusa. For the next five years he was military and civil governor of Dalmatia, and traces of his beneficent régime still survive both in great public works and in the memories of the people. In 1808 he was made duke of Ragusa, and in 1809, being summoned by Napoleon to take part in the Austrian War, he marched to Vienna and bore a share in the battles of Wagram and Ljubljana. On Napoleon's abdication in 1814 Marmont became a marshal and governor-general of all the Illyrian provinces of the empire. In July 1810 Marmont was hastily summoned to succeed Masséna in the command of the French army in the north of Spain. The skill with which he manœuvred his army during the year he commanded it has been always acknowledged. His relief of Ciudad Rodrigo in the autumn of 1811 in spite of the presence of the English army was a great feat, and in the manœuvring which preceded the battle of Salamanca he had
the best of it. But Wellington more than retrieved his position in the battle (see SALAMANCA), and inflicted a severe defeat on the French, Marmont himself being gravely wounded in the right arm and side. He retired to France to recover, and was still hardly cured when in April 1813 Napoleon, who soon forgot his recent remonstrance for the defeat, gave him the command of a corps. With it he was at the battles of Lützen, Bautzen and Dresden, and throughout the great defensive campaign of 1814, until the last battle before Paris, from which he drew back his forces to the commanding position of Essonne. Here he had 20,000 men in hand, and was the pivot of all thoughts. Napoleon said of this camp of Essonne, "C'est là que viendront s'adresser toutes les intrigues, toutes les trahisons; aussi y ai-je placé Marmont, mon enfant éveillé sous ma tente." Marmont then took upon himself a political rôle which has, no doubt justly, been stigmatized as ungrateful and treachery. A secret convention was concluded, and Marmont's corps was surrounded by the enemy. Napoleon, who still hoped to retain the crown for his infant son, was prostrated, and said with a sadness deeper than violent words, "Marmont me porte le dernier coup."

This act was never forgiven by Marmont's countrymen. On the restoration of the Bourbons he was indeed made a peer of France and a major-general of the royal guard, and in 1820 a knight of the Saint Esprit and a grand officer of the order of St Louis; but he was never trusted. He was the major-general of the guard on duty in July 1830, and was ordered to put down with a strong force in position to the ordinances (see FRANCE). Himself opposed to the court policy, he yet tried to do his duty, and only gave up the attempt to suppress the revolution when it became clear that his troops were outmatched. This brought more obloquy upon him, and the duc d'Angoulême even ordered him under arrest, saying, "Will you betray us, as you betrayed him?" Marmont did not betray them; he accompanied the king into exile and forfeited his marshalate thereby. His desire to return to France was never gratified and he wandered in central and eastern Europe, settling finally in Vienna, where he was well treated by the Austrian government, and seemed to have made tutor to the duke of Reichstadt, the young man who had once for a few weeks been styled Napoleon II. He died at Venice on the 22nd of March 1832.

Much of his time in his last years was spent upon his Mémoires, which are of great value for the military history of his time, though they must be read as a personal defence of himself in various junctures rather than as an unbiased account of his times. They show Marmont, as he really was, an embittered man, who never thought his services sufficiently required, and above all, an honest man, in love with his country and his own glory to be a true friend or a faithful servant. His strategy indeed tended to become pure virtuosity, and his tactics, though neat, appear frigid and antiquated when contrasted with those of the instinctive leaders, the fighting generals whom the theorists affect to despise. But his military genius is undeniable, and he was as far superior to the mere theorist as Lannes and Davout were to the pure divisionnaire or "fighting" general.

His works are Voyage en Hongrie, &c. (4 vols., 1837); Voyage en Sicile (1838); Esprit, des institutions militaires (1843); César: Xenophon: and Marmont (2 vols., published after his death in 1856). See the long and careful notice by Sainte-Beuve, Coursiers du Lundi, vol. vi.

MARMONTEL, JEAN FRANÇOIS (1723-1799), French writer, was born of poor parents at Bort, in Cantal, on the 11th of July 1723. After studying with the Jesuits at Mauriac, he taught in their colleges at Clermont and Toulouse; and in 1745, acting on the advice of Voltaire, he set out for Paris to try for literary honours. From 1745 to 1753 he wrote a succession of tragedies which, though only moderately successful in the stage, secured the admission of the author to literary and fashionable circles. He wrote for the Encyclopédie a series of articles evincing considerable critical power and insight, which in their collected form, under the title Éléments de Littérature, still rank among the French classics. He also wrote several comic operas, the two best of which probably are Sylvain (1770) and Zémire et Azor (1771). In the Gluck-Piccini controversy he was an eager partizan of Piccini with whom he collaborated in Didon (1782) and Pendépole (1782). In 1758 he gained the patronage of Madame de Pompadour, who obtained for him a place as a civil servant, and the management of the official journal Le Mercure, in which he had already begun the famous series of Contes moraux. The merit of these tales lies partly in the delicate finish of the style, but mainly in the graphic and charming pictures of French society under Louis XV. The author was elected to the French Academy in 1763. In 1767 he published a romance, Bélisaire, now remarkable only on account of a chapter on religious toleration which incurred the censure of the Sorbonne and the archbishop of Paris. Marmontel retired in Les Incas (1778) by tracing the difficulties of a Spanish hero in America to the religious fanaticism of the invaders.

He was appointed historiographer of France (1771), secretary to the Academy (1783), and professor of history in the Lycée (1786). In his character of historiographer Marmont wrote a history of the regency (1788) which is of little value. Reduced to poverty by the Revolution, Marmont in 1792 retired during the Terror to Evreux, and soon after to a cottage at Abivolle in the department of Eure. To that retreat we owe his Mémoires d'un père (4 vols., 1804) giving a picturesque review of his whole life and career, his last history, a great gallery of portraits extending from the venerable ancient to the young and handsome, who, though less than a half century previously he had seen at Clermont, to Mirabeau. The book was nominally written for the instruction of his children. It contains an excellently drawn picture of his own childhood in the Limousin; its value for the literary historian is very great. Marmont lived for some time under the roof of Mme Geoffrin, and was present at her famous dinners given to artists; he was, indeed, an habitué of most of the houses where the encyclopaedists met. He had thus at his command the best material for his portraits, and made good use of his opportunities. After a short stay in Paris when elected in 1797 to the Conseil des Anciens, he died on the 31st of December 1799 at Abivolle.

MARMORA (anc. Proconnesus), an island in the sea of the same name. Originally settled by Greeks from Miletus in the 8th century B.C., Proconnesus was annexed by its powerful neighbour Cyzicus in 362. The island has at all times been noted for its quarries of white marble which supplied the material for several famous buildings of antiquity (e.g. the palace of Mausolus at Halicarnassus).

MARMORA, SEA OF (anc. Proponitis; Turk. Marmar Denizi), the small inland sea which (in part) separates the Turkish dominions in Europe from those in Asia, and is connected through the Bosphorus with the Black Sea (g.t.) and through the Dardanelles with the Aegean. It is 170 m. long (E. to W.) and nearly 50 m. in extreme width, and has an area of 4500 sq. m. Its greatest depth is about 700 fathoms, the deepest parts (over 500 fathoms) occurring near the southern end; after this depth, which is about 100 fathoms, there is a low swell, one close under the European shore to the south of Rodosto, another near the centre of thesea, and a third at the mouth of the Gulf of Ismid. There are several considerable islands, of which the largest, Marmora, lies in the west, off the peninsula of Kapu Dagh, along with Afsia, Aloni and smaller islands. In the east, off the Asiatic shore between the Bosphorus and the Gulf of Ismid, are the Princes' Islands.

MARMOSET, a name derived from Fr. marmouset (meaning "of a gross figure"), and used to designate the small tropical American monkeys classed by naturalists in the family *Hapalidae* (or *Chrysotrichidae*). Marmosets are not larger than squirrels, and present great variation in colour; all have long tails, and many have the ears tufted. They differ from the other American monkeys in having one pair less of molar teeth in each jaw. The common marmoset, *Hapale* (or *Chrysotrix*) *jacchus*, is locally
known as the *oustî*, while the name *piriche* is applied to another species (see *Primates*).

**MARMOT**, the vernacular name of a large, thickly built, burrowing Alpine rodent mammal, allied to the squirrels, and typifying the genus *Arctomys*, of which there are numerous species ranging from the Alps through Asia north of (but including the inner ranges of) the Himalaya, and recurring in North America. All these may be included under the name marmot. In addition to their stout build and long thickly haired tails, marmots are characterized by the absence of cheek-pouches, and the rudimentary first front-toe, which is furnished with a flat nail, as well as by certain features of the skull and cheek-teeth. Europe possesses two species, the Alpine or true marmot (*A. marmotta*), and the more eastern bobac (*A. bobac*); and there are numerous kinds in Central Asia, one of which, the red marmot (*A. cuedata*), is a much larger animal, with a longer tail. Marmots inhabit open country, either among mountains, or, more to the north, in the plains; and associate in large colonies, forming burrows, each tenanted by a single family. During the daytime the hillock at the entrance to the burrow is frequently occupied by one or more members of the family, which at the approach of strangers sit up on their hind-legs in order to get a better view. It alarmed them utter a shrill loud whistle, and rush down the burrow, but reappear after a few minutes to see if the danger is past. In the winter when the ground is deep in snow, marmots retire to the depths of their burrows, where as many as ten or fifteen may occupy the same chamber. No store of food is accumulated, and the winter sleep is probably unbroken. From two to four is the usual number of young in a litter. In America marmots are known as "wood-chucks"

The Alpine Marmot (*Arctomys marmotta*).

(q.v.), the commonest species being *A. monax*. The so-called prairie-dogs, which are smaller and more slender North American rodents with small cheek-pouches, form a separate genus, *Cynomys*; while the term pouch-backed marmots denotes the various species of *souslik* (q.v.), *Spermophilus* (or *Citillus*), which are common to both hemispheres, and distinguished by the presence of large cheek-pouches (see *Rodents*). (R. L.)

**MARNE**, a river of northern France, rising on the Plateau of Langres, 3 m. S. by E. of Langres, and uniting with the Seine at Charenton, an eastern suburb of Paris. Leaving Langres on the left the river flows northward, passing Chaumont, as far as a point a little above St Dizier. Here it turns west and enters the department of Marne, where it waters the Perthois and the wide plain of Champagne-Pouilieu. Soon after its entrance into this department it receives the Blaise; and turning north-west passes Vitry-le-François where it receives the Saux-Châlons, below which it resumes a westerly course, and Epernay, where it enters picturesque and undulating country. Its subsequent course lies through the departments of Aisne, where it flows through Chateau-Thierry; Seine-et-Marne, where it drives the picturesque mills of Meaux; Seine-et-Oise and Seine. Its chief tributaries in those departments are the Petit-Morin, the Ourcq and the Grand-Morin. The length of the Marne is 328 m., the area of its basin 4894 sq. m. It is joined a mile from its source of the Marne-Soâne canal which is continued at Rouvroy by the Haute-Marne canal as far as Vitry-le-François. From that town, which is the starting-point of the canal between the Marne and the Rhine, it is accompanied by the lateral canal of the Marne to Dizy where its own channel is canalized. At Condé, above Epernay, the river is joined by the canal connecting it with the Aisne. From Lizy, above Meaux, it is accompanied on the right bank, though at some distance, by the Ourcq canal.

**MARNE**, a department of north-eastern France, made up of Champagne-Pouilieu, Rémois, Haute-Champagne, Perthois, Tardenois, Bocage and Brie-Pouilieu, districts formerly belonging to Champagne, and bounded

About one-half consists of Champagne-Pouilieu, a monotonous and barren plain covering a bed of chalk 1300 ft. in thickness. On the west and on the east it is commanded by two ranges of hills. The highest point in the department (920 ft.) is in the hill district of Reims, which rises to the south-west of the town of the same name, between the Vesle and the Marne. The lowest level (164 ft.) where the Aisne leaves the department, is situated on the right bank of the Marne, which is continued by the heights of Epernay (700 to 800 ft.). All these belong geologically to the basin of Paris. They slope gently towards the west, but command the plain of Champagne-Pouilieu by a steep descent on the east. On the farther side of the plain are the heights of Argonne (860 ft.) formed of beds of the Lower Chalk, and covered by forests; they unite the calcareous formations of Langres to the schists of Ardenne, and a continuation of them stretches southward into Perthois and the marshy Bocage. The department belongs entirely to the Seine basin, but includes only 13 miles of that river, in the south-west; it there receives the Aube, which flows for 10 miles within this department. The principal river is the Marne, which runs through the department for 105 miles in a great sweep concave to the south-west. The Aisne enters the department at a point 12 miles from its source, and traverses it for 37 miles. Two of its affluents on the left, the Suippe and the Vesle, on which stands Reims, have a longer course from south-east to north-west across the department.

Marne has the temperate climate of the region of the Seine; the annual mean temperature is 50° F., the rainfall about 24 in. Oats, wheat, rye and barley among the cereals, lucerne, oat-sold, clover, and root-beet are the principal agricultural crops. The vineyards, concentrated chiefly round Reims and Épernay, are of high value; the manufacture of the sparkling Champagne wines being a highly important industry, of which Épernay, Reims and Châlons are the chief centres. Several communes supply the more valuable vegetables, such as asparagus, onions, &c. The principal orchard fruits are the apple, plum and cherry. Fine woods are largely planted in Champagne-Pouilieu. The department produces peat, millstones and chalk.

The woolen industry has brought together in the neighbourhood of Reims establishments for spinning, carding, dyeing and weaving. The materials wrought are flannels, merinos, tarts, shawls, rugs and fancy articles; the manufacture of woolen and cotton hosiery must also be mentioned. The manufacture of wine-cases, corks, casks and other goods for the wine trade is actively carried on. Marne contains blast-furnaces, iron and copper foundries, and manufactories of paper and implements of all kinds. Besides these there are tan-yards, currying and leather-dressing establishments and glassworks, which, with sugar, chemical, whiting and oil works, potteries, flour-mills and breweries, complete the list of the most important industries. Biscuits and gingerbread are a specialty of Reims. The chief imports are wool and coal; the exports are wine, grain, live-stock, stone, whiting, pit-props and woolen stuffs. Communication is afforded chiefly by the river Marne with its canal connections, and by the Eastern railway. There are five arrondissements—those of Châlons (the capital), Épernay,
MARNIAN EPOCH—MARONITES

Reims, Ste Ménéhould and Vitry-le-François—With 33 cantons and 662 communes. The department belongs partly to the archbishopric of Reims and partly to the see of Châlons. Châlons is the headquarters of the VI. army corps. Its educational centre and court of appeal are at Reims. The ancient towns—Châlons-sur-Marne, Reims, Epernay and Vitry-le-François—are separately treated. The towns next in population are Ay (4994) and Sézanne (4504). Other places of interest are Ste Ménéhould (3348), formerly an important fortress and capital of the Argonne; Montmort with a Renaissance château once the property of Sully; Trois-Fontaines with a ruined church of the 12th century and the remains of a Cistercian abbey founded in 1115; and Orbais with an abbey church dating from about 1200.

**MARNIAN EPOCH.** The name given by G. de Mortillet to the period usually called in France the Gallic, which extends from about five centuries before the Christian era to the conquest of Gaul by Caesar. M. de Mortillet objects to the term "Gallic," as the civilization characteristic of the epoch was not peculiar to the ancient Gauls, but was common to nearly all Europe at the same date. The name is derived from the fact that the French department of Marne has afforded the richest "finds."

**MAROCHETTI, CARLO, Baron (1805-1867), Italian sculptor, was born at Turin. Most of his early life was spent in France, his first systematic instruction being given him by the British Museum Arabist, A. Khazin. Here his "Young Girl playing with a Dog" won a medal in 1829. But between 1822 and 1830 he studied chiefly in Rome. From 1832 to 1848 he lived in France. His "Fallen Angel" was exhibited in 1831. In 1848 Marochetti removed to London, and there he lived for the greater part of his time till his death in 1867. Among his chief works were statues of Queen Victoria, Lord Clyde (the obelisk in Waterloo Place), Richard Cour-Duc-Lion (Westminster), Emmanuel Philibert (1833, Turin), the tomb of Bellini (Père-le-Chaise), and the altar in the Madeleine. His style was vigorous and effective, but rather popular than artistic. Marochetti, who was created a baron by the king of Sardinia, was also a chevalier of the Legion of Honour.

**MARONITES.** (Arab. Muwarrana), a Christian people of the Ottoman Empire in communion with the Papal Church, but forming a distinct denomination. The original seat and present home of the nucleus of the Maronites is Mt Lebanon; but they are also to be found in considerable force in Anti-Lebanon and Hermon, and more sporadically in and near Antiouche, in Galilee, and on the Syrian coast. Colonies exist in Cyprus (with a large convent near Famagusta), in Damascus (at Beit Samaa), and in the United States of America. These began to be formed during the troubles of 1860. The Lebanon community numbers about 500,000, and the total of the whole denomination cannot be much under half a million.

The origin of Maronism has been much obscured by the efforts of learned Maronites like Yusuf as-Simasi (Assemanus), Vatican librarian under Clement XII., Faustus Naoner, Gabriel Sioniata and Abraham Eccchelienis to clear its history from all taint of heresy. We are told of an early Antiochene, Mar Marun or Maro, who died about A.D. 400 in the colour of sanctity in a convent at Ribha on the Orontes, whence orthodoxy spread over mid-Syria. But nothing sure is known of him, and not much more about a more historical personage, Yuhanna Marun (John Sirimensis of Suedia), said to have been patriarch of Antioch, to have converted Lebanon from Monothelitism, and to have died in A.D. 707. It is, however, certain that the Lebanon Christians as a whole were not orthodox in the time of Justinian II., against whose supporters, the Melkites, they ranged themselves after having co-operated while with the emperor against the Moslems. They were then called Mardarites or rebels, and were mainly Monothelites in the 12th century, and remained largely so even a century later. The last two facts are attested by William of Tyre and Barhebraeus. It seems most probable that the Lebanon offered refuge to Antiochene Monothelites flying from the ban of the Constantinopolitan Council of A.D. 680; that these converted part of the old mountain folk, who already held some kind of incarnationist creed; and that their first patriarch and his successors, for about 500 years at any rate, were Monothelites, and perhaps also Monophysites. It is worth noting that even as late as the close of the 16th century the Maronite patriarch found it necessary to protest against imputations of heresy. In 1812 it is said that Amaury, patriarch of Antioch, induced some Maronite bishops, who had fallen under crusading influences, to rally to Rome; and a definite acceptance of the Maronite Church into the Roman communion took place at the Council of Florence in 1445. But it is evident that the local particularism of the Lebanon was adverse to this union, and that even Gregory XIII., who sent the pallium to the patriarch Michael, and Clement VII., who in 1556 dispatched a mission to a synod convoked at Kannoubin, at Constantinople, the patriarchal see did not prevail on the Maronite clergy or the mass of the Maronites. A century and a half later Clement XII. was more successful. He sent to Syria, Assemanus, a Maronite educated at the Roman college of Gregory XIII.; and at last, at a council held at the monastery of Lowaizi on the 30th of September 1736, the Maronite Church accepted from Rome a constitution which is still in force, and agreed to abandon some of its more incongruous usages such as mixed convents of monks and nuns. It retained, however, its Syriac liturgy and a non-celibate priesthood. The former still persists unchanged, while the Bible is read and exhortations are given to the congregation by the patriarch himself. The Mass, however, has incorporated most of the Maronite saints in its calendar, while refusing (despite their apologists) to canonize either of the reputed eponymous founders of Maronism.

While retaining many local usages, the Maronite Church does not differ now in anything essential from the Papal, either in dogma or practice. It has, like the Greek Church, two kinds of clergy—parochial and monastic. The former are supported by their parishes; the latter by the revenues of the monasteries, which own about one-sixth of the Lebanon mountain. In fact, the Maronite Church (as well as that of the Druzes or other denominations) is one of the great institutions which has not escaped the danger of becoming an unwieldy, perhaps a superfluous, middleman in the religious and political life of the mountain. Its monasteries (many of these being mere farms in charge of one or two monks) are of the number of the order of St Anthony, but divided into three congregations, the Ishaya, the Halebiyeh (Alepine) and the Balaqiyeh or Libaniyeh (local). The distinction of the last named dates only from the early 18th century. The lower clergy are educated at the theological college of Ain Warka. There are five archbishoprics and five bishoprics under the patriarch, who alone can consecrate. The sees are Aleppo, Baalbek, Tripoli, Ehden, Damascus, Beirut, Tyre, Cyprus and Jebelin (held by the patriarch himself ex officio). There are also four prelats in paribus.

The Maronites are most numerous and unmixed in the north of Lebanon (districts of Bsherreh and Kesrawan). Formerly they were wholly organized on a clan system under feudal chiefs, of whom those of the house of Khazin were the most powerful; and these fought among themselves rather than with the Druzes or other denominations down to the 18th century, when the Arab family of Shehab for its own purposes began to stir up strife between Maronites and Druzes (see § above). The Maronite patriarch died hard, but since 1850 has been practically extinct; and so far as the Maronites own a chief of their own people it is the "Patriarch of Antioch and the whole East," who resides at Bkerkeh near Beirut in winter, and at a high station (Bdiman or Raini) in summer. The last however, has no recognized jurisdiction except over his clergy. The Maronites have four members on the provincial council, two of whom are the sole representatives of the two mudarris of Kesrawan, and they have derived benefit from the fact that so far the governor of the privileged province has always been a Catholic (see Lebanon). The French protection of them, which dates
from Louis XIV., is no longer operative but to French official representatives is still accorded a courteous precedence. The Maronite population has greatly increased at the expense of the Druses, and is now obliged to emigrate in considerable numbers. Increase of wealth and the influence of returned emigrants tend to soften Maronite character, and the last remnants of the barbarous slave-trade, not the community—ever the obstinate blood-feud—are disappearing.

See C. F. Schnurrer, De ecclesiis Maronitica (1810); F. J. Bliss in Pal. Expl. Per. of Assyriology Statement (1824); and articles on DRUSES and DRUSUS in the Dictionary of the Bible, and in the Dictionary of the Bible.

MAROON—MAROT, C.

A nègre marron is defined by Littré as a fugitive slave who betakes himself to the woods; a similar definition of cimarron (apparently from cima, a mountain top) is given in the Dictionary of the Spanish Academy. The old English form of the word is symaron (see Hawkins's Voyage, § 68).

The term "Marons" is applied almost as a proper name to the descendants of those negroes in Jamaica who, at an early English occupation in the 17th century fled to the mountains. (See JAMAICA.)

MAROS-VÁSÁRHELY, a town of Hungary in Transylvania, capital of the county of Maros-Torda, 75 m. E. of Kolozsvár by rail. Pop. (1900), 19,532. It is situated on the left bank of the Maros, and is a well-built town; once the capital of the territory of the Szeklers. On a hill dominating the town stands the old fortress, which contains a beautiful church in Gothic style built about 1446, where in 1571 the diet was held which proclaimed the equality of the Unitarian Church with the Roman Catholic, the Lutheran, and Calvinistic Churches. The Teleki palace contains the Teleki collections, which include a library of 70,000 volumes and several valuable manuscripts (e.g. the Teleki Codex), a collection of Old Hungarian poems, and a manuscript of Tacitus, besides a collection of antiquities and another of minerals. Maros-Vásárhely has also an interesting Szekler industrial museum. The trade is chiefly in timber, grain, wine, tobacco, fruit and other products of the neighbourhood. There are manufactures of sugar, spirits and beer.

MAROT, CLÉMENT (1496-1544), French poet, was born at Cahors, the capital of the province of Quercy, some time during the winter of the year 1496-1497. His father, Jean Marot (c. 1493-1523), whose more correct name appears to have been des Mares, Marais or Marets, was a Norman of the neighbourhood of Caen. Jean was himself a poet of considerable merit, and held the post of escribain (apparently uniting the duties of poet laureate and historian) to Anne of Brittany. He had however resided in Cahors for a considerable time, and was twice married there, his second wife being the mother of Clément. The boy was brought into France—it is his own expression, and is not unworthy of the rank of a poet—of the ballade and the rondeau. Clément himself practised with diligence this poetry (which he was to do more than any other man to overthrow), and he has left panegyrics of its coryphaeus Guillaume Crétin, the supposed original of the Ramin grand of Rabelais, while he translated Virgil's first eclogue in 1512. Nor did he long continue even a nominal devotion to law. He became page to Nicolas de Neuville, seigneur de Villeroy, and this opened to him the way to court life. Besides his father's interest in the legal profession was not inconsiderable, and the house of Valois, which was about to hold the throne of France for the greater part of a century, was devoted to letters.

As early as 1514, before the accession of Francis I., Clément presented to him his Judgment of Mimos, and shortly afterwards he was either styled or styled himself facteur (poet) de la reine to Queen Claude. In 1519 he was attached to the suite of Marguerite d'Angoulême, the king's sister, who was for many years to be the mainstay not only of him but of almost all French men of letters. He was also a great favourite of Francis himself, attended the Field of the Cloth of Gold in 1520, and duly celebrated it in verse. Next year he was at the camp in Flanders, and writes of the horrors of war. It is certain that Marot, like most of Marguerite's literary court, and perhaps more than most of them, was greatly attracted by her gracious ways, her unfailing kindness, and her admirable intellectual accomplishments, but there is not the slightest ground for thinking that his attachment was other than platonic. It is, however, evident that at this time either sentiment or matured critical judgment effected a great change in his style, a change which was wholly for the better. At the same time he celebrates a certain Diane, whom it has been sought to identify with Diane de Poitiers. There is nothing to support this idea and much against it, for it was an almost invariable habit of the poets of the 16th century, when the mistresses whom they celebrated were flesh and blood at all (which was not always the case), to celebrate them under pseudonyms. In the same year, 1524, Marot accompanied Francis on his disastrous Italian campaign. He was wounded and taken at Pavia, but soon released, and he was back again at Paris by the beginning of 1525. His luck had, however, turned. Marguerite for intellectual reasons, and her brother for political, had hitherto favoured the movement of Reforming, partly Calvinistic, partly Reformed, which distinguished the beginning of the century. Formidable opposition to both forms of innovation, however, now began to be manifested, and Marot, who was at no time particularly prudent, was arrested on a charge of heresy and lodged in the Châtelet, February 1526. But this was only a prelude to the coming trouble, and a friendly prelate, acting for Marguerite, extricated him from his durance before Easter. The imprisonment gave him occasion to write a vigorous poem on it entitled Enfer, which was afterwards imitated by his luckless friend Étienne Dolet. His father died about this time, and Marot seems to have been appointed to the place which Jean had latterly enjoyed, that of valet de chambre to the king. He was certainly a member of the royal household in 1528 with a stipend of 250 l., besides which he had inherited property in Quercy. In 1530, probably, he married. Next year he was again in trouble, not it is said for heresy, but for attempting to rescue a prisoner, and was again delivered; this time the king and queen of Navarre seem to have bailed him themselves.

In 1532 he published (it had perhaps appeared three years earlier) under the title of Adolescence Clémentine, a title the characteristic grace of which excuses its slight savour of affectation, the first printed collection of his works, which was very popular and was frequently reprinted with additions. Dolet's edition of 1538 is believed to be the most authoritative. Unfortunately, however, the poet's enemies were by no means discouraged by their previous ill-success, and the political situation was very unfavourable to the Reforming party. In 1535 Marot was implicated in the affair of "The Placards," and this time he was advised or thought it best to fly. He wrote in 1536, and was favourably received by King Catholic, Jean de Ferrara, a supporter of the French reformers as steadfast as her aunt Marguerite, and even more efficacious, because her dominions were out of France. At Ferrara he wrote a good deal, his work there including his celebrated Blasons (a descriptive poem, improved upon medieval models), which set all the verse-writers of France imitating them. But the duchess Renée was not able to persuade her husband, Ercole d'Este, to share her views, and Marot had to quit the city. 1

1 These "placards" were the work of the extreme Protestants. Pasted up in the principal streets of Paris on the night of the 17th of October 1534, they vilified the Mass and its celebrants, and thus led to a renewal of the religious persecution.

The blason was defined by Thomas Siblet as a perpetual praise of the virtues of the women. The first blasons were printed in 1543 with the title of Blasons anatopiques du corps féminin.
He then went to Venice, but before very long the pope Paul III., remonstrated with Francis I. on the severity with which the Protestants were treated, and they were allowed to return to Paris on condition of recanting their errors. Marot returned with the rest, and abjured his heresy at Lyons. In 1539 Francis gave him a house and grounds in the suburbs.

It was at this time that his famous translations of the Psalms appeared. The merit of these has been sometimes denied, it is, however, considerable, and the powerful influence which the book exercised on contemporaries is not denied by anyone. The great persons of the court chose different pieces, each as his or her favourite. They were sung in court and city, and they are said, with exaggeration doubtless, but still with a basis of truth, to have done more than anything else to advance the cause of the Reformation in France. Indeed, the vernacular prose translations of the Scriptures were in that country of little merit or power, and the form of poetry was still preferred to prose, even for the most incongruous subjects. At the same time Marot engaged in a curious literary quarrell characteristic of the time, with a bard named Sagon, who represented the reactionary Sorbonne. Half the verse-writers of France ranged themselves among the Marotiques or the Sagoniques, and a great deal of versified abuse was exchanged. The victory, as far as wit was concerned, naturally rested with Marot, but his biographers are probably not fanciful in supposing that a certain amount of odium was created against him by the squabble, and that, as in Dolet's case, his subsequent misfortunes were not altogether unconnected with a too little governed tongue and pen.

The publication of the Psalms gave the Sorbonne a handle, and the book was condemned by that body. In 1543 it was evident that he could not rely on the protection of Francis, Marot accordingly fled to Geneva; but the stars were now decidedly against him. He had, like most of his friends, been at least as much of a freethinker as of a Protestant, and this was fatal to his reputation in the austere city of Calvin. He had again to fly, and made his way into Piedmont, and he died at Turin in the autumn of 1544.

In character Marot seems to have been a typical Frenchman of the old stamp, cheerful, good-humoured and amiable enough, but probably not very much disposed to elaborately moral life and conversation or to serious reflections. He has sometimes been charged with a want of independence of character, and it is fair to say that in the middle ages men of letters naturally attached themselves as dependants to the great. Such scantly knowledge as we have of his life is not very convincing to us, but it is perhaps certain that one time quarrelled with Dolet, or at least wrote a violent epigram against him, for which there is no known cause. But, as Dolet quarrelled with almost every friend he ever had, and in every quarrel took them for an enemy, the presumption is not against Marot in this matter. With other poets like Melfin de Saint Celais and Brodeau, with prose writers like Rabelas and Bonaventure Desprez, he was always on excellent terms. And whatever may have been his personal weaknesses, his importance in the history of French literature is very great, and was long rather under than over-estimated. Coming immediately before the great literary reform—that of the Pléades—Marot bore the drawbacks of his position; he was both eclipsed and decried by the partakers in that reform. In the reaction against the Pléade he recovered honor; but its restoration to virtual favour, a perfectly just restoration, again unjustly prevented him. Marot is in no sense one of those writers of transition who are rightly obscured by those who come after them. He himself was a reformer, and a reformer on perfectly independent lines, and he carried his own reform as far as it would go. His early work was couched in the rètoriqueur style, the distinguishing characteristics of which are complete cadence and rhyme, allegoric matter and pedantic language. In his second verse he came more out of this, and became one of the easiest, least affected and most vernacular poets of France. In these points indeed he has, with the exceptions of Ronsard and de la Hire, no rivals among the other verse-writers ever since have taken one or the other or both as models. In the third period he lost a little of this flowing grace and ease, but acquired greater weight and steadiness, while he certainly lost nothing in wit. Marot is the first poet who seemed to catch the spirit as well as the Roman de la rose, it may be well to mention that he edited) and not so elaborately artificial as the second. Indeed if there be a fault to find with Marot, it is undoubtedly that in his gallant and successful effort to break up, supple, and liquefy the stiff forms and stiffer language of the 15th century, he made his poetry almost too vernacular and pedestrian. Published at an early age, Ronsard, and, indeed, all the second generation of the Pléade, and while the style Marotique was supreme, French poetry ran scarce risk of finding itself unequal to anything but graceful vers de société. But it is only fair to remember that for a century and more its virtues, its excellencies, its rare exceptions, had been vers de société which were not graceful.

The most important early editions of Marot's Œuvres are those published at Lyons in 1538 and 1539, and the second of these the arrangement of his poems which has been accepted as the correct one was first adopted. In 1596 an enlarged edition was edited by François Mizières. Others of later date are those of N. Lenglet du Carouil (at the Hague, 1731) and P. Jannet (1689-1692) more than two centuries later. In 1873-1876, on the whole the best, but there is a very good selection with a still better introduction by Charles d'Héricault, the joint editor of the new French edition in the larger Collection Garnier (no date). An elaborate edition, with text and notes, appeared with only vols. ii. and iii. (1875-1881) having been issued. For information about Marot himself see Notices biographiques des trois haguer. Edited from the MS. of Guillaume Collet by G. Greffey (1871); H. Morley, Clément Marot, a study of Marot as a reformer: O. Douen, Clément Marot et le psautier huguenot; the section concerning him in G. Saintsbury's The Early Renaissance (1901); and in Tilley, Literature of the French Renaissance, vol. iv. (1904).

MAROT, DANIEL (seventeenth century), French architect, furniture designer and engraver, and pupil of Jean le Pautre (q.v.), was the son of Jean Marot (1620-1679), who was also an architect and engraver. He was a Huguenot, and was compelled by the Revocation of the Edict of Nantes in 1685 to settle in Holland. His earlier work is characteristic of the second period of Louis XIV., but later it became tinged with Dutch influence, and in the end the English style, and the cabinet called "Queen Anne" owed much to his manner. In Holland he was taken almost immediately into the service of the Stadtholder, who, when he shortly afterwards became William III. of England, appointed him one of his architects and master of the works. Comparatively little is known of his architectural achievements, and his name cannot be attached to any English building, although we know from his own engraving that he designed the great hall of audience for the States-General of the Hague, and also decorated many Dutch country-houses. In England his activities appear to have been concentrated upon the adornment of Hampton Court Palace. Among his plans for gardens is one inscribed: "Parterre d'Amont-court inventé par D. Marot." Much of the furniture—especially the mirrors, guéridons and beds—at Hampton Court bears unmistakable traces of his authorship; the tall and monumental beds, with their plumes of ostrich feathers, their elaborate valances and chantournes in crimson velvet or other rich stuffs agree very closely with his published designs. As both an artist of the time of Louis XIV, splendid and elaboration are the outstanding characteristics of Marot's style, and he appears even to have been responsible for some of the curious and rather barbaric silver furniture which was introduced into England from France in the latter part of the 17th century. At Windsor Castle there is a silver table, attributed to him, supported by cariatid legs and gaderooned feet, with a foot-strap supporting the pine-apple which is so familiar a motif-in work of this type. The shab is engraved with the arms of William III. and with the British national emblems with crowns and cherubs. Unquestionably it is an exceedingly fine example of its type. During his life in France he had not made one of the designs for André Charles Boulle (q.v.), more especially for long cases and bracket clocks. The bracket clocks were intended to be mounted in chased and gilded bronze, and with their garnalas and masque- rons and elegant dials are far superior artistically to those of the "grandfather" variety. It is impossible to examine the designs for Marot's long clocks without suspecting that Chippendale derived from them some at least of the inspiration which made him a master of that kind of furniture. Marot's range was remarkably wide. He designed practically every detail in the internal ornamentation of the finest marquetry chased pieces, ceilings, panels for walls, girandoles and wall brackets, and even tea urns and cream jugs—he was indeed a prolific
designer of gold and silver plate. Many of his interiors are very rich and harmonious although commonly over-elaborated. The craze for collecting china which was at its height in his time is illustrated in his lavish designs for receptacles for porcelain—in one of his plates there are more than 300 pieces of china on the table! He was an excellent writer. Marot was still living in 1718, and the date of his death is unknown.

We owe much of our knowledge of his work to the volume of his designs published at Amsterdam in 1712: Oeuvres du Sieur D. Marot, architecte de Guillaume III. Roi de la Grande Bretagne, a reprint of a book originally published in 1707. In addition to decorative work these books contain prints of scenes in Dutch history, and engravings of the statues and vases, produced by Marot, at the Palace of Loos.

MARPLE, an urban district in the Hyde parliamentary division of Cheshire, England, 12 m. S.E. of Manchester, served by the Great Central, Midland & Sheffield and Midland railways, and the Cheshire lines. Pop. (1901), 5595. It lies on and above the valley of the Goyt, and its situation has brought the town into favour as a residential centre for those whose business lies in Manchester, Stockport, and the great manufacturing district to the west. Marple Hall, a beautiful Elizabethan mansion, is connected with the youth, and sometimes stated to be the birthplace, of John Bradshaw the regicide (1602-1660). It was the seat of the Tancred family, by whom and Marquard, Henry Gurdon (1819-1902), American philanthropist and collector, was born in New York City on the 11th of April 1819. In 1839, upon the retirement from the jewelry business of his brother Frederick (1799-1852), who was a liberal benefactor of Yale College and of the Union Theological Seminary, he became his brother's agent. He was one of the largest purchasers in 1868 of the Iron Mountain railroad, afterwards its president, and a director of the Missouri-Pacific system. He was the first honorary member of the American Institute of Architects, and president (1889-1902) of the Metropolitan Museum of Art, to which he made valuable presents and loans from his collection of paintings. He died in New York City, on the 26th of February 1902. His varied and valuable art collection and rare books were sold in 1903. He was a benefactor of Princeton University and other institutions. His son, Allan Marquard (b. 1843), graduated at Princeton in 1874, and in 1883 became professor of archaeology and art.

MARQUARDT, Joachim (1812—1882), German historian and writer on Roman antiquities, was born at Danzig on the 19th of April 1812. He studied at Berlin and Leipzig, held various educational appointments from 1833 onwards at Berlin, Danzig and Posen, and became in 1850 head of the gymnasium in Gottha, where he died on the 30th of November 1882. The dedication of his treatise Historiae equitum romanorum libri quatuor (1841) to Lachmann led to his being recommended to the publisher of the Grabhügelkunde. He was recommended to continue the work on the death of the author in 1846. It took twenty years to complete, and met with such success that a new edition was soon called for. Finding himself unequal to the task single-handed, Marquardt left the preparation of the third volumes (Römisches Staatsrecht) to Theodor Mommsen, while he himself contributed vols. iv.—vi. (Römische Staatsverwaltung, 1873-1878; 2nd ed., 1881-1885, vol. v. by H. Dessau and A. von Dobschewski, vol. vi. by G. Wissowa) and vol. vii. (Des Privathandel der Römer, 1879-1882; 2nd ed., by A. Mau, 1886). Its clearness of style, systematic arrangement and abundant references to authorities ancient and modern, will always render it valuable to the student.

See E. Förstemann in Allgemeine deutsche Biographie, Bd. XX; R. Ehwald, Gedächtnissrede (progr. Gotha, 1883).

MARQUESAS or MENDAÑA ISLANDS (Fr. Les Marquises), an archipelago of the Pacific Ocean lying between 7° 50′ and 30° 35′ S. and 138° 50′ and 140° 30′ W., and belonging to France. It extends over 250 m. from S.E. to N.W., and has a total area of 400 sq. m. The northern or Mendiñoa group consists of the islands of Fatuivaho or Magdalena, Motane or San Pedro, Tahuata or Santa Christina and Hivona or Dominica, the last with a coast-line of more than 60 m. With these is often included the rocky inlet of Fatuivaho or Hood, lying in mid-channel to the north of Hiva. The north-western or Washington group is formed of seven islands, the four largest being Hupu or Adams, Huhuans or Washington, Nukuhiva (70 m. in circumference) and Eiao. 1 Along 1 Most of the islands have each three or four alternative names.
the centre of each island is a ridge of mountains, attaining an altitude of 4042 ft. in Huapu, whence rugged spurs forming deep valleys stretch towards the sea. The volcanic origin of the whole archipelago is proved by the principal rocks being of basalt, trachyte and lava. Vegetation is luxuriant in the vicinity, which are well watered with streams and, from their seaward termination in small bays, are themselves known as "bays." The flora includes about four hundred known species, many of them identical with those of the adjoining mainland. Vegetable products comprise bananas, bread-fruit, yams, plantains, wild cotton, bamboo, sugar-cane, coconut and dwarf palms, and several kinds of timber trees. The land fauna however is very poor; there are few mammals with the exception of dogs, rats and pigs; and amphibia and insects are also generally scarce. Of twenty species of birds more than half belong to the sea, where animal life is as abundant as about other sub-tropical Polynesian groups. The climate, although hot and damp, is not unhealthy. During the greater part of the year moderate easterly trade-winds prevail, and at the larger islands there are often both land and sea breezes. The rainy season accompanied by variable winds sets in at the end of November, and lasts for about six months. During this period the thermometer varies from 84° to 91° F; in the dry season its average range is from 77° to 86°. The archipelago, which has some small trade in copra, cotton and cotton seeds, is administered by a French resident, and has a total population of about 4300, nearly all natives. The natives, a pure Polynesian race, are usually described as physically the finest of all South Sea Islanders. Their traditions point to Samoa as the colonizing centre from which they sprang. Their civilization is a healthy bronze. Until the introduction of civilization they were remarkable for their elaborate tattooing. Their cannibalism seems to have been dictated by taste, for it was never associated with their religion, the sacrifices to their gods being always swine. Of these and fowls they rear a great quantity. Their native drink is kava. Their houses are unlike those usual in Polynesia in being built on platforms raised from the ground. In disposition the islanders are friendly and hospitable, brave and somewhat bloodthirsty; and, although naturally indolent and morose, they have proved industrious and keen traders. As among their kinsfolk the Tahitians, dehauery was systematized and infanticide an organized institution. A population which at the time of the annexation by France (1842) was about 20,000 has been reduced to little over 4000. Latterly the natives have for the most part outwardly adopted Christianity.

The Marquesa Islands were discovered on the 21st of July 1595 by Alvaro Mendana, who, however, only knew of the south-east coast of the group, which they generally known (although they also bear his own), in honour of Don Garcia Hurtado de Mendoza, marquis of Cañete, viceroy of Peru, and patron of the voyage. Captain Cook preparing the same track rediscovered this group, with the addition of Fatu-Hiva, in 1774. The northern-western islands were first sighted by the American Captain Ingraham in 1791, and given the name of Washington by him; the French Captain Marchand followed in the same year, and Lieut. Hergest in 1792. The Russian explorer, Adam Ivan Kruscenstern, made an extensive investigation of the archipelago in 1804. In 1913 the American Commodore David Porter sailed the Baltimore, which were fitted as a floating hospital, and the British Consul, Mr. Alfred M. Clark, in 1914. In May 1842, after French Roman Catholic missionaries had prepared the way, Rear-admiral Dupetit-Thouars took formal possession of the archipelago for France; a population census was taken without compulsory registration, and about 1860-1870 the colony was practically abandoned.

MARQUES, or MARQUIS (Fr. marquis, Ital. marchese; from med. Lat. marchio, marchius, i.e. comes marchiae, "count of the March"), a title and rank of nobility. In the British peerage it is the second in order and therefore next to duke. In this sense the word was a reintroduction from abroad; but lords of the Welsh and Scottish marches are occasionally termed marches or marchies. The first marquess in England was Robert de Vere, the 9th earl of Oxford, who succeeded as marquess of Dublin by Richard II. on the 1st of December 1358, and assigned precedence between dukes and earls. On the 13th of October following the patent of this marquessate was recalled, Robert de Vere then having been raised to a dukedom. John de Beaufort, earl of Somerset, the second legitimate son of John of Gaunt, was raised to the second marquessate as marquess of Dorset on the 29th of September 1397, but degraded again to earl in 1399. The Commons petitioned for the restoration of his marquessate in 1402, but he himself objected because "le nom de Marquiys feust estrangue nunc est Roiatme." From this time the title have been borne by the younger sons of the kings of England. By the marriage of Henry VI., when it was revived (1442), and thenceforward it maintained its place in the British peerage. Anne Boleyn was created marchioness of Pembroke in 1532. A marquess is "most honourable," and is styled "my lord marquis." His wife, who is also "most honourable," is a marchioness, and is styled "my lady marchioness." The coronet is a circle of gold on which rest four leaves and as many large pears, all of them of equal height and connected. The cap and lining, if worn, are the same as in the other coronets (see Crown and CORONET), but the badge of parliament is scarlet, and has three and a half doublings of ermine.

In France, so early as the 9th century, counts who held several counties and had succeeded in making themselves quasi-independent began to describe themselves as marchions, this use of the word being due to the fact that originally none but the marquises, or counts of the marches, had been allowed to hold more than one county. The marchio or marquess thus came to be no more than a count of exceptional power and dignity, the original significance of the title being lost. In course of time the title was recognized as ranking between those of duke and count; but with the decay of feudalism it lost much of its dignity, and by the 17th century the favour of pretentiousness attached to it had made it a favourite subject of satire for Molière and other dramatists of the classical comedy. Abolished at the Revolution, the title of marquess was not restored by Napoleon, but it was again revived by Louis XVIII., who created many of Napoleon's counts marquesses. This again tended to cheapen the title, a process hastened under the republic by its frequent assumption on very slender grounds in the absence of any authority to prevent its abuse. In Italy too the title of marchese, once borne only by the powerful marquises of Verona, has shared the fate of most other titles of nobility in becoming common and of no great social significance. (See also MARGRAVE.)

(M. R.)

MARQUETRY (Fr. marquerie, from marquer, to inlay, literally to mark, marquer), an inlay of ornamental woods, ivory, bone, brass and other metals, tortoise-shell, mother-of-pearl, &c., in which shaped pieces of different materials or tints are combined to form a design. It is a later development of the ornamental inlays of wood known by the name of Intarsia, and though in the main the latter was a true inlay of one or more colours upon a darker or lighter ground, while marquetry is composed of pieces of quite thin wood or other material of equal thickness laid down upon a matrix with glue, there are examples of Intarsia in which this mode of manufacture was evidently followed. For instance, the backs of the stalls in the cathedral of Ferrara show the perspective lines of some of the subjects traced upon the ground where the marquetry has fallen off, but none of the sinkings in the surface which would be there if the panels had been executed as true inlays. In the endeavour to gain greater relief, shading and tinting the wood were resorted to, the shading being generally produced by scoring, either with a hot iron or hot sand, and the tinting by chemical washes and even by the use of actual colour, but the result is usually hardly commensurate with the labour expended. A combination of tortoise-shell and metal, the one forming the ground and the other the pattern upon it, which may be classed as marquetry also appears in the 17th century. The subjects of the intarsiorati are generally arabesques or panels with elaborate perspectives, either of buildings or cupboards with different articles upon the shelves seen through half-open doors, which themselves are frequently of glass. A work delineated with extraordinary perfection, though figure subjects also occur. The later marqueurs used a freer form of design for the most part, and scrolls and bunches of
flowers appear in profusion, while if architectural forms occur they are generally in the shape of ruins amid landscape. The greater portion of the examples in England are importations, either from Holland (in which country very fine work was produced during the latter half of the 16th and 17th centuries) or from France. The reputation of the Dutch *marqueteurs* was so great that Colbert engaged two, named Pierre Gole and Vortds, for the Gobelins at the beginning of the 17th century. Jean Macé de Blois, the first Frenchman known to have practised the art, who was at work in Paris from 1644 (when he was lodged in the Louvre), or earlier, till 1672, as a sculptor and painter, learnt it in the Netherlands. His title was "maissoirer et faiseur de *cabinets et tableaux en marqueterie de bois*"; but as early as 1756 a certain Hans Kraus had been called "marqueur du roi." Jean Macé's daughter married Pierre Boulle, and the greatest of the family, André Charles Boule (q.v.), succeeded to his lodging in the Louvre on his death in 1672. The members of this family are perhaps the best known of the French *marqueteurs*. Their greatest triumphs were gained in the marquetry of metal and tortoise-shell combined with beautifully chiselled ormulu mountings; but many foreign workmen found employment in France from this time onward. Colbert, and some of them rose to the highest eminence. The names of Roentgen, under whom the later German marquetry perhaps reached its highest point, Riesener and Oeben, testify to their nationality. A good deal of marquetry was executed in England in the later Stuart period, mainly upon long-case clocks, cabinets and chests of drawers, and it is often of real excellence. Marquetry in a shallower form was also extensively used in the latter part of the 18th century. The most beautiful examples of the art in Italy are mainly panels of choir stalls or sacristy cupboards, though marriage coiffes were also often sumptuously decorated in this manner. With the increase in luxury and display in the 17th and 18th centuries in France and Germany cabinets and escritoires became objects upon which extraordinary talent and expenditure were lavished. In South Germany musical instruments, weapons and bide chests were often lavishly decorated with marquetry. The cabinets are of elaborate architectural design with inlays of ebony and ivory or with veneers of black and white, the design counterchanging so that one cutting produced several repeats of the same pattern in one colour or the other. In modern practice as many as four or even six thicknesses are put together and so cut. When all the parts have been cut and fitted together face downwards paper is glued over them to keep them in place and the veneer are carefully levelled and toothed so as to obtain a freshly worked surface. The ground is then well wetted with glue at a high temperature and the surfaces squeezed tightly together between frames called "cauls" till the glue is hard. There are several modes of ensuring the accurate fitting of the various parts, which is a matter of the first importance.

**MARQUETTE, JACQUES** (1637-1693), French Jesuit missionary and explorer, re-discoverer (with Louis Joliet) of the Mississippi. He was born at Laon, went to Canada in 1666, and was sent in 1668 to the upper lakes of the St Lawrence. Here he worked at Sault Ste Marie, St Esprit (near the western extremity of Lake Superior) and St Ignace (near Michilimackinac or Mackinaw, on the strait between Huron and Michigan). In 1673 he was chosen with Joliet for the exploration of the Mississippi, of which the French had begun to gain knowledge from Indians of the central prairies. The route taken lay up the north-west side of Lake Michigan, up Green Bay and Fox river, across Lake Winnebago, over the portage to the Wisconsin river, and down the latter into the Mississippi, which was descended to within 700 m. of the sea, at the confluence of the Arkansas river. Entering the Mississippi on the 17th of May, Joliet and his companion turned back on the 17th of July, and returned to Green Bay and Michigan (by way of the Illinois river) at the end of September 1673. On the journey Marquette fell ill of dysentery; and the return expedition of the two men under the command of Father Louis Hennepin, after which the mission among the Indians of the Illinois river in the winter of 1674-1675 proved fatal. He died on his way home to St Ignace on the banks of a small stream (the less old and Marquette River) which enters the east side of Lake Michigan in Marquette Bay (May 18, 1673). His name is now borne by a larger watercourse which flows some distance from the scene of his death.

**MARQUETTE**, a city, a port of entry and the county seat of Marquette county, Michigan U.S.A., on the south shore of Lake Superior. Pop. (1900), 10,058 (3,060 foreign-born); (1910), 11,503. It is served by the Duluth, South Shore & Atlantic, the Marquette & South-Eastern, the Chicago, Milwaukee & St Paul, the Chicago & North-Western, and the Lake Superior & Ishpeming railways. The city, which is situated on a bluff 100 ft. above the lake, in a region characterized by rounded hills and picturesque irregularities, has a delightful climate, and is a popular summer resort. It is connected with the Great Lakes by a railroad north of the city, and is one of its principal attractions. Marquette is the seat of the Northern State Normal School (established 1890) and of the state house of correction and branch prison (established 1885). A county-court-house, the Peter White library, and the Federal building are the most prominent public buildings. Marquette is the seat of Roman Catholic and Protestant Episcopal bishoprics. The city is best known as a shipping centre of one of the richest iron-ore districts in the world, and its large and well-equipped ore docks are among its most prominent features. Marquette is the port of entry of the customs district of Superior. In 1896 its imports were valued at $358,505 and its exports at $4,708,302; in 1908, imports $1,845,724 and exports $7,040,473. Foundries, railway machine-shops, lumber and planing-mills, brewery and bottling works, and quarries of brownish-red sandstone contribute largely to the city's economic importance. The charcoal iron blast-furnaces of the city manufacture pig-iron, and, as by-products, wood alcohol and acetic acid, recovered from the smoke of the charcoal pits. The value of the city's factory products increased from $1,585,893 in 1900 to $3,364,087 in 1905, or 401%. The first settlement was made about 1845, and in 1849 it was named Worcester; but "Marquette" was soon substituted in honour of Jacques Marquette. It was incorporated as a village in 1859, and chartered as a city in 1871.

**MARR, CARL** (1858- ), American artist, was born at Milwaukee, Wisconsin, on the 14th of February 1858, the son of an engraver. He was a pupil of Henry Vianden in Milwaukee, of Schauss in Weimar, of Gussow in Berlin, and subsequently of Otto Seliz, Gabriel and Max Lindenschmitt in Munich. His first work, "Abasnerus, the Wandering Jew," received a medal in Munich. One of his pictures, "Episode of 1813," is in the Royal Hanover Gallery, and his "Germany in 1806" received a gold medal in Munich and is in the Royal Academy of Koenigsberg. A large canvas "The Flagellants," now in the Milwaukee public library, received a gold medal at the Munich Exposition in 1889. Another canvas, "Summer Afternoon," in the Phoebe Hearst collection, received a gold medal in Berlin, in 1892. Marr became a professor in the Munich Academy in 1893, and in 1895 a member of the Berlin Academy of Arts.

**MARRADI, GIOVANNI** (1852- ), Italian poet, was born at Leghorn, and educated at Pisa and Florence. At the latter place he started with others a short-lived review, the *Nuovi Goliardi*, which made some literary sensation. He became a teacher at various colleges, and eventually an educational inspector in Massa Carrara. He was much influenced by Carducci, and became known not only as a critic but as a charming descriptive poet, his principal work being *Il Mediterraneo* (1881), *Canzoni e fantasie* (1853), *Ricordi lirici* (1884), *Poesie* (1889), *Nuovi canzoni* (1891) and *Ballate moderne* (1895).
MARRAKESH—MARRIAGE

MARRAKESH (erroneously MOROCCO or MAROCCO CITY), one of the quasi-capitals of the sultanate of Morocco, Fez and Mequinez being the other two. It lies in a spacious plain—Blad el Hamra, "The Red"—about 15 m. from the northern underfalls of the Atlas, and 96 m. E.S.E. of Safi, at a height variously estimated at 1639 ft. (Hooker and Ball) and 1410 ft. (Beaumier). Rank- ing during the early centuries of its existence as one of the greatest cities of Islam, Marrakesh has long been in a state of grievous decay, but it is rendered attractive by the exceptional beauty of its situation, the luxuriant groves and gardens by which it is encompassed and interspersed, and the magnificent outlook which it enjoys towards the mountains. The wall, 25 or 30 ft. high, and resolved at intervals of 360 ft. by square towers, is so dilapidated that foot-passengers, and in places even horsemen, can find their way through the breaches. Open spaces of great extent are numerous within the walls, but for the most part they are defaced by mounds of rubbish and putrid refuse. With the exception of the tower of the Kutubia Mosque and a certain archway which was brought in pieces from Spain, there is not, it is asserted, a single stone building in the city; and even brick (although the local brick manufacture is of excellent quality) are sparingly employed. Tabiya or rammed concrete of red earth and stone is the almost universal building material, and the houses are consequently seldom more than two storeys in height. The palace of the sultan covers an extensive area, and beyond it lie the imperial parks of Aguald, the inner one reserved for the sultan's exclusive use. The tower of the Kutubia is a memorial of the constructive genius of the early Moors; both it and the similar Hasan tower at Rabat are after the type of the contemplation of St. Foy at Chartres. They, and if the palace all and three were designed by the same architect, Jabir. The mosque to which the tower belongs is a large brick building erected by 'Abd el Munin; the interior is adorned with marble pillars, and the whole of the crypt is occupied by a vast cistern excavated by Yakhbt el Mansur. Other mosques of some note are those of Ibn Yusef, El Mansur and El Mouizz; the chapel of Sidi Bel Abbas, in the extreme north of the city, possesses property of great value, and serves as an almshouse and asylum. There is a special Jews' quarter walled off from the rest. The general population of 100,000 is a very mixed and turbulent kind; crimes of violence are common, and there are many professional thieves. The murder of a Frenchman, Dr Mauchamp, in March 1907, by the rabble of Marrakesh was the immediate cause of the occupation of Udja by France (see MOROCCO: History). Almost the only manufacture extensively prosecuted is that of Morocco leather, mainly red and yellow, about 1,500 men being employed as tanners and shoemakers. Scottish missionaries and a few European traders have become established here. The city was founded in 1062 by Yusef bin Tashfin. Before it was a hundred years old it is said to have had 700,000 inhabitants, but the population in 1000 probably did not exceed 50,000 to 60,000.

See Leo Africanus, and Paul Lambert's detailed description in Notice sur la ville de Maroc (Paris, 1868). Lambert's plan of Marrakesh is reproduced with some additions by Dr A. Leared, and another may be found in Gattell.

MARRI, a Baluch tribe on the Dera Ghazi Khan border of Baluchistan. In the census of 1901 they numbered 19,161 and their fighting strength is about 3000. Their relations with the British commenced in 1840 with attacks made on the communications of Sir John Keane's army, after it had passed through the Bolan. An attempt was made to punish the tribe, which ended in disastrous failure. Major Clibborn was repulsed in an attempt to storm the Nauffuss Pass, losing 179 killed and 92 wounded out of 650. Many of his force died of heat and thirst. The fort of Khan, which he was trying to relieve at the time, was forced to capitulate with the honours of war. The Marris, however, joined the British against the Bugtis in 1845. After the annexa- tion of Sind in 1843 the Marris gave much trouble, but were pacified by the policy of General John Jacob and Sir Robert Sandhurst. In the Second Afghan War they made frequent raids on the British line of communications, ending with the plunder of a treasure convoy. A force of 3070 British troops under Brigadier-General Macgregor marched through the country, and the tribe submitted and paid 1¾ lakh (£12,500) out of a fine of 2 lakhs (£20,000); they also gave hostages for their future good behaviour. Since then they have given little trouble.

The Marr-Bugti country is classed as a tribal area in Baluchis- tan, politically controlled from Sibi, but enjoying a large measure of autonomy under its own chieftains. Total area, 7129 sq. m.; total pop. (1901), 38,919, almost equally divided between the two tribes of Marris and Bugtis.

MARRIAGE. Marriage (Fr. mariage, from marier, to marry; Lat. maritare, from mas, maris, a male), or "marriage" (Lat. matrimonium, from mater, a mother), may be defined either (a) as the act, ceremony, or process by which the legal relationship of husband and wife is constituted; or (b) as a physical, legal and moral union between man and woman in complete community of life for the establishment of a family.

It is possible to discriminate between three stages, taking marriage in the latter sense as an institution—the animal or physical stage, the proprietary or legal stage, and the personal or moral stage. The first or physical stage the relation of the sexes was unregulated, and in the course of time the legal or moral stage greater permanence was secured in marriage by assigning the husband a property right in his wife or wives. In the last stage the proprietary relation falls more and more into the background, and the relation of husband and wife approximates that of two individuals entirely equal before the law. Although in the history of marriage these three stages have been roughly successive, the order of their entering the conscious experience of the individual is usually the reverse of their order of development of the race; and in the solemnization of a marriage based upon affection and choice the growth of the relation begins with the moral, advances to the legal and culmi nates in the physical union, each one of these deriving its meaning and its worth from the preceding. In most legal systems marriage, in the sense of a ceremony, takes the form of a contract—the mutual assent of the parties being the prominent and indispensable feature. Whether it is really a contract or not, and if so to which class of contracts it belongs, are questions which have been much discussed, but into which it is not necessary to enter. While the consent of parties is uni versally deemed one of the conditions of a legal marriage, all the incidents of the relationship constituted by the act are absolutely fixed by law. The jurist has to deal with marriage in so far as it creates the legal status of husband and wife. It should be added that, while marriage is generally spoken of by lawyers as a contract, its complete isolation from all other contracts is invariably recognized. Its peculiar position may be seen at once by comparing it with other contracts giving rise to continuous relationships with more or less indefinite obligations, like those of landlord and tenant, master and servant, &c. In these the parties may in general make their rights and duties what they please, the law only intervening when they are silent. In marriage every resulting right and duty is fixed by the law.

Besides true marriage, inferior forms of union have from time to time been recognized, and may be briefly noticed here. These have all but disappeared from modern society, depending as they do on social and religious obstructions.

The institution of slavery is a fruitful source of this kind of de-based matrimony. In Roman law no slave could contract marriage whether another slave was a free person. The union of male and female slaves (consuberrnium) was recognized for various purposes: a free woman entering into a union with a slave incurred under the S.C. Claudianus the forfeiture of her own liberty; but the bond woman might be the concubine of a freeman. In the United States, where slavery was said to be regulated by the principle of the civil law, the marriage of slaves was so far recognized that on emancipation complete matrimony took effect and the children became legitimate without any new ceremony.

1 It is doubtless true, as anthropologists have pointed out, that in the history of the race "marriage" is rooted in the family rather than society in the sense of the modern family (see Marriage, p. 22); but in that conscious experience of the individual with which law and ethics are especially concerned, this relationship is reversed, and the family originates in marriage (see FAMILY, and allied headings).
MARRIAGE

In Roman law no legal marriage could be contracted unless there was connubium between the parties. Originally connubium consisted of cohabitation between plebs and patricians, and the privilege was conceded after a long struggle by the Lex Canuleia. In later times Lex Julia et Papia Poppea (27 B.C.) introduced restrictions depending on the condition of the parties which later legislation frequently required. Senators and menials were forbidden to marry freedwomen or women of inferior rank, and the husband of a freedwoman becoming a senator was set free from his mediate. The law was called ante-nuptial except where the right had been expressly conferred. The great law of the early empire (Lex Julia et Papia Poppea) introduced restrictions depending on the condition of the parties which later legislation frequently required. Senators and menials were forbidden to marry freedwomen or women of inferior rank, and the husband of a freedwoman becoming a senator was set free from his mediate. Persons who bound themselves not to marry were deemed incapable of marrying. The order of the clergy were forbidden to marry. And disparity of race was recognized by the early church as a bar to matrimony, e.g. between Christians and pagans and between orthodox and heretics (see Dictionary of Christian Antiquities, art. “Marriage”).

Covincasm, those which such restrictions tended to develop, is noticed under a separate heading (q.v.). It might be described as marriage which has no consequences, or only slight and peculiar consequences, in legal status. In the left-handed or “morganatic” marriages of the German royal families we have the nearest approach ever made by concubinage to true marriage, the children being legitimate, but neither they nor the wife acquiring any right to the rank or fortune of the husband. The marriage of persons of different religious confessions requires the intervention of the law as to the faith of the children, more particularly in Europe as between Roman Catholics and Protestants. English law gives the father exclusive right over his children, and the right to dictate the faith of his children (see INFANT). The question is, therefore, as to what extent on this point they differ, as regards Europe—the question being ignored in French law, Germany following in some part the same rule as England, in others giving effect to antinuptial stipulations. In Ireland marriages (i.e. between Roman Catholic and Protestant) were by 19 Geo. II. c. 13 null and void if celebrated by a Roman Catholic priest. This act was repealed by 3 & 4 Vict. c. 110, which permits mixed marriages to be validly celebrated by an Episcopalian or Roman Catholic clergyman, subject to conditions set forth in § 38.

Roman law.—The three primitive modes of marriage were conforaratio, coemptio in manum, and asus, all of which had the effect of placing the woman in the “power” (manus) of her husband, and on the same footing as the children. The first was a religious ceremony before ten witnesses, in which an ox was sacrificed and a wheaten cake broken and divided between the parties by the priest. Coemptio was a conveyance of the woman by manus, and might be described as a fictitious sale per aet et libram, like that employed in emancipation and testamentary disposition and other processes. Usus was the acquisition of the wife by prescription, through her cohabiting with the husband for one year, without having been absent from his house three continuous nights. But a true marriage might be concluded without adopting any of these modes, and they all fell into desuetude and with them the subject of the wife to the husband. Marriage without manus was contracted by the interchage of vows, with or without writing or formality of any kind. By some jurists it is regarded as being complete until consummated by delivery of the woman, and is accordingly referred to the class of real contracts. The restrictions as to age, relationship by consanguinity and affinity, previous marriage, &c., were in the main those which have continued to prevail in modern Europe with one important exception. The consent of the paterfamilias to the marriage of the children under his power was essential.

Canon law.—The canon law of marriage is based partly on the Roman law, the validity of which the Church from the first recognized, partly on the Jewish law modified by the new principles introduced by Christ and his apostles, developed by the fathers of the Church and medieval schoolmen, and regulated and defined by popes and councils. The most important of these principles was that of the indissolubility of marriage, proclaimed by Christ without qualification according to Mark x. 10, 12, and with the qualifying clause “saving for the cause of fornication” according to Matt. v. 32. This lofty view of marriage, according to which man and wife are made “one flesh” by the act of God (“What therefore God hath joined together, let no man put asunder,” Mark x. 9) is, however, modified by the idea of the consummating act of marriage as itself something unholy, a result of the Fall. Christ himself, indeed, did not teach this; but for St Paul marriage is clearly a Remarriage (betrothal) and was the Lord the procreation of children is a matter of no importance (v. 29), but “it is better to marry than to burn” (v. 9). He is, indeed, obviously not clear on the point, and at the end of his argument strikes a note of doubt (v. 40); elsewhere he defends marriage against those who would have forbidden it altogether, as a gift of God (1 Tim. iv. 3—5) and even, in seeming contradiction to 1 Cor. vii. 29, commands the bearing of children (1 Tim. v. 4). Finally it is to St Paul that the idea of marriage as a sacrament is traced, in the mystical comparison of the relations of husband and wife to those of Christ and the Church (Eph. v. 33—32). These are the main foundations in Scripture on which the Christian law of marriage is built up, and they are obviously principles which admit of a large amount of variety of interpretation and of practice. They were developed in the early Church under the influence of the rapidly growing passion for the celibate life, partly an outcome of the same dualistic principle which produced the asceticism of the Jewish Essenes and of the Gnostics, partly perhaps a natural reaction from the appalling moral corruption of the decaying empire. Marriage, it is true, from being no more than a terminable civil contract, became a thing holy, a mystical union of souls bound together by a real bond, and, therefore, voidable only by death; but valid, indeed, but not spiritually complete, without the public blessing of the Church (Tertullian, Ad uxorem, lib. ii. cap. 9); and from Augustine's time onward it was reckoned as a sacrament. But at the same time there was a tendency to restrict its rights and its range. So far as marriage was a physical union, this had for its object solely the perpetuation of the race and the avoidance of fornication; the most that was conceded was the intention of having offspring not only made the conjugal act blameless, but even gave to the desire that inspired it an element of good (Augustine, de nupt. et conc. 3). But the ideal married life was that attributed to Mary and Joseph. Thus Augustine cited this as an example that a true marriage may exist where there is a mutual vow of chastity (ep. cit. 12), and held that the sooner this relation was established the better (de bono conjug. 22). Marriage being then an inferior state, to be discouraged rather than the reverse, the tendency was rapidly to narrow the field within which it might be contracted. Consecrated (bishops) was only allowed after many struggles, and then only to the laity. St Paul had laid down that a “bishop” must be “the husband of one wife,” and the present day the priests of the Orthodox Eastern Church may not marry. Clerical celibacy, at first a counsel of perfection, was soon to become the rule of the Church, though it was long before it was universally enforced in the West; in the East it still applies only to monks, nuns and bishops (see CELIBACY). The marriage of the laity was hampered by the creation of a number of impediments. The few and definite prohibitions of the Roman and of the Jewish law (Lev. xxii. 6—13; xx.) in the matter of marriage between kindred, were indefinitely enlarged by 506 the council of Agde laid it down that any consanguinity or affinity whatever constituted an impediment. Moreover, man and wife being “one flesh,” the Church exaggerated relationship by affinity into equal importance with that of consanguinity as an impediment to matrimony; and, finally, to all this added the impediments created by “spiritual affinity,” i.e. the relations established between the baptizer and baptized, the confirmer and confirmed between godparents, their godchildren and their godchildren's relatives.

The result of this system was hopeless confusion andCanon lxi. Aut qui ex propria consanguinitate aliquam, aut quam consanguineus habuit . . . duceret uxorem . . . incestos esse non dubitamus (Mansi Conc. viii. p. 336). According to the Church “affinity” is between two persons of whom one has had commerce, licit or illicit, with a relation of the other.

1 These restrictions are enumerated in the following lines:—

Error, Concupiscitum, Cognatum, Cribemut,
Culpis, Diciparitas, Vis, Ord. Lignamen, Honestas,
Aetas, Affinis, et Clandestinum in Impos.
Raptum sit mulier nec parti reditum tutae.

2 The word "imbibe" is used in the same sense as the word "drink".
MARRIAGE

uncertainty, and it was early found necessary to modify it. This was done by Pope Gregory I, who limited the impediment to the 7th degree of relationship inclusive (civil computation)\(^1\) which was afterwards made the law of the empire by Charlemagne. Later still Innocent III. found it necessary again to issue a decree (4th Lateran Council) permitting marriages between a husband and the relations of his wife, and vice versa, beyond the 4th degree inclusive (canonical computation).\(^2\) This removes the canonical rule of the Roman Catholic Church. As regards impediments due to spiritual affinity this was done in the case of Trentham by the form of Trentham to the relatives of the baptizer and baptized; the baptizer and the parents of the baptized; the baptizer and the godfather and godmother; the godparents and the baptized and its parents: i.e. a godfather may not marry the mother of the child he has held at the font, nor the godmother the father of such child.

In the fully developed canon law impediments to marriage are of two kinds, public and private (impedimenta publica and privata), i.e. according as the objection arises out of the very nature of marriage itself or from consideration for the rights of parties. Impediments may be classified into public impediments, impotence (impotentia) and force (vis et metus) are private impediments. Impediments are further divided into separating (impedimenta dirimentia) or merely suspensive (impedimenta tantum impedientia); to the first class belong, e.g. a previous marriage not dissolved by death, which involves the nullification of the marriage even where through ignorance the crime of bigamy is not involved; to the second belongs the case of one or both of the contracting parties being under the age of puberty.\(^3\) Impediments, moreover, are absolute or relative, according as they are of universal application or only affect certain persons; near relationship, for instance, is an absolute impediment, difference of religion between the parties a relative impediment. In addition to consanguinity and affinity, impurity and existing marriage, the canon law lays down as public and absolute impediments to marriage the taking of holy orders and the vows of chastity made on entering any of the religious orders approved by the Holy See. In these impediments the canon law further distinguishes between those which are based on the law of nature (jus naturae) and those which are based on the law of the Church (jus ecclesiae). From impediments based on the law of nature, or of God, there is no power even in the pope to dispense; e.g. marriage of father and daughter, brother and sister, or remarriage of husband or wife during the lifetime of the wife or husband of another marriage, which is held to be a violation of the very nature of marriage as an indissoluble union.\(^4\) From impediments arising out of the law of the Church dispensations are granted, more or less readily, either by the pope or by the bishop of the diocese in virtue of powers delegated by the pope (see Dispensation). Thus dispensations may be granted for marriage between persons related by consanguinity in any beyond the 2nd degree and not in the direct line of ascendant or descendant; e.g. between uncle and niece (constrained by the council of Trent to the case of royal marriages for reasons of state) and between cousins-german, or in the case of marriage with a heretic. In this latter case a dispensation is now (i.e. since the papal decrees ne tenere of the 2nd of August, 1907, which came into force at Easter 1908) only granted on condition that the parties are married by a Catholic bishop, or a priest accredited by him, that no religious ceremony shall take place except in a Catholic church, and that all the children shall be brought up in the Roman Catholic faith.\(^5\)

In the absence of any impediment a marriage is according to the canon law completed between baptized persons by the facts of consent and consummation; the principle is still maintained that the parties to the marriage, not the priests, are the "ministers of the sacrament" (ministri sacramenti).\(^6\) From the first, however, the Church, while recognizing the validity of private contracts, enjoined the addition of a public religious ceremony, so that they might be "sanctified by the word of God and prayer" (1 Tim. iv. 5).\(^7\) Tertullian (de pudicitia, cap. iv.) says that clandestine marriages, not professed in the Church, were reckoned among Christians as all but fornication, and he speaks of the custom of seeking permission to marry from the bishop, priests and deacons (de monogonia, cap. xi.). This latter practice became general throughout France, and the pope in 1180, "to avoid a new necessity of imprisonment" forbade the celebration of a marriage until "the bishops, priests and elders of the people" had done diligent inquiry into the question of the consanguinity of the parties. This was the origin of the publication of banns which, long customary in France, was made obligatory on the whole Church by Pope Innocent III. In the Eastern Church the primitive practice survives in the ceremonial blessing by the priest of the betrothal, as distinguished from the marriage ceremony. The ecclesiastical recognition of clandestine marriages, however, survived, until the crisis evil was remedied by the canonical regulations on the validation of irregular marriages.\(^8\)

It is maintained that no pope has ever given a dispensation for such a marriage. Such a belief is based on the cases of Pope Ullathorne's Excl. Discourses (London, 1876). The papal Bull Matrihymn, pp. 686 ex. seq. For the Canon Law view see "An Instruction on Mixed Marriages" in Bishop Ullathorne's Excl. Discourses (London, 1876).

* The civil law counts, in the direct line, as many degrees as there are generations between the parties; e.g. the son is in regard to the father a third degree, the grandson in the 2nd, and vice versa. In the collateral line it computes degrees by generations, i.e. from one of the relations to the common ancestor, without including him or her, and from him or her to back the other relation; e.g. two brothers are in the 2nd degree of relationship to one another, uncle and nephew in the 3rd, cousins-german in the 4th.

* The canon law, which in this case derives from the old Germanic law, has the same computation as regards the direct line. In the case of collateral relations, however, it differs, having two rules: (1) In the case of equal line — i.e. when the collaterals are equally removed from the common progenitor, it reckons the same number of degrees between the collaterals as between one of them and the progenitor; e.g. brothers are related in the 1st degree, while cousins-german are related in the 2nd degree because they are two generations from the common grandfather. (2) In the case of unequal line — i.e. when the collaterals are unequally removed from the common ancestor, the degree of their relationship is that of the most remote from the common progenitor; e.g. uncle and niece are related in the 2nd degree, i.e. through the great-grandparents.

* The civil computation was furiously attacked by canonists as tending to laxity (see Peter Damianus, "De parentele gradibus," in Decretal Quaest. vol. vii. c. iv.).

* Innocent III. also decided that the husband's relations were not related to those of the wife, and vice versa, thus establishing the rule that "affinity does not breed affinity" (affinitas non parit affinitatem) canonically.

* This is fixed by the canon law at 14 for a male, 12 for a female. If, however, owing to the precocious physical development of a girl, the marriage has been consummated before she has reached this age, it cannot be nullified.
by a decree of the council of Trent (Sess. xiv. de martrim.), which laid it down that for a valid marriage it was at least necessary that consent should be declared before a priest and in the presence of three witnesses. According to the actual law of the Roman Catholic Church, then, a civil marriage is only valid when the Tridentine decree has not been published; where this has been published, or has been in practice without publication, such a marriage can only become valid if followed by a religious ceremony in the prescribed form. Where such form has not followed the ecclesiastical courts must treat the marriage as voidable through the impedimentum clandestinitatis.

Divorce, i.e., the annulment of marriage for any cause but an impugnment which makes the marriage <i>ipse dixit</i> void, is unknown to the Roman Catholic Church. Separation <i>a vincula matrimonii</i> is only possible under the canon law by a judicial decree of nullity (<i>anulatio matrimonii</i>), which implies, not the severing of the ties of a real marriage, but the solemn declaration that such marriage has never existed. There may, however, be a "separation from bed and board" (<i>a thorO et menA</i>, even perpetual, which does not however give either party the right to remarry during the lifetime of the other. But, marriage not being regarded as a sacrament until consummated, may be dissolved, if non-consummation be proved, by one or both parties taking the religious vows, or by papal dispensation.

The Church claims exclusive control over marriage, and the council of Trent anathematized the opinion held by Luther and other Reformers, that it was properly a subject for the civil courts (<i>si quis dixerit causas matrimoniales non spectare ad judices ecclesiasticos anathema sit</i>, Sess. xxiv. cap. 3). This attitude became of the utmost political importance when even in Catholic countries the codes established civil marriage as the only legally binding form.

England.—Marriage may be the subject of an ordinary contract on which an action may be brought by either party. It is not necessary that the promise should be in writing, or that any particular time should be named. Promises to marry are not within the meaning of "agreement made in consideration of marriage" in the statute of frauds, which requires such agreements to be in writing. Contracts in restraint of marriage, i.e., whose object is to prevent a person from marrying anybody whatever, are void, as are also contracts undertaking for reward to procure a marriage between two persons. These latter are termed marriage brocage contracts.

Any man and woman are capable of marrying, subject to certain disabilities, some of which are said to be canonical as having been formerly under the cognizance of the ecclesiastical courts, others civil. The effect of a canonical disability as such was to make the marriage not void but voidable. The marriage must be set aside by regular process, and sentence pronounced during the lifetime of the parties. Natural inability at the time of the marriage to procreate children is a canonical disability. So was relationship within the prohibited degrees, which has been made an absolute avoidance of marriage by the Marriage Act 1835. Civil disabilities are (1) the fact that either party is already married and has a spouse still living; (2) the fact that either person is a party of unsound mind; (3) want of full age, which for this purpose is fixed at the age of puberty as defined in the Roman law, viz. fourteen for males and twelve for females; (4) relationship within the prohibited degrees.

The statute which lawyers regard as establishing the rule on this last point is the 32 Hen. VIII. c. 38 (repealed in part by 2 & Edw. VI. c. 23, in whole by 1 & 2 P. and M. c. 8, but revived again by 3 Eliz. c. 2), which enacts that "no prohibition, God's law except, shall trouble or impeach any marriage without the Levitical degrees." The forbidden marriages, as more particularly specified in previous statutes, are those between persons in the ascending and descending line in inquinum, and those between collaterals to the third degree inclusive, according to the computation of the civil law. The prohibitions extend not only to consanguinei (related by blood) but to affines (related by marriage), now altered to the deceased wife's sister is concerned (see below). The act of 1835 enacted that a marriage between two people who may be celebrated between persons within the prohibited degrees of consanguinity or affinity shall be absolutely null and void to all intents and purposes whatsoever. They had previously been only voidable. The act at the same time legalized marriages within the prohibited degrees of affinity (but not consanguinity) actually celebrated before the 31st of August 1835.

For many years an active and ceaseless agitation was carried on on behalf of the legalization in England of marriage with a deceased wife's sister. In all the self-governing colonies, with the exception of Newfound-land, the right to remarry is thus permitted to exist. The first act legalizing marriage with a deceased wife's sister was adopted by South Australia. The legislation, however, which was based on the principle that the state of a given union, that is, of any marriage of that state had five times passed the bill. In quick succession similar statutes followed in Victoria, Tasmania, New South Wales, Queensland, New Zealand, West Australia, Barbados, Canada, Mauritius, the Hawaiian Islands, and Natal. In all the colonies, marriages of the kind in question were made legal in 1899, and in 1907 in the Isle of Man.

In 1899 the bill for marriage with a deceased wife's sister valid was first adopted by the House of Commons in 1856, and rejected by the House of Lords in 1851. It was subsequently brought before the legislature in 1855, 1856, 1858, 1859, 1861, 1862, 1866, 1869, 1870, 1871, 1872, 1875, 1877 and 1878 (Civil bills), 1879 (6th May, when in the House of Lords the prince of Wales and the duke of Edinburgh voted in favour of it), 1880, 1882, 1893, 1894, 1896, 1888, 1899, 1891, 1896, and 1898 and 1900 (Colonial bills). In most cases it passed the House of Commons but was rejected in the House of Lords. The bill of 1896, however, which was justiciably drafted to avoid the compulsory celebration by clergyman of marriages against which they had conscientious scruples, was carried in the Lords. Both the prince of Wales and the duke of York were among the "contents." The prime minister and eighteen bishops, including the two archbishops, voted against the bill. A bill of another House, however, in 1900 was carried; reading the bill was carried by 142 to 104 votes. Its promoters, however, did not succeed in getting an opportunity of bringing it before the House of Commons.

From 1896 to 1901 no further direct steps were taken, but in 1898 and again in 1900 (May 28) the subject was brought forward in the House of Lords by Lord Strathcona in the form of a bill under which marriage with a deceased wife's sister was permitted. Such a marriage between a member of the royal colony should be deemed valid for all purposes within the United Kingdom. In 1898, and again in 1900, the bill was carried on the third reading without a dissentient vote. The House of Commons took no action on either occasion. An imperial bill reached a second reading in the House of Commons in 1901 and again in 1902, but it was blocked by the High Church opponents of the measure when attempts were made to get it to the committee stage (Feb. 5 and June 6). The reform was, however, finally adopted in 1906 under the title of the Colonial Marriages (Deceased Wife's Sister) Act. The effect of the act was to make such marriages legal in all respects, including the right of the surviving party to remarry and the recognition of the marriage in the law of the land, and dignities within the United Kingdom. The natural sequence of the passing of the act of 1906 was the reintroduction in 1907 of the bill relating to England. Introduced by a private member, it was adopted by the government, passed the House of Commons, and finally the House of Lords (on the second reading by 111 votes to 79), and became law as the Deceased Wife's Sister Marriage Act, 1907.

The act contains a proviso justifying clergyman in refusing to solemnize marriages with a deceased wife's sister, and it preserves the peculiar status of the wife's sister under the Matrimonial Causes Act 1857, under which adultery with her by the husband is incestuous adultery.

The celebration of marriages is now regulated wholly by statutory legislation. The most important acts in force are the Marriage Acts 1823, 1836, 1896 and 1898. The former regulates marriages

A complete list of the acts regulating the solemnization of marriage or confirming marriages, which through some defect might be void, will be found in Phillimore's Ecclesiastical Law (2nd ed. 1895).
within the Church of England, but was intended to be of universal application, Jews and Quakers only being excepted by section 31. It requires either the previous publication of banns, or a licence from the registrar, or the consent of the archbishop, bishop, or other authority, the rubric, so far as not altered by the statute, is required to be observed. They must be published on three successive Sundays at least fifteen days before the marriage, in the church in which the parties dwell; the bishop may, however, authorize the publication of banns in a public chapel. Seven days' notice must be given to the clergyman of the names of the parties, their place of residence, and the name of the person according the notice to be granted by the archbishop, bishop, or other authority, for the solemnization of marriage within the church of the parish in which one of the parties shall have resided for fifteen days before. Before a licence can be granted, which notice is taken as being in a manner of residue book open to public inspection at all reasonable times, and thereafter suspended for twenty-one days in some conspicuous place in the registrar's office. Any person whose consent is necessary to an ecclesiastical licence may forbid the issue of a certificate, but in default of such prohibition the certificate will issue at the end of the twenty-one days. The marriage may then take place on any day within three months after the licence is granted, if (1) a certificate is granted by a registrar in a place of ecclesiastical worship for the solemnization of marriage; (2) at the superintendent registrar's office, with the same declaration, but with no religious service; (3) in a church according to the usual form, with the consent of the minister thereof having been previously obtained; (4) according to the usages of Jews or other religious denominations.

The place of marriage in all cases must be specified in the notice and certificate. In England, when it is desired to proceed by licence, notice must be given to the registrar of the district in which one of the persons resides, together with a declaration that he or she has resided for fifteen days therein, that there is no impediment, and that the licence has been previously obtained. The notice must be exhibited in the registrar's office, and the certificate may be obtained at the expiration of one whole day after entry, together with the licence. The marriage can only be celebrated in a place of ecclesiastical worship for the solemnization of marriage, or in a place of worship used for the celebration of public worship by an ecclesiastical body or authority as defined in the Church of England Act 1860.

The various rules as to consent of parents, etc., to the marriage of minors are regulations of procedure only. The absence of the necessary consent is not a disability invalidating a marriage actually solemnized.

The English Act 1867, Sec. 26 Geo. II. c. 33, commonly known as Lord Hardwicke's Act, which forbids the solemnization of marriage without banns or licence, also enacts that "in no case whatsoever shall any suit or proceeding be had in any ecclesiastical court in order to compel a celebration in facie ecclesiae, by reason of any contract of marriage whatsoever whether per verba de presenti or per verba de futuro." Blackstone observes that previous to this act "any contract made per verba de futuro, or by reason of any couple in facie ecclesiae, was, in the sense of the law, a mere promise, and of no force at all, and that the parties might be compelled in the spiritual courts to celebrate it in facie ecclesiae.

Royal Marriages have been subject to special laws. The Royal Marriage Act of 1772 (12 Geo. III. c. 11), passed in consequence of the marriages of the dukes of Cumberland and Gloucester, made necessary by the want of his late majesty George II. (other than the issue of princesses married by the late majesty, and their descendants) shall be capable of contracting marriage without the previous consent of his majesty, his heirs and successors, signified under the Great Seal. But in case any descendant of George II., being above twenty-five years of age, shall persist to contract a marriage disapproved of by his majesty, such descendant, after giving twelve months' notice to the privy council, may contract such marriage, and may therefore be married in any parish church, or in the presence of any justice of the peace, without the consent of the majesty, &c., and shall be good except both Houses of Parliament shall declare their disapprobation thereto.

The Act was passed at the instigation of the British parliament to remove doubts which had been entertained as to the validity of certain marriages solemnized in England when one of the parties was resident in Scotland. The Summary Jurisdiction Act 1878 (Married Women) empowers any judge enabled by whose husband is convicted of a crime on her, or who has been deserted by him, or has been obliged owing to his cruelty to live apart from him, to apply to the justices, who are authorized to order a marriage to be solemnized under the provisions of this Act, to take place in any place of public worship, and to make the necessary arrangements for the same. The Marriage Act 1949 authorized the celebration of marriages in places of worship other than churches, and the publication of marriage certificates in those cases. The Marriage Act 1836 without the presence of the registrar, on condition of their being solemnized in the presence of a person duly authorized by the governing body of the place of worship in question. It also made further provision for the due recording of all marriages in the general registers. The Marriages Validity Act 1899 removed doubts as to the validity of marriages in England on Irish born and in Ireland on English born. Lastly, the Marriage with Foreigners Act 1906 enabled a British subject marrying a foreigner in a foreign country to comply with the foreign law by obtaining from a registrar a certificate that no legal impediment exists to such marriage, and that such arrangements as His Majesty and foreign countries are, issued in the case of a foreigner desiring to marry a British subject in their country.

The Foreign Marriage Act 1892 has consolidated the English law relating to marriages celebrated abroad, and brings it into harmony with the current tendencies of marriage law reform generally. It provides that a marriage between British subjects abroad shall be an marriage duly solemnized in England (as heretofore), if celebrated in accordance with the local law in or in the presence of diplomatic or consular agents who are appointed to act as "marriage officers." The registrar of a British embassy or consulate abroad can no longer be relied upon to uphold a marriage at a British embassy solemnized by an ordained clergyman. An order in council of the British government, however, provides that in the case of any marriage under the act, if it appears to the registrar or officer that the woman about to be married is a British subject, and that the man is an alien, he must be satisfied that the marriage will be recognized by the law of the foreign country to which the alien belongs.

A marriage may be solemnized on board one of H. His Majesty's ships at a foreign station, provided a warrant of a secretary of state has authorized the commanding officer to be a marriage officer. At sea, marriages on British public or private ships are still valid at common law, if performed by an episcopally ordained minister. The Married Women's Property Act 1882, Sec. 9, provides that the master of a ship for which an official log is required shall enter therein every marriage taking place on board, with the names and ages of the parties thereto. Under the Foreign Marriage Act all marriages solemnized within the British lines by a chaplain or officer or other person officiating under the orders of the commanding officer of a British armed forces anywhere abroad, or elsewhere in the British dominions, have been solemnized within the United Kingdom subject to such forms required by law. The Naval Marriages Act 1908 authorizes, for the purpose of marriages in the United Kingdom, the publication of banns and the issue of certificates on board His Majesty's ships in certain cases, or when one of the parties to a marriage intended to be solemnized in the United Kingdom is an officer, seaman or mariner, borne on the books of one of His Majesty's ships at sea.

The principle of the English law of marriage, that a marriage contracted abroad is valid if it has been solemnized according to the local law, may be applied by the acting colonial secretary in a heathen as in a Christian country. Whether the marriage has or has not been celebrated according to Christian laws has no bearing upon the question, providing it is a monogamous marriage —one in which prevents the man who enters into it from marrying any other woman while his wife continues alive.

Scotland.—The chief point of distinction, as compared with English law, is the recognition of irregular marriages. (1) "A public or regular marriage," says Fraser, "is one celebrated, after due proclamation of banns, by a minister of religion; and it may be celebrated either in a church or in a private house, and on any day of the week at any hour of the day." The ministers of the National Church at first alone could perform the ceremony; but the privilege was extended to Episcopalians by 10 Anno c. 7 (1711), and to other ministers by 4 and 5 Will. IV. c. 28 (1834). (2) A marriage may also be constituted by
declarations made by the man and the woman that they presently do take each other for husband and wife." These declarations "may be omitted on any day at any time and without the presence of witnesses," and either by writing or orally or by signs, and in any form which is clearly expressive of intention. Such a marriage is called a **mutual agreement** marriage in England, and a **copula** marriage in Scotland. The children of it would be legitimate; and the parties to it would have all the rights in the property of each other, given by the law of Scotland to husband and wife. (3) A promise followed by **copula** does not constitute marriage, unless followed either by solemnization in facie ecclesiae or declaration. Lord Moncreiff’s opinion in the case of Brown v. Burns is admitted to be good law, viz. that declaration is essential to the constitution of a marriage of this kind, so that, if no such declarator be brought in the lifetime of both parties, the marriage can never be established afterwards. The **copula** is presumed to have reference to the promise, but evidence may be adduced to show that such was not the case.

By the Marriage (Scotland) Act 1856 it is enacted that no **irregular** marriage shall be valid in Scotland, unless one of the parties has lived in Scotland for the twenty-one years next preceding the marriage, or has or his or her usual residence there at the time of the marriage. Habit and repute "has sometimes been spoken of as constituting marriage in the law of Scotland, but it is more correctly described as evidence from which marriage may be inferred. The repute must be general, constant, and unvarying belief of friends and neighbors, not merely the controverted opinion of a section of them. The cohabitation must be in Scotland, but in one case proof of cohabitation was allowed to throw light on the nature of the cohabitation in Scotland.

The consent of parents is not necessary to the validity of the marriage, even of minors, but marriage under the age of puberty with or without such consent is void.

**United States.** The absence of ecclesiastical courts has suggested, with as great an apparent want to fill the law as England on this subject continued to prevail after the revolution. Bishop Burns has been the universal fact running through all the cases that everywhere in the country the English decisions on marriage and divorce are referred to with the same apparent deference which is shown on other subjects to the decisions of the English common law and equity tribunals. The same author observes that "all our marriage and divorce laws, and of course all our statutes on the subject, in so far as they pertain to localities embraced within the limits of particular states, are state laws and state statutes, the national power with us not having legislative or judicial competence of the matter at large." Some of the states have extended the ages below which marriage cannot take place. The common law of the states is assumed to be that "a contract per verba de presenti, or per verba de futuro cum copula, constitutes a complete marriage." Conditions, however, may be imposed by the various state legislatures, and as to these the rule has established itself in American jurisprudence that "a marriage good at common law is good notwithstanding the existence of any statute on the subject, unless the statute contains express words ofnullity." Thus in Pennsylvania, where a statute provided that all marriages " should be solemnized before twelve witnesses," marriages not so celebrated were nevertheless held to be good. In New Hampshire justices and ministers of the gospel are authorized to solemnize marriage, and all other persons are forbidden to do so under penalties; yet a marriage by consent, as at common law, without justice or minister, has been held valid. On the other hand, under a very similar statute in Massachusetts, it was held that "parties could not solemnize their own marriage," and that a marriage by mutual agreement, not in accordance with the statute, was void. Judicial opinions are abundant on this subject, as an illustration of the general course of the decisions. So when state legislation requires any particular form to be used the want thereof only invalidates the act if the statute expressly so enacts. Many of the state codes inflict penalties on ministers or justices for celebrating the marriage of minors without the consent of the parents or guardians. The original law as to prohibited degrees has been considerably modified in the states. The prohibition of marriage with a deceased wife's sister has been abolished in the United States. But New Hampshire, Ohio, Indiana, Kansas, Arkansas, Nevada, Washington, the Dakotas and Montana have for long forbidden marriages between first cousins by blood, and Louisiana, Oregon, Pennsylvania, Michigan, Nebraska, Utah and Wisconsin have since adopted the same principle. Virginia and South Carolina prohibit the marriage of a woman with the husband of her brother or sister's daughter.

Attention is also being paid to the question of marriage from a physical point of view. New Jersey prohibits the marriage of any person who has been confined in any public asylum as an epileptic, idiotic, feeble-minded, or dependent, without a medical certificate from two physicians of complete recovery, and that there is no probability of the transmission of such defects. This prohibits the marriage of a woman with a male epileptic. In Arkansas, it is a habitual drunkard, epileptic, imbecile or insane, or where the applicant at the time of making application is under the influence of any intoxicant or narcotic drug. In Michigan, Minnesota, Kansas and Oregon, marriage is prohibited to epileptics, &c., except when the woman is over forty-five. In Michigan, also, marriage is forbidden to anyone who has suffered from a venereal disease and has not been cured. The equality of marriage rights between husband and wife is fully established in America. Indeed, in many states the movement has gone so far as to give the wife in matters of property and in reference to divorce greater privileges than the husband. Thus a wife can make a separate contract, and the court will enforce a promise to pay her an allowance out of the husband's property. In New York, for instance, such a promise is enforceable. In Missouri, in a recent case, it has been held that a contract made with a woman for the purchase of her love and affection is an illegal contract.

**France.**—Articles 144-226 of the Code Napoléon, as amended by an act of 1907, prescribe the qualifications and conditions of marriage. The man must be eighteen and the woman fifteen years of age. A son and daughter under twenty-one cannot marry without consent of the father and mother, or of the father only if they disagree, or of the survivor if one be dead. If both are dead, grandfather and grandmother take their place. Between the ages of twenty-one and thirty the parties must still obtain the consent of their parents, but if this be refused it may be obtained by a "declaration of nullity" or a "declaration of annulling the religious and sacramental aspect of marriage." Marriage tends to become a relationship established by parties between themselves, and one in which the consent of the parties becomes the only constitutive element. In the theory of American law no ceremony is essentially necessary to create the marriage relation. But this position has never been endorsed by any considerable proportion of the community, and in fact probably 80% and perhaps 90% of the marriages in the United States are contracted through some ceremony.

**Germany.**—The code of 1900 lays down rules applicable to the celebration of all marriages within the German Empire. Civil marriage alone is recognized by the code. It is effected by the declaration of the parties before a registrar in the presence of witnesses.
MARRUCINI—MARRYAT

MARRYAT, FREDERICK (1792-1848), English sailor and novelist, was born at Westminster on the 10th of July 1792. He was the grandson of Thomas Marryat (physician, author of The Philosophy of Masons, and writer of verse), and son of Joseph Marryat, agent for the island of Grenada, who wrote pamphlets in defence of the Slave Trade. His mother was a Bostonian of German extraction. Young Marryat distinguished himself as a boy by frequently running away to go to sea; and at last, at the age of fourteen, he was allowed to enter the navy. His first voyage was uneventful (towards tenth earl of Dundonald) in the famous "Impérieuse," and no midshipman ever had a livelier apprenticeship to the sea. During his two and a half years of service under Cochrane, the young midshipman witnessed more than fifty engagements, and had much experience of service on the coast of Spain in the early stage of the Peninsular War, in the attack on the French squadron in the Roads (April 1809) and in the Walcheren expedition. Before the general peace of 1815 he had served in North America and the West Indies and gained a wide knowledge of conditions of military service under various commanders. In 1815 he was promoted to the rank of commander, and was with Admiral Lord Cochraneate of the Pacific, having been commissioned the "Larne," 20, for the East Indies and was senior naval officer at Rangoon during the Burmese War from May to September 1824. In the early part of the next year he commanded an expedition up the Bassin River, in which Bassin was occupied and the Burmese states seized. His services were acknowledged by a nomination as C.B. in 1826. He frequently received honourable mention for his behaviour in action, and in 1818 he received the medal of the Humane Society for "at least a dozen gallant rescues. Marryat's honours were not confined to gallant exploits. He adapted Sir Home Popham's code of signals to a code for the Mercantile Marine, for which he was made F.R.S. in 1819, and received the Legion of Honour from Louis Philippe in 1833. A pamphlet written to propose a substitute for the system of impressment in 1822 is said to have offended King William IV.

Marryat brought ripe experience and unimpaired vitality to his work when he began to write novels. Frank Mildmay, or the Naval Officer, was published in 1829, and The King's Own followed in 1830. The novels of the sea captain at once won many favour. The freshness of the new field which was opened up to the imagination—so full of vivid lights and shadowed, light-hearted fun, grinding hardship, stirring adventure, heroic action, warm friendships, bitter hatreds—was in exhilarating contrast to the world of the historical romancer and the fashionable novelist, to which the mind of the general reader was at that date given over. He had an admirable gift of lucid, direct narrative, and an unfailing fund of incident, and of humour, sometimes bordering on farce. Of all his portraits of adventuresailors, "Gentleman Chucks in Peter Simple" and "Equality Jack" in Mr Midshipman Easy are the most famous, but he created many other types which take rank among the characteristic figures in English fiction. Marryat's first attempt was somewhat severely criticized from an artistic point of view, and he was accused of gratifying private grudges by introducing real personages too thinly disguised; and as he attributed some of his own adventures to Frank Mildmay he was rather shocked to learn that readers identified him with that disagreeable character. The King's Own was a vast improvement, in point of construction, upon Frank Mildmay; and he went on, through a quick succession of tales, Newton Forster (1832), Peter Simple (1834), Jacob Fuzilier (1834), The Pacha of Many Tales (1835), Japhet in Search of a Father (1836), Mr Midshipman Easy (1836), The Pirate and the Three Cutters (1836), till he reached his high-water mark of constructive skill in Smalley-boy, or the Dog Fiend (1837). The best of his books after this date are those written expressly for boys, the favourites being Masterman Ready (1841), The Settlers in Canada (1844), and The Children of the New Forest (1847). Among his other works are The Phantom Ship (1839); A Diary in America (1839); Ollie Pedrida (1840), a collection of miscellaneous papers; Peer Jack (1840); Joseph Rushbrook (1841); Percival Keene (1842); Monsieur Violet (1842); The Privateer's...
MARS, Mlle—MARS

Man (1844); The Mission, or Scenes in Africa (1845); The Little Savage (1848-1849), published posthumously; and Valerie, not completed (1849). His novels form an important link between Smollett and Fielding and Charles Dickens.

Captain Marryat had retired from the naval service in 1830, becoming equerry to the Duke of Sussex. He edited the Metropolitan Magazine from 1832 to 1835, and some of his best stories appeared in that paper. He spent a great part of his time in Brussels, where he was very popular. He visited Canada during Papini's revolt and the United States in 1837, and gave a disparaging account of American institutions in a Diary published on his return to England. While at New York he wrote a play, The Woman of Wolf, or Channel Outlaw, which was considered forgotten. His versatility is further shown by the fact that he drew rough caricatures and other sketches with some spirit. Some capital snatches of verse are scattered throughout his novels, the best being “Pul! put her arm akimbo!” in Snarley-yow, and the “Hunter and the Maid” in Poor Jack. In 1843 he settled at Langham Manor, Norfolk. He indulged in costly experiments in farming, so that in spite of the large income earned by his books he was not a rich man. He died at Langham on the 9th of August 1848, his death being hastened by news of the death of his shipwright brother.

His daughter, Florence Marryat, herself a novelist, published her Life and Letters in 1872. See also David Hannay, Life of Marryat (1889).

MARS, Mlle [ANNE FRANÇOISE HYPPOLYTE BOUTET] (1779-1847), French actress, was born in Paris on the 9th of February 1779, the natural daughter of the actor-author named Monvel [Jacques Marie Boutet, 1745-1812], and Mlle Mars Salvetat, an actress whose southern accent had made her Paris début a failure. Mlle Mars began her stage career in children's parts, and by 1790, after the rehabilitation of the Comédie Française, she and her sister (Mars abée) joined that company, of which she remained an active member for thirty-three years. Her beauty and talents soon placed her at the top of her profession. She was incomparable in ingénue parts, and equally charming as the coquette. Molière, Marivaux, Sedaine, and Beaumarchais had no more accomplished interpreter, and in her career of half a century, besides many comedy rôles of the older répertoire, she created fully a hundred parts in plays which owed success largely to her. For her fascinating presence, she was selected for the leading role in Silvia in Jeu de l'amour et du hasard, two of her most popular rôles; and for her benefit, a few days after, Célimène in Le Misanthrope and Araminthe in Les Femmes savantes. She retired in 1841, and died in Paris on the 20th of March 1847.

MARS (MAVORS, MARMAR, MARSIPER, or MASIPER), after one who, unlike most Roman deities, was never so much affected by foreign influences as to lose his essentially Roman and Italian character. Traces of his worship are found in all parts of central and southern Italy, in Umbria, Picenum, Samnium, and in one or two Etruscan cities, as well as in Latinum; and in several communities, as we learn from Ovid (Fasti, 3. 93 seq.), he gave his name to a month, as at Rome to the first month of the old Roman year. We know little of the character of his cult except at Rome, and even at Rome it has been variously interpreted. He has been explained as a sun-god, a god of wind and storm, a god of the year and a god of vegetation; and he has been compared with Apollo by Roscher (Apollo, 4 Mars, 1873, and in the article “Mars” in his Lexicon of Mythology). But in historical times his chief function at Rome was to protect the state in war, and it is as a god of war that he is known to all readers of Roman literature. So entirely did this characteristic get the better of all others, that his name came to be used as a synonym for bellum; and in the latest and most careful of all accounts of the Roman religion he is pronounced to have been from first to last a god of war only (see Wissowa, Religion und Kultur der Römer, p. 129 seq.).

Until the time of Augustus Mars had but two temples at Rome, and both are connected with warlike operations. One of
with the Lares (q.v.) proves that he is not regarded as a war-
god who could avert the raid of an enemy. Still more striking
is the invocation of Mars (with the cult-title Silvanus) in the
earliest lustration of his land by the Roman farmer (Cato, De
re rustica, 141), where it is not a human enemy, but disease,
and all unwholesome influences, which the god is besought to
avert from the farm and land, plantations and flocks. Three
times the procession went round the land, reciting prayers
and driving the victims to be sacrificed, viz. ox, sheep and
pig (suetonauria), representing the farmer's most valuable
stock. We can hardly doubt that in the state ceremony of the
Ambarvalia, i.e. the lustratio of the ager romanus in its
earliest form, the same god was invoked and the same ritual
used (Fowler, op. cit. p. 124 seq.). Again in the curious ritual
of the sacrifice to Mars of the October horse (Oct. 15; Fowler
op. cit. 241), though the animal was undoubtedly a war-horse,
the head was cut off and decked with cakes, as we are told
(Paul. Dac. 220) ob fungum eventum. Even Quirinus, the
form of Mars worshipped in the Quirinal community, is not
without an association with agricultural perils, for it was his
flamen who sacrificed the victims at the Kolibigalia on the 25th
of April, when the spirit of the mildew (robigus) was invoked
to spare the corn (Ovid, Fasti, 4. 901 seq.).
War and agriculture are thus the two factors of human life
and experience which are unquestionably prominent in the
cult of Mars, and explain his importance in a community like
that of Rome: and there is no need, in a short account of this
religious conception, to determine whether he was by origin a
colar deity, a storm-god, or a vegetation-spirit. The name
MARS, the god, gained no doubt in this period of struggle and danger,
ever entirely left him. Even in the hymn of the Fratres
Ad Maiorem Deae Deaeus Marsis (for month of Mars), Mars as
the farmer's god, though he has become "Father Mars," he is
Silvanus (q.e.), the dweller in the woodland which surrounded
the agricultural clearing.

Kultur der Römer, p. 129 seq.; Pfeiffer, Römische Mythologie, ed.
Jordan, t. 32 seq.; Fowler, Roman Festivals, p. 33 seq. (W. W. F. *)

MARS, in astronomy, the fourth planet in the order of distance
from the sun, and the next outside the earth. To the naked
eye it appears as a bright star of a decidedly reddish or lurid
tint, which contrasts strongly with the whiteness of Venus
and Jupiter. At opposition it is brighter than any major
planet, sometimes outshining even Sirius. It is by virtue of
its position the most favourably situated of all the planets
for observation from the earth. The eccentricity of its orbit,
0.0033, is greater than that of any other major planet except
Mercury. The result is that at opposition near perihelion
Mars is markedly nearer to the earth than at an opposition
near aphelion, the one distance being about 35 million miles;
the other 63 million. These numbers express only the minimum
distances at or near opposition, and not the distance at other
times. The time of revolution of Mars is 686-9 days. The
mean interval between oppositions is 2 years 498 days, but,
owing to the eccentricity of the orbit, the actual excess over
two years ranges from 36 days to more than 2½ months. Its
period of rotation is 24 h. 37 m. 22-66 s. (H. G. Bakhuyszen).

Motions.—The accompanying diagram will convey a notion of
the varied aspects presented by the planet, of the cycles of
change through which they go, and of the order in which the
oppositions follow each other. The outer circle represents
the orbit of Mars, the inner one that of the earth. AE is the
line of the equinoaxes from which longitudes are counted. The
perihelion of Mars is in longitude 35° at the point π. The as-
cending node Ω is in longitude 47°. The line of nodes makes
an angle of 74° with the major axis, so that Mars is south of
the ecliptic near perihelion, but north of it near aphelion.
Around the inner circle, representing the earth's orbit, are marked
the months during which the earth passes through the different
parts of the orbit. It will be seen that the distance of Mars
at the time of any opposition depends upon the month in which
opposition occurs. The least possible distance would occur
in an opposition about the end of August, a little before Mars
reached the perihelion, because the eccentricity of the earth's
orbit throws our planet a little farther from the sun and nearer
the orbit of Mars in July than it does in August. The opposition
of 1906 occurred on the 24th of September, at a point marked
by the year near the equinox, and the month and years of the
oppositions following, up to 1941, are also shown in the same
way. Tracing them around, it will be seen that the points of
opposition travel around the orbit in about 16 years, so
that oppositions near perihelion, when Mars is therefore nearest
the earth, occur at intervals of 15 or 17 years.
The axis of rotation of the planet is inclined between 23°
and 24° to the orbit, and the equator of the planet has the same
inclination to the plane of the orbit. The north pole is directed
ward a point in longitude 355°, in consequence of which the
projection of the planet's axis upon the plane of the ecliptic
is nearly parallel to the line of our equinoaxes. This projection
is shown by the dotted line SP–NP, which corresponds closely
to the line of the Martian solstices. It will be seen that at a
September opposition the north pole of the planet is turned
away from the sun, so that only the southern hemisphere is
presented to us, and only the south pole can be seen from the
earth. The Martian vernal equinox is near Q and the northern
solstice near A. Here at the point S.P. the northern hemisphere
is turned toward the sun. It will be seen that the aspect of
the planet at opposition, especially the hemisphere which is
visible, varies with the month of opposition, the general rule
being that the northern hemisphere of the planet is entirely
seen only near aphelion oppositions, and therefore when farthest

FIG. 1.—Orbits of Mars and the Earth, showing aspects of
the planet relative to the earth and sun.
from us, while the southern hemisphere is best seen near perihelion oppositions. The distances of the planet from the sun at aphelion and at perihelion are nearly in the ratio 6:5. The intensity of the sun's rays on the plane of the orbit is the inverse square of this ratio. It is therefore more than 40% greater near perihelion than near aphelion. It follows from all this that the southern hemisphere is subjected to a more intense solar heat than the northern, and must therefore have a warmer summer season. But the length of the seasons is the inverse of this, the summer of the northern hemisphere being longer and the heat of the southern hemisphere shorter in proportion.

Surface Features.—The surface features of the planet will be best understood by first considering what is known of its atmosphere and of the temperature which probably prevails on its surface. One method of detecting an atmosphere is through its absorption of the different rays in the spectrum of the sunlight reflected from the planet. Several observers have thought that they saw fairly distinct evidence of such absorption when the planet was examined with the spectroscope. But the observations were not conclusive; and with the view of setting the question at rest if possible, W. W. Campbell at the Lick Observatory instituted a very careful series of spectroscope observations. To reduce the spectrum to a minimum the spectrum of Mars was compared with that of the moon when the two bodies were near each other. Not the slightest difference could be seen between any of the lines in the two spectra. It being certain that the spectrum of the moon is not affected by absorption, it followed that any absorption produced by the atmosphere of Mars is below the limit of perception. It was considered by Campbell that if the atmosphere of Mars were $\frac{1}{2}$ that of the earth in density, the absorption would have been visible. Consequently the atmosphere of Mars would be of a density less than $\frac{1}{2}$ that of the earth.

Closely related to the question of an atmosphere is that of possible clouds above the surface of the planet, the existence of which, if real, would necessarily imply an atmosphere of a density approaching the limit set by Campbell's observations. The most favourable opportunity for seeing clouds would be when they are formed above a region of the planet upon which the sun is about to rise, or from which it has just been setting. The cloud will then be illuminated by the sun's rays while the surface below it is in darkness, and will thus stand out in contrast to the earth as a spot of light outside the terminator, or visible edge of the illuminated part of the disk. It is noticeable that phenomena more or less of this character, though by no means common, have been noted by observers on several occasions. Among these have been the Mt Hamilton and Lowell observers, and W. H. Pickering at Arequipa. Campbell has shown that many of them may be accounted for by supposing the presence of mountains not more than two miles in height, which may well exist on the planet. While this hypothesis will serve to explain several of these appearances, this can scarcely be said of a detached spot observed on the evening of the 26th of May 1903, at the Lowell Observatory. Dr Slipher, who first saw it, was so struck by the appearance of the projection from the terminator upon the dark side of the disk that he called the other observers to witness it. Micrometric measures showed that it was some 300 miles in length, and that its highest point stood some 17 miles above the surface of the planet. That a cloud should be formed at such a height in so rare an atmosphere seems difficult to account for except on the principle that the rate of diminution of the density of an atmosphere with its height is proportional to the intensity of gravity, which is smaller on Mars than on the earth. The colour was not white, but tawny, of the tint exhibited by a cloud of dust. Percival Lowell therefore suggests that this and other appearances of the same kind seen from time to time are probably dust clouds, travelling over the desert, as they sometimes do on the earth, and settling slowly again to the ground.

Temperature.—Up to a recent time all that could be said of the probable temperature of Mars was that, being more distant from the sun than the earth, its atmosphere must be of a lower temperature. But in 1897, Lowell, in his planetary investigations, noticed that several observers, Dr Slipher and others, had occasion in 1896 to 1897, to note a faint red glow of the planet, visible for many hours after sunset, and before sunrise. Lowell attributes this phenomenon to a difference in the temperature of the atmosphere of the planet.

2 According to Percival Lowell these results were, however, incorrect, and the stronger line in the spectrum of Mars, which appeared to be the B band, is the broad band of water-vapour which appears in the spectrum far into the red. Comparison spectrometers of Mars and the Moon, taken by him at equal altitudes on such plates, eight in all, show the B band, the great band of water-vapour, to be definitely stronger in the spectrum of Mars, thus affording what appeared decisive evidence of water vapour in the atmosphere of the planet.

7 According to Lowell, the climatic conditions are proportionally warmer in summer.
when seen from the moon. With each improvement in the telescope the numerous drawings of the planet show more definiteness and certainty in details. About 1830 a fairly good map was made by W. Beer and J. H. Mädler, a work which has been repeated by a number of observers since that time. The volume of literature on the subject, illustrated by drawings and maps, has become so great that it is impossible here to attempt an abstract of it; and it would not be practicable, even were it instructive, to enter upon any detailed description of Martian topography. A few great and well-marked features were depicted by the earliest observers, who saw them so plainly that they may be recognized by their drawings at the present time. There is also a general agreement among nearly all observers with good instruments as to the general features of the planet, but even in the latest drawings there is a marked divergence as to the minutest details. This is especially true of the boundaries of the more ill-defined regions, and of the faint and difficult markings of various kinds which are very numerous on every part of the planet. There is not even a close agreement between the drawings by the same observer at different opponents; but this may be largely due to seasonal and other changes.

The most striking feature, and one which shows the greatest resemblance to a familiar terrestrial process, is that when either polar region comes into view after being turned nearly a year away from the sun, it is found to be covered with a white cap. This gradually contracts in extent as the sun shines upon it during the remaining half of the Martian year, sometimes nearly disappearing. That this change is due to the precipitation of watery vapour in the form of ice, snow or frost during the winter, and its melting or evaporation when exposed to the sun's rays, is so obvious a conclusion that it has never been seriously questioned. It has indeed been suggested that the deposit may be frozen carbonic acid. While we cannot pronounce this out of the question, the probabilities seem in favour of the deposit being due to the precipitation of aqueous vapour in a frozen form. At a temperature of -50° C, which is far above what we can suppose to prevail in the polar regions during the winter, the tension of aqueous vapour is 0.0344 mm. On the other hand Faraday found the tension of carbonic acid to be still an entire atmosphere at as low a temperature as -80° C. Numerically exact statements are impossible owing to our want of knowledge of the actual temperature, which must depend partly upon air currents between the equator and the poles of Mars. It can, however, be said, in a general way, that a proportion of aqueous vapour in the rare atmosphere of Mars, far smaller than that which prevails on the earth, would suffice to explain the observed formation and disappearance of the polar caps. Since no very great improvements in the telescope and in the conditions of observation must enable modern observers to see all that their predecessors did and yet more, we shall confine our statements to the latest results. These may be derived from the work of Professor Lowell of Boston, who in 1894 founded an observatory at Flagstaff, Arizona, 7250 ft. above sea-level, and supplied it with a 24-inch telescope, of which the main purpose was the study of Mars. This work has been continued with such care and assiduity that its results must take precedence of all others in everything that relates to our present subject.

Among the more probable conclusions to be drawn from Lowell's observations, the following are of most interest. The darker areas are all seamed by lines and dots darker than themselves, which are permanent in position, so that there can be no bodies of water on the planet. On the other hand, their colour, blue-green, is that of vegetation. This fades out as vegetation would at certain seasons to faint blue-green, but in some places to a tawny brown. Each hemisphere undergoes these changes in its turn, the changes being opposite in opposite hemispheres. The changes in the dark areas follow some time after the melting of the polar caps. The aspect of these areas suggests old sea bottoms, and when on the terminator appear as depressions, though this may be only apparent and due to the dark colour. The smoothness and soft outline of the terminator shows that there are no mountains on Mars comparable with ours, but that the surface is surprisingly flat. White spots are occasionally visible in the tropical and temperate regions, which are perhaps due to the condensation of frost or snow, or to saline exudation such as seasonally occurs in India (Lowell). Moreover in winter the temperate zones are more or less covered by a whitish veil, which may be either hoar frost or cloud. A spring haze seems to surround the north polar cap during its most extensive melting; otherwise the Martian sky is quite clear, like that of a dry desert land. When either polar cap is melting it is bordered by a bluish area, which Lowell attributes to the water produced by the melting. But the obliquity at which the sun's rays strike the surface as the cap is melting away is so great that it is not perceptible to preclude the possibility of a temperature high enough to melt the snow into water. Under the low barometric pressure prevailing on the planet, snow would evaporate under the influence of the sun's rays without changing into water. It is also contended that what looks like such a bluish border may be formed around a bright area by the secondary aberration of a refracting telescope. 3

The modern studies of Mars which have aroused so much public interest began with the work of Schiaparelli in 1877. Many of the terms used by this observer were adopted to designate the widely extended darker regions on the planet, and holding that they were really bodies of water, he found that they were connected by comparatively narrow streets. (Schiaparelli considered them really water until after the Lowell observations.) In accordance with the adopted system of nomenclature, he termed these streaks canale, a word of which the proper rendering into English would be channels. But the word was actually translated into both English and French as canal, thus connoting artificially in the supposed waterways, which were attributed to the inhabitants of the planet. The fact that they were many miles in breadth, and that it was therefore absurd to call them canals, did not prevent this term from being so extensively used that it is now scarcely possible to do away with it. A second series of observations was made by Schiaparelli at the opposition of 1879, when the planet was farther away, but was better situated as to altitude above the horizon. He now found a number of additional channels, which were much finer than those he had previously drawn. The great interest attaching to their seemingly artificial character gave an impetus to telescopic study of the planet which has continued to the present time. New canals were added, especially at the Lowell Observatory, until the entire number listed in 1908 amounted to more than 585. The general character of this complex system of lines is described by Lowell as a network covering the whole face of the planet, light and dark regions alike, and connecting at either end with the respective polar caps there. At their junctions are small dark pinheads of spots. The lines vary in size between themselves, but each maintains its own width throughout. But the more difficult these objects are only seen occasionally and are variable in definiteness. Of two canals equally well situated for seeing, only one may be visible at one time and only the other at other times. If this variability of aspect among different canals is true as they are seen from the Lowell Observatory, we find it true to a much greater extent when we compare descriptions by different observers. At Flagstaff, the most favourably situated of all the points of observation, they are seen as fine sharp lines, sometimes as well marked as if drawn with a pencil. But other observers see them with varying degrees of breadth and diffuseness.

One remarkable feature of these objects is their occasional

1 As against this, Lowell's answer is that the effect is not optical; for the belt surrounds the melting, not the making cap.
"gemination," some of the canals appearing as if doubled. This was first noticed by Schiaparelli, and has been confirmed, so far as observations can confirm it, by other observers. Different explanations of this phenomenon have been suggested, but the descriptions of it are not sufficiently definite to render any explanation worthy of entire confidence possible. Indeed the more cautious astronomers, who have not specially devoted themselves to the particular phenomena, reserve a doubt as to how far the apparent phenomena of the finer canals are real, and what the markings which give rise to their appearance might prove to be if a better and nearer view of the planet than is now possible could be obtained. Of the reality of the helps it is asked that there can be no doubt, as they have been seen repeatedly by many observers, including those at the Lick Observatory, and have actually been photographed at the Lowell Observatory. The doubt is therefore confined to the vast network of lines so fine that they never certainly have been seen elsewhere than at Flagstaff. The difficulty of pronouncing upon their reality arises from the fact that we have to do mainly with objects not plainly visible (or, as Lowell contends, not plainly visible elsewhere). The question therefore becomes one of psychological optics rather than of astronomical interpretation. When the question is considered from this point of view it is found that combinations of light and shaded areas very different from continuous lines, will, under certain conditions, be interpreted by the eye as such lines; and when such is the case, long practice by an observer, however carefully conducted, may confirm him in this interpretation. To give a single example of the principles involved; it is found by experiment that if, through a long line so fine as to approach the limit of visibility, segments not too near each other, or so short that they would not be visible by themselves, be taken out, their absence from the line will not be noticed, and the latter will still seem continuous. In other words we do not change the aspect of the line by taking away from it a part which by itself would be invisible. This act of the eye, in interpreting a discontinuous series of very faint patches as a continuous line, is not, properly speaking, an optical illusion, but rather a habit. The arguments for the reality of all the phenomena associated with the canals, while cogent, have not sufficed to bring about a general consensus of opinion among critics beyond the limit already mentioned.

Accepting the view that the dark lines on Mars are objectively real and continuous, and are features as definite in reality as they appear in the telescope, Professor Lowell has put forth an explanation of sufficient interest to be mentioned here. His first proposition is that lines frequently thousands of miles long, each following closely a great circle, must be the product of design rather than of natural causes. His explanation is that they indicate the existence of irrigating canals which carry the water produced annually by the melting of the polar snows to every part of the planet. The actual canals are too minute to be visible to us. What we really see as dark lines are broad strips of vegetation, produced by artificial cultivation extending along each border of the irrigating streams. On the other hand, in the view of his critics, the quantity of ice or snow which the sun's rays could melt around the poles of Mars, the rate of flow and evaporation as the water is carried toward the equator, and several other of the conditions involved, require investigation before the theory can be established.

The accompanying illustrations of Mars and its canals are less than 1 inch and 60 times respectively. These drawings represent the planet and its canals as the observer on the earth would see them if he were able to look through a telescope of 1,000 dollars.

Prof. Lowell's theory is supported by so much evidence of different kinds that his own exposition should be read in extenso in Mars and its canals and Mars the abode of life. In order, however, that his views may be adequately presented here, he has kindly supplied the following summary in his own words:

"Owing to inadequate atmospheric advantages generally, much misapprehension exists as to the reality of the network of Mars seen under good conditions. In steady air the canals are perfectly distinct lines, not unlike the Fraunhofer ones of the Spectrum, pencil lines or gossamer filaments according to size. All the observers at Flagstaff concur in this. The photographs of them those of Lowell, and represent the planet as seen by the Flagstaff observers."

**Satellites and Pole of Mars.**—At the opposition of Mars which occurred in August 1877 the planet was unusually near the earth. Asaph Hall, then in charge of the 26-inch telescope at the Naval Observatory in Washington, took advantage of this favourable circumstance to make a careful search for a visible satellite of the planet. On the night of the 11th of August he found a faint object near the planet. Cloudy weather intervened, and the object was not again seen until the 16th, when it was found to be moving with the planet, leaving no doubt as to its being a satellite. On the night following an inner satellite much nearer the planet was observed. This discovery, apart from its intrinsic taken there also confirm it up to the limit of their ability. Careful experiments by the same observers on artificial lines show that if the canals had breaks amounting to 16 m. across, such breaks would be visible. None are; while the lines themselves are thousands of miles long and perfectly straight (Astrophys. Journ., Sept. 1907). Between expert observers representing the planet at the same epoch the accordance is striking; differences in drawings are differences of time and are due to seasonal and secular changes in the planet itself. These seasonal changes have been carefully followed at Flagstaff, and the law governing them detected. They are found to depend upon the melting of the polar caps. After the melting is under way the canals next the cap proceed to darken, and the darkening thence progresses regularly down the latitudes. Twice this happens every Martian year, first from one cap and then six Martian months later from the other. The action reminds one of the quickening of the Nile valley after the melting of the snows in Abyssinia; dry with planet-wide rhythm. Some of the canals are paired. The phenomenon is peculiar to certain canals, for only about one-tenth of the whole number, 56 out of 585, ever show double and these do so regularly. Each double has its special width; this width between the pair being 400 m. in some cases, only 75 in others. Careful plotting has disclosed the fact that the doubles cluster round the planet's equator, rarely pass 40° Lat., and never occur at the poles, though the planet's axial tilt reveals all its latitudes to us in turn. They are thus features of those latitudes where the surface is greatest compared with the area of the polar cap, which is suggestive. Space precludes mention of many other equally striking peculiarities of the canals' positioning and development. At the junctions of the canals are small, dark round spots, which also wax and wane with the seasons. These facts and a host of others of like significance have led Lowell to the conclusion that the whole canal system is of artificial origin, first because of each appearance and secondly because of the laws governing its development. Every opposition has added to the assurance that the canals are artificial; both by disclosing their peculiarities better and better and by removing generic doubts as to the planet's habitability. The warmer temperature disclosed from Lowell's investigation on the subject, and the spectrographic detection by Slipher of water-vapour in the Martian air, are among the latest of these confirmations."

---

**FIG. 2.**

The object was not again seen until the 16th, when it was found to be moving with the planet, leaving no doubt as to its being a satellite. On the night following an inner satellite much nearer the planet was observed. This discovery, apart from its intrinsic taken there also confirm it up to the limit of their ability. Careful experiments by the same observers on artificial lines show that if the canals had breaks amounting to 16 m. across, such breaks would be visible. None are; while the lines themselves are thousands of miles long and perfectly straight (Astrophys. Journ., Sept. 1907). Between expert observers representing the planet at the same epoch the accordance is striking; differences in drawings are differences of time and are due to seasonal and secular changes in the planet itself. These seasonal changes have been carefully followed at Flagstaff, and the law governing them detected. They are found to depend upon the melting of the polar caps. After the melting is under way the canals next the cap proceed to darken, and the darkening thence progresses regularly down the latitudes. Twice this happens every Martian year, first from one cap and then six Martian months later from the other. The action reminds one of the quickening of the Nile valley after the melting of the snows in Abyssinia; dry with planet-wide rhythm. Some of the canals are paired. The phenomenon is peculiar to certain canals, for only about one-tenth of the whole number, 56 out of 585, ever show double and these do so regularly. Each double has its special width; this width between the pair being 400 m. in some cases, only 75 in others. Careful plotting has disclosed the fact that the doubles cluster round the planet's equator, rarely pass 40° Lat., and never occur at the poles, though the planet's axial tilt reveals all its latitudes to us in turn. They are thus features of those latitudes where the surface is greatest compared with the area of the polar cap, which is suggestive. Space precludes mention of many other equally striking peculiarities of the canals' positioning and development. At the junctions of the canals are small, dark round spots, which also wax and wane with the seasons. These facts and a host of others of like significance have led Lowell to the conclusion that the whole canal system is of artificial origin, first because of each appearance and secondly because of the laws governing its development. Every opposition has added to the assurance that the canals are artificial; both by disclosing their peculiarities better and better and by removing generic doubts as to the planet's habitability. The warmer temperature disclosed from Lowell's investigation on the subject, and the spectrographic detection by Slipher of water-vapour in the Martian air, are among the latest of these confirmations.---[Ed.]
interest, is also noteworthy as the first of a series of discoveries of satellites of the outer planets. The satellites of Mars are difficult to observe, on account not merely of their faintness, but of their proximity to the planet, the light of which is so bright as to nearly blot out that of the satellite. Intrinsically the inner satellite is brighter than the outer one, but for the reason just mentioned it is more difficult to observe. The names given them by Hall were Deimos for the outer satellite and Phobos for the inner one, derived from the mythological horses that drew the chariot of the god Mars. A remarkable feature of the orbit of Phobos is that it is so near the planet as to perform a revolution in less than one-third that of the diurnal rotation of Mars. The result is that to an inhabitant of Mars this satellite would rise in the west and set in the east, making two apparent diurnal revolutions every day. The period of Deimos is only six days greater than that of a Martian day; consequently its apparent motion around the planet would be so slow that more than two days elapse between rising and setting, and again between setting and rising.

Owing to the minuteness of these bodies it is impossible to make any measures of their diameters. These can be inferred only from their brightness. Assuming them to be of the same colour as Mars, Lowell estimates them to be about ten miles for Deimos and somewhat more for Phobos. But these estimates are uncertain, not only from the somewhat hypothetical character of the data on which they rest, but from the difficulty of accurately estimating the brightness of such an object in the glare of the planet.

A long and careful series of observations was made upon these bodies by other observers. Later, especially at the very favourable oppositions of 1892 and 1894, observations were made by Hermann Struve at Pulkova, who subjected all the observations up to 1898 to a very careful discussion. He showed that the inclination of the planes of the orbits to the equator of the planet is quite small, thus making it certain that these two planes can never wander far from each other. In the following statement of the numerical elements of the entire system, Struve’s results are given for the satellites, while those of Lowell are adopted for the position of the plane of the equator.

The relations of the several planes can be best conceived by considering the points at which lines perpendicular to them, or their poles, meet the celestial sphere. By theory, the pole of the orbital plane of each satellite revolves round the pole of a certain fixed plane, differing less from the plane of the equator of Mars the nearer the satellite is to Mars. Lowell from a combination of his own observations with those of Schiaparelli, Lohse and Cerulli, found for the pole of the axis of rotation of Mars:—

\[ R.A. = 313^\circ 5^\prime; \]
\[ Dec. = +54^\circ 4^\prime; \] Epoch, 1905.

Tilt of Martian Equator to Martian ecliptic, 23° 59¢. Hermann Struve, from the observations of the satellites, found theoretically the following positions of this pole, and of those of the fixed planes of the satellite orbits for 1900:—

- Pole of Mars: R.A. = 317° 25′ Dec. = 57° 66′
- Pole of fixed plane for Phobos = 317° 27′ Dec. = 52° 69′
- Pole of fixed plane for Deimos = 316° 20′ Dec. = 53° 37′

Lowell’s position of the pole is that now adopted by the British Nautical Almanac.

The actual positions of the poles of the satellite—orbits revolve around these poles of the two fixed planes in circles. Putting N for the right-ascensions of their nodes on the plane of the terrestrial equator, and J for their angular distance from the north terrestrial pole, N, and J, for the corresponding poles of the fixed planes, and \( t \) for the time in years after 1900, Struve’s results are:

Deimos:
\[ N = 46° 12′ 0′′ - 403′ 1′; J = 36° 42′ 0′′ - 024′ 1′ \]
\[ (N - N) \sin \theta = 97° 6′ \sin (356° 8′ - 6° 375°); J - J = 97° 6′ \cos (356° 8′ - 6° 375°) \]

Phobos:
\[ N = 47° 14′ 3′ + 046′ 4′; J = 32° 21′ 0′′ - 024′ 1′ \]
\[ (N - N) \sin \theta = 53° 1′ \sin (247° 9′ - 158° 9′); J - J = 53° 1′ \cos (247° 9′ - 158° 9′) \]

The other elements are:

Mean long. 1894, Oct. 00, G.M.T. 186° 25°
Mean daily motion (tropical) 283° 16196° 1128° 83396°
Mean distance (A = 1) 32° 373° 12° 938°
Long. of pericentre, (\( \pi + N \)) 264° 4° 375° 0° 156° 0′′
Eccentricity of orbit 0° 0031
Epoch for \( t \) 1900° 1900°

BIBLIOGRAPHY.—Flammarion, La Plaante Mars et ses conditions d’habitation (Paris, 1892), embodies so copiously a repressed of all the publications and drawings relating to Mars up to 1892 that there is little occasion for reference in detail to early publications. Among the principal sources may be mentioned the Monthly Notices and Memoirs of the Royal Astronomical Society, the publications of the Astronomical Society of the Pacific, especially vols. vi., viii. and ix., containing observations and discussions by the Mt. Hamilton astronomers, and the journals, Sidereal Messenger, Astronomy and Astrophysics and Astrophysical Journal. Schiaparelli’s extended memoirs appeared under the general title Observazioni astronomiche e fisiche sull’asse di rotazione e sulla topografia del pianeta Marte, and were published in different volumes of the Memoirs of the Reale Accademia dei Lincei. The observations and drawings of Lowell are found in extenso in Annals of the Lowell Observatory. Lowell’s conclusions are summarized in Mars and its Canals, by Percival Lowell (1906), and Mars as the Abode of Life (1909). In connexion with his work on his famous put forward the views vigorously in his Is Mars Habitable? and was briefly answered by Lowell in Nature, who contended that Wallace’s theory was not in accord with celestial mechanics.

MARSALA, a seaport of Sicily, in the province of Trapani, 19 m. by rail S. of Trapani. Pop. (1881), 15,723; (1901), 57,567. In the long coast on the eastern side of the island. The town is the seat of a bishop, and the cathedral contains 16 grey marble columns, which are said to have been intended for Canterbury Cathedral in England, the vessel conveying them having been wrecked here. The town owes its importance mainly to the trade in Marsala wine. Marsala occupies the site of Lilybaeum, the principal stronghold of the Carthaginians in Sicily, founded by Himilco after the abandonment of Mozia. Neither Pyrrhus nor the Romans were able to reduce it by siege, but it was surrendered to the latter in 241 B.C. at the end of the First Punic War. In the later wars it was a starting point for the Roman expeditions against Carthage.

and under Roman rule it enjoyed considerable prosperity (C.I.L. X. p. 74). It obtained municipal rights from Augustus and became a colony under Pertinax or Septimius Severus. The Saracens gave it its present name, Marsa Ali, port of Ali. The harbour, which lay on the north-east, was destroyed by Charles V. to prevent its occupation by pirates. The modern harbour lies to the south-east. In 1860 Garibaldi landed at Marsala with 1000 men and began his campaign in Sicily. Scanty remains of the ancient Lilybaeum (fragments of the city walls, of squared stones, and some foundations of buildings between the walls and the sea) are visible; and the so-called groto and spring of the Sibyl may be mentioned. Towards the south-east of the town is a great fosse which defended it on the land side, and beyond this again are quarries like those of Syracuse on a small scale. The modern town takes the shape of the Roman camp within the earlier city, one of the gates of which still existed in 1887. The main street (the Cassaro) perpetuates the name castrum.

MARSDEN, WILLIAM (1754-1836), English orientalist, the son of a Dublin merchant, was born at Verval, Co. Wicklow on the 16th of November 1754. He was educated in Dublin, and having obtained an appointment in the civil service of the East India Company arrived at Benkulen, Sumatra, in 1777. There he soon rose to the office of principal secretary to the government, and acquired a knowledge of the Malay language and country. Returning to England in 1779 with a pension, he wrote his History of Sumatra, published in 1783. Marsden was appointed in 1793 second secretary and afterwards first secretary to the admiralty. In 1807 he retired and published in 1812 his Grammar and Dictionary of the Malay Language, and in 1818 his translation of the Travels of Marco Polo. He was a member of many learned societies, and treasurer and vice-president of the Royal Society. In 1834 he presented his collection of oriental coins to the British Museum, and his library of books and Oriental MSS. to King's College, London. He died on the 6th of October 1836.

Marsden's other works are: Numismata orientalia (London, 1823-1825); Catalogue of Dictionaries, Vocabularies, Grammars and Alphabets (1796); and several papers on Eastern topics in the Philosophical Transactions and the Archaeologia.

MARES, a city of southern France, chief seaport of France and of the Mediterranean, 2 ½ m. S. by E. of Lyons and 534 m. S.S.E. of Paris, by the Paris-Lyon-Méditerranée railway. Pop. (1866) commune 357,468; town 521,116. Marseilles is situated on the Golfe du Lion on the eastern shore of a bay protected to the south by Cape Croisette but open towards the west; to the east the horizon is bounded by an amphitheatre of hills, those in the foreground clothed with vegetation while the more distant eminences are bare and rugged. The city is built on undulating ground and the south-western and most aristocratic quarter covers the slopes of the ridge crowned by a fort and the church of Notre-Dame de la Garde and projecting westward into the bay to form a protection for the harbour. The newest and most pleasant portion lies on the south-eastern slope of the ridge, between the southern end of the Rue Paradis and the Prado avenues, which is better protected than most other quarters from the mistral which blows down the Rhone valley, and where in summer the temperature is always a little lower than in the centre of the town. The old harbour of Marseilles opens on the west to the Golfe du Lion, the famous Rue Cannebière1 prolonged by the Rue Noailles leading E.N.E. from its inner end. These two streets are the centre of the life of the city. Continued in the Allées de Meliham and the Boulevard de la Madeleine, they form one of its main arteries. The other, at right angles with the first, connects the Place d'Aix with the spacious and fashionable Promenade du Prado, by way of the Cours Belsunce and the Rue de Rome. Other fine streets—the Rue St Ferréol, the Rue Paradis and the Rue Breteuil are to the south of the Cannebière running parallel with the Rue de Rome. To these must be added the neighbouring avenue of Pierre Puget named after the sculptor whose statue

1 From the Latin cannabis, Provençal cannabé, " hemp," in allusion to the rope-walks formerly occupying its site.

stands in the Boëly Park. The Prado, with its avenues of trees and fine houses, runs to within a quarter of a mile of the Huveaune, a stream that borders the city on the south-east, then turns off at right angles and extends to the sea, coming to an end close to the Boëly Park and the race-course. From its extremity the Chemin de la Corniche runs northwards along the coast, fringed by villas and bathing establishments, to the Anse des Catalans, a distance of 4½ miles.

The old town of Marseilles is bounded W. by the Joliette basin and the sea, E. by the Cours Belsunce, S. by the northern quay of the old port, and N. by the Boulevard des Dames. It consists of a town of steep, dark and narrow streets, inhabited by a seafaring population. Through its centre runs the broad Rue de la République, extending from the Cannebière to the Place de la Joliette. The entrance to the old harbour is defended by Fort St Jean on the north and Fort St Nicolas on the south. Behind the latter is the Anse (Greek) de la Réserve. Beyond this again, situated in succession along the shore, come the Château du Pharo, given by the empress Eugénie to the town, the Anse du Pharo, the military exercising ground, and the Anse des Catalans. To the old harbour, which covers only 70 acres and is defended only by sailing vessels, the basin of La Joliette (55 acres) with an entrance harbour was added in 1833. Communicating with the old harbour by a channel which passes behind Fort St Jean, this dock opens on the south into the outer harbour, opposite the palace and the Anse du Pharo. A series of similar basins separated from the roadstead by a jetty 2½ m. long was subsequently added along the shore to the north, viz. the basins of Lazaret and Arcen, bordered by the harbour railway station and the extensive warehouses of the Compagnie des Docks et Entrepôts, the Bassin de la Garde Maritime with the warehouses of the chamber of commerce; the Bassin National with the refitting basin, comprising six dry docks behind it; and the Bassin de la Pinède entered from the northern outer harbour. These new docks have a water area of 414 acres and over 11 m. of quays, and are commodious and deep enough for the largest vessels to manoeuvre easily.

In the roads to the south-west of the port lie the islands of Ratoneau and Pomègue, united by a jetty forming a quarantine port. Between them and the mainland is the islet of Château d'If, in which the scene of part of Dumas' Monte Cristo is laid.

Marseilles possesses few remains of either the Greek or Roman periods of occupation, and is poor in medieval buildings. The old cathedral of la Major (Sainte-Marie-Majeure), dating chiefly from the 12th century and built on the ruins of a temple of Diana, is in bad preservation. The chapel of St Lazare (late 15th century) in the left aisle is in the earliest Renaissance style, and a bas-relief of white porcelain by Lucca della Robbia is of artistic value. Beside this church and alongside the Joliette basin is a modern building begun in 1852, opened for worship in 1893 and recognized as the finest modern cathedral in France. It is a Byzantine basilica, in the form of a Latin cross, 460 ft. long, built in green Florentine stone blended with white stone from the neighbourhood of Aries. The four towers which surmount it—two at the west front, one over the crossing, one at the east end—are roofed with cupolas. Near the cathedral stands the bishop's palace, and the Place de la Major, which they overlook, is embellished with the statue of Bishop Belsunce, who displayed great devotion during the plague of 1720-1721. The celebrated Notre-Dame de la Garde, the steeple of which, surmounted by a gilded statue of the Virgin, 90 ft. in height, rises 150 ft. above the summit of the hill on which it stands, commands a view of the whole port and town, as well as of the surrounding mountains and the neighbouring sea. The present chapel is modern and occupies the site of one built in 1244.

On the south side of the old harbour near the Fort St Nicolas stands the church of St Victor, built in the 13th century and once attached to an abbey founded early in the 4th century. With its lofty crenellated walls and square towers built of large blocks of uncremented stone, it resembles a fortress. St Victor is built
above crypts dating mainly from the 11th century but also an embalming architecture of the Carolingian period and of the early centuries of the Christian era. Tradition relates that St. Lazarus inhabited the catacombs under St Victor; and the black image of the Virgin, still preserved there, is popularly attributed to St. Luke. The site of the abbey church of St Lazarus (an Islet of the ancient church of Accoules, marks the centre of Old Marseilles. At its foot are a "calvary" and a curious underground chapel in rock work, both modern. Notre-Dame du Mont Carmel, also in the old town, occupies the place of what was the citadel of the Massaliots when they were besieged by Julius Caesar.

Of the civil buildings of the city, the prefecture, one of the finest in France, the Palais de Justice, in front of which is the statue of the advocate Antoine Berrery (1790-1865) and the Exchange, all date from the latter half of the 19th century. The Exchange, built at the expense of the Chamber of Commerce, includes the spacious hall of that institution with its fine mural paintings and gilding. The hôtel-de-ville (17th century) stands on the northern quay of the old harbour. All these buildings are surpassed by the Palais Longchamp (1862-1870), situated in the north-east of the town at the end of the Boulevard Longchamp. The centre of the building is occupied by a monumental château d'eau (reservoir). Colonnades branch off from this, uniting it on the left to the picture gallery, with a fine collection of ancient and modern works, and on the right to the natural history museum, remarkable for its zoological and collection of ammonites. In front are ornamental gardens, and behind are extensive botanical gardens, with the astronomical observatory. The museum of antiquities is established in the Château Berolly (1766-1778) in a fine park at the end of the Prado. It includes a Phoenician collection (containing the remains that support the hypothesis of the Phoenician origin of Marseilles), an Egyptian collection, numerous Greek, Latin, and Christian inscriptions in stone, &c. A special building within the city contains the school of art with a valuable library and a collection of antique statues and bronzes to it. The city also has a colonial museum and a laboratory of marine zoology. The triumphal arch of Aix, originally dedicated to the victors of the Troadé, was in 1839 appropriated to the conquests of the empire.

The canal de Marseilles, constructed from 1837 to 1848, which has metamorphosed the town and its arid surroundings by bringing to them the waters of the Durance, leaves the river opposite Pertuis. It has a length of 97 miles (including its four main branches) of which 13 are under ground, and irrigates some 7500 acres. After crossing the valley of the Arc, between Aix and Rognac, by the magnificent aqueduct of Rognac, it is divided, its waters, charged with silt, in the basins of Réaltor. It draws about 2200 gallons of water per second from the Durance, supplies 4250 horse-power to works in the vicinity of Marseilles, and ensures a good water-supply and efficient sanitation to the city.

Marseilles is the headquarters of the XV army corps and the seat of a bishop and a prefect. It has tribunals of first instance and of commerce, a chamber of commerce, a board of trade arbitration, and a branch of the Bank of France. The educational institutions include a faculty of science, one of medicine and pharmacy, and a faculty (faculté libre) of law, these three forming part of the university of Aix-Marseille; lycées for boys and girls, a conservatoire of music, a school of fine art, a high school of commerce, a school for ship's boys, a school of navigation and industrial schools for both sexes.

Trade and Industry.—Marseilles is the western emporium for the Levant trade and the French gateway to the Far East. It suffers, however, from the competition of Genoa, which is linked by the Rhine basin by the Simplon and St Gotthard railway routes, and from lack of communication with the inland waters of France. In January 1902 the chamber of deputies voted 4,366,000 for the construction of a canal from Marseilles to the Rhone at Arles. This scheme was designed to overcome the difficulties of egress from the Rhone basin, by providing the natural outlet of the rich Rhone basin. Much of the activity of the town as regards commerce is due to the raw material created by the industries of Marseilles itself. The imports include raw silk, sesame, ground-nuts and other oil-producing fruits and seeds largely used in the soap manufacture, cereals and flour, wool, hides and skins, olive and other oils, raw cotton, sheep and goats' wool and other livestock. "Gaffe" (fish, wine, potatoes and dry vegetables, lead, cocoons, coffee, coal, timber. The total value of imports was 56,189,000 in 1907, an increase of 18,000,000 in the preceding decade. The exports, of which the total value was 21,000,000 (an increase of 24,000,000), consisted of cotton fabrics, silk fabrics, cereals and flour, hides and skins, wool fabrics, worked skins, olive and other oils, chemical products, wine, tobacco, raw cotton, wool, coal, building-material, machinery and pottery.

The port is the centre for numerous lines of steamers, of which the chief are the Messageries Maritimes, which ply to the eastern Massalia, the east coast of Africa, Australia, India, Indochina, Havre and London, and the Compagnie Générale Transatlantique, whose vessels run to Algiers, Tunis, Malta, Corsica, Morocco and the Canaries. In addition many important foreign lines call at the port, among them those of the Orient, the North German Lloyd, and the German East Africa lines.

Marseilles has five chief railway stations, two of which serve the new harbours, while one is alongside the old port; the city is on the main line of the Paris-Lyon-Méditerranée railway from the Riviera and Toulon to Paris via Arles, Avignon and Lyon, another less important line connecting it with Aix.

Soap-making, introduced in antiquity from Saxon and Genoa, is carried on in upwards of fifty factories. These utilize the products of the oil-distilleries and of the chemical works, the latter being also used to prepare candles, another leading industry. A large number of the factories, which cooperate in the soap-making industry, are situated in the blast-furnaces of Saint Louis in the vicinity and in other foundries, and the Mediterranean Engineering Company and other concerns have large workshops for the construction or repair of marine steam-engines and every branch of iron ship-building. To these industries must be added flour-milling, the manufacture of semolina and other farinaceous foods and of biscuits, bricks and tiles, rope, sacks, for coffee-Ingots, and mustard, distilling, brewing and sulphur- and sugar-refining. There are state tobacco and match factories.

History.—The Greek colony of Massalia (Lat. Massilia) was founded by the mariners of Phocaea in Asia Minor, about 600 B.C. The settlement of the Greeks in waters which the Carthaginians reserved for their own commerce was not effectuated without a naval war, but that of the Greeks is considered as one of the first settlements set up at Marseilles before the Greek period, and that the name of the town is the Phoenician for "settlement." Whether the judges (soplicem, "suffetes") of the Phoenician sacrificial tablet of Marseilles were the rulers of a city existing before the advent of the Phocaenae, or were consuls for Punic residents in the Greek period, is disputed. In 542 B.C the fall of the Phocaenae cities before the Persians probably sent new settlers to the Ligurian coast and cut off the remote city of Massalia from close connexion with the mother country. Isolated amid alien populations, the Massaliots, as they were called, laboured along with the inland tribes, by vigilant administration of their oligarchic government, and by frugality united to remarkable commercial and naval enterprise. Their colonies spread east and west along the coast from Monaco to Cape St Martin in Spain, carrying with them the worship of Artemis; the inland trade, in which wine was an important element, can be traced by finds of Massalian coins across Gaul and through the Alps as far as Tirol. In the 4th century B.C the Massaliots Pytheas visited the coasts of Gaul, Britain and Germany, and Euthymenes is said to have sailed west along the coast of Africa as far as Senegal. The great rival of Massalian trade was Carthage, and in the Punic Wars the city took the side of Rome, and was rewarded by Roman assistance in the subjugation of the native tribes of Liguria. In the war between Caesar and Pompey Massilia took Pompey's side and in A.D. 49 offered a vain resistance to Caesar's lieutenant Trebonius. In memory of its ancient services the city, "without which," as Cicero says, "Rome had never triumphed over the Transalpine nations," was left a civitas libera, but her power was broken and most of her dependencies taken from her. From this time Marseilles, as a little place in Roman Gaul, became one of the chief and most important school of letters and medicine, but its commercial and intellectual importance declined. The town appears to have been christianized before the end of the 3rd century, and at the beginning of the 4th century was the scene of the martyrdom of St Victor. Its reputation partly revived through the names of Gennadius and Cassian, which give it prominence.
In the history of Semi-Pelagianism and the foundation of western missions.

After the ravages of successive invaders, Marseilles was re-peopled in the 10th century under the protection of its viscounts. The town gradually bought up their rights, and at the beginning of the 13th century was formed into a republic, governed by a podestà, who was appointed for life, and exercised his office in conjunction with 3 notables, and a municipal council, composed of 80 citizens, 3 clerics, and 6 principal tradesmen. During the rest of the middle ages, however, the higher town was governed by the bishop, and had its harbour at the creek of La Joliette which at that period ran inland to the north of the old town. The southern suburb was governed by the abbot of St Victor, and owned the Port des Catalans. Situated between the two, the lower town, the republic, retained the old harbour, and was the most powerful of the three divisions. The period of the crusades brought prosperity to Marseilles, though throughout the middle ages it suffered from the competition of Isis, Genoa and Venice.

In 1245 and 1256 Charles of Anjou, count of Provence, whose predecessors had left the citizens a large measure of independence, established his authority above that of the republic. In 1243 the bishop had promised the town the half of its annual revenue, if the town made it his winter residence, however, caused trade, arts and manufactures again to flourish. On the emboldment of Provence in the kingdom of France in 1481, Marseilles preserved a separate administration directed by royal officials. Under Francis I. the disaffected constable Charles de Bourbon vainly besieged the town with the imperial forces in 1534. During the wars of religion, Marseilles took part against the Protestants, and long refused to acknowledge Henry IV. The loss of the ancient liberties of the town brought new disturbances under the Fronde, which Louis XIV. came in person to suppress. He entered the town by a breach in the walls and afterwards had Fort St Nicolas constructed. Marseilles repeatedly suffered from the plague, notably from May 1720 to May 1721.

During the Revolution the people rose against the aristocracy, who up to that time had governed the commune. In the Terror they rebelled against the Convention, but were promptly subdued by General Carteaux. The wars of the empire, by dealing a blow to their maritime commerce, excited the hatred of the inhabitants against Napoleon, and they hailed the return of the Bourbons and the defeat of Waterloo. The news of the latter provoked a bloody reaction in the town against those suspected of imperialism. The prosperity of the city received a considerable impulse from the conquest of Algeria and from the opening of the Suez Canal.

MARSH, Adam (Ande de Marsco) (d. c. 1238). English Franciscan, scholar and theologian, was born about 1200 in the diocese of Bath, and educated at Oxford under the famous Grosseteste. Before 1226 Adam received the benefice of Wearmouth from his uncle, Richard Marsh, bishop of Durham; but between that year and 1230 he entered the Franciscan order.

About 1238 he became the lecturer of the Franciscan house at Oxford, and within a few years was regarded by the English province of that order as an intellectual and spiritual leader. Roger Bacon, his pupil, speaks highly of his attainments in theology and mathematics. His fame, however, rests upon the influence which he exercised over the statesmen of his day. Consulted as a friend by Grosseteste, as a spiritual director by Simon de Montfort, the countess of Leicester and the queen, as an expert lawyer and theologian by the primate, Boniface of Savoy, he did much to guide the policy both of the opposition and of the court party in all matters affecting the interests of the Church. He shrank from office, and never became provincial minister of the English Franciscans, though constantly charged with responsible commissions. Henry III. and Archibishop Boniface II. of Canterbury, however, for him the see of Ely in 1256. In 1257 Adam's health was failing, and he appears to have died in the following year.

To judge from his corre-

spondence he took no interest in secular politics. He sympathized with Montfort as a friend of the Church and an unjustly treated man; but on the eve of the baronial revolution he was on friendly terms with the king. Faithful to the traditions of his order, he made it his ambition to be a mediator. He rebuked both parties in the state for their shortcomings, but he did not break with either.

See his correspondence, with J. S. Brewer's introduction, in Monumenta franciscana, vol. i. (Rolls ser., 1886); the biographical notice in A. G. Little's Grey Priests at Oxford (Oxford, 1892), where all the references are collected. On Marsh's relations with Gros-
teste, see Roberti Grosseteste epistolae, ed. H. R. Luard (Rolls ed., 1861), and F. S. Stevenson, Roberti Grosseteste (London, 1899. (H. W. C. D.)

MARSH, George Perkins (1801-1882). American diplomatist and philologist, was born at Woodstock, Vermont, on the 15th of March 1801. He graduated at Dartmouth College in 1820, was admitted to the bar in 1825, and practised law at Burlington, Vermont, devoting himself also with ardour to philological studies. In 1835 he was a member of the Supreme Executive Council of Vermont, and from 1832 to 1839 a Whig representative in Congress. In 1849 he was appointed United States minister to Turkey and in 1853-1855 discharged a mission to Greece in connexion with the imprisonment by the authorities of that country of an American missionary, Dr Jonas King (1792-1860). He returned to Vermont in 1854, and in 1857 was a member of the state railway commission.

In 1861 he became the first United States minister to the kingdom of Italy, and died in that office at Vallombrosa on the 23rd of July 1862. He was buried in a Protestant cemetery in Rome. Marsh was an able linguist, writing and speaking with ease the Scandinavian and half a dozen other European languages, a remarkable philologist for his day, and a scholar of great breadth, knowing much of military science, engraving and physics, as well as of Icelandic, which was his specialty. He wrote many articles for Johnson's Universal Cyclopaedia, and contributed many reviews and letters to the Nation. His chief published works are: A Compendious Grammar of the Old Northern or Icelandic Language (1838), compiled and translated from the grammars of Rask; The Camel, his Organization, Habits, and Uses, with Reference to his Introduction into the United States (1856); Lectures on the English Language (1860); The Origin and History of the English Language (1862; revised ed., 1883); and Man and Nature (1865). The last-named work was translated into Italian in 1872, and, largely rewritten, was issued in 1874 under the title The Earth as Modified by Human Action; a revised edition was published in 1885. He also published a work on Mediaeval and Modern Saints and Miracles (1876). His valuable library was presented in 1883 by Frederick Billings to the university of Vermont. His second wife, Caroline (Crane) Marsh (1816-1901), whom he married in 1839, published Wolfe of the Knoll and other Poems (1860), and the Life and Letters of George Perkins Marsh (New York, 1888). This last work was left incomplete, the second volume never having been published. She also translated from the German of Johann C. Biernatski (1795-1840), The Hallig; or the Sheepfold in the Waters (1856).

MARSH, Herbert (1757-1839). English divine, was born at Faversham, Kent, on the 10th of December 1757, and was educated at St John's College, Cambridge, where he was elected fellow in 1782, having been second wrangler and second Smith's prizeman. For some years he studied at Leipzig, and between 1791 and 1801 published in four volumes a translation of J. D. Michaelis's Introduction to the New Testament, with notes of his own, in which he may be said to have intro-
duced German methods of research into English biblical scholarship. His History of the Politics of Great Britain and France (1799) brought him much notice and a pension from William Pitt. In 1807 he was appointed Lady Margaret professor of divinity at Cambridge, and lectured to large audiences. He continued his biblical criticism, substituting English for the traditional Latin. Both here, and afterwards as bishop of Llandaff (1816) and of Peterborough (1816), he stoutly opposed
marshals, and Calvinism, Roman Catholicism, and the Evangelical movement as promoted by Charles Simeon and the Bible Society. Among his writings are Lectures on the Criticism and Interpretation of the Bible (1838), A Comparative View of the Churches of England and Rome (1834), and Horsa Pelagicæ (1812). He died at Peterborough on the 1st of May 1839.

MARSH, NARCISSUS (1638-1713), archbishop of Dublin and Armagh, was born at Haninging, Wiltshire, and educated at Oxford. He became a fellow of Exeter College, Oxford, in 1658. In 1662 he was ordained, and presented to the living of Swindon, which he resigned in the following year. After acting as chaplain to Sir William Ward, America, and in subsequent years as chaplain to Chancellor Clarendon, he was elected principal of St Alban Hall, Oxford, in 1673. In 1679 he was appointed provost of Trinity College, Dublin, where he did much to encourage the study of the Irish language. He helped to found the Royal Dublin Society, and contributed to it a paper entitled "Introductory Essay to the Doctrine of Sounds" (printed in Philosophical Transactions, No. 155, Oxford, 1864). In 1683 he was consecrated bishop of Ferns and Leighlin, but after the accession of James II. he was compelled by the turbulent soldiery to flee to England (1688), where he was subjected to a sentence of excommunication. Returning to Ireland in 1691 after the battle of the Boyne, he was made archbishop of Cashel, and three years later he became archbishop of Dublin. About this time he founded theMarsh Library in Dublin. He became archbishop of Armagh in 1703. Between 1699 and 1711 he was six times a lord justice of Ireland. He died on the 2nd of November 1713.

MARSH, OTHEMIEL CHARLES (1831-1896), American palaeontologist, was born in Lockport, New York, on the 29th of October 1831. He graduated at Yale College in 1860, and studied geology and mineralogy in the Sheffield scientific school, New Haven, and afterwards palaeontology and anatomy in Berlin, Heidelberg and Breslau. Returning to America in 1866 he was appointed professor of vertebrate palaeontology at Yale College, and there began the researches of the fossil vertebrata of the western states, whereby he established his reputation. He was aided by a private fortune from his uncle, George Peabody, whom he induced to establish the Peabody Museum of Natural History (especially devoted to zoology, geology and mineralogy) in the college. In May 1871 he discovered the first pterodactyl remains found in the United States, and in subsequent years light from Wyoming and other regions many new genera and families, and some entirely new orders of extinct vertebrata, which he described in monographs or periodical articles. These included remains of the Cretaceous toothed birds Hesperornis and Ichthyornis, the Cretaceous flying-reptiles (Pterodactyli), the swimming reptiles or Mosasauria, and the Cretaceous and Jurassic land reptiles (Dinosauria) among which were the Brontosaurus and Atlasaurus. The remarkable mammals which he termed Brontotheria (now grouped as Titanotheriidae), and the huge Dinocerata, one being the Uenothetia, were also brought to light by him. Among his later discoveries were remains of early ancestors of horses in America. On becoming vice-president of the American Association for the Advancement of Science in 1875 he gave an address on the "Introduction and Succession of Vertebrate Life in America," summarizing his conclusions to that date. He repeatedly organized and often accompanied scientific exploring expeditions in the Rocky Mountains, and their results tended in an important degree to support the doctrines of natural selection and evolution. He published many papers on these, and found time—besides that necessarily given to the accumulation and care of the most extensive collection of fossils in the world—to write Odontornithes: A Monograph on the Extinct Toothed Birds of North America (1880); Dinocerata: A Monograph on an Extinct Order of Gigantic Mammals (1884); and The Dinosaurs of North America (1896). His work is full of accurately recorded facts of permanent value. He was long in charge of the division of vertebrate palaeontology in the United States Geological Survey, and received many scientific honours, medals and degrees, American and foreign. He died in New Haven on the 18th of March 1899.

See obituary by Dr Henry Woodward (with portrait) in Geol. Mag. (1899), p. 237.

MARSH (O. F. merisc, for meris, a place full of "meris" or pools; cf. Ger. Meer, sea, Lat. mare,) an area of low-lying watery land. The significance of a marsh area is not so much in the manner of its formation as in the peculiar chemical and physical results that accompany it, and its relation to the ecology of plant and animal life. Chemically it is productive of such gases as arise from decomposing vegetation and are transitory in their effects, and in the production of hydrated iron oxide, which may be seen floating as an iridescent scum at the edge of many poorly drained marshes. Exposed to the action of powerful iron cement to many sandstones, binding them into a hard local mass, while the surrounding sandstones are loose and friable. A curious morphological inversion follows in a later geological period, the marsh area forming the hard cap of a hill (see MESA) while the surrounding sandstones are weathered away. Salt marshes are a feature of many low-lying sea-coasts and areas of inland drainage.

MARSHAL (med. Lat. marescarius, from O.H.G. marah, horse, and scale, servant), a title given in various countries to the military and civil officers, usually of high rank. The origin and development of the meaning of the designation is closely analogous with that of constable (q.v.). Just as the title of constable, in all its medieval and modern uses, is traceable to the style and functions of the Byzantine count of the stable, so that of marshal was evolved from the title of the marescari, or masters of the horse, of the early Frankish kings. In this original sense the word survived down to the close of the Holy Roman empire in the titular office of Erz-Marschall (arch-marshall), borne by the electors of Saxony. Elsewhere the meaning of office and title was modified. The importance of cavalry in medieval warfare led to the marshalship being associated with military command; this again led to the duty of keeping order in court and camp, of deciding questions of chivalry, and to the assumption of judicial and executive functions. The marshal, as a military leader, was originally a subordinate officer, the chief command under the king being held by the constable; but in the 12th century, though still nominally second to the constable, the marshal has come to the forefront as commander of the royal forces and a great officer of state. In England after the Norman Conquest the marshal was hereditary in the family of the king, and it derived its name from the office, and the hereditary title of earl-marshall originated in the marriage of William Marshal with the heiress of the earldom of Pembroke (see EARL MARSHAL). Similarly, in Scotland, the office of marischal (from the French maréchal), probably introduced under David I., became in the 14th century hereditary in the house of Keith. In 1495 the Scottish marischal became an earl under the designation of earl-marischal, the dignity coming to an end by the attainer of George, 10th earl-marischal, in 1716. In France, on the other hand, under Philip Augustus the marshal of France (maresculeus Franciae) appears as commander-in-chief of the forces, care was taken not to allow the office to become descendent; under Francis I. the number of marshals of France was raised to two, under Henry III. to four, and under Louis XIV. to twenty. Revived by Napoleon, the title fell into abeyance with the downfall of the Second empire.

In England the use of the word marshal in the sense of commander of an army appears very early; so Matthew Paris records that in 1214 King John constituted William, earl of Salisbury, marescarius of his forces. The modern military title of field marshal, imported from Germany by King George II. in 1736, is derived from the high dignity of the marescalus in a roundabout way. The maresculeus campii, or maréchal des champs, was originally one of a number of officials to whom the name, with certain of the functions, of the marshal was given. The marshal, being responsible for order in court and camp, had to employ subordinates, who developed into officials often but nominally dependent upon him. On military expeditions it was usual for two such marshals to precede the army, select the site of the camp and assign to the lords and knights their places in it.

In
time of peace they preceded the king on a journey and arranged for his lodging and maintenance. In France maréchal des logis is the title of superior non-commissioned officers in the cavalry.

Similarly at the king's court the marécaux aulic or intrinsecus was responsible for order, the admission or exclusion of others, or any breaches of the royal prerogatives of the court. The "marshals" were maintained not only by the king, but by great lords and ecclesiastics. The more dignified of their functions, together with the title, survive in the various German courts, where the court marshal (Hofmä W e) is equivalent to the English lord chamberlain. Just as the marécaux intrinsecus acted as the vicar of the marshal for duties "within" the court, so the marécaux forinsecus was deputed to perform those acts of seigniery due from the marshal to the Crown "without." Similarly there appears in the statute 5 Edw. III. cap. 6, a marécaux baner regii (marae dh Bou de du Roy), or marshal of the king's bench, who presided over the Marshalsea Court, and was responsible for the safe custody of prisoners, who were bestowed in the marrechola, or Marshalsea prison. The office of marshal of the queen's bench survived till 1839 (see Lord Steward; and Marshalsea). The official known as a judge's marshal, whose office is of considerable antiquity, and whose duties consisted of making abstracts of indictments and pleadings for the use of the judge, still survives, but no longer exercises the above functions. He accompanies a judge of assize on circuit and is appointed by him at the beginning of each circuit. His travelling and other expenses are paid by the judge, and he receives an allowance of two guineas a day, which is paid through the Treasury. He introduces the high sheriff of the county to the judge of assize on his arrival, and swears in the grand jury.

For the French maréchaussée see France: § Law and Institutions.

In the sense of executive legal officer the title marshal survives in the United States of America in two senses. The United States marshal is the executive officer of the Federal courts, one for each judicial district, or exceptionally, one for two districts. His duties are to open and close the sessions of the district and circuit courts, serve warrants, and execute throughout the district the orders of the court. There are United States marshals also in Alaska, Hawaii, Porto Rico and the Philippines. They are appointed by the President, with the advice and consent of the Senate, for a term of four years, and, besides their duties in connexion with the courts, are employed in the service of the internal revenue, public lands, post office, &c. The temporary police sworn in to maintain order in times of disturbance, known in England as special constables, are also termed marshals in the United States. In some of the southern and western states of the United States the Union the title marshal has sunk to that of the village policeman, as distinct from the county officers known as sheriffs and those of the justices' courts called constables.

In England the title of marshal, as applied to an executive officer, survives only in the army, where the provost marshal is chief of the military police in large garrisons and in field forces. Office and title were borrowed from the French prévot des maréchaus, the modern equivalent of the medieval praepositus maroclorum or gueruarum.

**MARSHALL, ALFRED** (1842– ), English economist, was born in London on the 26th of July 1842. He was educated at the Merchant Taylors' School and St John's College, Cambridge, being second wrangler in 1865, and in the same year becoming fellow of his college. He became principal of University College, Bristol, in 1877, and was lecturer and fellow of Balliol College, Oxford in 1883–1884. He was professor of political economy at Cambridge University from 1885 to 1908, and was a member of the Royal Commission on Labour in 1891. He became a fellow of the British Academy in 1902. He wrote (in conjunction with his wife) Economics of Industry (1879), whilst his Principles of Economics (1st ed., 1890) is a standard English treatise.

**MARSHALL, JOHN** (1752–1835), American jurist, chief-justice of the U.S. Supreme Court, was born on the 24th of September 1755 at Germantown (now Midland), in what four years later became Fauquier county, Virginia. He was of English descent, the son of Thomas Marshall (1732–1806) and his wife Mary Isham Keith. Marshall served first as lieutenant and after July 1776 as captain in the Continental Army during the War of Independence. He resigned his commission early in 1781; was admitted to the bar after a brief course of study, first by President John Adams to adjust the differences between the young republic and the directory. The commission failed, but the course pursued by Marshall was approved in America, and with the resentment felt because of the way in which the commission had been treated in France, made him, on his return, exceedingly popular. To this popularity, as well as to the earnest advocacy of Patrick Henry, he owed his election as a Federalist to the National House of Representatives in the spring of 1799, though the feeling in Richmond was overwhelmingly in favour of the opposition or Republican party. His most notable service to the Constitution was the action of the Court of Appeals at the hands of Jonathan Robbins, in which he showed that there is nothing in the constitution of the United States which prevents the Federal government from carrying out an extradition treaty. He was secretary of state under President Adams from the 6th of June 1800 to the 4th of March 1801. In the meantime he had been appointed chief-justice of the Supreme Court, his commission bearing date the 31st of January. Thus while still secretary he presided as chief-justice.

At the time of Marshall's appointment it was generally considered that the Supreme Court was the one department of the new government which had failed in its purpose. John Jay, the first chief-justice, who had resigned in 1795, had just declined a reappointment to the chief-justiceship on the ground that he had left the bench perfectly convinced that the court would never acquire proper weight and dignity, its organization being fatally defective. The advent of the new chief-justice was marked by a change in the conduct of business in the court. Since its organization, following the prevailing English custom, the judges had pronounced their opinions seriatim. But beginning with the December term 1801, the chief-justice became practically the sole mouthpiece of the court. For eleven years the opinions are almost exclusively his, and there are few recorded dissents. The change was admirably adapted to strengthen the power and dignity of the court. The chief-justice embodied the majesty of the judicial department of the government almost as fully as the president stood for the power of the executive. That this change was acquired in by his associates without diminishing their goodwill towards their new chief is testimony to the persuasive force of Marshall's personality; for his associates were men of meek ability. After the advent of Mr Justice Joseph Story the practice was abandoned. Marshall, however, still delivered the opinion in the great majority of cases, and in practically all cases of any importance involving the interpretation of the Constitution. During the course of his judicial life his associates were as a rule men of learning and ability. During most of the time the majority were the appointees of
Democratic presidents, and before their elevation to the bench supposed to be out of sympathy with the federalistic ideas of the chief-justice. Yet in matters pertaining to constitutional construction, they seem to have had hardly any other function than to add the weight of their silent concurrence to the decision of their great chief. Thus the task of expounding the constitution during the most critical period of its history was his, and it was given to him to preside over the Supreme Court when it was called upon in the former cases of great importance: *Marbury v. Madison* *McClung v. Maryland*, *Cohens v. Virginia* and *Gibbons v. Ogden*. In each of these cases it is Marshall who writes the opinion of the court; in each the continued existence of the peculiar Federal system established by the Constitution depended on the action of the court, and in each the court adopted a principle which is now generally perceived to be essential to the preservation of the United States as a federal state.

In *Marbury v. Madison*, which was decided two years after his elevation to the bench, he decided that it was the duty of the court to disregard any act of Congress, and, therefore, a fortiori any act of a legislature of one of the states, which court thought contrary to the Federal Constitution.
